In America, the pelican is found from the Antilles and Terra Firma, the isthmus of Panama, and the bay of Campeachy, as far as Louisiana, and the country adjoining to Hudson's bay. They are seen also on the inhabited isles and inlets near St. Domingo; and in greater numbers on those small isles, clothed with the finest verdure, which lie in the vicinity of Guadaloupe, and which seem to be occupied as the retreat of different species of birds: one of these isles has even been called the Isle of Pelicans. They augment also the flocks of birds which inhabit the island of Aves: the coast of the Sambales, which abounds with fish, attracts them in great numbers: in that of Panama, they are seen to alight in bodies on the shoals of pilchards left at spring tides: and all the adjacent islets are to such a degree covered with these birds, that their fat is melted for oil. They stray little from the coasts; and, when met with at sea, it is regarded as a sign of the proximity of land. Of the two names

pelicanus

PELECANUS.

Plate I.

The large white Pelican.

J. Pass Sc.

pelecanus and *onocrotalus*, the first has misled the translators of Aristotle, and even Cicero and Pliny: they have rendered it by the word *platea*, which would confound the pelican with the spoon-bill. When Aristotle says that the pelican swallows thin shell-fish, and casts them up half digested, in order to separate the meat which they contain, he imputes it to a habit which agrees better with the spoon-bill, considering the structure of its œsophagus; for the pouch of the pelican is not a stomach where digestion is begun; and Pliny inaccurately compared the manner in which the *onocrotalus* swallows and brings up its food, to the process carried on in ruminating animals. "There is nothing here," M. Perault very judiciously remarks, "but what enters into the general plan of the organization of birds: all of them have a craw in which their food is lodged; in the pelican it lies without and under the bill, instead of being concealed within, and placed at the bottom of the œsophagus. But this exterior craw has not the digestive heat of that of other birds, and in this bag the pelican carries the fish entire to its young. To disgorge them it presses the pouch against its breast; and this very natural act may have given rise to the fable so generally told, that the pelican opens its breast to nourish its offspring with its blood. The pelican, as voracious as it is destructive, takes up in a single excursion as many fish as would feast half a dozen men. It swallows easily a fish of seven or eight pounds: and we are told that it also eats rats and other small animals. Pison says, that he saw a kitten swallowed alive by a pelican, which was so familiar that it walked into the market; where the fishermen hastened to tie its bag, lest it should silyly purloin some of their fish. It eats with the side of its mouth, and, when a person throws it a morsel, it snaps at it. The pouch, in which it stores all its captures, consists of two skins; the inner coat is continued from the membrane of the œsophagus, the outer is only a production of the skin of the neck: the wrinkles in which it is folded serve to contract the bag, and when empty it becomes flaccid. The bag of the pelican is used as a tobacco-pouch; and, in the West-India islands, is termed *blague*, or *blade*, from the word bladder. It is asserted, that, when these are prepared, they are more beautiful and softer than lamb-skins. Some sailors make caps of them; the Siamese form musical strings of the substance; and the fishermen of the Nile use the sac attached to the jaw as a scoop for lading their boats, or for holding water; as it neither rots with moisture nor can be penetrated by it.

This very large species occupies the whole of the annexed Plate. It is copied from Edwards's Nat. Hist. of Birds, Part II. and we shall transcribe also a part of his description of it. "This bird seemed to me to be more than double the bigness of the largest swan; it measured from the point of the bill to the angle of the mouth twenty inches of our English measure, which is six inches more than any natural historian has found it; the Academy of Paris having measured one which was but fourteen inches, Paris measure I suppose; and our countryman, Willoughby, measured one brought from Russia, which he makes fourteen inches English; so that I believe this bird of mine must be proportionably bigger in all its parts than what have been before described. I thought it something incredible in Willoughby's description, that a man should put his head into the pouch under the bill, till I saw it performed in this bird by its keeper; and am sure a second man's head might have been put in with it at the same time: indeed it is said to be capable of holding twenty quarts of water. The upper mandible is straight and flat, having a ridge running along its middle, and at the point a remarkable hook; the skin round the eye is bare of feathers, of a light flesh-colour; the nostrils are not perceivable; the eyes are of a dark hazel-colour. The lower part of the bill is composed of two flexible sides, which it can open

pretty wide, or draw together at pleasure; these sides are joined the whole length, except at the point, by a loose skin of the consistence of thin tripe, of a yellowish colour, which it can either draw up close to the bill, or let fall to a considerable depth from it; this skin extends itself under the throat; it hath rather the appearance of the root of a tongue than what may be called a tongue. When it extends its neck, it appears longer in proportion than represented in the figure, and sometimes it is drawn in shorter. This bird was brought from the Cape of Good Hope by captain Pelly, in the India company's service, anno 1745, who obliged me with a sight of it before it was exposed in London. I find no material difference between this and what has been described by Willoughby, and the Academy of Paris, except its size, so that I cannot pronounce it specifically different from what has been described before. The curious, who desire to examine into the anatomy of this bird, may consult Mem. de l'Academie Royale des Sciences, 1666 to 1699. As no English author hath given a tolerable figure of this bird, my history in that respect will be new, as well as in its extraordinary magnitude, which all the curious in this city are witnesses of, it having been publicly shown here."

2. *Pelecanus roseus*, the rose-coloured pelican: colour rosy; gullet pouched. The bill and legs are black; the area of the eyes is naked; the pouch yellow. It is about the size of a goose; and inhabits Manilla.

3. *Pelecanus fuscus*, the brown pelican: cinereous brown; gullet pouched. This is the American pelican of Edwards; he says it is something larger than a full-sized tame goose, its length being nearly four feet. The bill is shaped as in the first species, and is fifteen inches long; at the base it is greenish, but inclines to blue mixed with red near the end: the pouch is of a bluish-ash-colour, streaked with reddish lines; irides deep bluish-ash-colour: the bare skin round the eyes whitish. The head and neck are white; the first a little crested at the back part: back, scapulars, and rump, cinereous brown; the middle of each feather whitish: the breast and under parts like the upper, but plain: the upper wing-coverts like the back; but some of the outer great ones are plain brown: the shape of most of the feathers is pointed, narrow, and long: prime quills black; the secondaries hoary brown: tail the same, and consists of eighteen feathers: legs lead-colour: claws black.

The brown pelican is very common in many parts of the coasts of America; and no where more so than in the West-India islands, Jamaica, Barbadoes, &c. Also in the Bay of Campeachy, and as low as Carthagen. In summer it is found as far north as Hudson's Bay. These birds are celebrated for a most affectionate attachment to the sick and maimed of their own species, to whom they will constantly carry a supply of food; a circumstance which the Americans take advantage of to procure fish without trouble. They take a live pelican, break its wing, and, after tying it to a tree, conceal themselves in the neighbourhood; there they watch the coming of the other pelicans with their provisions, and, as soon as they see these discharge the fish from their pouch, they run in, and, after leaving a little for the captive bird, carry off the residue.

4. *Pelecanus Manillensis*, the Manilla pelican: this species resembles the rose-coloured pelican, except in the plumage being wholly of a brown colour. It inhabits Manilla, where it is found in great abundance, making its nest on the ground, and seems very unwieldy while on land; yet at times they fly very high. Their flesh is rank and bad.

5. *Pelecanus Philippensis*, the Philippine pelican: white; crest varied white and brown; gullet pouched. This is nearly four feet and a quarter in length; the bill fourteen inches long, the colour reddish white, with a few spots of brown on the sides of the upper mandible: the bare space round the eyes is of the colour of the

bill: the pouch is very pale. The head and neck are whitish: from the hind head to the back is a stripe of feathers somewhat longer than the rest, mixed white and brown; those of the hind head still longer, so as to form a crest; the feathers of all these parts are very soft and silky. The upper part of the back and scapulars cinereous grey; the lower part of the neck, the breast, the lower part of the back, and rump, white: the wing-coverts cinereous grey, with the shafts and margins white; the outer greater ones, and bastard wings, darker, almost black: quills dusky black; the base of many of the secondaries white: tail composed of eighteen feathers, colour greyish white; all but the two middle ones white on the inner webs at the base; shafts black: legs red. This inhabits the Philippine islands, and is probably the bird known there by the name of *aleatraz*. The natives say that the skin of the breast, dressed with the feathers on, has a sweet smell; and, being worn on the stomach of any one afflicted with the asthma, proves a remedy for the same.

6. *Pelecanus rubescens*, the red-backed pelican: colour reddish; head crested; tail dusky; gullet pouched. Length five feet; bill thirteen inches, of a pale dirty yellow; reaches eight inches down the neck. The hind-head is crested, some of the feathers four inches in length. The head and neck dirty reddish white; the back of a fine pale cinnamon colour: the wing-coverts are like the neck, but darker: scapulars pale greyish lead-colour. The legs are yellow. This bird was brought to England by Mr. Lewis, a navy-surgeon, who had it alive from the governor of one of our forts on the gold-coast in Africa, where it had been kept tame for a long time, and was reckoned a scarce bird. Like others of its race, it was very voracious: an experiment was tried how many fish it could take into the bill, and numbers of different sizes were laid before the bird on the ground: it first attempted to take up one of ten pounds, but the bill would by no means raise it from the ground; it then picked, up as far as ten of the others, each weighing a pound, and stowed them carefully in the bag, arranging them along-side each other, with the heads towards the throat; and after this it walked off very stately, with the bag hanging down to its feet. The pouch held about two gallons of water.

7. *Pelecanus Carolinensis*, the Charlestown pelican: dusky above, white on the breast and belly; gullet pouched. These abound in the bay of Charlestown in America, where they are continually fishing. Two specimens of birds similar to the above, if not the same, are in the Hunterian Museum. The size corresponds: length four feet; bill thirteen inches long, and differs from many in having that part of the upper mandible which is next the base almost cylindrical, and not flat, though spreading out considerably near the end: the lower half of the back, in one specimen, striped black and dusky white; the feathers narrow, and edged with the last colour: in the other, the back is of a plain colour. The bag is of an enormous size, taking up the greatest part of the neck before; at the hind part of it, the feathers are much longer than the rest; yet neither the nape of the neck, nor back part of the head, were at all crested. These were brought from Cayenne.

8. *Pelecanus erythrorhynchos*, the rough-billed pelican: white, hind-head crested; gullet pouched. The size of this species is between a goose and a swan: length four feet six inches; bill thirteen inches, with the addition of some singular protuberances on the top of the upper mandible, from the base of which, for above seven inches, the surface is plane, as in other pelicans: at this part an elevated ridge begins, of about an inch and a half in height, and one-third of an inch in thickness; this continues about an inch and a half on the bill, and then other smaller ones rise, of different sizes, and continue growing smaller, in an abrupt manner, to the end of the bill. The colour of the bill and ridge is reddish

yellow, here and there inclining to red: the under mandible and pouch as in other species; but on each side, about the middle of the first, is a small black spot; and the bag is streaked with lines of black, which are pretty numerous on the fore part of it, mostly so next the end of the bill. The plumage of the bird is wholly of a pure white, except the greater quills, which are black: at the hind head the feathers are greatly elongated, forming a crest of four inches and a half in length: the legs are black. This species is found in several parts of America, having been seen at New York and in South Carolina. It is by some considered as a variety of the large white pelican; but it is a much smaller and more delicate bird. It is represented on Plate II. at fig. 1.

9. *Pelecanus aquilus*, the frigate-pelican, or man-of-war bird: tail forked; body ferruginous, orbits black; bill red; belly of the female white. It is three feet long; the extent of the wings is full fourteen feet. The bill is slender, five inches long, and much curved at the point; colour dusky; from the base a reddish dark-coloured skin spreads on each side of the head, taking in the eyes. From the under mandible hangs the pouch, which is attached some way down the throat; the colour of this is a fine deep red, sprinkled on the sides with a few scattered feathers; and when dilated, and resting on the breast, really looks as if it was punctured and running with blood, from whence the fabulous notion of tearing open its bosom to feed its young might most easily have been taken.

The whole plumage is brownish black, except the wing-coverts, which have a rufous tinge. The tail is long, and much forked: the outer feathers eighteen inches or more in length; the middle ones from seven to eight: the legs are small, all the toes webbed together, and the webs deeply indented; the colour of them dusky red.

The frigate pelican, or man-of-war bird, is chiefly, if not wholly, met with between the tropics, constantly out at sea, being only seen on the wing. It is usual with other birds, when fatigued with flying, to rest on the surface of the water; but nature, from the exceeding length of wing ordained to this, has made the rising therefrom utterly impossible; at least writers not only inform us, but every one who has particularly noticed them avers the same; though perhaps this is no defect of nature, as it scarcely seems to require much rest; at least, from the length of wing, and its apparent easy gliding motion (much like that of the kite), it appears capable of sustaining very long flights; for it is often seen above an hundred, and not unfrequently above two hundred, leagues from land. It has indeed been known to settle on the masts of ships; but this is not a frequent circumstance, though it will often approach and hover about the top-mast flag. Sometimes it soars so high as to be scarcely visible, and at other times approaches the surface of the sea, where, hovering at some distance, the moment it espies a fish, it darts down on it with the utmost rapidity, seldom without success, flying upwards again as quick as it descended. It is also seen to attack other birds which have caught a fish, when it obliges them to disgorge it, and takes care to seize it before it falls into the water. It is an enemy to the flying-fish; for, on their being attacked by the dolphin, and other voracious enemies in the sea, these semi-volatiles leap out of the water in clusters; and during their flight the frigate darts in among them, and seizes one or two.

These birds, though not uncommon every-where within the tropics, yet are less frequent in some places than in others. They were seen by Cook in $30\frac{1}{2}$ degrees. In the old route of navigators they are mentioned frequently, as being met with at Ascension Island, Ceylon, East Indies, and China. Dampier saw them in great plenty in the island of Aves in the West Indies. Our later navigators describe them as frequenting various places of the South Sea, about the Marquesas, Easter Isles, and New Caledonia; also at Otaheite, though at this last place

1. Rough-billed Pelican. 2. Man of War Bird. 3. Spotted Skua. 4. The Booby.

Engraved for the Encyclopædia Londinensis, 1823.

J. Pass sc.

place not in such plenty as in many others. They are said to make their nests on trees, if any are within a proper distance, otherwise on the rocks. They lay one or two eggs, of a flesh-colour, marked with crimson spots. This species is represented at fig. 2.

10. *Pelecanus minor*, the smaller frigate-pelican: tail forked; body ferruginous; bill and orbits red. It resembles the last; but is less, being only about three feet long.

11. *Pelecanus leucocephalus*, the white-headed frigate-pelican: tail forked; body brown; head, neck, breast, and belly, white; bill dusky, except at the tip, where it is nearly white; legs reddish brown. Total length about three feet. This is in the Hunterian Museum. In the same collection there is another very like it, with the head and half the neck all round white, passing on the fore part down the breast, and ending between the legs: sides of the body, and the vent, brown; which, as in the other, is the general colour of the rest of the plumage: legs reddish brown; middle toes serrated. Neither of these were bare on the sides of the head, nor had any appearance of a pouch on the under mandible. Not far different from the above is one mentioned by Osbeck. In his bird the cere at the base of the bill (he says) is blue, and extends to the eyes; the temples, or sides of the head, being naked: the tongue large, almost trifid at the top; the corner at the bottom split: the head, fore part of the neck, breast, and belly, white: the general colour of the rest of the plumage black: tail forked, giving the idea of a pair of scissors: legs black. This he met with at the Isle of Ascension, where it is very tame, and does not appear to be afraid of mankind. He supposes it incapable of fishing for itself, as he observed it to be on the watch till some other bird had caught a fish; which it immediately pursued, and obliged the successful captor to render up his prey.

12. *Pelecanus Palmerstonii*, the Palmerston frigate-pelican: bill five inches and a half long, black; space round the eyes well feathered; body brown with a greenish gloss; beneath white; vent black; tail forked; the shafts of all the feathers white: legs dusky black; the middle claw serrated on the inside. Inhabits the island of Palmerston, in the South Seas. It is in the collection of the late sir Joseph Banks. Three feet two inches long.

13. *Pelecanus carbo*, the cormorant, or corvorant: tail rounded; body black; head subcrested. In Greek this bird was called *φαλαερονκοραξ*, or bald raven; the Spanish name, *ciervo calvo*, has the same signification; and the notion of water or sea raven is implied in modern Latin, in Italian, in German, and Silesian, by the appellations of *corvus aquaticus*, *corvo marino*, *wasser-rabe*, *see-rabe*. In some of the French provinces it is styled *croc-pescherot*, or dirt-fisher. Dr. Kay, in Gesner, conjectures, that *cormorant* is a corruption of corvorant, *corvus vorans*, or devouring raven; and Pennant and Latham have adopted *corvorant*. The name was formerly pronounced cormoran or cormarin, contracted from *corvus marinus*, or sea-raven: yet it resembles the raven in nothing but its black plumage, and even this is downy, and of a lighter shade.

The cormorant is so dextrous in fishing, and so voracious, that, when it visits a pool, it commits alone more havoc than a whole flock of other piscivorous birds. Fortunately, it resides almost constantly on the sea-shores, and seldom occurs in inland countries. As it can remain a long time plunged, and swims under water with the rapidity of a dart, its prey scarcely ever escapes, and it almost always emerges holding a fish across in its bill: to swallow the victim it employs a singular expedient; it tosses up the fish in the air, and dextrously catches the head in falling, so that the fins lie flat and favour the passage down the the throat, while the membranous skin that lines the under side of its bill stretches to admit the whole body of the fish, which is often very large in proportion to the neck of the bird.

In some countries, as in China, and formerly in Eng-

land, the skill of the cormorant in fishing was turned to profit: for, by buckling a ring about the lower part of its neck, to prevent deglutition, and accustoming it to return with its acquisitions in its bill to its master, it was made a domestic fisher; and this toil continued, till its master, satisfied with the earnings, loosed its collar, and permitted it to fish on its own account. Hunger alone gives activity to the cormorant; it becomes lazy and sluggish after its appetite is glutted. It inclines to fat; and, though it has a very strong smell and an unpleasant taste, it is not always despised by sailors, to whom the simplest and coarsest fare is often more delicious than the constant repetition of salt meat.

These birds are plentifully found in England, particularly on the Needle and Freshwater rocks, at the back of the Isle of Wight: on Dover cliffs, and on most of our rocky shores. They abound in many places of the old continent; on the shores of the Caspian Sea they sometimes collect in immense flocks; and are frequent in the Lake Baikal; they inhabit the Cape of Good Hope; and are common in the Philippine Isles, New Holland, New Zealand, &c. They are found in many parts of the continent of America, being met with in Hudson's Bay, New York, and from thence as low as Carolina: at the last place they are seen in March and April, when the herrings run up the creeks, at which time they may be observed sitting on the logs of wood which fall into the water, waiting for the passing-by of the fish. Our late navigators met with it in Nootka Sound. The cormorant is likewise very frequent on all the northern shores, quite to Kamtschatka: in Greenland it remains the whole year, and builds on the tops of the crags, laying three or more pale green eggs, the size of those of a goose; but these prove so very fetid and disgusting, that the Greenlanders will scarcely ever eat them. The skin is very tough, and is used by the Greenlanders for garments; they also sometimes eat the flesh. The head of the cormorant is sensibly flat, like that of most diving birds; its eyes are placed very much forward, and near the corners of the bill, whose substance is very hard, and shining like horn; the feet are black, short, and very strong; the middle nail is serrated interiorly, like that of the heron; the pinions are very long, but clothed with short quills, and hence it flies heavily. It makes its nest with sticks, sea-weed, grass, &c.

β. P. c. cristatus, the crested corvorant, is described by Mr. Montagu in the Supplement to his Ornithological Dictionary. "The possession of this bird has given us much of its history we were previously unacquainted with. It is extremely docile, and of a grateful disposition, without the smallest tincture of a savage or vindictive spirit, and by no means possessing the bad qualities a celebrated writer would induce us to believe, by making it personify Satan. The bird in question was surpris'd by a Newfoundland dog, belonging to a fisherman, under the banks of a rivulet that ran into the British channel; it was taken home, and, not being in the accustomed plumage, was reported to be a curious and unknown species. When it had been made captive about a week, it was perfectly familiarized, making one in the family circle round the fire, and suffering the caresses of the children, who were very unwilling to part with it. That mode, however, by which all earthly matters are obtained, and by which kingdoms are lost and gained, succeeded; and it was conveyed to us by the coach, being placed in a basket. As soon as it arrived and was liberated, it followed the servant who released it, and was offered every sort of food at hand, all of which was equally refused; not even raw flesh was acceptable, and no fish could then be procured to satisfy its hunger. We therefore crammed it with flesh, which was taken very reluctantly; but, even with this rough handling, its formidable bill was not made use of offensively. After feeding, it was placed on a stool, in an adjoining room to the library, where it sat perfectly contented, and adjusted

its

its disconcerted plumage. Observing it so perfectly reconciled to its new abode, and having retired to the library, leaving both doors open, with intention of returning, we were astonished, in a few minutes, to see the stranger walk boldly into the room, and, coming towards us with the greatest confidence and familiarity, joined us at the fire-side, where it re-assumed the task of pluming and dressing its feathers. From hence we removed this bird to an aquatic menagerie, to which it was carried without offering the least offensive resistance; but the sight of water made it restless; and, when liberated, it instantly plunged in and dived incessantly for a considerable time, in hopes of prey; but, after searching every part of the pond, without obtaining a single fish, it appeared to be convinced there was none, and never made any other attempt for three days, during the whole of which time, it was crammed with flesh, not being able to procure any fish. It lives in perfect harmony with a whistling swan, a bernacle goose, various sorts of ducks, and other occasional birds; but, if it perceives a gull with a piece of fish, it instantly gives chase: if, however, the gull has time to swallow it, no resentment is offered: the sight of it created the desire of possession, and that desire ceases with its disappearance. If it gets out, it never attempts to ramble; but, walking direct to the house, enters the first open door without deference to any one, regardless even of a dog; and in fact is troublesomely tame."

14. *Pelecanus graculus*, the shag: tail rounded; body black, brown beneath; tail-feathers twelve. Weighs about four pounds; length twenty-nine inches. The female weighs about three pounds and a quarter, and is only twenty-seven inches long. The heaviness or rather indolence natural to all the cormorants, is still more remarkable in the present. This species is not less diffused than the former: it occurs particularly in the islands and the extremities of the southern continents. Cook and Forster found it on the island of Georgia, which, though not inhabited, and almost inaccessible by man, is stocked with these little cormorants, which share the domain with the penguins, and lodge among the tufts of rushy grass, the only vegetable production in that weary tract. Staten-land is similar, and contains likewise great numbers of these birds. An island in the Straits of Magellan was so full of them, that captain Cook called it Shag Island. It is in these extremities of the globe that nature, benumbed with cold, has allowed five or six species still to subsist, the last inhabitants of the territories invaded by the progress of refrigeration; they live in calm apathy amidst the dead silence which has there established its gloomy reign. "One is astonished," says captain Cook, "at the peace which prevails in this land. The animals that inhabit it would seem to have formed a league not to disturb their mutual tranquillity. The sea-lions occupy the greatest part of the coast; the white bear resides in the interior part of the island; and the shags lodge in the loftiest rocks: the penguins settle where they have easiest communication with the sea; and the other birds choose places more retired. We have seen all these animals intermingled and walking together, like cattle or poultry in a farm-yard, without offering the least injury to each other." In these dreary wastes, naked, and almost frozen, the shags breed in the ragged sides of rocks, or the projecting cliffs that overhang the ocean. In some parts, their nests are found among small patches of shags, or in the tall tufts of the coarse grass which we have mentioned. There they inhabit, collected in thousands: the report of a musket does not disperse them; they only rise a few feet, and alight again into their nests. Nor need we use fire-arms, for they may be felled with sticks, and yet their companions will not be alarmed, or endeavour to escape from the massacre. Their flesh, especially that of the young ones, is pretty good food. These birds do not stray far into the sea, and seldom lose sight of land. Like the penguins, they are clothed with a very thick plumage, well adapted to guard

against the severe and continual cold of the frozen regions which they inhabit.

The shags are very numerous on the coasts of Cornwall, and in the Irish sea, particularly on the Isle of Man. They are found also on the shores of Prussia, and in Holland near Sevenhuis, where they breed on tall trees. Willoughby says, that they swim with their body entirely immersed, and only their head out of the water; and that they are as nimble and alert in that element as they are sluggish on land, and escape the shot by diving the instant they perceive the flash. In general, the shag has the same natural habits with those of the cormorant, which it resembles in its figure and in its colours: the difference consists in this, that its body and limbs are smaller and more slender, its plumage brown under the body, its throat not naked, and that there are only twelve quills in the tail. Some ornithologists have styled the shag the palmiped jay: but this is as little proper as the appellation of water-raven given to the cormorant. The cornea of the eye is of a bright red, and the crystalline approaches the spherical form, as in fish: the base of the bill is furnished with a red skin, which also surrounds the eye: the aperture of the nostrils is so narrow a slit as to have escaped observers, who have asserted, that the cormorants, both the greater and the less, want the nostrils: the greatest toe in these two species is the outer, composed of five phalanges, the next one containing three, the third three, and the last, which is the shortest, only two: the feet are of a shining black, and armed with pointed nails: under the feathers there is a very fine down, as thick as that of the swan; and small silky feathers, close like velvet, cover the head.

There are two other varieties of this species. In the first, the chin is yellow, and the tail wedged: it is found in the Cape of Good Hope. The second is blackish, but underneath it is brown; the feathers above are edged with black: inhabits Cayenne, and the Caribbee islands; and is about twenty-six inches long.

15. *Pelecanus pygmaeus*, the dwarf shag: tail wedged, the feathers twelve in number. This species is scarcely so big as a teal. The bill, legs, and shape, exactly corresponding with those of the common shag. The body black, with a cast of green about the neck and breast: wing-coverts obscure-brown, each feather margined with glossy black: about the eyes dotted with white, but the spots not very numerous; on the neck, breast, and sides, are also a few scattered spots, which arise from pencils of very tender hairs of that colour, which are intermixed, and appear here and there among the feathers. The female is wholly brown, or a dull black, and not spotted. This species is met with about the Caspian sea, among others of the genus; also on the river Jaick.

β. This variety has the chin of a mouse-colour; wing-coverts and legs black; head and neck chestnut, with a few snowy spots; belly hoary, spotted with brown.

16. *Pelecanus punctatus*, the punctated shag: crested, black; tail rounded; wings dark-ash, spotted with black; sides of the neck with a white line. Bill lead-colour; orbits naked, reddish; feathers on the middle of the back and wings with a black spot; body above greenish-black; varies in having the bill and legs yellow. Inhabits New Zealand; nearly two feet long.

17. *Pelecanus cristatus*, the crested shag: shining green, beneath dusky; bill and legs dusky; head crested. Length two feet three inches; breadth three feet six; bill four inches long; irides fine green. On each side of the head a long tuft of dusky feathers reaching beyond the crown, forming a fine crest; the tail of a dusky green, consisting of twelve feathers. This inhabits Great Britain, and the vast precipices about Holyhead and the back of the Isle of Wight, in May and June; also Norway, Iceland, and Greenland, but in the latter not very common. Mr. Pennant observes, that he met with several shags in the Hebrides, but saw none with the crest; hence we may suppose it to be somewhat rare.

18. *Pelecanus violaceus*, the violet shag: crest erect; body

body black, glossed with violet. It is found about Kamtschatka and the isles.

19. *Pelecanus urile*, the red-faced shag: shining green, throat white, face bluish red. Length two feet ten inches; bill three inches and a half long; the base of a reddish green, the end black: round the eye a bare white skin: back and wings dusky black, but glossy; the back has also a gloss of green in some lights, with here and there a white slender feather: the belly is wholly black: on each side of the rump a large patch of white feathers: tail six inches in length, consisting of twelve feathers: colour of the quills black: legs black. It inhabits Kamtschatka, chiefly about the rocky and craggy places on the sea-coasts, where it builds its nest in June. The eggs are the size of a hen's, of a green colour, and very ill tasted; notwithstanding which the natives think it worth while to climb the rocks for them at the hazard of their lives. Like others of the genus, it feeds on fish, swallowing them whole. It flies well and swiftly; but rises with difficulty from the ground. While sitting on the rocks it is very stupid, being overcome with sleep, and not easily roused; hence the natives catch them easily, by means of nets thrown over them, or nooses at the end of long poles; and not unfrequently these silly birds suffer themselves to be taken one after another to the very last. As food, every one but a Kamtschadale must refuse it; yet this nation think it very tolerable, whether owing to the method of cooking or not, is uncertain: their method is to roast it in holes in the earth, whole, without plucking off the feathers, or taking out the entrails, and after it is done enough they skin and eat it. It is said to have no tongue; yet it is averred that it cries morning and evening, not greatly unlike the blowing of a trumpet.

20. *Pelecanus naevius*, the spotted shag: black; tail rounded, orbits naked, dingy red; front and hind head crested; a white curved stripe from the eye to the wing; wing-coverts spotted with black.

This species, which is suppressed by Dr. Turton in his translation of Gmelin, is the Crested Shag of Cook's last Voyage, vol. i. p. 151. and is represented on the annexed Plate at fig. 3. It might indeed be called double-crested, or two-crested; for just over the forehead arise some long feathers, forming a pointed crest; and at the hind part of the head a second, not unlike the first, but rather longer, some of the feathers measuring an inch and a half. Just over the eye begins a stripe of white, which passes down on each side of the neck quite to the wing, and growing broader as it proceeds downwards. The middle of the back, and the wings, are of a brownish ash-colour, each feather tipped at the end with a round spot of black, largest on the wing-coverts, but no where bigger than a small pea: quills not spotted: from the middle of the back to the end of the tail, and from between the legs to the vent, black glossed with green: tail three inches in length, rounded at the end; that and the quills plain black: legs deep brown or black. This species inhabits New Zealand, and builds among the rocks; it is met with principally in Queen Charlotte's Sound, where it is known by the name of *pa degga-degga*. Length two feet, or more.

21. *Pelecanus carunculatus*, the carunculated shag: black, beneath white; bill dusky: sides of the head bare of feathers; between the bill and eye much carunculated, and red; the rest of the space round the eye ash-colour; the orbits of a fine mazarine blue, and elevated; and over the eye is a tubercle larger than the rest. The irides are whitish, or very pale brown: the head somewhat flat on the sides, and the crown rather full of feathers: the top of the head, and sides of it, the hind part of the neck, and all the upper parts of the body, the wings, and tail, are black, except a longish patch of white on the wing-coverts: the forehead, chin, and all beneath, white: the legs are flesh-colour, or very pale brown. This inhabits New Zealand; and is found in Queen Charlotte's Sound, though not in plenty; but was met with by millions in

Staaten-land; and is said by our voyagers to build in towns. Length twenty inches.

22. *Pelecanus Magellanicus*, the Magellanic shag; black, beneath white: bill three inches long, and black: sides of the head, and chin, bare, and reddish; tail wedged. The head and neck somewhat glossy, and the feathers of the first seem full, making that part appear larger than it is; but the head is by no means crested: behind each eye a spot of white. It inhabits Terra del Fuego and Staaten-land: in Christmas Sound it builds by thousands among the rocks, choosing such places where they project over the sea, or at least where they rise perpendicularly, that, in case the young fall out, they may take no harm, dropping only into the water. Length thirty-six inches.

23. *Pelecanus varius*, the pied shag: brown, beneath white; bill four inches and a half; the top of it dusky; the bare space about the eye, yellow: over the eyes a narrow streak of a pale colour: the head, hind part of the neck, back, wings, and tail, are brown; the middle of the back, and wing-coverts, palest; the margins of the last almost white, or very pale: the lower part of the back, rump, and thighs, very deep brown, nearly black: quills black; tail rounded, and six inches or more in length; legs flesh-colour; claws dusky. This species inhabits New Zealand, and was met with frequently in Queen Charlotte's Sound. It builds in trees, on which a dozen or more are seen at once. The egg is two inches and a half long, rather smaller than that of a hen, and of a pale bluish white. Length of the full-grown bird, thirty inches.

24. *Pelecanus cirratus*, the tufted shag: black, beneath white; bill dusky yellow; round the eye bare: the head crested; on the wing-coverts is an oblong patch of white. The tail is four inches and a half in length, rounded in shape, and composed of fourteen feathers: the legs pale yellow brown. This was brought from Queen Charlotte's Sound; and is in the Hunterian Museum. Size of the preceding.

25. *Pelecanus Africanus*, the African shag: brown, beneath variegated, chin white; scapulars and wing-coverts blue grey, each feather margined all round, and tipped with black: the three first greater quills pale brown, inclining to cinnamon; the rest brown black: secondaries as long as the quills, of a dusky black, edged with brown. The tail consists of twelve feathers, is cuneiform in shape, the two middle feathers being seven inches long, the outer three inches and a half only; the four middle ones, and the outer on each side, are pale brown, the others black. Inhabits Africa; and is about twenty inches long.

II. Bill ferrate.

26. *Pelecanus thagus*, the saw-billed pelican: brown; tail rounded; gullet pouched, and covered with short cinereous feathers. Bill a foot long, each mandible hooked; pouch very large; legs black. Inhabits Chili; size of a turkey; extent of wings nine feet.

27. *Pelecanus baffanus*, the gannet, or Soland goose: tail wedged; body white; bill and quill-feathers black; face blue; irides yellowish; tail-feathers twelve; eyes surrounded with a naked skin of fine blue; legs black, and greenish on the fore part; the feet long.

Linnaeus gave the name of *Baffanus* to this species, because it is a native of the Baffin-isle, a stupendous rock in the Frith of Forth, near Edinburgh. It is about the size of a common goose; weight seven pounds; length near three feet, alar extent six. The gannet inhabits all the northern isles, but in particular that of the Baffin in Scotland. It generally first makes its appearance in March, and, after making a circuit of the island, departs in October or November. This race seems to be in pursuit after the herrings and pilchards, whose motions it watches; and fishermen know the coming of these fish by the appearance of the birds. That this is the inducement seems probable.

bable, as they are likewise seen, in the month of December, as far south as the coast of Lisbon and Gibraltar, plunging for sardines, a species of pilchard. The gannet is also common on the coasts of Norway and those of Iceland, and now and then are met with on the southern coasts of Greenland. In America, they are found on the coasts of Newfoundland, where they breed, migrating in winter as far as Carolina. They were also met with frequently by our several voyagers in many parts of the southern ocean. Their nest is composed of grass and sea-plants, intermixed with any thing the bird finds floating on the water. It lays only one egg, which is white, rather less than that of a goose; if this egg be taken away, the bird will lay a second; and, should this be taken also, a third; but, on the loss of the third, it can furnish no more that season. They place their nest in the clefts of the rock, and the common people believe that they perform the office of incubation standing on one foot, a notion suggested probably by the breadth of its sole. Hence, it is alleged, they received the name of *sole-angeese*; but Martin informs us, that this word is of Irish or Erse derivation, and signifies quick-sighted; these birds being noted for the bright lustre of their eyes. The foot, however, is widely palmated, and the middle and outer toes are each near four inches long, and all the four are connected by an entire piece of membrane.

Though large and heavy, they are very dexterous fishers; they descend from a vast height, and plunge many fathoms under water. It is in Scotland that they are usually called *solan-geese*, in Cornwall and Ireland *gannets*, and in Wales *gan*. The inhabitants of St. Kilda, we are assured by Martin, take above twenty thousand of the young birds annually, besides a prodigious number of eggs. These spoils are the chief subsistence of these hardy islanders, and they store up their provisions in pyramidal stone buildings, covering them over with peat-ashes.

It is very curious to observe, that in these birds the skin does not adhere to the body; it is connected to it only by small bundles of fibres placed at equal distances, such as one or two inches, and capable of being extended as much; so that the skin may be drawn out like a membrane, and inflated like a bladder. The following are the remarks of Mr. Montagu upon this singular conformation. "If a duck or a goose be attended to when the usual cry is emitted, it will be evident, that the pressure of the abdomen propels the air which is therein contained with much force into the anterior part of the body, which, with what is there already, not being able to escape through the trachea, not only inflates the cellular membrane about the breast to an unusual size, but, by compression, rushes with violence through the larynx, and produces a sound more or less intense, in proportion as the muscles are more or less exerted. Although this contrivance is so absolutely necessary to the existence of every species of bird, it is not immediately obvious for what particular purpose the property of inflation is so much further extended than usual in the gannet. We should not expect to find this power of inflating the skin peculiar to those who obtain their subsistence by diving, because, in the act of immersion, such power could not be exerted without obstructing that operation; and it is obvious, that the air contained within the cavity of the body is sufficient for all the ordinary purposes of seeking their prey under water. It will not be unreasonable, therefore, to conclude, that the gannet is endowed with such singular properties for very different purposes than that of long and continual immersion. It cannot be doubted, but such a power of inflation must contribute greatly to lessen the concussion in its rapid descent upon the water, in order to seize its prey: besides, as the enlargement of the surface, without materially adding to the specific gravity, must greatly contribute to its buoyancy both in air and water, it is well adapted for residing in the midst of the most tempestuous sea, floating on its surface in perfect security, and following those shoals of

fish on which depends its whole existence: thus, when all others are compelled to seek shelter in bays and creeks, the gannet is enabled to brave the severest weather in all seasons, without attempting to near the shore. This contrivance may also be of the most important service to an animal which is constantly exposed, even in the most inclement season, and cannot quit its station without starving: nothing could possibly conduce more to its security against intense cold, or be better adapted to preserve the necessary temperature of animal heat, than this intermediate body of air between the skin and the body, since that element is found to be a non-conductor of heat. Upon this principle, what animal can be more securely protected against cold, or retain its vital heat so effectually, as the gannet, or such birds as are almost surrounded with a body of confined air, divided by cells, and intersected by membranes between the skin and the body, and that skin so amply covered with a light porous substance, filled also with air, and impervious to water?" An account, by the same gentleman, of a non-descript insect which infests the cellular membrane of this bird, will be found under the word *CELLULARIA*, vol. iv. See also Mem. of the Wernerian Society, vol. i.

β. *Sula major*, the great booby: brown spotted with white, beneath white; orbits naked, blackish. This is about the size of a goose, but the tail is longer; the bill a little more than five inches long, and of a grey brown; irides hazel, legs black. It inhabits the shores of Florida, where it is frequent.

23. *Pelecanus piscator*, the little gannet: body whitish, face red; tail wedged, all the quill-feathers black. Size of the Muscovy duck: length two feet seven inches; bill five inches long. Throat naked, dusky black, the scapular feathers are also black at the ends. The tail consists of fourteen feathers; the base white, but black the rest of their length: the legs red; the middle claw broad and ferrated. This species is said to inhabit China, where it is called *bubbi*; and is supposed to be one of the sorts used by the Chinese to catch fish, a ring being placed round the neck. Some birds have those parts of a deep brown which in others are black.

β. The least gannet. Size of a duck: length twenty inches. Bill straight, as in the common gannet, and shaped like it. Colour reddish brown, with a dusky or black point; the base, and skin round the eye, of a deep red. The plumage is wholly white, except the wings, scapulars, and middle of the back, which are dusky, and the quills black: the tail is even at the end: legs blood-red. This bird was in the Leverian Museum; and Dr. Latham supposes it to be a variety of this species. It differs chiefly in being smaller, and in having the tail-feathers white throughout, which in the other are only white at the base, the rest of the length being black.

29. *Pelecanus fula*, the booby: body whitish, quill-feathers tipped with black; tail wedged. In every organized being, instinct displays itself by a chain of consistent habits, which all tend to its preservation; and this internal sense directs them to shun what is hurtful, and to seek what may contribute to the support, and even the enjoyment, of life. These birds, however, seem to have received from nature only half that faculty: armed with a firm bill, provided with long wings, and with feet completely and broadly palmated, they are fitted to exercise their powers both in the air and in the water; they are invited to act and to live; yet they seem ignorant what exertions they should make, or what precautions they should observe, to escape that death which perpetually awaits them. Though diffused from one end of the world to the other, from the seas of the north to those of the south, they have no-where learnt to distinguish their most dangerous enemy: the sight of man does not intimidate or discompose them. They suffer themselves to be taken, not only at sea on the ships' yards, but also at land on the islets and coasts, where they may be felled by blows with a stick, in great numbers, one after another, and

and yet the stupid flock will make no effort to escape. Hence these birds are called boobies because of their great stupidity, their silly aspect, and their habit of continually shaking their head and shivering as it were when they alight. And, since the mental powers and the moral qualities of animals are derived from their constitution, we must attribute the excessive sluggishness and helpless security of the boobies to some physical cause; and this, most probably, is the difficulty of putting their long wings in motion.

Man is not their only foe; their want of courage exposes them to another enemy, which perpetually harasses them. This is the frigate, or man-of-war bird. It rushes upon the boobies, which it descries at a distance; pursues them without intermission, and obliges them, by blows with its wings and its bill, to surrender their prey, which it instantly seizes and swallows: the silly creatures then return to seek new prey, which they often lose by a second piracy. The boobies hover above the surface of the water, scarcely moving their wings, and drop on the fish the instant it emerges. Their flight, though rapid and well supported, is greatly inferior to that of the frigate. Accordingly, they do not roam so far, and their appearance is regarded by navigators as a pretty certain sign of the vicinity of some land. Yet these birds frequent the remotest and most sequestered islands in the midst of the ocean. There they live in companies, with the gulls, the tropic-birds, &c. and the frigate, their inveterate foe, follows them to these retreats. Dampier gives a curious account of the hostilities between the man-of-war birds and the boobies, in the Alcrane islands, on the coast of Yucatan. "These birds were crowded so thick, that I could not," he says, "pass their haunt without being incommoded by their pecking. I observed that they were ranged in pairs, which made me presume that they were male and female. When I struck them, some flew away, but the greater number remained, and would not stir for all I could do to rouse them. I remarked also, that the man-of-war birds and the boobies always placed sentinels over their young, especially when they went to sea for provision. Of the man-of-war birds, many were sick or maimed, and seemed unfit to procure their subsistence. They lived not with the rest of their kind, whether they were expelled from the society, or had separated from choice: these were dispersed in different places, probably that they might have a better opportunity of pillaging. I once saw more than twenty on one of the islands fall out from time to time into the open country, to carry off booty, and they returned again almost immediately. When one surprised a young booby that had no guard, he gave it a violent peck on the back to make it disgorge, which it instantly did: it cast up one or two fish about the bulk of one's hand, which the old man-of-war bird swallowed still more hastily. The vigorous ones play the same game with the old boobies which they find at sea. I saw one which flew against a booby, and, with one stroke of its bill, made him deliver up a fish which he had just swallowed. The man-of-war bird darted so rapidly as to catch it in the air before it could fall into the water."

The boobies resemble most the cormorants in their shape and organization, except that their bill is not terminated in a hook, but in a point slightly curved; and the upper mandible is articulated, as it were, and formed of three pieces joined by two sutures; the first is traced near the point, which therefore appears like a detached nail; the second is situated at the root of the bill near the head, which enables the bird to raise the tip of its upper mandible two inches, without opening the bill.

These birds utter a loud cry, partaking of the raven and of the goose; and this is heard particularly when they are pursued by the frigate, or when, assembled together, they are seized by some sudden panic. In flying they stretch out the neck, and display the tail. They cannot begin their motion but from some lofty station, and

therefore they perch like cormorants. Dampier remarks, that in the isle of Aves they breed on trees, though in other places they nestle on the ground, and always a number in the same haunt; for a community, not of instinct but of weakness, seems to collect them together. They lay only one or two eggs. The young ones continue long covered, for the most part, by a very soft and white down. The common booby is sometimes met with on the British shores. It is of a middle size, between the duck and the goose: its length, from the end of the bill to that of the tail, is two feet five inches; the bill is four inches and a half, and its tail near ten. The naked skin which encircles the eye is yellow, and so is the base of the bill, whose point is brown. The legs are straw-coloured. The flesh is black, and has a marshy flavour; yet the sailors and marine adventurers often feed on it. Dampier relates, that a French fleet, being cast on the isle of Aves, partly subsisted on these birds; and made such consumption of them, that the number there has since been much diminished. They are found in great numbers not only on the isle of Aves, but in that of Remire, and on a rock shaped like a sugar-loaf, rising apart in the sea, within sight of Cayenne. Multitudes also occur on the islets which lie along the shores of New Spain and Caracca. The same species is met with on the coast of Brazil, and on the Bahama islands, where, it is asserted, they lay and breed every month of the year. What makes these birds so extremely numerous on those shores, is the incredible swarms of fish which attract them: a person can scarce let down into the water a line with twenty or thirty hooks, but he finds, on drawing it up, a fish hanging from each. This harmless helpless creature is represented on Plate II. fig. 4.

30. *Pelecanus fiber*, the brown booby: body brownish, quill-feathers blackish, face red; tail wedged. Bigger than a mallard: length two feet or more; bill three inches and three quarters; that and the legs red. It inhabits Cayenne, and other parts of America, as well as several of the West-India islands; and is found also in Africa.

31. *Pelecanus maculatus*, the spotted booby: brown, spotted with white; below, white waved and spotted with brown; bill, wing-quills, tail, and feet, brown. In this species, the wings are remarkably short, much more so than in any other of the known species. It inhabits Cayenne. Turton makes it a variety of the *P. bassanus*.

32. *Pelecanus parvus*, the little booby. This is the smallest of the boobies, and measures in length scarcely eighteen inches. The bill is pretty straight; and the space round the eye not bare; the throat, breast, and belly, white; all the rest of the plumage dusky black. This also inhabits Cayenne.

33. *Pelecanus Sinensis*, the leu-tze, or Chinese fishing-cormorant: tail rounded; body brown, beneath whitish spotted with brown; throat white, bill yellow, irids blue. Inhabits China, and is there tamed for the purpose of catching fish. On a large lake, near that part of the Imperial Canal where the river runs into it, Sir George Staunton saw "thousands of small boats and rafts built entirely for this species of fishery. On each boat stand ten or a dozen birds, which at a signal from the owner plunge into the water; and it is astonishing to see the enormous size of the fish which these birds bring up. They appeared to be so well trained, that it did not require either ring or cord about their throats, to prevent them from swallowing any portion of their prey, except what the master was pleased to return to them for encouragement and food. The boat used for this mode of fishing is remarkably light, and is carried on the shoulder to the lakes, together with the fishing-birds, by those who gain a livelihood by this employment."

PELECHU'CHO, a town of Peru, in the diocese of Cusco: thirty-six miles north-north-west of Caravava.

PELECI'NUS, *f.* in botany. See BISERRULA.

PELE'E,

PELE'E, a small island in the English channel, near the coast of France: three miles north-east of Cherbourg. Lat. 49. 41. N. lon. 1. 28. W.

PE'LEG, son of Eber, was born in the year of the world 1757. The Scripture says, his father gave him the name of *Peleg*, signifying "division," because in his time the earth began to be divided, (Gen. xi. 16. x. 25.) whether it was that Noah had begun to distribute the earth among his descendants, some years before the building of Babel; or that Peleg came into the world the same year that Babel was begun, and at the division of languages; or that Eber by a spirit of prophecy gave his son the name of *Peleg* some years before the tower of Babel was begun; is not absolutely certain. That which here perplexes the interpreters is, first, that Peleg came into the world not above 100 years after the deluge; and it should seem, that the number of men was not then sufficient for such an undertaking as that of Babel. Secondly, Joktan, the brother of Peleg, had already thirteen sons at the time of this dispersion, which happened after the confusion of Babel; (Gen. x. 26, 27, 28, &c.) Peleg being born in the thirty-fourth year of Eber, (Gen. xi. 16.) it is impossible his brother Joktan should have such a number of children at the birth of Peleg. It seems therefore that he was not born at the time of the dispersion. To this may be answered, that Moses has there enumerated the names of the thirteen sons of Joktan (in Gen. x. 26.) by way of anticipation, though they were not born till a good while after the confusion at Babel; but, as they possessed a very large country, it was convenient to take notice of them, and to name them among the other descendants of Noah, who divided the provinces of the east among themselves. *Ency. Brit.*

PELEGRINO, an island in the Pacific Ocean, discovered by Quiros in 1606. Lat. 14. S. lon. 162. W.—Also a mountain on the north coast of the island of Sicily, near Palermo, in which is a celebrated sanctuary dedicated to St. Rosalia.

PELENGON, or GELENGON, a town of Persia, in the province of Laristan: sixty-six miles north-east of Lar.

PELES, a town of Sweden, in the province of Savolax: forty-eight miles east of Nysslot.

PELETHITES. The Pelethites and Cherethites were famous under the reign of king David. They were the most valiant men in the army of that prince, and had the guard of his person. See Ezekiel xxv. 16. Zephaniah ii. 5. 1 Samuel xxx. 14. 2 Samuel xv. 18. xx. 7.

PELETHRO'NI, a name or epithet given to the Lapithæ, either because they inhabited the town of Pelethronium at the foot of Mount Pelion in Thessaly, or because one of their number bore the name of *Pelethronius*. It is to them, we are told, that mankind are indebted for the invention of the bit with which they tamed their horses with so much dexterity.

PELETHRO'NIUM, a town of Thessaly, situated in a flowery part of Mount Pelion; and hence the appellation *throna*, signifying, "flowers." Lucan says the Centaurs were natives of that place; to whom Virgil assigns Mount Othrys. Most authors, however, ascribe the breaking of horses to the Centaurs. Some make the Lapithæ and Centaurs the same; others a different people; allowed, however, to be both of Thessaly. Their story is greatly involved in fable. See LAPITHUS, vol. xii.

PELEUS, in fabulous history, a king of Thessaly, son of Æacus and Endeis, the daughter of Chiron. He was concerned in the murder of his brother Phocus, and was therefore obliged to leave his father's dominions. He fled to the court of Eurystus the son of Ætor, who reigned in Phthia, (or according to the opinion of Ovid, the truth of which is questioned, to Ceyx, king of Trachinina.) He was purified of his murder by Eurystus, with the usual ceremonies, and the king gave him his daughter Antigone in marriage. After this, as Peleus and Eurystus went to the chase of the Calydonian boar, the father-in-

law was accidentally killed by an arrow which his son-in-law had aimed at the beast. This unfortunate accident obliged him to banish himself from the court of Phthia, and he went to Iolchos, where he was also purified of the murder of Eurystus by Acastus the king of the country. His residence at Iolchos was short: Aftydamia, the wife of Acastus, fell in love with him; but, when she found him insensible to her passionate declarations, she accused him of attempts upon her virtue. The king her husband partly believed the accusations of his wife; but, not willing to violate the laws of hospitality, by putting him instantly to death, he ordered his officers to conduct him to Mount Pelion, on pretence of hunting, and there to tie him to a tree and leave him a prey to the wild beasts of the place. The orders of Acastus were obeyed: but Jupiter, knowing the innocence of his grandson Peleus, ordered Vulcan to set him at liberty. As soon as he had been delivered from danger, Peleus assembled his friends in order to punish the ill treatment which he had received from Acastus. He took Iolchos by force, drove the king from his possessions, and put to death the wicked Aftydamia.

On the death of Antigone, Peleus made love to Thetis, of whose superior charms Jupiter himself had been enamoured. His pretensions were rejected; for, as he was but a mortal, the goddess fled from him with the utmost abhorrence; and, the more effectually to evade his inquiries, she generally assumed the shape of a bird, or a tree, or of a tigress. Peleus's passion was fanned by refusal: he offered a sacrifice to the gods; and Proteus informed him, that, to obtain Thetis, he must surprise her while she was asleep in her grotto near the shores of Thessaly. This advice was immediately attended to; and Thetis, unable to escape from the grasp of Peleus, at last consented to marry him. Their nuptials were celebrated with the greatest solemnity, all the gods attending, and making them each the most valuable presents. The goddess of Discord was the only one of the deities who was absent, and she punished this seeming neglect by throwing an apple in the midst of the assembly of the gods, with the inscription of *Detur pulchriori*, "To be given to the fairest." The celebrated Achilles was the fruit of this marriage, whose education was early entrusted to the Centaur Chiron, and afterwards to Phœnix the son of Amyntor. Achilles, it is well known, went to the Trojan war, at the head of his father's troops; and Peleus gloried in having a son who was superior to all the Greeks in valour and intrepidity. His death, however, was the source of great grief to Peleus; but Thetis, to comfort her husband, promised him immortality, and ordered him to retire into the grottoes of the island of Leuce, where he should see and converse with the manes of his son.

PELEW ISLANDS, or PALA'OS, a group of islands in the western part of the Pacific Ocean, or in that extensive division of the globe called *Polynesia*, situated between the Philippine Islands and the Caroline Islands.

Various conjectures have been formed respecting the time of their first discovery by Europeans. Mr. Keate, the editor of the only voyage in which we have any account of their climate, soil, and produce, together with the manners of their inhabitants, thinks they were first noticed by the Spaniards from the Philippines, and by them named *Palos* from the number of trees growing in them resembling the masts of ships. This conjecture has been vehemently opposed by a critic, who affirms that the whole of Mr. Keate's introduction is erroneous, and that the islands in question were first discovered by some Jesuits of the Philippines, viz. the fathers Duberon and Cortil, who left the Philippines for this purpose on the 14th of November, 1710. Before this time, it was only known, that the largest island, which was the most northerly, was called Panlog, and that the royal residence was in Falu or Pelew. After a voyage of fifteen days these fathers discovered land towards the north-east; and the two isles that were seen were called those of St. Andrew, as hav-

ing

ing been discovered on the day of that apostle. From some Pelewans, whom they accosted, they received information that the true name of these isles was *Sonforol*: that Panlog was to the north-north-east, and Pulo to the south-south-east. Panlog was afterwards discovered about fifty leagues from Sonforol, in lat. 7. 14. N. This seems to be the island now called Babelthouap, and the largest of the group, the south extremity of which in Arrowsmith's maps is about lat. 7. 25. Father Cantova's letter, dated 1722, and contained in the collection entitled *Lettres Edifiantes*, gives a brief account of the Pelews, and very unjustly represents the natives as cannibals. By his account, the group called the Palaos or Pelews, consisted of seven principal isles, situated from north to south. Their names were Peilicu, Coaengal, Tagaiteu, Cogeal, Yalap, Mogulibee, and Nagarro; the king was called Yaray, and resided in Yalap. The natives were described by the Jesuits as naked cannibals, who were regarded with horror by the people of the Carolines.

It was not till the year 1783, that we were able to obtain a just account of these islands, and of their inhabitants. When captain Wilson, commander of the Antelope packet, in the service of the East India Company, was wrecked on one of these islands, he derived that information which was communicated on his return to Mr. Keate; and this ingenious writer, indulging perhaps in some degree the glow of his feelings and imagination, drew up that very pleasing and interesting account, which, from its first publication, has passed through several editions. The whole group is said to contain eighteen islands; but those which Mr. Keate mentions are Oroolong, Artingall, Pelelew, Emilligue, Emunga, Aramalorgoo, Arraguy, Caragaba, and Pethoull: but the names of all were not discovered; and it was but lately known that Pelew was only the name of the capital of the island called Cooroora, and the residence of the king.

From Mr. Keate we learn that the natives of these islands, so far from being savage cannibals, were remarkably mild, hospitable, and humane. The crew of the Antelope consisted of thirty-three Europeans besides the captain, and sixteen Chinese; and the only possible means by which they could be delivered from an island, which at first appeared to them uninhabited, was by building a ship capable of transporting them to the nearest European settlement in that quarter of the globe. Whilst they were meditating upon this undertaking, the natives appeared on the second day after their arrival; and their intercourse with them was facilitated by means which appear as singular as they were providential. Captain Wilson had a servant recommended to him at Macao, who spoke both the Malay and English languages perfectly well; and they had not been long at Pelew before they had the good fortune to meet with a Malay, who had been thrown by a tempest upon this very spot about a year before, and had made himself acquainted with the language of the country; so that by this extraordinary event each party had an interpreter who could readily explain their wants and desires.

After some time it was agreed on by Captain Wilson and his people, that some of the crew should be sent to the king of the place, in order to solicit his friendship, and intreat his permission to build a vessel that might carry them back to their own country. This business was allotted to the captain's brother; and during his absence, Raa Kook, the king's brother, and several of the natives, remained with our people. This amiable chief seemed to place an entire confidence in those he was among: he endeavoured to accommodate himself to their manners; would sit at table as they did, instead of squatting on his hams; and inquired particularly into the principles and causes of every thing he observed about him, lending his personal assistance in all that was going forward, and even desiring the cook to let him aid him in blowing the fire.

VOL. XIX. No. 1320.

In order to conciliate their affections, Captain Wilson had presented Arra Kooker, another of the king's brothers, with a pair of trowsers; but, having conceived a greater passion for a white shirt, one was immediately given to him; which he had no sooner put on, than he began to dance and jump about with so much joy, that every body was diverted by his singular gestures, and the contrast which the linen formed with his skin. This prince was about forty, of a short stature, but so plump and fat that he was nearly as broad as he was long. He possessed an abundant share of good humour, and a wonderful turn for mimicry; and had besides a countenance so lively and expressive, that, though our people at this time were strangers to almost all he said, yet his face and gestures made them accurately comprehend whatever he was describing.

After three or four days, Abba Thulle, the king, arrived with a great retinue. He was received with every mark of respect by the ship's company, who were exercised before him, and fired three volleys in different positions. The surprise of the natives, their hooting, hallooing, jumping, and chattering, produced a noise almost equal to the discharge of the muskets; and, when one of the men shot a bird, which was done to display the effect of their arms, the surprise it occasioned was wonderful. Some of the natives ran for it, and carried it to the king, who examined it with great attention, but was unable to comprehend how it could be wounded, not having seen any thing pass out of the gun.

The king then visited the different tents, and inquired about every thing he saw: all was novelty, and of course interested his attention. When he got to the tent where the Chinese men were, Raa Kook, whose retentive mind never lost a single trace of any thing he had been informed of, acquainted the king that these were a people quite different from the English, and that he had learnt there were many other nations besides these interspersed through the world, some of which fought with guns, and others with boarding-pikes, an instrument which he held very cheap in comparison with the former. When the king heard his brother discoursing about a variety of nations, who all spoke differently, and had before him the example of the Chinese, whose language was not the same with the English, he appeared instantly thoughtful and serious, as if struck with conceptions which had never before crossed his mind. He remained a while pensive and bewildered; and this circumstance impressed on every one at the time an idea that there was every reason to imagine that there had never been a communication between those people and any other nation: and indeed it is evident, that, if the Jesuits did really visit them in 1710, they had before 1783 lost the remembrance of every trace of European manners.

Some time after this, the king requested five of Captain Wilson's men to attend him in a war he was going to make against the inhabitants of a neighbouring island called Oroolong, who, as he said, had done him an injury. In this enterprise little more was done than braving their enemies, stripping some cocoa-nut trees of their fruit, and carrying off a number of yams and other provisions; but in another, which was undertaken against the island of Artingall, they were more successful, and showed signs of the same sanguinary disposition which some demon has infused into the whole human race. Nine prisoners of war who had been taken upon this occasion were cruelly put to death; and, notwithstanding the English strongly remonstrated against this proceeding, all the arguments they could use were of no avail. In justification of their conduct, they alleged the necessity of doing it for their own security, declaring that they had formerly only detained them as menial servants, but that they always found means to get back to their own country, and return with such a force as frequently made great depredations.

Having given this general account of the character and conduct

conduct of these hitherto-unknown people, we now proceed to lay before our readers what we have learned of their government, customs, manners, and arts; together with a description of the face of their country. In this the editor of Captain Wilson's Voyage must be our guide; and, if our narrative do not satisfy the man of science, it is to be observed, that the Antelope was not a ship sent out purposely to explore undiscovered regions, nor were there people on-board properly qualified to estimate the manners of a new race of men; they had amongst them no philosophers, botanists, or draughtsmen, experienced in such scientific pursuits as might enable them to examine with judgment every object which presented itself. Distress threw them upon these islands; and, while they were there, all their thoughts were occupied on the means of liberating themselves from a situation of all others the most afflicting to the mind, that of being cut-off for ever from the society of the rest of the world.

It however clearly appears, from their uniform testimony, that at Pelew the king was looked up to as the father of his people; and, though divested of all external decorations of royalty, had every mark of distinction paid to his person. His *rupacks*, or chiefs, approached him with the greatest respect; and his common subjects, whenever they passed near him, or had occasion to address him, put their hands behind them, and crouched towards the ground. Their councils were always held in the open air, where the king first stated the business upon which he had assembled them, and submitted it to their consideration. Each *rupack* delivered his opinion, but without rising from his seat; and, when the matter before them was settled, the king standing up put an end to the council. When any message was brought him, whether in council or elsewhere, if it came by one of the common people, it was delivered at some distance in a low voice to one of the inferior *rupacks*, who bending in an humble manner at the king's side, delivered it in the same manner with his face turned aside. His commands appeared to be absolute, though he acted in no important business without the advice of his chiefs; and every day in the afternoon, whether he was at Pelew or with the English, he went to sit in public for the purpose of hearing any requests, or of adjusting any difference or dispute which might have arisen among his subjects. But these, according to our editor, seldom happened; for, as their real wants were but few, and they saw nothing to create artificial ones, every one was chiefly occupied with his own humble pursuits; and, as far as the ship's crew, who remained among them about three months, could decide, they appeared to conduct themselves towards each other with the greatest civility and benevolence; never wrangling or entering into quarrelsome contentions, as is customary among those who call themselves a polished and enlightened people. Even when children showed a disposition of this kind, they strongly marked their displeasure, by stifling with rebuke their little animosities.

Next in power to the king was his brother Raa Kook, who was official general of all his forces. It was his duty to summon the *rupacks* to attend the king for whatever purpose they were wanted. He was also his presumptive heir; the succession of Pelew not going to the king's children till it had passed through his brothers; so that after the demise of Abba Thulle, the sovereignty would have descended to Raa Kook; on his demise to Arra Kooker; and on the death of this last it would have reverted to Qui Bill, the king's eldest son, when Lee Boo, his second son, of whom we have much to say, would have become the hereditary general.

The office of first minister is described as follows: "The king was always attended by a particular chief or *rupack*, who did not appear to possess any hereditary office, but only a delegated authority. He was always near the king's person, and the chief who was always first consulted; but, whether his office was religious or civil, or both, our people could not learn with any certainty. He was not considered as a warrior, or ever bore arms,

and had only one wife, whereas the other *rupacks* had two. The English were never invited to his house, or introduced into it, although they were conducted to those of almost every other chief." Of the other *rupacks* it is observed "That they could only be regarded as chiefs or nobles; they were not all of the same degree, as was plain by a difference in the *bone* they wore: this was a mark of rank worn upon the wrist, with which Captain Wilson was invested by the king; but what animal it came from, our people could not learn. They generally attended the king, and were always ready at his command to accompany him on any expedition with a number of canoes properly manned, and armed with darts and spears, who were to remain with him till they had his permission to return home with their dependents. In this part of their government we may trace an outline of the feudal system; but, from the few opportunities our people had of investigating points of internal government, it appeared that the titles of *rupacks* were personal badges of rank and distinction; nor did they apprehend they were hereditary honours, unless in the reigning family, who must of necessity be of this class."

These islands are in general of a moderate height, and covered with wood; and encircled on the west side by a reef of coral, from two to six leagues from the shore, and of great length. Cooroora, the capital of which is Pelew, bears the marks of industry and good cultivation. All the islands which the English saw were covered with trees of various kinds, and some of them of large size, which appeared from their canoes, made of their trunks, and capable of carrying twenty-eight or thirty men. Among the trees in the forest, they observed the ebony, and also a tree which, when pierced with a gimblet, yielded a juice of the consistence of cream; a species of the manchineel tree; a tree in size and its branches resembling the cherry-tree, and in its leaves the myrtle, and having, instead of bark, an outward coat of the thickness of a card, darker than the inside, though equally close in texture, the colour of the interior part being nearly that of mahogany, and so extremely hard, that few of the tools which the English had could work it without breaking their edges. Here were also the cabbage-tree, and a tree whose fruit resembled an almond; the carambola, and the wild bread-fruit, called by the natives *rasnall*. Yams and cocoa-nuts, being the chief means of subsistence, are objects of particular attention. Of the beetle-nut, which abounds, the natives make great use; and their islands also afford plantains and bananas, Seville oranges, and lemons. They furnish some sugar-canes, great abundance of the bamboo, and likewise the turmeric, used as a dye, and employed by the women for staining their skins. None of the islands which the English visited afforded any kind of grain, nor any sort of quadruped, except some rats, which were found in the woods, and three or four meagre cats found in the house, and which were probably drifted ashore from some wreck. Of birds, pigeons were the most numerous; and they had plenty of cocks and hens, undomesticated and running wild in the woods, of which they had made no use as articles of food till they were instructed by the English to eat them. Several birds of beautiful plumage were observed to fly about, and some of a small size, whose notes were very melodious, and particularly one, which used to sing every morning and evening, with a pipe as sweet as a flageolet. Of fish they had great variety.

These islands, when seen from the sea, exhibit high rugged land, covered with wood; the interior parts were in many places mountainous, but the valleys were extensive and beautiful, and presented many agreeable prospects. The soil was in general rich; the grass, as no cattle ate it down, grew high, and was burnt up with the heat of the sun. The English saw no river in these islands; their supplies of fresh water were derived from small streams and ponds, of which there were many. They had no salt, or any kind of seasoning with their food,

food, which consisted chiefly of fish; and they had also a kind of sweetmeats, which they prepared from the sugar-cane, which seemed to be indigenous. The milk of the cocoa-nut was their usual beverage. They had no method of measuring time, but by the height of the sun; and they divided their seasons, like the inhabitants of other tropical countries, into wet and dry. They appeared to have some knowledge of the stars, to several of which they gave names. Those islands that were visited by the English appeared to be populous, but the account of their population was not ascertained. Their houses were placed upon large stones, and raised about three feet from the ground; being constructed of planks and bamboos, and having the fire-place in the middle, secured with hard rubbish. Their fishing-hooks were of tortoise-shell: their twine, cord, and fishing-nets, were well manufactured from the hulks of the cocoa-nuts. The mats on which they slept, and which they threw over them at rest, were formed of plantain-leaf. At their meals they used a plantain-leaf instead of a plate, and the shell of a cocoa-nut served them as a cup, which they sometimes finely polished. Their best knives were of mother-of-pearl, and others of a large muscle-shell, or split bamboo. They had also vessels of an oval shape and reddish-brown colour, which were a kind of earthen-ware, and which they used for heating their water, and for boiling their fish, yams, &c. The principal weapons used in their battles were spears, about twelve feet long, formed of the bamboo, having its pointed end of very hard wood: these were barbed transversely, nor could they be drawn from the body without lacerating the flesh. Another weapon was the dart and sling; the sling was a piece of wood about two feet long, with a notch made in it, wherein the head of the dart was fixed. The dart was of bamboo, pointed with extremely hard wood. Their canoes were formed of the trunks of trees, and neatly ornamented.

The natives of these islands are a stout well-made people, rather above the middling stature; their complexion is of a far deeper colour than what is understood by the Indian copper, but not black. They are mild, affable, and industrious, and, like the inhabitants of Otaheite, they form an exception to the general rule of savage existence. Their hair is long and flowing, rather disposed to curl, which they mostly form into one large loose curl round their heads: some of the women, who wore remarkably long hair, let it hang loose down their backs. The men were entirely naked: the women wore only two little aprons, or rather thick fringes, one before and one behind, about ten inches deep and seven wide: these were made of the hulks of the cocoa-nut stripped into narrow slips, which they dyed with different shades of yellow: this, which was their only dress, they tied round their waists, commonly with a piece of line, though such as were of higher rank used a string of some kind of beads. Both men and women were tattooed, or, as they called it, *melgathed*; an operation which is supposed to have taken place at a certain period of youth, children of either sex not being marked by it. The men had their left ear bored, and the women both: a few of the first wore beads in the perforated ear; the latter put either some leaf through, or an ear-ring of tortoise-shell inlaid. The cartilage between the nostrils was also bored in both sexes, through which they frequently put a little sprig or blossom of some plant or shrub that accidentally caught their fancy. When the men and women grew up, their teeth were blacked, which was done by means of some dye; and the operation was tedious and painful. For this purpose they used groundsel, with four other herbs, bruised together, and mixed with a little chinam into a paste, which was applied to the teeth every morning, in order to dye them black; the patients lying with their heads upon the floor, and letting the saliva run out of their mouths. At night the paste was taken away, and they were permitted to eat a lit-

tle. The same process was repeated the day following; and five days were necessary to complete the operation. This occasioned great trouble, and made them extremely sick.

Persons of both sexes were very expert at swimming, and appeared to be as perfectly at ease in the water as on land. The men were admirable divers. Their marriages were probably no more than a civil contract, but at the same time the contract was regarded as inviolable. They allowed a plurality of wives, but in general had not more than two: the king had five, though not living together. They did not appear to be in any degree jealous of them, permitting them to partake of all their diversions. When a woman was pregnant, she always separated from her husband at night, and it was observed that the utmost attention was paid to women in that situation. Their children are named soon after they are born, and probably without any ceremony. Some peculiar circumstances attended their funerals. At the place of interment, an elderly woman was observed to get out of the new-made grave, who was supported by those who attended to be the mother or some near relation, who had been drawn by affection to the melancholy scene, in order to be satisfied that every thing was duly prepared. When the corpse was laid in the earth, the lamentation of the women that attended was very great. These last sad offices seemed to be wholly left to the tenderness of the weaker sex: the men only assembled round the body before it was carried to the grave, where they preserved a solemn silence. They had places appropriated to sepulture. Their graves were made like ours in country church-yards; having the mould raised up in a ridge over the place where the body was deposited, some flat stones raised above them, with a flat one laid horizontally over, and surrounded by a kind of hurdle-work, to prevent any one from treading over them.

On the article of religion the editor observes, that our people during their continuance with the natives of Pelew, never saw any particular ceremonies, or observed any thing that had the appearance of public worship. But it would perhaps be going too far to declare that the people of Pelew had absolutely no idea of religion. A few occurrences, which are mentioned in the course of the narrative, would lead us to believe that they could not be altogether unacquainted with the nature of religious worship; for, when they were present at the public prayers of the English, they expressed no surprise at what was doing, but seemed desirous to join in them, and constantly preserved the most profound silence. The general even refused to receive a message from the king which arrived during divine service. And upon another occasion, when Captain Wilson told Lee Boo, that good men would live again above, he replied, with great earnestness, "All same Pelew: bad men stay in earth; good men go into sky; become very beautiful;" holding his hand up, and giving a fluttering motion to his fingers.

The most wonderful circumstances in the history of this people, are the acuteness of their understanding, their hospitality, and the implicit confidence which they placed in utter strangers. That their manners were pleasing, and their society not disagreeable, is evident from the conduct of Madam Blanchard, one of the seamen, who, when the vessel was built and ready to take her departure with his captain and his companions, was left behind at his own particular request. That they had the fullest confidence in Capt. Wilson and his crew, is put beyond a doubt by the behaviour of the king and Raa Kook when their guests were to leave them. Raa Kook solicited his brother's permission to accompany the English, but from prudential motives was refused. The love-reign, however, resolved to entrust his second son *Lee Boo* to Capt. Wilson's care, that he might improve his mind, and learn such things as at his return would benefit his country.

The instructions which he gave the young man, and the

the fortitude which he showed upon this occasion, would have done honour to the most enlightened mind. Upon delivering him to Capt. Wilson, he used these expressions: "I would wish you to inform Lee Boo of all things which he ought to know, and make him an Englishman. The subject of parting with my son I have frequently revolved; I am well aware that the distant countries he must go through, differing much from his own, may expose him to dangers, as well as diseases, that are unknown to us here, in consequence of which he may die; I have prepared my thoughts to this; I know that death is to all men inevitable; and whether my son meets this event at Pelew or elsewhere is immaterial. I am satisfied, from what I have observed of the humanity of your character, that, if he is sick, you will be kind to him; and, should that happen which your utmost care cannot prevent, let it not hinder you or your brother, or your son, or any of your countrymen, returning here; I shall receive you, or any of your people, in friendship, and rejoice to see you again." This is the language of a king, a father, and a philosopher, who would have been delighted to see his son with European accomplishments. But, alas! the subsequent history of this amiable youth must force a tear from the eye of every reader whose heart is not callous to the genuine feelings of nature and humanity.

As soon as they arrived at Macao, the house into which he first entered, and the different articles of furniture, fixed him in silent admiration; but what struck his imagination most was the upright walls and flat ceilings of the rooms, being utterly unable to comprehend how they could be so formed. When he was introduced to the ladies of the family, his deportment was so easy and polite, that it could be exceeded by nothing but his abundant good-nature; and at his departure, his behaviour left on the mind of every one present the impression, that, however great the surprise might be which the scenes of a new world had awakened in him, it could hardly be exceeded by that which his own amiable manners and native polish would excite in others.

They were now conducted to the house of an English gentleman, who introduced them into a large hall, which was lighted up, with a table in the middle, covered for supper, and a sideboard handsomely decorated. Here a new scene burst at once upon Lee Boo's mind: he was all eye, all admiration. The vessels of glass particularly riveted his attention; but, when he surveyed himself in a large pier-glass at the upper end of the hall, he was in raptures with the deception. It was in truth, to him, a scene of magic, a fairy tale.

Soon after the people of the vessel came on-shore, some of them went to purchase things they were in want of; in doing which they did not forget Lee Boo, who was a favourite with them all. Among the trinkets they brought him was a string of large glass beads, the first sight of which almost threw him into an ecstasy; he hugged them with a transport which could not have been exceeded by the interested possessor of a string of oriental pearls. His imagination presented to him that he held in his hand all the wealth the world could afford him. He ran with eagerness to Capt. Wilson to show him his riches, and begged he would get him a Chinese vessel to carry them to the king his father, that he might see what the English had done for him; adding, that if the people faithfully executed their charge, he would at their return present them with one or two beads as a reward for their services.

Having no quadrupeds at Pelew, the sheep, goats, and other cattle, which he met with at Macao, were viewed with wonder; but soon after, seeing a man pass the house on horseback, he was so much astonished, that he wanted every one to go and look at the strange sight. After the matter, however, was explained to him, he was easily persuaded to get upon horseback himself; and when he was informed what a noble, docile, and useful, animal

it was, he besought the captain to send one to his uncle Raa Kook, as he was sure it would be of great service to him.

Omitting a number of other particulars of this kind, which excited his curiosity and showed the excellent disposition of his heart, we shall follow him to England, the country from which he was never to return. Here he had not been long before he was sent to an academy, to be instructed in reading and writing, which he was extremely eager to attain, and most assiduous in learning. His temper was mild and compassionate in the highest degree; but it was at all times governed by discretion and judgment. If he saw the young asking relief, he would rebuke them with what little English he had, telling them it was a shame to beg when they were able to work; but the intreaties of old age he could never withstand, saying, "Must give poor old man, old man no able to work."

He always addressed Mr. Wilson by the name of Captain, but never would call Mrs. Wilson by any other name than Mother, looking on that as a mark of the greatest respect; and, such was the gratitude of his heart for the kindness they showed him, that, if any of the family were ill, he always appeared unhappy, would creep softly up to the chamber, and sit silent by the bedside for a long time together without moving, peeping gently from time to time between the curtains, to see if they slept or lay still.

He was now proceeding with hasty strides in gaining the English language, writing, and accounts, when he was overtaken by that fatal disease, the small-pox, which the greatest pains had been taken to guard him against; and, notwithstanding the utmost care and attention of his physician, he fell a victim to this scourge of the human race. Upon this trying occasion, his spirit was above complaining, his thoughts being all engrossed by the kindness of his benefactors and friends. He told his attendant that his father and mother would grieve very much, for they knew he was sick. - This he repeated several times, "and begged him to go to Pelew, and tell Abba Thulle that Lee Boo take much drink to make small-pox go away; but he die; that the captain and mother very kind; all English very good men; much sorry he could not speak to the king the number of fine things the English had got." Then he reckoned up the presents which had been given him, desiring that they might be properly distributed among the chiefs, and requesting that particular care might be taken of two glass pedestals, which he begged might be presented to his father.

We have given this short history of Lee Boo, because it exhibits in a strong light the manners of the natives of the Pelew islands, to which we know nothing similar in the history of man from the savage state to that of civilization. They appear to have had no communication with any other people; and were yet neither treacherous, cruel, nor cowardly. They are a striking instance of the weakness of all the philosophic theories by which mankind are usually traced from their origin through the several stages of savagism, barbarism, and civilization, down to the period of refinement, ending in effeminacy.

Since the publication of Capt. Wilson's voyage we have some further accounts of these islands, all confirming what we were first told of the gentleness of the people. Two armed ships were, by order of the court of directors, fitted out at Bombay, for the purpose of surveying the islands of Pelew, and furnishing the natives with domestic animals, and such other things as might add to the comforts of life. Among the presents to the king were swords and other European implements of war; of which it is at least possible that he and his people might have been equally happy had they remained for ever in total ignorance. The foundation of a fort was likewise laid on one of the islands, and possession of it taken in the name

of the English; we trust with no remote view of enslaving the people, or of driving them from their native country.

The following is the sequel of the adventure here alluded to. The two vessels called the Panther and Endeavour, under the command of Capt. M'Cluer, were fitted out for a voyage to the Pelew islands, to acquaint Abba Thulle the king with the death of his favourite son Lee Boo. On the 24th of August, 1790, Capt. M'Cluer sailed from Bombay, having on-board Messrs. White and Wedgeborough, who had been shipwrecked with Capt. Wilson, and were much esteemed by the king of those islands, at which he arrived in January 1791. Abba Thulle, the king, received them with demonstrations of joy, as Englishmen of whom he had previously found reason to entertain a very favourable opinion. The presents which the company sent to Abba Thulle were landed with all convenient speed. These consisted of a considerable quantity of live stock, such as cows, bulls, ewes, rams, goats, pigs, and poultry, together with arms, ammunition, and packages of hardware, comprising a number of articles which could not fail to be of singular advantage to the natives. The grateful king was astonished at the meaning of all this; and, being informed that it was a small acknowledgment for his generous treatment of the crew of the Antelope when wrecked on his coast, he expressed his regret that it was not in his power to have done more.

With the nature and situation of these islands, as well as the amiable and engaging manners of the natives, Capt. M'Cluer was so well pleased, that he considered them as a paradise, where he could spend with pleasure the remainder of his days. The Panther sailed in the month of February from the Pelew islands for China, the Endeavour remaining behind till her return, which happened on the 10th of June the same year. Having visited these islands a third time, after a survey of the coast of New Guinea, Capt. M'Cluer formally signified to the officers of the Panther his intention of resigning the command of the expedition, and remaining on the island. To render his new situation as comfortable as possible, he requested from Mr. Wedgeborough about twenty muskets with bayonets, twelve pistols, twelve pole-axes, two wall-pieces, fustil and pistol ammunition, an anvil, bellows, frame-saw, standing vice, &c. After a consultation with the other officers, it was agreed to send him these articles, on condition that they should be accounted for by his attorneys, if the East India Company should not be satisfied with the measure. This resolution was carried into effect in the month of February 1793. Scarcely, however, had he been fifteen months in his new settlement, when he became impatient to abandon it; and he soon after set sail for Macao. He returned to the Pelew islands in the year 1795, for the purpose of removing his family; and, sailing from thence to Bombay, he touched at Bencoolen, where he met with a frigate bound for Bombay, into which he put a part of his family with six Pelew women, sailing himself with the other natives towards Bengal, from which last place he set sail some time after; but neither he nor any of his crew have been since heard of. The islands lie between lat. 6. 54. and 8. 12. N. and between lon. 134. 5. and 134. 40. E.

PELF, *f.* [in low Lat. *pelfra*, not known whence derived.] Money; riches; in contempt.—The thought of this doth pass all worldly *pelf*. *Sidney*.

I read thee rash and heedless of thyself,
To trouble my still seat and heaps of precious *pelf*. *Sp.*
To the poor if he refus'd his *pelf*,
He us'd them full as kindly as himself. *Swift*.

PELFRAY seems to have been the old original word.—Indulgences, beads, pardons, pilgrimages, and such other *pelfray*. *Cramer's Answer to Gardiner*.

PELHAM, a town of North America, in Massachusetts: twelve miles north-east of Northampton.—A town of New Hampshire: thirty-six miles north of Boston.

VOL. XIX. No. 1321.

PELHAM. See PERQUAIN.

PELHAM AR'SA, or Brent, PELHAM FURNEUX, and PELHAM STOKIN, are three villages in Hertfordshire, on the borders of Essex, and near Saffron Walden, which have each their church. The first is nearest to Clavering, between Pelham Furneux and Cockenatch. Pelham Furneux, to the south-east of Horneads. Pelham Stokin lies a little to the east of the latter. These three villages were but one at the time of William the Conqueror.

PELHESTRE (Peter), a learned French writer in the department of ecclesiastical history, was a native of Rouen, where he was born about the year 1645. At a very early age he was inspired with the love of learning, and he devoted his whole life to studious pursuits. In his course of reading, he did not confine himself to the perusal of such authors as are sanctioned with the approbation of the Catholic church, but also freely consulted the writings of Protestants. Having come to Paris at the age of seventeen or eighteen, M. de Perefice, who was then archbishop of that see, sent for him, and said, "I am informed, sir, that you read the works of heretics: are you sufficiently learned to venture on such a dangerous practice?" To which the young man replied, "Your question, my lord, greatly embarrasses me: for, were I to answer in the affirmative, you might charge me with presumptuous vanity; and, should I say that I have not sufficient learning, you would prohibit me from reading such books." Pleased with the ingenuity which he discovered, the archbishop laid him under no restriction. For some time M. Pelhestre wore the ecclesiastical dress, and officiated in the inferior clerical orders, particularly in Languedoc, as a missionary for the conversion of protestants to catholicism. Afterwards he resumed the habit of a layman, which he did not change upon his appointment to the place of sub-librarian in the great convent of the Cordeliers at Paris. His motive for accepting of this post, was the unrestrained access which it gave him to a valuable library. He visited most of the religious solitudes in France, and spent some time in that of Perrecy in the Charolois; but he told his friends, that, were he to seclude himself entirely from the world, he should make choice of one of the principal monasteries on mount Athos, for the advantage of consulting the numerous Greek manuscripts which they possess. When he had any particular subject in hand, it was usual for him to shut himself up in a room from which daylight was excluded, and there, wrapped up in a coverlet, and seated in a large armed chair stuffed with straw, he applied incessantly, day and night, excepting when nature called for rest or refreshment, till his labour was finished. He died suddenly in 1710, when about 65 years of age. He was a man of prodigious reading, and particularly conversant in theological controversy, and the knowledge of ecclesiastical authors. He wrote a severe criticism on various passages in M. Dupin's *Bibliothèque des Auteurs Ecclesiastiques*, and filled all the margins of Cave's *Historia Literaria* with notes. The manuscripts of these performances are said to have fallen into the hands of Benedictines, to whom they would prove useful in their editorial and critical undertakings. He was the author of the numerous additions and valuable notes to the second impression of Father Bonaventure's "Treatise on the most proper Method of Reading the Fathers of the Church," 1697, in a large 12mo. volume. He revised the French version of "the Letters of St. Paulinus," published in 8vo. under the name of Claude Fraffen, a Cordelier, but really executed by Claude de Santeul, brother to the poet of that name; and he was also for a long time a considerable contributor to the "Memoires de Trevous."

PELI'ALA, in ancient geography, a town of Asia, in Mesopotamia, between Rhafana and Alvanis. *Ptolemy*.

PELIAS, an island on the coast of Sicily, in the vicinity of the promontory of Drepanum.

PELIAS, in fabulous history, twin-brother of Neleus, was son of Neptune by Tyro, daughter of Salmoneus. His birth was concealed by his mother, who wished her father to be ignorant of her incontinence. He was exposed in the woods, but his life was preserved by shepherds; and he received the name of *Pelias*, from a spot of the colour of lead in his face. Some time after, Tyro married Cretheus, son of Æolus king of Iolchos, and became mother of three children, of whom Æson was the eldest. Pelias visited his mother, and was received in her family; and, after the death of Cretheus, he unjustly seized the kingdom, which belonged not to him, but to the children of Tyro by the deceased king. To strengthen himself in his usurpation, Pelias consulted the oracle; and, when he was told to beware of one of the descendants of Æolus, who should come to his court with one foot shod and the other bare, he privately removed the son of Æson, after he had openly declared that he was dead. These precautions proved vain. Jason, the son of Æson, who had been educated by Chiron, returned to Iolchos, when come to years of maturity; and, having lost one of his shoes in crossing the river Anaurus or the Evenus, Pelias immediately perceived that this was the person whom he had so much dreaded. But his astonishment was greatly excited, when he saw Jason arrive at his palace, with his friends and his relations, and boldly demand the kingdom. Pelias, conscious that his complaints were well founded, endeavoured to divert his attention, and told him, that he would voluntarily resign the crown to him, if he went to Colchis to avenge the death of Phryxus, the son of Athamas, whom Æeres had cruelly murdered. This, so warmly recommended, was with equal warmth accepted by the young hero, and his intended expedition was made known all over Greece. While Jason was absent in the Argonautic expedition, Pelias murdered Æson and all his family; but, according to the more received opinion of Ovid, Æson was still living when the Argonauts returned, and he was restored to the flower of youth by the magic of Medea. This change in the vigour and the constitution of Æson astonished all the inhabitants of Iolchos; and the daughters of Pelias, who have received the patronymic of Peliades, expressed their desire to see their father's infirmities vanish by the same powerful magic. Medea, who wished to avenge the injuries which her husband Jason had received from Pelias, raised the desires of the Peliades, by cutting an old ram to pieces, and boiling the flesh in a cauldron, and then turning it into a fine young lamb. After they had seen this successful experiment, the Peliades cut their father's body to pieces, after they had drawn all the blood from his veins, on the assurance that Medea would replenish them by her wonderful power. The limbs were immediately put into a cauldron of boiling water; but Medea suffered the flesh to be totally consumed, and refused to give the promised assistance; and the bones of Pelias did not even receive a burial.

PELICAN, *f.* [*πελεκαν*, Gr. *pelicanus*, low Lat. *pelican*, Fr.] A large bird. See PELECANUS.—There are two sorts of *pelicans*; one lives upon the water and feeds upon fish; the other keeps in deserts, and feeds upon serpents and other reptiles: the *pelican* has a peculiar tenderness for its young; it generally places its nest upon a craggy rock; the *pelican* is supposed to admit its young to suck blood from its breast. *Cabmet*.—The *pelican* hath a beak broad and flat, like the slice of apothecaries. *Hakewill on Providence*.

Should discarded fathers

Have this little mercy on their flesh;

'Twas this flesh begot those *pelican* daughters. *Shakespeare*.

A glass vessel used by chemists: written also *pellicane*, and *pelecan*.

Retorts, receivers, *pellicanes*, bolt-heads,

All struck in shivers!

B. Jonson's Alchemist.

An ancient piece of artillery which carried a six-pound weight of ball, and weighed two thousand four hundred pounds.

PELICAN I'SLAND, a small island near the north-east coast of Antigua. Lat. 17. 14. N. lon. 61. 24. W.—A small island near the south-west coast of Antigua. Lat. 17. 10. N. lon. 61. 35. W.

PELICAN I'SLAND, a small island near the south coast of New Florida. Lat. 30. 14. N. lon. 88. 6. W.

PELICAN I'SLANDS, a cluster of small islands, near the coast of West Florida. Lat. 29. 48. N. lon. 88. 55. W.

PELICAN KEY (Great and Little), small islands near the south coast of Jamaica. Lat. 17. 49. N. lon. 76. 48. W.

PELICAN ROCKS, rocks on the north-west coast of Antigua.

PELICAN SHOALS, small sand-banks on the south-west coast of Barbadoes.

PELICARE, a town of Cochín: fifty miles east of Cochín.

PELICARO, a town of Naples, in the Basilicata, at the mouth of a river, which runs into the Adriatic: ten miles east-north-east of Turfí.

PELICOIDES, *f.* [from the Gr. *πελεκυς*, a hatchet, and *ειδος*, a shape.] A geometrical figure so called on account of its resemblance to a hatchet.

PELICONDA, a town of Hindoostan, in the circar of Cicacole: twenty-five miles north-west of Cicacole.

PELIDES, a patronymic of Achilles and of Pyrrhus, as being descended from Peleus.

PELIGNI, a people of Italy, who dwelt near the Sabines and Marfi, and had Corfinium and Sulmo for their chief towns. The most expert magicians were among the Peligni, according to Horace.

PELIJARVI, a town of Sweden, in the government of Kuopio: 100 miles south-east of Kuopio.

PELIKANAI, a town of Lithuania, in the palatinate of Wilna: sixteen miles south-south-west of Braflaw.

PELIM, a town of Russia, in the government of Tobolsk, on a lake of the same name: seventy-two miles north of Turinsk.

PELIM, a lake of Russia, in the government of Tobolsk, about fifty-six miles in circumference. Lat. 59. 20. N. lon. 63. 50. E.

PELIM, a river of Russia, in the government of Tobolsk, which runs into a lake of the same name.

PELING, an island near the coast of Corea, in the Hoang-Hai, or Yellow Sea: ten miles long, and four broad. Lat. 38. 24. N. lon. 124. 28. E.

PELING, a small island in the Eastern Indian Sea, near the east coast of Celebes; fifty miles long, and fourteen broad. Lat. 1. 45. S. lon. 123. 20. E.

PELION (Mount), in ancient geography, a portion of that long chain of mountains which lay on the eastern coast of Thessaly, and which extended from the peninsula, inclosing towards the south the greatest part of the country called Magnesia, as far as the mountains that separated it from Macedonia. The portion which bore the name of Pelion commenced at the summit of Rhifus; and reached almost from the sea in advancing towards the north-west. In a kind of angle which this mountain formed in its return towards the east at the bottom of the mountain flowed the small river Amyrus. The coast, in the direction of the mountain, formed in this place a small gulf, in which was Melibœa. From Melibœa, to the right bank of the mouth of the Peneus, the chain of mountains, which approached very near to the sea, was called Ossa. On the other side of the Peneus, in ascending towards the north, it formed two chains of mountains, one of which took the course of the sea very exactly, and the other inclined a little from the south-east to the north-west. These two mountains were connected with the mountains which separated Thessaly from Macedonia. They were those two chains

of mountains which the ancients comprehended under the name of Olympus. When the giants are said to have piled Ossa upon Pelion, the meaning seems to be, that they had fortified these two mountains, whither they retired after their excursions, and kept Jupiter's garrison upon Mount Olympus in awe. The top of the mountain was covered with pine-trees. The celebrated huge spear of Achilles, which none but the hero could wield, had been cut down on this mountain, and was thence called *pelias*. It was a present from his preceptor Chiron, who, like the other Centaurs, had fixed his residence here. *Lempriere*.

PELIOSANTHES, [from *πελιδος*, livid or lurid, and *ανθος*, a flower; so named by the late Mr. George Jackson, in Andrews's Repository, in allusion to the pale lead-colour, for which the flowers are remarkable. *Andr. Repos.* ix. 605. *Ker in Curt. Mag.* 32. 1302.] In botany, a genus of the class hexandria, order monogynia, natural order farmentaceæ, *Linn.* (asparagi, *Juss.*) Generic characters—Calyx: none, unless the corolla be taken for such. Corolla: inferior, of one petal, permanent; tube cylindrical; limb wheel-shaped, in six equal obovate segments; nectary of one leaf, globular, contracted at the mouth, one-third the length of the petal. Stamina: filaments very short, equal, inserted into the inside of the nectary; antheræ oblong, of two lobes and two cells, projecting just beyond the nectary. Pistillum: germ superior, enveloped in the nectary, globose; style scarcely any; stigma of three obtuse furrowed lobes. Pericarpium: berry ovate, of three cells. Seeds two in each cell, some of them frequently abortive.—*Essential Character*. Corolla tubular; limb wheel-shaped, in six segments; stamens inserted into the globular nectary; berry with three cells, and six seeds. There are two species.

1. *Peliosanthes tetra*, or grey-flowered tetra: flower-stalks taller than the leaves; corolla obtuse. Gathered by Dr. Roxburgh in Bengal. Living plants were sent by him to the late lady Amelia Hume, in whose stove they flowered in the following spring, for the first time in England. Root fibrous, perennial; stem none; leaves several, radical, erect, a foot or more in height, on channelled stalks, elliptical, pointed at each end, entire, rather rigid, evergreen, smooth, plaited, with many longitudinal ribs, and fine transverse veins. Flower-stalks erect, round, simple, smooth, somewhat glaucous, each bearing an upright cluster of numerous inodorous small flowers, scattered or in tufts, of a livid purplish lead-colour, intermixed with dull green. Bractes scattered, ovate, pointed, concave, membranous, pale. The flowers fall off even before they wither, without producing any fruit in this country. The natives of Bengal know this plant by the name of *teta*; but we find nothing recorded of its qualities or virtues.

2. *Peliosanthes humilis*, or dwarf tetra: flower-stalks shorter than the leaves; cluster simple; corolla acute. Introduced from Prince of Wales's Island, about the year 1808, by Mr. Evans of Stepney, in whose hot-house it blossomed in November. This differs from the former in its much humbler stature, the leaves being not more than three inches high, and the flower-stalk hardly two inches, bearing an ovate dense simple cluster of flowers, whose segments are acute, green with a white edge.

Mr. Jackson observes, that he had seen two species in Mr. Evans's collection just imported from Prince of Wales's Island, one of which had the leaves nearly of a blue colour, the other probably was our *humilis*. Mr. Evans's collector declared that he had found five or six distinct species of this genus, growing wild in the island just named, though he did not succeed in his attempt to bring them alive to England.

PELIOU', a town of China, of the third rank, in Quang-si: seventy miles south-west of Ou-tcheou.

PEL'ISE, a river of France, which rises in Mount la Croix, passes by Lucerna, and runs into the Cluson one mile south of Vigone.

PELISSA'NE, a town of France, in the department of the Mouths of the Rhone: three miles east of Salon, and fifteen west-south-west of Aix.

PELI'SSE, *f.* [French; from *pelyce*, Sax. from the Lat. *pellis*, a skin.] A kind of coat or robe. See **PILCH**, the old word.—Coats lined with these skins are called *pe-lisses*. *Guthrie of Crim Tartary*.

PELL, *f.* [*pellis*, Lat.] Parchment or vellum upon which bills, deeds, &c. are written.—Clerk of the *pellis*, an officer belonging to the exchequer, who enters every teller's bill into a parchment roll called *pellis acceptorum*, the roll of receipts; and also makes another roll called *pellis exituum*, a roll of the disbursements. *Bailey*.

PELL (John), a divine of the church of England, and an eminent mathematician, was born at Southwick in Suffex, of which his father was minister, in the year 1610. He was educated in grammar-learning at the free-school of Steyning in the same county; and made so rapid a proficiency in the Latin and Greek languages, that at the early age of thirteen he was fully qualified for entering upon academic studies, and sent to Trinity-college, Cambridge. Here he prosecuted his studies with the greatest diligence and intenseness; and, besides a wonderful facility in acquiring languages, he possessed a peculiar turn towards mathematical learning; so that, in 1629, when only eighteen years of age, he drew up "A Description and Use of the Quadrant, written for the use of a Friend, in two Books." In the same year he held a correspondence with the celebrated Henry Briggs, upon the subject of Logarithms. In 1630, he wrote "Modus supputandi Ephemerides Astronomicas (quantum ad motum Solis attinet) paradigmata ad An. 1630, accommodato;" and "A Key to unlock the meaning of Johannes Trithemius, in his Discourse of Steganography." He had been admitted to the degree of B. A. at the regular period, and in the present year he proceeded M. A. He now quitted Cambridge, and paid a visit to Oxford, where he was incorporated M. A. in 1631. During this year he wrote "A Letter to Mr. Edmund Wingate, on Logarithms;" and he drew up "Commentationes in Cosmographiam Eftedii."

Mr. Pell seems to have formed an early intention of entering into the marriage-state; which was most probably the reason that prevented him from offering himself a candidate either for a scholarship or fellowship in Trinity-college. Otherwise there can be no doubt but that his extraordinary accomplishments would have secured to him any encouragement which his college could offer, to engage his residence in it: for, besides his reputation as a mathematician, he was distinguished, not only by his intimate knowledge of the Hebrew, Greek, and Latin, but also of the Arabic, Italian, French, Spanish, and High and Low-Dutch, languages. His inclination, however, led him to renounce all chances of college-preferment for the enjoyment of domestic felicity; and, in the year 1732, he married a lady by whom he had four sons and four daughters. But Mr. Pell's matrimonial connexion did not diminish his ardour for mathematical pursuits. In 1633-4, he finished his "Astronomical History of Observations of Heavenly Motions and Appearances;" and soon afterwards his "*Ecliptica prognostica*, or the Eclipse Prognosticator, or Foreknower of Eclipses; teaching how by calculation to foreknow and foretell all sorts of Eclipses of the Heavenly Lights." In 1634, he translated out of Latin, "The Everlasting Tables of Heavenly Motions, grounded upon the observations of all times, and agreeing with them all, by Philip Lansberg of Ghent in Flanders, &c. from the Sexagifal to the Decimal Subdivisions, for the more ease in Calculations;" and in the same year he wrote "the Manner of his deducing his Astronomical Tables out of the Tables and Axioms of Philip Lansberg." The year 1634 produced from him two "Letters of Remarks on Mr. Gellibrand's Discourse mathematical on the Variation of the Magnetic Needle."

By these and other works, which it is not necessary to enumerate,

enumerate, Mr. Pell's reputation for mathematical knowledge was so well established, that he was considered to be deserving of a professor's chair in that science. When, therefore, a vacancy took place in one at Amsterdam in 1639, interest was made to procure Mr. Pell the appointment. The vacancy was not, however, filled up before the latter end of the year 1643, when Mr. Pell was chosen to it. Of the estimation in which he was held in Holland, a good opinion may be formed from what was said of him by his colleague, Gerard John Vossius, who styles him "a person of various erudition, and a most acute mathematician;" and he greatly applauds his lectures upon Diophantus.

In 1644, Mr. Pell published at Amsterdam, in two pages, a refutation of Longomontanus's pretended quadrature of the circle, which obtained for him a high degree of credit among the most learned mathematicians in Europe. Two years afterwards, Mr. Pell was called to the display of his talents on a new scene; for the prince of Orange, having founded a *Scholia illustris* at Breda, invited him to be professor of philosophy and mathematics in the new institution, with an annual salary of a thousand guilders. This offer he accepted, and he filled the mathematical chair at Breda with the same reputation and success which attended him at Amsterdam, having, among his pupils, several who were afterwards distinguished as eminent algebraists. The death of the prince of Orange, in 1650, deprived him of his patron; and, the war which broke out between the English and Dutch in 1652 rendering it necessary for him to withdraw from the territories of the states, he returned to his native country. In 1654, Cromwell appointed him agent to the Protestant cantons in Switzerland; which character he retained till the year 1658, when he returned to England a short time before the death of Cromwell.

While he was abroad he is said to have privately rendered no little service to the interests of king Charles II. and of the church of England. Be that as it may, it is certain that after the restoration he was encouraged to enter into holy orders; and, having been ordained deacon and priest in 1661, he was immediately instituted to the rectory of Fobbing in Essex, with the chapel of Battlesden annexed, on the presentation of the king. During the month of December in the same year, he brought into the upper house of convocation the Calendar, reformed by him, with the assistance of Sancroft, afterwards archbishop of Canterbury. In 1663, he was presented by Dr. Sheldon, then bishop of London, to the rectory of Laingdon in Essex; and about the same time he was created D. D. Scarcely had he been honoured with this degree, when his patron was translated to the archbishopric of Canterbury, and made him one of his domestic chaplains. Such an appointment is generally considered to be a step to higher preferment; but Pell was so intent on his studies, that he neglected his own interest; and was indeed so imprudent with respect to the management of his worldly affairs, that he would have disgraced the station of a dignitary. Anthony Wood says, that "he was a shiftless man, and his tenants and relations dealt so unkindly with him, that they cozened him of the profits of his parsonages, and kept him so indigent, that he wanted necessaries, and even paper and ink, to his dying day."

In the mean time he distinguished himself in the Royal Society, of which he was elected a fellow in 1663. In the following year he published "an Exercitation concerning Easter," 4to. and in 1665 he made great alterations and additions to Rhonius's Algebra, which appeared in the English version of that work, printed in 1668, under the title of, "An Introduction to Algebra; translated out of the High Dutch into English by Thomas Branker, much altered and augmented by D. P." &c. 4to. After this, he drew up "A Table of ten thousand Square Numbers, namely, of all the Square Numbers between 0 and a hundred million, and of their Sides," &c. which were printed in 1672, folio. Dr. Pell also invented the method of rang-

ing the several steps of an algebraical calculus in a proper order, in so many distinct lines, with the number affixed to each step, and a short description or process in the line. He was likewise the inventor of the character \div for division, \oslash for involution, ω for evolution, and \therefore for ergo, or therefore. But, in the midst of the incessant application to his studies, owing to the neglect of his affairs, his embarrassments increased, and he contracted debts, which proved the occasion of his being thrown more than once into the King's-Bench prison. Being at length reduced to great indigence, Dr. Whistler, then censor and registrar to the College of Physicians, invited him to his house, in 1682, where he continued till, the ill state of his health requiring particular attendance, he was removed, at first to the house of a grandchild, and afterwards to that of the reader of the church of St. Giles's in the Fields, where he died in 1685, when in the 74th year of his age.

Besides the labours already noticed by us, in chronological order, Dr. Pell wrote a Demonstration of the Second and Tenth Books of Euclid, and also of Archimedes's Arenarius, and the greatest part of Diophantus's Six Books of Arithmetic. Of the latter author he spent some time in preparing a new edition, in which he intended to have corrected the translation, and introduced new illustrations. Some of our author's manuscripts were left by him at Brereton in Cheshire, where he had resided for some time, it being the seat of lord Brereton, who had been one of his pupils at Breda. A great many others came into the possession of Dr. Busby, which Mr. Hook was directed to endeavour to obtain for the Royal Society. They continued, however, mixed with the papers and pamphlets of that gentleman, in four large boxes, till the year 1755, when Dr. Birch, secretary to the Royal Society, procured them for that body from Dr. Busby's trustees. The collection contains not only Dr. Pell's mathematical papers, letters to him, and copies of those sent by him, but also several manuscripts of Mr. Walter Warner, an eminent philosopher and mathematician in the reigns of James I. and Charles I. *Wood's Fasti Oxon.* vol. i. *Hutton's Math. Dict.*

PELLA, in ancient geography, a town of Macedonia, near the sea, on the confines of Emathia. This city became the capital of the kingdom when Edeffa was annihilated, according to Ptolemy; and owed its grandeur to Philip, who had been educated there, and to his son Alexander, who was born in this place. Livy describes it as situated on an eminence surrounded by marshes, in the midst of which was a fortress, appearing like an island, and at a distance seeming to be joined to the city; it was, however, separated from it by a river, which ran between their walls, and over which there was a bridge of communication. This river was called Ludias, Loedias, and Lydius.

M. de Pouqueville, a French traveller, visited very recently the site of Pella. This ancient capital of the kings of Macedon, he informs us, does not announce itself, in its desolation, to the eye of the stranger, as at Athens and Corinth, by the display of the remains of its ancient splendour. The position of Pella is known only from its correspondence with the descriptions of its site, preserved in history. Thus it is described by Livy, in the conclusion of his forty-fourth book: "The consul M. Æmilius Paulus, proceeding from Pydna, after the utter discomfiture of Perseus of Macedon, arrived with his army on the second day at Pella. Encamping about a mile from the city, he there remained some days, examining the position on every side, and acknowledging that not without good reason had the royal residence been there placed. Pella was seated on an eminence sloping down to the south-west, and surrounded by marshes of impassable depth in summer as well as in winter, produced by several stagnant lakes. Within the marsh itself, on the side next to the city, appeared, like an island, the castle, or citadel, erected on a mound, a work of vast labour, which sustained the fortifications, while it resisted all injury

jury from the inclosing waters. This citadel, conspicuous from its situation and structure, was connected by a wall to the city, and within that wall was a stream of water, over which was erected a bridge. From its position it resulted, that, although the city might be blockaded, yet the citadel was wholly inaccessible; nor, on the other hand, if the king should shut up any person within the citadel, could he possibly escape but by the bridge, which might be very easily defended." Conformably with this representation, the vestiges of Pella are found on an eminence sloping down to the south-west, and encompassed by marshes. In vain, however, do we look for the walls of the city, for the citadel, for the dykes constructed to defend from inundation the temples, buildings, and other monuments of its grandeur: the barbarians from the north, the Romans, and the succession of ages, have destroyed even the ruins.

To Philip of Macedon, Pella was indebted for its rank and magnificence among the cities of the east; and it must have been with a view to its strength, in a position inapproachable in ancient times by any hostile force, that he selected for his capital a spot extremely unhealthy. Enlarged and improved by his son Alexander and his successors, Pella had attained a high degree of power and splendour, before it was taken and sacked by the adventurers from Gaul, the forerunners of the Romans, who overthrew the city after the conquest of Macedonia. Commanding, by its position, the mouths of the Axios and the Lydias, Pella would naturally have become an important commercial station, had not Thessalonica, distant only twenty-one miles, possessed a safe and commodious port for shipping. But in ancient times, military strength and security, and not commercial advantages, were the objects contemplated, in the founding and improving of cities.

"Looking forward, at last, we discovered the miserable village called Allah-Kilissa, or Allah-Hissar, (God's Tower or Castle,) composed of about threescore huts, inhabited by Bulgarians, with a tower, garrisoned by a dozen Albanians, with their officer. Such are the present edifices, population, and military establishment, of Pella, the once-powerful capital of Philip, and Alexander, and Perseus! A low Mahometan now commands, whip in hand, in the city where Alexander first saw the light; and the paternal seat of that monarch whose dominions extended from the Adriatic to the Indus, is now the property of Achmet, son of Ismael, bey of Serres. But, if Pella be sunk, well adapted to its fallen state are the inhabitants, distinguished, even in Macedonia, by their gross ignorance and their brutal hatred of strangers. Notwithstanding the orders of the commandant, and the abundant offer of money, it was not without a long altercation that we obtained entrance into a hovel, merely to deposit our baggage. Proceeding to survey the place, we first visited a church, built of stone, dedicated to St. Paul, usually styled by the Greeks, the Great Apostle. The children, attracted by the European dress, followed us from place to place; while the dogs, not less amazed, assailed us in the most ferocious manner. Some of the people, however, who had seen Franks in Thessalonica, offered to sale antique coins and small figures in *terra cotta*, found in the place. Traversing a large space of ground, covered with fragments of tombs, and masses of brick and tile, we came to the village-well, on a stone of which were these words: ΔΙΟΝΥΣΙΟΣ ΜΕΤΑΚΛΕΟΥΣ. Descending in a westward direction, we fully recognized the position of Pella, as described in the foregoing quotation from Livy, on the slope of a double eminence. The remains of the ramparts, constructed of stones of very large size, carried round the summit of the highest hill, induced me to suppose them to indicate the position of the citadel. Descending southwards, I followed the line of another inclosing wall, still called Pella by the inhabitants. The direction of this wall points to a square basin, of Turkish workmanship: but the facing wall is founded on a broader wall, of

ancient Greek construction. In the lake Lydias, now called Jenidgé, I observed the mouth of the river from the town so called, and those of the river Niagoufta, and of several rivulets, proceeding from neighbouring springs.

"Having thus surveyed all that remains of Pella above ground, and to attempt excavation was impracticable, (although under the surface, a rich treasure of antiquities must undoubtedly be concealed,) we returned to our Bulgarian hut, where our Janissaries had prepared a dinner of pilaw, the usual food of travellers, and the favourite dish of the people in the east. After dinner, I extended my researches towards Jenidgé, a considerable town, famed for its tobacco, distant about a league westward from Pella. Entering on the road which runs not far from the well before mentioned, I observed a tumulus, or barrow, which had been opened. Going into it, by an opening made on the south side, we found a fort of passage, thirty-one feet four inches, English, in length, by seven feet in breadth, which led to two square parallel rooms, both much injured by the openings made to enter and examine them. Continuing to descend to the second passage, by a steep slope under a vault, which terminated at a horizontal passage or gallery fifty-seven feet long, and eleven feet two inches broad, we observed two niches in the wall. These left us no doubt that the galleries and recesses, which externally appear as barrows, were certainly constructed as places of sepulture. A third passage opened into another vaulted chamber, fourteen feet three inches by twelve feet ten inches in length from north to south. This tumulus having been opened and examined, no discoveries were left for us to make. We were, however, convinced of the erroneoufness of the vulgar opinion, that the barrows found in various parts of the country were thrown up by the Turks, when they first invaded Macedonia, as a place on which to erect the precious national standard of Mahomet. Nothing now remaining to be seen at Pella, we returned to Thessalonica by the road we had before pursued." Tour from Thessalonica to Pella. *Monthly Mag.* March 1822.

PEL'LA, a town of Russia, at the junction of the Tosna and the Neva: twenty miles south-east of Peterfburg.

PELLACON'TA, in ancient geography, a river of Asia, in Mesopotamia. *Pliny*.

PELLACO'PAS, a river of Asia, in Mesopotamia. *Arrian de Exped. Alex.*

PELL'AGE, *f.* [from *pell.*] A custom or duty on tanned hides.

PELLA'GRA, *f.* [probably from *pellis*, the skin, and *agri*, scab.] A sort of cutaneous disease, which was first described about the year 1771 by some Italian physicians, as occurring in many persons in the neighbourhood of Milan and Venice. There is something bordering upon the marvellous in this early history of the pellagra; but subsequent observation has confirmed it. A full account of the disease may be found in Frapolti, "*Animadversiones in Morbum vulgo Pellagram dictum;*" Milan; 1771, (the first writer who noticed it;) and in an Essay by W. X. Janfen, "*De Pellagra, Morbo in Mediolanensi Ducatu endemio,*" Leyden, 1787. (This essay was reprinted in Dr. Frank's *Delectus Opusculorum Medicorum*, vol. ix. art. 9.) See also a long list of references to Italian writers on the subject, under the article *Pellagra*, in Dr. Parr's London Medical Dictionary.

A more recent and reasonable account of the disease is given by Dr. Holland, who had resided in the north of Italy for some time, and noted the symptoms and progress of it on the spot. The Pellagra, according to this writer, is a disease chiefly confined to the peasants of Lombardy, and owing its birth to deficiency of food and clothing, and the cachectic habit consequent thereon. The disease occurs in the spring, and begins like a common erythema. The patient perceives on the back of his hand, on his feet, and sometimes, but more rarely, on other parts of the body exposed to the sun, certain red spots or blotches; which gradually extend themselves, with a slight elevation

of the cuticle, and a shining surface, not unlike that of lepra in its early stage. The colour of this eruption is a somewhat more obscure and dusky red than that of erysipelas: it is attended with no other uneasy sensation than a slight pricking or itching, and some tension in the part. After a short continuance in this state, small tubercles are frequently observed to arise on the inflamed surface; the skin almost always becomes dry and scaly, forming rough patches, which are excoriated and divided by furrows and rhagades. Desquamation gradually takes place, and leaves a shining unhealthy surface in the parts affected; but towards the close of the summer, or occasionally still earlier, the skin resumes its natural appearance; and, but that the further progress of the disease is familiar to every inhabitant of the country, the patient might be led to flatter himself that the evil was gone by, and that there was no particular reason to dread its recurrence.

The constitutional symptoms which precede the eruption are those usually indicative of the cachectic habit; viz. languor, flabbiness of flesh, and debility; those which follow it are debility of the whole body; vague and irregular pains of the trunk and limbs, but especially following the track of the spine and dorsal muscles; headache, with occasional vertigo; irregular appetite, and general depression of spirits. The bowels are for the most part relaxed; and usually continue so in the further course of the disease. There are no febrile symptoms; and in females the menstruation is generally continued without irregularity.

The constitutional, like the local, derangement, usually goes off towards the latter end of the summer, but it returns the next year with increased violence, and during the third and fourth years acquires an horribly alarming character. The local appearance changes from that of the erysipelatous eruption and desquamation before described, to that of profound scabs and scales, or ill-conditioned ulcerations; and the constitutional derangement is marked by a severe impediment to the progress of the assimilative and the sensorial functions. Nervous irritation manifests itself, firstly, in a variety of spasmodic pains, uneasy sensations, and visual and aural deceptions; and, secondly, by desponding furious mania, and frequent attempts at suicide. No plan of treatment has been hitherto applied to pellagra with advantage; but the general indications, of course, are to cure the cachexy of the body, by removing to healthy situations, and the administration of wholesome food. This disease is supposed by some learned authors to be the leprosy of the middle and dark ages. See LEPROSY, vol. xii. and London Med. Journal for March 1818.

PELLA'NA, or PELLANE, in ancient geography, a town of Laconia, south-east of Belemina. It was washed by the Eurotas; and is thought to have been very ancient. In the time of Pausanias it had a temple of Esculapius and a fountain called Pellanide.

PEL'LEGRIN (Simon Joseph), a French poet and ecclesiastic, was born at Marseilles. He obtained, in 1704, the prize of the academy for his "Epistle to the King on the Success of his Arms." He entered into the religious order of the Servites, but afterwards obtained leave to remove into that of Cluny. He wrote several pieces for the theatres, and dramatized the History of the Old and New Testament, the Psalms of David, &c. He is also known as the translator of the works of Horace into the French language. He died in 1745.

PELLEGRINI (Camillo), a learned historian and antiquarian, was born at Capua in 1598. He was educated at the Jesuits' school at Naples, where, besides the usual studies, he acquired an accurate knowledge of civil and ecclesiastical law and theology. He entered into the clerical order; and, having been sent to Rome, he diligently consulted the archives and libraries of that capital, and formed the design of collecting all the ancient documents relating to his native place, and to the whole kingdom of Naples. For this purpose he made many journeys, and

was at great expense in procuring copies of records and manuscripts, and in forming a collection of antiquities. The first fruit of his labours was "L'Apparato alle Antichità di Capua," printed in 1651, in which he minutely describes all the parts of Campagna Felice, and relates its history and several revolutions. He afterwards published a work entitled "Historia Principum Longobardorum," containing the Chronicle of the Anonymus Salernitanus, and several other historical pieces which had not yet seen the light, illustrated with learned annotations and dissertations. This publication was of great service in elucidating the history not only of those provinces of Naples which were under the sway of the Lombard kings, but of all Italy; it was therefore republished in the collections of Burmann and Muratori, and has been re-edited, with various additions, at Naples, 1749, by Sig. Fr. Moria Pratlili. This learned writer published other works on different subjects, and had a great collection of MSS. as well of his own writing as others, which were unfortunately lost to the world by the following incident. Being in a bad state of health, he had given orders to a female domestic, that, when he should be near his end, she should burn a large bundle of papers which he pointed out. One day, overhearing the physicians prognosticate that he had not many hours to live, he too faithfully executed his commands, to his own great regret after he was somewhat recovered. He died at Naples in 1660, at the age of sixty-five.

PELLEGRINO of MODENA, a celebrated Italian painter, born 1511, and bred under Raphael, was killed in an affray.

PELLEGRINO-PELLEGRINI (Tibaldi), a celebrated painter and architect, was born at Bologna in 1527, of a family from the Milanese. He studied in the school of Bagnacavallo in his native place; but his chief education was derived from the works of Michael Angelo at Rome, viewed with the eye of genius. It is not easy to determine whether he ought to be reckoned among painters or architects; for he erected edifices, and ornamented them with his paintings; but he was great in both departments. At his visit to Rome he was patronized by cardinal Poggi, who sent him back to Bologna to finish his palace there, which is now the Academical Institute, and is decorated with his paintings. These, with those of the chapel of St. Jacopo of the Augustine friars, are the principal specimens of his art in Italy, and were the study and imitation of the Caracci. He went from Bologna to Loretto, in the church of which he built a chapel, and ornamented it with stuccos and paintings. At Ancona he gave decorations for two of the churches, and built and adorned the merchants' hall; and he likewise superintended the fortifications of the place as military architect. At Pavia he constructed the Palace of Sapienza, called afterwards the Borromeian College. The city of Milan named him, before 1570, architect of its celebrated cathedral: he disencumbered its dome of gothic ornaments, and in their room enriched it with several elegant chapels, and a majestic choir. Having been engaged by Philip II. to prepare plans for the Escurial, he went into Spain in 1586, and during nine years was employed as architect and painter of that vast edifice. His works would require a volume to describe, and they were amply remunerated with riches and honours. He returned to Milan, where he continued his labours, under the title of ducal engineer, to an advanced age. The year of his death is not exactly known, but it was under the pontificate of Clement VIII. and about the close of the sixteenth century. He was buried in a tomb erected for himself and his family in the dome of Milan.

