INDUSTRY DIVISION
Maxwell R. Conklin, Chief

## Acknowledgments

The 1963 Census of Manufactures was conducted under the direction of Maxwell R. Conklin, Chief, and Owen C. Gretton, Assistant Chief, of the Industry Division, Within the Industry Division, program responsibility along industry lines was shared by the following individuals who participated importantly in the entire census program: Willis K. Jordan, Foods, Textiles, and Apparel; Cyril M. Wides, Lumber, Paper, and Chemicals; and Paul F. Berard and Clarence H. Olsen, Metals, Machinery, and Equipment. Edward A. Robinson was responsible for the concepts and definitions of establishment-type data, for preparation of the introductory text to the volumes, and for planning the content of the statistical tables in the area and subject reports.

Louis J. Owen, Assistant Chief for Production and Process Statistics, was respon sible for the concepts followed in the product and materials inquiries and for the data on industrial water consumption and fuels and electric energy used. Jack L. Ogus, Assistant Chief for Statistical Methods, assisted by Donald F. Clark, was responsible for statistical methods and sampling techniques. Elmer S. Bile played an important role in developing the criteria for reviewing the tabulated data and supervised the review of the geographic statistics and much of the subject-volume materials for completeness and accuracy. Frank A. Hanna, a consultant to the Bureau of the Census, assisted in writing portions of the text.

William Cooper supervised the application of the system of industrial classification of establishments. Robert Torene made important contributions to the geographic statistics volume as well as to other phases of the census, and William R. Gray and Kenneth R. Brimmer made similar contributions to the product and materials inquiries. Alan I. Blum coordinated the work of the Division's professional staff at the Jeffersonville, Ind., Operations Office. The preparation of the manuscript for printing, within the Industry Division was the responsibility of Angela R. Dally.

Professional personnel in the commodity areas of the Industry Division developed the report forms for the various industries, reviewed the tabulations, and arepared the industry texts that accompanied the data. The respective areas and the individuals in charge during the census were as follows: Foods, John S. Berube and Charles A. Nicholls; Textiles, Robert J. Nealon; Apparel, Evelyn W. Colburn; Lumber and Furniture, Robert E. Bates; Paper, Printing, and Publishing, Lawrence J. LaMoure; Chemicals, Reese R. Morgan; Nonmetallic Minerals, Keith B. Willis; Primary Metals and Intermediate Metal Products, Malcolm E. Bernhardt; Machinery, Conrad J. Jacobs; and Electrical Machinery and Transportation Equipment, Bernard B. Bernsten. The names of the supporting statisticians in the commodity areas who made significant contributions are shown in the acknowl edgment statements appearing in the 80 industry reports published separately prior to their assembly into the Industry Volume.

Systems and procedures used in processing the reports were developed in the former Economic Operations Division. Marion D. Bingham, Chief, and in the present Systems Division, Sol Dolleck, Chief, assisted by Samuel Schweid, Nathan Lesowitz, and Jack Margolis. Mary H. Johnson and Roger O. Lepage, assisted by Paul E. Poissant, developed and supervised the computer programing under the direction of Eugene L. Went. Clerical procedures were developed by Joseph N. Brooks and William W. Perry under the supervision of Carl Mueller. Quality control plans and procedures were developed by George Minton, Maxwell R. Jeane, and John F. Powell, under the direction of Herman H. Fasteau. Robert D. Krook, Executive Officer, Census Operations Office at Jeffersonville, Ind., assisted by Gene P. King and Waller Wynne, Jr., was responsible for the phases of the processing operations performed there. Data processing and related operations were performed by the former Data Processing Systems Division under Robert F. Drury, Chief.

Staff members in other divisions and offices of the Census Bureau also made significant contributions to the 1963 census. Arthur Horowitz, in his capacity as Census of Manufactures Coordinator, made important contributions to the planning and operational phases of the work. Murray Dessel of the Economic Research and Analysis Division coordinated the overall processing of the large multiunit companies and provided the statistics on central administrative offices and auxiliaries. Harold T. Goldstein of that Division was responsible for coordinating industry coding concepts in manufactures with those followed in the business and mineral industries fields. Conrad J. Thoren and George W. Morris of the Geography Division supervised the preparation of the maps and charts. Geraldine Censky and Frances Bresnahan of the Administrative and Publications Services Division provided editorial supervision and publication planning.

U.S. Government Printing Office, Washington, D.C.. 1966

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402, or any Department of Commerce field office. Price $\$ 6.75$

## Preface

This is one of a series of volumes presenting the final results of the 1963 Census of Manufactures. The quinquennial census for 1963 was a large-scale undertaking and its success depended upon important contributions from a large number of private and public individuals and organizations. An essential element in the census was the fine cooperation received from over 300,000 manufacturing establishments in completing the appropriate report forms.

The advice and counsel of trade associations, individual manufacturing companies, government agencies, and research organizations were most valuable in determining the content of the census reports, especially the product and materials inquiries. The Advisory Council on Federal Reports provided special assistance in determining the feasibility of collecting various types of data. Precensus exchanges of ideas with the Census advisory committees of the American Statistical Association, the American Economic Association, and the American Marketing Association contributed significantly to the planning phases of the census. Timely publicity was given the manufactures census by chambers of commerce, local newspapers, trade papers, and television and radio stations.

## 1963

## Census of Manufactures Publication Program

Final results of the 1963 Census of Manufactures are published in three volumes, each containing a specific type of data.

## VOLUME I. SUMMARY AND SUBJECT STATISTICS

In addition to a summary chapter presenting the basic data historically for industries and geographic areas, separate chapters present data on a subject basis. Chapter titles are as follows:

1. General Summary
2. Size of Establishments
3. Type of Organization
4. Manufacturers' Inventories
5. Expenditures for Plant and Equipment
6. Power Equipment in Manufacturing Industries
7. Fuels and Electric Energy
8. Selected Materials Consumed
9. Selected Metalworking Operations
10. Water Use in Manufacturing
11. Concentration Ratios in Manufacturing Industries
Three special reports are also included in this volume: Manufacturing Activitiy in Government Establishments, Shipments of Defense Oriented Industries, and Origin of Exports of Manufactured Products. Each of the chapters in this volume was previously published as a separate report (Series MC63(1)-, numbers 1 to 10 . Chapter 11 was issued as a special report for the Senate Subcommittee on Antitrust and Monopoly.)

## VOLUME II. INDUSTRY STATISTICS

This volume contains separate chapters for each of 80 groups of related industries which cover approximately 430 individual industries. Statistics are shown on detailed product shipments and materials consumption in terms of quantity and value, cost of fuels and electric energy, value added by manufacture, employment, payrolls, inventories, and capital expenditures. Selected statistics are included for earlier census years. This volume is published in two parts. Part 1 contains a general summary chapter and chapters for SIC Major Groups 20 to 28, as well as chapters for related industries within these major groups; Part 2 contains chapters for SIC Major Groups 29 to 39 and 19 as well as chapters for related industries within these major groups. A special report, Manufacturing Activity in Government

Establishments, is included in both parts of this volume. The 80 related-industry chapters were previously published as separate reports in series MC63(2)-, 19A to 39D.

## VOLUME III. AREA STATISTICS

This volume contains separate chapters for each State and the District of Columbia. The statistics include all-manufacturing totals for the State and its standard metropolitan statistical areas, counties, and cities with populations of 10,000 or more, with industry detail for the larger areas. The volume also includes a summary chapter presenting data for each of the nine geographic divisions and a special report, Manufacturing Activity in Government Establishments. Each State chapter was previously published as a separate report in Series MC63(3)-, 1 to 51.

## OTHER REPORTS

Two series of reports have been issued showing the number of manufacturing establishments in each of the approximately 430 manufacturing industries classified according to their employment size class and the State and county within which they are located. The first series places emphasis on the industry, showing data by location (State and county). Nine separate reports present data for 20 major industry groups. The second series places emphasis on the location showing data by industry. Nine reports-one for each of the nine geographic divisions of the United States-were published in this series. The series titles are as follows:

Location of Manufacturing Plants by industry, County, and Employment Size (MC63(S) -3 , numbers 1 to 9 )
Location of Manufacturing Plants by County, Industry, and Employment Size (MC63(S)4, numbers 1 to 9 )

## The 1963 Census of Mineral Industries Publication Program

The 1963 Census of Mineral Industries was conducted jointly with the census of manufactures. This census was similar in scope and in publication program. Final results are published in two volumes, as follows:

Volume I. Summary and Industry Statistics, contains a summary chapter, 5 subjecttype chapters, and 18 chapters showing related mineral industries.
Volume II. Area Statistics, contains separate chapters for each State (Delaware, Maryland, and the District of Columbia are combined).

25. Special Inquiries
26. Special Reports Shown in Volume 1, Summary and Subject Statistics
27. Imputation of Data
28. Confidentiality of Data for Individual Companies
29. Abbreviations

## I. GENERAL

## 1. ROLE OF THE CENSUS OF MANUFACTURES

The census of manufactures provides a detailed profile of the largest sector of the American economy. That census obtains, from every manufacturing plant with one employee or more, information on its input of labor and materials, its output of products, its location, and the legal form of organization of the owning firm. This information is obtained in sufficient detail to permit its classification by industry, by size of plant, by the homogeneity of its output and, where desirable, by type of operation, extent of vertical integration, kind of equipment, relationship to other plants of the same firm, and other characteristics.

The census of manufactures is conducted simultaneously with the censuses of minera! industries, wholesale and retail trade and selected services, and transportation. ${ }^{1}$ This has facilitated the statistical coverage of the entire range of activities of most enterprises and a consequent improvement in the capability of the Bureau of the Census to deal effectively with the statistical problems of identifying establishments which support manufacturing activity, such as central administrative offices, auxiliaries, and sales branches; and to classify entire enterprises into industrial categories.

[^0]General statistics information (i.e., total employment, payroll, production-worker employment, man-hours, wages, cost of materials, value of shipments, inventories, capital expenditures, and value added by manufacture) from the census of manufactures is published by industry, by area, by employment size of establishment, by degree of product specialization within plant, and by type of ownership. Information is supplied on the detailed industrial characteristics of each State and large standard metropolitan statistical area (SMSA); overall measures of manufacturing activity are shown at the county and individual city level down to cities of 10,000 or more population. This information constitutes a periodic inventory of the Nation's manufacturing economy that provides a benchmark for measuring the changes in that structure.

The census of manufactures also provides a benchmark from which more frequent surveys can be developed on a scientific sample basis. In fact, the present legislation specifying that censuses be conducted every 5 years authorizes an annual survey of manufactures on a sample basis during the intervening years. At the end of each 5 -year census, a new sample is drawn relying on the overall characteristics described by the census itself. The sample, constituting about one-fifth of the establishments but with complete coverage of all large ones, provides an annual updating of the census of manufactures in terms of broad measures of economic activity. It provides the same basic measures of economic activity of the plant such as employment, payrolls, value of shipments, value added by manufacture, as does the census of manufactures, but contains
less detailed information on products, materials consumption, and equipment. ${ }^{2}$

The census of manufactures not only is a benchmark for many of the surveys conducted by the Census Bureau itself on a more frequent basis but also is the means of updating other important indicators of the economic activity. It provides very important information on the manufacturing segment used in the national income accounts. Census data on materials consumed and product output are basic to the manufactures sector of the input-output studies of the Office of Business Economics. The information derived from the census of manufactures is also used by the Federal Reserve Board in cooperation with the Census Bureau to develop indexes of industrial production for census years. This index is used as a benchmark for the monthly Federal Reserve Index of Industrial Production-a key monthly indicator of current economic activity.

2 Since the annual survey of manufactures is a sample, the crossclassifications by industry and by area are fewer than in the census of manufactures. At the U.S. level, statistics are published in the annual survey for practically all of the 425 industries. However, at the State and SMSA levels, statistics are published only for 3-digit and 2-digit industry groupings, respectively. At the county level, information is published for about 10 percent of the 3,000 counties. These 300 -odd counties are the larger ones in terms of manufacturing activity and account for about 80 percent of total manufacturing employment. No information is published at the city level.

The concurrent collection of comparable data on wholesale and retail trades, selected services, manufacturing, and minerals in the censuses beginning with 1954 has permitted the Census Bureau to develop its Enterprise Statistics Program, which relates census company-level data to the establishment data. Thus, a measurement of the integration and diversification of the American enterprise system becomes available. Likewise, through the Enterprise Statistics Program, it is possible, to link census establishment-based data on a modified basis to other statistical systems such as the Internal Revenue Service's "Statistics of Income" for corporations.

## 2. ECONOMIC SIGNIFICANCE OF MANUFAC. TURING SECTOR

Manufacturing is the largest sector in the country's economy. In 1963, manufacturing establishments employed approximately 17 million persons of a civilian labor force of 75 million. During the 35 -year period, 1929 to 1963, income originating in manufacturing has averaged 30 percent of national income (see table A). Wholesale and retail trade, the next largest sector, averaged about 15 percent.

The need for frequent and comprehensive statistics on manufactures derives as

TABLE A. National Income, Total and Amounts Originating in Ourable and Nondurable Manufactures, for Selected Years
(Dollar values in billions)

Source: Survey of Current Business, August 1965, pp. 42-45 and July 1966, p. 15.
much from its sensitivity to cyclical influences as from its relative size. Cyclical changes in income originating in manufacturing tend to be relatively larger than in the economy as a whole.

Within manufacturing, durable goods industries accounted for about 57 percent of all manufactures for that period. However, they tend to be more volatile than nondurable goods, accounting for a smaller percentage of all manufactures during periods of contraction and a larger percentage during periods of expansion. Of the census years since 1919, only 1925, 1935, 1939, 1947, and 1963 have not included some part of a period of contraction and a consequent underrepresentation of durable goods in the total. (See table B.)

Geographic Location of Manufactures.The preponderance of manufacturing in the United States is predominantly in the Northeast as is shown in table C, page 4 . Over the years, however, there has been a shift to the South and West.

Size Distribution of Manufacturing Plants.-Most manufacturing establishments require a substantial amount of capital and ordinarily a considerable volume of business for efficient operation. While there are many small plants, they account for relatively little of the Nation's production. Thus, as shown in table D, half the plants have less than 10 employees but they account for only 3 percent of the value added by manufacture.

## 3. EARLIER CENSUSES

The census of manufactures for 1963 is the 27 th such census for the United States. The first census of manufactures covered 1809 and, with the exception of 1829, a census was taken at 10 -year intervals in connection with the decennial census of population up to and including 1899. It was conducted at $5 \cdot$ year intervals from 1904 through 1919, and every other year from 1921 through 1939. The census was suspended during World War II, but it was resumed for 1947. Legislation enacted in 1948 provided for a census every 5 years, cov-

ering the years ending in " 3 " and " 8 ," and authorized an annual sample survey for interim years. ${ }^{3}$ An annual survey of manufactures has been conducted for the intercensal years beginning with 1949 and is a continuing part of the Bureau's program. Table 1, General Summary, provides national totals for manufactures for the censuses and annual surveys since 1849.

The census of manufactures was the public's only source of reliable statistical information on manufactures during the 19th century. During the current century, particularly since the first world war, more frequent statistical series on many aspects of manufactures have been developed. However, the census of manufactures continues to play an essential

[^2]role in the Nation's statistical program, since it remains the only source of comprehensive information on the detailed industrial and geo-

graphical structure of the manufacturing sector which is closely comparable over long periods of time.

## 4. DEFINITION OF MANUFACTURING

Manufacturing is the mechanical or chemical transformation of inorganic or organic substances into new products. The assembly of component parts of products is also considered to be manufacturing if the resulting product is neither a structure nor other fixed improvement. These activities are usually carried on in plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment.

Manufacturing production is usually carried on for the wholesale market, for transfer to other plants of the same company, or to the order of industrial users rather than for direct sale to the household consumer. However, some manufacturers (e.g., baking, milk bottling, etc.) sell chiefly at retail to household consumers through the mail, through house-to-house routes, or through salesmen. Some activities of a service nature (enameling, binding, platemaking, etc.) are included in manufacturing when they are performed primarily for the trade; but they are considered nonmanufacturing when they are performed primarily to the order of the household consumer. On the other hand, some manufacturing industries include business firms which do not undertake physical production but perform only the entrepreneural functions of buying the materials, designing, and marketing the product, and have the actual production done on contract (e.g., apparel jobbers).

In addition to the production of goods and manufacturing services, manufacturing plants engage in related and diverse supporting activities. These activities encompass the acquisition of materials to be processed, their movement into the manufacturing facility, their storage at the manufacturing site, the operation and maintenance of plant and equipment, the design of flow of work through the production process, and necessary arrangements for shipment of output to customers. Also included are a host of subsidiary activities associated with the conduct of the establishment as a manufacturing entity; e.g., management and policy formation, product and market orientation, engineering and quality control, recordkeeping and accounting, physical security of plant and equipment, and the like. Such subsidiary activities may be performed by personnel located at the manufacturing facility or at an auxiliary unit serving one or more manufacturing locations of the same company. Where these activities are carried on at a different physical location or are performed for more than one plant, they are excluded from the figures for operating manufacturing establishments and are included in the data shown for
central administrative offices and auxiliaries (see sections 8 (form NC-X6) and 11 of the text).

The following types of activities, while having many of the characteristics usually found in manufacturing, are considered as nonmanufacturing and, therefore, are excluded from the census:
(a) Processing on farms when the raw materials are grown on the farm and the manufacturing activities (poultry dressing, milk and butter production, logging) are on a small scale without extensive use of paid labor. Also custom milling, cotton ginning, egg hatching, and similar activities closely associated with agriculture are excluded.
(b) Mineral preparation such as the crushing, screening, and concentrating of ores. However, mining performed as a secondary activity in conjunction with manufacturing is included in the census; for example, stone and clay mining at cement, lime, and clay products plants.
(c) Custom work to the individual order of household consumers. Examples are custom tailoring, woodworking, lettering on monuments, setting of diamonds, and the making of orthopedic appliances.
(d) Repair and other service activities, except specified services performed "for the trade." Repair shops of railroads are also excluded.
(e) Production of coke for own use by establishments owned by public utility companies.
On the other hand, the census of manufactures excludes manufacturing at locations which are not primarily manufacturing plants: (1) Manufacturing by retail establishments which sell most of their products on the premises directly to household consumers, e.g., retail bakeries, ice cream stores, and feed stores; (2) manufacturing by construction contractors at the site, e.g., production of paving mixtures; and (3) manufacturing by educational, eleemosynary, and penal institutions.

Conversely, it is not unusual for manufacturing establishments to engage also in nonmanufacturing activities such as repair work, merchandising of products without further processing, and installation work. Ordinarily, these nonmanufacturing receipts are small in relation to the manufacturing activities and, therefore, it is not difficult to determine that the establishments should be included in the manufactures area. However, if the nonmanufacturing activities account for a significant proportion of total receipts of an establishment, the classification of that establishment
into the appropriate major economic sector is more difficult.

In the 1963 economic censuses, an establishment engaged in a combination of manufacturing and merchandising was assigned either to the manufacturing or the trade industries depending on which of these activities was estimated to account for the larger share of its "value added" or "income produced." This criterion, even though based on an approximation, was considered preferable to reported dollar volume of receipts from each type of activity in determining the primary industry, since manufacturing requires considerably more man-hours, salaries and wages, and other inputs per dollar of receipts than either wholesaling or retailing. However, in classifying establishments engaged in manufacturing and also in mining, repair work, installation, construction or other nonmanufacturing services, dollar receipts were used as the basis of classification because these activities require substantially comparable inputs per dollar of receipts.

Data were obtained on the manufacturing activities during 1963 of establishments owned and operated by the Federal Government (military arsenals, Navy yards, etc.) and of Federal and State prisons for the purpose of presenting complete information on manufacturing operations in the United States. Statistics on the employment, value added by manufacture, and products manufactured by the Department of Defense establishments and the quantity and value of products made in Federal and State prisons are shown in a separate chapter in each manufactures volume. These data are not included in any of the individual industry or industry group totals or area statistics appearing in the census of manufactures volumes. However, information on govern-ment-owned, privately operated establishments is included throughout the statistical tables in the appropriate industry on the same basis as privately owned and operated plants.

