Anemone ranunculoides in London Gardens.—A correspondent to the *Times* writes thus:—"Lovers of wild flowers have for several springs past been gladdened by the sight of a fair number of plants of the yellow wood Anemone, *A. ranunculoides*, flourishing in the Embankment Gardens between Waterloo and Charing Cross bridges. They were growing around several of the flower beds, and had most likely been brought thither in the turf used for edging, though so attractive were they that one was tempted to imagine they had been put in purposely, and to thank the authorities for this embellishment to the garden." The writer goes on to deplore the removal and destruction of these pretty, modest little plants, which is all the more to be regretted when we consider its rarity in the wild state and its comparative rarity under cultivation.

Ealing and District Gardeners' Society.—On the 29th ult., this society held its last sessional meeting, when Mr. George Cannon, of St. John's Nursery, Ealing, gave an address on "Landscape Gardening," Mr. C. B. Green presiding. Mr. Cannon dwelt, in a chatty style, on some of the more striking features of large gardens in the neighbourhood, adding, here and there, suggestions for the further improvement of landscape effect. Villa gardens, also, came in for a share of observation, as Mr. Cannon considered that these, when laid out properly and artistically, were capable of affording an immense amount of satisfaction to the occupiers. He recommended the planting of choicer trees and shrubs than generally prevailed, such as Maples, Hollies, Almonds, Hawthorns, and variegated shrubs, which would not be likely so soon to outgrow the requirements of a small place. The art of landscape gardening on a small scale, consisted in so arranging the trees that vistas beyond one's own premises could be obtained. Drainage and other matters received attention, a hearty vote of thanks being accorded. There was an excellent attendance, and a keen competition for the prizes offered for "Twelve Spring-flowering Plants." Mr. R. Green, gardener to W. Owen, Esq., The Elms, Castlebar, Ealing, was the successful competitor, he having a well-grown and very floriferous lot. Mr. Green was further awarded a cultural certificate. His plants consisted of *Azalea indica* vars., *Madame Camille van Langenhoven* and *Madame van den Cruyssen*, *Azalea mollis* in var., *Cypripedium barbatum nigrum*, *Oncidium sarcodes*, *Cyclamen latifolium* (persicum), *Primula obconica* (very fine), *Narcissus princeps*, and *Tulip Keizer Kroon*. Mr. Holloway, gardener to E. Hyde, Esq., Hill Crest, Castlebar, came in second with a nice lot of *Azaleas*, *Deutzias*, *Narcissus*, etc., and two specimen pots of the white Spanish Squill (*Scilla hispanica alba*); Mr. Long, gardener to E. P. Oakshott, Esq., Orchardene, Montpellier Road, was third with a very good collection; Mr. Woods, gardener to Mrs. Willey, being fourth.

The Brabourne Yew in Kent is said to be 3,000 years old, and the most ancient tree in the British Isles.

Cardiff Naturalists had on the 31st ult. the pleasure to hear a very interesting lecture on "Our Native Plants," delivered by Mr. W. W. Pettigrew, superintendent of Parks, of Cardiff. The lecturer first dealt generally with the distribution of plants, and stated that the determining influence of a country's flora were climate, position, and environment. The question of climate was the most important, and the mere size of a country did not determine the size of its flora, for while France had 4,000 native species, Scandinavia, which was much larger, had only a 1,000. Mr. Pettigrew then proceeded to deal with the British flora specially, and illustrated by means of a series of slides the various principles upon which it was constituted. Amongst the photographs that appeared upon the screen were several taken in Rooth Park. At the conclusion of the lecture, a hearty vote of thanks was accorded Mr. Pettigrew, on the motion of Mr. John Storrie, seconded by Dr. Vachell.

The Scottish Horticultural Association.—The monthly meeting was held on Tuesday evening last, when something like seventy members were attracted to hear a paper on "The Supply of Vegetables to the Edinburgh and Glasgow Markets," ably read by Mr. J. W. Scarlett, of Inveresk, who gave some very interesting statistics and information about each item of vegetable used in Edinburgh and Glasgow. The genial president, Mr. M. Todd, occupied the chair, and spoke very warmly of the manner in which the paper was compiled. Mr. Mackenzie, treasurer, made certain suggestions for additions when re-editing, and proposed a most cordial vote of thanks. Mr. W. Carmichael seconded this, and it was unanimously accorded. Mr. Scarlett duly responded to the various remarks made. The secretary, Mr. R. Laird, announced the following exhibits:—Seedling greenhouse Rhododendrons, from Mr. Calder, Trinity, one of which named "Hercules" received a First-class Certificate. Mr. Anderson, Panshanger, Herts, sent a fine clump of blooms of *Beaumontia grandiflora*. The president presented the society with an Album containing a portrait of each of the society's presidents, numbering fourteen. This was done in glowing language, and in honour of the association attaining its majority. Mr. Todd was warmly thanked for his thoughtful and timely gift by Mr. R. Laird and Mr. Grieve.

THE NARCISSUS IN DEVONSHIRE.

I HAVE often heard it proclaimed, if you wish to see the above growing to perfection you must take yourself across the water to Scilly, where no doubt they are grown in immense quantities, and most of the varieties well done. Here let me claim the same for genial Devonshire, as the many travellers can testify who visit the bulb farm of which I am about to speak.

Situated about the centre of the long scattering village of Newton Poppleford, three miles from Sidmouth, a favourite winter resort for invalids, and about ten miles from Exeter, you will find field after field aglow with these lovely flowers. The property is owned and worked by Messrs. Rendall, solicitors, London; and has risen from what was a small plot thirteen years ago to its present proportions of over sixteen acres, the greatest part of which is devoted to the growth of the Narcissus. It was on Tuesday, the 22nd of March, that I found myself among the golden fields, and the day being perfect with a cloudless sky, no doubt showed up the flowers to great advantage nestling among the narrow green foliage, almost blue in some varieties, notably *Maximus*. I found the manager, Mr. Hill (an ardent enthusiast among Daffodils) in the packing room superintending the packing and despatch of a huge pile of boxes, the like of which leaves Tipton Station, L. & S. W. Railway, by the five o'clock train each evening except Sunday, their destination being Covent Garden. As many as 350 boxes, each one containing from two to five dozen bunches according to variety, twelve flowers in a bunch, are sometimes sent off in a week, reaching London in good time for the next morning's sale. I found several pits that are used for forcing purposes, each 17 yds. long by 2 yds. wide. Each pit has a 2-in. hot water pipe running around it. Emperor and Bicolor *Horsfieldi*

are the favourites for this early work. A smaller pit, a span one, was devoted to *Narcissus poeticus ornatus*, just then coming in. These are slightly shaded during the few brightest hours of the day, as I learnt that the sun, if too hot, interfered with the eye of this variety.

Leaving this forcing ground we wended our way to the various quarters outside devoted to these flowers. First we came upon a large breadth of *Narcissus maximus*, a deep golden-yellow of grand form, and very early. The flowers had all been gathered, excepting a stray bloom here and there, which showed what a lovely flower it is. *Princeps*, another early, pale sulphur, flower, runs *Maximus* very close as to size. It takes well in the market and forces well, I learnt; an immense quantity of the variety is cultivated. *Horsfieldi* has a rich yellow trumpet, with white perianth, and is a large flower. This, too, is grown in quantity. *Emperor*, another large flower, was a grand sight at the time of my visit. *Cernuus pulcher* (Swan's neck) has a primrose trumpet, and is very pretty. *Rugulosus* (sweet scented) has a large yellow cup, and is very good. Bicolor *Horsfieldi* is made a speciality of here, and more of this variety is grown than of any other. There is a good breadth of Mr. H. J. Elwes, a large pale yellow trumpet; also of *Nelsoni major* a late variety, and very good; *Maximus*, a rich golden-yellow, large flower, graceful and early; and *Rugilobus*, a good flower, really a small Emperor.

A quantity of the Leedsii type is grown, most varieties of which are fragrant, pale yellow at first, but become white with age, almost resembling the *Eucharis Lily*. They last a very long time when cut and placed in water. *Amabilis* is a good one of this variety, as well as *Argenteus* and *Stella*. *Cynsure* is a showy variety, and a favourite of the writer's; there was a grand show of it. *Obvallaris* (*Tenby Daffodil*) is a distinct variety of fine quality, very early, and one of the best for market purposes; over an acre of it is grown. Bicolor and *B. grandis*, two grand varieties which come in late, have large quarters devoted to them. *Golden Spur* is a well-known kind, large and very early, most of which had been gathered. *Empress*, I noticed, was another good large flower, and of great substance. *Biflorus* or two-flowered is a good late kind, which our grandmothers grew largely in days long since. Bicolor *Horsfieldi* is found in most of the fields, in fact this firm is supposed to hold the largest stock of the variety in Europe. Sir Watkin is fairly well represented, but not such a favourite here as some others noted. Among other varieties grown in less quantities I noticed C. J. Backhouse, Mrs. Langtry, Duchess of Westminster, Sulphur Beauty, General Murray, Maurice Vilmorin, *Incomparabilis* Queen Bess, Marian Barton, Dean Herbert, W. P. Milner, Michael Foster, Minnie Hume, *Exquisite*, Mrs. F. W. Burbidge, F. W. Burbidge, Shirley Hibberd, John Nelson, J. B. M. Camm (scarce as yet), and many others. A large quarter is devoted to *N. poeticus ornatus*, which appeared as though it would be about right for Easter; and quite as large a piece of *N. poeticus recurvus*, a very late variety that carries the supply well into the month of May.

Mr. Hill showed me several of his seedlings which number a score, several of which he thinks and hopes will make good market kinds; one especially he mentioned, which is a cross between Emperor and *Obvallaris*, a very fine bold nearly upright flower, having a long stem, and of great substance. About twenty-five hands are employed during the busy season of flower gathering. Every year as many of the bulbs as can possibly be lifted in June and July, and replanted in August and September, are taken up, left on the ground a few days to dry, and are then taken to the drying-room where they are sorted, and despatched to the trade when the time arrives for this. The soil is of a light sandy nature, and favourable to the growth of the *Narcissus*. Mr. Hill believes in farmyard manure for dressing, worked into the ground the previous year. The *Lily of the Valley* is largely grown as well, and is generally forced and ready for Covent Garden about the middle of December, and continued up to the end of March. The bells were very fine, each spike carrying from eleven to thirteen. Mr. Hill evidently knows how to grow and force these. I was very sorry to leave these most interesting grounds, but the day was fast closing ere I had inspected the many varieties, and listened to the manager's eulogy of those which were his favourite varieties.—*James Mayne, Bickton, Budleigh Salterton.*

HINTS FOR AMATEURS.

BEDDING PLANTS.

YEAR by year the decoration and furnishing of the flower garden becomes more than ever a work of art. The amateur who has leanings towards the aesthetic can here find an abundance of room wherein to exercise his skill and taste in arrangement and association of the immense variety of plants that is now available for flower garden work. At one time we used to see Zonal Pelargoniums, Calceolarias, and Lobelias in almost endless repetition, and to the well-nigh total exclusion of everything else. With the popularising of what may be termed sub-tropical gardening, however, these plants have been confined to narrower limits, and, although nobody wants to banish them entirely, or, indeed, any other plant that is easy to grow and free to bloom, it is a matter of congratulation that they are no longer allowed to monopolise the whole of the space.

Whether the variety of plants that are destined to do duty in the flower garden in the forthcoming summer be large or small the present season of the year is a lively one amongst them, for stock has to be worked up in readiness for the time when the sun, to use a quaint localism, shines on both sides of the hedge. It may be of service if we take a brief glance at what is waiting to be done in this supply department at the present time.

Zonal Pelargoniums.—We may deal with these first on account of their commonness, for the old "Geranium" is the pet of the cottager, who, by the way, is somewhat conservative in his tastes and inclinations, and, moreover, a bed of good "Geraniums" still possesses the power to please those who like bright colours and bold masses. The approved custom is to strike cuttings of the plants in the autumn, placing these rather closely together in pots or boxes. Through the winter months these plants have been practically at a standstill, but lately they have commenced to grow, and, with the inveteracy of the race, to bloom. First of all these blooms and also all bloom buds must be picked off, in order to induce the plants to husband their strength, and not to squander it in producing flowers when they are not wanted.

If, through deaths or other causes, the number of healthy plants is too small for probable needs, the tops should be taken off these rooted autumn cuttings, and placed in pots or boxes to root. Under the stimulating influence of a gentle heat, such as will be obtained by placing them on a shelf near the glass in a greenhouse, they will soon make roots, and may then be separated, potted up, and started on the second stage of their existence. This taking of the tops off the old plants will not in any way hurt them, but will, in fact, do good, inasmuch as it will induce them to throw out side shoots and take on a bushy habit instead of spending all their energy in producing a long, lanky, single stem.

It follows from these remarks that if no more cuttings are wanted the tops of the old plants should be taken out all the same, only in this case just the central bud may be taken out by the finger and thumb. As the old plants have now been in the same soil, and packed closely together for fully six months it is time that they had a shift. This should be given at once. If a sufficiency of large 60 pots are to hand these may well be employed, one strong plant being put in a pot—if space is scarce two smaller plants may be put in a single pot. If pots fail shallow boxes must be used. The soil should consist of two-thirds of loam, one-third of leaf soil, and a sprinkling of coarse river sand, or better still, road sweepings.

Heliotropes.—A bed of the fragrant "Cherry Pie" is a desirable feature to have in a garden, but the plants are occasionally difficult to keep during the winter. The continued low temperatures, and the fogs of the town and city are very inimical to them, and thus it not infrequently happens that the number of plants even out of a batch of strong and healthy autumn cuttings that survive the winter is comparatively small, and insufficient to meet the demand. If the plants have not been placed in heat they should be without delay. Take the tops off as soon as they have commenced to move. These should be from 2 in. to 3 in. in length. Use very sandy soil for these cuttings, and cover

the soil itself with a layer of sand about a quarter of an inch in depth. If there is room for the cuttings on a shelf in a warm house they will strike very readily there, in fact almost as well as if they were in a close propagating frame. If, however, owing to pressure of space they have to be consigned to the stage some distance from the glass, it will be well to cover them with bell-glasses, both to induce speedier rooting and to prevent them from getting "drawn."

Verbenas.—These are even more touchy subjects than the Heliotropes, for a few days thick fog is sure to cripple them, and the old plants generally present a bare and sorry appearance by the time that the winter has passed. If placed in a gentle heat and treated very similarly to the Heliotropes, however, they will soon commence to grow, and will not be long in picking up. As a rule the cuttings are put in very thickly in the autumn, and if a good "strike" was obtained the plants are now considerably crowded. This it will be desirable to remedy as soon as possible by shaking the plants out, separating them from each other as tenderly as possible so as to preserve the greater portion of the roots intact, and potting them up singly into small pots—the size known as small 60's will be found very suitable and convenient. Prior to the potting the tops should be taken off the plants, and if cuttings are needed, inserted as such. Subsequent batches of cuttings may be obtained as desired from the old plants, for once they get a start they will make plenty of growth.

The greatest pest of Verbenas is mildew, and gardeners are chary of admitting them to houses containing plants susceptible to mildew on that account. If any traces of mildew are present amongst them, therefore, the plants should be given a careful picking over; all dead and dying leaves being taken away and burnt. Then, as a final precaution, the plants should be well syringed with water, in which potassium sulphide has been dissolved at the rate of $\frac{1}{2}$ oz. of the sulphide to a gallon of water. This will effectually destroy all the spores of the fungus, and prevent them from spreading further in search of new hosts. At the same time it will be well to shield the plants as far as possible from draughts.

Tuberous Begonias.—Year by year the value of the tuberous Begonia for bedding purposes becomes more fully demonstrated. Given a fairly favourable season the Begonia will hold its own against anything else both for freedom and continuity of flowering. One of its greatest recommendations from an amateur's point of view is the ease with which it may be kept during the winter. It is this item of wintering that gives the amateur more trouble than anything else, perhaps more than all put together, for in the majority of cases available space suitable for wintering bedding plants is exceedingly limited. The tubers of the Begonias, however, can be placed in bags or light boxes, covered with a little sand or soil, and stowed away in any odd corner: the exclusion of frost being really all that is necessary. It is high time now to hunt these tubers up and to start them growing. They should be carefully looked over first, and any that are unsound thrown away—it is no use wasting time with these. Last autumn the tubers were placed together according to the colours of their flowers, and care should be taken not to disturb this arrangement now. Shallow wooden boxes should be procured, a few crocks strewn over the bottom for drainage and covered with a little soil, and on this the tubers may be laid, an inch or two of space being allowed between each. A light covering of soil may then be given. A few boxes will suffice to start a considerable quantity of tubers, for it must be remembered that as soon as they are in active growth, a further shift into roomier quarters will be necessary. The boxes should be placed in a temperature of from 58° to 60° Fahr., and then if a moist kindly atmosphere is maintained, the young shoots will not be long in making their appearance. Shade from the direct rays of the sun will be then necessary as the young growths with their delicate leaves scorch easily, and the check sustained thereby is severe.—*Rex.*

A Chameleon amongst Flowers.—There is a Chinese flower that is red in sunlight and white in moonlight.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Chrysanthemums.—Would you tell me if it would injure Chrysanthemums to place them out of doors, as I have had them in a greenhouse all the winter also whether I should cut them down again, as they have made a lot of growth.—*H. B.*

We presume yours are old plants that flowered last autumn. If you do not intend to flower them again in pots you may plant them out at once so as to set the pots free. The foliage of Chrysanthemums is fairly hardy although the flowers are tender, and the little frost we are likely to get would not hurt them. It would be best to cut away a few of the most straggling growths so as to give a chance to the stronger ones beneath them. Old plants invariably throw up a lot more shoots than are wanted, so that you need not be afraid of thinning them a little. If intended for pots cut away last year's stems and thin out the others.

Early Flowering White Chrysanthemums.—*Amateur:* Lady Fitzwygram is certainly a very handsome and free, September flowering, white variety, of very compact and bushy habit, but you will find that Queen of the Earlies will suit your purpose better. The flowers, which are also white, are borne on stiff, wiry stems and raised well above the foliage, which they are not in Lady Fitzwygram. For supplying flowers for cutting Queen of the Earlies is infinitely superior. The height is from 3 to 3½ ft.

Incurved Chrysanthemum, Mrs. R. C. Kingston.—*Amateur:* Seeing that your cuttings were not put in until the beginning of February you should secure the first crown bud. Cuttings rooted earlier, say at the end of December, should have been stopped not later than the middle of March. The second crown bud should be taken on these plants.

Weevils on Peach Trees.—*C. T. B.:* The little holes in the leaves of your Peaches are caused by the Weevils. In order to catch them, you must visit the trees at night with a lantern. By carefully and quietly peering among the leaves without causing any disturbance, you will be able to catch the depredators. A pinch between finger and thumb is the readiest means of disposing of them.

Forced Asparagus Roots.—*Cabbage:* The roots of Asparagus that have been lifted and forced are of no further use, and may be thrown away at once.

Roses.—*Rosa:* Continuing the syringing of your Roses until the buds begin to show colour, then stop it. A little sulphur mixed in the water used for syringing is a capital preventive of mildew.

Ill-Shaped Camellias.—*Lentil:* The only way to reduce the Camellias to something like symmetry is by hard pruning. This is best done just after flowering is over, as the bushes are beginning to make their growth for the season. Cut them well back into the old wood. Never mind if they look stubby and ugly, but keep the syringe well at work amongst them in a gentle heat, and they will soon be clothed with verdure.

Melons Damping Off.—*L. E., Reading:* The rot may be checked by dusting powdered charcoal and lime round the collars of the plants, i.e., that part of the central stem close to the ground. In watering refrain from wetting this part of the bed, leaving a dry circle of 3 ins. or 4 ins. in diameter. If the rot appears on any of the branches higher up, you must give a daily dusting with the lime and charcoal until the wound dries up.

Lettuces in Onion Beds.—*Vegetables:* It is a fairly common practice to sow a pinch of Lettuce seed with the Onions, but the idea is not one that carries with it a particularly strong recommendation. A few Lettuces scattered here and there do not work any appreciable amount of harm, but the thing may easily be overdone, and then the Onions suffer through the loosening of the ground, caused by the pulling up of the Lettuces. We should advise you, therefore, not to leave many of them.

DIAMOND JUBILEE TABLE OF VEGETABLES (See p 506).

DIAMOND JUBILEE TABLE OF VEGETABLES.

THE Royal Caledonian Horticultural Society offered very valuable prizes for fruits, plants, cut flowers, and vegetables to be competed for on September, 8th and 9th last. The Victoria Diamond Jubilee Prizes in all the four classes brought out a lively competition for the respective honours. The vegetable class was open to gardeners and amateurs only, and the exhibitor had to select twenty-five dishes of not less than sixteen kinds, which had to be correctly labelled and tastefully arranged on a table 12 ft. long and 5 ft. wide. Surely all these requirements were sufficient to test the capabilities of the British gardener, as the arrangement had to be accomplished by himself or his regular assistant. The first prize offered was ten guineas and the Veitch Memorial Trustees' Large Silver Medal.

On the day appointed, the judges unanimously awarded the place of honour to Mr. James Gibson, gardener to E. H. Watts, Esq., Devonhurst, Chiswick, London. The accompanying illustration (p. 505) shows the table as it appeared when ready for the judges. Mr. Gibson, who effected the arrangements himself, stands behind the table. The vegetables were raised to a ridge in the centre of the table, the more bulky being placed there, while the others sloped to the edges in each direction. Only a portion of the vegetables, therefore, is visible, the isolated table being meant to let the public have a good view on all sides.

The varieties of vegetables used were The Lyon and Dobbie's International Leeks, Ailsa Craig, and Cranston's Excelsior Onions, Satisfaction and Sutton's Reliance Potatoes, Autumn Giant and Autumn Mammoth Cauliflowers, Sutton's Best of All Runner-Bean, Canadian Wonder Dwarf Bean, Giant White and Standard Bearer Celeries, Autocrat Pea, Sutton's Dwarf Gem Brussels Sprout, Mushrooms, Sutton's Perfection and Sutton's Eclipse Tomatoes, Student Parsnip, Pragnell's Exhibition Beet, Snowball and Goldenball Turnips, Sutton's Prizewinner Cucumber, Webbs' Emperor Cabbage, Globe Artichoke, and Vegetable Marrows.

All of the vegetables were grown in a garden which at one time formed a portion of that of the Royal Horticultural Society at Chiswick, and therefore fully within the deleterious influence of the London smoke. This speaks volumes to the care and industry devoted to them on the part of the cultivator.

EDINBURGH SPRING SHOW.

BY TELEGRAM.

It was a very good show. The Waverley Market was admirably staged, and the general arrangements capitally made by the new secretary, Mr. Thomson, assisted by Mr. Bryson and the council. The judges were Messrs. Dewar, of Glasgow Botanic Gardens; Mackinnon, of Melville; Paterson, of Salton Hall; Pirie, of Preston Hall; Lunt, of Keir; Moir, of Carnock; Mackinnon, of Terregles; Thomson, of Philip; Cook, of Gosford; McBean, of Craighend; Shillington, of Penicuik; and Dale, of Aikenhead.

Round the band-stand were staged the entries for hardy Rhododendrons, making a pretty picture. The first award went to Mr. Downie, of Beechill; the second to Messrs. R. B. Laird & Sons, Pinkhill.

For ten forced plants in bloom Mr. Malcolm McIntyre was an easy first with remarkable specimens of *Genista andreaana*, *Cytisus albus*, and *Kalmia latifolia alba*. The second prize exhibit consisted of Roses and Azaleas from Mr. James Bald, of Canaan House; Mr. Wm. Bennett, Hanley Lodge, came third.

Mr. Wm. Bennett was first for six forced plants; Mr. McIntyre, second; and Mr. Alex. Brown, of Craighend, third.

Mr. John Downie secured first prize for twelve forced plants, comprising *Genistas*, *Staphyleas*, and *Lilacs*; Messrs. R. B. Laird & Sons came second with *Kalmias*, *Azaleas* and *Deutzias*. The latter firm also scored first for eighteen forced plants, which made a grand display; Mr. John Downie made rather a poor second.

The premier competitive exhibit was made by Mr. Malcolm McIntyre on a twelve foot circular table. It consisted of *Dendrobiums*, *Amaryllis*,

Clivias, *Liliums*, and a remarkably fine specimen of *Genista andreaana*, with a bordering of *Smilax* and *Ferns*, dotted with *Cyclamen* and *Lily of the Valley*. This award carried also the Silver Cup presented by Messrs. T. Smith & Sons, Edinburgh. Mr. Geo. Wood, of Oswald House, took second; and Mr. James Cocker, of Chester's Hall, third. The judges had no difficulty in judging this class.

Messrs. Laird & Sons, and Mr. John Downie were first and second respectively for twelve hardy *Azaleas*. There was more variety of colour in the exhibit of the first named.

The class for six foliage plants in pots not exceeding 9 ins. in diameter, brought forth Mr. Malcolm McIntyre, Mr. D. Mackay, of Liberton; and Mr. James Macartney, of Liberton, who took awards in the order named.

Twelve Japanese Maples, exhibited by Messrs. Laird & Sons, took an easy first. Mr. John Downie was second.

For a table of Orchids, 5 ft. by 4 ft., there were two entries. The first prize went to Mr. Nicoll, of Craighowan who exhibited some fine pieces of *Cattleyas*, *Dendrobies*, and *Odontoglossums*, nicely arranged. Mr. Malcolm McIntyre came second.

Messrs. Laird & Sons took firsts for twelve hybrid *Azalea mollis* and for four *Azalea indica*, with Mr. John Downie as second. Mr. John Downie was first for six alpine *Auriculas*.

Some excellent Roses were shown by Mr. George Manson, of Wallhouse, and Mr. Wm. Galloway, of Fernieside, who each took a first. The two seconds went to Mr. D. Kidd, of Carberry, and the third to Mr. Geo. Manson.

Mr. McDougal, of Ascot Hall, was first for twelve *Gloire de Dijon* Roses, Mr. Geo. Manson, second; and Mr. Robert Lawrie, of Inveralmond, third. Mr. A. Dickson, of Glenormiston, was first for twelve excellent *Maréchal Niel* Roses, with Mr. J. Pearson, second, and Mr. George Manson, third. Mr. Malcolm McIntyre took first for twelve cut trusses of *Rhododendrons* containing not less than six varieties. Mr. Alexander Calder, of Calderbank, was second. A fine box of cut Orchids secured the first prize for Mr. David Wilson, of Westmount, Mr. M. McIntyre, being second, with Mr. John Mitchell, of Bantaskin, third.

For one hand bouquet, Mr. James Cossar, of Spott House, was first, Mr. James Bald second, and Mr. John Mitchell third. For ladies' dress spray, Mr. A. Dickson was first, Mr. John Mitchell second, and Mr. J. Cossar, third.

The only shower bouquet exhibited was by Mr. William Smale, of Blackford Park.

A class for three *Lycopods* brought forth Mr. George Chaplin, of St. Leonards; Mr. Thomas Gibb, of Redacre House; and Mr. George Wood, of Oswald House, who took awards in this order.

Six dwarf British Ferns were best shown by Mr. Wm. Anderson, of Woodcroft; Mr. John Pearson, of Rockville, was second; and Mr. James Preston, third. Mr. John Pearson was the only exhibitor of three exotic Ferns, Mr. James Cocker and Mr. J. Pearson were second and third for three *Adiantums*. Mr. Malcolm McIntyre was first; Mr. George Chaplin, second; and Mr. James Shearer, of Ratho Lodge, third, for six hardy *Azaleas*. For three hardy *Rhododendrons*, Mr. George Chaplin came first; and Mr. Malcolm McIntyre, second. Mr. John Cumming, of Liberton, was first; and Mr. James Bald, second for two *Pelargoniums* in flower, the first being very fine specimens.

The competition in *Hyacinths* was very strong. For twelve distinct, Mr. John Meiklem, of Sunnybank was first; Mr. Adam Brydon, of Tweedbank came second; with George McDougal, third. For six distinct, Mr. Meiklem was again first; Mr. R. M. Reid, second; and Mr. Robert Lawrie, third. Mr. Adam Brydon was first for six pots of *Tulips*, showing exceptionally good *Couleur Ponceau Keizer Kroon*, and *Wouverman*. Mr. A. Farquhar was second; and George McDougal, third. For six pots *Polyanthus Narcissus*, Messrs. J. Pearson, G. Wood, and J. Shearer divided the honours. Messrs. James Bald, A. Farquhar, and John Cowan took this order for six pots of garden *Narcissus*. Mr. John Pearson, of Beechwood, took first for six pots of spring bulbs, in which *Iris reticulata* and *Fritillaria pyrenaica* were well grown, Mr. John Pearson, of Rockville, and John Meiklem follow in this order. Mr. Wm. Galloway was first for four pots; and Mr. Malcolm McIntyre for two pots *Amaryllis*; the seconds were reversed.

Mr. McIntyre scored first for twelve *Cyclamens*; Mr. Alexander McMillan, of Douglas Castle, was second. For six *Cyclamens* the foregoing decisions were reversed. Mr. D. Mackay was first for six *Roses* in pots; and Mr. S. Abbott, of Prestonfield House, first for three, with Mr. Mackay as a third winner. The special training of the judges was fully required to make the awards for two *Crotons*, distinct, which went in order to Mr. James McCartney, Mr. M. McIntyre, and Mr. D. Mackay.

Mr. Alexander McMillan was first, Mr. James Cocker, second, and Mr. M. McIntyre, third, for two *Dracaenas*. Mr. James Wood was first, Mr. M. McIntyre, second, and Mr. D. Wilson, third, for a single specimen *Orchid*. The first-named presented a magnificent pan of *Cymbidium lowianum*. For four *Orchids*, distinct, Mr. David Wilson, Mr. Malcolm McIntyre, and Mr. F. Nicoll were first, second, and third. Mr. Alex. Campbell, Cove Gardens, took first for twenty-four *Hyacinths*; Mr. W. J. Watson was second. In the class for six pots of *Tulips* the same competitors take first and second respectively.

For twelve plants for table decoration Mr. John Downie and Messrs. Laird & Sons are first and second. Mr. D. Kidd was first; Mr. James Cossar, second; and Mr. Wm. Bennett, third, for six *Cinerarias*. Mr. John Cumming was first; Mr. Chas. Comfort, second; and Mr. D. Kidd, third, for three *Cinerarias*. For three *Azalea indica* there were two equal first prizes awarded to Mr. Malcolm McIntyre and Mr. Jas. Bald; the latter was first for two plants of *Azalea indica*; Mr. Wm. Murray being second; and Mr. Geo. Wood, third. Mr. Geo. Chaplin took first for four specimens of *Azalea indica*; and Mr. Wm. Murray was third. For a single specimen of *Azalea indica*, Mr. William Murray, Mr. James McCartney, and Mr. Malcolm McIntyre followed in this precedence. Mr. McIntyre led for four stove or greenhouse plants; Mr. Geo. Wood and Mr. James Cocker followed. Messrs. Calder and McIntyre were first and second for two greenhouse *Rhododendrons*, all very good plants. Mr. McIntyre, Mr. James Cocker and Mr. Bald were keen competitors with six stove and greenhouse plants; the judges decided in this order. Three exotic Ferns brought awards to Mr. George Wood, Mr. John Pearson, and Mr. James Cocker. The first named had a good tub of *Davallia dissecta*.

For four *Astilbes*, Mr. George Wood was the only exhibitor. For six *Astilbes*, Mr. T. C. Sutherland led; Mr. William Armstrong followed; and Mr. George Chaplin came a good third. For a tree Fern, stem not less than 3 ft., Mr. Andrew Pryde, of Newington House, was first; and Mr. James Bald, second. *Deutzia gracilis* was in fine form; Mr. Alexander Brown, Mr. J. Pearson, and Mr. Malcolm McIntyre took in order for a single specimen.

For two plant entries, Mr. Malcolm McIntyre was first; Mr. Alexander Brown, second; and Mr. John Pearson, third. Mr. D. Kidd took first; Mr. James Wood, second; and Mr. David Matheson, third, for six *Primula sinensis*.

Mr. McIntyre, Mr. Chaplin, and Mr. Pearson succeeded each other in the awards for six pots of *Primula obconica*; whilst for six *Primula Sieboldi*, Mr. Adam Brydon, Mr. W. Galloway, and Mr. Thomas Gibbs followed in this order. Six pots of single *Primula vulgaris* were exhibited and the prizes taken by Mr. P. Joseph Holmes, of Winton Castle; Mr. R. Reid, of Ashiestiel; and Mr. Thos. Shortreed, of Venlaw. The prize for double *Primulas* were taken by Mr. R. Reid and Mr. Adam Brydon. Mr. Robert Stuart, of Thirlestane Castle, and Messrs. Shearer and A. Dickson were victors with six pots of *Polyanthus*.

An excellent floral design was entered by Mr. John Downie, who secured first prize. Mr. John Lawson, of Bruntsfield Place, with a very neatly arranged harp, was second. The same order was maintained in the awards for one shower bouquet. Mr. John Lawson was first for one hand bouquet, and Mr. Wm. Johnson, of Murrayfield, second. The only entry for twelve *Camellias* was made by Messrs. R. B. Laird & Sons. The only award for twelve *Maréchal Niel* Roses went to Mr. John Downie.

MISCELLANEOUS EXHIBITS.

Messrs. R. B. Laird & Sons' non-competitive exhibit attracted many onlookers. This exhibit was in the form of a large circular table, sufficiently low to enable one to examine it comfortably. The outstanding features of this exhibit were *Amaryllis*, some seedlings of Messrs. Lairds' raising showing

great promise. Cliveias—to the hybridisation and improvement of this flower Messrs. Laird are also devoting attention, and that successfully—Azaleas, Lilacs, Japanese Maples, Acacias, and other seasonable plants in flower, as well as some fine Palms and foliage plants. The arrangement of the well-grown and well-flowered plants reflected great credit on Messrs. Lairds' skill as tasteful decorators.

They also exhibited a large selection of Alexander Shanks & Sons' lawn mowers. This exhibit comprises all the favourite patterns, including the British, Britannia, Standard Gear, and Caledonia Mowers, and is the largest show of the sort in the Waverley Market.

Mr. John Downie, 144, Princes Street, Edinburgh, has, in accordance with former precedent, a most impressive display. Mr. Downie's exhibits have for a good many years been one of the outstanding features of the Edinburgh shows; and his handsomely arranged circular table forms a most attractive exhibit. It includes a choice collection of all the best spring flowering and foliage plants, which, being admirably grown, bear evidence of successful cultivation; and the tasteful manner of staging was much admired.

Messrs. James Grieve & Sons have on exhibition a very nice table of fine foliage and flowering plants, including *Araucaria excelsa*, *Pandanus Veitchii*, choice *Dracaenas*, *Pteris cretica cristata*, *P. Wimsetti*, *P. tremula*, *P. major*, *P. straminea*, *Adiantum farleyense*, *A. Williamsii*, *A. Mariesii*, *Gymnogramme Mayii*, *G. Alstoni*, *Rhododendron Cunninghamii*, *R. M. Wagner*, *R. Jacksonii album*, *Epacris Deutzia*, *Azalea*, *Hyacinthus*, *Tulips*, *Narcissus*, including *Hersfieldi*, *Emperor*, *Sir Watkin*, and *Empress*, *Genista fragrans*, *Palms* in variety, and finished off with a fine edging of *Panicum* and spring flowering plants. We also observed a handsome wreath of choice flowers arranged with taste and skill.

Messrs. Dicksons & Co., 1, Waterloo Place, Edinburgh, filled a large table with a comprehensive exhibit of 150 species and varieties of Conifers, including *Abies excelsa pyramidalis*, *A. findonensis variegata*, *A. pungens glauca*, *Picea bifolia*, *P. Veitchii*, *P. Mariesii*, *P. subalpina*, *P. Pinsapo glauca*, *P. homolepis*, *P. nobilis glauca*, *Cedrus atlantica fastigiata*, *Pinus sylvestris aurea*, *P. s. globosa*, *P. insignis*, *P. rigida*, *P. pallasiana compacta*, and *P. umbraculifera*. They also had fine trees of *Cupressus lawsoniana caerulea*, *C. l. Kramerii*, *C. l. filifera glauca*, *C. l. argentea variegata*, *C. l. Triomphe de Boskoop*, *Retinospora squarrosa glaucescens sulphurea*, *R. filifera aurea*, *Juniperus canadensis aurea*, and *Thuja occidentalis lutea*. Other flowering and otherwise ornamental subjects were represented by *Andromedas*, *Pernettyas*, *Ligustrum aureum marginatum*, and *Ivies* in variety. Peaches and Nectarines, grown in pots, were in full bloom. They also showed Vines and various other useful subjects of which the firm makes a speciality.

Messrs. Barr & Sons, King Street, Covent Garden, London, exhibited a magnificent array of Daffodils from their Long Ditton Nurseries, Surrey. The public could not omit seeing such grand things as *Narcissus Madame de Graaff*, *Glory of Leiden* and the handsome new *Victoria*. Other trumpet Daffodils of leading importance were *Emperor*, *Captain Nelson*, *John Nelson*, *Golden Spur*, *P. R. Barr*, *Maximus*, *M. J. Berkeley*, *J. B. M. Camm*, *Madame Plomp*, *Her Majesty*, *Henry Irving*, the graceful *N. Johnstoni Queen of Spain*, *Mrs. Walter Ware*, *Duchess of Connaught*, *Lady Grosvenor*, and *Cernuus*, the three latter being white or sulphur coloured. *Capax Plenus* or *Queen Anne's Double Daffodil* was quite unique in form. The *Incomparabilis* section was well represented by *Princess Mary*, *Gloria Mundi*, *Beauty*, *C. J. Backhouse* (with its orange-scarlet crown), the giant *Sir Watkin*, *Queen Sophia*, &c. Other sections were represented by *N. Barri conspicuus*, *N. Leedsii Minnie Hume*, *N. L. Grand Duchess*, *N. triandrus albus*, *N. poeticus ornatus*, *N. p. grandiflorus*, &c. They also had an exhibit of many new and rare double and single Tulips—such as (singles) *Bride of Haarlem*, golden, beautiful rich scarlet, shot with gold; *Nelly*, handsome pure white; and *La Riente*, large bright rose. Doubles included *Couronne des Roses*, *Gladstone*, a beautiful cherry-scarlet; *La Grandeesse*, large rose flushed white; *Prince of Orange*, rich apricot-orange with yellow centre, &c.

Messrs. Ford & Co., 39 & 40, Princes Street, Edinburgh, have again ornamented the west end of

the Market with a very neat exhibit of pots and pedestals for the decoration of entrance halls and corridors. The designs are entirely new and *recherché*, whilst the colours are sweetly pretty. This firm also show a dessert table dressed in a most tasty fashion, the service being hand-painted; also a suite of cut glass, beautifully etched, a new table decoration comprising nicely-cut thistles, and their new ribbed glass flower tubes. The whole exhibit displayed much taste and attractiveness.

Messrs. T. Methven & Sons, of Warriston and

NARCISSUS JOHNSTONI QUEEN OF SPAIN.

The typical *N. Johnstoni* is a native of Portugal, and by the botanists is reckoned a variety of *N. Pseudo-narcissus*, that is of the smaller type of trumpet Daffodil. Though small in size it is for that reason one of the most graceful of all the Daffodils, for being highly poised on its stems it swings and dances in the slightest breeze. What applies to the type is even more applicable to *N. J.*

NARCISSUS JOHNSTONI QUEEN OF SPAIN.

Leith Walk Nurseries, staged a fine display of Clivias, Azaleas, Crotons, Guelder Roses, Lilacs, and other forced flowers, tastefully arranged with Palms, &c., occupying one of the three large tables allotted for non-competitive exhibits.

Flowers in the Arctic Regions number 762 species, all of which are said to be either white or yellow.

Queen of Spain, which is characterised and recognised by its pointed, reflexed, and more or less twisted segments, which give it a quaint and charming appearance. Amongst the first introductions of the type the trumpet was more or less truncate or clipped straight across the mouth, but Queen of Spain includes many variations in which the trumpet is widened at the mouth and more or less crenate or cut. The colour of both segments and trumpet is of a clear, soft lemon, and most refined in aspect.

The accompanying illustration, lent us by Messrs. Barr & Sons, of King Street, Covent Garden and Long Ditton, Surrey, shows the general features and conformation of this beautiful Daffodil. We have seen it grown in vast beds by thousands with Messrs. Barr, and shall never forget the sight. It should be grown in beds by itself to show off its graceful beauty properly.

THE NURSERYMEN, MARKET GARDENERS' AND GENERAL HAIL-STORM INSURANCE CORPORATION, LIMITED.

THE third annual general meeting of the shareholders of this Corporation, took place at Simpson's Hotel, 101, Strand, W.C. Mr. H. J. Veitch occupied the chair, and proceedings commenced at 3 p.m. precisely. After the minutes convening the meeting and those of the last annual general meeting had been read and duly passed, the report and balance sheet for 1897 were presented.

The report commented upon the violent hail-storms of 1897, which had done damage to upwards of eighty nurseries, the damage to glass and crops in Essex alone being estimated at £50,000. All the claims made upon the Corporation were assessed and paid within six days of the application. Attention was again drawn to the special advantage of insuring with this body, viz., that those insured can replace immediately their own glass broken by hail, payment according to the rate per square foot at which the glass is insured, being made by the Corporation.

Owing to the number of claims paid, and the large reserve set apart for unexpired risks (£500), it was not proposed to declare any dividend, although the directors were of opinion that the Corporation was at the present time in a much stronger position financially than ever before. The directors further expressed themselves fully satisfied with the results of last year's business. No directors' fees had been paid. The revenue account for the year showed that the total income from premiums to have been £1,360 17s., which, with interest, £45 7s. 3d. from investments, and transfer fees, 7s. 6d., made a total income of £1,406 11s. 9d. The total sum charged against the revenue was £2,228 11s. 11d. £1,532 17s. 5d. had been paid away in claims. The reserve for unexpired risks set aside last year was £300, so that the year's revenue had been drawn upon under this item to the tune of £1,232 17s. 5d. In addition to paying the working expenses, £261 11s. 2d., £80 had been written off the formation expenses, and 10 per cent. off the initial cost for office furniture and fixtures, whilst the large reserve of £500 had been set aside to meet unexpired risks.

In moving the formal adoption of the report and balance sheet, Mr. H. J. Veitch gave some further information as to the workings of the Corporation. This, he said, he was led to do because it might be thought that the two statements that it was not proposed to declare any dividend, and that the directors were thoroughly satisfied with the results of the last year's business might be considered to be conflicting and contradictory. The premium income was £681 1s. 9d. in 1895-6; £889 11s. 5d. in 1896-7; and £1,360 17s. in 1897-8, so that the premiums last year were 53 per cent. more than in 1896-7, and more than 100 per cent. than in 1895-6. At the end of 1895-6 there were 235 policies in force, covering 10,408,161 sq. ft. of glass, and representing a money value of £132,215 16s. In 1896-7 there were 346 policies, and 13,886,095 sq. ft. of glass insured at a value of £179,366 11s. 1d.; whilst they now had 550 policies, and 20,098,104 sq. ft. of glass insured at a value of £263,590 19s. 1d. With regard to the claims paid since the formation of the society, two claims amounting to £283 17s. 4d. had been met in 1895-6. There were no claims in 1896-7, but in 1897-8, thirty claims had been paid representing a value of £1,532 17s. 5d., as per revenue account. Of the formation expenses (£399 4s. 4d.) £239 4s. 4d. had been written off, leaving £160 for the next two years. The £500 reserve for unexpired premiums was £200 more than the reserve of the preceding year, owing to the increase in premium income. Mr. Veitch also read letters from various policy holders, whose claims had been settled, expressing their gratification at the prompt way in which it had been done. In conclusion, Mr. Veitch paid a high tribute

to the business acumen and industry of their manager and secretary, Mr. A. J. Munro.

Mr. Tillman seconded the adoption of the report and balance sheet, which was carried without demur.

On the motion of Mr. Hollis, seconded by Mr. Geo. Munro, junr., the retiring directors, Messrs. R. Piper, E. Rochford, W. Sams, F. Sander, N. N. Sherwood, and P. C. M. Veitch, were unanimously re-elected.

Votes of thanks to the agents and representatives of the Corporation, and to the Press were proposed respectively by Mr. Piper, and Mr. A. J. Munro, and carried with unanimity. Mr. A. J. Munro was also cordially thanked for his unremitting labours for the welfare of the Corporation, whilst Mr. Backhouse reminded the meeting how much they owed to the genial chairmanship and influence of Mr. H. J. Veitch. It is scarcely necessary to add that this found abundant echo in the hearts of Mr. Backhouse's hearers. Mr. Veitch suitably responded and averred his willingness to help in this as in any other good cause.

THE CINCHONA IN INDIA.

(Continued from p. 493).

A good many years ago, a private planter from Java, a Mr. Weinschenk, told me of a discovery he had made in open-air grafting by which, according to his own account, he got excellent results. In fact, he claimed by it to have almost no failures, and very little expense. But to this I cannot further testify than that I tried his plan on a small scale, but under unfavourable circumstances, with results that inclined me to view it with favour. His plan was very simple, but new to me. He commenced by making his graft sick, as he phrased it, by ringing its base, and letting it remain on the parent tree till its leaves became of an unhealthy colour, when he cut it off, and fixed it on the stock in the usual way. His whole discovery lay in making his graft sick beforehand, which, to me, appeared a very absurd procedure, but it really may have some reasonable foundation. Perhaps some one will be good enough to give the plan a trial with fruit and other trees at the proper season of the year, and chronicle the results. It should be done when the plants are in active growth. Mr. Weinschenk was a man of many theories, one of them being that the bark of the Cinchona, and not the roots or leaves, had the predominating, if not the entire, influence in the chemical conversion of the sap into the different alkaloids. Once when I was with him on a visit to the Nilgiri Cinchona plantations he asked the late Mr. M. A. Lawson, the superintendent of the Madras Government plantations, but formerly Professor of Botany at Oxford, and consequently well acquainted with vegetable physiology, where he thought the controlling chemist was located—whether in the leaves, or in the roots, or where? Mr. Lawson answered, off-hand, "In the leaves, of course." "How is it, then," said Mr. Weinschenk, "that if I cut over a succirubra plant and graft on it ledgeriana, which I let grow to some height, then behead and graft on a succirubra top, when I shall have succirubra leaves and succirubra roots, but the bark on the Ledger part of the stem, however many years afterwards, and however much it may have increased, will still be normal Ledger bark, and in the same way the succirubra bark at top and bottom will continue to be of the typical succirubra characters, i.e., the Ledger bark will continue to contain a large proportion of quinine and but little of the inferior alkaloids, cinchonidine and cinchonine, and the succirubra *vice versa*. Therefore, said Mr. Weinschenk, I maintain that the controlling chemist is neither in the leaves nor in the roots, but in the bark itself. Of course, the obvious weak link in this chain of argument is the fact that the bark on the Ledger part of the composite tree was started while it bore Ledger leaves. But I think it is suggestive of possibilities of getting branch sports by the engrafting of other bark, and that the bark may really have a large influence in determining the nature of the alkaloids, or the colour of the flowers, or in other ways. It is just possible that some of the inexplicable branch sports may have originated in the accidental engrafting of bark from kindred species or varieties.

COLLECTION OF BARK.

In Sikkim, the periodical crops of bark will be got

from thinnings and prunings from the fourth or fifth year up to the twelfth year, when the trees will be at their best, and it is then more profitable to totally uproot and plant on fresh land, than to allow them to remain longer in the ground. The plan originally laid down was to plant out 2,400 acres, and afterwards keep up this area after uprooting 200 acres annually and planting as much; but factory demands and other circumstances often compelled modifications, although in the main the plan was adhered to till of late years, when it was found that bark for the factory could be got from Travancore and elsewhere at less than it cost to grow in Sikkim, where planting operations have consequently been restricted of late. So Sikkim is gradually becoming more of a manufacturing than a cultivating centre for the East India Cinchona industry. When the trees are uprooted the bark of the larger roots, stems, and thick branches is collected by peeling or beating off with wooden mallets. The smaller branches and roots are peeled by pulling them smartly through between two upright sticks stuck firmly and closely together in the ground, when the bark comes away in ribbons.

One or two heavy and cumbersome machines have been invented for collecting this small bark, but none has answered better than the two simple sticks stuck in the ground, which reminds one of the old story of the inventor and his cabbage-cutting machine, which, the inventor declared, after all its good points had been explained and praised, cut Cabbages nearly as well as an old kitchen table-knife did. The bark is at once spread out to dry either in open or heated sheds, according to the weather, and when properly dried and protected from damp and rot, will remain chemically unchanged for scores, or perhaps hundreds, of years. Although the total uprootal plan is the most profitable for Sikkim, it is by no means so for countries geographically better situated for the growth of Cinchonas. On the Nilgiris, for instance, where several species thrive to perfection, the usual plan of collecting is that devised by the late Mr. McIvor, the first Superintendent of the Madras Government Plantations, and usually known as the stripping process. By it the half of the stem bark is taken from the standing trees in vertical strips of about an inch and a half in width, from the collar up to the lower branches, or as high as may be thought advisable. If the trees are quite healthy the bark will part from the wood, at the proper season, of course, with the greatest ease, and leave the cambium layer uninjured.

Immediately after the stripping the stem is covered thickly with moss or other soft substances, to exclude the weather. From the edges of the cuts, and all over the surface of the cambium layer, the new bark forms evenly, and with marvellous rapidity. In a year, or less, the renewed bark will be as thick as the original, and the remaining strips of original bark may be taken. Afterwards there may be annual collections of renewed bark for a considerable number of years. It is a curious fact that the renewed bark is much richer than the original in quinine, and consequently more valuable—often to the extent of 25 to 50 per cent. The plan requires generous treatment of the trees in the way of manure and cultivation, as only trees in vigorous growth will stand it; but it well repays the extra expenditure. For this discovery, and many other things, the Cinchona industry is heavily indebted to Mr. McIvor, perhaps more so than to any other man. Several modifications of his stripping plan have been tried, but none has succeeded so well. Perhaps the best of them is the shaving plan of the Dutch in Java. By it the outer half of the bark, all round the stem, is removed with spoke-shaves, and the stem covered up in McIvor's way. As it is well known that the great proportion of the alkaloids is located in the outer half of the bark, and very little in the inner, it is claimed for this plan that the whole of the useful factory bark can be removed by it, and the useless left behind to carry on the life-work of the tree.

It was also supposed to be less injurious to the trees, but, according to my experience, it is quite the other way. McIvor's plan, which was in operation many years before it, no doubt suggested it to the Dutch. Coppicing was tried in Sikkim, but was a commercial failure, as by it we lost the bark from the original roots, which usually amounted to quite one third of the whole out-turn. As the coppice shoots grew they threw out new roots for them-

selves, and the old ones died, and their bark was lost to us for ever.

(To be continued.)

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Dendrobium findlayanum Thwaites' var.—Under its most common form the species is a beautiful and attractive subject, being welcomed in collections during the early spring months. The variety under notice differs from the species chiefly in its size and the wide open and flattened character of the lip. The latter is orbicular, crisped at the edges, and the large golden or orange disc is surrounded by a relatively narrow white border. The ovate petals are also of great width, white in the lower and clear rosy pink in the upper half, the sepals being narrower, but similar in colour. Even after the flower was partly withered and contracted, it measured $3\frac{1}{2}$ ins. across the petals. The variety flowered last year with R. G. Thwaites, Esq., 23, Christ Church Road, Brixton Hill, and being now flowering again it maintains its character for the owner may well be proud of it.

Orchids at Falkland Park.—Many beautiful species, varieties and hybrids, are now flowering freely in the collection of Thos. McMeekin Esq., Falkland Park, South Norwood Hill, under the care of Mr. A. Wright. The fine hybrid, *Cypripedium grande* has petals fully 12 ins. in length. The rich spotting and green lines of *C. Argus* are clearly defined. *C. chamberlainianum* Falkland Park var. is notable for the great size and thickly spotted character of the lip. *C. Sedeni candidulum* and *C. vexillarium* are very fine hybrid sorts to be found in all good collections. Amongst *Dendrobiums* is a very fine variety of *D. Freemani*, with a rich maroon-crimson blotch on the disc of the lip, and very dark blue-purple petals, the colouring being continued to the base. Fine varieties are also to be met with in *Odontoglossum crispum*, *O. triumphans* and *O. Coradinei*, the latter being a natural hybrid between *O. lindleyanum* and *O. crispum*. It has a well defined, rich chestnut-red blotch on each of the segments (including the lip), on a soft, clear yellow ground.

GARDENING MISCELLANY.

AZARA MICROPHYLLA.

In Devon and Cornwall this beautiful evergreen shrub is now in the height of its glory. Usually it commences to flower in November or December, and keeps on opening its flowers at intervals according to the state of the weather till spring permits the free expansion of the remainder. They are small, and yellow, but though produced in myriads they by no means form the most important feature of the plant. The branches give off a large number of side shoots arranged in a double row in one plane. The leaves are small, evergreen and clothe the twigs profusely. Some branches grown in the open have been sent us by Mr. J. Reynolds, The Gardens, Sidbury Manor, near Sidmouth, Devon, that are the picture of rude health, glossy, and altogether clearer than is the case in the neighbourhood of London, where the species is liable to get injured in severe winters. The climate of Devon is, however, favourable in every way to this shrub, which is valuable for mixing with certain kinds of cut flowers, where *Adiantum* would be too frail and perishable.

AMPELOPSIS VEITCHII.

This plant, whose foliage is so justly admired, often (like other creepers) loses its high colouring when the roots make a free run into heavy, rich, and damp soil; but when such is the case, the roots should be examined and cut well back (according to the size of the plant). The heavy soil should be replaced with light, sandy material, well mixed with broken bricks or stones and made firm. Many plant this beautiful creeper in rich soil, where it soon develops a gross habit, and the party who has sold the plants is sometimes blamed for not supplying a genuine article. The Golden Honeysuckle is of this class of

plants, and loses much of its bright golden colour when planted in rich soil where sun does not act freely on the foliage.—*M. Temple, Carron, N.B.*

SEDUM SIEBOLDII VARIEGATA.

This is both an interesting and a pretty plant, well adapted for the cold greenhouse, and grown in pots or wire baskets. When in flower its rose coloured flowers combined with the creamy-white variegation of the leaves have a very pretty effect, hanging over the sides of the pot or basket, when suspended in a window. Give plenty of drainage and a rather loose light soil; avoid over-watering when not in active growth.—*W. B. G.*

THE PLANT HOUSES.

The Stove.

The recent spell of cold weather rendered it a matter of some difficulty to keep up the requisite heat without hard firing, and the watering-can and the syringe have had to be plied freely in order to counteract the drying effects of the hot pipes, but with the advent of April we look for and expect more genial weather when it will be possible to keep the coke hill down a bit. The temperature in the warmest stove should not now be allowed to go below 65° Fahr., even on cold nights, and if it stands at from 68° to 70° so much the better, since the stimulus thus obtained will not come amiss to plants that have been lately disturbed. The syringe must be plied freely and regularly morning and evening, both with a view to the keeping down of insect pests and to the imparting of sufficient moisture to the atmosphere.

SHADING.—The blinds on the south side of the houses were fixed during the second week in March, and now the rest of them should all be got in place without delay, for the sun has acquired considerable power, and scorching has to be feared. Odd corners and angles in the roof should have the glass painted over with "Summer Cloud Shading." Only a light covering should be given at first, except to the most inaccessible parts of the house; a heavier coating may be given in a month's time.

NEWLY POTTED PLANTS will require considerable care when being watered. It is true, that generally speaking, stove plants need abundant supplies of water, but this may well be overdone particularly when the plants, as now, have not fully recovered themselves of the check consequent on shifting. Plants that have been only topdressed and not potted must be watched with especial care, for it is easy to mistake their condition for water. The main watering should now be given in the afternoon sometime between two and four o'clock, another look over being given the following morning. In this way plants that do not need water at the one time may receive it at the next if they need it.

CALADIUMS.—Attend to the supporting of any large and heavy leaves that require it. These are exceedingly liable to be broken or bent under the weight of the water propelled by the syringe plus their own weight, which is considerable. The stakes used should be as thin and neat as is consistent with the required strength and rigidity, for nothing so heavily discounts the decorative value of a plant as clumsy and untidy staking.

TREE FERNS.—Tropical species of Tree Ferns are among the most stately and imposing of stove plants provided they are well looked after and not allowed to become infested with thrips, snowy fly, and mealy bug, all of which are exceedingly partial to them. Just now the roots emitted from the stems are very active, as an examination of the young green tips will speedily show. As it is advisable that these young roots should be encouraged as much as possible, the stems should be syringed at least twice a day with clear water, and an occasional variation with clear liquid manure will render good service. The plants themselves will also be in need of some manurial stimulant, and for the purpose there is nothing better than liquid cow manure and soot, if steps are taken to obtain a solution free from sediment. Pay close attention to young fronds that are being thrown up, and if necessary exercise some pressure upon them downwards to prevent their being crushed against the glass.

THE TALLER-GROWING ADIANTUMS, such as *A. aethiopicum*, *A. trapeziforme*, and *A. polyphyllum* are also now standing in need of staking. This is

especially the case with *A. aethiopicum*, whose numerous growths can only be manipulated at an early stage as they very quickly form a closely interlaced mass, which, as the stipes of the fronds are brittle, it is almost impossible to do anything with.

FERNS FOR CUTTING.—As Fern fronds, particularly those of *Adiantums* are in much request all through the year for making up in all sorts of floral decorations, it is advisable to have a good stock on hand to cut from. If the room can be spared and there is the convenience a small warm house may well be devoted exclusively to this class of plants. If not a bench in the large stove, in the shadiest portion of it, should be cleared and the Ferns placed upon it by themselves. It will then be easy to keep the syringe off them, which it is almost impossible to do when the plants are scattered about the house.

COCKROACHES.—With so many plants making new growths the cockroaches will have a fine time of it unless precautions are taken. The depredators are not at all particular, but seem to wage war indiscriminately upon all young leaves and stems. Ferns especially suffer at their hands. A few boxes of phosphorus paste should be spread on pieces of slate, crock, or cardboard, and laid about the house. The paste is greedily devoured by the cockroaches, and the dead bodies of the victims are likewise eaten by the living, thus helping to swell the list of deaths. No dead cockroaches should therefore be picked up, as they will find convenient sepulture in the bodies of their friends.

COLEUSES.—The earliest struck cuttings have now pretty well filled the 32's in which they were placed at the beginning of March, and should, therefore, be transferred to larger pots without delay. 8 in. or even ten in. pots will not be a bit too large for them if good specimens are required. The soil should consist of two-thirds of good loam, and one of old mushroom-bed manure, with sand. Pot firmly, as this helps to check too gross growth, and thus renders the plants more wiry and fitted for doing duty presently in the dwelling house. Attend to pinching as it becomes necessary. The tops were taken out of the plants soon after they were potted into 32's, and the main side growths should not be allowed to get too long before they are served similarly.

POINSETTIAS.—As soon as the shoots on the old plants have attained a length of 3 in. or 4 in. they should be taken off, with a heel of the old wood, and inserted as cuttings. Use very sandy soil, and plunge the cutting pots in a close propagating frame having a temperature of not less than 70° Fahr. Poinsettias are queer things to root; sometimes 95 per cent. of a batch will root, whilst at others scarcely 5 per cent. turn out well, and this when the conditions under which they are placed are, as far as human eye can distinguish, identical. In the face of this it will be wise to introduce plenty of old plants to treat, so that should a hatch of cuttings go wrong others may be had at once to take their places.—*A. S. G.*

SOCIETIES.

LIVERPOOL HORTICULTURAL ASSOCIATION, March 30th, 1898.

The spring exhibition of this society was held in St. George's Hall, under the most favourable auspices. The exhibition, taken as a whole, was bright and fairly good in quality; the specimen plants were somewhat under the Liverpool average for size; and Azaleas were conspicuous by their absence.

For a group of miscellaneous plants, 12 ft. square, E. Pryor, Esq. (gardener, Mr. E. Taylor), took the lead with a pretty array of flowering plants, in which *Dendrobiums*, *Odontoglossums*, *Amaryllis*, &c., showed to advantage, light Palms being used to break up the formality. W. H. Watts, Esq. (gardener, Mr. J. Bracegirdle), was second with a combination that showed taste, but lacked the quality of the former.

For ten pots of hardy herbaceous and bulbous plants W. B. Bowering, Esq. (gardener, Mr. T. Ankers) took the lead with a good lot, but unnamed. For six clumps of Lily of the Valley, Mrs. Cope (gardener, Mr. T. Carling) was to the fore with well-flowered plants. In a new class for miscellaneous bulbs and foliage plants, W. H. Watts, Esq., had a nice bright lot.

For twelve Hyacinths, distinct, O. H. Williams, Esq. (gardener, Mr. T. Wilson), staged the best, including Schotel, King of the Blues, La Grandesse, Fabiola, &c. For six varieties, J. Smith, Esq., took the lead. For six pots, three bulbs in a pot, W. J. Davey, Esq. (gardener, Mr. T. Leadbeater) won with grand spikes.

A. Earle, Esq. (gardener, Mr. J. Hitchman), had the best six pots of Polyanthus Narcissus; this exhibitor also won for six pots of single Tulips. C. MacIver, Esq. (gardener, Mr. H. Holford), winning for twelve varieties. For six double Tulips, C. J. Procter, Esq. (gardener, Mr. J. Williams) scored. For three Azaleas, in 8-inch pots, T. McClelland, Esq. (gardener, Mr. W. Bustard) won with well-flowered specimens.

The class for Amaryllis brought out a fine lot, the entries in this section showing that Liverpool is fully alive to these charming flowers. G. W. Moss, Esq. (gardener, Mr. T. Johnson) won with as fine a lot as has been seen in St. George's Hall, having strong spikes, large and well formed flowers of grand substance, including Sultan, Ladas, The Gem, Magnifica, etc.; W. J. Davey, Esq., was second. For a basket of cut flowers Col. W. H. Shirley (gardener, Mr. G. Eaton), took the lead, closely followed by Mrs. Cope.

For a single stove plant in bloom A. L. Jones, Esq. (gardener, Mr. A. Randall), won with *Coelogyne cristata*; E. Pryor, Esq., winning with *Acacia armata* for the greenhouse plant. For three Orchids W. H. Watts, Esq., was well to the fore, including a good plant of *Angraecum sesquipedale*, carrying twelve flowers. For two varieties E. Pryor, Esq., took the lead, and for the single plant the same exhibitor won with *Coelogyne cristata*. Col. W. H. Shirley won in the class for two hardy forced plants; W. H. Watts, Esq., leading for four exotic Ferns, with good plants. For a single Azalea A. S. Jones, Esq. had the best. For four hardy Rhododendrons T. McClelland, Esq., won with well flowered plants; E. Pryor, Esq., staging the best single. A. L. Jones, Esq., had the best greenhouse variety with *R. Gibsonii*.

W. H. Watts, Esq., won with good examples of three Palms, Mrs. Cope securing the premier award for the single specimen with *Thrinax elegans*, and was in a similar position for six pots of Lily of the Valley with good spikes. W. B. Bowering, Esq., won with fine plants of *Cyclamen*; W. H. Watts, Esq., for *Callas* (good); C. J. Procter, Esq., for a bouquet.

The exhibits not for competition added considerably to the beauty of the show, Certificates of Merit being granted for floral designs and plants to Messrs. Turner Bros. for *Azalea mollis*; to Messrs. Thomas Davies & Co., for *Mignonette Machet*; to Messrs. John Cowan & Co., for a table of Orchids and miscellaneous plants; to the Right Hon. the Earl of Lathom, for Royal Sovereign Strawberries; to Messrs. R. P. Ker & Sons, for a collection of *Amaryllis*, *Azalea indica*, and *A. mollis*; to Messrs. Dicksons for cut Daffodils and other bulbous flowers; and to Misses Hopkins for mixed *Polyanthus*.

The arrangements were somewhat altered from that of former years, the low tables being a distinct improvement, showing the flowers off to better advantage. The attendance only proved moderate.

BOURNEMOUTH AND DISTRICT DAFFODIL.—

March 30th and 31st.

WINTER was bound to come somewhere in the year, and Bournemouth has felt the recent inclement weather like many other places, but in spite of the clerk of the weather, Lady Willis open their first spring show under very favourable conditions on the first day, and the show was expected to be well attended. J. B. M. Camm, Esq., the president, in a few very appropriate introductory remarks, explained how easily Daffodils can be cultivated, and how beautiful they are when planted in copses, woodlands, in grass, and in the garden borders. He hoped the show would create amongst the residents of Bournemouth a love for the poetic Narcissus. Lady Willis declared the show opened and in a few words hoped the society would be a successful one. T. J. Hankinson, Esq., J.P., proposed a hearty vote of thanks for Lady Willis' kindness in opening the show, which was seconded by Mr. J. K. Ingram, of Parkstone.

In the class for a collection of cut Daffodils open

to all, five blooms of each, Mr. T. K. Ingram, of Bournemouth was first with some magnificent specimens of *N. Emperor*, *Golden Spur*, *Leedsii Amabilis*, &c.; Mr. J. J. Swaffield, was second. For twelve varieties, three blooms of each, the Rev. T. H. Marsh was first. For six varieties, three blooms of each, he was again first; T. J. Hankinson, Esq., being a good second. For three varieties of the large Trumpet type, six blooms of each, T. J. Hankinson, Esq., took the lead with *N. Emperor*, *N. bicolor Empress*, and *Golden Spur*. In the class for six blooms of any variety, T. J. Hankinson, Esq., again led with *N. Empress*; and the Rev. T. H. Marsh was second with *N. tortuosus*.

In the *Incomparabilis* section, T. J. Hankinson, Esq., was first with fine blooms of *Sir Watkin*; the Rev. T. H. Marsh being second; and J. B. M. Camm, Esq., third. For three blooms each of three varieties, T. J. Hankinson, Esq., was first; and the Rev. T. H. Marsh, second. For six blooms of one variety of *Double Trumpet Narcissus*, T. J. Hankinson, Esq., was first; and J. B. M. Camm, Esq., second.

For a bouquet of *Narcissi* (open to all), Miss Piper was first with a very graceful and artistically arranged bouquet, mixed with *Asparagus*, *Fern* and *Narcissi* foliage; Mrs. Lewis was second; and Miss Watkins came in third. For a similar bouquet, T. J. Hankinson, Esq., led the way; and Miss W. Moore came second. For an epergne of *Narcissi*, with *Fern* or other foliage (for ladies only), Miss E. M. Moore came first.

In the class for six pots of *Narcissi*, not less than four varieties, Mrs. Henry Rogers took first with six pots of well-grown specimens, including *N. Barrii conspicuus*, *N. Leedsii Minnie Hume*, *N. P. R. Barr*, *N. Empress*, *N. Sir Watkin*, and *N. Emperor*; T. J. Hankinson took second; and J. B. M. Camm, Esq. came in third. For three pots of *Narcissus*, T. J. Hankinson, Esq., came first.

For a group of flowering and foliage plants in pots arranged for effect, to occupy 30 sq. ft. of space, J. S. Sellon, Esq., was first; and W. H. Dore, Esq., a good second. For twelve pots of *Hyacinths*, T. J. Hankinson, Esq., took the lead. For three pots of *Spiraea astilboides*, T. J. Hankinson, Esq., took first, and also for three pots of *Dielytra spectabilis*. For three pots of *Cinerarias*, J. S. Sellon, Esq., was first with three well-grown plants, of good, decided colours; T. J. Hankinson, Esq., being second. Mr. Sellon was again first with three pots of *Primula sinensis*; while Mr. Dore was a good second. For *Deutzias*, Mr. Hankinson led with three well-grown specimens. For three and one specimen *Azaleas*, Mr. Sellon was to the fore, and Mr. Hankinson came second.

In the non-competitive groups Messrs. Barr & Sons, of Long Ditton Nurseries and Covent Garden, sent a large collection of their well known Daffodils, in which figured prominently in the Ajax Section, *Emperor*, *Queen of Spain*, *Golden Spur*, *Obvallaris*, *Wm. Goldring*, *J. B. M. Camm*, and their new bicolor *Daffodil Victoria* growing in a pot, thus showing its vigorous and sturdy habit. In the *Incomparabilis* and *Barrii* Sections, *Sir Watkin* and *Barrii Conspicuous* were fine; *Leedsii Grand*, and *Duchess of Westminster*, and *Katherine Spurrell* were good. In addition to Daffodils, Messrs. Barr had an assortment of *Anemones*, *Muscaris*, *Erythroniums*, etc.

Messrs. W. Edwards, F.R.H.S., & Son, of Sherwood, Nottingham, sent some very artistic manipulations, showing what can be done with plants of Ferns, Palms, *Selaginellas*, and cut flowers in their Edwardian ware.

Mr. M. Prichard, of Christchurch, sent a very interesting group of Daffodils; very good were *Countess of Annesley*, *Incomparabilis Sir Watkin*, and *Cynosure*; also *Emperor*, *Barrii Conspicuous*, *P. R. Barr*, and *Incomparabilis Titan*, very good. Some very fine specimens were also shown of *Tulipa Greigii*, *Iris reticulata*, some very good pans of *Aubretias*, *Primulas*, *Muscaris*, etc.

Mr. W. E. Tidy, Mr. T. K. Ingram, Messrs. G. Watts & Sons, and Mr. J. J. Swaffield, all of Bournemouth, contributed comprehensive groups of Greenhouse flowering and foliage plants. Mr. T. K. Ingram, of Parkstone Nurseries, exhibited, not for competition, an excellent group of *Lily of the Valley*, with enormous bells and handsome foliage.

The judges were Mr. P. R. Barr, of Barr & Sons, Covent Garden, and Mr. M. Prichard, of Christchurch.

QUESTIONS AND ANSWERS.

Ridge Cucumbers.—*J. T. Thurston*: The character and quality of ridge Cucumbers vary greatly; but their quality largely depends upon good cultivation. They should be grown quickly on vigorous and well fed plants. The fruits should be cut immediately they are full grown. Care should at the same time be taken that they are not much exposed to direct sunshine, as that is liable to make them tough and bitter by unduly drying and toughening the skin and tissues beneath. If protected by the foliage of the plants their safety would be ensured. *Stockwood* and *Pride of Devon* are very good ridge Cucumbers. You might, however, try some of the newer and improved sorts that have been raised by crossing the ridge with the frame (ordinary Cucumber) kinds like *Telegraph*. These crosses have given rise to varieties that are intermediate in length between the parents. They are prolific and of excellent flavour. Two of these newer kinds are *Sutton's King of the Ridge*, and *Baker's Triumph*, both of which are suited for open-air cultivation.

Book.—*F. Saunders*: "Hardy Ornamental Flowering Trees and Shrubs," by A. D. Webster, is priced at 2s., and free by post 2s. 3d.

Crested Begonias.—*W. M. W.*: Whether the name given this garden race of Begonias is *B. erecta cristata* or *B. grandiflora erecta cristata*, they are a strain of the summer flowering race, notable for the peculiar outgrowths on each of the four petals of the male flowers. The crest has already appeared in many varieties, differing chiefly in colour, and the peculiarity may yet be extended to many more, while at the same time we should expect that the crest itself will yet be modified and improved in size and general effect. Their cultivation is similar to that of other summer-flowering, tuberous Begonias.

Kind of Box for Edging.—*T. Brown*: As to what variety will be most likely to give satisfaction depends entirely upon the nature of your soil. The common tree Box (*Buxus sempervirens*) is the most vigorous and rapid grower, and most suitable for planting where the soil is of a stiff or heavy clayey nature. It requires more pruning or cutting in order to keep it within due bounds than the Dwarf Box (*B. sempervirens suffruticosa*); but then it succeeds where the latter is likely to fail or to die out here and there, leaving gaps. If your soil is light or free and easy to work, then you might safely plant the Dwarf Box, which grows slowly and requires little trimming.

Propagation of Lathyrus latifolius.—*H. W. J.*: The most satisfactory method of raising Everlasting Peas is to sow seed. It is not yet too late for the operation, as the plants grow so slowly the first year that they seldom, if ever, flower. Under moderately favourable conditions they would be almost certain to bloom next year. You could not do better than sow the seeds thinly in thumb pots, and place them in a cold frame to be kept close till the seedlings make their appearance. By placing them in a gentle artificial heat you might hasten their germination, but too high a temperature retards them. Artificial heat is, however, entirely unnecessary. When the plants are 3 in. high, and have been hardened by plenty of ventilation, you may plant them in their permanent positions at any convenient time. Here they will make more progress than if kept in pots, as they root very deeply.

Examination.—*D. E.*: We are sorry you were unable to go forward this year, but should advise you to continue your studies, and you will be in a much better position next year to insure success.

Names of Plants.—*C. Mackenzie*: 1, *Fitz-Roya patagonica*; 2, *Abies nordmanniana*; 3, *Pseudotsuga Douglasii*; 4, *Abies firma*; 5, *Thujaopsis dolabrata*; 6, not recognised. Send when in flower or at least when in full leaf.—*W. McIver*: *Cypripedium villosum* Boxalli; the other is *Oncidium aureum*, with more richly-coloured sepals and petals than usual.—*T. B.*: 1, *Asplenium bulbiferum minus*; *Platyoloma rotundifolia*; 3, *Selaginella Martensii*; 4, *Sibthorpia europaea variegata*; 5, *Forsythia suspensa*.—*A. C.*: 1, *Narcissus minor*; 2, *Sisyrinchium grandiflorum*; 3, *Cardamine trifolia*; 4, *Hacquetia Epipactis*; 5, *Anemone ranunculoides*; 6, *Primula rosea*.—*W. J.*: 1, *Odontoglossum crispum andersonianum*; 2, *Dendrobium nobile* var.; 3, *Cattleya Trianaei chocoensis*; 4, *Epidendrum radicans*.

Communications received.—*G. H. Cox*.—*M. Temple*.—*W. L.*—*L. Lubbers*.—*F. G. Brewer* (next week).—*A. B.* (next week).—*Geo. Russell*.—*A. L.*—*S. H.*—*W. M.*—*R. G.*—*C. C. L.*—*B. N.*—*S. Rose*.—*P. E. W. Baston*.—*F. Ames*.

CANNELL'S VIOLETS.

It is said no variety that we have so long and often recommended has ever given such complete satisfaction as Princess of Wales. We have the largest, most complete, and best kept stock of any in England. We shall be glad to quote special price for large quantities.

Catalogues free to coming customers.

SWANLEY, KENT.

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and prices of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

NEXT WEEK'S ENGAGEMENTS.

FRIDAY, April 22nd.—Sale of Imported and Established Orchids by Messrs. Protheroe & Morris.

APPLES FROM AUGUST TO MAY.—The subject of hardy fruits, generally, seems never to lack interest; and it would appear that the consumption of Apples as part of our diet (in North Britain at any rate) is greatly on the increase. Very often we read of great success by cultivators in districts wide apart, but seldom are details sufficient to encourage beginners to embark largely in Apple culture. It is pitiable to see so many old orchards throughout England, as well as in Scotland, in the last stage of decay. In our district (Stirlingshire) many old orchards, which had been famous for producing fine crops of fruit, have of late years, been cleared right away and are now useful pasture. Seldom do we see or hear of any new orchards being formed. When reports of successful Apple culture are given it would be well to note at the same time the elevation of the position, latitude, nature of soil, subsoil, drainage, and the varieties which succeed year after year without fail.

We find it is not necessary to go out of a county to see great diversity of results from orchards and fruit gardens, while the culture in each case is identical; but soil, drainage and exposure generally settle the matter. Large collections, instead of "Suitable Collections for the Situation," too often defeat the aspiration of cultivators. We have carefully noted sorts which have

given good crops season by season for 16 years past, and varieties remaining in good condition till May, which are as follows:—Beginning with Kitchen sorts, say during August, we have Lord Suffield (rather subject to canker in the wood), Keswick Codlin, Golden Spire, Lord Grosvenor, Eclinvill Seedling, Stirling Castle, Warner's King, Seaton House (the most certain cropper we have seen, lasting in use from October to April), Dumelow's Seedling, Northern Greening and Yorkshire Greening. They are kept dark and rather close, and newspapers are spread over the fruits which are in layers of 3 or 4 deep. The soil is wet, heavy, and below the surface of the sea.—*M. T., Carron.*

SHOULD SOIL GET TIRED OF ONE KIND OF CROP?—To agriculturists it is a matter of common observation and experience that Clover crops cannot be obtained from the same land consecutively for more than a few years. Science may yet be able in the near future to explain the reasons why the agriculturist should fail to secure a Clover crop annually from the same piece of ground. As far as we can at present determine, the species of Clover have peculiarities in this respect, that until they are more fully understood, cannot be surmounted. Other crops belonging to the same family do not seem to have given the same amount of trouble. The garden Pea has given successive crops from the same land for a period of fifty years without failure. Nevertheless it possesses the same peculiar faculties of collecting nitrogen from the surrounding soil, and of fixing the free nitrogen of the atmosphere as Clovers have. The inference furnishes no clue to the difference, which must, therefore, be sought for elsewhere. There can be little doubt that proper tillage and an intelligent use of the various animal and artificial manures to soils would help largely to overcome difficulties in the matter of continuous cropping. The more of any given crop that is conveyed off the land, the more the necessity for returning an equivalent in applied fertilisers. The soil is, indeed, an exhaustless store of plant food, but good crops taken off the land always deplete the latter of certain mineral and other ingredients at a greater rate than the forces of Nature can replenish the same in a condition that can be absorbed by plants. This is more particularly the case where land is badly tilled or not tilled at all. Air, rain, and frost are renovators of the soil's fertility; and the sun may also be placed in the same category, in the case of summer tillage at least. In India, the soil is dug up purposely so that the sun may pulverise it and otherwise restore its fertility. Moreover, tillage certainly hastens the solubility of plant food, while in a state of nature these operations proceed more closely.

For many years almost the sole crop of any importance grown in the Scilly Islands was early Potatoes. At length these became unremunerative owing to the competition coming from the Channel Islands, aided by the better climatic advantages. About thirty years ago, the Scillonians commenced Daffodil culture as a means of utilising their land, and affording them a living. In course of time Daffodils completely supplanted the Potatoes, from which we should infer that the crop was proportionately remunerative. This year, however, the islanders are complaining that the bulbs have failed to produce a remunerative crop of flowers. The same ground is continually cropped with Narcissi, which are lifted at intervals of three years or thereby, merely for the purpose of thinning out the bulbs and giving them more room.

When advised to manure the ground they complain that it is injurious to the Daffodils; and certain varieties do indeed dislike raw or little decayed farmyard manure at least. There can be little doubt, however, that the fertility of the soil requires restoring, after such hard and continuous cropping, with the removal of tons of flowers annually. The question arises, in what form may the necessary fertilisers be applied. That would have to be determined by one or more experimenters upon the ground, that is, in the Scilly Isles themselves. Both soil and environment would have a bearing upon the question at issue. Those having the time, the means, and the necessary knowledge of these things, should set apart a piece of land to be divided into plots, each one of which should be treated with a separate manure or a combination of several. Farmyard manure, catch crops for green manuring and the chemical fertilisers, should all be applied to see which gives the best return under the ordinary continuous cropping. The islanders might then be instructed in the method that most deserves to be pursued.

Several instances have come under our notice of continuous cropping, even by good practical gardeners, both in flower and vegetable culture. In many gardens, it happens that certain parts are sheltered, close to the principal walks (the borders of which have to be kept gay), and otherwise suitable for Dahlias, Hollyhocks, Gladioli, Roses, and similar flowers which are accordingly grown there, and successfully, for a great many years. We have also known nurserymen who have grown Dahlias upon the same ground for more than twenty years. We have known Onions being annually sown upon the same soil for more than twenty years in succession, and the crops pulled were heavy and the bulbs large. Successful gardeners often prepare a piece of ground for Carrots, and utilise it for this particular crop for years afterwards. In all these cases proper tillage and manures were solely responsible for continued successful cropping. Many other crops might be grown by the same practice, without raising a hue and cry about the exhaustion of the soil.

The Tobacco Raised in Baluchistan is said to be so exceedingly strong that it cannot be smoked by any but the most vigorous white men, though the natives have no difficulty with it.

The Post Office Authorities have, this Eastertide, contrived to irritate the public to a considerable degree over the carriage of boxes of flowers through the Pattern Post. During the past few years it has been a common practice for people living on the Riviera to send boxes of flowers to their friends and relatives in England by Pattern Post, these flower offerings being especially numerous at Easter. Hitherto the postal authorities have chosen to 'wink the other eye,' and the boxes have been duly delivered. This year a different course has been taken, and without any declaration as to their intentions the postal authorities have returned from Dover all such boxes to the senders. Of course flowers are not millinery or dress fabrics, and could scarcely be classed under the title of 'patterns,' strictly speaking, but in view of the fact that they have been allowed to be sent thus, some warning that they would no longer be received was surely necessary. In the light of the information to hand this latest freak of the Post Office is nothing less than churlish and wantonly disagreeable. Law is law of course, and regulations are regulations, but it is possible for both laws and regulations to fall into disuse by tacit consent, just as the hedge that is often trampled over disappears at last. The cultivation of flowers for *expédition* has been taken up largely in the Riviera district, and it is a thousand pities that these cultivators should be disappointed of the fruit of their labours.

Microbes to the number of 250,000,000 of various species are calculated to be taken into the lungs by a Londoner in the course of seventy years.

No Need for Fear.—The new occupier of a farm went to his Potato field early one morning, and dug up a few of them to see how they were getting on, when his attention was suddenly arrested by the appearance of a couple of strangers at the other side of the field, who were preparing to follow his example. He was about to challenge them, when the reassuring words were wafted to his ear—"Dinna let us disturb ye, we're stealin' a pickle Tatties like yerself."—*People's Journal*.

Fruit Prospects.—As far as the present appearance of our fruit trees goes they are promising well for good crops. The blooms of Cherry trees on walls are just expanding; so are those of Plums and Damsons. I notice some of the Pear blossom just opening, and every fruit tree is bristling with flower buds; and if frosts do not occur there is no reason why we should not have an abundance of fruit of all kinds in this neighbourhood. We escape late spring frosts fairly well, but the expansion of the blossom is taking place rather earlier this season.—*W. P. R., Preston, Lancashire, April 11th, 1898*.

Fires in the Forest of Dean.—On the 3rd inst fires broke out at several points simultaneously at Park-end, Forest of Dean, by which large tracts of forest were destroyed on an area extending over two miles. The simultaneous outbreak of the several fires is held as a true indication that the incendiary has been at work. There is much uneasiness in the district, the belief being held that certain persons are indulging in these acts of lawlessness in resentment at the work of the Commissioner of Woods in enclosing thousands of acres in the Dean Forest that used to be held as common land.

Tunbridge Wells Gardeners.—At a recent meeting of this society Mr. H. H. Cousins, M.A., of the agricultural staff at Wye College, gave an instructive lecture upon "Garden Manures." The lecturer first dealt with the chemical analysis of plant life, and the need of giving soils the benefit of various manures, such as nitrates, sulphate of ammonia, phosphates, and potash salts. He touched upon the needs of plants that were cultivated for their fruit and flowers. He assured his audience of the willingness of the County Council to give gardeners and agriculturists the benefit of the results of scientific experiments carried out at Wye College, and said, moreover, that the staff there would at all times be glad to answer inquiries on matters that required chemical analysis. The meeting followed very closely the various points raised by Mr. Cousins, and not a few questions were asked at the close, to all of which lucid answers were given by the lecturer.

Ealing and District Gardeners' Society.—The tenth annual dinner of this society was held on the 5th inst., in the Princes' Hall, Ealing, the president, J. Harris, Esq., F.R.H.S., in the chair. Nearly fifty persons partook of the annual spread and otherwise enjoyed themselves during the evening. After the usual loyal toasts the president proposed "Success to the Society," and congratulated the members on the solid work done and the excellency of the papers and lectures given during his term of office. Mr. W. Roberts, the hon. secretary, in responding stated that the society's finances were never in better condition; the meetings had also been well attended; and that the recent spring show had resulted in a profit of nearly £15, which would be duly handed over to the treasurer of the Royal Gardeners' Orphan Fund (applause). The distribution of prizes and certificates then took place, after which various other toasts were given and replied to, blended with some capital songs and an original recitation entitled "The Gardens of the Hesperides," by Mr. C. B. Green. Some very sensible speeches were made during the evening by Messrs. A. Wright (Falkland Park), R. Callard, W. W. Richardson, C. Edwards, W. J. Simpson, D. Cooper, C. Long, R. Green, Jas. Gibson (Chiswick), C. F. Harding, H. Burgess, Geo. Cannon, and others. After the chairman had retired the hon. secretary announced, amidst great applause, that he had received promises of £4 4s. from the chairman, and £2 2s. from Mr. Callard, besides other support. Thus ended a profitable as well as a very pleasant evening.

Messrs. J. Laing & Sons, Forest Hill, London, have been extending and perfecting the floral department of their business, that is, the branch which deals with bouquets, wreaths, crosses, anchors, sprays, table decorations, and everything else of that nature. This important department of their business is managed by an eminent staff of west-end lady florists.

A Monmouthshire Daffodil Grower.—Mr. W. J. Grant, who won the Silver Daffodil Cup, presented by Messrs. Barr & Sons, at the spring show of the Royal Botanic Society on the 30th ult., is the zealous organising agent for agriculture and fruit gardening to the Monmouthshire County Council. Mr. Grant's place at Bassaleg, near Newport, has been gay with Daffodils and other Narcissi for some years past, and the present case was his highest flight in open competition. His collection consisted of sixty varieties and over 1,000 blooms, including fine bunches of all the leading and better known varieties in cultivation.

The Alexandra Palace.—This place of amusement and recreation for the people, and where some good flower shows—principally Rose shows—have been held in the past, has been more or less completely closed during the past ten years. It was again opened, however, on Good Friday under new management. Since the closing of the Alexandra Palace a large population has sprung up in its immediate neighbourhood, and on the opening day there was a large attendance of the public. The beautiful grounds presented the appearance of having been hurriedly put into order, but the large staff of gardeners who have been engaged will soon get the place into trim order again, and make amends for the period of neglect.

A New Variety of *Salvia splendens*.—A new variety, since named *Salvia splendens purpurea*, was raised from seeds in 1895, and has since proved constant in colour. It has the habit of *Salvia splendens nana*, its height being about 18 ins., and it commences flowering in July, at least in Italy. The spikes and calyxes are purple, tending towards a chocolate colour, and the corolla is lilac. As a variety of this species it is very beautiful and very interesting. *Il Giardinere*, a Milanese periodical in 1881, gave a coloured plate of the typical *S. splendens* together with four other varieties, including one dedicated to Signor Pirota, and one to Countess Maria Teresa Olgiati. The other two were *S. s. flore albo* and *S. s. violacea*. The variety under notice as well as *S. s. pucciana*, with a white calyx and rosy corolla, are newer and commented upon by a writer in the *Bullettino della R. Società Toscana di Orticultura* for March last. He also describes five others, including *S. s. rosea*, also known as Apple Blossom.

Memorial to the late M. Jean Linden.—On the morning of the death of Jean Linden, some friends conceived the project of perpetuating the remembrance of the celebrated explorer, the learned botanist whose loss the horticultural world deploras, and whose innumerable discoveries have enriched the flora of our greenhouses and gardens with so many marvels. The idea of raising a monument to his memory was bruited and found numerous adherents. The monument would be erected at Brussels, where M. Linden passed the greatest part of his life. To realise this object a committee has been formed under the presidency of M. le Comte de Kerchove de Denterghem, president of the Royal Agricultural and Botanical Society of Ghent. M. Kegeljan, president of the Royal Horticultural Society of Namur, Belgium, was very willing to accept the function of treasurer, and subscriptions in the form of postal orders, payable at Namur, may be addressed to him. M. Lubbers, secretary of the Royal Floral Society of Brussels, consented to become secretary. It has been decided that an appeal should be addressed to botanists, amateurs of horticulture, horticulturists, public establishments, and scientific societies both Belgian and foreign, inviting them to co-operate in the manifestation, and to give it an international character. The services rendered to horticultural science by M. J. Linden are universally known and appreciated, so that those who are interested in botany and horticulture should join in raising a fitting memorial to the great traveller and plant collector.

Erratum.—On page 503, in the 24th line from the bottom of the second column, for "is owned and worked by Messrs. Rendall," read "Messrs. Kendall."

The Peach is said by some authorities to have been originally a very poisonous fruit, but that by long cultivation this quality has disappeared. After being properly matured, however, it is more than likely that the poison, if it existed at all, resided in the embryo or kernel, as in the bitter Almond.

A Pyramidal Lime.—A pyramidal variety of Lime is finding its way into gardens about Darmstadt, namely *Tilia platyphyllos pyramidalis*. The ordinary form of the broad-leaved Lime is a handsome tree, but never looks well when attempts are made to prune it into pyramidal shape by artificial means. The variety under notice might be planted where a tree of pyramidal shape is desired. There is a fine young specimen about 20 ft. high in the Prince Emil garden in Bessurgen, near Darmstadt.

Presentations at Torquay.—At the annual general meeting of the Torquay Gardeners' Association, Mr. F. C. Smale, the hon. secretary, on behalf of 133 members, presented their president, Dr. Hamilton Ramsay, with a magnificently illuminated address, in token of the appreciation in which the association held the valuable services rendered them. The address was an artistic piece of work, executed by Mr. A. Shelly. Dr. Ramsay was much touched by their kindness. Mr. Masterman then presented Mr. Shelly with a souvenir in token of the appreciation of his work in illuminating the address.

Anemone ranunculoides.—The writer of the note under this heading on p. 503 made a mistake in getting the wrong name of the plants growing upon the grass in the Embankment Gardens. They consisted of the Winter Aconite (*Eranthis hyemalis*), and had not come in the turf, but were intentionally planted. The planting having been accomplished at different times by the superintendent, Mr. G. Palmer, the result has been that a continuous succession of bloom has been kept up since February to the present time. We compliment Mr. Palmer on his forethought in planting so as to secure such a lengthened display by so simple a plan of procedure. Gardeners and superintendents of parks generally would do well to avail themselves of the practical utility of this hint.

Leaf-cutting Bees.—Mr. Fred Enock, F.L.S., F.E.S., etc., continues his most interesting essays on "British Bees" in the April number of *Knowledge*. The number of British species is sufficient to astonish all but those having an acquaintance with the subject. The doings of many of them are marvellous, and give the reader an impression that they are possessed of wonderful skill and intelligence—some would say instinct. Many gardeners, and Rose growers in particular, are familiar with the doings of the leaf-cutting bees, much to their sorrow. On the other hand, Mr. Enock, and other naturalists, he admits, are quite willing to allow the bees to cut up the leaves of their Rose bushes that they may have an opportunity of studying the habits of these interesting creatures. Though certain species prefer the green leaves of Roses with which to build the cells for the rearing of their young, Mr. Enock has also watched them cutting circles and oblongs from almost any sound leaf. Amongst others he mentions the leaves of Laburnum, Rhododendron, Laurel, Sweet Pea, Nasturtium, Pelargonium, Laurustinus, etc. Several species of *Megachile* visit London gardens during June and July, and he has watched *M. centuncularis* cutting dozens of pieces from the soft leaves of an edible Pea in a garden that possessed no Roses. In another instance he noted that *M. wilughbiella* always builds its cells with pieces of green Rose leaves, preferably those of *Maréchal Niel*. Gardeners who wish to catch the marauders red-handed must visit their Roses early in the morning, for the leaf-cutters are early risers. They also continue for several hours, however, and may be seen at work later in the day. Mr. Enock watched *M. centuncularis* cutting the leaves of Sweet Peas, and found that the bee required only fifteen seconds to cut out a circular piece and twenty-seven seconds to cut out an oblong piece. Thus a leaf-cutting bee could cut out a section and carry it away while the enraged owner of the Rose is preparing to hit her with his cap.

Aniline Dyes to the tune of 2,000 distinct shades are obtained from the 140 lbs. of gas-tar extracted from a ton of coal.

Royal Botanic Society.—The conservatories and grounds of this society were again opened to the public on payment of a small fee of admission on Bank Holiday. A military band played both during the morning and the afternoon.

Sparrows and Oats.—Miss Ormerod has been threepin' doon Miss Carrington's throat that sparrows destroy 1,500,000 quarters o' aits in Inglan' in the coorse o' a twalmonth. Mighty, me! there widna be muckle left for the horses. Miss O. maun surely be drawin' a lang bow in haste (nae at Hastings), 'cause the spurg only gets ae month's grace amon' the aits, let alane twal'.—*Snaggs*.

Marquetry in Natural Woods.—Her Royal Highness the Grand Duchess of Hesse, has, we understand, been occupied for some days past in working on "Tarsia," the new art inlay work for amateurs. It is well known that Her Royal Highness takes a keen interest in all amateur art work, and this new branch seems to have attracted her particular attention. "Tarsia" is a delightfully simple form of marquetry, executed in natural woods. It was first introduced to the public in the December number of *The House* (the artistic monthly for the home), which is published at the office of *The Queen*. This magazine devotes itself to all branches of amateur art, as well as the furnishing, decoration, comfort and management of the home. It has recently added a coloured plate to its many features. The price is sixpence. The illustrations of the designs in natural woods for the adornment of various articles of household furniture show that Daffodils, Buttercups, Irises, and various other flowers have been imitated.

Reading and District Gardeners' Mutual Improvement Association.—Mr. W. H. Lees of the Gardens, Trent Park, New Barnet, read a paper on "Profitable Orchids" before the members of the above Association on Monday evening, the 4th instant, Mr. C. B. Stevens presiding. The formal business having been transacted and a sum of £5 5s. od. been voted to the Special Fund raised by the Reading Horticultural Society, the president called upon Mr. Lees to give his paper. In introducing his subject, the essayist said that it was not his intention to treat the subject from a market grower's point of view, as the title seemed to imply, but from that of the private gardener, dealing with those varieties most suitable for cutting and decorative purposes. The general routine of the cultivation of *Odontoglossums*, *Cattleyas*, *Laelias*, *Dendrobiums*, *Coelogyne*, *Calanthes*, *Cypripediums*, and *Oncidium*s was briefly dealt with under the following headings:—ventilation, heating, staging, watering, manuring, potting, compost, insects, fumigating, etc. The following genera and their species were recommended for the purpose already named:—*Odontoglossum triumphans*, *O. histrix*, *O. Hallii*, *O. odoratum*, *O. crispum*, *O. Rossii*, *O. Edouardii*, *O. harryanum*, *O. Pescatorei*, *Cattleya percivaliana*, *C. Trianaei*, *C. Mendelii*, *C. Mossiae*, *C. gigas*, *C. dowiana*, *C. gaskelliana*, *C. labiata*, *C. Skinnerii*, *C. Harrisoniae*, *Laelia purpurata*, *L. elegans*, *L. harpophylla*, *L. anceps*, *L. autumnalis*, *Dendrobium nobile*, *D. wardianum*, *D. Phalaenopsis schroderianum*, *Coelogyne cristata*, *C. c. lemoniana*, *Cypripedium insigne*, *Oncidium tigrinum*, etc. An interesting discussion ensued in which Messrs. Martin, Stanton, Turton, Woolford, and Bound took part. A splendid exhibit of Orchids was made which added greatly to the interest of the meeting and helped to illustrate many of the remarks made by the speaker. Those who contributed the plants and cut flowers were Mr. Woodford, gardener to Alfred Palmer, Esq., East Thorpe (*Dendrobiums*, *Cypripediums*, *Coelogyne*, *Odontoglossums*, and *Oncidium*s); Mr. J. Pound, gardener to Dr. May, Caversham (*Dendrobium fimbriatum oculatum*); Mr. G. A. Parsons, Oxford Road (*Dendrobiums*); whilst Mr. Stanton, Park Place Gardens, exhibited some spikes of *Bougainvilleas*. A hearty vote of thanks was passed to Mr. Lees and to those members who had been the means of bringing together such a beautiful collection of bloom.

ORCHID NOTES & GLEANINGS.

By THE EDITOR.

Dendrobiums from Redlands.—In a box of flowers sent us by Mr. Geo. Russell, The Gardens, Redlands, Kelvinside, Glasgow, was a bloom of the sport of *Dendrobium nobile Cooksonii*, which originated at Redlands. It is as fine a form of this remarkable case of *peloria* as we have seen. The petals are nearly as wide as the lip, but they are longer; and the blotch on each of them is precisely of the same shape as that of the lip, though of a shade or two lighter in colour. The pale basal area of the blotch on the petals is broader than that on the lip proper, and the latter organ is more infolded at the sides, otherwise the whole three organs are closely similar in form, colour, and pubescence to the lip as seen in the more typical forms of the species. Accompanying the above were several varieties of *D. wardianum*, one of which Mr. Russell thinks has a dash of *D. crassinode* in it. The flowers are of medium size, and the petals more crisped than in the typical *D. wardianum*. The lip, however, is the most distinct organ of the flower, the two blotches being rather smaller and of a clear brownish-crimson instead of a blackish-maroon. Another flower has the blotches reduced to a few slender lines on either side of the base of the lip, where it envelops the column. The other flowers sent were large and had intense, blackish-maroon blotches.

GARDENING MISCELLANY.

CANTUA BUXIFOLIA.

UNDER unfavourable conditions this greenhouse wall-shrub may exist for years without ever showing a flower. This is particularly the case when grown in pots. The best method is to plant it out in the narrow side border of a greenhouse or cool conservatory, allowing it to grow freely, and ripen the wood towards the end of the season by plenty of ventilation. These facts are recalled to mind by a flowering spray before us, and which was grown in the garden of Lieut.-Col. Tremayne (gardener, Mr. J. Simmons), Carclew, Perranarworthal, Cornwall. The species is variable in the foliage, some of the leaves being entire and others deeply cut. The flowers are also variable if the various figures of the species are correct. Some have a short tube with a wide open mouth; but other plants have a very long orange-scarlet tube, and five rich magenta-rose lobes at the mouth, not spreading very widely. The flowers from Carclew belong to this latter type and are very much longer than those figured in the *GARDENING WORLD*, Vol. III, p. 501.

THYRSACANTHUS RUTILANS.

SOME years back this was much more frequently met with than at present. Like some others of the good old things it has got into the back-ground. At one time it was largely grown and much prized. It is, when in flower, a plant of very distinctive character, associating well with *Begonias*, *Aphelandras*, and *Poinsettias*. Owing to the comparatively great length to which the flower spikes attain it will generally require to be elevated to keep these clear of the benches. There is nothing much prettier at this time of the year than well-grown and flowered plants of this easily-grown and beautiful plant, in 6-in. pots, which should carry at least six panicles of flowers from 12 in. to 18 in. in length. The flowers are bright scarlet. Cuttings should be struck in heat during the spring and grown on, receiving their final shift in June, kept in a cold pit during summer and early autumn, giving plenty of air and sunlight. The thorough ripening of the wood is a most essential condition to procure free-flowering plants. An intermediate house is the best place for the plants during the flowering period, as in this temperature they remain in full beauty for a considerable time. A mixture of loam and peat with some sharp sand suits the plant well; and weak doses of liquid manure may be given occasionally but must not be overdone.—*W. B. G.*

HINTS FOR AMATEURS.

BEDDING PLANTS.

Fuchsias.—When well grown in pots under glass Fuchsias are among the most handsome and floriferous plants we have, and as such are deservedly great favourites with both amateur and professional gardeners—indeed, with any one who knows a good plant when he sees it and knows how to appreciate it. The Fuchsia is a subject of many parts, however, and is not content with simply shining as a pot plant. Planted out like other bedders in the open garden, and consigned to the tender mercies and chances of the weather it acquires itself as few other plants do: indeed, the specimens in pots are not infrequently put to the blush, both for size and brilliancy of flowers and continuity of flowering by the plants growing in the open air. Small wonder is it then that Fuchsias find a place in our flower gardens in increasing numbers year by year. The example set by those in charge of our public parks in London, and other towns and cities has been followed in this case as in others, and no one can deny that the flower garden has been much the gainer thereby. Much of its old time stiffness and monotony have disappeared, let us hope never to return.

Just now it is a busy time with the Fuchsias. Those cultivators who found a necessity for more plants have been busily at work for weeks past, taking off cuttings, rooting them and potting them on. The old plants were put in heat about the second week in January, and kept well syringed, the young growths being taken off when they were about 3 in. in length. The earliest cuttings have now developed into sturdy little plants in large 60 pots. These should be kept growing steadily—a matter of no great difficulty when day by day sees the lengthening days, and the shortening nights. Towards the beginning of May a further shift into 48-pots may be advisable, which size will last the plants until the beginning of June, when they may be transferred to the open.

The tall, sturdy specimens that are so conspicuously handsome and imposing are not, however, to be obtained in this way. The old plants have to be called upon for this, and with anything like ordinary care and attention they will respond readily. These old plants were at the beginning of the winter lifted, potted up loosely into rather dry soil, and placed beneath the bench to hibernate. Through the long winter months no water has been given them, but this treatment, although well enough for winter and early spring, must not be continued longer or the plants will suffer. Even now the buds have broken, and the first delicate leaves are showing themselves from a multiplicity of shoots. The plants are somewhat straggling in habit, where they were not pruned last summer. The first thing to do, therefore, is to prune them. This is a matter of great simplicity, although the pruning given in each case must be ultimately decided by the shape it is desired the plants should assume. Close pyramidal plants, or others with shorter and denser heads must have the shoots cut back rather harder. The loose pyramidal form is, however, the one that seems most natural to the Fuchsia, and the one in which, according to our opinion, it displays itself to the greatest advantage. In such cases the shoots should be shortened to about half their present length.

Bring the plants well up to the light by standing them on the stage in the greenhouse, and, if necessary, temporarily raising it (the stage) so as to lift the plants up quite close to the glass. A temperature not less than 50° Fahr. by night, rising on sunny days to 60° will suit them well, and the syringe should be kept to work regularly night and morning. After the plants have recovered themselves from the pruning they should be shaken out of their pots and repotted. This time rich light soil should be given them. A compost of three-fifths of good loam, one fifth old Mushroom bed manure, or dried cow manure rubbed through a sieve, and one fifth of leaf soil, with a sprinkling of silver sand or road scrapings will make a capital compost, and in this the plants will grow like weeds. Pinching the points of over-gross shoots must be attended to as required, and the result will be dense bushy habited plants, that will render a good account of themselves presently in the flower beds. Anybody can

grow good Fuchsias if they will only try, and surely the reward is worth the little trouble.

Celosias.—Those who are on the look out for rather uncommon effects in the flower garden cannot do better than work up a stock of the handsome, richly coloured *Celosia pyramidalis plumosa*. The plant is frequently met with in the summer months as an occupant of greenhouses and conservatories, and its golden or crimson plumes are always the subject of much admiration. Its employment in the flower garden is, however, comparatively rare, despite the fact that it does fairly well under anything like ordinary weather conditions.

The plants are rather tender, and require a fairly high temperature in the early stages, so that all the work of growing them on has practically to be done under glass. In other words they must be treated as exotics until the summer is fully here when they may be transferred to the open.

The early seedlings raised from the seed sown at the beginning of February are now in small 60-pots. These young plants must be carefully watched in order that they may be kept growing steadily on and that that dread pest, red spider, may be kept off them. As soon as the roots of the young plants have reached the sides of the pots a shift should be given. This time six inch pots may be employed, and the potting should be rather firmer than the first one. The soil should be light, but rich. By the beginning of June the plumes will have commenced to make their appearance, and bedding out may follow in the usual way. A warm spot should be chosen in a border facing south or south-west, and shaded if possible on the north and north-east. Given fine weather the display will then be grand. Those amateurs who are late in getting their seed should lose no time, for seed sown now will produce later plants that will still have time to develop their charms before the frost comes to spoil all. Such seed should be sown in a brisk heat, and germination will then soon take place.

Cannas.—Of late years these have become wondrously popular both for the decoration of the glass-houses, and the flower garden. The queenly *Canna* bears its honours well, however, and it is certain that it cannot be too highly praised for decorative value, since both flowers and foliage are handsome. A bed of Cannas is an exceedingly fine sight, and all the more worthy of striving to obtain, because the foliage has such a distinctly tropical appearance.

The rootstocks of the old plants that did duty in the flower garden last summer were lifted at the approach of winter and stored in shallow boxes in sand or old soil. About the beginning of February a start was made in propagation, the rootstocks being divided up to form independent plants. These divisions were placed, some in four inch pots, and others in shallow boxes. In both cases they have grown well and are now sturdy plants. A further shift on should be given as soon as it is observed to be necessary, and this, in the case of the strongest plants, is now.

By judicious treatment plants may be raised from seed and flowered in the same year. To do this, the seed must be sown early in the year, otherwise the plants do not flower until well towards the end of the summer.

All Cannas, no matter whether the plants have been raised from seed, or obtained by divisions of the rootstocks should be kept growing under glass until the end of May, after which they may be hardened off and planted out. Keep the syringe busily employed amongst them.

Iresines.—These old-fashioned plants have by no means outlived their beauty or their usefulness. Where breaks of permanent colour are wanted in the flower garden, there is nothing that can with greater safety be trusted to produce them than the Iresines. The plants are easy to grow, and will succeed almost anywhere, although they prefer a light rich soil. Both *I. Herbstii* and *I. Lindenii* are grown in great quantities, and there is room for both of them, even although the garden be small, for they are quite distinct from each other. Cuttings were inserted last autumn, and these have passed through the winter in their cutting pots. These autumn rooted cuttings were introduced to heat at the beginning of February, and cuttings taken off them as fast as possible. This cutting about has made the whole plants look rather scraggy, so it will be advisable to take them in hand. Make up a bed of light rich soil in a heated pit, so that the surface of the soil is not so far from the

glass, shake out the old plants, and plant them out in the prepared bed. Water them carefully as they require it, and syringe occasionally to keep them clean. If green-fly makes its appearance, a dusting with tobacco powder should be given before the fly gets a foothold. Treated thus, these old stocks will develop into fine large plants that will come in admirably for filling up the centre of the beds, where the Iresines are to be employed.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Sweet Peas in Pots.—*E. A.*: You may give the plants a top-dressing of rich soil, but do not fill the pots too full, as in the confined space the Peas will be very thirsty subjects. When the plants are about 18 in. high you may commence to give liquid manure. You should keep the seed pods picked off, for if you allow them to remain on you will lessen considerably the crop of flowers.

Cucumbers and Melons.—Please tell me if it is possible to grow Cucumbers and Melons in the same house. I have a lean-to house that has two beds in it, and I should like, if possible, to grow both Cucumbers and Melons in it.—*C. C. P.*

With care you may plant both Cucumbers and Melons, and succeed, but the Cucumber should be kept to one side of the house—that one next to the supporting wall—and the Melons on the other—the front. In this way the Melons would get as much light as they wanted, whilst the Cucumbers would get the shade they love. We have also seen excellent results obtained by dividing the house transversely between the two subjects. You may follow which method of division you choose, or the one which seems the more suitable to your circumstances.

Myriophyllum proserpinacoides.—*Geo. Willis*: You are quite right, this pretty little plant with the long name is usually treated as a stove subject. For adjoining the sides of Lily tanks in glass houses there is nothing finer, and visitors to the Lily house at Kew always admire it, but the plant may also be grown out of doors in the summer time. In warm sheltered places it does exceedingly well, provided it is given a swampy or muddy corner to root in, and from whence its feathery growths can trail down into the water. It is easily propagated by cuttings taken from the tips of the shoots.

Selaginella to name.—*S.*: The plant is a very strongly variegated piece of *Selaginella Martensii variegata*. This form varies considerably in its variegation, often almost losing it, and thus getting back very close to the type from which it originated.

Rose for a North Wall.—Would you let me know what sort of Rose would do best on a northern wall. I have a white Moss Rose there, and it does not do well—perhaps it is the want of sunshine?—*N. P. J.*

Your supposition concerning the non-flowering of the Moss Rose is probably correct. If the wall in question is very bleak or much exposed to cold winds, *Gloire de Dijon* is far and away the best variety you can have. This grand Rose will grow and bloom even in the bleakest and most wind-swept spots, and the flower itself is of good quality. *Gloire de Dijon* would be our first selection. You might also try *Marie Van Houtte*, also a good Tea-scented Rose, with pretty white-yellow flowers. Amongst Hybrid Perpetuals, either *General Jacqueminot* or *Climbing Jules Margottin* would be likely to give you satisfaction.

Pruning Marechal Niel Rose.—I have a *Marechal Niel* Rose that is growing close to the roof of a cool house. The plant is fearfully straggly. Would pruning improve it? and if so, please tell me if I may prune it now. *C.C.L.*

A hard pruning would be sure to reduce your plant to something like symmetry. Wait until it has flowered, which will not be long, and then slip the knife into it. Cut the growths hard back into the old wood, and remove any branches that are especially

ragged and whose wood is unsound. A season's growth will then put it to rights.

Tree Carnations.—*F. Ames*: The next shift for the young Carnations will be into 5 in. pots which will be large enough for them to flower in, and will thus last them for the remainder of the year. You must pinch off the points, otherwise the plants will never make bushy specimens. This may well be done at once. For the final potting make up a compost of two-thirds of loam, one-third of spent mushroom bed manure, and plenty of coarse river sand. To this add a little soot, at the rate of a 48 potful of soot to a bushel of soil. Mix the whole well together, and pot with medium firmness. If all goes well the Carnations will be ready for standing out of doors by the end of May. You will need to keep a smart look out for green fly which is very often troublesome.

STOCK PRINCESS ALICE.

A BOX of cut flowers of this choice Intermediate Stock comes to us from Mr. F. G. Brewer, gardener to Graham Fish, Esq., Oaklands, near St. Albans. The racemes of blossom, with their stalks, were about 1 ft. long, and admirably suited for filling

NARCISSUS BARRII CONSPICUUS.

THE forms of Daffodil coming under *N. Barrii* are considered hybrids belonging to the *Medio-coronati* section, the type being considered a hybrid between *N. incomparabilis* and *N. Pseudo-narcissus*. Many of the varieties come between *N. incomparabilis* and *N. poeticus*, with the greater leaning towards the former. *N. Barrii conspicuus* is one of the most handsome, vigorous, and easy to grow of all of them. The individual flowers are of great size, and produced singly on the stems. The segments are broad, overlapping, and of a rich sulphur or lemon-yellow, while the crown is beautified with an orange rim. For some time after the flowers are fully expanded the colour is at its best.

Bulbs planted in good, friable loamy soil, well cultivated, and lifted every year, so as to give them plenty of room, will increase very fast. The variety is, therefore, well adapted for planting in beds and borders; also upon the grass and in pots. Under the latter treatment it flowers most abundantly, several years in succession without being repotted, if otherwise given liberal treatment. The accompanying illustration, furnished by Messrs. Barr & Sons, King Street, Covent Garden, gives a view of a field of this useful variety. For cut flower purposes it is admirably adapted.

There were numerous processes tried at the Bengal plantations, but it will suffice to give brief details of the three principal. The first, which was started in Madras, and afterwards tried in Bengal, was supposed to be the process then worked by the European makers of sulphate of quinine, who, however, gave no information on the subject, but jealously guarded their trade secrets which, of course, was perfectly legitimate and business-like, but plainly showed that no help in starting quinine making in India was to be had from them. By this plan the alkaloids were extracted from the bark by repeated hot digestion with water mixed with a little sulphuric acid, and afterwards precipitated from the acidulated liquors with milk-of-lime. The precipitate was collected on calico filters, dried, powdered, and treated with strong, hot spirits of wine to dissolve out the soluble alkaloids from the insoluble sulphate of lime which formed the bulk of the precipitate. Then the alcohol, containing the alkaloids in solution, was mixed with a little dilute sulphuric acid and recovered by distillation for future use, and the remaining acidulated liquor treated in the ordinary way for the recovery of the quinine and other alkaloids. But the plan proved a miserable failure both in Madras and Bengal. It missed more than half the alkaloids, and was tedious and costly to work. This was unfortunate, as the chemicals

A FIELD OF NARCISSUS BARRII CONSPICUUS.

vases, glasses, &c. Every individual flower was 1 in. to 1½ in. in diameter, pure white, with the exception of the clear, soft, green claws of the petals; and when the box was opened a delicious aromatic fragrance of Cloves diffused through the room. The old name of Stock Gilliflower was well deserved, if the varieties cultivated in the olden times were as deliciously scented.

Seeds of Princess Alice were sown in September last, and after the seedlings had attained some strength they were pricked off into medium 60-size pots. From these they were repotted into the 48-size in January, and their points pinched out ten days afterwards. They have been flowering all through March, and promise to continue the display till the end of the present month. After that time the plants will be cut hard back, and when they have been started into fresh growth they will be planted out in a warm border, where Mr. Brewer hopes to have them in bloom again before the spring-sown batch attains that stage. Last year he had a third crop before frost became sufficiently severe in autumn to cut down the plants. The small amount of trouble they occasioned was more than repaid by the large amount of bloom they produced at different times of the year, and under different conditions. The quality of the flowers alone is sufficient recommendation for cultivating the variety.

THE CINCHONA IN INDIA.

(Concluded from p. 509).

FACTORY.

AFTER the collection of the bark its plan of disposal had to be decided. The easiest plan, which also would have been the most profitable for the plantation for many years, would have been to sell the bark in London, and buy back the manufactured sulphate of quinine. But the Government, both in India and at home, were anxious to have it worked up at the plantations, so as to save the heavy transport charges, and at the same time render India independent of other countries for her quinine supplies. The Madras plantations being the oldest, were the first to attempt local manufacture, but after some years of continual failure gave up the scheme as hopeless. Their experiments were conducted by Mr. Broughton, the quinologist to the Madras Government, who did most excellent and useful work in his laboratory, but did not succeed so well in the factory. So his experimental factory was shut up and the bark sent for sale to London, where for many years it fetched most profitable rates. But the Bengal Government, who began their manufacturing experiments a little later than Madras, persevered till success was attained. Now Madras finds it pays better to adopt the Bengal plan of local manufacture than to ship the bark.

required to work it were mostly procurable on the spot, an important consideration in a mountainous country, where carriage is difficult and expensive.

Lime was found and burnt on the place; carbonate of potash was made from the ashes of *Artemisia* and other indigenous plants; and the alcohol from Indian Corn grown by the native squatters. The method of spirit-making adopted was the one in general use among the hill-tribes of the Eastern Himalayas, and differs from the ordinary process for making grain-spirit in dispensing with the malting-step. The Indian Corn is coarsely ground, and heated till soft in as much water as it will soak up; then mixed with a small quantity of powdered ferment cake, and put into baskets lined with bracken fronds to ferment. When sufficiently fermented, the moist mass, with a little added water, is treated in the usual way in an ordinary still. Afterwards, the weak spirit thus got is put through a rectifying still to get it up to 60° over proof, the strength required. The ferment cakes are made on the same principle as Mushroom spawn, and consist of Rice and the fresh, fleshy roots of a rather pretty-flowering Himalayan shrub—*Polygala arillata*—pounded up together. The soft mass is made into round cakes an inch thick, and sprinkled with a little old ferment cake in powder. The cakes are then packed away loosely among Fern fronds in a warm place, and the light excluded till

the ferment fungus has permeated them, when they may be dried and stored for future use. It is a matter of common belief among all the tribes that whoever makes these cakes will be ever after afflicted with sterility, so only women beyond a certain age will make them. I do not suppose there is any real foundation for this idea, but in dealing with Eastern people it is always wise to respect their little prejudices and superstitions.

The second plan to be described was a very simple one, and inexpensive to work, but unfortunately, like the last, missed a large proportion of the alkaloids. For a good many years, however, it did good, useful work, while a better was being devised. It was never used in the manufacture of sulphate of quinine, but only for making the medicine known in India as *Cinchona febrifuge*, which is a mixture of the whole of the alkaloids, both amorphous and crystallisable, found in the red bark. It is not so elegant a preparation as sulphate of quinine, but is an excellent substitute for it in malarial fevers. In fact, some of the best Indian doctors prefer it. For some years it was sold at less than quarter quinine rates, and was a great boon to poor people. In making it the powered bark was repeatedly macerated in wooden tubs, with very dilute muriatic acid, for a few days at a time, and the resulting liquors mixed with a solution of caustic soda to precipitate the alkaloids they had dissolved out of the bark. After standing twenty-four hours, the precipitate was collected on filters, purified, dried, and powdered, which completed the operation.

The third process is the one now in operation in the East. It was started at the Bengal plantations in 1885, and at Madras a year or two later. Now it is being adopted by the Dutch in Java. It is a satisfactory process, as it completely exhausts the bark, and is not very expensive to work. The bark is reduced to an almost impalpable powder by means of disintegrators driven at a high speed by water turbines. The powder is then mixed with water, caustic soda, and shale-oil; heated by steam-coils to about 160° Fahrenheit, and kept constantly stirred by machinery for about an hour, when the stirring is stopped and the mixture allowed to rest quietly for an hour or two to let the oil—now containing the alkaloids—rise clear and bright to the top. The oil is then transferred to another vessel and thoroughly stirred up for a few minutes with sufficient dilute sulphuric acid to remove the whole of the alkaloids from it. After separation, by repose, the oil is drawn off for the next batch of bark, and the acidulated liquor, now containing the alkaloids in solution, is heated in steam-jacketed vessels, neutralised with a weak solution of caustic soda or ammonia, and set aside to cool and crystallise. To purify the crystals thus obtained they are collected, squeezed, redissolved in boiling water, digested for a few minutes with a little animal charcoal, filtered very hot, and allowed to cool, when the sulphate of quinine crystallises out quite white and clean.

How to get the quinine to the very poorest in the outlying fever districts of Bengal at the lowest possible price, without burdening the public revenues, was an anxious question till the happy thought occurred to Sir Chas. Elliott, late Lieut.-Gov. of Bengal, to make use of the Post Office Department for this purpose. He ordered the quinine to be put up in sealed packets of five grains each, an ordinary dose, by jail labour, and sent to every outlying post-office in Bengal for sale at the low price per packet of one pice, which is the lowest coin in ordinary circulation in Bengal, and of the value of about a farthing. Not only is a stock of these packets kept at all the post-offices, but the postmen who visit the outlying hamlets have to carry them in their bags, and sell to anyone who may ask for them. The postmasters and postmen get a small commission on the sale. A better or cheaper plan of distribution I cannot conceive, and the Italian Government have paid the India Government the compliment to adopt it for part of Italy.

Sulphate of quinine, quite equal in quantity to the very best brands in the market, is now turned out by the Government, at the Bengal factory alone, at the rate of about 1,000 lb. a month. Not many years ago, the annual quinine indent of the Government of Bengal was less than this monthly output. Madras will soon be turning out as much as Bengal, and perhaps more. So the Government can take credit for freely accomplishing the task they set themselves when introducing the *Cinchonas* to India, as I trust

I have proved to you without trying your patience over much.

Gleanings from the World of Science.

New Fossil Plant in Hampshire.—At the meeting of the Linnean Society on the 17th ult., Mr. Clement Reid, F.L.S., read a paper on *Limnocarpus*, a new genus of Fossil Plants from the Tertiary deposits of Hampshire. This new genus occurs in the Oligocene Strata of the Isle of Wight and the Hampshire coast. It is closely allied to *Potamogeton* and to *Ruppia*, but has a succulent fruit with two, deeply-pitted, stalked carpels adhering by their ventral edges. The seed is curved round a lateral process from the cell, as in the pond-weeds. So few Tertiary plants can be proved to belong to extinct generic types, that the discovery of this one is of interest. Though clearly allied to the recent pond-weeds, the inclusion of *Limnocarpus* will necessitate a modification of the ordinal characters. The paper was favourably criticised by Mr. Carruthers, F.R.S.

Mimetic Resemblance.—Prof. E. B. Poulton, F.R.S., F.L.S., read a paper entitled "Natural Selection the cause of Mimetic Resemblance and Common Warning Colours" at a meeting of the Linnean Society on March 17th. He remarked that the recent attacks upon the theory of natural selection as the explanation of the above-mentioned phenomena render it necessary to reconsider the whole of the evidence. Alternative hypotheses offered in explanation are—(1) the common result of common forces in a single region; (2) evolution producing the same result independently in different animals; (3) sexual selection. The main general aspects of mimicry, &c., their relation to kindred subjects, the most characteristic features which they present, are therefore to be considered in succession, and the attempt made to ascertain whether they best receive an explanation from natural selection or any one of the alternative suggestions.

The chief heads to be considered are:—(1) The relation of these resemblances to others which occur in Nature. (2) The relation of these resemblances between Classes and Orders to those within the limits of a single Order. (3) Resemblances within the Order entirely independent of affinity. (4) Resemblances not accompanied by any changes in the direction of another species except such as assist in producing or strengthening a superficial likeness. (5) Essential nature of the resemblance: its analysis into the several kinds of effect produced. (6) The forces which act in any animal depend more upon its life-history than upon its locality. Different animals in the same locality are frequently subject to entirely different forces. (7) Resemblances more characteristic of female than male. (8) The space and time relationships of these resemblances. (9) Resemblances between various Orders, etc., produced in the most diverse ways. (10) Resemblances even within the limits of the Order also produced in the most diverse ways. (11) The unproved, improbable hypothesis of the hereditary transmission of acquired characters demanded by the theory of the direct action of external causes.

The discussion of cases under each of these main heads leads to the conclusion that no help is to be derived from any alternative hypothesis, while natural selection in every case offers an intelligible explanation of the known facts. The conclusion to be drawn is that the recent attacks upon natural selection are not warranted by the facts at present known. A discussion followed in which Col. Swinhoe, F.L.S., and Prof. Weldon, F.R.S., F.L.S., took part.

The Orchid Grower's Calendar.

WITH the advent of something like spring weather it is possible to keep the temperature up to the required height without having to fire very hard. This enables us to admit air more freely than hitherto, and an increasing supply of moisture in the air, brought about by frequent syringings between the pots induces a free root action with a corresponding reaction amongst the plants; for the flower buds of

Cattleya Mendelli come popping up through the sheaths, and will be soon making a brave show.

THE SYRINGING or damping down, which is, in conjunction with fresh air and light, so essential for the successful culture of Orchids, must be carefully done at this season, so that none lodges in the hearts of partially made-up growths. *Cattleya labiata* Warnerii I may instance as being in this stage, and it would suffer if not looked after in this respect.

POTTING.—Push along with the work, giving a shift to all plants that to the eye appear to require it, the exception, of course, being those plants that are in bloom or fast approaching that stage. These may be left until the flowers fade or are cut.

PLANTS OF *LAELIA PURPURATA* that have not sheathed up well, may be done now with advantage, for it will be observed that the newly made-up pseudo-bulbs are pushing some fine large roots. *L. elegans* may be also attended to, for if left until after the flowering stage, the season is too far advanced to repot, and you have to be content with simply top-dressing it. A golden rule is to repot or add some fresh material for the new roots to take hold of when they appear. If attention is paid to this, we should have little cause to ask the question "Do Orchids degenerate?" That is, of course, providing proper houses and efficient hot-water appliances are at hand.

ANGRAECUM SESQUIPEDALE.—The spring-flowering variety of this wonderful Orchid is just now delighting all visitors with its great waxy flowers and curious appendages. We grow ours comparatively cool, that is, with the *Cattleyas*. Here they make short, broad leaves, which are much thicker in texture than when grown warm and shady.

COOL HOUSE.—I notice the beautiful autumn-flowering *Oncidium tigrinum* is just commencing to grow, and should be repotted at once, as the spikes appear with the young growths, so that they must be taken in hand early. To keep these in good health for long it is necessary that they should have some fresh material each season. If treated thus the foliage will always remain a deep green colour, so indicative of good condition. As the roots are small pot firmly. *O. macranthum* is a very fine Orchid, which, if the spikes are not too far advanced, will be greatly benefited by some fresh material. We find they do not like their roots confined too much, and neither must the material be pressed about them too firmly. They like moss rather than peat.—C.

Kitchen Garden Calendar.

WORK of all kinds in this department is now very pressing, for during favourable weather everything grows apace. Old plantations of Strawberries should have a top-dressing of artificial manure. The ground between the plants ought then to be hoed that any small weeds may be destroyed, taking care in doing so not to injure the roots of the plants. Any old stools that have become somewhat raised out of the soil will be greatly benefited by having a top-dressing of light, rich soil placed about them, that the young roots may the more readily take hold. So far the prospects of a crop are good, the winter not having been severe enough to do any injury to the crowns. Asparagus beds will be greatly benefited by an application of artificial manure to be washed in by the rains. It is not advisable to water at present, as this has a tendency to cool the soil, and thus retard growth. See that the beds are kept free from weeds, but care must be observed not to injure the crowns of the plants.

Planting out of such things as Onions, Leeks, Cauliflower, Lettuce, and other vegetables that were raised under glass should now be pushed forward with all possible speed, taking care in doing so not to injure the plants more than can be avoided. When plants are some time in making a start into growth after being put out, this is a sign that the work has not been done in a satisfactory manner. Either the soil has not been pressed firmly to their roots or the plants have been hung, as it is termed, that is, instead of filling in the hollow at the tips of the roots the soil has been pressed round the collar of the plants. In planting from the seed bed great care is necessary to avoid making the holes too deep with the dibber, for when this happens the holes are seldom filled in properly.

BROCCOLI seed should be sown towards the end of

the month for mid-season and late supplies; but where the ground is in good tilth the sowing may be deferred a little longer, as it is far better to wait for the plants than that the plants should wait for the ground to be got ready for them; as in the latter case they become drawn and are of little value. In many gardens Broccoli has to succeed some other crop, and when the plants are allowed to stand crowded in the seed bed until the previous crop is gathered satisfactory results seldom follow.

PEAS, to keep up a succession, must be sown as soon as the previous lot appears through the soil. Here let me again caution the cultivator of the error of sowing too thickly, as this is one of the chief causes of mildew later on when the soil becomes hot and dry. See that ample space is afforded between the stakes for the haulm and foliage to develop themselves. Those who are desirous of obtaining fine pods for exhibition purposes should select some of the most promising when they are small and pinch the points out of the plants to throw the sap into

The accompanying illustration represents a thick carpet of Crocuses under tall deciduous trees, and bordering the two sides of a winding walk in the grounds of Potternewton House, Leeds, the residence of J. Rhodes, Esq. The photograph was taken on the 22nd March, when the Crocuses were in full bloom. Mr. Robert Mason informs us that a great number of varieties is grown, all mixed together, but that the yellow and blue colours print black, so that only the white varieties come out prominently. When seen in reality, however, they have an effective and most natural appearance that cannot be gain-said, and furnish proof positive that they are admirably adapted for this kind of work. On a bright morning, says our informant, they act as a tonic to the eye and heart of the beholder, far surpassing any which the physician could administer. As to their ornamental effect there can be no doubt, and their hardiness even much further north than the latitude of Leeds is a strong recommendation for planting them extensively.

CROCUSES AT POTTERNEWTON HOUSE.

the pods. Whenever the weather is suitable the hoe should be run between the rows of Onions, Carrots, Parsnips, etc., which will by this have appeared well through the soil. Make further sowings of Lettuce and plant out the plants from former sowings as soon as they are large enough. Salads will now be in great demand, therefore strict attention must be paid to keeping up a continuous supply.

FORCED VEGETABLES.—As the frames and pits become cleared of these they should again be planted with Cucumbers, Vegetable Marrows, and other tender subjects, as Capsicums, or the beds may be used for pricking out Celery and tender bedding plants. In the former case it will be necessary to put a new lining round them to generate a little more heat. Plants fruiting must be kept pinched and have the growths regulated so as to admit the light and air amongst the foliage. Do not allow the fruit to get too large before removing it as this has a tendency to exhaust the plants. As the roots make their appearance through the soil give a top-dressing to keep the plants vigorous.—*Kitchen Gardener.*

CROCUSES UNDER DECIDUOUS TREES.

WHERE Oak, Beech, Lime, and similar deciduous trees are fairly closely planted, either on lawns or along the sides of drives, there is always a difficulty of getting grass to grow. In such cases the planting of Ivy is often resorted to, with the result of furnishing the ground with a perennially sombre carpet. Certainly this is better than absolutely bare ground, but a much brighter and more interesting effect is produced by planting Crocuses, Daffodils, Anemones, Doronicums, Corydalis, or other spring-flowering subjects which complete their annual growth before the ground gets too thickly overhung by a thick canopy of foliage that obstructs the light and prevents the further development of green verdure, always so refreshing to the eye.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

"VICTORIAN ERA FUND."

YOUR readers will doubtless remember that this fund was established last year to commemorate the completion of the sixtieth year of Her Majesty's beneficent reign. They will also recollect that its object is to temporarily assist unsuccessful candidates whilst awaiting election who have been (or their husbands) subscribers to, or life members of, the institution. The total amount received up to December 31st last has been invested, and the committee are glad to be able to announce that the income derivable therefrom this year enables them to distribute the sum of £106 10s., the first half of which was sent on April 1st last to eighteen unsuccessful candidates as follows, and has been divided at the rate of 15s. for each year they (or their husbands) had subscribed:—

| | Years self, or husband, subscribed. | Amount sent April 1, '98. |
|-------------------------|-------------------------------------|---------------------------|
| | | £ s. d. |
| Bryan, Andrew | 13 .. | 4 17 6 |
| Nixon, Francis | 13 .. | 4 17 6 |
| Plevy, James | 12 .. | 4 10 0 |
| Staples, George | 11 .. | 4 2 6 |
| Wood, Caroline | 11 .. | 4 2 6 |
| Gibbons, John | 10 .. | 3 15 0 |
| Watt, James | 10 .. | 3 15 0 |
| Hackwell, Elizabeth .. | 9 .. | 3 7 6 |
| Wills, George | 9 .. | 3 7 6 |
| Barnfield, Alfred | 8 .. | 3 0 0 |
| Hatch, Annie | 8 .. | 3 0 0 |
| Mitchell, Lucy | 7 .. | 2 12 6 |
| Shearn, Joseph | 7 .. | 2 12 6 |
| Lee, Alexander | 5 .. | 1 17 6 |
| Evans, Thomas | 4 .. | 1 10 0 |
| Gould, William | 2 .. | 0 15 0 |
| Thomas, William | 2 .. | 0 15 0 |
| Woodward, Emma | 1 .. | 0 7 6 |

From the above it will be seen that the aggregate number of years of subscription is 142, which at 15s. for each year gives a total of £106 10s., the first instalment of which, as already stated, was sent on April 1st last, and the remainder will be sent on

October 1st next. The committee are very anxious to bring up the total amount of this fund to £5,000, to do which they require a sum of £925, and I should like to draw attention to the generous offer made by N. N. Sherwood, Esq., Trustee, to contribute £50 provided the amount required be raised, in response to which the following gentlemen have each kindly promised a similar sum:—

ARTHUR W. SUTTON, Esq., Reading;

LEONARD SUTTON, Esq., Reading;

HARRY J. VEITCH, Esq., Treasurer;

and several smaller contributions have been already received. The committee sincerely hope before the close of the year they may be able to announce that the balance necessary to make up £5,000 has been received. They trust, therefore, that every well-wisher of the Institution will note that the "Victorian Era Fund" is still open, and that donations to it will be most gratefully received. The committee also desire again to emphasise the notice which has already appeared in your columns and elsewhere, that this fund is intended for the benefit of those only who have subscribed to the institution.—*George J. Ingram, Secretary.*

PLANTS RECENTLY CERTIFICATED.

FLORICULTURAL Certificates of merit were awarded to the following subjects at the spring show of the Royal Botanic Society held in the society's gardens at Regent's Park, on March 30th.

HYACINTH BALL OF GOLD.—This is a bright yellow variety of considerable merit, with a larger and more massive spike than is generally seen in the yellow flowered forms. The individual flowers are of good size and substance. Messrs. William Paul & Son, Waltham Cross, Herts.

HYACINTH CINERARIA.—There is a number of blues representing a wide range to be found amongst the Hyacinths, but this variety will be a welcome addition, as it exhibits a distinct shade of rich Gentian blue, with purple-blue tips to the segments. The spike is of medium size, full, and well formed. Messrs. Wm. Paul & Son.

CAMELLIA PRIDE OF WALTHAM.—This is one of the finest Camellias ever shown by Messrs. Wm. Paul & Son, whose reputation for Camellias is so great. The flower is large, full, and of perfect form and great substance. The colour is flesh pink, the edges of the broad, massive petals being prettily tipped with silver.

CAMELLIA BOADICEA.—This is a much looser flower than the preceding variety. The colour is bright pink with silver tips to the petals. The latter are also prettily veined with deeper pink. Messrs. Wm. Paul & Son.

CLIVIA MRS. A. SYKES.—In this new variety we have all the characteristics of a first-class Clivia. The umbel is of immense size, and the scape supporting it of more than ordinary thickness and strength. The flowers are large, deep orange in hue, with a yellow throat. Messrs. John Laing & Sons, Forest Hill, S.E.

CLIVIA O. C. WRIGLEY.—Here we have another exemplification of the immense size of truss and flower that is to be found in our modern Clivias. The colour is rich scarlet-orange, with an orange-yellow throat. The form is good, and the substance of the flowers amazing. Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N.

Botanical Certificates were awarded to the under-mentioned:—

ASPLENUM MAYI.—A very handsome plant is this, and as distinct as handsome. The deep green fronds are of medium size, and pinnate, but the central pinna is much produced. The margins of all the pinnae are much lacinated. The stipes are purple-brown in colour. Mr. H. B. May, Dyson's Lane Nurseries, Edmonton.

PTERIS GRACILIS MULTICEPS.—Crested Ferns seem to be increasing in favour, and in this case we have a plant that can scarcely fail to become very popular. The pinnae are very narrow, and light green in colour, and have their tips many times divided to form tassels of medium size. The stipes are slender, and brown in hue. The whole plant is a model of elegance and gracefulness. Mr. H. B. May.

ASPLENUM HILLI.—At first sight this Asplenium

recalls the well-known *A. bulbiferum* in general appearance, but the fronds are darker green in colour, and more erect. It should be of value as an addition to the ranks of this very ornamental class of plants. Messrs. Hill & Son, Lower Edmonton.

NARCISSUS MRS. WALTER WARE.—This is a fine bicolor form with a huge open, rich yellow trumpet, heavily frilled at the margin, and considerably reflexed. The segments are white and of good form and substance. Messrs. Barr & Sons, King Street, Covent Garden, W.C.

NARCISSUS J. B. M. CAMM.—This is fairly well known as one of the most refined bicolor Daffodils in cultivation. The corona is large and open, and has a prettily frilled margin. The colour is sulphur-yellow. The segments are pure white. Messrs. Barr & Sons.

ZYGOPETALUM PERRENOUDI.—The sepals and petals of this *Zygopetalum* are narrow and revolute. In colour they are rich chocolate-brown, with one or two narrow yellow transverse bars. The lip is the most conspicuous feature, for it is large, obscurely tri-lobed, and exhibits a mass of rich purple hue that renders the flower at once attractive and distinct. Messrs. B. S. Williams & Son.

PHAIUS NORMAN.—For a description of this handsome hybrid *Phaius* see p. 458, in the list of plants certificated by the Royal Horticultural Society on March 8th. Messrs. B. S. Williams & Son.

CYMBIDIUM EBURNEO-LOWIANUM.—A fine form of this handsome *Cymbidium* was shown on this occasion by Messrs. Hugh Low & Co., Bush Hill Park, Enfield.

ODONTOGLOSSUM TRIUMPHANS INTENSA.—This may be regarded as an improved form of the well-known *O. triumphans*. The flowers are larger, of better substance, and finer altogether, this being particularly noticeable in the width of the segments. The colours are richer and deeper, and the deep maroon blotches larger and more conspicuous. Messrs. Hugh Low and Co.

TO INTENDING EMIGRANTS.

The April circulars sent out by the "Emigrant's Information Office," 31, Broadway, Westminster, S.W., show clearly the present prospects of emigration. This is the best season of the year to emigrate to Canada, where there is a good opening for experienced farm hands.

Persons going to the Klondike gold fields should leave England now, but only those who are strong, experienced miners, or men accustomed to prospecting for minerals in wild and unsettled places, who have at least £300 for the journey and the providing of food, should think of going; all others are strongly warned against going there. The principal mining on these gold fields is "placer mining." Every miner must take out a miner's certificate, which costs \$10. Creek and gulch claims are 250 ft., measured in the general direction of the stream, the side boundaries to extend to the rim of the valley on each side, but not to exceed 1,000 ft. from the centre of the creek. River claims are on one side of the river only, and are 250 ft., measured and bounded as above. Other "placer" claims are 250 ft. square. Every alternate ten claims belong to the government. For every claim an annual fee of \$10 is charged, and a royalty of 10 per cent. on gold mined, but the annual product of any mining claim up to \$2,500 is exempt from this royalty.

Good, practical miners are always in request at the large Broken Hill silver mines in New South Wales, and, in fact, high-class men of all trades have no difficulty in finding employment there, although there is no opening for unskilled labourers. Work has been and is scarce in the New England districts, and Goulbourn has suffered much from drought.

In Victoria there is a full supply of all kinds of labour at the present time. Gold-mining has flourished, and the output was larger in 1897 than in any year since 1883.

There is no demand for more hands either in town or country districts in South Australia.

Queensland has only a fair demand for labour. Gold-mining and other branches of mineral industry have flourished. Agricultural districts are calling for good ploughmen and general farm hands. The sugar industry is in a prosperous condition, and there are good openings for farmers with a little capital.

In Western Australia an Act has recently been

passed prohibiting the landing of illiterates, probable paupers, or convicted felons. Mechanics, miners, and labourers can generally rely on finding work.

Good miners can also find work in Tasmania, but here again inexperienced men are not wanted.

Plenty of work offers itself in nearly all parts of New Zealand to farm labourers, mechanics, and miners.

Cape Colony is well supplied with ordinary labour. Recruiting for the Cape Mounted Rifles has again been started, and as this is a popular body there will probably be a rush. Each approved applicant must deposit £24 3s. for his passage to Cape Town.

The coal industry in Natal continues to progress, and the output of coal in 1897 exceeded that of 1896. The miners are chiefly natives, but about seventy whites are employed, amongst whom vacancies occur occasionally. Female domestic servants are in request, as indeed they are in all the Colonies, but the wages in Natal are not high considering the cost of living.

SOCIETIES.

FALKIRK HORTICULTURAL ASSOCIATION.—

March 31st.

The spring show of this society was held in the Town Hall, and was so far successful that there were fifty entries in excess of last year, while the quality of the exhibits was highly meritorious. Hyacinths and Tulips were not so plentiful as on former occasions, but their standard was very high indeed. Greenhouse plants in pots were plentiful and in excellent form. The show was well patronised by visitors in the afternoon and evening.

The Silver Cup offered for a table of plants arranged for effect was easily secured by Mr. Wm. Robertson, of Bainsford, whose exhibit was most tastefully laid out. Around a *Cocos weddelliana* in the centre he arranged *Acacias*, *Dracaenas*, Palms, Ferns, *Coleus*, *Crotons*, and bulbous plants. He was followed by Messrs. C. Henderson & Co, Camelon. In the class for fine foliage plants, open to gardeners and amateurs, the first award was taken by Mr. John M'Laren, gardener to—Mitchell, Esq., Millfield, with well grown specimens of Palms, Tree Ferns, &c.; Mr. T. Sutherland, Polmont, was second. The same order was maintained for a specimen Palm. Mr. John M'Laren also led the way for table plants, exotic Ferns, *Azalea mollis*, *Deutzias* (which were fine and greatly admired), and *Clivias*.

Mr. Wm. Henderson, gardener to Gray-Buchanan, Esq., Parkhill, staged the best Indian *Azalea*, also the best *Rhododendrons*, *Cytisus*, forced hardy plants, hardy border plants, and a rustic Fern basket. The best Hyacinth in the show was *La Grandesse*, exhibited by Mr. Peter Tait, Grahamston, who was also first for *Mignonette*, *Lily of the Valley*, three Hyacinths, Tulips, Laced *Polyanthus*, double Scotch Wallflower, single *Primulas*, and for a collection of vegetables.

Mr. Wm. Robertson was again the fore in the classes for *Cyclamen*, *Amaryllis*, the larger class for Hyacinths, *Polyanthus Narcissi*, and *Crocuses*. Mr. J. Ogilvie, Larbert, had the best *Dielytra spectabilis*, and *Spiraea japonica*. Mr. T. Sutherland exhibited the best *Cinerarias*, Chinese *Primulas*, and *Primula obconica*. Mr. J. Fleming, Falkirk, had the best border *Narcissi*, and hardy *Primulas*. Mr. Wm. Edwards, Grahamston, took nearly all the leading prizes for bouquets, epergnes, &c., as well as a large number of prizes in the amateurs' classes.

Messrs. Wm. Henderson & Co., Sunnyside Nursery, Camelon, in addition to their competitive exhibits, had also a fine display of wreaths, crosses, bouquets, and other devices in cut flowers. Messrs. Murray & Son, Nurserymen, Parkhall, exhibited two large tables of useful plants suitable for table and window decoration, and for various other purposes.

ROYAL HORTICULTURAL OF IRELAND.—

April 1st.

The annual spring flower show held under the auspices of this society took place in the Royal University Buildings, Earlsfort Terrace, by kind permission of the Senate. The show was opened at 2 p.m. and continued till 9 p.m. The weather was highly favourable and the attendance of visitors was good both in the afternoon and evening. The

arrangements were under the control of Mr. G. M. Ross, M.A., and faultless. Field-Marshal Lord Roberts and Lady Roberts were amongst the distinguished visitors. Music was dispensed by the band of the Queen's Own Royal West Kent Regiment. The recent stormy weather, no doubt, accounted for the display of Daffodils being smaller than usual. *Azaleas*, *Hyacinths*, *Cinerarias*, *Deutzias*, *Spiraeas*, and *Roses*, were the features of the show, the *Roses* grown under glass being in greater quantity than on former occasions.

In the competitive classes Mrs. Goodbody (gardener, Mr. G. Sayers) secured the leading prize for a group of nine distinct flowering or foliage plants. G. Drimmie, Esq. (gardener, Mr. Thos. Byrne) took the second place. The same order of merit was observed in the class for a table of plants arranged for effect. Lord Carew (gardener, Mr. J. M'Lennon), had the best six table plants, and was followed by Lord Cloncurry (gardener, Mr. Wm. Rigg). Mrs. Goodbody took the lead for six *Crotons* in 7-in. pots, and for six specimen *Azaleas*. The Right Hon. J. Meade (gardener, Mr. J. Colgan) had the six best *Azaleas* in 10-in. pots; and was followed by Mrs. M'Cann (gardener, Mr. T. Goff).

F. A. Millar, Esq. (gardener, Mr. D. Colohan), led the way for six *Deutzias*, and was followed by Mrs. M'Cann. *Cinerarias* were good, and for six distinct varieties, J. C. Parkes, Esq. (gardener, Mr. E. Dunne), led the way, Mrs. M'Cann being second. Mrs. Moore (gardener, Mr. M. Kearns), took the premier place for Chinese *Primulas*, which were good. J. C. Parkes, Esq., came in second. Mrs. A. West (gardener, Mr. J. M'Dermott), took the first prize for *Lily of the Valley*; and Lord Cloncurry was second. Mrs. Burrowes (gardener, Mr. G. Carroll), took the lead for six pots of Tulips, followed by Mrs. M'Cann.

The Right Hon. J. Meade took the lead for *Mignonette*. That position for *Freesias* was taken by Mrs. Moore, who was followed by R. Tedcastle, Esq. (gardener, Mr. C. Caldwell). The latter came to the front for a specimen exotic, *Orchids* excluded. Mrs. M'Cann had the best *Arum Lilies*; and G. Drimmie, Esq., the best *Spiraeas*.

Hyacinths produced a fine display, and competition was good. The premier place for twelve varieties was taken by John Miller, Esq. (gardener, Mr. P. Geoghegan), F. A. Millar, Esq., being second. General Sir R. Palmer (gardener, Mr. P. Stringer), led the way for six varieties, followed by George Drimmie, Esq. Lord Ashtown (gardener, Mr. A. Porter), had the best six sorts. The leading prize for a stand of twenty-five blooms of Tulips was taken by the Hon. C. F. Crichton (gardener, Mr. J. Mitchison), who was succeeded by the Right Hon. Joseph Meade, P.C. There was good competition here. For a collection of cut Daffodils, exclusive of *Polyanthus*, and representing the three principal sections, the lead was taken by the Countess of Mayo (gardener, Mr. Doyle). General Sir R. Palmer carried off the leading award for twenty-four bunches of Daffodils, in not less than twelve varieties; Col. the Hon. C. Crichton being second. The latter came to the front, however, for twelve varieties. Lord Cloncurry was second. There was close competition in this class. Col. the Hon. C. Crichton also led for twelve bunches of double Daffodils in trusses of three blooms each, Mrs. Burrowes being second. All these lots made a most interesting display.

Lady E. H. Bury (gardener, Mr. A. M'Kenna) took the premier place for twelve *Maréchal Niel* *Roses*, and was succeeded by Ed. D'Olier, Esq. (gardener, Mr. J. Harvey). The latter had the best stand of Tea *Roses*, and was followed by Lord Ashtown. There were also classes for single and double *Pelargoniums*, *Violas*, baskets and bouquets of Daffodils.

Mrs. Geoghegan had the best dinner table decoration to seat six persons. Another interesting class was that for a stand of twenty-four hardy cut flowers grown in the open, the number of trusses or spikes not being limited. A challenge cup (value £10) has to be won three times by one competitor before it becomes his property. Mrs. Lawrenson, of Killiney, took the lead on this occasion, followed by R. Tedcastle, Esq.

Fruit and vegetables were well represented. Lady E. H. Bury had the best dish of Strawberries. Miss A. Robertson (gardener, Mr. W. Kaye) was second. Mrs. M'Cann had the best baking Pears. Lord Carew took the place of pride for dessert Apples; and

was followed by Lady E. H. Bury. Ed. D'Olier, Esq., had the best baking Apples. Mrs. Burrowes was first for Broccoli, Lettuce, and Cabbages. Lord Carew took the lead for French Beans, and for a collection of ten kinds of vegetables, being followed by Lady E. H. Bury in the latter case. Sir R. Palmer showed the best new Potatoes, and the finest collection of six kinds of vegetables, being followed in the latter class by Mrs. Goodbody.

Amongst the miscellaneous non-competing exhibits was a fine group of flowering and foliage plants from the Royal Botanic Gardens, Glasnevin. Mr. Smith, from the Viceregal Gardens, also exhibited a group of plants. Messrs. Dicksons, Ltd., Chester, set up a beautiful and richly varied collection of Narcissi and other spring flowers, including the new and rare *Crinum yemense*. Messrs. C. Ramsay & Sons, Ballbridge, sent a group of flowering and foliage plants. Messrs. Alex. Dickson & Sons, Newtownards, sent a fine collection of Hyacinths in pots, as well as bouquets and baskets of Narcissi. Mrs. Grogan, Slaney Park (gardener, Mr. Lendrum), staged a magnificent stand of twenty-four bunches of St. Brigid Anemones, arranged with their own foliage, and which was much admired. The same may be said of Bermuda Lilies sent from Lord Cloncurry's garden at Lyons. Mrs. Miller (gardener, Mr. Geoghegan), Baggotrath House, staged Chinese Primulas.

ISLE OF WIGHT HORTICULTURAL.—April 2nd.

This association held its annual spring flower show in the St. Pauls New Rooms, Shanklin, on the above date. The exhibition was opened by Mrs. White Popham under very favourable weather. The attendance numbered many hundreds. Much credit is due to Mr. S. Heaton, the secretary, and to Mr. J. H. Silsbury for the manner in which they arranged the hall.

On tiers in the centre, Messrs. Barr & Sons, of Covent Garden and Long Ditton, Surrey, staged one of their comprehensive collections of Daffodils that are so well known to frequenters of the London shows, consisting of 250 bunches in about fifty varieties. Conspicuous amongst them were a large, finely-formed, trumpet variety, M. J. Berkeley, of a rich orange-yellow; and P. R. Barr, a sturdy variety with golden flowers similar to Emperor, but smaller, which was also shown. In the chalice-cupped section, Sir Watkin was fine; Beauty had large sulphur-yellow perianth and the cup margined with orange-scarlet. Autocrat was very fine, the perianth and cup being full yellow and the latter much expanded. Princess Mary was very beautiful with its perianth creamy-white, and a large, expanded cup, suffused orange. In the shorter cupped varieties, Barrii Conspicuous and Maurice Vilmorin were very fine. Of the Leedsii varieties Mrs. Langtry, Duchess of Westminster, Grand Duchess, and Minnie Hume were all showy and pure white. Messrs. Barr had also some very beautiful sprays of *Iris fimbriata*, also *Muscari*, *Anemone Rose de Nin*, a beautiful double pink and white, &c.

Mr. J. H. Silsbury, Shanklin, sent many varieties of Daffodils. In his collection Henry Irving was exceedingly fine and well coloured, as were Sir Watkin and Obvallaris. Mr. John Gell, St. Lawrence, sent from forty to fifty bunches of well-grown specimens such as Emperor, Maximus, Empress, Sir Watkin, Leedsii Amabilis, Barrii Conspicuous, etc.; also some large flowers of *Anemone fulgens*.

Mr. W. H. Jobling, gardener to Lady Harper Crewe, Spring Hill, sent four boxes of spring flowers such as Anemones, *Chionodoxas*, Scillas, *Doronicums*, and Daffodils; also a beautiful dwarf *Iris palestina*, and Mr. G. F. Wilson's Blue Primrose in large clumps.

Mr. C. H. Snook set up a pretty group of greenhouse foliage and flowering plants. Mr. S. Banks, Landguard Manor, contributed a large and well-arranged group of foliage and flowering greenhouse plants, amongst which figured some well-grown plants of Azaleas. From Mr. F. Woods, Steephill Castle, came twelve magnificently-grown plants of *Cinerarias*, with some very decided shades. Mr. W. Tribbick, F.R.H.S., Brooke House, contributed cut spikes of meritorious *Amaryllis* seedlings, also some beautiful spikes of *Iris fimbriata*.

EDINBURGH SPRING SHOW.—April 6th and 7th.

The classes for fruit did not bring many competitors, and amongst the winners were Mr. Malcolm

McIntyre, who took three prizes, Mr. W. Smith (two), Mr. J. Cairns (two), Mr. Jas. Day (two), and Messrs. P. J. and G. MacKinlay (one each).

Vegetables also were somewhat disappointing, Mr. William Harper, of Tulliebelton House, Perth, being the only exhibitor of a collection containing twelve distinct kinds, for which he was awarded first prize. For two Cucumbers Messrs. D. Kidd, G. McDougal, and J. Grahame took the three awards. Mr. G. McDougal was first for twelve Tomatoes, second for twelve early Potatoes, and third for a basket of Mushrooms. Mr. Wm. Macrobie and Mr. Samuel Tanner were first and second respectively in this latter class, though their baskets were made of pottery, and looked very much like ordinary plates.

The remainder of the prize list was as follows:—For fifty pods of French Beans, first, Mr. James Cossar; second, Mr. A. Dickson. For twenty-five Asparagus, first, Mr. Wm. Harper; second, Mr. G. MacKinlay. For six heads of Seakale, first, Mr. James Shearer; second, Mr. Wm. Harper. For six heaviest stalks of Rhubarb, first, Mr. Wm. Henderson; second, Mr. D. Brown. For twelve early Potatoes, first, Mr. Wm. Galloway; second, Mr. G. McDougal. For three Broccoli, first, Mr. A. Lander; second, Mr. James Cossar. For three Cabbages, first, Mr. W. Galloway; second, Mr. D. Brown. For twelve Onions, first, Mr. J. Laing; second, Mr. J. Ramage. For six Leeks, first, Mr. D. Kidd; second, Mr. James Hall. For six Beet, first, Mr. Wm. Harper; second, Mr. H. Dunsmore. For six Carrots, first, Mr. Wm. Spence; second, Mr. John Waldie. For six Swedish Turnips for kitchen use, first, Mr. Wm. Spence; second, Mr. Adam Brydon.

The Hybrid Rhododendrons exhibited by Mr. A. Macmillan, of Trinity Cottage, were exceedingly beautiful, being of good size and form, and with distinctly fringed edges. A first-class certificate was awarded to Rhododendron "Nathaniel Bryson," a very large and handsome snow white variety, delightfully sweet-scented, and with a decided fringe, its flowers measured $4\frac{1}{2}$ ins. to $5\frac{1}{2}$ ins. across. But the best and most interesting of this exhibit was a new seedling hybrid named "Mrs. Alexander Macmillan," a large white with conspicuous rosy apricot marking on upper segments with fringed edge, and sweet-scented. Mr. Macmillan gained the society's First-class Certificate with this var. He also had many new seedlings of much merit, but which have not as yet been named. Mr. Macmillan has proved a very successful hybridist in the cultivation of these charming greenhouse flowering plants.

A tastefully arranged stand showed samples of "Jadoo" fibre, and Messrs. Tomlinson and Hayward' Weed-Killing Specialities.

The Banquet was excellently served by Host Clark of the Royal British Hotel, in the sumptuous dining hall just completed. The Chair was occupied by C. W. Cowan, Esq., of Penicuik. The diners were naturally anxious to return early to the Show, so the after-banquet speeches were short and sweet, the speakers being Baillies Mackenzie and Robertson, Mr. D. Thomson, of Drumlanrig (the oldest member of the society), Mr. Thomas Methven, Mr. Thomas Dale (Aikenhead), Mr. Mitchell, and Mr. Milne.

ROYAL HORTICULTURAL.—April 12th.

The leading features of the exhibits on Tuesday last were Orchids, Daffodils, *Cineraria stellata*, Roses, Camellias, Azaleas, new plants, etc.

A group of hybrid Orchids, set up with Palms and Ferns, was exhibited by Messrs. J. Veitch & Sons, Ltd., Chelsea. Showy and interesting things were *Laeliocattleya Pallas*, *L. wellsiana*, *Laelia Latona*, *Cattleya intertexta*, *Cymbidium eburneo-lowianum*, *C. lowio-eburneum*, *Dendrobium Cybele*, *D. Euryclea*, *D. Niobe superbum*, *D. Wiganiae* and various others. *Phalaenopsis stuartiana-Mannii* expresses its origin, and both that and *Epidendrum elegantulum leucochilum* were very interesting and pretty hybrids (Silver Banksian Medal).

A large and handsome flower was *Odontoglossum Pescatorei* Prince of Orange, richly blotched on a bright yellow ground, and exhibited by Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking. *Eulophiella Peetersiana*, flowering for the first time in Britain, attracted a great amount of attention from visitors. The mas-

sive, rich purple flowers were very showy. He also showed *Odontoglossum coronarium miniatum*, a magnificent *Cypripedium* named *C. Olenus* Burford var., several *Dendrobiums*, a grand piece of *Epiphronites Veitchi*, and other showy things.

J. Bradshaw, Esq. (gardener, Mr. Whiffen), The Grange, Southgate, staged a group in which *Cattleyas*, *Odontoglossums*, and *Cymbidium lowianum* were conspicuous. The forms of *Odontoglossum crispum* were very varied, and some of them handsomely spotted, including *O. c. Mrs. John Bradshaw*. *Cattleya speciosissima* was notable for the high size of its flower (Silver Banksian Medal).

R. I. Measures, Esq. (gardener, Mr. H. J. Chapman), exhibited a group of Orchids, including healthy pieces of *Cymbidium eburneo-lowianum*, *C. lowio-eburneum*, two large pieces of *C. devonianum*, one of them carrying seven spikes; also a fine bit of *Angraecum modestum*, *Dendrobium nobile Cooksoni*, and several *Odontoglossums*.

Sir Frederick Wigan (grower, Mr. W. H. Young), Clare Lawn, East Sheen, S.W., exhibited a grand spike of *Coelogyne pandurata* bearing ten large flowers.

Major Joicey (gardener, Mr. F. J. Thorne), Sunningdale Park, Sunningdale, Berks, staged a showy and most interesting group of *Epidendrum bicornutum*, a most difficult subject to manage, but which Mr. Thorne grows well. He also had a piece of the handsome *Dendrobium atroviolaceum* Major Joicey's var., and a well-flowered bit of *Cattleya Schroderae* (Silver Banksian Medal).

J. Colman, Esq. (gardener, Mr. W. King), Gatton Park, Reigate, staged a small group of showy and useful Orchids, including *Dendrobium nobile nobilissimum*, *Dendrobium brymerianum*, and the new blue one, *D. Victoriae Reginae* (Silver Banksian Medal).

Messrs. Seeger & Co., Bandon Hill, Croydon, exhibited a piece of *Zygopetalum protheroeanum* with wholly chocolate sepals, and a dark violet-blue lip. C. Hamilton, Esq., Dunmore Park, Larbert, Stirling, N.B., exhibited a fine bit of *Dendrobium nobile* Dunmore Park var. *Laeliocattleya* Sir Wm. Ingram was exhibited by C. L. N. Ingram, Esq. (gardener, Mr. T. Bond), Elstead House, Godalming. H. T. Pitt, Esq., Rosslyn, Stamford Hill, staged the magnificent *Odontoglossum wilckeanum* Pitt's var. with huge flowers. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham, staged several splendid varieties of *Odontoglossum*, including *O. crispum schroderianum*, *O. Osmani*, *O. dellense*, &c. Other exhibitors of Orchids were Walter C. Walker, Esq. (gardener, Mr. Geo. Cragg), Winchmore; M. S. Cook, Esq., Tankerville, Kingston Hill; A. Warburton, Esq., Vine House, Haseldene; and Messrs. Hugh Low & Co., Clapton, who showed the hybrid *Phalaenopsis Schroderae*.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, staged a very showy group of plants. The group was semi-circular in form, and in it some profusely flowered plants of *Rose Crimson Rambler* were greatly in evidence. *Clematis* Miss Bateman and the double *C. Duchess of Edinburgh* were in good form, and a number of plants of *Spiraea astilboides* added to the effect. Ferns in variety and the variegated *Acer negundo* furnished the foliage (Silver Gilt Banksian Medal).

The magnificent strain of *Cinerarias* supplied by Messrs. Carter & Co., of High Holborn, were well represented by a large semi-circular group of plants upon the floor of the hall. The plants themselves were sturdy specimens, and bore large, spreading heads of mammoth flowers. The variety in colour was remarkably great (Bronze Flora Medal).

The hardy flowers sent by Mr. T. S. Ware, of Hale Farm Nurseries, Tottenham, comprised some fine panfuls of *Primula frondosa*, *P. viscosa*, *P. v. nivalis*, and *Ophrys Speculum*. *Tulipa Greigi* in pots was a huge success. The display of Daffodils was likewise very fine. Upwards of sixty varieties were on view, all of them in good form. Some of the best sorts were *N. Victoria*, *N. spurius coronatus*, *N. Barrii* conspicuous, *N. triandrus pulchellus*, *N. Leedsii Grand Duchess*, *N. L. Minnie Hume*, and *N. L. Katharine Spurrell*.

Messrs. J. Hill & Sons, Barrowfield Nurseries, Lower Edmonton, again had a capital display of Ferns. As on previous occasions, the plants were tastefully and well arranged, and there was a great variety to admire. *Adiantum rhodophyllum*, *A.*

scutum, *Pteris nemoralis*, *P. palmata*, and *P. arguta* were a few of the handsomest.

A group of *Azaleas* was set up by Mr. W. Kemp, The Gunyah, Barnes. The plants, which were of the best named varieties, were exceptionally well flowered, and afforded a very pretty picture. An edging to them was furnished by a row of *Lily of the Valley* in pots. (Bronze Banksian Medal).

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, showed a group of varied and handsome hybrid *Cinerarias*, in which the habit of *C. cruenta* was very evident. These plants should become very popular by reason of their free flowering and high decorative qualities. *Deutzia hybrida Lemoinei*, *Rhododendron racemosum*, and *Azalea carminata splendens* were well shown by the same firm in a mixed group staged by the side of the *Cinerarias*. Here too, the pretty *Rhamnus alaternus foliis argenteis* was very noticeable.

Messrs. John Laing & Sons, Forest Hill, S.E., showed a collection of their hybrid *Streptocarpus*. There were some remarkably fine forms among them, and the plants showed to great advantage in a setting of *Maidenhair Fern*.

Messrs. W. Paul & Son, Waltham Cross, Herts, put up a handsome lot of *Camellias*, both pot plants and cut blooms. In the Waltham Cross Nurseries the *Camellias*' wants are evidently well-known and well looked after.

A choice collection of *Erythroniums* was contributed by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester. *E. revolutum* in variety, *E. Hartwegi*, were some of the gems. *Tulipa Greigi* in pots was remarkable here also for the great size and brilliance of its flowers (Bronze Flora Medal).

Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent a lot of *Marie Louise Violets*, and some bunches of capital *Narcissi*.

Mr. H. Walters, gardener to Lord Gerard, Eastwell Park, sent four boxes of cut *Roses*, chiefly of *Maréchal Niel* (Bronze Banksian Medal). A unique exhibit came from Mr. C. Turner, Slough, in the shape of three hanging baskets of the wondrously handsome *Nepeta Glechoma variegata*, which has all the promise of being a grand basket plant. Three boxes of cut *Camellias* came from Mr. R. Brown, gardener to F. T. Barry, Esq., St. Leonard's Hill, Windsor.

Messrs. Wm. Cutbush & Son, Highgate, N., had a fine array of forced flowering plants. In the background was a grand lot of *Cytisus Laburnum* in 8-in. pots, the plants being full of flower. *Staphylea colchica* and *Deutzia Lemoinei* were likewise good.

The *Roses* sent by Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, were another tribute to his skill as a cultivator. *Maréchal Niel*, *General Jacqueminot*, *Comte Raimbaud*, and *May Rivers* were some of the best varieties (Silver Floral Medal).

Ten dozen huge cut blooms of *Maréchal Niel* *Roses* were contributed by Mr. J. Walker, Thame, Oxon, who must grow this charming *Rose* in great quantity (Silver Banksian Medal).

Messrs. Paul & Son, The Old Nurseries, Cheshunt, received a Silver Flora Medal for a capital group of pot *Roses*. *Clara Watson*, *Madame de Watford*, and *Elsie Tugier* were three of the premier varieties.

Messrs. Sutton & Sons, Reading, made an extensive display of their race of hybrid *Cinerarias*, called *C. stellata*. The varying stature of the plants, which ranged from eighteen inches to four feet, was well shown, and this, combined with their elegant habit and large spreading heads of flowers in a considerable diversity of colour, bespeaks a race of plants of great horticultural value. Our plant houses will be all the richer for this notable addition to the gardener's resources.

Messrs. Jas. Veitch & Sons, Ltd., sent a number of new and noteworthy *Amaryllis*. *P. Purnell*, Esq., The Woodlands, Streatham, had an exhibit of *Primulas* and *Auriculas* in considerable variety.

As may be expected, *Narcissi* entered very prominently into the day's show. Messrs. Jas. Veitch & Sons, Ltd., had a large and comprehensive exhibit of the leading forms, of which we may mention *N. Sir Watkin*, *N. Barri conspicuus*, *N. Emperor*, *N. Golden Spur*, *N. Glory of Leiden*, also innumerable fine forms of *N. Leedsii*, and *N. incomparabilis* (Silver Banksian Medal).

A superb display of *Daffodils* was made by Messrs.

Barr & Sons, of King Street, Covent Garden. Upwards of sixty varieties were staged, and all in the pink of condition. *N. Victoria*, *N. incomparabilis Beauty*, *N. i. Sir Watkin*, *N. i. Beauty*, *N. Leedsii Minnie Hume*, *N. Golden Spur*, *N. Wear-dale Perfection*, and *N. Henry Irving*, together with a lot of other choice and popular forms, evidenced the wondrous strength of the Messrs. Barr's collection. Some good *Hyacinths* in pots were shown by the same firm (Silver Flora Medal).

The *Narcissus* competition for the Daffodil Cup, offered by Messrs. Barr & Sons, brought out two competitors. The Rev. G. H. Engleheart, Apple-shaw, Andover, whose collection was chiefly new hybrid and seedling forms, was easily first. *N. White Queen*, *N. Lady Margaret Boscawen*, *N. Lucifer*, and *N. Homer* were a few of the finest. J. W. Jones, Esq., Woking, was second.

At a meeting of the fruit and vegetable committee, Mr. C. Herrin, Dropmore, was awarded first prize for the best flavoured *Apple* in *Sturmer Pippin*. Mr. J. C. Tallack, Livermere Park Gardens, was second with *Court Pendu Plat*. No *Pears* were shown.

A Cultural Commendation was given to Mr. E. Beckett, Aldenham House Gardens, Elstree, for *Strawberry Royal Sovereign*. Mr. J. McLeod, Dover House Gardens, Roehampton, received a similar award for a basket of *Brown Turkey Fig*, gathered from a trained tree 6 ft. by 18 ft., and carrying 470 fruits. Mr. J. Miller obtained a Cultural Commendation for a large basket of *Mushrooms*.

GUNNERA MANICATA.

THIS most highly ornamental plant may be said to be a forbidden one to those who have only small gardens, for well developed specimens will carry leaves 10 ft. or more in breadth, with prickly foot stalks 7 ft. in length. It is most effective when seen near water, and requires a rich, deep soil. It is one of the noblest hardy plants yet introduced. A sheltered position must be given it, because the large size of the leaves render them so liable to be torn to pieces with any winds.—W. B. G.

SWEET PEA SENSATION.

A PICTURE of this novelty appeared in the issue of the *Florists' Exchange* for February 12th. It is said to well merit the name *Sensation*, and to be a really good thing. Four flowers are produced on the same stem quite frequently, and the plants are of strong constitution and vigorous growth. The individual flowers are of large size, first-class form, and delightful fragrance. The standard especially is of great size, and exhibits a dainty shade of cream-yellow. The wings are pure white. The variety is, moreover, stated to be very floriferous, and thus it has good points all round.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Everlastings for Drying.—A. M.: *Antennaria margaritacea* is perennial and very useful for the purpose. Amongst annuals you should not overlook *Helichrysums*, *Rhodanthe Manglessii*, *Acroclinium roseum*, and the biennial *Ammobium alatum*. Excellent grasses for drying are *Briza gracilis*, *B. maxima*, *Agrostis nebulosa*, and *Eragrostis elegans*.

Carnations Diseased.—A. B.: Your *Carnations* are badly affected with *Spot*, a disease caused by *Septoria Dianthi*, one of the fungi affecting *Carnations*, and which are very difficult to deal with owing to the fact that the fungus lives inside the tissue of the leaves and stems. As a preventive measure you should keep your plants, that is, their foliage, as dry as possible during the winter months, indeed, at all periods of the year when the atmosphere is moist. As a remedy you should clear away and burn all the affected leaves, and the whole plants when they are very badly injured. Any fresh stock that you may get should be kept in a separate house, pit, or frame, away from all that have been attacked with the disease. It would also check and prevent the spread of the fungus if you were to spray the plants at intervals with a solution of sulphate of copper at the rate of 1 lb. to 22 gallons of water. It often proves the most profitable plan to secure fresh

and clean stock, completely destroying the old. Remedies are most effective when used in the very earliest stage of the disease, or as soon as you can detect it.

Solomon's Seal and *Dielytra spectabilis*.—W. P.: The first named has a rootstock which is a typical rhizome. *Iris germanica*, *I. pumila* and *Lily of the Valley* are other examples. The rootstock of *Dielytra* is a rhizome of another form, namely upright, and fleshy. A rhizome is an underground stem more or less branched, but varying greatly in being thick and fleshy, or slender and fibrous, horizontal or upright. The rhizome of *Dielytra* may be compared to that of the common *Primrose* or *Scabiosa*, differing in minor particulars, but botanically speaking all of the above mentioned species have rhizomes. Some gardeners might term the rootstock of *Dielytra*, simply a root or possibly an underground stem, but rhizome is certainly a more correct description of the structure in question. We fail to see why the point should have been disputed. In *Achimenes* we have a more remarkable rhizome, covered with fleshy scales representing modified leaves.

Beetle in Duck Pond.—T. R.: The specimen you sent was the female of *Dytiscus marginalis*, a common but rather interesting water beetle, on account of its large size and peculiar structure fitting it for an aquatic existence. It feeds on other insects and sometimes on small fish. The male may be recognised by a large club or swelling on the two fore legs, just above the tarsus or foot. During the evening these beetles often quit the water, and being strong on the wing fly to long distances. This accounts for your finding the specimen close to your *Melon house*. You need not be alarmed, therefore, as they do not feed on plants. The sharp nippers you speak of are maxillae or jaws with which they catch and cut up their insect food, or the fry of fishes as the case may be.

Colour in Foliage.—W. P.: We do not know of any book that treats of or explains the colour or variegation in foliage. More than probable there is no such thing. Nobody has ever been able to explain it. There is an absence of the green colouring matter in certain variegated plants; and in others more or less of additional colouring matter, but why this should be remains to be discovered.

Books dealing with the Organs of Plants and their Functions.—W. P.: There are now several good books on the subject by different authors; but it would be difficult to say which is the best. Some are more exhaustive than others, and, of course, more expensive. Two useful books of moderate price are *Elementary Botany*, by Joseph W. Oliver, published by Blackie & Son, Ltd., London, Glasgow, Edinburgh, and Dublin; and *Edmund's Botany*, published by Longmans, Green & Co., Paternoster Row, London. The first is sold at 2s. and the second at 2s. 6d. for the second edition. Then there is a larger book, *Pratt and Vine's Botany*, price 9s. A much larger and more comprehensive work is *Hensley's Elementary Course of Botany*, fourth edition, by Masters and Bennett, published by Gurney & Jackson, Paternoster Row, at 15s. If you buy either of the first two above-mentioned and study them well, you will have made a good beginning, and could proceed to get some of the larger ones if so inclined. The first two would enable you to pass the R. H. S. examination as far as morphology and physiology are concerned. Your own practice and gardening books would enable you to pass the practical questions.

Names of Plants.—G. R.: *Sarcanthus laxus* is the name of the small flowered *Orchid*.—T. J.: 1, *Arabis albidus*; 2, *Corydalis solida*; 3, *Primula marginata*; 4, *Pulmonaria saccharata*; 5, *Caltha palustris flore pleno*.—W. B.: 1, *Asplenium thaccidum*; 2, *Aspidium* (or *Cyrtomium*) *caryotideum*; 3, *Pteris cretica Mayi*; 4, *Sibthorpia europaea variegata*; 5, *Ophiopogon japonicus*; 6, *Convolvulus mauritanicus*.—R. Will be found to be a great treasure to all fond of their Gardening. Post free to coming customers. The following will convey an idea of the importance and advantage of our firm:—

" Wharf House, New Mills, Derbyshire,
April 4th, 1898.

" GENTLEMEN,—Just a line to say that I have lent your 1898 Catalogue to Dr. Chapman of this place, who has recently built a greenhouse, and have strongly recommended him to send his orders to you. I have told him all that I had from you has been far and away better than what I have had from any other source, and I have decided never to get anything more from anyone but you. He has seen my place, and is much pleased.

Yours truly,
J. SWINDELLS."

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

JOHN FORBES,

ESTABLISHED 1870.

Nurseryman, Hawick, Scotland.

JADOO FIBRE.

WONDERFUL SUCCESS.

At a great Horticultural Exhibition recently held in New Orleans, plants grown in Jadoo were awarded

20 FIRST PRIZES and 2 SECONDS.

ADVANTAGES OF GROWING PLANTS & SEEDS IN JADOO.

Seeds germinate much more quickly in Jadoo than in earth.

Greater perfection easily attained.

Suits all kinds of plants.

Is much lighter than earth.

Less frequent watering is required.

The flowers are larger, of richer colour, and last longer.

No soil to mix: No manures required.

Ghent Exhibition, 1898. The two principal prizes of the show (including Gold Medal), were gained by plants grown in Jadoo, by Messrs. Byrvet, Bros., Haarlem.

PRICES:—3/6 per bushel. 8/- per 3-bushel sack. Special prices for large quantities.

Testimonials and full directions for use post free.

Obtainable through any Nurseryman, or from—

JADOO, Limited, EXETER.

ROSES, strong H.P.'s., competition varieties 6/- doz.
VIOLAS, strong plants, bedding varieties, 1/9 doz., 10/6 100.
VIOLAS, strong plants, competition varieties, 2/6 doz.
FANGY PANSIES, best varieties for competition, including many of recent introduction, 3/6 doz.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, April 26th.—Royal Horticultural Society: meeting of Committees at 12 noon.

GENERAL VIEW OF THE GHENT SHOW.

—It may not be inopportune on this occasion to take a bird's eye view of the Fourteenth International Horticultural Exhibition at Ghent; because when one enters into details the general effect as it strikes the eye of the visitors is lost. The judging was accomplished on Friday the 15th inst., and the show was formally opened by His Majesty the King of Belgium on Saturday morning. The most imposing spectacle for colour and general effect was certainly that in the temporary building termed the *Annexe Mobile*. The *Salle Primitive* is the oldest part of the buildings in which the show was held, and dates back to 1835-36. The Casino or *Salle Vitree* was built in 1868, and is in the form of a huge conservatory. General details will be found in another column.

The view from the gallery in the *Annexe Mobile* was very imposing. It was traversed by three walks connected by transverse ones; but the continuity of the central one was broken by some huge groups towards the far end, and by plants in tubs, stood on tripods. Fine plants of *Dracaena Doucetti* in tubs, Palms and other plants were stood in prominent positions. Massive beds of Indian Azaleas, as well as *Azalea mollis* and other

deciduous types furnished a blaze of colour at once picturesque and unique. The endless variation of colour varieties of the Indian Azaleas were subtly blended, giving the bizarre effect of convex sheets of patterns of colours, like an old fashioned bed quilt. At the far end was a huge circular bed of large dome-shaped specimens of Indian Azaleas in tubs, on the same mixed plan as the smaller specimens. They were superbly flowered, the foliage in most cases being completely hidden. These massive specimens, forming mounds of colour, included splendidly flowered *Roi Leopold*, salmon, *Baron de Pret*, rose, *Bijou de Paris*, white and striped red, *Comte de Chambord*, soft salmon, pink and silvery white at the edges, *Souvenir de Maximilian*, a large red flower, and others of various handsome colours. Against or between the red, white, salmon, purple, &c. of the Indian varieties, there was the orange, apricot, yellow, and other shades of *Azalea mollis*. All of these massive beds were raised in the centre, and sloped in every direction to the walks by which they were surrounded, thus affording the public every opportunity of inspecting the varieties in detail.

Around the sides of the huge building the ground rose behind so that the plants stood upon it faced the spectators. Along the back line most of the large Palms were arranged, a few being in prominent positions elsewhere. They consisted of huge specimens of *Areca Baueri*, *Cocos Bonettii* (with the habit of a Phoenix), *Livistona sinensis*, *L. robusta*, *Corypha australis*, *Phoenix reclinata*, *Rhapis humilis*, and many others. Their dark green foliage formed a pleasant and refreshing foil to the bizarre display of blossom. In front of and under the Palms were huge groups of New Holland and other greenhouse plants of a very varied character, so closely placed that the arrangement seemed continuous from end to end. Groups or collections of *Camellias* and New Holland plants were very prominent, particularly the *Acacias*. Pyramidal and standard specimens of *A. longifolia*, *A. armata*, *A. verticillata*, and others ranged from 6 ft. to 10 ft. high, and had the appearance of *Erica Cavendishii* from the gallery. Other New Holland plants were *Pimeleas*, *Ericas*, *Clanthus*, *Coleonema*, *Diosma*, *Leptospermum bullatum* (finely flowered, globular standards, 1½ ft. to 2 ft. high), *Chorizemas*, *Polygalas*, *Hardenbergia monophylla*, *Cytisus scoparius andreanus*, *Pultenaea stricta*, *Eriostemons* in variety, *Choisya ternata*, and other hard wooded subjects of that nature, which have been so neglected in Britain for some years past. A large number of them were grown as dwarf standards, others as bushes or pyramids, but in most cases informally trained, or altogether unsupported by artificial means. Even the large Azaleas have merely ties of raffia. There were three varieties of Azaleas, in four tiers, grafted one above the other. *Sparmannia africana*, in bushes or standards, 6 ft. to 10 ft. high, was very floriferous. A few Orchids appeared in this building, including specimens of *Odontoglossum Edouardi*, *Cymbidium lowianum* and *Lycaste Skinneri alba*. The roof was partly of glass and partly of wood, but underneath was a thin transparent shading in eight folds or stretches, transversely banded in light green and pink colours that seemed to vary in intensity at different times of the day, according to the brightness of the sun and the incidence of the rays. The coloured shading also had its effect upon the appearance of the plants.

The Casino is a permanent building of oblong rectangular form, in which the society holds its monthly meetings and smaller

shows. The ridge and furrow roof is supported by iron pillars and girders, the ridges being of glass, and the furrows opaque. The effect from the staircase landing was altogether different from that of the *Annexe Mobile*. The stove and greenhouse plants, chiefly fine foliage plants, requiring stove heat were located here, so that there was a wealth of greenery in every direction, consisting of huge Palms and Cycads, towards the ends and sides of the building, as well as in the centres of the high banks or mounds into which the floor space was broken up. Ferns were also prominent, exhibiting a much lighter shade of green. All these were relieved by the variegation of such subjects as Crotons, Caladiums, Dieffenbachias, Dracaenas, Phrynium variegatum, Pandanus Veitchii, Alocasias, Phyllotaeniums, and a host of other subjects of that character. Some Orchids were noticeable, particularly large specimens of *Oncidium ampliatum majus*, *O. sarcodes* and *Cymbidium lowianum*. Two groups of them were also very effective. The Anthuriums, chiefly varieties of *A. scherzerianum* and allies were represented by several large groups which were particularly effective in the *tout ensemble*. A fountain played in the centre, where some rockwork formed a rustic bridge across the water leading from a small pond. At the junction of some walks a specimen of *Rhapis humilis*, about 10 ft. high and 8 ft. through, was the finest we have seen.

The *Salle Primitive*, and other compartments, or galleries branching off from it, were filled with a most varied assemblage of plants. Amongst the new plants the most striking was *Acalypha Sanderi*, a new species from New Guinea, exhibited by Messrs. F. Sander & Co. They had a large number of plants of it in groups in their magnificent exhibit. It had large green leaves, from the axils of which dense rope-like spikes, 1 ft. to 2 ft. in length, of crimson-scarlet flowers hung down, for all the world resembling *Love-lies-bleeding*. Young plants up to three feet in height consisted of a single stem furnished with flowers throughout. Old plants develop their branches candelabra fashion, but the rope-like spikes of flowers are still pendant. In another division of the upstairs galleries were the exhibits of Hyacinths, Tulips, Daffodils, *Polyanthus Narcissi* and *Gardenias*, which were almost overpowering with their varied scents and perfumes in this confined space. *Amaryllis* were well represented, and in most cases in an advanced stage of evolution. *Gloxinias* were moderately numerous, but good at this early period of the year. Very fine were the two groups of the new crisped *Cyclamen latifolium Papilio*, with broad, frizzled and goffered segments like Indian lace. They existed in a great variety of colours, and are sure to become popular in British gardens in a few years.

Canada supplies about one-fourteenth of the imported food of Great Britain.

Mr. P. Barham, formerly foreman under his father at Croxteth, Liverpool, has been appointed gardener to Col. W. H. Walker, the Grange, Gateacre, Liverpool. Mr. Barham entered upon his duties on the 15th inst.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, April 26th, in the Drill Hall, James Street, Westminster, 1—5 p.m. In addition to the society's ordinary meeting, the National Auricula and Primula Society will hold its annual show. At three o'clock a lecture on "Sweet Scented Leaves v. Fragrant Flowers," will be given by Mr. F. W. Burbidge, M.A., V.M.H.

The Crystal Palace and grounds cover 200 acres.

A Noble Gift.—Miss Cruickshank, the sister of the late Dr. Cruickshank, has given £15,000 to Aberdeen University for the purpose of founding a botanic garden in memory of her brother.

British Orchids.—Mr. A. D. Webster, of Greenwich Park, announces for immediate publication by J. S. Virtue & Co., Ltd., a work on British Orchids. The book will contain an exhaustive description of each species of our native Orchids, and will be fully illustrated.

The Dunlop News.—The Dunlop Pneumatic Tyre Co., Ltd., 160, Clerkenwell Road, E.C., has issued No. 11 of the *Dunlop News*, a neatly got up magazine intended for cyclists. We are requested to state that the company will be pleased to send a copy gratis and post free to any cyclist upon receipt of name and address. Many gardeners cycle, and the *Dunlop News* will therefore be of interest to them.

The Sovran Postcard.—We are in receipt of a number of samples of this postcard from the "Sovran Card Co.," 29, King Street, Covent Garden, W.C. The "card" in question is an ingenious device—a multifold card which can be neatly folded up until it is of the size of an ordinary postcard, and subject to the same postal rates. For business people of all classes who have to send lengthy notices or reminders to existing or prospective clients through the post these cards will be invaluable. Prices per 100 or 1,000, with special wording to suit the customer can be had on application to the company.

The Science of Manuring.—This is the title of a small pamphlet issued and forwarded to us by the Sulphate of Ammonia Committee, 4, Fenchurch Avenue, London, E.C. It contains a collection of practical facts connected with the application of manure to the soil according to scientific principles that cannot fail to be of service to the horticulturist and agriculturist. The value of sulphate of ammonia is especially set forth for Hops, Potatoes, vegetables and fruits of all kinds. In a second and smaller pamphlet accompanying the first and larger one is a number of facts about the application of this valuable manure, and at the end appears a table, treating on the quantities of various chemical manures to be applied to such crops as Potatoes, Swedes, Cereals, Clover, and Grass.

Shirley Gardeners' Mutual Improvement Society.—The monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday the 19th inst., Mr. B. Ladhams presiding over a fair number of the members. Mr. J. Jones, The Gardens, Terrace House, Polygon, Southampton, gave a most interesting and useful lecture on "Table Plants, and Plants for House Decoration." He exhibited a number of very good specimens, and later on he proceeded to cut them up for the purpose of illustrating his remarks on methods of propagation. Quick propagation, he said, was necessary, so many decorative plants being annually lost owing to bad treatment, draughts, &c., while in use indoors. A number of questions was put, and answered satisfactorily, and a hearty vote of thanks was accorded to Mr. Jones for his valued lecture. There was a good display of hardy Primulas by Mr. B. Ladhams, also Caladiums by Mr. E. J. Wilcox.

New York Botanical Gardens is about to be enriched by the erection of a range of thirteen glass houses, which, it is estimated, will cover an area of 45,000 sq. ft. The houses will enclose a large court, which is to be utilised for the cultivation of aquatic plants. The central feature of the southern front of the range will be the large circular Palm house, which will have a diameter of 100 ft., and a height of 90 ft. The wings running east and west from this will be 30 ft. wide, 116 ft. long, and 26 ft. high, measuring to the ridge, and they will be terminated by more roomy erections 46 ft. high and 84 ft. wide. The connecting houses which run south from these will be lower, measuring 30 ft. in width by 75 ft. in length, terminated by two domed, square houses 50 ft. in diameter, and 35 ft. in height. These are in their turn joined by two more low houses, each 38 ft. in width and 103 ft. in length. The heating apparatus will be sufficient to maintain an atmosphere of 70° Fahr. whatever the weather, and the houses are to be all well supplied with hot and cold water.

The Sudden Climatic Changes in America are by some attributed to the fatal policy of cutting down the forests.

Don't be afraid to eat Onions.—They are very wholesome, and drinking sweet milk afterwards, it is said, will purify the breath, leaving no odour.

For Small Capitalists.—Sir Harry Johnston suggests a new opening for small capitalists in the sunny South. He states that the culture of flowers and herbs for supplying material for the manufacture of perfumes is in Tunis a profitable undertaking. If this be true, the business would be almost an ideal one, for a pleasanter one cannot be imagined.

The Cold Storage and Ice Trades' Review.—We are in receipt of the first issue of this publication, which has been published to supply information to all those connected with what is now a very important modern industry, viz., the preservation of all sorts of food by means of the cold chamber and refrigerator. The magazine, which is priced at 4d., should therefore supply a want, and we welcome its arrival, hoping that it has come to stay. The publisher is Mr. R. M. Leonard, 28, Great Ormond Street, London, W.C.

Beddington, Carshalton, and Wallington Horticultural Society.—This flourishing society has just issued in catalogue form its schedule for 1898, together with a list of officers and subscribers, the statements of receipts and expenditure, and the report of the committee for the past year. We notice in the list of officers the name of Mr. W. T. Toogood, of 21, Vicarage Road, Croydon, as secretary. The financial statement shows total receipts of £335 14s. 9d., and an expenditure of £282 7s. 3d., thus leaving a balance in the hand of the treasurer of £53 7s. 6d., as against last year's balance of £35 13s. 4d. From these figures it will be observed that there has been a profit on the year's working of £17 14s. 2d. The balance sheet shows £124 4s. 7d. standing to the credit of the society, with the liabilities nil. The report of the committee naturally congratulates the society upon the satisfactory condition of affairs. The annual show is fixed for Monday, August 1st.

Sweet Gale and Lungwort in the New Forest.—I find the narrow-leaved Lungwort (*Pulmonaria angustifolia*) very common here, at Brockenhurst, growing in the hedges, and now in full bloom, with flowers of all shades, from dark purple to red and lilac. I have never met with it before. The Bog Myrtle (*Myrica Gale*) too, is very common, lighting up the bogs with the ruddy brightness of its buds. I am told that a beer is made of this, called Gale beer in Yorkshire, and is much relished by the men working in the hay and harvest fields. Of Sundews I have found but one, a very small one, and think, though the plant is perennial, that here, as in Devon, where I have found it just at this time of the year, it springs up annually from seed. The trees are covered with lichens, of which I dare not put down the names, though they have been kindly named for me by Mr. Masee and Mr. Marquand, of Kew, who are also staying here. One of them, *Opegrapha taxicola*, a species of the writing lichen, covers the old Yew tree in the churchyard, and looks for all the world as if some ancient Assyrian had been at work with pen and ink, choosing the trunk and the branches of the tree as a means of conveying in cuneiform characters a message to endure for at least a thousand years, for both tree and lichen must have been there for some such period. I heard the wryneck's note to-day (April 12th), showing that spring is come.—J. C. S.

The Simplest Living Things.—The eleventh and last of the course of lectures upon the "Simplest Living Things" was given by Professor Ray Lankester on the 29th ult. The Professor began by discussing the Acinetaria. They had a simple nucleated body, usually with several processes extending from it. These processes were either pointed or ended in suckers which enabled the organism to obtain its food. Besides propagating by fission and by conjugation the Acinetaria also developed buds which on being thrown off by the parent became possessed of cilia, thus establishing a connection between Acinetaria and Ciliata. It was probable, continued the lecturer, that the first living

things formed from albuminous matters were animals subsisting on much the same substance as that of which they were composed. At some period in the growth of these living things chlorophyll came into existence and enabled such as had it to assimilate carbon from carbonic acid and nitrogen from ammonia. The forms intermediate between these and those that required albumen were derived from green plants, and fed on juices containing sugar and less highly elaborated substances than albumen. Fungi and Lichens had this saprophytic mode of nutrition. In classifying the simplest plants the professor divided them into Confervoidae, Conjugatae, and Schizophytae. The first-named were plate-like or spherical forms which separated into biflagellate individuals forming zoospores that conjugated to produce a single mass from whence a new colony arose. The Conjugatae had filamentous or single cells. In the Schizophytae continued division of the cells was the only method of reproduction. There were two series of these, one, the Physochromaceae, living in fresh or sea water. These had peculiar colouring matters and were often without chlorophyll. The second series, Bacteriaceae were smaller and more dependent for food upon organic matter. Some of the bacteria were putrefactive, others like the bacillus of anthrax and tetanus passed into the body and fed on the living substance; whilst others, like diptheria, did not enter the body, but produced on the outside a poison which was absorbed. Some of the spherical forms, as for instance the typhoid bacillus, were able to develop filaments by which they moved.

VALLOTA PURPUREA.

THESE useful autumn-flowering bulbs are beginning to grow afresh, so they should be overhauled at once. The plants resent being disturbed too often and grow and flower freely for several years without repotting, though the surface soil should be loosened each year about this date and removed, giving them a top-dressing of fairly rich soil. Our batch did not flower very freely last autumn, so I have had them all shaken out and repotted. This operation had not been done for the past seven years. The bulbs were sorted as to size, placing from five to seven in an 8 in. pot, three or four in a 6 in., or a single bulb in a 4½ in., or 5 in. pot. The last two sizes given are very useful for small vases, the bulb carrying two spikes of bloom.

With the knowledge that the bulbs will remain in the same pots four or five years, a fairly lasting compost should be given them, which in our case consisted of fibrous loam, peat, leaf-soil, and enough river sand to keep it porous, the first-named predominating. A small quantity of bone meal could be added to this, if at hand. After potting, stand them in a cold pit or frame kept fairly close, and lightly syringe overhead two or three times a day, shading from the sun, until you see they have got hold of the new soil, when more air must be given them and shading dispensed with. They require an abundance of air and water during their growing season from the month of April to the end of July. After that date they can be advantageously stood outdoors in this mild country until the flowers are about to open, when they should be removed to a greenhouse. Manure water should be afforded those that have not been repotted, thrice a week; while those that have been given new soil will scarcely require any stimulant the first season. In any case it should not be given until you perceive the flower spikes showing, and then it should be weak. After flowering, less water will suffice, in fact, water can be withheld altogether during December and the two succeeding months, if the plants are not placed in a too drying position, which they should not be. They are fairly hardy; all that is required is merely to keep them away from severe frost. I have had our pots frozen quite hard, but no harm accrued; of course, they were fairly dry at the time. I find them most serviceable for church decoration at harvest festivals, during the month of September and early October.

—J. Mayne, Bicton.

A FEAST OF DAFFODILS.

MARCH winds have been something more than a proverb this year, for into them winter has concentrated practically the whole of its rigour, with

disastrous results to not a few of our favourite plants, be it said. But the Daffodil has passed victorious through even this severe test, scathed it may be, but not destroyed, beaten to the earth by the malevolence of the gale, but risen again in a very triumph of beauty.

When we take into consideration the grand weather resisting qualities of this flower of many parts it is not surprising that the succeeding years see its share of popularity steadily moving on the up grade and the number of its votaries as consistently upon the increase. Beneficent Nature, assisted by the hand of man has in the Daffodil given us a flower that is without compeer in the months of March and April, and no matter whether nodding at us from nooks in the rockery and beds in the flower garden, or waving 'neath the gentle influence of spring zephyrs in broad stretches naturalised in meadow and orchard, the flowers are alike imperially beautiful. At this season of the year they flood our markets, and are displayed in prodigal profusion to tempt buyers from amongst the busy moving masses in the thoroughfares of our great towns and cities. "Narciss," sweet "Narciss," is the cry, and we welcome the heaven-born radiance of the flowers as we would welcome the face of spring herself. The breath of the country with its wide, untrammelled expanse of sky and meadow is in every blossom, and with it a message of good cheer to the busy worker who is debarred from participation in the exuberant delight of a country spring.

But if so sweet a taste of heaven lurks in the culled blossom, what shall be said of the place where the Daffodil grows, where it is nourished, cherished, and tended with parental care and solicitude, and where in return it yields ungrudgingly the whole of its bright beauty as tribute to its foster-parent? A visit to Messrs. Barr & Sons' nurseries at Long Ditton is not a new experience to us, and yet the glory of the Daffodils comes to us ever fresh year by year, and the sense of enjoyment it brings strengthens rather than weakens. It fell to our lot this year to enjoy a perfectly lovely spring day for our visit, when the Narcissi were absolutely at their best. The sight was, indeed, one to wonder at and admire, for we found the flowers massed as for a field day, the individual characteristics of each form being thus apparent to even a casual observer. Over these huge breaks of colour the eye travels with the most acute sensation of pleasure, for the glittering gold of the blooms is softened by the subtle green of the foliage beneath, and we do not suffer the sense of oppression that comes from the beholding of huge masses of bright colours without any appropriate setting.

An idea of the magnitude of the scale upon which operations are conducted is furnished by the fact that upwards of two million bulbs of Narcissi were planted last year in these nurseries, and even this host will be scarcely sufficient to keep pace with the ever-growing demand. One of the most conspicuous features is a magnificent stretch of N. Barrii conspicuus. Over 180,000 bulbs of this variety alone were planted, all of which we found in full flower. If we calculate that, on an average, each bulb will throw four flowers, we get a grand total of 720,000 blooms of this variety alone. Other popular varieties are grown in proportion, and show conclusively the directions in which the public fancy is trending.

Daffodils fall naturally into three sections according to the size of the corona or trumpet relative to the segments. In all these three sections there are ranged varieties of surpassing beauty, and he would be a bold man, indeed, who would venture to attempt to uphold the merits of one section to the exclusion of those of another.

In the Ajax (Magni-coronati) section, with its huge corona or trumpet, we get the largest and most massive flowers. The very size of many is imposing, although we find all sizes, since the comparatively small Hoop Petticoat Narcissus (N. Corbularia) is included. Then also we have the small forms, N. minimus, N. nanus and N. minor, and these lead up to the large-flowered forms in the order named, N. minimus being the smallest. The Ajax section is, for the sake of convenience, divided according to the colours of the flowers.

First we have the self yellow varieties—in themselves a host. Chief among them comes Glory of Leiden with its mammoth trumpet and segments in proportion—truly a noble flower. Emperor is

another large and very popular flower that is especially valuable for bedding and naturalising, on account of its great vigour and floriferousness. P. R. Barr is rather smaller in size, but fully as useful. The perianth is primrose, and the trumpet a full yellow. The foliage is sturdy, of medium height, and quite distinct. Golden Spur is the variety for those who are on the look out for a good thing at a low price. The trumpet is large, prettily frilled at the margin, and rich yellow in colour. Although the bulbs are cheap, the flower is one of the finest of all. As the result of crossing N. Ajax and N. triandrus the "Johnstoni" group has been evolved, and in it are several highly pretty things, one of them, N. J. Queen of Spain, being one of the most beautiful and refined Daffodils in cultivation.

The bicolor varieties form the second division of the trumpet Daffodils, the segments of the perianth being white, and the corona some shade of yellow. Empress is the most useful of all in this division, for its vigour of habit, and the imposing character of the flowers have marked it out as eminently suitable for both naturalising and bedding purposes. J. B. M. Camm represents the ideal bicolor Daffodil from the enthusiast's point of view, and there is no doubt that for refinement and elegance it is hard to beat. A superb batch of the new Victoria was remarkable for the uniformity of height of the plants, and the size, splendour and symmetry of the flowers.

In the white and sulphur varieties we have some vastly pretty forms, and also some of the most difficult to grow. We found N. cernuus was over, but its variety N. C. pulcher well sustained its reputation. N. moschatus (of Haworth) is another charming dwarf variety. Madame de Graaf maintains its reputation as one of the largest and finest white trumpet Daffodils in existence, it being only surpassed by Weardale Perfection, but its price is prohibitive.

In the second section, the Medio-coronati, we find the corona about half as long as the perianth segments. The latter are often long, and we thus get an elegant star-shaped flower of wondrous beauty. Of varieties of N. incomparabilis alone there is a host, the most important and valuable for general purposes being Sir Watkin. Other varieties such as Gloria Mundi, G. J. Backhouse, Autocrat, Beauty, and Gwyther, being fully as beautiful, but less suitable for extensive planting. N. Barrii conspicuus we have already alluded to, and we may now make mention of N. B. C. Orphee—another charming form.

The varieties of N. Leedsii are legion, but all are chaste and beautiful. Such varieties as Minnie Hume, Beatrice, Duchess of Westminster, Mrs. Langtry, and Katharine Spurrell should be in every collection. At Long Ditton under Mr. J. W. Barr's fostering hand they acquit themselves marvellously well. N. Backhousei is another group which contains some fine things. In addition to N. Backhousei, we have N. B. Wolley Dod and N. B. William Wilks, both very handsome forms.

The third section, Parvi-coronati, contains N. Burbidgei and its numerous forms, N. poeticus, and its varieties of which N. p. poetarum, and N. p. ornatus are the chief.

Novelties are ever dear to the heart of the specialist, and as the work of crossing with a view to the production of new and improved forms is diligently prosecuted at Long Ditton under the vigilant eye of Mr. J. W. Barr himself, we annually look for results. There is no keener or surer eye in the Daffodil world for meritorious novelties than that of Mr. Barr, and a new form has to be good as well as new before it is considered to be worth naming. There are several promising unnamed seedlings now in bloom, carefully protected from all adverse conditions. One of these (a bicolor form) must create a veritable *furor* when it is sent out, for its size and majesty of proportions totally eclipse anything that has gone before—in short, it is a colossus among Daffodils, for Glory of Leiden growing hard by was as nothing to it, and Glory of Leiden is not a pigmy.

'Tis a pity that the stay of the Daffodils, like that of the angels, is so comparatively short, for we would fain keep them for ever with us, but the remembrance they leave behind is a vivid and lasting one, and as delightful as it is vivid and lasting. A day amongst the Long Ditton Daffodils is an intellectual feast to be remembered and treasured as long as memory itself shall last.

HINTS FOR AMATEURS.

Nepeta Glechoma variegata.—Everyone who knows anything about British wild flowers must know the Ground Ivy, *Nepeta Glechoma*, or *Glechoma hederacea*, as it used to be called, for there is no plant more widely distributed. In partially shaded or damp spots it grows with the greatest luxuriance, and its ivy-like leaves, whence the popular name "Ground Ivy," and the old specific name "hederacea," form a rich green carpet upon many a hedge bank, and by many a lane side, the blue flowers peeping from amongst the foliage in countless numbers. Variegated, or improved forms of a few British wildings are cultivated to some extent in gardens, and the Ground Ivy is one of the cases in point. Some of the so-called improved forms of wildings are very little, if any, superior to the wild forms, but in the variegated *Nepeta Glechoma* we have a plant of uncommon merit and great beauty. It is totally distinct in appearance from anything else, and is as easy to grow as it is distinct. We have none too many plants that are suitable for the filling of baskets for the greenhouse and cool conservatory—at least, such plants as the ordinary amateur can take up with confidence—hence it is all the more important that it should not be lost sight of. The variegated form has leaves of the same shape and size as the type, and the creeping habit is the same. It will grow vigorously in almost any soil, but likes a light rich one for preference. The best method of showing it to advantage is to grow it in baskets, for the long trails soon cover the outside of the baskets and hang down a considerable length below them. One of the most noteworthy exhibits at the last meeting of the Royal Horticultural Society was composed of three plants grown and shown in this way by Mr. Charles Turner, of Slough, and a very pretty effect these three plants gave.

Campanula isophylla alba.—The present is a good time to see about repotting the old plants. Some of these have been rather badly treated during the winter, and are only just beginning to break into growth. Shake them out of the old soil, and pot them up, using a compost of two-thirds of loam and one of leaf soil with sand. All the dead snags should be cut off neatly with a pair of sharp scissors or a knife. By coddling these old plants up for a few weeks they may be turned into good specimens that will flower freely before the summer is very far advanced. An occasional sprinkling with the syringe will not do them any harm. As basket plants, both *Campanula isophylla* and its charming white variety are everything that could be desired, and the plants never show up to such advantage as they do when thus suspended. In order to fill a good-sized basket several plants will be required. These may either be put into the baskets at once or grown on for a while in pots—say until the middle of May. The old plants of which we have been speaking will come in finely for this kind of work, as they will naturally throw more shoots, and will clothe the sides of the baskets more quickly than the young plants obtained from autumn or early spring-struck cuttings.

Not infrequently do we see various devices resorted to by amateurs to suspend pots from the roof of the greenhouse or the top of the window, in order to show a particular plant off without having recourse to growing it in special baskets. We may take the present opportunity of again calling the attention of those amateurs who may be handicapped by the lack of suitable baskets, to Lawton's Patent Pot Suspenders, a capital contrivance which was figured in *THE GARDENING WORLD* in the issue for February 5th last. By the use of this clip, and a little wire or string threaded through the eyes, any pot may be safely and easily suspended in any position that may be desired. The cost is comparatively trifling, and will be saved many times over.

Achimenes.—The earliest plants have now attained a height of 2 in. or 3 in., and staking should be proceeded with as soon as possible. If left too long the young plants, being very weak in the stem, soon commence to lop over the sides of the pots, and, if the mischief is allowed to proceed, they eventually become twisted and gnarled looking things that are anything but an object of beauty. The best method of staking is to insert five or six light

stakes all round, near the edge of the pot, and pass a strand of raffia loosely round them, giving it a double turn round each of the stakes to keep it in position. The stakes should be at least 10 in. long above the soil, and no attempt should be made to cut off the ends of the stakes until the plants have nearly attained their full growth. These early *Achimenes* may be kept growing on in heat, so as to get them into bloom betimes, but the later hatches that are to afford a succession to them should not be hurried too much. The latest batch of all will need nothing more than a cool frame, in which they may be grown from start to finish. The summer proper will be gone before these commence to bloom, but there will be the corresponding advantages of larger, finer blooms, and sturdier, shorter-jointed growth. *Achimenes* grow away freely enough when placed in heat, but they then attain a much greater height than they do when the cool treatment is practised.

Freesias.—As the later batches of *Freesias* go out of bloom and begin to show signs that their approaching rest is at hand, the water supply should be gradually lessened and all manurial stimulants must be stopped entirely. Give the plants plenty of light and air, so as to facilitate the ripening process. The plants that flowered earlier in the year are quite at rest now, and nothing should be allowed to disturb or stimulate them into premature growth. A cold frame facing to the north is a good place to put resting plants such as these.

Tulipa Greigi.—This handsome and robust growing species takes as kindly to cultivation under glass as it does in the open, and, when we take into consideration the huge size and brilliant flame-scarlet of its flowers, it is evident that it is well deserving of extensive cultivation as a pot plant. Some of the early Tulips are largely grown in this way, yet none of them is more handsome in every way than *T. Greigi*. At the last show of the Royal Horticultural Society it was very conspicuous in at least two exhibits, and in both cases the pots it was grown in were very small in comparison to the size of the plant and the mammoth proportions of the flowers. Those who make a speciality of bulbs for conservatory decoration will do well not to lose sight of it for another year, if they have not already proved its merits. The great thing is not to force too heavily, but to allow the plants to come on gradually, and to bloom just a little before their relatives in the open ground. *T. Greigi* is a native of Turkestan, and was introduced from thence no farther back than the year 1873, so that it is yet a comparative stranger.

Coleuses.—The present is a good time to take a few of the largest of the plants obtained from early spring struck cuttings in hand, and pot them up to form fairly large specimens. As it is obvious that it takes some time to obtain these, even although the *Coleus* is a very quick growing subject, it is advisable to select these specimens during the present month. They will then have all the best part of the year in front of them, and by the month of June or July will be in good condition for transference to the conservatory. This will be quite warm enough for them then, and up to—say the end of September—but after that time the leaves will begin to fall, owing to the lowering of the temperature all round.

Good specimens can be obtained in 8-in. pots, but 10-in. or 12-in. will not be too large for very strong-growing plants. *Coleuses* are rich feeding and thirsty plants, and, therefore, the soil should be rich and retentive. Two-thirds of good loam, and one of spent Mushroom bed manure, rubbed through a sieve, with a good sprinkling of sharp river sand will form a good compost. Drain the pots fairly well and pot rather firmly. In order to obtain symmetrical plants pinching must be resorted to occasionally; all flowers in particular must be kept pinched out. The syringe should be plied freely amongst the plants morning and afternoon, and the temperature should not be allowed to fall below 60° Fahr. Generous treatment such as this will be sure to produce good plants in a month or two.

Coleus Cuttings should still be put in as they can be obtained from the old stock plants. Although every amateur may not have room for big specimen plants neat little samples in 48 and 32 pots are always of service both for the greenhouse and conservatory as well as for the windows of the dwelling house. In the latter position they are always much admired by the ladies of the house, and when properly looked after they do exceedingly well through the summer months.—*Res.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Woodlice.—A warm pit which I used for propagating tender plants is infested with woodlice. I have trapped many of the pests in pieces of Potato, hollowed out and laid about different parts of the pit, but the numbers of the pests show no appreciable signs of diminution. Please give me a hint as to how to get rid of them a little quicker.—*C. C. L.*

The best plan we know of is to pour boiling water in any corners where the woodlice are observed to be. If you clear the plants out of the pit you might easily do this. See that the water used is quite boiling and do not be afraid to use plenty of it. A kettleful or so will be of little use, so you should fill the kitchen copper and heat that, when you will have a plentiful supply.

Incurved Chrysanthemums.—*Rob*: You will find the following varieties to be as good a dozen as you can have:—Mrs. R. C. Kingston, C. H. Curtis, Lady Isabel, Mme. Ferlat, John Lambert, Lord Wolseley, Robert Petfield, Brookleigh Gem, D. B. Crane, J. Agate, Bonnie Dundee, and Baron Hirsch.

Chrysanthemum C. H. Curtis.—*Rob*: First crown buds of this popular variety produce good blooms, and it also does well when it is stopped at the beginning of March, and the second crown buds are taken.

Chrysanthemum N. C. S. Jubilee.—*S. Bencraft*: This handsome variety received an Award of Merit from the Royal Horticultural Society on October 26th of last year, as an incurved Japanese variety, and not as a true incurved. You would scarcely get judges to pass it as an incurved on the show board, but if you choose to run the risk of disqualification there is nothing to prevent you from so doing.

Potting Camellias.—*A. Denison*: You must wait until the flowers are all off the plants, and the young shoots have begun to make their appearance—that will be the best time to pot. Avoid as far as possible giving too big shifts.

Newly Planted Peach Trees.—*P.*: We think you may proceed to tie your trees now. As a couple of months have elapsed since planting, there is little danger of much more subsidence of the soil. You may, however, make the ties rather looser than is usual, as you say the ground was disturbed to a considerable depth all round. In training the tree you must be careful to bring the lower branches down as near to the ground as you can without straining them. You will then have the base of the tree well furnished, which is a matter of some importance. If the branches of young trees are not thus brought down early in their career they soon become so stiff that it is impossible to do anything with them, and, as a consequence, the base of the tree is bare for the whole of its existence.

Syringing Vines.—*R. Jones*: It is usual to stop syringing the Vines as soon as they have got into the stage that is technically known as "rough leaf." The syringing then becomes unnecessary, although it is not harmful. You may syringe the Vines when in full leaf if you so desire, but in such a case you must be careful with the ventilation, so as to prevent burning.

Davallia canariensis.—*A. E. B.*: The healthy rhizomes of *Davallia canariensis* may be divided to form small plants, if desired. In dividing, take care to preserve intact as many as possible of the roots attached to the rhizomes. In potting these divisions up, it will probably be necessary to give support to the heavier fronds. A higher temperature than the old plant was growing in should be given at first, so as to give the small plants a good start.

Potting Japanese Maples.—*W. Baston*: Your plants do not need potting yet, for these pretty Maples will remain a long time in the same pots and

flourish, even although they may appear to be pot-bound. If the plants had not been in good health they would not have produced such a quantity of foliage. You may give an occasional dose of liquid manure if you like—fresh farmyard manure is as good as anything. A very strong reason for endeavouring to keep the plants in the same pots for as long as possible is that they are so much more useful for decorative purposes.

Dwarf Cockscombs.—*S. Rose* is much puzzled to account for the very dwarf Cockscombs that are to be seen at exhibitions throughout the country. He has tried to grow them himself, but has only succeeded hitherto in producing rather "leggy" specimens.

The cultivation is chiefly accountable. These dwarf specimens are obtained by growing the plants close up against the glass, also by potting rather firmly. The strain again has something to do with it. Those cultivators whose plants *S. Rose* so much admires procure only the best strains of seed, and this fact coupled with the kind of cultivation we have mentioned produces the desired results. If *S. Rose* tries his hand again the hint may be of service.

chosen. These were in 3-in. pots at the time, and were potted in pairs into 6½-in. After the roots had taken to the new soil, the top of one was taken off, about 5 ins. from the tips, and a slit was made with an upward cut of the knife at an equal height in the other. The point of the first was shaped into a long wedge and inserted carefully in the slit of the second. They were then carefully bound with fine threads of raffia, and some moss bound round all to insure moisture. Placed in a cool, shady position, they united perfectly in about a fortnight. The plants now stood growing two roots to one plant, and each was contributing an equal share to the maintenance of the growing foliage and resultant blooms. This was evident from the stems of each stock swelling at the same rate through the growing season. They were finally potted into 10-in. pots and took their place with the rest of the collection.

The varieties chosen were picked with an idea of testing what effect the union would have on the colour and shape of the resultant blooms. For this purpose *Mdlle. Thérèse Rey* was united with *Chas. Shrimpton*, the lead being taken by the first-named so that any tinge of colour would show most distinctly on the white flowers. In *No. 2. Mdlle. Thérèse Rey* was again used in con-

last season, but they showed no variation from the true variety, and so I suppose the experiment ends; and I am as far as ever from producing sports by artificial means. To my mind, however, it seems to prove that the roots have little or nothing to do with the colouring of the flower, for though two root stocks were absorbing materials and mingling the resultant sap all the summer, yet nothing of a colouring nature could have been collected by them. This, of course, may be nothing new to those versed in colour science and plant structure, but perhaps the experiment may have other teachings to them, and this must be my excuse for taking so much space in recording it. The accompanying photograph will explain things, perhaps, more clearly than I have been able to do.—*R. E. Richardson, Wollaton, Notts.*

NOTES FROM THE SWANLEY NURSERIES.

In addition to the Chinese Primulas which have been making such a grand show at the Swanley and Eynesford Nurseries of Messrs. H. Cannell & Sons, there are not lacking other attractions. Amongst these one of the most conspicuous is the

GRAFTED CHRYSANTHEMUMS.

AN EXPERIMENT TO INDUCE SPORTING.

THE recent recurrence to the subject of sporting in Chrysanthemums has suggested to me that the following account of an experiment I made in the season of 1896, may be interesting; though it may not throw any additional light on the subject.

It was in the dark days of the previous winter, while lamenting the hard fate of sundry seed heads of Chrysanthemums, which, after having been carefully fertilised, had given up the struggle to reproduce their kind, and which hung ugly and disgusting, a victim to damp, that the wish (being father to the thought) to produce new kinds suggested an experiment in grafting to gain the desired end. The idea may not be new, but as I have never heard or read of anything similar, perhaps a short account of the process may be interesting. My desire at first was to induce an artificial sport from the plant, but all my cogitations failed to give me a cue to work upon.

I had, so to speak, the material, but no tools and no formula. Then the thought presented itself of graft-hybridising, and, though this is no new scheme, the method so far as I know is original. Two plants of similar size, but of very opposite characters, were

junction with *J. S. Dibbens*, the first being again the leader. In *No. 3 Etoile de Lyon* was coupled with *Brookleigh Gem*; in this case the incurved was given precedence to see if the coarse reflexed blooms would influence its co-partner. In *No. 4 Louis Boehmer* and *Mrs. F. A. Spaulding* were wedded, the latter taking the lead; this was to try if the hirsute petals would tell on the smooth ones. *No. 5* was *Gloire du Rocher* with *Jean d'Arc*; and *No. 6*, *Chas. Shrimpton* with *Mme. Chas. Molin*, the second-named in each case leading.

The result was certainly not very startling. In only one case could I see any variation from the normal; this was in *No. 1*, in which some petals were a decided pink. In all the other cases I could not distinguish anything from those under normal conditions, the blooms, however, being exceedingly large and fine for their kinds. This hint may prove serviceable to big bloom growers, and prove a "leg up" to some beautiful but delicate kinds, which have feeble root action; and, perhaps, might correct the deplorable bud-producing habit of others. As no patent rights have been secured for the method I'll make Chrysanthemists a present of the idea.

Cuttings were taken above the union, from the plant which showed a slight pink tint, and grown on

CINERARIAS.

We found several houses filled with these handsome and popular plants, one house in particular in which the cream of the collection was placed being a magnificent sight. The plants were all sturdy specimens of their kind, dwarf and compact, but not so dwarf as to give that idea of squatness that dwarfness carried to the extreme invariably does. The foliage throughout was of remarkable substance, and well exemplified the vitality and vigour of the strain. The heads of flower were magnificent in size and grandeur, and the individual flowers were all that could be desired for size, regularity of outline, and richness and variety of colours. We were informed upon enquiry that all the plants we saw were really the progeny of the "March Past" strain that was shown a considerable number of years ago with excellent results by the Messrs. Cannell, the words "March Past" having been given in allusion to the superiority of the strain over others then in existence.

Naturally enough no trouble has been spared to improve the strain, and make it keep pace with that almost feverish spirit of improvement that has characterised matters floricultural during the last two decades of the present century. Thus, whilst

improved forms, as well as new shades of colour and colour combinations, have been sought for and found by raising seedlings obtained by judicious crossing and recrossing, superior forms have been perpetuated by means of cuttings or root divisions. Comparing the plants raised by these two methods with each other there was, however, very little difference apparent either in vigour of the plant, size of flower, brilliancy of colouring, or floriferousness, but all were alike good in both sections. The whole of the plants were in six inch pots, which size, judging from appearances, is amply large enough for all ordinary purposes.

The Swanley collection is especially rich in shades of blue and maroon, the number of shades being so many, and their differences so subtle, as to baffle adequate description. In addition to the self-coloured flowers, which in Cinerarias as well as in everything else have a richness and effect peculiarly their own, we noticed an infinite variety of what may be termed the bi-coloured flowers, if we accept white for the time being as a colour. On a central white zone which varies in width according to the flower we found margins of all shades of blue, purple, and maroon, the varying widths of which gave an almost bewildering variety; indeed of the seedlings scarcely any two plants had flowers exactly alike. What a field of research a detailed examination of the kaleidoscope-like association of colours this would prove to the physiological botanist, for from one or two primary colours a wondrous variety of hue has been evolved by Nature and man as the result of collaborate working.

Good white varieties are almost invariably the weakest colour section of all modern strains, for the plants seem to be possessed of a feeble constitution, and the flowers are often ragged as compared with the other varieties. The Messrs. Cannell have, however, in Miss May Symbal a grand white form that seems to have risen above the weaknesses common to its kind, for it is certainly both as regards habit of the plant and form of the flower a very fine thing. We hope to see this section fully on a level with the others before very long.

Double varieties find their admirers; indeed it seems as if some people admire anything double simply because it is double. In the case of the Cineraria we cannot adduce any other reason, for the Cineraria has certainly taken too much advantage of its opportunities in assuming the double guise. In deference to those who call for the monstrosity, however, the Messrs. Cannell have a considerable stock on hand. The floriferousness of the plants and the size of the flowers were truly amazing, and left us wondering where this hypertrophy of bloom is to end. The plants, like the singles, bore unmistakable evidence of the high cultivation that the Messrs. Cannell bestow on all the plants they take up.

PLANTS RECENTLY CERTIFICATED.

At the meeting of the Royal Horticultural Society on the 12th inst., the undermentioned certificates were awarded.

Orchid Committee.

EULOPHIELLA PEETERSIANA, *Nov. sp.*—In this recent introduction, flowering for the first time in Europe, we have a species that caused a considerable amount of sensation amongst visitors to the Drill Hall. The large and massive flowers are produced in a raceme surmounting a scape about 3½ ft. to 4 ft. high. The sepals are oblong, the upper one being hooded, and all three, as well as the obovate petals, are of a rich, dark, magenta-purple. The bifid lamina of the lip is small, transverse, and of the same colour, with a golden crest of three to five lamellae passing into seven purple lines that run down the tube. The interior of the latter is creamy-white, the exterior being magenta-purple. It is a magnificent and noteworthy introduction. First-class Certificate. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burtford Lodge, Dorking.

CYPRIPEDIUM OLENUS BURFORD VAR., *Nov. var. hybr.*—This was obtained from *C. bellatulum* crossed with the pollen of *C. ciliolare*, and is undoubtedly one of the finest hybrids in cultivation, and the Burford variety is the finest yet obtained from this parentage. The flower is of enormous size. The roundly ovate, dorsal sepal is heavily veined and

coloured with purple, the white appearing towards the edges only. The oblong petals are heavily spotted with blackish-crimson on a rosy ground. The massive lip is dark purple. First-class Certificate. Sir Trevor Lawrence, Bart.

ODONTOGLOSSUM WILCKEANUM PITT'S VAR., *Nov. var.*—Though we described and recorded this last year, it has never before been exhibited. The flowers are of great size and generally admitted to be the finest form of *O. wilckeanum*, a natural hybrid. The sepals are almost covered with two large, lobed, chocolate blotches on a yellow ground. The petals are very deeply jagged at the edges and furnished with a horseshoe-shaped line of chocolate blotches, with numerous smaller ones at the base. First-class Certificate. H. T. Pitt, Esq., Rosslyn, Stamford Hill.

DENDROBIUM ASPASIA LANGLEYENSIS., *Nov. hybr. var.*—The sepals and petals of this hybrid variety are sulphur-yellow, faintly tipped with purple. The orange disc of the lip has a bilobed, crimson blotch. It is certainly a charming Dendrobe. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

PHALAENOPSIS STUARTIANO-MANNII., *Nov. hybr.*—The origin of this hybrid is indicated by the name. The gray leaves are mottled with dark green recalling *P. stuartiana*. The sepals and petals are oblong and thickly spotted with brown on a pale yellow ground. The lip is orange-brown with a white tip, and the side lobes are striped with orange-brown. It is both a singular and pretty hybrid. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

EPIDENDRUM ELEGANTULUM LEUCOCHILUM.—The origin in this case was *E. Wallisii*, fertilised with the pollen of *E. Endresio-Wallisii*, itself a hybrid. The oblong sepals and elliptic petals are clear yellow, and the lip pure white, as indicated by the varietal name. The variety is both choice and pretty. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

PHALAENOPSIS SCHRODERAE., *Nov. hybr. nat.*—The leaves are dark olive green above and intense beneath. The sepals and petals are white, with a pale purple tint at the base of the latter, where they are inserted on the purple column. The lip is rose on a white ground, with purple veins; and the side lobes are spotted with orange. It is a pretty Phalaenopsis, presumably between *P. leucorrhoda* and *P. Portei*. Award of Merit. Messrs. Hugh Low & Co., Clapton, and Bush Hill Park, Enfield.

ODONTOGLOSSUM CRISPUM LINDENII., *Nov. var.*—This variety is furnished with large, light, reddish-brown blotches on a white ground. Award of Merit. A Warburton, Esq., Vine House, Haseldene.

MASDEVALLIA VENTRICULATA LONGICAUDATA., *Nov. var.*—In this we have a very dwarf Masdevallia, a pet in its way, having a tubular crimson-purple flower, with three triangular lobes ending in tails 1½ in. in length, and all of a dark hue. Botanical Certificate. Sir Trevor Lawrence, Bart.

Floral Committee.

AMARYLLIS DAONES.—The funnel-shaped flowers of this variety are bright orange-scarlet with white edges to the segments, making a beautiful and charming contrast. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

DRACAENA AUREA STRIATA.—In this we have a third variegated form of *D. fragrans*. The broad, arching leaves are of a dark glossy green, irregularly variegated with broad and narrow bands of bright yellow. The variegation is not confined to the edges or middle as in the other varieties, but occur on any part of the leaf, the bands running the long way of the same. Award of Merit. Messrs. Hugh Low & Co.

CAMELLIA PRIDE OF WALTHAM.—For description see p. 523. Award of Merit. Messrs. Wm. Paul & Son, Waltham Cross.

CAMELLIA MRS. J. BUCHANAN.—This may be described as a single or semi-double variety, with white flowers, irregularly striped and mottled with red. It affords a foil to the massiveness of the large double sorts. Award of Merit. Messrs. Wm. Paul & Son.

CAMELLIA DUCHESS OF TECK.—This is a large, fully double, imbricate, and smooth flower, with soft rose or rosy pink flowers. Award of Merit. Messrs. Wm. Paul & Son.

Narcissus Committee.

NARCISSUS POETICUS HOMER.—The flowers of this noble variety are of huge size, with imbricate, pure white segments. The crown is saucer-shaped, of large size, and rich orange, intensified to crimson at

the edges. First-class Certificate. Rev. G. H. Engleheart, Appleshaw, Andover.

NARCISSUS LADY MARGARET BOSCAWEN.—This is a handsome hybrid, with a very wide perianth of ovate, creamy-white segments, rounded and broad at the apex. The trumpet is of medium length, but very wide and golden-yellow. First-class Certificate. Rev. G. H. Engleheart.

NARCISSUS WHITE QUEEN.—Here again we have a hybrid with a crown of medium length, but wide, deeply cut, and crisped at the mouth, and lemon, fading to white or nearly so. The perianth segments are ovate, of great size, and creamy-white. Award of Merit. Rev. G. H. Engleheart.

NARCISSUS LUCIFER.—Though belonging to the Medio-coronati section, the crown of this variety is much shorter than those of the previous two, cup-shaped, and deep orange almost to the base, being very handsome. The sulphur segments are shaped like those of *N. poeticus*. Award of Merit. Rev. G. H. Engleheart.

NARCISSUS ORIFLAMME.—The short, wide, cup-shaped, rich orange-scarlet crown of this hybrid also shows an affinity with *N. poeticus* or *N. Burbridgei*, the latter itself a hybrid. The oblong segments are creamy-white. It is a very pretty sort. Award of Merit. Rev. G. H. Engleheart.

GHENT QUINQUENNIAL SHOW.

April 16th to 24th.

SPLendid weather favoured the opening of the fourteenth International Horticultural Exhibition (the 163rd held by this society), of the Royal Agricultural and Botanical Society of Ghent. The opening ceremony and inspection of plants was performed by His Majesty the King of the Belgians, who was accompanied by the Queen, and his daughter Princess Caroline. The royal party arrived about 8 a.m. on Saturday the 16th, and were immediately escorted to the Place du Casino by the Civic Guard. The King spent three hours or more inspecting the plants and speaking to the various notable exhibitors and visitors, both Belgian and foreign, who were introduced to him. He was accompanied by the president, M. le Comte de Kerchove de Denterghem, and his daughter, besides the Belgian Minister of Agriculture and many other distinguished people.

THE CASINO.

Prizes were offered for the most varied collection of the forty best flowering or non-flowering plants, in the name of an English committee to honour the memory of M. Louis Van Houtte père. The first prize, a Work of Art (value 300 francs), was awarded to the Ghent Horticultural Society, Ghent, who had fine specimens of *Cyanophyllum magnificum*, *Phyllotaenium Lindeni*, *Heliconia illustris*, *Alpinia vittata*, *Oncidium sarcodes*, *Smilax argyrea*, *Pavetta borbonica*, *Aralia sonchifolia*, *Dieffenbachia Fournieri* and others. The greater number of the plants were fine foliage subjects. The second prize, a Work of Art (value 200 francs) was taken by M. Albert Rigouts, Meirelbeke, Ghent. The opinion freely expressed was that this exhibit should have been first. He had magnificent specimens of *Phyllotaenium Lindeni*, *Polypodium difforme macrophyllum*, *Encephalartos Altensteinii*, *Vriesia moensiana*, with variegated leaves, *Erica Cavendishii*, in fine form, a magnificent pan of *Anoectochilus Petola*, *Dracaena sanderiana*, *Phoenix Roebelinii*, *Heliconia illustris*, *Anthurium Hookeri*, *Dichorisandra argentea*, *Schismatoglottis Roebelinii*, *Dieffenbachia Bausei*, and other fine foliage subjects. He had grand specimens of *Oncidium ampliatum majus*, *Odontoglossum luteo-purpureum*, and *Clerodendron Balfourii*, representing flowering plants. The Gold Medal offered as the third prize was taken by the society Anonyme Louis Van Houtte père, Gendbrugge, Ghent. *Pimelia spectabilis*, *Anthurium Veitchii*, *Dracaena Doucetti*, and *D. Triomphe de L'Exposition* were good, the latter being pretty. Several of the *Anthuriums* were also noteworthy, and *Erica Cavendishii*, and *Cymbidium lowianum* particularly so.

For a collection of twenty miscellaneous plants, flowering or foliage, and open to amateurs, the Gold Medal was secured by M. E. Bedinghaus, Ghent.

In the nurserymen's class for twenty miscellaneous plants the first prize, a Work of Art, was again secured by the Ghent Horticultural Society, with a

massive specimen of *Nephrolepis davallioides* furcans, also *Anthurium Veitchi*, *Aglaonema Roebelina*, *Maranta picturata*, *Cyclanthus spectabilis*, and various others. The second prize, a small Gold Medal, went to M. G. Van den Abeele, Ghent. The third award went to M. Albert Rigouts.

The Ghent Horticultural Society took the Gold Medal for twelve *Crotons*, which were plants of medium size. Very fine varieties were Mme. Bause and Georges Lesneuer. M. A. Dallièrè, of Ledeburg, took the Silver-gilt Medal in case as the second prize. The Society Anonyme L. Van Houtte came in third.

For twenty-five *Dracaenas* or *Cordylines*, with coloured foliage, the Ghent Horticultural Society again took the lead with well coloured specimens 18 in. to 3 ft. high. Very fine were Bartelli, Excellent, Mme. de Smet-Duvivier, and Directeur Alphan (Gold Medal, value 100 francs). M. J. E. Story, Ghent, took the smaller Gold Medal as the second prize.

The leading prize for the best and most varied collection of twenty-five *Anthuriums* in bloom was taken by M. Louis de Smet, Ledeburg, Ghent, whose finer plants were *A. scherzerianum purpureum*, *A. rothschildianum*, *Secrétaire Fierens*, and *A. r. Mme. Eliza Braga*.

The Ghent Horticultural Society came second with smaller plants, but a greater amount of variety, including *A. ferrierense album*, *A. scherzerianum album*, *A. roseum* (salmon-pink) *A. punctatum*, *A. Souv. de l'Exposition*, *A. grandiflorum*, and other finely spotted varieties, hybrids between *A. scherzerianum* and *A. rothschildianum*. M. Arthur de Smet also took a prize for a large group of *Anthuriums*, but the card was too distant to be read without a telescope. He was second for twelve plants of *A. scherzerianum* in flower, and for twenty varieties of the latter species, taking the small Gold Medal. M. Vervaene-Verraert took the large Gold Medal, being first.

M. Gustave Botelberge, Melle, Ghent, took the Silver-gilt Medal for four huge plants of *Strelitzia Reginae*, all in bloom.

For a collection of ten *Dieffenbachias* the Silver-gilt Medal in case was taken by M. A. Rigouts, the varieties *D. Jenmanni*, *D. picta*, and *D. Fournieri* were very fine.

The Gold Medal for a collection of fifty *Caladiums* was taken by the Society Anonyme L. Van Houtte, père. Some of their fine varieties were *Louis Van Houtte*, *L'Automne*, *Atala*, *Clio*, *Raimond Lemoinier*, *Pintado*, and *Chantini*. M. C. Vermeire, of Gendbrugge, Ghent, took the Silver-gilt Medal for the twenty-five *Caladiums* in large pots. The Silver Medal of the first-class for fifteen new *Caladiums* went to the Society Anonyme L. Van Houtte.

The Work of Art offered for fifteen *Cycads*, in large specimens, was taken by M. de Ghellinck, Walle, Ghent. He had enormous specimens of *Encephalartos Altensteinii*, *Cycas siamensis*, *C. circinalis*, *C. revoluta*, *Zamia Hildebrandi*, *Z. verucosa*, *Dioon edule*, and others. MM. de Smet, frères, of Ledeburg, Ghent, took the Gold Medal for eight *Cycads* in large samples. The Silver-gilt Medal for fifteen *Pandanus Veitchi* was taken by MM. Verdonck, Gendbrugge, Ghent. M. K. J. Kuyck, of Mont-St. Amand, took the Silver Medal.

For a collection of fifteen *Palms*, open to amateurs, the Work of Art was taken by M. J. Moens, Lede.

In a similar class open to nurserymen the Work of Art was unanimously awarded to M. Emile de Cock, the treasurer of the society, 55, Boulevard d'Akkergem, Ghent. He had enormous specimens of *Phoenix*, *Rhapis flabelliformis*, *Marattia sorbifolia*, &c. M. Arthur Rigouts was second, taking the Gold Medal.

M. A. de Smet, was accorded the Silver-gilt Medal for Filmy Ferns. M. Em. de Cock, had the best fifteen greenhouse ornamental plants, showy, huge *Palms*, *Ferns*, &c., taking the Work of Art. M. B. Spae took the large Gold Medal, as the second prize.

The Work of Art offered by the members of the council of administration of the society for six Tree Ferns, was taken by the Comtesse de Kerchove de Denterghem, with large samples of *Cyathea dealbata*, *Cibotium Schiedei*, *Alsophila Cooperi*, *Dicksonia antarctica*, &c. The Gold Medal, as second prize, went to MM. de Smet frères, Ghent. For a collection of tree and herbaceous Ferns, the large

Gold Medal was taken by the Comtesse de Kerchove de Denterghem. The small Gold Medal went to M. Ed. Pynaert van Geert, Ghent. He took the leading award, however, for an exotic Fern remarkable for culture or beauty, showing a huge piece of *Polypodium aureum*. He also had the best stove plant in a tall specimen of *Aralia elegantissima*. M. J. Moens took the Silver-gilt Medal for a huge *Vriesia* about to flower.

For a collection of twenty-five stove plants with variegated foliage the Work of Art was taken by M. H. Millet, of Ledeburg, Ghent. M. A. Rigouts took the Gold Medal, worth 150 francs. They were well grown examples of *Dieffenbachia*, *Crotons*, *Alocasias*, *Heliconia*, *Tradescantia superba*, &c.

The valuable Work of Art, offered by M. le Comte de Germiny for the hundred most varied exotic Orchids was awarded to M. A. Peeters, Brussels, with unanimity. He had a great variety of *Cattleyas*, including the pure white *C. intermedia Partbenia*, *C. P. gratissima*, *C. Schroderae*, *C. Mossiae reineckiana*; also *Laelia Latona*, *Eulopbiella Elizabethae*, *Phaius Norman*, *Odontoglossums*, and *Oncidium sarcodes*, in great variety. *Miltonia bleuana nobilior*, *M. b. aurea*, the blue lipped *Zygopetalum Perrenoudi*, and many others set up with *Adiantums*.

The Gold Medal offered by His Majesty the King of the Belgians, for 100 exotic Orchids, was taken by M. Gustave Vincke-Dujardin, of Bruges. The *Odontoglossums* were the predominant feature of this group. *O. crispum Gabrieli* was a beautifully blotched variety, as were *O. andersonianum superbum*, *O. ruckerianum superbum*, *O. scheepsdaliensis* and others. A bold effect was also produced by *Oncidium sarcodes*, *O. spilopterum*, *O. serratum*, and other tall sorts. An enormous specimen of *Anthurium Hookeri*, with leaves about 4 ft. to 5 ft. long and 18 ins. wide, shown by the Comtesse de Kerchove de Denterghem secured a Silver Medal of the first-class. The Work of Art offered by M. le Comte de Kerchove de Denterghem for twenty-five *Palms*, was taken by the Ghent Horticultural Society with very tall specimens of *Caryota*, *Astrocaryum*, *Cbamaedorea elegans*, &c. The Gold Medal (value 200 francs) was taken by MM. de Smet frères.

The Ghent Horticultural Society took the Gold Medal for the collection of fifteen rare *Palms*, showing fine plants of *Brahea havanensis*, *Trachycarpus khasyanus*, *Pinanga Kuhli*, *Livistona Hoogendorpii*, *Dasmonorops javanensis*, &c.

M. A. Rigouts took the leading award (Gold Medal) for twelve stove plants, having variegated or marbled foliage. M. H. Millet was second in this case. The plants were similar in kind to those in the class for twenty-five plants.

The Silver-gilt Medal in case, offered for a collection of fifteen *Bromeliads* in flower, was taken by M. L. Duval, Versailles, in the nurserymen's class. In the class for amateurs the Silver-gilt Medal was taken by M. J. Moens. MM. Duriez frères, Wondelgem, had the best twelve exotic herbaceous Ferns in well-grown samples. They also had the best twelve species and varieties of *Asparagus*. M. Pynaert van Geert took a Silver Medal of the first class for a large *Pandanus desmetianus*. The Silver-Gilt Medal offered for the most beautiful *Rhapis humilis* was taken by M. Arthur de Smet, with a specimen about 10 ft. high and 8 ft. wide.

In the non-competitive classes, Messrs. F. Sander & Co., St. Albans, England, and Bruges, Belgium, exhibited a collection of new and other plants, covering about 70 ft. running of table space round one end of a hall, all the pots being plunged in moss. The most striking and novel of all their plants, or indeed in the exhibition, was the new *Acalypha Sanderi*, with long drooping spikes of flowers like crimson-velvet ropes or a glorified *Love-lies-bleeding*. Other very striking things were *Geonoma pynaertiana*, almost like a *Stevensonia*; *Areca Ilse-manni*, with purple petioles; *Pandanus Sanderi*, with variegation running all over the leaves, and not confined to the margin; *Licuala Jeananceyi*, after the style of *L. borrida*, but having smaller and less formidable spines; and the beautifully variegated *Dracaena Broomfieldi*. The scolloped leaves of *Alocasia wavrineana* are dark green and very singular in appearance. There is a considerable amount of grace in *Calamus Albertii*, and *C. Caroli*, having long, arching, pinnate leaves. *Aralia balfouriana* has trifoliate, variegated leaves, in the style of *A. Guilfoylei*, but having broader segments. *Pan-*

danus Sanderi is bound to become popular on account of its abundant variegation and handsome appearance. *Panax mastersiana* has pinnate leaves curiously bifurcate at the apex. Huge specimens of *Dracaena godseffiana* and *D. sanderiana* were very fine indeed. *Anoectochilus Leopoldi*, in a case as imported, were in good condition after a four months' journey. The large leaves have a golden tracery. Very richly spotted was *Odontoglossum crispum Roi Leopold*. Fine plants of *Cocos weddeliana* had an olive-blue background, as in their native wilds.

Messrs. J. Veitch & Sons, Ltd., Royal Exotic Nursery, Chelsea, London, showed the largest exhibit of *Amaryllis* in the show, in a transept off the *Salle Primitive*. There was a great amount of colour in different named varieties, all arranged in a most effective and telling way. Splendid varieties are *King of the Belgians*, *Elatior*, *Petrina*, *Dorothea*, *Armoire*, *Evadine*, *Model*, *Cecilia*, *Surprise*, *Euphrasia*, *Parthenia*, *Owick*, *Callaby*, and the noble variety *Francisca*. On the opposite side of the pathway they had a fine display of insectivorous plants, chief amongst which were the *Nepenthes*. They had massive pitchers of *N. mixta*, *N. amesiana*, *N. dicksoniana*, *N. mastersiana*, *N. Wittei*, *N. Veitchii*, *N. bookeriana*, and various others on massive plants in pots and pans. Some tall *Cocos flexuosa* formed a background to the whole. In front were flowering specimens of *Sarracenia Stevensii*, *S. Drummondii*, *S. Popei x purpurea*, *S. Popei-Chelsoni*, *S. Chelsoni*, and others not in bloom. They also had a large pan of the rare *Heliampora nutans*, and a fine pan of *Cephalotus follicularis*. *Nepenthes sanguinea* is a rare, but handsome species. They received the highest award given, a bronze Work of Art.

The Jadoo Company, Ltd., Exeter, England, had an exhibit of plants grown in Jadoo fibre, showing that plants of a very varied character may be reared and accommodated by this substitute for soil. For instance, they had *Roses*, *Ferns*, *Lilies*, *Crotons*, *Araucarias*, *Pelargoniums*, *Ficus*, *Palms*, and other subjects. Here also were some photographs of houses in the nursery of Messrs. R. Veitch & Son, Exeter.

Messrs. Wm. Cutbush & Son, Highgate, London, N., had a beautiful group of *Malmaison Carnations*, in several varieties, and all remarkably dwarf. Other tree varieties were represented by a small group of *Winter Scarlet* (free and bright), *King Arthur*, *Waterwitch*, and several others of recent introduction. They also had a fine lot of *Richardia elliottiana*.

MM. L. & G. Duriez, frères, Wondelgem, Ghent, had an exhibit of large *Palms*, *Pandanus*, *Araucaria*, *Ferns*, *Calatheas*, &c., in the Casino.

Messrs. H. Cannell & Sons, Swanley, Kent, had a fine exhibit of *Pelargoniums* in large, imposing bunches of cut flowers, numerous first-class varieties being represented. They also had some fine plants of crimson *Polyanthuses*, and blue *Primroses*.

A very extensive collection of plants was exhibited on the bridge over the ornamental water in the Casino, by M. Lucien Linden, *L'Horticulture Internationale*, Parc Leopold, Brussels, in memory of the late M. Jean Linden, who discovered and introduced about 1,200 Orchids, 250 *Palms*, and 3,000 other species of plants. Amongst others were good examples of *Haemanthus Lindenii*, *Maranta majestica minor*, *M. m. rubra*, *M. m. alba*, *Vriesia hieroglyphica*, *Tillandsia musaica*, *Furcroya Lindenii*, *Dieffenbachia Meleagris*, *Alocasia Putzeysi*, *Dracaena Lindenii*, *Cyanophyllum magnificum*, *Gunnera manicata*, *Dioon edule*, *Dracaena neo-caledonica*, *Caraguata cardinalis*, &c. The native countries of all these things were on the cards attached to the plants.

A small group of *Odontoglossum crispum* was staged by M. A. Van Beerlere, Mont-St.-Amand, Ghent.

MM. Koster & fils, Boskoop, Holland, received a Silver Medal for a group of *Azalea Anthony Koster* (*mollis x sinensis*), with large and very handsome apricot flowers.

Altogether, the Ghent Quinquennial Exhibition on this occasion was finer than it was five years ago.

SALLE PRIMITIVE.

ORCHIDS.—With the exception of the two fine groups in the Casino, the Orchids were mostly arranged on the central tables in the original hall for the show as above named. M. J. Moens secured the Silver-gilt Medal in case offered for the twenty-five best *Cypripediums* and *Selenipediums*. *C. Niobe*, *C.*

van imschootianum, C. Charles Madoux, C. harrisia-num violaceum, and C. Schroderae were noticeable hybrids.

For a similar collection, open to nurserymen, the Gold Medal was secured by M. Ed. Pynaert Van Geert, Ghent, who had five pieces of C. Exul, C. bellatulum album, C. lambertianum, C. mastersianum, C. Bartelli, &c.

In the amateurs' class for the most varied and meritorious collection of fifty exotic Orchids, the Gold Medal was taken by M. F. Panwels, of Antwerp. He had five pieces of Cattleya citrina, Odontoglossum Rossii majus grande, Miltonia Vandesvoordti, Dendrobium macrophyllum, &c.

The Gold Medal for the most numerous collection of species of Orchids was taken by M. A. Van Imschoot, Mont-St.-Amand, Ghent. He had a most varied collection of Odontoglossums, Dendrobiums, Miltonias, Masdevallias, Cochliodas, Cypripediums, &c., but mostly in small plants. M. Ch. Maron, Brunoy, Seine-et-Oise, France, secured the Silver-gilt Medal in case for a new hybrid Orchid, showing the beautiful Laeliocattleya Henry Greenwood, with a large purple lip and lemon throat. He also had the Silver-gilt Medal for the most beautiful Laelia, showing L. digbyana.

In the nurserymen's class for the most varied and meritorious thirty exotic Orchids, the Gold Medal was taken by M. L. de Smet Duvivier. The smaller Gold Medal went to M. H. Van der Straeten, of Bruges. The plants were all of moderate size.

For the most beautiful Oncidium a group of O. sarcodes was shown by M. L. P. de Langhe-Vervaene, taking the Silver-gilt Medal. M. L. de Smet Duvivier had the best Dendrobium in D. thysiflorum, taking the Silver Medal. He also took the Silver-gilt Medal for the three best flowered Orchids, showing Odontoglossum luteo-purpureum, Cymbidium lowianum superbum, &c.

W. Thompson, Esq., Walton Grange, Stone, England, took the Gold Medal (value 100 francs) by acclamation for the best collection of thirty Odontoglossums. He had grandly grown pieces of O. crispum Thompsoniae, O. crispum Annie, O. wilckeanum nobilior, O. luteo-purpureum amplissimum, O. l-p. miniatum, O. Roezlii alba, O. humeanum splendens, &c., in the pink of condition. He was second for the most beautiful Odontoglossum, showing a fine piece of O. Halli. The first prize in this case went to M. Metdepenningen, Ghent, who showed Odontoglossum Mme. Metdepenningen. The latter had the best O. crispum. He also took the Silver-gilt Medal in case for the best fifteen Odontoglossums in the amateurs' class. They were small, clean and healthy plants. M. Metdepenningen again led the way in the amateurs' class for the most beautiful collection of fifteen exotic Orchids, taking the large Silver Medal offered by the committee of the Williams Memorial Fund. He had large pieces of Oncidium sarcodes, Cymbidium lowianum, and Cypripedium lawrenceanum.

AMARYLLIS.—For the finest lot of seventy-five Amaryllis, the Work of Art was taken by Messrs. R. P. Ker & Sons, Liverpool, England. Mars, Lothair, Medusa, Imperial, Fairy Queen, Dido, and others were some of his finer varieties, in a most effective and meritorious display. He also secured the leading prize, a large Gold Medal, for forty Amaryllis, which were of the same character and quality as the previous ones. The smaller Gold Medal for forty went to MM. E. H. Krelage & Son, Haarlem, Holland; and M. F. D'Hooge de Loochristy, was third.

Messrs. R. P. Ker & Sons again came to the front for twelve Amaryllis, taking the Silver-gilt Medal in case. They also took the Silver-gilt Medals for six Amaryllis and for seedlings not before shown at the exhibitions of the society. The standard of merit in all these cases was very high.

In one of the wings of this building was the competition for plants grown by chemical manures, and others without feeding. The Gold Medal was taken by M. E. Truffant, of Versailles, France, who feeds his plants with doses of chemical manures in cartridges of twelve different kinds, each lasting four months.

The L. Van Houtte Society, Ltd., took the Silver Medal for Gloxinias in the nurserymen's class.

BULBS IN POTS.—The Work of Art for 150 Hyacinths in fifty varieties was taken by MM. Byvoet frères, Overveen, Holland. They were very fine considering that they were grown in 4½ in. pots. The Society L. Van Houtte, Ltd., was second; and

M. K. J. Kuyck, Hillegom, Holland, was third. In the class for 100 Hyacinths in 100 pots, the third exhibitor in the previous class was placed second, otherwise the awards were similar.

The Silver-gilt Medal for twenty-four pots of Polyanthus Narcissi was secured by M. K. J. Kuyck, who had five bulbs in each 24-size pot. The L. Van Houtte Society, Ltd., was second. MM. E. H. Krelage & Son, exhibited the most beautiful lot of fifty self-coloured Tulips, which were remarkable for the height of their stems and size of flower (Silver-gilt Medal in case).

The L. Van Houtte Society, Ltd., had the best fifty double Hyacinths, and the best fifty single sorts, taking Silver-gilt Medals in each case.

M. K. J. Kuyck took the Gold Medals for 300 single early Tulips and 300 early double varieties. The same exhibitor took the Gold Medal for 250 Hyacinths in twenty-five varieties grown in pans. They were very effective. He secured the Silver-gilt Medal in case for fifty pots of mixed Daffodils. The L. Van Houtte Society, Ltd., was second.

MISCELLANEOUS NEW PLANTS, &C., IN THE SALLE PRIMITIVE.

The large Silver Medal offered by the Committee of the Williams' Memorial Fund for twenty-five Cyclamen was taken by M. L. P. de Langhe-Vervaene, St. Gilles, Brussels, for his fine lot of C. latifolium Papillo with the finely crisped flowers. He also secured the Silver-gilt Medal in case for the finest fifty Cyclamen showing the same variety in many colours. The Silver-gilt Medal for twenty Gloxinias was taken by M. A. Van Laethem, Gendbrugge. He took a similar prize offered by Herr E. Benary, Erfurt, for thirty Gloxinias.

M. L. Duval, Versailles, France, took Silver-gilt Medals for a collection of fifteen Bromeliads; for three new hybrid Bromeliads; and the best Bromeliad not in commerce (showing Vriesia griesseniana). The Ghent Horticultural Society had the best Anthuriums with variegated flowers. They were of the A. rothschildianum type and very fine indeed. M. A. Peeters, Brussels, had the best seedling in Anthurium hybridum bruxellense.

M. A. Rigouts had the best collection of thirty Aroids, which were very well grown indeed, and also varied (Gold Medal). The L. Van Houtte Society, Ltd., took the smaller Gold Medal for a good lot. M. A. Rigouts took the lead for ten Marantas. The first prize for seedling plants not in commerce was taken by M. L. de Smet-Duvivier, who also was first for a new plant with double flowers, and for ten plants put in commerce since 1895. He also took Silver-gilt Medals for twelve and six Alocasias.

M. Ed. Pynaert-Van Geert took the Gold Medal for ten species of Anoectochilus and their allies, which were fine. M. E. Dallièr, Ledeburg, was second with another interesting lot.

M. C. Petrick, Ghent, took the Gold Medal for the best ten plants put into commerce since 1893. M. A. Rigouts was second.

In the amateurs' classes M. E. Fierens, secretary of the society, had the best forty single and twenty double Cinerarias. The Silver-gilt Medals for forty single and twenty double Cinerarias in the nurserymen's classes was taken by MM. Vilmorin Andrieux & Co., Paris.

ANNEXE MOBILE.

AZALEAS.—The finest display of all was undoubtedly that in this huge structure, on account of the bright hues of the flowers, and the quantity of them. For a collection of thirty large specimen Azaleas the leading award (a Work of Art) was taken by M. de Ghellinck, of Ghent, whose huge, dome-shaped specimens were well flowered and most gorgeous in appearance. Hooi-brencki, Reine de Pays-Bas, Modelle, Baron de Pret, Roi Leopold, and Marie Vervaene were some of his finer sorts. M. Ad. D'Haene, Gendbrugge, Ghent, was second, taking a Work of Art. The Comtesse de Kerchove de Denterghem also took a Work of Art for twenty large Azaleas, which were heavily bloomed.

In the nurserymen's class for twenty Azaleas, M. Ad. D'Haene took the lead (Work of Art). MM. Vervaene, frères, were second (Gold Medal). For a collection of sixty Azalea indica, of market size, the leading award (a Work of Art by MM. de Smet, in memory of M. Louis de Smet) was secured by the L. Van Houtte Society, Ltd. The Gold Medal was taken by M. Bottelberge, Melle. The smaller Gold Medal was taken by M. A. Van Acker, Loochristy. The Silver-gilt Medal in case as fourth prize was

taken by Messrs. F. Sander & Co., St. Albans and Bruges. This latter lot was really grand, and many thought they should have had the first prize, but they were plunged in moss. All these market plants had a most imposing effect, there being nine entries.

The Gold Medal for a collection of 100 varieties of Azalea indica was taken by M. Ad. d'Haene, with a grand lot of medium sized plants, occupying a large kidney-shaped bed. The L. Van Houtte Society, Ltd., was second, taking the smaller Gold Medal.

In the amateurs' class for a collection of twelve Azalea indica in good-sized samples, the Gold Medal was accorded to Mme. La Comtesse de Kerchove de Denterghem.

In a corresponding class for nurserymen, M. P. E. de Cock took the Gold Medal for a beautiful lot of medium size. MM. Vervaene frères were second with larger plants but smaller flowers.

In the nurserymen's class for twenty specimen Azalea indica the Work of Art was taken by M. Ad. d'Haene with dome-shaped specimens of considerable size. MM. Vervaene frères were second with a similarly fine lot, taking the Gold Medal. M. Jos. Vervaene was third (small Gold Medal.) The latter had the Gold Medal for twelve double Azalea indica. He also had the Gold Medal for twenty varieties of A. indica put into commerce since 1888; and the Work of Art offered by Herr R. Seidel, of the Laubegast Society, Saxony, for the best twelve new A. indica. M. P. E. de Cock was second (Gold Medal), but came to the front for the best A. indica with double flowers, not yet shown before the society, taking the Silver-gilt Medal for a seedling with large, regular, flat, rich red corollas, having a rosette in the centre. It was much admired by connoisseurs.

The Silver Medal for A. indica with double flowers, in a variety fixed by grafting, was taken by M. L. Eeckhaute, St.-Denis-Westrem, with Mdlle. Emma Eeckhaute, rose with silvery edges.

M. Ed. Pynaert-Van Geert took the Gold Medal for twenty large plants of Azalea mollis, which were very varied, handsome, and well-flowered. The Gold Medal for thirty plants of Azalea pontica was taken by the L. Van Houtte Society, Ltd. For a collection of twenty hybrid Azaleas (mollis × sinensis) the first prize was taken by MM. Koster & fils, Boskoop, Holland. M. J. Brack, Loochristy, was second. M. Ed. Pynaert-Van Geert came in third with a grand lot; and M. B. Spae was fourth.

For the finest lot of thirty standard Azalea mollis, the Gold Medal was taken by M. A. de Smet, with well-flowered specimens about 5 ft. high; M. B. Spae Coupure, Ghent, was second.

RHODODENDRONS.—The Work of Art for a collection of forty specimen Rhododendrons, was awarded to M. Ed. Pynaert van Geert, who had large and well-flowered bushes in tubs forming an imposing bank, and occupying a great amount of space. M. B. Fortie, Ghent, received the Gold Medal for twenty-five large Rhododendrons, which were well flowered. M. B. Spae took the Gold Medal for ten standard Rhododendrons; and was followed by M. F. Spae. M. Bernard Spae also came to the front for twenty-five standard Rhododendrons, taking the large Gold Medal; and M. F. Spae the small one.

NEW HOLLAND PLANTS, &C.—Her Majesty the Queen of the Belgians offered a Gold Medal for twenty-five specimen plants, and this was secured by the fine exhibit of M. Emile de Cock, Ghent, who had grand samples of Acacia armata, A. longifolia, A. grandis, A. cordata, Erica mediterranea, Azalea linearifolia, Cymbidium lowianum, &c.; M. E. Bedinghaus was second, taking another Gold Medal for a grand lot; and M. E. Collumbien Mirelbeke, Ghent, came in third, taking another Gold Medal for a very fine lot. He was first, however, for a collection of thirty plants in the nurserymen's class, showing a very fine lot of interesting things.

Citrus sinensis (Otaheite Orange) was well grown and heavily fruited. M. C. Vande, Wynckele, took the Silver-gilt Medal for twenty-five plants. M. E. Lossy, Mont-St.-Amand, was a good second (Silver Medal). A Work of Art was accorded to M. C. Vander, Haegen, Neve, for a collection of 100 standard Roses. He was first for the best lot of Maréchal Niel.

The Work of Art for a collection of thirty Camellias was taken by M. L. Eeckhaute, who had pyramidally trained specimens. The Gold Medal for a collection of fifteen greenhouse plants was taken by M.

E. Bedinghaus, who had the Gold Medal for ten Cape and New Holland plants. He also had the Gold Medal for fifteen greenhouse plants in large healthy specimens, his pyramidal *Acacia longifolia* being 10 ft. to 12 ft. high. M. A. de Clercq Van Ghyssem took the Gold Medal for fifteen *Ericas*. In the amateurs' classes for thirty and twenty Cape and New Holland plants, M. E. Bedinghaus again led the way with interesting collections. He also secured the Gold Medal for the best twelve plants in tubs for the summer garden, showing a huge *Doryanthes Palmeri* and other interesting subjects. Mme. la Comtesse de Kerchove de Denterghem took the Gold Medal for twenty Cape and New Holland plants in fine form.

The Gold Medal for twenty *Rhododendrons* of Java, and the Himalayas, or their hybrids, was taken by M. J. Baumann, Ghent, with a well-flowered and powerfully-scented lot, including *R. Edgworthii*, *R. fragrantissima*, *R. dalhousieanum*, *R. d. victoria-num*, *R. Aucklandi*, *R. asamicum*, *R. Gibsoni*, *R. formosum*, Countess of Sefton, and other fine greenhouse types.

M. Jules de Cock, Ledeborg, secured the Gold Medal for twenty Cape and New Holland plants. M. G. de Saegher, Ghent, was second, taking the Silver Gilt Medal in case.

Clivias were well grown and richly coloured; and the Gold Medal for twenty plants was taken by M. C. Ver-Meire, Gendbrugge; M. B. Fortie was a good second.

There was a large number of exhibits of Conifers and other hardy shrubs in the open air, as well as greenhouses, tools, machinery, &c. M. Fred. Burvenick père, Gendbrugge, Ghent, took Silver-gilt Medals for twenty dwarf and ten new Conifers, and a Gold Medal for forty Conifers.

Gleanings from the World of Science.

THE following subjects came before the Scientific Committee of the Royal Horticultural Society on the 22nd ult. :—

Orchid Roots with Fungus.—With reference to the nature of the fungus attacking Orchid roots in a damp atmosphere, referred to at the last meeting, Dr. W. G. Smith, of the Yorkshire College, Leeds, writes as follows:—"The Orchid aerial roots sent contained a fungus which lives on them and has killed some already. The absence of any form of reproductive organs renders it impossible to identify the parasite. Other portions of the diseased plants (*i.e.*, leaves) would be required to ascertain the true nature of the fungus. The fungus present attacks living cells, consumes the food laid up by the plants, and finally kills the roots. A disease having somewhat the same effects has been found in the *Vanilla* plants of Mauritius."

Palm Leaves Discoloured.—Mr. W. A. Holmes, F.R.H.S., of the Putney Nurseries, sent some portions of Palm leaves with numerous translucent spots. They were received from the Continent. An examination appeared to indicate a previous attack by insect grubs, but none were present, the interior tissue having disappeared from the spots; so that the new leaves would probably be quite healthy.

Vine-Browning.—Mr. Hudson showed a young shoot, the leaves of which were blistered and brown. This is due to the presence of the well-known myxomycetous fungus, *Plasmodiophora Vitis*, allied to *P. Brassicae*, the "slime fungus," which gives rise to "club-disease," or "finger and toe," in cultivated cruciferous plants. The only remedy is to cut away and burn all affected leaves or shoots. It is described and figured in Viala's *Maladies de la Vigne*, p. 400.

Ivy Sports.—Dr. Masters exhibited sprays of a peculiar small-leaved dwarf Ivy, remarkable for sending up vertical shoots with distichous leaves, though unattached to a wall. The habit appears to have become fixed, even in free-growing branches. On some shoots, however, the leaves were spirally arranged, as is usual on such branches. It may be observed that the change from the distichous arrangement of the leaves on the horizontal branches of the common Laurel to a spiral one, when the boughs grow erect is common; but it is not a fixed character.

WAKE UP! YOUNG GARDENERS.

I HAVE before me the programme of a flourishing Gardeners' Mutual Improvement Society, issued last October. Amongst the various prizes offered for exhibits, essays, &c., the said prizes being generously placed at the disposal of the committee by various local gentlemen, who I know are actuated by a desire to further self-help and improvement amongst the younger members—I observe three prizes, books to the value of 15s., 10s. and 6s., first, second, and third respectively, for an essay on "A Visit to Kew Gardens" (to be competed for by undergraduates only).

I was present on the 5th inst., when the annual dinner and distribution of prizes took place, and was mortified to hear that although this said society numbers nearly 100 members, and includes many young men, not one attempted to obtain these prizes, although residing not more than an hour's walk from the finest botanic garden in the world, and given six months wherein to complete the task, not one entry being sent in to the secretary. This is not creditable to young men who aspire to any position in the profession, and who possess such advantages as a residence within a few miles of Kew and the R.H.S. Gardens at Chiswick, to say nothing of other historic establishments, such as those at Gunnersbury, afford. It may be that the prize of a 15s. book was not tempting enough for these young men. The single effort, without any prize, to describe a visit to Kew would repay anyone. The educational value of such an attempt to the essayist, is far greater than the intrinsic value of the book. And would any sensible young man, possessing any ambition, despise such a book as beneath his notice? I have before me four Jefferies' "Field and Hedgerow" (not a third of the value) gained as a prize when a younger member of the self-same society, which has given me many a half-hour of pleasure and delight, and is always refreshing. It does seem to me from observation during eight years' residence in this neighbourhood, so rich in its advantages and associations, that the young men simply ignore these golden opportunities of intellectual improvement, and only remember with regret when too late, when perhaps they have undertaken responsibilities and cares in other spheres, that their youth, which is the best time for learning, was so full of opportunities, not utilised, but thrown away.—A. P.

HOW A KNOWLEDGE OF BOTANY IS A HELP TO GARDENING.*

THIS subject is a most important one, a subject, in fact, far too large to be justly dealt with in a single essay. Botany has so much to teach us which is of great interest in gardening, that it cannot be otherwise, because through a knowledge of the science, we get an insight of the physiological principles upon which the practice of horticultural operations are founded.

A gardener is a physiologist in practical horticulture. It is the one and greatest aim of a gardener to bring plant life to its highest state of excellence; or if I may use a scientific phrase, to develop every organ of plant life to its highest condition. Now in order to do this, various are the means which he brings to bear upon it. In the first place it is the soil which occupies his attention, then come heat and moisture; in fact, all the conditions under which a plant is found naturally, he fulfils to the best of his ability. It often happens that by thoughtful care he so much improves the surroundings of these plants compared with those of their natural home, that he coaxes Nature as it were, and consequently there are greater developments of parts, higher perfection of flower and fruit. Then is not the gardener a true physiologist, though often unknowingly so?

I contend that if a knowledge of botany is a means by which we can better understand the nature of plants, it must be a help to gardening, and it is, therefore, advantageous for the gardener to understand it.

It is questioned by some whether a gardener should have a knowledge of botany at all. The objections raised by those people are, that it is possible for a gardener to become "too much of a naturalist," too great a lover of Nature, they assert;

* A paper read by Mr. R. Hodder, gardener to Mrs. Trevor Barolay, Ponsonby, Torquay, Devon, at a meeting of the Devon and Exeter Gardeners' Association.

that the gardener would see more beauty in plants before being improved by the skill of the hybridist than afterwards; that is to say, that to him a single flower would be more a thing of beauty than a double one.

Evidently, some people have the idea that double flowers and others, so much improved by cultivation, are altogether unnatural. Such is not my opinion. There is nothing unnatural in a plant as it grows, although there are at times abnormal developments. The powers which plants possess of developing the double from the single flower are the lawful possibilities of Nature, and are as natural as it is for the sun to shine.

Therefore, the improvements of plants by man (and they are many) represent no new powers added to Nature, but are the result of thoughtful and intelligent men grasping the possibilities in plant life.

There are no men to whom we are more indebted than to the hybridists, whether it be of fruit, vegetables, or flowers, in which they develop a new feature; we might say the world is benefited by their operations.

Though in all this, man is the instrument by which the changes are brought about, it is my contention that man adds no new possibilities to Nature, but he takes advantage of the powers already there.

Therefore, I maintain that horticulture or gardening is the perfecting of Nature, or the development of parts which in a wild state is often an impossibility. It is often the case with our choicest plants in their natural habitats, that they have to keep up a tremendous struggle for existence.

Let me give you one example which I think will prove beyond doubt what I have already asserted that "Gardening is the art which does mend Nature," and that is in the case of the *Gloxinia*. The *Gloxinia* has its parts divided into fives; but in its natural state without the aid of the cultivator four stamens only at first are to be found. The fifth one is in the form of a little projection at the bottom of the flower tube, waiting as it were for more favourable conditions, when it will readily spring to the top of the flower tube to make the fifth, which under proper cultivation it always does.

Then this art must be simply the helping of Nature to attain to its highest state of perfection from our point of view. This art was that which formed the occupation of our first parents, and it is an art that will engage the attention of man to the last.

Well, then you ask what has botany to offer? Wherein is it a help to gardening? In the first place it teaches us about the structure of plants; secondly, the functions performed by living plants; thirdly, the systematic arrangement of plants in their sub-kingdoms, classes, orders, etc.

Before we go on to the examination of their structure, it is well for us that we should understand something of the characters by which plants are divided into sub-kingdoms and classes. We are all aware that the vegetable kingdom is divided into two sub-kingdoms, namely—flowering and flowerless plants. The former are called *Phanerogams*, the latter *Cryptogams*.

Again, flowering plants are divided into two great classes known as *Dicotyledons* and *Monocotyledons*. The first are plants which germinate with two seed leaves, as the term implies, while the second has only one, hence the term, the first part of it being derived from *monos*, one. The characters of these two classes we must keep clearly before us, as we shall see other distinctions as we go on.

(To be continued.)

GREENHOUSE RHODODENDRONS AT EDINBURGH.

A GROUP of eight varieties of hybrid Greenhouse *Rhododendrons* was exhibited by Mr. McMillan, Trinity Cottage, Edinburgh, at the recent spring show of the Royal Caledonian Horticultural Society, and two of them were awarded First-class Certificates. I asked him a few particulars concerning their parentage, and other matters.

"The pure white one is a cross between *R. veitchianum* and a large white-flowered seedling from Lady Alice Fitzwilliam, the former being the seed parent. The other with the blotch is from the reverse cross of the same parents. Mother Nature

must have given the blotch, as this variety is quite distinct from both parents."

"I understand you have been raising seedlings for the last ten years. How many plants do you grow?"

"Three hundred."

"Is that all you have raised in ten years?"

"Oh, no. I had at one time 800, but I was obliged to part with 500, as I had no room to flower them all."

"Were you not afraid, when giving so many away that you might be parting with some of your very best?"

"That is so; and it cost me some anxious thoughts on the subject. But I have two angels that sometimes pay me a visit when I am in a difficulty. The one I call Miss Head, and the other Miss Heart. Miss Head, as usual, paid me the first visit one night when I had been thinking what would become of my 500 seedlings, and gave me her advice in this way:—'You will act very foolishly if you give away so many of those young plants that have cost you years of thought and careful nursing; for some may get them that will grow and show them as their own raising. Take my advice and burn what you can't grow yourself.' Well, I knew that this was good, sensible, worldly advice; but I also knew that Miss Heart would have a say in the matter, and I was not mistaken.

"Early next morning, when the first rays of the rising sun had tipped the hills with its golden glory, who should come tripping in but Miss Heart, so fresh and beautiful, bringing with her from the hills, where she had landed, the smell of the mountain Pine on her Macmillan tartan wings, and the perfume of the Heather on her fairylike feet. So after 'dichting' her feet on the mat, she says, 'Sandy, am ashamed o' ye.' I may tell you that this good angel of mine, when she wants to give me a bit of her mind, speaks braid Scotch, has a tongue, and can use it to some purpose.

"'Am ashamed o' ye. Dinna think but I ken a' yer wicked thochts. Would you gang and rost a' they bonnie wee innocent plants that ye brocht into the world? Oh, man, hae ye nae herrt? Let them live; if ye canna bring them up yoursel, let some ither bodie hae them, so that if they dinna live to flower and smile on you they may gladden the heart o' some ither fair garner.'

"So this curtain lecture saved the innocents from the fiery furnace, and the first work that I did that morning was to pack up a lot and take them to the Botanic Gardens. Another lot went off next day to Mr. Dewar, of the Glasgow Botanic. Then I divided the others among nurserymen and gardeners in private places.

"I am rather disappointed with the Countess of Haddington's seedlings; of course, I have a good many of them to bloom yet, but any that have bloomed are not so good as the Countess. I have been always obliged to make the Countess the seed bearer, as I could never get pollen from my plants. I have sixteen different crosses in pots of various sizes and ages. My seventeenth cross was sown the other day, so that it will be eight years before the seedlings from it flower. Some do flower in less time, and others take longer, but seven years is about the average."

"That is a long time to wait?"

"Yes; but Jacob served seven years (fourteen—ED.) for Rachel, and what true gardener would grudge to serve seven years for a beautiful Countess of Haddington, or a sweet Lady Fitzwilliam."—*Viator*.

GARDENING MISCELLANY.

ROMNEYA COULTERI.

THE members of the Natural Order Papaveraceae have many of them very showy flowers, and of this characteristic *Romneya Coulteri* has a full share. It is a tall, branching herbaceous perennial with large white flowers, and very handsome pinnatifid leaves. It is not so much grown in English gardens as it would be were it better fitted to withstand the influence of the cold. Even ordinary winters try it severely, and it is only in the more favoured localities of our islands, such as in southern Devon, and Cornwall that it does really well. As a greenhouse plant it is worthy of attention, as it takes fairly well to pot culture. A capital illustration of it appears in the current issue of the *Tijdschrift voor Tuinbouw*.

CHLOROPHYTUM ELATUM VARIEGATUM.

THIS is better known as *Anthericum variegatum*, and was heralded forth as a rival plant to *Pandanus Veitchii*. Well, certainly, in this respect, it has disappointed not a few; and, again, many were led to believe it to be a hardy plant, and in consequence a large number of plants were lost. An ordinary frame is not sufficient protection during a winter of moderate severity. I have had it succumb to five degrees of frost. Having seen, during the last few seasons, batches of well grown plants in a small nursery, has revived my interest in it, for well grown plants under artificial light may easily, at a short distance, be mistaken for *P. Veitchii*. I think it well worth the attention of those who have not the command of heat required by the *Pandanus*, and think an appropriate common name for it would be the Poor Man's *Pandanus*, although of course it has a very remote botanical affinity to that genus of plants.—*W. B. G.*

THE EVERGREEN SEDUM AS A BEDDING PLANT.

SOME time back I recommended covering beds with the evergreen *Sedum*, a bit of which I enclose, [*Sedum Anacampseros*,—ED.] and dotting bulbs singly about it. I have now carried this out on a large raised bed at Oakwood, using bulbs having blue flowers such as *Chionodoxa gigantea*, *C. Lucillae*, *C. sardensis*, and different *Muscari*. This has been much admired and is, I think, worthy of note. I propose trying another *Sedum* bed with the best of the smaller and lower growing species of *Narcissus*. Another quite different bed is now in beauty—a tree of Weeping Cherry (*Cerasus pendula*) now in full bloom had thickly planted under it Primroses of many different colours, and the effect of the flowers above and below is, I think, good.—*George F. Wilson, Heatherbank, Weybridge Heath.*

READING AND DISTRICT GARDENERS.

ONE of the most interesting and successful meetings in the annals of the Reading and District Gardeners' Mutual Improvement Association was that held on Monday last, when the prizes offered by Mr. Leonard Sutton at the commencement of the season 1898, for the best essays on "How to keep the Greenhouse gay from October 1st to March 31st," and "How to crop the Vegetable Garden to ensure the best varieties of Vegetables from October 1st to March 31st," were awarded to the successful competitors. The interest taken in the competition was greater than anticipated, thirteen members sending in papers, and it was not a matter of surprise that a good gathering of members assembled on Monday evening last to learn the result, and to hear the prizewinning papers read by their writers. After the formal business had been transacted, Mr. C. B. Stevens announced the awards as follows:—"How to keep a Greenhouse gay."

1st (£1 11s. 6d.), Mr. A. W. Blake, Foreman, The Gardens, East Thorpe, Reading; 2nd (£1 1s.), Mr. G. Stanton, The Gardens, Park Place, Henley-on-Thames; 3rd (10s. 6d.), Mr. John Botley, Foreman, The Gardens, Warfield Hall, Bracknell.

"How to crop the Vegetable Garden:—1st (£1 11s. 6d.), Mr. E. Trollope, The Gardens, Coombe Lodge, Whitechurch; 2nd (£1 1s.), Mr. H. Wilson, The Gardens, Lower Redlands, Reading; 3rd (10s. 6d.), Mr. G. Hinton, The Gardens, Sherwood Lodge, Reading.

The judges were Mr. James Hudson, Gunnersbury Park, and Mr. Edwin Beckett, Aldenham House, Elstree.

Mr. Leonard Sutton, in presenting the prizes, said that he considered the subject of essay writing was one of the most useful and beneficial to the members that the society could take up, for it encouraged the putting of one's ideas on paper and at the present time it was those gardeners that could go to their employers with well thought out ideas that would prove successful, and it would also be of the utmost value to the young gardeners who entered these competitions, for they would reap the benefit of their study and research in after life. The president then called upon the various winners to read their papers and although of course all were on the same subject yet they were treated from different standpoints, thus creating great interest amongst the members present.

A hearty vote of thanks was passed to Mr. Leonard Sutton for his kindness in giving the prizes and also to the members for reading their papers.

Owing to the success of the venture and the statement by the writers of the assistance they had received, from an educational point of view, in writing their papers, the association had decided to take up this interesting subject as a part of their programme for season 1898-99, and a vote was passed that a sum not exceeding £8 should be devoted for this purpose, but that the competition should be divided into various grades, thus giving all members an equal chance to compete.

Cut flowers were staged by Mr. Woolford, The Gardens, East Thorpe, including two good forms of *Odontoglossum crispum*, two fine types of *Cattleya lawrenceana*, spikes of *Amaryllis Empress of India*, and spathes of *Anthurium scherzerianum Wardii*; also flowering spikes of *Prunus sinensis flore pleno* by Mr. Swansborough, Warfield Hall Gardens, whilst vegetables were shown by Mr. Stone and Mr. Hinton, including some nice heads of Sutton's April Cabbage.

QUESTIONS AND ANSWERS.

"* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Chrysanthemums.—*E. Bebbington*: Your question is a somewhat lengthy one, and your collection of 'Mums must be proportionately large. The following varieties need not be stopped at all, but allowed to grow on naturally and the second crown bud taken. These will be produced in time to form flowers for your show on November 12th:—*J. W. McHattie, Ma Perfection, J. Cornford, Mrs. Hermann Kloss, Edith Tabor, Mrs. D. Dewar, Commandant Blusset, General Roberts, J. Shrimpton, Western King, Mathew Hodgson, Royal Sovereign, Walter Owen, Boule d'Or, (Calvat's), Phoebus, J. Fulford, H. J. Cutbush, G. Brockman, Mrs. Dr. Ward, Helen Owen, and Mutual Friend.* Exmouth Yellow is a very early variety, and thus second crowns would only be of use if the plants were late, otherwise you must take the terminals if you want it in November. The same may be said of *Emily Silsbury, Phoebus, Mutual Friend, and Edith Tabor* come well on any bud, but second crowns will suit your time best. *Mrs. C. Blick* may be stopped early in March and the first crown bud taken. *Duchess of Fife, and C. W. Richardson* should be stopped at the same time and the second crown bud secured. *G. Seward* may be allowed to grow without stopping and the first crown bud taken, or it should be stopped at the end of March and the second crown bud looked after. *C. B. Whitnall, Directeur Tisserand, Mrs. G. Gover, Bonnie Dundee, and Major Bonnafon* should be pinched about the same time. *Milano, Pride of Madford, Lady Ridgway, Mrs. C. Keyser, Niveus, and Yellow Madame Carnot* should be stopped some time during the first week in April. In both these groups the second crown bud should be secured. *M. Gruyer* requires to be stopped about the middle of April, and the first crown bud taken. All these varieties will do under fairly generous treatment, excepting *Mrs. Dr. Ward*, which needs rather high feeding, and *Australian Gold*, which it is dangerous to feed too strongly.

Names of Plants.—*Enquirev*: 1, *Euonymus japonicus albo-marginatus*; 2, *Euonymus japonicus latifolius-albus*; 3, *Kerria japonica flore pleno*; 4, *Picea orientalis*; 5, *Thujaopsis dolobrata variegata*; 6, *Phillyrea latifolia*; 7, *Cornus stolonifera*; 8, *Buddleia globosa*.

Communications Received.—*J. McLennan*.—*N. B. R. C. H. S.*—*L. Lubbers*.—*George Allen*.—*S. A. Senell*.—*Geo. James*.—*R. L.*—*T. T.*—*Saynor*.—*Gardener*.—*P. T. O.*—*Mentor*.—*Acalypha*.

TRADE CATALOGUE RECEIVED.

H. CANNELL & SONS, Swanley, Kent—Catalogue of sixty bedding designs.

DAHLIAS.

H. CANNELL & SONS,

Sole introducers of the Cactus and single varieties, beg to assure all admirers of this family that they have for twenty-five years been awarded highest honours for the best general collection, and that their stock of 40,000 in 600 varieties is the completest and best kept in England, and give the greatest satisfaction from one end of the World to the other. As a proof append the following.

G. HERBERT HASZARD, ESQ.,
CHARLOTTETOWN,
PRINCE EDWARD ISLAND,
NORTH AMERICA.

MARCH 31st, 1898.

"I wish to thank you for Dahlias. I got some from four different places in England which more or less failed. Whereas all yours are fine plants."

Send for illustrated catalogue, free to coming customers.

SWANLEY, KENT.

Caladiums

FINEST COLLECTION in the World. We make a speciality of GALADIDIUMS. Gold Medals Manchester & Leicester. Silver Cup, R.H.S., &c.

Satisfaction guaranteed. JOHN PEED AND SONS, West Norwood, London.

ORCHIDS.

Clean Healthy Plants at Low Prices.

Always worth a visit of inspection. Kindly send for Catalogue.

JAMES CYPHER,
Exotic Nurseries, CHELTENHAM.

1898. **FORBES' CATALOGUE** 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

JOHN FORBES,

ESTABLISHED 1870.

Nurseryman, Hawick, Scotland.

JADOO FIBRE.

WONDERFUL SUCCESS.

At a great Horticultural Exhibition recently held in New Orleans, plants grown in Jadoo were awarded

20 FIRST PRIZES and 2 SECONDS.

ADVANTAGES OF GROWING PLANTS & SEEDS IN JADOO.

Seeds germinate much more quickly in Jadoo than in earth.

Greater perfection easily attained.

Suits all kinds of plants.

Is much lighter than earth.

Less frequent watering is required.

The flowers are larger, of richer colour, and last longer.

No soil to mix: No manures required.

Ghent Exhibition, 1898. The two principal prizes of the show (including Gold Medal), were gained by plants grown in Jadoo, by Messrs. Byrvet, Bros., Haarlem.

PRICES:—3/6 per bushel. 8/- per 3-bushel sack. Special prices for large quantities.

Testimonials and full directions for use post free.

Obtainable through any Nurseryman, or from—

JADOO, Limited, EXETER.

BOUGAINVILLEA CYPHERII.

Grand new plant, largest and best coloured Bougainvillea ever offered, a splendid grower and remarkably free bloomer. Awarded First Class Certificate at the Wolverhampton Floral Fete, 1896, and also at the Oxford Commemorative Show, 1896, and also the Gold Medal at Shrewsbury Great Royal Commemorative Show, 1897, for the best new plant in the exhibition.

JAMES CYPHER has great pleasure in offering this grand novelty. Plants ready end of May, price 10/6 each.

Exotic Nurseries, CHELTENHAM.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, APRIL 30th, 1898.

ROYAL GARDENERS' ORPHAN FUND.—

Amongst the names of those who attended the great annual gathering of this charity, we notice many who were present at the Ghent Quinquennial Show, yet made a point of returning in time to show their loyalty to the interests of a good cause. Notwithstanding the fidelity displayed by the staunch supporters of the Fund, we note a falling away in the amount collected at the annual festival. No doubt several causes have conduced to this result, and we do not anticipate that this deficiency will be anything more than temporary. While such a conclusion is entertained, the supporters of this excellent charity should relax no effort to maintain its vigour and effectiveness in dealing with the distressed orphans of gardeners, who may have been worsted in the battle of life through no fault of their own. But while efforts are made by this and the other gardening charity to induce the great body of gardeners to contribute to the support of the same, it must not be forgotten that this industrious body of men are often sorely taxed to maintain themselves and families in the early and middle portions of their life, in a manner befitting their social surroundings. While this is undeniably true, it is germane to the subject to recall the suggestion of N. N. Sherwood, Esq., at the dinner, that the children of noblemen and gentlemen, who have large estates, should be invited and encouraged to save money and initiate special funds for the benefit of the orphan children of gardeners. There are, doubtless, many owners of gardens endowed with sufficient philanthropy not only to encourage their children in works of benevolence and charity, but to lend a helping hand themselves by contributing to the special funds started by the younger members of their families. We think that if a few influential employers of gardeners were to set the example, it would be copied and adopted by a considerable number of them in various parts of the country in the course of a few years. The lady members of the family would generally have most leisure for this sort of thing, and the charitably disposed could not but find it a congenial occupation. The knowledge that they would be helping the less fortunate of their servants, could not but act as an incentive to strengthen and support their endeavours.

DEPTH TO WHICH PLANTS PENETRATE THE SOIL.—At first consideration many gardeners would regard this as a purely scientific subject, and beyond their sphere of action. Nevertheless, it applies and appeals to every cultivator of the soil on a small as on a large scale. The subject is dealt with by Prof. F. W. Oliver in a paper which appears in Vol. xxi, part 3 of the *Journal of the Royal Horticultural Society* just to hand. He commences his subject by referring to the subterranean rhizomes, bulbs, and tubers of plants, which have each their peculiar depth to which they penetrate the soil. This has a bearing upon the subject, but the roots are the more important organs to consider, seeing that they are the collectors of plant food in the soil, and that the depth to which they penetrate the latter has a direct bearing upon the cultivator's art. The subject, therefore, is of primary importance to gardeners, and they cannot too early in life give it their most serious consideration. In a state of nature germinating seedlings usually commence at or near the surface, but many of them in the course of a few years make a strong effort to bury their crowns at varying depths in the soil. Many seeds, by accident or otherwise, get deeply buried by soil or fallen leaves, and if naturally provided with the means raise their crowns through the superincumbent matter till they reach the surface. Large seeds come into this category rather than small ones. Professor Oliver speaks of the root-shortening which is peculiar to and more or less conspicuous in certain plants, but while that is the case we are fully convinced that such roots as Carrots, Parsnips, and Beet are often shortened through force of circumstances, that is, by their inability to penetrate the soil beyond a certain depth, owing to its hardness, dryness, and improperly prepared condition generally. These tap roots often, indeed, throw themselves partly out of the soil, so that the exposed parts soon become unfit for human food, and thereby represent so much wasted matter.

The tuber of *Arum maculatum* (Lords and Ladies) is taken as a type of what results in this particular case by some of the roots being contractile while others do not possess this faculty. The miniature tuber has its apex erect the first year although by the action of the cotyledon it has been buried to a certain depth in the soil. During the second year the contractile roots have the effect of dragging the apex of the tuber on one side, and this action goes on till the tuber has its apex growing more or less perpendicularly down into the soil. This continues till the tuber has reached its normal depth in the soil, after which it penetrates the same horizontally. This depth varies according to the species, but we find it in Tulips, Colchicum, Crocuses, Gladioli, and various other subjects. These may be regarded as subjects which bury their buds or crowns at a certain depth in order to protect them against various casualties to which they are subjected in their natural habits, the roots penetrating to a still greater depth, become more or less exempt from the incidents and effects of a dry soil and droughty season.

Except where the gardeners engaged in the raising of seedlings, the above facts are more or less of purely scientific interest to the gardener, because the bulbs, corms and tubers find, of their own accord, the normal depths at which they can carry on their functions to the best advantage. Turning to root crops such as Carrots, Beet and Parsnips no one knows the advantage of assisting Nature better than those gardeners who grow vegetables for exhibition purposes. Unless the ground is

trenched and broken up to a certain depth the roots, or at least the usable portions of them, will be very short and comparatively worthless. Besides depth of root run, the fineness of the soil must also be considered, otherwise the roots will lack evenness of surface. If the slender, primary root has to penetrate between stones and hard lumps of soil, it then proceeds to thicken in that position, resulting in a twisted, crooked or even forked tap-root. Deep and fine soil enables shapely roots to be obtained, while it also permits the roots to forage more freely in quest of the necessary ingredients of plant food. This is one of the chief reasons why deep rooting subjects are able to produce heavy crops on land which has become, more or less, exhausted temporarily by the growth of shallower rooting subjects. Various observers and experimenters have noted that certain plants penetrate the soil to a much greater depth than they had suspected. It becomes the gardener, therefore, to study the necessity of trenching and otherwise preparing garden ground, so that the best possible results may be obtained from any given crop.

Wren's Nest on a Brussels Sprout.—A curious instance of birds building their nests in strange places is to be seen in the garden of Miss Humberston at Newton Hall, Chester, where a wren has built its nest on the stem of a Brussels Sprout.

A Royal Gardener.—According to the *Samoa Weekly Herald*, King Malietoa has been severely indisposed of late, and is seeking relief and rest in his palace at Alaca, which is situated in the middle of the bush. At this place his black skinned majesty is starting a Taro patch and Banana plantation.

Testing American Bulbs.—Mr. Andrew V. D. Snyder, of Ridgewood, N.J., U.S.A., has tested American grown Narcissus, the bulbs of which were grown in North Carolina, with imported European bulbs, and finds that the American bulb makes less growth and bears smaller flowers than the European article.

An Improved Step-ladder.—American ingenuity has produced an improved form of step-ladder for the use of the fruit grower when gathering in his crops. The contrivance is supplied with wheels, and by means of the pair of handles affixed can be wheeled from place to place like an ordinary wheelbarrow. A shelf for carrying baskets of fruit is placed between the steps at the front, and the supports at the back, thus serving the double purpose of steadying the ladder instead of the cords used in the ordinary make, and of accommodating the fruit gathered. The "ladder" is capable of being folded up and packed away into small compass when not in use. Whether it will find favour with the British fruit gatherer must depend, however, upon whether it is a too elaborate affair or not, and also upon its price. If these two points are satisfactory it may prove of service.