Tibaldi is regarded as the greatest designer of the Bolognese and Lombard schools. He was called by the Caracci "the reformed Michael Angelo," possessing his grandeur and energy, without his extravagance; and they commended *Del Tibaldi il decoro e il fondamento*, "his decorousness joined with learning." He is principally known

known as a painter by his works in fresco, his pictures in oil being extremely scarce; his pieces in the Institute of Bologna, representing stories from the *Odyssæy* in fresco, are his most remarkable remains. Of these a book has been engraved. *D'Argenville. Pilkington.*

PELLEGRU'É, a town of France, in the department of the Gironde: twelve miles north-north-east of La Reolle, and thirty east of Bourdeaux.

PEL'LEN, a town of Prussia, in the circle of Natangen: sixteen miles south of Brandenburg.

PELLE'NA, in ancient geography, a town of the Peloponnesus, in the Argolide.

PELLENBECK, a village of the kingdom of the Netherlands, in the province of South Brabant; three miles of Louvain on the river Dyle; and till the late peace was included in the (French) department of the Dyle.

PEL'LENDORF, a town of Austria: ten miles west of Zisterdorf.—A town of Austria: eight miles south-east of Vienna.

PELLE'NE, in ancient geography, a town of the Peloponnesus, in Achaia, south of Ariftonautæ. It was built round a mountain, and formed a beautiful amphitheatre. The inhabitants pretended that it took the name from Pallas, one of the Titans; but the Argians with greater probability ascribe its name to Pellenè, the son of Phorbas, and grandson of Triopas, who came from Argos to this place. Water was conveyed to this city by a beautiful aqueduct; and at a small distance was a gymnasium. Near the town was a temple, on a spot consecrated to Neptune. About two leagues towards the south-east from Pellenè was a famous temple of Ceres the Mysian. In its vicinity feasts were celebrated for seven days. Pellenè was defended by a fortress called Olurus towards the south-east, and by the valour of its inhabitants long maintained its liberty; at length it became a part of Sicynonia, retaining its liberty to the time when the Romans took possession of Greece.

PELLENIN'KEN, a town of Prussian Lithuania: nine miles north-east of Interburg.

PELLERIN' (Joseph), an eminent medalist, born at Paris in 1683, was commissary-general of the French marine. Having obtained his dismissal after forty years' service, he devoted the remainder of his life to the study of antiquity. His collection of medals, which was the richest and most valuable that was ever made by a private individual, was purchased by the king in 1776. He contributed to the promotion of the numismatic science by a publication in nine volumes, 4to. enriched with a great number of plates. It consists of a collection of medals of kings, hitherto inedited or little known; a collection of medals of people and towns, inedited or little known; miscellaneous medals; supplements to the above; and letters on medallic subjects. This is reckoned a very valuable work, not only on account of the beauty of the engravings, but of the learned and judicious explanations subjoined. The author died at Paris in 1782, in the ninety-ninth year of his age.

PELLERIN' a town of France, in the department of the Lower Loire, on the Loire, with a harbour for small vessels: nine miles north of Nantes, twelve south-east of Painbœuf.

PEL'LET, *f.* [from *pila*, Lat. *pelote*, Fr.] A little ball.—That which is sold to the merchants, is made into little pellets, and sealed. *Sandys.*—I dressed with little pellets of lint. *Wijeman's Surgery.*—A bullet; a ball to be shot.—The force of gunpowder hath been ascribed to rarefaction of the earthy substance into flame, and so followeth a dilatation; and therefore, lest two bodies should be in one place, there must needs also follow an expulsion of the pellet or blowing up of the mine: but these are ignorant speculations; for flame, if there were nothing else, will be suffocated with any hard body; such as a pellet is, or the barrel of a gun; so as the hard body would kill the flame. *Bacon.*—In a shooting-trunk, the longer it is to a

certain limit, the more forcibly the air passes and drives the pellet. *Ray.*

To PEL'LET, *v. a.* To form into little balls. *Not in use:*

Oft did she heave her napkin to her eyne,
Which on it had conceited characters,
Laundering the silken figures in the brine
That season'd woe had *pelleted* in tears. *Shakespeare.*

PEL'LETED, *adj.* Consisting of bullets:

My brave Egyptians all,
By the discandying of this *pelleted* form,
Lie graveless. *Shakespeare.*

PELLETIER (Bertrand), a very able French chemist, was the son of an apothecary at Bayonne, where he was born in 1761. He received his early education at the college of that city, and distinguished himself from childhood by his ardour for study. At the age of seventeen he came to Paris, and particularly attached himself to the eminent chemist Danet. He soon acquired an extraordinary passion for chemical experiments, to the expenses of which he sacrificed almost the necessaries of life. At length a lover of the science offered him his laboratory, which he gladly accepted, and for more than a year he paid it a daily visit. He had conducted his experiments with so much care and accuracy, that at the age of twenty-one he made himself advantageously known by some observations on the arsenical acid and other substances, printed in the *Journal de Physique* in 1782. In the next year Danet entrusted him with the management of the pharmaceutical establishment of his father-in-law Rouelle. His reputation caused him to be aggregated to the company of apothecaries at Paris earlier than the regulated age; he also took his degrees in medicine; and in 1784 he married. Employing all his leisure in experimental chemistry, he gave to the public successively a variety of memoirs which have perpetuated his name among those of the most ingenious and successful cultivators of the science. Of these, some of the most curious relate to phosphorus. In five papers upon this production, he considers the best method of preparing and purifying it, its powers of decomposing the arsenical acid, and the mode of uniting it with the metals, so as to produce phosphurets of almost all metallic bodies. Other memoirs relate to the analyses of plumbago and molybdena, to acetic ether, to caustic alkalies, oils, and the preparation of soap, to bell-metal, muriate of tin, carbonate of barytes and potassium, and strontian. The latter, with many more, are inserted in the "*Annales de Chymie*," in the compilation of which he was concerned from the year 1792. In the preceding year he had been admitted a member of the Academy of Sciences, an honour which few have obtained at so early an age. After that establishment was suppressed, he was employed by the government in several important commissions. He was in succession a member of the board of consultation for the arts, inspector of the hospitals of Belgium, commissary of gunpowder and saltpetre at Essonne and La Fère, and member of the council for superintending the health of the armies. Notwithstanding his natural weakness of constitution, he made a point of performing all his duties with the utmost punctuality.

When the National Institute had taken the place of all the other academical institutions, Pelletier was called to a seat in it, which he occupied with distinction. During the two last years of his life he was employed to give a course of chemistry in the Polytechnic school; and the clearness, precision, and method, of his lectures were universally admired. His language was simple, pure, and devoid of all ornament foreign to the subject. He exactly described what he had seen and proved; and never suffered his imagination to wander in brilliant theories, or to lead him to exaggerate in his facts. A timid disposition and feeble organization had caused him to undergo several

several severe shocks during the storms of the revolution; and his tranquillity was also occasionally invaded by the claims of other persons to his discoveries, the injustice of which deeply wounded him; but the metallic and carbonic vapours to which he was so much exposed in his experiments were the immediate cause of the pulmonary affection that proved fatal to him. During the progress of it, he felt no diminution of his zeal for chemical science, and was often roused from a fit of low spirits by the sight of some curious preparation. He had determined upon a journey to his native place, which he flattered himself would restore him to health, when, in July 1797, he was carried off at the early age of thirty-six, to the great regret of his friends and the public. He had been made a member of several learned societies, native and foreign, among which were the Academy of Turin, and the Paris and London Medical Societies. His works were published collectively in two volumes, 8vo. Paris, 1798; with an Eloge prefixed, from which the above account is collected.

PELLICAN (Conrad), a learned German divine of the reformed communion, was the son of respectable but not opulent Catholic parents, and born at Ruffach in Alsace, in the year 1478. His family surname was originally *Kürfner* (Skinner), which he changed to *Pellican*. Having been instructed in the rudiments of learning at his native town, he was sent by an uncle to the university of Heidelberg, and supported there for about sixteen months, when, the expense proving too heavy, our young student was obliged to return to his father's house. He now for some time gratuitously assisted his old schoolmaster, and gladly availed himself of the permission which was given him to read the books belonging to a neighbouring convent. Observing his fondness for study, the monks used all their arts to engage him to enter into their community; and by degrees made such an impression upon his mind, that he took the habit in 1493, when he was in his sixteenth year, without the approbation or knowledge of his parents. In this convent he applied with unwearied diligence and distinguished success to the study of the Latin and Greek languages, polite literature, philosophy, and divinity; and in the year 1496, he was sent for further improvement to the university of Tübingen. Here he spent between four and five years in attending the lectures of the different professors; and during this period, with incredible labour for want of proper books, which reduced him to the necessity of constructing a grammar and dictionary for his own use, he made himself a tolerable proficient in the Hebrew language. In the year 1500, John Capnio, who then came to Tübingen, assisted him in greatly improving his acquaintance with this tongue. In 1501, Pellican was ordained priest at Pfortzheim, and immediately returned to the convent at Ruffach. He had now acquired so high a reputation for learning and knowledge, that in 1502 he was appointed professor of divinity in the convent belonging to his order at Basil. This situation was peculiarly acceptable to him, as it proved the means of introducing him to the acquaintance of the eminent literary characters who frequented that city; and also of the learned printers for whom it was famous, who engaged his assistance in editing the complete works of St. Augustine and St. Chrysostom. He contracted an intimacy, in particular, with the celebrated John Froben, who never suffered him to be in want of useful books. In the year 1504, cardinal Raymund, the legate of pope Alexander VI. having been informed of the great merits of Pellican, and tried him by an examination which lasted some hours, created him licentiate in divinity; and with this extraordinary distinction, that, when arrived at the age of thirty, he should succeed to the title of doctor in that faculty, without going through any other forms.

About this time he drew up, at the request of the bishop of Basil, "A Summary of Christian Doctrine," in which he adhered to the Catholic creed, and used the language

of the schools; but his mind was beginning to entertain doubts on the subjects of indulgencies, purgatory, confession, the eucharist, and the papal power. In the year 1508, he was appointed to fill the divinity-chair at Ruffach; and was afterwards elected successively guardian of the convents belonging to his order at Pfortzheim and in that town. While he held these offices, he made himself master of the Chaldee dialect, and read with great attention the Targum of Onkelos on the Pentateuch, and various Jewish commentators on the Old Testament writings. In 1516, he was deputed by his province to attend a general congregation of the Minorite order at Rouen in Normandy; and he was afterwards their representative in a general congregation held at Rome. In 1519, to his great satisfaction, he was appointed guardian of the convent at Basil, and renewed his learned connexions and intimacies in that place. By reading the writings of Luther, which were about this time brought to Basil, the doubts which he had formerly begun to entertain respecting some of the leading tenets of the papal church, were strengthened and confirmed, and he gradually became an entire convert to the doctrine of that great reformer. Under the influence of this change in his principles, he delivered in the pulpit an exposition of the gospel of St. Matthew, which lasted nearly eighteen months, and was attended by crowded auditories, among whom were some of the most learned men in Basil, who heard him with the highest satisfaction, and encouraged him to proceed with his plan. But by this conduct he exasperated the zealous adherents to popery; and in the year 1523, when the provincial Satzgerus visited the convent at Basil, some doctors of the university, and canons of the great church, preferred a charge against Pellican, his vice-guardian, and other members of the fraternity, that they were Lutherans, and encouragers of the books of that daring heretic. By their representations the provincial was determined to remove the accused from their situations; but he was prevented from taking that step by the interference of the senate of Basil, who confirmed them in their places, and appointed Pellican fellow-professor of divinity with Oecolampadius. Some time afterwards, however, in a general congregation of the Minorite order at Landslut, on the representation of Satzgerus, Pellican was removed from the office of guardian; but he still retained his post in the university, and filled the theological chair alternately with his learned colleague. In the mean while, some of his fellow-monks were secretly employed in endeavouring to prejudice the citizens against him; and they carried their hatred to such a length in the convent, that his life was in danger, and he was daily furnished with provisions by friends, that he might not prove the victim of apprehended attempts to poison him. Thus circumstanced, his friends prevailed upon him to consult his personal safety; and in the year 1526, on the invitation of Zuinglius, he privately withdrew to Zurich, where he was appointed professor of divinity and of the Hebrew language. Upon this event he laid aside his cowl, and adopted the common dress of ecclesiastics. To show, likewise, that he finally renounced the papal communion, he followed the example of many of the other clergy who embraced the reformation, by taking to himself a wife. In the same year, he edited a second impression of the "Biblia Hebraica, cum Comment. R. Abraam, Abenezra, et R. Salomonis, in Prophetas;" and also of the "Sepher Michlol," first printed at Constantinople. In the year 1528, he took part in the celebrated disputation at Bern, on the subject of the eucharist; and published a volume of the debates and speeches on that occasion. During the following year he commenced his public exposition of the books of the Old Testament, which employed him till 1539, and exhibited proof of very laborious application, extensive learning, and, particularly, an intimate acquaintance with the Jewish commentators, ancient and modern. This Exposition he afterwards published, in four volumes folio; and then devoted

devoted his labours to an illustration of the New Testament, which he gave to the world in a fifth volume. He had, besides, a considerable share in preparing for the press and editing the Commentaries of Sebastian Meyer upon the Apocryphal Books. Pellican also translated into Latin the Chaldee paraphrases, including the Targum of Onkelos, Jonathan, and Jerusalem, various small talmudical treatises, and Elias Levita's edition of the Masora. He published, in German, "An Exposition of the Pentateuch, Joshua, Judges, Ruth, Samuel, and the Books of Kings." With the hope of introducing the philosophy of Aristotle and Cicero into Germany, he translated several books from their works into the German language; and he bestowed immense labour in editing various commentaries, dictionaries, &c. He died in 1556, about the age of seventy-eight, highly respected for his learning, and esteemed for his integrity, candour, modesty, and simplicity of manners. His works have been collected together, and published in seven vols. folio. *Melchior. Adam. Vit. Germ. Theol. Gen. Biog.*

PELLICER (Josef de Ossau, Salas, y Tobar), a long name of considerable eminence in the literary history of Spain. He was born at Saragossa, April 22, 1602; and inherited a disposition to letters from his father D. Antonio Pellicer de Ossau, who left in manuscript an epitome of Garibay's Great History, and a poem called *Batavia Rebelde*; doubtless of a right Catholic complexion. He took an honorary degree at Alcala, and from thence removed to Salamanca; and at the age of twenty-two took up his residence in Madrid, full of academical honours, and with as much learning as ever so young a man could possibly have acquired. In 1629 he was made chronicler or historiographer of Castille. The states of Arragon named him to the same office for their kingdom; but, as this was already held by Francisco Ximenez de Urrec, it was ultimately decided that the reversion could not be granted. Philip IV. made him amends by creating him Arch-Historiographer for the kingdoms of the crown of Arragon, an office which had been invented for Lupercio Leonardo de Argensola, and which had remained vacant since the death of his brother Bartolous. The duty of this arch-historiographer was to revise and correct the works of the chronicler of the particular kingdoms. As a father honour, the habit of the order of Montesa was given him, and afterwards exchanged for that of Santiago.

These honours did not bring with them corresponding profits, and Pellicer all his life was poor. He died at seventy-seven, worn out, say his biographers, by incessant literary application. He was author of a great number of works, the titles of which, some time previously to his death, filled five folio pages. His learning is generally acknowledged, and his learned works are still consulted by the literati of different countries. *Gen. Biog.*

PELLETIER (James), a French physician, and medical and mathematical writer; born at Mans 1517, died 1582.

PEL'LICLE, *f.* [*pellicula*, Lat.] A thin skin.—After the discharge of the fluid, the *pellicle* must be broke. *Sharp's Surgery*.—It is often used for the film which gathers upon liquors impregnated with salts or other substances, and evaporated by heat.

PELLICULATION, *f.* [from the Lat. *pellicular*, to cover with a pellicle.] A deception. *Cole*.

PELLICULATOR, *f.* A deceiver. *Cole*.

PELLIPA'RIOUS, *f.* [in old records.] A skinner, one that dresses leather.

PELLIS, *f.* [Latin.] The skin of a beast.

PELLISON' (Fontanier Paul), an eminent French writer, born at Beziers in 1624, was descended from a family in the law. He lost his father at an early age, and was brought up by his mother, who educated him in the Protestant religion. He studied successively at Castres, Montauban, and Toulouse; and acquired an intimate knowledge of the best authors in the ancient and modern languages. He applied professionally to the study

of the law, and had already appeared with distinction at the bar at Castres, when he was attacked with the small-pox. This cruel disease left a permanent weakness in his eyes, and so disfigured him that he became a model of ugliness. Under a forbidding exterior, however, dwelt many fair qualities of the mind. He quitted the bar, and retired for some time into the country. He then came to Paris, and made himself known as a man of letters. In 1652 he obtained the place of a king's secretary, and applied with diligence to the affairs of the council, with which he became intimately acquainted. In the same year he read before the French Academy a history which he had composed of that institution, and which was so much approved, that a resolution was made to admit him as a member on the first vacancy, and in the mean time to give him the privilege of being present and speaking at the meetings of the academy. His History was printed in 1653, and many successive editions were given of it. Although too minute and panegyric in the account of authors of little merit, negligent in its style, and not very correct in its facts, it is a curious and interesting performance.

M. Pellison was brought into a conspicuous public situation in 1657, by being appointed first clerk to the celebrated superintendent Fouquet. The financial business into which he was now plunged impaired neither the disinterestedness of his character nor the amenity of his disposition. His services were recompensed in 1660 by admission into the council of state; but in the following year he was involved in the fall of his patron, and, as having been one of his principal confidants, was committed to the Bastille. As it was found impossible to corrupt his fidelity to his former master, attempts were made to worm out his secrets by means of a German, a pretended fellow-prisoner, who concealed craft under a gross and simple exterior. Pellison was aware of his artifices, and treated him with so much politeness, that he converted him into a friend. During his imprisonment he composed three memoirs in favour of Fouquet, which are reckoned among the most eloquent and best-written pieces of the kind in any language, and have conferred lasting honour on his memory. They were, however, the immediate cause of increased rigour in his confinement. He was prohibited the use of ink and paper, and was reduced to write with the lead of his casement upon the margins of books, or to use a kind of ink which he made with burnt crusts tempered with wine. His whole company was a stupid Basque, whose only talent was playing on the bagpipe. With infinite pains he trained a spider to come out of its hole at the sound of this instrument, and take flies from his hand. Books of controversy were another employment of his solitary hours; and he received in the Bastille those impressions which afterwards produced a change of religious profession. He preserved many friends in this forlorn situation; and Tannegui le Fevre had the courage to dedicate to him, whilst in prison, his *Lucretius*, and his translation of Plutarch's *Treatise on Superstition*. At length, after a confinement of four years and a half, he obtained his liberty; and thenceforth, says Voltaire, "he passed his life in lavish praises upon the sovereign who had deprived him of his liberty; a thing seen only in monarchies!" He was taken into favour, obtained a royal pension and a brevet of *entrée*, and was made the king's historiographer. His public recantation of Protestantism, in 1670, was doubtless one of the conditions of this favour. He soon after took the order of sub-deacon, and was presented to an abbacy and a rich priory. It was with some reason, therefore, that he annually celebrated his reconciliation with the church of Rome. He gave a more interesting proof of the goodness of his disposition by commemorating the anniversary of his liberation from the Bastille with the annual release of some prisoners.

In 1671, Pellison delivered at the French Academy, a "Panegyric on Louis XIV." which was translated into

various languages, and even into Arabic by a patriarch of Mount Lebanon. He accompanied his royal master in his campaigns, and for some time was the only man of letters engaged in writing his history; but some offence which he gave to Mad. de Montespan induced the king to give the appointment of historiographer royal to Boileau and Racine, and take it from Pellisson. He was, however, ordered to proceed in his own historical labours; and he produced a "History of Louis XIV. from the Death of Cardinal Mazarine in 1661 to the Peace of Nimègue in 1678," 3 vols. 12mo. It is, as might be expected, more the work of a courtier than of a faithful historian; yet Voltaire speaks with applause of his relation of the conquest of Franche-Comté. Pellisson engaged with great zeal in what was called in France *la grande affaire*, namely, the conversion of heretics. It is to his credit that he disapproved of the dragooning system of proselyting; and he seems to have relied much more on the judicious distribution (which was entrusted to him) of the third of the savings destined by the king for rewards to such as should conform to the established religion. He also employed his pen in controversy, and wrote "Reflexions sur les Differences de la Religion," and "Traité de l'Eucharistie," works composed with art, and in a laudable tone of moderation. Pellisson was made a master of requests, and passed all the latter part of his life in great credit and prosperity. As, in Roman-catholic countries, the last scene of a man's life is generally thought of more consequence than all the preceding part, it was the cause of much regret, and some scandal, that he died (in February 1693) without confession or the usual sacraments. It is probable, however, that this circumstance was rather owing to an unconsciousness of his own danger till too late, than to any doubts respecting his adopted faith. Besides the works above mentioned, he wrote several pieces in verse and prose, among which were, 6. An Abridgment of the Life of Anne of Austria. 7. Lettres Historiques, being a journal of the king's journeys and encampments. 8. Recueil de Pieces galantes. 9. Poésies Chrétiennes et Morales. His poetry is but indifferent; his prose is often eloquent and forcible. *Bayle. Voltaire Siecle de Louis XIV.*

PELLITORY, *f.* An herb. See PARIETARIA.

The *pellitory* healing fire contains,
That from a raging tooth the humour drains. *Tate's Cowley.*

PELLITORY, Bastard. See ACHILLEA.

————— of Spain. See ANTHEMIS.

————— of the Wall. See PARIETARIA.

PELLMELL', *adv.* [*peste-meste*, Fr.] Confusedly; tumultuously; one among another; with confused violence.—The battle was a confused heap: the ground unequal; men, horses, chariots, crowded *pellmell*. *Milton's Hist. of Eng.*

He knew when to fall on *pellmell*,
To fall back and retreat as well.

Hudibras.

PELLO'NIA, in mythology, a goddess invoked at Rome, when her votaries wished to be delivered from their enemies, or from any thing that annoyed them.

PELLOUTIER (Simon), pastor of the French Protestant church at Berlin, member and librarian of the academy in that capital, and ecclesiastical counsellor, was born in 1694 at Leipzig, of a family originally from Lyons. He filled with reputation the posts confided to him, and obtained a high character for erudition by his work entitled "Histoire des Celtes, et particulièrement des Gaulois et des Germains, depuis les Temps Fabuleux jusqu'à la Prise de Rome par les Gaulois." Of this work, which is replete with learned and curious research, the best edition is that of M. de la Bastide, Paris, 1770, in eight vols. 12mo. and two vols. 4to. Pelloutier also enriched the Memoirs of the Berlin Academy, with a number of valuable papers. He died in 1757, universally esteemed for his learning and beneficence.

PELLU'CID, *adj.* [*pellucidus*, Lat.] Clear; transparent; not opaque; not dark.—If water be made warm in any *pellucid* vessel emptied of air, the water in the vacuum will bubble and boil as vehemently as it would in the open air in a vessel set upon the fire, till it conceives a much greater heat. *Newton's Optics.*

PELLUCID'ITY, or PELLUCIDNESS, *f.* Transparency; clearness; not opacity.—The air is a clear and pellucid medium, in which the insensible particles of dissolved matter float, without troubling the *pellucidity* of the air; when on a sudden by a precipitation they gather into visible misty drops that make clouds. *Locke.*—We consider their *pellucidness* and the vast quantity of light, that passes through them without reflection. *Keil.*

PELLUSIN', a town of France, in the department of the Rhone and Loire: twelve miles east of St. Etienne.

PELO'DES, in ancient geography, a port of Epirus, between the gulf of Buthrotori and the promontory of Thyamis.—Also, a gulf of Asia, in Susiana.

PEL'ONIA, *f.* in botany. See ANTIRRHINUM.

PELON'TIUM, a town of Spain, in the Tarragonensis and country of the Lingones. *Ptolemy.*

PELOPE, a town of Asia Minor, in Lydia, on the confines of Phrygia. *Steph. Byz.*

PELOPIDAS, a celebrated Theban general. See the article GREECE, vol. viii. p. 209-16.

PELOPONNE'SIAN, *adj.* Belonging to the Peloponnesus.

PELOPONNE'SUS, a celebrated peninsula, which comprehends the most southern part of Greece. It received this name from Pelops, who settled there, as the name indicates (the Island of Pelops). It had been called before *Argia*, *Pelagja*, and *Argolis*; and, in its form, it has been observed by the moderns highly to resemble the leaf of the plane-tree. Its present name is *Morea*, which seems to be derived either from the Greek word *μορεα*, or the Latin *morus*, which signifies a "mulberry-tree," which is found there in great abundance. See GRÆCIA ANTIQUA, vol. viii. p. 378.

The Peloponnesus was conquered, some time after the Trojan war, by the Heraclidæ, or descendants of Hercules, who had been forcibly expelled from it. The inhabitants of this peninsula rendered themselves illustrious like the rest of the Greeks by their genius, their fondness for the fine arts, the cultivation of learning, and the profession of arms; but in nothing more than by a celebrated war which they carried on against Athens and her allies for twenty-seven years, and which from them received the name of the Peloponnesian war; for a full account of which, see the article GREECE, vol. viii. p. 879-94. The Peloponnesus scarcely extended 200 miles in length, and 140 in breadth. It was separated from Greece by the narrow isthmus of Corinth, which, as being only five miles broad, Demetrius, Cæsar, Nero, and some others, attempted in vain to cut, to make a communication between the bay of Corinth and the Saronic Sinus.

PE'LOPS, a celebrated prince, son of Tantalus king of Phrygia. His mother's name was Euryanassa, or according to others Euprytone, or Eurytemista, or Dione. He was murdered by his father, who wished to try the divinity of the gods who had visited Phrygia, by placing on their table the limbs of his son. The gods perceived his perfidious cruelty, and they refused to touch the meat, except Ceres, whom the recent loss of her daughter had rendered melancholy and inattentive. She ate one of the shoulders of Pelops; and therefore, when Jupiter had had compassion on his fate, and restored him to life, he placed a shoulder of ivory instead of that which Ceres had devoured. This shoulder had an uncommon power, and it could heal, by its very touch, every complaint, and remove every disorder. Some time after, the kingdom of Tantalus was invaded by Trös king of Troy, on pretence that he had carried away his son Ganymedes. This rape had been committed by Jupiter himself; the war, nevertheless, was carried on; and Tantalus, defeated and ruined,

ruined, was obliged to fly with his son Pelops, and to seek a shelter in Greece. This tradition is confuted by some who suppose, that Tantalus did not fly into Greece, as he had been some time before confined by Jupiter in the infernal regions for his impiety, and therefore Pelops was the only one whom the enmity of Tros persecuted.

Pelops came to Pisa, where he became one of the suitors of Hippodamia, the daughter of king Cœnomaus, and he entered the lists against the father, who promised his daughter only to him who could outrun him in a chariot-race. Pelops was not terrified at the fate of the thirteen lovers, who before him had entered the course against Cœnomaus, and had, according to the conditions proposed, been put to death when conquered. He previously bribed Myrtilus, the charioteer of Cœnomaus, and therefore he easily obtained the victory. According to some authors, the horses which drew Pelops's chariot had wings, and they had been given to him by Neptune; the meaning of which is, if we believe Pindar and Palæphatus, that Pelops made use of a ship with sails to carry off Hippodamia.

When Pelops had established himself on the throne of Pisa, Hippodamia's possession, he extended his conquests over the neighbouring countries, and from him the peninsula, of which he was one of the monarchs, received the name of Peloponnesus. Pelops, after death, received divine honours; and he was as much revered among all the other heroes of Greece, as Jupiter was above the rest of the gods. He had a temple at Olympia, near that of Jupiter, where Hercules consecrated to him a small portion of land, and offered to him a sacrifice. The place where this sacrifice had been offered was religiously observed, and the magistrates of the country yearly, on coming into office, made there an offering of a black ram. During the sacrifice, the foothsayer was not allowed, as at other times, to have a share of the victim, but he alone who furnished the wood was permitted to take the neck. The wood for sacrifices, as may be observed, was always furnished by some of the priests, to all such as offered victims, and they received a price equivalent to what they gave. The white poplar was generally used in the sacrifices made to Jupiter and to Pelops.

The children of Pelops by Hippodamia were Pitheus, Troezen, Atreus, Thyestes, &c. besides some by concubines. The time of his death is unknown, though it is universally agreed, that he survived for some time Hippodamia. See HIPPODAMIA, vol. x.

The era of Pelops's arrival in Greece must have been about the 110th or 120th year before the Trojan war. Among other fatalities of Troy, it is said that it could not be taken by the Greeks, unless they had the bones of Pelops; and they therefore sent for them to Pisa where he had been interred. The vessel was shipwrecked in its return; and some time after a peasant found upon the shore the shoulder of that prince, and hid it under the sand. The Elæans having gone to the temple of Delphos to consult the oracle, in order to be delivered from the plague, the priests ordered them to go and dig up the bones of Pelops; and, perhaps in memory of this event, they made an ivory shoulder, which they consecrated to Ceres, and the Pelopidæ bore it afterwards upon their ensigns.

PELO'RIA, in antiquity, feasts instituted and celebrated by the Thessalians. They had a considerable affinity with the Saturnalia; for in these the masters served while their servants sat at table, as in the Chronia celebrated at Athens in honour of Chronos, or Saturn. At the festival of the Peloria, public entertainments were made for strangers, and even for slaves, who were served by their masters: and it is said, that the practice, as well as the feast, originated from this circumstance, that one Pelorus was the person who first gave intimation to Pelægus, that by means of an opening in the valley of Tempè the waters of Deucalion's deluge were removed; which intelligence gave that prince so much joy, that he

regaled Pelorus in a magnificent manner, and insisted upon serving him at table.

PELO'RUS, in ancient geography, now Cape Faro, one of the three great promontories of Sicily. It lies near the coast of Italy; and received its name from Pelorus, the pilot of the ship which carried Hannibal away from Italy. This celebrated general, as it is reported, was carried by the tides into the streights of Charybdis; and, as he was ignorant of the coast, he asked the pilot of his ship the name of a promontory which appeared at a distance. The pilot told him, it was one of the capes of Sicily; but Hannibal gave no credit to his information, and murdered him on the spot on the apprehension that he would betray him into the hands of the Romans. He was, however, soon convinced of his error; and therefore, to pay honour to his memory, he gave him a magnificent funeral, and ordered that the promontory should bear his name, and from that time it was called Pelorum. Some contend that this account is false, and observe that it bore that name before the age of Hannibal.

PELO'SO, a town of Italy, in the Cadurin: seven miles north-east of Cadora.

PELOUAILLE, a town of France, in the department of the Mayne and Loire: five miles north-east of Angers, and fourteen west of Baugé.

PELO'W, a town of Ava, on the left bank of the river Ava: fifteen miles from Prone.

PELT, *f.* [*pellis*, Lat.] Skin; hide.—The church is fleeced, and hath nothing but a bare *pelt* left upon her back. *Bp. Hall's Contempl.*—They used raw *pelts* clapped about them for their clothes. *Fuller's Holy War.*—The camel's hair is taken for the skin or *pelt* with the hair upon it. *Brown's Vulg. Err.*

A scabby tetter on their *pelts* will stick,
When the raw rain has pierc'd them to the quick. *Dryd.*

The quarry of a hawk all torn. *Ainsworth.*—A blow from something thrown; a stroke.—George hit the dragon such a *pelt*! *Ballad of St. George for England.*

To PELT, *v. a.* [*spoltern*, Germ. *Skinner*. Contracted from *pellet*; Mr. Lye. Or from *pellere*, Lat. to drive or push away.] To strike. It is generally used of something thrown, rather with teasing frequency than destructive violence.—Obscure persons have insulted men of great worth, and *pelled* them from coverts with little objections. *Atterbury.*

Do but stand upon the foaming shore,
The chiding billows seem to *pelt* the clouds. *Shakespeare.*

To throw; to cast:

My Phillis me with *pelled* apples plies,
Then tripping to the woods the wanton hies. *Dryden.*

PELT'-MONGER, *f.* [*pellio*, Lat.] A dealer in raw hides.

PELT'TA, *f.* [Greek.] A kind of buckler, used among the ancients. The *pelta* was small, light, and more manageable than the *parma*. It appears from Virgil, and other authors, that the *pelta* was the buckler used by the Amazons; and Xenophon observes, that the *pelta* of the Amazons was shaped like a leaf of ivy. Pliny, speaking of the Indian fig-tree, says its leaves are of the width of the Amazonian *pelta*. Servius on the *Æneid* says, the *pelta* resembled the moon in her first quarter. This small shield, or buckler was used by the Macedonians, Cretans, Africans, and ancient Spaniards. Those who carried shields of this description were called *peludos*.

PELT'Æ, in ancient geography, a town of Asia, in Phrygia. This town was well peopled, and situated at the distance of ten parasangs from Celenes. Cyrus sojourned here three days, and was a spectator of the Lupercalia which Xenias of Arcadia celebrated by sacrifices and games at which the prizes were curryscombs of gold. This town is not mentioned by Xenophon, Strabo, Ptolemy, or Stephanus of Byzantium.

PELTAN' (Theodore Anthony), a learned Jesuit in the

the 16th century, was born at Pelta, in the diocese of Liege, whence he derived his surname, but in what year we are not informed. He became a member of the Society of Jesus in the year 1552; and acquired celebrity by his proficiency in the Latin, Greek, and Hebrew, languages, and his knowledge of philosophy and divinity. When Albert duke of Bavaria founded the University of Ingoldstadt, in 1556, he was appointed professor of Greek and Hebrew literature in that seminary, and discharged the duties of his office with uncommon applause. At different periods he was admitted to the subordinate degrees in the faculty of divinity, and in 1562 proceeded Doctor. Immediately afterwards he was called to the theological chair, which he filled with great reputation till the year 1574; when he retired to the college belonging to his order at Augsburg, where he spent his time in laborious study and writing till his death, which took place in the year 1584. He was the author of a work entitled "Theologia Naturalis, et Theologia Mystica;" together with numerous doctrinal and controversial Treatises, Theses, Propositions, &c. and sundry translations from Greek into Latin. After his death were published from his manuscripts, 2. *Catena Græcorum Patrum in Proverbia Salomonis, Latine facta*, 1604, 8vo. 3. *Commentarii ac Paraphrasis in Proverbia Salomonis*, 1606, 4to. *Sotwelli Bibl. Script. Soc. Jesu.*

PELTA'RIA, *f.* [from the form of the seed-vessel, round and flat, like the *pelta*, or round shield.] In botany, a genus of the class tetradynamia, order siliculosa, natural order of siliquosæ, cruciformes, or cruciferæ. Generic characters—Calyx: perianthium four-leaved; leaflets ovate, concave, erect, coloured, deciduous. Corolla: four-petalled, cruciform; petals obovate, entire, flat, with claws shorter than the calyx. Stamina: filaments six, awl-shaped; of these two opposite, shorter, the length of the calyx; antheræ simple. Pistillum: germ roundish, compressed; style short; stigma simple, blunt. Pericarpium: silicle entire, suborbiculate, compressed flat, one-celled, not opening. Seed one to three, roundish, compressed-flat, emarginate.—*Essential Character.* Silicle entire, suborbiculate, compressed-flat, not opening. There are two species.

1. *Peltaria alliacea*, or garlic-scented peltaria: leaves embracing, oblong, undivided. This is a biennial plant, and generally dies soon after the seeds are perfected. It rises with an upright branching stalk, about a foot high. Leaves heart-shaped, smooth. White flowers terminate the stalk in form of umbels. It is a native of stony mountainous places in Austria, near the lofty Schneeberg. It was introduced into our gardens in the time of Clusius, as he himself mentions; and is still preserved, for the sake of curiosity, in botanical collections; flowering in May and ripening seed a month or six weeks later. The herb when bruised has an unpleasant garlic scent somewhat like that of *Erysimum alliaria*. The seeds are bitter and acrid.

2. *Peltaria Capensis*, or Cape peltaria: stem-leaves quinate-pinnate, linear, somewhat fleshy. Stem upright, branched, round, even, a foot high, leafy. Petals of the flowers white, subemarginate, four times as big as the calyx, spreading, sessile. Seeds in the centre as in *Clypeola*, solitary in each cell, compressed. Native of the Cape of Good Hope.

Jussieu reduces this genus to *Clypeola*, and he is followed by Lamarck; but *P. Capensis* (Linn. Suppl. 296.) has, as Willdenow well observes, a pouch of two cells, with distinct valves and a membranous partition. Its habit is like a *Heliophila*. Whatever it may be, it is no *Peltaria*.

PELTATE, or TARGET-SHAPED, *adj.* in botany, having the stalk inserted in the disk of the leaf, and not in the edge.

PELTER, *f.* A pinch-penny; one withered with vetousness: a mean paltry wretch. *Not now in use.*

PELTING, *adj.* "This word in Shakespeare signifies,

I know not why, mean; paltry; pitiful." Dr. Johnson.—"The word is not peculiar to Shakespeare: it is used by writers before and after him; and appears to have been common." Todd.—They shall not suffer, that any of these light wanderers in markets, and *pelting* sellers, which carry about and sell pinnes, points, and other small trifles, whom they call pedlars, to set out their wares to sale, either in the church-yeardes, or in the porches of churches. *Booke of Certaine Canons, &c.* 1571.—Abused and baffled by every *pelting* paultry lust. *Hammond.*

Could great men thunder, Jove could ne'er be quiet;
For every *pelting* petty officer
Would use his heaven for thunder. *Shakespeare.*

PELTING, *f.* Assault; violence:

Poor naked wretches wheresoe'er you are,
That bide the *pelting* of this pitiless storm,
How shall your houseless heads, and unfed sides,
Your loop'd and window'd raggedness, defend you!
Shakespeare.

PELTRY, *f.* [*peltric*, old Fr.] Furs or skins in general.—The profits of a little traffick he drove in *peltry*. *Smollet.*

PELTU'NUM, in ancient geography, a town of Italy, in the territory of Samnium.

PEL'UA, a town of Illyria, on the route from Sirmium to Salonæ, between Salva and Æquum, according to the Itinerary of Antonine.

PELU'CHE, or **FELUD'SJE**, a small island in the north-west part of the gulf of Persia, near the coast of Arabia: ten miles east of Koueit. Lat. 29. 45. N. lon. 48. E.

PEL'VIS, *f.* [Lat. a basin.] A large irregular bony cavity, open above and below, and forming the inferior end of the trunk of the human body. At the upper and back part its parietes support the vertebral column, and they are sustained below and towards the front by the thighs, to which they transmit the weight of the body; thus a well-marked space, which measures the immediate base of support of the trunk, is left between the plane of the limbs and of the spine. In a well-formed individual, the pelvis divides the body into two equal halves: that is, if a line be drawn across its middle, the upper and lower portions of the body have the same length. This rule, however, is subject to some exceptions: the lower limbs are imperfectly developed in the fœtus; and, in unusually tall or short adult individuals, the lower extremities or the trunk exceed the just proportion.

The pelvis is symmetrical, but of a figure not easily defined. It forms, by its upper portion, a cavity nearly oval in the transverse direction, expanded at the sides, and hollowed out in front, communicating by an elliptic opening, called the superior aperture, with its lower portion, which is much smaller in size, and ends below by an opening called the inferior aperture.

The position of the pelvis is oblique, the back part being considerably higher than the front: this obliquity is well seen in the superior aperture, which slants very manifestly from above downwards and forwards: the inferior aperture looks downwards and backwards. Soemerring states, that in the erect attitude the last bone of the coccyx is an inch higher than the inferior edge of the symphysis pubis; and that the promontory of the sacrum is higher than the same point, by the whole depth of the sacrum and coccyx. The axis of the upper or broad part of the pelvis is nearly perpendicular; that of the lower or smaller division slants from above downwards, and from before backwards. It is said to correspond to a line drawn from the apex of the os coccygis to the umbilicus. This line would cut the level of the pelvis nearly at a right angle; that is, the meeting of the two lines would form an angle of 75 degrees in front, and of 105 behind. The weight of the trunk being obliquely transmitted to the thighs, in consequence of this inclination of the pelvis, it follows, says Bichat, that the latter is the seat of a decomposition of motion in this transmission,

mission, proportioned to the degree of inclination, which is about thirty-five or forty degrees at the upper part, where we can easily estimate it by the line, which extends from the sacro-vertebral articulation to the upper edge of the symphysis pubis.

The capacity of the pelvis differs remarkably in man and woman. It is manifestly larger in the latter in every direction: thus the two iliac crista, the two anterior and the two posterior spines, the cotyloid cavities, the tuberosities of the ischia, &c. &c. are further apart. These are all transverse measurements; and those from before backwards are greater, as we may see in measuring from the sacrum to the pubes, from the anterior to the posterior spine, from the sacro-iliac articulation to the foramen ovale, &c. The oblique measurements, from one side to the other, are also larger in the female. The superior aperture often exhibits deviations from the accustomed arrangement, in the diminution of its diameters subsequently to birth; and these are generally caused by rachitis, which exerts its effects more on the antero-posterior than on the transverse or oblique diameters, because the weight of the upper parts, transmitted by the spine, is the principal exciting circumstance.

The breadth of the pelvis in the female produces some difficulties in progression; but the passage of the child in parturition is facilitated. It performs an important part in this function, besides having the same offices as in man, viz. those of forming the basis of support to the trunk, and of containing and protecting the viscera.

The comparative height of the pelvis in the male and female is exactly the inverse of the breadth. The measurement from the crista of the ilium to the tuberosity of the ischium, the depth of the symphysis pubis, and the length of the canal formed by the smaller pelvis, are considerably greater in men than in women. There are some individual varieties in the dimensions of the pelvis, but they depend very little on stature. Parturition is as easy in small as in large women, although the former frequently produce very large children. See the article *PARTURITION*, vol. xviii. p. 691.

The pelvis is formed of few but very broad bones, united in such a manner as not to admit of motion on each other: it can be moved therefore only all together, and not partially. Four bones enter into its composition: two posterior, symmetrical, and placed on the middle line, are the sacrum and coccyx; two anterior and irregular, transmit to the thigh-bones the weight of the trunk, which they have received from the sacrum; they are the ossa innominata. The sacrum and coccyx, placed at the back of the pelvis, form a continuation of the vertebræ, and are constructed on a mode similar to that of the vertebræ. In most quadrupeds this prolongation of the spine is much more extensive, and forms the tail, which goes considerably beyond the anus; while in man, that opening is situated a little farther than the end of the coccyx.

The organs contained in the cavity of the pelvis are excellently protected from all external shocks. The kind of arch formed by the ossa pubis in front, the thick muscles, the hip-joints, and the trochanter, at the sides, and the muscular masses of the spine behind, constitute an effectual provision for the resistance of injury. The projection of the ossa innominata beyond the sacrum behind, protects the latter bone in cases of blows or falls on his part of the pelvis. See the article *ANATOMY*, vol. i. p. 548, 617. and *PARTURITION*, vol. xviii. p. 691.

PE'LUS, in ancient geography, the name of an island, situated in the vicinity of that of Chios.—Also, a mountain of Italy, in Etruria.—Also, a torrent of Sicily.

PE'LUS, a town of Persia, in the province of Mecran: fifty-four miles north-north-east of Kieh.

PELU'SIUM, in ancient geography, a town of Egypt, at the eastern extremity of the lake Menzalé, near one of the mouths of the Nile, and, according to Strabo, about two miles from the sea. Its name, which in Greek fig-

Vol. XIX. No. 1322.

nifies *mud*, proves its situation to be in the midst of lakes and marshes; as does also the Hebrew term *Sin*, by which the prophet Ezekiel denominates it; and also the *Tinch* of the Arabians. The period of its foundation, as well as that of the other ancient cities of Egypt, is lost in the obscurity of time. It flourished long before Herodotus. As it commanded the entrance of the country on the side of Asia, the Pharaohs rendered it a considerable fortress: one of them raised a rampart thirty leagues in length, from the walls of this town to Heliopolis. This rampart, which covered Pelusium, did not, however, stop Cambyfes, who attacked it with a formidable army. Cambyfes, after a bloody battle, in which he slaughtered his enemies, entered Pelusium in triumph. Herodotus, who visited Pelusium some years after the conquest of Cambyfes, says that he surveyed the plain where the two armies had fought, and found it covered with human bones collected in heaps; those of the Persians on one side, and those of the Egyptians on the other. Pelusium, after passing under the dominion of Persia, was taken by Alexander. The brave Antony, general of cavalry under Gabinius, took it from his successors; and Rome restored it to Ptolemy Auletes. Pompey, after the fatal battle of Pharsalia, took refuge at Pelusium; but he had scarcely landed on the shore, when he was murdered. The assassins cut off his head, sent it to Cæsar, and left his body naked on the shore. Pelusium was often taken and pillaged, during the wars of the Romans, the Greeks, and the Arabs; but, in spite of her disasters, she preserved, to the time of the crusades, her riches and her commerce. The Christian princes, having taken it by storm, sacked it. It never again rose from its ruins, and the inhabitants went to Damietta.

Farama, founded by the Arabs, a little to the eastward of Pelusium, took place of it. But this town did not long subsist, for it was destroyed in the 13th century. It had a mausoleum, which some have erroneously supposed to be the tomb of Galen, but which in reality was that of Pompey, placed by Pliny at some distance from Mount Cæsus, in the vicinity of which are the ruins of Farama. See *Savary's Travels in Egypt*.

PELU'SO, a small island in the Mediterranean, near the coast of Natolia. Lat. 36. 45. N. lon. 28. 36. E.

PE'LYN, a village in Cornwall. See *LESTWITHEL*.

PEMAQUID', a bay on the coast of Maine, containing several small islands. Lat. 43. 45. N. lon. 69. 30. W.

PEMAQUID' POINT, a cape on the coast of Maine. Lat. 43. 37. N. lon. 69. 30. W.

PE'MAR, a town of Sweden, in the province of Fiåland: twelve miles east of Abo.

PEMA'RO, a town of Etruria: fifteen miles east-south-east of Leghorn.

PEM'BA, a province of Congo, bounded on the north by the province of Sundi, on the east by Batta, on the south by Bamba, and on the west by Songo. Some divide the province into two; one called the province of St. Salvador, and the other the marquise of Bamba, from the chief towns. The land is generally fertile, particularly towards the east. See *BAMBA*, vol. ii.

PEM'BA, or *PENDA*, an island in the Indian Sea, near the coast of Africa; about 100 miles in circumference, governed by a king, tributary to the Portuguese. Lat. 5. 55. S. lon. 42. E.

PEM'BA BA'Y, a bay of the Indian Sea, on the coast of Africa. Lat. 13. S.

PEM'BERTON, a village in Lancashire. The number of inhabitants 2309, of whom 1366 are employed in trade and manufactures: two miles south-south-west of Wigan.

PEM'BREY, a village and district in South Wales. The earl of Aghburnham has reclaimed 500 acres of fine rich marsh-land from the constant overflow of the tide at this place. The length of the bank is two miles and a half; in many parts it is 12 feet high, and the base 84 feet wide. Sept. 1818.

PEM'BRIDGE, a town in the county of Hereford, on the

the Arrow; with a manufacture of woollen cloth, a weekly market on Tuesday, and fairs May 12 and Nov. 22. The number of houses, in the year 1821, was 288, and of inhabitants 1138. It is fifteen miles north-north-west of Hereford, and 145 north-west of London. Lat. 52.19. N. lon. 2.48. W.

PEM'BRIDGE POINT, a cape on the east coast of the Isle of Wight. Lat. 50.42. N. lon. 1. 56. W.

PEM'BROKE, a township of America, in Plymouth county, Massachusetts; thirty miles south by east from Boston; incorporated in 1752, and containing 2051 inhabitants. Some vessels have been built here.—Also, the *Suncook* of the Indians, a township of Rockingham county, New Hampshire, on the east side of Merrimack river, opposite to Concord; incorporated in 1759, and containing 1153 inhabitants.

PEM'BROKE, a borough and market town in the county of Pembroke, South Wales, situated on a singular neck of land, dividing the small estuary of Down-Pool, which flows from Milford-haven. It is the county-town; and, next to Caermarthen, is one of the largest and richest towns in the southern division of the principality. The period of its foundation is unknown; but it is certainly of great antiquity, and is supposed to have derived its name from the British word *Penfro*, signifying a cape, or promontory. It was anciently fortified, and protected by a most magnificent castle, the vast ruins of which still give it an appearance of uncommon grandeur; and was likewise defended by a strong wall, still nearly entire, on the northern side, where it is flanked by numerous bastions of great thickness and strength. Through this wall were formerly three gates, on the east, north, and west, sides; besides a small postern on the south side, leading to the marsh. Of these gates, that facing the north is the only one now standing; the other two having been long since destroyed. The east gate, which remained in Leland's time, is described by him as consisting of solid iron, and as being highly ornamented and fortified.

The corporation of Pembroke is composed of a mayor and council, two bailiffs and serjeants at mace, and about 1500 burgesses. The mayor holds a court every fortnight for the decision of civil causes arising within his jurisdiction. Here are also held the petty sessions for the hundred of Castle-Martyn. The markets are on Wednesday and Saturday; and the fairs on the 14th of May, Trinity Monday, St. Peter's day old style, and 25th of September. Pembroke, in conjunction with the neighbouring boroughs of Tenby and Wiston, sends one member to the British parliament: the mayor is the returning officer. The voters are estimated at 500 in number; and these boroughs have been represented by the family of Owen, of Orielson-house, barts. and by persons nominated by them, ever since the restoration of Charles II. in 1660. This family having become extinct in the direct male line, their estates have been bequeathed to John Lord, esq. a grandson in the female line, who has assumed the name of Owen, and was created a baronet in 1813. This gentleman is at present member for the county, and patron of this district of boroughs.

According to the population-returns of 1811, this town contained 501 houses, and 2415 inhabitants; in 1821 it had 4925 inhabitants. The houses are ranged principally in one long street, which extends from east to west along the ridge of a hill, and is terminated by the castle at the west end; bearing in general appearance, but on a smaller scale, a strong resemblance to the towns of Edinburgh and Stirling in Scotland. The public buildings are a town-hall, a free grammar-school, and two parochial churches, dedicated to St. Mary and St. Michael. St. Mary's church stands near the centre of the town, and consists of a nave, chancel, and north aisle, with a small chapel to the south. St. Michael's bears evident marks of great antiquity. The architecture is a rude specimen of the Norman style, the arches being massive, and round-

ed, and entirely destitute of ornament. Both these churches are consolidated with that of Monckton in one vicarage, the impropriation and presentation of which belong to viscount Hereford, as proprietor of Monckton-priory and its estates. Attached to St. Michael's was a chapel, or hospitium, dedicated to St. Mary Magdalen, the ruins of which are now vulgarly known by the name of the Marlan's Chapel. St. Mary's had likewise its chapel, called St. Anne's; but this edifice is now nearly demolished.

The castle, as already mentioned, forms the western extremity of the town, occupying a rocky termination of the ridge on which it is placed. It is a noble ruin, and exhibits, in certain points of view, one of the finest subjects for the pencil which Wales can boast of. The fortrefs, according to Caradoc of Llancarvon, was founded in 1092, by Arnulph de Montgomery, son to the earl of Shrewsbury, on the site of a more ancient British work. It seems, however, to have received great additions in the reigns of Henry I. and Giraldus even refers its foundation to that period; though he acknowledges the existence of another much more slender erection of anterior date. During the wars with the Welsh it was frequently besieged; but, owing to its great artificial strength, and almost impregnable natural position, it seems to have resisted successfully all the efforts of the assailants to reduce it. Oliver Cromwell also besieged it in person, and compelled its garrison to surrender, after a long and vigorous attack. From the period of its surrender, Pembroke castle has been much neglected, and is now so ruinous as to be uninhabitable. It is divided into two parts, called the inner and outer wards; the former of which comprises the keep and the state apartments; and the latter, the buildings formerly appropriated to the garrison; though over the principal gateway from the town, and within it, there are also some very handsome apartments. Here, according to Leland, was "the chambre where king Henri VII. was born, in knowlege whereof a chimney is new made, with the arms and badges of king Henri VII." This honour, however, is traditionally given to a room in a very splendid suite of apartments built over "the marvellous vault, entitled the Wogan, or Hogan," which is cut out of the solid limestone rock, and forms one of the most extensive and lofty excavations of its kind in Great Britain. Its figure approaches that of a circle, the diameter from north and south being 76 feet 8 inches, and from east to west 57 feet 4 inches. The natural opening, which was of great width, is built up, and contracted into a small door-way, that appears to have been once strongly barricaded. Above are the marks of four loop-hole windows, and of another door-way, now stopped up. Of the uses to which this vault was applied there is no account upon record, but it was most likely a dépôt for stores of every kind; "the stuffura of the garrison." At its south-east corner is an adit, traditionally said to communicate with Tenby; and under the south-east bastion of the castle is another very curious passage, in some parts spacious, and in others extremely narrow, which has been explored to a considerable distance, but its termination is not known. This last is doubtless, however, in a great measure a natural duct; apertures of a similar kind frequently appearing in most limestone rocks. It is supposed by some to penetrate under the keep that rears its proud head in the centre of this magnificent ruin, terminating, as Leland observes, "with a rose of stone, almost in conum, the toppe whereof is keverid with a flat millstone." This building is 75 feet in height to the dome, and in girth 163 feet 7 inches at the base, the mean thickness of the wall being about 14 feet. It is divided into four stories.

Pembroke is distant from Caermarthen thirty miles, Haverfordwest ten, Narbeth fifteen, Tenby ten, Coheston two, Jameston four, St. Florence eight, Lamphay two, Hundleon two, Pwllchrochan six, Templeton twelve, Hubberstone eight, Angle ten, Lawrenny four, Manerbear

bear five, Hodgeston four, Stackpool four, Jefferston nine, and from London 237 west. Lat. 51. 37. N. lon. 5. 0. W.

On the south-east side of the town of Pembroke is the village of Monckton, so called from its having been the site of an ancient priory, founded by William Marshall about the year 1120, as a cell to the Benedictine abbey of St. Martin at Sayes, in Normandy. Part of the priory-church is still entire, as is likewise the prior's mansion; but the other buildings are in a state of great decay. From the varied style of the church, it has evidently been erected at different periods. That portion of it which is now appropriated to public worship, is completely modernized within, and scarcely a vestige of its former ornaments remains. This structure has long been the burying-place of the Owens of Orielson, and probably also of their predecessors the Wyrriots, as some early monuments of the latter family still appear here.

The village of Castle-Martyn is situated about three miles to the westward of Pembroke. This place was formerly adorned with a magnificent castle, erected by some Norman chieftain of the name of Martyn, on the site of an extensive British earthen-work. Few vestiges of that pile now remain, but they appear to have been pretty considerable in the time of Leland.—Between this village and the county-town is a furzy moor, called Dry-Burrow, which is covered with tumuli, similar to those on the downs of Wiltshire.—Northwards from the moor stands Orielson, the seat of the Wyrriot and C-wen families; and beyond it is the village of Pwllcrochon, memorable for a skirmish between the royal and parliamentary forces, in March 1648. In the church are several ancient monuments, in honour of the Benegers of Bangeston.—In the adjoining parish of Rhôfcrowther is Jestington, the residence of a branch of the royal family of Wales previous to the conquest: it is now the property of the family of Meares.—Further to the westward is the village of Nangle, which was formerly a place of very considerable consequence, and had a castle attached to it, some vestiges of which are still visible near the extreme point of the curved promontory, which forms the bay of Nangle.

Cressely, the seat of John Hensleigh Allen, esq. M. P. for the town, is situated about two miles and a half to the west of Pembroke. The house occupies an elevated site, overlooking the river Cresswell. Beyond this, on the same road, stands Carew-castle, one of the most conspicuous features of this county, and celebrated as the residence of characters of great distinction at different eras. It was a royal residence, and formed part of the dowry of Nesta, daughter of Rhys ap Tewdor, who married Gerald de Windsor, lieutenant to Henry I. after the outlawry of Arnulph de Montgomery. The descendants of this lady took the name of Carew, and continued to possess the castle till the reign of Henry VIII. when it reverted to the crown, and was granted to sir John Perrot. In the time of the rebellion it was garrisoned for the king, and withstood a long siege; but, after the ill success of the royalists at Tenby, it surrendered upon quarter. Subsequent to that period it has been suffered to go to decay, and now constitutes a most magnificent and picturesque ruin. Its form is that of a quadrangle, with a court in the centre, and an immense bastion at each exterior angle. The architecture of this pile belongs to various ages, but a great part of it is undoubtedly coeval with the original structure. The north front is peculiarly grand and majestic, and can boast of windows "than which nothing more nobly magnificent is known in the kingdom." On the south-west side appear a number of old towers, all differing from each other in height, diameter, and form. On three sides this castle is bounded by water, but to the south was formerly a very extensive deer-park, the outer wall of which is yet apparent in many places, though it is divided into several distinct inclosures, in one of which sir Rhys ap Thomas held a tilt and tournament, which was the first show of the kind recorded to have been exhibited in Wales. Near this spot

stands one of the early crosses, richly ornamented with true-love knots, &c. and having an inscription upon it, which, though often copied, and submitted to the examination of the curious, has never yet been accurately deciphered. The church here contains several ancient monuments, with effigies and inscriptions in memory of various members of the Carew family.

Lamphey, or Lanfey, was once the favourite palace of the bishop of St. David's. The ruins of this palace are situated a short distance out of the road (on the north side) between Pembroke and Tenby. They occupy an extensive plot of ground; and though, literally speaking, in ruins, and every part uninhabitable, yet large and comparatively perfect portions of the principal buildings are left standing, the plain substantial walls of which are covered with thick masses of luxuriant ivy. The great hall towards the south is plain both within and without, and appears never to have been richly ornamented; but the arches of its windows and doors have well-carved mouldings, and an arched parapet extended round the building. The original entrance-gateway is entire, excepting its roof. The lower part has a modern inclosure, and is used for the purposes of a shed. But the most ornamental portion of these ruins is the chapel, a short distance from the north-east angle of the hall, which still retains its east window with the tracery uninjured. Towards the east end of the hall is the kitchen, with a large circular chimney, strongly maintaining its erect position above the ruins of surrounding walls. There are numerous other offices and buildings distributed over a large uneven area of ruins; but none are ornamented more than, and few of them so much as, those described: from which it appears that this noble palace, when perfect, had but little architectural decoration to enrich its spacious walls, and was greatly inferior to the residence in the city, though perhaps superior to any other of the episcopal palaces.

Stackpool-court, the seat of lord Cawdor, also deserves mention. It is built on the site of a former castellated structure, and is certainly one of the most splendid modern mansions in Wales. It has two fronts, and is surrounded by very extensive and well-wooded pleasure-grounds, which are further adorned by a beautiful lake, and most luxuriant gardens. The estuary of Stackpool being the only safe and commodious landing-place on this coast, it was much frequented by the predatory chieftains of ancient times, and particularly by earl Harold, some of whose successes are supposed to be commemorated by three large upright stones, which are fixed here at the distance of about a mile from each other. *Beauties of England and Wales. Wilkes's British Directory. Oldfield's Repr. Hist. Gent. Mag.* April 1820.

PEM/BROKESHIRE, one of the southern counties of Wales, is bounded on the south by the Bristol Channel, on the west and north by St. George's Channel, and on the north-east and east by the counties of Cardigan and Caermarthen. It is irregular in its form, and deeply intersected throughout its extensive coast by bays and havens. Its extreme length from north to south is about 35 miles, and its greatest breadth from east to west 29. According to the most accurate surveys, its superficial content amounts to 335,600 acres. According to the population report of 1811, this county is divided into the hundreds of Castle-Martyn, Dewisland, Dungleddy, Kemess, Kilgerron, Narberth, and Roofe; and contains the city of St. David, and three towns, Pembroke, Haverfordwest, and Tenby; it also comprises 142 parishes, and 3 hamlets. The number of houses in 1811 was stated to be 13,024, inhabited by 60,615 persons, viz. 27,453 males, and 33,162 females. The population in 1821 had increased to 74,009 persons. The amount of assessment under the property-tax in 1806 was 322,700*l.* and the amount of money raised for the maintenance of the poor in 1803, was 13,213*l.* at the rate of 11*s.* 8*d.* in the pound. The average scale of mortality, according to the registered

registered burial for ten years, appears to have been as 1 to 70 of the existing population.

At a very remote period this county formed part of the kingdom of Demetia, or Dyvet, which subsisted as an independent monarchy till conquered by Ethelwolf king of England. Brodhmael, king of Demetia, is mentioned as one of the princes who assisted Cassibelanus in compelling Julius Cæsar to evacuate Britain. How far this ancient kingdom extended is uncertain; some supposing it to have comprised the three counties of Cardigan, Caernarthen, and Pembroke; and others, that it was confined to the last-mentioned county only. In the time of the Danish incursions, this county suffered more injury than perhaps any other in the principality. Among the chieftains who commanded in these depredations were Hubba and Ivar, or Inguar, both of whom are described by the old writers as men of the "most dreadful ferocity, and unheard-of courage."

The name of Pembrokeshire, or rather Pembrochshire, was first given to this county shortly after the Norman conquest, and was evidently derived from that of the town. In later times, Milford, a port in this county, is remarkable as having been the landing-place of Henry earl of Richmond, afterwards king Henry VII. when he came from Brittany to wrest the throne of England from the usurper Richard III. During the era of the civil wars in the reign of Charles I. several of its castles, particularly those of Pembroke and Roch, were garrisoned for the king, and withstood long and obstinate sieges in the royal cause. Some skirmishes likewise appear to have been fought within Pembrokeshire at the same period, and with various success. See MILFORD-HAVEN, vol. xv. p. 370.

A considerable tract of Pembrokeshire, consisting of the country which lies west of Milford-haven, and between that bay and the Irish Sea, is called by the Welch *Rhos*, which signifies a large green field. King Henry I. settled in this district a colony of Flemings, who came over into England upon an inundation of the sea, which drowned a considerable part of the Low Countries. These Flemings, being a warlike people, and proving very faithful to the crown of England, were a great check upon the Welch, who often attempted to turn them out and recover their country, but without success; for the Flemings maintained their ground, and *Rhos* is at this day inhabited by their descendants, whose language and customs still differ from those of the Welch.

The aspect of this county presents an almost continued succession of swells, or easy slopes; but there are no mountainous ridges, excepting one which runs from the coast near Fishguard to the borders of Caernarthenshire. These hills are locally denominated "The Mountains," and the inhabitants distinguish the country with reference to them; the north side being said to be "above the mountains," and the south side "below the mountains." The central portion of this ridge is known by the name of Percelly, and its highest summit by that of Cwmkerwyn: it commands a view over the whole county. Another high point is called Carn-Englie, as tradition says, from a giant who occupied it as his place of habitation. Vrenny-Vawr, or Vryn-Vawr, is also of considerable altitude and size, as its name imports; the words *Vryn Vawr* signifying in English the Great Hill. The climate of Pembrokeshire is temperate. Rains are perhaps more frequent here than in any part of England, and are particularly violent during westerly winds. Frosts are neither intense nor of long continuance; nor does snow usually lie upon the ground more than two or three days.

Few counties are better watered with rivers, or are more abundantly supplied with excellent springs. The names of the chief rivers are the Tivy, the Clethy, and the Dougledye. The Tivy is more properly a river of Caernarthenshire. The name of the Clethy is a corruption of the ancient British name *gledheu*, "a sword." This

river rises at the foot of the hill called Vrenny Vawr, some miles east of Newport; and, running south, falls into the mouth of the Dougledye, and its conflux with a bay of the sea near Pembroke, called by the English Milford-haven, but by the Welch *Aber dau Gledheu*, or the Haven of Two Swords. The name of the Dougledye is also a corruption of the original British name *Dau Gledheu*, two swords. It rises some miles north-east of the city of St. David's, and, running south-east, and passing by Haverfordwest, falls with the river Clethy into Milford-Haven, as mentioned already. The less considerable rivers of this county are the Cwch, which divides Pembrokeshire from Cardiganhire; the Nevern, which flows by Newport; and the Gwain, which falls into the sea at Fishguard.

The mineralogical products of Pembrokeshire are coal, limestone, freestone, and that "species of marble called pudding-stone." No metallic ores, except iron, we believe, have yet been discovered here; at least none of any consequence in a commercial estimate. Some mineral springs, particularly one in the parish of Fishguard, however, are strongly tinged with that metal; and on the Trefin are several works of iron and tin. The soil is various, but in general tolerably fertile. The state of agriculture, however, is defective; and, though much improved within the last few years, it is still susceptible of great amelioration. Woods are rather scarce in this county, particularly towards the western coast, where, being much exposed to the winds blowing from the sea, they are shorn in a very curious manner. Cattle are reared in considerable numbers, and a large quantity of butter is made, both for home-consumption and for exportation.

Pembrokeshire cannot boast of being either a manufacturing or a trading county; though it possesses manifest advantages, for commerce at least, in its numerous natural harbours and great extent of coast. Haverfordwest is the only town within its limits which has a cotton-manufactory of any consequence; and all the attempts hitherto made for the introduction of the linen-business have completely failed. Milford and Fishguard alone can justly claim the appellation of trading-ports; and even in these towns the exports and imports are extremely limited; but they are certainly susceptible of great augmentation, with a very little exertion and expense. Indeed we have no doubt, but that, if the spirit of manufacturing and commercial enterprise were once properly excited and fostered, Pembrokeshire would, from its natural advantages of situation, soon become the trading emporium of Wales. At Milford has lately been established a South-Sea whaling, which is in a flourishing condition; and we are happy to observe, that the same thing may be affirmed of the herring-fishery of Fishguard, though it might be improved to an almost unlimited extent.

There is a peculiarity in the dress of the Pembrokeshire women, who, even in the midst of summer, wear a heavy cloth gown; and, instead of a cap, a large handkerchief wrapt over their heads, and tied under their chin. This custom is certainly peculiar to Pembrokeshire; for in the other parts of Wales the women as well as the men, wear large beaver hats, with broad brims flapping over their shoulders.

Pembrokeshire was formerly a county palatine within Wales, and its earl was *comes palatinus*, and had *jura regalia*. Its jurisdiction was taken away by the statute 27 Henry VIII. which enabled it to send one knight of the shire, and two burgeses, one for Pembroke, &c. and one for Haverfordwest. The political interest in this county has been disputed between lord Cawdor and sir John Owen. At the general election in 1812, there was a contest between sir John Owen and the hon. Mr. Campbell, eldest son of lord Cawdor, which terminated in favour of the former, who has maintained his seat ever since, although lord Milford had represented the county in the eight preceding parliaments, and was always chosen in opposition to the Owen interest.

Pembrokeshire abounds with objects of antiquarian curiosity and interest, of almost every kind and era. Druidical circles and cromlechs are frequent, of which the principal are those near Cattle-Hendrev, Drewson, Trellys, Long-house, Lech-y-dribedd, Pentre-Evan, and Cattle-Martyn. Single stone monuments are also numerous, particularly along the coast, where they are conjectured to have been raised as memorials of predatory battles. The great Roman road to Menapia, St. David's, enters the county near Llandewi-Velfry, and proceeds by Haverford-west and Roch-Castle, almost on the same line with the present turnpike-road from Caer-marthen, which it crosses at different points. Another Roman road led from the great road to the station called Ad-Vicifimum. But the most important antiquities are its castles, of which there are nineteen mentioned as belonging to princes and great barons. Some of the churches in this county are likewise objects worthy the attention of the antiquary. The cathedral and palace of St. David's are particularly entitled to attention. See SAINT DAVID'S; also Norris's Architectural Antiquities of Wales, 4to. Fenton's Historical Tour in Pembrokeshire, 1811. Cambrian Register for 1796. Camden's Britannia, vol. ii. British Directory, vol. iv. and Universal Magazine for April 1766.

PEMIGEWASSET, a river of New Hampshire, which, united with the Winipisokee, forms the Merrimack river.

PEMISSISQUEWAK'EE, a river of the district of Maine, which runs into the sea in lat. 44. 23. N. lon. 68. 20. W.

PEMNAGUR', a fort of Hindoostan, in Bahar: thirty-one miles north-west of Durbungah. Lat. 26. 29. N. lon. 85. 43. E.

PEMPHIS, *f.* in botany, a genus of plants, so named by Forster from *πεμψις*, a globule, in allusion to the globular protuberance of the germen above the calyx, or of what, in Linnæan language, is the receptacle of the flower. This genus consists of but one species, which is the *LYTHRUM pemphis*, already described in vol. xiii. p. 849.

PEN, *f.* according to Camden, originally signifies a high mountain, which was thus called among the ancient Britons, and even the Gauls. And hence that tall range which parts Italy and France is called *Apennines*.

PEN is often used for a pound, or head of water artificially kept up. Hence *Pen Stock*, a sort of sluice or flood-gate placed in the water of a mill-pond, or a canal, to retain or let it go at pleasure.

PEN, *f.* [*penna*, Lat.] An instrument for writing. — He remembers not that he took off *pen* from paper till he had done. *Fell*.

Eternal deities!

Who write whatever time shall bring to pass,
With *pens* of adamant on plates of brass. *Dryden*.

He takes the papers, lays them down again;
And, with unwilling fingers, tries the *pen*. *Dryden*.

Feather; [*penna*, old Fr. Old also, in this sense, in our own language; and still so used in the north of England. Wicliffe employs it.] — The proud peacock, overcharg'd with *pens*. *B. Jonson's Staple of News*.

The *pens* that did his pinions bind,
Were like main-yards with flying canvas lin'd. *Spenser*.
Wing; though even here it may mean *feather*.

Feather'd soon and fledg'd,
They summ'd their *pens*; and, soaring the air sublime,
With clang despis'd the ground. *Milton's P. L.*

[From *pennan*, Sax.] A small inclosure; a coop. — The cook was ordered to dress capons for supper, and take the best in the *pen*. *L'Esrange*.

Ducks in thy ponds, and chickens in thy *pens*;
And be thy turkeys numerous as thy hens. *King*.

As long as people wrote upon tables covered with wax, they were obliged to use a style or bodkin made of bone, metal, or some other hard substance; but, when they began to write with coloured liquids, they then employed a reed, and afterwards quills or feathers.

It is rather astonishing, that we are ignorant what kind of reeds the ancients used for writing, though they have mentioned the places where they grew wild, and where, it is highly probable, they grow still. Besides, we have reason to suppose, that the same reeds are used even at present by all the oriental nations; for it is well known, that among the people of the east old manners and instruments are not easily banished by new modes and new inventions. Most authors who have treated on the history of writing have contented themselves with informing their readers that a reed was employed; but that genus of plants called by the ancients *calamus*, and *arundo*, is more numerous in species than the genus of grasses, to which the corn of the ancients belongs; and it might perhaps be as difficult to determine what kind of reed they employed for writing, as to distinguish the species of grain called *far*, *alica*, and *avena*.

The most beautiful reeds of this kind grew formerly in Egypt; near Cnidus, a city and district in the province of Caria, in Asia Minor; and likewise in Armenia and Italy. Those which grew in the last-mentioned country, seem to have been considered by Pliny as too soft and spongy; but his words are so obscure, that little can be gathered from them; and, though the above places have been explored in latter times by many experienced botanists, they have not supplied us with much certain information respecting this species of reed. As the old botanists give no characterising marks sufficiently precise, Linnæus was not able to assign any place in his system to the *arundo scriptoria* of Bauhin.

Chardin speaks of the reeds which grow in the marshes of Persia, and which are sold and much sought after in the Levant, particularly for writing. He has even described them; but his account has been of no service to enlarge our botanical knowledge. Tournefort, who saw them collected in the neighbourhood of Teflis, the capital of Georgia, though his description of them is far from complete, has taught us more than any of his predecessors. We learn from his account, that this reed has small leaves, that it rises only to the height of a man, and that it is not hollow, but filled with a soft spongy substance. He has characterised it, therefore, in the following manner in his System of Botany: *Arundo orientalis, tenuifolia, caule pleno, ex qua Turcæ calamos parant*. The same words are applied to it by Miller; but he observes that no plants of it had ever been introduced into England. That the best writing-reeds are procured from the southern provinces of Persia is confirmed by Dapper and Hanway. The former says, that the reeds are sown and planted near the Persian gulf in the place mentioned by Chardin, and gives the same description as that traveller of the manner in which they are prepared.

The circumstance expressly mentioned by Tournefort, that these writing-reeds are not entirely hollow, seems to agree perfectly with the account given by Dioscorides. It is probable that the pith dries and becomes shrunk, especially after the preparation described by Chardin, so that the reed can be easily freed from it in the same manner as the marrowy substance in writing-quills is removed from them when clarified. Something of the like kind seems to be meant by Pliny, who says, that the pith dried up within the reed, which was hollow at the lower end, but at the upper end woody and destitute of pith. The flowers of this reed were employed instead of feathers for beds, and also for caulking ships. Forskal only tells us that a great many reeds of different kinds grow near the Nile, which serve to make hedges, thatch, and wattled-walls, and which are used for various other purposes.

These reeds were split, and formed to a point like our quills; but certainly it was not possible to make so clean

and fine strokes, and to write so long and so conveniently with them, as one can with quills. The use of them, however, was not entirely abandoned when people began to write with quills, which in every country can be procured from an animal extremely useful in many other respects.

Some assert, from a passage of Juvenal, that quills were used for writing in the time of that poet; but what he says is only a metaphorical expression, such as has been employed by Horace and various ancient writers. Others have endeavoured to prove the antiquity of writing-quills from the figure of the goddess Egeria, who is represented with a book before her, and a feather in her right hand; but the period when this Egeria was formed is not known, and it is probable that the feather was added by some modern artist. No drawings in manuscripts, where the authors appear with quills, are of great antiquity. Among these is the portrait of Aristotle, in a manuscript in the library of Vienna, which, as expressly mentioned at the end, was drawn at Rome in the year 1457; and we have great reason to think that the artist delineated the figure for ornamenting his work, not after an ancient painting, but from his own imagination.

If we can give credit to the anonymous author of the History of Constantius, extracts from which have been made known by Adrian de Valois, the use of quills for writing is as old as the fifth century. We are informed by this author, who lived in the above century, that "Theodoric, king of the Ostrogoths, was so illiterate and stupid, that during the ten years of his reign he was not able to learn to write four letters at the bottom of his edicts. For this reason the four letters were cut for him in a plate of gold, and, the plate being laid upon paper, he then traced out the letters with a pen." The western empire was governed, almost about the time of Theodoric, by the emperor Justin, who also could not write, and who used in the like manner a piece of wood having letters cut in it; but with this difference, that, in tracing them out, he caused his hand to be guided by one of his secretaries.

The oldest certain account however known at present respecting writing-quills, is a passage of Isidore, who died in the year 636, and who, among the instruments employed for writing, mentions "reeds and feathers:" "Instrumenta scribæ calamus et penna. Ex his enim verba paginis insiguntur; sed calamus arboris est, penna avis, cujus acumen dividitur in duo; in toto corpore unitate servata." *Origines*, vi. 13.

Another proof of quills being used in the same century, is a small poem on a writing-pen, to be found in the works of Althelmus, called sometimes also Aldhelmus, Adelhemus, and Adelmus. This writer, descended of a noble family, was the first Saxon who wrote Latin, and who made the art of Latin poetry known to his countrymen, and inspired them with a taste for compositions of that kind. He died in the year 709. The poem is as follows:

De Penna scriptoria.

Me pridem genuit candens onocrotalus albam
Gutturæ qui patulo forbet in gurgite lymphas.
Pergo ad albentes directo tramite campos,
Candentique viæ vestigia cærule linquo,
Lucida nigritis fuscans anfractibus arva.
Nec fatis est unum per campos pandere callem;
Semita quin potius milleno tramite tendit,
Quæ non errantes ad cœli culmina vexit.

The author does not, speak here of a goose-quill, but of a pelican's, (*onocrotalus*, adopted from the Greek word, compounded of *ovos*, an ass, and *κροταλο*, a rattle, from the gurgling in the throat or pouch,) which, at any rate, may be as good as that of a swan.

In the eighth century writing-pens are mentioned by Alcuinus, who at that period, in the time of Charlemagne, was of service in extending literary knowledge. He

composed poetical inscriptions for every part of a monastery, among which there is one even for a privy, and another for a writing-study. Speaking of the latter, he says that "no one ought to talk in it, lest the pen of the transcriber should commit a mistake."

After the above period, proofs occur which place the matter beyond all doubt. Mabillon saw a manuscript of the Gospels, which had been written in the ninth century under the reign of St. Louis, in which the evangelists were represented with quills in their hands. The same author mentions a like figure of the eleventh century. In the twelfth century, Peter de Clugny, who by scholastic writers is called *Venerabilis*, and who died in 1157, wrote to a friend, exhorting him to assume the pen instead of the plough, and to transcribe instead of tilling land. In short, writing-quills are often called *calami* by ancient and modern authors who wrote good Latin; and it is probable that this word is employed by older writers than Isidore to signify writing-pens, where, for want of other proofs, we understand reeds.

Notwithstanding the great advantage which quill-pens have over reeds for writing, the latter however seem to have continued long in use even with the former. Men of letters, well versed in diplomatics, assure us, from comparing manuscripts, that writing-reeds were used along with quills in the eighth century, at least in France; and that the latter first began to be common in the ninth. The papal acts, and those of synods, must however have been written with reeds much later. In convents they were retained for texts and initials, while, for small writing, quills were every-where employed.

We can allow little credit to a conjecture supported merely by a similarity of the strokes in writing, because it is probable that people at first would endeavour to write in as strong and coarse a manner with quills as had been before done with reeds, in order that the writing might not seem much different from what was usual; and with quills one can produce writing both coarse and fine. Meiners, however, refers to a passage in a letter of Reuchlin, which removes all doubt on the subject. When this worthy man, to whom posterity is so much indebted, was obliged to fly by the cruelty of his enemies, famine, and the plague, and to leave behind him all his property, he was supplied with the most common necessaries by Pirkeheimer. Among other articles the latter sent to him, in the year 1520, writing-materials, good paper, penknives, and, instead of peacocks-feathers which he had requested, the best swan-quills. That nothing might be wanting, he added also proper reeds, of so excellent a sort, that Reuchlin considered them to be Egyptian or Cnidian. These reeds at that period must have been scarce and in great request, as it appears by some letters of Erasmus to Reuchlin, that the former received three reeds from the latter, and expressed a wish that Reuchlin, when he procured more, would send some of them to a learned man in England, who was a common friend to both.

Whatever may have been the cause, about the year 1433 writing-quills were so scarce at Venice, that it was with great difficulty men of letters could procure them. We learn at any rate, that the well-known Ambrosius Traversarius, a monk of Camaldule, sent from Venice to his brother, in the above year, a bunch of quills, together with a letter, in which he said, "They are not the best, but such as I received in a present. Show the whole bunch to our friend Nicholas, that he may select a quill; for these articles are indeed scarcer in this city than at Florence."

"Had the ancients been acquainted with the art of converting quills into writing-pens," says Mr. Professor Beckmann, "they would undoubtedly have dedicated to Minerva, not the owl, but the goose." We think so too; yet there are some men among us, as likely to rival the goose in understanding as in usefulness, who prefer writing, or trying to write, with an iron pen, or a steel pen,

or a silver pen, because these, they say, do not wear out. But suppose they *do* wear away, (as what does not?) who is to mend them? These pens cost from a shilling to half-a-crown apiece, the price of a score, or even a hundred, of quills or pens, which *can* be mended, and which are so obedient under the knife, that they can be made hard or soft, so as to suit any hand, or any kind of character, small or large, round or square, thick or thin; and the celerity with which quills are converted into pens is astonishing. It is recorded, that an usher at Rugby-school made 2000 pens in little more than eight hours. This was in the year 1813. The man's name was Thacker.

To PEN, *v. a.* [pret. and part. pass. *penmed.*] To write. It probably meant at first only the manual exercise of the pen, or mechanical part of writing; but it has been long used with relation to the style or composition.—I would be loth to cast away my speech; for, besides that it is excellently well *penne'd*, I have taken great pains to con it. *Shakespeare's Tw. Night.*—He frequented sermons, and *penmed* notes with his own hand. *Hayward's Edw. VI.*—The precepts, *penmed* or preached by the holy apostles, were as divine and as perpetual in respect of obligation. *White.*—The digesting my thoughts into order, and the setting them down in writing, was necessary; for, without such strict examination as the *penning* them affords, they would have been disjointed and roving ones. *Digby on the Soul.*

Twenty fools I never saw
Come with petitions fairly *penne'd*;
Desiring I should stand their friend.

Swift.

[Preter. and part. pass. *pent.*] To coop; to shut up; to incage; to imprison in a narrow place.—Away with her, and *pen* her up. *Shakespeare.*—The plaister alone would *pen* the humour already contained in the part, and forbid new humour. *Bacon.*—The glass, wherein it is *penne'd* up, hinders it to deliver itself by an expansion of its parts. *Boyle.*—The prevention of mischief is prescribed by the Jewish custom; they *pen* up their daughters, and permit them to be acquainted with none. *Harvey on Consumptions.*

My heavy son
Private in his chamber *pens* himself. *Shakespeare.*
Their armour help'd their harm, crush'd in and bruise'd,
Into their substance *pent.* *Milton's P. L.*

As when a prowling wolf,
Whom hunger drives to seek new haunt for prey,
Watching where shepherds *pen* their flocks at eve
In hurdled cotes, amid the field secure,
Leaps o'er the fence with ease into the fold. *Milton's P. L.*

PEN Y DAR'RAN. See vol. xv. p. 164.

PEN DINAS, a cape of Wales, on the north coast of St. Bride's Bay. Lat. 51. 48. N. lon. 5. 10. W.

PEN PARK. See vol. iii. p. 414.

PEN SELWOOD, a village in the county of Somerset, on the borders of Wiltshire and Dorsetshire, on an elevated situation, near the river Stour. In the year 658, a battle was fought here between the Saxons and the Britons, which proved in favour of the former, and in so decisive a manner, that the Britons never after made head against their enemies. In the year 879, the Danes are said to have been defeated here by king Alfred: in the year 1001, a few of king Ethelred's troops were defeated by the Danes; and in the year 1016, the Danes were defeated here by king Edmund. It is four miles north-east of Wincanton, 106 west of London.

PENNA (John), an able French mathematician, was descended from a noble family at Aix in Provence, and born at Moustiers, in the diocese of Riez, about the year 1530. He distinguished himself by his proficiency in the

Latin and Greek languages, and philosophy; but the bent of his genius particularly directed him to the study of the mathematical sciences. Ramus had been his tutor in the belles-lettres, and is said to have been inspired by his pupil with a taste for mathematical studies, and to have prosecuted them under his instructions. M. de Thou says, that they both taught at the same time in the Collège de Presles. About the year 1556, he was appointed Professor of Mathematics in the Collège Royal; and, according to some writers, his post was a professorship-extraordinary, created out of compliment to his extraordinary merit, and suppressed after his death. He published a Latin version of the Catoptrics of Euclid, with a curious Preface, explaining and illustrating the uses of the cylindrical mirror; the Optics of the same geometrician; Euclidis Elementa Musices; Sectio Regular Harmonicæ, in Greek and Latin; and a Latin version accompanying the Greek text of The Spherics of Theodostus, 1558, 4to. He also wrote some papers on the Mechanics of Hero, and the Geometry of Euclid, which have not been given to the public. This very promising young mathematician was prematurely cut off by a violent fever in 1560, when only about thirty years of age. *Teiffier's Eloges des Hommes Savans.*

PENNA, in geography. See PEENE.

PENNA COVA. See PEGNA COVA, p. 473.

PENAC, a town of Naples, in Abruzzo Citra: nine miles east-south-east of Civita Borella.

PENÆ'A, *f.* [received that appellation from Linnæus, in memory of the learned *Peter Pena*, a native of Jouques, near Aix, in Provence; who afforded great assistance to Lobel, in the composition of his "Adversaria." Plumier had already consecrated a plant to his honour, which Linnæus reduced to POLYGALA; see that article.] In botany, a genus of the class tetrandria, order monogynia. Generic characters—Calyx: perianthium two-leaved: leaflets opposite, lanceolate, concave, equal, coloured, shorter by half than the corolla, loose, deciduous. Corolla: one-petalled, bell-shaped: border four-cleft, spreading a little, much shorter than the tube; segments sharp. Stamina: filaments four, awl-shaped, extremely short, placed on the tube of the corolla between the divisions of it, upright, naked; antheræ upright, flattish, emarginate both ways. Pistillum: germen ovate, four-cornered; style four-cornered by four membranaceous longitudinal wings; stigma cruciform, blunt, permanent. Pericarpium: capsule four-cornered, furnished with the style, four-celled, four-valved. Seeds: two, somewhat oblong, blunt.—*Essential Character.* Calyx two-leaved; corolla bell-shaped; style quadrangular; capsule four-cornered, four-celled, eight-seeded.

There are nine species. They are shrubs, rugged below with the vestiges of fallen leaves, leafy above; leaves opposite, crosswise, sessile, approximating imbricately in a four-fold row, the upper ones near the flowers like scales and coloured, whence the calyx in some species is as it were many-leaved and imbricated; flowers terminating, sessile, solitary or several heaped together; fruit as in the order of Acanthi, but four-celled. Perhaps this genus may be allied to them; but, having been hitherto little examined except in dried specimens, the *natural order* of the genus Penæa must yet remain uncertain. The species are all natives of the Cape of Good Hope.

1. Penæa sarcocolla, or ovate-leaved penæa: leaves ovate, somewhat rhomboid, acute; bractes wedge-shaped, pointed, coloured; calyx-leaves linear. This is an humble much-branched bushy shrub. The leaves are about half an inch long, of a pale tawny glaucous hue in the dried plant, their mid-rib rather convex. Flowers few together, at the tops of the branches, rather longer than the leaves, red. It has been generally believed that the substance called *sarcocolla*, or flesh-glue, is an exudation from the flowers of this plant; but there is very good reason to doubt the truth of the opinion. It was first taken up by Linnæus, and has been maintained ever since upon

upon the authority of his name. Professor Thunberg has published an account of the genus *Penæa* in the Berlin Magazine for 1807. The species all grow at the Cape of Good Hope, and have been seen no where else. The *P. farcocolla* grows on the mountains of Hottentot Holland, and in those below the west side of the Table Mountain. Now Thunberg, who was on the spot, expressly affirms that farcocol is neither collected nor known in that country. It would have some tendency to throw light upon the plants that yield several resins and gum-resins with the history of which we are at present unacquainted, if any wholesale druggist, or merchant, in London, who is in the habit of importing these articles, would state the countries from which they are brought.

2. *Penæa mucronata*, or heart-leaved *penæa*: flowers terminating, leaves acuminate smooth. Style four-cornered. Leaves on the stems and branches frequent, sessile. Flowers at the ends of the branches, heaped together, red.

3. *Penæa marginata*, or margined *penæa*: leaves cordate margined, flowers lateral. This is a stiff shrub, with the branches commonly in threes. Leaves opposite or in threes, subsessile, bluntish, shining, with the edge curved back, the size of box-leaves. Flowers among the leaves, subsessile, not longer than the leaves, white.

4. *Penæa lateriflora*, or side-flowering *penæa*: leaves ovate, flowers lateral sessile. Stems red, with elongated branches. Leaves sessile, exactly ovate, even, sharpish, quite entire, almost keeled under the base, longer than the interstices. Flowers in the axils of the leaves, yellow, the length of the leaves; calyx four-leaved, yellow, scarious, the length of the leaves. Willdenow doubts whether this be distinct from the preceding.

5. *Penæa tomentosa*, or downy-leaved *penæa*: leaves ovate tomentose, flowers lateral. Of this we have no description.

6. *Penæa fucata*, or painted *penæa*: leaves rhomb-ovate; bractes wedge-shaped acute, coloured. Branches very numerous, round; branchlets angular. Leaves ovate, narrower at the base, acute, spreading, even. Flowers purple, in terminating bundles; bractes smaller than the leaf, purple.

7. *Penæa squamosa*, or scaly *penæa*: leaves rhomb-wedge-shaped, fleshy; bractes fringed, glutinous, larger than the leaves; segments of the corolla reflexed. Distinguished by its large terminal flowers, enveloped in dark-red, glutinous, broad, densely-fringed, bractes. The leaves most resemble the first species, but their mid-rib is depressed, not prominent, and their colour in a dried state very dark. Linnæus at first marked his specimen farcocolla, then resinosa, and finally squamosa, under which last appellation he described this fine plant. It may, perhaps, yield a gum, as well as the first species. The corolla seems to be white or yellowish; its tube is above an inch long; the segments of the limb ovate, obtuse, reflexed.

8. *Penæa fruticulosa*, or shrubby *penæa*: leaves somewhat oblong blunt, bractes orbiculate acute. This is a little shrub with round branches. Leaves oval or somewhat oblong, thickish, veinless, remote. Floral leaves small, rhomb-orbiculate, or orbiculate-acute; flowers at the ends of the branches, subsolitary, on very short peduncles, sharpish.

9. *Penæa myrtoidea*, or myrtle-leaved *penæa*: leaves lanceolate. Branches upright round red. Leaves sessile clustered even, like those of *Myrtus tarentina*, scarcely nerved underneath. Flowers terminating, subsolitary, surrounded by sharp green bractes, under which are two small leaves; calyx acute, green, not at all coloured.

Loureiro has added two species, natives of CochinChina: *Penæa nitida*, which he thinks is allied to Linnæus's *P. myrtoidea*; and *Penæa scandens*, to *P. marginata*. He allows that they are not conformable to Linnæus's generic character: and indeed they certainly belong to another genus. See POLYGALA.

PEN'AL, *adj.* [Fr. from *pena*, Lat.] Denouncing pu-

nishment; enacting punishment.—Gratitude plants such generosity in the heart of man; as shall more effectually incline him to what is brave and becoming than the terror of any *penal* law. *South*.—Used for the purposes of punishment; vindictive.—Adamantine chains and *penal* fire. *Milton's P. L.*

PENAL'ITY, *f.* Liableness to punishment; condemnation to punishment.—Many of the ancients denied the Antipodes, and some unto the *penalty* of contrary affirmations; but the experience of navigation can now assert them beyond all dubitation. *Brown*.

PEN'ALTY, *f.* Punishment; censure; judicial infliction.—Political power is a right of making laws with *penalties* of death, and consequently all less *penalties*, for preserving property, and employing the force of the community in the execution of the laws. *Locke*.

Beneath her footstool, science groans in chains,
And wit dreads exile, *penalties*, and pains. *Pope's Dunciad*.

Forfeiture upon non-performance:

Lend this money, not as to thy friend,
But lend it rather to thine enemy,
Who if he break, thou may'st with better face
Exact the *penalty*. *Shakespeare's Merch. of Ven.*

PENAL'VA, a town of Portugal, in the province of Beira: nine miles north of Coimbra.

PENAMOU'SHILY, a town of Hindoostan, in the circar of Rajamundry: forty-two miles east of Rajamundry.

PEN'ANCE, *f.* [*penance*, *penéance*, old Fr. for *penitence*.] Infliction either public or private, suffered as an expression of repentance for sin.—No penitentiary, though he enjoined him never so straight *penance* to expiate his first offence, would have counselled him to have given over pursuit of his right. *Bacon*.—A Lorain surgeon, who whipped the naked part with a great rod of nettles till all over blistered, persuaded him to perform this *penance* in a sharp fit he had. *Temple*.

And bitter *Penance*, with an iron whip,
Was wont him once to disple every day. *Spenser's F. Q.*

Mew her up,
And make her bear the *penance* of her tongue. *Shakesp.*

The scourge
Inexorable, and the torturing hour
Calls us to *penance*. *Milton's P. L.*

Repentance.—Seeking to bring forth worthy fruits of *penance*. *Commination, Comm. Prayer*.

PENANCE is one of the seven sacraments of the Romish church. Besides fasting, alms, abstinence, and the like, which are the general conditions of penance, there are others of a more particular kind; as the repeating a certain number of ave-marys, paternosters, and credos, wearing a hair-shirt, and giving one's self a certain number of stripes. In Italy and Spain it is usual to see Christians almost naked, loaded with chains and a cross, and lashing themselves at every step.

This kind of penance is enjoined by the church, for sins of omission or of commission. But in the very early ages men practised penance and mortification for no other reason than because they believed that every indulgence was sinful; that whatever gratified the senses, however apparently innocent, must be injurious to the soul; that the ties of natural affection weaned the heart from God; that the duties of social life must be abandoned by those who regarded their own salvation; and that, in proportion as man inflicted privations and torments upon himself, he pleased his Creator.

The extravagancies which grew out of this system might appear incredible, if they were not as well authenticated as any facts in history. Some shut themselves up in cells so low that they could not stand upright in them, and of such dimensions that they could neither lie at length, nor place themselves in any but painful positions.

Others

Others took up their abode in tombs, like the demoniacs; or dwelt in dens with wild beasts; or made dens for themselves, and burrowed in the ground. Men and women lived promiscuously in the deserts, with no other covering than what mere decency required, bare to the sun, and the wind, and the sand-showers. These persons renounced all such food as was used by their fellow-creatures, and grazed and browsed upon herbs and shrubs; for which reason they were called *Βοσχοί*. They even affected to appear like beasts, by going upon their hands and knees; and like beasts they fled from the sight of man, and betook themselves to the most inaccessible places for concealment. If this system had continued a few generations, it might have been seen how far it is possible for man to degrade his physical as well as his intellectual nature; he would have degenerated into an animal little superior to the ape or baboon, and more loathsome than either.

St. Pior always walked while he was eating; because (to use his own words) "he did not consider eating as a business for which time was to be set apart, but as a thing to be done when it did not interrupt his avocations." St. Pachomius, in order that he might sleep as little as possible, and with the least possible comfort and convenience, never allowed himself to lie down, nor even to recline against any thing that might support him, but sat upon a stone in the middle of his cell. And among the rules which, according to the historians of the Romish church, were given to him by an angel, and are the first code of monastic laws, is one whereby the monks are enjoined in like manner to sleep sitting, and not recumbent. Beradat used for his clothing a close sack of skins, which had no other opening than one small one for his mouth, and another for his nose.

The female saint, Eufraxia, belonged to a convent containing a hundred and thirty nuns, not one of whom ever washed their feet, and the very mention of a bath was an abomination among them: "De balneo verò superfluum est loqui; audientes enim vehementer vituperabant, confusionis et opprobrii plenam consentis, vel solam illius mentionem, et tanquam rei abominabilis, nec auditam quidem volebant tolerare." St. Macarius, (for all these madmen are saints!) having one day killed a gnat which had bitten him, was struck with compunction at the sight of the insect's blood, and by way of atonement went into the marshes, and there for six months exposed himself to all winged and creeping insects, till every part of his flesh was swollen and ulcerated with their bites. Sozomen relates of him, that he had so hardened his body by austerities, that the very beard could not make way through his skin. This personage, when in the full odour of filth and rags, returned one day to his convent, humbled and mortified by the sense of his own inferiority, exclaiming, "I am not yet a monk, but I have seen monks!" for he had fallen in with two or three wretches stark naked.

The English reader is familiar with the extraordinary history of St. Simeon Stylites. "This godly man, while yet in the flesh, imitated the life of the angels, withdrew himself from earthly things, forced nature, which ever inclineth downwards, aspired to things heavenly, and placed himself between earth and heaven, on the top of a pillar. He, together with the angels, praised the Lord, lifted up the prayers of men, and offered them to God, and brought down the mercy of God to make men partakers thereof." Such is the language of Evagrius! His celebrity long survived him. A church was built round the pillar upon which "this earthly and incarnate angel led his heavenly life; and every year, on the saint's day, a star was exhibited playing round the pillar." Evagrius says he himself had seen it, and does not intimate the slightest suspicion of the trick. His body was removed to Antioch, from whence the emperor Leo would have translated it to Constantinople; but the people of Antioch represented, "that the fortifications of their city

had been thrown down by an earthquake, and therefore they had brought thither the holy body of Simeon, that it might be to them instead of a wall."

The same freaks and follies of the human mind, the same diseases of the moral and intellectual nature, have shown themselves in all ages: the Romish church has had the dexterity to turn them to account. In her service there was a place for every one, faint or sage, the painful student and the expert sophist, the haughtiest temper and the humblest, knave, madman, and idiot, all had their uses, and were employed with excellent advantage to the papacy. When, by some lucky combination of events, a monk had attained that sort of influence which enabled him to institute a reform, it suited the policy of the church, and his order also, to accredit the fables forged by himself and his accomplices, and propagated by vulgar credulity; to canonize the fanatic who during his life had been an object of contempt to all his brethren; and to publish for edification the strangest pranks and the most disgusting actions of insane and grovelling superstition.

The most remarkable fanatic of the time we are speaking of was the personage known by the name of St. Dominic the Cuirassier, because of an iron cuirass which he wore next his skin, and which was never taken off till it was necessary to replace it by a new one. Dominic had been intended for an ecclesiastical life; but, when he received priest's orders, his parents presented a furred robe to the bishop who ordained him; and Dominic, conceiving that he had thus incurred the guilt of sinning, not only refrained from performing mass, but resolved to do penance for the crime as long as he lived. For this purpose he entered into the Congregation Santa Croce de Fonte Avellana, the most extravagant of all the orders which had been produced by reforming the system of St. Benedict. The monks of this congregation never touched either wine or oil, and during five days in the week only bread and water; they were never allowed to speak, except for a short time on Sundays, and then only concerning spiritual things; they went barefoot, and each day after evening-service, they flogged one another. In those days it was believed that a sinner might be flogged into a saint, as it has been supposed, within our own memory, that a dunce might be whipped into a scholar. But, besides the general utility of flagellation as a means of obtaining the favour of heaven, the actual value of stripes, the price at which they were taken by the score in the treasury of good works, had been settled, according to the most minute and accurate calculation. This well deserves to be explained.

It is a point of faith, say the Catholics, that every mortal sin deprives the sinner of the grace of God, and makes him liable to eternal punishment; but, if he repents and confesses, the mercy of God is so great, that he restores the grace which had been forfeited, and commutes for temporal punishment that which should else have been eternal. How long a time a soul has to remain in purgatory for one mortal sin, or for many, whether for one year, ten, twenty, or more, is what the divine majesty has revealed to none: the popes, however, have granted indulgencies, by some of which they remitted a certain number of years of purgatory, by others half the term, and by others the whole. The monks of Fonte Avellana had determined that thirty psalms said or sung, with an accompaniment of one hundred stripes to each psalm, making in all three thousand, would be received as a set-off for one year of purgatory; the whole psalter, with the full compliment of fifteen thousand stripes, would redeem five years from the same vast crucible; and twenty psalters with three hundred thousand stripes, fairly entered in the recording angel's book, would be equal to a receipt in full for an hundred years of fire and torments in the world to come. This scale was sanctioned (if not formally approved) by the popes.

Dominic the Cuirassier was ambitious above all men in laying up treasure of this kind in heaven; and to a man

of his temper it was a great excitement to know that he was working by the piece. He tasked himself ordinarily at ten psalters and thirty thousand lashes a-day, at which rate he would have redeemed three thousand six hundred and fifty years of purgatory per annum; and, as Dominic is said never to have committed any other sin in his life than that of consenting to the present of the furred robe, one year of such discipline might have been thought full measure and overflowing for that offence. But, in addition to this regular allowance, he used to petition his superior in Lent for a supplementary task of an hundred years; and then his day's work was two psalters and a half, with thirty-four thousand five hundred stripes. Even this did not satisfy the ambitious Dominic. He was already creditor to a large amount in the angel's books; but no good works can be lost; all that was over and above the sum necessary for his own redemption from purgatory would go to the great sinking fund of the holy Catholic church; and Dominic therefore continued to flog himself with more spirit than ever, for the good of his fellow-creatures. He entreated and obtained, during another Lent, the imposition of a thousand years; and St. Pietro Damiano affirms, that in these forty days he actually recited the psalter two hundred times, and insisted upon himself sixty millions of stripes, working away during the recitation with a scourge in each hand. This was in addition to his regular task; and I neither know, says Yepes, how his head should have been capable of repeating so many psalms, nor how his arms could have had strength to give him so many blows, nor how his flesh, not being of iron, could have endured so inhuman a battery. In him, however, increase of appetite grew by what it fed on; and like our pedestrians, who go on walking hour after hour, till they ascertain the utmost exertion which their abused strength is capable of enduring, he, in an heroic mood, determined once to flog himself, in the jockey phrase, again in time. In this noble feat, he so far outdid all his former outdoings, that beginning in the evening, and singing and flogging through the day and night, at the end of twenty-four hours he had gone through the psalms twelve times, began them a thirteenth time, and proceeded as far as Beati quarum, the 32d psalm; the quota of stripes being 183,100, thereby reducing purgatory-stock in the amount of sixty-one years, twelve days, and thirty-three minutes, to a fraction.

With regard to the authenticity of this account, it rests upon the authority of Pietro Damiano, saint and cardinal; and he relates it from his own personal knowledge, in an epistle to pope Alexander II. It is laid down as an axiom by Ambrosia Morales, that whatever one saint relates of another, is to be implicitly believed; and Calmet, living in a less credulous age and country, premising that the statement appears incredible, says, that after seeing it confirmed by St. Pietro Damiano, "there ought to be no further hesitation;" *la chose ne doit faire aucune difficulté*. It seems, however, that certain awkward doubts respecting the possibility of Dominic's exploits obtruded themselves upon the minds of those who were very desirous of believing them if they could. It appears, upon calculating the great achievement of the four-and-twenty hours, that if during the whole of that time he had given himself two blows (that is, one with each hand, for he always used both) in every second, the number would have been 172,800, being 10,300 short of the stated amount. Padre Maestro Castaniza supposes that Dominic's cats had ten tails each, and that every tail was reckoned; but this mode of reckoning would favour so much of vain-glory, not to say deceit, that other writers reject the solution, as derogatory both to the saint and his canonized biographer. They therefore agree with Castaniza, that "the divine grace which the Almighty imparts to his servants produces in them marvellous effects, however weak they may be by nature;" and so they take the sum total without scruple. But the

saying *Credo quia impossibile est*, will not pass current out of the pale of Catholicism; and a Protestant may be allowed to ask, how Dominic contrived to reckon the stripes while he was singing the psalms? Another question will have already occurred to the reader, was Dominic in his cuirass all the while? if he were, he might have laid on as lustily as Sancho upon the trees, and kept a whole skin. But the cardinal mentions that he stripped himself for the work. What, then, becomes of the assertion that the cuirass was never taken off till it was worn out? The story bears the stamp of fraud as well as of folly and madness; and the church, which has accredited it by canonizing the man, whether knave or fool, or both, thereby encouraging the grossest superstition and the most absurd practices, is implicated in the imposture.

As the mythology of Greece was less gross than that of Egypt, and that of Egypt less so than that of India; so the penances and self-tortures of the Hindoo fakeers; yogeys, and saniassees, exceed in extravagance and folly every thing that we have related above. See the article HINDOOSTAN, vol. x. p. 148-52.

PENANCE, in our common law, is an ecclesiastical punishment, used in the discipline of the church of England, and affecting the body of the penitent; by which he is obliged to give a public satisfaction to the church for the scandal he hath given by his evil example. In the case of incest or incontinency, the offender is usually enjoined to do a public penance in the cathedral, or parish-church, or public market, barelegged and bareheaded, in a white sheet, and to make an open confession of his crime in a prescribed form of words, which is augmented or moderated according to the quality of the fault, and the discretion of the judge. So in smaller faults and scandals, a public satisfaction or penance, as the judge shall decree, is to be made before the minister, churchwardens, or some of the parishoners, respect being had to the quality of the offence, and circumstances of the fact, as in the case of defamation, or laying violent hands on a minister, or the like. And, as these censures may be moderated by the judge's discretion, according to the nature of the offence, so also they may be totally altered by a commutation of penance: and it hath been the ancient privilege of the ecclesiastical judge to admit that an oblation of a sum of money for pious uses shall be accepted in satisfaction of public penance. But penance must be first enjoined, before there can be a commutation; or otherwise it is a commutation for nothing. Linwood and other canonists mention three sorts of penance: viz. private, enjoined by any priest in hearing confession; public, enjoined by the priest for any notorious crime, either with or without the bishop's licence according to the custom of the country; and solemn, the particulars of which are prescribed by the constitution of archbishop Peckham. By the statute of "Circumspecte agatis," (13 Edw. I. stat. 4.) the king to his judges sendeth greeting: Use yourselves circumspectly concerning the bishops and their clergy, not punishing them if they hold plea in court-christian of such things as be mere spiritual; that is, to acts of penance enjoined by prelates for deadly sin, as fornication, adultery, and such like; for the which sometimes corporal penance, and sometimes pecuniary is enjoined, (2 Roll. Rep. 384.) in which cases the spiritual judge shall have power to take knowledge, notwithstanding the king's prohibitions. By the statute of "Articuli Cleri," (9 Edw. II. stat. 1. c. 2.) if a prelate enjoins a penance pecuniary to a man for his offence, and it be demanded, the king's prohibition shall hold place; but, if prelates enjoin a penance corporal, and they which be so punished will redeem upon their own accord such penance by money; if money be demanded before a spiritual judge, the king's prohibition shall hold no place. And by the same statute, (c. 3.) if any lay violent hands on a clerk, the amends for the peace broken shall be before the king, and for the excommunication before a prelate, that corporal penance may be enjoined; which if the offender will redeem of his own

own good will, by giving money to the prelate, or to the party grieved, it shall be required before the prelate, and the king's prohibition shall not lie.

PEN'AR VAL'LI, *f.* in botany. See ZANONIA.

PENAT', a town of Hindoostan: thirty miles south-south-east of Agra.

PEN'ATES, in the ancient mythology, a term applied to all the domestic gods, whom the ancients adored in their houses: whence they are ordinarily confounded with the lares. See LAR.

Authors are not all agreed about the origin of the *dii penates*, who were properly the tutelary gods of the Trojans, and were only adopted by the Romans, who gave them the title of penates.

The penates seem to have originated in a vulgar opinion which prevailed very generally amongst mankind, that the manes of their ancestors took pleasure after death to dwell in their houses, where indeed they were frequently interred, and where their pictures used to be preserved in the places that were most respected. After having been accustomed to consider them under the character of illustrious persons, they by degrees paid them respect and homage, they then implored their assistance, and lastly they succeeded to the worship and religious ceremonies. The penates were therefore the manes of their ancestors, which St. Augustine (de Civ. Dei. ix. 11.) maintains, on the authority of Apuleius and Photinus; and in process of time they were associated with all the other gods without distinction.

The statues of these gods were made not only of wax, as some authors pretend, but indifferently of all sorts of materials, even of silver itself: they were consecrated in the most secret places; altars were erected to them, lamps kept burning, and symbols added, all of them expressive of vigilance. Anciently children were offered to them in sacrifice; but Brutus, who expelled the Tarquins, discontinued this barbarous practice; and from that time nothing was offered to them but wine, incense, fruits, and sometimes bloody victims, lambs, sheep, &c. their statues were likewise crowned with festoons of garlic and poppy. In the public sacrifices offered to the penates, they sacrificed to them a sow. It was in the time of the Saturnalia that they celebrated the festival of the lares and penates; and there was a day besides in each month set apart for the worship of these domestic gods. At the temple consecrated to these gods in Rome, there was set apart for them a holiday, which was observed with much solemnity; and this was the second of the kalends of January, or the last day of December. To this were added the games called Compitalia. Indeed, the respect paid to the penates was so great, that no important enterprise was undertaken without consulting them: their figures were even sometimes carried about in journeys, as we learn from Apuleius: "Wherever I go," says he, "I always carry with me in my journey the figure of some god."

Authors have conjectured, that the idols which Jacob brought from the house of Laban his father-in-law, and which the Scripture denominates "teraphim," were gods penates, whose worship was propagated afterwards into Phrygia, and transmitted from thence into Greece and into Italy. This, it is confidently asserted, was their true origin.

PENATO'LEN, a town of Chili: twenty miles east of St. Yago de la Nueva Estremadura.

PENATOOR, a town of Hindoostan, in the Carnatic: eight miles west of Gingee.

PENAUTI'ER, a town of France, in the department of the Aude: three miles north-west of Carcassonne.

PEN'BRAY, a cape on the fourth coast of Wales, in the Bristol Channel; three miles south of Kidwelly.

PENBUGHTO'E HEAD', a cape of South Wales, on the north coast of the county of Pembroke. Lat. 51. 56. N. lon. 5. 5. W.

PENCA'DER, a village of South Wales, in the county

of Caermarthen. In the year 1038 a battle was fought here between Griffith prince of North Wales, and Howel prince of South Wales, in which the latter was defeated. Howel's wife was made prisoner, and the prince himself very narrowly escaped. It is ten miles south-south-west of Llanbeder.

PENCAR'ROW, a cape in the English Channel, on the fourth coast of Cornwall: two miles east from the river Fowey.

PEN'CIL, *f.* [*penicillum*, Lat.] A small brush of hair which painters dip in their colours.—There are *penicils* of various kinds, and made of various matters; the most usual are of badgers and squirrels hair, those of swans down, and those of boars bristles; which last are bound to a stick, bigger or less according to the uses they are destined for; and, when large, are called *brushes*. The others are inclosed in the barrel of a quill. The ancients, M. Felibien observes, had *penicils* made of little pieces of sponge; whence, doubtless, the story of the painter, who, not able to express the foam of a horse, succeeded by throwing the sponge at the picture. *Chambers*.—Black lead (Graphites) laid between two grooved slips of cedar, and then cut to point.—Black lead in fine powder may be readily mixed with melted sulphur; and, though the compound remains fluid enough to be poured into moulds, it looks nearly like the coarser sorts of black lead itself. This was probably the method by which prince Rupert is said to have made black lead run like a metal in a mould, so as to serve for black lead again. The German black-lead *penicils*, and those which are hawked about among us, are prepared in this manner: their melting or softening, when held in a candle, or applied to a red-hot iron, and yielding a bluish flame, with a strong smell like that of brimstone, discovers their composition. *Penicils* of this kind are hard and brittle, and cut or scratch the paper or wood, instead of marking them. The true English *penicils* are formed of black lead alone, sawed into slips, which are fitted into a groove made of the softest wood, as cedar, and another slip of wood glued over them. These *penicils*, however, are of different quality, on account of different sorts of the mineral being fraudulently joined together in one *penicil*, the fore-part being commonly pretty good, and the rest of an inferior kind. To avoid these inconveniences, some take the finer pieces of black lead itself, which they saw into slips, and fix for use in port-crayons. *Lewis's Commerce of Arts*.—A black-lead pencil is certainly a very neat and convenient instrument; and we may join in the prayer or thanksgiving of an old Nubian, who saw Mr. Waddington using his pencil: "Praised be God, the Creator of the World, who has taught man to inclose ink in the centre of a bit of wood." Waddington and Hanbury's Journal of a Visit to Ethiopia, 1822.—Any instrument of writing without ink. A little flag or streamer; [*pennoncel*, old Fr.] *Obsolete*.—She made him wear a *penicell* of her sleeve. *Chaucer's Tr. and Cress.*

To PEN'CIL, *v. a.* To paint:

Smooth forehead, like the table of high Jove,
Small *penicill'd* eyebrows like two glorious rainbows.

Trag. of Soliman and Perjada, 1599.

PENCK, a town of Germany, in the principality of Culmbach: four miles north-east of Bayreuth.

PEN'CKUM, a town of Anterior Pomerania: thirteen miles south-west of Old Stettin, and forty-four north-north-west of Custrin. Lat. 53. 15. N. lon. 14. 20. E.

PEN'CO. See CONCEPTION, vol. v. p. 13.

PEN'DANT, *f.* [French.] A jewel hanging to the ear:

Some thrid the mazy ringlets of her hair,
Some hang upon the *pendants* of her ear.

Pope.

Any thing hanging by way of ornament:

Unripe fruit whose verdant stalks do cleave
Close to the tree, which grieves no less to leave

The

The smiling *pendant* which adorns her so,
And until autumn on the bough should grow. *Waller.*

The part of a watch to which the chain or ribbon is hung. A pendulum. *Obsolete.*—To make the same *pendant* go twice as fast as it did, or make every undulation of it in half the time it did, make the line, at which it hangs, double in geometrical proportion to the line at which it hanged before. *Digby on the Soul.*—A small flag in ships.

PENDAR'RYE, a town of Hindooftan, in Oude: seventeen miles north-west of Kairabad.

PENDAR'TY, a town of Hindooftan, in the Carnatic: eight miles east of Ongole.

To PENDE, *v. a.* To hang up; to pen; to shut up. *Chaucer.*

PEN'DENCE, or PENDENCY, [from *pendeo*, Lat.] Slopeness; inclination.—The Italians give the cover a graceful *pendence* or slopeness, dividing the whole breadth into nine parts, whereof two shall serve for the elevation of the highest top or ridge from the lowest. *Wotton on Architecture.*—Suspense; delay of decision.—The judge shall pronounce in the principal cause, nor can the appellant allege *pendency* of suit. *Ayliffe.*

PENDE'NE-VOW', on the north coast of Cornwall, near Penzance, has an unfathomable cave under the earth, into which the sea flows at high water. The cliffs between this and St. Ives glitter, as if they had store of copper, of which there is abundance hereabouts within land.

PENDEN'NIS CAS'TLE. See FALMOUTH, vol. vii.

PEN'DENT, *adj.* [*pendens*, Lat. some write *pendant*, from the Fr.] Hanging:

I sometimes mournful verse indite, and sing
Of desperate lady near a purling stream,
Or lover *pendent* on a willow tree.

Philips.

Quaint in green she shall be loose enrob'd
With ribbons *pendant*, flaring about her head. *Shakespeare.*

Jutting over:

A *pendent* rock,
A forked mountain, or blue promontory. *Shakespeare.*
Supported above the ground:

They brought, by wondrous art
Pontifical, a ridge of *pendent* rock
Over the vex'd abyss.

Milton's P. L.

PENDEN'TIVES, *f.* in architecture, are those parts in the angles, between the arches of the nave, which spring from a point, and gradually advance in a concave direction to receive the circular entablature of the cupola. Or, if we suppose a circle inscribed within a square, the curvilinear triangles cut off will be the plans of the *pendentives*.

PEN'DENTNESS, *f.* The state of being *pendent*.

PENDERA'CHI, or ERE'GRI, a seaport town of Asiatic Turkey, on the Black Sea, anciently Heraclea, governed by a *cadî*; at one time episcopal: 100 miles east of Constantinople. Lat. 41. 36. N. lon. 31. 18. E.

PEN'DICE. See PENTICE.

PENDIL'HO, a town of Portugal, in the province of Beira: twelve miles south-east of Lamego.

PEN'DING, *adj.* [*pendente lit.*] Depending; remaining yet undecided.—A person, *pending* suit with the diocesan, shall be defended in the possession. *Ayliffe.*

PEN'DLETON, a village in Lancashire, with a population of 3611, including 226 employed in trade and manufactures: two miles west of Manchester.

PEN'DLETON, a county of Virginia, in America, bounded north-west by Randolph, and south by Rockingham, counties; watered by the south branch of the Patowmack. It contains 4239 free inhabitants, and 202 slaves. Its chief town is Frankford.—Also, a district of South Carolina, on the Keowee and Savannah rivers; containing 22,897 inhabitants, of whom 3485 are slaves: fifty-two miles west of Cambridge.—Also, a county of

Kentucky, containing 2940 people, of whom 346 are slaves.

PEN'DOUN, a town of Birmah: twelve miles south of Raynangong.

PENDRAG'ON CAS'TLE. See KIRKBY STEPHEN, vol. xi. p. 761.

PENDULOSITY, or PEN'DULOUSNESS, *f.* [from *pendulous*.] The state of hanging; suspension.—His slender legs he encreas'd by riding; that is, the humours descended upon their *pendulosity*, having no support or suppedaneous stability. *Brown's Vulg. Err.*

PEN'DULOUS, *adj.* [*pendulus*, Lat.] Hanging; not supported below.—Bellerophon's horse, fram'd of iron, and placed between two loadstones with wings expanded, hung *pendulous* in the air. *Brown's Vulg. Errors.*—The grinders are furnished with three roots, and in the upper jaw often four, because these are *pendulous*. *Ray.*

All the plagues that in the *pendulous* air
Hang fated o'er men's faults, light on thy daughter. *Shak.*

Doubtful; unsettled.—In a *pendulous* state of mind. *Atterbury.*

PEN'DULUM, *f.* [*pendulus*, Lat. *pendule*, Fr.] Any weight hung so as that it may easily swing to and fro, of which the great law is, that its oscillations are always performed in equal time:

Upon the bench I will so handle 'em,
That the vibration of this *pendulum*
Shall make all taylor's yards of one
Unanimous opinion.