## 5. THE STANDARD INDUSTRIAL CLASSIFICATION (SIC)

The specific industry coding and groupings in the 1963 Census of Manufactures follow the structure of the Standard Industrial Classification Manual, published by the Bureau of the Budget. This manual, which is a classification structure for the entire national economy, was first issued in 1939. ${ }^{4}$ In the

[^3]manufacturing sector, the manual built upon the Bureau of the Census manufacturing industry classifications developed over the years. The SIC was developed for use in classifying establishments by type of activity in which they are engaged in order to facilitate the collection, tabulation, and publication of data relating to establishments and to promote uniformity and comparability in the presentation of statistical data by government agencies, trade associations, research organizations, and others.

The SIC divides all activities into broad industrial divisions (manufacturing, mining, retail trade, agriculture, etc.). It further subdivides each division into major industry groups, then into industry groups, and finally into detailed industries. The numbering system provides flexibility, permitting use of classification at various levels of detail according to the specific needs and uses desired. Employing a decimal system of coding, the Major Industry Group is assigned two digits (Major Group 20 for Food and Kindred Products), the Industry Group, three digits (Group 201 for Meat Products), and the industry, four digits (Industry 2011 for Meat Packing Plants). Thus, for each 4-digit industry, it is possible to identify the Industry Group to which it belongs by the first three digits of its code and, by its first two digits, the Major Industry Group. For the manufacturing division, the 21 2-digit SIC Major Groups (19 to 39) are subdivided into 149 3-digit SIC Groups (191 to 398) and into 427 4-digit industries (1911 to 3999). While the SIC contains 427 industries, the Bureau of the Census combines three industries in the automotive area into one, for a total of 425 industries.

Most of the 425 manufacturing industries are defined in terms of a specific group of related products. Usually, the products are made of similar materials and by similar processes, and are competitive. In determining the boundaries of product-defined industries, ${ }^{5}$ it is essential that each industry comprise a group of establishments whose output of products defining the industry (primary products) accounts for a relatively high proportion of the total shipments of the industry as well as of the total shipments of these primary products by establishments in all manufacturing industries. Some industries are defined in terms of the processes or equipment used regardless of the final product of the establishment. A small number of industries are basically defined by material used as well as final product of the plant.

[^4]There are wide differences among industries in the extent to which the establishments classified in the industry (a) account for the total production of commodities "primary" to the industry, (b) produce products or services "belonging" to other industries (i.e., secondary products), and (c) use similar materials or processes. (See sections 15, 16, 18, and 24). While these variations are frequently construed to be shortcomings, the fact is that the limitations observed in the classification structure arise from the inherent complexity of our economic system and from the disparity in the methods of production among the individual producing units of which it is comprised. The data collected in the census of manufactures provide a statistical basis for a critical evaluation of the classification system; i.e., for assessing the boundaries between industries, the growth and decline of industries, and the impact of technological change on the classification of industries. Consequently, the census is the primary instrument for effecting revisions in the SIC manufacturing sector. ${ }^{6}$

No general-purpose system of industrial classification can hope to satisfy all users of census data. Some business users will be interested primarily in data relating only to themselves and to their competitors in the production of a narrow range of products; others will wish data relating to all products, including complementary and substitutable products, competing in a particular market; others may wish data relating to the consumers of one or more types of materials. Some may be interested only in the data for plants producing a specific product; others only for those plants producing a "full line"' of products. The large number of SIC industries provides the analyst with the "building blocks" for obtaining useful approximations, if not "clean" data, relevant to many of these problems. But, at best, a single gen-eral-purpose system of classification can satisfy these diverse needs only partially; a point is soon reached beyond which the adaptation of a system to serve one use somewhat better will reduce its ability, often disproportionately, to serve an alternative use.

Accordingly, users of data frequently regroup detailed SIC industries into broad groupings along lines different from those in the SIC 2 - and 3 -digit categories. The Federal Reserve Board for many years has made combinations to stress such criteria as durable, nondurable, consumers, producers, finished, intermediate goods, etc. Other public and private agencies also recombine the detailed classes. By and large, the 4 -digit industries are susceptible to allocation to such categories, while the 2-digit SIC groups are not.

[^5]To increase the usefulness or improve the editing of the data, the Census Bureau frequently has further classified the basic 4 -digit SIC industries into "subindustries." This device is employed where there are wide disparities in the operating ratios of the plants in the industry because of differences in the degree of intraplant vertical integration, technology, methods of distribution, geographic location, types of materials used, etc. This technique was used for about 65 manufacturing industries for editing purposes and many were regarded as sufficiently significant to be used for publication: For example, the bakery industry (SIC 2051) is subdivided into wholesale bakeries, chain-store bakeries, home-service bakeries, and retail multi-outlet bakeries; many apparel industries (Group 23) are subclassified into manufacturers, contractors, jobbers; the lumber industry (2421) by degree of integration, etc.

To provide a further measurement of variations within 4 -digit industries, the Bureau also subclassifies establishments by the degree to which they produce the primary products or specific classes of primary products of the 4-digit industry. This is in effect a subindustry classification based on degree of product specialization. (See section 24 for a more complete discussion of product specialization data.)

## 6. ESTABLISHMENT BASIS OF REPORTING

The census of manufactures is conducted on an establishment basis. That is, a company operating establishments at more than one location is required to submit a report for each location; also, a company engaged in distinctly different lines of activity at one location is required to submit separate reports if the plant records permit such a separation and if the activities are substantial in size.

Census tabulations of establishment reports, therefore, differ substantially from those prepared on a company basis; i.e., from consolidated reports which combine various types of activities at different locations (thereby yielding a net sales figure for the industry exclusive of interplant transfers but making meaningful geographic tabulations of employment and value added impossible). These consolidated reports also include nonmanufacturing activities of companies primarily engaged in manufacturing. Census figures will also differ to some extent from other tabulations based on establishment reports where the definition of an establishment, as to location and line of activity, is not applied in the same manner.

The requirement that distinct lines of activity at the same location be separately reported was selectively applied where the establishment produced and shipped significant amounts of products classified in different SIC
industries. In widely varying degrees, this product overlap exists in many manufacturing establishments. Generally, the amounts involved are not of serious proportion so that the filing of separate reports would not be warranted as a practical matter, even if feasible. However, there are a number of locations at which large numbers of employees are engaged in each of two or more distinct lines of manufacturing as defined in the SIC. Frequently, companies organize their operations and their records separately where diverse activities are large and choose to report them as separate plants. When they do not do so on their own initiative, the Census Bureau requests separate reports. For the most part, companies have responded favorably, particularly for very large operations where failure to "split out" the different activities would significantly distort the relationship of the industry and product statistics. Not infrequently, though, the two groups of products were made on the same production lines by many of the same employees and could not be distinguished sufficiently in the companies' records to provide establishment-type reporting.

SIC industry definitions take account of special situations where otherwise separately classifiable activities are frequently combined at one location. For example, in the lumber area the definition of industry 2421, Sawmills and Planing Mills, General, recognizes the situation that sawmills may include logging operations. Similarly, in the pulp and paper area, pulp mills operated in combination with paper mills are included in one report.

In 1963 and 1958, as in earlier years, a minimum size limit was set for including establishments in the census. Reports were required from all establishments employing one or more persons at any time during the census year. The same size limitation has applied since 1947 in censuses and annual surveys of manufactures. In the 1939 and earlier censuses, establishments with less than $\$ 5,000$ value of products were excluded. The change in the minimum size limit in 1947 has not appreciably affected the historical comparability of earlier census figures except for data on number of establishments for a few indus. tries.

A special study of manufacturing plants with no employees in 1958 was made to analyze the amount of manufacturing activity conducted by these very small establishments. While there were over 50,000 manufacturing establishments in this category in that year, they had only about one-quarter of 1 percent of the total value of shipments of all manufacturing.

The SIC coding system operates in such a way that the definitions become progressively narrower with successive additions of numerical digits. At one extreme are
the 21 very broad 2 -digit groups and at the other about 10,000 individual 7 -digit products. In between are approximately 150 3-digit groups, 425 4-digit industries, and 1,100 5 -digit product classes. The 7 -digit products and 5 -digit product classes are considered the primary products of the industry with the same first four digits as the product code. Accordingly, an establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. The industry code assigned to the establishments is derived from a summation of values for 7 -digit product codes to their 4 -digit industry and the selection of the largest such value as the establishment's industry classification. However, as mentioned earlier, the industry classification of an establishment may be determined not only by the products it makes but also by the processes employed or materials used in making those products.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. Therefore, the general statistics (employment, payrolls, inventories, value added by manufacture, total value of shipments, capital expenditures, etc.) shown for an industry (tables 1 to 4 of the industry chapters in Volume II) reflect not only the primary activities of the establishments in that industry but also their activities of a secondary nature. The product statistics in table 6 of the industry chapters represent the total output of specific products whether they are produced by establishments classified in the same industry as the product or not. For this reason, in relating the industry statistics in the industry chapters, especially the industry total value of shipments (tables 1 to 4 ), to the product statistics (table 6 ), the composition of the industry's output as shown in tables 5A and 5B should be considered.

The extent to which industry and product statistics may be matched with each other is measured by the two ratios which are computed from these tables 5A and 5B. The first of the ratios, called the primary product specialization ratio, describes the proportion of product shipments (both primary and secondary) of the industry represented by primary products. The second, defined as the coverage ratio, is the proportion of primary products shipped by the establishments classified in the industry to total shipments of such products by all manufacturing establishments.

In many industries, establishments making products falling into the same industry category use a wide variety of processes and materials to produce them. Also, within the same industry classification based on end products, may be included those establishments which are vertically integrated and those
which put only the finishing touches on an al. ready highly fabricated purchased item. For example, in the refrigeration industry, there are instances of almost complete process integration in which the production of the compressor and condensing unit, electric motor, and even the castings for those intermediate products, as well as the stamping of the case and the final assembly, are all carried on at one plant. In other plants, the condensing unit, the motor, and the case may be purchased and merely assembled into the finished product.

In some instances, nonintegrated plants have been placed in separate industry categories from the integrated plants. In many industries, the census provides separate statistics on departmental operations or on the production of intermediate commodities made and used in the producing plant. When an industry includes plants which ship a significant proportion of their output to other plants of the same company, separate figures are usually shown on the interplant transfers.

These differences in the integration of production processes, types of operations, and types of materials used should be taken into account when relating the general items (employment, payrolls, value added, etc.) to the product and materials data. For those industries where the integrated type of operations is of consequence, that fact is pointed out in the explanatory text for the industry.

In many industries, there are some large plants with a product-mix such that the value of secondary products is as large as or larger than the value of primary products. In the Annual Survey of Manufactures (ASM), these plants are prevented from shifting back and forth among industries because of only minor shifts in products by the application of a "resistance formula'" in assigning industry classifications.

The formula gives approximately equal weight to the need for statistical measurement of change in an industry and the measurement of an industry's status at a point in time.

The resistance technique for large establishments was introduced for the first time in the quinquennial census in 1963 and was applied to certainty cases in the ASM panel for 1963.

The 1963 industrial classification of an ASM plant with 100 employees or more was allowed change from that assigned in 1962 where-
(1) The new primary activity constituted 60 percent or more of its total value of shipments, or
(2) The new primary activity, while less than 60 percent, was at least twice as great as the old primary activity in the current year, or
(3) The new primary activity, if it did not meet either of the first two conditions, exceeded the old primary activity by at least 20 percent in both the current and the preceding year.
Where the establishment's industry classification coded in the "annual survey" manner differed from that developed independently from the 1963 census report, the annual survey code took precedence, except where additional census tests not available in the annual survey justified the census code (e.g., type of materials consumed, type of operations, special inquiries).

## 7. GEOGRAPHIC AREAS

Census Regions, Divisions, and States.For over a century, the Census Bureau has presented data for States and major sections of the United States related not only by geographic proximity but also by similarities of agriculture, industry, and social characteristics. Since the 1909 Census of Manufactures, the present nine Census geographic divisions have been used. Beginning with the 1939 census, the nine divisions were grouped further into four broad geographic regions: Northeast, South, North Central, and West.

Not only are these State groupings convenient for the summary presentation of data below the U.S. level, but they are essential to presenting a maximum of geographic information for those individual industries in which application of the census disclosure law precludes the publication of individual State data. (See the discussion in section 28, Confidentiality of Data for Individual Companies.) The relative importance of manufacturing among the States and divisions is shown in table E.

In Volume III, Area Statistics, industry detail is shown wherever possible under the rules of confidentiality at the regional, State, county, and standard metropolitan statistical area (SMSA) levels, in addition to the allmanufacturing totals. The level of industry detail shown for each area is as follows:

State-2-, 3-, and 4-digit industry detail;

County-2- and 3-digit industry totals, but only for those industry groups which have 500 employees or more in the industry group in the county;

City-information only at the all-manufacturing level for cities of 10,000 or more population according to the 1960 Census of Population or later special censuses conducted by the Bureau of the Census.

Standard Metropolitan Statistical Areas.-The SMSA's for which data are shown are those defined by the Bureau of the Budget

Note: Detailed figures may not add to the totals because of independent rounding.
in 1964. ${ }^{7}$ An SMSA is a county or group of contiguous counties (except in New England) which contains at least one central city of 50,000 inhabitants or more or "twin cities" with a combined population of at least 50,000 . In addition to the county or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, towns and cities rather than counties are the units used in defining an SMSA. Thus an area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, con-

[^6]tribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the area title may include one or two additional city names.

Industry group (2- and 3-digit) statistics as well as all-manufacturing totals are published for SMSA's with 40,000 to 190,000 manufacturing employees. Detailed industry (4-digit) statistics are published for SMSA's with more than 190,000 employees. These industry statistics for each area are presented in table 6 in the report for each State. There are 75 SMSA's with more than 40,000 employees, and 15 with more than 190,000.

Assignment of Geographic Area Codes.In the census of manufactures, as in the entire economic census, each individual establishment (plant) was assigned a geographic code that indicated the State, the county, and the city in which it was located. Most manufacturing activities require a permanent structure and fixed equipment so that the location of a plant usually can be specified with little or no ambiguity. Plants which straddle boundary lines are classified as located within the more populous of the two areas in which some part of the plant is located.

In previous censuses, the geographic code was assigned manually to every report after a clerical review of the physical location reported by the respondent. In 1963, the report form was precoded by high-speed electronic equipment prior to mailing through the use of an extensive file of addresses classified by place. 'Only those reports which indicated differences between the mailing address and the reported physical location were manually coded after receipt.

## 8. THE CENSUS REPORT FORMS

The diversity of manufacturing activities in the United States made it necessary to use about 200 different report forms to collect information on the products shipped and materials used by the 425 manufacturing industries. In order to obtain the data essential to the census in a manner consistent with cost considerations and reportability by the respondent, it was decided to require detail information only from larger plants. For the numerous smaller plants, typically having less detailed records and representing a very minor portion of manufacturing activity, data requirements were limited to a relatively few key items on a series of short forms. All plants in the annual survey of manufactures sample reported on standard forms irrespective of their employment size. Using the administrative records of the Social Security Administration in conjunction with existing Bureau of the Census records, it was possible to determine correctly, in most cases, the specific questionnaire each manufacturing establishment should receive.

Information was obtained on all 1963 report forms regarding the physical location, Social Security employer identification number, company affiliation, and legal form of ownership. These kinds of information were necessary to assure control over the completeness of coverage (see section 9, Development of the Mailing List), and also permitted the classification of each establishment by geographic location and type of organization. (See section 26, Special Reports.)

Standard Forms.-All ASM establishments and all of the larger non-annual survey establishments received the standard (long) form which contained the full census detail.

Each standard form called for the same general items regardless of the industry: Total employment, total payrolls, production-worker employment and man-hours by quarter, pro-duction-worker wages, material costs, value of shipments, fuel and electric energy costs, inventories by type, and capital expenditures by type. However, the forms differed in the detailed inquiries on the quantity and value of products shipped and the quantity and cost of individual materials consumed. There were also miscellaneous inquiries such as type of operation and equipment used, departmental inquiries, special details on delivery operations, etc., that were unique to an individual in. dustry or industry groups.

Information on the gross book value of total fixed assets in place (structures and equipment combined) at the end of 1962 and at the end of 1963, and on rental expenditures for buildings and for equipment during 1963 was requested of establishments in the 1963 Annual Survey of Manufactures sample panel. This special information will be published beginning with the 1964 Annual Survey of Manufactures.

Short Forms.-A short form was mailed to establistiments with less than 6 employees except in a few industries where it was sent to those with less than 10 employees. This form required considerably less detail; e.g., total employment and payrolls without any detail on production workers, cost of materials as a grand total, and value of shipments in terms of broad classes of products. No information was requested on inventories or capital expenditures.

However, for the few industries in which small plants account for a significant proportion of the total value of shipments or employment, special modifications were made to collect some detail on the individual products shipped and less frequently on the types of materials used. These industries consisted of logging and sawmills, concrete products, dairy products, meat products, and several printing and publishing industries.

Form MA-101, Manufacturing Plants Under Construction During 1963.-This form was designed to obtain data on capital expenditures by large manufacturing firms for new plants under construction during 1963 but not yet in operation at the end of the year. It was mailed to all multiestablishment companies with 250 employees or more. It was also mailed to any other company which indicated on one of its establishment report forms, in a special check-box section, that it had a plant under construction but not yet in operation. Each such plant was coded geographically and to a 4 -digit industry from the description given of its expected activity. The information obtained on form MA-101 was integrated into
new capital expenditures figures in all tables of the 1963 Census of Manufactures. (For further discussion, see section 22, Expenditures for Plant and Equipment.)

Form NC-X6, Central Administrative Offices and Auxiliary Establishments.-Separate reports were required from each multiestablishment company which indicated that it was operating a separate central administrative office or auxiliary (i.e., a warehouse, a research laboratory, a garage, a repair shop, etc.) serving one or more of its operating establishments. Each auxiliary establishment for which a report on form NC-X6 was submitted was classified as to the nature of the activity it performed and as to the 2-digit industry category of the establishment(s) which it primarily served. The form requested information on employment as of March 15 and payrolls for the year, as well as a percentage breakdown of its employment total, by the type of activity that the employees were performing-administrative work, research and development work, warehousing, direct selling, etc. In addition to this information, the report form also collected data on the total sales that were made for the company from the central office or auxiliary, the cost of research and development work done, value of inventories held, and the capital expenditures for structures and equipment.

The information on the central administrative offices (CAO) and auxiliaries has been tabulated separately and appears as part of the Census Bureau's report, Enterprise Statistics 1963, Part 2, Central Administrative Offices and Auxiliaries. In that publication, information will appear not only by 2 -digit industry of the establishments served but also by type of function performed and industry category of owning company. In the census of manufactures, the employment and payrolls of central administrative offices and auxiliaries serving manufacturing have been added to the
figures for operating establishments into the State, county, standard metropolitan statistical area, and city all-manufacturing totals. Wherever industry detail is provided, the employment and payroll at the central administrative offices and auxiliaries appear as a separate 2-digit industry category at the end of the list of industries. In the manufacturing sector, in 1963, there were approximately 5,300 such establishments which accounted for 726 thousand employees with payrolls of $\$ 6.6$ billion, representing 4 percent and 7 percent, respectively, of the totals of all manufacturing employment and payrolls. It should be noted also that employment of CAO's has been increasing more rapidly than employment of operating establishments, partially the result of the tendency of larger companies to centralize operations formerly carried on a decentralized basis at each plant. (See table F.)

Other Related Forms in the 1963 Economic Censuses:

Form NC.KL, Company Sum. mary Report Form.-This form requested, for the consolidated company, information on payrolls, employment, sales or receipts, inventories, capital expenditures, value of assets, and rental payments. It was restricted to companies with 250 employees or more in the industries included in the economic censuses.