Agricultural Rates Act.—Smith and others v. Richmond. The Court of Appeal, reversing the judgments of the Courts below, has held that glass-houses are not to have the benefit of the relief given by the Agricultural Rates Act, 1896, to market gardens and nursery grounds. Having regard to the importance of the question to growers, my association has determined to carry it to the House of Lords, if we can secure the support of the trade generally. We have many calls on our funds, and, as it is felt that the serious expense involved in proceedings of such widespread interest should not be wholly thrown on the subscriptions of our members, growers throughout the country are invited to inform our treasurer, Mr. George Monro, by letter addressed on or before the 30th inst. to the offices of the association, 32, King Street, Covent Garden, London, W.C., what financial support they are under the circumstances prepared to afford the association.—*William Poupart, President of the Market Gardeners, Nurserymen and Farmers' Association.*

Powdered Rice is said to be very effective in stopping the bleeding of cuts and bruises.

The Doom Palm.—The Doom or Dom Palm grows plentifully on the banks of the Atbara in the Soudan, and the Fellaheen and Soudanese soldiers in the Anglo-Egyptian army which has been heard of so much of late find some amusement in shying at the clusters of fruit as they hang. The pulp surrounding the stone tastes like ginger bread.

The Cooking of Fruits.—Such fruits as Apricots, Peaches, and Pears have to be subjected for fully a week to the influence of the sun's rays before they are sufficiently dried, and this in California where the sun's rays are much better than here. In cooking these dried fruits, therefore, it is manifest that a large quantity of moisture has to be returned to them before they can possibly be anything like what they were when taken from the trees. Instead of cooking them at once, therefore, or with only two or three hours' soaking, as is too often given, they should be allowed to soak in water for from twenty-six to thirty hours. The bulk will not only be increased thereby, but the flavour and delicacy of the fruit will be incomparably finer.

A Plant for Dry Banks.—Seeing that there is so much discussion about plants suitable for covering bare spaces under trees, it may be germane to the subject to recall to mind a plant that was much in vogue, for covering dry banks where few other things except succulents would grow, about a quarter of a century ago. The plant is *Chrysanthemum* or *Pyrethrum Tchihatchewi*, a Composite of dwarf, creeping habit, with finely divided dark green leaves, forming a rich carpet of green over the dry ground. The white heads, not unlike those of a small Oxeye Daisy, are very abundantly produced in May and June, and may be allowed to remain upon the plant or cut off to bring the dark green carpet into prominence. It may be propagated to any extent by division, cuttings, and seed.

Important Sale of Books of Natural History.—The library of M. De M. G. Dumont, a member of several learned societies, is to be put up for auction on the 9th, 10th and 11th May, next, at 8 p.m., in the Salle Silvestre, 28, Rue des Bon-Enfants, Paris, by the Minister of Me. Maurice Couturier assisted by MM. J. B. Baillié and Fils, experts. Some idea of the importance of the collection may be gleaned from the fact that 1,007 books are catalogued to be sold. They embrace physical and chemical science, and natural science, such as geology, mineralogy, paleontology, botany, zoology, medical science and literature. The bulk of the books are by French authors, and written in French, but there are books in fair numbers by English authors, such as J. S. Bowerbank, Esq., Sir John Lubbock, Sir Joseph D. Hooker, Charles C. Babington, Esq., and others. There are also the journals of some London scientific societies. Some of the works of British authors seem to be translated into the French language. Germany is represented by Reichenbach, the great authority on Orchids, and others. Many of the books are valuable scientific works.

Pellaea atropurpurea in cultivation.—In the April number of the *Fern Bulletin*, a quarterly edited by Mr. Willard N. Clute, Binghamton, New York, U.S.A., is an interesting article on the cultivation of this interesting dwarf Fern. Plants were found in abundance in the seams of masonry of a railway bridge, and having been picked out by an iron tool were transferred to the Dolobran Wild Garden, on the estate of C. A. Griscom, Esq., Haverford, Pennsylvania. To establish these plants in the crevices of rock walls in a garden consisting of two old building-stone quarries transformed into model gardens for native plants, must have been no small feat to accomplish on the part of the cultivator. Usually *Pellaea atropurpurea* is confined to rocks of the limestone formation. The stone in these old quarries consists chiefly of mica schist, without lime. The compost in which the Ferns were planted consisted of mica schist and wood-soil, and the experiment has been very successful. When picked out of the crevices of the railway bridge the fronds were only 2 in. to 3 in. in height, now they are 8 in. to 10 in. Fern growers in Britain might try the experiment with *Asplenium Ruta-muraria* and several other of the smaller growing species.

The Weed.—Darwin at the age of seventy-three said that a cigarette gave him more rest after a hard day's work than anything else.

Blechnum spicant, a common British Fern, is said by the *Fern Bulletin* to grow nearer to the North Pole than any other known species. In the United States it is known as the Deer Fern from the fact that reindeer eat it.

Hibiscus syriacus and its varieties have for some time been known as very handsome flowering shrubs that are particularly valuable, in that they bloom in July and August when there is a dearth of hardy trees and shrubs in flower. Until last year, however, no award had been made them by the Royal Horticultural Society, and it thus fell to the two fine forms *H. s. coelestis*, and *H. s. Painted Lady* to be the first to obtain this distinction. Awards of Merit were granted to both of these plants on the 27th of July last.

Black Rot of the Cabbage.—A bulletin, written by Professor Erwin F. Smith, has been sent out by the United States Agricultural Department. Some of the rules for prevention are "to plant seed on land where the disease has never appeared; to set plants on land that has not been under crops of cruciferous plants for some time; to avoid the use of stable manure, and as far as possible make use of commercial fertilisers; not to turn animals into diseased fields and then allow them to wander over other parts of the farm; to keep up a warfare against insects; to remove and burn all badly-affected plants as they appear; and to destroy weeds systematically." All of these measures commend themselves to the common prudence of the gardener and farmer, with perhaps the exception of the prohibition of the use of stable manure, which, to say the least of it, would be difficult to carry out.

Apple Calvill Grossherzog Friedrich von Baden.—Half a dozen names, or rather that number of words in a name, are surely sufficient for any variety of Apple, whatever its value may be. For general use in this country the translation, namely, Grand Duke Frederick of Baden, might be more acceptable than the original. It was raised by Herr G. H. Fiesser, court-gardener at Baden-Baden. The fruit in form is similar to the White Winter Calville, and of very large size, being about 12 in. in circumference, 3½ in. wide, and 3 in. to 3½ in. high. The skin is yellow, but in the mature state shining orange-yellow, and on the sunny side flushed with a red-brown tincture. The flesh is yellowish-white, of a sweet fine, agreeable flavour, and very fine quality. The period of maturity is from October to December, during which time it is fit for table. A figure of the whole fruit, as well as a section, and the portrait of the raiser are given in *Möller's Deutsche Gartener Zeitung* for the 2nd inst.

Technical Education in Essex.—The technical education committee of the Essex County Council has arranged a new system of testing the horticultural capabilities of the rising generation of the county. Pioneer courses of two days' instruction in horticulture are being given at various sub-centres, of which that in the Church Room at Epping delivered on the 20th and 21st inst., may be taken as an example. The subject was the science and practice of the propagation of plants; and the instruction was imparted by means of lectures, demonstrations, and practical work. The day classes are primarily intended for youths between the ages of fourteen and twenty-five; and in the event of the applications being in excess of the accommodation provided, preference is given to applicants engaged in horticultural pursuits or intending to be. No charge is made either for instruction, or the use of microscopes, tools, &c., required by the student. Anyone interested in gardening is allowed to attend the evening lectures, which the public is invited to attend. Discussion at the evening lectures is also invited. On the first day at Epping the subject was upon the propagation of plants by seeds and cuttings, and other matters pertaining thereto. On the second day propagation by buds and grafts was taken in hand, the students during the day doing practical work and hearing lectures. During the evenings of both days two lectures were delivered, one commencing at 7.30 p.m. and the other at 8 p.m. The lecturers were Mr. David Houston, F.L.S., and Mr. Wakely, the latter taking the practical side of horticulture.

Korean Paper is considered superior to that of China or Japan, and is used in both those countries as a substitute for glass, also for roofing and umbrella covers.

Lily bulbs and Beefsteak.—From the western "States" comes the story of a man who had been sent a free lot of government seeds and bulbs, but whose wife promptly consigned the bulbs to the frying pan in company with a tender bit of steak. The acknowledgment stated that the "Onions" were excellent.

Syringa Senateur Volland.—In this we have one of the handsomest of the many double-flowered Lilacs which have been raised by the celebrated nurseryman M. Lemoine, of Nancy, France. The flowers in this case are of good size, and rich purple when first expanded, but shading to lilac in the later stages. The trusses, too, are exceptionally large and heavy. The variety received an Award of Merit last year from the Royal Horticultural Society.

A Chrysanthemum Controversy.—The awards made in the Jubilee Championship Competition for forty-eight Japanese Chrysanthemums held last autumn by the Ulster Horticultural Society appear to have given a considerable amount of dissatisfaction. We notice that a somewhat belated discussion is being carried on in the columns of the *Irish Farming World*. From the statements made by Mr. Peter Brock, of Glenmor Gardens, Drogheda, it appears that there have been some irregularities that at least require explanation. Mr. Brock states that in the exhibit made by Mr. Mease was a bloom of the Primrose sport from Madame Carnot, Mrs. W. Mease, and that this variety not being at that time in commerce, the exhibit should have been disqualified. The objection was lodged, but one of the judges, Mr. E. Beckett, of Aldenham House Gardens, Elstree, Herts, qualified it by declaring the variety to be Yellow Madame Carnot, as sent out by Mr. H. J. Jones. To this demur was subsequently made by Mr. W. Wells, of Earlswood, who claimed that the bloom should be labelled "Primrose Sport from Madame Carnot." This is the first point of issue, and it practically resolves itself into the question of the identity or non-identity of the varieties G. J. Warren, or Yellow Madame Carnot, and Mrs. W. Mease, the above-mentioned "Primrose Sport from the well-known white variety. As we have seen the two varieties exhibited in this country, Mrs. W. Mease is a much paler yellow than G. J. Warren—in fact, it is a primrose yellow. The second point of issue is that of paper collarets. Mr. Brock avers, and so far the statement has not been challenged, that in the exhibit which was awarded the third prize in this competition, thirty-one out of the forty-eight blooms were supported by paper collarettes, some of these collarettes being as much as 5½ in. in diameter. In defence of these supports, Mr. Beckett is declared to have said that "cardboards, or no cardboards, the exhibit would have won," which is not a justification but an evasion. Mr. Brock states that the supporting of blooms by cardboard collarettes is contrary to the "adopted and recognised standard regulations of the National Chrysanthemum Society." If the Ulster Horticultural Society has "adopted" these rules, there is no doubt of the breach of observance on the part of the exhibitor in question, and Mr. Brock's argument is valid; but, on the other hand, there are many societies who do not follow the N. C. S. rules and regulations, and if the Belfast society be one of them, the argument falls to the ground, unless, of course, there was direct contravention of a rule made by the Belfast society. In the latter case, however, we should imagine that disqualification must have followed.

GARDENING MISCELLANY.

NEW HOLLAND PLANTS AT GHENT.

In reading your "leader" upon the Ghent exhibition I was, like Rip van Winkle, obliged to rub my eyes to make sure I saw clearly; for to read that anywhere out of the United Kingdom such things as Acacias, Ericas, Pimeleas, Diosmas, Polygalas, Chorizemas, &c., should take a leading position at a flower show, and that after they have been so long

neglected among us is a startling revelation. Some day, perhaps, when it takes the public fancy to grow flowers for the pleasure of looking upon them, growing on the plant rather than going to rapid decay in a heated apartment, these old favourites will come to the fore again. I hope this may come about before the generation of plantmen, who delighted to grow and exhibit them, has all passed over to the majority, or else a later generation may have to feel its way in the dark when undertaking their culture.—W. B. G.

CLEMATIS INDIVISA.

THIS Clematis is a well known and valued occupant of the cool greenhouses and conservatories in this country, but its beauty and free flowering character have induced a number of American florists to take up its culture systematically for the purpose of supplying cut flowers. Blooming as it does early in the year, when flowers are as yet comparatively scarce it cannot fail to render good service if looked after properly. The plant was introduced to Europe from New Zealand in 1847, or more than 50 years ago.

TRIPLE-FLOWERED CYCLAMEN.

TWIN flowers amongst cultivated plants of *Cyclamen latifolium* are fairly common, and three separate flowers upon a peduncle are not rare, but, speaking from memory, we do not remember having previously seen so complete a combination of three flowers as that sent us by Mr. A. Pentney, gardener to A. J. Howard, Esq., Worton Hall, Isleworth. The flower stalk was very stout, but perfectly round as a straw, and bore on the top a huge flower consisting of three completely amalgamated into one, with fifteen perfect segments arranged round a transverse opening showing the indications of three cups or openings with three clusters of stamens numbering sixteen in the aggregate, being one in excess of the normal fifteen required for three flowers. The variety belonged to the giganteum strain, and was pure white, except at the month which was slightly tinted with blush. It was distinctly scented, though not very sweet, but this might have been due to the age of the flower.

THE BARBERRY.

SOME of the *Berberis* family are among our showiest spring-flowering shrubs, and the majority of them being quite hardy makes them doubly valuable. They look well in the shrubbery, but far more conspicuous as isolated specimens on the lawns, for what is prettier than a huge bush of *B. buxifolia* (Syn. *B. dulcis*), quite 10 ft. high and 15 ft. through, with its drooping branches touching the turf, and crowded with tiny orange cups, with a yellow perianth? It is a perfect mass of flower just now, and is worthy to be included in the planter's collection. *B. stenophylla* makes another good specimen, whose habit is much more drooping than the first-named, and its flowers appear in clusters, unlike the former. The colour is very nearly the same. The finest plant that has come under my notice of this sort was at Broadlands, Romsey, South Hants., standing on the east side of the flower garden on the turf. This is supposed to be a hybrid between *B. empetrifolia* and *B. Darwinii*.

The last-named is another showy kind, and thrives almost anywhere. I have noticed it growing on an old wall with but 1 in. or so of rubble to give it a start. This variety seeds and sows itself freely in Devon. Then there is the common Barberry (*B. vulgaris*) and its varieties, all very pretty, but much taller growing than the previous species, so they should be kept more to the shrubbery border proper. The berries of some of them are very pretty later on, and are often used to make a sort of preserve. *B. nepalensis* is another handsome species, if given a good position. It has cuspidate, pinnate leaves, nearly 2 ft. in length, and is well worthy of a place. There are several other kinds, but the foregoing have come under my notice more often than them.—*Devonian*.

HOW A KNOWLEDGE OF BOTANY IS A HELP TO GARDENING.

(Continued from p. 541.)

Again, flowering plants have two kinds of stem. The Dicotyledons increase in size on the outside by

a continuous ring of wood, and are called exogens. They include trees, shrubs, and a great many of our choicest flowering plants. Monocotyledons have their woody matter arranged in isolated bundles scattered through a groundwork of cellular tissue. They include Palms, Liliaceous plants, grasses, Bamboos, Cereals, Orchids, and various other plants.

A third division is called Acrogens; and these are non-flowering plants, which increase or grow on the top, as you very plainly understand by the growth of the Tree Fern. These form a part of the sub-kingdom Cryptogamia.

Now a few words on the germination of the seed which contains the embryo or future plant. The embryo is composed of three parts, namely, the root, the seed leaves, and the young stem. Then again seeds differ much in their composition. For instance, in the natural order Leguminosae, which is the Pea and Bean family, you will find that these two seed lobes are thick and fleshy, and occupy the entire seed; while in other cases the embryo or future plant occupies but a very small space in the seed. The other portion of the seed is filled with nourishing matter known as perisperm, which substance nourishes the embryo or young plant until it has attained a certain state of development and has sufficient root and leaf to provide for itself.

Now before germination can take place this nourishing matter has by the agency of moisture, heat, and air, to be brought to a state of solution or decomposition. Hence the truth of the proverb where it says, "Except a corn of wheat fall into the ground and die it abideth alone."

Well, then, what are we to gather from a knowledge of the seed that may help us in accomplishing its germination? It is just this, that we let the seed get due proportions of heat, moisture, and air. If a pan is not well drained, the pores of the soil remain clogged; air cannot penetrate, and consequently the seed will remain a long time dormant or very probably perish. The system to be adopted for all seeds, and especially for those which are very small, is to well water the pans before the seed is sown, to let the pot stand for a time so that the superfluous water may drain away and then to sow the seed on the even surface of the soil. By the time the pot again wants watering, if stood in a moist atmosphere, in most cases, your seeds will have germinated.

Some recommend that if a pan of seed becomes dry it should be stood in water in order to give it a thorough soaking. With this I entirely disagree. By watering a pan in this way, in almost every instance, the rushing in of the water at the bottom causes the material on which the soil is resting to get displaced; the soil also settles down and it never again assumes a condition suitable for the growth of seeds. Now I have tried both systems here mentioned; with the former I seldom get a failure, but with the latter seldom a success.

Let me give you an instance which has occurred under my notice during the different processes which I have tried. This was with a pan of seed of an Arabian Thistle, which was sown in the ordinary way, watered as some recommend, and placed in a position, supplied with bottom heat, having a minimum of 65°, and a maximum of 75°. The seed remained there for about four or five weeks, and showed no signs of germination; therefore, I took the pan containing the seed and placed it under a warm wall in the open air, and allowed the soil to get dry, then watered again in the ordinary way, and what happened? In a few days the seed grew splendidly.

What was the cause of failure with this seed, let me ask? Simply this: the soil retained far too large an amount of moisture, the air could not permeate, as freely as it should have done, to insure germination. I found by close observation that as soon as the soil resumed its proper condition, with the proper amount of air, heat and moisture, growth at once took place.

Here again is another difference in the growth of the root with those two great classes of plants which have been previously mentioned, and this also is worthy of our notice. In the Dicotyledons the root grows by one direct prolongation of the radicle, and it never branches until after leaving the seed: while on the other hand amongst the monocotyledonous plants, with one seed lobe, a branching of the root takes place immediately on germination.

(To be continued.)

HINTS FOR AMATEURS.

SEEDLINGS.

THERE is no more interesting part of the gardener's experience than the raising of seedling plants of all descriptions, more particularly tender plants that require the shelter of glasshouses to get them up betimes. At the same time these plantlets require particularly careful treatment, for in their early stages they will not stand the hardships that they will in their more mature conditions. Many of these seedlings require watching almost continually during the choppy and changeable weather that is characteristic of April, and often of the earlier part of May, and the amateur who cannot devote the whole of his time to them is at a disadvantage. Still, the raising of seedlings is such an important part of gardening that no man can claim to be even fairly proficient in the art unless he has learned by practice to handle seedlings with success. The flower garden, for instance, is dependent for a large part of its material upon plants raised from seed sown in the early months of the year, and tended through the critical stages of babyhood in April and May until they arrive at the first stage of vigorous planthood in early June, when they are ready for transference to open beds and borders out of doors.

Recently we discussed the ways and means whereby a stock of bedding plants might be worked up from cuttings. Now we have to consider briefly the other common method of propagation, viz., by seed.

Pricking Off.—This operation is one of the most important in the whole routine of seed raising, and is, indeed, fully as important as the sowing of the seed, for upon its proper performance depends in a very great measure the future career of the young plants. If carelessly carried out it is very seldom that the young plants do much good after it, whilst, on the other hand, if well done the plants grow away with little or any check, thankful for the increase of space granted them. Just now this kind of work is pressing its claims persistently, for it is not of the kind that can be relegated to some time in the future, near or otherwise. It must be done at once, for every day imperils the safety and welfare of the plants. At such a time as this the value of the oft repeated warnings against sowing seed too thickly can best be gauged, for where these warnings have been disregarded the seedlings are crowded from the very first, and really never have a chance to develop into vigorous plants. Where the sowing was practised as advised the seedlings can be left until they are of a fair size before they are disturbed, and they can then, as a matter of course, be handled by the operator with much greater ease and certainty.

To the beginner "pricking off" will come as a somewhat tedious piece of work which will try his patience to a considerable extent. In such cases as tuberous Begonias, for instance, when the plants are so small that a pointed stick with a slit at the point has to be used to pick them up because the fingers are scarcely nimble enough to perform the task, the patience of the operator will have to be strongly developed. With such things as Stocks, Asters, Pyrethrum, Golden Feather, Lobelias, Dianthus, Ageratum, &c., the seedlings will be of a size that can be readily picked up by the fingers without the aid of the stick a-forementioned.

The soil for the seedlings should be carefully freed from all rubbish, and coarse lumps should be broken up by passing it through a sieve. No manure, chemical or otherwise, should be mixed with it. A good compost may be made of equal parts of loam and leaf soil with plenty of sand, mixing the whole thoroughly together. The pans, pots, or boxes which are to be used should be fairly well drained, and a layer of moss, or rough leaf soil, put over the cracks. Make the soil fairly firm, and the surface should be smooth and even. Then everything will be ready for a start.

In taking the seedlings out of the seed pan the utmost care must be employed. The separation of the plants from each other is also a matter of the first importance. Rough or careless handling will lead to the destruction of a large proportion of the young side rootlets, and the baby plants start in their new quarters handicapped from the outset. "Stripping," as the destruction of these side root-

lets is technically called by gardeners, is a matter of very frequent occurrence, and amateurs are specially warned against making the mistake. Such are often exercised in their own minds to account for seedlings dying off, one after the other, after they have been "pricked off," and in the majority of cases this is the real cause.

Another mistake equally as common is that of "hanging"—a not inappropriate term which is applied to the practice of leaving the young roots suspended in the soil but not in close contact with it. This is often brought about when too large holes are made, the plants roughly thrust in, and the holes as roughly covered in. The plants whose roots are thus exposed inevitably perish. "Stripping" and "hanging" then are to be carefully avoided if success is desired.

The soil and pans or boxes having been got in readiness a few of the plants should be taken out of the seed pan and carefully separated. Lay these out on a flat surface such as the lid of a box, where they can be picked up easily. Then with a wooden dibber make a hole in the soil in the prepared pan just large enough to take the roots of the plant without crushing them. The seedlings may be planted rather deeper in the new soil than they were in the seed pan, as this will help to keep them upright. Fill in the hole carefully, and make it firm by pressing the dibber down into the soil by its side. Avoid having too many of the young plants out of the soil at once, for the delicate roots soon perish.

After Treatment.—Supposing the operation of pricking off the seedlings to have been properly accomplished, the next thing is to give them a watering with water of a temperature of from 65° to 70° Fahr. This should be done in such a way that the soil is not washed into mud, and a fine rose-can will therefore be necessary. Return the plants to the warm house from which they were taken, and keep them quite close for a few days. As the sun has now a good deal of power special attention must be given to shading. The shading should be put on and taken off as it is necessary, for it is not advisable to permanently shade seedlings, since it tends to make them drawn and weak in the stem. On dull days the full benefit of the light may thus be given the young plants, and this in itself is of no small moment.

When the seedlings have begun to grow away vigorously they will call for more hardy treatment (we are dealing now exclusively with plants that are intended to do duty in the open presently), and to this end the house in which they are growing should be kept cooler, or, if this is not practicable on account of the presence of other tender plants in the same house, a removal should be made to a cooler house. If all goes well this removal may take place about the third week in May, and it will be the first step in the hardening off process.

Other seedlings that are intended to grow into plants to do duty in pots under glass may, of course, be kept growing on as freely as possible in a gentle heat. Such things as Celosias and Cockscombs revel in an abundant supply of heat, whilst in the case of Primulas, Cyclamen, and the like which have to be raised in heat a cooler treatment is desirable. Not a few people make the mistake of keeping their Primulas in heat for too long and the plants become drawn and weekly at the collars as a consequence when a rather lower temperature would have produced sturdy and vigorous plants.

Seedling Ferns.—We ought perhaps to apologise for using the term "seedling" instead of the more correct "sporeling" Ferns, but the idea conveyed by both terms to the average gardener who is not a student of physiological botany is practically the same, and we are not now discussing the points wherein a spore differs from a seed, and a seed from a spore. Where Ferns are grown for any length of time in a house it will always be possible to pick up a supply of young plants from the floor of the house underneath the trellis, in nooks in the walls, or indeed in any place where a little moisture is obtainable. Where this has not been considered sufficient and a quantity of spores have been sown in pots of specially prepared soil, these pots will have to be watched with especial care. They must be kept closely shaded from the sun and well looked to for water. Instead of so much overhead watering, however, which no matter how carefully it is done will wash the spores up together in heaps it will be well

to stand the pots in saucers, 2 in. or 3 in. deep, filled with water.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Tomatos.—I have a wall which is at present unoccupied, facing to the west in my garden, and should like to utilise it for Tomatos, if you think they would do well. The soil is a rather sandy one, but I have a supply of stable manure that I could use for it if necessary. The height of the wall is 4 ft.—*P. T. O.*

The western aspect will suit the Tomatos fairly well, although it is not so good as a southern one. Still, the plants will get a fair amount of sun, and sun is what Tomatos need first of all. The soil is of secondary importance, although it should not be neglected by any means. If it is inclined to be poor give it a good dressing with the manure you speak of. This should be done at once in order to avoid bringing the roots of the plants into contact with raw manure. You will need to train your plants diagonally, as they will soon get to the top of a 4 ft. wall.

Hoya gone wrong.—I have (or rather had, for I am afraid it is dead now) a nice plant of *Hoya carnosa* growing on the back wall in my greenhouse. The wall had got rather green and dirty, and last winter I thought I would try to improve the look of it a bit. I took the plant down, cleaned and lime-washed the wall, and returned the plant to its place. The wall now looks nice and clean, but the leaves of the plant have all gone yellow, and it appears to be dead. Has the limewashing done the mischief, and is there any hope of saving the plant?—*Mentor.*

The limewashing could have had no evil effects, but we think the cause of the evil lies in the fact that you have twisted the stems of the plant just above, or, perhaps, just below the soil, and death is following the injury. A speedy examination should ascertain whether the suggestion is correct, and if it is not the evil must be sought at the root. We fear there is little hope of saving the plant, as the succulent leaves of the *Hoya* do not hold out signals of distress immediately the injury to the plant is received, and the injury, whatever it is, has probably been operative for some time.

Tulips with Mottled Leaves.—*Gardener:* The most notable instance of a Tulip having mottled leaves is *Tulipa Griegi*, the foliage of which is, in its way, as handsome as the flowers. The leaves are of large size for a Tulip, rich green in colour, and spotted over with heavy, dark maroon spots. You should certainly grow the species.

Acalypha musaica for the Flower Garden.—You are quite right in your supposition, *Acalypha*, that this plant would do well out of doors in the flower garden, but, unfortunately for the originality of the idea, as far as you are concerned, the practice has been adopted in several quarters. The plants colour exceedingly well, in fact, fully as well as as they do in the best warm houses, and they are very effective, for the colour is not at all a common one. Cuttings struck in the early spring if pushed on will make just the sort of plants for use in this way.

Digging against Box Edging.—*P. E.:* We do not think you have made a mistake in turning the roots of the Box edging into the border, since it will give the Box a much better chance than if the roots had been turned into the gravel walk. In any case, the roots would ultimately turn towards the richer soil so you have only taken time by the forelock as it were. You must be careful not to dig too closely to the box with the spade; up to within 3 in. or 4 in. will be close enough for deep digging.

Aponogeton distachyon.—*G. T. B.:* You may grow the Cape Pond Weed very well in the concreted tank of which you speak, but the depth (4 ft.) will be too much for the plants to be placed at the bottom of the tank. You might build a bank of soil in the middle of the tank as you suggest, but we think

the better plan would be to grow the plants in rough baskets or boxes, and bring these up to the required height by placing them on a pedestal of bricks or other boxes. A depth of 2 ft. of water will be the maximum, and 18 in. will be a good medium.

SPRING FLOWERS IN HYDE PARK.

AMONGST dwellers in the country there is a very prevalent idea that to the teeming multitudes in town and city the faces of the flowers are but the faces of strangers, which stray into their midst incidentally, but which have no settled abode in the smoke and bustle of the busy haunts of men. To such people the magnificent floral effects that are, year by year, prepared for the benefit of the public in the parks and open spaces of the metropolis are an unknown quantity, and it is not difficult to imagine the astonishment that would be exhibited were they able to take just a peep at some of these

Narcissi, and Tulips galore have been blooming with right good will for the past fortnight, and we question very much if they have ever appeared to greater advantage. The Hyacinths, in particular, have been much above the average, and this in a season when there has been a good deal of complaint in many quarters that the consignments of bulbs from Holland have not been so good as usual. With commendable foresight, however, a superior lot of bulbs was obtained by the authorities by paying a higher price than ordinary, and no one can doubt that the departure was a wise one. The firm who supplied the bulbs, Messrs. Jas. Carter & Co., of High Holborn, have every reason for congratulation upon the results, whilst the triumph of the able park superintendent, Mr. W. Browne, who has planned and arranged their disposition with such consummate skill is as complete.

No elaborate associations of colours have been attempted, but considerable attention has been given

Hyacinths Grand Maitre, Mirandolina, Grandeur à Merveille, Charles Dickens (in blue and rose varieties), Robert Stieger, General Havelock, and Queen of Hyacinths. A good deal of variety has thus been obtained and the general effect is good.

Further on, between the Stanhope and Grosvenor Gates, the flower garden becomes considerably wider, a large grass area encircled by gravel walks having numerous beds of various sizes laid out upon it. Here there are to be seen some grand masses of Hyacinths, large beds being completely filled with one variety. These beds have been planted in pairs, one on the eastern and the other on the western side of the enclosed space. Such sorts as Marie Stuart, white; Sir H. Barkley, deep blue-black; Mdme. Hodson, pale rose; and Gertrude, rich rose; have acquitted themselves wonderfully well, the uniformity of height, the size of the flower spikes, and the time of flowering, bearing unmistakable evidence of careful sorting of the bulbs. Several

BORDER OF TULIPS AND HYACINTHS IN HYDE PARK.

displays which the true Londoner takes very much as a matter of course.

The 400 acres of Hyde Park afford something more than a vast promenade to the ranks of fashionable society, for flowers are distributed with great profusion, and, it may be added with excellent taste, and their bright hues add much to the gaiety of the scene that may be seen there on any bright spring day. The face of spring in the park may not be the modestly beautiful one that the countryman knows and loves, for the subtle jade has not disdained to add the blandishments of art to the charms of nature, but for all that, it is a vastly pleasurable experience to make her acquaintance, and to pass an hour amongst the hosts of floral subjects that she has called into being.

As usual, the greatest effort has been made on that side of the park nearest to Park Lane, where a series of rather formally shaped beds, cut out in the grass, run from a little above the entrance at Hyde Park Corner to the Marble Arch. There, Hyacinths,

to simple and effective contrasts of two colours. That time-honoured association of blue and yellow is worked out in a variety of ways, and appears at almost every turn, white not unfrequently being added, whilst the combination of red, white, and blue is to be met with in several places.

Entering from Hyde Park Corner, the first bed, and a very pretty one, is filled with the blue Hyacinth *Regulus*, interspersed with and overtopped by *Narcissus Sir Watkin*. An edging is furnished by two rows of *H. Mont Blanc*. Another effective bed has an edging of two rows of *H. Regulus*, the centre block consisting of the rich rose *H. Incomparable*, interspersed with *Jonquil Campernelle*. A red, white, and blue bed all of Hyacinths is exceedingly rich. The red is furnished by *Mdme. Rachel*, the white by *Mdme. Van der Hoop*, and the blue by *Orondates*. Most of the beds here are oblong in shape, and such handsome Daffodils as *Golden Spur*, *Emperor*, *Empress*, and *Sir Watkin* have been freely employed in conjunction with

smaller round beds give abundant evidence of the effectiveness of the blue and yellow contrast. The blue is furnished by a groundwork of *Scilla sibirica*, and the yellow by *Narcissus Sir Watkin*, *N. Horsfieldii*, *N. Emperor*, or *N. maximus* thinly planted.

The Tulips are rather later than the Hyacinths, but the earlier ones are fully as good, and the later ones promise well. They are planted in considerable numbers both in the beds in the enclosed area above referred to and on the Park Lane side. Near the Grosvenor Gate is a fine mass of *Keizer Kroon*. This is a warm corner, being well sheltered on the east and north and the Tulips have signified their satisfaction by especially good behaviour. *Proserpine*, also a fine Tulip, has come rather badly from some reason or other, but *Ophir d'Or* has made the most of its opportunities. Several mixed beds in which Tulips have been mixed with *Doronicum plantagineum* are to be seen hereabouts, and very pretty they are, for the *Doronicum* has a delightful shade of

green, and helps to tone down the rather gaudy hues of the Tulips.

From the Grosvenor Gate on to the Marble Arch both Tulips and Hyacinths are rather later, the heavier shade being no doubt accountable. There are here several fine beds of such Tulips as Molière, Murillo, Rosa Mundi, Rex Rubrorum, and Yellow Tournesol, while we must not forget to mention a grand bed of Hyacinth King of Blues on the Park Lane side, certainly one of the best examples of Hyacinths in the whole of the park. Some mixed beds of Polyanthus are also very gay here, as they are in other parts of the park.

On the northern side, west of the Marble Arch, we find one of the prettiest pictures to be found in the whole of the park. The crest of the mound which is terminated by, and runs parallel to, the Bayswater Road, is clothed with various shrubs, and in front of these and facing full south is a border which runs westward in a series of graceful curves until it is terminated by a mass of Narcissi which have been naturalised in the grass. In this border a large number of varieties of Hyacinths and Tulips has been planted, each variety forming a distinct block of colour that stands out freely by itself, and helps to form a very vivid, and showily varied whole. The illustration, to which we are indebted to the kindness of Messrs. J. Carter & Co., depicts one of the most imposing of these curves. Our readers will have no difficulty in recognising Keizer's Kroon Tulip in the foreground, and will be able to gain a good idea of the general arrangement, which is well worth imitation.

ROYAL GARDENERS' ORPHAN FUND.

CHAS. E. KEYSER, Esq., of Aldermaston Court, Reading, presided at the annual dinner of this charity, which took place at the Hotel Metropole on the evening of Wednesday, the 20th inst. The chairman was supported by a strong gathering of gentlemen well known in horticultural circles, including Sir Trevor Lawrence, and Messrs. N. N. Sherwood, Martin J. Sutton, Leonard G. Sutton, W. Marshall, W. B. Hemsley, Geo. Nicholson, H. B. May, J. Assbee, H. J. Jones, R. Dean, G. Wythes, G. Reynolds, M. Gleeson, J. Smith, H. J. Adams, J. Gould Veitch, H. Hicks, W. Sherwood, E. Sherwood, W. H. White, W. R. Alderson, W. Y. Baker, A. J. Baker, P. R. Barr, J. W. Barr, G. H. Barr, H. J. Balderson, W. J. Brewer, J. Butler, G. Bick, A. B. Crichton, J. N. Cox, W. Cox, Geo. Cuthbert, G. H. Cuthbert, G. Dean, E. T. Cook, C. H. Curtis, Geo. Featherby, Geo. Gordon, R. P. Glendinning, Harris, G. J. Ingram, J. Kay, Peter Kay, Rev. Mayall, J. A. Laing, D. P. Laird, Stuart H. Low, J. F. McLeod, A. Marshall, A. J. Monro, E. Feathers, E. Mott, W. Moore, W. J. Nutting, W. Nutting, J. Odell, C. E. Osman, A. Outram, F. Penney, J. Poupert, H. Rides, J. Russell, E. Rochford, Jos. Rochford, John Rochford, G. H. Richards, D. Pell Smith, T. W. Sanders, J. Smith, T. Speller, J. Stephens, J. B. Stevenson, J. Sweet, S. M. Segar, T. Swift, J. Tiffin, H. Tellman, J. G. Taylor, J. Walker, W. Woodman, H. P. Wooderson, Wheatley, B. Wynne, T. C. Ward, A. W. G. Weeks, and the secretary, A. F. Barron.

After a plentiful repast had been discussed, the chairman rose to propose the customary loyal toasts of "The Queen," and the "Prince and Princess of Wales, and the rest of the Royal Family." In speaking of Her Majesty he said that she interested herself in everything in which her subjects were interested, and he thought that horticulture had a special claim upon her regard. The Princess of Wales was, next to Her Majesty, probably the most beloved lady in the land, whilst the Prince astonished everyone by the amount of work he accomplished; in short, the Royal Family always sought to identify itself as closely as possible with all classes of the people, and he hoped it would be long before loyalty ceased to be an essential characteristic of an Englishman. Both toasts were enthusiastically received.

The toast of the evening, "Success to the Royal Gardeners' Orphan Fund," was also given by the chairman, who said he felt much diffidence in occupying a position as their chairman, which had been previously filled by eminent noblemen and gentlemen. He had felt that he was not an inappropriate person to propose the loyal toasts since he was High Sheriff for the Royal County of Berkshire.

His audience knew fully as much of the "Fund" as he. They knew it was started in 1887, in commemoration of Her Majesty's Jubilee, that it had made good progress since then, and that it now had invested funds to the value of £10,000. During the past year help had been given to nearly 100 orphans. He, with others, regretted that the charity was not able to do more, seeing how valuable was the work it was doing—those who had been fortunate in horticulture trying to alleviate the distress of those who had been unfortunate. He thought the "Fund" was not so well known as its foster association, the Gardeners' Royal Benevolent Institution, and hoped that when it became better known its sphere of influence for good would be widely extended. He coupled with the toast the name of Mr. N. N. Sherwood, their treasurer. The toast was enthusiastically drunk.

Mr. Sherwood, in replying, said that, as a society, they had much to be thankful for, but it was a matter of regret that last year the annual subscriptions showed a slight falling off. He hoped that in the near future they would be able to elect all those who applied for assistance, and that they would not, as now, have to send some away. He suggested, as a means of increasing the income of the "Fund," that the children of noblemen and gentlemen who had large estates should be invited to save for the purpose of founding special funds for the benefit of the orphans, these funds to be called by the name of the house, or of the children supplying them. He thanked the company for receiving his name so heartily.

Mr. Martin J. Sutton proposed "Gardeners and Gardening." He said that he himself was not, in business, strictly connected with gardening, but his two brothers, Mr. Leonard G. Sutton and Mr. A. W. Sutton were. His province was agriculture, but he thought that farmers would have to take a lesson in thorough cultivation from gardeners before they could get their land to pay. He coupled the name of Mr. A. W. G. Weeks with the toast. After the reception of the latter by the audience Mr. Weeks responded, saying that he had a great respect for gardeners, for he had ever found them to be an honest, praiseworthy, body of men, who were often trusted by their employers with many thousands of pounds worth of goods.

Mr. R. Dean, in a humorous speech, proposed "The Press." He laid particular stress upon their indebtedness to the horticultural Press, and associated with the toast the name of Mr. George Gordon. That gentlemen, in replying, assured the company that the Press had been closely associated with the "Fund" since its inauguration, and that its merits had been kept persistently before the public.

The chairman was heartily received at the invitation of Mr. W. Marshall. Mr. Keyser replied at some length, thanking them all for the reception they had given him, and the manner in which they had shown their appreciation of his humble services. He took a great interest in gardening, and he had given his representative at Stanmore (Mr. M. Gleeson), and his representative at Aldermaston (Mr. A. Gal), a chance of showing what they could do in horticultural exhibitions. This he had done with a view to helping the magnificent exhibitions of plants, flowers, fruits, and vegetables now held in this country.

It was announced that the evening's subscriptions amounted to £559 6s.

This was made up of the following large subscriptions:—C. E. Keyser, Esq., £116 16s. (including Baron Schroder, £10 10s.; G. W. Palmer, £20; T. F. Blackwell, £10 10s.; and J. H. Benyon, £10); Mr. Assbee, £63 6s. (including £5 from Mr. E. Rochford, £5 from Mr. J. Sweet, £5 3s. from Mr. John Rochford, £3 3s. from G. Monro, £3 3s. from Mr. Jos. Rochford, £3 3s. from J. G. Taylor, £3 3s. from C. P. Kinnell, and £5 from Mr. J. Walker); N. N. Sherwood, Esq., £58 14s. (including J. Veitch & Sons, £10 10s.); Mr. G. Reynolds, £32 18s.; Baron A. de Rothschild, £21; N. M. Rothschild, Esq., £26 5s.; M. J. Sutton, Esq., £25; L. G. Sutton, Esq., £25; A. W. Sutton, Esq., £5; S. M. Segar, Esq., £19 19s.; A. W. Weeks, Esq., £16 5s.; W. Robinson, Esq., £10 10s.; Mr. J. F. McLeod, £10 16s. 6d.; Mr. J. B. Stevenson, £6; Messrs. Dickson (Chester) £5; Mr. H. J. Adams, £5 5s.; Sir Trevor Lawrence, Bart., £10 10s.; P. Rudolph Barr, £10 7s.; Thames Bank Iron Co., £7 7s.; Hugh Low & Co., £5 5s.; H. J. Clayton, £4 10s.; C. J. Denning, £4 2s.; Mrs. Head, Sydenham, £10;

H. Hicks, £3; W. J. Nutting, £6 6s.; Dr. Masters, £3 3s.; J. Godseff, £3; H. Balderson, £3 3s.; G. Cuthbert, £5 5s.; T. Whillans, £2 8s.; M. Gleeson, £2 12s. 6d.; and £2 2s. each from W. J. Brewer, T. C. Ward, R. P. Glendinning, P. Crowley, H. J. Wimsett, W. Marshall, A. Marshall, R. Dean, G. H. Richards, F. Blackwood, J. Russell, and J. Speller.

The evening's proceedings were much enlivened by Songs from Miss Gertrude Snow, Miss Foxcroft, and Mr. H. Schartau, whilst a recitation by Mr. H. Hudson excited a good deal of laughter.

The singing of "Auld Lang Syne" in demonstrative fashion terminated the proceedings.

BELGIAN NURSERIES.

I.—M. ED. PYNART-VAN GEERT, GHENT.

ONE of the most easily accessible nurseries in the city of Ghent, and one of the nearest to the principal railway station is that of M. Ed. Pynaert-Van Geert. It occupies an island between two arms of the River Escaut, at Port Bruxelles, an ancient gate of the city, at the outer end of the Rue Bruxelles. Beds of Hyacinths, and single and double Tulips on the lawns around the dwelling house make the place gay at the present time.

Having announced our arrival we were soon led into the propagating pit, where a varied assortment of plants is being reared from seeds and cuttings. The broad pinnae of the new *Adiantum claesianum* have a broad silvery centre from whence radiate numerous silvery veins, making a highly ornamental Maiden-hair Fern. Here we noted a remarkable variety of *Kentia balmoreana*, five years old, yet only 6 in. high, and having a very compact arrangement of the pinnae. Small plants of *Pandanus utilis*, having red edges to the leaves are highly ornamental, and reminded us of a time when the plant was more common in this country than it is at present. A compact growing subject is *Pitcairnia tabulaeformis*, having a rosette of leaves lying close upon the soil. A rare plant is *Labisia pothoiana* having olive-coloured leaves with white edges and midrib, and suitable for stove culture. A curious Aroid is *Cryptosperma ferox*, having its petioles marbled like a snake.

M. Pynaert-Van Geert is a successful cultivator of *Anoetochilus*, as it may be remembered he took the first prize at the Ghent Show for this class of plants, which he grows in frames in the propagating pit. The golden tracery of lines on the leaves of *A. Petola* is well known. The velvety-olive leaves of *A. Dawsoniana* are netted with red. Yellowish and creamy lines on the leaves of *A. sanderianus* make this another very handsome species. These three are grown in quantity and all are very vigorous and healthy. Other species are cultivated in smaller quantities.

Azaleas of all sizes in the nursery number some 30,000, most of which consist of the finest modern varieties of *A. indica*. Those of market size and under are planted out in leaf soil upon the benches of the house, but presently they will be planted in beds in the open-air for the summer months. Here again leaves, scarcely half-decayed, constitute the staple of the material in which they are to be planted, say about a fortnight hence. They were all cut back some time ago and the prunings used as cuttings or grafts. *Azalea mollis* is also grown in great quantity and variety, the larger specimens taking the first prize for this class of plants at the great show. In another part of the nursery we passed through a block of houses entirely filled with Indian Azaleas about ready to be planted outside. Amongst flowering specimens a very fine new variety is *A. indica Souvenir de Madame Francois Vervaene*. The flowers are large, double, and pink, fading to silvery margins.

In the cool corridor is a collection of hybrid *Rhododendrons* of the *ponticum* type. Large specimen plants are also grown in tubs, producing a very fine display when in bloom. Particularly interesting is the hybrid *Azaleodendron*, the parents being a variety of *R. ponticum* and *Azalea mollis*. The leaves are evergreen and intermediate between the parents. The oldest plant is laden with blush flowers beautifully spotted upon the upper segments, so that this triumph of the skill of the hybridist is ornamental as well as botanically interesting.

Many of the best of the Orchids were at the exhibition on the occasion of our visit to the nursery.

Amongst those in bloom we noted *Cypripedium mastersianum*, *C. Exul* and *C. chamber-leanum*, a hybrid between two species indicated in the name. It has perhaps a greater leaning towards *C. chamberlainianum* than to the other parent. The upper sepals of *C. violaceum*, another hybrid, are brown, with a greenish-yellow edge. The petals are violet-purple, with a brownish base; and other parts of the flower show the influence of *C. hirsutissimum* and *C. villosum*, which were the parents. The upper sepal of *C. Druryi delectum* is of a soft yellow, with a maroon midrib; and the petals are golden-yellow. *C. koffmannianum* (insigne x *Boxalli*) has the dorsal sepal richly blotched with brown on a greenish-yellow ground, and the upper portion is blotched with violet. A plant of *Odontoglossum cuspidatum platyglossum* carries a large panicle of flowers. In passing through the various divisions of the Orchid and some other houses we noted a layer of the midribs of tobacco leaves laid under the benches, generally over or near the hotwater pipes. Heat and moisture cause a slight vapour of nicotine to rise in the house, thus driving away or killing greenfly and other insects.

Araucaria excelsa is one of the specialities of this establishment. One large, cool, shaded house is filled with plants ranging from 1 ft. to 4 ft. high. The bulk of them consists of the typical form, but there are several interesting and distinct varieties, of which *A. e. glauca* is, perhaps, the best known, and characterised by the sea-green hue of its foliage. The branchlets and twigs of *A. e. compacta* are densely crowded together, giving the growth of the trees a compact appearance. Another house is filled with plants 6 ins. to 12 ins. high, all in the picture of health. The method of propagation is entirely by cuttings. The compost in which they are grown consists mostly of leaf soil with a little loam and well-rotted manure.

Fine foliage plants of various kinds are grown in considerable quantities, besides those already mentioned as being in the propagating pit. *Curculigo recurvata variegata*, a Palm-like plant with undivided leaves, is in very fine condition. Of a useful decorative size, and well coloured are the plants of *Pandanus Veitchi*. *Vriesia fenestralis* is handsomely netted with dark green on a light green ground. *Citrus sinensis*, the Otaheite Orange, in compact specimens about a foot high, is well furnished with fruit. *Dracaena Bruanti*, having the young foliage deeply tinted with reddish-bronze, is a plant that is very popular on the Continent, and is grown at this nursery in considerable quantity. The long, drooping sprays of *Asparagus Sprengeri* are very effective and graceful. Well known and useful plants are *Eucbaris grandiflora*, *E. Mastersi*, *Sibthorpia europaea variegata*, and *Saxifraga sarmatosa tricolor superba*, the latter thriving well here, and producing handsomely-coloured foliage.

Palms constitute one of the leading features of the establishment, the span-roofed houses being constructed so as to accommodate plants of various size. There are also some rare species in the collection. The long, black spines on the leaves of *Oncosperma Van Houttei* remind one of those of an *Astrocaryum*. The species has pinnate leaves, and is, moreover allied to *Areca*. The huge undivided leaves of *Phoenicophorum sechellarum* are always striking and of noble appearance. The leaves of *Areca triandra* are pinnate and divided at the apex like those of a *Geonoma*. *Washingtonia robusta* has fan-shaped leaves furnished with a thin fringe of white filaments at the edges of the segments. Here also are fine plants of *Licuala grandis* 2 ft. to 3 ft. high, and furnished with twelve to sixteen well-developed leaves each. *Livistona rotundifolia* is a handsome fan Palm, with orbicular leaves, fingered at the edges.

No Palms are more popular or more extensively grown on the Continent than *Kentia fosteriana*, *K. balmoreana*, and *Cocos weddelliana*, which are cultivated in pots or tubs according to size. The bulk of the plants are, however, of useful, decorative, or market size, and confront the visitor in every house or every second one. *Areca Baueri* is also very abundant, in sizes varying from 1 ft. to 3 ft. high, and upwards to specimens of gigantic size. In the case of seedlings for market two or three are often put into one pot to make little specimens well furnished with foliage. One block of four large houses practically constitutes one building, for the interior is continuous and the temperature accordingly uniform in all. The Palms here are mostly of large size

with the foliage arching over every pathway. *Kentias*, *Areca*s and *Latania*s are most abundant here. *Areca sapida* is similar to *A. Baueri*, but may be recognised by its much paler petioles. Another house is filled with *Latania borbonica*, 2 ft. to 3 ft. high, and mixed with *Kentia balmoreana* in fine condition.

The next house entered was filled with *Kentia fosteriana*, 3 yds. to 4 yds. high, and grown in tubs. A still more lofty house accommodated the largest specimens on the premises, or such of them as were at home. Some of the biggest, consisting of *Sabal Adansoni* and *Areca Baueri* were at the Ghent show, where they attracted a great amount of attention from visitors, as they towered above everything else in the exhibition, and took the first prize along with others in a class for Palms. M. Ed. Pynaert-Van Geert exhibited in eighteen classes and took as many prizes. Other huge specimens in this house were *Latania borbonica*, *Chamerops humilis*, *Chamaedorea Dermesti*, *Areca sapida*, *Phoenix reclinata*, *Phoenix canariensis* and *Chamerops Stauracantha*, with orbicular, very deeply divided glaucous leaves. It is 14 ft. to 16 ft. high, and the largest specimens of its kind in Belgium. *Kentia fosteriana variegata* (panachée) has its leaves more or less heavily striped and banded with yellow, and is unique in its way.

Kitchen Garden Calendar.

WEEK'S WORK.

FRENCH BEANS.—To have these early it is necessary that some pains and trouble be taken both in preparing the ground and protecting the young plants as soon as they appear through the soil. In but few districts is it safe to allow the plants to go unprotected till the first week in June, as a very slight frost will cut them down. If seed be sown now, and the weather is favourable, the young plants will make their appearance about the middle of May; therefore, to make them safe from injury hoops should be put over the rows on which mats or canvass can be placed to afford protection at night. Runner varieties grow very fast when the weather is favourable; but, as a rule, they will come to no harm for a fortnight or three weeks from the time the young plants make their appearance. Dwarf kinds are more easily protected as they do not grow so rapidly, and most of them will withstand two or three degrees of frost. It is, however, not safe to allow them to remain exposed at night till all danger of frost is past. So far, the spring has been dry with cold ungenial weather, so that the growth of all vegetables has been slow.

PEAS have suffered from the cold winds and frosty nights, and these together with the absence of rain have somewhat retarded progress. Another sowing should be made as soon as the former ones make their appearance through the soil, choosing some of the main crop or late varieties such as *Autocrat* and *Carter's Michaelmas*. The former sowings should have the stakes put to them as soon as they are a couple or three or inches high. It may be necessary where the ground is light to have recourse to watering the early lots, as the ground owing to the absence of rain has become dry; but this should not be resorted to unless actually necessary, as the water cools the soil.

POTATO PLANTING ought now to be brought to a close as soon as possible, as the growth will not have made sufficient progress to suffer should we be visited with late spring frosts. Another sowing of Carrots may now be made, selecting such varieties where the soil is not deep, as *Matchless*, *Red Intermediate*, *Model*, and *Scarlet Perfection*. The former should be sown in drills at least 15 in. apart. The earlier sowings should now be thinned, leaving the plants about 4 in. from each other. Beetroot for an early supply must also be thinned, allowing ample room for the plants to develop. The main sowing should now be made unless in places where the soil is very fertile, then it would be better to defer doing so till towards the end of May as the roots are apt to grow too coarse. Broccoli of all kinds should now be sown choosing an open piece of ground or one facing the north, as on such the plants grow more sturdy than on hot dry borders facing south.

Should the Turnip fly make its appearance the ground should be kept moist and the plants occasionally dusted over with lime. We often see plants riddled with these troublesome little creatures, in fact many of them are eaten off as soon

as they make their appearance through the soil, and the gardener is sorely tried to get sufficient plants for his requirements. A rich fertile seed bed and plenty of moisture to assist the plants to make their growth will usually prevent any serious attacks. Turnips will now grow more readily, particularly if assisted by frequent waterings. Small sowings should, therefore, be made about every three weeks to keep up a supply of nice crisp tender roots.

CELERY will now need attention, plants ought to be pricked out as soon as they are large enough to handle. If a gentle hot-bed can be afforded them in cold districts, so much the better, but failing this a warm border that has been liberally manured and where an abundant supply of water can be given will suit them well. Celery should suffer no check at any time. The young plants from the late sowings in the open ground will now be making their appearance, and these should be assisted by gentle waterings till such times as we have some rain.

Tomato plants ought now to be potted on and grown in a gentle heat under glass until the weather is favourable for putting them out. Air should be admitted freely on all favourable occasions, that the plants may be short jointed and sturdy. Pay particular attention to all newly planted vegetables such as Onions, Leeks, Cauliflower, Cabbage, and Lettuce, and see that they do not in any way suffer for want of water; at the same time do not sodden the soil, as this will retard progress. Vegetables in pits and frames will now need special care as the soil soon becomes dry. French Beans, Peas, and Potatoes will all need watering, and both the former will be greatly benefited by gentle syringing when the lights are closed in the afternoon. See that there is an ample supply of all kinds of herbs and salads, as these will now be in constant demand.—*Kitchen Gardener*.

The Orchid Grower's Calendar.

THE rather sharp spring frosts which have been pretty prevalent since the last calendar have necessitated our turning on the heat in the cool houses the last thing at night; and as a help to keep the temperature from going down too low, we have put the blinds down also. This protects plants that are hanging up near the roof glass; but the blinds should be pulled up again as soon as the sun rises. A little care in this direction saves firing hard, and at the same time helps the plants considerably.

In the warmer divisions, the fires must be kept well in hand, for although the sun at times is powerful, the cold east winds prevent our putting on much air even by the bottom ventilators; and unless it can pass over the warm pipes before it reaches the plants it is not beneficial to the plants. Careful shading, as before advised, and a judicious use of the heating apparatus is much the best at this season.

CYPRIPEDIUM HIRSUTISSIMUM is a most useful all-round slipper, flowering well under anything like reasonable conditions. A medium temperature, too, suits it well, so that most amateurs may grow it. It is just now in flower, side by side, with the newer introduction *C. Chamberlainianum*, which appears to me very much like a geographical form of *C. hirsutissimum*. The difference only seems that the one has the colour on the petals and the other on the pouch. However that may be, they are certainly both worthy of a place in even a small collection, on account of their good growing properties.

MILTONIA VEXILLARIUM growing in the intermediate house should be closely looked after for yellow thrips which soon play sad havoc with the young growths and also the spikes, which will soon be in sight as they show before the growths are above half made up. Dust a little tobacco powder into the growths, as this makes them shift to the outside, then fumigate, and those that the powder does not kill will soon be got rid of. The same applies to *M. Roezlii* which, however, grows best when placed where it can get the shade and heat of the warmest division.

TRICHOPILIAS.—Where room is limited, a few of these dwarf-growing Orchids may be grown with advantage. We have just now the pretty *T. crispata* in flower, which is much admired. The plants do best in pots or pans, which may be suspended near the glass. Very little compost should be placed about the roots; and as they are very impatient of much moisture at the roots they should be allowed

to get dry between each watering. Treated in this way they give very little trouble and flower freely.

COOL HOUSE.—Here the handsome *Odontoglossum polyxanthum* is making a good show. Considering it was introduced by Klabock twenty years ago, the wonder is that it is not more plentiful. Like *O. luteo-purpureum* and *O. Hallii* it does best if accommodated with just a few more degrees of heat than is afforded *O. crispum*, otherwise the treatment is identical.—C.

POTATO ONIONS.

THE value of these does not appear to be recognised so much as their usefulness deserves. They are so mild and valued much by *chefs*, after the old Onions are over, and when the latter fail to keep well. (We learn such is pretty general in Scotland this season. The autumn rains being heavy and the season remarkably late, tubers were in many parts badly ripened). The Potato Onions—and those from the old stock of bulbs planted in the same way as the former—were valued much till the young crops were forming bulbs and becoming serviceable. By reason of the heaviness and dampness of the land, our own stock of bulbs (Potatos, or underground bulbs), are not worth the keeping for transplanting. Shallots often may be seen in gardens, in capital condition, where Onion growing is not attempted by reason of the grub pest.—M. T., Carron, N.B.

SOCIETIES.

THE NEWCASTLE SPRING FLOWER SHOW.—

April 20th and 21st.

THE Durham, Northumberland, and Newcastle Horticultural and Botanical Society has had in the course of its long career (for the society is one of the oldest of its kind in the country), many ups and downs. The spring show, however, which was opened at Olympia, Newcastle, on the 20th inst., was a distinct success. Advantage was taken of the commodiousness of the place to stage the various exhibits with excellent general effect, but apart from this improvement the show, as far as the material staged went, was one of the best ever held in Newcastle, and far in advance of the spring shows of late years.

The classes according to schedule were well patronised all round, both amateurs and professional cultivators turning up in strong force.

In the "open" section of the schedule, Mr. Geo. McDougal staged a fine group of miscellaneous plants occupying the space allotted of 60 square feet; Mr. J. McIntyre was second; and Mr. H. H. Hillier, third.

Mr. J. McIntyre scored for three flowering plants, three plants of *Azalea indica*, four specimens of *Dicentra (Dielytra) spectabilis*, and six *Spiraeas*.

Auriculas were well shown, and formed a centre of attraction. Six distinct varieties (Alpines excluded) were best shown by Mr. Thos. E. Hay, who also had the premier two plants of the same class, Mr. Richard Willis taking the first for four. Mr. S. Bewick had the best green-edged, and Mr. Thos. F. Hay the best self-coloured variety. The premier six and two plants of Alpines came from Mr. Geo. Lee.

Mr. McDougal came to the front in the classes for bulbs, for twenty-four Hyacinths in pots in not less than twelve varieties. Mr. D. Wylam had the best twelve Hyacinths in nine varieties, and Mr. T. Wheeler the premier twelve of one variety.

The nine pots of Single Tulips in six varieties, and the six pots of double Tulips in four varieties gave Mr. McDougal other successes.

In the classes for floral decorations, Messrs. Perkins & Sons, of Coventry, again won high honours. They secured first prizes for the basket of cut flowers, the bridal bouquet, two hand bouquets, lady's sprays, and buttonhole bouquets, a sufficiently clear demonstration of their skill in the art of flower arrangement.

The classes from which nurserymen were debarred from competing contained some excellent material. Here Mr. J. McIntyre won for four Chinese Primulas and six *Spiraeas*, Mr. Wm. Pitt for six *Cinerarias*, and Mr. T. Morris for four pots of Lily of the Valley (the pots or pans not to exceed 8 in. in diameter).

Mr. T. Wheeler staged the best twelve Hyacinths, and Mr. D. Wylam the best six Hyacinths in the classes for bulbs.

Mr. D. Wylam and Mr. Jos. Ellison were the most successful exhibitors in the amateurs' portion of the schedule.

The judges were Mr. James Douglas, of Edenside, Great Bookham, Surrey, and Mr. Chas. Paul, Old Trafford Gardens, Manchester.

The non-competitive exhibits were fairly numerous and attracted a good deal of attention. Mr. James Douglas staged a fine lot of blue Primroses that were much admired. Messrs. Wm. Clibran & Son, of Altrincham, showed a general collection of stove foliage plants, Cacti, and Carnations. Amongst the last-named the variety Yellow Wonder was especially noteworthy.

Messrs. Pearson & Sons, of Chilwell, Notts, had a large assortment of Daffodils, which flower they cultivate largely. Glory of Leiden, Madame de Graaff, and forms of the handsome *Narcissus triandrus* were in great prominence.

Messrs. Tell & Co., Hexham, sent a fine group of miscellaneous plants, and the table decorations submitted by Messrs. W. Edwards & Son, Sherwood, Notts, were in capital taste, and were much admired by visitors. Messrs. J. Thompson & Son, of Forest Hall, Messrs. T. A. Hutchinson & Son, of Forest Hall, and Mr. A. E. Campbell, Gourock, N.B., all sent groups of plants, whilst a showy stand of Orchids came from Mr. J. G. McKenzie, Heddon-on-the-Wall.

NORFOLK AND NORWICH HORTICULTURAL.

—April 21st.

The Annual Spring Show of this society was held in the spacious St. Andrew's Hall, Norwich, and was extremely well attended. The principle feature in the show was the centre table, which consisted only of those beautiful silvery-white and golden flowers, the Narcissi or Daffodils. Other flowers and flowering plants, such as Orchids, Amaryllis, Azaleas, Cinerarias, and Gloxinias were arranged on tables; and the large specimens of stove and greenhouse foliage and flowering plants were effectively arranged, forming in all a very interesting show. During the afternoon and evening the band of the Seventh Dragoon Guards played selections of music.

For six Amaryllis J. H. B. Christie, Esq., of Framingham Manor, took first, with W. J. B. Birkbeck, Esq., of Thorpe, a close second. The only entry for six distinct Auriculas came from B. E. Fletcher, Esq., with some very fine specimens. An extra prize was awarded to J. J. Colman, Esq., for a basket of Auriculas, and deservedly awarded.

The Azaleas, in six distinct varieties, were poor, and in consequence the leading prize was withdrawn; second prize went to G. D. Trafford, Esq., Wroxham Hall, with Col. Rous, Worstead House, third.

F. Chaplin, Esq., of Thorpe Road, took the leading place with six well-grown plants of *Coleus*; J. G. Snelling, of Eaton Hall, was second. F. P. Hinde, Esq., of Thorpe Hamlet, was an easy first with six Gloxinias; F. Chaplin, Esq., second; and W. J. Birkbeck, Esq., third. J. G. Snelling, Esq., led with six well-grown pots of *Mignonette Machet*; F. P. Hinde, Esq., came in second; and E. S. Trafford, Esq., third. For six pots of *Cinerarias* W. J. Birkbeck, Esq., was an easy first, followed by J. G. Snelling, Esq.

For six pots of bulbous plants in flower Col. Rous was first with some grand specimens of *Narcissus bicolor Horsfieldii* and *N. Barrii conspicuus*; S. G. Buxton, Esq., of Catton Hall, was second. For six Orchids, distinct, S. G. Buxton, Esq., took first with five pieces of *Vanda suavis*, *Dendrobium nobile*, and *Cattleya Schroderi*; Rev. Canon Ripley, of Earls-ham Hall, was second; and Col. Rous, third. For three Orchids the Hon. A. E. Fellowes, M.P., of Honingham Hall, was an easy first with well-grown pieces of *Dendrobium nobile*, *Lycaste Skinnerii*, and *Cattleya lawrenciana*; Canon Ripley was second; and E. S. Trafford, Esq., came in third. Mr. Trafford also took first for a single specimen of *Dendrobium densiflorum*; and S. G. Buxton, Esq., was second. For six *Caladiums* W. S. Birkbeck, Esq., was placed first.

In the class for twelve bunches of greenhouse flowering plants, E. S. Trafford, Esq., was first with specimens of *Dendrobium thyrsoflorum*, *Rhododendron Countess Fitzwilliam*, *Amaryllis*, &c., with

Col. Rous, second, and Canon Ripley, third. For six bunches, the Hon. A. E. Fellowes, M.P., took the lead, B. G. Fletcher, Esq., was second, and J. H. B. Christie, Esq., third. For twelve bunches of hardy cut flowers, distinct, Mrs. Petre, of Westwicke House, was first with fine bunches of *Gentiana acaulis*, *Narcissus Horsfieldii*, *Anemones*, &c.; O. Corder, Esq., was second, and Col. Rous, third. For six bunches, B. E. Fletcher, Esq., secured the first place, J. H. B. Christie, Esq., was second, and S. G. Buxton, Esq., third. The prize for six bunches of *Anemones*, distinct, went to Canon Ripley with *A. ranunculoides*, *A. apennina*, *A. nemerosa alba*, &c., with R. B. Longe, Esq., second. For twelve cut *Gardenias* the Hon. A. E. Fellowes was first, followed by S. G. Buxton, Esq.

For six flowering stove and greenhouse plants (Orchids excluded), S. G. Buxton, Esq., was first, with J. G. Snelling, Esq., second. For four distinct plants Canon Ripley, A. G. Buxton, Esq., and Col. Rous were first, second, and third respectively. For a single specimen S. G. Buxton, Esq., was first; W. J. Birkbeck, Esq., second, and Col. Rous, third. For eight foliage stove and greenhouse plants, S. G. Buxton, Esq., took the lead. For six foliage plants, S. G. Buxton, Esq., was again first, with Canon Ripley, second, and A. J. Bunting, Esq., third. For four plants, A. J. Bunting, Esq., was first; J. G. Snelling, Esq., second, and Canon Ripley, third. For a single specimen, S. G. Buxton, Esq., had the best. F. P. Hinde, Esq., and Col. Rous scored respectively in this order.

In the classes for Narcissi there was an exceptionally keen competition, and the judges had an extreme difficulty to decide in many of them as to where to place the awards.

In the open class for three blooms each of thirty-six distinct varieties, Messrs. Barr & Sons, of King Street, Covent Garden, and Long Ditton Nurseries, carried off the leading prize. We saw those varieties as this firm is so well known to possess and raise, such as the beautiful Weardale Perfection, and delicate Madame de Graaff, the showy *Barrii* conspicuus, and Dorothy E. Wemyss, the graceful and delicately tinted cup of *Duchess of Westminster* and many others, such as Mme. Plemp, Capt. Nelson, their new bicolor *Victoria*, which was much admired, Mrs. Vincent, and C. W. Cowan. A large yellow trumpet variety, named Fred. Moore, was very striking, also the graceful *Queen of Spain*, and the beautiful *triandrus albus*. The second prize went to Mr. G. W. Miller, of Wisbech, who had some well-known varieties, exhibiting good culture, such as Mme. de Graaff, Mad. Plemp, *Apricot*, *incomparabilis Gloria Mundi*, *Leedsii* Mrs. Langtry, and many others. Miss K. A. Spurrell, of Bissingham Hall, was a very good third.

For twenty-four distinct Narcissi, Mrs. Petre was first; Col. Rous, second; and O. Corder, Esq., third. A special prize was deservedly awarded to Mrs. Cator, of Woodbastwick Hall, who contributed twenty-four very well grown specimens.

For twelve Daffodils, Lord Suffield, of Gunton Park, was first; J. H. B. Christie, Esq., was second; with Canon Ripley, third. For six varieties, Miss Spurrell took first; Mrs. Petre, second; and O. Corder, Esq., third.

For twelve distinct Pansies, J. H. B. Christie, Esq., was first. The entries for Tulips were exceedingly weak. For twelve distinct varieties, W. J. Birkbeck, Esq., was first, with fine blooms of *Ophir d'Or*, Thomas Moore, *Proserpine*, &c.; Canon Ripley, was second; and S. G. Buxton, Esq., third. For six Tulips, W. J. Birkbeck, Esq., was first; B. E. Fletcher, Esq., second; and S. G. Buxton, Esq., third. For six zonal *Pelargoniums*, F. P. Hinde, Esq., was first; J. B. Lennard, Esq., second; and J. G. Snelling, Esq., third. Mr. Snelling was first for six tricolor *Pelargoniums*. For twelve plants for table decoration, A. J. Bunting, Esq., led the way; S. G. Buxton, Esq., was second; and Canon Ripley, third.

FRUIT.—For a dish of six dessert Apples, E. S. Trafford, Esq., was first; Canon Ripley, second; and Miss Penrice, third. Canon Ripley had the best kitchen Apples; E. S. Trafford Esq., was second; and Miss Penrice and A. J. Bunting, Esq., were equal third. For dessert Pears, R. B. Longe, Esq., was first. For stewing varieties, Mr. R. B. Longe, was first; and Col. Rous, second. Mrs. Petre had the best dish of twenty-four Strawberries. For twelve Strawberries, E. S. Trafford, Esq., was first. For six Strawberry plants in pots,

A. J. Bunting, Esq. was first; E. S. Trafford, Esq., second; and Col. Rous, third.

VEGETABLES.—B. E. Fletcher, Esq., had the best thirty sticks of Asparagus. For Kidney Beans, Col. Rous was first. Lord Suffield had the best Broccoli. Hon. A. E. Fellows, M.P., led in the class for Cabbages. For a brace of Cucumbers, E. S. Trafford, Esq., led. The Cos Lettuce shown by Mr. E. S. Trafford was best. For Cabbage Lettuce, Col. Rous was first. A. G. Buxton, Esq., Mrs. Lubbock and Hon. A. E. Fellowes, M.P., scored for Mushrooms, respectively. For Onions, Col. Rous was first; Lord Suffield, second; and A. J. Bunting, Esq., third. Mrs. Lubbock was first for Peas. R. B. Longe, Esq., had the best late Potatoes. Mrs. Petre was first for early varieties. Mrs. Lubbock had the best collection of vegetables.

The non-competitive exhibits came from Messrs. Barr & Sons, who sent a very comprehensive collection of Daffodils, about 200 bunches in about 70 varieties, comprising some of the very choice sorts, backed up with their own foliage, and dotted with Palms. Some of the most conspicuous were Mme. de Graaff, Mme. Plomp, Mrs. Walter Ware, Mr. and Mrs. Camm, M. J. Berkeley, P. R. Barr, Leedsii Mrs. Langtry, Duchess of Westminster, and many others. They also sent a very interesting collection of early spring-flowering bulbous plants, such as *Erythronium revolutum*, *E. Hendersoni*, *Fritillaria aurea*, *F. armena*, *F. ruthenica*, *F. plnriiflora*, and varieties of *Meleagris*, a few *Muscari*, in variety, also the curious *Iris tuberosa*, some grand specimens of *Tulipa Greigii*, *T. Leichtlini*, &c.

Messrs. Daniels Bros., Norwich, sent a large assortment of horticultural sundries as well as a collection of Narcissi, among which we noticed some fine specimens of *N. Barrii* conspicuus, *Emperor*, *Empress*, *Victoria*, etc. Mr. Miller, of Wisbech, also had a group of Narcissi and some very fine double and single Primroses. Mr. J. Green, of East Dereham, sent a similar collection including some fine *Pelargoniums*. Messrs. Read Bros., of St. Stephen's, sent a large exhibit of their floral decorations, which were much admired for the light and artistic arrangements in bouquets, wreaths, baskets of flowers, &c. From Messrs. Ruymp & Sons, St. George's, Norwich, came some very useful manipulations in horticultural pottery ware, showing what, and how, Ferns, Begonias, *Pelargoniums*, &c. can be grown to adorn the conservatory and greenhouse.

The hon. secretary, Mr. J. E. T. Pollard, and the stewards are to be complimented upon the way the show was arranged and conducted throughout. The plan of a clearance ticket is a good one, and should be copied and adopted by other societies. This would prevent the loss of many plants.

ROYAL HORTICULTURAL.—April 26th.

THE combined meeting of the Royal Horticultural Society and the annual show of the National Auricula and Primula Society had the result of bringing together a great variety of plants hardy and tender, which evoked a considerable amount of enthusiasm amongst the visitors. Orchids, Daffodils, Roses, and Primulas in their various sections were the leading features of the show on Tuesday last.

Messrs. J. Veitch & Sons, Ltd., Chelsea, exhibited an interesting lot of Orchids. Very striking was *Laeliocattleya Thorntonii* (*Laelia digbyana* x *Cattleya gaskelliana*) with a massive, fringed lip. Other handsome things were *Laeliocattleya Ascania* superba, *L. wellsiana langleyensis*, *Laelia Latona*, *Cattleya Schroderae amabilis*, and *Epidendrum Wallisii* (Silver Banksian Medal).

The Right Hon. J. Chamberlain (grower, Mr. J. Smith), Highbury, Birmingham, staged a small group of Orchids, including *Laeliocattleya highburyensis*, *Epicattleya*, *guatemalensis*, both bigeneric hybrids. He also had *Masdevallia chamberlainiana*, *Cattleya Schroderae highburyensis*, and *Galeandra devoniana*, etc.

J. Bradshaw, Esq., (gardener, Mr. H. Whiffen), The Grange, Southgate, exhibited some very fine forms of Orchids, including *Odontoglossum crispum* Whiffeni, *O. Inteo-purpureum sceptrum*, *Cattleya intermedia alba*, and various other handsome *Odontoglossums*.

A large group of *Cattleyas* and *Odontoglossums* was exhibited by Messrs. Hugh Low & Co., Clapton. *Cattleya Mossiae* and *C. Mendelii* in several varieties were fine. Noteworthy also were the forms of

Odontoglossum andersonianum, *O. wilckeanum*, *O. ruckerianum splendens*, *O. crispum*, *Oncidium St. Legerianum*, and various other useful things, all set up with Ferns and Palms (Silver Banksian Medal).

A Cultural Commendation was accorded to J. Colman, Esq., J.P. (gardener, Mr. W. King), Gatton Park, Reigate, for a grand specimen of *Cattleya lawrenceana*. A similar award was accorded to De B. Crawshay, Esq., (gardener, Mr. S. Cooke), Rosefield, Sevenoaks, for a splendidly grown piece of a magnificent variety named *Odontoglossum triumphans Lionel Crawshay*. A similar award went to Walter Cobb, Esq., (gardener, Mr. J. Howes), Dulcote, Tunbridge Wells, for a fine piece of *Cypripedium Gertrude Hollington*. He also showed *Dendrobium albo-sanguineum*, and *Odontoglossum polyxanthum Dulcote* var.

A large group of *Cattleya Mendelii* in variety, *Odontoglossum ruckerianum*, *O. crispum*, *O. Pescatorei*, *O. triumphans*, *O. wilckeanum*, and others was exhibited by Messrs. B. S. Williams & Son, Upper Holloway. They also had fine forms of *Odontoglossum harrayanum*, *Vanda suavis*, &c., (Silver Banksian Medal).

Messrs. Linden, Parc Leopold, Brussels, exhibited a large group of *Odontoglossums*, *Miltonias*, and *Cypripediums*. Very striking forms of *Odontoglossum* were *O. wilckeanum Thompsoni*, *O. w. tenuiflorum*, *O. w. luteolum*, *O. w. mooreanum*, *O. cirrhosum* in fine varieties, *O. ruckerianum gratissimum*, *O. Princesse de Canaries*, *O. triumphans castaneum*, *O. hystrix haumontianum*, *O. ruckerianum lilacina*, and others, the bulk of which are regarded as natural hybrids. A bold hybrid was *O. crispum Comte de Flandre*, by reason of the large purple blotch on each of the sepals. *Miltonia vexillaria Memoria Lindeni* is a rich rose-magenta variety. The forms and markings were endless (Silver Gilt Flora Medal).

H. T. Pitt, Esq., Rosslyn Stamford Hill, staged a fine form of *Odontoglossum triumphans*. H. Greenwood, Esq., Highfield, Haslingden, exhibited *Odontoglossum hunewellianum maximum*, *O. humeanum*, and *O. aspersum fulgens*. Sir Trevor Lawrence, Bart., staged *Mormodes oenanthum* and a splendid form of *Odontoglossum crispum*. E. Ashworth, Esq. (gardener, Mr. Holbrook), Harefield Hall, Wilmslow, had the beautiful *Cattleya Mendelii Beatrice Ashworth*, and *C. Schroderae Harefield Hall* var. C. L. N. Ingram (gardener, Mr. Bond), Elstead House, Godalming, had a fine hybrid named *Cattleya Sedeni*.

A group of handsome and shapely *Dracaenas* was put up by Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E. The plants were all clean and well grown specimens of named varieties of merit, some of the best of which were *D. terminalis alba*, *D. Constant Lemoine*, *D. Denisonii*, *D. pendula*, *D. Salmonea*, and *D. Gladstonei*.

A collection of choice hardy flowers sent by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, consisted chiefly of *Fritillarias* and *Erythroniums*. *F. macrophylla* (*Lilium thomsonianum*) was very conspicuous, also *F. Meleagris alba*, *Erythronium revolutum*, *Watsoni*, and *E. giganteum*. A collection of flowers of hardy Himalayan *Rhododendrons* was sent by Sir John Dillwyn Llewellyn, Penllergaen, Swansea, contained some very handsome varieties.

A quantity of cut Roses came from Mr. W. Rumsey, Joynings Nurseries, Waltham Cross, Herts. They comprised some excellent samples of *Nipbetos*, *Ulrich Brunner*, *Senateur Vaise*, and *Maman Cochet* (Silver Banksian Medal).

Six dozen large, fine blooms of *Rose Maréchal Niel* were sent by Mr. J. Walker, Thame, Oxon. The wonderfully free-flowering *Rose Fortune's Yellow*, was exhibited in both cut single blooms, and sprays by Mr. Fyfe, gardener to Lord Wantage, Lockinge, Wantage (Bronze Banksian Medal). Messrs. R. & G. Cuthbert, Southgate, Midx., had an exceedingly showy lot of named hybrid *Azaleas*, produced by crossing *A. mollis*, and *A. sinensis*. The plants were all well flowered (Silver Banksian Medal).

A very interesting exhibit of Ferns was made by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton. It consisted of some of the most valuable members of the three genera, *Gymnogramme*, *Cheilanthes*, and *Nothochloenas*. Of the first-named genus, twenty-five species and varieties were staged, amongst which were robust specimens of *G. Parsonsii*, *G. Alstonii*, *G. chrysohylla*, *G.*

scbizophylla gloriosa, *G. peruviana argyrophylla*, and *G. wetenballiana*. Five forms of *Cheilanthes* and *Nothochloena* were on view (Silver Flora Medal).

Messrs. John Laing & Sons, Forest Hill, S.E., showed a capital lot of their prize strain of *Gloxinias*. The colours of the flowers were very varied and brilliant, and the size and refinement of the flowers much above the ordinary. Bedded as they were in Maidenhair Fern, with an edging of *Isolepis gracilis* they formed a very pretty picture (Silver Flora Medal).

The cut Roses submitted by Mr. Geo. Mount, Canterbury, were of that superior quality that we expect to see from Mr. Mount. The samples of the *Bride*, *Catherine Mermet*, *Captain Hayward*, *Ulrich Brunner*, and *Mme. de Watteville* were really perfect (Silver Gilt Banksian Medal).

Messrs. Paul & Son, The Old Nurseries, Cheshunt, had several fine *Rhododendrons*, including *R. Handsworth White*, and *R. caucasicum roseum*; also some grand samples of the new hybrid *Polyantha Rose Psyche*. A superb potful of *Trillium grandiflorum album* came from Mr. Empson, gardener to Mrs. Wingfield, Amptill House, Ampt-hill.

Mr. W. Bain, gardener to Sir Trevor Lawrence, Burford Lodge, Dorking, showed a handsome group of *Anthuriums*, also cut flowers of the same. *A. scherzerianum latifolium*, *A. lawrenceanum*, *A. andreanum*, *A. Dr. Lawrence*, and *A. Perfection* were a few of the best forms on view (Silver Flora Medal).

A Silver Banksian Medal was awarded to L'Horticulture Internationale Société Anonyme, Parc Leopold, Brussels, for a collection of *Anthuriums*.

Mrs. Bowman (gardener, Mr. F. Cornish), Joldwynds, Dorking, Surrey, exhibited a fine pan of the parasitic plant *Lathraea squamaria* grown on the roots of *Hazel*. We have never seen the flowers in such abundance from so small an area.

As usual at this time of year there was a number of exhibits of hardy flowers, and amongst these Daffodils played an important part.

A very varied and comprehensive collection of hardy flowers came from Messrs. Paul & Son, of Cheshunt. Here there were to be seen some grand masses of *Doronicum plantagineum excelsum*, *Adonis vernalis*, *Geum miniatum*, *Iris pumila aurea*, and *Saxifragas* in variety.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., also showed a lot of similar material, although *Primulas* were a strong feature of his group. From the same firm came a large group of Daffodils, in which many of the leading varieties, including the new bicolor *Victoria*, occupied a prominent place. Three fine masses of *Narcissus Bulbocodium* were specially noteworthy.

Messrs. Barr & Sons, King Street, Covent Garden, had a magnificent array of Daffodils, comprising upwards of seventy varieties, which represented all sections of this charming flower. Such varieties as *Glory of Leiden*, *Madame de Graaff*, *Fred Moore*, *De Rudini*, *Weardale Perfection*, *Mrs. H. J. Elwes*, *Incomparabilis Gloria Mundi*, *Leedsii* *Duchess of Westminster*, and *Barri* conspicuus were in splendid condition. Early-flowering Tulips and miscellaneous hardy flowers were also shown by the same firm (Silver Flora Medal).

Messrs. J. R. Pearson, Chilwell, Notts, had a choice collection of Daffodils, in which were some grand *incomparabilis* and *Leedsii* forms.

Messrs. James Veitch & Sons, Ltd., likewise had a big group of Daffodils, all the flowers being first-class. *N. Leedsii Gem*, *N. L. Katherine Spurrell*, *N. L. Mrs. Langtry*, *N. Glory of Leiden*, and *N. Maurice Vilmorin* were some of the best (Silver Flora Medal). The Chelsea firm also showed *Rhododendron indicum* var., *Kaempferi*, *Chionanthus virginicus*, and *Deutzia hybrida Lemoinei*.

An interesting group of seedling Daffodils was contributed by the Rev. G. H. Engleheart, Apple-shaw, Andover.

Collections of scented-leaved plants were sent from the Royal Gardens, Kew, and the nurseries of Messrs. J. Veitch & Sons, Ltd., for the purpose of illustrating the lecture by Mr. Burbidge.

At a meeting of the fruit and vegetable committee, a Silver Gilt Medal was awarded to Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford, for a first-class collection of vegetables. Broccoli, Asparagus, Tomatoes, Leeks, Seakale, Cabbage, French Beans, Potatoes, and Saladings were of the

best, and formed a capital example of the variety of vegetables that can be obtained thus early in the year by the exercise of skill and foresight.

Messrs. Jas. Veitch & Son, Ltd., sent samples of Broccoli Market Favourite. A Cultural Commendation went to Mr. H. T. Martin, gardener to Lord Leigh, Stoneleigh Abbey, Kenilworth; for a grand dish of Seakale.

A Silver Gilt Banksian Medal was awarded to Mr. W. J. Empson for a first class collection of fruit and vegetables. Amongst the former were Strawberries, Apples, Pears, and Bananas, and included in the latter were Asparagus, Seakale, Tomatos, Broccoli, Leeks, and Potatos, all of excellent quality.

Eight dishes of Apples were submitted for the Veitch flavour prize. Col. Brymer, Ilington House, Dorchester, was placed first with Allen's Everlasting; and Mr. R. Bullock, gardener to C. P. Serrocold, Esq., Taplow Hill, Maidenhead, second with Hereford Pearmain.

Mr. A. Outram, 7, Moore Park Road, Fulham, showed his patent thermometer holder and indicator—a handy and useful contrivance.

A Silver Banksian Medal went to Messrs. Osman & Co., Commercial Street, E.C., for an exceedingly handsome set of lamp shades, fans, Menus, &c., of natural, dried Ferns and Palm fronds—a very chaste and interesting exhibit.

NATIONAL AURICULA AND PRIMULA.—April 26th.

THE annual show of this society was held in conjunction with the fortnightly meeting of the Royal Horticultural Society on the above date. There was a lot of material present, but the flowers were not so refined as usual, although the size was good.

SHOW AURICULAS.

Mr. J. Douglas staged the premier twelve dissimilar varieties, showing Mrs. Potts (Barlow), Mrs. Dodwell (Woodhead), Negro (Pohlmann), Greenfinch (Douglas), Olympus (Douglas), Mrs. Kenwood (Barlow), Acme (Read), Black Bess (Woodhead), George Rudd (Woodhead), Dr. Hardy (Simonite), Marmion (Douglas), and George Lightfoot (Headley). Mr. C. Phillips, Bracknell, was second; Mr. William Smith, Bishop's Stortford, third; and J. T. Bennett Poë, Esq., Ashley Place, S.W., fourth.

In the smaller class for six dissimilar, Mr. C. Phillips came to the front with Geo. Rudd, Mrs. Phillips (Phillips), Mrs. Barnett, Mrs. Henwood, Richard Headley, and Jno. Simonite; Mr. Wm. Smith was second; and J. T. Bennett Poë, Esq., third.

The first award for four, dissimilar, went to Mr. J. Sargent, Cobham, who had Mrs. Potts, Abbe Liszt, Mrs. Dodwell, and Lancashire Hero. Mr. A. S. Hampton, Reading, was second; Mr. A. R. Brown, Reading, third; Mr. A. Fisk, Broxbourne, fourth; Mr. W. Palmer, Shortlands, Kent, fifth; and Mr. J. Gilbert, gardener to the Rev. L. R. Flood, Merrov, sixth.

Mr. P. Kennell, Winchmore Hill, led for two, dissimilar, showing F. D. Horner (Simonite), and Acme (Read); Mr. J. Sargent was second; Mr. A. R. Brown, third; Mr. A. S. Hampton, fourth; Mr. W. Palmer, fifth; and Mr. J. Gilbert, sixth.

Mr. C. Phillips had the best green-edged specimen in an unnamed variety. Mr. Sargent was second with F. D. Horner; Mr. J. Douglas, third; and Mr. Sargent, fourth with the same variety.

The first award for the best white-edged specimen went to Mr. Sargent for Featherbell. Mr. J. Gilbert was second with Acme; Mr. J. Douglas, third, with the same variety; and Mr. A. R. Brown, fourth with Feather Bell. Mr. Sargent also had the best gray-edged specimen in Lancashire Hero; Mr. W. Smith coming second with Geo. Rudd, and third with Rachael; Mr. J. Douglas, fourth with the same variety; and Mr. J. T. Bennett Poë, fifth with G. Lighthody.

There was a great deal of competition for the self-coloured specimens. Mr. Fisk led with Heroine; Mr. J. Douglas was second with Mrs. Potts (Barlow); Mr. W. Smith, fourth and fifth; and Mr. J. T. Bennett Poë, sixth.

GROUPS.—There were three competitors for the group of fifty plants in not less than twenty varieties, Alpines included. Mr. J. Douglas was first with a fine exhibit that contained, amongst other varieties, Mrs. A. Potts (Barlow), Snowdon's Knight (Douglas), Miss Prior, Monarch (Horner), Colonel Chamneys (Turner), Heatherbell, Negro (Mellor) Lord of Lorne,

Mrs. Dodwell, Rachael and Ajax (Horner). The Guildford Plant Nursery, Guildford, was second; and Mr. Chas. Phillips, third.

The premier Auricula in the show was adjudged to the Abbe Liszt shown by Mr. J. Sargent. Mr. P. Purnell obtained a first for six show varieties amongst competitors who had never won a prize. Mr. J. W. Euston was second.

ALPINE AURICULAS.

Mr. C. Phillips headed the list of competitors for twelve plants, dissimilar. He had Sister Mary, Edith Western, Vandyke Jubilee, Regina, Perfection, Mrs. Gorton, Evelyn Phillips, Saturn, Lady Clementine Walsh, Mrs. Martin Smith, and Gladys Phillips, all of them in excellent order. Mr. J. Douglas was second, also with some good flowers, and the Guildford Hardy Plant Nursery third.

The first award for six varieties went to Mr. G. W. Euston, gardener to Mrs. Whitbourn, Gt. Gearies, Ilford, who had The Bride, Tennyson, Psyche, Schubert, Calypso, and Urania, all of them Douglas's seedlings. Mr. C. Phillips was second; Mr. J. Douglas, third, and Mr. J. J. Keen, Southampton, fourth.

Mr. J. W. Euston also scored for four Alpines, showing Tennyson, Rosy Morn, Hiawatha, and Cimiez, also all of Mr. Douglas's raising. Mr. Walker, Reading, was second; Mr. A. R. Brown, third, and the Rev. L. R. Flood, fourth.

Clara, shown by Mr. C. Phillips, was placed first as the best Alpine Auricula with a gold centre. Mr. J. T. Bennett Poë was second with Dean Hole. The finest white centred variety was Perfection, shown by Mr. C. Phillips; and the second, Amazone, shown by Mr. J. Kean. The premier Alpine Auricula in the show was Mrs. Martin Smith, shown by Mr. C. Phillips. Mr. G. H. Addy, Waddon, Surrey, was first for six plants in the competition for previously unsuccessful or non-competitor. Mr. J. W. Euston was second.

FANCY AURICULAS.

The Guildford Hardy Plant Nursery staged the leading group of twelve fancy forms, having Harlequin, Moonlight, Rosy Morn, Innocence, Buttercup, Old Gold, Russett, Khartoum, Canary Cup, Belle, Twilight, and Full Moon; Mr. J. Douglas was second.

PRIMULAS AND POLYANTHUS.

Mr. J. Douglas won the first prize for twelve Polyanthuses, dissimilar, with a grand exhibit; Mr. G. Dixon, Chelford, was second; and Mr. J. W. Euston, third.

Mr. Douglas was also first for twelve single Primroses, dissimilar, showing grand clumps. The Guildford Hardy Plant Nursery, was second. Messrs. Paul & Sons, of Cheshunt, led for six double Primulas.

The first award for a group of Primulas or Auriculas was won by the Guildford Hardy Plant Nursery with a capital lot of Auriculas; Mr. P. Purnell was second, with Primulas and Auriculas mixed; Mr. J. Douglas was third.

Mr. Douglas scored for twelve distinct species of Primulas, showing P. mollis, P. japonica, P. cortusoides, P. floribunda, and P. decora amongst the rest.

The first prize for six species of Primulas was won by Mr. J. W. Euston; The Guildford Hardy Plant Nursery was second; and the Messrs. Paul & Sons, of Cheshunt, was third.

There were four competitors for the basket of Primroses and Polyanthuses arranged for effect; J. T. Bennett Poë, Esq., was first; Mr. J. Douglas, second; and Messrs. Paul & Son, third.

NARCISSUS MAXIMUS.

WHEN well grown there is none of the large trumpet Daffodils that possess a handsomer presence than Narcissus maximus. It is an early variety, however, and, perhaps, the knocking about by cold winds that it gets as a consequence of its earliness has something to do with the fact that only now and again do we see it in really first-class condition. At the time of writing it is blooming away in grand style in Battersea Park, and the two round beds of it situated near the aviary are certainly the finest examples of it that we have ever seen. The size and substance of the segments are unusually good, and impart a solidity to the flower that is far too seldom seen, thus setting off to perfection the huge and handsomely frilled trumpet which is the conspicuous

feature of the flower. There are also some good clumps of it growing amongst the grass and down by the edge of the ornamental water; indeed, with the well known varieties Emperor and Empress it evidently enjoys almost a monopoly of attention in the park above-mentioned.

POTATO GROWING IN SCOTLAND.

IT is difficult to understand why Potato planting by farmers is, in so many cases, prolonged till late in the season. Often the farmers (who cultivate many acres) may be seen planting in May. Certainly their success cannot be under-rated, as capital remuneration, by many, is received for their fine tubers. It may be worthy of note that most of the leading cultivators believe in giving plenty of room for the development of the shaws, and to allow sun and air, to have full influence on the ground. As much as 2½ ft. and 3 ft. between the rows may be seen. Of course, strong growers have the greatest space. Heavy and light land have also due consideration. On light sandy soil manure is liberally supplied, but more sparingly on damp heavy land. It is surprising to find such fine quality from strong, clayey land; but fields of highest elevation are preferred for Potato culture.—M. T., Carron, Stirlingshire.

OBITUARY.

DR. ALEXANDER PATERSON.

ORCHID growers in particular, and our readers in general will regret to hear of the death of Dr. Paterson, which took place at his residence, Fernfield House, Bridge of Allan, Stirlingshire, on Friday the 22nd inst. For many years past his name has been kept prominently before the horticultural world on account of the valuable collection of Orchids which he had gathered together at Bridge of Allan. Latterly through failing health he was less active and the outside world heard less of him, while he was prostrated with illness of several months' duration previous to his death.

Dr. Paterson was born in 1822, in Dundee, so that he was in his seventy-sixth year. When sixteen years old he entered the medical classes at Edinburgh University, and obtained his degree of M.D. in 1843. He commenced the practice of medicine in Edinburgh, but his health giving way he was advised to visit the Bridge of Allan, where he derived so much benefit that he settled down there for life, and never afterwards failed to recommend his adopted home as a salubrious and otherwise delectable resort for those in quest of health. The notoriety of the Bridge of Allan as a health resort had so augmented through the exertions of the doctor, both in the Press and by private correspondence that it became a popular spa. The community acknowledged his services in 1885 by a public presentation. He held the office of medical officer for the burgh and was a J.P. for the county.

The Doctor had a wide knowledge of Orchids and was no indifferent botanist; whilst he took an active interest in the cultivation of his favourites, as well as in gardening generally. For several years past it has been his delight to send the Queen a basket of Orchids annually on the occasion of her birthday. Many a gardener has had reason to be thankful for the privilege granted him of inspecting the Doctor's Orchids.

Independently of his practice and his love for Orchids, Dr. Paterson was an intelligent antiquary, and kept a large collection of all sorts of curios and antiques for many of which he was indebted to his numerous friends and old patients, who took pleasure in gratifying his antiquarian tastes. As with his Orchids so with his museum, the Doctor shared his pleasure with others, so that his house became a great attraction to visitors, who were welcomed by the genial and hospitable owner. He leaves a widow and a grown-up family, but his lamented death will be regretted by a wide circle of friends, not only at Bridge of Allan, but over a great portion of the country to which his influence extended.

QUESTIONS AND ANSWERS.

Marechal Niel Rose losing leaves.—J. T. Thurston: It would be unsafe to hazard a complete solution as to the cause of the lower leaves of your plant falling, so much being dependent upon circumstances. The leaves are thin in texture, and the spots are not due to any fungoid disease. The poor texture may be

due to insufficient light and ventilation in the first place. Secondly, they have evidently been injured by water hanging in globules from their edges and tips, which may have been acted upon by the morning sun or unduly heated air from the heating apparatus, while yet the ventilation was insufficient. If the leaves are too far from the glass, that would in a great measure account for their thinness, making the premature falling of the leaves to some extent unavoidable. As it is, the evil may to some extent be counteracted by judicious ventilation from now onwards, so that the health of the plant may yet be maintained, notwithstanding the bare condition of the lower portion. A rapid rise of temperature from bright sunshine may, and should be prevented by a little ventilation in the early morning, increasing it as the sun waxes stronger, and again reducing it as the afternoon wears on.

Beetle and Grub.—*L. Marsland*: The specimens you send are those of the well-known Black Vine Weevil (*Otiorhynchus sulcatus*), but too often found in vineries, Peach, and other hothouses, doing damage to a great variety of plants. The grubs attack the roots, while the weevils gnaw the leaves, young shoots, flowers, and fruits. In order to get rid of them see that all cracks and crevices of the brick or other walls are cemented. Clear away all loose rubbish in the houses that would afford them shelter. Lay down some loose boards, or pieces of bark if you like, to act as traps, inducing the weevils to lay up beneath the same. Examine the traps every morning, and destroy those you find. If any trees or Vines are affected lay a white cloth under them by day; then go in at night with a lantern. Turn on the light and tap the trees, &c., when the weevils will fall on the cloth where they may be caught before they have time to crawl away. Search for the grubs by turning out of their pots those plants suspected, repotting them in fresh soil. By perseverance, you should soon get rid of the pest.

Azalea sporting.—*Henry Thom*: This is quite of common occurrence. Some varieties are so liable to it that half the plant may produce red or other coloured flowers, while the rest may be white or white and silvery-pink according to the variety. It is merely a separation of the colours of two parents or grandparents; for, like Chrysanthemums, the varieties have been much mixed by intercrossing, so that the colours are much mixed. Some have a tendency to revert, or the colours separate in different parents. New varieties are often obtained in this way, and with the object of fixing them the sporting shoots are grafted on some ordinary variety as a stock. This might also be effected by cuttings as in the case of Chrysanthemums, but they take longer time to root, and the wood should only be half ripened.

Variiegated Abutilon.—*A. H.*: You have probably seen Abutilon Czarwitzii, or a sport similar to it from the same parent, namely from A. Souvenir de Bonn, which has now been in cultivation for some years. The new variety is a sport from the last named, and has the greater portion of the leaves of a creamy-white, changing to silvery-white when fully matured. A. Souvenir de Bonn has the white variegation almost confined to the margin.

Begonia Gloire de Lorraine.—*G. West*: What we now say is largely confirmatory of what we said on a former occasion. The plant originated on the Continent and was derived from B. scotrana and B. Dreggei, the latter being closely similar to, or according to some authorities, identical with B. parviflora. The latter, judging from the habit of Gloire de Lorraine, was the seed parent. The pollen parent is, however, very often as potent as the seed bearer in effecting bold and striking changes in the progeny from both the originals.

Strobilanthes dyerianus.—*A. J. B.*: The leaves of this species generally lose colour in winter, but particularly when allowed to run to flower. Cut the plants back and grow them on again into bushy specimens, or take the cuttings when they have attained a length of 3 in. to 3½ in., and root them in sandy soil under a bell glass or in the frames or cases of a propagating pit in the usual way. As soon as they are fairly well rooted, pot them off singly, and grow them on with cooler treatment with a judicious amount of ventilation and exposure to light, and they will assume their wonted rich colours presently.

Names of Plants.—*J. T. Thurston*: Saxifraga crassifolia (often called Megasea crassifolia).—*Sigma*: The plant is the Savin (*Juniperus Sabina*), and Saffron is undoubtedly a mistake for Savin. The plant from which Saffron is obtained, and from which Saffron Walden takes its name is *Crocus sativus*, the orange stigmas of which furnish the colouring matter in question. Savin is entirely a different thing. There are various kinds of it, that from Colchicum autumnale being Meadow Saffron.—*C. Etherington*: *Tritelia uniflora*.—*H. W.*: 1, Saxifraga Composii; 2, Aubrietia deltoidea; 3, Cardamine pratensis flore pleno; 4, Primula rosea; 5, Lamium Galeobdolon; 6, Scilla hispanica alba.—*R. H.*: 1, Odontoglossum wilckeanum; 2, Dendrobium Bensoniae; 3, Odontoglossum Cervantesii; 4, Oncidium sarcodes.

FIXTURES FOR 1898.

MAY.

- 10.—Royal Hort. Society's Committees.
- 18.—York Florists' Exhibition.
- 18.—Alexandra Palace Show (3 days).
- 25.—Temple Show (3 days); Bath and West of England at Cardiff (5 days).
- 27.—Manchester Whitstuntide Exhibition (6 days).

JUNE.

- 8.—Royal Botanic Society's Summer Show.
- 14.—Royal Hort. Society's Committees.
- 15.—Grand Yorkshire Gala (3 days).
- 20.—Royal Agricultural Show, Birmingham.
- 22.—Jersey Rose Show.
- 23.—National Society's Rose Show at Bath.
- 28.—Royal Hort. Society Committees; Special Rose Show; R.H.S. of Southampton (2 days).
- 29.—Richmond Horticultural Society; Croydon Rose Show.

JULY.

- 2.—Rose Show at Crystal Palace.
- 6.—Farningham Rose and Horticultural Show.
- 6.—Co. Boro' of Hanley Floral Fête (2 days).
- 9.—Manchester Rose Show.
- 9.—Garden Party and Exhibition, N.A.G.A.
- 12.—Wolverhampton Floral Fête (3 days).
- 12.—Royal Hort. Society's Committees.
- 13.—Durham and Newcastle Hort. Society's Show (3 days).
- 14.—National Rose Show at Halifax.
- 20.—National Carnation and Picotee Society, at the Crystal Palace.
- 26.—Royal Hort. Society's Committees.

AUGUST.

- 1.—Beddington, Carshalton, and Wallington Show.
- 1.—Leicester Show (2 days).
- 1.—Northampton Hort. Society (2 days).
- 9.—Royal Hort. Society's Committees.
- 10.—Bishops Stortford Hort. Society's Show; Hastings and St. Leonards Hort. Society's Show.
- 10.—Salisbury Show.
- 10.—Etwell & District Show.
- 11.—Taunton Deane Show.
- 17.—Shropshire Hort. Society (2 days).
- 17.—Newton Stewart Floral Fête.
- 18.—Leighton Buzzard Show.
- 19.—Devon and Exeter Hort. Society's Show.
- 20.—Leven and District Show.
- 23.—Royal Hort. Society's Committees.
- 26.—Royal Hort. Society of Ireland Show.
- 27.—Falkirk Show.

SEPTEMBER.

- 1.—Stirling Show (2 days).
- 2.—Dahlia Society's Show at Crystal Palace.
- 3.—R. B. and H. S. of Manchester, Amateurs' and Cottagers' Exhibition.
- 6.—Royal Hort. Society's Committees; Nat. Chrys. Society (3 days).
- 14.—Royal Cal. Hort. Society (2 days).
- 20.—Royal Hort. Society's Committees.
- 29.—R.H.S. Fruit Show at the Crystal Palace (3 days).

OCTOBER.

- 11.—R.H.S. Committees and Lecture.
- 25.—R.H.S. Committees and Lecture.

NOVEMBER.

- 1.—West of England Chrysanthemum Show (2 days).
- 1.—Boro' of Croydon Chrysanthemum Show (2 days).
- 1.—Kingston and Surbiton Chrysanthemum Show (2 days).
- 3.—Devon and Exeter Fruit and Chrysanthemum Show (2 days).
- 8.—R.H.S. Committees, with Floral and Botanical Demonstration at the Drill Hall.
- 8.—Highgate Chrysanthemum Show (3 days).
- 11.—Huddersfield and District Chrysanthemum Show (2 days).
- 15.—Folkestone & District Chrysanthemum Show (2 days).
- 15.—R. B. and H. S. of Manchester Chrysanthemum Show (2 days).
- 16.—Ascot, Sunninghill, Sunningdale, and District Show (2 days).
- 22.—R.H.S. Committees and Lecture.

Secretaries of Societies will greatly oblige the Publisher by forwarding early information of Fixtures.

WEST'S PATENT IVORINE PLANT LABELS

NAME TO BE WRITTEN ON WITH ORDINARY LEAD PENCIL OR PEN AND INK.

The "IVORINE" Writing Disc, being made of a specially prepared substance, having the properties of real ivory, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, washable, and does not become unreadable, as is the case with all painted labels, as the paint gets old. It is for all purposes, and will last a century either in a greenhouse or out in a garden, and not only is it always ready for use and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free.
 PRICE:—9d. per dozen, 8s. per Gross; per post.
 Supplied by all Nurserymen, Florists, &c.

THE LEEDS ORCHID CO.,
 ROUNDHAY, LEEDS.

With every doz. is enclosed new vars. of 1898. **VIOLAS**, 1 doz. Champion vars., 1/6; 2 doz., 2/6. Blue, White and Yellow, separate or mixed colours, 25, 2/6; 50, 4/6.

DAHLIAS, from any section of our world-renowned collection, Show, Fancy True Cactus, Pompon and Single, 1 doz. superb plants and vars., 3/6; 2 doz., 6/6.

Summer **CHRYSANTHEMUMS**, 1 doz. best selected vars., 2/3. Every plant offered is in the best of health, true to name and carriage paid. Cash refunded if unsatisfactory in any way. Our **NEW BOOK** on the **PANSY, DAHLIA**, etc., 7d.; free on all orders of 5/-. New Plant List free.

LISTER & SON, Florists, ROTHESAY.

Caladiums

FINEST COLLECTION in the World. We make a speciality of **CALADIUMS**. Gold Medals Manchester & Leicester. Silver Cup, R.H.S., &c.

Satisfaction guaranteed. **JOHN PEED AND SONS**, West Norwood, London.

ORCHIDS.

Clean Healthy Plants at Low Prices.

Always worth a visit of inspection. Kindly send for Catalogue.

JAMES CYPHER,
 Exotic Nurseries, CHELTENHAM.

1898. **FORBES' CATALOGUE** 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

Is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other valuable information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

JOHN FORBES,

ESTABLISHED 1870.

Nurseryman, Hawick, Scotland.

JADOO FIBRE.

WONDERFUL SUCCESS.

At a great Horticultural Exhibition recently held in New Orleans, plants grown in Jadoo were awarded

20 FIRST PRIZES and 2 SECONDS.

ADVANTAGES OF GROWING PLANTS & SEEDS IN JADOO.

Seeds germinate much more quickly in Jadoo than in earth.

Greater perfection easily attained.

Suits all kinds of plants.

Is much lighter than earth.

Less frequent watering is required.

The flowers are larger, of richer colour, and last longer.

No soil to mix: No manures required.

Ghent Exhibition, 1898. The two principal prizes of the show (including Gold Medal), were gained by plants grown in Jadoo, by Messrs. Byrvet, Bros., Haarlem.

PRICES:—3/6 per bushel. 8/- per 3-bushel sack. Special prices for large quantities.

Testimonials and full directions for use post free.

Obtainable through any Nurseryman, or from—

JADOO, Limited, EXETER.

BOUGAINVILLEA CYPHERII.

Grand new plant, largest and best coloured Bougainvillea ever offered, a splendid grower and remarkably free bloomer. Awarded First Class Certificate at the Wolverhampton Floral Fete, 1896, and also at the Oxford Commemoration Show, 1896, and also the Gold Medal at Shrewsbury Great Royal Commemorative Show, 1897, for the best new plant in the exhibition.

JAMES CYPHER has great pleasure in offering this grand novelty. Plants ready end of May, price 10/6 each.

Exotic Nurseries, CHELTENHAM.

KEYNES' CACTUS DAHLIAS.

Best Plants. Best Varieties. Moderate prices.

Send Post Card for Catalogue.

About half the good varieties in commerce were raised here.

KEYNES, WILLIAMS & COMPANY,
 Dahlia Growers, SALISBURY.

FOWLER'S LAWN SAND.

(INTRODUCED IN 1877).

A Certain and Effectual Destroyer of Daisies, Plantains, and Weeds generally, so troublesome and unsightly on Lawns. A renovator also of old and decayed Lawns.

All Lawns should be dressed at least once a year with this article, its fertilizing properties being equal, if not superior, to anything at present offered.

PRICES—In Tins, 1s., 2s. 6d., 5s. each; in Casks, ½ cwt., 8s. 6d.; ¾-cwt., 16s.; 1-cwt., 30s. each.

Manufacturers, **CORRY & Co., Ltd.**
 Finsbury St., LONDON, E.C.

To be had of the Seed and Nursery Trade generally.

CAMPBELL'S FUMIGATING ROLLS.

The cheapest, simplest, and most effectual method of fumigation known. No lamp, fumigator, oil or spirit required. Simply light the Roll, and hang it up.

| REDUCED PRICES:— | | | | s. | d. |

JOHN PEED & SONS, West Norwood, London

ORCHIDS of the highest quality, every plant guaranteed true to name, from 2/6 each. Please send for free list.—**P. MCARTHUR**, The London Nurseries, 4, Malda Vale, London W.

CARTERS' HOLBORN PRIMULA.

—SINGLE or DOUBLE in choicest mixture. Our Prize Strain of the beautiful winter-flowering conservatory plant is the finest in cultivation. We were the originators of the blue variety now so popular. SINGLE, separate colours, white, scarlet, blue or pink. In Sealed Packets, price 2s. 6d., 3s. 6d., and 5s. each, post free.

CARTERS' BRILLIANT CINERARIA.

—The very finest strain ever submitted to public notice. Awarded Highest Prize, Medal Royal Botanic Society, 1837, Royal Horticultural Society, 1898. A customer recently sent us blooms measuring 3½ inches across. Fresh seeds, all colours, mixed. In Sealed Packets, 2s. 6d., 3s. 6d., and 5s. each, post free.

CARTERS' VICTORIA CALCEOLARIA.

—Our grand strain is the very perfection of scientific culture, being compact in habit, and brilliant in colour and size of blossoms. A customer writes:—"The plants were a perfect picture, many with 600 blooms; we took first prize." Fresh seeds, all colours, mixed. In Sealed Packets, price 2s. 6d., 3s. 6d., and 5s. each, post free.

CARTERS' INVINCIBLE GLOXINIA.

—We have brought this fine summer decorative plant to the highest excellence. H.R.H. the Princess of Wales greatly admired our exhibit at the Temple Exhibition last summer, and was graciously pleased to pronounce it an "exquisite display." Fresh seeds, all colours, mixed. In Sealed Packets, price 2s. 6d. and 5s. each, post free.

CARTER'S, THE QUEEN'S SEEDS-MEN, 237, 238, and 97, HIGH HOLBORN, LONDON.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, MAY 7th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, May 10th.—Royal Horticultural Society: meeting of Committees at 12 noon.

Sale of established Orchids by Messrs. Protheroe & Morris.

WEDNESDAY, May 11th.—Royal Botanic Society's exhibition at Regent's Park.

Sale of Lilies, Palms, and greenhouse plants by Messrs. Protheroe & Morris.

FRIDAY, May 13th.—Sale of imported and established Orchids by Messrs. Protheroe & Morris.

EXPERIMENTS WITH CROPS AND MANURES.

—A pleasing and satisfactory sign of the times is the activity displayed in various parts of the country in experimenting with the cropping of land under local conditions as to soils, climatic influence and other conditions of environment. General conclusions for any wide area or tract of country are not only useless, but would be misleading to cultivators; hence the value of giving results obtained under the prevailing conditions in separate centres or districts. Most of these experiments are being carried on under the auspices of agricultural schools or colleges, but their findings apply equally to horticulture in so far as the plants dealt with are of a kind common to both industries. We should like to see departments attached to different colleges dealing exclusively with gardening for the simple reason that many important garden crops or plants do not come under the domain of agriculture at all. Peas, Beans, Potatoes, all the Brassica tribe, and occasionally some other crops, such as Carrots and Onions, are common to both agriculture and horticulture; but that is all unless orchards and market gardening generally are to be regarded as farming. Even then the hundreds of plants in common cultivation, with which British gardeners have to deal, are entirely disregarded by the professors attached to agricultural colleges.

Supplement V to the "Journal of the University Extension College, Reading" is before us, containing the fourth annual report on field experiments. The report deals with various trials which have been

conducted during the past year in Berkshire, Dorset, Hampshire and Oxfordshire. The county councils for these respective shires co-operate with the College at Reading, and each grants subsidies to cover the expenses. During the past year the experiments consisted largely of testing the effects of manures on the principal farm crops, but arrangements have been made for experiments that will continue from year to year till the whole course of a rotation of crops has been completed. Much valuable information should be obtained from this course regarding the value and effects of unexhausted manures, that is, of those that retain their fertilising faculty in the soil for two or more years and thus benefit succeeding crops. The average results for different centres are given separately. Samples of soils from the different districts have been analysed, and glass jars containing sections of soil have been stored in the College Museum for future reference. The experiments have been carried out under the supervision of Douglas A. Gilchrist, B.Sc., the Director of the Agricultural Department. The report of the experiments should prove valuable to those farmers who are provident enough to avail themselves of the information supplied.

Experiments were made with Swedes and Turnips with the view of combating or checking the destructive and much dreaded Finger-and-toe Disease (*Plasmodiophora Brassicæ*.) Under the name of club or clubbing gardeners are only too familiar with this pest of Cabbages, Cauliflower, Brussels Sprouts and other members of this important tribe. Some important and interesting results have been obtained at Headington, Oxford, in a soil consisting chiefly of fine sand, where one would have expected that the fungus could make but little headway. In 1895, the crop of Swedes outside the experimental plots was almost completely destroyed. It was observed that the disease was most virulent where farmyard manure had been applied, a result due, no doubt, to the greater amount of moisture available for the fungus. The soil consisted of sand overlying the Middle Oolite system, a calcareous formation; but where the sand was deep it was very poor in lime, and here the greatest amount of damage occurred. Eleven plots of land, each $\frac{1}{12}$ of an acre were marked off in 1896 upon the same ground where the disease had been so prevalent the previous year. Dressings of varying quantities of caustic lime, gas lime, sulphate of copper, bleaching powder and basic slag were given to separate plots in January to give them time to disinfect the soil before the time of sowing the Turnips arrived. They were applied and stirred into the soil to a depth only of 1 in. or $1\frac{1}{2}$ ins., so as to give them a good chance of being evenly distributed.

The roots were carefully classified at the end of the growing season, according as they were sound, slightly diseased, or badly so, and each heap weighed separately. The results were singular and striking, but the obvious conclusion was that the fungicides applied had been inoperative. None of the dressings had appreciably reduced the ravages of the disease, while, singularly enough, the heaviest lot of sound roots was obtained from the undressed plot. This gave Turnips at the rate of 5 tons 6 cwt. per acre perfectly free from disease. The next heaviest weight was 5 tons 4 cwt. of sound roots where a dressing of 3 tons of gas lime per acre had been given. The heaviest total crop came off the plot dressed at the rate of 4 tons of caustic lime per acre. The next highest total again came from the plot dressed at the rate of 3 tons of gas lime. It was obvious that no reliable data could be deduced from the results. It

was resolved therefore to continue the experiments on the same plots last year, without further dressing, in order to ascertain whether the reputed fungicides would show any appreciable results after a more lengthened period in which to disinfect the soil. In 1897 these expectations were fully realised, for excellent results were obtained by the use of caustic lime, gas lime and chalk, that had been applied in January 1896. Nothing satisfactory was obtained from dressings of sulphate of copper and bleaching powder. The conclusions, therefore, are that lime in some form or other has the effect of destroying the fungus to a greater or less extent, but that it must be applied to the soil some considerable time previous to the sowing of the Turnips. We should reasonably expect that the same instructions would apply to all other crops of the Brassica tribe.

Elaborate experiments were also made with Potatos in the Trial Grounds of Messrs. Sutton & Sons, Reading, as well as at five other centres. The results in each case go to prove that Potatos always give the most satisfactory returns from ground that has been manured for some previous crop. As we recorded on a previous occasion the application of artificial manures may not only not be serviceable, but prove harmful on dry or sandy soils in drouthy seasons. Provided the rainfall were sufficient during the growing season artificial manures would give satisfactory or even handsome returns; but the Potato is a shallow rooting plant, and suffers in the southern counties in drouthy seasons, to an extent of which northern growers enjoying a moister climate can have no conception. The most generally useful manure for Potatos has been found to consist of 12 tons of farmyard manure, $1\frac{1}{2}$ cwt. nitrate of soda, 3 cwt. superphosphate, and 1 cwt. muriate of potash per acre, all applied in the autumn previous to planting, except the nitrate, which should be given in two applications during the earlier period of growth.

The Ghent Quinquennial.—It is estimated that this superb show cost 100,000 francs, or £4,166 13s. 4d. in English money.

May Day in Bermondsey.—The annual May Day festival of the Children's Guild of Play was held in the Town Hall, Bermondsey, on Saturday, the 30th ult. The Chairman of the London School Board (Lord Reay) presided.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, May 10th, in the Drill Hall, James Street, Westminster, 1—5 p.m. At 3 o'clock the Rev. Prof. G. Henslow, V.M.H., will lecture on "Some of the Plants Exhibited." The schedule of the show of British grown fruit, to be held at the Crystal Palace, on September 29th, 30th, and October 1st, is now ready and can be obtained on application to the Secretary, R. H. S., 117, Victoria Street, S.W.

Havoc by Hail.—The towns of Plymouth, Devonport, and Stonehouse were visited on Monday by a hurricane of wind and rain accompanied by a storm of hailstones of large size. Many places of business had to cease work for the day owing to the work-rooms being deluged as a result of the down pipes refusing to act. At the dinner-hour the main entrance gates to Keyham Dockyard were blocked by hailstones and debris washed down from the higher thoroughfares, and some twenty carts were at work removing the obstruction. At the Marine Barracks, Stonehouse, the covered drill shed was inundated, and the fire brigade were requisitioned to pump the water out. No casualties from seawards are yet reported, but from the fruit-growing vicinity of the Tamar it is announced that the crops have been irretrievably damaged by the hailstorm. The damage is estimated at several thousand pounds.

Mrs. McKinley receives so many flowers daily at the Windsor Hotel, Washington, that a special cold store-room has been set apart to maintain them in a fresh condition.

Raffia.—The finer matting now so extensively used for tying purposes in gardens has no affinity with the material of which Russian mats are made. It is prepared from the leaves of *Raphia Ruffia*, a Palm native to the island of Madagascar.

Species of Cacti.—Something like 1,000 species of the order Cactaceae are admitted by botanists; but gardeners have greatly multiplied this number independently of those which are the direct result of artificial hybridisation. Most of them belong to tropical and subtropical North America, including Canada. A few are found in Brazil and Chili. A solitary species of *Rhipsalis* is found in South Africa, Mauritius and Ceylon, being the only member of the family truly indigenous to the Old World. Several *Nopaleas* and *Opuntias* introduced from America have been naturalised on this side of the Atlantic. Farmers in Cape Colony would be glad to get rid of the *Opuntias* which now infest their fields.

National Amateur Gardeners' Association.—The first Saturday afternoon excursion of this association takes place on the 7th inst. As we go to press we notice that the members have for the second time within the last three years made the beautiful gardens of Aldenham House, Elstree, the destination of an outing. They have reason to be thankful for the kind permission of Lord Aldenham to visit his gardens and grounds; and no doubt they will highly appreciate the horticultural skill of the gardener, Mr. E. Beckett, independently of his welcome and personal attention to the party. The association has also made arrangements for visiting the Trial Grounds of Messrs. Sutton & Sons, at Reading, on the 23rd July next. On that date the main party will travel by the train leaving Paddington at 1.45 p.m. Those wishing to leave sooner will be permitted to travel by an earlier train.

M. Ed. Pynaert-Van Geert.—We learn with much satisfaction that M. Pynaert, of Ghent, Belgium, has been named a Chevalier du Mérite Agricole. He was for many years professor at the School of Horticulture, Ghent, in company with his three illustrious friends, MM. Em. Rodigas, Van Hulle, and Burvenich. All four of them have come to be designated familiarly as the four-bladed Clover or Trefoil. They have rendered great services to Belgian horticulture, collaborating amongst them several journals, organising conferences, occupying themselves with exhibitions, and in a word defending and supporting the horticultural interests of their country. When the Government of France, in 1890, wishing to develop the hothouse industry of their country, had inscribed a duty of thirty francs per 100 kilogrammes, in addition to the ordinary tariff, M. Ed. Pynaert and M. Bruneel went to France in order to combat the projects of the Government. They acquitted themselves of their mission with great address and energy, resulting in establishing an equal reciprocity between the two neighbouring countries. We congratulate M. Pynaert on his recent distinction from France.

The Pope and the Gardener.—Whilst walking in the gardens of the Vatican recently, Leo XIII came across an undergardener who was engaged in digging. His Holiness is a zealous student of the practical adjustment of scales of remuneration for workmen, and is always glad of the opportunity of putting some of his broad-minded theories to the test. So he said to the gardener: "My good man, how much do you receive a day for your labour?" "Two francs, your Holiness," was the reply. "And how many children have you?" "None, your Holiness." "And does your wife also work for her livelihood?" "Holy Father," said the labourer, "I have never been married." The Pontiff paused and reflected, "Then, my good man," said he, "I shall give instructions that from henceforward, instead of two francs a day, you shall receive a franc and a-half, and that half-a-franc shall be added to the wages of some other workman who has a wife and family to support." His Holiness appeared pleased with his own decision; not so the gardener, who failed to see the justice of the decision, and by no means shared in the enthusiasm of the Pope over his solution of the question.

Quick Changes of Temperature.—We in England are apt to grumble at the great and sudden changes in temperature from day to day, and we have had our full share of such vicissitudes this spring, but parts of the United States have been more hardly treated, for on April 5th it was freezing all day, and on the 13th, a little more than a week later, the thermometer stood at 70° Fabr.

Addition to Greenwich Park.—The recent addition made to this park is now thrown open to the public. The grounds, known as "The Wilderness" were at one time attached to the Chief Ranger's Lodge on Blackheath, the residence of H.R.H. the Duke of Connaught. The wild character of the place has disappeared by the making of paths and converting the erstwhile stagnant pool into a miniature pond. There are some fine trees on this addition to the park, and all has been tastefully laid out.

The Island of Cuba, which is the centre of the world's interest at the present time, is one of the most fertile spots on the earth's surface. It is stated by authorities that a farm of 33 acres will produce in one year thousands of pounds each of sugar, coffee, tobacco, cacao, cotton, indigo, maize, rice, and bananas. Of the total area of the island, however, only ten per cent. is under cultivation, seven per cent. is not reclaimed, and four per cent. is forest. Great tracts are unexplored. The forests contain many valuable woods, such as cedar, mahogany, and rosewood. The commerce of the island, even under the incapable rule of the Spaniards, has been great, for in 1893, before the curse of war fell in all its blighting misery, she exported 718,204 tons of sugar out of a total production of 815,894 tons. The exports of leaf tobacco amounted in the same year to 227,865 bales, whilst 147,365,000 cigars and 39,581,493 packages of cigarettes left her shores. Now everything has changed, and the people are in the direst misery.

Ink, Ancient and Modern.—The statement is frequently made, says *The Journal of the Society of Arts*, that since Mediaeval times the art of ink-making has declined, and it is adduced as evidence that on documents written over 800 years ago the writing is more legible and better preserved than that on some written within the last 100 years. It is probable that this inferior ink has come into use from the desire to employ an ink of more perfect fluidity that would facilitate rapid writing better than the old ones. Vitruvius, Pliny, and Dioscorides each speak of ink as containing soot or lampblack mixed with some mucilaginous fluid, and the legibility of the old records was doubtless due to the fact that carbon was the base of the ink, and that when this began to be discarded the fading of manuscripts became more rapid. An ink receptacle found at Herculaneum contained a quantity of ink which proved to be composed of lamp-black mixed with oil. Such ink must have required constant stirring, and a brush instead of a pen was probably used for writing. The lamp-black, says Underwood, was ground up with the oil as painters' colours are now, and this throws light upon the meaning of the taunt hurled by Demosthenes at his great rival Aeschines, that the latter had been compelled in his youth, through poverty, to sweep the school, sponge the benches, and grind the ink. The rapidity with which carbon settles out from the liquid in which it is suspended precludes its use for modern commercial inks. The extract of gall-nuts or other tannin matter in combination with an iron salt, which forms the base of most black inks of the present day, was used many centuries ago, and was at first mixed with lamp-black. The coloured inks of to-day are chiefly simple solutions of aniline dyes, but logwood and other vegetable dyes are still used to a considerable extent, as they were by the ancients. A very remarkable modern fireproof ink is used for writing on fireproof paper largely composed of asbestos. This ink has a platinum salt for its basis. Indian ink so much used by draughtsmen is chiefly made in China. It is a mixture of carbon and gum with the addition of a small quantity of musk or Borneo camphor. To make it properly the ingredients must be of the best and the carbon must be finely divided. After the carbon and gum have been mixed, the product has to be slowly dried, and moulded into sticks to which a high polish is subsequently given by brushing them with a hard brush anointed with beeswax.

He was a vegetarian.—Brown; "I thought you were a vegetarian, but I bear you eat mutton." Robinson: "I am not a bigoted vegetarian; I only eat the meat of animals that live on vegetable food."

The Oxlip in Belgium.—In this country the Oxlip (*Primula elatior*) may be regarded as a very local plant, being confined to two areas in Essex, Suffolk, and Cambridge, with two other small, outlying spots. It is much more abundant upon the Continent, and grows by the acre in moist meadows and other low-lying places between Ghent and Brussels. The plants cover the ground about as thickly as the Primrose and Cowslip do in some parts of this country where they have not been destroyed either by the plough or by wholesale uprooting by the "penny-a-root" marauders. The plants in Belgium form thriving tufts of several crowns throwing up numerous flower scapes from 4 in. to 8 in. in height, and practically giving the meadows a pale yellow hue.

Tomatos and Early Vegetables in the South of France.—According to the *Nord Horticole* it is only a few years since the Tomato was, particularly in the neighbourhood of Antibes, the object of extensive cultivation. This cultivation has, however, diminished considerably of late because it has ceased to be so remunerative as in the past. Both Egypt and Algeria have become close competitors in this direction. The first crops of the season in these countries arrive rather sooner at maturity than those growing on the French side, and the placing of these upon the market have brought about a sensible lowering of prices. Nevertheless, the resources of vegetable culture are many, as the collections of vegetables got together by the "Syndicat de Cagnes," and by MM. Vilmorin-Andrieux & Co. have proved. The culture of Asparagus, for instance, has been absolutely transformed. Instead of old local varieties, poor and miserable, the grand varieties of Argenteuil have been substituted, and the results obtained have been excellent. M. Maraini has been especially successful. We must also make mention of the Strawberries of M. Nigon, the Artichokes shown by M. Herbert, and the collections of vegetables of MM. Angosso, Rondelli, and Malaussena which illustrate the magnificent results which can be obtained in this naturally favoured country.

DWARF BEAN, VEITCH'S EARLY FAVOURITE.

As the new year comes round, in most places where glass structures exist to any extent, the owners are looking forward to have early forced vegetables, and these are amongst those most frequently asked for. This being to those who have to provide for the demand are always anxious to obtain a variety that comes quickly into use. All those who have been cultivators of French Beans from thirty to forty years, will remember many selections being put on market, all more or less good.

For many years I pinned my faith to Osborn's Prolific as a quick dwarf early kind, with Ne Plus Ultra to follow; but last year I obtained a small supply of Veitch's Favourite, and tried it beside Osborn's and one or two other kinds, with the result that it was earlier than either of them, the pods being large, very straight, and of first-rate quantity. Some were sown later, and became ready for use early in May, being grown in 3-in. pots, six plants in a pot, the soil being good, and the plants stimulated when in fruit; and from these we had some of the best Beans I ever saw.

This year our first supply was sown on December 23th in 7 in. pots, and from these we had Beans ready for use on February 14th. Ne Plus Ultra sown at the same time was twelve days later. Everyone who wants a good quick Dwarf Bean should give this a trial, as it is first-rate.—J. C., Chard.

A FINE STRAIN OF POLYANTHUS.

A BOXFUL of cut flowers of an admirable strain of Polyanthus reached us the other day from Mr. W. Angus, gardener to J. Ogston, Esq., Norwood Hall, Cults, Aherdeen. They were cut from the open ground and had stout stalks 6 in. to 9 in. in length, and therefore well adapted for placing in water. Mr. Angus saves seed of the best varieties every

year, and sows it in a mild botbed sometime in March. The seedlings are pricked out in due course, so as to facilitate and encourage good growth during the summer months. Early in October they are placed in their flowering quarters, where they prove a source of great attraction for many weeks when in bloom. All were delightfully fragrant, and redolent of the old-fashioned gardens of the spring time of the present generation.

The flowers sent exhibited a considerable amount of variety, but we were particularly taken with a golden yellow one, having five faint rays round the centre; otherwise, the usual orange eye was wanting, leaving a pleasing, uniformly golden flower. This ought to make a good bedding variety. The yellow sorts, with a large orange eye, were also in good form. The white varieties were, however, deficient in size. Crimson selfs varied from a glowing red-crimson to dark maroon, almost black, all being certainly fine of their colour. The gold-laced varieties were also fine, one in particular being quite equal to many of the named varieties in the clearly defined outline of the lacing and the crimson-maroon body-colour. There were also good purple sorts with large flowers. Red, purple, and crimson varieties, edged or laced with white, might be considered fancies. They certainly add greatly to the bizarre effect of the whole in mixed plantations. These hardy flowers evoke a considerable amount of enthusiasm amongst all classes of people, and we congratulate Mr. Angus on his strain.

INTERESTING WILD PLANTS IN DEVON.

LAST week I had an opportunity of looking at some of the Devon wild flowers, and found two of the three sundews, *Drosera rotundifolia* and *D. intermedia*, growing on Woodhury Common. *D. anglica* grows also, I believe there, but I have never met with it. At the same spot I came upon *Pinguicula lusitanica* in some abundance, *Schoenus nigricans*, the black hog-rush, and the lovely yellow mitred fungus (*Mitrula paludosa*) floating in the water on dead leaves.

At the mouth of the River Exe, which is about a mile and a half wide, juts out a large sandbank reaching from the Great Western Railway line nearly to within a quarter of a mile of Exmouth, the river flowing into the sea between the end of the bank and the Exmouth shore. This is known as the Warren, and in the fifties there were still a great number of rabbits on it, though I believe they have now all disappeared. I took the ferry from the Exmouth beach and walked over the sand to the farther extremity and saw much that was interesting. Parts of the sand are well kept together by the Marram Grass (*Psamma arenaria*). It is also called mat grass, starr, and bent, the two latter names occurring in an Act of Parliament passed in the reign of George II., which describes it as a rush or shrub. The Act forbids the cutting of it in the north-east coast of England and especially in Lancashire, as it is stated that the best way to preserve the sandhills from being blown away and so letting in the sea and destroying cultivated land is to preserve this grass; and any person cutting it without the leave of the owner is subjected to a penalty of twenty shillings, or in default three months' hard labour in the House of Correction. It seems, from the Act in question, that this grass was cut by "idle persons and disposed of for the purpose of making mats, brushes, and hrooms or hesoms." In Anglesea it is still used for making baskets and ropes. It is stated that were it not for this grass the town of Hull would have been long since washed away; and Holland's sandbanks are kept up by it in conjunction with a sedge (*Carex arenaria*) and Lyme Grass (*Elymus arenarius*).

The pretty little cress *Teesdalia nudicaulis* grows plentifully on the Warren, and already many plants were in seed. A few plants of *Cakile maritima* were also flowering. The Portland Spurge showed up well with its bright-red leaves, and at each step the flowers of the Stork's-hill (*Erodium cicutarium*) were to be seen varying in colour from lilac to white. Very like this last flower, but with grassy leaves, I found another flower—and this find is the reason of my writing to you—a flower which grows only on this particular Warren in Great Britain, though I am told it is a common flower in Jersey and Guernsey. I mean *Trichonema Columnae*. It is a modest little

flower, white in colour, veined with pink, and not growing more than from $\frac{1}{2}$ in. to 1 in. out of the ground. It is a bulbous plant, in flower just at this time, and few, I fancy, have seen it. As *Euphorbia pilosa* only grows near Bath in this country, and is not found again until Portugal is reached, so would this little flower seem to be connected with a southern flora, for it is plentiful on sandy hillocks in southern countries.

I wish to record that since I have returned to London I have gathered, growing wild, in an open meadow the Snake's Head (*Fritillaria Meleagris*) within nine miles of London, on April 29th, 1898.—*J. C. S.*

PEOPLE WE HAVE MET.

MR. WILLIAM CARMICHAEL.

THE subject of this sketch was born in the beautiful Vale of Upper Strathearn. He was educated at the parish school, which was as efficient in the early part of the century as now, thanks to John Knox for having an endowed school established in every parish, as well as a kirk. The heritors were obliged to build to build a school, a master's house, and provide a playground. John Knox ordained that every head master should have a fair knowledge of Greek and Latin, that he was to receive a salary of not less than £60 a year, in addition to the fees, and that the latter should not exceed 10s. per half-year. Scotch boys, therefore, had advantages in those days not possessed by their English contemporaries.

At the age of fourteen Mr. Carmichael informed his mother that he wanted to be a gardener, to which she replied, "Dinna be a gardener, Willy, as it is a poor, wandering trade, besides, you hinna a frien' in the gardening world." "I shall be a gardener, mother," he replied. At the first election after the Reform Bill, he went with his father to Crieff, when the latter went to give his vote. There father and son met the head gardener to the Duke of Montrose, Buchanan House, and Mr. Carmichael, sen., remarked that his son wanted to be a gardener. The Duke's gardener said he would be glad to have the boy, that his terms were £15 as apprentice fee, and that the lad would be bound for three years.

Buchanan House was then one of the best places in Scotland. Mr. Montgomery was an old Kew man, and a model gardener in every respect. The garden was about twelve acres in extent, and Mr. Montgomery was a great man for trenching. He used to walk up the garden, saying, "Now my lads, give it the steel; when I was a young man at Kew I used to give it right and left." There were six journeymen and labourers besides the boy. Grapes, Pines, Peaches, Nectarines, and hardy fruits were well done. Mr. Carmichael was never under a gardener who could wield the pruning knife so well, or was a better kitchen gardener. The walks were rolled every morning while the family was in residence, and not a weed was to be seen.

After spending his three years, Mr. Carmichael got into the Royal Botanic Gardens, Edinburgh, under the great Mr. Wm. McNab, to study botany under Professor Graham. Mr. McNab was an excellent cultivator, and the father of Heath culture. After staying about two years his master sent him as foreman to Mr. McMath, at Archerfield, and afterwards at Drumlanrig. Before Mr. Carmichael had been two years at Archerfield, Mr. McNab sent for him and engaged him as principal foreman to the Duke of Norfolk, Arundel Castle, Sussex. As Mr. McNab employed fifty men, and was very strict with them, the subject under notice was much surprised at receiving an invitation to dine with him. This was before the days of railways, so Mr. Carmichael sailed from Leith to London, and from thence travelled to Arundel by coach, a distance of fifty miles.

There were about forty men employed in the gardens, but Mr. Wilson, the head gardener, was not considered very expert. The collection of fruit trees, however, was fine, wall trees in particular being second to none in the matter of training. There were no table decorations in those days, a good supply of fruit and vegetables being all sufficient. Mr. Gilpin was landscape gardener, and Mr. Carmichael got some valuable hints from him which were serviceable in after years. About two years later the adjoining estate of Bignor Park was in want of a gardener, and Mr. Wilson told his foreman that he wanted to give him a start in life. Mr. Carmichael

objected on the score of youth, but his master drove him over to Bignor Park, a distance of eight miles across the South Downs, where they had an interview with Mr. and Mrs. Hawkins. The squire was pleased with the appearance of Mr. Carmichael, but objected on the score of youth. Mr. Wilson exhibited great tact, however, and told Mr. and Mrs. Hawkins that his foreman had been educated in a good school, was full of energy, and a better gardener than himself. The objection was then dropped.

Mrs. Hawkins was a niece of the great botanist Sibthorp, and inherited his taste. When Mr. Carmichael asked her whether he might purchase a few Cape Heaths she replied that she had already spent a good deal in them, and had been told by her previous gardener that they could not be grown in Sussex. Mr. McNab, of Edinburgh, however,

MR. WILLIAM CARMICHAEL.

obliged him with three dozen bushy plants, which he grew like weeds and exhibited. The late Mr. Glendinning, of Turnham Green, then travelling for Lucombe, Pince & Co., Exeter, called at Bignor Park, and was much struck with the Heaths. Mr. Ewen, of Petworth, heard that Mr. Tugwell, of Crowe Hall, Bath, wanted a gardener who could grow Cape Heaths and hard-wooded plants, and wrote about Mr. Carmichael, with the result that the latter had a telegram to go there immediately.

Thus after being three years at Bignor Park, Mr. Carmichael moved to Crowe Hall, where his employer allowed him to exhibit Heaths and erect new houses. Mr. Tugwell proved the best master he ever served. Mr. Carmichael, in the course of ten years, got together the finest collection of Heaths (over 100 varieties) in the county. After being at Crowe Hall three years, he won about £60 annually at Bath, Bristol, Cheltenham, and other shows.

After serving ten years at this place he next moved to Dunmore Park, Stirlingshire, as general manager. Lord Dunmore was then a minor, but asked whether money would make his gardener stop with him. He did stay for six years, when H.R.H. the Prince of Wales, offered him, unsolicited, the entire management of his place at Sandringham, and the laying out of it under the directions of the Princess. Everything had to be made or re-modelled, and Mr. Carmichael saw nothing but incessant toil before him; but he was just the man to put a "stout heart to a stey brae." He turned a Turnip field of fifteen acres into a kitchen garden. During the ten years of his stay at Sandringham he also made about 500 acres of plantations, thinned all the woods which were in a neglected state, and made the game covers. He had from 300 to 400 labourers under him, trenching for plantations and road making. The first job he had when he went there was to lay out the ground of the Bachelor's Cottage, now enlarged and called York Cottage.

It is now one of the keenest pleasures of Mr.

Carmichael's life to visit Sandringham and see the effect of his labours. He planted most of the rare Conifers which are now fine trees. He also took to the Home Farm for a few years. After leaving Sandringham he went to lay out the new gardens at Nowton Court, Bury St. Edmunds. J. H. Porteous, Esq., is a great man for Coniferae, and has a fine collection.

The hero of this short sketch has had a long and active career, but is now resting on his oars, having chosen Edinburgh in his retirement—the word is, however, scarcely correct, for he is still a gardener, and says that if he had to begin his career over again he would choose gardening as his profession. He was fortunate in getting a small garden, about a rood in extent, which is entirely filled with seedling Strawberries. He has got new blood into the race by crossing Waterloo with other sorts. They are great bearers, unsurpassed in flavour, and only want to be known to be widely cultivated. Mr. Carmichael still possesses great vitality, and energy, and takes infinite delight in conversing with a brother of the craft about his favourite profession.

THE LATE CHRYSANTHEMUM SHOW AT BELFAST.

ON page 55r of your issue for April 30th, I notice you refer to the dispute raised by Mr. Peter Brock and others, and as it very much concerns myself, I shall be obliged if you will kindly allow a short space in reply to the same.

The facts of the case I will deal with as briefly as possible. The bloom of the yellow sport shown by Mr. Mease was exactly the same in colour as shown by him at the Royal Aquarium which was labelled Yellow Mme. Carnot and passed as such. He instructed his assistant who was in charge of his blooms at Belfast to name it Yellow Mme. Carnot, but Mr. W. Wells advised him to label it Primrose sport from Mme. Carnot. In looking over the stands I did not notice the name, but took it for granted it was a bloom of Yellow Mme. Carnot, and passed it as such. I may here mention we had blooms of that variety about as pale in colour as the one shown by Mr. Mease. During the afternoon a protest was lodged and I was called into question. Mr. Wells and Mr. Mease's assistant both assured me that it should have been shown as Yellow Mme. Carnot. I certainly did not feel justified in disqualifying the stand, as I knew full well that in several places Mme. Carnot sported the previous season.

Respecting the paper collars, if the rules were violated to the extent stated, surely it was the place of Mr. Brock, or whoever noticed it, to enter a protest at the proper time, and the case would have been thoroughly investigated, and, as far as I was concerned, justice done; but I heard nothing of this till I read it in print some weeks after, and the writer then attempted to criticise the stand of blooms in question, and in replying I did state that cardboard or no cardboard the blooms would have received the same award. At the same time I attempted to make it clear, and I think most readers would have understood me as meaning to take away the cardboard and the stand was well ahead of the next competing stand. This I fully explained in a further reply later.

I do not wish for one moment to attempt to screen myself from all blame, I honestly did my best to do justice. I was the only judge appointed to judge the principal classes of cut blooms, and I had a considerable amount of work to do. Perhaps it was somewhat unfortunate that three English growers received the three highest awards at the hands of an English judge; but I value my reputation far above showing any partiality.—*Edwin Beckett.*

I have read your interesting remarks, *re* the above in your issue for 30th ult., and as you refer to further explanation being required, I beg to ask your insertion of the following:—It has been made perfectly clear that Chrysanthemum Mrs. W. Mease was not in commerce at the date of the Belfast show, Mr. Mease's stand should therefore, in justice to other exhibitors, have been disqualified. Mr. E. Beckett, of Aldenham House, Elstree, was the sole judge of this great show. The Belfast show dispute is a matter which other Chrysanthemum show committees should take timely notice of and appoint such expert judges as

will fully understand and adhere to the rules of competition, and make their awards in accordance with such regulations as their schedules adopt or imply.

The second point of issue relates to the cardboard collarets as employed in the third prize stand, exhibited by Mr. Henry Perkins, of Greenlands, Henley-on-Thames. The Ulster Horticultural Society adopted "the regulations" of the National Chrysanthemum Society. Having regard to this fact, how could collarets be considered permissible? It was clearly shown by the blooms that were dismantled on the second day of the show that, without such extraneous aid as cardboard collarets, the third prize stand would have had to take a much lower place in the list of awards. The Belfast committee only allow till 3 p.m. on the first day of the show to lodge protests. It being the second day when the collarets were discovered a protest was then useless. The first prize stand, exhibited by Mr. W. H. Lees, of Trent Park, New Barnet, constituted a centre of attraction for exhibitors and visitors that will not readily be forgotten by those who had the privilege of seeing it.

The Ulster Horticultural Society have deservedly earned the best congratulations of all interested in the cultivation of the queen of autumn flowers for the energy and enterprise they have shown in bringing their show to such a high standard of excellence, and to rank as one of the foremost in the United Kingdom. I have no doubt they will much regret that the awarding of the Jubilee prizes was the cause of so much dissatisfaction among the competitors in the class referred to. I have no wish to further belate this discussion, but consider your remarks in reference to my statements about the collarets demand the above explanation.—*Peter Brock, The Gardens, Glenmor, Drogheda.*

THE APPLE BLOSSOM WEEVIL.

(*ANTHONOMUS POMORUM*).

THIS destructive pest is again very busy in the kitchen garden; and unless prompt steps are taken it will play sad havoc with the young growth as well as the blossom buds, with the result that very little, if any, good fruit will be found on the trees, and the greatest part of the foliage will be disfigured. Of course, it is next to impossible to think of tackling large standard trees at this time of year, but where espaliers and medium size pyramid or bush trees are suffering on account of this depredator, no time should be lost in endeavouring to dislodge it.

These notes would have been of more value had they been given a month ago; still a great deal can be done even now in saving a part of the crop as well as lessening the attack another year. I have found hand picking to be the only safe and certain remedy; a very tedious operation some will say, but it is only by close attention that one can hope to battle successfully with this enemy. There will be found at times, right in the centre of the young shoot, a little white miniature creature that takes a keen eye to detect it. As a guide to where it is lurking in the shoot you will see a tiny hole has been bored. It is also found in the curled leaves from whence it can easily be dislodged.

Each individual blossom too should be carefully examined, as it is from early in April, or soon as the shoots begin to expand their first leaf that this pest can be found. If allowed to remain long in the blossom bud the mischief is soon done. It never expands properly and eventually has the appearance of being scorched, and on being opened will be found to contain the little white maggot. All the blossom buds that might have been bored into by the female to lay its egg drop off at a later stage. I have as yet only found one maggot in a single blossom, while occasionally I have found (what I consider the female) nestled in between the many blossoms of the flower bud. Squeezing them between the finger and thumb soon puts an end to them.

Last autumn I put on grease bands to all the Apple trees in the garden hoping to escape this dreaded pest, but am sorry to record that my hopes have not been realized. Grease bands no doubt are a preventative on trees in the open, but I doubt if they are of much avail where Iron trellising is in use, as in my case, where it is possible for the females to crawl up to the tree from the soil without making use of the main stem of the tree, and one cannot

well go in for greasing these many uprights, which stand 6 ins. apart. If some kind of paste could be prepared to paint the trees all over as a preventative, I think we should stand a far better chance of eradicating this the greatest pest the Apple grower has. What do some of your better informed readers say to this.—*J. Mayne, Bicton.*

THE FLOWER GARDEN.

THE April of 1898 has achieved the distinction of being the driest that we have had for many years, for it brought really no rain, with the exception of a few nice showers on the last two or three days. May has been ushered in with showery weather, and this, combined with the rise in temperature, has been working wonders with the aspect of the flower garden during the last few days. The want of rain all through what we regard as one of the showery months of the year, has been a sad trial to shrubs which were shifted during the past winter, and the labour of watering these has been an item in the general bill that has had to be taken in. Even now the rains we have had up to date are by no means sufficient, and we can only hope for a continuance of the showery weather. The rains have come just right for Rhododendrons which were planted within the last two or three weeks, but these plants will need to be very closely watched if they are to do well.

THE GRASS has been and is growing with wondrous rapidity, and the mowing machines must be kept busily at work to keep pace with it. The knives of the machine should not be set down too low, for too close cutting is very injurious to the sward, and it is far wiser practice to mow twice with medium closeness than to cut very close once. On sward that is to be devoted to cricket, lawn tennis, and bowls the roller must also be kept regularly at work. With the ground soft from rain, as it is now, a splendid opportunity occurs for the roller to work effectively, and there is not that subsequent "baking" of the surface that arises from rolling after artificial waterings during hot weather. A sprinkling of soot, given just before a shower, is a capital dressing for any lawn, and advantage should be taken of the showery weather to give it.

SPRING FLOWERS.—The early Tulips have been having a fine time of it, and the Daffodils have also done well, although the dry weather was not exactly to their liking. The value of the Daffodils for spring bedding becomes more apparent each year, and such large trumpet varieties as Emperor, Empress, Maximus, and Golden Spur can scarcely be planted in too great quantities. Besides the filling of the flower beds, however, the practice of naturalising large numbers in the grass has much to recommend it; indeed, when we take into consideration the grand object lesson that is provided in this direction for the gardener who wishes to make the most of things at Kew and the public parks of London it is a wonder that the idea is not more extensively carried out.

After the flowers are off the Tulips and the Daffodils in the beds every attention should be given to the plants, in order that they may have the opportunity of making their growth properly.

Polyanthuses represent such a wealth of colour variety that it is a pity they are not used in greater numbers. Beds filled with a mixture of varieties are very showy, and last in condition for a considerable time. The double crimson and double white Daisies make capital groundwork for either beds or borders, and when employed in conjunction with Wallflowers, Tulips, Narcissi, Hyacinths, and other spring-flowering subjects are always admired. A good stock of them will be found a great advantage.

SEEDS.—The present time is an important one as far as seed sowing goes, for there are many things that require to have seed sown now if the flower garden is to present that gay and varied appearance, which it should do if the gardener fully grasps his opportunities. A considerable proportion of seed sowing is done under glass in heat towards the end of February and the beginning of March, but these early plants may well be supplemented by others raised from seed sown in the open air. Choose a sunny, sheltered border not overhung by trees, and after carefully breaking up and levelling the soil sow

the seed, either broadcast or in very shallow drills, transplanting the seedlings as soon as they are fit to handle. Stocks, Asters, Zinnias, &c., raised thus will form a capital succession to those reared under glass. There are many other half-hardy annuals that may well be sown *in situ*, in the mixed borders, and even the handsome *Perilla nankinensis*, and such Castor-oil plants as *Ricinus communis*, and *R. Gibsoni*, although generally regarded as very tender subjects will do exceedingly well if treated in this way. These late-sown seeds produce plants that are often very little behind, in point of time, those raised under glass. Suitable spots should be selected in the borders, the soil prepared, and the seed sown, taking care to label each plot so as to avoid subsequent disturbance of the soil. When the seedlings appear thinning out may follow, the strongest plants being left, and these not being subjected to the check of transplanting will grow with great rapidity, given anything like favourable weather.

Polyanthuses should be sown on a shady border in light, rich soil. If a convenient situation does not offer itself out of doors, a bed of soil may be made up in a north frame and the seed sown there, the seedlings being subsequently transplanted to the open ground as they become large enough.

TUBEROUS BEGONIAS.—The second week in March the tubers were looked over, sorted, transferred to shallow boxes, covered lightly with soil, and placed in a gentle heat. These have now developed into sturdy plants which are much in want of more room. This should be given them at once, for if they are left in their present somewhat confined quarters they will be starved before their time comes to be consigned to the open. A plan that we have followed for some years with conspicuous success is to plant them out in specially prepared beds. A shallow hotbed, about 3 ft. in height, is made up of stable manure, and on the top of this is placed some 10 in. of soil. In this, the plants are put out, allowing space for further growth. A spare frame with its attendant lights is put over the whole in such a way that the plants are brought up to within a few inches of the glass. They are closely watched for airing, shading, and watering, and they are regularly sprinkled with the syringe. During cold nights they are covered up warmly with mats, for seeing that they are so close to the glass they would be injured by even a slight frost if left uncovered. By this system sturdy short-jointed plants are obtained that fill the beds well from the commencement, and which are in flower immediately after they are planted out.—*A. S. G.*

Gleanings from the World of Science.

A New Fertiliser.—We have on previous occasions alluded to the bacteria or microbes which aid leguminous crops in collecting their nitrogen from the soil and atmosphere. Nitragin is the name applied to these organisms collectively. More recently Herr Caron has been experimenting with a mixture of bacterial organisms under the name of "alinit," which he claims to be of immense value in the cultivation of crops in the field, but particularly when used on certain soils. He claims to have had remarkable results from his experiments, which have been carried on for the past four years, with laborious assiduity. Further experiments are still necessary in order to fully demonstrate the value of his discovery. The leading or more important organism is a bacillus belonging to the aerobic group known as the hay bacilli, and which bears a close resemblance to *Bacillus mycoides*, so abundant in most soils that are tilled and cropped. "Alinit" consists of spores forming a creamy-yellow powder, which has to be dusted thinly over the ground intended to be sown or planted.

Water Voles and an Apple Tree.—At the meeting of the Linnean Society of London on the 21st ult., an exhibit was made, on behalf of Lieut.-Col. Birch-Reynardson, of a portion of the trunk of an Apple tree which had been so seriously attacked by Water Voles (*Arvicola amphibius*) as to cause the death of the tree; and several others, it was stated, had been similarly injured. Such extensive damage from such a cause was regarded as unusual.

HINTS FOR AMATEURS.

MAY.

"Hail, all hail, the merry month of May."

THUS far go the words of the old ballad in which we are invited to hail with joy the appearance of the May month, when Nature awakes from her sleep in right good earnest, and clothes wood and glade and hedgerow with her myriad-hued mantle. The May month has from time almost immemorial held a peculiarly distinguished position amongst the months of the year, and the junketings and merry-makings with which its first day was wont to be ushered in in the good old times are matters of common knowledge. With the staid wisdom of the nineteenth century these practices have lapsed, and it is only in country places very remote from the busy swirl of latter-day civilisation that the spectacle of Jack-in-the-Green and his attendant satellites can be observed, whilst the once ubiquitous May-pole has vanished from our village greens.

The name-mother of the month was *Maia*, daughter of that much-occupied individual Atlas, the mother of the nimble Mercury, by Jupiter. Her goddess-ship could not have chosen or have been given a better month to perpetuate her memory amongst mortals for standing as it does upon the threshold of summer it possesses a peculiar charm which none of the other months of the year can boast of; indeed, it is *par excellence* the month of spring, with all her subtle influences, for it is in spring, according to the poet Tennyson, that—"A brighter plumage glows upon the hunched dove, and in spring a young man's fancy lightly turns to thoughts of love." Surely what is true of the "young man" is true of the "young maiden" also, and if we assume this we have committed ourselves to a very close association of the seasons with the hopes and blessings, pains and pleasures of the human race.

The month of May, seems to have taken to itself as its special characteristic the youth and vigour which mark the season of spring, and this idea has been immortalised by Shakespeare in the phrase "his may of youth and bloom of lustihood," whilst in Spenser's quaint phraseology we find the term "may" applied to a young woman in the words "the fairest may was she that ever went."

It is not at all surprising when we consider the facts of the case that a deal of superstition should have been interwoven with the legends concerning the qualities of the month, and one of the most amusing, perhaps, is that of the May dew. The dew falling in May was supposed to possess peculiar virtues. Careful housewives were of opinion that the dew of May was especially efficacious in the bleaching or whitening of linen, and they accordingly took every opportunity of exposing their stores of linen to its beneficent influences. This belief was harmless enough, and contained the elements of truth, inasmuch as exposure to the air, when it is the pure air of mountain or moorland, has certainly bleaching properties, but she would be either a hold or an ignorant housewife who attempted to carry out the idea within reach of our towns and cities, for efficacious as the May dew may be, its virtue would scarcely be potent enough to counteract the malevolent action of the blacks and smuts with which the townsmen and townswomen are painfully familiar.

The May dew, moreover, was believed by some of the ancient philosophers to contain a universal solvent in the form of a red and odoriferous spirit which could be obtained by careful and repeated distillations. It has been stated that the sect of the Rosicrucians took their name from the fact that they prepared this spirit. Certainly the name may have been derived from the Latin *ros* signifying dew, and *crux*, cross. The members of the order were often known as the "Brothers of the Rosy Cross," by reason of the fact that the first syllable of the word Rosicrucian was supposed to come from the word *rosa* a rose, instead of *ros*, dew.

Even in our own day there is a good deal of superstition connected with the influence of the May month upon various maladies. Thus there are thousands of mothers who implicitly believe that children will never get rid of whooping cough until May, no matter at what time of the year they catch it. This belief has probably risen from the fact that the nasty cough which invariably remains with children after the regular "whoop" has disappeared

except during exceptionally severe paroxysms, only disappears after the advent of genial spring weather. As we often enough do not have really genial weather until May it is easy to see how the superstition has been evolved.

We have been speaking, hitherto, of the kindly and beneficent side of the nature of May, but fickle as she is she has yet another side, and one that is not so commendable, just as the honoured "May Queen" is balanced by the May-game, who was the sport and derision of his comrades and acquaintances, as illustrated in Ford's well-known lines—"Why should not I, a *May-game*, scorn the weight of my sunk fortunes." Sometimes the month brings with it warm and favourable weather, and occasionally extreme heat is reached, which as we are not yet used to hot weather thus early in the year often proves more trying than the sultry sun of July and August, when we have become shaken down to the regularly higher temperature. Occasionally the other extreme of cold, biting winds is reached that makes us shrink within ourselves, so to speak, and don hastily the garments which previous warm weather may have induced us to doff. Between these extremes we are called upon to enjoy (?) all manner of fluctuations, and thus the month has come to be regarded as a highly treacherous one as far as the weather is concerned. There is thus a world of truth in the old advice—"Till May be out ne'er cast a clout."

Lovers of plants know full well that treacherous, changeable weather is quite as distasteful and injurious to plant life as it is to animal life, and they will be likely to repeat the words of "hail" in a slightly sarcastic frame of mind, and far more likely to speed the parting than to welcome the coming guest.

To speak the whole truth the May month is one of the most trying that the gardener has to contend with, the more so that it is a critical season with many crops both indoors and out. Outdoor crops, however, are in a better condition to take care of themselves, and it is only when actual frost threatens that the gardener is worried to any great extent on their behalf. In cases of frost, of course, protection has to be given to many things, and it will be well to have protective materials of all kinds ready to hand for immediate use when it is required, more particularly during the first half of the month. The difficulties of the outdoor gardener who has to bestir himself to prevent his young Potatoes from getting nipped are slight as compared with the man who has to see after a varied collection of fruits and flowers growing under glass. The question of ventilation during catchy weather, for instance, is a perfect bugbear, for it should be the aim to prevent frequent fluctuations of temperature as far as possible, since plants under glass are far more likely to take harm in this way than the hardier subjects which are outside.

During the prevalence of cold cutting winds in conjunction with hot sun the greatest care must be exercised, for the heat of the sun sends up the temperature of the house to a considerable height, and if much air is given a cold draught is generated. This is especially harmful to Vines which are in various stages of growth, from the first rough leaves and onwards. Draughts check the growth and disfigure the foliage, and yet some air is necessary, otherwise burning would be likely to result. In airing all warm houses the lights should be opened on one side of the house only, and that side should be the one facing to the south.

Shading is now a matter of considerable importance to most things, for the young and tender growth is easily burnt. Such things as tuberous Begonias, Gloxinias, and Achimenes, scorch very readily, and as the month wears on and the heat of the sun becomes fiercer, scorching may be looked for upon Palms, Dracaenas, and foliage plants generally, unless means are taken to prevent it.

Watering must receive the closest attention. The best time to give the heavy watering is the afternoon—say from 3 p.m. to 5 p.m. A good watering then will carry all but the thirstiest subjects over until the same time next day, although such things as Spiraeas, which have very little soil indeed in the pots, may require it twice or thrice a day in dry weather if they are to be kept from flagging.—*Rex*.

Roses at Marriage Ceremonies.—America is credited with originating the plan of throwing the petals of Roses at bridal ceremonies instead of rice.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Stag's Horn Fern Attacked with Fungus.—*T. T.*: If you have any suspicion that a fungus is the cause of the mischief to your pot plant, you might water it with a weak solution of Condy's Fluid. The plants growing on the tree stump may be served in the same way. Enough of the fluid to make the water a light pink, and no more, should be put into the water. You will do well to follow this up by giving the plants some fresh sweet compost to grow in, and should advise you not to use so much sphagnum moss, and more fibrous peat. A few pieces of charcoal are quite a necessity.

Chrysanthemum Sunstone.—*Mum*: You will find Sunstone just the variety you need. It is a free grower, a good doer, and the flowers besides being of noble proportions exhibit that rich shade of bronze-yellow that is so attractive and effective in all floral decorations, especially those that have to stand the test of artificial lights.

Propagating Perennial Asters.—*Saynor*: You are rather late in thinking about doing this for the plants out of doors are pretty forward. The system generally adopted is division of the roots. Lift the old stools and divide them up carefully; a single strong shoot with a few roots attached will grow into a good plant if potted up and looked after. After potting consign the young plants to a pit or frame where they may be kept close, and carefully watch them for shading and watering, and airing presently when you see they are making a start. If you like to wait a little longer cuttings may be taken from the tops of the shoots of the old plants. These will form bushy little specimens that will flower as freely as the old plants, but which will be much dwarfer.

Winter Tomatos.—I have half a dozen Tomato plants that I grew on through the winter for fruiting. They have only borne a very slight crop, however, although they appear to be in vigorous health. Is it worth while attempting to do any more with them, or would you advise me to have young plants in their stead.—*T. T. L.*

The latter alternative would certainly be the better plan, inasmuch as it would be the surest. Occasionally, however, old plants of this kind may be made to start afresh and bear good fruit. If you wish to try this, cut out any growths that have fruited and are not needed for carrying other growths, also the tops. Then train up young shoots from as near the bottom as possible. You ought then to get some fruit.

Hyacinth of two colours.—In a bed of Hyacinths which I have of the blue variety Charles Dickens I notice some of the spikes have rose coloured flowers mixed with the blue ones, and in two instances half the spike is blue and the other half is rose. Is this uncommon? I thought it might interest some of your amateur readers.—*T. Ewart*.

There are two varieties of the Hyacinth Chas. Dickens, the one with blue flowers and the other with rose. It is not an uncommon occurrence to see the two colours on the same spike, as yours are, and, indeed, we only noticed last week that some plants of this variety growing in Hyde Park were exhibiting this peculiarity. The effect is certainly rather strange. These bulbs with the flowers of two colours may not come the same next year, for the flowers would probably be all blue or all rose. It might be interesting to make the experiment. The flowers would of course be much smaller than those thrown this year.

Deutzia gracilis.—*Carl*: It would be little short of barbarous to turn your Deutzias out of doors now that the flowers have fallen off them. It is true that the Deutzia is a hardy subject, but then you must remember that plants in the open have not yet commenced to flower, and should frost supervene would not be in a condition to withstand harm. Your plants, however, are just making their growth for the season, and upon this depends next year's crop of flowers.

Instead of turning them out of doors, therefore, put them in a gently heated pit or frame, where they can develop their growths at their leisure. No great amount of pruning is needed, but a little thinning of the shoots may be required in order to keep the plants in good shape. This thinning may be done at once.

Chrysanthemum G. J. Warren.—*Roxburgh*: This variety originated at Balcombe Place Gardens, Sussex, and was named after the gardener at that place. It has received three certificates, viz., an Award of Merit from the Royal Horticultural Society on October 26th, 1897; a First-class Certificate from the National Chrysanthemum Society on November 1st in the same year; and another First-class Certificate from the Scottish Horticultural Society on November 18th, also in 1897. From what we have seen of the variety and its behaviour we should consider it considerably the inferior of its parent, Madame Carnot, as far as robust habit and general vigour go.

CAMPANULA PORTENSCHLAGIANA MAJOR.

For some years the typical form of this Bellflower might have been seen in gardens under the name of *C. muralis*, and possibly that is still retained in some collections. The correct name, however, has been adopted in most of the leading collections of hardy herbaceous and alpine plants. The specific appellation is rather cumbersome on account of its length, but no hardy plantsman will quarrel with the plant itself, for it is one of the prettiest and most useful of the dwarfier growing kinds. The variety under notice has larger flowers than the type. The accompanying illustration of it was prepared from a photograph which was taken in the nursery of Messrs. R. Veitch & Son, Exeter, Devon. For some years past they have been getting together a fine collection of herbaceous and alpine plants, the latter being chiefly grown on the rockery in the Queen's Road Nursery, where we have noted many choice things. The large, blue flowers of *C. portenschlagiana major* are produced in the greatest profusion on plants not exceeding 6 in. in height, but as a rule considerably under that. The blooms are bell-shaped and upright, and perfectly distinct from those of any other species flowering in the open air during the summer months. The species is a native of Dalmatia, and proves perfectly hardy in this country.

ORCHIDS AT CLARE LAWN.

GARDENING is still carried on with spirit and intelligence at the suburban residence of Sir Frederick Wigan, Clare Lawn, East Sheen, Surrey. It is a quiet and beautiful place, enshrouded with trees, and situated close to the Sheen Gate of Richmond Park.

We made a rapid survey of the Orchids the other week under the guidance of the grower, Mr. W. H. Young, and noted that the collection is still on the increase, and the cultivation of several sections vastly improved within the last few years. In one of the houses a fine piece of *Sobralia macrantha alba* is on the point of flowering; while the fragrant flowers of *Cattleya citrina* and *Odontoglossum citrosimum* made their presence unmistakable. *Cymbidium traceyanum*, *C. winnianum*, and *C. eburneolum* are some of the many types here.

The cool *Odontoglossums* have now been associated with the *Masdevallias*, having changed their quarters since we saw them last; and their improvement is at once apparent. Baskets of *O. Rossii* in great variety, and including *O. Rossii rubescens*, are now floriferous and pictures of beauty. Other species are *O. ruckerianum*, *O. Cervantesi*, *O. c. Morado*, *O. odoratum*, *O. o. baphicanthum*, and *O. Oerstedii*, the latter a gem, of which a pan carried three dozen flowers. On one of the smaller pieces a peduncle carried twin flowers—quite an unusual occurrence. *Ada aurantiaca*, with its rich orange flowers, made a fine contrast with the paler *Odontoglossums*.

In another compartment of the same house *Odontoglossum Uro-Skinneri* is throwing up spikes of remarkable vigour. *O. polyxanthum grandiflorum* is a handsome variety. Amongst *Cymbidiums* we noted *C. devonianum* and *C. tigrinum*, the latter

being a great favourite with Mr. Young. Hybrid and other *Disas* are responsible for adding largely to the display in the house. Beautiful and interesting are *Disa langleyensis*, *D. Veitchii*, *D. kewensis*, and *D. tripetaloides*, the latter being a species with medium-sized flowers of great charm. *Masdevallias* are numerous, a considerable number being already in flower, including the singular *M. Chestertoni*, with black, spotted segments and a salmon lip, having red veins. Good things are *M. ignea*, *M. i. Echartii*, *M. harryana*, *M. trochilus*, and others. The singular looking *M. trochilus* has chestnut-brown flowers with long yellow tails. *Epidendrum hastatum* has brown sepals and petals, and a white lip.

The third compartment of this house contains a handsome and well-flowered variety of the hybrid *Odontoglossum elegans*, many plants of *Cypripedium bellatulum*, with leaves like leather, and a fine batch of *Miltonia vexillaria* coming into bloom.

The rock house has been the charm of the place for many weeks past, and was an eye-opener to us. When the door was opened it seemed like an entrance

ludemanniana is also flowering well. Some plants of *P. schilleriana* have been here for the last fourteen years, and are still in pristine vigour. All are grown in teak baskets suspended from the roof. *Saccolabium ampulaceum* is a little gem. A bed of varieties of *Cypripedium barbatum* planted out on one of the benches has been gay for some time past. *C. b. nigrum* is a very fine thing. The white-lipped *C. Godefroyae leucochilum* is very pretty. The well-defined and rich colours of *C. mastersianum* marks the hybrid as the finest form of it we have seen. There are some giants amongst the specimens of *C. lawrenceanum*. Many hybrids of various kinds have been raised here. The metallic-looking leaves of *Microstylis Scottii* are very pretty. The same may be said of *Anoetochilus Dawsoni*, whose velvety-olive leaves are lined with red veins. The upper third of the petals of *Cypripedium sargentianum* is deep red.

Another house of choice Orchids contains *Dendrobium thysiflorum* bearing twelve racemes of bloom. The blue-purple hybrid *Epidendrum endresio-Wallisii* is also very handsome. Very choice are

CAMPANULA PORTENSCHLAGIANA MAJOR.

to fairyland. The rocks and walls are covered with various Ferns, Selaginellas, Ficus, &c., and from every prominent elevation and coign of vantage long, drooping sprays of *Cymbidium lowianum* depend in such a way that almost every flower is seen to the fullest advantage. The plants are mostly of large size, grown in pots, and fling out their racemes on all sides in the most charming and enchanting way, owing to their being elevated and unsupported by stakes. There are only ten plants, but they carry 100 spikes, bearing 1,628 flowers, all in prime condition. One of the plants carries twenty-seven spikes with an average of sixteen flowers each. The finest spike is 5 ft. long, and carries thirty-six flowers; the plant has seven spikes. Thirty-two flowers on a spike is of common occurrence. One variety has a rich maroon-crimson blotch on the lip, and tinted sepals and petals. *C. l. concolor* carries twelve and fifteen flowers on two spikes. *C. grandiflorum* is also here. The plants have been kept five years in the same house, and during the severe winter three years ago the inside temperature for several days sunk to 34°. The duration of the flower is marvellous.

The *Phalaenopsis* house still contains some flowering plants of this genus. The first spike of *P. grandiflora aurea* was caught in a London fog, and having been partly cut back is now in full bloom. *P.*

Cattleya Skinneri alba, bearing four spikes; *C. Mendelii* and *C. inter-elegans* (*intermedia* x *elegans*) a larger and much finer thing than the first-named supposed parent. The choicest and most handsome Orchid in this house is *Cattleya Schroderae* with a large orange blotch in the throat, and having blue veins radiating from the blotch, the rest of the lip being suffused with lilac. The lip is 2½ in. wide. *Laelia Latona* in the richest colours of this hybrid may also be seen here.

The true form of *Cattleya intermedia* is flowering in another house along with a choice variety of *Dendrobium roobile*, named *D. n. Hutchinson's* variety. The lip measures 1¼ in. across, and its dark maroon blotch contrasts finely with the soft lilac of the rest of the flower. The blue-purple *Sobralia Ruckeri*, *Trichopilia suavis*, and *T. s. alba* are all choice things, the last-named carrying ten flowers.

The next house we entered was also a warm or East Indian one, containing many *Dendrobiums*. The long racemes of white flowers of *D. veratrilium*, having a lined and marbled blue lip are very graceful. Other species flowering are *D. Bensoniae*, *D. Parisii*, *D. rhodocentrum*, and *D. polyphlebium*, having a crimson lip edged white, and appearing like a hybrid between *D. Parisii* and *D. macrophyllum*. The display in this house is also enriched with *Thunia alba*, *Oncidium ampliatum*, *Angraecum*

arcuatum, A. Leonis, *Cypripedium barbatum* Warneri, *C. niveum*, and *C. concolor*. A fine plant of the latter, which has been here since 1893, has yellow, spotted flowers. A smaller plant is carrying three flowers on one spike, a very rare occurrence. We have never seen so many before on one scape, and must compliment Mr. Young upon his success.

BLIGHT AND BLESSING.

PROFESSOR FRED. ENOCK has delighted many British audiences by his interesting and lucid descriptions of the insects and insect life of this country, and the Royal Horticultural Society was fortunate in securing him for a lecture on the 12th ult. The end of the Drill Hall where the lectures are usually given was enclosed by canvass, and a dark room was thus improvised to enable the audience to have the benefit of the numerous lantern slides which the professor brought with him. These illustrations were taken from drawings and photographs of the various insects dealt with, and it would be difficult to overpraise them for accuracy and detail of finish. Every member of the audience must have gone away with a very faithful idea of the structure and qualities of some of the insect friends and foes he meets with, thanks to these admirable illustrations and the Professor's not less admirable descriptions. Mr. McLachlan occupied the chair.

In his opening remarks, the lecturer spoke of the ubiquity of "blight" or green fly. In his humorous way he said that green fly was not always green, but was sometimes black and brown and white. This fly bred so rapidly that unless something else preyed and lived upon it everything would soon be completely covered, and we should never be able to grow plants at all. He then proceeded to enumerate some of the insects which preyed upon the fly or blight, and were, therefore, to be regarded by the gardener as friends.

First of all came the Wasp Fly or Hoverer. There were twenty or thirty of these flies belonging to the genus *Syrphus*. They all fed upon the green fly and laid their eggs amongst it; in fact he had counted 500 on a single leaf. The maggot of the wasp fly hatched after a few days, and straightway began to feed upon the green fly. These maggots could easily be identified by the way in which they fixed themselves to the midrib of the leaf by their anoclasters and waved their bodies about, seizing the green fly with their hooked mouths. One of these maggots could destroy as many as 150 green flies in an hour, and they kept this up for thirteen or fourteen days. In the chrysalis stage this insect resembled the bud of a tree to whose bark it was affixed. The eye of the wasp fly had 11,000 facets, or 22,000 for the two eyes, each facet being capable of receiving a distinct image. Some capital slides were shown illustrating all stages of the wasp fly's existence.

Nearly every fly, continued the professor, had its own parasite, the one insect preying upon the other, and this hyperparasitism was often carried to the third degree.

Speaking of the Black Currant Gall mite which had done so much damage to the Black Currant industry in various parts of the country, more particularly in Kent, the lecturer showed how the mite, which was a torpedo-shaped insect barely one-fourth of an inch long, took up its quarters in the bud and eventually destroyed it. The only way to get rid of them at present known was to pick off all the galls and burn them. He had discovered, however, that this mite had a parasite which preyed upon it, and perhaps something might be done by cultivating the parasite.

Professor Enock next turned his attention to the Willow Gall, which was to be seen in such quantities upon Willows. These galls were the work of the Willow Sawfly (*Nematus gallicola*). He had never yet found a male of this Sawfly, and the flies were really not plentiful. The eggs are laid generally in the month of April, and the leaf feels the effects of the piercing of its epidermis and the insertion of the egg within an hour. He had cut open the galls and found the maggots hatching. The Willow Sawfly also had its parasites which pierced the body of the maggot and thus paralysed it, so that it would form a means of subsistence for the maggots hatched from its own eggs, which it subsequently laid within the gall.

The Devil's Coach-horse Beetle was described as one of the most useful of the insects that were to be found in a garden. It preyed upon all sorts of caterpillars that were injurious to vegetable life, and on that account should be spared whenever it was found, and not, as was too frequently the case, destroyed.

Mr. McLachlan made a few remarks at the conclusion of the lecture, mentioning among other things, that the chrysalis of the Lace-wing Fly had been described as fungi by an Italian botanist of some repute, thus showing how easy it was for anyone to be led astray.

A very hearty vote of thanks was accorded to Professor Enock at the close.

BELGIAN NURSERIES.

II.—MM. LOUIS VAN HOUTTE CIE., LTD., GHENT.

THE famous nursery of this company is situated at Gendbrugge, just beyond the ancient gateway of the city of Ghent, known as Port Bruxelles. According to the Belgian custom the title of the firm is Société anonyme L. Van Houtte, Père, being named after the founder of the firm, the father of M. L. Van Houtte.

Arriving at the nursery during the dinner hour we went for a stroll through the grounds, some fifteen acres in extent. A considerable portion of the ground at the time of our visit was planted with spring flowering bulbs such as Hyacinths, Tulips, and Daffodils, all of which were remarkably dwarf and sturdy. Their dwarf character would no doubt be due to the peculiar nature of the soil which consists almost entirely of very fine, gray sand annually enriched with applications of farmyard manure or leaf soil. The Hyacinths were practically past their best, but Daffodils were at their best, including breadths of the large trumpet varieties such as are grown for commercial purposes. *Narcissus odorus* and its variety *N. o. rugulosus* were 12 in. to 18 in. high and grown in considerable quantity, as was *N. orientalis*, also in full bloom. Beautiful and interesting were the numerous forms of the Duc Van Thol Tulips, in a brilliant array of colours. Slightly later, but still belonging to the section we term early, was a great number of sorts of Tulips planted for spring bedding in this country. Each variety was grown in some quantity, and it only required another week or so to set the whole field ablaze with a gorgeous array of different colours. The plants were dwarf, but evidently at home in the sandy soil of this part of Belgium.

We passed through portions of the nursery planted with the stocks of fruit trees. Various ornamental shrubs and trees were coming into bloom, including *Pyrus spectabilis*, *P. salicifolia*, and others. Sweet Bays (*Laurus nobilis*) are grown in great quantities, in pots and tubs which cover a considerable area of ground. Very fine were the standards, having heads 3 ft. by 3 ft. on stems averaging about 4 ft. high. Pyramids are equally, if not more, plentiful, and were symmetrical specimens varying from 4 ft. to 12 ft. in height according to age. The upright stems are closely furnished with side branches from base to apex. These Bays are grown as we would Oranges for ornamental purposes, housing them in winter and standing them out as soon as the weather gets sufficiently mild in spring.

Various choice hardy plants were growing in frames or stood in the open, including terrestrial Orchids, both European and Asiatic. *Cypripedium*, *Orchis*, and *Ophrys* were some of the genera represented. Four frames, each about 12 yards in length, were filled with the rare and interesting *Myosotidium nobile*, the New Zealand Forget-me-not.

M. Jules van de Kerckhove now came to our assistance, and we passed through the houses which number something like ninety-five of all sizes, and for various purposes. Most of them are span-roofed structures, and well adapted for plant culture. A general collection of plants is grown, though perhaps they are not so numerous as when M. Louis Van Houtte Père made Belgian horticulture a household word in this country many years ago. The times have changed, and the aim now is to grow those plants chiefly which are of leading commercial importance. Stove and greenhouse plants with ornamental foliage are still, however, well represented. Palms, *Alocasias*, *Anthuriums*, &c., are grown in

quantity. Amongst others we noted *Dracaena Bruanti*, *D. Doucetti*, *Acalypha obovata*, *Asparagus Sprengeri*, with its long, drooping sprays; *Claviga squamata*, and *Abutilon Czarwitzi*, the latter having its leaves almost wholly white. *Furcroya Lindeni* closely resembles an American Aloe with white edges to the leaves, and is very distinct. The *Rhopalaspis* are represented by *R. vervaeneana*, with rusty, woolly stems and paler woolly leaves; and *R. aurea*, having a clothing of yellow-brown wool. *Ficus lanceolata* is an uncommon species, with lanceolate, dark green leaves, 6 in. to 12 in. long. The blue *Amaryllis*, *A. procera*, also known as Empress of Brazil, was flowering in the same house as the above.

Fine foliage plants were also the feature of the next house entered. A new plant is *Alocasia Kerchovei*, the large leaves of which are dark green and silvered all over, while the under-surface is violet. *Begonia Otto Foster* has velvety olive leaves and large silvery blotches. Notable also are *Heliconia illustris*, *Pandanus pacificus* and numerous species and forms of *Dieffenbachia*. The dark and light green leaves of *D. Rex*, covered with large creamy blotches, are very handsome. There is a large, general collection of Aroids, and *Melastomads*. *Dracaena sanderiana* and *Smilax Sarsaparilla* are grown in quantity. *Globa alba*, belonging to the Ginger family, has yellow flowers and white bracts. A graceful and handsome foliage plant belonging to the Myrtle family is *Eugenia glazioviana*, having small rhomboid leaves, and a drooping, twiggy habit of growth.

Crotons are grown to some extent, preference being given to the finer varieties. *C. caudatus tortilis* has long, twisted, dark green leaves, richly variegated with yellow and having red petioles. Along with them the hybrids between *Anthurium scherzerianum* and *A. rothschildianum* are very numerous, varied and beautiful.

Numerous houses are filled with Palms of various sizes, thousands of them being of a size often required for decorative purposes in private establishments, and including *Phoenix*, *Kentias*, *Cocos*, *Geonomas*, *Latantias*, &c. We passed through a large house, really consisting of six built in one block, and continuous internally from one side to the other. This contains *Cocos weddelliana* by the thousand, and of all sizes. The same may be said of *Kentia balmoreana* and *K. fosteriana*. *Aspidistra lurida*, and *A. l. variegata*, in well grown plants, constitute the glory of another house.

Indian *Azaleas* are so abundant and varied that they cannot be ignored. They meet the visitor at every turn, in all sizes from the cutting to plants of useful market size in full bloom. These latter would vary from 15 ins. to 18 ins. in diameter, with stems about a foot high, and flat tops so profusely covered with flowers as to completely hide the foliage. The first house we entered was a curvilinear-roofed structure, 180 yards in length, and entirely filled with varieties of *Azalea indica*, planted out in beds of leaf soil and making their growth. Flowering specimens of market size were stood at intervals amongst them.

Elsewhere we came upon a block of twenty houses, or in other words one huge house covered by twenty spans of glass roofing. The same order prevailed as already described. Many of the finest varieties in commerce were in bloom. The large double flowers of *Lady Hellington* are of a beautiful rosy-purple. *Deutsche Perle* is well known in this country as the best white. The flowers of *Comte de la Torre* are salmon, edged with silvery white. Fully double and very handsome are the flowers of *John T. D. Llewellyn*, being flesh-coloured, deepening to pink in the centre, and white at the edges. Plants raised from grafts are ready for market in the course of three years. Those which are intended to be grown into large specimens are grafted on stems 18 ins. high, this height being convenient for growing into broad, dome-shaped heads, like the large plants at the Ghent exhibition.

Every preparation was being made for planting out the young stock in the open ground. They are to be grown in leaves collected in the woods and forests last autumn, so that they are yet scarcely at all decayed. During hot weather the beds are heavily watered every night. Many English visitors crossed our path while passing through the houses and grounds.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Laelia elegans Mrs. Moojen.—The flowers of this variety are of large size and differ in form from those of the more common types in cultivation. *L. elegans* is so variable, however, that some authorities do not hesitate to consider it a natural hybrid between *Laelia purpurata* and *Cattleya guttata*. Some of the forms, at least, favour this view. The form under notice has white sepals and petals, faintly tinted with blush, at least, after it has been open for a week or more. The petals are twice as broad as the sepals, being elliptic-oblong, and measuring $1\frac{1}{2}$ ins. or nearly so across the middle. The tube of the lip is white on both surfaces or slightly tinted blush; the side lobes and the apical one are crimson-purple, with a small, pale blotch at the apex of the latter. This rich colour narrows at the base of the lamina into a band of the same colour, running almost to the base of the tube. The column is white, slightly tinted purple, especially on the concave inner face. This fine variety has been flowering for some time past with Mr. J. Segar, Bandon Hill, Croydon.

PLANTS RECENTLY CERTIFICATED.

THE awards mentioned hereunder were granted by the Royal Horticultural Society on the 26th ult. Orchid Committee.

LAELIOCATTELYA WELLSIANA LANGLEYENSIS. *Nov. hyb. var.*—The seed parent was *Cattleya Trianaei*, and the pollen bearer *Laelia purpurata*. The sepals are pale lilac and the petals a shade darker. The large orbicular lamina of the lip is crimson-purple; the outer face of the tube is deep purple, and the blotch in the throat yellow. Form and colour are chiefly due to *Laelia purpurata*, and the variety is far superior to the type. First-class Certificate. Messrs. J. Veitch & Sons, Ltd., Chelsea.

LAELIOCATTELYA THORNTONI. *Nov. hyb. bigen.*—This was derived from *Cattleya gaskelliana* crossed with the pollen of *Laelia digbyana*, and the result is a bold, handsome and very singular flower. The sepals and petals are soft mauve, the latter being finely fringed or toothed on the outer edges. The large, deeply bifid lip is deeply fringed all round the margins, lilac with a broad lemon disc, and strikingly distinct. First-class Certificate. Messrs. J. Veitch & Sons, Ltd.

CATTELYA SCHRODERAE AMABILIS. *Nov. var.*—The sepals are blush and the petals soft silvery lilac. The lip is characterised by a large coppery-orange blotch in the throat, and the base of the lamina is beautifully shaded with pale blue. It is altogether a very choice variety. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

ODONTOGLOSSUM PESCATOREI DUCHESS OF WESTMINSTER. *Nov. var.*—The pure white flowers of this striking variety are handsomely blotched all over with circular, violet markings. It received an Award of Merit, but deserved a higher honour. The Duke of Westminster (gardener, Mr. N. Barnes), Eaton Hall, Chester.

CATTELYA SEDENI. *Nov. hyb.*—This is the result of crossing *C. lawrenceana* with *C. percivaliana*. The sepals and ovate petals are deep rose. The strongly curved tube of the lip is deep purple, the lamina crimson-purple and the throat yellow, making altogether a handsome hybrid. Award of Merit. C. L. N. Ingram, Esq. (gardener, Mr. Bond), Elstead House, Godalming.

CYMBIDIUM CANALICULATUM.—This bears a long raceme of flowers, the oblong sepals and lanceolate petals of which are almost black. The lip is crimson-red with a white band along the centre. Award of Merit. J. Sparks, Esq., Heathcote, Ewhurst.

CATTELYA SCHRODERAE HAREFIELD HALL VAR. *Nov. var.*—The sepals and ovate, crisped petals are blush, while the lamina of the lip has lilac margins, a dark purple disc and two orange blotches in the throat. It is a highly meritorious variety. E. Ashworth, Esq. (gardener, Mr. H. Holbrook), Harefield Hall, Wilmslow.

CATTELYA MENDELII BEATRICE ASHWORTH. *Nov. var.*—The sepals and petals in this case are of a faint

blush, while the lip is pure white, with a yellow blotch in the throat, making a chaste and beautiful variety. Award of Merit. E. Ashworth, Esq.

MORMODES OENANTHUM.—The singular dull red, purple flowers of this species are strongly scented, and have the lip sharply reflexed at the sides. One pseudohub carried three racemes. Botanical Certificate. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

ODONTOGLOSSUM HUNEWELLIANUM MAXIMUM. *Nov. var.*—The flowers of this form are much larger than the type and almost covered with chestnut blotches. The petals have very numerous, smaller spots on a pale yellow ground. The lip is white, spotted with purple-brown. Award of Merit. H. Greenwood, Esq., Highfield, Haslingden.

Floral Committee.

DEUTZIA PARVIFLORA.—This is a distinct and pretty species, with corymbs of pure white flowers like those of a *Spiraea* and leaves quite characteristic of *Deutzia*. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

AZALEODENDRON EDOUARD ANDRE.—The parents of this hybrid were *Azalea mollis* and a variety of *Rhododendron ponticum*. The flowers are rose, spotted on the upper segments with crimson. The crisped, lanceolate leaves are evergreen. Messrs. J. Veitch & Sons, Ltd.

PTERIS SUMMERSI.—This may be described as a crested form of the well-known *P. Wimsetti*. Every pinna is heavily crested and the variety of first-class merit for decorative and market purposes. Award of Merit. Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton.

RICHARDIA RHODESIA.—The spathe of this new form is of great size and rich golden-yellow, with a green midrib externally. The broad, triangular leaves are spotted with white. There is a black blotch at the base of the spathe. It is a great improvement on the better known yellow sorts. Award of Merit. Leopold de Rothschild, Esq. (gardener, Mr. J. Jennings), Ascott, Leighton Buzzard.

PRIMROSE EVELYN ARKWRIGHT.—The flowers of this variety are of enormous size, measuring 2 in. to $2\frac{1}{2}$ in. across. They are primrose-yellow with a five-lobed orange eye. The original stock of it was found wild in Dinmore Wood, Herefordshire, in 1887, and has retained its character to the third generation from seed. Award of Merit. J. H. Arkwright, Esq., Hampton Court, Leominster, Herefordshire.

RHODODENDRON HANDSWORTH WHITE.—The flowers of this *ponticum* variety are profusely produced, and white tinted with pink along the ribs, and spotted with yellow on the upper segments. Award of Merit. Messrs. Paul & Son, Cheshunt.

THE DAWSON ROSE.—This looks like a hybrid between the China and polyantha Roses. The flowers are semi-double, and rosy-pink. Award of Merit. Messrs. Paul & Son.

Narcissus Committee.

NARCISSUS WILL SCARLETT.—The white segments of this hybrid are those of *N. poeticus*. The crown is very wide or bowl-shaped, and of a rich orange almost to the base. The variety is certainly handsome. First-class Certificate. Rev. G. H. Engleheart, Appleshaw, Andover.

NARCISSUS POETICUS DIADEM.—The segments of this variety are sulphur at first, fading to white. The cup is very wide, shallow, and bright orange at the edges. Award of Merit. Rev. G. H. Engleheart.

NARCISSUS WHITE WING.—The segments are ovate and white. The cup is of moderate length, narrow, and clear yellow. Award of Merit. Rev. G. H. Engleheart.

NARCISSUS WHITE LADY. The flowers of this form are of large size, with white segments, shaped like those of *N. poeticus*. The short, crisped cup is lemon-coloured. Award of Merit. Rev. G. H. Engleheart.

The National Auricula and Primula Society made the undermentioned awards at the Drill Hall, on the 26th ult.

AURICULA HIAWATHA (DOUGLAS).—This variety belongs to the Alpine section, and has a rich golden eye, maroon ground colour, and a buff-red edge of an uncommon shade. First-class Certificate. Mrs. F. Whitbourne (gardener, Mr. J. W. Euston), Great Gearies, Ilford, Essex.

AURICULA FIREFLY (DOUGLAS).—Here again the eye of this Alpine Auricula is golden; the ground colour much reduced in extent, and maroon-crimson;

while the edge is broad and bright crimson. First-class Certificate. Mr. James Douglas, Edenside, Great Bookham, Surrey.

AURICULA OLYMPUS (DOUGLAS).—In this we have a gray-edged, show variety of first-class merit. The maroon ground is limited in extent, and the paste pure white. First-class Certificate. Mr. James Douglas.

AURICULA MRS. DRANFIELD.—This is a self-coloured, violet show Auricula, with a white paste. The flowers are larger and flatter, and the throat and paste better than those of the well-known variety Mrs. Potts. The variety is therefore choice and handsome. First-class Certificate. Mrs. Dranfield, (gardener, Mr. Charles Phillips), Dranfield.

HOW A KNOWLEDGE OF BOTANY IS A HELP TO GARDENING.

(Continued from p. 551).

Now we will go on to consider the organs of nutrition, and the manner in which the operation is carried on by root, stem, and leaf. The root is the first part which makes its appearance, and serves not only as a nutritive organ, but also holds the plant in the ground. Roots assume various forms, and it is not always an easy matter to distinguish between a root and a stem, especially that of an underground stem. Take for instance the Moutan Paeony, and *Anemone japonica*, both of which have a great power of forming buds upon the root.

Well, before we get too far above ground let us look for a moment at the functions of the root and let us see whether a knowledge of the botany of this particular part of the plant, will be of any help to the gardener.

Roots absorb nourishment by a process known as imbibition, which means a flow inwards, and it is by the extremities alone that this process is carried on; but right at the very point of the root, there is what is known as the root cap, which covers the growing point of the root. It is far better adapted to push its way through the soil than the very soft cellular tissue which is immediately behind it; and it is by the extremities of the roots and the root hairs that the whole of the nourishment is taken up.

To prove this statement, here is a very interesting experiment that you can try for yourselves, and one that will afford you much pleasure whenever you have a few minutes to spare. Take a small flourishing plant, fix it in some position so that the points of the roots can just be immersed in water, and you will find that so long as the extremities are immersed the plant will flourish. Now, fix it in another position, and let the extremities of the root be in dry air and all the other part of the root immersed, and in this case you will find that the plant will wither and die.

Then there is another thing to be taken into consideration in connection with the root taking up nourishment, and that is that those little rootlets cannot absorb anything of a much greater density than water; so you quite understand before anything can be plant-food it has to be brought to a state of solution. Therefore, what a lesson we learn here in connection with the feeding of plants, and especially those in pots.

I do not believe in the plan that some recommend for using artificial manure, especially that of putting it upon the surface of the soil for pot plants. My first objection to this is that the time the water occupies in soaking through the surface of the soil is not sufficient to bring much manurial substances to a state of solution and the consequence is that a great deal of ammonia and other gasses is carried off by the air which should have been carried down to the roots.

Secondly, my objection is that the manure so used lays upon the surface of the pot in lumps, and the result is, by the burning nature of some manures, that the roots immediately under become damaged, and consequently the plants suffer.

Then the third objection is that by placing manure on the top of the soil in this way, you are stopping the air passages of the soil and this will soon throw your plants into a bad state of health, because the moment the air passages become stopped there is a great difficulty in soaking the ball with moisture in a proper manner.

Of course this does not apply to the open ground where the surface of the soil can be constantly stirred and other air spaces renewed; neither do I refer to the mulching of plants in pots, where, if the material used is as it should be, there is no hindrance to either air or water.

Well then, if you are going to give a plant manure that is to be easily assimilated or taken up by the plant, and where you do not want all the energies of the same to be spent on food conversion, but where you want all its energies thrown into growth, and the development of its floral organs, I believe in applying it, whether it be artificial, farm-yard manure, organic or inorganic ingredients, in a really soluble state, not of much greater density than clean water. There is no doubt that the best plan is to soak all manures before putting them on a pot, and if a plant is to be forced, and is required to grow to perfection in a short space of time, it must be fed by solutions and by foods that are easily assimilated. Again I maintain that a knowledge of root function cannot fail to be a help to the gardener.

Then there is another point which we must notice before leaving the root, and that is the process of exosmosis or the outflow carried on by the root. From this also we can see the necessity in the rotation of crops, because, as you all know no two orders of plants contain the same chemical composition of sap. Therefore, it is plain that the sap of one order would convert certain mineral substances into plant food which the sap of another could not do.

Now with the stem we shall be very brief, just noticing a few forms of stem. The stem receives various names according to its duration and structure. In herbaceous plants it is called *caulis*, that is stem, which dies down to the ground naturally every year, such as Asparagus, etc. Stem is termed culm in grasses, *truncus* in trees, caudex or stork in Palms and Cacti, and stipes in Ferns.

Then we pass from the stem to another very important part of the plant, and that is its leaves. Leaves as you know, carry on a very important part in connection with the growth of the plant. All the sap that is taken up by the roots is carried up to the leaves and there it undergoes various changes, through the agency of light, air, &c.

The sap in its ascent passes up through the young wood and flows to the leaves, carrying with it the mineral ingredients of plant food. The leaves take up their carbon in the form of carbon dioxide from the atmosphere, and under the influence of sunlight the materials are rearranged chemically and built up into the substances which go to the increase of root, stem and leaf. A considerable amount of it is drafted into the cambium layer between the bark and the young wood. In this region it goes to thicken the stem and part of it passes downwards to extend the root system. When rooting cuttings you will find that the young roots are produced from the cambium layer, the new material descending from above, not rising from below.

When you ring a *Dracaena* or any other plant for the purpose of rooting it the roots would form from the under lip instead of the upper one if the building matter came from below, and not only this, but the upper part of the plant after being ringed would wither and die under the conditions named, because all communication from the root would be cut off.

Now there is a practical point which presents itself, and it is this: Should a cutting be divested of its leaves before being put into the soil, or should it be put in with as many leaves as possible? My opinion is that this depends almost entirely upon the place you have to root it in. If you put a cutting in an atmosphere that is almost at the point of saturation, no evaporation can take place from the leaves, then I prefer as many leaves as possible, because the more leaves you have on a cutting, where it cannot flag, the more do they assist in the formation of roots. If, on the other hand, you expose the cutting to a drying atmosphere then I would advise the stripping of its leaves almost entirely. If not, with an arid atmosphere these leaves will evaporate the life blood of the cuttings, and give it off to the air.

Then again there is another point to be taken into consideration, and that is the power that some plants have over others in giving off moisture. Plants whose natural habitat is a high and dry atmosphere, have always a feeble power of evaporation; whilst on the other hand those of warm and moist climates have a great power of evaporation. It is generally

supposed that plants evaporate more by the agency of light than by sun heat.

Now, how is this process of evaporation carried on? It is carried on principally by breathing pores in the leaf, known as stomata, which mean mouths. They are openings placed on the epidermis of the leaf and consist usually of two crescent-like cells, supposed to resemble the lips and the orifice of the mouth. They open and close according to the state of the moisture or dryness of the atmosphere.

Then again the position of the leaf also affects stomata. Leaves which are borne horizontally have much the largest number of stomata upon the under side.

Then again, leaves which are borne vertically have often an equal number on each side. Take for instance the Hyacinth, where you will find them, with a very little magnifying power, irregularly distributed over the surface of the leaf.

The number of stomata varies very considerably on different plants, from a few hundreds to many thousands on the surface of the leaf.

Another point of importance as to how a knowledge of botany may help a gardener is in defining the division or otherwise of the leaf, whether it be simple or compound, pinnatifid, or palmatifid; and to define its margin, whether it be serrate or what. This I think to be most important to a gardener, as the shape of the leaf is so often asked for when one has to describe a plant. The venation of the leaf is also very important in the classification of plants.

You will always find that in the case of dicotyledons the venation of the leaf resembles network, and is said to be reticulated; while in monocotyledons the veins are parallel from margin to midrib; and in acotyledons the veins are forked, as in Ferns.

(To be continued.)

SPRING FLOWERS IN REGENT'S PARK.

REGENT'S PARK has an individuality peculiarly its own, and this individuality lends itself with remarkable ease to the accommodation of spring flowers. It has no Serpentine, and no Row, but it manages to do very well without them, and yet remain highly attractive.

The particular feature that strikes the visitor in the month of April is the extent to which the naturalisation of suitable bulbous subjects in the grass has been carried out, and the conspicuous success that has been attained in this direction. On every hand, wherever a suitable stretch of grass has presented itself, one finds the sward starred with Narcissi, Muscaris, and Tulips, following the Snowdrops and Crocuses of earlier spring. These sweeps of grass-set flowers have much to recommend them; they break the monotony of formally shaped beds, and long, straight borders, and they distribute more evenly the rich colours of the flowers instead of confining them within the comparatively limited area of carefully laid-out beds, caged in with wire fencing, round which the public marches as around the den of some curious animal.

Not that beds are wanting, however, for their requirements are well looked after, but the garden of grass, old-fashioned in idea as Nature herself, and yet original in execution, claims the first attention.

The wide avenue with its fringe of umbrageous Horse Chestnuts is a pleasant promenade on a summer's day, but amidst the fresher green of the peeping young leaves it is simply delightful, whilst the eye rests with a sense of complete approval upon the line of graceful Elms, also in their rudimentary spring dress, which flanks them on either hand. This avenue runs approximately north and south, and by its side are gathered the greater part of the flower beds proper. All these beds are cut out in the grass, and even the borders have grass verges, but the public is rigorously kept off the grass, or else the latter would scarcely look as fresh and green as it does. Gravel paths, clean, dry, and comfortable, are provided in plenty, however, and the beauties of the flowers can thus be observed from all points of view. Hyacinths, Tulips, and Narcissi have been freely utilised, and a few Wallflowers have been introduced here and there to break the monotony, but we were rather surprised not to find them in greater numbers.

Of the Hyacinths used the deep blue Grand Monarch was exceedingly good. H. Gertrude, and H. Grandeur à Merveille in association looked well,

but by far the prettiest thing in Hyacinths was a bed filled with the flesh-coloured Gigantea, and the light blue La Peyreuse, the two forming a very aesthetic blend.

Of the Narcissi Sir Watkin, Empress, Barri conspicuus, Horsefieldii, and Emperor have all been planted in considerable quantity, and one of the sights of the park was a large triangularly-shaped bed filled with the last named variety, a few dark maroon Wallflowers being interspersed with them.

Tulips have been exceedingly gay and bright, such varieties as Ophir d'Or, Keizer's Kroon, and Proserpine, being the favourite varieties. Proserpine has been especially good in both the beds and the various ornamental vases scattered about the park.

The narrow ribbon borders which run parallel with the centre avenue and on either side of it, have been filled with great taste and judgment. The double crimson and double white Daisies have been employed as a groundwork, and out of them there stood, in relief as it were, showy blocks of Narcissi, Tulips, and Hyacinths of various sorts; in fact to our idea these borders constituted the most effective part of the bedding proper. Several round beds filled with Polyanthuses in variety and Alpine Auriculas were also rendering a good account of themselves.

SWEET-SCENTED LEAVES v. FRAGRANT FLOWERS.

MR. F. W. BURBIDGE, M.A., of Trinity College Botanic Gardens, Dublin, read an interesting paper on this subject before the Fellows of the Royal Horticultural Society, on the 26th ult. Mr. J. Hudson, of The Gardens, Gunnersbury House, Acton, occupied the chair.

Before proceeding to discuss the merits of fragrant leaves as against those of flowers, the lecturer spoke of the widespread use of perfumes amongst the members of the human race. They had been employed, he said, by the sturdy Norman and the crafty Moor, by the Hindoo and the Aztec, and their uses had not in fact, been restricted to any age or clime or nation. Many of these perfumes had been obtained in some way or other from sweet smelling leaves, and many plants were grown expressly for the purpose of preparing perfumes from them. In Shakespeare's time all the old gardens were full of sweet herbs used by housewives and chemists in the making of potions, pomanders, sweet waters, etc. Botany, medicine, and chemistry were then in their swaddling clothes. It was the age of perfumed gloves and shoes, and perfumes and sweet-scented plants generally were in high favour. English literature abounded in reference to sweet smelling leaves. He wished to persuade gardeners to place a higher value upon plants having fragrant foliage, and to cultivate them as carefully as they cultivated others for their flowers. The scent of certain leaves was due to the presence in those leaves of essential oils, and the perfume was the vapour exhaled from these oils under the influence of heat and moisture. He distinguished between odours exhaled by floral and foliage leaves by describing the former as positive, and the latter as negative. Flowers emitted their fragrance only at certain times, and this fragrance was given off spontaneously, whilst in the case of foliage leaves the fragrance was there during the whole life of the leaf; it was persistent, and in some cases was retained even after the leaf was dead. In one or two instances the fragrance of the dead leaf was more powerful than that of the living one, as for instance in the scented Cape Pelargoniums. The audience was invited to test this by means of the samples of dead and living leaves of some of these Pelargoniums which had been brought to the meeting by Mr. Hudson. Finally leaf odours were negative because they were not given off spontaneously as in the case of floral leaves, but were apparent when the glands containing the essential oils were ruptured by pressure in the hands.

Leaf odours and flower odours on the same plant often differed. Thus in the Orange the scent of the flowers was different from that of the leaves, and that of the leaves from that of the bark and wood.

Discussing the value to the plant itself of the presence of these essential oils, Mr. Burbidge suggested that perfumes were an aid to fertilisation in that they served to attract insects in much the

same way as the fragrance of the flowers, and, moreover, many plants which had sweet-smelling leaves had not fragrant flowers. The presence of these oils also tended to check evaporation of water from the leaf tissues, and this was an advantage to those plants which were growing in dry, sunny places; the temperature was also made more regular. Again the odours often acted as a safeguard to the plants possessing them in warding off the attacks of predatory animals and insects. The smell of Cloves, camphor, and Lavender were used to keep insects away from textile fabrics, whilst chests made of camphor wood were the only thing that had been found efficacious in the tropics in keeping at bay the destructive termites or white ants. On the other hand, some animals had a great liking for the smell of some leaves. Thus cats were inordinately fond of Nemophila, Valerian, and Fenugreek.

Perfumes affected various people differently. Some were anosmic, or had no sense of smell, whilst others were hyposmic, and had the sense of smell in an exceedingly acute degree. To the latter class of people belonged the best buyers of Tobacco, Tea, Spices, &c. Some objected strongly to perfumes, and one of the early examples of this distaste was to be found in Socrates who abhorred perfumes of every description, whilst it was stated that Nero burnt more than one year's produce of Arabian perfumes upon the funeral pyre of his Empress Poppeia. It would be hard, moreover, to imagine a person like Oliver Cromwell or John Knox using perfumes, and it would be just as difficult to think of Queen Elizabeth not employing them. Seeing how great a measure of enjoyment it was possible to bestow upon many people through their organs of smell, he strongly advocated the planting of plants having sweet-smelling leaves, all round and about institutions for the blind.

In conclusion, Mr. Burbidge averred that there was a sound sanitary basis for the use of perfumes both on the person and in the dwelling room, seeing that most of them had strong antiseptic properties. Thus the burning of Lavender in a room would destroy all obnoxious odours, and not merely mask them. He advocated the use of bunches of sweet-smelling leaves for use in bed chambers, and alluded to the fact that the old Duchess of Leinster was very partial to the employment of these, what she prettily termed, "bed-room bouquets." He thought also that there was a good market for plants of this class, as well as sweet-scented pot herbs.

Collections of living plants illustrative of the lecture were sent from the Royal Gardens, Kew; and by Messrs. Jas. Veitch & Sons, Ltd., Chelsea, and Mr. Burbidge expressed his obligation to the senders; also to Mr. Hudson for the sprays, and dried leaves of the Pelargoniums referred to, and to Lord Annesley, of Castle Weilan, Co. Down, Ireland, who had sent him sprays of between forty and fifty species of plants with sweet-smelling leaves.

GARDENING MISCELLANY.

THE VARIEGATED GROUND IVY.

THE common Ground Ivy (*Nepeta Glechoma*) is probably as well known as any British plant, for it is, as *Rex* states on p. 536, pretty widely distributed; in fact, I saw it only the other day on the top of the Chiltern Hills. But the variegated form, which is equally as free as the type, is, as yet, comparatively unknown. Last year I came across it in the Glasgow Botanic Gardens—and made a note of it—but I did not recognise its value for decorative purposes, or its extreme beauty, until I was introduced to it afresh on the 24th ult., in the gardens of Falkland Park, South Norwood Hill, where my friend, Mr. A. Wright, has draped the whole of the staging in one of his plant houses with its remarkably effective foliage. Doubtless, as the season advances, the effect will become still finer, for the plant is so distinct and handsome, and grows so vigorously that its acquisition is a *sine qua non*. *Rex*, therefore, does well to call attention to it, for it is, undoubtedly, a valuable addition to the amateur's stock.—*C. B. G., Acton, W.*

A BED OF CAMPERNELLE AND SPIRAEA.

SIMPLE combinations of bedding plants often pro-

duce very pleasing effects by the contrast between two colours, whether of the foliage or flowers, or both. A large circular bed in the gardens at Kew has been planted with a few bushes of *Spiraea arguta*, placed at regular intervals all over the bed. The groundwork was closely planted with *Narcissus odorus rugulosus* last autumn, and both subjects have been flowering freely for some time past. The slender, twiggy branches of the *Spiraea* are leafless as yet, so that the small clusters of white flowers show distinctly against the golden-yellow of the *Campernelle*, and at a short distance are suggestive of a shower of snowflakes upon the otherwise naked bushes.

SOCIETIES.

NATIONAL AURICULA SOCIETY (Northern Division).—April 30th.

THE above society held its annual exhibition in the Free Library Hall, Middleton, near Manchester, on the above date, which was unfortunately accompanied by heavy rains and high wind, which were obviously responsible for the poor attendance during the day.

The show was a good one, though not nearly as large as in the previous year. The quality of the individual specimens was, however, up to the usual high standard, according to the Rev. Mr. Horner and Mr. T. Lord, the leading figures of the show.

SHOW AURICULAS.

For six, dissimilar Rev. F. D. Horner secured the premier prize with *Titania*, *Miranda*, *Favourite*, *Rainbow*, *Sprightly*, and Rev. C. Dalton. He had a very close second in Mr. T. Lord, who showed Mrs. Henwood (very good), Mrs. Potts, Gerald, Seedling No. 10, *George Lighthody*, and *Favourite*. Mr. J. Simonite was third with *Ossian*, *Melaney*, *Seedling*, *Heatherbell*, *Atalantis*, and Dr. Hardy; with Mr. W. H. Midgley fourth, showing *F. D. Horner*, *Heroine*, *Black Bess*, Mrs. Dodwell, *George Lighthody*, and *Acme*.

For four, dissimilar, Mr. T. Lord was a good first with Mrs. Potts, F. D. Horner, *Acme*, and *George Lighthody*; Mr. B. Simonite came second with *Ossian*, *Heatherbell*, *Flamingo*, and *Invincible*; Rev. F. D. Horner was third with *Favourite*, *Orient*, *Mirano*, and *Agathas*; Miss Woodhead took the fourth place; Mr. W. H. Midgley was fifth; Mr. A. R. Brown, sixth; and Mr. J. Clements, seventh.

In the class for pairs, Miss Woodward secured first with *Heroine* and *Rachel*; Mr. N. M. Shipman was second; Mr. R. Gorton, third; Mr. E. Shaw, fourth; Mr. J. Clements, fifth; Mr. G. Thornley, sixth; and Mr. A. R. Brown, seventh.

In the class for pairs by "Maiden Growers," Mr. W. M. Shipman took the prize with *Beauty* and *Admiral Napier*. For single plants, green edges, Rev. F. D. Horner secured the first award with *Orient*; Mr. T. Lord was second and third; Rev. Mr. Horner fourth and fifth; Mr. B. Simonite, sixth; Mr. T. Lord, seventh; and Rev. Mr. Horner, eighth. For a single, gray edge, Mr. T. Lord was first with *Geo. Lighthody*; Miss Woodhead, second; Mr. T. Lord, third and fourth; Rev. Mr. Horner, fifth; and Mr. A. R. Brown, sixth. For a single, white edge, Miss Woodhead was first with Mrs. Dodwell; Mr. T. Lord, second; Miss Woodhead, third; Rev. Mr. Horner, fourth; Miss Woodhead, fifth; Rev. Mr. Horner, sixth; Mr. T. Lord, seventh; and Mr. D. Kershaw, eighth. For a single self, Rev. Mr. Horner was first with *Favourite*; second and third, Mr. J. Beswick; fourth and fifth, Rev. Mr. Horner; sixth, Mr. J. Clements; seventh, Rev. Mr. Horner; and eighth, Mr. T. Lord. The premier Auricula in the whole show was secured by Mr. T. Lord with Mrs. Henwood.

ALPINE AURICULAS.

For six dissimilar varieties, Mr. T. Lord secured first with magnificent specimens of *Charles Turner*, *J. Ashton*, *Dr. Knott*, *Brighteyes*, *Dr. Durnford*, and *John Allen*; Mr. R. Gorton, second, with seedlings Nos. 128, 114, 117, 129, 87, and 96; Mr. J. Beswick, third, with *Miss Walker*, *Dr. Knott*, *Brighteyes*, *John Allen*, *Forest Queen*, and *John Ashton*; Mr. J. Stallfort, fourth; and Mr. J. W. Bentley, fifth.

For four, dissimilar, Mr. J. Beswick took first, with *J. Allen*, *J. Ashton*, *Rising Sun*, and *Dr. Durnford*; second, Mr. T. Buckley; third, Mr. R. Gorton;

fourth, Mr. A. R. Brown; fifth, Mr. T. Lord; sixth, Mr. J. Clements. In the class for pairs, dissimilar, Mr. T. Buckley took the lead with *Emir* and *J. Allen*; with Mr. J. Lees, second; Mr. A. R. Brown, third; and Mr. W. Stringer, fourth. For single plants, yellow centres, Mr. A. R. Brown was first, with *Evelyn Phillips* (very good); Mr. T. Buckley, second; Mr. A. R. Brown, third, with *Gladys*; Mr. R. Gorton, fourth and fifth; and Mr. A. R. Brown, sixth, with *J. J. Kean*.

For a single, white centre, Mr. R. Gorton led the way with seedling 119; Mr. J. Beswick was second; Mr. T. Lord, third; Mr. J. Stilfort, fourth; Mr. J. Beswick, fifth; and Mr. R. Gorton, sixth. The winner of the show Auricula again took the prize for the premier Alpine in the show, given by R. Gorton, Esq.

The competition for gold laced Polyanthuses was weak, only a few deserving comment. For three dissimilar black grounds, Mr. Geo. Thornley was first, with Mrs. Brownhill, seedling, and *Cheshire Favourite*; second, Mr. J. Beswick; and third, Mr. W. Stringer. For three red grounds, Mr. J. Beswick was first, with *Middleton Favourite*, *Seedling*, and *George IV.*; the second prize went to Mr. W. Stringer; and third to Mr. Geo. Thornley. For a single plant, black ground, the first, second, and third prizes went to Mr. G. Thornley, with Mrs. Brownhill, *Cheshire Favourite*, and *Exile*; the fourth and fifth prizes went to Mr. J. Beswick, with *Thomas Ball*, and *Lancashire Hero*. For a single plant, red ground, Mr. J. Beswick took the lead with *Middleton Favourite*; Mr. J. Greenhouse was second; and Mr. G. Thornley, third.

J. W. Bentley, Esq., of Stakehill House, Castleton, sent some well grown specimens of *Azaleas*, also *Wistaria sinensis*, and *Aponogeton distachyon*. From Messrs. Barr & Sons, of Covent Garden, came a large collection of Daffodils, including some fine specimens of *N. Glory of Leiden*, *N. Emperor*, *N. Shirley Hibberd*, *N. bicolor Madame Plomp*, *Dean Herbert*, and a single specimen bloom of their large Trumpet Daffodil, "Weardale Perfection," which attracted much attention. Messrs. Barr also had a large collection of single and double Tulips, conspicuous amongst which we noticed some good, single bedding varieties, such as *Thos. Moore*, *Keizer's Kroon*, *Proserpine*, *Cottage Maid*, etc.; and of double sorts, *Tournesol*, *Murillo*, *Rex Ruhrorum*, etc.; some beautiful species, such as *T. clusiana*, and *T. Greigi*; also *Anemones*, *Fritillarias*, *Erythioniums*, etc.

OBITUARY.

MR. LYNCH WHITE.

WITH deep regret we have to record the death, on the 2nd inst., at Bournemouth, in his 47th year, of Mr. Lynch White, of Homefield, Bickley, Kent, only son of Mr. Lynch White, of Leigham House, Streatham Hill, S.W., the founder of the extensive business carried on at Upper Ground Street, S.E., under the title of The Thames Bank Iron Co. Deep sympathy is felt in the trade for the widow and family, and also for the surviving partner, Mr. W. Y. Baker.

QUESTIONS AND ANSWERS.

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Larvae on Cherry Trees.—*J. M.*: It is not the first time we have met with caterpillars on Cherry trees under glass, precisely under the same conditions, and doing the mischief you mention. We believe, however, that there are more than one species of moth guilty of this sort of thing. There are two large groups of moths to either of which it might belong, namely, Tortricina and Tineina, the latter consisting of some 650 British species. The Small Ermine Moth (*Hyponomeuta Padellus*), which you suggest, belongs to the Tineina, but the caterpillars sent do not belong to the genus *Hyponomeuta*, because the latter are social or gregarious living in great numbers under a common tent or web, and are of a different colour from those on your trees; Those you sent live singly under their webs, and as far as we can make out from the larvae belong to the

Tortricina, and might possibly be *Antitbesia pruni-ana*, as they correspond pretty closely in size, colour, habit, and other particulars. In any case the only remedy we have seen put into practice, or that can be suggested is hand picking. Wherever you find a curled leaf have it examined, and the contained larva destroyed. It is a laborious job if the larvae are abundant, but you might set a boy to examine the trees at intervals from the time the leaves commence to expand. By catching them when young it will prevent much damage, and the insects from reaching the perfect state. We take it that the eggs were laid upon the trees last summer, and the larvae have hatched out a few weeks before their time owing to the warmth of the house.

Interchange of Papers on Gardening Subjects.
—W. B.: In the course of our varied experience with mutual improvement societies there has been no difficulty in getting an exchange of papers by members of different societies to read at their respective meetings; but as a rule it is arranged between the secretaries or other officials and members of other societies, it may be at a distance of three to hundreds of miles. We think, however, there are such arrangements, whether by affiliation or otherwise, whereby two or more gardeners' associations can and do effect an interchange of papers. We believe the Woolton Gardeners' Mutual Improvement Association is constituted on those lines, or something similar, because members of that association read papers at the meetings of others. You might apply to Mr. R. G. Waterman, Church Road, Woolton, Liverpool, and we have no doubt he will put you on the right track. That is sufficiently near your place to make it possible for the writers of the papers to turn up in person and read their papers. In our experience papers always give most satisfaction when the writers are present to read them and answer questions. There are some societies about London which might be willing to exchange papers, but as they are over for a season, there is no chance of bringing the matter before them till October next. In the meantime, however, you may proceed with your arrangements, and by applying again if necessary, we have no doubt we could help you in getting other papers.

Choice Varieties of Streptocarpus.—*Gloxinia*: Any fine varieties you may wish to increase may be multiplied by cuttings of the leaves in the same way as Gloxinias are propagated, so as to keep them true to name, that is, by leaf cuttings. The leaves should be fully developed but in fine condition, not when they begin to get exhausted and die back with age. Even then, however, you might be able to root the basal half of the leaf where vitality is retained long after the top has died. Use sandy soil, and do not over-water the cuttings till roots have been formed and they show little crowns. After that stage you may pot them off singly in 60-sized pots.

Lathraea squamaria.—*T. Gerard*: It is quite true that this subject is a parasite, just as much as the allied species of Broom-rape are. Therefore, you will have to sow seeds or plant roots in pots or pans of soil in which something is growing to which the fleshy roots of the parasite may attach themselves and thus be able to subsist. In a wild state it grows on the roots of various trees and shrubs such as Hazel, Willow, Elm, Black Walnut, Rhododendrons, &c. We believe it takes to the roots of Willows as readily as to anything, so that you can strike some cuttings and be ready to plant the *Lathraea* when you can procure seeds or specimens. There is not so much trouble attached to the growing of these subjects as might be imagined, provided you have suitable host plants to the roots of which the parasites can attach themselves. There being no chlorophyll in them they must be connected with something which can make and supply food for them.

Saffron.—*Sigma*: You will find a reply to your question on p. 559 under "Names of Plants."

Names of Plants.—*W. H. Y.*: The Fern is *Polypodium quercifolium*, the reference being to the barren fronds; the flowering plant is *Agathosma rugosa*.—*H. Cannell*: *Asclepias curassavica*.—*T. M.*: 1, *Pyrus Maulei*; 2, *Spiraea Thunbergii*; 3, *Forsythia viridissima*; 4, *Rhododendron dauricum*; 5, *Rhododendron flavum*; 6, *Kalmia glauca*.—*W. B.*: *Lunaria biennis*; *Fritillaria Meleagris*; 3, *Caltha palustris flore pleno*; 4, *Scilla hispanica*; 5, *Scilla hispanica alba*; 6, *Lathyrus vernus*.—*A. B. L.*: 1, *Masdevallia Shuttleworthii*; 2, *Odontoglossum andersonianum*; 3, *Oncidium sarcodes*; 4, *Dendrobium infundibulum*; 5, *Oncidium heteranthum*.—*A. H.*: 1, *Retinospora plumosa aurea*; 2, *Taxus adpressa*; 3, *Podocarpus andina* (also known as *Prumnopitys elegans*); 4, *Sequoia sempervirens*; 5, *Juniperus sinensis aurea*.

Agricultural Economist

An ILLUSTRATED MONTHLY MAGAZINE of 52 pages and Exponent of scientific and high-farming; advocate of co-operation in agriculture, in the supply of farm requisites and the sale of produce; organ of the Agricultural and Horticultural Association, the pioneer society for mutual supply of pure alloakes, complete manures, reliable seeds and implements on wholesale terms. Specimen copy free. Subscription per annum, 5s. inclusive of postage. Single Copies 6d. each, through all Newsagents.—3, AGAR STREET, STRAND, LONDON, W.C.

EPPS'S COCOAINE.

COCOA-NIB EXTRACT.

The choicest roasted nibs (broken-up beans) of the natural Cocoa on being subjected to powerful hydraulic pressure, give forth their excess of oil, leaving for use a finely-flavoured powder—"Cocoaine," a product which, when prepared with boiling water, has the consistence of tea, of which it is now, with many, beneficially taking the place. Its active principle being a gentle nerve stimulant, supplies the needed energy without unduly exciting the system. Sold only in labelled tins. If unable to obtain it of your tradesman, a tin will be sent post free for 9 stamps.—JAMES EPPS and Co., Ltd. Homoeopathic Chemists, London.

RUBBER STAMPS

WITH A MOVEABLE LINE.

SPECIALLY DESIGNED OUTFIT

FOR

Seedsman and Florists. COMPLETE FOR 7/6.

The Outfit consists of Rubber Die (any wording) mounted on Special Air Cushion Rubber (1/4 inch thick) so as to neutralise any inequalities of surface in Seed Bags, &c.; a Font of Solid Rubber Type, containing 74 Letters, Points, and Ornaments. These are simply pressed into designs, and can be altered at will. In addition a Type Holder is enclosed for marking single lines of moveable type only. For 1/6 extra we include 21 figures, so that it can also be used as a dating stamp.

All sorts of Rubber Stamps made to order at short notice and low prices.

"AMERICAN GARDENING."

An Illustrated Journal of Horticulture, published in the interests of the amateur in the Garden, the Conservatory, the House, the Fruit and Vegetable Grower, Trees, Shrubs, and Flowers.

The Leading American Horticultural Authority.

Issued weekly, and mailed, postage paid, to English subscribers for a 6s. money order.

Address, "AMERICAN GARDENING," 170, Fulton Street New York, U.S.A.

No worm or other vermin can possibly enter a plant where

Porter's Patent Invincible Crocks

is used. Neither boards, slates, nor ashes are required to stand the pots on, so that money, time, and injury to plants are saved; they fit any pot, and last for many years. All Chrysanthemum growers should use them.

Mr. J. Crawford, Coddington Hall Gardens, Newark, when writing in "The Bazaar" about these Crocks, says—"I now use them for anything and everything that is of the least value, and I am quite confident that when as well known as they deserve to be, no other Crock will be used."

30, 1s.; 100, 3s.; 1,000, 25s.; Carriage Paid.

JADOO FIBRE.

WONDERFUL SUCCESS.

At a great Horticultural Exhibition recently held in New Orleans, plants grown in Jadoo were awarded

20 FIRST PRIZES and 2 SECONDS.

ADVANTAGES OF GROWING PLANTS & SEEDS IN JADOO.

Seeds germinate much more quickly in Jadoo than in earth.

Greater perfection easily attained.

Suits all kinds of plants.

Is much lighter than earth.

Less frequent watering is required.

The flowers are larger, of richer colour, and last longer.

No soil to mix: No manures required.

Ghent Exhibition, 1898. The two principal prizes of the show (including Gold Medal), were gained by plants grown in Jadoo, by Messrs. Byrvet, Bros., Haarlem.

PRICES:—3/6 per bushel. 8/- per 3-bushel sack. Special prices for large quantities.

Testimonials and full directions for use post free.

Obtainable through any Nurseryman, or from—

JADOO, Limited, EXETER.

CARTERS' HOLBORN PRIMULA.—SINGLE or DOUBLE in choicest mixture. Our Prize Strain of the beautiful winter-flowering conservatory plant is the finest in cultivation. We were the originators of the blue variety now so popular. SINGLE, separate colours, white, scarlet, blue or pink. In Sealed Packets, price 2s. 6d., 3s. 6d., and 5s. each, post free.

CARTERS' BRILLIANT CINERARIA.—The very finest strain ever submitted to public notice. Awarded Highest Prize, Medal Royal Botanic Society, 1897, Royal Horticultural Society, 1898. A customer recently sent us blooms measuring 3 1/2 inches across. Fresh seeds, all colours, mixed. In Sealed Packets, 2s. 6d., 3s. 6d., and 5s. each, post free.

CARTERS' VICTORIA CALCEOLARIA.—Our grand strain is the very perfection of scientific culture, being compact in habit, and brilliant in colour and size of blossoms. A customer writes:—"The plants were a perfect picture, many with 600 blooms; we took first prize." Fresh seeds, all colours, mixed. In Sealed Packets, price 2s. 6d.; 3s. 6d., and 5s. each, post free.

CARTERS' INVINCIBLE GLOXINIA.—We have brought this fine summer decorative plant to the highest excellence. H.R.H. the Princess of Wales greatly admired our exhibit at the Temple Exhibition last summer, and was graciously pleased to pronounce it an "exquisite display." Fresh seeds, all colours, mixed. In Sealed Packets, price 2s. 6d. and 5s. each, post free.

CARTER'S, THE QUEEN'S SEEDSMEN, 237, 238, and 239, HIGH HOLBORN, LONDON.

ORCHIDS of the highest quality, every plant guaranteed true to name, from 2/6 each. Please send for free list.—P. MCARTHUR, The London Nurseries, 4, Maida Vale, London W.

FRIDAY, May 20th.—Sale of imported and established Orchids by Messrs. Protheroe & Morris.

SUCCESSFUL CULTURE OF VANDA TERES.—

Some ten or fifteen years ago gardeners looked upon this Vanda as a difficult subject to bloom, and we have seen large plants put under various peculiar conditions with the object of inducing them to bloom. Since then, however, a number of gardeners and Orchid growers, that is, specialists, have learnt how to bloom this species more or less satisfactorily. No one is more successful in this respect than Mr. George Reynolds, gardener to Messrs. de Rothschild, Gunnersbury Park, Acton. The species has now been grown here for many years with greater or less success, till this year something over 200 spikes of bloom have rewarded the cultivator. In the early days of its culture at Gunnersbury Park, almost the whole of the stock was grown in a heated pit, planted out in sphagnum over a considerable amount of crocks and brick bats as drainage. In this pit the plants were necessarily dwarf, and had to be frequently let down by cutting off the lower portions or by taking the tops as cuttings. The old plants that were beheaded threw out a few side shoots. A certain quantity of bloom was annually obtained from this pit, and was at that time regarded with a certain amount of pride and satisfaction. A few plants were later on transferred to the stove by way of trial, and grown in pots, if

we rightly remember, against the west aspect end of the stove, close to the glass. Here the plants had more head-room, and were allowed to run up. The heat and moisture of the stove proved even more suitable to the welfare of the plants than the conditions that prevailed in the pit, so that more and more of the plants were transferred to the stove, where the whole of them have been accommodated for some time.

These plants have now been flowering for three weeks at least, the first batch of flowers having been cut on the April 27th. Usually the flowers keep up a display for a month or somewhat longer. The gorgeous effect of 200 spikes, with their massive and curiously formed flowers, has to be seen to be admired and fully appreciated, particularly by those who have never previously seen so many plants in flower. As the plants have to be accommodated in accordance with the slope of the glass roof, they vary in height from 2 ft. to 6 ft. or more. The taller and stronger the stems, the finer the spikes and the larger the size attained by the individual blooms. The advantages gained in the stove, therefore, are greater head-room, more uniform temperature, and atmospheric moisture during the growing season. From the time the flower spikes make their appearance till the plants show signs of having completed their growth in early autumn, an abundant supply of water is furnished the roots, independently of atmospheric moisture, which in itself must be of material advantage judging from the numerous aerial roots produced at different points all along the stems. The aim of the cultivator is to get good growth, and then to ripen it properly. This is secured by the withholding of water at the roots, and the reduction of atmospheric moisture as the days shorten, and sunlight and heat decrease. The gradual withholding of moisture induces the plants to go to rest, while the tissues of the wood and leaves get matured and hardened.

The other conditions of cultivation are very simple. The plants are grown in four large wooden boxes, two of them close to the glass, and two others on the opposite side of a pathway, the latter resting on the end of the central, raised bed of the house. Four rows of plants occupy the boxes against the glass, and two rows the remaining set. The boxes are about 18 in. wide, or thereby, and 6 in. deep, inside measurement. The rooting medium, or compost consists of an ample depth of crocks, mixed with some nodules of charcoal and surfaced with a layer of living sphagnum. While in bloom the plants are carefully shaded, as that conduces to the durability of the flowers. Such cultural treatment is well worth copying, and might be pursued to advantage by all gardeners having this Vanda under their care. The results amply justify the means adopted, namely, a harvest of over 200 spikes, each carrying from three to seven blooms, the latter number not being uncommon. Counting the number of growths on these two hedges of plants, they would be six to eight years old. Strong cuttings a foot in length, after having made a good growth, may flower within the twelvemonth, after which the plants flower annually. Many of last years growths have each produced two spikes, though a third sometimes appears only to be checked by the two that secure the lead. The sepals and petals are of a silvery rose, while the disc and interior of the side lobes are yellow, more or less closely lined with orange-brown. There are several varieties, some of them being handsomely lined or banded with crimson spots or markings on the yellow ground of the lip. In some cases the lines are very faint. The whole taken

together constitute as fine a lot as any gardener might wish to see or possess.

The National Schools of Berlin are furnished with over 100 specimens of four different kinds of plants twice a week, for botanical demonstrations.

Dried Fruits.—It requires five to six pounds of Apricots, six to eight pounds of Peaches or Pears, and about two-and-a-half pounds of Prunes to make, respectively, one pound of dried fruit.

Messrs. B. S. Williams & Sons, of Upper Holloway, have acquired extensive grounds, forming part of the Manor Farm, Regent's Park Road, Finchley, for the purpose of further extending their business, and growing hardy trees, shrubs, general nursery stock, and plants under glass.

The Queen Bee lives three or four years, and the workers only three to six months. As the drones usually die by violence it would be difficult to determine their natural lifetime. Bees have been known to occupy the same hive consecutively for forty-six years.

The Royal Horticultural Society's Forthcoming Great Show.—Members of the Preston and Fulwood Horticultural Society are forming a party to visit London during the show week. Mr. Frame, the courteous tourists' conductor of Fishergate, Preston, has charge of the arrangements, and will conduct parties wishing to see the sights of London. The train starts on Tuesday night, May 24th, leaving Windermere at 9 o'clock, Kendal 9.18, Oxenholme 9.27, Carnforth 9.55, Lancaster 10.7, and Preston 11.51. There will also be trains on the branch lines from the Fylde District to Preston. It is expected that a number of gardeners from Liverpool will join the train at Wigan, who will be accommodated with saloons if timely application is made. Further information may be had from Mr. Frame or Mr. C. Parker, Secretary Preston and Fulwood Horticultural Society, 11, Cannon Street, Preston.—"P."

Dover Flower Show.—The committee responsible for the management of this show, have a president (the Mayor of Dover), a treasurer, and a secretary, yet it does not appear to assume the title of horticultural society. Nevertheless, a very good schedule of prizes has been got up for the show to be held on August 17th and 18th. Prizes are offered in 120 classes, of which fifty-nine are open to all England, including classes for plants in pots, cut flowers, fruit and vegetables. Another group of classes is open to gardeners residing within a radius of 15 miles of the borough of Dover. Twenty-two classes are devoted to the interests of cottagers and allotment holders in the borough, whose garden does not exceed forty perches. Other groups are open to amateurs, ladies, nurserymen, and florists, and there are ten classes in which special prizes are offered. Eight out of ten just mentioned are for vegetables, so that Dover evidently wishes to increase the love for vegetables of a useful and, therefore, economic kind. We wish the committee of the Dover flower show every success in its laudable endeavour to promote the cause of gardening. The hon. secretary is Mr. E. M. Worsfold, Market Square, Dover.

A Prescription for Mordant Ink given by Theophilus is, according to the summary appearing in the current issue of the *Journal of the Society of Arts*, as follows:— "Cut with your own hand twigs from the Hawthorn trees in April or May, before they put forth their leaves and flowers, and lay them by in the shade to dry somewhat. Then pound off all the bark and put the same into casks full of water, and let them stand for eight days until the water absorb all the sap of the bark. Then pour out the water into a pan or cauldron and boil it, and then throw in more bark, until you boil all the sap out of it, and repeat this until the water is boiled down to a third; and then boil this until it grows black, and begins to thicken, taking care to add no more water. Then add one-third of pure wine, and put it into three new pans until a skin forms on the surface. Then place the pots in the sun until the black ink separates itself from the red dregs. Afterwards pour the pure ink into small bags of parchment or bladders, and hang in the sun until all is quite dry. And when dry take as much as you want and mix with wine over a fire, and add a little atramentum (here sulphate of iron) and write.

Errata.—At p. 566, in the 25th line from the bottom of the first column, for "Mr. McMath" read "Mr. McIntosh." In the 36th line from the bottom of the second column for "Mr. Ewen" read "Mr. McEwen."

Green Peas and French Beans, unshelled, are being sold at 1s. 6d. a pound in the London markets. A basket of Strawberries, containing about a dozen fruits costs 3s., that is a shilling for four fruits, or threepence apiece.

Irish Gardeners' Benevolent Society.—A special meeting of the supporters of this charity was recently held at the Rotunda Buildings, Dublin, Mr. Cranmer, the president of the society, in the chair. The chief business was the election of a secretary in the room of Mr. Thomas Shaw, who has resigned. On the motion of Mr. Campbell Mr. W. S. Hall was chosen as successor to Mr. Shaw. Mr. Campbell, Jun., then read a very instructive paper on the "Naturalisation of Flowering Plants," which was ably discussed by several of the members.

The Twenty-five best Chrysanthemums from an American point of view would naturally differ from the best twenty-five in the opinion of English growers. The Americans set special value upon the flower stem and foliage of the variety. The former must be long and stout, and the latter sturdy and vigorous. A list of the best varieties was given in November last by Mr. Robert G. Carey, before the Florists' Club of Philadelphia, and subsequently appeared in *The American Florist*. In the issue of *Le Nord Horticole* for May this list is again given, with description of the varieties mentioned. The first varieties on the list are Mrs. Jerome Jones, Maud Dean, Major Bonnaffon, Vivand' Morel, Silver Cloud, William Lincoln, Mrs. H. Robinson, The Queen, and Mutual Friend. Of the remaining varieties, Modesto, Charles Davis, Miss Agnes L. Dalskov, Miss Georgina Pilcher, and Golden Wedding are well-known on this side of the water, whilst the others are either utter or comparative strangers. An editorial note at the bottom of the French translation calls the attention of Gallic readers to the fact that varieties in America must have good stems and foliage as well as other good qualities if they are to rise above mediocrity.

Scottish Horticultural Association.—The usual monthly meeting on Tuesday evening, the 3rd inst., under the chairmanship of the president, was largely attended by members. A number of new members were elected, and a further list nominated. The leading paper of the evening was one on "Bulb Culture in Lincolnshire," by Mr. J. Alexander, Revesby Abbey, Horncastle. The paper was read by the secretary, and was of a very interesting and informative character, shortly describing the soil, method of culture, the varieties cultivated, and the *modus operandi* of bunching and marketing pursued by two of the leading bulb farmers of Lincolnshire, a county which may now be described as the Holland of Britain in so far, at least as Narcissi culture is concerned. During the spring season tons of cut blooms are despatched daily to the principal markets, and in the autumn a very large and rapidly increasing trade is done in bulbs. The paper was much appreciated, and a hearty vote of thanks was awarded to Mr. Alexander. Mr. D. P. Laird, of Messrs. Laird & Sons, who acted as one of the jurors at the recent Quinquennial Show at Ghent, afterwards gave a highly interesting, entertaining and eloquent account of the great show, which he saw there and the people he met. His short address was much appreciated by the members present, who accorded him a very warm vote of thanks. There were several interesting exhibits on the table, amongst which may be specially mentioned several blooms of Chrysanthemum W. H. Lincoln, which, though they seemed born out of due season, were excellent specimens. A new Cabbage, shown by Messrs. Laird, and raised by a Mr. McKinlay, was also much admired as a very early hearting and handsome variety. The president also contributed a very early elegant vase of Spanish Iris in beautiful variety. The annual outing of the association takes place on Saturday the 21st inst., the place to be visited this season being Gosford House, the beautiful and interesting demesne of the Earl of Wemyss. We wish the excursionists a pleasant afternoon.

Fragrance of *Lilium Harrisii*.—It is stated that the pastor of a church in Jersey City, U.S.A., requested that no Easter Lilies should be used for decorative purposes in his church, several persons having for several years past fainted owing to the overpowering fragrance of the flowers.

The Vine Mildew was named *Oidium Tuckeri* by the late Rev. M. J. Berkeley. Until quite recently its natural history was but little known; then its true fruits or asci were discovered and it was relegated to the genus *Erysiphe* as *E. Tuckeri*. Now the fungologists say that an inspection of the perithecia shows it to be a *Uncinula*, namely, *U. americana* or *U. spiralis*.

Canals in Mars.—Hitherto the phenomenon of the doubling of the canals in Mars, as seen through the telescope, has been set down to the growth of vegetation on either bank. The newest explanation by M. Antonidi is that the phenomenon of doubling is caused probably by the eye of the observer, seeing double. Surely this is a serious allegation against the condition of the star-gazers.—*Snaggs*.

Packing Watercress in Tins has been attempted by an enterprising farmer in Wisconsin, U.S.A. The Cress, after having been pressed tightly in the tins was covered with saline fluid, and the tins were then hermetically sealed. After the tins had lain unopened for a year they were opened, and it is stated that the Cress was found to be as fresh in appearance and as tasty as when it was first cut. We understand that the farmer intends to follow up the experiment by canning Watercress on a large scale for trade with tropical countries.

Poor *Dracaena*.—M. C. Petrick, of Ghent, has recently raised a new *Dracaena* which he has named after the great French writer, M. Emile Zola. The *Nord Horticole* takes exception to this and speaks in very strong language concerning what is evidently regarded as a gross insult. In the comments upon the matter which appear in the May number of that paper, Zola is spoken of as being under the ban of society, and of all loyal and independent people. It concludes by saying that the writer is convinced that no honest Frenchman, or foreigner who is also a friend of France, will be found who will attempt to obtain it, which is distinctly hard—upon the *Dracaena*.

Forfar Horticultural Improvement Association.—This Society held its concluding meeting in the Burgh Court Room, on the evening of Tuesday, 3rd May, the president, Mr. Thos. Wilson, Glamis Castle Gardens, presiding over a good attendance. The paper for the evening was "Progress of Horticulture in America during Her Majesty's Reign" by Mr. Alfred Outram, F.R.H.S., London, which, in his absence, was read by Mr. James Brown, the secretary. At the close a hearty vote of thanks was passed to Mr. Outram for his very interesting paper. There were on exhibition from Glamis Castle Gardens, twenty-five varieties of *Narcissus* besides some blooms of that grand strain of single *Begonias* so well grown there, which were very much admired. A vote of thanks was passed to Mr. Wilson, who in returning thanks, intimated that that closed the session and called on the secretary to read the balance sheet, when it was found the society was in a healthy condition financially. The annual general meeting to elect office bearers for the coming session was then held, when the following were appointed—viz.: Mr. John Knox, hon. president; Mr. Thos. Shiel, New Cemetery Lodge, president; Mr. Thos. Wilson, Glamis Castle Gardens, vice-president; Mr. James Brown, 86, Castle Street, hon. sec. and treasurer. Committee: Mr. John Clark, Fernbank; Mr. Andrew Lees, Southview; Mr. James Saddler, Honeyplace; Mr. J. R. H. Robbie, Castle Street; Mr. A. Harris, Baronhill; Mr. Wm. Moir, View Mount; Mr. Walter Piggott, Zoar. The company then adjourned to Mr. Robertson's hall for supper, Mr. Wilson presiding, and Mr. Shiel being croupier. After covers had been removed, Mr. Robbie, vice-president, in the unavoidable absence of Mr. Knox, hon. president, in name of the members presented Mr. Wilson with a silver-mounted silk umbrella, along with a ladies' combination workbox for Mrs. Wilson, bearing suitable inscriptions in recognition of his valuable services as president during the past session. Mr. Wilson very feelingly replied. With song and sentiment a happy evening was spent.

Echinocactus polyancistrus is a recent introduction from California, but is yet very rare in this country. A figure of it is given in *The Cactus Journal* for April, Pl. V. It is a very spiny plant like most or all of its congeners. The spines are its special feature, some being red and others white, while they may be of several hues on one and the same plant. They are 3 ins. to 4 ins. long, and very much flattened. The plant body is light green, thus forming a striking contrast with the particoloured spines. Very few plants have been found in the native home of the species, and as it multiplies very slowly even under cultivation, it is bound to be a rare plant for years to come.

Lettuce Forcing in the States.—In this country the growing of Lettuce under glass is not carried on to any extent, but in America vast crops are raised thus. One of the most successful cultivators in the neighbourhood of Bolton calculates that within a radius of ten miles of that city not less than from 150 to 200 acres of under-glass space are devoted to this crop. The returns must be remunerative or we should not hear of vast areas such as this being devoted to the purpose. The structures employed are chiefly frames, which are either placed on hotbeds or are unheated. The plants in the cold frames are raised from seed sown in the open ground in September, which are transferred to the frames early in October; or the seed is sown on hotbeds or in heated houses later on in the winter, the plants being put in the frames early in the spring. The plants from the autumn sowing need but little or no water during the winter months, but careful attention is given to ventilating on bright sunny days.

ROYAL HORTICULTURAL SOCIETY.

THE TEMPLE SHOW, MAY 25TH, 26TH, & 27TH. FOR the eleventh year in succession, the Royal Horticultural Society will hold their great annual flower show in the Inner Temple Gardens on May 25th, 26th, & 27th. Every year the desire of growers to exhibit increases, and the officials of the society have a very anxious task in endeavouring to do justice to those growers who support the fortnightly shows of the society held at the Drill Hall, and yet at the same time to encourage others to come forward. The space is absolutely limited by agreement with the Temple Authorities; no more or larger tents may be erected. Hence, every new exhibitor whose entry is accepted means curtailment of the space allotted to previous supporters.

A catalogue of the show will be given gratis to every visitor, and will contain a notice of new and rare plants entered on or before May 19th. It will also contain a programme of the music to be performed each day. On the first two days the Band of H. M. 2nd Life Guards, and on the 3rd day the Band of H. M. Royal Horse Guards will perform.

The judges will meet at the secretary's tent at 10.30 a.m. on May 25th, at which hour, punctually, the tents will be cleared of all exhibitors and their assistants. The Fruit, Floral, and Orchid Committees will assemble at the secretary's tent at 11 a.m. sharp; and the show will be opened at 12.30.

N.B.—All plants for certificate must be entered on or before Monday, May 23rd. Address:—Secretary, R. H. S., 117, Victoria Street, S.W.

They cannot be entered under any circumstances on the day of the show.

TO GROW FINE FRUIT.

THE *Journal de l'Agriculture* gives the following instructive story by Mr. Duret, agriculturist of Indret-Loire, a story all those who have charge of an orchard will do well to remember.

"Two or three years ago (the tale is old, but as will be seen, is for this very reason more valuable), I visited an old friend for whom I had obtained some slips of a Vine called Gros Cabernet. It was near the middle of September when one day we drove together into his vineyard. "There they are," he exclaimed, "your magnificent Grapes."

"I do not recognise them," I replied. "You have not grown them on my slips? The Lignieres Pinot Noir does not produce such fine fruits."

"They are indeed your Pinots."

"But the Grapes are enormous, what have you done?"

"Well, I dissolved 2 kilogrammes (4.410 lbs.) of sulphate of iron in 100 litres (22 gallons) of water, and with this solution I sprayed the leaves and fruit of my Vine. But one must work at the right time. I waited until the Grapes had attained one third of their ordinary size. I sprayed again a month later, and again twenty days before gathering. You see the effect. I obtained similar results with Cherries, Pears, and Apples."

"That was a success," I said, "and next year I shall try your method."

Alas, when the time arrived I had quite forgotten the receipt and the magnificent Grapes of which I have just spoken. Yesterday, by chance I met this old friend, after an absence of two years. I thought of his Cherries, Apples, and Pears. "Well," I said, "have you repeated your sulphate of iron experiment?"

"Yes, and always with the same success. What about yourself?"

"I have so many matters to attend to that I can hardly help forgetting some, but what is delayed is not lost and I intend next July, August, and September, to spray some rows of Vines, to see whether I shall obtain Grapes of wonderful size and beauty."

Let us observe that the method is applied, at least for fruit, by the horticulturists of the environs of Paris, who moisten each promising fruit with a solution of sulphate of iron by means of a brush.—*Cosmos, September 18th, 1897.*

AUSTRALIAN PERFUMES AND ESSENTIAL OILS.

Although the Australian colonies are rich in plants yielding delicious perfumes and valuable essential oils, little or nothing has been done, so far, to practically utilise the advantages thus afforded. Systematic flower farming is still in its experimental stages, and there exists an almost untouched field of illimitable extent at the command of those possessing the necessary capital and experience in the manufacture of perfumery and essential oils, coupled with the advantage of an abundance of mutton fat, so largely used in the perfumery trade, at minimum prices. In New South Wales all the garden flowers of Europe and Asia, especially those emitting the richest fragrance, are found growing in unsurpassed luxuriance, many being obtainable nearly all the year round, their profusion and cheapness proving how easily they are reared. Several of the essential oils obtained from the leaves of native plants are really perfumes, and their chief use is in scenting soaps and other preparations. The quantities used are small, and the plants used are wild.

Among the native perfume-yielding plants which remain unutilised are several varieties of *Acacia*, including a few which furnish a scented wood. The *Acacia farnesiana*, which is largely cultivated in Italy and the south of France, the well-known pomade, called "Cassia" being produced by placing the sweet scented flowers in melted mutton fat or olive oil, until the latter becomes impregnated with their odour, grows plentifully in many parts of New South Wales; and another species of *Acacia*, familiarly known as the Golden Wattle, is equally useful as a perfume plant; as is also the Native Laurel, or Mock Orange. Among the plants from which sweet-scented and other oils may be obtained are the Native Sassafras, Peppermint, Bloodwood, Blue Gum, Mountain Ash, White Gum, Ironbark, Woolly Butt, Spotted Gum, Tallowwood, Messmate, Red Gum, Poplar Box, and other species of *Eucalyptus*; Ridge Myrtle, Tea-tree, Native Peppermint, Dogwood, and Turmeric.

The essential oil of the Red Gum has been found a reliable remedy for chronic dysentery and diarrhoea, and that of the Moreton Bay Ash makes an excellent furniture polish. The oil obtained from the Native Sassafras resembles, in odour, ordinary Sassafras oil, with an admixture of oil of Caraways, and is used for medicinal purposes. *Eucalyptus* oil possesses many valuable qualities, and is said to possess the power of destroying bacteria, or animal life. Its antiseptic powers have been fully recognised by the medical profession, and by many it is preferred to carbolic acid in the treatment of wounds. The leaves of the various kinds of *Eucalyptus* are found useful

in preventing or removing scale in boilers. The oil of the Mountain Ash, a common species of *Eucalyptus*, dissolves gutta percha readily, and can be used, like kerosene, for lamps, having a greater illuminating power, a pleasant odour, and absence of liability to explosion. Three ounces of the oil have been found sufficient to scent eight pounds of soap at a cost of one farthing per pound.

The oil obtained from the Stringy Bark is found to be more efficacious, in many complaints, than the ordinary English Peppermint, being less pungent and more aromatic. The oil of the White Gum has been suggested as a soap-perfume. The Woolly Butt oil possesses the remarkable property of imparting an indelible stain to paper, but at present it has not been utilised for commercial or industrial purposes. The oil of the Grey Gum possesses a delicious citronelle odour, and makes an excellent soap perfume. Several varieties of the Tea Tree furnish an oil possessing most, if not all, of the properties of cajuput, so largely used in India as a remedy for rheumatism. Practically the number of native shrubs and trees in New South Wales capable of being utilised in the manufacture of perfumes and essential oils is without limit, and when the large quantities of either product, obtainable from comparatively small proportions of bark or leaves, is taken into consideration, it will be seen that in this direction New South Wales possesses exceptional advantages for those possessing the requisite capital and experience to establish large remunerative productive industries. It may also be mentioned that the Olive, Castor Oil Plant, and Linseed grow luxuriantly in the colony, and are easily cultivated.

NOTICES OF BOOKS.

FLOWER FAVOURITES: Their Legends, Symbolism, and Significance. By Lizzie Deas. London: George Allen, 156, Charing Cross Road. 1898. Price 3s. 6d. nett.

Those who delight in reading and treasuring legends, fairy tales, traditions and sentimental tidbits concerning the popular flowers of garden, field, and wayside, will find much in this handy little volume to gratify their taste and occupy their leisure moments. It consists of some 229 pages, is of foilsap octavo size, and contains short quotations from the poets, but has no illustrations. The letterpress is of large and clear type, requiring little exertion of the eye in following it.

Naturally the Rose, Thistle, Shamrock, and Leek come under review, together with other old flowers with which most people come in daily or frequent contact. Tales concerning the Rose go back to the time of the Arabs and Persians, thence onward to the king of Babylon, Greeks, Romans, and peoples of other parts of the world. The account of the English emblem comes under the heading of Rose Brier, and it is stated, according to some authorities, that the Rose *argent* of York was a cultivated form of the Field Rose (*Rosa arvensis*). The "York and Lancaster" Rose symbolical of the union of the two ancient royal families of England, is rightly ascribed to a variety of the Damask Rose, notwithstanding the fact that it is frequently confounded with *Rosa Mundi*, a variety of *Rosa gallica*. There are also English legends about the Rose, which he who runs may read.

The legends, tales, and accounts of the Thistle, including amongst several other species the Scotch Thistle, are very fully given. One tradition given about the adoption of the Thistle as the badge of Scotland attributes it to a company of bearded men with high crowned hats, who met in the Council House of Edinburgh, about the middle of the sixteenth century. The Order of the Thistle, according to another legend, goes back to the time of Archius (other history spells his name Achaius), a Celtic king of the Scots, and it claims, therefore, to be the most ancient of all orders of high honour. The popular legend about the origin of the high respect given to the Thistle by Scotchmen is also correctly recorded. A party of invading Danes were proceeding to surprise the Scottish camp by night when a bare-footed Dane trod upon a Thistle, and gave vent to an involuntary howl which aroused the Scots, who flew to arms with a mighty shout and bloody rout, according to their wont, and drove back the foe. If this is the correct origin of the Thistle as the national emblem of Scotland, the date must

lie somewhere between 830 and 1014 A.D., the beginning and end of the Danish invasions north of the firths of Forth and Clyde. No more than other authorities is the author able to settle the specific identity of the Scotch Thistle. The heraldic device does not, in our opinion, represent a Thistle, native of the British Isles within the botanico-historic period at least.

The story of the Shamrock is discussed in a short chapter of about three pages. It is stated to be a Trefoil, but beyond that its specific identity remains undetermined as in the case of the Scotch Thistle. If we are to accept the cultivated Leek as the true Welsh emblem there would be no doubt as to its botanical name. On the contrary, if, as tradition says, Welshmen wear the Leek in memory of St. David, their patron saint, the specific identity of the plant again becomes obscure; for St. David "did feed only upon the Leeks which he gathered in the fields." Now there are several wild Leeks, and the cultivated one (*Allium Porrum*) is not a native.

Several legends hang around the Blue Cornflower (*Centaurea Cyanus*). At the present day it is held dear to the Germans as the national emblem of Germany. When Queen Louise of Prussia was forced by Napoleon to flee from Berlin, she took shelter in a cornfield where she amused her children by making them wreaths of the Blue Cornflower. Her son Wilhelm, afterwards king of Prussia and first Emperor of United Germany, chose as his emblem *die Kornblume*; hence it is dear to all patriots of the Fatherland. The above notes culled from the book will give our readers a general idea of the tenor of the book, much of which is interesting.

REASONS WHY APPLES DO NOT KEEP WELL.

THOSE proprietors of gardens who have a limited experience of fruit keeping are oftentimes sorely tried by finding, after following the best advice obtainable, that in some seasons no inconsiderable portion of their Apple harvest goes prematurely to decay, and possibly accuse the unfortunate individual who gathered them with carelessness, without justifiable reason beyond their own want of knowledge. Now Apples, like almost or quite all vegetable productions, are liable to so many diseases and enemies that it is almost sure, whatever the character of the season may be, that at least some of the fruit will be affected by one or more parasites in a greater or lesser degree, as the atmospheric conditions have favoured their development. In some years the damage done is very little, and almost or quite escapes notice; in others the damage is much greater, and calls for constant attention in the looking over the fruit, and using those having symptoms of decay first.

It will frequently be found that in even small collections of Apples and Pears there are two or three of these fungoid growths among them. One of the most common belongs to the genus *Cladosporium*, which, developing beneath the true cuticle, often covers the surface of the fruit with dark round spots. Decay frequently takes place at these. Sometimes, however, it dries up the fruit, causing it to adhere to the tree through the winter, and when allowed to remain is often a cause of canker. Again, it not unfrequently happens that some fruits turn brown on the trees, and soon after round mealy spots form on the surface showing that the spawn of *Oidium fructigenum* has been vegetating in its tissues.

Sometimes a fungoid growth will be found in apparently sound fruit, much resembling in appearance the Potato disease. So far as my own experience goes the softer fleshed Apples are the most subject to this, and it appears to be most prevalent after dry, hot summers. The fruit is available for culinary purposes for some time after it is first taken with the malady. Lastly, fruit decays naturally in the ordinary course of things according to whether it is naturally an early or late variety. For instance a French Crab will keep for many months after Codlings, and yet these latter may in truth be said to have kept well if preserved in fair condition two months after being gathered. Now it is out of all reason to expect these varied enemies to be kept altogether at bay; but when observed all affected fruit should be carefully removed from those which are sound, because if no other mischief is done, it is

certain that sound fruit will acquire a musty taste if surrounded by that in a state of decay.—W. B. G.

CINERARIA STELLATA.

THERE is a considerable diversity of opinion about this strain of *Cinerarias* which has been worked up and put into commerce by Messrs. Sutton & Sons, Reading. The strain is the result of crossing the modern greenhouse race of *Cineraria* with the old *C. cruenta*. The general public is generally highly delighted with, and full of admiration for, the easy grace of the large panicles of starry flowers, as well as the great variety of colours already to be met with in the strain. The gardeners, on the contrary, have for some years past been so heavily weighted with the idea that massive, imbricated flowers and dwarf plants are the only things worth striving for in a *Cineraria*, that every thing else must be put in subjection to this view.

We may recall the fact that only a few years ago the wild *C. cruenta* was re-introduced and annually raised in some quantity at Kew, when and where it was greatly lauded for its graceful and elegant appearance, notwithstanding the fact that the plants varied from 3 ft. to 5 ft. in height. Now by the crossing of the wild original with its cultivated progeny, the plants have been reduced to half the height or less. Surely that in itself is an advantage. The flowers are intermediate in size, and intense as well as pale colours of many shades have been imparted to them. The strain is, therefore, well adapted for conservatory decoration, even where space is limited. The decorative value is infinitely superior to that possessed by their dumpy garden relatives. A purpose may be served by both strains which are well worth preserving, so that neither may be discarded to give exclusive preference to the other. It may be urged that the new strain lacks pedigree, but that is merely sentiment, and a narrowing of the view of what may be regarded as really beautiful. That of course is a danger to which specialists lay themselves liable; but let us not forget the once despised race of Japanese *Chrysanthemums*, and the *Carnations* that would not conform to the canons of the florist.

The new strain known as *C. stellata* shows a great range of colour such as mauve, pink, purple, magenta, magenta-purple, blue-purple, lilac, rose-purple, white tipped with purple and other shades, which have been flowering in profusion at Reading for some time past. In company with them are batches of *C. lanata*, *C. pcpulifolia*, and *C. multiflora*, which have more or less of a shrubby habit, with smaller, generally woolly leaves, and are later in coming into bloom. All these intercross with one another, and whether the strain of *C. stellata* can be improved by intercrossing with the above-named species remains to be seen. The garden race has every appearance of having been brought to its present stage of development simply by intercrossing and selection from the wild *C. cruenta*, if we are to judge from their strictly herbaceous character and large leaves.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Dendrobe and Odontoglot from Fairfield.—A richly-coloured variety of *Dendrobium nobile* comes to us from Mr. A. Grigor, gardener, to Alex. O. Gill, Esq., Fairfield, Aberdeen. The upper half of the sepals and petals is of a rich, intense purple, quickly giving place to a pale, nearly white ground towards the base. The lip also has the usual colour markings much intensified. The bloom is of average size, but the rich colouring makes it a variety of no ordinary merit. Accompanying it was a bloom of *Odontoglossum polyxanthum*, also highly coloured as far as the blotches were concerned, but the markings on the petals were reduced to one small blotch at the base, leaving all the rest of a bright yellow. The lip was shorter than we often see, and almost roundly-cordate. Both Orchids were therefore good of their kind, the *Dendrobium* being the more distinct of the two.

Cypripedium kerchovianum W. H. Young, *Nov. var.*—The original or typical form of this hybrid was raised in the Brussels Botanic Garden, where it was first flowered in 1892, as the result of

crossing *C. Curtisii* with *C. barbatum*. It was named in compliment to M. le Comte de Kerchove de Denterghem, the president of the Royal Agricultural and Botanical Society of Ghent. The variety under notice was raised by Mr. W. H. Young, Orchid grower to Sir Frederick Wigan, Clare Lawn, East Sheen. It resulted from the reverse cross of the original, namely *C. barbatum* var., with *C. Curtisii* as the pollen parent. The seeds were sown on the 26th December, 1893, and is now flowering for the first time. The dorsal sepal is white, lined with green veins and shaded with purple towards the sides. The dusky petals are tipped with purple, and marked all over with black spots, thus showing the influence of *C. Curtisii*. The huge purple lip also has the long claw of the lip peculiar to the last-named. The oblong leaves are broad and very vigorous. Mr. Young has already flowered several hybrids of his own raising.

THE YELLOW SPORTS OF CHRYSANTHEMUM MME. CARNOT.

I DON'T know who wrote the paragraph concerning *Chrysanthemum* G. J. Warren, but the paper was laying on the potting bench, and you see what one of my men's opinion is:—Poor G. J. Warren! he does get it hot, and for what reason I cannot think; for I will defy anyone to see any difference in the growth of that and Mme. Carnot and Mrs. Mease. The make, shape and size of the flower are the same, only different in colour, and the only thing I can see against it is, it isn't pure white; for this is the only thing in which anyone can see any difference in the two (or three).

Concerning *Chrysanthemum* Mrs. Mease, it was not till I went to the Belfast show that I saw it was distinct from G. J. Warren. I wired from there to Edinburgh to tell Mr. Mease to reserve me the stock, and I have no doubt but that it was my telegram which lost me the stock and caused the bother; for as you know I was not in Edinburgh, though someone else was. Even Mr. Mease himself did not know any difference, but considered that he was exhibiting G. J. Warren, or as he called it, Yellow Mme. Carnot. He also said "I did not know the conditions of the Ulster Horticultural Society's schedule, otherwise, you may rest assured, I should not have done as I did. It turned out to be distinct, and I did what I did quite innocently."—*W. Wells.*

Kitchen Garden Calendar.

THE WEEK'S WORK.

THE dry weather of the last month somewhat retarded the growth of plants, so that vegetable crops in general are by no means so forward as one would have expected to find them after such a mild winter. The welcome rains, however, of the last week have been favourable to the growth of most things, the gardener who does not wish to be behind must, therefore, be busy if he would keep pace with the work. Cauliflower for autumn should now be transplanted. Such varieties as Michaelmas White, Autumn Giant, and Autumn Mammoth are all good kinds, as they are not liable to run to seed. If planted while the ground is moist, they will soon take fresh hold of the soil. Brussels Sprouts ought also to be put out as soon as the ground can be got ready for them. This is a crop that takes some time to grow, and unless the plants are put out early the season becomes advanced before any sprouts are formed. The last sowing of Broccoli seed ought now to be put in, choosing an open place that the plants may grow sturdy. This crop has been exceptionally fine with us during the present spring, particularly Standwell, Model and Late Queen. There is an advantage, where a continuous supply has to be kept up, of growing several varieties, as all do not turn in together. Borecole should also be got out in good time that the plants may grow sturdy. There can be no advantage in leaving the plants in the seed beds after they are large enough to handle, and if the ground is ready better take advantage of showery weather to put them out.

PEAS.—Particularly those grown under glass have done well this season; it is doubtful, however, if there is yet anything equal to William Hurst for either pot culture or growing in pits. Those sown

on the open borders have done well and are showing plenty of pods. Late Peas are often troublesome to grow in hot seasons, as they are subject to the attack of fly in a very young state. Small sowings should, therefore, be made at intervals of about a week. Pay particular attention to earthing up Potatoes. The soil between the rows should be loosened up and rendered as fine as possible before being drawn up to the plants, for where left rough it is seldom that the tubers are of good shape. The thinning of many vegetable crops at this time of the year is an important item.

CARROTS, PARSNIPS, BEET AND ONIONS will all require to be done in a young state if fine, well-shaped roots are to be obtained. It is, however, not necessary to set the plants out at the full distance at first as the young tender roots may be drawn for use as they become large enough; but thinning ought never to be deferred until such times as the plants become crowded. The sooner this work is done the better, for when allowed to remain until the foliage becomes crowded, this is produced at the expense of the roots. Gardeners are apt to overcrowd as they are compelled to produce a large bulk from a small space, but it is not wise to attempt too much.

Continue to make small sowings of Turnips and Spinach; both of these crops require an abundance of moisture to keep them growing. Early thinning should also be resorted to that the plants may gain strength in a small state. We have before advised that Carrots are much sweeter if drawn young, and cannot do better than repeat that advice by stating that for general use seed sown now will give better results as regards roots for storing than that sown early in April. The old orthodox rule was to sow in spring for storing in winter, but experience teaches us that when ground is well cultivated, it is far better to make small sowings at intervals for general use, relying on seed sown about this time of the year for roots to store for winter, allowing them to remain in the ground as long as possible in the autumn.

CELERY that was sown early should now be got into the trenches, for like all other plants, there is no advantage gained by allowing them to be overgrown before being put out. When plants flag to any serious extent this is a sign that proper cultivation is not given them. Those from the later sowings ought to be pricked out as they become large enough to handle, allowing a distance of 2½ in. between the plants. Cauliflower that was planted out early in the last month will be greatly benefited by having liberal doses of manure water. It is impossible for the ground to be too rich for this crop. Weeds will now be growing apace, therefore the hoe should be kept at work in fine weather, taking care in doing so not to injure the plants, as many which might have been fine roots are spoiled by being scarred with the hoe when young. It should always be the rule to hand weed round all plants for a distance of at least 2 in. from them, which precaution will prevent any mishap in this respect. A close look-out should now be kept for the Onion fly; dusting with soot ought not to be neglected.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

THE DEGENERATION OF ORCHIDS.

SEVERAL opinions have been put forward in the gardening papers from time to time as to the probable cause of so many Orchids dying out, that I feel constrained to have my little say about the matter.

The up and down the country notion is very good, and is no doubt answerable for a great number of deaths. Locality too has been thought by good men to have a more or less deleterious effect on this aristocratic family of plants. I am not, though, a great believer in the locality craze. Of course, I am putting close proximity to the Metropolis and all other large centres out of the reckoning, as it is well known that in and near large towns it is impossible to get so much light and pure air—two essentials in the culture of Orchids—as you do in the country.

My opinion based on a twenty years' experience, is, that the position, elevation, and kind of structures some gardeners find themselves hampered with have more to do with failures when attempting the culture of this beautiful class of plants than any other yet advanced.

In building glass houses there is too much hanker-

ing after scenic effect rather than putting up structures suitable for growing plants. Again, those that build houses do not know really what is required; it is not their business. They naturally erect houses that catch the eye rather than for general utility; and who can blame them? To those intending putting up a range of Orchid houses, I would suggest that they should first visit some of our large Orchid growing establishments, private or otherwise, and see for themselves the kind of house that seems best adapted to each particular species. A little forethought in this direction would, I am sure, bear good fruit. Having made up your mind as to the kind of structure to be erected, the effective heating of the same must be considered. This is of the greatest possible importance. A badly heated house is the curse of all gardeners. Sufficient piping should be put in so that the required temperature can be kept up without having to make the pipes so hot that on entering the house the atmosphere strikes you as being too dry and unwholesome. Plants never thrive on dry hot air, it is so unnatural to them.

A great many failures, I cannot help thinking, should be laid at the door of those that are constantly settling forth that such and such an Orchid can be grown cool. Cool Orchids there are, but not in the sense often implied. You may, in the perusal of, say, a catalogue, find it stated that the particular Orchids to be sold were found growing at an elevation of some 8,000 ft. above sea level where it was not unusual to find them covered at daybreak by frost. Quite so, but for how long? not long enough to do any harm; besides, under natural conditions the plants are better seasoned, and able to stand any fluctuation in temperature that may and does occur in their native habitats.

Another cause, to my mind, is that they do not get the nourishment in the way of plant food under cultivation as they undoubtedly do under natural conditions. In their own homes there is always a certain amount of decomposition going on amongst the vegetation underneath them. The heavy dews with which they are enveloped at night must of necessity benefit them greatly, likewise the heavy falls of soft water in the rainy season; how different is this to the hard water we are only too often compelled to use.

How changed are those conditions under our forced hot-water system. Yet, given a fair chance, they even do better than they did in their own homes. Some there are, and always will be, that absolutely refuse to do well for long; but, generally speaking, it may be said that we have mastered their requirements, and only when an attempt is made to grow them in too low a temperature, or in unsuitable houses do they fail to please.

To beginners I would say, First see that you have properly heated structures in which to grow the plants; secondly, do not try to grow more than the staff you intend to keep can properly manage; thirdly, always buy good, sound plants; and fourthly, deal with the best firms; it is cheapest in the end.—*C.*

Gleanings from the World of Science.

THE undermentioned subjects were brought before the Scientific Committee of the Royal Horticultural Society on the 26th ult.

Vine Leaves with Gummy Exudation.—Some leaves were received from Mr. F. M. Gulrin, Iscoed, remarkable for a stickiness. This appeared to be attributable to green fly, although none was present. The exudation is the result of puncture.

Paeonies, Decayed.—Mr. F. F. Freeman sent some leaves which appeared to have decayed at the junction with the stem. They were forwarded to Mr. W. G. Smith for examination for the presence of fungi.

Ribes sanguineum, Growth of.—Mr. Henslow described a rather curious case of a bush growing by the south side of some palings. It had sent up a number of shoots on the north side. The former half was in full leaf bearing very few racemes; while that on the other side was covered with flowers, the foliage being scarcely apparent.

HINTS FOR AMATEURS.

Tulipa biflora.—The flowers of the Tulip, whether it be of the earlier flowering species and varieties, or the more refined and highly bred florists' Tulips which flower in May, are, as a rule, borne singly upon the flower stalk or scape, but there are very few rules without an exception or exceptions, and we have an instance of this in *Tulipa biflora*, a Caucasian species, which found its way to this country about the year 1806. The specific name, "biflora," would denote, of course, that there are two flowers to the scape, but however true this may have been of the wild plants it is no longer true of the cultivated ones; indeed, "multiflora" would be a much more appropriate name, for the scapes are "many-flowered," the number varying from five to eight or nine, seven and eight being very common numbers. *Tulipa biflora* is exceedingly interesting from a botanical point of view, seeing that it forms a connecting link between the genus *Tulipa* proper, and the sub-genus *Orithya*. It is not, however, of its botanical affinities that we wish now particularly to speak, for the plant has another side, that of horticultural value, to which it may be profitable to draw attention. For a sheltered nook in the rock garden lovers of hardy plants will find it a real gem of great beauty, and as it is easy of cultivation it is a plant that the amateur will do well not to overlook. This year it was in full flower by the middle of April, and very pretty it looked, in spite of the fact that the fore part of April was anything but genial. The flowers are rather small as compared with the size of other Tulips, but then their number more than compensates for this. The colour is a delicate cream-yellow, with a slight flushing of green on the outer side of the segments.

Tulipa undulatifolia Boissieri.—Tulips are generally cultivated for their flowers, but in one or two instances we have amongst them plants possessed of distinctly handsome foliage. One of these, *T. Greigi*, we noticed a week or two ago, and in *T. undulatifolia Boissieri* we have yet another that is almost worth growing for the sake of its foliage alone, which, with that of the type *T. undulatifolia*, is distinct from that of any other Tulip. The leaves are long, and narrow in proportion to their length. The margins of the leaves, as the specific name denotes, are much waved and undulated, presenting, in fact, a series of strong curves. The colour is deep green. The flowers are very showy, and will compare favourably with those of any other form for beauty. They are rich crimson in colour, with a black centre, surrounded with a narrow yellow zone, and stellate in shape, the segments being rather narrow. The height of the plant is only about 6 in., so it should be given a position where it will not be overshadowed by taller and more vigorous growing subjects.

Tulipa Leichtlini.—Whilst speaking of beautiful species of Tulips we cannot refrain from making mention of *T. Leichtlini*. With the two already spoken of it is of great beauty, and a charming plant for a nook in the rockery. The flowers are of medium size. The inside is pale flesh-pink, with a bright yellow base, while the outside is a rich coral-red. The mixture of colours is thus very handsome and effective. The height of the plant is from 5 in. to 6 in. The only thing that militates against the plant is its price, which, to tell the truth, is somewhat high, but then it is so beautiful.

Arabis albida is neither a new nor a rare plant, but its great value for spring bedding purposes compels a note. If hardy, free-flowering, easily cultivated subjects such as this were taken up and properly utilised our gardens would be much gayer during the early part of spring than they are. The plant is only from 6 in. to 9 in. in height, and hence it can be usefully employed for covering the spaces between taller growing subjects; indeed, we have noticed that it has been effectively employed in this way in association with Tulips at Regent's Park. As an edging for beds or borders it is likewise all there, and there are many less showy plants than it in the rockery during April and May. The flowers are pure white, and are very freely produced in terminal racemes over a long period, whilst the habit of the plant is close and trailing, and it loves to form close tufts of greenery, out of which the flower scapes rise with a freedom that not infre-

quently endangers the safety of the plant; indeed, the tufts are simply masses of white. Such a subject as this should be in every amateur's garden. *Arabis albida* is a native of Tauria and the Caucasus regions, having been brought to this country a little over a hundred years ago. It is occasionally met with in gardens under the name of *A. caucasica*.

Under cultivation this species has given rise to at least one variety of considerable merit—the silver variegated one known by the name of *A. a. variegata*. It is, perhaps, not quite so free-flowering as the type, but the foliage is prettily variegated, and is thus showy when the plant is out of bloom, in which respect it may be said to score off the plain green form.

A. procurrens variegata is a variegated form of the dwarf, Servian species, *A. procurrens*, which commences to flower earlier than *A. albida*, although the two may be seen in bloom together. This is much dwarfer in stature than *A. albida*, and may be roughly considered a miniature of it.

A. lucida foliis variegatis is a long name under which another handsome *Arabis* has to labour. The flowers are white, and the foliage a pretty mixture of green and gold. This should be grown with the silver-variegated varieties of *A. albida* and *A. procurrens*, if only for the sake of contrast. The plants run to about 6 in. in height.

A. rosea should not be lost sight of. As the specific name suggests, the flowers are of a rose colour, very soft and delicate. It is a native of Calabria, and its height is about that of *A. albida*. These two species make a capital pair.

As we have previously mentioned, all the Arabises or Rock Cresses are very easy of cultivation. They will grow almost anywhere if sufficient light be given them. On dry, sandy banks, for instance, where most other plants would languish and ultimately die, they do well, and flower with surpassing freedom. Propagation is fully as easy, and the amateur may take his choice between root divisions, cuttings, or seed. Perhaps the surest way is to divide the roots after flowering has ceased for the season. Cuttings put in during the summer also root freely enough, and if looked after will make good plants by the following spring. Seed should be sown as soon as it is ripe, and may be put either in the open ground or in pans placed in a cold frame; in any case artificial heat should not be given.

Fritillaria macrophylla.—The changes which are ever occurring in the nomenclature of plants are exceedingly puzzling to the amateur and professional gardener alike, and some of us are apt at times to think that this changing of names is done out of pure spite, or merely a desire for a change. This, of course, is not so, as the correct affinities of a plant can only be obtained after a vast amount of trouble, but the puzzlement that is brought about by the changing has still to be reckoned with. Very few plants, indeed, have been so hardly treated as *Fritillaria macrophylla*, for in addition to this name it has been called both *Lilium roseum* and *L. thomsonianum*, whilst the changes have been rung on these names in a most provoking manner. First the plant is a *Fritillaria*, then it is a *Lilium*, and both genera are to be found in use in different parts of the country. Many of our amateur readers may be inclined to ask, and not without good reason, how they can possibly be expected to know and use the right name of a plant that has so many aliases, and over which authorities disagree so much. The *Index Kewensis* has adopted the name of *Lilium roseum*, but we have referred to the plant under the name under which it is most frequently met, viz., *Fritillaria macrophylla*. This was the name given to it by David Don, who was the first to describe it.

According to Dr. Wallace, in his "Notes on Lilies," the plant is "a native of the Western Himalayas, extending from Afghanistan eastwards by way of Massoorie and Nepaul. It has been gathered by nearly all the collectors who have visited that region. In the eastern part of its range the height which it attains above the sea-level appears to be from 5,000 ft. to 6,000 ft. . . . It seems to have been first introduced into cultivation by Loddiges, who flowered it in 1844. Captain Strachy sent it to Kew in 1853 from Kumaon."

To pass from the botanical affinities of the plant, no matter whether it be *Lilium* or *Fritillaria*, it is a distinctly handsome thing, and a gem for pot culture. It is about 1 ft. in height, and the flower scape bears a number of medium-sized, rose-coloured flowers,

which are broadly funnel-shaped, and have the tips of the segments slightly reflexed. It is totally distinct from anything else.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Fern Pots.—*P. Ford*: You would be able to obtain earthenware pots suitable for hanging against a wall from any good maker of flower pots. If your order is not large enough to send direct to them we should imagine you would have no difficulty in getting them through your local sundriesman. The kind of Fern pocket you mention with one side flat, and a hole in the top for suspending it is made, but we do not often see them in use. The Ferns do very well in them, but our own objection to them is that they look rather glaring. We should prefer to have wooden receptacles made, and to cover these on three sides with sheets of cork. These would come quite as cheap as the earthenware pots, and in our opinion look far nicer, but tastes differ.

Pots for Selaginellas.—*P. Ford*: Selaginellas may be grown in the ordinary pots, but we prefer pans from 4 in. to 6 in. in depth, and either square or round in shape. These pans give the large amount of surface room which Selaginellas like, without the unnecessary quantity of soil which the use of ordinary pots entails.

Gloxinias.—*E. P.*: The Gloxinia leaves have been scorched by exposure to the sun. You must shade them. There are no signs of insect attacks.

Mealy Bug on Streptocarpuses.—*Karl*: Mealy bug is very partial to Streptocarpuses, and now that you have allowed your plants to become badly infested you will find some difficulty in getting rid of the pest. We have found that dipping the plants in a fairly strong mixture of Lemon Oil insecticide to be the best method of cleaning them speedily and safely. Lay the plants on their sides after they have been dipped, so as to prevent the insecticide from getting amongst the roots.

Thinning Grapes.—*E. P.*: It is almost impossible to give you full instructions on paper as to the way to thin Grapes. A practical demonstration is necessary, and would teach you more in two minutes than we could with pen and ink in a week. As your Grapes are Black Hamburgs the operation is easy enough, seeing that the berries generally set in threes. The middle berry of each three is generally the largest, and must, therefore, be left, cutting away the one on either side of it. In thinning you should first of all remove all the inside berries, that is, those that are borne towards the centre of the bunch. The smallest ones in the outside ranks should follow next, and finally, if it is required, a few of the large ones may be taken out, but this is rarely necessary at the first attempt. If you can get a practical man to show you, do so, if not, proceed cautiously on the lines we have indicated.

Shrubby Calceolarias.—*D. James*: You will do well to plant the Calceolarias out now if the bed is ready for them, but if frost comes they will require protection. It is better, however, to do this than run the risk of spoiling them by leaving them in their present crowded condition for another fortnight.

Chrysanthemum Golden Queen of England.—*Mum.*: In a lately issued list of too much alike Chrysanthemums which will not in future be accepted upon the same stand by the National Chrysanthemum Society, Golden Queen of England, John Lambert, Emily Dale, and Emily Dale improved are all bracketed together. This means that the four varieties that you mention as being so much alike are recognised as being so by the committee appointed by the N. C. S. to inquire into the matter.

A North Frame.—*Seasons*: There are numbers of plants which can be grown to advantage in a frame facing to the north, and although a frame having a southern aspect is naturally more useful we should not advise you to take the trouble of shifting it unless you are obliged to do so from lack of under-glass space in the latter position. A north frame, having a bottom of clean coal ashes, and not too deep, is a first-class place for Cinerarias, and if you grow any of these handsome plants you will do well

EARNOCK CONSERVATORY IN DECEMBER.

The accompanying illustration shows the interior of the beautiful conservatory at Earnock, Hamilton, N.B., the residence of Sir John Watson, Bart. His gardener, Mr. James Moir, also sent us a photograph of the interior of the Chrysanthemum house, both pictures being taken in the first week of December last. Naturally, the bigger and finer display of the

main ranges of glass and other houses. The interior is occupied with tall Tree Ferns and Palms, so that the flowering plants were merely added to brighten the effect at the dull period of the year. Chrysanthemums, *Primula obconica* and other subjects were stood round the sides of the central bed; and as the illustration shows, baskets of *Nephrolepis* and *Adiantum caudatum* were suspended from the roof. Chrysanthemums can evidently be made to produce a respectable display in the moist climate of

EARNOCK CONSERVATORY IN DECEMBER.

to bear this fact in mind. Then again, Tuberoses which were potted up at the commencement of the year, and have been growing slowly, may well remain in such a position until it is desirable to introduce them to heat. Then resting plants, such as Nerines, Freesias, and Lachenalias, find safe asylum during their rest. Ferns do well in such a place, and various other plants, whose flowering season it is desired to retard more or less, may well be placed in it. You will find plenty of stuff to fill a medium-sized frame of this kind, and to fill it with advantage.

popular Autumn Queen was in the Chrysanthemum house. The plants are grown for decorative purposes at Earnock, and considering how fresh they were in the first week of December, it would scarcely describe them properly to say they are merely grown for autumn display, autumn and winter being more appropriate terms under the conditions.

The conservatory is a fine structure situated amidst beautiful surroundings in the pleasure grounds which are planted with numerous fine old trees and shrubs. It is therefore isolated from the

Hamilton during winter under the care of Mr. Moir.

China Grass is largely cultivated in Japan for the purpose of manufacturing paper and twine. In order to maintain its price at a uniform figure and keep down competition, large companies have been formed to supply cultivators with plants and give the necessary instructions for growing them. The farmers are bound to return the crops at a fixed price.

BELGIAN NURSERIES.

III.—MM. DE SMET, FRÈRES, GHENT.

SITUATED at Ledeborg, a north-eastern suburb of Ghent, is the horticultural establishment of MM. De Smet, Frères, who grow a few specialities, and grow them well. As an article of commerce *Araucaria* must be of leading importance, judging by the enormous quantities grown in this establishment alone. M. de Smet informed us that 50,000 cuttings are rooted on the premises every year. Every cutting is inserted singly in sandy soil and covered with a miniature bell glass not much larger than a tumbler. A houseful of these was an interesting, because unusual, sight. In other houses the plants may be met with of all sizes, to meet the requirements of different customers, and to serve for all purposes to which this useful decorative subject may be put. There are thirty houses of *Araucarias* on the establishment, which will give some idea of the extent of the industry. Some of the houses consist of blocks of four, built practically as one. In one house we noted three plants grown in a pot, a method of culture we sometimes met with in the case of Palms in other nurseries.

Palms constitute another speciality, more important in fact than *Araucarias*, for sixty houses are entirely devoted to them. *Kentia belmoreana* varies from 1 ft. to 8 ft. in height, all being clean and well-furnished specimens, according to their size. *K. fosteriana* is the less important of the two, but the quantity in stock is nevertheless great. House after house is entirely filled with one or both of these species, showing that, commercially, they are amongst the most important of Palms. One curvilinear house was interesting as being a remnant of the old nursery of the well-known house of Verschaffelt, which no longer exists. Such plants as *Verschaffeltia splendida* and *Fittonia Verschaffeltii*, &c., recall the name of the old firm at one time established in this neighbourhood. M. de Smet requires but a short time to show visitors over his nursery, for he can open one of the doors of a block of fifteen houses, and say "*Kentia belmoreana*" when he has given the name of all the plants they contain. One house is filled with seedlings of *Areca sapida*. Another is filled with species of *Cocos*, of which *C. weddelliana* seems always to be the most important in Belgium. A great curiosity we noted while inspecting the houses was one built of cement, not merely the walls, but the sash bars large and small on which the glass rests. Cement would appear to be more durable than wood or iron, but time alone can tell.

Sweet Bays (*Laurus nobilis*) constitute the third great speciality, for they meet the visitor at every turn in the open air at present. They are raised from cuttings, and grown in the form of pyramids and standards. The pyramidal form we think the most interesting, though that may be purely a matter of opinion. There is an avenue, 150 yds. in length, of shapely and trim pyramids grown in tubs stood in the open for the summer. The strength of the central stem of young plants gives evidence of the vigour of growth, in the earlier stages of the specimens at least. During winter they are housed in a huge structure, consisting of an iron framework, covered with wooden laths, over which additional protection may be given in winter, when the weather is severe. Hotwater pipes in the interior give sufficient heat to keep frost at bay.

One house is filled with various flowering *Anthuriums*, including *A. scherzerianum*, its varieties and allies. *Aspidistra lurida* and *A. l. variegata* are well grown. *Tillandsia hieroglyphica* is also a noteworthy plant, whose foliage is covered with peculiar bronzy markings comparable to Egyptian or other hieroglyphics. Between the blocks of houses, but in the open air, is an avenue of large plants of *Dracaena lineata*, which may be put to various useful purposes in the flower garden or in house decorations.

IV.—M. COPPITERS, GHENT.

The horticultural establishment of M. Em. Coppiters is situated at 341, Chaussée d'Anvers, Mont St. Amand, Ghent, a northern suburb of the latter, but beyond the ancient boundary of the city. As the name indicates, the nursery is situated on the causeway leading to Antwerp, and so thickly are similar establishments planted here that the suburb might be regarded as a little town of nurseries.

M. Coppiters grows a great variety of fine foliage

and decorative plants. One large house is filled with *Kentia fosteriana*, 6 ft. to 12 ft. in height, and *Latania borbonica*, in well-furnished specimens. In another house *Kentia belmoreana* occupies the prominent position. *Dracaenas* may be regarded as a speciality here, for several houses are more or less completely filled with a great number of varieties, both green, variegated and highly coloured. Amongst the former were fine specimens of *D. lineata* and *D. australis aurea striata*. Seedlings of *Clivias* are raised in some quantity. *Aspidistra lurida*, *A. l. variegata*, *Araucaria excelsa* and *A. e. glauca* are plants continually in request for decorative purposes.

Another house contains a collection of many named varieties of *Dracaena* with highly-coloured foliage, amongst which we should mention *D. Lindeni*, *D. massangeana*, *D. Doucetti* and *D. Bruanti* all well known and generally useful. The last named is notable for the bronzy hue of its younger leaves. *D. Dannalli* would come into the same category, but the leaves are merely tipped with bronze. The younger leaves of *D. terminalis* are bright red; while the broad leaves of *D. stricta* are much variegated with that colour. A large batch of *Cypripedium insigne* is grown for the sake of cut flowers.

Several other houses are filled with fine-leaved *Dracaenas*, which M. Coppiters knows how to turn out in clean, healthy condition. We could only note the finer and more distinct varieties. Very fine is *Mme. Fred. Bergmann*, with short, broad, bronzy leaves, having red edges. On the contrary *Lord Wolseley* is characterised by its long, narrow, spreading leaves of a rich bronzy hue, margined with red. A handsome variety is *Prince Manouq Bay*, with large reddish-bronze leaves, which, when young, have quite a reddish-purple hue, and stand out quite conspicuously amongst a collection. *De Smetiana* is equally if not more beautiful, for the young foliage is of a beautiful dark rose, the undersurface being more intensified, and some of the young leaves are pale. The plant is of good habit, grows vigorously, and might be grown as a substitute for *D. amabilis*, which is well known in Britain, and shows a similar range of colour. We noted, however, a fine batch of the last named, in specimens 3 ft. to 3½ ft. in height. The plants were quite small and young in January last, so that they have made splendid growth, plunged in leaf soil. Several of the leading commercial varieties are grown in batches of several hundreds.

The vigorous growth and clear variegation of *Phrynium variegatum* is also noteworthy. Here it seems to get taller than we are accustomed to seeing this handsome plant. In other parts of the nursery Palms again take prominence, including *Latania borbonica* and *Kentias* in plants of useful size, and well furnished with foliage. Along with them, but occupying the side benches, are small plants of *Ficus elastica* (propagated from cuttings of the tops of shoots, which, when rooted, form useful plants), small trees of *Araucaria excelsa*, *Aspidistra lurida variegata*, *Dracaena Bruanti*, and others.

Palms, *Dracaenas*, and Indian *Azaleas* may be considered the specialities of this establishment being abundantly represented by various species and varieties. Several frames were already filled with varieties of Indian *Azaleas*, put out to make their growth during the summer months. The rest were still growing in leaf soil upon the benches of numerous houses, except a quantity of plants of market size, which were in pots.