Hudibras.

For a full explanation of the theory of pendulums, see the article HOROLOGY, vol. x. p. 307 & seq. We shall add here only two particulars which have since occurred to our notice.

1. Professor Bridge has calculated the following little Table, on a supposition that the length of a seconds pendulum is 39¹/₂ inches in latitude 52°, which is taken as his standard; and he has given the lengths corresponding not only to six different latitudes, but to four different heights, six at the earth's surface, and at one, two, and three, miles of elevation respectively.

Latitude.	Length of Pendulum at the Earth's Surface.	One Mile above the Earth.	Two Miles above the Earth.	Three Miles above the Earth.
At the Equator	39°060	39°036	39°013	38°997
Lat. 30°	39°115	39°091	39°068	39°052
45	39°170	39°146	39°122	39°107
52	39°200	39°176	39°152	39°137
60	39°225	39°201	39°177	39°161
At the Pole	39°281	39°257	39°233	39°218

Thus we see that the greatest variation in the length of a pendulum vibrating at three miles above the equator, and on the earth's surface at the pole, is only .284 of an inch, which affords but a small scale for determining either altitudes or the figure of the earth, to both which purposes the observed variations in the lengths of the pendulum have been proposed as a measure.

2. When a pendulum of a given length has been observed to gain or lose a certain quantity daily, it is convenient, in making the adjustment for exact time, to have some concise theorem as a guide to bring it to the point desired, at one trial, in all cases, which theorem professor Bridge has given in these words: "Multiply twice the length of the pendulum by the number of seconds gained or lost, and divide the result by the number of seconds in a day; the quotient will give the number of inches, or parts of an inch, by which the pendulum is to be lengthened or shortened." Suppose the gain of a seconds pendulum to be three minutes, or 180", in a solar day; then $\frac{39\frac{1}{2} \times 2 \times 180''}{86400} = .16\frac{2}{3}$ parts of an inch, is the quantity, in this case, by which the pendulum

P E N E L O P E .

1. The Horned Turkey Pheasant. 2. The Quon. 3. The Yucru. 4. The Morant.

pendulum must be lengthened to measure mean time ; but, if the three minutes had been lost with a half-second pendulum, then $\frac{9.8 \times 2 \times 180}{36400} = .041$ of an inch, or the

fourth part of the former gain, will be the quantity by which the said pendulum will require to be shortened. This rule is not only short in its application, but easy to be remembered.

PENEL'LA, a town of Portugal, in the province of Beira : fifteen miles south-east of Coimbra.

PEN'EDON, a town of Portugal, in the province of Beira : nineteen miles north-east of Viseu.

PENEL'OPE, a celebrated princess of Greece, daughter of Icarus, and wife to Ulysses king of Ithaca. Her marriage with Ulysses was celebrated about the same time that Menelaus married Helen ; and she retired with her husband to Ithaca, against the inclination of her father, who wished to detain her at Sparta, her native country. She soon after became mother of Telemachus, and was obliged to part with great reluctance from her husband, whom the Greeks obliged to go to the Trojan war. The continuation of hostilities for ten years made her sad and melancholy ; but, when Ulysses did not return like the other princes of Greece at the conclusion of the war, her fears and her anxieties were increased. As she received no intelligence of his situation, she was soon beset by a number of importuning suitors, who wished her to believe that her husband was shipwrecked, and that therefore she ought no longer to expect his return, but forget his loss, and fix her choice and affections on one of her numerous admirers. She received their addresses with coldness and disdain ; but, as she was destitute of power, and a prisoner as it were in their hands, she yet flattered them with hopes and promises, and declared that she would make choice of one of them as soon as she had finished a piece of tapestry on which she was employed. The work was done in a dilatory manner ; and she baffled their eager expectations, by undoing in the night what she had done in the day-time. This artifice of Penelope has given rise to the proverb of *Penelope's web*, which is applied to whatever labour can never be ended. The return of Ulysses after an absence of twenty years, however, delivered her from fears, and from her dangerous suitors.

Thus Penelope is described by Homer as a model of female virtue and chastity ; but some more modern writers dispute her claims to modesty and continence, and they represent her as the most debauched and voluptuous of her sex. According to their opinions, therefore, she liberally gratified the desires of her suitors, in the absence of her husband, and had a son whom she called *Pan*, as if to show that he was the offspring of "all" her admirers. Some however suppose that Pan was son of Penelope by Mercury, and that he was born before his mother's marriage with Ulysses. See PAN. After the return of Ulysses, Penelope had a daughter, who was called Ptoiporthe ; but, if we believe the traditions that were long preserved at Matinea, Ulysses repudiated his wife for her incontinence during his absence, and Penelope fled to Sparta, and afterwards to Mantinea, where she died and was buried. After the death of Ulysses, according to Hyginus, she married Telegonus, her husband's son by Circe, by order of the goddess Minerva. Some say that her original name was Arnea, or Amirace ; and that she was called Penelope, when some river-birds called Penelopes had saved her from the waves of the sea, when her father had exposed her. Icarus had attempted to destroy her, because the oracles had told him that his daughter by Peribœa would be the most dissolute of her sex, and a disgrace to his family.

PENEL'OPE, *f.* the TURKEY PHEASANT ; a genus of birds of the order gallinæ. Generic characters—Bill naked at the base ; head covered with feathers ; chin naked ; tail with twelve feathers ; legs without spurs.

This beautiful genus of birds partakes of the form and nature of the Meleagris (turkey), the Phasianus

(pheasant), and Crax (curassow). It was instituted by Gmelin in his last edition of the *Sylt. Naturæ* ; so that the six species of which it consists have been selected from the Linnæan genera we have mentioned. See the article MELEAGRIS, vol. xv. p. 49.

1. *Penelope fatyra*, the horned turkey-pheasant : two horns on the head ; body red, with ocellated spots. This elegant and singular bird derives its name from two protuberances which grow from its head like horns, which are of a beautiful blue colour, a cylindrical shape, blunt at their ends, reclined backwards, and consisting of a substance resembling callous flesh. It has not that round circle about its eyes which occurs in the pheasants, and is sometimes dotted with black ; the space which furrounds the eyes is shaded with black hairs, like feathers. Under this space, and from the bottom of the lower mandible, grows a kind of gorget, consisting of loose skin, which falls down and floats freely on the throat and the upper part of the neck ; this gorget is black in the middle, and is sprinkled with a few straggling hairs of the same colour. It is marked with wrinkles ; so that it appears to admit of extension in the living animal, and can be inflated or contracted at pleasure ; like the caruncles of the turkey-cock : the lateral parts are blue, with some spots of orange, and without any hair on the outer surface ; but the inside, which applies to the neck, is shaded with little black feathers, as well as that part of the neck which it covers. The crown of the head and fore part of the body are of a beautiful red, and the hind-part of a dusky orange. Over the whole bird, including even the tail and the wings, are a profusion of pellucid spots, furrounded with black, and dispersed with considerable regularity. These spots are round on the fore-part, and oblong or shaped like tears of pearl on the hind-part, with the point turned towards the head. In size this bird is between a fowl and a turkey, and shaped very much like the latter : " the legs (Edwards says) resemble those of the cock pheasant, being armed, like them, with sharp spurs." If so, it is wrongly placed in this genus.

The female, contrary to the usual ordination of nature in the plumage of birds, is nearly if not quite as beautiful as the male. It is but of late date that these birds have been known in England. The male was first figured by Edwards, in his *Gleanings of Natural History* ; and the female appeared only in 1798, in Mr. Pennant's *View of Hindoostan* ; from the British settlements in which country it was brought by Sir Elijah Impey, on his return to England. The principal distinction of this sex is, that it has not the horns, so conspicuous in the male. The feathers on the front of the head, and part of the neck, are of a silky texture, black, glossed with ultramarine blue ; the feathers on the hind head are a beautiful crimson, forming a tuft or crest flowing backward. The neck, the breast, the belly, and thighs, are of the same glowing crimson colour, which, as well as the back and wings, are spangled with the same pearly tears as in the male, though less numerous on the wing-coverts : the back and wings, and smaller tail-feathers, are of a rich orange ground, marked with minute black lines or bars ; the tip of the tail black. These birds are by no means common in Hindoostan, though frequently seen in paintings done in India ; where the male is called *gingee moory*, or marbled bird ; and the female *moory mammooree*, or the bright bird.

2. *Penelope cristata*, the crested penelope, or quan : an upright crest on the head ; temples violet. Marcgrave was the first who noticed this curious bird. Several ornithologists, copying him, have ranged it with the pheasants : whilst Brisson, Edwards, and Latham, have classed it with the turkey. It is rather larger than a fowl : length two feet six inches ; bill two inches long, and black ; irides dull orange ; sides of the head covered with a naked purplish blue skin, in which the eyes are placed ; beneath the throat, for an inch and a half, the skin is loose, of a fine red colour, and covered only with a few hairs ; the top of the head is furnished with long feathers, which

the bird can erect as a crest at will. The general colour of the plumage is brownish black, glossed with copper in some lights; but the wing-coverts have a greenish and violet gloss: the quills mostly incline to purple. The fore part of the neck, breast, and belly, are marked with white spots; the thighs, under tail-coverts, and the tail, brownish black: the legs are red, and destitute of spurs; claws black. Some of these birds are observed to have little or no crest, and are supposed to be *females*. It inhabits Brazil, where it is often made tame. It frequently utters a noise not unlike the word *jaeu*. The flesh is much esteemed.

Dr. John Latham, of Romsey, in a most elaborate Essay on the Tracheæ of Birds, read before the Linnæan Society in 1797, has noticed wherein some species of this genus differ from the ordinary conformation in that particular. But he previously observes, that "in most birds the natural shape of the trachea, *aspera arteria*, or windpipe, by all which names this part is known, is that of a regularly-uniform cylinder of equal diameter, or nearly so, throughout, from its rise at the root of the tongue to its entrance into the hollow of the thorax, sternum, or breast-bone, where it divides into two branches called bronchiæ, which ramify into air-vessels which compose the two lobes of the lungs. This, I say, is the general mode of construction: but ornithologists pretty far back have noticed nature's deviation from this usual structure, both in respect to the various curvatures of the windpipe itself, as well as the difference of some from others in respect to conformation; but their sentiments were penned in too vague a manner to determine much thereon, not answering the purpose further than to stimulate our future researches. As far as the deviation from a cylindrical shape is concerned, it is observable that the peculiar difference in structure is seen only in the male sex, the female not having the least enlargement, or increased cavity, as will hereafter be mentioned: but to what purpose nature has intended this, is, I believe, at present unknown to us. Some authors have given as their opinion, that the enlargement of the trachea in males, whenever it happens, serves to increase the tone of voice; and that this sex is enabled, by means of it, to cry out more forcibly than those birds which have no such construction of parts, an instance of which is pointed out in the golden-eye duck, the Latin name of which (*Anas clangula*) has been given to it from this supposed circumstance. In respect to what assistance such a construction of parts as above said may afford to the tone of the voice, I will not venture here to affirm; for it cannot be denied that some birds are able to utter very loud sounds without such aid, witness the cock, peacock, and others. We see Nature's operations and admire them in course, yet cannot always comprehend the utility of her works; and this seems one of her designs concerning which we are not at all clear.

"In the quan, or guan, the windpipe not only descends much lower on the breast, but at the bottom part it doubles upwards for at least one-third of its length. It differs also in another particular; for, instead of making a descent on the left side, it passes down on the right, and, contrary to the others, returns upwards, and goes into the cavity of the thorax over the left clavicle."

3. Penelope Cumanensis, the Cayenne penelope, or yacou: blackish; crest and first quill-feathers white. This is also larger than a fowl. The bill black; the head-feathers long and pointed, forming a crest, which can be erected at pleasure; irides pale rufous; space round the eyes naked, of a bluish colour, and not unlike that of a turkey: it has also a naked membrane, or kind of wattle, of a dull black; the blue skin comes forward on the bill, but is not liable to change colour like that of the turkey. The plumage has not much variation; it is chiefly brown, with some white markings on the neck, breast, wing-coverts, and belly; the tail is pretty long, and even at the end; legs red. This is found at Cayenne, but is a rare bird, being met with only in the interior parts, or

about the Amazons country: though it is in much greater plenty up the river Oyapoc, especially towards Camoupi: and indeed those that are seen at Cayenne are mostly tame ones; for it is a familiar bird, and will breed in that state, and mix with other poultry. It makes its nest on the ground, and hatches its young there, but is at other times mostly seen on trees. It will frequently erect its crest, when pleased or taken notice of, and likewise spread the tail upright, like a fan, in the manner of the turkey. It has two kinds of cry; one like that of a young turkey, the other more plaintive: the first of these is thought by the Indians to express the word *couyavoit*, the other *yacou*,

4. Penelope marail, the green penelope, or marail: upper surface green; naked orbits and legs red; throat naked, speckled with white. This species is of the size of a fowl, and not unlike it in shape. The bill and irides blackish; space round the eye bare, and of a pale red; chin, throat, and fore-part of the neck, barely covered with feathers: but the throat itself is bare, and the membrane elongated to half an inch more; both this, and the skin round the eyes, change colour, and become deeper and thicker when the bird is irritated: head-feathers longish, so as to appear like a crest when raised up, which the bird often does when agitated; at which time it also erects those of the whole head, and so disfigures itself as to be scarcely known. The general colour of the plumage is a greenish black; the fore-part of the neck tipped with white. The wings are short; the tail long, even at the end, and can be lifted up and spread out like that of a turkey; the legs and toes of a bright red; claws crooked, and somewhat sharp. This species is common in the woods of Guiana, at a distance from the sea, though it is much less known than could be imagined. They are generally found in small flocks, except in breeding-time, when they are only seen by pairs, and then frequently on the ground, or on low shrubs; at other times on high trees, where they roost. The female makes her nest on some low bushy tree, as near the trunk as possible, and lays three or four eggs. When the young are hatched, they descend with their mother, after ten or twelve days. The mother acts as other fowls, scratching on the ground like a hen, and brooding the young, which quit their nurse the moment they can shift for themselves. They have two broods in a year; one in December or January, the other in May or June. The young birds are easily tamed, and seldom forsake the places where they have been brought up; they need not be housed, as they prefer roosting on tall trees to any other place. Their cry is not inharmonious, except when irritated or wounded, when it is harsh and loud. The flesh is much esteemed.

Buffon supposes this bird to be the female of the yacou, or at least a variety; but that this cannot be, the anatomical inspection will at once determine. The windpipe of this bird has a singular construction, passing along the neck to the entrance of the breast, where it rises on the outside of the flesh, and, after going a little way downwards, returns, and then passes into the cavity to the lungs. It is kept in its place on the outside by a muscular ligament, which is perceivable quite to the breast-bone. This is found to be the case in both male and female, and plainly proves that it differs from the yacou, whose windpipe has been already described.

If this be the bird mentioned by Fermin, in his history of Guiana, he says that the crest is *uneiform*, and of a black-and-white colour; and observes that they are very scarce at Surinam. Bancroft mentions a bird of Guiana by the name of *marrodee*, which, he says, is wholly of a brownish black; the bill the same; legs grey. These, he says, are common, and make a noise not unlike the name given it, perching on trees. The Indians imitate their cry so exactly as to lead to the discovery of the place the birds are in, by their answering it. The flesh of them is like that of a fowl. This is probably a variety of our species.

The figures on the annexed Plate correspond with the four species above described.

5. Penelope pipile, the piping curassow: back brown spotted with black, belly black; caruncle on the chin blue. This species was discovered by Jacquin; and is readily distinguished by its hissing or piping noise. The skin is bare on the neck, and of a dull green, with a blue caruncle on its throat. The head is partly black, and partly white; and adorned with a short crest, similar to, though smaller than, the other species. The irides are black, and the space round the eyes white: the belly and vent is white; but the back and wing-coverts are brown, waved or spotted with deep black; legs and feet inclined to red. It is about the size of a common fowl; and is found in Guiana and Brazil; but is a scarce bird.

6. Penelope vociferans, the crying curassow: brown; bill and breast blue, belly whitish. This bird was first introduced by Fernandez, who gives a very slight description; viz. "that the bill is bluish; the back brown; the breast blue; and the belly of a whitish brown; and that it is of the same size with the others." It inhabits Mexico, and cries like other fowls, or rather like the whole family of the poultry-yard together; for it is so loud and continual, that one of these often makes more noise than all the rest of them put together. The Mexican name *chachalacumetl*, signifies crying bird. It is said to frequent mountainous places, where it brings up its young. This last has been removed by Dr. Turton to the end of the genus CRAX.

PENE'OS, or SALAM'PRIA, a river of Thessaly, which runs into the Egean Sea twenty miles east of Larissa. See PENEUS.

PENERARIUS, *f.* in old records, a standard-bearer, the officer who bore the banner.

PENETRABILITY, *f.* Susceptibility of impression from another body.—There being no mean between penetrability and impenetrability, passivity and activity, they being contrary; therefore the infinite rarefaction of the one quality is the position of its contrary. *Cheyne's Phil. Principles.*

PENETRABLE, *adj.* [Fr. *penetrabilis*, Lat.] Such as may be pierced; such as may admit the entrance of another body:

Let him try thy dart,
And pierce his only penetrable part. *Dryden.*

Susceptive of moral or intellectual impression:

I am not made of stone,
But penetrable to your kind entreaties. *Shakespeare.*

PEN'ETRAIL, *f.* [*penetrabilia*, Lat.] Interior parts. *Not in use.*—The heart resists purulent fumes, into whose penetrails to insinuate some time must be allowed. *Harvey.*

PEN'ETRAL, *f.* The inner open part of a house. *Cole.*

PEN'ETRA'LE, *f.* A sacred room or chapel in private houses, which was set apart for the worship of the household gods among the ancient Romans. In temples also there were *penetrabilia*, or apartments of distinguished sanctity, where the images of the gods were kept, and certain solemn ceremonies performed.

PEN'ETRANCY, *f.* Power of entering or piercing.—The subtilty, activity, and penetrancy, of its effluvia, no obstacle can stop or repel, but they will make their way through all bodies. *Ray on the Creation.*

PEN'ETRANT, *adj.* Having the power to pierce or enter; sharp; subtle.—The food, mingled with some dissolvent juices, is evacuated into the intestines, where it is further subtilized, and rendered so fluid and penetrant, that the finer part finds its way in at the freight orifices of the lacteous veins. *Ray.*—Having power to affect the mind.—A modest and friendly style doth suit truth; it, like its author, doth usually reside (not in the rumbling wind, nor in the shaking earthquake, nor in the raging fire, but) in the small still voice: founding in this, it is most audible, most penetrant, and most effectual. *Barrow's*

Serm. 4 on Tit. iii. 2.—The learned writings of St. Austin, St. Hierom, &c. [and] penetrant and powerful arguments. *Boyle's Style of H. Script.*

To PEN'ETRATE, *v. a.* [*penetro*, Lat. *penetrer*, Fr.] To pierce; to enter beyond the surface; to make way into a body.—Marrow is, of all other oily substances, the most penetrating. *Arbuthnot on Aliments.*

Thy groans
Did make wolves howl, and penetrate the breasts
Of ever-angry bears. *Shakespeare's Tempest.*

To affect the mind. To reach the meaning.—There shall we clearly see the uses of these things, which here were too subtle for us to penetrate. *Ray.*

To PEN'ETRATE, *v. n.* To make way:
Court-virtues bear, like gems, the highest rate
Born where heav'n's influence scarce can penetrate:
Though the same sun, with all-diffusive rays,
Smile in the rose, and in the diamond blaze,
We praise the stronger effort of his power,
And always set the gem above the flower. *Pope.*

To make way by the mind.—If we reached no farther than metaphor, we rather fancy than know, and have not yet penetrated into the inside and reality of the thing. *Locke.*

PENETRA'TION, *f.* The act of entering into any body:

It warms
The universe, and to each inward part
With gentle penetration, though unseen,
Shoots invisible virtue even to the deep. *Milton's P. L.*

Mental entrance into any thing abstruse.—A penetration into the abstruse difficulties and depths of modern algebra and fluxions, is not worth the labour of those who design either of the three learned professions. *Watts.*—Acuteness; sagacity.—The proudest admirer of his own parts might consult with others, though of inferior capacity and penetration. *Watts.*

PEN'ETRATIVE, *adj.* Piercing; sharp; subtle.—Let not air be too gross, nor too penetrative, nor subject to any foggy noisomeness from fens. *Wotton.*—Acute; sagacious; discerning:

O thou, whose penetrative wisdom found
The South-sea rocks and shelves, where thousands drown'd.
Swift's Miscellanies.

Having the power to impress the mind:

Would'st thou see
Thy master thus with pleacht arms bending down
His corrigible neck, his face subdu'd
To penetrative shame? *Shakespeare.*

PEN'ETRATIVENESS, *f.* The quality of being penetrative.

PENEUS, in ancient geography, a river of Thessaly, rising on mount Pindus, and falling into the Thermean gulf, after a wandering course, between mount Ossa and Olympus, through the plains of Tempè. It received its name from Peneus, a son of Oceanus and Tethys. The Peneus anciently inundated the plains of Thessaly, till an earthquake separated the mountains Ossa and Olympus, and formed the beautiful vale of Tempè, where the waters formerly stagnated. From this circumstance, therefore, it obtained the name of *Araxes*, from *αραξωω*, to cleave. The present name of *Salampria* is ancient, as, according to Eustathius, this river was in his time called *Salimprias*, a name, according to Hesychius, of Greek origin, *σαλαβρη* and *σαλαμβρη*, signifying the "openings of gates."

Most authors are of opinion, that Deucalion's deluge was occasioned by the river Peneus. To this purpose, Herodotus observes, "It is said that Thessaly once was nothing but a lake, being environed on all sides with hills. The country which lies between those hills is what they call Thessaly, which is watered with plenty of rivers, the chief

chief of which are the Peneus, the Apidanus, the Onchones, the Eripeus, and the Panito. These five rivers, falling down from the neighbouring mountains, after having run through the low country, disembogue themselves into the sea by a very narrow canal, where they all unite, and make but one great river, which retains the name of Peneus. They tell us farther, that before the canal was made, these rivers flooded the whole country, and turned it into a great lake; but that, Neptune having formed that great canal, all the waters retired." Peneus, on account of its beauty, was an object of worship. Daphne, the daughter of the Peneus, according to the fables of the mythologists, was changed into a laurel on the banks of this river. This tradition arises from the quantity of laurels which grow near the Peneus. *Ovid's Met.* i. 452, &c.

PENGEHUR', a town of Persia, in the province of Mecran: 130 miles north of Kidge, and 180 east-north-east of Kieh.

PENGHIU'M, a town of the Birman empire, at the confluence of a small river with the Irawaddy: near Yayingnangheum, or Earth-oil creek.

PEN'GUIN, *f.* [from the Welch *pen*, head, and *guin*, white.] See *APTENODYTES*, vol. i.—This bird was found with this name, as is supposed, by the first discoverers of America; and *penguin* signifying in Welch a white head, and the head of this fowl being white, it has been imagined that America was peopled from Wales; whence Hudibras: "British Indians nam'd from *penguins*." Grew gives another account of the name, deriving it from *pinguis*, Lat. fat: "The *penguin* is so called from his extraordinary fatness; for, though he be no higher than a large goose, yet he weighs sometimes sixteen pounds; his wings are extreme short and little, altogether unuseful for flight, but by the help whereof he swims very swiftly." Grew's Museum.—But it is as unlikely that the American Indians should derive the name of a bird from the Latin as from the Welch.—The isle is three miles about, in which we saw abundance of *penguins*, in Welch "white-heads," agreeable to their colour. *Sir T. Herbert's Travels*.—There are very many great lazy fowls upon and about this island, with great coal-black bodies, and very white heads, called *penguins*. *Terry's Voy. to the East Indies*, 1655.—A fruit. See *BROMELIA penguin*.—The *penguin* is very common in the West Indies, where the juice of its fruit is often put into punch, being of a sharp acid flavour: there is also a wine made of the juice of this fruit, but it will not keep good long. *Miller*.

PEN'GUIN I'SLAND, a small island near the coast of New Holland, at the entrance into Adventure Bay. Lat. 43. 21. N. lon. 147. 33. E.

PEN'GUIN I'SLAND, a small island near the Cape of Good Hope, a little to the north of Table Bay.

PEN'GUIN I'SLAND, an island near the south coast of Newfoundland. Lat. 47. 22. N. lon. 56. 45. W.

PEN'GUIN I'SLAND, a small island near the coast of Patagonia, abounding in seals and penguins: nine miles south-east of Port Desire.

PEN'GUIN ISLAND, one of the New Shetland Islands lately discovered! No official accounts of the discovery of this antarctic country has yet been made public; and it is said that no official account is meant to be promulgated from that high branch of government to which such matters more immediately belong. This report is, however, we trust, inaccurate. Since the second voyage of the *William*, a journal of which voyage has been published in the *Literary Gazette*, it appears that two Russian frigates on a voyage of discovery circumnavigated the *New Shetland Islands*, (for islands it is said this supposed antarctic land is;) and the *Sandwich Land* of Capt. Cook proved also to be an island. From the whole of these discoveries it results, as far as is hitherto known, that a very lucrative trade in seals may be carried on, as the sea swarms with these animals, which are of great size, full of oil, and have the finest fur. In other respects ani-

mal existence is limited in variety, though not in the number of particular species. The shores are covered with penguins, which even dispute possession with the human visitors. There are gulls, albatrosses, and one land-bird about the size of a pigeon. The sea-elephant also inhabits these dreary parts; whales are also numerous, but extremely poor. No small fish were caught or seen; and the only conchological products on the shores were the empty shells of limpets.

One of these islands has been named *PENGUIN ISLAND*: the latitude of anchorage was ascertained to be 62. 6. S. at the south-east end of the island; the longitude where the jack was planted, 58. 7. W. variation of the needle, 23. 59. E. In *George's Bay*, so named in honour of his majesty, on account of its being the first part in which the British flag was hoisted, the tides rise pretty regularly from 14 to 16 feet, and appear to be entirely influenced by the winds. The coast at the bottom of the bay consists of high snow-cliffs. Notwithstanding the sterility of the land, there is a slight soil at the back of the watering-place, a mixture of sand and mould, by digging into which, not more than a foot in depth, water was found. The swampy land was covered with a sort of grass and moss, both of which abound in great quantities, and are all that deserves to be called vegetation. No land-animal, except birds, was seen. Snow of a reddish tint was seen here, as in the arctic regions: the cause of this colour the observers could not account for; it could not be occasioned by the soil, since under the chief place where the snow was found there ran a very rapid stream of considerable depth, and the voyagers were then passing over valleys filled with snow. The stones and rocks consisted principally of white and brown granite and lime-stone, together with some varieties, of which specimens were preserved.

PEN'HA GARCIA. See *PEGNA GARCIA*.

PEN'IA, in mythology, the goddess of Poverty and mother of Love.

PENJANG'. See *PANJANG*.

PEN'IBLE, *adj.* [French.] Painful. *Chaucer*.

PEN'ICHE, a seaport town of Portugal, in Estremadura situated on a peninsula which runs into the Atlantic. It is fortified, and defended by a citadel; it contains three parishes, and about 2800 inhabitants. This town is sometimes called *New Lisbon*: thirty-nine miles north-north-west of Lisbon, and thirty-four west of Santarem. Lat. 39. 20. N. lon. 9. 5. W.

PENICIL'LA, *f.* A lozenge, a form of medicine.

PENICIL'LUS, *f.* A tent, a medicated roll to be put into a deep wound or ulcer.

PENIDIUM, *f.* A form of medicine prepared from clarified sugar.

PENI'EL. See *PENUEL*.

PENJEKO'REH, a town of Candahar, in Cabulistan: eight miles west of Mashanger.

PENJEKO'REH, a river of Asia, which runs into the Sewad about five miles south of the town of Penjekoreh.

PEN'IGK, or PENIG, a town of Saxony, and capital of a lordship in the principality of Schonburg, which is a Saxon fief, on the Muldau. Here is a manufacture of woollen stuffs and a pottery: thirty-eight miles west of Dresden, and twenty-eight south-south-east of Leipzig. Lat. 50. 52. N. lon. 12. 35. E.

PEN'ING, a town of Bavaria, in the principality of Aichstatt: nine miles east-north-east of Aichstatt.

PENIN'NAH, *f.* [Heb. a pearl.] The second wife of Elkanah, the father of Samuel. Peninnah had several children, (1 Sam. i. 2, 3, &c.) but Hannah, who afterwards was mother of Samuel, was for a great while barren. Peninnah, instead of giving the glory to God, the author of fruitfulness, was elevated with pride, and insulted her rival Hannah. But, the Lord having visited Hannah, Peninnah was thereupon humbled; and some interpreters think that God took away her children from her, or at least that she had no more after this time, according

ording to the words of the song of Hannah, (1 Sam. ii. 5.) "The barren hath born seven, and she that hath many children is waxed feeble."

PENIN'SULA, f. [*penè insula*, Lat. *peninsula*, Fr.] A piece of land almost surrounded by the sea, but joined by a narrow neck to the main.—A side of Milbrook lieth the *peninsula* of Infwork, on whose neckland standeth an ancient house. *Carew*.—Spain, from its situation, is generally called, by way of distinction, the *Peninsula*. *James's Mil. Dict.*

PENIN'SULA POINT, a cape on the west coast of the island of Mindoro. Lat. 12.40. N. lon. 120.56. E.

PENIN'SULATED, adj. Almost surrounded by water.—The mountains, the river Neath, and its shady banks, form a beautiful back-ground and contrast to the bold craggy shore, and the broken *peninsulated* knolls, which not infrequently project from it. *Wyndham's Tour*.

PENINUS, in mythology, a god acknowledged by the Penini, inhabitants of the Alps, from whom that chain of mountains derived its name: as we learn from Livy, Dec. 3. xi. 38. Guichenon, in his History of Savoy, has preserved the inscription that was upon the pedestal of a fine statue, that represented this god under the figure of a young man naked, in these terms, "L. Lucilius Deo Penino Optimo Maximo donum dedit." Cato and Servius (in 3 Æn.) say, that this was not a god, but a goddess, whom the one calls Penina, and the other Apenina; but both the figure and the inscription express the contrary. The statue of that god was afterwards carried off, and that of Jupiter put in its place. Nevertheless, the worship of Peninus was not abolished, but the mountaineers continued to pay adoration to him. Some say that this god was Jupiter himself, which they infer from the epithets "Optimus Maximus;" but others say that he was the Sun; and that the carbuncle upon the statue, called Peninus's eye, was the same with that of Osiris, who, in Egypt, represented the Sun.

PENISAA'RI, an island of the Baltic, three versts long, and distant six versts from LavanSaari, which see. It is inhabited only by a few families, and has no water-springs.

PENISCO'LA, a town of Spain, in Valencia, situated on the coast of the Mediterranean, surrounded on three sides by the sea, and difficult of access by land: twenty-four miles south of Tortosa, and 195 east of Madrid. Lat. 40.24. N. lon. 0.24. E.

PENISHE'HR, or **PENJESHEHR**, a town of Candahar, and capital of a district, in the Cabulistan, on the east side of the Hindoo-Kho Mountains: forty-six miles north of Cabul. Lat. 35.16. N. lon. 68.24. E.

PEN'ISTONE, or **PENNISTON**, a small market-town, in the West Riding of Yorkshire, situated eight miles west-south-west from Barnsley. The market is on Thursday, but it is little frequented. Here are four annual fairs, which are chiefly noted for the sale of moor-sheep. The town is environed with dreary moors, especially to the westward, where nothing presents itself to the eye but bleak and barren mountains, covered with heath or ling. Penistone, according to the population returns, contains 115 houses, and 515 inhabitants. The church is a large structure; and near the centre of the town is a well-endowed grammar-school. *Beauties of England and Wales*, vol. xvi.

PEN'ITENCE, or **PENITENCY, f.** [*penitence*, Fr. *pœnitentia*, Lat.] Repentance; sorrow for crimes; contrition for sin, with amendment of life or change of the affections.—Where *penitency*, not disturb'd may grieve. *Taylor's Hog hath lost his Pearl*.

Death is deferr'd, and *penitence* has room
To mitigate, if not reverse, the doom.

Dryden.

PENITENCE is sometimes used for the discipline, or punishment, attending repentance; more usually called *penance*. It also gives title to several religious orders, consisting either of converted debauchees and reformed

VOL. XIX. No. 1323.

prostitutes, or of persons who devote themselves to the office of reclaiming them. Of this latter kind is the

Order of Penitence of St. Magdalen, established about the year 1272 by one Bernard, a citizen of Marseilles, who devoted himself to the work of converting the courtizans of that city. Bernard was seconded by several others; who, forming a kind of society, were at length erected into a religious order by pope Nicholas III. under the rule of St. Augustine. Father Gesnay says, that they also made a religious order of the penitents, or women they converted, giving them the same rules and observances which they themselves kept.

Congregation of Penitence of St. Magdalen at Paris, owed its rise to the preaching of one Tiferan, a Franciscan, who converted a vast number of courtizans about the year 1492. Louis duke of Orleans gave them his house for a monastery; or rather, as appears by their constitutions, Charles VIII. gave them the hotel called Bochaigne, whence they were removed to St. George's chapel in 1572. By virtue of a brief of pope Alexander, Simon bishop of Paris, in 1497, drew up for them a body of statutes, and gave them the rule of St. Augustine. It was necessary, before a woman could be admitted, that she had first committed the sin of the flesh. None were admitted who were above 35 years of age. Till the beginning of the 17th century, none but penitents were admitted; but, since its reformation by Mary Alvequin, in 1616, none have been admitted but maids, who however still retain the ancient name penitents.

PENITENT, adj. Repentant; contrite for sin; sorrowful for past transgressions, and resolutely amending life.—The proud he tam'd, the *penitent* he chear'd. *Dryden*.

Much it joys me

To see you become so *penitent*.

Shakespeare.

PEN'ITENT, f. One sorrowful for sin.—The repentance, which is formed by a grateful sense of the divine goodness towards him, is resolved on while all the appetites are in their strength: the *penitent* conquers the temptations of sin in their full force. *Rogers*.—One under censures of the church, but admitted to penance.—The counterfeit Dionysius describes the practice of the church, that the catechumens and *penitents* were admitted to the Lessons and Psalms, and then excluded. *Stillingfleet*.—One under the direction of a confessor.

PENITENTS, an appellation given to certain fraternities of persons distinguished by the different shape and colour of their habits. These are secular societies, who have their rules, statutes, and churches, and make public processions under their particular crosses or banners. Of these there are more than a hundred, the most considerable of which are as follow: The White Penitents, of which there are several different forts at Rome, the most ancient of which was constituted in 1264; the brethren of this fraternity every year give portions to a certain number of young girls, in order to their being married: their habit is a kind of white sackcloth, and on the shoulder is a circle, in the middle of which is a red-and-white cross. Black Penitents, the most considerable of which are the Brethren of Mercy, instituted in 1488 by some Florentines, in order to assist criminals during their imprisonment, and at the time of their death: on the day of execution, they walk in procession before them, singing the seven penitential psalms and the litanies; and, after they are dead, they take them down from the gibbet and bury them; their habit is black sackcloth. There are others whose business it is to bury such persons as are found dead in the streets: these wear a death's head on one side of their habit. There are also blue, grey, red, green, and violet, penitents; all of whom are remarkable for little else besides the different colour of their habits. Mabillon tells us, that at Turin there are a set of penitents kept in pay to walk through the streets in procession, and cut their shoulders with whips, &c.

Penitents of the Name of Jesus, a congregation of religious

Y

religious

ligious at Seville in Spain, consisting of women who had led a licentious life, founded in 1550. This monastery is divided into three quarters: one for professed religious; another for novices; a third for those who are under correction. When these last give signs of a real repentance, they are removed into the quarter of the novices, where, if they do not behave themselves well, they are remanded to their correction. They observe the rule of St. Augustine.

Penitents of Orvieto, are an order of nuns, instituted by Antony Simoncelli, a gentleman of Orvieto, in Italy. The monastery he built was at first designed for the reception of poor girls abandoned by their parents, and in danger of losing their virtue. In 1662 it was erected into a monastery, for the reception of such as, having abandoned themselves to impurity, were willing to reform, and consecrate themselves to God by solemn vows. Their rule is that of the Carmelites. These religious have this in peculiar, that they undergo no novitiate. All required is, that they continue a few months in the monastery in a secular habit; after which they are admitted to the vows.

PENITENTIAL, *adj.* Expressing penitence; enjoined as penance.—Is it not strange, that a rational man should adore leeks and garlic, and shed *penitential* tears at the smell of a deified onion. *South.*

I have done penance for contemning love,
Whose high imperious thoughts have punish'd me
With bitter fasts and *penitential* groans. *Shakespeare.*

PENITENTIAL, *f.* [*penitenciel*, Fr. *penitenciale*, low Lat.] A book directing the degrees of penance.—The *penitential*, or book of penance, contained such matters as related to the imposing of penance, and the reconciliation of the person that suffered penance. *Ayliffe.*—There are various *penitentials*, as the Roman *penitential*, that of the venerable Bede, that of pope Gregory III. &c. *Chambers.*

PENITENTIARY, *adj.* Relating to the rules and measures of penance.—There needed no other *penitentiary* tax. *Bp. Bramhall's Schism Guarded.*

PENITENTIARY, *f.* [*penitencier*, Fr. *penitenciarus*, low Lat.] In the ancient Christian church, a name given to certain presbyters or priests, appointed in every church to receive the private confessions of the people, in order to facilitate public discipline, by acquainting them what sins were to be expiated by public penance, and to appoint private penance for such private crimes as were not proper to be publicly censured.—Upon the loss of Urbin, the duke's undoubted right, no *penitentiary*, though he had enjoined him never to straight penance to expiate his first offence, would have counselled him to have given over pursuit of his right, which he prosperously re-obtained. *Bacon.*—At the court of Rome, an office in which are examined and delivered out the secret bulls, graces, or dispensations relating to cases of conscience, confessions, &c.—An officer, in some of their cathedrals; vested with power from the bishop to absolve in certain cases. The pope has at present his grand penitentiary, who is a cardinal, and the chief of the other penitentiary priests established in the church of Rome, who consult him in all difficult cases. He presides in the penitentiary, dispatches dispensations, absolutions, &c. and has under him a regent and twenty-four proctors.—The great *penitentiary* with his counsellors prescribes the measure of penance. *Ayliffe.*—A penitent; one who does penance.—A prison restrained John Northampton's liberty, who, for abusing the same in his unruly mayoralty of London, was condemned hither as a perpetual *penitentiary*. *Carew.*—To maintain a painful fight against the law of sin is the work of the *penitentiary*. *Hammond.*—One kind of Franciscan.—Many other reformations have been from time to time of the Franciscans, as by the Minims, Recollects; *Penitentiaries*, Capuchins, &c. *Weaver.*—A place where penance is enjoined; as the *Penitentiary* at Milbank.

PENITENTLY, *adv.* With repentance; with sorrow for sin; with contrition.

PENITENTNESS, *f.* The state of being penitent.

PENK, a river of England, in the county of Stafford, which runs into the Sow about a mile below Stafford.

PENKE'MAS POINT, a cape or headland on the west coast of Wales, and north point of the county of Pembroke, at the mouth of the Tivy, four miles below Cardigan.

PEN'KNIFE, *f.* A knife used to cut pens.—Some schoolmen, fitter to guide *penknives* than swords, precisely stand upon it. *Bacon.*—We might as soon fell an oak with a *penknife*. *Holyday.*

PENK'RIDGE, a market-town in Staffordshire, seated on the river Penk, whence its name is supposed to have been derived, at the distance of six miles to the south of Stafford. It is of very great antiquity, and, according to Camden, was the site of the Roman station *Pennocrucium*, mentioned in the Itinerary of Antoninus; but Plot, Stukeley, and Horsley, place that station at the neighbouring village of Stretton; and Salmon transfers it to Oldbury in Warwickshire. However, though thus entertaining different opinions respecting the actual position of *Pennocrucium*, all these authors agree in considering the present town of Penkridge as the immediate offspring of the deserted station. Some Roman remains were discovered here about the middle of the last century; and, among other smaller articles, a brass head of the bolt of a catapult.

Penkridge is but a small mean-looking town. The inhabitants are principally engaged in different departments of the iron-trade. The market-day is Tuesday; and there are, besides, two fairs annually; one on the 30th of April; and the other, on October 10, for horses; and to this fair is brought a prodigious number of the finest and most beautiful horses that can any where be seen, from Yorkshire, the bishoprick of Durham, and all the horse-breeding counties in England. It may be marked for the greatest horse-fair in the world for horses of value, especially saddle-horses; though there are great numbers of fine large stone-horses for coach and draft sold likewise.

The church of Penkridge, *olim* Pencriz, is mentioned in the charter of king Stephen and the bull of pope Lucius, as given to the bishop and churches of Coventry and Lichfield, in the same manner with Wolverhampton and Stafford, which were notoriously royal free chapels, or colleges, and which makes it probable that this of Pencriz might be of the same nature. The advowson of the church and the manor were granted by one Hugh Houise to the archbishop of Dublin and his successors, which gift was confirmed by king John, anno regni 17; and in process of time that archbishop was always dean of this church, and had the collation of all the prebendaries, who were thirteen in number about 26th Henry VIII. when they were valued at 106l. 15s. The grant of king John to the archbishop of Dublin bears date 13th Sept. 1216, and is done away by the 1st Edward VI. 1547, by which act colleges and chantries were vested in the crown. King John's charter makes no mention how this church came to be endowed and became collegiate. Here was some foundation before the conquest; and it seems to have been collegiate temp. Hen. II. and it undoubtedly was so 20 Edw. I. In the time of Edw. III. that king gave to John de St. Paul the prebend of St. Michael in the free chapel of Pencrich, Dec. 6, 1337; and he protected Wm. de Killeley in the prebend of Cauk (perhaps rather Cank) in the chapel of Pencrich.

The church (a view of which was drawn and engraved by T. Donaldson for Shaw's History of Staffordshire, but never published) is dedicated to St. Michael; and at the dissolution was granted, 2 Edw. VI. to John earl of Warwick; and, 4 & 5 Phil. and Mary, to Wm. Riggs and Wm. Buckbird. Penkridge church is a large handsome fabric of stone, in the gothic style of architecture; the general exterior

WILLIAM PENN.

Engraved for the Encyclopædie Louthensis July 1823.

exterior appearance is magnificent, the walls being ornamented with small pinnacles and battlements; and contains sundry monumental memorials of the Littletons of Teddesley and Pileworth, barts, which title became extinct on the death of the third sir Edward, May 17, 1812, at the age of 84. Edward John Littleton, esq. of Teddesley, (about a mile from Penkridge,) who inherited the property, is son-in-law to the marquis of Wellesey, and M. P. for the county of Stafford: he possesses the great tythes of the parish. This church, or free royal chapel, has within its jurisdiction four chapels, Dunstan, Coppenhall, Sharehill, and Stretton.

Here is a charity school for twelve boys and eight girls. In 1819 two excellent school-rooms for the children of this and the neighbouring parishes, and a house for the master and mistress, were built by the above-named E. J. Littleton, esq. The schools are on the Madras system, and the whole of the expence defrayed by him.

According to the parliamentary returns of the population in 1821, the parish of Penkridge contained 1136 males and 1166 females; total of persons, 2302. Penkridge is ten miles from Wolverhampton, twenty-two from Newcastle-under-line, twenty-four from Birmingham, fifty-eight from Manchester and 129 north-west from London. Lat. 52. 43. N. lon. 2. 7. W.

West of Penkridge is the village of Whiston.—East of Penkridge is Wulaston.—Burton is near Penkridge: it had an abbey, built in 1004.

Cank, or Cannock, with its forest, is on the south of the Trent, near Penkridge. Here is an iron ore, called *cannock-stone*; the workmen call it yellow share. The village of Cank is near five miles south of the wood.

Sharehill is a small village belonging to the parish of Penkridge, two miles from Cannock. At the north and south entrance of this place are two square entrenchments, the area of the largest about one rood; they are generally supposed to have been Roman encampments, which their proximity to the Watling-street road seems to favour. The body of the church was rebuilt about sixty years since; only the tower and a few monuments were preserved from the old church, which are of very old date, and on them are several curious inscriptions.

Lapley, a small village to the south of this town, is distinguished as the site of an alien priory for black monks, which was annexed as a cell to the abbey of St. Remigius at Rheims, on whom it was bestowed by Aylmer, earl of Chester and Mercia, in the time of Edward the Confessor. At its suppression by Henry V. its site and possessions were given to the college of Tong. The church belonging to this priory is still standing, and is now the parochial place of worship. It has a handsome tower, which rises between the chancel and the body of the church.

Near this village is Stretton, mentioned above as the supposed site of Pénnochrucium. An elegant seat here, belonging to the family of Monckton, was anciently the property of the Congreves, ancestors to the celebrated dramatic poet of that name. The Roman road, called the Watling street, passes close to the south side of the village. *Tanner's Notitia Monastica. Camden's Britannia. Beauties of England and Wales, vol. xiii. British Directory, vol. iv. v.*

PEN'KUM, a town of Anterior Pomerania, surrounded with walls in the year 1190. It has often suffered greatly by war and fire: fifteen miles south-west of New Stettin, and forty-three north-north-west of Cultrin. Lat. 53. 19. N. lon. 14. 20. E.

PEN'LAU LEN'GAU, a river of Austria, which flows from Lake Alben, and runs into the Traun four miles south-west of Wels.

PEN'LEE POINT, a cape in the English Channel, on the south coast of the county of Cornwall, west of the entrance into Plymouth Sound.

PEN'MAEN MAUR, a large and lofty mountain of Caernarvonshire, North Wales, rises with a rapid ascent

from the southern shore of the Menai river. Its summit is about 1540 feet above the level of the sea. On the top is an ancient British fortress called Braich y Dinas; also a *bardie*, or Druidical circle of upright and prostrate stones. Near the base of the mountain, on the north side, is a turnpike-road from Aberconway to Bangor, &c. which was formed, with much difficulty and expence, about the year 1772. In some parts it is constructed on arches thrown across fissures, and in other parts it hangs over a steep and lofty precipice about 200 feet above the sea, and presents a terrific appearance to the traveller. A wall has been built to guard against dangers.

PEN'MAN, *f.* One who professes the art of writing.—I shall speak of this master and accountant, [E. Powell,] not only as a dexterous *penman*, but also as a scholar very well versed in the classical learning. *Masseys Orig. and Progress of Letters.*—An author; a writer.—The four evangelists, within fifty years after our Saviour's death, consigned to writing that history, which had been published only by the apostles and disciples; the further consideration of these holy *penmen* will fall under another part of this discourse. *Addison on the Chr. Religion.*

And thou, the *penman* of my historie,
Prepare sad verse for my sad tragedie. *Mir. for Mag.*

PEN'MAN HEAD, a cape of Scotland, on the north coast of Aberdeenshire. Lat. 57. 37. N. lon. 2. 9. W.

PEN'MAN ROSS, a mountain in Denbighshire, North Wales, near which there is a narrow dangerous road to St. Afaph.

PEN'MANSHIP, *f.* The use of the pen; art of writing.—In 1664 he [Cocker] published his Guide to *Penmanship. Masseys Orig. and Progress of Letters.*

PEN'MARCH POINT, a cape on the west coast of France, situated on the south of a bay, which takes its name from the town of Audierne: eighteen miles south-west Quimper, fifteen south-south-east of Audierne. Lat. 47. 48. N. lon. 4. 17. W.

PEN'MARCH ROCKS, rocks near the west coast of France, and south-east coast of the department of the Finistere, east of Penmarch Point. Lat. 47. 48. N. lon. 4. 6. W.

PENMOR'SA, a village in Carnarvonshire, North Wales, with three fairs; Aug. 20, Sept. 5, and Nov. 12.

PENN (Sir William), an admiral of England, and one of the commanders at the taking of Jamaica, was born at Bristol, 1621. Being addicted from his youth to the sea, he became a captain at twenty-one; and, after several intermediate promotions was made admiral in the first Dutch war, at thirty-two years of age. In 1665 he came home, and was chosen member of parliament for Weymouth, not without hereby incurring the displeasure of the republican government, by which he was committed for a while to the Tower, on a charge of quitting his command without leave, to the hazard of the army. Upon the restoration of the monarchy, he was made a commissioner of the admiralty and navy, governor of the town and fort of Kinsale, vice-admiral of Munster, and one of the council of that province. After sustaining the chief command, under the duke of York, in the victory over the Dutch in 1665, he took leave of the sea, but continued in his other employments till 1669, when, growing infirm, he retired to Wanstead, in Essex, and died there the year following. He is said to have acquitted himself, in his several high offices, with honour and fidelity.

PENN (William), an illustrious person among the Quakers, and founder of the colony of Pennsylvania, was the only son of the admiral above mentioned, by his wife Margarete, daughter of John Jasper, a merchant of Rotterdam. He was born in London, in the vicinity of the Tower, 14th October, 1644. His father gave him a liberal education, induced, no doubt, to greater care in the finishing of it, by prospects of his son's advancement at court, where he himself was in high favour. But the mind of the son was formed for other pursuits; and, before he had passed his twelfth

twelfth year, was already glowing with a sensibility to religion, which eventually unfitted him for the employments of a corrupt court, and gave him to others of a more honourable and beneficent nature. He was placed first at Chigwell school in Essex; then at a private academy on Tower Hill, with the advantage besides of a tutor; and lastly, in 1660, entered a gentleman commoner of Christ-Church college. He continued at Oxford two years, and was intimate with Robert Spencer, afterwards earl of Sunderland, and with John Locke. Though fond at this time of youthful sports, he had strong religious impressions; and, together with some other students withdrew from the national way of worship to hold private meetings, at which they preached and prayed among themselves. This conduct gave great offence to the heads of the college; and a large fine, with suitable admonitions, were imposed upon the young nonconformist. Just at this critical period, an order was unluckily received from court to resume the use of the surplice, which it seems had been discontinued almost ever since the period of the Reformation, and the sight of this unfortunate vestment "operated," as Mr. Clarkson expresses it, "so disagreeably on William Penn, that he could not bear it; and, joining himself with some other young gentlemen, he fell upon those students who appeared in surplices, and tore them every-where over their heads." This, we conceive, was not quite correct, even as a Quaker proceeding; and was but an unpromising beginning for the future champion of religious liberty. Its natural consequence, however, was, that he and his associates were, without further ceremony, expelled from the university; and, when he went home to his father, and attempted to justify by argument the measures he had adopted, it was no less natural that the good admiral should give him a box on the ear, and turn him out at the door.

The patience of young Penn held out under this rough treatment, until (parental affection taking place of anger, and possibly suggesting the expedient) his father concluded to send him, in company with some persons of rank, on a tour to France. This took place in 1662. Here, though he spent some time in study under the celebrated Protestant preacher Moses Amyraut, the very different conversation of other associates at length diverted his thoughts from religion. He had however acquired the language, together with the polished manners, of the French, when, in 1664, he was recalled by his father from Turin, to which place he had proceeded from Saumur, the residence of Amyraut. The admiral joyfully received his son, concluding the main point (of his fitness for promotion) was now gained. He was admitted of Lincoln's Inn to study the law, where he continued till the breaking out of the pestilence; soon after which, being now twenty-two years of age, his father put under his management a considerable estate in Ireland, and he went to reside in that kingdom.

In solitude, the religious struggle in Penn's breast revived. On the one hand, natural vivacity, personal accomplishments, and the respect and favour of his friends, attracted his regard to the present world: on the other, devotion, and an indelible sense of duty, fixed his contemplations on the next. He had been affected, about ten years before this time, by the preaching of Thomas Loe, a Quaker; and, being at Cork, was informed of a meeting for worship, then about to be convened, as it seems, by desire of the same person. Penn attended it, and Loe delivered a discourse, beginning with the words, "There is a faith that overcomes the world, and there is a faith that is overcome by the world;" on which he is said to have expatiated with much clearness and energy. His doctrine agreeing with the previous experience and present disposition of Penn, he now inclined to enter into a communion with the Quakers, and from this time constantly attended their meetings. At one of these held at Cork, November 1667, he, with many others, was apprehended by order of the mayor, who would have liberated Penn upon his giving bond for his good behaviour; but

the latter, deeming the meeting no misdemeanour, refused bond, and was sent to prison with the rest. He wrote a few lines to the earl of Orrery, containing exceptions to the mayor's proceedings, an argument against persecution, and a request "for the speedy release of all" who had been committed on the occasion. The earl contented himself with ordering Penn's discharge.

His father, being informed by a nobleman of his acquaintance of the danger his son was in of being proselyted to Quakerism, remanded him home, and was readily obeyed. Penn had now again to pass through the ordeal of parental displeasure; and in this a principal object seems to have been, his continuance in the exterior of his education, or, as his biographer has it, in the customs and fashions of the age. But so fixed was he in the resolution to follow what he esteemed a manifestation of the will of God in his conscience to the contrary, that, although he behaved on these occasions with Christian meekness and filial affection, neither threats nor entreaties could move his constancy. The honour of the hat (in these times a matter of no light esteem) was especially contended for by the punctilious admiral; who, at last, would have tolerated his son in other instances of nonconformity, on condition that he should be uncovered before the king, the duke of York, and himself. Penn took time to consider of this proposal in secret; he even made it a subject of fasting and supplication to God to be directed aright; and he at length deliberately refused the terms. This was sacrificing much to sincerity and consistency in his profession; for his father, upon this, finding his hopes of the *courtier* at an end, could no longer endure the *son* in his presence, and he was a second time driven from the paternal mansion. His integrity was now put to a severe proof: it appears, that he found a shelter among his adopted friends the Quakers, while his mother privately supplied his wants. At length the admiral relented, so far as to wink at his return to the family; and when, in consequence of being found at religious meetings (by the state then called seditious conventicles), he was at any time imprisoned, would privately use his influence to get him released.

The talents of Penn were soon devoted to the support of the doctrine he had espoused. He became a preacher among the Quakers, and published, in 1668, on their behalf, a piece entitled "Truth exalted." Another occasion, however, more important in its consequences, presently occurred. A preacher named Thomas Vincent, irritated by the going over of two of his hearers to the Quakers, accused the latter of holding erroneous doctrine concerning the Trinity. A dispute was held in consequence, in a meeting-house belonging to a presbyterian congregation in London, chiefly between Vincent on the one part, and George Whitehead, an eminent Quaker, on the other; but the dispute ended for the present to the satisfaction of neither side. In prosecution of the controversy thus raised, Penn wrote a piece with the following title: "The sandy Foundation shaken, or those so generally believed and applauded Doctrines, of one God subsisting in three distinct and separate Persons; the Impossibility of God's pardoning Sinners; a plenary Satisfaction; the Justification of impure Persons by an imputative Righteousness; refuted from the Authority of Scripture and right Reason." The dispute with Vincent had excited much attention. This publication did more; it stirred up the vindictive spirit of intolerance. It was evil spoken of, says Sewel, the historian of the Quakers; and not long after Penn was committed to the Tower; and, as some thought, not without his father's being acquainted with it, perhaps to prevent a worse treatment. From what quarter this was apprehended we shall see presently; for Penn being thus secured in the Tower, and denied the access of his friends, his servant one day brought him word (as it seems, from the admiral) that the bishop of London was resolved he should either publicly recant, or die a prisoner. His reply evinced a mind unterrified at the

the prospect of sufferings, which he considered as inflicted for conscience sake: and he began to occupy his solitude with religious compositions, the most considerable among which was a practical treatise on the Christian religion, entitled "No Cross No Crown." In this work his contemporary, Dr. Henry More, says, he has treated the subject of a future life, and the immortality of the soul, with a force and spirit equal to most writers. It has passed through many editions.

After near seven months' duration, Penn wrote to the secretary of state, lord Arlington, requesting to be heard in his own defence before the king, and complaining warmly of the manner in which his sentiments had been misrepresented by his enemies. In this letter several just and noble sentiments occur. He tells his lordship, "that he is at a loss to imagine how a diversity of religious opinions can affect the safety of the state, seeing that kingdoms and commonwealths have lived under the balance of divers parties. He conceives that they only are unfit for political society, who maintain principles subversive of industry, fidelity, justice, and obedience; but to say that men must form their faith of things proper to another world according to the prescriptions of other mortal men in this, and, if they do not, that they have no right to be at liberty or to live in this, is both ridiculous and dangerous. He maintains that the understanding can never be convinced by other arguments than what are adequate to its own nature. Force may make hypocrites, but can make no converts, &c. &c." He now likewise published a short piece, entitled "Innocency with her open Face, presented by way of Apology for the Book entitled The Sandy Foundation shaken." He here says, "that which I am credibly informed to be the greatest reason of my imprisonment, and of that noise of blasphemy which hath pierced so many ears of late, is my denying the divinity of Christ, and divesting him of his eternal Godhead; which most busily has been suggested, as well to those in authority, as maliciously insinuated among the people." In confutation of which charges, he proceeds to prove from Scripture the Godhead of Christ. Both of these tracts were republished in the collection of his works, in folio, 1771; and the reader, who desires to obtain a just view of his sentiments on the several controverted points, will do well to compare them with each other, and with his doctrinal works at large. Soon after this explanatory defence, Penn was liberated from the Tower; and went to Ireland, where he seems to have been occupied for twelve months in the care of his father's estate, and in various services to his friends, the Quakers; after which he returned to England.

In the year 1670, the Quakers, being persecuted by some magistrates under the act against conventicles, were forcibly kept out of their meeting-house in Gracechurch-street. They met as near it as they could, in the street, agreeably to their practice in such cases; and their firmness herein eventually procured them the free exercise of their right. On the occasion alluded to, Penn, preaching in the street, was apprehended by warrant from sir Samuel Starling, lord-mayor, and committed to Newgate. At the next sessions at the Old Bailey he was indicted, along with William Mead, another eminent Quaker, for meeting in, and conspiring to preach to, an unlawful and tumultuous assembly. He made, says his biographer, a brave defence, discovering both the free spirit of an Englishman, and the undaunted magnanimity of a Christian; in so much that, notwithstanding the most partial frowns and menaces of the bench, the jury acquitted them both. It ought to be added, that this jury exhibited an instance of firm persevering justice under most tyrannical and indecorous treatment by the court, worthy of the notice and remembrance of every Englishman. *They were fined forty marks each for the verdict which they had brought in, and ordered to be imprisoned till the fines were paid.* But this dangerous assumption of power was afterwards adjudged illegal by the court of Common Pleas, on which

occasion the chief justice Vaughan distinguished himself by a very able speech in vindication of the rights of juries. The trial of Penn and Mead is inserted in the collection of Penn's Works, and has been also published separately. (See Monthly Mag. Mar. 1811.)

Not long after this event admiral Penn died, perfectly reconciled to his son, to whom he left an estate of 1500l. per annum. Penn engaged about this time in a public dispute, at Wycombe, with Jeremy Ives, a celebrated Baptist, on the universality of a divine light in the minds of men; which doctrine Ives undertook to disprove, but seems to have quitted the field to his antagonist immediately after stating his argument. In the month called February, 1670-1, Penn was again committed, on the pretext of preaching publicly, to Newgate, where he remained six months. It is observable that he had recently published a piece in favour of liberty of conscience, and another entitled "A reasonable Caveat against Popery;" the one probably offensive to the intolerant clergy, the other to the court. At his commitment he held a spirited dialogue on persecution with sir John Robinson, lieutenant of the Tower; at the close of which, the latter calling for an officer with a file of musketers, "No, no," said Penn, "send thy lacquey, I know the way to Newgate."

Early in 1672 he married Gulielma Maria, daughter of sir William Springett, formerly of Darling in Sussex. He settled at Rickmanworth, Herts, continuing to render service, both by preaching and writing, to the religious cause in which he was now engaged for life. Nor did he neglect an attention to the interests of his country, but published, in this year, a pamphlet entitled "The proposed Comprehension soberly and not unseasonably considered;" and, in 1675, a larger work, the title of which is, "England's present Interest considered, with Honour to the Prince and Safety to the People, in Answer to this one Question, What is most fit, easy, and safe, at this juncture of Affairs, to be done for quieting of Differences, allaying the Heat of contrary Interests, and making them subservient to the Interest of the Government, and consistent with the Prosperity of the Kingdom?"

The year 1675 made a commencement of Penn's connexion with the North-American colonies. A moiety of the province of New-Jersey having been granted by Charles II. to sir George Berkeley, he sold his interest in it to one Billinge, a Quaker, who, being embarrassed in his circumstances, transferred his right in trust to William Penn and two others, for payment of his debts. Through their means, that moiety, named West New-Jersey, became settled principally by Quakers; and, through the prudent conduct of the trustees and settlers, it soon put on the appearance of a flourishing colony, which it has ever since maintained.

In 1677, Penn, in company with George Fox, Robert Barclay, and others, went over to Holland, and assisted at a general meeting of the *Friends* in those parts, held for the purpose of settling their religious discipline; and, those at Dantzic being under persecution, Penn wrote, in their name, an Address to the King of Poland, with a Confession of Faith, and a request that he would interpose for them. He then proceeded with Barclay to Herwerden, the court of the princess Elizabeth of the Rhine, elder sister of Sophia electress of Hanover, on whom the succession of the crown of England was afterwards settled. Their object was a religious visit to this princess and the countess of Hornes, her companion, both Protestants, and the former esteemed one of the most learned of her sex in that age. Some correspondence, begun upon the report of their extraordinary piety, had opened the way for a personal interview. Penn and his companion were well received at Herwerden; a correspondence by letter was afterwards kept up between the former and the princess; and, she dying in 1680, he inserted in the second edition of his "No Cross no Crown" a testimony to her highly-exemplary character. In returning through Germany and Holland, he

he preached in many places, at meetings convened for the occasion. He was heard, this year, before a committee of parliament, in support of a petition from the Quakers, who were oppressed by prosecutions in the exchequer, under statutes enacted against the Papists, but converted by some magistrates into engines of annoyance to Protestant dissenters. In 1679, and during two years following, he published several things; as, "An Address to Protestants;" "England's great Interest in the Choice of this new Parliament," a piece dedicated to the electors; and "One Project for the Good of England," which he presented to the parliament itself. He likewise exerted himself to procure the return of Algernon Sidney as a member of the house, first at Guildford, and afterwards at Bramber. About this time he was elected a fellow of the Royal Society.

We come now to the most considerable of Penn's actions, the settlement of a colony in North America, on liberal and pacific principles. A tract of country on the west side of the Delaware (formerly belonging to the Dutch, and called the New Netherlands) was granted, on petition, by Charles II. to William Penn, and his heirs, in consideration of admiral Penn's services, and of debts due to him from the crown at his decease. To this the duke of York added, by cession, a further contiguous portion of territory seated lower on the Delaware. The king's patent bore date the 4th of March, 1680-1. Penn originally intended, that the country should have been called *New Wales*; but the under secretary of state, being a Welshman, thought, it seems, that this was using too much liberty with the ancient principality, and objected to it. He then suggested *Sylvania*; but the king himself insisted upon adding *Penn* to it, and after some struggles of modesty, it was found necessary to submit to his gracious desires, and PENNSYLVANIA was the name adopted.

Penn, being thus constituted absolute proprietor and governor, published "A brief Account of the Province of Pennsylvania," in which he proposed terms of settlement to such as might incline to remove thither, offering land at forty shillings purchase, and one shilling per annum quit-rent, for one hundred acres. A great number of buyers came forward, several of whom formed a company, calling themselves "The free Society of Traders in Pennsylvania." Three ships presently departed, with adventurers from England and Wales, chiefly industrious and reputable persons of Penn's own communion. Two of these ships arrived on the coast in time to winter; the third was detained till spring in the West-India islands. Thus was the settlement begun, the proprietor being occupied meantime in providing a government for the colony, and in concerting measures for its security.

The native Americans, or Indians, having experienced, in some provinces on that continent, much injustice, had made the most terrible reprisals; sound policy, therefore, conspiring with his own temper and principles, made it Penn's care to have them treated with candour, justice, and humanity; and his relation, W. Markham, failing with the first settlers, he joined him with others in a commission to open a friendly intercourse with the natives, to whom he sent out considerable presents, and a letter couched in plain conciliatory terms. In the beginning of 1682 he published "The Frame of the Government of the Province of Pennsylvania in America, together with certain Laws agreed upon in England, by the Governor and divers Freemen of the aforesaid Province, to be further explained and confirmed there by the first provincial council that shall be held, if they seem meet." In the preface to this work we have a sketch of his sentiments on the forms and substance of civil government. "That," he observes, "which makes a good government, must keep it such: to wit, men of wisdom and virtue; qualities that, because they descend not with worldly inheritances, *must be carefully propagated by a virtuous education of youth.*" And, in order to give effect, where he had power, to that great principle of good government, liberty

of conscience, in behalf of which he and his friends at home so deeply suffered, he recognized it in the first article of his "Constitutions," and proceeded to establish it by the following "Law." "All persons living in the province who shall confess and acknowledge the one Almighty and Eternal God, to be the creator, upholder, and ruler, of the world, and that hold themselves obliged in conscience to live peaceably and justly in civil society, shall in no ways be molested or prejudiced for their religious persuasion, or practice in matters of faith and worship; nor shall they be compelled, at any time, to frequent or maintain any religious worship, place, or ministry, whatsoever."

In order to enforce these excellent laws and constitutions, Penn now prepared for his voyage to North America. As he intended to leave his family behind, he took leave of them in a most pathetic and instructive letter, from which, as it shows evidently the strength of his understanding and the benevolence of his mind, and contains matter of importance to every family, we shall make some extracts.

"My dear Wife and Children; My love, which neither sea, nor land, nor death itself, can extinguish or lessen toward you, most endearingly visits you with eternal embraces, and will abide with you for ever; and may the God of my life watch over you, and bless you, and do you good in this world and for ever! Some things are upon my spirit to leave with you in your respective capacities, as I am to one a husband, and to the rest a father, if I should never see you more in this world.

"My dear Wife! Remember thou wast the love of my youth, and much the joy of my life; the most beloved, as well as most worthy, of all my earthly comforts; and the reason of that love was more thy inward than thy outward excellencies, which yet were many. Now I am to leave thee, and that without knowing whether I shall ever see thee more in this world, take my counsel into thy bosom, and let it dwell with thee in my stead while thou livest.

"Cast up thy income, and see what it daily amounts to; by which thou mayest be sure to have it in thy sight, and power to keep within compass; and I beseech thee to live low and sparingly till my debts are paid, and then enlarge as thou seest it convenient.

"And now, my dearest, let me recommend to thy care my dear children; abundantly beloved of me, as the Lord's blessings, and the sweet pledges of our mutual and endeared affection. Above all things endeavour to bring them up in the love of virtue, and that holy plain way of it which we have lived in, that the world in no part of it get into my family. I had rather they were homely than finely bred as to outward behaviour; yet I love sweetness mixed with gravity, and cheerfulness tempered with sobriety. Next bring them up in a love one of another; tell them it is the charge I left behind me, and that it is the way to have the love and blessing of God upon them. Sometimes separate them, but not long; and allow them to send and give each other small things to endear one another with. Once more I say, tell them it was my counsel they should be tender and affectionate one to another. For their learning be liberal. Spare no cost; for by such parsimony all is lost that is saved; but let it be useful knowledge, such as is consistent with truth and godliness, not cherishing a vain conversation or idle mind; but ingenuity mixed with industry is good for the body and the mind too. I recommend the useful parts of mathematics, as building houses or ships, measuring, surveying, dialling, navigation; but agriculture is especially in my eye: let my children be husbandmen and housewives; it is industrious, healthy, honest, and of good example. Be sure to observe their genius, and do not cross it as to learning: let them not dwell too long on one thing; but let their change be agreeable, and all their diversions have some little bodily labour in them."

He next addresses himself to his children. "Be obedient

dient to your dear mother, a woman whose virtue and good name is an honour to you; for she hath been exceeded by none in her time for her integrity, humanity, virtue, and good understanding; qualities not usual among women of her worldly condition and quality. Therefore honour and obey her, my dear children, as your mother, and your father's love and delight; nay love her too, for she loved your father with a deep and upright love, choosing him before all her many suitors: and, though she be of a delicate constitution and noble spirit, yet she descended to the utmost tenderness and care for you, performing the painfullest acts of service to you in your infancy, as a mother and a nurse too. I charge you, before the Lord, honour and obey, love and cherish, your dear mother.

"Next: betake yourselves to some honest industrious course of life, and that not of sordid covetousness, but for example and to avoid idleness. And if you change your condition, and marry, choose with the knowledge and consent of your mother if living, or of guardians, or those that have the charge of you. Mind neither beauty nor riches; but the fear of the Lord, and a sweet and amiable disposition, such as you can love above all this world, and that may make your habitations pleasant and desirable to you. And, being married, be tender, affectionate, patient, and meek. Be sure to live within compass; borrow not, neither be beholden to any. Ruin not yourselves by kindness to others; for that exceeds the due bounds of friendship; neither will a true friend expect it. Small matters I heed not. Know well your in-comings, that your out-goings may be better regulated. Love not money nor the world; use them only, and they will serve you; but, if you love them, you serve them, which will debase your spirits, as well as offend the Lord. In making friends, consider well first; and, when you are fixed, be true, not wavering by reports, nor deserting in affliction; for that becomes not the good and virtuous. Watch against anger, neither speak nor act in it; for, like drunkenness, it makes a man a beast, and throws people into desperate inconveniences. Avoid flatterers, for they are thieves in disguise; their praise is costly, designing to get by those they bespeak; they are the worst of creatures; they lie to flatter, and flatter to cheat; and, which is worse, if you believe them, you cheat yourselves most dangerously. But the virtuous, though poor, love, cherish, and prefer. Next, my children, be temperate in all things; in your diet, for that is physic by prevention; it keeps, nay it makes people healthy, and their generation sound; this is exclusive of the spiritual advantage it brings. Be also plain in your apparel: keep out that lust, which reigns too much over some. Let your virtues be your ornaments; remembering that *life is more than food, and the body than raiment*. Let your furniture be simple and cheap. Avoid pride, avarice, and luxury.

"And as for you who are likely to be concerned in the government of Pennsylvania, and my parts of East Jersey; especially the first, I do charge you, before the Lord God and his holy angels, that you be lowly, diligent, and tender; fearing God, loving the people, and hating covetousness. Let Justice have its impartial course, and the Law free passage. Though to your loss, protect no man against it; for you are not above the law, but the law above you. Live therefore the lives yourselves, you would have the people live, and then you have right and boldness to punish the transgressors. Entertain no lurchers, cherish no informers for gain or revenge; use no tricks; fly to no devices to support or cover injustice; but let your hearts be upright before the Lord, trusting in him, above the contrivances of men, and none shall be able to hurt or supplant. So farewell to my thrice dearly beloved wife and children! Dated Worminghurst, 4th of Sixth Month, 1682.

WILLIAM PENN."

Immediately after writing this letter, he embarked, and arrived safely in the Delaware with all his companions.

The country assigned to him by the royal charter was yet full of its original inhabitants; and the principles of William Penn did not allow him to look upon that gift as a warrant to dispossess the first proprietors of the land. He had accordingly appointed his commissioners, the preceding year, to treat with them for the fair purchase of a part of their lands, and for their joint possession of the remainder; and, the terms of the settlement being now nearly agreed upon, he proceeded, very soon after his arrival, to conclude the settlement, and solemnly to pledge his faith, and to ratify and confirm the treaty, in sight both of the Indians and Planters. For this purpose a grand convocation of the tribes had been appointed near the spot where Philadelphia now stands; and it was agreed that he and the presiding Sachems should meet and exchange faith under the spreading branches of a prodigious elm-tree that grew on the bank of the river. On the day appointed, accordingly, an innumerable multitude of Indians assembled in that neighbourhood; and were seen, with their dark visages and brandished arms, moving, in vast swarms, in the depth of the woods which then overshaded the whole of that now-cultivated region. On the other hand, William Penn, with a moderate attendance of friends, advanced to meet them. He came of course unarmed; in his usual plain dress; without banners, or mace, or guards, or carriages; and only distinguished from his companions by wearing a blue sash of silk network (which it seems is still preserved by Mr. Kett of Seething-Hall, near Norwich), and by having in his hand a roll of parchment, on which was engrossed the confirmation of the treaty of purchase and amity. As soon as he drew near the spot where the Sachems were assembled, the whole multitude of Indians threw down their weapons, and seated themselves on the ground in groups, each under his own chieftain; and the presiding chief intimated to William Penn, that the nations were ready to hear him. Mr. Clarkson regrets, and we cordially join in the sentiment, that there is no written contemporary account of the particulars attending this interesting and truly-novel transaction. He assures us, however, that they are still in a great measure preserved in oral tradition, and that both what we have just stated, and what follows, may be relied on as perfectly accurate. The sequel we give in his own words. "Having been thus called upon, he began. The Great Spirit, he said, who made him and them, who ruled the heaven and the earth, and who knew the innermost thoughts of man, knew that he and his friends had a hearty desire to live in peace and friendship with them, and to serve them to the utmost of their power. It was not their custom to use hostile weapons against their fellow-creatures; for which reason they had come unarmed. Their object was not to do injury, and thus provoke the Great Spirit, but to do good. They were then met on the broad pathway of good faith and good will, so that no advantage was to be taken on either side, but all was to be openness, brotherhood, and love. After these and other words, he unrolled the parchment, and by means of the same interpreter conveyed to them, article by article, the conditions of the purchase, and the words of the compact then made for their eternal union. Among other things, they were not to be molested in their lawful pursuits even in the territory they had alienated, for it was to be common to them and the English. They were to have the same liberty to do all things therein relating to the improvement of their grounds, and providing sustenance for their families, which the English had. If any disputes should arise between the two, they should be settled by twelve persons, half of whom should be English, and half Indians. He then paid them for the land, and made them many presents besides, from the merchandise which had been spread before them. Having done this, he laid the roll of parchment on the ground, observing again, that the ground should be common to both people. He then added, that he would not do as the Marylanders did, that is, call them

them "children or brothers" only; for often parents were apt to whip their children too severely, and brothers sometimes would differ; neither would he compare the friendship between him and them to a chain, for the rain might sometimes rust it, or a tree might fall and break it; but he should consider them as the same flesh and blood with the Christians, and the same as if one man's body were to be divided into two parts. He then took up the parchment, and presented it to the Sachem who wore the horn in the chaplet, and desired him and the other Sachems to preserve it carefully for three generations, that their children might know what had passed between them, just as if he had remained himself with them to repeat it."

The Indians, in return, made long and stately harangues; of which, however, no more seems to have been remembered, but that "they pledged themselves to live in love with William Penn and his children, as long as the sun and moon should endure." And thus ended this famous treaty; of which Voltaire has remarked, with so much truth and severity, "that it was the only one ever concluded between Savages and Christians that was not ratified by an oath, and the only one that never was broken!"

Such, indeed, was the spirit in which the negotiation was entered into, and the corresponding settlement conducted, that, for the space of more than seventy years, and so long indeed as the Quakers retained the chief power in the government, the peace and amity which had been thus solemnly promised and concluded, never was violated; and a large and most striking, though solitary, example afforded, of the facility with which they who are really sincere and friendly in their own views, may live in harmony even with those who are supposed to be peculiarly fierce and faithless.

William Penn now held an assembly, in which fifty-nine important laws were passed in the course of three days. The most remarkable were those which limited the number of capital crimes to two, murder and high treason; and which provided for the reformation as well as the punishment of offenders, by making the prisons places of compulsive industry, sobriety, and instruction. It was likewise enacted, that all children, of whatever rank, should be instructed in some art or trade. The fees of law-proceedings were fixed, and inscribed on public tables; and the amount of fines to be levied for offences also limited by legislative authority. Many admirable regulations were added, for the encouragement of industry, and mutual usefulness and esteem.

Philadelphia, the capital of the province, was next to be laid out, of which, at the time of Penn's arrival, not a house was completed; the colonists having, in general, no better lodgings than caves, hollowed out of the high banks of the river: the very plot fixed on for the city was claimed by some Swedes, to whom the governor allowed a greater quantity of land in exchange. This city, extending two miles in length and one in breadth, and abutting at each end on a navigable river, was now planned, with admirable boldness, convenience, and regularity, and laid out under the inspection of Thomas Holmes, surveyor-general to the province. Ere twelve months had elapsed, the rudiments of the future metropolis showed themselves in about fourscore dwellings, the seats of freedom, peace, and industry. The governor dispatched his plan to the committee of the Free Society of Traders, accompanied with a description (the best extant of these times) of the country, its natural history, and aborigines: this description is inserted in the collection of his works before mentioned. The first jury was impannelled here early in 1683; and one Pickering was tried, with others his accessaries, before the governor and council, and convicted of counterfeiting the Spanish silver money current in that province. His sentence discovers the same spirit of mildness and equity, which, at this day, constitutes the praise and the efficacy of the criminal

code of Pennsylvania. He was to pay a fine of forty pounds towards the building of a court-house, standing committed till payment; and securities for his good behaviour; and make restitution, in good silver, to the holders of his base coin, *which, being first melted down, was to be restored to him.* Various legislative, economical, and religious, measures, together with a tedious dispute with lord Baltimore, on the subject of the boundary-line between this province and Maryland, continued to occupy Penn till about Midsummer 1684; when he found it needful, on various considerations, to return to England. His interest at court had declined during his absence: but it was now restored, upon the death of Charles II. by the accession of his more immediate patron James II. He made use of his influence for the use of his friends, the Quakers, who still lay under the scourge of penal statutes; and for the gratuitous service of many others. In particular he exerted himself in favour of the measure at that time so much, though so insincerely, held out by the court, of universal liberty of conscience. His intimate reception at court, and the appearance of being in some way trusted or employed by the king, now subjected him to the general imputation of being a concealed Papist. Even his old acquaintance, Dr. Tillotson (afterwards archbishop of Canterbury), suspected him: but, some expressions of Tillotson's on the subject coming to Penn's ears, a correspondence ensued between them, at the close of which Tillotson acknowledged himself fully satisfied that there existed no just grounds for the surmise. About this time (besides a further account of his province) Penn published several pieces on his favourite topic, liberty of conscience, one of which was entitled "Good Advice to the Church of England, Roman Catholic, and Protestant Dissenter, in which it is endeavoured to be made appear, that it is their duty, principle, and interest, to abolish the penal laws and tests."

The last occasion in which we have to view Penn in connexion with the court of James, is in an occasional attendance on the movements of the latter, this year, through several of the midland counties. Penn seems to have made use of several intervals in this *progress*, to pay religious visits to his friends, and to preach to the people. On some of the latter occasions the king too was present to hear him. At Oxford he remonstrated with James on his arbitrary treatment of the fellows of Magdalen-college, and attempted a mediation between them and the king, which he farther prosecuted afterwards at Windsor; but it proved abortive.

The revolution brought Penn again into difficulties, as a suspected Papist, or Jesuit, and a secret agent for the old government. On the 10th of December, 1688, walking in Whitehall, he was sent for by the lords of the council, then sitting, who, though nothing was laid to his charge, obliged him to give sureties for his appearance on the first day of the next term: he was continued on these to the Easter term following, on the last day of which he was cleared in open court. In 1690 he was again brought before the council, on an accusation of holding a correspondence with the late king James; he appealed to king William, who, after a conference of near two hours, inclined to acquit him; but, to please some of the council, he was held upon bail for a while, and in Trinity term of the same year again discharged. He was yet a third time attacked, and his name inserted in a proclamation, dated July 18th this year, wherein (among divers of the nobility, and others to the number of eighteen) he was charged with adhering to the king's enemies; but, proof failing respecting him, he was again cleared by order of the court of King's Bench.

He now purposed to go again to his province, and gave out proposals for a new settlement there. It appears that, though his stay in England might be necessary to the security of his title as proprietary, it was highly detrimental both to his interests in America, and, through deficiency hitherto of revenue from it, to his private estate.

estate. His order for convoy had already passed the secretary of state, when the voyage was prevented by a new charge against him, backed by the oath of one Fuller, a wretch who was afterwards declared by parliament an impostor: the charge, however, being that of partaking in a plot to restore the late king; a warrant was granted for his apprehension, which he narrowly escaped at his return from George Fox's burial, on the 16th of the month called January, 1690. Seeing now no probability of fair treatment, he retired (or, as Burnet chooses to say, absconded) for two or three years: during which time, besides a Preface to the collected Works of Barclay, he wrote the following pieces: 1. Just Measures; an epistle to the Quakers in vindication of religious discipline. 2. A Key, or a treatise explanatory of their principles and practice. 3. Reflections and Maxims relating to the Conduct of Human Life. The two latter of these have gone through many editions.

In 1694 he wrote, as a Preface to George Fox's Journals, a "Brief Account of the Rise and Progress of the People called Quakers," which has several times been reprinted. He was also actively employed in this and the subsequent years as a preacher in several parts of England and in Ireland. Having in 1693 lost his wife, with whom he had lived in perfect harmony, he took, in 1696, a second wife, the daughter of Thomas Calowhill of Bristol, by whom he had several children. His eldest son by his first marriage, a youth of great hopes, died of a consumption in his 21st year, to his deep affliction. A bill in 1697 being depending in the house of lords against blasphemy, Penn, ever vigilant against restrictions in matter of religion, presented to that house a "Caution requisite in the Consideration of that Bill," advising that the word *blasphemy* might be so explained as to leave no ambiguity by means of which ground might be given for malicious prosecutions. The bill itself was, however, dropped.

During the prevalence of Penn's enemies at court, he had been deprived of his government of Pennsylvania, which was annexed, in October 1692, to that of New-York, under colonel Fletcher. The ostensible reasons for this step were mal-administration, and danger of the loss of the province thereupon: the real one probably was a jealousy excited by the growing prosperity of the colony, and by principles and practices in its jurisprudence too liberal for the age. At length, in the latter end of 1693, through the mediation of his friends, he was admitted to plead his cause before the king and council, by whom he was acquitted, and his government was restored. This instrument is dated August 1694; but it was not till five years after this, that he embarked a second time for the province, accompanied by his family. Penn seems now to have intended to spend the remainder of his life in America; and he applied himself diligently to the offices of government, in which the inevitable difficulties arising from a mixed population of various dispositions and interests, and enjoying a great share of liberty, required the exercise of both skill and patience. His administration was successful; and the colony is stated to have been at this period, when compared with others of the same standing on the continent, in an easy and flourishing condition. His old allies, the natives, were not overlooked; and, religion being ever a predominant consideration with Penn, he engaged his friends, at a monthly meeting for discipline, held the beginning of 1700, in a plan for the instruction of the natives and of the negroes, who had now been introduced among them, in the principles of the Christian faith. Later experience has shown that Christianity, to obtain a cordial and general reception among these people, should be preceded by her handmaid, civilization. A public school (free to the children of the poor) had been accordingly founded here. In February 1701 a treaty was held between the governor and about forty of the chief persons among the natives, in which, besides renewing former covenants, the parties ef-

established some regulations on the subject of trade between them: a principal care of the governor, on this occasion, seems to have been to prevent the abominable practice, already used by some unworthy colonists, of drawing the natives into a ruinous traffic, by offering them spirituous liquors.

During these transactions, an attempt was making at home, under pretence of advancing the prerogatives of the crown, and of national benefit, to invade the several proprietary governments in America, and reduce them to regal ones. A bill for this purpose was already before the lords, when the land-owners of Pennsylvania, present in England, petitioned the house, and gained time for the governor's return; who, on notice of the measure, presently embarked, and arrived at Portsmouth in December 1701. The bill, which had been postponed, was now entirely dropped; and the accession of queen Anne, soon after, placed Penn once more in the sunshine at court. His estate, however, had now suffered much, by liberal disbursements, by inadequate returns, and by the continual political impediments thrown in his way. He was moreover involved, in 1707, in a suit at law with the executors of a person who had been his steward; and, his case not admitting of relief by the court of chancery, he was obliged to live within the rules of the Fleet until the dispute could be adjusted.

It is not to be concealed, that a party in Pennsylvania made heavy complaints against his government of that colony, and so much disquieted him, that at one period he was inclined to make over his right as governor to the crown. How far there was real ground of blame in his administration it is not easy to determine; in fact, all the proprietary governments have been subject to similar contents, naturally arising from the double relation of proprietor and governor. On the whole, it is certain that the colony Pennsylvania soon became one of the most flourishing of the North-American settlements, and still reverts the memory of its founder.

The infirmities of age now began to creep upon him; and the air of London not agreeing with him, he took a handsome seat at Rushcomb, near Twyford, in Buckinghamshire, where he passed the remainder of his life. This proved to be a lengthened state of decline; for, having been seized with some fits of the apoplectic kind in 1712, his bodily and mental powers began gradually to decay, though for a considerable time not so much as to prevent his enjoyment of life. He was at length reduced to perfect imbecility; and died in July 1718, in the 74th year of his age. He was interred at Jordans, near Beaconsfield. His works were printed collectively in 1726 in two vols. 4to. Select editions have since been given, omitting most of the controversial pieces. *Life prefixed to Penn's Works. Proud's Hist. of Pennsylvania. Sewall's Hist. of the Quakers. Monthly Mag. vol. xxxi. Clarkson's Life of William Penn, 1813.*

PENN's, a township of Pennsylvania, on the river Susquehanna, containing 3798 inhabitants.—Also, a township of Northumberland-county, with 2072 inhabitants.

PENN's COVE, a bay on the east coast of Whidbey's Island, in the gulf of Georgia. Lat. 48. 16. N. lon. 237. 39. E.

PENN's CREEK, a river of Pennsylvania, which runs into the Susquehanna in lat. 40. 48. N. lon. 76. 56. W.

PENN's FORT, lies at the mouth of a small creek, on the west side of Delaware-river, in Northampton-county; about twenty-one miles north of the line of Easton, and near seventy north of Philadelphia. Lat. 40. 59. N. lon. 75. 13. W.

PENN's NECK, a town of Salem-county, New Jersey, in Old Man's creek: twelve miles north-east by north of Salem. Upper Penn's Neck contains 1638, Lower 1163, inhabitants.—Also, the name of a range of farms of excellent soil, situated about one mile and a half south-east

of Princeton, in New Jersey, on a point of land formed by Millstone-river and stony-creek; so called from the celebrated William Penn, who formerly owned this tract.

PENN's ROCKS, two clusters of rocky islets in the south-west part of Hudson's Bay.

PEN'NA (Lorenzo), an ecclesiastic of Bologna, published a work entitled, "Li primi Albori Musicali, per li Principianti della Musica figurati;" one of the best treatises on practical music that appeared in Italy during the 17th century. The first sketch of this book was published in 1656; a second edition, enlarged, of the first book, appeared at Bologna, 1674; the second book at Venice, 1678; and the whole completed, in three books, 1684. In 1696, the work had gone through five editions. The author's rules for counterpoint, and extemporary playing on keyed instruments, are concise and clear, as far as they go; which is, however, very short of what is now wanted, since the bounds of modulation and use of discords have been so much extended.

PEN'NA, a town of the Popedom, in the marquise of Ancona: nine miles east of Camerina.

PEN'NA D'AGHER, a small island near the west coast of Sardinia. Lat. 43. 33. N. lon. 8. 16. E.

PEN'NA DI BIL'LI, a town of the Popedom, in the dutchy of Urbino, the see of a bishop: fourteen miles west-north-west of Urbino, and eleven south-west of St. Mariuo.

PENNA'CEOUS, *adj.* in botany, feathered like the web of a quill.

PEN'NACHED, *adj.* [*pennache*, Fr.] Applied to flowers when the ground of the natural colour of their leaves is radiated and diversified neatly without any confusion. *Trevoux*.—Carefully protect from violent rain your *pennached* tulips; covering them with matresses. *Evelyn*.

PEN'NANT, *f.* [*pennon*, Fr.] A small flag, ensign, or colours. See PENNON.

PEN'NANT (Thomas), an eminent naturalist and tourist, was the son of a gentleman of moderate fortune at Downing in Flintshire, where he was born in 1726. He received his school-education at Wrexham and at Fulham; and from the latter was removed to Oxford; where he entered upon the study of jurisprudence, but, as appears, with no intention of pursuing the law as a profession. He has himself recorded, that a present made him at the age of twelve of Willoughby's Ornithology gave him the first taste for the study of natural history; and that a tour into Cornwall, which he made about 1746 from Oxford, in which he became acquainted with Dr. Borlase, inspired him with a strong passion for mineralogy. In 1754 he made an extensive tour in Ireland, which seems, however, to have been rather an excursion for pleasure than for scientific purposes. In that year he was elected a Fellow of the Society of Antiquaries, whose pursuits he always combined with the study of nature. A paper on certain coralloid bodies found in Coalbrookdale, inserted in the Philosophical Transactions of 1756, was the first of his publications in the department of natural history. He had the year before commenced a correspondence with the illustrious Linnæus, to whom he sent an account of a *cancha anomia* from the Norwegian seas; and, in return, he was made a member of the Royal Society of Upsal. Mr. Pennant about this time, married an amiable woman, and passed some years in domestic retirement. By way of occupation, he began, in 1761, to prepare his "British Zoology," in 132 coloured plates, imperial folio, with explanations. It was published for the benefit of the Welsh charity-school in London. He came to the possession of the estate of Downing at the death of his father in 1763, and with it a rich mine of lead-ore, which enabled him to make great improvements.

The death of his wife interrupted his domestic enjoyments; and in the spring of 1765 he made a tour to the continent. France, Switzerland, part of Germany, and

Holland, were visited by him; and he became personally known to several men of scientific eminence, among whom were Buffon, Haller, the Gesners, Trew, Gronovius, and Pallas. His conference with the latter at the Hague, gave rise to the plan of one of his most valuable works, the "Synopsis of Quadrupeds." In 1767, he was elected a Fellow of the Royal Society, and in the next year he republished his British Zoology, in 2 vols. 8vo. with reduced plates; another volume relative to reptiles and fishes was added in 1769. An "Indian Zoology," of which 12 plates, with descriptions, were published by him in 1769, remained a fragment. In the same year he undertook a journey to the remotest point of Scotland; and the numerous observations which he made were afterwards the basis of a very interesting publication. In 1770 he published 103 additional plates to his British Zoology, with several new descriptions; and in the following year he printed his Synopsis of Quadrupeds, in one vol. 8vo. His well-earned reputation caused him, in the same year, to receive the compliment, from his alma-mater, of the degree of doctor of laws.

His first "Tour in Scotland" was given to the public in 1771, and was received with avidity. At that time Scotland was little known to the sister-kingdom, except by slight and partial accounts; and the curious and varied information communicated by this liberal traveller, in a spirit of candour and good-humour, was equally acceptable to both sides of the Tweed. This reception of his work, and the attachment he had contracted to his subject, induced him, in 1772, to repeat his northern tour, and extend it to the principal islands of the Hebrides. For the latter purpose he hired a vessel to convey him from one island to another, and wait upon him at proper stations; and the result was a rich harvest of valuable and entertaining observation. In 1773, he published "Genera of Birds," in one volume; and likewise employed himself in a journey through the northern counties of England. Antiquities and family-history were now become favourite objects of his enquiry, and he visited every place which was likely to afford curious matter of this kind. A third edition in 4to. of his first Tour in Scotland, with additional plates, and the first vol. 4to. of his second Tour and Voyage to the Hebrides, were published in 1774.

Mr. Pennant was now become an habitual traveller; and he found his excursions, almost always made on horseback, equally serviceable to his health and spirits. Few men, indeed, have more enjoyed the *viridis senectus*, or better preserved their bodily and mental activity to an advanced period. In all his journeys he laid up new stores of information; and he found even the most frequented tracks fertile of those topographical memoranda, to which his attention was now chiefly directed. In 1775, he published the third vol. 4to. of his Tour in Scotland, which he had the satisfaction of seeing a popular work both at home and abroad.

Thinking it disgraceful for a literary native of Wales to neglect his own country, so abundant in objects interesting to all the different species of travellers, he gave to the public, in 1778, the result of several journeys through the six counties of North Wales, in one 4to. vol. with many plates, entitled "A Tour in Wales;" and in 1781 he added another volume, with the title of "A Journey to Snowden." These are particularly entertaining, on account of the many anecdotes interspersed, illustrative of the manners and history of that part of the island. In the mean time he did not forsake his original object of pursuit, natural history. He had added, in 1777, a 4to. vol. to his British Zoology, containing the Vermes, including the testaceous and crustaceous animals. His Synopsis of Quadrupeds, now greatly enlarged and improved, and bearing the title of "History of Quadrupeds," was published in 2 vols. 4to. 1781; and in the same year, his "History and Natural History of the Turkey" was inserted in the Philosophical Transactions.

His

Tho Paine.

Engraved for the Encyclopædia Londinensis May 1789.

His "Arctic Zoology," in 2 vols. 4to. containing quadrupeds and birds, appeared in 1785. There was prefixed to it a copious Introduction, which is, perhaps, the most interesting and original of all his writings. It is a kind of survey of all the coasts of the arctic regions, beginning from the Straits of Dover, and proceeding to the remotest north, on the east and west; and filled with a great variety of geographical, historical, and physical, facts, affording a series of the most animated pictures. A Supplement to this work was given in 1787. "A Journey from Chester to London," 4to. 1782, and an account of the antiquities of the capital itself, entitled "London," 4to. 1790, were agreeable additions to his publications of this class. The latter, in particular, was popular, and reached a third edition. Several smaller pieces of the political and miscellaneous kind, filled up the intervals of his greater works, and proved the continued activity of his mind.

Thus far Mr. Pennant has himself recorded the history of his literary life, in a work printed in 1793, together with some miscellaneous tracts. He had at this time taken a formal leave of the public, and had alluded to Gil Blas's archbishop of Granada, as a memento not to employ his pen till the defect of its powers should become manifest to his readers. But the habit of authorship was too strong to permit him to adhere to his resolution. In 1796 he published "The History of the Parishes of Whiteford and Holywell," 4to. the first of these was his native parish; and he took occasion to give many particulars of his family-history, with a degree of senile garrulity, but enlivened by his usual vivacity. The natural history of the parishes is curious and instructive. In his literary life he had mentioned a great mass of manuscript which he kept by him under the title of "Outlines of the Globe," being compilations of geographical and other matter, in the manner of the introduction to Arctic Zoology above mentioned, and which was a part of them. From these he published in 1798 two quarto volumes, entitled, "A View in Hindoostan," which were well received by the public. He died in the course of that year, at the age of 72. Besides the works above enumerated, he wrote some smaller pieces; and was a promoter of the publications of other men of science, particularly of Mr. Lightfoot's *Flora Scotica*. To the list of his literary honours are to be added his election into the Royal Academy of Stockholm, and the American Philosophical Society of Philadelphia, besides several minor societies. He had married a second wife in 1776, the sister of his neighbour, sir Roger Mostyn; and he left a family by both marriages.

Mr. Pennant possessed a well-compact frame of body, an open and intelligent aspect, and a cheerfulness and vivacity of disposition, with gentlemanlike manners, which rendered him highly agreeable in society. He was exemplary in the relations of domestic life, zealously attached to the interests of his country, both local and general, and kindly attentive to the wants of his poor neighbours. As an author, he was too rapid and various to be perfectly correct either in matter or style; but he always meant honestly, and was ready to rectify mistakes. In the department of natural history, in which he stands highest, he is clear and judicious in his species of arrangement, concise, energetic, and exact in his descriptions. He is regarded both by native and foreign naturalists as very respectable authority. *Pennant's Literary Life, and History of Whiteford and Holywell. Gen. Biog.*

PENNANTIA, *f.* [so named by Forster in honour of the subject of the preceding article.] In botany, a genus of the class polygamia, order dioecia; or rather class pentandria, order monogynia; natural order uncertain; perhaps akin to the urticæ of Jussieu. Generic characters—Calyx: none, unless the corolla be taken for such. Corolla: petals five, equal, lanceolate, acute, concave, widely spreading. Stamina: filaments five, capillary, the length of the petals; antheræ oblong, incumbent. Pif-

tillum: germen superior, obtusely triangular; style none; stigma flat, peltate, obscurely three-lobed. Pericarpium: capsule triangular, of two cells. Seeds solitary; somewhat triangular. Some flowers, on a separate plant, have the filaments twice as long as in the above, with ovate antheræ, but no pistil.—*Essential Character.* Calyx none; petals five, equal; style none; capsule of two cells; seeds solitary.

Pennantia corymbosa, a single species; native of New Zealand. It is a tree or shrub, with round leafy branches, dotted, and somewhat downy, when young. Leaves alternate, stalked, two inches or rather more in length, obovate; either quite entire, or with two or three broad blunt shallow teeth, or small lobes; furnished with a midrib, and many transverse interbranching veins; dark green above, nearly smooth, except the rib, which is on both sides minutely hairy; pale and smooth beneath. Footstalks not half an inch long, channelled, hairy. Flowers about the size of *Laurustinus*; as far as can be judged of them in a dry state, they seem to be pale green or yellowish white. The whole bears a general resemblance to some kind of *Viburnum*, but the absence of a calyx is a striking difference.

Such is Forster's original specimen. The younger Linnaeus, however, obtained in England, if we mistake not, a specimen under the name of *Pennantia*, which is a very different thing. The leaves are ovate, four inches long, green on both sides, undivided and entire. Branches and footstalk smooth, with a solitary stalked gland at a little distance above each of the latter, and no stipules. Flowers numerous, in a terminal compound smooth cluster; their style as long as the corolla, their stamens longer; and, what is most remarkable, each flower has a calyx, deeply divided into five ovate fringed segments, and rather elongated at its base. This plant therefore is unquestionably altogether different from Forster's *Pennantia*; it may be an *Ehretia*, but we know nothing of the fruit, nor is it to our present purpose to investigate this question.

PENNAQUID. See **PEMAQUID**.

PENNAR', a river of Hindoostan, which rises in Mysore, crosses the circar of Cuddapa and the Carnatic, and runs into the bay of Bengal twelve miles east of Nellore, in lat. 14. 26. N. lon. 80. 13. E. This is the first considerable river to the north of Madras. It rises nearly in midway between the two seas, near Chinna Balabaran, or about twenty-five miles north of Bangalore. It has a northern course as high as lat. 15, from whence it runs easterly till it reaches the sea. It is a considerable river, being three hundred yards wide seventy miles from the sea, confined by mountains on each side. On the southern part stands the strong fortress of **GANDICOTTA**; which see, vol. viii.

PENNA'RE POINT, a cape in the English Channel, on the south coast of Cornwall: six miles west-south-west of Dedman's Point. Lat. 50. 12. N. lon. 4. 46. W.

PEN'NARTH BAY, a bay on the south coast of Wales, in the Severn, at the mouth of the Trave, below Cardiff, to which it is a harbour. A point of land, called *Pennarth Point*, bounds it on the south.

PEN'NAS (Las), a town of Peru, in the diocese of La Paz: seventy miles north of Potosi.

PEN'NATED, *adj.* [*pennatus*, Lat.] Winged.—*Pennated*, amongst botanists, are those leaves of plants as grow directly one against another on the same rib or stalk; as those of ash and walnut-tree. *Quincy.*

PENNAT'ULA, *f.* [dim. of *penna*, Lat. a quill-feather, from the appearance of some of the species.] The **SEA PEN**; in helminthology, a genus of vermes zoophyta, or plant-like worms, consisting of eighteen species. Generic characters—Animal not affixed, of various shapes, supported by a bony part within, naked at the base, the upper part with generally lateral ramifications, furnished with rows of tubular denticles, producing radiate polypes from each tube.

This genus of animals differs remarkably from all the other zoophytes by their swimming freely about in the sea, and many of them having a muscular motion as they swim along. They have no opening at the bottom as was formerly thought, nor any other passage but through their polype mouths; by these they take in their food, and through these they produce their eggs, as in most zoophytes. When we compare them with the other zoophytes, they approach nearest to the Gorgonia, as having a bone in the inside like them, which is covered with flesh, and their upper parts full of polype-like mouths.

1. *Pennatula coccinea*, the scarlet sea-pen: stem round, radiating, with papillous polype-bearing sides, and clavate at the top. It inhabits the deeps of the White Sea, and unites the two genera, *Alcyonium* and *Pennatula*; it is soft, red, an inch and half high, and as thick as the little finger; it is wrinkled, with the papillæ disposed in rows.

2. *Pennatula grisea*, the thorny sea-pen: stem fleshy, with a smooth midrib and imbricate plaited spinous ramifications. It is found in the Adriatic, and is about eight inches long; it shines by night; back of the midrib lanceolate, smoothish; rays imbricate, and undulate on the anterior margin, the lobules are armed with a spine, and obtusely crenate at the margin.

3. *Pennatula phosphorea*, the British sea-pen: stem fleshy, with a rough midrib and imbricate ramifications. It is about four inches long, and red. Dr. Solander calls it the British sea-pen, to distinguish it from the *rubra*, which he calls the Italian sea-pen, and because it is found in great plenty sticking to the baits on the fishermen's lines round the coasts of this kingdom; especially when they make use of mussels to bait their hooks. Great numbers have been taken on the coast of Scotland, especially near Aberdeen.

This animal was well known to the ancients by the name of the sea-pen; many of the old authors took it for a fucus, or sea-plant. It has been found in the ocean from the coast of Norway to the most remote parts of the Mediterranean; and not only dragged up in trawls from great depths of the sea, but often found floating near the surface. Dr. Shaw, in his History of Algiers, remarks that they afford so great a light in the night to the fishermen, that they can plainly discover the fish swimming about in various depths of the sea. The luminous effect is confined to the plumule of the quill, or that part which is inhabited by the polype. Spallanzani, in a letter to Bonnet, states that the light is only emitted when the sea-pen is in motion; and that there is a mucous luminous substance furnished by the polype, which is soluble in water, and becomes mixed with the sea-water that is admitted into the pen by means of a hole situated at the extremity of its stalk. (Mem. Soc. Ital. tomo ii.) But the existence of any hole at the extremity is denied by Mr. Ellis, whose description (Phil. Transf. liii.) is as follows:

"The outward appearance of this animal is not unlike one of the quill-feathers of a bird's wing; but they are found of different sizes, from four to eight inches in length; the lower half of it is naked, round, and white, not unlike the quill-part of a writing-pen; the upper part represents that of the feathered part of the pen, and is of a reddish colour. This upper half, which arises from the quill, and is feathered on both sides, is a little compressed, and becomes smaller and smaller till it ends in a point at the top; along the back of this, in the same manner as in the inner side of a common writing-pen, there is a groove in the middle, from the quill to the extremity; from each side of this upper part of the stem proceed little parallel feather-like fins; these begin at the top of the quill-part, very small on each side at first, but lengthen as they advance towards the middle; hence they shorten gradually on each side, till they end in a point at the top, their terminations preserving on each side the figure of the segment of a circle.

"To come now to consider more minutely those pin-

nulæ, or feather-like fins, that project on each side, and form the upper part of this animal. These are evidently designed by nature to move the animal backward or forward in the sea, consequently to do the office of fins, while at the same time, by the appearance of the suckers or mouths furnished with filaments or claws, they were certainly intended to provide food for its support; for, notwithstanding what Linnæus has said in regard to its mouth, in his System of Nature, viz. *Os basæos commune rotundum*, Mr. E. could not, with the help of the best glasses, discover that the point of the base was penetrated in the least; so that he is clearly of opinion, that this animal, like the *Hydra arctica*, or Greenland polype, described in his Essay on Corallines, nourishes and supports itself by these suckers or polype-like filaments; that by these both kinds take in their food, and have no other visible means of discharging the exuvæ of the animals they feed on, than by the same way which they take them in; and that, from attentively considering the structure and manner of living of both these animals, he classed them in the same genus of *Pennatula*, though they vary very much in their exterior form and size, and consequently are of very different species. The stem of the suckers of this animal is of a cylindrical form; from the upper part proceed eight fine white filaments or claws, to catch their food: when they retreat on the alarm of danger, they draw themselves into their cases, which are formed like the denticles of the corallines, but here each denticle is furnished with spiculæ, which close together round the entrance of the denticle, and protect this tender part from external injuries."

Some of the most curious remarks of Dr. Bohadsch on the anatomy of this animal, as also on the appearance of it while alive in sea-water, are as follow: "When the trunk is opened lengthwise, a fattish liquor flows out of it, so viscid as to hang down an inch; the whole trunk of the stem is hollow; its outward coraceous membrane is more than a line thick, and forms a strong covering to it: between this and another thinner membrane of the pinnated part of the trunk, are innumerable little yellowish eggs, floating in a whitish liquor, about the size of a white poppy seed; these are best seen when the trunk is cut across; this thin membrane lines the whole inside of the trunk, in which we observe nothing but a kind of yellowish bone, which takes up three parts of the cavity. This bone, in some of these animals, is above two inches and a half long, and about half a line thick; in the middle part of it, it is quadrangular; towards each end it grows round and very taper: that end is smallest which is nearest the top of the pinnated trunk. The whole bone is covered with a yellowish clear skin, which at each end changes into a ligament; one of which is inserted in the top of the pinnated trunk, the other in the top of the naked trunk; by the help of this upper ligament, the end of this little bone is either contracted into a very narrow arch, or disposed into a straight line, according to the motion of the trunk. The fins likewise are composed of two skins: the outer one strong and leathery, and covered over with an infinite number of crimson streaks, the inner skin is thin and clear: the cylindrical part of the suckers are in the same manner, only with this difference, their outer skins may be softer. Both the fins and the suckers are hollow, so that the cavity of the suckers may communicate with the fins, as their cavity does with the trunk.

"We now come to the appearance which this animal makes when alive in sea-water. The trunk then was contracted circularly at the bottom of the naked part of the stem, and by this contraction formed a zone of the most intense purple, which moved upwards and downwards successively: when it moved upwards through the length of the pinnated trunk, it there became paler, and at length terminated at the top: the motion being scarcely finished, a like zone appeared at the end of the naked trunk, which finished its motion in the same manner as the

PENNATULA.

Æ R E R.
Lucas Penni.

Three Species of Sea Pens.

Engraved for the Encyclopædia Londinensis 1823

the former. When this zone becomes very much constricted on every side, the trunk above it swells and acquires the form of an onion; and then it appears as if a compressed globe moved along through the whole space of the trunk; this constriction of the trunk gives that fine red colour to the zone; for, when the skin of the trunk is outwardly full of purple papillæ, the intermediate spaces are of a whitish colour. In this constriction then of the skin, the intermediate spaces are obliterated, and the papillæ are brought nearer together; consequently only the purple colour presents itself to the eye, and appears more bright. The end or apex of the naked trunk is sometimes curved like a hook, and sometimes extended in a right line; both these motions then must be directed by the little bone in the inside, and from this motion of this little internal bone, that sinus or cavity at the lower end of the trunk (thought by authors heretofore to be the mouth) seems plainly to be formed; for sometimes it is deeper, sometimes shallower; it is deeper while the movable globe appears in the middle of the pinnated part of the trunk, and shallower when it is in the bottom of the naked trunk, at which time the bone is most extended. The fins, or pinnulæ, have four different motions; they are moved both towards the naked stem, and towards the pinnated stem; and sometimes they are drawn in very much to the belly, a little after they are inclined to the back; further, the fleshy filaments or claws move in all directions, and the cylindrical part with the filaments is either extended out or drawn in and hid in the fins."

4. *Pennatula filosa*, the eye-sucker: stem a little fleshy, with a rib feathered on each side, and furnished with two filiform tentacula at the base. It inhabits the European seas, and is from four to six inches long.

Mr. Baker, author of *Essays on the Microscope*, has described a worm which is said to have been a mutilated specimen of this species. "I was lately presented (he says) with a couple of small sea-insects, by a gentleman, who said they were found fixed by the snout to the eyes of sprats; that they are often observed sticking there, and may consequently be supposed to suck their nourishment from thence. The length of this little creature, from end to end, is near three inches, of which the head is about one quarter-part. Its body is somewhat thicker than a hog's bristle, and of a pleasant green colour. A gut seems running through it, and terminates at the anus. The head is light brown, twice the thickness of the body, and of an oblong figure, tapering towards the snout. It has a pair of fine small black eyes, and a couple of holes, at some distance forwards, which probably are its nostrils. But the most remarkable part of the head is its proboscis, or snout; which is nearly half its length, and does not end in a point, but spreads at its extremity with a considerable aperture. This snout appears of a horny substance, and has on every side several large knobs or protuberances, by which, when once insinuated into the fish's eye, it must necessarily be fixed there, so as not easily to be removed."

5. *Pennatula rubra*, the Italian sea-pen: stem fleshy, with a broad tuberculate midrib; the ramifications are imbricate, with each a short spine at the base. The Italian sea-pen differs from the British so much, that there is no room to doubt but they are very different species. The British is much longer, more slender, and not so fleshy, as the Italian; but the broad warted midrib, and spiny fins, of the latter, distinguish it plainly; besides, the denticles are placed so thick as to appear like a double row. This varies in colour from a deep red to a pale red. It inhabits the Mediterranean. The specimen described and figured by Mr. Baker (*Phil. Transf.* vol. xliii.) was presented to him by Mr. Pennant. The figure, however, we have not copied, being fully persuaded it belongs not to this species, nor even to the genus. It is luminous in a high degree, like the phosphorea and several other of the *Pennatulæ*.

6. *Pennatula mirabilis*, the strange sea-pen: stem long and slender, the midrib pennated on both sides; the pin-

næ or fins placed alternate, and at a distance from each other, and shaped like a half-moon, each ramification consisting of eight filaments.

This species, which is rather a group, or chain, than an individual animal, was first seen alive by Otto Frederic Muller, author of the *Zoologia Danica*; and from that work our description and the annexed figures are collected. Linnæus and Pallas had both examined the dead subject in the museum of the king of Sweden; Linnæus has delineated it in the *Musæum Ad. Fr.* and Ellis has copied his figure into the *Philosophical Transactions*, vol. liii. t. 20. fig. 17. Linnæus's description of it in the *Amœnitates* and in the *Museo* is embarrassed and inaccurate; for in the former he calls it a filiform bristle, stiff, about half a foot in length, to which are attached lunated cilia of a transparent whiteness, and turned to either side; while, in the latter work, he says that it is in a great degree allied to the phosphorea; whereas it is in fact totally different from the *Pennatula phosphorea*, or at least only agrees with it in having an *officulum*, or little bone, attached to its extremity. Hence Dr. Pallas doubts whether we should not rather place it among the *Gorgonia*; but its calcareous bone, its fleshy parenchyma, and its distinct polypi, evidently indicate its situation to be among the *Pennatulæ*.

The *vachis*, or round bone, is uniform in thickness through the greater part of its length, truncated at both ends, and of an orange colour; flexible while fresh, but brittle when old, so that it snaps under the nail like a thin bit of ivory. A fleshy parenchyma invests the whole of it except its apex; and from the face to the apex azure-coloured, lunated, and polypetalous, lamina, sprout out alternately. The margin of these lamina, which is turned towards the base, is studded with cylindrical polypi; each consisting of as many tentaculæ. The stem, or bone, is calcareous, while its covering and the polypiferous laminae are of a fleshy and gelatinous substance. The basis or extremity, fixed by the fleshy parenchyma into a clayey soil, is ferrated and thick, and in that part the polypi are not evolved; but about half an inch from it they begin to appear, and sixty or seventy tufts of them may be numbered on each side. Hence it results that the increase of the *officulum* and the polypi takes place, not towards the apex but in the direction of the base, and that part of the *officulum* is developed before either the fleshy parenchyma or the polypes.

When out of the water, the polypi contract, and the bone is seen covered by the fleshy substance; when, however, water is poured on them, the lamina and the tentacula both expand, and present a beautiful spectacle. They inhabit the American, Atlantic, and Norwegian seas; from the latter of which, particularly from the clay in a creek of Christiana called Sand pollen, O. F. Muller dragged several of them alive. On the annexed Plate, fig. 1, is represented a specimen containing more than a hundred clusters of the polypi of the natural size; fig. 2. a piece of the same, magnified.

7. *Pennatula sagitta*, the arrow sea-pen: stem filiform, with close-set ramifications, and naked at the tip. It inhabits the Ocean; and, according to Linnæus, is found sticking in the *Lophius histrio*, or spotted toad-fish, having its stem pierced into their sides. Mr. Ellis supposes it to be merely a variety of the preceding.

8. *Pennatula antennina*, the peacock-fish sea-pen: stem single; the midrib square, and full of polype like suckers on three sides. This extraordinary sea-pen was discovered by Dr. Bohadsch, of Prague, while he was at Naples in the year 1757. He says, when it was brought to him, it was two feet ten inches long, and very possibly had been much longer, as it was broken off at the base. The bone, which was square, was covered over with a yellowish membrane, dotted with red; and three sides of the upper part of the trunk were covered with tentacles, the fourth bare. He says he numbered them, and found 1310; and that these tentacles are not drawn in, as

in the other sea-pens. Other authors mention, that the tentacles are only on one side; but Dr. Bohadsch had an opportunity of seeing it as it was taken out of the sea.

9. *Pennatula stellifera*, the starry sea-pen: stem simple, about four inches long. See the article HELMINTHOLOGY, vol. ix. p. 357, 358. and Plate V. fig. 11.

10. *Pennatula phalloides*: simple, with a cylindrical midrib every-where covered with polypes. It inhabits the Indian Ocean; is six inches long, and grey.

11. *Pennatula arundinacea*: stem quadrangular and very long. It inhabits the Norway seas, and is four feet long; the stem is linear, with cylindrical rays of solitary tubes, which are deciduous, erect, crowded, and seated on a thin pedicle.

12. *Pennatula scirpea*: stem simple, linear, tapering, with a round midrib producing polypes on one side. It inhabits the ocean, and is eighteen inches long; the stem is fleshy, thicker and longer than the midrib; the bone is somewhat flexile.

13. *Pennatula juncea*: simple, linear, with a truncate rib, and transverse polype, bearing wrinkles on each side. This is found in the Indian Ocean; is two feet long, white, beneath horny, the rays mixed, fulvous and white.

14. *Pennatula grandis*: pen-shaped, linear-lanceolate, with a smooth round stem, and jagged toothed ramifications. It inhabits the Indian Ocean; is a foot long, greenish grey, shines with a cinereous light in the dark, and sometimes stings the hand if it be touched.

15. *Pennatula argentea*, the silver sea-pen: pen-shaped, lanceolate, with a smooth round stem, and close-set imbricate striate ramifications. This also is found in the Indian Ocean, and was brought from Batavia by William Webber, esq. F.R.S. Its fins are not unlike those of a bat, with several sharp points. They are striped black and white, with a shining surface, not unlike silver: they are often found above a foot long, and are said to be very luminous in the sea at night. There is one of them in the British Museum near eighteen inches long. Fig. 3 of the annexed Plate is a very exact representation of this genuine sea-pen, where the bone appears burst through the bottom; fig. 4 is a section, to show the fins more distinctly; and one of them is magnified at fig. 5.

16. *Pennatula encrinus*, the great cluster sea-pen: stem quadrangular, taper, very long, bony, covered with a callous membrane, with an umbellate cluster of polypes from the top. It inhabits the Greenland Seas: is about six feet long; and, when taken fresh from the sea, appears like a nosegay of yellow flowers.

17. *Pennatula cynomorium*, the finger sea-pen: cylindrical, fleshy, somewhat clavate, bearing polypes on the whole upper surface. It inhabits the Mediterranean; is reddish, and about four inches long.

18. *Pennatula reniformis*, the kidney sea-pen: stem round, vermicular, supporting a kidney-shaped leaf-like head, producing polypes on the upper surface. This beautiful purple sea-pen was found on the coast of South Carolina, by John Greg, esq. of Dominica. It is remarkably different from all this kind. From the stiffness of its stem, it is very probable it is supported by a bony substance. The body is about an inch long, and half an inch across the narrowest part: it has a small roundish tail of an inch long, proceeding from the middle of the body; this tail is full of rings, from one end to the other, like an earth-worm; and, along the middle of the upper and under part of it, there is a small groove which runs from one end to the other. The upper part of the body is convex, and near a quarter of an inch thick; the whole surface of it is covered over with minute yellow starry openings, through which are protuded little suckers like polypes, each furnished with six tentacles, or filaments. The under part of the body is quite flat: this surface is full of ramifications of fleshy fibres, which, proceeding from the insertion of the tail, as their common

centre, branch out so as to communicate with the starry openings on the exterior edge and upper surface of this uncommon animal. The upper surface (fig. 6) is of a rich purple colour; the under side (fig. 7) less brilliant, and sometimes yellowish. *Ellis's Zoophytes*, by Solander. *Phil. Transf.* vol. xliii. xlvi. l. liii.