Based on information filed on the establishment reports of the multiestablishment companies, the entire company was classified into 1 of 179 enterprise industry categories developed by grouping the Standard Industrial Classification industries. A special report, Enterprise Statistics, 1963, Part 1, General Report on Industrial Organization, provides tables showing the characteristics and diversification of these multiestablishment companies as derived from the information on census establishment reports.

TABLE F. Comparison of Employment and Payrolls at Operating Manufacturing Establishments and Central Administrative Offices
and Other Auxiliaries Serving Them

| Period | Operating establishments |  | Central administrative offices and auxiliaries ${ }^{1}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Employees$(1,000)$ | Payrolls <br> (billion dollars) | Employees$(1,000)$ | Payrolls <br> (billion dollars) | As a percent of total ${ }^{1}$ |  |
|  |  |  |  |  | Employees | Payrolls |
| 1963. | 16,234 | 93.3 | 726 | 6.6 | 4.3 | 6.6 |
| 1958. | 15,423 | 73.9 | 602 | 4.5 | 3.8 | 5.7 |
| 1954. | 15,645 | 63.0 | 453 | 2.9 | 2.8 | 4.4 |
| Percentage increase: |  |  |  |  |  |  |
| $1958 \text { to 1963...... }$ | 6 | 26 | 20 | 47 | (X) | (X) |
| 1954 to 1958..... | -1 | 17 | 33 | 54 | (X) | (X) |

[^7]Form CB-51, Wholesale Sales Branches and Sales Offices of Manufacturing Companies.-As part of the census of business, information was collected on the sales branches and sales offices of manufacturing companies. In addition to figures on employment and payrolls, these forms requested information on inventories held at and sales, by merchandise line, from these locations. The merchandise lines in the census of business for these wholesale branches and offices are very similar to the classes of products used in the manufacturing area. The totals of the two areas cannot be directly compared inasmuch as the sales from the sales branches and offices include products which were bought and resold as well as those of the company's own manufacture.

Special Surveys Relating to the 1963 Census of Manufactures.-In addition to the information collected on the standard 1963 census of business, manufactures, and mineral industries forms, additional information was collected on special survey forms. The census of manufactures publications also contain the data collected in these various special but related surveys, as described below. The publications, described below, appear as chapters in Volume I, Summary and Subject Statistics.

Form MC-D3, Department of Defense Establishments, and MC-D4, Penal Institutions were used to collect information on government-owned and government-operated manufacturing establishments. These forms were used to collect information on two types of establishments: (1) Manufacturing facilities owned and operated by the Department of Defense, and (2) prison industries (Federal, District of Columbia, and State). The data were prepared with the cooperation of the Department of Defense, the Department of Justice, and the District of Columbia and State prison systems. For Department of Defense installations, information is provided on employment, man-hours, payrolls, cost and value of work done, by industry group and by State. For prison industries, however, only product data is included in the census of manufactures reports. For a detailed description of the methods used to collect this information and the data presented, see the Special Report, Manufacturing Activity in Government Establishments, at the end of this volume.

Form MC-D12, Supplementary Inquiries for 1962.-In order to reduce the burden of the 1963 census on the respondent and the Census Bureau, information on horsepower rating of equipment in place by type of equipment, fuels consumed by the type of fuel, and electric energy was collected for 1962 and restricted to those establishments included in the annual survey of manufactures. In previous censuses, this information had been requested
on the standard census forms. Information is published on these items by industry, by State, and by standard metropolitan statistical area. Within State or standard metropolitan statistical area, 2 -digit industry detail is provided wherever possible. For details on this special survey, see Volume I, Summary and Subject Statistics, chapters 6 and 7.

Form MA-175, Report on Shipments to or Receipts for Work Done for the Federal Government Agencies and Their Contractors and Suppliers for 1963.-To measure the impact of government procurement on the economy and on geographic areas, form MA- 175 was mailed to approximately 2,500 annual survey of manufactures establishments accounting for over 95 percent of all shipments and receipts of 30 defense-oriented industries which account for the major portion of government procurement. The survey provided information on the value of products shipped to or receipts for work done for Federal agencies, their contractors, subcontractors and suppliers. The information was further subdivided into shipments or receipts on government prime contracts and to other manufacturers in the ultimate performance of Federal Government contracts.

Information on employment and value of shipments by class of product and by Federal agency is provided. Likewise, information is available for States and SMSA's by broad industry groups within each geographic area wherever possible.

Special Survey Form MA-161, Origin of Exports of Manufactured Products.This report form was mailed to a special subsample of the annual survey of manufactures plants with 100 employees or more and exporting more than $\$ 25$ thousand per year. The report provides information on the value of manufacturers' exports by State, standard metropolitan statistical area, and by industry of the producing plant.

MC-D13, Industrial Water Use, 1964.-This special survey, although collecting data for the year 1964, was conducted as part of the 1963 Census of Manufactures. The form was mailed to approximately 10,000 establishments which had indicated on their census of manufactures form consumption of 20 million gallons or more of water in 1963. Information is provided on water intake and discharge by industry and by area.

## 9. DEVELOPMENT OF THE MAILING LIST

The manufacturing plants included in the census of manufactures were identified as part of the overall program to develop the mailing list for the 1963 censuses of business, manufactures, and mineral industries.

The Internal Revenue Service (IRS) maintains a comprehensive list of names and addresses of legal entities with one employee or more which are required to file quarterly tax returns under the Federal Insurance Contributions Act. To each of these legal entities, IRS has assigned a unique employer identification (EI) number. Arrangements were made to obtain this list of El numbers for the selection of those companies which were to be included in the 1963 censuses of business, manufactures, and mineral industries. Since this list contained many companies not within the scope of the economic censuses, it was matched to a similar list of El numbers maintained by the Social Security Administration (SSA). In cooperation with IRS, the SSA assigns an industry code to every El number based on information reported by the taxpayer when he applied for an El number. Only those El numbers with industry codes within scope of the economic censuses were included in the basic mailing list.

This list of El numbers provided the industry code necessary to select the current report form and a payroll size code to determine whether a standard or a short form was to be mailed. However, the list was defective in one basic respect: The El number applies to a legal entity and not to an individual establishment, the basic unit for which census data is required.

Therefore, it was necessary to supplement this list by contacting all known or possible multiestablishment companies to obtain a list of their individual plants or business locations. In January of 1963, a precanvass form (NC-X1, Listing of Establishments) was sent to all companies that had indicated in the 1958 Census of Manufactures or the 1962 Annual Survey of Manufactures that they were operating at more than one location. In addition, all "apparent" single-establishment companies in the IRS-SSA file of EI numbers with sizeable employment were included in this precanvass.

For the known multiestablishment companies, the Census Bureau prelisted the establishments as they had been last reported to the Census Bureau (the 1958 census except for the manufacturing companies which had reported for their manufacturing establishments in the 1962 Annual Survey of Manufactures). The company was requested to update this list by deleting closed locations, correcting the addresses, reporting the current El numbers used for each plant, as well as adding any locations operated but not already included in the listing. The El numbers reported for these multiestablishment companies were excluded from the list of El numbers obtained from IRS-SSA prior to mailing the 1963 census report forms. Thus, the 1963 Census of Manufactures list for single-establishment companies was obtained from the IRS-SSA, but the list of plants of mul-
tiunit companies was obtained directly from those companies by a special precensus survey.

While the IRS-SSA list was generally adequate in providing sufficient industry and size information to determine the proper form for mailing, a number of the EI numbers did not have precise industry or size information associated with them. A special form (NC-X3, General Report) was mailed to all such companies in the 1963 censuses of business, manufactures, and mineral industries. Since it was assumed that these establishments were quite small, only limited statistics were required. On the basis of the information reported, these establishments were coded and included in the basic tabulations. If the NC-X3 indicated substantial activity, the company was recontacted with a standard census form.

The 1963 census was distributed and returned by mail. The very large complex multiestablishment companies were mailed their report forms in November 1963 to give them as much lead time as possible to meet the substantial demands of the 1963 census on their statistical staffs. Report forms for the smaller companies were mailed in January 1964. Collection was completed by August 1964. All mailing and receiving, including the various reminder mailings as well as routine editing, coding, and card punching, was done at the Census Bureau's Operations Office in Jeffersonville, Ind. The more difficult problem reports and all reports from very large companies were sent to Washington for review prior to punching. The punched data were transmitted to Washington through a telephone computer link-up and all computer processing, review of the tabulated data, and the preparation of the publications were performed there.

## 10. COMPLETENESS OF COVERAGE AND ACCURACY OF THE DATA

Since the 1963 mailing list was considered to be complete, no field coverage check was conducted. There was a concerted effort to assure completeness of coverage through systematic reminders at 4 - to 6 -week intervals including the use of certified mail, telegrams and, for the larger companies, telephone calls.

Considerable attention has been devoted to assuring completeness and correctness of the reporting by large companies. In the early stages of processing, the individual establishment reports of the very large companies were reviewed along with the company summary report, form NC.K1, to make certain that the company had included reports for all its establishments and subsidiaries and that there was no duplication in reporting among manufacturing, minerals, central offices, and sales branches and offices. The NC-K1 was also a vehicle for the company to report changes in ownership since the census precanvass was
conducted in the preceding year. Accurate company affiliation information is necessary, it should be noted, to enable the Census Bureau to review the tabulations to assure confidentiality of the data; to provide statistics for the "enterprise statistics" program; and, in manufacturing, to prepare the company concentration ratios by industry and product class. Part 2 of form NC-K1 required that the parent company reconcile its payroll figures by employer identification numbers filed with the Internal Revenue Service to those reported on the individual censuses of manufactures, business, and mineral reports. As a result of this comparison, omissions were detected as well as duplication of the reporting within the census establishment file.

As part of the computer edit of the data, all "annual suvey of manufactures" establishments in the census were matched to the list of establishments in the 1962 Annual Survey of Manufactures. All large unmatched establishments were reviewed to make certain that plants which changed ownership, were newly established, or had been closed down since 1962 were properly handled. Furthermore, during the review of the published data, whenever there was a significant change from the previous year in the totals for each industry or geographic area, the reports were checked out individually to make certain that there was no inadvertent omission or duplication in reporting between years, and that the change was valid.

All report forms in manufacturing were audited by the computer. The figures reported in 1963 by each of the 60,000 annual survey of manufactures establishments were compared to those reported in 1962. Establishments with significant increases or decreases in any data item or with significant changes in selected operating ratios (e.g., cost of materials per dollar of shipments, payroll per employee, production-worker wages per manhour, etc.) were identified for subsequent review by the Bureau's statisticians. Small establishments with problems were tentatively accepted or modified by the computer but annotated for subsequent examination.

The operating ratios of the 250,000 smaller establishments not in the annual survey of manufactures were edited against industry averages developed from the 1958 Census of Manufactures and brought up to date through the 1962 Annual Survey of Manufactures data. In the review of the tabulations prior to the publication of the final reports, the selected operating ratios for all establishments were analyzed and the mean ratio for all establishments in each industry determined. A frequency distribution of establishments according to operating ratio class was prepared, and those establishments whose ratios were more than two standard deviations from the industry
average were isolated as "outliers," examined and, if necessary, corrected. A similar type of analysis was made for the individual products shipped and the individual materials consumed. A unit value was calculated for each item reported by an establishment. An industry average unit value was also calculated and a frequency distribution tabulation of unit values prepared. Extreme unit-value cases were isolated and corrected during the preliminary and final table review.

## II. EXPLANATIONS OF TERMS USED IN COLLECTION AND PUBLICATION OF DATA

## 11. EMPLOYMENT AND RELATED ITEMSGENERAL

The census of manufactures provides information on employment and payrolls at operating establishments and central administrative offices and auxiliaries. The standard form for operating establishments collected the number of production workers by quarter and all other employees as of the 15th of March, as well as annual payrolls for production workers and other employees separately. Form NC-X6, Central Administrative Offices and Auxiliaries, collected figures on employment as of March 15 and payrolls for the year.

In presenting the data, the employment and payrolls of central administrative offices and auxiliaries which serve manufacturing plants are included in the all-industries totals in every summary table (U.S., State, standard metropolitan statistical area, county, and city). However, whereas the operating establishments were coded to a 4 -digit manufacturing industry, the administrative offices and auxiliaries were coded only to the 2-digit industry group of the establishments they served. Thus, in all tables with industry detail, the administrative offices and auxiliaries are shown as a separate industry group following the industries in Major Groups 39 and 19.

Separate statistics for all central administrative offices and auxiliaries including those of nonmanufacturing companies will be published as part of the 1963 censuses of business, manufactures, and mineral industries in Enterprise Statistics 1963, Part 2, Central Administrative Offices and Auxiliaries. In that publication, information will appear not only by 2-digit industry of the establishments served but also by type of function performed and industry category of owning company.

## 12. EMPLOYMENT OF OPERATING MANUFACTURING ESTABLISHMENTS

All Employees.-The category "all employees" comprises all full-time and part-time employees on the payrolls of operating manufacturing establishments who worked or re-
ceived pay for any part of the pay period which included the 12th and ended nearest the 15th of the months specified on the report form. At the all-industry level, the employees of central administrative offices and auxiliaries are included. Included are all persons on paid sick leave, paid holidays, and paid vacations during these pay periods. Excluded are members of the Armed Forces and pensioners carried on the active rolls but not working during the period. Officers of corporations are included as employees; proprietors and partners of unincorporated firms, however, are excluded from the total.

Production and Related Workers.This category comprises workers (up through the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivering), maintenance, repair, janitorial, watchman services, product development, auxiliary production for plant's own use (e.g., power plant), recordkeeping, and other services closely associated with these production operations at the establishment covered by the report. Supervisory employees above the working foreman level are excluded from this category.

All Other Employees.-"All other employees" are nonproduction personnel of the manufacturing establishment, including those engaged in the following activities: Factory supervision above the working foreman level, sales (including driver salesmen), sales delivery (highway truck drivers and their helpers), advertising, credit, collection, installation and servicing of own products, clerical and routine office functions, executive, purchasing, financing, legal, personnel (including cafeteria, medical, etc.), professional, and technical. Also included are employees on the payroll of the manufacturing establishment engaged in the construction of major additions or alterations to the plant and utilized as a separate work force.

Average Employment.-The 1963 Census of Manufactures report forms requested employment figures for "production and related workers" for four selected pay periods (i.e., production worker midmonth employment in March, May, August, and November). For "all other employees" only a mid-March figure was requested. Thus, the "annual average" of operating establishments is composed of an average of the four monthly figures for the "production workers" plus the March figure for "all other employees."

This approach was initiated in the intercensal annual surveys of manufactures to simplify the schedule format and lighten the reporting burden of respondents, since it was found that the average of these selected pay
periods approximates very closely the average employment for the year that would be obtained from the 12 pay periods for almost all industries.

The employment figure shown for all industries in most tables is the 4-month average.

For a few highly seasonal industries, production-worker figures were collected for all 12 months and are shown in Volume II, table 3 , for those industries.

## 13. PAYROLLS OF OPERATING MANUFACTURING ESTABLISHMENTS

For each industry, this total includes the gross earnings paid in the calendar year 1963 to all employees on the payroll of operating manufacturing establishments. Respondents were told they could follow the definition of payrolls used for calculating the Federal withholding tax. It includes all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. The total includes salaries of officers of these establishments, if a corporation; it excludes payments to the proprietor or partners, if an unincorporated concern. Also excluded are payments to members of Armed Forces and pensioners carried on the active payroll of manufacturing establishments.

The 1963 census definition of payrolls, identical to that recommended to all Federal statistical agencies by the Bureau of the Budget, is also the same as the 1958 census definition. It should be noted that this definition does not include employers' Social Security contributions, or other nonpayroll labor costs such as employees' pension plans, group insurance premiums, and workmen's compensation.

As in the case of employment figures, the payrolls of separate central administrative offices and auxiliary units of multiestablishment companies are not included in the totals for individual industries or industry groups.

## 14. MAN-HOURS OF PRODUCTION AND RELATED WORKERS

This total consists of all plant manhours of production and related workers as defined above. It represents all man-hours worked or paid for at the plant including actual overtime hours (not straight-time equivalent hours.) It excludes hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. Where employees elected to work during the vacation period, only actual hours worked by such employees were reported.

Man-hours were generally well reported except in some industries, like apparel, where work is commonly performed on a piece-rate basis. However, man-hours were not collected for the very small establishments which were mailed special short forms (see section 8). Experience has shown that these small establishments have difficulty in distinguishing between production and other types of employees. Manhours were estimated for these small establishments as well as for other nonreporters. Because estimating was largely confined to small establishments, there is no significant qualification to the validity of overall industry and geographic area totals for man-hours, except for sawmills and a few other industries characterized by small establishments. However, the man-hour figures for establishments with fewer than 10 employees, shown in the size of establishment tables, should be interpreted with this factor in mind.

## 15. MATERIALS

Cost of Materials, Etc., Consumed.-A summary inquiry on the 1963 census report forms requested information on the cost of materials, supplies, semifinished goods, fuels, and electric energy, actually consumed or put into production during the year and the cost of products purchased for resale, by each manufacturing establishment, whether purchased, withdrawn from inventories, or received from other establishments of the company. Included also were the costs of materials supplied by the establishment which were processed elsewhere on contract for the establishment. (The products produced elsewhere under contract for the establishment are included in the value of shipments of the establishments; see section 16 , value of shipments).
"Cost" was defined as the direct charges actually paid or payable for items consumed or put into production during the year, after discounts, and including freight charges and other direct charges incurred by the establishment in acquiring the materials.

To arrive at the industry total "cost of materials, etc.," separate figures were obtained for (a) the total delivered cost of all raw materials, semifinished goods, parts, components, containers, scrap, and supplies consumed or put into production in 1963; (b) the amount paid for electric energy purchased; (c) the amount paid for all fuels consumed for heat, power, or the generation of electricity; (d) the cost of work done by others on materials or parts furnished by manufacturing established (contract work); and (e) the cost of products bought and resold in the same condition.

It should be noted that the cost of fuel consumed under " $c$ " above does not include fuel used as a material in the manufacturing process; for example, coal used in the produc-
tion of coke. Such costs were included with other materials cost in category "a" above.

The total excludes the cost of services used, such as advertising, insurance, telephone, etc., and developmental, research, and consulting services of other establishments. It also excludes overhead costs, such as depreciation charges, rent, interest, royalties, etc., and it excludes materials, machinery, and equipment used in plant expansion or capitalzed repairs which are chargeable to fixed assets accounts.

For materials received from other plants of the same company or from a central materials depot (whether at the same or different physical location), the respondent was asked to value the items at their full economic value as produced, plus freight and other direct handling charges. The respondent was asked to check, where possible, that reported costs equaled the value of shipments reported for the items by the company's plant which produced and transferred the goods plus the freight and other direct charges (see value of shipments, section 16).

A summation of industry cost of materials figures to industry group totals results in large and unknown amounts of duplication, owing to the addition of costs reported by related industries engaged in successive fabrication stages in the production of finished manufactured products. For this reason, cost-of-materials figures shown at the industry group (2and 3 -digit) and all-industry levels must be used with caution. With some important exceptions (such as refrigeration machinery, radios and television receiving sats, and motor vehicles and parts), this duplication is not significant within incividual 4-digit industries.

Individual Materials Consumed.-In addition to the total cost of materials which every establishment was requested to report, quantity and cost information was collected on 633 specific materials.

Of these materials, 314 were "complete coverage" materials; i.e., every industry that consumed appreciable quantities of the material was canvassed so that the data would represent at least 90 percent of manufacturing consumption. For the remaining 319 "partial coverage" materials, information on consumption was obtained on a more limited basis, generally only in those industries in which the materials were important inputs. Consumption information was also collected for an additional 492 items which were produced and consumed in the same plant as part of the product sections of the report forms.

Because American industry uses an enormous variety of materials, the number of materials for which "complete coverage" consumption data ( 90 percent or higher) were ob-
tained had to be strictly limited. The selection of a particular material for such coverage was, therefore, based on the following criteria:
(1) The importance of the material as measured by the total value of U.S. consumption of the material;
(2) The percentage of total consumption accounted for by manufacturing establishments;
(3) The availability of consumption information from manufacturers' records; and
(4) In certain instances, other factors such as the strategic importance of the material or the availability of historical data on the use of the material.