THYRSACANTHUS RUTILANS.

THIS handsome stove subject seems to have fallen upon evil days of late years and to a very large extent to have been consigned to the regions of oblivion, to which many a pretty plant has preceded it. At one time it was almost a constant occupant of collections of stove plants; now it is but comparatively rarely met with. This is all the more to be regretted when we consider its extreme beauty and usefulness, as well as the great easiness with which it may be grown. It is perfectly safe to assert that there are numbers of plants that one meets frequently in various parts of the country to which *Thyrsacanthus rutilans* can give points. Visitors to the Drill Hall recently could scarce help noticing the brave display that a batch of it made in the group of miscellaneous plants put up by Messrs. Wm. Cutbush & Son, of Highgate, N.

Propagation may be easily effected by cuttings,

and the time of the year is now with us when these cuttings should be inserted. After the old plants have done flowering the points of the young shoots should be taken off at a length of three or four inches. In order to facilitate subsequent shifting these cuttings are best put only one in a thumb pot, the soil being rather sandy. Place these cuttings in a propagating frame having a temperature of not less than 65° Fahr.—if 68° so much the better—and keep them moist and well shaded. In a very few weeks they will have made plenty of roots to warrant them being taken out of the frame and stood on a shelf near the glass. As soon as the roots touch the sides of the pots they should be given the first shift—into 4 in. pots.

The plants we usually see are grown with a single stem only, but if stopping is practised they may be obtained having a bushy head of several branches. A good specimen of this kind in a 10 or even a 12-in. pot is a fine sight, although the single stemmed plants lose nothing of their elegance by comparison. When large specimens such as this are desired, the plants should be in their flowering pots by the beginning of July.

Ordinary plants should receive their final shift into 6-in. pots not later than the middle of July. The soil in each case should be composed in staple of good loam with a fifth part each of cow manure and leaf soil, with sand.

During the summer months the plants may be accommodated in frames, but as the year wears on and the temperatures begin to fall all round they should be removed to a warm pit or stove. Red-spider is somewhat partial to the plants, but this may be kept down by frequent and copious syringings. Mealy bug, too, will have to be watched for and kept down. After the pots have become filled with roots liquid manure may be freely given, an application of soot-water once a week being of the greatest value. Liberal feeding is naturally of the greatest importance to those plants which have to flower in rather small pots, but the usefulness of such plants for decorative purposes well repays any trouble that may be bestowed upon them.

HOW A KNOWLEDGE OF BOTANY IS A HELP TO GARDENING.

(Concluded from p. 572.)

Now we will pass from the organs of nutrition, and look at the organs of reproduction. These consist entirely of the flower.

It often happens that a flower has only one coat or one set of floral leaves, and in all instances where this occurs you will find that it is the calyx that is present, and the corolla absent. These form a subclass known as the monochlamydeous, which means one coat; and where this happens the calyx sometimes becomes coloured; take the *Begonia* as an instance. Then, again, in the case of *Lilies* both the calyx and corolla are coloured. The *Tulip* is another instance.

Then in speaking of flowers without a knowledge of botany, can we define these different forms so easily as one can do that has a knowledge of botany? If one is speaking of complete flowers botanically it usually means those which have the calyx usually green, and the corolla coloured. On the other hand, if you speak of those flowers which have a calyx only, or both coats and coloured, as in the *Tulip*, *Arum*, and *Poinsettia*, you would call such structures a perianth from a botanical point of view.

Now we will look for a moment at the symmetry of the flower. You will always find that the different parts of a flower are arranged in twos, threes, fours, fives, or multiples of those numbers. In monocotyledons there are the threes; in the dicotyledons, twos, fours, and fives. So you see that if a plant has five sepals it may have ten, twenty, thirty, forty, or fifty stamens.

Then, again, the situation of the stamens plays a very important part in connection with the classification of plants. Now in the dicotyledons the stamens occupy three different positions. Sometimes they grow upon the thalamus when they are called hypogynous. When they grow on the calyx they are called perigynous; thirdly, on the ovary they are called epigynous. In the case of the *Orchid* tribe, where the stamens and pistil are united, the flower is called gynandrous, forming a column.

The pistil, as you all know, is the innermost part,

and occupies the centre of the flower. This also consists of parts which are often united, and correspond in number with the other parts of the flower, unless there is a suppression of parts.

One point more before we leave the essential organs of the plant, and that is, it is most important that a gardener should have a knowledge of the sexuality of plants. When a flower has both stamens and pistil it is called hermaphrodite; when, on the other hand, stamens only exist it is called staminate; if a pistil only it is pistillate. When both the organs are carried by one plant but in separate flowers, the plant is called monoecious; when they are borne on different plants the latter are called dioecious, that is to say, plants which carry only one sexual organ.

Well, then, I maintain this to be very important in connection with fruit growing and seed saving to have a knowledge of these things; because, if a man wants either fruit or seed, the pollen from the stamens must be brought into contact with the pistil. If the flower contains only one sex it is necessary to see that the flower becomes properly fertilised; and if the plant should be dioecious greater care will have to be bestowed.

Amongst professional men many a good crop is lost of Cucumbers, Melons, Vegetable Marrows, &c., through the picking off of the male blossom before the pollen is ripe. These flowers are quite as essential as the female flower, with the fruit attached to it.

Another great advantage we get here through a knowledge of botany is that the male blossoms do not punish a plant or in any way retard its free bearing; because, as soon as the pollen is ripe, the functions of a male flower are performed, no matter how long it may remain on the plant afterwards. In the case of the female quite a different nature of things exists. If a female blossom is allowed to remain upon a blooming plant, when the seeds are commencing to swell, these are absorbing the very life of the plant, because if seed is allowed to ripen the plant has attained the end of reproducing itself for which it came into being.

I shall say nothing upon fertilisation except it be that of the Fern, in which quite a different state of things happens from flowering plants. The spores, as you know, are usually borne upon the back of the frond. When the spores are sown under favourable conditions and germinate a little flattened body is developed, known as the prothallus; and it is upon this little flat body that the organs equal to stamens and pistil are developed, and are called antheridia (male organs), and archegonia (female organs). After these little organs reach maturity the archegonium becomes fertilised, and the future plant commences to grow from this very spot.

Here cross-fertilisation becomes a tedious business. How is it to be accomplished? Well, I believe in the principal of sowing two or more distinct varieties or species of spores in the same pan, and by so doing there is a possibility of cross-fertilisation taking place, through the movement of small insects, or probably by the air. Here again, I claim that a knowledge of botany will help a gardener.

Now, briefly, a few words upon classification. The sub-kingdom of flowering plants is divided into two classes as we have already seen, dicotyledons and monocotyledons. These are again divided up into sub-classes. The dicotyledons contain four sub-classes, the monocotyledons contain two, and the acotyledons two. These sub-classes are again divided up into orders, orders into genera, genera into species.

The four sub-classes of the dicotyledons are very easily distinguished from each other. Thalamiflorae have the stamens situated on the thalamus; and as we saw just now the stamens are hypogynous. The second is the Calyciflorae, which have the stamens situated on the calyx and are called perigynous, which means around the ovary. The Corolliflorae have stamens usually united to the petals; the Monochlamydeae have flowers with the calyx only.

In monocotyledons there are two sub-classes, namely, the Petaloideae, and Glumiferae. The Petaloideae include Orchids, Lilies, and Tulips; and all flowers with a coloured perianth belong to this class. Glumiferae include our cereals, grasses, etc. Acotyledons are divided into two sub-classes, namely, Acrogenae, and Thallogeneae. The first are plants with a distinct stem such as Ferns and Mosses, whilst the latter have no distinct stem and

leaves. They include lichens, Mushrooms, and other fungi.

Therefore, before we can determine the name of a plant, we have to know its class, sub-class, order, genus, and species. In calling a plant by its name we mention the genus and species. This subject of nomenclature is of great importance to the gardener, and one which would take some space to treat it as it should be. I hope I have made it plain that botany is a help to gardening. Another thing I will also say without fear of contradiction, that there is no man nor class of men by whom botany can be acquired so easily and thoroughly as by the gardener; because not only has he the theoretical part of the science, but also the practical part to deal with in the cultivation and management of plants. All the different aspects of plant life come before him, so by a little observation the practical gardener can become a professional botanist. Wherefore, let us do our best to attain a thorough knowledge of the profession (gardening), and nothing will help us onward to this goal better than a knowledge of botany.

This occupation of ours is almost I may say hereditary; it has come down to us all through the ages from our first parents. It was the art—ah! and the science—which first engaged the attention of man, and it will engage his attention to the end. We find also further down in history that the cultivation of gardens followed very closely upon civilisation; wherever a nation sprang up gardening was a prominent art. The Romans in all their conquests throughout the world never forgot to forward the cultivation of vegetables and other plants. Sir William Temple says, "Gardening has been the common favourite of public and private men, a pleasure of the greatest, and a care of the meanest; and, indeed, an employment and a possession for which no man is too high and none too low."

Do not for a moment think, although the profession of gardening has come down through so many centuries, that the whole field of plant improvement has been traversed, nor that there is little more to be achieved. Nay, far from it; there is a vast field ahead of us, where much remains to be done in the cultivation and improvement of plants. Therefore, let us do our part in this great work, for there are rich blessings yet to be attained which providence has ordained for industry.—R. Hodder.

MORLAND NURSERY, SOUTH NORWOOD.

WHEN Mr. F. C. Bause first set up his establishment at Portland Road, South Norwood, in the year 1884, he had already acquired great renown as a cultivator and hybridiser of Caladiums, Crotons, Dracaenas, and other fine foliage plants. These were taken up with renewed vigour in the Morland Nursery, with the result that numbers of fine things own this place as their home—the spot where they first found the light. Since the comparatively early death of Mr. F. C. Bause, at the age of fifty-six, in October, 1895, the business has been carried on by the eldest son, Mr. C. F. Bause, aided by his brother-in-law, Mr. Luther, and the usefulness and fame of the nursery has in no way decreased.

There are in all some seventeen glasshouses, all of them roomy, well appointed, and well stocked with superb collections of the various plants that are taken up.

Of Crotons it has never fallen to our lot to see a finer batch, for the richly-coloured foliage was such that is very seldom seen so early in the year, even on good plants. The collection is an exceedingly rich one, for it includes nearly a hundred varieties, amongst which we find a wonderful variety of colour, size, and shape of leaf. The rough distinction between broad-leaved and narrow-leaved forms has been broken down, for a number of intermediate ones have been raised. The older sorts, such as *C. evansianus*, *C. Weismanni*, and *C. Queen Victoria*, are not made a specialty of; they are left to the market growers, and the whole of the energy is applied to the care of the choicer and newer varieties. Of these Golden Ring is certainly one of the finest Crotons that was ever sent out. As a decorative plant there are no Crotons to beat it, its long, arching, green and gold leaves of medium width, with their gracefully undulated margins, being as suitable for dinner-table decoration as they are

imposing in the warm conservatory or stove. Baron Alphonse de Rothschild is the name given to a new broad-leaved variety whose leaves exhibit a rich shade of orange-red, flushed with green. This variety received the Gold Medal at Paris two years ago, and is specially to be recommended on account of the fact that the leaves assume their characteristic colouring at a very early stage, which cannot be said of many other Crotons, and of none to the same degree as of this one. Madame Baillon is a new French variety that is thought well of. The leaves are broad, the colours being green and gold, with rose petioles.

One large house contained an especially fine lot of plants amongst others of such handsome varieties as Prince of Wales, Princess of Wales, Aigburth Gem, Reedi, Flambeau, Flamingo, Magnificent, and Albert Truffaut. Here they were in all sizes from the lately-struck cutting to the noble plant in an 8-in. pot—something to suit all buyers, both big and little.

To keep up such a big stock of plants entails a great deal of labour, and we were informed that cuttings are taken whenever they can be obtained, although spring cuttings are favoured as they strike quicker and make better plants.

Dracaenas are grown in even larger numbers than the Crotons, and they are in equally as good condition. There we saw *D. pendula*, one of the first plants sent out by Mr. Bause, and one that for a number of years has proved itself well worthy of all the commendations lavished upon it from time to time. For general purposes, however, it must now take a second place to Lord Wolseley, also a dark variety, but with rather narrower and less pendulous leaves, and more pyramidal habit. This variety makes a capital table plant, and being a remarkably good doer should find a place in all collections of stove plants. Mr. Bause has a magnificent stock of this *Dracaena*, and some particularly fine specimens in 7-in. pots were eloquent witnesses of capable management and careful cultivation.

Princess Charles of Denmark is a new variety of considerable merit that originated from a batch of seedlings. It is a noteworthy addition to the *D. terminalis* type. The narrow leaves, however, have a gracefully-arching tendency, and the whole plant is very elegant in appearance. The colour is dark olive green with a carmine-red margin of variable width. *D. Alexander Laing* is another handsome narrow-leaved variety of high decorative quality. There again we have a carmine margin to the olive-green leaves. It makes very useful stuff in 48-sized pots.

Other well-known forms, such as *D. goldieana*, *D. Lindenii*, and *D. Exquisite*, are grown in some quantity, whilst the very distinct *D. godseffiana*, and the prettily variegated *D. sanderiana* are likewise well looked after. *D. Laingii* is one of the handsomest of the very narrow leaved section. It has slightly broader leaves than the graceful *D. Doucetii*, and the colours are much the same, green and white, although in *D. Laingii* there is the addition of a pink flush to the middle of the leaf. Of green-leaved varieties the only one that is grown is *D. Danalli*. We noticed a grand batch of this in an old house that was on the place when Mr. Bause went, but which before that date had been used as a vinery.

Palms are grown in great numbers, but they are chiefly of such forms as find a ready market. The two *Kentias*, *K. belmoreana*, and *K. fosteriana* find a place near the top of the list, for they are favourites everywhere. The same may be said of the elegant but more delicate *Cocos weddeliana*. These are to be seen in all sizes from the seedling, with only two or three small leaves, up to noble plants in 7 in. and 8 in. pots, several houses being entirely filled with them. *Geonoma gracilis* is also grown to an unusual extent, and we were practically pleased with the fine batches of various-sized plants that were to be seen. We have never before seen so many plants of this pretty Palm collected in one place. *Phoenix rupicola* is another favourite, indeed it probably commands a more ready sale than any other of its congeners, which is not surprising when we consider its beauty and tractability.

Amongst miscellaneous foliage plants which are deserving of increased attention from the gardener we may mention *Leea amabilis splendens*, with its singularly handsome olive-green leaves with white midribs and veins. This plant is rather tender, and

we do not often see it in such fine condition as it is with Mr. Bause. Under good cultivation, such as is given it at Morland Nursery, it grows vigorously, as was testified by some grand bushy plants which were only in 48s. *Heliconia illustris rubricaulis* is another subject that claims a place in all collections. It grows freely, may be propagated readily, and soon makes fine specimens even when in comparatively small pots. When in condition there is no gainsaying the nobility of its appearance or its value for decorative purposes.

SOCIETIES.

ROYAL HORTICULTURAL.—May 10th.

THERE was a considerable amount of variety at the meeting on Tuesday last, more in fact than we have occasionally seen at this particular period of the year. Orchids were prominent, and so were Tulips, hardy herbaceous plants, flowering shrubs, Roses, Indian Azaleas, Auriculas, Crotons, and other subjects.

Messrs. J. Veitch & Sons, Ltd., exhibited a large and very varied collection of Orchids, abundantly flowered and set up with Palms and Ferns. Prominent amongst other things were *Laelia purpurata*, *Cattleya Mendelii*, *C. Mossiae*, *C. lawrenceana*, numerous plants of *Laelia Latona Odontoglossum Edwardii*, *O. Hallii*, *O. luteo-purpureum*, in fine varieties, *O. crispum*, showing a considerable range of colour, *Epidendrum Wallisii*, *Cymbidium lowianum* and others. Showy and distinct were such bigeneric hybrids as *Laeliocattleya wellsiana*, *L. Ascania*, the hybrid *Dendrobium Stratius* (*D. japonicum* x *D. dalhousieanum*) and the pure what *Cattleya intermedia alba*, the choicest thing in the group (Silver Flora Medal).

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, set up a fine group of *Laelia purpurata*, *Cattleya Mendelii* and *Odontoglossum crispum* in great variety. Amongst the more interesting and less common subjects we noted the beautifully marked and lined *Bulbophyllum claptonense*, *Laeliocattleya schilleriana*, *Oncidium concolor* and a fine variety of *Odontoglossum triumphans* (Silver Banksian Medal).

MM. Lucien Linden & Co., 117, Rue Belliard, Brussels, Belgium, exhibited a collection of cut flowers of *Miltonia vexillaria*, *Odontoglossum crispum* and *O. Pescatorei*. A splendid panicle of *O. Pescatorei* carried sixty-five flowers. The varieties of *O. crispum* bore large, round flowers mostly having white flowers, but some of them shaded rose.

Welbore S. Ellis, Esq. (gardener, Mr. W. S. Barrell), Hazelbourne, Dorking, staged a small group of *Odontoglossum crispum* in variety, and two splendidly grown *Miltonia vexillaria*, richly coloured and profusely flowered.

Major Joicey (gardener, Mr. F. J. Thorne), Sunningdale Park, Sunningdale, Berks, exhibited a grand piece of *Anguloa Ruckeri*, for which he received a Cultural Commendation, and an equally fine piece of *Eriopsis rutidobulbon*, having a curiously wrinkled pseudobulb. Walter Cobb, Esq. (gardener, Mr. Howes), Dulcote, Tunbridge Wells, showed the richly-coloured *Laeliocattleya Hippolyta Dulcote* var.

Messrs. J. Veitch & Sons, Ltd., staged the beautiful new hybrid *Spathoglottis aureo-viellardi*. Thos. Statter, Esq. (gardener, Mr. R. Johnson), Stand Hall, Manchester, received a Cultural Commendation for *Cypripedium macrochilum giganteum superbum*. C. L. N. Ingram, Esq. (gardener, Mr. T. W. Bond), Elstead House, Godalming, staged the bigeneric *Laeliocattleya Fascinator*. Fred Hardy, Esq. (gardener, Mr. Stafford), Tyntesfield, Ashton-on-Mersey, staged *Soprocattleya George Hardy*, *Cypripedium Goweri*, *Cattleya Laura-Mossiae*, &c. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford, exhibited *Cattleya intermedia Fowler's* var.

A nice group of small but shapely and well-grown Crotons, interspersed with Ferns and *Panicum variegatum* was exhibited by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton. Among the varieties of Crotons shown were *C. Reidii*, *C. Golden Ring*, *C. Aigburth Gem*, *C. Thompsoni*, *C. Gordoni*, and *C. Warreni*, all of them well-coloured samples (Silver Banksian Medal).

The hardy flowers sent by Messrs. Paul & Son, of Cheshunt, included sprays of *Cerasus Avium flore*

pleno, *C. Myrobalan pendula*, and *Cydonia Maulei*. There were also panfuls of the pretty *Phlox atropurpurea*, P. G. F. Wilson, *Hutchinsia alpina*, and *Saxifraga Wallacei* (Silver Banksian Medal).

On either side of the doorway, Messrs. Wm. Paul & Son, of Waltham Cross, Herts, put up a group of Roses. Here there were to be seen some large pot plants of such varieties as *Caroline Testout*, *Violette Bowger*, and *Jeannie Dickson*. The blooms of *La France*, *Medea*, and the pretty *Apricot-hued Queen Mab*, were some of the best of the cut flowers shown (Silver Flora Medal).

Messrs. W. Cutbush & Son, Highgate, N., put up an exceedingly showy group of miscellaneous plants. In the background was a row of *Wistaria sinensis*, and in the front of this were clumps of *Azalea mollis*, and such *Ericas* as *E. Cavendishii*, *E. ventricosa magnifica*, and *E. perspicua nana*; also fine clumps of *Boronia heterophylla*, and *Hydrangea Thomas Hogg*. Ferns, *Isolepis gracilis*, and Japanese Maples afforded the necessary reeneries (Silver Banksian Medal).

Mr. Charles Turner, The Royal Nurseries, Slough, contributed a quantity of small well-flowered Azaleas, amongst which were such handsome forms as *President Van Imschoot*, *Dryade*, *Ami Chas. Vermeire*, *Louise Cavalier*, *Marie Vervaene*, *Joseph Vervaene*, and *President A. d'Haene*. Three plants of each variety were shown, and these were placed together in baskets to form a single mass. The same firm showed capital samples of the grand *Malmaison Carnation Princess May*, and a single plant of the *Polyantha Rose Thalia*.

The cut Roses sent by Mr. George Mount, Canterbury, were really superb. The blooms were not only large, but of perfect form, and rich colour. *Catharine Mermet*, *Ulrich Brunner*, and *Mrs. John Laing* were represented by a large stand of two dozen blooms of each variety, and in addition to these there were fine blooms of *General Jacqueminot*, *Niphotos*, *Catharine Mermet* and *Gabriel Luizet* (Silver Flora Medal).

Sprays of hardy flowering and foliage shrubs came from Messrs. J. Cheal & Sons, Crawley, Sussex; also sprays of bedding *Violas*, in which there was a good collection of varieties, *A. J. Rowberry*, *Colleen Bawn*, *Crimson King*, *Blue Cloud*, *Blue Gown*, and *Archie Grant* being some of the finer forms.

Messrs. R. Miller & Co., 267, Fulham Road, S.W., sent white and crimson *East Lothian Stocks* in pots, also a special strain of *Pyrethrum aureum*.

Messrs. W. Balchin & Sons, of Hassocks, Hove and Brighton, have a great name as cultivators of hard-wooded subjects, and on this occasion they contributed a quantity of fine young plants of *Boronia serrulata*, *B. heterophylla*, and *Erica perspicua nana*. There was also a very pretty batch of the bright blue *Browallia elatior*.

Mr. A. Tulett, Crocken Hill, Swanley, had a basketful of plants of the new and very free-flowering zonal *Pelargonium A. Tulett*, a sport from the well-known *F. V. Raspail*. Mr. J. Gilbert, Dyke, Bourne Laues, had a hatch of the handsome *Aнемone King of Scarlets*.

Messrs. J. Veitch & Sons, Ltd., Chelsea, showed a number of interesting and beautiful plants, amongst them being *Citrus trifoliata*, *Daphne Cneorum major*, *Hydrangea japonica Mariesii*, *Rubus deliciosus*, *Cytisus Schipkaensis*, and *Notospartium junceum*. They also had a fine plant of *Acer platanoides marginata alba*.

A very interesting exhibit was made by Mr. David Storrie, St. Madoes Cottage, Glencarse, Carse of Gowrie, Perthshire, in the shape of a strain of sweet-scented giant border Auriculas. This strain has been obtained by Mr. Storrie after fifteen years continuous selection from the progeny of one yellow-flowered plant. The strain was a very fine one, both individual flowers and umbels being of great size. *Souvenir de Helen Theresa*, *Miss Constance*, *Souvenir de Sir James*, and *Miss Evelyn* were some of the most noteworthy of the named sorts. Some magnificent forms of Alpine Auriculas were sent by Mr. J. Douglas, Edenside, Great Bookham, Surrey. *Dean Hole*, *Perfection*, *Zixa*, *John Gilbert*, and *Captain* were the best of the varieties shown. A huge inflorescence of *Dracaena indivisa* was contributed by B. Bennett, Esq., Cheverells Park, Dunstable.

The hardy flowers sent by Messrs. Barr & Sons, of Long Ditton, exhibited a vast amount of variety. *Iris*, *Primula cortusoides* in variety, *Fritillaria*

recurva, *Orchis papilionacea*, and *O. italica* were all noteworthy. The Tulips, however, attracted by far the greatest amount of interest. The collection of Darwin varieties was very comprehensive, and included such distinct and handsome forms as *Glow*, *The Sultan*, *Hecla*, *May Queen*, *Aurora*, and *Apricot*. The species of Tulipa comprised *T. retroflexa*, *T. strangulata*, the curious *T. viridiflora*, *T. Batalini*, and *T. fulgens*. The so-called Cottage or May-flowering Tulips were represented by *Picotee*, *elegans*, *elegans alba*, *Buenaventura*, *Blue Flag*, and *maculata Brilliant*. There were also a few samples of the quaint *Parrot Tulips*. A Silver Gilt Medal was awarded.

Mr. W. James, Woodside, Farnham Royal, Slough, sent an interesting batch of hybrid *Cinerarias*, obtained by crossing *C. cruenta* with the garden *Cineraria*, and recrossing the progeny with *C. lanata*.

At a meeting of the fruit and vegetable committee a Silver Knightean Medal was awarded to Mr. G. Norman, gardener to the Marquis of Salisbury, Hatfield, Herts, for three boxes of grand samples of Royal Sovereign Strawberry.

Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, received a cultural commendation for a dozen fruits of *Nectarine Cardinal*. A similar award went to Mr. John Ryder, gardener to the Dowager Countess of Limerick, for two dishes of Peaches.

Six dishes of Apples competed for the Veitch flavour prize. Hereford Pearmain shown by Mr. R. Bullock, gardener to C. P. Serrocold, Esq., Taplow Hill, Maidenhead, was first; whilst *Colville Rouge*, sent by Mr. George Woodward, Barham Court Gardens, Maidstone, was second. Only one dish of Pears was forthcoming, and that of the variety *Baurré Bretonneau* to which the second prize was given.

Mr. George Wythes, gardener to Earl Percy, Syon House, Brentford, had six dishes of forced French Beans. There was a collection of Radishes on the tables illustrative of the produce of a number of seedsmen. Several Awards of Merit were given, for which see a succeeding issue.

ROYAL BOTANIC.—May 11th.

THE summer show of this society was held on the above date at Regent's Park, when a fair quantity of material was forthcoming, but chiefly in the miscellaneous exhibits, for the competitive classes were very poorly patronised. The weather was fine and bright, but gusty, and tried considerably the tent in which, as usual, the exhibits were accommodated.

In the scheduled classes, Mr. G. Cragg, gardener to W. Walker, Esq., Winchmore Hill, received first prize, for a group of Orchids. Messrs. G. Jackman and Sons, Woking, obtained similar honours for ten pot Roses, distinct, showing fine samples of *Crimson Rambler*, *Mme. Lacharme* and *La France*. Mr. W. Rumsey was second, with much smaller but healthy plants. Mr. G. Kelf won first prize for six specimen Palms. *Areca lutescens*, *Chamaerops humilis*, and *Latania borbonica* were his strongest plants. Mr. Empson, gardener to Mrs. Wingfield, Amptill House, Amptill, Bucks, scored for two specimen *Dracaenas*, showing *D. sanderiana*, and *D. Lord Roberts*.

Mr. W. Rumsey obtained first prize for the group of Roses, and showed some very clean and good material. Mr. Empson had the best six fine foliage plants; Mr. G. Kelf coming in second. Mr. G. Cragg, gardener to W. Walker, Esq., Winchmore Hill, was first for six Orchids, whilst Mr. G. Kelf had the best six fine foliage plants in the gentlemen's gardeners' and amateurs' class; Mr. Empson being second. Mr. G. Mout won chief honours for two dozen cut Roses; Mr. W. Rumsey being second.

The miscellaneous exhibits, as has been mentioned, constituted the bulk of the show.

The four large central beds surrounding the fountain in the large tent were occupied by some imposing and exceedingly showy groups.

Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, had a group of small but well-flowered pot plants of *Rose Crimson Rambler*, interspersed with *Spiraea astilboides floribunda*, and *Acer Negundo*. Ferns were tastefully employed as a ground work; and there were also some late plants of *Begonia Gloire de Lorraine*, and some handsome pieces of *Hydrangea Thos. Hogg*, and *H. hortense* (Large Silver Medal).

Messrs. Wm. Paul & Son, Waltham Cross, sent some nice pot Roses and a quantity of cut blooms of the same for which a Silver Gilt Medal was voted.

The showiest exhibit in the whole tent came from Messrs. John Laing & Sons, of Forest Hill, S.E. It consisted of a great variety of flowering and foliage plants, amongst which were some capital Crotons, Dracaenas, Caladiums, and Palms in variety amongst the foliage element, whilst Gloxinias and Ericas were wonderfully bright and good (Silver Gilt Medal). The Messrs. Laing also had a table of very handsome floral arrangements, set off with pot plants and draped with sprays of Smilax. A basket of Irises, Liliun Harrisii, and Pelargoniums with Croton leaves and sprays of Asparagus was specially worthy of note. A bouquet of Roses and Lilies of the Valley was also good (Large Bronze Medal).

Messrs. B. S. Williams & Son, of Victoria and Paradise Nurseries, Upper Holloway, N., had a nice group of Orchids, and with them showed Clivias, Ericas, Anthuriums, and the new American Canna Mrs. Fairman Rogers in capital condition (Silver Gilt Medal).

A showy exhibit of miscellaneous flowering plants set up with Palms and Ferns came from Messrs. Wm. Cutbush & Son, Highgate, N. Erica candidissima, E. ventricosa minor, Boronia heterophylla, and the fine Malmaison Carnation Princess of Wales were the choicest of the flowering element (Large Silver Medal).

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., had a varied group of hardy plants for which a medal was given. Tulipa Greigi, Epimedium alpinum and Dodocatheon jeffreyanum were in grand condition, whilst a collection of hardy Orchids was very interesting (Small Silver Medal).

The Caladiums sent by Messrs. John Peed & Sons, of Roupell Park Nurseries, Norwood Road, S. E., were of that high quality that we expect to see from this firm. There were some grand specimen plants of such varieties as John Peed, Excellent, Pavis de Chevannes, and Triomphe du Comte, whilst the smaller samples of Rose Laing, Lady Mosley, Duke of Teck, and Louis Van Houtte were equally bright (Silver Gilt Medal). A collection of Dracaenas was also contributed by the Messrs. Peed, and consisted of well-grown and shapely plants of a number of leading varieties, likewise cut blooms of single tuberous Begonias and Gloxinias.

Mr. Kelf, gardener to Mrs. Abbott, South Villa, Regent's Park, received a Small Silver Medal for a semi-circular group of Palms, Liliiums, Caladiums, and miscellaneous foliage plants. This was a meritorious exhibit.

The specimen Azaleas from Mr. Charles Turner, Slough, were first-class, for all the plants were well flowered, and in excellent trim. Reine des Pays Bas, Mme. Hermann Seidel, Rosa Mundi, Charmer, Ceres, Kronprinzessin Victoria, and Louise Cuvelier were some of the best varieties. Mr. Turner also showed Rose Thalia and Malmaison Carnation Princess May (Silver Gilt Medal).

A very charming exhibit of Japanese Maples, varieties of A. palmatum was made by Messrs. John Waterer & Sons, Ltd. (Large Broze Medal).

Cardinal Nectarine, both in plucked fruit and on the trees, was again well shown by Messrs. T. Rivers & Son, of Sawbridgeworth, Herts. (Silver Gilt Medal).

Messrs. A. Young and Co., of Stevenage, Herts, had a collection of hardy flowers (Large Bronze Medal).

Mr. George Mount, of Canterbury, sent some magnificent cut roses. Catherine Mermet, Mrs. John Laing, and Ulrich Brunner were Mr. Mount's best varieties (Small Silver Medal).

The hardy cut flowers from Messrs. Barr and Sons, of Covent Garden, consisted chiefly of Tulips, of which a great variety was shown. The Sultan, Picotee, Hecla, King Harold, T. retroflexa, and T. maculata Brilliant were some of the finest forms, and a few bunches of Parrot varieties were also in evidence. A Silver Medal was awarded for this grand display. A Bronze Medal went to Mr. A. Smith, Downley, High Wycombe, for a quantity of good Marechal Niel Roses. The floral table sent by Mr. J. Prewett, of 11, Lancaster Street, Bayswater, was very pretty. Some tastefully executed and imposing floral devices came from Messrs. B. S. Williams and Son (Small Silver Medal).

A splendid collection of vegetables and fruit was

staged by Mr. J. Empson, to whom a large Silver Medal was given. Beans, Peas, Potatos, Asparagus, Tomatos, and saladings in variety amongst the vegetables were of the best, and the fruit was represented by Bananas, Strawberries and Apples.

NATIONAL TULIP.—May 11th.

THE annual show of the National Tulip Society was held in conjunction with the Royal Botanic Society's summer show at Regent's Park, the exhibits being staged in the long corridor.

There was rather a dearth of material, as far as quantity went, and the blooms, too, were inclined to be smaller than usual, doubtless owing to the malign influence of the late cold weather, for the season this year is fully ten days late. The chief feature of the exhibition was a splendid collection sent by Messrs. Barr & Sons, of Long Ditton. The following were some of the finest varieties in their respective sections:—Rose breeder: Mabel, Lord Derby, Lady C. Grosvenor, and Annie McGregor. Rose rectified: Annie McGregor, Aglaia, and Alice. Bizarre breeder: James Wild, Wm. Lee, Sam Barlow, and Dr. Hardy. Bizarre rectified: Colbert, Sir Joseph Paxton, Sam Barlow, and Lord Stanley. Bybloemen breeder: Miss Hardy. Bybloemen rectified: Friar Tuck, Talisman, and Lord Denman. A Gold Medal was deservedly awarded.

Mr. C. W. Needham showed a collection of three blooms each of twenty-five varieties of English florists' Tulips. They comprised some excellent flowers of Mabel, Lord Derby, Adonis, Talisman, Sir Joseph Paxton, Chancellor, Modesty, and Mrs. Hardy.

In the competitive classes, Mr. Alfred Chater, Cambridge, was placed first, for twelve dissimilar rectified varieties. He showed Duchess of Sutherland, Sarah Headley, Gucedo, Arion, Glory of Stapleford, Mrs. Jackson, Richard Headley, and Sam Barlow among his best. The last named variety was adjudged to be the premier flamed bloom in the show. A. D. Hall, Esq., Wye, Kent, was second for the twelve, having good blooms of Comte de Vergeunes, Duke of Devonshire, Sir Joseph Paxton, and Annie McGregor; Mr. Chas. W. Needham, Rayton, Lancashire, was third; Messrs. Barr & Sons were fourth. The best feathered bloom, a variety named Industry, was in the Messrs. Barr's twelve.

In the smaller class for six dissimilar, rectified, Mr. J. W. Bentley, Middleton, Lancs., came to the front, showing Annie McGregor, Lord Stanley, Adonis, Comte de Vergeunes, Wm. Wilson, and Bessie. Mr. A. Chater, and Mr. Charles W. Needham were awarded equal seconds.

Three flamed Tulips, one of each class, were best shown by Mr. J. W. Bentley, who had capital blooms of Lord Stanley, Mabel, and King of the Universe; Mr. C. W. Needham was second; and Mr. A. Chater, third.

Mr. J. W. Bentley was placed first for the Barlow prizes for a pair of rectified Tulips. He showed San Josef, and Duke of Devonshire. Mr. A. D. Hall was second with Sir Joseph Paxton, and Comte de Vergeunes. Mr. A. D. Hall received first for six breeder Tulips. He had grand samples of Mabel, Glory of Stakehill, John Heap, Lloyds 200, Annie McGregor, and Excelsior. Messrs. Barr & Sons were second, and their stand contained the premier "breeder" bloom in Goldfinder. Mr. J. W. Bentley was third.

In the smaller class for three breeder varieties, Mr. J. W. Bentley was first, showing Mabel, Storer's Seedling, and Glory of Stakehill. Mr. C. W. Needham was second.

QUESTIONS AND ANSWERS.

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Aerial Roots on Vines.—R. S. W.: It is quite a common thing for Vines to produce roots in clusters

from the old rods in the interior of vinerias and other houses. The warm, moist air of the house encourages their development; but you must seek elsewhere for the cause. They mean that the proper roots in the soil are not performing their functions properly. They may be in a wet or damp, cold soil, so that some of them may have perished in winter. The border should be examined to see if the drainage is good, and whether there is a drain or a proper and natural escape for the superfluous moisture in the border. If not, you had better take out the soil in September, or in case the Grapes are still hanging it might be done in March before the Vines begin to grow. September is the best time if you could manage to have the Grapes removed. After making the drainage good, put some turves over the brick bats used for drainage, cover this with a layer of soil, and then carefully spread out the roots of the Vines about 9 ins. from the surface, and cover with soil. Shade the house for about a week to prevent the Vine leaves from flagging till the roots have taken fresh hold of the soil. They will be established before winter. Do not place a pot under the air roots nor encourage them in any way. They will die of their own accord when the wood ripens in autumn.

Book on Table Decorations.—E. E.: There was a book on floral decorations by Miss Hassard, but we believe it is out of print, and can only be obtained second hand by a rare chance now and again. We understand that Messrs. S. Perkins & Sons, Coventry, Warwickshire, issue a pamphlet or small hook on the subject, but whether it is illustrated we have not heard. You could ascertain by writing to the firm at Coventry, which is noted for floral decorations generally. There does not seem to be a good handbook on the subject, probably because fashions in decorations are continually changing. You should make a point of visiting some good shows where floral decorations are well done, and so get a few hints upon which you can act and work up fresh devices for yourself. You only want a start, and with a little care and observation you will soon get a good notion of the subject.

Bedding Arrangements.—Box. We should have liked to know the colours of your Begonias, but in the absence of the same we should say plant No. 4, with scarlet Begonias; No. 10, with orange Begonias; No. 9, with rose varieties; and No. 12, with white varieties. These would not clash with the Roses in the centre, nor outside of the design. Mesembryanthemum would answer in Nos. 4 and 10 as a groundwork, but we should like something green in No. 12 not to clash with the white, and No. 6 might be done to match No. 12. Use Herniaria or Mentha gibraltaria, but if you have not got either you can use the yellow Mesembryanthemum. The Begonias may be put further apart if you use a groundwork. Edge them with blue Lobelias. Plant Nos. 3 and 7 with Pelargonium Flower of Spring, mixed with blue Violas, and edged with Iresine. No. 3 will be close to No. 12, but we would aim at getting the lighter colours towards the centre. Nos. 1 and 9 might be planted with Pelargonium Mr. Christine, edged with Pelargonium Mrs. Pollock to tone down the dark Roses at the circumference. Nos. 2 and 8 might be planted with Pelargonium Crystal Palace Gem, which will be an intermediate shade between Nos. 1 and 3 on the one hand, and Nos. 7 and 9 on the other. Edge No. 2 and 8 with a double line of blue Lobelias. Nos. 5 and 11 could be planted with bronze Pelargonium Marshal MacMahon, edged with Echeveria. By-the-bye you have a number of small ones edged with Echeveria, so that those edgings which we have already named in those cases may be omitted. The design is rather complicated, and we have arranged the colours as well as we can with the material you have in stock. The central line, including the bed of Rose Gloire de Dijon, contains seven beds which come in contrast with so many others that great caution is needed to avoid their clashing with one or other of the rest. Unless you employ Pelargonium H. Jacohy in Nos. 2 and 8, we do not see where else you can place them without clashing with other beds, and even then they would be close to the dark Roses on the circumference of the plan. We shall keep your plan for a week or two, so that if you have other suggestions to make we can refer to it. Your second plan arrived as we were going to press, but you will see that we have adopted the beds in pairs exactly as you have marked them.

Watercress Culture.—D. W. D.: The Watercress (Nasturtium officinale) is a common British weed, often choking up small streams of clear, running water, so that the streams you mention should answer admirably. It should grow freely with you, for it does so, to our knowledge, only a few miles to the south of your locality. We have seen the stems 6 ft. long, and choking up the waterway. Seeing that you do not know the plant, the best way would be to order some Watercress seeds from your seedsman, telling him to get them for you if he does not keep them in stock. The seeds are small, so that a small quantity will give you many plants. The best way to proceed would be to sow the seeds in boxes, pans, or in an

open border, keeping them moist till they get a good start, if the weather should make watering necessary. Then proceed to make a bed for the permanent plantation. The best plan would be to dig out a square bed of the size you want a little above the bed of one of the streams you mention. Place a layer of clean river gravel over the surface of the bed after putting in a layer of good loam mixed with leaf soil and sand. The gravel is merely to make a clean bottom. Higher up the stream cut out a little ditch or channel or even put in a drain of drain pipes, so as to lead a small quantity of water into the Cress bed. About 3 in. or 5 in. of water will be a sufficient depth in the bed, above which you may provide an overflow into the stream again. You should provide for raising or lowering the level of the water at the outlet. When your plants are sufficiently strong, plant them 1 ft. apart each way in the bed. Water should be kept slowly running over the bed to keep it clean.

Vine Leaves, Spotted and Scalded.—*Alister*, and *W. A.*: After examining the Vine leaves you sent us, *Alister*, we are fully convinced that your supposition about the dull weather is the correct one. At all events that is at the bottom of it. The leaves are very thin and flabby, and the excess of moisture has caused the spotting. The larger, brown or withered, patches are due to scalding by the sun striking upon them while they were wet with condensed moisture. You should ventilate more freely early in the morning, and, if necessary, get a little brisk heat by the aid of the hot-water pipes, so as to dispel the moisture. It will take a little more fire-heat to do this, but it will enable you to give plenty of air to strengthen or harden the leaves. You can economise sun-heat by closing at 3 p.m. or soon after, according to the heat of the sun, at the same time syringing and damping down the house thoroughly. Ventilate again early in the morning, and so continue through the season. The leaves you sent us, *W. A.*, were scalded, as gardeners say. The house has been kept rather close, and the sun has acted upon the leaves when drops of moisture were on them. Ventilate early in the morning, as above advised, and we think your Vines will soon get over the difficulty. The dull weather and lack of sunshine has much to answer for. The above cases occurred hundreds of miles apart, yet we have no doubt the cause is the same, the dull weather being general over the British Isles.

Book on Bedding Out at Hampton Court.—*A. B.*: A "Guide to Hampton Court," containing bedding designs, was published by the superintendent some years ago and was sold by him at the gardens till quite recently at least. There is a new superintendent there, and we are not sure whether he still continues the sale of the book, which was priced at 6d., if we rightly remember. You could write to the "Superintendent," Hampton Court Gardens, Middlesex, and we think he will put you right. Messrs. H. Cannell & Sons, Swanley, Kent, also offer a small book containing sixty bedding designs, which they send post free for six stamps.

Vanda Suavis Bare at the Bottom.—*T. E.*: You should have no difficulty with healthy plants, which are generally furnished with an abundance of good roots all up the stem. The bare part of the latter could be cut away so that the good foliage could come down to the pots. This should be done while the young roots are just commencing to grow, which you can easily determine by watching the tips which become greener than the older portions, or even the tips themselves while growth is stationary. If the plants are somewhat top-heavy you can steady them with a stake till the young roots have taken firm hold of the fresh material. This has often been done by gardeners, and the plants get over the operation without apparently having suffered in the least, by a little careful treatment while the young roots are taking fresh hold. Keep the atmosphere fairly moist, but not stagnant, throughout the twenty-four hours of the day.

Names of Plants.—*L. M.*: 1, *Forsythia suspensa*; 2, *Kerria japonica flore pleno*.—*S. G.*: *Dendrobium speciosum*.—*Alister*: 1, *Doronicum Pardalianchus*; 2, *Helonias bullata*; 3, *Adonis vernalis*; 4, *Hacquetia Epipactis*; 5, *Garrya elliptica*; 6, *Polypodium vulgare cambricum*; 7, *Libocedrus decurrens*.—*W. G. B.*: 1, *Saxifraga Stracheyi*; *Doronicum plantagineum*; 3, *Phlox subulata Nelsoni*; 4, *Ophiopogon japonicus*; 5, *Lychnis alpina*; 6, *Primula veris*.—*J. C. S.*: 1, *Lamium maculatum*; 2, *Arenaria trinervis*.—*A. C.*: 1, *Dendrobium findlayanum*; 2, *Odontoglossum odoratum*; 3, *Odontoglossum crispum ruckerianum*; 4, *Cattleya schroderae*.—*M. W.*: 1, *Pyrus floribunda*; 2, *Pyrus spectabilis*; 3, *Magnolia soulangeana*; 4, *Akebia quinata*.

STANDEN'S MANURE. TRADE MARK.

ESTABLISHED OVER 30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

Promoting a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. Its highly-fertilising properties render its money value, in comparison with other Manures, at least double; very small quantities will produce favourable and lasting results.

ANALYSIS ON APPLICATION.

Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 8s. each; and in Kegs, well secured, to prevent loss through exposure, 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s.

To be had from all Seedsmen and Florists.

MANUFACTURERS—**CORRY & Co., Ltd., London.**

PARISIAN BLINDS.

Awarded over 50 Prize Medals.

A SALT-WATER FLOOD ON CULTIVATED LAND.—Those living on the coasts of the south-eastern counties of England as well as on the tidal reaches of the rivers, will remember the high flood that occurred owing to the strong up-channel gale that resulted in heaping up the waters in the German Ocean on the 29th November last. Many parts of the low coast line of Essex were flooded with the briny waters of the sea, the calculation being that 50,000 acres of land were covered, and damaged in proportion to the time that elapsed before the waters drained away. On some farms this occurred in six hours, while in other cases it varied from twenty-four hours to six or eight days. In one district the water remained on the land for eight weeks, and elsewhere it has been flooded continually ever since. Much of the sea wall was broken down and where the damage has not been repaired, the land gets flooded at high tide every day. The damage done consists chiefly in the saturation of the land with a deposit of salt. An examination of the state of the land has been undertaken by the County Council of Essex; and a report is drawn up by Mr. T. S. Dymond, which appears in the issue of *The Journal* of the Technical Laboratory, Chelmsford, just to hand.

Crops of Peas and Tares have suffered severely, even where the land was only flooded for a few hours. Half a crop of wheat will be obtained from land that was flooded, so that this crop has suffered less than the leguminous subjects. Grass pasture has suffered least of all and may ultimately show that it has benefited. All the crops are dead on land that has been flooded periodically since the high tide of November last. The outlook is hopeful for

coming crops on land that was only a short time under water. Wheat that had been sown just previous to the flood has since germinated and is now looking well. Turnips are sending out fresh roots that do not appear to suffer from the salt still remaining in the soil. In order the more fully to test the condition of the soil and its influence upon various plants, Mr. D. Houston undertook a series of experiments. Flower pots were filled with soil taken from two of the flooded districts, and seeds of Mustard, Turnips, Mangolds, Beet, Cabbages, Peas, red Fescue and creeping Bent grass were sown in the same. All of them have germinated and are now doing well.

Analyses of the soil show that, where flooding occurred, about 0.2 per cent. of salt is deposited in the surface layer, and this would amount to 2 tons per acre, which if applied to growing crops would be injurious. Land that has not been flooded contains only 0.01 per cent. of salt. Samples of soil taken from numerous localities give a varying per cent. deposit of salt, according to the depth or duration of the flood, but a glance at the table giving the percentage shows that a little patience is all that is necessary for Nature to repair the damage. The rains have evidently been doing their work before the analyses were made for the greater percentage of salt now occurs at some distance below the surface, or even in the subsoil. An interesting case occurs at Tillingham where the land was enclosed or reclaimed in 1871. About 8 in. below the surface is a compact layer of vegetable matter, consisting mostly of seaweed, which has retained a considerable amount of salt at that depth. At West Thurrook the salt was most abundant in the first inch of soil, which was flooded for eight weeks. The analysis was made before any rain had fallen after the draining of the land, a fact which readily accounts for the salt being on the surface. On the contrary salt has been brought to the surface by evaporation, just as, under ordinary conditions, a coating of nitrates may be deposited on the surface of soils during dry weather.

The injury done to the land by salt indirectly has been more harmful than any direct injury to the roots of plants. Earthworms have been killed in the flooded portions, so that the natural means of draining and aerating the soil do not now exist. This is more particularly serious on heavy clay lands, because in the absence of drainage it will take a much longer period of time for the rainfall to wash the salt away and aerate the soil. The first remedy will be the removal of the salt from the soil. This may be done by providing means for the water to drain away from the soil, and rain will do the rest. The growing of special crops to absorb the salt would take many years to fully accomplish, and is therefore impracticable. The cereals are least liable to injury on land containing salt, but they absorb only a very small percentage during a growing season. When the salt has been sufficiently washed out by rain for earthworms to exist, it would, we think, be a good plan to resow the land with a fresh stock of worms obtainable from land having an over-abundant supply. Amongst the crops suggested for the salt land no mention has been made of Seakale or Asparagus, which surely could be turned to profitable account in some of the districts at least.

Caltha palustris as Food.—It is stated in a recent issue of *Gardening* (American) that some of the early settlers in America cooked and ate as greens the stalks and young leaves of the Marsh Marigold, *Caltha palustris*. In view of the acrid and poisonous principle that characterises the order Ranunculaceae this is somewhat surprising. The "greens" would, we imagine, be rather "strong."

The Cowslip.—In this country the popular name of "Cowslip" is given to *Primula veris*, but in the "States" it is applied to *Caltha palustris*, known here as the Marsh Marigold.

Unprofitable Orchid Culture.—A Cornish gentleman, who was an Orchid enthusiast, for some years spent £600 annually in the pursuance of his pet hobby. He died, as people have a knack of doing, the greenhouse fires were let out, and the whole collection was sold for £3, rather a serious depreciation upon the nominal value. It only goes to show that Orchids will not stand neglect.

A Green Primrose was brought to us a few days since by Mr. J. C. Stogdon. The flower was of the ordinary size, and perfectly green, but the segments were cut at the edges like leaves. The green Primrose, although it may be a curiosity to many, is really an old favourite which has been lost sight of for some time and again revived. As a matter of course several popular names have been bestowed upon it at various times and in different parts of the country. Of these Jack-in-the-Green, Pantaloons, and Galigaskins are some of the most noticeable.

Chestnut Sunday.—Last Sunday was "Chestnut Sunday," but the weather clerk was in a most unpropitious humour. The day was wet, cold, dark, and miserable, and the famous avenue of Bushey Park was, as a consequence, well nigh deserted. The boats which ply between Hampton Court and the London piers carried very few people, and even they did not appear to greatly enjoy themselves. It will take a full week's bright sunshine to bring the Chestnuts to their best, so what with the weather, the unreadiness of the trees, and the consequent lack of people, "Chestnut Sunday" was so only in name.

Sutton's Cycling Club.—Ever on the watch for means of affording healthful pleasure and instruction to their employés, this, the formation of a cycling club, is again encouraged by Messrs. Sutton & Sons, of Reading. The club is under the presidency of Mr. Martin J. Sutton, M.P., the other partners of the firm being vice-presidents. A neatly printed, single-fold card gives the list of officers and the rules of the club, as well as the projected excursions for the year 1898. These fall into two divisions. The entries in the first take place on Wednesday afternoons. There are ten of them, commencing on May 11th, and continuing fortnightly up to and including September 7th. Places of interest within a radius of 20 miles of Reading are to be visited, and these include Basingstoke, Silchester, Burnham Beeches, Virginia Water, Aldershot, Nettlebed, Windsor, and Finchhampstead, besides the trip to Great Marlow, which took place on the 11th inst. The second section is for evening runs, and a blank space, to be filled in as the season wears on, has been left for these. Altogether, the idea is a happy one, and worthy of the generous spirit that animates the governing partners of the renowned seed firm.

The Modest Violet.—It seems, at first sight, rather curious that Napoleon, the proud Dictator of Europe should have chosen as his emblem the modest Violet, and yet he did so, although the selection was made at a time when the great warrior's star was in obscurity. He remained faithful to his choice, however, through his life, for on leaving France for Elba he is reported to have said, "I shall return with the Violets," and he did return. On the eve of his second and final banishment to St. Helena, he gave a Violet to an English naval officer, in whose charge he was, but whether as a prophecy of his second return or not is not known. The Violet thus became closely associated with the fortunes of the Napoleonic dynasty, and during the reascendency of the house of Bourbon it was dangerous to wear the Violet publicly, as it was still regarded as the Napoleonic flower. With the second Empire came the revival of the popularity of the Violet, and curiously enough Louis Napoleon owed to it his escape from the fortress of Ham, at which place he was a prisoner. A package of Violet plants had arrived, and the prison officials were so much occupied with planting them that they forgot all about their royal prisoner, who, promptly availing himself of the opportunity, escaped.

Oranges from California.—No fewer than 12,000 carloads of Oranges are being, or have been, shipped from southern California this year, which, at present prices, will realise some £1,200,000. The estimated loss by frost was 2,000 carloads, representing a money value at current prices of £200,000. The greater part of the produce is from the celebrated Navel Orange, of which the first plantation was made at Riverside, California, in 1877—twenty-one years ago.

A Yorkshire Lecture.—On the 4th inst., Mr. T. Reddington gave the last of his series of four lectures at Scarborough. On this occasion he took for his subject "Flowers and the Flower Garden." Dealing first with the position of the flower garden he recommended a piece taken from the kitchen garden as likely to give satisfaction. He cautioned his audience against choosing draughty corners, for cold draughts were injurious to plants in the open as well as to plants in the window or the greenhouse. He spoke of various soils, and gave directions for improving such as were unfit. Manures also came in for discussion. In conclusion he made some remarks about window plants generally, and advised them as to the sort of soil to use for various plants and the method of preparing it for use.

Loughborough Gardeners met on Tuesday evening, the 3rd inst., to hear a paper upon the "Cultivation of Azaleas and Camellias," by Mr. J. Smith, gardener to J. Griggs, Esq., of Mountfield. The subject was handled by the essayist in a capable manner. He advocated the potting of the plants just after growth had commenced, and recommended plenty of heat and moisture throughout the growing season. After the buds were set the plants should be stood outside to ripen their growths. The soil given Camellias should be rather more loamy than that supplied to Azaleas. A brisk discussion took place after the reading of the paper. A number of exhibits was forthcoming from various sources, including some well-flowered Azaleas from Mr. Smith.

Praying for the Crops.—The 14th inst. being the fifth Sunday after Easter, and Rogation Day, a period for special supplication, a quaint old custom of "praying for the crops," was this year observed at Hitchin, in Hertfordshire, as it has been for several years past. At 2.30 p.m. on the day in question a procession, headed by the choristers and clergy in full canonicals, wended its way through the streets of the old-fashioned market town towards the fields and homesteads in the Walsworth and Parwell districts. A service was performed thus beneath the canopy of the great temple of the sky, special prayers being offered for the crops. On the following day, Monday, the 16th inst., similar visits were made to other districts in the vicinity of the town.

Vegetation in the Cape Verde Islands.—Mr. Boyd Alexander, M.B.O.N., who is evidently an ornithologist, gives a picture, though not a very alluring one, of the vegetation of Sao Nicolau, Cape Verde Islands, in the May number of *Knowledge*. He was on a bird collecting expedition, but frequently alludes to the vegetation. On dropping anchor in Porto Preguiza, the harbour of the above named island, he says that "one seeks in vain for cool verdure on which to look and rest one's eyes." Soft brown hills acutely angled confront the visitor in every direction. The grass which grows on the lower portion is quickly eaten by the goats, and the thousands of locusts that infest the plains. Trees of *Acacia albida* grow here and there on the small plains, but by their stunted appearance show the difficulty they have in getting a foothold, while others are bent double by the north wind. Scarcely any rain has fallen upon the island during the past three years. The village of Stancha occupies the only fertile valley upon the island, and nestles amongst an abundance of tropical growth in the bottom of a dried-up watercourse. Coffee bushes clothe many portions of the steep sides of the valley; and on the higher ground patches of Maize surround the huts of the peasants. Orange trees flourish in the more fertile spots, together with plantations of sugar cane. The fish cane forms an avenue along the banks of a stream; while Cocconut Palms overtop everything else. The foliage of the orange is dark green; the Cocconut is lighter; the Sugar Cane has very light green foliage; and the Fish Cane is of delicate bluish green. Bananas have their leaves torn to shreds by the wind. Maidenhair Ferns hang in graceful festoons from the banks of the stream.

The Present Season promises to be one of the most fruitful on record in Herts, both in field and orchard. Let us hope it will not belie its promise.

Mr. P. C. M. Veitch, of Exeter, we are pleased to learn from J. C. Stogdon, Esq., is rapidly recovering from the serious illness under which he was suffering recently.

Royal Gardeners' Orphan Fund.—We are in receipt of a postcard soliciting the votes and interest of friends on behalf of a candidate for relief from the above fund during 1898. We are somewhat at a loss to account for such a belated appeal seeing that the balloting for candidates for the fund took place at Anderton's Hotel, Fleet Street, E.C., on February 18th last.

New Year's Banquets in Japan.—The first day of the year is so extensively fêted in Japan that even the prisoners in gaol rest and make merry in their dungeons. On this day a Japanese gentleman will find in his room a vase of brass or porcelain containing some sprigs of Fir, Bamboo, or Plum. It is thus that the servants express their good wishes. The Fir, by its constant leafage, signifies long life; the Bamboo, prosperity; and the flower of the Plum, the first flower of the season, white, chaste, and sweet, filling the room with its delicate fragrance, bespeaks the presence of the all-pervading wisdom.—*Revue de l'Horticulture Belge.*

A Generous Donor to Horticulture.—The *Bulletin d'Arboriculture, de Floriculture, &c.*, states that M. Durant-Castelin, sole legatee of M. Dobrée, who died leaving a fortune valued at 30,000,000 francs has given to the department of Loire-Inferieure, France, 300,000 francs for the building and management of a national school of horticulture and viticulture, and 1,000,000 francs for the construction of greenhouses, destined chiefly for exotic and colonial plants, for improvements and ornamentation in the park and its buildings, as well as to constitute capital destined for the maintenance of the park, greenhouses, and dwelling-houses. That national school of horticulture ought to be constructed in the park of Grand-Blotterau, at some distance from Nantes in the commune of Doulon. The departmental commission has accepted the gift of M. Durant-Castelin.

Sale of Orchids at Walton Grange, Stone.—The sale of surplus and duplicate established Orchids on the 11th and 12th inst., at Walton Grange, Stone, Staffs., the residence of William Thompson, Esq., was well attended by nurserymen and amateur buyers of Orchids. Mr. A. Outram, of London; Mr. J. Godseff, of Sander & Co., St. Albans; Mr. Low, of Messrs. H. Low & Co., Clapton; Messrs. Backhouse, of York; and Charlesworth, of Bradford, were the principal buyers in the trade. A splendid show of Orchids, beautifully arranged in the houses attracted great attention, and were much admired by those who had the privilege of seeing them. The plants are in splendid condition, reflecting great credit upon the abilities of Mr. Stevens, who has had the important charge of the collection for so many years. The sale was conducted by Messrs. Protheroe & Morris on the premises of Walton Grange, and many princely sums were obtained for the finer varieties. For instance, *Odontoglossum crispum*, with six pseudo-bulbs, went for £24; *O. excellens* for £21; *Cypripedium insigne* Dorothy, £22; *C. rothschildianum*, £22 1s.; *Cattleya labiata* Peetersi superba, £78 15s.; *Odontoglossum crispum* Katae £21 6s.; *Cypripedium* Charles Richman and *Oncidium ornithorrhynchum* album, £10 10s. each; *Odontoglossum crispum* aureum, £27 6s.; *Cypripedium leeanum* superbum, £31 10s.; *Laelia gouldiana*, £11 11s.; *Odontoglossum wilckeanum* concinnum, £15 15s.; *O. crispum* Stevensii, £115 10s.; *O. Meleagris*, £36 15s.; *O. crispum* Alfred, £25; *O. nebulosum* album, £15 15s.; *O. crispum* Golden Queen, £168; *Cattleya Victoriae* Reginae, £46 4s.; and *Dendrobium splendidissimum* grandiflorum. All of the above went on the first day of the sale. On the second day, *Cypripedium insigne* Dorothy fetched £21 and £22; *Laeliocattleya* Pallas, £12 12s.; *Odontoglossum sceptrum* aureum, £147; *O. ruckerianum* ocellatum, £52 10s.; *O. sceptrum* Argus, £15 15s.; *O. excellens* Thomsoni, £147; and *Cattleya labiata* caerulea, £30. The list is headed by the *Odontoglossums*, while *Cattleyas* and *Cypripediums* follow in this order, showing that choice things still bring their price.—*Rusticus.*

Starlings in great numbers have built their nests this year in the chimneys of Buckingham Palace.

Destructive Fire at Edinburgh.—On the night of the 11th inst. a fire broke out on the premises of Messrs. Mackenzie & Moncur, Edinburgh, doing damage to the extent of £25,000. Fears were for some time entertained that the fire would spread to other properties, but it was finally subdued.

The German Society of Rose Growers.—The Congress of the German Rose Society will be held this year in Gotha, Germany, in conjunction with a Rose show, inside the great Thuringian Industrial Exhibition, from the 10th to the 12th July. All the particulars will be made known through the local committee in Gotha, and the executive of the German Rose Society, of whom also programmes are to be had. This intimation has been furnished us by the editor of *Rosen Zeitung*, the organ of the German Rose Society.

READING GARDENERS.

THE first meeting of the summer season of the Reading and District Gardeners' Mutual Improvement Association was held on Monday evening last, when the chairman of the association, Mr. Turton, presided over a good attendance of members. The subject for discussion was hardy flowers, including shrubs and bulbs. This was introduced by Mr. Townsend, gardener to Sir William Farrer, Sandhurst Lodge, who said that he should refer principally to those varieties which made the garden look gay during the early months of the year and only those which were grown in the gardens under his charge.

The following varieties were touched upon:—Flowering Shrubs: *Amygdalus*, *Abelia*, *Andromeda*s, *Buddleias*, *Berberis*, *Cydonias*, *Cerasus*, *Crataegus*, *Ceanothus*, *Choisya*, *Cytisus*, *Carpenteria*, *Chimonanthus*, *Cistus*, *Cornus*, *Deutzia*, *Daphne*, *Diplopappus chrysophyllus*, *Escallonia*s, *Forsythias*, *Garrya elliptica*, *Genista*, *Iberis*, *Jasmine*, *Kerrias*, *Laburnum*, *Leycesteria* formosa, *Ledum*, *Mespilus*, *Magnolias*, *Nuttallia*, *Pyrus*, *Prunus*, *Philadelphus*, *Ribes*, *Spiraea*, *Sambucus*, *Ulex*, *Viburnum*, *Veronica*, *Weigela*. Bulbs: *Hyacinths*, *Tulips*, *Narcissi*, *Crocuses*, *Aconite*, *Chionodoxas*, *Triteleias*, *Scillas*, *Grape Hyacinths*, *Alliums*, *Ornithogalum*, *Leucojum*, *Dog's-Tooth Violets*, *Trilliums*. Flowers (flowering from February till the early part of May): *Heleborus*, *Violets*, *Arabis*, *Aubrietias*, *Daisies*, *Wall-flowers*, *Myosotis*, *Primroses*, *Polyanthus*, *Alyssum*, *Doronicum*, *Alpine Phlox*, and *Primula Sieboldi*.

A discussion followed. An interesting feature of the meeting was the large display of cut flowers, including *Primula Sieboldi*, *Daisies*, *Myosotis*, *Tulips*, *Trilliums*, *Pansies*, *Lily of the Valley*, *Wall-flowers*, *Narcissi*, *Auriculas*, *Honeysuckles*, *Roses* (outdoor growth), &c. These were contributed by Mr. Turton, Maiden Erleigh Gardens, Mr. W. Smith, gardener to Miss Neild, Greenbank, and Mr. Townsend, the latter exhibiting a splendidly-grown *Anthurium* showing forty-three spathes. A vote of thanks to the lecturer and to those members who had brought the flowers ended a pleasant evening.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

A Fine *Laelia purpurata*.—A beautiful variety of this species was secured for £3 10s. at the Sale Rooms of Messrs. Protheroe & Morris, on the 13th inst., by Mr. G. E. Day, gardener to H. J. Simonds, Esq., Mendham House, Park Place, Leyton, Essex. The sepals and petals are rosy-pink. The lip is the feature of the flower, the large lamina being of a rich, velvety-crimson, while the pale lemon throat is handsomely striated, as usual, with slender purple lines. The variety, therefore, is in keeping with several other fine things that have recently been added to the same collection.

Dendrobium chryseum.—To all intents and purposes this is a rare *Dendrobe* seldom seen in cultivation. The stems are about 1 ft. high, and bear a few flowers in pairs as a rule. The richness of the golden-yellow sepals and petals compensates in a measure for the moderate size of the flowers,

which are not unlike those of *D. Griffithi* in size and colour, though belonging to a different section of the genus. The lip is pubescent on the upper surface, finely toothed at the margins and orange-yellow, with a few slender, brown lines at the very base. For some years past it has been grown and flowered by Mr. W. H. Young at Clare Lawn, East Sheen, Surrey.

Laelia elegans *Monica*.—This handsome variety belongs to the *Schilleriana* type or section of *L. elegans* and possesses all the good qualities of the original though differing somewhat in colour. The sepals and petals are white, faintly shaded with pale rose along the veins and margins, and having a few scattered purple spots towards the apex on either surface. The exterior of the tube of the lip is similar in colour at the edges, passing into white round the sides and back. The lamina and anterior edges of the lateral lobes are rich crimson-purple, the colour becoming wedge-shaped at the base, and then running along the centre of the tube to the very base. The throat and interior of the tube are pale lemon, thus forming a beautiful contrast with the intense hue of the lamina. Some idea of the size of the flower may be gleaned from the fact that it measures fully 6½ in. across the petals. The variety is flowering with Mr. J. Seeger, Bandon Hill, Croydon.

ORCHIDS AT MESSRS. LEWIS & CO., SOUTHGATE.

I WAS very much pleased when visiting this enterprising firm not long since, to find everything that has been said in its favour to be well warranted. As is well known they have for some time made a great mark by importing large quantities annually of free-flowering Brazilian and Mexican Orchids, and as may be expected they are well represented. The spacious *Cattleya* House, which is 130 ft. long and 25 ft. wide, is crammed full of fine unflowered pieces of *C. Mossiae*, of which there are sixty to seventy pieces marked white; quantities of *C. Harrisoniae*, *Laelia purpurata*, *L. tenebrosa*, and *L. praestans*, the varieties of which created such a sensation last year. *Oncidium tigrinum* in the cool house was just breaking strongly into growth. *Oncidium marshallianum*, too, is making good plants. Of *Odontoglossum crispum* there are some 4,000 plants in various stages, several good forms being amongst those in flower. In another division there are grand pieces of the beautiful yellow *Oncidium ampliatum* majus, one with nine spikes, and such spikes, too. The season is, of course, over for *Dendrobes*, but the beautiful *D. dalhousianum* was making a good show. Of imported plants there is a great quantity of *Cattleya labiata*, all ready to break away into growth.—S. C.

PEOPLE WE HAVE MET.

MR. GEORGE WYTHES.

The subject of our sketch is a Worcestershire man, born in 1851, and educated at the Queen Elizabeth's Grammar School, in the old city of Worcester; but both parents dying just as he had entered upon his scholastic course, he unfortunately had to leave school and begin work earlier than most boys (at the age of twelve), and rely upon night schools to gain the necessary knowledge so needful for a gardener. Strange to relate there was no one connected with gardening at any period in the family history; and of the two surviving boys, the eldest and youngest, the latter is the now well-known Syon gardener; the eldest having for the past twenty-five years held a responsible position in the Botanic Gardens, Melbourne, Victoria. Both had a liking for the work, and though much pressure was used with Mr. G. Wythes to turn his attention to other things, by persistence he carried the point and passed the first four years as garden boy in a small place in the city, utilising his evenings in improving himself, there being some excellent night classes.

At the age of sixteen he says "I was very restless and I fear I gave my good old instructor some little trouble by my enquiries as to the name of this or that, and how to grow it; and I think I never was happier than when I obtained for a shilling a bit of Mrs. Pollock Geranium to add to my own collection; and I can assure you shillings with me then were scarce enough, and I never watched a plant grow as I did that one. I had at the time quite a respectable

collection of the tri-coloured varieties. They were at that time much thought of."

At the age which Mr. Wythes thought it time to begin gardening in earnest, and after much thinking he was fortunately sent to the Messrs. Smiths' Nurseries to get a small Conifer, and as it was not a very large order he had a good tramp over their extensive nurseries to get it. He there saw the then senior partner, and told him he was anxious to get into a good garden. In a short time Mr. Smith sent him to a newly made place, Whitbourne Hall, Herefordshire. Here there was a splendid collection of trees and shrubs, and ample glasshouses, but none too much labour. Here he served the usual three years, and though the pay was small, and there was many a struggle as to ways and means, he got a good insight which proved valuable in later days.

From Whitbourne Hall Messrs. Smith sent him as journeyman to Abernant House, Glamorganshire, and though the gardens probably did not exceed 20 acres some forty men were employed, as the owner was member for the district, and the gardens were thrown open weekly; and being a great mining district it was thickly populated. Stove and greenhouse plants were specialties: Pine Apples also. There was a greater number of plants than is generally seen in private establishments; but Mr. Wythes' department was the flower gardens which were made most attractive, there being an enormous herbaceous border in addition, and a good collection of plants. At the end of a month he was offered the foreman's place in this department, but refused it as he was much younger than his brother journeymen.

He did not stay quite a year at Abernant, as he was offered the foreman's situation at the Hendre, Monmouth, then, as now, a leading garden for fruit culture, but of late years greatly enlarged by that excellent cultivator, Mr. Thomas Coomber. His stay of three years at the Hendre was most beneficial as he never remembered seeing better Grapes; and Pines were well done. To show how his employer, Lord Llangattoch, valued his work, the gardener leaving, Mr. Wythes was asked to take his place; but though he greatly appreciated the trust reposed in him he felt he had not obtained sufficient experience to fill so responsible a position, and declined.

His next move was to Knowle House, Sidmouth, Devon, a large garden with much glass and beautifully situated. Here he was general foreman under a most kind and genial gardener, Mr. Emleigh, for a short time, but was unable to stay, his health being indifferent. He then went to the Duke of Bedford, Woburn Abbey, Beds., but was only here twelve months, as the then Duke pulled down the large conservatory and plant houses, and did not rebuild the department under the charge of Mr. Wythes.

He was employed at the nurseries of Messrs. Veitch & Sons, Chelsea, for a time, going from there to Lord Waveney's, Flixton Hall, Suffolk, under Mr. Fisher, an excellent all round gardener, and a specially good fruit grower. Whilst here he had a much better berth offered him, to go to Stourton Hall, Lincolnshire, much glass having been erected, and he accepted. He made but a short stay of twelve months only, as, owing to insufficient labour, good results were impossible.

His next move was an important one, as he was wanting a head gardener's place, having had a fair innings, as will be seen. Messrs. Dickson, of Chester, having done much planting at Stourton Hall, he went to the nurseries and stayed some months, after which he accepted the position of foreman at Alexandra Park, Manchester, under the superintendent, Mr. Manderson, a genial employer, and whom he much respected. Here was ample scope for a man. The park was some eighty acres in extent; a large staff of men was employed, and the park being just made, needed considerable attention to make it attractive. Here at that time both spring and summer bedding were great features.

At the end of three years, through the kindness of Lady Llangattoch, he was offered the position of head gardener to H. W. Freeman, Esq., at Thirlestaine Hall, near Cheltenham. He found this more congenial to his taste, as the work was more varied, and his employer being fond of his garden, he encouraged his gardener in every way. He well remembers the first spring exhibition in Cheltenham his employer drove him to. After walking round the show Mr. Freeman remarked "now if you can do us credit show what you like, but good things." His task at Thirlestaine Hall was a pleasant one. Mrs.

Freeman was fond of Orchids, and houses were quickly built by the best friend a gardener ever had, namely, Mr. Jas. Cypher, as he not only grows plants well, but never minds what trouble he takes to further a gardener's interest, and give friendly advice, yea, and help also if needed. Mr. Wythes

MR. GEORGE WYTHES.

owes a deep debt of gratitude to him for the many kindnesses he received from him and his family whilst in Cheltenham.

It was to be regretted that his stay here was under five years, his employer dying; but during that time he was very successful at the Cheltenham shows, of which there were three large ones yearly, in addition to the Chrysanthemum show which was not connected with the county of Gloucester. His success was mostly with Orchids, stove and greenhouse and foliage plants. For two years he was the chairman of the Gardeners' Society. To leave Cheltenham and many kind friends was a wrench to him.

He was fortunate, however, in being appointed head gardener to the Rt. Hon. Lord Hatherton, Teddesley Park, Penkridge, Staffs., out of many applicants, and in one of the prettiest spots in the kingdom at the foot of the Cannock Chase, and with a most kindly employer. Here again, death after a period of three years, caused changes. The gardener's noble employer dying, Lady Hatherton, sister to His Grace the Duke of Northumberland, recommended him to fill his present post, the seat of Earl Percy, Syon House, Brentford, Middlesex. He will always remember the great kindness he received from her ladyship and the family, at Teddesley Park, whose whole interest was to make those employed on the estate feel they had a friend, and to study their welfare. Mr. Wythes has now been ten years at Syon, following a worthy man, but one difficult to follow, as he had made a name in the horticultural world. He has, nevertheless, endeavoured to keep up the gardening interests of the place and that with signal success. He has been assisted by a willing staff, and always grateful, according to his wont, acknowledges many kindnesses at the hands of new friends, since he settled in the neighbourhood of London. The accompanying portrait will recall the features of the man, in whose company we have spent many a pleasant hour, examining the gardens, houses, grounds, and fine collection of trees at Syon House.

PLANTS RECENTLY CERTIFICATED.

THE undermentioned awards were accorded by the Royal Horticultural Society on the 10th inst.

Orchid Committee.

SPATHOGLOTIS AUREO-VIEILLARDI, *Nov. hyb.*—The parentage of this hybrid is expressed in the name given it. The flowers are similar in size to those of

the parents, and produced in a short raceme. The sepals are soft primrose tipped with pale rose. The petals are elliptic, coloured like the sepals, and spotted with rosy-purple on the lower three-fourths of their length, the yellow and the spotting being introduced by *S. aurea*. The terminal lobe of the lip is wedge-shaped, tapering into a long, yellow spotted claw. The hatchet-shaped side lobes as well as the terminal one are carmine-crimson. The hybrid is very pretty and well deserved the First-class Certificate. Messrs. J. Veitch & Sons, Ltd., Chelsea.

LAELIOCATTLEYA FASCINATOR, *Nov. hyb. bigen.*—This bold and showy bigeneric hybrid was obtained from *Laelia purpurata* crossed with *Cattleya Schroderae*. The sepals and petals are soft mauve-pink. The lamina of the lip is wavy, crimson-purple; the interior of the tube is white overlaid with soft yellow along the middle, except towards the base, where there is a band of fine crimson lines. First-class Certificate. C. L. N. Ingram, Esq. (gardener, Mr. T. W. Bond), Elstead House, Godalming.

LAELIOCATTLEYA HIPPOLYTA DULCOTE *VAR. Nov. var.*—In this handsome Orchid we have a richly coloured variety of a hybrid of which there are now several varieties in cultivation differing chiefly in colour. The sepals and petals are rich orange, the latter being shaded with red towards the apex. The lip has an orange-yellow tube, lined with red, and its lamina is wavy and crimson-red. First-class Certificate. Walter Cobb, Esq. (gardener, Mr. Howes), Dulcote, Tunbridge Wells.

SOPHROCATTLEYA GEORGE HARDY, *Nov. hyb.*—The flowers of this bigeneric hybrid are strikingly distinct. The parents were *Sophronites grandiflora* and *Cattleya Acklandiae*, the latter being the pollen bearer. The pseudobulbs are about 1½ in. long, and carry two lanceolate leaves. The sepals are lanceolate-oblong, the petals elliptic, and all are red with a few crimson spots towards the apex. The lamina of the lip and the tips of the lateral lobes are carmine-red. The throat and base of the side lobes are yellow, lined with red. It is a little pet. Award of Merit. Fred Hardy, Esq. (gardener, Mr. Stafford), Tyntesfield, Ashton-on-Mersey.

CATTLEYA INTERMEDIA FOWLER'S VAR. Nov. var.—The sepals and lanceolate petals are white, faintly suffused with blush-lilac. The tube of the lip is similar; but the bifid lamina is crisped, wavy and crimson-purple; the side lobes are creamy. The curved column is pale purple. The variety is certainly a pretty one. Award of Merit. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, S. Woodford, Essex.

Floral Committee.

ALYSSUM SAXATILE FLORE PLENO.—The golden-yellow flowers of this variety are perfectly double, but otherwise like the type. It should make a handsome and useful border, rockery, and bedding plant. Award of Merit. Messrs. Paul & Son, Cheshunt.

ALPINE AURICULA ZIXA (Douglas).—The large flowers have a rich, golden-yellow centre, a black ground and an orange-red edge. Award of Merit. Mr. James Douglas, Edenside, Great Bookham, Surrey.

ALPINE AURICULA PERFECTION (Douglas).—Flowers of large size, with an intense golden-yellow eye, a small area of maroon body-colour, and a broad crimson margin. Award of Merit. Mr. J. Douglas.

ALPINE AURICULA DEAN HOLE (Douglas).—Flowers of large size, the ground maroon, and the broad edge rich crimson-red. All the three Alpines are very choice. Award of Merit. Mr. J. Douglas.

YELLOW BORDER AURICULAS.—During the past fifteen years Mr. David Storrie, St. Madoe's Cottage, Glencarse, Carse of Gowrie, Perthshire, has been working up a magnificent strain of yellow border Auriculas, all of which have been evolved from a single plant. The plants varied from 6 ins. to 10 ins. in height or more and carried large trusses of deliciously scented flowers varying from rich golden-yellow through many shades to creamy-yellow, nearly white. They had been grown, wintered, flowered, and seeded in the open air, without protection. They are the result of selection from a sweet-scented variety that originally cropped up in a batch of ordinary border seedlings, and have been fertilised naturally by insects, the raiser merely selecting the finest flowers and most vigorous plants. Some of the best have been given names. The

paste round the centre shows that they belong to the show type, though no attempt has been made to make them florists' flowers. Award of Merit for the strain.

AZALEA MME. JOSEPH VERVAENE.—The double flowers of this charming Indian Azalea are of great size, soft salmon-pink and silvery-white towards the edges. There is a patch of crimson spots on the upper segments. Award of Merit. Mr. Charles Turner, Slough.

AZALEA AMI CHAS. VERMEIRE.—Here the single flowers are of good average size and intense crimson-red with a few spots on the upper segments. Award of Merit. Mr. Charles Turner, Slough.

Fruit and Vegetable Committee.

RADISH SUTTON'S FORCING.—This and all the other varieties mentioned below have been on trial at the society's gardens at Chiswick. Sutton's Forcing, White, Olive-shaped, is a variety that is clear in colour, and grows very quickly, so that it is useful for forcing under glass, and early use from the open ground. Award of Merit. Messrs. Sutton & Sons, Reading.

RADISH FIRST OF ALL.—In all respects this is closely similar and equally valuable as the previous sort. Award of Merit. Messrs. Barr & Sons, King Street, Covent Garden.

RADISH SUTTON'S FORCING CARMINE OVAL.—Root intense or bright carmine-red, smooth and early. Award of Merit. Messrs. Sutton & Sons.

RADISH FIRST OF ALL SCARLET OLIVE-SHAPED, is similar in form to Carmine Oval, and of good quality. Award of Merit. Messrs. Barr & Sons.

RADISH WOOD'S FRAME.—In this we have a long, tapering, pale pinkish-red sort, the only long type that received an Award of Merit. Messrs. Watkins & Simpson, Strand, London.

Floricultural Certificates of Merit were awarded to the under-mentioned subjects by the Royal Botanic Society at the summer show, held on the 11th inst., at Regent's Park:—

BEGONIA EARL OF DARTMOUTH.—A large, double-flowered tuberous Begonia, with rich scarlet flowers of great depth. Messrs. John Laing & Sons, Forest Hill, S.E.

CHERIANTHUS HARPUR CREWE.—This is a valuable double-flowered Cherianthus. The blooms are of medium size, bright yellow, very sweet scented, and produced in great profusion. This plant should not be lost sight of in spring bedding arrangements. Messrs. Barr & Sons, Covent Garden, W.C.

TULIP GLOW.—Here we have one of the finest of the Darwin section of May-flowering Tulips, and one that should prove useful for bedding purposes. The flowers are of medium size, rich crimson in colour, with the characteristic black base, round which, however, runs a narrow zone of yellow. Messrs. Barr & Sons.

TULIP SALMON KING.—Another of the Darwin Tulips that will make a capital hedder. The colour is not salmon, as the varietal name would suggest, but cherry-scarlet, and very bright and showy. Messrs. Barr & Sons.

AZALEA LE PRINTEMPS.—This is a handsome variety of *A. indica*, with medium-sized, single flowers of a bright crimson-magenta hue. There are a few dark maroon blotches on the base of the upper petal in the tube, but they are not very conspicuous. The variety is very free, and should prove of service. Mr. Charles Turner, The Royal Nurseries, Slough.

AZALEA AMI VICTOR CUVELIER.—A fine, semi-double variety of *A. indica*. The flowers are large, rather flat, open, and rosy-pink in colour, with a silvery margin. The upper petal is blotched heavily and flushed with crimson maroon. Mr. Charles Turner.

AZALEA LOUISE CUVELIER.—This is another beautiful form of *A. indica*, but the flowers are very double, and pure white, although occasionally they have a broad, conspicuous, radial scarlet stripe. The great substance of the petals seems to indicate a variety that will take kindly to forcing for cut flowers, and that will become very popular for this purpose. Mr. Charles Turner.

AZALEA MADAME JOSEPH VERVAENE.—For description see above. Mr. Charles Turner.

AZALEA AMI CHARLES VERVAENE.—For description see above. Mr. Charles Turner.

Botanical Certificates were accorded the following:—

CALADIUM GUARALINGUETOR.—The *Caladium* which is to bear the burden of this somewhat outlandish name is an exceedingly handsome one. The lobes of the large cordate leaves are more strongly produced than usual. The colour is deep carmine, with veins and midrib still a shade deeper. The narrow green margin is prettily waved and undulated. Messrs. John Laing & Sons.

DRACAENA ROSE LAING.—This is a welcome addition to the *D. terminalis* section. The leaves are of medium width, the lower ones bronzy-green in hue, flushed and streaked with carmine, the upper ones being bright rosy-carmine. The contrast between the two sets of leaves is very effective. Messrs. John Laing & Sons.

ADONIS PYRENAICA.—This is one of the most showy and useful members of the genus. The plant grows from a foot to 18 in. in height, and strong clumps throw up numerous stems which flower at the apices. The leaves are very much divided, and resemble those of Fennel to some extent. The flowers are of great size, bright golden-yellow in colour, and nearly sessile upon the stems. Both flowers and foliage are thus exceedingly showy. As the specific name suggests the plant is a native of the Pyrenees, but although it was introduced as far back as 1817 it is yet comparatively rare in cultivation. Messrs. Barr & Sons.

THE PLANT HOUSES.

THE STOVE.

In this department the summer routine of treatment is now, or should be, in full swing. Warmer nights and days are with us, and less fire-heat will as a matter of course be needed. An occasional cold night, however, warns us that a bright look out must be kept upon the thermometer, for anything like a heavy drop in the temperature of the house is to be avoided. Through the night the thermometer should be kept up to 70° Fahr., and on bright days it will rise close to 80°, which will not be a whit too high, seeing that so many plants are making young growths. Air should not be given too liberally yet, for the tissues of these young shoots are very tender and ill-fitted for battling with cold draughts. By dint of judicious shading, and frequent dampings down in conjunction with the regular morning and afternoon syringings, it will be easy to keep the house at a reasonable temperature without rushing on a lot of air.

With many plants, particularly those which were potted within the last two months, it is yet too early to think of giving stimulants, but there are some that did not receive a shift this year, and others that were only top-dressed. These will benefit by a manurial stimulant of some kind. For *Crotons* and *Dracaenas* we have found nothing better than Clay's Fertiliser, which helps wonderfully to put the colour on. For *Palms*, a pinch of nitrate of soda given about every ten days will work wonders with plants that have put on the sickly yellow hue so indicative of starvation. The only objection to the employment of this manure is its great strength, which is such that it should never be trusted in the hands of a careless or inexperienced workman, for in such a case more harm than good will result from its use, or rather abuse. Liquid cow manure will be found capital stuff for such things as *Caladiums*, and *Coleuses*, and *Ferns* of all descriptions.

WINTER-STRUCK CROTONS.—In establishments where the demand for a consistent supply of young plants is heavy, it is occasionally necessary to put in cuttings whenever they can be obtained. The cuttings taken in the winter, however, rarely do so well as the others, for the long period of stagnation seems to severely handicap the after chances of the plant. It will be well, therefore, to take off the tops of those that will make good cuttings, and start them afresh. Being fairly firm and wiry they are almost sure to root if properly looked after, and they make plants much quicker than the old plants would have done. The potting up of the spring hatch of cuttings, which are now rooted, should be taken in hand as soon as possible. The compost may contain rather more peat for these young plants than is given to the older specimens, also a larger proportion of sand.

EUPHORBIA JACQUINIAEFLORA AND E. (POINSETTIA) PULCHERRIMA.—Cuttings of these should still be secured as they are thrown up by the old plants. The potting on of the rooted cuttings in the early batches must likewise receive attention. After potting they should be kept in the propagating frame for a few days if space can be spared; if not a place on a shelf near the glass is the next best thing for them. Some of the old plants of *E. jacquiniaeflora* may well be grown on for another season, and as they have now had enough rest should be shaken out and re-potted. Give them a high temperature and rather dry atmosphere.

ACALYPHIAS.—Both *A. musaica* and *A. marginata* are handsome and useful foliage plants, but they are of most service in a small state. It is advisable, therefore, to keep up a constant supply of plants in 48's and 32's, which are the handiest sizes for general decorative work. After the spring cuttings have got a start they will do fairly well in a frame during the summer months, where they will colour much better, owing to the greater amount of light that can be given them. In the stove they must take the shade with the other plants.

GARDENIAS.—The cuttings which were put in at the end of March are now ready for their first shift—into 3 in. or 4-in. pots. The soil should consist of two parts of good loam and one of peat, with sand, and a few pieces of charcoal. Pot fairly firmly, and place them on a shelf near the glass, or, better still, in a frame in one of the warm houses. Keep them close for a time, and syringe regularly morning and afternoon. The watering-can must be used very carefully at this stage of their career.

Pits and Frames.

For the last few weeks the hosts of bedding plants have been choking up every available inch of frame space, but with the transference of some of these plants to the open air at the beginning of the past week some relief from the crush has been given, and by the end of the month things will be normal once again.

TUBEROUS BEGONIAS.—Where large plants are required it will be well to look over the stock and select some of the strongest, giving them a shift on into a larger pot. The remainder of the plants will do as they are for pot room, but they will require a little feeding later on—for the present they do not stand in need of it. Up to this time the stems have been stout enough to support their own weight, but staking will soon require attention. On basket plants, too, a start must be made to draw the growths gradually, but they must not be forced.

CINERARIAS.—The first sowing of seed, which was made the second week in April, was to supply plants for very early flowering—in November and December. Such plants are useful in some establishments, but they are not grown to any great extent. The second sowing, to be made now, will furnish plants that will bloom in succession to these early ones at the beginning of the next year. This is quite early enough for most people, and thus the May sowing is usually the first with them.

COCKSCOMBS.—In order to induce these to take on a dwarf habit, and at the same time to produce large 'combs,' it is often necessary that the young plants should go through a starving process. This is best done when they are in small 60-sized pots, preparatory to their final shift into the flowering size. Another plan of obtaining dwarf plants is to allow them to make their combs, and then if the plants are too tall to cut off the comb with a fair length of stem, and some leaves attached, pot this up into a smaller pot, and plunge upon a brisk hotbed, when the cutting, for such it really is, will soon make roots.

CELOSIA PYRAMIDALIS PLUMOSA.—Make another sowing to supply a hatch of plants for late work. The seed will germinate very quickly now, and the subsequent growth of the seedlings will also be rapid. Pot off into 48's and 32's, according to the strength of the plants, those that are now in small 60's. Keep them near the glass, give plenty of water, and syringe freely to keep down red spider—their greatest pest.

ZONAL PELARGONIUMS FOR WINTER FLOWERING.—As soon as the cuttings are well rooted pot them off into large 60's. Stopping may be resorted to after they have recovered from the check. A little more heat than is usually given to these plants is of advantage now to start them growing strongly, but it must not be overdone.—A. S. G.

HINTS FOR AMATEURS.

Hardening-off Bedding Plants.—We are once again close upon the heels of the bedding-out season, so close indeed that it is of paramount importance that what time remains should be properly utilised in preparing as far as possible the plants for an outdoor life. Many subjects that will ordinarily grow in a comparatively low temperature have been luxuriating in heat during the spring months in order that the requisite stock of plants may be furnished by propagation, and in addition there are numbers of others that really require a high temperature at all times; also seedlings of plants almost innumerable that have passed their babyhood in warm pits and houses, and are now fast developing into sturdy young plants. All of these need a special education before they can be safely transferred from the shelter of glass structures to the open ground; they must be inured to stand the lower temperatures, their tissues must be toughened to resist with the minimum of injury to themselves cold winds and rains, for it is quite likely that they will have to contend with both, and the gardener gives this special education by the process that he pithily calls "hardening-off."

It does not take a very vivid imagination to see that the sudden transition from heat to cold must be injurious to a high degree. But the plants are now in heat and there is the other probable extreme looming in their near future. The only thing to do, therefore, is to effect a gradual transition, of which each stage shall not be sufficiently great to do direct damage to the things subjected to it, but which, on the other hand, will be a preparation for the next. Plants are like human beings in many ways—they may be trained to stand a good deal by means of suitable preparation, for they have within themselves the power of adapting themselves to circumstances to an extent that comparatively few appreciate. In employing this their adaptability to attain his own ends, the gardener then is only taking advantage of a potentiality wherewith Nature has endowed all her children. It would be somewhat late in the day had this "hardening-off" process only commenced in this, the third week in May; it should have been begun at least a fortnight ago, or better still with the beginning of the month, and thus only the final stage will be wanting to complete the education of the hardier plants.

Zonal Pelargoniums.—For the last six weeks these, with the exception of the later cuttings, have all been in cold frames. First of all the frames were kept rather close, then air was gradually admitted, and then the lights were pulled off altogether during the day, but pushed on again at night. Now the light may be left off all night unless frost threatens, when, of course, on they must go. It is more than likely that the frame room will be wanted for sheltering other more tender plants, and hence the Pelargoniums must be shifted out of it, and stood in a sheltered corner out of doors, where, in addition to the natural shelter afforded by position, further covering may be given if it becomes necessary—which may the fates forbid. The late struck cuttings that were potted up singly in small pots at the beginning of the month have now got a sufficient start. They should be shifted at once, therefore, to a vacant frame, kept close at first as the older plants were, and gradually inured to free ventilation, also as the others were. Ivy-leaved varieties may be treated in similar fashion.

Heliotropes, Verbenas, Iresines, and Coleuses are all of them much more tender than the "Geraniums," and if possible these should be kept in the frames until the last moment. At the time of writing the weather is anything but genial, cold rain and even colder winds are making it uncomfortable for man and beast as well as plants. Such things as Iresines and Coleuses too are particularly liable to receive damage when the low temperatures are combined with too much water at the root, and when they are put out of doors they naturally have to take and put up with all the rain that falls. The result is that exposure to such untoward conditions causes many to damp off.

Seedlings.—These require the greatest care of all, for in addition to having to get over their liking for heat they have not yet passed entirely out of the baby stage, and with it the tenderness that accom-

panies it. Too much water at the root is as injurious to them as it is to the Iresines and Coleuses, and hence it is almost as important that they should be shielded from cold rains as from low temperature.

Sub-tropical Bedding Plants.—In these we may include many Palms, together with other ordinarily stove foliage subjects as Acalyphas and Musa Ensete, flowering plants like Cannas, Erythrine Crista-galli, Plumbago capensis, P. rosea, and such annuals as the Castor Oil Plants. These have to undergo a preparatory training similar to that given the smaller subjects, but their greater height and bulk renders the frames that are employed for the smaller plants of no good. For these subjects, therefore, it is necessary to have a roomy, cool house, in which they will not be crushed up against the glass, and the ventilators of which may be opened more and more each day in the same way as the lights of the frames.

Tuberous Begonias.—These constitute such an important feature in the flower garden that any extra pains that may be taken to secure superior plants are well repaid. We always follow the plan of taking out the plants from the boxes in which they have been started into growth, and planting them out in a prepared bed of light, rich soil, placed upon a hotbed, and covered by a frame. This intermediate shift is given not later than the beginning of May, and great care is subsequently taken in the matters of shading, watering, syringing, and airing. The plants are now a mass of fine, stout foliage, and as the glass is so close they are all dwarf and sturdy. Air is given them pretty freely in the daytime now, although up to the present it has been taken off at night. During the coming week, however, if the weather be at all suitable a little air will be left on at night, so that the plants will ere long be fit for their final transference to their flowering quarters. Frost, however, may even yet make its appearance, and it must be watched for vigilantly, for with the leaves so close to the glass they would suffer almost as much as if they were out of doors. In the event of even a slight frost, therefore, the frames must be warmly covered.

Seedling Begonias.—The raising of these handsome plants from seed is a hobby that specially recommends itself to the amateur, for with a packet of seed purchased from a reliable source he has every prospect of getting a number of good things. Moreover, he has not to wait, as in the case of many other seedlings, for years before he can see the result of his labours, for if he sows fairly early, and has a fair amount of luck, he will be able to tell what the plants are like, and whether they are worth saving or not in the first season. Of course, with the seedling plants there is no necessity to harden them off so quickly for planting in the open, but they may and should be kept growing on under glass until the summer is fully here, when they will grow quite as fast out of doors as they would under glass, provided a warm and sunny spot be given them. Just now the young plants are in the boxes into which they were pricked off from the seed pans, and in these they may remain until there are signs of crowding, which, if growth proceeds as it ought to, should be by the end of this month or the beginning of next. The present is a rather critical time with the young plants, for there is a great tendency to over-water them, when the soil becomes sour and unkindly, and the vigour of the plants crippled. Consistent shading will be necessary, for whilst under glass the foliage burns very quickly.

Violets.—It is now high time that something was done with these or the season will be too short to obtain good, sturdy plants by the end of September, when it will be time to put them in the frames again. The frames in which the old plants were accommodated last winter were lifted off them at the end of last month. This was rendered necessary by the large amount of room needed by the bedding plants, and the Violets would, of course, take no hurt, as the most of the flowers were over by that time. The old plants should now be rooted out, and divided up into single young crowns, with two or three leaves and a few roots attached. These divisions may straightway be consigned to the open, and the old plants thrown away. If there is a vacant place on a north, east, or north-east border this should be selected for the Violets, as they will be there less liable to the attacks of red spider than they would in a sunnier locality. The best method is to plant in rows about 1 ft. apart, leaving 9 in.

between each plant in the rows. If the showery weather that we are now having continues, the Violets will soon take a hold of the ground, but if dry weather supervenes immediately after planting, watering must be resorted to. All the subsequent attention that will be necessary will be further watering, and keeping them clear of weeds. An occasional stirring of the soil by means of the Dutch hoe will be of great service.

Richardias have now finished flowering for the season and may be kept rather drier at the root than formerly, so as to give them a period of partial rest before they are planted out in the open border to make their growth for the season, or re-potted, according to which system the amateur prefers. Each plan has its advantages, but we should recommend planting out as being most suitable for the amateur to follow, for it is always best to have as few pot plants as possible to water during the summer months.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Ten-Week Stocks Dying.—S. O.: With the information contained in your letter it is impossible for us to say definitely what is the cause of your seedling stocks going off. Do the young stems show evidence of rotteness near the point of contact with the soil? If so, you have probably over-watered them. If this is not the case you have most likely committed one of the mistakes in pricking them off that *Rex* speaks of in his recent article on seedlings, which see.

Polygonum cuspidatum.—This is the plant you speak of, *R. Stueud*, as being employed to a considerable extent in town gardens. It is a fairly good town plant, but it is apt to become sadly besmirched by the smoke. When placed in more favourable surroundings there is no finer sight than a good clump of it with its numbers of pure white flowers arranged in long, graceful sprays. We should not advise you to plant it in your garden unless you have plenty of room. It throws up a lot of suckers for some distance around the old stool.

Mignonette in Window-box.—I should like to fill one of my window-boxes with Mignonette this year. Which would be the better plan—to sow the seed in the boxes, or to sow in other pots or boxes and transfer the plants to the window boxes as soon as they become large enough.—*G. Laithway*.

Mignonette does not take with great readiness to transplanting, although the operation may be performed if care is taken; hence we should certainly advise you to sow the seed in the window box straight away. The plants may be afterwards thinned as required.

Size of Pots.—E. A.: The following are the diameters in inches, inside measurement, at the rim of the pots of the following sizes:—small 60's, 3 inches; large 60's, 4 inches; 48's, 5 inches; 32's, 6 inches; 24's, 7 inches; 20's, 8 inches; 16's, 9 inches; and 12's, 10 inches.

Large Chrysanthemums.—*Amateur*: You will find the following the eight largest-flowered varieties of those you have enumerated in your list, taking them in order, as you have written them down:—Phoebus, Lady Ridgway, Baron Hirsch, Emily Silsbury, Edith Tabor, Silver King, Col. W. B. Smith, and Charles Davis.

Lily of the Valley Crowns are of no use after they have been forced, *T. W.* The flowers are produced chiefly at the expense of the nourishment stored in the swollen crowns, root action being comparatively weak.

Violet Comte de Brazza.—E. S.: We do not know whether you could obtain divisions or crowns of Violets from nurserymen. You see if they supplied orders of this kind they would be spoiling their trade for plants in the autumn. You can only write to one and ask.

Cineraria Seed not Germinating.—*Ohio*: There may be several reasons why your Cineraria seed has not produced plants. The first is that the seed is bad, but, on the other hand, if you procure it from a trustworthy source this reason need not be entertained. Then again, you may have sowed too deeply

GREENWICH PARK.

IN connection with Greenwich Park, an interesting event takes place on Saturday the 21st inst., when the ceremony takes place of opening the grounds belonging to the Ranger's Lodge for the use and

crown property, are now added to Greenwich Park, which, like Kew, is a royal park, under the charge or care of the Chief Commissioner of Works.

Some little time ago Mr. A. D. Webster, a great authority on all that pertains to woods, forestry, and ornamental plantations, was made superintendent of the park, and ever since has been closely engaged in effecting improvements in every corner of it with the object of bringing it in line with the modern requirements of this thickly populated and fashionable, south-eastern suburb of London. Mr. Webster has made no attempt at remodelling the grounds, but has been and is renovating them upon the old lines so as to maintain the quaint, antique English style as much as possible.

As the Ranger's Grounds are the object of the present ceremony, we may here pass them in review, entering the same by the superintendent's lodge on the south side of the park. A great mound of soil here has been converted into an American garden. After clearing away the old tangle of rubbish, much peat was added to the natural soil, which was then planted with *Andromeda floribunda*, *Azalea mollis*, *Kalmias*, *Heaths*, *Menziesias*, in variety, *Rhododendron praecox*, *R. p. Early Gem*, choice hybrids of *R. ponticum* and many other subjects of that class. Even here some fine old trees exist, including the Tulip tree (*Liriodendron tulipifera*) and the Tree of Heaven (*Ailantus glandulosa*) each about 65 ft. high, also a fine specimen of the rare *Pavia flava*. By the path side is a unique specimen of the common Thorn, measuring 52 ft. in height, and girthing 7 ft. at ground level.

A little further on is The Dell (see accompanying illustration), a deep hollow, which has been partly cleared of old shrubbery and replanted with American shrubs. Some old specimens of the Pontic Azalea (*Rhododendron flavum*), several fully 12 ft. high, are now in full bloom. The Snowy Medlar (*Amelanchier canadense*) has just gone out of bloom. Fine old deciduous Oaks, Elms, and other deciduous trees occupy the high grounds.

A little further on the visitor comes upon a redoubt (see illustration) constructed or thrown up in 1863 by H. R. H. the Duke of Connaught while residing at the Ranger's Lodge, and then known as Prince Arthur. Near the latter building is a neatly constructed and curious bath supposed to be between 200 and 300 years old. It was covered by a house which fell to ruins over the site, and when the debris was cleared

THE DELL, RANGER'S GROUNDS.

or watered too heavily; indeed, it seems probable that a combination of these two is the reason for the failure, having caused the seed to rot. Do not throw the seed-pan away yet, however, for you may get a few plants out of it yet.

Isolepis gracilis.—*E. Seville*: You may readily multiply this pretty edging plant by splitting it up into pieces. From your large plants in 5-in. pots you should easily get four good pieces, each of which will be quite large enough. Pot the divisions up into 3-in. pots, using rather light soil and draining the pots fairly well. If you have a warm house or pit, place the divisions in it for a week or two to give them a start; after that, they will be ready for the conservatory.

Lifting Tulips.—*C. T.*: When the stalk of the Tulips can be bent without breaking, the plants may safely be lifted. They should then be laid in ashes to finish ripening.

Plants for hanging Pots.—*Enquirer*: There is quite a number of plants that you can have in small suspended pots in your greenhouse besides Ferns. Amongst variegated subjects there is nothing finer than *Sibthorpia europaea variegata*, and *Nepeta Glechoma variegata*, to which attention has lately been drawn in the Amateurs' page. The dwarf blue *Lohelias* are also very bright and showy, whilst the common yellow-musk *Mimulus moschatus*, and its large-flowered and exceedingly handsome variety, *M. m. Harrisonii* are both good. The chaste little *Campanulas*, *C. isophylla*, and *C. i. alba* have been so often alluded to that it is almost unnecessary to mention them again. *Thunbergia alata* and its varieties will also flower in your house if you raise them and grow them on to a good size in a gentle heat before consigning them to the cooler quarters. A rather uncommon plant, but one which makes a pretty subject for hanging pots is *Fuchsia procumbens*, and you ought to get it, as it is easy to grow, and may be propagated to any extent by cuttings.

Tomatos, Melons, and Cucumbers.—You evidently intend to have a mixture, *U.* We have frequently seen Melons and Cucumbers grown in the same house, but never the three together. However, you can but try. The Tomatos and Melons will need all the sun you can give them, and the Cucumbers like the shade, so as your house is a lean-to, plant the two first-named in the front bed, and the Cucumbers in the bed behind. We shall be glad to hear how the experiment succeeds.

enjoyment of the public. On two previous occasions we announced that the said grounds were to be opened; and in the interim extensive preparations have been made to put them in order for public enjoyment, the date of opening being selected in honour of the Queen's birthday.

In 1753, Philip, Earl of Chesterfield purchased the house now known as the Ranger's Lodge on the south side of Greenwich Park. Besides, the Earl of Chesterfield, other notable personages have lived in the house, including the Duke of Montagu, the Duchess of Brunswick, sister of George III., Prin-

REDOUT MADE BY H.R.H THE DUKE OF CONNAUGHT.

cess Sophia Matilda of Gloucester in 1816, Lord Haddo, afterwards Earl of Aberdeen, and Lord Wolseley, who was the last to live in it. Prince Arthur, afterwards and now Duke of Connaught, stayed at the Ranger's Lodge from 1862 to 1873 while pursuing his studies at Woolwich. The house and kitchen garden are to be let or sold, while the pleasure grounds, extending to some 13 acres of

away the bath was discovered underneath. On entering the old kitchen garden, which has been allowed to relapse into a wild state for many years past, we found it to be quite in the old English style, oblong in outline and surrounded with high brick walls. The vines in an old vinery still continue to flourish, but they have been tended by a caretaker. In the garden Forget-me-not (*Myosotis sylvatica*),

Pansies, *Impatiens Roylei*, and Thistles flourish side by side. The kitchen garden is not to be opened to the public, but will go with the Ranger's Lodge when it finds a tenant.

Immediately outside of the kitchen garden are some grand old trees, including *Pyrus Malus floribunda*, 25 ft. high, and profusely laden with blossom now falling; also *Quercus castaneaefolia*, 55 ft. high; a huge, spreading, and drooping Copper Beech, covering an area 63 ft. in diameter; numerous Hollies and Evergreen Oaks, all doing well; and a fine specimen of the Hornbeam, having a stout trunk and broad head. Old Lilacs in variety are now in full bloom. A well furnished specimen of the Snowy Medlar, 30 ft. high, was a grand sight till quite recently. The Walnut and Mulberry are represented by fine specimens, while there are giant Spanish Chestnuts. Every part of the Ranger's Grounds has a secluded appearance, still retaining the character of a pleasure ground belonging to a private establishment. The old Oak fencing has given place to neat iron railings, which, while excluding the fine herd of 100 deer, admit the public by cradle gates. Though only about six miles from London Bridge, the visitor, when inside these grounds, might imagine him or herself 50 or 100 miles from town. Walks have been made or re-made and gravelled, while the fine old turf is soft for the feet. The new entrance from Blackheath is through a beautifully designed wrought iron gate.

Greenwich Park, as a whole, has an area of over 200 acres, and in the matter of the natural scenery excels every other London park. Very little, if any, of it is really level, but undulated in every direction, so that strangers are continually finding themselves on a hill, or in a deep hollow, with sharply ascending or descending slopes. It is traversed in every direction by avenues, intersecting one another, of trees, of which by far the most dominant is the Spanish Chestnut in gigantic, patriarchal specimens, which must have braved the storms of hundreds of years. They certainly are one of the leading features of the park, and help largely to make it unique in or near London. Many of the trees are singularly thickened and bulb-like close to the ground line. Hundreds of them have immense boles with a girth of 12 ft., 16 ft., 22 ft., and 26 ft. There are several of them in the Ranger's Grounds, including one with an immense trunk, dividing into huge limbs about 10 ft. from the ground. Some of these we intend reproducing on a future occasion.

One avenue of moderate length consists of Horse Chestnuts now coming into bloom. Passing these, going in the direction of the Greenwich Observatory from the Ranger's Grounds, the visitor soon comes in sight of that world-famed pile of buildings and domes. On the way, some twenty-three tumuli or barrows are encountered, forming grassy mounds, supposed to be the burial place of Danes, by the side of an ancient highway now green and almost obliterated. The observatory stands on a mound from which one can look down upon the ancient village and Greenwich Palace where Queen Elizabeth lived, also the Naval College, and the Thames with its teeming life and shipping. The grand old river forms a sharp bend here, and appears to be flowing back in the direction from whence it came, the Isle of Dogs on the opposite shore forming the obstruction which diverts the waterway.

Proceeding in the direction of One Tree Hill also opened to the public on Saturday, Queen Elizabeth's Oak comes in view, an immense old bole that has been dead for the last twenty-three years, but being covered with Ivy is still green, it must be 800 to 1,000 years old, being headless, hollow, and probably as large in the time of good Queen Bess as now, for the interior is chipped smooth, the wall pierced to form a small window, and the floor furnished with wooden seats round the sides and conforming to the interior. Close by it is a young Oak, about 13½ ft. high, planted on the Diamond Jubilee day of her Majesty Queen Victoria. Not far off is a rustic fountain constructed of huge blocks of granite. On ascending the opposite side of the gully the grounds of One Tree Hill are entered. Seats are to be placed on a flat area, on the top from which magnificent views are obtainable in every direction, including the finest view of the observatory and river to be had. A little beyond is the steep slope known as the "rolling hill," down which children delight to roll. Some bare ground beneath high Elms in another direction is to be covered with

sand for the enjoyment of children, out of the way of danger from bicycles, machines, deer, &c. A new road down the hill to Greenwich Park station has been made by Mr. Webster in this locality.

Not far off is an enclosed area set apart as a nursery for the rearing of trees, shrubs, herbaceous plants, &c., for planting in the park. A greenhouse gives shelter to the Pelargoniums, Fuchsias, and other bedding plants intended for the park. Not far off is the paddock in which the deer bring forth their young in June and July, and in which they may be penned when occasion requires. The Blackheath avenue is bounded by a double row of noble trees, consisting largely of Spanish Chestnuts, Oaks, Elms, and Horse Chestnuts, the first named predominating. It was opened for carriage traffic only about twenty-three to twenty-four years ago, and is now much frequented by bicycles and vehicles of every description.

The ornamental grounds formerly known as the wilderness is a beautifully undulated area of the park which has been improved and planted by Mr. Webster, and opened to the public during the past year. The deer are excluded from this portion by a neat iron fence, owing to the fine plantations which everywhere abound. A lake or ornamental piece of water has been planted with Water Lilies, including the beautiful *Nymphaea alba rosea*. The Cape Pondweed is also established. Around the lake are plantations of Bamboos; pink and white Thorns; masses of double Gorse, now a blaze of orange-yellow; Mountain Ash, Almonds, *Olearia Haastii*, Magnolias, and other choice shrubs, all supplied from the nurseries of Messrs. James Veitch & Sons, Ltd., Chelsea. Specimens of almost every flowering and ornamental tree and shrub, grown by that firm, have been planted in suitable positions to determine which will succeed best. Masses of German Irises, Dornicums, and other herbaceous plants are now in full bloom.

On emerging from this pleasant spot we found many old gravel paths turfed down, and grass walks lined off and regularly mowed for the enjoyment of the public in fine weather. The trees used all to be surrounded, each one individually, by a circular fence, but those eyesores have now been obliterated, as unnecessary by the exclusion of the deer. The White Beam tree (*Pyrus*) scattered through the grounds is at present very effective. What was a gravel hole four months ago is now a rosery planted with a mass of wild Roses. Lord Penzance's Sweet Briars have also been added to the collection. Rhododendrons, Portugal Broom, and other fine shrubs surround the rosery. Turner's Hybrid Oak (*Quercus Turneri*) originated here through natural agencies, as well as at other places. It is a hybrid between *Q. Cerris* and *Q. Ilex*. Beds of Hyacinths and Tulips are out of keeping with this semi-wild and beautiful place, and are to be turfed down. A bandstand has been erected, the pitch of which was made under the instructions or advice of Mr. Dan Godfrey, and a chaste and highly ornamental fence is being placed around it. Music will be dispensed here on Sundays and Thursdays. The thousands of well-dressed people who flock here show how they appreciate this beautiful park, which, though very ancient, as indicated by the patriarchal trees alone, has been thoroughly adapted to modern requirements, the imprint of the present superintendent's hand being largely visible in almost every corner and retreat of it, but particularly in the recent additions.

BOUGAINVILLEA GLABRA.

As a climber for the roof of the stove or other warm house the value of *Bougainvillea glabra* is well known to British gardeners. Rightly or wrongly the idea is held, however, that the plants will not flower in a young state, and hence we rarely see them treated as pot subjects, excepting in the case of large balloon-shaped specimens. A recent issue of *The Florists' Exchange* gives an illustration of a houseful of *Bougainvilleas* supposed to be *B. glabra*, growing in 4-in. and 5-in. pots, every plant being full of bloom. It is even stated that the plants will flower in 2½-in pots. If this be true here is a wrinkle for English growers, unless the plant be not really *B. glabra*, in which case the sooner the variety or species becomes known to British horticulture the better.

HARDY HERBACEOUS PLANTS.

THE rains of the early part of May have already worked a wondrous change in all our hardy plants. They had been having but a poor time of it through April for the rains that ought to have come did not, and what with bright sun in the day and cold nights, growth was necessarily slow and attended with some danger. They have made up for lost time, however, during the last fortnight, growth having been remarkably rapid.

Arabis albida.—There are not wanting people who decry planting showy subjects in large masses as productive of a vulgarly garnish effect, but for all that the practice has something to recommend it. The easiness with which *Arabis albida* may be propagated either by cuttings, root division, or seed, and the fact that it will grow and flower on dry banks where many other less common and more particular things would not, should induce us not to lose sight of it in making spring bedding arrangements. A good sized clump or collection of clumps in the rock-garden are moreover not to be despised.

Claytonia sibirica.—The genus *Claytonia* does not bulk largely in hardy plant collections, but *C. sibirica* is well worthy of notice as a good plant for growing in the shade. It forms rather dense tufts or clumps, and the shining green, succulent leaves are not without a charm of their own. The flowers are produced with fair freedom in racemes, and are individually about half-an-inch in diameter, and bright rose in colour. They have a pretty star-shaped appearance owing to the fact that each of the petals is deeply bifid.

Stylophorum diphyllum.—This showy member of Papaveraceae is just now in capital condition. At first sight the plant looks like a glorified form of *Chelidonium majus*, for the foliage and habit favour the latter subject a good deal. There is no mistaking the bright yellow flowers, however, for they are fully three or four times as large as those of the *Chelidonium*. There is no more easily suited subject than that under notice for it will grow almost anywhere, and in almost any soil. It appears, however, to be partial to a shady position, for comparing some plants lately that were growing in the shade with those that were in the open the former appeared to have larger and finer flowers than the latter. The height of the plant varies from 1 ft. to 18 in. and the habit is naturally bushy and tufted, although when the shade is too close it is apt to exceed this height and to take on a rather more straggling appearance; but this is only what might be expected. It commences to flower before the spring has very far advanced and continues to bloom throughout the whole of the summer, so that it has a fairly lengthy flowering season. *S. diphyllum* is a native of North-Western America, and made its appearance in this country about the year 1854. It is occasionally met with under the name of *S. ohioense*, and has also been placed by some botanists in the genus *Chelidonium*.

Azalea procumbens is the name generally given in gardens to this pretty, but small, trailing, evergreen shrub, although it would be more correctly called *Loiseleuria procumbens*, in commemoration of the French botanist Loiseleur des Longchamps who lived in the early part of the present century. Other names have not been wanting, moreover, for it has been placed in both the genera *Chamaecistus* and *Chamaeledon*. At this time of the year the plant is fully as beautiful as during its flowering time in July for the tips of the young growths are prettily suffused with pink, and have a charm and elegance peculiarly their own. The most suitable soil is a rather sandy peat, and excellent results are obtained by treating it as an undergrowth plant in conjunction with other taller-growing things that also like a peaty soil. If a position is assigned it in the rock garden the soil should be well drained and a close watch should be kept upon it, for from its very diminutiveness it is apt to be lost sight of.

Adonis pyrenaica.—There is quite a number of pretty subjects in flower just now, but none of them has more claims upon the attention of the hardy plant grower than this *Adonis*, for both foliage and flowers are handsome, and either of them alone would be sufficient justification for its inclusion amongst all collections. The large bright yellow flowers are produced over a considerable time, and with the much-divided, light green foliage give a pretty effect. The rains seem to have given unusual lustre to the flowers, and the

foliage is all the better for having some of the April dust cleansed from it. As the specific name suggests *A. pyrenaica* is a native of the Pyrenees, from whence it was brought to this country as far back as the year 1817. With Messrs. Barr & Sons, at Long Ditton, it grows very vigorously, but it is most in evidence in protected parts of the nursery where, in addition to protection from cold winds and frosts, a light shade has been afforded it through the day.—*Plant Lover*.

NOTICES OF BOOKS.

BRITISH ORCHIDS: containing an exhaustive description of each species and variety. By A. D. Wehster, Author of *Hardy Ornamental Flowering Trees and Shrubs*, *Hardy Coniferous Trees*, *Practical Forestry*, &c. Second and Enlarged Edition, Illustrated. London: J. S. Virtue & Co., Limited, 26, Ivy Lane, Paternoster Row, E.C. 1898. Price 5s.

In response to repeated inquiries after "British Orchids," the author has been induced to prepare a second edition of his book, which now extends to 128 pages of large octavo size, exclusive of a good general index, index of illustrations, and a table of contents. Except, perhaps, in the case of British Ferns, it rarely occurs that a single family of British plants is accorded the honour of a book entirely devoted to its interests. The author rather pleads the poverty of the British Isles in Orchids, which number only forty species, or slightly over, by comparing them with the 300 or more which are native of Java, though Great Britain is fully $2\frac{1}{2}$ times as large as that East Indian island. Nevertheless, the British Orchids are all interesting, some of them particularly so, and several of them are really handsome.

There are twenty-two chapters in the book, sixteen of which are devoted to as many genera, by which the family is represented in our flora. The first chapter is devoted to a general review of the Orchid family; the second to classification; and the last four to cultivation, fertilisation, enemies, and distribution. These odd chapters deal with the science and practice of the subject, and are therefore fraught with interest to many, particularly since the remarkable methods of fertilisation peculiar to several of them were studied by Darwin and others. Many gardeners would like to cultivate British Orchids, but few of them have been so successful as Mr. Wehster evidently has been, for he here gives the results of his own experience and practice. He makes no attempt to laud his own successes, however, but frankly acknowledges the successes of many cultivators from the time of Gerard in 1597, to the present day, including several enthusiasts still alive and amongst us. It may interest would-be cultivators to know that British Orchids may be removed from their native wilds at any period of their growth even when in full bloom; but he warned his readers to lift the plants most carefully so that neither tubers nor roots may in the least be damaged. We have seen most flagrant cases of carelessness in this respect, and short of nailing or sewing the broken pieces together, the transplanters could scarcely have treated the plants with less regard to their chances of survival. For many years Mr. Wehster cultivated nearly every British species, though as far as we see he does not state the locality where this was done. "No doubt soil and situation require careful consideration in the cultivation of British Orchids," he states, and in this we quite agree. It reminds us of what Emerson said of the sparrow:—

"I thought the sparrow's note from heaven,
Singing at dawn on the alder hough;
I brought him home, in his nest, at even;
He sings the song, but it cheers not now,
For I did not bring home the river and sky;—
He sang to my ear,—they sang to my eye."

We note with satisfaction, however, that Mr. Wehster, although he imitated nature to the extent of using limestone blocks or boulders for those requiring chalk or lime, and elevated some portions of his bed for those that affect dry situations, he did not follow her slavishly. Instances occur in other families of plants, where the cultivator reaps a larger measure of success by adopting methods of his own, and this is what the author advocates as a result of his own experience. Some would-be cultivators are impressed with the idea that most of the British Orchids require lime or chalk if success is to

be assured. We have seen such species as *Orchis maculata*, *O. latifolia*, *O. carnea*, *O. mascula*, *Habenaria hifolia*, and others making a more rampant growth and producing finer spikes of bloom in heavy clay soil, overlying the old red sandstone formation, in the alluvium of river beds, and in the peaty soils of woods, than we have yet noted upon the chalk.

The sixteen chapters devoted to the descriptions of species, their distribution, and hints upon the culture recommended for individual species, are full of interest. Under *Goodyera repens* we note that slugs are their dread enemies which will eat the plants bit by bit close back to the roots. Cultivators of exotic species often relate, with real sorrow, their experiences in this respect; a perusal of the book also shows how nearly several of the British species have been exterminated by various causes, and the preventable ones are most to be regretted and deplored. The interesting discussion upon the evicted Orchid of Ireland in 1886, does not escape the author's notice, but receives a due share of attention. We refer to *Spiranthes romanoviana*, which has been destroyed in one of the few localities in which it existed in Ireland, by the draining of the land, which was planted with Potatoes in one spot, and sown with Oats in another. Such is the fate of other British plants. *Cypripedium Calceolus*, and *Epipogium Gmelini* are also on the verge of extinction. Very interesting are *Malaxis paludosa* and *Liparis Loeselii*, the only British species having a tendency to be epiphytal. There are illustrations of many of the species scattered throughout the book, which every lover of this interesting family should possess.

THE YELLOW SPORTS OF CHRYS- ANTHEMUM MME. CARNOT.

IN the fifth line from the bottom of the paragraph, "Yellow Sport, &c." page 583, the words "He also said," is an error. Did I put that? [The words had some marks which we took for inverted commas, and thought they were meant for a quotation. Hence our alterations, which we admit. ED.] I meant it was myself who did not know the conditions of the schedule, because Mr. Mease's man called it Yellow Mme. Carnot. I said this is not Yellow Mme. Carnot (G. J. Warren); I should label it Primrose Mme. Carnot, which he did. That caused the hother; for the schedule said they must be varieties already in commerce, and Primrose Mme. Carnot was not in commerce; hence the hother. It was quite innocently done, and I am sure Mr. Mease would not have done it in contradiction to the rules had he known it was distinct from G. J. Warren. Mr. Mease's man had plenty of spare blooms with him, so that he was not pushed at all.—*W. Wells*.

THE sport which originated at Balcombe Place Gardens, Sussex, is certainly getting it hot—Ah! poor G. J. Warren. When anything is affected with heat or jaundice, many pin great faith in water as a cooler and cure, selecting some of the wells or other that abound in the land. But apart from this it does seem strange that such an excellent cultivator as Mr. Wells should have to cross such a high expanse of water before he could detect any difference in the shades of Warren and Mrs. Mease. Perhaps it was the salt that exerted its bleaching influence upon the petals. But, no, Mr. Beckett, the judge himself says he has grown the bloom in question as pale in colour, which was identical with the blooms staged at the Aquarium by Mr. Mease as Yellow Mme. Carnot.

Nay, it seems probable that Mr. Mease has had a leak sprung upon him prematurely; for he instructed his assistant to name it Yellow Mme. Carnot, and this, coupled with Mr. Wells' defiance of anyone detecting any difference, excepting in colour, leaves us in doubt as to Mrs. Mease having a long lease of separate existence. The names of *Chrysanthemums* and synonyms are legion and bewildering. They land our judges between the horns of dilemmas, and promote discussions upon things infinitesimally small. For it is almost needless to say that the transfusion of the pigments in the colourations of flowers can be altered slightly by placing them more or less in light and shade.—*B. L.*

Pineapples at the rate of 10,000 a week throughout the year are imported into London.

MIRAMAR, EXMOUTH.

THE seat of J. Gordon, Esq., is just now very interesting. The grounds are full of spring flowers of the usual class as well as many of the rarer forms. Being situated not far from the coast on well elevated land, and having a light sandy soil, it is surprising how early and free many things come on compared with others but a short distance away, where the soil is heavy and winds at times strong and keen. In one quarter I noticed on the carefully-kept grass plot a number of pyramid Apple and Pear trees, some 6 ft. high, full of fruiting spurs, perfect in form, and remarkable for vigour and cleanness. The Pears were mostly gone out of flower, and were setting well with fruit. The Apples were gay with their blossoms, which were large, intense in colour, and most attractive. Really, to see a lot such as these was a pleasant surprise, for though not quite in the pleasure grounds, they were still apart from the kitchen garden, in a well-kept portion with clipped hedge, well-mown grass, and neat square or diamond-shaped spaces about the trees, which would doubtless have a good mulching as the fruits swell and call for greater support.

Passing into the Vineries, I was again much pleased. The clean rods, many jointed, had produced stout growth, and leathery leaves; and the abundance of fine bunches now in flower or just setting, gave evidence of good attention on the part of Mr. Ide, who planted these some eighteen years ago; and leads one to expect a good display on the exhibition hoards next autumn, as has been the case in previous years. In the Orchid houses I noticed *Cattleya lawrenceana* with seven spikes of its bright, showy blooms; *C. Mossiae* and *C. Mendelii* in various shades, *C. amethystoglossa*, *C. intermedia*, &c. *Laelia purpurata*, *L. tenebrosa*, &c., were just coming on; *Dendrobiums* mostly over, but *D. dixanthum*, seldom seen, was gay with bright yellow blooms on its long, tapering bulbs. *Maxillaria Turnerii* was a mass of flower, and *Epidendrum rhizophorum* was gay with its scarlet and orange blossoms. *Vanda tricolor*, with six spikes, was also very creditable, and *V. t. Patersonii*, with two spikes of its highly-coloured and densely-spotted flowers, called up memories of shows at Manchester in days gone by. *Cypripediums* were very numerous and gay, a very fine form of *C. exul* striking the eye immediately on entering. *Cymbidium eburneum*, *Cattleya citrina* on blocks, and many others deserve mention; but these will give a slight idea of some of the good things grown here.—*W. Swan, Exmouth*.

BARE SPACES UNDER TREES.

I HAVE frequently noticed in otherwise well-kept gardens large bare spaces under trees where this condition of things prevails in conspicuous positions. The aspect of affairs is highly unsatisfactory; and although the choice of plants suitable for the clothing of these barren spots is a rather restricted one, what few things there are available for the purpose are well adapted for planting in the positions indicated. The foremost plant is the Ivy, and where large spaces are sought to be covered chiefly by it, the great variety of foliage both as respects form and colour embraced among the many varieties, which are now obtainable at a moderate cost, should lead those who are about to carry out work of this kind to plant as a groundwork the ordinary Irish Ivy. Either brick hurrs or the hutt of the roots of trees may be scattered about and plants of either variegated or distinct foliage varieties trained over them.

Ivy is not one of the quickest things in establishing itself, especially under the condition of things I am here contemplating, where the soil will be in an exhausted condition and permeated with roots. A good dressing of fresh soil should be spread on, say from three to four inches, more if available will be better, having first broken up the old soil. This will give whatever is planted a good start, whether Ivy or the few other things we are about to specify, which afterwards will be well able to take care of themselves.

The creeping rooted St. John's Wort, *Hypericum calycinum*, is possibly next to Ivy the best plant we have to grow under the shade of trees, and when established will require but little attention beyond cutting back the old growths occasionally. We have seen it flowering well under these conditions,

although, when planted on the banks of a running stream the flowers and growth are much finer. Another good plant is *Euonymus radicans variegata*, of which we learnt to our cost the rabbits are very partial to, so that wherever these rodents have access it is inadmissible, for they eat it off faster than it grows. The sweet Woodruff (*Asperula odorata*) has a good effect under the shade of smaller growing trees and shrubs. Where the space to be covered is of only limited area, we have often when passing patches of this after a warm shower been at a loss, till we discovered its presence, to think where the smell of new made hay was coming from. When in flower it is one of the prettiest white flowers imaginable.

Then there are again the Vincas, the large common one (*V. major*), being the best. Of this there is a beautiful golden margined variety. The type will grow anywhere and in almost anything; but about the end of the present month they are apt to get a bit shabby. If so, cut them over and they speedily furnish the ground again. *Vinca minor*, and its silvery variegated form are also available; but it takes more time to cover the ground with them. To give variety in foliage plant among these spreading plants a few clumps of the Male Fern (*Lastrea Filix-Mas*), and the sword fern (*Polystichum angulare*). The first being quite deciduous will have to be cut over in the autumn. As the Ivy grows it must be prevented, by cutting it back at intervals, from climbing too far up the trees. I have found the young strands of Ivy of a year or two's growth much admired when used for decorating church pillars on festive occasions.—*W. B. G.*

GARDENING FOR CHILDREN.

It has often occurred to me as to whether we are giving that encouragement to the younger portion of the community we ought to do in gardening. It must be clear to all thoughtful and observing minds that if you want a profession or art to develop and extend then one of the best methods is to encourage the rising portion of the community, as it is far more easy to bring these to new ideas than those of more ripened years.

This is most forcibly seen in the encouragement that is given in schools, &c., with a view to develop and bring out the ideas and powers of the young. I am aware much is done in industrial schools and elsewhere in the way of teaching them horticulture, but this does not apply to our village life. It may be said here they have an opportunity of learning it in their own parents gardens. True, but children want encouragement as well as grown-up people.

There is now a very large number of villages, &c., that have their cottage flower shows to encourage the love and produce of the garden by the cottager and amateur, and I am glad to say they have done noble work in many places. But what have these societies done to encourage the young? I say absolutely nothing to speak of. Some may say that we give prizes to children for collections of wild flowers, &c. This is true, but how can this be looked on as help towards cultivating a garden? Often, as I look on these when I am judging them at these country shows, I am apt to think they do more harm than good, seeing that they encourage these children to rob the hedgerows, &c., of much beauty to bring to shows to answer no good end. I am very doubtful if the collecting of these wild flowers has more than one end, namely, that of obtaining the prize.

If our flower shows are to do the work they have done in the past, in what way could they advance the cause better than by giving prizes to the young for material cultivated by themselves?

To illustrate my idea, what could encourage them better than by offering three prizes, for, say, three or four plants of any kind grown in pots? Or again for the best produce of any kind in the way of vegetables? If something as a change is wanted prizes might be offered for a bunch of cut flowers obtained from plants grown by the exhibitor. Another way of stimulating the young is to offer prizes for a given piece of ground which has the best vegetables growing on it and to be cultivated by the one competing.

Some may say they doubt whether many of these may be obtained honourably. Be this as it may, I have quite as much faith in children's honourableness as in those of more ripened years in such matters. Why could not the Gardeners' Mutual

Improvement Societies adopt something of the kind for their younger members?

I note the mutual society at Sherborne does this at their annual exhibition, and it is gratifying to see that Chard Flower and Fruit Society has adopted the idea by offering prizes for three pot plants grown by children under fourteen years of age. This is the way to infuse a love into, and to extend the art of gardening in the future.—*J. Crook.*

THE WORKING VALUE OF FUELS.

IN some experiments carried on at the New York State Veterinary College it was found that the heat lost by ventilation was 39 per cent. of the whole, and my attention has been called to the fact that these figures, which may be taken as correct, differ seriously from those given in my book on the "Commercial Uses of Coal Gas," where the amount lost in Messrs. Walker's bottling stores is given as varying from 22½ to 25 per cent. The explanation is simple—the minimum ventilation required in living rooms is 500 cubic ft. of air per hour for each adult; in bottling stores only a fraction of this is required, in fact, no provision whatever is made for ventilation, and all which takes place occurs from leakages and the constant opening of doors for the passage of trucks and barrels. The figures given by me are clearly stated as being observed results in practice in bottling stores only. I had no opportunity before the book was published of making exact experiments in living rooms, these being very difficult, if not impossible, under ordinary conditions in any house, the speed of the air currents in the flues varying almost from minute to minute.

Recent experiments in rooms where the ventilation is controlled and can be measured have established a rule which may be safely relied on for every practical purpose. The accepted standard is the British Thermal unit, *i.e.*, the amount of heat necessary to raise the temperature of one pound of water one degree Fahrenheit, and one unit is required per hour for each degree rise of temperature over the outside for each square ft. of glass, or for every 4 square ft. of exposed wall, and two-thirds more for the loss of heat by ventilation in ordinary living rooms. The loss of heat in living rooms is an unknown quantity, as it varies in every room, and in the same room from hour to hour, but taking the theoretical value of coal gas at 660 British Thermal units per cubic ft., that of coal 13,000 units per lb., and of coke 10,000 units per lb., it becomes easy to calculate the effective value, and the loss of heat in different systems.

A flueless gas stove may be taken as the highest type of efficiency, and using this 1 cubic ft. of gas per hour will be required for every 660 square ft. of glass or every 2,680 square ft. of exposed wall, for every one degree rise of temperature over the outside, and, in addition to this, two-thirds of cubic ft. for loss by ventilation. Taking a room 22 ft. square and 10 ft. high, with all walls exposed, 2 cubic ft. of gas per hour will maintain a rise of three degrees over the outside, allowing for the average window surface.

The exact figures for warm air stoves with flues, and for open fires, are not available, and perhaps not possible, but for average practice, it may be taken that nearly one-half the total heat is lost in a warm air stove with a flue, and two-thirds with an open fire. This can hardly be considered as all loss, as the ventilation necessary for comfort and health cannot be always obtained without some assistance, and the so-called loss may be partly taken as useful work done. The whole subject is beset with variations and difficulties, and any standard can be proved to be seriously wrong in individual cases, but the figures given may be taken for average work. It must be clearly understood that the figures given are for maintaining the heat, not for raising the temperature of any room quickly, for which a much larger fuel consumption is required.

HEATING PLANT HOUSES.

These figures work out in practice in greenhouse heating, where steady temperatures are required, night and day, and the loss from any system of boilers or stoves, can be readily calculated, a matter of interest to nurserymen whose fuel consumption is a question of vital importance. The loss in most forms of boilers is enormous, and the subject needs careful consideration. For this purpose the calculation is exceedingly simple, on the basis of 10,000 units per lb. of coke. One pound of coke burnt per

hour will give a rise of 10 degrees for every 1,000 sq. ft. of glass, or 4,000 sq. ft. of exposed wall, not allowing for loss by ventilation. For this one-half more fuel must be allowed; this gives us the maximum possible duty, and a comparison with the fuel burnt gives the waste.

Where the fuel heat is not utilised, there is no doubt that at least 50 to 60 per cent. of the fuel is completely wasted in most of the systems at present in use, and the value of the fuel is not considered as it should be. In my own case, with a Chatsworth boiler, burning gas coke, and heating a range of houses 45 x 30 ft., one-half of which is kept at a tropical temperature, the flue heat not being used, the calculated consumption is 8 lbs. per hour by theory, allowing one-eighth loss for wind, as the houses are on high ground, and rather exposed (this wind allowance will vary in different districts). The actual winter average is 11½ lbs. per hour, showing a waste of 31½ per cent., nearly one-third of the fuel; this being with a first-class boiler, clean, well set, carefully fired, and of the correct size for its work. It is doubtful if better results could be obtained in practice under any ordinary conditions.

The following rule may be taken as a guide for coke-fired greenhouse boilers:—

For every 1,000 sq. ft. of glass, and for every 4,000 sq. ft. of exposed wall, for each 10° rise of temperature over the outside.

Loss through glass and walls 16 ozs. per hour.

„ by ventilation 8 ozs. „ „

„ „ wind (average) .. 3 ozs. „ „

„ „ boiler and flue .. 13 ozs. „ „

Total 2½ lbs.

Three-fourths of the flue loss can be recovered by taking these under the beds in the houses. Any fuel consumption over this may be taken as waste which can be prevented.—*Thos. Fletcher, F.C.S.*

INTERESTING PLANTS.

THE third of the series of botanical and horticultural demonstrations that has been arranged by the Royal Horticultural Society to be given during the year by Professor Henslow attracted a capital audience on the 10th inst. Philip Crowley, Esq., occupied the chair.

In his opening remarks the lecturer dealt with Alpine plants generally—such plants as are found in the Arctic and Antarctic regions, and in high altitudes on the rest of the earth's surface. He said that three things were to be noticed about them:—first, they were much dwarfer than other plants; secondly, the flowers were more abundant; and thirdly, more brilliant than those plants in lower altitudes. Some families, such as the Primulaceae, stood out conspicuously in the Alpine floras. *Primula Auricula* was mentioned as one of the most notable plants of this order. The modern race of *Auriculas* was probably derived from several species, but the exact parentage of the race was unknown. He pointed out that whereas the old *Primula Auricula* had the normal number of petals—five—the modern forms had seven or eight, the increase being due to the stimulus of cultivation, the increased nutriment given the plant by the cultivator inducing the change, which had now become permanent. Dr. Weissman believed that no acquired characters were hereditary, but he disagreed with this, and the *Auricula* supported his own views that acquired characters might be reproduced in the progeny. The professor contrasted some of the magnificent yellow-flowered forms sent to that day's show by Mr. David Storrie with the refined Alpine varieties submitted by Mr. Douglas, the latter representing the florists' ideal of refinement. Other plants, such as *Primula involucrata*, *P. Sieboldii*, and *P. farinosa*, were mentioned, the latter being found in Cumberland and also close to the Straits of Magellan. The genus *Androsace*, belonging to the same order was also very largely Alpine. There were many *Saxifragas* too, such as *S. muscosa*, and *S. oppositifolia* amongst Alpine plants. It was held that the climatal conditions were the cause of the dwarfing, although the effects of climate were often exemplified in other ways. Thus plants which were not woolly in the lower altitudes tended to become woolly in the higher. *Gnaphalium Leontopodium*, the Edelweiss, was cited as a typical Alpine plant. The

Gentians were abundant in Alpine floras, in fact they were all Alpines with few exceptions including *Gentiana Pneumonanthe*, which was to be found in this country, at Swanage.

Professor Henslow then explained the theory that was accepted in order to account for the presence of Alpines in widely severed areas, possessing similar climates. He alluded to the idea that England was at one time part of the Continent, and that the glacial epoch covered the face of the Continent very far to the south with glaciers, and that as the glaciers retreated further north, and the temperature became higher the, then Alpine, plants in the plains retreated or were driven up the hills in search of the lower temperatures they loved. This accounted for the presence of these plants on our highest hills, and also for the destruction of the links that at one time joined them to their relatives in other parts of the world.

The *Medicagos* were the next plants that came in for discussion, allusion being made to the spirally twisted pod or fruit, characterising the genus, as different from the usual straight pod to be found in *Leguminosae*. There were several variations, however, from this curled pod, especially in *M. sativa*, where all gradations from nearly straight to curled were shown. In *M. falcata*, also, the pod was curved like a sickle. It had been suggested that the snail-like appearance of the pod had been adopted by the plant in order to delude certain birds who dashed the fruits about, and thus distributed the seeds.

Bougainvillea was next discussed, and the fact explained that the so-called "flower" was nothing more than three large showy bracts which enveloped the flower proper, which was quite inconspicuous.

Passing to the consideration of double flowers, the lecturer pointed out that a florist could not make a flower double, but must watch for and take advantage of the signs given by nature that she was willing to produce a double flower. The actual causes which produced doubling were not as yet understood. It might be the excess of nutriment; and in connection with this it had been stated that no plant with variegated leaves bore double flowers. *Kerria japonica*, curiously enough, was always single in Japan, but generally double in England. Double flowers of a certain plant were occasionally produced contemporaneously in several parts of the country. Thus there were no double *Primulas* until twenty years ago, when double flowers occurred at the same time over parts of Britain and the Continent. Mr. Engleheart had told him that day that, although they had been trying for years to get a double *Narcissus poeticus*, none had appeared until this year, when it had been forthcoming in three different places.

The different forms of the roots of *Radishes* were finally dealt with. They were the progeny of *Raphanus Raphanistrum*, and of *D. maritimum*, the former probably a mere variety of the latter species. Pliny had much to say about *Radishes*, and amongst other things he stated that the Greeks had found out the way to turn the male *Radish* into the female—the long roots were thought to be the male, and the round ones the female. It had been found by Carrière that this change was quite possible, for he had planted the long ones on hard soil and had discovered that they had a tendency to shorten, and become round; similarly, when grown in soft, light soil, the round roots had a tendency to lengthen. This was only another instance of the adaptation of plants to their environments, and was evidence of the statement that everything in nature tends to become hereditary.

GARDENING MISCELLANY.

VIOLA TRUE BLUE.

IN spite of the influx of new varieties of *Violas* that has taken place of late years there are some of the older sorts that have held their ground successfully amongst the newcomers. Freedom and continuity of flowering are both alike indispensable for varieties that have to be employed for bedding purposes, and refinement of flower, however much we may admire it, and however high a place those varieties possessing it may rank in our estimation, has to take a

subordinate position to these two requisites. True Blue is a notable example of an old form holding its own against newer and more refined sorts. I know of nothing to touch it as a bedder, for the rich blue flowers are produced with almost prodigal profusion, and it is the best of its colour for bedding purposes. Seen in the mass the effect is rich in the extreme. Added to this floriferousness is a hardy and vigorous constitution, and what more do we want? Messrs. Barr & Sons have a nice stock of this variety at Long Ditton, where as it is grown side by side with other sorts its relative value may easily be gauged.—*Wandever.*

THE VARIEGATED CORNISH MONEYWORT.

VARIEGATED plants invariably receive a large meed of praise because they are, so to speak, always in character. Flowering plants, on the other hand, as a rule, are only presentable when the floral organs, for which they are grown, are in the best condition. Many flowering plants, as is well known, are not admissible for decoration nine or ten months out of the year; but with variegated ones this does not apply—they are always with us. The variegated *Cornish Moneywort* (*Sibthorpia europaea*) is not, perhaps, a case in point, as it is too small to create a great sensation in the horticultural world; but to those whose love for plants is not in direct ratio to their size the little plant in question is a gem of the first water. It is not quite so robust as the species, but it is far more elegant, its tiny, round, crenated, money-like leaves being beautifully variegated and produced in great profusion on slender, thread-like stems. It requires a cool and moist atmosphere, and does exceedingly well with Mr. A. Wright, Falkland Park Gardens, amongst the cool *Orchids*, both in pots and on the covered stages. It goes well with greenhouse *Ferns*, and can, therefore, be strongly recommended.—*C. B. G., Acton, W.*

WALLFLOWER HARPUR CREWE.

Those who take delight in good old fashioned flowers would do well to add this fine double yellow variety to their collections of hardy flowers. The plants live for many years provided we get no severe winters, when, of course, *Wallflowers* that have got tall are liable to get cut down. The entire loss of the variety can, however, be readily avoided by taking cuttings during summer or early autumn and inserting them in pots of sandy soil. The cuttings should be shaded somewhat from the glare of the sun during the hotter parts of the day, but not longer. A cold frame will be sufficient for this purpose, as well as for the preservation of the young plants during winter, along with other hardy or half hardy subjects. The stock of young plants may be put out about the end of March or the beginning of April according to the weather and latitude. The old plants may be allowed to remain till they get cut down by a severe winter. It will be safe, however, to keep a few cuttings in frames as a reserve every winter. The yellow, fully double, and delightfully fragrant flowers are produced in abundance. We noted old and young plants in the garden of Mr. William Goldring, of Kew, with whom the variety is a favourite.

BERBERIS STENOPHYLLA.

THIS hybrid *Barberry* was raised by crossing *B. Darwinii* with *B. empetrifolia*, the progeny being intermediate in habit and foliage. The lower leaves are long and narrow, while those on the flowering shoots are shorter, lanceolate or linear, and entire. The orange flowers are usually produced in great profusion, quite rivalling *B. Darwinii* in this respect as well as in vigour. The foliage is more sparsely arranged on the lower part of the stronger growing stems. No collection of *Barberries* can be complete without this handsome garden form; and pleasure grounds from which it is absent lack the presence of a decorative subject of first-class importance. The quantity of flowers, and their rich orange-yellow colour are only to be met with in *B. Darwinii* and *B. stenophylla*. The leaves are dark green, leathery, and equally as fine at mid-winter as at mid-summer. The last-named is perfectly hardy, and shows up well by contrast with deciduous subjects in winter. The flowers are succeeded by blue-black berries.

QUESTIONS AND ANSWERS.

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Tuberous Begonias.—*Box*: We were a little doubtful about the colours you were going to use, but were of opinion that you would be getting as many colours as your beds would allow. We were fully aware that the four colours coming so near each other in a geometrical design would be somewhat odd, but could not see how to get away from it with four colours to deal with; but since you are resolved to plant two of the beds with scarlet varieties, we see no objection to it. At the same time the other two should be planted with one colour to match, and the result would be a more perfectly balanced combination. If the tubers are small your best plan would be to put them in fairly thickly without carpeting. You require tubers two or three years old to make it worth while planting them widely with a carpet of other plants beneath them.

Dwarf Dahlias.—*Omega*: The best dwarf scarlet, white, and yellow *Dahlias* as far as we know are *Scarlet Globe*, *White Bedder*, and *Yellow Globe*. We do not understand, however, why you should desire dwarf *Dahlias* for cut flower purposes. They are excellent for bedding purposes, if the beds must be dwarf; but we consider them unsuitable for cut flowers because their short, stout stalks are stiff and ungainly when put in vases. We should prefer *Pompons* or *Cactus Dahlias* for cutting as they flower more freely, and if the latter are not too large, they hang gracefully. In the southern counties of England few of the varieties of these two types are very dwarf. A few dwarf ones have been raised but they never become popular, because they produce few flowers compared with those that grow more freely.

Plan of Bed.—*Bedding*: We take it for granted that the bed, of which you send the plan, is of moderate size. If a large one you ought to have a centre of something. On other occasions please state the width of the bed. *Iresine Wallsii* should answer perfectly in the lines you propose. *Pelargonium Robert Fish* would also suit for the six spaces marked No. 2. The two spaces marked No. 3 might be filled with *Pelargonium Lass o' Gowrie*; but you will have to stop some of the shoots to keep it from overtopping the other plants if it grows strongly. We think, however, that it would be an advantage to make it change places with *Pelargonium R. Fish*. The two spaces marked No. 4 might well be filled with *Begonia Vernon Compacta*. You have still two spaces unnumbered; let us mark them No. 5. By filling them with *Begonia Duchess of Edinburgh*, or some other pale variety belonging to the same fibrous-rooted strain, your design would be complete, and we think would look well. Your edging will answer.

Ladies and Orange Blossom.—*Omega*: No doubt there are several reasons why ladies are partial to *Orange Blossom*. The flowers possess considerable decorative value, and are sweet-scented, but the principal reason is one of association. The flowers have been used from time immemorial at weddings for decorating the bride, who would ever after, perhaps, cherish a fond remembrance of them and their use on her wedding day. The daughter catches up the infection from her mother, and so on. We can only imagine there are no ladies about the establishment, or they are plotting to keep you in the dark. That, of course, is their little game.

Leaves of Azalea.—*J. T. Thurston*: The leaves you sent have been injured by thrips, most likely during the dry weather last summer. These little black insects are particularly fond of *Azaleas*, and very mischievous. The plants require careful and constant attention so that the pest may be attacked whenever it makes its appearance. When this happens make a strong solution of soft soap, or *Gishurst Compound*, in water. Lay the plants on their sides on a board placed across the mouth of a large tub. Syringe the underside of the leaves vigorously with the solution, making sure that you thoroughly wet every leaf. The tub will catch the soapy water and enable you to give the plants another turn with the liquid. Wash with clean water an hour afterwards. A good syringing with clean water now and again during the summer months would help largely to keep away these and other insect pests.

Insects in Yineries.—*A. D.*: The larger of the two insects that can fly, was the perfect or fully developed stage of one of the skipjacks; but as you had decapitated the prisoner we shall not attempt to name the species. It does no harm in the winged state, but as a wireworm you probably know what it is capable of doing. By all means destroy every one you can lay hands on to prevent the females from laying their eggs. The small black beetle is evidently a woodborer, but the large pin had smashed it up. The brown, hard beetle that does not attempt to fly

is the Clay-coloured Weevil (*Otiorynchus picipes*), a destructive pest in vineries, Peach houses and in the open garden as well. Destroy every one of them you can find. We have no doubt this is the one that riddled the leaves of your Peaches with holes. Clear away all rubbish that would afford shelter to the weevil. Cement all the cracks and crevices in walls. Then lay down some short boards, slightly raised above the soil to act as traps, which should be examined every morning. You could also spread a white cloth on the ground under the trees attacked before leaving off work at 6 p.m. Go into the houses at night with a lantern; turn on the light upon the trees, giving the trees at the same time a sharp tap with the hand. The weevils will drop on the cloth and should be picked up and destroyed immediately. Persevere till you cannot find any more.

Pear Leaves Blistered.—*M. M'Laren*: The leaves sent are affected with what is known as Pear-leaf Blister, caused by a small mite named *Phytoptus Pyri*, which lives in the interior of the leaves producing the blisters. You cannot apply any remedy that would be effective; therefore, the best plan is to pull off all the blistered leaves and burn them to prevent the mite from going into the healthy leaves. The sooner you do this the better. Some may appear next spring, and you should serve them in the same way till you have mastered the pest.

Apple de Neige.—*M. M'Laren*: This is an older variety than Royal Snow, which was newly introduced to this country about the end of 1896, or the beginning of 1897, from Canada.

Shrub or Small Tree for Town.—*M. M'Laren*: Amongst those we have seen giving satisfaction under the conditions you name are the Hop Trefoil (*Ptelea trifoliata*), Lilac (*Syringa vulgaris*), the Bladder Senna (*Colutea arborescens*), the Lime (*Tilia vulgaris*), Caragana arborescens, Forsythia suspensa, the Flowering Currant (*Ribes sanguineum*), and the White Thorn (*Crataegus Oxyacantha*), and its varieties.

Vines Diseased.—*Holly Bush*: The Vine leaf you sent presents certainly a very curious appearance, and would seem to have been gnawed by weevils, such as the clay-coloured weevil (*Otiorynchus picipes*) or the black Vine weevil (*O. sulcatus*). For remedies see under "Insects in Vineries" above. Keep a sharp look out for weevils, that is, long snouted beetles. They appear to have been punctured in places and might have been injured by small mites when unfolding; but the leaf was too dried up to keep any if they had been there. Leaves with mites travel best with a little damp moss about them.

Nitric Acid at Rothamsted.—*John McEwan*: We can furnish you with the loss of nitrogen per acre in the drainage for nine months in 1895-6. The report was issued before the completion of the year, hence its incompleteness. It is reckoned as nitrogen, not nitric acid, and in lbs. per acre. From soil 5 ft. deep the loss was for September, 0.21; October, 2.00; November, 10.55; December, 4.04; January, 1.60; February, 0.20; March, 3.52; April, 0.14; and May, 0.04. From soil 3 ft. 4 ins. deep the loss of nitrogen per acre was, September, 0.27; October, 2.38; November, 10.84; December, 3.98; January, 1.46; February, 0.20; March, 2.94; April, 0.13; and May, 0.02. We can, if desired, give the losses for the twelve months each of 1893-4, and 1894-5; also the averages for eighteen years, &c.

Names of Plants.—*Wm. Keen*: Your plant is *Echium fastuosum*, one of the shrubby, Canary Island species of Viper's Bugloss.—*J. T. Thurston*: *Fuchsia procumbens*.—*Enquirer*: The green variety of *Arum maculatum*, by some botanists named *A. maculatum* var. *immaculatum*.—*Omega*: The red flower is the Red Campion (*Lychnis dioica*); the other is the English Bluebell (*Scilla nutans*).—*Constant Reader*: 1, is a species of *Bignonia* from the New World; 2, is a *Bauhinia*, which may not be a native of Egypt any more than the *Bignonia*. We do not recognise either species, and both are too unfamiliar to be named from leaves. If they were raised from seeds they may take a good many more years to flower in our climate, because we have too little sunshine, especially in winter. When they flower we should be pleased to find the names for you.—*A. C.*: 1, *Myosotis sylvatica*; 2, *Trollius asiaticus*; 3, *Berberis Darwinii*; 4, *Syringa persica*; 5, *Dendrobium chrysootoxum*.

NEW LARGE YELLOW TREE CARNATION.

"DUCHESS CONSUELO" (Dicksons).

Having secured the entire stock of this exquisite variety, we are now booking orders for plants for delivery in autumn at the prices noted below. "DUCHESS CONSUELO" is undoubtedly the finest yellow Tree Carnation yet introduced. The blooms, which are very freely produced, are as large as a Malmaison, reaching 5 in. in diameter, and are of a clear, soft, canary-yellow, petals large, and of great substance. The habit is all that can be desired, and it may be had in bloom all the year round.

ORCHIDS of the highest quality, every plant guaranteed true to name, from 2/6 each. Please send for free list.—P. McARTHUR, The London Nurseries, 4, Malda Vale, London W.

"Gardening is the purest of human pleasures, and the greatest retirement to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, MAY 28th, 1898.

TEMPLE SHOW OF 1898.—The eleventh great annual exhibition on the Thames Embankment, inaugurated by the Royal Horticultural Society, cannot on this occasion be described as larger than in any previous year, for it reached the impassable limit some years ago. The Inner Temple Gardens are of moderate extent, and the Benchers cannot allow any more tents or larger ones to be put up. There were 105 exhibitors, however, against 83 last year, which is evidence in itself of advancement. What falling away there may be in some directions is more than made up in another. The greater number of exhibitors means that some of the former ones have had their space reduced, so as to admit the extra 22. The staging ran to 12,000 sq. ft., but over three times this amount was applied for some time ago. The gangways under canvas were more extensive than the staging space; but this is always an absolute necessity at the Temple Shows, in order to accommodate the vast concourse of people which congregates during each of the three days to inspect a display which is difficult to realise without having seen it. If other evidence were needed of the growing popularity of the society and its general progress, it need only be mentioned that 325 fellows, and 2 associates have already joined it this year, with the prospect of a great many more before the end of the season, while 12 provincial societies have become affiliated with it. Various alterations were made in the arrangements of some of the tents to meet the differences in the nature of the exhibits, so that the show was by no means a repetition of last year.

The Orchids were not so numerous as we have seen them, but the deficiency in numbers was quite made up in the better quality of the useful and most decorative kinds—a tribute we should impute to the cultivator. Many regretted the absence of Baron Sir Henry Schroder, who does not exhibit every year; but the superb exhibit of the president, Sir Trevor Lawrence, Bart., was in its usual good form. The amateur element was further supported by fine exhibits from Earl Percy, Sir Frederick Wigan, Bart., W. Thompson, Esqr., Ludwig Mond, Esqr., H. S. Leon, Esqr., and others

who had smaller exhibits. There were many interesting Orchids, as may be seen by reference to our report, but the lions of the display were *Odontoglossums*, *Cattleya Mossiae*, *C. Mendelii*, *Laelia purpurata*, *Cypripediums*, *Oncidium ampliatum*, *O. marshallianum*, *Masdevallia Veitchi*, &c. Nurserymen exhibiting Orchids were represented by Messrs. Hugh Low & Co., F. Sander and Co., James Cypher, W. L. Lewis & Co., Charlesworth & Co., B. S. Williams & Son, and M. Linden, the latter with some others representing our Continental neighbours.

Foliage groups and flowering stove and greenhouse plants were more numerous, if anything, than on previous occasions, and in spite of the sunless nature of the past winter and spring, the exhibits were very creditable indeed. Evidence was not wanting that greater taste in arrangement was displayed by several of the exhibitors than last year, and they were certainly a long way ahead of their achievements at the earlier shows held in the Inner Temple Gardens. *Caladiums* were a strong feature in tent No. 5, the exhibits apparently getting larger and finer every year. Sunshine is necessary to bring out the brilliant colouring of these gorgeous, tropical, fine foliage subjects; but all things considered they would have been difficult to beat or even to match at any provincial or even Continental show. *Malmaison* and other *Carnations* were magnificent and more tastefully set up than ever we have seen them before. The new *Acalypha Sanderi* was the wonder and astonishment of all who saw it for the first time. The large groups of *Clematis*, *Roses*, *Gloxinias*, *Phyllocacti*, greenhouse plants in great variety, hardy herbaceous plants, rockeries of alpiners, and other exhibits made up a varied and magnificent assemblage of early summer and late spring flowers combined. Not the least important part of the show by any means were the fruit and vegetables, the latter being represented by *Peas*, *Cucumbers*, and *Tomatos* grown in pots as well as by gathered samples, besides many others making up some large exhibits. The fruit trees also attracted great attention on the part of visitors, and are always a source of profound interest to gardeners.

A substitute for silk is now prepared from wood-pulp, and is said to be so perfect as to deceive the most expert observers.

Poor Jobbing Gardener Again.—Gentleman: "Well, my man, what is that plant?" J. G.: "Why, that is an ample lobster, sir." (*Ampelopsis*).—*Patterson*.

A pair of *Tomtits* have built their nest in the letter-box attached to the workhouse at Uttoxeter, and the hen is now sitting on her eggs. She seems in no way disturbed by the dropping of letters in the box, which is going on constantly.

Leaf-cutter Bees.—Mr. Fred. Enoch, F.L.S., F.E.S., continues his story about British bees in the May number of *Knowledge*. Thirteen photographic illustrations of the leaf-cutter bees at their work of cell-building and the rearing of young, serve to give some idea of the marvellous ingenuity displayed by these carpenters of nature in the construction of their homes. There seems to be no scamping nor jerry building with these industrious workers, which carry on their work with remarkable precision without having served an apprenticeship. The interest which these bees would have for the gardener lies in their disfiguration of certain of his plants, but particularly *Roses*, the leaves of which soon become riddled with holes of two different forms, circular and oblong. The former are about as exact as a compass could make them. While the entomologist can not only look upon this sort of work with equanimity but with delight, the gardener is equally provoked to wrath at the disfigurement of and injury to his *Roses*.

Mr. R. Weller, F.R.H.S., who has been 11½ years at Glenstal Castle (4 years as head gardener, 5½ years as steward and gardener, and 2 years as steward to Sir C. Barrington, Bart.), has been appointed steward and gardener to Captain Green, Cretans-town, Newbridge, Co. Kildare, Ireland.

Mr. William Minty, after nine years' service with Mrs. Wood, Isle of Raasay, Kyle of Lochalsh, N.B., has been appointed head gardener to C. W. Dyson Perrins, Esq., Ardross Castle, Alness, Rosshire, N.B. We understand his predecessor at Ardross Castle Gardens, Mr. Massie, is retiring from the gardening profession after more than thirty years' service.

Frost in May.—A correspondent, writing from the modern Athens, says that the weather there has been very cold of late, last week having been especially bad. *Pelargoniums*, *Lobelias*, and *Pansies* have all been frosted and spoilt. *Potatos* have likewise been "nipped," and many fruit trees have had a rough time of it. This is much worse than our experience in the south, which, during the week in question, was anything but a pleasant one.

Field Mushrooms.—A trifle early as yet, you will say, to write anent these. My little boy of 5½ years brought in two very fine "*Agaricus Campestris*" on Sunday last, from the park. This is the earliest date I recollect seeing out-of-door Mushrooms, and it cannot be owing to any warm weather we have had this season; on the contrary, I do not remember having such cold days and nights during the month of May for some years past, and the only reason I can assign for it is the deluge of rain we have had during the present month, which amounts to 3.38 ins. up to Monday, the 23rd inst.—*J. M., Bicton, Devon*.

Saxifraga granulata.—One of the prettiest of wild plants on the banks of the Thames between Kew and Oxford, and on the meadows adjoining it in many localities, is this *Saxifraga*, which has larger flowers than many of the cherished exotic species. The stems grow about a foot in height or often under that, but are sufficiently tall at the time of flowering in May as to surmount the grass amongst which it grows. The double form is pretty frequent on rockeries and in collections of herbaceous plants, its flowers lasting longer than those of the single form. The specific name applies to the miniature tubers at the root by which the plant is perpetuated from year to year.

The Postmen's Park.—Arrangements have been proceeding for some time past for the purchase of a piece of land in the city of London, known as the Postmen's Park, much frequented by postmen during the dinner-hour and other leisure time. The vicar and churchwardens of St. Botolph, Aldersgate, have just purchased of the City Parochial Trustees the adjoining land in Little Britain, on condition that the western portion be handed over on June 24th on the payment of £6,000; and that the eastern portion be handed over on the payment of a further £6,000 if made within the next two years. By this arrangement the public garden will be enlarged and prevented from falling into the hands of the builder. £3,000 is still required to complete the second purchase.

Naturalisation of Flowering Plants.—A very interesting paper on this subject was read at the last meeting of the Irish Gardeners' Benefit Association, by Mr. J. A. Campbell, of St. Anne's. The essayist advocated the widespread planting of bulbs in all parts of the garden and grounds, wherever there was an opening. He referred to the broad acres of Mayo, Glencomb, near Tuam, as a happy example of the results produced by the naturalisation of suitable plants, amongst others of *Narcissi*, *Aquilegias*, *Antirrhinums*, *Geranium sanguineum*, and *Potentilla dubia*. At Dalkey, *Cineraria maritima*, *Valerians* and *Veronicas* grew freely on the cliffs, and added much to the beauty of the surroundings. In Trinity College Gardens, Dublin, *Daffodils* and other wild flowers abounded, especially in the grass. Straffan, the seat of Major Barton, was another example of the grand effects produced by the naturalising system. *Snowdrops* especially were freely employed at that place. Mr. Campbell also drew the attention of his audience to the saving of labour that might be affected by planting in wild or semi-wild surroundings, for once they were planted, many subjects were then able to look after themselves.

Kew Palace was opened to the public on Saturday last.

The Madder Plant (*Rubia tinctoria*) is cultivated in Hindustan, and furnishes the dye known as Turkey red.

Fruits of Bragging.—A man, having boasted a good deal, was asked if he had grown diatoms. Yes, he had, in a greenhouse, in 48's, and had flowered them as well, but had forgotten what the flower and foliage were like.—*Patterson*.

Greenwich Park.—The grounds lately attached to the Ranger's House, Greenwich Park, were thrown open to the public on Saturday last (21st inst.) in honour of the Queen's birthday. The welcome change which took place in the weather on that day was more encouraging to the people than it had been the two previous days. The site chosen for the opening ceremony was at the foot of a large tree in the centre of the grounds. The Vicar of Greenwich, at 12 o'clock noon, expressed thanks on behalf of the parish for this gracious gift of Her Majesty the Queen to the public.

Royal National Tulip Society.—The next exhibition of this society will be held at the Free Library, Middleton, near Manchester, on Whit Tuesday, May 31st, 1898. The exhibition will be open to the public from 1 p.m. until 8.30 p.m. The balance sheet for 1897 shows the society to be flourishing financially. The receipts totalled £43 9s., and the expenditure was £37 2s. 11d., thus leaving a balance to the credit of the society of £6 6s. 1d. This compares very favourably with the balance of 18s. 2d. carried over from 1896. Exhibition Tulips in many cases are still in perfection about London, so that they should be in their prime as far north as Manchester. The Hon. Secretary is James W. Bentley, Esq., Stakehill, Castleton, near Manchester.

Violet Culture in Germany.—A large quantity of Violets is grown in France, and we generally speak of our supplies coming from thence as if no other country on the Continent gave the matter any attention. It is evident, however, that Violet culture in Germany is an industry of no small importance. *Moller's Deutsche Gartner-Zeitung*, for the week ending Saturday, May 21st, devotes an entire issue to the consideration of the subject. The best Violets and their culture are dealt with, after which there follow articles on Violets as grown in private establishments and by nurserymen. The three newer varieties are Kaiser Frederick, Kronprinzessin Viktoria, and The California. A considerable number of other varieties are passed under review, some of which are well known in Britain. Illustrations of the Violet houses in several German nurseries show that this popular winter and spring flower is extensively grown under glass, planted out in beds and on benches, much after the style of the American method of growing many things. They are evidently grown to great perfection by several cultivators.

Border Auriculas.—There is no question but that these old fashioned border flowers have a great fascination for the general public. Independently of their beauty and their fragrance, they appeal to the lovers of spring flowers by many ties of early associations. Mr. A. Grigor, gardener to Alex. O. Gill, Esq., Fairfield, Aherdeen, sends us two boxes of cut flowers from the open border where they had been subjected to exceptionally cold weather and sleety showers for ten days or so previous to the time they were cut. The trusses had stout stems, 6 in. to 8 in. in length, and each truss in many cases consisted of 20 to 30 flowers, indicating remarkable vigour. As a rule, however, the flowers were less numerous and larger. Most of them belonged to the show class, as indicated by the ring of paste round the centre. Mr. Grigor's flowers were mostly very dark, ranging from purple to violet, crimson and maroon, sometimes nearly black. A few were coppery and others inclined towards yellow. Some were intermediate between the show and Alpine types, being edged, and a few of them were strictly Alpines. We should recommend Mr. Grigor to get more of the Alpine blood into his strain, or to get a packet of Alpine Auricula seed with the view of getting bright colours and golden centres if possible. As it is the strain is good for border Auriculas, but Alpines would add greatly to the value, the beauty and sprightliness of the whole.

William Ewart Gladstone.—Born at Liverpool on December 29th, 1809, and dying at Hawarden on May, 19th, 1898, the great statesman who has just passed away was in his eighty-ninth year. He entered Parliament at the age of twenty-three and served his country for nearly seventy years. The brilliancy of his Parliamentary career will never be forgotten; but amidst his incessant energy over a wide and varied field the domain of horticulture was not by any means beneath his notice, nor neglected by him. As a woodsman it is well known that he possessed great skill, and on occasion did not disdain to wield the axe himself. On many occasions he has delivered lengthy speeches to large and delighted audiences on the subject of horticulture and fruit-growing for jam-making and other commercial purposes, and no doubt a large number of his countrymen profited by his encouragement. The annual flower show at Hawarden was opened by him on many occasions, and his lengthy speeches on gardening and kindred matters were listened to with wrapt attention.

Royal Caledonian Horticultural Society.—At a meeting of the council held in Edinburgh on May 18th, the "Neill prize" was awarded to Mr. Thomas Lunt, gardener, Ardgowan. A fund was bequeathed to the society in 1851 by Mr. Patrick Fraser, LL.D., who had for many years acted as secretary, for the purpose of the interest being applied in furnishing a medal or other reward every second or third year to a distinguished Scottish botanist or cultivator. Part of the prize must be expended on plate or books bearing a suitable inscription. Amongst those to whom the prize has been awarded are the following: Mr. James McNab, Curator of the Royal Botanic Garden, Edinburgh; Professor Balfour, Edinburgh; William Thompson, gardener, Dalkeith Park; John Webster, gardener, Gordon Castle; David Thomson, gardener, Drumlanrig; Isaac Anderson Hendry, of Woodend; William Young, Assistant Secretary of Royal Caledonian Horticultural Society; Malcolm Dunn, Dalkeith Palace Gardens; Professor Bayley Balfour, Edinburgh; Alexander Kirk, Alloa; Robert Lindsay, late Curator Royal Botanic Garden, Edinburgh.

CALCEOLARIAS AT READING.

At the Portland Road Nurseries of Messrs. Sutton & Sons, Reading, a long, span-roofed house, in three divisions, is filled from end to end with Calceolarias in the full blaze of bloom. The seed was sown last June, so that the plants are scarcely twelve months old. They are grown in 10-in. pots, stood on fine river gravel from the bed of the Thames, spread over the corrugated iron benches. The plants are remarkably dwarf, say about 12 in. above the surface of the pots, and form spreading, flat-topped masses of bloom, entirely concealing the foliage, except at the base. The tall plants that were at one time grown here have been reduced in stature, and the flowers enlarged, so that the strain has now reached that state of perfection which makes it difficult to see where or in what direction they can be further improved. The flowers may be compared to great inflated boxing gloves, or large Strawberries of the flattened or compressed types. A few blooms are distinctly heart-shaped, being prolonged into a short, rounded point in front. They have entirely lost the old elongated and slipper form. On the whole, however, they are comparatively uniform in shape, but most diversified in colour, no two scarcely being exactly alike, except the self-coloured varieties.

The standard of merit from a packet of seed is so high that little attempt is made at naming varieties, except in the case of Cloth of Gold, a beautiful golden-yellow variety which has been perpetuated true from seed for many years. Like the rest of them, it is now dwarf, and the flowers enlarged. The mildness of the past winter, and the light, airy character of the frames and houses are conducive to this result. Being always near the glass, abundantly ventilated, and kept cool and moist by the wet gravel beneath them, and otherwise well attended to, have combined to produce the plants which visitors cannot but admire. No finer decorative plants could be placed in the conservatory at this season of the year; yet there is nothing to prevent any gardener from pursuing the same methods, and obtaining similar results, provided he has a suitable house of

the required dimensions for accommodating his plants after they have to be removed from the frames which sheltered them during summer and autumn.

To adequately describe the colours would be a difficult task, for they range from the darkest maroon-crimson to the lightest cream, the markings of the spotted sorts being intricate and hieroglyphical. Amongst the selfs are crimson, maroon-crimson, golden-yellow, soft yellow, and primrose, fading to creamy-white. A plum-coloured sort is shaded with rose in front. Many resemble pastry or confectionery, one type of the former being crimson above and citron beneath, as if it had a cap of chocolate. Others are blackish-crimson, crimson, and rosy-red with a few yellow spots. Bronzy or coppery varieties are thinly spotted with crimson. Very handsome are the crimson flowers marbled with gold, others akin to them being marbled with crimson and yellow in about equal proportions. The creamy-yellow and creamy-white sorts mottled with purple or crimson are also chastely pretty in their soft hues.

comparable to it in the wide domain of cultivated flowers, the work of nature having been developed or evolved in a way that redounds to the credit of the hybridist and cultivator.

TUBEROUS BEGONIAS.

THERE has been so much written respecting this charming and valuable class of plant that I always approach the subject with a certain amount of diffidence. The facts of the case respecting both the improvements effected among them and the magnitude to which the culture of them has attained are most startling. It seems but as yesterday that they were in their infancy, and now the little one has become a thousand. The leading nurserymen were proud to show a stock of a few hundreds, and now the stocks run up to hundreds of thousands. Messrs. Laing's nurseries are crammed with them just now, this year's seedlings being reckoned at a quarter of a million; and whilst the quantity grown is on the increase the quality still improves both as respects

ACALYPHA SANDERI (See p. 619).

Other golden grounds are marbled with golden-brown and maroon-crimson hieroglyphical markings. A most remarkable development of this occurs where the golden ground is marbled with massive blotches of hieroglyphical forms, in two shades of crimson, dark spots being studded over the lighter blotches. It is, perhaps, impossible to account for the peculiar form the markings take, but something akin to it occurs in certain species of Stanhopea. Other shades of colour are salmon mottled with crimson; salmon shaded pink-cerise, and spotted crimson; cerise and crimson, spotted with gold; and pinkish-heliotrope and cream. A great curiosity in its way is a tricolor with crimson, rose, and pink flakes on a yellow ground, recalling what occurs in the flaked and mottled flowers of the florists' types of Antirrhinum belonging to the same family as the Calceolaria. In the way of spotted, marbled, and variegated flowers nothing can match this class of plants for cool conservatory work. The quaint form of the inflated pouch or lip has nothing

size and form of flower. The advance made among the doubles places them in the first rank of decorative flowering plants, either in the conservatory or flower garden. As bedding plants they have a great future before them, making a great display of colour. The erect stemmed ones of dwarf habit should be selected for this purpose. I took particular notice of the following:—Duke of Fife, rosy salmon, very large double flowers, erect; Duchess of Northumberland, bright salmon, extra large flowers; Dr. Nansen, single, large salmon-scarlet; Britannia, single, golden bronze; Countess of Pembroke, single, charming pink; Lady E. Smith, single, cerise and white, very distinct; Lady Plowden, single, a superb white; Countess of Dudley, double, creamy white, fringed petals; Lady Dunsary, double, pink; Lady Amphyl, single, splendid salmon, fine habit; Mrs. Arnold, single, yellow, first rate; and Fringed White, single. Almost every shade of colour can now be obtained among Begonias except blue. At the same time I noticed one which is a near approach to purple.—W. B. G.

THE TEMPLE SHOW.

May 25th, 26th, 27th.

As we go to press on Wednesday, the gates have admitted the general public to one of the finest shows that has been held by the Royal Horticultural Society, in the Inner Temple Gardens. The morning was cloudy and dull, but mild and dry. As far as the plants were concerned it was an ideal day for a show, because there was nothing to make either the flowers or foliage fade. The public was coming inside in great crowds, all highly delighted with the display provided.

ORCHIDS.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, occupied his usual position in the big tent with a magnificent group of Orchids, profusely flowered. A large piece of *Cymbidium lowianum* occupied the centre and on either hand were masses of *Miltonia vexillaria* in various

Oncidium marshallianum had a most gorgeous effect. Amongst the numerous pieces of *Odontoglossum crispum* and its allies, as well as the pure white *Cattleya Skinneri alba* and *C. intermedia Parthenia*, there were bright bits of colour in *Miltonias*, *Cattleya lawrenceana*, *C. Mendelii*, *C. Mossiae*, *Aerides crispum*, *Warneri* and *Masdevallia Veitchi*. *Cypripedium callosum Sanderaae* was a pretty green veined variety. The miniature prodigy, *Eria extinc-toria* will not stay at home on the occasion of this show.

The Right Hon. Earl Percy (gardener, Mr. G. Wythes), Syon House, Brentford, had an extensive exhibit of Orchids, prominent amongst which were great masses of *Cypripedium barbatum grandiflorum*, *Laelia purpurata*, *Cattleya Mossiae* and *C. Mendelii*, all of which showed evidence of good cultivation. He also had choice hits of *Vanda teres*, *Laelia tenebrosa*, *Odontoglossum Edouardi*, *O. Reichenheimii*, *Coelogyne dayana*, *Oncidium*

the ground at the end of the stage. Amongst the Orchids were bold and massive clumps of *Laelia purpurata*, *Oncidium sarcodes*, *O. ampliatum majus*, *Odontoglossum crispum*, *O. luteo-purpureum*, *O. hystrix*, *Miltonia vexillaria*, *Cypripedium mastersianum* finely coloured, and others. Choice was the large plant of *Coelogyne dayana*, and *Cypripedium callosum Sanderaae*, *C. hellatulum album*, *C. concolor bellatulum*, a hybrid *Odontoglossum*, *Cattleya Wageneri*, *Maxillaria sandariana*, &c., equally so.

H. S. Leon, Esq. (gardener, Mr. A. Hislop), Bletchley Park, Bletchley, Bucks, staged a grand group of *Laelia purpurata*, *Cattleya lawrenceana*, *C. Mossiae* and *Odontoglossum crispum*. He had choice plants in a fine form of *Cattleya Skinneri oculata*, *Oncidium concolor superbum*, *Dendrobium nobile Bletchley Park var.*, &c.

Messrs. Charlesworth & Co., Heaton, Bradford, had a large and imposing display of *Oncidium ampliatum*, in huge panicles, *Odontoglossum crispum*, *O. Pescatorei*, *Masdevallia Veitchii*, *Miltonia vexillaria*, *Laelia purpurata*, and *Cattleya lawrenceana*, all of which were shown in massive, well-grown, and profusely flowered pieces. Interesting or new sorts were *Epilaelia Charlesworthii*, *Laelia elegans*, *Cattleya Ferdinand Denis*, *Laelia cinnabrosa*, and *Laeliocattleya Admiral Dewey*.

Messrs. B. S. Williams & Son, Upper Holloway, had a bold and showy display of *Cymbidium lowianum*, *Vanda suavis*, *V. tricolor*, *Miltonia vexillaria*, *Oncidium concolor*, *O. marshallianum*, *Miltonia vexillaria*, *Odontoglossum crispum*, *O. cirrhosum* and others. Amongst the interesting bits were *Laeliocattleya Latona*, *L. intermedio-flava*, *Pescatorea Lehmanni*, &c.

Ludwig Mond, Esq. (gardener, Mr. J. O. Clarke), 20, Avenue Road, Regents' Park, had a group of *Cymbidium lowianum*, *Oncidium ampliatum majus*, *Miltonia vexillaria*, *Cattleya Mossiae* and other showy subjects.

W. Thompson, Esq. (gardener, Mr. W. Stevens), Walton Grange, Stone, Staffs, had a small group of very choice *Odontoglossums*, including magnificent forms of *O. crispum thompsonianum*, *O. wilckeanum grandis*, *O. crispum Lily*, *O. c. Dorothy*, and other choice sorts. A special Cultural Award was accorded by the Orchid Committee.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, staged a large and very valuable group of Orchids, the leading features of which were *Laelia purpurata*, *Cattleya Mossiae*, *C. Mendelii*, *C. lawrenceana*, *Oncidium sphacelatum*, *O. ampliatum majus*, *O. tetracopis*, *Odontoglossum crispum*, and other species. New or choice things were *Laelia elegans Lowiae*, *Odontoglossum hybridum*, *O. crispum Dieudonné*, *O. c. W. E. Gladstone* (In Memoriam), *Cypripedium Gertrude Hollington* and several fine new *Cattleyas*.

M. A. Madoux exhibited a few choice *Odontoglossum* and *Cattleyas*, a choice one being *Odontoglossum charlisianum*, in the way of *O. rechfordianum*, (Award of Merit), *O. Trianaei*, with large spots on sepals. M. Chas. Vuylsteke had a plant of an artificially raised hybrid between *Odontoglossum crispum* and *harryanum*, fairly intermediate between the two. It gained a First-class Certificate.

Messrs. W. L. Lewis & Co., of Southgate, staged a good group which unfortunately did not show itself off to advantage, owing to the bad light in which they were situated. The background, consisting of some good *Laelia purpurata* and *L. p. russelliana*, *Oncidium ampliatum* adding relief to the prevailing colour, numerous *Odontoglossums* and *Cypripediums*. Of the latter, *C. Gertrude Hollington Southgate var.* was particularly fine, also *C. Evenor*. The rare *Epidendrum hastatum* is a gem with dark coloured segments and a pure white lip; the plant had seven flowers. A bright spot of colour was added to the group with *C. intermedia var. "Stanley Mohhs."* The sepals and petals are spotted with violet-purple, and the lip of a deep violet-purple.

CYPRIPEDIUM GERTRUDE HOLLINGTON SOUTHGATE VAR.—The first raised seedlings of this hybrid were obtained from *C. hellatulum*, crossed with the pollen of *C. ciliolare*. Since then the reverse cross has been made, so that there are really several varieties clustered round the more typical or first-named form. The variety under notice is the finest of all. Its distinguishing feature is that it has taken the *C. hellatulum* form with its fine dorsal sepal, and broad, massive petals heavily blotched with blackish-

CYPRIPEDIUM GERTRUDE HOLLINGTON SOUTHGATE VAR.

colours, likewise *Laelia purpurata*, *Cattleya Mossiae*, *C. Mendelii*, *Odontoglossum crispum*, and *Masdevallias*, all in a most pleasing variety of rich colours. Some of the finer things in this exhibit were *Cypripedium Olenus Burford* variety, *Schomburgkia tibeticus*, *Epiphronitis Veitchi*, *Macodes Petola*, *Epidendrum Randii*, *Cymbidium tigrinum*, and *Cypripedium grande atratum*, the latter being a superbly coloured variety. On a small table in front of the group were interesting gems such as *Aganisia caerulea*, *Habenaria rhodochila*, *Masdevallia obrieniana*, the Blue Dendrobe (*D. Victoriae Reginae*), *Renanthera imshootiana*, *Masdevallia Arminii*, *M. shuttryana Chamberlain's var.*, *Saccolabium miniatum*, *Microstylis macrchila*, and many others, making a very attractive exhibit.

Sir Frederick Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen, occupied the next space in the centre of the tent. Along the back row the long, drooping spikes of *Cymbidium lowianum* intermixed with masses of *Laelia purpurata* and

marshallianum, &c., making an imposing group of large size.

M. S. Cooke, Esq., Kingston Hill, Surrey, had a cheerful little group of *Odontoglossums*, *Brassias*, *Miltonia vexillaria*, *Laelia tenebrosa*, *Cattleya Acklandiae*, *Cymbidium lowianum*, and several *Masdevallias*.

Mr. James Cypher, Orchid grower, Cheltenham, had a large and imposing exhibit dominated by fine varieties of *Laelia purpurata*, *Oncidium marshallianum*, *Miltonia vexillaria*, and *Odontoglossum crispum*, beautifully tinted and spotted, and in great profusion. Very fine also were *Cattleya lawrenceana*, *C. Skinneri oculata*, *C. citrina*, *C. schilleriana*, *Dendrobium Dearei*, *Cypripedium rothschildianum*, *Oncidium Krameri*, *Epidendrum vitellinum majus*, and many other useful subjects. The plants were profusely flowered.

Messrs. F. Sander & Co., St. Alhans, occupied the end of the central staging on both sides with their Orchids, while their new plants were arranged on

crimson on a white ground. The flower measures 4 in. across the petals, which are $1\frac{1}{2}$ in. broad. The dorsal sepal measures 2 in. in width. The accompanying illustration will give an idea of this fine new variety, shown by Messrs. W. L. Lewis & Co.

Mr. Burkinshaw, of West Hill, Hesse, York, had three good plants in *Cypripedium rothschildianum*, *Cattleya Mossiae-Barkeri*, with white sepals and petals, and a slatey-blue lip, *C. Mendelii Ameliae* is a splendid white form, the only colour being a small blotch on the front portion of the lip. Award of Merit.

Some exceedingly fine things came from M. Jules-Hye-Leysen, of Ghent, including *Odontoglossum sceptrum*, *O. Vuylstekeanum*, *O. polyxanthum*, and a home-raised *O. wilckeanum*. The finest, however, was *Miltonia bleuana rosea gigantea*, with eight enormous flowers, and a singularly striated hybrid between *Cattleya lawrenciana* and *Laelia cinnabarina*.

Messrs. Linden, of Brussels, put up a large group of their spotted and otherwise distinguished *Odontoglossums*, principally *O. crispum* and *Pescatorei* the following being a few of the most striking:—*O. richardianum*, a prettily spotted one of the Andersoni section; *hunnwellianum superbum*; a bright *O. polyxanthum* named *expansum*. *O. crispum decorum* is a grand thing, with peculiarly incurved segments, with large, bright chestnut spots; *O. venustum* is a good variety of *O. rochfordianum*, and gained a First-class Certificate. *O. Pescatorei bellatulum* is a very pretty form, with triangular blotches on the sepals (Award of Merit); *O. crispum rubellum* has poorly shaped flowers, but handsomely blotched segments; *O. crispum zebrinum* is a very pretty flower, profusely spotted with chestnut (Award of Merit). There were numerous others, all of good quality, and varying degree of beauty. At one end was a grand batch of *Cypripedium lawrencianum*, and a splendid bit in flower of *Cypripedium gowerianum*.

CALADIUMS.

THE interest in this highly ornamental class of plants is still unabated, for Messrs. J. Veitch & Son, Ltd., Chelsea, surpassed all previous efforts in their grand display in the big tent. Their largest plants formed huge masses of gorgeous colours. They were grown in tubs and large pots so arranged that the public could get a good general view of them. Notably fine amongst the giants were Mrs. Harry Veitch, netted and heavily shaded with red on a white ground; Baron Adolphe de Rothschild, red with pink blotches; Mme. John Box, soft rosy-pink with dark veins; Raymond Lemonier, red, margined with greenish-yellow; Gaspard Crayer, with a red centre radiating along the course of the principal veins; George Berger, rosy-red with a broad pale border; *Candidum*, with slender green veins on white, and remarkably dwarf; Mme. Groult, shaded with red and netted with green on a white ground; *Williamsii*, soft rosy-red, edged green. New varieties, a size smaller, included *Pantia Ralli*, bronze, blotched with cream and pink; John Lovatt, crimson, with a broad green border; and Sir Julian Goldsmid, rich crimson, almost covering a paler ground, new last year, and one of the finest sorts. Of the same size and particularly choice were Louis A. Van Houtte, bronzy-red and dwarf; Noaksi, bronze and crimson veins; Marquis of Camden, pink and white, heavily veined with crimson; Silver Cloud, creamy-white, blotched green; Lord Derby, translucent pink, with green veins; Assurgay, rosy-pink, handsomely netted green; Comte de Germiny, dwarf, salmon-red; Sir Henry Irving, white, with broad green border; *Triomphe de Comte*, brilliant carmine and green netting; *Duchess de Montemarte*, white, with green blotches; and Mme. Pynaert, a magnificent crimson-red. The small plants round the front of the group included many of the finest in cultivation, and words can scarcely convey their subtle shades of colour. Some of them were Sir Oswald Mosley, crimson-claret; Princess Olga, bronzy-red; *Duchess of Teck*, red and gold; *Oriflamme*, red and green border; Mme. Schmidt, magenta-red; *Golden Queen*, self pea-green; *Lady Northcote*, dark bronzy-red, and one of the best; *Lady Mosley* translucent pink; *Chelsea Gem*, dwarf, red; *Edith Luther*, salmon-pink, with paler blotches; *John Luther*, crimson-rose, and one of the finest new sorts; *Ignati*, translucent pink; *Leonard Bause*, cream; *Her Majesty*, creamy-white, with green veins; *Rose Laing*, a charming soft pink;

Duchess of Fife, cream with rosy veins; *Prince Edward*, cream, with scarlet veins; and *The Mikado*, metallic red centre, with olive-green border. The group was large and the finest of its class in the show, reflecting credit on the cultivator, Mr. Tivey.

As specialists in the cultivation and improvement of the *Caladium*, Messrs. John Peed & Sons, of Roupell Park Nurseries, Norwood Road, S.E., have acquired a great name and fame. On this occasion, as on previous ones, they showed a superb representative collection of the varieties of this noble foliage plant. The exhibit occupied some 300 square feet, and this area contained about forty plants in as many varieties, and of different sizes. The health and vigour of the plants were remarkable throughout, some of them being veritable giants in point of size, whilst the colouring was all through up to the highest standard of excellence. In the back row were some high specimens of such varieties as Mme.

sorts, and its silver counterpart *Argentine* was equally noteworthy. *Princess of Teck*, Mrs. John Peed, Thomas Peed, *Le Nain Rouge*, *Ibis Rose*, and *Ibis Rouge* were all remarkable for the high development of colour. The comprehensive character of the exhibit was completed by samples of the charming dwarfs, *Minus Erubescens*, and *C. Argyrites*.

Messrs. John Laing & Sons, Forest Hill, London, were to the fore with a splendid group of *Caladiums*, forming a large group in tent No. 5. From the commencement of the Temple Shows, Messrs. Laing, when showing have always been strong in this class of plants. A few graceful Palms formed a back ground, in front of which the *Caladiums* were arranged, the larger pieces at the back, and gradually succeeded by smaller ones. The leaves of John Laing, with a carmine centre and creamy edges, were very conspicuous. Those of Mme. Mitjama were nearly of a uniform red. The bronzy-crimson

DRACAENA SANDERI (See p. 619).

J. R. Box, Comtesse de Malley, Mme. Groult, Gaspard Crayer, and Excellent, the last named measuring fully 5 ft. in diameter, by 4 ft. in height. In the row in front of these was a magnificent plant of Mrs. Harry Veitch, certainly the best we have ever seen of it. The rich crimson carmine leaves were of enormous size, and in our opinion this was the handsomest specimen in the whole exhibit. Such varieties as *Rose Laing*, *Candidum*, Mme. E. Pynaert, *Silver Cloud*, *Charlemagne*, *Princess Royal*, and *Baron Adolphe de Rothschild* were also all represented by large and magnificently developed plants. Amongst the smaller specimens which were dotted about among the larger ones, and occupied the front ranks, were some of the most refined and delicately coloured of all. Here we noticed the new forms, H. J. Chapman, with its rosy pink and white leaves with carmine veins, and *Charlotte Hoffman*, a small leaved, pure white variety. Amongst the others *Golden Queen* was the best of the self yellow

and pink blotched leaves of *Baron Adolphe de Rothschild* mark this as a good exhibition sort. The carmine-red and bronze of *Sir Julian Goldsmid* mark this as one of the finest of last year's introductions. Grand new varieties in this collection were *Lady Mosley* of a bright crimson-red, edged green; *Marquis of Camden*, bronzy-red and netted with green on a creamy ground towards the sides; and *Sir William Broadbent*, with a red-rayed centre and the rest blotched with white on a green ground. The huge leaf of *Stanstead Gem* have carmine nerves, the rest being netted with white and green. Striking were the leaves of *Altaire*, having a carmine centre and broad green edges. The intense carmine-crimson rayed centre of *Barao de Marmore* also showed up prominently in this group; and a fine contrast was made by *La Duchere*, having a broad green border surrounding a rose-red centre. The bronze-red of the massive leaves of *Flambeau* merged into a dark olive-green border. *Hermine* was notable for its

carmine-crimson leaves of massive breadth. The carmine centre of Excellent, and the creamy marbling on the outer border also marked this as a meritorious sort. The broad, shield-like leaves of Rose Laing were delicately shaded with pink on a creamy ground. In striking contrast to the creamy ground of Mme. Kochlin were the bright blood-red blotches. Amongst the dwarfier sorts Ladas, with its large, rich, rosy-red leaves, was very noticeable. The delicate pink veins of Martha La Forge made a chaste tracery on a creamy ground.

GLOXINIAS.

THE fine display of Gloxinias made by Messrs. J. Veitch & Sons, Ltd., in former years was more than sustained by their profusely flowered and grand strain. The plants were grown in 48 and 32-sized pots, yet bore from fifty to sixty flowers and buds each; in some cases this number was greatly exceeded, thus establishing the free-flowering character of the strain. Where such a high standard of merit can be sustained from seeds it seems superfluous to give names to the seedlings; yet so fine are some of the sorts that names are given to preserve their identity. Amongst those we noted were the violet-purple Cicera and Irene deepening to maroon in Electra, which had a black spot at the junction of every two lobes, the edge in all three cases being white. The large flowers of Cordelia had six to seven imbricate segments densely spotted with violet. The broad blue border of Cygnet Improved was also fine. Very floriferous were the rosy-scarlet Eclatant; the soft scarlet, rose-edged Seraph; the scintillating scarlet of Mars; the pure white Virginalis, which sometimes carries one hundred flowers and buds; Flambeau Improved brilliant scarlet and free; the large, crimson-scarlet Columbus; and Evatina, densely spotted with rose, and having a band consisting of darker spots. The quantity of fully opened pure white flowers of Galatea marked this out as a most valuable variety. Many of the varieties had two rows of segments, making a distinct break. Six to seven segments in a flower are now quite common, and include Adine, crimson with broad white border, and Cordelia, already mentioned. The dwarf and sturdy habit of Mars, Adine, and others, was notable. The crimson lobes and white edge of Oberon were very decided; and the same may be said of the delicate blue band on a white ground of Alraine; the velvety-maroon and blue edge of Sidonic; and the purple of Achilles extending in the form of broad, rounded rays out of a white throat. Hebe was intense crimson and a great improvement on Monarch; and the intense crimson of Empress of India was fortified by great substance. It would be futile to attempt grasping all of the shades of colour. Drooping flowers are not neglected, and Eveline was a very fine white in this section. The bigeneric hybrid Gloxinera Brilliant, having scarlet and rose flowers, still reminded us that Gloxinia and Gesnera are capable of being crossed. Mr. West, who has charge of the Gloxinias has done his work well.

Messrs. John Peed & Sons occupied 100 sq. ft. with some of their choicest Gloxinias. The plants, which were all in 32's and 48's, were of named varieties, of which the Messrs. Peed have a capital collection. The setting of Maidenhair Fern served admirably to show off the bright colours of the Gloxinias, and gave both finish and variety to the group. One of the finest of the varieties on view was one named Mrs. G. W. Sawday. This was a pure white flower of the highest type—large, well opened, of good substance, and perfectly erect on scapes of great strength and medium height. Aigburth Crimson was equally conspicuous by reason of the richness of its crimson flowers. This is a very free-flowering and valuable form. Duchess of York, lilac; Exquisite, pink; Ethel, deep purple; and Pelina, light blue with a pure white throat were other good sorts that gave a good account of themselves.

Messrs. J. Laing & Sons staged a group of their fine strain of Gloxinias, showing large self, edged, and spotted types, generally well defined. Some of them were named, including Mrs. Laing, with large violet flowers and a broad white border to the segments. On the contrary, the violet flowers of Lady Edridge faded to a paler blue edged like an Alpine Auricula. Handsome was John Laing, the crimson flowers of which faded to a rose edge. Most of the group, however, which was arranged close by the Begonias, consisted of unnamed seedlings. Very

choice was that having purple lobes, and a white border spotted with blue. The flowers consisted of seven segments. Other handsomely spotted sorts were scarlet, spotted on the white border; purple in the tube and spotted with violet on a white ground; and that which was spotted with dark blue on a sky blue ground. Gloxinias are certainly showy and sprightly flowers of great decorative value. A group of Streptocarpus, exhibited by the same firm, may also be noted here. The great size of the flowers was a notable feature of the strain. They varied from dark violet-blue, through various lighter shades of the same colour to a dead white, marked with violet bands in the tube. A variety named Gigantea exhibited great vigour and large, deep blue flowers. Very choice was that named Her Majesty, being pure white, except the violet in the throat. Others had lavender, rose, and purple flowers of great merit. The well-flowered plants consisted of last year's seedlings of a strain to which Messrs. Laing have been devoting considerable attention for some years past.

The Gloxinias sent by Messrs. H. Cannell & Sons, consisted of some wonderfully handsome varieties, and a considerable range of colour was apparent. The varieties were all named, some of the best being White Queen, Perfection, Princess of Wales, Prince of Wales, and Fetunia. Maidenhair Fern was used as a setting for the plants. The shades of green thus obtained were very striking.

The Anglo Continental (late Ohlendorff's) Guano Works, 30, Mark Lane, E.C., sent a batch of Gloxinias grown with their special guano, which is evidently a good plant food.

A small group of seedling Gloxinias was forthcoming from Messrs. A. W. Young & Co., of Stevenage, Herts:

BEGONIAS.

TUBEROUS Begonias have always been a strong and noticeable feature of the Temple Show, and attract attention by the brightness of their large and strong flowers. The plants are also dwarf and fresh in spring and early summer. Lack of space prevents extension and limits the size of the groups.

Messrs. J. Laing & Sons, set up a bold mass of single and double varieties, a large proportion of which were select, named sorts. The doubles were massed in the centre, with the single sorts at either end. Some Cocos stood here and there, relieving the blaze of colour, and the group was finished off with an edging of Isolepis. Countess of Dartmouth, with large double white flowers, is a choice new variety for this year. Equally fine in its way was a new sort with broad-petalled, primrose flowers. A number of seedlings included double blush-pink, salmon-rose, and red flowers, the latter being carried erect and suitable for bedding. Very fine sorts were Clio, large, crimped and yellow; Dr. Jim, fiery scarlet; Duke of Fife, a salmon-rose sort, excellent for bedding; Lady Tweedmouth, a fine cerise colour; Miss Griffiths, goffered white and blush, making one of the largest and most refined flowers in cultivation; Lady Powerscourt, delicate salmon; Lady Gifford, rich pink with broad petals; and Diamond Jubilee, a full yellow. All of the above were double varieties of great merit. Single flowered sorts were abundantly represented and fine in form. New varieties for this year were Lord Charles Beresford, fiery scarlet; Model having perfectly circular rosy salmon flowers, in keeping with the name, and of excellent habit; and Lord Dartmouth, having maroon-crimson flowers, several times the size of those of its antetype, Duke of Edinburgh. Striking bicolors were Esther Smith, cerise with white centre; and Duchess of Westminster, carmine with white centre. A sweet-scented variety is Marechal Niel. Other good singles were Viscount Grimston, intense crimson; Dr. Nansen, bright salmon; Lady Amptill, soft salmon-pink and pretty; Mrs. Davis, a fine yellow; and Countess of Aberdeen, pure white. One of the most distinct in the group was the fringed, flesh-coloured Duchess of Fife, possessed of close and bushy habit.

In tent No. 3 there was an exceedingly bright and showy group of tuberous Begonias sent by Mr. H. J. Jones, of Ryecroft Nursery, Lewisham, S.E. All Mr. Jones' Exhibits are characterised by taste and skill in setting up, as well as by the excellence of the material of which they are composed, and this one was no exception to the general rule. Maidenhair Fern was freely used as a setting for the Begonias, and the elegant Cocos weddelliana formed

an excellent background, and dotted about over the whole area served to give the group both height and lightness. The general contour of the exhibit presented three mounds, of which the central one was the highest and the most massive. The plants, which were all in 32's and 48's, were sturdy and short-jointed subjects, and in the glory of their first flowers made a pretty picture. Both single and double-flowered sections were shown, and the colours varied from pure white to intensest crimson. The double flowers in particular were noticeable by reason of their size and refinement, the Camellia type being here well represented. Most of the plants shown were unnamed seedlings, but some of the finer forms were named. Of these we must make mention of H. J. Jones, a grand double flower of bright crimson-scarlet, and one of the finest in the whole exhibit.

A magnificent display of tuberous Begonias came from Mr. J. R. Box, the West Wickham Nurseries, Kent. Both single and double flowered sections appeared to great advantage, for not only were the plants well foliated and flowered but the individual flowers and leaves were of large size, and the colours of the former very brilliant. Canary bright yellow; Hecla, rich rose; Distinction, rose-pink, edged cerise; and Belona, large, pure white were the best named, single varieties. Of the double Defiance, rich crimson-scarlet; The Bride, creamy white; Harmony, salmon-pink; and Opal, salmon, were the best. There was a background of Keatias to the group, Maidenhair Ferns were interspersed with the plants, and the edging was composed of Caladium argyrites and Isolepis gracilis.

Messrs. H. Cannell & Sons, of Swanley, Kent, had a small group of tuberous Begonias. The rich crimson, double, Lord Rothschild was the best variety here. There were several good single forms but these were unnamed with the exception of Miss A. Stewart, yellow; W. H. Foster, rich scarlet-rose; Miss Newman, salmon, and one or two others.

The tuberous Begonias submitted by Mr. T. S. Ware, of Hale Farm Nurseries, Tottenham, N., were from all points of view first class. There were comparatively few single flowered varieties shown, but these were of the very finest. They included Mrs. Sharp, white and rose; Bexley White, pure white; Alba fimbriata, pure white with fimbriated margins; and Attraction, bright bronzy yellow. The double flowers constituted by far the larger bulk of the exhibit, and it would be difficult to overpraise their beauty and choiceness. Mr. James Portbury, bright scarlet; Samuel Pope, creamy pink, edged rose; Mrs. John Fowler, white; Her Majesty white, with gophered petals; Duchess of Devonshire, flesh pink; and Pride of Kent, rose, were the cream of the collection. Cocos weddelliana was dotted here and there along the bank of flowers, and the margin was of Isolepis gracilis, interposed with the variegated Poa trivialis.

CROTONS.

A BEAUTIFULLY arranged and highly-colored group of Crotons was set up by Messrs. J. Veitch & Sons, Ltd., who had over three dozen of the best varieties in cultivation, representing the broad and narrow-leaved sections with other characteristic types. Broad-leaved varieties were well represented by Baroness James de Rothschild, Evansianus, Warrenii, Queen Victoria, Prince and Princess of Wales, and others. Some of the above are notable for the length of their leaves and beautiful colours rather than their breadth. The three-lobed leaves of Disraeli are very distinct, and the variety has long been a favourite. Hawkeri is handsomely variegated with creamy-white, and Reidii shows a similar combination. The rich yellow of Johannis has always been popular and much admired. Of another type are Caudatus tortilis and Golden Ring, whose colours are supplemented by the peculiar twisted form of the drooping leaves. Aigburthensis is essentially a narrow-leaved form, much in request for table decoration. Other grand forms, furnishing endless variations of beautiful colours were Sunbeam, Emperor Alexander III., Goldii, Aigburth Gem, Mortii, Thomsoni, Rodeckianus, Challenger, Alice, Flamingo, Sinitzinianus, Dairsii, Elegantissima, Magnificent, Delight, Gordoni, Superba, Eugenie Chantrier, Newmanni, Hammondi, &c., all in the finest condition.

NEW PLANTS.

At the northern end of the central stage in the large tent, Messrs. F. Sander & Co., St. Albans, set up a

magnificent group of new plants, amongst which there was a number of subjects that cannot fail to figure largely in the horticulture of the immediate future. The most conspicuous and perhaps the most valuable of these novelties was the magnificent *Acalypha Sanderi*, which was shown in all sizes from plants four to six months old, clothed with leaves right down to the pots to standards with a clear stem of from two to four feet. The new *Acalypha godseffiana* was also much in evidence. As a subtropical bedding subject this should prove very useful. Not less noteworthy was a new and very showy *Haemanthus*, to which no name has yet been given, but which is sure to be heard of again. *Caladium Ami Schwartz*, *Panax mastersiana*, *Kentia sanderiana*, and *Licuala Jeanenceyi* were other striking novelties. In addition to these there were staged grand specimen pieces of *Dracaena Van Belti*, and handsome clumps of *D. sanderiana*, and *D. godseffiana*.

ACALYPHA SANDERI.—There are something like 220 species of *Acalypha* known to science, and to this number the present species must be added. Of all that number surely some or more of them will prove valuable for horticultural purposes. That under notice is a native of New Guinea, and is the most remarkable species we have ever seen. All the other *Acalyphas* in gardens are grown solely for the sake of their beautiful foliage; the glory of *A. Sanderi* is its flowers, which are small individually, but produced in dense masses upon long, pendent spikes like ropes of crimson-velvet, or, as we formerly remarked, like *Love Lies Bleeding*, belonging to a different family. The accompanying illustration (p. 615) scarcely does justice to it, for we have seen some of the spikes not far short of 2 ft. in length, though the average would be less. The large, ovate leaves are dark green. Young plants have upright stems, from which the spikes depend, but older ones give off branches horizontally, while the flowers are brought even into more prominence, by being clear of the foliage.

PANDANUS SANDERI.—This will constitute a beautiful companion to *P. Veitchi*, of which it has the habit, though nothing seems to be known of the wild original. The last named has dark green leaves with white margins. *A. Sanderi* has sword-shaped, recurving leaves, finely serrate at the edges with small spines. They are banded and lined all over with golden yellow, green stripes alternating in about equal proportions. Messrs. F. Sander & Co. are to be congratulated upon both of the above acquisitions to gardening. Both of the plants are certain to find their way into many gardens before this time next year. (See p. 617.)

An interesting exhibit of *Anthuriums*, all of them seedlings from the well-known *Anthurium scherzerianum* was made by M. L. de Smet-Duvivier, Mont St. Amand, Ghent, Belgium. A considerable range of differentiation was manifested in these seedlings. *Prince of Wales* with its huge scarlet spathes is simply an improved form of the parent; *A. s. formosum* has deep crimson spathes; and *A. Baron Schroder* is only a few shades lighter. *A. Senateur Montefior Lewis* has a white spathe curiously mottled with scarlet.

Half-a-dozen samples of the elegant, narrow-leaved *Dracaena Kippisii* were shown by Messrs. Dicksons, Ltd., of Chester. This *Dracaena* has the makings of a good table plant.

Baskets of the new *Dracaenas Rose Laing* and *Distinction* were submitted by Messrs. John Laing & Sons.

GREENHOUSE PLANTS.

MESSRS. J. CARTER & Co., High Holborn, London, exhibited a large and mixed group, in which their *Calceolarias* were the dominant feature. The plants were grown in 24-size pots, dwarf, and extremely varied in colour and markings. The crimson varieties were very numerous, some being dark, and others of a fiery glow. Some were finely spotted with crimson on an apricot ground; orange, and beautifully spotted; rose, marbled with crimson, and handsomely marbled with crimson on an orange ground; glowing red and marked with yellow; and crimson on the top, and yellow beneath. There were several shades of yellow, of which the darkest was named *Cloth of Gold*, and a sulphur one, *Princess of Wales*. To these a strong contrast was furnished by plants having maroon-crimson flowers, giving place to rose beneath; purple flowers, marbled with yellow; maroon-carmine and maroon-

crimson, the latter shades being numerous. All these colours and markings need to be seen to be fully comprehended. Their bizarre colours were toned down or contrasted with the fragrant *Lilium Harrisii*; the graceful panicles of the white *Saxifraga Cotyledon pyramidalis*; the plummy white of *Astilbe (Spiraea) japonica*; fragrant, white *Intermediate Stocks*; and *Streptocarpus*, in blue, white, and rose varieties. Some tuberous *Begonias* added fresh colour of quite a different type. Single and double *Petunias* furnished bits of purple, intense violet or purple blue and white. Around the sides were some pots of a large spiked variety of *Mignonette*, sweetly scented. *Mimulus*, grown in small pots, supplied an old-fashioned flower of great beauty, but in modern strains with flowers of huge size. That named *Queen's Prize Yellow Ground* had its markings on a yellow groundwork. A fine form named *Gloriosa* was heavily blotched with rich dark crimson. The *Queen's Prize White Ground* also explains itself. *Princess Beatrice*, heavily blotched and marked with crimson on a white ground represented this strain. *Ruby* belongs to *Mimulus cupreus*, and has very large flowers for this type. All these useful conservatory and hardy subjects occupied the whole of the centre of tent No. 1, and the above-named flowers, being surmounted by a central ridge or chainwork covered with plummy *Asparagus* and ornamental seaweeds of the same colour, the display was very effective. *Duke of York Tomatos*, *Cucumbers*, and *Daisy Peas* added much to the general appearance of the exhibit.

One of the principal features of the show is the magnificent group of plants exhibited by Messrs. Wm. Cutbush & Son, Nurserymen, Highgate, arranged at one end of the large tent with *Palms* and *Bamboos* at the back, and a series of small groups composed of *Lilium Harrisii*, *Crimson Rambler Roses*, *Spiraeas* in the centre, two groups of tree *Carnations* in the corners, edged with *Ferns*, and *Erica ventricosa magnifica*. Between is a grand arrangement of *Souvenir de la Malmaison Carnation* varieties, including *Madame Adelina Patti*, *President McKinley* (both new), and older sorts—*Charles Freemantle*, *Princess May*, *Princess of Wales* and *Blusb*. Also included are plants of *Calla Elliottiana*, *Browallia elatior*, and small *Cocos*, the whole finished off and edged with *Maidenhair Fern*. This important exhibit occupies about 400 square feet.

Leopold de Rothschild, Esq. (gardener, Mr. J. Jennings), Ascott, exhibited a fine bank of *Malmaison Carnation* plants, well grown and beautifully set up, at the end of the *Orchid* stage.

Messrs. Geo. Jackman & Son, Woking, exhibited a large group of new, hardy hybrid *Clematis*, the plants trained balloon shape, and others loosely on stakes. *Sir Trevor Lawrence*, bright in colour; *Duchess of York*, bluish; *Duchess of Albany*, *Countess of Onslow*, and *Grace Darling* are the most attractive. Mr. W. Icton, Putney Park Lane, had a large and attractive group of decorative plants, including *Palms*, *Dracaenas*, *Crotons*, *Caladiums*, large, well-flowered masses of *Lilium Harrisii* at the back, with *Caladiums*, *Heaths*, *Oranges*, *Ferns* and *Lycopodium* intermixed.

Mr. Charles Turner, Slough, exhibited two groups of choice *Pelargoniums*. There were among them well flowered specimens of *Iona*, *The Shah*, *Magpie*, *St. Blaise*, *Marguerite*, *Ed. Perkins* and *Lady Isabel*. Mr. Turner also had a nice group of tree *Carnations*, and the large bank of *Roses* from Slough divided these two groups at the end of the large tent.

Messrs. John Waterer & Sons, Ltd., Bagsbot, had a large display of hardy *Rhododendrons*, composed of tall standards and bushes, all well flowered and forming a very pleasing feature.

Messrs. R. & G. Cuthbert, Southgate, had a group composed of well bloomed *Azalea mollis* and *sinensis*, and intermediate hybrids, *Anthony Koster* being among the latter, a beautiful form of good shape and substance, in colour a lovely yellow; there were also some similar good plants of *A. rustica fl. pl.* forming dense clusters of blooms.

Messrs. W. Fromow & Sons, Sutton Court, Chiswick, exhibited a pretty group of Japanese *Maples* and *Lilium Harrisii*.

Messrs. Richard Smith & Company, Worcester, maintained their reputation with a magnificent exhibit of *Clematis*. Very beautiful in form is the

white *C. Mrs. George Jackman*. Other good varieties are *Madame Van Houtte*, *Marie Lefebvre*, *Blue Gem*, *Princess of Wales* among singles; and *Countess of Lovelace*, *Enchantress*, *Lucie Lemoine*, *Venus Victrix* and *Belle of Woking*, doubles.

Messrs. Kelway & Sons, Langport, exhibited a group of well-flowered *Paeonies* and *Pyrethrums*, but the large flower pots and numerous stakes employed were too conspicuous to please the eye.

Messrs. Cannell & Sons, Swanley, put up a charming collection of *Cannas* at the end of one tent in great variety, very bright and pleasing in effect.

Messrs. T. Cripps & Son, Tunbridge Wells, had a collection of Japanese *Maples* in variety.

Mr. A. Tulett, Green Court Nurseries, staged plants of a sport from *Pelargonium V. Raspail*, free flowering double scarlet.

Mr. W. Palmer, Junction Road, Andover, had several pots of *Lobelia Blue Queen* and *True Blue*.

Messrs. Paul & Sons, Cheshunt, staged a collection of dwarf well flowered *Cannas*.

Mr. Amos Perry, Winchmore Hill, put up a group of zonal *Pelargonium King of Denmark*, good trusses of semi-double salmon coloured flowers also *Tulips* and herbaceous cut flowers. From Messrs. F. Miller & Co., Florists, Fulham, came baskets of plants of *Spiraeas*, *Lobelia*, *Mignonette* and *Petunias*. Mr. Frederick Perkins, Leamington, had a dozen well grown plants of *Carnation Primrose Queen*, beautiful soft colour. A variety of plants in flower and foliage came from the *Jadoo, Limited*, Exeter. Messrs. R. Wallace & Co., Colchester, exhibited a large collection of *Lilies*, *Iris*, *Watsonias* and others (see list).

From Reid's Nursery, Beckenham Hill, came dwarf plants of *Rhododendrons* and some small plants of *Pelargonium Remembrance of Rotterdam*.

Messrs. W. Balchin & Sons, Hassock's Nurseries, exhibited a beautiful collection of greenhouse plants, which included quantities of *Boronia heterophylla*, *B. serrulata*, *Genetyllis tulipifera*, *Erica Spencerii*, *E. candidissima*, *E. Cavendishii*, *E. ventricosa rosea*, and the showy blue *Leschenaultia biloba major*.

From Mr. John Forbes, Hawick, came a bright group of *Carnation Yuletide*, a perpetual flowering, brilliant scarlet variety, well worthy of extensive cultivation. He also showed a collection of bedding *Violas*.

A yellow Tree *Carnation* was exhibited by Messrs. Dicksons, Ltd., Chester, named *Duchess Consuelo*, the flowers resembling a *Malmaison* in shape.

CACTI.

MESSRS. J. VEITCH & SONS, LTD., seem determined to maintain their reputation for hybrid *Phyllocacti*, whose huge flowers, gorgeous colours and subtle tints and shades make them the aristocrats of the order to which they belong. There are no spines and no shaggy old man in the genus *Phyllocactus*. Messrs. Veitch had a general collection of new and older varieties numbering seventy-two distinct, named, varieties in flower and bud, and 350 plants. About 120 of them were seedling hybrids, flowering for the first time. In the general collection very choice were *Romeo*, light red and pale purple edge; *Agatha*, rose-pink; *Dante*, a fine rose; *Ensign*, orange, shaded with scarlet; *Niobe*, deep crimson-scarlet, with a purplish centre; *Jessica*, delicate, soft pink; *Thalia*, crimson, shaded violet; *Rose Perfection*, bright rose; *Brilliant*, vivid scarlet; *Exquisite*, fine, rose-pink; and *Homer*, red with a violet centre. The acme of delicacy is reached in *Vesta*, which is white. The creamy-white *Cooperii* is also very choice, forming a strong contrast to such as *Grand Monarch*, crimson-scarlet, with violet centre; *Plato*, deep crimson, shaded scarlet; *Eurasian*, a very large, dark scarlet flower shading to a magenta margin; and the crimson *Venus*, shaded violet. The bright rose-pink of *Sirius* was a pleasing foil to the light, scarlet-crimson of *Hecla*. *Ovis* was a fine rose variety; and *La Reine*, soft light pink. Mr. Heal is no less successful in the hybridising of this showy class than of *Amaryllis*, *Streptocarpus*, and *Rhododendrons*. Some of his latest acquisitions are *La Belle*, *Epirus*, *Timora*, *Portenia*, *Marsus*, *Norma*, *Cato*, *Melia*, *Sylvia*, *Scipio*, *Dorian*, *Cordelia*, *Lorina*, *Rowana*, *Gerona*, *Iantbe*, *Minos* and *Nemesis*, in endless combinations of colour.

A very neat group of *Cacti* was staged by Mr. G. J. Pritchard, 78, Godwin Road, Forest Gate, E. In all there were twelve genera represented. The two gems of the group with regard to rarity were

Pelycyphora pectinata, and *P. aselliformis*. There was a fine specimen of the crested *Mamillaria*, *M. nivea cristata*, which was shown in the same pot with the type. Other *Mamillarias* were *M. longinamma*, *M. crassispina*, and *M. Nicholsonii*. *Cereus peruvianus mostrosus* was another notable plant, its gnarled and contorted presence being apparently very interesting. A grand sample of *Melocactus biformis* was shown in robust health. The same might indeed be said of the whole collection.

ROSES.

A GROUP, occupying one end of the large tent intermixed with Palms and edged with Ferns, was put up by Mr. C. Turner, of Slough, Crimson Rambler both as standards and trained up the pillars forming a background. This was also trained as a bush, lighting up the whole group with admirable effect. *Francisca Kruger* with its delicate yellow flowers was much admired, the scent being very delicate. The old *La France* was well shown, as was *Junno*, *Marie Baumann*, *Comtesse de Serenzi*, *Mme. Victor Verdier*, *The Bride*, and *Souvenir de Madame Verdier*.

Messrs. W. Paul & Son made a magnificent display with Ramblers as standards as well as trained plants. Teas were well to the fore in this group, comprising such varieties as *Corinna*, *Medea*, *Sylph*, and *Souvenir de Madame Verdier*. This group was edged with cut Roses in boxes, which in our opinion somewhat marred the effect.

Messrs. Paul & Son, of Cheshunt, occupied one corner of the large tent, and made a magnificent display. *Diana*, a very pretty rose of the Rambler type, with white flowers, attracted much attention. The Roses in this group were clean and well grown, *Ulrich Brunner* standing out well amongst such varieties as *Souvenir de S. A. Prince*, *Captain Hayward*, and *Caroline Testout*.

Messrs. F. Cant & Co., of Colchester, had a neat, small group in the centre of the adjoining tent, comprising such well-known varieties as *Mme. Falcot*, *Niphotos*, and *La France*. A peculiar small-flowered *Polyantha* form named *Thalia* was very striking.

At the end of this tent a group, put up by Mr. W. Rumsey, Waltham Cross, consisting of standards, trained plants, and cut blooms edged with Ferns, made a nice arrangement, *Mme. Hoste*, and *The Queen* being amongst the best.

There was also a group of a single variety named *Carmine Pillar*, exhibited by Mr. J. Russell, of Richmond, which was very showy. The flowers are fairly large, of a bright red with a light centre. This will doubtless make a companion to Rambler.

FERNS.

The collection of Ferns shown by Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, was a remarkably fine display of choice material. There were none of the so-called market Ferns, whose very easiness of culture, combined with their beauty, has caused them to be grown in their thousands each year, but instead, the rarer and choicer forms were shown, and these, by their evident health and fitness, not less than by their elegance and variety, gave to visitors a good representation of the wide range of type that is to be found amongst Ferns as a class of plants. The exhibit in question occupied about 250 square ft., and in this space were congregated a large number of magnificent specimens, although there was no duplication. For rarity the special feature was a single plant of *Polypodium Mayii*, a new form that cannot fail to do credit to Mr. May. This was covered and shielded from profane touch by a large bell-glass, and the delicacy of its tints were well shown up by a setting of the golden *Selaginella kraussiana aurea*. This *Polypodium* has the same glaucous hue as *P. aureum* and *P. glaucum*, but in a much greater degree. The lobes of the leaves are broader, whilst the whole leaf has a graceful droop that goes well with the much crisped and charmingly undulated margins. The venation stands out clearly by reason of the almost translucent character of the leaf, and the fact that the veins are of a lighter blue than the surrounding tissues. The *Gymnogrammes* were strongly represented by some superb samples. There were, in all, about a dozen forms, of which we may mention *G. flavescens*, *G. chrysophylla grandiceps* and its strong-growing form *G. c. g. superba*, *G. Mayii*, and *G. schizophylla elegantissima*, with very finely cut and elegant fronds. A fine specimen of *Davallia fijiensis robusta* was most conspicuous by reason of its size and vigour, and the same may be said of *Platyterium*

grande. *P. aethiopicum* and *P. Willinckii* were suspended above the other plants on the stage, and thus had every chance to display their charms. *Asplenium caudatum* was employed in the same way. The distinct *Asplenium Mayii*, with its deeply lobed fronds, and the closely allied *A. ornatum* were much admired, whilst the noble fronds of *A. Nidus musaeifolia* formed a great contrast to them. Of *Pterises* there were the handsome *P. Reginae* and *P. R. variegatum*, as well as the noble *P. ludens* and the equally distinct *P. sagittifolia*. *Adiantums* were represented by *A. elegantissimum*, the new *A. hemsleyanum*, and *A. fasciculatum*, three very beautiful forms. The genus *Pellaea*, which contains several highly ornamental subjects was represented by *P. cordifolia* and *P. ternata*.

A number of the smaller growing forms was accommodated upon diminutive tree stumps, in which situation they formed a pleasing feature of the group. *Drymoglossum piloseloides*, *D. spatulatum*, and *D. Nephrolepis pectinata* were all shown thus. We must not forget, moreover, to pay a tribute of praise to the way in which the staging was carried out, for the characteristic beauties of each plant were well brought out, and the smaller plants equally with the big ones were able to give the public the full benefit of their charms.

A meritorious and tastefully set up group of exotic Ferns came from Messrs. J. Hill & Son, Lower Edmonton. It was composed of a great variety of material, amongst which were grand specimens of such things as *Pteris tremula smithiana*, *Davallia fijiensis plumosa*, *D. mooreana*, and *Asplenium caudatum* suspended above the stage. On the stage itself were such popular Ferns as *Blechnum occidentale*, *Adiantum scutum roseum*, *A. macrophyllum*, *A. Farleyense*, and *Lygodium scandens*, all of them in considerable numbers and in first-rate condition.

As in former years Messrs. W. & J. Birkenhead, Sale, near Manchester, staged a capital exhibit of the kind of Ferns they grow at their nurseries, both exotic and hardy forms being on view. The familiar glass case with its "filmy" occupants was also present. On this occasion it was filled with pot plants of such choice things as *Trichomanes maximum*, *T. radicans cambricum*, *T. r. dissectum cuneatum*, *Todea superba* and other *Trichomanes*, and *Hymenophyllums* in variety. The rest of the exhibit outside of the glass case contained a large number of small and medium sized plants, amongst which we noted *Davallia pentaphylla*, *D. fijiensis elegans*, *Adiantum trapeziforme*, *A. lawsonianum*, *Alsophila pinnata*, and *Onychium japonicum*. There were some pretty crested forms among the hardy element, and the hardy *Maidenhair*, *Adiantum pedatum* was well shown in this section.

HARDY HERBACEOUS PLANTS.

THE hardy flowers contributed by Messrs. Barr & Sons, of Covent Garden, constituted a brilliant and very comprehensive display. The miniature rockery, which was last year such a successful departure, was repeated with even greater success this year. The creeping *Arenaria halarica*, and the larger flowered *A. montana* were tastefully employed to clothe the nakedness of the stones, whilst *Ranunculus pyrenaica*, peeping out here and there from crevices and cranies, looked thoroughly at home. Masses of *Gentiana verna*, *Primula rosea*, *P. farinosa*, *Saxifraga Phei*, *Cistus purpureus*, and *Androsaces* added plenty of colour. We should also not forget to mention the pretty and distinct *Viola pedata*, and its variety *V. p. bicolor*. A background to the rockery was furnished by *Cytisus scoparius andreanus*, and *C. albus durrens*. Flanking the rockery on either hand were masses of cut flowers and plants in pots, the whole forming a capital representation of the wealth of material that the lover of hardy flowers has at command. Amongst the cut flowers a collection of bedding *Violas* included such useful sorts as *True Blue*, *Colleen Bawn*, *Nellie*, *Sulphur Gem*, *Duchess of Fife*, *J. B. Riding*, and *Floriel*. *Gladiolus Colvillei alba*, *G. C. Blushing Bride*, *Heuchera sanguinea splendens*, *Papaver Beauty of Livermere*, *Eremurus robustus*, *E. himalaicus*, *Geums*, *Irises*, *Pyrethrums*, single and double, and *Darwin Tulips* were all in the best of trim. The double *Poet's Narcissus* was also well shown. It is not unlike a *Gardenia* in form and smell, and should prove very useful for cutting. Amongst the plants, *Cypripedium calceolus*, *Orchis italica*, *O. bombilifera*, *Spanish Iris*, in variety, more especially the forms *Golden King* and *Snowball*,

Trollius Orange Glohe, *T. napelliformis* were very noteworthy. *Fritillaria recurva*, with its handsome red-orange flowers, was very conspicuous, and attracted a good deal of attention. *F. Elwesii* was likewise well shown.

These, with the cut flowers, were distributed over the available space in tents Nos. 1, 2, and 3.

Mr. F. G. Foster, Brockhampton Nurseries, Havant, staged forty bunches of cut Sweet Peas in as many varieties. They were cut from pot plants grown in a cool house, and were prettily made up with the foliage of *Carex variegata* and *Eulalia japonica* with small *Adiantums* interspersed. *Lady Mary Currie*, *Golden Gate*, *Aurora*, *Isa Eckford*, *Royal Rose*, *Shahzada*, and *Queen Victoria* were some of the best forms.

From Mr. George Edom, Walton-on-Hill, Epsom, Surrey, came a collection of cut florists' Tulips. The flowers were in grand condition considering the advanced season, both colour and size being above the average. *Annie McGregor*, *Rose Hill*, *Mrs. Schofield*, *Mrs. Hardy*, and *Goldfinder* were the finest of the breeder forms, and *Lord Frederick Cavendish*, *Adonis*, *Samuel Barlow*, *Annie McGregor*, and *Duchess of Sutherland* the premier rectified blooms.

Messrs. J. Cheal & Sons, of Crawley, Sussex, put up a charming miniature rockery, prettily furnished with various Alpines, including *Phlox G. F. Wilson*, *P. violacea*, *Papaver miniatum*, *Lithospermum prostratum*, all in bold masses. In the cut flowers shown by the same firm the chief feature was the collection of bedding *Violas*. Here there were many pretty varieties, some of the finest being *Colleen Bawn*, *Iona*, *Florize*, *Archie Grant*, *Hamish*, *Bullion*, *A. J. Rowberry*, and *Border Witch*.

On the left-hand side of the entrance to No. 2 tent, Messrs. Geo. Jackman & Son, of Woking, had a collection of choice herbaceous plants. There were large clumps of *Iris germanica* *Mme. Chereau*, *J. g. Bacchus*, single and double *Pyrethrums*, in variety. *Tree Paeonies*, *Haddesi*, and *Mme. Rattier*. *Centaurea montana ruhra* was very gay, and the bright yellow of *Cheiranthus Marshalli* was fully as conspicuous. We must also make mention of the choice *Incarvillea Delavayi* here just commencing to bloom.

In the western end and in the centre of tent No. 2, the hardy flowers, sent by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, were staged. A special feature here was a quantity of *Liliums* in pots, all of the pots being full of flower, dwarf and sturdy. *L. thunbergianum atrosanguineum*, *L. t. alutaceum*, *L. t. brevefolium*, *L. t. marmoratum aureum* were the most noteworthy. By the side of the *Lilies* appeared a collection of hardy *Cypripediums*, chief of which were *C. calceolus*, *C. parviflorum*, *C. occidentale*, and *C. aculea*. In another part of the group a batch of *Lilium rubellum* was well to the fore, as the beauty of the species would entitle it to be. *Fritillarias*, *Calochortuses*, *Ixias*, and the various *Irises*, shown by the Colchester firm, were all of them choice and well found.

In the hardy flowers sent by Mr. Amos Perry, Winchmore Hill, N., the majority were cut. A hold mass of *Tulipa gesneriana* occupied a central position, and around it were grouped *Trollius*, *Ranunculus aconitifolius flore pleno*, *Lupinus*, *Aquilegias*, and *Centaureas* in variety. *Camassia Leichtlinii* was one of the notables.

Messrs. A. W. Young & Co., of Stevenage, Herts, had a collection of cut hardy flowers and plants, in which *Lilium Harrisii* figured conspicuously.

Messrs. Isaac House & Son, Coombe Nurseries, Westbury-on-Trym, near Bristol, staged a splendid lot of sprays of Bedding *Violas* with their own foliage. *Border Witch*, *A. J. Rowberry*, *Archie Grant*, *Amy Barr*, *Bullion*, *Wm. Haig*, and *Ira Fergusson* were some of the best. Small plants in pots were on view, thus exhibiting the habit of some of the forms. Amongst the plants the variety *White Empress* gave a good account of itself. A couple of stands of single blooms of fancy *Pansies* appeared in the front rank. These were very good considering the somewhat unfavourable character of the season.

The western end of No. 3 tent was devoted to a choice collection of cut hardy flowers sent by Mr. T. S. Ware. A huge spike of *Eremurus elwesianus* was the most conspicuous occupant of this group. *Irises*, *Lilium*, *Saxifragas*, *Epimedium niveum*, *Trolliuses*, *Lupinus*, *Paeonies*, *Lilium*, and *Irises* were present in considerable variety, and there were also such high-class things as *Cypripedium calceolus*, *Iris Mariae*,

and *Ramondia pyrenaica*. All the plants were stood upon the ground, and this made it somewhat difficult to look at them to advantage.

The miniature rockery put up by Messrs. James Backhouse & Son, York, was certainly the finest effort of its kind in the whole of the show. Amongst the plants were to be seen very many floral gems of great beauty and value, not the least interesting being the hardy Orchids. *Armeria setacea*, *Gentiana acaulis*, *G. verna*, *Sarracenia purpurea*, *Daphne cneorum* and *Morisia hypogaea* are a few of the dwarf subjects that were in the the front ranks. In the background appeared *Iris*, *Tolliuses*, *Ranunculus cortusifolius* and small pieces of *Pinus cembra*. Two grand pans of *Cypripedium calceolus*, and two other pans of cut Water Lilies were shown by the same firm.

ORNAMENTAL TREES AND SHRUBS.

Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, W., had a varied and showy group of Japanese Maples in pots, varieties of the versatile species *A. palmatum*. The range of cutting and colour of the leaves was very great, and the exhibit formed a capital representation of the utility of these subjects for conservatory decoration, whilst they are perfectly hardy. *A. p. marmoratum*, *A. p. dissectum palmatifidum*, *A. p. variegatum*, *A. p. sanguineum*, and *A. dissectum purpureum* were some of the finest forms. An edging to the group was furnished by the dwarf and handsome *Aralia pentaphylla variegata*.

Messrs. Thos. Cripps & Sons, of Tunbridge Wells, had an exhibit of similar material. This was split up into two groups, one of which appeared on either side of the eastern end of Tent No. IV.

The greater part of the hardy trees and shrubs were accommodated upon the grass outside the tents, where they appeared to much greater advantage with their setting of green grass than they possibly could have done under canvas.

Messrs. J. Cheal & Sons, of Crawley, Sussex, made a unique exhibit by planting a large oblong bed with a variety of foliage and flowering plants. Of the latter there were some beautifully flowered pieces of *Rhododendron Fred Waterer*, *R. John Waterer*, *Azalea amoena splendens*, and *Kalmia glauca*, whilst foliage subjects were represented by such things as the elegant *Sambucus serratifolia*, *Acanthopanax pentaphylla variegata*, *Cupressus lawsoniana filifera glauca*, *Taxus baccata lutea*, and other green and golden Conifers. The edging was of *Eurya latifolia aurea*.

A magnificent array of fine foliaged trees and shrubs came from Messrs. Fisher, Son, and Sibray, Handsworth Nurseries, Sheffield. The material was split up into two distinct groups, the smaller of which was stellate in form. This contained well grown and shapely little specimens of *Acer japonicum crataegifolium*, *Cornus sibirica elegantissima* and *Acer reticulatum*. The plants in the larger group as well as those in the smaller were bedded in and their roots hidden from view by a carpet of moss. The larger group occupied a space of about 50 ft. in length by 12 ft. in width. It contained in addition to larger samples of the plants mentioned as being in the smaller group a splendid collection of varieties of *Acer japonicum*. The new *Persica purpurea* was also very noteworthy. *Quercus concordia*, *Q. macrophylla* *Andromeda japonica alba magnifica*, *Euonymus Silver Gem*, *Betula purpurea* and *Hedera arborea Crippsii* were shown in dwarf, but bold and telling masses in the foreground, the outline being a series of short curves with an edging of *Euonymus argenteus*. Considerable taste was displayed in the arrangement, for there was a great wealth of material on hand and it was displayed to the fullest advantage.

Messrs. Paul & Son, the Old Nurseries, Cheshunt, showed a number of cut sprays of *Rhododendrons*, and a collection of Bamboos. These included several mammoth specimens in large tubs.

From Mr. John Russell came a bright and varied assortment of Acers, Ivies, and miscellaneous foliage shrubs. *Cotoneaster horizontalis* was also very conspicuous and in capital condition. In the background the variegated *Acer Negundo* was represented by a number of fine plants. *Acer palmatum niveum*, and *A. p. dissectum* were in excellent form. A double row of *Euonymus latifolius albus* made an appropriate edging.

A new variegated Holly called Golden King was

shown by Messrs. Little & Ballantyne, Carlisle. It is a distinct improvement upon the old Golden Queen.

Yet another group of the evidently popular Japanese Maples was contributed by Messrs. John Waterer & Sons, Ltd., Bagshot, Surrey. *A. palmatum dissectum purpureum*, *A. p. d. variegatum*, *A. p. atropurpureum*, *A. p. d. ornatum*, *A. p. insolutum*, *A. p. roseum marginatum*, and *A. p. tricolor* are a few of the many fine forms which were exhibited here.

On the eastern side of the large tent a superb collection, both in point of size and merit, of hardy flowering shrubs displayed to visitors what Messrs. James Veitch & Sons, Ltd., can grow at their nurseries at Coombe Wood. *Rhododendrons Sappho*, *Lord Eversley* and *Prometheus*, hybrids of *Azalea mollis* and *A. sinensis* in variety, *A. glauca stricta*, *Cytisus scoparius praecox* in 4 ft. standards, *C. s. andreanus*, in 6 ft. standards, *Hydrangea japonica Mariesii*, and *H. hortensis rosea* were all magnificently flowered. Of the rarer subjects *Andromeda speciosa cassinefolia*, *Philadelphus Lemoinei*, *P. coronarius Boule d'Argent*, and *Ceanothus veitchianus* were exceedingly showy. *Vitis heterophylla variegata* was likewise in capital trim, being well variegated and in vigorous health. Nine grand spikes of *Eremurus himalaicus* scattered in the front ranks of the group were much admired, and clumps of *Lilium Harrisii* in the background added their quota of beauty to the general effect, which was imposing in the extreme.

FRUIT.

FRUIT under glass has long been a specialty with Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, and on this occasion his exhibit was fully worthy of his reputation. It consisted of Figs, Peaches, Nectarines, Cherries and Strawberries, both plucked and shown in cases, as well as in position upon the trees. In the background was a row of Vines carrying full crops of large bunches for pot Vines. Both Early Rivers and Cardinal Nectarine were well shown, the fruit which was of medium size and upwards, being in every case highly coloured. Some of them were very large, nine of them plumping the scale at 3 lb. 3 oz. Fig St. John, Strawberries Royal Sovereign, Auguste Nicaise, and Louis Gautier, and Cherries Frogmore Early Bigarreau, Bigarreau de Schreken, Early Rivers, Empress Eugene, and Guigne Annonay were all of the highest quality. The condition of the trees, moreover, was fully on a level with the quality of the fruit. Several Plums were shown but they were not so forward as the remainder of the fruit, but they, like them, bore heavy crops. All of them were in pots of various sizes. This exhibit was certainly one of the best efforts, if not the best, Mr. Hudson has yet made.

Messrs. T. Rivers & Son, Sawbridgeworth, also made a magnificent display with pot fruits, but in this case the exhibit was confined to Nectarines, Figs, Plums, Peaches, and Cherries. Of the Nectarines Early Rivers was surely never shown in better form, for the trees, although only small ones, were heavily cropped. Peach Hale's Early, was in similarly good condition. May Duke Cherry was represented by some heavily-laden standards. The Fig was White Marseilles.

In order to demonstrate the way in which Apples may be kept through the winter, spring, and on into the summer so as to join hands with the new crops, Messrs. Bunyard & Co., of Maidstone, staged a grandly representative collection of seventy dishes in as many varieties. All of the fruit was in a splendid state of preservation, shrivelling being almost entirely absent, and from its appearance one would surmise that it was December instead of May. Amongst the numerous varieties it seems invidious to particularise, for they were all good. We may, however, mention Hornead's Pearmain, Calville Rouge Precoce, Chelmsford Wonder, even better for keeping than the well-known Newton Wonder, which was also shown, King of Tomkin's County, Tibbit's Pearmain, Seaton House, Sandringham, Lane's Prince Albert, Hoary Morning, and Bramley's Seedling. Figs and Pears in pots were shown in the back ground, and here, too, we observed samples of the new Strawberry-Raspberry, a Japanese fruit that evidently partakes of the characters of the Strawberry and Raspberry.

VEGETABLES.

THE exhibit of Giant Early Marrowfat Peas of Messrs. Sutton & Sons, Reading, was particularly interesting on account of the revolution which this Firm has effected in the culture of this important vegetable. By the introduction of their new race of Early Giant Peas, possessing as fine a marrowfat flavour as the maincrop varieties, the public can now obtain the choicest Peas ready for use even before the small round-seeded sorts are seen in the greengrocers' windows. It will be remembered that the Peas exhibited by Messrs. Sutton at the Temple Show in 1895 were sent by command to Windsor Castle, and graciously accepted by Her Majesty the Queen. The varieties exhibited were Sutton's Early Giant, Seedling, Excelsior, Bountiful, Empress of India, and A1. Messrs. Sutton also make a grand display of Cucumbers, amongst which Sutton's Peerless, Matchless, Pride of the Market, Improved Telegraph, and A1 are remarkably well shown, particularly the latter variety. The Peas were shown in baskets containing about half a bushel in each. Early Giant was perfect, both as regards pod and seeds, and Sutton's Seedling reminded one of May Queen. Pride of the Market Cucumber, and Sutton's A1 were shown in grand form, as also was Sutton's Every Day.

Messrs. Carter & Co., made a grand display of their Model Cucumber, Climbing French Bean, Darby Stratagem, Daisy and Early Morn Peas, and Duke of York Tomato. And a large collection of vegetables from Mrs. Wingfield (gardener, Mr. Empson), Ampthill, consisting of Peas and Beans in pots, Broccoli, Leeks, new Potatos, Cucumbers, Asparagus, Mushrooms, etc., occupied a large portion of one side of the tent, and the Leeks for the time of the year were particularly fine.

The Horticultural College, Swanley, sent a collection of vegetables comprising Cucumbers and Peas growing in pots. The former was surrounded by small pots of the latter, and these were interspersed with New Potatos, Asparagus, Tomatos, French Beans, and Broccoli, the whole making a very tasteful arrangement.

Mr. Beckett, gardener to Lord Aldenham, exhibited a very fine lot of vegetables, comprising Early Red Milan Turnip, Moon's Cream Marrow, Carter's Perfection Tomato, Sharp's Victor Potato, Holhorn Model and Lyon Leeks, Flower of Spring Cabbage, Perfection Broccoli, and Colossal Asparagus. A collection of Rhubarb was sent by Mr. Frank Chapman, Colchester. The same exhibitor also sent a collection of Asparagus.

MISCELLANEOUS.

The Jadoo Company, Ltd., Palace Gate, Exeter, had a very interesting exhibit of plants grown in Jadoo fibre. These included *Stephanotis*, *Pandanads*, *Dracaenas*, *Caladiums*, *Acalyphas*, *Liliums*, show *Pelargoniums* and *Strobilanthus dyerianus*. All of them were in the best of health, and evidently take kindly to the Jadoo. Some of the plants were in glass pots, and through these the freely interlacing and fleshy roots could be readily seen.

Miss Emmett, 239, Ladbroke Grove, W., exhibited a case of very life-like wax models of Orchids, similar to those fashioned by her for the Royal Gardens, Kew, and the British Museum.

TREE FERNS AND SURFACING.

It is not uncommon to see old tree Ferns in tubs struggling for an existence. It is not always suitable to cut them over at the surface of the soil and re-tub them; but we know that by judicious surfacing they will grow and remain in good health for many years. The surface of the soil is removed several inches deep and replaced with sandy loam and bone meal, made thoroughly firm. Clay's Fertiliser is capital for keeping the plants in healthy growth through the summer. Other fertilisers also do well when not too liberally supplied. We have some plants which have been in the same tubs a dozen years, and the fronds (which started freely into growth at the new year, average 9 ft. (or more) in length. They stand strong heat, and some are often in a temperature near to freezing point, but when kept very cool and airy their growth is shorter.—M. T., Carron, N.B.

Newport, U.S.A., possesses a "Purgatory," and a little way out of it is "Paradise."

QUESTIONS AND ANSWERS.

Bedding Arrangement.—*Bedding*: We consider that *Peargonium Robert Fish* should be placed in the centre as it grows taller, as a rule, than *Begonia Vernon compacta*. By planting the latter in the patches No. 2, it would throw the darker colours as well as the dwarfier plants towards the outside where they would be best seen, and would certainly look better a short way off. Moreover, the darker colours should always be kept towards the outside of a bed, or of a design. *Santolina incana* will answer very well for the dividing lines between the above two. Top the plants by pinching them when on a level with the flowering subjects. *Echeveria secunda glauca* will make a very good edging to the whole.

Double Polyanthus and Green Primrose.—*W. Angus*: The double crimson form is a variety of the garden Polyanthus; but though the crimson petals are very numerous, they are very small, and we do not think it has ever been named. Numerous forms have been raised at one time or another from partly double flowers; but yours were so completely double that the ovary has been developed into petals, partly green and partly coloured, so that you cannot raise seedlings from it. The other is a green variety of the Primrose (*Primula vulgaris*), but we do not find that it has been named in an old list of Primroses and Polyanthus before us. For the sake of distinction you may call it the Green Primrose or *Primula vulgaris viridiflora*. It seems to exist in several gardens, for we had it from another correspondent recently.

Fimbriated Polyanthus.—*David May*: The flowers you send were pretty and deliciously fragrant. The principal distinction about them is the fimbriated character of the segments, which have been increased in number from five to six. They are also very much widened, so that there is no room for them to lie flat, the result being that they have become plaited and more or less deeply divided at the outer edges. This latter character is what you should develop. Do not be content with the present form, but fertilise the flowers with their own pollen, and raise seedlings. If you get a number of plants with fimbriated flowers, intercross them and always select the most deeply fringed varieties. You might ultimately raise something very pretty for border work—a new race in fact.

Worm in Raspberry Buds and Canes.—*D. Stuart*: Your Raspberries are very badly infested with the larvae or grubs of a tiny moth known as the Red Bud Caterpillar (*Lampronia Rubiella*), being named red from the colour of the larvae. You have done

right in cutting off all the buds and destroying them; but you might do this at the first indication of the injury. They should really be burned to prevent any of the grubs from going into the pupae state and from thence to the perfect stage to repeat the injury to your plants another year. We recommend you to have all rubbish cleared away about the plants and burned. The old stems, which have fruited, should also be cut away after the fruit has been gathered and burnt. If there are plantations of wild Raspberries in the neighbourhood of your garden, we would recommend you to destroy them completely, by cutting them down, old and young, so as to destroy any larvae that may be in them, and to prevent their breeding there. Unless this is done your cultivated specimens will be liable to infestation from thence every year. It will require considerable perseverance to get rid of the pest. You might even make a fresh plantation with young canes obtained from another source where the canes are clean, planting them in a different part of the garden. This latter plan is of course an extreme measure.

Lily of the Valley.—*Omega*: This will grow in almost any situation and aspect, but it succeeds best where it can get shade and plenty of moisture, not, however, a saturated soil, but such as might be found in some woods under the slight shade of trees. Therefore, if you can find a spot in your garden that is slightly shaded and moist, that is what you should select. Avoid a south aspect near houses or walls. An open situation would be better than that. If the soil is heavy use plenty of leaf soil or old forcing bed manure. Planting should be done about the end of March, before growth commences.

Vines.—*Omega*: The present is a very good time to plant Vines in an outside border. We take it for granted that the plants are now growing in pots, and that the rods will be inside the vinery. If you perform the operation properly, this is the best time for outdoor planting. Keep the atmosphere of the house moist till the Vine roots have taken fresh hold.

Pear Leaves Blistered.—*M. M'Laren*: All the leaves you sent were affected with the Gall Mites of the Pear (*Phytoptus Pyri*). None of the mites ever have wings at any stage of their existence, but when once they attack a tree it is most difficult to get rid of them. Sometimes a tree may continue in fairly good health for many years, when the mite does not make rapid headway; at other times it succumbs rapidly, when there is no hope of saving it. There was no evidence of the blister caused by the Pear

Leaf Blister Moth (*Tinea Clerckella*), the blisters in that case being large and different in appearance. On one leaf we found a few scales of the Pear Oyster Scale (*Diaspis ostreaefomis*). If they are only in limited numbers you could easily sponge them off the young trees. The *Phytoptus* is more difficult to deal with. The only time you can make sure of getting at the mites is when the leaves newly expand. Some time after that they come out of the leaves by a little hole on the under side, and find their way into the young buds, where they take up their quarters, and penetrate the leaves before they expand. Entomologists have not yet been able to tell us when they quit the old leaves; probably they do it at various times, so that any application of insecticide would have to be applied frequently, and then might fail to have any effect upon the mite. You will have to exercise patience, and not destroy valuable trees, but that is ultimately all that the authorities recommend. The mites must breed in spring, for the eggs are laid inside the blister.

Polyanthus Refusing to Bloom.—*M. M'Laren*: The cause of seedlings refusing to bloom for six or seven years is very interesting. We have noted something similar amongst other plants, including Violas, and conclude that there is constitutional weakness or a tendency to malformation, as in the case of your plants, which prevents them from flowering. Such plants can never be serviceable in a garden.

Names of Plants.—*W. J. G.*: 1. *Laelia purpurata* var., in poor condition; 2. *Fabiana imbricata*. It is hardy in the more favoured parts of the country, particularly near the sea coasts, but gets killed in severe winters.—*Jas. Sivewright*: *Epidendrum atropurpureum roseum*; 2. *Aspasia* sp. (see next week).—*E. Ballard*: 1. *Orchis Morio*; 2. *Cedrus Deodara*; 3. *Buddleia globosa*.—*W. P.*: 1. *Staphylea pinnata*; 2. *Acer circinatum* var.; 3. *Thermopsis montana*; 4. *Erigeron philadelphicus*; 5. *Anchusa sempervirens*; 6. *Geranium sylvaticum*.—*William McIver*: 1. *Cypripedium hirsutissimum*; 2. A hybrid *Rhododendron* which we may be able to name later on when in bloom here; yours evidently has been grown under glass.—*J. B.*: 1. *Brassia verrucosa*; 2. *Oncidium flexuosum*; 3. *Maxillaria tenuifolia*.—*A. T.*: 1. *Primula involucrata*; 2. *Paeonia tenuifolia*; 3. *Aesculus rubicunda*.—*Omega*: The Germander *Speedwell* (*Veronica Chamaedrys*).

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other valuable information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, JUNE 4th, 1898.

NEXT WEEK'S ENGAGEMENTS.

WEDNESDAY, June 8th.—Royal Botanic Society's Floral Fete, at Regent's Park (2 days).

Braintree Show (2 days).
Gardeners' Royal Benevolent Institution, 59th Anniversary Dinner at the Hotel Metropole.

FRIDAY, June 10th.—Sale of imported and established Orchids by Messrs. Protheroe & Morris.

A SECOND VISIT TO THE TEMPLE SHOW.—

While hurrying off to press with the report of a show of the magnitude of that held annually on the Victoria Embankment it is impossible to grasp all the details of importance in the bustle of a short, dark morning. There was indeed no rain during the whole of the three days, but Wednesday was very dark all day inside the tents, though Thursday and Friday, till well through the afternoon of the latter, were a great improvement in this respect. The show was not honoured on this occasion by the presence of royalty; but there were several important visitors, including The Right Hon. Joseph Chamberlain, M.P., Sir Wm. Vernon-Harcourt, Kt., M.P., Sir Trevor Lawrence, Bart., president of the society, Lord Kenyon, ex-president of the Shropshire Horticultural Society, Lady Warwick, Baron Schroder, and Captain Holford, besides the benchers of the Temple, judges and justices in great numbers. The cool, dry weather, indeed, brought out such a concourse of the élite and the people generally of London and the provinces during each of the three days, such as has, probably, never before assembled on any one occasion in the Temple Gardens, not even including the time when Plantagenet plucked the white Rose and Somerset the red one. The cool weather was conducive to the comfort both of the people and the flowers, which were in most cases as fresh as when the judges went round on the opening day.

In spite of unanimity of opinion with regard to the quantity and quality of the Orchids, we think the section was well maintained, and that no other exhibition can boast of a finer or more comprehensive representation of the family. It is true that we have nothing of the £1,000 Orchid on this occasion; but we noted several that had an

equal right to that value as some that have enjoyed the title on previous occasions. There was a falling off in the quantity of tuberous Begonias, though the quality was equally good, if not decidedly better, in the matter of refinement of new varieties than last year. The Caladiums were decidedly in advance of last year, in spite of the general lack of sunshine. Ferns were more numerous and better than last year. That shown as *Phlebodium Mayi*, by Mr. H. B. May, is a decidedly distinct thing, but being yet quite young we shall eagerly await its development to the adult stage. The *Phyllocacti* exhibited by Messrs. J. Veitch & Sons, Ltd., constituted the largest, finest, and most varied collection of these gorgeous flowers we have ever seen in one group. The cultivator, Mr. John Heal, well known to the gardening fraternity, is to be congratulated on his skill in timing the flowers to a date, in spite of adverse weather.

Roses are always a feature of the Temple Show, and on this occasion were more numerous and varied than ever. There was a slight falling away in herbaceous plants, particularly cut flowers from the open, owing to the cold, wet and sunless spring, but their absence has been more than compensated by the larger quantity of pot plants of those and allied subjects shown, necessitating the central bed of tent No. 4 for their reception. Amongst them may be mentioned the extensive collection of *Paeonies* shown by Messrs. Kelway & Son; and the magnificent exhibit of *Clematis*, single and double of the large flowering sorts set up by Messrs. Richard Smith & Co., as detailed in our last issue. The hybrids of the *C. coccinea* type shown by Messrs. Jackman & Son, were more numerous and finer than ever they have previously been. Hardy plants were also well represented by Messrs. Barr & Sons, Mr. T. S. Ware, Messrs. J. Backhouse & Son, Messrs. J. Cheal & Sons, Mr. Pritchard, and others. Show and fancy *Pelargoniums* were not shown last year, but made their reappearance in small quantity on this occasion.

A pleasing sign of the times is the increasing attention being given to hardy trees and shrubs, both fine foliage and flowering subjects; for that is how we must translate the meaning of the presence of six fine exhibits in place of the two or three last year. Messrs. J. Veitch & Sons, have had a large group of them every year during the last ten, and we believe it was never finer nor more varied than that sent up from the Coombe Wood Nursery of the firm last week. Outside the tents were several charming groups, including a very effective exhibit of flowering shrubs from Messrs. J. Cheal & Sons, fine foliage shrubs from Messrs. Fisher, Son & Sibray, and Mr. John Russell.

Fruit and vegetables were more numerously represented, and finer than they have been for several years past. The heaps of Peas, in several varieties of half a bushel each, and the quantities of well-grown Cucumbers, exhibited by Messrs. Sutton & Sons, were remarkable for this early period of the year, showing what can be done with their grand new marrowfat varieties. Mr. Empson, gardener to the Hon. Mrs. Wingfield, had a very large and splendid collection of vegetables; while the exhibit staged by Mr. E. Beckett, gardener to Lord Aldenham, was equally noteworthy, and ample testimony to the capabilities of the British gardener when called upon to exert his faculties. Mr. S. Mortimer, Rowledge, was also strong in his specialities in the way of vegetables. The Horticultural College, Swanley, had a highly meritorious exhibit of Peas growing in pots, which can-

not fail to be fraught with an object lesson for the students attending the instruction given there.

The collection of Apples exhibited by Messrs. Geo. Bunyard & Co., was ample testimony of their skill in preserving British grown fruit in an admirable state of preservation—surely to the limit of the capabilities of the first and best of hardy fruits. Of forced fruit trees in pots the large collections shown by Messrs. T. S. Rivers & Son, and Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., were such as rarely come before the public in May. Gathered fruits were well represented by that champion of the north, Mr. McIndoe, gardener to Sir Joseph Pease, M.P. Descriptions of the finest new plants will be found under "Plants Recently Certificated" in another column.

Strawberries and Cream may already be had for 6d. at some of the seaside resorts on the south coast.

Kew Gardens, it is announced, will be opened to the public at 10 a.m. instead of noon as hitherto, commencing on Wednesday, 1st June.

The New Race of Marrowfat Peas shown by Messrs. Sutton & Sons at the Temple Show, as noted in our last issue, again received the highest award in the vegetable division. On a previous occasion by command of the Queen they were sent to Windsor for Her Majesty's inspection and served at the Royal table the same evening. This year two baskets (Sutton's Early Giant) were taken from the show to Marlborough House by command of the Prince of Wales for use at the Derby Dinner given by His Royal Highness.

Gold Medals from the Linnean Society.—At the anniversary meeting of the Linnean Society on the 24th ult., the Gold Medal of the society was awarded to Surgeon-Major George Charles Wallich, M.D., in recognition of his researches into the problems connected with bathybial and pelagic life. In consequence of his inability to attend in person, his son was deputed to receive it on his behalf. At the same time a special Gold Medal was awarded by the society to Sir Joseph Dalton Hooker, G.C.S.I., C.B., P.-P.R.S., on the occasion of the completion of "The Flora of British India," in recognition of the eminent services rendered by him to science during sixty years of unremitting labour.

French Strawberries in Britain.—The crop of Strawberries in the Plougastel district of France for 1897 was estimated at 2,870 tons by the British Consul at Brest. Of this quantity 600 tons were sent to Plymouth by steamers chartered by some of the growers. About 345 tons went *via* St. Malo to Southampton and Paris. The remaining 1,925 tons were retained in the neighbourhood of Brest. The Strawberries arriving at Plymouth are sent off by special trains to London, Liverpool, Manchester, Leeds, Glasgow, and Bristol. Last year two steamers plied regularly between Plougastel and Plymouth, but a third is to be chartered this year by another syndicate of growers. This method of sending fresh fruit has hitherto been very successful.

Phyllocactus latifrons.—The lower part of the stems of this species are round or angular and slender, while the upper portion, but chiefly the branches, are suddenly widened and flattened so as to appear like leathery, oblong leaves. Flowers are produced from the branches in considerable abundance, and the long, funnel-shaped buds expand during the evening revealing a great number of lanceolate, delicate white petals, shaded with amber outside and resembling those of the night flowering *Cereus*. Like many other white flowers they are sweetly scented. The species is one of the strongest growers in the genus, and is of the easiest culture in a rich porous soil, when supplied with plenty of moisture during the growing season, but particularly in hot weather. The plant should be kept rather dry in winter. Well established plants throw up stems 3 ft. to 4 ft. long in a season, and then throw out branches which arch over gracefully. The *Cactus Journal* for May gives a figure of this species, which we think might be tried for the purpose of hybridisation.

Sturmer and French Crab Apples have been coming into Covent Garden, during the past week, in fine condition.

English Peaches and Nectarines are already being sold in Covent Garden, the earlier arrivals of the former fetching from 3s. to 6s. per dozen, and the latter, 4s. to 6s.

The Stirling Seed Establishment, belonging to the well-known firm of Messrs. Drummond & Son, was destroyed by fire on Whit Monday. It is estimated that £10,000 will only just cover the damages.

Gamboge is a Gum resin, which exudes from the stems of several species of tree, and receives different names according to the country from whence it is obtained. Ceylon Gamboge is obtained from *Garcinia Morella*; Siam Gamboge from *Garcinia Morella pedicellata*; and Mysore Gamboge from *Garcinia pictoria*. American Gamboge is the juice of *Vismia guianensis*.

Midland Great Western Railway of Ireland.—This company has generously offered to carry Potato-spraying powder and machines free, at the owner's risk, for the current season. This can scarcely fail to be of the utmost value to growers of the esteemed tuber in the Emerald Isle, and especially so now that spraying as a preventive as well as cure for disease is so extensively practised.

The Rook and Cape Colony.—The writer on African sport and natural history strongly opposes the proposition to introduce the rook into Cape Colony. He remembers the case of the rabbit in Australia, and thinks it would be equally dangerous to introduce the rook to the Cape. If it would flourish and multiply there it might be the means of diminishing the locust pest, and that would far outweigh the damage it might occasion to cultivated crops.

The Myrobolan Plum.—Though this is often recorded as a distinct species, it would seem that the garden form enjoying the name is only a variety. In any case, trees raised from the stones do not come true to the parent tree, but give rise to seedlings, generally inferior to the parent as far as the fruit is concerned. A coloured illustration of a fruiting spray is given in the *Bulletin d'Arboriculture, de Floriculture, &c.*, for April last, showing dark red, globular fruits about the size of a Cherry.

Spring Poetry.—We cull the following from the columns of the *Florists' Review* for April 28th. It is nothing if not original.

Spring! oh, Spring!
You're not such a beautiful thing,
And poets all lie when they sing
Of your manifold charms, naughty Spring!
Meadly Spring!

For 'tis the grower that mighty well knows
You're the cause of one-half of his woes,
And you can't get a price for a Rose
That'll pay for the wear of the hose,
Hang you, Spring!

The Hawthorns on Hampstead Heath.—It is evident that the youth of London has not yet been taught to break away from the old custom of tearing down branches and boughs of the Hawthorn when in bloom. Adults as well as children, however, are guilty of this practice on Hampstead Heath and Parliament Fields, notwithstanding the injunctions of the notice boards. It may be difficult or impossible to stop the practice by the public highways and in country lanes, but surely this cannot be said of a London recreation ground under the care of the the County Council.

Strawberries in Fancy-handle Baskets.—Growers of this soft fruit are now adopting a method of marketing the same in fancy-handle baskets, according to the *Journal of Greengrocery*. The less that Strawberries are handled the better they appear when they reach the consumers, so that if neatly packed in baskets as they are gathered, no further handling is necessary. The baskets come from France, and having thus got the start of us it is considered that English basket makers cannot be expected to turn out so light and serviceable an article at the money. We think, however, that they might be encouraged to furnish a cheap article of their own design for the home growers. They might be used for Peaches, Nectarines, Apricots, and other soft fruits.

Gum is imported into this country at the rate of 327,316 cwt. annually, and the estimated value of it is £1,074,218.

Erratum.—The illustration on page 617 was by a slip of the pen named "Dracaena Sanderi." For this read Pandanus Sanderi, as described on page 619.

The Yeast Plant (*Saccharomyces cerevisiae*) is said to be only rooth of a millimeter in diameter. It must therefore be cultivated in greater numbers than any garden, field, or forest plant.

Eulophiella peetersiana.—A plant of this new and rare species of Orchid was sent to the Sale Rooms of Messrs. Protheroe & Morris on the 27th ult., by M. A. Peeters, St. Gilles, Brussels, and was knocked down at £39.

The Neill Prize.—An Edinburgh correspondent directs our attention to an error in last week's issue, p 615, in the first column. The fund for this prize was founded by Dr. Neill and not Patrick Neill Fraser, Esq., the late treasurer of the Royal Caledonian Horticultural Society, and nephew of the founder. Mr. Angus McLeod, superintendent of the City Gardens, Edinburgh, and Mr. John Paterson, of Saltoun Hall, Haddingtonshire, one of the most outstanding plant judges in Scotland, are two of the recipients of the Neill prize still living.

McDougall's Insecticide Fumer.—The "Fumer" is a handy little article that may be accommodated in the coat pocket, yet one of them is sufficient for a house of 1,000 cubic ft. capacity. It is like a short tin of mustard, the lower portion of which contains a small bit of specially prepared candle, and is perforated at the sides to admit air. The top is a closed box containing the insecticide. Having ascertained the cubic contents of the house, the operator places the requisite number of "Fumers" on the floor, and taking off the top box proceeds to light the candle in the lower one. A round lid, which is soldered or fixed on the top of the box containing the insecticide is then prised off so that the fumes can escape when roused to action by the heat of the candle. The box is replaced over the candle, and the operation is complete. Having lighted and placed all the "Fumers" in this way the gardener can then make his exit leisurely and leave the "Fumers" to do their work. They quickly destroy thrips, greenfly, and other vermin, and leave no bad odour behind as in the case of fumigation with tobacco rag or paper. The "Fumers" are issued by Messrs. McDougall Bros., 10, Mark Lane, London.

Ferns growing in Chancery Lane.—It may be taken for granted that many years have elapsed since Ferns grew wild in this busy thoroughfare of London; yet what shall we say of Ferns which have sprung up without human intervention, and without anyone knowing it until the other week. In a vault of two or more compartments underneath the roadway and the side pavement at 33, Chancery Lane, seedlings of *Scolopendrium vulgare* and *Asplenium bulbiferum* have sprung up in some quantity on the bricks and in the seams between them. There are also some mosses, including a species of *Hypnum*. They occur at three separate places, one under a pavement light, and the other two under coal plates in the pavement overhead. One *Scolopendrium* had a leaf 8 in. long, the other seedlings being much smaller. The pavement light and the coal plates are filled in with thick glass for pedestrians above, and as one stands in the vault the feet of a continuous stream of people may be heard passing over the roof of this curious fernery. The Ferns had come there in the form of spores, which may have blown in at a crack beside the lights or while the coal plates were open. Water may have been the vehicle of conveyance as the vault is damp; and the spores might have been carried down while it was raining. The light that could penetrate through the thick glass had been just sufficient for the germination and development of the seedlings. Our attention was called to the presence of this unsuspected find by Mr. F. Hudson, 1, Houghton Street, Strand, a builder who is now doing some repairs in the vault. The fate of the Ferns, we fear, is sealed under those conditions; but their presence, growing spontaneously in the heart of London, is by no means a common occurrence.

A Professional Bird-catcher.—Berlin employs a bird-catcher at a salary to supply scientific institutions with birds, nests and eggs. He is the only man in the empire who has this permission.

Gooseberries are a glut upon the market, making it self evident that the past winter and spring have not been unfavourable to this crop. Growers would do well to merely thin the crop, leaving a good picking on the bushes for harvesting in the ripe state.

Pilocereus senilis var. *longisetus*.—A contributor to the *Cactus Journal* for April has something to say about the rate of growth of this curious Cactus. He obtained an old plant, amongst some young ones, in the autumn of 1855. From this plant he has taken pieces at various times which now measure 2 ft., 2 ft. 5 in., 1 ft. 6 in., and 10½ in. high respectively, or a total growth of 6 ft. 9½ in. in forty-three years.

Richardia Little Gem.—Many cultivators who have tried this pretty miniature *Richardia* have failed with it. Considering the number of failures with it which we have observed, the success which has attended its culture under the care of Mr. Geo. Reynolds, gardener to Messrs. de Rothschild, Gunnersbury Park, Acton, is remarkable. It has been flowering freely for considerably over two months in the Rose house. The secret of this success consisted in rubbing off all the young tubers when rotting the old ones. When the plants are well into growth they are liberally fed. When the spathes are cut others continue to be thrown up from the same tubers. Five to seven or more spathes would be obtained from a few tubers in a 32-sized pot. From a 12-sized pot an average of twenty-five spathes is secured, while some pots will throw up thirty of them in succession during the course of growth in the Rose house. When the plants have done flowering, or when the space is required, they are placed outside to mature, preparatory to starting into fresh growth. Most of them had been placed out of doors by the middle of May.

MAGNOLIAS.

THERE are a score or more varieties of these lovely flowering shrubs or trees which give us a succession of flowers from early March right up to the appearance of frost. Often we find a few stray blooms in the month of November of *Magnolia grandiflora*. All the species thrive better if given a sheltered position, and a fairly rich soil.

We have some noble specimens in the arboretum here, some of them reaching 50 ft. in height. *M. stellata* was the first to open its flowers with us this season. I consider this is one of the prettiest of the whole family, and is pure white; it flowers very freely, and is slightly perfumed. Ours is only a small hush as yet, but I can well imagine what a grand sight a bush 15 ft. or 20 ft. high would be. It continues in flower a long time; it began early in March, and is still in bloom (the first week in May). It is assiduous, the flowers generally appearing in advance of the foliage, similar to *M. conspicua*, another early kind, and valuable to the planter on account of its earliness. This latter is very fragrant, and opens early in March if given a wall. It attains a height of nearly 50 ft. On account of our fickle springs it often gets much damaged when in flower. There are one or two of this variety named *M. c. soulangeana*, with tints of purple on the petals, and another, *M. c. s. nigra*, with deeper tints. *M. purpurea* is another pretty species, flowering early in spring, but not so fragrant as the last-named; still, it is a desirable kind to plant, and makes an excellent bush.

M. fuscata is the smallest flowered one I am acquainted with, but none the less fragrant; in fact, one flower will scent a large room. Generally speaking, this is a greenhouse species, but it is quite hardy on a south wall, with us in Devon, and retains its narrow green foliage throughout the year. *M. grandiflora*, as its name implies, is a beautiful object when nicely in bloom. It commences to flower in June, and continues up to the time frost puts a stop to it, as before mentioned.

M. glauca is another fine species, with white flowers, and very fragrant. This is an evergreen, and forms a spreading tree 15 ft. to 20 ft. high. *M. glauca thompsoniana* has flowers very much larger than the latter type, and is often called *M. g. major*. The foregoing are the cream of them, I consider, though

we have several other varieties about the grounds, namely, *M. acuminata* (Cucumber tree), with very large leaves and flowers of a glaucous green, and *M. auriculata* (syn. *M. Fraseri*), with yellowish-white flowers. This, too, has very large leaves, and looks well on the lawn, but the wood appears rather crisp, and quickly breaks off when a strong wind prevails if the tree is at all exposed.—*J. Mayne, Bicton.*

CRICKET.

HURST & SON v. GLOSTER & SONS.

THE match was played at Walthamstow on Whit-Monday, May 30th.

THE RULES OF COMPETITION.

THE recent dispute in your columns, pp. 566-7, and 583, upon the awards given at the Belfast Chrysanthemum exhibition, shows how important a subject this is. No matter what the class is or the geographical position of the show held, abstractions and deviations from rules are highly dangerous, and full of critical explosives, which, sooner or later, are sure to burst forth in front of judges, exhibitors, and the public interested.

It is well to remember a rule is only another name for the whole of the committee, and the sum total of these is law, and judges are subordinate thereunto. Therefore, how imperative it is that all, especially judges, should avoid complication, should keep well to the concrete, and make themselves thoroughly conversant with the true meaning of the schedules that are posted or placed in their hands by the secretary previous to starting on their mission.

To those who have followed the discussion it is quite apparent, even without acknowledgement, that the—taking a thing for granted—the had not seen—the second day's discovery—and the should not have done as I did—conditions were the predominating causes.

What names should have been attached and collarets detached under and around the chests and necks of Madame this and blooms of others, but were not, are inconsequential mistakes and violations, whichever they may be, and are best left for the exhibitors and their assistants to settle amongst themselves.

Disqualification upon a single wrong detail, when every other is of surpassing excellence, is certainly hard, and judges who do so do it very reluctantly, and sympathetically at the same time for the exhibitor. Faults and mistakes are very often dearly paid for; the parties concerned take a lesson therefrom, and are very cautious in after years. 'Tis an old saying that when a director on the railway gets killed we may look out for safer travelling.

I have written this in no spirit of disparagement to anyone. That committees expect too much from their judges in some cases is obvious, and if a timely

disqualification were adopted and adhered to by the committees of many horticultural and floral shows it would not encroach upon the time of the judges, who often have very little margin for proper discrimination.—*A Country Judge.*

PLANTS RECENTLY CERTIFICATED.

THE under-mentioned awards were made by the Royal Horticultural Society, at the Temple Show, on the 25th May:—

Orchid Committee.

CATTLEYA LABIATA MENDELII AMELIA, Nov. var.—Here we have a large and beautiful *Cattleya* of a chaste light colour, the sepals and the back of the petals being faintly tinted with blush on a white ground. The lip was even whiter, with a pale purple blotch on the disc, a lemon throat, and some pale purple lines at the base of the tube. Award of Merit. W. P. Burkinshaw, Esq. (gardener, Mr. J. T. Barker), The West Hill, Hessle, Hull.

MILTONIA BLEUANA ROSEA GIGANTEA, nov. var.—This is notable for its huge flowers which measure 5 in. the long way and 3½ in. across the lip. The latter is white, tinted with blush. The basal third of the petals is rich violet-purple and the rest white. Award of Merit. M. Jules Hye-Leysen, 117, Coupure, Gand.

CATTLEYA MENDELII MRS. E. V. LOW, Nov. var.—The sepals and petals of this handsome variety are of the most delicate blush-white. The lamina of the lip is beautifully frilled or crisped, rather deeply fimbriated and rich, bright purple with a white margin. The throat is golden-yellow. Award of Merit. Messrs. Hugh Low & Co., Bush Hill Park, Enfield.

DENDROBIUM DALHOUSIEANUM SALMONEA, Nov. var.—The sepals and petals of this variety are of a clear yellow, while the two large, salmon-red blotches on the lip make it one of the most distinct varieties of the species we have seen. First-class Certificate. Messrs. Hugh Low & Co.

CATTLEYA MENDELII OAKES AMES, Nov. var.—The petals of this choice and richly coloured *Cattleya* are soft rosy-pink with a large violet-purple blotch at the apex. The sepals are paler. The intense crimson-purple lamina of the lip is the feature of the flower. The throat is pale yellow and the side lobes mostly white. First-class Certificate. Messrs. Hugh Low & Co.

LAELIOCATTLEYA GOLDEN GEM, Nov. hyb. bigen.—This is the progeny of *Cattleya intermedia* x *Laelia flava splendens*. The sepals and petals are golden-yellow, and in shape intermediate between the parents. The tube and side lobes of the lip are pale yellow, while the crisped middle lobe is rich crimson-red, overlying yellow. Award of merit. Messrs. Charlesworth & Co., Heaton, Bradford.

LAELIOCATTLEYA ADMIRAL DEWEY, Nov. hyb. bigen.—This handsome and striking bigeneric hybrid was raised from *Cattleya Warnerii formosa*, crossed with *Laelia elegans Mastersii*. The sepals and petals are of a soft rosy-pink. The lamina of the lip is of a rich crimson-purple, wavy at the margins, and the feature of the flower. The tube is pale purple externally, with a central crimson band internally. First-Class Certificate. Messrs. Charlesworth & Co.

CATTLEYA FERDINAND DENIS, Nov. hyb.—The parentage of this hybrid was *Cattleya Acklandiae* x *C. gigas*, the former being the seed bearer. The hybrid is remarkably distinct. The oblong, blush-pink petals have reddish-purple markings at the apex. The petals are ovate, suddenly narrowed into a broad claw, and rosy-blush with darker veins. The lip has a short, open, and white tube, with pink side lobes. The large, transversely oblong lamina is crimson-purple, with a transverse yellow band at the base. The tube beneath the purple column is rich purple. First-Class Certificate. Messrs. Charlesworth & Co.

ODONTOGLOSSUM CRISPUM DECORUM, Nov. var.—The pure white ground of this variety has a cluster of reddish-brown blotches, more or less amalgamated in one mass on the centre of the sepals. A darker and large blotch on the petals is even brighter. The lip has numerous spots on a white ground. The bright blotches on the pure white ground are very effective. Award of Merit. Messrs. Linden, Brussels.

ODONTOGLOSSUM PESCATOREI BELLATULUM, Nov. var.—The sepals of this wonderfully pretty variety had a large violet-purple blotch towards the apex, and there were one or two smaller blotches on the centre of the petals. The lip had darker violet spots round the crest. The pure white ground of the flower set off the spotting beautifully. Award of Merit. Messrs. Linden, Brussels.

ODONTOGLOSSUM ADRIANAE VENUSTUM, Nov. var.—The sepals of this strikingly beautiful variety are densely spotted and blotched with brown all over a creamy ground. The spotting of the petals is darker and the ground whiter. The brown mottling of the white lip is also very pretty, and completes a highly, meritorious natural hybrid between *O. crispum* and *O. hunnewellianum*. First-Class Certificate. Messrs. Linden, Brussels.

ODONTOGLOSSUM CRISPUM ZEBRINUM, Nov. var.—The blotches on the sepals in this case often take the form of transverse bands, hence the varietal name. They are of a rich, reddish Chestnut, as they are on the petals, but they are roundish on the petals, with numerous small ones at the base. There is also a rich blotch on the lip with a few smaller ones. Award of Merit. Messrs. Linden, Brussels.

ODONTOGLOSSUM CRISPUM-HARRYANUM, Nov. hyb.—In this we have a remarkable hybrid between the two species indicated by the name. The oblong sepals are rich brown, with a yellow apex, and a few yellow bands on the brown. The petals are lanceolate, rich brown, marbled with pale yellow, shaded violet near the base, and yellow at the apex. The lip is flatter than in *O. harryanum*, as are the sepals and petals, creamy-yellow on the upper half, and spotted and blotched with violet and brown on the lower half. First-Class Certificate. M. Chas. Vuylsteke, Loochristi, Gand, Belgique.

ODONTOGLOSSUM CHARLESIANUM, Nov. hyb. nat.—This would appear to be another hybrid between *O. crispum* and *O. hunnewellianum*. The flowers are moderate in size and round. The sepals are heavily blotched with rich chestnut-brown, the blotches or spots on the ovate petals being much smaller. The lip also has three large and numerous small blotches. Award of Merit. M. A. Madoux, Anderghem.

MILTONIA VEXILLARIA EMPRESS VICTORIA AUGUSTA, nov. var.—The sepals of this handsome variety are rosy-pink with white edges, but the petals are dark rose-purple, with paler veins. The lip is darker or more intense rose-purple, with a triangular base of white, on which are the yellow crest and three crimson rays from it. Award of Merit. Messrs. James Backhouse & Son, York.

Floral Committee.

PHYLLOCACTUS EPIRUS.—The flowers of this grand variety are 7 in. across, with numerous bronze, oblong petals of a charming shell pink; the inner ones are the broader, rounded at the ends and cuspidate. The great brush of stamens and the style are white. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

PHYLLOCACTUS AGATHA.—The flowers in this case are smaller, of a soft salmon-red and very distinct. The petals are rounded at the end, cuspidate, and the innermost ones are elliptic. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

LILIUM RUBELLUM.—Here we have a charming new species of *Lilium* like a miniature *L. Kramerii*, with nodding, funnel-shaped flowers, and broad overlapping segments varying from pale pink to reddish purple. In some of the flowers are a few red spots in the throat. First-class Certificate. Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester.

AURICULA SNOWDROP.—While the buds are expanding they are of a greenish-yellow hue, but when fully developed they are pure white, with numerous overlapping petals arranged round one centre, and forming the finest double *Auricula* we have seen. The leaves are devoid of farina, large and obovate-elliptic. Award of Merit. Mr. Richard Dean, 42, Ranelagh Road, Ealing, W.

PHLEBODIUM AUREUM MAYI.—The fronds of this magnificent new form assume a gracefully arching habit. The pinnae are very much broader than in the type, deeply cut into oblong, blunt segments, which are so numerous that they cannot lie flat, but become beautifully undulated. The stipules often assume a purple hue, which is continued along the rachis, and most of the veins, primary and secondary. First-class Certificate. H. B. May, Dyson's Lane Nurseries, Upper Edmonton.

HOLLY GOLDEN KING.—The leaves of this new

Holly are of large size, oblong-elliptic, dark green edged with golden-yellow, fading to a paler hue in winter, when they are hard and leathery. The plant is a sport from *Hedginsii*, and is a remarkably vigorous grower, besides being perfectly hardy in the far north. Award of Merit. Messrs. Little & Ballantyne, Carlisle.

ANTHURIUM SCHERZERIANUM SENATEUR MONTEFIOR LEVIS.—The upper surface of the spathe of this beautiful variety is thickly marked with crimson-scarlet blotches, made up of numerous small spots, scattered over a white ground. The back of the spathe is almost wholly crimson. The leaves are those of the type. Award of Merit. M. L. De Smet-Duvivier, Ghent, Belgium.

ACALYPHA SANDERI.—For description of this striking new plant, see p. 619, and the illustration, p. 615. First-class Certificate. Messrs. F. Sander & Co., St. Albans.

CALADIUM AMI SCHWARTZ.—The leaves of this remarkably distinct and pretty variety are triangular, almost truncate at the base, and of a rich crimson-red with brighter veins and a narrow, olive-green margin. Award of Merit. Messrs. F. Sander & Co.

ARECA ILSEMANNI.—The leaves of this Palm are pinnate with irregularly arranged linear-lanceolate pinnae, of a dark green, and gracefully arching. The young leaves and their petioles are of a rich dark bronze. Award of Merit. Messrs. F. Sander & Co.

LICUALA JEANENGEYI.—The leaves of this beautiful fan Palm are nearly circular, but divided into seven or eight segments that are cuneate, truncate at the apex and crenate there. The petioles have short hooked spines on their edges. First-class Certificate. Messrs. F. Sander & Co.

ROSE AURORA.—This is the latest addition to the ranks of the hybrid Teas. The flowers are large, of great depth and substance, and good shape. The colour is a rich rosy-pink. The foliage is stout, the stems strong, and the constitution sturdy. Award of Merit. Messrs. Wm. Paul & Son, Waltham Cross, Herts.

EREMURUS ROBUSTUS ELWESIANUS.—This is a seedling from the well-known *E. robustus*, but differs from it in being fully three weeks earlier in flowering. It is also a rather stronger grower, and the spike reaches an enormous size, carrying an innumerable quantity of flowers. There is also a shade more pink in the flowers, otherwise they are the same as those of the type. Award of Merit. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N.

TUBEROUS BEGONIA MR. DUNBAR-WOOD.—Here we have quite a distinct colour break, and a proportionally valuable plant, both for what it is and for what it may lead to. The flowers are of medium size, double, and approaching the *Camellia* type, although they are somewhat loose. The colour is a rich rosy-salmon of great delicacy. Award of Merit. Mr. T. S. Ware.

TREE PAEONY JUAN DE RESZKE.—The flowers of this new tree *Paeony* are of huge size, some of them measuring full 10 in. in diameter. They are pure white, and semi-double. This is certainly one of the finest varieties in cultivation. Award of Merit. Messrs. Kelway & Son, Langport, Somerset.

TREE PAEONY HENRY IRVING.—Here the blooms are also large and imposing, but the colour is deep black-crimson, a most effective hue in the bright sunlight. Award of Merit. Messrs. Kelway & Son.

TREE PAEONY JULIUS CAESAR.—This is a semi-double variety of great beauty. The flowers are fully as large as those of the two varieties mentioned previously, but the colour is a glowing crimson. The petals are prettily serrated. All three of these forms are very free-flowering and perfectly hardy. Award of Merit. Messrs. Kelway & Son.

CALADIUM GUARATINGUETOR.—For description of this *Caladium* see the list of plants certificated at the summer show of the Royal Botanic Society at Regent's Park on May 11th, p. 599. Award of Merit. Messrs. John Laing & Sons, Forest Hill, S.E.

Fruit Committee.

APPLE ONTARIO.—The fruits of this variety are of large size, oblate, and five-angular round the half-open eye, which is situated in a rather deep moderately wide cavity. The skin is bright yellow and richly tinted with red on the exposed side. It is a splendid keeper, as the season amply testifies, and is a kitchen Apple of first-class quality. Award of Merit. Messrs. Geo. Bunyard & Co., Maidstone.

EALING GARDENERS.

ON the 21st ult. about forty members of the Ealing and District Gardeners' Society paid an afternoon visit to Gunnersbury House, Acton, at the instance of that well-known and much-respected horticulturist, Mr. James Hudson, who so ably presides over this establishment. Tea was provided at 6 o'clock, through the generosity of Leopold de Rothschild, Esq., Mrs. Hudson presiding, while Mrs. Snow may be said to have occupied the vice-chair. After full justice had been done to the repast, Mr. C. B. Green proposed a very hearty vote of thanks to Mr. and Mrs. Hudson for their kindness in making such admirable arrangements on their behalf. This was duly seconded by Mr. F. Read, and met with an enthusiastic reception. Mr. Hudson replied very favourably, and said that he was always pleased to assist the members of this society, or otherwise to advance, as far as lay in his power, the interests of gardening generally.

The tea took place in the long room known as the "Museum," overlooking the terrace, the lawn, the lake, and the beautiful trees beyond. These latter being just now in their full spring glory of many hues and tints, the view from the windows was very fine. The Rhododendrons, Azaleas, and other shrubs also contributed to the general effect, while the verdure of the grass was at its very best. The grounds of Gunnersbury House are not extensive, but the art which does mend Nature has been so aptly employed that Nature might well complain that she has been practically superseded.

After an inspection of the scented-leaved Pelargoniums, of which there is a unique collection, the party descended the sloping lawn, noting here and there fine specimen plants, shrubs, or trees. The Judas Tree (*Cercis Siliquastrum*) came in for much comment on account of its associations, and the fact that it was completely smothered with bright purple flowers. Some clumps of hardy Bamboos attracted notice, while the choice assortment of Nymphaeas in the lake, although not in bloom, were much admired. Thence the glasshouses were visited, the ventilation noted, the remarkable productiveness of the fruit trees, the size and quality of the fruit, the vigour and health of the various subjects under Mr. Hudson's care, the order and cleanliness everywhere apparent, the condition of the Vines, Peaches, Nectarines, &c. All these things were so many object lessons to the visitors, and so much testimony to the skill and ability of Mr. Hudson and his staff.

From the fruit under glass to the fruit in the orchard and on the walls is not a long way—except in point of time—for while the former has arrived at the acme of perfection under the watchful eye of the cultivator, the latter has yet to run the gauntlet of the vicissitudes of our changeful climate. The vegetable department also was inspected and approved, and much valuable information thereby imparted. As Gunnersbury House Gardens have been frequently reported on in these columns it is unnecessary to say more than that those who were privileged to perambulate them were amply rewarded, and expressed themselves in such terms as only the practical gardener can.

The Orchid Grower's Calendar.

AERIDES.—This is one of those beautiful genera of Orchids, which at present are somewhat out of fashion, the reason being, perhaps, that they do not lend themselves to the wiles of the florist as do such kinds as Cattleyas, Odontoglossums, Oncidiums, &c. Only in a few representative collections do we find them appreciated as they deserve.

Coming as they do from India and tropical Asia, it is easy to see that to grow them well they should be accommodated with plenty of heat and moisture. Collectors tell us that they are found clinging to branches of trees which overhang running streams of water, so that to succeed we should as far as practicable follow the dictates of nature in this respect by putting shallow tanks underneath the middle stages.

The growing season is from April to October, during which time the night temperature should range from 70° at night to 85° to 90° by day with

sun-heat. They must, of course, be shaded from the direct rays of the sun, or considerable damage will be done to the foliage; but a deep and constant shade should be avoided, or they will flower but sparsely. They may be grown in baskets, pots or pans; but, in any case, the drainage must be ample, so that the copious supplies of water which they require during the growing season may pass freely away.

Sphagnum moss and potsherds broken up fine and mixed are about the best materials to grow them in, although they do not object to a layer of good peat underneath a top-dressing of moss. This genus may be said never to rest, and, as a natural consequence, should never be allowed to get dry. *Ae. crassifolium*, *Ae. crispum*, *Ae. Fieldingii*, and *Ae. Lawrenceae* are some of the best. *Ae. vandarum* differs from those mentioned by having terete foliage, which points to their being found in rather exposed positions, and at times to a lengthened period of drought.

Sir John Kirk grows and flowers it well in a warm greenhouse, where it receives but very little shade, and to him I am indebted for the above hints respecting the climatic conditions in its native home. I should say that his plants are growing on rafts with just enough sphagnum moss to keep them going.

POTTING.—In large collections there is always something that requires doing; and it is better to do it even if the season is a bit advanced, than let it go undone.

CYMBIDIUMS.—We have left our spikes on a long time—in fact, they are only just cut—so that we are late in repotting them. We shall, however, get them done at once, giving a good shift. The compost we find best suited to them is good fibrous loam, peat, and a little cow dung, and sand.

WORKING THE HOUSES.—The principal work now onward is the careful attention to shading, airing, and affording plenty of moisture. Our summers are all too short, so that we must make the most of them by shutting up fairly early, as there is nothing like sun-heat.—C.

Kitchen Garden Calendar.

WEEK'S WORK.—Since my last remarks were penned we have had some very peculiar weather, for on the night of the 12th ult. we registered about 8° of frost, and as this was shortly after a heavy fall of rain considerable damage was done to kitchen garden crops in general. Peas in bloom suffered considerably, as many of the early flowers were killed. Since that date it has rained more or less most days, which has rendered operations on stiff land most difficult, and work in this department has been almost at a standstill. With us about 3 in. of rain has fallen during that period. With such weather weeds grow apace, and as the hoe cannot be plied with much success, recourse must be had to hand weeding as soon as the soil is sufficiently dry to work upon.

All seedling plants should receive attention at the first favourable opportunity. As the soil has now been thoroughly moistened, proceed with the planting out of Cauliflower for Autumn use, also Brussels Sprouts, Borecole, Savoys, and early Broccoli. With regard to all these, if space cannot be found for them to be planted out permanently, better prick them off about 6 in. apart, as they will soon spoil if allowed to remain close together in the seed bed. There has been no lack of all kinds of green vegetables this spring, and the late showers having retarded the tendency to run to seed abundant supplies may be had for some time to come. The tender sprouts of Sutton's Favourite Borecole have been and are still much appreciated, while the supplies of Asparagus have been more plentiful than usual. Where young beds of this vegetable were planted last month the plants have made satisfactory progress. Seedling plants should be thinned to 6 in. apart as soon as large enough to handle, the thinnings if required may be transplanted in rows a foot apart, when they will make strong plants by the autumn.

PEAS for a late crop should be sown. It is not too late yet to sow the best marrow kinds, particularly in the southern districts, but further north the second earlies will stand a more favourable chance should the autumn be wet. Peas sown now will usually

give a supply in September, while those sown about the latter end of June will continue fruiting until quite late in the season should the weather be favourable.

BROAD BEANS are not much in request late in the season, but where a constant change of vegetables is required these will be found very acceptable. There is often much difficulty in growing Broad Beans so late in the season, as the plants frequently suffer from the attacks of Aphis. A moist rather rich soil should be chosen, that the plants suffer no serious check in hot weather. Runner Beans will now be making rapid progress. To prevent the young vines from becoming entangled put the stakes to them as soon as they have made the first rough leaf. These may be successfully grown without stakes by pinching the hearts out of the plants when about six inches high, this will induce them to make lateral growths.