PEN'NE, a town of France, in the department of the Lot and Garonne: three miles east of Villeneuve d'Agen, and seven west of Tournon.

PEN'NE, a town of France, in the department of the Tarn: seventeen miles north-north-west of Gaillac, and twenty-one north-west of Alby.

PEN'NECUICK (Alexander), a Scottish writer of the last century, and a burges of Edinburgh. He published, 1. *Streams from Helicon*, 1720. 2. *Corydon and Cochrania*, a Pastoral, 1723. He lived a very irregular life; and died, in poverty and wretchedness, about 1728 or 1729. *Biog. Dram.*

PEN'NED, *adj.* Winged; plumed. *Haluct.*

PENNE'DO DE ST. PE'DRO, a small island in the Atlantic. Lat. o. 55. N. lon. 27. 10. W.

PEN'NER, *f.* A writer.—He talked to me a great deal of the Declaration: he told me he was the *penner* of it. *Diary of the Earl of Clarendon*, 1688.—A penceaf. Obsolete, except perhaps in Scotland.

PENNERVA'EN, a mountain of South Wales, a little to the south of Brecknock.

PENNEWANG', a town of Austria: three miles north of Scwanastadt.

PEN'NI (Giovanni Francisco), a painter, born at Florence in 1488, was the disciple of Raphael, who, observing his genius and integrity, intrusted his domestic concerns to his management; by which means he got the appellation of *Il Fattore*, or the Steward, which he retained ever after. The genius of Penni was universal; but his greatest pleasure was in painting landscapes and buildings: he was an excellent designer, and coloured extremely well in oil, distemper, and fresco. He painted portraits in an exquisite style; and had such happy natural talents, that Raphael left him heir to his fortune in partnership with Julio Romano his fellow-disciple. After Raphael's death, Penni painted many pictures at Rome, particularly in the palace of Chigi, so exactly in the style of his master, that they might not undeservedly have been imputed to him: he finished, in conjunction with Julio and Perino del Vaga, the celebrated designs of the Battles of Constantine, and others, which Raphael had left imperfect; but, differing with them about a copy of the Transfiguration, which the pope intended for the king of France, they separated. Penni went to Naples; but, the air of that country disagreeing with his constitution, he died soon after in 1528.

PEN'NI (Lucas), brother of the preceding, was born likewise at Florence. He also frequented the school of Raphael, and studied a considerable time under Perino del Vaga. He possessed considerable merit as an historical painter, and George Ghisi of Mantua has engraven from several of his pictures. After visiting Genoa and Lucca, he travelled to England, where he was employed by Henry VIII. he afterwards went to France, and practised for a while at Fontainebleau. On his return to Italy, he applied himself to etching and engraving, and we have several meritorious prints from his hand; he sometimes worked from his own designs, but oftener from Rosso and Primaticcio. His mark was usually composed of an L and an R joined together, or separate; for he chose to add the word *Romanus*, or the Roman, to his name, or the initials of it; but it is necessary to caution the young collector with respect to these marks, all of which will be found in our preceding Plate, because they were used by other masters greatly inferior in point of abilities to Penni; and to state, that his engravings are not only executed in a very spirited style, but also accurately drawn. He chiefly etched, but at times worked with the graver only. The following is a list of his principal works:

Two

Two Satyrs giving Wine to Bacchus; Leda drawing Arrows from Cupid's Quiver; Sufannah at the Bath surprised by the Elders; all of which are from Rosso. But the four following are from Primaticcio: Abraham sacrificing Isaac; The Marriage of St. Catharine; Jupiter metamorphosing Calisto into a Bear; and Penelope at work with her women; and are of folio dimensions.

PENNIG'EROUS, *adj.* [from the Lat *penna*, a wing, and *gero*, to carry.] Winged, feathered. *Cole.*

PENNIGON'DA, a town of Hindoostan, in the circar of Rajamundry: thirty-eight miles east of Rajamundry.

PEN'NING, *f.* [from *To pen.*] Written work; composition.—Read this challenge; mark the *penning* of it. *Shakespeare's Tw. Night.*—I may the better be encouraged to go on with my plain manner of *penning*, though it be unpolished. *Brykett's Disc. of Civ. Life.*—How shall he be thought wise, whose *penning* is thin and shallow? *B. Jonson's Discoveries.*

PEN'NINGTON, a town of Lancashire, with 1739 inhabitants, including 441 employed in trade and manufactures: ten miles north of Warrington.

PEN'NINGTON, or PENNYTOWN, a pleasant and flourishing village in Hunterden county, New Jersey, nine miles west of Princeton, containing a church and about forty-two houses.

PEN'NINGTON (Isaac), a member of the society of Friends, or Quakers, and a considerable writer among that people, was the son of an alderman of London, who repeatedly filled the office of chief magistrate, was a noted member of the long parliament, and nominated one of the judges of king Charles I. though he did not take his seat among them. Isaac was born about the year 1617; and, having the prospect of succeeding to a large estate, he was furnished with the means of obtaining the best education. As he grew up, he had, from his father's situation in life, opportunities of mixing with some of the most considerable men of the age; and, if he had been of an ambitious turn of mind, he might have occasionally indulged hopes of rising very high in the world. But from a very early age he was under strong religious impressions; and, as he grew up to manhood, discovered an increasing attachment to retirement, serious contemplation, and the reading of the Scriptures. While he was in this state of mind, he met with some of the writings of the Friends; "which," says he, "I cast an eye upon, and disdained, as falling very short of that wisdom, light, life, and power, which I was searching after." There was, however, something in them that roused his attention, and he went to one of their public meetings at which George Fox preached, whose discourse produced on him a sudden and complete conversion to the principles of the new sect. From this time he joined the society, in opposition to the influence of his connexions, as well as unmoved at the prospect of reproaches and losses to which his profession would unquestionably expose him. In the years 1661 and 1662, Mr. Pennington was called forth to be a confessor for the profession which he had embraced. For the crime, as it was called, of holding meetings for the worship of God in his own house, he was committed to Aylesbury gaol, where he was kept in close custody for seventeen weeks, great part of which was in the winter season; and, to aggravate the severity of his treatment, he was confined in a cold and very uncomfortable room, without a chimney, by which cruel usage he contracted so violent a disorder, that for several weeks after his release he was not able to turn himself in his bed. From this time till the year 1670, he suffered six different imprisonments. These repeated calamities, together with heavy pecuniary losses, arising, in many instances, from the oppressive fines which were levied upon him, Mr. Pennington sustained with firmness and serenity, believing himself to be a sufferer for obeying God rather than man. With the same equanimity and fortitude he bore the attacks of a painful distemper, which terminated his life in the year 1679, in the 63d year of his age. His

character procured him the respect and esteem of all good men, as it exhibited an excellent pattern of piety, virtue, and the strictest morality. He was most faithful in the discharge of all the duties of life; and was author of numerous writings, which were highly prized by the people with whom he associated. They were collected and published in a folio volume in 1681. They have since been reprinted in 4to. and 8vo. and in the year 1796 some of his Letters were published. *Bevan's Memoirs of Pennington*, 1807.

PEN'NINGTON (Lady), wife of sir Joseph Pennington, bart. of Water Hall, Yorkshire. Family misunderstandings having separated this lady from her children, she wrote for their use "An Unfortunate Mother's Advice to her Absent Daughters;" a work of great merit, and which all parents ought to put into the hands of their female offspring. Lady P. died Sept. 3, 1783. *Jones's Biog.*

PENNISE'TUM, *f.* [from the Lat. *penna*, a feather, and *seta*, a bristle.] A name given by Richard in Perf. Syn. i. 72. and Brown Prodr. Nov. Holl. i. 195. to the species of the first division of the genus PANICUM. The name alludes to the feathery structure of the bristles which compose the involucre. See PANICUM.

PEN'NON, or PENON, *f.* A standard with a triangular tail, anciently borne before knights bachelors who brought a certain number of followers into the field. Some instances occur of pennons being carried before esquires; but they were only such as possessed certain estates or fiefs, or who could bring a sufficient suite of vassals into the field. The pennon was in figure and size like a banner, which was small and of a square figure, with the addition of a triangular point. They were charged with the armorial bearing of their owner. On the performance of any gallant action by the knight and his followers, the pennon was converted into a banner by the king, or commander-in-chief, cutting off the point, by which the knight was raised to the degree of a banneret. Both knights and bannerets were bound to appear in the field at the head of a certain number of men, whence ancient historians frequently express the strength of an army by the number of banners and pennons of which it consisted.

PEN'NOT (Gabriel), an Italian canon-regular of the order of St. Augustine, in the 16th and early part of the 17th century. Of his personal history we are furnished with no other particulars than that he was a native of Verona, and flourished under the pontificate of pope Urban VIII. that he distinguished himself by his learning, and by his virtues; and that, on account of his extraordinary merits, he was chosen to fill the most important and honourable offices belonging to his congregation. Besides some theological and controversial works, he wrote a curious historical account of the order of which he was a member, which will be of use to the ecclesiastical historian, and claims for the author this brief notice in our pages. It is entitled, "Generalis totius Ordinis clericorum canonicorum Historia tripartita," and was published at Rome in 1624, and reprinted at Cologne in 1645. *Gen. Biog.*

PENNSBOROUGH (West), a town of America, in Cumberland county, Pennsylvania; famous for a remarkable flow of water from a ridge of lime-stone, called The Big Spring, which, after turning six mills, discharges itself through Conidogwinnet-creek into the Susquehanna. Population, 2635.

PENNSBOROUGH (East), a township of the same county, containing 1264 persons.

PENNSBURY, a small town of Pennsylvania, in Buck's county, on a small creek of Delaware river. This was a manor which Mr. Penn reserved for himself, where he built a house, and planted orchards and gardens; which, with many additional buildings and improvements, still continue.

PENNSYLVANIA, one of the principal provinces of the United States of America, extending in length 228

and in breadth 156 miles, between 39° 43' and 42° N. lat. and 74° 48' and 80° 8' W. lon. and comprehending 46,000 square miles. It is bounded east by Delaware river, which divides it from New Jersey; north by New York and lake Erie; north-west by a part of lake Erie, where is a good port; west by the state of Ohio and a part of Virginia; south by Virginia, Maryland, and Delaware.

This country was granted to the famous William Penn, son of sir William Penn, admiral of the English fleet in the time of Oliver Cromwell and Charles II. Sir William, as some reward for his services, and in consideration of sundry debts due to him from the crown, was promised a grant of this country from king Charles II. but died before he obtained it. His son did not for some time apply himself strenuously to solicit the grant promised to his father; but at length, finding his friends, the Quakers, were harrassed in every part of England by spiritual courts, he renewed his application to the king, and, having obtained his grant, went into America, and purchased the soil at a very low rate of the Indians, its original possessors. By this cheap act of justice at the beginning, he rendered all his future dealings the more easy, the Indians having conceived very favourable opinions both of him and his designs. Having thus succeeded in the first part of his plan, he proceeded to the other, namely, to people the country he had thus obtained. And this was greatly facilitated by the uneasiness of the English Quakers, who, from their high opinion of the man, determined to follow him over the vast Atlantic Ocean to a country uncultivated, and a climate strange and unknown. Nor was he himself wanting in any thing that had a tendency to encourage his followers: he expended large sums in transporting and supplying them with all necessaries; and, not aiming at a sudden fortune, by selling his lands at a very easy purchase. By this means, and the noble charter of privileges he gave the settlers, the country was soon changed from a wilderness to a garden, and is now one of the most flourishing countries in the New World; and still called after his own name. See PENN (William).

At the American revolution, Penn's constitution was of course abolished; and the people, by their representatives, formed a new one on republican principles. The proprietaries were excluded from all share in the government, and the legislature offered them 130,000. in lieu of all quit-rents, which was finally accepted. The proprietaries, however, still possess in Pennsylvania many large tracts of excellent land. After many disputes, the republicans acquired the ascendancy, and the constitution underwent an alteration that assimilated it nearly to the federal constitution. The federal constitution was ratified by Pennsylvania, December 13, 1787.

According to the present constitution of this state, the supreme executive power of the commonwealth is vested in a governor; the legislative, in a general assembly, consisting of a senate and a house of representatives. The governor is chosen for three years, but cannot hold his office more than nine years in twelve. A majority of votes makes a choice. The representatives are elected for one year; the senators for four. The latter are divided into four classes. The time of one class expires each year, whose seats are then filled by new elections. Each county chooses its representatives separately. The senators are chosen in districts formed by the legislature. There is to be an enumeration of the inhabitants once in seven years. The number of senators and representatives is, after each enumeration, to be fixed by the legislature, and apportioned among the several counties and districts, according to the number of taxable inhabitants. There can never be fewer than sixty, nor more than one hundred, representatives. The number of senators cannot be less than one-fourth, nor greater than one-third, of the representatives. The elections are made on the second Tuesday of October. The general assembly meets on the first Tuesday of December in each year, unless sooner

convened by the governor. A majority of each house makes a quorum to do business; and a less number may adjourn from day to day, and compel the attendance of members. Each house chooses its speaker and other officers, judges of the qualifications of its members, and establishes the rules of its proceedings. Impeachments are made by the house of representatives, and tried by the senate. All bills for raising revenue originate in the lower house, but the senate may propose amendments. The senators and representatives are free from arrests, while attending the public business, except in cases of treason, felony, and breach of the peace; and are not liable to be questioned concerning any thing said in public debate. They are compensated out of the public treasury, from which no money can be drawn but in consequence of appropriation by law. The journals of both houses are published weekly; and their doors kept open, unless the business require secrecy. All bills, which have passed both houses, must be presented to the governor. If he approve, he must sign them; if not, he must return them, within ten days, with his objections, to the houses in which they originated. No bill so returned shall become a law, unless it be re-passed by two-thirds of both houses. The governor is commander-in-chief of the military force; may remit fines and forfeitures, and grant reprieves and pardons, except in cases of impeachment; may require information from all executive officers; may, on extraordinary occasion, convene the general assembly, and adjourn it, for any term not exceeding four months, in case the two branches cannot agree on the time themselves. He must inform the general assembly of the state of the commonwealth; recommend such measures as he shall judge expedient; and see that the laws are faithfully executed. In case of vacancy in the office of governor, the speaker of the senate exercises that office.

The judicial power is vested in a supreme and inferior court, the judges of which, and justices of peace, are appointed by the governor, and commissioned during good behaviour; but are removable on the address of both houses. The other officers of the state are appointed, some by the governor, some by the general assembly, and some by the people. The qualifications for an elector are twenty-one years of age, two years' residence, and payment of taxes. They are privileged from arrests in civil actions, while attending elections. Those for a representative are twenty-one years of age, and three years inhabitancy. For a senator twenty-five years of age, and four years' inhabitancy. For a governor, thirty years of age, and seven years' inhabitancy. The governor can hold no other office. The senators and representatives none, but of attorney at law, and in the militia. No person, holding an office of trust or profit under the United States, can hold any office in this state to which a salary is by law annexed. All the officers of the state are liable to impeachment, and are bound by oath, or affirmation, to support the constitution, and perform the duties of their offices.

The declaration of rights asserts the natural freedom and equality of all; liberty of conscience; freedom of election, and of the press; subordination of the military to the civil powers; trial by jury; security from unreasonable searches and seizures; a right to an equal distribution of justice; to be heard in criminal prosecutions; to petition for the redress of grievances; to bear arms; and to emigrate from the state. It declares that all power is inherent in the people, and that they may, at any time, alter their form of government; that no person shall be obliged to maintain religious worship, or support any ministry; that all persons, believing in the being of a God, and a future state of rewards and punishments, are eligible to office; that laws cannot be suspended but by the legislature; that all persons shall be bailable, unless for capital offences, when the proof is evident or presumption strong; that every debtor shall be released from prison, on delivering his estate to his creditors, according

to law, except there be strong presumption of fraud; that the privileges of the writ of *habeas corpus* shall not be suspended but in time of rebellion or public danger; that no *ex post facto* law shall be made; that no person shall be attainted by the legislature, or forfeit his estate for a longer term than his own life; that no title of nobility or hereditary distinction shall ever be granted. The constitution above described was ratified in 1790.

In the year 1811, Pennsylvania was divided into forty-three counties, as in the following Table.

Counties.	No. of Towns.	No. of Inhabitants.	Chief Towns.	No. of Inhabitants.
City and County of Philadelphia	18	81,009	Philadelphia	41,220
Montgomery	28	24,150	Norristown	922
Bucks	28	27,496	Newtown	781
Delaware	21	12,809	Chester	957
Chester	40	32,093	West-Chester	374
Lancaster	25	43,403	Lancaster	4,292
Berks	35	32,407	Reading	2,886
Northampton	30	30,062	Easton	1,055
Luzerne	19	12,839	Wilksburg	835
Dauphin	12	22,270	Harrisburg	1,472
Northumberland	24	27,797	Sunbury	613
Wayne	9	2,562		
Adams	16	13,172	Gettysburg	
Alleghany	16	15,087	Pittsburg	1,565
Armstrong	3	2,399		
Beaver	6	5,776	Beaverton	
Bedford	12	12,039	Bedford	
Butler	4	3,916		
Crawford	2	2,346	Meadville	
Cumberland	18	25,386	Carlisle	2,032
Fayette	17	20,159	Union	1,719
Franklin	14	19,638	Chamberston	
Green	10	8,605	Waynesboro'	
Huntingdon	18	13,008	Huntingdon	1,251
Lycoming	10	5,414	Williamsport	
Mercer		3,220

M'Kean				

The total number of acres in all the counties is reckoned at 29,634,840; and a great portion of the state is divided into townships, in each of which the freemen assemble annually to choose overseers of the poor, assessors, a collector, supervisors of roads, and a constable. The number of inhabitants, which (March 3, 1821) is 1,049,458, includes only 211 slaves.

In this state are six considerable rivers; viz. the Delaware, Schuylkill, Susquehanna, Youghiogeny, Monongahela, and Alleghany. The only swamps worthy of notice are, the Great Swamp, between Northampton and Luzerne counties, and Buffaloe Swamp, near the head waters of the Susquehanna. These swamps are found, upon examination, to be bodies of firm land, thickly covered with beech and sugar-maple. A considerable portion of this state may be reckoned mountainous. The principal ridges, in the great range of the Alleghany mountains, comprehended in Pennsylvania, are the Kit-

tatinny, or Blue Mountains. Behind these, and nearly parallel to them, are Peters, Tufcarora, and Nefcopek, mountains, on the east of the Susquehanna; and, on the west, Sharemon's hills, Sideling hills, Ragged, Great Warriors, Evi's and Will's, mountains; then the great Alleghany ridge, which, being the largest, gives name to the whole range; and west of this are the Chestnut ridges. Between the Juniata and the west branch of the Susquehanna are Jack's, Tuffy's, Nittiny, and Bald Eagle, mountains. The vales between these mountains are generally of a rich black soil, suited to the various kinds of grafs and grains. Some of the mountains admit of cultivation almost to their summits. The other parts of the state are generally level, or agreeably variegated with hills and valleys.

The climate of Pennsylvania is very agreeable, and the air sweet and clear. The *fall*, or autumn, begins about the 20th of October, and lasts till the beginning of December, when the winter sets in, which continues till March. Frosty weather, and extreme cold seasons, are frequently known here; so that the river Delaware, though very broad, is often times froze over; but at the same time the weather is dry and healthy. The spring lasts from March till June, but the weather is then more inconstant than in the other seasons. The heats are very great in July, August, and September; but mitigated so much by cool breezes, that they are very tolerable. The wind is at south-west during great part of the summer, but generally at north and north-west in spring, fall, and winter; which, blowing over the frozen lakes and snowy mountains of Canada, is the true cause of the coldness of the weather in the winter season.

The soil of Pennsylvania is of various kinds: in some parts it is barren; but a great proportion of the state is good land, and no inconsiderable part of it is very good. In general, however, the soil is more fit for grain than for grafs. This state includes the greater part of the kinds of trees, shrubs, and plants, that grow within the United States. Oaks of several species form the chief bulk of the woods. Hickory and walnut are also more abundant than in the northern states. Sassafras, mulberry, and tulip (or poplar), trees, are frequent and thriving. The *Magnolia glauca* grows in low grounds; and the *acuminati* attains to great height above the western mountains. Grapes are common; and some of them, mellowed by frost, with the addition of sugar, make good wine. The white pine and white cedar grow well in some parts; and also red cedars are not rare in high grounds. The sugar-maple is plentiful in the western and northern parts of the state, and the inhabitants are supplied from them with a considerable quantity of sugar.

Iron ore is distributed in large quantities through various parts of the state; and in some places appear copper, lead, and alum. Here are also limestone quarries, and various kinds of marble. In the middle and western country is abundance of coal. In the new settlements there are large flocks of wild turkeys. Partridges are numerous; pheasants are dear; and grouse are found in some districts. In the cold season pigeons migrate from the north in large numbers. In spring and autumn, several kinds of ducks, and some wild geese, are found on the rivers. The singing-birds migrate to Pennsylvania from the north and south in certain seasons, and are numerous. In the rivulets trouts are common; in the eastern rivers the principal fish are roach, shad, and herring, which, in the spring, come from the sea in large shoals. In the western waters is a species of catfish, weighing from 50 to 100 pounds; and also yellow perch and pike, which are large and numerous.

Among the useful quadrupeds in the new districts are deer in great number, beavers, otters, racoons, and monkeys. Buffaloes rarely cross the Ohio, and elks seldom advance from the north. Panthers, wild cats, bears, foxes, and wolves, are not rare; the fur of all which is valuable. In the north settlements rabbits and squirrels

Squirrels are frequent: in the marshes are minks and musk-rats; but opossums and ground-hogs are rare. The best-fertile land is on the south side of Pennsylvania; which is owing to the roads that have been formed in this part of the country and adjacent districts. The principal article of agricultural cultivation is wheat. The next in value is Indian corn. Buck-wheat, rye, barley, and oats, are also cultivated; as are also German speltz, chiefly as food for horses. Potatoes are plentiful; and also turnips, cabbage, parsneps, and carrots, and the small oval pea. The culture of meadows is a considerable object in this state: those on the rivers are banked, drained, tuffocked, ploughed, and harrowed; and sown with Timothy grass and clover. The summer is long enough to admit of two mowings, and even three in rich ground. On farms that have springs and streams, dairies are built over them so as to place the milk-vessels in the water, which is necessary to avoid the injurious effects of heat. Horses, it is said, are raised beyond the proper use, as oxen might more generally supply their place. The best for teams are bred in Lancaster county; and the elegant saddle and coach horses have more or less of the blood of stallions imported from England. The number of sheep is considerable, and increases. Hogs, supplied with food from the woods of oak and beech, exceed home-consumption. Mules and asses are hitherto very rare. Poultry are abundant, and turkeys are cheap. Flax and hemp are cultivated; the growth of hops is inconsiderable: bees are objects of attention. In favourable seasons, cherries, apples, and cider, abound.

The general style of architecture in this state is neat and solid. Stone buildings are most common in the old settlements; log and frame houses in the new. Towns have a considerable proportion of brick houses: shingles cover the roofs. Necessary tradesmen and mechanics are settled on small farms or lots throughout the improved country, and also in villages. Manufacturers dwell chiefly in towns, though many of them are scattered through the country. The product of domestic female industry is considerable. The wives and daughters of even opulent farmers knit and spin; and, in the towns, some females of higher rank do the same. Woolen stockings are made in sufficient quantity for use: and hemp, which is used in several places for coarse wearing apparel, bags, lines, and nets, &c. is manufactured, in large quantities, into cordage, cables, and ropes. Iron-works are of long standing, and are in improving condition. The furnaces are 16, and the forges 37. The slitting and rolling-mills are said to cut and roll 1500 tons per annum. The fabricated articles are numerous, and of all the common kinds. Manufactories of leather, skins, and fur, are very extensive and good. The most respectable trades employed in materials of wood are cabinet-making, house-carpentry, coach-making, and ship-building. The port of Philadelphia is said to be among the first in the world for naval architecture. Paper of most kinds forms a beneficial branch of manufacture, in which are employed above 50 mills, the annual product of which is computed at 25,000 dollars. Manufactories in stone, clay, and fossils, are bricks, and various pieces of marble, common earthen ware, grind-stones, and mill-stones; tin-ware are well executed for various domestic purposes; copper, brass, lead, and pewter, are also the materials of various manufactured articles. Linens imported are now printed. Sugar-refineries, and distilleries of molasses, and various preparations of tobacco, furnish employment for many hands.

The commerce of Pennsylvania with the eastern and northern states, is, in great part, an exchange of staple-commodities; which are too numerous to be recited. The commerce of Pennsylvania with the west is carried on by the Ohio with the Spanish, and by the lakes with the British dominions; and both ways with the Indian tribes. Nearly the whole foreign commerce is carried on by the port of Philadelphia. The value of the exports

from this state in the year ending September 30, 1791, was 3,436,092 dollars, 58 cents; in 1792, 3,820,662 dollars; in 1793, 6,958,836 dollars; in 1794, 6,643,092 dollars; in 1795, 11,518,260 dollars; in 1799, 12,431,967 dollars; in 1801, 17,438,193 dollars; in 1804, 11,030,157 dollars. The importation is very great, both for the consumption of Pennsylvania, and of the districts supplied from Philadelphia: common and fine imported linens and woollens are used to a great amount, notwithstanding the quantity of home-made; much Swedish iron and Russian hemp is imported; and English hard-ware is in great demand. The tonnage of this state amounted, in 1796, to 98,237 tons; in 1799, to 93,824 tons.

The inhabitants of this state are principally the descendants of English, Irish, and Germans, with some Scotch, Welsh, Swedes, and a few Dutch. The Friends and Episcopalians are chiefly of English extraction, and compose about one-third of the inhabitants. The Germans compose about one-quarter of the inhabitants of Pennsylvania; they consist of Lutherans (who are the most numerous), Calvinists or the reformed church, Moravians, Catholics, Mennonists, Dutch Baptists (corruptly called Tunkers and Dunkers, by way of reproach), and Zwingfelters, who are a species of Quakers. They are all distinguished for their temperance, industry, and economy. The Baptists (except the Mennonist and Dutch Baptists) are chiefly the descendants of emigrants from Wales, and are not numerous. The original Swedes went over in the year 1638, as a colony, under the government and protection of Sweden. Few Swedes have since settled in America; and their language is nearly extinct. These people uniformly had the character of probity, mildness, and hospitality; but have been careless of their lands and interest. A privilege, almost peculiar to this state, has been granted to foreigners by the legislature; viz. that of buying or holding lands and houses within this commonwealth, without relinquishing their allegiance to the country in which they were born.

The congregations of the different denominations of Christians in Pennsylvania are as follow: viz. Presbyterians, 101 congregations; German Calvinists, 84; German Lutherans, 84; Friends or Quakers, 54; Episcopalians, 26; Baptists, 15; Roman Catholics, 11; Scotch Presbyterians, 8; Moravians, 8; Free Quakers, 1; Universalists, 1; Covenanters, 1; Methodists, several; besides a Jewish Synagogue, amounting in all to about 400 religious societies.

There are six colleges in Pennsylvania: Dickenfon College, at Carlisle; the University of Pennsylvania, in Philadelphia; Franklin College, at Lancaster; Jefferson College, at Cononsburg; Washington College, seven miles from the same place; and Allegany College, at Meadville. Dickenfon College has an excellent central position. It is under the direction of forty trustees; has a principal and five professors; a good philosophical apparatus; a library of about three thousand volumes; and a revenue of considerable amount, arising from ten thousand acres of land, and funded certificates. It is divided into three departments; the college, the medical, and the grammar schools; in all of which there are about 650 students; about fifty in the first, five hundred in the second, and one hundred in the last. Its funds are not so extensive as they ought to be, yielding a revenue of only 2365l. but, in other respects, it is on a very good footing; and the philosophical apparatus, particularly, is, without a doubt, the most complete in the United States. Washington and Jefferson Colleges are in the neighbourhood of each other; and are very much alike in every particular. The funds of the former are small; but it has a pretty good library and philosophical apparatus. In each of these colleges the average number of students is about sixty.

Pennsylvania abounds with literary, humane, and other useful, institutions more than any other of the American

American states. We shall here merely enumerate them, and mention the time of their institution. They are—The American Philosophical Society, formed 1769; the Society for promoting Political Inquiries, instituted in February 1787; the College of Physicians, instituted in the same year, and incorporated in 1789; the Pennsylvania Hospital, established in 1751; Philadelphia Dispensary, instituted in 1786; the Pennsylvania Society for the Abolition of Slavery and the Relief of free Negroes unlawfully held in bondage, begun in 1774, and enlarged in 1787; the Society for alleviating the Miseries of Prisons, which is become a regular work-house with an annexed place of confinement; the Society of United Brethren for propagating the Gospel among the Heathens, instituted in 1787; the Pennsylvania Society for the Encouragement of Manufactures and useful Arts, instituted in 1787; the Philadelphia Society for the Information and Assistance of Persons emigrating from foreign Countries, instituted in 1794. Besides these, there are two insurance-companies; an humane society, for the recovery of drowned persons, instituted in 1770; an Agricultural Society, a society for the relief of German, and another for the relief of Irish, emigrants; a Marine Society, a Society for the Support of Widows and Families of Presbyterian Clergymen, and St. George's and St. Andrew's charitable Societies. Most of these societies are in the city of Philadelphia.

In the Philosophical Transactions for 1757, there is an account of a spring in Pennsylvania, which rises from a copper-mine, and yields 800 hogshheads in 24 hours. The water is of a pale-green colour, of an acid, inky, and nauseous, taste. The saline matter which it holds in solution is probably sulphate of copper; for a piece of polished iron immersed in it is soon covered with a crust of metallic copper. It contains also, it is said, sulphate of iron.

Near Brownville, a town on the Monongahela, in the western part of Pennsylvania, a storm lately (July 1821) tore up a large oak. By its fall with its roots, the surface of a sand-stone was laid bare about sixteen feet square. On the smooth surface of this work several figures are engraved, among which are two of the human form, a man and woman, with a tree between them; the woman has fruit in her hand: figures of deer, bears, and turkey-cocks, are also carved on it. The oak was at least from 500 to 600 years old, consequently these figures must have been carved long before the discovery of America by Columbus. Similar discoveries have likewise been made in other parts of the United States. In the countries about the Ohio several hills have already been discovered, which are certainly the work of human hands, and must have required the labour of thousands. On the sides and on the summit grow large oaks, apparently from four to six hundred years old. Near the mouth of the river Muskingham, 183 miles below Pittsburgh, there is an ancient fortification, occupying about forty acres of ground. Round it are several quadrangles of 140 to 200 feet in length, surrounded with ramparts from ten to thirty feet in height, on which there are also very old oaks. On each side are three openings at equal distances; the middle one about thirty feet in breadth and twenty-two in height. The whole is surrounded by a mound of earth, the base of which is from thirty-six to forty feet, and its height about ten feet. According to all appearance, the works have been abandoned for many centuries, but by whom they were erected is unknown; the oldest Indians say that they existed at the arrival of their forefathers. In digging cellars and wells, are occasionally found petrified instruments and utensils, which indicate a degree of civilization unknown in any of the Indian nations. For accounts of other antiquities and natural curiosities, see the articles PHILADELPHIA, READING, SCHUYLKILL, &c. *Morse's American Geography. Monthly Mag. Aug. 1817. Gent. Mag. Nov. 1822.*

PEN'NY, a town of Bengal: eighteen miles south-east of Purneah.

PEN'NY, *f.* plural *pence*; [penɪz, Sax. It is derived by Camden from *pecunia*; but by others from *pendo*, to weigh, and it was sometimes written, according to this origin, *pending*.] A small coin, of which twelve make a shilling. A penny is the radical denomination from which English coin is numbered, the copper halfpence and farthings being only *nummorum famuli*, a subordinate species of coin.—The same servant found one of his fellow-servants which owed him an hundred *pence*, and took him by the throat. *Matthew.*

She sighs and shakes her empty shoes in vain,
No silver *penny* to reward her pain. *Dryden.*

Proverbially. A small sum.—We will not lend thee a *penny*. *Shakespeare.*—Because there is a latitude of gain in buying and selling, take not the utmost *penny* that is lawful; for, although it be lawful, yet it is not safe. *Bp. Taylor's Holy Living.*

You shall hear
The legions, now in Gallia, sooner landed
In our not-fearing Britain, than have tidings
Of any *penny* tribute paid. *Shakespeare's Cymbeline.*

Money in general.—It may be a contrivance of some printer, who hath a mind to make a *penny*. *Swift's Miscellanies.*

Pepper and Sabean incense take;
And with post-haste thy running markets make;
Be sure to turn the *penny*. *Dryden.*

The ancient English penny, *penig*, or *pening*, was the first silver coin struck in England; nay, and the only one current among our Saxon ancestors; as is agreed by Camden, Spelman, Dr. Hickee, &c.

Of the heptarchic pennies we have given an account under the article MEDAL, vol. xiv. p. 820. and we have there given a brief history of the penny, as a silver coin, both before and after the Conquest.

The penny, which in Elthelred's time was the 20th part of the troy ounce, was equal in weight to our three-pence; five of them made one shilling, or scilling Saxon; and thirty a mark or mancuse, equal to our 7s. 6d. It was the largest silver coin in England, and retained this value till the reign of Edward III.

Till the time of king Edward I. the penny was struck with a cross so deeply indented in it, that it might be easily broken, and parted, on occasion, into two parts; thence called *half-pennies*; or into four, thence called *fourthings*, or *farthings*. But that prince coined it without indenture; in lieu of which he first struck round half-pence and farthings.

Stow, in his Annals, p. 200, says, that half-pennies were first coined round, A. D. 1279, in the reign of Edward I. But historians have since discovered, that half-pennies of this kind were coined by Henry I. and that, though the usual way in the reign of the two first Williams was to cut the penny into two for making of half-pennies, &c. yet it has been supposed that some few half-pennies might even then be coined round. Some few pieces of this kind are preserved in the cabinets of the curious. See Mr. Pegge's remarks on this subject in *Gent. Mag.* vol. xxviii. p. 64.

Edward I. also reduced the weight of the penny to a standard, ordering that it should weigh thirty-two grains of wheat, taken out of the middle of the ear. (Stat. 13 Edw. I.) This penny was called the penny *sterling*. Twenty of these pence were to weigh an ounce; whence the penny became a weight as well as a coin.

By 9 Edw. III. it was diminished to the twenty-sixth part of the troy ounce; by 2 Henry VI. it was the thirty-second part; by 5 Edw. IV. it became the fortieth, and also by 36 Hen. VIII. and afterwards the forty-fifth; but by 2 Eliz. sixty pence were coined out of the ounce; and during

during her reign sixty-two, which proportion was observed till the new coinage of 1816, when sixty-six pence were made from an ounce of silver, and sixty-six shillings from a pound.

The silver penny sterling has been long difused as a coin; and is scarcely known but as a money of account, containing the twelfth part of a shilling, or the two hundred and fortieth part of a pound; and indeed, from its very diminutive size, it can never more become a current coin, nor probably will any thing less than a sixpence ever be so used. But, in the year 1797, when gold was withdrawn from circulation, the silver coinage being also in a very bad state, copper pennies, weighing, an ounce each, were introduced into circulation. In the copper coinage of 1806, the penny was made somewhat less; so that, at length, instead of 20 pennyweights to the ounce, we have about 20 to the pound.

The course of exchange between England and France is settled on the foot of 50 many pence sterling for a French half-crown of three livres.

PENNY, in ancient statutes, &c. is used for all silver money. Hence the *ward-penny*, *aver-penny*, *hundred-penny*, *tilling-penny*, and *brothal-penny*.

PENNY EARTH, *f.* A term used by farmers for a hard loamy or sandy earth, with a very large quantity of sea-shells intermixed in it, some of which being round and flat, in some measure resembling pieces of money, have occasioned the earth's being called by this name. It is an earth not easily dug, but is usually undermined with pickaxes, and then falls in large lumps; which, with the frosts, break to pieces, and leave the shells loose. It is prepared by breaking and mixing well with water, and then makes very desirable floors. The Jersey combers' comb-pots are also made of it, and the sides and roofs of ovens are plastered with it; and, being rightly managed, it combines into a floor almost as strong as plaster of Paris.

PENNY-GRASS. See RHINANTHUS.

PENNY-POST, *f.* An office for conveying letters for the price of a penny to all places within the London bills of mortality, till the year 1807, when the price was advanced to 2d.

PENNY-ROYAL, or PUD'DING-GRASS, *f.* [*pulegium*, Lat.] A plant. See MENTHA.

First *pennyroyal*, to advance her fame,
(And from her mouth a grateful odour came.)
Tells 'em, they say, how many ills that source
Threatens, whene'er, &c. *Cowley englished.*

PENNY-TOWN. See PENNINGTON.

PENNY-WEIGHT, *f.* A weight containing twenty-four grains troy-weight. So called from the ancient silver penny being of this weight.—The Sevil piece of eight is $1\frac{1}{2}$ pennyweight in the pound worse than the English standard, weighs fourteen pennyweight, contains thirteen pennyweight twenty-one grains and fifteen mites, of which there are twenty in the grain of sterling silver, and is in value forty-three English pence and eleven hundredths of a penny. *Arbutnot on Coins.*

PENNY-WISE, *adj.* Saving small sums at the hazard of larger; niggardly on improper occasions.—Be not *penny-wise*; riches have wings and fly away of themselves. *Bacon.*—*Penny-wise*, pound-foolish. *Burton's Anat. of Mel. Pref.*

PENNY-WORT. See HYDROCYCLE.

PENNYLESS, *adj.* Moneyless; poor; wanting money.—The doors, for ever barred to the *pennyless* populace, seemed to open themselves at his producing a silver sixpence. *Arbutnot and Pope.*

Hail, ticking! surest guardian of distress!
Beneath thy shelter *pennyless* I quaff
The cheerful cup! *Warton on Oxford Ale.*

PENNYWORTH, *f.* As much as is bought for a penny. Any purchase; any thing bought or sold for

money.—Lucian affirms, that the souls of usurers after their death, are transported into the bodies of asses, and there remain certain days for poor men to take their *pennyworths* out of their bones and sides by cudgel and spur. *Peacham.*

Pirates may make cheap *pennyworths* of their pillage,
And purchase friends. *Shakespeare's Hen. VI.*

Something advantageously bought; a purchase got for less than it is worth:

For fame he pray'd, but let the event declare
He had no mighty *pennyworth* of his prayer. *Dryden.*

A small quantity.—My friendship I distribute in *pennyworths* to those about me, and who displease me least. *Swift.*

PEN'OBSCOT, a river of America, which is the most considerable in the district of Maine, and rises by two branches in the high lands. Between the source of the west Fork and its junction with the east, is Moosehead lake, thirty or forty miles long and fifteen wide. The east branch passes through several smaller lakes. From the Forks, as they are called, the Penobscot Indians pass to Canada, along either branch, principally the west, the source of which, as they say, is not more than twenty miles from the waters that empty into the St. Lawrence. At the Forks is a remarkable high mountain; and from thence down to Indian Old Town, situated on an island in this river, the distance is about sixty miles, and in the interval the river widens and embraces a great number of islands. Just below Indian-town are the Great Falls, where is a carrying-place of about twenty rods; and thence for twelve miles to the head of the tide there are no falls to obstruct boats. From thence for thirty-five miles, to the head of Penobscot-bay, or to the site of Old Fort Pownal, the river flows in a pretty straight course, and is easily navigated. Passing by Majahagaduse on the east seven miles, and Owl's-head twenty miles farther, you enter the ocean. The Indians have a communication from this river to Scoodick-river, by a portage of three miles. This river was the eastern limit of Nova Scotia, or Acadia, by the treaty of Utrecht. Within about twenty miles there are more than sixty islands of various sizes, comprehending in the whole about 12,000 acres. Fifty-four of these the Indians have reserved to their own use. See INDIAN Old Town, vol. xi.

PEN'OBSCOT, a bay on the coast of Hancock county, in the state of Maine, and called by the first discoverer *Novembega*, about sixteen leagues wide from Naakeag-point and Burnt-coat island on the east, to the point on which Thomastown stands on the west side of the bay. The chief islands it incloses are Fox, Haut, Long, and Deer, islands; besides a number of small isles, rocks, and ledges. On a fine peninsula, on the east side of the bay, the British built a fort, and made a settlement, which is now the shire-town of the county of Hancock, and is a commodious place for the lumber-trade. Haut-island, or the Isle of Holt, lies in lat. 44. 23. N. lon. 68. 10. W. and is the southernmost of the large isles.

PEN'OBSCOT, a post-town of Maine, on the east side of the bay of its name, which is a port of entry, and carries on a small trade in fish and lumber. In 1796 it was divided into two towns; the one retaining the name of Penobscot, containing 1302 inhabitants, and the other named CASTINE, which see, vol. iii.

PEN'OL (El), a castle of Fez, near Velez: taken by the Spaniards in 1513.

PENOMA'ZIN, a town of Siam: sixty miles south of Tenasserim.

PEN'ON (El), a town of South America in the province of Carthage: thirty-six miles south of Mompox.

PENO'WAL, a town of Hindoostan, in the circar of Oudeypour: twenty miles south-east of Cheitore.

PENRHYN', a seaport of North Wales, in the county of Caernarvon, on the Menai, from whence great quantities

ties of slate are exported: two miles south-west of Bangor.

PENRHYN DWA', a cape on the west coast of Wales, and county of Caernarvon: ten miles south of Pulhely.

PENRHYN'S ISLANDS, a group of islands in the South Sea, which, having only been seen by their discoverer at a distance, have at length been satisfactorily described by Otto Von Kotzebue, of the Russian ship *Rurick*, in his late Voyage of Discovery.

"On the 30th of April, 1816, in the afternoon, we saw Penrhyn's Islands, which we found, like all other coral-islands, forming a circle, connected by reefs from the lake in the middle; many rocks were also seen above the water. We were surprised to see these islands covered with thick forests of cocoa-trees; and our astonishment was agreeably increased when we perceived, by the columns of smoke issuing from them, that this small and distant group was inhabited. With our telescopes we could even see the people running about on the shore; and the setting sun only induced us to postpone the farther investigation till the next day. On the 1st of May we brought the *Rurick* under the wind; at eight o'clock we were in calm water, within a couple of miles from land, and then distinctly saw a great many people on shore, actively engaged in putting their boats to sea, while some from the other islands were already approaching in theirs. On seeing a number of boats coming towards us, we came-to: some of the boats, which carried from twelve to eighteen people, had sails; in each of them was an old man, probably the commander of the rowers, for he was sitting gravely with a wreath of palm-branches round his neck, holding up in his left hand a palm-branch, as a sign of peace. When the boats had approached within twenty fathoms they stopped, and began singing in a very melancholy strain; but, after this ceremony, they fearlessly came nearer, yet without coming on-board. We were, however, disappointed in our expectation of meeting with fresh provisions; for they brought nothing but unripe cocoa-nuts, which they offered to barter for old nails and pieces of iron; however, to profit something by them, I allowed every one to supply himself with the manufactures of the savages, as far as he liked. The *Rurick* was soon surrounded by twenty-six boats, which we kept on one side of us, my crew not being sufficiently strong to protect the ship against the greediness of three hundred savages. The trade was carried on in a very lively and clamorous manner: many boats, in their endeavour to be foremost with their goods, upset; but the most violent quarrel always ended with laughing and joking. Those who could not approach the *Rurick*, on account of the crowd, amused themselves in their boats with singing and dancing; their droll movements, and particularly their skill in making faces, gave us much amusement. The exchanges were effected by means of a rope, to which they fastened their goods without mistrust, and waited patiently for their payment, which was conveyed to them in the same way. One of the chiefs, who got up so high on the side of the ship that he could reach to look over the deck, was pulled back by the legs by the others, amidst lamentable screams; but, when he had got back again into the boat, they surrounded him, and with a great many gestures he told them of the wonders which he had seen, showing at the same time, the presents which he had made him, to reward his courage. By degrees, the boldness of the islanders increased: they stole as much as they could, and at last went even so far as to threaten us. Unacquainted with the superiority of European arms, they grew bold by their numbers; so that at last I was obliged to have a musket fired, which had its effect: in the same instant they all jumped into the sea, in which they disappeared. A death-like silence followed the monstrous noise, and an immense grave seemed to have swallowed them all, till, by degrees, one head after the other appeared above the surface. Fright and terror were depicted in every

face; they looked carefully about them to see what mischief the report had done; and, when they found that there was none, they returned into their boats; but they were more orderly. Nothing pleased them better than large nails, for which they sold us some lances of black wood, very neatly made, with some other arms.

"These islanders resemble in size and strength the inhabitants of the Marquesas: their faces, too, may be something like them, although those of the Marquesas seemed to me to be handfomer and whiter. Of the women I cannot judge, having only seen two of them, who were old and very ugly. They have the happy cheerful temper of the other South-Sea islanders, but they are rather more savage in their conduct. It is remarkable that these islanders are not tattooed, in which they deviate from all the other South-Sea islanders, particularly as they are so near the Friendly Islands, that they either have their origin among them, or have been driven here from the Washington Islands. However, not to be altogether without ornaments, most of them have scratched stripes down their backs, which gives them, with their long matted hair hanging over them, a disgusting appearance. With the exception of a few, who wear a girdle of badly-made stuff, they are all naked. They wear their nails long; and this forms probably the principal ornament of the chiefs, for I saw several who had them near three inches long. The Penrhyns do not possess the tree from which, in most of the South-Sea islands, they make their dresses; which is a proof that they have no connexion with the Friendly Islands; yet they understood some words of their language, which we repeated, borrowed from Cook's Voyages. Their boats, which are badly made, resemble those of the Marquesas, having also the balanciers, and carry conveniently twelve men; the sails, made of coarse matting, are only fit to sail with the wind. Whether the islands produce any thing besides cocoa-nuts, I cannot say; of these however, judging by the number of trees, there must be a great abundance. Through the telescopes, we saw many women walking on-shore, who were admiring the ship from a great distance. We did not perceive any thing like a house; but we saw a stone wall, which was very well built. I should have liked to have gone on-shore, but could not venture with my few people, the savages being so numerous and bold. Towards noon, we had a violent thunder-storm, just when I was about quitting the islands. The savages, far from being frightened at the thunder, had fastened their boats to our ship, and endeavoured to draw the nails out of it, making, at the same time, such a noise, that it was impossible to hear the word of command. To get rid of them I hoisted all sail; and the unexpected quick motion of the ship, which upset several of their boats, obliged them to desist; but they followed us for a long time, making signs that they wished our return. The great population of these islands, and the bold spirit of the savages, prove that there must be other islands near them with which they are connected. We found the latitude of this group 9. 1. 35. S. mean between the chronometers and the observed longitude 157. 34. 32. W. declension of the needle 8. 28. E.

PENRISE, or **PENRICE**, a town of South Wales, in the parish of Oxwich, and county of Glamorgan, on the west side of a bay in the Bristol Channel, with a weekly market on Thursday; and fairs, May 17, July 17, Sept. 17, and Dec. 1. This town has a good harbour for ships. It got the name of Penrice, or Penrice, from the following circumstance. At Carno, near this place, a bloody battle was fought between Rees ap Tudor king of Dynevor, (from whom descended Henry VII. of England) and his rebellious subjects, in which that amiable prince was defeated, and, flying to his castle at *Gower*, (the ancient name of this place,) was there inhumanly beheaded, from which time it was called *Castle Pen Rees*, or the *Castle of Rees's Head*. It is now called *Penrice Castle*.

The defeat of Rees ap Tudor was a little before the Norman conquest. A considerable part of the ruins of the castle are still visible. See *Oxwich*, vol. xviii. Penrith is fourteen miles west-north-west of Swansea, and 219 west of London. Lat. 51. 46. N. lon. 4. 10. W. *British Directory*, vol. v.

'PENRITH' (New), a market-town in the county of Cumberland, is situated in a vale within the district called Inglewood Forest, eighteen miles from Carlisle, and 283 from London. It is a place of considerable antiquity, and was successively in possession of the English and Scottish sovereigns; during whose contentions it suffered by the depredations of the Scots, by whom it was burned in the 18th of Edward III. and again in the following reign. About that period the plague raged in Penrith: and in the year 1598, a second visitation of this dreadful disorder nearly depopulated the parish: for 583 persons fell victims to it according to the register, but incorrectly stated on a brass plate in the church as amounting to 2260. The fear of infection prevented the continuance of the regular markets; and places were appointed, without the town, for purchasing the provisions brought by the country people.

Penrith is an inland town; not large, but has, when viewed collectively, a very neat appearance, many of the houses being handsome structures, built of red freestone, and covered with that lasting and beautiful article called blue slate. It is perhaps the greatest thoroughfare in the north of England; passengers to and from the metropolis to Ireland, crossing the sea at Port Patrick, or Whitehaven, pass through this town; and, since the improvements of the roads, those who are travelling from Scotland to London mostly take this way. In 1715 the Scots highland rebels entered this town, and quartered here one night, in their way to Preston, without doing much harm; but in the last rebellion, in 1745, they were very rapacious here, and cruel. Its handsome spacious church above mentioned has its roof supported by pillars, whose shafts are of one entire reddish stone, dug out of a neighbouring quarry.

The population of Penrith, in the year 1811, amounted to 4328, occupying 938 houses. The inhabitants are chiefly employed in agriculture, and in weaving checks and fancy-cloths for waistcoats. A weekly market is kept on Tuesday, and a smaller one on Saturday; and here are five annual fairs. The stations for marketable commodities are disposed in a singular manner: the wheat-market is in one part of the town, barley is sold in another part, rye and potatoes in a third; cattle, hogs, and horses, have also distinct places of sale.

The church is a neat, but plain, structure: the body was rebuilt of red stone in the year 1722, at the expense of 2253l. and connected with the ancient tower. In the church-yard is a singular monument of antiquity, called the Giant's Grave, the origin of which has frequently exercised the sagacity and speculations of antiquarians. It consists of two stone pillars, standing at the opposite ends of a grave, about the distance of fifteen feet asunder, eleven feet six inches in height, and nearly five feet in circumference at the bottom, where they are mortised into round stones embedded in the earth. The space between them is two feet in breadth, and is inclosed by four thin semicircular stones, two on each side, of unequal lengths, but little more than twenty inches in height. Three of these stones have an ornament of foliage, rudely sculptured, remaining round their upper edges; the fourth is plain, of a different kind, and seems to have been placed in the room of one decayed. The pillars taper upwards; their lower parts are rounded to about the height of seven feet, where they assume a square form, and appear to have terminated in a point; but the tops are broken. On the square parts are some traces of ornamental fretwork; and the interior side of one pillar has a rude delineation of some animal, resembling a bear. Near the summit of each pillar are the vestiges

of a raised cross, now almost obliterated. Bishop Lytleton, in his remarks on this monument, (published in the *Archæologia*), inclines to the opinion of its being the sepulchre of some British prince interred here subsequent to the introduction of Christianity; and tradition ascribes it to the British king Ewain, a warrior of gigantic size, who reigned in this county in the time of Athelstan, or Ida. That this Ewain was actually buried at Penrith, appears in the highest degree probable, from the notice of his sepulchre in the "Verfes of the Graves of the British Warriors," written about the close of the sixth century. At a small distance from this monument, with which, however, it does not appear to have any connexion, is a single stone, called the Giant's Thumb, five feet eight inches in height, about fourteen inches broad at the lower part, but contracting upwards to ten inches; the head, which appears to have been circular, expands to the diameter of about eighteen inches. This seems to have been an ancient stone cross.

Previous to the year 1400, the inhabitants of Penrith were frequently distressed for fresh water; but about that time, Strickland, bishop of Carlisle, purchased a sufficiency of the water of the river Peteril, which he conveyed to the town at his own expense. He also founded a chantry here, and endowed it with six pounds annually for the support of a priest. The revenues of this establishment were given by queen Elizabeth to an ancient school (instituted so early as the year 1340.) which she re-founded, by the title of "The Free Grammar School of Queen Elizabeth in Penrith."

A little to the south of the town, on a small elevation, stand the remains of an old castle, of which we have no certain account, either of the time of its foundation or even of the time of its being demolished. Previous to Edward IV. his uncle, Richard duke of Gloucester, (afterwards Richard III.) resided here in quality of sheriff of Cumberland, who repaired it, and lived here five years together, doubtless with a design to collect his friends in the north, and intimidate those of the house of Lancaster. The duke's repairs, consisting of a tower, porter's lodge, &c. have been pulled down and taken away; but that part of the ancient building which is still standing is too firmly cemented to be separated by the efforts of the workmen employed for that purpose, and probably must remain till the all-subduing hand of time moulders the materials, and levels it with the ground. This castle, with the manor of Penrith, was part of a grant from William III. to William Bentick, esq. (afterwards earl of Portland,) in which family it continued till 1784, when the third duke of Portland sold it to his brother-in-law the duke of Devonshire.

Greytokes Castle is near five miles to the west of Penrith, a seat belonging to the late duke of Norfolk, and the place of his nativity. His grace added several thousand acres to the ancient demesne, and built some curious edifices upon the improved lands.

Dalemain, a handsome modern stone building, belonging to Edward Hasell, esq. is something more than three miles to the south-west of Penrith, on the right of the road leading from Penrith to Ullswater, taking the Cumberland side of the river Eden, (there being another road leading to Ullswater on the Westmoreland side of the said river.)—A little further on the same road, but at a greater distance from it, stands Dacre Castle, an old tower, though pretty entire, and formerly the seat of the Dacres. It appears to have been standing at the time of the Saxon invasion, and probably much earlier. This castle also belongs to Edward Hasell, esq.

Hutton-John, a seat belonging to the ancient family of Huddleston, is about five miles and a quarter from the town of Penrith, a little to the left of the road leading to Keswick. It is out of sight in passing along the road, standing on the declivity of a hill facing the south; but its situation may be nearly known to travellers by some small groups of firs, &c. adjoining to the road.—Hutton Hall.

Hall, a handsome modern building, belonging to Sir Frederic Fletcher Vane, bart. is about five miles from the town of Penrith, on the road leading to Wigton.

Eden Hall, about three miles to the east of Penrith, is an ancient, large, and noble, structure, several of the apartments being ornamented with curious historical prints, tapestry-hangings, and stucco-work; and an elegant staircase with hanging stairs, &c. This noble structure belongs to Sir Philip-Christopher Musgrave, bart. who seldom resides at it, though it is pleasantly situated. —Melmerby Hall, eight miles east, in a pleasant sporting country, is the seat of Thomas Pattinson, esq.

Leaving Penrith and travelling towards the bridge, at about half a mile from the town, on the left, may be observed a road which leads to Carleton Hall, the seat of the late James Wallace, esq. who died attorney-general to his late majesty George III. which place he filled with the highest reputation. He spared no expense in improving and beautifying it, and lived to see it a most charming and delightful place of retirement from the arduous and busy scene of life in which he made so conspicuous a figure.

After passing the bridge, (the river Eden being the boundary which separates the counties of Cumberland and Westmoreland,) and proceeding on the road to Brough, at about two miles from Penrith, on a small but beautiful eminence, stands Bird's Nest, or Brougham Hall, a handsome building, with small but neat gardens; but this place has of late been much neglected, and consequently much out of repair, the present proprietor, Henry Brougham, esq. seldom residing at it.

At the distance of three miles from Penrith, on the left of the road leading to Brough, are the venerable ruins of Brougham Castle, erected in 1070. From what remains standing of this ancient pile, it has evidently been a fortress of great strength. It formerly belonged to the illustrious family of the Cliffords. Margaret, daughter of Anne countess dowager of Pembroke and Montgomery, being married to John lord Tufton, brought this and the adjoining estate into the family of the earl of Thanet, in whose possession it still remains. This noble castle was repaired by the aforefaid Anne countess dowager of Pembroke in the year 1651, having been in a dilapidated state nearly five and thirty years. After her death it was entirely neglected, and all the materials sold for 100l. to two attorneys in Penrith. It is now a mouldering venerable ruin on the banks of the river Eden. The keep and chapel are the most prominent features; the former of which is very ancient, of massy construction, having several circular arches in front, and has probably been considerably higher. To the north-east angle is attached a gateway of less ancient erection. The chapel was very small; part of the east window, stalls, and holy-water recess, with large corbels of the roof, remain. The old church at Brougham, being considered in a dangerous state, was taken down, and rebuilt by the countess of Pembroke, in the year 1659.

About a mile from this place, on the south side of the road (to London), the attention is drawn to a pillar standing on a gently-rising ground. This pillar was erected in the year 1656 by the same countess of Pembroke, a woman so justly celebrated for her many excellent qualities, that a little description of this memorial may not be unacceptable. This pillar is between seven and eight feet high, and about three in diameter, of an octagonal form, with capital and base: it supports a square block of stone, on two sides of which are fundials, on a third the arms of Veteriponts and Clifford, impaling Russell, surmounted by an earl's coronet; and on the fourth, the following inscription, on a brass plate: "This Pillar was erected, anno 1656, by the Right Honourable Ann, countess dowager of Pembroke, &c. and sole heire of the Right Honourable George earl of Cumberland, &c. for a memorial of her last parting in this place with her good and pious mother, the Right Ho-

nourable Margaret, countess dowager of Cumberland, the 2nd of April, 1616. In memory whereof she also left an annuity of four pounds to be distributed to the poor within this parish of Brougham every 2nd day of April for ever, upon the stone table here hard by. *Laus Deo.*" A few paces towards the south is the base of a small stone table, the upper part of which has been thrown down, and lies near the spot: how long it has been in this state we know not; but with very little trouble it might be replaced, and both preserved from destruction. Gratitude to the benevolent distributor of so many charities should be alone sufficient to preserve this and all other of her works from wanton demolition; and, when we reflect on the doubly pious intention of this little monumental tribute, as expressed in the inscription, it is a duty absolute and indispensable. This exalted female character (the daughter of George Clifford, third earl of Cumberland, by Margaret Russell his wife) was born at Skipton Castle on the 30th of January, 1590. She first married William Sackville, earl of Dorset, and afterwards Philip Herbert, earl of Pembroke, who died in the year 1649. After his death the countess devoted her attention to many pious works, and the restoration of six of her noble castles, which had suffered delapidations during the civil wars.

On the north bank of the river Eden are two caves or grottoes, dug out of the solid rock, and sufficient to contain one hundred men. The passage to them is very narrow and dangerous, and perhaps its perilous access may have given it the name of *Isis Parlus*, though the vulgar tell strange stories of one Isis, a giant, who lived here in former times, and, like Cacus of old, used to seize men and cattle, and draw them into his den to devour them. But it is highly probable that these subterraneous chambers were made for a secure retreat in time of sudden danger: and the iron gates, which were taken away not long ago, do not a little confirm that supposition.

PEN'RITH (Old), is five miles from New Penrith, and thirteen from Carlisle. Here are great ruins of a town; here was formerly a Roman station, of which there are a great many remains, and numbers of Roman antiquities have been found here.

Beacon-hill is thus described by Mr. Hutchinson: "Our first excursion from Penrith was to mount the steep hill on which the beacon is placed, upwards of a mile to the northward of the town; the labour was great by which we ascended, but the view amply rewarded our fatigue. The beacon-house is a square building of stone, and happily situated for the purpose of alarming the country in times of public danger, as it commands an extensive vale. The northern window of the beacon-house affords a prospect of Cross Fell, with the pikes of Dufton, together with a chain of mountains extending from east to west near thirty miles; the western point sinking in the spacious plain where the city of Carlisle lies. The utmost bounds of this view are formed by a ridge of Scotch mountains. The eastern window presented a view of the country bounded by the hills of Stanemore, and that lofty promontory Wildbore Fell, with its neighbouring mountains above Kirkby Stephen. The south window presented to us a view of Brougham Castle, with its plains of pasture-ground. The spreading woods of Lowther, (see vol. xiii.) intermixed with rich cultivated lands, formed the rising grounds. Some parts of the lake of Ulswater were seen, whilst the mighty rocks and mountains, which hemmed in the lake, lifted up their heads in rude confusion, and crowned the scene. The western window afforded a new, and not less pleasing, prospect: the town of Penrith lay before us, and here and there the river Eamont (Eden) showed its windings through the woods. The hill which rises above the town is crowned with the awful remains of a royal fortress; time has despoiled its grandeur, but its honours still survive to its noble owner, the duke of Portland, who

who therewith holds the honour of Penrith, formerly a royal franchise. Beyond these objects, amidst a range of mountains, at the distance of eighteen miles, Skiddow is seen, whose majestic front surmounts all the high lands that terminate the view." *Wilkes's British Directory*, vol. iv. *Beauties of England and Wales*, vol. iii. *Genl. Mag.* 1814 and 1819.

PENROSE (Thomas), born at Newbury, Berks, in 1743, was the son of the rector, a man of high character and abilities, descended from an ancient Cornish family, beloved and respected by all who knew him. Thomas, being intended for the church, pursued his studies with success at Christ-church, Oxon, until the summer of 1762, when, his eager turn to the naval and military line overpowering his attachment to his real interest, he left his college, and embarked in the unfortunate expedition against Nova Colonia, in South America, under the command of captain Macnamara. The issue was fatal. The Clive (the largest vessel) was burnt; and, though the Ambuscade escaped (on-board of which Mr. Penrose, acting as lieutenant of marines, was wounded), yet the hardships which he afterwards sustained in a prize-ship, in which he was stationed, utterly ruined his constitution. Returning to England with ample testimonials of his gallantry and good behaviour, he finished, at Hertford College, Oxon, his course of studies; and, having taken orders, accepted the curacy of Newbury, the income of which, by the voluntary subscription of the inhabitants, was considerably augmented. After he had continued in that station about nine years, it seemed as if the clouds of disappointment, which had hitherto overshadowed his prospects, and tinged his poetical essays with gloom, were clearing away; for he was then presented by a friend, who knew his worth and honoured his abilities, to a living worth near 500*l.* per annum. It came, however, too late; for the state of Mr. Penrose's health was now such as left little hope, except in the assistance of the waters of Bristol. Thither he went; and there he died in 1779, aged thirty-six years. Mr. Penrose was respected for his extensive erudition, admired for his eloquence, and equally beloved and esteemed for his social qualities. By the poor, towards whom he was liberal to his utmost ability, he was venerated to the highest degree. In oratory and composition his talents were great. His pencil was ready as his pen, and on subjects of humour had uncommon merit. To his poetical abilities the public, by their reception of his "Flights of Fancy, &c." (12mo. 1781.) have given a favourable testimony. *Ency. Brit.*

PENRY, or AP-HENRY (John), a noted Welsh non-conformist divine, and a victim to persecution and tyranny in the reign of queen Elizabeth, was born in some part of the county of Brecknock, about the year 1559. When he was about the age of nineteen he became a sizar of Peter-house, in the university of Cambridge, where he was admitted to the degree of B. A. about the year 1583. Anthony Wood says, that he afterwards performed some or most of the exercises requisite for his taking the degree of M. A. but that, quitting Cambridge abruptly, for reasons not known, he removed to Oxford, where he entered a commoner of St. Alban's Hall. Here he proceeded M. A. in 1586; and about the same time, having taken holy orders, he preached at Oxford, as he did afterwards at Cambridge, with great reputation. Mr. Penry, however, soon rendered himself obnoxious to the ruling party in the church, by adopting the sentiments of that body of the clergy who were distinguished by the name of *Puritans*. Having chosen his lot with this proscribed party, he travelled into Wales, and was the first, as he said, who preached the Gospel publicly to the Welsh, and sowed the good seed among his countrymen. In the year 1588 he published "A View of some Part of such public Wants and Disorders as are in the Service of God, within Her Majesty's Country of Wales; with an humble Petition to the high Court of Parliament for their speedy Redress," 8vo. in which he undertook to show,

not only the necessity of reforming the state of religion among the Welsh, but also the most proper means for bringing about that work. He likewise published, about the same time, "An Exhortation to the Governors and People of Her Majesty's Country of Wales, to labour earnestly to have the preaching of the Gospel planted among them," 8vo. Both these pieces were written upon puritanical principles; on which account they were attacked by some zealous friends to the established hierarchy.

As the public printing-presses were shut against the Puritans, some of them purchased a private one, and carried it from one part of the country to another, to prevent discovery. Their publications, which excited the greatest attention, were supposed to be the productions of a club of writers, since the authors were never discovered; and Mr. Penry was supposed to be one of their most active members. Among the tracts which were printed and dispersed by them all over the kingdom, one that gave the greatest offence bore the name of "Martin Mar-Prelate;" which contained a violent and bitter satire against the hierarchy and all its supporters, and was soon followed by other pieces of the same description, for the titles of which the reader may consult either of our authorities. When these pieces had been published, a special warrant was issued by the privy council in 1590, with the signatures of archbishop Whitgift and several other members, for the apprehending of Mr. Penry as an enemy to the state, and calling upon all the queen's good subjects to consider him in that light. To avoid falling into the hands of his enemies, well knowing what little mercy he had to expect from them, he withdrew into Scotland. In this country he drew up many Observations on subjects relating to religion, for his own private use; and he prepared the heads of a Petition, or Address, to the Queen, intended to lay before her the true state of religion, and the many abuses in the Church of England, especially in the management of ecclesiastical matters, of which her majesty was ignorant. One object of it also was, to pray for liberty to return to Wales, with the queen's permission to preach the Gospel in his native country. With the intention of finishing the petition above mentioned, when opportunity should offer, and of delivering it afterwards to the queen with his own hands, Mr. Penry ventured back to England in the year 1593, and lived in concealment at Stepney, near London, till he was discovered by the vicar of the parish, upon whose information he was taken into custody, and his papers seized. Having thus secured the person whom they considered to be the most bitter enemy to the established order of things, particularly in ecclesiastical matters, the privy council determined to prosecute him without delay for a capital offence. It was intended to indict him for the books which had been printed in his name; but it was now too late to endeavour to prove his criminality by any passages to be found in them, since the law required that the accusation should have been preferred within one month after their appearance, upon the oath of two witnesses, and that a prosecution should have been commenced within one year from that time. The court, therefore, determined to take a new and most iniquitous step in order to reach his life. He was indicted for "seditious words and rumours uttered against the queen's most excellent majesty, tending to the stirring-up of rebellion among her subjects;" and no evidence was produced to criminate him, excepting expressions taken from his private papers, the *Petition* and *Observations* above mentioned. Yet upon such proofs was he convicted of felony, and adjudged to be put to death. In vain did he protest against such an unjust use of private observations written in a foreign land, and never communicated to the public; and in vain did he assert his uniform and steady loyalty to her majesty, defying his enemies to point out an action of his life which was unbecoming a faithful subject. For his hardihood

In attacking the hierarchy it was determined that he should die; and archbishop Whitgift was the first man who signed the warrant for his execution. The treatment of him in his last moments, likewise, was as unfeeling and cruel as his sentence was unjust. After the warrant had been signed, it was immediately sent to the sheriff, who, on the very same day, gave directions for erecting a gallows at St. Thomas Waterings, and, while the prisoner was at dinner, sent his officers to bid him prepare to die that afternoon. Accordingly, he was carried in a cart to the place of execution; and, when he came thither, the sheriff would not permit him to speak to the people, nor to make any profession of his faith towards God, or of his loyalty to the queen; but ordered him to be turned off in a hurry, on the 29th of May 1593, when he was in the thirty-fourth year of his age.

His learning and piety are highly extolled by his friends; and Mr. Strype says of him, that "he was well disposed to religion, but mistaken in his principles, and very hot in his temper; and so became busy in church-controversies, to his own destruction. He had studied the arts and the tongues, and attained to some knowledge and learning therein." He had connected himself with that branch of the Puritans denominated *Brownists*, who maintained the discipline of the Church of England to be popish and anti-christian, and all her ordinances and sacraments invalid; and who held, that every society of Christians meeting in one place constituted an independent church, having full power within itself to admit and exclude members, to choose and ordain officers, and, when the good of the society required it, to depose them, without being accountable to classes, convocations, synods, councils, or any jurisdiction whatsoever. Besides the articles already noticed, Mr. Penry was the author of, 3. An Appellation to the High Court of Parliament, from the bad and injurious Dealing of the Archbishop of Canterbury, and other his Colleagues of the High Commission, 1589, 8vo. 4. Dialogue, wherein is plainly laid open the tyrannical Dealings of the Lords Bishops against God's Children, 1589, 4to. 5. A Treatise, wherein is manifestly proved, that Reformation, and those that sincerely favour the same, are unjustly charged to be Enemies to Her Majesty and the State, 1590, 4to. *Wood's Athen. Oxon.* vol. i. *Neal's Hist. Purit.* vol. i. ch. 6 and 8.—The learned and venerable Dr. Rees, editor of the *New Cyclopaedia*, traces his genealogy, by the maternal branch, to the family of Mr. Penry.

PENRYN', a borough and market-town in the parish of St. Gluvias, and county of Cornwall, is situated three miles from Falmouth, on the side of a hill, and bank of a river, called the King's Road, which unites with Falmouth harbour. The town formerly possessed a college, which, according to Leland, was castellated, and had three strong towers: parts of this were lately to be seen, but are now enveloped by modern buildings. The manor was an appendage to the see of Exeter; and the town appears to have been made a borough by one of the bishops towards the end of the reign of Edward I. anno 1270. Three weekly markets are held, Wednesday, Friday, and Saturday; and three fairs annually, viz. May 12, July 7, and December 21.

Penryn is exceedingly well watered, having streams of water running through it, and being bounded by a stream on each side. Upon these streams are four grist-mills and a paper-mill; and in the town are three very good porter and beer breweries. This place is the granary of the south-west of the county, the warehouses for flour and grain being very numerous, and the supply from the Isle of Wight and Hants being considerable. An extensive woollen-manufactory was once set on foot near the old abbey-lands of Glasney, but for want of proper management did not succeed. From the peculiar situation of the town, it possesses an extensive fishery.

The principal street of Penryn is spacious and airy;

and there are many very good houses. The market-house, which is also used as a town-hall, stands near the middle of the principal street, from which others diverge at right angles. In the population returns of the year 1821, Penryn is stated to contain 2933 persons. There is no church within the borough; but the inhabitants attend divine service at the village of St. Gluvias, on the opposite side of the river, where the situation of the church and parsonage-house is exceedingly beautiful. Lillo's "Penryn Tragedy," which title Colman changed to "Fatal Curiosity," was founded in truth; the horrid scene was really acted at this village of St. Gluvias.

This borough never sent members to parliament till the 1st of Mary, and was incorporated by James I. in the 18th year of his reign. A new charter was granted by James II. which vested the election of members in the magistracy only; but this they refused to accept. A custom is said to have prevailed here for the steward of the bishop of Exeter, who is lord of the manor of this borough and its *forreus*, or out-borough, to send his precept to the portreve, or mayor, to return two elizors, or principal men of the place, who were to elect twenty-two more, to make up a jury upon all law court-days, to execute the town-business, and choose the members; but this has been long rejected. The sheriff's precept is still directed to the portreve, who for many years has been the same person who executed the office of mayor. Under the charter of James I. the corporation consists of a mayor, eleven more aldermen, and twelve burgesses, with power to choose a recorder, steward, town-clerk, two constables, and two mace-bearers. The right of election is in the inhabitants at large who pay scot and lot. Returning officer, the mayor, who is also portreve. Number of voters, 140.

In 1784, this borough was under the joint influence of the duke of Leeds, and sir Francis Basset, now lord de Dunstanville; but an agreement was said to have been entered into between these two noblemen not to interfere in each other's boroughs of Helston and Penryn; in consequence of which, lord de Dunstanville became sole patron of the latter borough. His lordship's interest was, however disturbed at the general election in 1802, by John Milford, of Exeter, esq. and Henry Swan, esq. who opposed his lordship's nomination of the late sir Stephen Lushington and sir John Nicholl, and obtained a majority of legal votes upon the poll. A number of names however were by some means intruded into the poll the night before the election, and admitted the next day to vote, which made the numbers on the poll appear as follow:

Sir Stephen Lushington	94		John Milford, esq.	81
Sir John Nicholl	89		Henry Swan, esq.	62.

A petition was accordingly presented against the return, and actions for bribery to an enormous amount were commenced; but a compromise was afterwards effected before either of them came to trial; for which the injured party is said to have received ten thousand pounds besides having all their expenses reimbursed. Lord de Dunstanville, to whom many of the voters are tenants upon leases for lives, has still the controlling interest in this borough; but Mr. Swan has continued one of its members. His election, however, in the last parliament of the late king, which met in Jan. 1819, was declared void on account of bribery and corruption, which were proved to such an extent, that a bill was moved in the house by sir C. Burrell, to disfranchise the borough, and to admit the freeholders of the adjoining hundreds of Penrith and Ferrier to the right of voting. The bill was not persisted in; but Mr. Swan was prosecuted at the instance of the house, and at the ensuing assizes for Cornwall, held at Bodmin in July, was fully convicted, and sentenced to a year's imprisonment. We may just mention that, about the same time, sir M. M. Lopez, bart. member for the borough of Grampound, was sentenced,

upon two convictions of bribery, in Cornwall and in Devon, to a fine of 10,000*l.* and two years' imprisonment; and that borough has really been disfranchised.

Penryn is distant from Truro nine miles east, Gram-pound seventeen east, Marazion twenty west, St. Ives twenty-two west, Mitchel seventeen east, St. Columb's sixteen east, Penzance twenty-three west, Redruth eight west, and from London two hundred and sixty-six. *British Directory*, vol. iv. *Beauties of England*, vol. ii. *Oldfield*, vol. iii. *Gen. Mag.* 1819.

PENS, a town of the island of Cuba: twenty-two miles south-west of Bayamo.

PENSACO'LA, the capital of West Florida, situated on the west side of a bay, to which it gives name. The harbour is on the north shore of the Gulf of Mexico; 11 leagues east of Port Lewis and Mobile, and 158 west of the islands of Tortuga. It is spacious, and secure from all winds, having four fathoms of water at its entrance, deepening gradually to seven or eight. The bay lies in lat. 30. 15. N. lon. 87. 14. W. and admits of vessels drawing no more than 21 feet of water.

The town is of an oblong form, healthfully as well as delightfully situated, about one mile in length, and a quarter of a mile in breadth. While the British nation possessed it, it contained several hundred habitations, and many of the houses and public buildings were spacious and elegant. But, after the Spaniards took possession of it, it has been upon the decline. The exports from this town, consisting of skins, logwood, dyeing stuff, and silver dollars, amounted, while it belonged to Great Britain, to 63,000*l.* annually; and the average value of imports from Great Britain was 97,000*l.* The town and fort of Pensacola surrendered, after a spirited defence, to the Spaniards in 1781; and with them the whole province. This place was delivered up to Gen. Jackson on the 17th of July, 1821, by which the cession of the Floridas from the Spanish to the American government was finally completed. The negotiations on the subject had lasted, we believe, twenty years.

PENSAM, *f.* The ancient way of paying into the exchequer as much money for a pound sterling as weighed twelve ounces troy. Payment of a pound *de numero*, imported just twenty shillings; *ad scalam*, twenty shillings and six-pence; and *ad pensam*, imported the full weight of twelve ounces.

PEN'SEN, a town of Germany, in the principality of Culmbach: six miles east of Bayreuth.

PENSFORD *St. Thomas*, or, as it is sometimes called *PUBLOW St. Thomas*, a small town in the county of Somerset, near Frome, on the road to Wells, is seated on the river Chew, which here flows through a fine wooded vale, environed by small hills, the acclivities of which are covered with orchards. It is a town of high antiquity, and is conjectured by Dr. Stukely to have derived its name from the British words *Pen Isc*, signifying the Head of the River, being near the source of the Chew. In the time of Leland it seems to have been a very flourishing place, for it is mentioned by that assiduous antiquary as "a praty townlet, occupied with clothing." This business is now, however, much declined; and the town is nearly bereft of all its former trade. None of its buildings deserve notice except the church, which is a handsome modern structure, with a tower at the west end, apparently of more ancient date than its other portions. An old stone bridge of three arches is thrown over the river, and connects the town with the village of Publow, to the church of which that of Pensford is a chapelry, though in other respects it is parochial. According to the late population returns, Pensford town and parish contain 66 houses and 144 inhabitants. By the same census the parish of Publow contains 166 houses and 820 inhabitants. Wilkes's *British Directory* says, that its market, which was on Tuesdays, has been long discontinued; the fairs are, May 6, and Nov. 8, for cattle, sheep, and pedlary. Pensford lies near Frome, on

the road to Wells; six miles south of Bristol, and 117 west of London. Lat. 51. 21. N. lon. 2. 44. W.

PENS'HURST, or PENCHESTER, a village in Kent, by the Medway, three miles south-west of Tunbridge. Here is a fair, July 1. Here was the mansion of the Sidney family. It was the scene of sir Philip Sidney's poetic dreams, and the birth place of that renowned patriot Algernon Sidney: It has since heard the warblings of the poet Waller in praise of his Sacharissa, who was an inhabitant of it, and whose picture is still preserved. It is a noble structure; and, though its park is greatly diminished by enclosures, still retains much of its ancient beauty and magnificence.

Penhurst Place was, in the time of Edward I. in the possession of Sir Stephen de Peneshurste, who was made Constable of Dover Castle, and Warden of the Cinque Ports, by Henry III. after which it was conveyed to John de Pulteney; who, in the reign of Edward II. had licence to embattle his mansion-house of Penhurst; and in the reign of Edward III. he was so highly favoured as to receive from that prince the honour of knighthood. In the same reign he was four times elected to the high office of lord-mayor of the city of London. From this family it came by marriage to sir John Devereux; who, in the succeeding reign of Richard II. had also a licence to embattle and fortify this mansion. After passing through several hands it was at length forfeited to the crown, in the fourth year of Edward VI. by the attainder of sir Ralph Vane. The estate was then given by that young prince, in 1553, to sir William Sydney, who enjoyed it but a few months: from him it devolved to his infant son sir Henry, who, from his childhood, was bred at court, and was the playmate and bed-fellow of prince Edward. The young monarch afterwards made him gentleman of the privy chamber; and is said to have taken so much delight in his company, as to have rarely permitted his absence. The young prince expired in his arms at Greenwich soon after; at which period sir Henry retired to Penhurst, there to indulge his grief; and, by thus withdrawing himself escaped the fury of the times, and most probably the fatal consequences that attended his father-in-law, the duke of Northumberland, in the succeeding reign of the bigotted Mary. This fact is adverted to in the inscription over the gateway at the grand entrance.

This ancient mansion has been formerly a place of considerable strength, as appears from its immense walls and high embattled towers. The principal entrance to the great quadrangle, which is of hewn stone, is nearly in its original gothic state of design, and impresses the mind very forcibly with the gloomy and reserved pomp of our brave ancestors. The hall is spacious and lofty, and the fragments of ancient armour, here exhibited, strongly recall to memory

The ancient errant knights,
Who won their ladies hearts in fights,
And cut whole giants into fritters,
To put them into amorous twitters.

The apartments of this famous mansion have been much modernized within a few years by the late owner, William Perry, esq. who became possessed of this estate by marriage with the Hon. Elizabeth Sydney, niece to the late earl of Leicester. *Ireland's Picturesque Views on the Medway*, 1793. *Wilkes's British Directory*, vol. v.

PENSICULA'TION, *f.* [from the Lat. *pensiculo*, to ponder.] A deliberate consideration. *Cole*.

PEN'SILE, *adj.* [*penfils*, Lat.] Hanging; suspended. — Two trepidations; the one manifest and local, as of the bell when it is *penfile*; the other secret, of the minute parts. *Bacon*.

This ethereal space,
Yielding to earth and sea the middle place,
Anxious I ask you, how the *penfile* ball
Should never strive to rise nor never fear to fall. *Prior*.

Supported above the ground :

The marble brought, erects the spacious dome,
Or forms the pillars' long-extended rows,
On which the planted grove, and *pensile* garden, grows.
Prior.

PEN'SILENESS, *f.* The state of hanging.—Wherein the *pensileness* of the earth, the pole of the north, and the finiteness or convexity of heaven, are manifestly touched. *Bacon on Learning.*

PENSILITY, *f.* The state of being pensile.

PENSION, *f.* [French.] A payment of money; a rent. This is the primary meaning, which Dr. Johnson has overlooked; and has cited no earlier example of the word, under his violent definition of it, than that from Addison. It is also a sum of money paid to some churches in lieu of tithes.—He commanded to give to all that kept the city *pensions* and wages. *1 Esdr.* iv. 56. —Our Saviour rejects all such unwise and perverse traders, who will not exchange brittle glass for solid gold; a small temporary *pension* for a vastly rich freehold. *Barrow*.—An allowance made to any one without an equivalent. In England it is generally understood to mean pay given to a state hireling for treason to his country. *Dr. Johnson*.—This definition extremely puzzled the great lexicographer himself, when it was proposed to bestow a pension on *him*, in the year 1762. See Boswell's *Life of Johnson*. And the candid biographer informs us, that lord Loughborough told him, "the *pension* was granted to Johnson solely as the reward of his literary merit, without any stipulation whatever, or even tacit understanding that he should write for administration!" The true meaning of *pension*, in its secondary sense, (however a pension may be sometimes undeservedly accepted and bestowed,) is the allowance made as an acknowledgment for any eminent and distinguished services. *Todd*.—It would be very agreeable to her majesty, if the *pension* of 5000*l.* per annum were continued and limited by act of parliament to the duke of Marlborough's posterity, for the more honourable support of their dignities, in like manner as his honours, and the honour and manor of Woodstock, and house of Blenheim, were already limited and settled. *Message of Q. Anne to the Commons, Jan. 9th, 1706*.—A charity bestowed on the education of her young subjects has more merit than a thousand *pensions* to those of a higher fortune. *Addison's Guardian*.—He has lived with the great without flattery and been a friend to men in power without *pensions*. *Pope*.

Chremes, for airy *pensions* of renown,
Devotes his service to the state and crown. *Young*.

To receive a pension from a foreign prince or state, without leave of our king, has been held to be criminal, because it may incline a man to prefer the interest of such foreign prince to that of his own country. All pensions are liable to certain duties annually imposed by parliament. Persons having pensions from the crown at pleasure are incapable of being elected members of parliament.

PENSIONS of the **INNS** of **COURTS**. Annual payments of each member to the houses. And also, that which in the two Temples is called a *parliament*, and in Lincoln's Inn a *council*, in Gray's Inn is termed a *pension*; being usually an assembly of the members to consult of the affairs of the society. *Jacob's Law Dict.*

To **PENSION**, *v. a.* To support by an arbitrary allowance.—One might expect to see medals of France in the highest perfection, when there is a society *pensioned* and set apart for the designing of them. *Addison on Medals*.

The hero William, and the martyr Charles,
One knighted Blackmore, and one *pension'd* Quarles. *Pope*.

PENSIONARY, *adj.* [*penionnaire*, Fr.] Maintained

by pensions.—They were devoted by *pensionary* obligations to the olive. *Howell's Vocal Forest*.

Scorn his household policies,
His filly plots and *pensionary* spies. *Donne*.

PENSIONARY, *f.* [*penionarius*, low Lat.] One receiving a pension, or annual payment.—All parsons, vicars, *pensionaries*, prebendaries, and other beneficed men. *Injunct. by K. Edw. VI.* 1547.

PENSIONARY was the title given to the first minister of the regency of each city in Holland, under the old system. His office was to give his advice in affairs relating to the government, either of the state in general, or of the city in particular; and, in assemblies of the states of the province, he was speaker in behalf of his city. The function, however, of these pensionaries was not everywhere alike: in some cities they only gave their advice, and were never found in assemblies of the magistrates, except when expressly called hither; in others they attended constantly; and in others they made the propositions on the part of the burgomasters, drew up their conclusions, &c. They were called *pensionaries*, because they received an appointment or pension.

Grand Pensionary was the appellation of the first minister of all the States of the province of Holland under the old system. This high officer was chairman in assemblies of the states of that province; he proposed the matters to be consulted on, collected the votes, formed and pronounced the resolutions of the states; he also opened letters, conferred with foreign ministers, &c. He was charged with inspecting the finances, preserving the rights of the province, maintaining the authority of the states, and seeing to the observation of the laws, &c. for the good of the state. He assisted in the college of deputy-counsellors of the province, who represented the sovereignty in the absence of the states; and he was perpetual deputy of the states-general of the United Provinces. His commission was only given for five years; after which it was deliberated whether or no it should be renewed. But there was no instance of its having been revoked; death only put a period to the functions of this important minister. Formerly he was called the *advocate of the province*: the title *pensionary* was only given at the time Barneveldt had the office. Grotius calls him in Latin *adessor jurisperitus*; Merula, *advocatus generalis*; and Matthæus, professor at Leyden, *consiliarinus pensionarius*, which is the quality the states gave him in their instruments.

PENSIONER, *f.* One who is supported by an allowance paid at the will of another; a dependant.—Prices of things necessary for sustentation grew excessive, to the hurt of *pensioners*, soldiers, and all hired servants. *Camden*.

Hovering dreams,
The fickle *pensioners* of Morpheus' train. *Milton*.

A slave of state hired by a stipend to obey his master.
Dr. Johnson.—See **PENSION**.

In Britain's senate he a feat obtains,
And one more *pensioner* St. Stephen gains. *Pope*.

One of an order of students in the university of Cambridge.—About forty years since, forty pounds per annum for a commoner (or *pensioner*, as the term is at Cambridge) was looked on as a sufficient maintenance. *Dean Prideaux's Life and Lett.* 1715.

PENSIONER, in the university of Cambridge and in that of Dublin, has a very peculiar meaning; for those students, either under-graduates or bachelors of arts, are called *pensioners* who live wholly at their own expense, and who receive no emolument whatever from the college of which they are members. They are divided into two kinds, the *greater* and the *less*: the former of which are generally called *fellow-commoners*, because they eat with the fellows of their college; the latter are always called *pensioners*, and eat with the scholars, who are those students of the college, either under-graduates

duates or bachelors, who are upon the foundation, who receive emoluments from the society, and who are capable of being elected fellows. *Ency. Brit.*

Gentlemen PENSIONERS, a band of gentlemen, whose business it is to guard the king's person in his own house; and who for that end wait in the presence-chamber. They were first established by king Henry VII. the number is forty; and each was then obliged to keep three double horses, and a servant, who was to be armed; so that they properly made a troop of horse-guards, and have accordingly been mustered by their own officers; but this part of duty, to which they are sworn, the king usually dispenses with. Their officers are a captain, whose salary is 1000l. a-year; lieutenant, with 500l. a-year, standard-bearer, with 310l. a-year; and a clerk of the cheque, whose annual appointment is 120l. Their ordinary arms are gilt pole-axes, with which they attend the king to and from the chapel royal; receiving him in the presence-chamber, or coming out of his private lodging; as also at all great solemnities. Their pension 100l. per annum. They purchase their places. To this band belong also a pay-master, secretary, harbinger, axe-keeper, and messenger.

To PEN'SITATE, *v. a.* [from the Lat. *penfito*.] To weigh in the mind. *Scott.*

PENSIVE, *adj.* [*penſif*, Fr. *penſivo*, Ital. from *penſer*, Fr. to think. Our word was at first *penſife*; and it was also written *penſative*. "Laodomie, his lusty wife, which for his love was *penſife*." Gower's Conf. Am. B. 4. "He was very *penſative* to hear the follies that Don Quixote spake." Shelton's Tr. of Don Quix. i. 5.] Sorrowfully thoughtful; sorrowful; mournfully serious; melancholy. —My leisure serves me, *penſive* daughter, now. *Shakespeare*.

Anxious cares the *penſive* nymph oppreſs'd
And ſecret paſſions labour'd in her breaſt.

Pope.

* is generally and properly used of persons; but Prior has applied it to things:

We at the ſad approach of death ſhall know
The truth, which from theſe *penſive* numbers flow,
That we purſue falſe joy, and ſuffer real woe. *Prior.*

PEN'SIVELY, *adv.* With melancholy; sorrowfully; with gloomy ſeriousneſs:

So fair a lady did I ſpy;
On herbs and flowers ſhe walked *penſively*
Mild, but yet love the proudly did forſake. *Spenser.*

PEN'SIVENESS, *f.* Melancholy; ſorrowfulneſs; gloomy ſeriousneſs.—Concerning the bleſſings of God, whether they tend unto this life or the life to come, there is great cauſe why we ſhould delight more in giving thanks than in making requeſts for them; inasmuch as the one hath *penſiveness* and fear, the other always joy annexed. *Hooker.*

Would'ſt thou unlock the door
To cold deſpair and gnawing *penſiveness*? *Herbert.*

PEN'STOCK, *f.* A ſort of ſluice, placed in the water of a millpond; a flood-gate.

PENT, *part. paſſ.* of PEN. Shut up.—The ſon of Clarence have I *pent* up cloſe. *Shakespeare.*

The ſoul pure fire, like ours, of equal force;
But *pent* in fleſh, muſt iſſue by diſcourſe. *Dryden.*

PEN'TA, a town of the iſland of Corſica: ſeven miles north-eaſt of La Porta.

PENTACAP'SULAR, *adj.* [from the Gr. *πεντε*, five, and the Lat. *capsula*, a cheſt.] Having five cavities; having five ſeed-veſſels.

PENTACHON'DRA, *f.* [from *πεντε*, five, and *χονδρος*, a grain, becauſe of the five ſeeds in the berry.] In botany, a genus of the claſs pentandria, order monogynia, natural order epacridæ, (*Brown's Prodr. Nov. Holl. i. 549.*) Generic characters—Calyx: perianthium inferior; dou-

ble; the innermoſt of five equal, lanceolate, concave leaves; outermoſt of four or more, much ſmaller, imbricated ones. Corolla of one petal, funnel-shaped; limb in five ſpreading equal ſegments, longitudinally bearded on the upper ſide with denſe hairs. Nectary of five ſcales at the baſe of the germen. Stamina: filaments five, thread-shaped, equal, inſerted into the tube; antheræ incumbent, oblong. Piſtillum: germen ſuperior, roundiſh, of five cells; ſtyle ſhort, columnar; ſtigma obtuſe. Pericarpium: berry with five ſeeds.—*Effential Characters.* Outer calyx of four or more leaves; corolla funnel-shaped; its limb ſpreading, longitudinally bearded: berry with five ſeeds.

This genus might perhaps, without impropriety, be referred to LEUCOPOGON, ſee that article; it being very difficult in this tribe to define the limits between a drupe and a berry, at leaſt in ſome caſes. The only two ſpecies known are dwarf mountain-ſhrubs, with ſcattered stalked leaves, and ſolitary, terminal, erect, white flowers. They are natives of Van Diemen's Land and New Zealand.

1. **Pentachondra involucrata**: filaments projecting beyond the tube; calyx fringed, the outer one of eight ſcales; leaves elliptic-lanceolate, flattiſh, many-ribbed; young branches downy; ſtem erect. Gathered by Mr. Brown in Van Diemen's Land.

2. **Pentachondra pumila**: ſtamens ſhorter than the tube; outer calyx of four ſcales; leaves nearly elliptical, three-ribbed, naked at the margin; young branches ſmooth; ſtem proſtrate, much branched. Found by Forſter in New Zealand, and by Mr. Brown in Van Diemen's Land.

PENTACHORD, *f.* [from the Gr. *πεντε*, five, and *χορδη*, a ſtring.] In ancient muſic, an inſtrument of five ſtrings invented by the Scythians, played with the jaw-bone of a dog, inſtead of a plectrum. *Laborde.*—The concord of the fifth is ſometimes called pentachord.

PENTACOC'COUS, *adj.* [from the Gr. *πεντε*, five, and *κοκκος*, a grain.] Having five ſeeds.

PENTACROSTIC, *f.* [from *πεντε*, five, and *σλιχος*, a verſe.] In poetry, a ſet of verſes ſo diſpoſed, as that there are always five acroſtics of the ſame name, in five diviſions of each verſe. See ACROSTIC, vol. i.

PENTADO'RON, *f.* [from *πεντε*, five, and *δρον*, a ſpan.] A large kind of bricks anciently in uſe among the Greeks, being three feet nine inches long and one foot broad, with which they erected their public buildings. *James's Mil. Dict.*

PENTAE'DRON, or **PENTAE'DRON**, *f.* [from the Gr. *πεντε*, five, and *εδρα*, a baſe.] A figure with five ſides.

PENTAE'DROUS, *adj.* Having five ſides.—The *pentædrous* columnar coralloid bodies are composed of plates ſet lengthways, and paſſing from the ſurface to the axis. *Woodward on Fossils.*

PENTAG'AMIST, *f.* [from the Gr. *πεντε*, five, and *γαμος*, a marriage.] One who has had five wives. *Cole.*

PENTAGLOS'SUM. See LYTHRUM thymifolium, vol. xiii.

PENTAGLOT'TICAL, *adj.* [from the Gr. *πεντε*, five, and *γλωττα*, a language.] Skilled in five languages. *Cole.*

PEN'TAGON, *f.* [from the Gr. *πεντε*, five, and *γωνια*, an angle.] A geometrical plain figure having five ſides and angles.—I know of that famous piece at Capralora, caſt by Baroccio into the form of a *pentagon* with a circle inſcribed. *Wotton.*

PENTAG'ONAL, or **PENTAGONOUS**, *adj.* Quinquangular; having five angles.—The body being cut tranſverſely, its ſurface appears like a net made up of *pentagonal* meſhes, with a *pentagonal* ſtar in each meſh. *Woodward on Fossils.*

PENTAGONIA, *f.* in botany. See CAMPANULA.

PENTAGONOTHE'CA. See PISONIA.

PEN'TAGRAPH, **PANTOGRAPH**, or **PANTOG'RAPHER**, *f.* [from the Greek *πεντε*, five, the number of ſcrews by which the inſtrument is adjusted; or from *παν*, *παντας*, all,

PENTAGRAPH AND PERAMBULATOR.

1. 2. The Pentagraph. 3, 4, 5. The Perambulator. 6. Edgeworth's Coëmeter.
7. Tugwell's Pedimeter.

all, and *γραφω*, to trace or delineate.] An instrument designed for drawing figures in what proportion you please, without any skill in the art. The instrument is otherwise called a *parallelogram*. The following is the description of it by Mr. Adams. "It is an instrument as useful to the experienced draftsman as to those who have made but little progress in the art. It saves a great deal of time, either in reducing, enlarging, or copying of the same size, giving the outlines of any drawing, however crooked or complex, with the utmost exactness; nor is it confined to any particular kind, but may with equal facility be used for copying figures, plans, sea-charts, maps, profiles, landscapes, &c. I have not been able to ascertain who was the inventor of this useful instrument. The earliest account I find is that of the Jesuit Scheiner, about the year 1631, in a small tract entitled *Pantographice, sive ars nova delineandi*. The principles are self-evident to every geometrician; the mechanical construction was first improved and brought to its present state of perfection by my father, about the year 1750. It is one, among many other scientific improvements and inventions completed by him, that others have ingloriously, and many years after, assumed to themselves."

The pantograph is usually made of wood or brass, and consists of four flat rules, two of them long, and two short. See the annexed Plate, fig. 1. The two longest are joined at the end A, by a double pivot, which is fixed to one of the rules, and works in two small holes placed at the end of the other. Under the joint is an ivory castor, to support this end of the instrument. The two smaller rules are fixed by pivots at E and H, near the middle of the larger rules, and are also joined together at their other end, G. By the construction of this instrument, the four rules always form a parallelogram. There is a sliding box on the longer arm, and another on the shorter arm. These boxes may be fixed at any part of the rules by means of their milled nuts; each of these boxes is furnished with a cylindrical tube, to carry either the tracing-point or crayon or fulcrum. The fulcrum or support K, is a leaden weight inclosed in a mahogany box; on this the instrument moves when in use. There are two moveable rollers, to support and facilitate the motions of the pantograph; their situation may be varied as occasion requires. The graduations are placed on two of the rules; on each of them are two scales; the fiducial edges of the boxes are to be set to these, according to the work to be performed by the instrument. The crayon, the tracer, and fulcrum, must in all cases be in a right line; so that, when they are set, if a string be stretched over them, and they do not coincide with it, there is an error either in the setting or graduations. The long tube, which carries the pencil or crayon, moves easily up or down another tube; there is a string affixed to the long or inner tube, passing afterwards through the holes in the three small knobs to the tracing-point, where it may, if necessary, be fastened. By pulling this string, the pencil is lifted up occasionally, and thus prevented from making false or improper marks upon the copy.

To use this instrument when the copy is to be of the same size as the original.—Place the instrument upon a large table, and set the sliding-boxes B and D to the divisions there marked 1, 2. Put the crayon into the box B, place the box D upon the fulcrum, or leaden foot; the tracing-point at C. Then lay a piece of paper under the crayon, and the original drawing under the tracer, and move the tracing-point over the principal strokes of the original, and the crayon will form the required copy.

To reduce a drawing, &c. to half the size of the original.—Set the boxes B and D to the divisions marked $\frac{1}{2}$; place the fulcrum at B, the crayon at D, and the tracer at C.

To reduce a drawing to less than one half.—Suppose one-third, one-fourth, one-fifth, &c. Place the fulcrum at B, crayon at D, and tracer at C, and slide the boxes B and D to the divisions marked $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, &c. on the longer scales. It may be proper to observe here, that if the copy be less

than one-half the original, or when it is required greater than the original, the longer scales are to be used.

For greater than one-half the original drawing.—Suppose it be required to make a drawing, two-thirds, three-fourths, four-fifths, &c. Set the Boxes B and D to corresponding divisions, as $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, &c. on the shorter scales, place the fulcrum at D, the crayon at B, and tracer at C.

When the original drawing is to be enlarged.—Suppose one-eighth, one-sixth, &c. set the Boxes B and D, to $\frac{1}{8}$, $\frac{1}{6}$, &c. on the longer scales, place the fulcrum at D, the crayon at C, and tracer at B.

Where the copy is required of a size differing from the fractional parts laid down on the instrument.—For this purpose there are two scales laid down, containing 100 unequal parts; one scale numbered from 10 to 80, the other from 50 to 100.

If the copy is to be under one-half the original size, place the boxes B and D to any two corresponding divisions under 50; the fulcrum at B, and crayon at D.

If the copy is to be larger than one-half the original, place the boxes B and D to corresponding divisions between 50 and 100; the fulcrum at B, and crayon at D.

To change the situation of the pantograph.—Copy first as much as the pantograph will take in; then make three points on the original, and as many corresponding points on the copy. Then remove the fulcrum to another situation, but so that, when the tracing-point is applied to the three points marked on the original, the crayon may exactly coincide with the other three points on the copy, and proceed as before; and so on for every change in the situation of your instrument, and by this means a pantograph of two feet and a half in length will copy a drawing of any size whatsoever.

The construction of this instrument (says Mr. Chambers) requires a considerable degree of accuracy; for which reason there are very few of the instruments that succeed. Few will do any thing tolerably but straight lines; and many of them not even those. In order to prove that the figure described by a pantograph is similar to the given figure; let C, fig. 2. be the fixed centre of motion; P the pencil for tracing the given figure P P, and p the pencil which traces the other figure p p; p, &c. must be so adjusted, that p, C, and P, may lie in one straight line; then, since B p : A p :: B P : A C, whatever be the situation of the pantograph, the angles P C P and p C p, are vertical; and, therefore, P C p will in every position of the instrument be a right line; but P C : p C :: B A : A p, in each of the two positions in the figure, and consequently the triangles P C P, p C p, are similar; and P P : p p (:: P C : C p) :: B A : A p, or in a given ratio. Hence it appears, that by moving the pencil p, A p may be equal to B A, or less in any proportion; and consequently p p may be equal to P P, or less in the same proportion.

We have heard of a very recent improvement upon the pantograph, for which indeed a patent is now (March 1823) making out, which will be extremely useful, not to draughtsmen only, but to engravers. The ingenious artist, Mr. A. Smith, of Wingrove-place, St. John-street Road, calls his invention the *apograph*. We shall have an opportunity, probably, of describing it under some future article.

PENTAGYNIA, f. [from the Gr. *πεντα*, five, and *γυνη*, a female.] The name of an order which occurs in the 5th, 10th, 11th, 12th, and 13th, classes of the Linnæan artificial system. Its character depends, as the name expresses, on the presence of five styles, or, if styles be wanting, of so many sessile stigmas. In the 12th class however, Icosandria, it is necessary to take this character with considerable latitude. Plants of the natural tribe of *po-macea*, which make an important part of that class, are very uncertain as to the number of their styles in the same genus, and even variable in the same species. Hence Dr. Smith has, in his Introduction to Botany, presumed to advise that the order in question should admit flowers with from two to five styles, or even a few more occasion-

ally. In the 13th class, polyandria, the order pentagynia separates some genera from others to which they are closely allied, in the tryginia, and admits *Nigella*, some species of which have ten styles. Hence it is no less eligible to adopt the same latitude here as in icofandria. Perhaps the definition of the order, in both these classes, might most conveniently be "styles from two to ten." Some genera in other classes may have five styles; but the orders of such classes being marked by other characters, the number of styles usually becomes a part of the generic definition. *New Cyclopædia*.

PENTALO'BA, *f.* [so named by Loureiro, from the five lobes of the berry.] In botany, a genus of the class pentandria, order monogynia, natural order of meliæ, *Juss.* Generic characters—Calyx: perianthium inferior, of five lanceolate erect hairy leaves. Corolla: petals five, lanceolate, erect, cohering by their lower part, somewhat reflexed at their summits. Nectary tubular, erect, with five teeth. Stamina: filaments five, thread-shaped, flattish, inserted into the incisions of the nectary, about as long as the petals; antheræ ovate, erect. Pistillum: germen roundish, hairy, with five furrows; style short, thick, hairy; stigma simple. Pericarpium: berry roundish, five-lobed, of one cell. Seeds five, ovate.—*Essential Characters*. Corolla of five petals, bell-shaped; nectary tubular, five-cleft, bearing the stamens; calyx of five leaves; berry superior, with five lobes and five seeds.

Pentaloba seffilis, the only species, is a native of hills in Cochinchina, where it is known by the name of *Cây Cuong tau*, and forms a middle-sized tree, with ascending branches; leaves alternate, lanceolate, slightly serrated, smooth. Flowers sessile, clustered together, of a pale hue. *Lour. Cochinch.* 154.

PENTALU'PO, a town of Naples, in Calabria Ultra: six miles east of Reggio.

PENTAM'ETER, *f.* [from the Greek *πεντε*, five, and *μετρον*, a measure.] A Latin verse consisting of five feet, or metres. The two first feet may be either dactyls or spondees at pleasure; the third is always a spondee; and the two last anapests: such is the following verse of Ovid: *Carmine]bus vivit tempus in om[ni]bus meis*. A pentameter verse subjoined to an hexameter constitutes what is called the *elegiac*. It is usually joined to hexameters, in elegies, epistles, epigrams, and other little pieces. There is no work extant of pentameters alone.

PENTAMETER, *adj.* Having five metrical feet.—Like Ovid's Fasti, in hexameter and pentameter verse. *Warton*.

PENTAM'YROM, *f.* [in pharmacy.] An ointment compounded of five ingredients.

PENTAN'DRIA, *f.* [from the Greek *πεντε*, five, and *ανδρως*, a man.] In botany, the fifth class in the Linnæan artificial system. It is so called from its distinctive character of having five unconnected stamens in the same flower with the pistil or pistils. This is the largest of all the Linnæan classes. The number five prevails far beyond any other in the structure of flowers; for the great class Syngenesia has also five stamens in nearly every known instance, but their antheræ are united into a tube, and the flowers compound. Some genera of the Pentandria indeed have likewise combined antheræ, and such, having simple flowers, constitute the Linnæan order of Syngenesia monogamia; an order now, by common consent, abolished, being found not only unnatural, but highly inconvenient, various species of other genera, as *Gentiana*, having likewise combined antheræ. See the article **BOTANY**, vol. iii. p. 257, 266, 7. and Plate X. fig. 5.

PENTANDRIA is also the appellation of some orders in the Linnæan system, as the second of the class monadelphia; the first in diadelphia; the fifth in gynandria; and finally the fifth orders in monœcia and diœcia.

PENT'ANGLE, *f.* [from the Greek *πεντε*, five, and the Lat. *angulus*, an angle.] A figure having five sides and angles. *Scott*.

PENTANGULAR, *adj.* Five-cornered.—His thick and bony scales stand in rows, so as to make the flesh almost pentangular. *Grew*.

PENTAPET'ALOUS, *adj.* [in botany, from the Greek, *πεντε*, five, and *πεταλον*, a leaf.] Having five petals, or flower-leaves.—The simple and original rose is *pentapetalous*, and all the duplications and reduplications of its petals follow the same division of five. The heraldic denomination of *cinqvefoil* is a sort of abstraction of *pentapetulous*, excepting that this is an adjective and the other a substantive; and that the term *folium* is derivatively used instead of *petalum*. For it must be noticed, that in Greek the leaf of a tree is called *φυλλον*, and the leaf of a flower *πεταλον*; a distinction which is scrupulously observed in English and French botanical works. *Etymological Gleanings*, MS.

PENTAPETES, *f.* [Gr. "having five leaves;" an ancient name for Cinquefoil, adopted for a very different plant by Linnæus. Though he declines any explanation of it, the five leafy expansions, which, in his *Pentapetes*, accompany the stamens, seem so well to account for this appellation, that one cannot but think the idea of such an adaptation of the word had occurred to him, though he might have forgotten it when he wrote the *Philosophia Botanica*, p. 175.] In botany, a genus of the class monadelphia, order dodecandria, natural order of columiferæ, (malvaceæ, *Juss.*) Generic characters—Calyx: perianthium double; outer three-leaved, one-sided, caducous; leaflets linear, acuminate; inner one-leaved, five-parted, permanent; segments lanceolate, acuminate, spreading, longer than the corolla. Corolla: petals five, roundish, spreading, fastened to the pitcher of stamens. Stamina: filaments fifteen, filiform, upright, shorter than the corolla, united below into a pentagonal pitcher, but free above; antheræ sagittate, upright; ligules five, linear-lanceolate, petal-shaped, upright, each between every three stamens, springing from the pitcher. Pistillum: germen ovate; style filiform, thickened above, striated, longer than the stamens, permanent. Stigma obsolete five-toothed. Pericarpium: capsule membranaceous, subglobular, acuminate, five-celled, five-valved: partitions contrary. Seeds eight, ovate, acute, four on each side, fastened within side to the partition.—*Essential Character*. Calyx double: outer three-leaved; inner five-parted. Stamina fifteen, with five ligules, petal-shaped; capsule five-celled, many-seeded. Only one species.

Pentapetes phœnicia, or Indian vervain-mallow; (*Flos impius*, *Rumph. Amb. Naga-pu*, *Rheed. Mal.*) This is an annual plant, which dies in the autumn, soon after it has ripened the seeds. It has an upright stalk from two to near three feet high, sending out side-branches the whole length; those from the lower part of the stalks are the longest, the others gradually diminish, so as to form a sort of pyramid. They are garnished with leaves of different forms; the lower leaves, which are largest, are cut on their sides towards the base into two side-lobes which are short, and the middle is extended two or three inches farther in length, so that the leaves greatly resemble the points of halberts in their shape; they are slightly serrate, and of a lucid green on their upper-side, but paler on their under, standing upon pretty long footstalks. The leaves which are on the upper part of the branches are much narrower, and some of them have very small indentures on their sides; they sit closer to the stalks, and are placed alternately. The flowers are axillary; they come out for the most part singly, but sometimes there are two arising at the same place from the side of the footstalk of the leaves. The peduncle is short and slender. The flower is of one petal, cut into five obtuse segments almost to the bottom; but, as they are joined and fall off in one piece, the flower is monopetalous according to Ray and Tournefort; but Linnæus makes it pentapetalous. It is of a fine scarlet colour, (see Botany Plate X. fig. 16. vol. iii.) expanding at noon and falling in the evening. The foolish name by which Rumphius has distinguished this flower, and which is said to be a translation of its Indian appellation, alludes to its "profane or impious nature, in never looking towards heaven." So may flowers, as well as men, be sometimes calumniated!

calumniated! The all-wise Creator, rich in infinite resources, has caused many blossoms to droop, that their stamens may be sheltered from rain; whilst the same end is accomplished in others by their courting the full blaze of day, in an erect expanded position. In the spring of our damp climate, drooping or closed flowers abound; in India perhaps a different economy is generally best suited to the nature of the country. It is a native of various parts of the East Indies, sometimes cultivated for its beauty in our stoves, where it has been known considerably above a century. It flowers in July, and is annual.

Propagation and Culture. The seeds of this plant must be sown upon a good hot-bed early in March; and, when the plants are fit to transplant, there should be a new hot-bed prepared to receive them, into which should be plunged some small pots filled with good kitchen-garden earth; in each of these should be one plant put, giving them a little water to settle the earth to their roots. They must also be shaded from the sun till they have taken new root; then they should be treated in the same way as other tender exotic plants, admitting the free air to them every day in proportion to the warmth of the season, and covering the glasses with mats every evening to keep them warm. When the plants are advanced in their growth so as to fill the pots with their roots, they should be shifted into larger pots, filled with the same sort of earth as before, and plunged into another hot-bed; where they may remain as long as they can stand under the glasses of the bed without being injured; and afterwards they must be removed either into a stove or a glass-case, where they may be screened from the cold, and in warm weather have plenty of fresh air admitted to them. With this management the plants will begin to flower early in July, and there will be a succession of flowers continued till the end of September, during which time they will make a good appearance. The seeds ripen gradually after each other in the same succession as the flowers were produced, so they should be gathered as soon as their capsules begin to open at the top. These plants are sometimes turned out of the pots, when they are strong, and planted in warm borders, where, if the season prove very warm, the plants will flower pretty well; but these very rarely perfect their seeds. See PTEROSPERMUM.

PENTAPHYLLOIDES. See POTENTILLA and SIBALDIA.

PENTAPHYLLOUS, *adj.* Having five leaves.

PENTAPHYL'LUM. See CLOMEE, COMARUM, POTENTILLA, and TORMENTILLA.

PENTAPTERIS, and **PENTAPTEROPHYLLUM.** See MYRIOPHYLLUM.

PENTAPOGON, *f.* [from *πεντε*, five, and *πωγων*, beard; so named by M. R. Brown, in allusion to the five beards, or awns, of the hulk.] In botany, a genus of the class triandria, order digynia; natural order gramina. Generic characters—Calyx: glume of two oblong acute equal beardless valves, containing one stalked floret. Corolla of two valves; the outermost rather longer than the calyx, ovate, bearing five awns at the summit, of which the middle one is much the longest, and spirally twisted; inner half the size of the outer, ovate, acute, concave, membranous, beardless. Stamina: filaments three, capillary, shorter than the corolla; antheræ oblong, pendulous. Pistillum: germen superior, roundish; styles none; stigmas two, spreading, feathery. Pericarpium: none, except the permanent corolla. Seed one, oblong, pointed.—**Essential Character.** Calyx of two equal beardless valves, containing one stalked floret; outer valve of the corolla with five terminal awns; the middle one longest, and spiral.

Pentapogon Billardiæ, a solitary species. Native of Van Diemen's Land. A small and slender grass, scarcely a span high. Root fibrous. Stems several, round, striated, with one bent joint near the bottom, and one short leaf, with a long hairy sheath. Radical leaves numerous, tufted, short and setaceous. Panicle erect, about two

inches long, not much branched, of fifteen or twenty upright flowers. Valves of the calyx serrated at the keel. Floret hairy at its base. *Brown, 173. Labillardiere, 20. t. 22.*

PENTAPOLIS, [Greek.] A country wherein are "five cities." The Pentapolis of the sacred writings comprehended Sodom, Gomorrah, Adama, Zeboim, and Segor, or Zoar; (Wisdom x. 6.) They were all five condemned to utter destruction, but Lot interceded for the preservation of Zoar. The Pentapolis of the Philistines (Josephus) had its name from their five principal cities, Gaza, Gath, Ascalon, Azotus, and Ekron. But the most celebrated was the *Pentapolis Cyrenaica*, or Pentapolis of Egypt, whose five cities were Berenice, Arsinoe, Ptolemais, Cyrene, and Apollonia. Among the ancient geographers and historians we likewise read of the Pentapolis of Lybia, now called *Mesrata*; the Pentapolis of Italy; and the Pentapolis of Asia Minor, which contained Lindus, Jalyssos, Camiros, Cos, and Cnidus. This country once bore the name of Hexapolis, when it comprehended Halicarnassus.

PENTAPTOTE, or **PENTAPTOTON,** *f.* [in grammar, from the Gr. *πεντε*, five, and *πτωσις*, a case.] A noun that has five cases.

PENT'ARCH, *f.* [from the Gr. *πεντε*, five, and *αρχος*, chief.] A captain of five. *Cole.*

PENT'ARCHY, *f.* Government exercised by five.—My name is Appetitus, common servant to the *pentarchy* of the senses. *Brewer's Lingua.*

Through the world I wander night and day,

To seeke my straggling senses;

In an angry moode I met old Time,

With his *pentarchy* of senses.

Old Mad Song.

PENTASPAST, *f.* [from the Gr. *πεντε*, five, and *πασω*, to draw.] An engine with five pulleys.

PENTASTICH, *f.* [from the Gr. *πεντε*, five, and *στιχος*, a verse.] A poem or stanza consisting of five verses.

PENTASTYLE, *f.* [in architecture, from the Gr. *πεντε*, five, and *στυλος*, a pillar.] A building or work in which are five rows of pillars.

PENTATEUCH, *f.* [from the Gr. *πεντε*, five, and *τευχος*, an instrument or volume.] The collection of the five instruments, or books, of Moses, which are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy; which books we have given an account of under the article BIBLE, vol. iii. p. 8, 9.

Some modern critics have disputed Moses's right to the Pentateuch. They observe that the author speaks always in the third person: *Now the man Moses was very meek above all the men which were upon the face of the earth; the Lord spake unto Moses, saying &c. Moses said to Pharaoh, &c.* Thus they think he would never have spoken of himself; but would at least sometimes have mentioned himself in the first person. Besides this, say they, the author of the Pentateuch sometimes abridges his narration like a writer who collected from some ancient memoirs. Sometimes he interrupts the thread of his discourse; for example, he makes Lamech the bigamist to say, (Gen. iv. 23.) *Hear my voice, ye wives of Lamech, hearken unto my speech; for I have slain a man to my wounding, and a young man to my hurt; without informing us before-hand to whom this is related.* These observations, for example, (Gen. xii. 6.) *And the Canaanite was then in the land, cannot be reconciled to the age of Moses, since the Canaanites continued to be the masters of Palestine all the time of Moses.* The passage out of the Book of the Wars of the Lord, quoted in the book of Numbers (xxi. 14.) seems to have been put in afterwards, as also the first verses of Deuteronomy. The account of the death of Moses, which is at the end of the same book, cannot certainly belong to this legislator; and the same judgment may be made of other passages, wherein it is said, that the places mentioned lay *beyond Jordan*; that the bed of Og was at Ramah to this day; that the Havoth of Jair, or the cities of Jair, were known to the author, though probably they had not that

that name till after Moses's time; (Numb. xxxii. 41. Deut. iii. 14.)

It is observed also in the text of the Pentateuch, that there are some places that are defective; for example, in Exodus xii. 8. we see Moses speaking to Pharaoh, where the author omits the beginning of his discourse. The Samaritan inserts in the same place what is wanting in the Hebrew. In other places, the same Samaritan copy adds what is deficient in the Hebrew text; and what it contains more than the Hebrew seems so well connected with the rest of the discourse, that it would be difficult to separate them. Lastly, they believe that they observe certain strokes in the Pentateuch which can hardly agree with Moses, who was born and bred in Egypt; as what he says of the earthly paradise, of the rivers that watered it, and ran through it; of the cities of Babylon, Erech, Resen, and Calneh; of the gold of Pison, of the bdellium, of the stone of Sohem, or onyx-stone, which was to be found in that country. These particulars, observed with such curiosity, seem to prove, that the author of the Pentateuch lived beyond the Euphrates. Add what he says concerning the ark of Noah, of its construction, of the place where it rested, of the wood wherewith it was built, of the bitumen of Babylon, &c. But in answer to all these objections, we may observe in general, from an eminent writer of our own country, (Jenkin's Reasonableness of Christianity,) that these books are by the most ancient writers ascribed to Moses; and it is confirmed by the authority of heathen writers themselves, that they are of his writing: besides this, we have the unanimous testimony of the whole Jewish nation, ever since Moses's time, from the first writing of them. Divers texts of the Pentateuch imply that it was written by Moses; and the Book of Joshua, and other parts of Scripture, import as much; and, though some passages have been thought to imply the contrary, yet this is but a late opinion, and has been sufficiently confuted by several learned men. The Samaritans receive no other Scriptures but the Pentateuch, rejecting all the other books which are still in the Jewish canon.