The materials included on a limited coverage basis were chosen not only because they constituted important inputs for particular industries but frequently because they provided information necessary to classify plants by SIC industry.

The individual materials are shown by industry of the consuming establishment in Volume II, table 7's. In Volume I, Summary and Subject Statistics, information is shown for most of the complete-coverage materials according to industry and geographic area of consuming establishment.

The data on materials consumed relate generally to the quantity and cost of materials purchased or transferred from other plants of the same company. However, for selected materials which are also importantly produced for use within the same establishment, information was requested on such "captive" production in quantity terms only.

Some undercoverage exists in the statistics for most individual materials. The undercoverage results from the fact that:
(1) Individual materials consumption information was obtained only from establishments using one of the census of manufactures standard forms, except on industries for which the short forms were modified to request consumption of a limited number of important materials. For the most part, therefore, plants with a very small number of employees are not represented in these statistics.
(2) Establishments consuming less than a specified amount of material were not requested to report consumption of the material separately. For the majority of individual materials, the mininmum amount was $\$ 5,000$.

The use of such cutoffs, as well as the use of short forms, is not believed to have had a significant effect on the totals for most materials. However, for industries where a sizeable proportion of the activity is accounted for by small establishments or where a specified material is used in relatively small quantities, the above limitations may be of some consequence.

## 16. PRODUCTS

Value of Shipments.—Except in a few industries, the respondents were instructed to report net selling values, f.o.b. plant, after discount and allowances and excluding freight charges and excise taxes. In a few industries, specifically noted in the text of the industry chapters, Volume II, delivered prices were acceptable if delivery was included as an integral part of the plant operations, such as in the milk and bakery industries.

Manufacturers were asked to include as products shipped, not only the products made in the establishment but also those made elsewhere under contract from the materials owned by the establishment. Included were all products sold, transferred to other plants of the same company, or shipped on consignment.

In addition, manufacturers reported receipts for contract work performed for others, resales (i.e., the value of all products resold without further processing), receipts for miscellaneous activities such as sale of scrap and refuse, and the value of installation and repair work performed by the plant employees. Although the value of products bought and resold without further processing is included in the value of shipments totals for each industry, it is excluded from the figures for individual products or classes of products.

Multiestablishment companies were asked to report value information for each establishment as if it were a separate economic unit. They were instructed to report the value of all products transferred to other plants of the company at their full economic value; i.e., to include, in addition to direct cost of production, a reasonable proportion of company overhead and profits.

Individual Products.-In the 1963 census program, information was collected on the output of approximately 10,000 individual product items. The term "product" as used in the census of manufactures represents the finest level of detail for which output information was requested. Consequently, it is not necessarily synonymous with the term product as used in the marketing sense. In some cases it may be much more detailed and in other cases it is more aggregative. For example, "pharmaceutical preparations" was distributed
into nearly 100 items, whereas, "automotive gasoline" was reported as a single item.

Some 6,000 of the product items were listed separately on the 1963 census report forms. Data for the remaining 4,000 products were obtained in the monthly, quarterly, or annual surveys comprising the Current Industrial Reports series of the Census Bureau. ${ }^{8}$ Totals for the year 1963 for these items as derived from the commodity surveys are shown in the "products shipped" table (table 6) in the industry chapters of Volume II together with the tieline total value collected in the census for reconciliation. Appendix $F$ contains a complete listing of the surveys in the Current Industrial Reports program with page references in Volume II where the data appear.

The list of products for which separate information was collected was prepared after consultation with industry and government representatives. Comparability with previous figures was given considerable weight in the selection of product categories so that comparable 1958 information is presented for most products.

Typically, both quantity and value of shipments information was collected. However, if there was no meaningful physical quantity measure that could be reported by manufacturers, only value of shipments was collected.

As mentioned earlier, shipments include both commercial shipments and transfers of products to other plants of the same company. For industries in which a considerable portion of the total shipments are transferred to other plants of the same company, separate information on interplant transfers was also collected. Moreover, for products which are used to a large degree within the same establishment as materials or components in the fabrication of other products, total production and often consumption of the item within the plant was collected. Typically, the information on production was also collected for products for which there are significant differences between total production and shipments in a given year because of wide fluctuations in finished goods inventories. Alternate measures of output of products, such as value of work done for products with long production cycles, were used as appropriate and feasible.

Classes of Products.-For the purpose of summarizing the product information, the separate products were aggregated into classes of products which were, in turn, grouped into all primary products of each industry. The code structure used is a 7 -digit number for the individual product, a 5 -digit code for the class of product, and a 4 -digit code for the total pri-

[^8]mary products in an industry (see section 6 for application of coding structure to the assignment of SIC codes for establishments).

The 10,000 product items in the 1963 census (including products from the Current Industrial Reports program) were grouped into approximately 1,100 separate classes. Products were grouped into product classes to bring out significant differences in the broad types of products within a 4 -digit industry. General similarity of the kind or purpose of the products or of the manufacturing processes, type of markets, or of materials used, were the basis for product combinations. The economic significance of the class was also taken into account; residual products of an industry were grouped when the products were not sufficiently significant in dollar value to warrant separate classes.

As a result of the increased number of respondents included in the product-class shipments totals, these categories lend themselves to many more cross tabulations than do the 7-digit products, without disclosing information about the operations of individual companies. In the industry chapters of Volume II, table 6D provides information on the value of shipments of product classes by State; and table 5B, by industry of the establishment producing them. The latter table is the best vehicle for showing the primary and secondary product mix of an industry, as well as the interrelationship between the 4 -digit industry value of shipments and the 4 -digit product group value of shipments. In table 8, the product class is used to provide finer industry-type general statistics by classifying establishments within an industry according to the degree to which they specialize in producing a specific class of products.

The class of product concept was incorporated by the Census Bureau into its own program with the 1947 Census of Manufactures after it developed the technique in the compilation of World War II production statistics. Product classes formed the basis of collecting product information in the annual survey of manufactures when that survey was initiated in 1949. The classes have been revised over the succeeding years to improve the balance and significance of product combinations within each industry and to keep abreast of the growth and decline of products.

## 17. INDEXES OF PRODUCTION AND UNIT VALUE.

Based on the type of quantity and value statistics shown in table 6A's of the Industry Volume, preliminary indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries. These indexes are shown in table 6B's of the industry
chapters. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A unit-value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate value of shipments of products for which no satisfactory quantity data were available.

A special census of manufactures report will be issued, in cooperation with the Federal Reserve Board, on indexes of production, consolidating the information shown in the 6B tables into group and total indexes and discussing in some detail the objectives and methodology of the indexes and the data problems and limitations. That report will contain revisions of the table 6 B indexes and will include indexes for some industries not previously published.

## 18. INDUSTRY AND COMMODITY APPROACHES TO VALUE OF SHIPMENTS

In the census of manufactures tables, value of shipments figures are shown for 4-digit industry and 4-digit product groups which are primary to an industry. Both categories are identified by the same 4 -digit number and title. However, the two sets of figures must be distinguished carefully in use.

Under the industry approach, each plant is assigned to one or the other of the approximately 4254 -digit industries. This is done primarily to secure information on payrolls, man-hours, cost of materials, value added by manufacture, and other matters which relate to the operations of the entire plant. As part of this process, the entire shipments of the plant are also assigned to a particular industry. This will include its output not only of products classified in the industry (primary products) but of products classified in other industries as well (secondary products) and miscellaneous receipts and resales. The value of shipments on an industry basis appears in tables described as "General Statistics" (e.g., most tables in Volume I; and tables 1, 2, 3, 4, and 8 in Volume II).

Tables 6A through 6C in the industry chapters of Volume II are tabulated on a commodity basis and provide value-of-shipments figures for 4 -digit product groups as well as 5 -digit product classes and 7 -digit products on a wherever-made basis. The 4-digit value figures are derived by aggregating the values of individual products (or product classes) shipped, irrespective of the industry code of the establishment shipping them. Thus, the 4 -digit product-group total avoids the complications of secondary products and miscellaneous receipts inherent in the 4-digit industry value of shipments.

From census to census, the value figures for some 4-digit product groups show
greater stability than the comparable 4-digit industry value of shipments. The latter includes the contribution of some establishments which are highly diversified and only marginally coded to the industry. Minor and temporary shifts in product mix could reclassify such establishments from one industry to another without any substantial or permanent change in their operations. In the annual survey of manufactures and the 1963 Census of Manufactures, this erratic shifting was minimized by the application of a resistance factor which required that large establishments (100 employees or more) be reclassified only if there was a very substantial shift in product mix or evidence that the newer product mix remained stable over a number of years. (See also section 6 above.)

## 19. DUPLICATION IN COST OF MATERIALS AND VALUE OF PRODUCTS

The aggregate of the cost of materials and value of shipments figures for industry groups and for all manufacturing industries includes large amounts of duplication since the products of some industries are used as materials by others. With some important exceptions, such as motor vehicles and parts, this duplication is not significant within individual 4-digit industries. However, it is significant at the 2 -digit and 3 -digit industry groups because these totals often include industries which represent successive stages in the production of a finished manufactured product. Examples are the addition of flour mills to bakeries in the "Food Group" and the addition of pulp mills to paper mills in the "Paper and Allied Products Group" of industries. Estimates of the overall extent of this duplication indicate that the value of manufactured products exclusive of such duplication-the value of finished manufac-tures-tends to approximate two-thirds of the total value of products reported in the census of manufactures.

Because the amounts of duplication contained in the cost of materials and value of products figures cannot be measured with any degree of precision, these data are not shown in the geographic area tables (Volume III) and caution is urged with their use when they are provided at the 2- and 3-digit industry group level in Volumes I and II.

Even where no significant amount of duplication is involved, value of shipments figures are deficient as measures of the relative economic importance of individual manufacturing industries or geographic areas because of the wide variation in ratio of materials, labor, and other processing costs to value of shipments, both among industries and within the same industry.

The difference between the industry and the commodity approach can be illustrated by the example of fabricated structural steel.

While the major share of the output of these products comes from plants which are principally engaged in their production, substantial quantities are also manufactured by plants classified in other industries, such as boilershop products, sheet-metal work, and miscellaneous metal work. At the same time, plants classified in the fabricated metal products industry also manufacture products of other industries. The resultant overlapping is evident from the excerpt from table 5B in the Industry Volume, below.

Thus, it will be seen that of the total shipments of $\$ 1,916$ million by plants classified in the fabricated structural metal industry, $\$ 1,432$ million consisted of products of this industry, while $\$ 237$ million consisted of products of other industries, and $\$ 247$ million of miscellaneous receipts. Shipments of fabricated structural steel products totaled $\$ 1,604$ million, of which $\$ 172$ million was contributed by plants classified in other industries.

It should be noted that the figures shown in table $5 B$ for the total value of shipments of the 5 -digit product classes and the 4 -digit product groups are the subtotals and totals of the individual products in table 6A which bear the same first 5 -digit and 4 -digit code numbers.

In order to measure the extent to which industry and product statistics may be compared, two measures have been developedthe "specialization ratio" and the "coverage ratio." The specialization ratio measures the extent to which the plants in an industry spe-
cialize in making the products primary to that industry. It is derived by dividing the total output (both primary and secondary products) of the industry's plants into their output of products primary to the industry. Thus, in the above illustration, the specialization ratio is 0.86 ; that is, shipments of fabricated structural steel products account for 86 percent of all products made and shipped by plants in that industry $(1,432 \div 1,669=.86)$. The coverage ratio measures the extent to which the products primary to an industry are shipped by plants classified in that industry. In the illustration, the coverage ratio is 0.89 ; that is, 89 percent of all shipments of fabricated structural steel products was made by plants primarily engaged in the manufacture of these products $(1,432 \div 1,604=89)$. These ratios appear in tables 1 and 5A in the industry chapters, Volume II, and in appendix B, industry descrip. tions, Volumes I, and III.

In table G, industries are grouped by 1963 specialization and coverage ratios. In 1963, as in 1958, approximately 95 percent of manufacturing employment is included in industries with specialization of 80 percent or higher. Nine of 412 industries, for which the industry (primary product) specialization ratio was published for 1963, had ratios of 100 percent and 218, with 56 percent of the employment in all industries for which the ratios were published, had ratios between 90 and 99 percent. Only 29 of the 412 industries showed ratios below 80 percent. The higher the ratio, the smaller the output of secondary products; conversely, the lower the industry specialization

${ }^{3}$ Less than 0.5 percent.
ratio, the higher the output of secondary products. Lower industry specialization ratios give evidence of diversity of output by an industry and overlap with other industries. Over time, decreasing industry specialization ratios would be a manifestation of the need for revision of the classification structure.

## 20. VALUE ADDED

Value added by manufacture is derived by subtracting the total cost of materials (including materials, supplies, fuel, electric energy, cost of resales and miscellaneous receipts) from the value of shipments (including resales) and other receipts and adjusting the resulting amount by the net change in finished products and work-in-process inventories between the beginning and end of the year. ${ }^{9}$

[^10]Value added avoids the duplication in the value of shipments figure which results from the inclusion of the shipments of establishments producing materials and components along with the shipments of establishments producing finished products. It does not exclude, as described in the paragraph below, purchased services. Nevertheless, it is considered to be the best value measure now available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Value added by manufacture should not be confused with "national income originating in manufacturing," as presented in the national income by industrial origin estimates compiled by the Office of Business Economics (OBE), Department of Commerce. (See tables H and I.) The latter measure is the sum of factor costs incurred by an industry in production and is, therefore, a more "net" concept of value added than that used in the census of manufactures. "Income originating" excludes,

Source: Survey of Current Business, July 1966 p. 15.
in addition to cost of materials, such other costs as depreciation charges, State and local taxes (other than corporate income taxes), allowance for bad debts, and purchases of services from nonmanufacturing enterprises, such as contract costs involved in maintenance and repair, services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income originating estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by nonmanufacturing establishments of companies classified as being primarily manufacturing, and conversely, in the exclusion of some part of the net value added by manufacturing establishments of companies classified as primarily nonmanufacturing. It is believed that for manufacturing as a whole the net effect increases income originating. (In fact, in the Petroleum and Coal Products major industry group, nonmanufacturing activities of manufacturing companies are so significant that this is the one major industry group in
which OBE "income originating" exceeds Census "value added by manufacture.")

Figures are not available to permit a reconciliation of the estimates for value added in manufacturing and the national income originating in manufacturing for the current period. However, in 1957, the Census Bureau conducted a special survey, MC-D11, "Selected Costs and Assets of Manufacturing Establishments," which collected information on some of the costs included in value added for services purchased from other sectors or excluded from the national income estimates. These specific costs which accounted for about $\$ 15$ billion of the $\$ 148$ billion of value added in 1957 were maintenance and repairs, $\$ 4.5$ billion; insurance, $\$ .7$ billion; property taxes, $\$ 1.5$ billion; rental payments, $\$ 1.4$ billion; and depreciation, $\$ 7.3$ billion. The residual value added, $\$ 132$ billion was approximately $\$ 16$ billion in excess of national income of $\$ 116$ billion.

Table J presents an approximate reconciliation of national income and value added figures for manufacturing in 1957. The national income estimates for payrolls and other fac-
(In billions of dollars)

[^12]tor income in that year are based on the unrevised national income figures which are somewhat lower than the revised estimates appearing in table $H$. it should be noted that the labor costs included in national income and value added are reasonably close despite the fact that they are computed on a slightly different basis. If the proprietary and profit incomes of the company-based national income estimates are allocated to the establishments included in the census of manufactures, value added exceeds national income by $\$ 35$ billion of which $\$ 15$ billion is attributable to costs reported on survey MC-D11. Somewhat more than half of the $\$ 35$ billion excess represents the inclusion in value added by manufacture of purchased business services arising in other economic sectors; the remainder reflects conceptual differences arising from the inclusion in value added of indirect business taxes and depreciation which are excluded by definition from national income.

## 21. INVENTORIES

The value of beginning-of-year and end-of-year inventories, respectively, held by each manufacturing establishment was obtained in the 1963 census. Separate inventory figures
were requested for (1) finished products; (2) work in process; and (3) materials, supplies, fuel, and other inventories.

Respondents were asked to report their inventories at approximate current costs, if feasible; otherwise "at book values." Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the value of inventories aggregate for all establishments in an industry is not precise. The figures on change in inventory between the beginning and the end of the year are of considerably greater significance.

In using inventory data by stage of fabrication for all industries and at the 2-digit industry level, the following should be noted: An item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. For example, the finished product inventories of a steel mill would be reported as raw materials by a stamping plant. Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and all manufacturing which are merely aggregates of figures reported by establishments in specified
industries. Further, the total finished goods inventory for "all manufacturing"' includes items that are not finished manufactured products.

For a few industries in the food group, there are special problems in the handling of inventories by stage of fabrication. These are industries in which the production cycle is short, the products are usually stored under controlled conditions, and the products are aged. Included among such types of products are meat products, stemmed and dried tobacco cheese, and whiskey. It is not clear whether such products should be treated as finished gaods inventories or as work in process while in storage.

In the meat processing industries, establishments were allowed to report finished products and work in process combined as finished products. In the distilling industry, products stored for aging were to be reported as finished products. In all foods industries, substantial finished goods inventories have been reported. These data have been summarized in the inventory tables in a consistent manner for all of the years included in this report.

## 22. EXPENDITURES FOR PLANT AND EQUIPMENT

In the 1963 census, manufacturers were asked to report expenditures made during the year for permanent additions and major alterations to their plants, as well as for new machinery and equipment purchases, that were chargeable to fixed asset accounts of manufacturing establishments and were of a type for which depreciation accounts are ordinarily maintained. Expenditures for machinery and equipment were to include those made for replacement purposes, as well as for additions to plant capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense; new facilities and equipment leased from nonmanufacturing concerns; new facilities owned by the Federal Government but operated under contract by private companies; and plant and equipment furnished to the manufacturer by communities and organizations.

In addition to total capital expenditures, respondents were requested to indicate the following subtotals: (a) New structures and additions to plant (including major alterations and capitalized repairs and improvements); (b) new machinery and new equipment (including capitalized repairs and improvements); and (c) expenditures for used plant and used equip. ment acquired from others (including the U.S. Government). In most tables of these publications, the statistics on capital expenditures are confined to a total of new plant and equipment (items "a" and "b" above). However, in table 3 of the industry chapters in Volume II, and in Expenditures for Plant and Equipment, chapter

5 in Volume I, separate figures are shown for each type of expenditure.

The figures include (a) the expenditures made at manufacturing plants that were in operation during any part of the year, plus (b) expenditures made at plants that were not as yet in production. The data on capital expenditures for plants not in production at the end of 1963 were collected on a separate report form (MA-101) requesting companies to report the value of new plant and new equip. ment put in place during the year. The form also requested description of the type of products that would be made so that the establishment could be classified into a 4-digit industry. This form was sent to (a) the 1,500 largest manufacturing companies; (b) all other companies which indicated on the census of manufactures establishment report form or the "Listing of Establishments" Form NC-X-1 that they had one or more manufacturing plants under construction but not yet in operation at the close of 1963.

The Census Bureau estimates of capital expenditures tend to be lower than those published in the joint Office of Business Eco-nomics-Securities and Exchange Commission survey. (See table K below.) In addition to normal sampling variation, a major source of differences is to be found in the scope of the two series. Census data relate only to manufacturing establishments, whereas the OBE-SEC series cover all establishments of manufacturing companies-nonmanufacturing as well as manfacturing. This factor is particularly important in the petroleum industry where company expenditures for developing new wells and new distribution facilities are ordinarily much larger than their capital expenditures at refineries. On the other hand, manufacturing establishments of companies engaged primarily in nonmanufacturing activities are excluded from the OBE-SEC series but included in Census figures.