CELERY for a succession may now be planted in the trenches, and young plants in the seed bed should be pricked out. Tomatos should also be planted in warm situations such as a south wall or fence. It is seldom that those planted in the open quarters ripen their fruit satisfactorily, thus causing a waste of time and labour. Ridge Cucumbers that were raised in frames should now be planted on heaps or ridges out in the open. The same remark applies to Vegetable Marrows. Continue to make small sowings of Turnips, as young tender roots are far preferable to those coarse, overgrown specimens one sometimes sees. When the weather is favourable plant out Lettuce, choosing a piece of well manured ground to grow this crop on, for the more moisture the plants have the finer and better flavoured will be the result. Capsicums may now be planted on the warm border, allowing about a foot between the plants. Keep a sharp look out for Aphis, as they are often very troublesome to these plants.—*Kitchen Gardener.*

Gleanings from the World of Science.

AT the meeting of the Scientific Committee of the Royal Horticultural Society on the 10th ult. the undermentioned subjects were discussed.

Morchella, Species.—Some specimens were sent of a small species of this fungus, which appeared in a garden bed; but the locality was not recorded.

Peas, Decayed.—Mr. Cook, The Croft, Detling, Maidstone, forwarded some young plants of the "American Wonder," which had failed to grow. They were sown last November, and while many are doing well, others close by turned a sickly yellow. Mr. Sutton observed that his experience was that no wrinkled Peas, as the above, were suitable for autumn sowing; the skins, being more delicate than those of round Peas, will not stand the winter so well. This was, therefore, the probable cause of failure.

Freesia Bulbs Arrested.—Mr. F. Egbert Hollond, Satis House, Yoxford, sent some bulbs which had been planted last July, had never thrown up any leaves, but had formed fresh bulbs upon the old ones, which had withered. It appeared to be a case common in Potatos, when it is called super-tuberation; fresh tubers being formed at the expense of the old ones. It was possibly due to the Freesia bulbs having been planted at the wrong time of the year, energy being expended in a wrong direction.

Cineraria Hybrids.—Mr. James, Woodside, Farnham Royal, Slough, sent a collection of hybrids raised between *C. lanata* (mother) and the progeny of *C. cruenta* crossed with the garden race. They were a small selection of a numerous progeny, the greater number of which were said to resemble the garden form; but the present ones had a tomentose stem and branches, as well as the under surface of the leaves, which also in form resembled *C. lanata*. The blossoms were rather small, some being a pure white, others mauve, but remarkable for their quantity. Unfortunately the best plant with white flowers refuses to set, much, if any seed; but it was hoped that Mr. James would persevere and try to establish a new race, which would certainly be attractive from the silvery appearance.

Begonia Leaves Diseased.—Mrs. Caddy, Lion Gate Gardens, Richmond, sent some leaves decayed round the margins. They were forwarded to Mr. W. G. Smith for further examination.

HINTS FOR AMATEURS.

BEDDING OUT.

AT last the time has arrived when the multitudes of plants which have been worked up through the winter and spring months may be consigned to their flowering quarters out of doors. The cold weather, which was pretty general through the country last week, has happily given place to a milder and more genial condition of things. The rains have penetrated to a considerable depth, and although at the time of writing the soil is too wet to be worked properly, this need not cause any great amount of fear, since moisture at this time of the year soon dries up, and by the time these notes are in the hands of my readers everything will be in readiness for a start.

First of all the beds have to be cleared of their spring-flowering occupants, and where these were rather later in blooming than usual, for the season after all has not been an early one, some little delay may occur. The earlier Tulips and Narcissi have, of course, been out of bloom for a considerable time, but their growth may not yet have finished. The drought which preceded the recent rains prevented the growth from being very rank, but the rains seem to have given many of the apparently ripening plants a fresh lease of growth. Where this is the case they must not be unduly disturbed. Once the stems of the Tulips can be bent without breaking the plants may be lifted and laid in in ashes or dry soil in a sunny corner of the garden to ripen. Narcissi are even more particular than the Tulips, for they continue to grow for a considerable time. The beds in which they have flowered, therefore, should be left undisturbed until the last moment, when the plants may be lifted and laid in in the same way as the Tulips. Where the Daffodils are planted in the mixed border they should be left undisturbed, and this system should be followed wherever it is practicable. Hyacinths have long since become shabby, and if they have not been already removed should be seen to at once.

In putting out the various subjects that it is proposed should enliven the garden during the summer months some judgment must be used, for even a small garden has usually a sunny as well as a shady side. In larger gardens the variety of positions that have to be filled with something is necessarily much greater, and the wise gardener will so adjust matters that the plants that best love the sun, shall, all things being equal, have the sunniest spots whereon to grow. Generally speaking, all the flowering plants love the sun, although Calceolarias are more partial to the shade. If, therefore, there is a shady corner it should have been given them. We say "have been given" advisedly, for the beginning of May is not a bit too soon to put out the Calceolarias, for they make much better growth, and get a hold of the new ground more easily than they would if left until the end of the month, when the sun is as a rule far more trying. It is a bad practice to keep the poor plants cooped up in frames or pans until they spoil each other, and when sent to the garden look both ragged and ugly.

Now that the actual process of transplanting has begun the amateur will soon discover how much easier it is to "bed out" from pots than from boxes. But this is not the only advantage that the pots have over the boxes, for it is obvious that to simply knock a plant out of its pot does not cause nearly so much disturbance to the plant as it does to dig it out from amongst others in a box. There is apt to be a heavy run on the pots, however, in the months of March and April, and thus boxes have often to be employed just because there is nothing else to use.

Wide versus Close Planting.—This is a point that is likely to cause the amateur some little exercise of spirit, and "how much room shall I give my plants?" is likely to be a common query. The amount of space given must in all cases depend upon whether or not an immediate effect is desired. If it is there is nothing for it but to put the plants so close together that the beds wear a furnished appearance at once. The disadvantage attaching to this system is that as soon as the plants begin to grow at all freely they become crowded, and they are not then in a position to acquit themselves so well as they might otherwise do, unless thinning is practised consistently.

All plants do better for a free passage of light and air all about them, and not merely over their tops, although in the case of purely foliage subjects crowding is not so great an evil, since the crowded parts are hidden from sight.

A good rule to follow under all circumstances is to give each plant at planting time enough room to contain it when it is full grown. Those who do this will not go very far wrong.

There is very little to be said about the operation of planting itself. A trowel will be found the proper tool to use, for there are not many plants of such a size that a spade will be required. If such things as Pyrethrum Golden Feather, Stocks, Asters, Zinnias, and other annuals have to be lifted from the ground or from boxes in which they were pricked off, care should be taken to avoid having too many out of the ground at once. The hot summer sun plays sad havoc with these delicate young plants, and the severe wilting they are likely to get by exposure to its rays generally handicaps them sadly, and if dry weather immediately follows their putting out, is often the beginning of their end. If showery weather follows immediately after the plants have been put out there is very little fear but that they will do well, but if, on the other hand, it is dry it will be necessary to give repeated waterings until the roots have got a hold of the soil, otherwise the poor things will have but a rough time of it.

Plunging Pot Plants.—This practice obtains to some extent in both large and small gardens, although it is not by any means one that should be followed extensively. It may happen now and again that it is desirable to keep the plants in the pots even when they are sent out into the flower garden, and then they are plunged deeply enough in the beds to cover the rims of the pots so that it cannot really be seen without examination but what they are planted out in the orthodox way. There is no doubt that in the autumn the fact of the tender subjects being in pots renders it easier to lift them and place them in security, but this, we think, is more than counterbalanced by the great danger that the plants run all through the summer months of suffering from lack of water. Then again the roots usually grow through the holes in the pots, and at lifting time these roots have to be cut or twisted off in order to get the pots to stand level, and a more or less severe check is the inevitable result. We should advise therefore, to do with as little of this plunging as possible, for generally speaking all plants do far better when planted in the ground than when confined in pots. In the few cases in which plunging may have to be done see to it that during dry weather plenty of water is given to the plants so treated.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Yellow Coleus.—*R. Strong:* The nearest approach to a yellow Coleus which we know is one named Cloth of Gold. The leaves are yellow but for a shading of green, which varies in extent according to the conditions under which the plant is placed.

Tomatos.—I intend making up a bed of soil outside for Tomatos, and should be glad if you will tell me how much soil per plant would be enough. The bed would only be temporary and would be enclosed with boards on three sides, and would have the wall at the back.—*F. Williams.*

In this case you do not want to have too much soil. You will find a cubic foot per plant will be ample. Thus if you put in your plants about a foot apart the bed may be a foot deep, exclusive of drainage, and a foot wide.

Mimulus Moschatus.—Is the little yellow Musk, which is usually grown in pots, hardy? I noticed the other day several fine clumps of it in the open ground. *Amateur.*

Yes, the Musk is hardy and the fact of its being utilised so frequently as a pot plant is due to its beauty and suitability, not to its tenderness.

Azalea mollis losing its Buds.—I have several plants of Azalea mollis in 8-in. pots. They were set

well with flower buds last autumn, and I looked forward to a good show of flowers. For some reason or other, however, the sparrows declared war against them, and picked out fully two-thirds of the buds, for what reason I know not. The buds were simply picked out and thrown down by the side of the plants, and I could not, upon examination, discover any traces of insects to induce the sparrows to do this. Can you assign a reason? And is this a common occurrence?—*A. Wylie.*

Pure cussedness on the part of the sparrows is doubtless the reason. The occurrence is not uncommon. Have any other of our reader's plants suffered in the same way this year?

Vine Leaves Spotted.—*Anderson:* The Vine leaves are badly scorched by the sun. This scorching has been caused by the sun shining directly upon the leaves when the latter are covered with moisture. Although the leaves have not been syringed, as you say, this deposit of moisture is caused by the lowering of the temperature during the night. You must first of all try to prevent the serious lowering of the night temperature, and next you must ventilate the house early in the morning, so that the leaves may be dry by the time the sun gets high enough to burn. If you can manage to leave a little air on the house all night it will be better.

Box Edgings Dying.—Last autumn the Box edgings to several of my flower beds were relaid, but I find there are several dead patches in them. How can I best mend these, must I leave the dead pieces in with the living until next autumn?—*Enquirer.* What is the reason of the deaths?

Taking the second question first, it is difficult to assign the exact reason for the failure of some of the plants to grow. Perhaps they were trimmed too severely; indeed this seems to us the most probable cause, as we have known failure to result in this way in not a few cases. You may try and mend the brown places by planting now small plants with plenty of roots. If the wet weather continues for long they will have a chance, and you must follow it up by waterings as required. If you are successful in mending a few of the bare places it will be something gained.

Tomatos not Setting.—*Tomato:* The dull, sunless weather is no doubt to blame for your Tomatos failing to set. Try and keep a bouyant atmosphere in the house by giving plenty of air and more heat in the pipes. It will be also worth while to pollenise the flowers artificially by brushing them over with a soft brush. Keep all the laterals pinched in pretty closely, but do not defoliate your plants any further than this operation entails.

Lapagerias.—*Ohio:* From the description you give, it would seem to us to be almost hopeless to think of separating the growths. You should not have allowed them to intertwine so closely with each other. An attempt to disentangle them now would inevitably ruin most of the young growths, for they are very soft and easily bruised, and death is sure to follow bruising. You will be able to put matters straight next winter when you prune.

Dahlias.—*Benj. Comble:* The plants may be put out of doors at once. Frost, we are hoping, will not visit us again this side of September. Certainly we have had frosts in June, but to keep the plants out of the ground so long as that would scarcely be advisable.

Top-dressing Fuchsias.—*James R.:* Unless you left room in the pots last March for a further top-dressing, we should not advise you to give it. Even a small further quantity of soil would cause serious difficulties in watering the plants, and you must avoid this. Liquid manure may be given instead of the top-dressing.

Tree Carnations.—*W. Soames:* About the end of the first week in June the tree Carnations may be stood out of doors. They will do better there for the summer than they would under glass. As they are old plants, they will probably throw a few flowers, which should be picked off before they expand, so as to husband the energies of the plants. Give a sheltered position, and attend to the tying in of the shoots as they become long enough.

Rhododendron.
"NATHANIEL BRYSON."

Rhododendron.
"MRS. McMILLAN."

AB.

TWO NEW RHODODENDRONS.

ON the previous page we give an illustration of two hybrid greenhouse Rhododendrons which were raised by Mr. Alexander McMillan, gardener to James Currie, Esq., Trinity Cottage, Trinity, Edinburgh. That named Mrs. Alexander McMillan is pure white, decidedly fragrant, and was raised from Rhododendron veitchianum, crossed with the pollen of a white-flowered seedling raised from Lady Alice Fitzwilliam, a well known and fragrant, popular hybrid, cultivated in many establishments. The hybrid named Nathaniel Bryson was raised from the reverse cross of the same parents, and is also white, with an additional patch of rosy-apricot markings at the base of the two upper segments. The presence of these spots is difficult to account for, seeing that both parents had white flowers, unless one of the parents of Lady Alice Fitzwilliam possessed markings. The Royal Caledonian Horticultural Society honoured each of the above Rhododendrons with a First-class Certificate on the occasion of their spring show, which was opened on the 6th April last. The flowers are shown of the natural size, and the form of the leaves is well indicated by the illustration, which was sketched by Mr. Nath. Bryson, assistant secretary to the Royal Caledonian Horticultural Society. Mr. Bryson is an enthusiastic amateur gardener, who loves and grows flowers, besides sketching and painting those which are new or captivate his fancy. Indeed, the sketching and painting of them seem to be the sister hobby to the love of cultivating them. We recently published the raiser's, Mr. McMillan's, account of his labours amongst this section of greenhouse Rhododendrons.

THE TEMPLE SHOW.

MAY 25th, 26th, and 27th.

(Concluded from p. 621.)

MISCELLANEOUS PLANTS.

A CAPITAL strain of herbaceous Calceolarias was shown by Messrs. H. Cannell & Sons, Swanley, Kent. The plants were dwarf, sturdy, and well-flowered, whilst the individual flowers were much above the average size. There was also a considerable variety in colour. As in the case of the Gloxinias and Begonias shown by the firm, Maidenhair Fern was freely used in the setting up.

The herbaceous Calceolarias sent by Messrs. J. James & Son, of Farnham Royal, Slough, were in every respect a creditable display, and fully up to the high standard for which the James' strain is famous. The plants were exceedingly dwarf, and bore huge heads of mammoth flowers. The colours throughout were good, and ranged from pure white to deep crimson and yellow, with almost innumerable intermediary variations.

M. Koster & Sons, Boskoop, Holland, had a grand array of cut trusses of flower from named hybrids of Azalea mollis and A. sinensis. Both flowers and trusses were of great size, and there were many exquisite shades of orange and yellow.

Mr. Jas. Douglas, Edenside, Great Bookham, sent a number of choice varieties of Alpine Auriculas, of which Solemnis, Ceres, Hecate, Dean Hole, and Delphi were the most noteworthy.

Carnation Primrose Queen, a new yellow tree Carnation of great merit, was shown by Mr. Fred. Perkins, Regent Street, Leamington Spa.

The cut hardy flowers sent by Mr. Maurice Pritchard, Christchurch, Hants, was an exceedingly praiseworthy effort. A fine spike of Eremurus robustus elwesianus was the central feature here, and Pyrethrums, Aquilegias, Trolliuses, Phloxes, and Irises were all very showy.

Messrs. Kelway & Son, Langport, Somerset, staged a magnificent lot of cut hardy flowers. The Paeonies were really splendid. James Kelway, Jean de Reszke, Mr. Chapman, and Julius Ceasar gave a capital account of themselves. In addition to these there were Amaryllis. Delphiniums were well represented. Lupinus polyphyllus Foxi was shown in an imposing mass, and the double-flowered Wistaria sinensis was another noteworthy thing. The whole group, indeed, was a most brilliant display of floral excellence.

The fine batch of Zonal Pelargonium King of Denmark with which Mr. Amos Perry, of Winchmore Hill, was credited in our last issue in reality came from Messrs. A. W. Young & Co., Stevenage, Herts.

FLORAL DECORATIONS.

THESE were all accommodated in No. 3 tent, and comprised some wondrously pretty exhibits.

Mr. Wm. Sydenham, of Tamworth, made a unique exhibit of various floral devices constructed of Violas with appropriate greenery. These were all very handsome, and were the outcome of not a little taste and skill. Sprays of bedding Violas and fancy Pansies were forthcoming from the same source. Of the Violas Masterpiece, Devonshire Cream, Charm-Blanche, Pembroke, Archie Grant, and the new Lucy Franklin were all first-class.

Miss J. Dalton, 28, Pilgrim Street, Ludgate Hill, E.C., had some fine bouquets and vases of flowers; also a massive and imposing wreath of white without a tinge of colour in it.

Mr. W. G. Parkin, 20, Oakdale Road, Sheffield, sent a number of variously shaped vessels filled with flowers, Fern fronds and grasses. The table decorations sent by Miss Edith Langton, The Rowans, Hextable, Swanley, Kent, were both light and elegant.

The Women's London Gardening Association, 62, Lower Sloane Street, S. W., had bowls and bouquets of white flowers set up with Asparagus and grasses in tasteful fashion.

Mr. Moyses Stevens, 146, Victoria Street, Belgravia, did himself great credit in the wreaths and bouquets he contributed, for although they were massive they were not too heavy to serve their purpose.

Mrs. M. V. Seale, The Vine Nurseries, Sevenoaks, had a miniature grotto filled with a great variety of wreaths, crosses, &c. The bouquets and baskets of flowers contributed by Messrs. Perkins & Sons, of Coventry, were as usual in perfect taste, and far ahead of anything else of the kind in the show.

Mr. J. Prewett, 11, Lancaster Street, Bayswater, W., had a showy arrangement of devices, in which rosy-pink Pelargoniums were the flower. The table was draped with sprays of Smilax. Mr. L. H. Calcutt, Fernbank Nursery, Fairholt Road, Stoke Newington, sent a number of massive epergnes in the dressing of which infinite skill was displayed.

Messrs. Jones & Sons, of Shrewsbury, filled a long table with bouquets, sprays, and baskets of flowers in a variety of styles.

Messrs. B. S. Williams & Son, of Victoria and Paradise Nurseries, Upper Holloway, N., exhibited a table of floral decorations. The basket of Orchids here shown was really grand, and the imposing character of its beauty could not well be exaggerated.

FRUIT.

Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Herts, sent six grand Melons of huge size. The varieties were Blenheim Orange, Aldenham Perfection, Sutton's Ar, Sutton's Masterpiece, The Countess, and an unnamed seedling.

A collection of much smaller Melons came from Mr. Thos. Robinson, Elsfield House Gardens, Hollingbourne, Kent. Mr. John Miller, gardener to Lord Foley, Ruxley Lodge, Esher, had a fine dish of Strawberries.

Mr. Geo. Featherby, The Vineries, Gillingham, Kent, showed some capital bunches of Black Hamburgh Grapes, well finished, and of good size; also dishes of Dryden Nectarine, and Hale's Early Peach.

A collection of fruit exhibited by Mr. McIndoe, gardener to Sir Joseph Pease, Bart., Hutton Hall, comprising Melons, Grapes, Figs, Strawberries, Peaches, Nectarines, Apples, Pears, Citrons, Cherries, Tomatos, and Oranges, called for special comment. The Black Tartarian Cherries were first-class.

VEGETABLES.

MR. W. L. BASTIN, gardener to Alexander Henderson, Esq., M.P., Buscot Park, Faringdon, staged a handsome collection of vegetables, which included new Potatos, Cauliflowers, Cucumbers, French Beans, and Tomatos. There were upwards of a dozen seedling Melons, all fine fruits, shown from the same source.

Mr. W. Godfrey showed a colossal bunch of giant sticks of Asparagus, but which looked tender and inviting, despite its size.

Three trays of fine Mushrooms came from Messrs. Mount Bros., Willow Farm, Canterbury. Mr. John Nicholls, Swain's Farm, Tooting, sent white Celery, which was very good considering the time of year.

Mr. Robert E. Addey, Ealing Road, Brentford, had extensive samples of the Mushrooms he grows

so well, and in such quality for the market. The quality of the material shown was high, and the spawn evidently very productive, judging from the size of the clusters. Cakes of this special "Virgin Track" spawn were also on view.

A splendid exhibit of Tomatos and Cucumbers come from Mr. S. Mortimer, Rowledge, Farnham, Hants. The Tomatos were of medium size, good shape, fleshy, and of great weight, the varieties being Abundance, Best of All, Mitchell's Hybrid, Sutton's Eclipse, Earliest of All, Perfection, Sutton's Ar, and Improved Conqueror. Cucumbers Tender and True, Sulton's Ar, Sensation, Progress, and Lockie's Perfection were likewise well shown.

Mr. Hayes, gardener to the Marquis of Northampton, Castle Ashby, Northampton, staged a comprehensive group of vegetables. The Broccoli, Leeks, and Cabbage were poor, but Turnips, Tomatos, Cucumbers, Asparagus, and Rhubarb were everything that could be desired.

AWARDS.

GOLD MEDALS.

Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, for Orchids.

Messrs. W. Paul & Sons, Waltham Cross, for Roses.

Mr. George Mount, Canterbury, for Roses.

Messrs. J. Veitch & Sons, Ltd., Chelsea, for Caladiums, Crotons and Cacti.

Leopold de Rothschild, Esq., Gunnersbury House, for pot fruit trees.

SILVER CUPS.

Messrs. Jackman & Son, Woking, for Clematis and herbaceous plants.

Messrs. R. Smith & Co., Worcester, for Clematis.

Messrs. Barr & Sons, Covent Garden, for herbaceous plants.

Messrs. Wm. Cutbush & Son, Highgate, for foliage plants, Palms, and Carnations.

Messrs. Charlesworth & Co., Bradford, for Orchids.

Messrs. Hugh Low & Co., Bush Hill Park, for Orchids.

Messrs. Sander & Co., St. Albans, for Orchids.

MM. Linden & Co., Brussels, for new plants and Orchids.

Mr. Jas. Cypher, Cheltenham, for Orchids.

Messrs. Paul & Sons, Cheshunt, for Roses.

Messrs. T. S. Rivers & Son, Sawbridgeworth, for pot fruit trees.

Messrs. Sutton & Sons, Reading, for vegetables.

Sir Fred. Wigan, Bart., Clare Lawn, for Orchids.

Earl Percy, Syon House, for Orchids.

Mr. J. R. Box, Croydon, for Begonias.

Mr. C. Turner, Slough, for Roses, Pelargoniums and Carnations.

H. S. Leon, Esq., Bletchley Park, for Orchids.

Lord Aldenham, Aldenham House, for vegetables.

Sir J. Pease, Bart., Hutton Hall, for fruit.

Messrs. Carter & Co., High Holborn, for vegetables and flowering plants.

Messrs. H. Cannell & Sons, Swanley, Kent, for Cannas, Gloxinias, Calceolarias, Begonias.

SILVER GILT KNIGHTIAN MEDALS.

Messrs. Geo. Bunyard & Co., Maidstone, for Apples, &c.

Mrs. Wingfield, Ampthill, for vegetables.

Mr. S. Mortimer, Rowledge, for Cucumbers and Tomatos.

SILVER GILT FLORA MEDALS.

Mr. T. S. Ware, Tottenham, for herbaceous plants.

Messrs. Perkins & Sons, Coventry, for bouquets.

Mr. H. B. May, Upper Edmonton, for Ferns.

Messrs. B. S. Williams & Son, Upper Holloway, for Orchids and decorations.

Messrs. W. L. Lewis & Co., Southgate, for Orchids.

W. Thompson, Esq., Walton Grange, Stone, for Orchids.

Jules Hye-Leyson, Esq., Ghent, for Orchids.

Leopold de Rothschild, Esq., Ascott for Carnations.

Messrs. W. Balchin & Sons, Hassocks, for Leschenaultias, &c.

Messrs. J. James & Son, Woodside, for Calceolarias.

Messrs. Fisher, Son & Sibray, Sheffield, for hardy foliage plants.

Messrs. Kelway & Son, Langport, for Paeonies, &c.

Messrs. J. Laing & Sons, Forest Hill, for Caladiums, Gloxinias, and Streptocarpus.

Messrs. J. Peed & Sons, Norwood Road, for Caladiums.

Messrs. J. Waterer & Sons, Bagshot, for Rhododendrons,

Messrs. J. Cheal & Sons, Crawley, for flowering shrubs.

SILVER GILT BANKSIAN MEDALS.

Ludwig Mond., Esq., Regent's Park, for Orchids.
Mr. H. J. Jones, Lewisham, for Begonias.
Messrs. Frank Cant & Co., Colchester, for Roses.
Messrs. J. Backhouse & Son, York, for Alpines, &c.
Messrs. R. Wallace & Co., Colchester, for hardy plants, &c.
Mr. George Edom, Epsom, for Tulips.
Mr. J. Pritchard, Forest Gate, E., for Cacti.
Mrs. M. V. Seale, Sevenoaks, for decorations.
Messrs. J. Hill & Son, Lower Edmonton, for Ferns.
Messrs. W. & J. Birkenhead, Sale, for Ferns.
Malcolm S. Cooke, Esq., Kingston Hill, for Orchids.
M. L. de Smet-Duvivier, Ghent, for Anthuriums.
Mr. W. Rumsey, Waltham Cross, for Roses.

SILVER KNIGHTIAN MEDALS.

Horticultural College, Swanley, for vegetables.
Mr. Geo. Featherhy, Gillingham, for fruit.
Marquis of Northampton, Castle Ashby, for vegetables.

SILVER FLORA MEDALS.

Messrs. Isaac House & Son, Bristol, for Violas.
Messrs. A. W. Young & Co., Stevenage, for Gloxinias, &c.
Mr. A. Perry, Winchmore Hill, for herbaceous plants.
Mr. Moyses Stevens, 46, Victoria Street, S.W., for bouquets, &c.
Mr. W. Sydenham, Tamworth, for Violas.
Mr. L. H. Calcutt, Stoke Newington, for decorations.
Mr. J. Prewett, Bayswater, for Azaleas.
Mr. M. Prichard, Christchurch, for herbaceous plants.
Messrs. F. Miller & Co., Fulham Road, for Mignonette, &c.
Messrs. R. & G. Cuthbert, Southgate, for Azaleas.
Messrs. W. Fromow & Sons, Chiswick, for Maples.
Mr. W. Icton, Putney Park Lane, for foliage plants.
Jadoo, Limited, Exeter, for plants.
Messrs. Cripps & Son, Tunbridge Wells, for Maples.
Messrs. Jones & Son, Shrewsbury, for decorations.
Mr. John Russell, Richmond, Surrey, for Azaleas.

SILVER BANKSIAN MEDALS.

MM. Koster & Son, Boskoop, Holland, for Azaleas.
Mr. A. G. Tulett, Crockenhill, Swanley, for Zonal Pelargoniums.
Mr. E. G. Reid, Beckenham Hill, for Rhododendrons.
Mr. F. Chapman, Colchester, for Asparagus.
Mr. W. Godfrey, Colchester, for Asparagus.
Lord Foley, Esher, for Strawberries.
A. Henderson, Esq., Faringdon, for fruit and vegetables.
W. Lawrence, Esq., for Asparagus.

CYPRIPEDIUM EVENOR, SOUTHGATE VAR.

THE accompanying illustration shows the character of this new hybrid variety, which commemorates Southgate, Middlesex, where the establishment of Messrs. W. L. Lewis & Co. is situated. One scape carries two flowers, whose leading and distinguishing feature is the yellow ground colour of *C. concolor* (one of the parents), which is more defined in the Southgate variety than in the others. The flower measures $3\frac{1}{2}$ in. across the petals, which are 1 in. broad. The dorsal sepal is $1\frac{3}{8}$ in. wide. The spotting is also well defined, consisting of small crimson specks, and making this a beautiful and interesting hybrid. It was raised from *C. Argus* crossed with the pollen of *C. concolor* Regnierii. The twin flowers on the scape and the beautiful yellow ground of the segments owe their existence to the last-named variety.

Cheap Seeds.—Some of the American free seeds appear to have been nasty as well as cheap. A gentleman is reported to have weighed in with "a big bunch of the meanest, sourest, cussedest looking Mustard that ever grew on earth," and to have said, "there is your fine Turnips from Government seeds." This Mustard is, moreover, stated to have been "so infernally worthless that green worms and small bugs had starved to death on the leaves." We don't wonder at that farmer kicking.

ORCHIDS AT BUSH HILL PARK, ENFIELD.

THE removal of all the Orchids from the Clapton Nursery of Messrs. Hugh Low & Co. to the above well-appointed nursery having been completed, I was much gratified by being given an opportunity of inspecting them in their new quarters.

The Phalaenopsis House, being the nearest to the office of the establishment, was the first to come under notice. On entering it was apparent that every precaution had been taken to provide the plants with heat and moisture, without which their culture would be impossible.

The plants themselves looked quite at home, and will no doubt uphold the reputation held for years by the firm in connection with this beautiful class of Orchids. The Dendrobe House, which adjoins, contains a magnificent batch of *Dendrobium wardianum*, all making splendid growth, the prices of which are most reasonable. Here there is a great

Mossiae, *C. Mendelii*, *C. Trianaei*, and *C. gaskelliana*. *Laelia purpurata*, too, is in great quantity and in grand condition. There were several *Cattleyas* and *Laelias* in flower, but as the bulk formed one of the leading features of the Temple Show last week, I shall, instead of particularising, advise every one that could not visit the show to make a point of seeing the Messrs. Hugh Low & Co.'s collection at Bush Hill Park.—C.

GARDENERS' CHARITIES.

I do not wish to decry in any way the management of these, but the system and principle on which they are carried out appears to me to be utterly wrong, and the exceeding small number who do subscribe shows that I am not alone in my opinion. A gardener is usually not a person who can afford to subscribe liberally to general charities; it needs all his care to do a little to provide for himself and his family, and

CYPRIPEDIUM EVENOR SOUTHGATE VAR.

quantity of hybrid Dendrobes, and a splendid plant of *D. nobile sanderianum*.

Cypripediums close by were in excellent trim, being represented by some of the best in cultivation, to wit, *C. Gertrude* Hollington, *C. Goweri* magnificentum, &c. In flower were several forms of *C. ciliolare*, and the shy *C. Druryi*. In this division was to be seen a wonderful variety of *Oncidium Papilio majus*.

Passing on, we come to what I shall term my special favourites, the *Odontoglossums*. *O. crispum* is represented by about 12,000 plants, all in excellent health, showing that their requirements are well understood. There was a good quantity in flower, and numerous spikes are fast reaching that stage. The strain is, if I might call it so, a good one; and although at the time of my visit there was nothing approaching their "Queen Victoria" of last year, there were plenty of good varieties and at reasonable prices, too.

Cattleyas are represented by whole housefuls of *C.*

naturally, under the circumstances, his charity begins, as it should, at home. If he subscribes 5s. per annum he gets a vote, and what use is the vote to him? Practically none. All his money may, and probably will, go to someone else, and it is worth while to consider what this 5s. per annum means to him.

If he begins to save this amount from the age of twenty-four, his average expectation of life is forty years more. His 5s. per annum, saved and invested at 4 per cent. interest would at the end of the period amount to the sum of £23 15s. If he saved 5s. per month it would be £285. Why should he sacrifice the certainty of £23 15s. for a simple vote? If the thing is to be a success, the subscriber, who is almost invariably a poor man, must be able to depend on some certain return for his money; 5s. per annum would, if properly invested, provide him with a valuable sick and accident fund, or it would ensure his family the sum of £23 15s. at his death, whenever it occurred.

Very large numbers subscribe to sick and benefit clubs, and these are a very costly luxury indeed. Taking the very best and most liberal of the English industrial insurance offices, it will be found that, on an average for several years past, for every shilling paid in premiums less than $\frac{1}{4}$ d. has been paid back, all the remainder going in expenses, profits to shareholders, &c. What this really means none but those behind the scenes know, but it is a fact that the difference between the premiums paid to one office only exceed the amount paid for claims during the last year by considerably over £2,800,000! In the face of such figures as these one ceases to wonder at the palatial offices, the salaries to officials, and the high price of the shares. Let it be borne in mind that this is only one out of a great many offices, and the loss to the poor workman will be appreciated. If a gardeners' industrial assurance can be inaugurated, dispensing with all the magnificent offices, salaries, and profits, and a fair and certain return for his hard-earned money could be depended on, it would not be necessary to make urgent appeals, they would gladly come in in their thousands, without being asked. At present they naturally like to feel they are saving something, and the Post Office Savings Bank is their best gardeners' benevolent society. Can this be wondered at? And, if I am wrong, will someone set me right?—*Thos. Fletcher, Grappenhall, Cheshire.*

LATE VEGETABLES.

DURING April and the early part of May vegetables (otherwise than those which have been forced) are not in great variety, and where the Cabbage comes in early and Broccoli remain in good condition late in the season, the culinary department will not suffer much.

Looking through the Cabbage plots, to take stock of the earliest and most serviceable varieties, I notice that Hurst's First and Best is worthy of its name; on a sheltered border and also in an exposed position it is the earliest, and the compact, upright hearts are handsome. Veitch's Earliest of All is again first-rate, being early, compact, and handsome. Early Etamps is also good. Winningstadt long stood the test in the north as an exhibition sort—certainly its perfect form and firm heart gives it a good position—but after testing a number of sorts last season to prove the quality of each, Winningstadt was among the most tender and of good quality. There are about a dozen sorts in all here, and scarcely a "bolted" Cabbage among them. Rosette Coleworts have done good service during the winter, and are still in use. It is one of the hardiest of its species, like a huge Brussels Sprout, and may be had when other Cabbages are very scarce.

The Broccoli crop has stood well, for some time past has been in quantity, and I hope to have supplies till Cauliflower is turning in for use. Methven's June is the latest we have had for some years. The plants are strong and promising this season. Veitch's Model is also a very late variety, of even, close growth, and evidently very hardy. I hope to have good heads from it well into June. Cattell's Eclipse, as usual, is still much in favour, but is now (middle of May) nearly over. Gordon's Niddrie, which preceded Cattell's, is a capital sort for Scotland. To get the plants hardy and of medium growth, dwarf, and compact, it is a good old practice to put them into undug ground, if such is at the time of planting at command. In market establishments in the South of England this was almost an established practice, cultivators often inserting the roots with a crowbar.

After Onions are removed, Coleworts are a most suitable crop to fill the space which remains undug, and the Rosette is one of the best for the purpose. We planted our Broccoli last season on the same ground whence the preceding crop was removed. Between the rows, where the old plants were growing, a pointed iron dibber was used with good effect. Watering once, and destroying the weeds as they appeared, was all the cultivation the Broccoli had, and we never had greater reason to be satisfied. Many years ago, when visiting my late friend, Mr. Gilbert, he pointed out an immense breadth of Broccoli, which had been treated as indicated. The plants were (then late in April) in capital condition.

Lettuce has stood well this year, losses having been nil. Bath Cos is best; All the Year Round Cabbage Lettuce is in fine form too. Leeks are

nearly over, but have done well. The Lyon and Musselburgh are highest in favour, and have been so (with us) for some years. Celery is now over, but kept remarkably well. Major Clarke's Red was, as usual, the best keeper, and was of fine quality. Veitch's Early Rose was first-rate, but was used earlier.—*M. Temple, Carron, N.B.*

THE SUMMER SHOW AT THE ALEXANDRA PALACE.

A THREE days' show was opened at the Alexandra Palace on Wednesday the 18th ult. The exhibits, which were not very numerous were accommodated in the Central Hall, a large and roomy place, and one well suited for such a show.

COMPETITIVE EXHIBITS.

The classes according to schedule were very poorly patronised, for strictly speaking there was competition only in one. There were no exhibits forthcoming in several, and the rest had only one each. The good quality of these exhibits, however, secured for them in each case the first award.

POT PLANTS.—Messrs. J. Peed & Sons, Roupell Park Nurseries, W. Norwood, S.E., were the only exhibitors in the class for a circular group of flowering and foliage plants occupying 250 sq. ft. Their exhibit, however, fully deserved the first prize it received, for round the central mound of Palms were staged tuberous Begonias, Boronias, Ericas, Hydrangeas, Crotons, Dracaenas and Ferns in great variety, in capital condition.

The best nine foliage plants were also sent by the same firm, the subjects being Croton Weismanni, Dracaena Gladstonei, D. Lindenii, Phormium tenax, Kentia fosteriana, Pandanus Veitchii, Latania borbonica, Kentia belmoreana and Caladium Mrs. H. Veitch.

Mr. George Cragg, gardener to W. C. Walker, Esq., Percy Lodge, Winchmore Hill, N., won the first award for a group of Orchids filling a table 12 ft. by 4 ft.

CUT FLOWERS.—Messrs. Paul & Son, The Old Nurseries, Cheshunt, were first for the collection of cut hardy flowers filling a table space of 20 ft. by 6 ft. A collection of large trusses of Rhododendrons and Azaleas were the chief feature here.

Messrs. Perkins & Sons, Coventry, were first for one bride's and two bridesmaid's bouquets with magnificent bouquets, in which Odontoglossums, Lilies of the Valley, and Carnations figured conspicuously. We have never seen the Coventry firm put up three finer samples of their art. Mr. Henry O. Garford, Stoke Newington, was second, also with three fine bouquets; and Mr. L. H. Calcutt, Fern Bank Nursery, Stoke Newington, was third.

Mr. George Mount, of Canterbury, scored successes for Roses, for he won the first prizes for both the twenty-four and the twelve blooms. His strongest varieties were Mrs. John Laing, Captain Hayward, Fisher Holmes, Catherine Mermet, Ulrich Brunner, Prince Arthur, and Caroline Testout.

Mr. George Cragg scored for twenty-four bunches of cut flowers, with a showy exhibit.

Mr. Amos Perry, Winchmore Hill, won the first prize for the table, measuring 15 ft. by 4 ft., of hardy cut flowers.

MISCELLANEOUS EXHIBITS.

These comprised a number of interesting and meritorious groups, for which medals of varying values were given.

The premier award, a large Gold Medal, went to Messrs. Wm. Cutbush & Son, Highgate, N., for an imposing circular group of miscellaneous plants. Amongst the flowering element breaks of Malmaison Carnations Princess of Wales and Princess May, Erica Cavendishii, E. perspicua nana, and E. ventricosa coccinea minor were noticeable. These were tastefully relieved by Palms, Ferns, Japanese Maples, and other foliage plants.

A Silver Gilt Medal went to Mr. H. George Bourne, Grove Villa, High Road, New Southgate, for a very comprehensive collection of succulent plants.

Mr. S. Mortimer, of Rowledge, Farnham, Hants., received a small Gold Medal for a magnificent lot of Cucumbers and Tomatos. Of the former there were exceedingly fine samples of such varieties as Pride of the Market, Sutton's Matchless, Progress, Sutton's Ar, and Rochford's Market, whilst Mitchell's Hybrid, Conqueror and its improved form, and Abundance represented the Tomatos.

A small Gold Medal also went to Mr. L. H. Calcutt for a superb table of floral decorations. The central trophy of Irises, Liliun Harrisii, and Fern fronds stood fully 7 ft. above the table. The other epergnes, floral arches, glasses, &c., on the table were both light and elegant, and the effect was completed by the trails of Smilax and Asparagus Sprengeri, which were spread on the cloth.

Mr. James Williams, of 4A, Oxford Road, Ealing, W., had a smaller table, prettily ornamented with the Poet's Narcissus and Yellow Tulips with grasses. A Silver Medal was voted it.

Decidedly the best exhibit in hardy plants, both for quality and comprehensiveness, was the exhibit sent by Mr. T. S. Ware, of Hale Farm Nurseries, Tottenham, N. A small Gold Medal was given it.

The pretty Edwardian ware in a variety of shapes, sizes, and devices, and filled with growing Ferns was a special feature, that was contributed by Messrs. W. Edwards & Son, of Nottingham. These variously sized receptacles on view attracted much attention from their manifest elegance and suitability for the purposes for which they are recommended.

An attractively set-up stand of horticultural requisites was set up by Messrs. W. Wood & Son, of Wood Green. The numerous garden tools, manures, bamboos, shading materials, &c., were tastefully interspersed with waving plumes of grass, both dyed and in the natural colours.

The Ichthemic Guano Company, of Ipswich, also had a stand of their well known fertiliser.

MORLAND NURSERY, SOUTH NORWOOD.

IN addition to the numerous Palms, Crotons, and Dracaenas, which are grown so admirably by Mr. C. F. Bause, at the Morland Nursery, and which we mentioned last week, there are several other noteworthy features. Not the least of these is the collection of Bertolonias. These diminutive, but exceedingly handsome foliage plants do not often find lavished upon them the attention that is commensurate with their beauty. They are rather delicate subjects perhaps, and will not stand the rough and ready treatment under which many stove plants will thrive; in short, they are the aristocrats of the stove, and must be treated as such. At Morland Nursery they are accommodated in a close frame in the propagating pit, the temperature of which suits them exactly. Here they produce large, healthy leaves, and develop to the full those exquisite colourings that are to be found nowhere else in such charming association. B. argyroneura with the multitude of white spots on light green is rendered yet more handsome by the myriads of silvery hairs with which the whole of the leaf is clothed. This is indeed one of the hairiest of all the Bertolonias, and certainly one of the most beautiful. Mme. Alfred Bleu is a new variety of great promise. When properly developed the leaves are of great size, the white spots and mottlings on the light green ground being exceedingly attractive. The same may be said of the rich magenta and olive-green foliage of Mme. August Van Geert Souvenir de Gand which has very prominent midribs and veins of cerise running through a groundwork of dark olive-green. The effect of the association of the two colours is at once rich and striking. Triomphe de l'Exposition is one of the best. Here we have a dark green ground, with pink veins, the whole surface being profusely dotted with small white dots, and prettily crenated.

A collection of Nepenthes is another of the special points of the establishment. Here we noticed that very intractable species N. sanguinea. This is very handsome when it can be got to do well, which, to tell the truth, is only very rarely. The full-sized pitchers are from 10 in to 12 in. in length, bright rosy-red in colour, and are furnished with two wings, which bear a few long, stout spines. We noticed several plants of this rarity, and they all appeared to be growing well. N. Rajah is another species that is one of the most trying to the gardener's patience, for it often refuses to do at all. It is very handsome, this Bornean species, but, like N. sanguinea, a puzzle to the cultivator.

Caladiums are grown largely, but here again it is the finer varieties, particularly the golden and delicate white leaved forms that occupy the bulk of the attention. Still, it must not be imagined that other varieties are neglected, for this is far from being the

case, as the grand samples of such varieties as Excellent, B. S. Williams, Triomphe de Comte, Gaston Chandon, and the handsome silvery-white and pink Rose Laing abundantly testified. Prince of Wales, with its large, rosy-cerise leaves, with gold margins, and Princess Royal are still much in request to-day, and yet they were two of the seedlings raised by Mr. F. C. Bause when at Chiswick. Of the newest varieties, one named Mrs. Bause is a remarkably handsome thing. The leaves are of good size, even on the young plants. They are silvery-white with a green-gold margin, and bright carmine veins. Princess Teck is still a very scarce variety, with the central zone rosy-pink, a green-gold margin, and carmine midribs. Her Majesty is one of the finest white varieties that we have ever seen. It can only be described as a translucent white, so clear and delicate looking are the tissues. Leonard Bause is another fine white, but in this case there is a conspicuous red spot in the centre of the leaf. It is certainly one of the most refined of the numerous varieties of Caladiums now in cultivation.

MANCHESTER WHIT-WEEK SHOW.

THIS annual event was opened on the 27th ult., and continued till June 2nd, in charming weather, and although some considerable doubt existed as to its success, owing to the competition of the Temple Show, it was satisfactory, both to the executive and visitors to find that there was no falling off in the exhibits either in quantity or quality. Some notable features were missing, but others of equal or more importance took their place, which enhanced the value to the general patrons of the society.

COMPETITIVE EXHIBITS.

The Orchids in this department, as throughout the show, engendered the greatest amount of praise and delight both to the expert and amateur.

For the best collection of Orchids in bloom (amateurs), E. Ashworth, Esq., Wilmslow, (gardener Mr. H. Holbrook), secured the premier award with a charming bank, set off to advantage with a plentiful ground work of Adiantums and other Ferns. The chief features were the grand spikes of *Odontoglossums*, *Miltonia vexillaria*, colour being afforded by good varieties of *Cattleya Mossiae*, *Lycaste Skinnerii*, &c. A. Warburton, Esq., Haslingden (gardener, Mr. T. Lofthouse), with a fine lot, well arranged, was second.

In a similar class for nurserymen, Mr. James Cypher, Cheltenham, won with a grand lot arranged in two half circles on the floor, cork and Ferns being freely interspersed amongst the grand specimens of *Laelia purpurata*, *Odontoglossums*, *Cypripediums*, *Cattleyas* in variety, and many other species, making a pleasing and imposing group. Mr. J. Robson, Altrincham, followed with a large exhibit of considerable merit.

For the best collection of *Cattleyas* and *Laelias* (open), Thos. Statter, Esq., Whitefield (gardener, Mr. R. Johnson), won with a grand lot including *Cattleya Mendelii* *superba*, *Laeliocattleya Phoebe*, *Laelia elegans statteriana*, *L. purpurata formosa*, &c. Duncan Gilmour, Esq., Sheffield (gardener, Mr. W. Day), was second.

The first prize for ten specimen Orchids, made-up plants excluded (open), was won by the amateur, E. Ashworth, Esq., with a grand lot, including *Cattleya Mossiae*, *C. Skinnerii alba*, *Laelia purpurata*, *L. elegans*, &c. Mr. Jas. Cypher followed.

For ten stove and greenhouse plants in bloom (nurserymen), Mr. James Cypher won with a good lot consisting of *Pimelea Hendersonii*, *Erica affinis*, *E. depressa*, *E. ventricosa magnifica*, *Anthurium scherzerianum*, *Aphelaxis macrantha purpurea rosea*, *Clerodendron Balfourianum* and *Franciscea eximia*.

For six plants for amateurs, Miss Lord, Ashton-on-Mersey (gardener, Mr. G. Wilkes), won with *Dendrobium fimbriatum oculatum*, well flowered, 4 ft. in diameter, *Clerodendron Balfourii*, *Allamanda grandiflora*, *Anthurium scherzerianum*, and *Ixora Coleii*.

For a group of miscellaneous plants, arranged for effect, not exceeding 200 sq. ft., Mrs. G. Pease, Darlington (gardener, Mr. J. McIntyre), secured chief honours with a well staged lot, chiefly foliage plants, the *Crotons* and *Dracaenas* adding tone to the arrangement; Mr. G. Wilkes was second with plenty of bloom. For the local group of 100 ft. Mr. Wilkes secured first honours.

For the nurserymen, in a space not exceeding 250 sq. ft., Messrs. R. P. Ker & Sons, Liverpool, won with a light and tasteful combination, the pot plants, such as *Crotons* and *Dracaenas*, being richly coloured. *Bamboos* and *Palms* were used for lightness and freshness, colour being introduced with *Rhododendrons*, *Amaryllis*, and foliage *Begonias*. Mr. A. J. A. Bruce followed with more flowers and a greater variety of colour.

For six fine foliage plants Mr. J. McIntyre won with large plants of *Croton Baron Rothschild*, *Phoenix rupicola*, *Cycas revoluta*, and *Kentia fosteriana*.

For twelve *Roses* in pots James Brown, Esq., Heaton Mersey, scored with well-flowered specimens. For ten exotic Ferns (open) Mr. J. McIntyre won with a good lot, *Gleichenia rupestris*, *G. dichotoma*, *G. Mendelii*, and *Davallia fijiensis* being good.

For eight table plants Mr. J. McIntyre won in a strong competition. Mr. G. Wilkes won for *Calceolarias* and *Caladiums*; Mr. J. McIntyre for six *Adiantums* and one Fern; and Mrs. Blair for *Gloxinias*. For ten hardy Ferns Messrs. W. & J. Birkenhead, Sale, won with a grand lot. Mr. G. Wilkes won, for a stove foliage plant, with *Croton angustifolium*, flowering plant, *Ixora Prince of Orange*, and greenhouse foliage plant *Kentia fosteriana*.

Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, secured the Gold Medal for the best hybrid Orchid, with *Cypripedium Olenus*, Burford variety. Mr. A. J. A. Bruce got the Silver Medal for a collection of *Carnations*, not less than fifty pots.

NON-COMPETING ORCHIDS AND FOLIAGE PLANTS. Messrs. J. Veitch & Sons, Ltd., Chelsea, were awarded a Gold Medal for a small collection of great merit, including *Laeliocattleya Eudora* Mme. Albert Pye (a magnificent hybrid, which was greatly admired by the many growers present), *Laelia Latona*, *Cattleya Mendelii*, and others.

Messrs. F. Sander & Co., St. Albans, were also the recipients of a Gold Medal for a collection, including the new *Acalypha Sanderii*, *Dracaena sanderiana*, very fine, *Nepenthes* in variety, and a large and varied collection of Orchids.

Messrs. Fisher, Son & Sibray, Sheffield, also secured the premier honour with a most interesting display, including many varieties of *Crotons* and *Nepenthes*, in robust form, with *Anthuriums* and Orchids in variety, *Cattleya Mossiae Valhallii* being conspicuous.

Messrs. Charlesworth & Co., Bradford, were awarded a Silver Medal for a meritorious bank of Orchids, and *Anoectochilus*, in many beautiful varieties.

Messrs. J. Cowan, Ltd., Liverpool, contributed a good lot of various species of Orchids, which gained the Silver Medal.

Mr. A. J. Keiling, Bingley, received a Silver Medal for *Cattleyas*, *Odontoglossums*, and *Cypripediums* in great variety.

Mr. B. S. Williams & Son, Upper Holloway, London, had a pleasing collection of Orchids, foliage plants, *Ericas* and *Boronias*, which obtained a Silver Medal.

MISCELLANEOUS PLANTS.

Messrs. Sutton & Sons, Reading, received the society's Gold Medal for a wonderful display of herbaceous *Calceolarias*, occupying a space of about 500 sq. ft. with 150 plants, including selfs, blotched, spotted, and tricolor barred varieties, with heavy heads of bloom, the individual flowers being of immense size. This exhibit undoubtedly is as fine of its class that has ever been staged in the north, and may be well described in the words of Mr. Owen Thomas in replying to the toast of the judges at the luncheon as "one of the finest features of the show." The exhibit had hosts of admirers throughout the show.

Messrs. W. & J. Birkenhead, Sale, secured a Silver Medal for a fine table of Ferns in great variety.

Messrs. R. Smith & Co., Worcester, were awarded a like honour for their exhibit of *Clematis*, so well-known at the leading spring shows.

Messrs. John Waterer & Sons, Bagshot, received a Silver Medal for an immense collection of *Rhododendrons*, which filled the lower portion of the annexe. A large number were in bloom with the

majority just bursting their buds, and which will be worthy of a visit during the next three weeks.

Messrs. Dicksons, Ltd., Chester, staged a fine bank of *Acers* in great variety, and cut flowers of *Pyrethrums*, *Iris*, &c.; and *Pansies* and *Auriculas* in pots. Messrs. W. Edwards & Son, Nottingham, staged baskets and stands of their ware and Ferns. The Misses Hopkins, Knutsford, had garden flowers. Messrs. W. Clibran & Son, Altrincham, staged a large collection of *Violas*, *Pansies*, *Calceolarias*, &c. Mr. J. Pinches, Camberwell, London, showed his imperishable labels.

CERTIFICATES OF MERIT were granted to Messrs. F. Sander & Co., for *Acalypha Sanderii*, and for *Licuala Jeanenceyi*; Messrs. John Cowan, for *Cymbidium lowianum* and *Odontoglossum crispum magnificum*; Messrs. B. S. Williams, for *Cattleya Latona*; Mr. A. Warburton, Haslingden, for *Odontoglossum crispum Mortebeckiense*, *Cattleya Mossiae Prince of Wales*, *Cattleya Mendelii Duchess of York*, and *Laelia purpurata backhousiana*; and Messrs. Fisher, Son & Sibray, Sheffield, for *Cattleya Mendelii*, and *Cattleya Mossiae*.

The arrangements were ably carried out by Mr. P. Weathers, curator and secretary. The wealth and beauty of the Orchids and stove and greenhouse blooms were admirably toned down by the festoons of climbing plants on the pillars and roof of the show house; and the large specimen foliage plants formed a fresh and pleasing background to such a galaxy of colour, making it an ideal place for a show of tender plants. The annexe, an ample building of some 450 ft. in length, is more suitable for the exhibits that prefer a cooler temperature. The judges, exhibitors and friends lunched in the dining room under the chairmanship of the president, T. Statter, Esq.

QUESTIONS AND ANSWERS.

Violets for Early Flowering.—*Tomatos*: We should not advise you to attempt growing Violets under glass in summer with the object of getting early flowers next year. They require a great deal of attention to keep them clear of red spider and other vermin, while the plants themselves cannot attain any constitutional vigour. Deeply dig a piece of rich ground at once in a fully exposed position. Ground that holds the moisture fairly well should be selected. Dig a quantity of old hot bed manure and leaf mould into the soil, and when this work is finished line off the ground so that the rows will be 1 ft. apart. You can even take out a shallow furrow along the side of the line with the end of the hoe. Lift a quantity of rooted runners and proceed to plant them with the trowel a foot apart in the furrows. Water the plants in dry weather and they should make bushy specimens before the end of the season. The bed you propose making across the end of your greenhouse should answer very well, provided the house is well ventilated in spring when growth is being made. Plant them in turfy loam mixed with some well decayed manure. This could be done about the end of September, lifting a sufficient number of plants from your stock in the open ground to fill the bed. Put them in just sufficiently thick to avoid crowding. They are most often grown in frames to be near the glass.

Cytisus Adami with Yellow Flowers.—*A. L. W.*: It is a case of reversion to one of the parents of the graft hybrid. The case is of common occurrence. Sometimes pale purple and yellow flowers may continue to be produced for many years by the same tree. In other instances the branches bearing the yellow flowers become so vigorous and grow so fast that the portions of the tree bearing purple flowers get robbed of sustenance and gradually decline in vigour till they at length cease to be produced. If you desire purple flowers only, then the shoots bearing yellow flowers should be removed; but on the other hand if you desire both colours then the shoots bearing yellow flowers must be held in check by reducing their size so that they cannot monopolise the energy of the tree. The necessary pruning may be given when the flowers are fading, but still sufficient to show what they are.

Tomatos in Pots.—*Tomatos*: Plants to be stopped when they have set four bunches of fruit might be grown in 8-in. pots. When the roots have well permeated the soil, and the plants are healthy, you must give them good supplies of water. Whenever a bunch of fruit has set, and the berries are beginning to swell, commence feeding with weak liquid manure twice or three times a week. After all the bunches have been set the liquid manure may be made stronger. Make sure that the pots are well filled with roots before you commence feeding, and do not overwater the plants until that happens. A pinch of nitrate of soda might be put in the water occasionally instead of the liquid drainings of the stables. If you have an artificial fertiliser

already made up with the principal chemical ingredients of plant food, that may be applied judiciously at intervals. For Tomato plants to be grown in a greenhouse till October you could use 10-in. pots, feeding the plants as above mentioned when the soil gets well permeated with roots, and a bunch or two of fruits have set. No feeding should be given until one bunch at least has been set.

Lifting a Holly.—A. J. C.: It is true that large Hollies are recommended to be lifted when they commence to grow; but the operation should have been performed in April or during the first half of May. If the tree is more than 6 ft high we should recommend you to root-prune it about the end of September, and transplant it about the end of April next year. Take out a trench 2½ ft. to 3 ft. from the trunk of the tree, and describing a circle round it, cut back all the strong roots to this distance with a sharp knife to smooth the cut ends, which will throw out numerous small roots before the winter. All roots that penetrate the soil perpendicularly should also be cut. You will then have got the roots within narrow compass, and the tree may be transplanted with safety at the time above stated, by lifting the ball of soil entire.

Brown Fly on Peaches—W. B.: The insects will be mostly confined to the young and tender leaves of the trees, so that you can in a short time go over them and dust all the affected portions with tobacco powder. Before commencing the operation syringe the trees, so as to wet all the foliage equally. This will cause the powder to adhere sufficiently long to destroy the fly. Should it be washed off by heavy rain before the insects have all been destroyed go over the trees a second time, and they will almost certainly be clean after that, if the operation has been thoroughly carried out.

Japanese Maples for Bedding.—J. B.: Plants in pots may be bedded out almost at any time, but if planted at once they would have time to become established before the approach of winter. They are hardier than is generally supposed, so that you may plant them in an open position in your locality without fear of losing them. They should not be exposed to cutting and sweeping winds from the north or east, otherwise the foliage will be liable to injury, making the trees or bushes look stunted. You can so arrange the plants that the bed will look furnished from the first, and so that every alternate bush may be lifted and planted elsewhere before the present bed gets overcrowded.

Large Leaves of Ailantus glandulosa.—S. J.: Plant the trees at regular distances apart and with sufficient room for the accommodation of large leaves, when such develop. The individual specimens should not encroach upon one another. As soon as planted cut the specimens back within a few eyes of the base of last year's wood. Do this every succeeding year in March and strong shoots bearing leaves 2 ft. to 3 ft. in length will be developed. The soil should be rich.

Vines Attacked with Mildew.—J. R.: The sunless, damp weather is responsible for the spread of the fungoid disease known as Oidium Tuckeri. There is no reason why you should not use the mildew composition you mention, ventilating freely afterwards to dispel the moisture which is undesirable in a vinery at present. There is an equally effective method, and though it would take longer time to accomplish, you would avoid wetting the foliage. This is to dust all the affected leaves and bunches of berries with flowers of sulphur, which you may put into a pepper box having a finely perforated lid, and distribute it over the leaves. There is a contrivance known as the "sulphurator" for distributing sulphur, but if you attack the fungus at once you are not likely to have much further trouble with it unless the weather continues wet and dull.

Names of Plants.—A. C.: 1, Narcissus poeticus patellaris; 2, Narcissus poeticus recurvus flore pleno.—Jas. Siewright: 2, Aspasia principissa, a very rare plant.—G. C.: 1, Juniperus bermudiana; 2, Juniperus communis var. Please send older specimens next time with fully developed leaves and fruit whenever you can.—W. B.: 1, Geum rivale; 2, Geranium sylvaticum; 3, Orchis Morio.—T. B.: 1, Oncidium sphacelatum; 2, Oncidium sarcoodes; 3, Cattleya Mendelii var.; 4, Odontoglossum luteo-purpureum; 5, Masdevallia harryana; 6, Cypripedium ciliolare.—H. S.: 1, Primula involu-crata; 2, Daphne Cneorum; 3, Trollius asiaticus; 4, Pyrethrum roseum var.; 5, Phlox subulata; 6, Saxifraga Camposii; 7, Tritelia uniflora.—A. D. W.: The tree by The Dell is Pyrus torminalis, a British tree; the Hawthorn appears to be Crataegus mollis, by others named C. sub-villosa, but we should like to see fruit and fully developed leaves.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, JUNE 11th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, JUNE 14th.—Royal Horticultural Society: meeting of committees at 12 noon.

WEDNESDAY, JUNE 15th.—Grand Yorkshire Gala (3 days).

THE JOURNAL OF THE KEW GUILD.—

This annual becomes more firmly rooted in the esteem of all connected with it from year to year. The issue for 1898 (No. VI, of the series) is now before us, and is as interesting as any that have preceded it, if not more so. The leading features of arrangement are the same as in previous years, but necessarily differ in detail on account of the numerous bits of biography, auto-biography and the personal experiences of various past Kewites throughout the world. Some may remark that these things can only interest Kewites, past and present; but apart from the fact that there is a good sprinkling of gardeners, who have been at Kew, now settled down in various parts of the British Isles, as well as in other countries of the Old and New World, scattered towards every point of the compass, the stories, incidents and biographies by various writers are of interest to gardeners, whoever and wherever they may be. They cannot be otherwise than finger-marks, guides, or monitors, and "foot-prints on the sands of time" for the younger generation of gardeners, who are preparing to follow in the footsteps of their predecessors, or to chalk out fresh lines for themselves in the pioneer-work of the horticultural world.

The frontispiece is a portrait of Prof. Daniel Oliver, F.R.S., F.L.S., LL.D. (Aberd.), late keeper of the Herbarium. This is followed by a short biography or memoir from the pen of William Botting Hemsley, F.R.S., F.L.S., principal assistant (Phanerogams) in the Herbarium. The venerable professor is now in his 68th or 69th year, living in retirement, as active as ever, and in the enjoyment of good health. He acted as keeper of the Herbarium from 1864 to 1890, working with untiring zeal and setting an example in punctuality to every one during the whole of that time.

He enjoyed a distinguished position amongst botanists, and the esteem and respect of everybody with whom he came in contact.

The report and balance sheet show that the sum of £43 15s. 7d., including a much smaller balance from 1896-7, stands to the credit of the Guild for the past year. The capital account, together with the stock in hand, shows the total assets of the Guild to be £166 17s. 7d. We mention these facts merely to show that the institution stands on a firm basis, and that there will be no difficulty in meeting the annual liabilities, notwithstanding the aloofness of certain of the old members who do not or cannot send their subscription of 1s., for which misdemeanour some would fain scratch the names of the offenders from the list. We think it would be a more important point to settle how long a name may be retained in the annual register, whose present address still remains a blank, since they retired into the bush or backwoods in distant countries.

The changes and improvements in the houses and grounds at Kew, several of which we have mentioned from time to time, are all recorded here, and will be of interest to members at a distance. While His Majesty the King of Siam was sojourning in our midst last year he visited Kew and displayed exceptional interest in plants as well as a knowledge of them. As a memento of his visit he purchased and took with him the prize collection of British plants collected by Mr. D. Tannock in 1896, and numbering some 400 species, all named and mounted. If we were Mr. Tannock we should make a fresh collection and name it the successor to that taken away by the eastern potentate in question, even if it cost us several all night journeys to complete. Several of the writers of short notes are distinctly funny, and the lodgings question is again reviewed. A friend of one Kewite was annoyed at the way in which his provisions found their way into other hands (mouths?), so in bringing home some fresh herrings he removed their eyes to prevent them from straying; but those that turned up at the breakfast table next morning had eyes, but though they could not see, the man to whom they were presented could, and disowned ownership.

Judging from recent discussions in the gardening, but particularly the lay Press, there will be an outburst of indignation (some would say fanaticism) at the appearance of a portrait in the *Journal* of the first lady gardener who has taken sole charge of a garden on the same terms as a man. We refer to Miss Annie M. Gulvin, gardener to J. Brogden, Esq., Iscoed, Ferry-side, South Wales, who gives an account of her first year's experience of the place. The difficulties with which she had to contend were neither few nor small, and even-minded gardeners will, we think, sympathise with rather than chastise her, for the part she has taken in horticultural affairs. The place must have been in a greatly dilapidated condition and overrun with vermin from greenfly to rats, mice and birds, the latter being so daring and confident as to break glass in order to steal the fruit. Her predecessor must have been antiquated, and possibly would be disowned by his brethren of the profession, if all is true regarding the neglect of duty attributed to him. Miss Gulvin has an assistant lady gardener and four men, who having been taught submission, now take their subordinate positions meekly. She has already taken a first prize for vegetables at a local show, and has otherwise given such satisfaction that her salary has been raised £10 a year.

Many other interesting bits are furnished

by old Kewites, including an account of Mr. William Cameron, who left Kew in 1857 and left his footprints in the Botanic Garden, Peradeniya, Ceylon. He was the planter of the giant Bamboos by the river-side in that garden, the pictures of which have astonished many a reader in this country besides ourselves. Mr. Cameron is now a tea planter in the district, and his story is furnished by Mr. MacMillan, the present curator of the Botanic Gardens.

The several accounts of different parts of Africa also make most interesting reading, particularly travel and gardening in Cape Colony, pioneer work in the hinterland of Lagos and British Central Africa, all of which may be read with profit, particularly by those who may ultimately find their way into darkest Africa. The piping times of peace, no less than the piping times of war, are fraught with danger to those who follow the peaceful profession of gardening and arboriculture in distant lands. We are reminded of this in the chapter on "In Memoriam," giving a brief account of six past Kewites who have fallen in the strife more or less recently, including the late Mr. Willey, curator of the Botanic Station at Sierra Leone. Silently and undauntedly the gaps are filled up by brave men from the mother country.

Gardeners' Royal Benevolent Institution.—We learn with pleasure that Messrs. J. Veitch & Sons, Ltd., Chelsea, gave a donation of £20 to the Festival Dinner Fund of this institution, the dinner taking place on Wednesday last.

Mr. G. W. Cummins, late gardener to A. H. Smee, Esq., The Grange, Wallington, Carshalton, Surrey, has been appointed head gardener to W. H. Lumsden, Esq., Balmedie, Aberdeenshire. We wish Mr. Cummins every success in his new appointment, and his numerous friends, we feel sure, will re-echo that sentiment.

Staging Vegetables at Edinburgh.—I notice in the schedule of the Royal Caledonian Horticultural Society that there is an addition of a class for sixteen varieties of vegetables to the class for ten, but exhibitors are asked to stage them on the same space as for ten, namely, on a box or tray 4 ft. by 3 ft. Surely this is an oversight, as the above space is barely sufficient for ten, far less for putting sixteen dishes on it. Why exhibit vegetables on trays at all? We do not see collections of fruit arranged as such; indeed, anyone who has sixteen dishes of vegetables to take by rail has sufficient excess to pay without adding the weight of a staging box. None of the leading vegetable exhibitors in England, such as at Shrewsbury, Reading, the Royal Aquarium, and many others I could mention, see any necessity for it. All that is required is a distinct division between each collection.—*James Gibson, Devonhurst, Chiswick.*

The National Dahlia Society.—We are in receipt of a most useful official catalogue of this society, the appearance of which all Dahlia lovers will cordially welcome. It is compiled upon similar lines to the catalogues sent out by the National Chrysanthemum Society, is well printed, and runs to forty-seven pages of printed matter exclusive of advertisements, and the red covers. The contents comprise a short history of the Dahlia, its bibliography, not as yet very extensive, selected lists of the best varieties of Dahlias of each section, together with the special characteristics of the different sections; and a general alphabetical list of all varieties in general cultivation in Great Britain, with the name of the raiser, and the date of sending out. A good deal of information has thus been collected, and the greatest credit is due to the compilers. Perhaps the "selected lists" above referred to are the most useful portion of the work, for descriptions are attached to each variety. In these lists the arrangement is not alphabetical but according to merit, the records of each flower at the recent exhibitions of the society being taken as the test of merit.

Kew Visitor to Friend.—"These are Orchids, and some of them catch flies and eat them.—*Patterson.*"

The Oldest Tree in the British Isles is said to be the Brabourne Yew, in Kent, the age of which is 3,000 years.

The Smallest Known Plant, says the botanist, is the Yeast. Well, if this is really the case the fruits are most universal.—*Patterson.*

The works of him who builds begin immediately to decay, but those of him who plants begin immediately to improve.—*Old Saying.*

The chap who made that remark had never been in a London back-garden.—*Sniggs.*

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, June 14th, in the Drill Hall, James Street, Westminster, 1.5 p.m. This will be the first meeting at which the Sherwood £10 ros. Silver Cup for annuals and biennials decoratively arranged will be competed for. A lecture on "Orchid Hybrids" will be given by Mr. James O'Brien, V.M.H., at 3 o'clock. Committees will meet as usual.

Galloway Floral Fete.—The date of the Galloway Floral Fete has been altered from August 17th, to August 18th, on which day the management committee has arranged for a military tournament to be given by a detachment of the Argyle and Sutherland Highlanders from Glasgow. The committee have also engaged the band of this regiment for the occasion, which in itself is a sufficient outside attraction. We are informed that this annual fete, which is now the only affair of the kind in Galloway, promises to be even more successful than the one held last year, and we hope these expectations may be realised. The fete is to be held in Kirroughtree Park, Newton-Stewart.

Recorded Sunshine.—The new sunshine recorder which was put into operation at the Greenwich Observatory at the beginning of last year, gave a total of 1,543 hours of sunshine during the twelve months. There were only 1,529 hours of bright sunshine out of the 4,454 hours during the time the sun was above the horizon of our murky skies. The Kew Observatory recorded 1,575 hours of sunshine during 1897, and, as usual, Bunhill Row, London, was again at the bottom of the scale with 1,279 hours of sunshine. The mean temperature for the year was 50.3° Fabr., being 0.9° above the average of the past fifty years. The highest temperature in the shade was 90.2°, which occurred on June 24th. The number of rainy days last year was only 149 in the London district, during which time there was a rainfall of 17.33 in., being 7.21 in. below the average of the last fifty years. The wind had an average velocity of 288 miles per day.

Devon and Exeter Gardeners' Association.—Summer outing: The committee are now able to announce that arrangements have been made for an excursion which they trust will be as enjoyable as any hitherto taken by the association. By favour of His Grace The Duke of Bedford, the members and their friends have permission to visit Endsleigh, one of the most charming family seats in the county. The excursion will therefore be to Tavistock and Endsleigh, on Wednesday, July 6th. The L. & S. W. Railway have been good enough to undertake to provide saloon carriages for the party to and from Tavistock, and Mr. Squire, of the Bedford Hotel, there, has arranged to drive us out to Endsleigh and back in brakes. The party will leave Queen Street Station at 9.5 a.m., and reach Tavistock at 10.45 a.m. Opportunity will then be taken to inspect the various interesting memorials in that historic town, and at 12.30 p.m. a light lunch will be served. The brakes will leave at 1 o'clock for Endsleigh, where two hours will be spent. On returning to Tavistock, a substantial meat tea will be served, and the return journey be made from Tavistock, leaving at 7.55, arriving at Exeter at 9.28. The tickets to members, including railway and brake fare, light lunch and meat tea will be 7s. 6d.; tickets to non-members (friends of members), 10s. All tickets must be taken by Friday, 1st July. No tickets will be issued at the station.—*Andrew Hope, hon. sec., 54, High Street, Exeter.*

The Cottage Grounds in Kew Gardens will be left in their present "semi-wild and exceedingly picturesque state," says the *Journal of the Kew Guild*. The public will have access by a broad path commencing near the Isleworth Gate, passing towards the Kew Observatory, thence turning to the left past the Queen's Cottage to the Cypress Walk. Bluebells and Red Campion are at present the glory of the grounds, and it would be a public loss if either they or the Brambles were destroyed to make room for a public promenade.

A Flower Hunter in Queensland and New Zealand is the title of a book recently written by that intrepid botanist and artist, Mrs. Rowan. In it she relates the discomforts and calamities which attended her in her extensive peregrinations through the countries mentioned. As the result of her travels, Mrs. Rowan has increased her collection of drawings of the flora of these countries to a considerable extent, and she has something to say of snakes and other creeping things which are to be found whilst searching for the flowers. Mr. John Murray is the London publisher of the book, and the price is 14s.

Dutch Horticultural and Botanical Society.—The Floral Committee at the meetings of March 9th, April 20th, and May 11th, 1898, awarded First-class Certificates to Messrs. V. Schertzer & Sons, of Haarlem, for *Primula veris acaulis coerulea* (March 9th); to the botanical garden of Utrecht, for *Cineraria Lynchi* (May 11th); to Mr. Baron van Boetzelaer, of Maartensdijk, for *Eulophiella Elisabethae* (May 11th); and to Mr. A. D. den Older, of Leiden, for *Plantago lanceolata fol. varieg.* (May 11th). A Certificate of Merit was awarded to Mr. Baron van Boetzelaer, of Maartensdijk, for *Stauropsis (Vanda) gigantea* (April 20th).

Rose Show for Newton-Stewart, N.B.—We are pleased to observe that the committee of the Newton-Stewart Floral Fête are to have an exhibition of Roses, herbaceous plants, and horticultural sundries on the 6th of July. Already there is an assurance that the exhibition will be on a very large scale, some of the leading houses having promised to send exhibits, while the enthusiastic manner in which it is being taken up locally augurs well for a successful show. Any seedsman or nurseryman desirous of exhibiting any of their specialities should make early application to the secretary, who will be pleased to allot sufficient space and see to the proper erection of the stand. We wish the exhibition every success.

To Encourage the Children.—The Toronto Horticultural Society proposes to make a most commendable departure from the general routine of the conduct of such societies by presenting 1,000 plants to the children of public schools in the city, such plants to be cared for by the recipients and exhibited by them at the Chrysanthemum show in the fall, when prizes will be given to the best specimens. The children will thus be induced to take a deep interest, which in many cases will be likely to culminate in an abiding one, in plants and plant life, apart from the interest that the healthy, and health-giving competition will inevitably promote. We should like to see the precedent thus established followed in every centre, not only across the Atlantic, but in this country and the Continent as well.

The Lands of Arniston, which belong to the family of Dundas, of Arniston, the head of which house is down for a baronetcy in the list of Birthday Honours, extend to upwards of 10,000 acres in Midlothian, 1,000 acres being well covered with timber. The estate lies at a considerable altitude on the northern slope of the Moorfort Hills, and although naturally in an exposed situation has been so well looked after since it was acquired by the house of Dundas in 1591 that it is one of the most fertile estates in the upper districts of the Lothians. The author of *Waverley* was a frequent visitor at Arniston, for in his diary we find the following entry:—"I am always happy in finding myself in the Old Oak Room at Arniston, where I have drunk many a merry bottle, and in the fields where I have seen many a hare killed." Sir Robert Dundas, the present proprietor of Arniston is an enthusiastic arboriculturist, and the members of the Scottish Arboricultural Society are always certain of a hearty welcome from him.

Violent Contrast.—The Judas-tree and Love-tree are popular names applied to *Cercis Siliquastrum*.—*Patterson*.

The Orchid Houses at Kew have long been inadequate for the proper housing and cultivating of this important and popular class of plants. For some days past they have been undergoing demolition, and are to be replaced by four smaller houses built or constructed on the principles most approved by the leading Orchid-growers. The Orchid pits will also be extended.

They mistook both cause and remedy.—A London suburban gardener, being greatly annoyed by his plant enemies, went across the way to get a bottle of Lemon Oil from the local sundriesman, and was returning with the bottle exposed in his hand. Two missionaries (natives) seeing the bottle and a serious face, and never divining the cause of the trouble to be of the common or garden bug order, held out a tract with the encouraging words, "Here my good fellow, this will cheer you."—*Snaggs*.

Bad for the Glasshouses.—On Saturday, the 14th ult., a severe hailstorm visited Kansas City, Mo., U.S.A. The damage done by the hailstones was very great, their average size being from 8 in. to 9 in. in circumference according to reports, whilst it is stated that some of them weighed from 8½ to 9 ozs. each. Not only glass but crops of all kinds have suffered much, and, in fact, many of them have been totally destroyed by this aerial bombardment. To quote the words of our contemporary, *The Florists' Review*, the place was "simply Deweyized."

The Lily Fields of Bermuda.—It is well known that it is from Bermuda that many of the necessary supplies of *Lilium longiflorum*, and its charming variety *L. l. Harrisii* are annually drawn, but just exactly how these Lilies first got to Bermuda is not known. It is probable, however, that they were first taken thither by some of the English governors, and quickly making themselves at home in the soil and the climate became generally distributed amongst the gardens in the islands. The cultivation of *L. l. Harrisii* for sale was in reality opened up by Mr. F. R. Pierson, of Tarrytown, N.Y., U.S.A., in the autumn of 1881. Mr. Pierson's attention had been previously called to the fact that the Lily grew with freedom in the Bermudas, and this visit which was fated to have such far-reaching results was made as the immediate consequence. Arrangements were made by him with General Russell Hastings for the systematic cultivation of *Lilium Harrisii*, and from this point the industry increased in size and importance year by year until it reached its maximum in the years 1894-5-6. In 1896, the number of bulbs grown amounted to upwards of 4,000,000. Since that time the acreage devoted to the bulbs has decreased, and prices have advanced somewhat, but the industry is still one of the chief sources of revenue to the islanders.

Fruit Prospects in North Britain.—At Saughall the outlook is decidedly favourable. Apples are an average crop; Pears, Raspberries, Gooseberries, Currants, and Strawberries very good, the latter having greatly benefited by the recent copious rains; Cherries, Plums, and Damsons, very fair, and Apricots decidedly above the average. At Ince, despite an abundance of bloom, all except small fruits will be scarce. At Norley, on the other hand, they all promise well. Shocklach has suffered severely from blight, and heavy thunderstorms followed by frost. Plums, Damsons, Pears, and Apples have received a deal of damage. At Backford, the Damson trees have been attacked by green fly, and the prospects of a crop are not inviting. Pears are a full crop in this district, however, and Plums and Apples are fair. Fordsham and Kingsley have both suffered severely from the cold weather and hailstorms of May. The trees bloomed well, and set well for fruit, but the inclement weather has blackened and withered the leaves and fruit. Such Pears as Jargonelle and Hessele, both of them prime favourites in the neighbourhood, are an utter failure. Cherries, however, look well, and are thus an exception among stone fruit, which is poor in this district. The season, which a few months ago looked as if it were going to be early, seems now to be rather backward, so much time having been lost through the very cold spring.

The Daisy did not make its appearance in the Southern States of America till after the civil war; and is believed to have been transported there in the hay sent to feed the army horses.

The Hardy Azaleas in the pleasure grounds at Kew have been in their glory for many days past, the early, midseason, and late varieties keeping up a very lengthened display. Their delicious and powerful Honeysuckle fragrance may be perceived far down the wind on the lee side of the beds; and their masses of brilliant colours may be sighted for great distances down the vistas or grassy avenues between the trees. Some of the shades of colour that may be noted are white, pink, lilac, rose, purple, cream, sulphur, yellow, golden-yellow, orange, orange-red, salmon, red, scarlet, crimson, glowing fiery-red, &c.

The Great Exhibition of British Grown Fruit held under the auspices of the Royal Horticultural Society since the year 1894 is one of the great horticultural events of the year. It is held by the R.H.S. conditionally upon the receipt of donations towards the prize fund of £100, and we are pleased to see that a sufficient sum has been received to admit of the schedules being printed and circulated. The show will be held as usual at the Crystal Palace, the dates fixed being September 29th, 30th, and October 1st. In view of the present general favourable promise for a good fruit year we may expect to see a display fully equal to any that have gone before. Prizes are offered in 172 classes. At the end of the schedule lists are given of the varieties of Apples, Pears, and Plums, each variety being placed in the section in which it will be allowed to be shown by the society. In view of the confusion between culinary and dessert varieties of the fruits named that existed until the R.H.S. took the matter in hand, these lists must be of vital importance to intending exhibitors.

A New Park for Margate.—The good people of Margate are indebted to the public spiritedness of Mr. John Woodward, a native of Margate, and a member of an old Margate family, but now a resident of Croydon, for a very handsome breathing space known as Dane Park. About three years ago certain farm lands situate in the Dane Valley, immediately adjacent to the town, came into the market. Mr. Woodward then conceived the idea of purchasing them, and presenting them to the town as a site for a public park and recreation ground. This he did in February, 1896, and the only conditions attached to his munificent gift were that all the roads of the estate should be fifty feet wide, and that the work of preparation should be completed within twelve months of the following Michaelmas when the tenants should give up possession. The laying out of the park was entrusted to Messrs. Cheal & Sons, of Crawley, Sussex. Mr. Joseph Cheal, the landscape gardener of the firm, has with great success undertaken the laying out and planting of various public parks in different parts of the country, and is the recipient of the Gold Medal given for this class of work at the Gardening and Forestry Exhibition at Earl's Court in 1893. Mr. Cheal has certainly made the most of the natural advantages of the Dane Park, which is twenty-three acres in extent, ten acres of the original purchase having been disposed of to defray expenses. On entering the grounds the visitor is attracted to the lake, a small but picturesque piece of water overhung with fine old trees. There is a miniature island in the centre of the lake, and in the background some imposing rockwork prettily planted with a variety of subjects. Clumps of trees and shrubs, and lines of trees are planted over the whole of the ground. The cricket field, lawn tennis courts, bandstand, shelters, and children's playground are other features that will not lack appreciation. The seats provided are due to the kindness of the Hon. Member for Thanet. The opening ceremony was performed on Wednesday, June 1st, by the Lord Mayor and Lady Mayoress of London, who were received by all the *élite* of the neighbourhood, including the Mayor and Mayoress of Margate (Mr. and Mrs. G. F. Brown). The whole town was *en fete* for the occasion, and the decorations and illuminations were carried out upon an extensive scale. Commemoration trees were planted at the close of the opening ceremony by the Lady Mayoress, the Mayoress of Margate, Mrs. John Woodward, and Miss Coleman.

ORANGE TREE IN GUERNSEY.

WE have pleasure in enclosing photograph of an Orange tree growing in our island, and if you reproduce it in your valuable paper, we think it will interest and possibly surprise many of your readers. The tree itself is a proof of our mild climate. It was planted in the year 1853, against a dwelling house, the property of John de Jersey Lainé, Esq., in the parish of St. Saviour's; the aspect is due south, hence it has the benefit of all the sunshine we enjoy. It covers about sixty-four superficial feet, and is loaded with fruit every alternate year. At this moment, May 30th, there are some 200 Oranges just on the point of ripening. The tree flowers during the month of June, and the perfume is spread at some considerable distance from the house.

The present proprietor, J. A. N. Lainé, Esq., informs us that only a slight covering is used during

ORANGE TREE IN GUERNSEY.

frosty weather, otherwise it is left quite exposed. It is liberally manured with road sweepings and decomposed cow dung during the early spring. We may mention that in most seasons the fruit is very juicy and sweet. — *W. Mauger & Son, Bulb Growers, Guernsey.*

GARDENERS' CHARITIES.

I WAS sorry to read Mr. Fletcher's letter in the GARDENING WORLD of last week with regard to "Gardeners' Charities" as I think them all excellent institutions and managed as economically as they possibly can be. I think we ought to feel pleased if in contributing to them we render assistance to others, even if we get no direct benefit ourselves. I should think from the tone of Mr. Fletcher's letter he is not aware of the existence of the United Horticultural Benefit and Provident Society, which is really a benefit society and savings bank (some of our oldest members having over £30 standing to their credit). I have been a member over twelve years and I can assure our friend that not a penny of our money is wasted, although I am aware that some so-called societies (not gardeners') are grossly mismanaged. I am afraid it would take up too much space here to give full particulars, especially as the Editor kindly gives full reports of our meetings from time to time, but I think if Mr. Fletcher will send to our secretary at the address given in the GARDENING WORLD for a copy of our Rules, he will see that our society covers all the requirements he has suggested. — *H. Peerless.*

Spain has more Sunshine than any other country of Europe, the yearly average being 3,000 hours.

CARNATION URIAH PIKE.

FOR some time past the existence of this variety, which suddenly became so popular a few years ago, has been held in the background. Gardeners are quietly cultivating it, however, and using it to good purpose in their houses and as cut flowers. A fine bunch of flowers reached us the other day from Mr. A. Pentney, The Gardens, Worton Hall, Isleworth. The rich velvety-crimson flowers make a fine contrast with the sea-green hue of the foliage. They are also of great substance and very durable, lasting for several days in excellent condition in the dry state, so that they ought to remain fresh for a longer period in water. Many varieties are relatively short-lived, but particularly in summer. The well-formed, stout calyx does not split; while the clove-like fragrance of the flowers keeps up its power apparently as long as the flowers last.

RHODODENDRON ANTHOPOGON.

YELLOW-FLOWERED Rhododendrons, apart from those generally spoken of as Azaleas, are comparatively rare in the outdoor garden. That under notice is a native of Northern Asia, and has been flowering for some time in the neighbourhood of King William's Temple, Kew. The oblong or lanceolate evergreen leaves are only about 1 in. long, and rusty beneath, as in the European *R. ferrugineum*, though otherwise very different. The flowers are small, pale, clear yellow, and produced in dense clusters at the apex of the numerous shoots and branches.

MESSRS. VEITCH'S ORCHIDS.

SOMETHING interesting may be found at all seasons of the year in the nurseries of Messrs. J. Veitch & Sons, Ltd., Chelsea. Every season has its special kinds, and in spring these are more abundant than at any other period; but the numerous hybrids for which this establishment has long been famed enable the firm to set up a group consisting entirely of garden creations at many of the R.H.S. meetings and elsewhere. Some or other of them are in bloom all the year round. As we passed through the houses the other week, however, there was a great wealth of flowers of a very varied nature.

The glory of the cool houses was undoubtedly the *Odontoglossums*, amongst which *O. crispum* and its endless varieties take the premier position. Of this there were numerous arching spikes of round and otherwise well shaped flowers, of white, pale rose, dark rose tinted and handsomely blotched flowers, with broad, imbricated segments. As beautiful as puzzling was a natural hybrid suggesting *O. crispum*, and *O. wilckeanum* as the parents. The flowers were richly blotched with brown on a light yellow ground. *O. luteo-purpureum* also exhibited great variety, including fine dark blotched forms. The vigour of *O. Hallii* was particularly noticeable, the flowering stems being 3½ ft. to 4 ft. long. All of the above occupied stages which placed the flowers in a convenient position for inspection.

The *Oncidiums* contributed their quota to the general display. One of the prettiest and most attractive was *O. spilopterum* with its rich purple, cushion-like crest on the lip, suggesting the specific name. This as well as the uniformly yellow *O. concolor* were suspended in Orchid pans. Many well grown plants of *O. macranthum* are now making their presence felt by their long racemes of bloom.

Passing into the warmer houses an even greater variety of species and hybrids invited inspection. There appears to be a considerable amount of blue in the showy flowers of *Dendrobium lituiflorum marmoratum*. Very pretty are the light yellow flowers of *D. cheltenhamense* (*aureum* × *luteolum*) with an orange blotch in the throat. The greenish-golden disc of *D. Boxallii* marks out this as a beautiful and most interesting type. Interesting and uncommon sorts are *D. Parishii* and *D. japonicum*, there being a fine importation of the latter sweetly scented species.

The large panicles of *Oncidium sarcodes*, *O. divaricatum*, and *O. phymatochilum* are both conspicuous and effective, owing to the graceful poise of their myriads of flowers. The pale salmon sepals and petals of *Coelogyne tomentosa* are pretty, but what shall we say of *C. dayana*, with fifteen of its long, pendent and graceful racemes of flowers? The racemes of fragrant white flowers of *Angraecum modestum* reach a length of 18 in. The sepals and petals of *Vanda striata* are pale yellow, and the white lip is heavily striated with reddish-brown. A vigorous and healthy piece of *Phalaenopsis luddeloviae* was flowering finely. The long and massive panicles of *Oncidium carthaginense* and *O. ampliatum majus* are always conspicuous by reason of the quantity of flowers they bear. Of *Cypripediums* in the same range of houses we singled out *C. Annie Measures*, *C. ciliolare*, and *C. mastersianum*, all widely distinct.

The rock house is always a centre of interest, because it forms a sort of conservatory in which the species that like an intermediate temperature may be kept while in bloom. The huge flowers of *Oncidium marshallianum* are strikingly gorgeous. A piece of *O. divaricatum* carries about 500 flowers on a spike 4 ft. to 5 ft. long. *Sobralia macrantha* has been flowering for more than two months past. Well

STAUNTONIA LATIFOLIA.

IN Devon this is a perfectly hardy evergreen climber and thrives well with us on an east wall, flowering each year fairly well early in May; but I think if it had been given a southern aspect better results would have followed. The individual flowers are rather small, but delightfully fragrant. It is a native of the Himalayas, and was introduced in 1840. It is sometimes found under the name of *Holboellia latifolia*. Any pruning necessary should be done early in the autumn; the long, trailing shoots should be cut back each year or it very soon becomes a perfect mass, which proves detrimental to its flowering.

It is usually propagated by cuttings of half-ripened shoots; but in January of this year a lady living at Paignton, near Torquay, forwarded me a ripe, purple, oblong fruit, about the size of a duck's egg, which I quite thought was a fruit of one of the *Passifloras*. I sowed the seed on January 29th, and when fit, potted off half a dozen young plants which are doing well. Last month the lady kindly sent me flowers and foliage of this climber, which I at once identified as *Stauntonia latifolia*. The plant from which the fruit was taken (it carried several) is trained on a verandah in front of the house; otherwise it is quite unprotected. Is it not unusual for this plant to fruit out in the open in this country? Perhaps Mr. Editor or some kind reader can enlighten us on the subject.

—*James Mayne, the Gardens, Bicton, B. Salterton.*

[We have never seen this climber in fruit, and do not recollect such an occurrence having been brought to our notice. It is usually looked upon as a cool greenhouse climber, and though it grows against walls in the latitude of London, it would naturally succeed better in Devon, where the winter is usually much milder.—ED.]

known and useful sorts are *Cymbidium lowianum*, *Maxillaria sanderiana*, and *Epidendrum elegantulum*, the latter being a secondary hybrid replete with numerous colour varieties. A fine variety of *E. Wallisii*, with golden-yellow sepals and petals, carried twenty-seven large flowers. Beautiful also is *Trichopilia marginata Champlatreux var.*, having a rosy-purple lip, and paler sepals and petals, outlined with a broad white margin. *Calanthe Masuca* is a rare old and pretty species, having purple-blue flowers. The sepals and petals of *Bifrenaria tyrianthina* are delicate lilac, overlying white; the orange-brown and purple-lined lip is heavily bearded all over. Many fine varieties of *Vanda tricolor* are noticeable. *Epidendrum radicans* grows with so remarkable vigour that it reaches the roof of the house every year in September, after which the upper portions of the plants are taken off and lowered into the pots. Numerous plants have been flowering all the winter, and still continue to develop their fiery scarlet flowers.

The *Cattleya* house has been particularly gay for weeks past, there being a great variety of rich colours in *Cattleya Mossiæ* and *C. Mendelii*, which are grown in great quantity. Other showy species are *C. lawrenceana*, *C. schilleriana*, *C. Skinneri*, *C. Schroderae caerulescens*, and *C. Roezlii*, the latter being yellow with a prominent purple blotch on the lip. Altogether there are something like 300 spikes of *Cattleyas*.

No less numerous are the species and hybrids of *Laelia*, of which the dark crimson-purple lipped *L. purpurata*, and the varieties with white sepals and petals are numerous and very ornamental at this period of the year. Other species are *L. cinnabarina* and *L. elegans*. The orange flowers and crimson lip of *Laelia Latona* are particularly handsome for this hybrid. The large, intense purple lip of the bigeneric hybrid *Laeliocattleya wellsiana* is very gorgeous. Of *Laeliocattleya Ascania* we noted four different colour varieties. It comes from *Cattleya Trianaei* × *Laelia xanthina*. The flowers are yellow, intensifying in the throat of the lip which is margined with soft lilac. In size the flowers is intermediate between those of the parents and charmingly pretty. A choice named variety is *Laeliocattleya Ascania superba*, having an intense purple lip, the dark colour running much further down the throat than in the type. A singular combination of colours is presented by *Dendrobium glomeratum*, having rich rosy sepals and petals contrasting with the rich orange-scarlet lip. The plants at Chelsea are always profusely flowered.

THE VIOLA.

THESE flowers are, in spite of the backward season, making a fine show in some of the Scotch nurseries. To see them at their best one should see them growing. An examination of the flowers at flower shows may give one some idea as to the value of a variety for competition, but you cannot tell whether it may be a good bedder or not. Although many of the best competition sorts are good hedders, some of them grow too tall.

One of the best varieties noticed is *Accushla*, a very pure white ground, heavily edged with purple. A bold and telling rayless yellow is *A. J. Rowberry*. An immense showy flower is *Butterfly*, the ground being pure white, edged with rose. *Blue Gown* is a gem for bedding, very light blue, and about 4 inches high. *Dorothy Stokes* is a massive fancy flower, purple ground, striped crimson. A white variety which takes one's fancy is *Duchess of York*, which has a dwarf tufted habit and throws its pure white flowers well up. Very pretty is *Iona*, which is one of the *Magpie* type. A very unique flower is *Jessie Pretswell*, the ground colour being white, striped with crimson and purple. *Lizzie Barron* is a large and fine rosy-purple self. A large showy white is *Lady Salisbury*, which is rayed. A very fine rayed lemon-yellow is *Lord Salisbury*. Another very bright rayed yellow is *Lizzie Paul*. *Magic* is a very pretty shade of light rosy-crimson, a very pleasing colour. An immense pure white is *Nellie*. *Princess Louise* is a very fine yellow bedder. A very sweet shade of rose is *Princess Ida*. The same may be said of *Sissy Mellows*, which is violet shading to lavender at the sides. *Sheelah* is a charming flower with a clear pale rose on the top petals; lower petals deep pink with darker centre. A very fine dark blue

is *Wm. Haig*. The above are a few of the best at the time of my visit.—J. J.

FRUIT UNDER GLASS.

THE dull, damp, and rather cold weather has been rather a trying time amongst under-glass fruits. At such a time the Vines particularly are apt to show their dislike of the experience by very flaccid foliage, of poor substance, and very light green in colour. Where this is the case the outbursts of hot sunshine that will come presently must be carefully watched, otherwise there will be a good deal of scorching to deplore.

NIGHT VENTILATION.—If the practice of leaving a little top, as well as bottom, air on all night has not been commenced up to the present, it should be started now. A couple of inches of air upon the top lights will be quite enough for a start, but it will help greatly in the making of stout and healthy foliage, and will, moreover, help to diminish the risk of scalding in Vines. Peaches and Nectarines, as well as orchard house fruit generally also benefit largely by night airing.

LATE VINES.—As the fruit here has now set, the thinning will require to be pushed on with all possible despatch. In the case of backward bunches only the small and inside berries should be removed at first, the work of thinning the rest being left to a later time, when the process of swelling is further advanced. All these late houses should have a temperature of about 70° Fahr. by night, although if it should occasionally drop down to 68° no great harm will be done. By day the temperature will much depend upon the weather; if bright it may rise to 85° without any danger, provided there is a good circulation of air. In dull weather the glass will probably not touch 80°, and may possibly not rise above 75°.

GRAPES RIPENING.—Houses in which the fruit is colouring will need to have a brisker and rather drier atmosphere maintained than hitherto, in order to expedite the ripening process. To this end the dampings down and syringings that have been regularly and frequently given should be discontinued at once. Any plants that may be in the house should likewise be removed. Vineries have often to accommodate a variety of plants in pots, more especially Ferns, which do really well up to this stage; now, however, the air will be rather too dry for their liking, and they must be given shelter elsewhere. The lights should be opened wider than they have been up to the present, and every effort should be made to maintain a continual current of dry air through the house. Manurial stimulants of all kinds may be dispensed with after the first stages of ripening are past, but clear water must be given, especially where the roots of the Vines are wholly inside the house, and therefore soon liable to feel the effects of drought. It is quite a fallacy to make total abstinences of the Vines from the time that the fruit commences to colour, under the idea of helping the fruit to colour. Under such treatment both colour and flavour are apt to be second rate.

PEACHES, NECTARINES, AND CHERRIES in pots that are now ripening their fruit should be given all the benefit of what sunlight there may be in order to put a good colour on the fruit. The whim of sending the fruit to table as it grows upon the trees seems to be growing in some quarters, and it is only by keeping a stock of medium-sized pot plants that the gardener is able to gratify it. As the condition of perfect ripeness is reached each Peach, and also each Nectarine if they be large and heavy, should be enclosed in small bags, so as to insure their being kept in place while they are being moved. After the trees have safely reached their destination the bags may be removed in order to allow guests more ready access to the fruit.

LATE POT STRAWBERRIES.—The season for forced strawberries in drawing very near its close. Only the very late pot plants are left, which will join hands with the earlier outdoor crops. Some of the finer flavoured but rather intractable varieties come in admirably at this juncture. Take for instance, *British Queen*, which is very often with many a failure out of doors, and but a qualified success when forced in pots early in the year. The best method of treating it seems to be to put some pots of it into a very gentle heat about the beginning of March, and to allow them to come along very

gradually, not much faster indeed than they would in the open ground, Nature only being anticipated for a space of about three weeks. Such plants are now bearing plenty of good fruit. With so many fine varieties it may seem superfluous to take so much trouble over one, but there is no finer flavoured Strawberry than *British Queen*, and it is often asked for in private establishments where the cost of production is not so closely watched.—*A. S. G.*

Kitchen Garden Calendar.

GENERAL WORK.

As the ground becomes cleared of the early Potatos and Peas, it should again be sown or planted with some other crop—the kind must entirely depend on the position and requirements of the establishment. Where early Potatos are grown on south borders the position is a good one for sowing Carrots to give a supply during winter, as they will be somewhat protected from the severity of the weather should there be hard frost. Such positions are also good ones for early Broccoli that turn in about Christmas, as the borders can again be cleared in time for forward crops another season.

Where Peas and Potatos are grown in the open quarters the crops will not be lifted or gathered for another few weeks, but to make the most of the land, plants should be had in readiness for putting out as soon as the other crops are cleared off. In many gardens Broccoli and Savoys are much in demand during the winter, and as sufficient space cannot be found for them to be planted out early in the season, recourse is often had to planting them between the rows of Potatos. When this has to be done, it is far better to put them between the early or second early kinds that do not produce much haulm, for when the tops of the Potatos overgrow the plants they become drawn and seldom prove satisfactory. In many places, too, there is not sufficient space to get out the Celery unless between some other crop, and gardeners are often put to their wit's ends to provide room. If the ground be set out in early spring for the various crops and those that are to succeed them much trouble and annoyance may be saved when the time arrives to sow or plant. Celery can occupy the spaces between the rows of early Peas, provided they are planted sufficiently far apart to admit of room for earthing; the plants will have taken good hold of the ground before the crop of the latter is gathered.

THINNING.—At this time of the year this is an important item in the growth of all crops. On no account should the plants of any kind be allowed to get overcrowded, as they soon spoil each other. Carrots, Parsnips, Onions, Beet, and such like root crops ought to be thinned in the first instance as soon as the foliage touches each other; and before they show the least signs of becoming drawn, the full space should be allotted to them. It is not necessary to thin Onions to any considerable extent unless extra large roots are wanted; for all ordinary purposes four inches will be ample, but where extra large bulbs are required a distance of from eight to nine inches should be allowed between the plants.

WATERING at this time of the year is also an important item, as no plants can make satisfactory progress unless provided with sufficient moisture; at the same time much harm is often done by giving dribbles. Never water until the plants actually need it, and then give sufficient to thoroughly moisten the soil to the depth of the roots. Peas, to grow them well, need much nourishment, because the space for them to grow in is usually limited, that is, many plants are growing close together side by side forming the rows. Much water is needed for all the roots to obtain the requisite amount. If the rows be thoroughly soaked and afterwards a mulching put along the sides, this will prevent a too rapid evaporation. The mulching should also be thoroughly soaked, as this will keep the soil underneath moist for a much longer period.

Often at this time of the year weeds grow apace, but these must be kept under at all points, for they soon seed, and as this will germinate after the first genial shower, the ground becomes filled with all kinds of rubbish. The hoe should be kept constantly at work when the weather is fine, as more execution can be done in one day when the sun is bright than in a week in dull, showery weather. Be careful in hoeing not to get too near the plants, as much harm is often done to root crops by scars with the hoe.—*Kitchen Gardener.*

HINTS FOR AMATEURS.

A NEW BREAK OF CLEMATISES.

AMONGST the many interesting and handsome plants which were forthcoming at the late Temple Show none were more worthy of note than the new type of Clematises shown by Messrs. Jackman & Sons, of Woking. In the genus Clematis we have a number of exceedingly beautiful plants, which cover a considerable range of variation, both in size of the flower, the period of flowering, and the habit of growth. With the exception of *C. indivisa lobata*, which needs the protection of a greenhouse, they are all hardy in our climate. The whole of this wealth of material is, therefore, at the disposal of the gardener for covering bare walls, ornamenting fences of all descriptions, or clothing all sorts of arbours and fancy arches. Quick to grow, and free to bloom, both large and small-flowered forms are, indeed, ideal climbing plants.

Not satisfied with all the beautiful forms hitherto in cultivation, the Messrs. Jackman & Sons have set to work to produce an entirely new break, and, judging from the plants exhibited by them at the Temple, they have abundantly succeeded. By crossing such varieties of the "patens" type as *Rubella*, *Fair Rosamond*, and *Mrs. George Jackman*, with the pollen of *C. coccinea*, really a variety of *C. Viorna*, and a native of Texas, an intermediate form has been obtained that bids fair to become of great service ultimately. Curiously enough the reverse cross, that is, when a variety of the "patens" type was employed as the pollen or male parent, yielded no results. Perhaps this difficulty may be surmounted in the near future, and if it is we may look for a considerable widening of the range of character exhibited by the break.

For the sake of distinction and easy reference the progeny has been labelled "hybrids from *C. coccinea*." Already there are several very fine and distinct varieties, and these will doubtless be added to in the near future. These we will speak of in detail presently.

The general characteristics of habit are the same throughout, and do not show much variation. The members of the "patens" section of Clematis are spring bloomers, the flowers being borne upon the ripened wood of the previous year, that is to say, upon year-old wood. In the new hybrids we have plants that flower upon the young growing wood of the same year as in the "Jackmanni" and "Viticella" type. The period of flowering, too, is late, as this difference in habit will prepare my readers to believe, for under ordinary conditions the flowers are produced in great profusion throughout the months of July, August, and September. The flowers themselves are quite distinct in appearance from any other of the Clematises. They are small, and bell-shaped, the narrow and acutely pointed segments being folded back (revolute) at the tips for about half their length. They are produced from the axil of each leaf all along the stem, as in *C. coccinea*, and are not borne in masses as in *C. Flammula*, but are solitary on rather long and fairly stiff stalks. This renders them eminently suitable for the filling of vases for dinner table, and other decorations. Moreover, they last well in water, so that for cut flower supplies alone they are worth the attention of the amateur.

Reverting once more to the matter of growth, they will frequently make shoots exceeding 12 ft. in length, and thus, if a flower is reckoned to the axil of every leaf on such a shoot some idea may be gained of the great floriferousness. After flowering the plants may be cut hard back in the usual way in which Clematises flowering on the young wood are treated. There is no fear of spoiling next year's crop by a free use of the knife. The plants throw up strongly from the bottom, and thus there is little danger of their suffering even in very severe winters.

Propagation, too, is remarkably easy, for cuttings inserted early in spring root quickly, and soon grow into plants that will bloom the same year, so that it will be seen that this new race of plants has much to recommend it to the favourable notice of the amateur. When shown by Messrs. Jackman & Sons at the Temple they were all in pots, and trained in the shape of balloons, but this was only done for

purposes of exhibition, since it is obviously impossible to show flowering plants of Clematis in anything like a natural way. The balloons, however, though stiff and ugly in themselves, showed off to advantage the free-flowering character of the race, and this in itself was no unimportant achievement.

The following are some of the best varieties. They are all well worth growing:—

Grace Darling.—The female parent of this was the handsome variety *Fair Rosamond*. The flowers are rather small, but the delicacy of the rosy-pink hue they manifest fully atones for this.

Duchess of York exhibits rather a paler shade, which may best be described as a flesh-pink. The female parent in this case was the large, satiny-white *Mrs. George Jackman*, with its delicate creamy bar.

Countess of Onslow is remarkable for the fact that its flowers usually have six petals, four and five being common numbers in the other forms, although even here examples of the smaller numbers are occasionally to be observed. The colour is a rich rosy-carmine, which looks exceedingly bright beneath any light, whether natural or artificial.

Sir Trevor Lawrence has deep carmine flowers, and is one of the richest hued varieties of the whole race. The flower stems are of exceptional length and strength.

Duchess of Albany is noteworthy by reason of the fact that it is the strongest grower amongst any or all of the allied forms. The leaves are not only larger and the stems stouter, but growth is more rapid, and the whole plant more vigorous than the rest. The flowers, too, are rather more open than those of the others, that is to say, the tube is shorter, and the segments turn back for a greater part of their length. In this case it is a distinct advantage, for the bright rose stripe which runs down the middle of each segment to the base is thereby rendered more apparent. The remainder of the flower is shell-pink.

Admiration, which is the darkest flowered form of any, yet owns the creamy-white and splendidly formed *C. Hearyi* as its mother. The influence of this variety is to be seen in the whiteness of the exterior of the flower. The interior is of a rich magenta purple, the contrast between the exterior and the interior being both striking and effective. It is difficult, indeed, to see this variety and withhold from bestowing upon it the admiration which it deserves, and which has been foreshadowed, as it were, in its varietal name.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Mildew in Vinery.—*Anglo-Saxon*: The mildew has probably been caused by the exceedingly cold and dreary weather that it has fallen to our lot to experience of late. Even healthy Vines will become affected at such times, and we do not think you need trouble yourself to worry about the state of the roots of yours, unless, of course, you are certain that they are in a bad condition. You may dust the spots with flowers of sulphur, and a little of the sulphur may be sprinkled on the hot water pipes. The house may be kept rather closer and warmer than usual, and you should be particularly cautious in avoiding draughts. If these precautions are taken, the mildew ought soon to disappear, and will not injure the crop to any appreciable extent.

Mulching with Coconut Fibre.—*E. A. T.*: You may, if you choose, give the tuberous *Begonias* a mulching with the fibre, if the weather after planting out proves warm and dry, otherwise the mulching will do very little if any good, and we should prefer not to put it on yet. The value of such applications is that during dry weather they tend to check rapid evaporation of water from the soil.

Gymnogramme schizophylla gloriosa.—*Neb.*: You will never succeed with this beautiful but rather delicate Fern in a cool house. You must give it plenty of heat, and look after it carefully for water, or it is no use attempting to grow it. To show it off

properly, the pot should be suspended above the stage, and the drooping habit of the finely cut fronds will then be more evident than if the plant were stood on the shelf or staged amongst others.

Arenaria balearica is the name of the little white flowered plant that is creeping over the stones in your friend's garden, *T. G.*, and of which you sent a small specimen. It is perfectly hardy, and there is nothing prettier for covering the stones than this.

Azaleas after Blooming.—*P. T. O.*: After the bloom has dropped from the plants go over the latter and pick off all the seed vessels, which, if allowed to remain, will weaken them to no purpose. A removal to a close house or pit will be advantageous to the plants, for a gentle heat and copious and regular syringings will do much to foster the new growth, which should just be making its appearance. By the middle or end of July the buds will be formed and the growths sufficiently firm to admit of a further shift to the open air. The plants will then be able to mature their wood properly. This proper ripening of the wood is an important matter, more especially where early forcing is to be carried on.

Azalea Deutsche Perle.—*C. Godden*: For a white variety you cannot beat *Deutsche Perle*. It forces very easily, and is of good habit and constitution.

Astilbe (Spiraea) japonica.—*C. James*: After the flowers have all gone off you should seek an early opportunity of putting the plants out in the open. The old stems that have flowered will gradually die away, and new growths will be thrown up from the bottom, if the plants are properly looked after. Unfortunately they are often treated rather badly at this stage of their existence. They are very free rooting things, and when potting them up in the autumn they are pushed into as small pots as possible, for the obvious reason that big pots would take up too much room. When in full growth therefore they naturally take a great deal of water in hot weather, two or three applications a day being oftentimes scarcely sufficient to keep them from flagging. When planted out of doors all this labour of watering is avoided and the plants have a better chance. They should be left out of doors until next autumn twelvemonths, as *Spiraeas* will not force successfully for two years in succession.

Greenhouse Stage.—*Amateur*: If you want to do the thing well you cannot do better than make the floor of the stage of rough slates laid upon an iron or wooden framework and cemented together, a few holes being left for drainage. Cover the whole with at least an inch of screened shingle, crushed shells, or finely broken coke or cinders, either of which will make capital stuff for standing the plants upon.

Morello Cherries.—*T. Renshaw*: It is a pity that all the bloom should have dropped from your Morellos without any fruit setting, but are you not somewhat previous in assuming that such is the case? We have been having such cold weather lately that the young fruits have been quite at a standstill, but warmer weather will soon settle the question whether you are to have any fruit or not. At any rate, the cause of the loss, if loss there be, will not be because of the aspect of the wall, for a northern or eastern wall suits Morellos admirably, and they are usually grown on one of these aspects. If the fruit turns out to be a loss, send us particulars of what the trees are like, when planted, soil, weather at the time of blooming, etc., and we will try to help you to a reason for the calamity.

Erythina Crista-galli.—*A. Erle*: If you look after the plant for water there is nothing that need prevent you from plunging it in the centre of the bed as you suggest. The twelve-inch pot will be large enough for it, for the plants do not seem to flower freely unless they are somewhat pot-bound. Liquid manure may be given twice or thrice a week in warm weather.

Rain Washing the Paths.—*Querist*: The recent rains have certainly been heavy, but not sufficiently as to cause so much washing of the gravel as you complain of. Perhaps you have neglected to cut channels in the grass, say about four feet in length, and running from the path. If you have not done

this you will do well to see to it at once, as this will, without doubt, remedy the evil.

Applying Manure to Vines.—*Rob*: After you have sprinkled the powder on the surface, fork it in gently with a small fork, keeping a bright look-out for any weeds that may be near the surface. Follow up with a good soaking of clear water.

GESNERACEOUS PLANTS AT READING.

THE plants of this family are typified by *Gesnera*, several of which are handsome subjects, more or less cultivated in this country. *Gloxinias* are even more popular and widely cultivated. The collection in the Portland Road Nursery of Messrs. Sutton & Sons, Reading, is later this year than usual, not merely on account of the long continued cold and sunless weather, but because they were started later than usual, so that they should flower in June instead of May. There are three generations of them in the houses all coming along in succession, and thus keeping up a lengthened display. The larger ones are in 32, large 32, and 24-sized pots. The foliage is vigorous and healthy, covering the soil and hanging down over the pots. Even amongst the leaves is a considerable amount of variation, as if the plants were of hybrid origin. The leaves of *Prince of Wales* are quite hoary, and may be singled out readily. Other sorts are characterised by dark green leaves, while another set has a silvery venation.

The flowers, however, always attract the greatest amount of attention, owing to their extremely varied and bright colours. The glowing and vivid scarlet of *Sutton's Reading Scarlet* is in marked contrast to the pure white and massive flowers of *Her Majesty*. The sky-blue colour of *Azure Blue* is a charming hue in this class, beautifully set off with the white throat. Amongst bordered *Gloxinias*, *Duke of York* is a bold and telling flower of a rich crimson, surrounded with a broad and regular white margin. Its companion, *Duchess of York*, is rich purple, bordered with white, and perfectly distinct. The flowers of *Sutton's Purple* are dark and very rich in tone, while characterised by great substance, as, indeed, are any and all of them to which special names are given. No attempt, however, is made at naming the varieties generally. None but good varieties are used as seed parents, so that the standard of the strain is very high.

Spotted varieties are accorded the attention they merit and afford endless combinations of colour, replete with beauty and interest to all who have the opportunity of watching the gradual expansion and development of the flowers. A giant strain is also being developed, with flowers 4 in. to 4½ in. in diameter, or more. They bear the same relation to the type as the giganteum strain does to *Cyclamen latifolium*.

From *Gloxinia* to *Saintpaulia ionantha* is a far cry as far as size of flowers is concerned; but the charms of the latter lie in another direction. From amongst the heart-shaped leaves flowers continually arise all through the summer, strongly recalling *Violets* both in shape and colour. Several shades already exist, varying from an intense to a light blue.

The collection of *Achimenes* at Reading is very comprehensive, exhausting the cream of the varieties in cultivation, and numbering some twenty-five. They constitute the glory of one of the houses for many weeks together, but only a few of them are yet in bloom. One of the most remarkable and handsome is that named *Rosy Queen* (see illustration), which has large, rich rose flowers and a white throat. The width of the latter and, indeed, the size and general aspect of the flower are distinct from every other kind. Some gardeners have even conceived it to be a hybrid with *Gloxinia*. In any case, it is of the easiest cultivation, flowers abundantly, and constitutes an excellent subject for the conservatory when in bloom. We are indebted to Messrs. Sutton for the accompanying illustration of it.

Nor can we overlook a fine batch of *Gloxinia maculata* with its dark and metallic looking foliage and spotted stems. The latter attain a height of 12 in. to 18 in., so that the species is entirely different from the better known and universally cultivated *G. speciosa*, the fine strain of which is noted above. The flowers of *G. maculata* are blue-purple, and short.

The *Gesneras*, that have found a home here, flower later on, and include a fine race of hybrids that produce pyramids of white, yellow, orange, and handsomely spotted flowers. A beautiful companion to the hybrids is *G. zebrina discolor*, with its velvety, claret and green bands and markings on the leaves. The bright scarlet flowers of *G. cardinalis* are also very effective.

The same family is further represented by *Streptocarpus*, in a fine batch of hybrids in which a great range of colour may be noted. The large flowers vary from white to rose, purple, and violet, generally marked with dark violet bands in the throat. The huge leaf of *S. Wendlandii* is always full of interest independently of the flowers, which are blue, with a white throat and produced in branching cymes. The under surface of the foliage is dark reddish-purple. This species was crossed with the pollen of a white variety of *S. Rexii*, having the usual violet markings in the throat. One of the progeny of this cross is remarkable, inasmuch as it has pure white flowers unmarked even by yellow in the throat. Other seedlings have light blue flowers, with a white throat.

While passing through the houses we noted representatives of other families, including fine batches of

December and February. The cuttings should be inserted in sandy soil covered with bell glasses or cases kept at a temperature of 53° to 55°. Ventilation must be attended to in order to avoid damping as in the case of other New Holland plants. Roots will be emitted in the course of six to eight weeks, under favourable conditions. A coloured plate of it given in the *Revue de l'Horticulture Belge* for January last, shows it to be a showy subject of considerable decorative value. Some of the Belgian cultivators consider that it will make an excellent commercial plant.

STOKE BRUERNE PARK.

A VISIT to Stoke Bruerne Park, the residence of B. Wentworth Vernon, Esq., is always interesting; but it is especially so during April and May when the spring bedding is in its beauty. During the season just closed there has been a great success in every respect. It was my privilege to see these gardens during the Easter holidays, and after being used to the great masses of colour in the London Parks it was a welcome change to see each bed carpeted

ACHIMENES ROSY QUEEN.

the fibrous rooted *Begonia semperflorens*, which has been greatly improved by the Messrs. Sutton within the last few years. Many superb named varieties are now cultivated, and some twenty-five types and selections will bloom in the course of this month. A new rosy-red variety is very promising. This type is equally suitable for pot culture and for bedding out.

GREVILLEA FORSTERII.

AMONGST New Holland plants this should take high rank, yet it is quite an uncommon subject in this country. The leaves are cut into long, linear pinnae; and the shoots and branches terminate in ovate spikes or heads of bright rosy-carmine flowers, beyond which their long styles of the same colour project. The individual flowers are large for the genus, and they are said to be produced in abundance. It has been noticed and described in this country as long ago as 1874, yet beyond the statement that it is reckoned to be an Australian plant its origin is unknown. The only method of propagation therefore, that can be recommended at present is by cuttings, which should be made some time between

with some dwarf plant as a groundwork, in addition to the usual flowering bulbs, etc. In the flower garden there the beds are necessarily close together, and it requires no little amount of forethought to get all the colours to harmonise with each other, but this has been accomplished in such a manner that the most severe critic could have little at which to cavil.

At each end of the flower garden is a colonnade or semi-winter garden, constructed with a glass roof and open at one side, but a difficulty is found in finding suitable flowering plants for winter. The value of *Sutton's* new dwarf annual *Wallflower* cannot be overestimated for such a position, as it had been in full flower the whole winter. A number of narrow borders backed by a low wall looked charming with clumps of the best-named *Daffodils* and *Wallflowers*, with a groundwork of *Myosotis dissitiflora* edged with *Crocus* of various colours, *Scilla sibirica*, etc., to form a succession of blooming. Nowhere have I seen this *Forget-me-not* to such an advantage. It blooms very freely, and with its dwarf habit is much to be preferred to any of the other species that I am acquainted with, where it

does well. It has the additional advantage of being about a fortnight earlier. I noticed on this border a white sport on that beautiful Daffodil, *Barrii* conspicuous. Mr. Dymock, the head gardener, had noticed this the year before, and I have no doubt he will take care of it.

One of the most beautiful combinations on another bed was Proserpine Tulip and Polyanthus *Narcissus Grand Monarque* in about equal numbers, and a ground work of the above-mentioned *Myosotis*. The purple Van der Neer and the yellow *Chrysolora Tulips* were splendid, together with a blue ground-work, and had a distinct effect from any other. Nowhere have I seen such wonderful hoods of Keizer Kroon and Duchesse de Parma Tulips; and the remarkable fact about them was that the same bulbs had been retained from the year before to grow a second time with better results than the first. I have noticed the same point with Keizer Kroon Tulip before, and where there is room to grow and ripen them well there is no need to buy fresh bulbs every year.

Mr. Dymock has a great liking for *Cynosure Daffodil* for massing, and, indeed, it was very light and effective in several of the beds, and carried its heads erect. The Wallflower was very fine, the variety being Sutton's Dark Red, and a noticeable feature was the uniformity in colour and habit. Mr. Dymock selects the small plants to grow on, considering them the most alike in shade of colour. There were many features in the flower garden, but having no notes to guide me I mention only those that appeal to me. Everything seemed in perfect order, and, indeed, a great credit to both owner and gardener. I may say that Mr. and Mrs. Vernon, with their usual generosity to the local villagers and residents, opened their gardens on several Sunday afternoons, and by this means hundreds of people enjoyed the privilege of a look at the spring-bedding—a kindness much appreciated.

The various departments in the garden were all in excellent order, and in the kitchen garden one could see that the vegetables were being well cared for. Mr. Dymock has already achieved some notable performances on the exhibition table, and at the Northampton show, in August of last year, practically carried all before him, winning four first and one second prizes out of five collections of vegetables, a feat for which many a man would retire on his laurels, especially as his opponents were of a doughty character. A fine batch of Onions was ready for transplanting from boxes, and Celery, Leeks, &c., were well on. Spring Cabbages were in splendid form, Ellam's Early Dwarf being especially so, without any holting. The last remnants of Brussels Sprouts were being gathered, and considering the season (Easter) were first rate, Sutton's Dwarf Gem being the variety. The young fruit plantation, made within the last three years, promised well, and to commemorate the Queen's reign, sixty Blenheim Orange Apples were planted last autumn.—*A London Visitor.*

STREPTOCARPUS HYBRIDS.

THIS genus, having yielded itself most readily to the charms of the hybridist, has brought forth some almost magical results in the eyes of those who can look back to the old days when the most commonly seen representatives of this class of plants were *S. Rexii* and *S. Saundersii*, both of which, although interesting and pretty, had not much about them to attract the notice of casual observers. How far different the present aspect of affairs in connection with them is was brought forcibly to my mind by a recent inspection of the strain grown by Messrs. J. Laing & Sons, of Forest Hill. In looking through them the idea of some startling developments in the near future was vividly impressed upon me. Although it can scarcely be expected that they will eventually oust the *Gloxinias*, they are even now formidable rivals, not only because of the great strides they have taken in the size and diversity of colour of the flowers, but also because of their floriferousness and the lower temperature in which they can be grown, and their adaptability for use as cut flowers. One thing to be aimed at is the production of varieties with somewhat shorter leaves. There will be within a year or two a strain with circular flowers; at least that is my own opinion, judging from recent developments among them, and what took place among

Gloxinias in bygone times. These new hidders for popular favour are evidently on similar errands hent. *S. gigantea*, about 3 in. across, is bright blue with purple blotches. Her Majesty is white with purple streaks. Princess of Wales is rosy-pink, and two unnamed seedlings struck me as being very distinct and good, the first being bluish-lilac with a purple throat, the other, light purple with a dark throat.—*W. B. G.*

BELGIAN NURSERIES.

V.—M. L. DE SMET-DUVIVIER.

IN a northern suburb of Ghent is situated the compact and well kept nursery of M. L. De Smet-Duvivier, 319, Chaussée d'Anvers, Mont-St.-Amand, Ghent, Belgium. It is within easy reach of the principal railway station (Gand Sud), and well worth a visit from those who like to see a tidy and well kept glass nursery, which was established thirty years ago. Like most others around the old-fashioned horticultural city, M. L. De Smet sends his plants abroad to Italy, Germany, France, Britain, &c. The nursery consists of twenty-five houses, besides pits and frames, and being compact every part of it is kept in trim order.

The first house we entered contained a beautiful and varied lot of hybrid and cross-bred *Anthuriums*, belonging chiefly to *A. scherzerianum*. This work was commenced many years ago, and the whole of the plants, including the few that we shall mention, were raised by the untiring industry of M. L. De Smet. The seedlings now range from white to scarlet and the deepest crimson, and on the other hand to yellow, white, and spotted and blotched varieties, intermediate between the scarlet and white and the scarlet and yellow. *Anthurium Mme. De Smet-Duvivier* (raised between *A. s. sanguineum* and *A. s. Adriani*) has very large, oval sepals of a deep reddish-amaranth, and beautifully distinct. Another of his triumphs is *A. s. duvivierianum*, with the ancestors of which he commenced ten or twelve years ago. The commencement was a small white-spined variety, which was crossed with a large red one. This he did in order to obtain size; then he crossed it three times back again with the white sort, and in the time above mentioned all the seedlings gave flowers of a beautiful creamy-white. Amongst a large hatch of seedlings we noticed some traces of soft salmon-red or pink, but the majority are of a beautiful creamy-white.

Equally distinct and grand in its way is *A. s. formosum*, having orbicular or nearly orbicular spathes of a rich crimson, and measuring 4 in. wide and 5 in. long. *A. s. roseum* is rightly named, for the spathes are of a beautiful clear rose, and therefore remarkably distinct. The seedlings from *A. s. duvivierianum* crossed with *A. s. sanguineum* are remarkably varied, being spotted and blotched with scarlet or crimson on a white ground and in a great variety of ways. One of the most distinct and striking of the most recent successes is *A. s. flaveolum*, which is thickly mottled with scarlet all over a clear yellow ground. Only two plants turned up amongst 1,000 seedlings. Very singular in their way are those having two or more spathes. *A. s. pomponatum album* has a large white spathe and numerous small ones higher up the spadix. In the same category comes *A. s. Prince Albert*, with two or three large, blood-red spathes, two of which are opposite. The flower stalk of this striking variety has the peculiarity that it always comes from the centre of the plant. One side of two houses is entirely occupied with this interesting garden race of *Anthuriums*, amongst which many other fine things may be noted.

The Orchid house consists of several compartments and wings, and many species were flowering on the occasion of our visit. There were fine spotted and blotched varieties of *Odontoglossum crispum*, *O. Pescatorei*, *O. cirrhosum*, *O. ruckerianum*, and *O. luteo-purpureum*, the latter having flower stems 3 ft. to 4 ft. long. Other beautiful species, flowering in the same house, were *O. roseum*, *O. Oerstedii*, *O. ramosissimum*, and others. *Dendrobiums* were doing grandly in *Polypodium fibre* and sphagnum. *Masdevallias* were represented by *M. Chelsoni*, *M. triangularis*, *M. ignea aurantiaca*, *M. houtteana*, and various others. *Mesospinidium sanguineum*, *Maxillaria sanderiana*, and *Cymbidium lowianum* were also in bloom, a grand piece of the

latter carrying nine spikes, each bearing about twenty-eight flowers. A pretty Iridaceous plant in this house was *Libertia bicolor*, having white flowers and reddish edges to the leaves. Leaf stalks of tobacco are placed under the stages to keep green-fly and other insects at bay.

Most of the other houses run parallel to one another, forming an immense block, connected at the ends by a continuous, glass-covered corridor, 130 metres long, and filled with such things as *Dracaenas*, *Aspidistras*, Palms, *Anthuriums*, Ferns, Bamboos, and *Dracaenas*, the latter 3 ft. to 4 ft. high.

The first house of this block is filled with flowering and foliage stove plants, including at the time we speak a large and remarkably healthy piece of *Medinilla magnifica*, grown in a tub and just commencing to open its flowers. Here also is *M. Curtisii*, with its pearly-white flowers. Much of the space is occupied with Palms such as *Cocos weddelliana*, *Latania horhonica*, also *Aspidistras*, Ferns, &c. The next two houses contain a larger complement of Palms such as *Areca Baueri*, *Kentia helmcoreana*, *Anthuriums* and Ferns.

A large block of many houses joined together and continuous inside were occupied at the time we speak with *Azaleas* planted out in large beds of leaf mould. Flowering plants were stood at intervals, amongst the *Azaleas*, or occupied shelves overhead and other coigns of vantage. Amongst them were *Boronia elatior*, *B. heterophylla*, *B. megastigma*, *Bauera ruhioides*, standard *Acacia armata*, with 3 ft. of stem, and pyramids of *A. longifolia*, 8 ft. high. Stiffly grown Palms delighting in an intermediate temperature were *Areca Baueri*, and *Phoenix reclinata*. *Araucaria excelsa* was stood in rows amongst the *Acacias*.

The contents of a stove were next inspected. Trained specimens of *Clerodendron halfourianum*, 3½ ft. high, and grown in pots, were flowering profusely. Other flowering subjects were *Caraguata Zahni*, *Gloneria jasminiflora*, *Impatiens Hawkeri*, with rich carmine flowers, *Saintpaulia ionantha*, *Anthurium andreanum album*, and others. Foliage plants were represented by *Alocasias* in variety, *Licuala grandis*, *Livistona rotundifolia*, &c., the two last named being choice Palms.

Two more Palm houses came under notice and were occupied with a variety of subjects, all very clean and healthy. Besides species already mentioned we noted fine hatches of *Raphis flabelliformis*, species of *Phoenix*, *Areca lutescens* in quantity, and others. In fine form also were *Nephrolepis davalloides furcans*, *Pandanus utilis*, *Crotons* in great variety, and *Anthurium andreanum* in rose, pink, scarlet and other colours. Then came a houseful of *Araucaria excelsa*, followed by a stove, filled with *Anthuriums*, *Begonia metallica foliis variegatis*, fine foliated sorts of the Arthur Mallet type, *Abutilon insigne foliis aureo-marmoratis*, *Ixora coccinea*, and *Gardenias*. Close by was another stove filled with *Crotons* in variety, and other fine foliage plants. A new thing is *Alocasia gandavensis*, having broader leaves than *A. Sanderi*, of a dark green edged with silvery-white, and traversed by strong nerves of the same hue. The edges of the young leaves are overlaid with purple.

In a house of *Azaleas*, *Boronias*, and other hard-wooded plants were miniature standards of the narrow leaved *Myrtle*, and charming globular headed bushes of *Acacia cordata*, 18 in. in diameter and profusely flowered. The Otaheite Orange (*Citrus sinensis*) is admirably grown and fruited in Belgium. A houseful of plants in this nursery were 12 in. to 18 in. high, well furnished with branches and loaded with small Oranges. The pots were plunged in a bed of the cut stems of flax. *Eurya latifolia variegata*, *Hydrangeas*, and *Metrosideros floribunda* are also well grown.

The soil in this neighbourhood consists of a very fine gray sand, yet we were surprised to see how well Conifers grow in it. Flowering subjects included *Prunus sinensis flore pleno*, *P. s. fl. pl. rosea*, *Kalmias*, *Spiraea astilboides florihunda*, *Hydrangea paniculata grandiflora*, and *Azalea mollis*. The latter is, of course, helped with leaf soil. The frames were being filled with Indian *Azaleas* for the summer, all being planted in leaves according to the universal plan in Belgium. Two-year-old standard Sweet Bays in pots were in vigorous and healthy condition.

Potatoes to the extent of 4,000,000 tons are annually utilised by France in making starch and alcohol.

HARDY HERBACEOUS PLANTS.

Trillium recurvatum.—The Trinity flowers have all been flowering with exceptional freedom this year, and *T. recurvatum* has not been forgotten. The flowers are rich deep crimson, very much of the same colour as those of the allied species *T. erectum*, but the difference between the two is apparent upon even casual comparison, for in *T. recurvatum* the calyx lobes are long, and reflex sharply, whilst in *T. erectum* they are erect, and press closely against the inner segments. The foliage of *T. recurvatum*, too, is distinct, on account of the mottlings of white upon the dark green ground which it exhibits. The height of the two is as nearly as possible the same, viz., a foot or thereabouts.

Phlox subulata Nelsoni.—The dwarf Phloxes, varieties of *P. subulata* are many of the freest flowering things we have, and this variety *Nelsoni* is one of the best of all of them. The flowers are pure white, with five violet spots, and make their appearance in such numbers as to hide the foliage, leaving only a dazzling sheen of white. It should be planted in an open spot where it will get the full benefit of the light and air. It is rather curious that it is not employed to a larger extent for spring-bedding, for which purpose it is admirably fitted, since it blooms all through May, with surpassing freedom; indeed, it is often difficult to get a sufficiency of good cuttings from it for this reason. Cuttings strike pretty readily if taken about the beginning of July, pricked off into a cold frame, kept fairly close, and shaded until they root. They will then make good plants by the following spring.

Viola pedata.—The rock garden has no prettier gem than the pedate-leaved *Viola*, or Bird's Foot Violet, as it has been called. Given a cool, sheltered position it grows, and flowers freely enough, and is perhaps the most beautiful of American Violets. The plant is only a few inches in height, whilst the flowers are about an inch in diameter, and bright blue. It does well in pots if not watered too heavily during the dull months of the year. The variety *V. p. bicolor* has the lower segments of the flower purple instead of blue, and is a pleasing variation from the type.—*Plant Lover*.

MEDICINAL FRUIT.

MR. G. VIAND, a young veterinary surgeon in the French Army, devotes his spare moments to the study of plants. Basing his experiments on the spontaneous absorption of medicinal principles by plants he has succeeded in storing the tissues of alimentary plants with iron, lime, &c. Under this form it will be easy to take medicine, and assimilation will be more safe on account of the quasi natural state of the medicinal principles in the plant cells. Thus he has produced ferruginous Cress, Lettuce, and Endive.

These plants preserve their good natural flavour, and are tonic in a high degree; they can be prescribed in cases of anaemia, constitutional diseases which are not cured by prolonged vegetable diet. This result is deserving of attention from gardeners, and we think that those who could supply ferruginous Lettuces and Endive would find sales remunerative. An experiment costs little, as sulphate of iron can be bought retail very cheaply. In the same class of ideas fruit is recommended as a remedy for certain diseases. The Cherry, refreshing and acid, cures diseases of the bladder and kidneys. It is said that a cure of asthma was effected by a regimen consisting of five or six Oranges eaten daily during some weeks. A youth who made a similar experiment with Cherries, on which he lived for eight consecutive days, was cured of chills, fevers, and bilious attacks. In the four following months he gained 18 lbs. in weight, his food being exclusively bread and Cherries.

Another example of the therapeutic value of fruit: a young man was attacked by influenza, and as at the time he was a long way from home sickness would be unusually severe, through there being no one to attend to him. Being aware of this fact, he went to bed and remained there two days eating nothing but a couple of dozen of Oranges. At the end of this time he was quite fit for work. In another case a lady was cured by living for two days on Lemons, remaining in her room during this time.

Abundant fruit diet, particularly seasonable fruit, aids digestion. Ripe Currants, sweet Apples, Pears, Peaches, &c., do no harm to a healthy stomach, and in sickness are of great therapeutic value. If the organism wants acidity, acid fruit is the best of remedies. Sluggish liver and kidneys, as also predisposition to fevers and cutaneous eruptions, are greatly attenuated by eating fruit, if a nutrient and not stimulating regimen is followed. There are some persons who are frightened because fruit causes diarrhoea in children, but they never reflect how many intestinal diseases are due to absence of a fruit diet. If persons of a bilious temperament would put aside their medicine and study the gifts of Nature they would certainly, like Adam, be tempted to eat.—*Gazzetta delle Campagne, December 20th, 1897.*

LEGUMINOUS TREES AND SHRUBS AT KEW.

NOT only is the natural order Leguminosae one of the largest but it is also one of the most important natural orders. The value of many of its members from a food point of view is unquestionable, and the same may be said of many others of the plants grouped under it which take high rank as decorative subjects. Kew, with all its wealth of special features both to the botanist and the horticulturist has no more instructive feature than the collection of Leguminous plants which is located on the eastern side of that fashionable promenade, the Pagoda Vista. In this place there is congregated a great number of the most handsome plants of the order, and it may at least be claimed for them that they have done their best to please and to exhibit their beauties for the delectation of Whitsuntide visitors to the far-famed gardens, for on Whit-Sunday very many of the plants were absolutely at their best.

At the northern end of the series of beds there is a round hed full of interest, or rather of interesting plants. There are three gnarled, twisted, and umbrella headed specimens of the handsome *Caragana arborescens* var. *pendula*, the feathery, pinnate leaves of which are touching a showy carpet of *Genista pilosa*. Next we find an oblong bed in which are more samples of the genus *Caragana*. In addition to *C. arborescens*, with its erect growing habit, and its fond tendency to develop short spurs along the whole length of its branches is the dwarf *C. a. nana*, also two fine specimens of *C. a. Redowskii*, a spreading, loose-habited Siberian tree, rather later in flowering than the type, but apparently a very free bloomer.

In close contiguity is *C. aurantiaca*, hailing from Central Asia. The flowers here are yellow, with spots of brown, and a large, much reflexed standard. The habit is quite distinct, for the flower, stalks, and leaves being short the branches look like immense spikes of leaf and bloom. The drooping *C. gracilis*, with its long whip-like branches, was not in flower when we saw it, and the pretty *C. microphylla* was only commencing to expand its blooms.

Cytisus purpureus incarnatus, a low growing and somewhat straggling shrub, was in a very luxuriance of bloom, and the rich rose flowers shading to carmine at the base of the petals were showy.

Genista hispanica, on the eastern side of the group of *Caraganas*, has been a mass of bright yellow.

Passing on southwards, the magnificent clumps of the Brooms catch our eye. The common Broom, *Cytisus scoparius*, if it were only less common would be held up to the public by every nurseryman as the perfection of a flowering shrub. Under cultivation its large yellow flowers tend to become larger and yet more yellow, and as its freedom of flowering has never yet been gainsaid, the effect produced by large masses of it can well be imagined. Its handsome variety *C. s. andreanus* is planted in a similarly imposing mass hard by, and is apparently attempting to out-rival its ancestor in prodigality of bloom. The bright crimson hue which characterises the wings or side petals is present upon one side of the petal only, the outer; but as the wings are folded upon themselves inwards, this is the side that is shown to a visitor. Another bed of handsome proportions is filled with the earth-hugging *C. s. pendula*, which, as growing here, is scarcely pendulous, since it never grows far enough from its mother earth to be strictly pendulous, but prefers to cover the ground as with a carpet of green and gold.

The last clump of the Brooms is perhaps the showiest of all, one of *C. albus*, one of the distinguished parents of the not less distinguished *C. praecox*. At the time of writing these plants are simply a dazzling sheen of white, and constitute a picture that no lover of plants in general, and hardy shrubs in particular, should miss seeing.

MESSRS. WM. WOOD & SON, LTD.

As the years roll on, the range of the gardeners' operations is ever widening, and with this increase comes a corresponding increase in the number of things that are to him necessities, if he is to fulfil the demands made upon his time and skill. Labour saving appliances of all kinds have been called into existence, in addition to numerous specifics which enable the cultivator of the soil to hold his own against his enemies, both insect and fungoid, which come to plague him and rob him of the due result of his labours.

How many and how varied the wants of the gardener are none but those who have been behind the scenes can tell. Even the ordinary gardener can, unaided, have but a faint perception of the quantity and variety of material that must, perforce, be included in the stock-in-trade of a first-class horticultural sundriesman.

We recently paid a visit to the establishment of one of the most reputed firms of this description in the country, viz., Messrs. Wm. Wood & Son, Ltd., of Wood Green, and must confess to a sense of surprise when the thousand and one gardener's needs, crystallised as it were, upon the shelves of the store-rooms and warehouses brought home to us the far-reaching and important character of this branch of the horticultural trade. Not one country alone, but many are taxed to meet the demand, and it would be difficult to mention a part of the habitable globe that does not contribute in some way to the everyday needs of the British gardener.

The premises of the firm are almost adjoining Wood Green Station, and indeed are connected with it by a private siding by which goods may be despatched and delivered, and which must be vastly convenient in these days when promptitude and despatch count for so much in business transactions. This siding is all the more necessary when we consider the big trade done by the firm in horticultural Anthracite, and other coals and coke. The frontage of the building or rather series of buildings is towards an open space or public garden prettily laid out and well kept up, and the large central show store-house is both a roomy and a commodious building. Truly it had need so to be, for even small samples of each of the goods in stock take up a lot of room. In the background other large store-houses supplement the show room. Here we found ample supplies of the various specialities of the firm. Amongst these mention may be made of shadings, now so important an appendage to glasshouses. The "A. White" variety, specially recommended by the firm, is a capital material at a reasonable price, and eminently suitable for all ordinary purposes. Many orders are annually taken for it, and these not infrequently include the making and fixing of the blinds in position, a branch of the business to which special attention is given. Green shadings are kept in stock, but they cast too heavy a shade for ordinary purposes, although they have a tendency to bleach with age. A special line is the ticks used for blinds which can be had in a variety of patterns which are stocked, or customer's own patterns can be worked up to order, since the Messrs. Wood are manufacturers as well as vendors.

Archangel mats are represented by huge bales filling several rooms, and of labels of all sizes there is goodly store. The quality of raffia supplied to customers is exceptionally good, for some of it measured fully 6 ft. in the twist, and moreover, was of that soft and easily twisted character for which the gardener is always on the watch.

Bamboos in all sizes, from thin tips suitable to staking such subjects as Freesias, Achimenes and other plants where light and neat staking is indispensable, to stout poles of 20 ft. in length, fit to support a sapling Oak, are stocked in thousands. These canes are the best productions of China and Japan and are shipped from thence to this country in thousands of bundles annually. They are sorted and cut up into special sizes to suit special plants. Thus

a 7-ft. cane, neat, and yet very strong is recommended for Tomatos, a 6-ft. cane of similar quality for tall growing Carnations, and a very stout cane of similar size and mahogany colour for supporting young trees. Smaller and neater canes are selected for Carnations and other dwarfing growing plants, and as these can be obtained in either yellow or brown, according to taste, the wishes of the customer are consulted in every possible direction. We were informed by our guide that in addition to the great stock of Bamboos on hand there were over half a million waiting at the docks for them.

Huge bales of wood wool, so useful for packing purposes, were shown us, and we were most favourably impressed with the appearance of a special sample that was exceedingly soft, white, and light.

Manures have long been a specialty with the firm, and Le Fruitier, with which the name of Wood is so closely associated, has been, and is, in greater favour for certain purposes than many others. Even now, we were informed, more of it is sold than of all the others kept in stock. Of these, by the way, there are numbers, for the manure business has been prolific of new fertilisers of late years. Wood's Special Soluble Manure is another manure of great repute, and we noticed that the stock of it was large. The crude materials of which the home-made fertilisers are made are ground at the docks, but the mixing is done at Wood Green. Bone meal, crushed bones of various sizes, and crushed oyster shells represent other goods for which there is a consistently brisk demand.

The soils department is an extensive one, and the firm is particularly famous for its brand of Orchid peat, which is becoming increasingly difficult year by year to obtain. The best quality is carefully pulled to pieces by hand, the dust shaken out, any rough sticks that may be present removed, and the peat packed in barrels. When sent out it is really a mass of fibre with practically no waste. Second and third qualities are supplied, and even the third is good. A special dark, rather sandy peat is supplied for Rhododendrons, and other hardy plants needing peaty soil. Banstead loam is annually sold in tons, of the best quality obtainable. The leaf soil supplied is likewise excellent. It is composed of Oak and Beech leaves only, and is singularly free from fungoid growths and foreign matter of all descriptions. Bedfordshire sand, both yellow and white, is kept in several qualities, from the best coarse to very fine. Shingle, carefully sifted and very clean is supplied in quantities for covering stages, also crushed shells. Derbyshire spar and tufa are kept for those requiring material for building rockeries. Hard-burnt masses of brick, the remnants of old brick kilns, make a cheaper but equally as suitable material, and are not quite so glaring as the white spar.

The weed killer sent out by the firm has so abundantly proved its efficacy that improved plant is being laid down in order to keep pace with the demand. It is estimated that when this extension is effected three times the quantity of the destructor can be turned out than has hitherto been possible.

The enterprising spirit of the firm is continually seeking out, and working up some new thing for the benefit of the gardener. One of the most promising of this year's novelties is a specific, called Carvita, for combating the rust affecting Carnations. This has proved effective in the tests given it, and is stated not to injure in any way the health of the plants operated on. If so there is no doubt but that Carnation growers the world over will hail its appearance with joy.

A syringe named the "Invicta," fitted with a patent automatic spray, is a contrivance that is bound to be well received. The device is so simple and withal so easily worked that a child might use it. The secret is a small flange or flap which works on a hinge. When the syringe is held so that the flap falls into position its edge catches the jet as it issues from the barrel and divides it into a fine spray. By simply turning the barrel of the syringe upon its centre, the flange falls clear of the stream and an ordinary jet is obtained. The need for all fixings is thus done away with, since a jet or a spray is obtained by a mere twist of the wrist on behalf of the operator. It may be added that while in use the syringe may be turned over on its centre without the spray flap falling clear, since it is kept in place by the force of the water.

The "balance plant carrier" is another ingenious

labour saving device. It is in the form of a light yet simple rack with holes to receive the pots of the plants, and fitted in the centre with a handle for carrying. Three plants may be placed on either side of this handle, six in all, and they can then be carried by a boy with perfect safety and ease. As a boy can manage two of these carriers he can account for a dozen plants each journey which is more than twice as many as a man could carry in the old way. In many establishments where many thousands of plants have to be shifted in the course of the year this "carrier" will be of the utmost value.

The above constitute a few of the more noteworthy articles of the huge stock in trade kept by Messrs. Wood & Son, Ltd. It would obviously be impossible to enumerate all since, as we have previously intimated, everything that a gardener can want is stocked and supplied by them.

SLUGS AND WOODLICE IN CONVERSATION.

"I SAY Cheesey, I have got such good news for you," said a large black slug, addressing a woodlouse one damp morning in May.

"Fire away with it then, I hope it is good for you too"

"Yes, very, thanks!" replied the slug. "Well, the lady gardener and the boy are busy planting the Cucumbers and Tomatos in the houses this morning."

"Hurrah!" shouted the woodlouse, "what a rare old time we shall have for the next few weeks. My mouth waters when I think of tasting Tomato again, and I daresay your's does at the thought of Cucumber."

"Oh! it won't be the first time this year, I have had a go at them in the pots, but it is a long crawl right up to the shelves; it will be much more convenient now they are in the borders. But I say, my friend, you are not looking very well, what is the matter with you?"

"Oh, nothing, I think I only want a change of diet, I am rather tired of Mushrooms. The beds have done very well this year, under the lady gardener's care, so I and my comrades have been almost satiated."

"Well! you will get the desired change to night. Shall we meet here to-morrow at the same time, and then we can tell each other our experiences?"

"Agreed. Farewell for the present."

* * * * *

"You are a bit late," said the woodlouse as the slug appeared next morning.

"Sorry, but after my night's dehauch, I over slept myself. But tell me, how did you get on?"

"Oh! capitally, I had a splendid night. Would you believe it, by the side of all the nice young Tomato plants, someone had kindly placed Potatos all scooped out. Now you know I have a great weakness for Potatos, in fact I was quite spoiled with choice."

"Oh! you innocent creature, you don't mean to say you really thought the Potatos were put for your delectation. Why! my dear fellow, they were merely there as a trap. Knowing your partiality for them, they thought you and your friends would probably try them before the Tomatos, and then you were to be caught and killed. I think it is wonderful you have escaped with your life. How did it happen, were not the Potatos examined?"

"Yes, quite early this morning the boy came in and lifted them all up."

"And where were you?"

"Oh, I had had my fill of Potato, and had moved on to a Tomato plant. I wondered what the boy was doing, when I heard him stamping his feet on the floor, but it never struck me that my poor brothers and sisters were being murdered."

"Well, we have all to live and learn. I am glad you escaped, for you are such a simple innocent little chap."

"I must be on my guard to-night. But now tell me how you got on?"

"Well, my wife and I started about nine o'clock to the greenhouse; these long evenings are a nuisance by the way, for we have to wait so long before it is dark enough to come out. The house felt warm and moist, and the Cucumber plants looked delicious. Round the roots of each of them, two or three fresh Cabbage leaves had been placed. Now if I had been

as guileless as you, I should have thought what kindness this was, but I knew that they, like the Potatos, were only a trap. 'Come,' I said to my wife, 'we won't waste time on the Cabbages, we can get them *ad lib.* out of doors, we will begin at once on the Cucumbers. So we crawled to the very end of the house, and started on the first one. We had only been there about half-an-hour, when the door opened and we heard talking. A match was struck and a candle lighted, and then a voice said, 'oh William, there are heaps already on the Cabbages.' I knew at once it was the lady gardener and the boy slug hunting. Gently touching my wife we crawled as quickly as we could behind some flower-pots that were near.

"Oh the poor, poor things," the lady gardener exclaimed, "are you quite sure William the water is boiling, and they die at once?"

"Quite sure, Miss," was the reply.

"You can imagine our feelings, Cheesey, as we crouched there, thinking every moment might be our last. But they never looked behind the pots fortunately, and after doing both sides of the house, and catching (I heard them say) over one hundred of my brothers and sisters, they took their departure.

"Then my wife and I returned to the Cucumbers, and had a good feast till about three this morning."

"Well, we both seem to have had a very narrow escape. I wonder how we shall get on to-night. Shall we meet here again to-morrow morning at the same time?"

"Yes, and I will try, and be in good time. Good-bye."

* * * * *

They never met again, for that night they took their departure to slug and wood-louse land.—*Solanaceae.*

WORK IN THE SUBURBAN GARDEN.

June! glorious June! the leafy month! the month of Roses! according to those who pretend to know all about it, is with us again, at least, the month is, the rest is somewhere else. A fair exchange is no robbery, however, and variety is charming; hence, let us proceed to enjoy in theory, if not in fact, the rain, hail, snow, wind, cold, and watery sunshine that the gods have sent us.

The garden is looking gay just now, says the gardening books, and everything is growing apace. By-the-way, I should just for once like to see the garden that these books talk about. One thing, I know, and that is, that it isn't mine.

There is plenty to do in it just now, further say the books, and with this I am perfectly in accord. Everybody is talking about bedding out, and I cannot forget it if I would, for the coster fraternity, with a persistence that in another cause would be praiseworthy, have well nigh worn out the knocker on my front door, and quite exhausted my patience. I presume that the one who called last understood this, for he invited me very sympathetically to "keep my 'air on."

Sweet Peas have been boomed a good deal of late, and last year I tried to grow a good many. I say "tried" advisedly, for the blessed things struck and wouldn't grow. They were advertised to grow 5 ft., and they didn't do as many inches, and never flowered at all. Not to be beaten, I sowed some more in February this year. I am not quite sure of them, however, for they have not grown an inch for the last month. I put sticks to them, more for the sake of ornament than anything else, for they don't like climbing, apparently.

I have a few melancholy Chrysanthemums in pots, but they seem too listless to do much. They'll want potting directly, and I expect they'll have to want. I can't get everything I want, and why should they?

Of all amusements the cutting of the grass has most to commend it. For a right down, hard, back-aching, commandment breaking, cussed sort of a job it is difficult to beat. It leaves a man wondering whether he is a man or only a donkey. One feels inclined to fall on the machine, and pull its inside out, and throw it in the corner and jump on it. My mower proved more than usually intractable yesterday, and I found upon enquiry that my boy and the boy next door, and the boy from the next door after that had been having a conversazione and had played "engines" with the mower afterwards.

Talk of the land of pure delights, why it isn't in it with a well managed garden. Think of the.

exhilarating pleasure of going down on one's marrow bones and gnawing away at the grass edge with a pair of antiquated scissors. This should be done frequently in order to mortify the flesh and improve the look of the grass.

But another attention must be paid to the verdant lawn. The showery weather is just the time to give it a dressing of some stimulant, say the gardening books, and they recommend soot sprinkled over the surface by hand. Of all the fiendish ideas that ever entered the brain of the adviser this is the one that has caused me the most bother. I dressed up in various and sundry garments in a more or less disreputable condition and bravely set to work. The soot was all right, and so was I before very long; in fact a bosom friend of mine, with the cruel candour often displayed by bosom friends, averred that I looked like a first-class devil in a cheap pantomime. If any of my readers covet such an appearance they can easily cultivate it by attending to their lawn as I did to mine.—*Nouveau Calendrier.*

GARDENING MISCELLANY.

MAKING UP PLANTS FOR SPECIMENS.

THE plan of placing a number of plants into one pot to form a huge specimen is an old and well known practice, not confined to common classes only, for pots with five or six Orchids placed together is not uncommon on exhibition tables. It is often objected to by competitors; but I have seen no schedules in which any rules appear against the practice, and so have (along with other judges) allowed to let the matter pass unnoticed. Some of the grandest specimens of Chrysanthemums which I have seen have been made up with a number of plants; and it would require sharp practice to unearth them. When size of pots is stated, as used to be the case at most exhibitions, "making up" is difficult.—*M. T., Carron, N.B.*

CYTISUS SCOPARIUS ANDREANUS.

I ENCLOSE sprays of this beautiful Broom, cut from plants raised from seed three years ago. The plants in question are now nice bushes some 6 ft. high, which shows how easy of culture they are. From a scrubby plant in a pot I was able to save about two pods of seed, which I sowed and obtained about a dozen plants, a few of which produced yellow flowers, without the crimson markings which characterise the parent plant. Both my employer and myself are proud of our Brooms, just now very gorgeous and beautiful, deserving a place with the choicest flowering shrubs.—*A. P.*

CRYPTOMERIA JAPONICA AS A POT PLANT.

THIS elegant Conifer is a well-known and valued occupant of the out-door garden, but in this country it is very rarely utilised as a pot subject. In this direction, however, it closely rivals the popular *Araucaria excelsa*, thousands of which find their way upon the market each year. The *Cryptomeria* can be propagated readily from seeds or cuttings, but as in the case of the *Araucarias*, cuttings make the dwarfest, closest jointed, and best furnished plants. Still seedlings are not unsatisfactory, and as they make nice little saleable specimens in 5-in. pots within a year from the date of sowing the seed they are not to be despised. We think more use might be made of the *Cryptomeria* as a pot plant.

GUNNERA SCABRA.

I OCCASIONALLY find plants in unlooked for places, and such was my lot recently in connection with this plant, whose native place is among the ravines of the Andes, where it most likely gets a plentiful supply of moisture. However that may be, it would appear to have a somewhat accommodating disposition, judging from the way it was flourishing in the position I found it, being under the shade of large trees on a dry soil. Those having a stock of it, if they have some bare places among their shrubberies, will do well to try it in these positions, for truly it is a most noble and telling plant when developed to its finest proportions. If, as it seems to me, it will do fairly well where many things utterly fail, it is well worth a trial. If those who are ignorant of the plant can

imagine a gigantic Rhubarb with leaves five feet in width and spiny footstalks five feet or so in height, they can form a pretty fair idea of the aspect of the plant when at its best. I do not think it possible for it to attain anything near these proportions in the positions above indicated. At the same time it would help materially to enliven many a bare, naked piece of ground.—*W. B. G.*

VEITCH'S EARLY FORCING CAULIFLOWER.

I HAVE begun cutting to-day, May 19th, this variety of Cauliflower from autumn-sown plants. Having grown this same variety four years, I find it (although not so large as many others), very useful, forming close white heads, much esteemed at table. The plants in question were sown in September, wintered in a cold frame, and planted out the last week in March in handlights. The peculiarity of this variety is that its foliage is small and erect, thus allowing four or five plants to one handlight, which, when filled, was removed to shelter the spring-sown plants.—*A. P.*

ADENANDRA FRAGRANS.

VERY frequently the flowers of New Holland plants belonging to the same group as *Adenandra* are very small. Those of *A. fragrans*, however, are about the size of a shilling, and white, tinted with red beneath. Others again have red midribs running along the basal half of the petioles, and presenting a beautiful starry appearance, the star consisting of five rays. A distinct variety with red flowers has been named *A. f. amoena*. The species grows in the interior of South Africa, but though it was introduced many years ago it is a rare plant in this country. The form with the five-rayed star turned up in several of the exhibits at the recent Ghent show.

AMERICAN WONDER PEA.

I HAVE just been reading in a contemporary an account of sickening and turning yellow of this garden Pea in an autumn sown crop. An expert, so the report states, expressed an opinion that owing to the thinness and delicacy of the skin of wrinkled Peas, they were not so suitable for autumn sowing as round varieties. I am of opinion that little or nothing is gained by autumn sowing of wrinkled Peas. My practice is to sow in pots (I use the above named variety) in February, putting five seeds in a 60-sized pot, and harden off and plant out at the foot of the Peach wall. I expect to gather next week, although I picked off a full pod yesterday, May 18th, to tantalise a friend, whose crop is still moving, but shows no bloom, notwithstanding announcement by label that he sowed "Early Sunrise."—*A. P.*

SPERGULA PILIFERA AUREA.

THOSE who are carrying out designs in carpet bedding would do well to introduce this into their designs, where a very dwarf-growing subject is desirable. A single plant of it is both bright and elegant. Those who do not follow this particular craze, but have a love of hardy plants should add it to their collections on account of its simple beauty.—*W. B. G.*

BARBAREA VULGARIS VARIEGATA.

THERE is quite a respectable number of British plants of which variegated or otherwise modified forms are in cultivation in our gardens. To the ranks of these plants must be added the golden variegated form of *Barbarea vulgaris*. It is not commonly met with, it is true, and is usually only to be seen in botanic gardens, but it is nevertheless possessed of a somewhat distinct and decidedly handsome presence. The lyrate shaped lower leaves are prettily barred or striped longitudinally with white, gold, and green, and this variegation is possessed in an equal degree by the smaller upper leaves. The yellow flowers are not greatly different to that of the wilding, but they serve to add a finish to the plant, although in themselves not very showy.

TULIP PARISIAN YELLOW.

THIS is one of the finest of the later Tulips and one of the most suitable for bedding purposes. It is rather tall in habit, for the flower scapes often reach a height of 18 in. and occasionally exceed that height. The flowers are full, deep, and of great size, the colour being a rich golden-yellow, very brilliant and showy, as indeed we expect everything

"Parisian" to be. The individual segments are of great width and substance, and are acutely pointed. There has been a fine bed of this Tulip in the grass at the back of the rockery at Kew, and near the eastern end of the Orchid houses.

CARNATION URIAH PIKE.

A HOUSE here containing several hundred plants of this variety in bloom (sample of which I send) is frequently visited just now, and a source of delight to many visitors. The fragrance of the flowers, in addition to their rich colour, adds to the charm of these favourites. This variety, which created a sensation three or four years ago when brought out, is deservedly popular, possessing as it does all the qualities of a good Carnation, robust in constitution, amenable to almost any treatment, flowering as freely at mid-winter as mid-summer. The foliage has a healthy vigorous appearance and is remarkably free from the many blights, rusts, and rots that plague the Carnation growers in other choice varieties.—*A. P.*

TULIP PICOTEE.

AMONGST the midseason bedding Tulips *Picotée* has very few varieties to equal it. Even as late as Whit-Sunday a round bed close to the director's office at the northern end of Kew Gardens was making an exceptionally fine display. The flowers had rather more pink in them than is usually the case, and the margins had spread considerably, but this added to rather than detracted from the general effect. The conspicuous feature, however, was the size of the blooms, which really surpassed anything we had previously seen. The foliage, too, was good, and the bulbs must have been exceptionally strong to produce such excellent results.

IRIS CRISTATA.

THIS is a gem amongst a family of gems, for although there are many beautiful Irises this dwarf plant with its pretty crested flowers is fully as beautiful as any. At Kew it is given a nook in the rockery, and judging from appearances it is just such a place as this that it requires. The flower scapes with the flowers are only about 4 in. in height, and the leaves are from 4 to 6 in. in length, so that the plant is a pigmy all through. The flowers, however, are relatively large. They are bright purple-blue in colour with a conspicuous white blotch and crest in the centre of each of the falls, next to this, passing towards the apex, being a zone of purple-maroon. The plant, which is a native of the south-eastern United States has a somewhat tufted habit, and flowers with great freedom, so that it is well worthy of a place in the rock garden amongst the choicer subjects.

CURIOSITIES OF THE ORCHID.

THE Orchid is in fashion, and we must admit that it deserves this honour, if honour it be, or at least this distinction, both for its strange colours and curious, varied forms and a thousand peculiarities of its existence.

Most of these plants do not bear fruit or come to seed unless some insect or bird transports the pollen to the stigma. Consequently, there is, as a rule, no fertilisation and only some few amongst the thousands of flowers fructify. It is true that ever provident nature has anticipated this in a very simple manner. If a fruit happens to die an enormous number of seeds escape; they are small, light, tenuous as sand, and are easily wafted on the wind in all directions. If a single capsule attains maturity in a forest the seeds are scattered everywhere; yet, by another strange peculiarity, only a very few of these seeds will germinate and grow into a new plant. The seed is not destitute of the necessary germinative power: in fact, the horticulturist, however little experience he may have, can easily succeed in growing this seed by placing it in certain necessary conditions not difficult to realise. But then, as our American contemporary, *The Independent*, lately remarked, how is it that nature rarely procures for these seeds the requisite conditions for success? Why does she take so much trouble and give the fruit the faculty of emitting so many seeds to end in such poor results? Let us observe that at least the seeds have extraordinary vitality, and that they can remain, so to speak, indefinitely exposed to the greatest heat and drought without losing any

of their germinative properties which will reappear in favourable conditions.

Let us add, too, that the Orchid is wonderfully inconstant in even the most essential characteristics. A certain variety, for example, in Australia, after bearing flowers of a particular kind for many years, suddenly produces leaves and flowers hitherto regarded as belonging to quite a different genus. It is for this reason, besides, that the boldest fancy hybridisation can be practised with the Orchid, the hybrids obtained being just as fertile as the parent plants. With such peculiarity we can understand the Orchid being in fashion nowadays when novelty is more prized than beauty. — *Vie Scientifique*, May 14th, 1898.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Fritillaria macrophylla Culture.—*M. M'Laren*: Dr. Wallace, in his book on *Lilies and their Culture*, says that he planted several full-sized bulbs in good earth, but nearly the whole rotted away, leaving plenty of small bulbs, and the flowers produced were poor. Others planted in poor stony soil, and sheltered gave good flowers, and the bulbs remained sound. After that he planted all of his plants in limestone sand, and they were to remain so for the future. That was in the Himalayas. In this country the plant succeeds best in pots in a frame or greenhouse. The light and porous soil above-mentioned should be enriched with leaf mould. Any potting that is attempted should be done immediately after the stems and leaves have completely died down, and are perfectly at rest. At this time the bulbs should be kept dry. When repotting it would be well to remove all the small bulbs and bulblets which generally cluster round the base of the mother bulb, impoverishing it, particularly when grown in pots. This is one of the secrets with the successful culture of *Richardia Little Gem* (see p. 629). The plant must also be kept near the glass to get as much substance in the foliage as possible.

Thinning the Fruits of Apples.—*Sigma*: What amount of thinning is actually advisable is best determined on the spot. Healthy, vigorous trees will bring more fruits to perfection than weakly ones. The clusters of fruit should be reduced to one, two, or three at the most, but if you desire the largest size and the best finished fruits the trees are capable of producing, you must reduce the number to one, and that should always be the biggest, most forward and best situated fruit for all the advantages of light, and space to develop without squeezing by neighbouring branches or shoots. If the trees are crowded with clusters of fruit, it may be necessary to remove a number of them entirely, without injuring the leafy spurs by or below them. Take a glance at the tree as a whole, and calculate what number of fruits it is able to bear; then you can regulate the number of clusters as equally as you can all over the tree. Then proceed to thin out the bunches, leaving one or two of the very best fruits. This operation might be delayed till towards the end of this month, or in fact till you can be certain what fruits are likely to fall naturally. You could remove the smallest fruits now and give the final thinning later on. That would be the safer plan.

Strawberry for Travelling.—*Omega*: For many years past there has been nothing to beat Sir Joseph Paxton, as a firm Strawberry that will travel successfully by rail. More recently, however, several other kinds, including Royal Sovereign, have been sent to market in the same way. For short distances, at least, Strawberries are sent in baskets, but the fruits get more or less crushed by their own weight. For select or picked fruits, boxes should be used, about 3 in. deep, inside measurement. When filled with fruit, a number of these boxes could be tied together, thus saving time in loading and unloading them.

Outdoor Chrysanthemums.—*Veld*: Early flowering or border Chrysanthemums cannot be relied upon as perfectly hardy; but we think that some of the crowns die away as much from the result of damp as from frost. At the time of cutting down the stems, it might be worth while digging up a few of the best crowns and putting them in pots or boxes to be preserved in a cool greenhouse or in frames. Most of the plants will live in frames when they get killed by severe frost outside, and that even if the pots in the frames get frozen hard. This refers to the old plants; but if house room is a leading consideration with you, it would be a better plan to take cuttings in November, fill some 60-size pots with them and stand the pots on shelves anywhere

near the glass in a greenhouse, pit, or frame, the latter being protected only in the severest weather. With regard to protection in the open, we consider it a mistake to place fine coal ashes round the young shoots and over the crowns, because it buries so much of them from heat and light, causing these soft-wooded subjects to damp off. Poor and sandy soil in perfectly exposed positions in the garden would keep Chrysanthemums better than any protection you can give them there, except hand-lights.

Gall Mites (Phytoptus) on Pears.—*M. M'Laren*: The plan you have adopted of making experiments with the trees ought to throw some light on the matter; and if you succeed in destroying or checking the spread of the mite, it will be doing gardeners good service. The spring is the only time, say the entomologists, that you can attack this pest with any hope of success; then the sooner you commence after the expansion of the leaves the better. The parent mites are believed to take up their quarters in the buds during winter. They pierce the young leaves and lay their eggs inside. These hatch out and the young mites make their exit by a minute hole on the underside of the leaf. In syringing with any insecticide, you must, therefore, thoroughly wet the lower surface of the leaves in the hope of getting at the mites in that way. Neither Gishurst Compound nor hellebore powder can do the foliage of the trees any harm. A little flowers of sulphur might even be added to the first named, so as to strengthen it. We shall be highly pleased to hear what success you meet with in the operations as well as with the tree which you have denuded of its foliage.

Gathering Garden Produce.—*Omega*: For such things as Carrots, Parsnips, Beet, and Potatoes it would matter very little at what time of the day they are collected. In the case of all green vegetables, such as Peas, Beans, Cabbages, Lettuces, and others of that type, there is no doubt but that the morning hours would be the best time to collect them during the summer months, especially during droughty weather. They would be in a more succulent condition than if gathered after the sun has made them limp. In wet weather, and after the end of September, they might be gathered during the day, choosing a time when they are fairly dry, if possible, as they would keep better when brought together or packed in quantity. All fruits should be gathered when perfectly dry, if possible; and the early morning would be the best time for picking the same. If gathered during the heat of the day they would suffer greatly in flavour, particularly such things as Strawberries and other soft fruits.

Drinks and Beverages from Plants.—*IV. H. Patterson*: You will find short accounts of a great many foreign plants yielding drinks of one sort or another in the "Official Guide to the Museums of Economic Botany, No. 1," relating to Dicotyledons and Gymnosperms, and in the "Official Guide to the Museums of Economic Botany, No. 2," both on sale at the Royal Gardens, Kew, price 4d. each, and by post 5d. The new edition of one or both of the above might be a little dearer, but of that we are not certain. More lengthy particulars concerning some of the economic plants under notice are given in the "Treasury of Botany," published by Longmans, Green & Co., Paternoster Row, London, price 15s. for the two volumes.

Names of Plants.—*Gardener*: The plant from the conservatory is *Bossiaea linophylla*; the other is *Saxifraga granulata flore pleno*, which must have originally been planted in the garden of the old ruin. The single form of it is a British plant; both the single and double forms are often planted.—*Omega*: The garden plant is the double Red Campion *Lychnis diurna*; the other is Beaked Parsley (*Anthriscus sylvestris*).—*T. B.*: 1, *Pyrus pinnatifida*; 2, *Pyrus Aria*; 3, *Acer platanoides*; 4, *Cupressus nutkaensis*; 5, *Libocedrus decurrens*.—*W. P.*: 1, *Oncidium sphacelatum*; 2, *Masdevallia harryana*; 3, *Odontoglossum odoratum*; 4, *Dendrobium densiflorum*.—*A. 1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

JOHN FORBES,

Nurseryman, Hawick, Scotland. ESTABLISHED 1870.

EXAMINATION IN HORTICULTURE.—The results of the examination held under the auspices of the Royal Horticultural Society on April 6th last are now before us, and show in what districts of the British Isles the rising generation of gardeners reside, who are taking advantage of the opportunity of getting a knowledge of their profession otherwise than by the ordinary routine of practice. We take it that the places which head the list with the greater number of students owe that distinction to their being centres of horticultural teaching rather than that the students belong there by right of birth. Altogether 190 candidates turned up for examination, of whom 155 were from various parts of England, 11 from Scotland, and 19 who gave no address. Five failed to get a place in the tabulated lists, but this is less than half the number of failures last year. The highest possible number of marks obtainable was 300, but none of the candidates reached this proud position. The list is headed by Miss Olive M. Harrison, Horticultural College, Swanley, with 285 marks. All who got 200 marks and upwards were placed in the first class, and the number reached 87 or 45.7 per cent., being slightly under last year's figure.

An examination of the list shows that established schools, giving systematic instruction to their pupils, take prominence on the examination day. The Horticultural College, Swanley, heads the list with 24 pupils who have passed first-class. Two-thirds of them were women. The County Technical School, Stafford, follows with 12 first class papers; the Technical Laboratories, Chelmsford, Essex, with 8; the Horticultural School, Holmes Chapel, Cheshire, with 6; and the Municipal Technical School, Leicester, with 2. The three students from Kew Gardens passed first-class, but no special instruction is

afforded them for this particular examination. It is certainly a tribute to the instruction afforded there in various phases of horticulture, as well as to the laudable desire for improvement, evidenced by the students themselves. The other first-class papers come from districts or places widely scattered all over the country, and are no doubt the results of teaching in isolated districts and towns by the county councils. Though Surrey is not represented by a school, numerous students from different places gave a good account of themselves, when committing to paper their answers to the questions set.

Sixty-one candidates passed second class, being an increase upon last year, when fifty-five passed. They all had 150 marks and upwards, but less than 200. The County Technical School, Stafford, heads the list in this instance with 7 students; Swanley, Chelmsford, and Holmes Chapel being represented by four students each. Aughton, Lancashire, furnished five second class papers, Leicester furnished three. In the third class Chelmsford leads with seven students; while Holmes Chapel has two in this category; and Swanley College and Leicester, one each. Surrey sends a considerable number, including four from Caterham Valley. Altogether thirty-six passed in the third class as against twenty-eight last year.

Of the 11 candidates from Scotland, 3 passed first class, 6 second, and 2 third-class. The principal centres here are Edinburgh, Glasgow and Longniddry, Haddington. One student who passed in the first class hails from Cullen Gardens, Banffshire, this being the most northern student recorded. A great many of the isolated cases throughout the United Kingdom must represent an exhibition of individual industry, perseverance, and talent that cannot be ignored in taking an account of the spread of education amongst young gardeners. It is satisfactory to know that the answers gave the examiners greater satisfaction than last year. Plant physiology is of considerable importance to gardeners, and though they have hitherto shown some antipathy to this branch of instruction, they are now waking up to the needs of the times. A list of the successful candidates is given in another column.

R. H. S. Rose Show: Change of Date.—May I ask you to be so kind as to announce in as prominent a manner as possible that the Council have changed the date of the R. H. S. Rose Show advertised on p. 59 of the arrangements for 1898, from June 28th to July 12th. This alteration is necessitated by the abnormally backward state of the Roses this year.—*W. Wilkes, Sec.*

Lectures at Chiswick.—The first of a series of four lectures for the benefit of the members of the Chiswick Gardeners' Mutual Improvement Association was delivered by Prof. the Rev. Geo. Henslow on Wednesday, the 22nd inst. The subject of this lecture was on "The Importance of a General Knowledge of Vegetable Physiology to Cultivators." Succeeding lectures will be delivered on the 22nd and 29th June, and on the 6th July.

Children and Fruit.—In the last issue of the GARDENING WORLD it is stated that "fruit causes diarrhoea in children." This is a mistake. It is possible that a boy, after devouring a large quantity of green Gooseberries or half grown Apples, may feel a pain behind his pinafore, but this is not the exclusive right of childhood. A strong man may feel the same, or more, under the same circumstances. If fruit is ripe and sound, experience shows that it can be eaten in any reasonable quantity by any one with pleasure and benefit to both the grower and the eater, be the latter ever so small.—*T. F.*

A Second Kew Gardens.—'Arry (eyeing a lady's hat): "I say, 'Arriet, 'as she got a second Kew Gardings in her 'at?"—'Arriet: "Yus 'Arry. W'en are you going to give me one like it?" Conversation flagged.

Staging Vegetables at Edinburgh.—Two Edinburgh correspondents have written to say that Mr. James Gibson is perfectly correct in his contention (p. 644) that trays of the size specified are too small for the proper display of sixteen varieties of vegetables, and that the matter will be placed before the council of the Royal Caledonian Horticultural Society, for the consideration of that body. This is so far satisfactory, and the society would do well to rectify the matter both in the interests of the public and exhibitors.

Orchid Display at Highfield, Woolton.—There is at the present time a grand display of Orchids in flower, beautifully arranged in one of the Orchid houses at this place, there being over 100 grand spikes of all the best varieties of *Laelia purpurata*. Many fine *Cattleya Mendellii* and *C. Mossiae*, *Oncidium* in variety, and *Odontoglossum citrosimum* in many well-flowered specimens hang gracefully from the roof. At the end of the house is a group of *Odontoglossum vexillarium* in many plants of beautiful varieties, well flowered. One specimen nearly 3-ft. through is producing dozens of spikes of charming flowers. These are beautifully grown. W. H. Tate, Esq., the owner, enjoys his plants and he may well be proud of his collection, which is skilfully handled by Mr. Haigb, his gardener, who has had charge here for many years.—*A.O.*

Cycle Race for Carwardine Cup.—The annual race, promoted by the Anerley Bicycle Club, for the historic Carwardine Cup, takes place on the Crystal Palace track on Saturday, June 18th, at 3 p.m. The race was originally run as a twenty-four hours competition for unlicensed riders and won by C. Fontaine, but owing to the action of the N.C.U. in stopping races for this class of men, the distance has been altered to 100 miles for amateurs, the winners being D. Frost in 1896 and A. H. Harris in 1897. Probably of all the Century races, there has been more competition for this Cup than any other, owing perhaps to its enormous value, 300 guineas; which is, we believe, the highest valued prize ever offered for a cycle competition. The amount of interest shown by riders in this year's race can best be proved by the number of entries (including the two previous winners Frost and Harris) being so great that it is quite impossible to start them all in one race, so only twenty picked riders will start, and as each rider is now allowed by the N.C.U. to have six tandems for pace-making, the race should be to the spectators very exciting and interesting, and a great crowd is expected to be present.

Mr. Gladstone's Favourite Flower.—Since the funeral at Westminster Abbey of Mr. Gladstone, Mr. Ellis Lever has made a suggestion that on every 19th of May, the anniversary of Mr. Gladstone's death, the English Rose should be worn. The late statesman had an intense love of flowers, especially of the Rose, and during the summer months was accustomed to wear one in his coat. The talented poetess, Mrs. Felicia Dorothea Hemans, who, like Mr. Gladstone, was born at Liverpool, wrote some lines on this floral emblem of England, which Mr. Lever quotes:—

How much of memory dwells amidst thy bloom,
Rose! ever wearing beauty for thy dower!
The bridal day—the festival—the tomb—
Thou hast thy part in each—thou stateliest flower!
Therefore with thy soft breath come floating by
A thousand images of love and grief,
Dreams, filled with tokens of mortality,
Deep thoughts of all things beautiful and brief.
Rose! for the bouquet gathered, and the bier;
Rose! coloured now by human hope or pain;
Surely where death is not nor change nor fear,
Yet may we meet thee, Joy's own flower, again!

On seeing Mr. Lever's suggestion, the Dean of Rochester, Dr. Reynolds Hole, the well-known author of "A Book about Roses" and other popular works, wrote to Mr. Lever as follows:—"You will be pleased to read the following extract from a letter dated 79, Harley Street, March 28th, 1877, addressed to the Rev. Canon Hole:—"The Rose is, in addition to other merits, an English flower, almost an English institution, and I am glad you have made it a subject of special study and commemoration.—I remain, dear sir, yours faithfully, W. E. Gladstone."—*The Southport Visiter.*

The Daffodil was Lord Tennyson's favourite flower.

Good and Bad Seeds.—Waggs was troubled about his Parsnips not coming up and asked if they had gone down the other way. Quoth I, "The good die young, and that accounts for the remainder."—*Snaggs, K.B.A.*

M: Scalarandis, head gardener to the King of Italy, the well-known Chrysanthemum specialist, has lately been named a *Chevalier du Mérite Agricole*. He has been honoured with this decoration by France on account of the numerous services he has rendered to horticulture.

Paris Exhibition of 1900.—The Royal Commission are now prepared to circulate information respecting the exhibition. The classification and rules for exhibitors, together with forms of application for space, can be obtained by applying to the Secretary of the Royal Commission, Paris Exhibition, 1900, St. Stephen's House, Westminster, S.W.

The Newcastle-upon-Tyne Flower Show.—As already announced this show will be held in conjunction with the Northumberland Agricultural Show in the Recreation Ground, on Wednesday, Thursday, and Friday, July 13th, 14th, and 15th. This will be the largest show ever held in the North of England. A large deputation from the Council of the Royal Horticultural Society will travel from London to visit the show and make awards. Several prominent nurserymen from different parts of England have made application for space. The whole show promises to be a great success.

The Fossil Forest of Atanakerdluk, as a fossiliferous exhibit, is unique. Many of the leaves of the trees are so perfectly preserved that fragments of insects are plainly to be detected on their surfaces. Amongst these trees are early representatives of *Sequoia gigantea* of the Yosemite valley, and also of the curious and interesting *Salisburia adiantifolia*, or *Ginkgo biloba*. Atanakerdluk is situated in northern Greenland, about 70° N. latitude. An early report places the date of its origin in the Miocene period, for out of the sixty-six species of plants which have been recognised in it no less than eighteen belong to that period. A party of Swedish scientists are even now preparing for a visit to this wonderful spot, and we shall, probably, thus in the near future, know something more definite as to the wonders which this forest, with the unpronounceable name, contains for the palaeontologist.

Messrs. Sutton & Sons' Annual Excursion.—For a number of years past Messrs. Sutton & Sons, of Reading, have organised a yearly trip for their employés. The excursion for the present year took place on Monday, the 6th inst., to Southampton. A special train was chartered from the Great Western Railway Co., and the journey was accomplished very comfortably from Reading in two hours, the route being via Newbury and Winchester. In a saloon carriage attached to the train were Mr. and Mrs. M. J. Sutton, Mr. A. W. Sutton, Mr. Leonard Sutton, Mr. M. H. F. Sutton, Miss Jessie Sutton, Miss Kathleen Sutton, and a party of friends. It is almost needless to say that the various members of the firm who thus identified themselves with the men's enjoyment did their utmost to render the day as pleasant as possible. Arriving at Southampton the trippers, who numbered nearly 700, embarked on two steamers, one of which, the "Solent Queen," left for Ryde, and proceeded round the island, touching at Sandown, Shanklin and Ventnor. The other vessel, "Her Majesty," went to Cowes and Totland Bay. Most of the passengers by this boat landed at Cowes and visited Osborne, Her Majesty the Queen having graciously given permission to view the grounds. The party was shown round by Mr. Sclater, the agent, and Mr. Nobbs, the gardener. The weather was gloriously fine throughout, and thus the lovely Isle of Wight was seen at its best. In addition to meeting the travelling expenses both by sea and land, the Messrs. Sutton generously made an allowance to each employé for incidental expenses, and each married man was invited to bring his wife. The return train left Southampton at 8 p.m., and Reading was reached at 10 p.m., another red letter day in the experience of the employés of the Reading firm thus being brought to a successful close. The organisation was perfect throughout.

A Rare Tree.—*Botanist*: "That seems a rare tree, Pat; what kind is it?"—*Pat*: "Begorra! I think it is a wooden one, but will have it cut down to see."—*Snaggs, K.B.A.*

The Royal Domain of Laeken.—For some time past important works have been carried on upon this estate by the command of the King of the Belgians, who has recently added some new lands to the domain of Laeken. He is building no less than fifteen vineries, each 30 metres long by 8 metres wide, and 21 plant houses for flowers, 30 metres long by 6 wide. Amongst these plant houses will be a block of three, destined to house all the plants of the Congo. The whole of these glass buildings will be surrounded by a large gallery intended as a new orangery.

The Language of Fruit and Vegetables.—We have all heard of the language of flowers, although we may not all be initiated into its mysteries. Here is a sample of the way fruit and vegetables talk which lately appeared in the *New York Herald*. Out of consideration for our readers, we only give the first verse:—

I will "Beetroot" to thee, my dear,
My love will never change;
A happy "Pear" we'll be, my dear,
To wed, "Lettuce" "Orange."
Do not "Turnip" that pretty nose,
Excuse, I pray, the hint;
But kindly list while I propose,
My offer is well "Mint."

Fruit in Queensland.—The colony of Queensland is well adapted for the culture of tropical and sub-tropical fruit. In the warmer northern districts the Mango, Banana, and Custard Apple come to perfection, as well as various other more or less luscious and valuable fruits of tropical countries. Queensland supplies Victoria and New South Wales with Bananas. About 17,059,124 dozen bunches of this useful fruit were grown in 1896, and mostly disposed of to these latter colonies. The children of the white settlers live to a great extent upon Bananas, which make excellent meals and an appetising dish when stewed. Even the skins constitute nutritious food for pigs, and, where the latter are kept, can be turned to profitable account. The Orange and other fruits of temperate countries grow luxuriantly in the southern districts of Queensland, from whence an experimental consignment of Oranges is about to be despatched for London, where it will arrive when the ordinary supply is exhausted. It may be remembered that this is practically the reason for the success of Apples in the London markets from Victoria, Tasmania, &c. This cannot affect the home grower in any way, as the British grown fruits were exhausted long ago.

Tree labels in the Brussels Botanic Garden.—Some years ago the authorities in the Botanic Garden of the Belgian capital must have been impressed with the idea of doing the thing thoroughly in the matter of labelling the trees. The labels consist of iron plates about 6 in. square or thereby, and though they are still suspended on many of the trees, there seems to be no recent work of the kind. The botanical name is first given, then follows the name in French, and Flemish. Below this is a small map of the world showing the localities or countries of which the particular species of tree is a native. The sea is painted green, the land white, and the parts inhabited by the tree picked out in red. Sometimes the labels mention the uses to which the wood, fruit, &c., of the tree are put. The White Beam tree (*Pyrus Aria*) is named *Sorhus Aria*, Grantz. Then follow the synonyms, such as *Pyrus*, *Sorhier Alouchier*, and *Meelhesselaar*. The native countries are Europe, Asia Mineure, Altai and China, these being in French. In like manner the Horse Chestnut is furnished with such names as *Aesculus Hippocastanum*, *Marronnier d'Inde*, and *Wilde Paardekastanjeaar*, the latter being the Flemish name. The map of the world shows that it is a native of Greece and the Caucasus. The name *Sorhus Aria* is now rather antiquated a name for the White Beam tree, but otherwise the information furnished is very good, and well calculated for the instruction of the visitors. Something similar would not be wasted labour in this country, but we do not seem to be progressing very fast in this respect.

The Plants of the Arctic Regions, numbering some 762 species, have mostly white or yellow flowers.

Apples, according to an eminent doctor, have the power of curing confirmed drunkards of their craving for drink. They should be eaten at every meal, and if eaten in quantity, the drink craving gradually subsides.

A Bouquet that Miscarried.—In connection with the visit of the Prince and Princess of Wales to the gardens of the Royal Botanic Society at Regent's Park on the occasion of the Floral Fête of Friday, 10th inst., it was arranged between Messrs. Russell of Richmond and Mr. J. B. Sowerby for the Botanic Society that a bouquet should be made by the Messrs. Russell and presented to the Princess of Wales. The bouquet, which was composed of *Cattleyas*, *Odontoglossums*, and *Asparagus*, was accordingly made, but owing to some unfortunate hitch was never presented to the royal visitor, although it was promptly delivered to time.

Fruit and Vegetables in South Devon.—In a communication to us, Mr. A. McDonald, The Gardens, Stowe Park, Newton Abbot, South Devon, says he has been digging Potatoes in the open since the end of the third week in May, and commenced pulling Peas last week. The Apple is a very fair crop, as is the Plum. Pears and Cherries are even a better crop, being very good. Peaches and small fruits are all bearing good crops; and Strawberries never looked better. Raspberries are not at all promising, and do not seem to succeed well in that part of the country. Mr. McDonald, when he has had time to look round and study the subject under the conditions, which are new to him, may succeed in raising fine plantations of this useful fruit in the course of a year or two.

The buried Romano-British City at Silchester.—This celebrated ancient city has for many years been identified with the *Calleva* or *Calleva Atrebatum* that occurs in the *Antonina Itineraries*. Casual excavations during last century revealed the presence of antiquarian and archaeological treasures. Excavations were inaugurated by the Duke of Wellington in 1864 and continued more or less intermittently till 1890, when the Silchester Excavation Fund was established to carry out the work systematically. The finds for this year have been on view to the British public for some time up to the 15th inst. in the rooms of the Society of Antiquaries, Burlington House, Piccadilly, London. Some pseudo-Samian ware shows that even in the time of the Romans considerable advance had been made in the art of pottery. Clay of various degrees of fineness was the material used, and the potter had even then discovered the value of putting his stamp on the pottery, his name being as legible now as it was 1,400 years ago. Some of the red and glazed vessels were finely decorated in the Grecian style with leaves and scroll work. We noted what was evidently copied from the leaf of the Vine; but some other leaves were evidently conventional. Hunting scenes were also clearly represented. Wine casks after being drained of their contents were utilised for lining wells in the city, those on view being in a wonderfully sound and firm condition, more so in fact than some of the iron utensils and tools that were very much rusted. The iron shoe of a wooden spade suggested that the Adam of those days had to dig his garden or plot with a wooden spade, merely bound round the edges with iron. His modern representative, we fear, would grumble very much, particularly the lady gardener, if sent to trench the kitchen garden with a wooden spade. The site of the walled city occupies about 100 acres. The city seems to have died a peaceful and natural death by decay, as there was no store of anything in the houses.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Odontoglossum crispum rubellum, *Nov. var.*—The sepals of this extremely pretty variety are purple, shaded with brown in places, and white at the edges. The petals are jagged at the edges, with broader white margin than the petals, but otherwise similarly coloured. The lip is beautifully spotted

with rich brown. This pretty variety was exhibited at the Temple Show by Messrs. Linden, Brussels. *Cattleya Mossiae magnifica*. *Nov. var.*—A flower of this grand variety reached us the other day from Mr. P. McArthur, 4, Maida Vale, W. It measured 9 in. across the petals without being spread out flat, and the latter were 2½ in. wide, crisped at the edges and rosy. The lip was 3½ in. long, deep orange in the throat, and rich violet lower down the tube, with white, forking veins forming a handsome contrast. The side lobes and the lamina of the lip are all beautifully crisped and marbled with a rich violet-rose. A narrow white edging is continued from the lamina round the side lobes, making a pleasing finish to the flower. At this season of the year the houses would appear bare if the numerous fine forms of *C. Mossiae* and *C. Mendelii* were removed.

PRIMULA TRAILLI.

HAVING had another year's experience, I can now speak with a certainty as to *Primula Trailli*. I heard from my Indian botanical friend that he had met the collector of the seed sent me as that of *P. Trailli*, and had shown him the gardening papers which I had sent to India, with figures of the plants bloomed here. These, he said, were quite different from *P. Trailli*; that he had collected other *Primula* seed at the same time as *P. Trailli*, that the seed was mixed, and that *P. Trailli* had not come up. I think the best name for the *Primula* which I exhibited would be *P. Monroi* or *P. involucreta major*. It is utterly unlike the form of *P. Monroi* or *P. involucreta*, which I have grown for years. It has, when grown close to the glass and so free from any tendency to be drawn up, stems above 18 in. high, with long leaves. Probably several of the Indian *Primroses* have different forms. Some years ago I exhibited before the floral committee of the R.H.S. a giant form of *P. capitata*, which I suggested should be named *P. capitata major*. This received a First-class Certificate on 9th October, 1886, and some time afterwards a nurseryman exhibited a giant form of this *Primrose*, which, I suppose, the committee considered different from mine, as this also secured a certificate or award. The committee only followed the usual precedents in rewarding a fine, distinct new form of *Primula* in the case of *P. Trailli*, but I think that the name should be changed and that the fact be recognised that *P. Trailli* has still to be introduced.—*George F. Wilson, Heatherbank, Weybridge Heath.*

ROUND DONCASTER.

I WAS charmed with the compact and horticulturally resplendent grounds of Mr. John Athron, in Avenue Road, Doncaster, the other day. The whole covers but barely an acre, but every available spot is utilised with plants or glass structures—everything well grown, vigorous, and free flowering in the heds—a plenitude of bloom in great variety in the houses, the latter being well constructed and adapted for plant culture without a doubt. The wonder to me was, however, Mr. Powell the gardener there could possibly, singlehanded, do such infinite credit to himself, for he told me he has but an occasional help. Certain it is that his heart must be in his work, and that he has an abundance of good taste at his command, not to touch on the good experience Mr. Powell has had, which fact generally shows itself in one's handiwork.

There is nothing here to lend itself to the gardener's art, no natural background or breaks of trees or shrubs, but the whole effect has been produced in a very short time in a very skilful manner. The quaintly shaped iron receptacles on the little lawn in the front of the house, which is gained through an iron gate of orthodox style, rather add than detract from (as is so often the case) to the effect of the bedding plants and ornamental shrubs that are planted therein. Art and nature is well diversified on the front of the house, represented in the former by statuary work in good taste, and in the latter by happily blended heds comprising *Aubrietia Leichtlinii*, *Arahis*, *Pelargonium Flower of Spring*, *Marshal McMahon*, *Mrs. Douglas*, and other good zonals, &c. Inside the iron palisades I observed some grandly furnished specimens of *Ilex Silver Queen*. Passing through a portion of the conservatory, which is so arranged as to be the only ingress

except the house proper into the garden at the rear, I noticed the neatness displayed in the arranging of the flower border which forms the groundwork in this portion of the conservatory, and in which Fuchsia Sunray, and other varieties, Lobelias, &c. were all aglow.

The grounds at the immediate rear were a veritable picture, so early (June 1st) and well bedded out, with French Marigolds, and a few other annuals already in partial bloom. I have thought what a treat a look at Mr. Athron's grounds would afford the amateur enthusiast; for here is a model garden *pur et simple*, which reflects much credit on the painstaking gardener as well as his worthy employer. Mr. Powell was at one time in the gardens at Burghley Hall, and is looked upon as a very efficient gardener in the neighbourhood of Doncaster.—*Albert Upstone.*

STREPTOCARPUS HYBRIDS.

THE Streptocarpus, or, as it is sometimes called, the Cape Primrose, has been so thoroughly manipulated by the florist that hybrids of a very useful and decorative order have become quite common. Everybody seems to grow them; and when their merits, freedom of flowering, beautiful colouring, ease of culture, etc., are considered, it is no wonder they are found in nearly every stove or greenhouse. But, even plants that are not particular in their requirements must have attention, and it is that attention, given at the proper time, which so largely contributes to the success of plant culture.

Messrs. Veitch & Sons possess a good strain; at least, I thought so, when I called the other day on Mr. C. Edwards, The Gardens, Oakhurst, Ealing, W., who had a very respectable lot varying in colour from pure white, without markings, to bright, purple-blue, with streaks, or "guide lines," running down the tube towards the nectaries. Present day gardening is all on the side of economy, that is, no time is lost in producing a plant fit for inspection over the shortest possible period. These very floriferous plants in 6-in. pots, which averaged twelve to twenty flower-stalks, with panicles of six to eight corollas—some of these latter measuring 1½ in. to 2 in. in diameter—were only in the germ condition twelve months ago. A packet of seed, then, well-selected and properly grown on, will produce a charming floral display of many colours from May to September.—*C. B. G., Acton, W.*

CRICKET.

SUTTON'S, OF READING, v HURST & SON C.C.

THIS match was played at Streatham on Wednesday, June 8th, and resulted in an easy victory for the Reading team, as the following score will show. The principal features of the match were the batting of Mr. M. H. F. Sutton, who scored fifty-four in very free style, and the bowling of Mr. T. J. Bennett, who secured five wickets at a cost of only thirteen runs.

| SUTTON'S. | |
|--|-----|
| Hawes, A. J., c Sampson, b Main | 12 |
| Dane, W. G., c Squires, b Main | 5 |
| Sutton, M. H. F., c Thake, b Main | 54 |
| Allum, J., b Main | 4 |
| Barrett, H. J., c Delacourt, b Sampson | 1 |
| Bennett, T. J., b Swinfen | 9 |
| Bowery, F. M., b Swinfen | 0 |
| Bartlett, John, not out | 27 |
| May, T., b Swinfen | 5 |
| Austin, A. T., c Jerry, b Main | 13 |
| Waight, B. C. C., b Swinfen | 0 |
| Extras | 11 |
| Total | 141 |
| HURST & SON. | |
| Squire, b Bennett | 18 |
| Porich, c Bartlett, b Bennett | 12 |
| Sampson, b Bennett | 0 |
| Swinfen, b Bennett | 5 |
| Heuman, b Bennett | 2 |
| Blyth, b Deane | 2 |
| Main, c Austin, b Deane | 4 |
| Delacourt, not out | 9 |
| Cox, c and b Deane | 3 |
| Jerry, c Bowery, b Deane | 0 |
| Thake, run out | 5 |
| Extras | 12 |
| Total | 72 |

In the follow-on Hurst's scored forty-seven runs for six wickets.

PLANTS RECENTLY CERTIFICATED.

FLORICULTURAL Certificates of Merit were granted to the undermentioned subjects by the Royal Botanic Society at the flower show held in conjunction with the floral parade at Regent's Park, on Friday, 10th inst. :—

PAEONY DOROTHY WELSH.—A medium sized, full double Chinese Paeony, exhibiting a bright rose-pink hue. Messrs. Kelway & Son, Langport, Somerset.

PAEONY LADY LONG.—This is another Chinese Paeony with globular, medium sized flowers. The colour is rich satiny pink. Messrs. Kelway & Son.

PAEONY CARDINAL VAUGHAN.—Here we have a huge flower of most imposing presence. The colour is rose-pink, deepening to carmine in the centre, and shading paler towards the circumference, there being a distinct silvery margin. Messrs. Kelway & Son.

PAEONY PRINCESS OF WALES.—This is a very handsome variety of the Tree or Moutan Paeony. The blooms, which are single, are of immense size, and run from 10 in. to 1 ft. in diameter. The colour is a shining white with a flush of pink in the centre. The petals are prettily notched at their blunt apices. Messrs. Kelway & Son.

PAEONY DUCHESS OF MARLBOROUGH.—Another Tree Paeony with very large, but in this case semi-double, flowers, which are not so flat as those of other forms. The colour is a bright satiny rose, the notched petals having, moreover, a silvery margin. Messrs. Kelway & Son.

PAEONY MARCHIONESS OF LONDONDERRY.—This is also a handsome tree form. The flowers are of great size and semi-double. Their pure white is occasionally relieved by a radial splash or bar of carmine, but the degree of this marking does not appear to be constant. Messrs. Kelway & Son.

PAEONY PRINCE OF WALES.—Also of the 'tree' section, but a smaller flower than the foregoing. The colour is bright scarlet-rose, shading to crimson in the centre, and striped obscurely with white, except at the edges of the petals where the white situation is very pronounced. Messrs. Kelway & Son.

PAEONY ALTON LOCK.—This is a rather small-flowered tree Paeony, but the rich deep crimson of its semi-double flowers makes up for the lack of size. Messrs. Kelway & Son.

PAEONY JAMES KELWAY.—A rather curious but distinct shade of dull rose-scarlet is to be observed here. The flowers are of medium size, whilst the margins of the petals are much notched and waved. Messrs. Kelway & Son.

PYRETHRUM CASSIOPE.—The single varieties of Pyrethrum roseum are of great value for cut flower purposes, and in Cassiope we have one of the finest of these varieties from the florist's point of view. The blooms are very large and regular, the ray florets being both wide and long. The colour is deep crimson-carmine, a rich and showy hue. Messrs. Kelway & Son.

STOCK SNOWFLAKE.—This is a pure white Brompton Stock with large full double flowers which are deliciously scented. The spikes, which run from 1 ft. to 18 in. in length, are branching, and carry vast numbers of flowers. Messrs. A. W. Young & Co., Stevenage, Herts.

PAPAVER PRINCESS OF WALES.—Varieties of Papaver bracteatum, which itself is probably a form of P. orientale, comprise some very showy things. Of these Princess of Wales is a fine example. The flowers are of extra large size, delicate pink in colour, and have the large black spot at the base of the six petals that is usually to be seen in varieties of P. bracteatum. Messrs. Barr & Sons, Covent Garden, W.C.

PAPAVER SILVER QUEEN.—Here we have another form of P. bracteatum, but the basal spots are absent. The colour is light flesh-pink, and the single flowers are below the average size. The colour is the important point. Messrs. Barr & Sons.

THALICTRUM AQUILEGIFOLIUM ATROPURPUREUM is a pretty and useful plant badly afflicted with a lengthy and cumbersome name. It is a strong growing form of the type, running to 3 ft. or 4 ft. in height, but the varietal name "atropurpureum" is misleading, since the feathery flowers are not dark but light purple in hue. For cut flower purposes this is a most useful plant. Messrs. Barr & Sons.

CARNATION PRIMROSE QUEEN.—This is a new yellow tree or perpetual flowering Carnation of great promise. In colour the flowers much resemble those of Germania, but they are larger and the petals are of greater substance. The form is good, although not of the highest type, and the plant is a wonderfully free and persistent bloomer. Added to this it possesses a strong constitution, and as it produces plenty of grass there is no lack of material for cuttings. Mr. Fred Perkins, Regent Street, Leamington Spa.

BEGONIA COUNTESS OF ABERDEEN.—A tuberous variety with large, full double, rich salmon-scarlet blooms, the individual segments being prettily gophered and frilled. Messrs. John Laing & Sons, Forest Hill, S.E.

BEGONIA COUNTESS OF DARTMOR.—The double white flowered tuberous Begonias are none too strong in really first-class forms, hence this variety must prove an acquisition. It is a good exemplification of the true Camellia type. Messrs. John Laing & Sons.

BEGONIA GENERAL SIR WM. LOCKHART.—The name of this great soldier finds commemoration in this fine tuberous variety, which, fitly enough, is of glowing, fiery scarlet hue. The blooms are of great depth, the outer or guard segments reflexing considerably. The inner segments, in addition to crisped and notched edges, are pleated and folded in radial lines, and the whole flower has a pleasing and distinct individuality. The habit of all three of the above varieties appears to be dwarf and sturdy. Messrs. John Laing & Sons.

CLEMATIS DUCHESS OF YORK.—This is one of the varieties belonging to that distinct break of Clematises obtained by Messrs. Jackman & Son, of Woking, by crossing varieties of the "patens" type with the pollen of C. coccinea. In Duchess of York the sub-tubular, stellate pointed flowers are smaller than in the other varieties of this section, but they are vastly pretty, the colour being a delicate flesh-pink.

Botanical Certificates were awarded to the following :—

ONONIS ROTUNDIFOLIA.—This pretty and perfectly hardy Ononis was introduced to this country from southern Europe as far back as the year 1570, so that it seems decidedly curious to give it a Botanical Certificate now as a new plant. It is of dwarf and compact habit, and inclined to be shrubby. The leaves are trifoliate, and the leaflets usually obovate in shape, although occasionally elliptic, with much toothed margins. The flowers are relatively large and showy, bright rosy-pink in colour, the large elliptic standard being by far the most prominent part. The peduncles are axillary, and three-flowered. Messrs. Kelway & Son.

VERBASCUM PANNOSUM.—In general appearance this plant is not unlike the Great Mullein, V. Thapsus, but the spike is not quite so woolly. The flowers are large, bright canary-yellow in colour, and nearly regular in form, the lower petals being only a very little larger than the others. Messrs. Kelway & Son.

KNIPHOFIA TUCKER.—This "Poker Plant" throws a spike of medium size, in which the opened flowers at the base are bright yellow, the later unopened ones higher up being brick-red. The contrast is very conspicuous. Messrs. Kelway & Son.

THE FLOWER GARDEN.

THE showery weather which we had through nearly all of June as far as it has gone has given the various plants recently put out a chance of getting a hold of the new soil, but the low temperature that we are experiencing at the time of writing will not suit plants of tender constitution, which almost up to the time of planting out were luxuriating in warm houses.

Where the flower garden is not separated from the shrubberies and outlying grounds, where the rabbits hold possession, there is apt to be considerable outcry against the rabbits and the mischief they do. They will nibble almost anything, and occasionally beds for which they display a marked preference have to be enclosed by wire netting. In view of their depredations, causing gaps in the beds, it will

be advisable to pot up a quantity of such things as Heliotropes and Lobelias, which will then be ready to hand for filling in. Should they not be required, so much the better, but it is well to take the precaution.

The employment of the Dutch Hoe amongst beds and borders of all descriptions is at this season of the year of the utmost importance. A day's hot sun after rain will bake and harden the surface of the soil to a serious degree, more particularly where it is inclined to be heavy. In order to assist aeration, therefore, as well as to keep down weeds, the hoe should be kept going whenever there is opportunity.

CARNATIONS.—The staking of border Carnations should be completed at an early date. A supply of light Bamboos, say about 3 ft. in length is really a good investment, for not only do they look much better than the sticks cut from plantations and copses, but with care they will last for a number of years. In tying do not bunch the flower stems too much together, although there is a great temptation to do this when "work is plenty" and labour is scarce. Keep a sharp look-out for fly, and tackle it with dustings of tobacco powder, which may be washed off by the syringe an hour or two afterwards. We notice that some of our plants are infested with fly, and this in spite of heavy rains, so that those who know how quickly the pest multiplies will hold the warning seasonable. As soon as the present unsettled weather improves a good mulching should be given the Carnation beds, and for the purpose there is nothing better than old Mushroom-bed manure.

FLOWERS FOR CUTTING.—In most establishments there is a great demand for cut flowers, and while the herbaceous borders will stand a good deal of the strain, something should be done to relieve them by planting auxiliary breaks of such subjects as are likely to be useful. Chinese Asters, particularly white varieties, are wonderfully useful at the latter end of the summer, whilst Sweet Sultan, both white and yellow, Coriopses, double Scabiouses, annual Chrysanthemums, Marguerite Carnations, Mignonette, etc., are all of the greatest service in this direction. Of Sweet Peas it would be difficult to have too many, for not only do they admit of cutting and coming again to an almost unlimited extent, but they are great adornments to the flower garden as they stand, and may be employed to mask objects that it is desired to keep out of sight. There are no more beautiful flowers than the Aquilegias, and their value for the filling of vases and epergnes is well-nigh phenomenal. It will be advisable to supplement those grown in the herbaceous borders by a quantity of plants grown specially for cutting. For the purpose there is nothing better than the mixed or selected hybrids amongst which there is, a wonderful range and variety of colour. A packet of seed will furnish all that is required.

DAHLIAS.—As earwigs are now beginning to be plentiful again it will be necessary to set to work to trap them, and thus keep down their numbers, otherwise, by the time the flower buds are formed there will be a plague of the little creatures to deal with. Attend to the staking of the plants where this was not done when they were put out, and the further tying of others already staked. Where it is possible to do so a good mulching of short well-decayed stable manure should be given, particularly where the Dahlias are growing in borders bounding shrubberies, for in such places the soil is poor in proportion to the age of the shrubbery, and naturally, where the latter has been planted some time there is very little goodness left in it.—A. S. G.

into the wall opposite, and in a line with the hot water pipes, and at the top of the house, but not too freely, as a through current dries them up too quickly.

POTTING.—With imported plants we use as small pots as it is possible to get them into, plenty of drainage, and good peat and sphagnum moss in about equal parts. The watering is done during the summer months wholly and solely with the syringe, giving them a good shower bath morning and night. Under such conditions the moss grows like mad and the plants too. In twelve months you will have some good stuff, some of which will require a shift into 5-in. pots. The compost will not be sour, so that they can be potted on without disturbing the ball, setting the plant back so that the young growth coming up and the roots from it may have the full benefit of the new compost. It is from these second growths that you will get good spikes, although plenty will show the first season if good plants are procured—I am, of course, thinking now of *Odontoglossum crispum*—but they do not show themselves properly; and what would be a good variety when grown is as often as not discarded. It requires a bit of nerve, I know, to pull the spikes out, especially the first time of flowering, but it pays in the end.

COOL ORCHIDS.—I am very pleased to find that a great number of amateurs are taking up the culture of cool house Orchids as a recreation after the bustle and go of a busy day in the City; and what is there more beautiful or more healthful than the study of Nature? To such amateurs that have but little room the cool kinds have a decided charm, as they do not require a great amount of fire-heat even in winter, and, besides, take up but very little room, being for the most part dwarf and small growing, which is a consideration. Anyone possessing a greenhouse sufficiently heated so that the night temperature in winter can be kept up to 45° in severe weather without having to drive very hard could grow such varieties or species as are found under the heading of cool Orchids. There is one thing, however, I would mention: that to attempt to grow *Odontoglossums*, &c., in the same house with *Pelargoniums*, *Begonias*, and the like, would most likely end in failure with all, because cool house Orchids must have shade and moisture to do them well.

Assuming then that you have decided to turn your greenhouse into an Orchid house, I would suggest that the open lattice stages be covered over with ordinary roofing tiles. These we have used for years with marked success. Each tile will absorb a good quantity of water, which is given off by degrees as the temperature rises, thus making the conditions of the house as nearly as possible perfect.

In the next calendar I will give a list and cultural directions of some of the most suitable kinds for amateurs to grow.—C.

Gleanings from the World of Science.

Symblypharis, a genus of Mosses.—At the meeting of the Linnean Society of London, on June 2nd, Mr. E. S. Salmon read a paper entitled "A Revision of the Genus *Symblypharis*." This genus of Mosses, he said, as founded by Montagne in 1839, had proved too narrow, through the limits imposed by certain peristome characters, and he was of opinion that Mitten's later emended description should be accepted. Montagne had founded the genus for the Mexican *S. helicophylla*, and to this species Mr. Salmon would refer the Indian moss *S. himalayana*, Mitten (*Didymodon vaginatum*, Hook.), as well as *S. Chrismari*, C. Müll., and *S. asiatica*, Besch., which were found not to possess the characters by which they had been separated from *S. helicophylla*, Mont. *S. microcarpa*, C. Müll., he considered to be a variety of *S. helicophylla*, Mont., and two new varieties of that species were described—*vars. tenuis* and *macrospora*—the latter remarkable for its large spores, 35-45 μ .

In the course of his remarks on other species of the genus, Mr. Salmon observed that *S. fragilis*, Mitt., is peculiar in the bistratose structure of the leaf, and *S. socotrana*, Mitt. (doubtfully included in the genus in the absence of fruit), in the papillose cells. *S. circinata*, Besch., and *S. usambarica*,

Broth., he would exclude from the genus, and pointed out that the former species, from Grande Comore and La Réunion, comprises two distinct mosses. Mr. Charles Henry Wright, A.L.S., offered some critical remarks.

The food of the Springtails.—Surgeon-Capt. Cummins, F.L.S., read a paper "On the Food of the Uropoda." The nature of the food of these mites, which belong to a highly specialised genus of the Gamasinae, had long been a puzzle even to those who have paid particular attention to their organisation. From careful experiments and observation, the author of the paper had come to the conclusion that amongst the organisms on which the Uropoda live were many species of bacilli, including the Potato bacillus and the earth bacillus. Wild yeast-cells were rapidly devoured, as also were Micrococci. He had little doubt that they consumed the gonidia of Fungi, for species of *Penicillium* and *Mucor* never appeared in the boxes which contained mites in large numbers; otherwise, they were commonly present.

Mr. A. D. Michael, in criticising the paper, pointed out the distinguishing characters of the Uropoda as compared with others of the Gamasinae, and especially the peculiar form of the mandibles, which suggested a different mode of feeding to that adopted by other mites. He considered Surgeon Capt. Cummins's observations on the subject a useful contribution to knowledge.

[This account of original observations on the food of the Springtails (Uropoda) should interest those of our readers who have blamed these mites for eating their newly germinated seedling Orchids. It is now made plain that their food consists of vegetable matter, but whether they could eat young seedling Orchids does not yet seem to have been investigated either to blame or exculpate the Springtails.—ED.]

Fasciated *Primula japonica*.—A specimen of this well-known Japanese *Primula* reached us last week, showing remarkable vigour and fasciation. The cut base of the flower scape gave indication of the union of four stems, but above the middle the mass had separated into five, bearing the usual tiers of crimson-red flowers. Instances of this kind may not be uncommon, but a more unusual phenomenon presented itself in the imprisonment of one of the radical leaves by the united stems. One longitudinal half of the leaf was grasped by the stems, while the other half up to the midrib was free, and of the normal colour. It must have got imprisoned when both stems and leaves were in a rudimentary stage in the bud. It was sent by Mr. C. B. Green, Acton.

Twin Vine Leaves.—A curious instance of the union of two Vine leaves was supplied us by Mr. James Gibson, Devonhurst, Chiswick. The petioles of the leaves were united by their upper faces almost to the top, and one would have expected that the leaves would have been brought in contact by their faces. They spontaneously objected to this, and when fully developed had their upper and green faces turned outwards. The phenomenon that presented itself was that two leaves had grown together back to back. The short portion of free petiole at the apex had enabled the leaves to turn round as a response to the influence of light on their green surfaces.

Vagaries of Tulips.—In our small collection of the English florists' Tulip there has been evidence that the sunless winter and spring has not been at all unfavourable even to Tulips of this race. The flowers of most of the varieties were larger than they were last year and more durable, lasting about five weeks. The rectified form of Annie Macgregor threw up two flowers of large size on one scape. The bybloemen Princess Royal threw up two flower stems from one bulb, one carrying the usual complement, and the other bearing four flowers all of which opened in due course. The terminal one was of average size, the other three being smaller, as might be supposed seeing that all were axillary buds on one stem. Each of the three leaves had thus a flower stalk from its axil, but all three were united with the primary stem, so that they were carried three or more inches above the leaves to which they belonged, above which all had free stalks, one about 1 ft. in length. Another variety named Aglaia has produced a bulb about 1 in. in length in the axil of the lowest leaf, but perfectly exposed to light and air. A fourth variety produced a bract towards the top of the stem, partly green and partly coloured in stripes, like a rectified Tulip.

The Orchid Grower's Calendar.

SHADING.—This is of the utmost importance. We use the cotton shading as recommended by Messrs. B. S. Williams. But when new it is scarcely enough should the house be fully exposed, so that an additional shade should be supplied by lightly whitening the glass. Where convenient the blinds should be elevated above the glass some six inches. This allows the air to play between the blind and the glass, which has the desired effect of keeping down the temperature in very bright weather.

The air should be given through ventilators let

HINTS FOR AMATEURS.

PYRETHRUMS.

DURING the months of May and June there are no flowers that are more conspicuously in evidence than the numerous varieties of that versatile species *Pyrethrum roseum*. These varieties are almost innumerable, every nurseryman having a number of pet ones in addition to some that are of such a high order of merit that everybody keeps them in stock. The range of colour covered is, moreover, considerable, since it passes from show-white to the richest crimson in one direction and to subtle shades of yellow in another, although the yellows are as yet the weak section. The type and ancestor of all these double and single forms is in itself a handsome plant, throwing a large Ox-eye Daisy-like flower with a single row of rosy-hued ray florets, with a large bright yellow disc or centre, in which the male or staminate florets are congregated. Its height is from 1 ft. to 2 ft., according to the locality in which it is placed and the soil in which it is grown.

Pyrethrums are so exceedingly easy of cultivation, and withal so beautiful and useful that they constitute almost ideal amateurs' plants, whether in town or country. Scarcely is there a cottage garden in the country, indeed, but that a few of them may be seen at this season of the year, blooming as if they were thoroughly at home, as they are. The double flowered forms seem to be the favourites amongst cottagers, however, for the simple, honest-hearted country folk love the large showy Chrysanthemum-like flowers. It would not be much out of the way to call them the poor man's Chrysanthemum, for although the Queen of Autumn is much beloved of the masses, it blooms at a time of the year when it needs, generally speaking, shelter of some sort to develop and preserve its beauty, and this shelter is often, and in fact usually, out of the power of the cottager to give. Not so with the Pyrethrums, however, for they are ushered in with the gentle zephyrs of May, and the golden sunshine of June, and catching Dame Nature in her mildest mood, flood our gardens with a very flux of colour. Not only are the plants beautiful *in situ* with their dark green feathery foliage, surmounted by the bright flowers on their long, stout stalks, but they are of inestimable value for cutting. In cut flower decorations the single blooms are perhaps to be preferred to the doubles, inasmuch as they are lighter and more graceful than the big doubles, but each section has its uses, and the honours are pretty evenly divided between them. The great quantities of Pyrethrums that make their appearance in all exhibits of cut hardy flowers at this time of the year, furnish incontestable proof of their status amongst the hardy flowers of May and June.

It is a fact that does not seem to be very generally known that Pyrethrums may be induced to take up the burden of flowering for a second time in each year, in autumn, if proper measures are taken. After the first flowering the plants should be cut back, when, if looked after for water during dry weather, they will break into vigorous growth and flower again freely in the autumn, although the individual flowers will probably not be so large and fine as those produced at the ordinary season of blooming.

As we have already intimated, there are great numbers of varieties, but the flowering will be found to be a good selection of the best, and any good collection should at least contain these, even if no more.

SINGLES.

Agnes M. Kelway.—A rich rose flower of the largest size, and ray florets of great width, length, and substance.

Ruth.—Another rose hued flower, but of very much looser build than Agnes M. Kelway. The ray florets are of great length, but rather narrow in proportion to their length.

Princess Irene.—Although this has been placed among the singles, it is in reality a semi-double, for there are always two and occasionally three rows of ray florets. It is a pure white flower, of great size and beauty.

Ascot is a new variety that is, perhaps, the best of all the true singles. The flowers are only of medium

size, but they are produced with exceptional freedom.

Sir Hugo.—A large rosy-scarlet flower, with florets of great width and substance.

Geo Wallace is, in our opinion, the finest of the dark varieties. The blooms are only of medium size, and they are somewhat stiff in appearance, the flower not being so flat as the others mentioned, but the deep crimson colour shows up well by contrast with the extra large and high full yellow disc.

Francis.—In build and shape of bloom this closely approaches to Geo. Wallace, but the colour of the ray florets is bright rosy-crimson, and the disc is not quite so high and full in proportion to the length of the strap-shaped petals.

Those amateurs who do not wish to go in for a collection of named varieties cannot do better than purchase an assortment, which can be obtained at a lower figure, and which will answer for cutting from fully as well as the finer forms for all ordinary purposes.

DOUBLES.

The undermentioned are some of the best of the double flowered sorts:—

Aphrodite.—This new variety, which has obtained a First-class Certificate from the Royal Horticultural Society, is to our way of thinking the best white form in cultivation. The blooms are of large size, high and full in the centre, and the tips of the petals are much notched and lobed.

Sambanburgh rejoices in a rather outlandish name, but it is a capital, pure white form notwithstanding. The notching of the petals so prominent a feature in Aphrodite is not present here.

Wega is a handsome flower, as much like a Chrysanthemum in appearance as it is possible for a flower to be. The outer florets are pink, but the inner ones are flushed with a delicate shade of yellow and pass almost to apricot in the centre.

Cleopatra is something after the same style and with nearly the same colours, but is rather a smaller flower.

Virgo.—This is the best of all the pure yellow forms. It may best be described as primrose-yellow.

Transcendant.—A huge pink flower with the apices of the florets deeply cleft and notched. This deep notching imparts a particular charm to the bloom, as it relieves it from any appearance of stiffness.

Perle.—Here we have a very close and compact flower, the resemblance to a Japanese Chrysanthemum not being so great as in the others. The colour is pink.

Shotover is one of the largest of all. The outer or guard florets are very long and drooping, the inner ones being shorter, and compacted together to form a high close centre. The colour is bright pink.

Beauty of Laeken.—This is another new variety that is remarkable for the rich deep velvety crimson hue it displays. It is not a full double flower, but is nearer to a double than to a single.

Lord Rosebery is a deep, dark crimson that gives an exceptionally rich effect when the sun is shining full upon it. It is a medium sized flower, and rather close in build.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Strawberry Laxton's Noble.—*Benj. T.*: If we had to choose between Royal Sovereign and Laxton's Noble we should most decidedly take Royal Sovereign. Noble is an early Strawberry it is true, and the fruit is possessed of a fine appearance, but it lacks the weight and flavour of Sovereign, and it is not a day earlier than it; indeed, it is the other way about, for we have picked fruit in the open air from Royal Sovereign several days before there was any fit to gather upon Noble. With regard to cropping both are exceptionally good bearers, and there is little or nothing to choose between them for forcing, except that question of flavour and weight, for both force easily and well.

Mulching for Strawberries.—*Benj. T.*: The grass cuttings from the lawn will make a clean enough bed

for the Strawberries to rest on, and indeed, in that respect will be quite equal to straw, but there are the after effects to be considered, and this most probably will be a fine crop of Daisies that will give you a little employment in weeding out. We should not advise you to use the grass, unless you can get nothing else.

Bees.—I noticed last week that in two of the hives the drones were being turned out in considerable numbers. Is not this an unusual thing to take place early in the season?—*M. N.*

It is somewhat unusual certainly, but the cold weather is without doubt accountable for it. A protracted spell of cold weather will be almost sure to cause the workers to turn the drones out of the hives, more particularly if the stocks are not very strong. We remember that this occurred very extensively amongst our stocks in the summer of 1892, in the month of July, which was with us a very cold and inclement month.

Croton Queen Victoria.—*Patrick*: It is not at all a common practice to use Crotons in the outdoor flower garden, not, however, because they would not do in the summer months, but because they are often considered too valuable for such purposes. You may plunge the plant as it is, pot and all, if you so desire, but keep a sharp look out upon it for water.

Rose Crimson Rambler.—*Cobnut*: There is no rule without an exception, says the old saw, and we have an instance of this in the behaviour of Crimson Rambler Rose. As a rule it is the most rampant of growers and the freest of flowerers, but it will not do in every situation. What it loves is to be planted out in the open where the wind can blow all round and through it, and where its branches may trail over an arbour or trellis. You have committed the mistake made by not a few people in planting it against a south wall. Such a position is much too hot and dry for the likings of this Rose, and it becomes smothered with green fly, which suck the very life out of it, and ultimately leave it a woebegone starved, and stunted cripple. Try it in an open position such as we have indicated, and the results will undoubtedly be more satisfactory.

Celery.—*Rob*: If room is precious you may plant a double row of Celery in each trench by making the latter a few inches wider. The double row takes a little more trouble to earth up, but this is of no great consequence.

Supporting Melons.—*F. Betts*: Yes, it is usual to support Melons as they hang, because the footstalk would be unable to bear the whole of the weight of the fruit. If you closely observe a ripe Melon you will find that there is a crack all round the stalk, and that the latter can be easily pulled out. Were no support given this crack would occur some time before the fruit was fit for table, and the Melon would fall and be spoilt. As soon, therefore, as the fruits get the size of cricket balls or a little larger, they are given something to rest upon and take part of their weight. Both pieces of net and boards suspended at the corners are commonly employed.

Vandalism.—Once again our neighbourhood is besieged with those vandals who desecrate nature by ruthlessly digging up the lovely British Ferns wholesale, and hawking them round the streets for a penny or so a root. Only yesterday three barrows full of the poor plants torn so rudely from their native homes passed through our street. Each barrow must have contained at the lowest computation between two and three hundred plants, so that if other parts of the metropolis are canvassed in the same way one is appalled to think how wholesale is this annual destruction of British plants. It may be argued that this is all done for the embellishment of our gardens, but this is scarcely true, for speaking from my own observations not one in twenty of these poor plants do anything else than die miserably. Can nothing be done to stop this scandal, for it is nothing more? Surely it is time that the authorities in the districts in which these depredators ply their nefarious trade should institute restrictive measures, and enforce them rigorously. I am sure that all amateur gardeners who really care for plants would be pleased to see a movement of this kind as would—*A Lover of Nature.*

Plant to Name.—*A. E. J.*—The plant is a *Bigonia*, probably *B. tweediava*, but the specimen sent is not sufficient to determine. Send a piece when in flower and we shall then be able to say definitely.

A THREE-LIPPED CATTLEYA.

FLOWERS with a reduction of the number of parts are fairly common amongst *Cattleyas*, and occasionally we meet with two lips in a flower, though that is more common in the Genus *Cypripedium*. A short time ago we received a flower of *Cattleya Mossiae* having three distinct and well formed lips from Mr. P. McArthur, London Nursery, 4, Maida Vale, W. The accompanying illustration shows what the flower was like before removal from the plant, which was of moderate size and carried two spikes of three blooms each. Five of them were normal, and the sixth differed only in having a triple lip, the rest of the segments and column being perfect. The three lips were nearly of equal size, well formed and coloured alike. There was only one claw, adnate to the base of the column, but immediately the lip got free from the latter it divided into three, of equal length and all so perfect as if it was the normal and proper thing to do. The origin of the two supernumerary lips might well be set down as a nut for the philosophers to crack.

CULTIVATION OF THE STRAWBERRY.

THE Strawberry is one of our most useful and nutritious fruits. A very eminent doctor, Davis, of Bath, once told me that one could hardly eat too many of them, as they were a change to the system.

Select a piece of ground not shaded by large trees. Trench the ground 3 ft. deep. Pick up the subsoil, and place a good layer of manure over it, then a good spit over that, and another layer of manure more rotten. Should the former crop have been Strawberries, pare them off, and place them in the bottom of the trench. Depth of soil is a great thing, as the roots go down deeply. After the ground settles down give the plants 30 in. between the rows, and 18 in. in the rows. The month of August or September is the best time to plant them. I never dig between the rows, merely keep the hoe going to keep down the weeds.

Instead of laying the runners in small pots, I much prefer to use a small stone or flint, where these are to be got. Break up the soil with a trowel, and then place the stone on the runners to keep the plant steady. They will root in a fortnight, and then you can lift the plants with balls. They must be bedded out till the ground or pots are ready. After I laid out the new gardens at Sandringham I used to force about 10,000 every season, all in 6-in. pots.

When the plants have done bearing cut away all the runners and allow each plant to stand separate, and hoe the ground all over. Put no manure on in the autumn, but in March hoe the ground over and give a good sprinkling of soot, which prevents slugs from increasing. Then cover all the ground over with a good coat of stable litter, which keeps the ground moist and forms a clean bed for the fruit to lay on.

Strawberries, like most fruits, want weeding out, there being too many useless kinds. The best late one I had is Waterloo. In 1892 I crossed it with British Queen, my object being to get the flavour of the latter into the former, and I got just what I wanted in the kind I have named Prince of Wales. In 1893 I crossed Waterloo with Laxton's Latest of All, which gave me the kind I have named Princess of Wales. In 1894 I crossed Waterloo with Frogmore Late Pine, from which I got two splendid kinds, Queen of Denmark, new in colour and a prolific bearer, and Richard Gilbert. The former took after its male parent, and the latter, Richard Gilbert, after the mother. This kind will be a rival for Royal Sovereign when it becomes known. The fruit is as large but firmer in the flesh and better flavoured.

In 1896 I crossed my seedlings; many of them will fruit this season, which will be very interesting. I only take a single flower and remove all the stamens before the pollen is ripe. When I sow the seed I merely pare off all the outer pulp and place it on the seed pan and then sprinkle it over with silver sand. Water the seed pan before placing on the pulp. The seed comes up very quickly; merely

place it in a frame or greenhouse. At the end of April plant out the seedlings and invert a flower pot over the plant till it gets rooted. Take advantage of a shower to remove the flower pot. The plants will fruit the next season. Those I planted out last April made strong plants, and are now in full flower. I took three or four runners off each plant; they are also in flower. I will make a point not to send out anything that is not an acquisition, as it would hurt my reputation.—*William Carmichael, 14, Pitt Street, Edinburgh.*

SUCCESSFUL CULTURE AT EXETER.

CALLING a few days ago at the nursery of Mr. B. Brown, St. Thomas's, Exeter, I was much pleased and in a measure surprised at splendid plants now in flower of that most useful *Dendrobium Dearei*. Unless I am much mistaken I called attention to this plant in the first number of the *GARDENING WORLD*, and all I then said has been amply verified, and even greater praise can now be given, as it has proved to be a most useful plant to those who grow in a large measure for cut flower purposes.

A THREE-LIPPED CATTLEYA MOSSIAE.

The singular thing about Mr. Brown's plants is that without any attempt at special culture or even to convey an idea that he has an Orchid house, he nevertheless has this *Dendrobe* in many houses, where small stove plants are chiefly grown; and the treatment given the latter—sharp heat, plenty of light and moisture—admirably suits the *Dendrobe*. As the greater part are grown in pots and suspended from the roof, they just revel in a temperature that would seem to be just that which suits them. These plants, too, are not of recent importation, and so living on the strength of the native vigour acquired in the native habitat, but are of many years' culture. The growths stout and strong, the pots full of roots, so much so that it would be easy to move the plants by lifting them by the bulbs instead of by the pots. Growth, leaves, bulbs, and roots plentiful and strong, lead one to ask "Well, what of the flowers?" Well, I never saw finer flowers nor plants so uniformly well bloomed. 'Tis not one or two, but scores of plants full of their lovely, white flowers useful for bouquets, wreaths, or sprays; and, judging from a remark made by Mr. Brown, I should say he finds this one of his choicest and most profitable gems.

Another plant grown in a similar manner and with equally good results is *Odontoglossum Roezlii*; usually considered a bad one to do, and certainly one that many fail with for any length of time. Though I know Clapton has turned out perhaps many finer plants than all other places put together, yet here the specimens are perfect gems. Hung from the roof like the *Dendrobe*, the bulbs and leaves are clean and numerous, whilst the flowers of both species are large, stout, and wonderfully attractive, besides being very numerous and good stayers. A lesson certainly may be learned here how to manage these two rather difficult subjects—cleanliness first, then heat, light, and moisture, and death to any thrip, yellow or black, as soon as it puts in an appearance; and I venture to say greater success will follow its culture, than in many cases has hitherto been the case. For myself, I may say, I never saw a better lot; nor more freely bloomed. I hope, for a long time to come, the success of past years may continue, and if a few plants, say of *Epidendrum bicornutum*, were added, I think the same result would follow, and this also would prove to be equally useful, though, perhaps, not productive of quite so many blooms as the two mentioned.

Of the Ferns, such as *Adiantums* in varieties, *Pteris* of sorts, grown by the thousands, I would only say they are just splendid stuff. Each plant is a perfect one in its way; the same remark applies to the *Fuchsias*, zonal and show *Pelargoniums*, *Erica ventricosa*, and the numerous other plants grown here; whilst a word must be given to the yellow *Carnation*, *Pride of Penshurst*, of which so far the proprietor informs me he cannot obtain a sufficiency. The demand for this is so great, that the stock cannot be increased quickly enough to keep up with it. Of Mr. Brown's *Grapes*, *Black Hamburgh*, *Muscats*, and *Alicantes*, I hope to be able to allude to at an early date, sufficient to say at the time of my visit, the two former were in a splendid and forward condition, the latter just setting and promising equally well. The bunches of all, when finished, will be simply superb.—*W. Swan, Exmouth.*

A Hive Bee collects about a teaspoonful of honey during the season. That amount should therefore sustain her till she can again go out in spring, provided she is still alive.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE fifty-ninth anniversary festival dinner of this well-known charity was held at the Whitehall Rooms, Hotel Metropole, on Wednesday evening, June 8th. His Grace the Duke of Portland had promised to take the chair, but was prevented by illness from so doing. His place was taken by Sir Oswald Mosley, Bart., of Rolleston Hall, Burton-on-Trent. See accompanying portrait, for which we are indebted to Mr. Geo. J. Ingram, the secretary. Upwards of 140 sat down to a well-served dinner, the table being profusely and prettily decorated with flowers and plants, amongst which the now celebrated *Acalypha Sanderi* was very conspicuous. Amongst the gentlemen present were the Very Rev. the Dean of Rochester, and Messrs. A. W. Sutton, H. J. Veitch, James H. Veitch, John H. Laing, H. Cutbush, P. Kay, G. Munro, H. B. May, A. Turner, P. Crowley, N. N. Sherwood, W. Goldring, J. Assbee, J. Douglas, Owen Thomas, G. Reynolds, Geo. Wythes, J. Hudson, T. W. Sanders, and R. Dean.

A lengthy toast list was provided, commencing, as in duty bound, by the healths of the Queen, who has been patroness of the institution since 1851, the Prince of Wales, its patron, with the Princess of Wales and the rest of the Royal Family. After these had been honoured, at the invitation of the chairman, Sir Oswald then proceeded to give the toast of the evening—"Continued success to the Gardeners' Royal Benevolent Institution." This he did in a few well-chosen words. At his request, Mr. Ingram, the secretary, read a letter from His Grace the Duke of Portland, stating his regret at being unable to attend, his physician having forbidden the exertion, and expressing a willingness to preside on some future occasion. This, Sir Oswald thought, was a matter upon which they might congratulate themselves, that one of the finest noblemen in England was interested in the society. In his subsequent remarks, the chairman mentioned the fact that this was the 60th year of the society's existence. In his younger days he had not been much interested in horticulture; indeed, his first introduction to it was in the shape of the Birch, but as he had grown older he had grown wiser. He had found horses expensive, and hence he had practically given them up, and had taken to gardening, thus following the example of some of his ancestors. He was very emphatic in stating his opinion that employers should give their gardeners full pay during sickness, no matter how much they might receive from clubs, as that was the way to encourage self-help. He advised all gardeners to subscribe to this very necessary society, and coupled with the toast the name of Mr. H. J. Veitch, their treasurer.

Mr. Veitch, on rising to respond, was received with great applause, thanked Sir Oswald for coupling his name with the toast, and also returned thanks for the society, as he had done for a number of years. Mr. Veitch then proceeded to give some succinctly stated facts connected with the work and progress of the "Benevolent." They had now the largest number of pensioners they had ever had, 168, of whom 93 were men, and 75 women. Their oldest pensioner, Eleanor Brown, died recently. Her husband had subscribed a guinea a year for sixteen years, had been put upon the list in 1866 at the age of 76, and drew his pension until the year 1875, when he died, having received £144 from the society. His wife was put on in his place, and she, too, has now died, after receiving £314 in pension since 1875. This worthy old couple, therefore, drew £458 for 16 guineas subscription. Mr. Veitch then spoke of the need for making the institution more widely known. The wages of gardeners had not risen of late years in proportion to those in other occupations, and he read three very amusing advertisements for gardeners, in which, while experienced men were wanted to look after cows, pigs, horses, etc., as well as gardens, the pay was even below that of a labourer. If the men filling these positions had a family they would, like the prodigal of old, have "to live on the husks that the swine did eat." In speaking of the Victorian Era Fund, he said they had collected £4,000 of the £5,000 asked for, and £200 more had been promised, and he then dealt with the distribution of this money, showing how the interest was distributed *pro rata* to the number of years that the applicants had been subscribers. He commended the action of Mr. J. W. Thomson in leaving legacies to the charities,

both to his audience and to himself. They had auxiliary societies at Bath, Wolverhampton, and Worcester, all of them doing great things, and they hoped to have one at Reading, for Mr. A. W. Sutton had taken the matter up. In conclusion, he made a strong appeal to the hearts and purses of his audience, and reminded them that the institution was carried on for those "who, through unavoidable circumstances, were led to seek its benefits in their old days, and who in their young days had done so

SIR OSWALD MOSLEY, BART.

much to minister to the pleasure and gratification of others."

The toast of "Gardening" was proposed by Dean Hole, who spoke at some length, and highly delighted and amused his audience by his fund of ready wit and anecdote. Said the Very Rev. gentleman, Horace had averred that "he was a bold man who first went to sea in a boat," and someone else had declared that he was a bold man who first ate an oyster, but in his estimation the boldest man he had ever met was he who had asked the Dean of Rochester to speak on gardening, for how could he know when the Dean would stop. He had possessed a love of gardening from his early infancy, for it had been stated that one of his nurses had given warning because he would grab the flowers out of her Sunday bonnet. He was not sure that this was true, but he was sure that a love of flowers was innate in every human being, that it was a memory of Paradise lost, and a hope of Paradise regained. He remembered how he had purchased his first *Salvia* for sixpence, and cared, and tended it, and fought for it. Then, in succeeding years, came a period of apathy and indifference when his "Mary" was neither *Marigold* nor *Polyanthus*; when his "Annie" was not *Anagallis*, when his "Carrie" was not *Caryota*, and when the "Miss" he loved best was not *Mesembryanthemum*. In those days he loved "Marguerite," but regarded her with a lackadaisical expression. Since those days his love for flowers had returned, never more to leave him. He remembered the "scarlet and yellow" fever of *Tom Thumb Pelargonium*, and yellow *Calceolaria*, how it had swept over the land, but since we had recovered from it all branches of gardening had shown progression. He pleaded, however, for more gardens, and for more beauty of arrangement in our gardens. We had too many straight lines, and we saw too much of the garden from the windows of the house. Speaking particularly of his favourite flower, the Rose, he believed there was a splendid future for it, and that the Hybrid Tea would eclipse all others. For upwards of half a century he had enjoyed a sympathetic friendship with fellow gardeners that he had been unable to obtain in any other walk of life. From coronet and billycock alike, in ducal castles and humble cottages he had received the same brotherly sympathy. Even when he crossed the Atlantic there was not a hotel in which a box of Roses or Carnations was not there to greet him. In conclusion, he said that to the work of their institu-

tion might well be applied the blessing from the "Old Book"—"The blessing of him that was ready to perish came upon me, and I caused the widow's heart to sing for joy."

The toast was coupled with the name of Mr. Arthur W. Sutton, who, in replying, said that their gardens depended upon their gardeners. He referred to the Hon. Alicia Amherst's work on the "History of Gardening" in appreciative terms, and spoke of what the clergy had done for the art. In addition to Dean Hole there were such gentlemen as the Rev. D'Ombrain, Rev. G. Engleheart, and the Rev. W. Wilks, all of whom had worked well for the cause. He hoped that the Berkshire Auxiliary Society would be a huge success, and he had almost obtained a definite promise from Mr. C. E. Keyser, of Aldermaston, that he would be its president.

Mr. Geo. Munro proposed "Our Country Friends," and commented upon the value of the auxiliaries to the central society. Mr. Geo. A. Dickson briefly acknowledged.

The amount of money promised during the evening was then announced as being £2,300, including donations to the Victorian Era Fund. The chief subscribers were as follows:—His Grace the Duke of Portland, 50 guineas; Sir Oswald Mosley, £62 10s.; Messrs. Rothschild, 100 guineas; Mr. Coleman, 50 guineas; Messrs. Hurst & Son, £20; Mr. N. N. Sherwood, £20; Mr. W. Sherwood, 5 guineas; Mr. E. Sherwood, 5 guineas; Miss Sherwood 5 guineas; Messrs. Dickson and Robinson, £35; Mr. A. W. Sutton, £50; Mr. M. H. F. Sutton, £25; Messrs. Jas. Veitch & Sons, Ltd., £20; Mr. H. J. Veitch, £50; Mr. Leonard Sutton, £50; Mr. Geo. Munro (list), £131; Baron Schroder, £20; Mr. A. Wilson, £90; Lord Wantage, 10 guineas; Mr. T. W. Bond, 14 guineas; Mr. W. Thomson, 20 guineas; Mr. G. Maycock, £10; Mr. N. C. Cohen, 5 guineas; Mr. P. Blair, 5 guineas; Mr. W. Crump, £20; Dean Hole, £5; Mr. W. Jinks, £18 10s.; Mr. W. Y. Baker, 13 guineas; Mr. Chas. Turner, 5 guineas; Mr. B. F. Smith, 2 guineas; Mr. P. Crowley, 6 guineas; Messrs. Wrench & Son, 5 guineas; Mr. G. H. Richards, 10 guineas; Messrs. Fisher, Son & Sibray, 10 guineas; Mr. W. J. Corrie, 5 guineas; Mr. J. F. McLeod, 2 guineas; and the Worcester Auxiliary, £70. Mr. Geo. Dickson's list is not yet completed, but will run from £50 to £100.

The musical arrangements were in the capable hands of Mr. Herbert Schartau, and the songs given by him, and Mesdames Lucia Johnstone, and Edith Serpell, and Mr. Chas. Chilley, also the humorous sketches by Mr. Walter Churcher were much enjoyed.

A vote of thanks to the Chairman for presiding was proposed by Mr. N. N. Sherwood, and the meeting then came to a close at an advanced hour.

JUSTICIA CARNEA.

THIS old fashioned plant is too frequently met with, presenting appearances which are a long way from creditable either to the plant itself or those in whose collections it finds a place. Well handled, it is capable of becoming one of the most useful and beautiful among what may be fairly classed soft-wooded stove subjects. Plants well done in 4-in. and 6-in. pots are occasionally met with; but it is capable of greater things than these, and with a very moderate amount of care may be grown into a fairly large specimen. Take small plants and keep them moderately dry and at rest after flowering. Early in March shift them into No. 16 pots, using a mixture of fibre, loam, and peat, with some sharp sand. Place them near the glass in a temperature ranging from 50° to 60°; water sparingly till the plants get fresh hold of the soil, and syringe both morning and evening. Avoid getting the plants into a sodden condition, as they are rather impatient of excess of water at the root. The species is a rapid grower, and if left to its own resources will become leggy. To prevent this peg the shoots down, as this causes the back buds to swell, and when the points of these shoots turn up pinch them out with the thumb and finger, till enough breaks are secured to form a plant with a head commensurate to the size of the pot in which the plants are growing. They should be in flower during May; remove into cooler quarters during flowering time. As they go out of bloom dry them off partly, then prune back moderately, and in a month or so place in heat again; water more

freely, and during July they will be once more in full beauty, when the same routine may be repeated. After this flowering, and when growing freely again, moderate waterings with manure water will be required, and during September these should flower a third time.—*W. B. G.*

ALPINE AND ROCK PLANTS.

GYPSOPHYLLA CERASTIOIDES.—The short, elliptic leaves of this plant closely resemble those of a Mouse-ear Chickweed (*Cerastium*) and clothe the short trailing stems, above which the flower scapes rise only to a height of 1 in. to 2 in. The flowers are relatively large for the size of the plant, and white, beautifully lined with pink veins. The species is an ideal rock plant, a gem as it were for those who like to grow dwarf subjects corresponding to an alpine vegetation. It is easily propagated from cuttings of barren shoots during the summer months, in pots of sandy soil under a handlight or frame.

CHEIRANTHUS MARSHALLI.—The flowering season of this hybrid garden plant is now about over, but cultivators should set about securing a stock of cuttings for the raising of young plants. The flowers vary from golden-yellow to orange according to their stage of growth, and are perfectly barren, so that the plant must be perpetuated from cuttings, which are often difficult to get owing to the tendency the plant has of flowering itself to death. The great beauty of the large orange flowers is sufficient to make its perpetuation desirable, even in quantity.

CHEIRANTHUS ALPINUS.—While this is similar to the last-named in many respects, it differs in having pale yellow flowers, and by the production of barren shoots in considerable quantity by which the plant may be increased, or which may be left to flower the following season. This they never fail to do as soon as they acquire sufficient strength. The plant is naturally a rock-loving subject.

ALYSSUM SAXATILE.—The ordinary form of this plant is largely used for bedding purposes in spring. There are two varieties, as yet but little known, and well worthy of cultivating on the rockery, not merely because they are easy to cultivate, but because they are pretty and interesting on account of their great profusion of flowers, and conspicuous and showy character at a time when flowering plants in the garden are most admired. I refer to *A. s. citrinum*, with soft lemon flowers; and *A. s. flore pleno*, a pretty double variety. A pot of cuttings of each will furnish the rockery in spring with all that is required of these colours.

WAHLENBERGIA SERPYLLIFOLIA—This may be increased by seeds or cuttings of the barren shoots in July or August. It belongs to the Bellflower family, but is very distinct from *Campanulas* generally. The lanceolate, dark green leaves are small and arranged in a circular tuft upon the ground. Many flower stems bearing a few small leaves spread around the crown upon the ground, and then rise up for 2 in. or 3 in., carrying a single, deep blue flower each. The plant is a native of Dalmatia.

CERASTIUM ALPINUM.—The flowers of this alpine species are white, and almost as large as those of *C. arvense*, which is of much more straggling or spreading habit. It forms, in fact, compact tufts about 3 in. or 4 in. high. There is a woolly variety of this, namely, *C. a. villosum*, which has a gray appearance, and bears the same relation to the species as *Thymus Serpyllum lanuginosus* bears to its original. It is essentially a rock plant.

DAPHNE CNEORUM.—Amongst dwarf plants of a shrubby nature few appear to better advantage on the rockery than this. Its terminal clusters of rich rosy flowers are produced in great profusion, and are no more showy and effective than they are delightfully fragrant, especially on calm, dewy evenings. The small deep green leaves set off the flowers well. The plant often flowers a second time in September. It likes to be fully exposed to sun and air, but should have a considerable quantity of peat or leaf mould incorporated with the soil in which it is planted in order to keep the roots moist and cool during periods of drought.

LYCHNIS LAGASCAE.—Of Alpine Campions, few are prettier or flower more freely than this. The deep rose and large flowers are produced on stems only a few inches high. After flowering is over, the careful cultivator would do well to take cuttings of the flowerless shoots, which are not too numerous as

a rule, owing to the freedom with which the plant blooms during June.

SILENE ALPESTRIS.—The small but dainty white flowers of this Catchfly have their petals cut in a way that reminds one of Ragged Robin in miniature. The leaves are small and neat. Propagation may be effected by division or cuttings.—*J. Effe.*

BELGIAN NURSERIES.

VI.—**M. ARTHUR DE MEYER, GHENT.**

SEEING that so many nurseries are situated in the suburbs around Ghent it is but natural that many of them would have certain specialities to which particular attention is given. While such is the case here, M. Arthur de Meyer caters for foreign business alone, that is, he sends his plants to various countries outside of Belgium, such as France, Germany, Britain and America. He does a large business with the latter country, and we had the pleasure of witnessing a large consignment of *Ficus elastica*, *Araucarias*, and other plants packed in large wooden cases ready for shipment. Already on the occasion of our visit he had despatched 5,000 *Araucarias*, so that only a few of the plants of suitable size then remained. The plants of *Ficus* we noted were knocked out of their pots and the ball of soil and roots tightly wrapped up in wood wool. These were then laid all round the sides of the cases with the roots against the latter and the leaves projecting into the middle of the case, which was left open as air space. The solid layer of plants was then pressed down tightly so that no shifting could take place, and the lid was then placed in position and nailed down. In such position they cross the Atlantic and come out as fresh as if placed there only the day before.

Mr. Arthur de Meyer's nursery consists entirely of glass, and is situated at *Chausée d'Anvers, Mont-St.-Amand, Ghent, Belgium*. The establishment consists of some thirty-five houses, but many of them are 13 metres wide (a metre being 3 ft. 3 1/4 in.). One is 20 metres wide and 27 metres long, being a gigantic structure all under one roof, supported by slender iron pillars. This house contains seven huge beds, running the whole length of the building, and was occupied with Indian *Azaleas*, all planted out in leaves. Shelves or little elevated benches in this house are filled with young *Boronias*, planted out in decaying leaves, that is, leaf soil. Of *Azaleas* we noted 25,000 cuttings being rooted. They are fit for market in the course of two or three years. *Boronias* constitute one of the principal specialities of the establishment. The species grown are *B. heterophylla*, *B. elatior*, and *B. megastigma*. Of these we noted 30,000 saleable plants, bushy specimens about 1 ft. high, and all clean, healthy, and faultless. They would be a credit to any greenhouse or conservatory. In the propagating pits we inspected the frames containing 25,000 cuttings in the process of being rooted. The frames were simply covered with large, movable sheets of glass that could be removed for the inspection of the cuttings at any and every particular point in the houses. The cuttings are first of all put in thickly in small pots, and the latter plunged in the finely chopped stems of Flax, a plunging material we have never seen utilised in this country. The great point with these cuttings is to keep the foliage dry until they are rooted, the process taking three or four weeks. The young plants are then put singly into thumb pots, and take two years to develop into bushy specimens 1 ft. high.

A third great speciality of this establishment consists of the more useful Palms, which are grown in thousands. *Kentia fosteriana* and *K. belmoreana* are universally grown, many houses being filled with them here. A very sturdy growing Palm is *Phoenix tenuis*, with short leaves and leathery dark green pinnae, forming compact, well-grown specimens well fitted for decorative purposes. In addition to the above, another block of two large houses contained *Phoenix canariensis* and *Latania borbonica* in the pink of condition and plunged in Flax. The Canary Island *Phoenix* is also a sturdy growing species that will stand a lower temperature than most of the other species in cultivation. *Cocos weddeliana* is another favourite grown in considerable quantity, the seedlings or young specimens being grown in pots.

Other fine foliage plants include *Dracaenas*, of which *D. indivisa* is reared in quantity from seeds,

the younger specimens having only one or two leaves at the time of our visit. A batch of *D. Lindeni* was handsomely coloured, the pure air of Belgium being well suited to their welfare. *Aspidistras*, both green and variegated, are grown in quantity; and such is the demand for them that they are plunged in Flax to bring them on more quickly to meet the requirements. The graceful and useful *Carex brunnea variegata*, better, but incorrectly, known as *C. japonica variegata* also receives due attention. The beautiful *Asparagus Sprengeri* is being reared from seeds in quantity; the plants already occupied 60-size pots. Amongst *Araucaria excelsa* we noted two fine plants of a new variety named *A. e. glauca* Joseph Napoleon Baumann having strong branches, thickly clothed with stout rigid leaves. They were six years old, and two companions to them went to America at 100 francs, which will give an idea of the value placed upon them.

R. H. S. EXAMINATION IN HORTICULTURE.

THE undermentioned are the results of the examination held on April 6th last. The highest possible number of marks obtainable by the candidates was 300.

| FIRST CLASS. | | No. of Marks gained. |
|--------------|--|----------------------|
| 1. | Miss Olive M. Harrison, Horticultural College, Swanley | 285 |
| 2. | Miss Mary Banks, County Technical School, Stafford | 280 |
| 2. | Mr. O. H. Faulkner, County Technical School, Stafford | 280 |
| 2. | Mr. C. Lawrence, County Technical School, Stafford | 280 |
| 2. | Miss Ethel S. Lutley, Horticultural College, Swanley | 280 |
| 2. | Mr. C. Mann, County Technical School, Stafford | 280 |
| 2. | Mr. M. Wilson, Horticultural College, Swanley | 280 |
| 8. | Mr. F. A. Gwilliam, A.R.H.S., Palace Gardens, Gloucester | 275 |
| 8. | Mr. A. Tanner, School House, Cobham, Surrey | 275 |
| 8. | Mr. F. Ovenden, County Technical School, Stafford | 275 |
| 11. | Miss Mary H. Graves, Horticultural College, Swanley | 270 |
| 11. | Miss Ethel E. Rands, Horticultural College, Swanley | 270 |
| 13. | Mr. Henry Mitchell, County Technical School, Stafford | 265 |
| 13. | Miss Jessie H. Price, Horticultural College, Swanley | 265 |
| 15. | Miss Lilian Deane, Horticultural College, Swanley | 260 |
| 15. | Mr. Herman Spooner, Technical Laboratories, Chelmsford | 260 |
| 15. | Mr. Harry H. Thomas, 346, Kew Road, Kew | 260 |
| 15. | Mr. Geo. Underwood, Municipal Technical School, Leicester | 260 |
| 15. | Miss Eunice Watts, Horticultural College, Swanley | 260 |
| 20. | Mr. W. H. Brownridge, County Technical School, Stafford | 255 |
| 20. | Miss Ada C. Bryson, Horticultural College, Swanley | 255 |
| 20. | Mr. G. Mills, Bayham Gardens, Lamberhurst, Kent | 255 |
| 23. | Mr. F. Botterill, County Technical School, Stafford | 250 |
| 23. | Miss Ethel Edmunds, Horticultural College, Swanley | 250 |
| 23. | Mr. Robert Gaut, 3, Gloucester Terrace, Kew, Surrey | 250 |
| 23. | Mr. Jos. Gillibrand, Horticultural School, Holmes Chapel | 250 |
| 23. | Mr. Jos. Hope, The New Gardens, Elveden, Thetford, Norfolk | 250 |
| 23. | Mr. Arthur Jones, Horticultural School, Holmes Chapel | 250 |
| 23. | Mr. Harry Miller, Technical Laboratories, Chelmsford | 250 |
| 30. | Mr. F. E. Boyes, 19, Woodland Grove, Whitegate Lane, Blackpool | 245 |
| 30. | Mr. E. T. Cole, Technica! Laboratories, Chelmsford | 245 |

| | | | |
|---|---|---|--|
| 30. Mr. J. K. Cureton, County Technical School, Stafford 245 | 78. Mr. F. B. Davis, 4, Adon Terrace, Hendford Hill, Yeovil 205 | 33. Mr. H. P. Appleton, Municipal Technical School, Leicester 170 | |
| 30. Mr. Geo. Leadbeater, Junr., Horticultural School, Holmes Chapel 245 | 78. Mr. E. Walker, Dairy Cottage, Wales, near Sheffield 205 | 33. Mr. J. P. Quinton, 3, Ferry Road, Long Ditton 170 | |
| 30. Mr. A. J. Morland, Syon Gardens, Brentford 245 | 78. Mr. John T. Walker, The Gardens, Fairfield, Cobham, Surrey 205 | 33. Mr. A. Shaw, Staincross, near Barnsley, Yorkshire 170 | |
| 30. Mr. R. Newman, Horticultural College, Swanley 245 | 78. Mr. Edward Semper, The Gardens, Scawhy Hall, Lincolnshire 205 | 33. Mr. W. Smith, Bredon's Norton, Tewkesbury 170 | |
| 30. Mr. W. B. Pinder, County Technical School, Stafford 245 | 83. Miss E. M. Brace, 62, Lower Sloane Street, S.W. 200 | 33. Mr. W. C. Smith, Botanic Gardens, Glasgow 170 | |
| 30. Mr. Wm. Woodford, The Croft, Wallingford 245 | 83. Mr. Geo. W. Brookhank, 62, Queen's Road, Wimbledon 200 | 43. Mr. L. R. Baker, Blagdon House, Merton Road, Merton 165 | |
| 38. Miss Annie Ault, Horticultural College, Swanley 240 | 83. Mr. E. J. Pitts, Horticultural College, Swanley 200 | 43. Miss Gertrude Bridger, Primrose Bank, Aughton, Ormskirk 165 | |
| 38. Mr. Hy. Broadbent, Park Hall, Evesham 240 | 83. Mr. F. Weiste, Horticultural College, Swanley 200 | 43. Mr. G. J. Goodall, The Gardens, Streatley House, Reading 165 | |
| 38. Mr. Geo. Butcher, 188, Wellfield Road, Streatham, S.W. 240 | 83. Mr. W. H. White, Municipal Technical School, Leicester 200 | 43. Mr. W. Ness, Aberlady, Longniddry, N.B. 165 | |
| 38. Mr. John P. Holt, Horticultural School, Holmes Chapel 240 | SECOND CLASS. | | |
| 38. Mr. F. Lazenby, Botanic Gardens, Cambridge 240 | I. Mr. Hy. Brotherston, Gosford Gardens, Longniddry, N.B. 195 | 43. Mr. R. Sumner, Liverpool Road, Aughton 165 | |
| 38. Mr. C. E. Malins, Horticultural College, Swanley 240 | I. Mr. J. Burden, Crowmarsh Gardens, Gifford, Wallingford 195 | 43. Mr. R. Y. White, 67, Queen's Street, Cheapside, E.C. 165 | |
| 38. Mr. Geo. Ord, Causey Wood, Marley Hill, Newcastle-on-Tyne 240 | I. Mr. J. Child, County Technical School, Stafford 195 | 50. Mr. L. Davenport, Horticultural School, Holmes Chapel 160 | |
| 45. Mr. Isaac Godher, The Vineyards, Bracon Ash, Norwich 235 | I. Mr. A. H. Davis, F.R.H.S., Alhert House, Sutton, Surrey 195 | 50. Mr. Maurice Field, Newnham House, Wallingford 160 | |
| 45. Mr. W. J. Hurford, 3, Pound Street, Carshalton, Surrey 235 | I. Mr. W. Grantham, West Tower, Aughton 195 | 50. Mr. E. Russell, Municipal Technical School, Leicester 160 | |
| 47. Miss Marion Hawkes, Horticultural College, Swanley 230 | I. Mr. W. Hammett, 11, Granville Place, Stone, Staffordshire 195 | 53. Mr. W. Galloway, Gosford Gardens, Longniddry, N.B. 155 | |
| 47. Mr. William H. Neild, Horticultural School, Holmes Chapel 230 | I. Mr. R. Hudson, The Paddocks, Swaffham, Norfolk 195 | 53. Mr. J. Humphreys, Hillside, Winchmore Hill, N. 155 | |
| 47. Miss E. Morland, 7, Gloucester Road, Kew 230 | I. Mr. E. Miller, 55, Holly Road, Chiswick, W. 195 | 53. Mr. R. Jones, Aughton Springs, Aughton 155 | |
| 47. Mr. G. W. Pyman, Technical Laboratories, Chelmsford 230 | I. Mr. Basil G. Stanley, Bredon's Norton, Tewkesbury 195 | 53. Mr. W. T. Smith, County Technical School, Stafford 155 | |
| 51. Mr. John Benson, Liverpool Road, Aughton 225 | I. Mr. Thos. H. Usher, Hoe Place, Woking, Surrey 195 | 53. Mr. H. Weddell, Haycroft Cottage, Surhinton 155 | |
| 51. Mr. H. F. Easton, Puller Road, West Barnet 225 | II. Mr. A. J. Brabner, Ivelhurst, Yeovil, Somerset 190 | 59. Mr. H. Holmes, The Gardens, Garvald House, Dolphinton, N.B. 150 | |
| 51. Miss Katherine M. Gervais, Horticultural College, Swanley 225 | II. Mr. Thomas Carr, Undermount Gardens, Bonchurch, Isle of Wight 190 | 59. Mr. B. Ling, Technical Laboratories, Chelmsford 150 | |
| 51. Mr. E. Jeffrey, Horticultural College, Swanley 225 | II. Mr. Louis Hales, Horticultural College, Swanley 190 | 59. Mr. S. J. Sayer, Technical Laboratories, Chelmsford 150 | |
| 51. Mr. A. Manson, Moreton Hall Gardens, Whalley, Blackburn 225 | II. Mr. C. T. Illsley, Amhlecote, Cobham, Surrey 190 | THIRD CLASS. | |
| 56. Mr. Arthur Cooper, St. Peter's Street, Wallingford 220 | II. Mr. J. Jeffery, Moor Court Gardens, Oakmoor, Stoke-upon-Trent 190 | I. Mr. F. E. Belcher, 26, First Avenue, Bush Hill Park, Enfield, N. 145 | |

(To be continued.)

SOCIETIES.**ROYAL BOTANIC.**—June 10th.

THE floral fête and exhibition of this society at Regent's Park was originally fixed for June 8th and 9th, but owing to the inability of the Prince and Princess of Wales to attend and give away the prizes on those dates the function was postponed

until Friday, the 10th. The morning was wet and stormy (real "Botanic" weather), but cleared up at noon, and remained fine throughout the day.

The floral exhibits, which were all "miscellaneous," were accommodated in the large tent, which presented a gay and varied scene, being better filled than we have seen it for some time.

In the centre of the large tent, on the site occupied by the fountain, Messrs. Jas. Carter & Co., of High Holborn, had reared a huge and imposing floral trophy. The group was square in shape, and overhead, at a height of about 12 ft. from the ground, four arms, prettily decorated with dyed green seaweed, and various flowers, radiated to the corners. In the centre, where these arms met, a neat specimen of *Kentia belmoreana* surmounted all. This was supported by a central pyramid running up from the stage on which the various plants were staged. These latter included herbaceous *Calceolarias*, *Petunias*, single and double, *Gloxinias*, *Streptocarpus* and tuberous *Begonias*, in addition to Ferns, Palms and other foliage plants. A Gold Medal was awarded for this fine display.

The Roses sent by Messrs. Wm. Paul & Son, Waltham Cross, Herts, occupied a large semi-circular area. Amongst the pot plants shown were some magnificently flowered standards and bush plants of *Crimson Rambler*, and such varieties as *Alfred Colomb*, *Spenser* and *Enchantress* were well shown, whilst the front rank comprised a quantity of capital cut blooms. (Gold Medal.) The same firm also showed a collection of cut flowers of *Rhododendrons* and a batch of grand plants of *Bougainvillea sandieriana*.

Messrs. John Laing & Sons, Forest Hill, S.E., set up a magnificent group of miscellaneous flowering and foliage plants. Against a background of Palms were ranged some large, well-grown and coloured *Crotons*, *Dracaenas* and *Caladiums*. In the foreground the central figure was a bank of first-class tuberous *Begonias*, both single and double, prettily bedded in Ferns. *Streptocarpus*, *Gloxinias*, *Odontoglossums* and *Carnations* all added their quota of beauty. A handsome and varied edging was furnished by *Isolepis gracilis*, and the dwarf and chaste *Caladiums*, *Argyrites* and *Minus erubescens*. The group abundantly deserved the Gold Medal that was voted it.

Messrs. Geo. Jackman & Sons, Woking, showed a number of fine plants of their new hybrid *Clematises*. Countess of Onslow, Duchess of Albany, Sir Trevor Lawrence, Duchess of York and Grace Darling were all pretty forms of great merit. The group was tastefully lightened by *Acer Negundo variegata* and *Spiraeas*, and edged with *Maidenhair Ferns*. (Gold Medal.) Cut hardy flowers in grand condition likewise came from this firm but, our space is too limited to enumerate them all.

A showy group of hardy *Azaleas* and *Rhododendrons* came from Mr. John Russell, Richmond. From the same source came a number of American *Aloes*, in which were some shapely and handsome specimens. In another part of the tent Mr. Russell staged a comprehensive array of hardy ornamental trees and shrubs, chief among which were variegated *Maples*, *Ivies* and *Euonymuses*, all of them in first-rate trim. (Gold Medal.)

The cut hardy flowers sent by Messrs. Barr & Sons, of Long Ditton, contained a wealth of material. There were some fine varieties of *I. pallida*, *I. amoena*, *I. aphylla*, *I. variegata*, and *I. squalens*; also showy forms of *Papaver bracteatum* in addition to *Pyrethrums*, *Heuchera sanguinea* and other things too numerous to mention. (Silver Medal.)

The only group of Orchids present was sent by Mr. J. O. Clarke, gardener to Ludwig Mond, Esq., The Poplars, Clarence Road. (Large Silver Medal.) A group of the yellow *Carnation Primrose Queen* was shown by Mr. Fred. Perkins, Regent Street, Leamington Spa.

Messrs. A. W. Young & Co., Stevenage, Herts, had two large groups of the grand bedding zonal *Pelargonium King of Denmark*; also an exhibit of hardy flowers, together with a group of shrubby *Calceolarias* and *Coleuses*. (Large Silver Medal.)

The Jadoo Company, Ltd., sent a variety of plants grown in Jadoo fibre to illustrate the value of the fibre as a rooting medium for all classes of plants. (Small Silver Medal.)

A truly magnificent array of cut hardy flowers from

Messrs. Kelway & Son, Langport, Somerset, was arranged in long sinuous lines upon a grassy slope. Here there were large hunches of named varieties of single and double *Pyrethrums* in exquisite variety, also *Paeonies*, *Delphiniums*, *Lupines*, and *Hippeastrums* in quantity, and of the high grade quality for which the Langport firm is famed. (Gold Medal.)

Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E. staged a neat group of *Gloxinias* and *Streptocarpuses* with *Adiantums*. (Small Silver Medal.)

Mr. Brewin, 5, Winchendere Road, Fulham Road S.W., had a unique exhibit of dried flowers arranged to form a fire screen and a centre for a dinner table. The flowers had preserved their colour remarkably well. They were protected by a covering of fine muslin. (Small Silver Medal.)

Amongst the floral devices was a capital table of tastefully executed baskets, bouquets and other devices, sent by Messrs. John Laing & Sons. They were staged on brown velvet, which gave a rich, although slightly sombre effect, and the table was nicely draped with sprays of *Smilax*. (Small Silver Medal.)

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., had a table of very handsome bouquets and flower baskets. The most imposing piece was a large basket of *Cattleyas* and *Odontoglossums*, set up with *Asparagus*.

A bouquet of yellow Spanish *Irises* was also well constructed and very pretty. The handsome feather-weight bouquet of Orchids, presented by the society to H.R.H. the Princess of Wales, was in this exhibit, having been made by the Holloway firm. It weighed only a few ounces. (Large Silver Medal.)

Messrs. T. Rivers and Son, of Sawbridgeworth, had a superb lot of fruit trees in pots, all of them being heavily laden with fruit. *Nectarines Cardinal*, *Rivers' Orange*, *Stanwick Elruge* and *Dryden*, and *Peaches Grosse Mignonne* and *Dymond* were all in excellent condition. (Gold Medal.)

THE FLORAL PARADE.

This took place at 3.30 P.M. A great improvement in the arrangements over those of former years was observable, for a specially covered way had been constructed to shelter the procession. Crowds of people attended, and only those favoured ones having reserved seats could possibly see the procession to advantage. The number of entries for the parade was well up to the standard of former years, and some of the representations showed a good deal of artistic skill in their elaboration.

ROYAL HORTICULTURAL.—June 14th.

THE Drill Hall was well filled with plants and flowers on Tuesday last, there being a great influx of hardy herbaceous plants; also of such specialities as *Malmaison* and other *Carnations*, *Cannas*, *Chinese Paeonies*, *Begonias*, &c.

Messrs. J. Veitch & Sons, Ltd., Chelsea, exhibited a group of Orchids well interspersed with such greenery as Palms and Ferns. Prominent amongst the hybrids were fine specimens of *Laeliocattleya Eudora alba*, *L. canhamiana*, *L. Hippolyta* in several varieties, *Odontoglossum elegantius* *Baroness Schröder* and *Disa kewensis*. They received a Cultural Commendation for *Dendrobium Bensoniae* with a huge spike. A plant of *Odontoglossum crispum* was also well grown. Showy also were *Disa langleyensis*, *D. Veitchi*, *Epiphronitis Veitchi* and *Trichopilia suavis alba*. Amongst new Orchids *Laeliocattleya Eudora splendens* was magnificent and *Epicattleya radiato-bowringiana* of peculiar interest. (Silver Flora Medal.)

A magnificent piece of *Odontoglossum crispum* *Prince of Wales*, exhibited by Messrs. Hugh Low & Co., Clapton, had immense pseudo-bulbs and flowers, receiving a Silver Banksian Medal.

Messrs. L. Linden, Brussels, exhibited three handsome forms of *O. crispum*, named *O. c. Le Czar*, with a striking crimson-red blotch on each of the sepals; *O. c. Morning Star* and *O. c. Dallemagnea*, both blotched and mottled.

G. H. Bird, Esq. (gardener, Mr. Reddan), Manor House, West Wickham, exhibited *O. crispum bonnyanum* having a very bold blotch on each of the sepals. De B. Crawshay, Esq. (gardener, Mr. S. Cooke), Rosefield, Sevenoaks, exhibited *Cattleya Mendelii Sprite*, *Laelia purpurata*, De B. Crawshay,

and *L. purpurata* Mrs. De B. Crawshay. A. H. Milton, Esq., Castleton House, Clifton, showed a well-flowered piece of *Cattleya Mossiae*. R. I. Measures, Esq. (gardener, Mr. H. J. Chapman), Flodden Road, Camberwell, showed flowers of the beautiful *Laelia purpurata Ernestii*, having white sepals and petals. *Vanda pumila* was shown by Mr. J. W. Moore, Eldon Place Nursery, Bedford. H. Druce, Esq. (gardener, Mr. Walker), 43, Circus Road, Regent's Park, exhibited four remarkable forms of *Cypripedium*, named *C. bellatulum drucianum*, *C. walkerianum*, *C. Mrs. H. Druce*, and another.

Messrs. Stanley-Mobbs, & Ashton, Southgate, N., staged a splendid group of *Cattleyas*, *Laelias*, and other Orchids. Very fine were *Laelia tenebrosa*, *L. t. Sunset*, *L. purpurata* Southgate var., *L. p. millisiana*, *Oncidium crispum*, and *O. hastatum*. A fine new hybrid is that named *Cypripedium Sir Thomas Lipton*. *C. Gertrude Hollington* Southgate var. is a flower of splendid proportions and rich colour. *Cattleya Mossiae* *Sir Thomas Lipton* is a very distinct light-coloured variety of considerable merit. (Silver Flora Medal.)

Sir Frederick Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen, staged a showy group of Orchids, including *Laeliocattleya arnoldiana*, *L. superba-elegans*, *L. Lady Wigan*, *Cymbidium tigrinum*, and *Scuticaria Hadweni*. Messrs. F. Sander & Co., St. Albans, staged some beautiful varieties of *Sobralia* and *Thunia Bensoniae*.

J. Bradshaw, Esq. (gardener, Mr. W. Whiffin), The Grange, Southgate, N., staged an interesting group of Orchids, amongst which were *Cattleya Mossiae* *Admiral Bradshaw*, *Laelia grandis tenebrosa*, and some fine *Odontoglossum crispum*.

Messrs. Jas. McBean & Sons, Cooksbridge Sussex, exhibited a group of *Odontoglossum crispum* in great variety, many of the varieties being of great excellence, the blotched and tinted varieties more particularly. None of them were named.

Messrs. F. Miller & Co., 267, Fulham Road staged a capital batch of *Mignonette Miller's Civic* in pots. The variety is remarkable for dwarfness and size of the flower spikes, which render it very suitable for pot work. Samples of a fine strain of single *Primulas* were also shown. *Lilium Harrisii* in the background, and *Mimulus moschatns Harrisoni*, and blue *Lobelias* in the foreground were used as embellishments.

The flowering shrubs sent by Messrs. Jas. Veitch & Sons, Ltd., Chelsea, included some grand baskets of *Hydrangea hortensis mandschurica* in both blue and pink, *H. h. japonica variegata*, the showy *H. japonica Mariesii*, the bright blue *Hibiscus coelestis*, and the showy *H. grandiflora superba*, a double-flowered form. (Silver Flora Medal.)

Messrs. J. Cheal & Sons, the Lowfield Nurseries, Crawley, Sussex, submitted sprays of hardy ornamental trees and shrubs, amongst which were some handsome *Maples*, *Syringa*, *Josikaea*, *Cheal's New Golden Laburnum*, and *Rhododendrons* in variety.

Messrs. H. Cannell & Sons, Swanley, Kent, had a representative collection of double flowered tuberous *Begonias*, all of them named varieties, *Lord Sherborne*, *Lady Naylor Leyland*, *Conquête*, *Miss M. Griffith*, and *Freda* were some of the best forms. Side by side with the *Begonias* was a capital display of cut *Aquilegias*, ranging through a variety of hues from pure yellow to blue. The value of these handsome flowers for cutting was well shown on this occasion. From the Messrs. Cannell also came a grand lot of *Cannas* in large forty-eight sized pots, a system of culture of which the Swanley firm is one of the ablest exponents. Of the numerous varieties shown, *Aurea*, *Aurore*, *Ami Chretien*, *Paul Bruant*, *Incendie*, *Duchess of York*, *Paul Weylan*, and *Madame la Baronne P. Thenard* were remarkably good. (Silver-Gilt Flora Medal.)

Mr. Fred Perkins, 37, Regent Street, Leamington Spa, showed the new yellow tree *Carnation Primrose Queen*. From Mr. Geo. Norman, gardener to the Marquis of Salisbury, Hatfield, came a basket of blooms on long stems of the grand border *Carnations* *Miss Audrey Campbell* and *King Arthur*.

The Ferns sent by Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, were, as usual, models of what Ferns should be, both in point of health and symmetry. *Pteris Summerii*, *P. Reginae*, *P. serrulata corymbosa*, *P. s. multiceps*, *Gymnogramme Mayi*, the new *Polypodium Mayi* and

Asplenium Mayi were some of the most notable members of a fine group. The new American Tropaeolum Sunlight made a very successful first appearance in this country, having been raised at the Dyson's Lane Nurseries from seed. Mr. May also showed a basket of the splendid pink zonal Pelargonium Millfield Rival and another of Marguerite nivalis compacta. (Silver Flora Medal)

The cut Chinese Paeonies sent by Messrs. Kelway & Son, Langport, Somerset, were fully up to the high standard we expect from this source. Saturnalia Agnes May Kelway, Stentor and Delia were some of the finest of the varieties shown, but the majority of the varieties were either unnamed or the labels were out of sight. Single and double Pyrethrums and Delphiniums were also on view. (Silver Flora Medal.)

Martin R. Smith, Esq. (gardener, Mr. W. Blick), The Warren, Hayes, Kent, sent a few new Malmaison and border Carnations. Messrs. Jas. Veitch & Sons had some grand samples of Gloxinias Empress of India, Virginalis, Seraph and Galatea, also the dwarf and handsome Philadelphus coronarius Mont Blanc. Mr. James Stredwick, St. Leonards, Silverhill, showed a bunch of the precocious Cactus Dahlia Magnificent.

The great feature of the show was the magnificent show of Malmaison Carnations made by Mr. J. F. McLeod, gardener to J. P. Morgan, Esq., Dover House, Roehampton. Some of the plants were real giants in size, and all of them in marvellously good health. The flowers, too, for size and colour were of the best. Both rose and blush varieties were shown, and these were well set off with a groundwork of Maidenhair Fern, whilst light was given to the group by a central row of Palms. The group was set up on the floor, and ran the whole length of the hall, the widest and highest part being in the centre where the largest plants were grouped. Mr. McLeod received a Silver Gilt Medal in recognition of this unmistakeable display of cultural skill.

In the group of new plants submitted by Messrs. F. Sander & Co. were some splendid young plants of the now renowned Acalypha Sanderi, also A. godseffiana, and the new type of Caladiums represented by the variety Lord Annesley, and Mikania Sanderi.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, sent Cannas in pots as well as a small collection of cut hardy flowers. The same firm also showed a basketful of Rose Liliput.

Messrs. Barr & Sons, King Street, Covent Garden, staged a splendidly representative group of cut Irises. These included Spanish and German Irises in great variety. In addition to these there was a collection of miscellaneous hardy plants, including a capital lot of Ixias. (Silver Gilt Banksian Medal.)

On the left-hand side of the doorway on entering Messrs. James Veitch & Sons, Ltd., put up a huge semi-circular group, chiefly of Irises, the plants being in large clumps in baskets and exceptionally well flowered. The lovely varieties Mdme. Chereau, Albert Victor and Darius were very conspicuous, as also were spikes of Eremurus himalaicus and E. robustus.

Messrs. Wm. Paul & Son, Waltham Cross, had a long table filled with cut trusses of the choicer varieties of Rhododendrons, also sprays of the old-fashioned Provence and single Roses. The double white Scotch Rose was very noticeable by reason of its dwarfness and floriferousness. (Silver Banksian Medal.)

Mr. John Russell, Richmond, had a choice and beautiful collection of cut hardy flowers, all of them being remarkably fresh and good.

Messrs. R. Wallace & Co., Kilsfield Gardens, Colchester, were voted a Silver Banksian Medal for a showy array of Liliun, Calochortus, and Irises.

Messrs. Collins Bros., Waterloo Road, Hampton, also had cut hardy flowers in variety, Single Pyrethrums being especially to the fore.

The work of the fruit and vegetable committee was light. A Cultural Commendation was given to Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, Middlesex, for sixteen grand fruits of Nectarine Lord Napier. Mr. Hudson also had trays of Cherry Guigne Anroy gathered from the open air. A Cultural Commendation was obtained by Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Heris, for 'The Carter' Spinach.

Mr. S. Mortimer, Rowledge, Farnham, Hants, showed a box each of fine fruits of the new Cucumbers Sensation and The Keeper.

QUESTIONS AND ANSWERS.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Conifers.—A. McD.: We should be pleased to name the Conifers for you, if you send specimens, which should be as characteristic of the tree as possible, in order that the varieties may be determined. Some of the varieties of Cupressus and Thuya owe their distinction to habit, so that a piece showing some evidence of their respective traits should be sent. Cones would also be serviceable if you can get them, in case you send Pines. Characteristic twigs and foliage would, as a rule, be sufficient for all the more common kinds. "Hardy Coniferous Trees," by A. D. Webster, would furnish you with a considerable amount of information, botanical and otherwise, relating to Conifers for garden and park decoration; and after getting the names you would be able to study them quickly, as well as confirm the names. A little study like this will greatly help you to remember the names when associated with the actual specimens. The book is published by Hutchinson & Co., 34, Paternoster Row, London, E.C., at 3s. 6d.

Hyacinths after Forcing.—A. C.: If you refer to bulbs which were hard forced and, perhaps, indifferently treated or neglected after flowering, the chances are that their value the second year would not be great. Bulbs allowed to come on slowly in a cool house, carefully watered after passing out of bloom, and till the foliage begins to die down naturally, ought to be serviceable for planting in beds, borders or the wild garden for flowering next spring. They would even do better if you plant the bulbs next autumn in well prepared, sandy and fertile soil, in order to regain their strength next spring. Their flower spikes would not be equal to imported bulbs, but they would make a very creditable display in beds during the following spring, say about two years hence. While making their growth next spring keep the ground well hoed and perfectly free from weeds. This will encourage vigorous growth, and enable the bulbs to become plump and full.

Use of Stenotaphrum glabrum.—R. B.: The plant you had originally was probably the variegated one (S. g. variegatum) which is grown in pots or pans as a decorative subject, and is rather pretty, for some time at least, after the young foliage is developed. The stems have a creeping or trailing habit, so that the plant is handsome for furnishing the stages in the conservatory or greenhouse, when at its best. See whether any of the stems still have variegated leaves and, if so, take cuttings, which will root with the greatest freedom and soon make nice stocky plants.

Cutting Asparagus.—A. J. L.: Some prefer to leave the worthless stems to assist the roots while the best of them are being cut for use. As good, if not better results are obtained by cutting them all till you complete gathering for the season. All the shoots should then be allowed to come away together, and that being so, a more even growth will be the result. As to the precise time when you should leave off that will depend much upon the vigour of the plants. If the crowns are weak it would be best to leave off cutting at once; but if strong you may defer finishing till the end of the present month.

Book on Judging.—J. McFadzean: A pamphlet on the judging of fruits, flowers and vegetables is issued by the Royal Horticultural Society, 117, Victoria Street, London, S.W. As far as we remember it is priced at 6d., and certainly not more than 1s. It is reliable and authoritative where it has been adopted by other societies; but in other cases it might be objected to on the score that it had not been adopted by the society for which judging was being conducted. It is well worthy of adoption, however, by societies and judges generally.

Names of Plants.—Daniel Campbell: Asphodelus ramosus (it arrived a day late last week).—John W. Lang: Dendrobium suavisimum.—W. S.: 1, Ulmus montana pendula; 2, Liliun pyrenaicum; 3, Pulmonaria saccharata; 4, Veronica spicata; 5, Funkia ovata; 6, Rosa lutea.—A. C.: 1, Geranium pratense; 2, Euphorbia Cyparissias; 3, Saxifraga ceratophylla; 4, Tiarella cordifolia; 5, Heuchera glabra; 6, Heuchera Richardsoni.—I. B. D.: 1, Escallonia philippinensis; 2, Pyrus Maulei; 3, Philadelphus coronarius flore pleno; 4, Rhododendron ferrugineum; 5, Choisya ternata; 6, Kerria japonica variegata; 7, Daphne Cneorum.—A. J. H.: 1, Cattleya Mossiae var.; 2, Oncidium sphacelatum; 3, Laelia grandis tenebrosa - Veld; 4, Asphodelus ramosus; 5, Limnanthes Douglasii; 3, Iris sibirica; 4, Deutzia gracilis; 5, Rosa rugosa alba; 6, Polygonum cuspidatum.—L. M.: 1, Linaria Cymbalaria; 2, Pyrus japonica; 3, Coronilla Emerus; 4, Amelanchier canadensis.

Communications Received.—W. B. G.—M. M'L. (the matter is having our attention).—A. Simpson.—G. Gaskell.—H. Roach (next week).—X. Y. Z.—A. W.—M. D.—P. H.—A. M.—T. B.—C. E.—Ard.—Q.—C. Mason.—E. R. L.—K.—Geo. Need.—Forester.

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

Is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most rollable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

RETARDED LILY OF THE VALLEY CROWNS.

Headquarters at Dersingham.

For prices &c., apply to—

T. JANNOCH,

Lily Nursery, Dersingham, King's Lynn, Norfolk.

It combines efficiency with appearance, convenience with economy, and its effects are lasting. It is easily removed when necessary with hot water. It can be supplied either pale, green or grey.

Beware of spurious imitations which are offered through the success obtained for many years by Elliott's "Summer Cloud" Shading and see that in ordering you get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each

packet.

Sold in pkts., 1s. each, and in bags, 7 lb., 10s. 6d.; 14 lbs., 20s. To be had of the SEED and NURSERY TRADE generally. Manufacturers:

CORRY & CO., Ltd., Finsbury Street, LONDON.

STANDEN'S MANURE.

ESTABLISHED OVER 30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

Promoting a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

Its highly-fertilising properties render its money value, in comparison with other Manures, at least double; very small quantities will produce favourable and lasting results.

ANALYSIS ON APPLICATION.

Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 8s. each; and in Kegs, well secured, to prevent loss through exposure, 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s.

To be had from all Seedsman and Florists.

MANUFACTURERS—

CORRY & Co., Ltd., London.

THE "LOUGHBOROUGH" PATENT GREENHOUSE BOILER.

17,000 now in use.

The most economical, cheapest, and easiest to manage
No. 1, £2 17s. 0d.; No. 2, £4 2s. 6d.;
No. 3, £5. 10s. 0d.

Also made in larger sizes.

Complete Apparatus from £4 16s. 0d.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, June 28th.—Royal Horticultural Society: Meeting of Committees at 12, noon.

Royal Horticultural Society of Southampton's Show (two days).

Leeds Gala (three days).

WEDNESDAY, June 29th.—Richmond Horticultural Society's Show.

SATURDAY July 2nd.—National Rose Society's Show at the Crystal Palace.

THE SAN JOSE SCALE.—Entomologists still continue to discuss the question of the introduction of this member of the Coccidae into Britain. Mr. Fred. V. Theobald, M.A., F.E.S., Zoologist to the S.E. Agricultural College, Wye, describes the insect in its different stages, mentions the trees it attacks, and explains the effectual method of destroying it, in a small pamphlet of some twelve pages. Concerning its importation to this country he has no doubt whatever, but with regard to its being able to withstand the rigours of this country he is like the Scotchman who is credited with saying "I hae ma doots." The scale has appeared in this country adhering to the fruit of Pears; but unless the skins of these happen to get thrown about in the neighbourhood of fruit trees the danger of infection would not be great. A greater source of danger lies in the introduction of fruit trees, stocks or ornamental trees and shrubs from the United States or Canada. In such cases the plants must be disinfected before they are planted out. Even if our climate is too severe for the insect to live out of doors, there is the chance that it might get established in hothouses like the scales of Orange trees, Camellias, &c.

Gardeners being well acquainted with the sales infesting those subjects as well as of Peach trees and Ferns, have a pretty good idea of the appearance of the threatening intruder, for all scales have a family likeness. The eggs are laid below the body of the mother in autumn as a rule, and these hatch out in spring liberating small, six-legged, active larvae, which ramble about over the trees in quest of a position on which to settle down. Their beak or proboscis is inserted in the bark of the tree, on the midribs of the leaves and on the developing fruits; then the females lose their legs, antennae, &c., and become

CLAY'S MANURES.

CLAY'S SUCCESSFUL GARDENING.

CLAY & SON, Stratford, London, E.

TRADE MARK.

stationary, progressing to the mature condition after passing through two distinct larval stages, under the protecting scale. The males pass through similar stages, and have a scale of a different form, but ultimately acquire a pair of wings after passing through a pupa stage. They are seldom met with, however, being rare as in other allied insects. The scale of the female is round, flat, closely adpressed to the bark, which it resembles in colour; it also sometimes presents the appearance of concentric rings, and has a small nipple or umbo arising from the centre of a flat area. In size the full grown scale varies from the $\frac{1}{25}$ in. to $\frac{1}{3}$ in., and is mottled with gray, except over the centre which varies from pale reddish-yellow to dark brown. This scale is believed to be a native of Japan from whence it has been introduced to America by way of California, and to Sydney from the latter place on Apple and Pear Stocks. It attacks all fruit trees and bushes belonging to the natural order Rosaceae, as well as Red and Black Currants, Gooseberries and a host of ornamental trees and shrubs.

The scales, under favourable conditions increase at an enormous rate, as has been proved by the experiments made at the Department of Entomology at Washington. A mature female produces nine to ten young ones every twenty-four hours for the space of six weeks, giving a total of 400 in that time. One winter female, it is calculated, will give rise to 3,216,080,400 of a progeny during the year under favourable circumstances. The methods of distribution may even be more interesting to gardeners. The larvae can only wander about for short distances around the spot where they are born; but it is believed they are borne about by the wind from tree to tree. Birds and insects also serve to carry them about involuntarily, attached to their bodies, legs and wings. By this means alone the larvae of the scale could be carried to every tree in an orchard, and from plantation to plantation, it might be, miles apart. Artificial distribution, however, is most to be dreaded; for there is no more potent nor far reaching means of dispersing the scale than on nursery stock, whether fruit or ornamental trees. Its introduction to the different States in America has been traced either to nursery stock or cuttings. At the same time to be "forewarned is to be forearmed," and it would be well for people in this country to guard against casting the skins of imported fruit near trees or bushes of any kind. Examination of imported Pears has already revealed the presence of the scale in this country.

Several imported scales have given a greater or less amount of trouble to British gardeners, and it is just possible that the rapid propagation of the San Jose Scale might enable it to get acclimatised in this country by adaptation to changes of climate. The Peach Scale has accustomed itself to thrive in temperate as well as tropical countries. Scales often behave in an erratic manner in new territories under climatic conditions different from that to which they were previously accustomed, so that entomologists cannot even predict what would happen in the case of the species (*Aspidiotus perniciosus*) under notice. If it merely conformed to the habits of the Apple Mussel Scale (*Mytilaspis pomorum*) in this country, it would become single brooded, and, consequently, could not multiply with anything like the rapidity it does in America. Even then, however, it might become productive of much mischief.

The only successful remedy hitherto discovered for the pest is what is known as Gas Treatment, which unfortunately hardly appears to be practicable in the open orchard. In the case of infestation in hot-

houses, the plan is to ascertain the cubic contents of the interior, and for every 100 cub. ft. to use $\frac{1}{3}$ oz. cyanide of potassium, $\frac{1}{3}$ oz. sulphuric acid and $\frac{1}{3}$ oz. water. The requisite quantity of the cyanide is to be put in a box fixed at some little distance above the ground and quite clear of all foliage, say 3 ft. away. Each box employed should be furnished with a tin, movable bottom, attached to a wire passed through the wall of the house so that it can be got at by the operator from the outside. Beneath the box a soup plate or other open vessel is to be placed, containing the requisite amount of sulphuric acid and water in mixture. All these preparations should be made towards evening when the house can be closed and locked up for the night. The preparations completed, close and lock the door. Then the operator is to pull the wire so as to open the bottom of the box and let the cyanide fall into the sulphuric acid beneath. The fumes given off will quickly permeate the house, which need not be made more air-tight than usual. As the cyanide and the fumes given off from it are deadly poisonous, care should be taken not to inhale the same. The house should be kept closed till morning, by which time the poison will have done its work and become dissipated. The house should be freely ventilated early on the following morning. All infested trees, shrubs and other plants should be treated in this way before being planted, or placed with clean stock. Plants with delicate foliage cannot withstand this remedy, but Peaches and other hardy subjects could be treated with advantage.

National Italian Chrysanthemum Society.—A Chrysanthemum society has been founded in Italy. A provisional committee has been formed, having for its president M. Scalarandis, the King's gardener at the royal gardens of Monza.