PENTATHLON, or PENTATHLUM, f. [from the Gr. *πεντε*, five, and *αθλον* a contest.] The five principal exercises performed in the Grecian games. These were, wrestling, darting, leaping, running, and quoit-playing. He who bore away the prize in them all was called *pentathlus*; by the Latins, *quinquertio*; as the five exercises themselves were by those latter people called *quinquertium*.

The candidates in the pentathlon, as well as those in all the other gymnastic exercises, contended naked, and were also anointed with oil. Although some doubts have been suggested with regard to the conditions upon which the victory was awarded in the pentathlon, it is certain, that he who vanquished his antagonist in every one of the five exercises was alone entitled to the crown. If all hopes of gaining the pentathletic crown were lost to him who was vanquished in any one trial, it has been queried why the vanquished should contend any longer? The reply to this question is, that the pentathletes were probably obliged by the laws of the olympic games to go through all the five exercises. Although all the competitors, except one, must have despaired of gaining the crown, even from the first trial, yet they might still be desirous of carrying on the contest through the four remaining exercises, if they had not been required to do it by the olympic laws, either with a view of signaling themselves in some of the other contests, or the hopes of ravishing the crown from him by whose victory they had been excluded from the prospect of obtaining it. Pindar, in his thirteenth Olympic ode, congratulates Xenophon of Corinth upon his having gained in one day two olympic crowns; one in the *stadium*, or simple foot-race, the other in the *pentathlon*, which, as he says, never happened to any man before. The reason is, that the regimen of a pentathlete, as we are informed by both Epictetus and Arrian, was very different from that of an athlete, who qualified him-

self for a single exercise alone, as running, wrestling, or any other; whence, as both Plato and Longinus assure us, it seldom happened that a pentathlete, though very eminent in his profession, was able to contend with an athlete in that exercise, as, e. g. running or wrestling, to which alone he had applied himself altogether. The same observation is applicable to all the athletes in general; who differed from each other in their respective regimens and diets, as much or more than in the several exercises to which they peculiarly applied themselves. *West's Pindar.*

PENTECOST, f. [*pentecoste*, Sax. from *πεντηκοστη*, Gr. the fiftieth.] A solemn feast among the Jews, so called because it was celebrated the 50th day after the sixteenth of Nisan, which was the second day of the feast of the Passover: the Hebrews call it the Feast of Weeks, because it was kept seven weeks after the Passover: they then offered the first fruits of the wheat-harvest, which then was completed: it was instituted to oblige the Israelites to repair to the Temple, there to acknowledge the Lord's dominion, and also to render thanks to God for the law he had given them from Mount Sinai on the fiftieth day after their coming out of Egypt.

The modern Jews celebrate the Pentecost for two days. They deck the synagogue and their own houses with garlands of flowers. They hear a sermon or oration in praise of the Law, which they suppose to have been delivered on this day. The Jews of Germany make a very thick cake, consisting of seven layers of paste, which they call *Sinai*. The seven layers represent the seven heavens, which they think God was obliged to reascend from the top of this mountain. See Leo of Modena, and Buxtorf's Synag. Jud.

WHITSUNTIDE, a solemn feast of the Christian church, held in commemoration of the descent of the Holy Ghost on the Apostles, is also called *Pentecost* because the event commemorates happened on the day of the Jewish Pentecost, which came to pass on the fiftieth day after Easter.

Our heavenly Redeemer had frequently, before his passion, promised to his disciples some extraordinary gifts; and at his ascension expressly commanded them to tarry at Jerusalem, until they should be "endowed with power from on high," which he had vouchsafed to assure them they should receive. On the day of the Jewish feast of Pentecost, when the apostles were all assembled together in one place, *Suddenly there came a sound from heaven, as of a rushing mighty wind, and it filled all the house where they were sitting: and there appeared unto them cloven tongues like as of fire, which sat upon each of them: and they were all filled with the HOLY GHOST, and began to speak with other tongues, as the spirit gave them utterance.* Acts ii. In commemoration of this extraordinary supernatural endowment, the church very early established the day of Pentecost, as a solemn Christian festival; a name it still retains, though its more common appellation is that of **WHITSUNDAY, Dominica in Albis**, one of the ancient names also of Low-Sunday.

In the ancient church, Pentecost finished the paschal time, or Easter season; wherein, as Tertullian, St. Jerome, &c. observe, Hallelujah was sung every-where, the office celebrated standing, no fasting allowed, &c.

In the early ages of Christianity also, baptism, excepting in cases of urgency, was administered only at the two great festivals of Easter and Whitsuntide: at the former period from a conceived resemblance between the great events then celebrated of Christ's death and resurrection, and that part of the service of baptism which typifies the dying from sin, and *rising again unto righteousness*; while Whitsuntide was deemed also peculiarly appropriate for that holy sacrament, not only from the apostles having been baptized with the *Holy Ghost and with fire*, but from their having commenced their public ministry on that day; and themselves baptized three thousand persons. In token of the spiritual purity obtained by the holy participation of baptism, the garments of those admitted to that

that sacrament were made of *white* linen; and from this cause ensued the synonymous names of *Whit-Sunday*, *White-Sunday*, *Whitin-Sunday*, or *Dominica Alba*. Much ingenuity, however, has been exerted to prove that *Whit-Sunday* is derived from the French word *huit*, which signifies eight, thereby making the affirmed original name *Eighth Sunday*, which *Whit-Sunday* stands from Easter, reckoning Easter-Sunday as one of them. Some authors state that it was a custom of former times, for the rich to bestow upon the poor, on this day, all the milk of their kine, in order to qualify themselves to receive the gift of the Holy Ghost; and, that milk having been denominated *white meat*, the day was from that cause called *White Sunday*. Other authorities contend that the original name of this season of the year was *Wittentide*, or the time of choosing the *wits*, or *wise men*, to the *wittenagemote* of our Saxon ancestors; that the day was consecrated to Hertha, the goddess of peace and festivity; that, when Paganism gave way to Christianity, the period still kept its primitive title, as well as that given to it of Pentecost; and that most of the festivities of the *Wittentide* were continued to the people, which they yet enjoy in a manner not much surpassing, in a religious point of view, those they before indulged in. Some writers again suppose the word to have been corrupted from *WIED*, the Saxon word for *sacred*; but they do not offer any good arguments for such title being bestowed upon this Sunday, in preference to others at least as sacred in their object. *Pencas* and *Penkast* in the Cornish language, now totally lost, signified *Whitsuntide*; both evidently corruptions of Pentecost. *Brady's Clavis Calendaria*.

PENTECOS'TAL, *adj.* Belonging to Whitsuntide.—I have composed sundry collects, made up out of the church-collects with some little variation; as the collects adventual, quadragesimal, paschal, or *pentecostal*. *Sander-son*.

PENTECOS'TALS, *f.* Oblations formerly made at the feast of Pentecost by parishioners to their parish-priest, and sometimes by inferior churches to the mother church. A payment of this kind yet remains as a charge upon some particular churches; otherwise called *Whitsun-farthings*.

PEN'TECOSTE, a river of Canada, which runs into the river St. Lawrence in lat. 49. 45. N. lon. 66. 45. W.

PEN'TECOSTE. See **WHITSUNDAY ISLAND**.

PENTEKE'LIS, or **PENT EKELIS**, a town of Asiatic Turkey, on the south coast of Natolia: thirty miles west-south-west of Macri.

PENTELICUS, a mountain of Greece: six miles north-north-east of Athens.

PEN'TEMAN (Peter), a Dutch painter, born at Rotterdam in 1650. Nothing is recorded of him except the cause of his death. Being requested to paint an emblematical picture of mortality, representing human skulls and bones, surrounded with rich gems and musical instruments, to express the vanity of this world's pleasures, amusements, or possessions; that he might imitate nature with the greater exactness, he went into an anatomical room, where several skeletons hung by wires from the ceiling, and bones and skulls lay scattered about, and prepared to make his designs. While he was thus employed, owing either to fatigue or to intense study, he fell asleep; but was suddenly roused by the shock of an earthquake, which happened at that instant, on the 18th of September, 1692. The moment he awoke, he observed the skeletons move, as they were shaken, in different directions, and the skulls roll from one side of the room to the other: being totally ignorant of the cause, he was struck with such horror, that he threw himself down stairs, and fell into the street half dead. His friends took all possible pains to efface the impression made on his mind by this unlucky event, and acquainted him with the real cause of the agitation of the skeletons; but in vain; for this transaction affected his spirits in so violent

a manner, that it brought on a disorder, which in a short time ended his days.

PENTEPHAR'MACUM, *f.* [from the Gr. *πεντε*, five, and *φαρμακον*, a remedy.] Any medicine consisting of five ingredients.

PENTERIS, *f.* [Lat.] A vessel made with five benches of oars on a side.

PENTESYRIN'GUS, *f.* in antiquity, a sort of pillory with five holes; wherein were fastened the legs, arms, and heads, of criminals, to prevent their stirring.

PENTHEMIMERIS, *f.* [from the Gr. *πεντε*, five, *ημισυς*, half, and *μερος*, a part.] A part of a verse consisting of two feet and one long syllable; a kind of cæsura.

PENTHESILE'A, a queen of the Amazons, daughter of Mars. She came to assist Priam in the last years of the Trojan war, and fought against Achilles, by whom she was slain. The hero was so struck with the beauty of Penthesilea, when he stripped her of her arms, that he even shed tears for having too violently sacrificed her to his fury. Therfites laughed at the partiality of the hero, for which ridicule he was instantly killed. The death of Therfites so offended Diomedes, that he dragged the body of Penthesilea out of the camp, and threw it into the Scamander. Pliny says that Penthesilea invented the battle-axe.

PEN'THEUS, in fabulous history, a son of Echion and Agave, was king of Thebes in Bœotia. His refusal to acknowledge the divinity of Bacchus was attended with the most fatal consequences. He forbade his subjects to pay adoration to this new god; and, when the Theban women had gone out of the city to celebrate the orgies of Bacchus, Pentheus, apprized of the debauchery which attended the solemnity, ordered the god himself, who conducted the religious multitude, to be seized. His orders were obeyed with reluctance; but, when the doors of the prison in which Bacchus had been confined opened of their own accord, Pentheus became more irritated, and commanded his soldiers to destroy the whole band of the bacchanals. This, however, was not executed; for Bacchus inspired the monarch with the ardent desire of seeing the celebration of the orgies. Accordingly he hid himself in a wood on mount Cithæron, from whence he could see all the ceremonies unperceived. But here his curiosity soon proved fatal; he was desecrated by the bacchanals, and they all rushed upon him. His mother was the first who attacked him, and her example was instantly followed by her two sisters, Ino and Autonoe, and his body was torn to pieces.

PENTHIER POINT, a cape on the west coast of France: six miles south-east of Point St. Matthew. Lat. 48. 15. N. lon. 3. 17. W.

PENTHIEVRE, a fort of France, in the department of the Morbihan, situated on the peninsula of Quiberon, on the east and west sides washed by the sea: seven miles north of Quiberon, and nine south-west of Auray.

PENTHO'RUM, *f.* [appears to have been so called, by Grovonijs, from *πεντε*, five, and *ἄρος*, a column or post, in allusion to the figure of the fruit, which he says resembles five turrets.] In botany, a genus of the class decandria, order pentagynia, natural order of succulentæ, (sem-pervivæ, *Juss.*) Generic characters—Calyx: perianthium one-leaved, five or ten cleft, acute, permanent. Corolla: petals often five (seldom none), linear, very small, between the segments of the calyx. Stamina: filaments ten, bristle-shaped, equal, twice as long as the calyx, permanent; antheræ roundish, deciduous. Pistillum: germén coloured, ending in five conical upright styles, the same length with the stamens, and distant; stigmas blunt. Pericarpium: capsule simple, five-cleft, with conical distant angles, five-celled. Seeds numerous, very small, a little compressed. It differs from *Sedum* in having no nectaries. —*Essential Character*. Calyx five (or ten) cleft; petals none, or five; capsule five-cusped, five-celled; (compound, five-beaked, *Gartner*.)

Penthorum fedoides, or American penthorum, the only species. Stalks about a foot high. Leaves oblong, alternate. Flowers greenish-yellow in terminating clusters, making little appearance; they are alternate, pedicelled, ascending; the segments of the calyx for the most part alternately larger and smaller; antheræ red; styles none; capsule undivided, composed of five partial capsules, ventricose at bottom, rounded-five-cornered, starred at top, five-beaked, opening five ways between the beaks: beaks filiform, short, conical at the base, with a small head at top, spreading out horizontally. Seeds irregular like sawdust, or linear acuminate, shagreened with raised dots, rufescent, fastened to the partitions on every side. Native of Virginia. Biennial, according to Miller, who cultivated it in 1768. Others reckon it to be perennial. It flowers at the end of July, and the seeds ripen in the autumn.

PENT'HOUSE, *f.* [from *pente*, Fr. and *house*.] A shed hanging out aslope from the main wall.—This is the *penthouse* under which Lorenzo desired us to make a stand. *Shakespeare's Merch. of Ven.*—The Turks, lurking under their *penthouse*, laboured with mattocks to dig up the foundation of the wall. *Knolles*.—Those defensive engines, made by the Romans into the form of *penthouses* to cover the assailants from the weapons of the besieged, would he presently batter in pieces with stones and blocks. *Wilkins*.

Sleep shall neither night nor day

Hang upon his *penthouse* lid.

Shakespeare.

My *penthouse* eye-brows and my shaggy beard

Offend your sight; but these are manly signs. *Dryden.*

The chill rain

Drops from some *penthouse* on her wretched head. *Rowe.*

PENT'TICE, *f.* [appentis, Fr. *pendice*, Italian. It is commonly supposed a corruption of *penthouse*; but perhaps *pentice* is the true word. It was also written *pendice*, after the Italian word.] A sloping roof.—Climes that fear the falling and lying of much snow, ought to provide more inclining *pentices*. *Wotton*.

And o'er their heads an iron *pendice* vault

They built by joining many a shield and targe. *Fairfax.*

PENT'TICLE, *f.* [another name for] *Pendice* :

Their targets hard, above their heads they threw,

Which join'd in one, an iron *pendice* make,

That from the dreadful storm preserv'd the crew:

Defended thus, their speedy course they take,

And to the wall without resistance drew;

For that strong *penticle* protected well

The knights, from all that flew, and all that fell. *Fairfax.*

PENTICOT'TA, a town of Hindooſtan, in the circuit of Cicacole: thirty-two miles south-west of Coſſimcotta.

PENTIDATYLO, a town of Naples, in Calabria Ultra: twelve miles south-east of Reggio.

PEN'TILE, *f.* A tile formed to cover the sloping part of the roof: they are often called pantiles.—*Pentiles* are thirteen inches long, with a button to hang on the laths; they are hollow and circular. *Moxon*.

PEN'TIMA, a town of Naples, in Abruzzo Citra: five miles north-west of Sulmona.

PENT'LAND FRITH', the strait which separates the main land of Scotland from the Orkney Islands. It is sometimes called *Pitland Frith*; and indeed the latter is considered by many writers to be its proper and original appellation. This strait is about twelve miles across; and is remarkable for the impetuosity and opposition of its currents, from the meeting tides of the Atlantic and Northern oceans. So strong are these currents at times, that no vessel can navigate against them, however favourable the wind may be. Hence the navigation of this frith is so peculiarly dangerous and difficult, that few vessels attempt to pass it without the assistance of an experienced pilot. Its dangers are also greatly augmented by

several whirlpools, of which those most usually fatal are the Wells of Swinna and the Swalchie of Stroma, near the northern side of that island. On its southern shore is another very hazardous spot, called the "Merry Men of Mey," from the Mey, the name of a gentleman's residence on the opposite coast of Caithness. Here, from the concussion of the opposing tides, the sea is agitated in a very awful manner, even in the finest weather. From these concurrent causes, it is impossible at any time to cast anchor in any part of this frith; which, notwithstanding, is annually entered by between three and four thousand vessels. The number, however, will no doubt rapidly decrease, now that the Caledonian Canal is opened for navigation. Many of the natives of the Caithness coast, and of the islands, are said to derive their livelihood solely from the produce of the numerous ships which are foundered, or dashed to pieces, in their passage through this frith.

PENT'LAND SKER'RIES, three small islets, or holms, at the eastern entrance to the Pentland frith; four miles north-east from Dungby head. Being from their situation extremely dangerous to mariners, a lighthouse is placed upon the largest of them: it was erected in 1794.

PENT'LAND HILL'S, a range or ridge of eminences, which extend from a place about four miles south-west of Edinburgh, towards the confines of Peebles-shire and Lanarkshire. Some of these hills are of considerable elevation; particularly the western summits, two of which, called Capelaw and Caerketan-craig, rise to the height of nearly 1500 feet above the level of the sea. Logan-house hill even exceeds 1700 feet above the same level. The eastern division, near Edinburgh, however, seldom reaches much above one-half that elevation; in some places it is nearly flat on the top, and affords excellent pasturage for large flocks of sheep. Several streams, noted in song, take their rise among these hills; as the North Esk, Glencrofs, and Logan water; the two latter of which dispute the honour of being the scene of Allan Ramfay's Gentle Shepherd. Each of these vales is accordingly distinguished by the name of "Habby's Hough;" and both are frequently visited by poetical parties from the Scottish metropolis during the summer months. The composition of the Pentland hills is principally granite, but on the north side of the Logan summit is a rock of a very singular character, which has obtained the appellation of "Petunse Pentlandica," from its resemblance to the substance employed in the manufacture of Chinese porcelain.

PENTONVILLE. See the article ISLINGTON, vol. xi. p. 438.—We may just mention, that the White-Conduit Spring (p. 437) was, in 1822, entirely covered over, and the building was inhabited by a poor family.

PENTOWEN POINT, a cape on the south coast of Wales, in the Bristol Channel. Lat. 51. 45. N. lon. 4. 15. W.

PEN'TRIDGE, a village in Dorsetshire, by Cranborn-chase, on the borders of Wiltshire. On Penbury-Hill, near this place, is an extensive prospect. Hanley-Six-penny is a village about two miles from Pentridge, and also on the borders of Wiltshire, between Blagdon-Park and Cranburn-Chase. In the latter, that is, about 3 miles off, the parishioners are allowed one day in the year to hunt deer. It had formerly a market.

PEN'TRY, a village of Caermarthen, South Wales; with fairs on the 12th of May and 10th of October.

PENTSTE'MON, *f.* [from the Gr. *πεντε*, five, and *στυμιον*, a stamen; because this genus is distinguished from its allies by having a fifth stamen, more or less perfect, in addition to the four unequal ones which make the character of the class.] In botany, a genus of the class didynamia, order angiospermia, natural order of personatæ. Generic characters—Calyx: perianthium one-leaved, five-parted, permanent: segments lanceolate, almost equal. Corolla: one petalled, two lipped; tube longer than the calyx, gibbous above at the base, wider at top, and

PENTSTEMON.

Shrubby Pentstemon

Engraved for the *Encyclopædia Imperialis* 1823.

and there ventricose underneath; upper lip upright bifid; segments ovate, blunt, shorter than the lower lip: lower lip three-parted; segments ovate, blunt, bent down, shorter than the tube. Stamina: filaments four, filiform, diverging at the tip, inserted into the base of the tube, and shorter than it; the two lower longer. Anthers roundish, distant, included, bifid; with the lobes divaricating. The rudiment of a fifth filament between the upper ones inserted into the tube, the same length with the stamens, filiform, straight, bearded above at the tip. Pistillum: germ ovate; style filiform, the length of the tube, bent down at the tip; stigma truncate. Pericarpium: capsule ovate, acute, compressed, two-celled, two-valved. Seeds numerous, subglobular; receptacle large. — *Essential Character.* Calyx five-leaved; corolla bilabiate, ventricose; rudiment of a fifth stamen bearded above; capsule two-celled. There are four species.

1. Pentstemon lævigata, or smooth pentstemon: stem smooth; barren filament bearded above. Root perennial, creeping, fibrous, white. Stem a foot and a half high and more; round, purple below, brachiata. Lower leaves ovate-acuminate, quite entire, petioled, sometimes purple underneath, on petioles winged to the base. Stem-leaves ovate-lanceolate, opposite, embracing, toothletted, smooth on both sides. Flowering branches in a manner dichotomous, with the flowers two together. Corolla pale purple, somewhat hirsute on the outside.

2. Pentstemon ferrulata, or serrated pentstemon: stem smooth; leaves all sharply serrated, smooth; the upper ones ovate, somewhat hastate; panicle twice or thrice forked; barren filament bearded half way down. Gathered by Mr. A. Menzies on the west coast of North America. It is nearly related to *P. lævigata*, but differs in the copious acute serratures of its leaves, which are also broader, shorter, and more ovate; particularly those on the middle and upper part of the stem.

3. Pentstemon frutescens, or shrubby pentstemon: stem shrubby, branched. This is from the Herbarium of the celebrated professor Pallas, which is now in this country, as noticed under the article PALLAS, in our preceding volume. In one part of his MSS. he calls it *Digitalis dasyantha*. It is represented on the annexed Engraving. It inhabits Kamtschatka and Oonalashka. *Linn. Transf.* vol. x.

4. Pentstemon pubescens, or hairy pentstemon: stem pubescent; barren filament bearded from the tip below the middle. Of this there are two distinct varieties: *α.* Latifolia, or broad-leaved; with the leaves ovato-oblong. *β.* Angustifolia, or narrow-leaved; in which the leaves are lanceolate. See CHELONE, to which this genus is very nearly allied.

PENT'ZIA, *f.* in botany, a genus of plants so named by professor Thunberg in honour of his pupil Charles John Pentz, at whose graduation at Upsal, in 1797, the learned professor's dissertation on *Diosma* was published. It contains but one species, which appears to be our *GNAPHALIUM dentatum*. See vol. viii.

PEN'UEL, *f.* [Heb. the vision of God.] The name of a place on the east of Jordan, near the brook Jabbok; so called, because here Jacob, in his wrestling, saw the face of God, or enjoyed familiar fellowship with him. *Gen.* xxxii. 24.

In following ages the Israelites built a city in this place, which was given to the tribe of Gad. Gideon, returning from the pursuit of the Midianites, overthrew the tower of Penuel, (*Judges* viii. 17.) and put all the inhabitants of the city to death, for having refused sustenance to him and his people, and having answered him in a very insulting manner. Jeroboam the son of Nebat rebuilt the city of Penuel, (*1 Kings* xii. 25.) and Josephus says, that he built himself a palace there.

PENVENAN', a town of France, in the department of the North Coasts: three miles north-west of Treguier, and seven north-east of Lannion.

PENUKON'DA, a town of Hindoostan, in Mysore. sixty-five miles north of Bangalore.

PEN'ULA. See PÆNULA.

PENULA'TOR, *f.* [Lat. *penula*, a napped coat.] A furrier. *Cole.*

PENUL'TIMA, *f.* [from the Lat. *pene*, almost, and *ultima*, the last.] The last syllable but one of a word; and hence the antepenultimate syllable is the last but two, or that immediately before the penultima.

PENUL'TIMATE, *adj.* Belonging to the last syllable but one; belonging to the last but one.

PENUM'BRA, *f.* [*pene*, almost, and *umbra*, shadow, Lat.] An imperfect shadow; a faint or partial shade observed between the perfect shadow and the full light in an eclipse. It arises from the magnitude of the Sun's body; for, were he only a luminous point, the shadow would be all perfect; but, by reason of the diameter of the Sun, it happens, that a place which is not illuminated by the whole body of the Sun, does yet receive rays from a part thereof. — The breadth of this image answered to the Sun's diameter, and was about two inches and the eighth part of an inch, including the *penumbra*. *Newton.*

PENURE'E, a town of Hindoostan, in Bahar: twenty-three miles south of Bahar.

PENU'RIOUS, *adj.* [from *penuria*, Lat.] Niggardly; sparing; not liberal; sordidly mean. — As a *penurious* niggard of his wealth. *Milton's Commus.*

What more can our *penurious* reason grant
To the large whale or ponderous elephant? *Prior.*
Scant; not plentiful:

I have but little gold of late, brave Timon,
The want whereof doth daily make revolt
In my *penurious* hand. *Shakespeare's Timon of Athens.*

PENU'RIOUSLY, *adv.* Sparingly; not plentifully. — The place is most *penuriously* empty of all other good outides. *B. Jonson's Cynth. Revels.*

PENU'RIOUSNESS, *f.* Niggardliness; parsimony. — If we consider the infinite industry and *penurionsness* of that people, it is no wonder that, notwithstanding they furnish as great taxes as their neighbours, they make a better figure. *Addison.* — Scantiness; not plenty.

PEN'URY, *f.* [*penuria*, Lat.] Poverty; indigence. — The *penury* of the ecclesiastical estate. *Hooker.*

Sometimes am I a king;
Then treason makes me wish myself a beggar;
And so I am: then crushing *penury*
Persuades me I was better when a king;
Then I am king'd again. *Shakespeare's Rich. III.*

PENUT'URA, a town of Hindoostan, in the circar of Cicacole: twenty-five miles north of Cicacole.

PENWOR'THAM, a town of Lancashire, with 1049 inhabitants, including 317 employed in trade and manufactures: three miles south-west of Preston.

PEN'Y, a town of Hindoostan, in Bahar: twenty-four miles south-west of Rotasgur.

PEN'YCUIK, a village and parish in the county of Mid-Lothian, or Edinburghshire, Scotland. The village is situated nine miles south from the northern metropolis, and is adorned with a very handsome church, the living of which was formerly a rectory. This edifice is placed on the site of an older structure, which was dedicated to Kentingern, popularly called St. Mungo. The parish is twelve miles in length, and six in breadth. Its surface is extremely various, and exhibits almost every kind of soil, from clay and moss to the poorest gravelly loam. A great number of sheep are bred in this parish; but the greater proportion of it is under tillage. It is watered throughout its whole extent by the river North Esk, and abounds with coal and peat. It also possesses several objects entitled to the attention of the topographer and the antiquary. Near the village is the elegant seat of sir George Clerk, bart. M. P. for the county of Edinburgh. The situation of this mansion is delightful; and its prospects are both picturesque and extensive. In the library here is an excellent collection of books and paintings;

paintings; and in another room is a large assortment of Roman antiquities, principally from the wall of Antoninus, and the neighbouring encampments. Close to the river, within the "policy," is Ossian's Hall, the much admired work of Runciman; and behind the house is an exact model of the celebrated Roman temple, called by Buchanan *Templum Termini*, which formerly stood on the banks of the Carron, and which was known to the vulgar by the appellation of Arthur's Oon. Here is likewise an obelisk, in honour of Ramsay the poet, who frequently resided at Penyuik, and is supposed to have laid the scene of the Gentle Shepherd on the confines of this parish and Glencrofs. About two miles from this seat, lower down the river, stood the ancient castle of Brunstone, the baronial mansion of the Crichtounes, some ruins of which still remain. New-Hall, another residence of the same family, stands three miles north-west from the village. It is supposed to have derived its appellation of *New* from the circumstance of its occupying the site of an *old* religious house. The name of New-House, an inn on the lands of Spittal here, boasts a similar derivation, having been erected to supply the place of an ancient hospitium for the accommodation of travellers. Even at the present day, the weary and benighted traveller is considered as entitled to shelter and protection; and accordingly one of the out-houses, at the Old Spittal, is usually appropriated to that purpose. Traces of several encampments of different forms and eras are yet visible in this parish. Ravens-Nook Castle, situated on the Esk, belonged to the Sinclairs of Roslyn. The government had converted the buildings of two large paper-manufactories here into depots for prisoners of war.

According to the parliamentary returns, the houses in this parish amount to 309 in number, and the inhabitants to 1827.

A fossil tree is in existence near the village of Penyuik, of which phenomenon the following description is given in a letter by sir J. S. Mackenzie, bart. inserted in *Constable's Magazine* for Dec. 1818. "On the south bank of the river North Esk, a short distance above the paper-mill at Penyuik, where the strata usually accompanying the coal-formation of this country are exposed, a large portion of the trunk and several roots of a fossil tree are visible: it rises several feet above the bed of the river, as far as the strata reach; and the roots spread themselves in the rock. It appears as if the tree had actually vegetated on the spot where we now see it. It is, where thickest, about four feet in diameter. The strata, in which the remains of the tree stand, are slate-clay, and the tree itself is sandstone. There is sandstone below and immediately above the slate-clay; and the roots do not appear to have penetrated the lower sandstone, to which they reach. Small portions of coal were observed where the bark existed, the form of which is so distinct on the fossil, that we may conjecture the tree to have been a Scotch pine. This conjecture may appear more probable, from the roots spreading more horizontally than those of other species. There are several rents across the trunk, which may have been caused by frost."

PEN'ZA, a town of Russia, and capital of a government, near the Sura: 644 miles south-east of Petersburg, and 316 east-fourth-east of Moscow. Lat. 53. 30. N. lon. 45. 42. E.

PENZAN'CE, a seaport and market-town in the county of Cornwall, and the most westerly town in England, is situated on the north-west side of Mount's Bay, 287 miles west-fourth-west from London, and only ten miles from the Land's End. It is particularly distinguished for the cheapness of its fish-market, the mildness of its climate, and the fertility of the neighbouring lands: these circumstances have occasioned a considerable increase of population, by the influx of inhabitants from the adjacent villages.

In the year 1595, the Spaniards dispatched four vessels from Bretagne, (of which they were then masters,) to

invade the English coast. They landed near Moushole, which they burnt, together with the church of St. Paul. Meeting with little resistance, they proceeded to Penzance; and, the inhabitants deserting it, they entered the town in three places, and set it on fire, after which they re-embarked. The returning courage and increased numbers of the Cornish, prevented the Spaniards from re-landing, and Penzance has since remained undisturbed by foreign foes.

The parish-church is situated nearly at Madern, two miles from the town; but there is a chapel of ease nearer home, dedicated to St. Mary. There are various religious denominations residing here; Presbyterians, Quakers, Methodists, and Jews, who have separate places of worship. The government is vested in a corporation, consisting of a mayor, recorder, twelve alderman, and twenty-four common-councilmen; but sends no member to parliament. Penzance is one of the four stannary-towns of the Cornish tin-mines; and the petty sessions for the west division of the hundred of Penwith are holden here. There is a charity-school endowed by John Buller, esq. of Morval, in 1711. The town is very pleasant, many of the houses are large and respectable, and most of the streets are paved. A new pier, which was erected by the corporation some years since, affords much convenience to the considerable trade carried on here, consisting chiefly of tin, and the pilchard-fishery. The packets, which form the principal mode of conveyance to the Scilly-islands, sail from Penzance. By the census of 1821, Penzance contained 5224 inhabitants. Among these are a great many good families of gentlemen, though in this utmost angle of the nation; and the veins of lead, tin, and copper, ore, are said to be seen, even to the utmost extent of land, at low-water mark, and in the very sea. So rich, so valuable, a treasure is contained in these parts of Great Britain, though they are supposed to be poor, because so remote from London, which is the centre of our wealth.

The method of laying and pressing their fish, especially pilchards, is as follows: They pile them up on a bed of great length and breadth, indeed as long and broad as the house made for that purpose will permit, and breast-high; then in the wall behind they have a hole, into which they thrust a rafter or post of timber which reaches across the bed of fish, and on the other end of it hang one or two great stones, with a great hook of iron fastened in them for that purpose; of these holes and rafters they have many all along the bed, which keep down the boards wherewith the bed of fish is covered, and so press the fish equally underneath the bed; and they have a gutter to receive and convey the oil which is thus pressed out into a vessel fixed in the ground at one end of the building.

In December 1797, there was found here a vein of the material used by the Chinese in colouring their china-ware. A specimen of the same composition occurs on the PENTLAND HILLS, (see p. 572.) which was supposed to be only one in Europe, or at least in Great Britain.

Here is a good market on Thursday; and fairs on Trinity Thursday and Holy Thursday.

About half a mile west of Penzance are some remains of the celebrated Wherry Mine. They are situated in a part of the bay which is dry at low water, but covered by every returning tide to the depth of several feet. The peculiar situation of this mine renders it an object of curiosity, although the shaft is filled up, and the frame-work nearly annihilated. When the works were in operation, the labour was extremely adventurous; the miners working at the depth of seventeen fathoms below the waves, nearly 120 fathoms from the shore, and momentarily menaced with an inundation of the sea, which roared above them. The dangerous situation of the shaft, the injurious effect of storms and tides, and a partial failure of the lode, induced the proprietors to discontinue working it in 1798.

A large

A large tract of marsh-land adjacent to Penzance, subject to occasional inundations of the sea, has been partly rescued from sterility and waste, through the laudable exertions of Dr. Samuel Moyle, of Marazion. It was effected by means of an aqueduct or pipe, communicating with the sea, which carried off all the drainage-water from the marsh. Several crops of corn and potatoes have been obtained from the parts so saved, and it promises to reward the adventurer for his expense and perseverance. In cutting one of the drains, an earthen pot was discovered, containing nearly a thousand Roman copper coins, which the impressions show to have been issued between the years 260 and 350.

Madern, a village two miles north, is the parish in which Penzance is situated. It was once noted for a spring of water, said to cure lameness and the colic.—Morvath is also north of Penzance, near the sea.

West of, and contiguous to, Penzance, are several small villages and antiquarian objects deserving notice.—Moufe-hole, on the western side of Mount's Bay, is celebrated among antiquaries for having been the residence of Dolly Pentreath, one of the last persons known to speak the Cornish language. She lived to the great age of 102, and was buried in the parish church-yard of St. Paul's.—St. Burien is the name of a parish, which, though at present consisting only of a few wretched cottages, was formerly distinguished by a college of Augustinian canons, founded and endowed by Athelstan about the year 930. The deanery includes the parishes of Burien, Senner, and St. Levan. At the Norman conquest there were secular canons here, and in the 20th of Edward I. a dean and three prebends. The church is built on a high spot of ground; it consists wholly of granite, and its tower forms a conspicuous object from the Land's End, the Scilly Islands, and the North and South Channels.

The greater part of the district round St. Burien, though wild and unsheltered, is interesting to the antiquary, being interspersed with cairns, circles, cromlechs, and other Druidical remains. In the parish of St. Paul is a circular inclosure of stones, called the *Roundago*, fifty-two paces from north to south, and thirty-four from east to west. Some of the stones are erect, others piled in a wall-like form, but without mortar. In the parish of Senner is a circle of similar shape and character, and at Tredineck another of the same kind. In the parish of Burien is a small circle of 19 upright stones, called the *Dance Maine*, or the *Merry Maidens*, the stones are about four feet above the ground, and five feet distant from each other; the diameter of the circle is about twenty-five feet, and at some distance north-west from it are two taller upright stones, called the *Pipers*. Another of these Druidical circles is named *Boscawen-un*, which also consists of 19 upright stones, and is about 25 feet in diameter, having a single leaning stone in the centre. In the parish of Gulval is *Boskednan-circle*, consisting also of 19 stones, but of smaller diameter than the two former. In the parish of St. Just is a considerable structure of this kind, known by the name of the *Botallach circles*, composed of four circles of upright stones intersecting each other. *Lanyon Quoit* is a cromlech, consisting of four upright stones, three of which support the other, a broad flat stone, 23 feet long, by 14 wide. In the parish of Morval is a cromlech, similar to this last, but of smaller dimensions, called *Chûn Quoit*; and half a mile east of Senner church is another, the *quoit* of which is supported by a barrow heaped round it, 14 yards in diameter. In the parish of Madern stand three stones erect, on a triangular plane, the middle one of which is perforated with a large hole near the base, nine inches in diameter. Dr. Borlase conjectures that this perforation was appropriated to superstitious rites, in the days of Druidism.

The same antiquary has described various logan or rock-

ing-stones as formerly extant in this part of Cornwall; the most considerable and curious of which was at Treryn-Castle, in the parish of St. Levan. The chief stone is an immense granite block, supposed to weigh nearly 90 tons, poised on the top of a vast pile of rocks which project into the sea. This enormous mass, it is stated and believed, was once liable, from a peculiarity of position, to be moved to and fro. Treryn-Castle is a large piece of rocky ground, projecting into the sea, and inclosed by two formidable ramparts and ditches, one within the other, stretching in a semicircular form from the sides of the cliffs: the perpendicular rocks form three sides of this fortification, and the land-side is guarded by these thick and high embankments. About a mile and a half west of this, the cape, called *Tolpedn-penwith*, is divided from the main land by a stone wall. The castles *Karniheck* and *Boscagell*, in the parish of St. Just, are also of the same kind, as well as many others on the sea-coast.

A little up in the country towards the north-west is *Godolchan*; which, though a hill rather than a town, gives name to the ancient and noble family of *Godolphin*; and nearer on the northern coast is *Ryalton*, which gave the second title to the earls of *Godolphin*. This place, also, is infinitely rich in mines.

From the tops of the hills, on this extremity of the land, you may see out into what they call the *Chops of the Channel*; which, as it is the greatest inlet of commerce, and the most frequented by merchant-ships, of any place in the world, so one seldom looks out to seaward, but something new presents of ships passing or repassing. The point of the main land called the *Lizard*, which runs out to the southward, and the other promontory called the *Land's End*, make the two angles or *horns*, as they are called, from whence it is supposed this country received its first name, *Cornwall*, or, as *Camden* says, *Cornubia* in the Latin, and in the British *Cerneu*, as running out in two vastly-extended horns.

The *Land's End* is the most westerly promontory in England. It is a point of huge and ragged rocks, forming a barrier to the tumultuous sea, of the most awful and wildly-sublime kind. It was called *Bolerium* by *Ptolemy*; by the British bards *Penringhuaed*, or the Promontory of Blood; and by their historians *Penwith*, or the Promontory to the Left. Near this craggy cliff are three caverns, in which the agitated waters occasionally roar with tremendous fury. Several masses of rock are seen above the surface of the sea, more than two miles west of the *Land's End*, called the "Long Ships." On the largest a light-house was erected in 1797 by Mr. Smith, who obtained a grant for that purpose, and is rewarded by a certain rate on all ships that pass the *Land's End*.

Nature has fortified this part of the island of Britain in a strange manner, and very much worth a traveller's observation. First, there are the islands of *Scilly*, (which see,) and the rocks about them, placed like out-works to resist the first assaults of this enemy the ocean, and so break the force of it; as the piles or *starlings* were placed before the solid stone-work of *London-bridge*, to fence off the force, either of the water or ice, or any thing else that might be dangerous to the work. Then there are a vast number of *funk rocks*, besides such as are visible and above water; which gradually lessen the quantity of water, that would otherwise lie with an infinite weight and force upon the land. It is observed, that these rocks lie under water for a great way off into the sea on every side the said two horns or points of land; so breaking the force of the water, and lessening the weight of it. But, besides this, the whole body of the land, which makes this part of the isle of Britain, seems to be one solid rock, as if it was formed by nature to resist the otherwise irresistible power of the ocean. And, indeed, if one were to observe with what fury the sea comes on sometimes against the

shore, especially at the Lizard Point, where there are but few, if any, outworks to resist it; how high the waves come forward, storming on the back of one another, particularly when the wind blows off-sea; one would wonder, that even the strongest rocks themselves should be able to resist and repel them. And yet, as if all this were not enough, nature has provided another strong fence; and that is, that these vast rocks are, in a manner, cemented together by the solid and weighty ore of tin and copper, especially the latter, with which the stones may be said to be soldered together, lest the force of the sea should separate and disjoint them, and, breaking in upon these fortifications of the island, destroy its chief security. It is very probable that all these isles were once part of the main land; but the sea, violently beating against it, carried off the softer parts, and left the harder. This process of nature and time may be seen in miniature at the western point of the Isle of Wight, and many other exposed places. Undoubtedly, had not such hard bodies as these rocks been there, the sea would have made still greater havock, and carried away much more of the land. This is certain, that there is a more than ordinary quantity of tin, copper, and lead also, fixed by the great Author of Nature in these very remote angles, so that the ore is found upon the very surface of the rocks a good way into the sea, and does not only lie, as it were, upon or between the stones among the earth; which in that case might be washed from it by the sea, but is even blended or mixed in with the stones themselves, so that the stones must be split into pieces to come at it. By this mixture the rocks are made exceedingly weighty and solid, and thereby still the more qualified to repel the force of the sea. See farther under the articles MARAZION, vol. xiv. p. 333. and SCILLY; also Borlase's and Polwhele's Antiquities of Cornwall; Beauties of England and Wales, vol. ii. and Wilkes's British Directory, vol. iv.

PENZEN'SKOE, a government of Russia, bounded on the north by Nizgorodskoi, on the east by Simberkoe, on the south by Saratovkoe, and on the west by Tambov-koe; about 172 miles east to west, and from forty to sixty north to south. Penza is the capital. Lat. 52. 40. to 54. 36. N. lon. 42. to 47. E.

PENZINSKA'IA, a gulf of Russia, at the north part of the Penzinskoe Sea. Lat. 61. to 62. N. lon. 162. 14. E.

PENZIN'SKOE SEA, a large bay of the North Pacific Ocean, between Russia and Kamtschatka, situated to the north-east of the sea of Ochotsk; about 320 miles in length, and from 120 to 160 broad. Lat. 58. to 62. N. lon. 152. to 161. E.

PENZLEIN, a town of the duchy of Mecklenburg; thirty-seven miles south-east of Gultrow, and fifty-three east of Stettin.

PE'ON, *f.* In India a foot-soldier: one employed also as a servant or attendant. The original word is said to be *peadah*. See the article HINDOOSTAN, vol. x. p. 177. and the corresponding Plate.—Little boys, or *peunes*, who, for four-pice a day, are ready to run, go errands, or the like. *Sir T. Herbert's Travels*.

PE'ONY, *f.* A flower. See PÆONIA.—A physician had often tried the *peony*-root unseasonably gathered without success; but, having gathered it when the decreasing Moon passes under Aries, and tied the slit root about the necks of his patients, he had freed more than one from epileptical fits. *Boyle*.

PE'OPLE, *f.* [*peuple*, Fr. *populus*, Lat.] A nation; those who compose a community. In this sense we have *peoples*.—Prophecy again before many *peoples* and nations and tongues. *Rev.* x. 11.—Ants are a *people* not strong, yet they prepare their meat in summer. *Prov.* xxx. 25.

What is the city but the *people*?
True, the *people* are the city. *Shakespeare's Coriol.*

The vulgar.—The knowing artift may judge better than the *people*. *Waller*.

I must like beasts or common *people* die,
Unless you write my elegy. *Cowley*.

The commonalty; not the princes or nobles:

Myself shall mount the rostrum in his favour,
And strive to gain his pardon from the *people*. *Addison*.

Persons of a particular class.—If a man temper his actions to content every combination of *people*, the music will be the fuller. *Bacon*.—A small red flower in the stubble-fields country *people* call the wincopipe. *Bacon*.—Men, or persons in general. In this sense, the word *people* is used indefinitely, like *on* in French.—The frogs petitioning for a king, bids *people* have a care of struggling with heaven. *L'Estrange*.—*People* were tempted to lend by great premiums and large interest. *Swift's Miscell.*—Watery liquor will keep an animal from starving by diluting the fluids: for *people* have lived twenty-four days upon nothing but water. *Arbutnot on Aliments*.

To PE'OPLE, *v. a.* To stock with inhabitants. Suppose that Brute, or whosoever else that first *peopled* this island, had arrived upon Thames, and called the island after his name Britannia. *Raleigh's Hist.*

He would not be alone, who all things can;
But *peopled* heaven with angels, earth with man. *Dryden*.

PE'OPLISH, *adj.* Vulgar. Not in use.—Rudeness, and *peplishe* appetite. *Chaucer's Tr. and Crest*.

PE'OR, a famous mountain beyond Jordan, which Eusebius places between Heshbon and Livia. The mountains Nebo, Pisgah, and Peor, were near one another, and probably made but the same chain of mountains. It is very likely that Peor took its name from some deity of the same name, which was worshipped there; for Peor, Phegor, or Baal-peor, was known in this country. See Numb. xxv. 3. Deut. iv. 3. Psal. cv. 28.

PE'OR, was a city of the tribe of Judah, which is not read in the Hebrew, nor in the Vulgate, but only in the Greek of the Septuagint (Josh. xv. 60.). Eusebius says it was near Bethlehem; and Jerome adds, that in his time it was called *Paora*.

PEO'RIA, a township of St. Clair, in the Illinois territory, with 93 inhabitants.

PE'ORY, a town of Hindoostan, in Dowlatabad: thirty-five miles north-north-west of Darore.

PEPARE'THOS, in ancient geography, a small island of the Ægean Sea, on the coast of Macedonia, about twenty miles in circumference. It abounded in olives, and its wines have always been reckoned excellent. They were not, however, palatable before they were seven years old. *Pliny*.

PEPAS'MUS, *f.* [from the Gr. *πεπαινω*, to mature.] Maturation of morbid humours.

PEPAS'TIC, or PEP'TIC, *f.* [*πεπαστικός*, or *πεπτικός*, Gr. formed from *πεπαινειν*, to digest, or ripen.] A kind of medicament of the consistence of a plaster, proper to bring vitious and corrupt humours to a head, and dispose them for suppuration.—Butter, roots of mallows, of fleurs-de-lys, onions, and leaves of oxylapathum, are esteemed good *pepastics*, or maturatives. *Chambers*.—The word is also used for such medicines as promote the digestion of food in the stomach; properly *peptics*.

PEPAS'TIC, *adj.* Suited to digest crudities in the stomach.

PEPECHAISIN'AGAN, a river of Canada, which runs into the St. Lawrence in lat. 48. 26. N. lon. 68. 55. W.

PEP'ERAH, a town of Hindoostan, in Gurry Muddella: ten miles south of Gurra.

PEP'ERAH, a fort of Hindoostan, in Bahar: forty-eight miles east of Durbungah. Lat. 26. 8. N. lon. 86. 58. E.

PEPERAL'LY, a town of Hindoostan, in Bahar: thirty miles north of Durbungah.

PEPER'AH,

Water Parslane.

PEPERIAH, a town of Hindooftan, in Bahar: 54. miles east-fourth-east of Hajypour.

PEP'IN LE GRO'S, PEPIN LE BREF, &c. see the article FRANCE, vol. vii. p. 651—6.

PEP'IN LA'KE, an expansion of the river Mississippi. Lat. 42. 20. N. lon. 92. 45. W.

PEP'LION, *f.* in botany. See EUPHORBIA.

PEP'LIS, [a name borrowed from Dioscorides, whose *πεπλίς*, nevertheless, is evidently the Linnæan Euphorbia pepelis, and essentially different in characters and qualities from the genus of which we are about to treat.] WATER PURSLANE; in botany, a genus of the class hexandria, order monogynia, natural order of calycanthemæ, (salicariæ, *Juss.*) Generic characters—Calyx: perianthium one-leaved, bell-shaped, permanent, very large, with the mouth twelve-cleft; toothlets alternate, reflex. Corolla: petals six, ovate, very small, inserted into the throat of the calyx. Stamina: filaments six, awl-shaped, short; antheræ roundish. Pistillum: germ oval; style very short; stigma orbiculate. Pericarpium: capsule superior, cordate, two-celled; partition opposite. Seeds very many, three-sided, very small. In many florets on the same plant the corolla is entirely wanting. In *P. tetrandra* the parts of fructification are less by one-third.—*Essential Character.* Calyx bell-shaped, with a twelve-cleft mouth; petals six, inserted into the calyx, (or none.) capsule two-celled. There are three species.

1. *Peplis portula*, or common water-purslane: flowers apetalous. This is an annual creeping plant. Stems numerous, branched, dichotomous, from half a foot or a span to a foot in length, smooth, angular, jointed, of a reddish colour. Leaves opposite, obovate, orbiculate or spatulate, tapering into the petiole, smooth, quite entire. Flowers very small, solitary, opposite, sessile; corolla and filaments pinky red; petals deciduous, regularly six, but more frequently one, two, or three, and sometimes none; calyx greenish white, smooth, angular-plaited, striated; antheræ dark coloured; stigma white. Capsule small, globular, membranaceous, very thin, knobbed on account of the protuberant seeds, valveless; partition membranaceous, corresponding with the external groove of the capsule; receptacle fleshy, roundish, compressed a little, fastened to the partition on both sides. Seeds about thirty in each cell, obovate acuminate, convex on one side, flat on the other, pale. Native of many parts of Europe, in bogs, marshes, ditches, and especially where water has stagnated in winter and becomes dry in summer. It flowers from July to September; and is represented on the annexed Plate.

2. *Peplis tetrandra*: flowers one-petalled, four-stamened. Calyx bell-shaped, with the border eight-cleft; corolla tubular, with the border four-parted; stamens four; germ growing to the tube of the calyx; stigmas two, capsule inferior, two-celled, crowned. According to Jussieu, the corolla is monopetalous, four-stamened; the germ inferior, the stigma double; the capsule two-celled, two-valved, many-seeded; with a stipule between the leaves: it is therefore more nearly allied to the Rubiacæ, and particularly to *Oldenlandia* or *Gomezia*; but it is distinguished from them by its eight-toothed calyx. In the opinion of Swartz, the corolla, fruit, number, and habit, do not admit of its ranging with *Peplis*. It seems rather to be a *Hedyotis*, and differs little in appearance from *H. pumila*. It is an annual plant, native of the West Indies, in dry shady places at the foot of mountains or trees. Willdenow also says the *P. tetrandra* of Linnæus is a *Hedyotis*, of which indeed it has all the appearance. He adds, in its stead, the following new species.

3. *Peplis Indica*: flowers spiked, bracteated; leaves sessile. Native of the East Indies. Stem ascending, square, smooth, six inches or more in height. Leaves opposite, oblong-obovate, abrupt, entire, veiny, smooth. Flowers sessile, opposite, each accompanied by a lanceolate bract, twice its own length; calyx with only eight teeth; petals wanting; stamens four. See EUPHORBIA.

PEPLOU'D, a town of Hindooftan, in the Candesh country: eighty miles south of Indore, and thirty north-east of Burlampour. Lat. 21. 42. N. lon. 76. 45. E.

PE'PLUS, *f.* A long robe worn by the women in ancient times, reaching down to the feet, without sleeves, and so very fine, that the shape of the body might be seen through it. The Athenians used much ceremony in making the peplus, and dressing the statue of Minerva with it. See the article PANATHENÆA, vol. xviii. p. 313.

PE'PO, *f.* in botany. See CUCURBITA and MOMORDICA.

PEPONG', or PEPUNG. See PEPUNG.

PEP'PER, *f.* [peppon, Sax. *pipor*, Lat. *poivre*, Fr.] An aromatic pungent spice.—We have three kinds of *pepper*; the black, the white, and the long, which are three different fruits produced by three distinct plants. Black *pepper* is a dried fruit of the size of a vetch, and roundish, but rather of a deep brown than a black colour: with this we are supplied from Java, Malabar, and Sumatra; and the plant has the same heat and fiery taste that we find in the *pepper*. White *pepper* is commonly factitious, and prepared from the black by taking off the outer bark; but there is a rarer sort, which is a genuine fruit naturally white: long *pepper* is a fruit gathered while unripe and dried, of an inch or an inch and a half in length, and of the thickness of a large goose-quill. *Hill.*—See the article PIPER.

Scatter o'er the blooms the pungent dust
Of *pepper*, fatal to the frosty tribe. *Thomson's Spring.*

To PEPPER, *v. a.* To sprinkle with pepper, or with the appearance of it:

Note the lining of the royall robe,
Its powder'd ermine, *pepper'd* too with stings,
That, like a nettle, make the wearer rub. *Davies.*

Of praise a mere glutton, he swallow'd what came;
And the puff of a dunce he mistook it for fame;
Till, his relish grown callous almost to disease,
Who *pepper'd* the highest was surest to please. *Goldsmith.*

To beat; to mangle with shot or blows.—I have *peppered* two of them; two I have paid, two rogues in buckram suits. *Shakespeare's Hen. IV.*

Thou art hurt.—I am *pepper'd*;
I was i' the midst of all, and bang'd of all hands;
They made an anvil of my head; it rings yet;
Never so thresh'd: do you call this fame? *Beaum. and Fl.*

PEP'PER (Guinea). See CAPSICUM.
——— (Jamaica). See MYRTUS.

PEP'PER-BA'Y, a bay on the west coast of the island of Java: thirty miles south-fourth-west of Bantam. Lat. 6. 24. S. lon. 105. 40. E.

PEP'PER-BOX, *f.* A box for holding pepper.—I will not take the leacher; he cannot creep into a half-penny purse nor into a *pepper-box*. *Shakespeare.*

PEP'PER-CORN, *f.* A grain of pepper; any thing of inconsiderable value.—Our performances, though dues, are like those *pepper-corns* which freeholders pay their landlord to acknowledge that they hold all from him. *Boyle.*

Folks from mud-wall'd tenement
Bring landlords *pepper-corn* for rent. *Prior.*

PEP'PER-GIN'GERBREAD, *f.* What is now called *spice-gingerbread*; and in the north *pepper-cake*:

Swear me, Kate, like a lady as thou art,
A good mouth-filling oath; and leave in sooth,
And such protest of *pepper-gingerbread*,
To velvet-guards and Sunday citizens. *Shakespeare.*

PEP'PER-GRASS. See PILULARIA.

PEP'PER-WORT. See LEPIDIUM.

PEP'PERBERG, a town of the island of Java, on the south coast: seventy-five miles south of Batavia.

PEP'PER-

PEP'PERELBOROUGH, a township of America, in York-county, and state of Maine, on the north side of Saco-river, near the mouth, which separates it from Biddeford to the south. A bank, by the name of Saco Bank, was established here in 1803. It lies about twelve miles south-west of Portland. It was incorporated in 1772; and contains 1842 inhabitants.

PEP'PERELL, a township of Massachusetts, on the east branch of Nashaway-river, and on the north line of Middlesex county; forty miles north by west of Boston; incorporated in 1753, and containing 1333 inhabitants.

PEP'PERING, *adj.* Hot; fiery; angry.—I resented highly that he [lord Lansdown] should complain of me before he spoke to me; I sent him a *peppering* letter; and would not summon him by a note, as I did the rest; nor ever will have any thing to say to him, till he begs my pardon. *Swift's Journal*, 1711.

PEP'PERMINT, *f.* Mint eminently hot. See MENTHA.

PEPSIQUI'ACH POINT, lies on the northern side of Chaleur-bay, now called Papibiach Point; about three leagues west-north-west of East Nouvelle. It is a barren plain, nearly a league long, where is carried on a very extensive fishery.

PEP'SIS, *f.* [Greek.] The concoction of food; the maturation of humours.

PEP'TIC, *adj.* [Greek.] Helping digestion. See PEPASTIC.

PEPUNG', two small islands of the East-Indian Sea, near the coast of China. Lat. 23. 22. N. lon. 107. E.

PEP'USCH (John Christopher), a very learned musician, was born at Berlin in 1667; and made so great a progress in music at the age of fourteen, that he was sent for to court, where he gave such proofs of his abilities that he was appointed to teach the prince, father of the late king of Prussia. He remained at Berlin till he was about twenty, when he went to Holland, where he first began to publish his compositions. Continuing there about a year, he came to England soon after the Revolution. His first employment in London was playing the tenor in the band at Drury-lane play-house; but, having convinced the managers that he deserved a better place, he was advanced to the harpsichord about 1700. In 1707 he had acquired English sufficient to adapt Motteux's translation of the Italian opera of *Thomyris* to airs of Scarlatti and Bononcini, and to new-set the recitatives. In 1709 and 1710, several of his works were advertised in the first edition of the *Tatlers*, particularly a set of Sonatas for a flute and bass, and his first book of Cantatas. In 1713 he obtained, at the same time as Crofts, the degree of doctor of music at the university of Oxford. And soon after this, upon the establishment of a choral chapel at Cannons, he was employed by the duke of Chandos as maestro di capella; in which capacity he composed anthems and morning and evening services, which are still preserved in the Academy of Ancient Music. In 1715 he composed the masque of *Venus and Adonis*, written by Cibber; and, in 1716, the *Death of Dido*, by Booth; both for Drury-lane. These pieces, though not very successful, were more frequently performed than any of his original dramatic compositions. In 1723 he published an Ode for St. Cecilia's Day, which he had set for the concert in York-buildings. And, about the year 1724, Dr. Berkeley, dean of Londonderry, afterwards bishop of Cloyne, having formed a plan for erecting a college in one of the Bermudas, or Summer Isles, among the several persons of distinguished abilities whom he had engaged to accompany him thither, fixed on Dr. Pepusch. But, having embarked with his associates for the intended settlement, the ship was wrecked, and the undertaking frustrated. Pepusch returned to England after this accident, and married Margarita de l'Epine, who had quitted the stage, where she had acquired a fortune that was estimated at 10,000*l.* These possessions, however, did not incline the doctor to relax in his musical studies or pursuits. He

had always been a diligent collector of ancient music and musical tracts; and he was now enabled to gratify this passion without imprudence. He still continued to compose for the play-house in Lincoln's-Inn-Fields; and had the Squire of Alsatia for his benefit there in 1726, "with singing by Mrs. Chambers, also singing in Italian and English by Mrs. Forfyth, Mrs. Davies, and Mrs. Grimaldi, being the first time of their respective appearances on the stage." Soon after he was very judiciously chosen by Gay, to help him to select the tunes for the *Beggar's Opera*, for which he composed an original overture upon the subject of one of the tunes (*I'm like a skiff*), and furnished the wild, rude, and often vulgar, melodies, with most excellent basses.

After this period he composed but little, applying himself chiefly to the theory of music, and explaining the mysteries of composition to young professors. He had always been extremely anxious for the prosperity of the Academy of Ancient Music, of which he was one of the first founders, and continued very active in its service to the time of his death. As a consequence of his musical erudition and zeal for the advancement of his art, he published, in 1731, a correct edition of a short "Treatise on Harmony," which the seventh earl of Abercorn is supposed to have assisted him in putting into English. This nobleman had so long studied composition under Dr. Pepusch, and so frequently conversed with him on the subject, that he was supposed more able to explain his principles in English than the doctor himself. The first edition of this small tract appeared without the plates or the consent of the author. This work contains many elementary rules for composition that are practical and useful; but it likewise contains many prejudices and exploded doctrines, which to revive would shackle genius, and throw the art back into Gothic times.

In 1737 he was appointed organist of the Charter-house, which afforded him a tranquil retreat well suited to his time of life and love of study; and he was visited and consulted as an oracle, not only by young musical students, to whom he was always kind and communicative, but by every master who modestly supposed he had still something to learn. Here he greatly augmented his library, which consisted of musical curiosities, theoretical and practical, of all kinds. In 1739 he lost a son, his only child, upon whose genius and disposition there was every reason to found the greatest expectations; and in 1740 Mrs. Pepusch died; after which, his time seems to have been chiefly devoted to the study of the genera and systems of the ancient Greek music, concerning which he presented a paper to the Royal Society in 1746, No 481. and was soon after elected a member of that learned body.

Dr. Pepusch died in the year 1752, at the age of eighty-five; and was buried in the chapel of the Charter-house, where a tablet was placed, and inscribed to his memory, by his friends and associates of the Academy of Ancient Music.

As a practical musician, though an excellent harmonist, the doctor was possessed of so little invention, that few of his compositions were ever in general use and favour, except one of his twelve cantatas, "Alexis," and his airs for two flutes or two violins, consisting of simple easy themes or grounds with variations, each part echoing the other in common divisions for the improvement of the hand. But, though only one cantata of the two books he published was ever much noticed, there is considerable harmonical merit in them all; the recitatives are in general good, and the counterpoint perfectly correct and masterly. Among all the publications of Pepusch, the most useful to musical students was, perhaps, his correct edition of Corelli's Sonatas and Concertos in score, published in 1732. He treated all other modern music, in which there was fancy or invention, with sovereign contempt. Nor is it true, as has been asserted, that "he readily acquiesced in Handel's superior merit." Handel despised the pedantry of Pepusch; and Pepusch, in re-

turn, constantly refused to join in the general chorus of Handel's praise.

The sole ambition of Pepusch, during the last years of his life, seems to have been the obtaining the reputation of a profound theorist, perfectly skilled in the music of the ancients; and, attaching himself to the mathematician De Moivre and Geo. Lewis Scot, who helped him to calculate ratios, and to construe the Greek writers on music, he bewildered himself and some of his scholars with the Greek genera, scales, diagrams, geometrical, arithmetical, and harmonical, proportions, surd quantities, apotomes, lemmas, and every thing concerning ancient harmonics that was dark, unintelligible, and foreign to common and useful practice. But, with all his pedantry and ideal admiration of the music of the ancients, he certainly had read more books on the theory of modern music, and examined more curious compositions, than any of the musicians of his time; and, though totally devoid of fancy and invention, he was able to correct the productions of his contemporaries, and to assign reasons for whatever had been done by the greatest masters who preceded him. But, when he is called the most learned musician of his time, it should be said, "in the music of the 16th century." Indeed, he had at last such a partiality for musical mysteries, and a spirit so truly antiquarian, that he allowed no composition to be music but what was old and obscure. Yet, though he fettered the genius of his scholars by antiquated rules, he knew the mechanical laws of harmony so well, that, in glancing his eye over a score, he could by a stroke of his pen smooth the wildest and most incoherent notes into melody, and make them submissive to harmony; instantly seeing the superfluous or deficient notes, and suggesting a bass from which there was no appeal. His industry deserves to be honourably recorded: he told Dr. Burney, that, when he was a young man, he determined never to go to bed at night till he knew something that he did not know in the morning.

His very valuable library of scarce musical authors was dispersed after his death. He bequeathed a considerable part of his best books and manuscripts to Kelner, an old German friend, who played the double-bass in the theatres and concerts of the time; some to Travers, and these and the rest were at last sold, dispersed, and embezzled, in a manner difficult to describe or understand. *Burney's Hist. of Music.*

PEPUZA, in ancient geography, a town of Asia, in Phrygia Pacatiana.

PEPUZIANs, in ecclesiastical history, a sect of ancient heretics, who had their name from a pretence that Jesus Christ appeared to one of their prophetesses in the city of Pepuza in Phrygia, which was their holy city. The name of this prophetess was *Quintilia*; hence they are called *Quintilians* also. In this sect, the women were permitted to perform the sacerdotal and even episcopal functions; grounding their practice on Gal. iii. 28. where St. Paul says there is no distinction of males and females. They attributed extraordinary gifts to Eve for having first eaten of the tree of knowledge; told great things of Mary the sister of Moses, as having been a prophetess, &c. They added, that Philip the deacon had four daughters, who were all prophetesses, and were of their sect. In these assemblies it was usual to see the virgins entering in white robes, personating prophetesses. *Chambers's Cyclopaedia.*

PEPYLYCHNUS, in ancient geography, a river which bounded Macedonia.

PEP'YS'S ISLANDS. See FALKLAND ISLANDS.

PEQUANACK, a town of America, in Morris-county, New Jersey, separated from Bergen-county on the north by Pegunnock-river: contains 3853 inhabitants.

PEQUANNOCK POINT, and RIVER. The *River* is a small stream which runs south through the towns of Huntington and Stratford, in Fairfield-county, Connecticut, and discharges itself into a bay in the sound,

VOL. XIX. No. 1326.

where vessels may anchor. The *Point* forms the western extremity of the bay, near which are some rocks: five miles south-west of Stratford-river.

PEQUEA CREEK, a river of Pennsylvania, which runs into the Susquehanna in lat. 39. 54. N. lon. 76. 22. W.

PEQUESIGEHAU'GEM, or BEAR LAKE, the source of a river of the same name, which is the north-easterly branch of Maggakadawa river; it is of an irregular form, about three miles long, and two wide.

PEQUEST CREEK, a river of New Jersey, which runs into the Delaware in lat. 40. 47. N. lon. 75. 10. W.

PEQUIGNY, a town of France, in the department of the Somme, memorable for an interview and treaty between Edward IV. king of England, and Louis XI. king of France, in the year 1474: one post and a half north of Amiens, and three and three quarters south of Abbeville.

PER, *prep.* [Latin.] By, through. A word much used in composition.

PER SE', *adv.* [Latin.] By himself, herself, or itself abstractedly:

They say he is a very man *per se*,

And stands alone. *Shakespeare's Tr. and Cress.*

PERA, *f.* in botany. See PERULA.

PERA, in ancient geography, a place near Mount Hymettus in Attica, where was a temple of Venus, with a fountain, which procured a happy delivery for the females who drank of it, according to the relation of Suidas.

PERA, one of the suburbs of Constantinople, where ambassadors and Christians usually reside. See CONSTANTINOPLE, vol. v.

PERA, a town of Portugal, in Algarva: eight miles east of Villa Nova de Portimao.

PERA, a seaport, capital of a kingdom on the west coast of Malacca, on a river of the same name: 170 miles north-west of Malacca. Lat. 4. 23. N. lon. 101. 15. E.

PERA, or PU'LO PE'RA, a small island in the Eastern Indian Sea, at the entrance of the Straits of Malacca. Lat. 5. 54. N. lon. 98. 36. E.

PERACTIC, *f.* A mathematical instrument used in surveying.

PERACTION, *f.* The act of finishing. *Cole.*

PERACUTE, *f.* [*peracutus*, Lat.] Very sharp; very violent.—Malign continual *peracute* fevers, after most dangerous attacks, suddenly remit of the ardent heat. *Harvey.*

PERA'DO, *f.* in botany. See ILEX.

PERADVENTURE, *adv.* [*par adventure*, Fr.] Perhaps; may be; by chance.—That wherein they might not be like unto either, was such *peradventure* as had been no whit less unlawful. *Hooker.*—What *peradventure* may appear very full to me, may appear very crude and maimed to a stranger. *Digby.*—Doubt: question. It is sometimes used as a noun, but not gracefully nor properly.—Though men's persons ought not to be hated, yet, without all *peradventure*, their practices justly may. *South.*

PERÆA, in ancient geography, a province of Asia Minor, which commenced on the frontiers of the Doride, towards Mount Phœnix, north-east of the Isle of Rhodes, and terminated at Dædala. The first writer who mentions this province is Polybius. It was for a long time subject to the Rhodiats, and a town called Cryassus was situated in it.—Also, a country on the other side of Jordan, which was one of the divisions of Palestine. According to Josephus, Peræa had for its limits on the east Rabba, or Philadelphia; on the west, the Jordan; on the south, Macherontes; and on the north, Pella.—Also, a small country of Asia, on the banks of the Tigris.—Also, a canton of Greece, in the territory of Corinth, the inhabitants of which were called Paræi.

PERÆQUATORRES, *f.* among the Romans, assessors appointed to regulate the census according to every man's

circumstances, by easing those that were overcharged, and raising the taxation if too low.

PERÆTHUS, in ancient geography, a town of the Peloponnesus, in Arcadia. Pausanias says, that among the ruins of this town there was visible a temple of the god Pan.

PERAFITA, a town of Spain, in Catalonia: ten miles north-north-west of Vique.

To PER'AGRATE, *v. n.* [from the Lat. *per*, through, and *ager*, a field.] To wander through the country; to rove about.

PERAGRA'TION, *f.* The act of passing through any state or space.—A month of *peragrations* is the time of the moon's revolution from any part of the zodiac unto the same again, and this containeth but twenty-seven days and eight hours. *Brown.*

PERAGU', *f.* in botany. See CLERODENDRUM.

PERAGU'A. See CASSINE.

PERALADA, a town of Spain, in Catalonia: twenty-two miles north-north-east of Gerona.

PERALES, a town of Portugal, on the left bank of the Tagus, opposite Abrantes.

PERALTA, a town of Spain, in Navarre, celebrated for its wine: seven miles south-south-west of Olite.

PERALTA (Francisco de), a Jesuit, and *Moderator* of the English college at Seville. He is to be enumerated among the foreigners who have written upon English history, having published "An Account of the State of the Catholick Religion in England, the Persecution of the Catholicks, and the Martyrdom of two Priests and one Layman in that Country," Seville, 1616. He also edits "A Letter from P. Rodrigo de Cabredo, giving an Account of the happy Death of the Lady Donna Louisa de Carvajal in London," Seville, 1614. *Gen. Biog.*

PERALU', *f.* in botany. See FICUS.

PERAM', a small island in the Gulf of Cambay. Lat. 21. 30. N. lon. 72. 3. E.

PERAMA, *f.* in botany. See MATTUSCHKÆA.

To PERAM'BULATE, *v. a.* [from the Lat. *per*, through, and *ambulo*, to walk.] To walk through. To survey, by passing through.—Persons the lord deputy should nominate to view and *perambulate* Irish territories, and thereupon to divide and limit the same. *Davies on Ireland.*—To visit the boundaries of the parish.

PERAMBULATION, *f.* The act of passing through or wandering over.—The duke looked still for the coming back of the Armada, even when they were wandering and making their *perambulation* of the northern seas. *Bacon.*—A travelling survey.—France is a square five hundred and fifty miles traverse, thronging with such multitudes, that the general calcul, made in the last *perambulation*, exceed eighteen millions. *Hovell.*—A district; limit of jurisdiction.—It might in point of conscience be demanded, by what authority a private person can extend a personal correction beyond the persons and bounds of his own *perambulation*? *Holyday.*—Survey of the bounds of the parish annually performed.—*Perambulation* of parishes is to be made by the minister, churchwardens, and parishioners, by going round the same once a-year, in or about Ascension week: and the parishioners may well justify going over any man's land in their *perambulation*, according to usage; and it is said may abate all nuisances in their way. *Jacob.*

PERAM'BULATOR, *f.* A wheel for measuring roads.—The method of doing this is either with an instrument and chain, or else with a *perambulator*, or measuring-wheel. *Alingham on Maps.*

PERAMBULATOR is also an instrument for measuring distances; called also *odometer*, *pedometer*, *way-wiser*, and *surveying-wheel*.

This useful and common instrument is represented on the same Plate with the PENTAGRAPH, at p. 567. This perambulator consists of a wheel A, fig. 3, two feet seven inches and a half in diameter; consequently half a pole, or eight feet three inches, in circumference. On one end

of the axis (drawn separately at fig. 4.) is a nut, three quarters of an inch in diameter, and divided into eight teeth; which, upon moving the wheel round, fall into the eight teeth of another nut *e*, fixed on one end of an iron-rod Q, and thus turn the rod once round in the time the wheel makes one revolution. This rod, lying along a groove in the side of the carriage of the instrument, has at its other end a square hole, into which is fitted the end *b* of a small cylinder P. This cylinder is disposed under the dial-plate of a movement, at the end of the carriage B, in such a manner as to be moveable about its axis: its end *a* (fig. 5.) is cut into a perpetual screw, which falling into the 32 teeth of a wheel perpendicular thereto, upon driving the instrument forward, that wheel makes a revolution each 16th pole. On the axis of this wheel is a pinion with six teeth, which falling into the teeth of another wheel of 60 teeth, carries it round every 160th pole, or half a mile. This last wheel, carrying a hand or index round with it over the divisions of a dial-plate, whose outer limb is divided into 160 parts, corresponding to the 160 poles, points out the number of poles passed over. Again, on the axis of this last wheel is a pinion, containing 20 teeth, which falling into the teeth of a third wheel which hath 40 teeth, drives it once round into 320 poles, or a mile. On the axis of this wheel is a pinion of twelve teeth, which, falling into the teeth of a fourth wheel having 72 teeth, drives it once round in twelve miles. This fourth wheel, carrying another index over the inner limb of the dial-plate, divided into 12 for miles, and each mile subdivided into halves, quarters, and furlongs, serves to register the revolutions of the other hand, and to keep account of the half-miles and miles passed over as far as twelve miles.

The use of this instrument is obvious from its construction. Its proper office is in the surveying of roads and large distances, where a great deal of expedition, and not much accuracy, is required. It is evident, that driving it along and observing the hands, has the same effect as dragging the chain and taking account of the chains and links.

Its advantages are its hardness and expedition; its contrivance is such, that it may be fitted to the wheel of a coach, in which state it performs its office, and measures the road, without any trouble at all.

The following is a description of an instrument invented by Mr. Edgeworth for the same purpose. "This *odometer*," says Mr. Edgeworth, "is more simple than any which I have seen, is less liable to be out of order, and may be easily attached to the axle-tree bed of a post-chaise, gig, or any other carriage. One turn and a half of the screw is formed round the nave of one of the hinder wheels by a slip of iron three quarters of an inch broad and one-eighth of an inch thick; this is wound round the nave, and fastened to it by screws passing through five or six cocks, which are turned up at right angles on the slit of iron. The helix so formed on the nave of the carriage-wheel acts as a worm or screw upon the teeth of the wheel A, fig. 6. upon the arbor of which another screw of brass B is formed, which acts upon the brass wheel C. This wheel C serves also as a dial-plate, and is divided into miles, halves, quarters, and furlongs; the figures indicating the miles are nearly three quarters of an inch long, so as to be quite distinct; they are pointed out by the index D, which is placed as represented in the plate, in such a manner as to be easily seen from the carriage. These two brass wheels are mounted by the irons EE upon a block of wood F, eight inches long, two inches thick, and five inches broad. This block may be screwed upon the axle-tree bed by two strong square-headed wood screws. If the carriage permits, this block should be fixed obliquely on the axle-tree bed, so that the dial-plate may be raised up toward the eye of the person looking out from the carriage. H is a ratchet-wheel attached to the arbor of the wheel A, which, by means of the click I, allows the wheel to be set with a key or handle

fitted to the squared end of the arbor at K. L is a long spring screwed on the block; it presses on the wheel A, to prevent it from flaking by the motion of the carriage. A small triangular spring is put under the middle of the dial-plate wheel for the same purpose. If the wheel of the carriage is exactly five feet three inches in circumference, the brass-toothed wheel which it turns should have 20 teeth, and that which serves as a dial-plate should have 80; it will then count five miles. If the carriage-wheel is either larger or smaller, a mile should be carefully measured on a smooth road, and the number of turns which the carriage-wheel makes in going this mile may easily be counted by tying a piece of fine packthread to one of the spokes, and letting the wheel, as it moves slowly forward, wind up the packthread on its nave. When the wheel has proceeded a half or a quarter of a mile, unwind the string and count the number of turns which it has made. By the addition of another wheel of 81 teeth placed under the dial-plate wheel and moved by the screw C, with a proper hand fitted to it, and proper figures on the dial-plate, this machine would count four hundred miles."

In the Letters and Papers of the Bath Agricultural Society, we find a description of an improved perambulator, called a *pedometer*, by Mr. Lewin Tugwell, of Beverstone. As the account contains some remarks upon the two instruments we have already described, we shall give it entire.

"In the Cyclopædia of Chambers, under the article *Perambulator*, it is said, that the proper application of that machine is, for surveying of roads and large distances, "where great expedition, and not much accuracy, is required." This want of accuracy, as will be obvious enough to every inspector, arises from the too-small dimensions of its measuring-wheel, which, in its application, too readily adapts itself to the casual inequalities of the surface; and hence the desideratum of some contrivance for admitting a larger wheel, to obviate that defect. This, some years since, was attempted by Mr. Edgeworth, whose machine for the purpose seems the most simple that can be conceived; he, however, simplicity being in mechanics a criterion of excellence, (and probably from considering, in addition to the above-mentioned defect in the old machine, its too great complexity,) seems to have gone into the opposite extreme, and, almost through the whole of his machine, to have sacrificed utility to an unnecessary degree of simplicity. Mr. Edgeworth, in conformity to the above-mentioned simplicity of his odometer, found it necessary to attempt nothing more in its operations than the measuring of roads, distances, &c. and, even for this, unless where the stones had previously been broken, and the roads worn smooth, (instances, for any considerable length, rarely to be met with,) I found it, on trial, very inadequate.

"In the specimen I have now sent, nothing has been omitted to render it capable of measuring roads in general, with greater facility, accuracy, and expedition, than can be done by any other mode I have seen or heard of; while it also equally excels in surveying or measuring of lands. By the common mode of measuring these, by Gunter's or any other chain, the progress (comparatively, in respect to that made by the pedometer) is usually slow; and, while it ingrosses the constant attention of two or more persons in company, the result is sometimes erroneous. A person using the pedometer has not only, when at work, no need of an assistant; but, while of himself he measures with greater accuracy and expedition than is done by the chain, if an unemployed companion casually attend him, he is at liberty, for the most part, while the work goes forward, to take a share in conversation on any indifferent subject. The idea of land-measuring by this mode arose from an imposition, which is, perhaps, but too frequently practised. A labourer's task-work being to be measured, no one was at hand to carry the chain (the usual term) but the labourer himself; when

the land was measured, and the money paid, he went to the ale-house, got drunk, and boasted of having outwitted his master, in having shortened the chain, by gathering some of the links in his hand at its fore end.

"This instrument is represented at fig. 7. A, the stock of the pedometer. BBB, twelve spokes; one end of each inserted in the stock; the other fastened, with a screw, to the outward ring, or periphery, of the wheel. C, the periphery, being an iron ring, $16\frac{1}{2}$ feet, or one pole, in circumference, and divided into 25 equal parts, corresponding to the links of his chain for land-measuring, &c. DDD, twelve small plates, denoting the separate spokes, each including two links of the chain above mentioned. The twelfth spoke is divided at its foot for taking in the odd or 25th link. E, an iron axis, being a screw with 320 circumvolutions, separately marked on an engraved index on one of its sides: in its application, it is screwed fast into the stock of the wheel, and, when at work, revolves with it. F, a style or alidade, being an expanding screw-nut, embracing the axis, and screwing along it, as the latter revolves with the wheel; and, as each revolution of the wheel, when rolling on the surface, describes an exact longitudinal pole, (and consequently four of them a chain,) the style, being pendent, and moving to its proper figure, denotes the length of ground passed over, as divided into chains and poles on the index of the axis E, and into links on the periphery C. G, a small adjusting-screw, by turning of which the style may be instantaneously moved back to the beginning of the index, when, in land-measuring, the given line has been ascertained in chains, poles, &c. H, a cross or square, with sights for determining, in land-measuring, the perpendiculars; suspended at its ends on the axis, and occasionally to be detached therefrom, when used, with a touch only of the finger and thumb. It farthermore acts (by the lower end of the style F embracing also its standard) in preventing the said style from being carried round, by any possible accident, with the axis as it revolves, which, before it was used, had sometimes taken place, and greatly embarrassed the account; and, as the 320 divisions, marked poles on the index of the axis, are calculated for describing an exact mile, the style F, having passed over them, will then screw no farther; but, moving round with the axis, takes with it the standard, and, striking it on the wrist of the operator, prevents the possibility of his proceeding farther, till he has drawn his hand from between the said standard and the axis: having received the necessary hint, he turns the screw G, puts back the style F to the bottom of the index, and goes on as before. The standard of the cross, being divided into five lengths, occasionally substitutes the ten-link rod, which is used for measuring off-sets, &c. and is also used for small distances inaccessible to the wheel."

It has been supposed that the ancient Romans were acquainted with an instrument of this kind. The foundation of this opinion is an expression of Julius Capitolinus in his life of the emperor Perrinax. The words are, "*Peralia (vehicula), iter metientia, et horas monstrantia*; Carriages for measuring the length of the road, and marking the time of the journey."

PERA'MES, a town of New Jersey: eight miles north of Hackensack.

PERAMI', a town of the island of Cuba: twenty-five miles south-east of Villa del Principe.

PERAN IN THE SANDS, a village in Cornwall, on the British Channel, north-east of St. Agnes. It has been almost destroyed by the sea-fands forced into it by the north-west wind, so that the inhabitants have been obliged to remove their church.

PERANGUST', *adj.* [from the Lat. *per*, and *angustus*, strait.] Very narrow. *Cole*.

To PERARATE, *v. a.* [from the Lat. *per*, through, and *aro*, to plough.] To plough through. *Cole*.

PERARO'LO, a town of Italy, in the Cadore: two miles south of Cadora.

PERAROO'R,

PERAROO'R, a town of Hindoostan, in the Carnatic: ten miles south of Tiagar.

PERASEMAJO'KI, town of Sweden, in the province of Wafsa: fifty miles east-north-east of Christinestadt.

PERASHACOT'TA, a town of Hindoostan: eighteen miles west-north-west of Coimbatore.

PERAS'TA, a town of Albania, on the Cattaro.

PERAS'TA, a town of European Turkey, in Romania, on the coast of the sea of Marmora: twelve miles north-east of Galipoli.

PER'ASTORFF, a town of Austria: five miles south-fourth-west of Ips.

PER'AVAIL. See PARAVAIL, vol. xviii.

PERAY' (St.), a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Tournon. The place contains 1652, and the canton 7492, inhabitants.

PERBI'GA, a town of Hindoostan, in Bahar: forty-five miles south-fourth-west of Patna.

PERBUTPOUR, a town of Hindoostan, in Allahabad: forty miles north-east of Gazypour.

PER'CA, *f.* [Lat. from *περκη*, Gr. of *περκος*, spotted with black.] The PERCH; a genus of fishes of the order thoracici. Generic characters—Jaws unequal; teeth sharp, incurved; gill-covers scaly, of three laminae, the upper serrate; gill-membrane seven rayed; lateral line arched with the back; scales (in most species) hard and rough; fins mostly spinous; vent nearer the head than the tail.

Of the numerous species of perch, only three were known to the ancient Romans; and, as a proof how greatly natural history is improved in our own times, Artedius knew but seven; Bloch says he has thirty undescribed species, most of them from India; yet he describes but five or six, being the species found in Germany. In order more easily to distinguish the different species, Linnæus divided them into two classes; in one he placed those with two dorsal fins, in the other those with only one, which he subdivided into such as have the tail-fin divided or undivided. Only five species are found in the lakes and on the coasts of Britain; the river-perch, the sea-perch, the baffle, the ruffe, and the black perch.

These fish are remarkably tenacious of life; some of them, particularly the river-perch, have been carried sixty miles among straw, and have survived the journey. Their fins are so prickly, that they are said to defy the attacks of the pike: this, however, is only true with regard to the larger perches, if it can be credited at all; for there is no animal which the pike will more readily devour than a small perch. From the ease with which the river-perch is taken and transported, it has become the most common inhabitant of our fish-ponds, and affords a very wholesome and palatable food. See Gmelin's Linn. 1306. Turton's Linn. 809. Bloch, ii. 56. Shaw's Gen. Zool. iv. 545. and Cope, iv. 248—428. which last author has separated a considerable part of the genus Perca, and Sciæna also, into a new genus *Centropomus*, from the Gr. *κεντρον*, a spine or prickle, and *πωμα*, the operculum, or gill-cover. He has also added several new species, for some of which he has instituted new genera, but which we shall bring, as nearly as possible, into their proper places in this genus, and we shall also some of the new genera and species of Bloch.

I. Dorsal Fins two, distinct.

1. *Perca fluviatilis*, the common or river perch: eleven rays in the anal fin, the first of them hard, and 16 soft rays in the second dorsal, are the specific character of this fish. There are 7 rays in the membrane of the gills, 14 in each pectoral fin, 5 in each ventral, 25 in the tail, 15 in the first dorsal. This is a very handsome fish, especially when it has lived in pure clear water; it sparkles with gold-yellow and green, intermixed with stripes of black; and the beauty is heightened by the contrast of its beautiful red fins. The aperture of the mouth is wide;

the jaws of nearly equal length, armed with little sharp teeth; there are also small teeth in three different parts of the roof of the mouth, and in four different places in the gullet. The tongue is short and smooth; the nostrils double, and not far from the eyes; in front of the nostrils are two small apertures, the use of which is not known. The eyes are large; the pupil is black; the iris bluish, edged with yellow within. The covers of the gills are furnished with very small scales; the upper plate is jagged, and armed with small prickles towards the belly; the aperture of the gills is wide. The back is round; there are six bands or stripes on each side, of different lengths; and more of them in old fish. The scales are hard, and strongly fixed to the skin. The belly is broad, and white; the anus is nearer to the tail than to the head. The pectoral fins are of a reddish colour; the ventrals, anal, and tail, are of a deep red; and the dorsals violet; the first dorsal has a black spot at the extremity, and the rays are hard; in the other fins the rays are soft, simple in the dorsals, branched in the rest.

As this fish is found in most parts of Europe, the ancients were acquainted with it; and among them it was deemed one of the first delicacies of the table. Rondeletius, and after him Gefner, blames the physicians in his time for ordering the river-perch to their patients in febrile disorders, after a prescription of Galen, who meant the sea-perch, a fish much lighter, as he alleges, and easier of digestion. Experience, however, has shown that this distinction is made without a difference; both the sea and river kind being found equally palatable and salubrious. In the time of Willughby this prejudice against the river-perch had been forgotten. It lives in fresh water, whether stagnant or running. Its length is sometimes two feet; its common weight from three to six pounds; sometimes in England they have been known to weigh nine pounds, but this is very rare; in Lapland and Siberia they attain however a very considerable size; in a church in Lapland is preserved the dried head of a perch which is almost a foot long; so that the fish must have been at least six feet long. According to Falck, this fish is also found in Russia, in Siberia, in the districts of the Kirgises and the Songoriches, in the rivers and fresh-water lakes, and also in such salt-water lakes of which the waters, when most salt, that is in summer, do not contain more than a drachm of salt to 12 oz. of water. In the fresh and salt lakes of the districts of Ifette, Ischmia, and Baraba, they are found in plenty, where they grow only about a hand's breadth long, and are rather bitter to the taste; the fishermen gut them, and dry them well in the air and sun, having first wrapped them in branches of willow. Falck saw many at Baraba and Kamskoi in the open air, lying one over the other, but covered at top to defend them from the rain. They are then sold to certain traders who travel most of the year to buy dried fish, particularly pike and carp, which they sell retail in distant provinces. The perches fished up in the Rhine are much esteemed. There is an ancient proverb in Swisserland, which proves its agreeable and salutary qualities to have been long known in that country; and at Geneva they make a very delicate dish of the small perch they catch in the lake Lemane, which, when prepared after their manner, they call *mille cantons*.

This species spawns in April in shallow places, and in May in those which are deeper. Their mode of excluding their ova is singular: the female seeks for a pointed stick or something of that kind, and suffers it to enter the navel, and squeeze the ovary; after that she recedes, making a kind of wriggling motion till the ova are all excluded, which are inclosed in a common skin in form of a net; this skin, which is a perforated gut, is two inches thick, and two or three ells long, like the spawn of frogs: when examined through a microscope, four or five of these eggs are seen united by a hard skin, and the skin forms an angle where the eggs unite, so that they appear square or hexagonal; in the middle of each egg, is a little

J. Pass sc.

1. The Common River Perch. 2, 3. Scale of the Sea Perch.
 4. The Tontelton. 5. The Japan Perch.

the transparent bubble, round which is the yolk, and round that the white. In a perch of two pounds and three quarters weight, the ovary weighed seven ounces, and contained 258,800 eggs: according to the calculation of Harmer, a perch of only half a pound weight had 281,000 eggs, "an immense number," says Bloch; "but necessary for the preservation of a species continually exposed to the rapacity of so many of the inhabitants of the flood, and of which the eggs are so often lost, dispersed by storms, and devoured by aquatic birds: add to this, the male can never fecundate all these eggs, and many remain fastened together by a viscous matter, and those which lie underneath remain barren." But from later observations we may conclude, that the perch produces a much larger number of eggs still: Citizen Pictet of Geneva wrote to Cedepe, in Floreal, an 6. or May 1798, that he opened a perch caught in the lake of Geneva, which weighed about 650 grammes, or 1 $\frac{1}{2}$ lb. avoirdupoise: and that the ovary made about one-fourth of the whole weight, the number of eggs being 992,000. The perch spawns, like the pike, from the third year; and about that time, if opportunity serve, they leave the lakes to get into streams and rivers.

The perch swims as swiftly as the pike, remaining at a certain depth, which must be observed when this species is fished for with a bait. Like the pike, they devour their own species; and are so bold and heedless, that they sometimes lose their lives in seizing their prey: for the stickleback, when it feels itself caught, writhes about, and works its prickles into the mouth of the perch, which is thus left to die of hunger. Some indeed assert that the perch is as ravenous as the pike, and not so easily checked in pursuit of his prey. "I saw once in Mr. Hawes's subscription-water on the Lea, a perch chase some small fry that had gathered round the ground-bait, until, one small fish, in trying to escape, leaped on the shelving bank of the river out of the water. The perch immediately followed, and pounced his prey on dry land, not deterred by the presence of myself and another person. The perch weighed about two pounds." Sporting Mag. Nov. 1822.—And Walton calls the perch "a fish of prey, that, like pike and trout, carries his teeth in his mouth; he dares venture to kill and destroy several other kinds of fish."

The perch is subject to a peculiar malady under the ice: the body is swelled, and, if fished for at this time in deep lakes, a sort of wedge-shaped bladder comes out at the mouth; but, when taken out of more shallow water, this bladder is found at the navel. Bloch examined several in this condition; he found that this bladder was nothing but the skin of the mouth which came away; so that fishermen are greatly deceived who suppose that the air-bladder thus comes out of the body, for this fish has properly no air-bladder, but instead thereof a thin skin which goes from one side of the ribs to the other.

The flesh of the perch is white, firm, and well-tasted; and, not being fat, furnishes good food for weak stomachs. With its skin a very good glue is prepared, which the Laplanders use in gluing their bows. As this glue serves many good purposes, it may not be amiss to speak of the manner of preparing it. The Laplanders make it as follows: they tear the skin from the largest perch, and dry it; then soften it again in cold water, that the scales may be rubbed off; commonly they take four or five of these skins at once, and put them in a reindeer's bladder, or wrap them in birch-bark, that they may not touch the water; they put the skins into a pot with boiling water, laying a stone on them to sink them to the bottom, and thus keep them boiling for an hour; when soft and slimy, they are drawn out, and plastered over the wood their bows are made of. It is evident, that, with a little change in the process, it would be easy to have this glue in pieces, like ours. Perch, if kept in ponds, should be by themselves, for they will devour the young of any other fish; they may be fed by throwing in fish of small value among them: a pond might

also be stocked by means of the spawn, as has been proved by experiment.

β. Linnæus and Pennant make a variety of the hunch-backed perch; but Bloch is of opinion that the bending of the back-bone is owing to accident, and cannot constitute any distinguishing character. The species however varies in the number of transverse stripes on the body: Johnson saw some with 12, Aldrovandus and Willughby with 9, Sheffer with 8, Cedepe with 7, Pennant with 4, Marigli and Bloch saw some without any: the usual number is 6, as represented on the annexed Engraving, at fig. 1.

2. *Perca Americana*, the American perch: red; 13 rays in the second dorsal fin. There are 9 rays in the first dorsal, $\frac{3}{5}$ (printed by mistake $\frac{3}{7}$ in Gmelin and Turton) in the second, 15 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{2}{1}$ in the anal, and 18 in the tail. (The upper small figures denote the spinous rays.)

The name of this species shows its country: it lives in the brackish waters of North America; that is, in the mouths of rivers or lakes communicating with the sea. It resembles the preceding; but the back is flatter, there are no transverse stripes, nor any spot at the extremity of the first dorsal fin. The lower lip, throat, membrane of the gills, and upper edge of the opercula, are of a beautiful red. There is one spine in the second dorsal fin; but in general in this genus, the first dorsal consists of spinous rays, the second wholly of articulated ones.

3. *Perca lucioperca*, the pike-perch, or sander: fourteen rays in the anal fin, and $\frac{2}{3}$ in the second dorsal. There are 7 rays in the membrane of the gills, 15 in the pectoral fin, 7 in the ventral, 22 in the tail, 14 in the first dorsal, and 23 in the second. This fish resembles the pike in its long body and strong teeth, and the perch by its hard scales and blackish rays; hence the name. The head is long, without scales, and ends in a blunt point; the mouth is wide; the upper jaw protrudes a little, and each jaw has forty teeth of different sizes. There are teeth also in the palate and throat. The pupil of the eye is dark brown, the iris brownish red; and it is remarkable that the eye has a cloudy aspect, like a man afflicted with a cataract. The back is round, with spots of dark-blue and reddish colour; the sides are silvery, and the belly white. The pectoral fins are yellowish, the others of a whitish cast; the tail is bifurcated, and the dorsals are spotted with black.

This excellent fish is found in Germany, Russia, and Hungary; and, as it delights in clear deep waters, it is taken mostly in those lakes which have a bottom of sand or clay, and communicate with running streams: those caught at Plantensee in Hungary are sent to Vienna as a rarity, for presents to the nobles of that city. According to Falck, this species is found in all the fresh-water lakes and great rivers of Russia. They grow three or four feet in length; and in the Danube sometimes weigh 20lbs. or more. They are voracious, and commonly rest at the bottom of the water. They thrive best in ponds where there are smelts, which the sander easily makes his prey, because they likewise haunt deep places. The ovary of a sander of three pounds weighed four ounces and a half towards the end of December: the ova were very minute; the 128th part of an ounce contained 618, making in the whole 355,986 eggs. This species seems not very tenacious of life, but will die in warm weather soon after being taken out of the water, and even when put into water-tubs for transportation; so that, when they are to be moved from place to place, they should be kept in constant motion, and a cold season should be chosen: but the best way to breed them in a distant part is to use the fecundated eggs, which must be carefully taken from the branches or stones, and carried in a vessel with a little water. They must be well fed if you want them to thrive: young fry of small value, such as rud, roach, &c. will answer the purpose; but smelts and gudgeons are the best. Though they yield not to the pike in voracity, they will not eat when kept in reservoirs, &c. therefore

if kept long they lose their flavour. The flesh in general is white, well-tasted, tender, and easy of digestion; and when fresh is good food for ailing people; in autumn, and in the spring before spawning, they are fattest. They are exported from Germany and Prussia, fresh, salted, and smoked, into different countries, and are reckoned good food. When sent away fresh, they pierce the tail, and, when it has bled sufficiently, the fish is packed up in snow or grass; if salted or smoked, it is put into tubs, being prepared various ways.

4. *Perca Volgenfis*, the Volga perch: colour gold green; 23 rays in the second dorsal fin. The first dorsal fin 13 rays, 14 in the pectorals, 6 in the ventrals, 15 in the tail. Cedepe regards this as a variety of the preceding; Gmelin considers it an intermediate species between the preceding and the river-perch, or perhaps as a hybrid race produced from both. It was first described by the celebrated Pallas. Inhabits chiefly the Volga and neighbouring rivers. Body with six transverse interrupted black bands, scales large and rough, iris silvery; two large teeth at the tip of the lower jaw, dorsal fins with five bands, the rays strong and rigid.

5. *Perca zingel*, the zingel: the upper jaw protruded like a nose; 19 rays in the second dorsal fin. The pectoral fin has 14 rays, the ventral 6, the anal 13, the tail 14, the first dorsal 16. The head is large, flattened above and below; and, as well as the body, is armed with hard jagged scales which adhere very firmly. The back is round; the mouth is large, and opens downwards; the jaws and roof of the mouth are armed with sharp teeth; the tongue is hard, and loose; the upper jaw much longer than the lower. The nostrils are double, placed in the upper jaw, some way before the eyes; the pupil of the eye is black, encircled with a yellow iris. The aperture of the gills is wide, and the cover is only a single plate. The ground-colour of the fish is yellow, varied with brown stripes which go across, and between them are spots of the same colour. The belly is white. The rays of all the fins are yellow, and branched at the extremities, except those of the first dorsal, which are simple, and pointed; the tail-fin has a crescent-shaped furrow.

This species is natural to the southern parts of Germany; they are found in the different lakes and rivers of Bavaria and Austria, and even in the Danube; also in Russia, in the Volga, the Irtisch, and the rivers which run into them. They are from fourteen to sixteen inches long, and weigh two or three pounds. The flesh is white, firm, and easy of digestion; and is eaten by the gentry. They are fond of clear water, spawning in stony places in April and May. They are voracious, as may be seen by their teeth; the pike only will venture to attack them, on account of the hardness of their scales and the prickles which defend their back: thus it is not surprising that they increase very fast, in spite of their great enemy, man.

6. *Perca asper*, the smaller zingel: the upper jaw protruded; 13 rays in the second dorsal fin; body yellowish, with transverse black stripes. There are 7 rays in the branchiostegæ membrane, 13 in the pectoral fins, 4 in the ventrals, 11 in the anal, 18 in the tail, 8 in the first dorsal. The body is long; the head broad; the mouth, which opens downwards, is small, and crescent-shaped, with teeth scarcely visible: near the aperture of the mouth are the nostrils, which are double; those in front are round, and covered with a skin like the sucker of a pump; but the hinder ones are oblong, and without covers. The pupil of the eye is black, the iris white with a reddish border. One small piece forms the covering of the gills, as in the preceding; this is contrary to the generic character, and therefore the species is removed by Cedepe. The ground-colour of this fish is yellowish, with three or four black stripes running across. The back is round, and black; the belly white, short, and smooth. The fins are of a pale yellow. The body is covered with large, hard, rough, scales; the fish goes tapering off towards the tail, where it is not much bigger

than a quill. The lateral line is not far from the back, with which it keeps a parallel line. The anus is nearer to the head than to the tail-fin, which last is bifurcated. The rays of the fins are branched, except those of the first dorsal, which are single, and sharp-pointed.

This species is found not only in France in the Rhone, and in the lakes and rivers of Bavaria, but also in the Volga and the Jaik. It grows to the length of eight inches, and lives in clear water. The ova are small and whitish. The spawning-time is in March, when they are caught in great quantities; after this they retire to the depths; they are also taken in winter from under the ice. They live on worms and insects: in seeking for these in the clay, they often swallow pieces of the clay, which in some of the rivers they inhabit is mingled with particles of gold, which being found in their stomachs has caused it to be said that in certain countries they fed upon gold. Their flesh is wholesome and well-tasted: and they are brought to the tables of the great. As they are hardy, they may be easily transported into other waters; spring and autumn are the most proper time.

Gesner, Aldrovandus, and Jonston, consider this as only a variety of the preceding species; and, as it agrees with that in many respects, we have given it the name of the smaller zingel. But it differs in the following particulars: 1. The zingel weighs two or three pounds; this species seldom more than an ounce or an ounce and a half. 2. The head of the zingel is sharper, the mouth larger. 3. The tail of the zingel is thicker, shorter, and less round, than in this species. 4. The zingel has fifteen rays in the first dorsal fin and nineteen in the second: this species has only eight in the first and thirteen in the second. 5. The zingel has the end of the tail-fin blunt or rounded at the extremity: this species has it sharp. 6. The zingel is of a lighter colour. 7. The zingel has 48 vertebræ, and 22 ribs on each side; this species 42 vertebræ, and 16 ribs on each side.

7. *Perca labrax*, (*P. punctata*, Gmel.) the bass: scales small; fourteen rays in the second dorsal fin; back dusky tinged with blue, belly white. The membrane of the gills contains 5 rays, the pectoral fin 18, the ventral 6, the anal 14, the tail 20, the first dorsal 9. The body is long; the head tapers off almost to a point: having a wide mouth and broad lip-bones, this species somewhat resembles the salmon, and the Germans have given it that name. The jaws are of equal length, and the teeth short and sharp; the palate and throat are rough like a file. The nostrils are double, separated by a membrane. The eyes are high in the head; they have a black pupil, a red iris, and a nictating membrane. The back is of a brownish colour, sides and belly white; the anal and dorsal fins are reddish, the tail blackish. It is found in the sea of Greece, since the Grecian naturalists describe it; also in England, and in several parts of France, Italy, Sardinia, and Malta. It grows to a large size: Rondeletius says three ells in length, Willughby says about fifteen pounds weight; Duhamel says, that at Noirmoutier in France there are caught some of thirty pounds. This fish is distinguished by an uncommon degree of voracity, and hence was termed *lupus*, a wolf, by Ovid, a name generally adopted by succeeding writers. In the salt-water pools of Italy, it sometimes weighs fifteen pounds; and the flesh is extremely grateful to the taste. In the lakes they are frequently found by the fishermen frozen to death, as they suppose, but more probably suffocated by the exclusion of the air from the surface of the water; a circumstance from which Willughby takes occasion to caution those who keep them in ponds to break the ice frequently during the continuance of frost. This species inhabits indiscriminately lakes, rivers, and the sea; to the former, however, they probably ascend from the sea, for they do not seem to breed in fresh water. They are usually found near the surface of the water, especially at the mouth of a stream emptying itself into the sea. They are delicate eating, and were highly prized by the Romans, especially if caught in the Tiber, and more particularly

ticularly under the bridges of Rome. They are still much esteemed at Venice. Being very greedy, they are easily caught with a bait; and may be taken with nets all the year round, but chiefly in the months of August, September, and October. According to Aristotle, this species spawns in summer and in winter; but the summer spawn is the best; they deposit their ova at the mouths of rivers.

8. *Perca alburnus*, the whiting-perch: dorsal fins unarmed; 3 rays in the membrane of the gills, tail-fin entire. In the first dorsal fin $\frac{1}{8}$ rays, $\frac{1}{4}$ in the second, 22 in the pectorals, $\frac{1}{2}$ in the anal, and 19 in the tail. Observed by Catesby and Dr. Gardner in the sea at Carolina. It is remarkable for having only one short spine in the first dorsal fin, that fin being generally made up of stiff rays. There are five or six excrescences on the lower jaw; the tail is a little forked. Colour of the body light brown, with darker bands; length one foot or more. The gill-coverts are obscurely serrated. Body oblong. In the figure given by Catesby, (ii. 12. f. 2.) the second dorsal, which is described by Bloch to consist of 24 rays, is entirely omitted; and the fish has no appearance of belonging to this genus.

9. *Perca pusilla*, the little perch: body oval, compressed, rough; only an inch and a half long. Six rays in the membrane of the gills, 9 in the first dorsal, 23 in the second, 14 in the pectorals and tail, $\frac{1}{2}$ in the ventrals, and $\frac{3}{4}$ in the anal. Inhabits the Mediterranean sea; first described by Brunnich. The surface of this pretty little fish shines with the splendour of rubies set in silver. The back is raised; irides white: the head is armed with large prickles, snout pointed, lower jaw longest, and very rough beneath. The ventral spine is very strong, and serrate on the anterior edge.

10. *Perca loubina*, the Cayenne perch: jaws rounded in front, and furrowed, the lower much the longest; gill-cover 2-spined; scales rhomboidal, and ciliated; lateral line visible upon the tail-fin. Six rays in the membrane of the gills, 8 in the first dorsal fin, $\frac{1}{4}$ in the second, $\frac{3}{4}$ in the anal, 16 in the pectorals, $\frac{1}{2}$ in the ventrals, and 21 in the tail.

Transmitted from Cayenne to France by Citizen Le Blond; *loubine* is its name in that country. The third piece of each operculum terminates in a long membranous appendage. In the furrowed parts of the jaws there are no teeth, but the other parts and front of the palate are full of very small even teeth. The head, body, and tail, are long, and compressed.

11. *Perca Novæ Britannæ*, the Utopian perch: two spines in the second piece of each operculum; colour reddish, with 14 longitudinal stripes, alternately brown and white, upon each side. Seven rays in the membrane of the gills, 10 in the first dorsal, $\frac{1}{3}$ in the second, $\frac{1}{2}$ in the anal, $\frac{1}{2}$ in the ventrals, 14 in the pectorals, and 20 in the tail. Observed by Commerçon at Port Praslin in July 1768. Length a foot; haunts the coral and madrepora on the shores of New Britain; is good food. Fins yellow and red; a number of raised lines and stripes on the head, like carved-work. The upper lip is moveable; teeth small, like a file, in both jaws; a semicircular indented bone over each eye. The first dorsal fin is edged above with purple, below with red; a purple spot on the anal.

12. *Perca triacantha*, the three-spined perch: three spines in each piece of each operculum; lower jaw longest; scales small, and raised; tail rounded; colour dark, with eight longitudinal white stripes. Six rays in the membrane of the gills, and in the first dorsal fin, 14 in the second, 9 in the anal, 16 in the pectorals, $\frac{1}{2}$ in the ventrals, and 19 in the tail. This and the two following were first described by Ceppe from the Dutch collection brought to Paris during the war, but probably restored at the peace of 1815. Of the present species the upper lip is double; several rows of small sharp teeth in the jaws, tongue, palate, and at the entrance of the gullet.

13. *Perca pentacantha*, the five-spined perch: five spines in the first dorsal fin, two or three to the last piece of each operculum; lower jaw longest; scales very small; tail rounded; lateral line with several sinuities; one white stripe along the back, and four along each side. Seven rays in the membrane of the gills, 14 in the second dorsal, 10 in the anal, 14 in the pectorals, and 15 in the tail. The upper is retractile; teeth very small.

14. *Perca Fourcroy*, the scaly-finned perch: scales on the base of the dorsal, pectoral, and tail, fins; tail spear-shaped; one spine to the second piece of each operculum; scales rounded and toothed. Six rays in the membrane of the gills, 10 in the first dorsal, 23 in the second, $\frac{3}{4}$ in the anal, 17 in the pectorals, $\frac{1}{2}$ in the ventrals, and 17 in the tail. Snout long; upper lip double, and flexible; a longitudinal furrow on the head; eyes large, teeth very small.

15. *Perca lophar*, the lophiar: silvery; ventral fins connected. Seven rays in the first dorsal fin, 27 in the second, 16 in the pectorals, $\frac{1}{2}$ in the ventrals, $\frac{3}{4}$ in the anal, and 17 in the tail. Caught in the Propontis, near Constantinople; size and shape of a herring; back greenish-brown; head with elevated grooves placed longitudinally between the eyes; anterior gill-coverts serrate only at the sides; rays of the first dorsal fin hardly spinous, the other and anal very fleshy at the anterior base; ventrals connected by means of a ridge upon the belly; tail forked, the rays blackish at the tips.

16. *Perca Arabica*, the Arabian perch: silvery, with 16 or 17 longitudinal black lines on each side; a golden spot, black in the middle, on the tail. Six rays in the first dorsal fin, $\frac{1}{4}$ in the second, 14 in the pectorals, $\frac{1}{2}$ in the ventrals, $\frac{3}{4}$ in the anal, and 17 in the tail. Inhabits Arabia, as its name imports. Body oblong lanceolate, truncate, beneath without spots or lines; scales lax, broad, deciduous, denticulate, disposed in about ten rows. Crown flat; iris yellow; between the eyes a ridge, obtuse on the fore part and forked behind; behind the eyes are three elevated bones. Teeth long, subulate, straight, remote; in each jaw on each side three, the middle one larger; and in the middle of the lower jaw are two stronger remote ones; lips nearly equal; palate covered with setaceous teeth; tongue flat, smooth. Anterior gill-coverts slightly serrate at the hinder angle and beneath only. Dorsal fins remote; the first brown, all the rest yellowish-brown; dorsal, ventral, and anal, triangular, pectoral lanced; tail bifid, the segments lanceolate.

17. *Perca skibea*, the skip-jack: three notches in each operculum; lower jaw the longest, tail much forked. There are 7 rays in the membrane of the gills, 7 in the first dorsal fin, 24 in the second, 15 in each pectoral, 6 in each ventral, 26 in the anal which is adipous, and 18 in the tail. Observed by Bosc near the mouths of rivers in Carolina; it is a rare species. It can dart pretty far out of the water. The flesh is well tasted. In each jaw there is a row of flattened teeth, nearly equal, distinct. The second dorsal is longer than the first, almost equal to the anal, which last is so fat that the rays can scarcely be counted. This fish is green on its upper surface, silvery beneath; irides yellow; pectoral fins yellowish, with a black spot at the base. This and three following are from Ceppe: the present species was communicated by M. Bosc to that gentleman, who calls it *Pomatofus*; *poma* in Greek signifies the gill-cover, and *tomus*, an incision; because the opercula are deeply cut in.

18. *Perca edentula*, the toothless perch: no teeth; scales rounded; tail crescent-shaped; opercula not serrated. Seven rays in the membrane of the gills, 10 in the first dorsal, which is of a triangular shape, 32 in the second, 14 in the anal, 13 in the pectorals, 6 in the ventrals, and 16 in the tail. This was also communicated by Bosc, who saw it at Carolina, where it is called *yellow-tail*. From the opercula not being serrated, Ceppe has made it a distinct genus, *Leiofostomus*, which in Greek signifies "smooth or toothless mouth." The fins are all yellow or yellowish,

fish, and dotted with black. The upper surface is silvery brown, the under parts silvery white. The eyes are large; irides yellow; the nostrils double; the end of the snout blunt; head, body, and tail, compressed. Length four inches, height one and a half. It is pleasant food; found in the fresh-water rivers of Carolina, in North America.

19. *Perca fasciatus*, the banded perch: tail straight; colour brown and white, with seven or eight transverse brown stripes or bands; opercula very little serrated.

20. *Perca perculus*, the round-tailed perch: tail rounded; 27 rays in the second dorsal; colour greyish, with eleven or twelve oblique lines upon each side. The brown-grey of the body is shaded with white on the belly. The ventral fins are yellowish; anal and pectorals variegated yellow and brown; the irides are brown above, silver or gold on the rest of the surface.

21. *Perca Nilotica*, the Nile perch: the dorsal fins hardly distinct; tail entire. Eight rays in the first dorsal, $\frac{1}{2}$ in the second, 14 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{1}{3}$ in the anal, and 15 in the tail. Inhabits the river Nile and the Caspian Sea.

II. Dorsal Fin single. Tail undivided.

22. *Perca undulata*, the undulated perch: dorsal fins hardly united; body brown, waved; a brown spot at the pectoral fins. Ten rays in the first dorsal fin, $\frac{2}{3}$ in the second as far as they can be distinguished, 18 in the pectorals, $\frac{1}{2}$ in the ventrals, $\frac{1}{2}$ in the anal, and 19 in the tail. Inhabits Virginia and Carolina, where it is called the *croker*: the scales are red; the eyes gold-colour; the gullet is wide, and there are several rows of little teeth in the jaws. Length three feet. Five short teeth in the anterior gill-covert. Tail red, "and entire," says Gmelin; but Catesby describes it otherwise.

23. *Perca ocellata*, the ocellated perch: dorsal fins hardly united; a black ocellate spot encircled with white at the base of the tail. Ten rays in the first part of the dorsal fin, $\frac{1}{2}$ in the second, 16 in the pectorals and tail, 6 in the ventrals, $\frac{1}{8}$ in the anal. Noted at Carolina by Dr. Garden; called there the *teffe*. The first ray of the dorsal and ventral fins very short.

24. *Perca argus*, the argus perch: silvery bluish, with numerous ocellate brown spots. This species, which is added by Turton, though he does not say from what source, grows to about the length of a foot, and is a very beautiful fish. The spots on the body are white in the centre; those on the head, pectoral and ventral fins, smaller, without the white centres.

25. *Perca marina*, the sea-perch: red, with 7 transverse dusky lines on the sides; a black spot on the gill-coverts; dorsal spines 15. In the dorsal fin $\frac{1}{2}$ rays, in the pectorals 19, ventrals $\frac{1}{2}$, anal $\frac{1}{4}$, tail 14. This is caught in the Mediterranean Sea, about Norway, and in other European seas; a foot in length. Head large, deformed; snout long and pointed; teeth small, numerous; strong spines on the head and gill-coverts. Eyes large. It is good food. The dorsal, anal, and tail, fins, are often yellow with darker spots; and sometimes there are red lines on the pectorals. On the annexed Plate, at fig. 2. is shown a scale of the sea-perch of the natural size, and the same magnified at fig. 3. from Adams's Essays on the Microscope.

26. *Perca scandens*, the climbing perch: dorsal fin with $\frac{1}{2}$ rays; scales rough, with a whitish denticulate edge. Twelve rays in each pectoral fin, $\frac{1}{6}$ in the ventrals, $\frac{1}{8}$ in the anal, and 17 in the tail. This species was discovered at Tranquebar in Nov. 1791, by Lieut. Daldorff, and is described in the Linnæan Transactions, vol. iii. p. 62. It has the very singular faculty of climbing up trees by means of the spines on the opercula and the spinous rays of the dorsal and anal fins, aided by the motion of the tail. It was observed in a cleft in the bark of a fan-palm more than six feet above the rivulet; and when disturbed began to mount higher with apparent facility; when taken down it crawled along upon the sand, and lived

more than four hours out of the water. The body is covered with a black slimy mucus, which is very abundant on the opercula; and the natives of Tranquebar think the wounds made by the opercular spines very dangerous, probably on account of the introduction of some drops of that mucus, which they suppose to be poisonous. The upper surface is dusky green, lighter on the sides, pale golden beneath. Length one palm. Mouth toothed each side before the lips; front porous, the scales with an entire edge. Eyes lateral, flat; pupil large, black, iris shining golden. Gill-coverts scaled, spinous, the middle spines longer. Dorsal and anal fins, when folded, hid in a longitudinal cavity; pectorals oblong, obtuse; ventrals somewhat connected, reddish; tail a little rounded; the rays bifid.

27. *Perca nobilis*, the handsome perch: body silvery with eight brown bands. In the dorsal fin $\frac{1}{2}$ rays, pectorals 15, ventrals $\frac{1}{4}$, anal $\frac{1}{2}$, tail 17. Inhabits North America. The spinous rays of the dorsal fins are silvery at the sides; the orifices of the nostrils are at the end of a kind of tube or cylinder.

28. *Perca polymna*, the tonleton: brown, with three white bands, the middle one passing through part of the dorsal fin. There are six rays in the membrane of the gills, 16 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{1}{2}$ in the anal, 14 in the tail, and $\frac{1}{2}$ in the dorsal. The head is small, declining, and covered with little hard serrated scales. The mouth is narrow; the jaws of equal length, and armed with a number of small teeth, the longest in front. The tongue and roof of the mouth are smooth; but there are two bones in the gullet with teeth like a file. The nostrils are single, and round; the pupil of the eye black, the iris blue. On the inner side of the front operculum is a single gill, and there is a furrow in the edge of the hinder one; this last is much more serrated than the former; the aperture of the gills is wide, and the membrane loose. The trunk is broad; the back sharp, the belly round. The lateral line is interrupted near the end of the dorsal, and appears again in the middle of the tail. The ground colour is a light brown, making an agreeable contrast with the three white stripes edged with black. The rays of the ventral and pectoral fins are branched, except the prickly rays; the soft rays of the other fins are bifurcated. It is a small fish; native of the East Indies and South America. See the Plate, fig. 4.

β . There is a variety of this species, which differs in the following particulars only: It is longer; the fins are edged with black, and are partly ash-colour; the middle band has a double border, black and white; and the lateral line is continued without interruption.

29. *Perca merra*, the Japan perch: body white, with numerous brown spots; lower jaw longest; the posterior gill-covert spiny; tail-fin rounded. The membrane of the gills has five rays, the pectoral fins 15, the ventrals $\frac{1}{2}$, the anal $\frac{1}{4}$, the tail 16, the dorsal $\frac{1}{2}$. The body is long, the head sloping; the jaws are armed with short and pointed teeth, of which the two in front are the longest; the tongue is smooth and at liberty, the palate is exasperated with little teeth. The nostrils are single, and nearly mid-way between the mouth and eyes; the pupil is bluish in a silvery iris. Under the front operculum appears the single gill; three spines distinguish the second. The gills have a wide aperture, and the membrane is for the most part at liberty. The scales are very small, hard, and serrated. The spots are brown, lighter towards the belly, and nearly round. The back is brown, the belly white, the fins transparent, and covered with spots similar to those on the body and head; there is a furrow on the back to receive the dorsal fin. The sea of Japan produces this fish, where it is called by the natives *ikan merra*, which specific name Bloch has preserved in his new genus of *Epinephelus*, or wall-eye. This fish is represented at fig. 5.

30. *Perca cottoides*, the bull-head perch: two dotted lines across all the fins. In the dorsal $\frac{1}{2}$ rays, in the pectorals 14, ventrals $\frac{1}{2}$, anal $\frac{1}{2}$, caudal 12. Brown spots, almost

 9. The Red-spotted Sea Perch. 10. The black-tailed Sea Perch.

almost round, all over head, body, and fins. Inhabits India.