[^13](In billions of dollars)

| Year | OBE/SEC | Census | Census as percent of OBE/SEC |
| :---: | :---: | :---: | :---: |

Source: U.S. Department of Commerce, Office of Business Economics Business Statistics, 1963, and the Census of Manufactures.
${ }^{1}$ Excludes plants under construction but not yet in operation.

Both series, it should be noted, exclude expenditures for plant and equipment at establishments owned by the Federal Government but operated under lease or contract by private companies.

## 23. FUELS, ELECTRIC ENERGY, AND POWER EQUIPMENT

In industry table 7B, Volume II, and in chapter 6 , Volume I, information on the use of detailed fuels and electric energy and on the horsepower of power equipment in place is provided for the year 1962. This information was collected as part of the 1963 Census of Manufactures on a special sample survey, "MC-D-12, Supplementary Inquiries for 1962." The information was collected for the year prior to the regular census in order to reduce the reporting burden on the respondents and the tabulation burden on the Bureau of the Census during a major census year. The survey report form was mailed to all establishments included in the 1962 Annual Survey of Manufactures. Insofar as these figures are based on a sample, they must be considered approximations and subject to sampling error. A more complete discussion of the compilation and limitations of these data appear in the introductory text to chapter 6, Volume I.

Totals for prime movers and electric motors are shown separately. The horsepower ratings for "prime movers" include information for such types of power equipment as internal combustion engines, steam and hydraulic turbines, and reciprocating steam engines. The totals for prime movers are further separated between those driving electric generators and those used for other purposes. The statistics for prime movers not driving generators exclude data for automobiles, trucks, and other highway equipment.

The aggregate horsepower figure represents the unduplicated rating for total installed equipment and thus provides a measure of the mechanical power available in manufacturing establishments. The figure is derived by summing the horsepower rating of prime movers and that for electric motors driven by purchased electricity. To secure the latter figure, the total horsepower for electric motors was distributed, by establishment, into two categories: Motors driven by purchased electricity and motors driven by energy generated at the establishment. For the relatively small number of establishments which both generate and purchase electricity, the total horsepower for electric motors was prorated on the basis of the ratio of the net quantity purchased to the net total for electricity consumed.

As in past censuses, respondents were requested to report horsepower of stand-by equipment as well as equipment in operation at the end of the year, including all prime movers and motors in mobile (except automo-
biles, trucks, and other highway equipment) as well as in stationary equipment.

Separate data are shown for coal, coke, fuel oil, gas, and other fuels used for heat and power; purchased electric energy; electric energy generated by manufacturing establishments; and energy generated less sold. Total figures for purchased fuels and electric energy were published as part of the 1962 Annual Survey of Manufactures at the 2 -digit major group and selected 3-digit industry group levels.

## 24. PLANT SPECIALIZATION DATA

As discussed above, the relationship between the product output and the statistics on employment, payrolls, cost of materials, and value of shipments for an industry can be measured by the specialization ratio and the coverage ratio for the industry. At the aggregate industry level, these data relationships are presented in tables $5 A$ and $5 B$ of the industry reports. For each establishment, two measures of its degree of specialization are prepared: (1) A 4-digit primary product-specialization ratio which is the sum of the values of all the plant's primary products divided by the sum of all its primary and secondary products; and (2) a 5 -digit primary product-class specialization code which is the sum of the largest 5 -digit product-class value divided by the sum of its primary and secondary products (contract work and miscellaneous receipts and resales are not included in these calculations). For example, assume that an establishment reported the following:

| Total value of shipments | \$1,000 |
| :---: | :---: |
| Miscellaneous receipts and resales | 15 |
| Total products shipped | 985 |
| 32721 Concrete pipe products | 100 |
| 32722 Precast concrete products | 785 |
| 32730 Ready mixed concrete | 100 |

This plant would be coded into the 4-digit SIC industry 3272, Concrete Products, with a primary product specialization ratio of 90 percent ( $\$ 885 \div 985$ ); it would be subclassified into the 5 -digit class 32722 , Precast Concrete, with a primary product class specialization ratio of 80 percent.

In the census of manufactures, general statistics (employment, payrolls, cost of materials, value of shipments, etc.) have been tabulated to 4 -digit industry and 5 -digit primary product-class levels on the basis of assigning the plant totals to the principal 4 - and 5 -digit codes representing its output. Table 8 of the industry chapter, Volume II, provides general statistics for those 4 - and 5 -digit industry categories with subtotals for the two largest specialization classes ( 90 percent and over, 75 to 90 percent). Not all industries and product classes can be shown in table 8 without disclosing figures for individual companies.

Certain product classes are primary to more than one industry. The industry classification of establishments primarily producing such classes of products is determined on the basis of the kind of operation performed in the establishment; e.g., making the product from purchased materials or from materials produced at the same location. In the plant specialization data (table 8), product classes primary to two or more industries are shown in each of the respective industries. For each industry, the specialization data by industry and product class include only those establishments producing the class of product in the manner defined (e.g., lubricating oils from purchased materials).

Table 8 of the Industry Volume permits analysis of an industry in terms of the differences introduced by variation among establishments in the degree of specialization in the products of the industry or a subgroup ( 5 -digit). For example, where the ratios of various statistics tend to be different for establishments specializing to different degrees in the products of the industry or in different product classes, the ratios for the industry as a whole would be significantly affected by shifts in product mix. It should be noted that for those industries in which a production process results in the manufacture of byproducts or other similarly higher correlated products which are separate product classes in the census, the degree of specialization in each of the product classes tends to be somewhat lower.

Differences in the degree of integration of production processes within establishments are often more important than the element of product mix. A partial measure of differences arising from this factor can be derived for some industries through the metalworking operations or other equipment data. For some other industries, data on the production and use of products within the same establishments may be used as an approximate measure.

## III. SPECIAL INQUIRIES, REPORTS, AND PROCEDURES

## 25. SPECIAL INQUIRIES

Selected Metalworking Operations.For all industries in SIC Major Groups 35 and 37, and for selected 4 -digit industries in Groups 19, 33, 34, 36, and 38, the 1963 census included a special inquiry on "Selected Metalworking and Related Operations" to provide a measure of certain metalworking and related facilities in manufacturing. The following operations were included in this inquiry: foundry (iron or steel); foundry (nonferrous, except die castings); die casting (nonferrous metal only); forging-presses, hammers, or upsetters; electroplating and other plating; gal-
vanizing and other hot-dip coating; heat treating of metals for production purposes; automatic screw machine department; machine shop; tool and die shop, if separate from machine shop; pattern shop (foundry patterns on-ly-metal, wood, etc.); plate or structural fabrication; stamping, blanking, and forming of metals; painting, lacquering, and enameling of metals; plastics molding; assembly of product; and shipping department (including packing and crating).

In Volume I, Chapter 9, Selected Metalworking Operations, the number of establishments performing these operations and the number of production workers engaged in these operations classified by size of the specific operation are shown by industry in table 1 and, for selected operations, by geographic division and State in table 2. The size distribution is based on the number of production workers usually employed in the operation. In addition, for selected industries, the actual number of man-hours worked by production workers in specified operations is also shown. The metalworking operations data by industry are also presented in table 9 of the industry chapters in Volume II.

Information on selected metalworking operations was obtained for practically all industries where such operations are important. For individual industries or groups of industries, the inquiry on metalworking and related operations was tailored to fit the principal operations that were characteristic of those industries.

In many industries, however, small establishments reported on a short form that did not include the inquiry on metalworking operations. Also, a few larger establishments that filed standard forms did not report their metalworking operations. This has resulted in an understatement of the number of establishments maintaining specific operations, primarily in the smallest size class, and to a much smaller degree an understatement of the total number of production workers in the operation.

An approximation of the coverage in terms of number of production workers is provided for both industry and geographic totals. The coverage for most industries is over 90 degree an understatement of the total number larger establishments predominate.

For foundry operations, the number of plants operating foundries consists of the number reporting the operation for each industry plus the number of establishments classified in the foundries industries. For forgings operations, the number of plants operating forge shops consists of the number reporting the operation for each industry plus the number of establishments classified in the forgings industries. In footnotes to table 1,

1963 data are shown for the number of establishments classified in these industries. For example, in addition to establishments shown in the table as operating foundries and die casting facilities, the number of establishments classified in the foundry industries is given in the footnote. In the State table, separate columns have been included giving the number of establishments classified in these industries in each State. Similarly, the form used by respondents in industry 3471, Planting and Polishing, did not include the metalworking inquiry. Consequently, data for establishments in these latter industries were presented in the same manner as for the foundry industries.

A limited inquiry covering machine shops and pattern-shop operations was included for the foundry industries, and an inquiry covering machine shops and tool and die shops was included for the forgings industries.

Selected Equipment Data.-An inventory of textile equipment in place was obtained for a number of the important machines used in the basic textile industries. These data, grouped by type of operation or industry activity of the plant, are shown in a separate chapter in the Industry Volume. Information regarding the coverage of the inquiry is also shown.

Special Departmental Reports.-For paper plants, stone and clay plants, steel plants, aluminum rolling mills, brass mills, and nonferrous wire drawing and insulating plants, where vertically integrated activities are characteristic of establishment operations, selected employment information regarding certain departmental activities was obtained in the 1963 census, as had been done in the 1958 census. Information relating to pulping departments, printing employment, and presses in paper and paperboard converting plants, quarrying activities, and selected operations in steel plants, aluminum rolling mills, brass mills, and nonferrous wire drawing and insulating plants is shown in the chapters for these industries in the Industry Volume.

Distribution of Products or Sales.There was a series of special inquiries which collected information on the distribution of specific products; e.g., sales of packaged milk by retail and wholesale routes; the number and payroll of delivery employees engaged in the milk, bakery, soft drink, and beer industries; sale of books and storage batteries by class of customer; the circulation of periodicals by type of periodical and frequency of issue; production of shoes and slippers by type of construction.

The data resulting from these selected special inquiries on the standard census forms appear in the chapters for the industry in Volume II.

## 26. SUBJECT REPORTS SHOWN IN VOLUME I, SUMMARY AND SUBJECT STATISTICS

In Volume I, there are several summary reports on inventories, capital expenditures, size of establishments, type of organization, power equipment in place, fuels and electric energy, materials consumed, water use, shipments of defense-related products, operations of government-owned establishments, exports of manufactured products, and the degree of concentration in manufacturing.

Most of these chapters are merely summarizations or special compilations of data reported on the standard census forms and presented in the industry or area chapters. Others, however, are the result of information collected on special surveys. The introduction to each of these latter reports describes the report form used, and the sampling or compilation techniques used to assemble the data.

The following chapters which are recompilations of basic data reported on the census of manufactures report forms should be noted.

Size of Establishment.-Each establishment in the census is coded not only to an industry and geographic location but also by its size based on the average number of employees for the year. These size tabulations provide significant insight into the variations in operating ratios among plants within an industry and between industries. Information on the number of establishments, employment, payrolls, value added, value of shipments, and capital expenditures is presented for 10 employment size classes in each industry in table 4, Volume II, and in chapter 2, Summary Volume I. In Volume I, size information at the 2-digit industry and all-manufacturing levels is presented.

## Type of Organization:

Multiunit, Single-Unit Estab-lishments.-Information on whether plants are independent or part of multiestablishment companies contributes importantly to our knowledge of the structure of manufactures in the United States. However, this classification is affected by the way the census of manufactures is conducted. Prior to the 1954 census, the census of manufactures was conducted independently and the multiunit classification was assigned if the company operated more than one manufacturing plant. Beginning in 1954, it has been part of the overall census of business, manufactures, and mineral industries and the multiunit classification applies to companies that may have only one manufacturing plant but also operate separate retail, wholesale, service, or minerals establishment, or a separate administrative office.

The proportion of employees and of value added by manufacture accounted for by multiunit plants has grown rapidly since 1947. (See table L.)

TABLE L. Multiunit Plants as a Percentage of Total
Manufacturing

| Year | Employees | Value added by manufacture |
| :---: | :---: | :---: |
| 1963.... | 68 | 76 |
| 1958.... | 65 | 74 |
| 1954... | 01 | 68 |
| 1947.... | 50 | 59 |

However, some of the increase from 1947 to 1954 was a consequence of taking the censuses of manufactures, mining, trade, and services simultaneously in 1954, but not in 1947.

Legal Form of Organization.Each establishment was asked to report the forms of organization of the company which operated it; e.g., corporation, partnership, proprietorship, cooperative. In chapter 3, Volume I, selected general statistics are shown for each 4-digit industry for each of these forms of business organization. Cooperatives are combined with "other" forms of business organization because of the disclosure problems. In manufacturing, about half the plants are operated by corporations but these plants account for about 95 percent of value added by manufacture.

Concentration Ratios in Manufactur-ing.-In chapter 11 of Volume I, information is provided on the share of all manufacturing accounted for by the $50,100,150$, and 200 largest manufacturing companies ranked by their total value added in manufacturing for 1963, 1958, 1954, and 1947. Information is also shown for the share of value of shipments in each 4-digit industry accounted for by the 4, 8, 20 , and 50 largest companies in each of these industries. A description of the methods used in compiling these data accompanies the tables in Volume I.

## 27. IMPUTATION OF DATA

Each "key" census total called for on the standard forms had its counterpart in the various short forms. The short forms, however, did not require the detailed distribution of such totals (see section 8, The Census Report Forms). It was necessary, therefore, to impute figures for these missing detail items in order to publish universe totals of manufacturing activity.

Imputation of missing items, which was done on an industry basis, was made feasible
by use of the Census Bureau's high-speed electronic computer. The procedures for imputation were of two types: (1) Production workers, production-worker wages, and man-hours were imputed from fixed ratios specified in advance from historical relationships of these items to total employees and total payroll; (2) other items, such as capital expenditures and inventories, were imputed on the basis of their historical relationship to value of shipments. Missing detail was generally imputed on the basis of the historical relationship of the item to its respective total.

For industries characterized by establishments of some size, the percentage of imputation of general measures such as employment and payrolls, cost of materials, inventories, expenditures, and the like is negligible; for the industries in which small establishments account for a significant portion of the total, the percent may go as high as 10 or 25 , but this occurs only in a handful of industries. Of the various statistics, man-hours worked tended to have a higher degree of imputation than the other items due to difficulties in reporting those data by small and mediumsize establishments.

The major exceptions to the imputation procedure for missing data were the detailed products and materials, metalworking operations, and equipment inquiries. The value of products and the cost of materials, parts, supplies and containers for establishments not reporting the detailed inquiries were treated as "unspecified" materials or products in the appropriate tables. For metalworking operations and equipment, the statistics were based on establishments reporting data, with appropriate measures of coverage shown in the tables.

## 28. CONFIDENTIALITY OF DATA FOR INDIVIDUAL COMPANIES

The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In the 1963 census, as in previous censuses, preference was given to geographic regions and divisions over individual States in applying disclosure rules; similarly, States took precedence over standard metropolitan areas, while such areas were given preference over counties, and counties over cities. In tables showing industry detail, major industry group (2-digit) totals were given preference over industry group (3-digit) totals which, in turn, had precedence over individual (4-digit) industries. Similarly, in product tables, 4 -digit product groupings took precedence over 5 -digit product classes; the latter were given precedence over individual 7 -digit products.

Such order of precedence was used because (1) it was considered preferable to show
regional data for an industry, even at the cost of withholding data for some (usually the least significant) State in a region, rather than to show all publishable data for the individual States and group the disclosure States throughout the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) by giving preference to industry group statistics over individual industries within each State, the extent to which individual States can be compared within the SIC industry classification framework is increased.

For each producing State not shown separately in table 2 of the Industry Volume, a footnote gives the number of establishments and either an employment range or the actual employment figure. The employment is shown in a range if the State had less than 1,000 employees, and the employment data represented the total for only one or two companies, or if the exact figure would permit deriving (by subtraction) the number of employees in other States represented by only one or two companies. In addition, figures for States with less than 100 employees are shown only in the footnote together with the number of establishments and employment in a range.

In the Area Volume, figures are not shown for a county or for an industry within a State, metropolitan area, or principal industrial county if the publication of such statistics would disclose information for individual companies. In table 4 of that Volume, however, the number of establishments is shown for every county and the number of employees for most counties represented by three or more companies. Moreover, all counties having manufacturing establishments are included in table 7 , showing for each county, the distribution by employment size of establishments in each major industry group.

A special series of publications entitled "Location of Manufacturing Plants" was originally developed for the 1954 census and has been continued in subsequent censuses. In these publications are tables showing the number of establishments cross-classified by 4-digit industry, county, and employment size class. This is the maximum information which can be provided at such narrow industry-areasize categories without disclosing figures for individual companies. These data are designed to meet the needs of (a) those involved in economic development programs at the regional, State, and local area levels, (b) those engaged in industrial market analysis or allocation of
sales territories, and (c) those concerned with industrial dispersion, regional shifts of industry, and similar problems. For a more complete description of the content of these publications, see the publication statement in the introduction of this volume.

For industries with few establishments or considerable geographic concentration, it has frequently been necessary to use geographic regions broader than the traditional nine census divisions in order to show all plants by some geographic grouping. For this purpose the following combinations of Census divisions have been used:

NORTHEAST<br>New England<br>Middle Atlantic<br>NORTH CENTRAL<br>East North Central<br>West North Central<br>SOUTH<br>South Atlantic<br>East South Central<br>West South Central<br>WEST<br>Mountain<br>Pacific

## 29. ABBREVIATIONS

The following abbreviations and symbols occur frequently in tables and footnotes:

| $\bar{X}$ | Zero |
| :--- | :--- |
| NA | Not applicable |
| n.e.c. | Not available |
| n.s.k. | Not specified by kind |
| lin. | Linear |
| equiv. | Equivalent |
| hp | Horsepower |
| kw.-hrs. | Kilowatt-hours <br> D |
| Withheld to avoid disclosing fig. <br> ures for individual companies |  |
| SIC | Standard Industrial Classifica- <br> tion |

Other abbreviations, such as lb., gal., yd., doz., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 pounds; where the figures are expressed in tons of 2,240 pounds, the unit of measure is specified as "long tons" or "gross tons."

Note: See Introduction for an explanation of terms used.
Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not
applicable.
${ }^{1}$ The figures for 1939 to 1963 include data for employees at manufacturing establishments who were engaged in distribution and in construction work. The extent to which data for such employees were included in the figures for earlier years is not know. In addition to the employment and payroll for operating manufacturing establishments, manufacturing concerns ordinarily reported separately for central administrative offices or auxiliary units (e.g., research laboratories, storage warehouses, power plants, garages, repair shops, etc.) which service the manufacturing establishment(s) of a company. These figures were collected by the Bureau of the Census for 1963, 1958, and 1954. The data for 1963 and 1958 are shown in table 2.
${ }^{2}$ The method of compiling these figures has varied, as follows: All employees: for 1955-1963, figures represent the average of the number of production workers for the payroll period ended nearest the 15th of March, May, August and November, plus all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November; for 1947, an average of 12 monthly figures for all employees; and for 1939 and prior years, the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). production workers: for 1949-1963, figures are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November; and for 1947 and prior years, they represent the average of 12 monthly figures.
${ }^{3}$ For the period 1954 to 1963 value added by manufacture represents adjusted value added and for earlier years, unadjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year. For 1849-1933, cost of contract work was not subtracted from value of shipments in calculating value added by manufacture.

4The figures for 1951 to 1963 include expenditures for plants under construction and not yet in operation. This information was not collected prior to 1951.
${ }^{5}$ Based on current Federal Reserve Board bulletins.
${ }^{6}$ These figures represent estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, therefore, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates are published in the annual survey of manufactures volumes for this period.