Mr. Thomas Henderson, formerly head gardener to the late A. O. Shalders, Elmleigh, Ilkley, has been appointed head gardener to J. H. Rand, Esq., Woodside, Baildon, near Leeds. Orchids are great favourites with Mr. Henderson, who has sent us *Odontoglossum coronarium* and other species for our inspection, while he was at Elmleigh. He gave great satisfaction to his late master, and we hope he will be equally successful in his new situation, where there are valuable collections of Orchids and other plants.

Rotherham and Horticulture.—"I was through your district the other day, and thought of you at once, and wondered in my mind however you can manage to grow anything in your smoke-begrimed neighbourhood." These were the words addressed to the writer by a celebrated nurseryman who luxuriates in wealthy and charming suburban London, on the first day of the Temple Show. Well, it is an undisputed fact, perhaps, that a great deal more judgment than luck is required to grow things to perfection hereabouts, but many subjects grown would certainly not disgrace any show-board in London. It may be true, it no doubt is, that nothing has attracted the horticultural world in Rotherham district since the celebrated Selwood collection of Orchids disappeared, but what is supposed locally is undoubtedly considered universally, so far as horticulture is concerned, that Rotherham is all very well for steam whistles, pistons, and brass work generally, stove grates, and wrought iron, but horticulture is, and must be quite off, to speak in up-to-date style. If this were a fact, why is Sheffield not considered equally unfortunate for matters horticultural? Why, forsooth! No, depend upon it, Rotherham is, perforce, dwarfed by the importance of busy Sheffield, but I hope, Mr. Editor, that with your permission I may be able to prove in successive articles that Rotherham possesses natural charms and able men to make the best of them.—*Albert Upstone.*

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, June 28th, in the Drill Hall, James Street, Westminster, 1 to 5 p.m. The Rose show which was to have been held on this date is now postponed until July 12th. Will all intending exhibitors please note this. At 3 o'clock a lecture on "Some of the Plants Exhibited" will be given by the Rev. Prof. Henslow, V.M.H.

Lectures at Chiswick.—The meeting on the 15th inst., in the gardens of the Royal Horticultural Society, Chiswick, was a very successful one, being attended by sixty to seventy of the members of the Mutual Improvement Associations of Kew and Chiswick to hear a lecture by the Rev. Prof. George Henslow, on "The Importance of a General Knowledge of Vegetable Physiology to Cultivators." The chair was occupied by Mr. Wm. Marshall, the chairman of the floral committee of the R.H.S. The lecturer dwelt on the functions of the roots, stems and leaves of plants. The second lecture of the series was delivered on Wednesday evening last after we had gone to press. The members of the Ealing Gardeners' Society were invited to attend, and having arrived some time before the commencement of the lecture, they inspected the various trials being conducted in the gardens this year.

Hybrids of *Anthurium andreanum*.—An article, historical and descriptive of the hybrids of this *Anthurium*, now so plentiful in cultivation, appears in the current number of *Tijdschrift voor Tuinbouw*, and is illustrated by a double page coloured plate of some of the more recent acquisitions as well as by beautifully executed photographic reproductions of some of the older forms. The coloured plate includes a variety having a very large smooth spathe of a delicate creamy-salmon colour, and an orange-salmon spadix. This has been named H. C. Zwart, in compliment to the secretary of the Dutch Horticultural Society. A very much smaller form, having a creamy-salmon, nearly orbicular spathe, tinted with apricot, has been named J. H. Krelage. The spathe is also smooth, as in the previous form. That named Columbus has an orange-scarlet, and elongated spathe, corrugated in the same way as *A. andreanum*.

New Public Park at Tipton.—The first prize of £25 in the public competition for the best plan for laying out the new Victoria Park at Tipton, has been unanimously awarded to Messrs. William Barron & Son, Elvaston Nurseries, Borrowash, Derbyshire. Their plan shows a lake about 3 acres in extent, cricket and recreation grounds, lawn tennis grounds, bowling green, bandstand, shelters, etc., etc. They also furnish plans for lodges, entrance gates, ornamental fencing, etc. The park is 33 acres in extent. The second prize was awarded to Mr. John Perry, Architect, Tipton. There were ten competitors. The site of the park is a very difficult one to deal with, on account of the undulating and unlevel nature of the ground. A great quantity of material will have to be removed in order to obtain the spaces for cricket and other forms of recreation, as well as in excavating the lake. Material for construction is obtainable almost on the site. Provisions have been made for a lodge on a southern aspect, and a site for a reading-room in the future suggested. These sites are situated at the main entrance in the Victoria Road, which gives its name to the park. It is proposed to be partly surrounded by ornamental fencing 6 ft. high, and in less conspicuous places by plain unclimbable fencing. The cricket ground is to be oval, a little over $5\frac{1}{2}$ acres in extent, and surrounded by a drive 12 ft. wide, the latter being continued round the park. The greater portion of the walks are to be 8 ft. wide, to be winding, and traverse all the more important parts of the park. According to the plan, the cricket ground will be surrounded by a line of trees, of which there will be groups and short lines in suitable places elsewhere. A belt of shrubbery will surround the park, with clumps and masses in various places, including the banks of the lake and the islands. The lake is to be narrow in the middle, widened towards either end like a dumb-bell, and is to be nearly 3 acres in extent. A mound would be formed of the excavations from the lake and would be a feature of the park. Plantations would occupy nearly 8 acres of the surface.

An experiment in the cultivation of Potatoes in Africa is proposed by the German Government.

Shirley and Districts Gardeners' Mutual Improvement Association.—The monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on the 20th inst., there being a fair attendance of the members, presided over by the president, W. F. G. Spranger, Esq. The lecture was entitled some "Asiatic Plants noticed in the course of travels in Japan, China and Ceylon," given by W. Frank Perkins, Esq., and being profusely illustrated with limelight views of tropical vegetation; it was a most interesting subject. Tea and Coffee plantations in Ceylon came in for a large share of the descriptive remarks, as also did the family of Palms and Musas. A very hearty vote of thanks was accorded to Mr. Perkins at the close of his lecture. There was a good display of Roses, some contributed by Mr. W. H. Rogers, Red Lodge Nursery, being awarded a Certificate. In the competition for three prizes for the best six Roses Mr. W. Knapp was first; Mr. J. Hallet, second; and Mr. Vernon, third. Mr. Ladhams, F.R.H.S., sent a display of hardy herbaceous cut blooms, and was awarded a Certificate for twelve Gloxinias. Mr. E. J. Wilcox sent a large number of prints of tropical plants in horticultural journals.

Messrs. Webb & Sons at Birmingham.—Messrs. Webb & Sons, Wordsley, Stourbridge, have an imposing stand full of material, grown from the seeds they supply, at the Royal Show now in progress at Birmingham. In the section devoted to flowers some magnificent Begonias, Calceolarias, Sweet Peas, Stocks, Lilliums, Gladioli, &c., make a brave show. Vegetables form another meritorious collection; Beans, Parsnips, Cucumbers, Tomatos, Cauliflowers, Carrots, Leeks and Onions are represented, and all are of the best that skill can produce. The new Peas, Pioneer and Senator, growing in pots show a profusion of long, well filled pods, whilst among the Potatos, Webb's New Motor is conspicuous for its large size and splendid quality. Cereals form an important part of the exhibit, and here the Hardy Winter Black Oat instances a wonderfully heavy cropper that stands the most severe winter with impunity. New Standard Red and New White Queen Wheat are two grand sorts for autumn sowing. Some remarkably fine Mangolds and Swedes of last year's growth are eloquent witnesses of the quality of seed supplied by the firm. All these together with various mixtures of grass seed for lawn and meadow sowing, and manures for all sorts of crops, constitute a comprehensive exhibit, interesting to both agriculturist and horticulturist alike.

A Classic Legacy of Agriculture.—Under this heading Mr. John Mills writes, in *Knowledge*, about the world renowned establishment for agricultural research at Rothamsted, as it has been carried on for more than fifty years by Sir John Lawes and Sir Henry Gilbert. He says, that "The time is past when practice can go on in the blind and vain confidence of a shallow empiricism, severed from science like a tree from its roots. Rothamsted is described as a model establishment, where the collaborators have elicited information that will ever after serve as a foundation on which to build up all future scientific knowledge on agricultural chemistry and its relation to plant life. The exact data placed at the disposal of chemists is without parallel in the annals of science. Chemistry and botany have never before been brought into more profitable correlation than in the Rothamsted experiments. Sir John Lawes first commenced operations in 1834, and has continued them uninterruptedly even since. He has carried on the experiments at his own cost; and, furthermore, has endowed the establishment with the munificent sum of £100,000 to ensure the experiments being continued after his death. Germany followed in the wake of Rothamsted, and now she maintains twenty-five experimental stations at the public expense, though they were founded by associations of agriculturists. The British farmer takes more produce out of the soil than is done in any other country of the world. The college at Glasnevin, near Dublin, receives a Government grant, but the colleges at Cirencester, Downton, and the Colonial Training College in Suffolk are self-supporting.

The lost Orchids.—Distinguished foreigner: "O John, I have been keeping my eye on the Orchids all the evening, but now they are gone."—*John Bull*: "My dear Mosoo, I'm weally very sorry; but if you 'ad been a 'oss instead of a hass you would 'ave kep' both heyes on 'em!"—*Waggs*.

Royal Horticultural Society.—The members of the various committees of this society have been invited by the council to visit and inspect the gardens at Chiswick at 12 noon on the 5th July, and to lunch with them at 1.30 p.m. The meeting will be continued till 4.30 o'clock. Last year the meeting was well attended, and proved a very pleasant one to all participating in the same.

Preparing for the Prince of Wales at Birmingham.—By the special permission of the Council of the Royal Agricultural Society, Messrs. Webb & Sons, the Queen's Seedsmen, have decorated the exterior of the hall in Four Oaks Park with ornamental lawns, flowering plants, Palms, &c. The effect is very pleasing, and Messrs. Webb are to be congratulated upon having added so materially to the attractiveness of the show yard. The hall was to be used for the reception of the Prince of Wales on Wednesday.

Reading and District Gardeners' Mutual Improvement Association.—The second meeting of the summer session of the above was held in the Club Room on Monday evening last, when Mr. Turton, the chairman of the association, presided over a good attendance of members. The subject chosen for the evening was "Vegetables in Season," introduced by Mr. H. Wilson, gardener to Mrs. Bland-Carlud, Lower Redlands, Reading. The varieties principally touched upon were Asparagus, Cabbage, Carrots, Mushrooms, Tomatos, Turnips, French Beans, Vegetable Marrow, Peas, Lettuce, Broad Beans, Cucumbers and Potatos. A most profitable discussion took place, some fifteen to twenty members giving their experience with regard to the various kinds referred to. The exhibits were exceedingly interesting, Mr. Townsend, gardener to Sir William Farrer, Sandhurst Lodge, showing a splendid collection of tropical and hardy Nymphaeas, amongst which were the following:—*N. stellata*, *N. amazonica*, *N. Lotus*, *N. zanzibarensis*, *N. z. rosea*, *N. elegans*, *N. pygmaea helvola*, *N. Laydeckeri rosea*, *N. tuberosa*, *N. alba*, *N. candida*, *N. marliacea carnea*, *N. cromatella*, *N. odorata gigantea*, &c.; Mr. Wilson, considering the backwardness of the season, had some excellent specimens of Sutton's First Crop Cauliflower, Snowball Turnip, Champion Horn Carrot, Commodore Nutt and Tom Thumb Cabbage Lettuce and Black Seeded Bath Cos Lettuce. Mr. Turton, Maiden Erleigh Gardens, had a splendid sample of Sutton's Ringleader Potato. Mr. Smith, gardener to Miss Nield, Greenbank, showed nine bunches of Pansies, distinct varieties. Mr. Osborne, Junr., brought a plant of *Streptocarpus*, a cross between *Wendlandii* and the hybrid strain. A vote of thanks to Mr. Turton and to those who had staged the flowers and vegetables brought an enjoyable evening to a close.

HARDY HERBACEOUS PLANTS.

Papaver nudicaule.—The genus *Papaver* is noted for bright and showy flowers, and some of them as is *P. bracteatum* and its numerous varieties attain colossal proportions. The ingenuity of the genus, if I may so phrase it, has not been exhausted in producing these huge, and it must be admitted, stately flowers. In the opposite direction it has run into a race of dwarf, tufted plants that flower with surpassing freedom, and over a very long period. In this section the Iceland Poppies, varieties of the species *P. nudicaule* are exceedingly useful subjects for the rockery or herbaceous border. The plants vary from 8 in. to 15 in. in height, according to the soil in which they are growing, and the special character of the season. This year growth has been pretty vigorous owing to the rainy May and early part of June. The flowers, which are large, relative to the height of the plant, and the numbers in which they are produced, exhibit a variety of shades of white, yellow and orange, and they last well when cut and placed in water, but when intended for that purpose should be gathered early in the morning while the dew is yet on them. Like other perennial Poppies,

propagation may be effected by division of the roots in spring, and this is, of course, followed when it is desired to increase the stock of any particular variety that has taken the fancy of the grower, but for general purposes a packet of seed will do all that is required. Once get a healthy clump of plants, and the area they occupy will extend year by year, for the self-sown seed germinates freely enough. I recently observed a grand lot of plants, most of which originated from self-sown seed in Messrs. Barr & Sons' Nurseries at Long Ditton.

Thalictrum adiantifolium.—Most of the *Thalictrums* are possessed of ornamental foliage, and some of them have in addition very bright and showy flowers. In the case of *T. adiantifolium*, however, we have a plant whose small, green-yellow flowers in themselves are inconspicuous when taken severally, although in the mass they harmonise well with the *tout ensemble* of the plant, since they are borne in tall, elegant panicles that form a finish to the finely-cut deep green foliage beneath. The popular specific name "*adiantifolium*" is not at all inappropriate, since the small segments or pinnules of the leaves are in shape very much like those of the common Maidenhair Fern, *Adiantum cuneatum*. The name *T. adiantifolium* is the one under which the plant is usually to be found in gardens and nurseries, but it is synonymous with the *T. minus* of the botanist, and a British plant to boot. This is sufficient evidence of its hardiness in even the severest winters, whilst to this we may add that it is very easily cultivated in any ordinary garden soil. It may be increased from divisions, but this is rather too slow where quantities of plants are wanted for cutting from, so a packet of seed, which germinates easily enough, and which may be obtained very cheaply, is a good investment. For dinner table decoration the foliage will be found invaluable.

Thalictrum aquilegifolium atropurpureum.—A fearfully long name is this to bestow upon a poor, long-suffering plant. In this case we have an instance where both flowers and foliage are ornamental, for although the leaves are not so finely cut, nor the ultimate segments so small as in *T. adiantifolium*, they are yet handsome and imposing. The flowers are produced in huge corymbose panicles, the filaments of the stamens really constituting what is popularly known as the "flower," for the sepals which are the only series of floral envelopes left to the genus are rather short-lived and soon drop. The flowers are not, as the varietal name would seem to indicate, dark, but light purple, and the name *atropurpureum* would be better applied to the stems, which are very dark in hue. Propagation is usually conducted by division.—*Plant Lover*.

DOUBLE AND SINGLE PYRETHRUMS.

The popularity of these is abundantly evidenced by the gay displays of their flowers in the hawkers' baskets at the present time. Some of the very best varieties in each section are constantly being offered from door to door. Many acres of ground must be covered by them to produce the abundant supplies we see on every hand. They certainly are one of the most valuable groups of hardy perennials we have, and ought to have a place assigned to them in every garden. They will thrive in almost any soils with the exception of such as are very cold and retentive. Where these conditions prevail special preparations must be made as respects drainage and the addition of some lighter material, such as sand and well decayed manure or leaf soil. Slugs are their worst enemies and must be kept in check, especially during the early period of growth. The month of May is the best time to form fresh plantations. Those commencing their culture should procure plants established in pots. When planting loosen the balls of soil so that the fresh roots may obtain a hold of the soil more rapidly than they otherwise would do. Give them plenty of room; 2 ft.—provided good strong healthy plants are used—will not be too much. Keep them clear of weeds by frequently stirring the ground with the hoe. A most excellent plan after a stock is secured is to make a fresh plantation every year by taking off pieces from established plants. This somewhat prolongs the flowering season, those already established flowering somewhat earlier than freshly planted ones. Although they will last for years in the same position, better results are obtained by frequent renewals of

plantations. All our leading nurserymen have good stocks of them, and those ignorant of the varieties may safely leave the selection in their hands.—*W. B. G.*

HERBACEOUS CALCEOLARIAS.

THE herbaceous Calceolaria when well grown is an excellent decorative plant for a cool greenhouse or conservatory. Moreover, nine months is not a long time from the sowing of the seed to the full blown plant in an 8 in. or 10 in. pot, smothered with flowers. The herbaceous Calceolaria, however, unless well grown is a sorry sight, and had better be left alone. Cleanliness is its first consideration, and some special, though simple, details are requisite to its culture if it is to be presented in a floriferous and creditable condition, such as I saw it the other day in the gardens of Oakhurst, St. Stephen's Road, Ealing, W.

A small collection of about fifty plants exhibited a great variety of colour, running from pure yellow through infinite shades of red to darkest claret. The foliage also possessed a healthy hue, and bespoke a vigour born of cleanliness, suitable soil, and attention to other details. Mr. C. Edwards informed me that the seed was sown the first week in August last, and came from the well-known firm of Veitch & Sons. Mr. Edwards was rather proud of his plants, but, alas! they will soon have to go the way of all "flesh;" their place will soon know them no more; a fresh start will have to be made; the cycle will be complete; for who would grow such plants as these from cuttings or divisions, when they may be satisfactorily raised from good strains of seed, and treated as annuals or biennials.—*C. B. G., Acton, W.*

A FINE FERN FACTORY.

FERNS have long been prized and cared for, and cultivated in and for the hothouses and mansions of the opulent, but of late years a change has come over 'the spirit of the dream,' and they are not alone the peculiar property of the classes nor solely the setting to wealth and luxury, but are to be seen represented by one or other of their myriad forms in the humble cottage, as well as the more pretentious villa, where the children of the masses, both indigent and comparatively well-to-do, live and move, and have their being. A great change truly is this, and one that has not been worked in a day, for as with dead so with living things, before a popular demand for either can be met the problem of wholesale supply has to be considered and solved. With the solution of this particular phase of the industrial problem the name of Mr. H. B. May has been indissolubly connected, for with true business enterprise he has grasped the real inwardness of the situation, and—the British public has but to ask and to have, in fact, has asked, and has had, Ferns galore.

Mr. May now owns three large and thriving establishments in the neighbourhood of Edmonton, each of which is a business complete in itself, and independent of the others, and each of which is supplying day by day, and year by year, plants of all sorts and sizes that popular fancy may call for. The Dyson's Lane Nurseries, the oldest of these three, are the headquarters, as it were, of the industry, and here it is that the complex workings of the scheme are most readily apparent to the visitor, who sees house after house, block after block of houses, every nook and corner of them filled with plants of all sizes, from the tiny sporeling to the matured plant—Ferns here, Ferns there, Ferns everywhere, hanging from the roof, clinging against the wall, filling high shelves, and covering the lower stages, and yet the remarkable thing is that there seems to be never a weakling amongst them. They all grow vigorously, for they seem to have nothing else to do.

A word as to the arrangement of the houses. They are of the usual span-roofed type that experience has found to be the best for market work, but at Edmonton they are associated in blocks of five or six or seven, a heated corridor used as a potting shed being built on the end. Potting can thus be conducted at any season without the trouble and risk of exposing the plants to the outer air. In one case a very long corridor is placed in the middle, and forms a junction to two large blocks of houses (one on either side) which constitute in them-

selves a huge glass area. The corridor itself is set off with *Neprolepises* and other Ferns, either growing in pendant baskets, or standing on high side shelves.

The contents of the houses it would be well-nigh impossible to describe in detail, for of the numerous species of the order Filices many are very versatile, and run into all sorts of variations, and it is almost needless to say their natural tendency to sport, to become plumed, feathered, tasselled, or variegated, as the case may be, is encouraged. Thus many of the finest Ferns in cultivation have first seen the light at Dyson's Lane.

The newest comer is *Polypodium Mayi*, a sporeling raised from *P. glaucum*, which was exhibited by Mr. May at the late Temple Show, and which we fully described then. *P. glaucum* is itself a vastly pretty thing, and is grown in great numbers, whilst *P. aureum* still holds its own with the public.

The genus *Pteris* is probably the most important from a market point of view. The numbers of crested and tasselled *Pterises* are legion. *P. serrulata* and *P. cretica* alone have given rise to a quantity of handsome plants, showing all gradations of tasselling. Thus *P. s. gracilis multiceps* has medium sized, very finely cut, tassels to the ends of the narrow pinnae, whilst *P. s. corymbosa*, certificated in 1894, has heavy, bunchy tassels, and the fronds have assumed in consequence a pendant habit. Both of these are grand basket Ferns. *P. s. compacta*, on the other hand, is true to its varietal name, the stipes of the fronds are shorter and stiffer, and the plant has a bushy and compact habit. *P. cretica Wimsetti* is probably the finest market Fern in existence, whilst *P. c. nobilis* and *P. c. Summersii* are other splendid forms. *P. tremula* has evidently no desire to be outdone in versatility. The heavily crested form, *P. t. smithiana* shows what it can do in this direction, whilst *P. t. elegans*, although it has a true "tremula" rootstock, appears at first sight to have got clean away from the type, with its long, tasselled fronds. *P. t. flaccida* is equally distinct with its looser habit and graceful, feathery presence. The broad fronds of *P. Drinkwateri* are most distinct, and the plant is of noble appearance; indeed, it bids high for second place to *P. Wimsetti* as a market Fern, and is a distinct advance on the common *P. umbrosa*.

Variegated Ferns find favour in some quarters, and one is astonished at the wealth of material available. The genus *Pteris* is again the heaviest contributor. *P. Mayi*, *P. c. Reginae*, *P. c. R. cristata*, *P. Victoriae* and *P. t. variegata* are all chaste and handsome plants that ought to be in every collection. The rather rare but highly beautiful *P. goringianum pictum* may be placed in this section. We cannot leave the genus without allusion to the noble *P. ludens*, and the equally distinct *P. sagittifolia*, with its arrow-head shaped fronds.

Of *Adiantums* Mr. May has a magnificent stock, the numerical strength of which may be gauged from the fact that *A. Farleyense* is turned out at the rate of 12,000 plants a year—an army in itself. The new *A. hemsleyanum* is a distinct acquisition to the genus. *Gymnogrammes*, again, are in superb condition, every variety in cultivation that is worth anything being grown, *G. Mayi*, *G. chrysophylla grandiceps*, *G. c. g. superba*, *G. Alstoni*, *G. flavescens*, *G. wettenhalliana*, *G. Parsoni* and *G. schizophylla elegantissima* being just a few of the gems. It would be easy to give the names of the plants, but it would not be so easy to convey to our readers a correct idea of the wonderful beauty of the varied forms of the gold and silver Ferns to be seen here. The curious *Platycteriums* are much in evidence, *P. grande*, *P. aethiopicum*, and *P. Willinckii* being three of the best, although we must not forget the commoner *P. alcorni*. All of these appear to great advantage when grown in pockets against a wall, or planted on rustic tree stems.

Among *Aspleniums* the elegant *A. caudatum* is a capital basket Fern, whilst for stateliness and distinctness there is nothing like *A. Nidus*, with its huge shining green fronds and black stipes. *Davallia fijiensis robusta* is a strong growing variety of the pretty Fijian *Davallia*. *D. Mariesii* and its crested variety are other notable plants. *Lygodium japonicum* is the best of the so-called climbing Ferns, and we were greatly struck by the fine batches of it in 6-inch pots that were to be seen in some of the houses. Small wonder is it

that these plants sell well when we consider how elegant and effective they are.

For basket plants the *Neprolepises* have few compeers. Some twenty species and varieties are grown by Mr. May, and these include all that are worth growing. *N. davallioides plumosa* and *N. d. multiceps* are two of the finest forms of this species, and seeing that they originated from the same batch of spores it goes to show how subtle is the tendency to variation possessed by our cultivated Ferns. *N. pluma*, *N. recurvata*, *N. philippinense* and *N. Duffi* are other well-known forms that were represented in great quantity.

The above mentioned Ferns constitute only a few of the gems of a collection that is a marvel of completeness and comprehensiveness. Many good things have been passed over, perforce, from lack of space, for our notes are already lengthy enough.

PLANTS RECENTLY CERTIFICATED.

THE undermentioned awards were made by the Royal Horticultural Society on the 14th inst.

Orchid Committee.

LAELIOCATTLEYA EUDORA SPLENDENS. Nov. var.—The parents of this grand variety were *Laelia purpurata* and *Cattleya Mendelii*, the latter being the pollen bearer. The progeny has the vigour of the former. The sepals and elliptic petals are rich rose-purple. The lip is of huge size and has a crimson-purple crisped lamina; the throat is white, tinted with pale yellow; and the base is crimson lined with white. The lip is the great feature, being darker and richer than the type. First-class Certificate. Messrs. J. Veitch & Sons, Ltd., Chelsea.

EPICATTLEYA RADIATO-BOWRINGIANA. Nov. hyb. bigen.—Strange results continue to be obtained by the hybridisation of Orchids. That under notice was derived from *Cattleya bowringiana* and *Epidendrum radiatum*, the latter having a cochleate, striate lip. The flowers in size recall those of the *Cattleya*, and have the sepals and elliptic petals of a dark slate-purple hue. The lip has a short tube striated with crimson purple on a white ground, and a short lamina, also veined. The plant bore three flowers, one of them having three lips, the lateral ones being petals. It is an interesting case of *peloria*. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

LAELIOCATTLEYA HIPPOLYTA AURANTIACA. Nov. hyb. var.—In this we have one of the prettiest varieties of this bigeneric hybrid in cultivation. The sepals and petals are rich orange-scarlet, the lip being orange and striated with crimson forking veins. The contrast is beautiful. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

ODONTOGLOSSUM ELEGANTIUS BARONESS SCHRODER. Nov. var.—To the light and graceful form of *O. elegans*, this beautiful variety adds the colours of *O. excellens*. The sepals and petals are clear yellow with a few rich brown blotches. The lip is white, with a large chestnut blotch in front of the crest. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

BULBOPHYLLUM SALTATORIUM.—The subulate sepals of this species are yellow with black spots at the base. The lip is black at the edges and furnished with a beard of long, purple hairs. It is a rival for *B. barbatum*. Botanical Certificate. Messrs. J. Veitch & Sons, Ltd.

BULBOPHYLLUM LOBBII BURFORD VAR. Nov. var.—The upper sepal is yellow, richly spotted with brownish-purple, the lateral ones being falcate and paler. The petals are beautifully lined with purple on a yellow ground. Botanical Certificate. Messrs. J. Veitch & Sons, Ltd.

CATTLEYA MOSSIAE MADONNA. Nov. var.—The sepals and large petals of this chaste and handsome variety are pure white. The tube of the lip is bluish externally and purple, lined with white internally; the throat is orange, and there is a pale purple blotch on the centre of the lamina, the rest being white. The variety belongs to the *C. M. reineckiana* section. Award of Merit. Messrs. Stanley-Mobbs & Ashton, Southgate, N.

LAELIA PURPURATA ERNESTII. Nov. var.—Here we have a chaste and beautiful variety of delicate colours. The sepals and petals are pure white. Both the outside and inside of the tube are yellow, lined in the latter case with fine purple striae. The lamina has a broad, distinct zone of purple running

across its base. Award of Merit. R. I. Measures, Esq. (gardener, Mr. H. J. Chapman), Cambridge Lodge, Camberwell.

SCUTICARIA HADWENI.—The terete leaves of this species are erect, not pendulous like those of *S. Steellii*. The solitary flowers have rich brown sepals and petals barred and marked with yellow. The concave lip is pubescent all over and white, striped and blotched with purple and brown. It is an uncommon and beautiful species. Award of Merit. Sir F. Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen.

LAELIOCATTLEYA DUKE OF YORK. *Nov. hyb. bigen.*—This was derived from *Laelia elegans* crossed with *Cattleya brymeriana*. The sepals and ovate, clawed petals are deep purple. The lamina of the lip is transverse, and rich crimson-purple, while the side lobes are paler purple. The bigeneric hybrid is bold and distinct. First-class Certificate. Messrs. F. Sander & Co., St. Albans.

Floral Committee.

MIKANIA SANDERI.—In this Composite we have a handsome climber that is a great improvement upon the few species already in cultivation. The leaves are about 6 in. long, ovate, and of a rich green above, and conspicuously blotched with dark olive. The under surface is mostly coloured with dark purple. First-class Certificate. Messrs. F. Sander & Co.

CALADIUM LORD ANNESLEY.—The long, narrow leaves of this pretty decorative variety are ovate-lanceolate, and of a glossy carmine along the centre, the rest being metallic red, narrowly bordered with green. Award of Merit. Messrs. F. Sander & Co.

BEGONIA REX MRS. F. SANDER.—The large and showy leaves of this variety have a broad, light green border, then a broad zone of rose surrounding a velvety brown or olive centre. It is an acquisition to this section. Award of Merit. Messrs. F. Sander & Co.

CALOCHORTUS PURDYI.—In this, we have a remarkably distinct and striking Mariposa Lily, with flowers of medium size. The inner petals are obovate, white, and heavily bearded all over with hairs of the same colour except at the base, where there is a pale purple and glossy spot. It is as hardy as other species in cultivation, and grows about 12 in. to 15 in. high. First-class Certificate. Messrs. R. Wallace & Co., Colchester.

GLOXINIA GALATEA.—The white ground of this very pretty and interesting variety is ornamented with a marbled, blue-purple, wavy zone, about half-way between the centre and the margin. Award of Merit. A pan of plants was exhibited by Messrs. J. Veitch & Sons, Ltd.

PHILADELPHUS CORONARIUS MONT BLANC.—The leaves of this variety are much smaller than those of the type, while the white flowers are produced in great profusion, and delightfully fragrant. Little bushes a foot in height or less are very handsome. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

PAEONY ELLA CHRISTINE KELWAY.—The large, double flowers of this Chinese variety are blush-pink and chastely pretty. Myriads of narrow petals are surrounded by broad guards of the same hue. Award of Merit. Messrs. Kelway & Son, Langport, Somerset.

PYRETHRUM LADY KILDARE.—The flowers are double, many of the florets being quilled, and of a pale peach with an apricot centre. The shade of colour is distinct and pretty. Award of Merit. Messrs. Kelway & Son.

MECONOPSIS CAMBRICA FLORE PLENO.—The flowers of this variety of the Welsh Poppy have very numerous petals quite filling the cup-shaped cavity of the bloom. They are of the ordinary colour, but the exterior of the petals in the bud state are tinted with orange. Award of Merit. Messrs. Paul & Son, Cheshunt.

BEGONIA COMMODORE DEWEY.—The glowing scarlet flowers of this tuberous variety are of large size and of beautiful Camellia form, the broad petals being neatly imbricated. Award of Merit. Messrs. H. Cannell & Sons, Swanley, Kent.

PYRETHRUM MONARCH.—The flowers are of large size, and single, with broad rosy-pink rays. It is very suitable for cut flower decorative work. Award of Merit. Messrs. Collins Bros., 39, Waterloo Road, S.E.

CANNA MRS. W. MARSHALL.—The broad outer petals of this handsome *Canna* are golden-yellow with occasionally a red streak along the centre. The

small inner petals are much spotted with scarlet. Award of Merit. Messrs. Paul & Son.

CANNA MOSAIC.—The large flowers in this case are scarlet, richly netted with golden-yellow, after the fashion of mosaic work. Award of Merit. Messrs. Paul & Son.

HARDY FRUIT GARDEN.

STRAWBERRIES.—The netting of these should be seen to without delay, otherwise the finest fruits, for the first fruits are generally the finest, will fall a prey to the birds. The old plan of simply spreading the nets over and upon the plants necessitates the pulling to and fro of the nets every time a punnet of fruit is to be picked. It will be really a saving of labour, therefore, to rig up a temporary framework by driving in a few stout posts and connecting these by light iron rods or wooden spars, over which the nets may be spread, thus keeping them clear of the plants, and at the same time giving more efficient protection to the fruit. The later crops should be mulched at once if this has been put off for any reason, but previous to this a good soaking should be given the beds if they are at all inclined to be dry. The Strawberry is almost unique amongst hardy fruits for the great quantity of food which it has to draw from the ground during a very limited period: At this season, therefore, when the strain is practically at the highest it will be well to supplement the food stored in the ground by a little manurial stimulant. If access can be had to a farmyard there is nothing better than the liquid farmyard manure. The only difficulty is that it is apt to vary considerably in strength, but if care is taken not to use it too strong there is nothing that will yield better results upon the Strawberry crop. Of course, it should not be given after the fruit has commenced to colour.

RASPBERRIES.—The rains of a few weeks ago were pretty general the country over, but at this season of the year the effects of a heavy rain are soon gone, and some soils could do with a heavy downpour three or four times a week, so quickly do they dry. Raspberries love rich soil and heavy feeding, and, in fact, unless they have these the fruits will be small and poor in flavour. This season they have done remarkably well up to the present, although the cold weather seems to have retarded them a good deal. If the soil on which the plants are growing is comparatively light and poor, manure water will be found of service. Failing this clear water will have to be given if the weather continues dry. The secret of good Raspberries is to manure heavily each autumn, when alone it is permissible to disturb the roots. We have found a good annual dressing of cow manure worked into the soil as deeply as could be without causing serious disturbance to the roots to suit the Raspberries finely. Such a practice minimises considerably the effects of drought, and fine fruit has been gathered even in dry seasons. A mulching of short stable manure is also good practice, for after the goodness has been washed into the soil either by the rains or by the water from the hose, it affords a clean and dry foothold, and prevents the soil from becoming trodden hard during the period that the crop is being gathered.

CHERRIES, PLUMS, APRICOTS, AND PEACHES ON WALLS will now be all the better for regular washings with the garden engine. Green fly, black fly, and red spider are all too plentiful, more particularly upon the Cherries and Peaches, and clear water forcibly applied is the best method of keeping them down. It becomes a serious matter to treat a few hundred yards' run of wall trees with insecticides, and yet these will have to be used if the insect pests are allowed to get the upper hand. The washings with clear water, therefore, if given in time, will effect a considerable saving; besides, they are better for the trees.

PEACH BLISTER.—This has been even more prevalent than during previous years, which unpleasant fact is doubtless to be accounted for by the long visits of the cold east winds, of which we had a recurrence only last week. With the advent of warmer and more typical summer weather it is to be hoped that the trees will get the better of the malady. Where only a few leaves are affected they may be picked off, in order that they may not afford

a refuge for insects, but where the trees are badly attacked such extensive defoliation would neither be wise nor prudent.

Peaches are calling for constant attention in the stopping of laterals before they get inconveniently long; also in the timely removal of badly situated or unnecessary shoots that only take up valuable room, and spoil the chances of development of other needful shoots. The timely pinching of all wall and bush trees, in fact, is to be recommended, for not only are the finger and thumb more expeditious than the knife, but they are also more economical where the interests of the trees are concerned.—*A. S. G.*

Kitchen Garden Calendar.

DURING the last few days there has been an improvement in the night temperature, so that vegetation has made better progress. In many places, however, rain is sadly needed to help the growth of all newly-planted things, as the ground has become very dry. It is at this time of the year that the foundation is laid for a plentiful supply of green vegetables through the winter, and unless every precaution is taken to establish the plants as they are put out it is next to useless to plant. We have found that by placing an inverted pot over each plant during the greater part of the day when the weather is hot and dry much labour is saved in watering, which is a great consideration where water is scarce. If the pots are put over as the planting is done there will be but very little flagging take place, particularly if the soil is thoroughly moistened as the work proceeds. The pots may remain on the first day, but should be removed on the evening of the second, or the plants will suffer for want of light. By this time new roots will have commenced to form. If, however, the weather is very hot, it is advisable to cover the plants during bright sunny days for at least a week or ten days, by which time the plants will have thoroughly established themselves.

The main crop of Celery, if not already planted out, should now be got into the trenches. It is far better to transplant while the plants are small, and get them established by frequent waterings, than to wait with the hope of rain until they become overcrowded, as a much longer period elapses before the plants recover themselves. Celery is by no means difficult to grow well, provided due care be taken in establishing the plants and supplying them with plenty of nourishment afterwards. In some districts the Celery fly (*Tephritis onopordinis*) is very destructive. The larva of this little creature burrows between the two skins of the leaves and eats the pulp. It can easily be seen where they are at work, as brown patches appear in the leaves which somewhat resemble blisters. The plants should be carefully looked over, and where any of these are observable the leaves should be pressed between the finger and thumb to destroy the pest. The plants should also be frequently dusted with soot to prevent the fly from laying its eggs.

CUCUMBERS in frames will now be making good progress. To prevent the growths from becoming overcrowded pinch them at the first joint beyond the fruit, and repeat this on every new growth. It may be necessary to reduce the number of growths, but this should be done with care. Should there be any signs of red spider, sponge the foliage with clean water. To maintain a brisk heat close the lights early in the afternoon. It is a great mistake with some to put air on both at the top and bottom of the lights; by doing this a cold current is set up, which passes amongst the leaves, and retards growth. When air is admitted let this be at the top of the frame only.

CAPSICUMS, TOMATOS, and other tender vegetables must be encouraged while the weather is warm, that their fruit may be matured before autumn is too far advanced. Make another sowing of Peas and French Beans, choosing a sheltered situation for them. Plant out Lettuce and Endive as the plants become large enough to handle, and keep up a supply of small salads by frequent sowings, as these will now be much in request. When the weather is fine keep the hoe at work amongst all growing crops to destroy the small weeds, and give the whole a neat and tidy appearance.—*Kitchen Gardener.*

HINTS FOR AMATEURS.

CHRYSANTHEMUMS.

THE time has at last arrived when the final potting into the flowering pots can no longer be delayed. Professional cultivators have by this time given all their plants, with perhaps the exception of the late ones, their final shift. Those who have to show in strong competitions have thus to be bright and early with the work, for experience has proved that a good long season of growth in the final stage is necessary to procure sound, well ripened wood, which in turn will produce fine, well coloured flowers. There is a distinct danger to be run by too late potting. The plants (unless they are late right from the cutting, when a deal of difference results) are starved and stunted in their pots, usually 32's, and the roots become an interlacing fibrous mass, which it is impossible to disentangle or to avoid injuring in a very considerable degree. The check of potting is thus, in itself, considerable. It is some time before the poor plants recover from it, and when they do it is not infrequently at the expense of all their lower leaves. The consequence is that during the months of July and August, when the plants should be in full vigour of growth, they are struggling for a bare and miserable existence. Then they commence to grow, just as the summer shows signs that its course is merging to a close. The rich soil causes undue rankness, and corresponding sappiness of growth, as if an attempt were being made to make up for lost time, and the plants finish the season in anything but that condition which the gardener would like to see them.

These are some of the dangers involved by neglecting to shift the plants at the proper time, and we would urge all who may be growers in a small way to avoid these dangers by getting their 'Mums into flowering pots at least by the end of the present month.

Up to this time the plants have had a somewhat chequered experience. They were placed out-of-doors during the third week in May, but since that time they have been subjected to a variety of climatical conditions that has sorely tried their patience. During the late cold weather they have been almost, if not quite, at a standstill.

Soil.—This is naturally of the first importance, and the amateur will do well to go to a little extra trouble to procure the right kind of stuff. Large cultivators are very particular with their soil. The loam, which is the staple of the compost, is cut from good old pastures and stacked under cover, with or without manure, for months previous to the time at which it will be required. When it is cut out for use it will then be in a capital condition as far as moisture goes, the grass will have rotted, but all the fibrous roots will be there, and the whole will be sweet and friable. This loam is then chopped up with a spade—not sifted in any way be it noticed—and mixed with the other ingredients. Loam that has been employed for Cucumbers or Melons is usually in capital fettle for Chrysanthemums, and, should no fresh material offer, may be used with the greatest confidence. The proportions of the various ingredients may be as follows:—To a cubic yard of the loam add a barrowful of leaf soil, that obtained from Oak or Beech leaves being the best, a similar quantity of old mortar rubbish broken up to the size of Hazel Nuts, half the quantity of old Mushroom bed manure, from ten to twelve pounds of Clay's Fertiliser or Thomson's Vine and Plant Manure, and enough rough river sand to keep the whole open, say a little over half a bushel to the above quantity of compost if the loam be heavy, and a little less if it be light. The whole must be mixed thoroughly together by turning it three or four times. In doing this the outside of the heap should be turned into the centre each time, and the centre to the outside. The chemical manure added will thus get well spread throughout the whole, which is of vital importance. Some growers advocate the addition of more of these artificial manures to the soil than we have recommended, but this is a practice that can very easily be overdone, and, to our way of thinking, one that is overdone by more than one professional grower. If the loam be good it would be far better to add no chemical fertiliser at all than to put a thimbleful too much. The evil effects of an over-

dose in conjunction with careless watering will soon be seen by even a tyro. Besides, any stimulants that may be necessary may easily be applied afterwards, as the plants call for them.

Pots.—The size of pots most suitable for general purposes is the "large sixteen," which has a top, inside diameter of about 9 inches. A larger pot, the "twelve," which has a top inside diameter of 10 inches, is occasionally employed, but only in the case of especially tall growing and heavy rooting varieties, that is when one plant only is put into a pot. The alternative plan of growing more than one plant in a pot has not much to recommend it. It may be a saving of space, but at the expense of the quality and quantity of the bloom. All pots should be clean, and if new they should be soaked for a few hours to take the "fire" out of them. New, unsoaked pots are exceedingly harsh and unkindly, and their dry and thirsty nature would take too much moisture out of the soil.

Drainage.—Seeing the vast quantities of water that will pass through the soil in the pots during the next three or four months, it is obvious that the drainage must be of the best if things are to be kept sweet and wholesome. After crocking the pots carefully with clean crocks, a sprinkling of half-inch bones may be put in, say a small handful to each pot. Over this place a layer of the roughest part of the compost, to keep the finer particles from being washed down amongst the crocks, and the drainage is complete. The addition of the crushed bones has been criticised by some growers, and declared to make the soil sour and evil smelling when wet weather has supervened immediately after the potting, but we have followed the practice for a number of years, and only in one case have we known bad results to follow, and that was in the case of a very weakly plant of Golden Wedding. The bones give out their goodness slowly, and in that respect do not give the immediate surfeit of good things that is produced by too much chemical manure powders which are stronger and speedier in their action from obvious mechanical reasons. The most valid objection to bones is one that might be made on the score of economy, for their value as a manurial agent is not nearly exhausted by the end of the year, but then the Chrysanthemum soil of this year will come in for something else next year so that their virtue is not wasted after all, and the Chrysanthemums only have the first share.

Ramming.—In order to obtain short-jointed and sturdy growth the rammer has to play a prominent part in the final potting of the Chrysanthemum, but just as one can have "Too Much Johnson," so there can be, and very frequently is, too much rammer. Directions to pot firmly are generally construed pretty literally, and the result is that the soil, when it chances to be heavy, is made so hard that the roots cannot penetrate, nor the water percolate, the results being simply disastrous. As in other written directions as to the way to perform gardening operations, the operator's own sense of discretion must be called actively into play in this instance, judgment must direct the rammer and the "rammist," if we may be allowed the word to distinguish between the instrument and the operator who works it.

Don't fill the pots too full of soil, but allow room for enough water to be given at one application to soak the ball right through. Also never attempt to pot a plant that is dry at the time. This would be folly, for the probability is that the dry kernel in the centre of the pot would remain dry, and then goodbye to the roots and the plant's chance of success. All plants, therefore, that it is intended to pot, should be looked over on the evening previous, and well-watered if they are at all inclined to be dry.

After Potting.—A very usual but a mistaken plan of action is to deluge the plants with water immediately after potting. Instead of doing this, the plants should be stood in a shady corner, and, if the weather be fine, sprinkled overhead twice or thrice a day by means of the syringe. Two or three days of such treatment and the plants will have recovered themselves of the check, and will then be ready for drafting to the quarters wherein they are to remain for the summer months.—*Rev.*

Oranges and Salt.—The Mexicans when eating Oranges season them with salt, the fruit being considered more wholesome when so seasoned.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Hyacinths.—*Forester*: You will see an answer to part of your question about Hyacinths on p. 671 of last week's GARDENING WORLD. The bulbs that have been grown in water in glasses are of no further value, and may as well be thrown away at once.

Ridge Cucumbers.—*Geo. Need*: Ridge Cucumbers are not grown to any great extent, partly because they are often a very qualified success. They may be grown out-of-doors on heaps of fermenting matter, it is true, but they only do well in warm seasons, whilst the fruit is apt to be rather bitter. To do them properly they want the shelter of a frame, more particularly in the earlier stages. Now we have so many really good Cucumbers of far better quality than the ridge varieties that can be grown in a frame that it is no wonder that they are chosen in preference to the latter. The best of the ridge Cucumbers is King of the Ridge, which is nearly as good in quality as the frame or tenderer sorts. Stockwood Ridge is a good old variety that is to be depended on. It is a good bearer, but the fruit is shorter, fatter and more prickly than that of King of the Ridge.

Watering Vines.—*K.*: Now that the fruit is ripening you must stop giving manure water, and clear water must be very judiciously administered. Water will be occasionally required, it is true, but only very seldom, otherwise the fruit will be apt to split or crack, and this will spoil its appearance. You might cover the border with straw, if you like. It will certainly tend to prevent evaporation of moisture, and cannot do any harm.

Apple Tree Backward.—*E. R. L.*: If your tree had been going to fruit this season it would certainly have made some show of flower-buds before this, as well as of ordinary foliage. It must be in a bad way. Was it in good condition when you purchased it? The variety, Melon, is not one that we should recommend for a cold soil and a bleak situation.

Kentias Dying.—I recently bought several Palms (Kentias) which looked exceedingly healthy and vigorous at the time, but which have since all died off. In pulling one of them out of the pot I discovered that there were no roots, and this proved to be the case with all of them. Can you tell me what is the reason? The soil in which the plants were growing was not at all sour or wet; indeed, it looked as if the plants had been newly potted.—*Palms.*

You are probably correct in your latter surmise. It seems to us most likely that the plants had been hastily potted up and sent out to sell, not to grow. Taken from a warm house, subjected to the potting process, perhaps half of their roots destroyed, and sent out straight away into a low temperature, then into the comparatively arid atmosphere of a dwelling, it is no wonder that the plants succumbed. Palms are really tropical or sub-tropical subjects, and need a certain amount of training, so to speak, before they can be expected to stand a lower temperature.

Crushed Bones for Chrysanthemums.—*P. E. A.*: You may sprinkle a small handful of the ½-in. bones over the crocks at the bottom of a No. 12 pot. Some nutriment will, of course, be afforded to the Chrysanthemums from these bones, but their employment is not really economical, for they are not nearly exhausted by the end of the season.

Melons in Frames.—*L. James*: You are in time, but have no time to waste if your Melons are to do any good in the frames, unless, of course, these frames are well supplied with hotwater pipes, when a longer season can be counted upon. You will find that two plants will be enough for each light. Plant at once on mounds of soil which should be raised up close to the glass. Do not stop (pinch) the plants until they have got a hold of their new surroundings. After the stopping two or three main shoots may be taken along from each plant, according to the space there is at command. Soil may be added at a later date when the white roots have made their appearance at the sides of the mound.

Cucumbers.—*L. James*: From the description you give of your Cucumbers they have evidently got a bad dose of red spider. The best thing to do would, therefore, be to root them out, cleanse the frame, put in new soil, and plant afresh. If you do not wish to sacrifice the plants you can only pinch off the leaves that are badly affected with the pest, and keep the syringe vigorously at work for about ten minutes morning and afternoon. In this way you may succeed in getting rid of the spider, for it cannot stand regular and forcible applications of clear water. You see in a frame it is impossible to apply any insecticides with advantage to the plants.

THE BAMBOO GARDEN AT KEW.

For many years past Bamboos, taking the term in its widest sense, have been grown in the Royal Gardens, Kew, but the most of them were grown under glass till 1892, when a Bamboo garden was laid out for the reception of such species as prove hardy in the latitude of London. Previous to that year Bamboos were chiefly represented in the open air collections by *Arundinaria japonica*, *Bambusa For-*

Arundinaria gigantea in the open air here, for it requires a stove temperature, and at Kew and Syon House throws up main stems 50 ft. to 60 ft. high in the course of four months. The Bamboo garden, having been planted in 1892, is now well established. It passed through the severe winter of 1894-95, and, therefore, furnishes evidence of the relative hardiness of the species collected within its confines. There are over forty species and varieties in the collection at the present time, which will be passed in review separately in these pages. Several others have been tried and found too tender to give satisfaction in the open; they have practically taken French leave, so that there is no necessity for discarding them. *Arundinaria Laydekeri* flowered in 1895, here and in other parts of the country, after which it died, and so proved useless for general culture. *A. falcata*, *A. spathiflora* and *A. hookeriana* have also been tried, but were too tender, and may only now be seen in the Temperate House. To these may be added *Phyllostachys heterocycla*, so that no further mention of them need be made here.

The Bamboo garden is situated near the banks of the Thames and towards the western end of the Rhododendron Dell, from which it is entered by a walk. It is roughly triangular, this being the form of

clined to clay, but being retentive of moisture serves to supply the plants with the quantity necessary to support their vigorous growth, particularly when throwing up the main stems as suckers from the root. These stems are covered with sheaths, at least in their early stages, but the leaf surface they support is reduced to a minimum. The material for these main stems must be stored in the roots and stems of previous years, but an abundance of moisture is necessary to make rapid growth possible. The beauty of the plants depends chiefly upon the branches, twigs and foliage developed the second and succeeding years upon the upright young stems. The latter do, indeed, supplement the general effect of the plants, but particularly in the case of the species of *Phyllostachys*, whose stems and twigs become naked and polished when fully developed.

Some start into growth early, and have stems nearly of their full length by the beginning of June; while others are later and just commencing to development their young stems. While some are in full leaf, others are only commencing to move, being still furnished with last year's foliage, which, with rare exceptions, passed through the winter safely. Indeed, the garden has never appeared in better condition after having passed through the winter than it

VIEW IN THE BAMBOO GARDEN AT KEW.

tunei and *Phyllostachys viridi-glaucescens*. The hardy species of Bamboo range themselves under those three genera, but the tribe Bambusae includes some twenty-two genera, most of the species of which, being natives of tropical countries, cannot be grown in Britain except in heated glasshouses.

In the more favoured and warmer districts of this country several amateurs began to ascertain their hardiness and their great beauty for garden decoration, and in the course of a few years became enthusiastic cultivators. In 1890 we inspected a fine collection in Guernsey, but had no idea even then that the bulk of them would have proved so hardy in the southern parts of this country. A. B. Mitford, Esq., Batsford Park, Moreton-in-the-Marsh, Gloucestershire, has since proved the pioneer in popularising Bamboos for outdoor culture in this country, and has written a book on the subject. The idea of establishing a Bamboo garden at Kew was a happy conception on the part of the authorities there, as it gives the public an idea of the subtropical appearance and decorative effect of these shrubby grasses at the command of the owners of a garden. It also shows what species may be relied upon to withstand the inclemency of our climate.

We can never hope to see arboreal species like

the large central bed or area, which is outlined by as many walks, from which others pass off in different directions into the surrounding woods. The Bamboos occupy the central area, as well as the borders and banks surrounding the whole. Shelter is afforded by tall, mostly deciduous, trees, of which Oaks, Beeches, Sycamore, and Spanish Chestnuts are the principal. On the high banks are masses of single rambling Roses, Smilax, Philadelphus, and other shrubs, forming a background. Various interesting flowering plants have been planted at intervals, including *Lilium giganteum*, *Kniphofias* (Red Hot Poker), *Eremurus robustus* and *E. elwesianus*, the showy spikes of the two latter often inducing the public to trespass over the ground in order to make a closer inspection of their magnificent racemes of flowers. Several strong growing grasses are also associated with the Bamboos proper, including *Miscanthus* (*Eulalia*) *japonicus*, *M. j. zebrinus*, *M. sinensis*, Pampas Grass (*Gynerium*), and the South European Reed, *Arundo Donax*. The latter, although shrubby, is not a Bamboo, and generally dies down to the root in winter. It throws up strong stems during summer, and is, therefore, a fit associate for the Bamboos of warmer countries.

The soil consists of a heavy substantial loam, in-

did this spring, the foliage of many species being almost perfect, and glittering in the morning sunshine. Some being in full growth carry the leaves of two or more seasons. During July, August and September the Bamboo garden will be in its finest condition; but even now is particularly interesting and draws a great many visitors.

The accompanying illustration will afford a glimpse of this retreat, and give a general idea of the whole, together with the surroundings, but the individual plants must be seen for the full appreciation of their individual beauty. Nothing which exists amongst the ordinary collections of trees and shrubs are at all comparable to these woody grasses, which have a distinct and characteristic beauty of their own. The photograph was taken at the angle where the path enters from the Rhododendron Dell, and gives a view along one side of the central area. On the left is a mass of *Bambusa pygmaea*, one of the best of the very dwarf ones owing to its hardiness and vigour of growth. Beyond it is a Gorse bush, appearing dark in the picture, and behind it are the tall and very upright stems of *Arundinaria Hindsii*. At the corner on the right is a dense mass of the neat habited *Phyllostachys ruscifolia*, which has been compared to the Butcher's Broom. Further on are

several dwarf species, behind which are some magnificent bushes of *P. viridi-glaucenscens*.

(To be continued.)

BELGIAN NURSERIES.

VII.—L'HORTICULTURE INTERNATIONALE,
BRUSSELS.

THIS is one of the three Linden establishments, two of which are in Belgium and the third in France. That under notice is a vast establishment situated at Park Leopold, Brussels, and under the management of M. Lucien Linden. The whole range of glass is so constructed that visitors can inspect every house without going outside. Plants can also be conveyed from the one to the other at all seasons of the year, whatever the weather may be.

On entering the range, the visitor is first ushered into the entrance hall, which is always kept gay with plants in flower, and presents a very inviting appearance. The next move is into the winter garden, a capacious building with plenty of space for parading about on iron gratings under large Palms, Cycads and Tree Ferns. Under the central dome is a huge specimen of *Latania Sieboldi*, and elsewhere are equally fine giants of *Cybotium prln-* and *Cycas dealbata*. A rare and fine specimen of *Theophrasta imperialis* stands 10 ft. high.

A great many of the plant houses lead off from this fine building, on either side. On the occasion of our visit, April 20th last, our chief object was to see the Orchids, of the fame of which we have often heard. As it happened, we passed into houses (most of the plant houses are span-roofed and recently built on the most modern principles) containing fine importations of *Laelia grandis tenebrosa* and *Cattleya labiata*, the latter being semi-established and in grand condition. The compost used is *Poly-podium fibre* and sphagnum.

An *Odontoglossum* house was gay with *O. vexillarium*, *O. luteo-purpureum*, in a great variety of richly blotched varieties, *O. andersonianum*, the heavily fringed *O. Halli*, *O. crispum* and *O. cirrhosum*. All were carrying fine spikes, and the last named existed in many richly blotched and crisped forms; each plant was also displayed to the best advantage.

Two houses were chiefly occupied with *Masdevallias*, abundantly represented by species in flower. The plants were intermixed with *Odontoglossum luteo-purpureum* in bloom. The varieties of *Masdevallia harryana* and *M. Lindeni* were numerous. The blue flush pervading the orange-scarlet flowers of *M. parlatoresana* heightened their beauty. *M. Veitchi*, with its large flowers, might be put in the same category as the last. Varied and different, however, were the beautifully spotted *M. Shuttleworthii*, *M. melanopoda* and *M. polysticta*. The wide open purple flowers of *M. ludibunda* were enhanced by white tips to the segments. The huge brown long-tailed flowers of *M. Ehippium* were remarkable for their peculiar form.

The next five houses were devoted to *Odontoglossums* and their allies. They were characterised by great vigour of growth and cleanliness, strong pseudobulbs and spikes. They included *O. crispum*, *O. polyxanthum*, *O. sceptrum* and *O. triumphans*, all varied and richly coloured in many cases. A striking instance was that of *O. crispum* bearing thirteen spikes, two on a pseudobulb, the scapes being only 12 in. high, but very stout. Others in grand form were *O. Halli*, *O. luteo-purpureum* and *O. cirrhosum*, the latter being grown in great quantity, and having panicked stems 2 ft. to 3 ft. high. *O. luteo-purpureum*, being in season, dominated many of the houses. Some of the varieties were very fine indeed. *O. Pescatorei* and *O. vexillarium* also made their presence felt. *Mesospidium Noetzlium* and *M. vulcanicum* were in fine form, particularly some of the former, which had very broad segments of a rich orange-scarlet. A large house was devoted to a collection of *Cattleyas* and *Laelias* in fine condition, the species represented being *C. Mossiae*, *C. Mendelii*, *Laelia purpurata*, *L. grandis* and *L. g. tenebrosa*. The two last-named were then in sheath.

From the winter garden we passed through two *Cypripedium* houses, containing many well grown species and hybrids. The enormous flowers of *Cypripedium lawrenceanum* measured 6 in. across the petals, and other parts of the plant were in pro-

portion, thus testifying to cultural ability. Other well grown things included *C. ciliolare*, *C. gowerianum superbum*, with enormous leaves; *C. Schroderae splendens*, having larger and darker flowers than the type; *C. Argus*, *C. hirsutissimum*, *C. Parishii* and *C. bellatulum*, there being a fine importation of the latter.

A bright display met the eye in a houseful of *Odontoglossum vexillarium*, with three to four spikes from a pseudobulb, and showing a wide variation in colour. There were panicles of *Oncidium sarcodes*, 5 ft. to 6 ft. long, and profusely flowered. Next came a houseful of *Cattleya labiata*, semi-established, and followed by half a houseful of *Laelia pumila*, and *L. pumila praestans*. The other half of the house was occupied by the rich orange *Epidendrum vitellinum*. The yellow lamina of the lip of *Cymbidium lowianum concolor* made a beautiful contrast with the soft green of the rest of the flower.

Here we noted a fine piece of workmanship in a house built about thirteen years ago, and has had no repairs since with the exception of painting. The walks were all neatly gravelled. The benches consisted of boards, coloured slate, and pitch pine edgings and doors. Everything here was in neat order, and *Tradescantia zebrina* covered the ground under the benches. In another house close by *Laelia crispa*, *Cattleya Mendelii* and the chaste light coloured *C. Mossiae reineckiana*, were the prevailing features. A houseful of semi-established plants of *Cypripedium bellatulum* should now be furnishing a rich variety of colours. The Butterfly *Oncidium*, *O. Papilio*, having scapes 3 ft. to 4 ft. long, was stood about amongst the *Cypripediums*. *Oncidium crispum* and *O. marshallianum* in pans were both semi-established, and throwing up flower spikes 3 ft. in length. The pseudobulbs of the former were fixed to rafts, stood upon end in flower pots, so as to retain a certain amount of moisture about them.

Vandas occupied a considerable portion of one house, including *V. tricolor*, *V. t. planilabris* and other varieties. The last-named was beautifully spotted with brown and edged with purple. *V. suavis* was equally well represented with varieties. Very pretty was *V. s. magnificans*, richly spotted with brown on a white ground and having a dark purple lip. The gray-blue and silvery-tinted flowers of *Vanda amoena* are exceedingly pretty. It is supposed to be a hybrid between *V. Roxburghii* and *V. caerulea*. The wavy, brown flowers of *Dendrobium Roxburghii* are distinct as they are uncommon. *Oncidium lanceanum* and *O. luridum* are handsome species with richly spotted flowers. *Cymbidium eburneum* was also in bloom.

The pathway was next through a Palm house filled with useful stove subjects including *Alsophilas* and other tree Ferns. Very fine were *Verschaffeltia splendida*, with a blade 4 ft. by 2½ ft.; and *Stenersonia grandifolia*, with leaves 7 ft. long by 3½ ft. wide independently of the petiole. The packing sheds and potting benches are conveniently placed to the houses and are admirably fitted up for the purpose in view. The whole place, in fact, is compact and well adapted for the needs of the establishment.

There were still many Orchid houses to examine and we hurried on. *Dendrobiums* were well represented by such as *D. wardianum*, *D. crassinode*, *D. devonianum*, *D. densiflorum* and *D. chrysotoxum*. Some of them were flowering and others recently imported. Importation is a strong feature of the establishment. The central stage of another house was filled with the same class of plants, *D. Farmeri*, *D. suavissimum* and others being grown in quantity. The side benches were occupied with *Cypripediums*.

Two houses were occupied with *Laelias*, including *L. anceps*, *L. majalis*, *L. autumnalis*, *L. albida*, and *L. elegans*, many of the latter being already in flower, showing fine varieties. A recent importation of *Thunia marshalliana* was just commencing to sprout. The stems varied from slender twigs to the thickness of the thumb. *Vanda caerulea* had recently been imported. A quantity of *Cattleya bulbosa* flowering on the young growths showed flowers of fine form and colour. We next came upon *Trichopilia*, *Pilumnas*, *Oncidium heteranthum* with its few perfect flowers and many rudimentary ones; *Maxillaria luteo-alba*, with its large, orange-brown and white flowers; *M. nigrescens*, dark orange-brown; and *Phaius maculatus*. The subjects of this and the previous paragraph occupied seven houses.

Very pretty was the yellow flowered *Laelia flava*

and *Warszewiczella bicolor* with its violet lip. Half a house was filled with *Anguloas* just starting into growth. *A. Ruckeri*, *A. Clowesii* and *A. eburnea* were the principal species. Prettily spotted was *Oncidium Phalaenopsis* and *Odontoglossum Oerstedii* is a gem. We next passed through several houses of *Odontoglossums*, *O. luteo-purpureum*, *O. sceptrum* and others being conspicuous. An importation of *Cypripedium Parishii* and *C. hirsutissimum* filled a house. Suspended from the roof was the pretty *Brassavola cordata*.

Many pits were filled with *Cypripedium bellatulum*, *Vanda caerulea*, and *V. sanderiana*. The cases in the propagating pit were filled with the cuttings of fine foliage plants, inserted in sand. Here also were unflowered seedlings of *Cypripedium* and *Cattleya*. Very handsome were the new *Tradescantias*, *T. superba* and *T. Reginae*. Unflowered plants of *Bulbophyllum* and *Cirrhopetalum* were plentiful. A very handsome Fern is *Adiantum claesianum*, with a silvery-white centre and veins radiating from it.

NOTICES OF BOOKS.

HOME GARDENING: a Manual for the Amateur, containing Instructions for the Laying out, Stocking, Cultivation, and Management of Small Gardens, Flower, Fruit, and Vegetable. By W. D. Drury, F.R.H.S. London: L. Upcott Gill, 170, Strand, W.C., 1898. Price 1s.

As the sub-title of this book indicates, it is intended for the amateur, and the introduction further speaks of its being intended to assist those having small back gardens in urban and suburban districts. It makes no pretensions, however, at helping amateurs in preparing flowers and vegetables for exhibition. There are many amateurs even in the localities mentioned who can show very respectable flowers and win prizes with them at local exhibitions, while others run the professional gardener pretty close or even beat him at times in growing vegetables.

The book runs to 130 pages, including a lengthy index, but many plants are of course merely mentioned in the lists and selections. Some illustrations show simple and also more or less complicated plans of villa gardens, the design being in accordance with the size and surroundings of the garden. Under hardy perennials a considerable number of popular garden plants are included, such as Primroses, Violas, Violets, border Carnations, Gaillardias, perennial Asters, and a host of plants suitable for the herbaceous border proper. The space being limited, there is little opportunity to go into cultural details, but a few lines might have been devoted to the raising of border Carnations from seed. Apart from the intense delight of watching the flowers expand for the first time, especially when seed of a good strain has been procured, the fact remains that no other method of raising Carnations will yield such a profusion of flowers for cutting and yet leave the beds practically as gay as ever. Strains are now obtainable that yield a large percentage of double flowers of really beautiful forms and excellent quality.

The author has little love for summer bedding plants proper and in this we think he is right, for tender things seldom repay the trouble and expense of housing which they entail. The aspect and cramped surroundings of town gardens are often very little favourable to a proper display with sun-loving subjects. Amateurs, moreover, like variety, and there is nothing like herbaceous subjects, including bulbs and annuals for supplying it. The author might have dwelt more upon the value of digging and trenching, the latter especially, as it is not only capital exercise for town dwellers, but improves the conditions of small gardens immensely, and helps the amateur to get rid of a vast amount of vermin, particularly slugs, which find the suburban garden a perfect paradise for them, and in return give the amateur no end of trouble and vexation.

All kinds of herbaceous plants, including annuals, biennials, perennials, bulbs, and tuberous subjects are dealt with in one chapter. The third chapter deals with trees, shrubs, and climbers; the fourth with plants for small greenhouses; the fifth with plants for room decoration; the sixth with fruits for small gardens; and the seventh with vegetables. Plants for small greenhouses include such things as Azaleas, Camellias, Cannas, Chrysanthemums, Ferns,

Hydrangeas, Myrtles, bulbs and tubers, Primulas, Honeysuckles, Auriculas, Cyripediums, &c. Various illustrations are scattered through the book, and the type is clear and easy to read.

TOOGOOD'S CALENDAR of Sowings and Plantings in the Flower and Vegetable Gardens. By E. Kemp Toogood, F.R.H.S. Toogood & Sons, Southampton, and William Holmes, Ulverston, 1898. Price 6d.

The Calendar is in paper covers, and runs to 104 pages. It is in two parts, the first being devoted entirely to the vegetable garden, and the second to the flower garden. Some general information is given at the beginning of each month, below which are tabulated lists of the things to be sown or planted during the respective periods. The months during which each subject should be fit for use, in the case of vegetables, are named in the same lines as the plants to which they refer, and on the right hand side of the page. Sowings and plantings of vegetables are given for every month of the year, but this includes forcing, and everything, or nearly so, for October, November, and December has to be sown or planted in heat or under the protection of frames. A few things, however, are recommended for planting or sowing on warm, sheltered borders, assuming, of course, that the respective periods of winter are open, and the ground is in suitable condition. Seakale seeds sown in April are said to become fit for use in the third or fourth year, but surely this statement ought to be brought up to date, for we hear of gardeners discussing the question of getting the crowns fit for forcing in much shorter time, and roots in the autumn of the first year. The Calendar says the second or third year for plants raised from roots. In the case of flowers they are grouped according as they are to be sown on hotbeds or in flames on the open border, and bulbs, corms, &c. for planting.

THE CULTURE OF VEGETABLES for Prizes, Pleasure, and Profit. By E. Kemp Toogood, F.R.H.S. Printed in 1898 by Toogood & Sons, Southampton, and William Holmes, Ulverston, Price 6d.

This is a second and revised edition of a book of 129 pages, concerning which we made some remarks last year. It deals with the subject in a practical manner, and finishes up by giving a calendar of operations for every month of the year. The soil is the first subject handled, several of the more common kinds being taken up, and dealt with concisely as far as space will permit. Directions are given for the improvement of sandy, limestone, clay and damp soils respectively. A sandy soil is to be ameliorated by the addition of stable manure, vegetable refuse, powdered clay, mud from ponds, manures from pigstyes, cowsheds, &c. The reasons for the application of these things are clearly stated. In like manner the antidotes for the deficiencies of limestone and clay soils are set forth, with the correctives necessary.

The short chapter on soil-working shows that the author realises the value of digging and trenching, laying proper stress on the latter as a means of increasing not only the staple but the depth of the soil, and giving an increased root run, with a correspondingly deeper area for the collection of plant food by the root system. We have seen a comparatively worthless kitchen garden, having a subsoil of pure sand often within a foot or ten inches of the surface, completely renovated and rendered highly fertile by trenching and the removal of some of the sand, while manure and fresh soil were added. Trenching every second year, and gradually incorporating the upper with the subsoil, and liberal manuring from the stables did the rest. The importance of trenching gardens, whether by the amateur or professional gardener, cannot be too much emphasised. A plan for the amelioration of bad subsoils here given, elucidates and simplifies the work.

This is followed by the theory and practice of rotation of crops, a matter which is too frequently disregarded, with bad results, as might be expected. Reasons for the practice include not only the exhaustion of certain constituents of the soil, by particular crops, but also the question of the insect enemies and fungoid diseases that attack plants to such an extent in old garden soils that are too frequently cropped with the same kinds of plants. Observation of the rules of rotation of crops should go hand in hand with trenching, which does much to clear a soil not only of such special enemies as clubbing and Gall-root Weevils, but general pests

like slugs, the chrysalis stage of various moths and wireworms which infest kitchen and flower garden crops. A chapter is given to garden pests, of which the more common are passed under review.

A valuable addition to the second edition of the book is a table showing the comparative value of farmyard and artificial manures in general commerce. The number of pounds of the principal and most valuable elements of plant food in a ton of each kind mentioned lays before the reader what he applies to the soil by using any given sort. Several other kinds are mentioned in the notes that follow the table, but we think sawdust as a manure might have been omitted. Green-manuring is not so often employed by gardeners as it might be. Forcing is briefly dealt with, after which all the more important vegetables receive special treatment, according to their respective requirements. Strawberries and Tomatos are associated with the vegetables.

BUDDLEIA GLOBOSA.

THIS handsome Chilian shrub, or tree, is flowering freely this year owing, no doubt, to the mildness of the past winter. In the southern and western counties it is frequently seen in good condition, but round about the metropolis, it is somewhat of a *rara avis*, inasmuch as it is only half hardy, and therefore liable to be destroyed during severe weather. But for this fact it would, doubtless, be more in evidence, as, under favourable conditions, its rich, orange-yellow, globular flower-heads—which are unique in their way—produce a very fine effect. *Buddleia globosa* is often trained to walls, where it possesses a stiff and ungraceful habit; but planted out and treated as a shrub, in a free and easy manner, with a background of other shrubs and trees, it is, in such a season as the present, an object of great beauty. Mr. D. Cooper, of Hanger Hill House Gardens, Ealing, W., has so disposed it, the aspect being due south. In fact, he has two quite respectable trees—about ten feet high by six feet through—which were in their cutting-pots four or five years ago. The progress they have since made is due, in large measure to the mild character of the winters of 1896-7 and 1897-8. At any rate this subject is worth a trial, if only for the sake of its remarkably distinct and beautiful flowers.—C. B. G., Acton, W.

R. H. S. EXAMINATION IN HORTICULTURE.

(Concluded from p. 668.)

QUESTIONS.

Eight questions only to be answered: four from division A and four from Division B.

DIVISION A.

ELEMENTARY PRINCIPLES.

1. Describe the methods of propagation of different weeds; explain why Groundsel and Chickweed and the large-whiteflowered *Convolvulus* are particularly troublesome. What are the best means of exterminating these plants?
2. Point out the importance to the plants of a good circulation of air in a hot-house, and the consequences of a stagnant condition of the atmosphere within it.
3. Describe the different functions of leaves, and the best way to secure their due performance.
4. What are the component parts of a flower, and of what use are they respectively to the plant?
5. What external conditions are favourable for inducing variations to appear in cultivated plants; and how would you proceed in order to fix any variation?
6. What parts of the flower are retained and altered in forming the fruit of the Peach, Melon, Mulberry, Fir-cone, and Pineapple?
7. To what Natural Orders do the following trees belong:—Tulip tree, Maple, Apricot, Ash, Laburnum, Guelder-rose, Horse-chestnut, Horn-beam, Thuia, and Evergreen Oak? Which are natives of this country?
8. Describe the structure of the bulb of the White Lily, the corm of *Gladiolus*, the creeping-stem of Couch-grass, the rhizome of the Flag, and the tuber of the Potato; and explain their uses to the plants.

DIVISION B.

PRACTICE.

9. Describe landscape gardening as an art.
10. Describe the formation of a garden lawn, and the details of the work necessary to keep it in condition during the year.
11. What are the preliminary operations necessary to the laying-out of a garden for fruit and vegetable culture? Describe the arrangement of the fruit trees, and the method of planting them.
12. A garden having four walls facing north, south, east, and west, what varieties of fruit trees should be planted on each? Describe their first year's pruning and training.
13. Give full details of the propagation and culture of Grape Vines and Fig trees in pots.
14. Describe the culture of Seakale, Asparagus, and French Beans; and the best method of forcing them.
15. What are the best manures for kitchen and fruit gardens? How ought they to be applied, and when?
16. Describe the propagation and culture of Roses and Carnations intended to be cultivated under glass.

NOTES ON PARIS GARDENING.*

STREET TREES.

PARIS is said to be the gayest city in the world. Whether it was designated such from a social or floral point of view I do not know, nor care to ask. Be that as it may, however, on the occasion of my visit, from the wealth of flowers that I saw, both in public and private gardens, it struck me as being a very gay city in that respect, although I was informed it was not then the gayest season, socially speaking.

Having read and heard so much about the French system of tree planting in their boulevards, and this being the first object of interest to meet my view, I was naturally anxious to gratify my curiosity in a somewhat larger sense, and see for myself and compare with street planting that has come under my notice at home, so as to form a humble opinion of my own. Now the opinion I arrived at is, if general appearance is any criterion, that the French authorities pay a great deal more attention to these matters than the English public bodies, or whoever have the management of such work, and that the trees are planted and pruned on a more practical and scientific principle than any I have seen at home, our neighbourhood not excepted. For instance, trees that are planted in the public thoroughfares in Paris are not covered to within a few inches of the stem with

* A paper read by Mr. D. Cooper, Hanger Hill House Gardens, Ealing, W., before the Ealing Gardeners' Society.

flagstones, asphalt, or whatever the paving material consists of, and you need not travel far for demonstration for this assertion; but a space of about 4 ft. radius is left from the stem, and this, covered with iron gratings, so that the roots can get the required air and moisture. This practice, I am aware, is carried out in some parts of England, but, I believe, in rather a half-hearted manner. Then again, I observed in the case of young trees that were planted in gravel walks on sloping ground, soil would be placed round, a little distance from the stem, in basin form, so as to hold the water given them from municipal watercarts, or to catch and retain the rain that might fall. I mention this just to form a comparison, and, I think, you will generally admit that it goes to show how much the French authorities value their public trees. The species of trees used for planting in streets and public gardens about Paris are much about the same as we are accustomed to see at home, namely, Horse Chestnut, London Plane, Limes, and broad-leaved Oak, except the *Catalpa bignonioides*, which, with them, are almost as common as any of the former with us. I noticed, too, that the *Magnolia conspicua* was planted much more freely than we are accustomed to see it here in England.

BEDDING IN PUBLIC GARDENS.

The French, as do the English in the matter of bedding out their public gardens, show great skill and taste, and by the enormous quantity of choice plants used give an abundant proof that the management is dealt with in no mean spirit by the proper authorities, financially and otherwise. Judging from the general pleasing and instructive effects of these plants, I should say that the public gets good value for its money. The *Begonia* and *Canna*, as might be expected, were well to the front, both in quantity and effectiveness. The *Begonias*, however, were infinitely beyond anything that I ever saw, or expected to see, both in size and substance, and planted, as they were, in masses, the effect was truly magnificent. These remarks, in the case of the *Begonia*, not only apply to public gardens, but also to private ones, and for superiority there was very little to choose between them; in fact, I may say wherever I saw the tuberous-rooted *Begonia*, either planted out or in pots, to say the least they were in a general state of excellency, and a credit to the growers. I will here quote the opinion of one of our leading nurserymen, who took a tour through France last autumn. Respecting the *Begonias*, when questioned by one of the leading growers as to what the *Begonias* were like over there, his reply was, "Those that you grow inside, where one expects to see the finest flowers, are simply rubbish to those grown in France outside in every possible way, except in variety." Only in this latter respect are we able to keep pace with the French growers. If it was not for this question of colours and varieties one would be inclined to lose all heart in *Begonia* growing, after seeing those grown in France. With me, as with the authority just alluded to, this was a very noticeable and—I hope I may be pardoned for mentioning this—gratifying feature. One more remark concerning the *Begonia*, that is, it was admitted by all growers I came in contact with that they never saw the *Begonias* looking better than they were last autumn, especially the seedlings; in fact, the seedlings did so well that one of the leading private growers in the suburbs of Paris informed me that in future he should treat his tuberous *Begonias* for bedding purposes as annuals.

The general system of bedding, as a rule, was of a mixed character, and in some cases large pot plants were employed by way of relief; but this was more the exception than the rule. The general idea appeared to be, with some exceptions, to form huge masses of plants of different species and colours, so as to give a very imposing appearance, especially when seen from a distance, and with that object, in my humble opinion, it was a great success. For this purpose very large flower beds were used, much larger than we are accustomed to see them in England, and when filled with such gorgeous subjects, as *Cannas* for instance, in various shades of colour in flower and foliage they would naturally have a bold and telling effect, and when once seen not easily forgotten.

In some of the public gardens I noticed that large plants in tubs were used in addition to tall bedding and other plants, plunged about in the grounds. These plants were more particularly in evidence at the Tuilleries, in Paris, and at the Palace Gardens at

Versailles, and consisted of such plants as Aloes, Citrons, Bays, Myrtles, Palms, Pomegranates, &c. The arrangement of these plants, however, was in a measure somewhat varied to restrict formality. Some were arranged in groups, some in lines to form avenues, whilst some of the larger ones were stood out singly. In all cases they looked very conspicuous, but to my mind too formal and hardy in keeping with the general system of French bedding which, although the flowers are tastefully blended, is somewhat of a promiscuous nature. If the appearance of some of the tubs and plants was any criterion, I think the authorities must be of the same opinion as myself, as some of them appeared to be just dragging out a natural existence, and looked a remnant of former times. These latter remarks apply more to the place just alluded to.

Carpet bedding was not in evidence to any great extent, at least, not carpet bedding in the true sense of the term, although it still lingers there as in England, and I noticed some very clever and, to me, original designs worked out. Whilst speaking of carpet bedding I observed in many private gardens, as also in public gardens, that there was a fancy for bedding on what we might call a semi-carpet style, that is, instead of using dwarf plants the designs would be worked out with plants of a taller habit. I also noticed, too, in this particular kind of bedding in some cases very tender plants were used, such as *Crotons* and *Dracaenas* of sorts; also *Anthurium andreaeanum* and one or two more of that section. It was in villa gardens where I saw these tender plants used, and where this style of bedding appeared to find special favour.

I was very much struck by the absence of the *Dahlia* as a bedding plant; in fact, I do not remember seeing it grown anywhere except in one private garden to any marked degree, for reasons of their own. Perhaps the French do not favour this autumn subject for that purpose. Of climbing plants the *Bignonia sanguinea* seemed to be a general favourite, and by the manner it luxuriated it appeared to be quite at home, the dark red, tubular flowers showing up with very striking effects. With the exception of the above-mentioned plant, which, by the way, is very common, as I noticed it in many cottage gardens, and on old, disused walls, I did not come across anything very striking among the climbing plants; in many places where one would expect to find them they were conspicuous by their absence.

JARDIN D'ACCLIMATISATION.

As the period of my visit to France was very limited, and as I had then no idea of writing this paper, it consequently did not occur to me to take any special notes, so what I have recorded here is principally from memory. That being so I do not think I have anything more to add that I can remember on Paris gardening proper. I will now deal with a few notes I have made on private gardens outside Paris. As we are all more or less interested in private gardens, perhaps these few remarks might be more congenial to your minds than the preceding, but before I proceed I will just say a few words on the Jardin d'Acclimatisation. This garden is situated just outside of Paris, and is similar to our Zoological Gardens, with a dash of the Crystal Palace thrown in, and it is with the latter part of the establishment that my remarks will touch upon.

Whoever is head of the management of the horticultural department, well, to say the least, it is a credit to him and his staff. The bedding, which is somewhat extensive, would compare favourably with any that I saw, either in public or private gardens, for taste, neatness, and in quality. Mostly all the principal bedding plants were represented and labelled, *Begonias* (tuberous) and *Cannas* playing the most important part. The glass department was somewhat extensive, and appeared to be in capital order, fitted up with the latest improvements, including the electric light. The principal and most interesting building in this department is the conservatory. I say interesting advisedly, for I never saw Nature more successfully imitated than it was in this particular house, all formality as regards arrangement being entirely dispensed with. It was simply an arrangement made up of grotto-work, caves, rockwork, fountains, miniature bridges, &c., and shadowed with tree Ferns, Palms, Bamboos, and undulated with other suitable plants; whilst here and there would be hollows, carpeted with *Selaginella kraussiana*, with stately Palms or Bamboos rising out singly, the whole growing most luxuriantly, and with very natural

effects. The adjoining houses, however—as, indeed, all the others—were furnished in the usual way with pot plants and others planted out. Most of the stove and greenhouse plants were represented; so, too, were Orchids, though not in a very marked degree. Still, those that were there gave one the impression that no novice was attending their requirements. I noticed one house filled with choice *Vandas* and *Anthuriums* growing together, showing fine spikes and spathes. Whether there was anything else in this house more prejudicial to the public than the plants just alluded to I am not in a position to say, as I was debarred from going inside by bars being placed across the doorway. Perhaps the usual "Please do not touch" had not had the desired effect.

(To be continued.)

HYBRID ORCHIDS.

DR. MASTERS occupied the chair on the occasion of Mr. Jas. O'Brien's lecture on hybrid Orchids which was delivered before the Royal Horticultural Society on the 14th inst.

In his opening remarks, Mr. O'Brien referred to the able lecture by Mr. H. J. Veitch on the "Hybridisation of Orchids," which appeared in the society's *Journal* for 1895, and also to the interesting remarks made by Mr. C. C. Hurst upon "Some of the curiosities of Orchid Breeding." These gentlemen had covered a good deal of ground, and he wished, therefore, to deal with the matter from a purely cultural point of view. Each year brought with it a number of hybrid Orchids from various sources that upon comparison with the parent plants might not appear to be any improvement, but the fact should not be lost sight of that flowering, as they did at a different season from either of the parents, they helped to lengthen the season of flower in their houses. In the case of *Laelia Perrini* many hybrids raised from it flowered in the dead of winter, and were thus proportionately valuable. Generally speaking, the hybrid progeny tended to approach the female parent in time of blooming.

Many varieties of *Cypripediums* had been brought into existence by unhappy crossing, of which it could only be said that they were weeds, and their kind. The synonyms, too, were very puzzling and exasperating, and he hoped to see this point straight before long.

Passing on to the fertilisation of Orchids, the lecturer said that cross fertilisation effected by insects was the now accepted theory, although self fertilisation did undoubtedly take place in some instances. To this he thought were due the poor strains or forms of certain kinds that were occasionally found. With regard to the seeding of the plants in their native habitats he believed that the production of seed was not nearly so common as it appeared to be. Occasionally certain species were observed to be carrying numbers of seed capsules, but there were no seeds in them. He thought that these seedless capsules were caused by the irritation of the stigmatic surfaces by dust or other foreign bodies. Lehmann had said that the number of seed vessels produced by Orchids was smaller in comparison to the number of the flowers, although in some wind-swept, exposed spots certain species would produce a lot of seed vessels, whilst the same species in more sheltered spots would bear but few. This went to support the lecturer's contention that irritation by grit and dust was the real cause of the appearance of a number of capsules.

Mr. O'Brien then went on to speak of the difficulties with which the Orchid hybridist had to contend in this country. First of all he had to arrange the temperature to suit the young plants. Again, much of the seed sown never possessed the power of germinating, and there were many failures on that account alone. Then there was the lack of sunshine throughout a considerable part of the year, and this had to be seriously considered.

The question of affinity in relation to the government of crosses was next discussed. Crosses had been effected between apparently the most unlikely species and genera, whilst other plants which it was expected might be tractable, had yielded no results. Others again could only be employed in one way. Thus *Laelia digbyana*, although it had been exceedingly useful as a pollen agent, had, as yet, yielded no seed itself.

Passing to the consideration of cultural details, Mr. O'Brien pointed out the necessity for affording

the swelling seed capsule some support. The capsules of cultivated plants took longer to ripen than those of wild ones, and hence the seed should be sown immediately it was ripe, no matter what the season. Mr. Seden had practised with great success the plan of sowing seed on the compost in which established plants of the same species were growing. To do this the sphagnum was clipped back, the seed carefully sprinkled over the surface, the celluloid label with the date and other particulars of the cross attached, and the plant watered as usual. Nothing but rain water was ever used. Of course, in watering, care had to be taken not to wash the seed off, but no matter how carefully watering was done, some of the seed would perish thus. One of the most fruitful causes of failure was the presence of low forms of vegetable life which spread over this compost in which the young plants were. As these pests generally appeared in freshly made-up material this was a great point in favour of Mr. Seden's plan. Where freshly made-up compost was employed for sowing the seed upon, it was necessary to sterilise it. This might be done in two ways, first by watering with or steeping in boiling water, and secondly by baking. He preferred the former method as it was less likely to destroy the fibre of the peat. The pots and crocks should be perfectly clean, and sphagnum moss should be used sparingly or not at all. The seed pots or pans should either be suspended from the roof or placed on a shelf near the glass. A Wardian case was a very suitable place for them, but he preferred a propagating case covered with loose sheets of glass which could be arranged at will. As soon as the young plants were big enough to handle they should be pricked off into pans or Orchid pots. At this stage it was very important to avoid too much ventilation; in fact, with all warm Orchids during spring and summer, this caution was necessary. He had occasionally seen Orchid houses with their top ventilators open during the prevalence of cold east winds.

In conclusion, the lecturer pointed out that home raised Orchids had a great advantage over imported ones, seeing that they were much better able to withstand the vicissitudes of our climate.

In the discussion which followed, Mr. Hurst spoke of the pseudo-fertilisation of *Odontoglossum crispum* which had come under his notice. The capsules, however, contained no seed, but only the remains of a few shrivelled ovules.

Mr. De B. Crawshay spoke of *Cymbidium lowianum* fertilising its own pods.

Mr. Rolf said that there were two or three species of Orchids which had a habit of self-fertilisation, including *Maxillaria rufescens* and *Dendrobium crepidatum*. Speaking of natural hybrids, he said that although they had been severely criticised who had attributed the intermediate forms of certain Orchids to a hybrid origin, yet it had been proved that they had had good grounds for so doing. Thus *Laeliocattleya schilleriana elegans* had been found, as what was then supposed, to be a natural hybrid, and proof of this hybridity was afforded by the fact that it had been obtained artificially by crossing *Laelia purpurata* and *Cattleya intermedia*.

Dr. Masters also made some remarks upon the formation of pseudo capsules. He said it was simply due to irritation of the stigmas, and was not confined to Orchids, being quite common amongst Lilies.

A vote of thanks to Mr. O'Brien brought the meeting to a close.

SOCIETIES.

THE GRAND YORKSHIRE GALA.—June 15th, 16th, and 17th.

OUR readers will remember the catastrophe which overtook the York Gala last year, when the winds of heaven blew upon the tents and they fell; also the losses felt by the society in the deaths during the same year of the chairman, Sir Joseph Terry, and the vice-chairman, Mr. Edward Rooke. In view of this series of misfortunes, it is highly gratifying to be able to record the fact that the gala this year has been a brilliant success in every way. Not only were the entries more numerous than ever, but the quality of the exhibits was of the highest, whilst the weather was ideal, and the arrangements, as usual, perfect. Under such circumstances the 'gate' was an exceedingly heavy one, as, indeed, it

had need to be when we consider that the council offer £750 in prizes. As in previous years, the exhibition was held in the grounds of the Bootham Asylum, in the grand old cathedral city of York, the general plan of the marquees accommodating the exhibits also being the same as on past occasions. Some difference in the disposition of the exhibits was, however, manifest, the great bank of *Pelargoniums*, which formerly occupied a prominent position in the main marquee, having been relegated to one of the smaller side tents, and its place occupied by a superb array of Orchids.

In the competitive classes, the first prize for a group of miscellaneous plants arranged for effect, and occupying a space of 300 sq. ft., was well won by Mr. G. J. Mee, of Nottingham, with a light and tasteful combination, in which Palms, Crotons and Orchids, especially *Odontoglossum crispum*, figured conspicuously. Sir James Reckett, Bart. (gardener, Mr. Geo. Wilson), Swanland Manor, Brough, was second; whilst Mrs. Gurney Pease (gardener, Mr. J. McIntyre), Woodside, Darlington, was third.

The specimen stove and greenhouse plants are always a prominent feature at the Yorkshire Gala, and on this occasion they were fully up to the mark. Mr. J. Cypher, of Cheltenham, repeated his successes of former years in this connection, carrying off the chief prize for ten specimens with superb samples of *Bougainvillea Cypheri*, *Pimelea dionaeolia*, *Clerodendron Balfouri*, *Erica depressa*, *Cycas undulata* and *Latania borbonica* amongst other subjects. Mr. G. Letts, gardener to the Marquis of Zetland, Aske Hall, was second; and Mr. William Vause was third. Mr. J. Cypher was likewise first for six plants, three Cape Heaths, and one greenhouse *Azalea*; whilst Mr. J. McIntyre scored for six and three ornamental fine foliage plants in their respective classes, four Crotons of distinct forms, six and three exotic Ferns.

In the open classes for Orchids Mr. J. Cypher carried all before him. His most notable success was the winning of the Victoria Prize (£20 and a Gold Medal) for the group occupying 150 sq. ft. Palms, Azaleas, Bamboos, and Asparagus were all employed to give height and lightness to the exhibit. Mr. J. Robson, of Altrincham, received the second prize. Mr. Cypher's other firsts were for ten, six and three Orchids in full bloom.

In the classes for cut flowers there was a lot of capital material forthcoming. The premier exhibit of the hardy element occupying 18 ft. x 4 ft. came from Messrs. Harkness & Son, Bedale. Roses, as might have been expected from the inclement weather, were not up to the mark. The premier award for 72, in 36 varieties, went to Messrs. A. & J. May, Bedale, who, despite the untoward climatal conditions had good blooms of Ulrich Brunner, Caroline Testout, La France, and Maréchal Niel. Mr. G. Mount, of Canterbury, was second in this class, but led for 48 blooms, with Captain Hayward, Mrs. John Laing, Cleopatra, and Ulrich Brunner good. Messrs. A. & J. May were second. The same order was preserved in the class for 36 blooms distinct, Mr. Mount securing first, and Messrs. A. & J. May, second.

The fruit classes were well patronised, and a good deal of interest centred about the competition for the decorated table to carry from ten to fourteen dishes. Mr. J. Tullett, gardener to Lord Barnard, Raby Castle, won the chief honour, having a table prettily decorated with *Odontoglossums* and *Schizanthuses*, and carrying grand dishes of Black Hamburg and Muscat of Alexandria Grapes, Brown Turkey Figs, Royal Sovereign and James Veitch Strawberries, besides Peaches, Melons, Pineapples, Bananas, and two Melons. Mr. Goodacre, gardener to the Earl of Harrington, was second, and Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Hutton Hall, Guisborough, was third.

The premier collection of vegetables came from Mr. J. McIndoe, who staged a grand lot of stuff. In the classes for six kinds of vegetables in which special prizes were offered by Messrs. Sutton & Sons, of Reading, and Messrs. Webb & Sons, of Stourbridge, Mr. McIndoe was an easy winner.

The various non-competitive exhibits constituted an attractive feature of the show. Messrs. Hugh Low & Co., of Bush Hill Park, Enfield, staged a grand lot of Orchids in which were many fine *Cattleyas*, *Laelias* and *Odontoglossums*; also the choice *Cypripedium lawrenceanum hyeanum*.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, also sent a splendid collection of Orchids, amongst which some grand forms of *Laeliocattleya* stood out prominently. Of these *Lc. Hippolyta*, *Lc. Eudora Langleyensis*, and *Lc. canhamiana superba* were specially noticeable. The scarce *Vanda cristata superba* was also well shown. The Chelsea firm had also a huge stand of magnificent *Caladiums*, as well as *Streptocarpus* and miscellaneous flowering and foliage plants.

In the group of Orchids contributed by Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., the *Odontoglossums* were much admired, some exceedingly fine spikes being on view. From the same firm came some good *Malmaison Carnations*.

Messrs. W. Cutbush & Son, of Highgate, had one of their tastefully set-up groups of *Malmaisons*, *Azaleas*, *Ericas*, and other flowering subjects, with the requisite complement of greenery.

The *Caladiums* sent by Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood, S.E., were, as usual, first-class, and contained several new varieties of note. The Norwood firm also had tuberous *Begonias*, named *Gloxinias*, and *Streptocarpuses* in variety, all in capital condition.

Messrs. Sutton & Sons, of Reading, had a magnificent lot of Peas and Tomatos in their fine array of vegetables, all of the plants being heavily cropped. Amongst the *Gloxinias* shown from Reading was that splendid white variety, *Her Majesty*. A Gold Medal was deservedly awarded here.

Messrs. Fisher, Son & Sibray, Handsworth Nurseries, Sheffield, had three distinct exhibits that occupied in all some 600 sq. ft. In addition to a representative group of hardy ornamental trees and shrubs, of which the firm has long made a speciality, was a grand bank of *Rhododendrons* of the leading varieties, and a capital group of stove plants.

The group of new plants sent by Messrs. F. Sander & Co., St. Albans, contained *Dracaena sanderiana*, *D. godseffiana*, *D. Van der Biltii*, and that plant of the year, *Acalypha Sanderi*. A choice lot of Orchids was staged in association with these.

Amongst other noteworthy exhibitors were Messrs. R. Smith & Co., of Worcester; Dicksons, Ltd., of Chester; Clithran & Sons, Altrincham; and Jarman & Co., Chard, all of whom showed hardy flowers in great profusion and variety. Messrs. R. Smith & Co. also had some of their fine, trained Clematises in pots, all of them being exceptionally full of flower. Messrs. W. & J. Birkenhead, Sale, Manchester, sent Ferns in great variety, and of the high quality that we expect to see from this source. Plants illustrating the value of Ichthemic Guano as a fertiliser came from the Ichthemic Guano Company, Ipswich. Mr. M. Campbell, High Blantyre, showed show, fancy, and hedding Pansies and Violas in capital style, most of the leading varieties being represented. Mr. S. Mortimer, of Rowledge, Farnham, Hants, showed some excellent new Cucumbers, seedlings from that time-honoured favourite, Telegraph.

COLCHESTER.—June 16th.

THE summer show of the Colchester Rose and Horticultural Society was held on the above date in the charming grounds of Hill House, Colchester, the residence of Mr. C. E. Egerton-Green, and was favoured by bright, sunny weather. So far the Rose season has been anything but a good one, and Colchester, among the rest, has suffered. The entries were fewer, but the quality was well sustained.

Roses were, of course, the backbone of the show. Competition was very keen amongst the growers, and there was a series of tough fights in the open classes. Mr. Geo. Mount, of Canterbury, scored a signal success for the thirty-six single trusses, distinct. He was followed in the second and third places respectively by Messrs. D. Prior & Son and Mr. B. R. Cant, both of Colchester. The best twelve single trusses, either Teas or Noisettes, came from Mr. Geo. Prince, Oxford, the Colchester growers, Messrs. Frank Cant & Co. and Mr. B. R. Cant, following in the order of mention. Messrs. Frank Cant, B. R. Cant, and Paul & Son, Cheshunt, won in order of mention for twelve distinct garden or decorative Roses, so here Colchester had her revenge. Mr. G. Prince received a Gold Medal for a grand single bloom of *Souvenir d'un Ami*.

In the amateurs' classes, Mr. R. E. West,

Reigate, won for eighteen distinct single trusses, and Mr. H. G. Egerton-Green (gardener, Mr. F. Kettle), for six trusses of Teas and Noisettes. The Rev. J. H. Pemberton was placed first for twelve garden Roses.

Messrs. J. Burrell & Co., Howe House Nursery, Cambridge, staged the first prize exhibit of twenty-four bunches of cut, hardy herbaceous flowers, Mr. R. C. Notcutt, of Woodridge, coming in second. In the smaller class for twelve bunches of similar material, Mr. H. G. Egerton-Green scored, and Mrs. A. Cant had the best six bunches. The most tastefully decorated dinner table was adjudged to be that contributed by Mrs. R. W. Wallace.

The exhibits of pot plants were not very numerous. In the group arranged for effect, Mr. H. G. Egerton-Green was first, with Messrs. Bunting & Sons, second, and Mr. W. Draper third. Mr. H. G. Egerton-Green was also first for the table of plants arranged for effect, Mr. James Round, M.P. (gardener, Mr. H. Bishop), Birch Hall, being second in this competition. Amongst the non-competitive exhibits was a nice collection of Palms, Ferns, and other decorative plants, illustrating the use of Ichthemic Guano, shown by the Ichthemic Guano Company, Ipswich.

Both fruit and vegetables were poor, especially in number of exhibits. Mr. W. J. Trott, gardener to Lady North, Little Glemham Hall, had the best black Grapes, and Mr. H. Cook, gardener to Mr. W. Nocton, Langham Hall, was equally successful for three bunches of white Grapes.

In the vegetables, by far the most noteworthy exhibit was that of the collection of eight distinct kinds sent by Mr. H. G. Egerton-Green. Here the quality was really good.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

Yellow-flowered Shrub.—W. B. G.: The shrub is known as the Himalayan Laburnum (*Piptanthus nepalensis*). Being rather soft in the wood and partly evergreen it is liable to be injured in very severe winters. In the neighbourhood of London, however, it has stood through many winters against a wall without suffering any great injury. North of London, as in the Midlands, a wall is necessary for its protection. In the neighbourhood of the sea, that is, all round the coast, the conditions are more favourable to it. To our knowledge at least it grows as far north as the Firth of Tay. It was introduced from Nepal in 1821. There should be no difficulty with it in your neighbourhood.

White Thorn Mildew.—J. T. Thurston: According to our observation, Thorns, when so badly attacked with mildew as the specimens sent, are liable to be attacked every year, the reason being, probably, that when once the trees get into an unhealthy condition they have a difficulty in shaking themselves clear of the malady. No doubt the light and dry nature of the soil augments and encourages the growth and spread of the mildew, as the tree is unable, under the circumstances, to make fresh and vigorous growth. If the tree is not a valuable one, probably the least expensive method of dealing with it would be to uproot and burn it to prevent the spread of the fungus on healthy Thorns and allied subjects. If, on the other hand, it is worth taking some trouble with, you might take out a shallow basin round the tree and give copious supplies of water at intervals during dry weather. You might also give the tree a good syringing with flowers of sulphur in water. In the autumn it might prove advantageous to transplant the tree into richer soil in a fully exposed position, adding some fresh soil of a retentive nature.

Peas for Market.—X. Y. Z.: Peas sown in the open field for market purposes are never staked, whether dwarf or tall growers. They do not grow so tall when not staked, but fall over and lay upon the ground. Early Sunrise and First Crop are dwarf early varieties, popular with the market growers in Kent. The Essex growers believe strongly in Blue Eclipse, and in a selection from it named Blue Re-selected Express, which proves a week earlier with them than the original. They also grow Gladiator and William I. In some parts of East Anglia American Wonder and English Wonder are grown to some extent. Pride of the Market is a popular maincrop Pea in Kent. In Yorkshire they believe in Telegraph, Yorkshire Hero, Dr. McLean, and Telephone as maincrop varieties, Telegraph being more extensively grown, perhaps, than either of the others. In the Midlands the growers believe in Prince of Wales and Blue Imperial as maincrop sorts for pulling in the green state. You could use some or others of the above, and make experiments with a few others annually to ascertain which give the best return. William I. you may remember, is a round Pea, valued chiefly for an early picking.

Pelargoniums of Different Races.—Omega: All Pelargoniums of whatever race belong to the same family, namely, the Geraniaceae. The spotted Pelargoniums of the greenhouse, as you call them, have been developed from the wild Pelargonium cucullatum. This applies to show, fancy, and regal varieties. The zonal Pelargoniums or hedders have been obtained by hybridising two or more species together. The most frequently used, perhaps, was P. zonale, having a dark band on the leaf. Another was P. inquinans, which had its leaves entirely green. You will find the influence of the latter in green-leaved varieties amongst bedding and pot plants. The Ivy-leaved Pelargonium has been derived from P. peltatum. The scented-leaved varieties and hybrids have been obtained from several species. You will see from this that all the Pelargoniums belong to different species of the of the same family.

Worms in Small Box.—H. Roach: The so-called worms you sent were Centipedes or Scolopendrae, not worms, which have no feet. The specimens you sent are believed to be the Geophilus electricus of Linnaeus, and are certainly the G. longicornis of Leach. You must certainly have a fine breed of them, for several of those that reached us were of large size. Younger ones had escaped from the box, but having been struck by the stamp in passing through the post were glued to the box by the tail. They have from 51 to 55 pairs of short legs by which you may distinguish them from true worms. Entomologists do not seem to think them very injurious because they are carnivorous and prey upon their allies as well as upon members of their own species. They also seem to concede that they live upon decaying Potatos and other vegetable matter. If too numerous and troublesome you might lay pieces of Potatos and Turnips about in their haunts to act as traps which you should examine every morning. We think, however, that deep trenching of the ground every second year would help greatly in destroying these vermin. If the garden consists of old soil with much vegetable matter in it, you might improve the same by working a quantity of lime into the top spit, and this would help to destroy or drive away these and other vermin.

Carnation Disease.—Omega: You do not state what particular disease has attacked your Carnations. There are several maladies to which this class of plants is subject. It would be better to send a specimen of anything suffering from disease, as it would give us a chance of determining the disease and suggesting a remedy. Very possibly, your plants may be suffering from a fungus known as Helminthosporium echinulatum, a most troublesome customer, and difficult to get rid of. Most likely the fungus obtained a footing in winter when the light was had and the atmosphere moist. As it lives inside the tissue of the leaves, no fungicide that will destroy it has yet been found, without killing the plants at the same time. The most that you can do is to cut off diseased leaves and shoots, and burn them. During winter and other dull times you should keep the air of the house in which they are grown dry and cool. Propagate from healthy layers or cuttings only. It might even be worth your while to get a fresh stock of plants or cuttings elsewhere and start afresh, after thoroughly cleaning the house in which they have been grown. This would be the best plan if your plants are very badly attacked. If you decide to get rid of the old stock you should burn it.

Name of Rhododendron.—Wm. McIver: The truss of Rhododendron sent on the 20th ult., and which you had flowered under glass is Rhododendron gowenianum, a garden hybrid now flowering in the open air in the South. It was raised from Azalea nudiflora or A. viscosa crossed with a garden hybrid of Rhododendron ponticum and R. catawbiense.

Names of Plants.—W. B. G.: Iris sibirica.—J. T. Thurston: 1, Sedum acre; 2, Saxifraga umbrosa; 3, Gladiolus byzantinus.—A. Simpson: The Prairie Anemone or May Flower (*Anemone patens nuttalliana*); it is closely allied to the British A. Pulsatilla or Pasque Flower.—A. C.: Aquilegia chrysantha; 2, Geranium sylvaticum; 3, Phlox subulata nivea; 4, Dianthus plumarius var.; 5, Lupinus polyphyllus; 6, Allosorus crispus.—W. J.: 1, Cattleya Mendelii; 2, Deadrochium undulatum; 3, Masdevallia harricana; 4, Odontoglossum nebulosum.—A. L.: 1, Deutzia crenata, 2, Crataegus oxyacantha flore pleno coccineo.—T. Ward: 1, Rubus hiflorus; 2, Ribes alpina pumila aurea; 3, Retinospora plumosa aurea; 4, Retinospora obtusa.—Omega: The Cockspur Thorn (*Crataegus Crus-galli*).—R. M.: 1, Athyrium Filix-foemina var.; 2, Athyrium Filix-foemina; 3, Aspidium angulare var.; 4, Athyrium Filix-foemina var.; it comes into the section Cruciatum, of which 59 at least have received names; it comes near A. F.-f. percruciatum, but would have to be named from a collection.—J. L. Reynolds: The broad-leaved tree is Ilex latifolium or the Broad-leaved Holly; the small-leaved shrub is Escallonia philippiana.

PLAGUE OF GREEN FLY.—The conditions of the past few months as to climatic influence and otherwise would seem to have been very favourable to the propagation and distribution of one of the most universal pests in British gardens, that is, if green fly can be spoken of in the singular. The gardener is generally content to utilise the term in this sense, yet there are over 180 species, natives to these islands. Some of the species may partly or completely confine their energies or depredations to one species, of plant; but more often they extend their ravages to any or all of the species of a genus. Instances of this are the Rose Aphis (*Siphonophora Rosae*) and the Pea Aphis (*S. Pisi*). The latter attacks not merely the garden Pea, but various species of *Lathyrus*, possibly any of them. If the entomologist is right the Rose Aphis is so far adaptable to circumstances as to give rise to varieties differing in colour, but one named *S. Rosae glauca* has a special weakness for Carnations, and on occasion extends its depredations to other species of *Dianthus*, particularly Sweet Williams, while yet the flowers are in the early bud stages. On the other hand some of the aphides can live and thrive on a great variety of plants belonging to different genera and families. Perhaps no green fly is a more universal feeder than *Rhopalosiphon Dianthi*, so named from its being found originally probably on some *Dianthus*; but it is now

known to attack plants so widely separated as Fuchsias, Peaches, Pansies, Verbenas, Potatos, and a host of other garden plants.

The gardener is chiefly concerned as to the easiest method of getting rid of his troublesome enemy. Our observation leads us to believe that the shelter a garden affords is particularly conducive to the welfare of aphides and various other insect and fungoid pests. The more completely a garden is hedged round with walls, trees, and houses the more plentiful the insect enemies of plants become. This even extends to the shelter the plants themselves afford. The Apple, Plum, and some of the Peach aphides have the power of curling up the leaves, thereby sheltering and hiding themselves. Others take advantage of the half-unfolded leaves of the buds, thus doing incalculable damage to the flowers and foliage at a time when they are most vulnerable. Any remedies that can be taken are most effective and result in the greatest advantage to the plants, if taken in the earliest stages when the insect colonies are yet small and have not had time to do damage. What can one do, however, in the case of Lettuce whose leaves are just closing in and covering up myriads of the filthy red Lettuce Fly? At the present time and for weeks past nothing has been giving more trouble, perhaps, in gardens generally than the Rose aphides, but particularly the species above mentioned. The bushes may be syringed weekly, daily, or oftener, with clean water and foul, but all the same the pest is present in force a few hours later. It is a hardy insect and survives a deal of bad usage with applications of quassia water, tobacco water, soap suds, and Gishurst Compound. No doubt many of the insects get destroyed, but others crawl to the sheltered side of the stems and leaves, resuming their nefarious work when the storm is past. Those which get knocked to the ground crawl or fly up again; hence their sudden reappearance. It must not be forgotten, however, that winged specimens may and do come from other quarters, where the increase of their own numbers and the neglect of the owners of Roses, obliges the aphides to seek for fresh pastures. Amongst all the remedies used tobacco powder seems as effectual as any. Where much ground has to be covered, the application of the remedy is a tedious process; but if worth doing it is worth doing well. The object is to reach the insects in their sheltered positions, which alone will start them out. The bushes, if dry, should first be lightly syringed all over so as to make the tobacco powder cling to the leaves. Then the operator may proceed to work, dusting the powder well into the opening buds, the flower trusses, the axils of the younger leaves, and wherever the enemy may be sheltering. In a short time the insects may be seen in hundreds at the tips and edges of the leaves, and all trying to escape to some safer retreat. Some of them ultimately sicken and fall off, particularly if powder is adhering to them. Some that are ready to pupate acquire wings and fly away, but all disappear in one way or another. After this period the leaves get firmer, and the pest is never so potent for mischief in the later half of the season.

THE OLDEST TREE IN EUROPE.—There are many isolated instances of trees that are reckoned to be of great age if not the oldest existing in the country; but when they happen to be hollow as is often the case how is their age to be reckoned with any degree of exactness? In any case the Yew and the Oak, particularly the former, hold a high position in the claim to longevity. *The Dundee Advertiser* gives a lengthy and interesting account of the Fortingall Yew, in Perthshire. With the particulars at his

command De Candolle, in 1831, reckoned the Fortingall Yew to be 2,500 to 2,600 years old in 1770. Even if this is admitted to be true the Brabourne Yew in Kent is reckoned to be some centuries the senior of this patriarch. Nevertheless both trees may enjoy the benefit of the doubt until proof of their age is forthcoming. The writer from whom we quote is satisfied, however, amidst all the local antiquities that the Yew is the oldest object the eye can see at Fortingall, "next to the everlasting hills themselves." He thinks this tree was a sturdy sapling when Solomon was building his temple, and the ancient druids may have worshipped under its shadow. The tree stands in the graveyard at Fortingall, and Pennant mentions having seen it in 1761, when it was 56 ft. in circumference. At one time the village boys used to kindle their Beltane fires at its roots. Curio hunters, until they were deterred from interfering with it, used to cut down branches and make them into cups and boxes &c., for sale. The huge trunk is now a mere hollow shell from which three great trunks appearing like separate trees arise. There is a younger but large tree just outside the graveyard, probably a seedling from the patriarch, and unless the chronicler is careful, the daughter tree may in the future be recorded as the parent. Such things have happened before now, as in the case of King Charles' Oak.

Guttapercha was introduced to Europe from Malaga in 1852. The annual consumption now totals up to 4,000,000 lbs. per annum.

A Sad Accident to Mr. T. Humphreys.—We are exceedingly sorry to learn that a sad accident has befallen Mr. T. Humphreys, Mr. S. T. Wright's able lieutenant at Chiswick. Whilst playing cricket at Turnham Green last week a ball struck him on the head. Hemorrhage of the brain has set in, and he lies in a critical condition.

Tom-tits in a Letter Box.—I saw in your number for the 14th of May last that a pair of tom-tits have built their nest in a letter box, and the hen was sitting on her eggs. Here is something in the same way just opposite my nursery, on the leading way from Ghent to Antwerp (Chaussée d'Anvers 406). A pair of tom-tits have built their nest in a letter box as well, and have young now for the second time. As soon as the gentleman saw that those birds had built their nest there he told the postman to ring the bell, and to give the correspondence into his or his servant's hands.—*E. Coppiters.*

Chiswick Gardeners' Mutual Improvement Association.—There were 100 students present to hear the lecture on "The Origin of Common Garden Vegetables," by the Rev. Prof. George Henslow, at Chiswick, on the 22nd ult. These included young gardeners from Chiswick, Kew and Ealing. The lecture that was to be delivered on the 29th ult. was postponed till July 6th, owing to the coincidence of the Richmond Show on the 29th last. The lecture on the 6th is to be on "The Origin of Common Garden Flowers." The lecture on the 13th will be on "The Origin of Species and how Variations may be induced under Cultivation."

Vegetable Products of the Philippine Islands.—The area of these islands is reckoned at 150,000 square miles, and the population at eight to ten millions. The soil is fertile and productive, requiring only intelligent cultivation. Manilla Hemp is one of the chief sources of wealth. Sugar plantations give less satisfaction owing to the ignorance of the cultivators. Tobacco culture, as most people may imagine, is one of the leading industries. The Coffee has a fine aroma, though not equal to that of Mocha or Bourbon. Indigo produced here is notable for its fine qualities. Cocoa trees (*Theobroma cacao*) grow in abundance. During the ten years ending in 1897, 914,055 tons of Manilla Hemp were exported from the Philippines; and 1,582,904 tons of sugar in the same period.

A Lemon Bath is almost a daily luxury in the West Indies; and a pleasant sense of freshness and cleanliness is imparted to the skin by its use. The method is to slice three or four limes or lemons and let them lie for half an hour in the water, so that the juice may be extracted.

Plants and Snakes.—There is a plant in India, says a native paper, which so closely resembles the cobra that it can only be distinguished from that deadly snake by close inspection. It has a sort of expanded hood similar in size, shape, colour, and other respects to that of the cobra. The juice of the plant is also said to be highly poisonous, thus completing the resemblance to the cobra.

A Patriarchal Chestnut Tree.—At Tortworth, in the county of Gloucester, there is a remarkable tree of the Sweet or Spanish Chestnut (*Castanea vesca*, or *C. sativa*) which was known as far back as 1135. More recently in 1766 the trunk measured about 17 yards in circumference, at a yard and a half above the ground. About a century later it had added another yard to its circumference, and must now be a very venerable patriarch of its kind.

The Pip of a Scottish Peach.—A rather rugged Scotch laird, about 1,800, was dining at Hamilton Palace for the first time, and after dinner he pointed to a dish of Peaches, and said to his hostess, "What kind of Apple is yon?" She told him they were Peaches, and he said he would just take one to taste it. He took one and stuck half of it in his mouth, and bit hard into it, so that the juice ran out of the corners of his mouth. Then spake, or rather sputtered that guileless Gael, "Oh, it's a gran' Apple, but sic a pip as it's got!"—*Scraps.*

Orchids at the Sale Rooms.—The natural hybrid *Odontoglossum crispum-harryanum* made its appearance at the Sale Rooms of Messrs. Protheroe & Morris, Cheapside, on Friday, the 24th ult., when some lively bidding run it up to 38 guineas, but the lucky owner declined to part with it at that sum. There were several very pretty Cattleyas amongst the flowering plants including a charming, light-coloured variety of *C. Mossiae*, with blush sepals and petals, and a large, lively and conspicuous purple blotch on the otherwise pale lip. This went for £5. The present is a grand time to get Orchids at reasonable prices.

The Destruction of Charlock.—For many years, possibly for centuries, there has been a desire to find out some ready method by which Charlock or Field Mustard (*Brassica arvensis*) might be destroyed in fields of corn without at the same time destroying the latter. The French tried the plan of spraying with a solution of sulphate of copper. The Essex County Council made some experiments last year with the same object in view, but it was too late in the season before operations were commenced. Further trials were commenced about the middle of last April, and the results so far have been given in a report signed by Mr. Reginald W. Christy, and Mr. Thos. S. Dymond, of the County Technical Laboratories, Chelmsford. By means of a strawsonizer, several strips of a field of barley infested with Charlock were sprayed with 1, 2, 4, and 6 per cent. solutions of sulphate of copper, applied in quantities varying between 10 and 100 gallons per acre. A 1 per cent. solution was too weak to kill the Charlock; and a 6 per cent. solution was too strong for the barley. Ten gallons per acre did not afford sufficient to wet all the Charlock. The best results were obtained by using a 2 per cent. solution at the rate of 25 to 50 gallons per acre, during dry weather in the earlier stages of growth. The experiment was "completely successful" in the words of the report. The sprayed strips were perfectly free from Charlock when the report was written, while the unsprayed portions were yellow with it. The barley was stronger and of better colour in the sprayed strips. Other crops showed that sulphate of copper might be used to advantage, except in the case of Turnips and Swedes, which belong to the same genus as Charlock, and are burnt in the same way as the latter. The best time to perform the operation is a still, dry day, when the Charlock first appears. Later on it is partly protected by the crop; nevertheless, if sprayed while in flower, the Charlock is prevented from seeding. Surely this will not be allowed to pass into oblivion without a full and decisive trial by those concerned.

Imitation Coffee Berries have recently been manufactured abroad. Examination showed that they were made of ash-gum, dextrine, and other materials.

Put on more air.—*Gardener*: "Come now, Mike, my boy, run into the vinery and see how high the temperature stands." *Mike* (after being in the vinery): "Sure, and it is higher than the three-foot rule."—*Snaggs.*

A Bounty for Tree Planting.—In Minnesota there is, says *Gardening* (American), a law to encourage tree planting. A bounty of \$2.50 (10s.) an acre is offered, and a full acre must be planted. No person can collect the bounty for more than 10 acres in a year, or for more than six years. Any tree but the black Locust may be planted. Last year bounty was paid on 9,524 acres. The law has been in force for sixteen years, during which time upwards of 100,000 acres have been planted.

The Widow of the Late Dr. Woodman.—I am more than glad to inform you that I have just heard from the widow of my old master and dear departed friend, Dr. W. R. Woodman, saying she has been elected a pensioner of the Royal Masonic Benevolent Institution. Mrs. Woodman writes: "I am thankful to say that I am elected to the pension, and thank all who assisted me, especially yourself." The public notice of this deserving case, kindly given recently in your popular and influential journal, arrested considerable attention in all parts, and did much good for the cause. On Mrs. Woodman's behalf, I am grateful and thankful to you.—*William Napier, June 23rd, 1898.*

A Royal Visit to Messrs. Lucien Linden & Cie's Establishment at Moortebek.—On Thursday, June 23rd last, the King of the Belgians paid a visit to this well known Orchid establishment, situated in the neighbourhood of Brussels. Under the guidance of Mr. Lucien Linden, the King inspected for several hours the various houses and their treasures, and expressed his high admiration of the admirable arrangement and perfect condition of everything he saw. At every point he showed the deep interest he takes in horticulture, which plays such an important part in Belgium. On taking leave he very highly complimented Mr. Lucien Linden, on the model establishment he has created, and maintains in such a highly efficient manner.

National Chrysanthemum Society.—The Annual Picnic and Outing will take place on Monday, July 25th next. This will take the form of a trip to Harwich by Great Eastern Rail, a water trip from Harwich along the picturesque Orwell to Ipswich and back, returning from Harwich by rail in the evening. The General Manager of the Great Eastern Railway Hotel, Liverpool Street, has entered into a contract to convey the company throughout the entire journey by rail and water, providing dinner and tea at the Great Eastern Railway Hotel, Harwich. The charge for the day, including rail, boat, dinner and tea will be 10s. 6d. to members, and 11s. to non-members. A special train of saloon carriages, and one of the splendid saloon steamships of the Great Eastern Railway Company will be placed at the service of the party, provided a guarantee can be given for 250 persons. The exclusive use of these modes of conveyance would greatly promote the comfort and convenience of the company. As one or two of our affiliated societies are desirous of taking part in the trip, this preliminary circular is issued in the hope that by the participation in the trip of affiliated societies, and by members exerting themselves to dispose of tickets, the number stated above may be secured. *Bona fide* members of affiliated Societies will be charged for the trip at the same rate as members of the N.C.S. It is certain that the catering will be most satisfactory, and should the weather proved unfavourable, the protection on the steamship will be found ample. Should the required number of 250 not be obtained, the party will have to travel by ordinary trains and steamboats. A complete programme of the day's arrangements, together with menus for dinner and tea, is in course of preparation, and a copy will be furnished to every person taking part in the trip. As it is most important some idea of the probable number forming the party should be known by July 1st, I shall be glad to hear from you by that date. All communications relating to the trip to be addressed to—*Richard Dean, General Secretary, Ealing, London, W.*

Prof. Anton Kerner Ritter von Marilaun, the eminent botanist at Vienna, has just died at the age of 67.

Coming of Age Festivities at Stourbridge.—The coming of age of Mr. E. Stanley Webb—eldest son of Mr. Edward Webb—was celebrated on Saturday afternoon, Mr. and Mrs. Webb having invited the staff of Messrs. Webb & Sons, the Queen's Seedsmen, to their beautiful residence at Studley Court, Stourbridge. There were about 400 present, including the staff from Wordsley and the hands employed at the Kinver Seed Farms, also the managers from the Chemical Works at Chester. Fine weather prevailed and the visitors were enabled to spend a very pleasant time. A variety of games was provided for their amusement, including bowls, tennis, cricket, quoits, &c., whilst many availed themselves of boating on the lake, a fine sheet of water four acres in extent. The house and grounds were both open and in the early part of the proceedings afternoon tea was served, after which the whole party was photographed on the terrace. The band of the 2nd Battalion Bedfordshire Regiment, comprising 37 performers under Bandmaster Willis, gave great pleasure by their performances. Dinner was served in a large marquee, after which Mr. W. W. Wyld, on behalf of the staff, presented Mr. Stanley Webb with an illuminated address, together with several handsome articles, including a travelling bag, dressing case, hunting crop, sandwich case, &c. Mr. Wyld testified to Mr. Stanley Webb's popularity with the staff. Mr. Stanley Webb in responding said he could not sufficiently thank them for the kindly feeling towards him as expressed in the address, and he also acknowledged his indebtedness to them for the assistance they had given him since his connection with the business. "Success to the Firm" was proposed by Mr. J. W. Berrington, who referred to the great abilities and untiring energies of the firm—Col. Webb and Mr. Edward Webb. They always kept the business abreast with the times. Every year saw some new development, either the extension of the warehouses at Wordsley, the acquisition and enlargement of the works at Chester, or, as it had been during the past year, the purchase of an additional estate adjoining their Seed Farms at Kinver, and also the erection of more plant houses at Wordsley for the growth of certain flowers and other special experiments. Col. Webb in replying said, great as the business was, wonderful as the growth had been, he confidently looked forward to even greater progress in the future. Mr. T. R. Marshall proposed the health of Mr. and Mrs. Edward Webb who were so highly esteemed in the district no less for their liberality to public institutions than for their unassuming benefactions in private life. Mr. Edward Webb responded. He said the event was one of the greatest in his life and he hoped his son would uphold the traditions of the firm and maintain the high position it occupied.

IRISES AT LONG DITTON.

As the months come and go, and the wheel of nature revolves through the seasons, bringing with it in its revolutions the bright faces of the flowers as they reach their climax of beauty and, passing away, leave the field to others, we are greeted with a series of ever-changing colour effects amongst our hardy plants, but amongst all the varied and brightly-hued children that nature calls up for our delectation there is none upon which the eye rests with a keener sense of pleasure than upon the rainbow flowers, the Irises, which rival the gayest Orchids of exotic climes in their quaint markings and brilliant colours. The month of June seems to be essentially a month of Irises, for although the versatility of the genus has brought forth flowers that bloom both earlier and later, and practically extend the season well-nigh throughout the entire year, June has a greater share than the other months.

It is at this season of the year that the tall Flag Irises in their several sections produce their flowers, following closely upon the heels of the showy German Irises and taking up the tale where they lay it down.

Messrs. Barr & Sons' nurseries at Long Ditton have, ever since their formation, been a happy hunting ground for lovers of hardy plants, and it is almost needless to say that their collection of Irises is one of the most comprehensive in existence. Not

only are rare species looked after, and by careful cultivation coaxed to do their best, but choice varieties are watched for with equal keenness, and tended with the same care.

This year the plants have done remarkably well, and we were agreeably surprised during a recent visit to see how successfully they had resisted the somewhat trying climatical conditions of our early summer. The growth all round has been most satisfactory, and the flowers large, fine and numerous.

The descendants of *Iris barbata*, or the Bearded Flag Iris, have been divided into sections according to the colour of the standards and falls, and this colour division harmonises well with the several periods of flowering. After the "germanica" section with its self-blue standards and falls, and flowering in May, come in order of mention the varieties grouped under the sections "aphylla," "amoena," "neglecta," "pallida," "squalens," and "variegata."

In the "aphylla" section the prevailing hues are some soft shades of blue and white, the segments being prettily frilled. The choicest of these is Madame Chereau, now of course out of bloom.

"Amoena" varieties have white standards, and falls of blue, purple, or varying shades of these, and white. Here Mrs. G. Darwin is one of the finest, with large white falls, netted with gold and violet, and although when contrasted with the name it may seem somewhat anomalous a fine yellow beard. This is a very free flowering variety. Victorine has large purple-violet falls, curiously mottled with white. It is a noble flower and very showy.

"Neglecta" varieties have standards which range in colour from lavender to rich purple, the falls being usually dark or violet purple with occasionally mottlings of white. Willie Barr, Amabilis, Fairy Queen, and Hannibal are pretty well known varieties, and they represent the general excellence of the group.

In the 'pallida' forms we find paler shades of blue and purple in both standards and falls that are at once delicate and pleasing. Occasionally, as in Garihaldi and Albert Victor, we find a suffusion of rose that is very striking. In *I. rubella* we have rosy-lilac standards and deep claret falls, whilst Queen of May exhibits a soft rosy-pink shade that is almost indescribable.

The 'squalens' group contains all varieties which exhibit dun shades of copper, bronze, and fawn. Here we get some of the most uncommon colours and combinations, which are to be found nowhere else. Numerically also the section is one of the strongest, and it contains many forms of rare beauty. Very striking is *La Prestigieuse* with bronze-yellow standards, and maroon-purple falls netted with yellow-white. Dr. Bernice has bronze-yellow standards and deep lavender falls, an exquisite combination that only needs to be seen to be appreciated.

The 'variegata' section is likewise strong in numbers. The standards are yellow, and the falls of various shades. In this group we have some of the most showy of all Irises, the colours being in all cases brighter and decided. Maori King is a comparatively new form with rich crimson, gold-margined falls. In *Gracchus* the falls are crimson, netted with white, whilst in *Darius* they are lilac, and netted with both brown and white.

Passing from the innumerable forms grouped under the above-mentioned sections, we were much taken with a variety of *I. spuria* named Notha, which runs from 3 ft. to 4 ft. in height, and has rich violet standards with blue, yellow-spotted falls.

The Xiphions, or bulbous Irises, are of equal importance to the rhizomatous division which we have been considering, for to them belong such early-flowering subjects as *I. Histrio*, *I. persica*, and *I. reticulata*. The June flowering representatives are of taller and more imposing presence than these, and the flowers are larger and finer, although we do not wish to make invidious comparisons. We must, confess, however, that a magnificent break of *I. Xiphion* Thunderholt excited in us the liveliest feelings of admiration. This grand variety grows to a height of about 3 ft., and the flowers are large and massive in proportion. The standards are rich crimson-black, the falls are chesnut-brown with a prominent central orange blotch, and both are of great width and substance. The exceedingly rich effect produced by the sun shining on this mass of flowers entirely baffles description. Side by side

with Thunderbolt was another form of *I. Xiphion*, called Blue Beauty. This is much dwarfer, the height being not more than 18 in. The flowers are only a little smaller, however, and the colours, deep blue standards, and azure falls with yellow blotch, are brilliant in the extreme.

The above-mentioned varieties are only a few of those that are to be seen in all their glory at Long Ditton during the season.

RAISING NEW PANSIES.

FEW plants lend themselves so readily to artificial fertilisation as Pansies do; and yet very few growers take the trouble to artificially cross them. In Scotland, at any rate, nearly all the seedlings are chance ones, that is, the seed saved from varieties which have been only fertilised by insects. There are a few exceptions to this rule, however. One grower by systematic crossing turns out many fine varieties yearly. Generally, chance seedlings are no improvement on their parents. They are generally only variations, in colour, size or shape, a shade or two darker or lighter, a broader or narrower margin, a slight difference in the eye. On the other hand, in artificial fertilisation a variety, fine in colour, size and markings, but deficient in the lower petal can be crossed with another, which is good in that respect; or a very fine variety, but with a weak constitution, could be crossed with a robust sort with splendid results.

If raisers of new Pansies would look a little more to the constitution of the plants from which seed was saved, there would not be so much dying off in Pansies. For fertilisation a dry bright day should be chosen. The best plan to adopt is to gently remove the lower petal of the pollen parent. The pollen lies immediately below the pistil, but there is not generally much of it. When the petal is taken out of the pollen parent, take a camel-hair brush and brush some of the pollen on to the pistil of the seed parent. Always choose the best grower for the seed parent.

It makes it the more interesting to label all crosses, and it is also a guide for the following season. It does not always happen that pods swell up. They sometimes just seem to stand still, and when opened only contain one or two fully developed seeds. The seed pods should be allowed to stand until they begin to turn slightly brown; but care must be taken or they will open and the seed get lost. The seed may be sown when ripe or kept in a dry place until spring.

If sown on a hotbed in March, and planted out in May they should flower in June.—*Scotch Grower.*

WHY DO SO MANY STANDARD ROSES DIE?

THAT there is a great disproportion between the number of deaths which occur among standard and dwarf Roses will, I think, be readily admitted by all conversant with Rose growing, the fatality among standards being generally attributed to a variety of causes. At the same time, what I take to be the most prevalent cause of failure seems to escape general attention, owing, I believe, to the hardness of the stock employed, when under natural conditions among our hedge rows and plantations where its stems are to a considerable extent protected by the surrounding growths from frost, especially late spring frosts. When taken from their natural position, and treated in a somewhat barbarous fashion, what do we usually find? Why their naked stems are exposed to the influences of all weathers, and being naturally excitable a few week's mild weather will set the sap in motion, and then early morning frosts setting in will freeze the sap in the stems, which being fully exposed to the rays of the rising sun thaws suddenly. The cells of the bark are ruptured, and the sap can no longer have its free course. The roots below ground may live and continue to throw up strong suckers for a time, and the head of the plant may possibly drag out a feeble existence for a season or two, but must finally succumb. This phenomenon is very familiar to those in charge of fruit nurseries, where, sometimes, whole plantations of Cherry and other stocks are killed to the ground. I readily admit that there are other destructive agencies at work among standard Roses, but at the same time think the cause I indicate is the most general one to which standard Roses succumb.—*W. B. G.*

A FINE FRILLED HARTSTONGUE.

THE varieties of the common Hartstongue (*Scolopendrium vulgare*) number many hundreds, in fact their name is legion. Their nomenclature, too, is considerable; so much so that none but the pupils in the highest school board standards would be able to wrestle with some of their names, or propound their orthoëpy. Our purpose here, however, is not with the common forms, but with the frilled, ruche-like, or crispum section; and whether or not their names offend is immaterial—the beauty of the plants is beyond question. In this section alone—perhaps the most highly developed—Mr. E. J. Lowe describes, in his scholarly little work on "British Ferns," no less than fifty-eight varieties. Unfortunately, nearly all of these are sterile, that is, they do not produce spores, hence their propagation is slow and their acquisition, in consequence, somewhat prohibitive. Still, they are very fine decorative plants, and an absolute necessity in a collection of our native Ferns.

The particular variety which has called forth these remarks is known as *Scolopendrium vulgare crispum* (Stewartson), and is in the possession of Mr. A. Wright, Falkland Park Gardens, South Norwood Hill, S.E., Mr. Wright being a lover of British Ferns, as well as every other vegetable product in the horticultural line.

The Fern in question occupies a 6-in. pot, possesses twelve evenly-balanced fronds, arranged in shuttlecock fashion, which measure from 3½-ins. to 4-ins. in diameter, the average length of the fronds being about 14-ins. As the stipes are very short the whole plant presents a very foliaceous and beautifully frilled appearance. As the normal width of a Hartstongue is about 2½-ins. only, the massiveness of this one will be apparent.

The plant is perfectly barren, this barrenness being probably due to hypertrophy, or over-nourishment of the leafy parts, the plant thus having, so to speak, no energy left for the production of spores.—C. B. G., Acton, W.

PEOPLE WE HAVE MET.

MR. ALBERT F. UPSTONE.

MR. ALBERT F. UPSTONE, F.R.H.S., whose photograph we have much pleasure in reproducing this week, and who is well known in horticultural circles, is now in business on his own account in Rotherham, near Sheffield. He commenced his career in the seed trade with Mr. George Prince, in the university city of Oxford, having previously been educated at St. John's College School, where he was a solo chorister for many years, and, indeed, at one time, Mr. Upstone had serious thoughts of taking up music in the vocal department as a profession, as he has been for many years well known as a very able exponent of the art.

After leaving Mr. Prince, where he received a very fair ground-work, in order to fit him for his future career, he was successively assistant with Messrs. Thos. Perkins & Sons, Northampton, the late Mr. Donald Cuthbert, of Liverpool, Messrs. J. R. Pearson & Sons, Nottingham, five years traveller for Messrs. John Peed & Sons, Norwood, where he proved very successful on the road and gained many friends, who stick to him even now, though severed by many miles away in South Yorkshire. Leaving the Messrs. Peed, who regretted his departure, he took up the position of local manager at Norwich to Messrs. Daniels Bros., and during the five years he remained here he led an exceedingly busy life. He formed and carried through as managerial secretary what became well known in the Eastern Counties as "Daniels Brothers' Dramatic Corps," and cleared in successive years some substantial amounts for different charities, which latter included the Benevolent Fund of the East Anglian Horticultural Club, of which he was also hon. secretary during the whole time he was in Norwich. Leaving here to take up the management of the seed department for the Messrs. Veitch, at Chelsea, he was presented at Norwich with a handsome clock and a purse of money, the outcome of general appreciation, as a conscientious worker who has always faithfully, honestly, and with considerable ability fulfilled his duties to employers, and studied the welfare of the gardener.

He soon afterwards resigned his position with Messrs. Veitch, being on the look-out for a place to

settle down, and commence business on his own account, for which he had for many years had a craving. After a time he chose Rotherham as his destination. We are pleased to hear that success is attending him so far, whilst we do not think for a single moment that Mr. Upstone is one of those gentlemen who is at all likely to give way under any ordinary circumstances. He is now thirty-eight years of age, and has become, already, a very well-known gentleman in South Yorkshire.—"Omnia bona bonis."

MR. ALBERT F. UPSTONE.

ALPINE AND ROCK PLANTS.

ERANTHIS CILICICA.—With us this is an early spring flowering subject like its congener *E. hyemalis*, so well known under the name of Winter Aconite. In its native home, in the Alpine region of the Cilician Taurus, it blooms in the month of May, while the upper part of the mountain is still clad with its mantle of snow. At that time bulbous plants begin to bloom in great abundance, including Tulips, Crocuses and Fritillaries, which make the grass look bright and cheerful. *Erantnis cilicica* in millions covers the sward, as it were, with a yellow carpet. The flowers have more numerous petals than in the case of *E. hyemalis*, and when this native of the Taurus becomes more common it will make a welcome addition to our early spring flowering rock plants, whose requirements are really very few and easily satisfied.

CAMPANULA G. F. WILSON.—The general aspect of this plant indicates that it is a hybrid, apparently between *C. pulla* and *C. turbinata* or one of that group. The plant is compact and squat in habit; but instead of bearing a single drooping flower, it often produces a number on stems which have acquired a vigorous growth. The blooms are much larger than those of *C. pulla*, and nodding, with the rich blue-purple colour of the latter. In the course of a few years the plant spreads over the ground, forming a large patch, provided it is not planted in a roasting, dry spot. For this reason there is no difficulty in propagating it; and pieces may be taken off with a trowel during moist weather in early autumn, so that it may get established in the fresh soil before winter.

ACANTHOLIMON ACEROSUM.—The near relations of this plant, the *Statice*, are natives of the mud flats of the sea shore, and in some instances of the dry chalk, where the wonder is how they can subsist. All the species of *Acantholimon* I have seen are truly rock plants, and well adapted for planting in exposed positions, though they must not be planted skin-deep, so to speak, amongst stony rubbish, where they cannot find moisture. The roots must have plenty of room to extend downwards into good soil. The large pink flowers are not very numerous, but are very pretty nestling on the top of the carpet of spiny-pointed leaves. The latter are glaucous as in the case of *A. venustum*, but much narrower.

VERONICA TEUCRIUM RUPESTRIS.—The profusion of rich blue flowers produced by this dwarf Speedwell entitles it to a prominent position in every garden. Although it is first-class for bold and projecting parts of the rockery, it is equally serviceable in the flower garden where those concerned with its management are not all gone upon the usual run of bedding plants. It makes a grand edging to permanent beds of herbaceous plants and dwarf subjects generally. The flower stalks only rise 4 in. or 5 in. above the ground.

DIANTHUS CAESIUS.—There is nothing more charming amongst Pinks than the Cheddar Pink during June and part of July. The flowers, about the size of a shilling, vary from light to dark rose-pink, but are always so fresh and pleasing that no rockery should be without a good clump. The gray foliage also looks happy, and forms a cheerful setting for the flowers. The latter vary considerably in size and colour, making it doubtful whether, after all, one has got the Cheddar Pink. Such plants, I believe, are sometimes obtained from Continental seed, and are very convenient for those who have a new name to give away. The plant is, however, capable of variation, and some enterprising hybridist should develop a new race of Pinks.

ASTER ALPINUS.—A perennial Aster that flowers in June and July cannot be regarded as a Michaelmas Daisy. It is a neat growing Starwort, 3 in. to 6 in. high, and carrying blue-purple flowers about the size of a florin. The plant is of the easiest culture, and may be propagated freely enough by division in early autumn.

ACHILLEA UMBELLATA.—Of the dwarf species of *Achillea* this will always merit a place amongst Alpine plants for its neat habit, forming as it does a patch of gray, closely hugging the soil and stones of the rockery. The umbels of white flowers rise a few inches above the gray, deeply-cut leaves, having narrow-spreading segments. Cuttings of the flowerless shoots root very readily in pots of sandy soil in a frame. The plant comes from Greece.

TANACETUM ARGENTEUM.—At first sight, this closely resembles *Achillea umbellata*; but even if the resemblance is only superficial, it is remarkably close. Outwardly, the flower might be regarded as identical, and the leaves only differ in being narrower, with more numerous, spreading but overlapping, lobes of a silvery-gray as indicated by the name. It comes from Asia Minor, and is worthy of a place amongst a select collection. Cuttings soon furnish all the plants wanted.

ACHILLEA MONGOLICA.—This may be regarded as a Sneezewort in miniature, the stems and leaves being like our native *A. Ptarmica*, except in being smaller in every way. The white flowers are much larger and purer white, so that the plant well merits all due consideration. Its appearance is of no mean order.

SILENE QUADRIFIDA.—The petals of this hardy European Catchfly have four short and rounded teeth at the apex, thus suggesting the name employed by the botanists. The plant forms a neat tuft of upright habit, surmounted by the snow-white flowers. The general aspect of the whole plant reminds one of *S. alpestris*, but the slender, linear leaves are very different. It is a gem of the first water for the rockery, and of easy cultivation. Planters might give ease of culture a primary consideration, because a well-furnished rockery is always more interesting than one which is occupied with rare and slow-growing or half hardy sorts that never make a real show.—J. Effe.

The Orchid Grower's Calendar.

COOL HOUSE ORCHIDS.—As promised in the last calendar, I will just run through a few of the best kinds for cool house culture.

The first on the list is undoubtedly *Odontoglossum crispum*, on account of its variability, lasting qualities and beauty. Besides it is out of *O. crispum* of all cool house Orchids that you get the plums. As I touched on the culture of this particular kind in the preceding calendar I shall pass on to

COELOGYNE CRISTATA, which is one of the finest Orchids grown for early spring flowering. We find they do wonderfully well when grown cool. We use pans about eight inches in diameter; into these you

can get a sufficient number of leading growths that will give you ten to twelve racemes of flower. This we think is much better than putting them into large pots or pans, because they can be suspended above the Odontoglossums. The compost is similar to that used for most Orchids, that is, good peat and live Sphagnum moss in about equal parts, added to which a little silver sand is useful, as it affords better drainage. They are great lovers of moisture at the roots and should never be allowed to shrivel much, although during the dull winter months water must be given very cautiously or the spikes are likely to turn black and sometimes damp off altogether. During the summer months when growth is most active a dose of *weak* manure water will be found beneficial about once a week.

CATLEYA CITRINA.—This is the only *Cattleya* as yet that lends itself to cool-house culture, but in time, perhaps, the hybridiser may, through the aid of the above species, come to the rescue. On account of their peculiarity in growing head downwards, blocks seem to suit them best, and on these they do very well for a time, but in the long run pans will be found the most suitable, in which they must be well elevated. In time they will be found to resume their natural habit by growing over the sides of the pans, so that in fixing the wires keep this trait of theirs before you, and tilt the pans in a manner that the growths may assume their natural conditions. It may be necessary, however, to secure the plants in the pans by copper wire, using as compost good drainage and a small quantity of peat and moss.

CYPRIPEDIUM INSIGNE.—This is so well known, and the culture understood, that it only remains for me to say that for general usefulness it still holds its own. It does best in a compost of peat, loam, and chopped moss in equal parts, with a little sand. It flowers best when it becomes pot-bound.

DENDROBIUM INFUNDIBULUM AND ITS VARIETY D. 1. JAMESIANUM.—These do well in the cool house, but should be placed at the warmest end. The beautiful white flowers, set off with a deeply stained cinnabar-red lip, are very attractive. The usual compost of peat and moss does them well. When in flower they may be kept in a moderately dry place, so that the flowers do not spot, but no attempt should be made at resting them, as is practised with most other Dendrobies.

SOPHRONITES GRANDIFLORA is a most brilliant dwarf-growing Orchid that should be in every collection. Hanging pans suit it best, and treatment as advised for *Odontoglossum*.

ONCIDIUM MACRANTHUM is one of the best grown. It makes long, fleshy roots, and on that account should be provided with plenty of pot room. The compost should be placed about them rather loosely with a preponderance of moss.—C.

THE PLANT HOUSES.

The Stove.

Cold winds and fluctuating temperatures out of doors have rendered it anything but easy work to regulate conditions of temperature and moisture under glass, but with the advent of July we, at least, expect more settled and summer-like weather. Everything should now be in full vigour of growth, and this will apply not only to the plants but also to the insect pests which infest our stoves. In order to keep these from multiplying the syringe must be kept regularly at work twice a day, and should, in bad cases, be further supplemented by sponging with insecticides.

CLIMBERS.—The growth of these will need to be regulated to some extent, for where the plants are making too much growth it is advisable to remove some if only for the sake of the subjects which are occupying the stages beneath.

BOUGAINVILLEA GLABRA.—Instead of keeping the shoots of this showy plant strained tightly to wires upon the roof they should be loosened and allowed to hang nearly at their full length, or at least just so that there is room to pass beneath them. As the strain of flowering is very great a good deal of water will be needed, and liquid manure may be given once or twice a week according to circumstances.

NYMPHAEAS.—As a rule the tanks in the stoves are rather small for the number of plants that one would

like to get into them. Some of the stronger growing *Nymphaeas* are apt to crowd the other occupants of the tank by their superabundant foliage. Some of this may with advantage be removed, for while to do so will give more room the flowering abilities of the plants will not be appreciably lessened. Both black and green fly are apt to prove troublesome at this time of the year, and as fumigation is out of the question the best method of dealing with the pest will be to sponge the dirty leaves with tobacco water.

ADIANTUMS IN BASKETS.—Maidenhair Ferns make exceedingly pretty baskets when properly looked after, but in the hot weather the great danger is that they are allowed to become too dry. Once this happens the plants are well nigh ruined, since they lose a great part of their fronds. It will be well to dip all those that can be easily lifted down, and those that are too heavy to lift must be watered at least twice a day, and three times in hot weather will not be too much. Liquid cow manure will be found to suit these Ferns admirably if it is not given too strong.

Pits and Frames.

CHRYSANTHEMUMS.—The tall plants that are to produce the show flowers have been in their summer quarters for a few weeks. Owing doubtless to the moisture-laden air they do not appear to have received the slightest check, and are growing strongly, too strongly, it is almost to be feared. As it is difficult to find stakes tall enough for them that are not also too clumsy a few stout posts should be driven in at intervals of a few yards all along the line, and light cross rails or stout string fastened to these. The uprights should be at least 6 ft. in height after they are driven in, and if 7 ft, so much the better. It is very customary to plunge the bush plants with a view to saving labour in watering. If this plan is to be followed it should be carried out at once. Give each plant sufficient room for the light to get all round it. Crowding is to be deplored, although necessity knows no law. Some growers there are who do not believe in plunging, and who prefer to have the pots fully exposed. Something may be said for both sides of the question. Where the plants, in pursuance of this system, are stood in lines along by the sides of paths or on vacant pieces of ground they should be stood on boards, slates or paving tiles, so as to keep the worms out of the pots.

WINTER FLOWERING ZONAL PELARGONIUMS.—These will need to be occasionally looked over to pick out all the flower buds, and to pinch such shoots as are growing too strongly at the expense of the rest. In about another fortnight's time some liquid manure may be given, for by then the plants will be in a condition to benefit by it.

CLERODENDRON FALLAX.—The plants raised from seed sown in early spring are now sturdy specimens in 5-in. and 6-in. pots. They like plenty of heat, and nothing suits them so well as a place in an ordinary brick pit, where they are brought up near the glass by standing them on a bed of fermenting material. Thin the plants out as growth proceeds, and keep the syringe well at work amongst them, for mealy bug is a great nuisance.

HERBACEOUS CALCEOLARIAS.—The young seedlings from the early sowing are now ready for pricking off. Use rather sandy soil, and drain the pots or pans thoroughly. Do not be in a hurry to discard all the weaker growing plants, for to do so would possibly mean that some of the finest varieties would be thrown away. Shade the young seedlings carefully. This is most important, for even a few minutes exposure to a hot sun would be likely to prove fatal. Light, thin tiffany is the best material for shading. If other plants are wanted, either to come in a bit later than those from the first sowing, or if the first sowing has only been a qualified success, a little more seed should be sown in pans prepared in the same way as for the first lot. The seed pans may now be placed in an unheated frame, where germination should be rapid enough.

CYCLAMEN.—The plants from the seed sown last August or September are now quite ready for transference from 60-sized pots to 48's. The plants from the January sowing have not been long in the 60's, and will not need shifting just yet. Use a compost of two-thirds of good loam, one of leaf soil, and plenty of coarse silver sand. Pot with medium firmness. Shade carefully, and as long as the weather proves as capricious as it has been throughout June, be cautious in ventilating.—A. S. G.

Gleanings from the World of Science.

Vagaries of Tulips.—A similar case to that described on p. 663 comes to us from Messrs. James Cocker & Sons, 130, Union Street, Aberdeen, whose representative picked it up in the garden of Mrs. Davidson, of Foresterhill, Aberdeen. The bulb came up amongst a lot of late mixed Tulips, and was a double, rectified bizarre, flamed with dark crimson on a golden-yellow ground. The stem was branched and carried four flowers. Two of the branches carried two small but perfect leaves each, which may have resulted from the degeneration or reversion of the outer floral leaves, as some of them were green, and others half green and half flamed like the rest of the segments. The upper portion of the stem also carried two leaves, one of which was caught between the main axis and an axillary branch that was amalgamated with the leaf, and the latter with the leading stem. Thus the leaf had a stem fixed to the front of it and another along the back of it. One of the floral leaves ran down a branch, being adnate to it for 2½ in. The ovary and styles were broken up into 3—6, some of the pieces being petaloid, that is, coloured. Mr. Chas. Urquhart, the gardener, said that several of the stems carried two flowers, but only one had four. Reaching us as these flowers did in the last week of June, they show a vast difference of one month between the season of flowering at London and Aberdeen.

THE undermentioned subjects were discussed at the meeting of the Scientific Committee of the R.H.S. on the 14th ult.

"Silver" Leaf Disease.—Specimens of this disease were received from Mrs. Floyer, Basingstoke. The disease is known to be very common on Pomaceous plants, the silvery appearance being due to the raising of the epidermis from the underlying tissue. The disease is very fatal both indoors and out, and is in all probability attributable to the growth of a fungus, the nature of which has not yet been ascertained.

Apple-leaves.—Some leaves injured by frost or scald from the effect of the sun shining on a damp surface were also sent.

Plant Diseases.—Dr. W. G. Smith reports as follows on the specimens submitted to him:—

Palania Disease.—From a further specimen of this disease I have confirmed my previous opinion. The latest specimen sent bore the fructifications of a fungus which I hope to have identified. The diseased tissues contain abundant mycelium, and the starting point for attack was from last year's old wood. I shall be glad to communicate further results later.

Begonia.—From the material sent by Mr. Caddy it was difficult to say really what was the cause of disease. One or more fungi were easily developed on the withering leaves, but whether these were saprophytic on the dying tissue or were the cause of trouble, it is not safe to say. Begonias of this class are so liable to wither at the margins (from draughts, &c.), and are so unsuitable for transit to a distance, that accurate observation can only be made on plants in their actual habitat.

Fungus on Thuja (Biotia).—The plants sent were attacked by *Pestalozzia funerea*, Desm., a fungus well known to occur on dying Thuyas and allies. The life-history is, however, imperfect.

Cytisus Adami.—Mr. Herbert E. Brooks sent specimens of the curious *Cytisus Adami*. The three forms of flowers on a Laburnum is from the well-known "graft hybrid," as it is supposed to be, known as *Cytisus Adami*, for Mr. Adams budded *C. purpureus* on *C. Laburnum* in 1825. The purple and yellow flowers are of the true species, but the brick-red is the hybrid. It was described in the *Gardeners' Chronicle*, 1841, p. 325, 336; 1842, p. 397, and often subsequently. The fullest account is in Braun's *Rejuvenescence*, 1851 (English translation, 1853); in Prof. Morren's paper in the *Belgique Horticole*, 1871; and a summary of the whole subject is given in Darwin's *Variation of Animals and Plants*, vol. i., ed. 2 (1875), p. 413.

An old tradition has it that the Beech is never struck by lightning.

HINTS FOR AMATEURS.

CANNAS.

WHEN the horticultural history of the last decade of the nineteenth century comes to be written the chief theme of discourse will be the vast improvements made in the various races of garden plants, some of which, as, for instance, the tuberous Begonia, have sprung into popularity since the termination of the seventies. Possibly the most remarkable flower of all, however, will be the Canna, for within the period alluded to it practically began what has since proved to be a glorious course. As the years have rolled on not alone have we seen rapid and important changes made in the appearance of the flower, but we have experienced something closely approaching a revolution in its culture. It has been demonstrated beyond question that in the gardener's hands the Canna is a very tractable subject indeed, and that although, in common with everything else, it has its likes and dislikes, yet it has probably fewer of the dislikes than most other things. It is a truly tropical plant, and likes plenty of heat as a consequence, but if proper care be accorded, it may be had in full beauty during our all-too-short summers in our out-of-door gardens, whilst under glass there is no difficulty in having plants in bloom for seven months of the year, from May to November inclusive.

Perhaps a feeling of surprise may be caused by the statement that the Canna is not quite so new to this country as it is popularly supposed to be. Most people, if asked to name approximately the date of the commencement of its rise, would be say about ten years ago, and they would be right in a sense. On the other hand, the ancestors of the modern Canna were cultivated in this country away back in Elizabethan times, although only to a limited extent. The parent species, *C. indica*, was first introduced to this country from the West Indies in 1570, so that for upwards of three centuries it has been in our midst, unknown to the great majority of gardeners, perhaps, but still there. Some of the more energetic of sixteenth century gardeners, however, noticed it, and cultivated it, and, what is more, recorded their experiences of varying successes and failures, usually the latter, it must be confessed. Thus John Gerarde, of herbal fame, wrote in 1596 that he had planted it in his garden a number of times, but that he had never been able to get it to flower. Parkinson, who came after Gerarde, had a little more luck, since he states that he obtained flowers from his plants in favourable years, but that they never came to seeding. This was about thirty years after the record left by Gerarde. Even at that date the original *C. indica* had acquired a "sporting" character for itself, for Parkinson speaks of a variety with yellow spotted flowers. The development of distinct varieties was slow, however; possibly the gardeners of that date had something else to think about, for the age was a troublesome one, or even more probably they had not recognised the vast potentialities that the then comparatively insignificant flower possessed, and certainly the rage for improvement of races of garden plants was not then so keen and consistent. We find, however, that Aiton, of Kew, mentions four species or well-marked varieties, called respectively *C. rubra*, *C. coccinea*, *C. lutea* and *C. patens*.

The cultivation of the Canna was continued more or less intermittently down to our own times, but the prevailing idea concerning it seems to have been that it was chiefly serviceable as a foliage plant simply. Flowers may have been obtained or they may not; it is not at all probable that they were in any great numbers. From fourteen to eighteen years ago a collection of varieties, even then mustering a respectable number, was grown for trial in the garden of the Royal Horticultural Society, but even then the foliage value of the plants overshadowed that of the flowers. Since that date, however, the development has been in the floral line, owing chiefly to the labours of Continental florists, who, in the enjoyment of more genial climes, were able to appreciate more correctly the excellencies, both hidden and revealed, of the flower.

Nowadays we grow Cannas almost solely for their flowers, at least, as far as pot cultivation goes. The

foliage is handsome certainly, and its true tropical appearance in the flower garden is not to be despised or even underestimated, but the modern gardener would be apt to be highly dissatisfied if his plants, like the Fig tree of old, and the Cannas of John Gerarde's time, bore "nothing but leaves."

The modern Canna is distinguished from the old not only by the size, brilliancy and various hues of the flowers, but by the exceptional freedom with which these flowers are produced. Certain it is that the needs of the plant are better understood now than they used to be, and it is equally certain that the modern gardener with his vastly increased facilities is in an incomparably better position than the old-time practitioner to supply these needs, but even taking all this into consideration the change is truly marvellous. Then, again, there is a wonderful change in the habit of the plant, for, whereas, the modern plant is dwarf, some of them not being an inch above 2 ft. in height, while the ancestral forms were at least double, and more often nearly treble that height.

The break away from the old style may be said to have commenced with the introduction of the variety Madame Crozy, still a grand form, but since that auspicious event the hybridiser and cross-fertiliser have been hard at work, and the number of varieties of a similar strain or habit is legion.

The past few years has seen almost as great a change in the cultural routine followed. Not so very long ago it was the prevailing idea that in order to get Cannas to do well under glass huge pots must be given them. Pots having a diameter of 10 in. or 12 in. were then frequently, and are now occasionally, to be seen. Fine handsome plants were grown in them we neither can, nor wish to, deny, but such plants were only suitable for large houses, and it is not every one that has large houses to spare. Again, the work of potting up, watering, and shifting these heavy plants was a serious item in the labour bill, and quite enough to deter an amateur cultivator from tackling the subject.

Small wonder was it, therefore, that certain enlightened cultivators set about looking for a more excellent way than that offered by the old style, and the amateur has much to thank these men for, since they have brought the Canna well within his reach as a pot plant, either suitable for his greenhouse or conservatory, or even in the case of the dwarfest plants as a subject for the window. What a wonderful change is this. Although it is not desirable to make invidious distinctions it is impossible to refrain from mentioning the name of Messrs. H. Cannell & Sons, of Swanley, in this connection, for they have certainly done more than anybody else to demonstrate the possibility of growing grand Cannas in 5 in. and 6 in. pots, plants with flowers and spikes that would compare very favourably with those formerly borne by plants in 10 in. and 12 in. pots. On the other hand, for practical utility there can be no comparison, for the smaller plants are so far and away ahead of the others.

The system of cultivation followed is both a rational and an easy one, and we may commend it strongly to the notice of all amateur cultivators. Vigorous plants are continually throwing up suckers from the base, and these suckers must be taken away from the parent plant before they get too big and potted up. Fairly strong suckers will flower on their own account within about three months of their separation from the parent. The breaking away of the suckers is not a matter of any difficulty, although occasionally a knife is necessary for a very tough specimen. The young plants come away with plenty of roots, and thus do not feel the check of severance. In potting use a compost of two-thirds of good loam, one of old mushroom bed dung, or cow manure, and a nice sprinkling of sand. Pot pretty firmly.

The first batch of plants should be started about the beginning of February, and if a temperature of 60° Fahr. by night, rising to 65° and then to 68° or 70°, as the season goes on, is given, they will be in full flower by May. By potting up the suckers as they can be obtained, a succession of bloom may be had right on until November, the last batch, that is, those flowering in November, being produced from suckers taken off about the middle of August.

Next week a selection of some of the best varieties will be given.—*Rex*.

London has an average of 178 rainy days in a year.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Herbaceous Plants Dying.—On taking possession of my present house at the end of last year I found the garden in a most neglected condition. I dug it well over, however, finding the usual quantity of brickbats and kettles beneath the surface, and manured it. At the end of February I planted a quantity of herbaceous subjects. These did fairly well up to a certain point, but during the last two months a number of things have succumbed, amongst them being *Polemonium Richardsoni*, every plant of which has gone home. *Lychnis Viscaria splendens plena*, and several varieties of *Papaver bracteatum*, whilst *Physalis Alkekengi* has never appeared at all, and *Violas* are at an absolute standstill. Can you help me to a probable reason?—*Suburban*.

There is no doubt that the soil of your garden is in a sour and unkind condition, which renders it very hard for plants with tender constitutions to get along. You cannot do anything now, whilst the plants are growing, except occasionally stir the surface of the soil in order to keep it as well aerated as possible. Next autumn we should advise you to take the plants up and give it a good liming in order to sweeten it. You might follow this up in the spring by introducing a quantity of ashes, road sweepings, or anything of that nature which will work a mechanical improvement. You should then have better luck. Meanwhile, you may also keep an eye upon the cats.

Poinsettia Cuttings Failing.—*C. Mason*: Poinsettia cuttings are often afflicted with what our American friends call "cussedness," and they damp off for no reason at all apparently. In your case, however, the reason probably is that you have not given them enough of heat. A temperature of 65° Fahr., such as you gave yours, is too low; it should be at least 68° or 70°, the latter preferably. It is getting rather late for cuttings now, and they will not have time to make big plants, but if kept in small pots they will be useful. Try again, and give a higher temperature.

Rhodanthes.—*Q.*: The flowers are rather too far advanced to keep well. You should have cut them just before they were fully opened, and then you would have preserved the colour of the centre or disc florets, which will now turn, or possibly have, in most cases, turned, black or dirty brown.

Thunbergia alata.—*C. E.*: You did quite right to start the *Thunbergias* in heat, and to place the baskets in a warm house after they were made up. Now, however, they should have made sufficient growth to warrant removal to a cooler place where they will flower and grow freely enough all the summer.

Dahlias in June.—*A. E.*: Your energies have been misapplied. Nobody wants Dahlias in June, no matter how good they are. They are pretty flowers, of course, but we want them in Autumn, not at Midsummer.

Swarms of Bees Uniting.—*Aura*: It is certainly a curious phenomenon, although a frequently occurring one, that two swarms of bees, each, perhaps, coming from hives a half a mile or so apart should unite of their own free will. Bees are very social as far as the members of their own hives go, but they do not like strangers, and under ordinary circumstances for one colony to join with another would mean a junction for battle. The swarming bee, however, is really in that interesting condition known as 'blind drunk,' and her sense of smell by which she distinguishes friend from foe, or what is the same thing, acquaintance from stranger, is blurred, and she usually forgets to sting even a meddlesome man. We believe the loss of the senses is not unusual in other cases when the subject is 'blind drunk,' we never confess to more than temporary exhilaration ourselves. Once the junction is effected between swarm and swarm, however, everything goes on peaceably after one of the rival

queens has triumphed over the dead body of her rival. Here the bees are sadly like the human, for—"the king is dead, long live the king." The most curious instance of union of swarms that we remember personally is one when three went together, one swarm settling on the cluster formed by the other, both being hived together, and the third lot coolly walking into the hive that contained the two within half an hour of the time that they had been placed there.

DIANTHUS MONSPESSULANUS ALPESTRIS.

THE great bulk of the plants coming under the genus *Dianthus* belong to *D. Caryophyllus*, *D. plumarius*, *D. sinensis* and *D. barbatus*. There is, however, a mass of material from which to choose for the enrichment of our gardens, but particularly the rockery, for 238 species are known to science, and most of them are suitable for planting on the rock garden. Botanically, that under notice comes under *D. monspessulanus*, as the original had been found at Montpellier, in France. The type has rose flowers, but several wild varieties, with pale rose and white flowers, and others differing in habit have been picked up and named by botanists. This is not to be wondered at, for in a wild state the species occurs in Hungary, Calabria, Caucasus and Corunna, the latter being its most westerly habitat in Spain. The plant forms a dense patch covering the ground, and during June and July throws up a profusion of flowers whose petals are deeply and beautifully fringed. The accompanying illustration was prepared from a photograph taken in the nursery of Messrs. R. Veitch & Son, Exeter.

NOTES ON PARIS GARDENING.

(Concluded from p. 684).

CHATEAU TURESNES.

BEING a gardener, and, as the old saying goes, "Birds of a feather, &c.," my natural desire was to make the acquaintance of some of the French gardeners, and I must admit, with pleasure, that those few I had the honour of being introduced to were most courteous and willing to show the products of their skill, and also to give any information respecting the treatment of these products, or, indeed, any information, even to the smallest details; only, unfortunately, I had to take my information second-hand, and *vice versa*. This was rather trying to me, who was bent upon getting as much information as possible, and having to go such a roundabout way to obtain it.

The first private garden I had the privilege to look over was at Chateau Turesnes, the residence of the late M. Worth. The place is situated about midway between Paris and Versailles. The spot was well chosen, as the house is built on the side of a hill, commanding fine landscape views. M. Louis Morin, the energetic and courteous gardener, very kindly conducted me over the establishment. The place was well worth a visit, as it was the first of its kind I ever saw, and no wonder, considering with whom the design and ideas originated, namely, the late M. Worth, who was, I believe, the pioneer of many new designs for Paris fashions. It was not by any means what we should call an all-round place, as flower gardening and house decoration were the two leading features; in fact, they were the all-important part, and, practically, during the summer months these two branches of gardening almost converged into one, for during that period of the year the family really lived in the garden, the house proper being only used for domestic and sleeping purposes.

The dining, drawing, billiard, and other reception rooms, with the conservatory were built quite apart from the house, and were, so to speak, accessories to the flower garden, or the whole grouped into one. The dining-room was like a grotto; in fact, it was under ground, with nooks and corners about, planted with Ferns and other suitable subjects. On the centre of the table a small fountain played at will to the occupants. The other rooms, as regards artistic taste, both from a horticultural and upholstery point of view, were the essences of originality and perfection. Baskets with drooping Ferns, Asparagus, Tradescantias, and other plants of pendent habit hanging in festoons were one of the chief features; whilst about the walls ornamental receptacles were built here and there to hold similar and other plants.

Besides this, a choice collection of china was arranged about the rooms to the best advantage, adding a considerable charm to the picturesque surroundings, and seemed to give one the impression of an intermingling of the old order and the new.

The general arrangement of the flower beds, and bedding was quite in keeping with the taste and skill shown in the inside furnishing. Begonias and Cannas were well to the front, and besides these many other choice and tender plants were employed for the purpose, and to summarise the whole they were in the pink of perfection. M. Morin informed me that he bedded out at least three times during the season, beginning early, and continuing as late in the autumn as possible. They have a fair amount of glass there, principally low span-roof houses and pits, for growing plants to meet the requirements of the flower garden, &c.

CHATEAU LEBAUDY.

The next place of special interest was at Chateau Lehaudy, Bogival, the residence of M. Lehaudy, situated between Paris and St. Germain. These gardens were more after the English style, and more of an all-round place than the one previously alluded to. Although the bedding here was quite a speciality, M. Page, the head gardener, who is a most enthusiastic plant cultivator and hybridist, and

results of the head gardener's handiwork were pointed out and compared with the parents. Cannas were largely used with good effect, especially in one instance, where a huge mass of these popular subjects was planted on a slope and graduated down from plants of 3 ft. to 4 ft. to 1 ft. and under.

Besides these, many of the high class *Pelargoniums* were used, also other choice plants of the higher order, including such subjects as *Anthurium andreanum*, *A. crystallinum*, *A. ferrierense*, *Crotons*, and *Dracaenas* of sorts. The lawn was quite in keeping with the flower beds, rather spongy to walk on, but pleasing to the eye. In fact, I should not be wide of the mark in saying that the whole place was in tip-top order, and it only took a cursory glance to come to the conclusion that there was no lack of the incentive that keeps good gardens up to the mark. In addition to the other subjects previously mentioned. M. Page has taken the *Gloxinia* and *Streptocarpus* in hand, with a view to improvement by cross-fertilisation, and judging by the size of the flowers and variety of colours on view, he fully demonstrated that he was no mean hand at the work. I cannot leave M. Page without passing one more remark. I trust his fellow countrymen will not think him unpatriotic when I say that he has a little weakness towards the English. Anyhow, on this occasion he

DIANTHUS MONSPESSULANUS ALPESTRIS.

his son, who, by the way, had spent several years in English gardens, kindly conducted me around the establishment. Of glass there is a considerable quantity, built much after the English style, and with the latest improvements. One block consisted of a long corridor, with several span-roofed stoves and Orchid houses, leading out at right angles. The corridor was used as a show house, and contained some well-grown Palms, Bamboos, &c. Orchids were well represented, and the several houses were filled to their utmost capacity, with a clear healthy-looking collection, *Cattleyas* and *Cypripediums* taking the lead in quantity. M. Page goes in for hybridising, and amongst his latest products, which was varied and in quantity, he pointed out many fine forms of *Cypripediums*. The general collection of Orchids contained some very fine pieces of *Laelias*, *Cattleyas*, *Vandas*, *Phalaenopsis*, &c. Besides these I noticed some grand *Anthuriums*, showing exceptionally large spathes.

The flower garden, well, to say the least of it, was truly magnificent. The principle feature here was the massive beds of one colour. Begonias, both tuberous and fibrous rooted, being the chief subjects. Many fine varieties of both sections, the

exhibited his appreciation of them in a very practical manner.

FERRIERES.

The establishment of Baron Alphonse de Rothschild was the next and last place I visited. This place is too generally known for me to enter into any geographical details, and as my time there was limited in proportion to the magnitude of the place, I could not grasp enough in the time to go into any horticultural details. I may say, that this is an establishment where gardening is carried out in all its branches to as near perfection as it is possible to get it. There are, I believe, about sixty glasshouses in all, and about 6,000 frames, besides many other temporary erections for protecting plants. Nine of these houses are devoted to Orchids; twenty-one to fruit, and the remainder to stove and greenhouse plants. Orchids in the various sections were well represented, especially *Odontoglossums*, and looked the picture of health.

The plant houses were furnished with nearly every kind of stove and greenhouse plant worth growing; and in appearance were everything that could be desired. One noticeable feature about the plant houses was the mixture of plants grown together, the

whole being arranged like show houses, with mixed groups only, of course, in their respective sections, that is, cool and warm.

Fruit under glass, including Pines, is a strong point here, Peaches and Nectarines being quite a speciality. At the time of my visit, the season with these was nearly over; still, they had some left, and those were of the highest order of merit. Turning to the kitchen garden, in size it was quite in proportion to the other parts of the establishment, and was a model of what a kitchen garden should be, both in cleanliness and cultivation. Here it is that one can see the French system of fruit tree training to perfection. Devices worked out with Apple and Pear trees were numerous, and it seemed almost incredible that the branches could be manipulated to such an extent; even the proprietor's name was growing from an Apple tree and flourishing so amazingly, that even the Apple shoots seemed to vie with each other, as to which should do the most in converting the name into the vegetable world. Peaches on the outside walls were very fine and highly coloured. The flower garden and pleasure grounds are very extensive and of the highest order. The indispensable Begonia and Canna were in the first rank in the bedding. Before I close I will mention one more plant, the Carnation. Here it is legion as a pot plant and for decorative purposes; and like the Apple tree previously mentioned, seems to have an affinity for the name. M. Schwart, the head gardener, appeared to have a good grip of the whole establishment, and is to be congratulated on his efficiency in keeping the gardens up to such a standard of perfection.—*D. Cooper.*

HARDY HERBACEOUS PLANTS.

Tradescantia virginica rubra.—The handsome *Tradescantia virginica*, the common Spider-wort, also known as Flower-of-a-day, has given rise to progeny even more handsome than itself, and in the case of the variety under notice we have one of the largest flowered forms of all. The individual blooms are fully 1½ in. in diameter under favourable circumstances, and exhibit a rich shade of carmine-purple. The height varies from 15 in. to 20 in. I was most favourably impressed with the merits of this variety when I saw some fine specimens the other day.

T. virginica alba.—This is probably the most popular of all the forms of *T. virginica*, and there can be no doubt that the popularity is well deserved, for it is a handsome plant for the herbaceous border. The flowers are not so large as those of *T. v. rubra*, but they are produced with exceptional freedom. Now and again the plant shows a tendency to revert, and in at least three cases this year, all in different localities, I have noticed the one plant bearing both blue and double flowers. In the case of my own plants, one that threw some white and some blue flowers last year, has changed again this, and is producing all white flowers this, whilst another that bore all white flowers last season has thrown up several stems that are carrying all blue flowers, there being little or no difference between these and those of the type, *T. virginica*. Truly, Nature's vagaries are occasionally very puzzling.

There are other good forms that are well worthy of cultivation, and there is a great uniformity of height and similarity of habit amongst them all. *T. v. delicata* has soft blush pink flowers, and *T. v. flore pleno* has fine double blue flowers. *T. v. azurea*, as the varietal name would signify, has bright blue flowers, and whilst those of its double form are of exactly the same hue.

All these plants are of the easiest culture. They will grow and flower freely in almost any soil, and although the blooms are ephemeral, yet they are showy and their numbers make up for the lack of "last." Planted in clumps in the herbaceous border or in nooks on the rockery they look exceedingly pretty, and excellent results may be obtained by filling beds entirely with them, as has been done at Kew from time to time.

Propagation is best conducted by division of the roots in Spring, just before growth commences. The divisions may either be consigned to the ground straight away, or they may be potted up, grown on in frames, and planted out subsequently. The latter method is to be preferred when the divisions are small, as it gives them a better chance to make plants at an early date.

Polygonum sachalinense.—Attention has been

drawn at various times to the value of this subject as a fodder plant, but it is not of its economic uses I wish now to speak. It is of noble presence, and, growing as it does, to the height of 8, 10 and even 12 ft., with its large, cordate lower leaves and truncate upper ones, it is a capital thing for the wild garden. It loves a moist root-run, and hence should be planted by the side of streams or ponds, where it soon establishes itself. There is a fine clump of it in such a position in the Long Ditton nurseries, and it forms a pleasing feature of the place. *P. sachalinense* was introduced from the Sachalin Islands in 1869.

Iris Pseudacorus variegata.—Everybody knows, or at least ought to know, our native yellow Iris or Water Flag, with its long sword-shaped leaves, and large bright yellow flowers. In the variety under notice we have a golden and green form of it, whose foliage is distinctly handsome. The flowers do not differ in any material way from those of the type, and so call for no special comment. As a subject for planting in the mud by the borders of streams or ponds, where its roots can enjoy the ooze that they so much love, there is nothing finer than this plant, I was pleasantly reminded of this by the sight of a number of plants flourishing by the side of the stream that runs through Messrs. Barr & Sons' rockery at Long Ditton.

Melissa officinalis variegata.—Of late years there seems to have been almost a craze for variegated forms of common hardy plants, and it seems rather curious that the variegated form of the common Balm should have been forgotten in the persistent pushing of variegated things, but very few nurserymen catalogue it. I lately saw a clump of this old-time favourite in one of those old-fashioned gardens that are now all too scarce in the country. How it got there the owner of the garden could not tell me. It had always been there so far as he could remember, he said. At one time it appears the plant was a favourite as an edging subject, a purpose for which its dwarf, stocky habit, and abundant leafage render it eminently suitable. The fragrance is fully as strong, and the medicinal value fully as great in the variegated form as in the type, but the habit is neater and more compact. Those who like sweet-smelling things about the house might well employ it, for it makes a capital window-box plant. A stock of plants may soon be worked up by division in spring just before growth commences for the season.—*Plant Lover.*

HARDY BAMBOOS.

(Continued from p. 682.)

As a guide to intending planters of Bamboos the species and varieties established in the Bamboo garden at Kew may be taken as representative, both on account of its comprehensiveness, and as being situated neither in the warmest nor the coldest district of Britain, in which a collection of Bamboos may be planted with reasonable hope of success. Paradoxical as it may seem there are species which may be grown in the Midlands with equal, if not greater success than in Cornwall, for the simple reason that the greater summer heat in the counties of the former is more conducive to the ripening or hardening of the stems, than the moister and more equable climate of Cornwall, the heat of which is tempered by proximity to the Atlantic and the English Channel. No description need be given of the species which have been tried, and have failed at Kew, as they do not come into the category of hardy in the broader sense of the term, though cultivators in the more favoured spots may reap a fair amount of success with them. Japan is the metropolis of the hardy Bamboos as far as Britain is concerned. A smaller number come from China, and one each from the Himalayas and North America.

Propagation is effected by division of the root-stock, and pieces will grow so long as they are provided with a piece of the underground stem or rhizome with its attached roots. Small pieces may be established the more quickly by potting them up and placing them in heat, which accelerates growth, as those know who grow them in pots or tubs for indoor decoration, either by themselves or in association with Palms. May and June is the best time for dividing the clumps in the open air, as growth is just commencing and soon repairs any damage that may be done to the roots.

For some years past the nomenclature of Bamboos

has been in a very tangled condition in gardens, which is quite natural and customary where cultivators have been working independently amongst a class of plants which is practically new to cultivation in Britain. It is true that they are well known to the Japanese, who make use of them for an infinite variety of purposes, both as food, decorative work in the living state and for use or ornament, in the case of the wood which is manufactured into all sorts of articles for which the Japanese are famous. The Japanese names do not, however, greatly assist the systematic botanist. Order out of disorder has now been effected in the Kew collection by the aid of various workers, of whom A. B. Freeman-Mitford, Esq., has been particularly active, judging by the frequency with which he is quoted as the authority for the specific name of the species under notice. Synonyms are pretty numerous in many cases, but only the more important may be noted here. The *Hand-list* of trees and shrubs grown at Kew may be consulted by those desiring an exhaustive synonymy. The Japanese names quoted may assist those who have plants obtained directly from the Far East. Many, if not all, of the best are now obtainable in this country. The alphabetical arrangement of the genera and species given hereunder is adopted for facility of reference, rather than for the natural affinity of species.

ARUNDINARIA.

The number of distinct species, computed by the *Genera Plantarum*, as belonging to this genus is 24, but, independently of synonyms, 41 have been described by botanists, and recorded in the *Index Kewensis*. Even these figures may undergo considerable alteration as a more complete knowledge of the species is attained as a result of original observation by botanists and cultivators, because these woody grasses seldom flower, and are difficult to define. The branches arising from the main stem are sometimes fasciated in a semi-whorled manner, giving them a characteristic appearance, though this, unfortunately for cultivators, is not a constant feature. The leaves are jointed with a sheath that is persistent, and form a noticeable feature of the species, especially when the nodes of the stem are long, bringing the dried and dead sheaths into prominence. The transverse veinlets of the leaves are obscure, or occasionally conspicuous and interesting. Flowers are seldom produced in Europe, and may be disregarded. The distribution of the species is tropical Asia and America, some extending into ultra-tropical regions of America, the Himalayas and Japan, the latter concerning the British cultivator most.

A. ANCEPS.—The origin of this Bamboo is unknown. The stems attain a height of 6 ft. to 8 ft., and vary from olive to brown and purple tints; they are erect, and give off tufts of very slender twigs at the nodes. The linear leaves vary from 2 in. to 4 in. in length, and are light green with purple sheaths, bearded at the apex, that is, the sheath has a fringe or collar of bristly hairs at the top. The habit of the plant is graceful, and the general effect of the foliage attractive.

A. AURICOMA.—In gardens this is well known under the name of *Bambusa Fortunei aurea*, having been grown as a golden variegated companion to *B. F. variegata*, which is even more common. *Arundinaria Fortunei aurea* is less often applied to it. In the open air it reaches a height of 4 ft., forming a dense, erect bush, with greenish-yellow and golden-yellow leaves, thinly striped with green. The foliage is handsome till winter cripples the leaves, causing many of them to drop. Pot plants seldom attain a greater height than 18 in. During July, August and September it is at its best. It comes from Japan.

A. CHRYSANTHA.—The reed-like stems attain a height of 3 ft. to 4 ft., forming a dense bush, clothed with grassy, finger-like leaves of a dark green. The leaves are generally of a soft yellow, with a few green lines, and are 4 in. to 8 in. in length. The species is a native of Japan. It is hardly so ornamental as *A. auricoma*, the variegation not being so conspicuous or attractive.

A. FALCONERI.—Amongst the Himalayan species of the Bamboo hitherto tried, this is the only one that has proved at all hardy at Kew. It loses its leaves in winter and occasionally its main stems, but comes up again from the root. Last winter the stems survived and commenced sprouting again about the beginning of June. The stems arise from the ground

in a dense tuft like erect willows about the thickness of a goose quill, and 5 ft. to 8 ft. high. They are olive-green and give rise to dense fasciated tufts of very slender twigs from the nodes. The lanceolate, bright green leaves are thin, 2 in. to 4 in. long, and clothe the twigs in such a way as to constitute an object of great beauty when full grown. For this reason and owing to the neat, upright habit of the plant it is much grown in pots and tubs for decorative work, and for planting in the sub-tropical garden out of doors in summer, when in full beauty. When grown entirely in the open ground, the season is far advanced before it attains its characteristic development. Nevertheless it is a most graceful and desirable Bamboo. Some years ago it was often grown under the name of *Thamnocalamus Falconeri*.

(To be continued.)

GARDENING MISCELLANY.

CARNATION MRS. LEOPOLD DE ROTHSCHILD.

THE quantity of flowers obtainable annually from this tree variety is surprising, when accorded suitable cultural treatment as practised at Gunnersbury Park, Acton, by Mr. George Reynolds. Flowers are produced in quantity during the winter months; but the plants seem in no wise disposed to go to rest even when the summer is well advanced, but continue to develop vigorous shoots, which in due time terminate in flowers, thus affording, as it were, an aftermath. The flowers are of a rich pink, and fragrant; those produced in spring and summer, when light is good, are of large size, and very useful in the cut state. Malmaison Carnations also receive due attention in the same establishment. A large quantity of rooted layers of border varieties are also potted up in autumn and brought along slowly in a greenhouse for early summer flowering, and seem admirably adapted for the purpose. They grow and flower freely, affording a great variety of colours for cut flower purposes.

MAGNOLIA PARVIFLORA.

WHEN the early flowering Magnolias have shed their last petals *M. parviflora*, a pretty and most interesting species, comes on the scene. The specific name is not particularly appropriate seeing that there are species with much smaller flowers in cultivation. As Magnolias go, the flowers of the little tree under notice may be described as of medium size, and produced in association with the leaves towards the middle and end of June. The three sepals are broad but short, reflexed and white; the six petals, on the contrary, are very much longer and of a beautiful pure white. The purple mass of stamens in the centre shows off to advantage against the white background. The light green obovate leaves are similar to those of *M. conspicua* and *M. obovata*, though smaller and not precisely identical. It has been flowering beautifully for some time past in the Bamboo garden at Kew, and hails from Japan.

A FRUITFUL ORANGE.

THE genus *Citrus* is found in most large gardens, where it is grown not only for the sake of its flowers and fruits, but for its cheerful, glossy green leaves. These latter, however, require frequent sponging, otherwise the "cheerful" appearance will soon become an absent quality. *C. Aurantium* and its varieties are those which usually find a place in British gardens, when it often occupies a conspicuous place, especially the tub on the terrace of the mansion during the summer months. Mr. D. Cooper, however, of the Gardens, Hanger Hill House, Ealing, W., disposes of the tub by interring it, in funereal phrase, beneath the sod, so that nothing but the tree and its golden fruits appear to please the eye. Several other sub-tropical subjects like *Ficus elastica*, &c., are similarly dealt with, the effect in consequence being very much enhanced. Moreover, less watering is required—a serious item in a droughty season—and the conditions generally are much improved. The tree in question is about 6 ft. high from the green sward, and 4 ft. through. It is a good, bushy specimen, clothed to the ground, and carries about 100 medium-sized fruits.—*C. B. G. Acton, W.*

SOLANUM JASMINOIDES.

THIS most certainly is one of the best half hardy climbing plants we have. A good plant of it under cover is never long out of bloom. The flowers which, in the shade, come almost pure white, are borne in large trusses, and are very useful among other cut flowers. The climber will live outside in a sheltered position near London, and then flower at the end of summer, and on till the frost comes.—*W. B. G.*

SOCIETIES.

THE ROYAL AGRICULTURAL AT BIRMINGHAM.

June 18th to 24th.

SINCE the inauguration of this Royal Agricultural Show in 1839 the number of entries for, and the importance of, the function has steadily increased. This year it was held at Four Oaks, Birmingham, and another success added to the already long list of successes.

Amongst the numbers of noteworthy exhibits which were to be seen in the Midland town last week was the Royal Stand erected by Messrs. Sutton & Sons, of Reading. This, when it was shown at Windsor in 1889, was honoured by visits from Her Majesty the Queen, and other members of the Royal Family. It is a stout and handsome structure, built of English Oak, and in its huge recesses were exhibited on this occasion, as on others, a large collection of flower and vegetable seeds, Potatos, &c. A highly interesting portion was a collection of grasses in flower, each bearing its popular and botanical name, with its duration of growth, season of flowering, and habitat, with other useful information. Some twenty varieties of disease-resisting Potatos were on view; also samples of growing crops of Peas and Tomatos. Another special feature of the exhibit was a seed germinator, the method of testing seeds being shown in operation. To the horticulturist not the least interesting portion was the grand display of Gloxinias.

Messrs. Webb & Sons had a fine stand of seeds and vegetables of all kinds, of which we gave particulars in last week's issue.

From Messrs. Dicksons, Ltd., Chester, came a collection of grass and Clover seeds, for permanent and temporary pastures. Special machinery for cleaning the samples of seeds was also shown in working.

Messrs. John Fowler & Co., Ltd., of the Steam Plough and Locomotive Works, Leeds, and of Lombard Street, London, E.C., had two stands containing various ingenious labour-saving machines. These included their patent six-furrow, turn-round plough, eminently suitable for light ploughing in countries in which it has hitherto been found difficult to compete with horses. The single cylinder ploughing engines with self-acting coiling gear, double crank compound spring-mounted road locomotive engines, and the 12-ton single cylinder steam road roller were also all on view. Of the machinery in motion the 10 horse power patent steam digger represented an exceedingly valuable machine.

Messrs. Potter, Hawthorn & Co., showed their improved patterns of poultry houses, greenhouses and pigeon cotes.

Messrs. Hill & Smith contributed a large assortment of fencing hurdles, guards and gates. The continuous iron fences vended by this firm are cheap and strong, and the unclimable fencing is worthy of attention.

Mr. Duncan Tucker, of Tottenham, made a fine display of horticultural buildings. These comprised a conservatory specially built for the show, fitted up with the latest and most improved ventilating gear, and with a projecting bay for folding entrance doors. The Orchid house was of Teak, which is specially recommended for buildings of this character, as the wood possesses great strength and "last." This house was fitted with special insect proof staging with iron frames and slate slabs, an evaporising tank under the heating pipes and modern ventilating gear. Tucker's patent anti-drip bar was also fixed in position.

The Pomona Cider made by Mr. John Watkins, Pomona Farm Nurseries, Withington, Hereford, has acquired a great name and has obtained many honours. It is pleasant in flavour, and while not too sweet, is free from roughness. Samples of this

Cider were on view, and visitors were invited to taste.

Cider and Perry in casks and bottles were also shown by Mr. Henry Godwin, of Holme, Hereford.

The responsible trust of protecting the showyard against fire was placed in the capable hands of Messrs. Merryweather & Sons, Ltd., of London. The firm showed some of their most valuable fire extinguishers, which have in their time gained sixty-nine gold medals and awards at various exhibitions. The "Greenwich" and "Gem" double cylinder fire engines, the "Farm Homestead" and other pumps suitable for farms, gardens, nurseries and Hop gardens, excited much interest on the part of visitors. The "Valiant" steam pump, used on one of Her Majesty's ships, was likewise a source of interest. The engine weighs 6 cwt., and is balanced on a small hand carriage.

Messrs. Webb & Sons were entrusted with the decoration of the exhibition hall, and this they carried out in an exceedingly tasteful fashion, Palms and flowering plants in variety being liberally employed.

Stand No. 1 was occupied by Messrs. Jas. Carter & Co., of High Holborn, with some remarkably fine samples of farm and garden produce. Cereals were strongly represented, and amongst them such grand varieties of Oats as Carter's Cluster, Golden Black Tartarian and Triumph, as well as Royal Prize Red Wheat, Prize Prolific, and Goldthorpe Barley. Unique clumps of pasture Grasses and Clovers were so arranged as to offer precise information to those requiring it as to the relative values of the various forms for different soils and localities. The piles of last season's Mangel Wurzel excited considerable attention, for the roots were as sound as if they had just been taken from the ground.

A neat and comprehensive collection of trees for park and pleasure ground ornamentation was staged by Messrs. Little & Ballantyne, of Carlisle. They included the new Holly Golden King, a great improvement in every way upon the older Golden Queen. Here, too, were specimens of pasture Grasses in flower, and swards of lawn Grass and permanent pasture grown from mixtures made and recommended by the firm. Cereals were represented by high class samples of seed, and these included pure stocks of pedigree Chevalier Oats, Barley and Wheat.

Messrs. Dickson, Brown & Tait, Manchester, showed dried Grasses and Clovers commonly employed in British agriculture. The root seed section was evidenced by specimen bags of the finest Turnips and Swedes, whilst Oats, Barley and Wheat were all in capital condition.

Manchester had another capable representative in the firm of Messrs. Dickson & Robinson, who had a particularly noteworthy exhibit of seeds. Capital samples of the famed Swedes Robinson's Eclipse, Lord Derby and Perfection were shown, and the seed Potatos were likewise a commendable feature. The seeds shown were representative of the best strains of both vegetables and flowers.

Messrs. W. H. Wilcox & Co., 23, 34 and 36, Southwark Street, London, E.C., are large manufacturers and vendors of engineers' tools, india-rubber and leather goods of all descriptions connected with the trade, including their wire-bound hose and lubricating and cylinder oils. Of all these they had a great store on view, and great interest thereby attached to their stand. All the goods shown were of the highest stamp.

NATIONAL ROSE, AT BATH.—June 23rd.

IT is some nine or ten years ago since the National Rose Society located their annual southern provincial show at Bath, and the committee are to be congratulated upon their selection of Bath for the 1898 fixture, which was in every way a most successful one. All but one or two of the twenty-seven classes provided brought competitors, and in not a few instances the struggle for premiership was exceedingly close. On the whole the quality of bloom forthcoming was exceptionally good, especially when we consider the backwardness of the season, and the difficulties which rosarians in all parts of the country have had to surmount.

The exhibition was held in the Sydney Gardens, in connection with that of the Bath Rose and Begonia Show.

NURSERYMEN'S CLASSES.—In the big class for forty-eight blooms there were three competitors,

first of whom was Mr. B. R. Cant, of Colchester; second, Messrs. D. Prior & Son; and third, Messrs. Frank Cant & Co., Braiswick Nursery, both from Colchester, so that the growers from the Essex town had matters all their own way. In the first-prize stand, which thus won the Silver Cup offered by the Mayor of Bath, all the blooms were good, both for size and form, as well as colour, but the best amongst them were the samples of Ulrich Brunner, Souvenir de S. A. Prince, Kaiserin Augusta Victoria, Suzanne Marie Rodocanachi, Niphetos, Gustave Piganeau, La France, Mme. Cusin, The Bride, Comtesse de Nadaillac, Mme. Gabriel Luizet, Marie Van Houtte, General Jacqueminot, Caroline Testout.

The twenty-four blooms, distinct, sent by Mr. Geo. Prince, of Oxford, were largely composed of Teas, and the fine form and delicate colouring of these were largely responsible for the gaining of the first prize. La France, Marechal Niel, Niphetos, Medea, Cleopatra, Kaiserin Augusta Victoria, The Bride, Mme. Hoste, Viscountess Folkestone, and Marchioness of Dufferin were the strongest varieties. Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, were second.

In the class for twenty-four trebles the Colchester growers had again all the running between them, although only two exhibited. Messrs. D. Prior & Son had rather the better lot, and just scored over Messrs. F. Cant & Co. Mrs. Sharman Crawford, La Fraicheur, Prince Arthur, Fisher Holmes, A. K. Williams, White Lady, Hon. Edith Gifford, La France, Grace Darling, Caroline Testout and Mrs. Harkness were the finest blooms in the first prize lot.

Colchester again carried off all the honours in the class for a dozen blooms of any Rose, Tea or Noisette excepted. The fragrant variety Lady Mary Fitzwilliam, shown in splendid condition by Messrs. D. Prior & Son, was adjudged first. Then followed Madame Gabriel Luizet, from Mr. B. R. Cant; and Lady Mary Fitzwilliam, exhibited by Messrs. F. Cant & Co.

In the premier class for Teas and Noisettes, that for twenty-four blooms, distinct, Mr. Geo. Prince, of Oxford, was an easy first. The blooms of Princess of Wales, Hon. Edith Gifford, Mdme. Cusin, Mdme. de Wateville, Comtesse de Nadaillac, Catharine Mermet, Innocente Pirola, Cleopatra, and Souvenir d'Elise Vardon were all exceptionally good. Colchester was not to be denied, however, for Messrs. F. Cant & Co. were second, and Messrs. D. Prior & Son, third, in this competition.

The premier stand of a dozen Teas was sent by Messrs. J. Burrell & Co. It contained a grand lot of flowers, Souvenir d'un Ami, Cleopatra, Princess of Wales, The Bride, Mme. Hoste and Souvenir d'Elise Vardon being the best. Mr. J. Mattock, New Headington, was second; and Messrs. G. Cooling & Sons, Bath, third.

OPEN CLASSES.—Mr. Geo. Prince came to the front in this section for twelve trebles of Teas and Noisettes. The blooms submitted of Cleopatra, Princess of Wales, Hon. Edith Gifford, M. Furtado, and Madame Cusin were some of the handsomest amongst a very fine lot. Mr. B. R. Cant came in second, and Messrs. D. Prior & Son, third.

The competition for twelve blooms of one variety was very keen, there being no fewer than seven entries. Mr. G. Prince headed the list with a grand stand of Marechal Niel; Mr. B. R. Cant secured second prize with Cleopatra; and Messrs. D. Prior & Son the third with Souvenir de S. A. Prince.

AMATEURS' CLASSES.—In this section Mr. Alexander Hill Gray, of Beaulieu, Bath, greatly distinguished himself. His most notable victory was in the class for a dozen Teas and Noisettes, the first award being the Silver Cup offered by Messrs. Cooling & Sons. The Rev. J. H. Pemberton was second, and Dr. S. P. Budd, Bath, third, in this competition. Mr. Gray's other successes were for two dozen blooms, distinct, eighteen distinct Tea and Noisette varieties, and six trebles, in all of which classes he showed some splendid material.

The Rev. W. Powley, Upper Scudamore, Warminster, was the only exhibitor of a dozen blooms, open to those growers who have less than a thousand plants. He was accordingly awarded the first prize.

Mr. Conway Jones showed the best twelve blooms in the class for growers of 500 plants.

GARDEN ROSES.—A magnificent array of large bunches of garden Roses was staged by Messrs. G.

Cooling & Sons, of Bath, and the first award in the class for thirty-six bunches of as many distinct varieties of this class of Roses was thus well won by the firm. Messrs. Paul & Son, of Cheshunt, won the second prize, also with a grand exhibit.

Mr. Charles Turner, of Slough, led for eighteen bunches, Messrs. F. Cant & Co. being second, and Mr. J. Mattock, third. Messrs. Paul & Son, of Cheshunt, secured the leading prize in the small class for twelve bunches.

In the amateurs' division for garden Roses the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, exhibited the first prize lot of eighteen bunches, and although he was the only competitor he fully deserved the first prize. Mr. E. Mawley, of Berkhamstead, had the best six bunches, distinct—a very choice and handsome set.

NOTABLE ROSES.—The Gold Medal went to Messrs. A. Dickson & Sons, Newtownwards, Co. Down, Ireland, for the new H. T. Rose Miss Bessie Brown, a creamy-white variety of splendid form and noble presence. The Silver Medals for the best blooms in the exhibition in their respective classes were given to hybrid Tea Lady Mary Fitzwilliam, shown by Messrs. Burrell & Co.; to Tea Comtesse de Nadaillac, shown by Mr. G. Prince; to hybrid perpetual Tom Wood, sent by Messrs. Alexander Dickson & Sons, in the nurserymen's and open classes. In the amateurs' division Tea Maman Cochet, shown by Mr. A. Hill Gray; hybrid perpetual Alphonse Soupert, from Dr. Budd; and hybrid Tea Caroline Testout, sent by the Rev. J. H. Pemberton; all received medals.

BATH SOCIETY'S CLASSES.—In this section five groups of miscellaneous plants, each occupying 250 sq. ft., were put up, the first prize being carried off by Mr. J. Cypher, of Cheltenham, in whose group were many fine Orchids and Caladiums; Mr. Tanzer, gardener to R. B. Cater, Esq., Bath, was second.

Messrs. Cooling & Sons deservedly obtained the first award for a handsome table of Roses, in which the Penzance Sweetbriars appeared to great advantage, as well as the long sprays of Rosa Harrisoni. The other Roses shown were chiefly Teas.

MISCELLANEOUS EXHIBITS.—Messrs. Barr and Sons, of Covent Garden, had a superb lot of hardy flowers, particularly Irises, Paeonies and Delphiniums. Messrs. R. Veitch & Son, of Exeter, erected a charming miniature rockery, and had also some notable new plants. Mr. F. Hooper, Widcombe Hill, Bath, had fine show and fancy Pansies. Mr. J. H. White, of Worcester, had hardy flowers; whilst an interesting lot of Cacti came from Mr. W. F. Gould, Bath.

WINDSOR.—June 25th.

THE seventh annual exhibition of the Windsor, Eton, and District Rose and Horticultural Society was held in the Home Park, under the slopes of Windsor Castle. It was a very pretty show and amply accommodated in five tents, a large one, a long one, and three smaller ones. Heavy thunder showers prevailed at intervals all day and greatly marred the enjoyment, and hindering the crowd from being so large as it might otherwise have been. The exhibits were of a high order of merit.

The Queen's Cup, value £10 10s., in the open division, for forty-eight distinct Roses, in single trusses, was secured by Mr. B. R. Cant, Colchester, whose property it now becomes, having been won by him for the second time. He had magnificent blooms of Caroline Testout, Catherine Mermet, Souv. de S. A., Prince, Souv. d'Elise Vardon, Princess of Wales, La France, Ulrich Brunner, Mrs. John Laing, Lady Mary Fitzwilliam, Duchesse de Vallembrasa, Suzanne Marie Rodocanachi, Golden Gate and others. Messrs. D. Prior & Son, Colchester, came in second with fine blooms of Mrs. John Laing, White Lady and Lady M. Fitzwilliam. Messrs. Harkness & Sons, Hitchin, were third with a fresh, even exhibit. There were seven entries for the cup.

Mr. George Prince, Oxford, secured the leading prize for eighteen Tea or Noisette Roses, with fine blooms of Cleopatra, Rubens, Medea, Souv. d'Un Ami, Catherine Mermet, and others. Messrs. Frank Cant & Co., Colchester, were a good second, showing several grand blooms. Messrs. D. Prior & Son, Colchester, were third. Mr. G. Prince had the best Rose in the show, in Comtesse de Nadaillac.

For twelve distinct, three trusses of each, Mr.

Benjamin R. Cant was again to the front, showing fine triplets of Cleopatra, Gustave Piganeau, &c. Messrs. Frank Cant & Co. were second with a very fine exhibit, the hybrid perpetuals being of large size. Mr. Geo. Prince was third, showing Tea Roses almost solely.

Messrs. Frank Cant & Co. took the lead for twelve blooms of any H.P. or H.T., showing charming blooms of Mrs. W. J. Grant. Mr. B. R. Cant came second with La France. Messrs. D. Prior & Son were third with Lady M. Fitzwilliam.

Mr. Geo. Prince had the best twelve blooms of any Tea or Noisette, showing Comtesse de Nadaillac in grand form. Messrs. D. Prior & Son were second; and Messrs. Frank Cant & Co. third.

Messrs. Paul & Son, Cheshunt, had the best eighteen bunches of garden Roses, showing bunches of the new Royal Scarlet, and Dawn, as well as W. A. Richardson, Carmine Pillar and others in grand form. Mr. Charles Turner was second with a very interesting lot. Messrs. Frank Cant & Co. were third with a varied and showy lot.

In the amateurs' division the first prize for twenty-four blooms of Roses was taken by Mr. R. E. West, Reigate, who had fine blooms of Gustave Piganeau, Captain Hayward, Anna Olivier, &c. Mrs. Irving (gardener, T. Elisha) had the best six blooms of one variety. Mr. R. E. West again took the lead for twelve Teas or Noisettes, followed by C. Romaine, Esq. (gardener, Mr. T. Guttridge), The Priory, Old Windsor. Mr. R. E. West was first for six varieties, three blooms of each.

In the section for local classes the first prize for eighteen blooms was taken by A. Munt, Esq., securing Mr. Frank Cant's Challenge Cup. Sir Robert Harvey, Bart., was second. Mrs. Burton (gardener, W. Wicks) had the best twelve blooms. Mrs. Irving had the cup for the best display of cut Roses arranged in a space 4 ft. by 3 ft.; W. H. Austin, Esq., was second.

There were seven groups arranged for effect round the side of one of the tents. The first prize group was bright, tastefully displayed and shown by Sir Charles Piggott, Bart. (gardener, Mr. T. Fleming), Hexham Park, Slough. Lilies, Carnations and Orchids were largely employed. Sir Robert Harvey, Bart., took the second place; and Miss Ridge (gardener, Mr. G. Lane) was third. The first prize for four specimen plants was taken by Major the Hon. H. C. Legge (gardener, Mr. J. G. Mowbray) with huge specimens. L. Baker, Esq. (gardener, Mr. T. Osman), Ottershaw Park, Chertsey, was second; and A. F. Lovett, Esq. (gardener, Mr. W. Smith), third.

L. Baker, Esq., took the first prize for Ferns with grand plants; Lord Boston had the best dinner-table plants; and C. Romaine, Esq., the best ten pot plants.

Dinner-table decorations occupied one round tent. The first prize for a table 8 ft. by 4 ft. was taken by Miss Edward Gould, who used mauve Sweet Peas and Iceland Poppies besides the greenery. Miss Gee was second, using Sweet Peas and Honeysuckle. Miss Amy B. Brown was third.

In the fruit tent Lord Boston had the best four dishes of fruit, showing Grapes, Figs, and Nectarines. L. Baker, Esq., was a good second. Miss Ridge had the best two Black Grapes; L. Baker, Esq., being second; and N. J. Cohen, Esq., (gardener, Mr. A. Street), third. L. Baker, Esq., had the best White Grapes, beating Miss Ridge. Major Hon. H. C. Legge was first for Peaches; and Lord Boston for Nectarines. A. F. Croth, Esq. (gardener, Mr. W. Smith), had the best Melon; and T. D. Irving, Esq., the best Strawberries.

The Hon. C. S. Teby (gardener, Mr. D. Paxton), had the best collection of six vegetables, showing well. L. Baker, Esq., was second; and George Quelde, Esq., third. Lord Boston had the best Tomatos; and Major Hon. H. C. Legge the best Cucumbers.

Vegetables were also well exhibited by the cottagers, Mr. H. T. Lambert taking first for four varieties. For the prizes presented by Messrs. Sutton & Sons, Reading, some good vegetable exhibits were forthcoming. Miss Ridge was first; and L. Baker, Esq., was second. For Mr. W. H. Titt's prizes the Hon. C. S. Teby took the first prize.

MISCELLANEOUS EXHIBITS.

Baron Sir Henry Schroder (gardener, Mr. H. Ballantine), The Dell, Egham, exhibited a showy table of Orchids in the centre of the large tent. He had fine

pieces of *Vanda teres*, *Cattleya Mossiae*, *C. Mendelii*, *Laelia grandis tenebrosa*, *Masdevallias*, and *Miltonia vexillaria* in great variety, and well flowered. The forms of *Odontoglossum crispum* were also grand, particularly *O. c. Lord Sherbourne*, and several others to which no special name was given. *O. Hallii leucoglossum* carried a spike $3\frac{1}{2}$ ft. long, with flowers almost to the base.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, also had a central table of Orchids, amongst which *Cattleya Mossiae*, in an infinite variety of shades of colour, was the most prominent and showy. Both dark and light forms were very pretty and interesting. Other fine things were *Laelia grandis tenebrosa*, *Oncidium ampliatum*, *Cypripedium superciliare ornatum*, and *C. Curtisii*. The gorgeous colours were toned down, with Palms, Crotons and Ferns.

Messrs. J. Veitch & Sons, Ltd., Chelsea, had a grand display of hardy herbaceous plants such as Chinese Paeonies, Irises, Delphiniums, Pyrethrums, *Lychnis Viscaria splendens plena*, *Digitalis purpurea alba maculata*, handsomely blotched, *Heuchera sanguinea*, *Gaillardias*, long trails of *Tropaeolum polyphyllum*, *Inula glandulosa*, *Verbasum olympicum* and many other things in season.

Messrs. Barr & Sons, 12 and 13, King Street, Covent Garden, London, also staged hardy herbaceous plants extensively. Delphiniums, Irises, and Chinese Paeonies were particularly prominent, including a new Paeony named Mr. Jules Elie. Handsome Irises were *I. ochroleuca gigantea*, *I. Monieri*, and *I. Monspur*. Oriental and Iceland Poppies, Campanulas, and Violas were also fine. *Philadelphus erecta* is a new hybrid Mock Orange, deliciously scented.

Messrs. R. Wallace & Co., Colchester, had a splendid display of Lilies, Irises and Paeonies. Amongst the Lilies, very fine were *Lilium washingtonianum purpureum*, *L. pardalinum minus*, *L. tennifolium*, *L. thunbergianum* The Sultan, *L. t. alutaceum*, the new *L. rubellum* in quantity, *L. Henryi*, and many others.

Mr. Charles Turner, the Royal Nurseries, Slough, had a showy and effective group of show, fancy and regal Pelargoniums, all beautifully flowered, and charming in effect.

Messrs. George Jackman & Son, Woking Nursery, Surrey, had an exhibit of hardy herbaceous plants, Roses, hybrid Briers, Sweet Peas, and hybrid Clematises including *C. Countess of Onslow*, *C. Duchess of Albany*, and *C. Duchess of York*. They also showed Chinese Paeonies, Campanulas and other hardy subjects. The Sweet Peas were sown in the open last autumn, and were handsome.

E. F. Such, Maidenhead, exhibited a collection of hardy herbaceous plants in season, including *Gaillardias*, Irises, Delphiniums, &c. At the other end of the large tent Mrs. Charles Turner had a circular group of Roses in pots, most of them being remarkably dwarf and well flowered.

Mr. W. H. Titt, 24, Thames Street, Windsor, had a fine display of cut flowers and various floral devices, including a magnificent shower bouquet. In one of the devices the pink Carnation *Duchess of Fife* was very noticeable and pleasing. Hardy herbaceous plants were also tastefully displayed and gorgeous.

Lady Mary Currie (gardener, Mr. F. H. Beney) had a beautiful collection of Sweet Peas on the round central table of the fruit tent.

ROYAL HORTICULTURAL.—June 28th.

THE meeting on Tuesday last was a very full one as far as exhibits were concerned, all the tables, both central and round the sides of the hall, being loaded with a galaxy of flowers of all sorts. Orchids were very prominent, as were hardy Campanulas, Paeonies, Delphiniums, Annuals in great variety, Sweet Peas, tuberous Begonias, Malmaison and other Carnations, Lilies, Crotons, &c.

Messrs. J. Veitch & Sons, Ltd., Chelsea, staged a very varied exhibit of Orchids, prominent amongst which were *Laelia purpurata*, *Cattleya Warscewiczii*, (gigas), *C. Mendelii*, *C. Warnerii*, and *C. Mossiae*. The bigeneric hybrids, *Laeliocattleya Eudora*, *Lc. Eudora alba*, and *Lc. canhamiana alba* were gorgeous in colour, and magnificent for size. Valuable and showy also were *Phalaenopsis ludde-violacea*, *Epiphronitis Veitchii*, *Disa kewensis*, *D. Veitchii*, *Thunia veitchiana*, *Vanda cristata superba*, *Dendro-*

bium Dearei, &c., in fine condition. (Silver Flora Medal.)

A grand exhibit of Orchids was also set up by Messrs. Hugh Low & Co., Bush Hill Park, Enfield. *Cattleya Mossiae*, in a great variety of shades of colour, including the beautiful *C. Mossiae arnoldiana*, were gorgeous and prominent. They also had *C. Mendelii*, *Laelia tenebrosa*, *Oncidium crispum*, *O. macranthum*, *Cypripedium superciliare*, and the pretty *C. lawrenceanum hyanum*. They were set up with Palms and Ferns. Very fine were the new hybrids *Cypripedium Iansonii* and *C. Mr. Reginald Young*. (Silver Flora Medal.)

Messrs. B. S. Williams & Son, Upper Holloway, also staged a collection of Orchids, of which *Laeliocattleya Edouard André* and *Cattleya breanteana* were noticeable features. Very fine also were *Cypripedium lebaudyum*, *Aerides expansum*, *Cochlioda roezliana* and several varieties of *Odontoglossum crispum*. (Silver Banksian Medal.)

Messrs. Stanley-Mobbs & Ashton, Southgate, exhibited a collection of Orchids, that were located on two tables. *Cattleya Mossiae*, *C. M. reineckiana*, *C. Mendelii* and *Laelia grandis tenebrosa* were very prominent, on account of their showy flowers. Interspersed with them were interesting subjects, such as *Mormodes unicolor var.*, *Oncidium spilopterum*, *O. Papilio*, *O. lanceanum*, *Chysis aurea*, the blue *Dendrobe (Dendrobium Victoriae Reginae)*, *Laelia purpurata*, *Cattleya schilleriana* and various others. Particularly fine were *Stanhopea Ashtonii* and *Lycaste Deppei virens*. (Silver Banksian Medal.)

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, exhibited the magnificent *Stanhopea rodigasiana*; also *Cattleya gigas*, *Odontoglossum excellens Sanderae*, *Laelia tenebrosa*, &c., most interest being displayed in the *Stanhopea*.

Thomas McMeekin, Esq. (gardener, Mr. A. Wright), Falkland Park, South Norwood Hill, staged a well-grown piece of *Cypripedium Rothschildianum* Falkland Park var. *Cattleya guttata Leopoldii* in fine form was shown by the gardener, Mr. W. Pope, The Willows, Wargrave, Berks. Sir F. Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen, exhibited *Laeliocattleya canhamiana*, *Lc. c. Joyce Wigan*, *Sobralia Xantholeuca*, *S. Wiganiae*, and others. De B. Crawshay, Esq., (gardener, Mr. S. Cooke), Rosefield, Sevenoaks, exhibited *Odontoglossum excellens*, Mrs. de B. Crawshay, and a fine variety of *Cattleya Mendelii*. Messrs. J. Veitch & Sons, showed the hybrid *Cattleya Adela*, *C. Clarissa* and *Phaius bicolor purpurascens* on the new plant table.

An exceedingly handsome and well set up group of flowering and foliage plants was sent by Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Herts. All the plants were stood upon the floor. Amongst the flowering element. Lilliums and *Odontoglossums* were especially prominent, and these were charmingly varied with Crotons and Ferns. An edging was furnished by *Caladium argyrites*, *C. minus erubescens* and *Isolepis gracilis*. Some large *Kentias* and *Arecas* dotted about the group served to give height and finish. The general contour of the front line of the exhibit was a series of curves. (Silver Gilt Flora Medal.)

Mr. H. B. May, of Dyson's Lane Nurseries, staged a splendid representative collection of *Adiantums* which included some ninety species and varieties. *A. farleyense*, the very rare *A. speciosum*, the new *A. hemsleyanum*, *A. Veitchii*, magnificently coloured, *A. gracillimum*, *A. fasciculatum*, *A. ciliatum*, *A. lambertiatum*, *A. Capillus-Veneris imbricatum*, and *A. C. V. magnificum* were some of the most noticeable forms. All these as well as the others not mentioned were in perfect health and condition. (Silver Gilt Banksian Medal.)

Messrs. Wm. Paul & Son, Waltham Cross, Herts., had a grand lot of Roses, chiefly cut blooms. Such varieties as *Queen Mab*, *White Lady*, *Soprano*, *Antoine Rivoire* and *Victor Verdier* were especially good. Samples of *Polyantha* varieties and Lord Penzance's Sweet Brier were also shown. (Silver Banksian Medal.)

Messrs. Jas. Veitch & Son, Ltd., Chelsea, sent sprays of a number of flowering shrubs, including *Styrax japonica*, *Robinia hispida*, *Escallonia langleyensis*, and *Philadelphus coronarius erecta*. On the cross table at the end of the hall the same firm put up a splendid array of varieties of *Campanula Medium calycanthema*. A number of

charming shades of rose and purple were included, and the plants were exceptionally well flowered. In the centre of this group was a stand of cut trusses and small flowering plants of the hybrid greenhouse *Rhododendrons* for which the Chelsea Nurseries are so famous. The flowers were exceptionally large and fine.

In another part of the hall the Messrs. Veitch had a long table filled with cut hardy flowers. There was a wealth of colour here. In the background was a double row of fine *Delphiniums* and in front of these was a splendid collection of herbaceous Paeonies, *Emile Lemoine*, *Delicatissima Vittata*, *Potsii superba*, *Duchesse de Nemours*, and *General McMahon*, were some of the best varieties. In the front rank were sprays of the free flowering *Tropaeolum polyphyllum*. Another charming feature was the collection of annuals and biennials, the flowers being arranged in bunches. These included three pretty vases set up for the Sherwood Cup Competition. (Silver Flora Medal.)

Messrs. Paul & Son, The Old Nurseries, Cheshunt, also had a handsome collection of cut Paeonies. (Silver Banksian Medal.)

From Messrs. H. Cannell & Sons, Swanley, Kent, came a capital lot of single-flowered tuberous Begonias. The plants were admirable samples of high-class culture, the flowers were of immense size and good shape, and there were some fine yellows, crimsons and roses. (Bronze Banksian Medal.)

Double Petunias were shown to great advantage by Messrs. Sutton & Sons, of Reading. Double Pink, Double Fringed White and Sutton's Superb, mixed, were the three strains shown, and all of them are of a high standard of merit. The new *Gladiolus Queen of the Roses* as shown by the Reading firm on this occasion created a most favourable impression. The flowers are of a delicate blush rose, and the variety is exceptionally free.

Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, received a Silver Banksian Medal for a showy lot of Lilies, *Brodiaeas* and Irises. Of the Lilliums, *L. szovitzianum*, *L. auratum rubrovittatum*, *L. thunbergianum* in variety, and *L. Henryi* were all good, whilst the distinct *L. tenuifolium* was a gem. *Paeonia albiflora striata*, white, striped carmine was another notable plant.

Messrs. Kelway & Son, Langport, Somerset, filled a long table with grand cut blooms of Paeonies, *Gaillardias* and *Delphiniums*. The last-named were especially good, and comprised, among others, such fine forms as *Sailor Prince*, *Clovelly*, *Julia*, *True Blue*, the yellow *Beauty of Langport*, *Wonder*, *Ustane*, and *Miss Salway*. Of the Paeonies *Princess of Wales*, *Dorothy Welsh* and *Cavalleria Rusticana* were the most noticeable. (Silver Flora Medal.)

The cross table at the bottom of the hall near the entrance was filled with a profusion of cut hardy flowers sent by Messrs. Geo. Jackman & Son, Woking. Sweet Peas, Delphiniums and Paeonies were all good here. (Bronze Banksian Medal.)

The cut hardy flowers from Messrs. Barr & Sons were, as usual, much in evidence. Amongst the Paeonies a number of leading varieties were represented, and Irises and Delphiniums in variety were very showy. (Silver Banksian Medal.)

The Sweet Peas sent by Mr. F. G. Foster, Brockhampton Nurseries, Havant, Hants, were in capital condition, the flowers being large and the colours good. Upwards of sixty bunches, in as many varieties were staged. *Blanche Burpee*, *Lady Mary Currie*, *Countess of Radnor*, *Black Knight*, *Lady Grisel Hamilton*, *Meteor*, and *Countess of Aberdeen*, were a few of the best. (Bronze Banksian Medal.)

Mr. Davis, of Yeovil, Somerset, staged a nice lot of tuberous Begonias both single and double flowered, for which a Silver Banksian Medal was voted. A tray of *Nymphaea* flowers was exhibited by Mr. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton. (Silver Banksian Medal.) Three large spherical-headed plants of *Lavatera arborea variegata* were shown by Messrs. H. Cannell & Sons.

A first-rate group of Malmaison Carnations in 8 in. pots was put up by Mr. Geo. Norman, gardener to the Marquis of Salisbury, Hatfield House, Hatfield. The plants were wonderfully well flowered. (Silver Flora Medal.)

Mr. C. Blick, gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent, had a grand lot of Carnations, the Malmaison blood being very apparent in

most of them. The flowers were of great size and good form throughout, such varieties as Margot, Lord Welby, Lady Grimston, Mrs. Torrens and Calypso being specially noteworthy. (Silver Gilt Banksian Medal.)

On the left hand side of the entrance Messrs. W. Cutbush & Son, Highgate, N., set up a remarkably fine group of Carnations, chiefly Malmaison varieties. The group had a pretty background of Bamboos, and an edging of Ferns. Churchwarden, Princess of Wales and Prime Minister were the cream of the Malmaison forms, whilst of border varieties, Duchess of Fife, Editb Ledenham and Andrew Noble (new) were all first-rate. (Silver Flora Medal.)

On the opposite side of the doorway, Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., had a nice lot of Carnations, the crimson R. H. Measures being a special feature. This is a very free flowering and useful variety (Silver Banksian Medal.)

Ten grand plants of Phenocoma prolifera Barnesii came from Messrs. W. Balchin & Sons, Hassocks, Hove and Brighton. It is not often that we see this old favourite so well grown.

From Reed's Nursery, Beckenham Hill, came sprays of ornamental trees and shrubs. Mr. Howe, gardener to Sir Henry Tat, Bart., Park Hill, Streatham Common, sent inflorescences of Chamaerops Fortunei.

At a meeting of the fruit and vegetable committee a Silver Gilt Banksian Medal was awarded to Mr. J. Hudson for a collection of very fine Tomatos, which included such varieties as Golden Nugget, Peachblow, and Abundance; and four trays of ripe Cherries.

A Silver Gilt Knightian Medal went to Mr. M. Gleeson, gardener to A. Von André, Esq., The Warren House, Stanmore, Middlesex, for eight magnificent fruits of Pineapple The Queen, each fruit of which had the remarkable average weight of 5½ lbs. They were well finished.

Messrs. T. Rivers & Son, Sawbridgeworth, showed six huge fruits of the new late Peach Thomas Rivers. Messrs. Jas. Veitch & Sons, Ltd., had a tray of delicious dessert Cherry Guigne Annonny. Mr. Geo. Wythes, gardener to Earl Percy, Syon House, Brentford, showed Royal Sovereign Strawberry ripened in the open within eleven months from the date of layering.

A Cultural Commendation went to J. J. Rolfe, Esq., Stanford le Hope, Essex, for Tomato Rolfe's Challenge.

QUESTIONS AND ANSWERS.

Book on Preparing Fruit, &c., for Exhibition.—*F. M. P.*: "The Horticultural Handbook and Exhibitors' Guide" is the only book on this special subject which has come to our knowledge. It deals with fruits, flowers and vegetables, giving details of the cultural treatment to be given, and other directions to be followed in preparing certain things for exhibition. The hints given as to what you should aim at in selecting the specimens should be as useful as anything in the book to the cultivator and would-be exhibitor. It is published by Messrs. William Blackwood & Sons, Edinburgh and London. Price 2s. 6d. cloth, and 2s. paper covers, exclusive of postage. You would also get many hints from a pamphlet on "Rules for Judging," published by the Royal Horticultural Society, 117, Victoria Street, London, S.W. It is priced at 1s., or by post 1s. 1d.

Malmaison Carnations failing.—*P. K.*: The specimen you sent us must have been in a worse condition than the one you examined, and found the roots apparently healthy. When we laid hold of the plant you sent it came away from the ball of soil easily, the stem being completely rotten just where it entered the soil. The latter consisted of good material and was in excellent condition, not wet and sour as we should have expected it to be on seeing the plant. The roots below were also good, and the growth of the plant showed that nothing was wrong with the cultural treatment, though it was drooping and turning yellow by the time we received it. The microscope showed the presence of Eel-worms in considerable numbers, leaving no doubt as to the cause of the malady. The Nematoid worms in question are white or colourless, and so minute that the naked eye can with difficulty detect them. They may have been introduced by the soil or by water, and appear to have entered at the cut end of the cutting or layer, and are now working their way up the stem. That sent us showed them to be already a little above the surface of the soil. If all your plants are affected in this way you cannot save them; but by way of trial you might stand the healthy ones by themselves on boards or shelves away from any other Carnations you may have in pots. The dying plants should be burned, and the soil buried deeply somewhere outside the garden. The only

chance of saving stock would be to take cuttings from near the top of the plants, observing whether they are perfectly healthy at the cut ends. A safer plan than that would be to get fresh stock somewhere else, using soil from a different source. You might also clean out your water tank, using quicklime in washing it as a precaution.

Thinning Potato Stems.—*F. P.*: Of itself we do not think that the thinning of Potato stems would be of any material advantage. It all depends upon how thickly the Potatos have been planted and the relative number of stems they have produced in a given area. So long as all the stems are fully exposed to light and air they cannot but be conducive to a good crop of Potatos. There are several things to be considered, however, in deciding about this. If the sets were planted too thickly in Spring they may become too crowded; or if the sets were too large and all the eyes allowed to develop stems the same results would obtain. Another view is that if tall growing varieties are planted in lines too closely together, in rich old garden soil, you are likely to get such a development of haulm that the stems will get crowded, or even fall over one another before the end of the season. Under any of these adverse conditions then it would be advisable to thin the stems with the object of allowing them full exposure to light and air. A better plan would be to guard against all of these conditions when planting.

Books for R. H. S. Examination.—*J. J.*: There are several books which would prove useful to you. "Elementary Botany," by Joseph W. Oliver is published by Messrs. Blackie & Son, Ltd., London, Glasgow, Edinburgh and Dublin, price 2s. This is a recent book with numerous illustrations. "Edmund's Botany" is sold by Messrs. Longmans, Green & Co., Paternoster Row, London, at 2s. 6d. if you rightly remember, and similar in character to the previous one. Either one or other of the above would be sufficient for a commencement. "Henfrey's Elementary Course of Botany," by Masters & Bennett, 4th edition, is a much larger book and more exhaustive of the subject. It is sold by Messrs. Gurney & Jackson, Paternoster Row, London, price 15s. All these are up-to-date books, and we should dissuade you from getting old ones, that is, old-fashioned and out-of-date books on the subject, because they are useless. Those we have mentioned you might be able to get second-hand at the book shops, but you would have to be there on the outlook, it might be for some time before you stumbled across any of them. Of course, you could ask your bookseller to be on the outlook for them. By getting new ones at once you could commence study immediately.

Propagating Pinks.—*Westbury*: You can propagate Pinks by layering just as well as Carnations in the case of the stronger growing varieties at least; but it is a tedious operation on account of the great number of stems crowded into a small area. The best plan when getting up a large stock would be to make up a bed of fermenting manure about 1 ft. deep. Tread it down firmly and place 3 in. or 4 in. of light, sandy soil over it. Make the soil firm; take off and prepare as many cuttings as you want and dibble them into the bed so prepared. A frame should be placed over the bed before putting in the soil. After the cuttings are all inserted give them a good watering with a rosed watering-pot to settle the soil. Put on the sash and shade lightly for a week during the hottest part of the day. Transplant as soon as rooted into beds in the open ground.

Variety and Kind of Vegetables.—*R. M. G.*: Asparagus, Cabbages, Leeks, Onions, Celery, and such things are considered distinct kinds of vegetables; but such as Ellam's Early, Winningstadt, Enfield Market, and Early York Cabbages would be considered mere varieties and not sufficiently distinct to be classed as kinds of Vegetables. There is an exception to the general rule; for though Brussels Sprouts, Cauliflower, Curled Kale, and Savoys are mere varieties of the Cabbage, they are, for exhibition purposes regarded as distinct kinds. You should not, however, use more of them in the same collection than you can help. Cauliflower and Broccoli are too closely allied to be regarded as distinct for exhibition purposes.

Names of Plants.—*L. M.*: 1, Stellaria holostea; 2, Tradescantia multiflora; 3, Spiraea japonica (this must not be confused with the garden plant of that name, which is Astilbe japonica); 4, Clematis Vitalba, probably, but send it when in flower; 5, Santolina Chamæcyparissus incana; 6, Polygonum Bistorta, well worth growing in the herbaceous border; 7, Silene inflata.—*F. M. P.*: 1, Hippeastrum aulicum var.; 2, Gymnogramme calomelanos; 3, Platycerium alcicorne; 4, probably Hymenocallis ovata, often named Pancratium fragrans in gardens. You might send a flower when the bulbs bloom.—*A. J.*: 1, Odontoglossum crispum, of good form; 2, Epidendrum prismatocarpum; 3, Cochlioda vulcanica; 4, Cyrtopodium Curtisii.—*J. M.*: 1, Geranium pratense album; 2, Campanula portenschlagiana; 3, Inula glandulosa; 4, Iris orientalis; 5, Campanula glomerata dahurica; 6, Viburnum plicatum; 7, Iberis amara.—*A. S. Cargill*: 1 and 2 are Tea Roses with remarkably healthy foliage, but we cannot undertake the naming of garden varieties; 3, Actæa racemosa; 4, Ourisia coccinea, upon the flowering of which we congratulate you.

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

Is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and prices of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

SATURDAY, JULY 9th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, July 12th.—Royal Horticultural Society; meeting of committees at 12 noon.
Woking Show (2 days).
Wolverhampton Floral Fete (3 days).
WEDNESDAY, July 13th.—Ipswich Rose Show.
Durham and Newcastle Horticultural Society's Show (3 days).
THURSDAY, July 14th.—National Rose Society's Show at Hallifax.

ROSES AT THE CRYSTAL PALACE.—The great annual exhibition of Roses at the Crystal Palace is once more a thing of the past; and visitors seemed more than usually pleased with the results, probably because they greatly exceeded expectations, after such a late and unfavourable season. Some of the visitors complained that their Roses were so badly cut up with the cold winds of May, that they thought the plants were dead. Since then, however, they have made favourable progress, but are late. Many growers consider that the season is two or three weeks later than usual, and seeing that the Palace show was held on the first Saturday of July as usual, it is not surprising that there were some misgivings about the success of the show. Most growers would have liked another week to open their flowers. The southern growers have practically had it all their own way on this occasion; and Colchester has fully maintained its previous reputation in respect of the mixed collections of Roses and the hybrid perpetuals. Oxford has taken the lion's share of the honours for Tea Roses, than which we have seldom, if ever, seen anything uniformly better in this class. There was some falling away in the number of entries in our opinion, judging from the general display; but the big prizes were just about as well contested as ever. All the classes were, however, well represented, there being no falling away in that respect. The dry atmosphere of the Palace and the oppressive heat for a short period in the forenoon caused the Roses to wilt a little, compared with their freshness at the close of the day last year; but there was no collapse such as we have seen in droughty seasons like 1887, 1893 and 1895. The blooms elicited well-deserved admiration even to the last.

Of Roses that distinguished themselves on this occasion, we consider that Comtesse de Nadaillac, White Lady and Mrs. W. J.

Grant stand at the top of the list. The first named furnished the best Teas both in the nurserymen's and the amateurs' sections. It also constituted the first prize stand of 12 blooms of any Tea or Noisette, and came from Oxford in two out of the three cases here mentioned. Mrs. W. J. Grant was the premier hybrid Tea in the nurserymen's classes, and secured the leading award as the best stand of any light pink or rose-coloured variety. White Lady was a sport from Lady Mary Fitzwilliam in 1889, and was not only the best hybrid Tea in the amateurs' section, but the best of that class in the show. Hybrid Tea Roses are now regarded by the National Rose Society as a distinct section, and it seems they are destined to increase in numbers, importance and in the estimation of growers largely on account of their perpetual flowering character and beautiful forms. Mrs. John Laing and Gustave Piganeau took the lead in the two principal sections as the premier hybrid perpetuals in the show and were characterised by fine form and colour, rather than by absolute size. Ulrich Brunner well sustained its reputation as an exhibition Rose, but did not gain the honour of being a premier bloom in the show. Large light Roses like Her Majesty and Captain Christy were conspicuous by their absence, so that we may conclude a stormy, late season is not in their favour.

The Colchester Roses in the "Trophy Class" gave entire satisfaction, several of the exhibits forming a very close competition, though there was little doubt as to the order of the winning stands. Here and there was a little evidence of stress of weather or the effects of insect depredations, probably a combination of both; for both of these adverse conditions seem to have been prevalent throughout the length and breadth of the land this year. There can be no doubt that many have got an impression of the difficulties attending the cultivation of Roses, though we do not apprehend that such checks will be anything more than accidental or temporary. The Rose is the universally popular summer flower, and most people with a garden give more or less particular attention to its cultivation. There was some evidence of this in the number of amateurs bent on note taking, and who were evidently familiar with a good many of the varieties, but had ocular demonstration that they were by no means masters of the art of cultivating them to that perfection of which they are capable.

The garden Roses were undoubtedly a feature of the show and no doubt converted many to an opinion of their surpassing beauty either in the garden or in the cut state. The annual shows at the Crystal Palace have been the means of increasing the popularity of this class, by demonstrating their superiority for effectiveness and general display. They far surpass the hybrid perpetuals for decorative effect at some distance away. Profusion of bloom, and the greater liberty of growth which the plants are allowed to enjoy is doubtless responsible for the widely prevalent and growing predilection for this race or mixture of races of the Rose. Hitherto the bulk of them have been blamed for their short season of flowering; but this can be extended by a more liberal use of the China or Monthly Roses, the Fairy Roses and others which owe their origin to Rosa indica. Nor can we forget that Tea Roses really originated from the same source. Many of the so called Polyantha Roses owe as much to Rosa indica as R. multiflora. The true Polyantha or cluster Roses ought really to belong to the latter; but no doubt hybridisation and cross-fertilisation have played their part in mingling the blood of the two, originally distinct races. We want now to

give increased incentive to the use of hybrid Teas for garden decoration. The Gold Medal for a new seedling Rose not distributed earlier than 1897 was granted to a variety named Purity and described as a new garden Rose. Without knowing its pedigree we suspect it to be a hybrid Tea, so that the race is bound to lay firm hold of cultivators everywhere in the near future. The flowers are white, and of beautiful form, with the outer petals revolute at the edges. It comes from Bath. The delicious fragrance of Sweetbrier's that pervades collections of garden Roses is another and distinct recommendation for their use. We are surprised that the whole race has not been more generally used for floral decorations. The light and graceful character of many of them favour artistic arrangements to a far greater extent than the heavier and more formal blooms for the exhibition table proper. The National Chrysanthemum Society might encourage their advancement for this particular purpose, as Chrysanthemums have been by the National Chrysanthemum Society. The dwarf or pot Roses from Chelsea demonstrated the limited compass within which well flowered plants may now be kept by an intelligent use of the knife and skilled cultivation.

Bamboo is the sole material of which the bridge of Shi Tsuen, China, is constructed. It spans a distance of 300 ft.

Royal Horticultural Society.—The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, July 12th, in the Drill Hall, James Street, Westminster, 2 to 5 p.m. On this occasion special prizes will be offered for Roses, and at 3 o'clock a lecture on "Edible Peas" will be given by Mr. N. N. Sherwood, V.M.H.

Mr. Thomas Humphreys, the assistant superintendent, Royal Horticultural Society, Chiswick, who met with an unfortunate accident a little over a fortnight ago, is now, we are pleased to learn, in a fair way to recovery; and we hope to see him at his accustomed duties again very shortly. At the time of the accident he was so badly hurt on the head as to be unconscious for some hours; and all who know him will be pleased to hear of his progressive recovery.

National Carnation and Picotee Society (Southern Section).—In consequence of the backwardness of the season, the date of the annual show to be held at the Crystal Palace, Sydenham, by the southern section of the National Carnation and Picotee Society has been postponed from Wednesday, July 20th to Wednesday, July 27th. Intending exhibitors would do well to note this, and that entries must be sent in at least four clear days before the day of the show, to the Superintendent of the Crystal Palace. The tickets of admission that have been issued for the 20th inst. will hold good for the 27th. We note that two classes have been added to the schedule, one each for six dressed blooms of any self Carnation, and six dressed blooms of any fancy variety.

Dutch Horticultural and Botanical Society.—At the Floral Committee meeting of June 8th, 1898, the committee awarded First-class Certificates to Messrs. E. H. Krelage & Son, of Haarlem, for *Acalypha Sanderi*; to Messrs. J. H. Kersten & Co., of Heemstede, for *Anemone coronaria* fl. pl. White Lady; to Mr. J. H. Schober, of Putten, for *Epidendrum purpureum*; and to Mr. J. C. de Lange, of Rotterdam, for *Lilium rubellum*. Certificates of Merit were awarded to Messrs. E. H. Krelage & Son, of Haarlem, for *Brodiaea Howelli* lilacina; and to Mr. H. D. Willink van Collen, of Breukelen, for *Lupinus nutkaensis*. Botanical Certificates were awarded to Messrs. E. H. Krelage & Son, of Haarlem, for *Calochortus maweanus* major, *Iris nigricans*, *Kniphofia Tucki* and *Tulipa Sprengeri*; and to Mr. W. C. Baron van Boetzelaer, of Maartensdijk, for *Masdevallia rosea* and *M. Ehippium*. An honorable mention was accorded Mr. Baron van Boetzelaer, of Maartensdijk, for *Odontoglossum crispum* in three varieties.

The Banana is reputed to be the most prolific of all plants grown for human food, being 44 times more productive than the Potato, and 123 times more than Wheat.

A Trade Alteration.—The firm trading under the name of Messrs. W. L. Lewis & Co., Southgate, N., was dissolved by mutual consent on the 31st of May last; and since then the business has been carried on by Messrs. Stanley-Mobbs & Ashton, who will receive all debts owing to and discharge all contracted by the late firm. Messrs. Stanley-Mobbs & Ashton continue to enjoy all the exceptional facilities for the direct importation of Orchids possessed by their predecessors, and will give unremitting attention to business.

Feeding Chrysanthemums.—There is a great tendency on the part of "Mum" growers to overdo the thing in the way of feeding their plants, undoubtedly fostered by the consistent pushing of the various vendors of the chemical manures, whose name, by the way, is legion. The mistake of over-feeding seems to have been carried to its extreme last year by a grower in the "States," who commenced to feed his plants with liquid manure in May. It is stated, in *The Florists' Review* for May 12th, that the "results did not make any great stir in the horticultural world," and the writer also sarcastically observes that this year that grower "will use more judgment and less manure."

Germinating Peas, Cress and Barley.—At a meeting of the Linnean Society of London, on June 16th, Professor J. B. Farmer, F.L.S., and Mr. W. G. Freeman, F.L.S., demonstrated the action of germinating Peas, Cress and Barley in causing the de-oxidation of a watery solution of methylene blue to a colourless liquid on shaking up the latter with air, while on adding a drop of hydrogen peroxide the blue colour was restored. Green plants placed in the solution were found to act in a manner precisely similar to the seedlings, though the action may be modified by assimilation in sufficient light. A number of experiments were shown. A discussion followed, in which Mr. Bennett, Prof. Howes, and Mr. Thomas Christy took part.

Leeds Flower Show.—The flower show held at Leeds last week, although a good one from a horticulturist's point of view, and despite the fact that it was favoured by fine weather, has been, we are sorry to learn, a financial failure. It leaves the committee with a deficit of about £150 in addition to last year's deficit of £40. Only £15 was taken at the gates before 6 p.m. on the first day, when the entrance fee was 2s. 6d. The attendance was more satisfactory on the second day, but on the third day, when the entrance fee was only sixpence, not more than 1,200 passed the turnstiles. In face of this great lack of local support the committee has a disheartening hill to climb. It is proposed to make an appeal for help to the principal residents of the town and neighbourhood, and if another show is projected steps will no doubt be taken to offer extraneous attractions, since it is evident that a flower show alone is not sufficient to draw the people of Leeds in any number.

Popular and Pretty Pot Plants.—Amongst the various subjects which have been given extensive trials in America as to their suitability for standing in dwelling rooms, the number of plants that have turned out satisfactorily is not large. *Latania borbonica* was condemned because the edges of the fronds turned brown so quickly. *Livistona rotundifolia* has been an equally qualified success, but the apparently more delicate *Cocos weddelliana* has done better. *Areca Bauerii* has not done well, but both *Pandanus utilis* and *P. Veitchii* have reaped golden opinions. *Phoenix canariensis* stands fairly well; but a complaint has been raised as to its stiff appearance. *Phoenix rupicola* is more elegant and stands equally well. *Cycas siamensis* has not been tested so much as the others but has been received well so far. Of Ferns the favourite appears to be *Nephrolepis exaltata bostoniensis*, but *Polypodium aureum* is in considerable demand. *Cyrtomium falcatum* is recommended in some quarters as being the best Fern for dwelling rooms inasmuch as it is always the last to succumb to adverse conditions. It will stand dry heat better than any other Fern.

Orange Juice is said to make an excellent dressing for black boots and shoes. The leather is rubbed with a slice of an Orange, and afterwards, when dry, brushed with a soft brush till it shines.

A Plague of Green Fly.—According to all accounts we have been enjoying a precious pest of red, brown and black, green fly. We ought to be terribly thankful for small mercies and this is not the least of them. The fly is altogether too deep for tears.—*Snaggs*.

Paper Flower Pots are a novelty that is being pushed by the trade on the other side of the water. They are made of stout waterproof card-board, are square in shape, and are stitched with wire. They are said to possess the advantages of economizing space. They can be shipped flat, so that they do not take up much space, and they are also very light and handy. They can be had in all sizes. Truly this is a paper age.

Rose Show at Southampton.—The Rose show held on the 28th and 29th ult., at Southampton Pier, under management of the Southampton Royal Horticultural Society is the first since that at Westwood Park some fifteen years ago. Roses were, of course, the predominating feature of the show, but it was not exclusively confined to the national flower. Moreover there were splendid displays of fruit and vegetables. The exhibits of Mr. Geo. Prince and Messrs. Prior and Cant were really superb, as were the Orchids shown by Mr. W. A. Gillett (gardener, Mr. Carr). In the first section Lady Ashburton secured no less than four prizes. The only seed merchants exhibiting were Messrs. Toogood & Sons, of Southampton, who were for the occasion representing the Ichthemic Guano Co., in addition to their own exhibit. The attendance during the afternoon was large, the interior of the pier pavilion presenting a very charming appearance. Music was supplied by the Police Band.

Floral Decorations at Chislehurst.—H.R.H. The Duchess of Albany opened a charity at Camden House, Chislehurst, on the 27th ult., on behalf of the poor of Deptford. Messrs. John Laing & Sons, Forest Hill, S.E., arranged to decorate the large tent 70ft. in length by 40ft. in width. An enormous quantity of material was used, Messrs. Laing & Sons sending something like nine van loads of plants for making groups, &c. Along the centre of the tent were three trophies, large Palms being elevated on pedestals so as to afford room for lounges beneath and for promenading about as if the tent were a winter garden. The floral lounges were decorated with Begonias, Orchids, Carnations, Caladiums, and various rare and choice plants. There were three groups of herbaceous plants. The water tower at Camden House was also decorated with garlands of flowers and foliage, and Palms were placed round the buttresses, &c. A great concourse of important personages and the élite of the neighbourhood were gathered together. After the opening ceremony the Duchess was presented with two bouquets of choice Orchids by the daughters of Alderman Truscott and A. Lyne, Esq.

Norwich Rose Show.—The picturesque Bracondale Woods were, on June 30th, open to the people of Norwich on the occasion of the Norfolk and Norwich Horticultural Society's Rose Show. Unfortunately for the complete success of this function, rosarians have had to deplore a rather unfavourable season, the result being that the exhibits were not up to the standard usually seen at this show. Mr. B. R. Cant, of Colchester, was first for the forty-eight, although, even here, the blooms were not so good as usual. Messrs. F. Cant & Co., of Colchester, were second. Miss Penrice, of Witton, was the only exhibitor of thirty-six blooms, and the second prize was awarded her. Mr. T. C. Blofield led for the twenty-four; the second prize going to Col. Rous. For eighteen blooms the Rev. A. L. Fellowes carried off premier honours, his stand being largely composed of Tea varieties. Mr. E. E. Burchier staged the best twelve. Miscellaneous cut flowers were a great feature, and in this section Mrs. Petre received a first prize for Antirrhinums. Mr. E. B. Fletcher secured a first prize for a bridal bouquet, with Col. Rous as second. Messrs. Burrell & Co., Howe House Nurseries, Cambridge, staged the winning lot of cut hardy herbaceous flowers. Mrs. Petre was second, and Mr. Charles Jacobi of Ipswich, third.

The Spaniards would Shell American Peas.—The current joke is that American market gardeners who live along the Atlantic sea board will not plant Peas this spring for fear that the Spaniards should come along and shell them.

Age of Trees.—The *Journal Horticole-Agricola* of Porto gives the ages of certain trees, but does not indicate by what process of reasoning or calculation it arrives at the deductions. Commencing with *Cercis Siliquastrum*, it gives the age as 300 years; *Ulmus campestris* reaches 335 years; *Hedera Helix*, 450; *Acer campestre*, 516; *Betula alba*, 576; *Citrus Aurantium*, 630; *Cupressus sempervirens*, 800; *Olea europaea*, 800; *Juglans regia*, 900; *Platanus orientalis*, 1,000; *Tilia europaea*, 1,100; *Abies pectinata*, 1,200; *Quercus rohur*, 1,500; *Cedrus Libani*, 2,000; *Taxodium distichum*, 3,000, and *Taxus baccata*, 3,200. The reputed age of the Lime is probably excessive, while several more durable species might have been cited.

Paper and Parchment.—The quality of the paper largely influences the permanency of the ink, and this matter is of considerable importance when we consider how largely wood pulp is used for paper-making nowadays. Such paper soon turns brown, and becomes so brittle that it may be broken into small pieces by merely crumpling it in the hand, says the *Journal of the Society of Arts*. The parchment skins, which were formerly used for writing on were infinitely superior to our modern paper, as far as the preservation of the writing is concerned. Even the old-fashioned unbleached paper was better than our present day bleached, glazed paper, for small quantities of both chlorine and lime remain in the latter, and apparently exert a detrimental effect upon both paper and ink.

THE R.H.S. COMMITTEES AT CHISWICK.

THE invitation of the council of the Royal Horticultural Society to the various committees to lunch with them at Chiswick was responded to by one hundred, who put in their presence at Chiswick on the 5th inst. The meeting took place at 12 noon, when the members of the committee proceeded to inspect the gardens and some of the subjects on trial. The luncheon took place at 1.30 p.m. in a large tent on the lawn, and was served by Messrs. Spiers & Pond.

This is the second of the kind, and the president, Sir Trevor Lawrence, Bart, who occupied the chair, after the usual loyal toasts, proposed "The Committees," and hoped that the gathering would become an annual institution. He expressed the thanks of the council to the committees for their unremitting and loyal attention to duty at the fortnightly and other meetings throughout the year.

Referring to the garden, he said that it had been so long under cultivation that for horticultural work the soil had become played out. Sooner or later they would have to find a different place to establish a garden. The speculative builder had got his eyes upon it as a valuable spot for partition in building plots. The society wanted a larger piece of so as to give greater scope for horticultural work. As long as the society continued to devote its attention to purely horticultural matters it was bound to succeed. There were few countries in the world which were so devoted to horticulture as this one. While at Geneva a lady had sent him a basket of fruit at his hotel, and everybody who saw it looked on with astonishment at the perfection of the fruit such as was but seldom seen outside of England.

The relations between the council and the committees continue to be of the most cordial character; and if at any time a difference should arise the council would be most anxious to remove it. Concerning the Temple Show, he had had most gratifying assurances from visitors that they had never seen a more beautiful show. A more tangible assurance of the success of the society was forthcoming in the fact that, at the first council meeting after the show, 110 new candidates had been proposed for election as Fellows. He coupled with the toast the name of Mr. W. T. Thiselton-Dyer, C.M.G., the director of the Royal Gardens, Kew.

Mr. Dyer, in rising to respond, said that he was at once flattered and not a little astonished at being invited to return thanks to this toast. The assembly that day had given him peculiar pleasure.

With the help he saw around him he had no doubt as to the cause of the society's success. The policy of having committees was not wrong. He made a humorous allusion to a kind of popularity which would make it difficult to see a flower without tread upon a duchess, but that might not be horticulture. The Horticultural Society must have a backbone; and that must rest upon the committees—a fact which could not be too widely acknowledged.

He then referred to the time when they practically held a council of despair in view of the first Temple Show, as they thought the tents could not be filled, though the show had since outgrown the limits of space at their disposal. Mr. Dyer was advised to take council of the market growers for Covent Garden, and he went to lay his case before Mr. Wm. Poupart, with the result that the market growers evinced a ready desire to come to the assistance of the society. Since then the show had grown to be what it is, and which had been well expressed as the high-water mark of horticulture. The Horticultural Society is now in touch with the entire horticultural world. One of his most earnest and interested hopes was the prosperity of horticulture. He further made reference to a case in which the nurserymen of England had supplied the Paris markets with a certain article of garden produce, which had met with encouraging success. The Legislature of France might well have excluded an article which was presumably very injurious to the interests of their countrymen. The experiment might well be repeated in other directions to the advantage of the growers in this country, particularly in the sending of fruit, some kinds of which were brought to greater perfection in this than in any other country of the world, notwithstanding the indifferent character of our climate. He also reminded his audience that the president of the society and he had been deputed to look after the interests of British horticulture at the forthcoming great international exhibition at Paris.

In concluding, he stated that the work of the committees had been subject to criticism, but all other useful institutions were subject to similar inconveniences. He considered that posterity would not regard them with less appreciation on that account. The differences of opinion about the granting of a First-class Certificate would soon be forgotten. Criticism was evanescent, and small outbursts of it would die like the gently diminishing ripples on a summer sea. Mr. Dyer was listened to throughout his speech with wrapt attention, and applauded as he resumed his seat.

A vote of thanks to the president for taking the chair was proposed by G. A. Smith-Dorrien, Esq., of the Scilly Isles, and after the president had replied, the company dispersed in parties through the garden.

GARDENING MISCELLANY.

SWEETBRIER LADY PENZANCE.

OF all the hybrid and cross-bred forms of Briers that have been raised few of them equal and none surpass the fascinating beauty of Lady Penzance. The flowers are of good average or even large size, and when they first expand they are of a rich salmon-rose shade, with a distinct yellow zone in the centre, but as they reach their full development the salmon mostly disappears. These colours indicate the union of the Sweetbrier and the Austrian Copper; but in any case the delicious perfume of the former is dominant. There is no more beautiful garden Rose in its season, during June and July particularly; and to the charming combination of colours may be added that of profusion of bloom, as visitors have seen in a bed of this variety near the greenhouse at Kew.

GRAMMATOPHYLLUM ELLISII v. G. RUMPHIANUM.

Among a number of interesting things at present in flower in the Orchid houses at Kew, these two species may be seen and comparison made of the differences and yet similarity. It is seldom that these two friends are seen in flower at the same time. Occasionally one or the other may be successfully bloomed; and to carry the differences in one's mind is not always safe or practical, for at first some little

doubt arose as to which was the one and which the other. This can be set at rest in the mind of any orchidist who has any doubt in the matter, and a journey to Kew will give opportunity of inspecting not only this but several other things equally interesting. In the case of *G. Ellisii* grown in a basket, the spike is some 2 ft. 6 in. in length with about twenty flowers on the spike.—W. S.

PRESERVATION OF MUSHROOMS.

LAY the Mushrooms around a stone jar, the cap separated, well cleaned, and the stalk cleft. The jar may be enamelled or glazed. The first closely packed row being arranged a layer of salt is laid on the top, and so on. The salt melts and hatches the Mushrooms with water; a weight is placed on the top to keep them in the water.

MUSCARI BOTRYOIDES ALBUM.

THIS pretty little white Grape Hyacinth is a great favourite in collections of hardy plants in this country, and it is occasionally grown in pots for the Alpine house by those who treat their choice Alpines very tenderly. In the United States, however, its pot culture for supplying cut flowers for market work has been taken up systematically. In this direction it has acquitted itself well, as it can be grown easily, flowers readily, and forces well; in fact, it is one of the greatest rivals of Lily of the Valley, although it has not the fragrance of the latter flower. As many as from eighteen to twenty-five fine spikes of bloom can be obtained from the plants grown in a 6-in. pot.

RHODODENDRON CINNABARINUM.

THE forms and features to be met with amongst Rhododendrons are remarkably varied. For all the world the flowers of *R. cinnabarinum* may be compared to those of a *Blandfordia nobilis*, a *Clivia nobilis* or *Desfontainea spinosa*. They are funnel-shaped, produced in umbels, while the individual flowers are decidedly pendulous on their pedicels. The tube is long and the segments short, orange-red or cinnabar, with yellow edges. The oblong-oval, leathery leaves, are evergreen and rich in colour, thus giving the finishing touches to a Himalayan species which seems to be perfectly hardy in the southern counties of Britain at least. Plants on the grass and in the Rhododendron collection at Kew have been flowering away with tolerable freedom for some weeks past. The blooms are not so plentiful as those of *R. ponticum*, *R. catawbiense*, and their hybrids; but so novel are the flowers that hybridists might well turn their attention to the improvement of this native of the Sikkim Himalayas, as it might give rise to a new race.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Odontoglossum tripudians xanthoglossum.—A richly coloured flower of this variety comes to us from Mr. J. O. Clarke, gardener to Ludwig Mond, Esq., The Poplars, 20, Avenue Road, Regent's Park, N.W. The sepals were of the darkest glossy chestnut with a bright yellow tip and base. The ground colour of the petals was bright yellow, but this was almost covered by large, dark chestnut blotches. The apical lobe of the lip was canary yellow, thus supplying the motive for the varietal name to distinguish it from the white-lipped variety. The basal two-thirds of the lip was purple-brown, with the exception of a pale area round the crest. The bristle-like processes of the latter were variegated with violet-purple on a white ground. Taking it altogether this is one of the darkest and finest varieties of *O. tripudians* we have seen.

Strange behaviour of *Odontoglossum crispum*.—Recently we gave an illustration of a three-lipped *Cattleya Mossiae*. The other day we had a flower of *Odontoglossum crispum* that seemed to consist of an amalgamation of two distinct flowers, but so complete was the union that few would guess at such an origin. It was handed to us by Mr. A. Wright, The Gardens, Falkland Park, South Norwood Hill, who had two flowers which behaved in the same or a similar manner. They had two lips,

and the dorsal sepal as well as one of the lateral ones were unequal sided, as if a supernumerary one were joined to a side of each of them. The column was of large size, but perfectly symmetrical, with wings, and a large anther cap of the usual form. On the removal of the anther cap of the flower given us, there were two pairs of unequal pollinia lying loose in the cavity, but firmly joined to one another at the base, and having the smaller lobe of each towards one another. Two pedicels were apparently perfect, and attached to two glands in the usual way on either side of the central line of what should have been the rostellum. The pedicels were not attached to the pollinia, however. A ridge ran down the middle of the face of the column showing further that the column was double.

FLORAL AND BOTANICAL DEMONSTRATION.

THE fourth of these series of lectures was given by the Rev. Professor Henslow, at the Drill Hall, on the 28th ult. Mr. H. J. Veitch presided over a fairly large audience.

The Canterbury Bells (*Campanula Medium calycanthema*) formed the first subject of discussion. The lecturer drew attention to the formation of the corolla in addition to the ordinary green calyx. In other cases the calyx became petaloid, and in others the stamens were turned into petals. Professor Henslow then proceeded to generalise upon the phenomena of doubling. In the case of the second corolla of the *Campanulas* it was probably due to a superfluity of nourishment, whilst from data he had collected it would appear that it might be brought about by some check sustained by the plant such as starvation.

The two methods of doubling were illustrated by reference to the Paeony, which had originally five petals. In some flowers it would be noticed that the calyx first became petaloid, then the outer stamens, the transformation working towards the centre of the flower. In other flowers the carpels were first changed, then the inner stamens, thus working outwards until, perhaps, only the green calyx was left. It was mentioned incidentally that the only British Paeony, *P. corallina*, was at one time to be found on Holmes Island at the mouth of the Severn, but that it had been extirpated, owing to the construction of forts there. In the *Canna* the calyx and half the stamens had been turned into petals. As if to show how doubling had been carried on, Nature had given them a permanent example in the Water Lily, in which it would be found there was a gradual transition from petaloid sepals outside to petaloid stamens and stamens in the centre of the flower. *Ranunculus acris* fl., pl., one of our oldest garden plants, and popularly known as "Bachelors' Buttons," was cited as another instance of a flower that had doubled under Nature's hands, for it was occasionally found double in the fields.

The next theme was the results obtained in the improvement of cultivated plants by selection over a long series of years, considered apart from, and in comparison with, those obtained by hybridisation and cross fertilisation. Great things had been done by selection alone. It was still a moot point whether the modern race of *Cinerarias* had been assisted by hybridisation. *Cyclamen persicum* had been mentioned as an instance of what could be done by selection, but he thought the Sweet Pea a still better one. He did not think a *Lathyrus* had ever been crossed with a Pea. *Antirrhinums*, again, were to be had in white, yellow, crimson, and in a multitude of intermediate shades, and they were all raised from the one species. Here the lecturer reminded his audience that by crossing a white form with another one a great variety might be obtained, and he again instanced the case of the *Abutilons*, which were always copper coloured until a white flower, *Boule de Neige*, was obtained. This, by subsequent crossings, gave the numerous shades that are now to be had.

Rhodanthe Manglesii alba was exhibited as illustrating a case in which the flower, as it was popularly called, was formed by the showy bracts of the involucre.

The curious habit of *Phaenocoma* was next referred to. It was explained that the little knobs on the branches were in reality branches themselves, clothed with very small leaves. A similarity of habit was to be observed in all those plants which

came from localities where periods of drought were experienced. *Phaenocoma* was one of the plants having "everlasting" flowers, and was allied to the *Helichrysums*. The old Latin writers confused these "everlastings" with the flowers of *Celosia pyramidalis*, for Pliny, writing of the latter plant, said that if cut it will revive at any time afterwards. The Greek, Dioscorides, describes *Helichrysum*, continued the lecturer, and says that some people call it *Celosia*. In the biblical passage, "an inheritance that fadeth not away," the word *amarantos*, unfading, was used, thus likening the "inheritance" to the "everlasting flowers."

The handsome *Paeonia albiflora striata* was employed to illustrate the curious effects caused by the dissociation of colours, the striation being described as a common occurrence in the progeny which had a white flower for one of their parents. The garden races of *Petunias* were given as other instances. These *Petunias* were the descendants of two species, the one with white flowers, and the other with purple, introduced to this country at the commencement of the present century. There were no double *Petunias* until a few years ago—they appeared simultaneously in Germany, France and England.

Lavatera arborea variegata was shown to exemplify the common occurrence of variegation. Proceeding to discuss the causes of variegation, the lecturer said that one cause was the want of iron, because Professor Church had found that if a variegated leaf were brushed over with a weak solution of iron it would turn green, and the same effect would be produced if the soil in which the plant was growing were watered with the iron solution. Variegation was also produced by depriving the plant of potash and magnesium, although exactly how it was brought about was not known.

The exhibition of the male inflorescence of *Chamaerops Fortunei* led to a discourse upon artificial fertilisation. The knowledge that it was possible to fertilise various flowers was possessed to some extent by the ancients, and Pliny said that "perhaps men might be able to set seed of the Date Palm by transferring the flowering branch of the male to the female." The knowledge was lost to the middle ages, but was now recovered.

The production of intermediate forms of plants by crossing two species was next touched upon and illustrated by *Philadelphus coronaria* and *P. microphylla*, an intermediate form having been called into existence by crossing these two. Another interesting hybrid was shown, a cross between a Black Currant and a Gooseberry. Although these two species were very distinct from each other they had been induced to cross. The hybrid partook of the characters of both parents, for the fruits, although of the same shape and appearance as Gooseberries, were no larger than Currants, and were produced in bunches in the same way. The leaves were scentless, and the branches destitute of spines.

The last plant shown was the new *Campanula mirabilis*, a native of the Caucasus mountains. The flowers called for no remark, but the leaves, which were nearly round, were very thick and fleshy, suggested that the plant must be a native of a very dry region. The flower buds and the margins of the leaves were protected with stiff, sharp spines.

At the close of the lecture, Mr. H. J. Veitch made some interesting remarks. Amongst other things he spoke of the way in which the dwarfed and stunted *Conifers* found in Japanese gardens had been considered so distinct that they had been described as new species by Dr. Lindley. They preserved their distinct characters as long as they were propagated by cuttings, but when grafted they broke away from the Japanese forms, and grew into trees almost identical with what English nurserymen had been growing for years.

PLANTS RECENTLY CERTIFICATED.

THE awards mentioned hereunder were made by the Royal Horticultural Society on the 28th ult.

Orchid Committee.

STANHOPEA RODIGASIANA, *Nov. sp.*—The flowers of this *Stanhopea* are very striking on account of their size and markings. The sepals are creamy or straw-yellow externally, and star-mottled with brown; while the inner face is creamy, and heavily spotted with crimson-purple blotches on the central and

basal portions. The lip is a very remarkable structure; the hypochile is black at the base, spotted at the sides, and the hollowed portion is rather shallow; the mesochile has hatchet-shaped side lobes, spotted with crimson-purple, and tailed at the anterior ends. There is also a tongue-shaped and tailed structure in the middle of the mesochile. The epichile is curved in a curious fashion, and spotted with crimson-purple. First-class Certificate. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

CATTELEYA ADELA, *Nov. hyb.*—The seed bearer was *Cattleya Trianaei*, and the pollen parent *C. percivaliana*. The sepals and petals are rosy-purple, with a paler margin, and displays the peculiar combination of deep-orange and crimson in the throat, which is characteristic of *C. percivaliana*. It is intermediate between the parents, and quite distinct from either. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

CYPRIPEDIUM IANSONI, *Nov. hyb.*—The parentage of this striking hybrid is a guarantee of the bold character of the progeny. *C. Morganiae* was the seed bearer, while *C. Rothschildianum* was the pollen bearer. The upper sepal is oblong-ovate, and heavily lined with crimson-brown on a creamy-white ground. The petals are broad, gradually narrowed to the apex, pale straw-yellow, and heavily blotched with blackish-crimson all over. The scape carried three grand flowers, and the ligulate leaves are leathery and green. First-class Certificate. It has been named in compliment to Mr. George Ianson, grower to Messrs. Hugh Low & Co., Bush Hill Park, Enfield, who exhibited it.

CYPRIPEDIUM MR. REGINALD YOUNG, *Nov. hyb.*—In this case the parents were *C. Lowii* and *C. sanderianum*, the latter being the pollen parent. The dorsal sepal is pale yellow veined with brown. The widely arching and drooping petals are linear, twisted, and 6 in. to 8 in. long. The basal quarter of their length is nearly white, blotched with purple, and wavy at the edge, the remaining portion being brownish-purple. The lip is short, wide and truncate at the mouth, and rich shining brown. First-class Certificate. Messrs. Hugh Low & Co.

LAELIOCATTELEYA CANHAMIANA JOYCE WIGAN, *Nov. hyb. var.*—The sepals and petals of this grand bigeneric hybrid are of a soft lilac with a paler centre. The lip is the distinguishing feature of the variety, being much darker in colour than the original *Lc. canhamiana*. The colour of the rich, crimson-purple lamina extends far down into the tube, which is orange-crimson; the margins are wavy and paler.

Floral Committee.

CAMPANULA MIRABILIS.—The rootstock of this species is fleshy, like that of a *Platycodon*; and the leaves are remarkably unlike those of any *Campanula* we have hitherto seen in cultivation. They vary from oblong to orbicular, with a subcordate base, leathery, dark green, and crenate at the margins, which are furnished with bristly hairs. The large, pale blue, bell-shaped flowers are erect and produced on short, cymose branches, as well as at the apex of the main stem, which is about a foot high. They are also thinly bearded in the throat, and furnished with bristly hairs on the five prominent angles of the buds. The species is a native of the Caucasus and has proved hardy during the past three years at least in this country. First-class Certificate. Messrs. Geo. Jackman & Son, Woking Nurseries, Woking.

LILIUM MARHAM.—Judging from the flowers this is a close ally of *L. pardalinum*. The back of the revolute segments is orange-brown. The face is yellow spotted with crimson in the lower half and buff orange in the upper half. The flowers are of good substance. First-class Certificate. M. C. G. van Tubergen, Junr., Haarlem, Holland.

PHILADELPHUS LEMOINEI.—The sweet-scented, four-petalled, white flowers of this hybrid are produced in great profusion just now in gardens. The leaves are small, ovate and numerous. Award of Merit. Messrs. Barr & Sons, King Street, Covent Garden.

NASTURTIIUM QUEEN OF TOM THUMB.—The flowers of this variety are dark, maroon-crimson; while the leaves are thickly mottled and splashed with silvery white. Award of Merit. Messrs. Watkins & Simpson, Neal Street, Long Acre, London.

BEGONIA FLORENCE NIGHTINGALE.—The *Camellia*-shaped flowers of this tuberous variety are large, double and pure white. The leaves are large, dark

green, and the habit of the plant dwarf and bushy. Award of Merit. Mr. B. R. Davis, Yeovil Nurseries, Yeovil.

BEGONIA THUNDERER.—The wavy and slightly fringed petals of this tuberous Begonia are imbricate and rich crimson. Award of Merit. Mr. B. R. Davis.

GAILLARDIA W. B. CHILD.—The blooms of this single variety are of great size and golden yellow, with a crimson-brown disc. Award of Merit. Messrs. Kelway & Son, Langport, Somerset.

LUPINUS POLYPHYLLUS SOMERSET.—This looks like a hybrid between *L. polyphyllus* and *L. arboreus*, having the long spikes of the former, but the branching habit and fine yellow flowers of the latter. It should prove a great acquisition to the perennial Lupines. Award of Merit. Messrs. Kelway & Son.

IRIS JUNCEA NUMIDICA.—The rich yellow flowers of this variety have the falls finely striated with brown on the lower portion or claw. The blade of the falls is orbicular, and the standards spatulate. The leaves are slender and rush-like. It is one of the bulbous Irises, and is rather later in flowering than the Spanish Iris. Award of Merit. Messrs. R. Wallace & Co., Colchester.

HEDYSARUM MULTIJUGUM.—After being brought up to the committee tables on three separate occasions, this has at last received a well-deserved Award of Merit. For small beds and rockwork it is a graceful and beautiful dwarf shrub belonging to Pea family. The long racemes of flowers are of a rich purple-red, striated on the standard with deeper veins. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorning.

CARNATION MARGOT.—This Malmaison variety produces large and shapely flowers of a bright rose and deliciously fragrant. Award of Merit. Martin R. Smith, Esq. (gardener, Mr. C. Blick), Warren House, Hayes, Kent.

CARNATION MRS. DE SATGE.—The habit of this Malmaison variety is excellent, and the scarlet flowers are of medium size and fragrant. Award of Merit. Martin R. Smith, Esq.

CARNATION LORD WELBY.—Of the four Malmaison varieties shown this was the darkest, being of a rich dark crimson, large, and very fragrant. Award of Merit. Martin R. Smith, Esq.

CARNATION BALDWIN.—This was the most deliciously fragrant of all; and the flowers were of very large size and rich rose-pink. Award of Merit. The large group of Malmaison Carnations showed what an immense variety of colour has been developed in this popular race by Martin R. Smith, Esq.

ROSE UNA.—Rose macrantha seems to have played a part in the production of this large-flowered single variety. The flowers are white, tinted with blush at certain stages, and have a few more than the normal number of petals. Award of Merit. Messrs. Paul & Son, Cheshunt.

ROSE REV. ALAN CHEALES.—The blooms of this hybrid perpetual variety are of average size, with a conical centre, and many of the outer petals revolute at the margins. The petals are of a bright and dark rose, with a pale pink reverse. Award of Merit. Messrs. Paul & Son.

GLADIOLUS SUTTON'S QUEEN OF ROSES.—This belongs to the early-flowering race, and has large flowers of a charming, soft, rosy or salmon-pink. The three lower segments have each a deeper, central rose blotch, enclosing a yellow one. It is an acquisition to the early-flowering race. Award of Merit. Messrs. Sutton & Sons, Reading.

DIGITALIS PURPUREA GRANDIFLORA.—Our native species of Foxglove is finer than any exotic, and has also been most extensively improved. The numerous varieties shown by Messrs. J. Veitch & Sons, Ltd., contained many fine forms far superior to the old *D. p. gloxiniaeflora* strain, both in size and markings. The ground colour varied from dark to light purple, rose, lilac and white. The last-named was a magnificent variety, having large blackish-purple blotches on the lip and in the throat.

Fruit and Vegetable Committee.

PEACH THOMAS RIVERS.—The fruits of this Peach are of huge size, suffused and marbled with red on a pale yellow ground. They were gathered from pot trees in the forcing house, which was started on the 20th December last. Other varieties in the same house were gathered nearly two months ago, so that this new variety is a late Peach. First-class Certificate. Messrs. T. Rivers & Son, Sawbridge-worth.

THE FLOWER GARDEN.

THE ordinary routine of summer treatment is at this time of the year somewhat exacting, for mowing, watering, sweeping, weeding, and rolling have all to be attended to week by week if the flower garden is to possess that trim and well kept appearance that is so much a charm. This year, despite the heavy rainstorms, insect pests, more especially red spider and aphides, have been having a good innings, and this has meant a heavy addition to the labour bill.

VERBENAS.—These have suffered to some extent from mildew, but the plants are now growing nicely, and will, it is to be hoped, outdistance the fungus. Attend to the pegging down of growths as occasion offers, not only that the plants may be kept dwarf, but that the whole of the ground may be covered as soon as possible.

HELIOTROPES.—These, too, will need timely pegging down, which should not be a difficult operation even although the shoots are brittle, if the plants were 'laid down' at planting. Keep the soil well stirred amongst the plants until growth has carpeted the ground, and the hoe can no longer be used. In the case of late-struck cuttings which were not stopped prior to planting, a little judicious pinching may be necessary.

ORNAMENTAL VASES.—In far too many cases these, even the most massive of them, have none too much soil-holding capacity, and yet a good deal of head growth is needed to furnish them properly. Tall, vigorous-growing plants have thus to be employed, and these soon exhaust the goodness in the little soil they have to grow and bloom in. Feeding with manurial stimulants must, as a consequence, be conducted at an early date, especially where such rich-feeding things as Castor Oil Plants, Maize, Cannas, and other subtropical foliage subjects are concerned. Liquid cow manure, or fresh farmyard manure are better than chemicals if the proximity of the vases to the mansion admits of their use. As a rule, however, a watering in early morning gives plenty of time for the odours to become dissipated by the breakfast hour.

CARNATIONS, like many other things, are rather backward this year, and they have suffered a good deal from greenfly. Keep up the dustings with tobacco powder, as advocated in the last calendar, for it is imperative that the health of the plants should not be impaired, seeing that the layering season is now within measurable distance. Dishudding to some extent will be found necessary, although where beds of Carnations are planted for effect the whole of the buds may be left to develop. The side blooms, although small, are useful, and continue the show for some time after the secondary flowers are gone. Even in the case of the plants grown for cutting from, only the small buds round the large central ones at the apices of the shoots should be taken out, for these would in any case be removed with the first flower cut. The secondary or lateral blooms will be sure to come in handy. Seedlings, as they commence to flower, should be carefully watched, and any especially good or distinct ones marked for propagation. Seedling Carnations ought to be raised in numbers in every private place, for not only is there always a chance of getting something good and new, but the plants flower much more freely than the plants raised from layers. Even if the flowers come single, as a certain percentage will, they are bright and useful.

VIOLETS.—With a view to keeping down red spider a sprinkle overhead with a rose-can should be given the plants during the evenings of hot days, with proper waterings as they may require it. Keep the soil constantly stirred by hoeing between the rows, and cut back all runners as fast as they make their appearance, so as to foster the development of sturdy tufts and crowns.

WALLFLOWERS.—As soon as the plants from the June sowing are a couple of inches in height make preparation to remove them to their nursery quarters. The soil should not be rich, but must be sweet and friable if sturdy, short-jointed growth is required. It is a good plan to plant in rows about 9 in. apart, with about the same distance between the plants in the row. Lift carefully, so as to preserve as many as possible of the roots intact, and water the young plants well in. If the position is a sunny one a little shading given by means of a few boughs of ever-

greens scattered over the ground will be very grateful to the plants during the time that the sun is on them, as it will enable them to get hold of the new soil more speedily. The old seed beds may be turned into nursery beds by lifting alternate rows completely, and by thinning down the plants in the row to from 6 in. to 9 in. apart.—A. S. G.

Kitchen Garden Calendar.

HAVING now arrived at the turn of the year, when it is necessary to consider the winter and spring crops, and so make preparations for them accordingly, it is advisable to apportion to each kind a sufficient space to secure ample supplies through the dull months, when vegetation for the most part is at a standstill.

In every well-appointed kitchen garden there should always be planted a goodly quantity of Celery, as this vegetable is much in request until quite late in the spring, and to have it in the finest possible condition several plantings must be made, but to waste no ground the latest plantings may be made at the present time, for if these are well looked after in the way of watering they will be equal in point of size and quality to those planted early in June. One thing must be specially guarded against in the cultivation of late Celery, and that is not to commence blanching until it is actually necessary, for be it remembered that this plant is perfectly hardy when left exposed, and will withstand the most severe of our winters unharmed. It is the blanching that makes it tender and so liable to be injured from frost and wet. So long then as the plants are left unearthed there is little danger of them suffering; for this reason, the late planted lots are best for spring use, as blanching takes place slowly. During winter the plants are not rendered tender till the severest of the weather is past. For blanching the early crops it is not necessary to earth, as there would be no danger of them suffering from frost; therefore, a more simple process may be adopted. If the stems are brought together and loosely tied this will hold them in position while Celery collars made of brown paper are fastened round them. All that is necessary to secure clean, well blanched stems is to exclude the light and air. Watering at the roots may go on as usual, which will soon cause the hearts to push up as white as possible.

Planting ought now to be completed of such things as Savoys, Sprouts, Borecole, Broccoli, and other winter crops, that they may be well established. As the ground becomes cleared of Potatoes, the same should again be sown with Turnips, as they will not so soon get stringy. When we have shorter days a greater breadth at a time may be sown; but it is not well to put too great a quantity at once until the middle of the next month, as young Turnips drawn fresh from the ground are always preferable to those that have been stored. Young Carrots are always much appreciated in winter. A good breadth of these should be sown now on a warm sheltered border where protection could be afforded in case the winter is unusually severe. The early varieties are best for this purpose, though, where the ground is in good heart, the intermediate ones will do just as well. Endive may now be sown with a surety of having fine hearts, as there will not be any danger of it running to seed after this date. A sowing ought now to be made of Brown Cos Lettuce. As these do not grow so rapidly as the summer varieties there is less risk of losing them during wet Autumns.

In the Northern counties a sowing of early Cabbage should now be made on a piece of well-prepared soil in an open situation. As the seedlings appear keep them well supplied with water. Colewort can also be treated in the same way. Attend to the staking of Peas and Runner Beans, and do not allow either to suffer for want of water, or mildew will soon make its appearance with the former, and the latter will fail to set any fruit. Sow Parsley for Winter and Spring use, and pay particular attention to small salads.—*Kitchen Gardener.*

A Big Price for a Carnation.—A United States florist recently refused an offer of \$4,000 (£800) for the stock of Carnation Mrs. T. W. Lawson.

HINTS FOR AMATEURS.

A LIST OF SELECTED CANNAS.

CARRYING out the promise appearing in last week's "Hints," the undermentioned varieties will be found some of the finest in existence:—

Aurea.—This is one of the finest of Crozy's many fine varieties. The flowers are of great size, and the individual segments very broad and of great substance. The colour is a rich golden-yellow. If space can only be afforded for one self yellow variety, this is the one to have.

Aurore.—Here we have a rich salmon-scarlet hue exhibited. Both spike and segments are large.

Ami Chretien is another huge flower in which the prevailing colours are rose and orange. The mixture of the two gives an exceedingly beautiful shade of rosy-salmon.

Florence Vaughan.—In America this variety is thought well of, and it is equally amenable to treatment in this. The flowers are deep yellow, heavily spotted with chocolate-brown.

I. J. Berkman.—Here the colour is a peculiar shade of rose-scarlet that is both distinct and handsome.

Madam la Baronne P. Thenard has been blessed with a name whose length is sufficiently cumbersome, but it is a noble flower notwithstanding. The colour is a rich shade of red-orange; with a more or less distinct margin of golden-yellow.

Incendie, appropriately enough, is one of the brightest of all. The colour is a rich orange red, with an unusually broad margin of yellow, which also bears a few spots of the same colour as the body colour. The flowers are of extra size, and are produced with exceptional freedom.

Milne Redhead.—Than this there is a number of larger flowers, but the variety is especially remarkable on account of its colour, which renders it quite distinct from everything else. It may, perhaps, be best described as dull scarlet-red. The plant is very dwarf in habit, and a free bloomer.

L. G. Bally is a variety of a number of years' standing, but is a real good thing still, although it can be obtained very cheaply. The colour is yellow, and there are numerous spots of deep carmine.

Mrs. W. Marshall, on the other hand, is one of the newest, for it received an Award of Merit from the Royal Horticultural Society no longer ago than the last meeting, viz., that on the 25th ult. On that occasion it was shown by Messrs. Paul & Son, of Cheshunt. It is a large and handsome flower, in colour yellow, but heavily spotted with large spots of deep crimson-scarlet.

Alpha is another new variety of great merit. The flowers exhibit a deep apricot hue, which, if not exactly a new colour, is distinct from anything we have as yet.

Mosaic is a showy flower that will doubtless find its admirers, although, personally, we prefer to see a more loosely built spike, which is also not so heavy in appearance as the close ones, of which this new variety is a good sample. The Royal Horticultural Society gave this also an Award of Merit on the 28th ult., but it is not nearly so good a flower as Mrs. W. Marshall. The colours are good, golden-yellow ground, with many blotches of red-orange.

Doyin J. Liabaud is light canary-yellow, with large blotches of pale salmon-red. The flowers are large, and the plant dwarf, and of vigorous habit.

Gloire Lyonnaise is also canary-yellow, but in addition to blotching and mottling with red the centres of the segments bear a number of stripes of the same colour.

Henry Irving.—Here we see a fiery orange-scarlet flower, with a broad orange margin to the segments. It is very showy, and the best of its colour.

Konigin Charlotte.—Although an old variety, this is still one of the most useful sorts in cultivation. It is dwarf, vigorous, a free bloomer, and very easy to grow. The flowers are bright red, with a very broad margin of golden-yellow. The price for this is very low, since good plants can be obtained for a shilling each.

All the above-named varieties have foliage of various shades of green. For the sake of contrast, however, one or two of the dark or purple-leaved sorts should be grown, since whether in or out of flower they are always effective.

Geoffrey Saint-Hilaire is one of the best of these, since not only is the foliage rich and effective, but the rich orange-red flowers are also large and showy, and fully up to the standard of many of the green-foliaged ones.

Paul Bert—This is a dwarf and sturdy variety that may well be included amongst the dark-leaved forms. The flowers are bright amber-yellow, the contrast between flowers and foliage thus being very conspicuous.—*Rex*.

WATERING FRUIT-TREE BORDERS.

THE man who has mastered the question of watering, whether it be of pot plants, or of plants growing in enclosed borders, or in the open ground, where the roots are free to run as they list—has gained a considerable knowledge of the whole art of gardening. On the other hand, without a man possesses a knowledge sufficient to guide him in giving water in sufficient quantity, and at the right time, he cannot be regarded as anything else than a novice.

Now, curiously enough, even after the watering of pot plants has been mastered by the amateur gardener, the treatment of borders seems to present a further difficulty. Many an amateur seems to think that the rules that apply to plants in pots do not apply to plants in borders, and if only the upper strata of soil appear to be damp it is assumed that all is well below, and the poor plants are left to look after themselves. In the case of Vines particularly it must be admitted that they often do the "looking after themselves," with great success. Their roots will travel almost incredible distances in the search for moisture, and in doing so will penetrate the sides of cesspools and wells to get at the precious liquid.

I have in my mind a case of an old gardener who always used to take the prize at the local show for Black Hamburgs. No matter how sunless the season, his bunches were always the best finished, and as black as Sloes, and yet he never appeared to treat his Vines any differently to other people. The secret came out, however, when an old well, situate at some little distance from the vinery producing the prize fruit, was opened in order to see what had gone wrong with the pump leading to it, which suddenly refused to work. It was found that the sides of the well were literally festooned with active feeding Vine roots, and it was these that had choked up the pipe and prevented the pump from working. The well was speedily covered over again, for the gardener was too shrewd to risk his Vines by disturbing these roots to any extent.

This only goes to show how important is the question of the water supply. At this season of the year, when Vines, Peaches, and other fruits are feeling the heavy strain of carrying a heavy load of foliage, and of developing their several crops of fruit, it becomes a matter of the first importance to see that the borders are not allowed to get dry. In vineries and Peach houses the regular damping down and syringing are apt to keep the surface soil wet, whilst underneath the soil is dry. The surface, therefore, must not be taken as an index of the true condition of the border, or the results may be disastrous. If Vine and Peach borders have been properly made in the first instance, and if the trees are in fairly vigorous health, they will take a thorough soaking every two or three weeks, not a dribble merely, but enough to moisten every particle of soil in the border. When such regular waterings are not given the roots are induced to push outside the border in search for moisture, they get into poor or sour soil, and shanking follows as a matter of course. It will thus be seen how desirable it is to keep the roots from straying too much by giving them what they require.

Liquid manure water is of the greatest value to trees carrying heavy crops, but it is not infrequently carelessly used, and its virtue to a large extent wasted. An all-too-common instance of this is to be seen when the borders are allowed to become so dry that cracks open in them, liquid manure is given, perhaps stronger than the roots are able to bear under ordinary conditions, and the roots, if not killed outright, are sadly injured. Liquid manure should never be given to very dry borders, but the latter should be first prepared for the stimulant by a good soaking of clear water, when, if desired, the manure water may follow.

Another fruitful cause of check to under-glass fruits is the application of large quantities of cold water drawn directly either from wells or the water

company's pipes, which, perhaps, are not any too deep in the ground, but the water from which is often cold and always hard.

All water used, therefore, should be exposed for a day or two in open tanks to the action of the sun, which will speedily raise it to something like a suitable temperature. The liquid manure, too, should always be rather too weak than too strong.—*Practice*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Tropaeolum Sunlight.—*Apt*: This Tropaeolum is new only to this country. We believe it has been cultivated for some time in the United States. It is a pretty plant, and produces its bright yellow flowers with great freedom. You would find it very useful for cutting, for the flowers last well in water.

Origin of Garden Petunias.—*Enquirer*: The parents of all the numerous fine Petunias that we find in our gardens are *P. nyctaginiflora*, a white flowered species introduced to this country in 1825, and *P. violacea*, a plant with purple violet flowers, introduced here in 1831, or six years after. Both are natives of South America.

Plunging Chrysanthemums.—*Jos. Ringold*: We think too much fuss has been made about the plunging and non-plunging of Chrysanthemums, for it has been conclusively proved that excellent results have been obtained from both methods. Some growers hold to the one, and some the other, but it is very largely a matter of convenience, and even more largely still a matter of habit—gardeners are highly conservative creatures and do not care about treading the mazes of the unknown in making experiments. We know gardens where early Chrysanthemums are plunged, and others where not a single one is thus treated. Again there are others which have come under our own observation in which the bush plants are plunged, but those plants which are to bear large flowers are not. In your own case we should advise you to do whatever is most convenient—you have plenty of latitude as to your choice of method.

Cucumbers Dying.—*R. P.*: From what you say we should say that your surmise is correct, and that the plants have been attacked by eel-worms. These are very diminutive creatures, and you would have need to have magnificent eyesight in order to see them without the aid of a microscope. You can do nothing in the way of cure. The only thing is to root the remains of the plants out, remove the soil, put in fresh, and start again with new plants. You should adopt some means of sterilising the soil, especially if you obtain it from the same sources as you did the last. This can be done either by soaking it with boiling water or by baking. If you want to use it soon the latter method would be preferable to the former.

Canna Suckers.—*Geo. Findlayson*: You will find that *Rex* has answered your question fully in last week's "Hints."

Descriptive Book of Carnations.—*J. G.*: As far as we are aware there is no book upon Carnations issued with coloured plates. "The Carnation," by E. S. Dodwell, will give you a deal of valuable information on all phases of Carnation culture, but it has only one illustration, and that not a coloured one. The book can be obtained from this office for 1s. 6d., or 1s. 7d. post free. The 'Carnation Manual,' published by Cassell & Co., Ltd., for the National Carnation and Picotee Society (Southern Section) is also a valuable book. The price is 3s. 6d., cloth boards. It has only one illustration, in fact, the same one as that appearing in "The Carnation." The book may be obtained either from the publishers or from the Hon. Secretary of the National Carnation and Picotee Society, Mr. T. E. Henwood, Auricula Villa, 16, Hamilton Road, Reading.

Strawberries.—*Awa*: You need not be apprehensive of being too late. The runners will make good plants if they are pegged down after the fruit crop has been gathered.

Apricot Moor Park.—*S. Menzies*: This otherwise fine variety is especially susceptible to the dying away of branches in the way yours has done. The only thing to do is to cut out the dead wood, and train the other in to fill. It is sometimes difficult to do this satisfactorily, and the symmetry of many a fine tree has been spoilt by the untimely deaths of branches.

A FAMOUS CANON HALL MUSCAT HOUSE.

The grapes grown purposely to supply the market are very limited in the number of varieties. The

wood very badly and sets its fruit in an equally unsatisfactory way as a rule, but Mr. Kay manages it splendidly, by according it the requisite amount of heat and by fertilising the berries artificially. The berries of well-grown samples measure $3\frac{1}{2}$ in. to $4\frac{1}{2}$ in. in circumference. The magnificent appearance of the grapes enables Mr. Kay to realise very high prices for them. The illustration shows an enormous number of bunches on the Vines. Something like 8,000 lbs. of Grapes are taken out of this house annually. Other houses are also devoted to the same variety.

The house in question is 400 ft. long by 38 ft. wide, and was built by Mr. W. Duncan Tucker, F.R.H.S., horticultural builder and hot water engineer, Lawrence Road, Tottenham, London, who supplied us with the illustration. Mr. Tucker builds market garden structures very extensively, at one time devoting his attention chiefly, if not solely, to

STRAWBERRIES, LEADER AND MONARCH.

A BOX of samples of these comparatively new Strawberries reached us the other day from Mr. J. Mayne, gardener to the Hon. Marke Rolle, Bickton, Budleigh Salterton, Devon. Mr. Mayne says he commenced gathering Strawberries in the open quite a fortnight later than usual.

Both varieties sent were noble-looking Strawberries of enormous size, and tempting enough to make the mouth water. The variety Leader was the darkest in colour, the exterior being of a dark, rich crimson, and the interior scarlet to the centre, with the exception of the white veins running through it. In shape, the largest fruits were dilated, sometimes angled, and lobed, the lobes being rounded; occasional ones were flattened and comb-like. The seeds or true fruits were inserted in slight cavities,

A FAMOUS CANON HALL MUSCAT HOUSE.

principal black sorts are Black Hamburg, and Gros Colman. Others that take a second place are Black Alicante, Madresfield Court, and Lady Downes, the latter now enjoying but little repute. Muscat of Alexandria is the most popular white variety; while Foster's Seedling and Buckland Sweet Water take a secondary position. Duke of Buccleuch and Canon Hall Muscat may be regarded as specialities, seeing that they cause gardeners, whether in private or market garden establishments, a great amount of trouble in their cultivation, so that few succeed with them. The berries of both are magnificent in appearance when well done, and of excellent quality. Nobody succeeds better with Canon Hall Muscat than Mr. Peter E. Kay, Clagmar Vineyard, Finchley, London. The accompanying illustration shows an interior view of his famous Canon Hall Muscat House, when in full bearing. This Vine ripens its

this kind of work. He now undertakes the construction of winter gardens, conservatories, vineries, ferneries, Camellia houses, Peach, Rose, and Chrysanthemum houses, and, in fact, plant houses in general for private establishments. The conservatories, &c., are designed to suit any situation. He now issues a well got up catalogue of designs of all these houses, giving exterior, interior, and roof views of the same. The illustrations chiefly represent houses, now filled with their occupants, which he has designed and built.

Olive Oil is said to improve the action of the skin, preventing eczema, if taken medicinally. The disease can be cured by a liberal use of fresh or dried fruit, olive oil, eggs and milk, avoiding starchy foods.

but fairly prominent. The riper fruits were soft and very juicy, with a rich aroma and slightly acidulated, just sufficient to make the fruit very pleasant eating, and to prevent the insipidity which is characteristic of those varieties which are merely sweet and watery. Of the two varieties Mr. Mayne says that Leader is cropping with him by far the better, and taking all things into consideration he thinks it is the better of the two.

The larger fruits of Monarch were dilated and flattened or comb shaped; and the smaller ones were conical, but nevertheless a little flattened. They were paler than those of Monarch, being scarlet externally and light orange-scarlet internally. The seed-like fruits are small, but prominent on the surface. The larger of the fruits were the more juicy and richly flavoured, being sweet and less acidulated than in the case of Leader, and possessed

a fair amount of aroma. The smaller fruits were firmer, but not quite so rich in aroma. It has done well at Bicton, but has not fruited so heavily.

Of the other varieties grown at Bicton, Royal Sovereign, Empress of India, Gunton Park, President and Sir Joseph Paxton are all carrying heavy crops. Both Leader and Monarch are handsome-looking fruits as grown by Mr. Mayne, but judging from its size, rich colour, very fair flavour and heavy cropping qualities we feel sure there is a great future before Leader. Opinions may differ, however.