31. *Perca Philadelphica*, the Philadelphia perch: a black spot in the middle of the dorsal fin; scales and gill-covers ciliate. In the membrane of the gills $\frac{7}{8}$ rays, in the dorsal fin $\frac{19}{21}$, in the pectorals 16, ventrals $\frac{1}{6}$, anal $\frac{3}{10}$, tail 11. Observed in North America by Dr. Garden. The body is spotted and barred with black; beneath red. Hinder gill-cover sharpened to a point; two first rays of the dorsal fin short.

32. *Perca palpebrofa*, the eyelid perch: a brown spot upon the eyelids; lateral line curved. In the dorsal fin $\frac{13}{13}$ rays, pectorals 15, ventrals $\frac{1}{6}$, anal $\frac{2}{11}$, caudal 17. This is a small American species.

33. *Perca atraria*, the black perch: body black; fins spotted with white. In the dorsal fin $\frac{20}{21}$ rays, 20 in the pectorals, 7 in the ventrals, 26 in the anal, 20 in the tail. Inhabits Carolina, where, according to Dr. Garden; it is called *black fish*. The anterior piece of the gill-cover is denticulate, the posterior ciliate; the lateral line straight; whitish lines, as well as spots, on the dorsal fin.

34. *P. chrysoptera*, the gold-finned perch: the lower fins gold-yellow spotted with brown. In the dorsal fin $\frac{12}{12}$ rays. Observed at Carolina by Catesby and Garden. The head is long, and entirely covered with small scales; mouth small; lower jaw longest; one row of sharp bent teeth in each. Gill-covers very finely toothed; lateral line straight, back rounded and raised.

35. *Perca Mediterranea*, the Mediterranean perch: all the fins tawny except the dorsal; a black spot on the pectorals. In the dorsal fin $\frac{12}{12}$ rays, pectorals and tail 13 each, ventrals $\frac{1}{6}$, caudal $\frac{1}{3}$. Inhabits the Mediterranean. Body green, with dusky lines parallel with the lateral line on the upper part, those on the lower part broader, and fine blue; about a span long; compressed, oblong. Head above naked, with transverse and wavy blue lines; iris golden, with a circle of blue in the middle. Dorsal fin filamentous, the hind part higher.

36. *Perca vittata*, the lined perch: five white and brown transverse lines, nearly equidistant, on the body. In the dorsal fin $\frac{13}{13}$ rays, in the pectorals 18, ventrals $\frac{1}{6}$, anal $\frac{2}{2}$, tail 16. Inhabits America; the second spine of the anal fin very strong.

β . There is a variety, with the lines on the body widened into bands; which inhabits Japan, and is about eight inches long.

37. *Perca punctulata*, the dotted perch: small blue spots on the body. There are 10 rays in the pectoral fins, $\frac{1}{6}$ in the ventral, $\frac{3}{3}$ in the anal, 14 in the tail, and $\frac{2}{2}$ in the dorsal. The head is free from scales as far as the eyes; the mouth large; the jaws armed with very small teeth; the bones of the lips are large. The eyes are oval, almost vertical; the pupil is black and blue, the iris yellow. The opercula are not jagged; the membrane is in great part loose. The scales are large; the lateral line nearly straight, but nearer to the back than to the belly; the anus is nearer the tail than the head. The fins are rounded. This beautiful species is found in both Indies. Plumier observed it at the Antilles, Catesby at Carolina, and Valentine at the Moluccas. It grows as large as the river-perch, and tastes like it. Its fine silvery ground is lost in red towards the back; and the small light-blue spots, or dots, form a pleasing variety. It is represented on Plate II. at fig. 6.

38. *Perca guttata*, the hind, or bloody perch: red spots on a red ground. The pectoral fins have 10 rays, the ventrals $\frac{1}{6}$, the anal $\frac{2}{2}$, the tail 15, the dorsal $\frac{1}{5}$. The head is large, and without scales as far as the opercula. The mouth is wide; the jaws of an equal length, and armed with sharp teeth. The eyes are oval, and near the top of the head; pupil black, iris gold-colour, with red spots. The opercula are large, smooth, and the hinder one ends in a blunt point; the aperture is very large, and strong rays support the membrane, which is in part loose. The belly is convex; the anus nearer the

tail than the head. The lateral line runs nearly straight through the middle of the body. The scales are pretty large. The fins are rounded; their soft rays ramified. The whole body is red; and the spots of a darker red have a fine effect. This species is found in the waters of both Indies: Catesby saw it at the Bahama islands, Plumier at the Antilles. It grows two feet long, haunting shallow places. Its flesh may be eaten. The scales are of a singular appearance under the microscope: at fig. 7, we have given one of the natural size, and, at fig. 8, greatly magnified, from Adams.

39. *Perca bimaculata*, the acara: two round black spots upon each side. The pectoral fins have 14 rays, the ventrals $\frac{1}{6}$, the anal $\frac{2}{2}$, the tail 15, the dorsal $\frac{1}{5}$. The head is sloping, compressed, and without scales as far as the opercula, which are smooth. The pupil of the eye is black, inclosed in a golden iris. The body is broad; the anus is nearer the tail than the head. The lateral line is somewhat bent, and runs nearer the back than the belly; the belly is silver-coloured, the back brown. The spots which form the specific character, lie one of them over the pectoral fin, the other over the tail-fin. The fins are of a brown colour; tail rounded. This species is found in the rivers of Brazil; it does not exceed nine inches in length; and is good eating.

40. *Perca Brasiliensis*, the Brazilian perch: oval black spots upon the lateral line. The pectoral fins contain 12 rays, the ventrals $\frac{1}{6}$, the anal $\frac{2}{2}$, the tail 16, the dorsal 23. The body is long; snout blunt; jaws of equal length, armed with little sharp teeth; nostrils single, and very near the eyes; the pupil of the eye is black, the iris yellow and white. The opercula and body are covered with small, hard, silvery, scales. The belly is long, and the anus is much nearer the tail than the head. The back is round, and bluish; the sides and belly silvery, the fins gold-yellow. The dorsal, pectoral, and tail, fins, have soft rays only. This species is also found in the streams of Brazil, growing to the length of seven or eight inches; it is good food, and easy of digestion.

41. *Perca maculata*, the spotted perch: red spots on a white ground. The pectoral fin has 12 rays, the ventral $\frac{1}{6}$, the anal $\frac{2}{2}$, the tail 12, the dorsal $\frac{1}{4}$. The body is long, laterally compressed, and covered with large silvery scales. The aperture of the mouth is large, and the lower jaw is the longest; they are armed with small teeth; the lip-bones of the upper jaw are very large. The nostrils are double, and very near the eyes; the eyes are almost vertical, having a black pupil with a blue-and-red iris. The opercula are not serrated; the posterior piece ends in a point, but soft. The head is bare of scales, as far as the opercula. The fins are rounded. This species is found in the Atlantic Ocean, near the Antilles.

β . Of this species there is a variety, which has the white ground intermingled with brown or black, and a dot of darker red in the centre of each red spot.

42. *Perca scriba*, the written perch: zigzag marks, like writing, on the head; pectoral and tail fins yellow. In the dorsal fin $\frac{10}{10}$ rays, in the pectorals 13, ventrals $\frac{1}{6}$, anal $\frac{2}{2}$, tail 15. Its country is not known.

43. *Perca gigas*, the giant perch: three feet long; body clouded; 3 spines in the gill-cover, 11 in the dorsal fin, which consists in the whole of $\frac{1}{1}$ rays. In the pectoral fins 16, ventrals $\frac{1}{6}$, anal $\frac{2}{2}$, caudal 15. This has gained the name of *gigas* from its size; it is not however so large as the *fasciata*, or white-banded perch, which we shall describe by and by. The present species inhabits the Mediterranean. Body oval, compressed at the sides, whitish-yellow with dusky-brown waves. Head naked on the fore-part, beneath red; iris pale yellow. Mouth large; teeth in the palate and gullet, the four upper fore-ones larger and conic; lips simple; tongue large, smooth. Lateral line dusky, parallel with the back and gradually curved; vent nearer the tail. Dorsal fin filamentous, the seventh ray shorter; pectorals rounded, red on the outside.

44. *Perca rogaa*, the red-and-black perch: reddish-black; tail equal; fins black; gill membrane dusky red. In the dorsal fin $\frac{9}{8}$ rays, pectorals 18, ventrals $\frac{1}{6}$, anal $\frac{1}{3}$, tail 14. Inhabits Arabia, among coral and madrepora; more than two feet long; crown convex, sloping between the eyes; iris black without, then yellow, and blue within; lips broad, very obtuse, the upper shorter and protractile; teeth numerous, setaceous, with frequently two strong remote fore teeth; before the nostrils a small cirrus. Gill-covers scaly, the posterior three-toothed; shoulders gibbous; lateral line not visible. Fins obtuse; dorsal filamentous; ventrals rounded.

45. *Perca lunaria*, the lunular perch: body rusty-black; pectoral fins black, behind yellow; dorsal and caudal behind pale hyaline; a lunular spot on the tail. Rays of the fins as the preceding, which this species resembles much. Inhabits Arabia. Ventral fins obversely triangular, black, and like the anal and dorsal with a dusky-red stripe towards the outer edge, the latter white at the posterior edge; tail with a hyaline lunule, and behind this reddish.

46. *Perca tauvina*, the small-scaled perch: body oblong-linear, brown with rusty-black dots; tail rounded; scales small, denticulate. In the dorsal fin $\frac{11}{8}$ rays, pectorals and tail 17, ventrals $\frac{1}{6}$, anal $\frac{1}{2}$. Inhabits Arabia, among coral and madrepora; not very good food. Head wedged, sloping from the crown; teeth small, remote, nearly equal, rigid, with a canine tooth in each jaw on each side; gullet and base of the tongue covered with teeth; lips obtuse, the upper shorter, retuse. Anterior gill-covert denticulate behind, posterior three-spined. Lateral line parallel with and nearer the back. Fins rusty-black with darker spots, the hinder edge whitish; pectorals and ventrals nearly equal.

47. *Perca fasciata*, the white-banded perch: red, with broad whitish transverse bands. Seven rays in the membrane of the gills, in the dorsal fin $\frac{11}{8}$, pectorals and tail 17, ventrals $\frac{1}{6}$, anal $\frac{3}{2}$. In Gmelin and Turton, the rays of the pectoral fins are mis-printed 7. This is larger than the *gigas*, being upwards of a yard long. Jaws equal, with two strong conical teeth in each, besides several rows of very small setaceous teeth in the upper, and one in the lower. Inhabits the Red Sea; scales small. Head large; eyes large, approximate, separated by two longitudinal furrows; iris greenish-rufous; lips rounded, obtuse, equal. Anterior gill-covert slightly toothed behind, posterior pointed, spinous. Pectoral fins on short pedicels, nearly connected by a membrane; lateral line nearer the back.

48. *Perca miniata*, the red-and-blue perch: scarlet, covered with blue dots; tail rounded. In the dorsal fin $\frac{7}{4}$ rays, in the pectorals 17, ventrals $\frac{1}{6}$, anal $\frac{3}{2}$, tail 15. This and the following were observed by Forsskael among the coral near the shores of the Arabian sea. It feeds on fish; the scales are small, round, and striate; flesh good. Crown marked with the letter V before the eyes; iris red without, yellow within; nostrils round, simple, with a conic cirrus; lips very broad, obtuse, sprinkled with blue dots; the upper shorter, protractile; teeth setaceous, with two strong canine ones in each jaw. Gill-covers slightly ferrate behind. Fins all rounded behind, the ventrals only pointed, the anterior edge blue.

There are two other varieties. β . Of a brown colour with ocellate blue spots; called *belah* by the Arabs. γ . Bright red, with blue dots; called by the Arabs *nagen*.

49. *Perca sumnaria*, the speckled perch. Of this species there are three varieties.

α . Body ashy brown, covered with white specks; tail rounded. In the dorsal fin $\frac{11}{8}$ rays, 17 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{1}{2}$ in the anal, 15 in the tail. Resembles the last. There is an oblong black spot beneath the eyes on each side; iris brown; head and fins brown, dotted with white; tail short, with a black spot above.

β . *P. fusco-guttata*: body bluish, with brown dots; the dorsal fin with only 7 rays, which are all spinous, 18 in the pectorals and tail.

γ . *P. areolata*: whitish-ash, with yellowish-brown dots.

50. *Perca Sinenfis*, the Chinese perch: yellowish; tail oval; lower jaw shortest. In the dorsal fin $\frac{19}{8}$ rays, in the pectorals 18, ventrals $\frac{1}{6}$, anal $\frac{2}{3}$, tail 17. Inhabits China: resembles the river-perch, but is smaller. Mouth oblong, rounded; lateral line curved; tongue, palate, and fins, yellowish; dorsal reaching from the head to the tail, narrower in the middle.

51. *Perca picta*, the painted perch: three longitudinal stripes, somewhat bent; the first directed towards the middle of the dorsal fin, the second towards its extremity, the third towards the tail fin, which is rounded. In the dorsal fin, which is long and low, $\frac{19}{8}$ rays, $\frac{3}{6}$ in the anal, 14 in the pectorals, $\frac{1}{6}$ in the ventrals, 16 in the tail. The prevailing colour in this species is white; the upper part of the dorsal is dotted white and brown; the anal white, but black at the tip; tail white, with a black line on each side. Observed by Thunberg at Japan, in the sea.

III. Dorsal Fin single. Tail divided.

52. *Perca Ascensionis*, the red-and-white perch: above reddish, beneath whitish. Eight rays in the membrane of the gills, $\frac{11}{2}$ in the dorsal fin, 16 in the pectorals, 8 in the ventrals, 14 in the anal, and 26 in the tail. Found in Ascension Isle, in the Atlantic Ocean. Body narrow; scales rounded, and denticulate in front; both pieces of the gill-coverts serrate; the second dorsal spine serrate also.

53. *Perca louti*, the carmine perch: body oblong-lanceolate; colour carmine, with pale violet dots; hind edge of all the fins yellow. In the dorsal fin $\frac{7}{4}$ rays, 17 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{3}{2}$ in the anal, 15 in the tail. This species inhabits the Arabian sea, among madrepora and corals, and grows to the length of a yard. The scales are small, round, and striate, but not serrated. Crown naked, convex; iris carmine; nostrils simple, with a conic cirrus before them; lips obtuse, the upper shorter, and protractile; teeth setaceous, flexible, remote, conic, some of them stronger. Gill-covers scaly, the anterior very entire, posterior three spined behind; lateral line nearer the back, and not parallel; pectoral and ventral fins without spots, the former oval, the latter with a falcate angle; tail linear.

54. *Perca venenosa*, the red-spotted sea-perch: pectoral fins tipped with yellow; tail lunate; body dark green, with blood-red spots. In the dorsal fin $\frac{19}{2}$ rays, 12 in the anal, 20 in the tail. Inhabits America; scales small, and smooth. This beautiful species is suspected of being poisonous, which must be in consequence of particular food, as it is not hurtful at all times. See the Plate, fig. 9.

55. *Perca melanura*, the black-tailed perch: tail-fin black, edged with yellow; pectorals white; body above black, below white with yellow stripes. The dorsal fin has $\frac{7}{2}$ rays. It inhabits North America; and was first made known by Catesby. Length, a foot or more. The gullet is wide, and red within; the scales are broad, and of a brown colour edged with red. This is represented at fig. 10.

56. *Perca seditrix*, the jumping perch: tail forked, red on the hind part; belly pale yellow, with grey lines. In the dorsal fin $\frac{7}{8}$ rays, $\frac{3}{9}$ in the anal, 3 large spines in the anterior part of the caudal. Inhabits America. Upper surface mostly brown; some dull yellow spots above the lateral line; on the opercula a mixture of white, red, and yellow. It can "jump" a considerable way out of the water, whence Catesby calls it *saltatrix*; and swims so fast that it can keep up with a ship in full sail; hence the Linnæan name, *seditrix*, or "follower."

57. *Perca unimaculata*, the pacu: a round black spot on each side, at the end of the pectoral fin. The pectoral fins contain 13 rays, the ventrals $\frac{1}{6}$, the anal $\frac{1}{6}$, the tail 15, the dorsal $\frac{11}{8}$. The head is small, and the scales reach no farther than the eyes; the rostrum declines; the opercula are not serrated, and the aperture of the gills is wide.

wide. The pupil of the eye is black, in a silvery iris; there is a yellow spot between the eyes. The jaws are of equal length, with even sharp teeth. The body is broad, of a silvery colour, with longitudinal stripes of yellow. The fins are all yellow.

This species is from Brasil, where it is called *paen*. Its flesh is excellent. Prince Maurice says it grows as large as a carp; but Marcgrave says it does not exceed a foot in length. It is one of the migratory kinds; for it quits the sea in spring for the rivers, and returns in autumn.

58. *Perca juba*, the jub: two brown spots on the fin of the tail. Each pectoral fin has 12 rays, the ventral's $\frac{1}{6}$, the anal $\frac{1}{2}$, the tail 27, the dorsal $\frac{1}{2}$. The head bends down very much; the jaws are of equal length, with sharp teeth; the bones of the lips are strong. A black stripe edged with yellow appears above and below the eye. The opercula are smooth, and the aperture of the gills is wide. The body is broad; the back arched. The fish is silver-coloured, except the back, which is violet inclining to black, with yellow longitudinal stripes. The fins are yellow at the base, but orange-colour upwards. The fish grows twice the size of the last; but it does not ascend the streams; it stops between rocks and at the mouths of rivers, and is caught in great numbers all the year round on the coasts of Brasil. This is very good food: Marcgrave reckons the tongue and the flesh of the cheeks great delicacies; Piso says, that, when roasted, it is one of the best fish in that country.

59. *Perca argentata*, the silver perch: $\frac{1}{2}$ rays in the dorsal fin, $\frac{1}{3}$ in the anal. The membrane of the gills contains 5 rays, the pectoral fins 14, the ventrals $\frac{1}{6}$, the tail 18. The head is small, bare to the opercula, and ends blunt; the mouth, teeth, and jaws, are small likewise. The opercula are not serrated; the nostrils are single, and near the eyes; the pupil is black, the iris yellow and white. The body is somewhat long; the tail is crescent-shaped. The colour of the fish is silvery; the fins grey; but the pectorals, ventrals, and anal, are reddish at their base; the back is dark. This species is from Japan.

60. *Perca Japonica*, the Japanese perch: ten spines in the dorsal fin and two in the anal. There are 5 rays in the membrane of the gills, 14 in the pectoral fins, 6 in the ventral, 8 in the anal, 16 in the tail, 20 in the dorsal. The head is small, without scales as far as the eyes; the jaws are of equal length, with teeth like a file. The pupil of the eye is black, surrounded with a golden iris. There are a number of thin yellow stripes along the body. The ground-colour of the fish is white; the back brownish; the fins incline to grey, with soft four-branched rays, except those which form the specific character. This species is found at Nippon, a large island in Japan.

61. *Perca stigma*, the branded perch: dorsal fins filamentous; gill-covers branded, as if marked with a hot iron. In the dorsal fin $\frac{1}{2}$ rays, 13 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{2}{9}$ in the anal, 17 in the tail. Inhabits India.

62. *Perca diagramma*, the warna: brown longitudinal stripes on a white ground form the specific character. There are 5 rays in the membrane of the gills, 16 in the pectoral fins, $\frac{1}{6}$ in the ventral, $\frac{2}{11}$ in the anal, 19 in the tail, and $\frac{2}{8}$ in the dorsal, but Linnæus makes 11 spines in the dorsal a part of the specific character. The head is sloping, compressed, and covered with small scales; the nostrils are double, nearer the eyes than the snout. The eyes are large, with a glistening membrane; the pupil is black, the iris gold-yellow. The anterior operculum is only serrated in front, and in its inner surface bears a single gill; the scales of this operculum are less than that of the other; the aperture of the gills is large, and half of the membrane is loose. The trunk is compressed; the belly long; the scales are very small, hard, serrated, prominent on the back, and forming a furrow to receive the dorsal fin. The general colour of this fish is white; but the stripes and spots on the pectoral, ventral, and anal, fins, are brown; the dorsal and tail fins partake of both co-

lours. This species haunts the East-Indian seas. Its flesh is fat and good. It grows a foot long, and as thick as a cod. It will attack fish larger than itself; hence the Indian name *ikan warna*, *warna roepanja*, "the fool-hardy fish." Seba calls it *Perca maxilla superiore longiore*, though the jaws really are of equal length.

63. *Perca striata*, the striated perch: body striate. In the dorsal fin $\frac{1}{2}$ rays, 15 in the pectorals, $\frac{1}{6}$ in the ventrals, $\frac{1}{11}$ in the anal, 17 in the tail. Inhabits North America; differs from *P. melanura* chiefly in not having the tail black. Gill-covers subferrate; second ray of the anal fin very strong.

64. *Perca lineata*, the five-lined perch: five alternate white and brown lines on the body; dorsal fin filamentous $\frac{1}{2}$ rays; pectorals 15, ventrals $\frac{1}{6}$, anal $\frac{1}{11}$, tail 16. Country not known.

65. *Perca cernua*, the ruffe: $\frac{1}{2}$ spines in the dorsal fin, and several indentions in the head. There are 7 rays in the membrane of the gills, 14 in the pectoral fins, 6 in the ventrals, $\frac{2}{8}$ in the anal, 17 in the tail. The body is long, and slimy; the head is large, flattened above and below; the neck and back are of a blackish colour. The eyes are large, pupil blue, iris brown, with a yellow spot. The jaws are of equal length, and are armed, as well as the palate and gullet, with small and very sharp teeth. The sides are yellow, inclining to green and brown; yet there are some all over of a gold-yellow, and hence Tragus has called it *gilt-fish*. The sides, and the pectoral, dorsal, and tail, fins, are marked with little black spots. The belly is wide; the anus is nearer the head than the tail. The breast is white; the fins yellow; the tail is bifurcated.

This species is indigenous to the northern countries of Europe, where it lies in deep rivers and lakes with a sandy or marly bottom, and whose waters are clear. They are very plentiful in Prussia; and, according to Klein, in fishing one day under the ice at Frisch-hoff, they took as many ruffes and small salmon as filled 780 barrels; but they are remarkably gregarious, going commonly in shoals. It is a small species, seldom exceeding six or eight inches in length, but in the lakes near Prenzlau they are said to grow to a great size. According to Falck, the species is also an inhabitant of all the fresh-water lakes and large rivers of Russia and Siberia. They are reckoned among the rapacious kinds, living on worms, insects, and the young of other fish. Their enemies are the pike, the perch, the eel, and the aquatic fowl. They spawn in March and April, laying their eggs in deep places, on sand-hills, or other hard bodies. The eggs are small, of a yellowish-white colour: in an ovary weighing but three drachms, 75,600 eggs have been counted. They multiply fast, but are slow in their growth. In spring they leave the great lakes for the rivers, and return in autumn. They are caught in great numbers under the ice. Their flesh is tender, well-tasted, and easy of digestion; and is therefore recommended to valetudinarians. The lakes of Golis and Wandelitz are famous for producing the best of this species. As they afford agreeable and wholesome food, and are too small to do much mischief among other fish, they are well worth being bred in lakes and ponds. The best seasons to catch them for this purpose are spring and autumn; but they should be taken out of the shallowest waters they may be found in, as, when fished up from great depths, they fatigue and spend themselves in the nets, and die soon after they are out of the water: yet in general they are hardy, and may be transported alive a long way in the winter; for though, as we observed of the river-perch, they appear to be dead, they will recover on being put into cold water. And indeed this fish (or the next species) may be preserved in glass jars with fresh water, and be made very tame; it must be fed; for it cannot subsist on the animalcula of river-water, as small dace can. No fish shows the circulation of the blood in a finer manner than ruffes, whose fins are exceedingly transparent. Besides,

sides, it is a creature vastly tenacious of life, and will live twenty or thirty minutes out of water, without receiving much damage. *Phil. Transf.* N^o 478.—This little fish is shown at Plate III. fig. 11.

66. *Perca acerina*, the great ruffe: $\frac{17}{3}$ rays in the dorsal fin; in the pectorals 25, ventrals $\frac{1}{6}$, anal $\frac{1}{6}$, tail 17; but the specific character is not certain, for Cope and some others give $\frac{17}{2}$ rays to the dorsal fin. In figure, colour, and habits, this resembles the ruffe; but the head is longer, and has several indentions; jaws equal. Found in the Euxine, or Black Sea, and during summer in the great rivers which run into it.

67. *Perca nigra*, the Cornish perch, or black-fish: body black, narrow, with small thin scales. This inhabits Cornwall; it is a very indistinct species; length 15 inches. The teeth and scales are small; dents in the head; jaws equal; nostrils large, double.

68. *Perca harpes*, the sickle-finned perch: very long and strong jagged teeth in the front and at the articulation of both jaws, with small compressed triangular teeth in the upper jaw between the large ones in the front and those in the corners; dorsal and anal fins very large, and sickle-shaped; the anal growing round a large fleshy triangular scaly process; caudal convex in the middle, and extended on each side into a very long sickle; a compressed triangular barble on each side near the joining of the lips. Eight rays in the membrane of the gills, $\frac{10}{8}$ in the dorsal fin, 10 in each pectoral, 6 in each ventral, $\frac{3}{1}$ in the anal, and 15 in the tail. This fish, which is represented in the paintings on vellum (copied from Plumier's MSS.) in the National Museum at Paris, is introduced by Cope as a new genus, *Harpe*, which signifies a sickle, from the shape of the fins. It is a beautiful species; its broad shining scales reflect the brightest tints of gold and sapphire-blue. The gold colour prevails on the lips, the irides, the sides, the under part of the body and tail, top of the dorsal fin, and upon the forks or sickles of that fin, the ventrals, anal, and tail; the rest of the surface is azure varied and enlivened by the golden tints. Nostrils single; head and two-thirds of the opercula naked, but there are several rows of scales on the base of the dorsal fin; the tail is widest where it joins the fin.

69. *Perca schræfer*, the bald-head: black stripes along the body; no scales on the head. The membrane of the gills has 6 rays, the pectoral fins 14, the ventrals $\frac{1}{2}$, the anal $\frac{2}{3}$, the tail 15, the dorsal $\frac{13}{8}$. The body is long; the head smooth, and of an oblong shape; there is a dent in the upper part, and it is sprinkled with black dots. The jaws are armed with file-shaped teeth; the palate is rough also, but the tongue is smooth. The lips are fleshy; the nostrils are double, and near the eyes: these have a nictating membrane, blue pupil, and yellow iris. The anterior operculum is serrated, the divisions standing at a distance from each other; and underneath lies the single gill. The scales on the breast are very small and smooth, covering the base of the pectoral fins; the scales on the body are larger, hard, and serrated, forming a furrow on the back to receive the dorsal fin. The black stripes are usually three in number, running from head to tail, and appear on the skin when the scales are removed. The anus is nearer the tail than the head, though at some distance from the anal fin. The back and sides are yellowish; the belly silvery; the fins bluish, with black spots on the front part of the dorsal. This species is found in the Danube and the rivers which run into it; it is probably by mistake that Bonaterre places it in the *jeas* of the fourth instead of the rivers, for it has never been described or considered as a sea-fish. It grows about ten inches long; the flesh is white, firm, wholesome, and well-tasted. It feeds on young fry and aquatic insects, which are often found in its stomach. It spawns in March and April; it is a hardy fish, seeks clear streams, and is sometimes carried by inundations into the lakes, where it thrives equally well. The ovary is single, but

the seed-vessels are double; the air-bladder is long, and fastened on each side to the ribs. The ribs are eight on each side; the vertebræ 39 in number. The ovary of a single fish contains about 120,000 yellow eggs of the size of a grain of millet.

70. *Perca argentea*, the white perch: shining white, with a black spot on the spinous part of the dorsal fin; nostrils tubular. In the dorsal fin $\frac{17}{2}$ rays, pectorals 12, ventrals $\frac{1}{6}$, anal $\frac{1}{11}$, caudal 17. Inhabits America; anterior part of the back carinated.

71. *Perca cabrilla*, the red-striped perch: four longitudinal blood-red stripes on the body. In the dorsal fin $\frac{19}{4}$ rays, 16 in the pectorals, $\frac{1}{2}$ in the ventrals, $\frac{1}{6}$ in the anal, 17 in the tail. Inhabits the Mediterranean. Sharp teeth, smaller than the rest, in the middle of the jaws; sides of the head red; a filament sometimes behind each dorsal fin.

β . It varies with yellow and violet spots; 14 rays in the pectoral fins, and 16 in the anal.

72. *Perca radula*, the scraper-perch: scales crenulate; white dots disposed in lines on the body. In the membrane of the gills 7 rays, dorsal fin $\frac{13}{5}$, in the pectorals 12, $\frac{1}{6}$ in the ventrals, $\frac{1}{3}$ in the anal, and 17 in the tail. Inhabits India; the dorsal fin is very long; no spots on the body.

73. *Perca formosa*, the squirrel-fish: alternate yellow and blue longitudinal stripes on the head. There are 5 rays in the membrane of the gills, 16 in the pectoral fins, $\frac{1}{2}$ in the ventrals, $\frac{1}{2}$ in the anal, 17 in the tail, and $\frac{13}{5}$ in the dorsal. The head slopes but little, and is all over scales; the mouth is large, the tongue broad, loose, and slippery; there is a hairy membrane on the palate. The jaws are of equal length, with one row of sharp teeth, which are crooked or bent; those in the upper jaw somewhat largest. The nostrils are double, and near the eyes. The front operculum is somewhat serrated, the hinder one smooth; the aperture of the gills is large, the membrane almost concealed. The body is broad; the back round; the ventral cavity is long, and the anus is nearer the tail than the head. The scales are blue edged with yellow, hard and serrated. The fins are yellow-tawny, spines of the dorsal blue; the anal, being covered with scales like the *Chætodons*, is stiff; the dorsal and tail fins are partly covered with scales; tail lunate. This species is found in the East Indies and in the Atlantic Ocean; Catesby found it in the Bahama Isles, Dr. Isert in the Isle of St. Croix, and Renard at the Moluccas. This is a large species; and is represented on the same Plate at fig. 12.

74. *Perca facer*, the rose-coloured perch: body rose-coloured; second ray of the dorsal fin very long. This is added by Dr. Turton from the Naturalist's Miscellany, 371. It inhabits the Mediterranean, and is about a foot long; the hinder gill-cover ends in a spine; tail lunate.

75. *Perca lunulata*, the reddish perch: colour reddish; a black lunular spot at the base of the tail-fin. In the dorsal fin $\frac{19}{4}$ rays, in the pectorals 16, ventrals 7, anal $\frac{1}{2}$, caudal 17. This and the two following are described by Mungo Park in the *Linn. Transf.* iii. 35. It inhabits Sumatra. Crown convex, naked; jaws equal; teeth conic, a little curved, the caning ones in the upper jaw stronger; ventral fins golden, the rest reddish. This delicate species is delineated at fig. 13.

76. *Perca aurata*, the yellow-striped perch: colour whitish, with a longitudinal yellow stripe. In the dorsal fin $\frac{19}{5}$ rays, pectorals 18, ventrals 6, anal $\frac{1}{6}$, caudal 18. This also inhabits Sumatra. The eyes are large, iris yellow; under the eye a single reflected spine. Anterior gill-covers toothed behind, the posterior nearly entire; lateral line nearer the back, a little curved on the hind-part; pectoral fins pale yellow; tail gold-yellow, the rest whitish-brown.

77. *Perca Sumatrensis*, the Sumatra perch: body dark silvery; fins longitudinally striate. In the dorsal fin $\frac{17}{2}$ rays, pectorals 14, ventrals 6, anal $\frac{1}{11}$, tail 18. Inhabits in shoals

Engraved for the Encyclopædia Londinensis. 1823.

Five species of Holocentrus.

froals the coasts of Sumatra; three inches long; scales small, denticulate, dotted with brown. Head small, wedged, the nose and front brown; iris brown-silvery, mouth small; the lower jaw a little longer. Lateral line parallel with the back, a little bent down at the end of the dorsal fin. Pectoral and ventral fins yellow, the rest brown, streaked with yellow.

78. *Perca trutta*, the trout-perch: gill-cover in four pieces, ending in a blunt process; nostrils double; colour blackish brown. Six rays in the membrane of the gills, $\frac{2}{3}$ in the dorsal, 13 in the anal and pectorals, 6 in the ventrals, 18 in the tail. This and the following were communicated to Cope by Bosc; they both inhabit Carolina. The trout-perch has a small-elevation on the snout; the mouth opens very wide; lower jaw the longest, both armed with a great number of very small teeth; the tongue is fleshy; two rows of small teeth on a triangular plate in the roof of the mouth; laminae similarly armed above and below the entrance of the gullet. The eye is large, with a yellow iris; the sides of the head covered with small scales. The lateral line runs parallel with the back; and there is a furrow to receive the spines of the dorsal fin; the ventrals are united by a membrane. The belly is white. This species is plentiful in all the rivers of Carolina, where it is called *trout*. Length near two feet; flesh firm and well-tasted.

79. *Perca iridea*, the iris-perch: gill-cover in four pieces, terminating in a blunt process; tail rather lunate; a large oval black spot edged with white at the extremity of the dorsal fin, and a little black spot at the hinder angle of the operculum. In the dorsal fin $\frac{3}{4}$ rays, $\frac{2}{3}$ in the anal, 9 in the pectorals, $\frac{1}{2}$ in the ventrals, and 24 in the tail. A little groove on the head before the eyes; the teeth are very small; the ventral fins united, as in the preceding. Less than six inches long; colour brown grey, spotted and dotted with darker brown; a delicate pale yellow line across most of the scales; two sloping lines, and several small black spots, on the dorsal fin. This species is also very numerous in the fresh waters of Carolina, and are particularly fought after in the spring.

80. *Perca trifurca*, the trident perch: tail-fin three-lobed; seven blue bands across the body. In the dorsal fin $\frac{1}{2}$ rays, pectorals 16, ventrals $\frac{1}{2}$, anal $\frac{3}{4}$, tail 20. Observed at Carolina by Dr. Garden. It is prettily variegated, especially the head and the ventral fins; gullet yellow; gill-covers very finely toothed. The third and fourth spinous rays of the dorsal fin with a filament as long as the spine itself.

81. *Perca trachichthys*, the New-Holland perch: abdomen cataphracted with large carinate scales; mouth wide, toothless, descending. Eight rays (the four lowermost rough on the edges) in the membrane of the gills, 14 in the dorsal fin, pectorals 13, ventrals 7, anal 12, caudal 24. This species is added by Dr. Turton as a separate genus, *Trachichthys*, from the Nat. Miscel. No. 106. Pl. 378. The head is rounded in front, and the eyes are very large, with a silvery iris. It inhabits New Holland; about five inches long, and two deep; body coated with rough scales, so strongly and closely inserted, that it is not possible to detach one from the rest without bringing with it a portion of the skin. Gill-covers armed on the upper part with a strong rough spine, and a small one on the lower. Scales fringed and covered with small spines, those on the abdomen projecting into a shortish spine, pointing backwards and forming a sharp keel. Tail strongly forked: edges of all the fins paler; three first rays of all the fins, except the pectorals, strong, rough, and finely ferrate outwards.

IV. Opercula aculeated, as well as scaly. *Holocentri*.

The HOLOCENTRUS [from the Gr. *δλος*, all, and *κεντρον*, a spine] is a very considerable genus in Bloch; as, besides some newly-discovered species, he has included in it all the perches which have the dorsal fin undivided. These last we have restored to their proper places in the

second and third divisions. The genus has been adopted by Cope, and more recently by Dr. Shaw; but the difference upon which it is founded is so small, that we have no hesitation about placing the remaining new species here as an appendix to the genus *Perca*; for the designation *holocentrus*, or "all-spiny," applies almost exclusively to the spines on the opercula, or gill-covers. See vol. xiii. p. 778, 9. The generic characters, as stated by Drs. Bloch and Shaw, are—Habit of the genus *Perca*; gill-covers scaly, ferrated, and *acuminated*; scales, in most species, hard and rough; one dorsal fin. See Bloch vii. 45. Cope iv. 327. Shaw iv. 553.

1. Tail divided, either forked or lunated.

1. *Holocentrus fogo*, the Welchman: this species is distinguished by having eight rays in the ventral fin, one spine at the first piece of the gill-cover, two at the second. It has 8 rays in the membrane of the gills, 17 in the pectoral fins, $\frac{1}{2}$ in the ventral, $\frac{1}{4}$ in the anal, 29 in the tail, $\frac{1}{2}$ in the dorsal. The body is compressed, and almost rectangular. It does not go tapering to the tail, like most fish: but grows narrower all at once; and the tail preserves the same thickness quite to the fin, which is forked. The jaws and palate are rough, like a file, the teeth being extremely small and sharp; the tongue is broad and slippery; the lip-bones of the upper jaw are double, and very strong. The eyes are large and protruded; the pupil is black, the iris silvery inclosed in a yellow ring. The head is furrowed between the eyes, and devoid of scales. There is one spine to the front operculum, two to the hinder one; both are ferrated on the edge; and there is a row of transverse scales on the foremost one. The gills have a wide aperture. The whole body is covered with large, hard, ferrated, scales, strongly adhering to the skin. Two rows of scales stand up along the back, forming a furrow in which the fish can withdraw the dorsal fin. The scales cover also part of the anal fin, which occasions that part to appear as broad as the belly. The lateral line is scarcely visible. A beautiful red shines through the silver colour of the scales, and, being intermixed with straw-colour stripes, forms an agreeable diversity. Its long red fins, and its large eyes, give it a beautiful appearance in the water. As the bones of the head terminate all in spines larger or smaller, Artedius has made it a genus of itself by the name of *holocentre*, or all-prickly. There are ten short spines at the origin of the tail-fin. A round bone is observed under the pectoral fin, which is only an apophysis or production of the omoplatus, or bone under the gill-cover; which assists the action of the pectoral fin. Another remarkable thing in this fish is an aperture which is discovered in the upper part of the mouth when the upper jaw is brought forward; to explain this, it must be remarked, that the jaws of fishes are divided in the middle, and both movable, whereas in most other animals the lower jaw only is so; in the middle, where the two halves of the upper jaw meet, each half has a process rising straight up, which carries the muscles for drawing back that jaw; this process goes under the skin between the nostrils; and, when it is drawn back by the protrusion of the jaw, the unbroken skin covers the space in other fishes; but in this species the skin is interrupted, and exhibits an aperture. This species is found in all the four quarters of the globe. Plumier made a drawing of it at the Antilles; Brown saw it at Jamaica; Duhamel describes it as belonging to the waters of Europe; and Bloch received it from Africa, where it is called *fogo*. It is the handsomest of the genus; and is much esteemed as food. The annexed Plate IV. is designed to exhibit the species of perch called *Holocentrus*; the present beautiful species (from Bloch, t. 232.) is shown at fig. 1.

β. A variety, which differs in the following particulars. The space between the eye and mouth is much narrower; and the snout is obtuse; only one small spine about the head. The 11th spine of the dorsal fin, instead

of being the shortest, is the longest, forming the beginning of the second division of that fin; the third spine of the anal fin is not near so long, and that fin contains two soft rays more; lastly, the longitudinal straw-colour stripes on the body are not visible. From these differences it is evident it might have been assumed as a new species; its name in Dutch is *roede haal/skop-vijsch de Vocean*.

2. *Holocentrus virescens*, the green holocenter: $\frac{12}{4}$ rays in the dorsal fin, and the tail-fin semilunar. There are 6 rays in the membrane of the gills, 14 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{6}$ in the anal, and 18 in the tail. The body is mostly of a green colour; the head is long; the lower jaw is protruded, and both are armed with sharp teeth, of which the two in front are the longest. There is a long thin bone on each side of the upper jaw. The nostrils are double; the opercula are striped with yellow. The eyes are large, and situated high in the head; the pupil is black, the inner iris is a broad circle of red, the outer one is narrow and white. The front operculum is serrated, and the hinder one is armed with two spines, sometimes with three. The lateral line runs arched near the back, with spines all the way like the teeth of a saw. The vent in the middle of the body. The fins are dark green on the edges; but towards the belly, the green colour fades away to white. The whole body is covered with hard serrated scales. This species is from the East Indies.

3. *Holocentrus tigrinus*, the chequered holocenter: body spotted and striped; tail-fin semilunar. There are 6 rays in the membrane of the gills, 13 in the pectoral fins, 6 in the ventrals, $\frac{3}{6}$ in the anal, 15 in the tail, and $\frac{12}{4}$ in the dorsal. The head is long, narrow, compressed, and truncated; the jaws are armed with little sharp teeth standing apart, and the under jaw is the longest; the tongue is slippery and loose, the palate rough; the nostrils are double, and near the eyes; the pupil is black in a silvery iris. The front operculum is dentated at both rims; the hinder one terminates in a membranous point, and is armed with three flat spines: this fish is also furnished with the single gill. The aperture of the gills is wide, and the membrane loose. The whole body is covered with minute serrated scales; both head and body are interspersed with brown spots of various shapes, but those on the fins are mostly round. The back is brownish; the sides bluish above the lateral line, silvery below it. This species is from the East Indies; and, according to Valentine, is delicate food. See fig. 2.

4. *Holocentrus quinque-lineatus*, the five-striped holocenter; five blue stripes on each side the body, and the tail crescent-shaped. The membrane of the gills has 6 rays, the pectoral fins 16, the ventrals 6, the anal $\frac{3}{6}$, the tail 20, and the dorsal $\frac{12}{4}$. The head is short, compressed, and bare of scales as far as the operculum, which is covered with small scales, but those on the body are large. The lower jaw is the longest, and each is armed with a row of small teeth standing apart, besides which there are a great number irregularly placed in the upper jaw and palate; nostrils double. The eyes are large; pupil black, iris yellow. The posterior operculum terminates backwards in a membranous point; but in the middle of its front rim is a spine which shuts into a corresponding furrow in the back of the other operculum; this is serrated at the lower rim, and the other is furnished with a flat spine. Four of the blue longitudinal stripes arise near the eye, the fifth from the aperture of the gills, which is very wide. The lateral line runs near and parallel with the back. This fish is yellow; the head and fins violet inclining to red; it is from Japan, but its habits are not known.

5. *Holocentrus Bengalensis*, the Bengal holocenter: four stripes along the body, and the tail crescent-shaped. There are 6 rays in the membrane of the gills, 14 in the pectoral fins, 6 in the ventrals, $\frac{3}{6}$ in the anal, 18 in the tail, and $\frac{12}{4}$ in the dorsal. The head is compressed, smooth in front, behind covered with round tenacious scales. The jaws are of equal length, armed with sharp

hooked teeth; the five front teeth in the upper jaw are much longer than the rest, and behind these is a great number of short thin teeth, which extend over the palate also, but the tongue is smooth; nostrils double. The front operculum is serrated both ways; and furnished with a notch to receive a kind of hook from the hinder one: this hook seems in some respect to assist in the work of respiration; for Bloch observed, in opening the mouth of the fish, that the front operculum receded, and pressed the hinder one against the breast by means of that hook; and this motion closed the aperture of the gills: it is probable that this operation favours the retention of the water taken in for a longer time, in order to cool the blood. The hinder operculum has two spines, and a small part of it is serrated. The gills have a wide aperture; the membrane is loose. The body is compressed, the scales are small and serrated; the anus is in the middle of the body. The back and head of this fish are red; the sides and belly white. The stripes are blue, with a brown edging; they arise from the head; the three first terminate in the dorsal fin, the last in that of the tail. The pectoral and ventral fins end in a point; the anal and dorsal are rounded.

6. *Holocentrus epinephelus*, the wall-eyed holocenter: seven transverse stripes on the body; small scales on the head; a membrane over the eye; tail lunate. The membrane of the gills has 5 rays, the pectoral fins 14, the ventrals 6, the anal $\frac{3}{6}$, the tail 15, the dorsal $\frac{12}{4}$. This and five other species, which have a membrane over the eye, are made a separate genus by Bloch, (Part. x.) called *Epinephelus*, or wall-eye.

The head slopes but little, and ends in an obtuse point. The under jaw is somewhat the longest; both are furnished with small teeth, and the palate also, but the tongue is smooth. The eyes are prominent, near the top of the head; the pupil is bluish, and the iris yellow; close to them are the nostrils, which are single. The single gill appears under the front operculum; the hinder one has two spines. The aperture is wide, and the membrane partly at liberty. The belly is short and broad, and the anus nearer the head than the tail. The lateral line is very near the back, and in the same direction. The colour of this fish is white, with seven broad stripes of brown across the body from back to belly, and two which intersect them longitudinally. The ventral fin ends in a point; the tail is crescent-shaped, the rest rounded. This species is found at Jamaica.

7. *Holocentrus perca*, the perch-holocenter: one spine bending toward the head in the last piece of each operculum; small scales on the head and opercula; the scales in general radiated and serrated. There are 7 rays in the membrane of the gills, 15 in each pectoral, $\frac{1}{6}$ in each ventral, 17 in the tail, $\frac{12}{4}$ in the dorsal, and $\frac{3}{6}$ in the anal. The lower jaw is somewhat longer than the upper, which is movable; the front teeth are long, the other small, and as close as the teeth of a file; there are teeth also in the palate and throat; but not on the tongue, which is very white. The nostrils are double. The head and belly are of a red colour; the back, sides, and tail-fin, gold brown. This and the three following are described by Cope from Commerçon's MSS. no writer having mentioned them before. Native of Burton's Straits; ten or twelve inches long. In the first piece of each operculum is a notch to receive the sharp spine of the second piece. The Molucca Indians brought several of this species to the ship in which Commerçon and Bougainville were voyaging in the year 1768.

8. *Holocentrus flavo-cæruleus*, the yellow-and-blue holocenter; tail-fin crescent-shaped, three spines in the hinder operculum; opercula and head with small scales; a membrane over each eye. Seven rays in the membrane of the gills, 18 in each pectoral, $\frac{1}{6}$ in each ventral, 15 in the caudal, $\frac{12}{4}$ in the dorsal, and $\frac{3}{6}$ in the anal. The nostrils are double; the lower jaw somewhat longer than the upper, which is retractile; teeth and tongue like the preceding.

preceding. The general colour of this fish is bluish; but the fins are yellow; hence the name. Found at the Isle of France; larger than the preceding. Sometimes the tips of the pectoral fins are black, and the upper jaw yellowish, the same between the eyes, and a yellow spot on the hind part of the head; but there is seldom any colour besides yellow and blue on any part of it. The first rays of the dorsal fin end in a filament. The species lives on crabs and young fish, which it swallows whole. Flesh pleasant and wholesome food.

9. *Holocentrus caudâ vittatâ*, the striped-tail holocenter: two spines in the hinder opercula; ventral fins with 5 rays, and fastened by a membrane to the belly; general colour blue; the tail with from three to ten longitudinal alternate white and black stripes. Six rays in the membrane of the gills, 16 in each pectoral, 15 in the tail, $\frac{15}{3}$ in the dorsal, $\frac{5}{1}$ in the anal. The nostrils are double. The vent nearer the head than to the tail-fin. This species is commonly less than the perch-holocenter. The upper jaw is flexible, and somewhat shorter than the lower; both jaws, and the palate, are armed with numerous small teeth like a saw; the tongue is smooth. Inhabits the Isle of France.

10. *Holocentrus nigricans*, the blackish holocenter: one or two spines in the hinder piece of each operculum, and a small serrated bone near each eye; a scaly plate at each end of the base of the ventral fins; prevailing colour bluish black. Five or 6 rays in the membrane of the gills, 20 in each pectoral fin, $\frac{1}{6}$ in each ventral, 15 in the tail, $\frac{15}{3}$ in the dorsal, and $\frac{1}{6}$ in the anal. The head is small; the eyes blue; nostrils double. The lower jaw is somewhat longer than the upper, which is movable; the teeth small, white, close together like the teeth of a comb; but none on the palate or tongue. The lateral line is very short, extending no further than the end of the dorsal fin.

11. *Holocentrus leopardus*, the leopard-holocenter: tail lunate; four large spines on the first piece of each operculum, one spine on the second; body spotted all over. There are 14 rays in the pectoral fins, 18 in the tail, $\frac{18}{3}$ in the dorsal, $\frac{1}{3}$ in the anal, $\frac{1}{3}$ in the ventrals. The upper jaw is somewhat shorter than the lower, and the lip double; there are six large strong hooked teeth, and several rows of smaller ones, in each jaw. This and the following were first described by Cope.

12. *Holocentrus ciliatus*, the ciliated holocenter: scales ciliate, teeth almost setaceous, one small spine at the hind part of the opercula. There are 17 rays in the pectoral fins, $\frac{1}{6}$ in the ventrals, 19 in the tail, $\frac{15}{3}$ in the dorsal, $\frac{1}{6}$ in the anal. The body is of a lengthened form; teeth in several rows, very small.

13. *Holocentrus Thunbergi*, Thunberg's holocenter: 7 articulated rays in each ventral fin, a single spine in the posterior part of each operculum; the hind part of the tail much lower than the front; scales striped and dented; prevailing colour silvery, but without spots. Seven rays in the membrane of the gills, 13 in the pectoral fins, 18 in the tail, $\frac{18}{3}$ in the dorsal, $\frac{1}{3}$ in the anal. The dorsal fin is divided, as it were, but it is in fact only one fin; the back is raised. The upper lip is double; three blunt teeth appear in the lower jaw on each side. Inhabits the seas of Japan; first described by Thunberg.

14. *Holocentrus albo-ruber*, the white-and-red holocenter: 12 spines in the dorsal fin; many spines between the eyes; which are very large; colour red, with eight or nine longitudinal stripes of white on each side. This and the eight following species are described only by Cope; the present and the next from the coloured Chinese drawings in the National Museum at Paris; these two therefore inhabit China.

15. *Holocentrus albo-fasciatus*, the white-banded holocenter: 11 spinous rays in the dorsal fin; spines before and behind the eyes, which are very large, with a black iris; colour red, with one transverse white bar near the tail-fin.

16. *Holocentrus diacanthus*, the two-spined holocenter: two spines in the anal fin; scales very broad, and edged with white; head, body, and tail, dotted with white; a black spot on the second piece of each operculum. Five rays in the membrane of the gills, 16 in each pectoral fin, 6 in each ventral, 16 in the tail, $\frac{15}{3}$ in the dorsal, and $\frac{2}{1}$ in the anal. This and the four following are described by Cope from the collection of natural history brought from Holland into France during the grand revolutionary war.

17. *Holocentrus tripetalus*, the tripetalous holocenter: operculum in three pieces, one spine to the third piece; upper lip double, lower jaw longest; scales oval, dented. Sixteen rays in the pectoral fins, $\frac{1}{6}$ in the ventrals, 18 in the caudal, $\frac{15}{3}$ in the dorsal, $\frac{1}{6}$ in the anal. Several rows of small teeth, one large one at each extremity of the lower jaw opposite the snout.

18. *Holocentrus tetracanthus*, the four-spined holocenter: four spines in the anal fin; a toothed scale above each pectoral fin, and several under each eye; a large spine and two small ones at the last piece of the operculum; spots on the dorsal and tail fins. Twelve rays in each pectoral fin, 17 in the tail, $\frac{15}{3}$ in the dorsal, $\frac{1}{2}$ in the anal. The lower jaw is the longest; teeth minute. Under the eyes are scaly laminae with radiating striæ; a great part of the dorsal fin, sustained by the spiny rays, is very distinct from the rest.

19. *Holocentrus acanthops*, the prickly-eyed holocenter: a fringed plate armed with spines along the lower half of the eye; one or two spines in the second piece of the operculum; one spine turned obliquely upwards over the base of the pectoral fins; small spots on the dorsal and caudal fins. Fourteen rays in each pectoral fin, $\frac{1}{6}$ in the ventrals, 19 in the tail, $\frac{15}{3}$ in the dorsal, $\frac{1}{6}$ in the anal. The eyes are large; the lateral line very strong.

20. *Holocentrus radjabau*, the radjabau: the front of the head almost perpendicular with the longest diameter of the body; dorsal fin extremely long; upper jaw longest; two or three spines in the second piece of each operculum; spots on the dorsal and tail fins. Sixteen rays in the pectoral fins, $\frac{1}{6}$ in the ventrals, 16 in the tail, $\frac{15}{3}$ in the dorsal, $\frac{1}{6}$ in the anal. The jaws are armed with several rows of small teeth, close together, and pretty equal in size. The eyes are very large; there is a scaly toothed plate under the last piece of each operculum. The lateral line is nearly straight. Inhabits the East Indies, where it is called *ikan radjabau*.

21. *Holocentrus diadema*, the crowned holocenter: the anterior part of the dorsal fin rounded, and lower than the posterior part; the spines rise higher than the membrane, and are black with a white stripe underneath them, which gives that part of the fin the appearance of an ancient diadem; that fin has $\frac{11}{1}$ rays, the anal $\frac{2}{6}$. The lower jaw is the longest; opercula scaly, with a spine on each piece. There are six or seven narrow stripes along each side of this fish. This and the following are from Commerçon's MSS.

22. *Holocentrus gymnosus*, the naked holocenter: body apparently naked, the scales being hardly visible; one spine to each operculum; lower jaw the longest; teeth small and sharp, some larger ones in front of the upper jaw. Fifteen rays in each pectoral fin, 6 in each ventral, 18 in the caudal, $\frac{15}{3}$ in the dorsal, and $\frac{1}{1}$ in the anal.

2. Tail entire; i. e. straight, rounded, or lanceolated.

23. *Holocentrus striatus*, the striped holocenter: the jaws of equal length, 3 spines in the anal fin, and the fin of the tail truncated. There are 4 rays in the membrane of the gills, 15 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{15}{3}$ in the anal, 15 in the tail, and $\frac{15}{3}$ in the dorsal. The head is laterally compressed, with a declining rostrum, and the eye is furnished with a nictating membrane; the pupil is black, the iris white and brown; the nostrils are double, and very near the eyes. The jaws and palate full of very small

small sharp teeth; the tongue is smooth. The front operculum is serrated behind at the lower part; and the hinder one ends in a membranous point, and a flat spine. The gills have a very large aperture; the membrane is hardly visible. The scales are small and serrated, and extend over part of the tail-fin. The body is of a dirty white, with five transverse stripes of brown. The ventral fins are of a darker colour than the rest; there is a large black spot on the dorsal fin. Its country is unknown. This and the sixteen following were first described by Bloch.

24. *Holocentrus argentinus*, the silvery holocenter: a silvery stripe along each side, and the tail truncated. There are 5 rays in the membrane of the gills, 14 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{1}$ in the anal, 15 in the tail, and $\frac{2}{5}$ in the dorsal. The head and body are compressed, and furnished with rough scales, which however do not entirely cover the head, but only the opercula. The lower jaw advances a little beyond the upper; and both are armed with small sharp teeth; the palate is rough, the tongue smooth, and at liberty. The front operculum is serrated at both rims; the posterior one consists of two laminae, three spines, and an adhesive membrane. The aperture of the gills is wide, and the membrane at liberty; the internal part of the front operculum exhibits the single gill. The vent is nearly in the middle of the body. The pectoral fins are rounded; the ventrals end in a point, and the rays, except the first, are ramified; the tail-fin is straight, with dichotomous rays; the rays of the dorsal and anal fins extend beyond the membrane that unites them; they are composed of stiff and flexible rays like the rest. The ground colour of this fish is a faint yellow, the upper part of the head is violet, and the sides silvery. The fins are sky-blue; the pectorals and ventrals edged with yellow. Its size and country are unknown.

25. *Holocentrus oncus*, the ongo: $\frac{1}{2}$ rays in the dorsal fin, and the tail-fin rounded. There are five rays in the membrane of the gills, 12 in each pectoral fin, 6 in each ventral, $\frac{3}{1}$ in the anal, 18 in the tail. The head is long; the jaws are armed with short pointed teeth; the palate smooth, the lip-bones are broad in the upper jaw. The nostrils are double, the eyes have a black pupil with an orange iris. The anterior operculum is serrated on one side, the posterior one is furnished with two spines; the aperture of the gills is very wide, and the membrane is loose. The lateral line runs near the back, and is free from spines; the vent is nearer to the tail than to the head. The scales are small, and not serrated, as in the preceding species. The prevailing colour of this fish is brown, which rather inclines to green towards the belly; and there are spots or bars of faint yellow on the anal, tail, and dorsal fins. The pectoral fin is broad, and the ventral has one very strong spine; both these fins are yellow. This species is from Japan, where it is called *ikan ongo*.

26. *Holocentrus auratus*, the golden holocenter; general colour golden, with little spots all over the body, and nine spines in the dorsal fin. The branchial membrane has 6 rays, the pectoral fins 16, the ventrals 6, the anal $\frac{3}{1}$, the tail 20, the dorsal $\frac{9}{2}$. The body is broad, but laterally compressed; it is covered with a thick skin and very small scales. The teeth in the jaws and palate are small and sharp; the lower jaw is somewhat the longest, but the upper is furnished with two long teeth and large lip-bones. The nostrils are double, and near the eyes; the front pair cylindrical, the hinder oval. The tongue is slippery, loose, and long, like a bird's. The eyes are prominent, and near the top of the head; the pupil is black, the iris violet and yellow, with yellow spots. The front operculum is minutely serrated at the back part, the hinder one ends in a membranous point and three flat spines. The aperture of the gills is very large, the membrane half concealed, and a single gill under the front operculum. The body is of a beautiful gold colour, paler on the belly; and the brown dots have a fine effect on this ground-colour. The fins are in ge-

neral rounded, with ramified rays. The dorsal, anal, and tail, fins, are yellow edged with scarlet; the pectorals are pale violet, the ventrals reddish brown; the stiff rays of the dorsal fins are branched in a peculiar manner, and the membrane has a dark-brown edging, which has a very pretty effect. This is from the East Indies.

27. *Holocentrus quadrilineatus*, the four-striped holocenter: the body four-striped, and the tail-fin rounded. The membrane of the gills is supported by 6 rays; there are 13 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{1}$ in the anal, 16 in the tail, and $\frac{2}{2}$ in the dorsal. The head is compressed, and somewhat sloping; the jaws are of equal length, with small teeth broad at bottom, pointed at top; the aperture of the mouth is small; the nostrils are double, and near the eyes. The first of the four longitudinal stripes runs near the back, the second begins on the forehead, the third from the tip of the mouth, the fourth from the corner of the mouth, and runs straight along the body and tail, but does not extend over the fin as in the preceding species. The pupil of the eye is black, the iris white bordered with red. The front operculum is serrated; the posterior one rounded, and furnished with one spine; both, as well as the body, are covered with very tender scales. There is a furrow on the back to receive the dorsal fin. The lateral line arises from the hinder operculum, and runs irregularly to the middle of the tail-fin. The cinereous ground of this fish is agreeably shaded with the blackish stripes. The belly is of a yellowish red, the back brownish, the fins lead-colour, only the pectorals and ventrals are bordered with yellow; before the dorsal fin there is a round black spot, and a large oblong spot or stripe on that fin, on each side. This species is also from the East.

28. *Holocentrus fasciatus*, the banded holocenter: body banded, and the lower jaw protruded; tail rounded. There are 6 rays in the membrane of the gills, 13 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{1}$ in the anal, 16 in the tail, and $\frac{2}{2}$ in the dorsal. The mouth in this species opens very wide; the upper jaw is armed with several rows of small teeth, and two long teeth in front; in the lower jaw there is but one row, but they are larger, and bent back; the palate is rough also, but the tongue is smooth. The nostrils are double; the eyes large; pupil black, iris yellowish green. The front operculum is serrated, and the scales on this are much smaller than on the posterior one, which is double, and furnished with two spines and a loose membrane. The aperture of the gills is very large, and the membrane only in part concealed; the inside of the front operculum exhibits the single gill. The body is thin; the scales hard and serrated. This fish is of a greenish yellow, which becomes lighter towards the belly; the transverse stripes or bands are ash-colour; the fins are mostly of the same colour with the body, and rounded. Its country is not known.

29. *Holocentrus punctatus*, the punctulated holocenter: the body punctated, and eleven spines in the dorsal fin. There are 12 rays in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{1}$ in the anal, 17 in the tail, and $\frac{1}{2}$ in the dorsal. The mouth has a wide aperture; jaws of equal length, armed with short teeth. The nostrils are double, but small. The pupil of the eye is blue, with a yellowish iris. The body is compressed, and covered with serrated scales, the roughness of which is easily perceived in passing the hand from the tail towards the head. Every part of the body is full of little round spots of black and red. The front operculum is rounded and serrated; the posterior one terminates in a point, and is furnished with one flat spine. There are no scales on the front part of the head. The fins are all rounded; the pectorals are entirely red, the others red mingled with yellow. This species is found at Brasil, among the shelves and breakers in the sea; hence the Dutch call it *gatirisch*, and the Portuguese *peixe-gatto*, or rock-fish. The flesh is white, firm, well-tasted, and very wholesome. It is tenacious of life; for Piso relates, that he found one alive after it had been

three hours out of the water, and two hours after that, when he opened it, the heart was yet beating. This species is represented on the Plate at fig. 3.

30. *Holocentrus lanceolatus*, the lanceolated holocenter: tail-fin rounded, the rest pointed like a lancet. The membrane of the gills has 6 rays, the pectoral fins 16, the ventrals $\frac{1}{6}$, the anal $\frac{3}{17}$, the tail 13, the dorsal $\frac{1}{2}\frac{1}{4}$. The head is large, with a mouth in proportion; the bones of the lips are broad; the jaws are of equal length, and armed with several rows of little sharp teeth, as is the palate; but the tongue is smooth and movable. The nostrils are double, the hinder pair near the eyes. Hereabout begin the scales, which are small, tender, and smooth. The pupil of the eye is black, iris blue. The front operculum is made of two small rounded plates, of which the hinder one is strongly serrated. The gills have a wide aperture, and one half of the membrane is concealed. The body is broad, the belly prominent, and the vent in the middle of the body. The colour of this fish is silvery, with transverse stripes and spots of brown. The soft rays of the fins are mostly divided into four branches. This species is produced in the East-Indies, and takes its name from the shape of the fins. See the Plate, fig. 4.

31. *Holocentrus cæruleo-punctatus*, the blue-spotted holocenter: blue spots on the fins only, and eleven spines in the dorsal fin. The pectoral fins have 12 rays, the ventrals 6, the anal $\frac{3}{17}$, the tail 13, and the dorsal $\frac{1}{2}\frac{1}{6}$. The head slopes off to the mouth, which is pretty large; the under jaw is the longest, and both are armed with small teeth; the palate the same, but the tongue is smooth and at liberty. The nostrils are so small as to be hardly perceptible. The eyes are near the top of the head, and furnished with a membrane; the pupil is black, the iris white. The scales are extremely minute. The front operculum is rounded, and serrated at both edges; the hinder one ends pointed, and has one spine and an adhesive membrane. The colour of this fish is pale blue, with large yellow spots on the body and tail; small blue ones on the fins. The lateral line runs near and parallel to the back; the anus is nearer the tail than the head. The fins are of a brown colour; the pectoral and tail are rounded, the others end sharp.

32. *Holocentrus maculatus*, the spotted holocenter: body brown, with white spots; tail rounded, and eleven spines in the dorsal fin. There are 6 rays in the membrane of the gills, 13 in the pectoral fins, 6 in the ventrals, $\frac{3}{17}$ in the anal, 15 in the tail, and $\frac{1}{2}\frac{1}{6}$ in the dorsal. The head and body are both compressed; the back is carinated, the belly round. The jaws are of equal length, and furnished with sharp teeth; the palate is rough, the tongue smooth; the lip-bones are broad; the nostrils are hardly perceptible. The pupil of the eye is black, the iris white. The scales are very small. The front operculum is serrated one way; the hinder one is armed with two small spines. The vent is nearer to the head than to the tail. This fish is of a brownish-colour, and the spots are white. The dorsal, pectoral, and tail, fins, are rounded; the anal ends in a blunt point, the ventral sharp. This species is from the East Indies, and in other respects resembles the preceding. See the Plate, fig. 5.

33. *Holocentrus Surinamensis*, the Surinam holocenter: $\frac{3}{17}$ rays in the anal fin; tail rounded. The membrane of the gills is supported by 6 strong curved bones; there are 14 rays in the pectoral fins, 6 in the ventrals, 17 in the tail, $\frac{1}{2}\frac{1}{8}$ in the dorsal. The head is small, somewhat broad at top, but compressed on the sides. The mouth is small; the lower jaw is the longest, with a row of short, conical, divergent teeth, bent inwards; but the upper jaw has, besides a similar row, a great number of very small teeth placed behind this row; the palate and tongue are smooth; the lip-bones narrow. The nostrils are single, round, and near the eyes, which have a black pupil standing in the midst of an iris half red and half white. The front operculum is serrated, and stretches into a long spine at the corner; the hinder one is rounded, and

armed with a long round spine; the scales on these are smaller than on the rest of the body. The scales in general are much serrated, and adhere strongly to the skin. The gills have a wide aperture, and the membrane is uncovered. The head is the colour of blood; the body is variegated brown, violet, and yellow; the fins are mostly yellow at their origin, deep violet towards the extremities; the fins of the anus, back, and tail, are partly covered with scales; all the fins are rounded; there is a furrow in the back, to receive occasionally the dorsal fin. This species attains the size of our ordinary perch; and is esteemed, as food, one of the best fish in Surinam.

34. *Holocentrus calcarifer*, the spur-fish: only 8 spines in the dorsal fin; tail-fin rounded. There are 6 rays in the membrane of the gills, 15 in the pectoral fins, $\frac{1}{6}$ in the ventrals, $\frac{3}{17}$ in the anal, 17 in the tail, $\frac{1}{2}\frac{1}{8}$ in the dorsal. The head is somewhat flattened at top, and compressed at the sides; the lower jaw is longest; both, as well as the palate, are armed with several small teeth scarcely visible, but much more numerous in the upper jaw. The nostrils are double; the upper ones very near the eyes, which are large, stand high, and have a black pupil in a silvery iris. The front operculum is serrated, and armed with four spines like the pricks of a spur, whence the name; the posterior operculum has one spine, and the shoulder-blade is serrated. The aperture of the gills is wide, and the membrane is mostly concealed. The trunk is compressed, and covered with large silvery scales, with yellow rims, which extend over part of the head; a line runs longitudinally over each row of scales. The back is brown, inclining to violet; the fins yellow and brown. The pectoral and ventral fins end in a point; the anal and tail are rounded, and have some brown stripes upon them; the dorsal sinks in the middle. It is found at Japan; and grows about a foot long.

35. *Holocentrus Afer*, the African holocenter: the scales on the posterior operculum larger than those on the body; a membrane over the eye. The membrane of the gills has 5 rays, the pectoral fins 19, the ventrals $\frac{1}{6}$, the anal $\frac{3}{17}$, the tail 17, and the dorsal $\frac{1}{2}\frac{1}{8}$. The head is small, and covered with scales; the jaws are of equal length, and furnished with very small teeth, of which those in the upper jaw are rather the longest; there is an arched row of teeth extending on the sides and back of the palate. The lip-bones are broad; the nostrils double, oval, and very near the eyes, which are even with the top of the head, furnished with a nictating membrane, bluish pupil, and dark-brown iris. The anterior operculum is serrated, and exhibits the single gill in its interior part; the posterior operculum has one spine, but terminates in a blunt point. The gills have a wide aperture, and the membrane is concealed. The body is nearly of the same breadth to the end of the tail; the lateral line is very thin, and nearly in the same direction with the back; the anus is placed at some distance from its fin, but still nearer to the fin of the tail than to the head. The back and belly are round, which arises from the thickness of the body in general. The scales are small, hard, and serrated, forming a furrow on the back, and extending over part of all the fins except the ventrals. The soft rays are ramified. The fins are all rounded, and short in proportion to the size of the fish. The colour is brown, very dark on the back, light on the sides and belly; the pectoral fin is brimstone-colour, the ventral orange. This species is from Acara, on the Guinea coast; it lies in the shallows of the sea, not far from the shore. The flesh is white and wholesome; it feeds on shell-fish, and grows to a considerable size. This and the four following are included by Bloch in his new genus *Epinephelus*, or wall-eye, from the transparent membrane over the eye. Cæpede has brought them into this genus, in which, to avoid multiplying genera, we have followed him.

36. *Holocentrus marginatus*, the bordered wall-eye: fins red, tail rounded, anterior part of the dorsal bordered with black. The membrane of the gills has 5 rays, the

pectoral

pectoral fins 17, the ventrals 6, the anal $\frac{3}{11}$, the tail 18, the dorsal $\frac{1}{5}$. The head is large, declining, and covered with small scales. The lower jaw is longer than the upper; and both are armed with small teeth at the sides, and four large ones in front. The nostrils are single; the eyes large, with a black pupil, yellow iris, and transparent membrane. The anterior operculum is serrated; the posterior has three spines, but not at the extremity. The aperture of the gills is wide, and the membrane loose. The scales are small and hard. The fish is broad in front, and tapers off towards the tail. The back and head are light brown, the sides silvery with a shade of blue.

37. *Holocentrus fuscus*, the brown wall-eye: the fins black; a membrane over each eye. The membrane of the gills has 5 rays, the pectoral fins 14, the ventrals 6, anal $\frac{3}{2}$, tail 18, dorsal $\frac{1}{2}$. The body is long, and tapers towards the tail; the scales are small, and serrated; the rostrum declines; the lower jaw is somewhat longest; the nostrils are single, and near the eyes; the pupil is black, the iris yellow and violet-colour. The opercula are striped with blue; the hinder one is furnished with three spines. The ground-colour of this fish is yellow, marked with stripes and spots of brown. The fins are light yellow at the base, black at the extremities; the dorsal and tail are partly covered with scales. This species is from Norway.

38. *Holocentrus ruber*, the red wall-eye: body red; eleven spines in the dorsal fin. The membrane of the gills has 5 rays, the pectoral fins 12, the ventrals $\frac{1}{6}$, anal $\frac{3}{2}$, tail 20, dorsal $\frac{1}{2}$. The head is narrow with a declining rostrum, and covered, as well as the body, with small scales, hard and serrated; the lower jaw is the longest. The pupil of the eye is bluish; the irides double, a yellow and a blue one. The front operculum is slightly serrated, the hinder one has two spines. The head, back, and sides, are red; the belly paler, the base of the fins yellow. There is a furrow to receive the spines of the dorsal fin; the hinder part of that fin has scales, as also has the base of the anal and tail. This species is from Japan.

39. *Holocentrus rubro-fuscus*, the red-and-brown holocenter: 7 rays in each ventral fin, tail rounded, upper jaw movable. There are seven rays in the membrane of the gills, 16 in each pectoral fin, 18 in the caudal, $\frac{3}{2}$ in the dorsal, $\frac{3}{2}$ in the anal. This and the following eight were first described by Cope. The present species is from Commerçon's MSS. that celebrated voyager met with it near the Isle of France in 1769. It is a rare species; flesh well-tasted, and easy of digestion; length eight inches. There is a blackish spot near each eye. The dorsal and anal fins are striped, spotted, and edged, with red, and a black spot just beyond the dorsal; the ventrals are of the colour of minium, or red-lead; pectorals yellowish with small red spots on their base. The back is brown; sides spotted with red, and two red or reddish spots on the tail-fin. Three spines from the back of the operculum, which is pointed. Small bent teeth, crowded together, in both jaws; some still smaller in the palate and throat; tongue whitish, and almost smooth. The lateral line is made up of little interrupted strokes. Scales small and rough.

40. *Holocentrus soldado*, the soldado: $\frac{2}{10}$ rays in the anal fin, the second spine very long, strong, and flat; two spines in each operculum. Five rays in the membrane of the gills, 16 in each pectoral fin, $\frac{1}{6}$ in each ventral, 17 in the tail, $\frac{1}{2}$ in the dorsal. This was described from two specimens, one in a dried collection from Holland, the other was sent to Cope from Cayenne. The lower jaw is longer than the upper; the teeth are of various sizes, strong and sharp, larger in front, distributed in several rows in the upper jaw, the inner rows much crowded. There are beautifully-shining silver scales on the lower jaw, the opercula, the lateral line, and that part of the branchial membrane not covered by the opercula.

41. *Holocentrus gibbosus*, the gibbous holocenter: one spine in the second piece of each operculum, and a serrated plate rising over that second piece; the lateral line reaches from the tip of the snout to the origin of the dorsal fin, making an angle of more than 45° with the axis of the body and tail; the posterior part of the anal and dorsal fins rounded, and the ventrals also. In the pectoral fins 16 rays, $\frac{1}{6}$ in the ventrals, 17 in the tail, $\frac{1}{6}$ in the dorsal, $\frac{3}{10}$ in the anal. Teeth small, crowded, equal. This and the two following are from the Dutch collection so often mentioned.

42. *Holocentrus Sonnerat*, Sonnerat's holocenter; the first piece of each operculum notched; two spines of very unequal length over each eye; the dorsal fin very long, and rounded towards the tail; anal the same; three transverse bars with a very dark edging. Six rays in the membrane of the gills, 17 in each pectoral fin, $\frac{1}{6}$ in the ventrals, 20 in the tail, $\frac{1}{2}$ in the dorsal, and $\frac{2}{3}$ in the anal. Body long and compressed; general colour yellowish, the bands shining white or silvery. Sent from the Isle of France, where it is called *tanda-tanda*, and *kakatovea itam*; but Cope has named it after a very ingenious Frenchman.

43. *Holocentrus heptadactylus*, the seven-fingered holocenter: 7 rays in the ventral fins; lower jaw the longest, and upper lip double; three spines turned towards the snout and one towards the tail in the first piece of the operculum, one spine in the second piece; a plate deeply toothed over this second piece, another above each pectoral fin. Fifteen rays in the pectoral fins, 17 in the caudal, $\frac{1}{2}$ in the dorsal, and $\frac{3}{4}$ in the anal. Several rows of small even teeth in each jaw and the palate. The dorsal fin is divided very distinctly into two. From an examination of several of this species, Cope discovered, that the notches or points, in the toothed plate upon the operculum, increase with age. For instance, in a young one not 8 inches long, he reckoned six on the lamina nearest to the pectoral fin, and three in the second; but on an older one, more than 12 inches long, one of the plates had ten notches and teeth, the other five.

44. *Holocentrus pantherinus*, the panther holocenter: head, body, and tail, spotted like a panther; tail rounded. Fourteen rays in the pectoral fins, $\frac{1}{10}$ in the dorsal, $\frac{2}{4}$ in the anal. The lower jaw is the longest; one row of teeth only, standing apart, nearly equal in size, in each jaw. Three spines in the second piece of each operculum. Commerçon has left a drawing of this species, and the three following; the scales are hardly visible.

45. *Holocentrus rosmarus*, the sea-cow holocenter: two long strong conical teeth in the upper jaw, like the tusks of the *Trichechus rosmarus*, or sea-cow; scales small. Ten rays in the pectoral fin, $\frac{1}{2}$ in the dorsal, $\frac{1}{2}$ in the anal. The lower jaw is the longest; there are two spines in the hinder part of the operculum. The tail-fin is rounded; the dorsal bordered with brown or black, and the anterior part lower than the rest.

46. *Holocentrus oceanus*, the ocean holocenter; tail rounded; lower jaw the longest, one row of even teeth in each, upper lip double; three spines in the hinder part of each operculum; five transverse short blackish bars. In each pectoral fin 14 rays, 16 in the tail, $\frac{1}{2}$ in the dorsal, and $\frac{3}{4}$ in the anal. Inhabits the great ocean near the line or the tropics; dorsal fin like the preceding.

47. *Holocentrus salmoides*, the salmon holocenter: head like a salmon, snout flattened and compressed, upper jaw longest, teeth in several rows; 3 spines in the last piece of the operculum. Eleven spinous rays in the dorsal fin; a vast number of very small round equal spots on the head, body, tail, and fins. Has the same haunts as the preceding.

48. *Holocentrus Norvegicus*, the Norwegian holocenter: the lower jaw the longest, teeth numerous in both; spines over and under the eyes; dorsal fin very long; colour red. Seven rays in the membrane of the gills, 19 in each

each pectoral fin, $\frac{1}{6}$ in each ventral, 16 in the tail, $\frac{15}{2}$ in the dorsal, $\frac{3}{2}$ in the anal. Found between Greenland and Norway. The operculum terminates in a long spine. Nostrils double, some say treble. Scales round, large, and strongly adherent. The dorsal fin reaches from the top of the head to the tail.

PERCAPTURA, *f.* in old records, a wear or dam in a river for catching fish.

PERCA'ISE, *adv.* Perchance; perhaps. *Not used.*—A virtuous man will be virtuous in solitude, and not only in theatro, though *percase* it will be more strong by glory and fame, as an heat which is doubled by reflexion. *Bacon.*

PERCE', *adj.* In heraldry, perforated, represented as having a hole bored through.

PER'CEANT, *adj.* [*perçant*, Fr.] Piercing; penetrating. *Obsolete.*

Wonderous quick and *perceant* was his spright,
As eagle's eyes that can behold the sun. *Spenser.*

PERCE'E (Isle), a small but remarkable island on the west side of the Gulf of St. Laurence; being a perpendicular rock, pierced with two natural arches, through which the sea flows. One of these arches is large enough to admit a large boat to pass through it: fifteen miles south of Cape Gaspee.

PERCEIA'NA, in ancient geography, a town of Spain, in the route from the mouth of the river Anas to Emerita, according to the Itinerary of Antonine.

PERCEIVABLE, *adj.* [from *perceive*.] Perceptible; such as falls under perception.—The body, though it really moves, yet, not changing *perceivable* distance with some other bodies as fast as the ideas of our own minds will follow one another, seems to stand still; as the hands of clocks. *Locke.*—That which we perceive when we see figure, as *perceivable* by sight, is nothing but the termination of colour. *Locke.*

PERCEIVABLY, *adv.* In such a manner as may be observed or known.

PERCEIVANCE, *f.* Power of perceiving.—The senses, and common *perceivance*, might carry this message to the soul within, that it is neither careful, profitable, nor praiseworthy, in this life, to do evil. *Milton's Reas. of Ch. Gov.*—Hast thou any *perceivance* of these things, and do they make any impression upon thy mind? *Transl. of Boethius*, 1674.

To PERCEIVE, *v. a.* [*percipio*, Lat.] To discover by some sensible effects:

When you above *perceive* me like a crow,
That it is place which lessens and sets off. *Shakespeare.*

To know; to observe.—Jesus *perceived* in his spirit that they so reasoned within themselves. *Mark*, ii. 8.—His sons come to honour, and he knoweth it not; and they are brought low, but he *perceiveth* it not. *Job*, xiv. 21.—Till we ourselves see it with our own eyes, and *perceive* it by our own understandings, we are still in the dark. *Locke.*—How do they come to know that themselves think, when they themselves do not *perceive* it? *Locke.*—To be affected by.—The upper regions of the air *perceive* the collection of the matter of tempests before the air here below. *Bacon.*

PERCEIVER, *f.* One who perceives or observes.—Which estimation they have gained among weak *perceivers*. *Milton's Tetrachordon.*

PERCEL'LES (John), a Dutch engraver, the pupil of H. Cornelius de Vrooms, was born at Leyden in the year 1597. His son Julius was a native of the same city, and both excelled in painting and engraving shipwrecks, and other marine subjects. From the circumstance of the works of the father and son being marked with the same initial letters, some confusion has arisen; nor is it known whether to attribute the twelve small sea-views which bear these initials, to John or Julius. Another set of twelve in folio, of which the subjects are the Dutch navy,

are etched in a somewhat broader style, and are most likely the performance of the elder Percelles, being inscribed "Notatæ a famosissimo Navium Pictore Johannes Percelles," without any separate mention of the engraver's name.

PER'CEPIER, *f.* in botany. See APHANES.

PERCEPTIBILITY, *f.* The state of being an object of the senses or mind; the state of being perceptible. Perception; the power of perceiving. *Not proper.*—The illumination is not so bright and fulgent, as to obscure or extinguish all *perceptibility* of the reason. *More.*

PERCEP'TIBLE, *adj.* [Fr. from *perceptus*, Lat.] Such as may be known or observed.—No found is produced but with a *perceptible* blast of the air, and with some resistance of the air strucken. *Bacon.*—When I think, remember, or abstract; these intrinick operations of my mind are not *perceptible* by my sight, hearing, taste, smell, or feeling. *Hale's Orig. of Mankind.*—In the anatomy of the mind, as of the body, more good will accrue to mankind by attending to the large, open, and *perceptible*, parts, than by studying too much finer nerves. *Pope.*—Capable of perception.—The soul, when separated from the body, becomes more *perceptible* of happiness or misery. *Greene's Four Last Things.*

PERCEP'TIBLY, *adv.* In such a manner as may be perceived.—The woman decays *perceptibly* every week. *Pope.*

PERCEPTION, *f.* [Fr. *perceptio*, Lat.] The power perceiving; knowledge; consciousness.—*Perception* is that act of the mind, or rather a passion or impression, whereby the mind becomes conscious of any thing; as when I feel hunger, thirst, cold, or heat. *Watts.*—Matter hath no life nor *perception*, and is not conscious of its own existence. *Bentley.*—The act of perceiving; observation. Notion; idea.—By the inventors, and their followers that would seem not to come too short of the *perceptions* of the leaders, they are magnified. *Hale's Origin of Mankind.*—The state of being affected by something.—Great mountains have a *perception* of the disposition of the air to tempests sooner than the vallies below; and therefore they say in Wales, when certain hills have their night-caps on, they mean mischief. *Bacon.*—This experiment discovereth *perception* in plants to move towards that which should comfort them, though at a distance. *Bacon.*

PERCEPTIVE, *adj.* [*perceptus*, Lat.] Having the power of perceiving.—There is a difficulty that pincheth: the soul is awake and sollicit by external motions, for some of them reach the *perceptive* region in the most silent repose and obscurity of night: what is it then that prevents our sensations? *Glanville.*—Whatever the least real point of the essence of the *perceptive* part of the soul does perceive, every real point of the *perceptive* must perceive at once. *More's Dialogues.*

PERCEPTIVITY, *f.* The power of perception or thinking.—When the body is quite wearied out, consciousness and *perceptivity* do not leave the soul. *A. Baxter on the Soul.*—Although there be the difference of life and *perceptivity* between the animal and the plant, it is a difference which enters not into the account. *Paley's Nat. Theol.*

PER'CEVAL (Spencer), born Nov. 1, 1762, was son of John, the late earl of Egmont, by Catharine Compton, sister to Spencer earl of Northampton, from whom he took the Christian name of *Spencer*. His mother was, in 1770, created a peeress of Ireland, in her own right, with the title of Baroness Arden; and, dying in 1784, she was succeeded by her eldest son, Charles-George, who, in July 1808, was raised to the peerage of England. See the article HERALDRY, vol. ix. p. 591, 2. Mr. Perceval's infancy was spent at Charlton in Kent, the seat of his family, where he received the elements of his education. After this he went to Harrow school, where he was distinguished for the gentleness of his manners, the benevolence of his disposition, and the goodness of his heart: here he was contemporary with sir William Jones; and,

and, after having passed the usual time at this school, he was sent to Trinity-college, Cambridge, where he formed some of the most valuable connexions of his future life. As soon as he had completed his collegiate studies, he entered himself a member of Lincoln's Inn, and pursued the study of the law as a profession. He was remarkable for close and regular application; and, while employed as a barrister, was particularly noticed for his mild and gentlemanly behaviour, which he displayed in a high degree when he became prime minister.

At an early period he was appointed counsel to the admiralty: in the year 1799 he was honoured with a silk gown, and about this time he was elected counsel for the university of Cambridge. In consequence of his uncle's death, a vacancy was created in the borough of Northampton, which introduced Mr. Perceval into parliamentary life. He immediately gave his support to Mr. Pitt, and pursued the same line of politics regularly and consistently through the remainder of his life. Mr. Perceval had not been long in parliament before he attracted the marked attention of that minister, who it is said, being asked by his *secund*, Mr. Ryder, now lord Harrowby, when about to engage in a duel with Mr. Tierney, who was the fittest person to succeed him if he should fall in the contest, replied "Mr. Perceval is that man."

At this period, Mr. P. endeavoured to become thoroughly master of every branch of policy, dedicating his time and talents to the study of finance. In 1801, at the formation of the Addington administration, Mr. Perceval, then in his 39th year, was appointed solicitor-general, and in 1802 he was promoted to the situation of attorney-general, become vacant by the elevation of sir Edward Law, afterwards lord Ellenborough, to the chief-justiceship of the court of King's Bench. The only prosecution instituted by Mr. Perceval, in his character of attorney-general, worthy of notice, was that against Peltier, the editor of a French journal printed in London, for a libel on Bonaparte. Mr. Perceval retained his situation when Mr. Pitt resumed the reins of government, and continued to distinguish himself as a ready and staunch supporter of his measures. On the death of Mr. Pitt, Mr. Perceval, for the first time, appeared in the ranks of opposition; and it has been assumed, by those who were the witnesses of his parliamentary career at that period, that his talents were most conspicuous and marked when he rose as an opposition-speaker: in this character he was animated without asperity, earnest without ostentation, attached to his own party, without an indiscriminate contention with his adversaries.

When the Fox administration quitted office, towards the beginning of the year 1807, Mr. Perceval was appointed chancellor of the exchequer; but as the duke of Portland, who was first lord of the treasury, was very old and infirm, and seldom took an active or decided part in the administration of public affairs, Mr. Perceval was unquestionably, even then, the prime minister of Great Britain, and upon the death of that nobleman he became so nominally as well as virtually. The situation of the country and of Europe at this period was very difficult: it required great talents, exercised with uncommon delicacy, as well as decision and vigour. The talents of Mr. Perceval can hardly be said to have been of the first order; and it cannot be denied that the decision and vigour which he undoubtedly possessed, were not unfrequently mixed with something like precipitation and obstinacy. He seemed to have imbibed and acted upon a most dangerous idea, which a prime minister should never admit into his thoughts; viz. that a measure once openly avowed, ought on no account, and under no circumstances, to be abandoned.

As a public speaker, Mr. Perceval rose much in reputation and excellence, after he became minister: as the leading man in the house of commons, it was necessary that he should be able to explain and defend all his measures; and this duty, arduous under all circumstances,

was particularly so in his case, as there was scarcely any other member of administration, in that house, competent to the task of relieving or supporting him. He, in a short time, proved that he stood in no need of assistance; he made himself so completely acquainted with every topic that was likely to be regularly discussed, that he was never taken unawares or at a loss. In the statement of his measures, he was remarkably methodical and perspicuous. By many persons he was deemed particularly to excel in his replies; in rebutting any severe remark that came unexpectedly upon him, and in turning the fact adduced, or the argument used, against his opponent. "His speeches," says one of his biographers, "if carefully examined, will let us completely into the nature and extent of his talents: they display no large and comprehensive views; the arguments and illustrations that they contain do not proceed on any philosophical and luminous principles; but they are distinguished by their detail, by taking up a detached argument, and grounding it on the particular circumstances of the case, rather than upon any general maxim. This species of public speaking, however, was well adapted to his audience; for in a mixed and numerous assembly, such as the house of commons, there will always be found many more persons who can comprehend particular arguments than general reasoning, and who will deem the special pleader a man of much greater abilities than a comprehensive and philosophical statesman." In domestic life, few men were more amiable and more respected than Mr. Perceval; and few men, even in the private walks of society, can pass a greater portion of time with their family than did this prime minister of England.

The events of his administration do not properly belong to an article merely biographical. Some of them have been noticed in other places. His death was occasioned by the hand of an assassin, who was unquestionably mad. On Monday the 11th of May, 1812, about five o'clock in the evening, Mr. Perceval having walked from his house in Downing-street, was entering the lobby of the house of commons, where a number of people were standing; he was shot by a person named Bellingham, formerly a merchant, but whose distresses had probably deranged his mind. No serious attempt was, however, made on his trial to prove insanity; indeed time was not allowed for his friends, who resided at Liverpool, to appear in his behalf. The deed was committed on Monday evening; he was tried and convicted on the following Friday, which was as soon as it could be known in Liverpool that his trial would come on at the sessions then in its course. Ample provision was made for Mr. Perceval's family by parliament. See the article LONDON, vol. xiii. p. 288, 9.

PERCH, *f.* [from *perca*, Lat.] A fish. See the article PERCA.

PERCH, *f.* [from *perche*, Fr.] Something on which birds roost or sit.—For the narrow *perch* I cannot ride. *Dryden*.—The pole of a wheel-carriage, which is fastened to the middle of the hind axle-tree, and passes between the fore axle-tree and its bolster, being secured by the pole-pin, so as to move about it, and connecting the fore and hind carriages together. There have been various recent improvements in the perches of coaches and chariots, and the manner of hanging them, which we shall advert to under the article WHEEL CARRIAGES.

PERCH, *f.* [*pertica*, Lat.] A measure of length, otherwise called a *rod*, or *pole*; and much used in surveying and measuring of land.

Among the old Romans, and still among geometricians, the *pertica*, perch, is ten feet; and they otherwise call it the *catena*, *funis*, and *decempeda*. In England, the statute perch contains five yards and a half, or sixteen feet and a half; and for coppice-woods, &c. eighteen feet. A square perch is thirty square yards and a quarter. Forty square perches make a rood, and 160 an acre.

The customary perch is various in various counties:

in

in Staffordshire it is 24 feet; in the forest of Sherwood 21, the foot there being eighteen inches, the measure of which is marked in the chancel-wall of Edwyndstow, and in the church of St. Mary in Nottingham. In Herefordshire, a perch of walling is sixteen feet and a half; a perch of ditching twenty-one feet.

In France, according to the old system, the perch is from eighteen to twenty-three, and even twenty-seven, of their feet. The *arpent*, or acre of land, contains, in general, 100 square perches, but the perch varies in different parts of the country. The arpent of wood-land, however, is the same all over France, the perch being 22 feet long; this arpent, therefore, contains 48,400 French square feet = 6108 English square yards, or 1 acre, 1 rood, 1 perch. The arpent for cultivated land, in the neighbourhood of Paris, contains 900 square toises, or 4088 English yards; hence, 45 such arpents equal 38 English acres nearly.

To PERCH, *v. n.* To sit or roost as a bird.—Let owls keep close within the tree, and not perch upon the upper boughs. *South.*

The world is grown so bad,
That wrens make prey where eagles dare not perch.

Shakespeare.

To PERCH, *v. a.* To place on a perch.—It would be notoriously perceptible, if you could perch yourself as a bird upon the top of some high steeple. *More.*

As evening dragon came,
Affailant on the perched roofs,
And nests in order rang'd of tame villatic fowl. *Milton.*

PERCHAN'CE, *adv.* Perhaps; peradventure.—Finding him by nature little studious, he chose rather to endure him with ornaments of youth; as dancing and fencing, not without aim then perchance at a courtier's life. *Wotton.*

How long within this wood intend you stay?—
Perchance till after Theseus' wedding day. *Shakespeare.*

PER'CHANT, *f.* A decoy-bird, which the fowler has fattened by the foot, and which flutters about the place where it is tied, to draw other birds to it, and give the fowler an occasion of catching them.

PER'CHE, before the revolution, a country of France, which had formerly counts of its own; it enjoyed its own laws, subject to the parliament of Paris. It at present forms the department of the Orne.

PER'CHERS, *f.* Paris candles used in England in ancient times; also the larger sort of wax candles, which were usually set upon the altar. *Bailey.*

PERCIP'ANY, a town of New Jersey, on a branch of the Passaic: six miles north of Morristown.

PERCIP'IENT, *adj.* [*percipiens*, Lat.] Perceiving; having the power of perception.—No article of religion hath credibility enough for them; yet these cautious and quicksighted gentlemen can wink and swallow this sottish opinion about *percipient* atoms. *Bentley.*—Sensation and perception are not inherent in matter as such; for, if it were so, every stock or stone would be a *percipient* and rational creature. *Bentley.*

PERCIP'IENT, *f.* One that has the power of perceiving.—The soul is the sole *percipient*, which hath animadversion and sense properly so called; and the body is only the receiver of corporeal impressions. *Glanville's Scep sis.*

PER'CIVAL (Thomas, M.D.), an eminent physician, was born at Warrington, in September 1740. Having lost both his parents in one day, he was placed at the age of four years under the protection of his uncle, Dr. Thomas Percival, a learned and respectable physician, resident at the same place; but of his parental guidance he was also deprived at the age of ten, after which his education was directed with the most kind and judicious attention by his eldest sister, who conducted it with true parental attention. He received his classical instruction chiefly at the free-school of his native place, and was

afterwards (1757) the first enrolled student at the newly-founded Dissenting Academy of Warrington. At that seminary he particularly attended to ethical studies, and imbibed those theological tenets which fixed him as a conscientious separatist from the established church.

Having made choice of the profession of physic, he commenced his medical studies at the university of Edinburgh in his twenty-first year, and pursued them with that serious diligence which had marked his earliest introduction to learning and science. It was his characteristic, from the dawn of manhood, to seek the society of his superiors in age and attainments, and especially of persons of literary eminence; whence he reckoned many distinguished names among his friends and correspondents. One of these, lord Willoughby of Parham, vice-president of the Royal Society, was his particular patron; and shortly before his death proposed him for admission to that learned body, of which he was elected a fellow in his 25th year. In that year, 1765, he took the degree of M. D. at Leyden, and visited Paris and other parts of France on his return. He then married; and, after residing two years upon his property at Warrington, he removed, in 1767, to Manchester, where he almost immediately fell into extensive practice, and where he continued to reside till his death. Having during his former leisure engaged in various philosophical and experimental researches, chiefly relative to medical science, and drawn up papers on the results, he published them collectively in that year in one volume, under the title of "Essays Medical and Experimental." The favourable reception of this work induced him to follow it in 1773, which was as soon as his increasing avocations would admit, by a second volume; to which some papers of the philosophical and miscellaneous classes were added. In this many subjects of utility were touched upon; and though Dr. Percival's professional engagements, and the delicate state of his health, frequently suffering from severe headaches, did not allow him to pursue his enquiries to their farthest extent, he deserves the praise of having brought before the public several important topics which engaged the attention of others who enjoyed more leisure. A third volume of these Essays appeared in 1776.

Being the father of a rising young family, he employed some of his hours in a country retreat, during the summer of 1775, in composing for their benefit a small collection of "Moral Tales, Fables, and Reflections," which he published, and thus became distinguished in that class of highly meritorious writers, who have exercised, for the instruction of youth, powers of composition, practised in efforts of a superior, but perhaps not a more useful, kind. This little volume was very favourably received, both at home and abroad, where it was translated into the French and German languages; and it was followed by two other parts, successively adapted to readers of more advanced years. A "Socratic Discourse on Truth and Faithfulness," was a farther contribution to the plan of moral instruction by which it was his purpose to teach his elder children the most important branches of ethics by examples. The elegance of his language, the purity of his moral precepts, and the agreeable manner in which they were conveyed, justly caused him to be regarded as a great benefactor to parents in the discharge of one of their most essential duties.

Dr. Percival was a zealous promoter of all designs for mental improvement and the advancement of knowledge; and it was from weekly meetings for conversation held at his house that the Literary and Philosophical Society of Manchester took its origin. He was one of the first joint presidents, and afterwards for many years sole president, of that institution; and he contributed several valuable papers to its memoirs. The abolition of slave-trade, the repeal of the test-laws, and in general every attempt in favour of just and liberal policy, were assisted by his co-operation; whilst at the same time his mildness and moderation, his gentlemanlike demeanour, and the strict propriety

propriety of his conduct, preserved him from all angry contention. Steadily adhering to the religious sentiments which he had from conviction adopted, he however felt no alienation from those who followed different systems; and he manifested a great respect for the establishment, with many distinguished members of which he was upon terms of intimacy. Of his remaining literary productions the principal were a volume of "Moral and Literary Dissertations," 8vo. 1788, and "Medical Jurisprudence," first privately circulated in 1794, and afterwards published in an improved form, under the title of "Medical Ethics," 1803. This was the latest of his publications; and worthily terminated, by a tribute of valuable counsel to the members of a profession which he adorned, a course of authorship uniformly devoted to the best interests of his fellow-creatures. It should be added, that, although it is in the character of a writer he is chiefly entitled to biographical commemoration, that which he sustained as a physician of large experience, great sagacity, and manners singularly adapted to inspire confidence, was at least as conducive to the high reputation he enjoyed. This truly estimable person was carried off by an acute disease in August 1804, in the 64th year of his age, universally respected and regretted, and deeply lamented by a family with which he always lived in the most affectionate and confidential intercourse. His works were edited collectively by one of his sons in 1807, with a Memoir of his Life prefixed, from which, and from the Monthly Magazine of Sept. 1804, the preceding narrative is extracted.

PER'CKAM, a town of Austria: eighteen miles south-west of Freystadt.

PERCLOSE, *f.* Conclusion; last part. *Obsolete.*—By the *percolose* of the same verse, vagabond is understood for such an one as travelleth in fear of revengement. *Raleigh.*

To PER'COLATE, *v. a.* [*percolo*, Lat.] To strain through.—The evidences of fact are *percolated* through a vast period of ages. *Hale's Orig. of Mankind.*

PERCOLA'TION, *f.* The act of straining; purification or separation by straining.—Experiments touching the straining and passing of bodies one through another, they call *percolation*. *Bacon.*—Many have attempted the condensing of wines by *percolation*, or separating from them that superfluous moisture or water, which dilutes them below the true standard of vinous liquors, in order to make them richer, and fitter for keeping; but it does not appear that such attempts have as yet succeeded. *Chambers.*

PERCONTA'TION, *f.* A diligent enquiry. *Cole.*

PERCO'TE, in ancient geography, a town which belonged to Dardania, at a small distance south-west of Lampacus.

To PERCRU'CIATE, *v. n.* [from the Lat. *per*, through, and *crucio*, to torment.] To torment greatly. *Cole.*

PERCUNCTA'TION, *f.* A diligent enquiry. *Cole.*

To PERCUSS', *v. a.* [*percussus*, Lat.] To strike.—Flame *percussed* by air giveth a noise; as in blowing of the fire by bellows; and so likewise flame *percussing* the air strongly. *Bacon's Nat. Hist.*

We do love to cherish lofty spirits,
Such as *percu's* the earth, and bound
With an erected countenance to the clouds.

Beaum. and Fl. Laws of Candy.

PERCUSS'ION, *f.* The act of striking; stroke.—The *percussion* of the greater quantity of air is produced by the greatness of the body percussing. *Bacon.*—The vibrations or tremors excited in the air by *percussion*, continue a little time to move from the place of *percussion* in concentric spheres to great distances. *Newton's Opt.*—Marbles taught him *percussion* and the laws of motion, and tops the centrifugal motion. *Arbutnot and Pope.*

With thy grim looks, and
The thunder-like *percussion* of thy sounds,
Thou mad'st thine enemies shake. *Shakespeare.*

Effect of sound in the ear.—In double rhymes the *percussion* is stronger. *Rymer.*

PERCUSSIVE, *adj.* Striking; striking against.

PERCU'TIENT, *f.* [*percutiens*, Lat.] Striking; having the power to strike.—Inequality of sounds is accidental, either from the roughness or obliquity of the passage, or from the doubling of the *percipient*. *Bacon.*

PER'CY, an extensive township of America, in Grafton county, New Hampshire, watered by the several branches of Upper Ammonoosuck-river, bounded west by Northumberland, on Connecticut-river; incorporated in 1774, and containing 148 inhabitants.

PER'CY, or PERSY, a town of France, in the department of the Channel: twelve miles south of St. Lo, and fifteen north of Avranches.

PER'CY (Thomas, D. D.), a very learned prelate of Ireland, was a native of Bridgenorth in Shropshire, and educated at Christ Church, Oxford. In July 1753 he took the degree of M. A. and in 1756 he was presented by that college to the vicarage of Easton Mauduit, in Northamptonshire, which he held with the rectory of Wilbye, in the same county, given him by the earl of Suffex. In 1769 he was nominated chaplain in ordinary to the king; and in 1770 he took his doctor's degree at Emanuel-college, Cambridge. In 1778 he was promoted to the deanery of Carlisle; and in 1782 to the bishopric of Dromore in Ireland, where he constantly resided till his death, promoting the instruction and comfort of the poor with unremitting attention, and superintending the sacred and civil interests of the diocese, with vigilance and assiduity; revered and beloved for his piety, liberality, benevolence, and hospitality, by persons of every-rank and religious denomination. Under the loss of sight, of which he was gradually deprived some years before his death, he steadily maintained his habitual cheerfulness; and in his last painful illness he displayed such fortitude and strength of mind, such patience and resignation to the divine will, and expressed such heart-felt thankfulness for the goodness and mercy shown to him in the course of a long and happy life, as were truly impressive, and worthy of that pure Christian spirit in him so eminently conspicuous.

Dr. Percy was related to the family of the duke of Northumberland, and was many years domestic chaplain to the late duke. By his virtues and talents, more than by his connexions, he was raised to the prelacy, which he possessed for a long period, and the duties of which he discharged with exemplary zeal and true Christian charity. It is hardly necessary to say how much English literature has been indebted to the researches of this elegant scholar, who recovered from obscurity, and has preserved from oblivion, many beautiful remains of genius, which he gave to the world under the title of "Reliques of Ancient Poetry." In some that were mere fragments and detached stanzas, Dr. Percy supplied the deficiencies, and formed into a whole, by congenial taste, feeling, and imagination. The beautiful old ballad of "A Friar of Orders Grey," upon which Goldsmith founded his interesting Poem of "The Hermit," was among the remains of antiquity, which Dr. Percy completed in this manner; and he is the avowed author of the affecting song of "O Nannie, wilt thou gang with me." He was the last of the scholars of a famous school, the contemporary of Johnson, Gray, Shenstone, Goldsmith, Reynolds, &c. and the last of the illustrious association of men of letters who flourished at the commencement of the late long reign. In fact, he began his literary career in 1761, when he published *Han K'iou Chouan*, a translation from the Chinese; which was followed, in 1762, by a collection of "Chinese Miscellanies," and in 1763 by "Five Pieces of Runie Poetry," translated from the Icelandic language. In 1764 he published a new version of the "Song of Solomon," with a commentary and annotations. The year following he published the "Reliques of Ancient English Poetry," a work which constitutes an era to the history of English literature in the eighteenth century.

Perhaps

Perhaps the perusal of a folio volume of ancient manuscripts, given the bishop by a friend in early life, (from which he afterwards made large extracts in the Reliques,) led his mind to those studies in which he so eminently distinguished himself. The same year he published "A Key to the New Testament," a concise manual for students of sacred literature, which has been adopted in the universities, and often reprinted. After the publication of the Reliques, he was invited by the late duke and duchess of Northumberland to reside with them as their domestic chaplain. In 1769 he published "A Sermon preached before the Sons of the Clergy at St. Paul's." In 1770 he conducted "The Northumberland Household Book" through the press; the same year he published "The Hermit of Warkworth," and a translation of Mallet's "Northern Antiquities," with notes. A second edition of the Reliques of Ancient Poetry was published in 1775, a third in 1794; and a fourth was in the press at the time of his death, which took place at the sea-house near Dromore, where he had constantly resided for thirty years, on the 30th of September, 1811, in the 83d year of his age.

By his marriage he had one son, who however died before him. Two daughters survived him; the eldest married to Samuel Isted, esq. of Ecton, in Northamptonshire; and the youngest to the archdeacon of Dromore. In 1777 the Rev. John Bowle addressed a printed letter to Dr. Percy, announcing a new and classical edition of Don Quixote. In 1780 Mr. Nichols was indebted to him for many useful communications for the Select Collection of Miscellaneous Poems. When elevated to the mitre, Mr. Nichols was also under further obligations in the History of Hinckley, 1782. In 1786 the edition of the Tatler, in six volumes small 8vo. was benefited by the hints suggested by Bp. Percy to the Rev. Dr. Calder, the learned and industrious annotator and editor of those volumes. The subsequent editions of the Spectator and Guardian were also improved by some of his lordship's notes. Between the years 1760 and 1764, Dr. Percy had proceeded very far at the press with an admirable edition of "Surrey's Poems," and also with a good edition of the works of Villiers duke of Buckingham; both which, from a variety of causes, remained many years unfinished in the warehouse of Mr. Tonson, in the Savoy; but were resumed in 1795, and nearly brought to a conclusion; when the whole impression of both works was unfortunately consumed by the fire at Mr. Nichols's office, in Red Lion Passage, in 1808.

It is very remarkable, that the bishop's successor, Dr. Hall, survived his elevation only ten days; he died the very day on which his promotion to the see of Dromore was announced in the London Gazette. *Gent. Mag.* Nov. 1811.

PERDI', or PERDY, *adv.* [a corruption or softening of the French oath *Par Dieu*, by God.] A term of asseveration frequent in our ancient poetry; and, as Mr. Mason observes, it is used sometimes for *verily*, but often without any apparent meaning at all.—That redcrosse knight, *perdie*, I never slew. *Spenser*.—*Perdy* your doors were lock'd, and you shut out. *Shakespeare's Com. of Errors*.

She wist not, silly mayd, what she did aile,
Yet wist she was not well at ease, *perdy*;
Yet thought it was not love, but some melancholy. *Sp.*

So she, not having yet forgot, *perdy*,
Her wonted shifts and sleights in Cupid's toys,
A sequence first of sighs and sobs forth cast,
To breed compassion dear, then spake at last. *Fairfax*.

The knave turns fool, that runs away,
The fool no knave, *perdy*.

K. Lear.

It has become obsolete with us; but is still used in France, most commonly, instead of the awful oath *Par Dieu*, in order, if possible, to cheat the devil. We have similar softenings and shifts in the English language, used

with the same intentions, and producing the same effect; that is, none at all.

PERDIC'CAS, the name of several kings of MACEDON. See that article, vol. xiv. and GREECE, vol. viii. p. 949, 50.

PERDI'CIUM, *f.* [appears to have been so called by Linnæus, on account of a considerable resemblance between his original species, *semiflosculare*, and his Leontodon (now Hieracium) bulbosum. The latter was thought by some to be the *περδικιον* of Theophrastus, which received that appellation, as the Greek writer expressly mentions, because partridges frequented the plant and scratched its roots out of the ground. Now the roots of the Linnæan *Perdicium semiflosculare* are copious, long, and fleshy, and we cannot doubt that hence arose the scarcely-warrantable assumption of an old Greek name for a Cape and American genus, though that name had hitherto not been, with any certainty, appropriated.] In botany, a genus of the class syngenesia, order polygamia superflua, natural order of compositæ discoideæ, (corymbifera, *Juss.*) Generic characters.—Calyx: common oblong, imbricate; leaflets lanceolate, the inner ones scarcely longer than the corolla. Corolla: compound, imbricate, rayed: corollets hermaphrodite in the disk; female in the ray. Proper of the hermaphrodite tubular, semibifid: inner lip two-parted, acuminate, equal; outer semitrid, linear, equal: of the female linear, ligulate, three-toothed, two-toothed within at the base. Stamina: in the hermaphrodites; filaments five, short; anthers cylindrical, tubular, five-toothed. Pistillum: in the hermaphrodites; germen small; style simple; stigma bifid, blunt. In the females; germen small; style semibifid; stigmas blunt. Pericarpium none; calyx unchanged. Seeds solitary, obovate; down capillary, sessile, very copious, the length of the calyx, fastigate. Receptacle naked. The flower resembles a semifloscular corolla, though it is really rayed. The character is taken from *P. semiflosculare*, which is very distinct in the genus. *P. radiale* agrees with the genus in its bilabiate capsules, but differs in the whole habit. *P. brasiliense* has subradiate flowers, and hermaphrodite bilabiate florets in the disk and ray.—*Essential Character*. Corollets bilabiate; down simple; receptacle naked. There are fourteen species.

1. *Perdicium semiflosculare*: flower semifloscular; scape one-flowered, naked. Root fibrous. Stature of Leontodon. Root-leaves of Taraxacum, naked. Scape the length of the leaves. Flower the size of Leontodon; calyx of Scorzonera. Corolla rayed; corollets between those of semifloscular and radial flowers, semibifid, with the inner lip two-parted, the outer three-parted. Down simple. Receptacle naked. Native of the Cape of Good Hope.

2. *Perdicium radiale*; (*Inula Trixis*, *Linn. Amoen. v. 406*. *Trixis frutescens*, *Brown's Jam. 312. t. 33. f. 1.*) Flowers subradiate, outer calyx four-leaved, stem shrubby. Habit of the flowers as in *Inula* or *Conyza*. These two species differ in their whole appearance, and are scarcely allied; but the singular division of the corollets, in the outer segments smoother, almost as in *Elephantopus*, made Linnæus unite them, till they were examined more carefully in a living state. Browne says, that this little shrub is very common in the savannas about Kingston in Jamaica, and seldom rises above four or five feet in height. The common receptacles are disposed at the extremities of the branches, and the outer divisions of the flowers grow gradually smaller, and curl more downwards as they approach the centre; which gives the whole something the appearance of a radiated flower, at the first appearance.

3. *Perdicium Brasiliense*: flowers subradiate, calyxes simple, stem herbaceous. Root-leaves lanceolate-ovate, repand-toothed, subpubescent, viscid; stem-leaves alternate, sessile, lanceolate, narrow, somewhat toothed. Flowers at the top of the stem, naked, several: they have the appearance of *Arnica montana*, with the corolla yellow.

yellow. Florets both in the disk and ray bilabiate hermaphrodite. Native of Brazil.

4. *Perdicium Magellanicum*: leaves runcinate; stem two-leaved, simple, one-flowered. This is a pretty little plant. Leaves small, radical, several. Stem quite simple, tomentose, with two alternate ferrate leaves. Flower white, rayed. Native of Terra del Fuego.

5. *Perdicium tomentosum*: leaves lyrate, tomentose underneath. This is a small, stemless, herbaceous, plant. Leaves radical, several, petioled, erect, a finger's length; lobes toothed, the end-tooth rounded. Scape tomentose, erect, one-flowered, a little longer than the leaves. Calyx many-leaved, imbricate, smooth. Flowers with a purple ray; corollets of the disk yellow, four-cleft; one segment longer, linear, more deeply divided from the rest; the two lateral ones similar and equal; the middle one wider, rounded, scarcely longer than the lateral ones. Native of Japan; flowering there in April and May.

6. *Perdicium lævigatum*: flowers subradiate, stem suffruticose; leaves lanceolate acute, quite entire. Calyx cylindrical, consisting of eight equal leaves in one row; besides which, it has often at the base two or four similar leaflets, a little longer than the others. All the florets androgynous, bilabiate, fertile; in the disk four or five, tubular, bifid at top, with the lips equal, concave, quite entire, villose on the outside; in the ray eight, unequally bilabiate; the outer lip ovate-oblong, with two or three teeth, and rayed; inner lip linear, quite entire, rolled back at the tip. Receptacle narrow, flat, densely and very-shortly villose; seeds uniform, oblong, obsolete angular, with very minute bristles scattered over them, bay-coloured. Down bristle-shaped, with very many toothlets, twice as long as the seed. This differs from the others in the shape of the florets.

7. *Perdicium anandria*, or Siberian *perdicium*; (*Tussilago anandria*, *Lin.*) Stalk radical, single-flowered, with several awl-shaped bractes; leaves lyrate, acute, denudated on both sides; calyx closed, longer than the florets. Native of Siberia and the northern parts of China, in mountainous fields. Cultivated by Miller in 1759. It flowers in March, and is perennial; but has nothing to recommend it as a garden-plant, except botanical singularity. The root, according to Gmelin, consists of many fleshy spreading fibres, like that of *aphodel*. Leaves radical, stalked, minutely toothed; when young, cottony beneath, but becoming naked and smooth on both sides when fully grown. Flower-stalk a foot high, much taller than the leaves; flower nearly globose; its calyx downy, closed, rising much above the florets, which appear to have the proper characters of *Perdicium*, as was first pointed out by Mr. Brown. The whole habit of the plant, compared with the preceding species, confirms his determination of the genus.

8. *Perdicium populifolium*; (*Tussilago scapo imbricato*, *Gmel. Sib. ii. 141. t. 67. f. 1.*) Stalk radical, single-flowered, with several sheathing bractes. Leaves ovate, wavy, toothed; densely woolly beneath. Root creeping. Native of Siberia, in stony places. The root creeps among stones, and is not thicker than a crow's quill. Leaves simple, (not lyrate,) wavy or coarsely toothed; cottony beneath at all times; clothed with deciduous down on the upper side when young, but afterwards smooth and shining, of a dark purplish hue. Flower-stalk invested with three or four broad, sheathing, finally smooth, bractes. Flowers white; calyx chiefly downy at the base, scarcely more than half the length of the spreading radius, which is white.

9. *Perdicium purpureum*: stems mostly simple, nearly leafless, ascending; flowers solitary; leaves pinnatifid, cut, loosely woolly; radius revolute. Gathered by Commerçon in the Straits of Magellan. The root is perennial, with long slender fibres. Stems several, ascending three or four inches high, simple or rarely divided, loosely woolly, bearing usually one pinnatifid leaf near the base, and several alternate linear undivided ones higher up.

Leaves mostly radical, stalked, clothed with fine long lax deciduous wool, deeply pinnatifid; their segments ovate, or wedge-shaped, deeply and irregularly cut; their margins generally entire and smooth, but now and then minutely spinous. Flowers terminal, solitary, about an inch wide; radiant florets ovate, entire, revolute, purple. Down more feathery than in the rest. Given by Thouin to the younger Linnæus.

10. *Perdicium nervosum*: leaves simple; downy and ribbed beneath. Native of the Cape of Good Hope. *Willdenow.*

11. *Perdicium Chilense*: stem leafy, single-flowered; leaves linear-lanceolate, stalked, ferrated at the extremity. Native of Chili. Root perennial. Stems several, a span long, ascending, smooth, leafy, single-flowered. Leaves half an inch long, linear-lanceolate, tapering at each end, very narrow, sharply ferrated at the apex. Footstalks longer than the leaves. Bractes numerous, somewhat stalked, of the shape of the leaves, surrounding the flower, which is radiated. *Willdenow.*

12. *Perdicium laëticoides*; (After magellanicus, *Lamarck.*) Stem leafy, single-flowered. Radical leaves elliptic-lanceolate, on long stalks; the rest sessile, clasping the stem. Gathered at the Straits of Magellan, by Commerçon, who having marked his specimens as an *Alter*, the plant was described as such by Lamarck. The whole herb is destitute of pubescence. Stem from one to nearly two feet high, slender, quite simple, round, leafy. Radical leaves several, an inch or two long, entire, on slender almost-capillary footstalks, three or four times their own length. Flower solitary, rather drooping, not unlike that of *P. Magellanicum*, but scarcely half so large.

13. *Perdicium squarrosum*: stem many-flowered; leaves pinnatifid, with toothed bristly segments. Gathered by Commerçon at Monte Video. A very handsome species. The stem is above a foot high, leafy, corymbose, hispid in the manner of the fourth species. Leaves sessile, two or three inches long, linear, shining, rough with minute points; the radical leaves most numerous, somewhat stalked, their segments rather folded or imbricated. Flowers solitary at the top of each branch, from four to eight in all, an inch broad; calyx rough, pointed, its outer leaves fringed; radius purple, revolute.

14. *Perdicium recurvatum*: stem somewhat shrubby; leaves linear-lanceolate, recurved, revolute, bordered with minute spines; flowers terminal, solitary. Gathered by Commerçon at the Straits of Magellan. This seems to be a low tufted much-branched shrub, with crowded shining leaves an inch long. Flowering branches erect, roughish upwards, each bearing a few alternate, fringed, clasping leaves, and one erect purple flower, about an inch wide, whose outer calyx-leaves are fringed with small spines. A very pretty and singular species, which, though different in its first aspect, displays, when examined, abundant marks of affinity to the rest. This genus is the *TRIXIS* of Brown; and is nearly allied to *TUSSILAGO* and *ANANDRIA*.

PERDI'DO, or *PERDIGO*, a river and bay on the coast of West Florida. The mouth of the river is about ten leagues east of Mobile Point, and four west of the line of Pensacola. It has a narrow entrance, with a bar of six feet, but afterwards widens considerably. This was formerly the boundary between Florida and Louisiana, separating the (then) French and Spanish dominions, and is now considered as the eastern boundary of Louisiana, though both countries now belong to the United States. The river stretches in one place north-east, where it passes within a mile of the great lagoon west of the entrance of Pensacola Harbour; and runs into the Gulf of Mexico, forming a large bay at its mouth, in lat. 30. 20. N. lon. 87. 26. W.

PER'DIFOL, *f.* [from the Lat. *perdo*, to destroy, and *folium*, a leaf.] A plant that drops its leaves in winter.