The 1958 and subsequent years figures include establishments classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1939 to 1957, but are included for 1929 and earlier years. The 1954 to 1963 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the figures for earlier census years. In addition, beginning with 1954, the figures include data for Logging Camps and Contractors, industry 2411 , which were not included within the scope of the 1947 census. There were also a number of changes in the definition of manufacturing industries during earlier census years that affect the comparability of the historical series. Among the more important of these were the following: Figures for l935 and later years exclude data for railroad repair shops and manufactured gas which were included in 1899 to 1933 figures; the minimum size of establishment included for 1947 to 1963 was I employee; for 1921 to 1939, manufacturing establishments reporting value of shipments of $\$ 5,000$ or more were within scope whereas for 1919 and earlier years the cutoff was $\$ 500$. (These changes in procedure have not appreciably affected the comparability of the historical data except for the figures on number of establishments.)
${ }^{8}$ The figures for 1939, but not for earlier years, have been revised on the basis of retabulation of the returns wis exiluce daca for establishments classified as manufacturing in 1939 and prior years but classified as nonnanufacturing beginning with 1947. Value added by manufacture for 1939 , prior to revision and on abasis comparable with 1937 and previous years, was $\$ 24.7$ billion.
${ }^{9}$ Not revised to exclude data for establishments classified as manufacturing in 1939 and prior years but classified as nonmanufacturing beginning with 1947.
${ }^{10}$ The 1939 figures for "all employees" were revised on the basis of estimates rather than by retabulation of the 1939 reports. The estimates were made in the following manner: for number of employees, by multiplying the retabulated figure for number of production workers by the ratio of all employees to production workers computed from the unrevised 1939 statistics; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 statistics.
${ }^{11}$ Not including data for salaried officers of corporations and their salaries and, therefore, not strictly comparable with figures for other years. ${ }^{12}$ These figures for 1899 and earlier years represent hand and neighborhood manufacturing operations.

TABLE 2. Manufacturing Employment: 1963 and 1958

| Code | Major industry group | Year | All establishments |  | Operating manufacturing establishments |  | Administrative offices and auxiliaries |  |

Note: See appendix A for explanation of terms used.
IThe when the 1958 figures were previously published they did not include data for Alaska and Hawaii since these areas did not achieve statehood until 1959 . The addition of the 1958 Alaska and Hawaii figures to the previously published figures for major industry groups 26 and 29 would have resulted in a disclosure. Therefore the 1958 Alaska and Hawaii data are excluded from these major groups but are included at the "all industries" level.

TABLE 3. General Statistics for Establishments, by Industry

| Code | Industry group and industry | 1963 |  |  |  |  |  |  |  |  |  |

Note: The difference between value of shipments and payroll includes, in addition to profits, the cost of all materials used, supplements to wages, depreciation, interest, rent, as well as purchased services such as advertising, legal, accounting, maintenance and repair, and taxes.
Standard Notes: - Represents zero.
(D) Withheld to avoid disclosing figures for individual companies.
(NA) Not available.
(X) Not
applicable.
${ }^{1}$ Includes expenditures for plants in operation and for plants under construction but not yet in operation.
${ }^{2}$ The total value of shipments for industry groups (2-and 3-digit) and a few individual industries (4-digit) include extensive duplication arising from shipments between establishments in the same industry classification.
${ }^{3}$ The 1963 and most of the 1958 figures represent data for establishments located in the conterminous United States, Alaska, and Hawaii. However, when the 1958 figures were previously published they did not include data for Alaska and Hawaii since these areas did not achieve statehood until 1959 . If the addition of the 1958 figures for Alaska and Hawaii to the previously published figures for an industry resulted in a disclosure, the Alaska and Hawaii data for "all employees, total" and "value added by manufacture" are not included.

The industries and industry groups for which data for Alaska and Hawaii are not included and the combined employment was in excess of 100 are shown below. The industries with lesser amounts are not listed.

| Industry | Total Employment | Industry | Total Employment | Industry | Total Employment |

4Includes data for privately owned and/or operated establishments. Government owned and operated establishments are excluded.
In 1963 and 1958, in addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns reported separately for central administrative offices or auxiliary units which serve the manufacturing establishments of a company (e.g., storage warehouses, power plants, research laboratories, garages, repair shops, etc.), rather than the general public. Separate reports were obtained if these units were at different general locations from the establishments served or if they services more than one manufacturing establishment. The figures shown for these units do not represent a separate industry but rather a balancing total for all manufacturing industries.
${ }^{6}$ Establishments in this industry were requested to report value of production instead of value of shipments. Consequently, the formula for computing value added by manufacture was modified to exclude any change in finished products inventories between the beginning and end of the year.
${ }^{\prime}$ The 1963 and 1958 data for industries 2861 and 2999 are not strictly comparable. The 1958 figures for industry 2999 include an indeterminable number or establishments that were engaged in the manufacture of wood charcoal briquettes. These establishments are included in industry 2861 in 1963.
${ }^{8}$ Establishments in this industry were requested to report value of work done instead of value of shipments. Consequently the formula for computing value added by manufacture was not adjusted for any inventory change between the beginning and end of the year.

## TABLE 4. Selected Statistics on Central Administrative Offices and Auxiliaries, by Major Industry Groups of Establishments Serviced: 1963

Note: See Introduction for explanation of terms used.
The totals at the State and U.S. level were derived from separate tabulations based on industry rather than State detail. The sum of the State detail does not add to the U.S. totals because of (1) independent rounding, and (2) independent correction to the industry tabulations and State tabulations.

## TABLE 6. Manufacturing Employment and Payroll for Geographic Areas:

## 1963, 1958, and 1954-Continued

Footnotes for Table 6--Continued
${ }^{4}$ For the SMSA's listed in the table below (whose definitions were revised for 1963) the 1954 data for central administrative office and auxiliary do not include establishments located in specified counties. County data for 1954 for these units were not available.

| Standard metropolitan statistical area | County |
| :---: | :---: |
| Akron, Ohio. | Portage |
| Binghamton, N.Y.-Pa. | Tioga in New York and Susquehanna in Pennsylvania |
| Charleston, S.E | Berkeley |
| Charlotte, N.C. | Union |
| Cincinnati, Ohio | Clermont and Warren in Ohio, Boone in Kentucky, and Dearborn in Indiana |
| Cleveland, Ohio. | Geauga and Madina |
| Columbus, Ohio. | Delaware and Pickaway |
| Davenport-Rock Island-Moline, Iowa-Ilı. | Henry in Illinois |
| Dayton, Ohio. | Preble |
| Evansville, Ind.-Ky. | Warwick in Indiana |
| Flint, Mich.. | Lapeer |
| Grand Rapids, Mich. | Ottawa |
| Greenville, S.C. | Pickens |
| Harrisburg, Pa. | Perry |
| Houston, Texas. | Brazoria, Fort Bend, Liberty, and Montgomery |
| Indianapolis, Ind. | Hamilton, Hancock, Hendricks, Johnson, Morgan, and Shelby |
| Jackson, Miss. | Rankin |
| Kansas City, Mo.-Kans | Cass and Platte in Missouri |
| Memphis, Tenn.-Ark. | Crittenden in Arkansas |
| Milwaukee, Wisc. | Ozaukee |
| Mobile, Ala.. | Baldwin |
| Nashville, Tenn. | Surmer and wilson |
| New Orleans, La. | St. Tarmany Parrish |
| Peoria, Ill... | Woodford |
| Richmond, Va. | Hanover |
| Rochester, N.Y. | Livingston, Orleans, and Wayne |
| Sacramento, Calif | Placer and Yolo |
| St. Louis, Mo.-Ill | Franklin in Missouri |
| Salt Lake City, Utah. | Davis |
| San Antonio, Tex. | Guadalupe |
| Sioux City, Iowa-Nebr. | Dakota in Nebraska |
| Terre Haute, Ind.. | Clay, Sullivan, and Vermillion |
| Toledo, Ohio-Mich: | Wood in Ohio and Monroe in Michigan |
| Wichita, Kans. | Butler |
| Wilmington, Del.-N.J.-Md. | Cecil in Maryland |

${ }^{5} 1954$ employment and payroll data for administrative offices and auxiliary units located in the Anaheim-Santa Ana-Garden Grove, la lif. SMSA, are included in the data shown for the Los Angeles, Calif. SMSA.

# TABLE 7. General Statistics for Manufacturing Establishments by Geographic Areas: 1963 and Earlier Years 

| Geographic area ${ }^{1}$ | Establishments ${ }^{2}$ |  | All employees ${ }^{2}$ |  | Production workers |  |  | Value added by manufacture, adjusted <br> (\$1.000) | Capital expenditures, new ${ }^{3}$ | Comparative employment indexes |  |  |

## Standard Notes: - Represents zero.

 closing figures for individual companies(D) Withheld to avoid dis(X) Not applicable
${ }^{1}$ The 1958 and subsequent years figures include establishnents classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1939 to 1957, but are included for 1929 and earlier years. The 1954 to 1963 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the figures for earlier census years. In addition, beginning with 1954, the figures include data for Logging Camps and Contractors, industry 2411, which were not included within the scope of the 1947 census. There were also a number of changes in the definition of manufacturing industries during earlier census years that affect the comparability of the historical series. Among the more important of these were the following: Figures for 1935 and later years exclude data for railroad repair shops and manufactured gas which were included in 1899 to 1933 figures; the minimum size of establishment included for 1947 to 1963 was 1 employee; for 1921 to 1939, manufacturing establishments reporting value of shipments of $\$ 5,000$ or more were with-
in scope whereas for 1919 and earlier years the cutoff was $\$ 500$. (These changes in procedure have not appreciably affected the comparability of the historical data except for the figures on number of establishrnents.) ${ }^{2}$ Enployment and payroll totals for central administrative offices and auxiliaries are included in the statistics shown for the years 1954 to 1963. Prior to 1954, this information was not available. The "number of establishments with 20 or more employees" total for 1958 and all previous years and "total number of establishnenis" total for 1954 and previous years does not include data for central administrative offices and auxiliaries.
${ }^{3}$ For the years 1958 to 1963, includes expenditures for plants under construction but not in operation in addition to expenditures at operating manufacturing establishments. Prior to 1958, the data represents expenditures at operating manufacturing establishments only.

4 This table includes data only for standard metropolitan statistical areas with 40,000 or more manufacturing employees in 1963 or 1958. The definitions of the standard metropolitan statistical areas are shown on pages
${ }^{5}$ Comparable data for years prior to 1958 are not available due to a revision in the definition of the standard metropolitan statistical area. See the 1958 or 1954 Census of Manufactures Area Statistics, Volume III, for statistics for the area as defined at that time.
${ }^{6}$ Does not include data for Alaska and Hawaii.
${ }^{7}$ Data for 1954 employment and payroll exclude central administrative offices and auxiliary units. This information was not collected for Alaska and Hawaii in 1954.

## SIZE OF ESTABLISHMENTS

Each establishment in the census is coded not only by industry and geographic region, but also by its size, based on the average number of employees for the year. In this report, information appears on the number of employees, payrolls, value added, and value of shipments and capital expenditures for ten employment size classes for each 4digit industry, 2-digit major industry group, and for all manufacturing. Figures at the 4-digit industry level have been published earlier as table 4 of each separate industry report (MC63(2)-19A to MC63(2)-39D) and appear in Volume II of the 1963 Census of Manufactures.

Note: The 1963 data at the "all establishments, total" level and the individual size classes were derived from separate tabulations. Therefore the sum of the size class detail does not equal the "all establishments, total" because of (1) independent rounding and (2) independent review and correction of the separate tabulations. The differences between the sum of the size class detail and the "all establishments, total" are always less than one tenth of one percent.
(NA) Not available. Data for this item are included in the underscored figures at the left
$1_{\text {For }}$ the years 1954, 1958, and 1963, value added by manufacture represents adjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales: value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year.
${ }^{2}$ Includes expenditures for plants under construction and not yet in operation. Data for these establishments are included in the "l to 4 employees" category. Capital expenditures figures, classified by establishment employment size, are not available for the year 1947.

## TABLE 2. Percent of Total Manufacturing Activity, for Selected Statistics, by Establishment Employment Size: 1963, 1958, 1954, and 1947

Note: Percentage detail may not add to 100.0 due to independent rounding.
Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. Data for this item are included in the underscored figures at the left.
${ }^{1}$ For the years 1954, 1958, and 1963, value added by manutacture represents adjusted value added and for 1947, unadjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year.
${ }^{2}$ Includes expenditures for plants under construction and not yet in operation. Data for these establishments are included in the "l to 4 employees" category. Capital expenditures figures, classified by establishment employment size, are not available for the year 1947.

[^59]- Represents zero.
(D) Withheld to avoid disclosure. Data for this item are included in the underscored figures at the left.
ivalue of shipments for this industry contains extensive duplication (see text for detailed explanation).
${ }^{2}$ Represents value of work done.

## TABLE 3. Selected Statistics, by Employment Size of Establishments: 1963-Continued

Footnotes for Table 3--Continued
${ }^{3}$ Includes $\$ 5-\$ 10$ million for plants under construction but not in operation.
${ }^{4}$ Includes $\$ 1-\$ 2$ million for plants under construction but not in operation.
${ }^{5}$ Includes $\$ 2-\$ 5$ million for plants under construction but not in operation.
${ }^{6}$ Includes less than $\$ 1$ million for plants under construction but not in operation.
7 Includes capital expenditures for plants under construction but not in operation which constitutes approximately $\$ 200-\$ 500$ thousand of the total for the size class.
${ }^{8}$ Includes capital expenditures for plants under construction but not in operation which constitute $\$ 10,000-\$ 20,000$ thousand for the size class. ${ }^{9}$ Includes capital expenditures for plants under construction but not in operation which constitute $\$ 2,000-\$ 5,000$ thousand of the total for the size class.
${ }^{10}$ Contains extensive duplication because the products of some establishments are used as materials by other establishments classified in the same industry.
${ }^{11}$ Includes capital expenditures for plants under construction but not in operation which constitute a small proportion of the total for the size class.

Includes capital expenditures for plants under construction but not in operation which constitutes approximately $\$ 50-\$ 100$ thousand of the total for the size class.
${ }^{13}$ Data for manufacturers and jobbers are combined to prevent disclosure of information for individual companies.
${ }^{14}$ Includes 155 establishments with 2,944 employees classified in industry 2331, Blouses, which for 1963 provided no information on their detailed type of activity (manufacturer, jobber, or contractor). Figures for these companies are included in the total shown for the industry.
${ }^{15}$ Includes 667 establishments with 17, 356 employees classified in industry 2335, Dresses, which for 1963 provided no information on their detailed type of activity (manufacturer, jobber, or contractor). Figures for these companies are included in the total shown for the industry.
${ }^{16}$ Includes 396 establishments with 8,082 employees classified in industry 2337, Suits, Skirts, and Coats, which for 1963 provided no information on their detailed type of activity (manufacturer, jobber, or contractors). Figures for these companies are included in the total shown for the industry.
${ }^{17}$ Includes capital expenditures for plants under construction but not in operation which constitute $\$ 5,000-\$ 10,000$ thousand of the total for the size class.
18
Include size class.
${ }^{19}$ Includes capital expenditures of approximately $\$ 20-\$ 50$ thousand for plants under construction but not in operation.
${ }^{20}$ Includes capital expenditures of approximately $\$ 500-\$ 1,000$ thousand for plants under construction but not in operation.
${ }^{21}$ Includes capital expenditures of approximately $\$ 10-\$ 29$ million for plants under construction but not in operation.
${ }^{22}$ Includes capital expenditures of approximately $\$ 10-\$ 15$ million for plants under construction but not in operation.
${ }^{23}$ Includes capital expenditures for plants under construction but not in operation of approximately $\$ 10-\$ 20$ million.
${ }^{24}$ Includes capital expenditures for plants under construction but not in operation which constitute $\$ 100-\$ 200$ thousand of the total for the size class.
${ }^{25}$ Includes capital expenditures of over $\$ 10$ million for plants under construction but not in operation.
${ }^{26}$ Includes capital expenditures between $\$ 500$ thousand and $\$ 1$ million for plants under construction but not in operation.
${ }^{27}$ Includes capital expenditures over $\$ 3$ million for plants under construction but not in operation.
${ }^{28}$ Includes capital expenditures between $\$ 50$ million and $\$ 100$ million for plants under construction but not in operation.
${ }^{29}$ Value of shipments for this industry contains extensive duplication. This duplication arises because the products of some establishments are used as materials by other establishments classified in the same industry.
${ }^{30}$ Definitions are as follows: Fully integrated works are establishments having coke ovens, blast furnaces, steel works, and rolling and finishing mills or a forging department; partially integrated works with blast furnaces are establishments having blast furnaces, steel works, and rolling and finishing mills or a forging department; nonintegrated works represent all other types of establishments in this industry including beehive coke ovens, byproduct coke ovens operated independently of blast furnaces and steel departments; merchant blast furnaces, and establishments with hotrolling and finishing operations. In a few cases, operations which are, in fact, fully integrated, are classified as partially integrated or nonintegrated because separate establishment reports were collected either because the operations are conducted in different cities or towns, or the company treats the operations separately for their own administrative reasons.
${ }^{31}$ The subindustry separation for industry 3351 is based on the presence or lack of presence of the department described as "casting (except foundry)."
${ }^{32}$ Integrated producers represent companies which operate primary aluminum reduction facilities.
${ }^{33}$ Value of shipments for Industry 3717 include extension duplication. See text for more complete discussion.
${ }^{34}$ For 1963 the adjusted value added figure for the ship building and repairing industry has not been adjusted for the change in inventory between the beginning and end of the year, since the figures reported by establishments in this industry are value of work rather than value of shipments.
It does include the value added by resales. For prior years, this figure in unadjusted value added.
${ }^{35}$ Represents value of work done rather than value of shipments.
${ }^{36}$ The adjusted value added for the Guided Missiles and Space Vehicles Industry does not take into account the change in inventory between the beginning and end of the year, since the figures reported by establishments in this industry represent value of work done rather than value of shipments. It does include value added by resales.

# TABLE 4. Central Administrative Offices and Auxiliaries, by Employment-Size Class and Major Industry Groups of Establishments Serviced: 1963

TABLE 1 Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization: 1963, 1958, 1954, and 1947
2 Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization for Major Industry Groups and Industries: 1963

## TYPE OF ORGANIZATION

Information concerning whether a plant is either independent or part of a multiestablishment company contributes importantly to our knowledge of the structure of manufactures in the United States. However, this classification is significantly affected by the way in which the census of manufactures is taken. In 1947, it was not taken in conjunction with the census of business (1948) or mineral industries (1954) and the multiunit classification depended on whether or not the company operated more than one manufacturing plant. In 1954 and since, the census of manufactures has been conducted in conjunction with the censuses of business and mineral industries, and so the multiunit classification now depends on whether or not the company operates at more than one location within the temporal spans of those censuses. Thus, in 1954, 1958, and 1963, a company with one manufacturing plant and a nonmanufacturing location or separate administrative office was classified as multiunit. While the importance of multiunit establishments, in terms of employment and value added, has increased since 1947 (see table 1), part of this increase is undoubtedly due to the change in collection procedures that took place between 1947 and 1954. However, during those years, this increase in employment and value added was accompanied by a decline in the percentage of establishments accounted for by multiunit companies. Part of this was due to the inclusion in the 1954 Census of Manufactures of industries characterized by a large number of small firms (e.g., milk distribution and logging) which account for a very small amount of the total manufacturing employment and value added. This shifting in the determination of single and multiunit establishments did not occur after the 1954 Census and the 1958 and 1963 data are completely comparable.

Each establishment was asked to report the form of organization of the company which operated it (e.g., corporation, partnership, proprietorship, cooperative, or "other"). In most census years, and especially in 1963, a significant number of small companies operating under contract either failed to properly reportor improperly reported "other." Most of these were assumed to be proprietorships if they had less than 20 employees; or corporations if they had 20 or more employees. (See also footnote 3 to table 1 for further qualification of the data.)