BELGIAN NURSERIES.

VIII.—MESSRS. LUCIEN LINDEN & Co.,
MOORTEBEEK.

WHILE in Brussels on the 20th April last we went by the light railway to Moortebek, about three and a half miles or thereby out of town, to see the Orchid establishment of Messrs. Lucien Linden & Co., which was established there about three years ago. The situation is an ideal one for the cultivation of Orchids, being practically in the country, where only a few scattered houses are yet to be seen, and on the sloping side of a valley by no means common in Belgium, to the west of the capital. The houses are all new, and built on the most approved modern plan for the cultivation of Orchids. This was the establishment visited by Leopold II, the King of the Belgians, as mentioned at p. 692, in our last week's issue. The King himself is an ardent horticulturist, having a grand establishment at Laeken, and, being about to build many more glass-houses, is well able to judge for himself when he sees gardening in any of its branches well carried out. He spent several hours upon the establishment, and expressed his admiration at everything he saw.

In Belgium it is more often the custom than here to build large blocks of houses all connected together in such a way that the area enclosed is continuous, so that a uniform temperature is maintained throughout. The span ridges take the usual form, but there are no dividing walls between one house and another. At the time of our visit there was something between 50,000 and 60,000 plants of *Odontoglossums* on the establishment. On entering we were immediately ushered into a block of seven houses entirely filled with *Odontoglossums*, the bulk of them consisting of *O. crispum*, imported two years ago. They were a picture of rude health, the leaves being of a red or bronzy hue, leathery, and the pseudobulbs of large size. The pieces were mostly in 60-size pots. Blossom was abundant on the occasion to which we refer, but they reached their best about three weeks later. The cut flowers are sent to Italy, France and Germany, chiefly to the two latter countries. The benches consist of teak, the spars for carrying the pots being 2½ in. to 3 in. wide, and painted.

The second division of this block contained many interesting things including well flowered pieces of *Cochlidia noetziiana*, *Odontoglossum Pescatorei*, *O. triumphans* and *O. cirrbosum*. All were grown in a compost of *Polypodium* fibre and sphagnum. Of *O. cirrbosum* there were at least 200 plants in bloom, and carrying fine panicles of bloom. There was a considerable amount of variation, some having numerous maroon spots, others crimson, maroon-crimson on a yellow ground, and rose-tinted varieties. Of *O. Pescatorei* one hundred plants were in bloom, many of them deeply tinted with rose, and most of them carrying huge panicles of fine flowers. *O. P. Roi Leopold* was characterised by a large violet blotch on each of the sepals, with a few smaller ones on the petals. Natural hybrids were plentiful, *O. Tigre Royal* representing a form between *O. triumphans* and *O. crispum*, having the sepals almost covered with rich chocolate blotches, and a smaller number on the petals. *O. venustum* might be regarded as a white *O. wilckeanum*, blotched with purple-brown, the blotches on the petals being large, circular, and numbering six or seven. In like manner *O. Princess Victoria* appeared to be intermediate between *O. crispum* and *O. sceptrum*, the numerous light chestnut blotches on a pure white ground being very pretty. Handsome also was *O. crispum Van Cauwenbergii*, with a solitary, large purple blotch on each sepal, and numerous small spots on the petals and lip.

The next division contained beautifully spotted and tinted varieties of *O. crispum ruckerianum*, and

O. Pescatorei. The latter bore a panicle 3½ ft. long, carrying sixty flowers. A fine piece of *O. vexillarium Memoria Lindeni* carried six spikes of six flowers each, of a beautiful rich rose-magenta. The sepals of *O. wilckeanum Lindeni* were mostly of a dark chocolate, and the petals handsomely blotched.

A houseful of specialities we might term that which contained many named varieties. The colour of *Mesospinidium vulcanicum* was very rich. One large, brownish-purple blotch on each of the sepals and petals was the feature of *Odontoglossum crispum Prince Albert*. *O. vexillarium vittatum* had white sepals, and rose petals edged with white. *O. wilckeanum nobile* had two large blotches, and the petals numerous spots on a clear yellow ground. The soft rose flowers of *O. ruckerianum amabile* were thickly spotted all over. A fine light variety was that named *O. wilckeanum versicolor*, having one or two large, brown blotches on sulphur yellow. The numerous brown blotches on the canary-yellow sepals of *O. wilckeanum Princess de Canaries* and the crest of the lip pointed to a cross between *O. wilckeanum* and *O. sceptrum*. *O. hunewellianum maximum* has already been seen and admired in this country, the flowers being much larger than the type, and spotted all over. The large, circular, purple blotch on each of the sepals is characteristic of *O. crispum Comte de Flandre*, the petals being white. The sepals and petals of *O. ruckerianum delicosum* were richly spotted on a rosy ground. *O. Princesse Clementine* had white sepals and petals thickly spotted all over and indicated *O. sceptrum* and *O. crispum* as the parents. It is named in compliment to the King of Belgium's daughter. Quite of another type was *O. aspersum fulgens*, having maroon-brown sepals, rosy petals spotted with maroon at the base, and a deep purple lip. *O. Queen of the Belgians* recalled *O. crispum* and *O. sceptrum*, being of the same shape as the latter, but larger, with the sepals and petals richly blotched with dark cinnamon. *O. wilckeanum Wm. Stevens* is named after a well-known English gardener, the sepals and petals being handsomely blotched and spotted with chocolate.

Time being pressing, we now hurried through several other houses all directly connected with one another, the passages being under cover. Numerous varieties of *O. crispum*, *O. Hallii*, *O. luteo-purpureum* and *O. triumphans* monopolised a house. Then came two more, similarly occupied with plants in the picture of health. Very fine was *O. ruckerianum rubiginosum*, having large flowers richly blotched with crimson-purple. Batches of *Dendrobium nobile* and *Odontoglossum vexillarium* next engaged our attention. *O. v. candidulum* is a white variety with a yellow blotch at the base of the lip. Cattleyas were well represented by *C. Mossiae*, *C. Mendelii* and others of that type, which filled six houses and the large central hall. They were well furnished with sheaths at that time, and ready to throw up their flowers. The next two were largely devoted to *C. Trianaei*. A surprise was in store for us here in half a houseful of *Cypripedium lawrenceanum*, having magnificent foliage. The flower stems were 1½ ft. to 2½ ft. high, and the flowers measured 5½ in. to 6 in. across the petals. Equally well grown, though in smaller numbers, were *C. hirsutissimum*, *C. grande*, *C. villosum* and *C. v. Boxalli*.

Cattleyas were in force in another house, including *C. Mendelii The Pearl*, having pearl-tinted flowers and a pale yellow blotch in the throat. Isolated at intervals in this house amongst the Cattleyas were profusely flowered specimens of *Dendrobium nobile*. Elsewhere, *Cypripedium rothschildianum* was very fine, with three massive flowers fully opened upon a spike. The hybrid *C. lebaudianum* is finding its way into various gardens. It was derived from *C. Stonei* crossed with *C. haynaldianum*. The upper sepal was beautifully spotted with maroon in rows along the veins, and the petals were blotched on the lower third with the same colour. There was also a houseful of the beautiful and varied *C. insigne montanum*. The central staging of the large central hall was monopolised by *Cattleya labiata*, and flowering plants of *Odontoglossum vexillarium* occupied the front next to the entrance.

Hybrid and cross-bred Anthuriums were conspicuous here and there in several of the houses, the space beneath the staging of the central hall being occupied with seedlings of *A. scherzerianum*. In another house a variety of *A. scherzerianum* with twin and opposite, salmon-coloured spathes attracted

our notice. Varieties of the same species in another house presented orbicular spathes, as well as different colours in spathes of the ordinary shape. *A. s. rothschildianum Fascinator* was notable for its rich scarlet blotches on a rosy ground. Particularly handsome was *A. s. Triomphe de Moortebek*, in one of the Orchid houses. The large, oblong spathe was of a uniform light salmon, and therefore totally distinct from the original.

SOCIETIES.

RICHMOND HORTICULTURAL.—June 29th.

REAL Queen's weather favoured the summer fixture of the Richmond Horticultural Society on the above date, which took place, as usual, in the Old Deer Park. Four large tents were devoted to the various exhibits of flowers, fruits and vegetables. The quality was high and well maintained throughout, but there appeared to be a falling off in the groups of miscellaneous and specimen plants, also in the fruit and vegetable classes. The show arrangements throughout were excellent, and reflected great credit upon the executive.

In the large tent, which was given up to the specimen plants and groups, there was some first-class material.

In the competitive classes D. H. Scott, Esq. (gardener, R. Johnson), The Old Palace, Richmond, was first for a group of tuberous Begonias; also for twelve Begonias. Mr. H. E. Fordham, The Nurseries, Twickenham, was placed first for the large group of miscellaneous plants, having a very tastefully arranged exhibit. Mr. Wm. Vause, Royal Leamington Spa, was second, and Mr. John Russell, third.

In the class for a smaller group, open to gardeners and amateurs, Mr. C. Want, gardener to Sir F. Wigan, Bart, J.P., Clare Lawn, East Sheen, was first. The first award for a dozen specimen show Pelargoniums went to Mr. C. Turner, of Slough.

Mr. W. Farr, gardener to Andrew Pears, Esq., Spring Grove, Isleworth, received first prize for a capital group of Malmaison Carnations.

In the classes for specimen plants Mr. W. Farr was first, and Mr. C. Want, second, for six Ferns. Mr. Farr showed some huge pieces of *Polypodium aureum* and *Davallia fijiensis*; also for the single specimen stove foliage plant, showing *Asparagus tenuissimus*.

The best six foliage plants came from Mr. Wm. Vause, who had two grand Crotons. Mr. J. Allsop, gardener to W. Cunard, Esq., Orleans House, sent the best six Caladiums. Mr. W. Vause received a second prize for six stove and greenhouse flowering plants.

Messrs. Barr & Sons, King Street, Covent Garden, were first for two dozen bunches of cut bardy flowers. Messrs. Paul & Son, of Chesbunt, were second.

In the tent devoted to Roses and table decorations some grand lots of Roses were forthcoming from Messrs. Paul & Son, of Chesbunt; Frank Cant & Co., Colchester; B. R. Cant, also of Colchester; and Chas. Turner.

The table decorations showed the exercise of much taste and skill in construction.

The non-competitive floral exhibits were numerous, and added much to the general excellence of the show.

Messrs. W. Cutbush & Son, Highgate, N., set up a grand lot of Malmaison Carnations, in which the new crimson Churchwarden was a great feature.

Messrs. H. Cannell & Sons, of Swanley, Kent, sent a magnificent array of Cannas in small 32 pots. All of the plants were splendidly flowered, and we have really never seen Cannas shown so well before. Many of the leading varieties were represented.

Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., sent a collection of fruit trees in pots, all of them well cropped. Peaches, Nectarines and Plums were represented, and there were some fine baskets of Tomatos.

Mr. John Russell, Richmond, set up a very comprehensive collection of hardy ornamental trees and shrubs, of which he makes a speciality, in pots. Variegated subjects were most in evidence, and very nice they looked. Mr. Russell also showed the new *Dracaena Russellii*. Messrs. Wm. Fromow & Sons had a pretty semi-circular group of miscel-

laneous plants; also a pretty group of Japanese Maples.

From Messrs. Jas. Veitch & Sons, Ltd., Chelsea, came a capital lot of Roses in pots. In the back ground of these were some tall samples of *Hydrangea paniculata grandiflora*. Two groups of flowering and foliage plants were also contributed by Mr. Wm. Thompson, Sheen Nurseries.

A handsome lot of Orchids was sent by Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N. Finely-coloured flowers of *Laeliocattleya Edouard André*, and *Cattleya brantiana* were special features.

A very showy and varied lot of hardy cut flowers was contributed by Messrs. Geo. Jackman & Son, Woking. Mr. W. Spooner, also of Woking, had cut Roses.

In the tent set apart for Orchids and herbaceous subjects, Messrs. F. Sander & Co., of St. Albans, had an imposing group of Orchids and new plants, chief among which were *Acalypha Sanderi*, *A. godseffiana*, and *Dracaena sanderiana*.

Mr. A. Howard, gardener to Henry Little, Esq., Baronshalt, E. Twickenham, had a nice lot of Orchids, principally *Cattleyas*. Mr. Davis, of Yeovil, sent some first-rate tuberous *Begonias*. Messrs. Barr & Son, of Covent Garden, had some capital hardy flowers. Similar exhibits came from Mr. John Russell, Messrs. A. W. Young & Co., Stevenage, and Mr. A. Perry, Winchmore Hill, while Mr. F. Foster had a bright lot of Sweet Peas. The cut flowers from Messrs. R. Wallace & Co., Colchester, were chiefly *Liliums* and *Irises*.

A highly interesting feature was the charming miniature rockery staged by the Guildford Hardy Plant Co. It was composed of tufa and virgin cork and was well furnished with the choicest Alpines. A background of dwarf Conifers furnished a finish to the prettiest exhibit of the kind we have yet seen.

Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., had a nice group of Carnations.

Upon the grass outside the exhibition tents, Mr. Duncan Tucker, of Tottenham, N., had on view several of the convenient modern glasshouses of which he makes a speciality. They were fitted with the latest and handiest ventilating apparatus.

In the fruit and vegetable tent Messrs. T. Rivers & Son, Sawbridgeworth, had a superb collection of fruit, comprising huge Peaches, capital Plums, Nectarines and Cherries.

Mr. James Gibson, gardener to E. H. Watts, Esq., Devonhurst, Chiswick, was first for Strawberries, whilst Mr. A. Meaton, gardener to J. B. Hilditch, Esq., Ashgill House, Richmond, took a similar place for both black and white Grapes. Mr. Allsop led for a dish of Nectarines, Mr. Gibson being second. Mr. Bolton, gardener to Mrs. Blacker, Coome End, Kingston, carried off premier honours for a dish of Peaches. Mr. Thos. Osman, Ottershaw Park Gardens, Chertsey, was first for two bunches of white Grapes, and Mr. H. W. Blake, gardener to the Earl of Onslow, Clandon Park, Guildford, had the best three bunches of black Grapes.

Mr. C. J. Waite, gardener to Sir Patrick Talbot, Glenhurst, Esher, won the first award for the collection of vegetables grown from Sutton's seeds. Mr. A. J. Basile, gardener to the Rev. Powell, Woburn Park, Weybridge, was second, and Mr. J. Gibson, third. Mr. C. J. Waite was likewise first for the collection of vegetables grown from Carter's seeds, with Mr. Gibson as second, and Mr. Basile, third.

ROYAL HORTICULTURAL OF IRELAND—

June 30th.

THE beautiful grounds of Merrion Square, Dublin, were *en fête* on the above date with the Rose show of the Royal Horticultural Society of Ireland. Four large tents were required for the housing of the various exhibits, which were characterised throughout by remarkably high quality.

Roses, of course, were the special feature, and there was brisk competition in the various classes. The Challenge Plate, value £25, presented by Messrs. Alex. Dickson & Sons, Newtownards, for thirty-six blooms, in not less than twenty-four varieties was won by Lord Ashdown (gardener, Mr. Andrew Porter), Woodlawn. F. A. Millar, Esq. (gardener, Mr. D. Colohan), Monkstown, was second. Mrs. McCann (gardener, Mr. Thomas Goff), Simmonscourt, staged the premier stand of

twenty-four blooms, distinct, F. A. Millar, Esq., being second. The first prize for the twelve blooms went to E. D'Olier, Esq. (gardener, Mr. Harvey), Knocklin. A similar number of Tea and Noisette varieties brought to the front Lord Cloncurry (gardener, Mr. W. Rigg), Lyons.

The Silver Challenge Cup, value £5, presented by Edmond Johnson, Ltd., Grafton Street, Dublin, for a stand of seventy-two blooms of thirty-six varieties was carried off by Messrs. Alex. Dickson & Sons, who had a grand lot of flowers.

F. A. Millar, Esq., led for six blooms of any dark variety, and a similar place was taken for six blooms of any light by Lord Ardilaun (gardener, Mr. Campbell). Mrs. McCann sent the prettiest basket of Roses and foliage.

The society's Silver Medal for twelve blooms of new varieties, introduced since January, 1894, was well won by Messrs. Alex. Dickson & Sons, who moreover received certificates for the two new varieties *Bessie Brown* and *Ulster*. The Newtownards firm added to their list of successes the first award for the stand of twenty-four Tea Roses in twelve varieties, the twelve dark Roses of one variety, and the twelve light Roses of one variety. Messrs. R. Hartland & Sons, Cork, were second in the two last-named classes.

In the other classes for plants and flowers the Challenge Cup, value £6, presented by Messrs. Richard Hartland & Sons for an exhibit of twenty-four double flowered tuberous *Begonias* in not less than eighteen varieties was carried off by Lord Ashbrook (gardener, Mr. J. McKellar), Durrow, the variety *Miss Augusta Martin* being a special feature of the stand. Lord Ashbrook was likewise first for a collection of twelve zonal *Pelargoniums*.

The first prize for a stand of twenty-four bunches of cut hardy herbaceous flowers went to Lord Ardilaun who had a bright and varied exhibit. Robert Tedcastle, Esq. (gardener, Mr. Caldwell), was second. Lord Ardilaun scored another first in a class for similar material from which, however, bulbous subjects were excluded. The Challenge Plate, value £10, for twenty-four bunches of three sprays each of Carnations and Picotees was likewise won by Lord Ardilaun, Lord Cloncurry (gardener, Mr. W. Rigg), Lyons, being second. The smaller class for twelve bunches of three sprays each of Carnations and Picotees was yet another success for Lord Ardilaun.

J. Miller, Esq. (gardener, Mr. Geoghegan), was placed first for a table of show *Pelargoniums* set up with Ferns and other foliage plants, thus winning the prize presented by Mr. Robert Jameson, Park Avenue Nurseries, Sandymount.

The classes for fruit and vegetables, particularly the former were well patronised. The winning two bunches of white Grapes were sent by the Marquis of Downshire, whilst in another class for one bunch of black Grapes and one bunch of white, the Marquis was second to R. Tedcastle, Esq. The last named exhibitor scored another win for two bunches of black Grapes. J. C. Parkes, Esq. sent the winning dish of six Peaches, and Mr. Tyler the best dish of Strawberries. Mr. Tyler was also first for a dish of Tomatos.

In the classes for vegetables a handsome collection of nine kinds staged by General Sir R. Palmer was awarded the leading position in its class; the Rt. Hon. Lord Carew was second.

The non-competitive exhibits included contributions from most of the leading Irish houses, but the most conspicuous exhibit from the English side of the St. George's Channel came from Messrs. Dicksons, Ltd., Chester, in the shape of an imposing array of cut flowers.

From Mr. Jameson's Nursery at Sandymount came a beautiful series of floral devices which displayed great taste and ability in execution.

Messrs. R. Hartland & Sons, The Lough Nurseries, Cork, showed tuberous *Begonias* of the high quality that we always expect to see from this firm. Collections of Roses and *Pelargoniums* were also forthcoming from the same source.

Messrs. Dickson & Sons, of Newtownards, had hardy herbaceous plants in profusion, for which they were highly commended.

Messrs. W. Watson & Son were highly commended for hardy herbaceous plants, and sprays of Pansies.

Messrs. Ramsey & Son, Ball's Bridge Nurseries, exhibited a magnificent group of foliage plants, cut *Begonias* and floral devices of great merit, and the

numerous visitors evinced very keen interest in the fine display forthcoming from this celebrated firm. Hardy herbaceous plants were likewise shown in capital condition by Mrs. R. Jameson, of Park Nurseries.

NATIONAL ROSE.—July 2nd.

THE grand annual exhibition of Roses inaugurated by the National Rose Society on the first Saturday of July was held under very favourable auspices as to weather. Very early in the morning heavy rain fell but later on it was dull and dry; but as midday was reached the sun shone brightly. A large concourse of the votaries of the Rose assembled in the afternoon, though the crowd was fairly dense soon after the Palace was opened to the public. The show itself far exceeded the most sanguine expectations of most people, who had their fears that the Roses would not be fully developed by the day of the show. Visitors, however, were agreeably surprised at the display produced.

NURSERYMEN.

The Champion Challenge Trophy and Replica for seventy-two blooms of distinct varieties was secured by Mr. Benjamin R. Cant, Colchester, with a splendid display. He had grand blooms of *Souvenir d'Elise Vardon*, *Madame Cadeau Ramey*, *The Bride*, *Medea*, *Catherine Mermet*, *Ernest Metz*, *Madame de Watteville*, *Maman Cochet*, *Bridesmaid*, *Golden Gate*, *Kaiserin Augusta Victoria*, *Souvenir d'un Ami*, *Maréchal Niel*, *La France*, and *Cleopatra* as representatives of the Tea, Noisette and hybrid Tea section. Amongst hybrid perpetuals *Ulrich Brunner*, *Caroline Testout*, *Marie Verdier*, *Captain Hayward*, *Madame Jules Finger*, *Marie Finger*, *Abel Carriere*, Mrs. Paul, Duke of Edinburgh, *Senateur Vaise*, *Marchioness of Dufferin*, *Prince Arthur*, *Margaret Dickson*, Mrs. John Laing, *Horace Vernet*, A. K. Williams, Mme. Gabriel Luizet, Thos. Mills, Mme. Delville, *General Jacqueminot*, *Lady Mary Fitzwilliam*, *Crown Prince* and Mrs. W. J. Grant were some of his best. The second award for the seventy-two was taken by Messrs. Frank Cant & Co., Colchester, who had grand blooms of Mrs. John Laing, *Le Havre*, J. D. Pawle, *Viscountess Folkestone*, *Helen Keller*, *Etienne Levet*, Mrs. Frank Cant, Dr. Andry, *Lady Mary Fitzwilliam*, *Ulrich Brunner* and *Beauty of Waltham*. Messrs. Harkness & Sons, Bedale, Yorks, were a very good third, judged from the size of their flowers, but many of them had apparently been battered by storms. They had, however, some shapely blooms. There were six entries.

Mr. B. R. Cant again held the sway for forty triplets, having grand blooms of Mrs. Sharman Crawford, *Suzanne Marie Rodocanachi*, Mme. Gabriel Luizet, *Margaret Dickson*, Mrs. W. J. Grant, *Marchioness of Downshire*, *Duke of Edinburgh*, *Marie Baumann*, *Caroline Testout*, *Ulrich Brunner*, &c. Messrs. A. Dickson & Sons, Newtownards, Co. Down, Ireland, took the second place with smaller but fresh and well coloured blooms. Messrs. Frank Cant & Co., were third with an even lot of blooms. Competition was pretty good.

Messrs. D. Prior & Son, Colchester, took the lead in the class for the best forty-eight varieties, showing fine blooms of *Gustave Piganeau*, *White Lady*, *La France*, Mrs. John Laing, *Marie Baumann*, *Lady M. Fitzwilliam*, Mrs. W. J. Grant, Mrs. Sharman Crawford, *Marchioness of Dufferin*, *Etienne Levet*, *Caroline Testout*, *Ulrich Brunner*, *Abel Carriere*, *Prince Arthur*, &c. They were followed by Messrs. Townsend & Sons, Lower Broadheath, Worcester, who had very large blooms of *Ulrich Brunner*, *Henrich Schultheis*, Mme. Gabriel Luizet, *Etienne Levet*, *Gustave Piganeau* and *Caroline Testout*. Messrs. Burrell & Co., Howe House, Cambridge, took the third place with smaller blooms, many of which were charmingly coloured.

Mr. Charles Turner, The Royal Nurseries, Slough, took the lead in the class for twenty-four varieties, with fine blooms of Mrs. R. G. S. Crawford, *Caroline Testout*, *Etienne Levet*, *Beauty of Waltham*, *La France*, &c. Mr. George Prince, Oxford, took the second award with grand blooms of *Comtesse de Nadaillac*, A. K. Williams, *The Bride*, &c. Messrs. Geo. Cooling & Sons, 11, Northgate Street, Bath, came in third with some beautiful blooms in a great variety of colours.

Messrs. D. Prior & Son took the lead for twenty-four triplets, showing fine blooms of *La France*,

Alba Rosea, A. K. Williams, Mrs. John Laing, Mrs. R. G. S. Crawford, Caroline Testout, Mrs. W. J. Grant, Souv. d'un Ami, &c. They were closely followed by Mr. Geo. Prince, who showed fine triplets of Comtesse de Nadaillac, La France, Rubens, Souv. de S. A. Prince and The Bride. Mr. C. Turner took the third place with three fine stands.

The Dickson Challenge Cup for nurserymen presented by C. J. Grahame, Esq., was taken by Messrs. Dickson & Sons, for twelve varieties of Roses sent out by themselves. Killarney and Daisy were pretty varieties. Messrs. Frank Cant & Co. were a good second, but their blooms were of unequal size. Mr. B. R. Cant came in third. For twelve varieties, seven trusses of each, the first prize was taken by Mr. J. Mattock, Oxford. The flowers were neatly displayed in stoneware jars. Messrs. Paul & Son, Cheshunt, were a very good second, and Mr. G. Prince was third.

TEA AND NOISSETTE SECTION.—Mr. Geo. Prince took the lead in the class for twenty-four varieties of Tea and Noisette Roses, showing grand blooms of Comtesse de Nadaillac (the premier Tea Rose in the nurserymen's section), Anna Olivier, Cleopatra, Innocente Pirola, Ernest Metz, Maman Cochet, Souv. d'un Ami, Golden Gate, Muriel Grahame, Maréchal Niel and others. The second prize was taken by Messrs. D. Prior & Son, who showed some beautiful samples of Souv. de S. A. Prince, Souv. d'un Ami, Ernest Metz, Maman Cochet, &c. Mr. B. R. Cant came in third with some charming blooms of The Bride, Medea, Cleopatra, Souv. d'Elise Vardon, &c.

The first prize for twelve hlooms of distinct varieties was taken by Mr. John Mattock, whose hlooms of Rubens, Souvenir d'Elise Vardon and The Bride were fine. Messrs. Burrell & Co., were a good second; and Messrs. Townsend & Sons took the third place.

Mr. Geo. Prince took the lead for eighteen varieties in triplets with a magnificent and much admired array. He had glorious blooms of Comtesse de Nadaillac, Souvenir de S. A. Prince, The Bride, Catharine Mermet, Marie Van Houtte, Medea, Bridesmaid, Madame Cusin, Devoniensis, Rubens, Ernest Metz, Marechal Niel, Souvenir d'un Ami, &c. Visitors greatly admired them, whether gardeners or otherwise. Messrs. D. Prior & Son took the second place with smaller but fresh blooms of even size; Messrs. Frank Cant & Co. took the third place with a very meritorious exhibit.

Messrs. Paul & Son, Cheshunt, took the leading award for thirty-six bunches of garden Roses, which were more tastefully set up than we have seen them before from this firm. Very fine single Roses were Una, Alba, Royal Scarlet and Amy Rohsart. Other charming things were W. A. Richardson, Gustave Regis, Madame E. Resal, Moss Rose James Veitch, Camoens, Rosa rugosa fimbriata, R. r. Madame C. Worth, Madame P. Ducher, L'Idéal and Ma Paquerite. Messrs. G. Cooling & Sons took the second place with a very neat and showy arrangement, including such fine things as Papa Gontier, Rosa rugosa, Blanche de Coubert, Madame Falcot, Camoens, Purity, Rosa macrantha, Benda and many other charming things.

Mr. J. Mattock secured the leading award for eighteen bunches of garden Roses, which were very attractive. He was followed by Mr. Charles Turner, with fine moss Roses, &c.

OPEN TO NURSERYMEN AND AMATEURS.

Mr. B. R. Cant had the best twelve hybrid Teas, showing La France, White Lady, Kaiserin Augusta Victoria, Mrs. W. J. Grant, &c. Messrs. D. Prior & Son were second; and Messrs. Frank Cant & Co., were third.

Messrs. D. Prior & Son had the best twelve blooms of a yellow Rose, showing charming samples of Marie Van Houtte. Mr. Geo. Prince came second with Marechal Niel. He came to the front for twelve white Roses, showing Souvenir de S. A. Prince; Mr. B. R. Cant was second, with Margaret Dickson. Mr. C. Turner had the best twelve light or dark crimson hlooms in Ulrich Brunner; Mr. B. R. Cant took the lead for pink Roses, showing Mrs. W. J. Grant.

Mr. Geo. Prince took the lead for twelve hlooms of any Tea or Noisette, showing Comtesse de Nadaillac in grand form. Messrs. Townsend & Sons were second with Rubens. For nine blooms of any new Rose Mr. B. R. Cant took the lead with Mrs. W. J.

Grant; and for twelve varieties of new Roses he was equally successful.

Messrs. Geo. Cooling & Sons, Bath, had the best twelve bunches of single garden Roses, which were very fine and often sweet scented. Messrs. Paul & Son were second. The Gold Medal for a new seedling Rose was secured by Messrs. Geo. Cooling & Sons, Bath, with a new garden Rose named Purity, like a white Tea or hybrid Tea.

Mr. Geo. Prince had the best nine varieties of Roses suitable for buttonholes and shown in vases. Mrs. O. G. Orpen, Colchester, had the best three sprays of Roses.

The best hybrid Tea in the nurserymen's class was Mrs. W. J. Grant, exhibited by Messrs. Paul & Son, securing the Silver Medal. The best hybrid perpetual in the nurserymen's class was Gustave Piganeau, shown by Messrs. Townsend & Sons. The premier bloom in the Tea or Noisette section was Comtesse de Nadaillac shown by Mr. G. Prince.

AMATEURS.

In the amateurs' classes the best H.P. Rose was Mrs. J. Laing, shown by E. B. Lindsell, Esq., Hitchin, Herts. The best H. Tea was White Lady, shown by C. J. Grahame, Esq.; and for any Tea or Noisette the Silver Medal was given to Comtesse de Nadaillac, shown by A. Hill Gray, Esq., Bath.

There were six competitors for the challenge trophy in the class for thirty-six hlooms, distinct. The first prize was won by E. B. Lindsell, Esq., Bearton, Hitchin, who had a fine and even lot of samples. Captain Hayward, Gustave Piganeau, Mrs. John Laing, Ernest Metz, Marie Van Houtte, Mrs. Grant, Madame Cusin and Dr. Sewell, were the strongest flowers. The Rev. J. H. Pemberton, Havering, was second; and S. P. Budd, Esq., 8, Gray Street, Bath, was third.

Six exhibitors likewise competed for the twenty-four hlooms, distinct. Here F. W. Flight, Esq., Cornstiles, Twyford, scored. White Lady, Ulrich Brunner, Duke of Wellington, Mrs. Sharman Crawford, and Chas. Lefebvre were his best varieties. R. E. West, Esq., Reigate, was second, and A. Tate, Esq., Leatherhead, was third. This class was open only to those who have not won the Challenge Trophy within the last ten years.

In the classes for growers of under 2,000 plants, four competitors staged; pride of place went to G. B. Lindsell, Esq., for three blooms each of twelve distinct varieties. Captain Hayward, Dr. Sewell and Souvenir d'Elise Vardon were the strongest in these stands; T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was second; and Col. J. H. Pitt, Turkey Court, Maidstone, third.

C. J. Graham, Esq., Wrydelands, Leatherhead, won the first prize for twelve blooms of any Rose, Tea or Noisette excluded. White Lady was the sort shown; E. B. Lindsell, Esq., was second, with Horace Vernet; and S. P. Budd, Esq., third, with Caroline Testout.

The classes for growers of 1,000 plants were well patronised. In this section Conway Jones, Esq., Hucclecote, Gloucester, won for eighteen blooms, distinct, with a very even lot; E. M. Bethune, Esq., Denne Park, Horsham, was second; and R. E. West, Esq., third. There were eleven exhibitors in this class.

R. E. West, Esq., came to the front for three blooms each of eight varieties, P. G. C. Burnand, Esq., Reigate, being second. E. M. Bethune, Esq., was first for the nine hlooms of any variety, Tea or Noisette excepted, with Kaiserin Augusta Victoria.

Amongst the small growers, *i.e.*, of less than 1,000 plants, G. Moules, Esq., of Hitchin, had the best twelve hlooms, distinct. J. C. Trueman, Esq., Oaklands, Swanley, was first amongst the nine competitors for nine blooms, distinct; whilst G. A. Hammond, Esq., Camhrian House, Burgess Hill, had the best stand of six.

Extra classes were organised in this section of the schedule, and here G. Moules, Esq., won for twelve blooms, distinct. The Ramsey Cup, for three hlooms each of four varieties, was carried off by G. Wilkins, Esq., Rosedale, Sidcup, J. H. Scott-Tucker, Esq., Headington Vicarage, Oxford, being second. G. W. Cook, Esq., The Briars, North Finchley, was first for the six blooms of any variety, Tea or Noisette excluded, showing Mrs. W. J. Grant.

The Ramsey Cup, for twelve blooms, distinct, was well won by O. G. Orpen, Esq., of Colchester, with a capital stand; the Rev. J. H. Pemberton was second. The last named exhibitor received the first

award for nine bunches of distinct varieties. He was the only exhibitor in this class.

Fourteen growers competed for the six distinct, the first award going to J. Carter, Esq., Mill House, Halstead. J. Hinton, Esq., Batheaston, won for six blooms in four varieties, and G. Moor, Esq., Lyminster Vicarage, Arundel, was first for another lot of six blooms, distinct.

The Langton Memorial Cup, for six blooms, distinct, grown within a radius of eight miles of Charing Cross, was carried off by G. W. Cook, Esq. The premier stand of six blooms, of new and distinct varieties, came from C. Jones, Esq.

TEAS AND NOISSETTES.—Five stands of eighteen blooms, distinct, were forthcoming. A. H. Gray, Esq., Beaulieu, Bath, received the premier award for a magnificent lot. Catharine Mermet, Medea, Comtesse de Nadaillac, Maman Cochet, Bridesmaid, and Marie Van Houtte were the premier varieties. C. Jones, Esq., was second, also with a capital exhibit, and O. G. Orpen, Esq., third.

In the smaller class for the twelve, Mr. Gray repeated his success, the Bride, Bridesmaid, and Ernest Metz, being his best blooms in this stand. A. Tate, Esq., was second, and E. M. Bethune, Esq., third.

Another first award fell to the lot of Mr. Gray in the competition for three hlooms each of eight distinct varieties. S. P. Budd, Esq., was second, and Col. J. H. Pitt, third, amongst the five competitors. Mr. Gray had also the winning stand of nine hlooms of any variety, showing Catharine Mermet. S. P. Budd, Esq., was second.

Conway Jones, Esq., led for twelve blooms, distinct, in the classes for the smaller growers. His flowers were good all round. J. T. Strange, Esq., Aldermaston, staged the best nine hlooms, distinct. E. Mawley, Esq., Berkhamstead, was second.

Ten stands of nine hlooms each were forthcoming. Mahlon Whittle, Esq., 60, Belgrave Avenue, Leicester, being first, and A. Munt, Esq., Hedgerley, Slough, second. The Rev. G. E. Jeans, Shovewell Vicarage, Isle of Wight, had the best lot of six hlooms, distinct. J. C. Trueman, Esq., Oakland's, Swanley, was second.

Conway Jones, Esq., led for three blooms each of four distinct sorts, Comtesse de Nadaillac and Souvenir de S. A. Prince being particularly well shown. R. E. West, Esq., was second.

Conway Jones, Esq., was also successful for the six blooms of one variety, showing a fine stand of Maréchal Niel. L. Parry, Esq., Stinsford House, Dorchester, was second with The Hon. Edith Gifford.

Seven trusses of six varieties were best shown by O. G. Orpen, Esq., who had good Anna Olivier and Marie Van Houtte. J. Hinton, Esq., Batheaston, was first for the six hlooms in three varieties.

GARDEN OR DECORATIVE ROSES.—A. Tate, Esq., staged a magnificent exhibit of twelve bunches of garden Roses in as many varieties, winning the first award. Hebe's Lip, W. A. Richardson, Anna Maria Montravel, Safrano, Marquis of Salisbury and Gustave Regis were some of the best, but all were really good. The Rev. J. H. Pemberton was second with a much inferior lot, and O. G. Orpen, Esq., third.

Nine bunches of similar varieties were best shown by Mrs. A. F. Perkins, Oak Dene, Holmwood, Paul's Crimson Pillar, Cameons, Madame Notte and Marquis of Salisbury were the most effective varieties here. Miss Dorothy A. Nesfield, Shadwell, Speldhurst, Kent, was second; and Miss Beatrice H. Langton, Raymead, Hendon, was third.

O. G. Orpen, Esq., was first for twelve bunches of Lord Penzance's Sweet Briers; Mr. F. W. Champion, Colley Manor, Reigate, was second.

DECORATIVE SECTION.—The first-prize vase of Roses, Ferns and Grasses came from Mrs. O. G. Orpen, whose vase was an exceedingly pretty one. Mrs. G. Mawley was second; and Miss Beatrice H. Langton, third. This class was open only to lady amateurs, who are also members of the National Rose Society.

MISCELLANEOUS.

Messrs. Barr & Sons, 12 and 13, King Street, Covent Garden, London, exhibited a table of hardy herbaceous cut flowers, amongst which Chinese Paeonies, Iceland Poppies, Irises and Delphiniums were conspicuous. Very fine were Iris ochroleuca, I. Monieri, Heuchera sanguinea, Hemerocallis fulva, Potentilla Wm. Rollinson, &c.

Messrs. Wm. Cutbush & Son, Highgate, London, N., exhibited a fine group of Malmaison and other Carnations on the floor, and backed with Bamboos. The Malmaison varieties were arranged in three undulating mounds, in front of which were pyramids of the taller tree Carnations in several fine varieties. Visitors were much taken with them.

Mr. F. G. Foster, Brockhampton Nurseries, Havant, Hants, exhibited a collection of Sweet Peas tastefully set up in glasses, and interspersed with Ferns in pots. Countess of Aberdeen, Prima Donna, Little Dorrit and Daybreak were fine amongst the light colours.

Messrs. John Laing & Sons, Forest Hill, had some baskets and other devices filled and decorated with cut flowers. Begonias, early Gladioli, Roses and Chinese Paeonies were the flowers used. They also had a long table of hardy herbaceous and Alpine plants in the cut state and in pots. Amongst them was a new plant named *Gazania nivea latifolia*, with large white flowers and a yellow centre, Delphiniums, Iceland Poppies, Violas, Gaillardias, &c. The Alpines were interesting.

Messrs. Laing & Sons also set up a splendid group of tuberous Begonias, backed with Palms, Caladiums, Dracaenas, &c., and mixed with Adiantums, Orchids, and other fine foliage plants. Countess of Dartmouth was a splendid pure white double variety, and Sir William Lockhart, scarlet, Diamond Jubilee, orange, the Hon. Cecil Rhodes, crimson, Laing's Picotee Improved, and Lady Charles Beresford, cream, were good doubles; Dr. Nansen, scarlet, and Viscount Grimstone, crimson, were good singles.

Messrs. Geo. Bunyard & Co., Maidstone, exhibited five stands of hybrid perpetual and Tea Roses, and two stands of Roses suitable for buttonholes. The latter were done up in bunches and were charming, particularly Perle d'Or, Mme. Chedane Guinoisseau.

Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., exhibited a stand of metal labels of many sorts and for different purposes, some for suspending to trees and shrubs, and others for fixing in the ground. Amongst other things he had Mr. Wright's Orchid clip and suspender in combination.

Messrs. Geo. Jackman & Son, Woking, Surrey, sent a handsome lot of cut hardy flowers, in which Roses played an important part.

The cut hardy flowers sent by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, consisted chiefly of Lilliums, amongst which varieties of *L. thunbergianum*, *L. auratum* Wittei, *L. Brownii*, and the chaste *L. rubellum* were particularly noticeable. Irises and Delphiniums were also shown.

The Cannas in five-inch pots, shown by Messrs. H. Cannell & Sons, Swanley, Kent, were as usual of exceedingly high quality, the spikes and flowers being immense, and the variety of colour great. Between forty and fifty distinct forms were on view.

The cut hardy flowers from Messrs. Cheal & Sons, The Lowfield Nurseries, Crawley, Sussex, comprised Roses, sprays of Violas and some good Delphiniums.

In a corner of the gallery beneath the large organ was a capital group of pot Roses, contributed by Messrs. Jas. Veitch & S. n, Ltd., Chelsea. In the background were tall Bamboos, *Cocos plumosa* and *Hydrangea paniculata grandiflora*. The latter was heavily laden with large panicles of flower.

Mr. Wm. Spooner, Arthur's Bridge Nursery, Woking, had half a dozen stands of very neat, cut Roses. Kaiserin Augusta Victoria was well shown here, also the pretty apricot-hued buttonhole Rose, Perle d'Or.

Messrs. Dobbie & Co., Rothesay, had a superb display of bedding Violas. They were made up in pyramidal sprays with their own foliage. Amongst the numerous varieties shown, A. J. Rowberry, Countess of Hopetoun, Mrs. Kinnaird, Cherry Park, Duchess of Fife, Sylvia, Lucy Ashton, Florizel, Rob Roy, Lady Isobel, White Duchess and Marchioness were exceptionally good. In front of the Violas, which were in the background and upon a brown-velvet covered stand, tilted at an angle of 45° to the stage, was a collection of cut flowers of Sweet Peas. Most of the leading varieties were to be seen here, and the flowers were all large and fine.

NATIONAL VIOLA.—July 2nd.

THE annual exhibition of the National Viola Society was held in conjunction with the Rose show on the above date, the exhibits being accommodated in the

centre transept close to the organ. The display was a small one, and not up to the standard of former years. The flowers all round, although bright, were smaller than usual, and there was a considerable falling off in the number of amateur exhibits. This is not to be wondered at when we consider how trying to Violas, as well as to other things, the present season has so far proved, for both aphids and red spider have worked great havoc among the plants.

OPEN CLASSES.

The Gold Medal for the collection of forty-eight sprays of Violas, distinct, nine blooms going to a spray, was won by Mr. Wm. Sydenham, Tamworth, who was joined by one other exhibitor only in this class. Mr. Sydenham had some remarkably fine flowers, and the samples of such varieties as Goldfinch, Primrose Dame, Magnificent, Rover, Stephen, Lemon Queen, The Mearns, J. B. Riding, Virginius and Mr. H. Bellamy, which were shown by him, were from all points first-class. Messrs. Isaac House & Son, Westbury-on-Trym, Bristol, were second also with a lot of capital material.

In the corresponding class for Pansies Mr. M. Campbell, High Blantyre, N.B., was the only exhibitor, but his exhibit fully deserved the Gold Medal awarded it. Mrs. R. Stewart, Miss Sterling, Constance Steele, Mrs. D. Johnstone, Annie Ross, John Jackson, Jas. S. Irvine, Mrs. Wm. Steele and John Menzies were all exceptionally fine flowers; in fact, the average of size throughout was large, and the form and substance were good.

Mr. M. Campbell scored another well-merited success for the twenty-four sprays of Violas, six blooms to a spray. A. J. Rowberry, Lavender King, Lord Salisbury, Maggie, Lily Barron, Butterfly and Stobhill Gem were a few of the cream of the collection. Messrs. J. Cheal & Sons, Crawley, Sussex, were a very close second; and Mr. W. Baxter, Woking, was third.

Mr. D. B. Crane, 4, Archway Road, Highgate, N., sent the winning stand of twelve sprays of rayless Violas. He had white Empress, Florizel, Pembroke, Rosea Pallida, Nellie, Mary Scott, and Britannia, all of them in excellent condition. Mr. Crane's flowers were shown on two triangular and black velvet covered stands. Messrs. Isaac House & Son were second.

For twenty-four varieties of Violas, nine blooms of each, arranged in specimen glasses with Viola foliage, Messrs. Isaac House & Son were an easy first, showing good blooms of Acme, Flower of Day, Princess Ida, Iona, Goldfinch, Admiration, Bullion, Blue Cloud and Cissy Thornley. Mrs. C. C. Lowe, Ryhall, Stamford, was second.

In the smaller class for six vases of Violas, distinct, nine blooms in each vase, arranged with any foliage, Mr. D. B. Crane carried off chief honours, having his flowers very prettily set up with fronds of Maidenhair Fern. Messrs. Isaac House & Son were second, and Mrs. C. C. Lowe, third.

Mr. M. Campbell sent the winning stand of twenty-four fancy Pansies, also the best twelve, showing in each case fine bold flowers. Messrs. Isaac House & Son were second in both classes.

AMATEUR CLASSES.

Very little material was forthcoming under this section of the schedule. Mr. B. D. Crane was first for twelve sprays of six blooms each, of distinct varieties. His strongest blooms were of Mary Scott, Duchess of Fife, Pembroke, Endymion, Mrs. C. F. Gordon, and Isa Fergusson. Mr. Leonard Brown, Brentwood, received the first prize for six similarly sized sprays. He had Stephen, Mrs. C. F. Gordon, and Goldfinch particularly good.

In another class for six sprays of distinct varieties Major-General Gillespie, Sydenham, was first.

Mr. Brown was likewise first for six sprays of rayless varieties, showing Lucy Franklin, A. J. Rowberry, Pembroke, Florizel, Blanch, and Wm. Tell. Mr. D. B. Crane was second. Mr. Brown was also first in the smaller class for six sprays of rayless varieties.

B. J. Sinclair, Esq., won for six saucers of violets of distinct varieties. Mr. D. Shackleton, Sydenham, won for nine distinct varieties of Violas arranged in specimen glasses. Mr. B. J. Sinclair was second.

NON-COMPETITIVE.

Messrs. Isaac House & Son showed a score of bunches of capital Sweet Peas in as many varieties.

Mr. Wm. Sydenham had a table of charming floral

devices showing how Violas might be advantageously used for decorative purposes. Among these devices were baskets of several sizes, and two specimens of "Prince of Wales' Feathers," all very pretty.

HACKWOOD PARK TOMATO.

It may seem a little late in the day to draw attention to this variety, which is, as Tomatos go, an old sort. I grew it when first sent out, but afterwards discarded it in favour of others which took my fancy, because they bore a smaller proportion of misshapen fruit, and I believe many others did the same. So finding it being grown largely by Mr. M. Mills, gardener, Coombe House, Croydon, I expressed some surprise; but when told the reason I ceased to wonder, being assured that after repeated trials he finds it less susceptible than others to the various diseases to which this favourite fruit is liable. We have so-called disease-resisting Potatos and why not Tomatos? Mr. Mills has given particular attention to this subject and tested the Hackwood Park against other kinds for some six years till he has formed the resolution to grow no other variety because of its merits as a disease resister.—W. B. G.

NOTICES OF BOOKS.

BORON FOOD PRESERVATIVES, and their Influence on the Human Organism. Being a Collection of Medical and Scientific Data on the subject. Price 6d. Published by Perkins, Bacon & Co., Ltd., 69, Fleet Street, London, E.C.

The pamphlet under notice runs to fifty-nine pages, exclusive of a good index at the end. Antiseptics, in the form of salt, saltpetre and other substances, have been used from the earliest times for the preservation of human and other food. The antiseptic power of the preservatives employed, however, was low, hence arose the necessity of using them in larger quantities than was desirable, to the injury of the food by hardening it and inducing chemical changes, which render such preserved food less nutritious.

Dr. Redwood, Ph.D., Emeritus Professor of Chemistry to the Pharmaceutical Society of Great Britain, has drawn up a report on the subject, of which the present pamphlet is an extract. He says that one of the strongest arguments in favour of the use of boric acid preservatives is that the better class of preparations produce the required effect, even when used in very minute quantities. The food retains all its natural characters and qualities, while the presence of the preservative medium is imperceptible to the senses. This applies to meat, mild-cured bacon, milk, butter and other articles of food which are imported to the British Isles to the value of £150,000,000 annually, and some of which is preserved with boron antiseptics. Even milk cannot be conveyed from agricultural districts to towns during hot weather without something to prevent it from getting sour and entering into a state of decomposition.

The first part of the pamphlet deals with the scientific side of the question, experiments, analyses, &c; and the second takes up the medical phase of the subject. There is always sure to be an outcry against every innovation, though the use of boric acid preservatives is by no means new. The best way, undoubtedly, is to go to the root of the matter and get the scientific facts and plain evidence, which cannot be too fully disseminated and made public property. Answers are here given to the questions put to prominent medical practitioners in various parts of the country.

POTATO CULTURE, either for Pleasure or Profit.—Published by George Tucker, 1, 2, & 3, Salisbury Court, Fleet Street, London. Price 2d.

The pamphlet under notice is No. 11 of the "Salisbury" series of garden-produce handbooks, issued by the above firm. One would think that the literature of the Potato was already sufficiently extensive to enable cultivators to produce the best crops possible, and supply all our home wants; but we fear that the market gardener, to whom this pamphlet is chiefly directed, is very often blameless in the matter of reading about Potato culture, by improved methods or otherwise. The noble tuber is cultivated to the extent of 500,000 acres in the United Kingdom, independently of Ireland, yet the

author says that the foreign grower sends us thousands upon thousands of tons of early new Potatos every year. He seems to give the greatest credit to the Scotch growers and the poorest and least to the Irish, strange as it may seem. The Maincrop Potato is one of the easiest to grow and receives the greatest amount of attention, but yet he declares it to be the least profitable of all, and attributes to it the probable unsatisfactory condition of the industry. He also thinks that the home grower should supply the early Potatos, whether forced in greenhouses or grown out of doors, apparently basing his statements upon the fact that the home grown article is of far superior quality to the imported. That may or may not be the case, but it carries little weight with those who are always on the outlook for the cheapest article. The questions of climate and cheaper labour, together and separately, tell in favour of the Continental grower.

Amongst the remedies put forth to remedy the present state of matters are the sorting or grading of late Potatos to be put on the market; the planting of small but uncut sets, all of which should be sprouted in heat previous to planting; that more care should be given, without which there can be no improvement; that the sets should be hurried to the depth of 4 in., and afterwards earthed up moderately high; and that culture in rows is preferable to the bill or mound system for commercial purposes. For the earliest crops of Potatos, Peas are recommended to be planted alternately with the rows in order to protect the haulm from frost. If Peas are not wanted then the Potatos should be protected with straw litter worked in between sticks. Change of seed, varieties, early, second early, and late Potatos are also discussed.

MAY'S PRACTICAL METHODS to ensure instant Relief and Permanent Cure of Diseases, without Drugs, Minerals or Doctors' Fees. Compiled by E. and B. May. London: F. Pitman, 20, Paternoster Row, E.C., and other agents, and all Booksellers. Price 6d.

In this we have a medical book intended for home use, that is, that people when unwell should themselves apply the remedies suggested; but that there is little or no reason at all why persons should be unwell if they take the proper precautions against all excesses, and what is unsuitable for them, particularly in the matter of foods and drinks. This sounds well enough, but there are thousands of people in the United Kingdom who have to use food partly or wholly prepared by others outside their own families, and entirely beyond their control. Again, at public banquets, &c., the participants have to take what is presented or go famishing for a change.

Under the diet question people are recommended to eat succulent ripe fruits and vegetables, which have the effect of cleansing the whole system. In the case of acidity, biliousness, &c., the patient is advised to avoid certain foods, but to take plenty of salads, Artichokes, Dandelion, Tomatos, Celery, Oranges, Apples, Cherries, and all kinds of acid fruits. Strawberries, Bananas, Apples, Grapes, Watercress, &c., are recommended for Anaemia. Herb Tea of various kinds are prescribed for back-ache; Blackberries and Tomatos for Bright's disease; and in many other ailments to which human flesh is heir, garden produce of various kinds.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

Royal Horticultural Society's Examination.—H. Lodwig Jones: You will note in last week's issue, p. 702, that we mentioned a number of books suitable for the purpose of enabling gardeners to pass the R. H. S. examination in horticulture. What you will have to study chiefly is the physiology of plant life, that is, what functions are performed by different parts of plants, the nature of plant food, and the sources from whence the plants obtain it. A study of vegetable morphology, that is, of the structure of plants, will enable you all the better to comprehend the physiology. Your knowledge of gardening should enable you to answer the practical questions. We may refer you to p. 683 of our issue for June 25th, where last year's questions are printed, because they will give you an idea of what you are required to know in order to answer them. The date of next year's examination will be announced later on; and when you require further information we shall be pleased to assist you. In the meantime you should get one or other of the books we mention and commence studying the same.

Communication from Barnard Castle.—Would the correspondent who sent us something wrapped up in brown paper communicate with us again? Nothing reached us but the brown paper bearing the address, with the information from the Post Office authorities that it was found empty in the newspaper basket.

Tomatos Diseased.—C. Chick: The specimens you sent were very badly affected with the sleepy disease of Tomatos caused by a fungus named *Fusarium Lycopersici*. The fungus enters by the roots, and finds its way up the stems, finally reaching the leaves and fruit, all of which are much damaged and discoloured. The centre of the stem in many cases is destroyed, hollow and brown, the discoloured portions in the interior being interlaced with very fine threads of the fungus. You will understand from these remarks that cure is impossible, seeing that the fungus is quite inside, and, therefore, completely protected from any fungicide that may be applied. The best plan you can adopt is to carefully dig up every plant affected and burn it, roots, stems, leaves and fruit. Dig in a quantity of quicklime in the spaces from which the plants have been taken. You may get some fruit from the plants which are still healthy, but all that show signs of drooping or flagging may be destroyed at once, as they never recover. The soil may be removed, and fresh material put in the beds, so that the young plants may get a healthy start. When cleaning out the old soil use plenty of lime for disinfecting the walls and other places in contact with the soil. It would be a good plan when making up the beds afresh to use as much lime as could be done without injuring the plants.

Rose La France.—R. B.: For many years little attempt was made to separate hybrid Tea from hybrid perpetual Roses, so that La France could take or had to take its place amongst the hybrid perpetuals. It is, nevertheless, a hybrid Tea, and will now take rank as such in societies where a separate section is made for the reception of Roses of that class, which are yearly becoming more numerous and important. It was raised by MM. Guillot Fils in 1867. There are now three varieties of that name, the old one being only of moderately vigorous growth. La France de '89 is a vigorous grower with long buds and large flowers. Climbing La France is a vigorous grower of climbing habit. These variations alone would indicate a hybrid origin.

The Spanish Iris.—R. W.: If the Iris in question had been named *I. hispanica*, it would have been correct usage to translate this as the Spanish Iris; but it does not follow that this so-called Spanish Iris is *I. hispanica*. The English or popular name is given to the garden race of varieties, which have been raised from *Iris Xiphium*, the latter being the correct botanical name. Less frequently, *Xiphium vulgare* is used to denote this hulchous species, but good botanists hold all bulchous Irises as forming a section only of *Iris* proper.

Increasing Aubrietia.—H. T.: You can raise seedlings from any variety, but the chances are that a large percentage would not be true to name. You can of course, select those that come true after they come into flower. You can get up a stock, however, by means of cuttings under a bell-glass or handlight. Later on, when you have something to work upon, you can increase the same by division in spring or in autumn, say about the end of September.

Names of Plants.—P. J. G.: 1, The Marsh Mallow (*Althaea officinalis*); 2, *Alchemilla arvensis*.—C. E. Nicholson: 1, *Pyrus torminalis*; 2, *Hesperis matronalis*; 3, *Anchusa italica*; 4, *Hemerocallis flava*; 5, *Polygonum Bistorta*; 6, *Senecio Doronicum*; 7, *Veronica Teucrium rupestris*; 8, *Allium Moly*; 9, *Iris Pseudacorus*; 10, *Dactylis glomerata elegantissima*. All were well grown.—Wm. Galloway: *Laelia grandis tenebrosa*, not the darkest, but still a fine evenly coloured variety.—A. D. W.: *Philadelphus microphyllus*.—Heber Woodward: 1, *Habenaria chlorantha* (the largest flowered form of the Butterfly Orchis); 2, *Gymnadenia conopsea* (not *Orchis pyramidalis*); 3, 4, 5 and 6 are different colour varieties of *Orchis maculata*, which varies immensely from the dark and richly spotted forms to pure white. No. 1 is the most important.—A. C.: 1, *Campanula pusilla*; 2, *Sidalcea malvaeflora*; 3, *Hemerocallis fulva variegata*; 4, *Geranium sylvaticum*; 5, *Corydalis lutea*; 6, *Saxifraga rotundifolia*.—H. J.: 1, *Cistus ladaniferus maculatus*; 2, *Deutzia crenata flore pleno*; 3, *Euonymus japonicus maculatus*; 4, *Spiraea salicifolia*; 5, *Coronilla Emerus*.—T. L.: *Cattleya Mossiae* var.; 2, *Oncidium pulvinatum*; 3, *Lycaste plana*; 4, *Aerides odoratum*; 5, *Oncidium pumilum*; *Odontoglossum Pescatorei*.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

Is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

FLOWER AND FRUIT FARMING IN ENGLAND.

—These two branches of horticultural industry are annually extending their boundaries and influence, but as far as home cultures are concerned it would be difficult to formulate an idea as to the quantities produced, for it seems that no record is kept by the stall holders of Covent Garden, nor by the management officials of the market. Mr. William E. Bear gives a lengthy account of the industry, as carried on in various parts of England, in the *Journal of the Royal Agricultural Society*, for June 30th last. In speaking of the great increase of production, he mentions the fact, now well known to our readers, that Lily of the Valley may be had in bloom all the year round, by the use of the refrigerator for retarding the crowns beyond their natural season, and by forcing from early winter onwards. Spring flowers are extensively forced in vineries, Tomato and Cucumber houses, so that they come into the markets contemporaneously with the natural productions of the South of France and Italy. This takes place in December, and is immediately followed by the open air productions of the Scilly Islands and the more favoured parts of the mainland of England. The flowers include Narcissi, Anemones, and Marguerites. It may afford home growers some satisfaction to know that few forced flowers are imported, with the exception of French Lilac, in the early part of the year. As soon as flowers in the open air become plentiful the foreign supply ceases, until it commences with Chrysanthemums in early autumn. British wild flowers find a ready sale, including Violets, Primroses, Chrysanthemum segetum, C. Leucanthemum and others. The fruit houses are extensively utilised to bloom Chrysanthemums late in autumn and early winter, until last year the production was so overwhelming that prices were unremunerative. The modern development of the Narcissus industry is the most remarkable phase of flower growing, including the production of bulbs.

The Scilly Isles are first dealt with by the writer, appropriately, for it is from thence that the earliest supplies of flowers grown in the open are obtained. Only eight of the Scilly Isles are used for agricultural or horticultural purposes. The soil is mostly of granitic origin, the surface consisting of a sandy loam, mixed with clay in some places, and peat in others, but always light and well adapted for bulbous plants and vegetables. The islands are enveloped by the Gulf Stream, so that the climate is mild and equable at all times. Frost is rare, and snow more so, never lying more than twenty-four hours when it does come. The prosperity of the islanders really depends upon the mild and equable character of their climate. The mean annual rainfall is 34.38 in.; the maximum temperature, 55.5°; the minimum, 48.5°; and the mean, 52.1°. It will thus be seen that the weather is never very hot nor very cold.

In 1870, or the previous year, the father of the present steward packed a box of Narcissi for the late Mr. Augustus Smith, then Lord Proprietor of the islands, and sent it to Covent Garden. The return was £1, and this proved in fact the turning point in the prosperity of the islands, which had been in an impoverished condition, owing to over-population and the excessive division of the land. A few of the farmers began quietly to collect bulbs wherever they could find them growing in the fields or hedgerows, and to get up a stock for market work. The species and varieties of Narcissus then growing in the islands were confined to N. *Telamonius plenus*, Campernelli, Scilly White, Grand Soleil d'Or, two varieties of Grand Monarque, N. *biflorus*, N. *poeticus recurvus*, and N. *p. flore pleno*. It is believed that some of the above were first brought to Tresco by the monks, and later on by the Governors in St. Mary's. Two bulbs of Campernelli were obtained by Mrs. Gluyas from a French captain about sixty years ago, and from them the whole of the stock has been developed. The industry in Daffodils did not become thoroughly remunerative till 1880, and even then the quantity produced was small. Mr. T. A. Dorrien-Smith, the present Lord Proprietor, took up his residence at Tresco in 1875, and being greatly interested in the welfare of his tenants he visited the principal bulb-growing centres in 1883. He found that Daffodils flowered a month later in Holland than at Scilly, and from that concluded it would be safe to extend the business; he bought bulbs largely for himself and his tenants, introducing many new varieties. In 1885 the produce in flowers amounted to 65 tons a year, and this went on steadily increasing till the amount reached 448 tons in 1893, after which there was a falling-off; but in 1896 the climax was reached in the export of 514 tons of flowers, consisting of 3,598,000 bunches. The islands are subject to frequent gales of wind, and the Daffodils have to be sheltered by means of hedges consisting of Veronica, Escallonia, and Euonymus, which thrive splendidly. Accounts are also given of several of the bulb farms in the Scilly Islands.

Within the last twenty years there has sprung up a considerable industry in the growing of bulbs and of flowers for cutting in Lincolnshire. Snowdrops were grown, however, for the sake of their bulbs as far back as forty years ago; but the continuous production of them on the same land renders them liable to disease, and this militates against their production. Mr. White, of Spalding, has twenty-four acres of his farm devoted almost entirely to the cultivation of Narcissi. The only manure he uses is bone dust, of which he applies 14 to 15 cwts. per

acre before planting, and 5 cwts. every autumn afterwards as long as the bulbs are still in the soil. The land is fallowed about every fourth year, when the plough is used. At other times the spade, fork, and hoe are the only implements used. Mr. White forces about 500,000 bulbs annually. Some idea of the popularity of certain varieties may be judged from the fact that 1,500,000 bulbs of *N. poeticus ornatus*, between 400,000 and 500,000 each of *Sir Watkin* and *Horsfieldii*, 750,000 *N. Telamonius plenus*, 1,000,000 Double Whites, 100,000 each of *Emperor* and *Grandee*, and 40,000 *Empress*, are grown upon this farm, besides smaller quantities of others. In the open ground the cutting of the *Daffodils Emperor* and *Empress* at Tresco would be finished by March 14th, whereas at Spalding it is not commenced till April 7th or 8th. As far as open air flowers are concerned, the *Daffodil* cultures at the two places do not clash with one another.

At Frampton, Boston, *Daffodils*, *Lily of the Valley*, and early *Potatoes* are grown. A few flowers of the first-named were obtained on February 28th, and picking is continued till the middle of May, when *Roses* become plentiful in the market. *Crown Imperials* and *Aconites* are also grown here. *Tulips* thrive well enough, but can be obtained more cheaply from Holland. Messrs. Richard Bath & Co., of Wisbech, have fifty acres of land devoted to *Daffodils* and various other flowers for market, the rest of the farm of 450 acres being planted with fruit trees and bushes. Altogether the company holds about 900 acres of land devoted to flowers and fruit. In a bed of *Narcissus Sir Watkin*, an average of ten flowers are obtained from each bulb. Surely this is excessive. *Daffodil* bulbs generally are planted in October and lifted in July when to be sold. *Tulips* are grown for cutting. Other flowers cultivated here are *Roses*, *Carnations*, *Pansies*, *Polyanthuses*, *Wallflowers*, *Violets*, *Clematises* and *Dahlias*.

The *Potato Shaws* were blackened by frost at the end of June in the neighbourhood of Keith, Aberdeenshire.

Postponement of Show.—The Redhill, Reigate and District *Carnation* and *Picotee* Society's show has been postponed from Saturday the 23rd to Friday the 29th inst., owing to the lateness of the season, and the backward state of the *Carnations*.

What is a Drummer?—On this side of the water he is simply a man who murders music and paralyzes people by hammering away on a thing called a drum; in the "States" the horticultural trade has bestowed the title on the traveller who comes to look up business.

Honour to M. Baltet.—The well-known French nurseryman, M. Charles Baltet, has just received a gold medal from the National Horticultural Society of France, on the occasion of his publishing the 6th edition of his book, entitled "The Art of Grafting." This book is not unknown amongst British horticulturists.

Bamboos at Bicton.—Several species of these woody and noble-looking grasses are grown in the beautiful grounds of the Hon. Mark Rolle, at Bicton, Devon, including such fine species as *Arundinaria japonica*, *A. Simonii*, *A. falcata* and *Phyllostachys aurea*. They make very fine canes, ripening up perfectly, and Mr. Mayne, the gardener, cannot understand why they do not do better down in Cornwall. He should have thought it was just the home for them. He enquires whether it may not be the case that the growers there give too much in shade and moisture, as he thinks they would then be so soft that frost would play havoc with them. At Bicton he has to cut them back annually to keep them within bounds.

Jules Verne has now reached the age of seventy and attributes his health and vitality to a meagre diet of herbs and eggs.

A Lighthouse of Bamboo has recently been built in Japan. It does not rot like other kinds of wood and is said to resist the waves better.

A New Rose-flowered Lilac.—According to the *Bulletino Della R. Societa Toscana di Orticultura*, M. Thureau, of Garches, presented a new variety of Lilac, named *Monsieur Thureau*, at the last meeting of the Central Society of France. The flowers are of a beautiful lively rose colour.

The Richmond Show.—The Rose show recently held at Richmond, Surrey, was better all round than on any previous occasion, with the exception of trade groups. The *Roses* were fine, and the local people were much taken with the rockery of Alpine plants put up by the Guildford Hardy Plant Co. The gate money was the largest ever taken, and amounted to £139.

Kniphofia longicollis.—A species of Red Hot Poker has recently been introduced to Italy under this name, but its relative hardiness has not yet been sufficiently proved under conditions similar to those of *K. aloides*, the best known species. It promises to be an ornamental summer flowering plant in the opinion of the editor of the *Bulletino della R. Societa Toscana di Orticultura*. The flowers are rosy in bud and of a beautiful lemon-yellow when fully expanded.

Children's Geranium Club.—This unique club has this year organised a flower show, which was opened on Monday evening last, the 11th ult., by the Duchess of Devonshire, at the Cambridge House Settlement, Camberwell Road. The chief feature was a competition of "Geraniums" (*Pelargoniums*) amongst the members of the club. Young plants were sent out in the spring to 700 members, and of that number no fewer than 670 were returned into competition. Amongst the notables who were present at the show were the Attorney-General, the Countess of Jersey, Lady George Hamilton, and Lady Darling.

Onoclea Struthiopteris, the Ostrich Fern, is cultivated largely in the States. In Michigan, where it abounds in a wild state, its fronds are extensively used for decorations on public holidays, such as Memorial Day, Children's Day, and Fourth of July, for which occasions the plants are dug up in quantities from the woods and planted in pots, boxes and other receptacles. This *Onoclea* does wonderfully well under cultivation, and in addition to being perfectly hardy it may be lifted at almost any time of the year, and its fronds will not show any signs of distress. Even in winter it can be dug out from under several feet of snow, potted up, and started growing. It likes a soil rich in humus, and when given this, with partial shade and plenty of moisture during the growing season, it develops an exceedingly imposing presence.

Carnations, *Picotees* and *Auriculas* at Edenside.—The improvement of florists' flowers continues to enjoy marked attention at the hands of that veteran florist, Mr. James Douglas, Edenside, Great Bookham, Surrey. He has just issued a list of border and tree *Carnations*, *Picotees*, and *Auriculas*; but it is something more than a list, for much useful information to beginners and would-be cultivators of these popular flowers is added. The best varieties are also fully described, so that the reader can pick and chose for himself if he has any notion at all of the flowers under notice. New varieties, filling up gaps in the range of colour, and also furnishing improvements upon older sorts, are annually being raised by Mr. Douglas, who also secures the best of the acquisitions of other people, including the *Hayes Carnations*. The constitution of the new self and fancy varieties, now so plentiful, is remarkable by comparison with that of the old pets of the florist. An article entitled "Notes on Culture" gives a history of *Carnations* in this country, and then proceeds to deal with propagation by seeds, layers, and cuttings. *Malmaison Carnations* and tree or perpetual flowering varieties are dealt with in the same way, the respective articles being followed by descriptive lists of the best sorts. Cultural notes are also published concerning *Auriculas*, and all can be relied upon from such a skilled florist.

Woodthorpe, Southend Road.—It is always interesting to note any fresh extension of horticulture. H. G. Simonds, Esq., recently residing at Mendham House, Park Place, Leyton, found the accommodation there altogether inadequate for the housing of *Orchids*, of which he is getting together a choice collection. For some time past he has been on the outlook for a larger place within easy reach of London where he could build a suitable range of houses to enable him to extend his collection of *Orchids*. He has now acquired Woodthorpe, Southend Road, Beckenham, where he is to grow *Orchids* and *Roses*—by no means a bad combination. We wish him hearty success. His gardener, Mr. G. E. Day, also has these flowers fully at heart.

The Flag in Plants.—An eminent Frenchman has said that flowers and plants form a ground upon which all nations can meet amicably, since each nation can see in flowers the colours of its own flag. Lincoln Park, Chicago, U.S.A., has for one of its most popular features the "Stars and Stripes" exemplified in the shape of a carpet bed. The red "stripes" are formed of *Alternanthera Lindenii*, and the white ones of *Leucophyta Brownii*, the folds in the flag also being shown by the *Alternanthera*. *Echeverias* set in a field of crushed blue stone represent the "stars." The blue stone has been obtained by crushing limestone and then staining it blue with a mixture of Prussian blue, turpentine, linseed oil and Japan.

A Post-Gardener.—In the Buchan district of Aberdeenshire the grave recently closed over the remains of Mr. Alexander Kennedy, who was born in the parish of Slains seventy-three years ago. He commenced life as a farm servant, from which the transition to a gardener was easy. He was head gardener at Pitlurg House for thirty years until old age compelled him to resign his onerous duties. He still had a love for his profession and undertook the management of the farmers' gardens in the district where he resided, giving them great satisfaction by his skill and taste. He commenced to write verses while he was yet a young man, describing the scenes by which he was surrounded, and was received with considerable favour by the labouring country people who were his patrons and readily bought his book which he published under the title of "Rhymes and Love Strains." He also wrote metrical epistles to his friends and other effusions relating to a pastoral life.

A Fine *Odontoglossum Pescatorei*.—A beautifully blotched variety of this species, having shapely, round flowers, turned up at the Sale Rooms of Messrs. Protheroe & Morris recently, and several having their eye upon it the price was quickly run up to seventy-five guineas, at which figure it was knocked down to H. T. Pitt, Esq., Rosslyn, Stamford Hill. The elliptic sepals were spotted with dark violet-purple, the spots being the more numerous on the lateral sepals. The petals were white with a cluster of dark purple blotches on the centre. The lip had a triangular cluster of dark purple blotches tinted with crimson. The golden crest was ornamented with brown and violet. On the 8th inst. there was a lively demand for *Laelia* (*Brassavola*) *digbyana*, in the shape of newly imported pieces in fine condition. They were bought at prices ranging from £1 to 4½ gs., several good bits going at the latter price, and many of them not much less.

The Japanese as Flower Lovers.—A correspondent to *American Gardening*, who has had very intimate relations with the Japanese, writes, that "of all the denizens of the earth none are so passionately devoted to the culture and love of flowers. They have special days set aside for the enjoyment and worship of flowers, as each season brings them forth. When in early spring the *Cherry blossoms* break their buds and show forth in all their glory the *tokaido* (public roads) of the empire, where in many places these trees are planted, are alive with throngs of happy mortals, old and young, small toddlers carrying on their backs, securely strapped, wee infants, all bent on admiring the pink and white blossoms." That flowers have been assiduously cultivated in Japan for centuries the numerous subjects which have found their way to our gardens from thence bear sufficient witness.

A Mysterious Drug.—From time to time many curious problems connected with plants and vegetable drugs are brought before the Kew authorities for solution. The latest and most curious example is one that relates to supposed malingering on the part of Egyptian soldiers, several of whom have been admitted to hospital suffering from intense inflammation of the eyes, produced, it was thought, by means of some drug. None of the doctors resident in Egypt were able to throw light upon the source of the mischief, and hence the matter was referred to Kew. Dr. Scott, honorary keeper of the Jodrell laboratory, conjectures that fragments of the paleae of some grass have caused the inflammation, the irritation thus being mechanically rather than chemically produced.

The Growth of Canada.—"The first Manitoba crop bulletin shows an increase of about 200,000 acres under wheat over last year, the estimated total acreage being placed at 1,488,238 acres. The total acreage of crops of all kinds under cultivation in Manitoba this year is placed at 2,212,300 acres, an increase over last year of a quarter-million acres. The year 1897 showed a very large increase over 1896. The export of Manitoba wheat and flour, according to the report of the Winnipeg Grain and Produce Exchange, rose from 10,500,000 bushels in 1890 to 29,000,000 bushels in 1895. The next two years showed a great falling-off on account of poor crops. The acreage of 1898, with the yield per acre of 1895, would give results which we scarcely like to put upon paper lest disappointment should ensue; but it looks as if Canada would this year make a good showing in the British markets. New portions of Manitoba are being opened up for settlement, and cattle-raising and dairying are industries of growing importance. A year ago nearly 2,400,000 pounds of butter and nearly 1,000,000 pounds of cheese were made in the Province. Then it is to be borne in mind that, great as the resources of Manitoba are, it is a sort of model farm on a gigantic scale, an example of what can be done in the millions of acres of fertile land that await the plough in the North-West."—*Toronto Globe, June 14th, 1898.*

Devon and Exeter Gardeners on Holiday.—For the past six years it has been the custom for the Devon and Exeter Gardeners' Association to organise annually an excursion to a place selected. Several interesting places in the neighbourhood of Exeter have been visited by the members of the society, and on every occasion the enjoyment has been thorough. The seventh of these excursions was arranged for Wednesday, July 6th, a goodly company going to Tavistock and Endsleigh, the seat of the Duke of Bedford. The party was accommodated by the London and South-Western Railway Company with three saloon carriages. After inspecting the most interesting features of the old town of Tavistock, the visitors proceeded in three 'four-in-hands' to Endsleigh, where, on arrival, they were met by Mr. Yole, the gardener. At this princely establishment there are about a hundred acres of lawn and pleasure grounds, and a riding path of over seven miles in extent. The grounds are naturally varied and beautiful, the river Tamar winding along the valley far below the eminence on which the mansion stands. The grounds throughout are in a capital state of preservation. Rare and beautiful as well as the commoner trees and shrubs are not wanting, and there is more variety of this material than is usually to be found in private establishments. There were many pretty views to be enjoyed, and the party spent a happy time in doing full justice to them. The shell grotto, the dell and the cascade, and the model dairy embowered in climbers were all visited, and all found favour in the eyes of the visitors. Mr. Rundle, the Duke's agent, was very kind in arranging the visit, whilst Mr. Hope and Mr. Mackay excited the admiration and earned the thanks of all by the excellence of their arrangements. Tea was served at Tavistock, and the return journey was then commenced. The day was gloriously fine throughout.

The Birkbeck Building Society.—The forty-seventh annual meeting of the Birkbeck Building Society was held yesterday at the offices, 29 & 30, Southampton Buildings, Chancery Lane. The report adopted states that during the financial year just closed the total receipts from all sources, taken with the disbursements, disclosed the fact that the annual

turnover has amounted to £37,488,736, being a daily average of upwards of £120,000 for every business day that the office has been opened throughout the year. The investments now exceed ten millions—£10,773,675—and the total liabilities on subscriptions and deposits also exceed ten millions; whilst the balance of assets in excess of liabilities amounts to £431,984. The amount received for subscriptions during the year has reached the sum of £266,511. After allowing for withdrawals, the amount standing to the credit of investing members at the close of the year is £888,896, and the balance of deposits to £9,457,794, amounting together to £10,346,691, an increase over the past year of £1,233,236. The investments in convertible securities and the cash in hand have been augmented to the extent of £1,212,079, and now amount to £9,213,785, of which £1,542,652 is invested in Consols and other Government Securities, and upwards of two-and-a-half millions—£2,652,483—are inscribed in the books of the Governor and Company of the Bank of England, and £619,206 cash at Bankers. The number of members who have joined the Birkbeck during the past year is 2,924. In the Banking Department 2,116 current accounts, and 7,377 deposit accounts have been opened, in all 12,417 new accounts, being at the rate of 1,034 per month. The register of shareholders now contains the names of 13,601 members, and besides these there are 19,160 current accounts, and 52,333 deposit accounts; thus making the total of members and depositors, 85,094—the highest number ever attained. The number of shares in existence at the close of the year was 69,611, which is also the highest number yet reached. Since its establishment the society has returned to the shareholders and depositors more than one hundred and ninety-four millions—£194,672,808, the whole amount having been repaid upon demand. The amount advanced to borrowers has been £3,559,256, the amount of interest and bonus paid to investors and depositors is upwards of three millions sterling—the exact figures being £3,322,147—and the invested funds now exceed ten millions sterling—£10,778,675.

"KITSHAYES."

THIS is a charming little country residence, four miles from Budleigh Salterton, in the parish of Colaton Raleigh. It is nicely sheltered from all quarters, and stands at the bottom of a valley, lying between Aylesbeare Common and Sidmouth Hill; and I was pleasantly surprised to find such a pretty little place so well cared for. It was *en fête* at the time of my visit, a bazaar being held there with the hope of clearing off a debt in connection with the church bells recently placed in the above parish.

The pleasure grounds and kitchen garden are in the shape of a parallelogram, about 100 yd. in length, and 25 yd. in width. An evergreen hedge shuts out the vegetable quarters from the flower garden proper, while a herbaceous border runs the entire length on one side, and was very gay with the queen of flowers (Roses) and Canterbury Bells of nearly all colours. A beautiful soft pink one caught the eye at some little distance. I wonder these are not more grown, as nothing so brightens the borders in the months of June and July as these do. The white Pink Mrs. Sinkins made a capital undergrowth, planted every few yards, and the flowers were giving forth their delicious fragrance after a very slight shower. The Roses were simply grand, standards and dwarfs alike being full of bloom and very free of aphids. The standards were evidently of many years duration, and escaped that fatality mentioned by your correspondent, "W. B. G.," in your last issue, just at hand. On the verandah round part of the house I noticed a very fine Climbing Devonensis Rose, by far the best specimen I have met with outdoors, and it was *en masse*. Conifers, too, appear to luxuriate here. Several good specimens, dotted about the grounds, of *Picea smithiana*, *Pseudotsuga Douglasii*, *Tsuga albertiana* and *T. canadensis* were well represented. *Abies Pinsapo*, a very healthy tree, *A. nobilis* and *A. cephalonica* are all doing well, and, I should say, have been planted from fifteen to twenty years.

At the farthest end of the herbaceous border, before mentioned, stands the finest clump of the Royal Fern (*Osmunda regalis*) I have ever seen. A catch pit for water is close by, and I presume it often gets a bathing, or else such good results would not be obtained.

In the vegetable department all was looking well. Some fine pyramidal Apple trees were carrying good crops, while on the wall I noticed an extra large Fig, presumably Brown Turkey, hard to beat, and full of fruit, partly owing, no doubt, to such good space being left between each branch, and the wood well ripened last year. Plums and a Morello Cherry or two were heavily laden; but a few Peach trees on the south wall were a sorry plight; probably the soil is at fault here. The place was in excellent order, scarcely a weed to be seen anywhere; and the owner, Mrs. Davies, a widow lady, I feel sure, must be proud of her garden, every little nook and corner exhibiting signs that a practised hand has been assisting Nature in her development.

The above remarks are solely from memory, not intending to make any notes, or I should have equipped myself with pencil and book, but finding myself in such a snug little retreat I cannot refrain from committing to paper the good impression it left on me as to the way in which it is kept, and things in general are thriving so well.

Kittshayes must not be confounded with Hayes Barton, East Budleigh, the birth-place of Sir Walter Raleigh, to whom lovers of the fragrant weed are so much indebted. There is not the least doubt that Colaton Raleigh, the parish before mentioned, took the latter name from this great traveller, in going there to lodge at one time. Even now tourists wend their way to see this old house, where Sir Walter took apartments, as well as his birth-place just two miles apart.—*J. Mayne, Bickton Gardens, East Devon.*

HARDY HERBACEOUS PLANTS.

Inula Hookeri.—This is the best of the Inulas, and although it has come into bloom earlier in the season than usual it is yet welcome, for the flower heads are exceedingly graceful and showy. Comparing it with *I. glandulosa*, the species that is probably the most commonly grown, a considerable difference is manifest. The flower heads are not so large or coarse as in *I. glandulosa*, and the long, narrow ray florets give them an elegant and graceful appearance. The plant grows to about 18 in. in height, although in wet seasons it will attain 2 ft. It is a native of the Sikkim Himalayas, from whence it was brought to this country as far back as the year 1849. It is an exceedingly easy plant to grow, since it will do well in any ordinary garden soil. Propagation, too, is easy, since divisions of the roots in spring soon make good plants. If a great quantity is required a packet of seed is a good investment.

Iris sibirica japonica.—The Siberian Flag Iris is a very versatile species, and under cultivation has given rise to a considerable number of very pretty forms. Of these, *I. s. japonica* is one of the prettiest. Like the type, it loves to have its roots in mud or water, and its head in bright sunshine, hence it is a capital plant for naturalising by the side of lakes and streams, where, if left alone, it forms bold, handsome clumps from 3 ft. to 4 ft. in height that bloom profusely. The falls are bright blue, striated and flaked with white, whilst the standards are violet-blue. The leaves are rather narrow for their length, and very graceful in pose. The plant flowers almost continuously through May and June, and by planting in a number of places, where variety of conditions as to shade and to sun are forthcoming they may be made to cover a considerable period.

Dictamnus Fraxinella.—There is no more showy subject either for the rockery or the herbaceous border than this old favourite, which has been an occupant of our gardens for over 300 years. There is a number of varieties of it, varying in the colour of their flowers from pure white to shades of purple. All of them are easily grown, however, and do not take long to establish themselves. The foliage, moreover, is not by any means unhandsome, as it exhibits a glossy deep green hue that shows up well against the long spikes of flower that terminate the growths. The foliage, too, is possessed of a very strong, although not disagreeable, odour, like so many other of the subjects belonging to the natural order Rutaceae. This odour does not become apparent until the glands in the leaves are ruptured by being bruised by rubbing between the fingers. The correct name of the plant is *D. albus*, but *D. Fraxinella* is more usually employed in gardens, the name "albus" being usually applied to the white variety only. Of course the plant is not without its popular names, and it would indeed be curious if it had escaped

them during its three centuries of cultivation. Dittany, Fraxinella, and Burning Bush are some of them that will probably be familiar to my readers. Propagation may easily be conducted by means of root division; but seed is very expeditious, and possesses the advantage that a number of shades of colour in the flowers is thus obtained.

Lupinus arboreus luteus.—As the specific name signifies this is of an arboreal or shrubby habit, and not a herbaceous plant, strictly speaking. I am induced to speak of it amongst the herbaceous plants, however, because it is such a grand thing for association with the other plants in the border. It forms large clumps, which are swathed right down to the ground with foliage, and the sub-erect racemes of bright yellow flowers. The latter are like those of an ordinary Lupin and hence do not call for special comment. They come in very handy for cutting, as they last well in water. Seed germinates readily enough, and plants in abundance can soon be obtained in this way.

Lupinus polyphyllus Foxii.—This is one of the handsomest of the varieties of the truly herbaceous *L. polyphyllus*. The spikes are very tall and imposing, the colour of the flowers being blue, striped with white, and hence distinct from anything else. It may be as easily grown as the type, *L. polyphyllus*, which is well known as a tractable border plant.—*Plant Lover*.

TRIALS AT CHISWICK. VIOLAS.

No fewer than 203 entries of Violas were received from various sources last spring for trial at the Royal Horticultural Society's Gardens at Chiswick. These were all planted on March 26th in a border running round one of the fruit tree quarters on the north-eastern side of the garden. Despite the trying season the plants have grown well and flowered freely, and the foliage is remarkably clean and free from red spider and other insect pests. The plants were examined by the committee on July 5th, when the award of XXX was made to the following fifteen varieties:—

MINIATURE WRAJMENT.—This is a large creamy-white variety with a small, yellow eye. The flowers are of good form, and the plant a strong grower. Mr. John Forbes, Hawick, Scotland

DIANA.—A light, lavender-blue flower of medium size with a small, yellow eye, and heavy, black rays running nearly to the margins of the segments. The leaves are rather larger than usual and very deep green. It commenced to flower on May 9th. Mr. John Forbes.

JACKANAPES.—This is a very showy and somewhat curious flower. It is not of the best form, but is a good bedding variety, a sturdy grower, a free bloomer, and totally distinct from everything else. The upper segments exhibit a rich chestnut-maroon hue, whilst the lower ones, *i.e.*, the lip and wings, are bright yellow. Mr. John Forbes.

J. B. RIDING is well known as a fine variety of excellent form. The rich crimson-magenta hue which we find here is not approached by anything else. It has done fairly well at Chiswick, and the plants look healthy enough, but they are not nearly so strong as many of the other varieties. There are a few black rays in the flower. Mr. John Forbes.

SIR ROBERT PULLER is a grand bedding variety, free and vigorous. The flowers are large, bright purple-blue in colour. The eye is unusually large, and next to it comes a zone of very light blue, from which the black rays stand out prominently. Mr. John Forbes.

COUNTESS OF HOPETOWN.—A large creamy-white rayless variety of great merit. It is a free flowerer, and a strong grower, with rather large leaves. Its great value lies in its earliness, for at Chiswick it was one of the first to bloom, commencing to open its flowers on May 7th. Messrs. Dobbie & Co., Rothesay, N.B., and Orpington, Kent.

BULLION.—This fine yellow variety is well known as one of the best bedders we have. At Chiswick it has fully sustained its reputation both for earliness and continuity of flowering. Messrs. Dobbie & Co.

MARCHIONESS.—A truly grand flower, large and pure white, save for the small yellow eye, and a few narrow rays. The blooms are of exceptionally good form, and open until quite flat. It is a strong grower and a fairly free bloomer. Messrs. Dobbie & Co.

MRS. H. BELLAMY.—A deep violet-purple form shading to lavender-blue along the margins of the upper segments. The yellow eye is very small, and the white ridge or eyebrow is very prominent. The habit is very satisfactory. Messrs. Dobbie & Co.

IONA.—This showy flower may best be described as bright blue with four heavy radial blotches of black purple and regular outline running to the margin of the segments. The flowers are of medium size and capital form. Messrs. Dobbie & Co.

MRS. C. F. GORDON.—This is much like Iona in style, but is not nearly such a good variety, the flower being inferior in form, size, and distinctness of colouring. Messrs. Dobbie & Co.

DUCHESS OF FIFE—This shares with one or two other forms the quality of being earliest to bloom at Chiswick this year. The yellow flowers, shading to white towards the margins, and with their irregular borderings and blotchings of lavender, are exceptionally showy and distinct. Habit and constitution alike are good at Chiswick as well as in the thousands of other places that the variety has been grown. Messrs. Dobbie & Co.

HAMISH—Here we have an exceedingly fine flower. The colour is deep purple-magenta, passing to violet-purple in the centre. The form is good, and the plant a strong grower. Messrs. Dobbie & Co.

BLUE GOWN.—An early, dwarf, free flowering sort of great merit. The colour is light purple blue with a pretty white eye. At Chiswick the earliness of the variety was well maintained. Messrs. Dobbie & Co.

PRINCESS LOUISE.—This is a fine self yellow sort with a deep orange eye, and a few faint rays. The flowers are of medium size, capital form, and are produced with great freedom. Messrs. Dobbie & Co.

VEGETABLES.

On July 5th the fruit and vegetable committee pronounced upon the respective merits of the varieties of Peas grown to test. The seed was sown on March 15th Awards of Merit were granted to three varieties. They were:—

THOMAS LAXTON.—A large, wrinkled Marrowfat Pea, averaging seven seeds to a pod; pods green, slightly curved, produced singly; haulm, dark green; height, 3 ft; a capital cropper. Messrs. Laxton Bros., Bedford.

DRUMMOND'S NEW PEA.—A fine Marrow variety, averaging seven to nine seeds in a pod; pods produced in pairs, curved, acutely pointed; haulm and pods dark green; evidently a first-rate cropper; height, 4 ft. to 5 ft. Messrs. Drummond & Sons, Dublin.

VEITCH'S ACME.—The result of a cross between Stratagem and Veitch's Extra Early; pods rather small but exceptionally well filled, slightly curved, a little pointed, light green; seeds from five to seven in a pod, relatively large, and closely packed; a heavy cropper; Height, 3 ft. Messrs. Jas. Veitch & Sons, Ltd., Royal Exotic Nurseries, Chelsea.

LETTUCE CRYSTAL PALACE also received an Award of Merit from the committee. It is an exceedingly fine Cabbage variety, of great size and weight, and very suitable for dry soils. The heads last a long time in condition, and the flavour is excellent. The leaves are much crisped at the margins, and thus are very ornamental in appearance. The colour is green, flushed a little with brown. Messrs. Watkins & Simpson, Exeter Street, Strand.

STRAWBERRY REWARD.—This is a new Strawberry, with very rich Pine flavour. The bright scarlet fruits are conical in shape, and very long relative to their width. The habit is dwarf, and the plants have done fairly well at Chiswick, although the season has been a very trying one for them. Award of Merit. Messrs. Laxton Bros.

The Orchid Grower's Calendar.

EAST INDIA HOUSE.—In this division the various species of *Phalaenopsis* are just now making good headway as regards growth, &c., and should, of course, receive every attention at the hands of the cultivator. Coming as they do from the East, it is easy to see that to do them well they must receive a great amount of heat. We are told that they are found growing on bare rocks, and on branches of trees, and where a great quantity of water falls during the growing season, and at no time we may reason-

ably suppose are they subjected to a long season of drought, as are most Orchids, for not being provided with pseudobulbs they could not stand it for long. At the same time, the leathery leaves which we find on imported pieces tells us pretty plainly that at times they have something to put up with, which is unknown to them under cultivation. However, I am not going even to suggest that we coddle them too much over here, for experience teaches us that they are more susceptible to injury by fluctuation in temperature and exposure to the sun's rays than any other Orchid.

Under cultivation the leaves become thick and fleshy, but would soon become scorched if exposed. As mentioned, they are great lovers of moisture, so that attention should be duly paid to their requirements in this direction.

A friend of mine, who does them well, grows them for the most part in teak wood baskets, using as small quantity of moss as is convenient. Some there are who fill in all the available spaces with live moss, sometimes covering up the roots, which would otherwise be exposed. This a mistake, as it sometimes causes the roots to go black at the points, and die off altogether.

A temperature of about 80° should be maintained by day with sun heat, and the shading down; and a night temperature of about 70°. Only on rare occasions can fire heat be dispensed with in this division; for we get very cold nights, so that it is always best to be on the safe side by keeping a little heat running through the pipes.

THRIPS are very partial to these plants and must be kept under by fumigation. Sponging the leaves, too, keeps them down, besides having a beneficial effect on the plants.

CATTLEYA HOUSE.—Here the beautiful *C. gigas sanderiana* is making a good show, and is much admired. So are most Orchids; but you have to keep them up to concert pitch or they would not respond by showing their beauty. This then can only be done by giving them the necessary food. It has been my practical duty, set forth from time to time in these notes, to do the potting of these species as soon as the flowers fade, as we find at this season the roots are most active. Some there are that have missed flowering and are now ready for a new pot or pan as the case may be. Good peat and moss in equal parts are what they require. Be careful to drain the pots well; very little water will be required until they are well rooted.—C.

CYPRIPEDIUM I'ANSONI AND MRS. REGINALD YOUNG.

To succeed in obtaining two first-class Certificates for *Cypripediums* at one meeting of the Orchid Committee of the R.H.S. is a feat that is seldom attained, and, when it does happen, is worthy of special mention. This Messrs. H. Low & Co. succeeded in doing at the meeting on the 28th ult., with the two hybrids mentioned, and it must be admitted they were of exceptional interest and beauty. The former is a hybrid having *C. Morganiae* and *C. rothschildianum* as its parents, and is in every respect intermediate, the best characters of each being fully developed. Of Mrs. Reginald Young, to say that it was the product of a cross between *C. Lowi* and *C. sanderianum* will give a good idea of the beauty and distinctness of this one also. The flowers of this latter one were better in form and general appearance to either of its parents, whilst the colours of each were intensified and most pleasing. They are set fairly closely, each bloom measuring about 2½ in. to 3 in. across. The under colour is a yellow, but the major part of the bloom is densely covered with small, dark brown spots, giving the flower an almost sooty appearance. It, nevertheless, is a showy thing, and its successful blooming must give satisfaction.

Grammatophyllum rumphianum is grown at Kew in a basket, full of roots, and has evidently been treated in a manner suitable to it. The spike on this is just 6 ft. in length, the flowers appearing on two-thirds of the length, and set somewhat sparsely on the spike. The two basal flowers develop only four segments instead of the usual six; that is, there is an upper sepal and a lower one instead of two. There are two petals and no labellum. The colour of the flowers is a bright yellow, with heavy spots and mottlings on the whole, which are of a dark

purple. This irregular mottling gives the flowers a very distinct character, and when this is once seen and noted there need be no further doubt in the mind of the grower.

Coming to us as the Grammatophyllums do from the hot countries of the Islands of Java, Madagascar, and Singapore, the treatment of the ordinary East India house should usually suit these. At the same time it must be confessed they sometimes do well, and after a season or two turn weakly and die away. The yellow thrip has been their greatest enemy, but now, thanks to the XL All, this can be successfully overcome, and the removal of the pest will doubtless ensure to many a longer lease of life than was the case a few years back. Plenty of moisture, heat and light whilst growing, and a fairly dry and cooler time when at rest must assuredly be given.—*W. Swan, Exmouth.*

Gleanings from the World of Science.

THE undermentioned subjects were brought up at the Scientific Committee Meeting of the Royal Horticultural Society on the 28th ult. :—

Pyrethrum Flowers Arrested.—Mr. E. Ballard sent some flowers, "taken from healthy roots, full of bloom, but on which some of the flowers fade, owing to the shrivelling of the stalk some 2 in. or 3 in. below the flower. Last year whole roots were affected." It is difficult to pronounce without seeing the early stages, but the general opinion was that frost had checked the buds, and a fungus, possibly a myxomycete, followed. Buds of Pyrethrum, arrested in an early stage, appeared to be spoilt by frost and wet having got into them.

Beeches Dying.—Mrs. A. C. Campbell Swinton, of Berrywell, Dunse, Berwickshire, sent some bark, &c., showing much decay, taken from a very fine old Beech at Kimmerghame. It was described as having a cavity at a fork in which rain water lodged, but since the tree is only nineteen yards from the bed of the river the suggestion that the roots have got into the cold river soil is with very little doubt correct. Beeches preferring dry soil by nature, the above would be a sufficiently probable cause. Mr. Wilks described a case where in a space of 150 yards by 20 yards every shrub and tree dies after a time. The destruction began with a hedge, then Scotch Firs, Oaks, Ashes, and lastly Beeches of about forty-five years of age perished. The cause appeared to be a bed of white sand into which the roots penetrated, thus starving the trees.

Black Currant Shoots Falling.—Mr. E. Ballard sent specimens from a large plantation, which break off at a slight touch or by the wind. Dr. W. G. Smith, who has examined them, reports upon them as follows:—"The Currant leaves bore a mildew, but other fungi were also present when I examined the material. The characteristic mode of attack pointed to a *Peronospora* species. I have raised good crops of one on fresh portions of the leaves, and am following up the clue. If it be really a species of this family it is new to Britain, although one (*Plasmophora ribicola*, *Schraeter*) has been reported from U.S. America. I have observed the emission of motile swarm spores from the sporangia (so-called spores) of fresh material, and otherwise feel sure of the *Peronosporae* nature of this fungus. As to remedy, I should recommend a spraying of Bordeaux mixture or allied copper mixture. To a Black Currant plantation this could be done by a knapsack sprayer. Probably one can be had from the Strawson Company."

Cherry Leaves Diseased.—Specimens of the foliage was received from Mr. B. G. Berry, F.R.H.S., Scarbutts Manor, Broughton, Faversham, and submitted to Dr. W. G. Smith, who reports as follows:—"I cannot make up my mind whether the fungus on Cherry leaves you sent last week is *Cylindrosporium padi*, Karst, or *Cladosporium amygdalearum*, Pass. Both are given as causing spots on foliage similar to that sent. The spores are different, but I get both forms (or something very like them) present. In any case the fungus is the cause of trouble. The disease is common in the United States, though I have no definite record of its occurrence here. It is not considered serious, and yields easily to spraying remedies. I am afraid at present the crop is too far

advanced to allow of immediate treatment, but as soon as it is plucked Bordeaux mixture should be sprayed on the foliage. Next year the spraying should be continued as soon as the foliage is strong enough to allow it. The preparation of Bordeaux mixture and allied fungicides I have already described in the "Gardeners' Chronicle," last August. It should not be used towards the season of ripe fruit, as it stains the Cherries, but applied before and after is reliable."

Black Currant × Gooseberry.—Mr. W. Culverwell, of Thorpe Perrow, Bedale, sent a fruiting spray of this curious hybrid, showing well the resemblance to the manner of fruiting in the Currant, though it was entirely without its scent. The fruit resembled small Gooseberries, but the leaves had no spines.

Tetramerous Odontoglossum.—Mr. McBean sent a spray of *O. crispum*, in which all the four blossoms upon it had the two anterior petals adherent to the sepal between them, three points indicating the fusion. In addition to the above, the sepals fused with the petals were petaloid and the ovaries were aborted. In two flowers it was S_2 and in the other two S_3 that was petaloid.

Tuberous Growth on Vine.—Dr. Masters exhibited a specimen; similar ones are sometimes associated with a multiplication of buds. It is probably caused by a puncture of some insect, which sets up a subsequent growth by hypertrophy. It is occasionally seen on *Maréchal Niel* Roses.

FALKLAND PARK.

SITUATED as this suburban residence is on the top of a dry hill it is not surprising that some difficulty should be experienced in the matter of outdoor gardening. A garden has been established at Falkland Park, South Norwood Hill, for many years, but when Thos. McMeekin, Esq. took it over he completely remodelled the garden, with a few trifling exceptions, and built a splendid mansion fitted with all the modern appliances.

We are most concerned with the various phases of gardening carried out both under glass and out-of-doors. Many of the crowded old trees and useless shrubbery were removed, and much planting has since been effected. The finest of the old trees were of course, left standing intact, including tall Elms, *Sequoia sempervirens*, Oaks, the purple Beech and various others, most of which have greatly improved by the greater amount of breathing room afforded them. The shrubs, notwithstanding the thirsty nature of the soil, are getting thoroughly established in most cases and looking the picture of healthy vigorous growth. Mr. A. Wright, the gardener, has more recently planted a hedge or rather a winding bank of shrubbery round one side of the hill for the purpose of screening the houses belonging to another establishment, and already this is a pleasing feature of the grounds abutting upon the drive leading to the mansion. Elsewhere the view into the lower portion of the grounds, which are wooded, is left open, with most interesting effects. Some of the finer trees and shrubs are isolated upon the grass, while in other places they are planted widely apart so as to allow of a covering to the ground of Roses and clumps of annual and perennial herbaceous subjects of an ornamental character. Banks of the choicest varieties of hardy Pontic Rhododendrons and Azaleas on the fringe of the wood were in the full beauty of their June garb of foliage and flowers on the occasion of our visit. Ghent Azaleas, including the hybrids of *A. nudiflora*, were past their best, but the forms of *A. viscosa* were still in full bloom, being later than those of the former. The varieties of *A. mollis* were also early and over.

The grass everywhere covering the crest of the hill is now well established, and covers the ground with a soft carpet of verdure. For several years it remained very thin, the dry weather during what should have been its growing period being most inimical to its welfare. Besides the grass clovers are now taking a firm hold of the soil, including *Trifolium repens* and *T. procumbens*, but particularly the latter, which seems particularly adapted for covering the ground in dry situations. This small species has been spreading of its own accord. In the neighbourhood of the winding, ornamental water progress is also visible in the clumps, beds and irregular masses of various flowering subjects. Masses

of *Kalmia angustifolia* and *K. a. rubra* have been most profuse in blossom. The same may be said of *Cistus florentinus* and a variety of *Cistus albidus*, the large white flowers and dark green foliage of the former being very handsome. A bed of *Bryanthus empetriformis* was particularly handsome in early June; and later on its place was taken by varieties of the allied *Daboecia polifolia*. Masses of *Hemerocallis flava*, *H. fulva*, *Lychnis Viscaria splendens plena*, Single Pyrethrums, London Pride, &c., were very effective; and Pinks to be followed by Carnations in the mass show what can be effected with these garden flowers. *Lilium umbellatum* has done splendidly, and masses of *Iris Pseudacorus* and Water Lilies waded into the water, as is their wont. A large clump of *Typha latifolia* has sprung up in an old gravel pit that has been turned into a pond, but no one has any idea how it came there.

The hothouses were attractive in all save the temperature, and that was not particularly inviting because of the tropical heat prevailing outside. We walked inside, nevertheless, to have a cursory view of the plants in bloom. House No. 7 is used as a conservatory, and here the atmosphere was comfortable, as it was in the long corridor leading from end to end of the range. Tuberous Begonias were flowering away freely, including some fine forms. Zonal, show and regal Pelargoniums made the shelves gay; while *Lonicera sempervirens*, *Solanum venustum* and other climbers draped the roof overhead. Sweet Peas grown in large baskets were very ornamental and quite novel in being suspended high overhead. They answer the purpose admirably. *Datura sanguinea* with its long red trumpets was flowering freely in the corridor, along with a great variety of climbers.

In one of the Orchid houses a fine variety or form of *Dendrobium Falconeri* bore two dozen flowers of rich colour. *Coelogyne dayana grandis* in a basket carried nine spikes, one of which had thirty-nine flowers. Numerous pieces of the fragrant *Odontoglossum citrosum* were suspended in baskets, and flowering freely. Other fine things were *Cattleya Warneri*, a fine form of *Trichopilia crispa marginata*, *Laelia grandis tenebrosa*, the dwarf *Sobralia macrantha nana*, and numerous beautiful varieties of *Odontoglossum crispum*. One had large purple blotches on a white ground; another shapely flower was white except the richly-blotched lip. Very interesting was a third sort which had no purple or brown whatever, merely a golden disc and a few yellow spots on the lip, the rest being white. A variety of *O. c. guttatum* was tinted with rose.

In another house we came upon a large and healthy plant of *Sobralia xantholeuca*, full of flower buds. A very richly-coloured form is *Cypripedium rothschildianum*, Falkland Park var., with broad dark bands on the upper sepal and heavily blotched petals, which had a spread of 11 in., though they were still growing. In different houses *Dendrobium dalhousianum* was flowering grandly.

The stove accommodated grand pieces of various fine foliage plants, including a handsome piece of *Anthurium warocqueanum*, the leaves of which measured 3 ft. 9 in. to 4 ft. in length, by 19 in. across. We do not remember seeing larger leaves of this species.

A fine strain of *Gloxinias* is grown here, including banded, edged, white, and other selfs, and spotted varieties. One sort had a petaloid outgrowth from the outer face of the corolla, resembling a *Canpanula Medium calycanthema*. Very handsome was a light blue sort having large flowers abundantly produced; another had white rings enclosing areas of a dark colour.

A collection of British Ferns is being got together here, and the collection is further being increased by the raising of sporelings of some of the more popular sorts, including the Lady Fern (*Athyrium Filix-foemina*). Seedlings of the latter were characterised by having extremely finely-divided fronds; others had short fronds, heavily crested on the top. Very pretty was one having a very heavy top of almost hair-like segments. Still another noticeable plantlet had narrow fronds for all the world like a *Woodsia ilvensis*. There seems no limit to the variations of this popular species.

The Wings of Butterflies are shown by the microscope to be covered with very minute feathers, each provided with a quill and filaments.

HINTS FOR AMATEURS.

Border Carnations.—These are the most important of all the outdoor flowers just now, with, perhaps, the single exception of the Rose, which is the strongest rival of the Carnation in the struggle for popular favour. The season is decidedly backward the country over, and, therefore, it causes no surprise that the National Carnation and Picotee Society's show at the Crystal Palace has been recently postponed for a week.

The cold, wet May tried the border plants sadly, and they were almost at a standstill at the time when they should have been making their most vigorous growth. The warm weather that we have had during the last two weeks has, however, caused them to pull up wonderfully, even although they have had a hard battle with green fly.

Staking.—This operation should no longer be delayed, otherwise the heavy buds will be splashed with mud, and the flowers spoilt ere they are yet open. For the purpose bamboos are the best stakes, as they are neat, light and strong. They can be purchased cheaply enough in bundles of any size required. As a rule 2 ft. or 2 ft. 6 in. stakes are quite long enough, although 3 ft. ones may be useful for very strong growing varieties. In any case it will not be economy to cut off the points if they are a little bit too long. If they are taken care of bamboo stakes will last for years, and thus they are even more economical in the long run than Hazel twigs, which, as a rule, have to be cut fresh every year, or at the least every two years.

In tying do not bunch all the flowering stems together, as if it was a hirsch broom that was being operated on. Such treatment will spoil the look of the best plants, and, besides, every time a flower is cut there is a bother to get it disentangled from the rest, with possibly a forcible grumble or two as the immediate result. All this may be avoided if a little trouble is taken now with the tying. A number of strings should be used, each supporting two or three of the stems, when, by steering clear of crushing, the flowers will have a better chance to open than they would under the broom-head style.

Disbudding.—As a rule Carnations produce plenty of buds, some of which may, under ordinary circumstances, be dispensed with. To dishud heavily, however, is neither necessary nor wise, for the size of the flowers left will not be materially increased thereby, although, of course, some increase will accrue. We are not speaking now of the zealot who has the show board and the shekels of prize money in view—for him a totally different system is required. His plants are heavily disbudded, shaded from the sun, watched over almost day and night as if untold wealth were at stake. We do not wish to decry all this trouble, for to the grower who has the show fever probably no trouble is too much, no pains too great, if but he can achieve his object; and this is as it should be.

For ordinary purposes, flowers of medium size are what is wanted, and the more there are of them the better. The only disbudding that will be necessary, therefore, is when a cluster of three or four buds is formed at the apex of a shoot. In such cases the centre one should be left and the others pinched out.

Pot Carnations.—Those amateurs who possess a cold frame or two and a greenhouse will find that it is a profitable undertaking to grow border Carnations in 7-in. and 8-in. pots, and flower them under glass. Where there is any difficulty in getting them to do in the open, as is the case in some urban and suburban gardens where the soil is anything but kindly, you will find that it is quite easy to obtain plenty of fine flowers by cultivation in pots. Nothing like forcing is attempted, of course, but the plants are kept quite cool and allowed to come on as gradually as their relatives in the open border, which they antedate in blooming by about ten days or a fortnight. Just now the plants will be all the better for an occasional dose of liquid manure, but it should not be given to them too strong, and only at alternate waterings. As the flowers commence to open see that proper shading is given, for the flowers burn much more quickly under glass than they do in the open, and even if there is no "burning," strictly speaking, the colours soon fade under the action of

the sun's rays. Green fly too is much more troublesome under glass than it is out of doors, but this is to a certain extent compensated for by the fact that it is easier to deal with it in the house. If much of it is about, a fumigation before the buds begin to burst is advisable.

Violas.—Up to the present the season has been anything but a favourable one for Violas, for insect pests have been more than usually numerous and destructive. It is to be feared that the present hot, parching weather will favour still further the spread of the dreaded red spider, unless, of course, remedial measures are taken. As long as the hot weather lasts the plants should be heavily sprinkled overhead each evening with the rose can, giving enough water each time to go right down to the roots. This system is a most beneficial one and I have known a number of cases within the past year or two in which the Violas would have done very little had it not been followed. The production and development of seed vessels is a very exhausting process for the plants, and hence, if the continuity of blooming is to be kept up, these seed vessels should be picked off before they are any size. This must not be done once or twice simply, but continuously, and the plants will look all the better for it.

Calendula officinalis—A few plants there are that once they are put into a garden can only with difficulty be got rid of again, and of this number the common Marigold, *Calendula officinalis*, is a notable example. It will grow almost anywhere, and under any conditions, and year after year the seedlings come up in increasing numbers, for the seed sows itself all over the garden. In addition to these hardy and insistent qualities, the plants are very showy and free blooming, and are certainly not to be despised by those who have to deplore the failures of many choice plants to grow in the mysterious soil that is often to be found in town gardens. There are several varieties that are well worth attention. Of these Orange King is the best of its colour, which is a rich orange. The flowers are of great size and very double, whilst they are produced all through the summer. The plants are dwarf and hushy, the height being about 1 ft. This variety is not nearly so weedy-looking as the type, upon which it is a decided improvement. Its counterpart, as far as habit and general utility go, is to be found in Lemon Queen, the difference being in colour, which is, as the varietal name suggests, lemon-yellow. Of the striped varieties Meteor is the best. The flowers are fully as large as those of the other forms mentioned, bright orange in colour, with stripes of pale yellow.

Dahlias.—Where early flowers are wanted large old plants will require to have the growth thinned to some extent. They throw up a lot more than there is any necessity for, and it is only by removing some of them in good time that the rest have a fair chance. Three or four good main stems are quite enough for an ordinary plant, and after the strongest and healthiest have been selected the rest may be cut out. Some of the lateral growths and buds may also be removed with advantage if good-sized flowers are wanted. This applies chiefly to the show, fancy and Cactus sections, for the singles, being chiefly wanted for cutting, may be allowed to throw many more flowers. Another point is to be gained by thinning out the growths besides increase in size of flower, and that is, earliness of blooming. Many Dahlias, especially those that were not started under glass, have scarcely a chance to bloom until the summer has gone and frost is expected.

Double Daisies.—These old-fashioned but none the less useful plants are exceedingly effective in spring bedding combinations. A good stock of them is thus of no importance, seeing that they can be associated in the beds with bulbs of all kinds as a ground work for the taller plants. An edging of the red and white forms is also a capital set-off to either bed or border. If no attempt has been made at propagation this should be seen to at once. The old plants should be lifted, and divided up into nice little tufts with plenty of roots attached. Choose a spot on a shady border where the soil is light and rich, and plant the divisions in rows about 8 in. apart—just wide enough to admit of the use of the hoe. Water them in, and give subsequent waterings as the state of the weather determines. Nice plants will then be forthcoming for autumn planting.—*REN.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Adiantum Capillus-Veneris var. cornubiense.—*Y.*: The common, bardy Maidenhair is not exclusively British, being almost world-wide in its distribution. It is an exceedingly variable species, and there are numerous, handsome, named varieties of it in cultivation. *A. C.-V. cornubiense* is one of the prettiest of these, but it is somewhat delicate in constitution, and we rarely see anything like a really good plant. The cool greenhouse is the place for it. We hope you will succeed in getting it to grow.

Selaginella kraussiana and S. denticulata.—*Suburban*: You are both right and wrong. The *Selaginella* you send as *S. denticulata* is undoubtedly the same as the one known as *S. kraussiana*, which is its correct name. The true *S. denticulata* is not synonymous with *S. kraussiana*, for they are distinct species.

Asparagus Bed.—*Arry*: You must pull out the weeds by hand. We should not advise you to sprinkle enough salt on the bed to kill them, for although *Asparagus* likes a little salt it must not be expected to put up with such a strong dose as this. Cutting should cease after the expiration of June. It is not wise to work the beds too hard, for what you will gain one year you will inevitably lose the next, and a few years of consistent over-cutting will ruin the bed entirely.

Dahlias Eaten.—*Arry*: The Dahlias have probably been eaten by earwigs. Set traps for the pests by placing near the plants small pots or tins filled with hay, into which the earwigs will creep for shelter. By examining every morning, and destroying any of the insects that may be in them their numbers will be lessened.

Lavatera arborea variegata.—*F. L. Ames*: Despite its woody appearance, and almost tree-like stature, this *Lavatera* is only a biennial. Its chief value is for sub-tropical bedding, for which it may be used with excellent effect, especially when the plants are well variegated.

Adiantum pedatum.—*P. T.*: Although this *Adiantum* looks delicate it is hardy enough, and will do very well in a shady nook in the rockery. It is a native of North America.

Marguerites.—*P. T.*: Your plants have probably flowered themselves to a standstill, so to speak. Marguerites are very free-flowering things, and not infrequently do this when they are kept pent up in small pots. Your best plan will be to cut them back a little, shortening each growth to, say about half its present length. Leave the plants in their pots until they commence to break into growth. They may then be planted out in an open border in rich soil, where they will grow with astonishing vigour. By September they will have developed into plants that will be three times their present size, and which may then be lifted, potted up, and placed in the conservatory for the winter. They will commence to flower soon after they are lifted, and keep right on through the winter.

Pinching Vines.—*S. L. N.*: As a rule, two or three nodes beyond the bunch is sufficient length to allow the shoot to run before it is stopped. If the Vines are very subject to the cracking of the berries it will not be a bad plan to let the shoots run a little longer than this, so as to form a safety valve for the surplus of sap. The lateral growths, that is, those thrown out from the main shoots of this year's growth, and lateral to them, should be pinched at the first leaf.

Aerial Roots on Vines.—*Why*: It is a common thing to see aerial or adventitious roots produced by Vines in bunches along the stem. They are really roots, and if they were brought into contact with the soil this would soon be seen. As it is they cannot reach the soil, and only exist for awhile, dying off towards the close of the season. They do no

harm in themselves, but are simply a sign of distress, so to speak, on the part of the plant producing them. Their presence shows that the plant has not all its wants supplied by the normal roots in the ground, so it desperately tries to make up for the deficiency by throwing out others in other places. If these roots are present in large numbers it is a sure sign that the border wants looking to, perhaps renewing, otherwise shanking or other ailments may set in.

POLLARD WILLOWS.

VERY characteristic of the Thames Valley, and the fens and stream sides in Cambridgeshire and other English counties are the Pollard Willows, of which the accompanying excellent illustration was taken by Mr. W. J. Potter, one of the masters at the Roan School, in Greenwich.

Fringing the banks of the water courses, usually in the richest of pasture lands, these round-headed and curiously grotesque Willow trees are very picturesque; indeed, they may well be described as the most characteristic objects that are to be found in such districts.

When old they assume quaint forms, some-

On the Continent, particularly in Belgium and Holland, these pollarded Willows stretch for miles throughout the marshy grounds, a scene that forcibly reminds one of what we may see at home either on the Mendip Hills, or in our own Thames Valley.—
A. D. Webster.

DEVONHURST, CHISWICK.

GARDENING in the suburbs of London becomes more and more difficult every year, and this fact is, of course, most in evidence during the winter months, when the moisture in the atmosphere, rain and fog bring down the filth upon vegetation, or prevent it from ascending and being carried away, as the case may be. Nature, under the skilled attention of gardeners, makes an attempt during the few summer months to repair the injury caused in winter, but even then plants in the open air, as well as under glass, have a difficulty in holding their own. This was hinted at the other week by the president of the Royal Horticultural Society. We had further evidence of this in the gardens of Devonhurst, Chiswick, formerly a portion of the R.H.S. Gardens, but now the property of E. H. Watts, Esq.

Notwithstanding the disadvantages, however, to

the trees of the former being taken into the dwelling house when the crop was ripe. Late Peaches here are Exquisite, Sea Eagle and Princess of Wales. The large trees trained against the glass are Grosse Mignonne, Lord Napier and Violette Hative. The fruits of the latter are mostly picked, and are beautifully coloured. All three varieties matured enormous crops, the fruits of Grosse Mignonne being of remarkable size.

The Vines in the early vinery are now three years old and bearing magnificent crops of Grapes, Foster's Seedling, Black Hamburg and Madresfield Court being the varieties grown. The Grapes are fine in bunch and berry. A Grosse Mignonne Peach on the back wall of this house is rather shaded and bears only a few large fruits. Curiously enough a number of branches, allowed to pass through an opening in the glass partition, into the late vinery, carry a heavy crop of fine fruits equally as mature as those in the early house. In the late vinery the Vines are two years old and carry a fine crop of fruit. The varieties grown are Alicante, Muscat of Alexandria, Gros Colman and Madresfield Court. The herries of the latter never give any trouble by splitting as is often the case with this variety. Mr. Gibson attributes his success to his custom of water-

POLLARD WILLOWS.

times perfectly rounded as if they had been pruned into shape with the garden shears; while at others they divide out into a number of distinct heads, and which, with the gnarled leaning trunks and warty mop-heads, have a curious and weird appearance, especially when destitute of foliage.

To the naturalist these masses of protuberances caused by yearly lopping of the heads are of unusual interest, insects, birds and vegetable life finding a cosy home in the half decayed centres of the oldest trees. Not at all uncommon is it for the Willow to send out roots at the crown of the stem, which penetrate downwards through the accumulated soil of the hollow trunk.

Usually these Pollards begin life as a simple stake pushed into the ground, for the Willow is far from being fastidious in the matter of growth, which readily takes root and grows away freely, soon forming a medium sized trunk and usually a massy rounded head of foliage. The crown of shoots is cut over annually, the demand for Willow posts and houghs being considerable, the larger being used for fencing purposes, while the young and limber find a ready market for the basket and crate-making industry.

plant life, Mr. James Gibson, the gardener, manages to raise fruit and vegetables in quantity from the limited area, and of quality which makes its presence felt at various shows in different parts of the country. This he manages to do by unremitting toil and attention during the growing season, and by giving the soil that cultural treatment most conducive to its welfare, which can only be accomplished by thoroughly understanding its capabilities, and acting upon that knowledge.

Fruit under glass is much more extensively cultivated now than formerly at Devonhurst. The Peaches and Nectarines in pots have given great satisfaction this year. They are grown in 12-in. pots, and the earliest trees carried on an average twenty fruits, while some of them bore two dozen or more. Lord Napier, Early Rivers, and Humboldt are the early ones grown in the old Peach house. They are now mostly gathered. Some of the trees were taken into the dwelling house, and left there for the fruits to be gathered by the owner and his family, who were delighted by the innovation. Later batches of Nectarines in pots are Elruge, Pine Apple, Pitmaston Orange, and Lord Napier. The early Peaches include Early Alfred and Condor,

ing freely all through the growing, colouring and ripening periods of the fruit, and by leaving a little ventilation on all night after the berries commence to colour. The results justify the practice. Neither trees nor Vines are allowed to become really dry at the roots during any part of the year.

Melons and Cucumbers are treated in the same way. The latter have been bearing since March. The Melons are of handsome size, and now being cut. The varieties grown are Hero of Lockinge, Sutton's Windsor Castle, Triumph and Ar.

Passing through the Orchid house we noted fine spikes of *Laelia purpurata*, and a profusion of flowers on *Lycaste aromatica*. *Cattleya Mendelii* and *Dendrobium Pierardi* were passing out of bloom.

A curious combination of plant life occupies one house, yet all are giving great satisfaction. The wide staging at the back is filled with Apple and Pear trees in pots. Beauty of Bath Apple is just about ripe. Pears bearing heavy crops are Beurré Alexander, Clapp's Favourite, Louise Bonne of Jersey and Marie Louise. On the front staging is as fine a crop of Tomatos in 12-in. pots as one could wish. Sutton's Eclipse, D. Wilkie and a local

unnamed sort are the varieties grown. The last is a free but small fruiting Tomato; but the other two bear large bunches of shapely fruits of exhibition size. Many varieties of zonal Pelargoniums carry a profusion of blossom, in large trusses. The relatively dry atmosphere of the house evidently suits all the tree classes of plants.

Out of doors the fruit crop is variable. The cold winds of May destroyed the blossom with the result that the crops of Pears, Plums and Sweet Cherries are very poor. Morello Cherries on a north aspect wall are splendid. The young shoots are allowed to project from the wall about their full length, and the results amply justify this plan of treating them. The plan might well be adopted elsewhere, for a succession of fruit is ensured. Apples in pyramid and bush form carry wonderful and satisfactory crops of fruit. Black and Red Currants are fair. Gooseberries are weighted to the ground with fruit, the berries being in many cases of enormous size. Whinbam's Industry, Creeping Jane, Abraham Newland and Lord Radcliffe are some of the numerous varieties grown. Strawberries have been a grand crop, though quite a month behind time. Royal Sovereign is the favourite both for size, colour, flavour and cropping qualities. President, Waterloo and Laxton's Latest of All (the latter now swelling its fruits) are also grown. Leader and Monarch are useless at Chiswick, the trusses of fruit possessing no vigour either in this or in the R.H.S. garden. Mr. Gibson took the first prize for Strawberries at the recent Richmond show, besides several prizes for vegetables.

Onions sown under glass this year and planted out later have never looked finer at the same stage than they have done this year. Some of the bulbs measure 8 in. to 9 in. in circumference. The soil is not trodden because of its liability to bake here; but on the contrary is mulched with short dung or horse droppings.

Peas have made excellent growth, though late this year. Duke of Albany was not ready for gathering till the fourth week in June. The pods now measure about 5 in. long. Carters Seedling sown at the same time will not be ready till about the 17th inst. It promises well. Autocrat is very vigorous but only now in bloom. Duke of Albany and Alderman grown side by side are positively grand Peas either for exhibition or table use. Alderman is the favourite of the two having darker foliage, pods, and seeds, the latter being better in quality, and the pods, 5 in. to 5½ in. long, but slightly later than those of the Duke. The haulm is 6 ft. to 7 ft. high, and in both cases bears an enormous crop of pods. No farmyard manure was employed, only wood ashes and bone meal, Mr. Gibson being satisfied that the old garden soil contains sufficient humic matter for this crop. The surface is mulched with dry litter. The application of nitrogen has been ignored, Peas being able to collect all they want. Late Peas, in various stages of advancement, are now making good progress. They include such sorts as Sutton's Peerless, Ne Plus Ultra, The Gladstone and others. The last named is very vigorous and very late, while Sutton's Early Giant sown upon the same date is now ready for gathering.

Magnum Bonum Cauliflower is an excellent sort with pure white heads, now nearly over. Sutton's new Early Giant is promising. Winter Onions are strong. The earliest batch of Celery is now being blanched with coils of brown paper. The varieties grown are Sutton's Solid White, Giant White and Standard Bearer, the latter being a red variety. The true Lyon Leek, the favourite here, is being treated like the Celery, and the blanched portion is already 1 ft. long.

The beds in the flower garden are now making progress, but they are late, having had to battle with adverse circumstances for weeks past. Chrysanthemums in pots are vigorous and just now commencing to make the shoots to furnish the buds from which the flowers will be taken in due season.

The Peaches and Nectarines planted out in the late house were rather severely root pruned about the middle of last August, to check the undesirable vigour of growth, and the effect was highly beneficial, for they now bear heavy crops of fruit. This applies to the first and second division of the house. Sea Eagle Peach is remarkably well loaded with fruits, yet the vegetative vigour is strong, the root pruning notwithstanding.

Some Fig trees on the back wall bore a heavy

crop of fruit, but a black shower of flakes of burnt paper, of three to five days' duration, from a neighbouring paper manufactory, ruined the prospects, as all the fruits fell about two or three days afterwards. Vegetable Marrows in frames were ruined in the same way, the hairy leaves retaining the filth, and suffering in proportion to the amount of moisture on the leaves. This also applies to the Figs. We understand that a lawsuit is pending concerning the damage done to various things. Even now the filth has not all been washed from the leaves of the Vines in another house. The shrubs in the open have been washed several times with water from the main by means of the hose.

THE NATIONAL AMATEUR GARDENERS' ASSOCIATION.

ONCE a year the members of this association have an exhibition elsewhere than at their usual rendezvous, making it a sort of holiday and fete. On this occasion, as last year, they assembled in the gardens of the Royal Botanic Society, Regent's Park, the show being located in the corridor while the miscellaneous exhibits were placed in the large marquee. Dry, though cloudy, weather favoured the outing, and a goodly company turned up.

Mr. H. A. Needs, Woking, secured the first place in the Dobbie Championship for an exhibit of cut flowers effectively set up in vases or glasses. The Irises, Delphiniums, &c., were gorgeous. Mrs. H. W. G. Morris, Thame, was second with a pretty display; and Mr. Bland G. Sinclair, Highgate, was third.

Mrs. H. W. G. Morris took the lead for a vase of Roses. Ernest R. Smith, Esq., Muswell Hill, secured the first place for twelve Tea Roses in the Frank Cant prize class. G. W. Cook, Esq., Tooting Park, took the lead for twelve H.P. Roses in the Frank Cant Championship class. Mrs. H. W. G. Morris, and Mr. B. T. Marsh, Claygate, were equal second. Those who take the highest number of marks in this and two subsequent exhibitions get the prizes accordingly. For nine Roses grown within seven miles of the G. P. Office, Ernest R. Smith, Esq., had the premier place; John Bateman, Esq., Archway Road, being second.

Mr. J. W. Jones led the way for six bunches of decorative Roses. The Silver Medal for eighteen cut Roses was taken by G. W. Cook, Esq., with Mrs. John Laing. He also led the way for six Roses, distinct, showing grand specimens.

Mr. A. J. Foster, New Cross, was first for single tuberous Begonias, as well as doubles. Mrs. H. W. G. Morris had the best epergne of cut flowers, showing Shirley Poppies. Mrs. H. Lance Gray, Walton-on-Thames, was second. Mrs. G. W. Cook had the best bowl of Tea Roses, and the best vase of Roses; Mrs. H. W. G. Morris being second.

Mr. E. W. Gibbs had the best six sprays of Violas in the novice class; and Mrs. H. W. G. Morris had the best six Roses. Mr. A. J. Foster was the only exhibitor of Streptocarpus.

Mr. Bland G. Sinclair, Dartmouth Road, N., had the best six-rayed self Violas, and the best six rayless sorts. Mr. D. B. Crane, Highgate, took the lead for six sprays of Violas, setting up a neat arrangement. Mr. W. E. Reeve was a good second. Mr. Leonard Brown, Brentwood, was first in Mr. J. C. Smith's competition for six saucers of Violas. Mrs. F. H. Barnes, Ilford, had the best three sprays. Mr. D. B. Crane again came to the front in the "Pye Championship" for twelve sprays of Violas. Mr. Leonard Brown was second; and Mr. W. E. Reeve was third.

Fruit and vegetables were also shown, Mrs. W. H. G. Morris being first for four dishes of bush fruit. Mr. F. M. Vokes, Sholing, was second. Mr. J. W. Jones had the best dish of Strawberries. Mr. F. M. Vokes came to the front for six sorts of vegetables, Mr. A. Lewis, Beckenham, being second. He also was first for six bunches of Annuals. Mr. L. Brown had the best zonal Pelargoniums. Mr. A. Lewis had the best six bunches of hardy flowers, Mr. A. Taylor, Finchley, being second. Mr. F. M. Vokes was first for six bunches of annuals in the Allnut competition, Mr. W. E. Reeve led the way for Sweet Peas, followed by Mr. H. E. Needs.

MISCELLANEOUS.—Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, set up a semi-circular group of plants in the large marquee. The flower-

ing plants consisted of tuberous Begonias, Gloxinias, Petunias, Heliotrope and Pelargoniums, set in a groundwork of Maidenhair and other Ferns. In the background were tall Palms, variegated Negundo and Bamboos, while there were isolated plants distributed through the bright masses of colour.

Messrs. Barr & Sons, 12 and 13, King Street, Covent Garden, set up a bold group of Delphiniums in many varieties, and along the front of these were bunches of Galega officinalis, double Potentillas, Phloxes, Eryngium alpinum, E. oliverianum in fine condition, Sidalcea malvaeflora, Lychnis chalconica, Anthemis tinctoria sulphurea and various other showy perennials.

Messrs. Wm. Cutbush & Son, Highgate Nurseries, London, N., set up a fine bank of Malmaison Carnations in the form of the Prince's Feather. Fine varieties were Princess of Wales, Mrs. C. H. Wilson, Churchwarden and Sir E. Wood. Other types of Carnation were Andrew Noble, Her Grace, Lorna Doone, Ness, Edith Ledenham and May Queen, all tree varieties.

Messrs. Dobbie & Co., Rothesay, N.B., and Orpington, Kent, exhibited a beautiful and varied display of Violas and Sweet Peas. Choice amongst the latter were Queen Victoria, Salopian, Mars, Ramona (new), Her Majesty, Little Dorrit, Coquette, Dawn of Day, Lovely, Lady Mary Currie (new and rich rose, shaded with scarlet), Duchess of York and other beautiful colours. Amongst new Violas were Jennie P. Robertson, Lucy Bertram, Marchioness, Hamish, Pembroke, &c.

The Ichthemic Guano Co., Ipswich, had a neat stand of their specialities, decorated with a considerable variety of flowering plants in pots. M. Le Cornu, the agent of the company for the Channel Islands and the Continent, was in charge of the stand, being the first time he has done so in England.

The Jadoo Co., Palace Gate, Exeter, exhibited plants grown in Jadoo Fibre, some plants such as Grevillea robusta being in a glass jar showing root action.

The Agricultural and Horticultural Association, Dyott Street, London, W.C., exhibited a collection of vegetables, including Cauliflower, Onions, Beet-root, Tomatos, &c.

Messrs. J. Cheal & Sons, Crawley, Sussex, had a group of Delphiniums, Violas, Roses, Campanulas, Tropaeolum polyphyllum, Lychnis chalconica and other herbaceous plants.

The Lawes Chemical Manure Co., Ltd., 116, Fenchurch Street, London, E.C., had a stand of Lawes' Horticultural Garden Manure in tins and bags of various sizes, the manures being a valuable specific for various crops.

Messrs. W. E. Ward & Co., 6, Wormwood Street, E.C., exhibited garden requisites. Messrs. Fenlon & Son, 8, Tudor Street, Temple, London, set up heating apparatus.

Mr. Septimus Pye, F.R.H.S., Catterall, Garstang, Lancashire, exhibited a fine collection of Violas, fancy Pansies, &c. The former were staged on tall sloping stands. Mr. W. Baxter, Woking, also set up a stand of choice varieties of Violas.

Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., had a stand of metal labels, cast and cut for suspending, and also for sticking in the soil. Wright's Pot and Orchid Basket Suspender was also in evidence. Messrs. D. Dowell & Son, Hammersmith, exhibited garden sundries.

VICTORIA TRICKERI.

ON the front page of a recent issue of *American Gardening* is a capital illustration of this handsome Water Lily growing in a pond in the open in Salem, N.C., U.S.A. This plant is much hardier than the well-known *V. regia*, and the self-sown seed has been known to germinate after having lain in the water all the winter, despite the fact that the pond was covered with several inches of ice. In appearance the most striking feature of the plants is the depth of the upturned rim of the leaves, which is to be seen in the leaves even when quite young. This feature is well shown in the illustration referred to. In *V. regia* the rim is only noticeable upon large, fully grown leaves, and even then the depth of the rim seems to be determined according to whether the plant is in vigorous health or not.

HARDY BAMBOOS.

(Continued from p. 699.)

ARUNDINARIA.

A. FORTUNEI.—Gardeners will recognise this species under the name of *Bambusa Fortunei variegata*, for it is one of the commonest and most widely cultivated species of Bamboo in British gardens, being more often grown in pots for decorative purposes than planted out. It is well adapted for rockeries and as an edging to beds of shrubs, as well as the Bamboo garden proper. The green form is unknown at present, so that if it ever arrives at our shores, the botanists will be giving the species a varietal name to indicate the typical form as in the case of *Aucuba japonica vera*, the green form. When planted out it forms dense erect tufts 1½ ft. to 2½ ft. high. The leaves are 3 in. to 6 in. long, and dark green, irregularly striped with creamy-white. The native country is Japan.

A. FORTUNEI COMPACTA forms neat little tufts 6 in. to 12 in. high.

A. HINDSII.—The garden synonym of this species namely, *Bambusa erecta*, is characteristic of its most striking feature, for it is one of the most strictly upright of the tall species in the Kew collection. The top of this plant is shown in the illustration on p. 681. The upright stems vary from 6 ft. to 12 ft. in height, are olive-green, and give rise to fascicled, erect twigs at the nodes. The linear-lanceolate leaves are long-pointed, intense green, grassy in appearance, 5 in. to 6 in. long, and ¼ in. to ½ in. wide. The old sheaths are short and moderately conspicuous. The species is desirable on account of its strikingly distinct habit. Its native habitat is in Japan, and its native name *Kanzan-chiku*.

An interesting variety of it is *A. Hindsii graminea*, so named by Mr. W. J. Bean, the foreman of the pleasure ground department, who is an enthusiastic Bamboo cultivator. It differs from the type chiefly in being much dwarfer, only 18 in. to 4 ft. high, and having greenish-yellow stems. It is the *Bambusa graminea* of French gardens, and has a rich dark green, grassy appearance. The Japanese name is *Taimin-chiku*.

A. HUMILIS.—This Japanese species grows 3 ft. to 4 ft. high, and is of erect, dense, reedy habit, but may often be seen only half that height. The dark green, finger-like leaves are 4 in. to 6 in. long. The plant is rather untidy just after winter, on account of numerous dead leaves, until the summer growth has been developed, when it greatly improves in appearance. It is the green form of *Arundinaria Fortunei* of gardens, but is totally distinct from that species.

A. JAPONICA.—Of this there are some grand specimens in the country, being one of the first hardy species with which gardeners became acquainted, *A. Fortunei* being the other. Here it is best known as *Bambusa Metake*, the Japanese popular name being *Mé-také*. It grows 6 ft. to 10 ft. high, the pale green stems being much covered with long, dry and dead, white sheaths that are very conspicuous in the early stages of the plant, but ultimately become hidden by the massive drapery of drooping branches, and intensely dark green and glossy foliage. The lanceolate leaves are 6 in. to 12 in. long, by 1 in. to 1½ in. wide in the middle, and drawn out to a long point. In rich soil of a substantial nature and fairly moist (though the latter condition is not absolutely necessary), this Bamboo forms large and massive bushes of great beauty after attaining their characteristic development. A sheltered position enables the plant to retain the beauty of its foliage throughout the year. The leaves, furthermore, are the largest of any of the arboreal Bamboos, and by this characteristic it may readily be recognised. It is a native of Japan, as the name suggests.

A. MACROSPERMA TECTA.—In this we have the dwarfer of the two distinct forms of the only hardy Bamboo coming to us from North America. The late Asa Gray, the well-known American botanist, considered it a distinct species. It has a number of synonyms. The erect stems are 3 ft. to 4 ft. high, and are furnished with ascending or spreading branches. The lanceolate and broad, finger-like, light green leaves are 3 in. to 6 in. long. The stems are much covered with sheaths that are bearded with a whorl of bristly hairs at the apex, and cover the stems all the year round, hence apparently the inference for the varietal name *tecta*.

A. NITIDA.—This may be described as the queen of all the really hardy species of *Arundinaria*, on

account of its graceful habit, handsome appearance and the surpassingly rich hue of the foliage. The slender stems attain a length of 6 ft. to 9 ft., varying in colour from olive to brown and purple, and very often are furnished with a glaucous bloom near the joints which are situated at no great distance apart. The twigs are very slender and densely fascicled at the joints. In these respects the species shows a close affinity with the Himalayan Bamboos, of which *A. Falconeri* may be taken as the type. It retains its foliage, however, generally in fine condition throughout the year, which the Himalayan species never do. The leaves are very small, being only 1½ in. to 3½ in. long, and glaucous-green when young, but ultimately assuming a rich, dark olive-green hue of a shade difficult to describe. A southern aspect suits it better than a northern one. The short, young sheaths are purple, but on the main stems fall away after a time, recalling the Himalayan species in this respect. Central China is its native home. *Bambusa Kan-si* is the garden name in China.

A. NOBILIS.—The origin of this Bamboo is uncertain, but opinions are not wanting that it is a seedling from *A. Falconeri*, whose *fascies* it bears in every respect, except that the slender stems are more or less tinted with olive, brown, or purple at the nodes. The leaves fall, and the stems are sometimes killed in winter, but shoot up to a height of 8 ft. to 10 ft. towards the end of summer. The sheaths, likewise, are purple.

A. PUMILA.—This is the *Bambusa pumila* of gardens, and forms erect, dense tufts, 12 in. to 18 in. high. It is clothed with oblong-lanceolate, or finger-like leaves, 3 in. to 6 in. long, and of a bright, ultimately dark green hue. The bushes have a reedy appearance, and though lacking in the distinctive traits of the Bamboo tribe, will doubtless prove useful for planting in situations where tall-growing species would be inadmissible. It comes from Japan.

A. SIMONI.—As the last-named is one of the dwarfest, this is the tallest of the hardy Bamboos, being quite a giant in its way, ranging from 6 ft. to 18 ft. in height. It stands head and shoulders above its brethren; and the stout stems being perfectly erect, it appeals to the eye at once by its conspicuousness. The long sheaths are persistent, and very noticeable on the main stems during the first year. The naked portions of the stems are glaucous-green. The branches are densely fascicled at the nodes in a semi-verticillate fashion, after the style of the Himalayan species, and are nearly erect, but after a time assume an arching or drooping habit, though still relatively open. The leaves are 6 in. to 10 in. long, and of a dark green hue, though lighter than those of *A. japonica*. They are long and finger-like. The species has a tropical appearance and should be in every garden. The sheaths are bearded at the apex with gray hairs. It enjoys several synonyms, the native Chinese name being *Naribiradaké*.

A. S. VARIEGATA differs merely in having white edges, and sometimes a few narrow white lines to the leaves.

A. VEITCHI comes from Japan, and has many synonyms, the Japanese names being *Ko-Kumasasa* and *Yakiba-Zasa*. The stems grow 2 ft. to 3 ft. high, and the sheaths covering them are bearded with coarse bristly hairs at the top when young. The leaves are dark green above, glaucous beneath, 4 in. to 6 in. long, and 1½ in. to 2 in. wide. In the young state they are handsome, but in the early part of winter become pale yellow and then brown at the edges, and remain disfigured in this way till they are replaced by those of fresh growth. The summer foliage, however, is handsome.

Of the sixteen species and varieties or forms of *Arundinaria* above described, *A. nitida* easily takes the first position for graceful beauty. *A. Falconeri* and *A. nobilis* would probably rank equally high, provided they retained their leaves throughout the winter. All things considered, *A. japonica*, *A. Simoni* and *A. Hindsii* follow very closely in order of merit, and together with *A. nitida* constitute the princes of the tall-growing and hardy species belonging to the genus. Of the dwarfer growing forms of *Arundinaria*, *A. Hindsii graminea*, *A. Fortunei*, *A. auricoma* and *A. macrosperma tecta* are the best.

(To be continued.)

SOCIETIES.

GLASGOW AND WEST OF SCOTLAND

PANSY.—July 6th.

THE annual exhibition in connection with this society was held in the Trades Hall, Glasgow, on the 6th inst. The entries were numerous and the quality of the blooms was excellent. Indeed, this season's show is said to be the best the society has ever had.

Messrs. Dobbie & Co., Rothesay, set up a fine exhibit of *Violas*, Sweet Peas, *Delphiniums*, *Fuchsias*, *Pelargoniums*, etc. Mr. H. Dickson, Belmont, Belfast, sent a fine exhibit of *Roses*.

In the competition open to nurserymen, Mr. J. Smellie, Pansy Gardens, Busby, carried off first for forty-eight fancy Pansies, distinct, having a very bright even lot, his best blooms being seedling *Miss Neil*, Wm. Brownlie, *Maggie McPhail*, Lord Sallsbury, and Mrs. Wm. Steele. Mr. M. Campbell, Blantyre, was a good second, his best flowers being *John Jackson* (fine) *John Sweeney*, and *John Menzies*. Messrs. A. Lister & Son, Rothesay, were third. They also won for twenty-four show Pansies open to nurseryman, followed by Mr. M. Campbell and Mr. Arthur Brown in the order named. Mr. J. Smellie won for twenty-four sprays of *Violas* open to nurserymen. He showed nice bunches of *Maud*, *Butterfly*, *Nellie*, *Dorothy*, and *Ulida*. Messrs. Lister & Son were a close second, showing fine bunches of *Sydney Masters*, *Jessie Pretswell*, *Princess Ida*, and *Alex. Renton*. Mr. A. Brown, Blantyre, was third.

Mr. Chas. Kay, Gargunnoch, was first for twenty-four show Pansies, open to all, followed by Messrs. Lister & Son, and Mr. M. Campbell, in this order. Mr. Kay also won for twenty-four Fancies, open to all. In this stand were some new Pansies of great merit, including *Kathleen Stirling*, *D. Airdrie*, *Sir John Watson*, *Robt. White*, and *Provost White*. Mr. J. Smellie and Messrs. Lister & Son were second and third respectively.

In the class for twenty-four Fancies, open to gardeners and amateurs, Mr. R. Dunsmure, Avon-bridge, won the first award and Championship Gold Medal. He had very fine blooms of *Mrs. W. L. Fraser* (the best bloom in the show), *Lord Dunraven*, *Col. Buchanan*, *Mrs. R. G. Moir*, and *Robt. Callan*. Mr. And. W. Frater, Llnlithgow, was second; and Mr. Geo. Kidd, Kilbarchan, third.

Mr. Campbell won for twelve sprays of *Violas*. This stand was also awarded the Championship Gold Medal; it included bunches of *Princess Ida* (the best self *Viola* in the show), *Sissy Mellows*, *Dorothy Stokes*, *Butterfly*, *A. J. Rowberry*, and *Liz. Barron*. Messrs. Lister & Son and Mr. J. Smellie were second and third in the order named.

Mr. J. C. Erskine, Bridge of Weir, had the best spray of a *Viola* in the show. This is a seedling of splendid substance, and great size. It is a sort of mahogany ground colour, striped with purple and crimson. This variety also won for the best seedling and best striped variety. It is named after the exhibitor.

Mr. Parlane, Helensburgh, won for twenty-four *Roses*, beating Messrs. Robertson & Co., Helensburgh, and Mr. H. Dickson, Belfast, in the order mentioned. Mr. J. Stewart, Lennoxton, was first with twelve fine bunches of herbaceous plants. Rev. R. Munro, Old Kilpatrick, was second. The following were also prize winners:—Messrs. W. Wilson, Kirkintilloch; T. Hunter, Carlisle; T. Grossart, Carlisle; A. Warnock, Carmunock; J. Fleming, Carmunock; J. A. Renton, W. Buchanan, Torrance; A. Gilchrist, C. W. Frame, Kirkliston; P. Braithwaite, D. Gourlay, Bishopbriggs; P. Carmichael, J. Marshall, Rutherglen; J. Maxwell, Newtown; Sam Caig, Stirling; Jas. Paul, Killearn; Jas. Smellie, Jas. Johnson, J. McLaughlin, R. Stewart, Lenzie; R. Lyon, Blantyre; A. Watson, Bearsden; and P. Robertson, Pollockshaws.—*Visitor*.

HANLEY FETE, July 6th and 7th.

THE second annual County Boro' of Hanley Fête opened on Wednesday morning. To say that the veritable floral feast provided was an agreeable surprise as a record of a second year's show is but faintly to convey the impression created upon the mind of the visitor.

Hanley Park is situated on an eminence on the south side of the town, is furnished with all the attributes of a modern public park, is well watered,

and has, withal, plenty of space and freedom under no ordinary climatic conditions, which our readers will readily realise from the fact that this is the centre of the pottery district. Mr. Joseph Kent, the talented curator, has succeeded in placing the park among the very first in the kingdom.

Not only is the laying out of the park itself unique, the conditions of the surrounding neighbourhood having been studied, but the winter garden, pavilion and conservatories are well filled, and their interiors give evidence of management by a master-hand.

To Mr. Kent's initiative and personal energies as secretary of the Horticultural Section the present success of the show is undoubtedly due, but the able co-operation of his colleague, Mr. J. B. Barrow, Assistant Town Clerk of Hanley, who undertakes the duties of general secretary, is also a fact worthy of record. The opening ceremony was gracefully performed by Mrs. Jas. Meaken, of Darlastone Hall, Stone, who was introduced by the Mayor of Hanley (M. Tunnicliffe, Esq.). A pretty feature was the presentation of a bouquet to Mrs. Meaken by Master Ernest Tunnicliffe.

The size of the show and the number of exhibits rendered the judges' duties very onerous. The gentlemen chosen to adjudicate were Mr. W. J. Grant, Bassaleg, Monmouth; Mr. Cranston, Hereford; Mr. Owen Thomas, Frogmore; Mr. Barnes, gardener to the Duke of Westminster, Eaton Hall, Cheshire; Mr. Speed, gardener to Lord Penrhyn, Penrhyn Castle; Mr. Gilman, gardener to the Earl of Shrewsbury; Mr. Peter Blair, Trentham Gardens; Mr. J. H. Goodacre, Elvaston Castle Gardens; Mr. Bolas, gardener to Mr. Chandos Pole-Gell; and Mr. A. Outram.

OPEN CLASSES.

PLANTS.—A great deal of interest centred around the large marquee where the various groups of plants were staged. Substantial prizes had been offered by the committee, and thus a keen competition was assured. The prizes in the class for a group of plants arranged for effect, and occupying not more than 300 sq. ft., alone exceeded £64. Here Mr. J. Cypher, of Cheltenham, scored a great success. Mr. Peter Blair, gardener to the Duke of Sutherland, Trentham Hall, was second, and Messrs. Jenkinson & Sons, Newcastle, Staffs., were third. For the 100 ft. group of Orchids, Mr. W. Stevens, gardener to W. Thompson, Esq., Walton Grange, was first, and Mr. J. Cypher, second. The last-named exhibitor was first in the classes for six flowering plants, and six Palms, whilst Mr. Peter Blair led for eight exotic Orchids, distinct, and twelve table plants.

Roses were exceedingly well shown. Messrs. A. Dickson & Son, Newtownards, Ireland, scored a great success for the forty-eight blooms, distinct. Messrs. Harkness & Sons, Bedale, Yorks, were second; and Messrs. D. Prior & Sons, Colchester, third. The best exhibit of three blooms each of thirty-six varieties came from Messrs. Harkness & Sons, with Messrs. Dickson, Ltd., Chester, as second, and D. Prior & Sons, third. Messrs. A. Dickson & Son led for twenty-four blooms, distinct, and Messrs. D. Prior & Sons for twelve Teas. The first prize for a decorative exhibit of Roses covering a table space of 12 ft. by 5 ft., was won by Mr. S. Lake, Stoke-on-Trent, Mr. W. Vause, Leamington being second.

FLORAL DEVICES AND TABLES.—Messrs. Perkins & Sons, of Coventry, are known the county over for their remarkable skill in the execution of bouquets, wreaths, sprays, and other creations of the decorative florist. On this occasion they well sustained their reputation, chief honours falling to them for a hand bouquet, a ball and bridal bouquet, and a basket of flowers. Messrs. Jenkinson & Sons were also very successful, for they won the first award for the 8 ft. by 4 ft. table of flowers; also firsts in each of the two classes for a bouquet of Sweet Peas. Mr. R. Cock, Stafford, sent the best collection of twelve varieties of Sweet Peas.

FRUIT AND VEGETABLES.—Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, staged the leading collection of six dishes of fruit. Mr. Goodacre won other firsts for two bunches of black Grapes, one green-fleshed Melon, and a dish of Strawberries. Mr. R. P. Richardson, of Chester, scored for two bunches of Black Hamburgh Grapes. Mr. T. S. Bolton, Oakamoor, led for two bunches of white Muscats, and for two bunches of any other white Grapes. Mr. P. Blair staged the best dish of six Nectarines; and Mr. T. Bannerman,

gardener to Lord Bagot, Blithfield Hall, Rugeley, the premier dish of Peaches.

Lady Guest sent the premier collection of nine kinds of vegetables, and also won in the classes for three Cauliflowers, six Carrots, and twelve Onions. Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, was first for twelve Tomatos.

GARDENERS' AND AMATEURS' CLASSES.

PLANTS.—Mr. B. Howson, Newcastle, won for six Orchids. Mr. J. F. Maddock staged the winning group of miscellaneous plants in the prescribed area of 100 sq. ft.; Mr. Howson being second in this class. Mr. J. F. Maddock was likewise first for six stove or greenhouse plants and six Caladiums. In another class for six stove and greenhouse plants Mr. J. McKnight, of Oakamoor, was first. The same exhibitor carried off the premier honours for six exotic Ferns and six tuberous Begonias.

MISCELLANEOUS EXHIBITS.

These were present in considerable force, and it must have been highly gratifying to the committee to see how well the trade and private growers supported the exhibition.

Messrs. Jas. Carter & Co., High Holborn, received a large gold medal for a very handsome Floral Temple which made a grand centre to tent No. 1. Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, sent a fine lot of Orchids. Mr. F. Walton, of Birmingham, showed Cacti, in the cultivation of which he takes so prominent a part. Mr. R. W. Sydenham, of Tamworth, contributed Violas. Messrs. Sander & Co., of St. Albans, sent new plants amongst which *Acalypha Sanderi* was the most noticeable. Messrs. Webb & Son, of Stourbridge, and Mr. Henry Eckford, of Wem, Shropshire, both had grand collections of Sweet Peas, whilst Mr. Eckford had another stand of new varieties that was especially noteworthy. The Ichthemic Guano Company, of Ipswich, had an imposing stand of plants to illustrate the merits and qualities of Ichthemic. Collections of cut flowers were furnished by Messrs. Dickson, of Chester, Jarman & Co., of Chard, and Mr. J. H. White. Messrs. W. & J. Birkenhead, Sale, Manchester, staged a representative collection of rare and choice Ferns. Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., had a splendid array of Caladiums, also Gloxinias and tuberous Begonias in variety. Mr. John Pinches, 3, Crown Street, Crown Buildings, Camberwell, had samples of the Acme Label, and the flower holder (Outram's patent).

CHILDREN'S SHOW.

Not the least interesting section was the "children's show" which the worthy chairman of the society, Mr. Alderman Hammersley, takes under his especial control. No fewer than 800 exhibits were staged, and all from children of the working classes. Last year the exhibits in this section numbered only 300, so that the huge increase should be extremely gratifying to those who, like Mr. Hammersley, take an interest in children. Mr. John Cartledge, of Hanley, and Mr. Goodill, gardener to T. W. Harrison, Esq., were the judges for the children's exhibits.

MANCHESTER ROSE SHOW.—July 9th.

THIS annual fixture was held on the 9th inst., under the auspices of the Royal Botanical and Horticultural Society of Manchester, in their charming gardens at Old Trafford. The flowers were staged down the centre of the large show house, giving ample room for the arrangement of the blooms and for the large number of visitors who thronged the building and grounds throughout the afternoon. The exhibits, especially those of the open classes, were of considerable merit—a distinct improvement on those staged at the National. In fact, the show was considered by some of the exhibitors as the finest yet held this season. Nearly all the leading growers were present, and in some classes the judges had considerable difficulty in making their awards.

NURSERYMEN.

For sixty distinct single trusses six lots were staged, and all good. Mr. B. R. Cant, Colchester, succeeded in securing the premier award with many flowers of high excellence, the chief being White Lady, Helen Keller, La France, Gustave Piganeau, Caroline Testout, Marquis Litta, Mrs. John Laing, Ulrich Brunner, Mrs. Delville, Maman Cochet, Prince Arthur, Mrs. W. J. Grant, Souv. d'Elise Vardon (beautiful), Xavier Olibo, Golden Gate,

Comtesse de Nadaillac, Horace Vernet (fine form), Catherine Mermet, Mad. Gab. Luizet, Jas. Cocker (seedling), A. K. Williams, Le Havre, Mgr. Boudet, Countess of Roseberry, Bridesmaid, &c. Messrs. Harkness & Sons, Bedale, were second; Messrs. F. Cant & Co., Colchester, taking the remaining prize.

For thirty-six distinct single trusses Messrs. Harkness took the lead out of nine lots, Comte de Ludre, Suz. M. Rodocanachi, and Helen Keller being fine. Messrs. D. Prior & Son, Colchester, and Messrs. F. Cant & Co., followed in this order.

For twenty-four Teas or Noisettes, single trusses, Mr. G. Prince, Oxford, won out of seven lots with a fine stand including Innocente Pirola, Mme. Cusin, Mad. de Watteville, Bridesmaid, Maman Cochet, Cleopatra, &c.; Messrs. F. Cant & Co., and D. Prior & Son, were second and third. For twelve Teas or Noisettes, Mr. Prince was again to the fore.

For twelve trusses of any yellow, Mr. Prince scored with Comtesse de Nadaillac; Messrs. A. Dickson & Sons, Newtownards, and Mr. J. Matlock, Oxford, being placed as named. For twelve trusses of any light coloured Rose, Messrs. Harkness & Sons, with a grand box of Mrs. W. J. Grant, were to the front; Messrs. Townsend & Sons, Worcester, and Mr. G. Prince, being second and third respectively. For twelve crimson Roses, Mr. B. R. Cant took the lead in ten lots, with Ulrich Brunner, Messrs. F. Cant & Co., and Harkness & Sons, taking the remaining prizes.

AMATEURS.

For twenty-four distinct single trusses Mr. E. B. Lindsell, Hitchin, was accorded the place of honour, staging good Horace Vernet, Beauty of Waltham, Mrs. S. Crawford, Victor Hugo, Mrs. J. Laing, Dupuy Jamain, &c. The Rev. J. H. Pemberton was second, and Mr. S. P. Budd, third.

For twelve distinct trusses out of eight boxes, the Rev. J. H. Pemberton and Mr. E. B. Lindsell were placed equal first, and Mr. Budd, third.

For eighteen Teas or Noisettes Mr. Budd staged a good lot. The Rev. W. H. Jackson, Bedford, was second, and the Rev. J. H. Pemberton, third. For twelve varieties Messrs. E. B. Lindsell and Budd and the Rev. W. H. Jackson were the prize takers.

For twelve "yellows" the Rev. W. H. Jackson won with Madme. Hoste, Mr. Budd being second with Maréchal Niel.

For a dozen light varieties the Rev. J. H. Pemberton led the way with a splendid box of Mrs. J. Grant, Mr. Lindsell following with Mrs. J. Laing.

For twelve "crimson" Mr. N. T. Carrill-Worsley, Rusholme, won with Marie Baumann. Mr. Lindsell was second with Ulrich Brunner, and Mr. Budd third with Alfred Colomb.

In the district classes Mr. T. S. Jackson, Ashley, staged the best twenty-four, Mr. C. Burgers, Flumbley, the best twelve, and six, distinct, and the best six Teas, other prize takers being Messrs. R. Foster, James Brown, G. Morris Midwood, and N. T. Carrill-Worsley.

MISCELLANEOUS ROSES.

For the best twelve bunches suitable for buttonholes Mr. J. Matlock won with some charming varieties.

For a display to be arranged on a space 6 ft. by 3 ft. Mr. G. Prince scored with a tastefully arranged lot. Mr. Matlock was second. For the basket of Roses Mr. Townsend took the lead. For three bouquets Miss Lord, Ashton-on-Mersey, secured first honours; and Messrs. Harkness & Sons second. Miss Lord also won in the amateurs' class.

Messrs. F. Cant & Co. won the Silver Medal for the best H.P. with a massive, well-formed Star of Waltham. Messrs. D. Prior & Co. took a similar position for Teas and Noisettes with a splendid Maman Cochet.

The Gold Medal of the society was awarded to Messrs. William Paul & Sons, Waltham Cross, for a magnificent bank of cut blooms in a large number of varieties covering over a 100 sq. ft. of space, which were greatly admired by the visitors. A Certificate of Merit was awarded to this firm for Waltham Standard, a variety of considerable promise.

Messrs. A. Dickson & Son, Newtownards, staged a unique box of single varieties, raised by them, and all named after their country. Irish Beauty, a large, pure white, and Irish Eloquence, of good substance, the inner side of the petal a pleasing rosy-pink, the reverse being of a deeper shade were singled out by the judges for Certificates of Merit.

The arrangements were ably carried out by Mr. P. Weathers, the genial curator, and his capable

staff, the exhibitors speaking in high terms of the courtesy that was shown them.

The gardens themselves are looking well, and in two or three weeks when the bedding is a little more advanced, should be the means of drawing large crowds of lovers of floriculture.—R. G. W., Woolton.

ROYAL HORTICULTURAL.—July 12th.

THE Drill Hall presented a somewhat unusual appearance on Tuesday last owing to the presence of so many Roses, which occupied three of the long tables. Orchids, Lilies, Sweet Peas, Carnations, Ferns, fruit and vegetables were also prominent.

A large and very showy group of *Cattleya gigas* was exhibited by J. W. Temple, Esq. (gardener, Mr. E. Bristow), Leyswood, Groomsbridge. There was a considerable range of colour amongst the flowers, from pale to very dark colours, particularly in the case of the lip, which, in many instances, was crimson-purple. The spikes carried three or four flowers each. (Silver Flora Medal.)

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, exhibited *Cattleya gaskelliana alba*, *C. g. delicata*, *Dendrobium dahousieanum giganteum*, *Bulbophyllum Dearei*, *Cypripedium Alice* and *C. T. W. Bond*.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, received a Cultural Commendation for a plant of the hybrid *Vanda Miss Joaquim*, a hybrid between *V. teres* and *V. hookerianum*. He also exhibited *Oncidium alb-verrucosum*. Sir F. Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen, sent flowers of *Cattleya Warscewiczii rothschildianum*. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham, exhibited a variety of *Odontoglossum crispum*. Mr. Wm. Bull, 536, King's Road, Chelsea, exhibited *Oncidium macranthum chelseiense*. A Cultural Commendation and a Silver Banksian Medal were awarded to Herbert Hicks, Esq. (gardener, Mr. James Machar), Branwoods, Great Baddow, Chelmsford, for a large piece of *Dendrobium Dearei* having four old leafless stems and four young leafy ones, all carrying fine spikes of bloom. The stems were 3 ft. long, and two of the young ones bore three spikes each of flowers of large size. There were twelve spikes of bloom on the plant and everybody acquainted with Orchids was astounded at the evidence of cultivation displayed in this specimen.

The Ferns sent by Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, were on this occasion all *Aspleniums*. Upwards of sixty-five species and varieties were staged, and these formed a very representative display of the members of this important genus. Four fine plants of *A. caudatum* suspended above the group on stands, were specially noteworthy, whilst *A. nidus musaeifolia*, *A. praemorsum*, the golden *A. divaricatum*, *A. ornatum*, the distinct and somewhat intractable *A. marginatum*, *A. nobilis*, *A. Neo-Caldeonicum*, *A. Mayii* and *A. erectum* were all exceedingly good. Every plant shown was in perfect health. (Silver-Gilt Banksian Medal.)

An imposing group of Ferns was also forthcoming from Messrs. J. Hill & Son, Lower Edmonton. The plants shown were chiefly market Ferns. *Pteris tremula smithiana*, *Nephrolepis rufescens tripinnatifida* and others were represented by fine specimens. Baskets of young, highly coloured plants of *Adiantum scutum roseum* and *A. macrophyllum* were other prominent features. (Silver Banksian Medal.)

On the left hand side of the entrance, just inside, a semi-circular group of superb Malmaison Carnations was set up on the floor of the hall by Mr. C. Blick, gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent. The flowers were veritable giants in point of size, whilst the colours were also good, and the plants in first-rate condition. Mrs. Martin Smith, King Oscar, Lord Welby, and Mrs. Trelawny were some of the finest varieties shown. An edging of Maidenhair Fern imparted a finish to the group. (Silver-Gilt Banksian Medal.)

On the opposite side of the doorway, and also upon the floor was another excellent exhibit of Malmaisons from Mr. Thos. H. Young, gardener to Daniel Cooper, Esq., Warren Tower, Newmarket. (Silver Flora Medal.)

Messrs. Barr & Son, Covent Garden, had a most interesting exhibit of cut flowers of Japanese Irises (*I. laevigata*). There were about sixty distinct varieties shown, of which Tosa, Chiyo, Yamagata, Ada, Yeza, Akubo and Keiki were a few of the most

noteworthy. Three spikes of the lovely yellow *Eremurus Bungei* were likewise on view, and were certainly the best flowers we have yet seen of this grand form. (Silver Banksian Medal.)

Messrs. Carter & Co., High Holborn, made a brave display of cut Delphiniums and Sweet Peas. Many leading varieties of the latter charming flower were shown, the blooms being set up in ornamental china bowls, surfaced with moss. (Silver Banksian Medal.)

Mr. Jas. Douglas, Edenside, Great Bookham, sent a group of flowers of new border Carnations, amongst which were some real gems.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, staged a splendid group of cut flowers of annuals and biennials in competition for the Sherwood Cup. Campanulas, Poppies, Sweet Peas, and Rhodanthes were specially bright, and great taste was evinced in their arrangement. The Chelsea firm also showed *Cytisus nigricans*, and the charming pink *Richardia Rehmanni*.

There were several exhibits of Sweet Peas, and these in themselves contained much that was worthy of note. Messrs. H. Cannell & Sons, Swanley, Kent, had seventy-two bunches in as many varieties, and all good flowers. The samples of Her Majesty, New Countess, Prince Edward of York, Princess Victoria, Venus, Brilliant, Primrose, and Emily Eckford were particularly praiseworthy. A groundwork of common Bracken served as a foil for the bright hues of the Peas, and in the background a row of bunches of the elegant *Stipa pennata* added a finish to the whole. (Silver Banksian Medal.)

About fifty bunches of Sweet Peas in as many varieties were sent by Mr. F. G. Foster, Brockhampton Nurseries, Havant, Hants. Meteor, Monarch, Little Dorrit, Golden Gate, Aurora, Queen Victoria, and Countess of Radnor were some of the best sorts. The bunches of flower were prettily interspersed with Ferns. (Silver Flora Medal.)

Mr. Henry Eckford, of Wem, Shropshire, sent fifty bunches of the same lovely flower, which he has done so much to improve. The new sorts for 1898 comprised Duchess of Westminster, Lady Skelmersdale and Fascination, three grand forms. Others were Prince of Wales, Lady Beaconsfield, Lottie Eckford, Blanche Burpee, and Countess of Powis. Every bloom shown was up to a very high standard of merit. (Silver Banksian Medal.)

Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, sent a select lot of cut Lilliums, amongst which *L. szovitzianum*, *L. canadense*, *L. dalmaticum* and *L. umbellatum Cloth of Gold* were particularly good. (Bronze Banksian Medal.)

A handsome plant of *Picea pungens glauca pendula* was sent by Messrs. Koster & Co., Boskoop, Holland. N. N. Sherwood, Esq., Dunedin, Streatham Hill, had new dwarf varieties of Sweet Pea Cupid.

At a meeting of the fruit and vegetable committee a Silver Knightian Medal was voted to Messrs. Jas. Veitch & Sons, Ltd., for a splendid display of Cherries and Strawberries. The former were represented both by trays of fruit and bearing trees in pots. Of Cherries there were about thirty varieties shown, of which May Duke, Bigarreau de Schrecken, Frogmore Early Bigarreau, and Elton were of the best. Strawberries were represented by a number of trays of grand fruit, especially of The Countess, Waterloos and British Queen. The new Veitch's Prolific was likewise well shown. Plants and fruiting sprays of this variety were also on view to illustrate its amazing fertility.

A Silver-Gilt Knightian Medal was awarded to Mr. Owen Thomas, gardener to Her Majesty the Queen, Frogmore, for a superb collection of fruit which comprised Strawberries, Cherries, Melons, Peaches, and Nectarines in great variety and all of magnificent quality.

Messrs. Laxton Bros., Bedford, showed trays of Strawberries Laxton Leader, and a seedling, a cross between Royal Sovereign and Commander. A dish of fruits of Peach Royal Charlotte was sent by Sir Trevor Lawrence (gardener, Mr. Bain), Burford Lodge, Dorking. A Bronze Banksian Medal went to Mr. G. Lane, gardener to Miss Ridge, Highfield, Staines, for six fine bunches of Black Hamburgh Grapes.

Messrs. H. Cannell & Sons sent a number of dishes of capital Peas.

A Silver Banksian Medal was awarded to Messrs. J. Carter & Co. for a representative collection of

Peas, upwards of fifty varieties being displayed. The quality throughout was first class.

SPECIAL ROSE SHOW.

The deferment of the Rose Show for a fortnight later than was primarily projected was attended with complete success, for the display of Roses was capital all round, considering the weather. Perhaps the most prominent feature was the conspicuous success of the variety Mrs. John Laing, as a perusal of the following prize list will show.

MIXED VARIETIES.—There were twelve entries for eighteen single trusses, distinct, open to amateurs only. Here O. G. Orpen, Esq., Hillside, Wes Bergholt, Colchester, staged the winning stand. His blooms of Mrs. John Laing, Maman Cochet, Gustave Piganeau, Ulrich Brunner, Mrs. W. J. Grant, Madame Hoste, Cleopatra, and Sharman Crawford were superb. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, was second, also with a capital lot, and G. J. Grahame, Esq., Wrydelands, Leatherhead, third.

In the open class for eighteen trusses, distinct, there were seven entries. Here Messrs. D. Prior & Son, Myland Nurseries, Colchester, led with a splendid stand. Horace Vernet, Suzanne Marie Rhodocanachi, Helen Keller, Maman Cochet, Marchioness of Londonderry, Mrs. W. J. Grant and Mrs. J. Laing were the strongest blooms. Messrs. Frank Cant & Co., Braiswick Nursery, Colchester, were second; and Messrs. Paul & Son, The Old Nurseries, Cheshunt, were third.

Five entries were staged for the twelve. Here E. Mawley, Esq., Rosebank, Berkhamstead, won chief honours. Suzanne Marie Rhodocanachi, Beauty of Waltham, and Ulrich Brunner were his best blooms. Alfred Tate, Esq., Downside, Leatherhead, was second; and the Rev. A. Foster-Melliard, Sproughton Rectory, Ipswich, third.

G. W. Cook, Esq., The Briers, North Finchley, won first award for the six blooms, J. T. Thompson, Esq., The Laurels, Oak Lane, Bound's Green, being second.

For nine blooms of any H.T. or H.P. variety Mr. C. J. Salter came to the front with Mrs. John Laing. C. J. Grahame, Esq., was second with the same variety; and O. G. Orpen, Esq., third, with Kaiserin Augusta Victoria. This was a popular class, for there were eight entries, in no fewer than five instances Mrs. John Laing being the favoured variety.

There were seventeen stands of six blooms each of one variety, Mrs. John Laing appearing on eight of them, including the three winning stands. G. W. Cook, Esq., was first; Alfred Tate, Esq., second; and G. M. B. Thune, Esq., Denne Park, Horsham, third.

TEAS AND NOISETTES.—In the amateurs' class for eighteen blooms in twelve varieties, O. G. Orpen, Esq., led with a stand of lovely flowers, amongst which the samples of Maman Cochet, Cleopatra, Mme. Cusin, Bridesmaid, Caroline Kuster, and Comtesse de Nadaillac were well nigh perfect. E. M. Bethune, Esq., was second, and the Rev. Foster-Melliard, third.

Three stands competed in the open class for a similar quantity of material, Messrs. D. Prior & Son taking the lead. Mme. Hoste, Bridesmaid, Innocente irola, and Mme. de Watteville were the premier samples. Mr. Geo. Prince, of Oxford, was second, and Messrs. Paul & Son were third.

The Rev. W. H. Jackson, Stagsden Vicarage, Bedford, had the best twelve trusses, J. T. Strange, Esq., Aldermaston, Reading, being second. For six trusses in four varieties Miss B. H. Langton, Raymead, Hendon, was first, R. W. Bowyer, Esq., Haileybury College, Hertford, second; and J. T. Thompson, Esq., third.

O. G. Orpen, Esq., had the winning stand of nine trusses of one variety, showing Souvenir de S. A. Prince. C. J. Grahame, Esq., was second with Mme. de Watteville, and the Rev. W. H. Jackson, third, with Mme. Hoste.

The premier stand of six blooms of one variety came from E. M. Bethune, Esq., who had capital samples of The Bride. The Rev. A. Foster-Melliard was second with Souvenir d'Elise Vardon and F. W. Flight, Esq., Cornstiles, Twyford, third with Maman Cochet.

The competitive classes were admirably supplemented by miscellaneous groups of Roses. From Messrs. Wm. Paul & Son, Waltham Cross, came a magnificent lot of bloom, both cut and on the

plants, for which a Silver Banksian Medal was awarded.

Mr. Will Taylor, Hampton, Middlesex, sent two dozen grand trusses of the variety Mrs. John Laing.

A Silver Banksian Medal went to Mr. Joseph Pitt, gardener to F. W. Campion, Esq., Colley Manor, Reigate, for twenty-four bunches of garden Roses. Crimson Ramhler, Dundee Ramhler, L'Idéal and Longworth Ramhler were some of the most meritorious forms.

A Silver Flora Medal went to Mr. Chas. Turner, of Slough, for three dozen large bunches of garden Roses, all of which were in splendid condition.

Messrs. Paul & Son, of Cheshunt, received a Silver Banksian Medal for a group of similar material, a very showy and meritorious exhibit.

Facing the doorway, Messrs. F. Cant & Co. staged a splendid array of garden Roses, for which a Silver Banksian Medal was voted. The flowers here were exceptionally bright and good.

The exhibit of hybrid Sweet Briars and garden Roses from Mr. Geo. Baskell, gardener to Lord Penzance, Eashing Park, Godalming, was highly meritorious, a number of fine forms being included. (Silver Flora Medal.)

GARDENING MISCELLANY.

JUGLANS REGIA LACINATA.

We have in this a combination of the useful and ornamental, which, singularly enough, too often escapes notice, or it would more frequently be planted by those engaged in landscape gardening. Among the many varieties of trees with lacinated foliage, in my opinion this stands first, and merits a conspicuous position on any well kept lawn. At the same time it comes well into a fruitful condition in a comparatively young state. The nuts are of fair average size and are freely produced.—W. B. G.

LYCHNIS VISCARIA SPLENDENS.

This pretty Lychnis is not so much grown as it deserves to be. Coming as it does before the Pink and Carnation families, its fine spikes of rosy-pink flowers are very acceptable. Whether in the border or cut it is always much admired. It is also very hardy and easily propagated. This species has not the fault of many of the other species of this family whose shoots all run to flower. It blooms freely but there is always more "grass" than flower stems. Unless a very large stock is wanted the best way to increase it is to divide the rootstock after the flowering has finished. But if a large stock is wanted cuttings may be taken and treated in the same manner as Pinks.—Scotch Grower.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Taking the Buds of Chrysanthemums—Buds: The varieties you mention, namely, G. J. Warren, Mrs. Hume Long, Royal Sovereign, W. H. Lincoln, Van den Heede and Duke of York are too early if showing the bud at present. You cannot, therefore, get the first crown bud, but you can secure the second crowns by simply pinching out those showing now. Do not cut back the tops, but merely pick out the buds carefully. They will show the buds again about the third or fourth week in August, and will then be in good time. Van den Heede and Duke of York being naturally rather late varieties, it will be necessary to place them in a sheltered and warm or sunny place so as to bring them on more rapidly than they otherwise would, and ripen or harden up their growths. Other varieties showing their buds may be treated in the same way. Make notes of all that you do, and the general character of the weather as to heat or cold, and you will be better able to regulate and guide your work accordingly in timing the buds next year. The buds, we may say, should have been removed about ten days ago or thereby, and we think you would have hit the time exactly for your part of the country.

Names of Plants.—D. W. D.: 1, Geranium ibericum; 2, Aster sp., send when in flower; 3, Tradescantia virginica alba; 4, Hemerocallis flava; 5,

Ranunculus acris flore pleno; 6, Spiraea Ulmaria variegata; 7, Lilium Martagon; 8, Veronica Teucrium; 9, Achillea Eupatorium; 10, Funkia Sieboldi; 11, Helianthus rigidus, apparently, but send when in bloom; 12, Chrysanthemum maximum; 13, Campanula grandis; 14, Veronica sp., send when in flower; 15, Campanula glomerata; 16, Centranthus ruher; 17, Iris sp. (the flowers had gone to pulp); 18, Alstroemeria aurantiaca; 19, Lilium umbellatum; 20, Papaver orientale bracteatum; 21, Eryngium alpinum; 22, Centaurea montana.—R. M.: 1, Retinospora plumosa aurea; 2, Libocedrus decurrens; 3, Fagus sylvatica cuprea; 4, Choisya ternata; 5, Spiraea Douglasii.—W. J.: 1, Oncidium pulvinatum; 2, Odontoglossum Hallii; 3, Cattleya Mendelii var.; 3, Utricularia montana.—A. R.: 1, Miscanthus japonicus variegatus, generally known in gardens under the name of Eulalia.

Centipedes in Hyacinths and Tulip Bulbs.—H. Marsh: These may not be entirely blameworthy in the matter. There are often decaying scales and other vegetable matter about resting bulbs; but very often slugs get at them and bore holes into the interior. Wireworms may be guilty of the same thing, and encouraged by these means the centipedes take up their abode in the cavities where they eat the decaying matter and hasten further decay. Lift the bulbs and lay them in a dry, shady place to thoroughly ripen off. After they are dry the centipedes will give them no further trouble.

Primula japonica.—R. W.: Wait till the seeds are thoroughly ripe, but no longer. Gather and sow them at once when that happens, and you will get any quantity of seedlings next spring. You need not look for them sooner; but if you keep them dry till next spring before sowing you need not look for them at all, as they seldom, if ever, come up when so treated. Sow in a cool, shady, border in the open, or in boxes of soil, which you must keep continually moist, and sheltered during winter in a cold frame. Seeds gathered from red or crimson-flowered plants will give rise to seedlings of the same colours; but seeds from the white variety will give seedlings with white flowers, some pink ones and probably a few red or crimson ones.

Caterpillar on Morello Cherry.—John Duff: The specimen you sent was a very fine one; and is the caterpillar of one of the Geometers or Loopers, so named from their peculiar method of walking. Having only six true legs in front and four behind, that is, ten in all, it can only walk by looping up its long, legless back and then draw in its hind quarters. It closely corresponds to the description of the Oak Beauty (Amphidasis prodromaria), which we think it is. It is the finest imitation of a half-ripened twig we have seen. The larva feeds on various trees. You ask if it is very destructive, to which we answer in the affirmative, for it can gnaw the leaves into narrow strips, without wasting a morsel, and that, too, as fast as you could clip a leaf with a pair of scissors. We do not think, however, it will cause you much trouble unless more numerous than we should suspect. The caterpillar feeds during June, July and August, but is so large that you could look over your trees and pick off every specimen in a very short time if you have sharp eyes. When resting it will cling by its two hind feet and the two claspers at the tail, while the head and body are projecting into the air like a leafless twig. You should set about finding all of them at once before further damage is done.

Green Fly on Celery.—Subscriber:—It is not often that green fly attacks Celery; at least that is our experience. You do not say whether the insects are inside the leaves or outside. We should suspect the former. If the leaves are blistered and brown in places, the Celery Fly is at work. There is a good deal of it this year. In this case you should cut off all the brown portions and burn them so as to destroy the grubs inside. Where the blisters are only small you may pick them off or squeeze them between the finger and thumb. Be sure you burn all that you cut off. Then syringe your plants with tobacco water to prevent the winged or mature flies from laying the r eggs upon the leaves. Trench the ground 2 ft. deep in winter, giving it a good dressing of gas lime to kill the pupae in the soil. If the pest is really green fly you might first syringe the plants with a strong solution of tobacco water (half a pound of tobacco to a gallon of water) with an addition of ¼ lb. of soft soap to make the tobacco juice adhere to the foliage. As a second remedy you might lightly syringe the plants with water, and then dust them with tobacco powder, which may be obtained from the horticultural sundriesman at a very reasonable price. Leave the powder on until it gets washed off with rain, but if the latter comes soon after the application, you may have to repeat the operation of dusting with tobacco powder. One application is usually very effective. It would help us greatly in giving directions if you would send specimens of leaves and the insects attacking them.

1898. **FORBES' CATALOGUE** 1898.
(Over 150 Pages. Nearly 150 Illustrations.)
of Florists' Flowers and Hardy Border Plants
is got up regardless of trouble or expense, with the result that
it is by unanimous consent pronounced the most comprehen-
sive, most accurate, most reliable, most complete and best
extant.
It gives full and accurate descriptions of everything in the
way of Florists' Flowers, also colour, height, time of
flowering, and price of all the best Hardy Border Plants,
together with their English or Common Names, and a mass of
other Valuable Information that cannot be had else-
where.
It is in fact a veritable reference-book, invaluable to all
growers of these plants, and should be in the hands of all
intending purchasers. Free on application.

JOHN FORBES,
Nurseryman, Hawick, Scotland.
ESTABLISHED 1870.

VIOLET Roots. R. W. Hockey, Brid-
port, has been honoured with the distinguished patron-
age of Her Most Gracious Majesty the Queen. Is receiving
orders for Comte de Brazza, Lady Hume Campbell, Marie
Louise, California, Czar, &c. Prices on application.

**A
NEW
SHADING.**

As Cool
as a
Cucumber.

FROSTEEN SHADING.

Heat, but not light proof. Easily
applied. No beating required; no
mess, no trouble; the latest scientific
discovery; beautifies the greenhouse,
inexpensive and won't wash off;
entirely superseding old fashioned
methods and preparations. Can be
ordered through all seedsmen and
florists, or direct from the makers,
price 1s. FROSTEEN AZO must be
used in addition to make it permanent,
price 1s. 6d. Both sent carriage paid
for P.O. 2s. 6d.

of committees at 12, noon.
WEDNESDAY, July 27th.—National Carnation and Picotee
Society's Show at the Crystal Palace.
FRIDAY, July 29th.—Redhill, Reigate and District Carnation
and Picotee Society.

WOBURN EXPERIMENTAL FRUIT FARM.—
Some three or four years ago the
Duke of Bedford established a fruit farm at
Ridgmont, Beds., for the purpose of conduct-
ing experiments, with the view of settling
various questions concerning the cultural
treatment of fruit trees and bushes, which
arise from time to time either in gardens of
large or small extent. The experiments are
superintended by Spencer Pickering, Esq.,
who is managing director, and is assisted
by Mr. Lewis Castle. In response to an
invitation, a party of gardeners and other
experts connected with fruit in some way
or other, visited the Woburn Experimental
Fruit Farm on the 13th inst., and were con-
ducted over the place by Mr. Pickering.

The experiments are of a very varied and
sometimes complicated character, and like-
wise vary in importance, though the points
they are intended to settle are of frequent
occurrence in gardening and fruit culture.
Geologically, Ridgmont is situated on the
oolite formation, not far from the lower
cretaceous, but decidedly on the former. The
surface soil of some depth consists of sub-
stantial loam inclined to clay and well mixed
with sand. It gets very hard and lumpy
during droughty periods, but readily crum-
bles down on the advent of rain, and in
winter assumes a very plastic and adhesive
condition. It is very fertile, however, as the
fruit trees amply testify by the vigorous
growth they make where good tillage is
carried out. This is not accomplished
throughout, however, because the intention
is to demonstrate the results of good and
bad methods of cultivation. The ground
slopes gently towards a brook, which
occasionally overflows its channel and sub-
merges the low lying ground in its vicinity.
This has been going on for centuries
evidently, for the soil in the lower part of
the grounds consists of alluvial silt laid
down by the brook, and even presents a
peaty appearance, being soft and allowing
the feet to sink into it.

We shall here indicate the nature of a

few of the varied experiments we noted in
passing over the grounds with the results
hitherto obtained. Trees of 1, 2, 3, and 4
years of age were planted, and up till now
the 3 year old trees have done best. Rows
of trees were pruned in autumn, others at
mid-winter and some in spring, but little
difference is observable amongst them. Plan-
tations of mixed cropping are under trial,
standard Apples being planted wide apart,
with bush and pyramidal Apples, Pears, and
Plums between the primary rows, and Cur-
rants and Strawberries in the interspaces.
A cottager's plantation was established in
1899, fruit and vegetables being grown
separately in the upper portion, and in
mixture in the lower part of the grounds.
The mixed plantation did better the first
year, which happened to be a dry one, be-
cause the resulting shade prevented evapora-
tion to some extent. Dwarf Apples are
grown on the Paradise stock, and standards
on the Crab. Bramley's Seedling, Cox's
Orange and Stirling Castle are largely used
in these experiments, and it was noted that
the first named, being the most vigorous
grower, took the longest time to become
established after removal, owing apparently
to its influence upon the stock.

A series of experiments were instituted
to prove the advantage or disadvantage of
various methods of pruning. During the
first year or two the leaves were counted,
and the leaf surface actually measured, but
this is now practically impossible, but the
leaves are weighed and the branches
measured in order to determine the amount
of annual growth. Some trees were pruned
when first planted and others not till the
end of the first year. The latter lost in
vigour during the first year, but made up
for it during the second. One row of trees
was pruned when planted, but not pruned
subsequently. Long portions of the
branches are now without either leaves or
spurs, so that this method is inadvisable.
One row has not been cut back at all from
the time of planting till now, with the result
that the branches are long and slender,
being weighted to the ground whenever
they carry a crop of fruit. This is ocular
demonstration that the practice is a bad
one and should not be adopted in garden or
orchard. Another row that has been
pinched in summer like a trained tree,
carries a crop that is making good progress;
but perhaps this may not prove an economi-
cal plan in the long run. A row of trees,
having the shoots shortened in summer but
not further pruned after the fall of the leaf,
has given similar results. Cox's Orange
was the variety used in both cases.

Root pruning has been tested in various
ways, and the results in many cases are
quite obvious. Good growth has been
made by trees root-pruned every third year,
and they are carrying a good crop of fruit.
Growth is not very rampant, however, in
the case of trees upon the Paradise. Trees
that have been root-pruned every year have
made little growth, the trees remaining
small and stunted. Lifting and replanting
trees with a ball of soil, and as little injury
to the roots as possible has given little or
no check. Trees conveyed to a distance
could hardly be placed under so favourable
conditions. Mulching with dry straw has
hitherto given no results even in dry sea-
sons. The whole of the ground was origin-
ally treated alike by being trenched 2½ ft.
deep. After the ground was planted a
broad strip containing a row of trees was
sown down with grass to imitate an orchard.
Another band was trodden very firm but
kept clear of weeds, but this gave no results
over the untrodden. On a third piece the
weeds were allowed to grow, and the results
were thoroughly as bad as when sown down
with grass. The trees in both cases remain

small, stunted, yellow, and of poor but very irregular growth. Mr. Pickering mentioned these two cases as samples of bad practice often pursued by the British farmer. Nothing is worse for the fruit trees than allowing the ground beneath to be covered with grass. The evaporation of moisture from grass-covered land is about four times the amount of that given off by naked soil.

A considerable number of trials have been conducted in the matter of manuring, by using nitrogen, phosphorus and potash, leaving out one or other of the fertilisers in each case. Fruit trees, at least in the young condition, do not seem to respond to manures in the same way as farm crops on the same soil. For instance, one plot received no manure; a second got half the usual quantity; a third got the ordinary amount; a fourth plot had this doubled, and other plots had three or four times the regular amount given them. No results were apparent in either case. At first the manure was scattered upon a circular area round the tree, and the circle is widened annually. When the trees are full sized and cover the ground, manure will be extended over the whole surface. Why there should be no results from the use of manures, either in large or small quantities, is a mystery which the near future may unravel; but in the meantime it would be interesting to determine the reason for this strange behaviour. The ground may contain all the elements of plant food which the trees can utilise at present, but the fact remains to be discovered and demonstrated. Artificial manures were employed in all cases.

Elsewhere some trees were carelessly planted in well prepared ground, and their rate of growth has been good. This is surprising and serves to show the accommodating nature of fruit trees, and their power of recuperating. Some trees were badly planted in unprepared ground, and a few of them are making headway, but very irregularly. In another instance close by, the ground which had been overgrown with weeds has been cleaned and the trees have greatly recovered making good bushes. There is another valuable lesson in this for the careless fruit grower. It shows that a neglected orchard may be renovated simply by improving the method of culture. Experiments were also made with deep and shallow planting. Trees were planted at depths ranging from one to three feet, but there is very little difference between either of the sets now. This may appear to explode a theory held by fruit growers generally; but it may have reference solely to the character of the soil in the matter of natural drainage and fertility.

Other experiments are being conducted near the brook in the lower portion of the grounds. Autumn, winter and spring planting was tried, and the evidence was slightly in favour of the latter, though there was little difference in growth. The Black Currant Mite threatens to destroy the plantations, particularly some of the varieties, in spite of spraying with insecticides. The Common Black Currant is most immune from attack. Lee's Prolific and Carter's Prolific are almost free; but Black Naples gets very much destroyed, and Baldwin's Black is the worst, the bushes being almost killed. No insecticide has yet proved efficacious and practical. A number of screens are placed round trees in one of the quarters to imitate crowding and ascertain the effect of it. Those trees entirely surrounded get drawn up and taller than the others. Some of the screens are open at certain angles to the points of the compass in order to ascertain the most suitable direction for the rows of trees to be planted. Plantations of Strawberries have been treated with different kinds of manure, and

last year the nitrates gave slightly the best return in fruit. The ground thermometer in the lower part of the ground shows that the disadvantage to fruit trees has reference to air drainage rather than moisture, the air being cold and stagnant by comparison with that on the high ground.

Oranges in China.—During the past year 53,614 cwt. of Oranges, valued at £10,218, were exported from Foochow, in China. The fruit trade, in the future, promises to be of some considerable importance.

Harvesting Hay on the Ice.—In one of the States of America there is a shallow lake where the grass, growing in the bottom, projects considerably above the water. During winter, when the lake is frozen over, the farmers find it a profitable occupation to cut the hay and sell it.

Carnation Countess Ferrers is the name given to a new Carnation that has been raised at St. Anne's, Clontarf, Ireland, which promises to be one of the most successful introductions of the season. In size and colour it approaches the popular Souvenir de la Malmaison, but exhibits rather a richer shade of pink. The perfume is both strong and agreeable, and in this respect the variety is far superior to some of the other modern forms.

Mr. James Gibson, who for some years past has given great satisfaction to his employer, E. H. Watts, Esq., Devonhurst, Chiswick, has been appointed head gardener to W. R. Hudson, Esq., Danesfield, Great Marlow, Bucks. The estate runs to 3,000 acres, and since the present proprietor took it over vast improvements have been effected, both on the agricultural portion and in the garden. Admirably furnished bothies have been built for both young and married men; some splendidly fitted glasshouses have been put up, and others are under the course of construction. The place has an ancient reputation, and that will not only be re-established but greatly increased. There is a fertile, walled-in vegetable garden, that will presently be turned to excellent account. We understand that there were between 300 and 400 applications by gardeners for the situation. Mr. Gibson leaves Devonhurst on the most friendly terms with his present employer, whose only regret is the losing of a good gardener. He commences his duties at Danesfield on August 1st next.

Visitors at Woburn Abbey.—After inspecting the Woburn Experimental Fruit Farm at Ridgmont, and partaking of luncheon in a fine building on the farm, the party of inspection on the 13th inst. were driven to Woburn Abbey in two brakes, under the care of Spencer Pickering, Esq. Amongst the visitors were Dr. Masters, Messrs. G. Norman, J. Jennings, Luckhurst, A. F. Barron, S. T. Wright, W. B. Latham, J. Asbee, Cheal, Jun., Udale, J. Fraser and others. Woburn Abbey is a great quadrangle of buildings enclosing a central court, and in these respects reminding us of Hampton Court. The party were broken up into two, and conducted through and round the whole quadrangle of rooms to inspect the pictures, &c. After this the beautiful grounds were inspected. The park is very extensive (three miles by two miles within the walls), and some parts of it are roamed by herds of deer from various parts of the world, including many species of deer and allied genera. There is a fine avenue of Beech, Oak, Elm, Lime, Ash and other trees, about 120 years of age, and now in the full beauty of summer leafage. One grand old Beech measures 110 ft. in height, and possesses 48½ ft. of clear trunk up to the first branch. Near the mansion are magnificent trees of Taxodium distichum, 65 ft. high, in a moist soil overlying blue clay; also Cedrus Libani, C. atlantica and C. a. glauca in healthy condition. Araucarias die after getting into the sand beneath. Huge, globular bushes of the Portugal Laurel were covered with masses of powerfully fragrant flowers. Beds of Heaths on the grass included Erica carnea, E. vagans, varieties of Caluna vulgaris and Daboecia polifolia. The beds in front of the house are planted chiefly with tuberous Begonias. The Duke of Bedford was away from home, but the privileges granted the party were much appreciated.

Grey Coat School, Westminster.—Her Royal Highness the Duchess of York distributed the prizes at this school on the 15th inst. The whole of the floral decorations were admirably carried out by Messrs. John Laing & Sons, of the Forest Hill Nurseries, Forest Hill, London, S.E. They also made the bouquet presented to Her Royal Highness.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held in the Drill Hall, James Street, Westminster, on Tuesday, July 26th, 1 to 5 p.m. Bamboos will be a special feature at this show, and at 3 o'clock Mr. A. B. Freeman-Mitford, C.B., will lecture on the "Economic Uses of Bamboos."

Making Himself Known.—At a recent show in the neighbourhood of the Metropolis, the following was overheard:—A gentleman in neat black cloth, and bright silk hat, patronises the refreshment tent, and draws near to some leading horticulturists sitting in a group. A gracious bow to each by the silk hat, and a word of expostulation. "Yes; I have certainly been overlooked. My merits have not been appreciated as they deserve. I quite think it time I advertised myself. Then probably I should become better known." Addressing each: "What paper would you suggest?" No. 1, replied, "The 'Referee.'" No. 2 advised "Pick-me-up." No. 3 recommended "A Society Journal." Roars of laughter. "Thank you gentlemen. Yes—Pick-me-up—Yes—that shall be the one. Good day." This is a fact.—Snaggs.

Victoria regia at Regent's Park.—The great Water Lily of South America has developed wonderfully fine proportions in the gardens of the Royal Botanic Society this year, several of the leaves measuring 5 ft. 9 in. to 6 ft. inside the very deep and upturned rim. The plant has been flowering for some time, and the other day three flowers in various stages of development were calling for attention from visitors. The oldest was in its second day of expansion, the petals being all reflexed and showing a remarkably dark colour. All the petals were of a deep rose, some of the smaller ones in the centre being tinted with crimson. The rose flowers and the deep rim of the leaves would indicate a distinct variety. A second flower was white, being in its first day of expansion. A third bud, rising well out of the water, had its sepals slightly parted, showing the white petals inside them. In spite of the moderate amount of sun we have had, the Victoria is really fine this year. The large square tank in the Lily house affords plenty of room for its development.

Self-irrigation in Plants.—For many years past there have been many believers in the old theory that plants absorb moisture, and even plant food in solution, through their foliage, even though it has been scientifically demonstrated that the leaves do not absorb water under normal conditions, that is, unless they are actually flagging owing to an insufficient supply from the roots. Another proof of it is that the plants have generally made ample provision to throw it off, not retain it. There is ample evidence, on the other hand, that plants have made ample provision to carry it within reach of the main body of feeding or absorbing roots wherever they may happen to be situated. This phase of the subject is taken up and explained, as well as illustrated, by the Rev. A. S. Wilson, M.A., in the July number of *Knowledge*. The fact is amply demonstrated in the general inclination of the leaves of the Beech, Elm, Lime, Plane and other trees of like habit, whose feeding roots are at some distance from the trunk, the leaves being directed outwards, and inclined tier above tier like the slates on a house. Caladiums, Alocasias and allied plants have the blades of their leaves inclined outwards from the top of the petiole, which is so bent or inclined to throw the water away from the centre. On the other hand, plants which have the main body of roots in a central position below them have channelled petioles to carry the water collected on the leaf surface towards the centre. This class of plants are very plentiful, and include such as Tulips, Hyacinths, Palms, Radishes, Bananas, Tree Ferns, Rhubarb, Thistle, Dandelion, and hundreds of others. The stems are also often angled and furrowed or fluted, or striated, so as to act as guides for the descending current. Auriculate leaves throw the water upon the leaves next below them.

An International Horticultural Exhibition will be held at St. Petersburg next year, commencing on May 17th, and continuing for ten days. The function will be carried on under the special patronage of the "Great White Czar."

Mr. J. H. Krelage.—A portrait of this well known Dutch nurseryman of the firm of MM. E. H. Krelage & Son, Haarlem, Holland, is given in the current number of *Tijdschrift voor Tuinbouw*. Having been born in 1824, he is now in his 54th year. His popularity amongst botanists, nurserymen and others is indicated by the fact that many plants have been named in compliment to him, including *Agapanthus umbellatus Krelagei* (Leichtlin), *Begonia tuberosa J. H. Krelage* (Zocher), *Bladcanna Krelagei* (Chatin), *Gladiolus gandavensis Monsieur Krelage* (Leveau), *Gladiolus Lemoinei J. H. Krelage* (Lemoine), *Hyacinth enkel rood Monsieur Krelage* (Kruyff), *Iris Kaempferi Krelagei* (Siebold), *Iris reticulata Krelagei* (Regel), *Paeonia albiflora (chinensis)*, *Monsieur Krelage* (Crousse), and *Anthurium hybridum J. H. Krelage* (Kottmann).

Floral Decorations at Nottingham.—On the occasion of his grace the Duke of Portland being installed grand master for Nottingham, the floral decorations were entrusted to Mr. C. J. Mee, the eminent florist of Long Row, Nottingham. This floral work was the admiration of everyone privileged to see it. Dozens of stately Palms and other foliage plants were used with telling effect. Hundreds of flowering plants such as *Hydrangeas*, *Kalosanthes*, *Petunias*, *Pelargoniums*, *Marguerites*—the yellow one—with deep purple Canterbury Bells where extensively used with grand masonic effect. The whole display was admirably executed and Mr. Mee received numerous congratulations upon the excellent and practical way in which he carried out this important work, which was undoubtedly the best ever seen in Nottingham. Mr. Mee is an old and skilled hand at this kind of work.—*Rusticus*.

Celluloid Auto-labels for Plants.—Samples of what appear to be a useful label have been sent us by Mr. Douglas Allport, 108, Queen Victoria Street, London, E.C. They vary in size, but consist of a strip of celluloid, rolled up at one end for the purpose of fixing the same to a stake or to the plant itself. The coil may be unrolled or partly opened with the fingers, to admit of the supporting object, after which the coil closes again elastically of its own accord. When fixed the label is always in a horizontal and readable position. Undoubtedly the label is very clean and neat, and described as permanent and dirt-proof as porcelain. It occasions no difficulty or loss of time in the matter of fixing. The label is said to be uninjured by heat, damp or time; and the clip to expand with the growth of a stem to which it may be attached. It should prove very neat and handy for Orchids. Only one side can be written upon, the other being as smooth as glass. A soft black pencil is said to be the only thing required for writing the name; but we can manage to write with a pen and ink, which might even be more permanent than pencil writing. If it will stand the damp of the stove and Orchid houses, all indoor plants might be furnished with it on the score of neatness alone.

A New Seed Sowing Machine.—There are many seed sowing machines, but in the present case we refer to a machine, for which patent rights have been granted to Mr. W. Evans and Mr. W. F. Hamilton. The invention is intended by means of suitable machinery to fix seeds of various sizes, both agricultural and horticultural, between sheets of specially prepared paper, the seeds being deposited at any required distance apart, in rows or special designs, and fixed there by some glutinous material. On the top of them another sheet is fixed. When the operation is completed the pieces of prepared paper may be circular, so as to fit into a flower pot, or they may be in strips suitable for laying along the bottom of the trenches taken out by the hoe in the usual way. The object of all this is to regulate the distance apart the seeds should be, and to ensure their being at an equal depth in the soil. The paper sheets or strips are covered with soil, and treated in the usual way. The seeds will also be protected from birds. Fertilising manures can also be placed between the sheets of paper, so as to be ready to hand for the germinating seedlings. Mr. A. Armfield is secretary for Evans' Seed Sowing Company, Ltd., 40, Chancery Lane, W.C.

Green Fly is now on the Hop in Kent. Where is it likely to hop to next?—*Snaggs*.

Orchids at the Sale Rooms.—At the Sale Rooms of Messrs. Protheroe & Morris, Cheapside, on the 15th inst., the strangely formed flowers of *Catasetum fimbriatum*, and the golden-yellow of *Mormodes leopardinum*, thickly spotted with crimson attracted considerable attention amongst those present. Two pieces of the former fetched £2 5s. and £2 respectively. A well-flowered piece of *Odontoglossum cristatellum*, carrying a long panicle of flowers, did not seem to find so many admirers, probably because less curious, but it was, nevertheless, a fine piece of its kind.

Dictionnaire Iconographique des Orchidees.—This work has been going on since October, 1896 and is intended to form a dictionary in which coloured plates of Orchids, each 7½ in. long by 5½ in. wide, are given. The plate is accompanied by text descriptive of the species. The description is in the French language. Twelve monthly deliveries, each containing thirteen coloured plates are sent to subscribers during the course of the year, that is, 156 plates annually. The subscription price is 48s. annually, commencing in October. The intention is to figure and describe all the genera, species and varieties that are of sufficient interest in the Orchid family. The special features of the work are that a portfolio bearing the title of a genus is delivered every month; that all the plates and text are left unbound so that the numbers belonging to any one genus may be brought together and arranged in alphabetical order, no matter what the time of their publication may be. The portfolios are to be arranged in the bookcase in alphabetical order. Whenever a species flowers in the collection of an owner or his gardener, who may not know the name, all that is necessary is to turn over the sheets in the portfolio till the plate representing the species is arrived at. This, it will be seen, affords an immense advantage in facility of reference compared with existing works on the subject, many volumes of which have often to be consulted before the right plate is found. The *Dictionnaire Iconographique des Orchidées* is managed and edited by A. Cogniaux, and the paintings are done by M. A. Goossens, Artiste-Peintre, Rue Quinaux, 24, Schaerbeek, Brussels, Belgium, to whom intending subscribers should apply.

The Fruit Tree Beetle.—A leaflet dealing with the peculiarities of this pest has lately been issued by the Board of Agriculture, which was moved to the investigation by frequent complaints of the destructiveness of this boring beetle which turns out to be *Scolytus rugulosus*. In the majority of cases brought to the notice of the Board, the larvae of the beetle had honeycombed the tips of small branches, whilst many of them were esconced in bark and wood that was dying or already dead. On the other hand they were seldom found in healthy bark, which fact confirms the statement made in Kollar's *Treatise on Insects* "that it is probable that this beetle only attacks trees which are sickly." The larvae have been frequently found in the tips of branches injured by frost, also near scars from canker, and knife cuts, and knots. It is not clear that the beetle attacks healthy trees, but it is certain that it greatly retards or prevents the recovery of sickly ones. It is partial not only to the Apple, but to the Plum, Cherry, Pear, and Peach, and its presence may be discovered by the existence of many round holes, not more than a pin's head in diameter, through the bark to the wood. The female beetle may be seen flying about towards the end of April. She bores holes in the bark, lays her eggs, and the larvae hatch out in a few days. After pupation the beetles bore other holes in the bark and escape, for there are at least two generations born in the year, while the larvae pass through the winter as they are, the active injury being thus unintermittent. The beetle is barely one-tenth of an inch in length, and black, while the larva is a little smaller, and milky-white with black mandibles. The only method of dealing with the beast is to cut down and burn all worthless trees; and holders of orchards should see to it that they keep old dead branches cut out regularly each year for this will materially lessen the risk of infection. Syringing with insecticides is of very little use for the larvae are out of their reach. The trapping of the female beetles would certainly be of service,

USEFUL HARDY PLANTS.

AMONG the most useful hardy plants for heavy damp soil we have found none to surpass *Doronicum caucasicum* and *D. plantagineum excelsum*. They are capital for forcing, and in the open ground they begin flowering in April, and now (middle of July) are very striking. These were plants which had been forced and stood out behind a wall in pots for some weeks. *Gaillardias* are continuous flowering, herbaceous plants, and grown in beds or borders in masses make a fine display, and are most useful for cutting. They stand well in rooms. They can be easily raised from seed, but it is more satisfactory to get proved varieties. I notice some old roots which have been in the same position (not by any means a choice one) for over a dozen years, and are now full of bloom. *Paeonies* do well on strong, firm soil. We have planted a new collection this season, but the old ones are by no means despicable. They have been in their quarters untouched for over twelve years, except when they have been reduced with a spade to get pieces to give to friends. *Coreopsis* (*C. grandiflora* appears to be the best) flowers very abundantly, coming in when many of the earlier species have ceased to flower for the season. It seems to do best when treated as a biennial, or, perhaps, it is best of all to sow some each spring and plant out during autumn for next year's use. *Pyrethrums* are most valuable on our heavy wet soil. They last long, and make a charming display. Ours have had little done to them for many years past, and they never flowered more freely than they have done this season. There are great numbers of new sorts added of late. A large collection of new named ones is before us, received as cut flowers from Mr. M. Cuthbertson, of Rothesay.—*M. Temple, Carron, N.B.*

GARDEN CROPS IN WEST LoTHIAN.

THE season has been a very backward one, in fact I think we will this year break the record in that respect.

At this date (July 18th), Strawberries are still green; it will be several days ere a first picking can be made. The crop is good, but for want of rain the fruit will be under average size. Cherries are plentiful, but small; Gooseberries, a fair average crop; Raspberries, light; Black Currants, an enormous crop; and the same may be said of Red Currants. Plums are practically a failure; as for Apples and Pears, they are, as usual with us, very thin, except on a south wall, where Apples are very good.

Vegetables have withstood the long drought wonderfully well. Peas look remarkably well, and carry heavy crops. Cauliflowers, and in fact all the Brassica tribe are quite healthy, but backward. Early Potatos are a very light crop, but the quality is excellent. Late Potatos look splendid. Kidney Beans have suffered more with drought than any other vegetable, all other vegetables being an average. Roses are first rate. Herbaceous plants of nearly all kinds have suffered very much. The bedding plants of all kinds have done fairly well, but most things have made very little growth. The long spell of dry weather broke yesterday, and we have had some fine genial showers, but would require twenty-four hours' continuous rain to fairly get to the roots.—*Black Watch*.

HARDY BAMBOOS.

(Continued from p. 731.)

BAMBUSA.

THIS generic name supplies both the popular name of the whole tribe and the tribal name itself. The *Genera Plantarum* reckons about twenty-four distinct species, but the names of ninety described as species are recorded in the *Index Kewensis*. More than fifty of them, however, have been placed under this genus provisionally, for the simple reason that neither flowers nor fruit have been seen by which to establish their identity and determine their proper classification. The better known species are natives of tropical and subtropical Asia, and one of them, widely distributed in tropical America, is very often cultivated. The botanical characters of *Bambusa* are a paniced inflorescence, with two to many

flowers in each spikelet, a two-keeled, ciliate pale, and six stamens, having their filaments free. The stems are arborescent, rarely shrubby, and more rarely climbing, though none of the latter appear to be hardy. The dwarf and shrubby species are best represented in gardens owing to their hardiness. The name Bamboo is a native one, coming from the Mahratta or the Malay *Bamboo* or *Bambu*, the English name being identical with the former spelling.

B. ANGUSTIFOLIA.—The specific name is here very appropriate, for the leaves are linear, 3 in. to 5 in. long, and light green on both surfaces. It is also known in gardens, however, as *B. Vilmorini*, and why the name should have been changed is not very apparent. The stems are very slender, erect, twiggy, densely crowded, and in the Kew collection at present about 2 ft. high. It is therefore a pretty Bamboo of dwarf and grassy habit, though not particularly striking. It comes from Japan.

B. DISTICHA—The plant now described under this name has been known in gardens for a number of years as *B. nana*, but it is not the plants to which Roxburgh affixed the appellation. Indeed, the origin of the plant under notice is rather obscure, but believed to be in Japan. The light green, lanceolate leaves vary in length from $1\frac{1}{2}$ in. to $2\frac{1}{2}$ in. The stems are only 30 in. high, very slender, intertwined and so numerous that they form a compact and dense bush, resembling a reedy grass.

B. MARMOREA.—Of the dwarfed Bamboos proper this is one of the most distinct and characteristic. The stems are 3 ft. to 4 ft. high, brown or purplish, and arching in different directions. The side branches or twiglets are very slender, short, ascending and crowded in dense clusters all round the stems. So short are the laterals, and so numerous are they, that the stems with their branches may be compared to a lady's feather boa. They are also densely clothed with light green leaves, $1\frac{1}{2}$ in. to $2\frac{1}{2}$ in. long, making the species both graceful and handsome, while it is quite distinct from any other. It is a native of Japan, where its garden name is *Kan-chiku*.

B. NAGASHIMA.—As the name would suggest, this is also a native of Japan. The stems are only 1 ft. to 2 ft. high, similar to those of *Arundinaria Fortunei*, but more decidedly of Bamboo or reedy habit, and not so dense as the last-named species. The leaves are 4 in. to 6 in. long, and of a rich green on both sides while still young, but later on they become of a uniform intense green as they reach maturity. It might be serviceable where taller subjects would be inadmissible, and could be utilised for decorative work in pots.

(To be continued.)

PEOPLE WE HAVE MET.

MR. JOSEPH KENT, F.R.H.S.

THE subject of this notice first saw the light at Penkull Nursery (Burgess and Kent), in 1845, and is now the well-known superintendent of Hanley Park, Hanley, Staffs., where the horticultural fête was held with such success recently, as recorded in our pages last week.

In 1864 Mr. Kent spent some time at Mr. William Bull's Establishment, King's Road, Chelsea, after which he returned to Penkull Nursery, which was then carried on by his uncle, Mr. J. Kent. In 1897 he was appointed Superintendent of the Borough of Hanley Cemetery. On the formation of the park he was called upon to purchase and superintend the planting of ornamental trees and shrubs. The park extends to eight acres, but the more ornamental portion of it, namely, the flower garden, consists of nine acres. This portion was first taken in hand, and completed, and was opened by his Worship the Mayor (Alderman Edwin John Hammersley) on the 26th July, 1894. It is known as the Cauldon Grounds, and contains a large winter garden open to the public every day. Other glass structures here consist of three span-roofed plant houses, each 40 ft. long, by 16 ft. wide; one lean-to, 50 ft. long, by 12 ft. wide; and one lean-to, 100 ft. long, by 18 ft. in width.

Mr. Kent carried out the work entrusted to him in an entirely satisfactory manner, with the result that he was appointed superintendent of parks, &c. The good work he commenced then has been continued ever since, and Hanley Park has now an ever-increasing circle of admirers both in the district and

amongst visitors from a distance. Some idea of the annual amount of labour that has to be accomplished may be gleaned from the fact that 150,000 bedding plants of various kinds have annually to be turned out of the houses in their proper season. The summer display is followed by that of Chrysanthemums in the autumn and early winter, say from October to December, inclusive. To accomplish

MR. JOSEPH KENT, F.R.H.S.

this with the success that attends Mr. Kent's labours is no small test of ability in the smoke laden atmosphere of Hanley, rendered worse by neighbouring chimney stacks clustered round it within a radius of a few miles.

The trees and shrubs selected for this smoky district are interesting from the fact that they not only survive but flourish in spite of the prejudicial influences of the atmosphere to vegetation generally. Hollies include Hodgin's Broad-leaved, *madeirensis*, and *laurifolia*, all in fine condition; also *Aucuba japonica*, *Skimmia japonica* (usually known as *S. oblata*), *Euonymus radicans*, *Olearia Haastii*, *Diervillas* (Weigelas) of sorts, *Lonicera Ledebouri*, *Ribes sanguineum*, *Ligustrum vulgare ovalifolium*, *Hydrangea paniculata grandiflora*, Golden and other Elders, Willows of all kinds, and *Cornus mas*. The evergreens amongst the above, it will be noticed, are smooth leaved; and the deciduous kinds are of course able to get rid of accumulated filth by throwing off their leaves in autumn. Other deciduous trees that do well are English and Siberian Elms, Sycamore, Ash, Thorns, Poplars of sorts, Laburnums, Lilacs and various other subjects of that character, than which few are more beautiful in any country, at their respective seasons of leafing and flowering. Concerning Rhododendrons, it is instructive as well as interesting to note that varieties of the Pontic type are quite useless under the conditions prevailing here. On the other hand, *Rhododendron Cunningham's White* and hybrids give entire satisfaction under the circumstances. *Azalea pontica*, *A. mollis* and its varieties also grow and flower well.

A flower show at Hanley is now one of the institutions that be, and though one of the youngest is one of the most successful in the country. It is held in the park, and naturally enough Mr. Kent is the hon. secretary. Groups of plants arranged for effect are a strong feature of nearly every provincial show nowadays, and they are strongly in evidence at Hanley, where the annual show will now be looked forward to as something to be attended by thousands of visitors. On the evening of the Thursday, the second day of the recent show, the park appeared to be completely packed with people, making the show a glorious success. The difficulty that cropped up at the last Temple Show, and at most other shows, when the tents are being cleared of their contents, was entirely circumvented at Hanley by the genius

of its secretary. To prevent confusion and pilfering the tents were entirely cleared at 8 p.m., and only exhibitors and their assistants, who wore a certain badge, were re-admitted to clear away the exhibits. No one but those in authority knew what the colour of the badge was to be till late in the afternoon of the closing day, so that the whole scheme was an entire success, and a well-known exhibitor stated that he never before packed up his plants with such comfort and despatch. Other societies might copy the plan to their advantage. The organisation, arrangement and the success of the show was mainly due to the energy and abilities of Mr. Joseph Kent, the superintendent of the park, and hon. secretary, whose portrait we have much pleasure in placing before our readers.

BLACKBERRIES.

Well, what about them? Are they worth growing? Many who have tried them will say no, in a most unhesitating manner, but not all. The introduction of the American varieties induced many to take up their culture, who met with very varying degrees of success, and in many instances their culture has been abandoned as useless. Not so, however, a friend of mine who went in for Blackberry growing, and who has a covered wire archway some fifty yards in length by six in width, from which he gathers fruit by the bushel, much finer and more luscious than that grown out on a neighbouring common. Though just the same variety, cultivation makes all the difference. He commenced with the best American varieties, growing some of our English ones with them, but has at length discarded all the Americans, finding that our humble Bramble gives far better results under the same conditions. This method of culture is most simple. After fruiting, the old canes are cut down to the ground. Meanwhile the current year's growth is lightly looped up just to keep it out of the way, and tied into position after those which have fruited are cut out. If some one would only take to raising seedlings from cultivated plants, selecting the best for a few years, we might see some grand results follow.—*W. B. G.*

PLANTS RECENTLY CERTIFICATED.

THE awards mentioned hereunder were made by the Royal Horticultural Society on the 12th inst.

Orchid Committee.

ONCIDIUM ALBO-VERrucosum.—The sepals of this *Oncidium* are linear, keeled and yellow. The petals are oblong and yellow, transversely blotched with brown at the base. The three-lobed lip is yellow, faintly tinted with brown on the lower portion; the terminal lobe is transverse and reniform. Botanical Certificate. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

Floral Committee.

ASPLENIUM ORNATUM.—This may be described as a handsomely cut, garden form of *A. Baptisti*. The fronds are usually about 1 ft. long and of an intense dark green colour. They are bipinnate at the base and pinnate upwards with a long, terminal, deeply toothed segment. The pinnae, but particularly the lowermost ones are again pinnate, and they are further cut into unusually long, comb-like, linear, teeth, which gives to the plant its characteristic and graceful appearance. The fronds are tufted, arching and handsome. First-class Certificate. Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton.

PICEA PUNGENS GLAUCA PENDULA.—In this we have a pendulous variety of the Colorado Blue Spruce, and a distinct and handsome thing it is. The habit of the plant is very much like that of *Sequoia gigantea pendula*. First-class Certificate. A tree, 9 ft. high was exhibited by Messrs. Koster & Co., Hollandia Nurseries, Boskoop, Holland.

POLYSTICHUM MARSHALLII.—This is a supposed natural hybrid between *P. angulare* and *P. aculeatum*. The fronds are bipinnate, $3\frac{1}{2}$ ft. long, sharply ascending, and then spreading towards the top. The pinnules are deeply serrate and terminate in long, bristly points. The lowest pinnule on the posterior side of each of the pinnae projects forward so that in looking down the frond there is a prominent line of them on either side of the rachis,

as if the pinnae were showing a tendency to become cruciate. Award of Merit. William Marshall, Esq., Auchinraith, Bexley.

CARNATION NELL GWYNNE (Martin R. Smith).—The flowers of this Malmaison variety are of moderate size, pure white, moderately fragrant, and having the petals slightly toothed at the edges. Its value lies in its being a pure white Malmaison variety. Award of Merit. Mr. James Douglas, Edenside, Great Bookham, Surrey.

ROSE EDITH TURNER.—This hybrid perpetual Rose is conical in the centre, firm, and of beautiful shape generally. The central portion is of a delicate silvery-pink, with the petals revolute at the edges, but the outer ones are much more rolled back, and of a pale blush. Award of Merit. Mr. C. Turner, Slough.

CARNATION SUNDRIDGE.—Here we have a tree variety about 3 ft. high, with narrow, glaucous leaves, and large flowers of fine form, and brilliant scarlet. The petals are slightly involute at the edges. Award of Merit. Mr. F. Tapper, gardener to Lady Scott, Sundridge Park, Bromley, Kent.

ROSE PERLE DES ROUGES.—The flowers of this Polyantha variety are produced in great abundance, in flat or corymbose trusses, and are crimson and of moderate size. Having considerable resemblance to the old monthly Rose, this has evidently some affinity with *Rosa indica*, as well as *R. multiflora*. Award of Merit. Messrs. Wm. Paul & Son, Waltham Cross.

CARNATION MRS. MARTIN SMITH (M. R. Smith).—The soft, silvery-rose flowers of this Malmaison Carnation are of great size and handsome appearance. They are very fragrant, and the petals are much involute at the edges. The leaves are broad and glaucous. Award of Merit. Martin R. Smith, Esq. (gardener, Mr. C. Blick), The Warren, Hayes, Kent.

CARNATION CALYPSO (M. R. Smith).—Here again the flowers are of immense size, but the petals are more erect, and not involute at the edges. They are of a charming silvery-blush, and deliciously fragrant. Award of Merit. Martin R. Smith, Esq.

SWEET PEA AURORA.—This is one of the most handsome of the striped varieties, being attractively streaked and marbled with rose on a white ground. Award of Merit. Mr. F. G. Foster, F.N.C.S., Brockhampton Nurseries, Havant, Hants.

SWEET PEA GOLDEN GATE.—The name has no reference to the colour, but is stated to take its rise from the way the wings unfold. The standard is mauve, shaded with deep purple on the back. The wings are paler mauve, and tinted violet at the edges. Award of Merit. Mr. F. G. Foster.

Fruit and Vegetable Committee.

STRAWBERRY VEITCH'S PROLIFIC.—This new variety was derived from Empress of India, crossed with the pollen of British Queen. The fruits are conical or occasionally slightly compressed, of medium size, bright scarlet, and possessing the aromatic and delicious flavour of British Queen, with the colour of the fruits of the mother plant. Some plants consisting of last year's runners, and a great heap of the gathered trusses, showed how prolific a bearer the variety is. First-Class Certificate. Messrs. Veitch & Sons, Ltd., Chelsea.

CUCUMBER SENSATION.—The fruits of this variety are about 18 in. long, straight as a gun-barrel, and but slightly tapered to each end. They are smooth or faintly ridged, and of a rich dark green colour. First-class Certificate. Mr. S. Mortimer, Rowledge, Farnham, Surrey.

EDIBLE PEAS.

A LARGE and interested audience assembled on the 12th inst. to hear Mr. N. N. Sherwood's lecture on "Edible Peas." Mr. A. W. Sutton, of Reading, occupied the chair. Mr. Sherwood treated his subject under two heads, the first relating to the ancient history of the garden Pea, and the second dealing with the development of the culinary Pea within the last fifty years. Under the first head Mr. Sherwood had collected a mass of interesting detail such as is only to be gleaned from old and rare books, and the information thus got together could only have been collected by much careful and painstaking research.

The garden Pea, said the lecturer, was of very ancient origin, and probably its true ancestor was not now in existence, nor was its native country

known. Evidences of its existence had been found in the remains of the Lake Dwellers in Switzerland, in the Bronze Age, and also in the relics of the stone age. There were no records of its existence among the early Egyptians and Hebrews, unless, indeed, the Lentils eaten by various biblical celebrities were Peas, but the plant was cultivated in India at a very early age, and is mentioned in the Sanscrit under various names. It was introduced into China at an early date, and was afterwards known there as the Mahomet Pea. With the migration of Aryan races westward the Pea was supposed to have been introduced to Europe. *Pisum sativum* was, according to A. de Candolle, cultivated by the Greeks 300 or 400 years B.C. Pliny mentioned in his writings that the Greeks sowed their Peas in November, but that the Romans did not sow until spring.

The word *Pisum* was taken from Pisa, near Olympia. Gerarde in 1597 spoke of "Peasen," and the word subsequently became Pease. "Peasen" were said to be one of the chief crops in England in 1066, and between the years 1403 and 1538 there were numerous entries in the accounts belonging to old monastic establishments for pottage or porridge Peas. They afterwards became a delicacy, and were regarded as dainties for ladies, for in the reign of Charles II. a guinea a pottle was paid on October 28th for Peas. Gerarde enumerated diverse sorts of shelling and edible podded or sugar Peas, and gave a good deal of information about their cultivation. In the *Historie of Plants* four photographs of the forms cultivated were given. They comprised representations of *P. majus*, *P. minus*, *P. umbellatum* and *P. excorticatum*. These Mr. Sherwood had obtained permission from the authorities at the British Museum to copy, and some excellent photographs of these forms were handed round.

Proceeding, the lecturer said that in 1629, Parkinson, in his *Paradisus Terrestris*, enumerated several of the following varieties of Peas:—Runcifal, Spotted, Gray, Sugar and the Fulham or Early French Pea. Gardeners at that time were, judging from the accounts given, very eager to sow early, but they did not always succeed in getting a crop. *Miller's Gardeners' Dictionary*, in 1737, mentioned seventeen varieties of Peas. The varieties with white flowers and bluish seeds were supposed to come from *P. sativum*, and those with coloured flowers and dun, grey or speckled seeds from *P. arvense*, the Field Pea, which had been regarded by botanists as a variety of *P. sativum*.

Passing to the recent development of the garden Pea, Mr. Sherwood remarked that all the old varieties were round-seeded. The introduction of the wrinkled type, for which they were indebted to Mr. T. A. Knight, of Elton, near Ludlow, some time president of the Royal Horticultural Society of London, marked a great step in advance. From Knight's Tall Wrinkled Pea, afterwards sent out as British Queen, came a numerous family of wrinkled varieties. In 1850 Dr. McLean took up systematic cross fertilisation of the Pea, and the first fruits of his labours appeared in 1859. Little Gem was the first dwarf wrinkled Pea ever sent out. Its height was from 15 in. to 20 in. Mr. Laxton, Mr. Henry Eckford, of Wem, Shropshire, Mr. Culverwell, and Messrs. Sutton & Sons, of Reading, had all done much to improve the Pea, and as the result they had numbers of grand varieties far superior to anything in existence before.

In the year 1877-78 there were offered in nurserymen's catalogues 97 varieties of Peas. In 1897-98 only 46 of these varieties were still offered, although the number of varieties was constantly increasing, for there were now 625 names. These he could safely aver might be easily reduced to a quarter of that number. During the present year his own house (Messrs. Hurst & Son) were growing 700 rows of Peas at the trial grounds in Essex for the sake of comparison.

The chief supplies of Peas for the London markets came from Surrey, Middlesex and Essex, but large quantities were grown at Selby, in Yorkshire, and in the Evesham district.

The lecturer then went on to speak of the great vigilance that was required to keep stocks pure and true to name. Roguing and selection had to be carried on year after year with thoroughness and consistency. He also gave a practical description of the methods that should be adopted in cross-fertilising. The flowers on the plant selected as the seed

parent had to be operated on some time before they were open, and the anthers removed before they shed their pollen. One pod of six seeds would produce a number of varieties from which selections had to be made; indeed, both wrinkled and round-seeded sorts had been obtained from the same pod. The selections made in the fourth or fifth year generally gave the best results.

Mr. Sherwood had on view a number of baskets of Peas, both green pods and ripe seeds of each being shown for purposes of illustration. He showed by reference to these how the work of improvement gradually went on, each variety being an improvement upon those preceding it. He concluded by saying that probably the garden Pea had made greater progress than any other vegetable during the 60 years of the Queen's reign.

At the close of the lecture, Mr. H. J. Veitch, Mr. A. Dean, Mr. H. Eckford and the chairman commented upon the subject of the lecture, and all agreed that full justice had been done to it by Mr. Sherwood.

Kitchen Garden Calendar.

THE hot weather of the last few weeks has brought many of the garden crops to a standstill, particularly where water is scarce. Peas, for example, were very late this year and now the hot, dry weather is playing sad havoc with main crop varieties. Where water can be supplied, this should be given without stint, for if the plants are once allowed to flag mildew soon sets in, which carries off the plants very quickly. The advantage of their sowing, will, in such weather, be very apparent, particularly where the ground is not in the best of heart.

At this time of the year, when the weather is hot and dry evaporation is very great, therefore, mere drippings of water are useless, nothing less than a thorough soaking will suffice to keep plants in the best of health. Some vegetables, however, require more water than others, the softer and larger foliaged kinds usually take the most. Cauliflower, for example, during such weather not only requires plenty of moisture but there must be added such acids that will build up the plant. Lime and sulphuric acid are two of these, therefore, to keep them in a flourishing condition during such weather these constituents must be present to be taken up. Watering is often so carelessly done, that instead of the plants benefitting thereby, much injury is effected. In the case of small plants, instead of putting on the water through a rough rose watering pot use one with smaller holes. The same amount of water will certainly not be used, but if a second dose be given it will go deeper into the soil. Has it never been noticed that the water penetrates further after a gentle shower than during a heavy storm? In the first case the water soaks in as it falls, while in the latter much of it runs away on to places not requiring to be watered.

There is always much difficulty in growing first-class vegetables where there is only a scanty supply of water, as it is next to impossible during hot weather to keep them growing if sufficient moisture cannot be afforded. Much, however, may be done by husbanding the moisture, as it were, by keeping the surface loose and fine. Ground that is left rough will dry much faster than if broken down. It stands to reason that late digging does much to deprive the soil of some moisture. Mulching again should be resorted to in good time. Many of the crops which now lack nourishment might have been kept in a healthy condition with far less labour had this been attended to in the early part of the summer.

As the land is cleared of the crops others should be got in whenever the weather is favourable. It is useless to plant while the ground is in a parched condition, or has not been properly prepared, therefore, as the crops are cleared away break up the clods and render the ground ready for the next. Do not neglect such things as Lettuce, Endive, Radishes and other salads, as these are now much in request; and to have them in the finest possible condition every attention must be paid to planting out and watering. In all cases take time by the forelock, as it is far better to have a surplus than a dearth. Cooks, as a rule, are extravagant creatures, and unless their wants are kept well supplied there is sure to be some unpleasantness.—*Kitchen Gardener*.

HINTS FOR AMATEURS.

THE month of July is one of the most important of all the months of the year to the fruit grower, for at this season of the year hardy fruit trees are calling for special attention, upon the proper performance of which will be very largely determined their future career. Experience has shown most conclusively that the summer pruning or pinching cannot be neglected with impunity, and that if it is carelessly or ignorantly performed the trees are bound to suffer. The whole object of a fruit-tree's existence is to produce fruit of good quality and in abundance. Everything else is subordinate to this, although the cultivator soon finds out that in the case of wall trees closely trained according to a particular system there is a very close connection between symmetry of shape and fruitfulness.

Different trees must, of course, be treated in different ways, but in every case the summer pruning or pinching is directed towards assisting the trees to develop fruit buds, by turning their energies into the proper channel and preventing the waste of material that would otherwise ensue were this restraining and directing influence not brought to bear. Besides this husbanding of the tree's resources another advantage accrues from timely pruning, viz., that the removal of superfluous branches and portions of branches lets in the light to all parts of the tree, and firmer, better ripened, wood is forthcoming.

Cordon Pears.—The cordon system of training Pears is a very popular and successful one, and has, moreover, given rise to a number of styles, all of which are to be recommended according to what is required. Thus we have single cordons, in which the plant is confined to a single stem which is allowed to lengthen as it lists, and which may be trained either vertically or at some angle to the ground, usually from 45° to 60°. Then again we have the multiple cordon, in which each tree has several branches, all of which, however, are looked after in exactly the same way as the single cordon. These, too, may be either trained vertically or at an angle. The fruit is borne upon the spurs, which clothe these main branches along their whole length, and in order to get fruit we must endeavour to induce the trees to develop blossom or fruit buds upon all the spurs. The lateral growths will now need to be stopped, say between the fifth and sixth leaves. Very weak shoots may be pinched closer, but it is not advisable to pinch or cut back the strong growths too closely, for to do so would cause the now dormant buds to break into growth this season, and produce a lot of whip-like shoots, and this is not at all what is wanted. This is the usual system of pinching. Another plan that is both safe and effective is to pinch all the strongest shoots at the fifth leaf rather earlier in the season, say about the end of June in an ordinary year, leaving all the weaker ones untouched; then in October to follow this up by cutting all the shoots down to three buds. The only disadvantage attaching to this method is that the trees look rather untidy during the summer months.

Horizontally Trained and Espalier Pears.—There is no difference in the treatment required by these to that recommended for the cordons. The trees are really multifold cordons with their branches trained horizontally. Allow the leaders of main branches to lengthen as they will. The laterals towards the end of the branches should be pinched rather early in the season, and before any of the others have been touched. With espaliers a good deal of care is necessary. The laterals on the upper main boughs should be pinched some days before those on the lower ones, for the lower branches have always a tendency to be weak, as the sap rushes in its greatest force to the highest point. If the growths on the lower boughs are observed to be very weak allow them to remain as they are for a few weeks. They will be all the better without the check of pinching. By following this plan the balance of strength between the main branches will be preserved, and the cultivator will not have to deplore undue strength in one and undue weakness in another.

Pyramidal Pears.—Here again the top boughs have a tendency to appropriate the sap that should go to the nourishment of the lower ones, and thus the practice of stopping the upper laterals some

days before the lower ones should be carried out. Pinch back to the fourth or fifth leaf according to the strength of the shoot, but leave the leader of each branch at its full length for the present.

Horizontally Trained Apples.—Here also the fruit is borne upon spurs, and summer pinching to the fourth or fifth leaf must be practised in order to induce the development of fruit instead of simply wood bulbs at the bases of these shoots.

Cup-shaped Apples.—This system of training has been exceedingly popular, and the old-fashioned kitchen garden had usually a row of cup-shaped Apple trees all round the sides of the walks. In this case also the aim is to have fruitful spurs along the whole length of the branches. Stop all the growths upon these spurs at the fourth or fifth leaf, but leave the leader of each branch at its full length to be dealt with at the winter pruning. Trees of this sort will not infrequently make a great deal of strong growth in their leaders, but there is little to fear from this as far as the welfare of the fruiting spurs goes.

Dwarf Bush and Pyramid Apples on the Paradise stock are invaluable for small gardens, inasmuch as they commence to fruit while they are yet small, and the trees can be easily looked after without using a step-ladder. The object with these is to keep the centre of the tree from becoming crowded with sucker-like shoots and thus to admit the light and air to all parts of it. Any thinning of centre shoots that may be necessary should therefore be looked after, but those shoots that need stopping should not be cut back at all closely, for these dwarf trees are not inclined to make nearly such rank growth as others on the Crab stock. After the requisite thinning has been done the other shoots may be left at their full length for the present, and shortened back to half their length in October.

Morello Cherries.—These are distinct from the ordinary sweet Cherry in their manner of growth and bearing, for they produce their fruit on wood of the previous season's growth. Hence it will be necessary to lay in at full length a sufficiency of shoots to keep up next year's fruit supply. In "laying," or tying in, take care that the growths are not too crowded. The thin and weak ones may be cut clean out if neatness is desired, or they may be allowed to remain to keep the nets pushed away from the wall, and thus prevent the birds from getting at the fruit. After the fruit is gathered the old wood, as far as it is not wanted to carry the young, may be cut out in order to give more room, but this will not require attention until at least the middle of August.

Sweet Cherries on Walls.—Here the fruit is borne on spurs from fruit buds formed the previous summer. Accordingly, the usual pinching must be resorted to in order to induce the formation of these buds. The leaders of the main branches should not be shortened, but left at their full length.

Plums.—On wall trees Plums generally send out a lot of breastwood—probably the extra heat and shelter they obtain from the wall is the cause of this—but it is dangerous to pinch too early or too closely, for the now dormant buds at the base are very quick to answer to any stimulus, and would soon break into growth if supplied too freely with sap. The fruit is borne on spurs on growth from one to three years of age. The general instructions given for spur pruning will apply here, with the caution above given not to pinch too close or too early.

Peaches and Nectarines.—With these, the chief part of the pruning should have been done in Spring with the finger and thumb, only instead of calling it pruning then we called it disbudding. From the buds then selected to be left strong young shoots have sprung, and these must be laid in to form succession shoots for bearing next year. A few of them may need to be cut out, but this will depend upon the state of the tree, whether crowded or not. It must therefore be left to the operator's own discretion, with the caution to avoid crowding as far as is possible. More room will, of course, be given these succession shoots when the gathering of the fruit renders it possible to take out many of the shoots bearing it.—*Rex.*

The Common Bindweed, *Convolvulus arvensis*, also a native of this country, is a great pest in Canadian farms and gardens. It has been discovered that common salt is the best thing for killing it.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Raspberries.—*C. P.*: You might increase the size of the fruit to some extent by watering with liquid farmyard manure as you suggest, but this would only be temporary relief. The plants are evidently run out and the ground poor and exhausted. Next autumn, therefore, we should strongly advise you to root the whole lot out, and make a plantation in another part of the garden, when special attention may be given to the preparation of the soil. If you decide to do this write later on and we will give you what hints you may need. We may say at once, however, that it would be advisable to get fresh plants from the nurseryman, and it would probably be mere waste of time troubling to replant pieces of the old stools.

Aspidistra lurida.—*Craft*: We should scarcely term the plant hardy, although it will pass comparatively unhurt through mild winters out-of-doors in the south of England. It is true the constitution of the plant is vigorous and enables it to withstand a fairly low temperature as well as conditions of aridity and drought that are almost equally fatal with most other plants, but this does not render it "hardy," as gardeners understand the term. The variegated form is a little more tender than the type, but for all practical purposes is fully as easy to grow as the green one.

Tree Lupine.—*Carolus*: The Tree Lupine, *Lupinus arboreus*, although perhaps not seen so frequently in gardens as it ought to be, is not at all a rare plant. It does very well in the herbaceous border, or in a shrubbery, but likes a light rich soil, and a sheltered position. Its habit is that of a dense bush with long branches that sweep the ground, whilst the racemes of flower stand up all over in very conspicuous fashion. The best method of propagation is by seed, which may be obtained at a very reasonable price. The seed should be sown in Spring, either out-of-doors in the position in which the plants are to remain, or in pots or pans placed in a cold frame. Cuttings will root if they are taken off with a small heel, inserted in very sandy soil, placed in a frame and covered with a bell glass, but seed-sowing is the much easier way.

Hanging Basket for Front Door.—*Geo. Henson*: We think you cannot do better than go in for one of the fine varieties of Ivy-leaf Pelargonium for your hanging basket. You will find Souvenir de Charles Turner one of the best varieties for your purpose. The plant is naturally of pendant habit, and the trusses of deep pink flowers are large and showy. For a basket, one of the ordinary wire ones to be met with at oil shops, will suit well enough if you must have a basket. It should be lined with moss to keep the soil from being washed through during watering. If there is any difficulty in getting a basket to suit why not suspend an ordinary pot? It would be even less trouble.

Azaleas.—*S. L. C.*: If the plants are making growth freely we should keep them under glass for another fortnight, when they may be put out-of-doors to harden and mature their growth.

Fuchsia not Flowering.—*Fuchsia*: Probably your Fuchsias are of some nearly worthless variety that is very shy in flowering. Plants picked up at the door at a penny each are not to be trusted. We assume the plants are yet small and weak. They may flower later on in the summer.

Herbaceous Calceolarias.—*C. P.*: It is not too late to sow seed of herbaceous Calceolarias but you should not delay a day longer in doing it. Do not put the seed pan into heat; a cold frame will be the best place for it.

Peaches.—*C. P.*: The lateral growths of Peaches should be pinched, and not allowed to run on. The dropping of the fruits that often and in fact usually takes places to some extent when the stones are being formed in the fruits is often due to imperfect fertill-

sation of the flower. Irritation of the stigmatic surface of the flower is occasionally sufficient to cause the fruit to swell to some extent, but when the stones should be formed the fruit is at a loss to proceed further and the tree shakes it off.

Bedding Calceolarias not Flowering—*Why*.: The position you have given your plants is not a good one. It is too hot and dry, whereas Calceolarias love a cool and shaded spot, although it should not be overhung with trees.

Sweet Peas.—*Enquirer*: The formation of seed pods will undoubtedly lessen the production of flowers. You must either sacrifice the seed or a great part of the flower crop

CLIVIA MINIATA SUPERBA.

COMPARATIVELY a few years ago this richly coloured variety was the best of the genus in gardens; but notwithstanding the large number of fine varieties, bearing massive flowers, that have been raised and put into commerce since then, the old favourite still finds many cultivators and admirers. The size and vigour of the leaves are fairly moderate, and the bright orange-scarlet flowers are produced in great profusion upon well grown plants. The only respect in which it differs from the best of modern types is in the relative width of the segments, which do not overlap one another owing to their narrowness, but the brightness of their colour and freedom of flowering amply compensate the grower for his careful, cultural attention. The accompanying illustration shows a specimen which has been grown to splendid proportions by Mr. R. W. Saunders, gardener to J. Leadbetter, Esq., Lismore, Broughty Ferry, N.B., as will be seen by the number of trusses of bloom which the plant carries. The plant was raised from a cutting about five or six years ago, so that the number of crowns which it possesses is an indication of the kindly cultural treatment to which it has been subjected during that short period by Mr. Saunders, who is also a successful grower of other members of the same family, including *Eucharis grandiflorum*, and *Pancreatium fragrans*, of which we measured bulbs, 3 in. to 4 in. in diameter. The *Clivia* carried twenty trusses of bloom in 1897, and the photograph was taken this year.

FLOWERING SHRUBS IN SEASON.

PHILADELPHUS LEMOINEI (hybrid) is a charming bush when in full bloom. The flowers are pure white, delightfully fragrant, and last a good time on the plants. The scent is neither so overpowering as the common Mock Orange (*P. coronarius*) nor is the plant such a strong grower, and it is more fitting for mixed beds.

P. GRANDIFLORUS is another good species now expanding its flowers. It is of the purest white, and sweetly scented. The growth is more after the style of *P. coronarius*, so should be planted well back, and given plenty of room. The Mock Oranges require pruning annually after flowering, especially the strong-growing kinds; the first-named species merely requires the strongest shoots pinched to keep the plants symmetrical.

ESCALLONIA PHILIPPIANA is another excellent shrub, now in flower, of the purest white, and the fragrance it emits is not unlike the Hawthorn. The foliage is very much smaller than in the other species.

LEPTOSPERMUM BACCATUM, so named here, but I think it must be *L. laevigatum*, is a pretty little white-flowering shrub. We have it in the open as well as on the wall, and in both positions is flowering well this year. On the bush in the open could be cut pieces from 4 ft. to 5 ft. long, laden with small, tiny blossoms, not at all unlike the *Escallonia* just mentioned. It is a shrub rarely met with now.

LESPEDEZA BICOLOR, otherwise known as *Desmodium penduliflorum*, is a pretty little pea-shaped flower, purplish in colour, not very showy, still pretty, and the foliage is finely cut, not unlike the *Acacia*, and closes up in the evening similar to the sensitive plant.

CYTISUS CAPITATA is another useful flowering shrub for the month of July. The foliage is good,

and the flowers yellow. *Potentilla fruticosa*, too, is very pretty, with yellow flowers of cup shape. *Jasminum revolutum*, with yellow flowers, sweetly scented, does well in the open in this part. It also makes a good climber.

OLEARIA STELLULATA is a charming little bush with pure white flowers, far in advance of *O. Haastii*. The former is planted near the dark flowered *Weigela floribunda* or *W. Stelzneri*, and has been greatly admired. These have just passed out of flower, and were at their best the third week in June.

Then there are several of the bush-growing Rock Roses or Gum Cistus, some of them most handsome and distinct, and their many colours of the richest. Most of them are just now at their best, but will continue to expand, more or less, flowers for several weeks yet. They thrive luxuriantly in our genial climate in almost any position, while in cold localities a southern aspect should be chosen. The majority of the species, especially the dwarf ones, revel on the rockery overhanging the stones; the varieties are numerous. I append a few that I consider good:—*Cistus Creticus*, purple petals, with yellow at the

gets badly nipped when severe frost occurs. The flowers are produced at the end of the branches in long, drooping racemes of white, thickly studded with purple, bracts not unlike a spike of *Medinilla magnifica* in shape, though not in colour. It is a most interesting plant, and not so often met with as it deserves.

Very soon the hardy Fuchsias, corallina and *Riccartoni* will be in full flower, as well as several kinds of *Hydrangea*, whose flowers will carry us well into the autumn. I could enumerate many more useful flowering shrubs, but am already afraid I have taken up too much of your valuable space; but before closing my remarks I would like to mention one other good thing in *Viburnum plicatum*, a beautiful white, ball-shaped flower, similar to *V. Opulus* (Guelder Rose), but far prettier. The plant attains to 8 ft. or 10 ft., and when well flowered is one mass of snowy whiteness. This was at its best about the middle of June.—*J. Mayne, Bickton, Devon.*

MELVILLE CASTLE IN JULY.

A RUN out from Edinburgh to Melville, the seat of

CLIVIA MINIATA SUPERBA.

base; an established plant of *C. crispus*, making a grand show, petal almost red; *C. ladaniferus* has white flowers of large size; *C. l. maculatus*, very similar, but petals marked at the base with dark velvet-like spots; *C. laurifolius*, a white flower with yellow spots at the base of the petals, is a charming flower, so taking in appearance. While all the varieties are more or less pretty, in yellow, purple, rose, red, chocolate, etc., no garden of any dimension should be without some of this genus.

STUARTIA VIRGINICA is another rather tall-growing shrub not often met with outside, but flowering with us just now, and well worthy a place where not too much frost is experienced. It should be given a sheltered nook where plenty of sun can reach it, and assist in ripening its wood. It bears a creamy-white, cup-shaped flower, with many stamens of a purple hue.

The double-flowered *Deutzia scabra* is very pretty just now in the background of the shrubbery border, and so is *Leycesteria formosa* in a like position. The latter requires plenty of room, as it is a strong grower, and should be planted in a fairly open position, or, I find, the growth made during the summer

Viscount Melville, is a very interesting as well as pleasing experience. Melville is a charming place at any season, but on a bright July day it is perfectly paradisaical. The valley of the Esk, in which it lies, affords one of the sweetest bits of idyllic seclusion to be found in Midlothian. Nature and man never conspired so successfully to improve the capabilities of any spot, is the involuntary impression borne in upon the mind as the eye surveys the scene from some wooded eminence like Nancie's Knowe.

A peep at the gardens suffices to show that Melville is still equal to its past reputation for excellent crops, both inside and out. The Peach and Nectarine houses present quite a phenomenal picture of which a carefully reared article of this kind can become. They are simply magnificent in size and finish. The same compliment might be paid to the vineries, with crops at all stages, late and early, bespeaking thorough knowledge of viticulture. There is, too, in another part of the range a magnificent crop of Apples and Pears in pots, a feature of Melville horticulture which deserves appreciative mention.

Passing out of the houses through the kitchen garden—prolific in healthy and heavy growth this

year, as usual—we take a glance at the flower garden. The Rhododendrons are slightly past their best, but there is still enough of gorgeous colour, beautifully blended, to charm the eye. They are skilfully mingled with other decorative shrubs, not to speak of the floral devices that intersperse the lovely lawn. Many of the beds contain collections of Roses just about to burst into bloom, and to take the place of the fading Rhododendrons with striking effects.

Passing onwards, the visitor is next led down a sloping avenue flanked with a blaze of Rhododendrons to the Castle. There has been a good deal of thinning and replanting of valuable shrubs in accordance with Lord Melville's tasteful dispositions; and if the environs of the Castle were beautiful before, they have now been improved almost as near to perfection as it is possible to come. Next we have a stroll over the home farm, which shows excellent results under Mr. Mackinnon's enlightened management; and it is with sincere pleasure that we drink his lordship's health, as an enthusiastic agriculturist and horticulturist, before taking leave of his manager and bringing to a close a most delightful afternoon.—*Caledonia*.

HORTICULTURE IN ROTHERHAM.

THE WOODLANDS.

As a not unfitting commencement to my notes under this heading as promised, I will go through the items of interest as grown at the Woodlands, Doncaster Road, the residence of James Rhodes, Esq. Charmingly situated on the north side of this beautiful suburban road, and close to the town from whence is copiously emitted sulphur fumes to discount the efforts of the gardener, is the profession in question carried on to the credit of the aforesaid and the delight of his generous employer.

The main entrance abuts immediately on the road, and the greenhouses and mansion are gained by a charming asphalted drive, about 60 yards long, the banks being thickly bedded with healthy Aucubas, which lend to the entrance a sylvan beauty that is in happy contrast with the smoky town one has just left behind. Emerging from this drive one may discern the homely residential retreat, immediately on the left; whereas on the direct right hand are the glass structures that do duty under the guidance of the able gardener, Mr. Stocks, to disseminate amongst the horticultural world, such specimens of deft culture that have "many a time and oft" made the triumph of horticulture in some particular branch better than he found it. A well constructed vinery helps to make up the small total of the glass structures, and in it a week ago were to be seen some handsome Grapes, comprising such varieties as Black Hamburgh and Gros Colmar, with Muscat of Alexandria divided off at the further end.

Mr. Stocks cleared the decks at Sheffield show four years ago, being first in the open and the same in the district class. The length of the vinery is about 48 ft., and the Vines are exceedingly well done. But it is in the little Chrysanthemum world that comprises the district that Mr. Stocks has proved such a terror, having shown groups at the Rotherham Show seven years in succession, and not having once been beaten, as he says. First for five years, also for miscellaneous groups at the same show, in rotation, make up a very enviable record. The Chrysanthemums were standing out in their final pots at the time I called, and were the picture of health and good culture. Good wood and fine healthy foliage were the characteristics, the plants being well covered with leaves down to the pot.

About 400 plants were in evidence, and comprised such varieties as Mrs. Weeks, Edith Tabor, Phoebus, Mme. Carnot, Pride of Madford, M. Chénon de Léché, and, of course, many others old and up-to-date. For exhibition blooms the cuttings are taken in December and January, whilst to grow plants for grouping April and May are preferred. They are then pinched back and not cut, as Mr. Stocks prefers this method to produce stronger breaks.

The stove was full of healthy, richly-coloured, well grown Crotons, embracing such sorts as B. Rothschild, Warreni (best for grouping), Intimidalis, Improved Queen Victoria, &c; also a grand batch in 3 in. pots of Caladium argyrites that would tempt many a London nurseryman, fine specimen Cocos weddeliana, Chamaerops, Kentias, Seafortias, Phoenix, and other useful Palms without which any

aspirant for grouping honours would be placed at a discount. Dracanas, in many varieties, Orchids, including Cattleyas, Dendrobis, Coelogynes, Cypripediums, &c., go to make up an excellent stove collection well done. It was Mr. Stocks who raised the Empress of India Carnation, and he has now a large number of plants of a decided improvement on this variety.

In a large lean-to house adjacent were some extraordinary blooms of this variety, not showing any sign of bursting. In the same house were some luxuriant Roses in bloom, embracing Gloire de Dijon, Niphetos, W. A. Richardson, Grace Darling, and Perle des Jardins varieties.

Nor should the large conservatory escape some passing remarks, some fine red and white Lapagerias covering the roof, large Camellias, a fine strain of Celosias, equally good Calceolarias, a fine Eucalyptus flanking the entrance to the house, with an adjacent large plant of Genista fragrans in full bloom. Coleus and some up-to-date zonal Pelargoniums vied with each other to excel in what was a beautiful all-round display. Some Sweet Peas trained close to the glass had a happy effect. A glance at the bedding outside, which did not detract from Mr. Stocks' ability, and a few moments' gaze at the beautiful Clifton Park, of which a grand view is obtained from the drawing-room windows, and I closed my pocket book.

Mr. James Rhodes, the worthy employer, is a liberal contributor to many charities in the neighbourhood, having but recently, I am informed, topped the subscriptions towards the new wing for a children's ward at the Rotherham Hospital; but he is a gentleman who consistently hides such deeds under a bushel.

His enthusiastic and able gardener has been with him eleven years, his father having been gardener to the late Mr. H. J. Dixon, at Stumperlowe Hall, near Sheffield, nearly thirty years. To take second prize for the best cultivated cottage garden at fifteen years of age is the earliest triumph that Mr. Rhodes' gardener can boast of, this having occurred at the Hallamshire Show, at Ranmoor, Sheffield.—*Albert Upstone*.

MALMAISON CARNATIONS.

It has been my good fortune just recently to have had opportunity of visiting several establishments in the neighbourhood of the Metropolis, and whilst interested in many things that came under my notice, I gladly admit that progress characterises much that I saw. I think, however, the fact that struck me more than anything else during the past few weeks has been the immense quantities of these Carnations now cultivated; the general healthy condition of the plants, and the size and excellence of the flowers. The first lot that came under my notice was at the Round Oak, Englefield Green, where Mr. A. Sturt, gardener to N. L. Cohen, Esq., had a good portion of the greenhouse filled with them. These were remarkable for health and vigour, the blooms of large size, not flat as is sometimes the case, but globular and full, almost reminding one of blooms of Paeonies. The varieties here were Rangemore Pink, Churchwarden, Prime Minister, Sir Evelyn Wood, Princess May, and Mrs. Eva Hambro. The first named was the one chiefly grown; the others were much less in number, one or two kinds being represented by just a single plant. It is evident that at Round Oak their culture is understood.

Another wonderful lot that came under my notice was at Hatfield, where Mr. Norman has the best varieties represented by hundreds of strong and vigorous plants. The group, too, he exhibited at the Drill Hall recently was an evidence of the quality and quantity he had at home. Again, at the Richmond Show, the wonderful display of Messrs. W. Cutbush & Son, Highgate, was very meritorious, and much admired. Again, at Gunnersbury Park, Acton, Mr. G. Reynolds has a most extensive and meritorious display; whilst I think the house, perhaps, that took my fancy was that at Spring Grove House, Isleworth. Here Mr. Farr has a Carnation house, just 50 ft. long, with a stage on either side, the broadest one being at the back. Here some hundreds of plants were staged in the very pink of health and floriferousness. In straight running lines the flesh-coloured variety, and the lovely Princess of Wales were carried right the length of the house. Just standing on a slightly raised eminence, I could see

the whole at a glance, and a most charming sight it certainly was. Horace Trelawny is a variety also grown here; but however good some of the deep scarlets may prove, so far the pale flesh-colour and the deep rose seem to be the varieties chiefly grown.

The layering process has already commenced in some establishments. To propagate some hundreds of plants, in a few cases, thousands, is no mean addition to a gardener's labours. To keep them in health and free from disease, and present them during the summer in such grand form and quantity is surely evidence of skill and attention, such as few other things demand.—*Wilson*.

OSTERLEY PARK.

THIS fine estate is situated in West Middlesex, and is about equi-distant from the severely practical, not to say odoriferous, town of Brentford, and the utilitarian, but highly necessary institution at Hanwell, whose inmates are said to be in some way affected by the "Queen of the Night." Notwithstanding, however, the somewhat unfavourable position thereby created, it contains within itself the elements of a rustic life. It possesses fine trees, extensive lakes, gentle undulations, umbrageous glades, ornamental buildings, modern horticultural requisites, the peace and quietude of a certain isolation, a good gardener, and a noble proprietor. It is, in fact, an epitome of the country, so near to and yet so far from the modern Babylon, by reason of its undulations and diversified scenes, that the visitor is not quite sure of his location. It is, of course, quite independent of its neighbours, although it is in nowise exclusive of their welfare, the Earl and Countess of Jersey being noted for their kindness and consideration toward their poorer brethren. Here, during the summer months, not only do the *élite* of the land promenade its classic shades, comment on its sylvan beauties, or discuss its historic halls; but the poor and the ragged, also, are invited to witness its ways; to gambol, it may be, on the grass; to watch the rabbits run about; to hear the songs of birds; or to partake of the wholesome fare which is spread out for their enjoyment.

Thither, it was, a small but interested party of gardeners and amateurs from the Ealing Society went, by invitation, on the 30th ult. The evening was a very fine one, and the time of year such that the park, the gardens, and the vegetation, generally, looked at their very best. The mansion, too, is quite a study. It is a solid quadrangular structure of cheerful red brick and stone, with a tower at each angle; a spacious courtyard, which is approached by a magnificent flight of stone steps, surmounted by six huge columns of the same material, and which, it is said, was the result of a suggestion by Queen Elizabeth during a visit to Sir Thomas Gresham in 1573. Whatever our forefathers took in hand appears to have been done with spirit and vigour; no cost was spared to obtain strength and solidity—in fact, they appeared to fight against time; thus, it is, we are in possession of a goodly number of remarkable buildings of the present type.

The interior, we were given to understand, is elaborately fitted up, and the picture gallery contains some choice and rare productions. These things, however, like ancient trees, appear to be considered more in relation to their age than to their utility—links in the chain of time. So long ago as 1596, Norden, in his "Survey of Middlesex," quaintly writes:—"Osterley, the house now of the Lady Gresham, a faire and stately building of bricke, erected by Sir Thomas Gresham, knight, citizen, and marchant adventurer of London, and finished about anno 1577. It standeth in a parke by him also impaled, well wooded, and garnished with manie faire ponds, which affordeth not only fish and fowle, as swanes and other water-fowle, but also a great rise for milles," and so on, the description being applicable even at the present day. The Park comprises about 700 acres, and if the "ponds" were "faire" in Norden's day they are surely fairer in ours, inasmuch as they now contain many aquatic plants, such as Water Lilies, Amphibious Persicaria, Richardia Africana, etc.

The soil, as might be expected in so large an area, varies considerably; it is, however, generally of good quality, judging by the vigorous condition of the common and Portugal varieties of the Laurel, the Irish Yews, and other ornamental trees and shrubs.

The Portugal Laurels exhibited a robustness and beauty seldom seen, for they were literally smothered in blooms. A large bed of Paul's new Carmine Pillar Rose excited surprise, and advertised itself with flaunting flowers. These are of a pleasing colour, as the name implies, and Mr. Hawkes speaks favourably of their usefulness and value in a cut state. The flowers are large and single, and so are in demand by those who love nature unsophisticated so to speak, in place of nature with a modern touch of abnormality about her. Turner's Crimson Rambler is also done well here, and although not yet in bloom—the season being late—the buds are there in myriads and promise a fine effect. This Rose should prove a *via media* to those who love not single and yet are averse to double forms of the type and size of Paul Neron. But—whether single or double, mid-way or between exotic or British, the Rose must be queen. Turner's Rambler as seen here, is a rampant grower, and six large plants cover completely six separate trellises 12 ft. high and 4 ft. through. These had to be devised by Mr. Hawkes, of strong material, to resist the force of the wind which sometimes sweeps across the park in hurricanes. The uprights have each three prongs in trident fashion, firmly fixed in the ground, the upper portions being braced together by cross-pieces, which give the necessary strength and stability. It is needless to say that these Roses, when in bloom, are worth going a long way to see, and form a feature in the pleasure grounds of no mean order.

Herbaceous plants are likewise used with much effect in front of the shrubs and ornamental trees; and annuals, too, come in for a share of culture and attention; while the greensward is, just now, of the loveliest colour and character. The lawns, in fact, are most extensive, and in the best of texture, which circumstance reflects the greatest credit on all concerned. The lawn is an English institution; and where kept in perfect order, it cannot be superseded.

(To be continued.)

DYSON'S LANE NURSERIES.

IN a recent issue we mentioned some of the most noteworthy features of the magnificent collection of Ferns that Mr. H. B. May has got together at his establishment at Dyson's Lane, Upper Edmon-ton. Not only Ferns, however, but all sorts of plants for which the public has signified its appreciation are taken up, and most of them are cultivated on a very extensive scale. Mr. May's motto evidently is that "a thing that is worth doing at all is worth doing well," and the visitor to the nurseries cannot fail to be impressed with the painstaking thoroughness that is displayed in dealing with each class of plants. Perhaps one of the best instances of this thoroughness of system is that handsome winter-flowering Begonia, Gloire de Lorraine. Soon after it was brought out it was fixed upon by Mr. May as a good thing, and a grand stock of it was worked up. The superb specimens of it that made their appearance at the Drill Hall and other shows from the Dyson's Lane Nurseries must still be fresh in the minds of our readers who had the pleasure of seeing them. This Begonia undoubtedly owes not a little of its present popularity to these exhibits.

When dealing with the Ferns we spoke of the disposition and arrangement of the houses in blocks, with potting sheds attached to each block. This plan is followed not only for the houses devoted to Ferns, but also for the thousands of Palms, Crotons, Dracaenas and other foliage plants that are grown. There really seems no end to the houses, and yet everywhere neatness and order reigns, although the work of looking after the contents of even one of these long houses must be immense.

The collection of Crotons is one of the best in the country, and although there is nothing absolutely new to chronicle the rarer and finer varieties receive special attention. Golden Ring, Aigburth Gem, and Reidii are especially in demand, and good plants fetch a high price.

Dracaenas, too, are grown in large quantity, as their importance as decorative subjects would demand. Such forms as Lord Wolseley, Lindenii, Sidneyi, and Elegatissima find a ready sale, and include some of the most useful members of the genus. The distinct *D. sanderiana* is also in request, and when it is not suffered to become too leggy, but

is kept dwarf by continual propagation, it is a showy thing.

Aralia Veitchii, *A. gracillima*, and *A. elegantissima* occupy an important place amongst stove plants, and hence we were not surprised to find that Mr. May goes in for them heavily. Plants in all sizes were to be seen, from the lately grafted one just starting freely into growth to comparative veterans several feet in height.

In passing we may mention the pretty but comparatively uncommon *Alpinia vittata*, which was represented by some finely variegated plants.

Crossing over to the other side of the road to that on which the offices are situated, the visitor finds scores of houses filled with various subjects. Palms, of course, form a staple feature, and we found Kentias, Cocoses, Phoenixes, and Arecas in overwhelming numbers, and yet these legions have been called together in response to a demand. One can only ask where do all the Palms go? And what becomes of them that the demand goes on increasing thus, year by year?

Lapagerias, both red and white, are largely grown, upwards of a thousand layers being rooted each year.

Of Asparagus *A. tenuissimus* is perhaps the favourite, but *A. retroflexus*, *A. r. arboreus*, and *A. Sprengeri* all find a home. As a basket plant *A. Sprengeri* should have a great future before it, although it is at present much better known in the States than on this side of the herring pond.

Bedding plants of all descriptions, Bamboos, Carnations, Cyclamen, Coleuses, Gloxinias, and many other things which find favour with the public are each accorded a share of attention, and all are well done.

SOCIETIES.

WOODBIDGE FLOWER SHOW.—July 7th.

THIS show has attained the first place in the county for some years past; and the forty-seventh exhibition, which was held on Thursday, July 7th, far exceeded any previous year in exhibits and novelties in flowers, fruits, &c. One new feature was a class for decorated bicycles, which were greatly admired. The general arrangements were under the superintendence of Mr. John Andrews, the hon. secretary, to whom good praise is due. The town was beautifully decorated with bunting, as was also the Abbey grounds, where the full band of the York and Lancaster Regiment, under the command of Mr. E. W. Wood, gave great satisfaction with their performances.

The judging commenced about 11 o'clock, when the following gentlemen and ladies undertook the different tasks before them:—Roses, open, and cut flowers: Mr. J. Burrell, Cambridge; Rev. Page Roberts, Scole; and Rev. J. H. Pemberton, Havering. Amateurs: Mr. E. B. Cant and Mr. D. Prior, Colchester; and Mr. Ambrose, Cheshunt. Local amateurs, growing less than 1,000 plants: Mr. F. Cant, Colchester; Mr. O. G. Orpen, West Bergholt. Pot plants: Mr. J. Wright, of the *Journal of Horticulture*, and Mr. James Hudson, gardener to Mr. Leopold de Rothschild. Subscribers' classes: Miss Howey, Miss Pemberton, Miss G. Smith, Havering; Mr. J. H. Wrinch, Ipswich; and Rev. Page Roberts. Fruit: Mr. Allen, Gunton Park; Mr. J. Wright and Mr. J. Hudson. Cottagers' Classes: Mr. J. Fincham, Nacton. Allotments: Mr. A. Andrews, Campsey Ash.

The fruit was not so good or so large a class as usual, being a little too early for many things. The unique and most interesting feature of the whole show was a display of Water Lilies, in different varieties and colour, never before known in this class of plants. The specimens on view were grown in a pond in the garden of Mr. Leopold de Rothschild, at Gunnersbury Park, Acton, and brought to the show by his gardener, Mr. James Hudson. Some of them were very rare and scarce and could not be bought under twenty guineas a piece.

One large tent was devoted to Roses, which were declared by competent judges to have been superior to those shown at the Crystal Palace on the 2nd inst. In the open class for thirty-six varieties Messrs. D. Prior & Son stood first, and Mr. B. Cant, second. Great interest was manifested in the result of the judging of the open class for Teas. The prize was a cup, value twenty-five guineas, and won by Mr. B.

Cant, with a wonderfully fine display. Messrs. D. Prior & Son stood second. In the amateur classes the Rev. J. H. Pemberton won the cup for the third time, so it becomes his. A new exhibitor was the Right Hon. Lord Battersea, who won a third prize for bunches of garden Roses.

Several other tents contained herbaceous flowers, table decorations (which were a very large class), bouquets, baskets, and other flowers and fruits much too numerous to mention. Messrs. Fred. Smith & Co., of the Suffolk Seed Establishment, had a tent on the ground, in which they exhibited amongst many other things fifty varieties of Sweet Peas. In another tent, under the charge of Mr. R. Ennals, the Ichthemic Guano Co., Ipswich, had a good show of their largely used and Ichthemic Guano; and the handsome prize offered by the firm for produce grown by this fertiliser was won by Mr. Martin, gardener to Gen. Sir Richard T. Farren, Bealings.

In the evening a promenade concert and musical fête was held, the grounds being beautifully illuminated. A grand display of fireworks by Messrs. Brock brought a most successful day to a close.

WOLVERHAMPTON FLORAL FETE.

July 12th, 13th, and 14th.

For the past ten years the Wolverhampton Horticultural Society has enjoyed an unbroken run of successes in their series of Annual Floral Fêtes, and it is gratifying to note that this high standard of merit has been more than realised this year, for the show, which was opened on the 12th inst., was far ahead of anything that has gone before it. The West Park, Wolverhampton, presented a scene of great animation during the three days of the fête, the number of visitors being very great.

No fewer than six large tents were requisitioned to accommodate the exhibits, which all round were of high quality.

ROSES.—These are always a prime feature at Wolverhampton, and this occasion was no exception to the rule. Mr. B. R. Cant, of Colchester, had a brilliant win in the class for the seventy-two blooms, staging the fresh, bright flowers we expect to see from him. Catherine Mermet, Helen Keller, Mrs. W. J. Grant, Madame de Watteville, Golden Gate, and Countess were his strongest varieties. Amongst the three other competitors the second prize fell to the lot of Messrs. Harkness & Sons, Bedale, Yorks., and the third to Messrs. Frank Cant & Co., Braiswick Nursery, Colchester.

Messrs. Harkness & Sons scored first for the forty-eight blooms, distinct, Messrs. F. Cant & Co. being second, and Mr. B. R. Cant third. Mr. B. R. Cant obtained another first for three blooms each of eight distinct varieties, with capital samples of Mrs. John Laing, Ulrich Brunner, and Mrs. W. J. Grant. Messrs. Harkness & Sons were second, and Messrs. F. Cant & Co. third.

Messrs. J. Townsend & Son, Coventry, staged the winning stand of twenty-four blooms, distinct, Mr. J. Mattock, of Oxford, falling into the second place. Messrs. F. Cant & Co. led in the class for twelve varieties introduced during the last three years. Helen Keller, Countess of Caledon, Ellen Drew and Lawrence Allen were the most noteworthy varieties; Messrs. A. Dickson & Sons, were second; and Mr. B. R. Cant, third.

Messrs. J. Townsend & Son were first for twelve blooms of a dark Rose, with Gustave Piganeau; whilst Mr. B. R. Cant won a similar honour for twelve trusses of a light variety with Mrs. John Laing.

Messrs. Perkins & Sons, of Coventry, received first prize amongst the four competitors for a decorative exhibit of Roses.

PLANTS.—Mr. J. Cypher, of Cheltenham, was by far the most successful competitor in this section. In the leading class for sixteen specimens, he was an easy first with magnificent Palms and Crotons amongst the foliage subjects and *Phaenocoma prolifera Barnesii*, *Allamanda nobilis* and *Bougainvillea glabra* amongst the flowering element; Mr. W. Finch, of Coventry, was second; and Mr. Vause, of Leamington, third.

Mr. Cypher was also first for six stove and greenhouse flowering plants, eight exotic Orchids, six Palms, and six fine foliage plants, showing capital material in each case.

The groups arranged for effect were a most popular feature. For the one occupying 450 sq. ft. Mr. Cypher distanced all competitors with a magnificent exhibit, which must be regarded as one of the finest

efforts he has ever made. Not only were the plants composing the group good, but the arrangement was excellent.

The first prize for six stove and greenhouse plants shown by amateurs, went to Mr. H. Fewkes, gardener to T. Clayton, Esq.

MISCELLANEOUS CUT FLOWERS.—Mr. J. Cypher put another first to his credit in this section for a grand display of stove and greenhouse flowers, Orchids being a conspicuous part of his exhibit. For bouquets, Messrs. M. Jenkinson & Sons, Newcastle, Staffs., and Messrs. Perkins & Sons well sustained their reputation, being the most successful competitors.

The class for collections of cut hardy herbaceous flowers brought out some showy exhibits, that coming from Messrs. W. F. Gunn & Co., Sunderland, being accorded the place of honour. The second award was carried off by Messrs. Barr & Sons, King Street, Covent Garden.

Amongst the competition for floral dinner tables, one sent by Messrs. Jenkinson & Son, was the most meritorious. The Hawley Silver Challenge Cup, offered for a mixed exhibit of flowers and plants was won by Messrs. Dickson, Ltd., of Chester, who now claim ownership of this interesting trophy. A collection of cut blooms of varieties of *Nymphaea marliacea* was not the least meritorious part of the Chester firm's display.

FRUIT AND VEGETABLES.—Fruit, especially, was in capital condition. The premier collection of nine dishes was contributed by Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby. Black Hamburg and White Muscat Grapes, The Queen Pineapple, Apple Lady Sudeley, Strawberries, Peaches and Nectarines were all in the best of trim here.

Mr. Goodacre also won for four bunches of Grapes, showing Gros Maroc, Madresfield Court, Black Hamburg and Muscat Hamburg, all of them well ripened. Two bunches of Muscat Hamburg, shown by Mr. Goodacre, received first prize in the class for black Grapes; whilst a similar number of bunches of white Grapes were best shown by Mr. T. Jordan, The Gardens, Impney Hall, who had Muscat of Alexandria.

Mr. Bannerman, Blithefield Gardens, Rugeley, won for a dish of Peaches, showing grand samples of Royal George. Mr. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, led for Nectarines with Elruge.

For the collection of vegetables, for which prizes were offered by Messrs. Sutton & Sons, of Reading, the Lady Theodora Guest, Blanford, was first; also for the collection in which Messrs. Webb & Sons, of Stourbridge, found the prizes.

NON-COMPETITIVE EXHIBITS.—These included contributions from a considerable number of eminent houses. Mr. Henry Eckford, of Wem, Shropshire, sent a grand lot of cut Sweet Peas. From Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., came a splendid lot of *Caladiums* and tuberous *Begonias*. Messrs. John Laing & Sons, of Forest Hill, staged some of their celebrated *Begonias*. Messrs. W. & J. Birkenhead, Sale, Manchester, had Ferns in variety; whilst cut flowers came from Mr. Henry Deverill, of Banbury; Messrs. Thompson & Co., of Birmingham; and Messrs. Hewett & Co., also of Birmingham.

READING HORTICULTURAL SHOW.—July 13th.

THE unfortunate weather which has for some years tracked the steps of the above society has, we are pleased to say, entirely disappeared, for the day of the show was one of the loveliest the summer has presented to the town this season.

The show in quality was quite equal to any ever seen in this centre of horticulture, the whole of the exhibits being of first-class order, and must have caused considerable trouble to the judges, the exhibits being so closely allied one to the other. One of the principle features was the magnificent groups exhibited by Miss Todd, Shirley, Southampton; and Mr. Alfred Palmer, of Easthorpe, Reading, both composed of lovely flowers and Ferns, and exquisitely arranged, the first and second prizes having been awarded to these two. The specimen Palms and Tree Ferns were very good and well furnished, some of the largest and best having been sent by Caversham Simonds, Esq., of Caversham.

A lovelier effect has seldom been produced than

that by the Roses here to-day, well-shaped, large and full. The season has evidently suited this lovely class of flowers. In the class for six Ferns, Mr. A. Palmer was again first with such sterling varieties as *Davallia mooreana*, *Davallia fijensis*, *Microlepia hirta cristata*, and a grand specimen of *Adiantum*, a seedling of his own raising, which is certainly one of the best of its class for exhibition purposes. We have never at any show seen a better collection of Sweet Peas than those exhibited here by Mr. J. G. Foster, Rockhampton Nurseries, Hants. The colours in this arrangement were beautifully blended and extremely well arranged.

Twelve grand specimen Fuchsias were exhibited by Mr. Bright, Whiteknights Park, Reading, and Major Bottiscombe, of Reading. The show would seem to have been arranged for the day at which they were at their best; but, at any rate, the growers of these are deserving of great praise. Mr. G. Phippen, the celebrated florist at Reading, arranged a charming group of designs in flowers of wreaths, crosses, lyres, hearts, and other lovely floral emblems, on a beautiful background of black velvet, draped with gold silk, which greatly assisted to produce the grand display of this charming group. In front were noticeable bouquets of Sweet Peas and *Scabiosa caucasica*, and a lovely bridal bouquet, the whole finished off with lovely exotics.

The vegetables and fruit were exceedingly good. The competitors were not so numerous in this class. A new feature was two pastoral plays by a theatrical company in the grounds.

IPSWICH.—July 13th.

The committee of the Ipswich Society have just cause for congratulation upon their summer show, held on Wednesday the 13th inst., in the Upper Arboretum in Christchurch Park. All previous records have been broken with regard to the number of entries, which exceeded by 122 those received on any previous occasion. The weather turned out fine, and the day was a most enjoyable one. A difference in the method of tent arrangement was effected, and instead of several scattered tents a large cruciform shaped marquee was provided. Music was discoursed at intervals throughout the day by the band of the Royal Engineers. The number of visitors was estimated at 4,000, and the total receipts at £104 15s. 6d.

Roses were particularly fine. The first prize in the open class for thirty-six blooms went to Messrs. D. Prior & Sons, of Colchester, who had a splendid lot, in which were especially commendable samples of such varieties as Helen Keller, White Lady, Margaret Dickson, Mrs. John Laing, and Duke of Edinburgh. The second award fell to the lot of Messrs. Frank Cant & Co., Braiswick Nursery, Colchester. Amongst the classes for Roses open to amateurs only the Rev. Foster-Melliard, Sproughton Rectory, Ipswich, scored a number of successes. He was first for the twenty-four blooms, and his stand included grand trusses of *Madame de Watteville*, *Her Majesty*, and *The Bride*. His blooms of *Catharine Mermet* also received first prize in their class, and his first prize stand of twelve Tea varieties was a still further exemplification of the reverend gentleman's Rose growing capabilities.

There were three exhibitors of groups of plants, Mr. R. C. Notcutt leading, with Messrs. Clover & Sons, second.

The cut hardy flowers were a specially attractive feature. Mr. C. Jacobi, Ipswich, scored a great success in the class for forty-eight bunches of herbaceous flowers in as many varieties. Mr. R. C. Notcutt occupied the second place.

In the local classes Mr. G. E. Moberley won for a light and graceful arrangement of Sweet Peas, in which many of Eckford's best varieties were to be seen. Mr. D. C. Warnes scored for a smaller group of herbaceous flowers.

The fruit shown was of uniform excellence and good finish. In this section Mr. W. Messenger, gardener to C. H. Berners, Esq., Wolverstone Park, Ipswich, greatly distinguished himself. He won many firsts, the most important being for the collection of six dishes of fruit, black Grapes, Peaches, Nectarines and black Cherries. Mr. A. Creet, gardener to Mrs. Skinner, The Chantry, Ipswich, staged the best white Grapes.

Mr. H. Rogers, Rendlesham Hall; Mr. T. W. Sanders, Lewisham; the Rev. Page Roberts; Mr. W. Allan, Gunton Park Gardens; Mr. J. Wallis,

Ormeil Park Gardens; Rev. H. A. Berners, Mr. F. Cant, and Mr. D. Prior officiated as judges.

THE DURHAM, NORTHUMBERLAND AND NEWCASTLE BOTANICAL AND HORTICULTURAL.—July 13th, 14th and 15th.

THE annual summer exhibition at Newcastle is one of the most important horticultural fixtures of the year, but on this occasion it received an additional importance, owing to the visit of a deputation from the Royal Horticultural Society of London, with which the Newcastle Society is affiliated. The deputation consisted of Sir Trevor Lawrence (president), Mr. Philip Crowley (treasurer), the Rev. W. Wilks, M.A. (secretary), and Messrs. C. Shea, A. Pearson, G. Paul, G. Anson Yeld, J. Wright, A. Turner and J. O'Brien. These gentlemen were entertained at luncheon at the conclusion of the judging, when Riley Lord, Esq., J.P., of Highfield Hall, Gosforth, presided, and Sir Trevor Lawrence gave thanks for the very hearty welcome accorded them by the people of Newcastle. He advised the Newcastle Society to stick to horticulture in their exhibitions, and assured them that it was only by so doing that the R.H.S. was to-day in such a strong position. Mr. C. E. Shea proposed prosperity to the Newcastle Society, and endorsed Sir Trevor's remarks and advice.

The show was favoured with real Queen's weather, an agreeable change from past years, when wind and rain have done their best to mar the success of the fixture. No fewer than 10,382 people passed through the turnstiles on the first day, the takings amounting to £558 plus £104 taken at the grandstand.

The exhibits, which came up to a high standard of excellence, were all accommodated in one huge marquee, a very colossus of canvas. The judges were Mr. James Douglas, Edenside, Great Bookham, Surrey; Mr. James Hudson, Gunnersbury House Gardens, Acton, Middlesex; Mr. Malcolm McIntyre, the Glen, Inverleithen, Peeblesshire; and Mr. George Paul, The Old Nurseries, Cheshunt, Herts.

PLANTS.—The first prize for a group of miscellaneous plants, set up for effect, was won by Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington, whose exhibit was largely composed of foliage subjects, *Anthuriums*, *Crotons*, *Coleuses*, *Dracaenas* and *Caladiums* being especially good. The second award fell to the lot of Mr. J. Farquharson, gardener to R. O. Lamb, Esq., West Denton, Scotswood.

Mr. F. Nichols, gardener to the Marquis of Zetland, Upleatham, led for the half-dozen flowering plants, *Stephanotis floribunda* being his strongest subject. Mr. J. McIntyre led for six foliage plants, and three *Crotons*, while Mr. F. Nicholas scored another well-deserved point for six table plants in 6-in. pots.

ROSES.—Messrs. Harkness & Sons, of Bedale, added to their already numerous honours of this season by coming out an easy first for the seventy-two Roses in twenty-four distinct varieties, also first for four dozen distinct. The blooms were of even size and capital colouring throughout, Mrs. John Laing, Suzanne Marie Rodocanachi, Her Majesty, Horace Vernet, Fisher Holmes, Ulrich Brunner, Caroline Testout, Helen Keller, Marie Baumann, Mrs. Harkness, and Duke of Edinburgh being a few of the best samples. Messrs. R. Mack & Sons, Catterick, were second, and Messrs. D. and W. Croll, Dundee, third, in the latter class.

Yet another first went to Messrs. Harkness & Sons for twelve blooms, of equally as good quality as those staged in the larger and more important classes. Messrs. R. Mack & Sons were second here. The leading award for twelve blooms of one variety was well won by the Bedale firm with Mrs. John Laing.

CUT FLOWERS.—The class for twenty-four bunches of hardy herbaceous flowers brought out some splendid material. Messrs. J. Cocker & Sons, Aberdeen, took pride of place here with a handsome selection, in which *Delphiniums*, *Irises*, *Liliums*, and *Aquilegias* were remarkably fine. Messrs. Harkness & Sons were second. Messrs. J. Cocker & Sons scored again in the smaller class for eighteen bunches. The winning exhibit of forty-eight show Pansies, distinct, came from Mr. M. Campbell, High Blantyre, N.B. Messrs. A. Lister & Son won for twenty-four show

Pansies, distinct, and for twenty-four sprays of six blooms each of Violas.

Messrs. Perkins & Sons, of Coventry, were as usual very successful in the section for floral designs.

FRUIT was remarkably well shown, Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, had the best collection of eight dishes; Mr. J. McIndoe, gardener to Sir Joseph Pease, Bart., M.P., Hutton Hall, Guisborough, was second. Mr. Goodacre also won for the smaller collection of four dishes. Mr. McIndoe was first for two bunches of white, and Mr. Goodacre for two bunches of black Grapes, and also for Peaches.

VEGETABLES.—Mr. J. McIndoe staged a splendid collection of vegetables in both Messrs. Sutton & Sons', and Messrs. Webb & Sons' special classes, winning the first award in each case.

NON-COMPETITIVE EXHIBITS.—Messrs. Jas. Veitch & Sons, Ltd., Chelsea, had a magnificent display of miscellaneous plants, including Orchids and stove and greenhouse plants in variety. The exhibit occupied 500 sq. ft. Messrs. H. Cannell & Sons, Swanley, Kent, sent a handsome lot of Cannas. Messrs. William Paul & Son, Waltham Cross, had an extensive array of Roses. Mr. J. Forbes, of Hawick, had a grand lot of Phloxes and Pentstemons, of which he makes a speciality.

The miniature rockery erected by Messrs. J. Backhouse & Son, of York, was an exceedingly pretty feature, and was greatly admired by visitors. Messrs. Little and Ballantyne, of Carlisle, showed a handsome group of Palms, Crotons and other foliage plants, enlivened with Sweet Peas, also the new Holly Golden King. The cut hardy flowers sent by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, comprised Lilliums and Calochortuses in variety. Messrs. W. Yell & Co., of Hexham, had another charming collection of hardy flowers. Mr. S. Pye, of Caterall, Garstang, showed some grand Pansies and Violas, as did also Mr. A. Lister, of Rothesay.

Mr. Jas. Hudson showed a handsome lot of hardy Water Lilies, varieties of *Nymphaea marliacea*. Mr. Jas. Douglas showed some of his choice Carnations. A comprehensive group of Conifers and other ornamental shrubs was put up by Messrs. J. Robson & Sons, of Hexham. Messrs. Laing and Mather, of Kelso, sent Carnations, and Messrs. J. Cocker & Sons, Aberdeen, had a fine lot of Irises.

R.H.S. AWARDS.—The following awards were made by the deputation of the R.H.S. in addition to the prizes and awards given by the Newcastle society:—Gold Medal to Messrs. J. Veitch & Sons, Ltd.; Silver Gilt Flora Medals to Messrs. Wm. Paul & Son, J. Backhouse & Son, and J. Forbes; Silver Gilt Banksian Medal to Messrs. R. Wallace & Co.; Silver Flora Medal to Messrs. J. Cocker & Sons, H. Cannell & Sons, and Perkins & Sons; Silver Banksian Medals to Messrs. J. Hudson, A. Lister, Harkness & Sons, J. H. Goodacre, J. McIndoe, J. McIntyre, and S. Pye; and a Bronze Flora Medal to Messrs. Harkness & Sons.

NOTTS HORTICULTURAL AND BOTANICAL.—

July 14th.

LAST year the summer show of this influential society found accommodation after a number of unsettled years, in the Arboretum at Nottingham. This year the same privilege was accorded, and thanks to the admirable arrangements of the indefatigable hon. secretary, Mr. C. J. Mee, the enthusiastic support of the townspeople, and glorious weather, the fixture has been an unqualified success. The exhibits were about 200 strong, and with one or two minor exceptions were, in both number and quality, fully up to the standard of former occasions. Lord Henry Bentinck, M.P., performed the opening ceremony.

PLANTS.—In the open class for a group of plants covering 200 square feet, there were four competitors, the first prize going to Mr. Joseph Ward, gardener to Mr. T. H. Oakes, Riddings House, Alfreton, Derby, who had some richly coloured Crotons and *Dracaenas* in his exhibit. The second prize went to Mr. A. Wagg, gardener to S. Chanler, Esq., Ossington Hall, Newark, Notts. There were also four competitors for the smaller group occupying 100 square feet. Here Mr. R. J. Watters, gardener to Mrs. J. W. Leavers, The Park, was first, as he also was in

the class for six stove and greenhouse plants. Mr. E. H. Eccleston, gardener to J. T. Forman, Esq., J.P., Wilford House, was first for a fine flowering stove plant. Mr. J. Ward was second in this class, but scored an easy first for table plants.

ROSES.—There were six entries of twelve blooms, dissimilar, the first prize going to Mr. Lowe. Mr. J. Meller carried off the premier award for the decorative exhibit of Roses.

FRUIT.—In this section the competition was especially keen. Mr. A. Wagg won the first award and the Mayor's five guinea cup for the 6 ft. by 4 ft. table of fruit. He had handsome, excellent Figs, Peaches, Nectarines, Melons, Grapes and Pine-apples. The second award fell to Mr. J. Read, gardener to the Earl of Carnarvon, Bretby Park, Staffs. The collections of outdoor fruit were also good, Mr. J. Baker, of Bastford, being the most successful exhibitor.

Mr. J. Ward led for two bunches of Black Hamburg Grapes, showing large and well-finished samples. Mr. A. Wagg obtained similar honours for two bunches of Muscat of Alexandria Grapes, Mr. J. Read making a good second. Royal Sovereign Strawberry, shown by the City Asylum Committee, Mapperley, was first in the class for a dish of this popular fruit.

VEGETABLES were all up to the mark, with the exception of Potatos, which were much affected with scab. The first award in the most important class, that for twelve kinds, was well won by Mr. J. Read.

The judges were Messrs. A. Outram, W. Elphinstone, and A. Weeks for plants, groups, and cut flowers; Messrs. N. H. Pownall and A. Parr for vegetables; and Messrs. H. Merryweather, and W. English for fruit.

NATIONAL ROSE AT HALIFAX.—July 14th.

IT is now four years since the National Rose Society fixed its northern provincial show at Halifax, and its return to that town, under the auspices of the Satterhebble Rose Society, was warmly received by Rosarians, both local and at a distance. The event, as usual, came off in the grounds of Spring Hall, kindly lent by Mr. Clement Holdsworth for the occasion. The weather was fortunately bright and warm, and the attendance large, whilst competitors found a keen struggle awaiting them.

NURSERYMEN'S CLASSES.

GENERAL SECTION.—The first award for thirty-six blooms, distinct, which carries with it the nurserymen's Jubilee Challenge Trophy and a memorial gold medal, went to Messrs. Harkness & Sons, Bedale, Yorks. Mr. B. R. Cant, of Colchester, and Messrs. Frank Cant & Co., Braiswick Nursery, Colchester, were second and third respectively. Messrs. Harkness & Sons were first in the large class for seventy-two blooms, distinct, and for three blooms each of thirty-six varieties. Mr. B. R. Cant took second place in the former class, and Messrs. Alex. Dickson & Sons, Newtownards, Ireland, second in the latter.

Eighteen blooms, distinct, were best shown by Messrs. James Townsend & Sons, Worcester, Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, being second. Messrs. J. Townsend & Sons likewise staged the best lot of three blooms each of eighteen varieties, Messrs. G. Cooling & Sons, Bath, following in the second place.

TEAS AND NOISETTES.—Mr. Geo. Prince, of Oxford, staged the premier stand of eighteen blooms, distinct; Mr. B. R. Cant was second. Mr. J. Mattock, of Oxford, had the winning twelve.

OPEN CLASSES.

GENERAL SECTION.—Messrs. A. Dickson & Sons had the winning stand of twelve new Roses. Messrs. F. Cant & Co. were second, and Mr. B. R. Cant, third. There were no fewer than ten entries in this class. Mr. Geo. Prince was first for twelve blooms of any light Rose, Messrs. Harkness & Sons were first for twelve trusses of a pink variety, and Messrs. J. Townsend & Sons led for twelve blooms of a dark crimson sort.

Messrs. Paul & Son, of Cheshunt, took the premier place for eighteen bunches of garden Roses, while the best table of Roses, from a decorative point of view, was contributed by Mr. Geo. Prince.

TEAS AND NOISETTES.—The first award in the most important class for blooms of three sections went to Mr. Geo. Prince, Mr. J. Mattock being second and Messrs. F. Cant & Co., third.

AMATEURS' CLASSES.