PERDIT'ION, *f.* [*perditio*, Lat.] Destruction; ruin; death.—Upon tidings now arrived, importing the meer

perdition of the Turkish fleet, every man puts himself in triumph. *Shakespeare*.

Quick let us part! *Perdition's* in thy presence,
And horror dwells about thee! *Addison's Cato*.

Loss:

There's no foul loft,
Nay not so much *perdition* as an hair
Betid to any creature in the vessel
Which thou saw'st sink. *Shakespeare's Tempest*.

Eternal death.—Men once fallen away from undoubted truth, do after wander for evermore in vices unknown, and daily travel towards their eternal *perdition*. *Raleigh's Hist.*

PER'DIX, a young Athenian, son of the sister of Dædalus. He invented the saw, and seemed to promise to become a greater artist than had ever been known. His uncle was jealous of his rising fame, so he threw him down from the top of a tower, and killed him. Perdix was changed into a bird, (the partridge,) which bears his name. *Hygin. fab. 39. & 274.—Ovid. Met. viii. 220, &c.*

PERDO'LI, a town of Istria: four miles north-north-west of Pola.

PERDU', *adv.* [Fr. *loft*, or appearing to be lost; as, *enfans perdus*, advanced sentinel, or forlorn hope.] Close; in ambush.—If a man is always upon his guard, and (as it were) stands *perdu* at his heart. *South*.—If God keep not the house and the city, in vain the builder builds, and the watchman wakes, and the sentinel stands *perdu*. *Abp. Sancroft*.

Few minutes he had laid *perdue*,
To gnard his desp'rate avenue.

Hudibras.

PER'DU, *f.* [Fr. *loft*. It was often accented on the last syllable in poetry.] One that keeps watch by night.—Call in our *perdués*. *Suchling's Goblins*.

As for *perdués*,

Some choice fous'd fish brought couchant in a dish,
Among some fennel or some other grass,
Shews how they lie i' th' field. *Cartwright's Ordinary*.

One of ruined fortunes:

I know him for a wild corrupted youth,
Whom profane ruffians, squires to bawds, and strumpets,
Drunkards spew'd out of taverns into th' sinks
Of tap-houses and stews, revolts from manhood,
Debauch'd *perdués*, have by their companies
Turn'd devil-like themselves. *Chapman's Widow's Tears*.

PER'DU, *adj.* Employed on desperate purposes; accustomed to desperate purposes:

A *perdue* captain,
Full of my father's danger. *Beaum. and Fl. Loy. Subject*.

PERDU' (Mont), the loftiest mountain of the Pyrenées, and the most elevated in which any marine remains have been found in Europe. M. Ramond observed that this mountain was calcareous, and contained shells and other organized bodies, in a fossil state, at an elevation of about 3000 metres. As he ascended this mountain, in August 1802, by passing the Col de Fanlo, or Nisele, he constantly found strata of compact carbonated lime in a position nearly vertical. They include strata of calcareous sandstone, and these strata sometimes cover the salient angles of the vertical strata, nearly in a horizontal direction. This calcareous stone falls off spontaneously in little irregular fragments; and on the slightest friction, or dissolved in acids, it emits a nauseous fœtid smell, probably owing to the animal matter it contains. Some of the strata of this stone contain nodules of flint; others such considerable masses of "Camerines," that the stone appears entirely composed of them. The summit is formed of a fœtid limestone, contaminated with quartz, and containing a little iron, and $\frac{1}{50}$ th of carbon, without alumine. The elevation of this summit is the same as that of the Col du Géant in the Alps, or 3426 metres = 3727 yards.

VOL. XIX. No. 1328.

M. Ramond has ascertained the limits of permanent snow, and of vegetation, for this lofty part of the Pyrenean chain. The snow terminates at 2440 metres. The last trees are Scotch firs, which reach 2150 metres. Next come the shrubs, of which the juniper is the highest. At 2760 metres were found the *Ranunculus parnassia foliis*, the *Saxifraga Groenlandica*, &c. then the *Artemisia rupestris* of Lamarck; and lastly, round the very peak of Mont Perdu, on rocks too sloping to retain the snow, grow the *Cerastium*, perhaps the alpinum of Linnæus, and the rose-flowering *Aretia alpina*.

PERDUC'TION, *f.* [from the Lat. *per*, through, and *duco*, to lead.] The act of leading through. *Cole*.

PER'DUE BA'Y, a bay on the south-west coast of the island of St. Vincent: one mile north-west of Kingston Bay.

PERDUEL'ION, *f.* [*perduellio*, Lat.] An open act of hostility. *Cole*.

PERDUEL'LISM, *f.* An open act of hostility.

PER'DULOUS, *adj.* [from *perdo*, Lat.] Lost; thrown away.—There may be some wandering *perdulous* wishes of known impossibilities; as a man who hath committed an offence, may wish he had not committed it: but to chuse efficaciously and impossibly, is as impossible as an impossibility. *Bramhall against Hobbes*.

PER'DURABLE, *adj.* [Fr. from *perduro*, Lat.] Lasting; long continued. A word not in use, nor accented according to analogy.—O *perdurable* shame! let's stab ourselves. *Shakespeare*.

The vigorous sweat
Doth lend the lively springs their *perdurable* heat. *Drayton*.

PER'DURABLY, *adv.* Lastingly:

Why would he for the momentary trick
Be *perdurably* fin'd? *Shakespeare's Meas. for Meas.*

PERDURA'TION, *f.* Long continuance.

PERDY'. See PERDI'.

PERE-EN-RET'Z (St.), a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Paimbœuf. The place contains 1973, and the canton 5988, inhabitants.

PERE'A, a small island near the coast of Brasil. Lat. 2. 22. S. lon. 45. 2. W.

PEREAS'LAU, a strong populous town of Poland, in the palatinate of Kiovia, situated on the river Tribeccz. Lat. 49. 46. N. lon. 32. 44. E.

PEREBE'A, *f.* in botany, (Aubl. Guian. 952. t. 361. *Juss. 402.*) a Guiana plant, whose botanical characters are not fully known. Aublet describes it as a middling-sized tree, throwing up from the root many straight flexible trunks, about four or five inches in diameter, which bear striated leafy branches. Leaves alternate, nearly sessile, elliptic-oblong, pointed, wavy and somewhat toothed, a foot or more in length, and about five inches wide, green, smooth and shining, with one principal rib and many transverse ones. When held against the light, these leaves appear full of transparent dots. Stipules solitary, large, membranous deciduous. Flowers axillary, on short stalks, solitary, each consisting of a flat fleshy receptacle, toothed at the edge, two inches or more in diameter, its upper surface covered with about thirty crowded florets, and at length becoming convex. Each floret consists of a tubular calyx, with four teeth, embracing a roundish germen, a fleshy columnar style, and cloven stigma. Aublet saw nothing of the stamens, which he supposes are in separate flowers, on a distinct tree. The calyx becomes a fleshy fruit, of a coral red, containing a single seed, as in the mulberry; but each fruit falls off separate, leaving the receptacle bare. Every part of the tree yields a milky juice. The bark serves for cordage. This genus is justly ranged by Jussieu in his natural order of Urticæ, being evidently allied to *Ficus*, *Morus*, *Broussonetia*, &c.

PER'EFIXE (Hardouin de Beaumont de), a prelate and historian, descended from an ancient family in Poitou, was the son of cardinal Richelieu's maitre-d'hotel. That

minister took care of his education; and, being brought up to the church, he was made a doctor of the Sorbonne, and preached with applause. He was chosen to be preceptor to Louis XIV. and some time after was nominated to the see of Rhodéz; but, as he could not fulfil the duties of both these functions, he resigned his bishopric. In 1654. he was admitted into the French Academy. By the king's command, he composed an abridgment of French history, from which he detached the Life of Henry IV. and it was published at Amsterdam in 1661, and with augmentations at Paris the year after. The last Paris edition is of 1749. Though written in a negligent style, it is accounted an excellent work, and one which gives a better picture of that amiable monarch than the fuller history of Father Daniel. Perefice likewise published a small piece, entitled "Institutio Principis," 1647, being a plan of royal education during the period of childhood. In 1664. he was created archbishop of Paris, and had the fortune to be deeply involved in the quarrels of Jansenism. He was governed by the Jesuits; and it was by the advice of Father Annat that he published his *mandement* for the pure and simple signature of the Formulary of Alexander VII. He imagined the distinction between divine faith and human faith, which pleased the fanatics of neither party. He gave particular offence by requiring a subscription of the Formulary from the nuns of Portroyal, and thence has been painted in unfavourable colours by the writers of that party. His private character, however, was mild and amiable. He died at an advanced age in 1676.

PERE'GAL, *adj.* [French.] Equal. *Obsolete.*

Whilom thou wast *peregal* to the best,
And wont to make the jolly shepherds glad;
With piping and dancing didst pass the rest. *Spenser.*

PEREGRINARY, *f.* [*peregrinarius*, Lat.] In the ancient monasteries, a monk to whom was committed the care of receiving and entertaining strangers, or visitors.

To PER'EGRINATE, *v. n.* [*peregrinor*, Lat.] To travel; to live in foreign countries.

PEREGRINA'TION, *f.* [French.] Travel in foreign countries.—That we do not contend to have the earth pass for a paradise, we reckon it only as the land of our *peregrination*, and aspire after a better country. *Bentley.*

PEREGRINA'TOR, *f.* [Latin.] A traveller.—He makes himself a great *peregrinator*, to satisfy his curiosity, or improve his knowledge in natural things. *Casaubon on Credulity.*

Mr. Todd derives this word from the verb to peregrinate; but it is pure Latin. Cicero says, "*Non tam sum peregrinator jam quam solebam. Edificia mea me delectant. I am not so much of a peregrinator as I used to be. Raising new buildings keeps me at home, and delights me.*" *Cic. fam. i. 18.*—Here we note the real feelings of a man getting old. He gives up visiting distant places; he lives quietly upon his estate; looks about his own grounds; improves his premises with new edifices, and suitable additions to his family-mansion; and endeavours to find at home the diversions which, when young, he sought for abroad. Such a man was this highly-esteemed consular personage, M. T. Cicero. *Etymological Gleanings, MS.*

PER'EGRINE, *adj.* [*peregrin*, old Fr. now *pelerin*; *peregrinus*, Lat.] Foreign; not native; not domestic.—The received opinion, that putrefaction is caused by cold or *peregrine* and preternatural heat, is but nugation. *Bacon's Nat. Hist.*—A term applied, among astrologers, to a planet, when found in a sign where it has none of its five essential dignities.

PEREGRINITY, *f.* [*peregrinité*, old Fr.] Strangeness.—Mr. Boswell says, that Dr. Johnson coined this word; and, upon being asked if it was an English one, he replied No. See his Journal of a Tour to the Hebrides. It is, however, an old English word; and, being inserted in the vocabulary of Cockeram, early in the seventeenth century, may be presumed to have been in use; but it is

not worthy to be revived. *Todd.*—These people, sir, that Gerrard talks of, may have somewhat of a *peregrinity* in their dialect, which relation has augmented to a different language. *Boswell's Tour*, 2d edit.

PEREGRINUS, surnamed PROTEUS, a cynic philosopher in the second century, was a native of Parium in Pontus. If we are to credit the account which Lucian has given of him, his conduct in early life was profligate and flagitious; having been guilty of adultery when he had scarcely reached the age of manhood, and even suspected of strangling his own father, in order to get possession of his estate. Being obliged to fly from his country, he went to Palestine, where he made a profession of Christianity, and gained a temporary credit with the Christians, by his firmness in submitting to imprisonment under Trajan's persecution, sooner than renounce his avowed principles. During his confinement, he was visited by deputies from the churches of Asia, who liberally administered to his relief; and, in the character of a persecuted believer, he contrived to amass a considerable sum of money. At length he was set at liberty by the governor of Syria, who was a lover of philosophy, and admired the contempt of death which Peregrinus displayed. Upon this he returned to Parium, where he secured exemption from the punishment due to his crimes, by surrendering his property to the use of the city, and acquired reputation in the character of a disinterested philosopher. By the charity of the Christians, whom he still continued to deceive, he was furnished with all necessary supplies, till, having been detected in the commission of some crime, he was dismissed from their society, and fell into indigence. He now endeavoured to recover the possession of his estates from the city, by the intervention of the imperial authority; but failed in that design, and went into Egypt. Here, in the character of a mendicant cynic, he practised the most extravagant exploits of fanaticism, in order to show his contempt for the opinion of the world. From Egypt he went to Italy and Rome, where he poured forth the most indecent invectives against men of rank, and even the emperor himself, whose bounty he experienced; till at length the prefect was provoked to drive him from the city. Passing over into Greece, he attracted the admiration of the crowd at Athens, by the severity of his cynical manners, and the lectures which he delivered.

Finding, by degrees, their enthusiasm in his favour becoming less ardent, he determined to procure an immortal name, by burning himself at the olympic games, in imitation of Hercules. This design he announced throughout the whole of Greece; and, at the appointed time, went to Olympia, where, in the presence of a vast concourse of spectators, he raised a funeral-pile, and devoted himself to voluntary death. By the weaker part of the assembled multitude this action was highly applauded, and Peregrinus was spoken of as worthy of divine honours; but it was properly condemned by the wise, and finely exposed by Lucian, who observes, that, of all who have been plagued with that passion, the love of fame, there can scarcely have been one who had fewer pretensions to her favour than our cynic.

In the foregoing particulars we have chiefly followed the Grecian satirist; but it may be questioned whether he has given a strictly impartial account of the character of Peregrinus: for Aulus Gellius speaks of him as a philosopher of reputation at Athens, who was admired for his constancy, and whose moral lectures were much frequented. The story of his last mad adventure is probably true. According to Eusebius, he committed himself to the flames in the year 168. *Lucian de Morte Peregrini. Aul. Gel. lib. xii. xiii. Enfield's Hist. Phil. vol. ii.*

PERE'IRA (Bartholomé), a Portuguese Jesuit, and one of the many epic poets whom that extraordinary society has produced. The work which he published bears this title, "*Pacificados, libri 12.*" Coimbre, 1640. It is rarely met with. Any person acquainted with Portuguese history would suppose that Pacheco to be the hero whose

whose exploits against the Zamorin approach more nearly to the achievements of Amadis or Palmerin than any other parallel which history can supply: the poem, however, is in honour of a Jesuit who suffered martyrdom in Japan, and to whom the poet was related.

PERCIRA has written without any appropriate learning. Except the names of the idols and the bonzes, there is no allusion to any rite or custom of the country. There are, however, some curious passages in the poem, particularly a personification of Amor Vitæ, and some of real merit. Were a collection of the modern Latin poets to made, the *Pacicis* ought undoubtedly to be included. R. S. in *Gen. Biog.*

PERE'IRA DE SU'SA, a town of Portugal, in the province of Beira: twenty-three miles north-east of Bragança Nova, and eighteen south-east of Oporto.

PEREK, a town of Persia, in the province of Faristan: fourteen miles north of Darabgherd.

PER'EKOP, a fortress of Russia, in the province of Tauris, on the isthmus which joins the peninsula to the continent, and which has always been reckoned the key to the whole country. Its name is Sclavonian, and signifies "a cut made through" a place; being derived from a ditch dug here, in very remote ages, across the neck of land at the entrance of the Crimea, for the security of the peninsula; and which has been from time to time repaired, and at length fortified. On this account the Greeks called it *Taphros*, or *Taphra*, and the Turks and Tartars *Or*; which have pretty much the same signification with Perekop. The houses here are but mean. In the years 1638 and 1736, the Russians took it; at the last of which times, the whole Turkish garrison, consisting of 2554 men, were made prisoners of war. Though the Russians demolished the place, the Tartars took the pains to rebuild it. In 1771, it was again taken by the Russians, when the garrison surrendered prisoners of war. In 1783 it was finally ceded to Russia, with the rest of the Crimea; by the abdication of the khan. It is 132 miles south-south-west of Ekaterinoslav, and 220 west-south-west of Azof. Lat. 46. 4. N. lon. 33. 20. E.

PEREKOPSKA'IA, a town of Russia, in the country of the Cossacks, on the Don: forty-eight miles south of Archadinkaia.

PEREL'LI (Thomas), a very able Italian mathematician, was born in 1704 at Florence, where his father was an advocate. He received the early part of his education at his native place, under the Jesuits; and, being destined by his father for the law, was sent to Pisa, where he attended the celebrated Averani, but without neglecting other branches of study, for which he seemed to be better fitted, and particularly the mathematics. In this department he made so great progress, without any assistance, that he attracted the notice of the celebrated Guido Grandi, who received him into his monastery of St. Michael, and communicated to him his writings on algebra. Having abandoned the law, he applied to philosophy and medicine; and, at length, succeeded Zambeccari in the chair of anatomy. The death of his father having obliged him to return to Florence, he had an opportunity not only of prosecuting his mathematical researches, but of applying to botany, Greek and Roman literature, ancient and modern history, and the examination of the monuments of antiquity in the Medicean collection. He frequently travelled with the celebrated Micheli, then considered as the Tournefort of Italy, and participated with him in the discovery of many new plants. He then removed to Bologna, where he formed an acquaintance with Manfredi, Beccari, Zanotti, and other eminent men. After various literary tours, he offered his services to the president of the University of Pisa, and in 1739 was made lecturer on astronomy. At this time astronomy was in a very neglected state in that institution; and, though a new observatory had been erected by the munificence of the duke of Tuscany, little progress had been made in the study of that science. Perelli, therefore, in

his inaugural discourse, written in elegant Latin, showed with great force and energy the necessity of restoring astronomy to its former dignity. He also endeavoured to procure for the observatory the best instruments, made by the most eminent English artists; and his zeal was well seconded by the liberality of Francis II. who refused no expense which could contribute to the benefit of his states. But Perelli had too fervid an imagination to be a laborious and patient observer. A few observations of eclipses, a part of Ptolemy's *Almagest* translated by him into elegant Latin, and a second preface to observations made by his assistant, containing a History of the Observatory of Pisa, were his only writings of the astronomical class.

His fame, however, was soon spread beyond the boundaries of Italy. The solution of an optical problem, "To find a curve of such a nature, that the rays of light which fall upon it shall always proceed, after two reflections, to one point in the middle," transmitted to the Academy of Sciences at Paris by the French minister at Florence, convinced Clairault, Bouguer, and Landelle, that he was fit to be associated with mathematicians of the first class. The approbation of these eminent judges incited him to apply with greater diligence to geometry; and besides other discoveries, he gave a solution of that curious problem, "To find the point of greatest illumination in a plane, supposing that there are placed at any distance from it a certain number of lights." How well Perelli was acquainted with synthesis, may be seen by the solution of that problem in which it is required "To find the radius of a circle that shall touch externally three other circles, the centres and radii of which are known;" a problem which Newton thought worthy of a place in his *Universal Arithmetic*, and which, after many solutions, both ancient and modern, was solved by our author with masterly and elegant simplicity.

One of the great services rendered by Perelli to his country, was the happy application which he made of his mathematical knowledge to hydrostatics, hydraulics, and hydraulic architecture. Unfortunately for Italy, it has often need of some superior genius to regulate the abundance of its waters, and provide for the security of its inhabitants, particularly where the natural courses of the rivers have been so changed, either by the different interests of the princes who rule in it, or the operations undertaken according to their caprice, that, without the application of artificial means, they cannot be prevented from inundating whole provinces. This necessity has produced a science which the Italians exclusively claim as their own; and in which, from the opportunities they have of acquiring practical knowledge, they are undoubtedly superior to the mathematicians of other countries. Perelli, formed in the school of Grandi and Manfredi, to whom this science was so much indebted, is entitled to the honour of having greatly contributed to improve it; and it may be said, that after the death of these two eminent men, there was no affair of consequence relating to it, in which he was not either employed or consulted. His great merit, in this respect, is fully proved by the various treatises which he wrote on that subject; such as, *Il Ragionamento sopra la Campagna Pisana*; *La Relatione sopra il modo de liberare la Campagna del Valdarno inferiore dall' inondazioni dall' Ufciana*; and *Relazione della maniera di dare scolo alle acque stagnante del pian del Lago*; which form a part of the ninth volume of the *Raccolta* of the author in regard to the motion of running water, published at Florence in 1774. It would be tedious to mention all the advantages which were the happy consequence of carrying Perelli's ideas into execution; and which he explains in the works above mentioned, and in others never published.

In the course of his different tours he collected remains of antiquity, and productions of the best artists; but particularly painters, sculptors, and architects, of which he was an excellent judge; also rare manuscripts and books.

He

He exercised his ingenuity in restoring ancient inscriptions, for which he possessed a wonderful talent; and amused himself sometimes in composing Greek and Latin verses, in which he endeavoured, and not without success, to imitate the ease and elegant simplicity of the ancients. Perelli was well versed, likewise, in theology, and had read the works of many of the ancient fathers, but particularly those written in Greek; and was thoroughly acquainted with the various theological disputes which have taken place in the Christian church. In the course of his reading he seldom made extracts of remarkable passages, trusting entirely to his memory, which was exceedingly retentive; but, during the last three years of his life, his faculties became greatly impaired. In the year 1779, finding himself unfit to discharge the duties of his office in the university of Pisa, he requested leave to resign; and died of apoplexy in October 1783. *Elogi d'illustri Italiani*.

PERELOMO'V, a town of Russia, in the government of Irkutk, on the Amur: fifty-six miles north-east of Stretenk.

To PEREM'PT, *v. a.* [*peremptus*, Lat.] To kill; to crush. A law-term.—Nor is it any objection that the cause of appeal is *perempted* by the desertion of an appeal; because the office of the judge continues after such instance is *perempted*. *Ayliffe*.

PEREM'PTION, *f.* Crush; extinction.—This *peremption* of instance was introduced in favour of the public, lest suits should be rendered perpetual. *Ayliffe*.

PEREM'PTORILY, *adv.* Absolutely; positively; so as to cut off all farther debate.—God's laws *peremptorily* injoin us, and the things therein implied do itraightly oblige us, to partake of the holy sacrament. *Kettlewell*.—Some talk of letters before the deluge; but that is a matter of mere conjecture, and nothing can be *peremptorily* determined either the one way or the other. *Woodward*.—Never judge *peremptorily* on first appearances. *Richardson's Clarissa*.

PEREM'PTORINESS, *f.* Positiveness; absolute decision; dogmatism.—*Peremptoriness* is of two sorts; the one a magisterialness in matters of opinion; the other a positiveness in relating matters of fact. *Gov. of the Tongue*.—Self-conceit and *peremptoriness* in a man's own opinion are not commonly reputed vices. *Tillotson*.

PEREM'PTORY, *adj.* [*peremptoire*, Fr. *peremptorius*, low Lat. from *peremptus*, killed.] Dogmatical; absolute; such as destroys all further expostulation.—He may have fifty-six exceptions *peremptory* against the jurors, of which he shall shew no cause. *Spenser*.—Though the text and the doctrine run *peremptory* and absolute, whosoever denies Christ shall assuredly be denied by him; yet still there is a tacit condition, unless repentance intervene. *South*.—The more modest confers, that learning was to give us a fuller discovery of our ignorance, and to keep us from being *peremptory* and dogmatical in our determinations. *Collier*.

To-morrow be in readiness to go:
Excuse it not, for I am *peremptory*.

Shakespeare.

PEREM'SCHAL, a town of Russia, in the government of Kaluga, on the Oka: sixteen miles south-south-west of Kaluga. Lat. 54. 15. N. lon. 35. 44. E.

PERENDO'RE, or PERENTORA'Y, a town of Hindoostan, in the Mysore, taken by Lieut.-Col. Oldham in 1790: ten miles south-west of Erroad.

PERENE, a river of Peru, which rises about forty miles north of Tarma, and after a south-easterly course of above 100 miles, joins the Xauxa, to form the Ene.

PEREN'NIAL, *adj.* [*perennel*, old Fr. *perennis*, Lat.] Lasting through the year.—If the quantity were precisely the same in these *perennial* fountains, the difficulty would be greater. *Cheyne*.—Perpetual; unceasing.—The matter wherewith these *perennial* clouds are raised, is the sea that surrounds them. *Harvey*.

PEREN'NIAL, *f.* A plant of which the roots will en-

sure many years, whether they retain their leaves in winter or not. Those which retain their leaves are called *evergreens*; but such as cast their leaves are named *deciduous* plants, or *perdifols*.

PEREN'NITY, *f.* [*perennité*, old Fr. from *perennitas*, Lat.] Quality of lasting through all seasons; perpetuity.—That springs have their origin from the sea, and not from rains and vapours, I conclude from the *perennity* of divers springs. *Derham's Phys. Theol.*

PEREN'TICIDE, *f.* [from the Lat. *pera*, a purse, and *caedo*, to cut.] A cut-purse. *Cole*.

PERERRATION, *f.* [*pererratus*, Lat.] Travel; act of rambling through various places.—These may be said to have been carried up and down through many countries; and, after a long *pererration* to and fro, to return as wise as they went. *Honell's Instruct. for Trav.*

PE'RES, or CONSTANTINE PERES, an island on the coast of Chili, near the harbour of Valdivia.

PERES'KIA, *f.* in botany. See CACTUS.

PERESLAVELZAL'SKOL, a town of Russia, in the government of Vladimir: sixty miles north-west of Vladimir. Lat. 56. 35. N. lon. 38. 54. E.

PEREU'IL, a town of France, in the department of the Charente: twelve miles from Angoulême.

PEREVOLOTZKA'IA, a fort of Russia, in the government of Upha, on the Samara: thirty-two miles west-north-west of Orenburg.

PEREVOZ', a town of Russia, in the government of Niznei Novgorod: forty-eight miles south-south-east of Niznei Novgorod. Lat. 55. 36. N. lon. 44. 34. E.

PEREVOZ'NOI (Nos), a cape of Russia, in the Straits of Vaigatkol. Lat. 69. 15. N. lon. 58. 22. E.

PEREY'RA (Luys), a Portuguese who in 1558 published an heroic poem upon the fate of Sebastian, which he dedicated to the Cardinal Archduke Albert of Austria. It was reprinted in 1785 by Bento Joze de Souza Farinha, Regius Professor of Philosophy at Lisbon, a man to whom the literature of his country is indebted for the republication of many rare works. The "Elegiada" of Luys Pereyra has however been deprived, by this new edition, of the only value which it possessed, its rarity. In the first canto, Sebastian loses himself in a wood, and meets a hermit there, who tells him the history of Portugal. In the sixth, another person relates the shipwreck of Sepulveda. The tenth is upon the actions of the Portuguese in Monomotapa. The twelfth contains a description of Africa, less amusing than what is to be found in the old geographical grammar. The thirteenth is the history of the siege of Goa. The fifteenth the siege of Chaul; and, at the conclusion of one of these pertinent episodes, the poet says, Now that he has finished his story, it is well that I should go on with mine. Nor are the remaining cantos of the eighteen all employed in the action of the poem. The siege of Mazagam, the accession of Sebastian, a plague, and a famine, Proteus, and the Devil, are called in to eke it out. The execution is as bad as the plan: it is bare, bald, beggarly narrative, hobbling upon crutches; yet Luys Pereyra was praised by his contemporaries. R. S. in *Gen. Biog.*

PE'REZ (Antonio). No history is so abundant in examples of the inconstancy of prince's favours as the history of Spain; and of all the fallen favourites in that country none ever excited such general sympathy as Antonio Perez. The father of this famous and unhappy man had been for forty years sole secretary of state to Charles V. and Philip II. in which post he was succeeded by his son. He was made also secretary of war, and demeaned himself so well as to enjoy at the same time the favour of the king and of the people. Never were any man's misfortunes so little to be imputed to himself. Don John of Austria, intoxicated with the renown he had acquired by quelling the Moriscoes, and still more by the glorious victory of Lepanto, could not rest satisfied with any thing short of royal dignity; and had therefore intrigued with the pope to give him the kingdom of Tunis first, and afterwards

afterwards of *England!* and influence his brother Philip to put him in possession of them. These designs were encouraged by his secretary Juan de Escovedo, though Escovedo had been appointed to that office by Philip expressly for the purpose of counteracting them. They had even assumed a treasonable form. The king, who behaved with more tenderness, or at least more decency, to Don John than he had to his own son, believed or fancied it necessary to put Escovedo out of the way. For his master's sake, he would not do this by common forms of law; and he therefore kindly ordered Antonio Perez to have him assassinated. It was supposed that this would be considered as a common accident; and accordingly Don Escovedo was killed in the streets of Madrid.

This action undoubtedly was murder. Antonio Perez was a politician; and, though he did not carry the doctrine of expediency quite so far as the king, seems never to have suspected that he had committed a crime in this instance. Escovedo's death he represents as necessary, and the forms of justice, he thought, might be dispensed with in extraordinary cases: he had too soon sufficient proof that under such a king as Philip they were nothing more than forms. Suspicion fell upon both him and the princes of Eboli. It has been surmised that Philip was an unsuccessful suitor to this lady, and jealous of Perez's intimacy with her. Be this, however, as it may, he took the opportunity, occasioned by the suspicion, to throw them both into prison, and suffered the accusation to hang over the secretary's head for many years, still continuing to employ him, and promising him his protection and favour. At length he got possession of the only papers which he thought could have established his own share in the murder, and then suffered Antonio to be put to the rack. It was the intention of this unfortunate man to bear the tortures inflicted on him without confessing; but the violence of the pain overcame his resolution, and he declared that he had procured Escovedo's assassination, but that it was by Philip's own orders. Happily for his own character, he had concealed papers sufficient to prove this; and with these he escaped to Arragon. "That kingdom," said Mr. Southey, in writing the life of Perez only a year or two since, "was still by its constitution a free country; but constitutions are nothing in the way of power, and no country has any other security for its freedom than the spirit and strength of the people." He appealed to the tribunal del justiza of Arragon, a free tribunal, to whose decision Philip did not choose to attend, and therefore removed the cause to the enquesta, a sort of star-chamber of his own, in which any wickedness that it pleased him to direct would receive the form of legality. "But," says the writer already alluded to, "the Arragonese had now espoused the cause of their injured countryman; and it was thought that the most effectual method of destroying him would be to deliver him over to the inquisition. That accursed tribunal, which had lately been established in Saragossa, laid hands on him, on a charge of witchcraft. Blinded and befottered with superstition as the Arragonese were, in common with all the Spaniards, their love of liberty was not at this time to be thus betrayed. They rescued him from the holy office. In consequence of this and other tumults, an army was marched into Arragon. The justiza, as he was bound to do, called upon his countrymen to resist this invasion of their rights; but he, and the nobles with him, aware of their inability to oppose veteran troops, set the example of flight. He and the other chiefs were secured and beheaded. Perez made his escape into France; and the forms of liberty in Arragon were extinguished. Antonio found the protection that he implored: he published a narrative of his sufferings; and it is certain, by the great names which appear in his correspondence, that he was highly esteemed and respected both in France and England. Several unsuccessful attempts were made to murder him. He died miserably poor in

VOL. XIX. No. 1329.

the year 1611, and endured to the last the heavy affliction of being separated from his wife and children. No interest could avail to procure their liberation; and he imputes the death of his eldest daughter to grief on his account. R. S. in *Gen. Biog.*

PE'REZ (David), the son of Juan Perez, a Spaniard, settled at Naples, was born in 1711, and brought up in the conservatorio of Santa Maria di Loretto, in that city, under Antonio Gallo and Francesco Mancini. His progress in composition was rapid, and discovered an uncommon genius. When he quitted the conservatorio, his first preferment was at Palermo in Sicily, where he was appointed maestro di capella of the cathedral in that city, at a considerable salary, the half of which he was permitted to enjoy, not only after he quitted Sicily, but even Italy, to the time of his death. He composed his first operas for the theatre at Palermo, from 1741 to 1748, and then returned to Naples, where his *Clemenza di Tito* was performed with such great applause at the theatre of San Carlo, as to extend his fame to Rome, whither he was invited the next year to compose for the Theatre delle Dame. Here he produced *Semiramide* and *Farnace*; and, for other cities in Italy, *La Didone Abbandonata*, *Zenobia*, and *Alessandro nell' Indie*.

In 1752, he went to Portugal, where he was engaged in the service of king Joseph. His first opera at Lisbon, *Demofonte*, was received with very great applause. Gizziello was the principal soprano, and the celebrated Raaf the tenor. It was besides rendered magnificent in the performance by a powerful orchestra, and decorations that were extremely splendid. But the new theatre of his Portuguese majesty, which was opened on the queen's birth-day, March 31, 1755, surpassed, in magnitude and decorations, all that modern times can boast. On this occasion Perez new-set the opera of *Alessandro nell' Indie*, in which opera a troop of horse appeared on the stage, with a Macedonian phalanx. One of the king's riding-masters rode Bucephalus, to a march which Perez composed in the manège, to the grand pas of a beautiful horse; the whole far exceeding all that Farinelli had attempted to introduce in a grand theatre under his direction at Madrid, for the fitting-out of which he had unlimited powers. Besides these splendid decorations, his Portuguese majesty had assembled together the greatest singers then existing; so that the lyric productions of Perez had every advantage which a most captivating and perfect execution could give them. But the operas by which he acquired the greatest fame in Portugal were *Demetrio* and *Solimano*, which, as they were to be alternately performed with the operas of *Vologeso* and *Enea in Latio* that Jomelli had been requested by his most faithful majesty to compose for his theatre, were produced with a degree of exertion and emulation which rendered him superior to himself. Jomelli on this occasion was chiefly admired for the ingenious and learned texture of the instrumental parts; and Perez for the elegance and grace of his melodies, and expression of the words.

His music for the church, of which a specimen has been printed in England, *Matutino dei Morti*, published by Bremner, in score, is grave, ingenious, and expressive. But, though Perez has composed a *Te Deum* which is greatly esteemed at Lisbon, and his *Lezione prima per il Giovedì Santo*, has considerable merit, yet it appears, on examining his scores, that this master had not, like Jomelli, much exercised his pen in the composition of fugues or learned counterpoint for the church, to the perfection of which, genius alone can contribute but little, without the assistance of great study and experience. There is, however, an original spirit and elegance in all his productions; in which, if any defect appears, it is the want of symmetry in the phraseology of his melodies, in which there may sometimes be found what the French call *phrases manquées*, and *contre-tems*, to which critical ears, in modern times, are much less accustomed than formerly. "An ear for measure, (says Dr. Burney,) and

an ear for harmony and the accuracy of tones, seem to be totally different gifts of nature; and it frequently happens that a person who dances perfectly well in time, knows not one tune or tone from another.

Perez, like Handel, was corpulent and gourmand, a propensity which has been supposed to have somewhat shortened his days. After living much admired, beloved, and respected, twenty-seven years in Portugal, where he was maestro di capella to his most faithful majesty, and master to the royal family, at a salary exceeding 2000*l.* per annum, he died extremely regretted at the age of sixty-seven. Like Handel, he was likewise blind during the latter years of his life; but after this calamity, when confined to his bed, he frequently dictated, without an instrument, compositions, in parts, to an amanuensis. His remains were deposited in the church of the Italian Barbadindros; and a solemn dirge of his own composition was performed at his funeral, by a concourse of the best musicians in Lisbon. *Burney's Hist. Music.*

PER'FECTION, *adj.* [*parfait*, Fr. *perfectus*, Lat.] Complete; consummate; finished; neither defective nor redundant; as, *Perfect numbers*, for which see vol. xvii. p. 316, 17.—We count those things *perfect*, which want nothing requisite for the end whereto they were instituted. *Hooker.*

Whoever thinks a *perfect* work to see,
Thinks what ne'er was, nor is, nor e'er shall be. *Pope.*

Fully informed; fully skilful.—I do not take myself to be so *perfect* in the privileges of Bohemia, as to handle that part; and will not offer at that I cannot master. *Bacon.*

Our men more *perfect* in the use of arms,
Our armour all as strong, our cause the best;
Then reason wills our hearts should be as good. *Shakespeare.*
Pure; blameless; clear; immaculate. A sense chiefly theological.—Thou shalt be *perfect* with the Lord thy God. *Deut. xviii.*

My parts, my title, and my *perfect* soul,
Shall manifest me rightly. *Shakespeare's Othello.*

Confident; certain.—Thou art *perfect*, then, our ship hath touched upon the deserts of Bohemia. *Shakespeare's Wint. Tale.*

To PER'FECTION, *v. a.* To finish; to complete; to consummate; to bring to its due state.—If we love one another, God dwelleth in us, and his love is *perfected* in us. *1 John, iv. 12.*—Endeavour not to settle too many habits at once, lest by variety you confound them, and so *perfect* none. *Locke.*

What toil did honest Curio take
To get one medal wanting yet,
And *perfect* all his Roman set? *Prior.*

To make skilful; to instruct fully:
Her cause and your's
I'll *perfect* him withal, and he shall bring you
Before the duke. *Shakespeare's Meas. for Meas.*

PER'FECTION, *f.* One that makes perfect.—Looking up unto Jesus, the Captain and *Perfectioner* of our faith. *Barrow.*—The person, whose condition marked her out as the defender and *perfectioner* of our reformation. *Burnet's Hist. of his own Times.*—This practice was altered; they offered not to Mercury, but to Jupiter the *perfectioner*. *Broome on the Odyssey.*

PERFECTION, *f.* The state of being perfect.—Man doth seek a triple *perfection*: first a sensual, consisting in those things which very life itself requireth, either as necessary supplements or as ornaments thereof; then an intellectual, consisting in those things which none underneath man is capable of; lastly, a spiritual and divine, consisting in those things whereunto we tend by supernatural means here, but cannot here attain. *Hooker.*—True virtue being united to the heavenly grace of faith

makes up the highest *perfection*. *Milton on Education.*—No human understanding being absolutely secured from mistake by the *perfection* of its own nature, it follows that no man can be infallible but by supernatural assistance. *Tillotson.*—The question is not, whether gospel *perfection* can be fully attained; but whether you come as near it as a sincere intention and careful diligence can carry you. *Law.*

Many things impossible to thought,
Have been by need to full *perfection* brought. *Dryden.*

Something that concurs to produce supreme excellence. In this sense it has a plural.—An heroic poem requires, as its last *perfection*, the accomplishment of some extraordinary undertaking, which requires more of the active virtue than the suffering. *Dryden.*

What tongue can her *perfections* tell,
In whose each part all pens may dwell? *Sidney.*

Attribute of God.—If God be infinitely holy, just, and good, he must take delight in those creatures that resemble him most in these *perfections*. *Atterbury.*—Exact resemblance.

PERFECTIONAL, *adj.* Made complete.—Now this life eternal may be looked upon under three considerations; as initial, as partial, and as *perfectional*. I call that *perfectional*, which shall be conferred upon the elect immediately after the blessing pronounced by Christ; "Come, ye blessed children of my Father, receive the kingdom prepared for you from the foundation of the world." *Pearson on the Creed.*

To PERFECTIONATE, *v. a.* To make perfect; to advance to perfection. A word proposed by Dryden, but not received nor worthy of reception. *Dr. Johnson.*—Dryden most probably adopted it from Butler, who uses it in his Remains; and I think I have seen this unworthy word in employment long before the time of Butler. *Todd.*—Painters and sculptors, chasing the most elegant natural beauties, *perfectionate* the idea, and advance their art above nature itself in her individual productions; the utmost mastery of human performance. *Dryden.*—He has founded an academy for the progress and *perfectionating* of painting. *Dryden.*

PERFECTIONIST, *f.* One pretending to extreme perfection; a puritan.—Amongst the most seraphical illuminati, and the highest puritan *perfectionists*, you shall find people of fifty, threescore, and fourscore, years old, not able to give that account of their faith, which you might have had heretofore from a boy of nine or ten. *South's Sermon.*—One who thinks perfection attainable by man.—The *perfectionists* may be refuted in their pretensions from their own avowed principles. *Conybeare.*

PERFECTISSIMATE, *f.* A quality or dignity, mentioned in the Justinian Code. *Perfectissimi* were those to whom the emperors trusted the presidentship of any province. Alciat imagined the name had been only given to the governors of Hispania Tarraconensis and Noricum; but Calvin has shown the contrary in his Lexicon Juridicum. The *perfectissimi* were inferior to the *clarissimi*, though the former word implies "most perfect."

PERFECTIVE, *adj.* Conducing to bring to perfection: with *of*.—Praise and adoration are actions *perfective* of our souls. *Mortimer.*—Eternal life shall not consist in endless love; the other faculties shall be employed in actions suitable to, and *perfective of*, their natures. *Ray on the Creation.*

PERFECTIVELY, *adv.* In such a manner as brings to perfection.—As virtue is seated fundamentally in the intellect, so *perfectively* in the fancy; so that virtue is the force of reason in the conduct of our actions and passions to a good end. *Grew.*

PERFECTLY, *adv.* In the highest degree of excellence. Totally; completely.—Chewing little sponges dipt in oil, when *perfectly* under water, he could longer support the want of respiration. *Boyle.*—Exactly; accurately.

rately.—We know bodies and their properties most *perfectly*. *Locke*.

PERFECTNESS, *f.* Completeness; consummate excellence; perfection.—Use makes *perfectness*. *Beaum.* and *Fletcher's Kn. Burn. Pestic.*

How then can mortal tongue hope to express
The image of such endless *perfectness*! *Spenser.*

Goodness; virtue; a scriptural word.—Put on charity, which is the bond of *perfectness*. *Col.* iii. 14.—Skill.—Is this your *perfectness*? *Shakespeare.*

PERFICIENT, *adj.* [*perficiens*, Lat.] Effectual.—The king being the sole founder of all civil corporations, and the endower the *perficient* founder of all eleemosynary ones, the right of visitation of the former results to the king, and of the latter to the patron or endower. *Blackstone.*

PERFIDIOUS, *adj.* [*perfidus*, Lat. *perfidie*, Fr.] Treacherous; false to truit; guilty of violated faith.—To be *perfidious* is nothing, so he may be secret: his Master knows him [Judas] for a traitor. *Bp. Hall.*

A most *perfidious* slave,
With all the spots o' the world tax'd and debosh'd.
Shakespeare's All's Well.

Expressing treachery; proceeding from treachery:

Forfaken of all good, I see thy fall
Determin'd, and thy hapless crew involv'd
In this *perfidious* fraud. *Milton's P. L.*

PERFIDIOUSLY, *adv.* Treacherously; by breach of faith.—Can he not deliver us possession of such places as would put him in a worse condition whenever he should *perfidiously* renew the war? *Swift's Miscell.*

They eat *perfidiously* their words,
And swear their ears through two-inch boards. *Hudibras.*

PERFIDIOUSNESS, *f.* The quality of being *perfidious*.—Some things have a natural deformity in them; as perjury, *perfidiousness*, and ingratitude. *Tillotson.*

PERFIDY, *f.* [*perfidia*, Lat. *perfidie*, Fr.] Treachery; want of faith; breach of faith.—Whatever poets may write of rural innocence and truth, and of the *perfidy* of courts, this is undoubtedly true; that shepherds and ministers are both men; their nature and passions the same, the modes of them only different. *Ld. Chesterfield.*

PERFLABLE, *adj.* [from the Lat. *per*, through, and *fla*, to blow.] Liable to be blown through, or of being *perflated*.

To PERFLATE, *v. a.* To blow through.—If eastern winds did *perflate* our climates more frequently, they would clarify and refresh our air. *Harvey.*—The first consideration in building of cities, is to make them open, airy, and well *perflated*. *Arbuthnot on Air.*

PERFLATILE, *adj.* Blowing strongly; blowing through. *Bailey.*

PERFLATION, *f.* The act of blowing through.—Miners, by *perflations* with large bellows, give motion to the air, which ventilates and cools the mines. *Woodward.*

PERFOLIATA, *f.* in botany. See BRASSICA, BUPLEURUM, and OPHRYS.

PERFOLIATE, *adj.* in botany, a leaf surrounding the stalk on every side, as if the stalk passed through its centre; as in *Bupleurum perfoliatum*, thence termed *through-wax*, from the old word *wax*, to grow.

To PERFORATE, *v. a.* [*perforo*, Lat.] To pierce with a tool; to bore.—Draw the bough of a low fruit-tree newly budded, without twisting, into an earthen pot *perforate* at the bottom, and then cover the pot with earth, it will yield a very large fruit. *Bacon's Nat. Hist.*—The *Hypericum*, or St. John's wort, is sometimes called "*perforata*," or *perforated*, from the small holes seen all over its leaves, if held up to the light. *Chambers.*

The labour'd chyle pervades the pores
In all the arterial *perforated* shores. *Blackmore.*

PERFORATION, *f.* The act of piercing or boring.—The likeliest way is the *perforation* of the body of the tree in several places one above another, and the filling of the holes. *Bacon.*—Hole; place bored.—That the nipples should be made spongy, and with such *perforations* as to admit passage to the milk, are arguments of providence. *Ray on the Creation.*

PERFORATIVE, *adj.* Having power to pierce: applied to the surgical instrument called a *trepan*. *Todd's Johnson.*

PERFORATOR, *f.* The instrument of boring.—The patient placed in a convenient chair, dipping the trocar in oil, stab it suddenly through the teguments, and, withdrawing the *perforator*, leave the waters to empty by the canula. *Sharp's Surgery.*

PERFORCE, *adv.* [*par force*, Fr.] By violence; violently.—She *perforce* withholds the loved boy. *Shakespeare's M. N. Dream.*

All trembling, and arising full of spots,
And pale with death at hand, *perforce* the breaks
Into the inmost rooms. *Peacham on Poetry.*

Of necessity.—Patience *perforce* is a medicine for a mad dog. *Ray's Proverbs.*

So forth he far'd, as now befell, on foot,
Sith his good steed is lately from him gone;
Patience *perforce*! *Spenser's F. Q.*

To PERFOR'M, *v. a.* [*per* and *formare*, Lat.] To execute; to do; to discharge; to achieve an undertaking; to accomplish.—All three set among the foremost ranks of fame for great minds to attempt, and great force to *perform* what they did attempt. *Sidney.*

Hast thou, spirit,
Perform'd to point the tempest that I bad thee? *Shakesp.*

To PERFOR'M, *v. n.* To succeed in an attempt.—When a poet has *performed* admirably in several illustrious places, we sometimes also admire his very errors. *Watts.*

PERFOR'MABLE, *adj.* Practicable; such as may be done.—Men forget the relations of history, affirming that elephants have no joints, whereas their actions are not *performable* without them. *Brown's Vulg. Err.*

PERFOR'MANCE, *f.* Completion of something designed; execution of something promised.—Promising is the very air o' th' time; it opens the eyes of expectation: *performance* is ever the duller for his act, and, but in the plainer kind of people, the deed is quite out of use. *Shakespeare's Timon.*—Men may, and must, differ in their employments; but yet they must all act for the same ends, as dutiful servants of God, in the right and pious *performance* of their several callings. *Law.*

His promises were, as he then was, mighty;
But his *performance*, as he now is, nothing. *Shakespeare.*

Composition; work.—Few of our comic *performances* give good examples. *Richardson's Clarissa.*—Action; something done.—In this slumbry agitation, besides her walking and other actual *performances*, what have you heard her say? *Shakespeare.*

PERFOR'MER, *f.* One that performs any thing.—The merit of service is seldom attributed to the true and exact *performer*. *Shakespeare.*—It is generally applied to one that makes a public exhibition of his skill; as an actor or musician.

To PERFRICATE, *v. a.* [from the Lat. *per*, through, and *frico*, to rub.] To rub over. *Johnson.*

PERFRICATION, *f.* The act of rubbing thoroughly. *Scott.*

PERFRICATION, *f.* The act of rubbing thoroughly; a shivering for cold. *Cole.*

PERFUMATORY, *adj.* That perfumes.—A *perfumatory* or incense altar. *Leigh's Crit. Sacra*, 1650.

PERFUME, *f.* [*parfum*, Fr. sometimes accented on the first syllable in poetry.] Strong odour of sweetness used to give scents to other things.—Pomanders and knots

of powders for drying rheums are not so strong as *perfumes*; you may have them continually in your hand, whereas *perfumes* you can take but at times. *Bacon*.—*Perfumes*, though gross bodies that may be sensibly wasted, yet fill the air, so that we can put our nose in no part of a room where a *perfume* is burned, but we smell it. *Digby*.—Sweet odour; fragrance.—And in some *perfumes* is there more delight. *Shakespeare's Sonnets*.

Even the rough rocks with tender myrtle bloom,
And trodden weeds send out a rich *perfume*. *Addison*.

PERFUMES are generally made up of musk, ambergris, civet, rose and cedar woods, orange-flowers, jessamines, jonquils, tuberoses, and other odoriferous flowers. Those drugs commonly called *aromatics*, such as storax, frankincense, benzoin, cloves, mace, &c. enter the composition of a perfume; some are also composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, hyssop, &c.

The use of perfumes was frequent among the Hebrews, and among the orientals in general, before it was known to the Greeks and Romans. In the time of Moses, perfumes must have been known in Egypt, since he speaks of the art of the perfumer, and gives the composition of two kinds of perfumes, (Exod. xxx. 25.) of which one was to be offered to the Lord upon the golden altar which was in the holy place; and the other was appointed for the anointing of the high priest and his sons, (ver. 34, &c.) as also of the tabernacle, and all the vessels that were used in divine service.

The Hebrews had also perfumes which they made use of in embalming their dead. The composition is not known; but it is certain that they generally made use of myrrh, aloes, and other strong and astringent drugs, proper to prevent putrefaction. (John xix. 49.) Besides the perfumes for these purposes, the Scripture mentions other occasions whereon the Hebrews used perfumes. The spouse in the Canticles (i. 3.) commends the scent of the perfumes of her lover; and her lover in return says, that the scent of the perfumes of his spouse surpasses the most excellent odours; (iv. 10—14.) He names particularly the spikenard, the calamus, the cinnamon, the myrrh, and the aloes, as making a part of these perfumes. The voluptuous woman described by Solomon (Prov. vii. 17.) says, that she had perfumed her bed with myrrh, aloes, and cinnamon. The epicures in the book of Wisdom (ii. 7.) encourage one another to the luxuriant use of odours and costly perfumes. Isaiah (lvii. 9.) reproaches Judea, whom he describes as a spouse faithless to God, with being painted and perfumed to please strangers: "Thou wentest to the king with ointment, and didst increase thy perfumes." Ezekiel (xxiii. 41.) seems to accuse the Jews with having profaned the odours and perfumes, the use of which was reserved to sacred things, by applying them to their own use.

Perfumes came afterwards to be very common among the Greeks and Romans, especially those composed of musk, ambergris, and civet. The *nardus* and *malobathrum* were held in much estimation, and were imported from Syria. The *unguentum nardinum* was variously prepared, and contained many ingredients. *Malobathrum* was an Indian plant. Perfumes were also used at sacrifices to regale the gods; at feasts, to increase the pleasures of sensation; at funerals, to overpower cadaverous smells, and please the manes of the dead; and in the theatres, to prevent the offensive effluvia, proceeding from a crowd, from being perceived.

Since people are become sensible of the harm they do to the head, perfumes are generally diffused among us; however, they are still common in Spain and Italy.

To **PERFUME**, *v. a.* To scent; to impregnate with sweet scent.—The distilled water of wild poppy, mingled at half with rose-water, take with some mixture of a few cloves in a *perfuming* pan. *Bacon's Nat. Hist.*—Smells ad-

here to hard bodies; as in *perfuming* of gloves, which showeth them corporeal. *Bacon's Nat. Hist.*

Why rather, sleep, liest thou in smoky cribs,
And hush'd with buzzing night-flies to thy slumber,
Than in the *perfum'd* chambers of the great,
Under the canopies of costly state,
And lull'd with sounds of sweetest melody? *Shakespeare*.

Then will I raise aloft the milk-white rose,
With whose sweet smell the air shall be *perfum'd*. *Shakespeare*.

See spicy clouds from lowly Sharon rise,
And Carmel's flowery top *perfumes* the skies! *Pope*.

PERFUMER, *f.* One whose trade is to sell things made to gratify the scent.—A moiety the *perfumers* have out of apple-trees, that hath an excellent scent. *Bacon's Nat. Hist.*

First issued from *perfumers'* shops
A croud of fashionable fops.

Swift.

PERFUMING, *f.* The act of communicating a perfume.

PERFUNCTION, *f.* [from the Lat. *per*, through, and *fungor*, to discharge.] The accomplishment of a design; the discharge of an office. *Cole*.

PERFUNCTORILY, *adv.* Carelessly; negligently; in such a manner as to satisfy external form.—His majesty, casting his eye *perfunctorily* upon it, and believing it had been drawn by mature advice, no sooner received it, than he delivered it to the lord keeper. *Clarendon*.—Lay seriously to heart the clearness and evidence of these proofs, and not *perfunctorily* pass over all the passages of the gospel, which are written on purpose that we may believe, without weighing them. *Lucas*.—Whereas all logic is reducible to the four principal operations of the mind, the two first of these have been handled by Aristotle very *perfunctorily*; of the fourth he has said nothing at all. *Baker on Learning*.

PERFUNCTORINESS, *f.* Negligence; carelessness.—Nothing more frequent than comparative openings of one another; their deserts, with the nimble *perfunctoriness* of some commentators that skip over hard places; but their faults, infirmities, or miscarriages, with descendants no less tedious than malicious. *Whitlock's Mann. of the English*.

PERFUNCTORY, *adj.* [*perfunctore*, Lat. from *perfunctus*, "having done his task;" because, after a man has done his work, he performs any other duty slightly, or carelessly.] Slight; careless; negligent.—A transient and *perfunctory* examination of things leads men into considerable mistakes, which a more correct and rigorous scrutiny would have detected. *Woodward*.

To **PERFUSE**, *v. a.* [from the Lat. *per*, through, and *fundo*, to pour.] To tincture; to overspread.—These dregs immediately *perfuse* the blood with melancholy, and cause obstructions. *Harvey on Consumptions*.

PERFUSION, *f.* The act of pouring out upon any thing.

PERG, a town of Austria: six miles south-south-east of Aigen.—A town of Austria: twelve miles east of Steyregg.

PERGA, in ancient geography, an inland city of Pamphylia, on the river Caystrus, near to which, on an eminence, stood a temple of Diana. It was famed for the birth of Apollonius, the renowned geometrician. Here Paul and Barnabas preached oftener than once; (Acts xiii. 14, xiv. 25.) and to the end of the eighth century we find a Christian church here, sometimes not a little eminent. It is now called *Karahissar*; but is at present of little or no importance.—There was another Perga in Epirus, or Albania; as to which, see **PARGA**.

PERGAMAR, a town of European Turkey, in Romania; the see of a bishop: sixty miles south-west of Adrianople, and sixty five north-west of Galipoli.

PERGA.

PERGAM'ENA, *f.* [from *Pergamus.*] Parchment. *Phillips.*

PERGAM'ENOUS, *adj.* Belonging to Pergamus; consisting of parchment. *Cole.*

PERGA'MO, a town of Asiatic Turkey, in Natolia, situated at the foot of a mountain; on a river which was formerly called *Caicus*, with a harbour, about fifteen miles from the sea. The inhabitants are chiefly Turks; the Christians have a church, but are poor. See PERGAMUS. It is 144 miles south-south-west of Constantinople. Lat. 39. 11. N. lon. 27. 0. E.

PERGAMUS, an ancient kingdom of Asia, formed out of the ruins of the empire of Alexander the Great. It commenced about the year 283 B. C. But the *City* of Pergamus is much more ancient; for the inhabitants pretended to be descendants of the Arcadians, who arrived in this part of Asia with Telephus, son of Hercules; and they say, that Esculapius came to Pergamus with a learned colony of Greeks, and practised medicine in this place. The Pergamenians paid him great honours, calling him by the titles of god the saviour, and the sovereign god. They constructed for him a magnificent temple, in which they offered sacrifices, and they celebrated in honour of him public games. The temple was visited by all the people of Asia Minor, and thus Pergamus became famous; the worship of this god continued in it till the establishment of Christianity. Pergamus was at first governed by its own magistrates, who were independent of any other power. It was afterwards under the dominion of the kings of Lydia, from whom it was transferred to the kings of Persia. After the death of Alexander it was subject to Antigonus; and at his death it was transferred to Lyfimachus, one of the successors of Alexander, according to Strabo. This prince deposited his treasures in the castle, and entrusted the custody of them to one Philetærus, an eunuch, by birth a Paphlagonian, of a mean descent, and in his youth a menial servant to Antigonus one of Alexander's captains. While he held this employment of treasure-keeper, having fallen under the displeasure of Arsinoë, wife to Lyfimachus, she found means to make a quarrel between him and his master; upon which Philetærus seized on the castle of Pergamus, together with the treasures entrusted to his care, amounting to 90,000 talents. At first he offered his service, together with his treasure, to Seleucus king of Syria: but, both Seleucus and Lyfimachus dying soon after, he kept possession of the town and treasure, fortified the castle, and thus laid the foundation of the *Kingdom* of Pergamus, which lasted 153 years.

Philetærus, though he did not assume the title of king, reigned however in quiet till his death, which happened twenty years after his revolt from Lyfimachus, and B. C. 264. He left the city of Pergamus to his brother, or, according to some, to his brother's son, Eumenes I. and he, laying hold of the opportunity offered by the dissensions among the Seleucidæ, possessed himself of many strong holds in the province of Asia; and, having hired a body of Galatians, defeated Antiochus as he was returning from a victory gained over his brother Seleucus Callinicus. By this victory he obtained possession of the greater part of Asia: however, he did not long enjoy his acquisitions; for he died next year of immoderate drinking, a vice to which he was greatly addicted.

Eumenes was succeeded by Attalus I. nephew of Philetærus, and the first who took upon him the title of King of Pergamus. He defeated the Gauls, who were desirous of settling in his territory; and according to Livy, was the first of the Asiatic princes who refused to pay a contribution to these barbarians. When Seleucus Ceraunus was engaged in other wars, he invaded his territories, and conquered all the provinces on this side of Mount Taurus; but was soon driven out of his new acquisitions by Seleucus and his grandfather Achæus, who, entering into an alliance against him, deprived him of all his newly-acquired territories, and even besieged him in his capital. Upon this Attalus invited to his assistance the Gauls who

had settled in Thrace: and with their help not only obliged the enemy to raise the siege of Pergamus, but quickly recovered all the provinces he had lost. After this he invaded Ionia and the neighbouring provinces, where several cities voluntarily submitted to him. The Teians, Colophonians, with the inhabitants of Egea and Lemnos, sent deputies, declaring themselves ready to acknowledge him for their sovereign; the Carænes, on the other side of the river Lycus, opened their gates to him, having first expelled the governor set over them by Achæus. From thence he advanced to Apia; and, encamping on the banks of the river Methigus, received homage from the neighbouring nations. But here the Gauls, being frightened by an eclipse of the moon, refused to proceed farther; which obliged Attalus to return to the Hellespont, where he allowed his allies to settle, giving them a large and fruitful territory, and promising that he would always assist and protect them to the utmost of his power.

Attalus, having thus settled his affairs with equal honour and advantage to himself, entered into an alliance with Rome, and afterwards joined them in their war against Philip IV. king of Macedon. Here he had the command of the Rhodian fleet; with which he not only drove the Macedonians quite out of the seas, but, having landed his men, he, in conjunction with the Athenians, invaded Macedon, and obliged Philip to raise the siege of Athens, which he had greatly distressed; for which services the Athenians not only heaped on him all the favours they could, but called one of their tribes by his name; an honour they had never bestowed on any foreigner before.

Attalus, not contented with all he had yet done against Philip, attempted to form a general confederacy of the Greeks against him. But, while he was haranguing the Bœotians to this purpose, and exhorting them with great vehemence to enter into an alliance with the Romans against their common enemy, he fell down speechless. However, he came to himself again, and desired to be carried by sea from Thêbes to Pergamus, where he died soon after his arrival, in the 72d year of his age and 43d of his reign, B. C. 197.

Attalus was succeeded by his eldest son Eumenes II. He was exceedingly attached to the Romans, in so much that he refused the daughter of Antiochus the Great in marriage, lest he should thus have been led into a difference with that people. He also gave notice to the Roman senate of the transactions of Ariarathes king of Cappadocia, who was making great preparations both by sea and land. Nor did Eumenes stop here; for, when he saw the war about to break out between Antiochus and the Romans, he sent his brother Attalus to Rome to give information of the proceedings of Antiochus. The senate heaped honours both on Eumenes and his brother; and, in the war which followed, gave the command of their fleet to the king of Pergamus in conjunction with C. Livius Salinator. The victory gained on this occasion was in a great measure owing to Eumenes, who boarded some of the enemy's ships in person, and during the whole action behaved with uncommon bravery. Some time afterwards Eumenes, entering the territories of Antiochus with a body of 5000 men, ravaged all the country about Thyatira, and returned with an immense booty. But in the mean time Antiochus, invading Pergamus in his turn, ravaged the whole country, and even laid siege to the capital. Attalus, the king's brother, held out with a handful of men, till the Achæans, who were in alliance with Eumenes, sent 1000 foot and 100 horse to his assistance. As this small body of auxiliaries were all chosen men, and commanded by an experienced officer, they behaved with such bravery that the Syrians were obliged to raise the siege. At the battle of Magnesia, too, Eumenes behaved with the greatest bravery; not only sustaining the first attack of the enemy's elephants, but driving them back again on their own troops, which put the ranks in disorder, and gave the Romans an opportunity of giving them a total defeat by attacking them opportunely with their

horse. In consequence of this defeat, Antiochus was obliged to conclude a peace with the Romans on such terms as they pleased to prescribe; one of which was, that he should pay Eumenes 400 talents, and a quantity of corn, in recompence for the damage he had done him.

Eumenes now thought of obtaining some reward from the Romans equivalent to the services he had done them. Having gone to Rome, he told the senate, that he was come to beg of them that the Greek cities which had belonged to Antiochus before the commencement of the late war might now be added to his dominions; but his demand was warmly opposed by the ambassadors from Rhodes, as well as by deputies from all the Greek cities in Asia. The senate, however, after hearing both parties, decided the matter in favour of Eumenes adding to his dominions all the countries on this side of Mount Taurus which belonged to Antiochus; the other provinces lying between that mountain and the river Mæander, excepting Lycia and Caria, were bestowed on the Rhodians. All the cities, which had paid tribute to Attalus, were ordered to pay the same to Eumenes; but such as had been tributary to Antiochus were declared free.

Soon after this, Eumenes was engaged in a war with Prusias king of Bithynia, who made war upon him by the advice of Hannibal the celebrated Carthaginian general. But Eumenes, being assisted by the Romans, defeated Prusias in an engagement by sea, and another by land; which so disheartened him, that he was ready to accept of peace on any terms. However, before the treaty was concluded, Hannibal found means to draw Philip of Macedon into the confederacy, who sent Philocles, an old and experienced officer, with a considerable body of troops, to join Prusias. Hereupon Eumenes sent his brother Attalus to Rome with a golden crown, worth 15,000 talents, to complain of Prusias for making war on the allies of the Roman people without any provocation. The senate accepted the present, and promised to adjust every thing to the satisfaction of their friend Eumenes, whom they looked upon to be the most steady ally they had in Asia. But in the mean time Prusias, having ventured another sea-fight, by a contrivance of Hannibal's, gained a complete victory. The Carthaginian commander advised him to fill a great many earthen vessels with various kinds of serpents and other poisonous reptiles, and in the heat of the fight to throw them into the enemy's ships, so as to break the pots and let the serpents loose. All the soldiers and seamen were commanded to attack the ship in which Eumenes was, and only to defend themselves as well as they could against the rest; and, that they might be in no danger of mistaking the ship, a herald was sent before the engagement with a letter to the king. As soon as the two fleets drew near, all the ships of Prusias, singling out that of Eumenes, discharged such a quantity of serpents into it, that neither soldiers nor sailors could do their duty, but were forced to fly to the shore, lest they should fall into the enemy's hands. The other ships, after a faint resistance, followed the king's example, and were all driven ashore with great slaughter, the soldiers being no less annoyed by the serpents than by the weapons of the enemy. The greater part of the ships of Eumenes were burnt, several taken, and the others so much shattered that they became quite unserviceable. The same year Prusias gained two remarkable victories over Eumenes by land, both of which were entirely owing to stratagems of Hannibal. But, while matters were thus going on to the disadvantage of Eumenes, the Romans interfered, and by their deputies not only put an end to the differences between the two kings, but prevailed on Prusias to betray Hannibal; upon which he poisoned himself, as hath been related under the article HANNIBAL.

Eumenes, being thus freed from such a dangerous enemy, engaged in a new war with the kings of Cappadocia and Pontus, in which also he proved victorious. His friendship for the Romans he carried to such a degree of enthusiasm, that he went in person to Rome to inform

them of the machinations of Perfes king of Macedon. He had before quarrelled with the Rhodians, who sent ambassadors to Rome to complain of him. But, as the ambassadors happened to arrive while the king himself was present in the city, the Rhodian ambassadors could not obtain a hearing, and Eumenes was dismissed with new marks of favour. This journey, however, had almost proved fatal to him; for, on his return, as he was going to perform a sacrifice at Delphi, two assassins, sent by Perfes, rolled down two great stones upon him as he entered the straits of the mountains. With one he was dangerously wounded on the head, and with the other on the shoulder. He fell with the blows from a steep place, and thus received many other bruises; so that he was carried on-board his ship when it could not well be known whether he was dead or alive. His people, however, soon finding that he was still alive, conveyed him to Corinth, and from Corinth to Ægina, having caused their vessels to be carried over the isthmus. He remained at Ægina till his wounds were cured, which was done with such secrecy, that a report of his death was spread all over Asia, and even believed at Rome; nay, his brother Attalus was so convinced of the truth of this report, that he not only assumed the government, but even married Stratonice the wife of Eumenes. But in a short time Eumenes convinced them both of his being alive, by returning to his kingdom. On the receipt of this news, Attalus resigned the sovereignty in great haste, and went to meet his brother; carrying a halberd, as one of his guards. Eumenes received both him and the queen with great tenderness, nor did he ever say any thing which might tend to make them uneasy; only he whispered in his brother's ear when he first saw him, "Be in no haste to marry my wife *again* till you are sure that I am dead."

Eumenes, being now more than ever exasperated against Perfes, joined the Romans in their war against him; but during the course of it he suddenly cooled in his affection towards those allies whom he had hitherto served with so much zeal, and that to such a degree, that he admitted ambassadors from Perfes, and offered to stand neuter if he would pay him 1000 talents, and, for 1500, to influence the Romans to grant him a safe and honourable peace. But these negotiations were broke off without effect, by reason of the distrust which the two kings had of one another. Eumenes could not trust Perfes unless he paid him the money beforehand; while, on the other hand, Perfes did not care to part with the money before Eumenes had performed what he promised. Neither could he be induced to pay the sum in question, though the king of Pergamus offered to give hostages for the performance of his promise. What the reason of such a sudden change in the disposition of Eumenes was, is no-where told; however, the fact is certain. The negotiations above mentioned were concealed from the Romans as long as possible; but they at length became known; after which the republic began to entertain no small jealousy of their old friend, and therefore heaped favours on his brother Attalus, without taking any notice of the king himself. Eumenes had sent him to Rome to congratulate the senate on the happy issue of the war with Perfes, not thinking that his practices had been discovered. However, the senate, without taking any notice of their disaffection to Eumenes at first, entertained Attalus with the greatest magnificence; and several of the senators who visited him proceeded to acquaint him with their suspicions of the king, and desired Attalus to treat with them in his own name, assuring him, that the kingdom of Pergamus would be granted him, if he demanded it, by the senate. These speeches had at first some effect; but Attalus, being of an honest disposition, and assisted by the advice of a physician called Stratius, a man of great probity, resolved not to comply with their desire. When he was admitted to the senate, therefore, he first congratulated them on the happy issue of the Macedonian

cedonian war; then modestly recounted his own services; and, lastly, acquainted them with the motive of his journey; intreated them to send ambassadors to the Gauls, who by their authority might secure his brother from any danger of their hostilities; and he requested them also, that the two cities of *Ænus* and *Maronea* might be bestowed on himself. The senate, imagining that *Attalus* designed to choose some other day to sue for his brother's kingdom, not only granted all his requests, but sent him richer and more magnificent presents than they had ever done before. Upon this *Attalus* immediately set out on his return to *Pergamus*; which so provoked the senators, that they declared the cities free which they had promised to *Attalus*, thus rendering ineffectual their promise which they were ashamed openly to revoke; and as for the Gauls, who were on all occasions ready to invade the kingdom of *Pergamus*, they sent ambassadors to them, with instructions to behave in such a manner as would rather tend to encourage them in their design than dissuade them from it.

Eumenes, being alarmed at these proceedings, resolved to go in person to *Rome* in order to justify himself. But the senate, having already condemned him in their own minds, resolved not to hear his vindication. For this reason, as soon as they were informed of his design, they made an act that "no king should be permitted to enter the gates of *Rome*." *Eumenes*, however, who knew nothing of this act, set forward on his journey, and landed at *Brundisium*; but no sooner did the Roman senate get intelligence of his arrival there, than they sent a quaestor, acquainting him with the decree of the senate; and telling him at the same time, that, if he had any business to transact with the senate, he was appointed to hear it, and transmit it to them; but, if not, that the king must leave *Italy* without delay. To this *Eumenes* replied, that he had no business of any consequence to transact, and that he did not stand in need of any of their assistance; and, without saying a word more, went on-board his ship, and returned to *Pergamus*.

On his return home, the Gauls, being encouraged by the cold reception which he had met with at *Rome*, invaded his territories, but were repulsed with great loss by the king, who afterwards invaded the dominions of *Prusias*, and possessed himself of several cities. This produced new complaints at *Rome*; and *Eumenes* was accused, not only by the ambassadors of *Prusias*, but also by those of the Gauls and many cities in *Asia*, of keeping a secret correspondence with *Perfes* king of *Macedon*. This last charge was confirmed by some letters which the Romans themselves had intercepted; so that *Eumenes* found it impossible to keep up his credit any longer at *Rome*, though he sent his brothers *Athenæus* and *Attalus* to intercede for him. The senators, in short, had conceived the most implacable hatred against him, and seemed absolutely bent on his destruction, when he died, in the 39th year of his reign, B. C. 159. leaving his kingdom and his wife to his brother *Attalus*. He left one son; but he was an infant, and incapable of governing the kingdom; for which reason *Eumenes* chose rather to give the present possession of the crown to his brother, reserving the succession to his son, than to endanger the whole by committing the management of affairs to his son's tutors.

Attalus II. in the beginning of his reign, found himself greatly distressed by *Prusias* king of *Bithynia*, who not only overthrew him in a pitched battle, but advanced to the very walls of *Pergamus*, ravaging the country as he marched along; and at last reduced the royal city itself. The king, however, saved himself by a timely flight, and dispatched ambassadors to *Rome*, complaining of the bad usage of *Prusias*. The latter endeavoured to defend himself, and to throw the blame on *Attalus*. But, after a proper enquiry was made into the matter, *Prusias* was found to be entirely in the wrong; in consequence of which, he was at last obliged to conclude a

peace with his adversary on the following terms. 1. That he should immediately deliver up to *Attalus* twenty ships with decks. 2. That he should pay five-hundred talents to *Attalus* within the space of twenty years. 3. That he should pay one-hundred talents to some of the other Asiatic nations, by way of reparation for the damages they had sustained from him. 4. Both parties should be content with what they had before the beginning of the war.

Some time after this, *Prusias* having made an unnatural attempt on the life of his son *Nicomedes*, the latter rebelled, and, with the assistance of *Attalus*, drove his father from the throne, and, as is said, even murdered him in the temple of *Jupiter*. The Romans took no notice of these transactions, but showed the same kindness to *Attalus* as formerly. The last enterprise in which we find *Attalus* engaged, was against *Andrifeus*, the pretended son of *Perfes* king of *Macedon*, where he assisted the Romans; after which he gave himself up to ease and luxury, committing state-affairs entirely to his ministers; and thus continued to his death, which happened in the 82d year of his age, about 138 B. C.

Attalus II. was succeeded by *Attalus* III. the son of *Eumenes*; for the late king, considering that he only held the crown as a trust for his nephew, passed by his own children in order to give it to him, though he appears to have been by no means worthy of it. He is said to have been deprived of his senses through the violence of his grief for his mother's death; and indeed, throughout his whole reign, he behaved more like a madman than any thing else. Many of his subjects of the highest quality were cut off, with their wives and children, upon the most groundless suspicions; and for these executions he made use of mercenaries hired out from among the most barbarous nations. Thus he proceeded till he had cut off all the best men in the kingdom; after which he fell into a deep melancholy, imagining that the ghosts of those whom he had murdered were perpetually haunting him. On this he shut himself up in his palace, put on mean apparel, let his hair and beard grow, and sequestered himself from all mankind. At last he withdrew from the palace, and retired into a garden, which he cultivated with his own hands, and filled with all sorts of poisonous herbs. These he used to mix with wholesome pulse, and send packets of them to such as he suspected. At last, being weary of this amusement, and living in solitude because nobody durst approach him, he took it in his head to follow the trade of a founder, and make a brazen monument. But, while he laboured at melting and casting the brass, the heat of the sun and furnace threw him into a fever, which in seven days put an end to his tyranny, after he had sat on the throne five years.

On the death of the king, a will was found, by which he left the Roman people heirs of all his goods; upon which they seized on the kingdom, and reduced it to a province of their empire by the name of *Proconsular Asia*. But *Aristonicus*, a son of *Eumenes* by an *Ephesian* courtesan, reckoning himself the lawful heir to the crown, could by no means be satisfied with this usurpation of the Romans, and therefore assembled a considerable army to maintain his pretensions. The people in general, having been accustomed to a monarchy, dreaded a republican form of government; in consequence of which they assisted *Aristonicus*, and put him in a condition to reduce the whole kingdom. The news, however, was soon carried to *Rome*; and *Licinius Crassus*, the pontifex maximus, was sent into the east, with orders to enforce obedience to the republic. Historians take no notice of any forces which were sent along with this commander; whence it is supposed, that he depended on assistance from the Asiatics, who were in alliance with *Rome*, or from the Egyptians. But, when he came thither, he found both the Syrians and Egyptians so reduced, that he could not expect any assistance from them. However, he was soon supplied with troops in plenty by the kings
of.

of Pontus, Bithynia, Cappadocia, and Paphlagonia; but managed matters so ill, that he was entirely defeated and taken prisoner. Those who took him, designed to carry him to Ariftonicus; but he, not able to endure the disgrace, would have laid violent hands on himself if he had not been disarmed. However, being allowed to keep a rod for managing the horse on which he sat, he struck a Thracian soldier who stood near him so violently with it that he beat out one of his eyes; upon which the other drew his sword, and ran him through on the spot. His head was brought to Ariftonicus, who exposed it to public view; but the body was honourably buried.

Ariftonicus had not much time to enjoy the fruits of his victory. Indeed he behaved very improperly after it; for, instead of preparing to oppose the next army, which he might have been assured the Romans would send against him, he spent his time in feasting and revelling. But he was soon roused out of his lethargy by Perpenna the new consul, who, having assembled with incredible expedition the troops of the allies, came unexpectedly upon him, obliged him to venture an engagement at a disadvantage, and entirely defeated him. Ariftonicus fled to a city called Stratonice; but was so closely pursued by the conqueror, that the garrison, having no method of supplying themselves with provisions, delivered up their leader, as well as a philosopher named Blossius, who had been the companion and counsellor of Ariftonicus. The philosopher behaved with great resolution after being taken, and openly defended his siding with Ariftonicus, because he thought his cause just. He exhorted the latter to prevent the disgrace and misery of captivity by a voluntary death; but Ariftonicus, looking upon death as a greater misery than any captivity, suffered himself to be treated as his conquerors pleased.

In the mean time, a new consul, named Manlius Aquilius, being arrived from Rome, sent a most haughty message to Perpenna, requiring him immediately to deliver up Ariftonicus, as a captive belonging to his triumph when the war should be ended. With this demand Perpenna refused to comply, and his refusal had almost produced a civil war. However, this was prevented by the death of Perpenna, which happened soon after the dispute commenced. The Pergamenians, notwithstanding the defeat and captivity of their leader, still held out with such obstinacy, that Aquilius was obliged to besiege, and take by force, almost every city in the kingdom. In doing this, he took a very effectual, though exceeding cruel, method. Most of the cities in the kingdom had no other water than what was brought from a considerable distance in aqueducts. These Aquilius did not demolish, but poisoned the water, which produced the greatest abhorrence of him throughout all the east. At last, however, the whole country being reduced, Aquilius triumphed, the unhappy Ariftonicus was led in chains before his chariot, and probably ended his miserable life in a dungeon. The country remained subject to the Romans while their empire lasted; but is now in the hands of the Turks.

The ancient City of Pergamus had been enlarged and embellished by Eumenes II. He enriched it with a library containing 200,000 choice volumes, for the transcribing of which parchment was here first invented, and thence called by the Latins *Charta Pergamena*. In Pergamus were likewise invented those costly hangings which we call *tapestry*, and which the Romans named *aulæa*, from *aula*, a hall, because the hall of Attalus II. who invented them, was the first room adorned with this furniture. Galen was born in this city. At Pergamus was one of the seven churches mentioned in the Revelation. Under the Romans the government of Pergamus was democratic, conducted by a council appointed by the people, under the direction and superintendance of a magistrate, who was president, and who was chosen annually. Pallas, Hercules, and Jupiter, were divinities held in great respect at Pergamus; but the most celebrated was Esculapius; and Apollo, who was regarded as his father, re-

ceived singular honours at Pergamus. Trajan had divine honours at Pergamus; and both the gods and the emperors had temples here, the most considerable of which was that of Esculapius. The temple of Augustus in this city was constructed at the expense of the province of Asia; the pagoda had eight columns, and is represented on many medals. This city celebrated, with a magnificence that was very expensive, the Olympic, Pythic, and Actian, games, and also others in honour of Esculapius and the emperors. These games were preceded by solemn sacrifices. The *Nicephorium*, or wood consecrated to Jupiter, was held in high veneration. This city accumulated great wealth by industry, by the commerce of parchment, and by the fabric of stuffs and tapestry. It is now an inconsiderable place, thinly inhabited; but preserves its names of Pergamus or Pergamo. In the neighbouring fields may still be found the ruins of the palace of the Attalic kings, an aqueduct, and a theatre.

A Christian church was very early planted at Pergamus; but they quickly degenerated from their purity, and tolerated the Nicolaitans, and such as taught to commit fornication, and eat things sacrificed to idols. For these things Jesus sharply reproves them in a letter by John. It is hoped this misse produced their reformation. (Rev. ii. 12-17.) For seven or eight hundred years the church here was of considerable note; but at present the Christians are reduced to about 15 miserable families; and the Turks are but about 2000 or 3000.

PERGASITE, *f.* The name given to a new mineral found at Ersby, near Abo, in Finland. The following imperfect account is the only one we have of its character: It has a green colour; its form is an octahedron, with a cleavage in three directions; it is harder than fluor spar. The specific gravity is 3.11. Before the blow-pipe, it melts into a mass with a pearly-white lustre. Its constituent parts are given as under:

Silex	-	-	-	42.10
Magnesia	-	-	-	18.27
Lime	-	-	-	14.28
Alumine	-	-	-	14.08

To PERGE, *v. n.* [from *pergo*, Lat. A vicious and pedantic fabrication, too near in sound to *perge*, and not followed (to the best of the compiler's knowledge) by any other author. *Mason*.] To go on.—Thou art a good Frank, if thou *pergest* thus. *Wilkins's Miseries of Inforced Marriage*.

PERGKIRCHEN, a town of Austria: eleven miles east of Steyregg.

PERGOLA, a town of the duchy of Urbino: eight miles east of Cagli.

PERGOLA, *f.* [Ital. from *pergula*, Lat.] A balcony, or gallery.—On Whitfun Tuesday beare-baiting being appointed for the king's pastime at Whitehall, I the day before gave notice of it to the Venitian ambassador (Alonso Contareni) resident, and the next morning had his servant sent to me to signify his desire to be present at it. This imparted to my lord-chamberlain, and by him to his majesty, he was ordained his standing in the *pergola* of the banquetting-house, on the left hand of that appointed for his majesty and the queen, with carpets to lean and tread on, and a stool (no chaire) to sit on. *Finetti's Obs. on Ambassadors*, 1656.

PERGOLESI (Giovan Battista), a celebrated musician, born at Casoria, a little town about ten miles from Naples, in 1704. His friends discovering, very early in his infancy, that he had a disposition for music, placed him in the conservatorio at Naples, called Dei Poveri in Giesu Christo,

Christo, which has been since suppressed. Gaetano Greco, of whom the Italians still speak with reverence as a contrapuntist, presided then over that celebrated school. This judicious master, soon perceiving uncommon genius in his young pupil, took particular pleasure in facilitating his studies, and communicating to him all the mysteries of his art. The progress which the young musician made was proportioned to the uncommon advantages of nature and art with which he was favoured; and, at a time when others had scarcely learned the gammut, he produced specimens of his abilities which would have done honour to the first masters in Naples. At the age of fourteen, he began to perceive that taste and melody were sacrificed to the pedantry of learned counterpoint; and, after vanquishing the necessary difficulties in the study of harmony, fugue, and scientific texture of the parts, he intreated his friends to take him home, that he might indulge his own fancies, and write such music as was most agreeable to his natural perceptions and feelings. The instant he quitted the conservatorio, he totally changed his style, and adopted that of Vinci, of whom he received lessons in vocal composition, and of Haffe, who was then in high favour. And, though he so late entered the course which they were pursuing with such rapidity, he soon came up with them; and, taking the lead, attained the goal, to which their views were pointed, before them. With equal simplicity and clearness, he seems to have surpassed them both in graceful and interesting melody.

His countrymen, however, were the last to discover or allow his superiority; and his first opera, performed at the second theatre of Naples, called "Dei Fiorentini," met with but little success. The prince of Stigliano, first equerry to the king of Naples, discovering, however, great abilities in the young Pergolesi, took him under his protection; and from the year 1730 to 1734, by his influence, procured employment for him at the Teatro Nuovo. But during this period the chief of his productions were of the comic kind, and in the Neapolitan dialect, which is unintelligible to the rest of Italy, except the "Serva Padrona," set for the theatre of San Bartolomeo. It was not till the year 1735, that an account of his merit penetrated so far as Rome, and inclined the directors of the opera there to engage him to compose for the Tordinona theatre in that city. Pergolesi, ambitious of writing for a better theatre and for better performers than those for which he had hitherto been employed, and happy in having the exquisite poetry of Metastasio's Olimpiade to set, instead of the Neapolitan jargon, went to work with the zeal and enthusiasm of a man of genius, animated by hope, and glowing with an ardent passion for his art. The Romans, however, by some unaccountable fatality, received his opera with coldness; and, the composer being a young man but little known, they seemed to want to be told by others that his music was excellent, and would soon, by the admiration of all Europe, make them ashamed of their injustice and want of taste. To complete his mortification at the ill reception of this opera, "Nerone," composed by Duni, the next that was brought on the stage, and for which his was laid aside, had very great success. Duni, a good musician, and a man of candour, though greatly inferior in genius to Pergolesi, is said to have been ashamed of the treatment which he had received; and with an honest indignation declared, that he was out of all patience with the Roman public, "frenetico contro il pubblico Romano." He even tried, during the short life of this opera, to make a party in its favour among the professors and artists who were captivated with the beauty of the music; but all their efforts were vain; the time was not yet come when judgment and feeling were to unite in its favour.

Pergolesi returned to Naples with the small crop of laurels which had been bestowed on him by professors and persons of taste, who in every country compose but a

very inconsiderable part of an audience. He was indeed extremely mortified at the fate of his opera, and not much disposed to resume the pen, till the duke of Matalon, a Neapolitan nobleman, engaged him to compose a mas and vespers for the festival of a saint at Rome, which was to be celebrated with the utmost magnificence. Though Pergolesi had but too much cause to be dissatisfied with Roman decrees, he could not decline the duke's proposition; and it was on this occasion that he composed the "Mafs, Dixit, et Laudate," which have been since so often performed for the public, and transcribed for the curious. They were heard for the first time in the church of San Lorenzo in Lucina, with general rapture; and, if any thing could console a man of genius for such unworthy treatment as he had lately experienced at Rome, it must have been the hearty and unequivocal approbation he now received in the same city. His health, however, daily and visibly declined. His friends had perceived, by his frequent spitting of blood, for four or five years before this period, that he was likely to be cut off in his prime; and his malady was still increased by this last journey to Rome. His first patron, the prince of Stigliano, who had never ceased to love and protect him, advised him to take a small house at Torre del Greco, near Naples, on the sea-side, almost at the foot of Mount Vesuvius. It is imagined by the Neapolitans, that persons afflicted with consumptions are either speedily cured, or else killed, in this situation; and so it happened in the present case.

During his last sickness, Pergolesi composed his celebrated cantata of Orpheus and Euridice, and his "Stabat Mater," at Torre del Greco, whence he used to go to Naples from time to time to have them tried. The "Salve Regina," which is printed in England, was the last of his productions; and he died very soon after it was finished, in 1737, at the age of 33. The instant his death was known, all Italy manifested an eager desire to hear and possess his productions, not excepting his first and most trivial farces and *intermezzi*; and not only lovers of elegant music, and curious collectors elsewhere, but even the Neapolitans themselves, who had heard them with indifference during his lifetime, were now equally solicitous to do justice to the works and memory of their deceased countryman. Rome, sensible now of its former injustice, as an *amende honorable* had his opera of Olimpiade revived; an honour which had never been conferred on any composer of the 18th century. It was now brought on the stage with the utmost magnificence, and the indifference with which it had been heard but two years before, was converted into rapture.

Pergolesi is characterised by Dr. Burney as "the child of taste and elegance, and nursing of the graces." His works make an era in modern music. His fame is chiefly built on his vocal compositions; "in which (says Dr. Burney) the clearness, simplicity, truth, and sweetness, of expression, justly entitle him to a supremacy over all his predecessors and cotemporary rivals, and to a niche in the temple of Fame among the great improvers of the art." *Burney's Hist. of Music.*

PER'GUBA, a town of Russia, in the government of Olonetz: sixty-four miles north of Petrozavodfk.

PERGULA'RIA, *f.* [from *pergula*, Lat. a balcony, or trellis, in allusion to its twining habit and fragrant blossoms, which render this genus very desirable for bowers.] In botany, a genus of the class pentandria; order digynia, or rather gynandria, natural order of contortæ; (apocineæ, *Juss.*). Generic characters—Calyx: perianthium one-leaved, five-cleft, upright, acute, permanent. Corolla: one-petalled, salver-shaped: tube cylindrical, longer than the calyx; border five-parted, flat, with oblong segments. Nectaries five, semi-sagittate, erect, compressed, attenuated into a dagger-point, curved inwards, with a nodding tooth at the outer base. Stamina: filaments ———; antheræ two to each gland, curved upwards,

upwards, divaricating, obovate, pellucid, yellow, with scarcely any discernible pollen. *Smith*. Tubercles (glands) five, immersed in the stigma. Pistillum: germs two, ovate, acuminate; styles none; (two very short, united, villose; stigmas obsolete. *Smith*.) Pericarpium: follicles two. Seed ———. This genus is allied to *Periploca græca*; but the character wants correction.—*Essential Character*. Contorted; nectary surrounding the genitals with five fagittated cups; corolla salver-shaped. There are six species.

1. *Pergularia glabra*, smooth pergularia, or sweet bower-vine; (*Vallis pergularis*, *Burm. Ind.* 51. and *Brown in Wern. Transf.* i. 31.) Leaves ovate, acute, smooth; stem shrubby. This species is a native of Java and Amboyna, used for bowers and trellis-work, as it makes a very thick shade. The Malay women are fond of adorning their hair with its fragrant flowers. The stem is perennial, shrubby, and twining. Leaves opposite, stalked, ovate, acute, entire, thick and shining, five inches long, two and a half or three wide, with strong pale veins. When the leaves or twigs are wounded, they discharge a thick viscid yellow milk. Flower-stalks from between the footstalks, forked, corymbose. Flowers white, and highly fragrant, compared by Rumphius to those of jasmine, (probably *Jasminum Sambac*), but having a shorter tube, with five shining bodies in the middle. He speaks of the scent of these flowers as too strong for Europeans, though highly esteemed by the natives of the country where they grow.

2. *Pergularia edulis*, or eatable pergularia: leaves ovate acuminate, smooth; stem herbaceous. The stem of this is also twining, but herbaceous; whereas in the preceding it is shrubby. Native of the Cape of Good Hope.

3. *Pergularia odoratissima*, sweet-scented pergularia, or Chinese creeper: leaves heart-shaped, nearly smooth; nectary and genitals shorter than the tube of the corolla; stigma conical, obtuse. Root branched, much spreading, whitish. Stem shrubby, twining branched, round; its bark ash-coloured, spongy, full of longitudinal fissures; branches nearly opposite, very long, flaccid, mostly simple, round, brown, downy, leafy. Leaves opposite, spreading and bent downwards, pointed, entire, slightly concave, opaque, veiny, downy on the veins and margin, paler beneath: footstalks one fourth of the length of the leaves, round, downy, with a furrow along the upper side, furnished at the base on each side and at the top with two or three acute brown-tipped glands. Flowers the size of a primrose, yellowish green; calyx bell-shaped, deeply five-cleft; segments lanceolate, veined, slightly downy, minutely ciliated, tipped with brown; tube of the corolla a little longer than the calyx, slightly downy, striped; inflated, and with five swellings in the base; having a pervious orifice, set with numerous hairs pointing backwards. Sir Joseph Banks is said to have sent this to Kew about the year 1784. It is cultivated in China, as a favourite bower-plant, though of what precise country a native is not known. We have been told it is wild in Sumatra. Lady Amelia Hume received a fine plant of this species in 1789, which covered the stern of the ship with its fragrant green blossoms, during a great part of the voyage, and has since been widely propagated in this country. It thrives either in a stove or warm conservatory, flowering throughout the summer and autumn, and exhaling, in an evening, that peculiar, light, lemon-like, but luscious, fragrance, of which the Chinese are so fond, and which belongs to various greenish night-scented flowers, as the *Chloranthus inconspicuus*, and some *Orchidææ*.

β. P. tomentosa. This variety, with somewhat rounder leaves, and more tawny flowers, is cultivated for its agreeable fragrance in the gardens of the East Indies. It was brought to the Kew garden about the same time that Lady Hume had the Chinese plant. The specimen in the Linnæan herbarium is from China, whence it appears to have been brought to the Upsal garden: and to this be-

longs the description in the *Mantissa*, 53. where the leaves are, not much amiss, described as smooth: but the specific character and place of growth relate to a widely different plant, the *Aclepias cordata* of Forskall.

4. *Pergularia minor*, sweet yellow pergularia, or West-Coast creeper; (*Cynanchum odoratissimum*, *Louveir. Cochinch.* 166.) Leaves heart-shaped, obtuse with a point; panicles axillary; calyx nearly as long as the tube of the corolla. Native of the East Indies, where it is cultivated for the same reason as the foregoing. From dried specimens this plant had been considered as a variety also; but, when compared alive, they appear to be distinct species. Besides what is noted in the specific character, the present is rather smaller in all its parts, with fewer flowers in each panicle. The corolla has broader and blunter segments, of a tawny yellow on their upper surface. Introduced into England by Sir Joseph Banks in 1784, and blooms in a stove all summer long.

5. *Pergularia purpurea*, or purple pergularia: leaves heart-shaped, smooth; segments of the corolla linear-oblong, smooth; umbels proliferous. Branches twining, slender, ash-coloured, appearing villose when examined by a glass. Leaves opposite, nerved and veined, two inches long; the upper one less; petiole the length of the leaves. It is allied to *P. Japonica*, but the umbels are proliferous, not simple; the segments also of the border are linear, not ovate: still it may be doubted whether they are actually distinct. Native of the East Indies and of China.

6. *Pergularia Japonica*, or Japan pergularia: leaves heart-shaped, smooth; segments of the corolla ovate, villose within; umbels simple. Stem twining, round, smooth, simple. Leaves opposite, acute; quite entire, nerved, spreading, an inch long, on round smooth petioles. Flowers axillary, peduncled, erect; calyx parted almost to the base, shorter than the corolla; the parts lanceolate, rough-haired. Tube of the corolla bell-shaped, a little shorter than the calyx: segments of the border blunt, spreading and bent back; smooth on the outside, but villose within. Native of Japan, where it flowers in August.

Loureiro has two other species, both natives of China, which he names *divaricata* and *sinensis*. He remarks, that in all the species of *Pergularia* and *Apocynum* which he had seen, the flowers have one pistil only. See *ASCLEPIAS*.

PERGUN'NAH, *f.* In the language of Hindoostan, means the largest subdivision of a province, whereof the revenues are brought to one particular *head cutchery*, from whence the accounts and cash are transmitted to the *general cutchery* of the province.

PERHAPS, *adv.* Peradventure; it may be.—Somewhat excellent may be invented, *perhaps* more excellent than the first design, though Virgil must be still excepted when that *perhaps* takes place. *Dryden*.—It is not his intent to live in such ways as, for ought we know, God may *perhaps* pardon; but to be diligent in such ways as we know that God will infallibly reward. *Law*.

Perhaps the good old man that kiss'd his son,
And left a blessing on his head,

His arms about him spread,
Hopes yet to see him ere his glass be run. *Flatman*.

Perhaps new graces darted from her eyes,
Perhaps soft pity charm'd his yielding soul,
Perhaps her love, *perhaps* her kingdom, charm'd him. *Smith*.

PERHAY (Point de), a cape on the west coast of France: six miles south-east of Point St. Matthew. Lat. 15. 2. N. lon. 4. 45. W.

PERHO', a town of Sweden, in the government of Wafa: fifty-six miles east of Jacobstadt.

PERHYEMA'TION, *f.* [from the Lat. *per*, through, and

and *hyems*, the winter.] The act of spending the winter at any place. *Bailey*.

PERI (Jacopo), a native of Florence, the principal inventor of recitative, and the composer of *Euridice*, written by Rinuccini, the first opera that was composed in *stilo rappresentivo*. This drama, written and set to a new species of music for the royal nuptials of Mary of Medicis with Henry IV. of France in 1600, was publicly exhibited at Florence in the most splendid manner, and in which Peri, the composer, performed a vocal part. Peri is said by Battista Doni to have been not only a good composer in the new style, but a famous singer and performer on keyed instruments. *Burney*.

PERIA, a town of Persia, in the province of Irac: ninety miles west of Isfahan.

PERIAC', a town of France, in the department of the Aude, celebrated for its salt-works: six miles south-west of Narbonne.

PERIACUL'TUM, a town of Hindoostan: thirty miles south-south-west of Dindigul.

PERIADA, in ancient geography, a town of Greece, in the island of Eubœa. *Strabo*.

PERIAGOGE, *f.* [from the Gr. *περι*, upon, and *αγω*, to drive.] In rhetoric, a sentence or period in which several things are crowded together which might have been divided.

PERIAGRA'RUM, a town of Hindoostan, in Coimbatore: three miles west-north-west of Errood.

PERIAGUA, *f.* A kind of large canoe made use of in the Leeward islands, South America, and the gulf of Mexico. It is composed of the trunks of two trees hollowed and united together; and thus differs from the canoe, which is formed of one tree.

PERIAMMA, *f.* [from the Gr. *περι*, about, and *αμλω*, to tie.] An amulet, something tied about the neck or other part of the body, as supposing it to have virtue to cure some hurt or disease.

PERIAMOO'DY, a town of Hindoostan: thirty miles west-south-west of Dindigul.

PER'JAN, a town of Grand Bukharia: thirty-six miles east-south-east of Anderab.

PERIANDER, a tyrant of Corinth and Corcyra, was the son of Cypselus, who before him had obtained an unjust authority over his fellow-citizens. Periander succeeded him about the year B. C. 628. and, in order to secure his power, put to death the principal persons in Corinth. In almost every other respect he well merited the title of tyrant, which has ever been attached to his name; but he was very inimical to that luxury which involved the inhabitants of the city, and he kept the country in peace by means of his fleet, which gave him the control of the sea. He is also applauded for not having imposed taxes upon his people, excepting those which resulted from the export and import of merchandise. His private life was stained with enormous crimes, with a detail of which we will not fully our pages. He banished his son Lycophron to Corcyra, for showing an abhorrence of the cruelty inflicted on his mother; but in his old age he sent to recall him, in order to govern Corinth in his stead, while he himself intended to retire to Corcyra. The people of that island prevented the exchange by putting the prince to death. Periander took ample revenge on the perpetrators of the deed; but, not contented with this, he indulged the most cruel resentment on the innocent, by sending three hundred youths of the best families to be made eunuchs by king Alyattes of Sardis. These victims to royal madness, stopping by the way to Samos, were rescued by the people; and it has been asserted that the chagrin occasioned to Periander by the disappointment, caused his death, at the age of 80, in the year B. C. 584. He was a man of great talents; and an inscription on his tomb at Corinth, preserved by Laertius, proves that his country regarded him as a wise and able ruler. He was traditionally reckoned among the seven wise men of Greece; and some of his maxims, which are

rather prudential than moral, seem to justify the title. The maxim most known is, "There is nothing which prudence cannot accomplish."

PER'ANTH, *f.* [from the Gr. *περι*, about, and *ανθος*, a flower.] In botany, the flower-cup. It is the most usual sort of calyx, and is immediately contiguous to, or more properly makes a part of, the flower. Such are the five green leaves, with their urn-shaped base, in the rose; and the tubular cup of a pink, including the scales at its base. In this last instance the perianth may be called double; and is avowedly so in most of the mallow tribe, while in the scabious it is triple. When the term *calyx* is used without any particular explanation, it means a perianth. This part is either deciduous, as in the poppy; or permanent, as in the pink. In many instances it becomes enlarged, thickened, or hardened, crowning or enveloping the fruit. Its situation is either *inferior*, below the germen, or *superior*, above that part. Its forms are infinitely various, on which the characteristic distinctions of many genera depend. In some instances it is divided more or less deeply, in others undivided; in some it is of one leaf, in others of several. The hue of the perianth is usually green; but not unfrequently otherwise, in which last case only it is technically said to be *coloured*. Many flowers have no perianth, as the tulip; and the narcissus, which has another kind of calyx, the *spatha*, or sheath. See farther under the article BOTANY, vol. iii. p. 246, 7.

PERIAPAL', a town of Hindoostan: twenty-seven miles north-east of Coimbatore.

PERIAPATAM', a town of Hindoostan, in Myfore: twenty-four miles south-west of Seringapatam, and fifty-four north-east of Tellicherry. Lat. 12. 15. N. lon. 76. 31. E.

PERIAPOL'LAM, a town of Hindoostan, in the Carnatic: twenty miles north-west of Madras.

PERIAPT, *f.* [from the Gr. *περι*, about, and *απλω*, to bind around.] Amulet; charm worn as preservative against diseases or mischief. *Hammer*.

The regent conquers, and the Frenchmen fly:
Now help, ye charming spells and *periapts*. *Shakespeare*.

PERIBOACA, a river of Canada, which runs into the St. John's Lake in lat. 48. 32. N. lon. 72. 20. W.

PERIB'OLUS, *f.* [from the Gr. *περι*, about, and *εωλλω*, to throw.] The outward wall of a place; a park; a warren. *Phillips*.

PERICA, three small islands in the gulf of Panama, lying at a little distance from the shore, and defending the road of Panama so as to form a good harbour.

PERICAR'DIAC, *adj.* [from *pericardium*.] Beneficial to the pericardium.

PERICAR'DIAN, *adj.* Belonging to the pericardium.

PERICAR'DIARY, *adj.* Belonging to the worms or animalcules bred in the heart.

PERICAR'DIC, *adj.* Belonging to the pericardium. *Phillips*.

PERICAR'DIUM, *f.* [from the Gr. *περι*, about, and *καρδια* the heart.] A thin membrane of a conic figure that resembles a purse, and contains the heart in its cavity.—The use of the *pericardium* is to contain a small quantity of clear water, which is separated by small glands in it, that the surface of the heart may not dry by its continual motion. *Quincy*.—He desired us first of all to observe the *pericardium*, or outward case of the heart. *Addison's Spect.* N^o 281.—A man may come into the *pericardium*, but not the heart, of truth. *Brown's Chr. Morality*.

PERICAR'PIUM, *f.* [from the Gr. *περι*, about, and *καρπος*, the fruit.] In botany, a pellicle or thin membrane encompassing the fruit or grain of a plant, or that part of a fruit that envelops the seed.—Besides this use of the pulp or *pericarpium* for the guard of the seed, it serves also for the sustenance of animals. *Ray*.

The use of the pericarp is to protect the seeds till ripe, and

and then, in some way or other, to promote their dispersion. It is curious to observe how admirably the very same part is contrived to answer these opposite intentions. This is generally accomplished on hygrometrical principles. While moist or juicy, the valves remain closed; but, in drying, they fly or split asunder; thus moreover, by an elastic action, assisting in the dispersion of their contents; and that in a dry state of the atmosphere, which is most favourable to the sowing seeds in general. An exception to this rule has been observed in some annual species of *Mefembryanthemum*, natives of the sandy country of Africa, where the arid soil but rarely enjoys the benefit of rain. The capsules of these expand by means of wet alone, when the elastic valves of each separate cell project their seeds to a distance, to take advantage of a favourable moment for vegetation, that might not soon occur if they were sent abroad during the dry season. Juicy pericarps commonly serve for the food of animals, more especially birds, in whose dung their seeds are deposited, at a distance from the spot where they grew, and in a condition peculiarly favourable for vegetation. See *BOTANY*, vol. iii. p. 250.

PERICARPIUM, [from *περιπος*, Gr. the wrist.] A medicine applied to the wrist as a charm to cure the ague. Sometimes called *epicarpium*.

PERICHÆTIUM, *f.* [from the Gr. *περι*, about, and *χαιτη*, a hair or bristle.] A scaly sheath peculiar to mosses, which owes its name to its situation around the base of their bristle-like fruit-stalk. It belongs also to the male, or barren, flowers of these plants, and indeed constitutes their *calyx* in both sexes. The perichætiæ consist of several imbricated leaves, differing, in a more or less striking manner, from the genuine foliage of the plant, either in structure, dimensions, or colour. In *Hypnum* it is of great consequence, constituting, by its presence, a part of the generic character, and assisting powerfully, by its diversities of shape, proportion, or structure, in the discrimination of species. Its duration is remarkable in some instances, even to the extent of three or four years, long after the seed and its pericarp have disappeared; of which we scarcely know an example among the generality of other plants. More frequently it is deciduous, after having accomplished its original purpose of protection to the tender organs which it encloses. See *PERIGONIUM*.

PERICHAREIA, *f.* [Greek.] A word used by the ancients to express a sudden surprise of joy, such as has been frequently known to occasion death. *Chambers*.

PERICHONDRIUM, *f.* [from *περι*, and *χονδρος*, cartilage.] The investing membrane of cartilages.

PERICHORE'SIS, or **CIRCUMINCES'SION**, *f.* in theology, a term employed by the schoolmen to express the existence of three divine persons in one another, in the mystery of the Trinity.

PERICHRI'SIS, *f.* A word used by the ancients for a liniment principally of the oleaginous or spirituous kinds, and as thin and fluid as oil.

PERICLASIS, *f.* [from the Gr. *περι*, and *κλαω*, to break.] In surgery, a fracture attended with a considerable wound of the soft parts, and exposure of the bone. *Chambers*.

PERICLES. See the article *GREECE*, vol. viii.

To PERICLITATE, *v. n.* [*periclitator*, Lat. to be in danger.] To hazard. *Cockeram*.

PERICLITATION, *f.* The state of being in danger. *Cockeram*.—Trial; experiment.

PERICLOSIS, *f.* See *PERICLASIS*.

PERICLYM'ENI FLO'RE. See *SPIGELIA*.

PERICLYM'ENI SIM'ILIS. See *VOLKAMERIA*.

PERICLYM'ENO ACCE'DENS. See *CINCHONA* and *PSYCHOTRIA*.

PERICLYM'ENUM. See *CHIOCOCCA*, *COMMELINA*, *CORNUS*, *HAMELIA*, *LANTANA*, *LONICERA*, *LORANTHUS*, *MORINDA*, and *VARRONIA*.

PERICLYM'ENUS, in the mythology of the poets, the brother of Nestor, and one of the Argonauts, who was supposed to have power to transform himself into any form, and was at last shot by Hercules in the shape of an eagle.

PERICO, a town of South America, in the province of Tucuman: fifteen miles south of St. Salvador de Jugui.

PERICONIA, *f.* [so named by Tode, from *περι*, about, and *κονις*, powder; because the fungus is entirely surrounded, when ripe, with its own dusty seeds.] In botany a genus of the class cryptogamia, order fungi.—Essential generic character. Stalk rigid, simple, terminating in a dry farinaceous head. There are four species.

1. *Periconia lichenoides*, or lichen periconia. This proceeds from a black crust-like base, so as very nearly to approach the nature of some of the Lichenes; hence the name. It has hitherto been found, only in rainy weather, among the castings and sweepings of gardens, adhering to stalks of cucurbitaceous plants when old and decayed. It is a summer production; and makes its appearance at the end of June.

2. *Periconia byssoides*, or flaxy periconia. This varies in height between one and two twelfths of an inch. Magnifying glasses have enabled us, if we are not egregiously mistaken, to discover a kind of farinaceous dust filling up the head, interwoven with many nearly imperceptible fibrous threads, contrived for its internal support. This humble class of vegetation delights in the stubbles and the dead leaves of the greater *Carex*, or sheer-grass, (sedge,) and conglomerated rushes. It thrives mostly in fens and marshy grounds. The time of its appearance is April and May.

3. *Periconia flavo-virens*, or green-headed periconia. A new species, added by Albertini and Schweiniz. It has a stiff, persistent, and striated, stalk, of a dark-brown colour; the head loose, farinaceous, with a few filaments or fibres, yellowish-green, and soon vanishing. In habits, size, and general form, it is somewhat similar to the preceding species; from which, however, it differs materially by its head, resembling the *Isaria* (which genus it manifestly approaches,) full of farinaceous dust, clearly interspersed with fibres, and which, being thrown out, appears conspicuously scattered upon the stem, which, thickening at the bottom, seems to rest upon a small bulb. In some the head is oblong, and somewhat smooth; in others nearly spherical; of a yellowish-green tint, not unlike the calycian bran; and, having lost its farina, disappearing entirely. We find this gregarious small fungus upon the damp and half-putrid leaves of the *Sorbus aucuparia*. Its season is the middle of May. It is represented on the annexed Plate, of the natural size, and lying on a dead leaf, at fig. 1. and considerably magnified at fig. 2.

4. *Periconia stemonitis*. Of this there are two varieties: *a*, common; *β*, dwarfish. The first variety is easily met with upon the small twigs of the gooseberry-tree, &c. as well as on the wood of the poplar. It appears in autumn, and again in the spring. The second is a microscopic plant, about the 24th part of an inch in dimensions; with a black stalk; the head full of a bran-like dust, ash-coloured, intermixed with hairs, like the *Isaria*. It is gregarious, and often found in the small cavities of deal-wood, sawed out for use. January produces this species. *Conspectus Fungorum à Methodo Personiana*.

PERICRANIUM, *f.* [from the Gr. *περι*, about, and *κρανιον*, the skull.] The membrane that covers the skull: it is a very thin and nervous membrane of an exquisite sense. A similar membrane covers immediately not only the cranium, but all the bones of the body, except the teeth, for which reason it is also called the *periosteum*. *Quincy*.—Having divided the *pericranium*, I saw a fissure running the whole length of the wound. *Wiseman's Surgery*.

PERIC'

1. 2. Green-headed Periconia. 3. Climbing Dog-bane, or Virginian Silk.

Engraved for the Encyclopaedia Londinensis 1793.

PERIC'ULOUS, *adj.* [*periculosus*, Lat.] Dangerous; jeopardous; hazardous. —A word not in use.—As the moon every seventh day arriveth unto a contrary sign, so Saturn, which remaineth about as many years in one sign, and holdeth the same consideration in years as the moon in days, doth cause these *periculous* periods. *Brown*.

PERIDIUM, *f.* in botany, a term introduced by Persoon, for the round membranous dry case of the seeds, in some of his first section of Fungi, the Angiocarpi, which bear their seeds *internally*, and not throughout the surface of an expanded membrane called *hymenium*. The various kinds of *Lycopodon*, or puff-ball, and its allies, afford good examples of a *peridium*.

PERIDROME, *f.* [from the Gr. *περι*, about, and *δρομος*, a course.] In architecture, the gallery; the alley or space between the columns and the wall. The same word is used by the old Greek writers to express the extreme edge of the hairs of the head, when hanging down in their natural form.

PERIEGETES, *f.* [from the Gr. *περι*, about, and *ηγουμεναι*, to lead.] One who conducts another about any place in order to show it him. It is applied in antiquity to geographers; especially to those who described the sea-coasts: thus Dionysius is styled Periegetes, for publishing a geography in hexameter verses, which Eustathius has commented on.—The name *periegetes* was also given to those who conducted strangers about in cities, to show them the antiquities, monuments, curiosities, &c. thereof. *Chambers*.

PERIERGY, *f.* [from the Gr. *περι*, about, and *εργον*, a work.] Needless caution in an operation; unnecessary care and diligence.

PERIERS, a town of France, in the department of the Channel: eight miles north of Coutances.

PERIERS (Bonaventure des), a French writer, was born at Arnai-le-Duc, in Burgundy. In 1536 he became valet-de-chambre to Margaret of Valois, sister of Francis I. He published several translations, and other pieces, in verse and prose; but is chiefly noted for his work entitled "Cymbalum Mundi," written first in Latin, and translated by himself into French under a fictitious name; first printed at Paris, in 1537, by Morin, who was imprisoned on its account. This work, concerning which much has been written, consists of four dialogues in the Lucianic style, ridiculing the follies and false opinions of mankind. It has been charged with gross impiety, upon the supposition that, under the appearance of laughing at the heathen theology, it meant to mask an attack upon the Christian mysteries, and religion in general. Others, however, have found in it more folly and extravagance than impiety. It was censured by the theologians of Paris, and ever after passed as a prohibited or scandalous book; on which account it became very rare, and much sought after by the curious. New editions of it were published in the last century. It is affirmed that the author made an unhappy end, by falling on his sword in a fit of despair. *Bayle*.

PERIGEE, or PERIG'UM, *f.* [from the Gr. *περι*, about, and *γη*, the earth.] That point in the heavens, wherein a planet is said to be in its nearest distance possible from the earth.—The sun in his apogee is distant from the centre of the earth 1550 semidiameters of the earth, but in his *perigee* 1446; the difference about 1,404,000 miles. *Mure's Song of the Soul*.—By the proportion of its motion, it was at the creation at the beginning of Aries, and the *perigeeum* or nearest point in Libra. *Brown's Vulg. Err*.

PERIGNAC', a town of France, in the department of the Lower Charente: ten miles south-east of Saintes.

PERIGONIUM, *f.* in botany, a more recent term than *Perichatium*, invented by Linnæus for the same part in mosses, the scaly leaves investing the flowers. It is derived from the Gr. *περι*, about, and *γενν*, generation; and, being common to the flowers of those plants in general, whether male or female, united or separated, the author

judged it more proper than a word which literally applied only to the leaves that surround the fruit-stalk. There is however no end of thus changing terms, when once generally established; and the inconveniences of such a measure greatly counterbalance any possible advantages. This improved denomination conveys no new idea, nor additional information, but rather less; for it is, in its meaning, ambiguous, as applicable to both calyx and corolla; whereas these plants possess a distinct and peculiar corolla in their calyptra, which is equally a *perigonium*, as encompassing the flower during "impregnation," but not a *perichatium*, because it is removed upwards, as soon as the fruit-stalk, or "bristle," is formed. *Perichatium* therefore, as an appropriate appellation for the calyx, and for the calyx only, is preferable, in our opinion, to *Perigonium*.

PERIGO'RD, before the revolution, a province of France; now the department of the Dordogne.

PERIGORD STONE. See MAGNESIUM petracorius, vol. xiv. p. 109.

PERIGRAPHE, *f.* [from the Gr. *περι*, about, and *γραφω*, to write.] A word usually understood to express a careless or inaccurate delineation of any thing. In Vesalius it is used to express the white lines or impressions that appear on the musculus rectus of the abdomen.

PERIGUEU'X, a city of France, and capital of the department of the Dordogne, on the Ille; before the revolution, the capital of Perigord, the see of a bishop, and residence of a governor. Here are some remains of Roman antiquities, as an amphitheatre, a temple of Venus, &c. This town is famous for its partridge-pies, which are sent all over Europe. The number of inhabitants is about 6000. It is 15½ posts north-east of Bourdeaux, and 58¾ south-south-west of Paris. Lat. 45. 11. N. lon. o. 47. E.

PERIHEL'IUM, *f.* [from the Gr. *περι*, about, and *ηλιος*, the sun.] That point of a planet's orbit, wherein it is nearest the sun.—Sir Isaac Newton has made it probable, that the comet which appeared in 1680, by approaching to the sun in its *perihelium*, acquired such a degree of heat, as to be 50,000 years a-cooling. *Cheyne's Philos. Principles*.

PERI'JA, a town of South America, in the government of Caraccas: eighty miles south-west of Maracaybo.

PER'IL, *f.* [Fr. *perihel*, Dutch; *periculum*, Lat.] Danger; hazard; jeopardy.—Strong, healthy, and young, people are more in *peril* by pestilential fevers, than the weak and old. *Arbutnot*.

How many *perils* do in fold
The righteous man, to make him daily fall! *Spenser*.

Denunciation; danger denounced:

I told her,
On your displeasure's *peril*,
She should not visit you. *Shakespeare's Wint. Tale*.

To PER'IL, *v. n.* [*periller*, old Fr.] To be in danger.—From the mixture of any ungenerous and unbecoming motion, or any soil, wherewith it may *peril* to stain itself. *Milton of Ch. Gov*.

PERIL'LA, *f.* [derivation unknown.] In botany, a genus of the class didynamia, order gymnospermia, natural order of verticillatæ; (labiatæ, *Juss*.) Generic characters—Calyx: perianthium one-leaved, upright, half five-cleft: segments equal, the uppermost very short; permanent. Corolla: one-petalled, irregular, four-cleft: upper segment emarginate, lateral ones spreading, lowest longer, blunt. Stamina: filaments four, simple, distant, shorter than the corolla; antheræ bifid. Pistillum: germens four. Styles two, filiform, connected, the length of the stamens; stigmas simple. Pericarpium: calyx unchanged. Seeds four.—*Essential Character*. Calyx, uppermost segment very short; stamina distant; styles two, connected.

Perilla ocymoides, a solitary species. Stem simple, stiff, blunt, quadrangular, rough-haired; leaves ovate, almost naked, serrate; on petioles the length of the leaves; racemes lateral and terminating, rough-haired, upright. Flowers small, white, solitary or by threes, rough-haired in the calyx, with leafy bractes longer than the flower. It is an annual plant, originally obtained by Arduino from India. It was introduced at Kew in 1770, by M. Richard, where it flowers in July and August. The whole plant has a strong balmy fragrance, and may be substituted for the balm of the shops.

PERIL'LUS, an artist at Athens, who made a brazen bull for Phalaris, tyrant of Agrigentum. This machine was fabricated to put criminals to death by burning them alive, and it was such that their cries were like the roaring of a bull. But the tyrant made the first experiment upon the donor, and cruelly put him to death by lighting a slow fire under the belly of the bull.

PER'LOUS, *adj.* Dangerous; hazardous; full of danger.—Alterations in the service of God, for that they impair the credit of religion, are therefore *perilous* in common-weals, which have no continuance longer than religion hath all reverence done unto it. *Hooker.*

Dictate propitious to my duteous ear,
What arts can captivate the changeful fear:
For *perilous* the assay, unheard the toil,
To elude the prescience of a god by guile. *Pope.*

It is used by way of emphasis, or ludicrous exaggeration of any thing bad:

Thus was the accomplish'd squire endu'd
With gifts and knowledge *per'lous* shrewd. *Hudibras.*

Smart; witty. In this sense it is applied to children, and probably obtained its signification from the notion, that children eminent for wit do not live; a witty boy was therefore a *perilous* boy, or a boy in danger:

'Tis a *per'lous* boy,
Bold, quick, ingenious, forward, capable;
He's all the mother's from the top to toe. *Shakespeare.*

PER'LOUSLY, *adv.* Dangerously.—After a man is sanctified, he receiveth from God another special grace to raise him; even then, when he is most *perilously* fallen. *Professor Benefield's Sermon.* 1615.