## TABLE 1. Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization: 1963, 1958, 1954, and 1947

NA Not available.
The 1958 and 1963 figures include establishments classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The 1958 and 1954 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not distribution of fluid milk, industry group 202, Dairies. These establishments were n include data for logging camps and contractors, industry 2411 , which were not included within the scope of the 1947 Census. Data for Alaska and Hawaii, which are included for 1963, are not available on a type-of-operation and legal form of organization basis for 1958 and earlier years.
${ }^{2}$ All data are based on reports for Individual manufacturing establishments, and not on a company basis. Each establishment of multiestablishment companies is classified by its primaxy industrial activity. For this reason the statistics presented in this table cannot be compared directly with tabulations in which the whole corporation or company is the reporting unit and the entire company is classified in one industry, for example,l"Statistics of Income, Corporation Income Tax. Keturns" compiled by the Bureau
of Internal Revenue, U.S. Treasury Department. Since 1958, establishments were clasified as part of a multiunit company wher the company operated two or more estabishments, or which ieast manufacturing establishments. ${ }^{3}$ The difference betreen the

The difference between the sum of individual and partnership forms of organization and the total for non-corporate is represented by other noncorporate forms including cooperatives, establishments operated by estate administrators, trusteeships,
receiverships, public and quasi-public organizations, and in addition, the statistically significant. This residual category not shown in the the table wore no statistically significant. This residual category not shown in the table above,
therefore is not directly comparable to the "other" category shown for earlier years.
4The figures for 1954, 1958, and 1963 include expenditures for plants under instruction and not yet in operation. This information was not collected for 1947.

TABLE 1 Value of Manufacturers' Inventories for Industry Groups and Industries: End of 1963 and 1962 ..... 4
2 Value of Manufacturers' Inventories by Divisions and States: End of 1963 and 1962 ..... 14

## INVENTORIES

See Introduction for discussion on how census was conducted. The value of beginning-of-year and end-of-year inventories, respectively, held by each manufacturing establishment was obtained in the 1963 census. Separate inventory figures were requested for (1) finished products, (2) work in process, and (3) materials, supplies, fuel and other inventories.

Respondents were asked to report their inventories at approximate current costs if feasible; otherwise, "at book values." Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the value of inventories aggregate for all establishments in an industry is not precise. The figures on change in inventory between the beginning and the end of the year are of considerably greater significance.

In using inventory data by stage of fabrication for all industries and at the 2-digit industry level, the following should be noted: An item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. (For example, the finished product inventories of a steel mill would be reported as raw materials by a stamping plant.) Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and all manufacturing which are merely aggregates of figures reported by establishments in specified industries. Further, the total finished-goods inventory for "all manufacturing" includes items that are not finished manufactured products.

For a few industries in the food group, there are special problems in the handling of inventories by stage of fabrication. These are industries in which the products are usually stored under controlled conditions, and the products are aged. Included among such types of products are stemmed and dried tobacco, cheese, and whiskey. It is not clear whether such products should be treated as finished goods, work in process, or material and supplies inventories while in storage. In the cheese and whiskey industries substantial finishedgoods inventories have been reported while in the tobacco industries, the bulk of the inventories have been classified as materials and supplies. These data have been summarized in the inventory tables in a consistent manner for the years included in this report.

${ }^{1}$ In 1963, establishments that reported on the short form (generally those with less than six employees) were asked to show only their total beginning and end of year inventories. The totals were prorated on the basic averages of establishments in the industry that reported detailed inventory by type.

## EXPENDITURES FOR PLANT AND EQUIPMENT

Expenditures-ln the 1963 census, manufacturers were asked to report expenditures made during the year for permanent additions and major alterations to their plants, as well as for new machinery and equipment purchases, that were chargeable to fixed asset accounts of manufacturing establishments and were of a type for which depreciation accounts are ordinarily maintained. Expenditures for machinery and equipment were to include those made for replacement purposes, as well as for additions to plant capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense; new facilities and equipment leased from nonmanufacturing concerns; new facilities owned by the Federal Government but operated under contract by private companies; and plant and equipment furnished to the manufacturer by communities and organizations.

In addition to total capital expenditures, respondents were requested to indicate the following subtotals: (a) New structures and additions to plant (including major alterations and capitalized repairs and improvements); (b) new machinery and new equipment (including capitalized repairs and improvements); and (c) expenditures for used plant and used equipment acquired from others (including the U.S. Government).

The figures include (a) the expenditures made at manufacturing plants that were in operation during any part of the year, plus (b) expenditures made at plants that were not as yet in production. The data on capital expenditures for plants not in production at the end of 1963 were collected on a separate report form (MA-101) requesting companies to report the value of new plant and new equipment put in place during the year. This form was mailed to (a) the 1,500 largest manufacturing companies; (b) all other companies which indicated on the census of manufactures establishment report form or the "Listing of Establishments" Form NC-X-1 that they had one or more manufacturing plants under construction but not yet in operation at the close of 1963.

The Census Bureau estimates of capital expenditures differ from those published in the joint Office of Business Economics-Securities and Exchange Commission survey. In addition to normal sampling variation, a major source of differences is to be found in the scope of the two series. Census data relate only to manufacturing establishments, whereas the OBE-SEC series covers all establishments of manufacturing companies--nonmanufacturing as well as manufacturing. On the other hand, manufacturing establishments of companies engaged primarily in nonmanufacturing activities are excluded from the OBESEC series but included in Census figures. Both series, it should be noted, exclude expenditures for plant and equipment at establishments owned by the Federal Government but operated under lease or contract by private companies.

MANUFACTURERS' EXPENDITURES FOR PLANT AND EQUIPMENT:
1954-1963

U. S. DEPARTMENT OF COMMERCE

MANUFACTURERS' EXPENDITURES FOR PLANT AND EQUIPMENT BY MAJOR INDUSTRY GROUPS: 1963

Standard Notes: - Represents zero.
(D) Withheld to avoid disclosing figures for individual companies.
(NA) Not available.
$1_{\text {The }} 1958$ through 1963 figures include establishments classified in industry 3273, Ready Mixed Concrete, and industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in Machine Shop repair work. The data for such establishments are excluded from the figures for the period 1947 to 1957. The 1954 to 1963 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the figures for earlier years. The 1954 through l963 figures include data for logging Camps and Contractors, industry 2411, which were not included within the scope of the 1947 census and 1949 to 1953 annual survey years. In addition, the figures for 1957 and earlier years do not include data for Alaska and Hawaii.
${ }^{2}$ The figures for 1951 to 1963 include expenditures for plants under construction and not yet in operation. This information was not collected prior to 1951 .
${ }^{3}$ Represents employment at operating manufacturing establishments. Figures for central administrative offices and auxiliary units are not included. ${ }^{4}$ For the period 1954 to 1963, value added by manufacture represents adjusted value added and for earlier years, unadjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year.
${ }^{5}$ The expenditures figures for 1949 to 1953, 1955 to 1957, and 1959 to 1962 are estimates derived from a sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates do not exceed l percent.
${ }^{6}$ In 1947, very small establishments that accounted for approximately 1.6 percent of the total value added by manufacture did not report expenditure data and are not represented in the 1947 figures. See 1947 Census of Manufactures, Volume I, Chapter VI, for a measure of undercoverage by industry.

TABLE 2. Manufacturers' Expenditures for Plant and Equipment, by Industry Groups and Industries: 1963 and 1958
(Thousands of dollars)

## POWER EQUIPMENT

The tables contained in this chapter show the horsepower rating of power equipment available in manufacturing industries as of December 31, 1962. Since 1939, such statistics have been compiled only once each decade, and because of changed definitions of manufacturing industries, comparative data, except in table 1, are shown only for 1954 and 1962. Figures for 1954 have been revised at the "All manufacturing" and 2-digit SIC levels to reflect the principal revisions in industry classification stemming from the 1957 Standard Industrial Classification. Only the 1954 "All industries" and "All States" totals have been adjusted to reflect data for Alaska and Hawaii; the individual industry and industry group figures exclude plants in those areas.

The 1962 statistics represent reciprocal estimates based on reports received from approximately 61,000 establishments comprising a probability sample (see below). The sample was designed to yield estimates for industry groups (table 2), important individual industries (table 3), geographic divisions, and States (table 4), and standard metropolitan statistical areas (table 6). Aggregates for selected major industry groups within States and SMSA's are also shown (tables 5 and 7). All of these data are based on tabulated figures collected in a special survey, MC-D-12, Supplementary Inquiries for 1962. This survey is a part of the 1963 Census of Manufactures program.

## AVAILABLE STATISTICS FOR PRIOR YEARS

The first census of power equipment available in manufacturing establishments was made by the Bureau of the Census in 1870 covering the year 1869. Data were also compiled in subsequent censuses. Because certain industries included in earlier censuses were not covered by the 1939 census, the power equipment statistics from 1899 through 1929 were adjusted in 1939 to provide a comparable series for the 70 -year period. The comparability of the 1954 and 1962 statistics with those for 1939 is affected by (a) the exclusion from the 1954 and 1962 inquiry of fractional horsepower motors included in the 1939 totals, and (b) the omission of data for selected industry groups in 1954 included in the 1939 and 1962 totals.

Data on aggregate horsepower per 100 (factory) production workers are comparable for all years, except for 1954 and for years prior to 1899 (table 1). The figures for 1954 exclude data for all establishments in Industry Group 279, Printing Trade Services, and those in Major Group 23, except Industry Group 238, Miscellaneous Apparel. The number of wage earners as published in the census reports prior to 1899 includes those in factory as well as in hand trades and neighborhood industries (carpentry, millinery, painting, etc.) and custom grist milling, custom saw milling, and cotton ginning. Changes in the minimum size limit set for establishments included in the several censuses, or the number of manufacturing establishments requested to report power equipment data are believed to have an insignificant effect on the industry or State totals appearing in this report.

## DESCRIPTION AND DEFINITION OF TERMS

Totals for prime movers and electric motors are shown separately. The horsepower ratings for "prime movers" include information for such types of power equipment as internal combustion engines, steam and hydraulic turbines, and reciprocating steam engines. The totals for prime movers are further separated between those driving
electric generators and those used for other purposes. The statistics for prime movers not driving generators exclude data for automobiles, trucks, and other highway equipment.

The aggregate horsepower figure represents the unduplicated rating for total installed equipment and thus provides a measure of the mechanical power available in manufacturing establishments. The figure is derived by summing the horsepower rating of prime movers and that for electric motors driven by purchased electricity. To secure the latter figure the total horsepower for electric motors was distributed, by establishment, into two categories: Motors driven by purchased electricity and motors driven by energy generated at the establishment. For the relatively small number of establishments which both generate and purchase electricity, the total horsepower for electric motors was prorated on the basis of the ratio of the net quantity purchased to the net total for electricity consumed.

As in past censuses, respondents were requested to report horsepower of stand-by equipment as well as equipment in operation at the end of the year, including all prime movers and motors in mobile (except automobiles, trucks, and other highway equipment) as well as in stationary equipment. Information for fractional horsepower motors, however, was not reported for either 1962 or 1954.

## THE REPORTING FORM

The 1962 reporting categories are similar to those for 1954 except that respondents in 1962 were requested to report figures for electric motors separately for two categories: (1) Those rated five horsepower and over, and (2) those rated one horsepower but less than five. Approximately 91 percent of the total was reported in this detail. Of the total horsepower rating reported in this detail, about 89 percent represents data for motors rated five horsepower or more, and the remainder for motors rated from one to five horsepower.

Information on the type of generating equipment available was also requested. Such detail was reported for 90 percent of the total ( 24 million horsepower) for all prime movers generating electricity, and these prime movers accounted for about 96 percent of the 82 billion kw.-hrs. of electricity generated in manufacturing industries in 1962. The distribution of both horsepower and electricity generated by reported type of equipment is as follows:

| Type of generating <br> equipment | Percent |  |
| :---: | ---: | ---: |
|  | Horse- <br> power | Electricity <br> generated |
| Sieam . . . . . . . . . . . | 79 | 80 |
| Hydro . . . . . . . . . . . <br> Internal combustion | 2 | 2 |
| engines and other . . . . . | 12 | 13 |
| Combinations of above . . . . | 7 | 5 |

The reporting form used, MC-D-12, Census of Manufactures, Supplementary Inquiries for 1962, not only included inquiries on the horsepower rating of installed equipment but also on specified fuels consumed and electricity purchased and/or generated by the reporting manufacturing establishment. These data as well as the reported information on total number of employees and value of shipments were also tabulated and/or used (a) for review of internal consistency in reporting and (b) to coordinate with the data reported in the 1962 Annual Survey of Manufactures.

## SAMPLE PANEL

The reporting panel for this survey is basically the same as that used for the 1962 Annual Survey of Manufactures. The Annual Survey panel consisted of a probability sample drawn from (a) the list of all manufacturing establishments included in the 1958 Census of Manufactures, (b) lists of new manufacturing companies obtained from the Bureau of Old- Age and Survivors Insurance, and (c) any new plants acquired or constructed by companies selected for the sample. (For further details see 1962 Annual Survey of Manufactures. Introduction.) In order to reduce the standard error of estimates for selected industries, the Annual Survey of Manufactures panel of about 60,000 establishments was supplemented by selecting about 1,000 additional establishments classified in 14 specified industries which had relatively high sampling errors associated with the 1961 Annual Survey estimates of fuel costs. The fourteen 4-digit industries from which establishments were selected as a supplemental sample are as follows:

| Industry | Title |
| :---: | :--- |
|  |  |
| 2023 | Condensed and Evaporated Milk |
| 2046 | Wet Corn Milling |
| 2096 | Shortening and Cooking Oils |
| 2231 | Weaving, Finishing Mills, Wool |
| 2261 | Finishing Plants, Cotton |
| 2816 | Inorganic Pigments |
| 2952 | Asphalt Felts and Coatings |
| 3111 | Leather Tanning and Finishing |
| 3251 | Brick and Structural Tile |
| 3259 | Structural Clay Products, n.e.c. |
| 3274 | Lime |
| 3341 | Secondary Nonferrous Metals |
| 3461 | Vitreous Plumbing Fixtures |
| 3729 | Aircraft Equipment, n.e.c. |

Establishments classified in these 14 industries were assigned probabilities of selection dependent on their 1958 total employment and their 4-digit industry classification. Based on these probabilities, a new sample of establishments was selected independently of the Annual Survey of Manufactures panel. Those establishments in the new sample which were not already included in the Annual Survey panel constituted the supplementary panel. Establishments in this supplementary panel were assigned their 1958 industry and geographic codes.

In order to develop unbiased estimates for these 14 industries, composite weights were assigned, to reflect that each establishment in these industries (with the exception of new manufacturing establishments which commenced operations after 1958) had a dual chance of selection, once for the Annual Survey of Manufactures, and once in the supplementary sampling operation. The formula for the weights assigned is as follows:

$\begin{aligned} & \text { Where } W_{c}=\text { composite weight } \\ & W_{1}= \text { weight associated with probability of selection } \\ & \text { in Annual Survey of Manufactures }\end{aligned}$
$W_{2}=$ weight associated with probability of selection in supplemental sampling operation

All establishments other than those in the supplemental panel carry the identical sample weights assigned for the Annual Survey of Manufactures. Furthermore, the geographic and industry codes also assigned in this survey are identical with those used for tabulating the 1962 Annual Survey of Manufactures. These identical characteristics of the two surveys permit the correlation of data appearing in this report with information appearing in the 1962 Annual Survey of Manufactures publications as well as with the information on specified fuels consumed and electric energy generated and purchased, also tabulated from the MC-D-12 survey.

## ESTIMATING PROCEDURE

The statistics presented in this report are reciprocal estimates obtained by inflating each establishment's reported data by its sample weight and summing the inflated figures. Algebraically these estimates may be expressed as follows:

Where

$\mathrm{X}_{\mathrm{h}}$ is the 1962 reported figure for establishment " i " in tabulation cell " h "
$W_{h i}$ is the assigned weight for that establishment
$\mathrm{n}_{\mathrm{h}}$ is the number of establishments in tabulation cell " h "

## QUALIFICATIONS OF THE PUBLISHED DATA

All figures published in this report should be regarded as approximate rather than exact measures. The estimates differ from the true figures because of sampling variations, reporting errors, and processing errors. Standard errors shown in the tables indicate the general magnitude of the sampling variations for "aggregate horsepower" and "total electric motors." The magnitudes of the sampling variations for other estimates appearing in this report are slightly higher. Specifically, the standard errors indicate the approximate range on either side of the published estimates within which a correspondingly complete census total would fall if a census were conducted under conditions that were strictly comparable with those of this survey. The estimates will differ from a complete canvass result, for reason of sampling variation, by less than (a) the percentage shown approximately 2 times out of 3 ; (b) twice the percentage shown approximately 19 times out of 20 ; and (c) three times the percentage shown almost always. Estimates with a standard error exceeding 25 percent generally are not shown.

Measures of the reporting and processing errors are unavailable. However, estimates which were subject to large errors from such sources were detected and corrected in the process of Census Bureau review of the data. Other specific qualifications of the published data are indicated in the appropriate footnotes to the tables.

## AGGREGATE HORSEPOWER OF POWER EQUIPMENT PER 100 PRODUCTION WORKERS FOR SELECTED MAJOR INDUSTRY GROUPS: 1962-1954

TABLE 1. Horsepower of Power Equipment in Manufacturing Industries: 1962 and Earlier Years

NA Not available.
${ }^{1}$ The 1962 figure comparable to 1954 , based on the 1954 industry coverage (see text), is 1,365 Figures for earlier censuses are comparable with 1962 except as explained in footnote 4.
${ }^{2}$ The 1954 figures have been revised to include data for Alaska and Hawaii as well as revised figures for Industry 3851 , "Ophthalmic goods."
${ }^{3}$ The data for 1939 include revisions due primarily to differences in scope of the 1939 and 1954 Censuses of Manufactures.
${ }^{4}$ Includes data for hand trades and neighborhood industries.

## TABLE 2. Horsepower of Power Equipment in Manufacturing Industries, by Major Industry Groups: 1962 and 1954

Note: Detailed figures may not add to totals because of independent rounding. No standard errors are shown for 1954 because these data are not subject to sampling variation (see text).

## NA Not available.

${ }^{1}$ The 1962 figure comparable to 1954, based on the 1954 industry coverage (see footnote 3 ), is 1,365 .
${ }^{2}$ Figures for 1954 reflect the principal revisions in industry classifications stemming from the 1957 Standard Industrial Classification and revised totals for Industry 3851, "Ophthalmic goods." Data for Alaska and Hawaii are included in the 1954 "All industries" total but have not been distributed by major group. The aggregate horsepower for these two States amounted to 232 thousand, of which 190 thousand was reported by establishments classified in Major \&roup 20.
${ }^{3}$ In the Apparel Industries, Major Group 23, horsepower data were collected only for Industry Group 238, Miscellaneous Apparel. Consequently totals for the 2-digit group are not available. The industries which were not canvassed would have a negligible effect on the United States totals. In the Printing and Publishing Industries, Major Group 27, horsepower data were not collected for group 279, Printing Trades Service Industries. Since these industries would have a negligible effect on the totals for Major Group 27, the Major Group totals are shown.
${ }^{4}$ Includes data for Industry 3273 , Ready-Mixed Concrete, which was included in the scope of manufacturing industries since 1958. (See table 3.)
${ }^{5}$ Data for Ma jor Groups 35 and 36 combined. Aggregate horsepower per 100 production workers for Major Groups 35 and 36 combined is 655 for 1962 .

[^83]table 3. Horsepower of Power Equipment in Manufacturing Industries, by Major Industry Groups and Industries: 1962-Continued

[^84] ponent industries whether or not separate figures are shown for the individual industries.

- Entry represents zero.

2 Less than half of the unit of measurement indicated.
${ }^{1}$ Excludes both the aggregate horsepower and the number of production workers for establishments located in Hawaii.

TABLE 4. Horsepower of Power Equipment in Manufacturing Industries, by Geographic Areas: 1962 and 1954

| Division and State | Aggregate horsepower of prime movers and electric motors driven by purchased energy (1,000 hp) | Prime movers (1,000 hp) |  |  | Electric motors ( $1,000 \mathrm{hp}$ ) |  |  | Aggregate horsepower per 100 production workers | Standard error of estimates (percent) for columns-- |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Total | Driving generators | Not driving generators | Total | Driven by purchased energy | Driven by energy generated at establishments |  |  |  |

TABLE 5. Horsepower of Power Equipment in Manufacturing Industries for States, by Major Industry Groups: 1962--Continued

Note: Detailed figures may not add to totals because of independent rounding. The State figures shown include data for all component industries whether or not separate figures are shown for the specific groups.