GENERAL SECTION.—Mr. E. B. Lindsell, Hitchin, came to the front with his stand of twenty-four trusses, distinct, thus carrying off the coveted trophy Gold Medal. The Rev. J. H. Pemberton, Havering, fell into the second position. Mr. E. B. Lindsell scored other noteworthy successes for the thirty-six trusses, distinct, and three blooms each of eight varieties.

Mr. O. G. Orpen, West Bergholt, secured the first award for eighteen blooms, distinct, Mr. Conway Jones, Hucclecote, Gloucester, being second. Mr. Orpen likewise won for three blooms each of six varieties, and six blooms of one variety. Mr. Georg Moules, of Hitchin, led for twelve blooms distinct.

TEAS AND NOISETTES.—Mr. A. H. Gray, of Bath, distanced all other competitors for twelve blooms, distinct. Mr. O. G. Orpen was first with nine blooms of one variety, and Mr. G. Moules for six blooms of one variety. Mr. H. V. Machin had the winning stand of twelve distinct varieties, not less than six trusses of each to be shown. The Rev. J. H. Pemberton scored for nine trusses in as many varieties.

MEDAL ROSES.

Gold Medals were offered in open competition for three trusses each of a new seedling. Here Messrs. A. Dickson & Sons were the most successful, winning two Medals, Mildred Grant (H.T.) and Mrs. E. Mawley (T.) being the selected varieties. Messrs. Jas. Cocker & Sons, of Aberdeen, received a Gold Medal for the H.P. Mrs. J. Cocker.

In the nurserymen's classes Mrs. John Laing, shown by Mr. B. R. Cant, obtained a Medal as the best H. P., a similar award going to Bessie Brown, shown by Messrs. A. Dickson & Sons, and to Comtesse de Nadaillac, shown by Mr. Geo. Prince as the leading Tea.

In the amateurs' classes Silver Medals were awarded to Her Majesty, exhibited by Mr. M. Whittle, Leicester; Lady B. F. William (H.T.) shown by Mr. W. Boyles, Derby; and Catharine Mermet, sent by Mr. E. B. Lindsell.

LOCAL CLASSES.

These were well patronised, and some excellent material was shown in them. The most successful exhibitor was Mr. H. V. Machin, and his most important win was for twenty-four blooms, distinct.

MILDENHALL HORTICULTURAL—July 14th.

THE twenty-sixth annual show of this society was held on Thursday, July 14th, and taken as a whole certainly proved one of the most successful ever held by this enterprising society. There was an excellent and varied collection of groups and cut blooms, in addition to a magnificent display of fruit; and in the vegetable classes special mention should be made of the Potatos staged, which were far above the average usually seen. A noticeable and attractive feature of the exhibition was a grand display of plants and fruit staged by Mr. A. C. Jessup, Jun., of the Red House Nurseries, conspicuous amongst which were some splendid Roses and Strawberries of grand size and quality, and this gentleman also had on view some special plants grown with the world-famed Ichthemic Guano of which he is the local agent.

KENILWORTH HORTICULTURAL.—July 14th.

THE Earl of Clarendon performed the opening ceremony of this show, which was held in The Castle grounds at Kenilworth on the above date. His lordship, in his speech, said that he should be only too willing to continue to lend The Castle grounds to the show committee, whose labours deserved to be crowned with success.

Two large tents were devoted to the exhibits, which were not only more numerous than, but of superior quality to, those forthcoming on previous occasions. The judges were Mr. W. B. Latham, Botanical Gardens, Edgbaston; Mr. F. Perkins, Leamington; Mr. W. H. Dyer, Northfield; and Mr. Thos. Pritchard, Umberslade. In the classes for plants, Mr. F. B. Wright was a very heavy winner. He was placed first for six and four specimens, six Ferns, Fuchsias, a single Fern, one flowering plant, a group of plants, and table plants.

This exhibitor won other firsts for a collection of cut Roses, and a bouquet of the same handsome flowers.

Amongst the exhibitors of fruit, Mr. G. Beard distinguished himself by winning the first awards for

the collection of six dishes, and Black Grapes. The second awards in many of the plant classes also fell to him.

Mr. W. H. Swan led for the collection of vegetables, and Mr. J. Murdock for a collection of hardy fruits.

The cottagers' classes provided were well patronised, and some really good material was shown in them.

Amongst the honorary exhibits appeared a fine group of cut hardy flowers from Mr. Deverill, of Banbury.

GARDENING MISCELLANY.

PLUMS UNDER GLASS.

IN view of the frequent failures among fruit crops on walls, it was frequently urged many years back, "Why not put up glass houses, which would be cheaper than walls in which to grow Plums, &c, where they would not suffer so much as they frequently do from climatic conditions?" They would also be more under command, and could be kept free from injury from insect pests. Even now to find a house some 200 ft. in length, entirely devoted to Plums, is somewhat of a rarity. I saw one recently, the trees being trained fan-fashion, about 9 in. from the glass, in a span-roofed house, in splendid condition, and carrying a heavy crop of fruit, which they never fail to do, and such fruit as is but seldom obtained outside.—W. B. G.

LINARIA MACEDONICA.

AMONGST the species of Linaria, both annual and perennial, many of them are particularly pretty and interesting. *L. macedonica* is one of the boldest and strongest growing of them all, easily attaining a height of 3 ft. under suitable conditions. Mr. W. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, considers it one of the best of the species of Toad-flax he has seen. It is now very fine with him, the stems being clothed with an abundance of ovate and lanceolate, glaucous leaves, and terminating in long spikes of large flowers. The upper segments of the corolla are creamy-yellow, but the large palate is of a rich orange. The spur is long, curved and more conspicuous than in many other species. The foliage alone makes it distinct from most other species with which we are acquainted.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Vine Leaves rusted.—*J. M. F.*: The leaves you sent were not affected with any rust caused by a fungus; and, what is more, the red colour could only have been assumed sometime after the fruit was ripe and the leaves commenced to ripen. The lower surface of the leaves has got what are termed warts, which are small excrescences or swellings caused by an excessive amount of moisture in the atmosphere during the early stages of growth. You say that they have been well looked after as regards watering, and we do not doubt it; but, most likely, what happened was that during the cold and sunless early part of the season you kept the house very close to maintain the temperature at the required height, with the result that the atmosphere of theinery was kept in a saturated condition, it might have been, for days together. The fact that the Vines carry a fair crop of well-ripened fruit shows that there is little the matter with them, though the presence of the warts is also evidence that the Vines are not in the best of health. An excessive amount of watering would be injurious, because the foliage could not perform its functions properly. Next year you can prevent it by giving the Vines more air, so as to dry up the atmosphere about the middle of each day. Give a little more fire-heat to maintain the requisite temperature while the house is open, provided the weather is cold and sunless. The ventilation will harden the foliage, thus making it able to resist various ailments.

Peas Diseased.—*W. B. G.*: You were correct in your surmise, and others with whom you were conversing were also right. We should say, however, that thrips (*Thrips pisivora*) were the chief cause of the evil. Nearly white, pale yellow and deep yellow forms, that is, different stages of the insect may be

found secreted in the buds, doing irreparable damage before the latter expand. The leaves were very much punctured, and the extent can only be seen after they have expanded. Green fly has also been at work, namely, *Siphonophora Pisi*, and when plentiful it is very harmful, crippling the buds and flowers. A mildew was also present. The specimens sent were too far advanced and too much injured for any remedy to be effective. Some good might be done by syringing with a strong solution of soft soap or Gishurst Compound, with the addition of some tobacco juice, in the very earliest stages, but the thrips are so sheltered in the bud that it is difficult to get at them. The dry weather is favouring the multiplication of the pest.

Watering Bedding Plants Overhead.—*Omega*: During the present excessive dryness of the weather it is often necessary to water bedding plants overhead, but if you do not water after eight or nine o'clock in the morning till four in the afternoon no harm will result. We should avoid wetting them during the middle of the day if the sun is bright and hot, because some tender-leaved bedding subjects are liable to suffer scorching or scalding, owing to the excessive evaporation and radiation while the atmosphere is in a dry and heated condition. If you do the watering after four or five p.m. no harm will result from the practice.

Pelargoniums not growing.—*R. Andrews*: The dry weather is the chief cause of the slow progress made, and the cold weather after they were put out checked them greatly, thus causing great retardation of growth till they had been sufficiently hardened. Loosen the surface soil with a small hand fork, and mulch the trees with cocoanut fibre or partly decayed horse droppings so as not to be conspicuous. This mulching will prevent evaporation to a considerable extent, and enable the Pelargoniums to progress more rapidly.

Soft Soap and Green Fly.—*Omega*: Soft soap is a good thing for destroying green fly, as well as thrips and other vermin. The usual method of making it is to dissolve 8 oz. to 10 oz. of soft soap in a gallon of hot water. When this gets cold add about two-thirds of a pint of tobacco water. This will be strong, and it may be advisable to dilute it with water for tender foliage. You do not mention the plants you intend syringing with this insecticide, so that you will have to use your discretion about the strength to be used. The addition of the tobacco water will make the mixture more effective, and the soap will make the tobacco adhere. In the case of tender plants they may be washed with clean water an hour afterwards. In the case of hard leaves the washing is not necessary except to make them look clean. If you lay a plank over the mouth of a tub, and stand the plants on this, the insecticide may be caught and used over again.

Gooseberries dying off.—*Black Watch*: You do not mention the age or probable age of your bushes. It is of common occurrence for old bushes to die off one by one or in pieces every year, particularly in heavy clayey soil, as yours is. In light or poor soil the bushes would sooner become exhausted and cease to bear much fruit, though they might continue to live for many years afterwards. We have noted their behaviour in various soils, but think that all things considered, a heavy or substantial loamy soil is the most productive. The bushes as they get old may get into cold, ungenial soil, and the roots gradually decay till they succumb. Heavy soils also become inert after being left undisturbed, except on the surface, for years. Under these circumstances we consider it a good plan always to be growing on young bushes from cuttings of the best sorts. This could be done in the reserve garden or in some out of the way border, so as to be at hand when planted. The gaps might be filled up after trenching up the soil and manuring it. This, however, is only a temporary make shift. A piece of ground may be trenched and well manured in another part of the garden, and some rows of young bushes planted. This might be continued the following and succeeding years, planting as many rows as you like either at once or in after years according to necessity. When the young plantation is well into bearing the old may be rooted up. See that the drainage is good.

Names of Plants—*M. W.*: 1, *Anchusa italica*; 2, *Valeriana officinalis*.—*D. W. D.*: 17, *Iris virginica* var. A bud of the specimen you sent expanded after being put into water, showing the plant to be a very pale variety of *I. virginica*.—*Omega*: The Tawny Day Lily (*Hemerocallis fulva*).—*R. M.*: 1, *Thalictrum glaucum*; 2, *Thalictrum angustifolium*; 3, *Althaea officinalis*; 4, *Malope trifida*; 5, *Veronica Teucrium latifolia*; 6, *Lychnis chalcidonica*.—*W. SATURDAY, JULY 30th, 1898.

NEXT WEEK'S ENGAGEMENTS.

MONDAY, August 1st.—Atherstone Show. Beddington, Carshalton and Wallington Show. Leicester Show (2 days). Northampton Horticultural Society's Show (2 days). FRIDAY, August 5th.—Midland Carnation and Picotee Society's Show (2 days).

THE FLAVOUR OF APPLES AND PEARS.—

In private establishments this is a matter of leading importance, and every energetic gardener does his best to solve the problem as best he can. He is limited, however, in many ways, by the nature of the circumstances, and the varieties under his care. The task of making a proper test as to the best and most useful annuals might at great expense be accomplished in the course of a single year; but the task becomes formidable and even prohibitive for any single gardener to test the hundreds of Apples and Pears in cultivation to discover which were the best flavoured and most suitable for table use during the twelve months of the year. A plebiscite, so to speak, has been taken by the Royal Horticultural Society during practically two years extending from July 14th, 1896 to May 10th, 1898, and the facts resulting have been tabulated in the *Journal* of the society issued the other week. The general custom of sending circulars to be filled up by gardeners in different parts of the country has not been followed, but prizes were offered for competition at the ordinary meetings of the society, so that the samples adjudicated upon have been open to the inspection and instruction of the public.

When this work has been continued for the space of time indicated, one should be in a position to base a general opinion upon the subject. In looking down the list of exhibitors it would seem that most or all of the prize winners belong to the southern half of England. This might give rise to various suggestions and reasons for the results, and no doubt several things would have to be taken into consideration in basing a hypothesis that would be fair both to exhibitors and exhibitors alike. The southern exhibitors are favoured by climate, and locally in some cases by the nature of the soil. By climate alone the earliness of

any particular variety would be determined so that an exhibitor at a distance, that is, from a northern country would be unduly handicapped by climate alone in entering the lists against a southern grower. The latter would be able to get the best varieties, during any particular month, properly matured before his northern rival could possibly do so. This idea would suggest that a similar competition should be held at some northern centre in order to determine which were the best flavoured Apples and Pears for the district or division of the country under consideration. No doubt many of the varieties at the top of the list in the North would correspond with the selections made in the South. We could hardly imagine that the varieties would be the same in both cases, for they vary widely under different conditions of soil and climate, some varieties giving great satisfaction in northern latitudes that are practically indifferent for culture in the south. Then it follows that while the varieties awarded the palm at London might hold good to some considerable extent for the whole of Britain, there would be defects of detail that would have to be remedied by making similar tests, say at, York, Edinburgh, Aberdeen and Inverness.

In the case of the competition at the meetings of the R.H.S., those who are conversant with the facts know that some of the varieties taking the first award at one meeting were placed second at the following or some subsequent meeting, or got no prize at all. This is obviously due to the fact that varieties remain in perfection during a certain period only, after which they lose flavour and practically become useless for table purposes. That of course applies to all Apples and Pears. Admitting these facts and their general application, we note that some varieties remain in excellent table form for a long period. Cox's Orange Pippin Apple took the first prize at 7 consecutive meetings, namely, from October 1st, 1896 to January 12th, 1897, that is, for five months of the year. It was not shown at all in February, and the premier award at the meeting on the 9th of that month went to Blenheim Orange. During the following year it had a checkered career, its place on several occasions being taken by such old favourites as American Mother, Cockle's Pippin, Adam's Pearmain, and Margil, the latter being shown on January 11th, 1898. Curiously enough it took a leading position on February 8th, the samples coming from Lincoln; and on March 8th it again proved the best out of twelve popular varieties shown. In different parts of the country then, this variety is the best flavoured Apple during seven out of the twelve months of the year. No other Apple can show such a record.

When the competition was first started, Pears made their appearance at the Drill Hall, a month in advance of the Apples, but they were represented only by Citron

A NEW SHADING.

FROSTEEN SHADING.

Heat, but not light proof. Easily applied. No heating required; no mess, no trouble; the latest scientific discovery; beautifies the greenhouse, inexpensive and won't wash off; entirely superseding old fashioned methods and preparations. Can be ordered through all seedsmen and florists, or direct from the makers, price 1s. FROSTEEN AZO must be used in addition to make it permanent, price 1s. 6d. Both sent carriage paid for P.O. 2s. 6d.

FROSTEEN SYNDICATE, LTD., 341, Argyle Street, Glasgow.

As Cool as a Cucumber.

des Carmes on the July 14th, 1896, and by Little William on the 28th of that month. A second prize only was awarded to the first named, and none to the other variety. The earliest Pear recognised with a first prize was Jargonelle, on August 11th. At the succeeding meeting, out of five Pears the first award was given to Beurré de l'Assomption, and during succeeding meetings of the same year similar awards were made in succession to Souvenir du Congrès, Thompson's, Doyenné du Comice, at two successive meetings, Beurré d'Anjou, Beurré de Buisson, Winter Nelis, (on two separate occasions), Passe Crassanne, and Beurré Rance. The latter was shown on March 9th, 1897, after which no more first prizes were awarded till Jargonelle appeared on August 10th following. It will thus be seen that no Pear got more than one first prize, with the exception of Doyenné du Comice and Winter Nelis. This is probably explainable by the fact that they are of short duration after they become fit for use. Possibly this also explains why Williams' Bon Chrétien only managed to secure one first prize during the two years' competition. For market work it enjoys a greater popularity than any other Pear, and is grown in corresponding quantity, but is of very short duration. Competition was briskest during September, October and November, after which, as is well known to every gardener, Pears rapidly disappear from the show boards.

Midland Carnation and Picotee Show.—Owing to the lateness of the season the annual exhibition of the Midland Carnation and Picotee Society has been postponed from July 27th and 28th to August 5th and 6th.

Mr. Douglas at Southampton.—At the Southern Counties Carnation and Picotee Society's show on the 22nd inst., Mr. James Douglas, of Edenside, Great Bookham, Surrey, was a very successful competitor. He won the Challenge Cup for bunches of undressed Carnations. He also secured the first prizes for twelve bizarres and flakes, twelve Picotees, and for twelve yellow ground Picotees, for which he can hold his own against anybody. Out of five premier blooms for which prizes are given in different classes of Carnations, he was the winner of three, namely, the premier flake or bizarre, with Phoebe; the premier yellow-ground Picotee with Mohican; and the premier white-ground Picotee, with Fortrose.

Jedburgh Amateur Horticultural Society.—The summer show of this enterprising little society took place at the Corn Exchange, Jedburgh, on Saturday last when an excellent all round display of flowers, fruit and vegetables was staged; and taken as a whole the exhibition was most successful, and compared very favourably with previous years. Amongst the exhibits not for competition may be specially mentioned that of Mr. William Neil, Jedburgh who had a fine collection of plants grown with pure Ichthemic Guano for which he is the local agent. Messrs. Laing and Mathers, Kelso, and C. Irvine, Jedburgh, had also an exhibition of a first-class assortment of Roses, etc.

Table decorations at Tiverton.—At the recent show at Tiverton the most effective arrangement in the dinner table competitions was made by using white and pink Carnations, with Sweet Peas of pale pink, the whole lightened with grasses, light Ferns and Asparagus plumosa. This first prize table was much admired. The second was also very well done; in this case, however, white Carnations were intermixed with a bright scarlet, and was not nearly so pleasing. In the vase or basket competition the winning stand was a most light and charming arrangement, and as it stood was doubtless a lesson to many in the way of making a little go a long way. One gilded basket with Pyrethrum uliginosum, grasses and an immense scarlet silk bow among the blooms did not meet with many admirers.

The Maze.—Probably the best example of the maze, with its closely clipped hedges and its sinuous and mysterious paths, apparently never-ending, is at Hotel del Monte, Monterey, Cal., U.S.A. As an instance of topiary art, now gone out of fashion, the maze was at one time a popular feature in English public gardens. The one at Hampton Court is the best living example in this country of a past craze.

International Horticultural Exhibition at Lyons.—The programme of this exhibition, which the city of Lyons is organising for September 1st next, has just appeared. It will be sent to anyone asking for it by M., the president of the commission of organisation, 16, Rue d'Algerie, Lyons. The exhibition is considered to have an exceptional importance. From September 1st—4th, Lyons will be the rendezvous of all who have a name in horticulture.

Messrs. Alex. Lister & Son, at Newcastle.—The special Silver Banksian Medal of the R.H.S., awarded to this firm at the Newcastle show on the 13th, 14th and 15th inst. was for twenty-four sprays of Violas, for which they also had the first prize. The same firm took the first awards for forty-eight Pansies, distinct; and twenty-four show Pansies, distinct; and the second award for twenty-four fancy Pansies also went to them. The heavy loamy soil of the Meadowbank Nurseries, Barone Road, Rothesay, where Messrs. A. Lister & Son grow so many florists' flowers, must be highly suitable for Pansies and Violas.

Oxford Cottager's Garden and Allotment Show Society.—The fourth annual exhibition of this society was held on July 21st in Cockfield Hall Park. There was an excellent and varied display of flowers, fruit and vegetables, and a nice collection of plants, not for competition, was staged by Mr. R. W. Dalby, local agent to the Ichthemic Guano Co. The classes for vegetables were by far the most numerous, as is natural in the case of a show for cottagers and allotment holders, and the prizes were in many cases well contested. Mostly all the prizes consisted of money, but for a collection of vegetables, six varieties, the first prize consisted of a pair of trousers, and the third of 2½ cwt. of coal, which will be more appreciated after the hot weather is gone.

The Palm Swindlers.—Some ingenious scoundrels in the United States have been making a good thing of it of late. Their particular "lay" is to give orders for Palms to be delivered at the houses of well known residents of the various towns and cities they have chosen for their nefarious enterprise, and then under some pretext to get these plants into their own hands, afterwards selling them at ridiculously low prices. The favourite dodge is for the man who ordered the plants to obtain the permission of the servants of the houses at which the plants are to be delivered to stand a few plants in the background for a time. He then meets the delivery van and indicates the place at which the plants are to be set down. After the van has gone he then removes his plunder at his convenience. A number of such cases have been reported.

Bulb Prospects for 1898.—At the last meeting of the "Verzendersbond" (an association of Holland bulb-growers and exporters to the U. S. A. consisting of twenty-one of the leading firms in Holland) held at Lisse, Holland, on July 6th, 1898, the following report about the crop of bulbs for the season 1898 has been made out:—As already reported to many trade papers in Europe and the U. S. America, this season will be a very disappointing one for all engaged in the cultivation and sale of bulbs. From Japan and France reports say that good stock is scarce, and every grower in our country reports a poor crop. As known, this was caused by an abnormally mild winter, followed by one of the worst springs we ever had, and frost, winds and cold, wet weather have shattered the outlook for a good, even for a moderate crop. Hyacinths have suffered, most of all, for they especially need, fine, warm weather, and the results are that the size of Hyacinths is very small, and that fine, well shaped bulbs are hard to find. Tulips have not suffered quite as much but still enough to bring mostly medium sized bulbs. Narcissus being more hardy came out best of all, but even here we can only expect fair, medium sized bulbs, and fine stock will not be plentiful.

A new Explosive.—A serious but rather curious accident occurred recently at Bovey Tracey to a servant at the King of Prussia Inn. He threw on the fire in an American stove a quantity of old French Beans. The result was that they exploded and blew off the top of the stove, whilst the servant and the aunt of the inn proprietor were both badly burnt about the face and arms. Both the victims of the accident are progressing favourably.

Trifolium resupinatum.—This Clover is a native of Western Continental Europe and of the Mediterranean Region, yet it has found its way by some occult means or other to the banks of the upper, tidal Thames and above it. The tufted stems are about 6 in. long, and lie all round the central rootstock, rising somewhat at their tips, and producing their bright rose heads of sprightly flowers poised on short, slender stalks. The standards are beautifully striped with a darker colour; and the flowers are quite as deliciously scented as Melilot. If it should become thoroughly naturalised it will be an interesting addition to the Thames Valley flora.

The Consumption of Coffee.—The inhabitants of the United States are the greatest Coffee drinkers in the world, for they consume more than all the people of Europe put together. In 1897 Europeans used 305,150 tons, as against 318,170 tons in the United States, according to the table quoted by the *Board of Trade Journal*. This is the first year that the balance has inclined to America in comparison with the whole of Europe, for in 1896 Europeans used about 27,000 tons in excess of the Yankees. Amongst the nations of Europe, Germany, with 136,390 tons, and France, with 77,310 tons, consumed the most Coffee. Britishers account for only 12,420 tons, and Italians for 12,500 tons.

Carnations that do not split the calyx.—It is satisfactory to note that amongst the hundreds of Carnations being raised at the present day special attention is given to those which do not burst the calyx. This desirable quality is not the sole recommendation of the varieties selected, but it is one of them; and the gardener or raiser, who would discard an otherwise good flower, but deficient in this respect, deserves well of his fellow gardeners. Quite recently we noted a number of varieties having this recommendation amongst those raised by Martin R. Smith, Esq. (gardener, Mr. C. Blick), The Warren, Hayes, Kent. The varieties we refer to are all Malmaison Carnations, specially liable, as a rule, to split the calyx if not prevented from doing so by tying. The under-mentioned require no such artificial assistance to expand properly. Nautilus is a delicately pale or blush form; The Geisha is rosy-salmon; and Mrs. de Satge, that recently received an Award of Merit from the Royal Horticultural Society, comes into the same category. Calypso is flesh-coloured and white, the outer petals being ultimately pure white; the form is very fine and the flower fragrant, as are all, or most, of the Malmaison varieties. Iolanthe is the most fragrant of all the above varieties, and is bright scarlet with a rosy reverse.

A Wonderful Beech Hedge.—On the Perth and Blairgowrie road, a little over a mile from Cargill railway station, and about half a mile from the village of Meikleour on some property belonging to the Marquis of Lansdowne, is what is probably the finest Beech hedge in the country. The trees composing it average about 80 ft. in height, and they are clothed with leaves and branches right to the ground. Local tradition has it that the trees were planted in the year 1746, a critical time in Scottish history. A dyke runs along the front of the hedge, and it is said that a number of the men employed in building it left to take up their claymores and follow Bonnie Prince Charlie to the fatal battle of Culloden in 1746. At this rate the hedge is 152 years old. For many years it was allowed to grow as it liked, and as the result the branches spread across the high-road, and greatly impeded the traffic. This caused the cutting back of the branches, and steps were subsequently taken by the proprietor to have the hedge pruned every five or six years. The operation is performed by men mounted on ladders furnished with wheels which can be easily moved from one end of the hedge to the other, a distance of 480 yards. Large numbers of tourists annually visit the place in order to see this remarkable wall of green, which again in the autumn puts on the loveliest tints.

Churchyard Bottom Wood, Highgate, was opened to the public on Saturday last, the 23rd inst., by the Duchess of Albany. The new name of this "breathing space" is to be 'Queen's Wood.'

The Dahlia was introduced from Mexico to Spain in 1789, and Lord Bute, who was representing Britain diplomatically at Madrid, sent it to England that same year. It was named in compliment to Dahl, the Swedish botanist; but Professor Willdenow, of Berlin, by mistake renamed it Georgina in compliment to Professor Georgi, the Russian botanist. It bore that name for some time in Britain, and to the present day in some Continental countries; but Dahlia by right of priority has been recognised in this country since 1832.

The Grounds of Tresco Abbey.—The mild climate of the Scilly Isles enables Dorrien-Smith, Esq., the lord proprietor of the Isles, to plant many trees, shrubs and other subjects on his estate, which could not outlive the winter on the mainland, except in the most favoured spots. Amongst rare or striking exotics in the open are the Dragon Tree of Teneriffe (*Dracaena Draco*), *Dasylyrion acrotrichum*, the strange *Puya lanuginosa*, Prickly Pears (*Opuntia*), *Fourcroya longaeava*, and many others. It is less surprising to find *Clethra arborea*, *Eucalyptus globulus* and other species, and the golden-yellow *Cassia corymbosa*; but the privilege of growing them in the open air, except in summer, is seldom enjoyed by gardeners on the mainland of England. Mr. Jenkins, the gardener at Tresco Abbey, is proud of his charge amongst these exotic subjects. Bamboos and Himalayan *Rhododendrons* also augment the list, together with *Araucaria excelsa*, *A. Bidwillii* and *A. Cookii*. A great number of species and varieties of *Mesembryanthemum* are grown in various parts of the grounds, and in this respect the Scilly Isles are comparable to the Channel Islands, where a few species are grown in exposed positions on rocks and walls.

Nitragin and Alinite.—The former name is meant to include all the microbes which are concerned in the fixation of free nitrogen from the atmosphere in the roots of various plants belonging to the order Leguminosae. While speaking of these microbes generally Dr. Aikman discusses a pure culture of *Bacillus megatherium*, under the name of alinite in the Nineteenth Century. This organism is also one that fixes the free nitrogen. As far as nitrogenous manures are concerned, it seems like contracting the subject into the compass of a nutshell, when the writer speaks of putting sufficient alinite into a phial, a little under 2 in. in length, and less than $\frac{1}{2}$ in. in width, for inoculating a whole acre of ground. This would, of course, ensure only the nitrogenous wants of plants, but even then it will mean a great saving of labour in the distribution of bulky and weighty manures over the land. In the preparation of food fit for the nourishment of the higher plants it seems that there is a considerable amount of co-operation amongst the microbes of the soil, which effect the respective stages of the chemical process. This is a well known characteristic amongst microbes in other fields of human industry. A second microbe takes up the work of decomposition, where its predecessor left the same, and beyond which it could not go.

OSTERLEY PARK.

(Concluded from p. 747.)

THE bedding-out at this establishment also calls for a brief notice. The beds which face the upper lake are pre-ordained—they must consist of three colours, red, white, and blue. That is a standing order. These colours are brought about by the use of scarlet *Pelargoniums*, like Harry Jacoby, and *Violas*, Cliveden Blue, and Countess of Hopetoun; and these have to be planted freely so that an immediate effect may be produced.

There are, of course, various other beds which are not restricted, but one which took our fancy was of a triangular shape, the base of each side projecting inwards in the form of an arc.

The centre is decorated with *Eucalyptus globulus*, round which are ranged *Grevillea robusta*, *Abutilons*, *Marguerites*, *Lilium Harrisii*, etc., with dwarfier subjects for a foil. *Pelargoniums* in variety, *Lobelia*, Golden Feather, and similar bedders find a place, the

whole constituting a very telling group. Sutton's new crested *Feverfew* is very pretty, resembling somewhat a miniature lacerated *Pteris* Fern, minus the colour.

With trees Osterley is well furnished, the Cedars being fine specimens. *Cedrus Libani*, *C. Deodora*, and *C. atlantica* attain grand proportions. There is also another quite distinct Cedar, which is probably a variety of *C. atlantica*, the growth being stiff and upright, after the manner of that species. *Pinus sylvestris* is there too—there is no mistaking that. Then there are fine specimens of *Platanus orientalis* and *P. o. acerifolia*, with an old-fashioned Cork Oak (*Quercus Suber*), containing enough material to stopper many thousand bottles. The purple Beech, the stately Elm, the hardy Oak, the graceful Birch, the massive Chestnut, the common Hornbeam, and a host of other trees display their various charms. An Arboretum, too, of choice Conifers is being planted, some of which, we may mention, on account of their beauty and at-home-like appearance. These are *Picea orientalis* (very fine), *P. pungens* var. *argentea*, *P. p.* var. *glauca*, *Abies grandis*, *A. lasiocarpa*, *Cupressus lawsoniana* var. *aurea*, etc. Palms, Myrtles and Oranges stand about in huge boxes, and are now enjoying their annual outing; while a fine *Rhododendron ponticum* measures about 100 ft. in circumference. Mr. Hawkes is a true arboriculturist, and takes great interest in the annual planting, which occupies a good deal of time in the winter season.

In the fruit and vegetable departments, Mr. Hawkes can also score some successes. Under glass the Peaches Royal George and Hale's Early, have been exceedingly prolific; while the Vines, Black Hamburg, Foster's Seedling and Madresfield Court, were colouring well. Outside the Strawberries were a promising crop, more especially Royal Sovereign and the new Leader, which took the visitors' taste—metaphorically, not literally.

The Kitchen garden was in good order, Carter's Early Morn Pea being not only ready for the table, but also just right for the photographer. *Caladiums*, *Crotons*, *Carnations*, *Begonias*, *Pelargoniums*, *Gloxinias*, *Celosias*, Sweet Peas in variety, *Roses* and many other things were much in evidence—were standing witnesses, in fact, to the multiple duties which devolve upon the modern professional man.

The visitors concluded an agreeable visit by returning by way of the "long walk," which sweeps round the park for over a mile amidst trees and shrubs of a very varied and interesting character. The new mown hay in the park also lent a fragrance; and this, combined with other scents of early summer, had their full significance. It was, therefore, lastly agreed that not "good bye" should be said, but "*au revoir*."—C. B. G., *Acton, W.*

HARDY BAMBOOS.

(Continued from page 742.)

BAMBUSA PALMATA.—The stems of this species are erect, 3 ft. to 6 ft. high and furnished with a few erect branches very nearly as strong as themselves. They are about as thick as a goose quill, and in their younger stages are covered with glaucous sheaths. Underground suckers ramble widely, so that new stems arise at some distance from the parent bush and soon form a large patch or clump. At Kew these young stems had already attained a height of 2 ft. to 3 ft. by the beginning of June. The huge leaves are mostly crowded towards the ends of the stem and branches; and assuming a horizontal or declining direction, as well as radiating to one side they present a somewhat palmate appearance. They are 6 in. to 12 in. in length, by 2 in. to $3\frac{1}{2}$ in. in width, with very prominent ribbed nerves; and are dark green with a whitish midrib above, and glaucous beneath. Undoubtedly this is one of the finest of the hardy Bamboos proper; and makes a striking tropical-looking bush or mass. It comes from Japan, in the gardens of which it is known as *Kumasasa*, and is perfectly hardy here.

B. PYGMAEA.—This is of dense, spreading habit, with stems about $1\frac{1}{2}$ ft. to 2 ft. high. The leaves are lanceolate, 4 in. to 6 in. long, by $\frac{3}{4}$ in. to 1 in. wide, of a rich dark green, and retained throughout the winter in excellent condition. Originally a small piece of it was grown in a 6-in. pot at Kew; but now there are two or more huge clumps of it which have

to be restrained within due bounds by lifting pieces with the spade. It is one of the best dwarf species of *Bambusa*, and though less elegant than *Arundinaria Fortunei*, it is superior to *A. humilis* in tidiness after having passed through the winter. It might be grown in suitable positions in the rock garden, or elsewhere in proximity to shrubbery. Japan is its native home.

B. QUADRANGULARIS.—The specific name refers to the square stems, but only the largest ones exhibit this peculiarity. They vary from 3 ft. to 8 ft. in height, and besides being brown are notable for the warty little elevations or hard points, which cover them. The lateral branches consist of numerous, short, slender twigs. The pale green, lanceolate and drooping leaves are graceful, and 3 in. to 6 in. long. In severe winters this Bamboo is liable to get injured, but generally recovers during the following season. Japan, and probably China are its native countries. The native Japanese name for it is *Shiho-chiku*.

B. TESSELLATA.—Though, perhaps, less strikingly ornamental than *B. palmata*, this is notwithstanding a very bold and distinct subject, forming a dense and tangled bush or mass, 3 ft. to $3\frac{1}{2}$ ft. high. The stems are also spreading and more or less branched. The leaves alone make this worthy of a place in collections, for they are oblong, 12 in. to 16 in. long by 3 in. to 4 in. in width, varying from light to dark green, with a whitish midrib and slightly glaucous beneath. The underground stems spread as widely as in *B. palmata*, to which it may be compared; but it lacks the elegance of the latter owing to its denser habit. Both are highly desirable in collections, and of the easiest culture after being once well established. Various garden names have been given it, including *B. Ragowski* and *Arundo Ragowski*. It inhabits China and Japan, proving very hardy in this country.

This concludes the genus *Bambusa* in the Bamboo garden at Kew. The finest of all of them are *B. palmata*, *B. tessellata*, *B. pygmaea* and *B. marmorea*.

(To be continued.)

VIOLAS FROM HAWICK.

A BOX containing flowers of a large number of varieties of *Viola* has reached us from Mr. John Forbes, Buccleuch Nurseries, Hawick, Scotland. All the leading types used for bedding and similar purposes were represented, including fine varieties belonging to the rayed, rayless, miniature, edged and parti-coloured groups.

Taking the rayless sorts first, we note the pure white *Marchioness* and Mr. Daniels, the former being sometimes slightly rayed, but one of the best for bedding purposes, and the latter being sweetly scented. *White Empress* and *Cordelia* are beautiful creamy-white sorts, the latter throwing its flowers well above the foliage. From the delicately pale *Blush Queen* to *Florizel* and *Blue Gown* there is a great jump in the intensity of colour. The habit of the two latter is faultless. *Pembroke* is one of the finest of new yellows, the flower being shapely and the lip golden.

Among miniature varieties *Lyric* is several shades darker than *Florizel*, being of a soft lilac. *Queen of the Year* is a beautiful soft blue; and *Seedling No. 2* is intense blue. The light yellow *Gnome* and the dark *Gold Crest* are good for this section.

Rayed *Violas* included such vigorous bedders as *Lord Elcho*, *True Blue*, *Stephen*, of better form than *Bullion*; the sky-blue and white *Diana*; the soft lilac and robust growing *Cherry Park*; *Lord Salisbury*, clear yellow, and *Lady Salisbury*, creamy-white, this and the previous one being very prominently rayed. *J. B. Riding* is now well known, being one of the best dark purple sorts for bedding, easily grown and very profuse. *Sir Robert Puller* is a large and bold deep blue flower, and was sent out from the Hawick nursery last year. *Buccleuch Gem* is a splendid bedder with white flowers and very prominent purple rays, the blooms being well elevated on tall, stout stalks.

Although *Ardwell Gem* is not usually an edged flower, some specimens sent had sported that way. We place it here, however, in connection with its named sports, all of which are gems of the first water, both on account of their combinations of

colour, and their excellent habit. We refer to Duchess of Fife, White Duchess and Goldfinch, which should be in every collection. Jeannie P. Robertson, a lovely cream, rayless flower, with a sky-blue edge is the finest of the new edged sorts we have seen. In the same category we should place Mayflower and Colleen Bawn, but both of these are rayed, with much more blue on the edges. The former is an early bloomer, and the latter has long flower stalks which make it suitable for cutting. Border Maid is the best yellow ground, with a deep blue edge, and differing from Blue Cloud only in respect of the white ground of the latter. We like Border Maid much better than J. Tullett, which has broader blue margins, and is otherwise different. The soft mauve and broad border to Cecilia is delicate and handsome. Hamlet is a yellow ground with a broad bronzy-purple margin, and very distinct. It was awarded a First-class Certificate by the Glasgow Pansy Society a few years ago. Mrs. R. K. Mitchell is a dark crimson-purple, with a white centre.

Parti-coloured or variegated flowers included several well known sorts and others that are just feeling their way. James P. Robertson is a large, exhibition flower of a dark, shaded purple, with rose top petals. It is new for this year, and was accorded a First-class Certificate by the National Viola Society last year. Maggie is a rosy flower with paler top petals. Mrs. F. C. Gordon and J. W. Moonman are blackish-violet flowers, with pale blue-white top petals and edges, something in the same line as Iona and the old Magpie. Lady Reay is a gem in this section with a bright violet centre and broad white margins. Craigie is maroon-violet with blue-white edges to the top petals. Jackanapes is a development upon Vernon Lee, with dark mahogany top petals, the rest being golden-yellow and rayed. It is a very conspicuous and free flowering hedder. W. H. Stewart is blackish-maroon, striped with rose and white.

SWEET PEAS FROM WORTON HALL.

A BOX of cut flowers of eighteen varieties of Sweet Peas has reached us from Mr. A. Pentney, gardener to A. J. Howard, Esq., Worton Hall, Isleworth. Taking the lighter varieties first we were particularly charmed with Venus, a lovely cream, shaded with soft salmon. Golden Gleam, a new American variety, has soft yellow flowers with a well-shaped standard coming up to the Sweet Pea specialists' ideal. The footstalks are about a foot long. Countess of Aberdeen and Prima Donna are lovely pink varieties, the latter being slightly the darker on the back of the standard. Another that may be placed in the same category is Lovely; the centre of the standard is darker than that of either of the previous ones, but the wings are much paler, being of a silvery bluish. All of the above are well worthy of cultivation. Amongst the collection were some beautiful rosy bicolor varieties. Royal Rose has deep rose standards and silvery-rose, netted wings, and is handsome for cut flowers, although the notched standards will hardly appeal to the specialist. The standard of Prince Edward of York is of a rich red, shaded with rose, while the wings are of a deep rich rose. We have always regarded it as a handsome variety, in spite of the notched standard. Blanche Ferry is a larger flower, and an improvement upon the old Painted Lady, the standards being scarlet-red, and the wings silvery-lilac, the two colours or combinations of colours being well marked. Countess of Powis seems to have done better than last year, the standards being of a rich salmon-orange, better defined than in Adonis and Orange Prince, and the wings of a rich rosy-pink, like Lady Penzance. No — we do not like Red Ridinghood, having now seen it several times, but we readily admit it is a great curiosity, with its rose flowers and far too short a hood, made apparently for a much smaller flower.

Of the blue or mauve types, Lady Nina Balfour is amongst the palest, being of a soft mauve, and a determined variety to run to seed. If the flowers sent are strictly representative Creole is decidedly a creole, for the deep mauve or lavender flowers had sometimes darker standards, sometimes deeply tinted with purple, and at other times with salmon-purple. The best of the blues is New Countess, being several shades darker than we usually see Countess of

Radnor. Gray Friar is finely mottled or dusted with purple on a white ground. A bold flower is Captain of the Blues, which has dark blue flowers, though the standards are heavily tinted with purple during most of their period of duration. The rich crimson standards and the dark carmine wings of Salopian are very handsome; but the former are liable to become tinted with black under certain conditions, and then there is an outcry against it. All the same it is very handsome when in its best character. The older variety Ignea is liable to the same changes, the veins of the standards becoming slaty black. Climatic conditions, soil and environment are responsible for great variations even in the same variety in all parts of the world where they can be grown. Mars comes into the same group as the two previous sorts, being a large and richly coloured flower. One of the darkest of its class is Shahzada, with dark maroon standards.

CURE FOR THE LILY DISEASE.

IN common with many other amateur horticulturists I have long been troubled with that widely prevailing pest known as the *Lily Disease*, and the yearly disappointment of seeing my Lilies come up merely to blacken and wither away before they reach the stage of bloom, has led me to investigate the matter with a view to the eradication, or, at least, the mitigation of the evil.

Some few years ago I took up the whole of my bulbs of *Lilium candidum* to the extent of about two bushels, for I thought that by a judicious selection of the strongest among them, and by replanting in the most favourable positions, I might be able to improve the then gradually degenerating blossoms. In spite of this the disease made rapid headway, so that of late I have had but a few poor sickly stems in the whole of my garden.

I consulted the County Council lecturers of this district, both of them Fellows of the Royal Horticultural Society, only to receive the discouraging information that this mysterious disease had defied all research, and all efforts for its cure; and I have read a recent article in the *Standard* to the same effect. The several attempts made to procure a healthier stock by the importation of fresh bulbs from Holland have not met with the success they deserved; for the new arrivals have been quickly reduced to the state of the old, apparently worn out bulbs, by the ravages of the same disease. Hence this strange visitation has been practically stated to be an *incurable disease*.

I have given the subject some thought for a considerable time past, and from what is exemplified at the present in my own garden, I believe I may state that I have discovered a cure for this persistent evil; which is remarkable at once for its simplicity and its effectiveness. My final experiment dates back to the autumn of 1896, and was confined to three groups of the bulbs. Last season they showed a marked improvement in the blossom heads, which appeared to be entirely free from the disease, though still evidently somewhat weak from its effects in previous years.

This summer I have the pleasure of seeing them perfectly healthy and well grown, with fine green stems and leaves, and the promise of large heads of bloom. Other groups in my garden, which have not been treated, have not a single blossom stem, and some of them are so far diseased that they have almost disappeared. Disease and health could not be more clearly exemplified than here, and I shall be pleased for anyone to see and compare them.

And now for the remedy, which anyone may try, I hope with the same pleasing success which has attended my own efforts. In the autumn of 1896, I removed the bulbs from the ground, and after they had dried somewhat, I put them into a large brown paper bag in which was a supply of *flowers of sulphur*; they were then well shaken up, until the sulphur had been worked thoroughly into the crevices; after this, and while still well smothered with the powder, they were planted straight away, with the result which I have described. I feel disposed to give the credit of my investigations to the Royal Horticultural Society's lecturers of the West Sussex County Council, who first aroused my attention to this subject.

From the nature of the disease I felt sure it must emanate from the bulb; for the bulb leaves are the first to be attacked, and it then proceeds upwards

through the stem to the flower, which is the last to be affected. This season I propose to treat more in the same way, and I shall be pleased to hear that others, whose plants are affected with the disease, have also tried this simple remedy with success.—*Horace Byatt, M. A., The Grammar School, Midhurst, Sussex, June, 1898.*

CARNATIONS AT CHELSEA.

THE grime and fogs of the Metropolis are blamed for many things, but while there is not a shadow of a doubt that the conditions that obtain in it at various seasons of the year are inimical and even fatal to many forms of plant life, it is not so certain that in every case these conditions might not be ameliorated by the skilful gardener, and some elements, at least, of success snatched from the desolation. We are led to make these remarks because we think the town gardener is apt to lose heart at repeated failures to get some favourite plants to do, and to give up attempting to do so. One of the most notable instances of success under atmospheric difficulties that has come to our notice is the Carnations at Chelsea. The nurseries of Messrs. Jas. Veitch & Sons, Limited, are not situated in the most suitable spot for the successful flowering of Carnations, and yet, year by year, they continue to overcome the difficulties and to furnish visitors with an admirable object lesson of what may be done with Carnations in London, and even in the low-lying district of Chelsea.

This season the display is much better than it has been for several years past. The plants are healthier, there is more "grass" upon them, and the flowers are more numerous, of larger size, and the colours show higher development. Whether the cold summer weather is responsible or not is only a matter of conjecture, but at any rate, the marked improvement is a fact, and one upon which the Messrs. Veitch's capable foreman, Mr. Weeks, may well congratulate himself.

The plants are located, as usual, in the series of oblong beds close to the Fulham Road entrance to the nursery, where they enjoy a fair amount of light and air. The effects of the late drought have been minimised by a mulching with cocoanut fibre refuse which, besides checking evaporation from the soil, has kept the roots of the plants cool, and has thus tended to keep down insect pests.

The influx of new varieties still continues, and there have been some exceedingly pretty things sent out in 1897 and 1898. Cassandra is one of the best of these. The flower is almost as large as that of a Malmaison, while the colour is a delicate flesh-pink, very much like that of Waterwitch, although here the likeness ceases. Boadicea, another huge self is a great acquisition. The colour is a rich rose-scarlet, very bright and attractive.

We have now quite a number of good white forms, but there is plenty of room for the new one named Sir Wilfred Laurier. The flower is of great size, and of the best form, whilst the petals are stout and smooth. The depth of the flower is another remarkable point. A bed filled with this variety is a conspicuous feature of the Veitchian collection. Mr. James Douglas exhibits a brilliant shade of rose-carmine. Like the other varieties raised and sent out by Mr. Jas. Douglas, the calyx is stout and does not burst. Mr. Douglas regards this as the best Carnation he ever raised, which is a sufficiently high recommendation for it. That fine old self variety, Hayes' Scarlet, has now a serious rival in Mrs. MacRae, which is a larger and a finer flower, the plants apparently being fully as floriferous and vigorous in constitution. Pandelli Ralli is a new self yellow that is of great size and merit. Nox holds the field as the darkest hued Carnation yet raised. The colour may be described as dark maroon-crimson, and this when the sun is shining full upon it gives an exceedingly rich effect. Mopsa is the best of the new fancy varieties to our way of thinking. The colour is a clear apricot-yellow, of fine form, with smooth petals—a very refined flower.

The ranks of the yellow ground Picotees have received decided acquisitions in Badminton, Stanley Wrightson, Wanderer and Miss Alice Mills, all of which have done remarkably well at Chelsea. The last named variety is especially noteworthy. The ground colour is a clear rich yellow with a

heavy scarlet margin. Wanderer has a rosy red, well defined margin, and Badminton a deep red margin of medium width. All three are varieties of great merit, and may be regarded as the best of those grouped in this section.

Amongst recent introductions we noticed a fine bed of Bendigo, the plants being particularly healthy and floriferous. The distinct shade of bluish-purple or heliotrope exhibited by this variety is still the nearest approach to the much longed-for but still unattained blue. As a bedding plant this is exceedingly showy, although the price is perhaps rather high to admit of its being employed in quantity. That lovely pair Seagull and Her Grace have also done very well. The only difference between the two is that Seagull is a deeper shade of blush, which difference can readily be seen on comparison of the two flowers. Little John, a large, scarlet self, of excellent form should not be overlooked. It belongs to one of the best types of border Carnations.

The comparatively new yellow ground Picotees likewise include several forms that have not yet been surpassed. Mr. Nigel forms one of the most notable examples. The ground colour is deep yellow, and the edge a heavy crimson one. Golden Eagle, El Dorado, Voltaire and Xerxes are other fine flowers, but we were particularly struck with May Queen as it has turned out this season. The margin is narrow and light rose in colour, the ground work being a very bright yellow. The size is above the average and the form of the flower excellent.

Old standard varieties are still grown in quantity and it is interesting to see how some of these old stagers hold their own against the newcomers, even although the latter may be more refined, and represent the florist's ideal more correctly. As bedding varieties Mrs. Fred Watts, white, and Joe Willet, scarlet, are a fine pair, for they are the counterparts of each other with regard to height and habit. Both are dwarf, vigorous, and free flowering, Miss Audrey Campbell is grand a yellow, and Mrs. Eric Hambro a grand white. Such fancy forms as Alice Ayres, George Cruickshanks, Chameleon, Cardinal Wolsey and The Dey are still to the fore, and we cannot yet do without them. The same may be said of such Picotees as Norma Carr, Stadrath Bail, Mrs. Henwood, J. B. Bryant, Mrs. Gorton and Little Phil, all of which, together with many others have won many, and will probably win many more, prizes upon the show boards.

Besides the collection of plants growing in the open ground there is a considerable quantity flowering under glass in pots in a house hard by. These plants, too, are doing splendidly, the flowers being abundant as well as brilliant in hue, and symmetrical in form. They are all replicas of those growing in the open, and there is little to choose between them save that, the under-glass flowers having been shaded exhibit rather better colour development, for they have not been bleached by the sun.

THE SWANLEY HORTICULTURAL COLLEGE.

THE Annual distribution of prizes to the various students of the unique horticultural training establishment at Swanley brought together a more than usually enthusiastic gathering on Wednesday, the 20th inst. The weather was beautifully fine, and this, no doubt, added to the high spirits of the students. Their bright faces literally glowed with happiness, and this apart from the natural exultation of the prize-winners; indeed, we never remember to have seen a better example of healthful, physical and mental training than these young disciples of Adam evidenced.

The prizes were given away in the lecture hall by Sir Trevor Lawrence, Bart., the president of the Royal Horticultural Society. The Hon. Dudley Fortescue occupied the chair. The resident principal, F. Graham Powell, Esq., first of all presented his report upon the year's working of the college. He was pleased, he said, to be able to give such a satisfactory account, for both students and teachers had done their very best, and had worked well together. He drew attention to the fact that the college was the only purely horticultural college in Britain. They claimed to be able to teach a man or woman a large percentage of practical and theoretical gardening at the college in the course of two years, two thirds of practical, and one third of

theory being the prescription. That this system was a good one was proved by the successes obtained by students, for the college had for the third time in the last four years, twice with a woman and once with a man, won the first place in the examinations in horticulture held by the Royal Horticultural Society. Of the twenty-nine students who entered for this examination twenty-four were placed in the first and only four in the second class. Miss Olive Harrison took the first place, Miss Lutley and Mr. Wilson were bracketed second, and the two Misses Graves third. Messrs. Goodlet and Flower had won the diploma of the college, one with 907, and the other with 864 marks out of a possible 1,100. Thirteen students had obtained 3rd class bee-keeping certificates from the Berks Bee Keepers' Association, whilst the only lady bee expert in existence was an old pupil of the college. In presenting the prizes to their respective recipients Sir Trevor Lawrence spoke a few kindly words of encouragement and congratulation to each student as he or she advanced in turn to the platform. The following is the list of prize-winners in their respective sections:—

College Diplomas—Messrs. Goodlet and Flower; Silver Gilt Medal of the Royal Horticultural Society—Miss Olive Harrison; Principles of Horticulture, advanced—Mr. Goodlet; Elementary—Mr. Benians; Practical Horticulture, advanced—Miss O. Harrison; elementary, Miss Lutley; Botany, advanced—Miss Deane; elementary, Mr. Wilson; Physics—Miss Young; Geology, advanced, Mr. Pickford; Elementary—Miss Deane; Microscopic Botany, advanced—Mr. Flower; elementary—Miss Young; Chemistry—Mr. Benians; Physiological Botany, advanced—Mr. Goodlet; elementary—Miss Lutley; Best Kept Lady's Diary—Miss Harrison; Man's Diary—Mr. Goodlet; Practical Work, 1st year, ladies—Miss Malins; 2nd year—Miss Petty; 1st year, men—Mr. Mitchell; 2nd year, Mr. Jeffrey.

Sir Trevor also gave away the R. H. S. Certificates, and the certificates from the Berks Bee Keepers' Association. In a subsequent speech, he said, that in looking round the grounds of the college he had found a marked improvement manifest. He would not pretend that there was not room for further improvement, but the fact remained that the college was doing useful work in the direction of horticultural education. In this direction he deplored the lack of the State aid which was given in other countries. The problem of how far a woman was suited for the occupation of gardening had been solved by Mr. Dyer, at Kew, where the women gardeners employed had given every satisfaction. The 'costume' difficulty had, among other things, been easily got over. He thought Kew was in many respects a model garden, and not simply a botanical institution. Sir Trevor impressed upon his audience the need there was for increased facilities for education if the Britisher was to keep up sides with the foreigner. He instance d the thoroughness of the system adopted by other countries by the action of a German firm who supply large quantities of agricultural seeds, particularly sugar Beet. Before planting the roots selected for seed bearing a small piece was cut out of each, and subjected to analysis in the laboratory in order to see if it contained the proper quantity of sugar. He did not know whether women would ever beat the men as gardeners; for his own part he should back the men. He assured his audience that he had done and would continue to do all that lay in his power to forward such institutions as the Swanley College.

A vote of thanks to Sir Trevor was proposed by Miss Cons, seconded by Dr. Beverley, and very heartily received by the company. The vote of thanks to the chairman was moved by Mr. Shea, and supported by Miss Goodrich-Freer. As hon. secretary of both the men's and women's branches, Miss Goodrich-Freer gave some interesting details of the work of the college, and spoke of the way she had approached the various county councils with regard to the scholarships which were really going begging. Miss Harrison, of whom they were all proud, was a county council scholar.

A competition for wild flowers, wreaths, floral decorations, etc., had been devised, and the prizes were allotted as follows:—A collection of wild flowers, Mr. Pickford; a collection of dried wild plants, Mr. Collard, who had 324 specimens; bouquets and sprays, Miss Cassidy; wreaths, Miss

Rands; wreath of wild flowers, first, Mrs. Lowther; second, Miss Lutley; table decorations, Miss Worland (in this case the judging seemed to us entirely wrong, for this exhibit was inferior to at least three others); packing competition, Mr. Hales; extracted honey, Mr. O'Hara; and honey in sections, Miss Ault. The gathering then resolved itself into a sort of garden party with an *al fresco* tea.

We inspected the gardens and glasshouses attached to the college, and were pleased to find a marked improvement all round. Mr. Budworth, the gardener, has some excellent results to show for the work performed by his mixed staff of men and women. Tomatos and Cucumbers are exceedingly good, and remarkably heavy crops, Tomato Up-to-Date being the favourite one. The Vines have all been lifted and replanted in fresh material, and insect pests have been carefully kept down. The apiary is another noticeable feature, and we noticed that a very handy bar-framed hive of rather large size is employed.

The lawns and flower gardens are all clean and well kept, and the whole establishment has smartened up wonderfully since last we had the pleasure of visiting it. Congratulations to Mr. Powell and his able assistants.

The Orchid Grower's Calendar.

CATTLEYA HOUSE.—I notice that the beautiful and free-flowering *Cattleya Mendelii* is breaking away unusually strong again after carrying a good crop of flowers; and as we believe in the principle of affording fresh material for them to root into each season, we shall run through them at once. Our experience teaches us that if done carefully and well—as it should be—when the roots are most active there is no fear of any check whatever. This can hardly be said of plants that are allowed to remain in the same pot two or three seasons until the compost has become sour and the plants weakened through the want of the little nourishment supplied in the sweet new compost.

Again, where there is a great number of species it is impossible to get through them all during the spring months, as is generally advised. Neither is it wise to do so. Some plants root after flowering; others there are which make up their growths and take a slight rest prior to pushing up their flower spikes. It is, therefore, patent to those that closely observe the habits of the various species that what is sauce for the goose, &c., does not apply to all Orchids. There are other advantages in potting plants during the summer months, and that is you avoid the drying influences of the hot-water pipes.

The compost we use for *Cattleyas* is of the best possible description. The peat, which is termed No. 1, is very fibrous, and the sphagnum moss fresh and green. The pots and crocks too are clean and dry. Plants that have done well, when turned out of their pots, will be found plentifully provided with white roots, so much so that it is with difficulty you can get away much of the old compost; neither is it necessary if in good condition, for by affording a pot one size larger you can afford them just that little fillip they require to keep them in good condition. After potting very little water will be wanted, the moisture in the air by the frequent syringing amongst the pots which is practised at this season of the year keeps the compost, moist until the growths are well up and the roots have fairly got hold of the new material. More *Cattleyas* are killed by over-watering than by any other cause: remember that.

COOL HOUSE.—*Odontoglossum Rossii majus* has growth, about half made up with us, and is pushing new roots from the base. We like to catch them in this state when affording new rooting material. This pretty, dwarf-growing, *Odontoglossum* detests anything stagnant about its roots. It quickly shows this by the foliage going off at the tips. A stuffy house, too, will do it.

ONCIDIUM TIGRINUM.—Look out for plants that are strong enough to flower, and protect the spikes, as they push up, from the ravages of slugs. We hang ours up, besides placing some cotton wool, rough side outwards around the spikes, and then we have to keep a sharp look out or a whole season is lost.—C.

HINTS FOR AMATEURS.

STRAWBERRIES.

THE crop of Strawberries has not been so heavy this year as was anticipated, owing to the spell of dry weather that we have had ever since the fruit commenced to ripen. This has caused all but the earliest fruits to be rather small, although we have to a certain extent been compensated for this by firmness of flesh and richness of flavour. The crop has also been later than usual this season, although it seems to have lasted fully as long as it does in an ordinary season. In the South of England, at all events, the crop is practically over, although, of course, up North people are still enjoying the favourite "berry." There is no crop that gives a better return than the Strawberry, and in addition to this no great amount of labour has to be expended upon getting it to do well. It is true the plant likes a rich, deep, loamy soil, but any ordinary garden soil will suit and bear crops.

The length of time during which a Strawberry plantation will continue to bear good crops of fruit varies from three to five years. Four years, as a rule, is quite long enough, and in many cases it is not advisable to allow the plants to remain for more than three years. Excellent results are obtained by some cultivators who treat the Strawberry as an annual, that is, they root out the plants after they have fruited once. This system, however, entails a great deal of work, and we should not recommend it to the ordinary amateur, as although the fruit borne in the second and third years is not perhaps so large as in the first, the aggregate of the crop is heavier.

Still, now and again, it is necessary to have a change, and a stock of plants must be worked up to do it. Besides this, there are plants wanted for forcing in pots next Spring.

Layering should therefore be commenced directly the crop of fruit has been removed from the plants. Not a few cultivators have special stock plants from which their supply of runners is obtained. The stock plants are not allowed to fruit, the flower trusses being cut out as fast as they make their appearance. The removal of the flower trusses gives an impetus to the production of runners, for if Nature's children cannot reproduce themselves in one way they will in another. Runners are thus forthcoming very early in the season, and have an extra long period of growth before them, wherein they may form good plump crowns and ripen the same thoroughly before the winter. This system is all very well for those who, unlike the majority of amateur cultivators, have plenty of space and labour to spare, and who want extra big and fine fruits, but for all ordinary purposes it entails a lot of needless trouble. Layers obtained from plants that have borne fruit will, if pegged down before the end of July, make strong plants by Autumn.

A number of pots of the size known as small sixties should be obtained. A single crock should be placed in the bottom of each of these, and the pots filled with soil. The latter may consist of any rough material that is handy. We always go to the old soil heap for ours, where a very decent compost may be had by just passing some of the contents of the heap through a rough riddle. Make the soil in the pots fairly firm.

The next requisite is a supply of pegs for fastening down the runners. In private gardens a stock of these is worked up in the dull days when work is slack, but the amateur is scarcely likely to be so provided for the future as that. Pegs of sufficient strength may be cut in abundance from the fronds of the common Bracken, and a few old birch brooms also come in handy in this respect. If any of my readers live in the country where hedgerows and copses are to be seen instead of shops and chimneys, a visit to some of the aforesaid hedges will yield plenty of material to go on with.

If pegs cannot be got the runners may be fastened down by placing stones upon the stems, but this is not so good a method of keeping them in place as the pegs, for if the pots happen to be turned over the young plants are disturbed. In selecting the runners choose the strongest. Fix the rosette of leaves to the soil in the pot by means of a peg, and cut off all beyond this rosette leaving the communi-

cation with the parent plant undisturbed. Where there is a whole bed to choose from layer only three or four runners from each plant and cut the rest away.

As watering will be a daily task if the weather turns out hot and dry, the pots containing the layers should be stood level and close together in batches between the rows, so that it will be fairly easy to water a lot of them at once by means of a rose-can.

Trimming the Old Plants.—If no layers are wanted, and it is desired to leave the plants in the beds for another year or two, some tidying up will be necessary. The old plants should be gone over, and all the runners cut off close to the stool with a sharp knife. To do this will mean sacrificing some of the lower leaves as well, but this will not matter. At one time it used to be a very common practice to see the old stools cut over until they were bare all but for a few straggling leaves, which were left, apparently, to mourn the disappearance of the rest. Common sense, however, has taught the gardener that it is too drastic to trim up the stools in this fashion, so a middle course is adopted, whereby only the lower leaves are sacrificed, and the check received by the plants is accordingly not nearly so great.

After the preliminary cutting over has been seen to all the prunnings, together with the mulching of straw or hay that was given to prevent the fruit from being splashed with mud, should be raked together, carted off to the rubbish heap or a piece of vacant ground, the latter for preference, and burnt out of the way. The ashes, by the way, will form a valuable dressing for a new plantation.

The rubbish removed, the hoe should be set to work between the rows and the plants, both to destroy the weeds and break up the surface of the soil which has become rather hard by constant treading upon it during the fruiting season. A light raking over will then take off the half dead weeds, and leave the ground clean and tidy.

If the soil is very dry, which it certainly is at the moment of ripening, the old stools should receive a thorough soaking with clear water. This will start them into growth, and should be repeated subsequently if the drought continues. Even if rain comes after the watering, the plants will be in a much better condition to make the best use of it, and the preliminary watering will be by no means wasted labour. It is important that the old plants should be given as much assistance as possible, for, like the young plants, they have their growth to make for next year.

Destruction of Old Plantations.—In making away with old plantations it is very necessary that the old stools should be got clean out of the ground, and not simply chopped off just below the surface. These old stools, if left in the ground, serve as a refuge for all sorts of vermin, especially wireworms. I remember seeing, not many years back, an old plantation in which the stools had been chopped off in this way. The ground was cropped the next year with Carrots, but it was so infested with wireworm that the Carrots were of very little use, for the roots were bored and eaten in all directions.

Varieties.—Each year sees the introduction of a number of new varieties, very few of which, however, come to stay. That time-honoured favourite, Sir Joseph Paxton, is still one of the very best in cultivation, its only rival being Royal Sovereign, which is now extensively grown both by private and market growers. Both these varieties are thoroughly to be depended on although Royal Sovereign gains somewhat in the matter of earliness, being from four to six days earlier than Paxton. Of the new varieties Prolific, obtained by Messrs. Jas. Veitch & Sons, Ltd., of Chelsea, as the result of a cross between Empress of India and British Queen, is well worthy of attention. It is a remarkably heavy bearer, and the deep crimson fruits are of delicious flavour, resembling British Queen in this respect, but ripening right to the tips in a way that that variety very seldom does.—*Rex.*

America Wants Country Gentlemen.—We notice that an American contemporary advises its readers "to sow 'Country Gentleman' up to the first of July." The species is getting rare in the old country now, but we have not yet attempted to propagate it in this way.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Grass to Name.—*Geo. T. T.*: The grass you enclose is called *Stipa pennata*, or Feather Grass. It has been grown in gardens for many years, for in Gerarde's time, as far back as the 16th century, the ladies are said to have worn it as feathers. The plant is perfectly hardy, and will grow in any ordinary garden soil. It may be increased either by dividing up the old plants or by sowing seed. If the flowering stems are required for decorative purposes they should be cut before they have been too much knocked about by the weather.

Asplenium marginatum.—*M.*: This *Asplenium* is exceedingly difficult to grow, and it is very rare indeed that even a respectable looking plant of it is to be seen. We are not at all surprised at your failure in getting it to grow; indeed, we should have been surprised had it grown in your greenhouse, which is too dry and draughty for it. Even if you get another plant it will be sure to die under such conditions. The plant, being a native of tropical America, requires stove heat, together with an atmosphere as near saturation point as possible, and plenty of water at the root. Unless you can give it all these it will never grow.

Cinerarias.—*L. K.*: From the description you give of your plants, and the conditions under which they have been placed, it seems very evident to us that it is far too hot and dry for them. Cinerarias love a cool, moist place, and do not like a hot, dry one. If you can shift the frame to a position under the shelter of a north or east wall, the former preferably, you will find that the plants will do much better. If you can stand them on a bottom of clean ashes, so much the better. Over-watering may have been the ultimate cause of the death of some of the plants, but the primary weakness was undoubtedly due to the reason we have indicated.

Lettuce Bolting.—*Lettuce*: It is not at all an uncommon thing for Lettuces to "run" or "bolt" in the way yours have done, although the "Cabbage" varieties are not any more liable to do it than the "Cos"; indeed, as far as our experience goes, the reverse of this is the case. There are several things that will cause wholesale "bolting." First, poor or old seed—this is a frequent cause. Then there is very poor soil. This is not so frequently the cause of bolting, because in most gardens the soil is up to, at least, a fair standard. The third reason is the hot, dry weather, which, more than anything else, causes Lettuces to run. It is this which has most likely brought about the evil in your case, probably assisted by the partial or complete action of the other causes mentioned. Probably, the later crops of plants raised from the same seed will turn out a 1 right.

Watering Flower Beds.—*Tyro*: If you once begin to water your flower beds you will have to keep on if the weather continues dry. The water draws the roots to the surface, and then, unless the supplies are kept up, the roots are burnt up and the plants suffer more than they would have done had no water at all been given.

Thrips in a Vinery.—*Reader*: Sponge the leaves with Tobacco water, and persist in the practice until the pests have been got rid of. It would be a serious matter to vapourise or fumigate the vinery, especially as it is attached to your dwelling-house, which makes it almost out of the question.

Celery Fly.—*R.*: The Celery plants are badly attacked with Celery fly (*Tephritis onopordinis*), which causes all those brown blisters on the leaves that you speak about. Seeing that all the plants are affected, it will not be possible to get rid of the pest by picking off the leaves. You should go over them, however, and pinch all the blisters between the finger and thumb, thereby killing the grubs that are eating their way between the epidermides of the leaf. You may dust the plants with soot or tobacco powder, in order to prevent the mature fly from lay-

ing its eggs upon the leaves. There is an Ichneumon fly that preys upon the Celery fly by laying its eggs in the body of the larvae of the latter. These eggs hatch into grubs which eat the grub of the Celery fly.

PHOENIX ROEBELINI.

FROM the very first time this graceful Phoenix made its appearance in public, everybody recognised its distinctness and light, elegant appearance; but fears were entertained that its growth would be too slow to meet the requirements expected of Palms at the present day. It is still a rare plant in this country, and likely to remain so unless seeds of it can be imported in quantity, as in the case of popular varieties which are grown by the thousand. Under cultivation, it has increased in size more rapidly than it was deemed capable of doing. The accompanying illustration represents a plant that was for some time in the keeping of Messrs. R. B. Laird & Sons, Pinkill Nursery, Murrayfield, Midlothian, and with whom we saw it some months ago. It was one of three that found their way into Scotland, and at the time we speak of it was one of two in the northern capital. It was certainly the best specimen of its kind in Scotland, and we believe was the best in the British Isles, being a perfect specimen. The leaves were very numerous, long for the species, and gracefully arching. The rigidity common to many of the species more generally cultivated was quite absent here. The plant, we learn, has since passed into the possession of Messrs. F. Sander & Co., St. Albans.

CARNATIONS AT EDENSIDE.

WITHIN the past few years Carnations have acquired a meaning and a name amongst the masses of the horticultural public. Previous to that the show Carnations and Picotees, with the Old Clove in the open garden held sway, but their monarchy, so to speak, was a very limited one. The show flowers still remain but their principal use is the exhibition table. It was a happy conception, both in the interests of the whole race of Carnations, and in that of the public, when the idea first dawned of raising varieties of hardy and vigorous constitution, in no way hampered by the canons of the florist proper, but which should in every way be suited for culture in the open border. A race aptly termed "border Carnations" is now a reality, and any one who is at all conversant with the requirements of plant life can grow these Carnations with ease and success. Thanks to the initiative and untiring perseverance of such men as Martin R. Smith, Esq., and Mr. James Douglas, who have already entirely revolutionised Carnation culture, and still carry on the good work with great vigour and earnestness.

It was our pleasure at the end of last week to examine the splendid collection of Mr. James Douglas, Edenside, Great Bookham, Surrey. His nursery is within five minutes' walk of Bookham Station on the South-Western Railway. All the sections of Carnations are well represented here and we devoted our attention chiefly to the newer and more popular types replete with the varieties that are rousing public attention everywhere.

MALMAISON CARNATIONS.

As is now widely known this race is best adapted for pot culture; and though the older varieties are still grown in the greatest quantity, the newer ones are being received by cultivators with open arms. The colours are already extremely varied. Prime Minister (M. R. Smith) is considered the finest scarlet Malmaison, and it is certainly of handsome form and beautifully refined. Another new variety, named Lord Rosebery (M. R. Smith), is a crimson-scarlet of rich and splendid colour and refined form. The first pure white Malmaison ever raised is Nell Gwynne (M. R. Smith) which does not burst its calyx. An Award of Merit was recently granted it by the R.H.S. The rosy-scarlet of Mrs. Everard Hambro is quite in another vein from either of the above; and the rich salmon-rose or bright rosy-pink (we have difficulty in naming the exact shade) of Princess May is almost certain to take the public fancy, for it is really charming. Those who like a striped flower will find it in the fragrant Lady Grimston, finely flaked and striped with scarlet and rose on a white ground. Trumpeter is of remarkably vigorous habit, and furnished with broad leaves; the

huge flowers are of a brilliant crimson-scarlet. The leaves of the variety just named, however, must give place to the remarkably broad and deep glaucous hue or almost steel-blue of the foliage of Churchwarden. Independently of the flowers, the leaves are a feature of the variety. The large flowers are of a brilliant crimson-scarlet. The largest flower in the whole collection of Malmaisons is Sir Charles Freemantle, the blooms being of fine form and rich rosy-pink. All of the above are practically new varieties, of which Mr. Douglas has a large and healthy stock now being layered. All the Malmaisons are delightfully fragrant.

TREE CARNATIONS.

The claims of this class are by no means ignored at Edenside, where progress is the order of the day. The finest scarlet is Patrocles (Douglas), being of very refined form, rich scarlet and floriferous. The blooms are carried erect on stout stalks and the calyx does not burst. By way of contrast Comus

Individual blooms last about a fortnight in perfection and are well worthy of inspection. They are grown in the full sun without any shading whatever, plenty of ventilation being kept on at all times. So numerous are the varieties that we can only mention a few of the best, all of which are grown in large batches, so that an excellent conception of their capabilities is obtained. The yellow ground Picotees are the acme of all that is lovely in this highly favoured race. Miss Violet is a heavy and bright rose-edged sort of leading merit and distinctness. So also is Dervish, which is lined with rose and has a beautiful lilac tint. The rosy margin of Empress Eugenie is taking and the form excellent. The bright rosy-red edge of Mohican (M. R. Smith) is almost confined to the margin, not a common occurrence in a yellow ground. Effie Deans (M. R. Smith) is a lovely and distinct thing even in its last stages when the pale yellow ground shows off the lilac margin. Mrs. Tremayne (M. R. Smith) is heavily

PHOENIX ROEBELINI.

(Douglas) may be described as the finest pure white tree Carnation, the form being neat, and the blooms carried erect on stout flower stalks. Being very floriferous this is a safe investment for winter work. Julia is a very dark maroon-crimson, and truly handsome in this particular shade of colour. It was granted an Award of Merit in 1896 by the R.H.S. The blossoms of Regalia are of a clear, attractive rose, as large as those of a Malmaison, and most abundantly produced. Sylvanus stands about 3½ ft. high and carries an abundance of dark purple flowers. It was raised from Royal Purple and Duke of York. All of these tree varieties are new and of Mr. Douglas' own raising. He never disbuds them, as they are grown for seed, the best of which is borne by the smaller flowers on the side shoots.

YELLOW GROUND PICOTEES.

A houseful of these is a magnificent sight, and sufficient to fill the mind of the grower in private establishments with invidious sentiments. The weight of bloom will be sufficient presently to hide the foliage.

edged with bright scarlet and strikingly distinct. A sport on one of the plants carried a fiery scarlet self-coloured flower. The vigorous growing Badminton (M. R. Smith) is a narrow red-edged variety of great beauty. His Excellency (M. R. Smith) is the best bright rose narrow-edged variety. Voltaire (M. R. Smith) is a huge flower lined with bright rose, and as a result of the plebiscite was placed at the top of the list of yellow ground Picotees in the second edition of the Carnation Manual. A sport from it is almost self yellow. The edge of Mr. Nigel is maroon-crimson, and the variety is one of the finest of the true yellow grounds. The narrow rose edge of Wanderer (M. R. Smith) is very handsome, and the flowers are produced in great abundance. The rose and deep purple of Harlequin justifies the name that has been given. Golden Eagle (M. R. Smith) used to be the best rosy-red edged sort, and it is certainly good yet. Fancy yellow grounds are not neglected and certainly some of them are marvellous and curious developments of colour. Dragon is

edged, barred, and mottled with purple. Cardinal Wolsey has been placed at the top of the yellow ground fancy Carnations, the scarlet and orange stripes showing a remarkable combination.

All the best of the show varieties, bizarre, flaked and self Carnations, as well as the white ground Carnations are grown and tended with great care at Edenside, but as few of them are really new we need not further mention them on this occasion, as they are well known to the specialists in this particular line.

WHITE GROUND PICOTEES.

As already mentioned, the exhibition types proper are grown along with the more modern races. We felt constrained to note some of the varieties of the white ground Picotees, on account of their refined and beautiful forms. In this latter respect, Harry Kenyon is one of the finest, and has a light purple edge. The lively rose edge of Mrs. Beswick is very heavy, being both conspicuous and attractive. Charlotte Brontë and Fortrose are really handsome, the one forming a fine contrast to the other. While both have broad and evenly rounded petals, the first named has a heavy red edge, and Fortrose a light rose edge on a clear white ground. All of the above are gems of the first water and new.

BORDER CARNATIONS.

For general cultivation we now come to the most interesting class, which has given such an impetus to the cause within the past decade. The selfs are the most generally useful though many of the fancy varieties have an attraction to the unsophisticated and unbiassed or unprejudiced mind, that their beauty cannot be resisted. Whether for border decoration or cut flowers they are unrivalled. Owing to the vigour of their constitution there is no difficulty in getting grass (leafy shoots) for layering, and their hardiness in well drained, firm ground is now a well established fact. The bulk of all the sorts at Edenside are grown in pots for convenience, with the exception of the seedlings which are grown and flowered in the open.

The maroon-crimson flowers and broad entire petals of Sir Henry Irving place it in the first rank of importance. The same may be said of the rich terra cotta of Mrs. Colby Sharpin, which carries its flowers erect. It is a great improvement upon Mrs. Reynolds Hole. Equally good in habit is Hampden, a shade or two lighter than the previous one. The huge white flowers of Delightful are slightly flaked with rose and very aptly named. Miss Florence comes into the same category, but the large and showy white flowers have a cluster of rose flakes generally about the middle of each petal. Both are great favourites with the ladies. A gorgeous and beautiful flower is Francis Wellesley, the flowers being of a most attractive shade of rich carmine-rose. Equally distinct in their way are Druid, bluish-mauve; Lady Hindlip, a fiery-scarlet of most refined form; and Bendigo, a most remarkable shade of blue-purple, being in fact the nearest approach to blue we have yet seen amongst Carnations. The Cadi is a rich scarlet and beautifully formed flower, with refined petals. The salmon-pink Endymion is the finest yet raised of this colour, and the growth is splendid. Mrs. Grey Buchanan is a finely formed flower of a rich and dark apricot. Queen of Sheba (Smith) is a masterpiece in delicacy, for it is pale yellow with an apricot centre.

White varieties are very numerous in the collection, and many of them are really acquisitions. The Briton is one of them, being a huge white flower with entire edges, and carried erect on stout stalks. The grass is also vigorous. Elfin is snowy white, and at one time was the best of its class; it flowers profusely. Saul is a clear, rich yellow; and Diana is paler, but much larger. The huge, rich rose flowers of Sapho never burst their calyx. Of dark varieties the richest are here, including the large maroon-crimson Mephisto, and Nox, a smaller, nearly black flower. A very pretty light colour is the rosy-pink Mrs. Gascoigne. Exile is of a rich rose, and was the premier self Carnation at the Southampton show. Mrs. James Douglas is a dwarf, free, early flowering variety of handsome form and rich scarlet.

Fancy border varieties are not neglected. A bold flower is Perseus, which is irregularly striped with heliotrope and orange on a yellow ground. Beautiful of its kind is Artemis, which is barred and striped with heliotrope and scarlet; but the finest of this type we have seen is Pelegia. The dark heliotrope and scarlet are well defined and regularly distri-

buted; the flower is also full and regularly formed. This as well as Sir Henry Irving, Miss Florence, Delightful, and Francis Wellesley belong to a set of nine, raised by Mr. Douglas for 1898-99.

Many of the above have been honoured with Awards of Merit and First-class Certificates at various London and provincial shows, and mark progress in the race that will quite revolutionise Carnation culture in the near future. These fine varieties are just as easy to grow, yes, easier than the bulk of the old types which they are bound to supersede. More than 150 of the varieties raised by M. R. Smith, Esq., are grown at Edenside, besides 100 raised by Mr. Douglas himself. He has 12,000 plants in pots under glass.

THE VIOLET AND THE TULIP.

AN ALLEGORY.

Down in a little silent dell
A simple Violet loved to dwell—
To plain and rustic manners bred,
She still hung down her bashful head;
Unfond to meet the gazer's eye—
For rural Nymphs are ever shy:
Yet still among the homely crowd,
'Twas universally allowed
That she had charms which well may vie
With many a flower of gaudier dye.
The Daisy at a distance sighed,
While Primrose dangled at her side,
Constant as any modern beau
That feigns a pang he ne'er can know.
The Bluebell, from a noble race
Descended, own'd the flower had pace,
And might, if polished in the town,
Put many a boasted flow'ret down.
Poor Periwinkle praised her air,
And "DAFFODILS" confessed her fair.
It happened, as the story goes,
That near the spot a TULIP rose,
A haughty DUTCHMAN of high birth,
And used to grow in "sifted earth";
But Time, that lays the proudest low,
Had here condemned the flow'r to blow;
By some rude gard'ner cast away,
And doomed to dwell in "humbler clay."
And like some vapoured city fair,
Ordered into the country air,
The TULIP plays off many a grace,
And proudly shews her painted face.
The neighbour plants, amazed, behold
Her purple petals streaked with gold;
Her slender stalk of tenderest green;
Her graceful form and courtly mein;
And gape as folks are wont to do
(Poor country folk) at objects new;
While she despises this and that,
Calls some "disgusting," others "flat."
But most the Violet she disdained,
And of her insolence complained.
"I wonder such a minx," said she,
"Could push thus into company;
Or with her little awkward ways,
Can think (poor silly wretch) to please.
Pray know your betters, miss," she cries,
"And keep your distance if you're wise;
'Tis pretty time o' day indeed,
When I must talk to such a weed,
That thus so impudently grows
Beneath, forsooth, my very nose."
"Madam," replied the modest flower,
"WE ALL CONFESS YOUR SOVEREIGN POWER,
And own that with so rich a dye
'Twere vain for Violets to vie,
And humbly make but this request—
Your ladyship may let us rest."
Just then a bee came buzzing by,
And on the Violet cast his eye,
Thrice humm'd around her azure breast,
Then on her lip a kiss impressed,
Whilst Tulip all neglected lay,
Tho' blazing in her proud array.

Hence humbled vanity may see
'Tis only sweets attract the bee:
—Richard Alfred Milikin, Cork; born, 1767; died, 1815.

Mountain Ashes are very plentiful on Vesuvius, yet strange to say, it is practically treeless.

BELGIAN NURSERIES.

IX.—MESSRS. F. SANDER & CO., BRUGES.

IN England the leading feature of this firm is the Orchids at St. Albans; but at Bruges, Belgium, the two leading specialities are Palms and Indian Azaleas. Several houses are also entirely devoted to Orchids; and a good many others are occupied with fine foliage plants generally, including new plants. The establishment at Bruges is only of two or three years standing, yet it has already developed to vast proportions, and a great block of houses was being added on the occasion of our visit in April last. The nursery or village of glass consisted of eighty houses besides the addition since made, and is easily reached from the station at Bruges, just outside one of the ports of the ancient city.

FINE FOLIAGE PLANTS.

Under this heading Palms easily take the leading place as far as numbers or quantity are concerned, but other subjects probably take precedence in number of species. The head quarters of the Sweet Bay (*Laurus nobilis*) are at Bruges, and on the occasion of our visit they were in the open air. There are thirty to forty Palm houses, and the first two entered were occupied with *Latania* and *Coryphas*, 12 in. to 18 in. high, the former being plunged in tan. The Palms are taken out of this and hardened off before being sent away. For economy of heating and in construction the Palm houses are all built in great blocks, the area continuous, and the roofs supported by brick arches. One centrally situated boiler heats a great number of these houses. A houseful of *Aspidistra lurida* and *A. l. variegata* was in first-rate order. We next entered a house of *Dracaenas*, consisting chiefly of *D. Bruantii* with bronzy young foliage, and very useful for decorative work. *Ficus elastica* was grown in thumb pots, plunged in leaves to root them. Numerous varieties of *Dracaenas* were being raised from seeds. Other occupants of this house were tuberous *Begonias*, *Phoenix canariensis* and *Cocos flexuosa* in quantity.

Kentias by the thousand engaged our attention in another house. The most popular are *K. belmoreana* and *K. fosteriana*. Less common are *K. rupicola* and *K. mooreana*, red petioled forms. *K. canterburyana* is not so popular. All these vary in height from 6 in. to 18 in., and seedlings were germinating under the benches. *Kentias* are grown cool, with plenty of air, and are never plunged, as are the *Latania*s which require more heat.

A cool house contained a fine batch of dwarf and sturdy *Coryphas*. Slender and graceful was *Phoenix rupicola*. *P. canariensis* consisted of sturdy plants 3 ft. high; and the Wax Palm (*Ceroxylon niveum*) stood 3 ft. to 4 ft. high. Next to this came *Kentias*, 2 ft. high; and the central beds were occupied with fine specimens of *Latania*, 3 ft. high, clean, healthy, and consisting of eight to ten leaves. The palmate or fan-shaped leaves of *Brahea glauca* were fringed with filaments on the edges, and the plants stood 5 ft. high. Plants of *Cocos Bonetti* were to be seen of various sizes up to 6 ft. and 8 ft., the pinnate leaves being glaucous and handsome. Outside the vestibules of some of these houses *Bambos* in tubs were represented by *Phyllostachys aurea*, 10 ft. high.

Elsewhere we came upon *Kentias* 18 in. to 2 ft. high in 48-size pots; and others 5 ft. to 6 ft. high carried about seven fine leaves. *Livistonas* in fine form were being got ready for despatch for the purchasers. Some huge houses were filled with *Phoenix canariensis*, with twelve to fourteen leaves; *Corypha australis*, 2½ ft. to 3½ ft. high, and bearing ten to fifteen leaves; *Seaforthias*, 18 in. high; *Phoenix rupicola*, in fine form; and *Cocos romanzoffiana*, 12 ft. to 14 ft. high, for furnishing. A magnificent specimen of *Encephalartos Altensteinii*, had a stem 4 ft. in girth; and a head of sixty leaves, with a spread of 12 ft. to 14 ft.

In another block we noted *Cocos romanzoffiana* already 5 ft. to 6 ft. high, although only yet in the juvenile state with undivided leaves. *Latania*s in tubs carried from twelve to fifteen leaves, and were 6 ft. to 7 ft. high, and as far through. Three or more seedlings of *Areca lutescens* are put in each of 48 and 32-size pots for decorative purposes. These Palm houses were shaded, some by means of paint and others by lath blinds. *Areca sapida* stood 3 ft. high. Tree Ferns were represented by *Dicksonias* 12 ft. to 14 ft. high. *Ophiopogon* is also grown in quantity. A magnificent specimen of *Kentia australis*, standing 14 ft. high, carried fifteen leaves. *Cocos plumosa*, *C. flexuosa* and *C. romanzoffiana* (the

latter being much bolder than *C. flexuosa*) stood 12 ft. to 14 ft. high. A rarer Palm than either was *Kentia Victoriae*, represented by the only known specimen, 14 ft. high and carried twenty-one leaves. The arching leaves and decurved pinnae resembled the wings of a gull half open and flying. *Raphis flabelliformis*, 3 ft. to 6 ft. high, was in excellent form.

A series of houses consisting of a mixed assemblage next engaged our attention. The beautiful and graceful leaves of *Daemonorops pyracantha* and *D. palambarica* were set off by batches of various *Dracaenas*, shapely plants of *Vriesia hieroglyphica*, with their strangely marked leaves, *Areca lutescens*, and the useful old *Pandanus utilis*. *Smilax*, *Pandanus utilis*, *Dracaena sanderiana*, *Geonoma gracilis* and *Kentia sanderiana* were all useful decorative subjects, here in fine marketable condition. The last-named species is a new plant, with light and graceful foliage, as fine as that of *Cocos weddelliana*. In one of the propagating houses we noted a remarkable *Kentia* of dwarf habit, with very much congested or crowded pinnae.

A huge house with a latticed roof, supported on iron pillars and open at the sides, was intended for housing *Araucarias* in summer. Such a house is always cooler in summer and warmer in winter than the outside air would be for such plants. Here we noted some curious tanks built or constructed with cement held together by wire netting embedded in it. Another gigantic building with an iron roof is intended for housing *Bays* and *Araucarias* in winter. Pyramid and standard *Bays* in excellent health stood in the open, some of the latter having stems 8 ft. high and heads 5 ft. through. Stems of 4 ft. to 4½ ft. high are more common, however, for standards. Pyramids 14 ft. high had a diameter of 5 ft. at the base.

Many new plants occupy the propagating houses, and amongst them we noted *Corypha Wogowii*. The obovate leaves of *Geonoma pynaertiana* are strikingly distinct. *Nepenthes* were plentifully represented. A graceful and handsome, fan Palm, seldom seen in private establishments was *Thrinax radiata*. The young leaves of *Areca Hsemanni* are purple and bronze coloured. Both this and *Licuala Jeananceyi* have recently been honoured with certificates from the Royal Horticultural Society. Better known are *Dracaena goldiana*, *Tillandsia Lindenii* and *Licuala horrida*. Very distinct and handsome is *Kentia Wendlandii*, having large, pinnate leaves. Graceful and slender are epithets we should apply to *Chamaedorea graminifolia*, which has all the characteristic beauty of *Cocos weddelliana*.

(To be continued.)

NATIONAL CHRYSANTHEMUM SOCIETY.

ANNUAL OUTING.

ABOUT this time last year, the National Chrysanthemum Society—parent of the many local organisations of this character—adopted a wise resolution which was on Monday successfully carried into effect. Like all well-constituted societies, that of the "Mums," hold an annual picnic or outing; twelve months ago, they had a most enjoyable excursion to Greenlands, the seat of the Hon. F. W. D. Smith, M.P., at Henley, and it was then and there decided, by the placid waters of the Thames, that the next trip should be to Harwich and Ipswich, with the view principally of obtaining a breezy sea and river excursion. The plan thus roughly sketched out was, in due course, very completely elaborated. The Great Eastern Railway Company lent every assistance, placing at the disposal of the party special saloon cars for the railway journey from London, and reserving for their use the fine steambot "Essex," where all arrangements were under the genial personal direction of Mr. Jackson, superintendent of the Ipswich District, and an attractive programme was provided. The only part of the original intention which had to be abandoned was a visit to Wolverstone Park; this was found to be impossible because there is no landing-stage.

The party reached Harwich shortly after half-past twelve o'clock, and proceeded straight to the Great Eastern Hotel. Dinner had here been provided in a large tent at the rear of the building, and the members lost no time in sitting down to the sub-

stantial repast. Some two hundred were present, including a large number of ladies. Mr. T. W. Sanders, Chairman of the Council (also President of the National Amateur Gardeners' Association), presided at the head table, and amongst those present were Mr. R. Ballantine (treasurer), Mr. T. Bevan (chairman of the Floral Committee; Mr. H. J. Jones, Lewisham; Mr. D. Ingamells, Covent Garden; Mr. Richard Dean, the general secretary of the Society, whose name is a household word amongst gardeners; Mr. W. A. Holmes, Puney, son of the first secretary of the Society; Mr. G. Langdon, Mr. J. F. Simpson, Mr. J. W. Moorman (superintendent of Victoria Park, London), and Mr. G. Stevens, members of the Executive Committee; Mr. A. E. Stubbs, one of the auditors; Mr. W. Seaward, of Hanwell, raiser of some of the finest Japanese *Chrysanthemums*; Mr. J. H. Witty, Mr. J. T. Anderson, Mr. T. J. Berridge, Mr. S. Mortimer, Mr. A. Bertoli, Mr. G. T. Evans, Mr. J. Emberson, Mr. Leonard Brown (secretary of the Amateur Gardeners' Association), Mr. Lawford (Finchley), Mr. H. T. Wooderson (Tooting), Mr. H. C. Prinsep (Buxted Park), Mr. Ennals (Stowmarket), Mr. G. W. Comfort, Mr. A. Robinson, F.R.H.S. (of Bishopsgate and Brentwood), Mr. G. Hayward (Brockley), Mr. G. P. Lingford, Mr. B. Wynne, editor of the *Nurseryman and Seedsman*, Mr. Ewens (of the Albert Hall), Mr. Middlebrook (Maidstone), Mr. Reeves (Hadley), Mr. A. Bishop (London C.C., chairman of the Forest Gate Society), Mr. James Tyler, East Ham Chrysanthemum Society, and many others.

After dinner the toast of "The Queen," to whom special reference was made as a great friend of horticulture, was proposed from the chair, and duly honoured. The toast list that followed was pleasantly informal.—Mr. H. J. Jones proposed the health of the ladies, and Mr. W. A. Holmes responded, both gentlemen protesting their inability, of course, to render justice to the subject, but nevertheless saying something "nice" and complimentary. The Chairman, in toasting "The Visitors," gave a quotation from some distinguished poet in favour of short speeches—a quotation which will not rhyme, anyhow—"Be brief, for it is with words as with sunbeams. The more they condense, the deeper they burn." In accordance with this maxim, he acknowledged in a short speech the excellent arrangements made for the pleasure of the party by Mr. F. Jackson and Mr. Ridgwell, and gave a very hearty welcome to Mr. John Andrews, as representative of the highly-successful Woodbridge Horticultural Society. Mr. Ridgwell responded in clever and humorous terms, which excited much laughter; Mr. Jackson and Mr. Andrews briefly returned thanks; and Mr. Stubbs was so repeatedly called that he was compelled to speak. After returning thanks for the cordial reception accorded him, he proposed the toast of "The Press," which was responded to by the representative of the *East Anglian Daily Times* and Mr. B. Wynne. The health of the Chairman, submitted by Mr. R. Ballantine, closed this part of the proceedings. The party afterwards formed up in a group outside the Hotel, and were photographed. It should be said that there were present some representatives of the Ipswich and East of England, Stowmarket, Colchester, Chelmsford, and other East Anglian Horticultural Societies.

The company embarked at three o'clock on board the good ship "Essex." It was a dull afternoon, with rather a keen touch of east in the wind; but the tide was full, and in the short run out round the Bell Buoy and back again up the river to Ipswich, the visitors enjoyed a splendid view of the scenery, with which residents are so familiar that they hardly realise its beauty, except on hearing the admiration expressed by strangers. Leaving Landguard and Felixstowe on the right, the splendidly wooded slopes of Orwell Park with the mansion and observatory could be seen, and on the opposite banks of the river with the trees in magnificent foliage down to the water's edge, and the park and mansion of Wolverstone on the high ground beyond, go far to maintain the reputation of the Orwell as one of the most picturesque of our English rivers. Various objects of special interest were noted in the famous obelisk at Wolverstone, and further up the lofty Frestan Tower. The quaint little hamlet of Pinmill with its snug position in a bend of the river was passed, and as the steamship neared Ipswich speed was slackened

in passing the considerable quantity of shipping, which the business of the water way engaged. The programme of instruction was "go as you please" reaching Ipswich, and it pleased one section of visitors to take a stroll round the town. Some went for the antiquities, including Cardinal Wolsey's Gate in College Street, a reminder of its one time power of the great Cardinal, who was born here. The ancient house in the old butter market and the municipal buildings of much more modern date were objects of interest. Others again visited the extensive docks, but a large number accepted an invitation to inspect the Ichthemic Guano Company's works. They were received by Mr. Charles M. Colchester, and, after partaking of four o'clock tea (and other refreshments) proceeded to view the processes—not very savoury, in some stages—of artificial manure manufacture. To attempt any adequate description of what was seen would involve certain failure. The establishment covers nearly four acres of ground; every part was thrown open, from the laboratory, in which the products are tested and analyses are taken, both of soils and manures, down to the room in which sacks of all sizes are made with marvellous rapidity; and everybody was much impressed with the extent and variety of the operations brought under notice. As the party were being ferried over to the other side of the river, a serious accident very nearly happened. One of the boatmen, who was taking a number of passengers across, including several ladies, rowed right under the bows of the steamer "Stour," as she was coming down the river, and, but for the promptness and presence of mind of two or three gentlemen on board—notably of Mr. Middlebrook—the boat would certainly have been upset. The escape was so narrow that it gave a nervous shock not only to those who were in imminent danger, but also to those who were spectators of the incident.

At 5.15 the party re-embarked on the "Essex," and on its return to Harwich an excellent and substantial tea was discussed by appetites which had been considerably whetted by the keen breeze which, as the afternoon wore on, had freshened to a smart blow. After tea there was yet time for a stroll along the esplanade and breakwater, and finally when the train left for London at 8.20 it was generally expressed that a very enjoyable and diversified day had been spent.

SOCIETIES.

HAUGHLEY AND WESHERDEN HORTICULTURAL.—July 19th.

THE annual exhibition of the above society was held on the above date in the beautiful grounds of Plashwood Park, Haughley, the residence of B. B. Booth, Esq., J.P. The display of fruit and vegetables was a particularly good one, and the show all round was most successful.

One of the chief features was the stand of choice fruits, Roses, Carnations, Sweet Peas, herbaceous and pot plants, "not for competition," arranged by Messrs. Tresver Bros., Nurserymen, Stowmarket. This firm also gave a prominent place on their stand for a good display of the well-known Ichthemic Guano, manufactured by the Ichthemic Guano Co., Ipswich; and the arrangement of the pretty tins, &c., proved quite an attraction to the visitors, many of whom are well acquainted with this excellent fertiliser. The Combs Brass Band attended, and added greatly to the enjoyment of the company, which was a very numerous one.

The judges were Mr. Musgrave, Finsborough Hall; Mr. Parsey, Stowmarket; Mr. Gilby, Plashwood Park; and Mr. Brett, Haughley Park.

CARDIFF HORTICULTURAL.—July 20th and 21st.

WITH the Sophia Gardens at Cardiff looking their best, and the clerk of the weather in his most genial mood, this two days' fixture turned out a remarkable success. The standard of the Cardiff show has always been considerably above the average, but on this occasion the competition was keener than ever, and thus the task of the judges was anything but a sinecure. Mr. E. M. Battram, Parknewydd; the Rev. G. H. Engleheart, Appleshaw, Andover; and Mr. Alfred Outram, Fulham, pronounced upon the respective merits of the exhibits of plants and cut flowers; while Mr. W. Iggulden, Frome; Mr. A.

Pettigrew, The Castle Gardens, Cardiff; and Mr. Stephen Treseder, Pullcock Nursery, Cardiff, performed the same offices for the fruits and vegetables, as well as for the cottagers' section.

OPEN CLASSES.

PLANTS.—Mr. J. Cypher, of Cheltenham, scored a well-merited success for the group of miscellaneous plants. Mr. R. Gossling, Penarth, was second, and Messrs. Case Bros., Cardiff, were third. Mr. W. J. Buckley, Llanelly, staged the best six stove and greenhouse Ferns, Dr. Lynn Thomas being second. Mr. B. R. Davis, Yeovil, led for twelve tuberous Begonias, Dr. Lynn Thomas being second in this class likewise. The first prize lot of twelve Gloxinias came from Mr. W. Green, Penylan.

CUT FLOWERS.—Roses formed an important part of the cut flower section, and some first-class blooms were to be seen upon the show boards. The competition was very close and well sustained. Messrs. Townsend & Sons, of Worcester, scored a notable success for twelve varieties of H. Ps. in trebles. They had excellent samples of Mrs. John Laing, Caroline Testout, Merveille de Lyon and Marchioness of Londonderry in their stand. Messrs. Cooling & Sons, Bath, received the second prize.

In the corresponding class for three blooms each of twelve varieties of Tea Roses, Messrs. Townsend & Sons again came to the front. Their samples of Madame de Watteville, Comtesse de Nadaillac, The Bride, Ernest Metz and Francesca Kruger were particularly good. A. Hill Gray, Esq., Beaulieu, Bath, was second.

The best stand of twenty-four blooms, distinct, of H. Ps. also came from Messrs. Townsend & Sons, although Mr. Stephen Treseder was a close second. Eighteen blooms, distinct, of Tea varieties were best shown by Mr. John Mattock, of Oxford, Messrs. D. & W. Croll, of Dundee, being second. Twelve blooms of Horace Vervet, sent by Messrs. Townsend & Sons, obtained the first award as the best H. P., whilst a similar number of trusses of Comtesse de Nadaillac, shown by Mr. Mattock, took pride of place amongst the Teas.

The class for a collection of Roses shown with their own buds and foliage was an interesting one, Mr. Mattock being first, and Mr. R. Crossling, Penarth, second.

FLORAL DECORATIONS were well to the fore. Messrs. Case Bros. won for the dessert table, and Mrs. Austin, Cardiff, for the dinner table. Messrs. Case Bros. also had the premier hand bouquet, and likewise won the Royal Horticultural Society's Silver Medal for the best aggregate of exhibits. Messrs. Perkins & Sons, Coventry, won for the bridal bouquet, the buttonholes, and the sprays.

FRUIT was rather below the average, but there was some good material forthcoming in one or two exhibits. Mr. R. A. Bowring, The Heath, Cardiff, was first for six bunches of Grapes in three varieties. Mr. Hollingsworth, gardener to Miss Talbot, Morgam Park, was placed first for three bunches of any black Grape with Black Hamburgh. Mr. J. Howe, gardener to Geo. Rutherford, Esq., Dulwich House, Cardiff, taking similar honours for three bunches of white Grapes.

VEGETABLES.—Lady Theodore Guest, Henstridge, was first for the collection of vegetables, thus winning, in addition to the first award a bronze medal from the Royal Horticultural Society.

AMATEURS' AND GARDENERS' CLASSES.

PLANTS.—Mr. W. Carpenter, gardener to W. J. Buckley, Esq., Llanelly, had the first prize group of plants arranged for effect, and occupying a space of 50 sq. feet; Mr. J. Howe was second. For the smaller group occupying 25 sq. feet, Mr. H. Rea, gardener to C. Waldron, Esq., Llandaff, was first; and Mr. J. Howe, second. Mr. J. C. Hanbury, Pontypool, had the best six stove and greenhouse plants, whilst Mr. Howe gained yet another first for four exotic Ferns.

TRADE EXHIBITS.

There were comparatively few trade exhibits, but such as there were were good. Mr. W. Treseder staged a capital group of Cactus Dahlias, his best forms being Mrs. Wilson Noble, Starfish, Lady Penzance, and Cinderella. The cup offered by the Mayor of Cardiff was won with this exhibit.

From Mr. Henry Eckford, Wem, Shropshire, came a grand lot of Sweet Peas, in the culture and improvement of which Mr. Eckford has achieved such great success. Amongst the numerous fine forms that were on view Fascination, Duke of West-

minster, Lady Mary Currie, Othello, and Senator were very conspicuous by reason of their fine development.

Violas, Sweet Peas and Pelargoniums were sent by Messrs. Dobbie & Co., Rothesay, N.B., and Orpington, Kent.

Messrs. Garraway, Clifton, had a nice lot of stove and greenhouse plants, whilst from Mr. W. J. Godfrey, Exmouth, Devon, came Cannas, Sweet Peas, and a collection of cut hardy flowers. Mr. B. R. Davis, of Yeovil, had some first-rate tuberous Begonias. Messrs. Barr & Sons, King Street, Covent Garden, staged an extensive array of hardy flowers.

TIVERTON HORTICULTURAL.—July 21st.

FOR several years the annual exhibition in connection with the above society has been in abeyance, but recently a fresh effort has been made, and the result on this occasion was such as we trust will warrant the officials of the society in continuing the exhibition. The site of the Public Park in which the show was held is a most beautiful one, well adapted to the purpose, and within easy distance from the station. Beautiful weather and a numerous company made a scene of pleasure and enjoyment. The entries were numerous, and most competitors staged in the classes for which they had sent word in. An interesting exhibition of bee handling and driving was announced to be given by Mr. John Tribble, of South Molton, under the auspices of the Devon Bee Keepers' Association. The lecture attracted a good muster. The demonstration was not altogether a success. The schedule contained just 100 classes, and several for honey, so that the work of the two judges was no light one.

For a group of miscellaneous plants, occupying a space of 80 sq. ft., Mrs. N. Row was first, the second being taken by Mr. L. Mackenzie. Mrs. Holland was first for four Orchids, showing very fine plants of *Oncidium phymatochilum*, *Sobralia xantholeuca*, full of its yellow flowers, *Epidendrum vitellinum majus*, a compact piece with over a dozen very tall spikes, and *D. suavisimum*. The second fell to T. Turner, who had *Cattleya gigas* and *Dendrobium densiflorum*, &c.

Some very fine Carnation blooms were shown by Mr. W. S. Clement, who was first for twelve, and had the special prize for best bloom in open class. R. B. Cullen, Esq., in the amateurs' division was first, and secured a special prize. Major Gardener and Mrs. Dickenson also secured prizes for these.

Capital Begonias, Fuchsias and zonal Pelargoniums were shown by Messrs. R. B. Cullen, L. Mackenzie and T. Turner. Roses were only moderate in the amateur classes, many of the Teas being small, and scarcely open. Plants for dinner-table decoration were shown by Mr. T. Turner, who was first, and Mr. J. R. Holland, second.

A tent was devoted to dinner table decorations arranged with fruit and flowers, laid for six persons, to be competed for by ladies only. Some five entered and made good displays, the first alternately falling to Mrs. E. H. Munford with a most beautiful and complete display, the second being taken by Miss L. Lock, Crediton, with one but slightly inferior. For a vase or basket for table decoration, with or without fruit, these two competitors were successful, but the position was reversed. For a collection of six dishes of fruit, the Rev. A. W. Hamilton-Gell, Exeter, was first, showing Black Hamburgh Grapes, Figs, Bananas, Peaches, and a Melon, in good form. The same exhibitor was first with Black Grapes and a Melon. For a dish of Peaches, T. Knapman was first; and Sir J. Davie, second. The latter exhibitor was successful with Nectarines.

The vegetable classes, both for amateurs and cottagers were well filled, and good exhibits mostly ruled. Mr. W. C. Cleave came first for a collection, W. A. Sanford, second, and Mrs. Norah Row, third. Many dishes of Potatos were shown, and were all of excellent quality. Peas, Beans, Onions, &c., numerous and good.

A separate tent was set apart for non-competitive groups, and here Messrs. R. Veitch & Sons, Exeter, had a large and varied collection of flowering plants, besides a number of choice varieties of Marliac's new Nymphaeas, and photographs of rock gardens recently erected by the firm, the one at Abbotsbury being largely represented. Messrs. Jarman & Co., Chard, had also a grand display of Roses, cut

blooms, &c. Messrs. G. Kerswell, and E. Sclater of Exeter, had capital groups of flowering plants, cut blooms, Ferns, &c. The committee and judges were entertained at lunch on the grounds, when the Mayor of Tiverton occupied the chair and several interesting little speeches were made. Hearty thanks were given to Mr. W. J. Pleass, the energetic secretary, who has worked hard to make the show successful. Doubtless the experience gained this first year will be of great service on future occasions. The judges were Mr. J. Mayne, Bickton, and Mr. W. Swan, Exmouth, whose decisions gave general satisfaction.

GLOUCESTER FLOWER SHOW.—July 21st.

THE Gloucester flower show was held in the Spa Cricket Field, and was in every sense a conspicuous success. The floral exhibits were by far the best ever got together in Gloucester. The marquee, which was over 66 yds. long by 25 yds. wide, was not large enough to display the wealth of floricultural exhibits sent for the occasion, and a second tent 22 yds. long had to be requisitioned for staging the table decorations and collections of Sweet Peas. The entries numbered close upon 270, while Mr. Colchester, of Ipswich, had a fine stand at the entrance to the large tent, on which were exhibited samples of the celebrated Ichthemic Guano, by the aid of which many of the fine specimens in the show were produced.

Messrs. J. House & Son showed specimen Pansies. Messrs. Webb & Sons, Wordsley, also set up a fine collection of flowers. The exhibitors in the nurserymen's class were Mr. J. Cypher, from Cheltenham, Mr. H. Whitehead, Heathville Nursery, Gloucester, and Mr. W. Vause, Leamington, who were awarded first, second and third prizes respectively.

The opening ceremony was to have been performed by Lord and Lady Fitzhardinge, but owing to the indisposition of the latter, the function was undertaken by the Hon. Maurice Gifford and Mrs. Gifford, nephew and niece of the aforesaid. They were accompanied by the Mayor (Ald. A. Estcourt), and the City High Sheriff. Mrs. Gifford was presented with a handsome shower bouquet by the grandson of the Mayor, Mr. Roy Estcourt.

SOUTHERN COUNTIES CARNATION.—July 22nd.

NOTWITHSTANDING the opposition which this society met with when it was first mooted, it evidently has made a good start, and seeing that it is held nearly a week in advance of the National Carnation Society's show at the Crystal Palace, it in no way interferes with that. Mr. William Garton, Argyll House, Woolston, has had the lion's share of the work upon his shoulders, as hon. secretary and treasurer, in organising the society, and he is determined that it shall enjoy a similar success to that attending other societies farther north. The society already numbers 200 members, which speaks volumes in favour of the good foundation which has been laid. It was only founded in August last, and the first show exceeded the most sanguine expectations as to its success. About seventy sat down to the luncheon provided and presided over by the Rev. G. W. Minns (Vicar of Weston) and having representatives from the Royal Southampton, Shirley and other horticultural bodies. The society also has the countenance of the Midland and National Carnation Societies. Messrs. John Ball and T. E. Henwood were the judges for the bizarres, flakes and white ground Picotees; and Messrs. James Douglas and Charles Blick for selfs, fancies, yellow grounds, cup competitions and bouquets.

For twelve varieties of flakes and bizarres the first award was taken by Mr. James Douglas, Edenside, Great Bookham, Surrey, who had blooms of excellent quality. He was followed by W. Garton, jun., Esq., Woolston. Mr. F. Hooper, Bath, took the leading place for six blooms, and was followed by Mr. J. J. Keen, Southampton, and two others. Mr. James Douglas again came to the front for twelve white ground Picotees, in which he is strong. Mr. S. A. Went, Thames Ditton, Surrey, took the first place for six varieties of the above type, followed by Mr. F. Hooper, and four other prize-takers.

As might have been anticipated Mr. Douglas led the way for twelve yellow ground Picotees, beating Mr. C. Turner, of Slough. For six yellow ground varieties Mr. F. Hooper came to the front, followed by Mr. C. Phillips, Bracknell, Berks, and four other prize-takers.

Mr. C. Turner came to the front for twelve yellow

ground and fancy Carnations, which were in fine form. Mr. W. Garton, jun., was second, and two others followed him. Mr. S. A. Went had the best six of this description; Mr. A. J. Rowberry, and four other successful competitors followed him. Mr. W. Garton, jun., and Mr. C. Turner took the two principal prizes in this order for twelve selfs; and the fact that they were ahead of four other winners in this class showed how keen the competition was.

Mr. F. Hooper took first and second for a single bloom of a bizarre Carnation; Mr. J. Douglas being third and fourth. Mr. E. Buckland, Winchester, had the best red-edged Picotee, Mr. F. Hooper being next. Mr. Douglas took the lead for a purple-edged variety; Mr. E. H. Buckland being second and fifth. Mr. Hooper came to the front for a rose-edged variety, competition being absent. He was first and second for a scarlet-edged Carnation, competition here being strong. Mr. C. Turner was first and third for a yellow ground Carnation; Mr. E. H. Buckland being second.

For a single bloom of a self of any colour Mr. J. Douglas took the first two prizes. He was second for a fancy, being beaten by Mr. C. Turner. For six mixed varieties, open to those who had never before won a prize, Mr. E. H. Buckland and Mrs. Whitely, Downton, scored in this order.

The premier bizarre or flake was won by Mr. J. Douglas, showing the crimson bizarre Phoebe. Mr. S. A. Went had the premier self; and Mr. C. Turner, the premier fancy. In the class for white ground Picotees Mr. J. Douglas led the way with Fortrose; and in the yellow ground class the premier bloom was Mohican, shown by Mr. J. Douglas.

The Silver Cup in the open class for twelve self or fancy blooms, undressed, was taken by Mr. J. Douglas. Mr. B. Ladhams, Shirley, had the best bouquet of Carnations. Mr. E. C. Goble was first for a spray of Carnations. Mr. A. J. Rowberry was first for three buttonholes. Miss E. Wadmore had the best vase of Carnations.

ROYAL HORTICULTURAL.—July 26th.

THE leading and most novel feature of the meeting on Tuesday last was the Bamboos, brought up to illustrate a lecture on the subject. Hardy herbaceous flowers, annuals, Sweet Peas, Caladiums, and other stove plants, Roses, Cacti, and Lilies were also shown in abundance. Fruit trees and bushes were abundantly represented and in a variety of forms.

W. G. Groves, Esq., Holehird, Windermere (gardener, Mr. Robertshaw), exhibited a huge piece of *Odontoglossum coronarium*, carrying two immense spikes having thirty-two and thirty-four flowers respectively. There were several pieces on a large raft, but the strongest pseudobulbs bore the flowers. A Silver Flora Medal was deservedly accorded it.

Messrs. J. Veitch & Sons, Limited, Chelsea, exhibited several hybrid *Cattleyas* and *Laelias*, including grand pieces of *Laeliocattleya calistoglossa ignescens*, *Lc. Zephyra*, the magnificent *Lc. Ingrami gigantea*, *Lc. amesiana*, *Lc. Lucilia*, *Cattleya Enid*, and the dark orange, mottled crimson *Masdevallia Imogen*.

Walter C. Clark, Esq. (gardener, Mr. Jones), Orleans House, Sefton Park, Liverpool, exhibited a grand piece of *Cypripedium Mrs. Walter Clark* (*C. Ashburtoniae* × *C. Stonei*). Messrs. F. Sander & Co., St. Albans, staged *Cypripedium Orion*. R. I. Measures, Esq. (gardener, Mr. H. J. Chapman), showed *Laeliocattleya schilleriana* Cambridge Lodge var.

Messrs. Hugh Low & Co., Bush Hill, Enfield, exhibited *Cattleya gigas*, *C. gaskelliana*, *C. g. alba*, a finely blotched *Odontoglossum crispum*, and a piece of *Vanda caerulea* bearing a large spike of flowers. (Silver Banksian Medal.) Norman C. Cookson, Esq. (gardener, Mr. William Murray), Oakwood, Wylam-on-Tyne, showed *Cattleya Lord Rothschild*. De B. Crawshaw, Esq. (Gardener, Mr. S. Cooke), Rosefield, Sevenoaks, exhibited *Cattleya gaskelliana* *crawshawiana*, a beautiful light coloured variety. G. W. Law-Schofield, Esq. (gardener, Mr. E. Shill), New Hall Hey, Rawtenstall, exhibited a richly coloured variety of *Cattleya Warscewiczii*.

Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, continued the meritorious representative exhibits of Ferns which have been such an attractive feature of the Drill Hall meetings of the last twelve-month. On this occasion the genus *Pteris* was represented by a hundred species and varieties.

covering a considerable range of habit, colour, and cutting of the fronds. The noble *Pteris ludens* was especially good, whilst such variegated Ferns as *Pteris reginae*, *P. r. cristata*, *P. nivalis*, *P. tricolor*, *P. Victoria*, *P. cretica albo-lineata*, and *P. c. Mayii* were some of the best of these. Crested and tasselled forms of *P. serrulata* and *P. cretica*, the handsome and distinct *P. palmata*, and a number of varieties of *P. tremula* were all well shown. The plants were all in first-rate health. (Silver Gilt Banksian Medal.) Mr. May also had *Bouvardia jasminoides* and *B. Queen of Roses* in a remarkably floriferous condition.

On the left-hand side of the doorway a nice group of small but highly coloured *Caladiums* was set up upon the floor by Mr. T. Tomlinson, gardener to R. Hoffman, Esq., Thurlow Lodge, West Dulwich. The green fronds of Maidenhair Ferns appeared to advantage among the brightly hued leaves of the *Caladiums*. (Silver Flora Medal.)

An interesting group of new plants was contributed by Messrs. F. Sander & Co., St. Albans. Included in it were the much-talked-of *Acalypha Sanderi*, the pretty and distinct *A. godseffiana*, and the new *Caladium Ami Schwartz*. *Furcraea watsoniana* was another noteworthy plant.

A tray of Water Lilies grown in the open was sent by Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton. There were some superb flowers of *Nymphaea tuberosa* and *N. gloriosa*.

Roses were represented by several meritorious exhibits. The most important of these was a collection from Messrs. Wm. Paul & Son, Waltham Cross, Herts. It was largely composed of popular garden and *Polyantha* forms which were effectively shown in large baskets of each variety. Souvenir de Mme. Levet, Ma Capucine, Mme. Abel Chatenay, Mme. Cadeaw Ramey, Marquise de Sallsbury, Souvenir de Lady Ashburton, Perle d'Or, Little Pet, Mignonette and Gloire des *Polyantha* were some of the most noteworthy forms. (Silver Flora Medal.)

Four dozen capital cut blooms of *H. P's* and Teas mixed, came from Mr. C. J. Grahame, Leatherhead. There were some splendid trusses of *Comtesse de Nadaillac*, *Kaiserin Augusta Victoria*, *Maman Cochet*, *Alfred Colomb*, *A. K. Williams* and Mrs. John Laing in this exhibit. (Silver Banksian Medal.)

Cut sprays of *Crimson Rambler* came from Mr. J. Fitt, gardener to F. W. Champion, Esq., Colley Manor, Reigate. They were remarkably heavy and full of flower.

Cut hardy flowers constituted a large percentage of the display. They included contributions from a number of the leading houses, and, as usual, were replete with interest.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., had a collection in which *Liliums* and *Carnations* were the chief feature. Of the former, *L. odorum*, *L. dalmaticum*, *L. napaleensis*, *L. auratum platyphyllum*, *L. giganteum* and *L. pardalinum* were much in evidence. (Silver Banksian Medal.)

Messrs. Wm. Cutbush & Son, Highgate, N., had another pretty group in which the *Malmaison Carnation*, *Princess of Wales* occupied a central and conspicuous position. *Eryngium giganteum*, *Gypsophilas*, *Carnations* and *Sweet Peas* were all good. (Silver Banksian Medal.)

The *Liliums* sent by Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, included *L. speciosum album novum*, *L. dalmaticum*, *L. pardalinum*, *L. Brownii* and *L. excelsum* and were all well shown. *Brodiaeas*, *Calochorti* and the curious *Michauxia campanuloides* were other notables. (Silver Gilt Banksian Medal.)

Messrs. Dobbie & Co., Rothesay and Orpington, Kent, made a grand display with bunches of *Sweet Peas*, sprays of bedding *Violas*. Many of the leading varieties by both these popular sections of flowers were shown, and all in capital condition. A number of bunches of hardy herbaceous flowers added to the display. (Silver Flora Medal.)

A very pretty exhibit of hardy herbaceous flowers was staged by Messrs. A. W. Young & Co., Stevenage, Herts, *Sweet Williams* being especially well shown.

The hardy flowers sent by Messrs. Barr & Sons, King Street, Covent Garden, were very bright and in great variety. *Phloxes*, *Eryngiums*, *Iris laevigata* and *Bocconia cordata carnea* were all good. (Silver Banksian Medal.)

Messrs. Jas. Carter & Co., High Holborn, staged upwards of 100 small bunches of *Sweet Peas* in as many varieties. The flowers were arranged in three lines, the back one being composed of shades of blue and purple, the middle one of shades of blush and white, and the front one of shades of rose and scarlet. (Silver Banksian Medal.)

The group of annuals, submitted by Messrs. Jas. Veitch & Sons, Ltd., in the Sherwood Cup competition were wonderfully strong, white and red varieties of *Lavatera*, the handsome *Malope grandiflora*, *Clarkia elegans rosea fl. pl.*, *Candytuft* and *Coreopses* being all good. From the same firm came a number of cut stems of the yellow *Althaea Primrose Queen*, also ten dozen large, handsome flowers of border *Carnations* and *Picotees*. *Sweetheart*, *Geo. Cruickshanks*, *Magpie*, *Pandelli Ralli*, *Voltaire*, *Little John* and *Cardinal Wolsey* were some of the best varieties.

Mr. Amos Perry, Winchmore Hill, sent a dozen bunches of hardy herbaceous flowers; and Mr. Eckford, of Wem, Salop, sent a small collection of new *Sweet Peas*.

BAMBOOS.

The subject of the afternoon's lecture being Bamboos, there were several groups of these noble grasses forthcoming from various sources. To the lecturer himself, A. B. Freeman-Mitford, Esq., C.B., Batsford Park, Moreton-in-Marsh, must be awarded the Palm, for his group, which was staged upon the floor of the hall and ran its whole length, comprised some magnificent Bamboos, and was of a most representative character. A Gold Medal was deservedly awarded for this fine effort. *Arundinaria aristata*, *Phyllostachys Quillioi*, *A. Simoni*, *P. nigro-punctata*, *A. Falconeri*, *P. aurea*, *P. boryana*, and *P. sulphurea* were all represented by some magnificent specimens that did infinite credit to their owner.

Messrs. James Veitch & Sons, Ltd., also staged a representative collection of these handsome plants. Fine masses of *Arundinaria nitida*, *A. fortunei* variegata and the noble *Bambusa palmata* were special features in this group. (Silver Gilt Flora Medal.)

On the right hand side of the doorway a small semi-circular group of Bamboos was staged by Mr. T. S. Ware.

A Silver Banksian Medal was awarded to Mr. V. N. Gauntlett, Redruth, Cornwall, for living canes of *Phyllostachys aurea* and *P. nigra*.

FRUIT AND VEGETABLES.

At a meeting of the fruit and vegetable committee a Silver Banksian Medal was awarded to Messrs. T. Rivers & Son, Sawbridgeworth, Herts, for a collection of sweet Cherries and Plums. Such Cherries as *Bigarreau Napoleon*, *Bigarreau de Schrecken*, *Large Black Bigarreau*, *May Duke*, and *Senu's de Burr* were especially good, and Plums, *Belgian Purple*, and *River's Early Transparent Gage* were likewise in splendid condition.

Mr. Owen Thomas, gardener to Her Majesty the Queen, Frogmore, sent eight fine fruits of a new Melon called *Lord E. Cavendish*, a huge, smooth yellow skinned, white fleshed variety of capital flavour.

Messrs. Jas. Veitch & Sons, Limited, sent trays of Strawberries, which included the new *Prolific*, *Waterloo*, *Oxonian*, and *Bicton Pine*. A number of trays of Cherries was also shown. The *Cordon*, fan-shaped, and standard *Gooseberries* and *Red Currants* shown by the Chelsea firm was the best example of this kind of culture that we have yet seen. All of the trees carried heavy crops. They were shown in large pots. Of the *Gooseberries*, *Sir Geo. Brown*, *Warrington*, *Early Red Hairy*, *Succeed*, *Early Green Hairy*, *Golden Drop*, and *Whitesmith*, were a few of the best in a collection which was remarkable for its high quality and comprehensiveness. (Silver Gilt Knightian Medal.)

Messrs. Laxton Bros., Bedford, showed a tray of fruits of the *Strawberry Trafalgar*, an exceedingly fine late sort, also plants of *Fillbasket*, a very heavy cropping late variety. *Strawberries* *Gunton Park*, *Waterloo* and *Dr. Hogg* were exhibited by Mr. H. Divers, gardener to His Grace the Duke of Rutland, Belvoir Castle, Grantham. Mr. W. Carmichael, 14, Pitt Street, Edinburgh, also showed some of his new *Strawberries*, several of which were of delicious flavour.

Mr. H. Eckford exhibited some of his new culinary Peas.

Messrs. W. Johnson & Son, Ltd., Boston, Lincs.,

received a Silver Banksian Medal for a collection of culinary Peas.

THE NATIONAL CACTUS SOCIETY.—July 26th. THE Cactus Society being affiliated to the R. H. S., its annual show was held as usual, in connection with a meeting of the latter society in the Westminster Drill Hall.

On this occasion the show was an exceedingly poor one, and although the schedule provided for six classes, only three were shown in, and only four exhibits in all.

The first award for six Cacti was won by P. Bodkin, Esq. (gardener, Mr. Crane), who had good specimens of *Mammillaria nogalensis*, *Melocactus communis*, *Opuntia Engelmanni cristata*, *Echinocactus Guisoni* and *E. Emoryi*. Mr. C. Aubry was first for a single specimen; and Mrs. L. Carter, second.

Messrs. H. Cannell & Sons, Swanley, Kent, had a remarkably fine lot of Cacti and succulent plants, but these were not staged for competition. *Opuntias*, *Mammillarias* and *Cereuses* were present in considerable numbers. There was also a grand batch of *Echinocactus Guisoni* and several good specimens of the Old Man Cactus, *Pilocereus senilis*. (Silver Flora Medal).

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Cox's Orange Apple Cracking.—W. Thom.: Many things might induce the fruit to crack, but we could only guess at the nature of the malady in the absence of specimens. It might be caused by the fungus *Cladosporium dendriticum*, or it might have been the sequel to a hailstorm. In any case, it would be due to injury to the skin, which, being unable to swell, must crack. You might send us specimens in a box, packed with a little damp moss, by post. The rusting of the leaves of *Blenheim Orange* and *New Hawthornden Apples* might be due to injury from hail in the early stages of their growth. The clay subsoil you mention, should have been trenched before planting, keeping the good soil on the surface and leaving the clay in the bottom, but thoroughly breaking it up. Supposing you had taken out holes in it for the purpose of putting in fresh soil about the roots of the trees, the chances are that the holes would have retained moisture, and that would have been greatly injurious to the roots of the trees. After trenching, it would have been advisable to plant the trees very shallowly, assisting them with fresh and good soil on the surface. The mulching with manure on the top is a good plan, provided the soil is properly drained. If water is stagnant in the subsoil you must put in drains at a moderate depth, and at short distances apart. You might send specimens of the rusted leaves, as well as fruit.

Pollard Trees.—G.R.M.: Various species of Willow are suitable for pollarding, including *Salix viminalis*, *S. alba*, *S. a. vitellina*, *S. Caprea*, *S. russelliana*, *S. fragilis*, and others. Several of the *Poplars* might be treated in the same way; also the *Hornbeam*, *Beech*, *Elm*, *Robinia Pseudacacia* *bessoniana*, and other varieties. We do not remember seeing the *Ash* pollarded, but think that young trees would answer the purpose well enough. The above would give you a good deal of variety, and you could add to the number by trying various other deciduous trees. We do not think that any of the *Conifers* would give you great satisfaction if pollarded. *Yews*, *Cupressus*, and *Retinospora*, would bear cutting, but they would always be too dense and mop-headed to be ornamental. Pollarding could be done with perfect safety during March, at the beginning rather than towards the end of the month. In any case it should be done sometime before the buds swell. There is little or no danger of their bleeding to do any harm, except in the case of *Vines* and *Birches*, so that no styptic is necessary.

How to get rid of Worms in Pots.—H. H.: Lime water may be used for most of the strong growing stove plants. The way to use it is to put some lumps of quicklime into a can of water. Allow it to stand for some hours till as much lime has been dissolved as to saturate the water. The latter cannot take up any more than sufficient to saturate it. Allow it to stand till the water is perfectly clear by the sediment falling to the bottom. Fill another can three-parts full, and make up the rest with lime water. Water the plants about once a week with this diluted solution till you have got rid of the worms. The latter usually come to the surface in a few minutes after the watering, when you may pick

up and destroy them. Always use weak rather than strong lime and water.

Manures for Stove Plants.—H. H.: With judgment and care you could use any of the manures you mention. None of them should be used more than twice a week, and then only in small quantities so as to form a weak solution. Use it only for the grosser and more vigorous growing plants. Thomson's would be an all round manure, and in moderate doses would be safe. *Ichthemic Guano* is rich in phosphates, but also contains other plant food, and should be used weak rather than strong. Nitrate of soda and sulphate of ammonia are nitrogenous manures, and should be used with great caution as they would burn the roots if too strong. Use about 1/2 oz. of the former to a gallon of water, and even less, say 1/4 of the sulphate to a gallon of water. These latter two supply nitrogen only and would stimulate the foliage, but should not be used to make coarse and rapid growth, otherwise the leaves will not be so durable. Neither of the above should be used more than twice a week in the weak state. Gross growing *Chrysanthemums* and similar things would, of course, take more. You might with advantage use all of the above alternately, as variety is often productive of good results. Use the first two by preference to the nitrate and sulphate, in case you do not intend getting all.

Black Fly on Cherry Trees.—Omega: The black *Aphis* of Cherry trees is a very troublesome pest, and has to be dealt with rather drastically. You may overcome it, however, by the use of various insecticides. You might steep 1/2 lb. of coarse shag tobacco in a gallon of hot water and add a quantity of strong soap suds, stirring the mixture well before syringing the trees with the liquid. Another insecticide consists of 8 ozs. to 10 ozs. of soft soap to a gallon of hot water, to which you might add half-a-pint of tobacco juice to make it more effective. Kerosene and petroleum emulsions are also excellent insecticides, if properly made so as to render the oil harmless to the foliage. The trees in either case could receive a good syringing with any of these mixtures just before leaving off work at night; then wash them with clean water in the morning. If there are Cherries on the trees you might wait till they are gathered before commencing operations on the black fly. The insecticides will help to remove the black matter on the leaves, and the clean water would wash it away. Repeat the operation at the end of a few days if the trees are not quite clean. See next week's issue for the remaining answers.

Insect in Vinery.—H. H.: The insect you sent was a very fine specimen of *Otiorynchus sulcatus*, or the *Black Vine Weevil*, which is very destructive to the foliage, fruit and young shoots of Vines if present in any large number. Take steps to eradicate them at once, laying some pieces of board on the borders of the vinery, but slightly elevated so that the weevils may crawl beneath them during the early morning, for they hide during the day, and come out at night. Examine the traps in the morning and kill all you can find.

"Hardy Ornamental Flowering Trees and Shrubs."—W. Borver, jun.: Your post card contained no address whatever, so that the sending of the book is impossible. Its price is 2s. 3d., post free, so that if you send the amount, together with your address, the book will be sent by post at once.

Names of Plants.—A. P.: 1, *Silene Armeria*; 2, the so-called American *Mignonette* is *Reseda alba*, a native of Europe and the Orient.—*Sigma*: *Sambucus nigra laciniata*, or cut-leaved Elder.—W. NEXT WEEK'S ENGAGEMENTS.

TUESDAY, August 9th.—Royal Horticultural Society; Meeting of committees at 12 noon.
WEDNESDAY, August 10th.—Bishop's Stortford Show. Hastings and St. Leonards Show. Salisbury Show. Etwall and District Show.

CARNATIONS AT THE CRYSTAL PALACE.—

Now that the most important of our southern Carnation shows is a matter of history, and a brilliant success, we are able to determine more exactly the progress that has been made in the culture of the Carnation during the past year. The abnormal climatal conditions that characterised the first half of the year naturally excited the fears of Carnation lovers that we were to have a bad year, and that good flowers would be scarce. This idea was strengthened when it was announced that owing to the lateness of the season the exhibition of the National Carnation and Picotee Society (Southern Section) at the Crystal Palace was postponed from the 20th to the 27th of July. However, all the fears happily proved groundless, for the exhibition turned out to be a brilliant success, both from the number of entries received, and the quality of the flowers themselves, which would have been considered first rate in a favourable season, but were nothing short of marvellously fine for such a year as 1898 has been. Picotees, particularly the white ground varieties, appear to have been the only ones to suffer, although in Mr. C. Turner's winning stand of twenty-four, in 12 varieties, there were some capital flowers. On the other hand the first-prize stand of twelve yellow ground flowers in six varieties sent by Martin R. Smith Esq., was by far the finest lot of blooms we have ever seen.

Self coloured and fancy Carnations were in really superb condition, and the merits of these sections were never more abundantly manifest. Mr. Martin Smith's successes in the most important classes in each of these sections were a remarkable feature, and he has certainly never shown finer, if such fine, flowers, at any show in any year. Flakes and bizarres were fairly well represented, but we opine that the interest they excite is gradually but surely waning. They are too

eccentric in their behaviour, too difficult to keep true according to the strict canons of the florist, and they do not yield a sufficient return for labour. We do not, however, wish to see them banished from the show board, for they possess an attraction and an individuality of their own

The general trend of modern taste is undoubtedly in favour of the self coloured varieties, and the advance made in this section in size, colour, and refinement of form during the last few years is nothing short of wonderful. Mr. Martin Smith's stand of twenty-four blooms comprising nineteen varieties showed conclusively that for general effect there is nothing to beat the 'self.' The grand yellow form Cecilia was adjudged to be the premier self in the show, and we may take it as typical of its class.

The classes for undressed blooms shown with their own foliage displayed a slight increase in popularity. The efforts of Mr. Martin Smith to bring home to flower lovers the value of the Carnation as a decorative subject are untiring, and find practical expression in the formation of classes for bunches of flowers from the open border set up with their own foliage, and not dressed or 'improved' in any way. These classes are due to his initiative and we may add, the prize money therein to his generosity. A full report of the show will be found on another page.

HARDY WATER LILIES AT GUNNERSBURY HOUSE.—

For many years past the common White Water Lily as well as Nymphaea odorata have been grown in the pond at Gunnersbury House, Acton, one of the residences of Leopold de Rothschild, Esq., and the former particularly occupies a considerable amount of space, flowering freely every year. When the crowns get crowded, however, the leaves rise above the water to a height of 6 in. to 12 in. thus largely hiding the flowers. The flowers of N. odorata attain an enormous size but otherwise closely resemble those of the common one. A small piece of the hybrid N. gloriosa was imported last year, and when we noted it recently, had 17 leaves and 7 flowers and buds. The blooms are massive when expanded and the rose and carmine colours are very effective. A First-class Certificate was recently awarded it by the R.H.S. At the same meeting a similar honour was accorded N. odorata rosacea, a most charming rosy-pink flower, of much larger size and more telling appearance than the old N. alba rosea, beautiful as it is. The intense carmine-red flowers of N. elliottiana are very telling, as they lie fully expanded just on the top of the water. There is now a well established patch of it at Gunnersbury House. Equally robust is N. robinsoniana, the medium sized bronzy leaves rising out of the water, but hitherto it has not flowered so freely as it did last year. The flowers of Sanguinea are only of moderate size, but intense crimson-red, with pink sepals that are green on the outer face. This striking hybrid is not yet in commerce owing to its not having had time to increase sufficiently to supply the public, so that Mr. James Hudson, the gardener, has been favoured by the raiser in advance of the public.

The lighter or intermediate shades of colour have not been neglected. The flowers of Seignourettii are rich light red, tinted with salmon and white on the back of the petals. The shade is such that some have described it as light yellow, tinted with carmine. The small, oval leaves are mottled with bronze on both surfaces. The silvery-pink flowers, and bronzy, ultimately splashed, leaves of N. lucida are also engaging. The Cape Cod Water Lily has also bronzy young leaves and silvery-rose flowers of considerable beauty. As seen here the

ORCHIDS of the highest quality, every plant guaranteed true to name, from 2/6 each. Please send for free list.—P. McARTHUR, The London Nurseries, 4, Maida Vale, London W.

flowers of *N. marliacea carnea* and *N. m. rosea* do not differ appreciably but there are some slight differences in the foliage. Huge clumps of leaves rise out of the water, indicating their vigour and the large white flowers are tinted with flesh or pink at the base of the petals. There is often a suspicion of pink at the base of the petals of *N. m. albida*, but otherwise they are of huge size and white. A huge clump of leaves is attended by numerous massive flowers that testify to the effectiveness of this hybrid. Decidedly blue flowers have yet to be added to hardy Water Lilies, though that may be accomplished in the near future. We have a slight tendency in this direction in the soft lilac flowers of *N. Laydekeri lilacea*, with its soft lilac flowers, surrounded by small bronzy, floating leaves.

Large and massive flowers are the aim of most raisers and most acceptable to the general public; but is nevertheless a genuine pleasure to pass from the above giants to the tiny pale yellow flowers of *N. pygmaea helvola*, hovering like distant stars on the surface of the water. The orbicular leaves are also quite small, thus justifying the specific name, but those of the variety never get so large as those of the type. The mass of stamens is orange, and forms a fitting centre to the flower. From the pigmy we again pass to the giant in the soft sulphur petals and golden anthers of *N. aurora*, which differs from *N. marliacea chromatella* chiefly by having its leaves blotched with bronze, whereas the foliage of the latter is green. The huge flowers, of the latter more especially, bear a not inapt resemblance to Cactus Dahlias as they rise clear of the water and their own foliage, which also stands clear of the water, owing to their vigour, crowding and morphological differentiation, as always happens when Water Lily leaves rise out of the water. The petals of *N. m. chromatella* are rather more pointed than those of its rival. Another hybrid named *Exquisita* has bronzy young leaves, and white flowers about the size of those of *N. alba*. Altogether the collection is a most interesting one.

Royal Horticultural Society.—The next meeting of the society will be held in the Drill Hall on Tuesday, August 9th. The committee will meet at noon, and at three p.m. a paper on "Water Lilies" will be given by Mons. Latour Marliac.

Grammatophyllum Ellisii and Grumphyllum, described on p. 709 and p. 726 should have formed one article, and not disjointed as they were. The second part of the article had been written by mistake upon a sheet containing a description of two *Cypripediums*, and the fact was overlooked till the second part was read on the succeeding week.

A Locality Rich in Ferns.—In the issue of *The Fern Bulletin* for October last, Dr. Underwood reported the finding of thirty-four species of Ferns within a circle with a diameter of not more than three miles, the locality being near Jamesville, Onondaga County, New York. A contributor to the issue of the same publication for July of this year goes one better than this, for she (it is a woman) speaks of a triangular piece of ground, two sides of the triangle being each three miles in length, and the third one mile, in which thirty-nine species and eight varieties are to be found. This piece of ground includes some limestone cliffs and part of a swamp, and is situated near Pittsford, Rutland County, Vermont. A list of the Ferns is given, and amongst them are many that are well known under cultivation in this country, whilst a goodly number are natives of the British Isles. Of these we may mention *Pteris aquilina*, our commonest Fern, *Asplenium Trichomanes*, *A. Ruta-muraria*, *A. Felix-foemina*, *Ophioglossum vulgatum*, *Osmunda regalis*, *Polypodium vulgare*, *P. Dryopteris*, *Cystopteris fragilis*, and *Woodsia ilvensis*.

Euphorbia corollata.—The *Florists' Review* for the 26th ult., gives an illustration of this distinct *Euphorbia* which is found wild in great abundance on railroad banks and in dry open fields in Illinois. It is a plant of easy culture and is grown to some extent for supplying cut flowers in the States. Its stems branch freely, and these branches divide and sub-divide to form a bushy plant bearing multitudes of small white flowers. Its general appearance is, roughly speaking, not unlike that of a *Gypsophila*, although there are, of course, wide points of variance.

Royal Botanic Society.—At the annual meeting to be held in the gardens on the 10th inst. at 1 p.m., Mr. J. S. Rubinstein will recommend that the present system of electing the Members of the Council whereby they are practically elected and re-elected year after year by the Council itself, should be brought to an end; and further that the scientific and administrative branches of the society's work should be divided and that each branch should be supervised by a competent manager. He will also propose (1) the establishment of classes for the study of botany to be open to all students (2) the reorganisation of the refreshment department and the obtaining of a licence for the restaurant newly built in the gardens, and (3) the erection of a large floral hall to serve as a winter garden and wherein exhibitions, flower shows, receptions and musical promenades can be held in all seasons and in any weather, architects being invited to send in plans in competition.—*J. S. Rubinstein, F.R.B.S., West Cromwell Road, S.W. August 1st, 1898.*

The Asparagus Rust, which has long been known to gardeners in this country has commenced to plague the United States as well—up to quite recently it was unknown in North America. In a badly attacked crop the plants appear as if they were maturing early in the season, for the healthy green changes to a brown hue as if the work of the stems and leaves had naturally come to an end. Examined closely, the rusted plants are observed to have the epidermis of the stems lifted as if in blisters, with ruptures here and there showing the spores within. A series of experiments has been carried on of late at the New Jersey agricultural experiment station, and the spraying of the plants with Bordeaux mixture is now recommended. Burning the infected brush in autumn, according to the common practice in this country, was also found effective. Research has brought to light the existence of two other Fungi that attack that producing the rust. One *Tubercularia persicina* appears to attack the cluster-cup stage of the rust. Future investigation may result in the finding out of a system whereby these two hyper-parasites may be turned to account on behalf of the Asparagus.

Our Fruit Crops.—In this garden we have a heavy crop of Apples, Blenheim Orange, Golden Noble, King Pippin, Grenadier, and a local variety named Scotch Bridgett; but this is a notable exception in this district for which I cannot account as our best tree of Blenheim Orange is fully exposed. In looking through an eight acre orchard about two miles from here, the only kinds of Apples that had anything like a crop were Golden Spire, Gold Medal and Irish Peach; and the owner assured me that it was the worst fruit year he had experienced for a great number of years, and from what he gathered from his friends at market, matters were no better in the district. In fact, he said, if any one else had a good crop of fruit he himself was sure to have one. The crop of Pears was, if anything, worse still. Ours are fair, the best being Louise Bonne, Beurré d'Amanlis, and Beurré Bosc. Plums are almost a failure except Damsons, of which there is a sprinkling. Small fruit is an abundant crop here and elsewhere. Cherries are more than an average crop, whilst other fruit trees have been infested with insect pests. The Cherries have been free from their enemy, the black fly. Continuous cold winds are said to be responsible for the light crops, for we had no frost, and it is possible that our trees were a week or ten days later in coming into flower than the orchard referred to, and others; and as gardens not more than a mile from here are that much earlier with vegetables, Strawberries and Raspberries, it is possible that there might be that difference some years in the trees flowering.—*W. P. R., Preston, Lancs.*

A Seedling Bamboo.—Seeing that Bamboos rarely flower even in their own country, seedlings must be rare. *Arundinaria Laydekeri* must be an exception to the general rule, for it flowered at several places in this country in 1895, after which it died. A seedling shown at the last meeting of the Royal Horticultural Society by A. B. Freeman-Mitford, Esq., C.B., must have raised from seeds that ripened in the open air during that year on his plants at Batsford, Moreton-in-Marsh. Seedlings of Bamboos are evidently of slow growth during the first few years of their existence, for that under notice was much branched, but only 1 in. high, leaves and all.

Dutch Horticultural and Botanical Society.—At the floral committee meeting of July 13th, 1898, the committee awarded First-class Certificates to Mr. C. Kwint, of Bloemendaal, for *Begonia Tuberosa* fl. pl. cristata; to Messrs. E. H. Krelage & Son, of Haarlem, for *Begonia tuberosa* fl. pl. Orange ball, *Begonia tuberosa* fl. pl. Souvenir de Pierre Notting, *Calochortus Gunnisoni*, and *Petunia Sneeuwbal* (Snowball); and to Mr. C. G. van Dijk, of Zeist, for *Schubertia grandiflora*. Certificates of Merit were awarded to Messrs. E. H. Krelage & Son, of Haarlem, for *Ageratum Blue perfection*, and *Helenium Bigelowi*. Botanical Certificates were also accorded to Messrs. E. H. Krelage & Son, of Haarlem, for *Calochortus obispoensis* and *Lilium elegans Alice Wilson*.

Victoria Regia at Kew.—At the present time there are ten huge leaves on the *Victoria regia* in the tank of the house No. 10, where it is always grown. Some of the larger leaves measure between 7 ft. and 8 ft. in diameter, the rim included. The upturned edge is not so deep as that of last year's plant, the variety being different. The first flower this year opened on July 1st, and another bud was so prominent that it appeared fit to open on the 31st of that month. This would make the twelfth flower for the season, or within the calendar month. The flowers are creamy-white on the first day, and when fully expanded on the second day they are of a rich rose all over, with the exception of the tips of a few of the outer rows of petals. At this time they are very handsome. The flower in question stood about 6 in. above the surface of the water, which would indicate that the peduncle is much stronger than usual.

A State Model Forest for Scotland.—Some discussion has arisen anent the proposed establishment of a Scottish State Model Forest for the practical and scientific training of foresters, and the carrying on of experiments has lately arisen, and we notice that our esteemed contemporary, *The North British Agriculturist*, strongly backs the proposal. *The Land Agent's Record* has had something to say against such an institution, and, amongst other things, says "we fail to see why the county should be called upon to purchase an estate for this purpose before it utilises any of the Crown Lands of England." Again, "If gross mismanagement be the object to be aimed at, these Crown Lands in England are worthy of being called model forests." *The North British Agriculturist* effectively disposes of these argumentative sneers, rightly calls attention to the fact that Scotland has a much larger interest in the matter than England has, for she has a far greater acreage of land suitable for afforestation. Besides, England has already a finely equipped forestry school at Cooper's Hill. In Scotland there are three separate courses of classroom instruction in forestry; viz., one at the Edinburgh University, one at the Royal Botanic Gardens, and one at the Heriot-Watt College—all in Edinburgh. Attention is also drawn to the points urged by Mr. Mackenzie before the Board of Agriculture, when he suggested as methods of aiding the advancement of forestry—(1) "Freeing lands under plantations from all taxes until the timber has reached the stage for being realised; (2) loans at a low rate of interest to landowners for extensive planting; and, (3) Parliament taking over the lands for the purpose of such afforestation, leaving it in the option of the landlord or his heirs to redeem the lands so taken over on paying the initial costs and interest thereon." That afforestation of waste land would pay is proved by the fact that whereas the Germans are, according to Dr. Schlich, well satisfied if they can produce 1½ tons per acre per annum, in Scotland, in properly managed woods 2 or 2½ tons per acre can be obtained, whilst the quality is fully equal to the Germans'.

To Extract Perfume from Flowers, one of three methods is adopted—by maceration, enfleurage, or distillation.

The Sparrow Pest.—The sparrow is nothing if not cosmopolitan. It appears from a statement made by *The Farm and Fireside*, Toronto, British North America, that for some time the Provincial Game Department has been inundated with enquiries about English sparrows, and the best way of getting rid of them. The game warden has answered by calling attention to the delicacy of the birds for eating. He advises that they should be caught, (which reminds us very much of the old fashioned recipe for getting rid of fleas) placed in hot water, skinned, and then dressed like chicken. We can vouch from experience that the birds are very nice thus, but they are not the kind of food a hungry man would waste his time upon.

How the Flower Girls Work.—There is no more interesting sight than the flower girls of London as they troop in, in early morning, to the flower market of Covent Garden. They crowd round the salesman for bunches of this, sprays of that—in fact anything that their experience teaches them will make up to advantage. Having obtained their supply of flowers the girls seek a quiet doorstep where they sit down and proceed to evolve their stock of hutton-holes from the fresh flowers and greenery. How nimbly they work, with what taste they can turn out quite a "tricky" hutton-hole from very ordinary materials. Long practice makes them adepts at their work, of course, but there must be a considerable amount of initial taste and skill.

Cherry, Peach and Almond Slips.—Is it possible to grow Cherry, Peach and Almond trees from slips? M. Teret maintains that it is, and has found an old document on the subject, dated 1859, in the *Bulletin de la Société Nationale d'Agriculture*. It is therein stated that Cherry, Peach and Almond trees can easily be grown from slips, provided that the slips are put into water, as stone fruit trees take root with difficulty when planted as usual in the soil. It is, however, recommended—(1) To plant the slips as soon as the roots are one centimetre long, because they would certainly die if longer when planted in the earth; (2) To cut the slip short before putting it into water, so that the tender roots may be able to nourish it, and for this purpose only leave one eye; (3) Preserve the delicate roots intact as grown in the water, which is done by putting the slip in a hole, and then filling it with fine sifted sand slightly moistened, so that it will sink down itself; (4) Close the lower end of the slip with sealing wax before putting in water, thus to prevent much water cannot enter the wood, which might cause decay. — *Cosmos*.

Bamboos at Gunnersbury House.—With the limited space at command in the gardens of Gunnersbury House, Acton, W., the residence of Leopold de Rothschild, Esq., Mr. James Hudson endeavours, and that successfully, to import and cultivate some of the more important and newer of garden plants in which interest may be centred. On the banks of the pond where the hardy Water Lilies are grown, and on the grass in the vicinity he has got together some of the best of the hardy Bamboos. *Arundinaria japonica* is the largest and oldest plant, and was no doubt at first put out tentatively and with some misgivings as to its ultimate success. It has now grown into a great thicket several yards in diameter at the base, with a spread of much greater dimensions. Even to-day it is best known, perhaps, under the name of *Bambusa Metake*. The most graceful of all the *Arundinarias*, namely, *A. nitida*, has also found its way here. *Phyllostachys nigra punctata* has made excellent young growths, much taller than last year's ones, thus showing that it is firmly established. Another of the most handsome species of this genus is *P. aurea*, of which a young plant is 4 ft. high. *P. Henonis* is light green and graceful in character. *P. ruscifolia* resembles a hush of the Butcher's Broom, as the name not inaptly expresses. A young plant of *Bambusa Mazellii* stands 6 ft. high, and is characterised by greenish-yellow, slender stems, and light green foliage, though the latter may be due to exposure. There is also a small but healthy plant or two of *Bambusa palmata*, which has broader leaves than any of the above.

Co-operation in France.—In many districts of France the farmers have found it necessary to combine to protect their crops from insect and fungoid pests. Syndicates are formed, the destruction of the Cockchafer being the special objective of one. At Pontivy there is an association for keeping down the Apple blossom Weevil (*Anthonomus*) by spraying with sulphate of copper. The syndicates for the protection of the all-important Vine against Phylloxera are very numerous, and various fungoid diseases are met in the same way. The preservation of fruits and vegetables has likewise received communal treatment, especially in districts where the crops are heavy but unremunerative by reason of lack of markets. The manufacture of fruit pulp from Apricots has been adopted in Provence, the growers having combined to buy the necessary machinery, and thus do without the middleman. In the department of the Alpes Maritimes the distillation of perfumes from flowers has engaged the attention of a syndicate, whilst in Provence again the preparation of Capers is looked after. The preservation of Peas, Beans and Tomatos is taken up in various departments, and the co-operative system is in full swing all over the country.

GARDENING MISCELLANY.

BASKET TUBEROUS BEGONIAS.

So many Begonias are now raised and grown in pots for conservatory and house decoration, as well too for planting in the flower beds and borders, that one is apt to think these purposes are the only ones in which these glorious plants can be utilised. They are indeed most beautiful when used in this manner, but another type and method is so successfully used at Cliveden, that perhaps the mention of the fact may induce others to adopt the same plan. Mr. Wadds has secured a number of the double, canary coloured Alice Manning, which are growing in baskets, and as they are suspended in the greenhouse, their racemes of flower which hang round the basket are singularly beautiful. Some five and six flowers are open at one time on a single spray, and as these are numerous the whole of the basket is hidden by these lovely yellow rosettes. These forms are most assuredly worthy of a more extended use.—*W. S.*

BOUGAINVILLEA GLABRA.

AN immense specimen of this most useful plant covers the whole of the roof in one of the houses at Berry Hill, Maidenhead. The quantity of flowers this annually produces must be very great, and for dinner table decoration can be used in a variety of ways. *Lonicera sempervirens*, also on the roof, was covered with its orange-scarlet blossoms. In the house where this latter is so floriferous were capital plants of *Hydrangea Thomas Hogg*, whose large pure white heads were very prominent amongst other showy things, double *Petunias* being very numerous.

Of Tomatos, Grapes and Peaches, I would only say they were in excellent condition, good crops, and each ripening well. Passing outside we noticed a fine clump of *Akebia quinata* at the end of one of the houses. I was just too late to see this in its beauty; some few flowers remained, but the sprays of purple blooms had been many and interesting. The singular Mummy Pea, whose flowers come in tufts and clusters, was shown me in the garden, and as we proceeded in this direction we passed a splendid lot of fruit trees bearing good crops. A fine border of Roses and Pansies as well as choice herbaceous plants was in close proximity; then passing through this pathway we came to a magnificent archway of weeping Beech. This tree spreads over a large space, and the pendulous branches overhead as we passed along took our notice immediately.

In the pleasure grounds were some glorious trees, Elms, Oaks and Conifers; but those that riveted my attention were the immense specimens in perfect health of the Copper Beech. These had a beauty of their own than which nothing else could be compared. The rockery here is very interesting and extensive, full of plants, a cool shady and refreshing spot, as we proved, our visit having been made on a hot trying day.—*W. S.*

WORTON HALL, ISLEWORTH.

WORTON HALL is the residence of A. Howard, Esq., and is situated on rising ground in the vicinity of Isleworth. The little river Crane runs merrily along at the bottom of the hill on its eastern face, and is soon lost to identity in the larger volume of old Father Thames. The mansion itself is one of the old-fashioned sort, without much pretension to architecture, and painted a dead white. This lack of colour gives it a very bald appearance, which Mr. Arther Pentney, the enthusiastic young gardener, is striving to overcome. *Wistarias*, *Ivy*, *Roses* and other climbers are beginning to take effect, while variegated *Maples*, standard *Bays* and other ornamental subjects do much in the way of toning down the decorator's "Art." The view from the eastern front of the house has, we think, been much improved since Mr. Pentney's advent, for many unsightly objects have been removed, and others of a more natural, interesting and permanent value substituted, while some things have been entirely obliterated, much to the advantage of the remaining vegetation. The lawns, for instance, are on different levels. These have not only been relaid and otherwise improved, but a path which hounded the upper one, and was, therefore, a conspicuous object, has been dropped down to the lower, with the result that the two grass plots become one without an apparent line of demarcation between them.

Some fine old Cedars (*Cedrus Libani* and *C. atlantica*) adorn the grounds and lend an air of antiquity and importance not to be gainsaid. Mr. Pentney has planted ornamental trees and shrubs in great variety, some large heds being made up entirely with such things as *Cotoneaster Simonsii*, *C. microphylla*, *Viburnum plicatum*, etc. *Roses*, too, have a large share of attention and are planted in quantity. A bed of the beautiful *La France*—fifty in number—was exceedingly floriferous, many of them being quite up to exhibition standard. This is somewhat remarkable for the second week in July. *Reine Marie Henriette*, the red *Gloire de Dijon*, possesses all the free-flowering properties of its progenitor, and certainly maintains them here on a Rose arch. Hybrid perpetuals generally occupy a considerable amount of space and make a grand return for labour expended. Lord Penzance's hybrid Sweet Briers have a hed all to themselves, the foliage as well as the flowers being agreeably scented; while in the Rose garden proper *Aimie Vihert* and *Crimson Rambler* make a fine show. As to the latter Mr. Pentney is planting this alternatively with American Brambles with a view to cover an iron fence over 100 ft. long, this fence being merely a division between a broad border. On the one side bulbous plants are largely grown, edged with *Pansies*, the *Spanish Iris* being rather past their best. On the other side, which faces the vegetable department, a fine collection of *Sweet Peas* finds a place. These are just now in prime condition. They seem almost "on tiptoe for a flight," for they are such beautiful papilionaceous things that butterflies may well be said to pale before them. The colours, too, are very varied. *Ignea* is a fiery crimson-scarlet, with pale scarlet wings; *Captain of the Blues* is self-descriptive; *New Countess* is a delicate blue; *Venus*, salmon-pink, very chaste; *Prima Donna*, rich rose; *Countess of Powis* is reticulated and otherwise tinted with orange, pink and pigments indescribable. Who can depict the combination of colour in these emblems of "sweetness and light?" The poet possibly, not the practical man.

Carnations, another flower of immense value and beauty, receive special attention here; and, as a consequence, there are not only thousands of plants in various stages, but some fine things on view. Under glass, however, the harvest is nearly over; but *Germania* is still good and possesses large, fully-developed flowers of great merit. The *Malmaisons* likewise, have seen their best days, although their sweetness lingers yet. Not so can it be said of the white one, *Miss Ellen Terry*, and the red one, *King of the Reds*. They are there, but their fragrance never was. It is, perhaps, fortunate that all flowers are not perfumed, otherwise we might seriously suffer from aromatic pain; but as some flowers are indissolubly associated with fragrance, so, the *Carnation* being one, we naturally expect a nasal gratification in this particular flower.

The border varieties are making a fine show for bloom, *Ketton Rose* being especially promising. Mr. Pentney also has some satisfactory seedlings.

Pinks, Her Majesty, Mrs. Sinkins, and Ernest Ladhams are very free. Herbaceous plants are at their best.

The vegetable department is somewhat extensive, large breadths of Cabbages, Potatos, Strawberries, etc., are doing well, the soil being a good loam on a gravelly bottom. Veitch's Main Crop Pea is producing pods freely; it is an excellent cropper, and the quality is good.

The principal range of glass is known as the "Crystal Palace," it having a large dome-like centre about 30 ft. high. This canopy of glass practically constitutes the conservatories, where animals as well as plants do congregate. Begonias, Pelargoniums, Heliotropes, Roses, and such like plants adorn the house; the most interesting subject, perhaps, is a large Blue Gum tree, which has reached the top of the dome. This tree is a study in itself, and was raised from seed by Mr. Pentney four years ago. Eucalyptus coccinea also finds a place.

A step from here and we are in the midst of Cannas, which have been planted out, bordered by Hybrid Streptocarpus, and backed by the new climbing French Bean. These Beans have already attained a height of about 8 ft., the pods, however, are conspicuously absent, Mr. Pentney having treated them too kindly. A row in another house, minus rich soil, is fruiting freely.

Transferring ourselves to the corresponding arm of the dome range we come across Peaches, Nectarines, and other subjects trained to wire supports; fruit trees in pots, and some miscellaneous flowering plants. Other houses exhibited Tomatos, Mr. Pentney's own selection; Melons, Blenheim Orange; Gloxinias, Carnations, etc., and some remarkably fine Streptocarpaceae. These occupied 14-in. pans, and were large and healthy-looking, many of the flowers measuring 3 in. from lobe to lobe. They were in the germ condition fifteen months ago, the seed being obtained from a friend as "very choice." Many more things were noted than we can set down here; suffice it to say that seed-raising and subsequent selection, and hybridisation is not only an effective and economical means of obtaining quantity and quality, but one of the most interesting and intellectual processes in the world of plants.—C. B. G. Acton, W.

VEGETABLES IN THE NORTH.

AFTER a mild winter, with little sunshine during spring and early summer, July has come in fairly seasonable, but the nights are generally cold, the thermometer being often down to from 38° to 45° in the early morning, and some tender plants have suffered thereby, French Beans especially, but vegetable crops on the whole are good—Peas never were better. Veitch's Chelsea Gem takes the lead among a number of dwarfs for earliness, and as a heavy cropper. The flavour is good, and the pods are much larger than those of any other dwarf variety. Grajus has sustained its high character this year, being one of the earliest, with large, well-filled pods of fine flavour, and its bearing proclivity is excellent. We find this is the experience of others in the Stirling district (where vegetable culture has more attention than in most localities). The useful dwarf American Wonder, sown between the tall early sorts, gives a heavy return on the space. Criterion, Exonian and Laxton's Fillbasket are coming in close to those named, and they are each of much excellence. Late Peas are very promising, but if the drought continues, heavy mulchings of manure or grass mowings will be given to save watering. Many fail in Pea growing by watering the surface only instead of administering liberal soakings which will go beyond the roots.

Potatos are productive, but smaller in size than they often are. Sharpe's Victor is still the earliest, but was this season cut down with the severe frosts we experienced during the middle of June. Veitch's Ashleaf is one of the best of its class, especially for earliness and fine quality. Belvoir Castle comes much the same as Veitch's Ashleaf, and appears to be a good selection from the old Ashleaf. Beauty of Hebron is doing well, and is of fine quality. Sutton's Ringleader is a first-rate early Kidney Potato, and promises to give much satisfaction in this district. Sutton's Ar is a capital round Potato, and with us is one of the earliest we have tried. Mid-season and late Potatos are looking fairly well, but generally smaller in the tops than usual. This applies to a

large portion of Perthshire as well as nearer to ourselves.

This being one of the best seasons we have had for Cabbages, it may be interesting to some, who have a strong prejudice to planting on unbroken ground, to mention the old market-growing practice to plant Brassicas of all kinds to stand the winter on extra firm land. By this practice, extending over many years, we have had the finest Cabbages from plantations on firm ground from whence Onions have been removed and not dug, but never saw the fact so exemplified as it is this season. The prominent hearts with few outside leaves on the Cabbages are all we can desire, while on adjoining ground where deep digging was done for several sorts of Cabbage, the leaves are large in proportion to the hearts, and the crop can in no way compare with Cabbages which were inserted by means of an iron-pointed dibber into the hard soil. We are planting a border of Rosette Colworts on undug ground. Simply clearing the surface of weeds after winter Onions were removed. They will be of much more value during the autumn and winter than if they were grown on newly-dug land. The ground for the previous crop was turned up deeply with plenty of manure added to the soil.—M. Temple, Carron, N.B.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Orchids at Edenside.—Mr. James Douglas has not yet been able to shake off his old love for Orchids, but on the contrary has devoted a house to them at his new place, Edenside, Great Bookham, Surrey, where they will form a contrast to the Carnations. The house is an intermediate one, and contains a considerable number of Cattleyas and Laelias, several of which are now flowering. A very fine variety of Cattleya gigas was characterised by a rich crimson-purple lip, and conspicuous, circular eye-like spots. Several varieties of C. gaskelliana were also flowering, including a distinct variety, with a long, narrow tube to the lip, and a delicately-coloured, but handsome, lamina. The original plant, or a piece of it, of Cattleya Warneri figured in the Orchid Album is here, having been bought at Rucker's sale.

Dendrobium Victoriae Reginae has hitherto proved very refractory to cultivate, but Mr. Douglas' plants have made young stems 6 in. to 12 in. long, and stout for the species. D. wardianum has also made excellent and firm growth, hung up close to and often touching the glass, the wood being firm and well ripened. The new D. spectabile has made young growths entirely unlike the old, whatever it may mean by that. A fine batch of Calanthes is making excellent, or in some cases, extraordinary, growth, thus indicating that Mr. Douglas thoroughly understands their culture. Amongst them are C. Phoebe, C. burfordiense, and Cookson's hybrids. A very fine form of Coelogyne speciosa is that named C. s. superba, the brown of the lip being much darker and better defined than usual. This plant seems to flower in season and out of season. The finest of all the Pitcher Plants for general cultivation is Nepenthes Mastersii, being dwarf, easily grown, and here carrying pitchers of the largest size and richest colour for the type. While inspecting the Cattleyas we noted some recently-imported pieces that had been put in Sander's Orchid pan, and others that had been put in pots at the same time. Those in the pans had made a mass of healthy and vigorous roots, permeating the compost everywhere, and pushing out through the slits of the pans, and attaching themselves to the outside in abundance. Seedling hybrid Orchids are another hobby of Mr. Douglas. Already he has some in various stages of growth and promising something distinct; while others are on the point of germinating, and seeds are still ripening in the pots of other plants.

Coryanthes maculata.—For some ten days past or more this strange member of the Orchid family has been one of the chief wonders to the public, of the houses at Kew. It is located in the Nepenthes house, where it has more fascination to visitors than the Pitcher Plants themselves, so much so in fact that the plant has had to be protected against the handling of the curious. A large plant is grown in a basket, and carries six flower spikes,

the youngest only a couple of inches long, and the flowering ones for the time being about as many feet, and drooping perpendicularly.

The structure of the flower is marvellous, and the variety at Kew a very fine one. The sepals are very large, like those of a Stanhopea, reflexed, and after a time more or less folded or crumpled over the apex of the flower; the outer face is straw-yellow, but the inner one is bright, almost golden yellow, richly blotched with crimson. The petals are similar in colour but very much smaller. The lip has a long, curved claw, continuous with the base of the column; and its lateral lobes are connate about the middle of the claw, as it were, forming a structure like a fireman's helmet, below which the claw is continued to another, much larger, and inverted helmet, or bucket to which the claw seems the handle. The upper small helmet is yellow; but the inverted one is pale yellow, richly blotched with crimson internally, and finely mottled with the same colour externally. The apex of the large helmet is trifid and lies around the face of the column. Right and left of the base of the column are two short horns or nectaries projecting over the bucket and distilling a copious liquid into it, which is intended as a special bath for insect visitors, though entirely unbargained for on the part of the latter. The uninitiated would have great difficulty in recognising the various parts of the flower, the sepals, petals, lip and column being so disguised or masked by the remarkable forms they have assumed. Being a native of tropical America, the warm, moist atmosphere of the Nepenthes house must meet its requirements pretty closely.

PLANTS RECENTLY CERTIFICATED.

THE Royal Horticultural Society made the under-mentioned awards on the 26th ult.

Orchid Committee.

LAELIOCATTLEYA INGRAMI GIGANTEA. *Nov. hyb. bigen.*—This hybrid variety was derived from Laelia pumila crossed with the pollen of Cattleya dowiana, and the latter must be responsible for the huge size of the flower. The stems vary from 3 in. to 6 in. in height and recall what occurs in the seed parent. The sepals are remarkably broad for any Cattleya or Laelia, and of a warm rose. The large ovate petals are similar in hue. The lamina of the huge lip is orbicular, crisped and crimson-purple, the dark colour contracting to a purple band running to the base of the tube. The interior of the latter is otherwise soft purple, and so is the outer face. A First-class Certificate was deservedly awarded to this variety, which has much larger flowers than Lc. Ingrami. Messrs. J. Veitch & Sons, Ltd. Chelsea.

MASDEVALLIA IMOGEN. *Nov. hyb.*—The seed parent in this case was M. Schlimii and the pollen bearer M. Veitchi. The spatulate leaves are light green, and the flowers about the size of those of the seed parent. The scapes are about 9 in. high and carry three flowers. The latter are dark orange, densely mottled with crimson and covered with a violet plush, as in M. Veitchi. The tails are about 1 in. to 1½ in. long. Award of Merit. Messrs. J. Veitch & Sons.

LAELIOCATTLEYA SCHILLERIANA CAMBRIDGE LODGE VAR. *Nov. var.*—The supposed parentage of this imported plant is Laelia purpurata and Cattleya intermedia, crossed back again with L. purpurata. The sepals are of the palest lilac, and the petals oblong-elliptic, lined and veined with soft purple on a silvery-blush ground. The curved tube of the lip is deep purple, while the rounded and crisped lamina is intense crimson-purple, as are the side lobes. The lamina is not clawed. A band of purple runs down the white interior of the tube. Altogether it is an uncommon looking form. Award of Merit. R. I. Measures, Esq. (gardener, Mr. H. J. Chapman), Cambridge Lodge, Camberwell.

Floral Committee.

ARUNDINARIA NITIDA.—The dense, spray-like drooping twigs, the purple young shoots, and the rich and handsome green hue of the foliage of this Bamboo all entitle it to the First-class Certificate awarded it. Besides being useful for conservatory work, it is perfectly hardy and retains its foliage throughout the winter in excellent condition. Messrs. J. Veitch & Sons, and A. B. Freeman-Mitford, Esq., C.B., Batsford Park, Moreton-in-Marsh.

PHYLLOSTACHYS CASTILLONIS.—The lanceolate,

bright green leaves of this Bamboo are much the broader at the base, and striped with white lines. The stems are green on one side and variegated with pink, purple and yellow on the other. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

PHYLLOSTACHYS FULVA.—The leaves of this new Bamboo are lanceolate, 3 in. to 6 in. long, dark green above, glaucous beneath and bearded at the top of the sheaths. The stems are slender, and green, giving off a few spreading branches, at least in the earlier stages of growth. Award of Merit. A. B. Freeman-Mitford, Esq., C.B. (gardener, Mr. John Garrett).

ARUNDINARIA ARISTATA.—The round stems, carrying the persistent sheaths at the nodes must help separate this Bamboo from that previously named. The lanceolate, finger-like leaves are 3 in. to 7 in. long, bright glaucous green above, and glaucous beneath; their sheaths are slightly bearded. The main stems are yellow and bear ascending branches that ultimately become very numerous. It is new. Award of Merit. A. B. Freeman-Mitford, Esq., C.B.

ARUNDINARIA VEITCHI.—The young foliage of this Bamboo is very handsome, the species being one of the dwarfest of the broad leaved types, and therefore admirably adapted for conservatory work. It is also hardy, and has oblong, glaucous-green leaves. Award of Merit. A. B. Freeman-Mitford, Esq., C.B., and Messrs. J. Veitch & Sons, Limited.

ARUNDINARIA METALLICA.—The specimen of this Bamboo shown was 2½ ft. high. The leaves are oblong, 6 in. to 10 in. long, and 1½ in. to 2½ in. wide, deep green, with a pale midrib and prominent longitudinal veins, and glaucous beneath. At present it seems allied to *B. palmata* and *B. tessellata*, and if perfectly hardy will be a fine thing. Award of Merit. A. B. Freeman-Mitford, Esq., C.B.

NYMPHAEA ODORATA ROSACEA.—The flowers of this Water Lily are of great size, of a charming rosy-pink, darker in the bud stage, and fading from blush to white in the centre when open. The petals are very numerous, and the anthers golden-yellow. It is altogether a finer thing than *N. alba rosea*, with which it may be compared. First-class Certificate. Leopold de Rothschild, Esq. (gardener, Mr. J. Hudson), Gunnersbury House, Acton.

NYMPHAEA GLORIOSA.—The broad, outer petals of this garden hybrid are rosy, while the central petals deepen to a carmine-rose. The sepals are variegated with rose and green externally. When fully expanded the flowers are massive and handsome. First-class Certificate. Leopold de Rothschild, Esq.

CARNATION ISINGLASS.—The flowers of this border variety are fiery crimson, with broad petals, slightly toothed at the edges, and highly fragrant, so that they resemble those of a glorified Uriah Pike. It was raised by Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate. Award of Merit.

CARNATION LADY SOPHIE.—This perpetual flowering variety has large, rich salmon-rose flowers, with broad rounded petals and does not split the calyx. Award of Merit. Mr. E. Tapper, The Gardens, Sundridge Park, Kent.

BUDDLEIA VARIABILIS.—The leaves of this hardy shrub are lanceolate, deep green above, and silvery beneath. The flowers are small and lilac, with an orange eye and produced in cymose clusters, covering 12 in. to 16 in. of the apex of the shoots. The shrub comes from Thibet. Award of Merit. Messrs. William Paul & Son, Waltham Cross.

ROSE SOUVENIR DE MME LEVET.—This is a Tea Rose of dwarf habit, bearing corymbose clusters of rich apricot flowers. The buds are conical, and open in the centre when fully expanded. Award of Merit. Messrs. Wm. Paul & Son.

ROSE CHARLOTTE GILLEMOT.—The flowers of this hybrid Tea are of large size and pure white, though the exterior of the young buds are tinted with red. Award of Merit. Messrs. Wm. Paul & Son.

Fruit and Vegetable Committee.

RASPBERRY GOLDEN QUEEN.—The fruits of this new variety are of huge size, rich amber-yellow and fine flavour. It was raised from the well-known Raspberry Superlative crossed with *Rubus laciniatus*, and is as productive as the former. The prolific character of the plant, and the fine appearance of the fruit will place this in the front rank of yellow Raspberries. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

PEA CONTINUITY.—The pods of this variety are 3 in. to 4 in. long, very broad, flattened, and of a light glaucous green. Each pod contains six to eight seeds of huge size, and fine flavour. This, as well as the five that follow, have been tried at Chiswick. Award of Merit. Messrs. Sutton & Sons, Reading.

PEA MANSFIELD SHOW.—The slightly curved pods are 3 in. to 5 in. long, dark, glaucous green, very full, with seeds of a rich green, and well flavoured. Award of Merit. Messrs. Wright Brothers.

PEA PRIOR.—This is a heavy bearer with straight, thick, but well filled pods, 3 in. to 5 in. long, and containing six to seven huge seeds. Award of Merit. Mr. Henry Eckford, Wem, Shropshire.

PEA THE BRUCE.—The nearly straight, light glaucous green pods are very full, and contain seven to nine seeds of good flavour. It has been tried for some years and is a prolific bearer. Award of Merit. Mr. Henry Eckford.

PEA SACCHARINE.—The straight, dark green pods are 3 in. to 5 in. long, and well filled with eight large seeds of fine appearance. Award of Merit. Mr. Sim, Fyvie, Aberdeenshire.

PEA HONEYDEW.—Here the pods are flattened, light glaucous green, and contain eight to nine seeds of great size and rich flavour. All of the above were selected at Chiswick for free bearing, as well as for the fine, well filled pods and flavour of the seeds. Award of Merit. Mr. Sim.

Kitchen Garden Calendar.

THE WEEK'S WORK.—In the southern districts most of the early Potatos will be sufficiently ripe for lifting. Where this is the case no time should be lost in getting them taken up. The larger ones ought not to be exposed to the sun longer than can be avoided, as this would cause the skins to become discoloured. Those intended for seed should be spread out, either in an open shed or on a hard path, until they are quite green. They should then be stored thinly in a cool, airy place. Sets so treated will not commence to grow so soon another season as those put away without hardening.

TURNIPS are an important winter crop, small, sweet roots of which are far more appreciated than those which have become overgrown and tough. A goodly patch should therefore be sown; and the roots may occupy the ground from which the early Potatos were lifted. If the soil is moist the seed will readily germinate at this time of the year, but if left loose and dry the plants will come up very irregularly. For this reason the soil should be made as fine as possible, and well watered previous to sowing. Sow thinly in drills about 18 in. apart, to prevent the foliage from becoming overcrowded, which it will do should the autumn be warm and moist; when, instead of nice shaped, close grained, sweet bulbs there will be a superabundance of foliage with coarse, ill-shaped roots, which will not withstand the severity of our winter should it prove unusually hard.

CABBAGE.—The last sowing of these should now be made, selecting some of the larger growing kinds, such as Enfield Market. Plants from the former sowings will soon be large enough for transplanting. They should not be left in the seed bed any longer than can possibly be avoided, for the more sturdily they are grown the finer the results. Tripoli Onions may now be sown. In cold districts choose a sheltered position, but as the plants, when properly grown, are usually hardy there is no necessity for any protection. We prefer getting them large enough to transplant in October, as, by so doing, the roots will take hold of the soil before frost sets in, and thus be the better able to withstand the winter. For early use there is no variety equal to the Queen, as this turns in so quickly.

GENERAL WORK.—At this time of the year, when there is so much watering, fruit gathering and other things requiring attention, many important items are apt to get neglected. It is well, therefore, to take stock, as it were, and see what will be required for winter and early spring before the season gets too far advanced; and should there be any doubt as to the quantity of any crop not being sufficient, see that more is planted. Weeds at this time of the year usually grow apace; the soil being warm, flower stems soon appear, and a crop of seed is the result

before one has time to realise they are there. When weeds reach this stage they should be pulled up and burnt, to prevent the seed from being scattered over other parts of the garden. Where it is possible to dig the ground, all such rubbish may be turned under out of the way, but it is not always possible to do this, therefore hurning is the next best remedy. Make another sowing of Radishes and other small salads, so as to keep up a constant supply.—*Kitchen Gardener.*

THE FLOWER GARDEN.

THE thunderstorms that have visited us during the past week have helped considerably, but they have not been nearly sufficient, for the ground had got very dry. The watering of such trees and shrubs, therefore, as are likely to need water, owing to their not having had sufficient time since they were planted to strike deep root, must be carried on as vigorously as ever.

The grass has revived wonderfully since the rain, and the same may be said of bedding plants, for they, at least, had a good soaking. Growth has been rather slow amongst the latter up to the present time, and this has given opportunity for keeping both beds and borders free from weeds; indeed, the season so far has been an exceptionally favourable one in this respect.

CARNATIONS.—Although the flowers are considerably later than usual, owing to the cold spring and early part of the summer, it will not do to defer layering on that account, for if this work is not completed by at least the end of the first week in August, the layers have a poor chance of becoming well rooted by autumn. If the operation of layering is entrusted to the younger hands it will be necessary to see that their knives are sharp and not too thick in the blades; also that the point of the layer is inserted in the ground in such a way that there is no possibility of the tongue closing, when a union will be formed with the other part of the stem, and the required roots will not be emitted. It is to these two causes, ragged cutting and closing of the tongue, that a very large percentage of the losses of layers are due. Pegs in sufficient quantity should have been got ready last winter during wet weather, and thus no time need now be lost in making them. After the layers are all neatly pegged down round the central stem of the parent plants give a good watering with clear water, and follow this up by subsequent waterings should occasion demand it.

CUT CARNATIONS.—Where large quantities of Carnations are grown for cut flowers they are usually of the older varieties, many of which are addicted more or less to "pod bursting." Before using these in decorations, therefore, it will be advisable to keep the petals of the flowers together by slipping a small elastic ring over the calyx. These elastic rings can be purchased in quantities very cheaply at the sundriesman's. The practice of putting the bands upon the buds as they open upon the plants should not be indiscriminately indulged in, for many malformed flowers are the result of undue compression of the half-grown petals.

BUDDING OF BRIERS.—Proceed with the budding of Briers as quickly as possible, so as to get the whole lot out of hand at an early date. If the bark will not lift readily do not attempt to force it, for to do so is only to court failure, but give the Briers a good soaking of water overnight. If this does not cause the bark to lift easier follow it up with another watering the next evening, and then everything will almost surely be well. In selecting the buds take plump dormant buds, borne by firm shoots, those that have borne flowers being preferable. A great deal depends upon this selection of buds, and they should never be taken from rank sappy wood.

HOLLYHOCKS.—The present occasion is favourable for the propagation, by eyes, of desirable varieties. The smaller side shoots just where they are getting firm should be cut up, a small heel of the wood, together with a leaf stalk being left attached to each eye.

The stalk is not only convenient for handling but is also the natural guardian of the bud in its axil. Insert these eyes in a bed of sandy soil in a cold frame. Keep the latter close, and shaded during the day, and sprinkle occasionally by means of a rose can or a fine spray from a syringe.—*A. S. G.*

HINTS FOR AMATEURS.

BORDER CARNATIONS.

WHEN Shakespeare wrote that "the fairest flowers of the season are our Carnations," he used words that would be as true if spoken to-day as they were in his own age. Other flowers too, have improved in the lapse of years since Shakespeare's day and this, the latter end of the nineteenth century, but the Carnation has also improved, and has moreover, distanced many other flowers in the race; indeed, it would not be too much to say that the Carnation of to-day holds a higher place amongst its contemporaries than did the flower of Shakespeare's time. True, he used the superlative "fairest," but this was only the expression of an individual opinion which may or may not have been endorsed by other writers and gardeners of his age.

Nowadays the month of July sees the Carnation, with which we include for the time being the Picotee, which is only a florist's variety, in a very flux of beauty in our gardens. Scarcely would it be possible to find a garden in which some plants are not grown, whilst in all establishments of any size a considerable amount of space is devoted to them.

As a rule the popular idea of a good flower and the florist's idea are two very distinct, and not infrequently opposite things, and the Carnation affords a case in point. The lay flower-lover does not go into ecstasies over the definiteness and regularity of a stripe, and the restriction of this stripe to a certain area. He does not, as a rule, care how many petals the flower has so long as it has enough to make a show; given this, he does not trouble whether the petals are notched or smooth, broad or narrow, thick or thin, but the next thing he asks for is colour. Generally speaking he likes a decided scarlet, a bright rose, a rich yellow, or a pure white. If he be of aesthetic tastes he finds time to admire some of the numerous half tones or shades of these colours, but there is no overwhelming note in favour of these as there is with the crimsons, the scarlets, the yellows and the whites.

The fancy varieties also take his fancy, more especially those in which shades of yellow mixed with purple, rose, scarlet and other almost indefinable hues exist. These are the flowers that puzzle the florist to classify. They will not be classified, for they will conform to none of the florist's rules, so for want of a better term the word "fancy" is applied, which may mean anything or nothing, and is in fact a sort of waste heap into which all non-descript forms are gathered. Possibly the unconventionality of the flotsam and jetsam of the florist attracts the man in the street, but it is a fact that he has a soft spot in his affection for them, and likes to grow them when he can.

Flakes and bizarres are the pets of the florist, the aristocrats amongst Carnations, but like other pampered pets they are exceedingly intractable. Their distinctive bars of colour will not keep true, but run into the ground colour, and become blurred and indistinct or disappear altogether. We do not know why they do it, or the exact conditions that cause them to behave in this way, we only know that it is a common practice and one that florists deeply deplore. At one time it was thought to be the soil, then the weather was blamed, and, of course, when we are reduced to this there is very little hope indeed of finding a reason for things. At one time the opinion was held that a very hot and dry season would cause a good many of the flowers to "run," but it was soon found that fully as many flowers went wrong in a wet year, and there was an end to that idea. Similarly other supposed causes were found, subjected to investigation and declared to be out of the question. The "running" of flakes and bizarres may therefore now be put into the same category as the rectifying of Tulips—it is a mystery. The man in the street, however, does not like mysteries. Give him a big flower with plenty of rich colour, and he can appreciate it, but he has not been educated up to the standpoint when he is able to appreciate the masterpieces of the florist.

It is in the direction of self coloured varieties that his tastes chiefly lie, and who will say that his choice is not a good one. Within the last few years such eminent florists as Mr. Martin Smith and Mr. Jas. Douglas have turned their attention specially in this direction, and the section of "selfs" is now not only

numerically the strongest but the most important from the gardener's point of view. Malmaison Carnations largely took the eye of the public by reason of their very size, but in the self-coloured border varieties we have many flowers that are almost as large as Malmaisons. Such sorts, for instance, as Cassandra, King Arthur, Miss Audrey Campbell, Exile, and Endymion, produce flowers of huge size when the plants are well grown. Of colours we have almost every conceivable shade, except the much sought after and still unattained blue. The rich purple Bendigo is, however, well on the way, and in a few years time we may be congratulating ourselves that the long sought for has been found at last, and the blue Carnation, the Ultima Thule of the hopes of the Carnation lover has been reached at last.

In several points the florist and the layman are in accord. We have already noticed the question of size. Next comes that of "pod bursting." The older forms were all of them much addicted to the bursting of the calyx, or "pod," as it is commonly called. This was a grave defect because the calyx once burst there was nothing to hold the petals together, they fell apart, and a straggling, ragged-looking flower was the result. Such flowers not only looked anything but handsome but they soon faded and withered. In order to do away with this defect at the time—to give temporary relief, as it were, the calyx of the flower had to be tied round before the bloom had yet fully expanded by pieces of string or raffia, until someone hit upon the idea of small elastic rings, which were not only neater but were far more expeditiously fixed on than the strings. But this was not striking at the root of matters, it was only temporising, and so the florists set to work to produce a race of plants with stouter calyces that would not break and would not therefore need to be supported by strings and rings. In this laudable enterprise they have abundantly succeeded, and the old varieties that used to split their "pods" have been entirely superseded with modern ones that do not except under exceptional circumstances. Of course when we get a very large and heavy flower the strain which the calyx has to bear as the result of the compression of a great number of petals within its tube is occasionally too great, and a split accordingly takes place. Despite this, however, we may, generally speaking, claim that "pod bursting" is now a thing of the past.

Improvement in the habit of the plants has also been kept constantly in view, and the modern forms are certainly taller and more vigorous than the old ones, whilst they are far and away ahead of them with regard to floriferousness. It is really astonishing to see how freely seedlings bloom, and this particular feature is sure to strike one who has had to do with layered plants all his life, and who looks upon a bed of seedlings for the first time.

The question of form is one over which the florist's ideal and the tastes of the layman do not entirely agree. The florist strives for a round petal of good substance with a margin smooth and entirely free from notches or cutting of any sort. The layman likes the bold substantial petals well enough, but the notching of the petals is to him a matter of no consequence, indeed some of his greatest favourites exhibit that characteristic. Take for instance the variety Waterwitch: here the notched petals add to rather than detract from the beauty of the flowers in many peoples' estimation, as a proof of which we find that the variety is very largely grown.

A most important advance has been made with regard to the lengthening of the flower stems. Formerly these were all short and dumpy, with the exception of those belonging to the central and primary flowers. Now we find that they are all much longer, even those of the secondary or side flowers, which are thrown out from the sides of the main stems after the first flowers are over. We, in this country, have not attached so much importance to this point as our American friends have done. There they insist on the flowers having long stalks, and a moment's reflection will convince anyone of the greatly increased value of a flower with a good stalk in all decorative undertakings. It is most likely that American ideas with regard to Carnations set an example to the Britisher, in the same way as was done with Chrysanthemums, for the practice of showing them with long stalks was a distinct following of American example.—*Ren.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Ficus radicans variegata.—*H. G.*: It was the variegated form of *Ficus radicans* received an Award of Merit in May, and a First-class Certificate in September of last year from the Royal Horticultural Society. If, however, it is the green form that you want, and not the variegated one, you would no doubt get it from Messrs. Jas. Veitch & Sons, Ltd., Royal Exotic Nursery, Chelsea. The variegated form could probably be obtained from the same firm, but if not, certainly from Mr. Wm. Bull, 536, King's Road, Chelsea.

Standard zonal Pelargoniums.—*Iris*: You ought to experience no difficulty in growing standard Pelargoniums. The most reliable method is to take seedlings from really good varieties, for seedlings are stronger growers than plants developed from cuttings, and it is thus easier to get a good stout stem, capable of carrying the weight of a head. The young plants may be allowed to grow away until they have reached the required height. In the meantime all lateral or side growths should be removed, cutting them back close to the stem; also all flowers after the first truss. It is necessary to allow the latter to develop in order that the quality of the flower may be seen, as it would be provoking to grow a plant on for two or three years to form a standard, only to find at the end of that time that it is a comparatively poor variety. A better plan is to graft a good variety on the top of the stock.

Araucaria excelsa.—*Conifer*: This handsome *Araucaria* does not need to be shifted very often. A comparatively small pot will carry a large plant with perfect safety. If your plant commences to show signs of starvation, which it usually does first of all by turning a very pale green, you may give it a little liquid cow manure about twice a week. If a little soot is mixed with the cow manure so much the better. Take the plant out of the window occasionally and sprinkle it overhead or syringe it with clear water. These washings will help it greatly. In giving the manure water it will be necessary for obvious reasons to stand the plant out of doors until the superfluous water has all drained away.

Tree Carnations.—*Llanely*: The plants are too small to flower during the coming winter, since they are only now in small thumb pots. You should pinch the points out of the plants, and then after they have commenced to throw out side shoots they may be potted up into large 60's.

Linaria Cymbalaria.—*C.T.*: Although this pretty little creeping plant, popularly known as Mother of Thousands, is a common British weed there are many subjects cultivated that are less beautiful. We have seen numbers grown in windows of London houses, and they not only resist the smoke and grow freely, but produce their lilac-coloured flowers in great abundance. There is a cultivated variety with white flowers, but in our estimation the lilac coloured one is the better of the two.

Peach Leaves Dropping.—The leaves on my Peach tree under glass have commenced to drop, although the fruit is not much more than half grown. The trees have, of course, plenty of leaves left yet, but is not the occurrence an unnatural one? The fallen leaves are all curled and twisted up as if they had been burnt.—*A.R.*

We do not doubt that red spider is the immediate cause of the trouble which if allowed to go on must inevitably do great damage to the tree. If you examine the leaves closely you will find the minute, red insects in considerable numbers, and they turn the leaves to that reddish-brown or brown hue that is followed by their fall. If the tree is very badly affected it will be well to syringe it with a solution of Nicotine Soap, following the instructions given on the label. After this give heavy syringings of clear water twice daily, that is morning and evening. If the pest has not attacked the whole of the tree the washings with clear water will probably be effectual without the agency of the insecticide. The syringings will be almost sure to bring down a lot of the leaves, but this will not matter as they would be sure

to fall in any case before long as their energies are crippled. The healthy leaves will not fall.

Grape Buckland's Sweetwater Splitting.—*G. L.*: The splitting of the Grapes is due to a rush of moisture, although we have found the variety, Buckland's Sweetwater, to be much given to cracking. Allow a moderate extension of the laterals so as to carry off some of the superfluous sap.

ORMISTON HOUSE.

THE half-hour's railway journey from Edinburgh to Ormiston carries the Saturday afternoon tourist through a very charming piece of East Lothian scenery.

Near Inveresk he turns off the main line and rises round Carberry Hill, the seat of Lord Elphinstone, and down into the valley of the upper Tyne, which

minutes further we reach the gate of Ormiston Grounds; in another couple of minutes we arrive at the house of Mr. Bannerman, the head gardener. Ormiston is not only a beautiful estate, it is a place with a history, and we are, therefore, glad to find so courteous and well-informed a guide. It was the home of the Cockburns, several of whom occupied conspicuous places in Scottish history, and distinguished themselves by their active and enlightened efforts to advance Scottish agriculture and horticulture in the days of their infancy. Moreover, it was in Ormiston House that George Wishart, one of the chief Martyrs of the Scottish reformation, was seized by the emissaries of Cardinal Beaton. Part of the old house is still standing where the Martyr slept on the night on which the mansion was surrounded by the Earl of Bothwell's men, and Wishart was arrested. Such facts quicken our interest in this historic spot, as Mr. Bannerman takes us round and

great Yew tree, one of the oldest, if not the oldest in Scotland. The tree was spoken of in an old lease in the possession of the Earl of Hopetoun as a remarkable one as early as the fifteenth century. It would be useless to hazard a guess as to its age, but its magnificent proportions incline one to be very generous indeed in reckoning, not merely the years, but the centuries. Its girth, when last measured at an elevation of 3 ft. above the ground, was 16 ft. 6 in.; its height 36 ft., and the circumference of the branches 250 ft. It is a glorious and graceful pile, but further comment is needless in presence of the accompanying photograph, which will speak for itself. The Yew tree, of course, bulks most in our eyes as we write these lines and must form the *Ne Plus Ultra* of the letter. We shall only add that Ormiston looks extremely well under Mr. MacDougall's enlightened tenancy. Seldom, in fact, does one see a tenant take such an interest in its proper upkeep. In Mr.

ANCIENT YEW AT ORMISTON HOUSE.

enters the Firth of Forth below Haddington. This sequestered vale is rich in pastoral beauties, consisting as it does of fertile agricultural ground along the Tyne banks, and magnificent woods along the higher ground. Among these woods those of Oxenford, Prestonhall, Ormiston, Winton, Salton, and several other fine estates are conspicuous. Our visit to-day is to Ormiston, one of the seats of the Earl of Hopetoun, and rented at present by Mr. MacDougall. On the way thither from the station you pass through the pretty village of that name, a quaint, pleasant little place with great shady trees lining either side of its one street and high gabled houses peeping out from behind them.

It is one of the most idyllic of Scottish villages, and the fine rich soil of the surrounding lands, which is used to produce splendid crops of fruits, vegetables, notably Strawberries and Raspberries, lends to the village an air of plenty and prosperity which does the heart good. Continuing our way for twenty

himself answers our enquiries as to the historical associations connected with it.

A stroll through the kitchen garden by way of preface is very enjoyable. The Portugal Laurels in full flower are particularly striking, and one magnificent old Holly tree deserves mentioning for its rare proportions. Excellent crops of fruit and vegetables with fine old-fashioned flower borders in full July blaze bespeak a charming blending of the practical and the pictorial in this fine old garden. From the kitchen garden we pass along a fine avenue of Beeches and Oaks, flanking a stately park to Ormiston House.

Here again there are more floral charms awaiting us, for there are two fine flower gardens in the rear of the mansion, one very old, near where the remnants of the old house stands, the other, more modern in style, alongside it. There are magnificent collections of Roses, Iris, etc., to arrest and delight the eye. But the feature of Ormiston flower gardens is the

Bannerman he has found an admirable practical man to direct the management of the gardens and beautiful grounds.—*Tyneside*.

BERRY HILL, MAIDENHEAD.

IN taking a hasty look through this pretty place a short time ago, I was impressed with two or three things that are grown here in a remarkably successful manner. Mr. Allen, the gardener, kindly acted as our guide, and our thanks are due to him for his kindness. The first, then, to which I would call attention were the grand flowering plants of *Begonia corallina*, and the newer form, *President Carnot*. These were specimens some six feet high, covered with clusters of large size of their distinct scarlet coloured flowers. They were just in splendid condition, a mass of colour, deserving in every respect the space they occupied. Another type equally meritorious was the seedling double *Begonias* that

were used as basket plants. Drooping spikes, on which I counted six and seven flowers, were hanging over the sides and presented a most interesting sight. Mr. Allen assured me he raised them readily from seed, and that the majority prove to be most beautiful and useful.

A grand lot of *Calanthe Veitchii* in pots on shelves was making strong shoots; last year's bulbs were some of them 6 in. and 8 in. high and stout in proportion. The display of flowers had been most satisfactory. Capital pots of *Browallia speciosa major*, more compact in growth than is often seen, were covered with their bright blue-purple flowers. In the stove was a fine plant of *Schubertia graveolens*, full of clusters of its sweet-scented white flowers. Certainly a useful flower for vases, &c., its milky juice would prevent its often being used for button-holes; though in many respects the blooms resemble a strong *Stephanotis*. I noticed, too, a fine lot of *Clerodendron fallax* in flower, raised from seed, and a later batch just coming on. These, I understood, were much appreciated, and it would seem deservedly so.—*W. S.*

THE HOME OF FLOWERS AND SOME OF ITS OCCUPANTS.

It was a happy inspiration that led Mr. H. Cannell, the head of the firm of Cannell & Sons, to call the establishment at Swanley the Home of Flowers. As the years pass on the absolute truthfulness of the title becomes more and more apparent, for the numerous plants taken up there grow and flower with an abandon that is unmistakable evidence that their requirements are fully known and attended to, and that they are, in very truth, "at home." It matters not at what season of the year the visitor makes the acquaintance of the nursery, there is always plenty to be seen, and to see is but to admire. Naturally, the distinctive features vary with the particular season of the year, for *Primulas*, *Cinerarias*, herbaceous *Calceolarias*, tuberous *Begonias*, *Cannas*, *Fuchsias* and *Chrysanthemums*, to mention a few of the most important classes, are all specialties for which the firm is justly renowned far and wide. But the ever perennial feature of the establishment, and one that always compels the admiration of the visitor at any season, is

THE PELARGONIUMS.

From January to December these plants are in bloom. The snows of winter, and the heat and drought of summer make but little difference to the display which is kept up by relays of plants. Mr. Cannell's name is written large upon the horticultural records of the nineteenth century, but in no direction has he achieved greater success than with the zonal *Pelargonium*. He has practically created a new race of plants suitable either for winter or summer flowering, in which the mere size of the trusses and individual pips is not only increased, but a wealth of new shades of colour is given. The contrast between some of the old forms and the modern ones is thus sufficiently striking. Amongst the former we noticed the curious variety *New-Life*, with its small pips and trusses, the colour being white striped with scarlet. This was a sport from the old favourite *Vesuvius*, a versatile variety to which we owe many of the best sorts now existing. *Black Vesuvius*, another old one, was remarkable for its very dark foliage, dwarf, sturdy habit, and the great freedom with which its rich orange-scarlet flowers are produced.

Of the modern varieties Swanley holds a magnificent collection, and the three or four houses filled with the flowering plants make a dazzling display of colour. The size of the flower trusses and pips is really wonderful, and the floriferousness of the plants equally so. Of the numerous varieties that claimed our attention the following are a few of the most noteworthy—it would obviously be impossible to mention all. *Beckwith's Pink* is one of the best of its colour, and the best of the *Master Christine* type. *Beauty of Poitevine* is practically the same as the *King of Denmark*, which has appeared at shows a good deal of late. *Mme. A. Bruneau* represents a charming section in which we hope to see still further progress. The pips are white, of capital form, and each petal has a narrow border of rose, very regular and well defined like that of a good *Picotee*. The flowers are double, and the truss of great size. Of the double whites *Hermine* is one of the very best, whilst

amongst the single varieties *Virginia* and *Snowdrop* represent the perfection of beauty. *Red Eagle* is a large showy flower of bright scarlet. *Sir James Kitson*, a comparatively new sort, is a grand orange-magenta variety, and *Mrs. Pole Routh* sent out at the same time (1897) is an equally good thing. The colour is salmon, several shades of which are apparent, for the flower is prettily mottled. *Mrs. Robert Cannell* is more particularly valuable for bedding purposes, and represents a bright shade of salmon that is very taking. Amongst the double crimsons there is no more useful thing than the double form of *Henry Jacoby*, itself a great favourite.

IVY-LEAVED VARIETIES constitute a very pleasing and valuable section. The old *Madame Crousse* is still one of the best for the filling of window boxes and hanging baskets, although there is a number of more refined and better flowers from a florist's point of view. *Cordens Glory* is bright scarlet, *Souvenir de Chas. Turner* is deep pink, feathered with maroon, and *Galilee* is soft rose-pink. All three of these varieties should be in every collection. The well-known *Ryecroft Surprise*, and the equally good *Beauty of Castle Hill* should likewise not be forgotten.

TRICOLOR AND VARIEGATED FORMS.—At one time these were more popular for bedding purposes than they now are. Probably the difficulty of keeping them through the winter is really responsible for this. Messrs. Cannell & Sons have a magnificent stock of them, and we have never had the beauty of this section of *Pelargoniums* so forcibly impressed upon us when looking over their collection. Of the showy golden tricolors *Mrs. Pollock* is still good, but *Mr. Henry Cox* and *William Sandy* are even better. In the ranks of the silver tricolors, *Mrs. Miller*, flushed deep crimson and black zone, is exceedingly handsome. *Mrs. Parker* is a striking variegated sort, much like *Flower of Spring* in foliage and habit, but with double pink flowers. Such old, and at one time popular, varieties as *Freak of Nature* and *Happy Thought* are kept in stock as well as the newer ones. The yellow-leaved section is not a strong one numerically, but it is an important one nevertheless, for to it belong *Crystal Palace Gem*, *Creed's Seedling* and *Robert Fish*, all three of which are much used as edging plants in summer bedding combinations.

TUBEROUS BEGONIAS.

The work of improving these already noble flowers is still going on year by year, and nowhere is the development more keenly watched than at Swanley. The strain of both singles and doubles is a remarkably fine one. From a spectacular point of view several houses which are devoted to the *Begonias* are just now one of the chief features of the establishment, and we have really never seen a finer display. The singles are characterised by tremendous flowers, which, stocky as the plants are, yet try them considerably by their weight. Many of the best of them have received distinctive names, and although this is a futile proceeding in the majority of cases when the next season probably sees the variety superseded by another, the forms that will supersede these will need to be something wonderful. *Lord Grosvenor*, orange-scarlet; *Golden Hind*, rich golden-yellow; *Paul Hardy*, deep crimson scarlet; *The Lady*, white; *Major Burke*, fiery scarlet; and *Mrs. Newman*, rose pink, were some of the best that we saw.

The doubles are fully up to the singles in point of merit, and we were particularly struck with a grand, new, pure white form named *Snowdrift*. The flowers are of great size, very regular in build, the margins of the segments being prettily frilled, and the segments themselves of great substance. *Commodore Dewey*, crimson; *Lord Sherborne*, scarlet-crimson; *Lady Roberts*, flesh-pink; *Miss Violet Kennard*, white; *Freda*, salmon; and *Miss Griffith*, blush pink, were all in fine condition, as were indeed a host of others that our space will only permit us to speak of in the mass. The *Begonias* are certainly the best that the Messrs. Cannell have ever had, and this is saying a good deal.

CANNAS.

Time was when huge pots were thought to be necessary to flower *Cannas* successfully, but this idea has been exploded, for the Messrs. Cannell have conclusively shown by their superb exhibits of *Cannas* at the London and provincial shows that the finest of flowers can be obtained from plants in 5-in. pots.

Cannas may be seen in flower at Swanley from the beginning of May till the end of November, and often into December and January, and in every case they are good from the earliest to the latest. At the present time one of the 100 ft. span-roofed houses is full of plants in flower. All the leading varieties are represented from the tall *Italia* and *Austria*, with their excessively wide but rather thin segments, down to dwarf, sturdy plants well under 2 ft. in height, but all carrying huge trusses of brilliant flowers. *Burgundia* is another of the tall, so-called *Orchid* flowering *Cannas*. It resembles *Italia* but the colours are a shade or two lighter. *Paul Bruant*, fiery orange-crimson; *Aurea*, pure golden yellow; *Konigen Charlotte*, bright red, edged with gold; *Partenope*, dark orange yellow; and *Leon Vassiliere*, scarlet-orange flowers, and handsome purple foliage, are a few of the cream of the collection. As the latter comprises upwards of 160 varieties, it is manifestly impossible to detail all.

Other houses were filled with young plants which had not yet reached the flowering stage. All of these were full of health and promise, and many of them are destined to make gay the dull months of winter.

THE ECONOMIC USES OF BAMBOOS.

MR. A. B. FREEMAN-MITFORD, C.B., is one of the greatest authorities upon all matters connected with Bamboos. His collection of living plants at his establishment at Batsford Park, Moreton-in-the-Mars, is one of the finest in existence, whilst in his travels he has had unique opportunities for studying the economic uses of these plants. A large audience listened with the greatest interest to his lecture on this phase of the subject which he delivered before the Royal Horticultural Society on the 26th ult. Sir J. T. D. Llewellyn, Bart., M.P. occupied the chair.

It was easy to see that Mr. Freeman-Mitford was an enthusiast, for from the commencement of his lecture until the end he was eloquent in the praises of the Bamboo. In China and Japan it was an absolute necessity, in support of which he quoted the old Chinese proverb—"Better a field without Wheat than a house without the Bamboo." "How shall I live for a day without this gentleman (referring to the Bamboo) was the expression of the common Chinese idea. The lecturer passed on to refer to the great height of the Burmese Bamboo, *Dendrocalamus giganteus*, and said that in the *Paradeniya* gardens in Ceylon there was nothing more striking. There were there to be seen huge clumps of as many as a hundred canes each, some of the canes running to a height of 135 ft., with a girth of from 25 to 27 inches. Apart from decorative effect the plant was of little value, for the culms were very hollow and the walls thin, whilst the fibres were spongy and liable to splitting. Water pipes and flower pots were often made from them. He showed a section of one of these gigantic culms which had been soaked in linseed oil, of which it had absorbed a large quantity, to prevent splitting. The only Bamboos planted in Ceylon were this giant, and *Bambusa vulgaris*.

Referring again to the usefulness to man of the Bamboo, the lecturer said that only the *Cocoonut Palm* (*Cocos nucifera*) could dispute with it pride of place. With regard to geographical distribution Europe was the only quarter of the globe in which some were not found. Asia and South America were probably the richest in species, but of the African forms little was known. *B. aristata* was found in abundance on the slopes of the Andes at a height of 13,000 ft. above sea level, whilst at 15,000 ft. altitude, and from thence nearly up to the limits of perpetual snow it formed a dense carpet covering the ground, and driving everything else out. *Dendrocalamus strictus* was to be found on dry hill tops and slopes in Central India and the Deccan, where the culms were solid and comparatively small. The same species, however, grew in the moister parts of Southern India and Ceylon, where the stems were larger and hollower.

In China the Bamboo entered very largely into all social functions. It was everything to a Chinaman, for it carried his mother as a bride to the altar, would carry him to his own grave, and in the meantime would provide him with a house and furnish it at a total cost of about \$5. From it he obtained paper, pens, clothing, fishing tackle, material for building boats, and rigging them with sails, whilst the tender

shoots were cooked and eaten as a vegetable. Here Mr. Freeman-Mitford spoke of a recently discovered quality of the Bamboo, discovered by a British officer stationed in one of the driest parts of India, for by stabbing the internodes of the culms, clear limpid water could be obtained. The blowpipes of Malaysians were obtained from the Bamboo, and shafts for assegais were supplied by the canes of *Arundinaria tessellata*. Five Indian species were largely used for fencing purposes, and the making of water pipes, fishing tackle, and house furniture. *Phyllostachys mitis*, which grew to a height of from 60 ft. to 70 ft. in China was very useful for many purposes, for the walls of the culm, although thin, were light and tough. *P. Quiloi* was employed in the same way. *P. nigra*, and *P. nigra punctata* were largely used for the making of house furniture. Samples of the curiously twisted canes of *P. heterocycla*, the tortoiseshell Bamboo, were also shown. He thought the curious "side to side" arrangement of the separating membranes was due to the plant growing in heavy compressed soil, for it was only the earlier formed nodes that showed the deformity, and it was not to be seen at all when the plant was growing in light soil. *P. aurea* showed the same peculiarity. This species could be easily distinguished from any other by the existence of swelling at the bases of the nodes, which were not found in any other form. He took *P. heterocycla* to be only a form of *P. mitis*, and *P. castillonis* to be a garden form of *P. Quiloi*.

The canes of *B. quadrangularis* were much in favour for fancy work in Japan. The species was not indigenous to Japan, but had been introduced to that country through China.

The lecturer thought that Bamboo growing for the canes would never become an important industry here, for, first of all, we lacked the steamy atmosphere and high temperature necessary to the quick development of the plants, and secondly, there was not sufficient demand for the canes. According to the Chinese from seven to ten years elapsed from the time of planting till the plantations were remunerative. He could find nothing reliable as to the costs and profits of the industry, but \$500 worth of canes had been sold annually from a plantation of two acres in area. He regretted that he could give no reliable information as to the importers' profits. He had applied to several large importers, but the accounts he received were variable and, in some cases, contradictory, one gentleman going so far as to say that Bamboos only came over here as ballast.

Mr. Freeman-Mitford concluded his very able and interesting lecture by an allusion to the fine decorative qualities of the Bamboo.

In the discussion which followed, the chairman strongly recommended all to visit the Bamboo Garden at Kew, which, he said, grew in grace and beauty year by year. He also urged each grower to experiment in his own garden with the different species and varieties. He had been agreeably surprised to see how well they adapted themselves to their changed conditions.

D. Masters put in a good word for *B. Metake*, which he described as a first-class town plant, suitable for planting in either South Kensington or Whitechapel.

Mr. Harry J. Veitch said that he had found that Bamboos would flourish in almost any soil, and their ability to resist drought had been remarkably shown during a period when many shrubs were dying for lack of water. He advised a mulching of good manure in the autumn.

In answer to a question Mr. Freeman-Mitford said that the most suitable Bamboos for planting for cover for pheasants were *Arundinaria Veitchii*, *B. palmata*, *B. tessellata* and *A. metallica*. The latter, which had been shown for the first time that day, in his own collection was more vigorous than either *A. Veitchii* or *Bambusa Metake*. It was needful, however, to protect it at first from rabbits, which were a great nuisance and very destructive.

Fagus sylvatica pendula, or the weeping Birch, is one of the most elegant trees of all those that the planter has at command. One of the finest specimens of it in existence is growing on the site of an old nursery at Flushing, N.Y., U.S.A. It is about forty years of age, is 48 ft. high, has a trunk girthing 10 ft. at 3 ft. from the ground, and the circle formed by the sweep of its branches is about 52 ft. in diameter. This fine tree was recently figured in *Gardening* (American).

HORTICULTURE IN ROTHERHAM.

OAKWOOD GRANGE.

SITUATED in a rectangular direction to the Woodlands, the subject of my previous notes, is the charming residence of G. Baker, Esq., horticulturally presided over by his capable gardener, Mr. A. Woodward. In upper Moorgate on the way to Whiston stands in bold relief the picturesque mansion alluded to, towering majestically above the surrounding country, which in this neighbourhood is somewhat undulated, and so a fine view is commanded of great rural beauty. Nor are the sulphur fumes so troublesome in this locality, consequently the kitchen garden department is worked with a large amount of success. A drive of about 150 yards from the Moorgate Road and the residence of Mr. Baker is open to view; so aptly, however, is the introduction of shrubs and banks intervened that the house is hidden, when walking up the drive, and so the pleasing revelation of this sightly mansion comes as an exceedingly pleasant surprise.

But away to the houses, six in number and of considerable dimensions, comprising large Peach house, vinery, greenhouse, Rose house, stove, &c., situated in the rear of the house, and suitably enclosed with the orthodox garden walls. In the vinery department general health was evident, plenty of good wood and vigorous bunches judiciously thinned. Alicantes, Gros Colmar, Lady Downes and Ham-burgh are the varieties grown. Two Peach houses (the one 28 yds. by 8 yds., the other 14 yds. by 4 yds.) showed a week ago a splendid crop; more really than they should have done, as Mr. Woodward said, to ensure a fair successive crop year by year. The varieties grown are Noblesse, Welbeck Seedling, Hale's Early and Royal George, with two or three Pitmaston Orange Nectarines introduced. The plentiful crop seemed in no way to affect the size of the fruit, which was everything to be desired.

In the stove were healthy Crotons in all the latest varieties, Marantas, *Ficus variegata*, *Dracaenas* of sorts, Cannas and choice Orchids, making grand breaks, and embracing such families as *Dendrobes*, *Cattleyas*, *Masdevallias*, and *Cypripediums* in many and choice varieties. The Exmouth variety of *Stephanotis* on the roof was in full bloom, and formed a glorious pendant.

A cool house which acts as conservatory was bright with good zonal and show *Pelargoniums*, the former including such varieties as *Amy Amphlett*, *Plutarch*, *Mrs. Leavers*, *Raspail*, *Golden Wedding*, &c. *Odontoglossum Rossi majus*, *O. Pescatorei*, and other species were identified, and apt dots of *Celosias*, *Gloxinias*, *Calceolarias*, *Streptocarpus*, and general foliage plants completed such a charm of culture and arrangement that could not, but please the most fastidious in horticulture.

In an adjoining span-roof house, 17 yds. by 7 yds. was a centre bed of fine specimen *Camellias*, surmounted on the entire roof by such *Roses* as the charming varieties *Anne Olivier* (a grand *Rose*), *Maréchal Niel*, *Jean Ducher*, *Homère*, *W. A. Richardson*, and *Gloire de Dijon*, all in perfect health and consequent vigour, and free from pests of any description. It was at this point that I found my wily chaperon (Mr. A. Woodward, the gardener), had by no means as yet shown me all the charming things at this establishment, for he had evidently kept till nearly the last what was undoubtedly one of the prettiest attempts at bedding I have as yet seen hereabouts.

A lawn and small intervening belts of shrubs, with flower borders comprising in all about an acre, situated in front of the mansion, was the scene of this latest development alluded to. Standing on the well kept sward facing the house the general effect was delightful. Access to the lawn is gained from the front entrance of the house either by a flight of steps or the slope of grass that prefaces, as it were, the entire front of Mr. Baker's residence. At the foot of this slope are laid out flower beds, serpent and circular shapes alternating. These are filled with *Calceolarias* *Golden Gem*, *Gold Cup*, and *Sultan*; zonal *Pelargoniums* *Harry Hieover*, *Flower of Spring*, *Princess Jacoby*, and *Crystal Palace Gem*, and last but not least, that irreproachable *Viola*, *The Tory*.

Around the borders generally in the pleasure grounds were some magnificent spikes of *Stocks*, charming *Roses*, mostly the hybrid perpetual, and in great variety, *Syringas*, *Buxus*, *Ilex*, the *Golden Yew* (*Taxus*), and the *Irish Yew*, *Retinospora*,

Cupressus and other *Conifers*, *Laurels*, *Aucubas*, &c.

To retrace our steps from this spot to the kitchen garden was an act of leaving the ornamental to observe the useful. Here were to be seen a magnificent lot of pink *Celery* (*Upstone's Superb*) that was absolutely fit for table if only earthed up and blanched. Following about four double rows of this were successive lines of *Duke of Albany*, *Sharpe's Queen* and *Prince of Wales Peas*, the latter full, fit and hanging about as thickly as they possibly could, with the other varieties promising equally as well. Early *Snowball Cauliflowers* were heading, with successive varieties well in advance of anything I have seen in South Yorkshire; *Beet*, bulbing nicely; *Carrots* of the *Intermediate* type, a fair size; *Parsnips* with wonderful tops, and almost as good bottoms; *Chelsea Gem Peas* with beautiful pods, and heavily laden (a grand stock); in fact, every nook and corner of this spacious kitchen garden was filled with grand examples of good culture, which undoubtedly will have much to owe to a copious supply of good manure, especially in such a dry season as we are experiencing. Thus is the moisture retained, and the season somewhat counteracted.—*Albert Upstone*.

MILLFIELD NURSERY, EDMONTON.

Nor only does Mr. H. B. May grow myriads of plants for market but he has taken up fruit culture to a considerable extent, and this branch of his business will probably largely increase in the course of the next few years. The Millfield Nursery, situated about a mile on the other side of Silver Street Station from that on which the Dyson's Lane establishment lies, is the nucleus of the fruit culture branch. The surroundings are open and breezy, for the ground lies fairly high, and everything is apparently conducive to success. The houses are much larger than those at Dyson's Lane, and are very substantially built.

Grapes and Tomatos are the chief subjects taken up, and under the capable management of Mr. Summers, excellent results are obtained. There are twelve established vineries each measuring about 160 ft. in length by 28 ft. in width. The canes are stout, healthy, and in full bearing. This year they are carrying exceptionally heavy crops, and we were very favourably impressed with the fine substance and rich green of the foliage, as well as the size and regularity of the bunches. *Gros. Colman* and *Muscat of Alexandria* are the chief varieties, and they are found to command a first-class sale. *Black Alicante* is grown to some extent, but *Canon Hall Muscat* is not touched at all; "it is too risky" said Mr. Summers to us in reply to the query.

In the early months of the year, up to and including May, the floor space in these vineries is utilised for the growing on of hordes of bedding plants, the zonal *Pelargonium West Brighton Gem* being an especial favourite both for flower beds and window boxes. *Spiraeas* and *Ferns* claim the space not occupied by the bedding plants and thus supplement to a very material degree the resources of the establishment at Dyson's Lane.

The two most recently constructed vineries are giants among their kind, for one measures 250 ft. in length by 26 ft. in width, and the other is 22 ft. longer. They are planted with *Vines*, and until these come into bearing the other part of the floor space is covered with *Tomatos*, *Chemin Rouge* being the favourite variety. When these two houses get into full swing they will indeed be magnificent vineries.

In the houses devoted to plants we were delighted with the grand batches of *Crimson Rambler Rose* in 48-sized pots. These plants were not only in vigorous health but were a mass of flower; indeed it is a wonder how they can be induced to do so well with such limited root space.

Clematises in 4-in. pots are another special feature during the spring months. They flower freely and make capital conservatory plants. Such varieties as *Miss Bateman* and *Fair Rosamond* take very kindly to this treatment. The white *C. Jackmani* also gives satisfaction thus, for although it is rather a weak grower it flowers freely and the flowers are of good size.

In the numerous pits and smaller houses zonal *Pelargoniums* were to be seen in great numbers at the time of our visit, and the fine new pink variety *Millfield Rival* was in splendid condition. *Tricolors*

are well looked after and the collection contains every form of note or merit.

In the open ground huge breaks of Roses and violas are to be seen, all the leading varieties of each being grown. Some of the Roses are induced to bloom early by enclosing large breaks with temporary glass. Light wooden frameworks are run up and these are covered with lights. The variety General Jacqueminot seems to be the favourite, and our guide informed us that it was by far the best of the dark varieties for market work. It can be got into bloom comparatively early in the season by the method mentioned above.

Both the establishment at Dyson's Lane and at Millfield are eloquent witnesses of the great business energy and executive ability possessed by Mr. May; and it is therefore not surprising that prosperity has crowned his efforts.

THE WEATHER AND THE CROPS.

In my rambles through the eastern part of Surrey I find that so far as culinary vegetables are concerned, in almost all instances with the exception of being later than usual, they present, at the present time, a more promising appearance than has been the case for several years past, this result being due to a more copious rainfall at the required time. Peas are in most luxuriant growth, some varieties being at least a third above their usual height. The various members of the Brassica family, with Lettuces and such like succulent subjects, simply delight in the showers. Potatoes, both in gardens and fields, are most promising. The hay crop is most abundant; some has been got in with very little rain upon it.

Those of our gardening friends who have this extra burden thrown upon them, and have a wet time in which to make it are much to be commiserated, but now that we have had a good spell of haymaking weather we hope they have been making hay while the sun has been shining. At the same time there are hundreds of acres still standing. A scarcity of labour is the plea with the procrastinators. I have been through some districts where a few heavy showers would be most welcome. Peas and Carrots are evidently suffering from a deficiency of moisture. Root crops generally would be much benefitted by a downpour. Should Wheat secure anything approaching present prices during the coming autumn the farmers will have a high time. Judging by the present condition of the crops the promise of harvest is splendid. I have passed through some of the best fields of Wheat I ever saw. The same holds good respecting Oats.

The fruit crop is very variable, with the exception of small fruits, which are generally abundant, Gooseberries and Strawberries remarkably so. Plums and Pears are almost a failure in some places, in others a moderate crop, and in a few, abundant. Apples are a poor crop in many places, and taking one variety with another, not more than a moderate crop anywhere. American blight seems to be in stronger force this year than it has been lately, the condition of young trees telling a sad tale of carelessness somewhere. Intending planters would do well to inspect the various nurseries and give those a wide berth where the pest exists.

It may be added that, with the exception of being a late season, owing to a low temperature with dull weather, while during the last few years there has been warmth and sunshine, should we be favoured with warm rain shortly, followed by warmer and brighter weather, 1898 seems likely as respects the fruits of the earth at home, to come out well at the close of the year. Outdoor Tomatoes will most likely prove an exception. They are everywhere in a too backward condition to inspire even the most sanguine with any bright hopes of success. Peaches and Apricots are a fair crop.—*W. B. G.*

SOCIETIES.

TIBSHELF FLORAL, HORTICULTURAL AND ROSE.—July 26th.

THE 23rd annual exhibition of this society was favoured by splendid weather, and an enormous attendance towards the close of the day. It was held in the Colliery Cricket Ground. The Tibshelf Society has

been a leading organisation of its kind in the Midland Counties for many years, and not only holds its own, but its recent show would seem to have inaugurated a new era of prosperity for the society. Sir Charles Seely, Bart., of the Tibshelf Collieries close by, was present at the show, and congratulated the society on the excellence of its exhibition. Mr. A. Outram, of London, who was one of the judges, averred that the groups were the finest he had seen this year, although he had judged at over thirty shows.

The groups in the open class had to be arranged for effect, and to occupy a space of 300 sq. ft. Eight competitors came forward and put the judges on their mettle to decide the relative merits of the exhibits. The prizes offered varied in value from £15 to £1. The premier honour was secured by Mr. Joseph Ward, gardener to T. H. Oakes, J.P., Riddings House, Alfreton, who is well known as an eminent and successful exhibitor, particularly at Tibshelf, where he has won the first prize for many years in succession. His group was remarkable for the light and graceful character of the plants and their arrangement, some of them being of great beauty and value. He won easily. Mr. J. T. Nelson, gardener to A. Barnes, Esq., won the second prize. Messrs. W. Arlingdale & Sons, were third; Mr. Wagg came in fourth; Mr. W. Haslam, of Hardstoft, fifth; and Mr. Vickers, the sixth.

The Roses were good and the competition keen. Messrs. Harkness & Son, Bedale, Yorks., were in good form, and took leading prizes for seventy-four, forty-eight, and thirty-six blooms, respectively, of hybrid perpetual, Tea and Noisette varieties. Other leading exhibitors in this division were Messrs. D. Prior & Sons, Colchester; Messrs. W. Boyes, Derby; and Mr. R. Mack, Catterick Bridge.

Fruit and vegetables made a very fine display, particularly the latter, notwithstanding the unfavourable character of the season generally. There was keen competition in the vegetable classes by cottagers residing in the parish of Tibshelf and the village of Newton. A large number of them are actually employed by Sir Charles Seely, Bart. The cottage gardens in the neighbourhood are a most interesting and wonderful sight. They are, in fact, pictures of high class or intense gardening. The cottagers may be seen by the dozen, each one trying to excel his neighbour with most commendable taste. The first class in the schedule, as usual, was devoted to the cottagers. The Potatoes were clean, smooth and shapely, and some of the earlier sorts were of great size. Flowers and fruits were also as good as last year. Some of the principal exhibitors were Messrs. J. Johnson, T. Draycott, C. Searston, W. Gibson, and T. Riley.

The class for amateurs was also well represented, and is always a feature of the show. The produce exhibited was considered superior to what it has been for some years past. The collections of fruit, particularly Gooseberries, were excellent. Everything passed off most satisfactorily and pleasantly, so that the society is to be congratulated on the holding of one of their most successful exhibitions.

NATIONAL CARNATION AND PICOTEE (Southern Section).—July 27th.

THERE was a splendid display of Carnations and Picotees at the Crystal Palace on the above date, and the wisdom of postponing the show from the 21st to the 27th was strikingly demonstrated for, owing to the lateness of the season many of the flowers would have been immature on the earlier date. Upwards of 500 entries were staged, from sixty-nine exhibitors. The show was a conspicuous success, for not only was it well patronised by exhibitors and visitors alike, but the quality of the flowers was much above the average, particularly self-coloured and fancy varieties.

CARNATIONS.

BIZARRES AND FLAKES.—Mr. M. Rowan, Clapham, staged the leading collection amongst the four exhibitors of twenty-four blooms of Flakes and Bizarres in not less than twelve varieties. J. S. Hadderly, Robert Lord, Wm. Skirving, Robert Houlgrave, Geo. Melville, Merton, Gordon Lewis, Constance Graham, Sarah Payne and Admiral Curzon were his premier varieties. Mr. J. Douglas, Edenside, Great Bookham, was a close second, Mr. Chas. Turner, Slough, was third; and Mr. Chas. Blick, gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent, was fourth.

There were six competitors for twelve blooms of similar material in as many distinct varieties. Here the first award fell to the lot of Messrs. Thomson & Co., Birmingham, whose best flowers were Merton, Guardsman, Master Fred, Vulcan, Gordon Lewis and Magpie. Mr. F. A. Wellesley, Woking, was second; Mr. C. Phillips, Bracknell, third; and Mr. J. Walker, Thame, Oxon, fourth. There were six entries in this class.

Nine competitors entered for six blooms of Flakes and Bizarres, distinct. Here Mr. A. R. Brown, Handsworth, Birmingham, led. He was followed in order of mention by Mr. F. Hooper, Bath; Mr. G. Chaundy, Oxford; Mr. J. Loveder, Bristol; and Mr. A. Greenfield, Sutton.

SELFS.—There were fine stands of twenty-four blooms, in twelve varieties. Martin R. Smith, Esq., was first with a magnificent lot in which there were only five pairs of duplicates. Mrs. Geo. Buchanan, Cecilia, Falcon, Helmsman, Kelpie, Archie Norman, Hildegard, Sir Bevy's, Firebrand, Purity, Miss Judith Harbord, Bomba, Sir Francis Drake, Enchantress, Exile, Cordelia, Joan of Arc, Torfrida, and Friar Tuck were some of the best. Mr. Jas. Douglas was second with a capital lot of blooms. Mr. C. Turner was third; Mr. M. Rowan, fourth; and Mr. A. Smith, Downley, fifth.

Seven entries were staged of twelve blooms, distinct. Here the honours were won by Messrs. Thomson & Co., Sparkhill, Birmingham, who had a stand of very fine, even blooms. The varieties were Her Grace, Exile, Mr. E. Hambro, Percy, Seagull, Ruby, Germania, Lady Mary, Nabob, Britannia, James Douglas, and a seedling. Mr. C. Phillips was second with much smaller, but bright flowers. Mr. A. J. Rowberry, South Woodford, was third; Mr. F. A. Willesey, fourth.

No fewer than twenty competitors staged in the class for six blooms, distinct, the first award going to Mr. A. R. Brown, who had capital samples of Royalty, Mrs. Eric Hambro, Miss A. Campbell, Mrs. J. Douglas, Negress, and a seedling. Mr. W. Gorton, jun., Wolston, was second; Mr. R. C. Cartwright, Birmingham, third; Mr. A. Chatwin, Edgbaston, fourth; and Mr. C. Harden, Dover, was fifth.

For six selfs of any one variety there were seventeen entries. Martin R. Smith, Esq., was an easy first with the fine yellow Cecilia; Mr. Jas. Douglas, second, with Mrs. Eric Hambro; Mr. C. Phillips, third, with Regina; Mr. R. C. Cartwright, fourth, with Niphetos; and Mr. C. Harden, fifth, with Mrs. Eric Hambro.

FANCIES.—There were four entries for twenty-four fancy varieties. Here Martin R. Smith, Esq., added to his previous successes by winning the first award with a really magnificent lot. Aglaia, Muleteer, St. Gatien, The Cid, Merry Duchess, Elaine, Renegade, Maid of Honour, Goldylocks, Zingara, Alexander, Electra, Eothen, Allegra, Hidalgo, Don Carlos, Lord Lieutenant, Guinevere, Fairy, and Persimmon were the varieties. Mr. C. Turner was second with much smaller but bright and well shaped flowers, Mr. J. Douglas was third, and Mr. A. Smith, Downley, fourth.

Four stands, also of twelve fancies, were staged, the first award going to Mr. A. J. Rowberry, the second to Mr. C. Phillips, and the third to Mr. J. Walker.

Six fancies was a popular class, for fifteen competitors entered. Messrs. Thomson & Co. were first, a superb bloom of Cardinal Wolsey being a special attraction. The second, third and fourth prizes fell to the lot of Mr. J. W. Ffoulkes, Chester; Mr. S. A. Went, Thames Ditton; and Mr. F. Hooper respectively.

In the class for six blooms of one variety there were fifteen entries. Mr. Martin Smith was first with Hidalgo, and Mr. A. W. Jones, Handsworth, second, with Golden Eagle.

SINGLE SPECIMENS — BIZARRES.—Mr. Robert Sydenham, Birmingham, had the premier scarlet bizarre in Richard Monk; Mr. A. Chatwin being second with Robert Houlgrave; and Mr. C. Turner, third, with the same variety.

Mr. Sydenham had the best crimson bizarre in Master Fred, and was also second with the same variety; Mr. C. Phillips being third with J. S. Hedderly.

William Skirving, shown by Mr. Robert Sydenham, was adjudged to be the best pink bizarre; Mr.

Rowan being second and third with the same variety.

FLAKES.—Mr. Robert Sydenham was first and second for the scarlet flake with John Wormald, the third prize going to Mr. A. R. Brown for the same variety.

Mr. Rowan was first for the purple flakes with Gordon Lewis, and second with Geo. Melville; Mr. R. Sydenham being third and fourth with Magpie.

Mr. A. R. Brown was first and second for the rose flake with Merton. Mr. Rowan was third with Mrs. Rowan.

SELFS.—Mr. Robert Sydenham had the best white in Mrs. Eric Hambro; Mr. Jas. Douglas, second with The Briton; and Mr. R. Sydenham, third, with Crystohel.

Exile, shown by Mr. Robert Sydenham, was the leading rose variety; Mr. A. R. Brown taking second place with Royalty.

Mrs. James Douglas, shown by Mr. Weguelin, was the leading scarlet variety, and The Cadi, sent by Mr. Douglas, the second best.

Uncle Tom, shown by Mr. A. R. Brown, was the leading purple, the second prize going to Mercurian, also shown by Mr. Brown.

The first award for the yellow went to Mr. A. R. Brown, for Miss Audrey Campbell, and the second to Mr. J. Douglas, for Miss Willmott.

Mrs. Reynolds Hole, shown by Mr. C. Phillips, was the leading buff form, and the Dyak, from Mr. A. Spurling, received second prize.

Voltaire, shown by Messrs. Thomson & Co., won as the fancy variety.

PICOTEES.

There were four entries for twenty-four white ground Picotees in twelve varieties. Here Mr. C. Turner led, his best hlooms being Acme, Favourite, Mary, Brunette, Little Phil, Mrs. Gorton, and Mrs. Payne. Mr. J. Douglas was second, also with a good stand, and Mr. M. Rowan, third. Messrs. Thomson & Co. were first in the smaller class for twelve hlooms distinct. Brunette, Favourite, Medhurst's Seedling, Somerhill, Mrs. Sharp, and Mrs. Payne, being the strongest samples. Mr. F. A. Wellesley, was second. Mr. A. R. Brown led for six hlooms, and was followed by Messrs. R. C. Cartwright, and C. Phillips in the second and third places respectively.

Mr. Martin R. Smith came to the front again in the premier class for twelve hlooms of yellow ground varieties, of which he had Lily, Duchess, Badminton, Hygeia, Lady Bristol, His Excellency, and Duke of Ahoa, in grand condition. Mr. C. Turner was second, and Mr. J. Douglas, third, both of them with good stands. There were five entries.

Of the nine competitors for six hlooms, Mr. G. Chandy, Oxford, led, Messrs. Thomson & Co. being second, and Mr. S. A. Went, third.

SINGLE SPECIMENS.

The following exhibitors won first awards in their respective flowers:—Mr. Albert Chatwin for the heavy red Isabel Lakin; Messrs. Thomson, for the light, red edged Mrs. Gorton; Mr. R. Sydenham, for the heavy, purple edged Medhurst's Seedling; Mr. A. R. Brown, for the light purple edged Harry Kenyon; Mr. R. Sydenham, for the heavy rose edged Madoline, and for the light rose edged Rosie Sydenham; Messrs. Thomson & Co., for the heavy scarlet edged Mrs. Sharp; and Mr. Sydenham, for the light scarlet edged Favourite; Wanderer (no exhibitor's name) won as the best yellow ground.

UNDRESSED BLOOMS.

In this section the flowers were shown with their own foliage. Mr. W. Garton, junior, won for six flakes and hizarres. There were thirteen entries for twelve selfs and fancies, the first award going to Mr. J. W. Foulkes; and the second to Mr. M. V. Charrington, Chislehurst. In the smaller class for six selfs and fancies, Mr. S. F. Selley, Forest Hill, won. Six white ground Picotees were best shown by Mr. M. V. Charrington, and the same number of yellow ground Picotees by Mr. S. A. Went. Mr. M. V. Charrington was adjudged to have the most prominent seedling self in a fine scarlet form.

MISCELLANEOUS CLASSES.

Mr. J. King, Crondall, received first award for six Carnations and Picotees, distinct, in the class for maiden exhibitors.

POT PLANTS.—Mr. Martin Smith added yet another first to his list of successes by staging the best twelve Carnations in pots; Mr. J. Douglas was second. Mr. Martin Smith also had the best speci-

men plant, showing Golden Eagle; Mr. Douglas was second, with Saul.

The group of Carnations occupying 50 sq. feet, sent by Mr. Martin Smith, was awarded first prize, and deservedly so, for it contained some grand plants. For the smaller group occupying 30 sq. feet Mr. J. Douglas, scored.

TABLE DECORATIONS.

Two Carnation dinner tables were forthcoming, that sent by Mr. H. Rogers, Rendlesham, Woodbridge, receiving the first prize. This was an exceedingly pretty and effective table.

Mr. S. A. West scored for the vase of Carnations, Mr. H. Rogers being second. Mr. Martin Smith sent the winning three shoulder sprays, and also the six huttonholes of Carnations and Picotees arranged with suitable greenery.

THE MARTIN SMITH PRIZES.—Mr. H. G. Smyth, Clark's Mews, High Street, Bloomsbury, won the first for the hunch of horder Carnations of one variety, set up with their own foliage, showing Jem Smyth. Mr. J. Euston, gardener to Mrs. Whitbourne, Ilford, scored for six bunches of similar material. Mr. E. C. Gohle, Ryde, Isle of White, was second. Mr. H. W. Weguelin, Torquay, had the winning exhibit of nine hunches of any section of Carnations and Picotees.

PREMIER BLOOMS.

The prizes for the premier hlooms in the whole of the show were as follows:—Carnations—Flake—Flamingo, shown by Mr. J. Douglas; Bizarre—Admiral Curzon, from Mr. M. Rowan; Self—Cecilia, from Mr. M. Smith; Fancy—Hidalgo, from Mr. M. Smith.

Picotees—Clio, heavy scarlet edged, from Mr. C. Turner; Summerhill, light purple edged, from Messrs. Thomson & Co.; and Mrs. Douglas, yellow ground, shown by Mr. C. Turner.

MISCELLANEOUS EXHIBITS.

An exceedingly showy group of cut flowers was staged by Messrs. Wm. Cuthush & Son, Highgate, N. In it Sweet Peas, Carnations, both Malmaison and horder varieties, Liliums, and Eryngiums were displayed to great advantage.

Four dozen hunches of Sweet Peas in as many varieties were shown by Mr. Henry Eckford, Wem, Shropshire. Mrs. Joseph Chamberlain, Royal Rose, Blanche Burpee, Lady Nina Balfour, Venus, Lady Beaconsfield, Prince Edward of York, Prince of Wales, Othello, and Sadie Burpee were some of the best forms on view.

Mr. J. Douglas sent a table of bunches of new self and fancy seedling Carnations raised by himself and Mr. Martin Smith. There were some exceedingly fine things amongst these.

Mr. F. G. Foster, Brockhampton Nurseries, Havant, Hants, contributed a fine stand of Sweet Peas.

ST. MARY'S, LEAMINGTON.—July 28th.

In spite of the showery weather the annual show of the St. Mary's Horticultural Society, which took place in the cricket field, Leam Terrace, east, on the 28th ult., proved a great success. Three tents were allotted to the exhibits of fruits, flowers, vegetables, and the industrial exhibits—the latter form an important section of the show. Mr. W. Vause, of Leamington, staged a group of miscellaneous plants, not for competition, which was greatly admired by visitors, and added much to the attractiveness of the show. The groundwork was of Maidenhair Fern, and out of this rose a quantity of well-grown foliage plants, amongst which Caladiums and Crotons were very conspicuous. The pretty *Francoa ramosa* was also freely employed. There was a background of large Palms. Mr. R. Greenfield, Jun., had another handsome group of plants and cut flowers, including Cattleys and Statices. Samples of Ichthemic Guano were forthcoming from the same source. Messrs. Webb & Sons, of Stourhridge, and Messrs. Hinton, of Warwick, both had showy collections of cut hardy herbaceous plants and Sweet Peas.

The competitive classes were well patronised and there were some lively tussles for the prizes.

In the classes open only to gentlemen's gardeners the most important exhibit was the group of plants set up by Mr. J. Tompkins, gardener to the Rev. J. Beaumont. Not only was the material good but the arrangement was very skilfully and tastefully carried out. The first prize was rightly awarded it. Mr. Tompkins was also first for Fuchsias, a specimen plant, and zonal Pelargoniums.

In the nurserymen's classes Mr. R. Greenfield, jun., carried off premier honours for the hand houquet, Mr. W. Vause being second, and Messrs. Finch & Co., third. Mr. Greenfield's bouquet consisted largely of Tuheroses, Stephanotis and Orchids. Mr. W. Vause led for Roses, Messrs. Finch & Co. for the epergne. The first prize for foliage plants went to Mr. Vause. The exhibits contributed by local allotment holders contained some capital vegetables, especially when the effects of the drought are taken into consideration.

BEDDINGTON, CARSHALTON AND WALLINGTON HORTICULTURAL.—August 1st.

The annual show of this society was held in Beddington Park, by the kind permission of J. H. Bridges, Esq., and B. Thirlhy, Esq., on Monday last, under very favourable auspices as to weather, bringing great crowds of people. There was a poultry and a honey exhibition in connection with it, the whole show being organised chiefly in favour of the cottagers and allotment holders.

GARDENERS AND AMATEURS.—In the larger class for a group of plants, Mr. J. H. Stevens, gardener to E. G. Coles, Esq., The Lodge, Carshalton, secured the first prize for a group, in which the taller plants consisted of richly coloured Crotons, and the flowering plants of Lilies, Cannas, Orchids, *Browallia elatior speciosa*, *Francoa ramosa*, Chimney Bell-flowers, &c. Mr. H. E. Gates, gardener to R. W. Miller, Esq., Brighton Road, Sutton, took the second place, using the variegated Pineapple, *Streptosolen Jamesoni*, Abutilons, Fuchsias, &c. The leading award in the smaller class was taken by Mr. A. Etheridge, gardener to A. Z. C. Cressy, Esq., Hayesden, Wallington, who had a pretty arrangement of Lilies, Trachelium, *Francoa*, *Browallia*, and Gloxinias, set off with Ferns, Palms, and grasses. Mr. H. E. Gates again came in second with similar plants to those in his other group.

Mr. A. Etheridge had the best Caladiums, and was followed by Mr. H. Shoebridge, gardener to M. Beddington, Esq., J.P., The Limes, Carshalton. Mr. Shoebridge also had the best Coleuses, which were trained in dwarf, semi-globular form. Mr. George Lewry, gardener to Mrs. Blake, Duppas Hill, Croydon, was second. Mr. H. Shoebridge had large and floriferous Gloxinias, the finest we have seen for some time, taking the first prize. Mr. A. Etheridge had the best tuberous Begonias.

Mr. George Lewry received the first prize for a collection of flowering and ornamental plants. Mr. J. H. Stevens had the best table plants, followed by Mr. Geo. Lewry and Mr. H. Shoebridge in this order. Six hunches of hardy border flowers were shown by Mr. J. H. Stevens, Mr. A. Etheridge, and Mr. W. E. Humphreys in this order. All were very fine. Mr. Thos. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, Chertsey, had the best stove and greenhouse flowers, and was followed by Mr. H. Sell, gardener to J. Wallis, Esq., The Banks, Beddington. Mr. H. Sell had the best garden annuals, Mr. H. Shoebridge being second, and Mr. J. H. Stevens, third. Mr. H. E. Gates had the best four tuberous Begonias. Mr. A. Etheridge was first for nine bunches of cut flowers. Mr. H. Shoebridge was first for four flowering plants. There were no less than ten tables set up as for dinner table decoration, several of them being very tastefully arranged. The pride of place went to Mrs. A. Robinson, Roma, Stafford Road, Wallington, with yellow Marguerites and Sweet Peas. Miss Lily Kirk, Honeywood, Carshalton, was a very good second, using pink and white Sweet Peas. Mrs. A. Robinson was first in another class for table decoration, using mauve and white Sweet Peas, &c. Mr. H. E. Gates was second.

Mr. G. P. Turner, gardener to H. W. Trollope Esq., Dover House, Woodcote, had the best collection of vegetables, having splendid Cauliflowers, Onions, &c. Mr. H. E. Gates was a good second; and Mr. James Cripps, gardener to F. Easterbrook, Esq., Park Hill House, Carshalton, was third.

Mr. G. P. Turner again came to the front for cooking and for dessert Apples. Mr. J. H. Stevens had the best six dishes of hardy fruit, showing Peach Alexander, &c. Mr. H. Shoebridge was second; and Mr. Thos. Osman, third. The latter came to the front for black Grapes, showing fine Black Hamburg. Mr. H. Shoebridge was second with smaller hunches. Mr. J. H. Stevens was first for Peaches.

THE COTTAGERS' CLASSES, chiefly devoted to vegetables, were located in a separate tent. Great care must have been exercised by the cultivators to get such good vegetables in a dry season. Mr. W. Ames, Beddington Corner, had the best collection, showing about twenty sorts. In another class Mr. J. H. Stevens led the way. Mr. H. Shoebridge had several of his vegetables in fine form, being second. Mr. Harvey Hopkins, 1, Ivy Cottages, The Writhe, Carshalton, was a good third, but was weak in some of his dishes. Mr. H. Sell took the fourth position, showing large Onions.

Potatos in most cases were fine. Mr. Harvey Hopkins was first for white varieties, followed by Mr. O. McRae, Beddington Corner. Mr. W. White, Westcroft Stables, was first for coloured Potatos, Mr. G. Bowditch, Wallington Corner, being second.

Mr. John Parfitt, William Street, Carshalton, had the best autumn sown Onions. Mr. W. White took the lead for spring sown Onions. Mr. F. Fuller, London Road, Wallington, had the best Shallots, followed by Mr. Harvey Hopkins. Mr. J. H. Stevens had the best eight dishes of Potatos, of which four dishes were hoiled and judged for quality. He also had the best dish of hoiled Potatos. Other vegetables were well shown.

Mr. Harvey Hopkins was first for three dishes of fruit, three other prizes being awarded. He was also first for Gooseberries. Mr. E. Bowditch had the best Black Currants; and Mr. W. Stedman, Penolver Cottage, Church Lane, Beddington, had the best Red Currants.

In the Champion class for the best kept allotment or cottage garden, the first prize was taken by Mr. Oliver McRae with 143 points. Mr. J. Parfitt had the best kept and cropped allotment ground. Mr. E. Bradley, Bandon Hill, had the best kept and cropped cottage garden. Mr. F. W. Eastland, Mitcham Junction, had the best kept and most tastefully arranged flower garden.

MISCELLANEOUS.—A triangular and pretty group of plants near the entrance of the large tent was set up by A. H. Smee, Esq., C.C. (gardener, Mr. W. E. Humphreys) "My Garden," The Grange, Wallington, Surrey. Two tall and well grown Humes, one either side of a Tree Fern, formed the background in front of which Trachelium caeruleum, Francoa ramosa, Statice Sewerzowi, Cattleyas, Cypripediums and other Orchids did much to brighten up a beautiful and tastefully arranged group. Palms, Ferns Caladiums and Begonias of the Rex type served as a set off to the flowers used. He also had another group at the far end of the tent.

A good length of side tahling was occupied by Mr. John R. Box, West Wickham and Croydon, who had hardy herbaceous plants, Sweet Peas and Roses. Amongst the Sweet Peas, Blanche Burpee, America, Countess of Aberdeen, Lovely, Mars, Mrs. Eckford, Prima Donna, Princess May and Royal Rose were some of his newer varieties. Mrs. John Laing, Victor Hugo, Alfred Colomb, Susanne Marie Rodocanachi and Marchioness of Londonderry were fresh amongst the Roses, notwithstanding the great heat.

The One and All Seed Company, Agar Street, Strand, London, had an exhibit of flowers, vegetables and seeds.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Sir Joseph Paxton.—Omega: As far as we can make out from contemporary accounts of the death of Sir Joseph Paxton he retained his position at Chatsworth to the last. He was born at Milton Bryant, near Woburn, Beds., either in 1801, 1802, or 1803, most probably in the latter year, but all three dates are given in different books. He was foreman in the Chiswick artoretum in 1824, became superintendent at Chatsworth in 1826, and was knighted in 1851 after having built the Crystal Palace in Hyde Park for the great International Exhibition of that year. In 1853 he commenced reconstructing the Crystal Palace on Sydenham Hill and finished it in 1854, in which year he became Member of Parliament for Coventry and continued to represent this division of the county till he died. Sir Joseph did not give up

his lucrative position at Chatsworth after having designed the Crystal Palace, but at the same time he followed the profession of architect and civil engineer after that masterpiece of his life time. The Duke of Devonshire made Sir Joseph the manager of his large estate in Derhshire, and, dying some years in advance of the latter, left him a munificent legacy. Sir Joseph visited the flower show at the Crystal Palace shortly before his death, but was then very feeble, and continued to get weaker till he died at his residence, Rockhill, Sydenham, close to the Palace, on June 8th, 1865.

Apples and Gooseberries.—W. Thom: We had a suspicion that the nature of the ground was at the root of the evil in connection with the Apple trees. The land consists of heavy clay soil that would be greatly improved by draining, trenching and manuring. Land that is good for Gooseberries would also hear heavy crops of Apples provided it is improved in the manner we mention and well tilled by rough digging in winter and frequent hoeing in summer to keep down weeds, and keep the surface loose and open. Such soil is capable of yielding heavy crops and will continue to improve year after year. Apples would, of course, require shelter by means of trees outside the garden provided the position is at all leak and exposed. Gooseberries bear well, as you say, but are liable to die off when old. The best way to remedy this is to have a quantity of young bushes coming on in a reserved part of the garden and to trench a piece of ground every few years, when it becomes necessary, and make a young plantation of bushes, it may be only a few rows at a time. By this means you will always have them in good bearing order.

Pounds of Fruit in a Sieve.—J. M.: The weight varies somewhat in Covent Garden according to the kind of fruit. Thus a sieve of Black Currants, Red Currants or Cherries would be 24 lbs. nett. A sieve of Gooseberries (green or ripe), Plums, or Damsons would contain 28 lbs. nett. We cannot say whether these weights would hold good for other places, but think it would as far as the large centres are concerned, for they are now working much on the same lines. It might be worth while making enquiries locally in the case of other places in which you might be interested.

Publisher of Plant Lore of Shakespeare.—Omega: The book named "Plant Lore and Garden Craft of Shakespeare," by the Rev. Henry N. Ellacombe, M.A., was published in 1878, by William Pollard, North Street, Exeter; but as far as we can learn he merely printed it for the author, and does not sell it. You should, therefore, apply to the author at Bitton Vicarage, Bristol, Gloucestershire, who will no doubt be pleased to give you particulars concerning the price, which is not stated in the book itself.

Specimen to Name, &c.—J. T. Thurston: The name of the plant you sent is Sedum stoloniferum ibericum, a native of Asia Minor and other countries. It is not a native of Britain and can hardly, therefore, be reckoned a weed. There are several varieties of S. stoloniferum, some having dark, others pale, and the present variety white, flowers. It is a cultivated plant and interesting for the sake of contrast with dark varieties, such as S. s. splendens, which is the darkest and best form.

Fig Leaves Injured.—W. B. G.: The leaves you sent were very much infested with a fungus in those places where they were reddish-brown. The fungus seems to be confined to the surface of the leaf, the mycelium forming a close felt, and now covered with short, oblong spores, rounded at the ends and in myriads. The first precaution you should take is to keep the atmosphere of the house drier till you get rid of the fungus. You might first of all dew the leaves over with the syringe, and then dust them with flowers of sulphur. The worst of the leaves should be cut off at once and burned, for, judging from the enormous number of spores, we think that the fungus must spread very fast under the influence of heat and moisture. If the plants have done hearing, perhaps the best plan would be to stand the pots out-of-doors, which will dry up and harden the leaves, as well as ripen the wood, and, perhaps, prevent further spread of the fungus. If the first dusting of sulphur is not sufficient you might repeat the operation, making sure that all the affected leaves at least get dusted.

Names of Plants.—E. C. H. D.: 1, Verhena officinalis, known as Common Vervain, Holy Herb, Juno's Tears, Pigeon's Grass and Simpler's Joy; 2, Cichorium Intyhus, or Chicory.—Botan: 1, Lychnis flos-Jovis; 2, Polemonium caeruleum album; 3, Centaurea macrocephala (this had no number but as 3 was missing we suppose this was intended); 4, Hieracium aurantiacum; 5, Galega officinalis alba; 6, Campanula glomerata; 7, Anchusa italica; 8, Deutzia scabra flore pleno.—L. M.: 1, Vitis cinerea; 2, Malva moschata; 3, Deutzia scabra purpurea plena.—J. W.: 1, Lythrum Salicaria; 2, Nepeta Mussini teucrifolia; 3, Fentstemon barbatus; 4, Geranium Endressii; 5, Inula glanduligera.—W. H.: 1, Cattleya gaskelliana; 2, Collogyne speciosa; 3, Masdevallia harryana.—E. C. H. D.: 1, Equisetum arvense; 2, Origanum vulgare or Common Marjoram; 3, Caulalis Anthriscus.

 THURSDAY, August 18th.—Leighton Buzzard Show.
 FRIDAY, August 19th.—Devon and Exeter Horticultural Society's Show.
 National Co-operative Show at the Crystal Palace (2 days).
 SATURDAY, August 20th.—Leven and District Show.

WORK ON A KENTISH FRUIT FARM*.—Information concerning the routine of work on a fruit farm must needs be interesting to the public at large, but most of all to those who are cultivators or intend becoming so, and require information on such a burning question as fruit culture. The author has a wide and practical knowledge of fruit farming as well as vegetable culture, with a grasp of market ways and prices; and his notes possessed such merit and instruction that Messrs. George Bunyard & Co., Maidstone, secured the copyright of them, and had them reprinted in book form. The book runs to 83 pages, in double column; independently of a list of the best paying market fruits, and other useful information. The articles had been written weekly in the form of a calendar, sometimes of the operations that require to be effected during any given period, but generally of things accomplished, or what actually happened or prevailed in market circles during the time specified. The work is practically the doings of a fruit and vegetable farmer, from Christmas to Christmas, recorded as it were for the benefit of his fellow men.

Dipping into the notes at the beginning of March, we find a record of the unusually mild weather that had prevailed for a fortnight previously and its effect upon fruit trees generally, and the earlier ones in particular. Occasionally we have a few of the cultivator's speculations in doing certain

*A Year's Work on a Kentish Fruit Farm by a practical man. Being a Reprint, with a few additional notes, of a series of weekly articles in *The South Eastern Gazette*. Maidstone: Published by George Bunyard & Co., the Royal Nurseries. Printed at "The South Eastern Gazette" Office. Copyright.

things on the off chance of being prepared to meet the probable requirements of the market and profit thereby. Instructions are given as to the burning of prunings and similar rubbish which may harbour the eggs of the Winter Moth. Although this moth ascends the trees during the last three months of the old year, there are other allied species which ascend in early spring and have to be combated. Evidently the author has no time, or at all events, does not attempt counting the eggs which a single female moth may lay, so that he runs into a very high figure when mentioning the circumstance. That may be owing to the effect produced in his eyes by the appearance of so formidable an enemy. We quite agree, however, with him that every female caught saves a deal of trouble afterwards. The demand for fresh vegetables increases in spring but prices rule lower, owing to the greater quantity obtainable as a result of spring growth, and to the fact that the public now expect cheaper vegetables. The latter become dearer as a rule later on if the spring supplies do not bridge over the gap till the early summer crops are ready. British Apples by this time are scarce, Dumelows Seedling or Wellington being apparently the mainstay. The continued supply of American Apples and the forced Rhubarb now finding its way to the market in quantity have a depreciating effect on the Wellingtons. The ruling prices for all these products are given for each week.

About the third week of March preparations are made to combat the newly-hatched caterpillars of the Winter Moth. The spraying of fruit trees with Paris green or London purple is carefully described by a practical man, who has his eye upon all the contingencies at issue. British grown Apples at the same period are no longer on the market as a quotable commodity, though a few odd lots still continue to make their appearance. Passing on to the first week of August to learn what the author would be doing at present, we find that he has been extremely busy, as for weeks previously, gathering bush and other fruits to be sent for market. He does not particularly desire rain at the present time, as it retards the operations of harvesting perishable commodities. The majority of the growers are of the same opinion. Early Apples and Pears by this time are plentiful, and such dessert Apples as Quarrenden, Red and White Juneating and Julian, are eagerly sought for; but modern cooks turn up their nose at cooking Apples unless of respectable size. This would mean that the work of

preparing them is too great for the mistress of the kitchen. Lord Suffield, apparently, is the only available one at this period of the year. The nondescript Apples foisted upon the market during August fetch but a very low price, and should not be encouraged. Only the inexperienced grower, however, is likely to invest in them, to his own disadvantage be it said. The writer asserts, on the contrary, that a good farmer, who attends to the proper manuring and pruning of his trees, will produce fruit double the value of those grown by a poor or neglectful farmer. The markets are generally good for all kinds of bush fruits, and Raspberries are often too scarce to meet the demand.

By the first week in October most of the fruits have been gathered and safely stored under cover, only the latest of the Apples in Kent being still hanging on the trees. Much of the crop of cob-nuts would still hang on the trees waiting for dry weather and the progress of the workers to harvest them in suitable condition. The Apples had been rather thin than otherwise during last year, but that was an advantage rather than otherwise, for the fruits attained a fine size, and were richly coloured by the abundance of sunshine. The best Apples and Pears fetched good prices in the market, whereas poor samples were more in supply than demand. Information like the above is abundant throughout the book, and many valuable hints are given in an interesting way, so that we can heartily recommend it.

Mr. Thomas Humphreys, the assistant superintendent at Chiswick, has so far recovered from his recent illness as the result of an accident, that he has again resumed his accustomed duties.

Mr. W. J. Simpson, for some years past head gardener to C. T. Sutton, Esq., The Beeches, East Acton, has been appointed in a similar capacity to E. H. Watts, Esq., Levonhurst, Chiswick, the position vacated recently by Mr. J. Gibson as recorded in our pages. Mr. Simpson is a keen and successful gardener, usually taking the lion's share of the prizes at the local flower show.

Professor L. H. Bailey, of the horticultural department, Cornell University Agricultural Experiment Station, Ithaca, New York, is now in London; and having visited the Drill Hall, was quite delighted to find so many people with whose names he was familiar in his own country. Needless to say, a great many on this side of the Atlantic are also familiar with his name, and with his writings on important horticultural topics—the results of his researches, experiments and original work in the wide domain of horticulture. It was like a meeting of well-known friends rather than strangers, and altogether pleasant for both parties.

What is a Drummer?—Our esteemed contemporary, *The Florists' Exchange*, wishing to give us further information about the 'drummer,' and *Job* (not the saint of old) has turned the light of his wisdom upon the subject. Thus saith *Job*—"The drummer in America is one of the most interesting insitutions connected with the horticultural trade. His movements and habiliments, even to his polka dot tie, are of more significance to the horticultural world than are those of the President of the United States. His presence in village, hamlet, or city, is duly announced in the horticultural press, the smile he wore, and the honeyed words that fell from his lips being all deemed worthy of chronicle. True it is that he does look up business, but his progressive work does not end there. He is a prolific contributor to the horticultural press, filling column after column, and the familiarity with which he handles his subjects, the vastness of his resources, the ease and volubility with which he can comment on the merits or demerits of plants, new and otherwise, have made him a *sine qua non* in the business. His musical abilities will compare very favourably with those of Sims Reeves or De Wolf Hopper, his histrionic attainments are only a shade inferior to Irving's or Booth's, and his renditions never murder." Many thanks to *Job*; we are now fully enlightened.

An Incongruity.—Kew Green is brown.

Jock and Jim at the Flower Show.—Jock, after inspecting the leading classes: "Come awa', Jim, and let's have a look o' the maiden exhibitors." Jim: "Ay, ay, I wud like to see the lady gaird'ners. Do they wear breeks?"—After inspecting the Potatos and the cards—"Michty me, Jock, they style thirsels Mister! They leave naething a man can ca' his ain!" Jock: "There goes ane o' them." Jim: "G' 'wa noo, Jock, yer jokin'." Jock, feigning anger at the doubt expressed: "I say positively that is a maiden exhibitor." Jim: "Weel, I nivver saw a maiden wi' whiskers afore."

Ealing and District Gardeners' Society.—The tenth annual excursion of this society will take place on Tuesday, August 16th. The new sea route from Charing Cross to Ramsgate, via Port Victoria, has been selected. Luncheon will be supplied on board at 12 o'clock, and tea at 5 o'clock. According to the time table, the gardeners must be ready to start from Charing Cross at 9.15 a.m., going thence by train to Port Victoria. A reserve carriage will be provided. There they will meet the steamer at 10.40 a.m., which will take them to Margate at 1 p.m. and Ramsgate at 1.45 p.m. The return journey from Ramsgate will commence at 4.5 p.m., arriving at Margate at 4.40 p.m., and Charing Cross at 8.15 p.m. Thus by avoiding the river till the estuary of the Thames is reached and *vice versa* the journey is accomplished in much shorter time than formerly. The expenses of the journey will be entirely covered by 8s. Tickets may be had from the members of committee; from Mr. H. Burgess, of Messrs. Lee & Son's Nursery, who is to conduct the excursion; and from Mr. W. Roberts, hon. secretary, 55, Haven Lane, Ealing.

The Golder's Hill Estate.—A short time ago there was a meeting at the Mansion House, when the Lord Mayor took the chair at a meeting considering the advisability of securing the Golder's Hill Estate as an adjunct to Hampstead Heath, and to prevent its being built upon as it was in the market. The Marquis of Lorne, Q.T., said there was no place like the Heath in the neighbourhood of London for excellent air, and all Hampstead had been aroused to prevent further encroachments of the builder. The Lord Mayor announced subscriptions amounting to £12,841. A garden party was also arranged to take place at Golder's Hill, the estate of the late Sir Spencer Wells. A company, estimated at something like 5,000 to 6,000 people, assembled on the estate, which runs to thirty-six acres, to view the beauty of the umbrageous trees, park-like lawns and waters glittering in the sunlight. On the 21st ult. the Hampstead Vestry agreed to contribute £10,000 towards the purchase of the estate, and other large sums have been obtained from different subscribers, so that the estate is now safe to be laid open to the public for ever, and under the maintenance of the London County Council.

Insect Miners.—The August number of *Knowledge* contains a valuable contribution by Mr. Fred Enoch, F.L.S., the eminent entomologist upon the insects which "mine" the leaves of many plants, notably the Marguerite and the Chrysanthemum. The article is accompanied by some admirable illustrations of these laborious but harmful little creatures. The miner which selects the Marguerite as its especial prey is *Phytomyza affinis*. It is a minute, two-winged fly of about a twelfth of an inch in length, slaty-black in colour, with black bristles on head and thorax. After piercing the upper cuticle of the leaf, and inserting the oval-shaped egg, it seals up the aperture with saliva, numbers of eggs being inserted in each leaf. The egg hatches on the fourth or fifth day, and the maggot commences to bore between the cuticles of the leaf. Like all other insect pests, it has its parasites—minute and busy Hymenoptera—which are ever ready to seize an opportunity to insert their own eggs in the body of the miner. *Trypeta chrysanthemi* turns its special attention to the Chrysanthemum, as its specific name indicates. Squeezing the leaves between the finger and thumb is the best remedy, but an attempt should be made to catch the female insect, for one of them is capable of spoiling a number of plants, as she lays many eggs. Professor Enoch advises the use of a small, deep net of fine muslin, fixed on a ring of cane 4 in. in diameter. Several broods of each of the above-named flies are hatched in the year.

Seaweed is to be used by a Norwegian engineer for the purpose of making paper glue, dressing gum, and even soap.

The Potato Crop is a fairly good one this year, but, owing to the drought many of the tubers are well advanced towards maturity. The recent rain will be likely to cause a second growth to take place, and thus the crop will seriously deteriorate in quality.

Artificial Food.—Every now and again some sensational scientific discovery reaches us from Vienna. On the last day of the Chemists Congress Dr. Leo Liliensfeld, of Vienna, demonstrated before an astounded audience how artificial albumen could be produced by a simple synthetic process. He condensed phenol and amido-acetic acid with phosphoro-chloric oxide. The result was pepton, a substance which has hitherto been supposed only capable of being produced by organic beings only. It is said to possess the same nourishing properties as the naturally produced albumen. Human food will be cheapened, and meat as well as all other organic products will be readily replaced by the manufactured article.

Dr. Morris as Imperial Commissioner of Agriculture.—Some time ago a commission of enquiry was sent out by the Government to the West Indian Islands for the purpose of ascertaining their financial position, and to remedy if possible the present bad and entirely unsatisfactory conditions that prevail with regard to the produce of the islands. The commissioners were accompanied by Dr. Morris, Assistant-Director of Kew Gardens, who has already had a wide experience in several of the British colonies of the west, and is largely responsible for the betterment that is already visible in Jamaica. The outcome of the debate in the House of Commons on the 2nd inst. was that Government accepted the recommendations of the Commissioners to appoint Dr. Morris as Imperial Commissioner of Agriculture for the West Indies. He will take up his headquarters at Barbados. His duties will be to deal with all questions of economic botany, being in fact the director of this new and special public department. We understand that Mr. David Tannock, at present sub-foreman in the Palm house, will accompany Dr. Morris as his assistant in carrying out the duties of his new appointment. The scattered islands and isolated islanders of the West Indies, we feel sure, will benefit by this arrangement.

The Glasgow Public Parks.—The annual inspection of the Glasgow public parks took place on the 2nd inst. A large company of gentlemen accepted the invitation of Lord Provost Richmond and the Parks Committee, and the party was driven from the City Chambers to the parks on the south side of the river. Altogether the Corporation has charge of nineteen parks, representing a total acreage of 1,022½, and acquired at a cost of £660,000. The largest of the nineteen is Bellahouston, 178 acres in area, and purchased in 1895 for 50,000. Glasgow Green is the oldest, and including Polmadie Land is 180 acres. It has been obtained piece by piece since 1662. The other parks are Kelvingrove, 85 acres; Queen's Park and Camphill, 148 acres; Alexandra Park and lands of Kennyhill, 114 acres; Cathkin Braes, 49 acres; Botanic Gardens and Banks of Kelvin, 40 acres; Maxwell Park, 21 acres; Springburn Park, 56 acres; Maryhill Park, 5½ acres; Ruehill Park, 53 acres; Govanhill Grounds, 4 acres; Bunhouse Grounds, 6½ acres; and Tollcross Park, 82½ acres. In addition to these there are 13 open spaces in various parts of the city. The visitors drove first of all to Glasgow Green, where the winter garden is the chief point of interest. Thence they went to the Queen's Park, skirting Govanhill Grounds on their way. Camphill, Maxwell Park, and Bellahouston Park were subsequently visited. Luncheon was served at the City Chambers, the Lord Provost presiding. After the customary loyal toasts had been duly given and honoured, Sir John Muir gave the 'Lord Provost, Magistrates, and Corporation of Glasgow.' He praised their generous and far-sighted policy in acquiring land for the public use and good, and assured them that they would have his hearty support in further operations. It was subsequently mentioned by Bailie Bilsland that ex-Bailie A. G. Macdonald had offered to the Corporation as a gift his conservatories at Ardrossan, which were plentifully stocked with valuable plants. The generous donor expressed his hope that they would be removed to Tollcross Park, and that his offer would be accepted.

A Black Calla Lily.—Such is the description given of a dark-flowered *Richardia*, of which Mr. B. Labbe, Portland Heights, U.S.A., is the proud possessor. The spathe is about 20 in., and the spadix about 17 in. in length, so that the flower is a very large one. When it first opens it is said that it has the odour of tainted meat, and attracts all the blue-bottle flies within range. The leaves are stated to be lobed like those of the Fig, and thus to be quite distinct from those of the ordinary *Richardia*. Mr. Labbe has had the plant a number of years, but has so far been unable to propagate it.

A Year's Orchids at Kew.—It is seldom that any record is kept of the actual number of species of Orchids that bloom in any particular establishment during the course of a twelvemonth. This may partly be owing to the fact that quantities of showy things are of more importance in private establishments than species, it may be, characterised by small flowers. The latter may be both beautiful and interesting all the same. In 1891 it was recorded in the *Journal of the Kew Guild* that 766 species of Orchids were flowered at Kew in 1890. To ascertain this fact it is necessary to keep a record for twelve months in succession. From Christmas 1896 to Christmas 1897 another record was made showing that 854 species of the family were flowered. This is certainly a record, and shows what is being accomplished in the national garden.

Public Park for Widnes.—The Borough of Widnes is determined to be up-to-date in affording the means of recreation to its inhabitants. Instructions and conditions to competitors in preparing and submitting designs for the park have been sent out. A lake is to be included in the design, and a band stand, entrance gates, the construction and drainage of the roads and walks, fencing and appurtenances have all to be considered. Suitable provision is to be made for recreation; plantations are to be arranged with a view to general and detailed effect. Some of the existing houses are to be removed, and others to remain; and six perspective sketches of the principal features of the park are to be given showing the shrubberies, &c., as they will appear five years after completion. There is a prevailing opinion amongst some that five years' grace is too long, and that they will all want replenishing before then. Surprises may be in store, however, under a capable man. The cost of the entire scheme is not to exceed £4,000, and the submitted estimates must give particulars of everything. The premiums offered for the designs are £36 15s., £10 10s., and £5 5s.

Caterham Gardeners' Outing.—On Wednesday, August 3rd, Caterham gardeners, to the number of forty-seven, paid a visit to Boxhill and Burford Lodge, Dorking, where Sir Trevor Lawrence escorted them over his beautiful grounds, and through his glasshouses, in which are accommodated one of the finest collections of Orchids in existence, with many other rare and beautiful plants. Not many of the Orchids were in flower, but they were still interesting to those who know the value of many of the rarer forms which Mr. White, the Orchid grower, so well looks after. The mansion presents a pretty picture, swathed as it is in the green folds of *Ampelopsis Veitchii*. The Lily pond, which is in the centre of the lawn near to the house, is a very interesting feature, for Sir Trevor is there cultivating a number of the finer hybrids. The flower garden is gay with Syringas, Phloxes, Abutilons, Begonias, and a host of other plants. The kitchen gardens, with the flower department, are also in excellent trim, and a warm tribute to the skill and care lavished upon them by Mr. W. Bain and his staff. After the party had partaken of refreshment, Mr. Jeremiah Lyon addressed the company, and offered the best thanks of the Caterham Horticultural Society to Sir Trevor and Lady Lawrence for their kind reception. Mr. Lyon alluded humorously to the fact that Sir Trevor was the first president of a Royal Horticultural Society who had entertained his horticultural friends, the first having been King Solomon. In his reply, Sir Trevor said that to him it was a genuine pleasure to see there any one interested in gardens and gardening, and he was glad to be able to welcome them there. Mr. Jeremiah Lyon generously paid all the travelling expenses of the outing, which was both an enjoyable and a profitable one to those taking part in it.

Dracaena sanderiana is stated to do well out of doors in the United States. It makes plenty of strong growths, and these come in handily for cuttings in the autumn. It is probably rather too expensive as yet to be extensively employed in this country for sub-tropical bedding.

Orange Flowers in Paris.—There are 150 Orange trees in the garden of the Tuilleries. Luxembourg has nearly a hundred. Each tree yields about a demi-kilogramme of flowers, which are sold by auction each year. They fetch on an average three francs per kilogramme, the cost of harvesting being not less than one franc fifty. The chemists, druggists and perfumers are the purchasers. Nearly all these Orange trees are several hundred years old.

Canadian Fruit for British Markets.—Last year Canada tried her apprentice hand in sending fresh fruits to the mother country, and as might be expected, had a few successes and a few failures, from which she will no doubt largely profit by avoiding the mistakes of last year. Canadian Apples are particularly handsome, and her Peaches are said to be unrivalled. Pears, Tomatos and other fruits can also be grown to great perfection in Canada, and the Dominion fruit growers intend to compete with their rivals by the sheer quality of their products.

SUTTON'S BULBS FOR 1898.

ALTHOUGH summer bedding is now in the height of its beauty, we are reminded, by the receipt of "Sutton's Bulbs for 1898," that the present wealth of colour will shortly wane, and that preparations must be made for ensuring a succession of flowers during the gloomy days of winter and the opening months of spring. Both for the adornment of homes and for securing magnificent displays in the open ground, bulbs produce sheets of colour which are unmatched throughout the year. Abundant evidence of the great utility of these flowers is offered in the work before us. The numerous portraits of individual specimens and the photographs of beds and borders are of singular beauty. These illustrations are not merely interesting, but they indicate the many ways in which the flowers may be employed with striking effect for decorative purposes in conservatories and gardens.

Bulbs offer advantages that can be claimed for no other flowers. During the four or five years necessary to bring them to maturity their energies have been conserved by experts, and they have only to be properly potted or planted in the autumn months to ensure brilliant results. These flowers also meet the needs of all classes; they brighten the windows of cottagers, and are ornaments in the drawing-rooms and corridors of sumptuous homes. They bear forcing with impunity, yet in the open ground the roots are unharmed by our severest winters, and they can be brought to perfection even in smoky towns by those who possess no horticultural skill, and are destitute of the appliances requisite for other flowers.

The necessary cultural instructions are given by Messrs. Sutton in language free from technicalities, and the lists of Daffodils, Tulips and Hyacinths are so clear and terse as to render the task of selection easy. For those who do not wish to incur the trouble of making their own choice, collections adapted for many purposes are offered.

Those who are familiar with the land of bulbs will recognise several well-known scenes from the snapshots of Mr. Martin H. F. Sutton during his recent visit for the purpose of selecting the finest growths harvested in the present year.

Subjects such as Begonias, Cyclamens, Gloxinias, and a few others which can only be cultivated under glass, do not, of course, belong to the category of Dutch bulbs. They are specialities for which Messrs. Sutton & Sons have won a high reputation, and it would be difficult to imagine a finer display than their exhibit of Gloxinias which won the Royal Horticultural Society's Gold Medal at the great Temple Show in May. A very attractive illustration of the inspection of these flowers by the Princess of Wales appears on one of the pages. Her Royal Highness was so much impressed with their beauty that, by Royal consent, a selection was sent to Marlborough House.

An illustration of *Gladiolus Sutton's Queen of Pinks* reminds us of the many beautiful things amongst

the hybrid early flowering *Gladioli*, which are superbly beautiful for conservatory work in pots, for the decoration of the open bed or border, and as cut flowers, separately, or in mixture with other flowers in season. The plethora of flowers at their time of flowering must be held responsible in some degree to the neglect which they suffer. *Spiraeas*, *Deutzias*, *Lilacs*, *Christmas Roses* and similar things are not bulbs any more than *Lily of the Valley* and *Dielytra*, but they are fit associates for winter work, and respond to forcing with the greatest facility.

GARDENING MISCELLANY.

GALEGA OFFICINALIS.

JOURNEYING to Tiverton recently by the newly-opened line up the Exe Valley, we were much pleased going and coming in observing the bright and showy flower beds at the various stations through which we passed; at one, I think Bramford, was a fine clump of *Leycesteria formosa*, and a plant of this *Galega* full of its pale blue flowers. This is a capital plant for such a spot, and if more often grown in the herbaceous border would be found to be equally useful with the pure white form that everyone seems to patronise.—W.S.

RHODANTHE MANGLESII.

I HAVE no recollection of seeing this old annual growing in the open until I came to this part. Some years ago, having a number in pots, I planted them out, and the next season I sowed a few in the open and they did very well. Those sown the present season, having reached their best, have been pulled up and dried. I thought until a year ago that I was the only one in this part that had ventured sowing outside, when I saw a large breadth growing in a market garden near Preston. I was told that there is a good sale for it in the market. It does not do to sow it in the mixed border where slugs are prevalent, for they soon devour it.—W.P.R., Preston.

NATURAL BEAUTY.

ONE of the prettiest peeps of greenery to be found in the south of Ireland is in Valentia Harbour. On the road leading to the slate quarries, in the wood beside the road, and sloping down some 200 ft. to the private road leading to the lighthouse is a perfect wealth of greenery consisting mainly of *Lastreas*, *Osmundas*, &c. Looking down some 50 ft. the common *Lastreas* are charming; fronds 4 ft. to 5 ft. in length and standing boldly out, are like an inverted bell fully 4 ft. across. When one sees a picture such as this it must engender a greater love for our hardy Ferns and the beauty of British woods.—R. G. W.

THE HOME OF FLOWERS AND SOME MORE OF ITS OCCUPANTS.

LAST week we mentioned a few of the more important classes of plants that are done so well at the great nursery establishment at Swanley, and we now propose to deal with some of the other points of interest that cannot fail to impress a visitor who takes a peep at the nursery towards the end of July or the beginning of August.

CHRYSANTHEMUMS need not occupy us for long just now; in another couple of months they will be the all absorbing topic of the horticultural world. It must suffice for the present to say that the Swanley plants are looking first-class, and that both the bush subjects and those that are destined to produce large flowers are full of promise for the future. The collection is a huge one, as all comprehensive collections must necessarily be now-a-days, when we count our varieties by the hundreds, and each year sees more or less important additions made.

SUCCULENTS have been taken up enthusiastically of late years by the Messrs. Cannell, and the long, roomy span-roofed house in which they are accommodated furnishes an admirable representation of the curious forms which Nature has evolved in those plants which have to exist in hot and arid climes. *Cactuses*, *Opuntias*, *Mammillarias*, *Euphorbias*, *Aloes*, *Agaves*, and other genera are represented in great variety, and the collection is one of the most valuable in existence. Of *Stapelias* there is also

great store, and the plants right through are in admirable health and condition. In this large house the more tender plants are grouped at one end, for as at Kew one end of the house is kept considerably warmer than the other.

COCKSCOMBS.—Never have we seen a finer batch of these handsome subjects than on this occasion, for one side of one of the 100 ft. houses was filled with them. A word of praise is due to the condition of the plants themselves, for they were dwarf, sturdy, and carried "combs" of enormous size and spread from the first to the last. In addition to the old purple form there is now a multitude of varieties to be had in various shades of buff, purple and rose. Some of the combs display an almost bewildering network of golden lines upon a groundwork of another colour, the effect, although *bizarre*, being both striking and distinctly out of the common.

BALSAMS.—The Messrs. Cannell have long been famed for their fine strain of Balsams, and on the occasion of our visit we were delighted with the grand batch of plants that were on view. The colours range from pure white to deep rose, yellow, scarlet, and purple, with numerous intermediate shades of these. Some of the striped varieties, too, are exceedingly showy. Not only are the flowers large and very double, but they are produced in great quantities all along the central stem and lateral branches, so that we get a plant of highly decorative appearance, well able to hold its own in point of effect with any other subject available for the furnishing of the cool conservatory.

FUCHSIAS.—Right from the very commencement of his distinguished horticultural career, Mr. H. Cannell has excelled as a cultivator and raiser of Fuchsias, and he has now got together at Swanley all the finest varieties in existence both of his own and other growers' raising. The number of varieties catalogued closely approaches 200, so that it is manifestly impossible to go into detail concerning the merits of each. Such lovely forms as Countess of Aberdeen, Eynsford Gem, Frau Emma Topfer, Rose of Castille, Phenomenal, including its rose and white forms, and Monarch, claim a special mention, but in this case it can only be a very cursory one. The varieties with ornamental foliage, such as Cloth of Gold and Meteor, constitute a distinct section, for they are not only of service as pot plants but they are extensively used for bedding in our public parks, and the more up-to-date of the private establishments. *F. triphylla*, a West Indian species, is a striking plant, and fully as handsome in its own way with its long tubed, glowing cinnabar-red flowers as the more highly bred florists' varieties. It makes a handsome plant, and as it is to be seen at Swanley is quite sufficient to captivate one who sees it for the first time. It is a great pity that its merits are not more widely known.

ACHIMENES.—We were a little too late to see the Achimenes in their full beauty, but even the remains were splendid, and we were able to judge of the magnificent show they must have made a few weeks earlier in the season. Upwards of thirty forms are grown, and from amongst these a selection may be made to please even the most exacting. From the deep purple *A. longiflora* there has sprung a number of very handsome varieties. *A. l. major* bears larger and rather richer hued flowers than the type, whilst the varietal names of *A. l. alba* and *A. l. rosea* sufficiently indicate the shades of colour they represent. Admiration is a very showy variety with exceedingly rich purple flowers, and is certainly one of the best of this colour section. Mauve Queen has equally large flowers, which display a charming shade of mauve that is both distinct and beautiful.

The needs of a general nursery establishment demand that a quantity of Ferns and other subjects should be grown for cutting from. *Adiantum cuneatum* is an old favourite, and here, as in other places, it is in much request. The much boomed American *Asparagus Sprengeri* also finds favour. We were informed that long trails of the graceful growths are often asked for in dinner table and other decorations. A stock of plants is therefore kept to supply this demand.

On the open ground, surrounding the site occupied by the glasshouses, a grand array of Dahlias is planted out. The plants are all looking remarkably healthy but as the time of Dahlias is not yet we will refrain from further remark concerning them. Distinctly a unique feature, which is to be seen close to Mr. H. Cannell, senior's, pretty house, is a row of standard

zonal Pelargoniums, with clear stems from 3 ft. to 4 ft. in height, and a fine bushy head, full of flower. Here, too, is a row of that handsome biennial *Lavatera arborea variegata*, which is a great acquisition for the sub-tropical garden, although it is not often that we find it so much "at home" as it is at Swanley.

AUSTRALIAN HORTICULTURE.

PERHAPS no portion of the world (observes an experienced writer), of the same area, is better favoured than New South Wales, with its varied climates and soils, for the production of fruits, vegetables, and flowers. It is really surprising how great a variety can be grown to perfection and at a minimum expenditure of labour. Exotics from cold, temperate, and even tropical countries thrive equally well within the limits of this comparatively small area; and still more remarkable is the fact that so many of these plants from different climates will grow side by side in many favoured localities. With all these advantages it seems strange that comparatively little attention should be devoted to the raising of vegetables for home use, or to the cultivation of flowering and ornamental plants for the adornment of the homes of the settlers in the country districts.

Occasionally one may meet with a well-cared-for, beautiful garden, like an oasis in the wilderness, but, as a rule, few attempts are made even to grow the commonest vegetables for family requirements; and dependence for supplies is placed on Chinese gardeners, whose gardens are generally to be found dotted about the country, especially in the more largely populated districts. The raising of vegetables, the selling of fruit, and the hawking of goods would seem to be almost entirely in the hands of the Chinaman, the Italian, the Syrian, and the Indian; despite the fact that a considerable proportion of the white colonial population consists of unemployed men tramping through the country in search of work, and dependent on the hospitality of the settlers. Considering the little difficulty there is, in most seasons, in producing a sufficiency of fruits and vegetables for a family's requirements in most parts of the colony, it is incomprehensible that the settlers or farmers do not grow everything they need. Instances have been known where vegetables were brought hundreds of miles to localities in which the same kinds of vegetable could be grown to perfection with but little trouble. In some places Chinamen will travel from forty to fifty miles carting vegetables to settlers who have soil sufficiently rich to grow all they need, if they took the trouble to devote but an hour or two each day to the work.

In the neighbourhood of Sydney, flower-gardening has been made a remunerative occupation by reason of the growing demand for bouquets, wreaths, and floral ornaments, but the continual expansion of the metropolitan suburbs is driving the older nurseries farther afield. A considerable business is done by nurserymen and florists in Palms of various kinds, especially that known as *Kentia belmoreana*, which is indigenous to Lord Howe's Island, and succeeds admirably in gardens about Sydney, and when planted with Tree Ferns grows freely and quickly, and is wonderfully effective. The bush-house is one of the most useful of structures in connection with the garden in all the warm parts of New South Wales. In it a multitude of plants can be grown which would be liable to perish in the hot sun. It can be, and is, constructed of all sorts of material, sometimes tea-tree brush, laths, bamboo blinds, and indeed anything that will break the rays of the sun without altogether obstructing them. In numerous gardens about the metropolis and large towns there are glass buildings where tender exotics of climates warmer than that of New South Wales, are grown as successfully as in any part of the world.

Everything indicates that the colonial taste for floriculture is improving rapidly, and will continue to improve, a result due in some measure to the fact that there are many excellent gardeners, professional and amateur, in the colony. A large proportion of the Potatoes and other vegetables consumed in New South Wales is imported from Victoria, where market-gardening is more largely in the hands of white men than in the older colony. The vegetable products of Chinese gardens are mostly of poor quality, insipid and watery, owing to the peculiar method of over-watering and over-manuring adopted. Although these vegetables are of such inferior

character, they are absolute blessings in many places where the colonists either will not or cannot grow those they need. Vegetables of excellent quality can be produced, even in dry districts, with but little irrigation, if they be properly managed; but unless a Chinaman has a superabundance of water he is lost. With a fair supply of water and experienced labour, almost every description of vegetable known in Europe or America can be grown with ease, generally yielding abundant crops.

NOTICE OF BOOK.

PANSIES, VIOLAS AND VIOLETS, by Charles Jordan, F.R.H.S., Jessie M. Burnie, John Ballantine and William Cuthbertson. London: Macmillan & Co., Limited. New York: The Macmillan Company. Rothesay: Dobbie & Co. 1898.

This neat and handy little book of some 102 pages includes practically the three great groups of the genus *Viola* which have been materially improved by the hand of man, and along particular lines consonant with the ideas of beauty and perfection. This latter remark would apply to Pansies and Violas more particularly than to Violets.

The four writers above-named have devoted their respective talents to giving a historical account of these flowers, the botany of the subject, growing for exhibition, Violas for the flower garden, the poetry of these garden flowers, and the Sweet Violet. The Pansy (*Viola tricolor*) has been cultivated at least for something between 300 and 400 years, yet it does not seem that any systematic or artificial cross-fertilisation was attempted for effecting improvements till the beginning of the present century. There were relatively fine flowers, however, even in Philip Miller's time, and had originated, no doubt, as the result of cultivation and the work of insects upon an already very variable flower. The earliest recorded history of improvements wrought of set purpose, and here quoted, is both interesting and instructive, showing that the British gardener was even then something real and not unworthy of his modern successors.

The history of the show and fancy strains of Pansies as they struggled to take root in the heart of the florist, particularly fancy Pansies, shows what innovations have got to overcome. The British florist's idea that his home raised strains of fancy Pansies are better than the Continental ones is also correct and might be applied with equal truth to other highly developed races of garden flowers, though the Continental flowers have something to recommend them. Whenever a strain of flowers becomes very highly evolved, a condition of relative sterility steps in, thus preventing the finest flowers from being raised from seeds in a wholesale manner for bedding purposes.

Violas are here distinguished from Pansies by being more floriferous, more compact in habit, and more perennial in their nature. A little of the botany of the subject might have been added to this to show some evidence of *Viola lutea* and *V. cornuta*, which have had a considerable share in the parentage of many of the modern race. The short and deeply toothed stipules of *V. cornuta* might have been mentioned as well as the long spur, common to both of the above species. *Viola tricolor* (Pansy) has long, deeply divided stipules, and a short spur.

Portraits of some of the leading men that have been or still are connected with the raising of Violas are here given, thus adding largely to the value of the book as a reference to everything essential to an exhaustive knowledge of the subject. The illustrations of leading types of Violas are useful to beginners as well as a reliable reference for the student for all time coming. The botany or science of the subject is admirably dealt with by Mr. John Ballantine, the only botanist as far as we know in the island of Bute. The explanation of the various parts of the flower should be studied by gardeners who attempt cross-fertilisation as a means of improvement. Besides the insects mentioned as visiting Violas we have also noted *Pieris* (*Pontia*) *Brassicæ* and *Vanessa Atalanta* (Red Admiral). Other sections of the book are well done; paper and printing leave nothing to be desired, and we have no hesitation in recommending the book to all concerned.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Cypripedium winoqzianum.—The apparently difficult name to pronounce, here used to specify this hybrid, takes its derivation from M. Arnold Wincqz. The parents were *C. harrisianum*, itself a hybrid, and *C. haynaldianum*, the progeny being intermediate but showing strange and beautiful combinations of colour, judging from the coloured plate of it in the *Lindenia Pl.* 620. The dorsal sepal recalls *C. harrisianum* in form and colour, but is more oval, and the colours altogether brighter and even handsome; the centre is brown-purple, passing into bright red close to the pure white edge, the contrast being striking. The spathulate petals are very similar in colour to those of *C. haynaldianum*, though shorter and broader; the lower two-thirds are greenish-yellow, blotched with brown-black, while the apical portion is washed with rose having a slightly violet tint. The lip conforms to *C. harrisianum* in form, and is heavily shaded with reddish-brown in front. The seed was sown in the establishment of L'Horticulture Internationale, Brussels, five years ago.

Rare Orchids at Kew.—The public is most taken with the larger flowers, whether Orchids or otherwise; nevertheless, there are those who in looking more closely at the form and individuality of things can appreciate the beauty and structure of even the smallest flowers quite apart from decorative effect. Many amateur growers may be placed in this category, and that the same or even a greater amount of pleasure can often be derived from a contemplation of interesting little flowers we feel quite certain. Owing to the rebuilding of the Orchid house at Kew the collection is housed at present in the Cape and Begonia houses, as well as in the private pits. Though the former are not particularly adapted for Orchids, a considerable number is flowering even at the dullest period of the year. The small yellow flowers of *Lockhartia Weigettii* are followed by seed pods that open widely with three valves in the same manner as a Pansy. Other interesting subjects in flower at present are *Bifrenaria aurantiaca*, *Laelia xanthina*, *Odontoglossum Kramerii*, and *Polystachya Kirkii*, all except the latter being large enough and sufficiently showy for general cultivation. The rosy-flowered *Disa nervosa* is notable for the length of its spur, and the relatively narrow opening to the flower compared with that of the better known species. Very singular is the pale blue *Bartholina pectinata* having its lip cut into slender filaments, but standing out stiffly like the teeth of a comb. Curious and beautiful is the terrestrial *Cynorchis grandiflora*, with a purple and lobed lip. *Restrepia maculata* is also uncommon as well as pretty. The most curious and most interesting of all in our opinion is, that named *Cirrhia viridis-purpurea*, the lip of which resembles a wasp or some similarly venomous insect. The petals are brown on the back and purple on the face; but the lip is green, and transversely banded with dark purple bars, and with crimson-purple at the base. It is also narrow, sharply pointed at the end, and more or less convex on the surface, so that the resemblance to some uncanny insect is not inconsiderable.