- Represents zero.
$z$ Less than half of the unit of measurement indicated.

## table 6. Horsepower of Power Equipment in Manufacturing Industries for SMSA's With 40,000 or More Manufacturing Employees: 1962

## FUELS AND ELECTRIC ENERGY CONSUMED

## GENERAL

The manufacturing industries consume a substantial portion of the coal, coke, fuel oil, gas, and electric energy produced in the United States. These items are a source for heat and power and, except for electric energy, also represent important raw materials for further manufacture. Census statistics on quantities of fuels important in manufacturing begin with those for 1909 and were compiled in subsequent censuses of manufactures for 1914,1919 . 1929, 1937, 1939, 1947, 1954, and 1958. Data on quantities of electric energy purchased by manufacturers were first collected for the year 1929 and then for the subsequent censuses. Cost data on fuel and electric energy were first published for 1929 although some data on costs had been collected in prior censuses. Data on quantity of electric energy generated by manufacturing plants were first compiled for 1939. The data for that year also provided, for the first time, statistics on fuels and electric energy purchased for heat and power separate from those purchased as materials.

Data on total fuel cost and purchased electric energy (quantity and cost) for intercensal years 1950 to 1953,1955 to 1957 , and 1959 to 1962 appear in the annual survey of manufactures volumes. For the years 1950 to 1953, the statistics also contain the amount of electricity generated by manufacturing plants. These statistics were prepared from Federal Power Commission data. For the years 1955 to 1957, 1959 to 1961, and 1963 the data for generated electric energy exclude the amounts sold or transferied. Except for the 1950 to 1953 statistics on electricity generated, all of the intercensal statistics are estimates. A description of the sample, sampling technique, coverage, etc., for these years is included in the respective annual survey reports.

## COMPARABILITY OF DATA

The 1962 fuels and electric energy data was collected as part of the 1963 Census of Manufactures. In this census about 130,000 of the approximately 310,000 manufacturing establishments were requested to complete standard report forms which contain information on fuels and electric energy. Standard forms requiring full census detail were sent to only those manufacturing plants above a given size in terms of number of employees. The numerous smaller establishments typically having less detailed records and representing a very minor portion of fuels and electric energy consumption, manufacturing output, and employment, were sent short forms limited to relatively few key items. The size cutoffs for short forms varied according to size composition of the industry so that, while the forms covered a small percentage of the industry's aggregates (employment, etc.). they did represent a much higher proportion of the number of establishments. The cutoff generally ranged from 4 to 10 employees.

The 1962 statistics represent reciprocal estimates based on reports received from approximately 61,000 establishments comprising a probability sample (see below). The sample, which was designed to provide estimates for all industry groups, included all manufacturing establishments employing 100 or more persons. In addition, the sample also covered representative smaller-sized plants. All of these respondents were requested to report figures for a standard detailed fuel inquiry; namely, separate figures for coal, coke, distillate and residual fuel oil, three specified types of gas, and for the category
"all other fuels." The inquiry on electricity, except as noted below, was similar to that for previous years.

In the 1958 Census of Manufactures, when the last survey on consumption of specified fuels was conducted, the reporting categories for oil and gas were not broken down by type of oil or gas and, in addition, the reporting categories varied by industry. Furthermore, detailed fuel data were requested only from establishments classified in the following industries: (1) Those that, when arrayed by size, accounted for 90 percent of the estimated total for the specified fuel consumed by manufacturing establishments; and (2) those for which the average fuel consumption per establishments was $\$ 100,000$ or more, even if the industry total fell under the 90 percent cutoff. The list of excluded industries also comprised (1) those industries for which the number of establishments exceeded 5,000 and the 1954 fuel cost was less than $\$ 10$ million, and (2) any industry for which the 1954 fuel cost was less than $\$ 250$ thousand. The net effect of these and other criteria employed in compiling the 1958 data upon the statistics for specified fuels are reflected by the data shown in the category "Fuels, Not Specified by Kind." This category, which does not appear for the 1962 statistics, and in 1954 for only the Apparel (Major Group 23) and Printing, Publishing, and Allied Industries (Major Group 27), provides a measure by industries (tables 6 and 7) or by States (tables 8 and 9) of the undercoverage in the 1958 specified fuels statistics.

While the major group totals shown in table 6 have been revised to reflect changes stemming from the 1957 Standard Industrial Classification (SIC), significant differences in the fuel data since 1954 have occurred because of industry reclassifications. In 1954 and prior years, separate establishment reports were submitted for blast furnaces, and for facilities producing coke, even when such operations were conducted in a complex including steelmaking and rolling mills at the same location. Thus, the statistics for 1954 and earlier years for "purchased fuels" include information for the interplant transfers of coke, cokeoven and blast-furnace gases, and other fuels used in associated coke ovens, blast furnaces, and steel mills. Since 1954, a single report, rather than separate reports, was requested when such activities occurred at a single physical location and the quantities of such fuels are reported as "produced and consumed." It is estimated that, for 1954, the value of such interplant transfers, which are excluded for later years, was about \$599 million.

The use of a single standard schedule for reporting consumption of fuels used for heat and power and as a raw material uncovered certain reporting inconsistencies by respondents. These primarily occurred in plants classified in the primary metal industries (Major Group 33). Such reports were adjusted and the items are shown in this report as "fuels consumed" so that users of the published totals for those industries for which multiple uses are common may allocate specified fuel types in accordance with their technical use.

In addition to the fuels statistics, separate figures on the quantity and cost of electric energy purchased and the quantity of electric energy generated and sold have been compiled. In 1962 and 1954, respondents were requested to report the value of electric energy generated and sold or transferred to other establishments of their company. In order to determine if reported figures for purchased electricity for 1962 and earlier years were overstated, respondents were requested in 1962 to report the quantity and cost of such interplant transfers. The amount of purchased electricity resold or transferred by manufacturing establishments totaled 2,507 million kilowatt hours valued at $\$ 24.8$ million, or less than 1 percent of the figures tabulated for purchased electricity.

All of the 1958 statistics in this report have been revised to include information for manufacturing establishments located in Hawaii and Alaska. Only the 1954 U.S. totals have been adjusted to include information for establishments located in these States.

## 1962 Survey Sample Panel

The reporting panel for this survey is basically the same as that used for the 1962 Annual Survey of Manufactures. The annual survey panel consisted of a probability sample drawn from (a) the list of all manufacturing establishments included in the 1958 Census of Manufactures; (b) lists of new manufacturing companies obtained from the administrative records of the Social Security Administration; and (c) any new plants acquired or constructed by companies selected for the sample. (For further details, see 1962 Annual Survey of Manufactures, "Introduction.") In order to reduce the standard errors of estimates for selected industries, the Annual Survey of Manufactures panel of about 60,000 establishments was supplemented by selecting about 1,000 additional establishments classified in 14 specified industries. All of these relatively important fuel-consuming industries had relatively high sampling errors associated with their 1961 Annual Survey fuel-cost estimates. The 14 selected 4 -digit industries from which establishments were chosen as a supplemental sample are as follows:

| Industry | Title |
| :---: | :--- |
| 2023 | Condensed and Evaporated Milk |
| 2046 | Wet Corn Milling |
| 2096 | Shortening and Cooking Oils |
| 2231 | Weaving, Finishing Mills, Wool |
| 2261 | Finishing Plants, Cotton |
| 2816 | Inorganic Pigments |
| 2952 | Asphalt Felts and Coatings |
| 3111 | Leather Tanning and Finishing |
| 3251 | Brick and Structural Tile |
| 3259 | Structural Clay Products, N.E.C. |
| 3274 | Lime |
| 3341 | Secondary Nonferrous Metals |
| 3431 | Vitreous Plumbing Fixtures |
| 3729 | Aircraft Equipment, N.E.C. |

Establishments classified in these industries were assigned probabilities of selection dependent on their total employment and 4-digit industry classification in 1958. Based on these probabilities, a new sample of establishments was selected independently of the Annual Survey of Manufactures panel. Those establishments in the new sample which were not already included in the annual survey panel constituted the supplementary panel. Establishments in this supplementary panel were assigned their 1958 industry and geographic codes.

In order to develop unbiased estimates for these 14 industries, composite weights were assigned to reflect that each establishment in these industries (with the exception of new manufacturing establishments which commenced operations after 1958) had a dual chance of selection, once for the Annual Survey of Manufactures, and once in the supplementary sampling operation. The formula for the weights assigned was as follows:

$$
\begin{aligned}
\mathrm{W}_{\mathrm{c}} & =\frac{\mathrm{W}_{1} \mathrm{~W}_{2}}{\mathrm{~W}_{1}+\mathrm{W}_{2}-1} \\
\text { Where } \mathrm{W}_{\mathrm{c}} & =\text { composite weight } \\
\mathrm{W}_{1} & =\begin{array}{l}
\text { weight associated with probability of selection in Annual Survey of Manu- } \\
\text { factures }
\end{array} \\
\mathrm{W}_{2} & =\begin{array}{l}
\text { weight associated with probability of selection in supplemental sampling } \\
\text { operation }
\end{array}
\end{aligned}
$$

All establishments other than those in the supplemental panel carry the identical sample weights assigned for the Annual Survey of Manufactures. Furthermore, the geographic and industry codes also assigned in this survey are identical with those used for tabulating the 1962 Annual Survey of Manufactures. These identical characteristics of the two surveys permit the correlation of data appearing in this report with information appearing in the 1962 Annual Survey of Manufactures publications as well as with the information on horsepower of available power equipment, also tabulated from the MC-D-12 survey.

## Estimating Procedure

The statistics presented in this report are reciprocal estimates obtained by inflating each establishment's reported data by its sample weight and summing the inflated figures. Algebraically these estimates may be expressed as follows:

Where $X_{h}$ is the estimated total for the tabulation cell $h$
$\mathrm{X}_{\mathrm{hi}}$ is the 1962 reported figure for establishment i in tabulation cell h
$\mathrm{W}_{\mathrm{hi}}$ is the assigned weight for that establishment
$\mathrm{n}_{\mathrm{h}}$ is the number of establishments in tabulation cell h
Qualifications of the Published Data
All 1962 figures published in this report should be regarded as approximate rather than exact measures. The estimates differ from the true figures because of sampling variations, reporting errors, and processing errors. Standard errors for specified cost measures are shown in tables 8,9 , and 10 and indicate the general magnitude of the sampling variations. The magnitudes of the sampling variations for total fuel costs are smaller, while those for quantities are either approximately the same or slightly larger. Specifically, the standard errors indicate the approximate range on either side of the published estimates within which a correspondingly complete census total would fall if a census were conducted under conditions that were strictly comparable with those of this survey. The estimates will differ from a complete-canvass result for reasons of sampling variation by less than (a) the percentage shown, approximately 2 times out of 3 ; (b) twice the percentage shown, approximately 19 times out of 20 ; and (c) three times the percentage shown, almost always. Estimates with a standard error exceeding 25 percent generally are not shown.
Measures of the reporting and processing errors are unavailable. However, estimates which were subject to large errors from such sources were detected and corrected in the process of Census Bureau review of the data. Other specific qualifications of the published data are indicated in the appropriate footnotes to the tables.

## Energy Used Conversion Factors

In order to provide total figures for energy used, the fuel figures were reduced to a common unit of measure representing kilowatt-hours, the international unit of energy, and added to those for purchased electricity. These figures include an estimated kilowatthour equivalent for "other fuels" for which only "cost" was reported and for "undistributed" fuels cost. The conversion factors used in computing these kilowatt-hour equivalents are as follows:

| Kind of fuel | Unit of measure | kw.-hrs. equivalent |
| :---: | :---: | :---: |
| Bituminous and lignite | ton | 7,677 |
| Anthracite (1939) | ton | 7,433 |
| Coke | ton | 7,618 |
| Fuel oil | barrel | 1,707 |
| Natural gas. | MCF (1000 cubic feet) | 307.7 |
| Coke-oven gas | MCF (1000 cubic feet) | 161.2 |
| Manufactured gas (1947 and 1939) | MCF (1000 cubic feet) | 158.2 |
| Other fuels (except for 1939 and 1929) | dollars | 239 |
| Other fuels (1939) | dollars | 380 |
| Other fuels (1929) | dollars | 330 |

For "undistributed" fuels costs, the conversion was based on the types of fuels used in 1958 or 1954 in the industry for which the undistributed costs were tabulated.

7-8

## PURCHASED ENERGY USED IN MANUFACTURING FOR MAJOR INDUSTRY GROUPS: 1962, 1958 AND 1954

## TABLE 1. Fuels and Electric Energy Used for Heat and Power: 1963 and Earlier Years

Note: The cost of purchased fuels for 1954 and earlier years includes the value of coke, coke oven gas, and coal tar produced in coke ovens and used in associated blast furnaces and steel mills at the same location. It also includes the value of blast furnace gas produced and used at associated coke ovens at the same location. Such operations, which were reported separately in 1954 and earlier years, were treated together as single establishments after 1954. It was estimated that for 1954 the value of such interplant transfers, which are excluded for later years, was about \$599 million.
(NA) Not available.

TABLE 2. Consumption Used, by Industry Groups and Industries: 1963, 1962, and 1958

| Code | Industry group and industry | Year | Total cost of purchased fuels and electric energy$(\$ 1,000)$ | Cost of purchased fuels$(\$ 1,000)$ | Electric energy |  |  |

## TABLE 2. Consumption Used, by Industry Groups and Industries: 1963, 1962, and 1958-Continued

Footnotes for table 2. Consumption Used, by Industry Groups and Industries: 1963, 1962. and 1958

Note: Detail may not add to totals due to independent rounding.

- Represents zero.
(D) Withheld to avoid disclosing figures for individual cormanies.
(NA) Not available.
n.e.c. Not elsewhere classified.
$r_{\text {Revised. }}$
(S) Withheld because the estimate did not meet publication standards.
(2) Less than 500 thousand kilowatt hours.
${ }^{1}$ Prior to 1963 industry 2095, Roasted Coffee, was classified with industry 2099, Food Preparations, N.E.C.
${ }^{2}$ For 1963, the Standard Industrial Classifications for the hosiery mills were revised to include in industry 2251, mills engaged primarily in producing women's hosiery, except socks, and in industry 2252, mills engaged primarily in producing all other hosiery.
${ }^{3}$ In 1962, industry 2541, Wood Partitions and Fixtures, and industry 2542, Metal Partitions and Fixtures, were shown only in the industry group 254, Partitions and Fixtures.
${ }^{4}$ Data for industry 2647, Sanitary Paper Products, was classified in industry 2649, Converted Paper Products, N.E.C., in all years preceding 1963.
${ }^{5}$ Statistics are not comparable for the years 1958 and 1962 for industries 2751, Commercial Printing, Except Lithographic, and 2752, Cormercial Printing, Lithographic. This was due to a misclassification of a number of small establishments.
${ }^{6}$ Data for industry 2872, Fertilizers, Mixing Only, was classified in industry 2871, Fertilizers, in all years preceding 1963.
${ }^{7}$ Establishments primarily engaged in producing exfoliated vermiculate were reclassified from industry 3296, Mineral Wool, to industry 3295, Minerals, Ground or Treated, in 1963.
${ }^{8}$ Data for industry 3446 , Architectural Metal Work, was classified in industry 3449, Miscellaneous Metal Work, in all years preceding 1963.
${ }^{9}$ During the period $1958-1963$ some of the large establishments which formerly manufactured individual instruments, and therefore were classified in industry 3811, began shipping complete navigational and guidance systems as their major products. These establishments have been reclassified into industry 3662 for the 1963 Census of Manufactures. 1958 and 1962 figures have been revised accordingly.
${ }^{10}$ Industry 3674, Simiconductors, was included in industry 3679, Electronic Components, in all years preceding 1963.
${ }^{11}$ Major group 19, Ordnance and Accessories, are aggregated with industry group 398 and 399, Miscellaneous Manufactures, in 1958.
table 3. Consumption for Heat and Power by Divisions, States and Selected Major Industry Groups: 1958, 1962, and 1963

| Code | Division, State, and industry group | Year | Total cost of purchased fuels and electric energy$(\$ 1,000)$ | Cost of purchased fuels$(\$ 1,000)$ | Electric energy |  |  |

Note: Data for 1954, 1958, and 1962 include establishments located in Alaska and Hawaii. Data for earlier years exclude Alaska and Hawaii. - Entry represents zero.

NA Not available.
X Not applicable.
${ }^{1}$ Data represent both (a) purchased fuels and electric energy; and (b) fuels and electric energy made and used in the same establishment.
${ }^{2}$ In 1954 and prior years, separate establishment reports were submitted for blast furnaces and for facilities producing coke, even when such operations were conducted in a complex including steel making and rolling mills at the same location. The quantities of coke produced were then reported as purchases (see text). For 1954, it is estimated that 38,539 thousand short tons of coke reported as purchased were produced and consumed in such associated coke, blast furnace, and steel making establishments. The comparable figures for 1947 and 1939 are 44,853 thousand tons and 24,557 thousand tons, respectively.

The 1954 quantity of coke purchased, comparable with 1958 , was estimated as 15,748 thousand short tons, valued at $\$ 250,424$ thousand. The 1954 value of such interplant transfers for coke, coke oven gas, coal tar, and blast furnace gas, which are excluded for later years, was about $\$ 599$ million.
${ }^{3}$ Inciudes 34,582 thousand barrels of residual oils, 33,304 thousand barrels of petroleum coke, and 7,523 thousand barrels of acid sludge, tar, etc.
${ }^{4}$ Includes 43,147 thousand barrels of residual oils and 17,415 thousand barrels of petroleum coke, acid sludge, tar, etc. Of this total, 8,024 thousand barrels were considered "Other Fuels" for computing "Total Energy Used."
${ }^{5}$ Includes 48,521 thousand barrels of residual oils and 11,582 thousand barrels of petroleum coke, acid sludge, tar, etc. Of this total, 7,745 thousand barrels were considered "Other Fuels" for computing "Total Energy Used."

Note: Detail may not add to totals because of independent rounding. - Entry represents zero. NA Not available. S Withheld because the estimate did not meet publication standards for one or more of the following reasons: The standard error associated with the figure was too high (generally in excess of 25 percent); cost of fuel less than $\$ 50$ thousand; quantity of electric energy less than 5 million kw. -hrs.; to avoid disclosing figures of individual companies; or on the basis of a general consistency review. (Unpublished estimates in the tables in this report, including those which can be derived by subtraction, are generally unreliable.) $X$ Not applicable. $Z$ Less than one-half of the unit of measure indicated. $1_{\text {See }}$ footnote 12, table 2. The total figures for "All industries" for all years include Alaska and Hawaii. However, figures for Alaska and Hawaii are distributed by major group only for 1962 and 1958. The total kilowatt-hours equivalent of energy used in Alaska and

Hawaii for 1962 amounted to 3,027 million; the corresponding figures for 1958 and 1954 are 1,932 million and 2,051 million, respectively. ${ }^{2}$ In-
cludes $\$ 4.1$ million reported by establishments located in Alaska and Hawaii, distributed by major group. This total includes 731 million barrels of fuel oil valued at $\$ 2.6$ million and minor amounts of other specified fuels. 3 The 1954 totals include the following figures for Alaska and Hawaii which have not been distributed by major group: Coal, I thousand tons valued at $\$ 7,000$; coke, 1 thousand tons valued at $\$ 28,000$; fuel oil, 914 thousand barrels valued at $\$ 2,981,000$; gas, 43 miliion cubic feet valued at $\$ 35,000$; other fuels valued at $\$ 1,426,000$, and purchased electric energy, l21 million kw.-hrs.valued at $\$ 2,456,000$. 41954 data for Major Group 35 include. figures for Major Group 36. ${ }^{5}$ For 1954, figures for Major Group 36 , see data for Major Group 35.