The Orchid Grower's Calendar.

MANURE FOR ORCHIDS.—How and when to apply it. —This is the fourth season that I have had the pleasure to write the Orchid Calendar, and those that have been good enough to peruse my notes will know that at seasons of the year I have advocated the judicious use of some stimulant for this aristocratic family. My contention is and always has been that plants in a healthy state, and rooting freely are much benefited by generous treatment. Terrestrial Orchids we always have given weak doses of manure water at various periods, but not until the past few years have we been bold enough to try it on the epiphytal section. *Laelia anceps* was the first we paid attention to, our plan being, as soon as the spikes are in sight, to treat them to weak doses of manure water—just a pinch of guano that you can take with the thumb and finger in four gallons of

water. In this the baskets or pans are dipped up to the rims about once a week. To show that when used judiciously no possible harm will accrue, I may say that seeds have germinated on plants so treated, and not only so, but have made excellent headway under similar treatment, so much so that we hope to flower quite a good batch next season. We often get four-flowered spikes on the dark varieties. The colour of the flowers, too, is much more brilliant. Of course, unless the flowers are already formed, no amount of stimulants will put them there, but it helps to build up the constitution of the plant and thus ensure better results in the future. My advise is, do not overdo it, or the remedy will be worse than the disease.

COOL HOUSE.—Where a great quantity of *Odontoglossums* is grown, it will be necessary to commence overhauling some of the most forward of the plants at an early date, or it will be late before the whole can be got through, therefore it may be well to get in a good supply of peat and moss, for there is nothing so annoying as to have to wait for the material. Delays, too, are dangerous.

"Do you manure your *Odontos*?" I was asked the other day. Well, generally speaking, no. The only time we deem a little help in this way beneficial is when they are developing large spikes, and as our plants in this stage are hung up they are taken down and dipped similarly to the *Laelia anceps*. The water, therefore, does not quite reach the moss, which, in consequence, keeps green.

The great thing in keeping *Odontoglossums* thriving is, as we have frequently pointed out, to afford them some fresh material each season, and not let them (as is too often the case) remain until they begin to go back before doing it.

THRIPS.—During the summer months these little pests make great headway if left to themselves. It is, therefore, advisable to fumigate often.—C.

THE PLANT HOUSES.

The Stove.

Now that the month of August is here, and we are nearing the end of the summer, every effort should be made to put the occupants of the stove into training, so to speak, with a view to fitting them for passing through the dull season with the greatest comfort to themselves. This can only be done by hardening the tissues of the leaves and stems, and by maturing the wood as far as possible, and the best way to effect this is to give plenty of air both by night as well as day.

The advantages to the plants of a current of air passing through the house at night are not grasped by many gardeners, with the result that too often we find the stove kept closely shut up all night, and a high temperature and excessively moist atmosphere maintained, which things are conducive to rank, but correspondingly flabby, growth. The top ventilators may be closed at night, but the bottom trap doors should be left nearly wide open. As the nights have been occasionally cold, it is advisable to keep a little heat running through the pipes, and thus the air passing into the house will be warmed during its passage into the house. Keep the syringe plied vigorously morning and afternoon, taking care that the under surfaces of the leaves are washed as well as the upper ones. There is often very little time at this season of the year for sponging, and thus the bi-daily syringings, are of the greater importance.

ARISTOLOCHIAS.—Where the plants are in good health they are apt to make too much growth for the welfare of the plants standing on the stage below them, and hence it will be advisable to thin out these growths to some extent. This will not materially affect the *Aristolochias*, but will give the plants beneath a much better chance, and will, moreover, improve the appearance of the house. The growths that are allowed to remain should be allowed to hang nearly at their full length, only allowing room to pass beneath them.

STEPHANOTIS.—Keep a sharp look-out for mealy bug here, for this is very partial to the plants, and is apt to prove a great nuisance unless it is persistently kept under. About a tablespoonful of petroleum in a gill of warm water kept well stirred and applied with a soft brush will soon clear out the bug. It is a good plan to mix the petroleum with soft soap before adding the water—the soap forms a good vehicle for the oil.

BOUGAINVILLEA GLABRA.—As plants which are flowering freely have now a great strain upon them, constant and liberal feeding must be practised. There is nothing better than liquid cow or farmyard manure, and if they get plenty of this the plants will not hurt. Pull down the flowering branches from the glass, and allow them to hang down, which they will be made to do by their own weight. Growths which are not flowering, or have already bloomed, may be thinned out to make room for the others.

TABLE PLANTS.—*Crotons*, *Dracaenas*, *Aralias*, etc., that have been purposely kept in small pots in order that they may be available as table plants will need a great deal of water just now, and it is imperative that they should not be neglected, or they will inevitably lose their bottom leaves, and their appearance will be spoiled. Liquid cow manure and soot mixed is a capital stimulant for them, and it may be used with the greatest safety. If chemical manures are employed they should be dissolved in the water, for as the pots are full of roots, and many of these roots are close to the surface the application of chemicals in the powder form endangers them considerably.

DRACAENA SANDERIANA.—This distinct habited *Dracaena* is best when in a young state, for after a few months the plants begin to get leggy and scraggy looking, whilst the variegation becomes less pronounced. Take off the tops of any plants that have got to this stage, and insert them as cuttings.

STROBILANTHES DYERIANUS.—Like the above-named *Dracaena* this plant is only good in a young state. The foliage of the older plants is coarse, and the rich colouring that marks the leaves of the younger plants is absent. It is necessary, therefore, to keep up a continual stock of young stuff. In this stage it is one of the handsomest stove foliage plants we have.—A. S. G.

Gleanings from the World of Science.

THE following subjects were discussed at the Scientific Committee meeting of the Royal Horticultural Society on the 26th ult.

TOMATOS AND SLEEPY DISEASE.—Plants suffering from this now not uncommon complaint were forwarded to Dr. W. G. Smith for examination. He reports as follows—"My observations agree with those of Mr. Masee given in the *Gardeners' Chronicle*, June 8th, 1895. I have already seen several cases of this disease this season. I do not see an easy way of getting rid of the fungus. Mr. Masee's suggestion of liming the soil seems a good one, but I have had no experience."

OUTGROWTHS ON POTATOS.—Mr. Sutton sent some tubers having curious excrescences upon them, received from Mr. Kerr, of Dumfries. They were reserved for examination.

ASTERS DISEASED.—Mr. W. P. Wright, of Fairview, Willesborough, Ashford, Kent, sent some specimens, and observes that "Growers of Asters in East Kent, especially in the Dover district, are in trouble over an Aster disease, which destroys thousands of plants. Some go off directly they are put out, others at a later stage. I found small white grubs in the lower part of the stems, and I do not feel any doubt that they are the cause of mischief." In the *Naturalist*, the organ of the Yorkshire Naturalists' Union, there is a paper by Rev. Hilderic Friend on this subject. The worms in question are of the family of *Enchytraeidae*, a group of annelids. Mr. Friend discovered a presumably new form in China Asters, and named it *E. parvulus* on account of its minuteness. A full description of the worm is given in Mr. Friend's paper. There is nothing to be done but consign the plants attacked to the flames. An account of the Aster worm will be found in the *Gardeners' Chronicle* for August 14th, 1897, p. 89, with figure.

MELONS WITH SEEDS GERMINATING.—Mr. Veitch read a letter from Mr. A. McKeller, of The Gardens, Sandringham, describing a Melon sent to Marlborough House, which was full of young Melon plants, quite green. They were plunging their roots into the flesh of the Melon and feeding upon it. Similar growths have often been seen in Lemons and Oranges, as well as Cucumbers, Pumpkins, Papaws, and other fleshy fruits. The cause appears to be that the fruit has been kept some time in a warm atmosphere.

HINTS FOR AMATEURS.

FREESIAS.

THE amateur finds a number of strong favourites amongst bulbous subjects, plants which may be grown with very little trouble, and with a full measure of success, but amongst them all we know of nothing that can claim a higher place than the Freesias. With Hyacinths, a yearly outlay for bulbs is necessary, for more favourable climes than ours are alone able to furnish the material that will yield us good flowers; but with Freesias this is not the case, for once a stock of bulbs is procured the cultivator is self-supplying, and with ordinary care he can not only maintain his stock at its original numerical strength but considerably increase it as the years roll on.

The requirements of the Freesia are but few, and as simple as they are few. Their beauty is beyond question, and they respond readily to any care and attention that may be lavished upon them. The delicious fragrance of the flowers, moreover, appeals strongly to the susceptibilities of the ladies of the household, although they may declaim against the too powerful odour of the Hyacinth and the Lily.

It is well to call to mind just now the existence of the Freesias, for it is at this season of the year that they are needing the first attentions. As the spring wore on and they gradually sank to rest they were consigned, just as they were in the pots, to some sheltered corner in the storeroom, or in an odd corner in a north frame where they would be sheltered from the rain and where they would be out of the way, but not out of mind for the rest of the spring and summer.

Now the time has once more arrived when they must be awakened from their rest, and induced to quicken into vigorous life once more. The soil in which the plants grew last year, and in which the quiescent bulbs are still lying, is now, of course, quite dust dry, and hence there will be no difficulty in separating the bulbs from it. By the way, we may comment here on the smallness of the bulb that produces such a relatively large truss of flowers. There is nothing else that can vie with the Freesia in this respect.

A place on the potting bench should be cleared without delay, the soil knocked out of the pots, broken up with the fingers, and the bulbs, large and small, picked carefully out. Take care to search each potful of soil thoroughly before another one is tackled, for the bulblets of last season's production are but small and are easily missed. The soil may subsequently be put out in a heap in the open air for the weather to play upon it. In a few weeks' time a quantity of soil will be wanted for cuttings of Pelargoniums, Coleuses, Iresines, Heliotropes, Calceolarias, and other bedding plants, and as this soil will have probably become fairly moist by that time, it will come in exceedingly handy for cuttings, which do not need a rich compost.

Sorting the Bulbs will be the next operation. All the largest and the medium sized bulbs will flower next year without fail, so these should be placed by themselves. The small ones should also be placed in a heap together so that they may be potted up by themselves. It is advisable to thus separate the bulblets from the bulbs of flowering size, for finer pots of bloom can thus be obtained, and the flowering plants will have all the benefit of the room instead of being choked up with a mass of young growths.

The Soil should be light and rich. One half of good fibrous loam well chopped up, with a quarter of the whole bulk of leaf soil, and the other quarter of cow manure dried and rubbed through a sieve, to which may be added a nice sprinkling of coarse silver sand, make a capital compost. Mix the ingredients thoroughly together by turning over the heap several times.

Pots.—For general purposes 5-in. pots are the handiest size to use, for an effective mass of bloom can be had in them, and they are not too large for placing in ornamental stands and vases in the dwelling rooms. This sized pot will hold five or six good bulbs, although some growers, who want extra fine flowers, put only three of the largest in them.

The pots should be clean, and fairly well drained, that is, the single crock in the bottom should be placed concave side downwards, and upon it five or

six other pieces a little smaller, a layer of moss being placed over the crocks. In potting the rammer should not be brought into play at all, as the soil can be made firm enough by the pressure of the fingers and a few smart taps upon the bench. Keep the bulbs rather low in the pots, as a top dressing will do good a couple of months hence. The tops of the bulbs should just be covered with soil, so that it will be necessary to allow at least 1 in. when filling in the soil up to the level upon which the bulbs are placed.

Subsequent Treatment.—No water will be wanted for some time as the soil will be moist enough for the present needs of the bulbs. Clear out a corner in a cold frame, stand the pots as closely together as they will go, and cover them with cocoanut fibre so that the soil is covered to the depth of several inches. If cocoa nut fibre is scarce or lacking, ashes may be employed, but in this case it will be advisable to prevent them from coming into direct contact with the young growths, which are very tender and quickly sustain injury. An empty pot should therefore be inverted over each of the pots containing the bulbs.

After the lapse of four or five weeks the plants will be ready for removal from the plunging bed, and may then be transferred to another cold frame, where they must be gradually inured to the light.

The Bulblets that are too small and weak to flower next year may be "sown" thinly in pans in the same sort of soil as that given the larger bulbs, and also plunged. It will be worth paying them a little attention, as if they are kept growing on properly they will make strong flowering bulbs by the end of next season.

Another Method of Culture.—We have given the routine of cultural treatment that is adopted in the majority of cases, but in most things horticultural there is more than one way, and often several methods, of accomplishing the same end. Some growers do not take the trouble to pot up the bulbs each year but simply start the plants in the same soil and in the same pots which accommodated them the preceding season. About the middle of August the pots containing the bulbs are taken from the place in which they have been resting, and by repeated waterings the soil is reduced to a state of moistness. The pots are then plunged, taken out when roots have been freely formed, and the plants are then given a nice light place on a shelf near the glass in a cold pit, or in a frame. The strongest growths thrown up by the big bulbs are allowed to remain, but all the weaker ones, that is, those coming from the bulblets, which would not produce flower are cut off close to the surface of the soil, and the bulblets are thus killed. Liberal feeding from an early date and onwards till the flowers appear is resorted to, and the result is that very fine pots of flowers are frequently obtained. Of course the pursuance of this method gives no chance of increasing the stock of bulbs, as all the young ones are destroyed by the pinching process.

Seedlings.—The raising of plants from seed is quite an easy undertaking but the practice is not at all a common one. The seed should be sown about the same time as the bulbs are potted up, viz., near the middle of August. The young plants will not stand transplanting at all well, for the roots are very thin and delicate, so that the common treatment of seedlings will not do for them at all. The best way of getting over the difficulty is to sow in pots or pans, and thin the plants down until those that are allowed to remain have plenty of room to grow. These young plants will make good flowering bulbs for the second year. It will be seen, therefore, that such amateurs as do not imperatively want immediate results, but are willing to wait for a season, will do well to invest in a packet of seed at once, and sow it as advised. Seed should be easily obtainable from all good seed houses.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Seedling Carnations.—*F.E.B.*: The self-coloured crimson-scarlet variety is a fairly good flower, but is not so good as either King Arthur or the recently certificated Isinglass, so that it would be waste of time to give it a distinctive name. The fancy variety

is really first rate, and you will do well to name and propagate it.

Table Decorations.—*Dissatisfied*: It would be impossible for us to pass an opinion upon the respective merits of the floral tables you speak of without seeing them. We think it quite probable, however, that you made your vases look too heavy by putting too much in them, and that the judges gave the prize to the other competitor because of the lightness and gracefulness of his exhibit. It is a common mistake to put too many flowers in the vases, and you are not the first competitor who has been dissatisfied because the judges preferred something lighter. Of course, judges may have individual tastes that may not be in accordance with somebody else's ideas; thus it is policy when you know your man, to dress the table according to his ideas of what it should be if you want to stand a good chance. The fact that the flowers on your table were of higher class than those on the other may or may not have influenced the award. Strictly speaking, the test is not for the individual excellence of flowers—that is done in the other classes—but for the arrangement of the material, and the general effect of the decorative scheme.

Cypripedium spectabile.—*E.L.*: This *Cypripedium* is one of the prettiest of the hardy Orchids. It requires a damp place, and peaty soil to grow in. The corner of the rockery you mention will suit it very well, but not the soil that is there at present. You should clear that out and fill up with a compost of two-thirds of peat, one of good loam, and sand. If the peat is very sandy a further addition of sand may not be required. You need not use expensive peat for the operation. The quality sold by sundriesmen for Rhododendrons and Azalea beds will do capitally.

Wallflowers.—*Reader*: You are very late in sowing your Wallflower seed, and the plants will be correspondingly late in blooming next year. The seed should have been sown at the end of May or the beginning of June. The plants then have plenty of time to make good growth, and get hard and well matured before the winter. If you must have Wallflowers lose no time in getting the seed in, but the plants will be valueless for spring bedding.

Dahlias.—*Carlos*: Thin out the growths of the plants, and pinch out some of the buds. Give plenty of liquid manure—fresh farmyard manure for preference, if you can get hold of it—and you will then have flowers as large as you want them.

Single Scarlet Dahlia.—*Carlos*: The flower is fairly good, but there are plenty better. The colour is the best point about it.

Retarding *Lilium auratum*.—*Tenby*: Stand the plants in a shady corner where they will not get much sun, and do not excite them with too much manure water. They will then develop their flower buds very slowly.

Nertera depressa is the name of the pretty dwarf-berried plant that you refer to, *Excelsior*. It would do quite well with you in an ordinary greenhouse, and is, as you say, something quite out of the common run of plants. We do not know why it is so comparatively rarely met with; perhaps it is because they look upon it more as a curiosity than anything else. It may be raised easily enough from seed, but is generally increased by dividing up the old plants. Almost any soil will suit it, but it should not have too much soil given it, and should therefore be grown in shallow pans or deep saucers.

Lapageria leaves dropping.—*Suburbs*: From the leaves you send it is evident that the plant is badly attacked with thrips, a pest which is very partial to the Lapageria. Can you not manage to fumigate or vapourise the house with "XI All." This is the quickest and best way of getting rid of thrips. Syringing with Fir Tree Oil, or other insecticides is a tedious operation, and for a big plant a rather expensive one. Follow up the smoking by heavy and repeated syringings with clear water. Never mind about the few flowers that are now upon the plant, as it is important that the leaves should be cleansed

from the intruders and their filth at as early a date as possible.

Nerines.—*Rob*: If the bulbs are fairly strong they should be showing signs of throwing up their flower spikes. Until they do you may keep them dry at the root in the same way as you have done for the last three months.

White Strawberry.—*E. R. L.*: The best white Strawberry in cultivation is undoubtedly Bicton Pine. The fruit is of medium size and good flavour, although not up to some of the scarlet fruited varieties. The plant is a capital bearer, and carries heavy crops even on dry soils. You cannot do better than try it.

HARDY BAMBOOS.

(Continued from page 757.)

PHYLLOSTACHYS.

THE species of *Phyllostachys* have their flowers arranged in small spikes, generally numerous, and those again are collected in loose panicles terminating the stems; but botanists only occasionally have an opportunity of inspecting or beholding them, even

four or five species, natives of Japan and China; but the *Index Kewensis* records twelve that have been described. Seventeen are included in the Kew list, including a variety and a species that has proved too tender for open air culture. Even this number has some likelihood of being augmented by fresh introductions, which may or may not prove to be either distinct or hardy; but time will tell. *Phyllostachys* is the third and last of the genera under which all the hardy Bamboos are classified. Their culture is precisely similar to that of the species already described under *Arundinaria* and *Bambusa*. A substantial soil, capable of retaining moisture in summer is one of their mainstays, and shelter from gales of wind is another, calculated to retain the beauty of the foliage. All of the species of *Phyllostachys* are eminently adapted for the conservatory and for temporary decorative work in dwelling houses, halls and ballrooms, in company with Palms. They have a particular grace and character of their own, for which it would be impossible to find a substitute.

P. AUREA.—In this we have one of the most frequent in gardens and one of the most handsome. The stems grow 8 ft. to 12 ft. high in our climate, and

about 3 ft. high, and the branchlets are covered with lanceolate, rich green leaves, glaucous beneath, and bearded at the apex of the sheath. Japan is its native country, where it is known as *Ya-daké*.

P. BORYANA.—The stems of this graceful and handsome species are erect or ascending, slender, naked, and vary from green to olive-brown. At Kew they have attained a height of 8 ft. to 9 ft., and bear slender, ascending twiglets, thinly arranged at the nodes. The leaves are lanceolate and small, being only 2 in. to 3 in. in length, dark glaucous green and shining when mature, glaucous beneath, and very numerous. The sparse arrangement of the side branchlets and the small size of the leaves gives to this species a light and airy or graceful appearance, at least when grown in the open air. Its native country is Japan, and being as hardy as any should be liberally planted in suitable positions in the garden or pleasure ground. *Bambusa boryana* is a name given to it on the Continent.

P. CASTILLONIS.—The erect or ultimately arching stems of this Japanese Bamboo are flexuous, and 6 ft. to 8 ft. high. The ascending branches are thinly disposed, forming a leafy, twiggy, bush. Both stems and twigs are pink and yellow on one side, while the

PHYLLOSTACHYS AUREA.

in their own country, not to mention Britain. The plants themselves are grasses of arborescent habit, though we may regard them as grassy shrubs or shrubby grasses in this country. The sheaths on the main stems soon fall away, leaving the wood naked and polished, hence the stems constitute no mean feature of their ornamental value. Another characteristic is that they are semi-terete, that is, rounded on one side, and flattened or grooved on the other, from the axil of one leaf to the base of the next that comes above or perpendicular to it. Every second leaf is alternately on the opposite side of the stem to that next above or below it, so that this flattened or grooved portion of the stem shifts from one side of it to the other alternately. The joints are rather thickened, and the branches or twigs arising from them are generally numerous, slender and graceful. The species of *Phyllostachys* contain many of the princes of the Bamboo family as far as the hardy members are concerned. The leaves are nearly always of very moderate or even small size, so that well developed stems, with their myriads of graceful, leafy twigs, are ornaments of no small importance and beauty

The *Genera Plantarum* reckoned that there were

when well ripened assume a beautiful golden-yellow hue by which it may be readily recognised; but in our murky skies they seldom attain anything better than a greenish-yellow hue. Even then they are handsome, especially after their myriads of ascending, fascicled twigs and twiglets are developed. The lanceolate or oblong-lanceolate leaves are serrulated on one edge 2 in. to 5 in. long, finger-like, and light green. The sheaths are bearded at the apex. It is also generally known as *Bambusa aurea* in European gardens; and in its native country, Japan, it is either very popular or its identity often mistaken, for it has received several names such as *Hôrai-chiku*, *Taibo-chiku* and *Hotei-chiku*. This latter name recalls another well-known Japanese plant, often named *Hoteia japonica* in British gardens. The accompanying illustration shows one of the clumps of this popular Bamboo at Kew. There is a small portion of *Arundinaria auricoma* in the foreground, and behind it the Lily showing itself is *Lilium pardalinum*. The camera faithfully records everything coming within its scope, so that the wealth of greenery present makes it difficult to show the individuality of any one Bamboo distinctly

P. BAMBUSOIDES.—This species forms a bush

other is green. The green side arises in the axil of any leaf, and passes to the base of the leaf next above it, and then the colours change positions at each successive leaf. The leaves are lanceolate, much the broader at the base, serrulate light green, shining and often striped or lined with creamy yellow. In the more shady positions the leaves assume a much darker green hue. The variegation is best seen when the foliage is in its prime, whether grown in the open air or under glass. The apex of the sheath is bearded. In France the species is known as *Bambusa Castillonis* and *B. Castillonis*. The Japanese name of it is *Kimmei-chiku*. The channel or grooved side of the stem above mentioned as peculiar to the species of *Phyllostachys*, is the portion that is green.

P. FATUOSA.—Though this Japanese species is fairly hardy, the foliage seems liable to considerable injury during the winter months, but that may be due as much to a filthy atmosphere as to actual frost. The stems reach the fine dimensions of 10 ft., and are dark green, with ascending branches and twigs, and dark green, finger-like leaves, 4 in. to 6 in. in length. The withering and browning of the foliage of this species in winter are the greatest faults to be placed to the credit of an otherwise first-rate Bamboo. Its native home is Japan.

(To be continued.)

DALKEITH PALACE, N.B.

TWENTY-FIVE members of the Edinburgh Junior Horticultural Association, visited Dalkeith Palace gardens on June 25th. It being a bonnie afternoon, everybody from the Scottish metropolis seemed to be hurrying to country dells or meadows. Our heavy train soon reached Dalkeith. Mr. Dunn's general foreman, Mr. Palmer, there awaited us and lent the party courteous guidance throughout the "Palace" demesne.

This ducal estate is well-known. Probably each department of its horticultural section has been figured once and again in our literature. This granted, we yet compile our quota which refers mostly to landscape scenes.

A broad walk, having a high hedge to the south, and a large cottage on its north side, leads from the highway to the orchard entrance. Within the walls we found everything fresh and well-advanced. Standard Apple trees were abundant. The older ones are closely pruned. Other Apple trees, with Plum and Pear trees are grown as bushes or pyramids. Both Apples and Pears are represented in hundreds of varieties. Only good sorts are grown in quantity. The walls bear many cordon-trained trees. Morello Cherries were laden with fruits, and for bush fruits, Black Currants showed best. The ground becomes hot and dry in summer, which fact Mr. Dunn well knows and counteracts by mulching everything freely. Vegetable crops are raised from spaces between the fruit trees. The orchard lies to the sun, the ground being awfully steep.

By an east door we passed from the orchard to the "grounds." Being at a distance from the Palace, verdure is allowed to luxuriate in natural form. This is proper in the outlying grounds. Wide-spread beauties are pleasingly blended. Tall bowing grasses such as *Dactylis glomerata*, *Festuca loliacea*, straight and imposing Foxgloves and Mulleins, soft, lowly Ferns, and other subjects grow in profusion, all cast like a lovely quilt beneath mighty and handsome trees. Such giant Rhododendron clumps there were. The old *R. ponticum* is everywhere. Its flowers lend a colour not at all common. The Portugal Laurel (*Prunus lusitanicus*) is much utilised for screening and for clothing banks. Through the grounds flows the river Esk. For long distances its sides are hemmed by high banks. These rise slopingly back for hundreds of feet. Domestic ducks there enjoy themselves in many pools and shallows.

On the banks and near the stream were some specially well clothed Beech trees, draped indeed like a specimen Abies. We thought Beeches liked a dry situation. They were very decorative. Very interesting also was the view we had of the old Oaks—the remnant of our ancient Caledonian Forest. They stand at considerable elevation and have a full east exposure. Time has converted the once stout, and vigorous natural architecture, into twisted, knotty, and gouty looking, patriarchal relics. Cabinet makers offer large sums for such quaint memorials, knowing well the purity and hardness of the rugged warriors. At one point we looked over a wide valley to an abrupt bank, tellingly decorated. On its middle left side were some typical trees of *Cedrus atlantica* with their rigid horizontal arms. Higher on their right swayed in graceful lines the branches of Abies or Picea. Lower, and nearer the river were drooping Birches. Deciduous trees were well placed for effect and variety. Bushy Ivy formed a groundwork to the less thickly planted spaces.

Sunk fences are not common on estates, yet their appropriateness of use in presenting an unbroken sweep of lawns and meadows, cannot be denied. Many writers on landscape-gardening scorn them as ludicrous. The kept lawns around Dalkeith Palace merge into broad deer parks; and without having adopted an unseen obstruction such as this, an erection at once offensive to the eye of taste and deleterious to the view, must have been employed. Horse Chestnuts and Planes (Sycamore) stand as impressive and imposing front objects on the outskirts of the great lawns. We passed through tunnels in our survey, cut in sandstone rock. What the intention was for having these tunnels Mr. Palmer could not state. Perhaps Loudon's idea may have been adopted, viz., to hide walks crossing each other, by leading one below the other. This, however, is only used in small areas to deceive one as to extent of grounds.

At a distance from the palace, and alone, is a high circular conservatory. The circle of supporting pillars are elaborately and intricately carved from solid blocks. It was very costly. Large Palms, Tree Ferns, and a miscellaneous collection was housed. The tall shapely Salisburias (*Ginkgo biloba* or Madenhair tree) were close by. This tree is more generally grown on walls here in the north, but the said specimens were beautiful without such shelter. *Escallonia philippiana* and *Viburnum plicatum* are represented in cosy corners. These two flowering shrubs, though somewhat tender, do well in gardens about Edinburgh.

Our notes must conclude with mention of the glasshouses. These consist of vineries, Peach, Fig and Melon houses, Pineapple pits, &c. Vine rods and laterals were well apart, and carried finished bunches. The heating system was ample, the pipes being black, which colour looks nicer than either light blue or lead. A small span had a varied collection of beautiful Caladiums. The beautiful Cloth of Gold Fuchsia filled a string of baskets hung from an Azalea house. Bananas were fruiting fairly. Near their house was a fine fernery. The orchard house was filled with mixed fruit trees in pots, bearing well. *Stephanotis floribunda* was trained, and showed splendidly in large pots. But—exit and to fruit room, where Mr. Dunn has abundance of refreshments. Having partaken of them, various votes of thanks were rendered.

Passing homeward by the Kitchen garden central walk, the side borders of which are filled by squares of all the varieties of Violas certificated at Chiswick last year. Some were poor enough, though certificated, but most were grand. They were mulched by short stable dung. Dahlias, Pinks, Sweet Peas, Carnations, &c., found a home in beds or lines near the vegetable grounds. All kinds of rare and good Roses are everywhere. Long archways are covered with climbing sorts.

But now readers, adieu. Great gardens require lengthened descriptions, but we know our pen must halt. We enjoyed the pleasant trip, and were much wiser by it.—*Harrison D.*

BELGIAN NURSERIES.

IX.—MESSRS. F. SANDER & Co., BRUGES.

(Concluded from p. 763.)

ORCHIDS.

ON entering a large span-roofed house we noted a very curious form of *Odontoglossum Pescatorei*, with lacinated segments, not merely jagged, as is common amongst the best varieties of *O. crispum*, but deeply and finely fringed, in fact. *O. Pescatorei* also presented numerous varieties, spotted with violet on the lip, the plants being semi-established and flowering for the first time. The same may be said of *O. crispum*, *O. c. andersonianum*, *O. vexillarium* and *O. triumphans*. *Cattleya labiata*, also semi-established, was making vigorous young growths. Two whole benches in one compartment were devoted to *O. grande*. The central stage was occupied with *Laelia anceps*, while beneath it were great quantities of *Cattleyas* just imported. Another compartment was also occupied with *C. gaskelliana*, *C. Trianaei*, *C. Warneri* and *C. labiata* in the same stages as above recorded, thus showing great activity by the firm in its new establishment at Bruges.

The central stage in another large house was given up to *Cattleya Mossiae*. *Odontoglossum crispum* was also to be seen in all stages of growth and with shapely flowers, as well as boldly blotched varieties of *O. triumphans*. *O. luteo-purpureum*, *O. ruckerianum*, *O. cirrhosum* and *Oncidium marshallianum*, with its huge pinnacles of showy flowers. *O. concolor* and *O. sarcodes* carried large spikes of bloom.

In another cool house we met with such popular and useful subjects as *O. Rossii majus*, *O. R. albescens* (the sepals and petals having pale green blotches, the rest being white), *O. Cervantesi*, *O. crispum*, and others. The next compartment housed collections of *Oncidium sarcodes*, *Odontoglossum luteo-purpureum*, *O. crispum*, *O. c. guttatum*, *O. triumphans*, and many natural hybrids of the same genus, all bearing richly blotched flowers of their kind. The beautiful *Masdevallia Shuttleworthii* was in its prime. The whole of the central stage in the next compartment was occupied with *Laelia purpurata* in sheath. Not far off was a teak basket, 2 ft. by 2 ft., completely filled with one gigantic piece of that species. Next to this came grand batches of

Cattleya Mossiae and *C. citrina*, the latter suspended in pans and filling the house with the grateful aroma of its flowers.

Some idea of the contents of these houses may be gleaned from the fact that they are sixty-six metres in length, those having a vestibule being 70 metres long. One of the latter, measuring 35 ft. wide, and divided into four compartments was devoted to Orchids requiring a high temperature. A fine sight was presented by great quantities of *Dendrobium Phalaenopsis schroderiana* suspended from the roof in large pans. The fuscous-orange and yellow flowers of *Phaius Humblotii* were also conspicuous. Many plants of the beautiful *Cattleya intermedia*, with its soft blush flowers and purple lip also attracted attention. Others were *C. amethystoglossa* and *C. schilleriana*, the latter being suspended in pans. In company with these were *Dendrobium thyrsiflorum*, flowering freely and *Cypripedium villosum*. There was a compartment chiefly devoted to *Lycaste Skinneri*, in many of the best forms. Very choice were varieties having dark red sepals and petals; and that having rosy petals and a spotted white lip. *L. aromatica* was fragrant and free; while *Cypripedium mastersianum* was highly coloured. Ten houses in one block behind the bureau accommodated *Odontoglossums*, and the seedlings of various Orchids.

OTHER FLOWERING PLANTS.

Rhododendrons and Azaleas are extensively grown at Bruges, particularly Indian Azaleas. A pretty plant is *Tradescantia albo-striata*, having its leaves beautifully striped with silvery lines. The flowers are also pretty, being white and plentifully produced in terminal cymes.

Only the very best of the Indian Azaleas are grown, and seeing that their cultivation is as easy as the very worst varieties we see no use for the latter. *Le Flambeau* and *Pluto* are grand sorts of a rich crimson-red, glowing in the sunshine. Many of the very best and some of the newest and most highly developed double varieties were also at their best on the occasion of our visit. Very fine was John D. T. Llewellyn, the flowers being pink in the centre, blotched on the upper segments, fading to silvery-white at the edges, and very full. The salmon-pink and silvery-edged *Souv. de Mdlle. Marie Rosseel* was also extremely pretty. *Deutsche Perle* is too well known and appreciated to require further comment. The half expanded bulbs of the salmon and white *Vervaeneana* resembled to a remarkable degree a Tea Rose in miniature. The huge rose-coloured flowers, and wavy petals of *Memoire de Louis Van Houtte* were also handsome. The flowers of *Dr. Moore* were also of a soft rose hue. *Sacuntala*, like *Deutsche Perle*, was a choice pure white sort. With the exception of the first two mentioned above, all the rest were fully double, with flowers of the largest size and most refined form. *Souv. de Francois Vervaene* and *Empress of India* were semi-double forms having a rosette of small petals in the centre. The former had white, and the latter silvery-pink flowers, blotched with red on the upper petals.

Elsewhere the propagation of Azaleas by grafting was being accomplished. They are kept in cases while this is being done. Azalea stocks, 3 in. to 6 in. high, were being reared by the thousand in other houses, some planted out and others in pots. Nearly full grown specimens, that is, of saleable size, were planted out in leaf mould in the beds of the houses. Flowering plants in pots were stood between the rows. We counted twelve Azalea houses, each 140 ft. long. Five of these were in one block, built on the most modern principles, light and airy, with very wide panes of glass. Numerous pits were also more or less devoted to Azaleas. About an acre of ground was surrounded by a brick wall, the foundations of another block of six houses having a continuous internal area. This huge space was also meant for Azaleas. The summer quarters of the young Azaleas are very extensive; and planting out was being accomplished at the time. The dug out beds were being filled with Oak and Beech leaves, mixed with sand. Enormous quantities of water are required at Bruges during the summer months for Azaleas, notwithstanding the fact that the district is below the level of the sea. To meet this requirement a cement tank has been constructed, 2½ ft. deep, about 3 ft. wide, and running across the Azalea-ground for a distance of 250 yards.

Gloxinias and tuberous Begonias are also grown in this establishment to some extent to meet the necessities of their admirers. Two houses are

filled with the best varieties of *Camellia japonica*. One variety with dark claret flowers is here known as the black *Camellia*. Very pretty was a double variety of *Lady Banks' Camellia*, namely *C. Sasanqua plena*, with small, double pink flowers, and small leaves, being quite a distinct species from the Japanese one, so largely grown in some establishments here. All of the above are grown in 32 size pots and will be marketable this coming autumn. *Azaleas* and *Camellias* are also grown in houses near the office or bureau.

SCOTTISH HORTICULTURAL ASSOCIATION.

The monthly meeting of this society was held at 5, St. Andrew's Square, Edinburgh, August 2nd. The audience was treated to a remarkably fine exposition on "Orchids for Cut Flower and Decoration in Winter," by Mr. Boyd—late foreman at the Glen, Innerleithen, now head gardener at Bellisle, Ayrshire. Orchids as a rule require plenty of light and ventilation. Heating apparatus should be rather more than actually necessary and so save a forced drying heat. Afford copious supplies of water during growth. In watering, make sure of testing the compost below its surface. Potting material—sphagnum, peat, crocks—only keeps the plants in position and lends moisture, but no nourishment. Cleanliness is a great item. For late autumn, *Cattleya labiata* should be grown in baskets, near the glass of an intermediate house. It flowers on the current year's growth. Re-pot in February before the roots start.

C. bowringiana from Central America, remains for three months in flower. It is a long-bulbed species and must be given more rest than short-bulbed sorts. It loves copious waterings, with liquid manure at times.

Calanthe Veitchii is an attractive subject in the dull period. Shake out the old compost before roots are made, and in 6-in. pots put three bulbs. Use one-half fibrous loam, one-fourth of sphagnum, one-fourth of small crocks. Water carefully till fully established, then allow greater freedom, but withhold when growth is finishing.

Dendrobium Phalaenopsis, varieties varying from deepest purple to pure white, are from North Australia. Grown in a warm division, using shallow baskets, and having good light, they throw up long racemes of *Phalaenopsis*-like flowers.

Vanda caerulea sometimes has frost in its natural habitat. Pot in sphagnum and crocks, keeping the crown above the pot. Place it in the warm end of the East India House. *Sopbronitis*, so decorative, thrives in the cool parts of the *Cattleya* house. *Laelias* with two to five flowers are very useful during November and December. When various varieties are grown they can be used to much effect. Naturally they receive nightly drenchings and are under full sunshine during day. Never shade unless the sun be scorching. Give air when 45° of heat is reached outside. The *Trentham*, or long-bulbed sorts, are later than the others. *L. albida* is a good one, but rather straggling.

Coelogynes may be potted in peat and sphagnum shortly after flowering. Allow plenty of water and some liquid manure to established specimens. *Cattleya Trianaei* flowers in February or March in an intermediate house. It requires a long resting period. Never shade unless in very strong sun. Longer leaves and bulbs are got under shade, but such plants must lack bloom. Imported bulbs should be washed clean and hung base uppermost near the glass, being syringed daily till roots are emitted. They do better in baskets than in pots.

Dendrobium wardianum make growths 4½ ft. long, and covered with bloom, as a recompense to Mr. Boyd's care. Insert in well-drained pots, with sphagnum and peat, and plunge these in cocoa-nut fibre. Growth, 5 in. or 6 in. long, are pushed before roots are emitted. This necessitates care when watering. Syringe slightly overhead on warm days. When the last little leaf at the apex is seen, they are best taken to an early vinery with as much light as possible. From October till March afford only enough water to keep the pseudo-bulbs from shrivelling. They flower best when pot-bound. An annual top-dressing is mostly all that is needed. *D. nobile*, being evergreen, takes more water in the resting stage. Other details are as for *D. wardianum*. Its profusion of blooms renders it useful for decorations and for hybridising.

Cymbidium lowianum may be placed in an early vinery, and shifted to a later vinery when the first one becomes too cool. It goes to rest with the vines. *Odontoglossums* were summed up as requiring (a) an equable cool temperature, (b) abundance of moisture, (c) sweet air, and (d) good, clear light. They are impatient of pipe-heat. Use water no colder than night temperature, and damp the stages, paths, &c. Admit air when 40° Fahr. externally is registered. Shade when the sun raises the temperature to 60° externally. *O. citrosium* loves liberal waterings and a place at the cool end of the intermediate house. Xl all Vaporiser is the best eradicator of pests on Orchids. No harm accrues to blooms. *Adiantum farleyense* is the only subject Mr. Boyd ever injured with this patent vaporiser.

The exhibits forthcoming consisted of a dozen seedling *Violas* from Messrs. Dickson & Co., Waterloo Place. A brilliant yellow one—Walter Welsh—received certificate. They had also *Lady Glamis Pinks* (blood-red) and *Snowflake* (white). Messrs. James Grieve & Sons staged beautiful *Carnations* of great brightness. A seedling, named *Britannia*, was certificated. Its colour is deep salmon. Strawberry Richard Gilbert from Mr. Wm. Carmichael received a certificate. *Geraniums* came from Mr. Comfort; fine *Spiraeas*, in 6-in. pots, from another member; and a lovely truss of *Nerium candidum* from Mr. A. McKenzie, Trinity Grove. This *Nerium* is not described in "Nicholson's Dictionary of Gardening," and is a rare, pure white, large, semi-double. After some business and a vote of thanks to Mr. Boyd, the chairman announced next month's subject—"The Rose; Its History and hints on its cultivation."—*Harrison D.*

ALPINE AND ROCK PLANTS.

CORONILLA CAPPADOICA.—Several of the herbaceous species of *Coronilla* are well adapted for trailing over the stones and boulders of the rock-work, for which they are very well adapted. Their long, rather woody roots penetrate the soil deeply, so that they flower profusely when various other subjects are suffering through the dry weather. The large, golden-yellow, and Pea-shaped flowers of *C. cappadoica* are produced in circular umbels, that is, the flowers of the truss point in every direction of the sky, and are carried quite clear of the glaucous foliage as it trails over the ground. The tufts are, however, compact, and evergreen. When once established they will flower for many years in succession without further attention than keeping them free from weeds, and preventing tall subjects from overshadowing them, for they love the sun.

RAMONDIA PYRENAICA.—The hardiness of this European *Gesnerad* is now a well established fact. A suitable position must be selected for it amongst sandstone rocks, or other soft and porous material, in a position that is shaded from the direct rays of the sun for the greater part of the day. The woolly leaves are rather soft in texture, and lie close to the stones, so that the latter must never become dry and hot, or the *Ramondia* will be a failure. So long as the roots are in well-drained but moist soil, and squeezed in between cool and porous stones the plant will be happy and flower beautifully every summer. The purple flowers are in beautiful contrast with the pencil of golden stamens in the centre, and the orange spots at the base.

HELIANTHEMUM FIREBALL.—The long continued dry weather has been rather hard upon the perishable and ephemeral flowers of the Rock Roses. After a day's hot sunshine the ground has several times been carpeted with the bright orange-scarlet flowers of this variety of the British Rock Rose. Another relay of flowers takes the place of the fallen ones day after day for weeks together. Even now the hoary or gray foliage looks appropriate on the rockery. If young plants are desired, take cuttings presently, but particularly a week or ten days after we get a good fall of rain to encourage fresh growth, and the rooting of them will be easy in a frame.

SAXIFRAGA AIZOIDES.—Happy are those plants which have been planted near water, or where moisture is plentiful in summer. This *Saxifraga*, in a wild state, grows where water is constantly dripping down the rocks. The bright yellow flowers then look happy above a carpet of dark green, and, in fact, evergreen foliage.—*J. Effe.*

Amber is the fossilised resin exuded by the prehistoric Pine tree.

TRIALS AT CHISWICK.

The fruit and vegetable committee of the Royal Horticultural Society met at Chiswick on the 22nd ult. to examine the Peas and Potatoes submitted to trial. There were sixty-six stocks of the latter sent, but these were most of them passed over. Several varieties were considered promising, however, and it was decided that another examination should be made in August.

It is to be regretted that the meeting of the Floral Committee was called for Wednesday, July 27th, for this brought it into collision with the annual exhibition of the National Carnation and Picotee Society (Southern Section) at the Crystal Palace. A considerable amount of work was passed through hands, however, for there were many things to pronounce upon, and the list of awards was unusually long.

VIOLAS.

In addition to the fifteen varieties which received the XXX distinction at the examination made by the committee on the 5th ult., the three undermentioned varieties were honoured:—

MARCHIONESS.—In addition to the XXX given on the 5th ult., an Award of Merit was granted Messrs. Dobbie & Co., of Rothesay, for this fine variety.

THE MEARNS.—A showy flower of medium size and good form with light lavender-blue, upper petals, and deep purple lower ones. The eye is small, and rich yellow in hue. The habit is vigorous, and the plant free-flowering. XXX. Mr. John Forbes, Hawick, N.B.

BRIDEGROOM.—This is a charming, mauve-coloured, rayless variety of great beauty and refinement. The flowers are of medium size, first-class form, and are, moreover, produced in great numbers. The habit is distinctly 'tufted,' and the plant should make a good bedder. XXX. Mr. John Forbes.

CARNATIONS.

From a single packet of seed supplied by Mr. Jas. Douglas, of Edenside, Great Bookham, Surrey, a nice batch of seedlings has been raised at Chiswick. An award of XXX was made to several of the most promising of these varieties. They were:—

FIREFLY.—A rich scarlet self of great substance and broad smooth petal.

ROSY MORN.—A large bright rose self with lacinated petals of good substance, and an exceptionally free bloomer.

CYGNET.—A pure white form of great merit, the flowers, although only of medium size, being in first-rate form, and the petals smooth, and of excellent substance.

BLACK DOUGLAS.—A rich, deep crimson self of great beauty, with petals round and flat, but with notched margins.

LADY PRIMROSE.—A bright primrose-yellow self, and an acquisition to this colour section.

GOLETTA.—A fine flaked variety, the ground colour being clear white, and the stripes of carmine-rose.

All the foregoing varieties have especially stout calyces which do not burst, and they are all very free flowerers, and, in fact, constitute good examples of a high type of border Carnation.

ANNUALS.

The trial of "Annuals" has been one of the most extensive trials at Chiswick this year, and its usefulness is not to be questioned, seeing how much we owe to the brilliancy and beauty of this class of easily grown plants. No fewer than 109 distinct lots have been forthcoming from various sources, and the committee had thus a variety of claims to investigate and satisfy.

LEPTOSIPHON DENSIFLORUS ROSEUS.—This pretty little plant is from 4 in. to 6 in. in height, of tufted habit, and with leaves arranged in dense terminal whorls, or pseudo whorls, upon the dwarf upright stems. The flowers are about a third of an inch in diameter and bright rosy-pink in colour. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

CLARKIA ELEGANS ROSEA FLORE PLENO.—This is rather a tall growing *Clarkia*, the plants being fully 18 in. in height, and inclined to be straggling in habit. The showy, bright rose, double flowers are produced in long sparsely flowered racemes. XXX. Messrs. J. Veitch & Sons, Ltd.

GODETIA ROSEA ALBA.—Here we have a tall-growing and distinct-habited *Godetia*. The plants are from 15 in. to 18 in. in height, the flowers being solitary in the axils of the leaves. The flowers themselves are of medium size, bright pink in colour,

with a central basal zone of carmine, and very showy. XXX. Messrs. James Veitch & Sons, Limited.

GODETIA LA BELLE.—This variety is bushy in habit, and about 10 in. in height and very free flowering. The blooms exhibit a shade of rich crimson-rose, and are large relatively to the size of the plant. XXX. Messrs. J. Veitch & Sons, Ltd.

GODETIA WHITNEYI.—The plant is from 1 ft. to 15 in. in height, the flowers being of medium size, and rich crimson-lake in hue, tipped with rose, and with a central basal zone of the same hue. XXX. Messrs. J. Veitch & Sons, Ltd.

GODETIA WHITNEYI BRILLIANT COMPACTA.—The plant bearing the burden of this sufficiently cumbersome name is much like the type in growth, but is also rather dwarfed. The flowers are rich rosy-carmine in hue, with a central zone of white, thus being exceedingly showy. XXX. Messrs. J. Veitch & Sons, Ltd.

GODETIA BUTTERFLY.—This is a very strong growing form with large flowers of a pale pink shade, a large blotch of carmine being a feature of each petal. The margins of the petals are more or less lacinated. XXX. Messrs. J. Veitch & Sons, Ltd.

GODETIA FAIRY QUEEN.—Here we have a dwarf form not more than 6 in. in height, of very bushy habit, and with small flowers and leaves. The former are white, with a carmine blotch on each petal. This is a pretty, dwarf, bedding plant. XXX. Messrs. Watkins & Simpson, Essex Street, Strand, W.C.

GODETIA DUCHESS OF ALBANY.—This favourite variety has done well at Chiswick this year, and its huge trusses of pink-white flowers have been and are much in evidence. XXX. Messrs. Watkins & Simpson.

GODETIA GLORIOSA.—A bushy form not more than 10 in. in height, with deep crimson, medium-sized flowers, a mauve blotch being at the base of each segment. XXX. Messrs. Jas. Veitch & Sons, Ltd.

VISCARIA CARDINALIS FULGENS.—In this we have a very bright and floriferous form of a popular subject. The flowers are above average size, and rich cardinal in hue, shading to rose with age. XXX. Messrs. Watkins & Simpson.

ALYSSUM MARITIMUM MINIMUM.—It would be difficult to imagine a more perfect sample than this of the kind of plant that is required for covering the ground under taller growing subjects. It makes a dense carpet not more than 2 in. or 3 in. in depth, and flowers so profusely as almost to hide the foliage with the relatively large corymbs of pure white flowers. XXX. Messrs. R. Veitch & Son, Exeter.

CANDYTUFT ROSE CARDINAL.—In this we have one of the very best forms of the coloured Candytufts. The umbels and individual flowers are small, but as they are freely produced and the plant is of bushy and symmetrical habit, a capital effect is obtained by a mass. The colour, as the varietal name suggests, is a bright rosy cardinal. XXX. Messrs. Watkins & Simpson.

ESCHSCHOLTZIA MANDARIN.—Here the flowers, which are rather small, present a distinctly stellate appearance, due to the fact that each petal is folded longitudinally upon itself. The colour is rich orange in the interior of the flower, and chestnut-orange on the exterior. The plant is about a foot in height, bushy and free-flowering. XXX. Messrs. Watkins & Simpson.

GYPSOPHILA ELEGANS (pure white).—A pure white form of this handsome and useful Gypsophila. XXX. Messrs. Watkins & Simpson.

POPPY CARDINAL.—A handsome, double-flowered Poppy, from 18 in. to 2 ft. in height. The flowers are large, globular in shape, and fiery scarlet in colour, whilst the inner petals are very narrow, and recall the appearance of a Paeony. XXX. Messrs. Watkins & Simpson.

POPPY WHITE SWAN.—Another very fine double Poppy, with huge, globular, pure white heads. The plants are from 2 ft. 6 in. to 3 ft. in height. XXX. Messrs. Jas. Veitch & Sons, Ltd.

POPPY DANEBROG.—This is a very showy single Poppy, deep scarlet in colour, with a large white blotch at the base of the deeply lacinated segments. The height of the plant is from 18 in. to 2 ft. XXX. Messrs. Jas. Veitch & Sons, Ltd.

CANNA.

CANNA CHISWICK KING.—This is a new variety raised at Chiswick. The plant is about 2 ft. in height, and

thus is dwarf enough for any purpose. The spike is rather loose and few flowered, but the individual blooms are of high excellence, bright scarlet in colour with a decided flushing of orange. The segments too are broad and substantial. Award of Merit.

SWEET PEAS.

Mr. Henry Eckford, Wem, Shropshire, sent a number of new varieties of Sweet Peas for the opinion of the committee who awarded three marks (XXX) to each of them. The following are the varieties:—

FASCINATION.—A fine flower; standard mauve, wings and keel bluish purple.

COCCINEA.—A rosy scarlet self-coloured variety of great beauty.

DUKE OF WESTMINSTER.—A very deep purple self; very rich and fine.

SADIE BURPEE.—A magnificent pure white form of great merit. Each stalk is three-flowered.

DUCHESS OF WESTMINSTER.—Standard soft rose; wings creamy white flushed with rose—an exceedingly pretty combination of colours.

MRS. FITZGERALD.—A creamy-white flower, delicately veined and flushed with pink, and quite distinct from anything else.

SOCIETIES.

BROOKFIELD.—July 23rd.

The fourteenth annual exhibition of fruit, flowers, and vegetables, held by the Brookfield Society, took place on the 23rd ult. at Highgate, in a field kindly lent for the occasion by Mr. W. Burdett-Coutts, M.P. Twenty-two years ago the Baroness Burdett-Coutts provided the Highgate Rise Allotment Gardens with a view to encourage a love of horticulture amongst the working classes. On this occasion the exhibits from these allotments were both numerous and good (over 700 exhibits were staged), and must have been gratifying to the kindly heart of this philanthropic lady. The chief prize winners, with their several aggregates of prize monies, were:—Mr. C. Williams, £5 10s. 6d.; Mr. C. Parling, £4 6s. 2d.; Mr. T. R. Whiting, £3 2s.; Mr. E. Hibbert, £2 17s. 6d.; and Mr. C. Stone, £1 17s.

For the first time in the history of the society the Royal Horticultural Society offered a Bronze Medal for the most meritorious exhibit in the show. This prize fell to the lot of Mr. C. Chancy for a splendidly grown Fuchsia.

The several non-competitive exhibits added materially to the attractiveness of the show, the most important of these being a splendid stand of Sweet Peas contributed by Messrs. Wm. Cutbush & Son, of Highgate.

On Thursday, the 29th ult., the Baroness Burdett-Coutts presented the prizes to their respective winners at a meeting held at the St. Anne's Mission House. The owners of the best kept allotments also received their awards from the same gracious hands.

ST. GILES COTTAGE GARDEN SHOW.—July 28th.

The annual exhibition of this society took place on Thursday the 28th July, in the charming grounds of The Hon. Mark Rolle's residence, Stevenstone. Unfortunately the morning was showery and must have interfered with the attendance, though about noon it cleared and the sun shone out brilliantly during the rest of the day. The entries were numerous and the quality of all the exhibits uniformly excellent. The window plants were very creditably grown and the beautifully arranged baskets of cut flowers were greatly admired, while the vegetables, taken as a whole, were excellent for cottagers, who appear to take a very keen interest in the show. There was a strong competition in the latter classes, and the collections of vegetables were very good. There were also prizes for sewing, knitting, darning, laundry work, carving, etc., and quite on an extensive scale for a cottagers' show. The Hon. Mark Rolle (gardener, Mr. Gillies) kindly filled the centre of one tent with an excellent collection of flowering and foliage plants, nicely arranged, and which was much admired. The award of the judges, Mr. G. Eames, Heanton, Latchville, and J. Mayne, Bicton, were generally approved.

ABBEY PARK, LEICESTER.—August 1st and 2nd.

This annual show was held on the above date in the beautiful Abbey Park, which just now is looking well,

every department being well cared for. The various styles of bedding are splendidly carried out, and are the admiration of everyone. The entries were not up to the average, which was, no doubt, attributable to the alteration of the show to a day earlier than usual, which prevented many exhibitors living at a distance from competing. The attendance was very heavy, for nearly 30,000 people passed the turnstiles on the first day, and the money taken at the gates amounted to over £850.

The groups were good, the specimen plants fairly so, cut flowers made a grand display, and fruit and vegetables were excellent. The competition was, in most cases, very keen. Great credit is due to Mr. John Burn, the energetic secretary, for his capable management, for everything passed off satisfactorily. The weather was all that could be desired—ideal show weather, in fact.

OPEN CLASSES.

PLANTS.—The most tastefully-arranged group of plants, occupying 50 sq.-ft., was contributed by Mr. H. Rogers, Gipsy Lane, Leicester. Mr. H. Blake-way, of Rugby, was second. The last-named exhibitor scored in the classes for six stove and greenhouse plants (three foliage, and three flowering subjects), and six exotic Ferns. Mr. James Wright, Granby Street, Leicester, won for six tuberous Begonias, and Mr. H. Rogers, for six Coleuses, dissimilar.

CUT FLOWERS.—In the principal classes for Roses, Messrs. Harkness & Sons, Bedale, Yorks., carried all before them, for they won first prize in each of the following classes, and in every case they had magnificent stands of blooms:—Thirty-six and twenty-four distinct, of all sections; twelve Tea Roses, distinct; twelve H.P.'s of any variety; twelve Teas of any one variety; and last, but not least, for the best Rose in the show.

Carnations and Picotees were another special feature. Here Messrs. Thomson & Co., Sparkhill, Birmingham, were the chief winners, staging some grand blooms in the various competitions in which they entered. They were first for twelve Carnations, dissimilar, and twelve yellow Carnations, twelve Picotees, dissimilar.

Mr. J. G. Stretton, Sharwell, Rugby, had the winning exhibit of twenty-four blooms of tuberous Begonias.

The first award for eight distinct dishes of fruit went to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby. Mr. Goodacre also won the Veitch memorial prize for the leading collection of fruit, and had, moreover, firsts for a Pineapple, two bunches of Black Hamburgh Grapes, two bunches of Muscat of Alexandria Grapes, a single dish of Nectarines, Figs, dessert Apples, Plums, and a green-fleshed Melon. Mr. J. Elphinstone, Shipley Hall Gardens, Derby, was another successful exhibitor in this section.

In the vegetable classes Mr. R. Shaw won many prizes, including firsts for the collection of twelve kinds of vegetables, six dishes of Potatoes, Broad Beans, Autumn-sown Onions, and Long Red Carrots.

AMATEURS.

The amateurs' exhibit of Roses formed a very noticeable feature. The Rev. J. H. Pemberton, Havering-atte-Bower, staged the premier lot of twenty-four blooms, distinct. The reverend gentleman also took pride of place in the smaller classes for eighteen and twelve blooms, distinct, Roses of all sections being admitted as in the first-mentioned class; also for six blooms of any one variety. First awards in their respective classes for cut Roses also fell to the lot of Mr. M. White, Leicester, for eighteen and twelve blooms, distinct; Mr. W. Bailey, Leicester, for six trusses, distinct; Mr. W. Upton for six Tea Roses of any one variety, and also for the same number of Tea or Noisette blooms dissimilar.

Mr. J. W. Barker sent the prettiest basket of cut flowers in the competition limited to cottagers.

In the cottagers' classes for vegetables of eight kinds Mr. R. Hoe was placed first. Mr. W. Lord, of Esher, won the special prize for a collection of six kinds offered by Messrs. Sutton & Sons, of Reading.

NON-COMPETITIVE EXHIBITS.

Mr. J. H. Goodacre set up a magnificent bank of Carnations and Sweet Peas, for which he deservedly received a Gold Medal.

Messrs. J. and W. Birkenhead, Sale, Manchester, had a fine lot of Ferns, both hardy and exotic. (Gold

Medal.) The Ichthemic Guano Company, Ipswich, had a tent all to themselves, and this they tastefully decorated with plants and cut flowers. (Gold Medal.)

Gold Medals were also awarded to Messrs. Wm. Cutbush & Son, Highgate, N., for a grand array of plants and cut flowers; and to Mrs. Ellis, of Knighton, Hayes, for Ferns.

Silver Medals were voted to Messrs. J. R. Pearson & Sons, Chilwell, Notts, for a collection of Gooseberries; to Messrs. Yarde & Co., Northampton, for Sweet Peas; Mrs. E. C. Carnall, Gipsy Lane, Leicester, for floral designs; Mr. Harry Rogers, Leicester, for stove and greenhouse plants; and Messrs. Harrison & Sons, Leicester, for cut flowers and vegetables.

NORTHAMPTONSHIRE HORTICULTURAL.—

August 1st and 2nd.

By kind permission of Earl Spencer, K.G., the seventeenth show of this society was opened on August Bank Holiday in the beautiful grounds of Althorpe House, Northampton. A capital exhibition was forthcoming, and the influx of visitors was heavy.

In the open classes Mr. J. Cypher, Cheltenham, carried off leading honours for twelve stove and greenhouse plants, showing grand specimens. Mr. W. Finch, Coventry, was second, and Mr. W. Vause, Leamington, third. The first prize for the central group of miscellaneous plants also went to Mr. J. Cypher, the second to Mr. W. Vause, and the third to Earl Spencer (gardener, Mr. S. Cole).

Messrs. J. Perkins & Son, Market Square, Northampton, staged the leading stand of twenty-four Roses, while the best twelve Tea Roses came from Messrs. T. Perkins & Sons, Drapery, Northampton. Mr. S. Mortimer, Rowledge, Farnham, Hants, scored for twenty-four Dahlias, and Mr. W. Vause obtained a first for twelve bunches of stove and greenhouse flowers.

Mr. H. Rogers, gardener to Lord Rendlesham, Rendlesham Park, Suffolk, won well merited honours for table decoration, Mr. J. Cypher taking second place.

In the "open" section of the schedule Mr. J. Dymock, gardener to B. Wentworth Vernon, Esq., Stoke Bruerne Park, won first prize with a capital collection of vegetables.

In the classes set apart for gentlemen's gardeners in the county of Northampton, Mr. J. Copson, gardener to Mrs. P. Phipps, Collingtree Grange, staged the best lot of six stove and greenhouse plants; Mr. J. B. Palmer, gardener to Mrs. R. Turner, Cliftonville, being second. Mr. J. Holland, gardener to Mr. F. Bostock, Springfield, scored for eight table plants, and Mr. W. Pearce, gardener to S. Lode, Esq., Floore, for exotic Ferns.

The first prize and the Royal Horticultural Society's Silver Medal, for a collection of fruit, was well won by Mr. S. Cole, who had a fine display. Mr. A. Child, gardener to H. A. Attenborough, Esq., Cateshy House, had the best black and also of white Grapes. Mr. S. Cole led for a Melon, and Mr. F. Bostock, for Peaches and Nectarines. Mr. F. G. Adnitt, Billing Road, Northampton, occupied the first places for early Apples and Pears.

The exhibits sent by amateur cultivators and cottagers were of a high order of merit throughout and spoke well for the condition of the small gardens in the county.

SPECIAL CLASSES.—In the class for a collection of vegetables, in which the prizes were offered by Messrs. Sutton & Sons, of Reading, Mr. J. Keightley, gardener to Sir Hereward Wake, Courtenhall, was first; Mr. J. Dymock, second; and Mr. S. Cole, third.

In another competition for a collection of vegetables, in which the awards were given by Messrs. Webb & Sons, Stourbridge, Mr. J. Dymock was first on the list. In a third competition for a collection of vegetables, Mr. Dymock also took pride of place, so that his great ability as a grower of vegetables was put beyond question.

The non-competitive exhibits were not numerous, but they were good what there were of them. Messrs. J. Perkins & Son sent a fine assortment of miscellaneous flowers and plants from their Billing Road Nurseries. Sweet Peas, Lilliums, and tuberous Begonias were special features of this group. The Ichthemic Guano Company, of Ipswich, showed

sample bottles of their manure. Messrs. Hinton Bros., of Warwick, contributed a meritorious collection of Sweet Peas. Messrs. T. Perkins & Sons likewise had a capital display of Sweet Peas, Carnations, and tuberous Begonias. They also showed the large white Goosberry Leveller.

ROYAL HORTICULTURAL.—August 9th.

THE finest feature of the meeting on Tuesday last was the large group of splendidly grown Pitcher Plants from Windsor. Hardy herbaceous plants, annuals, Gladioli, Carnations, Hollyhocks, Nephrolepis and stove and greenhouse plants were also in strong force. Hardy Water Lilies were shown in greater quantity than we have seen them before at any one meeting.

Orchids were poorly represented on this occasion as might be expected. Messrs. Hugh Low & Co., Bush Hill Park, Middlesex, exhibited the new hybrid *Cypripedium Olivia*, which had delicately light flowers and *Cattleya gaskelliana alba*. *Vanda (Stauroopsis) Batemanii* was exhibited by T. B. Hayward, Esq. (gardener, Mr. C. J. Salter), Woodhatch Lodge, Reigate. Mr. James Douglas, Edenside, Great Bookham, Surrey, staged *Dendrobium formosum Edenside* var., having flowers of wonderful size. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham, exhibited *Sohralia sanderiana*. G. W. Law Schofield, Esq., New Hall Hey, Manchester, exhibited *Odontoglossum crispum Lehmannii Schofield's* var., having a rich and handsomely marked lip.

On this occasion the Ferns sent by Mr. H. B. May, of Dyson's Lane Nurseries, Upper Edmonton, comprised a splendid representation of the genus *Nephrolepis*, no fewer than twenty-four forms being shown. A central and conspicuous feature was *N. pectinata*, of which there were some capital clumps massed upon the arms of a rustic tree stump. *N. exaltata*, *N. e. multiceps*, *N. e. furcans*, and *N. e. plumosa* were represented by exceptionally good specimens. Smaller plants of *N. rufescens tripinatifida*, *N. cordata compacta*, *N. Barterii*, *N. Duffii*, *N. pluma*, and *N. philippinense* were other notable forms. All the plants were in first-rate health. (Silver-Gilt Banksian Medal.)

Messrs. Wm. Paul & Son, Waltham Cross, Herts, had a showy group of cut spikes of Hollyhocks, which included some grand varieties, also herbaceous Phloxes and Pentstemons, and a large batch of cut blooms of *Yucca flaccida*. (Silver Flora Medal.)

The most imposing of the exhibits of plants or flowers was a large group, chiefly of foliage subjects set up by Mr. G. Kelf, gardener to Mrs. Ahbott, South Villa, Regent's Park, N.W. The outline of the group was three bold curves, and the plants, which all stood upon the floor, rose from very near the ground level in the front to a considerable height in the background, several tall Palms proving very effective. *Caladiums*, *Dracaenas*, *Acalyphas*, and Ferns were all tastefully and well employed, and the exhibit was really a very meritorious one. (Silver Gilt Banksian Medal.)

On the left-hand-side of the doorway a splendid group of *Campanula pyramidalis compacta*, in both white and blue forms, was set up by Mr. Geo. Wythes, Syon House Gardens, Brentford. A plant of the type was shown to illustrate the difference between it and the 'compact' variety, and from comparison it was evident that Mr. Wythes' variety has flowers of greater substance and wider petals, which reflex gracefully. A groundwork of Ferns gave a finish to this valuable contribution. (Silver Banksian Medal.)

Mr. Owen Thomas, gardener to Her Majesty the Queen, sent a nice collection of well pitched *Nepenthes*. The plants were elevated on stands above a groundwork of Maidenhair Fern, and comprised such elegant forms as *N. mastersiana*, *N. hookeriana*, *N. intermedia*, *N. mixta*, *N. dicksoniana*, *N. Morganiae*, *N. rafflesiana*, and *N. wrightiana*, all of them in splendid condition; also a few plants of *Acalypha Sanderi*, and the beautifully variegated *Ahutilon Swatzi*. (Silver Gilt Flora Medal.)

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, showed sprays of *Cornus macrophylla* and *Pavia macrostachya*; also small plants of the small blue-berried *Coprosma acerosa*, and the showy *Eucryphia pinnatifolia*.

From Mr. S. Mortimer, Rowledge, Farnham, Hants, came a quantity of excellent blooms of Show

and Cactus Dahlias. Of the Cactus varieties Mrs. Wilson Nohle, Matchless, Chas. Woodbridge, Lady Penzance, Britannia, and Earl of Pembroke were the best, whilst Mrs. Morgan, Perfection, Jas. Cocker, Mrs. Mortimer, John Walker, and Queen of the Belgians were some of the leading show forms. (Silver Banksian Medal.)

Mr. J. Walker, Thame, Oxon, also had a lot of cut blooms of Show, Pompon and Cactus Dahlias, the flowers being very large and fine throughout. (Silver Banksian Medal.)

Messrs. Webb & Brand, Saffron Walden, sent three stands of flowers of named Hollyhocks, amongst which *Delicata*, *Sunset* and *Rose Queen* were the leading sorts. (Bronze Flora Medal.)

A comprehensive display of cut hardy flowers came from Messrs. W. Cuthush & Son, Highgate, N. Carnations, Sweet Peas and *Aconitum Napellus* bicolor were the brightest subjects here. (Bronze Banksian Medal.)

A group of choice cut hardy flowers was contributed by Mr. M. Pritchard, Christchurch, Hants. They included the pretty *Montbretia rosea*, *M. Soliel Couchant*, *M. Pottii grandiflora*, *Helianthus multiflorus maximus*, and *Echinops sphaerocephala* in first-class order. (Silver Banksian Medal.)

Messrs. Jas. Veitch & Sons, Limited, sent a charming group of annuals in competition for the Sherwood Cup. Shirley Poppies, *Coreopses*, *Godecias*, double Scabiouses, and purple Sweet Sultan were particularly showy here.

A large exhibit of cut hardy flowers which came from Messrs. Kelway & Son, Langport, Somerset, occupied one side of a long table running the whole length of the exhibition hall. The principal feature was a grand array of cut spikes of Gladioli of which fully a hundred varieties were on view. *Cacus*, *Alhano*, *Leonard Kelway*, *Gallia*, *Mrs. D'Ombra*, *Sir H. D. Wolff*, *Remus*, *Menabrea*, *Marengo*, *Prince Edward of Saxe Weimar*, and *Wm. Roupell*, were some of the best of these. *Gaillardias* and *Eryngiums* were also well shown. (Silver Flora Medal.)

The group of cut hardy flowers coming from Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, was, as usual, replete with interest. Lilliums formed a notable feature of this exhibit, and of these the noble *L. auratum Wittei* was largely in evidence. The pretty *L. chalconicum*, *L. Batemanniæ*, *L. thunbergianum venustum*, *Montbretia Pottii* and several fine forms of Gladioli were all noteworthy. (Silver Banksian Medal.)

Mr. Jas. Douglas, Edenside, Great Bookham, Surrey, had a group of flowers of new Carnations raised by himself and Mr. Martin Smith. Miss Alice Mills, Hardii, Mr. Nigel, Queen Bess, and Queen of Scots, were some of the best. Mr. Owen Thomas sent a leaf and bloom of the white *Nelumbium nuciferum speciosum*. Messrs. Kelway & Son had the variegated *Antirrhinum majus kelwayanum*. Messrs. F. Sander & Co., St. Albans, showed the variegated *Furcroea watsoniana*. A seedling, golden Yew, named Waltham Golden, came from Messrs. Wm. Paul & Son. A plant of the golden Irish Yew was shown side by side with it for comparison.

A Silver Banksian Medal went to Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, for a collection of flowers of twenty-four varieties of Water Lilies grown in the open air. A noticeable variety here was the charming *Nymphaea stellata*.

A Bronze Flora Medal was voted to W. Robinson, Esq., 63, Lincoln's Inn Fields, W.C., for another large tray of Water Lilies; whilst a Silver Flora Medal went to A. B. Freeman-Mitford, Esq., Batsford Park, Moreton-in-the-Marsh, for two large pans of fine samples of the same chaste flowers. A group of flowers of border Carnations, sent by Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, obtained a Bronze Banksian Medal.

At a meeting of the Fruit and Vegetable Committee, a Silver Knightian Medal was awarded to Mr. G. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, for a capital collection of fruit, which comprised Melons, Peaches, Apricots, Apples, Plums, Cherries and Gooseberries, all of high quality.

A Silver Banksian Medal went to Messrs. T. Rivers & Sons, Sawbridgeworth, for trays of Early Rivers' Nectarines, and several grand varieties of Plums and Cherries.

Mr. Kelf demonstrated beyond question that he

could grow fruit as well as plants by staging an excellent collection of the former. Royal George Peaches, Grapes and Plums in variety were conspicuous by their excellent finish. A Silver-Gilt Knightian Medal was voted.

Messrs. Jas. Veitch & Sons, Ltd., had a large and highly meritorious exhibit of Gooseberries and Currants. Of the former there were a hundred dishes in as many varieties. Whinham's Industry, Langley Gage, Early Green Hairy, Champagne, Ironmonger, Langley Beauty, were some of the choicest of the dessert varieties, and these were in splendid condition, as also were such larger berried sorts as Legerdemain, Great Eastern, and Red Robin. There were twenty-five dishes of Currants shown, and the red varieties were undeniably good. Fruiting sprays of Currants were also on view. A Gold Medal was awarded this fine exhibit.

Messrs. Harrison & Sons, Leicester, sent a collection of Broad Beans. Messrs. Damman & Co., Naples, Italy, sent dwarf French Beans; and Mr. Wm. Carmichael, 14, Pitt Street, Edinburgh, had a dish of the new Strawberry Britannia.

A NOVEL SALAD.

A "BIRD'S NEST SALAD" is the latest addition to the menu of a fashionable dinner table. The white heart leaves of Lettuces are so disposed as to represent the nest itself, the requisite hollowness being obtained by curling the leaves. Several nests go to fill one big salad bowl. In each nest are placed five little speckled "eggs," made of cream cheese rolled into shape, and then sprinkled with finely-chopped Parsley. This is a quaint and rather pretty conceit.

QUESTIONS AND ANSWERS.

Will our friends who send us newspapers be so good mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Mushrooms Bored with Insects.—W. W.: In the neighbourhood of London, at least, it is a very common complaint for Mushrooms indoors to be infested with the grubs of a fly. Yours were bored not only in the stem but all through the top or edible portion. Unfortunately there is no cure for it, because the grubs are amply protected in the interior of the Mushrooms, as you will find by breaking one open. The grubs are small, white, active creatures. You will have to leave off growing Mushrooms indoors, at least, for a year or two during the summer months. You may make up fresh beds again in the same place next autumn without fear of being troubled with the insects. In the meantime, you might make up a bed or two of Mushrooms in the open air, under a north aspect wall. This can be done by taking out the soil and putting in a layer of horse droppings about a foot deep. Tread firmly, put in the spawn, and cover with a thin layer of soil. Some good Mushrooms are obtained in this way, when it is impossible to get them clean indoors. All the Mushrooms unfit for food ought to be burned to destroy the grubs.

Crucifer with Shrubby Thick Stems.—Sigma: The plant is *Raphanus Raphanistrum*, not quite typical of the plant as seen growing in our cultivated fields, though it is easily matched by Continental specimens. Usually the pods of our plant are not so distinctly jointed, this feature being more characteristic of *R. maritimus*. The latter has yellow flowers, and is biennial in duration with usually more divided radical leaves, but the biennial character is, perhaps, its most reliable point, though all are liable to be broken down by intermediate forms growing under different conditions. The mild and equable character of the Channel Islands is conducive to longevity and the shrubby character of which you speak.

A Beech with two Forms of Leaves.—A. C.: The deeply divided leaves are those of the cut-leaved Beech (*Fagus sylvatica laciniata*). It was most probably grafted or budded upon the common form of the Beech when young. The fact that the tree now carries two forms of leaves must be due to either one or other of two causes. The broad leaves may be upon branches springing from the stock, or they are the result of the cut-leaved form reverting to the original. You do not mention whether the tree is or is not budded or grafted; but you may depend upon it that such is the case. You should again examine the tree and ascertain whether there be any evidence of its having been grafted by a swelling or otherwise upon any part of the trunk. You could then determine whether or not the branches bearing the

broad leaves arise from the stock; if not, it must be a case of reversion, though we have never yet noticed it in the Beech. The latter would be a very interesting case, and we should be pleased to know what you make of it.

Groups of Cactus Dahlias.—William S. Watson: The schedule is rather loosely worded, but we should say that the common sense view of the matter would be that six and not eighteen are wanted, though the wording of the schedule might leave it open for the latter number. Instead of saying "six groups Cactus Dahlias, varieties, three in the group," we should have made it read "six varieties of Cactus Dahlias, three blooms in the group" (or bunch). If you were to put three varieties of Cactus Dahlias in each bunch it would give a mixed and bizarre effect; whereas if you put three blooms of one variety in a bunch there would be a more harmonising and effective display. We should say that this is really what is meant, and what we should do under the circumstances, and protest afterwards as to the wording of the schedule if the judges allow eighteen varieties to pass muster.

Geraniums and Pelargoniums.—W. M.: The schedule of your society must be very loosely worded even if we are to take the popular meaning; but we do not consider that show Pelargoniums would pass muster for zonals. We should take it for granted that the "best two Geraniums" would mean some or any variety of the zonal Pelargonium and think that is what is meant, from what we have seen or heard of the application of the word "Geranium." We should like, however, that gardeners and schedule makers would be a little more definite. A Geranium is quite distinct from any Pelargonium, and most of the Geraniums are hardy border flowers. Vesuvius, for instance, is a variety of Pelargonium zonale. The show Pelargoniums, as well as the fancies, have all been raised from *P. cucullatum*; the Ivy-leaved section from *P. peltatum*, &c.

Prices of Currants and Gooseberries.—W. M.: The half-seive of Red Currants at 5s. is the quotation we had from Covent Garden, so that we cannot dispute it. Half a seive of Red Currants weighs 12 lbs. That was the average wholesale price quoted on August 3rd. Some might have sold for less, some for more, according to the quality of the sample and the demand. Nothing is definite about the prices obtainable on any given day, so that only an average can be given. A half-seive of Gooseberries is 14 lbs., and the quotation for August 3rd was 2s. 6d. to 3s. per half-seive. On August 3rd, 1897, the price quoted for Red Currants was 4s. to 4s. 6d.; for Gooseberries 3s. to 4s., likewise per half-seive. On the same day Black Currants were quoted at 8s. per half-seive. These items for last year were furnished by a grower at some distance from London. The Gooseberries were then dearer than this year, but as the season was earlier, they must have been scarcer; hence the higher price. You state that the half-seive for different fruits in Glasgow is 24 lbs. and 28 lbs.; but that is probably a slip for whole seive, which would be on a par with Covent Garden.

Strawberries Certificated.—J. H. F.: As far as we have been able to ascertain the Award of Merit you mention is all that has been accorded to Strawberries at Chiswick this year. An Award of Merit has also been granted to a variety named Lady Sheffield, exhibited at the Drill Hall at the meeting previous to the last one of the R.H.S. A First-class Certificate was also awarded to Veitch's Prolific at a previous meeting at the Drill Hall, this being given chiefly on the score of prolific fruiting as expressed by the name and for flavour combined. The fellows are admitted to the gardens free every week-day, and the public can gain admission during the same days of the week at a nominal charge of 6d. The more we look into the matter the more apparent it becomes that soil and climate have a great influence upon the bearing of any particular variety and also upon flavour and other good points of a Strawberry. Even in different counties in the south-western and midland parts of England, the same varieties behave very differently. In some localities they do excellently, and in other parts with a different climate or rainfall they are practically a failure through the plants going blind, that is, in failing to produce flower stems. Strawberries are particularly troublesome subjects both in this country and in America, the plants often proving either male or female in the latter country, though their failure in some or other part of this country is entirely from some other cause, rather difficult to ascertain. The same might be said of Raspberries, Apples and Pears, though only in a lesser degree.

Names of Plants.—Plantarian; 1, *Rhoeo discolor*, often called *Tradescandia discolor* in gardens; 2, *Pteris cretica*; 3, *Fuchsia Riccartoni*; 4, *Escallonia punctata*; 5, *Escallonia pulverulenta*; 6, *Adiantum Capillus-Veneris* var.; 7, *Adiantum cuneatum*; 8, *Adiantum formosum*.—H.G.: 1, *Odontoglossum luteo-purpureum*; 2, *Odontoglossum Pescatorei*; 3, *Masdevallia harricana*; 4, *Dendrobium moschatum*.—A.L.G.: 1, *Veronica longifolia*; 2, *Veronica spicata amoena*; 3, *Veronica longifolia rosea*; 4, *Campanula rhomboidalis*; 5, *Corydalis lutea*; 6, *Lathyrus platyphyllos albus*.—T.B.: 1, *Polystichum aculeatum*; 2, *Polypodium Phegopteris*; 3, *Poly-*

podium Dryopteris.—H.C.: 1, *Daboecia polifolia*; 2, *Andromeda polifolia*; 3, *Genista tinctoria elata*.—E.C.H.D.: 1, *Mentha aquatica hirsuta*; 2, *Calamintha officinalis*; 3, *Apium nodiflorum*.

NEW HINTS
— FOR —
FRUIT GROWERS.

"A Year's Work on a Kent Fruit Farm."
1/- Post Free from the Publishers,
GEO. BUNYARD & CO., Maidstone.

SEEDLING STRAWBERRIES.

- 1. QUEEN OF DENMARK.**—Prolific bearer, medium size, unsurpassed in flavour.
 - 2. RICHARD GILBERT.**—Large in size, fine flavour, unsurpassed for market purposes; awarded a First-class Certificate R.H. Society, August 3rd.
 - 3. BRITANNIA.**—To be sent out for the first time, fruit medium size, delicious flavour, and the latest of all my seedlings; a great acquisition.
- The above three kinds are all standard kinds.
Queen of Denmark, £1 per 100; Richard Gilbert, £1 per 100; Britannia (new), £3 per 100.
Cheaper to the Trade.

William Carmichael, 14, Pitt Street, Edinburgh.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, AUGUST 20th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, August 23rd.—R.H.S. Show and committees at Drill Hall, Westminster, S.W.
THURSDAY, August 25th.—Shows at Wickersley and Boston.
FRIDAY, August 26th.—Show by R.H.S. of Ireland. Forfar Show (2 days).
SATURDAY, August 27th.—Falkirk Show.

GARDENS AND THE DROUGHT.—We are passing through a season of great surprises in the matter of climate; and no industry is sooner or more extensively affected by it than gardening. Early in the year and up to the end of February the weather was abnormally mild, with the result that many things in the open ground, both trees and soft wooded subjects, were much further advanced than desirable. Then followed a succession of cold and ungenial weather that continued more or less intermittently till well into June. Many things suffered in March and April to an extent from which they never fully recovered, including such things as Carnations and Roses, the latter suffering most of all in May. During the latter month and June, Strawberries were considerably injured by frosty nights, and cold ungenial winds, particularly the latter. The summer bedding plants suffered so much from the check, that many of them lost their best leaves, and besides being late in making a display, such things as Coleus remained in a naked and unattractive condition for weeks together, or never made a decent display at all.

As summer advanced great and sudden fluctuations of temperature continued at intervals, thus militating against the success of many things, by no means tender. It may afford some consolation to those concerned to know that similarly ungenial conditions have prevailed not merely in the south, but all over Britain. The early part of the season was more particularly notable for cold days and nights, and latterly for heat and drought, so much so that the crops which were late in June now promise to be considerably earlier than was anticipated. Italy and some other parts of the Continent, notwithstanding their supposed sunny skies and balmy nights, have had their share of climatic vicissitudes. The heat about the lakes of Como, Italy, has been excessive, but accompanied by violent thunderstorms and hail. Heat and storms have been equally excessive and violent at Naples, doing untold damage to the crops. Over the southern counties of England there has been a culmination of extremes, all within the space of a week or eight days. On the 7th inst., farmers and gardeners alike were rejoiced at the beneficial rainfall, which continued from 8 a.m. or a little later till nearly 5 o'clock in the afternoon. There was an absence of wind, and rain fell steadily and perpendicularly all day, but it was accompanied by a densely overcast sky and low temperature, so that the rainfall was the only blessing upon which we could count. On the following day (8th inst.) the lowest temperature in the shade was 45° and the

highest 54°, so that those not engaged in active work felt the need of a great coat, while fires were lighted in many dwelling houses, as well as the House of Commons. From that day till the 15th inst. the temperature kept rising rapidly, till it culminated in 85° in the shade, the minimum in the shade during the same day being 65°. Thus in the course of eight days there was a jump of 20° between the two minimum temperatures, and 31° between the two highest. In London itself the extremes are more severely felt than in the country, where a more or less perceptible breeze makes itself felt.

All the same the breeze is more conducive to the welfare of the people, gardeners included, than it is to plants in the open ground exposed to the full blaze of the sun all day, and to a high temperature at night. Even a heavy downfall would have been an advantage, but that has not been general for many days past. As far as Strawberries and bush fruits were concerned neither market nor private gardeners required rain; and such green crops as are already harvested give gardeners no concern; but the winter crops have yet to be established. Late sowings of Peas and French Beans, as well as other late summer crops, have yet to give an account of themselves. The flower garden on many dry soils, such as gravelly sandy, and chalky formations, require constant attention in the matter of watering; and in many establishments this has already become a problem. Apart from the labour attached to it all, there is the difficulty in getting water; for many of the wells and ponds or pools upon which gardeners have hitherto depended have dried up, or are almost drained of the last drop of their contents. This, of course, is due as much to the shortage of the annual rainfall as to the severity of the recent spell of drought. Even the steady rainfall of the 7th inst. did not penetrate the thirsty soil very deeply; while thunderstorms are often as productive of damage as of advantage, because the moisture runs away by the surface into the nearest drain or ditch, often washing away much of the soil with it.

The frequent recurrence of drought during the past decade might well impress upon owners of estates and gardeners the necessity of making more adequate provision against a deficiency in the rainfall, if they desire to have their gardens up to the standard of efficiency, or even capable of giving a satisfactory return for the labour and money otherwise expended upon them. Besides having sufficient work upon their hands in all ordinary seasons, gardeners have all this watering in addition; but when the pond or the pump fails it is impossible for many of them either to keep the flower garden gay, or the kitchen garden well stocked with vegetables. Means should be taken to ensure an adequate supply of water for all the more important garden crops at least, from an unfailing source. It would be possible in many establishments to make provision for irrigating certain parts of the garden, where the natural fall of the ground makes it possible to bring the water purely by gravitation or otherwise. A more recent innovation from America, and which has even been successfully conducted in this country, is the irrigation of important crops, such as Strawberries, by means of perforated pipes laid beneath the surface of the soil and between the rows of plants. Water applied on the surface has the ill effect afterwards of causing the surface to become baked and thus lose almost as much as it gains. Underground irrigation does not produce this result, and the water applied does not readily escape by the surface, because that is or should be covered by a non-conductive layer of dry soil. Gardeners might try this with advantage for various crops.

EDEN TENT.

6 ft. square.

A WORK OF ART!

For gardens, lawns, tennis and cricket grounds. Made from artistic striped tent canvas. No CENTRE POLE, allowing whole of interior to be used.
Complete with framework, lines, pegs, mallet and bag,
£1 17s. 6d. each.
If made with awning 10s. extra.
Carriage paid to purchaser's residence.
Lists, testimonials, and samples free.

A. POTTER, Tent Works, WOLVERHAMPTON.
Make to the Queen and Prince of Wales.

Royal Horticultural Society.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, August 23rd, in the Drill Hall, St. James Street, Westminster, 1.5 p.m. At 3 o'clock a lecture on "Perpetual Fruiting Strawberries" will be given by Monsieur Henry de Vilmorin.

A Vegetarian Experiment.—An orphanage is to be founded in Berlin, to be carried on strictly on vegetarian principles, for the purpose of settling the dispute as to the nutritive capacity of a vegetarian diet, by making a start at an early age. For this purpose a sum of money was left by Dr. Baron, late Professor of Jurisprudence in Bonn.

Royal Horticultural Society of Ireland—Final arrangements have been made for the show of this society to be held in Merrion Square on the 26th inst. Their Excellencies the Lord Lieutenant and the Countess Cadogan have intimated their intention to be present at the show in the afternoon. The band of the 1st Dragoon Guards will play during the afternoon and evening.

Rapid Growth of Potatoes.—"It's dreadfully queer," said the housewife, "that the Potatoes you bring should be so much bigger on the top of the basket than they are at the bottom." "Well mum," said the honest farmer, "it comes about this way. P'taters is growin' so fast right now, that by the time I get a basketful dug the last ones is ever so much bigger than the fust ones."

Syndical Chamber of Belgian Horticulturists.—The monthly meeting of this society was held in the Casino, Ghent, on the 7th inst., when the jury awarded Certificates of Merit for *Odontoglossum Adrianae* (crispum × hunnewellianum) var. M. Verdouck, exhibited by M. Maurice Verdouck; and to *Cyrtostachis Rendah*, shown by M. L. De Smet-Duvivier (with unanimity). At the same meeting Honourable Mention for culture was accorded to *Aralia kerchoveana*, presented by M. Ad. Alloncius; likewise an Honourable Mention for botany was given to *Selaginella proniflora*, presented by M. L. De Smet-Duvivier.

Shirley Gardeners' Mutual Improvement Association.—The monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday evening, 15th inst., Mr. W. F. Mayoss presiding over a rather thin attendance of the members. J. H. Aldridge, Esq., M.D., J.P., gave a most interesting and useful lecture on "Farm and Garden Insects and their Relation to Flowers and Crops." With the aid of lantern slides the lecturer was able to give the life history of those insects with which he dealt, and also to make his lecture very interesting. Some hints were also given as to the best time to destroy some of these pests, and the best means to attain that end. Mr. R. Beck assisted with a collection of beetles. On the conclusion of the lecture a hearty vote of thanks was accorded to the doctor, who expressed the pleasure it had afforded him to give the lecture. A vote of thanks was also given to the exhibitors for the display of fruits and flowers, with which they had brightened the room, and a vote of thanks to the chairman closed the meeting.

Phoenix Park, Dublin.—This splendid park, in addition to its miles of roads and turf rides, has features in its bedding that are specially worthy of a visit of all horticulturalists. Although not extensive in this department the arrangements are of a varied and interesting character; the bed of succulents in the centre of which stands the statue of George William Frederick, seventh Earl of Carlisle, is exceedingly pretty, the large fleshy limbs of many of the species utilised giving it a unique appearance. Begonias make a brave show; *Mme. O. Larmarke*, scarlet, proves a capital bedder for its free blooming qualities; *B. superba* is another fine scarlet with flowers of medium size and of good substance. Standard Heliotropes, some three feet in height, with stems over an inch in diameter, show that they have been carefully tended for a number of years, and give a fine effect, standing well above the dwarfer flowers of more brilliant colouring. The rock garden with its pools of water, and Palms that appear to have withstood the elements of many winters are well worthy of a visit to all lovers of nature. —R. G. W.

The Oaks, of Magdalen, Oxford, that Macaulay lauded so highly, proved to be Elms upon casual inspection.

Kew Notes.—Gentleman, showing his friends round: "This is the Holy Anna Plant" (Oleander). Lady, pointing to *Drosera rotundifolia*: "This is the Sensitive Plant."—After a pause: "Have you been into the wood house." (She meant Wood Museum.) —Patterson.

Tintern Abbey.—This fine old abbey and attached estate has been nominally in the market for some little time, but the Marquis of Worcester is hanging back from setting a price upon it. The proposal has been mooted that part of this fine Monmouthshire estate should be purchased for public use, but the proposal has not yet taken definite form.

A 160 Guinea Ring in a Tomato.—In a thickly populated part of Hull, says the evening paper of that town, an urchin picked up a Tomato and commenced eating it till something hurt his teeth. He dropped the hard substance on his hand, and lo, it was a ring, which he took home to his mother, who, seeing something flashing with brilliancy, took it to the jeweller to ascertain its value. That worthy assessed its value at 150 guineas. How did the milk get into the cocoon?

Crimson Rambler Rose an Old Acquaintance.—The current issue of the *Revue de l'Horticulture Belge* points out that the supposed new Rose, Crimson Rambler is in reality an old friend. In 1886 M. Cochet introduced it to France. It was figured in the July number of the *Journal des Roses* in the same year under the name of *Rosa platyphylla*, and appears to be synonymous with the *Rosa multiflora coccinea* which it bore in the year 1815, when some seeds of it were brought to Europe. Following M. Cochet came a Japanese student, M. Takasima, at the Nancy School of Forestry, who brought it to the notice of M. Sisley, of Lyons. In Japan, Crimson Rambler is called *Sakoura-Ihara* (rose-cerise) and there are numerous varieties of it in existence. One of the best is *Cramoisie* which was put into commerce by Mr. Chas. Turner.

Self-Irrigation in Plants.—The Rev. Alex. Wilson, M.A., B.Sc., continues his interesting remarks upon this subject in the current issue of *Knowledge*. The case of the Fuller's Teasel is instanced as one of the best established cases of imbibition, the plants being provided with "leaf-cups." The leaves of the Teasel are arranged in pairs, the broadened base of each leaf uniting with that of its neighbour to encircle the stem, and form the "leaf-cups." Silphium, a member of Compositae, also has "leaf-cups," whilst many epiphytic Bromelias and Tillandsias retain quantities of water in their expanded leaf bases. Of this water a portion is imbibed by means of thin-walled cells. The writer next goes on to consider the Chickweed, and attributes in large measure the rapidity with which it spreads over the garden to its very complete system of self-irrigation. Here again the sheathing bases of the leaves form "leaf-cups" in which the water collects. The leaf stalks are channelled, but the stems are not, the water being conducted from one "leaf-cup" to another by a line of deflexed, easily wetted hairs, which the writer considers are meant to act as water conductors. Each hair consists of several cells filled with protoplasm. In a dry condition the walls of the basal cell present a striated appearance, and this has caused Kerner to assign to them an absorbent function. The Rev. A. Wilson, however, points out that this can hardly be, for the cells are not directly connected with the vascular system. The water and particles of earth that collect in the "leaf-cups" conduce to the formation of roots, and the hairs serve to conduct water to these roots. Another interesting fact in the connection between the row of conducting hairs and the axillary buds, the former being placed on the same side of the stem as the axillary bud immediately below them. Aquaducts consisting of lines of hairs similar to those found in the Chickweed are to be seen in a number of other plants, including the Germander Speedwell. The Rev. A. Wilson thinks it not improbable that the rootlets of the Chickweed take up nitrogenous compounds dissolved in the water accumulated in the "leaf-cups." Several excellent cuts illustrate the writer's remarks, which, however, are exceedingly lucid throughout.

Asparagus grows wild, but sparingly, on some of the British coasts. On the Russian steppes it is so abundant that cattle eat it like grass. The seeds are used as a substitute for coffee in some parts of southern Europe.

A Lady Gardener in the Emerald Isle.—A military officer's wife was wandering in her husband's garden one day, and, seeing a spade, conceived the idea of digging up some Potatoes with it to see what the work was like. Her husband's servant, an old soldier and a Scot to boot, walked down the garden path. With a smiling countenance she looked up and asked, "Don't I dig these well, Sandy?" "Mebbe you were reared till it," was the Scot's reply, as he passed on to his work.

Public Park, Widnes.—The first prize of thirty-five guineas in the public competition for the best design for laying out the Appleton House Estate as a public park, has been awarded to Messrs. Wm. Barron & Son, Elvaston Nurseries, Borrowash. The area of the park is about 36 acres, and in addition to the general plan of the park, which contains a lake, cricket and recreation ground, and lawn tennis grounds, bowling green, gymnasiums, &c., they also furnish three alternative plans for dealing with Appleton House and premises; also designs for entrance gates, bandstands, shelters, fountains, &c.

Primeval Vegetation.—Lord Kelvin says there is not more than three hundred and forty million million tons of fuel in the earth, and says that this is the exact amount because all the oxygen of our atmosphere came from primeval vegetation. One ton of coal takes three tons of oxygen to burn it, and therefore its vegetable originals, decomposing carbon dioxide and water by the aid of sunlight, gave three tons of oxygen to the atmosphere. Every square metre of the earth's surface bears ten tons of air of which two tons are oxygen. The whole surface of the earth is one hundred and twenty-four thousand millions of acres; hence his reasoning.

National Co-operative Flower Show.—The "One & All" Flower Show to be held at the Crystal Palace on Saturday next, in connection with the National Co-operative Festival, promises this year to exceed even the gigantic proportions of previous years. Last year it will be remembered that the Crystal Palace authorities were unable to find accommodation even in their great building both for the Victoria Jubilee Exhibition and this great annual industrial flower show at the same time, and the flower show had to be housed in a gigantic tent, over one-tenth of a mile long, and the whole width of the great terrace of the Palace, specially erected for its temporary accommodation. This year, however, the "One & All" show is able to get back to its old quarters, where it will fill the whole centre of the Palace from end to end. The enthusiastic horticulturist who intends to conscientiously inspect every exhibit should be warned that if he is to walk down each side of all the long tables he will have over a mile to walk before his task is accomplished. The competition for the Challenge Cup, instituted this year by the Countess Grey, promises to be very keen, the entries in the industrial section being heavier than usual, we are informed by Mr. Edward Owen Greening, the Hon. Sec. The two classes for Vegetable Marrows in this section exceed 50 entries in each class; there are over 175 entries for the four classes of Potatoes, the other entries of vegetables being in equally remarkable proportions. But in addition to the large entries for the commoner kinds of vegetables usually grown by working men, the entries in the classes for the choice vegetables usually grown by well-to-do amateurs and professional gardeners, such as Tomatos, Celery and Cucumbers, are remarkably well filled, and the interesting comparison between the produce of these simple amateurs and the better equipped gardeners of the second section of the show has by no means in previous exhibitions always been to the advantage of the latter. More room has had to be found for the growing photographic section, which will move across from the Italian Court to the larger Egyptian Court near the main entrance. The hints which this pictorial exhibition enables one horticulturist to convey to another as to the arrangement of small town or gardens, the greenhouse, the window box, hanging basket, rockery, or other objects not readily movable, are most instructive, and form a feature entirely lacking in the usual exhibitions confined to the more portable fruit and vegetables.

Too much Expected.—Clergyman to groom-cowman-gardener who has brought a dirty trap to the front door: "Johnson, I must insist that you keep the pony and trap cleaner."

Johnson: "Well sir what with 'ortayculter' and the cow I ain't got much time for 'ossyculter'."—*Punch*.

Scottish Sporting Rents annually amount to a very respectable figure. The seventy estates upon which red deer are to be found, and of which the shooting rights are to be purchased represent an aggregate rental of £109,300 from last year's returns. In the county of Inverness alone the sporting rents of the first twenty estates on the lists of one of the large agents reached £10,000, whilst the first ten estates totalled a value of £26,000.

The Queen Elm of New England, so named by Oliver Wendell Holmes, was one of the handsomest in Springfield until it was killed by gas or the steam heating pipes. The tree stands in front of Elm Tree School, and was taken possession of recently by a swarm of bees. It is very unusual for "bee trees" to be found so near civilisation as the heart of the city. The intention is to have the defunct tree cut down in the autumn.

Haymaking in a Wet Season.—The methods of making hay pursued by our farmers do not vary to any extent whether the season be wet or fine, bad or good, for it has been proved through long years that we generally get enough of sunshine to admit of the hay being properly cured under the working of our present system. In Norway and Sweden, however, according to Mr. John Speir in "*The Transactions of the Highland and Agricultural Society*," other methods are followed, and good hay is thereby procured in these northern latitudes even in the wettest season. When the hay gets to the stage at which, in England, it is "cocked," the Scandinavians erect rows of poles at convenient places in the meadows and by means of ropes tied to these uprights the hay is suspended in layers of about 18 in. in depth, one above another. The ropes are so arranged that the layers just touch each other, and thus while rain is excluded air is freely admitted. Mr. Speir has tried the method and found it answer capitally, not only for ordinary hay but also for making sewage-dressed grass and the second cut of Italian Ryegrass into hay. He therefore recommends farmers to have recourse to this method in wet and unfavourable seasons.

SIDBURY MANOR, EAST DEVON.

SITUATED on the summit of a hill commanding extensive views on either side, four miles from the sea, stands this well built mansion, almost surrounded by a little town of glasshouses, which can be seen for miles, especially when the sun is shining. The wind from the north-east is very treacherous at times here, blowing right out to sea, some of the Conifers exhibiting signs of distress from this quarter. The putting out of summer bedding plants cannot be taken in hand until the month of June, as with us, and the soil being of a heavy texture it takes some little time ere the plants take kindly to it; but when once the plants are established it withstands the drought better than soil of a lighter nature similar to ours at Bickton. We patrolled the houses first, where all was thriving and clean. Tidiness was the order of the day in each department. One house was filled with Challenger Tomatos in 9-in. pots, heavily laden with fruit, some few clusters carrying as many as twelve and fifteen in various stages of maturity.

The early vinery had just been cleared of its crop, and the hard, nut-brown wood indicated that some good bunches (Hamburghs) had been taken from the Vines. Against the back wall two good plants of Pelargonium Raspail and Candidissimum plenum that had been in flower ever since March, and still in the middle of July are in full bloom. They are very useful to cut from in early spring, where double flowers are not objected to. The Muscats were extra fine in bunch and berry. Madresfield Court has medium-sized bunches with good berries, jet black, and not one showed the least sign of splitting. What do growers say to this who tell us it cannot be grown to perfection unless given a house to itself? The late Hamburgh house, just beginning to colour, had a heavy crop of medium-sized bunches. The

latest house contained nice bunches that had every appearance of finishing up well, the varieties being Gros Maroc, Gros Colman, Appley Towers, and Lady Hutt. The two last-named are thought highly of by Mr. Reynolds, the gardener.

Two fine clusters of Bananas I noticed in two separate houses. A batch of trees of the recently certificated Orange, Edith Cave, was carrying many fruits which are used for dessert, and are much esteemed by Sir Charles Cave, Bart. The Cucumber and Melon house had excellent crops. The first-named had remarkably fine fruits of Rollinson's Telegraph. Half a dozen Melon plants averaged five fruits on a plant of good size; the major part would average 6 lb. each, Earl's Favourite being the variety. Peaches under glass are retarded as much as possible, a quantity being required during August and September. The Fig house looked promising for a second crop.

A fairly good number of Orchids are grown here, Calanthes and Dendrobiums looking strong, and Oncidium jonesianum carrying a spike of fifteen flowers. One house is devoted to Crotons and Dracaenas, and no shade is afforded. This treatment suits the Crotons, but evidently not the latter. Several Acalyphas enjoyed the full sun, being of a most lovely colour; while outside I remarked a fine batch of Kalosanthes coccinea, fifty pots carrying good heads just about to expand. The Chrysanthemums, to the number of 500, looked well, and should yield good returns later on. Celosias, too, are always well done here, and showy things they are for early autumn work.

The kitchen garden had felt the drought, but was well cropped. The bush and pyramid Apples had an average crop, as well as Pears, principally against the wall. Plums and Peaches are scanty, though the latter look clean and healthy, and it is to be hoped the spring will be congenial to them another year when in flower. To show how mild the late winter has been two very large Ivy-leaf Pelargoniums against the gardener's house, had stood out unprotected, and were a mass of bloom at the time of my visit.—*J. Mayne, Bickton, East Devon.*

EMPLOYMENT OF MANURE IN HORTICULTURE.

By MESSRS. A. HERBERT AND G. TRUFFAUT.

THE production of flowering plants and ornamental shrubs having become a regular industry the questions of time and yield are now of the greatest importance. To rapidly obtain fully developed plants employment of manure is indispensable, but not in excessive amounts, which would be injurious from the horticultural point of view. Thus the Cyclamen growing in moderately manured soil gave an abundance of well developed flowers, whereas the same plants grown in excessively manured soil degenerated, and produced leaves to the detriment of flowers.

The authors employed manure in the culture of a good number of ornamental plants. Plants of Dracaena Bruanti were amongst the varieties giving the best results; they were grown in pots, ten centimetres high, containing 330 grammes of leaf humus. The experiment began with slips of twenty-five to thirty centimetres long. Only part of the plants were manured, the rest being kept for comparison. Preliminary analyses of these plants led to their being manured during the experiments with twenty-five grains of a mixture of nitrate of potash, ammonium chloride, phosphate of ammonia, sulphate of magnesia, sulphate of iron, as follows:—Nitrogen, 3.06 grs.; sulphuric acid, 3.91 grs.; potash, 7.39 grs.; magnesia, 1.06 grs.; chlorine, 0.72 grs.; oxide of iron, 1.08 grs.; and phosphoric acid, 1.45 grs.

The experiment lasted nine months (March to November), the plants being kept in a conservatory without repotting. The effect of the manure was clearly visible very shortly after the beginning of the experiment and became more and more marked. The plants were much stronger and more verdant than the others; their stalks more turgid, harder and more woody; the roots more developed but not proportionally with the aerial parts. The market value of the plants, which was about two francs, became double after the employment of manures.

The weighings and analyses of both sets of plants gave the following average figures for centesimal or total composition of a plant.

| | Dry extract per 100. | | Composition of an entire Dracaena. | |
|----------------|-----------------------|-------------------|------------------------------------|----------|
| | Dracaena not manured. | Dracaena manured. | not manured. | manured. |
| Total weight.. | — | — | 260 | 480 |
| Water | — | — | 187 | 349 |
| Dry extract .. | — | — | 73 | 131 |
| Organic matter | 82.50 | 81.89 | 60.23 | 107.28 |
| Ash | 17.50 | 18.11 | 12.77 | 23.72 |
| Nitrogen | 2.20 | 2.72 | 7.60 | 3.56 |

| | CENTESIMAL COMPOSITION OF ASH. | | | |
|-------------------------|--------------------------------|-------------------|--------------|----------|
| | Dracaena not manured. | Dracaena manured. | not manured. | manured. |
| Silica | 71.50 | 71.65 | 9.13 | 16.99 |
| Chlorine | 2.71 | 2.37 | 0.34 | 0.56 |
| Sulphuric Acid | 3.44 | 1.89 | 0.43 | 0.44 |
| Phosphoric Acid | 2.98 | 2.49 | 0.38 | 0.59 |
| Oxide of Iron | 2.10 | 2.59 | 0.26 | 0.61 |
| Alumina | 0.05 | 0.51 | 0.006 | 0.12 |
| Lime | 6.04 | 6.83 | 0.77 | 1.62 |
| Magnesia | 1.40 | 1.05 | 0.17 | 0.24 |
| Potash | 8.70 | 8.70 | 1.11 | 2.06 |
| Soda | 0.68 | 1.27 | 0.08 | 0.60 |
| Oxide of manganese | traces. | traces. | traces. | traces. |

The centesimal composition of the manured plants and others is exactly the same except for sulphuric acid, alumina and soda; but the final weight doubled in manured plants, both in the mineral and organic substances built up by the plant. Assimilation did not change relatively, but doubled absolutely. All the constituents of the manure improved the plant except sulphuric acid, which seems of slight importance. The plants having their subsistence amply assured were able to assimilate more silica, alumina, lime and soda, elements contained in excess in garden soils or water supplied to the plant. This example clearly illustrates the increased production to be obtained by judicious employment of fertilising substances. Similar experiments give equally good results with the following plants:—Chrysanthemum, Hortensia, Kentia belmoreana, Adiantum, Corypha australis, Latania, Anthemis, Dracaena (various), Medeolus, Areca sapida, Ficus elastica, Pandanus utilis, Asparagus (various), Fuchsia, Phoenix, Begonia Rex, Heliotrope and Rose trees.

FRUIT GROWING AND STUDY IN VICTORIA.

MR. HAMISH W. RUSSELL, at present studying horticulture, but particularly fruit growing, at the Government Horticultural College at Burnley, Victoria, is a grandson of the late Mr. James Russell, for a long time gardener at Pottaloch, Lochgilphead, N.B. In a letter, amongst other things, he writes to us as follows, showing the great necessity for untiring industry even in that comparatively young country:—

"I recently built a dingy in which I go to the outer reefs for shell-fish and do a little fishing. I never saw one being built. A general all-round knowledge is what is required here.

"You are aware that I attend the Government Horticultural College at Burnley. Mr. Luffmann is our curator; Mr. McAlpine, Government pathologist; Mr. French, Government entomologist; and Mr. Pearson, Government agricultural chemist. During the mornings students do practical work, and in the afternoons attend lectures given by either of the foregoing, or Mrs. Luffmann, who takes a great interest in the 'boys,' and gratuitously delivers lectures and gives instruction in different subjects.

"Our daily duties are 'listed,' and arranged so that we may each acquire a thorough knowledge of practical work, which is explained and supervised (under Mr. Luffmann's directions) by a practical and experienced gardener. One of the men is a son of the late curator, Mr. G. Neilson, Government fruit expert. Digging, trenching, ploughing, making cuttings, budding, grafting, inarching, pruning, planting trees, spraying, drying fruit, bottling fruit, packing fruit, examining fruit for export, fumigating diseased fruit trees, making cider and vinegar, grading, levelling, draining, the proper application of manures, &c., are among our daily duties.

"At present we are grading and levelling a part of the old orchard for a new Citrus plantation. The growth of the Citrus family is to have special attention at the college, and it will be a grand object lesson for old students who took part in its formation to revisit the scene of their labours and note the advance made, and the result of experiments with different varieties and methods.

"The Orange grows well in the colony of Victoria. In the Mildura and Wangaratta districts plantations

have been very successful. The trees are planted on the quincunx system about 20 ft. apart, preferably on slightly sloping ground. Drainage is not required on light soil with gravelly bottom; but where there is a clayey sub-soil drains are made two feet deep, and as required, either between each row or between every alternate row. Irrigation is sometimes resorted to. When flagging takes place, special drains or shallow trenches are made, and filled with water.

"Lemons grow further south, and, like Oranges, require a northerly aspect and sandy, loamy soil on a sandstone or limestone bottom. They do well in almost any well-drained soil. Humus is added where the ground is poor. Wood ashes are considered valuable. The ground is better if not too rich. Fungi and insects must receive constant attention, and proper pruning and careful management of the soil are imperative. Attention must be paid to mulching with stable manure, and care taken to avoid disturbing the roots, and that no stagnant water is allowed to sour the soil. As one mulching becomes exhausted another is applied. Grass is used for mulching, but is used only as a substitute for stable manure.

"Collar-rot is very troublesome in some districts. Mr. McAlpine has discovered the mycelium of a fungus in this 'rot,' and recommends an application of Bordeaux mixture.

"Where adequate protection is not provided, growers avoid tall trees, for north winds and other gales play havoc with them. Trees are grown more like shrubs, and pretty thick, to protect them from the heat of the sun. The lower branches are grown about 2 ft. from the ground. Mulching manure is not allowed to touch the trunks.

"The 'Parramatta' Orange and the 'Lisbon' Lemon are found most profitable in Victoria.

"Further on I may drop you a few lines, but meantime I do not seem to have the time to write at any great length.

"After Christmas, when I finish my college career, I am going into the country to rough it and get practical experience. Then I hope to visit you, and spend at least twelve months 'at home,' working and getting further experience. After that—well, I may do anything."—*Hamish W. Russell.*

BELGIAN NURSERIES.

(Concluded from p. 795.)

X.—M. VINCKE-DUJARDIN, BRUGES.

The famous nursery conducted by M. Vincke-Dujardin is situated within ten minutes' walk of the railway station at Bruges, and is just outside the canal that surrounded the ancient city. On entering the nursery, the first thing that strikes the visitor is the magnificent collection of pyramidal and standard Bays (*Laurus nobilis*), which appear like a little forest in front of the dwelling house; and from thence extend in three avenues right through the nursery. This is practically the metropolis of the Sweet Bay in Belgium, or for the matter of that the whole world. Europe is mostly supplied with Sweet Bays in tubs from Belgium, and a very large proportion of the whole originate at Bruges. Most of the outdoor space of the nursery is occupied with forests of these Bays, grown by thousands in tubs. Just outside the proprietor's house are some of the patriarchs of the establishment ranging from 150 to 170 years of age, rivalling the pigmies of the Japanese in age, but not in miniature decrepitude. On the contrary they are pyramids of real beauty, even if somewhat formal. They are housed in winter in large tiled houses, some of which are used as packing sheds in summer when their occupants are stood in the open air. The Bays exist in all sizes, and some of the old giants fetch very long prices.

ORCHIDS.

Orchids and Palms are the two other specialities of the establishment, and monopolise the village of glasshouses. There are something like twenty-seven Orchid houses alone, of which twenty are devoted to *Odontoglossums*. They vary from 75 ft. to 90 ft. in length, and all are built in the span-roofed style, but connected in blocks with a continuous interior space and a uniform temperature throughout. The first house we entered was filled with healthy, robust and clean plants of *Odontoglossum crispum* and *O. Pescatorei*, grown for the sake of cut flowers as well as for the sale of the plants. The next and several other houses were similarly occupied on the occasion

of our visit; and the day being bright they were shaded with lath blinds.

Proceeding to other houses we found quantities of *O. ruckerianum* and *O. Pescatorei*. A fine variety of the former was richly spotted all over with brownish-purple. Pretty also were fine varieties of *O. Pescatorei*, tinted with rose. The favourite of all is evidently *O. crispum*, for house after house is filled with it, some of the varieties being of excellent quality, with shapely, well imbricated flowers, both white, rosy tinted and blotched. Another house contained hundreds of *Ada aurantiaca*, also *Oncidium spilopterum*, *Odontoglossum polyxanthum* and *O. Rossii majus*. Well coloured varieties were *Odontoglossum crispum roseum*, *O. c. ruckerianum*, and *O. c. andersonianum*, the latter being a variety with nearly brown sepals and very finely spotted petals. Alongside of them *O. odoratum* and *Cymbidium lowianum* were also in season. We passed through several houses in succession filled with little else than *O. crispum* growing vigorously or flowering healthy and strong. Amongst *Oncidiums* there were grand pieces of *O. luteo-purpureum*, *O. luteo-purpureum sceptrum*, *O. marshallianum*, and beautifully clean they were. They are largely grown for the sake of cut flowers which are sent to France, England, Germany, Russia and Sweden, by hundreds of spikes. Something like 80,000 plants of *Odontoglossum* are grown, and that will give some idea of the resources at hand for cut flowers.

Cattleyas are also rather extensively grown; *C. citrina* being then in the height of its glory. The young pseudobulbs of *Oncidium marshallianum* attain a much larger size than those that were imported. Both this and *O. varicosum* Rogersi were strong and flowering grandly in baskets as well as upon rafts. A large quantity of *Cattleya labiata* put in pots, and also fixed on short rafts, having their ends inserted in pots, about ten or eleven months previous to our visit had become well established, being well furnished with leaves and commencing to grow a second time. About 2,000 flowers were cut from them last Christmas, and a second batch of 3,000 flowers in January.

A houseful of *Laelia anceps* was in grand condition, an importation having been made about seven years ago, when the pieces were put in pots and baskets. They have had nothing but supplies of water since, and we could not but admire the grand condition and health of every plant. Each pot or basket carried from seven to ten flower spikes last autumn. In another house close by *Laelia purpurata*, *L. elegans* and *Cattleya amethystoglossa* were flowering freely. Of the latter there were some finely spotted and richly coloured varieties, the latter bearing large spikes of bloom. A houseful of *Cattleya Mossiae* was at that time in sheath.

House after house lay in our path all completely devoted to Orchids, grown practically in a wholesale way, and their condition showed that M. Vincke-Dujardin, fully understood their culture. The fine orange blotch in the throat of *Cattleya Schroderae* was very conspicuous. Fine also were *C. Mendelii*, *C. gigas*, *Oncidium sarcodes*, *Miltonia Roezlii*, and *Odontoglossum vexillarium*, the latter just developing its flower spikes. The next house contained flowering plants of *Cattleya Mendelii*, *Vanda suavis*, and *Oncidium ampliatum majus*, with which no fault could be found.

A houseful of *Cypripediums* next engaged our attention, but we noted only some of those in bloom. Very fine were *C. barbatum superbum*, *C. lawrenceanum*, *C. callosum superbum*, *C. superciliare*, *C. superbiens*, and *C. Argus Moensii*, of the latter of which the flowers were handsomely blotched. Next to this came a houseful of *Vanda suavis* and *V. tricolor*, in plants of various heights, but all in robust vigour and flowering splendidly. Some of the varieties were handsomely spotted. Two houses were also filled with *Cattleya labiata*, newly imported.

PALMS.

Not having received the measurement of the glass-houses it would be difficult to say whether Orchids or Palms occupied the greater amount of house-room, though we believe the Palm ought to be given the latter, for some of the buildings were of enormous size and crowded to their utmost capacity. A block of seven houses was filled with *Kentia belmoreana* and *K. fosteriana* in 60-size and large 30-size pots, fit for decorative purposes. We next came upon a block of twenty houses, each 150 ft. long, and completely filled with Palms. Conspicuous

amongst them were *Kentias* of various sizes; *Latania borbonica* in healthy, vigorous specimens of all sizes; a fine lot of richly-coloured *Cycas revoluta*; and *Phoenix tenuis*, in plants 2 ft. to 3 ft. in height. The specimens of *Dracaena Doucetti* were 4 ft. to 5½ ft. high, and pictures of healthy vigour, and handsomely coloured.

Another gigantic block of five houses of wide span, entirely devoted to Palms, was shaded with lath blinds, which break the fierce rays of the sun, and ensure a healthy, dark green colour to the foliage. In this structure we noted *Cocos weddelliana*, *Rhaphis humilis*, *Kentia australis*, with beautifully arching fronds, and *K. dominyana*, a graceful tree, having long arching fronds and flat pinnae. Next the path, the leaves of the large *Latanias* had been tied up to allow free movement to visitors while moving through the houses.

Six other buildings were devoted to Palms of various useful kinds. Conspicuous amongst them were fine specimens of *Chamaerops humilis*. In the same house were handsomely furnished specimens of *Araucaria excelsa*, 3 ft. high. *Kentias* in 48-size pots filled another structure. Then came *Chamaerops excelsa* and *C. humilis*, monopolising a similar amount of space. *Latanias* filled two other houses; and a houseful of *Corypha australis* completed our inspection of an extensive glass nursery, kept up to a high standard of excellence under the watchful care of M. Vincke-Dujardin and his son.

CARNATIONS FROM MONTAGUE NURSERIES.

It is now late in the season for Carnations in the South of England, but a boxful of fine, named, border varieties reaches us from Mr. F. Gifford, Montague Nurseries, Tottenham, N. The size and colour of the flowers were wonderful for this late period of summer, and the vigour of the plants was evidenced by the size and number of the flowers borne upon each stem. Of course, Mr. Gifford knows well what is required in border Carnations, and does not disbud them. He is also a raiser, and has put many fine things into cultivation, including some delightfully scented ones.

Amongst those sent were two maroon-crimson varieties named Mr. John Hare and Pelham, respectively, the latter having very smooth and refined petals. Amongst the scarlet varieties was the Clove-scented Cantab, so highly appreciated by lovers of Carnations generally. An unapproachable fiery-scarlet is W. J. Fish, and an abundant bloomer. Florida is a large, bold flower. Senior Wrangler is powerfully scented, brilliant scarlet, and an advance on Cantab, being new for 1898. The rosy-scarlet Mark Welford produces flowers 3½ in. across. Andrew Noble is in the way of Endymion, but brighter rose and marbled. The flesh-coloured Dorothy Drew has petals of great substance. Edith Leadenham is a handsome white variety, with remarkably stout stalks that require no wiring for decoration purposes, as the flowers stand up stiffly. Hon. Harry Escombe we believe to be the finest golden-yellow Carnation in cultivation, the colour being rich, the flowers large, the calyx not splitting, and the plant hardy and robust.

Pandora seems to be a new colour, being of a rich salmon-red, the darker colour forming water lines, as it were, through the petals. A very pretty soft, but warm salmon is that named Cinnamon, the colour being attractive and not too common. The yellow ground Picotees in Mr. Gifford's collection are fairly numerous, and some of them extremely pretty. A cheerful and attractive flower was that named Dora, a light scarlet-edged variety. Mrs. Julian Storey is also a bold and handsome flower with a heavy red edge, and the colour running in lines and streaks down both surfaces of the petal. The other yellow grounds had much more colour corresponding to what would be termed fancy varieties. That named Julian Ralph is bold and free, erect on stout stalks, and thickly lined with bright scarlet. Father Rigg is heavily lined with rich crimson from the margin inwards, and is a magnificent variety. Atbara is another of the same colours, but the crimson markings are chiefly confined to the margin and centre of the petals. One of the prettiest of these fancies is Fantasy, a broad light purple-edged variety of beautiful form, and not liable to burst the calyx. It stood out very distinctly from all the rest. Very distinct in its way also was

Rhodesia, flaked with purple, and occasionally crimson, on a buff ground.

Other types included Walter Peart, a deep shade of rosy-pink, and Comic, a large and showy, bright rose flower. A fancy Carnation of quite another type is Mrs. C. W. Townley, heavily margined and lined with maroon-crimson. Col. Chard is marked in the same way with dark purple, and is certainly good of its kind. The dark purple of Surgeon Hugo is arranged in slender lines very closely placed, and occasionally covering the greater portion of the petal on both surfaces. The blooms in their prime grow to an immense size, making a good fancy or decorative flower. All were cut from the open border, and included many highly refined varieties. Stoker Lincoln is deep red, flaked with maroon.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE STRAWBERRY MEETING.

AT the August meeting of this association, a very cordial vote of thanks was awarded to the president, Mr. M. Todd, for the successful way in which he had organised and carried out the recent Rose and Strawberry meeting. This gathering, a report of which we have not hitherto had an opportunity of giving, was held on July 20th, and proved in every way a highly interesting and successful function. Last year, on the initiative of the president, the first Strawberry meeting was held in the Rooms where the usual monthly meetings of the society take place, and proved so welcome an addition to the ordinary programme of the association's proceedings, that it was repeated this year on a more extensive scale. Advantage was taken of the liberal offers from leading growers of Roses, herbaceous plants, &c., to make a "Bijou" Flower Show of the meeting which was transferred to the Albert Hall, Shandwick Place (the *locale* of one of Mr. Gladstone's most noted speeches), and opened during the afternoon to the public, free of charge, a boon which was largely taken advantage of.

Splendid exhibits of Roses were contributed by Messrs. Thos. Smith & Sons, Stranraer; Mr. Hugh Dickson, Belfast; Messrs. Croll & Sons, Dundee; and Messrs. Robertson & Co., Helensburgh. A very beautiful exhibit of herbaceous plants and Roses was made by Messrs. Cocker & Sons, Aberdeen, containing many choice and desirable things. Herbaceous plants came from Mr. M. Cuthbertson, Rothesay; and beautiful exhibits of Sweet Peas from Mr. H. Eckford, Wem, and Messrs. Dobbie & Co., Rothesay.

Beautiful exhibits were made also by the Edinburgh trade growers. Messrs. Laird & Sons made an elegant and interesting display of decorative plants on the platform of the Hall, showing the richness of their nurseries in decorative materials. Mr. John Downie exhibited a beautiful table of new and choice plants, including *Acalypha sanderiana*, which had not been previously seen in Edinburgh. Messrs. Dickson & Co. exhibited a lovely table of Violas, Pinks, herbaceous plants, &c. Messrs. Grieve & Sons had a nice exhibit of Violas, Ferns and Palms. Table decorations were contributed by Messrs. Todd & Co., and Messrs. Ford & Co. There were no competitive awards, but special certificates were given to the leading exhibits.

The Strawberry table was a most interesting one, and proved a great source of attraction to visitors and members. Over a hundred dishes were shown in about thirty leading varieties. Mr. Dunn, Dalkeith, had a very choice collection, the most notable kinds being Royal Sovereign, Scarlet Queen, and British Queen. Beautiful exhibits were also made by Messrs. Smith, Oxenford Castle; Smith, Hope-toun; Kirk, Alloa; Temple, Carron House; McIntyre, of the Glen, whose Glen Diamond was greatly admired; King, Castlemilk, &c., &c. At the evening meeting of the members of the association there were about 120 present, and a short discussion took place on the Strawberries of the season, and the merits of the varieties exhibited. At the conclusion of the meeting votes of thanks were cordially accorded to all who had contributed to the success of a most interesting meeting, and the proceedings terminated by those present partaking of the liberal supplies of Strawberries with the addition of sugar and cream.

PLANTS RECENTLY CERTIFICATED.

THE undermentioned received certificates from the Royal Horticultural Society on the 9th inst.:—
Orchid Committee.

SOBRALIA SANDERIANA. *Nov. sp.*—This is a recently imported species, bearing flowers of large size. The sepals are tinted with the palest lilac hue on a white ground, the petals being of a darker or a more decided lilac. The lamina is bifid and of a rich purple, shaded with pale brown. The throat is yellow, with a clouding of brown, extending right down into the tube, the extension of which is lilac. Award of Merit. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham.

VANDA (STAUROPSIS) BATEMANII.—Not very often do we see this peculiar species in flower, and less seldom is it exhibited in public. The sepals and petals are rather fleshy, wavy at the margins, spatulate, and yellow, spotted all over with crimson. The lip is concave at the base, resembling a slipper, and the basal lobes are more or less coloured with white, yellow and brown, while the upper portion is very thick, fleshy, turned up at the points, and rich purple, fading to red. Award of Merit. T. B. Haywood, Esq. (gardener, Mr. C. J. Salter), Woodhatch Lodge, Reigate.

CYPRIPEDIUM OLIVIA. *Nov. hyb.*—The female parent of this hybrid was *C. tonsum*, itself a hybrid, and largely giving to the progeny its own particular shade of colour. The pollen parent was *C. concolor*, and has largely determined the shape of the petals and lip. The dorsal sepal is shaded with soft lilac-pink on a white ground, and lined with green veins. The petals are oblong-elliptic, and much of the same hue as the petals. The lip has the same hue, but the contour of *C. concolor*, particularly about the mouth. Award of Merit. Messrs. Hugh Low & Co., Bush Hill Park, Middlesex.

Floral Committee.

FURCROEA WATSONIANA.—Something like fifteen species of this genus have been described, but many of them have a close resemblance to one another. They are allied to *Agave*, and come originally from the warmer parts of America, but are now widely cultivated in various tropical or sub-tropical countries of the old world for the sake of the fibre in their leaves. The leaves of *F. watsoniana* are lanceolate, grooved along the middle, leathery, deep green and shining, with a broad, gray-green band along the middle, and a creamy-yellow band, changing to creamy-white on either side of this. They are often striped and banded in other ways. It is a handsome foliage plant, and well deserved the First-class Certificate awarded it. Messrs. F. Sander & Co., St. Albans.

NELUMBUM NUCIFERUM SPECIOSUM.—The peltate, concave, and glaucous leaves of this grand plant closely resemble those of the Sacred Lotus or Sacred Bean of Egypt (*N. speciosum*). The flowers are of huge size, and white, the petals being very numerous, and the outer ones nearly orbicular and of great size, gradually becoming smaller inwardly towards the pale green, pitted and singular receptacle. The plant will form a handsome companion to the better known one, and be a valuable addition to the aquatic stove. First-class Certificate. Her Majesty the Queen (gardener, Mr. Owen Thomas), Windsor.

NYMPHAEA IGNEA.—This is probably the largest of the dark crimson-red varieties in cultivation, though some of the small ones may be a shade or two darker. The petals are broad and blunt, and the stamens of a rich orange-red at the base. Award of Merit. A. B. Freeman-Mitford, Esq. (gardener, Mr. John Garrett), Batsford Park, Moreton-in-the-Marsh.

GLADIOLUS W. B. CHILD.—Here we have one of the hybrid *G. nanceianus* type with triangular, widely expanded flowers of handsome size. They are of a rich crimson-red, paler or rosy in the centre, and finely mottled with crimson on a creamy ground of the lower petal. Award of Merit. Messrs. Kelway & Son, Langport, Somerset.

GLADIOLUS LEMOINEI VESUVIUS.—This variety of another distinct race of hybrids, has more curved and funnel-shaped flowers of a rich, dark crimson, the three lower petals being darker and furnished with a creamy-yellow band along the centre of each. Award of Merit. Mr. M. Prichard, Christchurch, Hants.

GLADIOLUS LEMOINEI BARON J. HULOT.—The form and size of this variety are similar to those of *Vesuvius*, but the flowers are of a remarkable shade of dark blue-purple, with a short creamy-yellow band or blotch on the centre of five of the segments. Award of Merit. Mr. M. Prichard.

CARNATION NOX.—As far as we know this is the blackest Carnation in existence, being of an intense maroon-crimson, with smooth and refined petals. Fragrance is an additional recommendation. Award of Merit. Mr. James Douglas, Edenside, Great Bookham, Surrey.

CHRYSANTHEMUM MDLLE. MARIE MASSE.—In this we have one of the very earliest of the early Chrysanthemums, having flowers of the size of *Mme. C. Desgranges*. They are of a soft rose with a darker centre, freely produced and very useful for cutting. Award of Merit. T. B. Haywood, Esq.

Fruit and Vegetable Committee.

BLACKBERRY-RASPBERRY.—This peculiar hybrid is the result of crossing *Raspberry Belle de Fontenoy* with the common *Blackberry (Rubus fruticosus)*. The fruits are large, black and handsome in appearance, but somewhat acid. For cooking purposes this should be a recommendation rather than otherwise. The stems are stout and similar to those of the *Raspberry*, but are spiny like those of a *Blackberry*. A new strain or race of hardy fruits might yet be developed from it by perseverance. Award of Merit. Messrs. J. Veitch & Sons.

Kitchen Garden Calendar.

WEEK'S WORK.—The continued bright sunshine and hot weather is taking serious effect on all newly planted winter crops, so much so in this part of the country, that some difficulty has been experienced in establishing the plants. If the present dry weather continues much longer many of the late planted crops will be a failure, as water in many places is becoming short. Where half-decayed manure can be procured, a thin coating placed over the ground around the plants would materially help to keep the soil moist and so promote root action. When the ground is very dry anbury or club makes greater headway, therefore every effort should be made to keep the soil moist around the plants. In such weather as we are now experiencing the *Celery Fly* becomes very troublesome, and often whole rows of promising plants are ruined through these little creatures laying their eggs in the leaves. The larva, which is very small at first, soon grows and eats the pulp from the leaves, causing them to wither. On its first appearance all leaves affected should be passed between the finger and thumb to destroy it. The plants too should be liberally treated with liquid manure to help them to grow out of the attacks.

CABBAGE.—As soon as plants from the first sowing are large enough to handle, these should be pricked out that they may grow sturdy from the commencement. Do not allow them to receive a check in any way; if the weather should continue dry they must be liberally watered to keep them growing. Late Peas will now need special attention, as mildew will soon put a stop to growth unless the plants are kept healthy. It is astonishing how soon the foliage becomes affected if we have bright hot days with foggy nights. The advantage of thin sowing can now be seen; for, where the plants are overcrowded, the foliage, even of such hardy varieties as *Autocrat* and *Late Queen* are affected, while those allowed plenty of room are as green as in May. Here there has only been one fall of rain for a long time, so that the ground has become quite parched. Runner Beans that have long stakes put to them will require well looking after in the respect of feeding, for though these when pinched and kept dwarf will withstand the dry weather better than most vegetables, when allowed to climb to their fullest extent require a lot of support, and no crop gives a better return for such extra labour bestowed upon it. Pay special attention to seedling plants such as *Lettuce*, *Endive*, *Corn salad*, and the like, for unless they make a free growth from the commencement, it is seldom they do well.—*Kitchen Gardener.*

HINTS FOR AMATEURS.

Combating the Drought.—Like the sun that shineth alike upon the just and the unjust, so the effects of the sun and the drought affect both amateur and professional gardener, although the latter, with his closer grip of his subject and his wider experience, is better able to minimise the evil effects of a long spell of drought upon his plants than the amateur. Deep and thorough cultivation of the soil is an inestimable blessing at such times, and the amateur would do well to take the hint and work his ground as deeply and as thoroughly as he can. The ever recurring question of watering is also of vital importance at such seasons. The tyro is apt to keep on sprinkling his plants day after day, and wondering in his blissful ignorance why they are always dry, and seem to be going backward all the time. He does not know that his wretched sprinklings and surface waterings in dry weather are worse than nothing, and that they do the plants more harm than if they had had not a drop at all. Deep root waterings is what is wanted, and unless these can be given it is better to leave the water-can alone, and let the clouds of heaven do all the sprinkling. Mulching with short, half-rotted stable manure or cocoanut fibre, if nothing better can be obtained, following after a good watering are of inestimable service. Such plants as Dahlias, Sunflowers, and perennial Asters benefit greatly by mulchings of manure, for not only is nutriment directly added to the soil but the excess evaporation of water from the soil is checked.

Helenium pumilum.—So comparatively few are the plants that do really well in a town garden that when we find one of them we cannot refrain from mentioning it. At the present time this pretty little *Helenium* is the most showy plant in the herbaceous border, and it will continue to produce its relatively large bright golden-yellow flowers for a considerable time. As the specific name implies the plant is dwarf in stature, its height varying from 1 ft. to 18 in., according to the season, whether it be wet or dry. This year the plants are not more than 1 ft. in height, owing to the prevalence of drying winds and hot sun, and the shortage of rainfall. The market growers know full well the value of this bright-faced flower, for many acres of it are grown solely for supplying cut flowers for market. It is, however, its remarkable smoke-resisting qualities that we wish now to point out, for it does equally as well in the town as in the country. It is rather tall for window boxes, except in the case of very large windows where a fairly high screen does not come amiss. In such cases it might well be utilised in this way, for it is certainly the most showy of the dwarf yellow flowers that we are acquainted with. Given one good strong plant a stock may soon be worked up by dividing the roots in springtime just before growth commences. The divisions soon make good plants if they are put into rich soil and are looked after for water during the early part of the summer. Seed also germinates freely enough.

Calystegia pubescens flore pleno—To general appearance this plant looks exactly like a *Convolvulus* with double flowers, and it is, in fact very closely allied to that genus, and is oftentimes called a *Convolvulus*. We get the same climbing habit, the long pliant stems twining round everything within reach. The chief, if not the only, difference between the two genera is that in *Calystegia* the calyx or green outer covering of the flower is itself enclosed by two large, persistent bracts or modified foliage leaves; hence the generic name *Calystegia*, from *kalyx*, a calyx, and *stegē*, a covering. The leaves in the form under notice are hastate or halberd shaped, and bear a certain resemblance to those of the Ivy. This has caused the specific name of *C. hederacea* to be applied to it, but *C. pubescens* is the one under which it is usually to be met with in gardens. This has allusion to the pubescent or downy character of the leaves. There are few climbers that will do better in a London garden than this handsome plant, for the large, full double bright pink flowers are produced with great freedom all along the stems during the latter part of summer and autumn. It does exceedingly well if trained to a wall facing towards the west, but a south wall is rather too hot for its likings. The plant is gifted with a strong constitution, and no matter how much the white, string-like roots are cut up during the winter digging, all the pieces will grow

as freely as those of the ordinary Bindweed (*Convolvulus sepium*); indeed, the roots of the two are very similar. This quality of the plant may be taken advantage of in propagating it, for all that is necessary is to cut the roots up into pieces 4 in. or 5 in. in length, and plant them just before growth begins. They should not be kept out of the ground too long, or they become withered and enfeebled.

Everlasting Peas.—The great boom that has been made in Sweet Peas of late years seems to have caused the eclipse, partial or otherwise, of our old friend the Everlasting Pea, *Lathyrus sylvestris platyphyllus*, or *L. latifolius*, to give it its rather commoner name. At the present time, however, the rose-coloured flowers of the type as well as those of the white flowered variety are much in evidence, and their huge trusses are making a great show. Those who are on the look-out for a hardy climber for covering arbours and trellises cannot do better than go in for it. Almost any soil will suit it, and the plants very quickly make themselves at home, when they take little or no looking after, for they are quite able to take care of themselves, and will appear year after year in ever increasing bulk. They like to be in firm soil, and by far the best plants and flowers that we have ever seen were growing by the side of a hard trodden gravel walk, and clambering over an old hedge of Yew and Holly trees. In such a position they can get but comparatively little moisture, but they do not seem to mind it. The flowers are very valuable for cutting, for if the trusses are heavier than those of the Sweet Pea, and less elegant, they score off the latter by lasting better in water. The footstalks, too, as a rule are long, stout and wiry, and thus are fully able to support the weight of the flowers. The white form is not quite so tall and vigorous a grower as the rose one, for if the latter gets into good soil it will grow with almost the abandon of a weed, although in such cases the flowers are not so numerous, even if they are individually a little larger. Both white and rose forms are, however, worthy of a place in every garden where there is a trellis or an arbour to cover and beautify. Propagation may be effected by seeds, but whether the seeds that are often sold are not good, or whether the treatment given has not been just the thing, many people have complained that they have failed to get them to germinate, particularly those of the white variety. We have known pans in which the seed was sown and tended carefully to lie for three months without a single plant making its appearance, until the gardener's patience has been lost, and the contents of the pans have been consigned to the rubbish heap. Happily other methods of propagation besides that of seeds offer themselves. Division of the root in spring is very easy and is generally attended with complete success, whilst cuttings, taken just as the young shoots are pushing through the soil root readily enough if placed in light soil round the edges of pots, and covered with a handlight. Once the plants are established in their places nothing should be allowed to disturb them at the roots, and then an annual display of bloom may be confidently looked for.

Carnation Raby Castle.—Last week we discussed the progress and development of the Carnation, and gathered up a few points whereby we contrasted the florist's ideal with the kind of plant that found favour with the general public. In Raby Castle we have a good instance of what we may term a popular Carnation. The bright salmon-pink flowers have those notched margins to the petals that the florist abhors, but the flower is all the prettier for them even if it be in a vulgar sort of way. A more serious defect is the occasional bursting of the calyx in the larger flowers, but in view of the general utility of the variety we are fain to overlook this. There is no other sort that beats it as a continuous bloomer, for with us it is the first to open its flowers, and continues to throw blooms from the side buds long after most of the others have entirely finished. The late blooms may be small, but the colour is good, and they come in very useful for decorative work—it is indeed cut and come again with them. The plant is of vigorous habit and makes plenty of "grass," so that there is no lack of material for making up with the flowers or for layers when they are wanted. We have found that this variety seems to do best when it is allowed to form large clumps, and is not layered every year. Such clumps throw a lot of bloom, and as they stand, are a great ornament to the flower garden. Young plants may throw finer flowers, but

as has been stated, these are most likely to split their pods, so that the apparent advantage is discounted. —*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Seedling Fuchsia.—*Sardon*: It is not at all likely that your seedling Fuchsia will bloom this year. Keep it growing on, however, in the same pot in which it now is until the leaves begin to fall off, thus showing that its season of growth has practically finished. Then give less water and expose it fully to all the sun you can in order to ripen up the wood thoroughly. Next year it will flower freely enough if these directions are followed. Seedling Fuchsias rarely, if ever, bloom the same year that they are raised from seed, but are all right for the following year.

Achimenes.—*Jas. T.*: You may turn the plants out of doors, and stand them on a bottom of ashes. Keep them well supplied with clear water, but give no manurial stimulant. They will gradually die down, and you should watch for this, curtailing the water supply as maturation advances.

Heeling down Onions.—*W. L.*: The practice of bending down the stems of Onions which you describe in this way is quite a common one. There is no doubt that it assists the development of the bulb as it tends to check the flow of sap to the leaves, and thus induces the plant to turn the whole of its attention to the swelling of the bulb.

Pear Citron des Carmes is ripe from the middle to the end of July, *C.*, according to the character of the year. The variety has nothing to recommend it but its earliness, and we think you would be disappointed with it. Of course it sounds very nice to hear of ripe Pears in July, but there is no comparison between them and those ripe in September and October.

Fig to name.—*Jarl*: The Fig is White Ischia, a very fine flavoured and good all-round variety. It never gets very much larger than the samples you sent, but it is an exceptionally prolific bearer, whilst in our own opinion nothing can touch it for flavour.

Gooseberries.—*A. Carleton*: You will find it a matter of considerable difficulty to keep the Red Warrington Gooseberries for any length of time. True, it is, that the variety will hang as long as, probably longer than, any other variety, but that accounts for only a relatively short period. The best thing that you can do will be to cover the bushes entirely with Archangel mats to exclude a great part of the light. If you want Gooseberries late in the season you must plant a few bushes against a north wall, where they will hang much longer than they will on bushes in the open ground.

Seedling Pentstemons.—*W. Barnes*: Cuttings should be taken within the course of the next month of the varieties that you wish to preserve. As a rule, plenty of cuttings are obtainable from side shoots near the base of the plant. Put the cuttings in a bed of soil in a cold frame, or if the frame is large use a small hand-light, such as those employed for covering Cauliflowers.

White Abutilon.—*A. B.*: Abutilon Boule de Neige is the best white-flowered variety that we know of. It is of a good many years' standing, but we presume that does not make any difference to you.

Mushroom Litter.—*Advance*: The preparation of the litter for Mushroom beds is one of the most important points, for if it be neglected or improperly performed, good-bye to the chances of success. The material should consist in bulk of horse droppings, but an admixture of leaves and straw will do no harm. The droppings should be procured fresh from the stables, and placed in a heap on the floor of an old shed or other place where protection from the rain can be given. About twice a week the heap should be turned over and well shaken out, so as to

incorporate the fresh manure with the old. Keep up this practice until a sufficiency of material has been obtained for making up the bed.

Mustard and Cress.—*f. O.*: In order to have these saladings good during the summer months you should sow the seed on a shady border. If exposed to the sun the produce will be bitter. Keep it well watered.

PEOPLE WE HAVE MET.

MR. WILLIAM BAYLOR HARTLAND.

THE subject of our portrait is the well-known seedsman, Daffodil and Tulip grower, of Cork, now in his sixty-third year, and grandson, or third generation of a Richard Hartland, who settled in Ireland during the Arthur Young period, and very soon after which time established himself in three distinct spots in the County of Cork as a nurseryman, seedsman and landscape gardener, finally settling down at one establishment outside the town of Mallow, where he raised trees by millions, planted and beautified most of the old places now seen through the counties of Cork, Kerry and Limerick. This Richard Hartland was a man possessed of great fortitude and patience.

A great many of the tree seeds were had from the old firm of Purday & Mersillys, in Scotland (now extinct), while the garden seeds came from 60, Strand, London, or from Lawson, of Edinburgh. No Swede or Mangel crops were grown in Ireland. Peas were limited to Early Hotspur, Chasleton, and Blue Prusslan; Beans to Early Mazagan, Long Pod, and Scarlet Runners. Flower seeds were Sweet Peas, blue Nemophila, Collinsia bicolor and Virginian Stock. The chief meadow grass was the common Yorkshire Fog. Sheep and cattle were but a primitive breed. There was no oil cake, no phosphates, no artificial manure of any sort, no tea or groceries unless at the "Great House," but plenty of Potatos and Wheat. Lime was largely burned and used; whiskey three halfpence the glass; war rife with America; and the first Napoleon or "little corporal," the embryo ruler of Europe. What changes!

This pioneer nurseryman died in 1821, leaving three sons, all at the business, Richard and Arthur removing to Cork in 1809 and 1810, and forming separate establishments. The younger brother and father of the subject of our notice remained at the pioneer's concern at Mallow. Arthur died in 1835;

May; while the city folk know the place as the Klondyke of South Cork on account of its hue.

Mr. Peter Barr visited the place for the first time this spring.

His eldest son is now with him at the work. Few firms in the United Kingdom can boast of a fourth generation at the calling. We wish him and his large family all happiness, and that the generation of the old pioneer of 130 years since may not soon die out.

Mr. Hartland had a brother Albert, now dead, who inherited the grandfather's art. For what the old man could get from the foliage and undulation, the grandson put on canvas, some of his pictures being purchased by South Kensington, as studies.

Mr. Hartland's neice, Gertrude Hartland, also draws beautifully, and has produced some exquisite water-coloured drawings in landscape; and her Daffodil portraits in her uncle's list of conference sorts are the finest extant. Mr. Hartland is also the author of "Wayside Ireland," second edition, being "A Trip from Cork to the Western Highlands," 1894, published by Messrs. Purcell & Co., Cork. The first edition of this little book we had the pleasure of reviewing at the time of its appearance.

MR. WILLIAM BAYLOR HARTLAND.

He was descended from an old Dorsetshire family, sent to Kew Gardens when a lad, noticed there by James Early, Esq., of Kingston, and brought over under his patronage for special departmental work at the Castle. One of his first undertakings was the planning and laying out of the present extensive grounds at Mitchelstown Castle, now celebrated and admired by tourists for its extent, for the manner of its tree grouping and effect, particularly during the autumnal season.

It is but a few years since the subject of our sketch had a most complimentary letter from the present Countess, in which her ladyship mentions how his grandfather must have been a born artist, because now, after a number of years, the work can show the masterhand, particularly for its undulations, and the light and shade of tree growth, while the grouping could not be surpassed.

This was the age of the timber plough, together with the great lack of skilled labour, so that it was no easy task to think of establishing the growth of young trees from the native seed, and teaching the peasantry to line them out afterwards. It was also the age of sailing vessels between the two countries.

William in 1843; and Richard in 1861. The families are now much scattered. The Mallow nurseries were given up in 1852. While in 1859 Mr. Wm. Baylor Hartland joined his cousin, the late Joseph B. Hartland, at 86, Patrick Street, Cork (now Oakenhead & Co's.), and in 1876 went into business for himself; while his cousin Oliver conducts the nursery at the Lough, under the title of Messrs. R. Hartland & Son. Mr. Baylor Hartland is fond of his work, is all his life at it, has a lovely spot outside the city, at Ardcairn, where he resides and grows some shrubs, splendid trees of Prunus Pissardi, Azara microphylla, golden variegated upright Yews, beautiful specimens, the finest tree of Abutilon vitifolium seen in the south of Ireland, in which poultry go to roost. He grows Daffodils largely as most of our readers are aware; and has formed a collection of late single Tulips, not seen in Holland. He has also gone in for Begonias, crossing and raising many beautiful double sorts from seed. In another month his batch of 1898, consisting of some thousands planted out, will be an interesting show.

But the chief attraction at Ardcairn is the golden sheen of Daffodils in the spring, and the Tulips in

ALPINE AND ROCK PLANTS.

ERODIUM RICHARDI.—No complaint can be made on the score of dwarfness in this case, for neither flowers nor leaves rise much above the soil. The diminutive, heart-shaped, and crenate leaves lie on the surface of the soil. The flowers are pure white, or show faint lilac veins at the base of the petals, and arise singly from amongst the leaves. The plant is a dainty gem, and although hardy, a small piece or two should be kept in pots so that they may be sheltered in winter, plunged in ashes, to guard against losing a little, but very uncommon, beauty.

LINARIA ALPINA.—Of the smaller species of Toad-flax none is prettier than this Austrian plant. It was introduced as long ago as 1750, but has never become very common, not because it lacks beauty, for in my opinion it is the acme of perfection amongst its kind. It is generally considered half-hardy, but the probabilities are that the soft and changeable character of our winters is responsible for the death of many plants. To guard against any loss half a dozen plants in small pots could always be kept in stock in a frame, so as to make good any

deaths that may occur. An earnest and enthusiastic cultivator will never grudge their space nor the trouble of rearing a few young ones now and again by means of cuttings in light and sandy loam under a bell glass or hand light. The short racemes of blue flowers contrast handsomely with the orange palate. The whole plant seldom exceeds 6 in. in height, but is often dwarfer. It flowers from July till the advent of frost.

THYMUS SERPYLLUM NUMMULARIUS.—This is often regarded as a distinct species, but is obviously only a form of the British wild Thyme, which is very variable even in this country. It only differs in having broader and nearly orbicular leaves, that are strongly ciliate at the base, and in having larger pale purple flowers. Certainly it is distinct enough to deserve wide cultivation. It was introduced from the Crimea in 1822. Propagation is particularly easy by means of cuttings, as in the case of other sorts of Thyme, more especially the creeping ones.

CAMPANULA PUMILA.—Some of the small Bell-flowers are liable to be confused with their nearest relations. This species may easily be distinguished from *C. pusilla* by a little careful observation. The lower leaves are heart-shaped, gradually becoming narrower and lanceolate on the short flowering stems. They are also light green, but more particularly on the albino *C. pumila alba*; and the flowers are truly bell-shaped, and blue or white according to the variety.

CAMPANULA PUSILLA has a few, small, heart-shaped leaves springing from the rootstock; but those on the stems become suddenly very narrow, few, and set widely apart on the slender stems. The flowers are narrower at the mouth than in its congener, generally paler blue, and appearing thinner in texture. The leaves, however, are generally sufficient to establish its identity. This species is also more inclined to creep, while *C. pumila* forms a dense tuft. The creeping habit makes propagation easy by division, especially if planted in free, not over dry, soil, on the rockery. Cuttings of either may also be taken, avoiding the flowering shoots. Both are very choice, and sure flowering rock plants.

ERIGERON MUCRONATUS.—The dwarf, branching, and bushy stems of this Composite produce a great profusion of Daisy-like flowers, extending over a long period of time. They are rather smaller than the common meadow Daisy, but their greater numbers, and the white rays, tipped with red, might very aptly have been addressed by the bard across the border as the "Wee, modest, crimson-tipped flower," for that describes the starry flowers to a nicety. Its cultivation usually presents no difficulty whatever, when planted in well drained, friable soil with plenty of root-run. In the Channel Islands it grows like a weed, and a very pretty one. A clump or two of it in moist or well-watered pockets on the rockery are very effective.—*J. Effe.*

PANSHANGER.

THE SEAT OF EARL COWPER.

I WAS much pleased on calling here a few days ago to notice a grand lot of plants of *Eucharis grandiflora*, and to find that they were grown in a house where the atmosphere and surroundings are of a much drier nature than is usually given to these useful plants. Mr. Anderson finds these plants grow well, that they retain their foliage and bloom most abundantly, on a front shelf in a warm house, where the open laths of the stage permit the warmth of the pipes to rise up immediately amongst the plants; this treatment and position suits them well. It is a long time since I saw such a quantity of healthy and clean looking specimens. The vineries here were also in capital condition, and in the separate houses Black Hamburgs, Buckland's Sweetwater, Muscats, Lady Downes, and Black Alicante were fine in berry, with large bunches and a very heavy crop. A new vinery has recently been planted with Muscats, Mrs. Pince and West St. Peter's. These have made good growth and are on the right track for good fruiting canes. Peaches and Nectarines were especially good. So, too, were the Figs, an immense tree of White Ischia being full of its luscious fruit. Pines were also fruiting well, the fruit of Queen running about 4 lbs. to 5 lbs. each, a goodly number of them. A quantity of Sir Joseph Paxton Strawberry was still fruiting in pots, no break occurring in the gathering of this fruit. I noticed in other houses a fine lot of

Clerodendron fallax, Gardenias, zonal Pelargoniums, Hydrangeas, Ferns, Caladiums, Crotons, &c., &c., besides Carnations in quantity inside and out.

In the kitchen garden some grand Royal Sovereign Strawberries were being gathered. These were fine in colour, of splendid flavour, and exceedingly large. Mr. Anderson's method with this and other sorts also is to plant in the autumn in rows, 18 in. apart each way, to fruit the plants the first year, when the crop is not a heavy one, and then cut away every alternate plant, so that for the second year of fruiting each plant has double the space. Grand crops are gathered from these, and the fruit is of uniformly large size. Generally the beds are then cleared away, and in other quarters similar processes are going on. It is only by emergency that a crop is gathered the third year. This is truly a far surer method than retaining the crop for three or four years, and never thinning away any of the plants. The crop of May Queen and William I. Peas was heavy, and in all respects satisfactory.

Leaving the kitchen and plant department, we drove across the park to the flower garden, the Rose borders, rock garden, &c., each having beauties of their own. The singular beds of close trimmed Box, planted in curves and scrolls, with sand, white limestone, and red shingle, with just a few shrubs here and there, is certainly a departure from the usual type of flower garden. The Tea Rose garden was just coming into beauty, and many fine flowers will, I should say, have been gathered here. In borders near this portion were fine masses of Roses, and on pillars some 8 ft. high many of the rambling and free-growing kinds were growing and blooming with great freedom. Of the grand lawn and park trees I had little time for inspection. One Oak, however, I was enabled to measure, and at 3 ft. from the ground this had a girth of 23 ft.—*W. Swan.*

HORTICULTURE IN ROTHERHAM.

CAIRNFORTH LODGE, MOORGATE.

THE residence of J. Kekwick, Esq., J.P., is situated a short distance from Oakwood Grange, the scene of my preceding article.

Here there is a large amount of good stuff grown in a considerably limited space; indeed from a cultural point of view the greater part is composed of glass structures, in which have been grown from time to time Chrysanthemums and other subjects that have graced the tables of local shows.

Immediately inside the entrance gate is the gardener's cottage, occupied by the veteran Mr. T. Gartery, who has done duty here quietly and unostentatiously for the past seven years. Proceeding past this spot and bearing to the right one comes to a small stretch of kitchen garden, &c., that was at the time of my visit well stocked with comestibles of grand culture. A bed of seedling Carnations arrested my attention in passing, being characterised by strong healthy grass and prodigious blooms in really first class variety, that had for the most part not burst. Continuing in the same direction the first plant house is upon us, and these houses continue without intermission for a length of 130 feet in all—the whole of them being either lean-to or three-quarter span, and built up to a high brick wall that flanks one side of the grounds. The first house alluded to is a spacious one, having a superficies of seventeen yards by seven yards. It is, however, of such an altitude that the wonder is how Mr. Gartery maintains such a striking dwarf habit that is noticeable in the small subjects of flowering plants that occupy a spacious stage on the left hand when entering.

Calceolarias, *Streptocarpus*, zonal and show Pelargoniums, Fuchsias, Petunias, Begonias and *Primula obconica* were all showing evidence of careful culture, and might have been in a model plant house instead of a structure that does duty as vinery, conservatory, Palm house, &c. The centre staging was occupied with specimen Azaleas, *Phyllocactus*, Palms, &c.; whilst on the wall was a conspicuous and huge plant of *Heliotropium* in partial bloom that I was told furnishes an enormous amount in the twelve months. The next compartment 5 yds. by 6 yds. is utilised as a stove and contained a good variety of suitable plants, embracing Marantas, Acalyphas, *Dracaena goldiana*, and many other species, Ferns of sorts, Eulalias, Crotons, *Dieffenbachias*, &c. Another section of 7 yds. by 8 yds. held a good plant each of *Euphorbia splen-*

dens, *Hibiscus Cooperi* and *H. grandiflora*, a nice piece of *Vallota striata* (an effective plant), some good pieces of *Eucharis grandiflora* sending up plenty of spikes, Caladiums in variety, Maiden-hairs in healthy condition, *Pteris* of sorts, &c.

Following on, one comes to a small section used as a vinery, containing the variety Black Hamburg, cropping well. In the large house first of all alluded to, I might have added most of the Grapes are grown, and a good crop is always realised, although the Vines are not as young as they were more than twenty years ago.

Proceeding, the next department is devoted to the culture of Peaches, merely holding two large specimen trees of Royal George in dimensions of about 8 yards by 6 yards. When I say that at the time of my visit there were on the respective trees 300 and 250 sizeable fruits, and that they were condemned by Mr. Gartery's predecessor as being beyond bearing more than seven years ago, it surely is a striking evidence that opinions differ on the matter of age and incapability. In what way some of our leading growers, for sale, will argue this point had better be left to imagination, description being unnecessary.

As we sat together at this spot, discussing the fruitfulness (the Peaches were not ripe), I had an opportunity of trying to draw Mr. Gartery, the gardener, as to his antecedent career in the profession which he, by general consent in South Yorkshire, so well adorns. But no, he obstinately hides his light under the proverbial bushel, and is as hard to draw as a good pipe stuffed up. However, after a lapse of skilful doggedness on his part I gathered a few hints that fell from his less reserved, but worthy son, Mr. C. Gartery, who presides over the gardens at Yhosapham Manor, a few miles away; and who was in our company at the time. It appears then that he first saw the light at Clarendon Park, Wilts, the seat of Sir F. H. Bathurst, Bart., where his father was foreman forty years, under the late Mr. Chard. He has been nearly thirty years in Yorkshire, about twenty of which have been spent in Rothertham, namely, four years at Clough House, nine years at Oakwood Grange—the subject of my last notes in the time of Mr. H. Jones' residence there—and seven years in his present employ. He is on the committee of the Sheffield Chrysanthemum Society, and was formerly secretary, being now chairman, of the Rotherham and District Chrysanthemum Society.

But to continue with a survey of all the good things under his skill, we emerge into the portion devoted to Roses (climbers) and other decorative climbers such as *Passifloras*, Fuchsias, Ivy-leaf Pelargoniums, &c., which were in full beauty. A spacious glass-roofed potting shed must perforce conclude the large number of houses, and here were setting luxuriant Tomatos and late Grapes, whilst on the stage at the side were to be seen in pots such subjects as Lilies, *Gloxinias*, Seedling *Primulas* and *Calceolarias*, &c.

Open sesame, and the small kitchen garden that revels in good things can be observed in an instant. Daisy and Gradus Peas were bearing gloriously, and were highly praised by the cultivator as desirable varieties. About eighty varieties of Chrysanthemums were stood out in the usual way one is wont to see, and were looking healthy and well wooded. Such examples as Condor, Phoebus, Mrs. G. Carpenter, Mrs. Weeks, Emily Wells, Silver Cloud, Silver Queen, Waban, Louis Boehmer, and Beauty of Teignmouth were conspicuous. A dozen or two of Tomatos (Peachblow) were also standing out in fruiting pots looking exceedingly well, and were about to be housed. Apples were few, and Pears a failure. Two rows of superb Celery, the same of each Ne Plus Ultra and Canadian Wonder Beans were a picture. Unlike the experience of most others the latter and Runner Beans, although sown early, not a single one missed according to Mr. Gartery's statement. Sharpe's Queen, Stratagem, and Autocrat Peas bore out in a high degree the prevalence of good culture, with the addition of seeds of a first-class stock. In the front of the mansion was to be seen a superb hedge of Sweet Peas, regularity of bloom and foliage with size of individual flowers being its characteristics. A narrow border running the whole length of the Sweet Peas, revealed a superb strain of Seedling Pansies, the blotching and markings being extremely pleasing. The pretty chain borders were bedded out, not much variety being utilised, but embracing zonal Pelar-

goniums, such as Happy Thought and Vesuvius, Brighton Gem Lobelia, and Echeveria secunda glauca. The effect was pleasing, and in good taste. To gaze from the elevated ground on which stands the mansion one can take a good view of the lawn, with its fine specimen Hollies introduced, banks of Laurels here, mixed shrubs there, and anon bright dots of such conspicuous representatives of the herbaceous family as Inula glandulosa, Helianthus, Rudbeckias, Gaillardias, Leucantheums, and the like. Mr. Kekwich takes a delight in his garden, and is a patron of the local Chrysanthemum society, whilst he is known to be as liberal as anybody in the district in all charitable objects. He is now eighty-four years of age, having been up to twenty-two years ago managing director to the Messrs. Stubbs' Holmes Steel Smelting Works for a period of thirty years. The only daughter takes as keen a delight in matters horticultural as he, whilst the gardener is made to be as comfortable as it is possible to be.—*Albert Upstone.*

BOTANIC GARDENS, DUBLIN.

On a trip to the Sister Isle I had the opportunity of visiting the well-kept grounds and gardens of forty-two acres, at Glasnevin, Dublin. The houses and Coniferae are well worthy of notice by lovers of horticulture. The contents of the houses will be noticed in the same order as they were visited. The Camellia house contains many healthy plants of the usual leading varieties. On the side stages was a bright array of Cannas and zonal Pelargoniums. At the lower end is a fine group of *Gleichenia circinata*, 7 ft. in diameter and 6 ft. high; *G. Mendelii*, 6 ft. by 4 ft.; *G. rupestris*, 6 ft. by 4 ft.; and a number of other large specimens. In this house some dozens of *Disa* blooms were in full beauty. The Palm house is a large structure, 66 ft. high, and the contents included Tree Ferns and Anthuriums, *A. acaule* carrying leaves 4 ft. 6 in. long and over a foot wide. *Marattia alata* was represented by a fine healthy plant; and a large plant of the Mango was conspicuous. *Kentias*, *Dion*, *Cycas*, and many lofty Palms completed an interesting collection.

Passing on to the next structures, I found Ferns in good form, *Adiantums* being in many varieties. *Nepenthes distillatoria* was carrying a grand lot of pitchers. *Sobralias* and *Cyrtopodiums* were in quantity, and in good health. Amongst other attractive things were *Anguloa Clowesi*, *Cattleya gaskelliana*, *Epidendrum prismatocarpum*, *Pleiones*, etc. *Nepenthes* overhead were doing well.

In the stove were attractive features in *Brownea Ariza*; *Hibiscus* with their showy flowers, *Cassia laevigata* with its blaze of golden colour, and a fine-formed *Araucaria Rulei*, well feathered to the pot. The New Holland house is at present stocked with a miscellaneous assortment of flowering plants such as *Balsams*, *Crassulas*, *Cannas*, *Liliums*, *Trachelium*, *Fuchsias*, *Heliotrope*, *Celosias*, etc. A good plant of *Philesia buxifolia* was fully 8 ft. through. The succulent houses (recently built by Messrs. Boyd, of Paisley, noticeable for their lightness and beauty), were most attractive, and contain a great array of these little known but charming plants. A pair of *Cerus gigantus*, standing 10 ft. above the pot, are noble columns. The *Agaves*, *Haworthias* and many other species make up a telling and instructive display.

Victoria regia gives every evidence that it approves of its treatment and position, some of the leaves being 7 ft. in diameter, with a rim 6 in. in depth. *Nymphaeas* were in various colours and doing well. Amongst the tree Ferns were *Dicksonias* and *Cyatheas*, *C. medullaris* being 20 ft. high. A peep into the small fernery at the back of the general range of houses showed *Todea mooreana*, *T. superba* (5 ft. in diameter), *T. wilkesiana*, &c. Our guide stated that they had more of the Killarney Fern than could be found in the whole district of Killarney; and this proves so far as I saw perfectly correct, for the only piece I saw in that district was a plant under a 10-in. bell-glass, whilst at Dublin the back-wall, for about 80 sq. ft., was covered with this charming plant.

There is much that is interesting in the grounds, *Wellingtonias* being about 35 ft. high, and Irish Yews grand with their well-furnished dark foliage. *Mistletoe* flourishes on several trees in the gardens.

Some 15 acres have been added during the last few years; and the Conifers in many choice varieties

must have been carefully planted, for they are doing admirably; and if they continue in the same form for a few years will make telling specimens. The Water Lilies and rockeries are details of special interest, and worthy of a more extended notice.

The gardens and houses alike reflect great credit on the esteemed curator, Mr. F. W. Moore, and his able staff.—*R. G. Waterman, Liverpool.*

THE BEAUTY AND ORDER OF GARDEN SCENERY.*

THIS is a heading which could cover a very wide area, and as my time is somewhat limited, I thought it best to leave the landscape part out, and confine my remarks chiefly to the garden proper, though there are many points which may apply equally to both. To unite the agreeable with the useful is an object common to all departments of gardening. We see examples of this everywhere, from the cottager's humble kailyard to the nobleman's lordly domain. In both cases, the principle is the same, to beautify and adorn the homes of their possessors, and at the same time to supply them with those necessities of life, good fresh vegetables and fruits. So it is how to secure these benefits and, at the same time, keep the garden in a beautiful and orderly manner that I intend to turn your attention to-night.

For more convenience I will divide it up a little, and first of all endeavour to show you my ideas of what beauty and order in garden scenery should be; secondly, how it may be attained; and, thirdly, how it may be kept. Beauty here is not meant to represent only such things as are ornamental; every part of the garden has beauties peculiar to itself, and the main beauty of each lies in the perfection to which all these separate results are attained. Take for example the kitchen garden. We do not intend to see there a great show of ornamental works or a great display of flowers in bloom; yet who among us will deny the fact that there is beauty in the utility of a well kept kitchen garden as well as in the more showy and ornamental parts of the flower garden and pleasure grounds? Of course, its main beauty is its usefulness, so we look at everything from a useful point of view. Ornamental work appears quite out of place, and this is no doubt a good part of the secret of real beauty anywhere, namely, having everything placed where it will appear in harmony with the surroundings.

A secondary beauty also no doubt lies in the skill displayed to attain all these separate results in the neatest and most perfect manner and in this, order plays a very important part. It is well named Heaven's first law; or as Johnson says, "Order is a lovely nymph, the child of beauty and wisdom, her attendants are beauty, neatness and accuracy, her abode is the valley of happiness, she is always to be found when sought for and never appears so lovely as when compared with her opponent disorder." Without it any establishment, although the most fertile in resources, is terribly handicapped; for if the leader or conductor of any sort of work be a man incapable of an orderly disposition, he will start work with no definite object in view, will follow it in a haphazard way, till at last, if it does not end in complete failure, will at least result in a heterogeneous mass without any of the beauty and neatness that go to make up a properly finished job.

But if he be of a well ordered mind, he will reflect, arrange and systematise ideas before putting them into practice; he will look well to the end he has in view, consider the means at his disposal to attain that end, and the best mode of employing those means. To every one who has the regulation and management of a number of servants, this orderly working is essentially necessary to reap the full reward of their labours and to none more so than to gardeners, the success of whose operations, always connected with and dependent on living beings and weather, depends so much on having everything done at the proper moment.

In the next place I shall endeavour to lay before you some of the ways by which this beauty and order in garden scenery may be attained. The first step I consider necessary is systematic working, and this, I think, is the keynote of success everywhere—the art of having a time for everything, and everything done at the proper time, and a place for every-

* A paper read by Mr. James Good at a meeting of the Ayrshire Gardeners' Association.

thing, and everything in its place. Of course, it is sometimes no easy matter to get everything done when it should be done; yet by carefully studying the work in hand and doing everything when it can be done most advantageously, and in the best manner possible, much more can be got through and the work is better done and with greater comfort and pleasure to the workman than by doing it in an unthinking or rule of thumb manner. Take, for instance, hoeing. No one will deny the fact that a bright sunny day is best for this operation; or on the other hand that a dull or even a wet day is best for transplanting; and also in winter much can be done to suit the weather and the comfort of those employed outside. By doing heavy work such as digging in cold weather, wheeling manure and other matter when the ground is hard, and reserving nailing and pruning for mild days, the best results will ensue; for it considerably spoils the beauty of any garden if we go into it some cold frosty morning and see the men standing in front of a wall and supposed to be nailing, but whose blue faces and benumbed hands bring vividly to memory Burn's memorable words:—

"Man's inhumanity to man
Makes countless thousands mourn."

Of course I do not mean to say that these things can always be strictly adhered to; to suit circumstances or other work any of them may have to be done when the climatic conditions are not of the best; yet wherever practicable these points should be kept in view.

There are also other cases when, although it may be perfectly proper to have certain work done, yet to suit circumstances, we may have to refine propriety a little and act in a decorous manner. For example, it is perfectly proper to cut the grass and do up the beds in the flower garden, or water the plants in the conservatory when they require it; but decorum demands that the bulk of this work should be done in the early morning before the family are astir, so as to leave these places during the day for the use and recreation of our employers and their friends, without being annoyed by the presence of workmen coming and going at all times. Of course, much more might be added to this part, but I think I have said enough to show my meaning plainly, and that there are benefits to be derived from doing everything at the proper time.

We will now proceed and consider the benefits to be derived by having everything in its proper place. A paper could be got up on this part alone, if I were to speak of the best places to suit all the different plants; but I will not attempt to tire your patience to-night, but confine my remarks to those things we can have fixed places for. No hard and fast rules can be laid down as to what positions any of the following should occupy, as almost every garden is differently situated in some respects. Therefore it must be left to the gardener in each place to choose his own sites. All I would say is that due regard should be given to convenience and neatness. About every garden, whether large or small, places should be set apart for all the different requisites necessary for its upkeep, such as composts of all sorts, manures and everything else required; also places for refuse of all sorts; one for weeds and all other waste matter; another for all vegetable refuse to form that most valuable addition to garden manures, vegetable mould; and another for all wood refuse, so as to be convenient for burning occasionally.

We often see these places very much neglected. I do not think this is as it should be. A little attention given them well repays any extra labour it may cause. Of course, they are generally placed in the background, somewhere out of view of any of the principal walks. Yet that need be no excuse for allowing them to lie in a rough and untidy state. Each heap should be kept entirely by itself, and it should be seen to that there and there alone all such matter is placed, and that the refuse heaps be occasionally squared off, and when anything is taken off any of the compost heaps let it be neatly taken off the end, and not a portion dug out here and there, as we sometimes see done.

Another point on which I must pass a remark before passing on to something else is the tool shed. How often do we see it kept as it should be? Yet here, if anywhere, this rule should be rigidly enforced. Nothing is more aggravating to a man of an orderly disposition than to be sent off to a certain job, and, perhaps, have to look over the whole shed before he can find the necessary tools to do it with,

and then, perhaps, find them in such a state as will take him a long time to get them into proper working order, all through the carelessness of the one who had been working with them previously, by neglecting to clean them and put them in their proper places when he had finished. The time it would have taken him then would have been nothing to the time wasted now, not only in looking for them, but also in the quality of the work now performed.

No one can do work in a businesslike and proper manner without having all his tools in thoroughly good working order. When this is attended to no slovenly work should be tolerated. It should always be borne in mind that if a job is worth doing at all it is worth doing well. It should always be seen to by the head gardener or foreman in the different departments that the younger men, especially apprentices, are thoroughly initiated into the proper way of working all the different tools; for this is undoubtedly another feature in garden scenery, to see the work being gone about in a neat and businesslike way, with everyone alike interested and determined to do his share in the best manner possible. Every job should be done thoroughly as you go along. For instance, in digging over a piece of ground it is a common practice with slovens to throw weeds, stones or other extraneous matter on the alley or walk adjoining, to be raked up afterwards. As this keeps these places untidy all the time you are at the job it is a much better plan to have a basket or barrow beside you to put them into as you pick them out of the ground. When the digging is finished, should it be a border requiring an alley made up, it should be done at once, and then the job is finished and looks quite tidy, although it may have to wait some time before any crop is put in. By thus performing every part of an operation as we go along we can leave it at any time, should occasion arise, and it will still have a finished appearance as far as we have gone. Should it happen that any of the other men be sent to finish it he will see at once what is done and what is not.

(To be continued.)

SOCIETIES.

EATON, CHESTER.—August 5th.

THE annual flower show of the Eaton Estate Society was held in Eaton Park. The show was a very good one and the cottagers of the estate are to be congratulated on the quality of their vegetables, which showed considerable improvement over those of previous years. Particularly well represented were such things as Carrots, Cauliflowers, Celery, Lettuce, Onions and sweet herbs. On the other hand Potatoes were scabby, and Peas and Vegetable Marrows were not up to former standards.

The amateurs took precedence of the cottagers in the flower and fruit classes, which were fairly well shown, all things considered. The most attractive exhibit of the show was a decorative table set up by Mr. N. F. Burnes, gardener to the Duke of Westminster, Eaton Hall, and which had been arranged with exquisite taste. The principal features of it consisted of Nectarines, Peaches, Plums and other luscious hot-house fruits, beautifully set off with Asparagus, Fern fronds and beautiful varieties of Carnations.

In the cottagers' section the greater number of classes were set apart for vegetables, fruit, plants and cut flowers not being by any means neglected, though the classes were fewer. Vegetable classes were equally numerous for amateurs, and they also did credit to the fruit prizes offered for competition. Prizes were also offered for annuals and other cut flowers, as well as for bread, butter and honey. The competing tenants were classed according to the number of cows they kept.

The prizes were distributed by the Duchess of Westminster, the Duke also being present, and read out the reports of some of the judges. He congratulated the prize-winners and hoped the unsuccessful competitors would not be discouraged. The Duke and Duchess were accompanied by Lady Lettice Grosvenor, Lord Arthur Grosvenor, Lady Mary Grosvenor, Lord Hugh Grosvenor and others. The Duke held an "At Home," to which the leading tenants and a number of Cestrians were invited, including the Mayor of Chester (J. Goodie Holmes, Esq.) and Miss Holmes, both of whom attended.

BIRMINGHAM CARNATION SHOW.—

August 5th and 6th.

THE annual exhibition of the Midland section of the National Carnation and Picotee Society was held in the Edgbaston Botanical Gardens on the above dates, and demonstrated in no small degree the progress that has been made in this popular flower. Last year's show was held by many competent judges to have been the best in England; the exhibition just opened was practically its equal in number of exhibitors, if not altogether so in regard to quality. "Sels" and "yellow ground" varieties, indeed, could scarcely be surpassed, and the observant visitor examining the number of and perfection in which these beautiful varieties were shown will easily discover that the trend of public fancy is in their direction, to the exclusion of "flakes" and "bizarres." It is not that the two latter branches of the Carnation family were not largely represented, nor that the high standard of quality associated with the Birmingham show were not maintained. Far from it. They are still as striking and beautiful in colour as heretofore; but the tendency of the age is unquestionably towards the more simple and delicate tones of the yellows and sels. The season has been a fairly good one for cultivation, and it was the general subject of conversation among the many experts gathered from various parts of the country that the exhibition could, on the whole, scarcely be surpassed.

The committee were fortunate in securing the support of Mr. Martin R. Smith, of Hayes, Kent—the chief raiser of sels and yellows in the country—and it is perhaps needless to say that he won in most of the classes in which he exhibited. At the same time it is satisfactory to know that a Birmingham amateur, Mr. R. C. Cartwright, of Selly Park, Edgbaston, ran him very close, and in the competition for the "Sydenham Amateurs' Challenge Cup," for the most successful exhibitors in Classes I. to XXXVIII., was only beaten by ten points—Mr. Smith securing 141 points to Mr. Cartwright's 131. The Midland Counties Challenge Cup, open to the trade—the competition in which, it may be remembered, Mr. Robert Sydenham, of Bristol Road, having last year won the previous Cup outright, promised not to compete—was carried off by Messrs. Thomson & Co., of Sparkhill, with 119 points, Mr. R. Brown, of Crompton Road, Handsworth, being a good second with sixty-eight points. Mr. A. W. Jones, also of Handsworth, who won the Amateurs' Cup last year, but who has in the meantime joined "the trade," was third with fifty-two points.

Mr. Sydenham, however, although not taking part in the challenge competition, won in many of the classes in which he competed, and had a splendid aggregate of 194 points. Mr. Martin Smith won the first prize in Class I.—for twelve self Carnations—his most prominent blooms being Cecilia, a very fine yellow seedling, which also won at the recent show at the Crystal Palace; Conqueror, a rosy-salmon of perfect shape; and Comet, a deep crimson. Mr. Robert Sydenham was a capital second, showing amongst a well-balanced collection a perfect specimen of Regina, a new yellow self, having much in character with the ever-popular Germania. Mr. A. W. Jones, of Handsworth, who was first in the class for six self Carnations, showed a very fine flower of the dark maroon Mancunian, and a dainty white, Mrs. Eric Hambro. The competition in this class was exceedingly close, and there was not much to choose between Mr. Jones's stand and that of Mr. R. C. Cartwright, of Selly Park, who was second, the blooms being amongst the choicest seen out this season, notably a wonderfully good Regina, which won the first prize also in the class for single blooms. Mr. Martin Smith had to be content with third prize here, but in Class III.—twelve yellow-ground Picotees—the Kent grower scored comparatively easy, his exhibits including some of the choicest varieties sent out for some years. Lady Bristol, a deep yellow ground, with heavy rose edge, which gained a First-class Certificate at the Crystal Palace, and Gazelle, an entirely new flower of the same character, but with a deeper edge, being amongst the most notable. Mr. James Douglas, who was second in the class, was best represented by Stanley Wrightson, a choice primrose, with deep red edge. Mr. R. C. Cartwright was first in the class for six yellow Picotees, Mr. Nigel, primrose ground with heavy maroon edge, being his best

flower; Mr. Brown, of Handsworth, who was second, also showing a Mr. Nigel, though a little loose in formation in comparison with that of Mr. Cartwright.

The competition in the class for fancies was exceedingly keen, and here again Mr. Martin Smith scored, showing a grand specimen of Hidalgo—the finest fancy yet raised, though a bad grower—having a yellow ground, with crimson and maroon flakings. Mr. Sydenham was a good second, Little Sam—primrose with maroon lacing—being the pick of his collection. Perhaps two of the closest stands in the show were those of Mr. Sydenham and Mr. Brown, staged in Class VI.—white ground Picotees—but the former just won, his Muriel and Mrs. Openshaw being remarkably good.

In the classes for flakes and bizarres it was a source of satisfaction to several growers that despite the introduction of many new varieties, such old favourites as Admiral Curzon, Sarah Payne, which have been in cultivation for fifty years, and Sportsman—a sport started from the Curzon forty-five years ago—still hold their own, and are shown to great perfection. Mr. Sydenham secured the premier honours in this section, some of his best blooms being Gordon Lewis, a purple flake, which won also the premier prize for specimen flakes; Richard Monk, a new scarlet bizarre, and John Wormald, a scarlet flake. Messrs. Thomson & Co. were well up second, their specimens including a fine Master Fred, which also won the premier prize for bizarres.

The classes for undressed blooms—flowers shown with natural foliage and without dressing or cards—produced a lively competition, and were amongst the most interesting features of the show. Here again Mr. Sydenham was first, and Mr. James Douglas, second. Mr. R. C. Cartwright, after a keen contest, just beat Messrs. Thomson & Co., in the class in which three flowers from each of six distinct varieties were staged, these, with their foliage, making a very pretty display. Mr. Martin Smith added to his other successes with three premier prizes for specimen blooms in sels, fancies and yellow grounds, whilst Messrs. Thomson & Co. won in bizarres, Mr. Robert Sydenham, in flakes, and Mr. A. W. Jones, of Handsworth, in two classes of Picotees.

The competition in single blooms was generally very close, the principal prizes falling to Mr. Sydenham, Messrs. Thomson & Co., and Mr. Brown. The maiden classes, open to growers who had never previously won, were remarkably well contested, there being no fewer than seventeen exhibitors—certainly an encouraging augury for the future success of the society. Mr. T. F. Dranfield, of Stoke-on-Trent, was the successful exhibitor. Mr. Martin Smith won further honours in the classes for border Carnations, Mr. H. W. Wyvelin, of Torquay, and Mr. A. J. Rowberry, of South Woodford, also showing to advantage.

In addition to the Carnations sent for general competition there were classes for bouquets, table decoration, sprays, &c., whilst the honorary exhibits—especially the Begonias of Mr. B. R. Davis, of Yeovil; the herbaceous plants shown by Mr. W. F. Gunn, of Olton; Messrs. Hewitt & Co., Solihull; Mr. J. White, of Worcester; and the Sweet Peas of Mr. Eckford, of Wem, Shropshire—were of great excellence. The judges were Mr. T. E. Henwood, Reading; Mr. John Ball, Royal Forest, Slough; Mr. John Whitham, Hebden Bridge; and Mr. Chas. Phillips, Bracknell, Berks.

HASTINGS.—August 10th.

THE annual flower show of the Hastings and East Sussex Horticultural Society was held in the Alexandra Park, Hastings, under very favourable auspices as to weather. The exhibits were fewer than last year, but the quality of the plants was quite up to the previous standard as seen at Hastings. There were sixty-one exhibitors as compared with seventy-eight last year, and the exhibits amounted to 490, while last year they were 523. There was considerable competition for cut flowers, including Roses, and table decorations were of a high order of merit, great taste in the arrangements being displayed. Vegetables were also a good feature of the show, and of good quality.

The first prize for eight stove and greenhouse plants was taken by J. Warren, Esq. (gardener, Mr. A. Offer), Handcross Park, Sussex, who had some excellent samples of good cultivation. Sir Archibald Lamb (gardener, Mr. T. Portnell) took the

second place with some good specimens. P. A. Eagles, Esq. (gardener, Mr. A. Gadd) came in third. He came to the front, however, for six stove and greenhouse plants, his previous rivals taking second and third in the order named. Mrs. Lewis (gardener, Mr. H. Clarke), Guestling, took the lead for four stove and greenhouse specimens. The Rev. E. N. Blomfield (gardener, Mr. J. Bannister), was second.

J. Warren, Esq., again led the way for eight fine foliage plants, followed by Sir A. Lamb and P. A. Eagles, Esq., in this order. C. J. Ebdon, Esq. (gardener, Mr. F. Morris), had the best four fine foliage plants. J. Warren, Esq., had the best eight exotic Ferns, and Sir A. Lamb the best six Fuchsias. Mr. J. Dawson, Silverhill, had the best single and best double Pelargoniums, the best four Fuchsias, and the best double Ivy-leaved Pelargoniums. Sir James Colquhoun, Bart. (gardener, Mr. T. J. Mitchell), took the lead for British Ferns and in some other classes.

Mr. J. Snow, The Gardens, Wadhurst, had the best collection of eight dishes of fruit. Mr. W. Robinson, Rye, took the lead for dessert Apples. The Duchess of Cleveland (gardener, Mr. W. Camm), staged the best culinary Apples. Mr. W. Robinson again came to the front for dessert Pears. The Duchess of Cleveland came to the front for Black Hamburgh and also for any other black Grape. Mr. J. Snow was second in both cases, but came to the front for Muscat of Alexandria.

Mr. L. Apps, Ore, took the lead in the class for a collection of nine vegetables, showing some fine samples. Mr. H. Colegate had the best French Beans. Mr. L. Apps again led the way for Cucumbers, Cauliflowers and spring sown Onions. Mr. T. Dake, Battle, showed the best Celery, and Mr. W. Paine, the best Carrots. Mr. F. Grinstead had the best Peas. The Rev. E. N. Blomfield took the lead for round Potatoes, and Miss Barnett (gardener, Mr. A. Foster) had the best kidney varieties.

A considerable number of prizes was also offered for competition by cottagers, who were, as usual, strongest in the division for vegetables, showing some examples of great care in cultivation. They also competed in the class for flowers, plants and honey. Mr. W. Robinson, Rye, took the leading prizes for honey in 12-lb. sections and 12-lb. bottles.

SEVENOAKS.—August 10th.

THE annual show of the Sevenoaks Horticultural and Floral Society was held in the grounds of Knole Park, by the kind permission of Lord Sackville, and was again a most successful affair, and by those who live in the district it is regarded as one of the best managed and attractive shows of its kind in the south of England. The private grounds of Knole Park are very beautiful and afforded great pleasure to the visitors, who took delight in roaming over the well-kept grass, admiring the beautiful and diversified scenery. Some heavy showers fell during the morning and threatened to spoil the show; the wind also blew half a gale, and much of the canvas that separated the show from the rest of the grounds was blown down, while the tents containing the exhibits were also partly damaged. The secretary, Mr. K. Hancock, assisted by Mr. Fenner, the late secretary, set to work, and having procured additional ropes, the tents and marquees were rendered secure against all further danger. The attendance of visitors was very great, and towards evening the tents proved quite inadequate to accommodate the vast assemblage of people, who cheerfully bore the discomfort.

The premier award for a miscellaneous collection of exotic flowering plants was taken by Mr. A. Gibson, gardener to T. F. Burnaby-Atkins, Esq., J.P., Halstead Place, who was followed by Mr. A. Hatton, gardener to Mrs. Swanz, The Quarry, Sevenoaks. This order was reversed for fine foliage plants. Mr. G. Cowper, gardener to H. Foster, Esq., Hillside, Kippington, took the lead for six Fuchsias. Mr. J. Talmage, gardener to Miss Hodgson, Hernewood, Sevenoaks, had the best Caladiums, and the best tuberous Begonias. Mr. H. Heath, gardener to Mrs. Petley, Riverhead, received the first award for zonal Pelargoniums; while Mr. W. Adams, gardener to J. Dixon, Esq., Edenhurst, Sevenoaks, led the way for Coleus. Mr. J. Talmage had the best hardy Ferns. Mr. C. Sutton, gardener to Earl Stanhope, Chevening, had

the best specimen stove or greenhouse plant. Mr. A. Hatton took a like honour for a fine foliage plant; he also had the best group of Ferns arranged for effect.

There was strong competition in the class for a collection of plants arranged for effect, the first prize going to Mr. C. Sutton; Mr. G. Fennell, gardener to W. M. Cazalet, Esq., Fairlawn, Shipbourne, followed; Mr. A. Hatton took the third place; Mr. S. Cooke, gardener to De B. Crawshay, Esq., Rosefield, Sevenoaks, came in fourth; and a fifth prize went to Mr. W. Tebay, gardener to Mrs. Rycroft, Everlands; a special prize was given to Mr. W. Hough, gardener to Mrs. Lambarde, Beechmont, in this class. Mr. R. Edwards had the best table plants.

Cut flowers were well represented in the numerous classes set apart for them. Mr. C. Sutton took the lead for twelve Roses, distinct varieties. Mrs. F. W. Seale, Sevenoaks, had the best twenty-four varieties of Dahlias; and Mr. A. Parks, Ivy Hatch, had the best twelve. Mr. A. Hoadley, gardener to F. L. Bevan, Esq., Kippington, showed the best twelve China Asters, the best twelve Cactus Dahlias, and the best six varieties of Phloxes. Mr. E. Turner, gardener to the Rev. H. P. Thompson, Kippington, had the best twelve Cactus Dahlias in six varieties. Mr. C. Noble, gardener to Miss Austin, Old House, Sevenoaks, led the way for twelve blooms of Zinnias and six spikes of Gladioli. Mr. E. Hatton secured the lead in the class for a collection of cut flowers of stove and greenhouse plants. Mr. C. Noble had the best collection of herbaceous flowers; and Mr. E. Hodgson led for border Carnations.

In the fruit division Mr. A. Hatton led the way for a collection of six kinds. Mr. T. Osman, gardener to L. Baker, Esq., Chertsey, had the best black Grapes, but was beaten by Mr. W. Hough for white Grapes. He again came to the front for three varieties of Grapes. Melons, Peaches, Nectarines, Plums, Apples, Pears and Cherries were well shown.

Mr. F. Leftley, gardener to T. Collyer Fergusson, Esq., Ightham Mote, set up the best collection of nine vegetables; and was followed by Messrs. F. Robinson, A. H. Hoadley, and G. T. Barney, in this order.

The competition for table decorations was keenly contested, and Mr. S. Cooke came out at the top of the list for a table 9 ft. by 4½ ft.; he was followed by Messrs. W. A. Searing, R. Edwards, and G. Fennell, respectively. Mr. W. A. Searing came to the front for an epergne or centre table decoration.

A division was set apart for gentlemen keeping one gardener and one assistant only. Messrs. C. Noble and H. Heath took the leading prizes for plants, the latter being the most successful. H. Monckton, Esq., Maidstone, had the best eight varieties of Roses. Mr. J. Humphrey, gardener to Mrs. Bouch, Ightham Lodge, took the lead for twelve varieties of Dahlias. Mr. C. Noble also took the lead for twelve varieties of cut flowers. Prizes were also offered to those who keep no gardener, in classes for plants and cut flowers. A division was open to both of the two previous classes of competitors, the prizes offered being for fruit. The first award for a collection of four varieties was secured by Mr. G. Denton, gardener to A. Earle, Esq.; Mr. W. Miles, gardener to F. W. Francks, Esq., Loampits, Tonbridge, being second. The latter showed the best white Grapes; but Mr. G. Denton took the lead for black Grapes. Others taking first prizes in this division were Mr. L. C. Edwards, Stone Pitts, Seal; Mr. E. Marchant, gardener to the Rev. — France, Sevenoaks; Mr. G. Cowper; Mr. C. Noble; and Mr. J. Ashby, Boxley, near Maidstone. Mr. J. T. Barney; and Mr. E. Hodgson, took the leading prizes for vegetables in this division. Many prizes were also offered to cottagers, and competition was good.

In the non-competitive classes Messrs. J. Veitch & Sons, Ltd., Chelsea, had a grand display covering 200 sq. ft. and consisting of Crotons, Orchids, Dracaenas, Caladiums, Golden Ferns and other subjects most effectively arranged. Messrs. J. Peed & Sons, Roupell Park, West Norwood, made a magnificent display with some thirty varieties of Caladiums in plants of large size. Mrs. M. V. Seal, The Vine Nurseries, Sevenoaks, covered about 100 ft. run of table space in the cut flower tent with wreaths, crosses, harps, lyres, Palms, Ferns, &c. The judges accorded these three exhibitors twelve points each. Messrs. H. Cannell & Sons, Swanley, Kent, had a tent all to themselves as in former years, and made a fine display with tuberous Begonias, Dahlias, Acaly-

pha Sanderi and vegetables. The judges adjudged them ten points. Messrs. Wm. Cutbush & Son, Highgate, London, filled 150 sq. ft. with Cannas, Hydrangeas, Crotons, Dracaenas, &c. They scored eight points. Messrs. G. & A. Clark, Dover, and Mr. J. R. Box, Croydon, each scored six points, the latter showing Tea and H. P. Roses in quantity, and of fine quality. Messrs. Holland, Tunbridge Wells, and Mr. F. Webber, Tonbridge, each received four points.

NAIRN.—August 10th.

THE annual exhibition of the Nairnshire Horticultural and Industrial Society was held in the Public Hall, Nairn, and proved a great success. The quality was good considering the unfavourable character of the season generally, though the entries were not so numerous. The show was opened by Brodie of Brodie, Esq., in the presence of a good attendance.

The first prize for stove plants was secured by Mr. Anderson, of Holme Rose, who easily won the Silver Medal presented to the most successful prize-taker in four sections open to gardeners. For stove plants he was followed by Mr. Macgillivray, The Gardens, Newton House, who also had the best Fuchsias. Mr. Anderson took the lead for greenhouse plants, exotic Ferns, Gloxinias, Lycopodiums, and in many of the classes for cut flowers and bouquets. Mr. Munro, Delnies, secured first prizes for tuberous Begonias, Phloxes, China Asters, and Antirrhinums. Mr. Wedderspoon, Croy, had the best show and fancy, single, and Cactus Dahlias, and fancy Pansies respectively. Mr. Masson, Kinsteary, was the most successful exhibitor of Tea Roses, herbaceous plants, &c. Mr. Anderson had the best hybrid perpetual Roses and Gladioli.

In the first division Mr. Macgillivray had the best Grapes and Peaches, while the leading honour for Pears was taken by Mr. Dallas Nairn. Mr. Anderson again led the way for Plums, Apricots and Cherries. Mr. Masson also took a number of prizes for fruit.

Mr. Munro, Mr. Campbell, of Boath, Mr. Anderson, Mr. Masson, and the Rev. J. Bonallo took numerous prizes in the section for vegetables. Mr. Masson secured the leading award for the collection of twelve vegetables.

Classes were also set apart for amateurs and cottagers, prizes being offered for plants, flowers, fruit, vegetables, dairy produce, honey, &c. In the amateurs' section the Silver Cup for the most successful prize-winner was taken by Mr. Finlay Duff, Grigorhill, Auldearn. He also had the best kept garden in Nairnshire. Mr. Macpherson, Mill Road, had the best garden in the burgh of Nairn.

Messrs. D. Stalker & Son, Nairn, exhibited a large assortment of pot plants in fine form. They also had a stand of Ichthemic Guano, which they recommended for pot plants.

BISHOP'S STORTFORD.—August 10th.

THE annual show of the Bishop's Stortford Horticultural Society was held at the Grange, Bishop's Stortford, by the kind permission of John Barker, Esq., and was a great success. The society is generally admitted to be one of the most important in the eastern counties, not a little of the success of the show being due to Mr. Wm. Smith, who has been hon. secretary for many years. The grounds, gardens and hothouses at the Grange were thrown open to visitors. There was a great increase of entries over former years, particularly amongst cottagers.

A Silver Medal was offered by Messrs. John Laing & Sons, Forest Hill, for the most effectively arranged group of plants, which brought out seven exhibits. The premier honours were taken by Mr. G. Barker, gardener to H. A. Blyth, Esq., of Stansted, with a group which was characterised by novelty in design. His most important plants consisted of Crotons, Dracaenas, feathery Cocos weddeliana and other Palms; Mr. J. Richardson, gardener to Sir James Blyth, who is well known as a strong competitor, had to be content with the second place on this occasion, being beaten for the first time during the past five or six years; Mr. W. Clarke, gardener to Charles Gold, Esq., M.P., took the third award; and Mr. T. H. Lodge, gardener to Mrs. Menet, was accorded an extra third, all of the four groups being really fine, and other extra prizes awarded. The last named came to the front for stove and greenhouse plants; Mr. G. Beech, gar-

dener to J. Barker, Esq., being second. Mr. J. Richardson again came to the front for fine foliage plants. Mr. B. Calvert, gardener to Col. G. B. Archer Houlton, had the best Ferns.

Considerable interest was aroused by the groups of tuberous Begonias which are here grown to great perfection. The premier award was taken by Mr. W. Pavitt, gardener to W. Smith, Esq., who had a magnificent display, but was run pretty close by Mr. E. Harris, gardener to A. Taylor, Esq. The latter came to the front for hanging baskets of tuberous Begonias, beating his previous opponent, who was second. He also received the first prizes for single tuberous Begonias, and also doubles. W. P. Neal, Esq., had the best twelve Gloxinias.

In the open class for hardy perennial or bulbous flowers, the first award was taken by Messrs. G. Paul & Son, Cheshunt. Mr. H. Brace, gardener to H. A. Hare, Esq., was second.

In the subscribers' division, the first prize for Sweet Peas was taken by Mr. J. Toms, gardener to F. Calvert, Esq. Mr. T. H. Lodge secured the lead for the prizes offered by Mr. H. Eckford for twelve bunches of his Sweet Peas. Mr. W. Bentley, gardener to E. H. Watts, Esq., had the best twelve bunches of stove and greenhouse plants. He was beaten, however, by Mr. G. Beech in the class for twelve bunches of hardy perennials.

In the subscribers' fruit classes, Mr. A. Handcomb, gardener to R. C. Haldane, Esq., took the leading award for a collection of eight dishes of fruit, Mr. B. Calvert being a good second. Mr. E. Skelton, gardener to J. Barker, Esq., Graperies, had the best black Grapes, and the best white.

Mr. E. Harris was the most successful winner in the class for a collection of eighteen varieties of vegetables, Mr. G. Beech being second. Mr. J. Toms came to the front in the class for nine varieties of vegetables; and was followed by Mr. W. Bentley. J. Todhunter, Esq., had the best six vegetables.

Non-competitive exhibits were fairly prominent, a fine collection of stove and greenhouse plants coming from Messrs. J. Veitch & Sons, Ltd., Chelsea, who received special prizes. Messrs. Paul & Son, Cheshunt, exhibited herbaceous plants and Roses. Messrs. W. Paul & Son, Waltham Cross, had a similar exhibit, and both received special awards. Mr. S. Mortimer, Rowledge, Farnham, Surrey, had a fine lot of Dahlias. Col. Archer Houlton, sent a collection of Gloxinias. The Ichthemic Guano Co., Ipswich, had a fine display of plants grown by their special fertiliser. Messrs. Webb & Brand, Saffron Walden, showed Hollyhocks.

SHREWSBURY. BY TELEGRAPH.

In the class for a group of plants arranged for effect in a space not exceeding 300 sq. ft., Mr. James Cypher, Cheltenham, took the lead with an imposing and novel display. He was followed by Mr. W. Finch, Coventry; and Miss Wright, Oswestry, in this order. The Duke of St. Albans took the lead for a group of fine foliage plants, followed by Mr. Jas. Cypher, and Mr. W. Finch. Lord Harlech had the best thirty stove or greenhouse plants; Mr. Jas. Cypher was second; and H. H. France Hayhurst, Esq., of Wellington, received a special third. Mr. James Cypher again took the lead in the class for twenty stove and greenhouse plants. Mr. W. Finch received a special second.

Messrs. Perkins & Sons, Coventry, took the lead for six bouquets; Messrs. Jones & Sons, Shrewsbury, were second; and Messrs. Jenkinson & Son, Newcastle, Staffs., took the third place. Messrs. Perkins & Sons were first for bouquets; Messrs. Pope & Sons were second; and Messrs. Jenkinson & Sons, third. Class XXVII. for bouquets, Messrs. Jones & Son were first; Mr. W. F. Gunn, Birmingham, second; and Mr. F. H. Morris, Handsworth, third. Prizes for shower bouquets were awarded to Messrs. Perkins & Son, Pope & Son, W. Treseder, Cardiff; Kimberley & Sons and Mrs. Loratt, Newport, Salop. Mr. M. Cromwell, gardener to T. Sutton Timmis, Esq., Liverpool, gained the first prize for twelve bunches of cut stove and greenhouse flowers, also for six bunches of the same.

For a collection of Gladioli, first came Messrs. Harkness & Son; Messrs. Wallace & Co., Colchester, were second; and Mr. W. F. Gunn, Olton, came in third. For the Birmingham collection of Roses, Messrs. D. & W. Croll, Dundee, were first; Messrs. Pope & Sons came second. For a collection of

Dahlia, Mr. W. Treseder, Cardiff, took the lead; Mr. M. Campbell, Blantyre, was a good second; and Messrs. Keynes Williams & Co., Salisbury, third. For a collection of hardy flowers, first came Messrs. Harkness & Son; second, Mr. W. F. Gunn; and third, Messrs. Barr & Sons, Covent Garden, London; Messrs. Dicksons, Ltd., Chester, came in fourth. In the class for a collection of Begonias, Mr. B. R. Davis, Yeovil, was first. For a collection of Carnations and Picotees, Laing & Mather, Kelso, were first; Mr. M. Campbell, Blantyre, took the second place; and Messrs. Thomson & Co., Sparkbill, Birmingham, came in third.

In the class for a decorative dessert table the first prize, representing 124½ points, went to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby. Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., Guisborough, was second with 119 points. Mr. W. J. Edmonds, Bestwood, Arnold, Notts., was third. Class LXX.—For fifteen dishes of fruit, first came the Earl of Harrington; second, Sir J. W. Pease, Bart., Guisborough; and third, Duke of St. Albans, Bestwood. Class LXXI.—Collection of nine dishes of fruit. First, Mrs. F. Need, Malvern; second, Lord Bagot, Blythfield; third, W. F. Webb, Esq., Newstead Abbey. Over 400 bunches of Grapes were shown for competition in fourteen classes, the principal prize-takers being C. E. Newton, Esq., Mrs. F. Need, Rev. T. M. Bulkeley Owen, Lord Bagot, J. T. Paton, Esq., Alloa; Sir Geo. Meyrick, Rev. F. Alderson, Mrs. Heywood Lonsdale, Lord Harlech, and Miss Wright.

In class CII. for garden produce there were four exhibits. The first prize of £7 16s. for 102 points, went to Mr. J. H. Goodacre, gardener to the Earl of Harrington. The second prize of £6 8s. 8d. for 96½ points went to Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., Guisborough, Yorks. The third prize of £6 14s. for 90½ points was taken by Mr. Thomas Wilkins, gardener to Lady Theodore Guest, Henstridge. The fourth prize of £5 10s. 8d. for 83 points was secured by Mr. W. S. Bremener, gardener to H. H. France Hayhurst, Esq., Overley, Wellington.

Mr. W. Pope, gardener to the Earl of Carnarvon, Higbclere, gained Mr. R. Sydenham's first prize for a collection of vegetables, and the £15 Challenge Cup for the year. The special prizes offered by the Ichthemic Guano Co. for the best collection of fruit and vegetables, grown with Ichthemic, brought up four competitors. Mr. Grindrod, gardener to G. T. Bates, Esq., Whitfield, Herefordshire, was first; and Mr. Huxter, gardener to T. B. Wood, Esq., Henley Hall, Ludlow, was second for the fruit. Mr. H. Huxter was first; and Mr. Geo. Davis, Pool, Parva, West Felton, took the second place for vegetables.

Gold Medals were awarded to Mr. E. Murrell, Shrewsbury; to Mr. Eckford, Wem, for Sweet Peas; to Messrs. R. Hartland & Sons, Cork, for Begonias; to Messrs. Pritchard & Sons, Shrewsbury, for a collection of cut Carnations and Picotees, Cacti Ferns, &c.; to Messrs. Sander & Co., St. Albans, for new and rare plants; and to Messrs. H. Cannell & Sons, Swanley, for a collection of Cannas, &c.

Silver Medals were awarded to Messrs. Dicksons, Ltd., Chester; to A. Meyers, Shrewsbury; to Mr. J. H. White, Worcester; to Mr. H. Deverell, Banbury; to Messrs. H. Birkenhead, Sale; to Messrs. Webb & Sons, Stourbridge; to Messrs. Wallace & Co., Colchester; and to Messrs. Smith & Co., of Worcester.

Bronze Medals were accorded to Messrs. Jones & Son, Shrewsbury; to Mr. John Forbes, Hawick; and to Mr. S. Mortimer, Rowledge, Surrey. Other awards were still being added as we went to press.

It was a record show for entries, which numbered 2,880, being 440 more than last year. There were seventeen collections of fruit, eighty bouquets, &c. The weather was fine, and there will probably be a record attendance, judging by appearances when this was written.

QUESTIONS AND ANSWERS.

List of Books on Gardening.—*W. Lowater*: By consulting this week's issue of THE GARDENING WORLD you will find a number of recently published gardening books mentioned there. Then there is the "Carnation Manual," published under the auspices of the National Carnation Society; "A

Year's Work on a Kentish Fruit Farm," published by Messrs. Geo. Bunyard & Co., Maidstone; "The Culture of Vegetables and Flowers," by Messrs. Sutton & Sons, Reading; "Dahlia," by Messrs. Dobbie & Co., Rothesay, N.B.; and "Pansies, Violas and Violets," by the latter firm. By consulting next week's issue of this paper, you will find under the heading of "Books, Notices of," the book and pamphlets on various topics we have reviewed during the course of the year. The number of books and pamphlets on various gardening topics published during the year is considerable; but if you specify more particularly what you require, we would endeavour to help you further.

Seedling Single Dahlias.—*A. West*: The colour is all right but the quality of the ray petals hardly comes up to the present standard exacted by the National Dahlia Society and connoisseurs generally. The rays should be broad, blunt and well overlapping one another so that the outline may be regular, and as circular as the compass could make them. A starry appearance is now altogether at variance with the requirements in this particular class of garden flowers. The substance must also be good, and the colours clear, bright and telling. Uniform or self colours are most in request. A good average size would also tell in their favour.

Half Sieve of Currants.—*W. M.*: At p. 798 the half sieve of Red Currants was said to consist of 12 lbs., whereas it should have been 24 lbs. The market measurements are complicated, and fearfully and wonderfully made, so that an error is liable to creep in occasionally.

Names of Plants.—*Sigma*: 1, *Helianthus debilis*; 2, *Helianthus rigidus*; 3, *Helianthus rigidus* var.; 4, *Helianthus multiflorus*.—*A. D. W.*: *Cattleya guttata Leopoldii*.—*W. B.*: 1, *Sidalcea candida*; 2, *Achillea tomentosa*; 3, *Veronica Traversii*; 4, *Phlomis fruticosa*; 5, *Prunus lusitanicus*; 6, *Rhamnus catharticus*.—*B. J. M.*: 1, *Oncidium sarcodes*; 2, *Masdevallia harricana*; 3, *Oncidium pumilum*.—*G. E.*: 1, *Spiraea discolor arifolia*; 2, *Cistus ladaniferus*; 3, *Tilia petiolaris*; 4, *Pyrus Maulei*; 5, *Clematis Jackmanni*.—*R. M.*: 1, *Veronica incana*; 2, *Physostegia imbricata*; 3, *Helianthus pumilum*; 4, *Solidago Virgaurea*; 5, *Helianthus multiflorus flore pleno*; 6, *Oenothera fruticosa Youngi*.—*A. T.*: 1, *Clematis Vitalba*; 2, *Choisya ternata*; 3, *Convolvulus mauritanicus*.—*E. C. H. D.*: 1, *Pimpinella Saxifraga*; 2, *Scabiosa succisa*.

FRUIT CULTURE EXTENDING.—Whoever may happen to be travelling about the country, but particularly in the best fruit-growing districts, will be able to see plantations of no great age, and making more or less vigorous growth according to the natural fertility of the soil, and the cultural treatment it received at the time of planting, and since then. The agitation that has been carried on for some years past anent the cultivation of fruit by home growers has certainly resulted in putting British cultivators upon their mettle, notwithstanding the scoffing and jeering in many quarters as to the unprofitable nature of the industry. A great many have undertaken the cultivation of fruit who knew little or nothing of a practical nature upon the subject. As might have been expected some of them made glaring failures; while others equally ignorant of the subject at the commencement, but being keen observers and men of business capacity, have been decidedly successful.

The British farmer learns slowly, and progresses accordingly; but if he is slow to adopt better methods of culture than he has hitherto pursued, he may be ready to urge that more labour is necessary for the newer methods of fruit culture than he can afford. Nevertheless a few object lessons may be gleaned from the methods pursued along the various railway routes in Kent. Not far from Sevenoaks a young orchard on the grass may be seen struggling with the various occupants of the soil and the dry weather. The young trees as yet afford but little shade against the fierce rays

of the sun, while the hard surface, together with the grass upon it evaporates four times as much of the soil moisture than would be the case if the surface were bare and kept loosened on the surface by means of the horse hoe. Beyond Wrotham, still going in the same direction, the spaces between the fruit trees are covered by Potatos and Wheat. This may be considered a degree better inasmuch as the surface is kept looser, while a profitable crop can be taken off the ground while the trees are growing. A little further on fruit trees may be seen on strips of grass, even while the middle space between the rows of trees is cropped. The grass can have little to recommend it, except that it saves the labour of cleaning. Another example may be noted where the space between the half standard trees is planted with fruit bushes. The latter help to shade the ground, keeping it cool, but the ground is very weedy even in a dry season like the present. Evidently the British farmer thinks that the loosening of the surface and the destruction of weeds are the last things to be undertaken. The heavy, loamy soil near Malling must be very fertile, for the fruit trees upon the grass are making wonderful progress. Close by one may notice that the Hop plantations are kept regularly hoed, while the Hops are now forming dense thickets amply shading the soil. Evidently more value is attached to the Hop fields than to the orchards. At the Allington Nurseries, alongside of Barming station, Messrs. George Bunyard & Co. believe in keeping the surface clean and loose by constant hoeing by means of a horse hoe, and the results proclaim the practice a good one. It does not always follow, however, that good examples are followed by others. A hedge or a fence is often all that separates well and badly-kept farms. Generally speaking, however, a healthy emulation is set up under such circumstances.

In spite of its northern latitude, Aberdeen is rapidly becoming the centre of a great fruit-growing industry. The growing city has acquired an appetite for fruit, but has little need to look abroad for supplies. The farmers situated around three sides of the Granite City, and within a range of 20 miles, are quietly setting themselves the task of meeting the demand for fruit. The largest and most important fruit farms are on Deeside, adjacent to the city. Strawberries, Gooseberries and Currants are the fruits most extensively cultivated, and for which the climate is wonderfully well adapted. Many years ago the late Mr. Gladstone recognised the suitability of Aberdeenshire for Strawberry culture. Potatos and other vegetables are also more or less extensively grown by the fruit farmers. For many years past the county of Kincardineshire has been contributing its quota to the fruit supplies of the Granite City, Mr. Sim, the Temple, Drumlithie, sending all his fruit there. His father, Mr. Sim, who commenced the cultivation of Strawberries at Strachan, Deeside, more than twenty-five years ago, is still hale, hearty and active. Strawberries were so little known there about that time that a native asked him if he was planting Avern, this being the local name for the Cloudberry (*Rubus Chamaemorus*). Mr. Sim now sends about 70 tons of Strawberries annually from this district to the jam makers. His favourite is the old-fashioned, but finely flavoured, Elton Pine.

How the Americans Advertise!—To what do they refer? Plants, ladies or stars? "Choice 3-in. Perles, for immediate planting. Fine stock which will make you money. Also some extra nice 3-in. Meteors; and some good Brides and Beauties. Sample on receipt." See American papers.—Patterson.

Water Lilies at Gunnersbury House.—There is no more enthusiastic grower of the new hardy Water Lilies than Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, W. On the occasion of the lecture on "Water Lilies," on the 9th inst., at the Drill Hall meeting of the R.H.S., he made an exhibit of twenty-four species, varieties and hybrids, all of which are grown in the pond in the grounds of Gunnersbury House. On the above-mentioned occasion he exhibited *Nymphaea alba*, *N. a. rosea*, *N. tuberosa*, *N. odorata*, *N. o. rosacea*, *N. o. rubra*, *N. o. sulphurea*, *N. o. s. grandiflora*, *N. pygmaea helvola* (a gem in miniature), and *N. stellata*, the latter only being tender. He also had such hybrids as *N. Aurora*, *N. ellisiana*, *N. gloriosa*, *N. Signouretii*, *N. andreana*, *N. lucida*, *N. Robinsonii*, *N. Laydekeri fulgens*, *L. L. rosea*, *N. marliacea chromatella*, *N. m. carnea*, *N. m. rosea*, *N. m. albida*, and *N. m. rubro-punctata*. He has since exhibited the hybrid *N. Exquisita*, and on Tuesday last he received an Award of Merit for *N. odorata sulphurea grandiflora*, a form measuring 8 in. or more across, and bearing a not inapt resemblance to a Cactus Dahlia.

Ladywell and Lewisham Flower Show.—This event took place on the 10th and 11th inst., and seems to have been an all-round success. A feature of the day's proceedings was the visit of the Tunbridge Wells Gardeners' Association. The gardeners also visited the Ryecroft Nursery of Mr. H. J. Jones, after which they were entertained at luncheon at the "Spotted Cow"; they then proceeded to visit the Crystal Palace, and Messrs. J. Laing & Sons' nursery. The Ladywell and Lewisham seventeenth annual show was held in the grounds of Campshill House, Hither Green Lane, Lewisham, by the kind permission of S. J. Gore, Esq. There were 450 entries, being an increase on all previous years, and the quality of the exhibits generally was excellent. When the society was founded there were 26 members and one acre of allotment ground; now the members number 300 and have 10 acres of allotment ground, while £50 is distributed in prizes at their show. Collections of flowering plants from Mr. H. J. Jones, Messrs. Laing & Sons, of Forest Hill, and Messrs. Maller & Sons, Burnt Ash, added greatly to the beauty and interest of the show. A collection of Ferns was set up by S. W. Fryett, Esq., Holmhurst, Beacon Road, Lewisham.

Foral Gala at Aberdeen.—A three days' flower show and gala were opened in the Duthie Park, Aberdeen, on the 18th inst., by the Royal Horticultural Society of Aberdeen. The enterprising committee managed to carry out their programme in spite of the interference of the War Office at the last moment forbidding staff instructors from the Aldershot Gymnasium from giving exercises there. The entries were not so numerous as last year but they were of higher quality. Mr. John Proctor, gardener to Sir Wm. Henderson, Devanha House, had the finest and most effective group of pot plants in the show, including Orchids, Palms and Crotons. Mr. J. M'Donald, gardener to Mrs. Crombie, Balgownie Lodge, secured the society's Silver Medal for the best flowering specimen in the show. A similar honour was gained by Mr. A. Howie, gardener to the Rev. J. S. Gimmell, Drumtochty Castle, for a fine foliage specimen. Mr. Alex. Grigor, gardener to A. O. Gill, Esq., Fairfield, Aberdeen; Mr. W. Ogg, gardener to Miss J. F. Taylor, Morkeu, Aberdeen; and Mr. A. Robb, gardener, Glenburnie Park, Aberdeen, were the most successful in the classes for Begonias, Pelargoniums and zonal Pelargoniums. In the class for a collection of nine dishes of different kinds of fruit, Mr. A. Hutton, gardener to George Keith, Esq., Usan, Montrose, was unfortunately disqualified owing to his having more than two dishes of Peaches. The first award then went to Mr. A. Reid, gardener to — Baird, Esq., Durris. Messrs. D. & W. Croll, Dundee, took the lead for H. P. Roses; but Messrs. Adam & Craigmile, Rubislaw, made a very close second. They came to the front for Tea Roses, beating Messrs. D. & W. Croll. In the non-competitive class Messrs. James Cocker & Son, Union Street, Aberdeen, filled a whole tent with Roses, Carnations, Sweet Peas and other flowers. Messrs. W. Smith & Sons, Market Street, Aberdeen, exhibited floral decorations, hardy cut flowers, stove and greenhouse plants. Mr. John Smellie, Busby, took the leading prize for Cactus Dahlias. Gooseberries and Strawberries were particularly good.

Daffodils Amongst Ripening Corn.—Surely the poet's licence is a far reaching one, since it allows him to sing of Daffodils amongst ripening Corn.

Erratum.—Under the heading of "People we have met" in our last issue, when noticing Mr. Wm. B. Hartland, will our readers kindly read for "James Early, Esq., of Kingston," "James Earl of Kingston."

Marriage of Mr. George H. Barr.—On August 11th, at Marylebone Parish Church, by the Rev. Hawley Sharpe, George Hewlings, youngest son of Peter Barr, of King Street, Covent Garden, to Lizzie, only daughter of Thomas Rawsley, of 39, York Street, Portman Square, W. A merry gathering sat to a most substantial dinner at the Holborn Restaurant, on Saturday evening, August 13th, at 6.30 precisely, on the occasion of Mr. George H. Barr's marriage, one of the firm of Messrs. Barr & Sons, of Covent Garden and Long Ditton. Mr. Rudolph Barr acted as president with Mr. Wm. Barr as vice, and both filled the respective positions admirably. There was a goodly number of their employees present, including a few friends, who spent a most enjoyable evening. After dinner the toast of "The Queen" was proposed from the chair, to whom reference was made as a great friend to all departments appertaining to gardens and gardening. All standing sang the National Anthem to the sweet strains from the piano. The vice-president proposed the health and safe return of Mr. Peter Barr who was now enjoying a well-earned holiday in America and elsewhere, and probably will be away for two or three years. He dilated at length upon his father's abilities in the various branches of horti- and floriculture, and sincerely hoped that all present would be with the firm and sit at the same table to welcome him when he returned, with him (Mr. Peter Barr) in the chair. Mr. T. Downes proposed the health of the ladies and Mr. Wm. Logan responded in a few well chosen and complimentary words. Mr. Rudolph Barr proposed the health of the employees and hoped that as many present had been in the firm for more years than he would care to say, yet he was delighted to say that they had been, and hoped that they would continue to work together in the future with the same love and spirit that they had in the past. Mr. J. de Gruchy (the oldest member of the staff) responded in very neat and respectful phraseology. Mr. George Leslie proposed the health of Mr. George Barr, coupling with it that of his bride, and expressed a wish that he and his co-workers hoped that an occasion similar to the present was in the near future. This was responded to by Mr. Rudolph Barr, who said that it certainly would come off, but he was not prepared to say when. The health of the "Visitors and Friends" was proposed by Mr. Tom Warburton, who dilated copiously on the number of strangers to England he had met in his travels abroad who had made "Barr" almost a household word. Mr. Rudolph Barr remarked in a very jocular manner how pleased he was to find that he did not have to go outside for Harry Randall's or Dan Leno's, &c., for talent, as those of his staff were sufficient to provide a most enjoyable evening according to the programme he had before him. The president gave the first on the programme "The Speaker's Eye" which was enthusiastically received and encored, with "Those Girls at the School." Mr. W. Logan though nervous, gave the "Bedouin Love Song" in fine style, his voice filling the spacious hall. Mr. Wm. Barr followed by a 'cello solo, and nothing less than an encore would satisfy the attentive hearers. Mr. H. Harris gave the "Alabama Coon"; Mr. Wilks, "The King's Own"; Mr. Tom Warburton, a recitation that completely carried the audience away with his dramatic rendering of the "Actor's Story"; Mr. W. Wilbraham came forward with a comic song, "The Whitewasher" which caused much laughter; and as an encore the "Green Grass Grew All Round" equally amusing. Mr. Wm. Logan's rendering of "Queen of the Earth" was cordially received, and nothing would suffice but an encore, with "Mary of Argyll" in clear voice. Mr. R. Barr followed with "Sister Mary"; and Mr. W. Barr with a 'cello solo. Lady singers were few, Miss Rapp being the only one prepared, and who sang in sweet contralto "Sunshine Above" and "Coming thro' the Rye." After the usual vote of thanks a very pleasant evening came to a close.

CRESTED BRACKEN.

THIS is an actual reality, though not mentioned in the recent edition of the *London Catalogue*, nor by the late Mr. Thos. Moore, of Chelsea, in his *British Ferns and their Allies*, though he records the crested form of the Royal Fern. Mr. C. B. Green, Acton, W., who is an enthusiastic grower and collector of Ferns, sends us mounted specimens of pinnae cut from a frond about 6 ft. high, and which he gathered in St. Leonard's Forest, near Horsham, Sussex, on the 13th inst. The apex of the frond was very fine, and is in the possession of Mr. C. T. Druery, the well-known enthusiastic pteridologist, who was travelling with Mr. Green at the time, and was sorry the find was not one of his own. *Pteris aquilina cristata*, he says, has only been found three times before, so that the present is the fourth time it has been collected in a wild state. The apex of the pinnae and every pinnule are bi-tri-furcate, with the divisions again more or less forked, giving each crest a distinctly tasselled appearance. The secondary pinnules or ultimate segments are entire and quite normal. We have not heard whether the variety is cultivated by anyone, or whether all or only some of the fronds on a rhizome are crested. This would be difficult, of course, to determine without digging up the entire plant. Mr. Green is trying to raise it from spores. If only single fronds occur in the crested condition the form in question must be a *lusus Naturae*.

LEITH FLOWER SHOW.

LEITH Horticultural Society arranged their fifteenth annual show in Victoria Park, Bonnington, on August 19th and 20th. Leith Town Council granted the park, which was a very suitable one. Hitherto the show has but lasted a day, but the addition of a day has been thought to increase the interest in the exhibition. Athleticism, as represented by races, &c., has been coupled with the calmer recreation got from horticulture.

There were 660 entries, against 699 last year. The industrial and juvenile sections are a pet feature. Model yachts were largely displayed, also fretwork, wood carvings, and model engines. Women's work was shown in shawls and such like and bakery. The juveniles had an array of free and geometrical drawing designs.

Regarded as a whole, the show was only of medium quality. Vegetables were of normal merit. Cauliflowers were extremely poor. Mr. J. F. Nairn, Cramond, stood first. The prize-winning Turnips were fair, being of goodly form and clean. Potato classes were a very even lot, and well represented. Mr. J. F. Nairn won in the Celery exhibit. Amateurs' greenhouse plants were, perhaps, fair for city folks, but their appearance evidenced no great care in cultural detail.

Mr. Hugh Dickson's stand from Belfast contained Roses of remarkably high colour and fine form. The cream of the batch were Mad. Eugene Verdier, Fisher Holmes, Gustave Piganeau and Sir Roland Hill, this latter an intensely deep blood-coloured variety. This was the only entry for Roses in the nurserymen's class.

For twenty-four herbaceous spikes or bunches, Mr. C. Irvine, Jedburgh, beat Mr. A. Brown, Piershill. Mr. Irvine also staged a host of Pentstemon spikes. He makes these a speciality, and though I did not measure the width of the mouth of the corolla, one feels sure in saying they would stretch an inch and a half. Everybody remarked them as "the best ever they saw."

Black Grapes were shown in nice condition. Mr. A. Clark, Trinity, was first; and Mr. Hunt, Coldbridge Hall, Murrayfield, was second. Other fruits were only second rate. Hardy Ferns were everywhere about the tent, many being vigorous and pleasing.

Messrs. M. S. & J. Gillespie, Leith, received a Gold Medal for a table of floral designs. Strikingly beautiful and novel was the model of a large bell. The outside was covered with crimson-scarlet Gladioli, while the inside was shown up by white Pinks and Gardenias. A single bloom of *Lilium candidum* answered superbly as the bell's tongue. Smilax and the same Gladioli were arranged twinedly down the supporting frame. Shower bouquets, harps, and crosses were other designs. In the composition of the harp, pink Asters formed a central band to the frame; a thin white line ran on either side of the Asters, while delicate Smilax fringed the

outside. A beautiful basket of Sweet Peas was also very tasty. Various colours were grouped in bunches and pleasingly blended.

We are glad to say the show days were both fine and a large surplus of money should be on hand, to provide larger prizes, and so secure greater quality in produce another year.—*Harrison D.*

BLACKPOOL FLOWER SHOW.

THE Blackpool and Fylde Horticultural Society held their second annual show in St. John's Schoolroom on the 17th inst. The entries were considerably in excess of last year, being 270 as compared with 190. The show was opened by Alderman Cocker, the president, who spoke of the aims and opportunities of the society, and rejoiced in its prosperity. He said that the committee might do worse than start a co-operative society to provide plants on a cheap scale for the gardens on the promenade, and maintain the same. As a shareholder he would give £200 with that object in view. The work of the society was to encourage horticulturists generally in the higher branches, and to promote flower culture as much as possible. Several speakers supported Dr. Cocker's suggestion.

The exhibits were of a high order of merit, except in some of the cut flower classes, though the collections were good. There were 55 classes for cut flowers, 112 for vegetables, 19 for fruit, and a few for industrial exhibits. There were four entries for the collection of twelve varieties of vegetables, and Mr. J. Collins was first. Mr. G. Rockliffe, gardener to T. G. Lumb, Esq., would have been an easy first but for the omission of Potatos from his exhibit, but for that reason was placed second. Tomatos and Potatos were well represented in the classes for them. Mr. Butler, gardener to G. H. Harrop, Esq., easily led the way for a group of plants amongst four entries. He had a grotto arrangement with Crotons, Pandanus, Cocos and other Palms, Acalypha, Gloxinias, Dracaenas, Begonias, Campanulas, &c., all tastefully arranged. Mr. G. Rockliffe made a very creditable second. Mr. Jos. Pasquill, gardener to T. Blane, Esq., was third. Messrs. Peter Cardwell & Sons took the lead for hardy shrubs and evergreens suitable for Blackpool, showing Veronica, Euonymus, Holly, Tamarisk, Rhododendron and Aucuba.

For non-competitive exhibits Certificates of Merit were awarded to Mr. W. Troughton, Preston; Messrs. F. W. Dicks & Co., Manchester; Mr. Wm. Colchester, Ipswich, represented locally by Mr. J. Brownsett, who made a speciality of Ichthemic Guano, which was new to the district; Mr. Tom G. Lumb; Mr. R. Aitken; Mr. J. Brownsett; Mr. W. Thom; Mr. P. Cannon; Mr. Heaton, gardener to the Winter Gardens Co.; and Alderman Cardwell, who showed both plants and vegetables.

The judges for plants and flowers were Mr. Wm. Tunnington, Liverpool, and Mr. Hargreaves, Lancaster; for fruit, vegetables, eggs, butter and front gardens, Messrs. Hathaway and Tomkins, Southport.

NATIONAL CO-OPERATIVE FLOWER SHOW AND FESTIVAL.

August 19th and 20th.

THE eleventh great annual occurrence of the "One and All" flower show and National Co-operative festival took place as usual at the Crystal Palace. Operations and meetings commenced on Tuesday at the Palace, and continued till the end of the week. The flower show was opened on Friday the 19th, by Earl Grey, K.G., accompanied by the Countess Grey and Lady Victoria Grey, and the great gathering culminated in the National Co-operative Festival on the 20th. Splendid weather favoured the proceedings throughout the entire week, and on the last day there was an immense gathering of people from all parts of the country.

The entries exceeded in number and variety any one of the previous exhibitions. They numbered 4,321 and the exhibits amounted to more than 5,000. The show of fruits, flowers and vegetables occupied the whole of the central nave of the Palace, both the central and the side staging, the industrial exhibits being in the north nave, and professional gardeners' and amateurs' in the south nave. There were sixty-one collections of vegetables, the workmen each showing six kinds, and the gardeners ten. There

were twenty-four minor collections; and the vegetables altogether amounted to 500 exhibits.

INDUSTRIAL CO-OPERATIVE SOCIETIES.

The industrial exhibits numbered four to one of the gardeners'. Thus the former had 239 dishes of Potatos; 146 dishes of various kinds of Beans; 107 entries of Vegetable Marrows; 86 of Onions; 83 of garden Turnips; 79 of Peas; 79 of Beet; 60 of Shalots; 56 of garden Carrots; 53 of Lettuces; 38 of Parsley; 35 of Celery; 31 of Cabbages; 24 of Cauliflowers; 43 of Cucumbers; 28 of Tomatos; 15 of Radishes and 11 of Leeks. The exhibits of cut flowers from workmen's gardens numbered 504; they also had 257 entries of pot plants; and 159 entries of fruit, the latter being more numerous and finer than ever we have seen them before.

While we noted a marked improvement everywhere, nowhere was more skill and taste displayed than amongst the vegetables. First prizes for collections of vegetables were taken by Mr. G. North, Banbury; Mr. C. Luff, Bromley; Mr. W. Biles, of the Sydney Herbert Society; Mr. E. Page, Lechlade; Mr. J. Yorke, Desborough; Mr. L. Daft, Long Eaton, and several others. The quality of the produce was of a very high order of merit, particularly the Potatos, Carrots, Broad Beans, Scarlet Runners, Peas, Parsnips, Onions, Cauliflowers, Celery, &c. Hardy fruit and a few bunches of Grapes were wonderful.

AGRICULTURAL AND HORTICULTURAL ASSOCIATION.

The flowers and plants exhibited by the members of this section of the show were very numerous; and in the case of Fuchsias, Ferns, Coleus, and hardy flowers the display was attractive. The first prize lot of herbaceous flowers was exhibited by Mr. C. F. Wood, gardener to St. B. Sladen, Esq., Reigate. Very fine were his bunches of *Lathyrus platyphyllus* albus, *Veratrum nigrum*, Phloxes, and *Montbretias*. He also had the best *épergne* of cut flowers.

Mr. R. Chamberlain, gardener to F. M. Souergan, Esq., Reading, was second with very similar species of plants. Mr. C. Moody, Penge, had the best annuals in pots showing, amongst other things, *Torenia Fournieri*. Mr. F. Batt, Norwood, had the best pot of dwarf *Lobelia*. Mr. J. Galley, Penge, had the best *Fuchsia*. Mr. J. Constable, West Norwood, had the best collection of Ferns, which were British. Mr. R. E. Stillwell, Bromley, had the best collection of Maidenhair Ferns; and Mr. R. Robertson had the best *Coleus*. Other flowers shown were Stocks, China Asters, Lilies, Ivy-leaved *Pelargoniums*, &c. The first prize for a collection of flowers and plants was taken by Mr. W. Smith, Mr. C. Moody being second.

Fruit was better represented than on former occasions, particularly hardy kinds. Mr. Thos. Osman, gardener to L. J. Baker, Esq., Chertsey, had the best black Grapes in Black Hamburgh. Mr. W. Taylor, gardener to C. Bayer, Esq., Forest Hill, was second with Madresfield Court, and Mr. C. J. Waite, gardener to Sir P. Talbot, Esher, came in third with nice bunches of Gros Maroc. Mr. W. Taylor came to the front for white Grapes, followed by Mr. T. Osman and Mr. C. J. Waite respectively. Mr. A. Chapman, gardener to Sir E. Walter, had the best Peaches. Mr. G. Cheal, gardener to Sir W. Farquhar, Dorking, had the finest Nectarines. Mr. C. J. Waite took the lead for dessert Pears. Mr. W. Taylor had the best cooking Plums, and Mr. C. J. Waite came to the front for dessert varieties. He also took the lead in the class for a collection of fruit represented by eight bunches of Grapes, two Melons, two dishes each of Peaches, Nectarines and Apricots. Mr. Thos. Osman took the second place with greater variety, but less quality in some cases. The latter came to the front for five dishes of fruit grown in the open air. Mr. R. Chamberlain was second. Apricots, Cherries, Red and White Currants and Gooseberries were also well shown. Mr. J. E. Bughy, Desboro', had the best Gooseberries. Mr. S. Chapman took the premier position for cooking Apples, which were good. Mr. R. Felton, gardener to R. B. Berens, Esq., St. Mary Cray, had the best dessert Apples. Both classes of this fruit were abundantly shown.

Vegetables were abundant and generally good. The leading place for a collection of ten sorts was taken by Mr. C. J. Waite, who had grand samples of Potatos, Tomatos, Onions, Celery, Beet, Scarlet Runners, Leeks, Carrots, Cauliflowers and Peas. Mr. J. Nowell had the best ten vegetables in another

class. Scarlet Runners were abundant and best shown by Mr. J. Holton, Oxford. French Beans, Broad Beans, Beet, Carrots, Cauliflower and Celery were also well shown. Mr. J. Holton took two of the leading prizes for Carrots, and the first for red Celery and Leeks. Mr. W. Omerton, Bucks., had the best spring sown Onions, and Mr. J. Holton was first in another class. Mr. R. Waham had the best autumn sown Onions. Altogether the Onions were abundant and excellent, but wanted a little trimming. Potatos were notable for their enormous size. Mr. C. J. Waite had the best six white dishes, the best dishes of white kidneys, and round white. Mr. W. Omerton had the best dish of round coloured, and Mr. J. Holton the best coloured kidneys. Quality generally was very good. Tomatos were abundant, the best dish coming from Mr. O. Basile, gardener to the Rev. O. L. Powell, Weybridge. Vegetable Marrows were of better quality than we have seen on former occasions here. Mr. J. Humphrey took the leading consolation prize for vegetables. Mr. C. J. Waite took the lead in the large collection of vegetables, and included a large number of varieties. Mr. O. Basile was a good second, and Mr. W. Smith, third.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, exhibited a collection of hardy cut flowers of Lilies, Phloxes, Gaillardias, Statice, *Echinacea purpurea*, &c., on two separate tables. The Royal Arsenal Co-operative Society, Ltd., exhibited a fine and varied collection of the Bostal Farm produce, from Woolwich and Plumstead.

The Orchid Grower's Calendar.

DENDROBIUMS.—This beautiful and extensive genus, when well done, pays to grow as well as most Orchids. So much, however, depends on attention being paid to the proper ripening off of the newly made up pseudobulbs, that just a few words at this period will no doubt be acceptable to amateurs who make their culture a speciality.

That to flower them well they must make good strong growths is apparent. It is equally essential that they should, to produce the best results, have a good season of rest. Therefore, those plants that have made up this year's new growths should be removed to a more airy structure, where the atmosphere is much drier and the light plentiful. It, however, would not be wise to expose them all at once to full sunshine during the hottest part of the day or they would dry up too quickly. Give a light shade at first and syringe the plants overhead for a week or two until they get used to the altered conditions.

D. nobile, which, after all is the most serviceable for supplying cut flowers early in the year, will stand any amount of rough treatment, for you may find it growing under most varied conditions; but it undoubtedly responds best when treated to plenty of heat during growth, and a good sound rest when the growths are made up.

D. FALCONERII.—This is a most beautiful *Dendrobie* hut one that does not seem to be so well understood. The best plants I ever saw grown were given the heat of the East India house in which to grow, and afterwards rested in a vinery. Grown in this way, from three to five hundred flowers to a plant were obtained. It would be impossible to do this if the plants were kept in heat, as they would always be on the move.

Then we have *D. densiflorum*, and *D. Farmeri*, which is identical in habit, requiring similar treatment as regards heat and moisture when growing freely. But they should not be allowed to shrivel to the extent practised with the two preceding varieties when at rest, or the graceful racemes will be short and the flowers poor.

Of garden hybrids, *D. leechianum*, one of Mr. Swan's raising from *D. aureum* and *D. nobile*, and the similar cross, *D. Ainsworthi*, and *D. dominianum*, all of which claim the good old *D. nobile* for one of their parents, require similar treatment to that species as regards culture, as does *D. splendidissimum*. The *D. highhum* section seems to require to be kept in rather strong heat all the year round, and the resting induced by withholding water from the roots, and by exposing them to all the light and air possible. A stove where Crotons are grown seems to suit them admirably.—C.

HINTS FOR AMATEURS.

Strawberry Runners.—Now that the runners which were pegged down in small potfuls of soil have had time to root they may be cut away from the parent plant at once, as this will give an opportunity of clearing off the rubbish from the old plantation, and of putting things ship-shape in that quarter.

Potting for Forcing.—The forcing of Strawberries is not by any means a difficult operation, for if the plants are treated at all well they will surely bear fruit, but there is a good deal of labour attached to the work, and those amateurs who embark upon it must make up their minds for this. Not a day should be lost in getting the plants potted up into their fruiting pots, for it is necessary that they should not be cramped up in the small ones any longer than is absolutely unavoidable. The plants need a good long season of growth to enable them to develop and mature their crowns.

The soil may consist of two-thirds of good loam, and one-third of old Mushroom bed manure, with, say, a quart of soot to each bushel of soil, and a fair sprinkling of coarse river sand. Mix the whole lot well together by repeated turnings. The condition of the soil with regard to moisture is an important point, for as the rammer will have to be used pretty freely during the potting process, in order to impart the necessary firmness, it will not do to have the soil too wet, otherwise it will become caked and unkindly for the roots of the plants. A good test for moisture conditions is to take up a little soil and squeeze it in the hands. If it is in fit state for use the particles will adhere together, but without "caking," and will separate on being thrown back on the bench.

Six-inch pots are the best size to use. They should be clean and well drained, with plenty of crocks in the bottom, and a layer of the rougher parts of the compost placed next to this. Some growers like to give a dusting of soot next to this, but this is more or less of a "fad," for the soot is much better incorporated with the soil in the first place. Pot firmly, and if the soil is in the condition recommended the rammer may be used with freedom. A thin lath or long wooden label should be used to work the soil equally round the sides of the balls, so that no hollow places may be left.

Strawberries are exceedingly thirsty subjects, and will need a lot of water presently, hence the pots should only be filled with soil to within three quarters of an inch or an inch of the top. This will allow of sufficient water being given at one application to thoroughly soak the ball.

Varieties for Forcing.—Of the numerous varieties of Strawberries that are in cultivation only comparatively few of them can be recommended for forcing. For general purposes there is nothing to beat Royal Sovereign, which takes very kindly to either early or late forcing. The plants crop well, and what is of considerable importance the fruits ripen regularly and at the same time as each other. Thus a batch of plants started at the same time and kept under the same conditions will all ripen their fruits at the same time. This is important, because it is a waste of space to keep plants hanging on for the sake of one or two fruits that may not be ripe when the room is wanted for succeeding batches. The fruit of Royal Sovereign is, moreover, of first-class appearance as well as high flavour, and another good quality, the flesh is firm and travels well. Laxton's Noble is a favourite in some quarters by reason of its good hearing qualities, and the fact that the fruit, although deficient in flavour, is very attractive in appearance. We should, however, prefer either the old Sir Joseph Paxton or Vicomtesse Hericart de Thury to it. Both of these do well, and the fruit is of capital flavour. August Nicaise and La Grosse Sucrée are two other good forcing varieties, and Keens' Seedling is not to be despised.

British Queen is pre-eminent amongst Strawberries for high flavour, but it is a very poor doer either when forced hard or when grown in the open ground. Some excellent fruit may, however, generally be obtained by potting up a hatch of plants, and allowing them to come along gradually and ripen their fruit just before the open air crops turn in. This system is well worth a trial by those who have failed with British Queen when they have attempted to grow it in the ordinary way. The plants may be

placed at the commencement of the year on a shelf in a Peach house, where the coolness and moisture that prevails will largely dispel the fear of red spider.

Zonal Pelargoniums for Winter Flowering.—Up to within a fortnight ago these plants had not made very much growth, but since the end of the first week in the month they have come along very quickly. The pinching off of flower buds will now be an operation requiring constant care, whilst shoots that are observed to be growing away at the expense of the others must be pinched in good time, otherwise unshapely, one-sided plants will be developed. Careful feeding with stimulants must now receive attention, but the thing should not be overdone, even to the extent of producing rank growth in the plants, for this should be avoided carefully.

Show and Regal Pelargoniums.—For the last six weeks the plants have been basking in the open, in the full enjoyment of the sun's rays, so that now the wood is well ripened, as may be easily seen by its rich brown hue. Pruning should, therefore, be resorted to without delay, the plants being allowed to become fairly dry at the root beforehand. This is quite a simple operation, and all that is needed is a sharp knife and sufficient experience to tell the difference between last year's wood and that of this year's production, which is not at all a difficult matter, for the older wood is harder and much darker brown, whilst the bark is thicker and rougher.

Pruning consists in cutting back the growths to within two or three eyes, say an inch, of last season's growth. The cuts should be made short and clean, and not long and ragged, as they far too frequently are, even in gardens where professional gardeners have the management; indeed, the pruning of stove and greenhouse plants very often to be seen leaves much to be desired.

After the old plants have been cut back in the manner indicated they should be given the shelter of a cold frame. Here they may be stood pot thick together, as there are no tops to occupy space. Meanwhile the soil should not be soaked with water, for an occasional sprinkle by means of the syringe will be quite sufficient, and will, moreover, assist the plants in breaking into growth. The frame in which the plants are should not be kept too close, but air should be given during the day, although the lights may be shut up at night. Potting will require to be seen to when the young shoots make their appearance.

Cuttings.—Old plants may be grown on year after year with advantage, and they really increase in usefulness each season, at least where large plants that will produce many flowers are wanted. As the plants are, moreover, pretty tough and hard to kill, there is very little danger of the stock diminishing. It is occasionally advisable, however, to increase the stock of particular sorts for which a special fancy is evinced, or which are of more than ordinary value to the grower. The approved method of doing this is by cuttings, and as cuttings are to be obtained in quantities from the prunings of the old plants. The present is the most suitable time to work up an increased stock of any chosen varieties. As a rule, with most plants the tips of the growths are the most suitable portions to select for cuttings, but in the case of these Pelargoniums the tips are very weak and spindly, having reached their natural limit of growth for the season. The shoots should, therefore, be cut up into lengths of about 5 in. each, and the stouter portions selected. Each cutting will be furnished with a number of leaves, and the lower of these should be removed in the usual way in order to admit of the cutting being inserted in the soil.

Very light sandy soil is necessary in order to get the cuttings to strike properly. Sixty-sized pots will be found the handiest, and if the cuttings are put all round the sides of the pot the latter will easily hold five or six of them. Make the soil fairly firm, so that the cuttings are not easily pulled out during the process of shifting about.

Varying treatment is accorded the cuttings by different cultivators. A favourite plan is to put them in a cold frame, and keep the frame fairly close and the cuttings rather dry at the root until they have rooted. The production of roots is, however, rather slow under such conditions, and the plants are a long time before they make good flowering specimens. The best way of inducing the cuttings to strike root speedily is to put them in heat. A place on a shelf near the glass in a warm

pit will suit them admirably. Under such conditions there is no need to limit the water supply, but they may be treated much the same as other cuttings in that respect. An occasional sprinkle with the syringe will do them good.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Drying Mint.—*Mint*: The proper time to cut Spearmint (*Mentha viridis*) for drying is just when it is coming into flower. Cut the stems back to within a couple of inches of the ground, and lay them out in a sunny place to dry. Beyond that nothing will be needed. The Mint thus dried will be brown in colour, and is not largely favoured by cooks who prefer to obtain green-dried Mint by placing the leaves in a hot oven for a while. Under such treatment the green colour is retained, but much of the essential oil, which is rather volatile, is driven off. The plants will throw out young shoots from the bottom after they have been cut back, and these will probably prove more useful than the flowering stems.

Mirabilis Jalapa.—*Emu*: This pretty plant, popularly known as Marvel of Peru, is really a perennial, but it is usually grown in this country as an annual, the seeds being sown in heat under glass early in March, and the young plants subsequently transferred to the open border as the weather permits. The tuberous roots which you speak of as being something like those of Dahlias can be lifted in the autumn, stored during the winter, and planted again in the spring to flower in the following summer the same way as Dahlias are commonly treated. The plant will grow in any ordinary garden soil, and as it generally flowers pretty freely is well worthy of attention as a border subject.

The Sensitive Plant.—*U.* The subject to which this name is commonly applied in this country is *Mimosa pudica*, but there are many other species of *Mimosa* which have leaves which prove sensitive to the touch. You may grow *M. pudica* in a window in an ordinary dwelling room during the summer months, but the seed must be sown and the plant reared to a certain size in heat, whilst as the autumn wears on and the temperature begins to fall, the leaves begin to drop, and presently only the bare stems are left. *M. pudica* is really a tropical or subtropical subject, as are most of its congeners.

Seedling Double, Tuberous Begonias.—*Foe.* The flowers sent are certainly large enough, but size is not the only thing that is wanted. Most of them have the heavy many-centred flowers, and this is a serious defect. The colours are good, however, and if the plants are free flowering the varieties would prove useful for decorative purposes to yourself and friends. Further than that we cannot hold out any hopes, for there are innumerable varieties now in cultivation, many named, and many others unnamed. For a person who wants to work up a stock, whether of single or double flowered varieties, the best plan is to purchase a packet of seed, sow it early in the spring, put out the plants in trial beds, select the colours and the varieties that suit him best, mark them, lift them in the autumn, and grow them on again next spring. There are comparatively few establishments where expensive, high class varieties are purchased.

Stocks Coming Single.—In a bed of ten-week Stocks that I have in my garden about 30 per cent. of the plants are producing single flowers. Has the drought had anything to do with this?—*E. A. G.*

The drought may certainly have had some effect upon the plants in the way you suggest, but it is very difficult to assign a reason for the variation of stocks of flowers and vegetables. A certain percentage of plants are almost sure to throw double flowers in any season, and this percentage varies considerably. Did you purchase your seed from a reliable source? Good seed is apparently high priced because it represents the results of much labour and incessant vigilance on the part of the part of the seed grower.

Asparagus plumosus nanus.—*Perplexed*: There is nothing for it but to cut the growths out. It will be

impossible to free the plant from the mealy bug otherwise. Fumigation is no use, and liquid insecticides will not penetrate the net work of fine leaves. The only thing therefore is to cut the dirty growths away and have a fresh start. Keep the plant a little drier at the root after it is cut back until the young growths show.

Peas.—Mearns.—The Peas have got mildew badly. You can do nothing except see that the plants get all the nourishment possible, and that during periods of drought they do not suffer from lack of water.

GORING HALL GARDENS.

THE accompanying illustration shows a view in the well-kept garden of Major Lyon, Goring Hall, near Worthing, Sussex. The close-mown green sward has numerous large beds distributed in suitable situations over it. A bold display of herbaceous plants occupies a border on the left, many of the

ALLINGTON NURSERIES.

ALTOGETHER the Royal Nurseries, Maidstone, run to something like 310 acres, including the nurseries proper and the seed farm, besides 66 glasshouses, chiefly in the town of Maidstone itself. Messrs. George Bunyard & Co. are known to our readers chiefly as pomologists or fruit growers, but they really transact a general nursery business, as we shall endeavour to show. Their seed business is also growing, and they grow the seeds of their own specialities themselves.

The London, Chatham and Dover Railway runs alongside of their Allington Nurseries, where the thousands of hardy fruit trees are raised to be disseminated broadcast all over the country. Every convenience for alighting at this spot is afforded by the station at Barming, for the visitor has only to cross the line to find himself in the midst of the trees which bear the far-famed Kentish fruit, particularly Apples. The Allington Nurseries are about

preventing the loss of moisture through evaporation. This is one of the great secrets of success, and an example that might well be followed by every fruit grower.

MEDLARS, PLUMS, CHERRIES, PEACHES, APRICOTS.

We saw so many useful things and samples of good culture that we must necessarily be brief, so as to cover the wide field as we hurriedly paced it. We first came upon a plantation of Medlars, grafted on the White Thorn, and observed two-year-old trees fruiting, as a result of two successive dry summers. Usually they take three or four summers before they commence bearing. The red and yellow fruited varieties of the Myrobalan Plum are the favourite stocks for standards. There are 30,000 trees of the wild Mazard used as stocks for Cherry trees. There are also Plum stocks and the thorny wild Pear stock, and all of the above stocks have made excellent growth.

A collection of Japanese Plums, which have been

E. EDWARDS.]

GORING HALL GARDENS.

[EXCELSIOR STUDIO, NEW STREET, WORTHING.

June and July subjects being in bloom at the time the photograph was taken. Araucarias, Cedars and deciduous trees, which shelter the garden, and some of the glasshouses, may be noted over the top of the well-kept hedges. The general upkeep of the place does great credit to Mr. W. Greenyer, the gardener.

The photograph from which the illustration was taken and lent us by Mr. Ed. Owen Greening, was sent to the "One and All" flower show photographic competition, in connection with the National Co-operative Show at the Crystal Palace, an account of which we give on another page. Prizes have been offered for photographs of gardens, large and small, garden and sylvan scenery, window boxes, &c., for the last three years by the "One and All" association, and the recent exhibition of photographs was the largest that has yet been got together, so that this competition has now become a well-established and important section of the great annual show.

1½ miles out of town, and lie on rising ground commanding a fine prospect of the North Downs on the other side of the valley, with corn, Hop fields and orchards spread out like a panorama before the eye. The soil here is a rich sandy loam, overlying the Kentish rag, and that it is rich one has only to look upon the cornfields, which, however, are well farmed. It was a burning hot day on the occasion of our visit, but the splendid breeze made us equal to the occasion of tramping over the wide acres without the slightest sensation of fatigue.

In spite of the heat and drought, the fruit trees have made excellent growth, though none of them are mulched, while watering is entirely out of the question. The ground beneath the trees is bare and clear of weeds, for an Exmoor pony is kept at work, and nimbly but patiently steps over the ground up one row and down the other, dragging a kind of five-toothed hoe or cultivator, which scarifies the surface and keeps it loose, killing the weeds and

creating a considerable amount of discussion in America, has been got together here, and amongst them we noted *Prunus Mume* and *P. Satsuma*, both belonging to the same section as the Myrobalan. We may here mention that Burbank's novelties have found their way here, including Giant Prune, Apple, America, Chalco, Wickson, and the Burbank Plum. The fruit of the latter is about the size and shape of Monarch, and when approaching maturity becomes first clear, sub transparent yellow, then overlaid with pale to deep rosy-purple. The flesh is yellow, flavoured like an Aprioot and very pleasant. It is very distinct in its way, and from all appearances will be a great acquisition for orchard house culture. It also does well at Margate in the neighbourhood of the sea, and should also prove hardy in the south and west of England.

Elsewhere we came across a fine plantation of the well-known Plum, Monarch, in maiden trees that have made growths 3 ft. to 5 ft. high, and propor-

tionately stout, and branched. The variety Rivers' Prolific seems to be held in high estimation, seeing that 40,000 trees of it are grown here, very largely, if not chiefly, in the form of standards. The Czar is grown more or less in the pyramidal form, and the fruit is now ripe and of high quality in the open nursery. The Plums have been wonderfully free from aphids, and their leaves glitter in the sunshine.

Here may be seen the finest collection of Kentish and English orchard Cherries generally, chiefly Bigarreus and Napoleons, grown in the form of full standards with stems $5\frac{1}{2}$ ft. to 6 ft. high, and all in robust vigour. On the other side of the pathway is a fine plantation of trees for the market people, which may be cut or pruned to form bushes or standards according to their liking. Peaches are grown in great numbers, trained and untrained. Some of them, including Sea Eagle, were making splendid growths; and, indeed, this was the case generally except where the trees were hopelessly crippled by the fierce and bitter cold winds of April. They are trained both in the fan and espalier forms, as are Apricots. Curiously enough the latter had not been injured in any way by the cold winds. A quantity of Peach and other trees purchased at Messrs. Lee's sale have made excellent growth the first season in the soil of Kent. Elsewhere we came upon more standard Cherries in grand form; and were informed that 10,000 trees in this form are grown. A plantation of American Peaches of the early ripening kinds, for culture in the open air was also interesting.

PEARS.

This is decidedly not a Pear year; indeed, in many gardens they are a failure, for which the cold and ungenial weather is chiefly to blame. They are not altogether a dead letter at Maidstone, however, though it is tantalising to see so many fine trees having so little to do in perfecting a crop. On the walls of the offices and other nursery buildings are many varieties trained in the form of long, oblique cordons, which carry a few fruits, but are destined, we believe, to swell to handsome size in the course of another month or six weeks. Many of the choicest of the old and new varieties are grown in this fashion. In the open ground are some fine plantations of pyramidal trees, two years old. Directeur Hardy is fruiting with exceptional freedom, when others have failed; and this should be a plea for growing numerous varieties, as some of them are sure to afford a supply. Emile d'Heyst usually fruits heavily, but this year very thinly. Williams's Bon Chretien is also fruiting fairly freely; and Jules Guyot, which is similar, is worthy of note, as the tree is a more vigorous grower, and the fruit not liable to spotting. Rivers' Princess carries some fine fruits. Rivers' Beacon is an early Pear, that is doing fairly well. Old Duchess is fruiting well as a tall pyramid. Beurre Jean Van Geert, Louise Bonne of Jersey, and the new Marguerite Marrillat, and others as cordons against a wall are carrying some fine fruits.

APPLES.

The Apple is the king of British hardy fruits, both from a utilitarian point of view, and the readiness with which it responds to cultivation throughout every part of the British Isles, from Land's End to the Orcaades, and in Ireland. Nowhere in these islands does it grow to greater perfection, both in the matter of size and colour, than in Kent, though a few other favoured southern localities are not far behind in this respect, when the cultivator in a private capacity devotes his energies to the care of the trees. The plantations of Apples in the Allington Nurseries make many a cultivator green with envy to see with what facility and ease the trees may be grown, and the size and colour the fruits attain. The trees are pruned and trained in every useful and fanciful form such as bushes, half standards (with stems $4\frac{1}{2}$ ft. high), full standards (6 ft.), pyramids, amateur standards, espaliers, oblique, horizontal and upright cordons, as well as the gridiron form.

In different parts of the ground Cox's Orange Pippin and Allington Pippin are grown in juxtaposition, and the visitor can compare and note their various excellencies or otherwise. Maiden trees of Cox's Orange almost invariably consist of a single stem, while those of Allington Pippin alongside are much taller, more vigorous and freely branched. In the two-year-old plantations the same differences are noticeable. The fruits of Allington Pippin are larger, and when mature have the flavour of the Golden Reinette. A plantation of three-year-old trees of these sorts is well worthy of inspection, for though

both varieties are splendid and bearing freely, the same differences are noticeable. Elsewhere is a line of Allington Pippin, half the trees of which are grown upon the Crab, and are fruitless. The rest of the trees are on the Paradise, and fruiting heavily.

Very interesting is a plantation of old-fashioned, highly flavoured dessert varieties that deserve a great deal more attention than they get. We refer to Russet Nonpareil, Cockle Pippin (an old Sussex dessert Apple), Golden Reinette and Lord Burleigh, all in dwarf form upon the Paradise and fruiting freely.

Alongside of the above and of the same age are fruitful trees of Sturmer Pippin, Lord Grosvenor (a stronger grower than Lord Suffield, and often recommended as a substitute), Mrs. Barron (a large fruiting and handsome Apple), a sort named Gris from Canada, and others. Maiden trees of Golden Spire, Baumann's Red Winter Reinette, and Belle de Pontoise are making wonderful growth. Frogmore Prolific is well named, for it is very prolific, and an Apple with a strangely greasy skin. Lord Derby, Eclinvill Seedling, Stirling Castle, Stone's and King of the Pippins are all fruiting splendidly. Lord Grosvenor has been fetching 7s. a bushel for the fruit in the market. Many of the above sorts are doing well as standards, also Castle Major, a large and handsome fruit.

A plantation of trees ranging from 2 ft. to $3\frac{1}{2}$ ft. high carried crops of fruit that would excite the envy of any pomologist. All are grown upon the Paradise, showing their suitability for this stock. Amongst these, particularly noteworthy are Bramley's Seedling, Grenadier, King of Tomkin's County (an American variety with the promise of a great future before it, as it fruits splendidly), Troughton Gold Medal, Small's Admirable (much favoured in Scotland), Scarlet Lamb, Gladstone and Beauty of Bath, the two latter highly coloured, and now ripe, as the birds have discovered. Equally good are Devonshire Quarrenden, Duke of Devonshire, Jubilee, Baumann's Red Winter Reinette, Yellow Ingestre, Col. Vaughan, Golden Spire, Duchess of Oldenburgh and Peter the Great or Cardinal, a twiggy and fruitful tree, with a clear yellow skin to the fruit, softly streaked with red and now ripe. Numerous trees of it convinced us of its extreme fertility and usefulness for private gardens.

Popular market varieties are grown in great quantities, including 5,000 of Worcester Pearmain. Another large plantation of maiden trees excited our admiration on account of their regularity and vigour. Besides many already mentioned, there were fine plantations of Bismarck, Newtown Wonder, Kerry Pippin, &c. A splendid plantation of three-year old trees left nothing to be desired. The large greenish-yellow fruits of Bielo Borodawka have the flavour of Irish Peach, while the tree is a splendid grower and bearer.

What is known as the trial orchard contains 400 varieties and is well worthy of going a long way to see. The trees are grown in the form of bushes, which are now of some size. We noted only a few of those which were heavily laden, including Tower of Glamis, Dutch Codlin, Mrs. Barron, Lord Grosvenor (which would beat Lord Suffield twenty times over), Ribston, Cox's, Margil, Foster's Seedling, Emperor Napoleon (a showy, early, red fruit), Kerry, Hubbard, Peter the Great, Peasgood's Nonsuch, Warner's King, Red Juneating (mostly gathered), Adam's Pearmain, Emperor Alexander, Sops in Wine, James Grieve (earlier than Cox's Orange) and Pome de Neige, otherwise known as Royal Snow.

Amateurs' standards are cordons which are allowed to run up and then form a head like a standard. They fruit along the stem as well as on the top, and are very handsome for small gardens. They are on the Paradise. They are movable and fruit the first year after planting. Very interesting was a lot of standards, ten years old, and fruiting abundantly. Some are on the Paradise, but most of them on the Crab. Some of them have heads 30 ft. in diameter.

(To be continued.)

SOCIETIES.

FLORAL FETE AT NEWTON-STEWART.— August 10th.

ON Wednesday, the 10th inst., Kirroughtree Park presented a very gay and attractive appearance.

The particular occasion was the Newton-Stewart, Minnigaff and District Horticultural Society's festival, the principal event of the kind in the South of Scotland. In the morning the weather was not at all promising for the event, but as the day advanced the sun broke through and continued to smile upon the day's proceedings, which were of an interesting and enjoyable character. Whatever may have been the success of the past, the society has never held a more gratifying nor encouraging exhibition from every point of view. Mr. Mann, the obliging and courteous secretary, under whose care the society has added greatly to its prosperity and popularity, continues to discharge his duties, with his usual courtesy, energy, and enterprise. The most complete arrangements were made for staging and showing the various exhibits, and one was at once struck with the admirable way in which this work had been carried out. The Galloway Marquee Company, Newton-Stewart, had come to the assistance of the society and put at their disposal a fine commodious marquee, in which the exhibits were displayed to great advantage. Notwithstanding the excellence of last year's show, this exhibition was far surpassing, both in point of quantity and quality. That the society is doing splendid service in developing a taste for floriculture is plainly evidenced, and the secretary and committee deserve to be warmly supported in their efforts to promote this laudable institution.

All the classes were well filled, and it would be difficult to say which section was the most representative. Vegetables and garden produce, generally, were plentiful, while flowers of every variety flourishing at this season of the year were in abundance, and the bloom generally was noticeable for its excellence. In addition to two special trains, one from Whithorn, and one from Stranraer, which brought many visitors to the show, a large number of brakes were also plying backwards and forwards between various parts. The attendance was most encouraging. A great attraction was the military tournament by a detachment of Argyll and Sutherland Highlanders, and the fine music discoursed by their band and pipers. At half-past twelve the exhibition was declared open by Lady Maxwell, who spoke some words of encouragement to the committee of management and the exhibitors, and concluded by thanking Major Armitage for the kind way in which he had introduced her. Provost Matthews and Major Armitage briefly addressed the audience, after which the judging was proceeded with. During the afternoon an excellent programme of music was sustained by the band and pipers. The committee are to be congratulated upon this new departure in securing the services of a detachment of this regiment to give a performance. Their exhibition of physical drill was one of the features of the day's proceedings, and has doubtless done much to add further to the popularity of the society. The rifle firing, bayonet exercise, and physical drill, which were gone through with the utmost precision, seemed to be thoroughly enjoyed by the spectators.

The principal prizewinners in the gardeners' classes were Messrs. Day, Galloway House; Young, Craignean; Silbury, Penninghame; M'Duvall, Mertonhall; Higgins, Craigenvever; and Falconer, Dornhill, Newton Stewart. In the amateur section the honours were divided among Messrs. A. M'Phaty, H. Blain, J. Clement, Stranraer; J. Devoy, Stranraer; and Jas. Stewart, Newton Stewart. In the cottagers' class Messrs. S. Smellie, H. Blain, and J. Muir were among the most successful exhibitors.

SHROPSHIRE HORTICULTURAL.—August 17th and 18th.

LAST year the brilliant success which attended the Royal Jubilee Commemoration Show at Shrewsbury gave rise to the idea that it could not be surpassed, but the imposing show which was again held in the Quarry, Shrewsbury, beat the record by 400 fresh entries, sufficient to make a provincial show in itself. It is the twenty-fourth floral and musical fete that has been held by the Shropshire Horticultural Society, and each succeeding show outgrows the previous one. The entries totalled 2,900, and included entries from all parts of the United Kingdom. There were nearly 400 bunches of Grapes, besides other fruits in abundance. The display everywhere has never been surpassed either in quantity or quality. The groups of plants which filled one of the principal tents have been declared

by competent judges never to have been better. All this was rewarded by £950 of prize money, besides Gold and Silver Medals. The crowds of people that entered the grounds of the Quarry blackened the roads, and at the end of the first day it was found that more than £850 had been taken, the amount being greater by £120 than on the same day last year.

PLANTS.

In addition to our telegram of last week we now give some additional details. The bulk of the classes were open to all. The groups naturally excited a considerable amount of attention. The group of miscellaneous plants, not to occupy more than 300 sq. ft. of space, shown by Mr. Jas. Cypher, Cheltenham, was characterised by airiness, gracefulness, elegance and taste in arrangement. His Humeas, Palms, Aralias, Lilies, Cattleyas and other Orchids produced a most charming effect of light and shade, colour and greenery. The group shown by Mr. W. Finch, of Coventry, well earned the second place on account of its brilliant effects, but the construction of it was heavier. Mr. Roberts, gardener to Miss Wright, Halston Hall, Oswestry, secured the third award.

An equal interest centred in a group of fine foliage plants of similar size. The premier honour was secured by Mr. Edmonds, gardener to the Duke of St. Albans, Bestwood, Notts, who had some magnificent specimens of *Acalypha musaica*, richly coloured and faultless in form. Scarcely less noticeable were his specimen *Crotons*, *Dracaenas*, *Bamboos*, *Begonias*, *Palms*, &c., all displayed to the best advantage. Mr. J. Cypher had to be content with a second place here, though his *Crotons*, *Palms*, and other tall plants were well shown off by smaller plants beneath them. Mr. W. Finch came in third.

The class for thirty stove or greenhouse plants in 10 in. pots also brought out some fine exhibits, amongst which Mr. Lambert, gardener to Lord Harlech, Brogyntyn, took the lead with choice *Ixoras* and *Dipladenias*, profusely flowered, *Phormium tenax variegatum*, *Heliconia illustris*, *Palms* and other subjects. He was followed by Mr. J. Cypher, and Mr. Bremmell, gardener to H. H. France-Hayhurst, Esq., Overley, Wellington, in this order.

Mr. J. Cypher again came to the front for twenty specimen stove and greenhouse plants, taking the Silver Cup. Mr. W. Finch was second. The flowering specimens of *Phoenocoma prolifera Barnesii*, shown by Mr. Cypher, were magnificent examples of cultivation. He again led the way for a specimen plant in flower with *Erica austrianæ*, followed by Mr. Finch, and Mr. Lambert in this order.

Mr. Edward Jones, gardener to A. M. Barber Esq., Field House, Wellington, had the best exotic Ferns; and was followed by Mrs. J. H. Slaney, Sunnycroft, Wellington. Mr. Bird, gardener to Mrs. Watkins, Shotton Hall, Shrewsbury, had the best *Dracaenas*, though not very highly coloured. Mr. Sawley, gardener to Mrs. Darby, Adcot, took the lead for *Caladiums*, which were well grown. For pyramidally-trained *Coleus*, Mr. A. Myers, Shrewsbury, took the premier place, with handsome specimens of medium height. He also had the best *Fuchsias* in one class; and Mr. Walford, gardener to Mrs. Wace, College Hill, Shrewsbury, took the lead in another class. Mr. A. Myers had the best single and double zonal *Pelargoniums*. Mr. B. R. Davis, Yeovil, Somerset, was the champion for tuberous *Begonias*. Mr. J. Parson-Smith, Abbotsmead, Shrewsbury, had dwarf and well-flowered *Gloxinias*, taking the first prize. Mr. Edmonds was again to the fore in the class for table plants.

In the class for thirty miscellaneous plants in 5 in. pots, Mr. Townsend, gardener to Col. R. T. Lloyd, Aston Hall, Oswestry, had a splendid exhibit, showing several fine *Cattleyas* and *Cypripediums*. He was followed by Mr. Bird. Mr. Lambert again came to the front for six stove or greenhouse plants, showing fine *Allamandas*, *Dipladenias* and *Ixoras*. In another class for six, Mr. Innes, gardener to G. Burr, Esq., took the lead with nice plants of moderate size.

Mr. Townsend had the best Orchids in a class open to the county of Shropshire only, showing very fine *Cattleya gigas*, *C. Mossiae* and *C. Mendellii*. Mr. Edward Jones had the best tuberous *Begonias* for Shropshire. Mr. Tugwood, gardener to T. F. Kynnersley, Leighton Hall, Ironbridge, upheld the

honour of the county for a group of miscellaneous plants in a space not exceeding 150 sq. ft. Mr. Bremmell was second. Both of the groups were elegant and airy in arrangement.

CUT FLOWERS.

Many classes were devoted to cut flowers, both for decorative and other purposes. Messrs. Perkins & Sons, Coventry, took the premier honours in the class for six bouquets and six baskets of cut flowers, in which Orchids played a very prominent part, together with *Pancreatiums*, *Lily of the Valley* and *Francoa ramosa*. Messrs. Jones & Sons, Shrewsbury, were second with a beautiful, though less varied display, and Messrs. Jenkinson & Son, Newcastle, Staffs, came in third. Messrs. Perkins & Sons again led for a ball and bridal bouquet, beating Messrs. Pope & Sons, King's Norton, Birmingham. The latter came to the front for similar bouquets, from which Orchids were excluded. Mr. W. Tresseder, Cardiff, had the best shower bouquet of *Cactus Dahlias*, and Messrs. Pope & Sons the best one of Sweet Peas, while Messrs. Perkins & Sons took the lead for a shower bouquet of *Roses*.

Mr. T. Sutton Timmis, Cleveley Hall, Allerton, Liverpool, showed the best twelve bunches of stove and greenhouse flowers, and the best six bunches. Messrs. Harkness & Sons, Bedale, Yorks., were first for *Gladioli* and for hardy flowers; Messrs. D. & W. Croll, Dundee, for a collection and for twenty-four *Roses*; Mr. W. Tresseder, for *Dahlias*; Messrs. Laing & Mather, Kelso-on-Tweed, for *Carnations*; and Mr. J. B. Wood, Ludlow, for twenty-four blooms of *Roses*. Mr. M. Campbell, High Blantyre, led for twenty-four show and *Cactus Dahlias*; Messrs. Keynes, Williams & Co., Salisbury, for twelve bunches of *Pompon Dahlias*; Messrs. Laing & Mather, for *Carnations*; and Messrs. Thomson & Co., Sparkhill, Birmingham, for *Picotées*. Dr. H. H. O. Sankey, Boreatton Park, Baschurch, secured the Eckford Silver Challenge Cup for thirty-six varieties of Mr. Eckford's Sweet Peas. Mr. A. Bessel, Ludlow, took the first award for eighteen varieties of Mr. Eckford's Sweet Peas.

FRUIT.

As is always now expected, the display of fruit at Shrewsbury is of a very extensive, interesting and instructive character, the greatest amount of interest, perhaps, centering in the classes for a dessert table, decorated with plants; and for a collection of garden produce, both classes being judged by points and the money awards distributed in proportion to the number of points scored, as we mentioned last week. The first prize table, shown by Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., Hutton Hall, Guisborough, was decorated with *Montbretias*, *Carnations*, and other cut flowers in an epergne, and some smaller glasses. In the garden produce class the exhibits consisted of six dishes each of fruits and vegetables, together with foliage.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, staged the winning lot of fifteen dishes of fruit, having first-class bunches of *Muscat of Alexandria*, *Alnwick Seedling*, *Canon Hall Muscat*, and *Gros Maroc Grapes*, together with other fruits. He was followed by Mr. J. McIndoe and Mr. J. Edmonds in this order. Mr. J. Jones, gardener to Mrs. F. Need, Malvern, was the leading winner in the class for nine dishes of fruit; and was followed by Mr. Bannerman, gardener to Lord Bagot, Blithfield, Rugeley, and by Mr. A. McCulloch, gardener to W. F. Webb, Esq., Newstead Abbey, Notts, respectively. Mr. Roberts upheld the honour of Shropshire in the county class for nine dishes of fruit. He was followed by Mr. J. Langley, gardener to the Rev. T. M. Bulkeley Owen, Tedsmore Hall, West Felton; and by Mr. S. Bremmell, in this order.

Some of the winners of leading prizes for Grapes were Mr. J. Campbell, gardener to C. E. Newton, Esq., Mickleover Manor, Derby, who took the lead in four of the principal classes; Mr. F. Bannerman; Mr. W. Pilgrim, gardener to Sir T. Meyrick, Bart., Bcdorgan; Mr. A. Kirk, gardener to J. T. Paton, Esq., Norwood, Alloa; Mr. J. Langley; Mr. T. Lambert; and Mr. W. Dawes, gardener to Lord Trevor, Brynkinalt.

Vegetables were abundant and of excellent quality, the Potatos being worthy of special attention. The premier award in the class for nine vegetables, the prizes for which were offered by Messrs. Sutton & Sons, Reading, was secured by Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle,

Newbury. Mr. G. Lye, gardener to Mrs. Kingsmill, Newbury, was a very good second. Mr. J. Bowerman, gardener to C. H. Hoare, Esq., Hackwood Park, Basingstoke, came in third with an exhibit of great excellence; while Mr. T. Wilkins, gardener to Lady Theodora Guest, came in fourth.

Mr. W. Pope took the first prize offered by Messrs. J. Carter & Co., High Holborn, London, for a collection of twelve vegetables, where the prizes were offered by Mr. Edwin Murrell, Shrewsbury. Messrs. Webb & Sons, Wordsley, Stourbridge, also offered prizes for a collection of eight vegetables, and the three leading prizes were taken by Mr. J. Bowerman, Mr. G. Lye, and Mr. T. Wilkins. For the Tomatos grown from Messrs. Webb's seeds, Mr. G. Lye again led the way. The leading prizes offered by Mr. R. Sydenham, Birmingham, were taken by Mr. W. Nicholson, Newcastle, Staffs.; Mr. W. Pope, and Mr. G. Lye.

The first prize for a collection of five dishes of Potatos was taken by Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk. Mr. J. J. Brewin, Brimstage, nr. Birkenhead, had the best three dishes of Potatos; Mr. C. J. Waite, gardener to Sir P. Talbot, Esher, was second, but came to the front for a dish of six Potatos.

Messrs. Adnitt and Naunton, the hon. secretaries, deserve great credit for the clockwork regularity and order with which everything passed off in its own proper groove.

NON-COMPETITIVE EXHIBITS.

Messrs. H. Cannell & Sons, Swanley, Kent, exhibited a gorgeous group of the *Cannas* which they grow so well in pots. All the best modern varieties were represented. (Gold medal.)

Messrs. Webb & Sons, the Queen's Seedsmen, made a fine display, including a bank of their *Excelsior* strain of *Gloxinia*, produced from seed in ten months. *Begonias* were also shown, together with a collection of cut flowers, amongst which was an effective lot of Sweet Peas, comprising thirty varieties. A Gold Medal was awarded, not a Silver one, as stated in the hurried report for our telegram.

Mr. Henry Eckford, Wem, Shropshire, made a splendid display of Sweet Peas, for which he is so justly famed in many parts of the world. (Gold Medal.)

Messrs. Pritchard & Sons, Shrewsbury, made a fine display with *Carnations*, chiefly seedlings cut from the open border. They also had a fine group of *Ferns*. (Gold Medal.)

Messrs. F. Sander & Co., St. Albans, exhibited Orchids and some fine examples of *Acalypha Sanderi*, *Dracaena sanderiana*, and other of their specialities. (Gold Medal.)

Messrs. R. Hartland & Sons, Cork, staged a fine lot of cut blooms of tuberous *Begonias*. (Gold Medal.)

Cut *Roses* were the feature of the fine group set up by Mr. Ed. Murrell, Portland Nursery, Shrewsbury. (Gold Medal.)

Messrs. Dicksons, Ltd., Chester, had a group of miscellaneous plants, including *Acalypha Sanderi*, the new *Cordyline Kippisii*, *Conifers* for which they are noted, &c. (Silver Medal.) Messrs. W. & J. Birkenhead, Sale, Manchester, made a pleasing display with the *Ferns* they grow so well. (Silver Medal.) Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, set up a showy group of *Montbretias* and other bulbous plants, including *Lilies*, *Gladioli*, *Kniphofias*, &c. (Silver Medal.) Messrs. R. Smith & Co., Worcester, exhibited cut flowers of hardy herbaceous plants and various other subjects in pots, of a more tender character. (Silver Medal.) Mr. A. Myers, Shrewsbury, had a group of well-grown Zonal *Pelargoniums*. (Silver Medal.) Mr. J. H. White, Worcester, exhibited *Crotons* and other stove and greenhouse plants and hardy flowers. (Silver Medal.)

Mr. John Forbes, Hawick, exhibited *Carnations*, *Violas*, and other hardy plants. (Bronze Medal.) Mr. S. Mortimer Rowledge, Farnham, Surrey, exhibited a fine lot of show and *Cactus Dahlias*. (Bronze Medal.) Messrs. Jones & Sons, Shrewsbury, also received a Bronze Medal for cut flowers. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham Hall, received a First-class Certificate for *Carnation Trentham Rose*. The Jadoo Company, Ltd., Exeter, had a group of plants grown in Jadoo fibre. Mr. H. Deverill, Banbury, exhibited cut flowers. Mr. Wm. Sydenham, Tamworth, had a display of *Violas*.

DEVON AND EXETER HORTICULTURAL.—

August 19th.

THE annual summer exhibition of this society was held on the recently improved grounds of Northernhay, on Friday the 19th inst., the event being favoured with perfect weather, a pleasant change from the past three or four years, which had been more or less showery and unfavourable to the society's finance. Let us hope this day made amends for past years. Taken altogether, the show was a decided improvement on last year's one. Several nurserymen greatly assisted the display. Messrs. R. Veitch & Son, Exeter, had a splendid show of Gladioli, Cannas, Dahlias, Lilliums, Water Lilies of the richest colours, hardy herbaceous and rockery plants for which this firm is noted. Mr. W. J. Godfrey, Exmouth, showed a very bright collection of cut flowers, pot stuff, &c., and included the purple Rudbeckia, Lobelia corallina and L. Milleri, but neither so bright and showy as Queen Victoria in my idea. His Cannas were remarkably good, well-flowered, and of the newest; pot Carnations, two new American varieties, Mrs. M. Burney and Flora Hill, pink and white respectively, and zonal Pelargoniums, all tended to make his exhibit most noteworthy. Messrs. Clarke & Son, Wellington, showed Gladioli, Roses and Sweet Peas in great variety, which were much admired. Messrs. Jarman & Co., Chard, exhibited some grand blooms of double Begonias, all seedlings, Roses, Gladioli, Cactus Dahlias, &c. Mr. J. Walters, Rose grower, Exeter, had a good lot of Roses. Mr. F. Smale, Torquay, brought up a very fine show of Dahlias, the most noteworthy being Ruby (new), Mary Service, Britannia, Primrose Dame, Standard Bearer, &c. The Devon Chrysanthemum Society had a beautiful collection of Cactus Dahlias, well grown and of the richest colours.

The Exeter Nursery Co. had a good collection of stove and greenhouse plants which reminded one of the old days when they used to compete at the great shows. Well-flowered Allamandas, Ixoras, Clerodendrons, Dipladenias, Bougainvilleas, &c., while for foliage some grand Crotons, finely coloured, were shown; also samples of wreaths and crosses for which this old firm are well noted. Lord Poltimore (gardener, Mr. Slade), had a non-competitive group of Maidenhair Ferns, Pancratiums, Bougainvillea glabra, &c., with half-a-dozen good Cotton plants, very interesting, which called for a lot of remarks. He also showed dishes of good Peaches, Dwarf and Runner Beans.

The prizes for the open group brought two competitors, both practical old hands at the work, the first a Silver Cup, value £5, falling to B. H. Hill, Esq. (gardener, Mr. G. Lock); second, W. Brock, Esq. (gardener, Mr. Roland). In the amateur class for a group of similar size, namely, in an oval with a diameter of 11 ft. by 15 ft., the tables were reversed, Mr. Brock beating his antagonist here. The two groups were well arranged, and had a good effect, but to my idea too much cork was used in Mr. Hill's exhibit. This appears unnatural to some observers. For six stove and greenhouse plants, Mr. W. Brock came first; R. Hamilton Gell, Esq. (gardener, Mr. Barnes), was second. For six stove and greenhouse Ferns the latter came to the front and Mr. W. Brock was second. For a miscellaneous group for effect, 11 ft. by 8 ft., Lady Duckworth King (gardener, Mr. Bake) was first, and W. F. Richards, Esq., second. Mr. Randall Johnson showed six Gloxinias (white), very good, taking first honours. Cockscombs, Begonias, Fuchsias, Coleus, &c., were all good.

In the fruit department there was a good competition for ten dishes. B. H. Hill, Esq., took first. This carried a Silver Medal with it. J. Brutton, Esq. (gardener, Mr. Crossman), was second; and Admiral Parker (gardener, Mr. W. Selly), came in third. For six dishes, Hammond Spencer, Esq. (gardener, Mr. G. Foster), was first with a good lot, Muscat Grapes being specially good; Hamilton Gell, Esq., was second; and Sir J. Fergusson, Davil (gardener, Mr. Seward), took the third place. For three bunches of Hamburgh Grapes, W. A. Sarford, Esq., was first; Washington, Esq., second. For three bunches of Madresfield Court, C. S. Eddy, Esq., first; Rev. H. Clerk (gardener, Mr. Pike), second. For three bunches of Muscats, C. S. Eddy, Esq., first; Hammond Spencer, Esq., second. For three bunches of Buckland Sweetwater, Admiral Parker was the only exhibitor. For three bunches, any

other variety, Hamilton Gell, Esq., first, with Black Alicante; F. Carr, Esq., second, with Foster's Seedling. For one Pineapple, Sir R. Buller (gardener, Mr. R. Bull), first. For six Peaches, B. James, Esq., was first, and Admiral Parker was second. For six Nectarines, W. A. Sarford, Esq., first; Hammond Spencer, Esq., second. Melons were very inferior as regards flavour. Apricots, Figs, Plums, Cherries, Apples, Pears, Gooseberries, Currants, &c., were all meritorious.

The vegetables, as a whole, were of exceptional merit, especially the first prize in the collection of twelve kinds. Here Sir John Shelly (gardener, Mr. Mairs), was a long way ahead; his Carrots, Leeks, Cauliflower, Onions, &c., were remarkable. This is the seventh year in succession this veteran exhibitor had premier honours; B. H. Hill, Esq., was second. For six kinds, Lady Duckworth took first, Lady Walrond being second. Potatos, Onions, Carrots, Parsnips, and, in fact, all the roots were very fine, taking into consideration the dry weather experienced in this part of Devon since the end of May.

ROYAL HORTICULTURAL.—August 25th.

THE meeting on Tuesday was not a very large one, though quite respectable for the month of August. Hardy herbaceous plants of all sorts, including Montbretias in quantity, also Gladioli, Lilies, Bouvardias, annuals, and some fruit were plentiful.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, exhibited a grand piece of *Platyclinis filiformis*. Sir Henry Fairfax, Ravenswood, Melrose, N.B., showed *Cattleya hardyana* and a grand spike of a fine variety of *Odontoglossum harryanum*, receiving a cultural commendation. Messrs. James Veitch & Sons, Ltd., Chelsea, exhibited *Epidendrum radicante-stamfordianum*, *Disa Clio*, *Cypripedium rothschildiano-villosum*. Thos. Hogg, Esq., Woodside Gardens, Paisley, exhibited *Cypripedium Lawrebel*. Norman C. Cookson, Esq. (gardener, Mr. Murray), Oakwood, Wylam-on-Tyne, staged *Cattleya hardyana* Oakwood var. G. F. Moore, Esq., Bourton-on-the-Water, Gloucester, exhibited *Cypripedium Godefroyae leucochilum mooreanum* and *Cattleya Trianaei* Popayan var.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, exhibited a group of Orchids, including *Sobralia xantholeuca*, *Cypripedium bellatulum album*, *Cattleya Harrisoniae*, *C. bicolor* wrightiana, &c.

Messrs. F. Sander & Co., St. Albans, exhibited the curious *Bulbophyllum barbigerum*, *Oncidium incurvum album*, and dwarf plants of *Acalypha Sanderi*, forming a pretty group.

Messrs. Kelway & Son, Langport, Somerset, made a splendid display with their Gladioli, which filled the whole of one side of a table. All the best types and their varieties were included in the collection. (Silver Gilt Banksian Medal.)

Messrs. R. Wallace & Co., Kilnfield Gardens, Colchester, had a splendid assortment of Montbretias, Lilies, Gladioli, and Kniphofias. The Gladioli included varieties of the *Brenchleyensis*, *Nanceianus* and *Lemoinei* types. (Silver Gilt Banksian Medal.)

Messrs. Barr & Sons, 12 & 13, King Street, Covent Garden, made an extensive display with hardy herbaceous plants, including Sunflowers, Lilies, Phloxes, Eryngiums, *Echinops ruthenicus*, &c. (Silver Flora Medal.)

Messrs. H. Cannell & Sons, Swanley, Kent, had a bank of fine varieties of *Salpiglossis*, *Scabiosa atropurpurea* and its varieties, backed with *Cosmos* and edged with *Gypsophila*. They also had some splendid Cockscombs. (Silver Banksian Medal.)

Sir Trevor Lawrence, Bart. (gardener Mr. Bain), exhibited a fine collection of Gladioli, dark crimson *Lobelia* seedlings of the tall hybrid Mexican strain, *Rudbeckia bicolor superba*, and a bunch of white hybrid *Anthuriums*, including *A. Laurenceae*, *A. Marie*, *A. Laingi*, &c. (Silver Flora Medal.)

Messrs. J. Veitch & Sons, Ltd., exhibited a group of annuals showing a great amount of variety, and including *Salpiglossis*, *Scabiosa*, *Cosmidium*, *Cent-aurea*, *Phlox Drummondii*, &c. They also showed a tall and well fruited specimen of *Rubus phoenicolasius*.

Mr. H. B. May, Dyson's Lane, Upper Edmonton, staged a highly meritorious exhibit of *Bouvardias*, including well flowered plants of *B. Humboldtii grandiflora*, *B. President Cleveland* and others, making twenty of the best varieties in cultivation. (Silver Flora Medal.)

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, exhibited Cactus and pompon Dahlias, Lilies, Kniphofias and other hardy herbaceous flowers. (Silver Banksian Medal.)

Purnell Purnell, Esq., Woodlands, Streatham Hill, exhibited a large group of Lilies, Fuchsias, tuberous Begonias and Ferns, interspersed with Palms and other ornamental subjects. (Silver Banksian Medal.)

At a meeting of the fruit and vegetable committee, a Silver Gilt Knightian Medal was awarded to Messrs. George Bunyard & Co., The Royal Nurseries, Maidstone, for a large and very fine collection of fruit, consisting chiefly of Apples, but also including Peaches, Pears, Plums and Early Prolific Filbert. The Apples were mostly ripe, and a large proportion of them handsomely coloured.

Alpine and perpetual fruiting Strawberries, to illustrate the lecture, were exhibited by Messrs. Laxton Bros., Bedford; Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House; Messrs. H. Cannell & Sons; and by M. Henry de Vilmorin, of Paris.

Messrs. T. Rivers & Son, Sawbridgeworth, exhibited grand samples of Apple Peasgood's Nonsuch, Rivers' Dryden Nectarine, Early Silver Peach, and several varieties of Plums, all grown under glass. (Silver Banksian Medal.)

Peaches and Figs were shown by Lord Foley (gardener, Mr. J. Miller), Ruxley Lodge, Esher.

The Dowager Lady Freake (gardener, Mr. Rickwood), exhibited a collection of Apples, Pears, Plums, Grapes, Figs, Peaches, Cherries and Currants. (Silver Banksian Medal.)

QUESTIONS AND ANSWERS.

Beech with two Forms of Leaves.—A. C.: From your lucid description and illustration we can now see that whether the tree has been grafted or not, the two forms of leaves are not due to that. The tree is extremely liable to variation, and has received several names accordingly, but the one that is adopted by good authorities, and which is most descriptive of the tree is *Fagus sylvatica heterophylla*. Other names, given it at different times, are *F. s. laciniata*, *F. s. incisa* and *F. s. salicifolia*. They have been applied to different sports of the tree, but which are not always constant. Over and above these variations in which the leaves assume different forms, the tree is liable to return to the normal form or branches of it. Now the broad-leaved form you sent us was very near the normal or typical form of the Beech, but not quite. The deeply-cut leaves are those of the variety *F. sylvatica heterophylla*. That the broad leaves should occur here and there on the tree is very interesting, as they show that the tree has a tendency to revert to the original. It is well worth looking after.

Names of Plants.—C. B. G.: *Rhamnus Frangula*.—A. L.: 1, *Hibiscus syriacus*; 2, *Rubus discolor flore pleno*; 3, *Rubus laciniatus*; 4, *Cupressus nutkaensis*; 5, *Lysimachia vulgaris*.—W. P.: 1, *Papaver glaucum*; 2, *Tropaeolum aduncum*; 3, *Impatiens fulva*; 4, *Inula Helenium*; 5, *Solidago canadensis*.—J. M.: 1, *Veronica longifolia subsessilis*; 2, *Monarda fistulosa*; 3, *Lilium tigrinum*; 4, *Lilium pardalinum*.—H. Hardy.—1, *Cattleya Warscewiczii*, more widely known as *C. gigas*; 2, *Odontoglossum luteo-purpureum sceptrum*; 3, *Oncidium maculatum*.—W. K.: *Salix purpurea pendula*; 2, *Viburnum Opulus*; 3, *Genista tinctoria elata*; 4, *Malva moschata*.—R. M.: *Epilobium hirsutum*; 2, *Ononis spinosa*.