PER'LOUSNESS, *f.* Dangerousness.

PER'IM, a small island in the Straits of Babelmandel, about four miles from the coast of Africa. It has a good port, but no fresh water. Lon. 12. 36. N. lat. 43. 50. E.

PER'IM KA'KU VAL'LI, in botany. See MIMOSA.

PER'IM TOD'DAL. See RHAMNUS.

PERIM'ETER, *f.* [from the Gr. *περι*, and *μετρον*, measure.] In geometry, the ambit or extent that bounds any figure or body whatever.—The *perimeters* of surfaces, or figures, are lines: those of bodies are surfaces. In circular figures, &c. instead of *perimeter*, we say *circumference*, or *periphery*. *Chambers.*

PER'IN KA'RA, *f.* in botany. See ELÆOCARPUS.

PERINAL'DO, a town of Italy, in the district of Monaco: eighteen miles east-north-east of Nice. The place contains 1283 inhabitants.

PERIN'DA, a town of Hindoostan, in the county of Dowlatabad: twenty-three miles south-east of Carmulla, and 188 north-west of Hydrabad. Lat. 18. 33. N. lon. 75. 50. E.

PER'INDARY, a town of Hindoostan, in Coimbetore: five miles south-west of Errood.

PERINE'UM, *f.* [*περινεαιος*, Gr.] That part of the body which extends from the organs of generation in either sex to the fundament. The space in question is much longer in the male than in the female; being about four or five inches in the former, one inch or one and a half in the latter. A roughish line, called the *raphe*, runs along the middle of it, and a few hairs are scattered over it.

PERINGIA'NO, a town of the island of Sardinia: twenty miles south of Villa d'Iglesias.

PERIN'GERSDORF, a town of Germany, in the territory of Nuremberg: three miles west-fourth-west of Lauf.

PERINGOO'DY, a town of Hindoostan, in Marawar: twenty miles north-west of Ramanadporum.

PERINGSKIO'LD (John), a learned Swede, was born in Sudermania, in 1654. He became secretary of antiquities and counsellor to the king of Sweden, and professor at Upsal. He died in 1720. His works are, 1. A History of the Kings of the North. 2. History of the Kings of Norway, two vols. folio. 3. Historical and Chronological Tables from Adam to Jesus Christ.

PERINRA'PAX, one of the Laccadive Islands in the Indian Sea. Lat. 11. 10. N. lon. 71. 18. E.

PERIN'THUS, a town of Thrace, in the Propontis, anciently surnamed *Mygdonica*. It was afterwards called *Heraclea*, in honour of Hercules; and now EREKLI.

PERIO'CHA, *f.* [from the Gr. *περιοχη*, an inclosure.] An argument indicating the nature and extent of a discourse. *Scott.*

PE'RIOD, *f.* [from the Gr. *περι*, through, and *οδος*, a way.] A circuit. Time in which any thing is performed, so as to begin again in the same manner.—Tell these, that the sun is fixed in the centre, that the earth with all the planets roll round the sun in their several *periods*; they cannot admit a syllable of this new doctrine. *Watts.*—A stated number of years; a round of time, at the end of which the things comprised within the calculation shall return to the state in which they were at the beginning.—A cycle or *period* is an account of years that has a beginning and end, and begins again as often as it ends. We style a lesser space a cycle, and a greater by the name of *period*; and you may not improperly call the beginning of a large *period* the epocha thereof. *Holder on Time.*—The end or conclusion.—There is nothing so secret that shall not be brought to light within the compass of our world; whatsoever concerns this sublunary world in the whole extent of its duration, from the chaos to the last *period*. *Burnet's Theory.*

What anxious moments pass between
The birth of plots and their last fatal *periods*!
Oh! 'tis a dreadful interval of time. *Addison.*

The state at which any thing terminates.—Light-confering stones must be set in the sun before they retain light, and the light will appear greater or lesser, until they come to their utmost *period*. *Digby.*

Beauty's empires, like to greater states,
Have certain *periods* set, and hidden fates. *Suckling.*

Length of duration.—Some experiment would be made how by art to make plants more lasting than their ordinary *period*; as to make a stalk of wheat last a whole year. *Bacon's Nat. Hist.*—A complete sentence from one full stop to another.—*Periods* are beautiful when they are not too long; for so they have their strength too, as in a pike or javelin. *B. Jonson.*

Is this the confidence
You gave me, brother?—Yes, and keep it still;
Lean on it safely, not a *period*
Shall be unpaid for me. *Milton's Comus.*

The point (.) that shows the end of a sentence.

To PERIOD, *v. a.* To bring to an end, or to a certain point.—The last letter *periods* the business until we met at Tergofa in Zealand. *Guardian*, N^o 133.

Your honourable letter he desires
To those have shut him up; which failing to him,
Periods his comfort. *Shakespeare's Timon.*

PERIODEU'TA, *f.* [*περιοδευτης*, Gr.] A church-officer among the Greeks, established by the council of Laodicea, in towns, &c. where there were no bishops. The *periodeutæ* were a kind of rural deans; so called, according

ding to Zonaras, because "always on the road," going from one quarter to another, to keep the people in their duty. Hence Gregory of Thessalonica calls them *ambulantes*, "walkers." Balsamon calls them *exarchæ*; by which name they are known among the Greeks at this day.

PERIOD'IC, or PERIOD'ICAL, adj. [*periodique*, Fr. from *period*.] Circular; making a circuit; making a revolution.—Was the earth's *periodic* motion always in the same plane with that of the diurnal, we should miss of those kindly increases of day and night. *Derham*.—Four moons perpetually roll round the planet Jupiter, and are carried along with him in his *periodical* circuit round the Sun. *Watts on the Mind*.—Happening by revolution at some stated time.—Astrological undertakers would raise men out of some slimy soil, impregnated with the influence of the stars upon some remarkable and *periodical* conjunctions. *Bentley*.—Regular; performing some action at stated times.—The confusion of mountains and hollows furnished me with a probable reason for those *periodical* fountains in Switzerland, which flow only at such particular hours of the day. *Addison*.—Relating to periods or revolutions.—It is implicitly denied by Aristotle in his politics, in that discourse against Plato, who measured the vicissitude and mutation of states by a *periodical* fatality of number. *Brown*.

PERIOD'ICALLY, adv. At stated periods.—The three tides ought to be understood of the space of the night and day; then there will be a regular flux and reflux thrice in that time, every eight hours, *periodically*. *Broome*.

PERIOD'ICALNESS, f. The state of being periodical.

PERICE'CI, f. [from the Gr. *περι*, about, and *οικω*, to dwell.] Such inhabitants of the globe as have the same latitudes, but opposite longitudes, or live under the same parallel, and the same meridian, but in different semicircles of that meridian, or opposite points of the parallel. These have the same common seasons throughout the year, and the same phenomena of the heavenly bodies; but their hours, or times of the day, are opposite to each other; i. e. when with the one it is mid-day, with the other it is midnight.

PER'ION, or PER'ION (Joachim), a learned French Benedictine, was born at Cormery in the Touraine, about the year 1500. At the age of seventeen he entered the monastery at his native place; and afterwards distinguished himself among the divines of his time. He particularly excelled in writing and speaking Latin with purity. He translated into that language several of the writings of the ancient philosophers and fathers, with notes; but his versions are entitled more to the praise of elegance than of fidelity; and for his deficiency in critical skill, he has been severely handled by Baillet, Joseph Scaliger, and other learned men. He was admitted to the degree of doctor by the faculty of theology at Paris; and during several years explained the Scriptures in that city with great applause, having among his auditors some of the most illustrious characters of his time. By a particular decree of the University, he was appointed to defend Aristotle and Cicero against Ramus; and discharged that task with great success. In the estimation of Henry II. he stood so high, that the monarch frequently sent for him, to enjoy the pleasure and benefit of his conversation. He died at his monastery about the year 1559, when he was near the age of sixty. His printed works are, 1. *De Dialectica*, lib. iii. 2. *Historia Abdiæ Babylonii*. 3. *Topicorum Theologicorum*, lib. ii. 4. *De Origine Linguæ Gallicæ, et ejus Cognatione cum Græca*. 5. *Liber de sanctorum Virorum qui Patriarchæ ab Ecclesia appellantur, rebus gestis ac Vitis*. 6. *De Vita Rebusque Jesu Christi, and De Vita Virginis et Apostolorum*; in both of which the Scripture-history is debased by the intermixture of absurd fabulous legends. 7. *De Romanorum et Græcorum Magistratibus*, lib. iii. 8. An edition of Aristotle, with a Commentary. 9. *Dionysii Areopagitæ Opera*. 10. *Ignatii et Polycarpi Epistolæ*. 11. *Juf-*

tini Martyris Opera, cum Observationibus S. Clementis de Vita S. Petri, &c. 12. *Exæmeri, et Platonis Axiochi, cum Annotationibus*. 13. *Orations, in Latin*. 14. *Notes on the Harangues of Livy*. 15. A Latin Version of the Commentary of Origen upon Job, &c. *Gen. Biog.*

PERIOPHTHAL'MIUM, f. [from the Gr. *περι*, about, and *οφθαλμος*, eye.] A thin skin which birds can draw over their eyes to defend them, without shutting their eye-lids; otherwise called the nistitating membrane.

PERJORE'E, a town of Bengal: ten miles west of Curruckdeah.

PERIOS'TEUM, f. [from the Gr. *περι*, about, and *οσσειν*, a bone.] The membrane that encompasses the bones.—All the bones are covered with a very sensible membrane, called the *periosteum*. *Cheyne's Philos. Prin.*

PERIPATET'IC, f. [from the Gr. *περι*, about, and *πατεω*, to walk.] One of the followers of Aristotle; so called, because they used to teach and dispute in the Lyceum at Athens, walking about:

Those

Surnam'd *Peripatetics*, and the sect
Epicurean, and the Stoic severe.

Milton's P. R.

Ludicrously used for one who is obliged to walk, who cannot afford to ride.—The horses and slaves of the rich take up the whole street, while we *peripatetics* are very glad to watch an opportunity to whisk cross a passage, very thankful that we are not run over for interrupting the machine that carries in it a person neither more handsome, wife, or valiant, than the meanest of us. *Tatler*, N^o 144.

Cicero tells us, that Plato left two excellent disciples, Xenocrates and Aristotle, who founded two sects, which only differed in name; the former taking the appellation of *Academics*, who were those that continued to hold their conferences in the academy, as Plato had done before; the others, who followed Aristotle, were called *Peripatetics*; from *περιπατεω*, I walk; because they disputed walking in the Lyceum; this was a grove in the suburbs of Athens, which had previously been used for military exercises.

Ammonius derives the name Peripatetic from Plato himself, who only taught walking; and adds, that the disciples of Aristotle, and those of Xenocrates, were equally called Peripatetics; the one Peripatetics of the Academy, the other Peripatetics of the Lyceum; but that, at length, the former quitted the title Peripatetic, for that of Academic, on occasion of the place where they assembled; and the latter retained simply that of Peripatetic.

The greatest and best part of Aristotle's philosophy he borrowed from his master Plato: Serranus affirms confidently, and says he is able to demonstrate it, that there is nothing exquisite in any part of Aristotle's philosophy, dialectics, ethics, politics, physics, or metaphysics, but is found in Plato. And of this opinion are many of the ancient authors, as Clemens Alexandrinus, &c. Gale endeavours to show, that Aristotle borrowed a good deal of his philosophy, both physical, about the first matter, and metaphysical, about the first being, his affections, truth, unity, goodness, &c. from the sacred books; and adds, from Clearchus, one of his (Aristotle's) scholars, that he made use of a certain Jew, who assisted him therein.

Aristotle, when he withdrew to Chalcis, was succeeded in the school of the Lyceum by one of his favourite pupils, Theophrastus, whom he appointed to this office in the 2d year of the 114th olympiad, B. C. 323. Under his conduct, the Peripatetic school maintained such high reputation, that he had about 2000 scholars. Theophrastus was succeeded by Strato of Lampascus, who undertook the charge of it in the 3d year of the 123d olympiad, B. C. 286. After his death, this school was continued, in succession, by Lycon of Troas, who enjoyed the friendship of Attalus and Eumenes, and filled the chair till the 138th olympiad; by Aristo, of the island of Coos, whom Cicero characterizes as more distinguished for the elegance

gance of his language than the depth of his philosophy; by Critolaus, a Lydian, who, with Carneades and Diogenes, was deputed by the Athenians on an embassy to Rome, and who is said to have held the doctrine of the eternity of the world; and Diodorus, with whom the uninterrupted succession of the Peripatetic school terminated. Of this school Demetrius Phalereus was an illustrious ornament.

The Peripatetic philosophy found its way into Rome, in the time of Sylla, with the writings of Aristotle and Theophrastus. However, the obscurity of Aristotle's writings greatly obstructed the progress of this philosophy; and Cicero, who seems to have had some respect for the Peripatetic philosophy, acknowledges that it was understood by very few even of the philosophers themselves. Under the Cæsars, it regained its ancient credit; and from the time of Andronicus, the preceptor of Plutarch, who, with Tyrannio, brought it to Rome, to that of Ammonius, that is, till the time of Nero, the peripatetic doctrines were taught with great purity in its schools. But after Ammonius it began to experience the influence of that spirit of confusion which prevailed among the eclectic philosophers; and the plan of Antiochus, who had formerly attempted a coalition between Aristotole, Plato, and Zeno, was revived. From this time the Peripatetic sect was divided into two branches; the one consisting of such as attempted to combine the doctrines of other schools with those of Aristotle; the other, including those who wished to follow more closely the steps of the Stagyræite.

Julius Cæsar and Augustus patronized the Peripatetic philosophy; the former in the person of Sofigenes, the latter in that of Nicolaus. Under the tyrannical reigns of Tiberius, Caligula, and Claudius, it experienced worse fortune; many excellent men of this sect, as well as others, being either banished from Rome, or obliged, through fear of persecution, to remain silent. In the reign of Nero, the philosophers of this sect, as well as others, enjoyed the temporary protection of the imperial court; but after a period of five years, they shared the fate of the professors of magical arts, or, as they were then called, "mathematicians," and were again banished the city. During the first century of the Roman empire, we find few celebrated names among the Peripatetic philosophers. The principal are Sofigenes, Boethius, Nicolaus, and Ægeus. About this time Ammonius, the preceptor of Plutarch, attempted to extend the authority of Aristotle beyond the limits of his own sect, by blending the Platonic and Stoic doctrine with the Peripatetic. After his death many Platonists studied the writings of Aristotle, and commented upon them; and thus prepared the way for the formation of the Eclectic Sect under Ammonius Sacca, who flourished about a century later than Ammonius the Peripatetic. After this time we meet with several genuine followers of Aristotle, of whom the most celebrated was Alexander Aphrodisæus. Among the eclectic commentators upon Aristotle, we may reckon, besides Porphyry, Jamblichus, Plutarchus, Nestorius, &c. Darippus, Themistius, Olympiodorus, and Simplicius.

From this concise detail we may learn, that, under several of the Cæsars, the philosophers of this school shared, with their brethren, the common discouragements and misfortunes of oppression. The concise and logical method of philosophizing, which prevailed in this school, could obtain few admirers at a period remarkable for a loose and florid kind of eloquence. Besides, the doctrine, which the Peripatetics of this period had received from their master, suffered much adulteration from the unwearied endeavours of the Alexandrian philosophers to establish an eclectic system. Many bold but injudicious grammarians and critics attempted to supply chasms, and to clear up absurdities, in the writings of Aristotle, from their own ingenious conjectures, which they presumed to incorporate with the author's text. Even Alexander Aphrodisæus, who professed to restore the genuine

Aristotelian system, not confining himself to the doctrine of his master, contributed towards its adulteration. But nothing proved so injurious to the Peripatetic philosophy, as the rage for commenting upon the works of Aristotle, which prevailed among his followers. Notes, paraphrases, arguments, summaries, and dissertations, piled up, century after century, under the general name of Commentaries upon Aristotle, created, as might be expected, endless disputes concerning the meaning of his writings; and it may perhaps be asserted with truth, that their genuine sense, after all the pains which have been taken to explore it, yet remains, in many particulars, undiscovered.

Some knowledge of the Aristotelian system was introduced among the Jews by Aristobolus, an Alexandrian Jew, who lived in the reign of Ptolemy Philometer, and was an admirer of the Greek philosophy. In order to facilitate the study of Aristotle among the Jews, his writings were, in a subsequent period, translated from the Arabic into the Hebrew tongue; and towards the end of the 13th century, the name of Aristotle was so highly respected among the Jews, that they not only called him the Prince of Philosophers, but maintained that his philosophy was the perfection of human science, and could only be excelled by the doctrine of divine revelation; and, in order to screen themselves from censure for submitting to receive wisdom from a heathen philosopher, they pretended that Aristotle was himself a proselyte to Judaism, and was indebted to Solomon for a great part of his philosophy.

The commencement of the Aristotelian philosophy among the *Arabians* may be referred to the time of Al-Mamon, who, among other writings in various languages, caused the works of Galen and of Aristotle to be translated into Arabic. After his death, which happened in the year 833, philosophy continued its progress among the Saracens, to which the eminent schools that were founded in different parts of the empire in no small degree contributed. In order to accommodate the established system, which was guarded by the sanction of penal laws, to their philosophical ideas, they blended the abstract speculations of the schools with the gross and vulgar conceptions of the Koran. They made use of the subtleties of the Aristotelian philosophy in the defective and corrupt state in which it had come into their hands, to assist them in improving upon the literal meaning of their sacred books, and thus gave a new, and for the most part a metaphysical, turn to the religion and law of Mahomet. This, it is said by one of their own writers, was the origin of their religious sects. Many of the Arabian philosophers, among whom we may reckon Jacobus-Al-Kendi of Bassora, Al-Farabi, or Abu-Nair, a native of Balch Farab, who flourished in the 10th century, Al-Rafi, called also Abubeker and Al-Mansor, a native of Rai in Persia, Avicenna, Avenpace, a Spanish Saracen, who flourished about the middle of the 12th century, Avenzoar of Seville, Thophail of the same city, and Averroes, acquired celebrity by their commentaries upon Aristotle, and other philosophical works. In every branch of science, in which Aristotle led the way, the Arabian philosophers followed him as an infallible guide; inasmuch that their tenets, as far as they are distinct from the peculiar dogmas of the Koran, are, without variation, those of the Peripatetic school.

In the earlier ages of *Christianity*, the Platonic philosophy was more generally preferred to the Peripatetic: the Christian fathers pointed the severest censures against the Peripatetic and Epicurean sects. The doctrines of the Peripatetics concerning Divine Providence, and the eternity of the world, chiefly excited their aversion against this sect; and, besides this, they were much displeased with Aristotle, for having furnished heretics and infidels with the weapons of sophistry. Nevertheless this did not prevent the doctrine of Aristotle from forcing its way into the Christian church. Towards the close of the fifth century, it rose into considerable credit: the Platonists,

nics, interpreting, in their schools, some of the writings of Aristotle, particularly his *Dialectics*, and recommending them to young persons. This seems to have been the first step to that universal dominion which Aristotle afterwards obtained in the republic of letters; which was also very much promoted by the controversies which Origen had occasioned: he was zealously attached to the Platonic system: and, therefore, after his condemnation, many, to avoid the imputation of his errors, and to prevent their being counted among the number of his followers, openly adopted the philosophy of Aristotle. Nor was any philosophy so proper for furnishing those weapons of subtle distinctions and captious sophisms, which were used in the Nestorian, Arian, and Eutychian, controversies. About the close of the sixth century, the Aristotelian philosophy, as well as science in general, was almost universally decried; and it was chiefly owing to Boethius, who had explained and recommended it, and who united the Platonic with the Aristotelian doctrine, that it obtained a higher degree of credit among the Latins than it had hitherto enjoyed. Towards the end of the seventh century, the Greeks, abandoning Plato to the monks, gave themselves up entirely to the direction of Aristotle: and in the succeeding century the Peripatetic philosophy was taught every-where in their public schools, and propagated in all places with considerable success. John Damascenus, who flourished at the beginning of the eighth century, very much contributed to its credit and influence, by composing a concise, plain, and comprehensive, view of the doctrines of the Stagirite, for the instruction of the more ignorant, and in a manner adapted to common capacities. Under the patronage of Photius, and the protection of Barda, the study of philosophy, having for some time declined, revived again about the end of the ninth century. About the year 1050, a revolution in philosophy commenced in France; when several eminent logicians, who followed Aristotle as their guide, took nevertheless the liberty of illustrating and modelling anew his philosophy, and extending it far beyond its ancient limits. In the twelfth century, three methods of teaching philosophy were practised by different doctors. The first was the ancient and plain method, which confined its researches to the philosophical notions of Porphyry, and the dialectic system, commonly attributed to St. Augustine, and in which were laid down this general rule, that philosophical inquiries were to be limited to a small number of subjects, lest, by their becoming too extensive, religion might suffer by a profane mixture of human subtilty with its divine wisdom. The second method was called "the Aristotelian," because it consisted in explications of the works of that philosopher, several of whose books, being translated into Latin, were almost every-where in the hands of the learned. The third was termed the "free method," employed by such as were bold enough to search after truth, in the manner the most adapted to render their inquiries successful, without rejecting the succours of Aristotle and Plato.

About this time, dialectic philosophy was supposed to be the key of theology, without which it would be impossible to unlock the mysteries of sacred wisdom. On account of this supposed alliance between logic and theology, the former was made the principal object of study in all the schools, and those who excelled in the dialectic art were regarded with the highest admiration, and attended by crowds of pupils. The Aristotelian philosophy had now for several centuries been studied by the Saracens, and was at this time taught in their schools in Spain. These schools were visited by many of the Western Christians, who learned Arabic, that they might be able to read translations of Aristotle, and other philosophical writers, and who afterwards translated many Arabic books into the European tongues. Another cause which served to establish a general taste for the Peripatetic philosophy, and particularly for the Aristotelian logic, was, that about this period many Greek copies of the writings

of Aristotle were brought from Constantinople into the West. Before this time, though they had been read in the original by a few monks, more learned than the rest, most persons had been contented with the translations of Victorinus and Boethius. But, at the beginning of the 12th century, the original writings of Aristotle were studied in Paris; whence they were introduced among the Germans, by Otho of Freisingen, in the time of Abelard. The guardians of the church were alarmed by the inundation of new opinions, which this fondness for logical disputations introduced; and, after having sentenced the works of two Parisian teachers of theology to be publicly burned, a general prohibition of the use of the physical and metaphysical writings of Aristotle in the schools, was issued first by the synod of Paris, and afterwards, under pope Innocent III. by the council of Lateran. The evil that had caused the alarm was not suppressed; but the fondness for the subtleties of Aristotelian logic and metaphysics became so general, that the orthodox clergy complained, that scholars spent their whole time in disputation. It was at length found necessary, under certain restrictions, to favour the study of Aristotle. Accordingly his *Dialectics*, *Physics*, and *Metaphysics*, were by express statute received into the university of Paris. It was ordered, however, in 1231, by a bull of pope Gregory IX. that only such books of Aristotle should be used in the schools as had been examined and purged from errors.

In several other countries, the Aristotelian philosophy was received with less opposition. In England, the writings of the Stagirite were read with great avidity; and in Germany and Italy the study of Aristotle was very much encouraged. The name of Aristotle, from the end of the twelfth century, obtained universal dominion; and so far were his writings, after this time, from falling under the censure of councils and popes, that the philosophy of Aristotle, and that of the Saracens, became the main pillars of ecclesiastical hierarchy. In the year 1452, Charles VII. ordered the works of Aristotle to be read and publicly explained in the university of Paris. Thus the union between the Peripatetic philosophy and the Christian religion was confirmed; and Aristotle became not only the interpreter, but even the judge, of St. Paul.

Although, at the beginning of the 16th century, the scholastic philosophy began to fall into general contempt, Aristotle still retained, in a great degree, his authority. This event was owing to many concurring circumstances. The partisans of the Platonic system, who, under the patronage of the Medicean family, had long maintained their ground against the Aristotelians, lost their influence as that of their patrons declined; and the advocates of the Peripatetic philosophy proportionally increased, and, after a violent conflict, obtained a victory. The deference which had been long paid to the decisions of Aristotle, induced the first restorers of learning to direct their principal attention to his writings: accordingly the number of critics and commentators became very considerable. The first persons of this description employed themselves in verbal rather than philosophical criticism, and in correcting the text of their author. But commentators of a different class were chiefly employed, from Pomponatius to the middle of the seventeenth century, in ascertaining and restoring the true Aristotelian philosophy. It would be an endless task to enumerate all the learned men, who, in the fifteenth and sixteenth centuries, attached themselves to the Aristotelian system. Among the Roman Catholics we may mention Nicholas Leonicus Thomæus, a Venetian, born in 1457, who seems to have been one of the first that attempted to restore the genuine Aristotelian philosophy; Pomponatius of Mantua, born in 1462, who taught the doctrines of Aristotle and Averroës in the schools of Padua and Bologna, and who had many followers of great celebrity; such were Simon Porta, a Neapolitan, Julius Cæsar Scaliger, a celebrated philologist, and Lazarus Romanicus,

namicus, who rivalled Erasmus in elegant Latinity: Majoragijs of Milan; Sepulveda of Cordova; Peter Victor of Florence; Zabarella of Padua; Strozza of Florence; Cæsalpinus, an Italian; and Cæsar Cremoninus of Modena.

Among the Protestants, especially in Germany, we find in their public schools many learned men who were followers of Aristotle. At the commencement of the reformation, indeed, both the scholastic philosophy and the dogmas of Aristotle were rejected with great indignation, particularly by Martin Luther. But afterwards, when men of the soundest judgment and best erudition perceived the value of philosophy as a guard against fanaticism, much labour was devoted to the promotion of learning, and to the encouragement of a love of science. The first place in this class of reformers is unquestionably due to Philip Melancthon. At Leipsic, Simon Simon of Lucca was distinguished; in the academy at Tubingen flourished Jacobus Schegkius; and in that of Altdorf, Philip Scherbius, whose contemporary, of the same school, was Nicholas Taurullus. To these we may add Ernestus Sonerus, a native of Nuremberg; and Hermannus Conringius, one of the most illustrious ornaments of the Germanic schools; and also Christianus Drierus, a native of Stettin in Pomerania; Melchior Zeidler of the same place; and Jacobus Thomasius of Leipsic, chiefly memorable as the preceptor of the illustrious Leibnitz.

The general prepossession in favour of the Aristotelian system, which from a variety of causes, some of which have been enumerated, prevailed for several centuries after the revival of letters, was attended with much inconvenience and mischief. Opinions were imbibed from the Peripatetic philosophy, wholly inconsistent with the principles of true religion; such as, for example "that God, the first mover, wholly intent upon the contemplation of his own intellect, disregards the affairs of the world; that the Intelligence, which presides over the lower sphere, is the universal soul of the world, of which all men partake; and consequently, that the soul of man has no distinct existence, and will no longer subsist as such than whilst the body continues to live." In consequence of these and similar tenets, infidelity prevailed; and the minds of the multitude, both ecclesiastics and laity, were deeply tinctured with atheism; and this fatal relaxation of principle produced an uncommon depravity of manners. In order to restrain this evil, the fathers of the Lateran council issued a bull, in 1510, against the Aristotelian corruptions; but the Peripatetics ridiculed this idle fulmination. The Stagirate having, for many centuries, possessed authority in the schools little inferior to that of Jesus Christ in the church, and his dogmas being intimately interwoven with those of religion, it was thought exceedingly hazardous to whisper any thing to the discredit of his philosophy. This reverence for Aristotle was supported, in popish universities, by statutes which required the professors to promise upon oath, that in their public lectures on philosophy they would follow no other guide. Among Protestants, the errors and corruption of the Peripatetic philosophy met with opposition; but it was attended with little success. Several eminent men ventured to inveigh against Aristotle himself, as the author of many pernicious errors. But, still, his system, for the most part, retained its authority; and even those who forsok this master, thought it necessary to make choice of some other ancient guide; so that, after all, the question was, what Aristotle, Plato, or Pythagoras, had taught, rather than what was truth.

The Peripatetic system, after having prevailed with very great and very extensive dominion for many centuries, began rapidly to decline towards the close of the seventeenth century, when the disciples of Ramus attacked it on the one hand, and it had still more formidable adversaries to encounter in Des Cartes, Gassendi, and Newton. *Brucker's Hist. Phil. by Enfield. Moheim's Eccl. Hist.*

PERIPATET'IC, or PERIPATETICAL, *adj.* Belonging

to the Peripatetics; denoting the Peripatetics.—Peregrination may be not improperly called a moving academy, or the true *peripatetic* school. *Howell's Instruct. for Trav.*—With those of the *peripatetic* school, he allows that ideas are impressed upon the mind from sensible objects. *Norris's Reflect. on Locke.*

PERIPATET'ICISM, *f.* The notions of the Peripatetics.—No man will dispute whether that be genuine *peripateticism*, which is plainly read in the writings of Aristotle. *Barrow of the Creed.*

PERIPA'TON, *f.* in antiquity, the name of that walk in the Lyceum where Aristotle taught, and whence the name of Peripatetics given to his followers.

PERIPE'TIA, *f.* [from the Gr. περιπέτης, something falling into a different state; of περι, about, and πέτω, to fall.] That part of a tragedy in which the action is turned, the plot unravelled, and the whole concludes.

PERIPH'ERY, *f.* [from the Gr. περι, about, and φέρω, I bear, or carry.] The circumference or bounding-line of a circle, ellipsis, parabola, or other regular curvilinear figure. The periphery of every circle is supposed to be divided into three hundred and sixty degrees; which are again subdivided, each into sixty minutes, the minutes into seconds, &c. The division of degrees, therefore, are fractions, whose denominators proceed in a sexagecuple ratio; as, the minute $\frac{1}{60}$, second $\frac{1}{3600}$, third $\frac{1}{216000}$. But, these denominators being troublesome, in their stead are used the indices of their logarithms; hence the degree, being the integer, or unit, is marked by $^{\circ}$, the minute by $'$, second by $''$, &c.—Neither is this sole vital faculty sufficient to exterminate noxious humours to the *periphery* or outward parts. *Harvey.*

The first *periferie* of all

Engend'reth mist, and overmore

The dewes, and the frostes here. *Gower's Conf. Am.*

PERIPH'RASE, or PERIPH'RASIS, *f.* [from the Gr. περι, about, and φρασις, a speech.] Circumlocution; use of many words to express the sense of one: as, for *death*, we may say, *the loss of life*.—The *periphrases* and circumlocutions, by which Homer expresses the single act of dying, have supplied succeeding poets with all their manners of phrasing it. *Pope*.—They show their learning uselessly, and make a long *periphrasis* on every word of the book they explain. *Watts*.—They make the gates of Thebes and the mouths of this river a constant *periphrasis* for this number seven. *Brown.*

She contains all bliss,
And makes the world but her *periphrasis*. *Cleaveland.*

To PERIPH'RASE, *v. a.* To express one word by many; to express by circumlocution.

PERIPH'RASTICAL, *adj.* Circumlocutory; expressing the sense of one word in many.

PERIPH'RASTICALLY, *adv.* With circumlocution.—Dr. Grainger, having become sensible that introducing rats in a grave poem might be liable to banter, could not, however, bring himself to relinquish the idea; for they are thus, in a still more ludicrous manner, *periphrastically* exhibited in his poem [the Sugar-Cane] as it now stands. *Boswell's Life of Johnson.*

PERIP'LOCA, *f.* [an old name adopted by Tournefort and Linnæus, derived from the Gr. περι, about, and πλοκη, binding, or twining; alluding to the long trailing stems and branches, which twine about each other to a great extent.] In botany, a genus of the class pentandria, order digynia, natural order of contortæ, (apocineæ, *Juss.*) Generic characters—Calyx: perianthium five-cleft, very small, segments ovate; permanent. Corolla: one-petalled, wheel-shaped, five-parted: segments oblong, linear, truncated, emarginate. Nectary very small, five-cleft, surrounding the genitals, putting out five threads, curved inwards, shorter than the corolla, and alternate with it. Stamina: filaments short, curved inwards, converging, villose. Antheræ twin, acuminate, converging

Esculent Periploca.

Engraved for the Encyclopædia Londinensis 1823.

over the stigma; with lateral cells. Pollen-bags five, at the notches of the stigma, each common to two antheræ. Pistillum: germs two, ovate, approximating. Styles united at top. Stigma capitate, convex, five-cornered, with the corners notched. Pericarpium: follicles two, large, oblong, ventricose, one-celled, one-valved, glued together at the tip. Seeds very many, imbricated, crowned with a down. Receptacle longitudinal, filiform. The above character is taken from *P. græca*.—*Essential Character*. Nectary encircling the genitals, and putting forth five threads. There are fourteen species.

1. *Periploca græca*, common periploca; otherwise climbing dog's-bane, or Virginian flk: flowers internally hirsute, terminating; corolla hairy on the upper side; leaves ovate, acute. Native of hedges and thickets in the Levant. Dr. Sibthorp gathered it on Mount Athos and near Prusa. Gerarde had the plant in 1597. "My loving friend," says he, "John Robin, herbarist in Paris, did send me plants for my garden, where they flower and flourish." He calls it *climbing dog's-bane*; and it has ever since been cultivated in England, as a hardy climber, flowering plentifully in July and August; and distinguished by the name of *Virginian flk*. Lord Bute sent a description of this periploca, as a new genus, without any idea of its being a described plant, to Peier Collinson, which the latter forwarded to Linnæus. The stem twines round every thing in its way to the extent of several yards, and is much branched, round, and smooth: Leaves opposite, on short stalks, ovate, sharp-pointed, entire, smooth and shining, very beautiful, two or three inches long, deciduous; the lowermost on each branch short, rounded, and obtuse. Flowers corymbosæ, at the ends of short lateral branches, inodorous, singularly elegant, with a velvet softness, each an inch in diameter; purple within, yellowish at the tips. It is cultivated in France to adorn arbours and walls, as its numerous purple flowers are very ornamental. It is not used in medicine; but is considered as a poison for destroying dogs and wolves; hence the old name of "dog's-bane." This pretty climber is represented on the preceding Engraving, (p. 618.) at fig. 3. the calyx and pistil at fig. 4. the petal detached, with a filament, at fig. 5. and the capsule which enclosed the seed at fig. 6.

2. *Periploca scamone*, or green periploca: flowers internally hirsute, panicled; leaves lanceolate-elliptic. Stem twining, shrubby, even. Leaves opposite, petioled, even, underneath paler, veined transversely. Flowers small. It differs at first sight from the preceding in its small copious flowers. Said to be a native of Egypt, but its place of growth is uncertain. It was cultivated in 1775, by John Fothergill, M. D. It flowers in July.

3. *Periploca lævigata*, or smooth periploca: corollas smooth, with blunt segments; cymes trichotomous; leaves oblong-lanceolate, veined, even; stem smooth. Native of the Canary islands, where it was found by Maffon. Introduced in 1779.

4. *Periploca angustifolia*, or narrow-leaved periploca: corollas smooth; segments emarginate; cymes trichotomous; leaves lanceolate, veinless, even; stem smooth. Stem frutescent, from three to five feet high, upright, branched, sometimes scandent by the top. Though very like the preceding, yet it is sufficiently distinct from it, by its narrower veinless leaves, and the emarginate segments of the corolla. Found by Labillardiere near Laodicea by the sea, and in the island Lampedosa; by Desfontaines on Mount Atlas; also on Mount Shibel Ichel, in the kingdom of Tunis.

5. *Periploca esculenta*, or esculent periploca: corollas smooth, wheel-shaped; racemes axillary; leaves linear-lanceolate, veined. Native of bushy places, near rivers and pools, in Ceylon and Malabar. Koenig, who sent fine specimens to Linnæus, has written on one of them that "the plant is esculent, and called *usepale* in the Tamul language." Dr. Roxburgh could not find that it was eaten by the people, at least of the Malabar coast.

He gives *oudy-palla* as its name among the Telingas, and remarks that cattle eat it. The root is fibrous, and perennial, as well as the twining, slender, smooth, round, branching stems. The leaves and flowers are produced during the rainy season; the former are opposite, stalked, above two inches long, linear lanceolate, acute, entire, smooth, single-ribbed, light green, rounded at the base, deciduous. Flowers the size of those of *Primula auricula*, of some of whose most beautiful varieties they give no very remote idea, but their segments are much more acute: their colour is a pale bluish, with crimson veins, a purple eye, and a mixture of green and white in the centre: they are well deserving, therefore, of a place in the flower-garden, though they have no scent. See the annexed Plate.

This (with the following) is made a distinct genus by Mr. Brown in the Wern. Transf. vol. i. and in his Prodr. Nov. Holl. vol. i. He calls his genus *Oxytelma*, from the Gr. *οξύς*, sharp, and *τελμα*, for *τεμμα*, a crown; because the crown of the stamens consists of five acute leaves.

6. *Periploca carnosa*, or fleshy periploca: leaves nearly oval, pointed. Segments of the corolla linear. Native of the tropical part of New Holland, where it was observed by Mr. Brown. The stems are twining, herbaceous; leaves fleshy, smooth, opposite. Flowers in umbellate stalked-clusters, from between the leaf-stalks. Mr. Brown remarks, that this New-Holland species is so very different from the East-Indian one, he is inclined to think they ought to be different genera. *Prodr. Nov. Holl. i. 462.*

7. *Periploca emetica*, or emetic periploca: corollas smooth; cymes few-flowered, axillary; leaves linear-lanceolate, veinless. Stem shrubby, with diffused rod-like even branches. Flowers small, smooth. Native of the East Indies, at the foot of mountains. Koenig sent it from Tranquebar. Thunberg says that the root is used as an emetic in the East Indies.

8. *Periploca Indica*, or Indian periploca: spikes axillary, imbricated; leaves elliptic, obtuse; mucronate; stem smooth. Stem twining, round. Leaves opposite, smooth, quite entire, on very short petioles: from the axils of them, simple spikes come out imbricated with sharp scales. According to Burman, the stem is ash-coloured, rugged with many very small tubercles. A pair of leaves from each joint, almost sessile, bright-green above, pale and ash-coloured underneath, oblong, acute, entire, veined; at the axils of these there are many flowers sitting close. Native of the island of Ceylon.

9. *Periploca capsularis*, or New-Zealand periploca: leaves lanceolate, quite entire, opposite; cymes axillary, diffused. Native of New Zealand.

10. *Periploca Africana*, or African periploca: leaves ovate, acute; flowers corymbed; stem hirsute. This has many slender stalks, which twine about each other, and by a shrub or other support will rise near three feet high, putting out several small side-branches: these are hairy, as are also the leaves, which are about three quarters of an inch long, and half an inch broad, standing by pairs upon very short footstalks. The flowers come out in small bunches from the side of the stalks; they are small, of a dull purple colour, and have a sweet scent. It flowers in the summer, but does not produce seeds here. Native of the Cape of Good Hope. Cultivated by Mr. Miller in 1726.

β. There is a variety of it with smooth leaves and stalks, from the same country.

11. *Periploca tunicata*: leaves oblong, heart-shaped, acuminate; flowers umbelled. Sent by Koenig from Tranquebar.

12. *Periploca sylvestris*: leaves roundish-ovate, netted-veined, pubescent underneath; flowers umbelled. Native of the East-Indies; found by Koenig.

13. *Periploca Cochinchinensis*: stem aboveous; leaves fleshy; racemes terminating. This is a middle-sized tree with

with spreading branches. Leaves heart-shaped, oblong, acute, quite entire, large, smooth, opposite. Flowers bluish-white, on short racemes. Native of Cochinchina, to the south of Huæa the metropolis. It occurs also in Bengal, but of a smaller size.

14. *Periploca fruticosa*: leaves oblong-cordate, pubescent; flowers axillary; stem shrubby, climbing. This rises with a strong woody stalk to the height of five or six feet, covered with a grey bark, putting out many weak branches, which twist themselves about any neighbouring support, and rise to the height of twenty feet; they are garnished with heart-shaped leaves three inches long, and two broad near their base; they are of a yellowish green, covered with silky hairs, which are soft to the touch; and stand opposite upon pretty long footstalks. The flowers come out in small bunches from the wings of the leaves; they are small, white, and of the open bell-shape; these are succeeded by swelling taper pods, filled with seeds crowned with long feathery down. Discovered by Dr. Houfoun at Vera Cruz in America.

Propagation and Culture. The first species is easily propagated by laying down the branches, which will put out roots in one year, and may then be cut from the old plant, and planted where they are to remain. These may be transplanted, either in autumn when the leaves begin to fall, or in the spring before they begin to shoot; and must be planted where they may have support, otherwise they will trail on the ground, and fasten themselves about whatever plants are near them. They require sun, as they will not flourish in the shade.

The tenth sort is hardy enough to thrive in this country, with a little protection from the frost in winter. If the plants are sheltered under a common frame, or placed in a green house during the winter season, and set abroad with other hardy exotic plants in summer, they will thrive and flower very well; but, as all the plants of this genus have a milky juice, so they should not have much wet, especially in cold weather, lest it rot them. They are easily propagated by laying down their branches, which in one year will have roots enough to transplant; these should be planted in a light sandy loam not rich, and the pots must not be too large, for when they are over-potted they will not thrive.

The fourteenth sort, being tender, will not thrive in England, unless the plants are placed in a warm stove. They may be propagated by laying down their branches in the same manner as the former; or from seeds, when they can be procured from the places where they naturally grow. These should be sown upon a good hot-bed; and, when the plants come up, they must be treated in the same manner as other tender exotic plants. If these plants are constantly kept plunged in the tan-bed of the stove, they will thrive and flower much better than in any other situation, but the stove should not be kept too warm in winter; and in the summer the plants should have a large share of free air admitted to them; for, when they are kept too close, their leaves will be covered with insects, and the plants will become sickly in a short time. See CEROPEGIA, CYNANCHUM, and ECHITES.

PER'IPLUS, *f.* [*περιπλος*, Gr. *periple*, Fr.] A voyage round a certain sea, or sea-coast; circumnavigation.—Arrian has described all the coasts of the Black Sea, after having inspected them in quality of general of the emperor Adrian, to whom he dedicates the description, under the title, "*Periplus of the Euxine Sea.*" *Chambers.*—The "*Periplus Hannonis*" is one of the most curious fragments transmitted to us by antiquity, and it is the only authentic monument of the Carthaginian skill in naval affairs. But some doubts have been entertained concerning its antiquity. The *Periplus* of the Erythrean Sea has been published by Dr. Vincent.

PERIPNEUMONY, *f.* [*peripneumonia*, Lat. from the Gr. *περι*, about, and *πνευμων*, the lungs.] An inflammation of the lungs and breast, attended with a fever and a difficulty of breathing. See p. 242, 3, of this vo-

lume.—A *peripneumony* is the last fatal symptom of every disease; for no body dies without a stagnation of the blood in the lungs, which is the total extinction of breath. *Arbutnot.*—Lungs, oft imbibing phlegmatic and melancholic humours, are now and then deprehended schirrous, by dissipation of the subtiler parts, and lapidification of the grosser, that may be left indurated through the gross reliques of *peripneumonia*, or inflammation of the lungs. *Harvey.*

PERIPO'LIUM, in ancient geography, a town of Magna Græcia, in the part called Brutium. It belonged to the Locrian-Epizephyrians, on the banks of the small river Alex, or Halex.

PERIP'TERAL, *adj.* in architecture, surrounded with columns. See the next article.

PERIP'TERE, or PERIPTERY, *f.* [from the Gr. *περι*, about, and *πτερον*, wing; q. d. winged on every side.] In ancient architecture, a building encompassed on the outside with a series of insulate columns, forming a kind of aisle, or portico, all around. Such were the Basilica of Antonine, the Septizon of Severus, the Portico of Pompey, &c.—*Peripteres* were properly temples which had columns on all the four sides; by which they were distinguished from prostyles, and amphiprostyles, the one of which had no columns before, and the other none on the sides. *Chambers.*—See ARCHITECTURE, vol. ii. p. 72, 3.

PERIPU', *f.* in botany. See DELIMA.

PERIPYE'MA, or PERIPYOMA, *f.* [from the Gr. *περι*, about, and *πυρ*, pus.] A collection of matter about any part.

PERIRRHANTE'RION, *f.* [Greek.] In antiquity, a vessel usually of stone or brass, filled with holy water, with which all those that were admitted to the sacrifices were sprinkled, and beyond which it was unlawful for any one that was profane to pass. Some say it was placed in the *adytum*, or inmost recess of the temple, into which none entered but the priest; but Casaubon will have it to be placed at the door of the temple, which opinion seems more probable, because all persons who were unpolluted were permitted to pass beyond it.

PERIRRHEU'SA, in ancient geography, an island placed by Pliny on the coast of Ionia, a province of Asia Minor.

PERIRRHO'E'A, *f.* [from the Gr. *περι*, about, and *ῥου*, to flow.] A reflux of humours from the habit into any of the larger excretories, in order to excretion.

PERISAB'ORA, in ancient geography, a town of Asia, in an island of the Euphrates, according to Ammianus Marcellinus. Zosimus calls it Bersabora, and says that it was well fortified, and that it was not inferior in grandeur to Ctesiphon. It was situated south-east of Sippara.

PERIS'BA, a town of Persia, in the province of Irac: fifty miles south of Hamadan.

PERISCIAN, *adj.* [from *periscii*, Lat.] Having shadows all around.—In every clime we are in a *periscian* state; and, with our light, our shadow and darkness walk about us. *Brown's Chr. Mor.*

PERIS'CII, *f.* [from the Gr. *περι*, about, and *σκια*, shadow.] Those inhabitants of the earth whose shadows do, in one and the same day, successively turn to all the points of the horizon. Such are the inhabitants of the frozen zones, or those who live within the compass of the arctic and antarctic circles; for, as the sun never goes down to them after he is once up, but moves always round about, so do their shadows; inasmuch that, in the same day they have their shadows on all sides.

To PER'ISH, *v. n.* [*perir*, Fr. *pereo*, Lat.] To die; to be destroyed; to be lost; to come to nothing. It seems to have *for* or *with* before a cause, and *by* before an instrument. Locke has *by* before the cause.—If I have seen any *perish for* want of cloathing, then let mine arm fall from the shoulder-blade. *Job*, xxxi. 29.—He keepeth back his soul from the pit, and his life from *perishing by* the

the sword. *Job*, xxxiii. 18.—I *perish* with hunger. *St. Luke*, xv. 17.—The sick, when their case comes to be thought desperate, are carried out and laid on the earth to *perish* without assistance or pity. *Locke*.

Still when the lust of tyrant pow'r succeeds
Some Athens *perishes*, or some Tully bleeds. *Pope*.

To be in a perpetual state of decay.—Duration, and time which is a part of it, is the idea we have of *perishing* distance, of which no two parts exist together, but follow in succession; as expansion is the idea of lasting distance, all whose parts exist together. *Locke*.—To be lost eternally.—O suffer me not to *perish* in my sins: Lord, carest thou not that I *perish*, who wilt that all should be saved and that none should *perish*? *Bp. Moreton's Daily Exercise*.

To *PER'ISH*, *v. a.* To destroy; to decay. *Not in use*.—Rise, prepar'd in black to mourn thy *perish'd* lord. *Dryden*.

The splitting rocks cow'r'd in the sinking sands,
And would not dash me with their ragged sides;
Because thy flinty heart, more hard than they,
Might in thy palace *perish* Margaret. *Shakespeare*.

His miseries have *perish'd* his good face,
And taken off the sweetness that has made
Him pleasing in a woman's understanding.

Beaum. and Fletcher's Hon. Man's Fortune.

Familiar now with grief, your ears refrain,
And in the public woe forget your own:
You weep not for a *perish'd* lord alone. *Pope*.

PER'ISHABLE, *adj.* Liable to perish; subject to decay; of short duration.—It is princes' greatest present felicity to reign in their subjects' hearts; but these are too *perishable* to preserve their memories, which can only be done by the pens of faithful historians. *Swift*.—Human nature could not sustain the reflection of having all its schemes and expectations to determine with this frail and *perishable* composition of flesh and blood. *Rogers*.

Thrice has he seen the *perishable* kind
Of men decay. *Pope's Odyssey*.

PER'ISHABLENESS, *f.* Liableness to be destroyed; liableness to decay.—Suppose an island separate from all commerce, but having nothing, because of its commonness and *perishableness*, fit to supply the place of money; what reason could any have to enlarge possessions beyond the use of his family? *Locke*.

PER'ISHMENT, *f.* Destruction.—Amidst this general scene of *perishment* and change, the holy gospel still remains. *Hewlett's Sermons*, vol. iii.

PERISSOL'OGY, *f.* [from the Gr. *περισσος*, superfluous, and *λογος*, a word.] A speech abounding with superfluous words.

PERISSO'SIS, *f.* A word used by Hippocrates to express a redundancy of humours.

PERISTAL'TIC, *adj.* [from the Gr. *περι*, about, and *σπασσω*, to contract.] Belonging to that vermicular motion of the guts, which is made by the contraction of the spiral fibres, whereby the excrements are pressed downwards and voided.—The *peristaltic* motion of the guts, and the continual expression of the fluids, will not suffer the least matter to be applied to one point the least instant. *Arbutnot*.

PERIS'TERA, in mythology, a nymph whom Cupid was supposed to have changed into a dove.

PERISTERION, *f.* The herb vervain.

PERISTERITES, *f.* the PIGEON-STONE; a name given by some whimsical people to an odd conformation of a pebble, which they suppose to represent very exactly a pigeon without its wings. It seems to have been a mere *hifus naturæ* in the formation of a common pebble. The variations of figure in the common pebbles are so infinite, that a person of a fertile imagination might find resemblances to all the parts of the creation in the stones of

a single gravel-pit. The giving names to such accidental things is not only unnecessary, but mischievous, as it causes great confusion in natural history.

PERISTOME, *f.* The fringe, or teeth, surrounding the mouth of the capsule in mosses.

PERISTYLE, *f.* [from the Gr. *περι*, about, and *στυλος*, a pillar.] A circular range of pillars.—The Villa Gordiana had a *peristyle* of two hundred pillars. *Arbutnot on Coins*.

PERISYS'TOLE, *f.* [from the Gr. *περι*, about, and *συστολη*, a contraction.] The pause or interval betwixt the two motions of the heart or pulse; namely, that of the *systole*, or contraction of the heart, and that of the *diastole*, or dilatation.

PERITA'NUS, an Arcadian who enjoyed the company of Helen after her elopement with Paris.

PERITAS, a favourite dog of Alexander the Great, in whose honour the monarch built a city.

PERITAS, a island in the Spanish Maine: ten miles west of Cumana Bay.

PERITE, *adj.* [*peritus*, Lat.] Skilful. *Not in use*.—A consumption of the whole body, left by the most *perite* physicians as incurable. *Whitaker's Blood of the Grape*, 1654.

PERITO, a town of Naples, in Abruzzo Ultra: sixteen miles west-south-west of Celano.

PERITONEUM, *f.* [from the Gr. *περι*, about, and *τεινω*, to stretch out.] The soft thin membrane that lies immediately under the muscles of the lower belly, and which encloses all the bowels contained in the lower belly, covering all the inside of its cavity.—Wounds penetrating into the belly, are such as reach no farther inward than to the *peritoneum*. *Wifeman*.

PERITONITIS, *f.* An inflammation of the *peritoneum*, or membrane lining the cavity of the abdomen, and investing all its viscera. For its causes and cure, see the article *PATHOLOGY*, p. 253, 4, of this volume.

PERITONIUM, in ancient geography, a town of Egypt, on the western side of the Nile, esteemed of great importance, as being one of the keys of the country. Antony was defeated there by C. Gallus, the lieutenant of Augustus.

PERITRO'CHIUM, *f.* [from the Gr. *περι*, about, and *τροχος*, to run.] A wheel or circle concentric with the base of a cylinder, and movable together with it, about an axis. The axis, with the wheel and levers fixed in it to move it, constitutes that mechanical power, called *axis in peritrochio*; which see. See also *MECHANICS*.

PER'IVALE, a town of Hindoostan, in Marawar: seven miles north of Ramanadporum.

PER'IVALE, the modern name given to a small village, formerly called Little Greenford, or Ganford, on the north side of Great Ealing and Castlebare-Hill; but is more properly that rich vale of excellent corn-land that extends from Heston to Harrow on the Hill and Pinner, including Northold, Southold, Norcote, Greenford, Hayes, &c.

PERJURA'TION, *f.* The act of committing perjury. *Bailey*.

PERJURE, *f.* [*perjurus*, Lat.] A perjured or forsworn person. *Not now in use*.

Hide thee, thou bloody hand,
Thou *perjure*, and thou simular of virtue,
Thou art incestuous. *Shakespeare's K. Lear*.

To *PER'JURE*, *v. a.* [from *per*, by, and *juro*, to swear.] To forswear; to taint with perjury. It is used with the reciprocal pronoun; as, *He perjured himself*.—The law is not made for a righteous man, but for the lawless and disobedient, for *perjured* persons. 1 *Tim.* i. 10.

Who should be trusted now, when the right hand
Is *perjur'd* to the bosom? *Shakespeare*.

PER'JURER, *f.* One that swears falsely.—The common oath of the Scythians was by the sword and fire; for that

that they accounted those two special divine powers, which should work vengeance on the *perjurers*. *Spenser*.—They write of a river in Bithynia, whose water hath a peculiar virtue to discover a *perjurer*; for, if he drink thereof, it will presently boil in his stomach, and put him to visible tortures. *Howell's Letters*.

PERJURIOUS, *adj.* Guilty of perjury.—The last [means] was their perfidious and *perjurious* equivocating, abetted, allowed, and justified, by the Jesuits. *Sir E. Coke in the Proceed. against Garnet, 1606.*—Thy *perjurious* lips confirm not thy untruth. *Quarles's Judg. and Mercy*.

PERJURY, *f.* [*perjurium*, Lat.] False oath:

My great father-in-law, renowned Warwick,
Cried aloud, What scourge for *perjury*
Can this dark monarchy afford false Clarence?
And so he vanish'd. *Shakespeare's Rich. III.*

PERJURY is defined to be, "a crime committed, when a lawful oath is administered by any who hath authority, to a person, in any judicial proceeding, who swears wilfully, absolutely, and falsely, in a matter material to the issue, or cause in question, by their own act, or by the subornation of others." 3 *Inft.* 163, 4.

In ancient times it was in some places punished with death; in others it made the false swearer liable to the punishment due to the crime he had charged the innocent person with; in others a pecuniary mulct was imposed. But, though it escaped human, yet it was thought, amongst the ancients in general, that the divine vengeance would most certainly overtake it; and there are many severe inflictions from the hand of God upon record, as monuments of the abhorrence in which this atrocious crime is held by the Deity. The souls of the deceased were supposed to be employed in punishing perjured persons. Even the inanimate creation was thought to take revenge for this crime. The Greeks supposed that no person could swear falsely by Styx without some remarkable punishment; and that no person guilty of perjury could enter the cave of Palæmon at Corinth without being made a memorable example of divine justice. In Sicily, at the temple of the Palici, there were fountains called *Delli*, from which issued boiling water, with flames and balls of fire; and we are told that, if any person swore falsely near them, he was instantly struck dumb, blind, lame, or dead, or was swallowed up by the waters. But, although perjury was thus held in general abhorrence, notwithstanding the credit which was given to such accounts of divine inflictions, it was so much practised by the Greeks, that *Græca fides* became a proverb. Lovers' perjuries, however, were supposed to pass unnoticed, or to be very slightly punished, as with blackness of the nails, a decayed tooth, or some small diminution of beauty. The ancient philosophers, however, were so afraid of perjury, that even an oath before a judge was never admitted but for want of other proof. Plato's precept was, "Not to administer an oath wantonly, but on deep grounds, and with the strictest caution." Ulpian gives his opinion thus: "Some are forward to take oaths from a contempt of religion; others, from an extraordinary awe of the Divine Majesty, carry their fear to an unreasonable superstition; so make an equitable decision of a judge necessary." "No man will perjure himself (says Aristotle) who apprehends vengeance from Heaven and disgrace among men." Clinias was so very scrupulous, that, rather than take an oath (though lawfully), he suffered the loss of three talents. Perjury, in the time of Philo Judeus, was abominated and capitally punished among the Jews; though since they have much degenerated, having been poisoned with the books of the Talmud, one of which says, "He who breaks his promissory oath, or any vows he enters into by the year, if he has a mind that they should be ineffectual and invalid, let him rise the last day of the year, and say, Whatever promises, oaths, and vows, I may think fit to make in the

year following, let them be null, void, and of no effect." Traët. iii. part 3. of the Talmud, in the treatise *Nedharim*, ch. 4. And the modern Jews use the same artifice, thinking they may then lawfully deceive the Christians. See Hieron. ex *Dictis* Talmud. c. 3. and Magister Joannes de Concor. Legum, tit. iv. c. 7.

In our law, no notice is taken of any perjury but such as is committed in some court of justice having power to administer an oath; or before some magistrate or proper officer invested with a similar authority, in some proceedings relative to a civil suit or a criminal prosecution: for it esteems all other oaths unnecessary at least, and therefore will not punish the breach of them. For which reason it is much to be questioned, how far any magistrate is justifiable in taking a voluntary affidavit in any extrajudicial matter, as is now too frequent upon every petty occasion; since it is more than possible that, by such idle oaths, a man may frequently, in *foro conscientie*, incur the guilt, and at the same time evade the temporal penalties, of perjury. The perjury must also be corrupt (that is, committed *malo animo*,) wilful, positive, and absolute; not upon surprise, or the like: it also must be in some point material to the question in dispute; for if it only be in some trifling collateral circumstance, to which no regard is paid, it is no more penal than in the voluntary extrajudicial oaths before mentioned.

Subornation of Perjury is the offence of procuring another to take such a false oath as constitutes perjury in the principal.

If a man calls another *perjured*, he may have an action upon the case. If he calls him *forsworn*, no action lies, because the forswearing may be extrajudicial.

At common law, the punishment of perjury, and subornation of perjury, was anciently death; afterwards banishment, or cutting out the tongue; then forfeiture of goods; and now it is fine and imprisonment; and the offender is ever afterwards incapable to be a witness. 3. *Inft.* 163. By stat. 5 Eliz. c. 9. persons committing wilful and corrupt perjury, in any cause depending concerning lands or goods, &c. in any of the courts of record, leet, ancient demesne-court, hundred-court, court-baron, or court of stannary, shall forfeit 20l. and be imprisoned six months, and their oaths shall not be received in any court of record, so that they are disabled from being jurors or witnesses; and, if the offenders have not goods or chattels to the value of 20l. they shall be set on the pillory in some market-place, and have both their ears nailed to it; and unlawful and corrupt procuring and suborning a witness to give false testimony in any court of record, &c. or corruptly procuring any witness to testify *in perpetuam rei memoriam*, incurs a forfeiture of 40l. and, if the offender be not worth 40l. he shall suffer six months imprisonment, and stand on the pillory one whole hour in some open market near the place where the offence was committed; and he shall incur perpetual infamy. But the prosecution is usually carried on for the offence at common law; especially, as, to the penalties before inflicted, the stat. 2 Geo. II. c. 25. (made perpetual by the 9 Geo. II. c. 18.) superadds a power for the court to order the offender to be sent to the house of correction for seven years, or to be *transported* for the same period; and makes it felony, without benefit of clergy, to return or escape within the time. Our ancient law inflicted the punishment of deliberate murder on wilful perjury, when it was the cause of the death of an innocent person; and by the laws of France it was universally capital.

By stat. 31. Geo. II. c. 10. § 24. the taking, or procuring to be taken, a false oath to obtain probates or letters of administration to seamen, is made felony, without benefit of clergy.

In Scotland the punishment of perjury is directed by statute, the last of which, 1555, c. 47, declares perjury to be punishable by confiscation of movables, piercing the tongue, and infamy; to which the judge, in aggravated cases, may add any other penalty that the case seems to require.

require. By the same act, subornation of perjury is punishable as perjury.

To convict a man of perjury, a *probable* evidence is not enough; but it must be a strong and clear evidence, and the witnesses must be more numerous than those on the side of the defendant, for otherwise it is only oath against oath. 10 *Mod.* 194. *Str.* 1230. It seems that the court will not ordinarily at the prayer of a defendant grant a certiorari for the removal of an indictment of perjury; for such crime deserves all possible discountenance, and the certiorari might delay, if not wholly discourage, the prosecution. 2 *Hawk.* c. 17.

Quakers making solemn affirmation wilfully and corruptly shall suffer as in cases of perjury. 8 *Geo.* c. 6.

If perjury be committed in a spiritual cause, the spiritual judge hath authority to inflict canonical punishment, and prohibition will not go. But the judge cannot punish *pro salute anime*; and the party grieved by such perjury must recover his damages at the common law. In the statute of the 5 *Eliz.* c. 23, concerning the writ *de excommunicato capiendo*, perjury in the ecclesiastical court is specified as an offence, among others, for which a person may be excommunicated; and conviction of perjury, either in the temporal or ecclesiastical courts, is cause of deprivation of benefice.

PER'IWIG, *f.* [*perruque*, Fr. The formation of our word, from the French, is curious; and I am surprised, says Mr. Todd, that Dr. Johnson should have taken no notice of it. Late in the sixteenth century, it was written *perwicke*, as by T. Churchyard; and in the following, *perewake*, by Fuller; afterwards it became *periwig*; and in modern times has sunk into *wig*.] Adcitious hair; hair not natural, worn by way of ornament or concealment of baldness.—For vailing of their visages, his highness and the marquiss bought each a *periwig*, somewhat to overshadow their foreheads. *Wotton*.

Her hair is auburn, mine is perfect yellow;
If that be all the difference in his love,
I'll get me such a colour'd *periwig*. *Shakespeare*.

From her own head Megara takes
A *periwig* of twisted snakes. *Swift*.

To PER'IWIG, *v. a.* To dress in false hair.—Having by much dress, and secrecy, and dissimulation, as it were *periwigged* his sin and covered his shame, he looks after no other innocence but concealment. *South's Sermons*.

Now when the winter's keener breath began
To crystallize the Baltic ocean,
To glaze the lakes, to bridle up the floods,
And *periwig* with snow the bald-pate woods. *Sylvester*.

Near the door an entrance gapes,
Crouded round with antic shapes,
Discord *periwigged* with snakes,
See the dreadful strides she takes. *Swift's Miscell.*

PER'IWIG-PATED, *adj.* Wearing a wig.—It offends me to hear a robustious *perwig-pated* fellow tear a passion to tatters, to split the ears of the groundlings. *Shakespeare*.

PER'IWINKLE, *f.* A small shell-fish; a kind of fish-snail; the *TURBO littoreus*.—Thetis is represented by a lady of a brownish complexion, her hair dishevelled about her shoulders, upon her head a coronet of *periwinkle* and escalop shells. *Peacham*.—A plant. See *VINCA*.—There are in use, for the prevention of the cramp, bands of green *periwinkle* tied about the calf of the leg. *Bacon*.—The common simples with us are comfry, bugle, ladies' mantle, and *periwinkle*. *Wifeman's Surgery*.

PERIZO'MA, *f.* [from the Greek.] A kind of girdle or truss for a rupture.

PERIZO'NIUS (James), a learned critic, was born in 1651 at Dam, in the province of Groningen, where his father was master of the public school. His family-name

was *Varbrek*, which, according to the pedantry of the times, he changed to *Perizonius*, having a similar signification in Greek. James studied at Deventer under Gifbert Cuper, and afterwards at Utrecht under Grævius. The invasion of Louis XIV. interrupted his academical studies in 1672; but he resumed them in 1674 at Leyden, where he attended the lectures of Ryckius. His first public employment was that of rector of the Latin school at Delft. In 1681, he was appointed to the chair of history and eloquence at Franeker, and in 1693 he removed to the same professorship, with that of the Greek language, at Leyden. He died, unmarried, in 1715, in his 64th year. This industrious scholar was the author of a number of learned works, of which the following are the principal: 1. *Animadversiones Historicae*, 1685, 8vo. consisting of explanations of many passages in the Greek and Latin writers. 2. *Dissertationes*, in several volumes 4to. chiefly relative to Roman history. 3. *Orations*. 4. *Origines Babylonicæ et Ægyptiacæ*, 2 vols. 8vo. 1736. a very learned performance, in which various errors of Sir John Marsham are corrected. 5. An Edition of Ælian's *Various History*, with a Commentary. 6. *Rerum per Europam, sæculo xvii. maxime Gestarum Comment. Histor.* Perizonius had collected a numerous and well-chosen library, and a cabinet of medals, which were sold after his death. He left to the University of Leyden several ancient manuscripts, and scarce editions of classics. *Moreri*.

PER'IZZITES, the ancient inhabitants of Palestine, mingled with the Canaanites. There is also great probability that they themselves were Canaanites; but having no fixed habitations, sometimes dispersed in one country and sometimes in another, they were for that reason called *Perizzites*, which signifies "scattered or dispersed." *Pherazoth* stands for "hamlets, or villages." The *Perizzites* did not inhabit any certain portion of the land of Canaan; there were some of them on both sides the river Jordan, in the mountains, and in the plains. In several places of Scripture the Canaanites and *Perizzites* are mentioned as the two chief people of the country. It is said, for example, that in the time of Abraham and Lot the Canaanite and *Perizzite* were in the land, (*Gen.* xiii. 7.) The Israelites of the tribe of Ephraim complaining to Joshua that they were too much pent up in their possession, (*Josh.* xvii. 14.) he bade them go, if they pleased, into the mountains of the *Perizzites*, and *Rephaims* or giants, and there, clearing the land, to cultivate and inhabit it. Solomon subdued the remains of the Canaanites and *Perizzites* which the children of Israel had not rooted out, and made them tributary to him: (*1 Kings* ix. 20, 21. *2 Chr.* viii. 7.) There is still mention made of the *Perizzites* in the time of Ezra, (*ix.* 1.) after the return from the captivity of Babylon; and several Israelites had married wives from that nation.

To PERK, *v. n.* [from *perch*. *Skinner*.—The original word is used by Nash in his *Lenten Stuffe*, 1599. "In 1240 it *perched* up to be governed by balies." Probably from a bird's mounting on a *perch* in his cage. *Malone*.] To hold up the head with an affected briskness.—Is not this therefore a fit bishop of Pergamus, that *perks* thus above all kings, and emperours, and princes of the earth? *More on the Seven Churches*.

If, after all, you think it a disgrace,
That Edward's mis's thus *perks* it in your face;
To see a piece of failing flesh and blood,
In all the rest so impudently good;
Faith, let the modest matrons of the town
Come here in crowds, and stare the strumpet down. *Pope*.

To PERK, *v. a.* To dress; to prank:
'Tis better to be lowly born,
And range with humble livers in content,
Than to be *perk'd* up in a glist'ring grief,
And wear a golden sorrow. *Shakespeare's Hen. VIII.*

PERK, *adj.* Pert; brisk; airy. *Obsolete*, Dr. Johnson

son says; but, I believe, it is yet in use among the vulgar. *Todd.*

My ragged ronts,
They wont in the wind wag their wriggle tails,
Perk as a peacock. *Spenser's Shep. Cal.*

PER'KELSKAREN, a small island in the Gulf of Finland. Lat. 60. 15. N. lon. 27. 24. E.

PER'KERI, a town of Curdistan, on Lake Van: eighteen miles east of Argish, and thirty north-north-west of Van.

PERKERNUCK'A, *f.* A term used in India for petty officers. *James's Mil. Dict.*

PER'KIN, *f.* [dimin. of *perry* or of *pear*.] A beverage made from pears, as cider from apples. It may be called the small beer of perry, as ciderkin of cider. See PERRY.

PER'KIN, [i. e. *Peterkin*, or Little Peter.] A man's name.

PER'KINS (William), a learned and pious English divine, was born at Marston, in Warwickshire, in the year 1558. From the grammar-school he was sent for academical education to Christ's College, Cambridge, where his behaviour was for some time wild and irregular, though he soon became reclaimed, and exhibited a commendable pattern of studious diligence, virtue, and piety. While he was an under-graduate he appears to have shown a strong attachment to the study of the mathematical sciences, which, in the reports of the ignorant and credulous, was construed into a fondness for the study of magic; but, after taking his first degree in arts, he devoted himself entirely to the study of divinity, and the branches of learning more immediately connected with that science. He was chosen a fellow of his college, of which he was also appointed one of the tutors, and acquired high reputation for the learning and judgment with which he discharged the duties of that office. He was likewise nominated catechist of his college, and delivered a course of Lectures on the Commandments, which made a deep impression on the minds of his pupils. After having entered into holy orders, he first exercised his pulpit-talents in preaching to the prisoners in the castle of Cambridge, whom he prevailed upon the jailor to bring to the adjoining shire-house every Sunday. When it was known that he had thus voluntarily undertaken the office of spiritual instructor to these ignorant and vicious wretches, some respectable persons from the contiguous parishes came to hear him, who soon spread abroad the fame of his extraordinary abilities as a preacher. At length he was invited to become preacher of St. Andrew's parish in Cambridge; and for many years was admired and followed by numerous auditories, comprehending many of the members of the University most respectable for learning and discrimination, who were instructed and edified by his discourses, while they were level to the understandings of the most common hearers.

Mr. Perkins had repeated offers of more advantageous situations; but, though he married, and had several children, his affection for the parishioners of St. Andrew's induced him to refuse them, and to be satisfied with the inconsiderable compensation for his arduous labours which he derived from his appointment, and the presents of some liberal individuals. Besides discharging the duties of his ministerial office, he devoted no inconsiderable portion of his time to the composition of various works. In his religious sentiments he was strictly Calvinistical; and he published several treatises in defence of the doctrines of that school, which involved him in a controversy with Arminius, then professor of divinity at Leyden, which continued till his death.

Perkins was deprived by archbishop Whitgift for Puritanism. He was one of those divines who "were sometimes called *conforming non-conformists*, as they were against separation from the national church." He fell

under the displeasure of the archbishop, in consequence of his having subscribed, or declared his approbation of, the *Book of Discipline*; but his deprivation, or suspension, seems not to have been of any long continuance; his great learning, worth, and quiet peaceable behaviour, making the high party ashamed of proceeding to any violent measures against him. He died of a violent attack of the stone in 1602, when he had only arrived at the 44th year of his age.

In person he was rather short and corpulent; in his disposition cheerful and pleasant; and, owing to a lameness in his right hand, wrote all his works with his left. Of his great industry, their number alone affords sufficient proof. Many of his pieces have been translated into elegant Latin; and others into the German, Dutch, French, Italian, and Spanish, languages. The whole have been collected together, in 3 vols. folio, consisting of A Foundation of Christian Religion; The Golden Chain, or Description of Divinity; An Exposition of the Apostle's Creed; An Exposition of the Lord's Prayer; Cases of Conscience, in Three Books; An Analysis and Harmony of the Bible; Commentaries upon the Fifth, Sixth, and Seventh, Chapters of St. Matthew; on the Five First Chapters of the Epistle to the Galatians; on the Epistle of Jude; and on the Three First Chapters of the Apocalypse; Problem of the forged Catholicism, or Universality of the Romish Religion, in Latin, intended as an introduction to young students in the study of the Fathers and Councils; together with numerous doctrinal, practical, and controversial, treatises. *Neal's Hist. Purit.* vol. i. ch. vii. viii.

PER'LEBERG, a town of Brandenburg, and capital of the Mark of Pregnitz, situated on the Stepenitz, and containing about 370 houses: seventy-six miles south-east of Hamburg, and sixty-two north-west of Berlin. Lat. 53. 8. N. lon. 11. 58. E.

PER'LICAN (New), a noted harbour on the east coast of Newfoundland-Island, eight leagues west-south-west of Old Pelican, and five leagues from Random-head. It has a wide and safe entrance; and ships may ride in it, locked from all winds, in from ten to five fathoms water.

PER'LING, *adj.* [from *pearl*.] Pearly:

Though plaine the saw, by all that she did heare,
That she of death was guiltie found by right,
Yet would not let just vengeance on her light;
But rather let, instead thereof, to fall
Few *perling* drops from her faire lampes of light.

Spenser's F. Q.

Her long loose yellow locks like golden wire,
Sprinkled with pearl, and *perling* flowers atween,
Did like a golden mantle her attire. *Spenser's Epithalamion.*

That in the latter of the foregoing citations the word *perling* could never mean *purling* is self-evident: whence it seems probable that the ingenious Upton was mistaken when he gave it that sense in the former. *Mason's Suppl. to Johnson.*

PER'LOUS, *adj.* [from *perilous*.] Dangerous; full of hazard.—In Phædrus's fleet bark over the *perulous* thard. *Spenser.*

A *perulous* passage lies,
Where many mermaids haunt making false melodies.
Spenser.

PERLUSTRA'TION, *f.* [*perlustratus*, Lat.] The act of viewing all over.—By the *perlustration* of such famous cities, castles, amphitheatres, and palaces, some glorious and new, some mouldered and eaten away by the iron teeth of time, he may come to discern the best of all earthly things to be but frail and transitory. *Howell's Instruct. for Trav.*

PERM, a town of Russia, and capital of a government, on the Kama: 808 miles east of Petersburg, and 620 east of Moscow. Lat. 57. 40. N. lon. 56. 14. E.

PERMA-

PERMACOIL, a town of Hindoostan in the Carnatic: seventeen miles north-north-west of Pondicherry, and forty-five south-south-east of Arcot. Lat. 12. 14. N. lon. 79. 55. E.

PERMAGY, *f.* A little Turkish boat.

PERMALOOR, a town of Hindoostan in the Carnatic: twelve miles south-west of Conjeveram.

PERMANENCE, or PERMANENCY, *f.* Duration; consistency; continuance in the same state; lastingness.—Salt, they say, is the basis of solidity and *permanency* in compound bodies, without which the other four elements might be variously blended together, but would remain incompact. *Boyle*.—Shall I dispute whether there be any such material being that hath such a *permanence* or fixedness in being? *Hale*.—From the *permanency* and immutability of nature hitherto, they argued its *permanency* and immutability for the future. *Burnet's Theory*.—Continuance in rest.—Such a punctum to our conceptions is almost equivalent to *permanency* and rest. *Bentley*.

PERMANENT, *adj.* [Fr. from *permanens*, Lat.] Durable; not decaying; unchanged.—If the authority of the maker do prove unchangeableness in the laws which God hath made, then must all laws which he hath made be necessarily for ever *permanent*, though they be but of circumstance only. *Hooker*.

Their joy sincere with no more sorrow mixt;
Eternity stands *permanent* and fixt.

Dryden.

Of long continuance.—His meaning is, that in these, or such other light injuries, which either leave no *permanent* effect, or only such as may be born without any great prejudice, we should exercise our patience. *Kettlewell*.

PERMANENTLY, *adv.* Durably; lastingly.—It does, like a compact or consistent body, deny to mingle *permanently* with the contiguous liquor. *Boyle*.

PERMAN'SION, *f.* [from *permaneo*, Lat.] Continuance.—Although we allow that haers may exchange their sex sometimes, yet not in that vicissitude it is presumed; from female unto male, and from male to female again, and so in a circle without a *perman'sion* in either. *Brown's Vulg. Errors*.

PERMEABLE, *adj.* [from *permeo*, Lat.] Such as may be passed through.—The pores of a bladder are not easily *permeable* by air. *Boyle*.

PERMEANT, *adj.* Passing through.—It entereth not the veins, but taketh leave of the *permeant* parts at the mouths of the meseraicks. *Brown*.

To PERMEATE, *v. a.* To pass through.—This heat evaporates and elevates the water of the abyss, pervading not only the fissures, but the very bodies of the strata, *permeating* the interstices of the sand or other matter whereof they consist. *Woodward's Nat. Hist.*

PERMEATION, *f.* The act of passing through.—The sensible world is inclosed within the intelligible; but withall I must add, that here is not a mere involution only, but a spiritual *permeation*. *Bp. Hall's Invis. World*.

PERMEL'LY, a town of Hindoostan, in the circar of Aurungabad: thirty miles north-west of Nander.

PERMERA ROCKS, rocks in the Eastern Indian Sea, near the coast of Canara: twenty miles north of Mangalore. Lat. 13. 10. N.

PERMES'SUS, in ancient geography, a river of Bœotia, rising in mount Helicon, and flowing all round it. It received its name from Permessus the father of Aganippe, who also gave her name to one of the fountains of Helicon. The river Permessus, as well as the fountain Aganippe, was sacred to the muses.

PERMIANS, a branch of the Finns, called in the Icelandic Reports *Biarmians*, and denominated by the Russians *Permiaki*, situated in the governments of Perm and Viatka, and in the northern districts of the river Oby. In the middle ages the Scandinavians seem to have given the name of Biarmia to the whole country between the White Sea and the Ural. The Permians on the Dwina were discovered in the ninth century by Othere of Halgoland, a province at the extremity of Norway, Vol. XIX. No. 1331.

who afterwards entered into the service of Alfred the Great, and drew up an account of this voyage in the Anglo-Saxon language.

The Icelandic Reports abound with accounts of these people. According to these Reports, the Permians on the White Sea, and the parts about the Dwina, were the most wealthy, most powerful, and most remarkable, of all the northern Finns. Here the carved image of the god Yummala, who was the universal deity of the Finns, as Perune was of the Slavonians and Lettes, and Odin of the Germans, had its far-famed temple, the description of which borders on the marvellous. According to this description, the temple was artfully constructed of costly wood, and so richly ornamented with gold and precious stones, that it threw a radiance round the whole circumjacent country. The image of the god wore a golden crown set with twelve precious stones, a necklace worth three hundred marks in gold, and a dress which outweighed the lading of three of the richest ships that navigated the Grecian sea. The figure also bore on its knees a golden chalice of such capacity, that four men might quench their thirst from its contents; and this vessel was filled with the same valuable metal of which its mass consisted. The northern free-booters were tempted by the reports of the wealth of this country to make incursions into it, and to take away some spoil from this temple. Even several Norwegian kings made predatory excursions into Permia, and usually returned with rich booty. We find also that the Scandinavian mariners visited this country for the purposes of trade, &c. without any piratical views. It is a curious inquiry how these Permian Finns accumulated so much gold, and how their country became the mart of a great and lucrative commerce. In very remote ages the Permians were already famous for their trade with the Persians and Indians: these nations brought their commodities over the Caspian, up the Volga and the Kama, to Tscherdyn, a trading town of ancient date on the river Kolva; and the Permians transported these goods as well as their own products along the Petchora to the Frozen Ocean, where they bartered them with the people of those parts against furs for their oriental trade. The ruins of ancient towns bear witness to the flourishing condition and the civilization of this people. The Permians appear, by historical traces still subsisting, to have been the only race of the Finns who were a polished and commercial people, and known to other nations, while their kindred tribes were in a state of barbarism. The reports likewise speak of kings, and a sort of political constitution in Biarmeland. With the year 1217, the expeditions of the Norwegians to Permia cease; but probably at an earlier period, in the eleventh and twelfth centuries, the republic of Novgorod made itself master of this country, leading thither Russian colonies to keep the people in subjection. About the year 1372, the Christian faith was propagated in Permia by bishop Stephen. The Novgorodians having renounced all claim to this country, the Permians for a considerable period maintained the liberty of choosing their rulers from their own body. In 1543 the czar Ivan gave them the first viceroy, to whom the chief of the inhabitants were to act in a subordinate capacity in the affairs of government, and who had his seat, first at Kolmogor, and afterwards at Archangel. At present the whole of ancient Biarmia, the borders of which cannot now be accurately defined, is divided into several governments; and the descendants of the Permians, heretofore so famous, numerous, and powerful, are dwindled away into an insignificant remainder, who, amidst thorough Russians, have lost almost all their national characteristics, even to their very language. *Tooke's Russia*, vol. i.

PERMISCIBLE, *adj.* [from *permisco*, Lat.] Such as may be mingled.

PERMISSIBLE, *adj.* [from *permisus*, Lat.] What may be permitted.

PERMIS'SION, *f.* [Fr. from *permisus*, Lat.] Allowance; grant of liberty.—You have given me your *permis'sion*

mission for this address, and encouraged me by your personal and approbation. *Dryden*.

With thy *permission* then, and thus forewarn'd,
The willing I go. *Milton's P. L.*

PERMISSIVE, *adj.* [from *permitto*, Lat.] Granting liberty; not favour; not binding, though not approving.—When evil deeds have their *permissive* pass. *Shakespeare's Measure for Measure*.

Hypocrisy, the only evil that walks
Invisible except to God alone,
By his *permissive* will, through heaven and earth. *Milton*.

Granted; suffered without hindrance; not authorized or favoured.—If this doth authorize usury, which before was but *permissive*, it is better to mitigate usury by declaration than to suffer it to rage by connivance. *Bacon's Essays*.

Thus I embolden'd spake, and freedom us'd
Permissive, and acceptance found. *Milton's P. L.*

PERMISSIVELY, *adv.* By bare allowance; without hindrance.—As to a war for the propagation of the Christian faith, I would be glad to hear spoken concerning the lawfulness, not only *permissively*, but whether it be not obligatory to Christian princes to design it. *Bacon's Holy War*.

PERMISTION, *f.* [*permistus*, Lat.] The act of mixing.
To PERMIT', *v. a.* [*permitto*, Lat. *permettre*, Fr.] To allow without command.—What things God doth neither command nor forbid, the same he *permitteth* with approbation either to be done or left undone. *Hooker*.—To suffer, without authorizing or approving.—To allow; to suffer.—Age oppresses us by the same degrees that it instructs us, and *permits* not that our mortal members, which are frozen with our years, should retain the vigour of our youth. *Dryden*.

Ye gliding ghosts, *permit* me to relate
The mystick wonders of your silent state. *Dryden*.

To give up; to resign.—*Not used*.—If the course of truth be *permitted* unto itself, it cannot escape many errors. *Brown's Vulg. Err.*

Nor love thy life, nor hate; but what thou liv'st,
Live well; how long or short, *permit* to heav'n. *Milton*.

Whate'er can urge ambitious youth to fight,
She pompously displays before their sight;
Laws, empire, all *permitted* to the sword. *Dryden*.

Let us not aggravate our sorrows,
But to the gods *permit* th' event of things. *Addison's Cato*.

PERMIT', *f.* A written permission from an officer for transporting of goods from place to place, showing the duty on them to have been paid.

PERMITTANCE, *f.* Allowance; forbearance of opposition; permission. A bad word.—When this system of air comes, by divine *permittance*, to be corrupted by poisonous acrimonious steams, what havock is made in all living creatures? *Derham's Phys. Theol.*

PERMIXTION, *f.* [from *permistus*, Lat.] The act of mingling; the state of being mingled.—They fell into the opposite extremity of one nature in Christ, the divine and human natures in Christ, in their conceits, by *permixtion* and confusion of substances, and of properties growing into one upon their adunation. *Brewerwood*.

PERM'SKOE, a government of Russia, including the provinces of Perm and Ekaterinburg; bounded on the north by the government of Vologda and Tobolsk, on the east by the government of Tobolsk, on the south by Uhimskoe, and on the west by Viatskoe; about 360 miles from north to south, and from 240 to 260 east to west. Lat. 55. 15. to 61. 15. N. lon. 52. to 63. E. The province of Perm extends from lat. 55. 30. to 61. 14. N. lon. 52. to 58. E.

PERMUTATION, *f.* [Fr. from *permutatio*, Lat.] Exchange of one for another.—If you can, by *permutation*, make the benefices more compatible. *Bacon on the Ch. of England*.—Gold and silver, by their rarity, are

wonderfully-fitted for this use of *permutation* for all sorts of commodities. *Ray*.—[In algebra and arithmetic.] Change, or different combination, of numbers or quantities.—*Permutation* of proportion hath place only in homogeneous. *Wallis*.—See ALGEBRA, vol. ii. and NUMBERS, vol. xvii.

To PERMU'TE, *v. a.* [*permuto*, Lat. *permuter*, Fr.] To exchange.

PERMU'TER, *f.* An exchanger; he who permutes.

PERNABIACA'BA, or PARANONBIACUBA, a mountain of Brazil, near the city of St. Paul.

PARNAL'LA, a town of Hindoostan, in the country of Guzerat: thirty-eight miles south of Surat, thirty west of Durrampour. Lat. 20. 35. N. lon. 72. 53. E.

PERNAMBUCO. See FERNAMBUC, vol. vii. In that place we spoke very briefly of a province which is now stated to contain 550,000 souls, and its chief town of the same name 60,000. But circumstances have since occurred to make the place better known, as well as more interesting to an English public. In fact, the great jealousy which the Portuguese have observed from time immemorial in all their commercial dealings, had induced them to prohibit foreigners visiting this coast; and, before the year 1807, when the prince regent emigrated with his court to Rio Janeiro, if any foreign vessel was discovered upon it, she was liable to confiscation, and her crew to imprisonment. But, soon after that had taken place, as mankind in general go from one extreme to the other, we had free access to all their ports; and, to say the truth, were allowed, like the Jews in Turkey, to monopolize nearly the whole of their trade, even the coasting part of it. Previous to this event, we were so little acquainted with the Brazils, that in most of our maps, the town is called "Olinda, or Pernambuco," though those are in fact two separate and distinct places; the first a city, and the second a populous town, distant at least three miles.

Pernambuco is a large town, containing 60,000 people, and carrying on a great foreign and domestic trade. The coast near it is very low, and the country well clothed with woods in perpetual verdure, which, contrasted with the white cottages scattered along the shore, the Indians fishing in their *jugadas*, or canoes, and the beautiful serene sky, affords to the European, as he approaches it, a most pleasing prospect.

The town stands on a great extent of ground, and many of the houses are well built, chiefly of stone. The streets are wide and spacious, the churches are truly magnificent, and the images they contain are immensely valuable. It is supposed that the religious form one-eighth part of the population; and of the continual crowd passing through the streets, they make no small portion. Nearly half of the inhabitants are slaves, who are humanely treated by the Portuguese, and make good and faithful servants. There is a market appropriated purposely for these unfortunate beings, where two or three hundred are commonly seen huddled together, squatted on their hams like monkeys, and completely *in cenero*. They are thus exposed for sale, having been previously rubbed over with a species of oil, which gives them a glossy shining appearance; and, in addition, are decorated with bead necklaces and bracelets, to set them off to advantage.

Pernambuco stands on two islands, and is connected together by two bridges, one of which is a most beautiful structure, built by the Dutch when they took this place from the Portuguese in 1630. It consists of fifteen arches, under which runs a strong and rapid river, that comes many hundred miles down the country. On each side of this bridge are shops full of European merchandise, particularly English manufactures, or, as they are called by the Portuguese "fazendas Inglesas." It is only in the middle that a person knows he is on a bridge; he then beholds an opening, which during the day is often full of passengers, enjoying the cool refreshing breeze that comes down the river, and gratifying themselves with the prospect, which from this spot is truly delightful. The river seen winding

winding up as far as Olinda, which is seated on a hill; on either bank beautiful white cottages, intermixed with mangrove and cocoa trees, and fruitful vineyards; the Indians paddling down the river with their unwieldy canoes, the fishermen on the beach drying their nets, and nature displaying her gayest verdure, form altogether a *coup d'œil*, which it is impossible to conceive, much more to describe. The other is a very long wooden bridge, in which there is nothing at all remarkable, more than being quite open to the breeze which comes down the river. It is on that account much resorted to in the evening.

Most of the houses in Pernambuco are lofty, and, instead of glass windows, have green lattices, which has a pretty effect, especially as all their houses are white, and frequently surrounded with beautiful evergreens. All these windows are prominent, not unlike the Elizabethan windows seen in some of our old country towns. During the morning, the better sort of Portuguese are seen leaning out of them, muffled up in their long cloaks, and exhibiting a genuine picture of indolence. They never live on the ground-floor, which is commonly used for cellars or shops. The ladies are only seen towards the evening, peeping through the lattices; very few ever appearing in the streets, and then closely veiled, and in a kind of hammock with curtains, carried by two slaves on a long pole.

There are a good many coffee-houses here, which are known by a small round board, with *Café de Caffé* written upon it. The principal one is kept by a priest, and is the common resort of the merchants, serving them as an exchange. Good wine, fangaree, and a tolerable breakfast, can be procured here at all hours of the day: here is also an excellent billiard-table, and several back-gammon tables, well frequented, especially on a Sunday, the day these amusements are mostly followed, according to the custom of the Roman-catholic religion. About eleven in the morning, the merchants make a tolerable show at this place, and a good deal of business is transacted.

After the Prince Regent came to the Brazils, the trade increased greatly. Before this period it was carried on with Europe in large ships, similar to our East Indiamen; but it was then thrown open to all nations. The Portuguese merchants are rich and respectable.

The harbour of Pernambuco is formed by a natural pier, extending in a direct line many miles: this is a coral reef, so exactly straight and even, that one would almost imagine it the work of art. The vessels lie alongside each other in tiers, moored head and stern, about half-pistol-shot from the shore, and close to this reef, which at high-water spring-tides is nearly on a level with the surface of the sea, and forms an excellent barrier. This place is in latitude 8° S. consequently the heat is excessive, the thermometer frequently being at 90° in the shade. During the night it is always calm, with a good deal of lightning. About nine in the morning the sea-breeze comes gradually, and is strongest about noon, when by degrees it dies away into a calm that generally takes place towards sunset.

The churches at Pernambuco are large buildings. They contain some excellent paintings, and each of them has a number of chancels, or more properly chapels, dedicated to particular saints, which on certain days are shown ornamented with flowers. They are quite open, having no pews; and the people either stand or kneel. All are very richly furnished; in short, no one can conceive the grandeur the insides some of them exhibit. They are generally very large, with a great number of pillars, which gives them the appearance of cathedrals. One large consecrated lamp is continually burning over the high altar, and also a great number of tapers in candle-sticks about seven or eight feet high, some of them of mafly silver. The glimmering of these candles, at noon-day, has a curious, and rather solemn, effect. The doors are generally open, and a good many people are seen on their knees at prayers before the different saints; others receiving the sacrament, some confessing, and *pa-*

dres (priests) gliding from one door to another, or traversing with a silent sanctified deportment the different parts of the church. These conspire to give a stranger an idea, that they have enough to do. A confessional chair, of which there are generally six or eight in a church, is made very large and high, so that the priest, who is in it, is not seen. Those who wish to confess (mostly women) go singly, and, kneeling down opposite a lattice-work in the side of it, ease their burthened consciences, and get absolution. Besides the church itself, there is always under the same roof apartments for the *padres*, or fathers, (as the Portuguese style the priests,) in which they live much in the same manner as our monks of old, having their cells, and a large room where they dine together. There are numbers of helpless old women, who live constantly in the churches, and are subsisted by what is left at their tables. Great numbers of the religious are always seen in the streets, dressed in their robes, soliciting alms; for which purpose they carry a small square box, with the figure of Christ, or some particular saint, painted upon it. Notwithstanding they consider the English as heretics, they do not scruple to receive their money, for which they bestow in return a benediction; and so well are they aware of the liberality of our countrymen, that, if a Portuguese and an Englishman are standing together in the street, they will never fail to accost the Englishman first.

In every street there are different images of the Virgin Mary and the saints, which on particular days are exposed to view, superbly illuminated with a number of large candles. About eight in the evening the children in the neighbourhood assemble round them, and sing hymns. This has a pleasing effect, especially as they keep time with great exactness, and have a person to direct them, who rings a little bell whilst they are singing particular parts. Another custom seems remarkably strange. Twice every day, about ten in the morning and seven in the evening, at the tolling of a bell every thing in an instant is at a stand. Men, women, or children, whether in the streets or the houses, instantly pull off their hats, cross themselves, and say a short prayer. This continues about a minute. At the second tolling every thing goes on again as usual. During this time a particular part of the mass is being performed in the grand church. Although this has a striking effect, the positions people are sometimes caught in are very ludicrous. It appears almost the effect of magic. Lent is most rigidly observed. The illuminations on the churches, as well as the fire-works and processions, during Easter, are very grand. It is impossible to avoid smiling at such a combination of superstition and folly, and at the same time being sensibly struck with the immense value of the images displayed on the occasion. As the procession passes along, the people fall on their knees with uplifted hands. These shows are often repeated, and, as may be conceived, have a wonderful effect on the lower classes, especially the slaves. Indeed the Portuguese take every method of impressing on the minds of the latter the importance of religion; and, whenever a slave happens to die before he is baptized, they do not allow him burial; but his body is thrown down on the sea-shore, a little below the town, where it is left a prey for bustards and wild beasts.

As Pernambuco is seated on low ground, and quite surrounded by water, intermittent fevers are very common. There is only one hospital, which consists of a very large room with about thirty beds on each side, filled with wretches suffering under the most loathsome diseases. A man stands at the door to solicit the charity of passengers, which helps to defray the expenses. When a patient dies, he is laid on a table at the entrance with a plate on his breast, to raise in a similar way money to bury him. It often happens four or five bodies are thus exposed. Great numbers of slaves die of the small-pox on their first importation, and still more from the fever and dysentery.

The country a few miles from the town is full of thick impenetrable woods, dreadfully infested with wild beasts

and reptiles, especially snakes. But it also abounds with the most beautiful birds, some of which are as red as scarlet, and sing delightfully. Macaws and parrots are also very common, nearly every house having one or two at the door. Fish are very numerous on this coast. The river near Pernambuco abounds with alligators, which are often very destructive; and that extraordinary fish the torpedo is frequently caught here: the electric power is so strong in this fish, that even the line which catches him conveys a slight shock. See RAJA. The blacks have a curious way of catching fish, which is thus performed: on a dark night they go on jungadas, (a sort of canoe composed of three or four long pieces of wood lashed together,) on which they make a large fire, which attracts the fish, when they strike them with harpoons; most of the fish with which Pernambuco is supplied are caught in this way.

We have before observed that OLINDA is a distinct city, three miles from Pernambuco. It is seated on a hill, on the summit of which is a large monastery. The place is small; and, though most of the merchants of Pernambuco have seats here, it is nevertheless very thinly peopled. The houses are beautiful white buildings, interspersed with delightful gardens; rising as they do one above another on the sides of the hill, the place is seen a great way off at sea. The trade and other advantages of Pernambuco have drawn all the merchants from it; and it now contains little more than two monasteries and a nunnery, with a few poor people dependent on them. The object which particularly attracts attention is the monastery on the hill. One cannot imagine a more romantic situation, or one which commands a more lovely prospect, than this monastery, especially the church, which is far the highest object on this coast, and is visible a long way off at sea.

This account is abridged from a very interesting article in the Monthly Magazine for Sept. 1811, to which we refer for farther particulars.

PER'NANCY, *f.* [from the Fr. *prendre*, to take.] In law, the taking or receiving any thing.—Tithes in *pernancy*, are tithes taken, or which may be taken, in kind. *Chambers.*

PER'NEK, a castle of Hungary: twelve miles north of Presburg.

PER'NES, a town of France, in the department of the Straits of Calais: $1\frac{1}{2}$ post north of St. Pol, $8\frac{1}{2}$ north of Amiens.—A town of France, in the department of the Mouths of the Rhone: twelve miles east-north-east of Avignon.

PERNET'TI (James), historiographer of the city of Lyons, and a member of the academy of that place, was a native of Forez. He assumed the title of "Miles Ecclesiæ Lugdunensis;" he was a man of pleasant manners, and entirely void of pedantry. He died at Paris in 1777. His works are, 1. History of Cyrus, in three vols. 12mo. 2. Counsels of Friendship. 3. Letters on Physiognomy, 3 vols. 4. The Abuses of Education. 5. Picture of the City of Lyons.

PERNETTY (Antony-Joseph), an ingenious and learned French writer, was born in 1716 at Roanne in Forez. He entered into the order of Benedictines, and devoted himself to study, and the composition of numerous works, in which he displayed a systematizing spirit with a singular mode of thinking. Some of the principal of these are the following: 1. Dictionnaire de Peinture, Sculpture, et Gravure, 1757. 2. Dictionnaire mytho-hermetique, 1758. 3. Discours sur la Physiognomie. 4. Journal historique d'un Voyage fait aux Îles Malouines en 1763 et 1764, 2 vols. 8vo. 1769. This contains many curious particulars: it was translated into English, and read with interest at the time of the dispute with Spain, relative to these islands, which are the same with the Falkland Isles. 5. Dissertation sur l'Amérique et les Américains, 1770. 6. Examen des Recherches Philosophiques de Pauw sur les Américains, 1772. 7. La Connoissance de l'Homme moral par celle de l'Homme physique, 1776. He likewise published

a translation of Columella, and of Wolff's Course of Mathematics; assisted in the 8vo. volume of the Gallia Christiana; and communicated several memoirs to the Academy of Berlin, of which he was a member, and in which capital he resided a long time. He at length returned to Valence, in the department of the Drome, where he died about the close of the century.

PERN'IA, a town of Croatia: sixteen miles south-east of Carlstadt.

PERN'ICIOUS, *adj.* [*perniciosus*, Lat. *pernicieux*, Fr.] Mischievous in the highest degree; destructive.—To remove all out of the church, whereat they show themselves to be sorrowful, would be, as we are persuaded, hurtful, if not *pernicious* thereunto. *Hooker.*

I call you servile ministers,
That have with two *pernicious* daughters join'd
Your high-engender'd battles, 'gainst a head
So old and white as this. *Shakespeare's K. Lear.*

Let this *pernicious* hour
Stand ay accursed in the kalendar! *Shakespeare.*

[*Pernix*, Lat.] Quick. An use which I have found only in Milton, and which, as it produces an ambiguity, ought not to be imitated. *Johnson.*

Part incentive reed
Provide, *pernicious* with one touch to fire. *Par. Lost.*

PERN'ICIOUS ISLANDS, a cluster of islands in the South Pacific Ocean, about fifteen miles in circumference; so called by Roggewein, on account of one of the vessels belonging to his Squadron being wrecked on the coast of one of them in the year 1772. Lat. 16. S. lon. 140. 45. W.

PERN'ICIOUSLY, *adv.* Destructively; mischievously; ruinously.—Some wilful wits, wilfully against their own knowledge, *perniciously* against their own conscience, have taught. *Afcham.*

All the commons
Hate him *perniciously*, and wish him
Ten fathom deep. *Shakespeare's Hen. VIII.*

PERN'ICIOUSNESS, *f.* The quality of being *pernicious*.

PERN'ICITY, *f.* [from *pernix*, Lat.] Swiftmess; celebrity.—Others armed with hard shells, others with prickles, the rest that have no such armature endued with great swiftmess or *pernicity*. *Ray on the Creation.*

PER'NO, a town of Sweden, in the province of Nyland, at the mouth of a river which forms a bay on the north coast of the Gulf of Finland: twelve miles east of Borgo, thirty-five west of Frederichamn. Lat. 60. 26. N. lon. 16. 4. E.

PERNOCTA'TION, *f.* [*pernoctatio*, Lat.] Act of tarrying or watching all night.—Whether we have paid for the pleasure of our sin by smart or sorrow, by the effusion of alms, or *pernoctations* or abodes in prayers. *Bp. Taylor's Holy Dying.*—When these *pernoctations* were laid aside, it was the custom to rise early. *Bourne's Antiq. of the Comm. People.*

PERNO'V or PERNAU, a town of Russia, in the government of Riga, on a river near the Baltic, fortified and defended by a castle. In 1635, it was numbered among the Hanse-towns. In 1562, it was taken by the Swedes from the Poles, who recovered it in 1565. The Russians took it in 1575, but restored it in 1617. It was afterwards taken by the Swedes; and finally, with the rest of Livonia, annexed to Russia. It is ninety-two miles north of Riga. Lat. 58. 30. N. lon. 42. 16. E.

PER'NSTAIN, a town of Austria: twelve miles north-north-west of St. Wolfgang.

PERO, or PERONE, a daughter of Cimon, remarkable for her filial affection. When her father had been sent to prison, where his judges had condemned him to starve, she supported his life by giving him the milk of her breasts. *Val. Max.*

PERO'E,

PERO'E, a town of Hindoostan, in Bahar: forty-five miles south-west of Patna.

PERO'LA, *f.* in botany. See MOMORDICA.

PEROJO'A, *f.* in botany, was so named by Louis Née, who gathered the plant at Port Jackson, New South Wales, in honour of Francis del Perojo, a Spanish apothecary, who had been his botanical companion in a journey over the hills of the north of Spain. Mr. R. Brown however reduces the Perojoa to his genus *Leucopogon*, the species of which are, however, generally included under *STYPHELIA*; see that article.

PERO'NES, *f.* in Roman antiquity, a kind of high shoes formed rudely of raw hides, and reaching up to the middle of the leg. Though, in the more ancient times of the commonwealth, the senators wore them, yet in later ages they were only used by ploughmen and labourers: hence *Peronatus Arator*; Persius's Sat. v. 192. and Juv. xiv. 186.

PERON'NE, a town of France, and principal place of a district, in the department of the Somme, situated on the Somme, surrounded by marshes, and strongly fortified. It contains spacious streets and good shops. The church is a building in the modern Gothic style, with a pretty tower, and a splendid roof something resembling King's Chapel, Cambridge, having a remarkable echo, which must peculiarly adapt it for music. This place has been several times besieged, but never taken; on which account it has been called *Pucelle*. It is a place of great antiquity; and the kings of the Merovingian race had a palace here: five posts south of Cambrai, and 16½ north-east of Paris. Lat. 50. 22. N. lon. 3. 1. E.

PERORATION, *f.* [*peroratio*, Lat.] The conclusion of an oration:

What means this passionate discourse?

This *peroration* with such circumstances? *Shakespeare*.

PE'ROS BAN'HOS, a range of small islands in the Eastern Indian Sea. Lat. 5. 30. S. lon. 72. 10. E.

PEROS'NA, an island in the Adriatic, about twelve miles in circumference. Lat. 45. 17. N. lon. 14. 22. E.

PE'ROT, an island of Canada, in the river St. Laurence, at the mouth of the Utawas river; fourteen miles in circumference; fertile, and well cultivated.

PERO'TA, a town of Mexico, in the province of Tlaxcala: forty-five miles east of Puebla de los Angeles.

PERO'TIS, *f.* [so named by the late Dr. Solander, from *περος*, deficient, because the calyx was supposed to be wanting.] In botany, a genus of the class triandria, order digynia, natural order gramina. Generic characters—Calyx: none. Corolla: glume two-valved; valves oblong, acute, almost equal, awned at the tip. Stamina: filaments three, capillary; antheræ oblong. Pistillum: germen superior, oblong. Styles two, capillary, shorter than the corolla; stigmas feathered, divaricating. Pericarpium: none; corolla inclosing the seed. Seed one, linear-oblong.—*Essential Character*. Calyx none; corolla two-valved; valves equal, awned. There are three species.

1. *Perotis latifolia*, or broad-leaved perotis: culm simple, leaves waved, joints smooth. Culm a foot and a half high, frequently jointed to a third part of its height, the joints half an inch and an inch distant from each other; from each joint springs a branch, which is also frequently jointed, and terminated by a spike. Leaf at each joint waved, and as it were curled, an inch long or less, a line and a half or two lines wide, smooth, with a white line, and short loose stiffish hairs at the edge. Sheath half an inch or an inch in length, whitish especially towards its origin; ending in a scarcely-visible whitish ligule. Spike a hand or half a foot in length, very thin. Florets pedicelled, a line long, livid or purplish; awn very slender, yellowish or purple, four or five lines in length. Seed very slender, acuminate, brown, near a line long. Peltiver sent it to Scheuchzer from London. It is an annual grass, native of the East Indies. Introduced

VOL. XIX. No. 1331.

in 1777 by Daniel Charles Solander, LL.D. It flowers in August and September.

β. The variety with flat lanceolate leaves, is, according to Willdenow, a distinct species.

2. *Perotis rara*, or narrow-leaved perotis: stem erect, somewhat branched; leaves linear, smooth; the lower ones flat, the upper involute. Gathered by Mr. Brown in the tropical part of New Holland.

3. *Perotis polytaclia*: culm branching, leaves flat, joints bearded. Culm branched. Leaves linear, not waved. Sheaths bearded at the edge. Native of the East Indies. This, which is the *Saccharum panicum* of Lamarck, and perhaps *Andropogon chirinum* of Thunberg, is judged by Mr. Brown to be a plant of a genus by itself, very nearly related to his *Imperata*, but differing in having awns to the calyx, no inner valve to the hermaphrodite floret, and only one stamen; marks which perhaps are not sufficient in this case to found a genus upon. See *SACCHARUM* and *LAGURUS*.

PEROT'TI (Nicolo), one of the early Italian men of letters, was born of an ancient but decayed family at Safferrato, in 1430. He was the scholar of Volpe at Bologna; and, after finishing his studies, became himself a professor in that city, first of polite literature, and then of philosophy. He made himself known by various translations of Greek authors into Latin. As early as 1453, he sent to pope Nicholas V. his version of the three first books of Polybius, to which he afterwards added two more, all that were then known of that author. He subsequently translated Epictetus's *Enchiridion*, the Commentary of Simplicius upon Aristotle's *Physics*, and Tatian's Oration to the Greeks. In 1452, when the emperor Frederic III. visited Bologna, Perotti complimented him in the name of the city in an oration which was printed, and was recompensed with the title of Poet Laureat and Imperial Counsellor. He appears in 1456 to have been in the service of pope Callixtus III. as his secretary, and a count of the Lateran palace. In 1458 he was nominated by Pius II. archbishop of Siponto, which is the same see as Manfredonia. He was also appointed to honourable offices under the court of Rome; being made governor of Umbria in 1465, of Spoleto in 1471, and of Perugia in 1474. He died in 1480 at a country seat to which he had given the name of *Fugicura*. The writings of this learned person are numerous, considering the public employments in which he was engaged. His most celebrated work was entitled "Cornucopia," being a diffuse and learned commentary on Martial's book on Spectacles, and the first book of his Epigrams. It was not published till after his death, as being somewhat incongruous with his ecclesiastical dignity. It contains a treasure of erudition respecting the Latin language. He also wrote remarks on other classical authors, many orations and letters; and had a share in the angry contentions among the literati of his time. *Tiraboschi*.

PEROU'GE, a town of France, in the department of the Ain: two miles west of Meximieux, and six north-east of Montluel.

PEROU'R, a town of Hindoostan, in the circar of Gooty: twenty-four miles south-south-west of Anantpour.

PEROU'SA (La), a town of Italy, in the department of the Po, on the river Cluson. It gave name to one of the four valleys of Piedmont: six miles north of Pinerolo, twenty-four east of Briançon.

PEROU'SE, or PEYROUSE (J. F. G. de la), an eminent but unfortunate navigator, was born of a gentleman's family at Toulouze in 1741. In his fifteenth year he entered into the French navy, in which he passed a life of almost constant service. Uniting the vivacity and gaiety usual to the natives of a warm climate with equanimity and solidity of character, he was generally esteemed and beloved, while his firmness and professional skill caused him to be regarded as fit for the most arduous enterprises.

fes. The triumphs of the French marine were few in his time; he however commanded in the successful attempt to destroy the English settlements in Hudson's Bay, in 1782. On that occasion he gave a signal proof of his considerate humanity; for, reflecting that the English who had fled into the woods would be exposed by the destruction of their settlements to perish through want, or by the hands of the savages, he left them a supply of provisions and arms upon his departure.

On the restoration of peace, it was resolved by the French ministry that a voyage of discovery should be undertaken to supply what had been left defective in the voyages of the illustrious Cook and his associates. Louis XVI. himself drew up the plan of the intended expedition with great intelligence; and La Perouse was the person fixed upon to conduct it. With two frigates, *la Boussole* and *l'Astrolabe*, the first under his own command, the second under that of M. de Langle, but subject to his orders, he sailed from Brest in August 1785. They touched at Madeira and Teneriffe, and in November anchored on the coast of Brazil. Thence they proceeded round Cape Horn into the South Sea, and in February 1786 cast anchor in the Bay of Conception, on the coast of Chili. At this time, so well had the means of preserving health been employed, they had not a man sick. The ships reached Easter-island in the month of April; and thence sailed, without touching at any land, to the Sandwich-islands. On June 23, they anchored on the American coast in lat. 58. 37. and landed on an island to explore the country and take observations. At this place M. Perouse had the misfortune of having two boats wrecked, with the loss of all their crews. Thence he ran down to California, and in September anchored in the bay of Monterey; whence they took their departure across the Pacific Ocean, and in January 1787 arrived in Macao-roads. In February they reached Manilla, which they quitted in April, shaping their course for the islands of Japan. Passing the coasts of Corea and Japan, they fell in with Chinese Tartary in lat. 42. 30. and ran to the northward. They anchored in a bay of the island of Saghalien; and thence proceeded up the shallow channel between that island and the continent, as far as lat. 51. 29. Returning thence, they reached the southern extremity of Saghalien in August, and passed a strait between it and Jesso (since named Perouse Strait) into the North Pacific. On September 6, they anchored in the harbour of St. Peter and St. Paul, in Kamtschatka. The ships having been refitted, they set sail, September 30, for the southward; and, crossing the line, arrived in December at the group called by Bougainville the Navigator's Islands. Anchoring in the Bay of Maoua, they met with a friendly reception from the numerous natives, and began to take in refreshments. A party of sixty-one, under the command of M. de Langle, went ashore to procure fresh water, when a most unfortunate occurrence took place. The natives, confiding in their numbers and personal strength, were resolved to make prize of the boats, and without the least provocation commenced an attack with clubs and stones, in which M. de Langle and eleven more lost their lives, the rest escaping with great difficulty. The humane forbearance, which was the principle of conduct during the whole voyage, appears to have been carried to an extreme on this occasion, and to have produced the catastrophe.

Quitting this polluted spot without any fruitless attempts at vengeance, Perouse proceeded to New Holland, and arrived at Botany Bay in January 1788, just at the time when governor Phillip with the whole English colony was leaving it for the new settlement at Port Jackson. Here terminates all that is known of the voyage of this navigator, from the journal which he transmitted to France. He had many and important objects of research remaining; but was never more heard of. There can be little doubt that both the vessels perished by shipwreck, probably with their whole crews. The interest excited by their continued absence caused the National Assembly in 1791 to decree that two ships should be sent in search

of them, and they accordingly failed under M. d'Entrecasteaux; but the effort proved fruitless, and no certain information has ever been procured of their fate. In the same year a decree passed for the publication of the accounts sent home by Perouse, at the national expense, and for the profit of his widow. Circumstances retarded the execution of this design till 1798, when the "Voyage autour du Monde, par J. F. G. de la Perouse, &c." edited by M. L. A. Milet Mureau, appeared in 3 vols. 4to. with an atlas in folio. It is an interesting work, and has been twice translated into English. The proper discoveries of Perouse are chiefly in the seas between China and Japan, and the latter and Tartary. *Voy. de Perouse*.

PEROUSE (La), Straits of, a narrow channel of the North Pacific Ocean, between the islands of Saghalien and Jesso.

PERPENAGAR'DE, a town of Hindoostan: twenty miles south of Calicut.

To PERPEND, *v. a.* [*perpendo*, Lat.] To weigh in the mind; to consider attentively.—Consider the different conceits of men, and duly *perpend* the imperfection of their discoveries. *Brown*.

Thus it remains, and the remainder thus;

Perpend.

Shakespeare's Hamlet.

PERPEND'ER, *f.* [from the Lat. *per*, by, and *pendeo*, to hang.] Any thing hanging down in a straight line. A stone fitted to the thickness of a wall; a coping-stone.

PERPEND'ICLE, *f.* [*perpendicularis*, Fr. *perpendicularum*, Lat.] Any thing hanging down by a straight line.

PERPEND'ICULAR, *adj.* [*perpendicularis*, Fr. *perpendicularis*, Lat.] Crossing any other line at right angles.—The angle of incidence is that angle, which the line, described by the incident ray, contains with the *perpendicular* to the reflecting or refracting surface at the point of incidence. *Newton's Optics*.

If in a line oblique their atoms rove,

Or in a *perpendicular* they move;

If some advance not slower in their race,

And some more swift, how could they be entangled?

Blackmore.

Cutting the horizon at right angles.—Some define the *perpendicular* altitude of the highest mountains to be four miles. *Brown's Vulg. Err.*

PERPEND'ICULAR, *f.* in geometry, a line falling directly on another line, so as to make equal angles on each side; called also a *normal* line.—From the very notion of a *perpendicular*, it follows that the perpendicularity is mutual; i. e. if a line be perpendicular to another, that other is also perpendicular to the first. *Chambers*.—A line crossing the horizon at right angles.—Though the quantity of water thus rising and falling be nearly constant as to the whole, yet it varies in the several parts of the globe; by reason that the vapours float in the atmosphere, and are not restored down again in a *perpendicular* upon the same precise tract of land. *Woodward*.—A level.—Her feet were placed upon a cube, to shew stability; and in her lap she held a *perpendicular*, or level, as the ensign of evenness and rest. *B. Jonson*.

PERPEND'ICULAR'ITY, *f.* The state of being perpendicular.—The meeting of two lines is the primary essential mode or difference of an angle; the *perpendicularity* of these lines is the difference of a right angle. *Watts's Logick*.

PERPEND'ICULARITY OF PLANTS, or the tendency which the stems of plants in general have to ascend, while their roots descend, is a curious phenomenon, first particularly noticed by M. Dodart, who laboured without much success to explain it; nor was M. de la Hire more happy in his theory on the subject. Dr. Darwin has, in our opinion, given the best explanation. He supposes that the root is most stimulated by moisture, the ascending part of the plant by air; and that each extends itself in the direction in which it meets with its requisite stimulus. This theory accounts, not only for the general direction

of

of the stem and root, but for the occasional variations observable in both.

PERPENDICULARLY, *adv.* In such a manner as to cut another line at right angles.—In the direction of a straight line up and down.—Shoot up an arrow *perpendicularly* from the earth, the arrow will return to your foot again. *More*.—All weights naturally move *perpendicularly* downward. *Ray*.

Ten masts attach'd make not the altitude
Which thou hast *perpendicularly* fallen. *Shakespeare*.

PERPEN'NA. See the article **ROME**.

PERPEN'SION, *f.* [from *pend.*] Consideration. *Not in use*.—Unto reasonable *perpensions* it hath no place in some sciences. *Brown's Vulg. Err.*

PERPEN'SUM, *f.* in botany. See **GUNNERA**.

PERPES'SION, *f.* [*perpessio*, Lat.] Suffering.—The eternity of destruction in the language of Scripture signifies a perpetual *perpessio* and duration in misery. *Pearson on the Creed*.

To **PER'PETRATE**, *v. a.* [*perpetro*, Lat.] To commit: to act. Always in an ill sense:

Hear of such a crime
As tragick poets, since the birth of time
Ne'er feign'd a thronging audience to amaze;
But true and *perpetrated* in our days. *Tate*.

It is used by Butler in a neutral sense, in compliance with his verse, but not properly:

Success, the mark no mortal wit
Or surest hand can always hit;
For whatfoe'er we *perpetrate*,
We do but row, we're steer'd by fate. *Hudibras*.

PERPETRA'TION, *f.* The act of committing a crime.—A desperate discontented assassin would, after the *perpetration*, have hounded a meer private revenge. *Wotton*.

—A woman, who lends an ear to a seducer, may be infensibly drawn into the *perpetration* of the most violent acts. *Richardson's Clarissa*.—A bad action.—The strokes of divine vengeance, or of men's own consciences, always attend injurious *perpetrations*. *King Charles*.

PERPET'UA (Cape), lies on the north-west coast of North America, in lat. 44. 6. N. lon. 235. 52. E. This is the northern extreme of the projecting land; and the southern extreme was called by Cook "Cape Gregory," in lat. 43. 30. N. lon. 235. 57. E.

PERPET'UA (Saint), was a married lady of distinguished parentage, and only in the 22d year of her age, when she was ordered into confinement, by Minutius Firmianus, the proconsul of Africa, in the fifth general persecution of the Christians, under the emperor Severus; who, having in the early part of his sovereignty been favourable to Christianity, proved, in the subsequent period of his reign, one of its most unrelenting and bitter enemies. The husband and mother of Perpetua were reputed Christians; her father was a heathen. While under confinement, every art which parental authority or affection could dictate, was essayed by the father of Perpetua, to make her abandon the Christian faith, and save the life of herself and that of the infant which she nourished at her breast: but she remained firm against every effort; and, when under the awful examination before Hillarian the procurator, who officiated as judge, displayed the most heroic fortitude, receiving with magnanimous resignation her sentence "to be devoured by wild beasts." A conduct so noble wrought upon Hillarian, who afterwards embraced those doctrines which he found no reason could refuse, or earthly power overcome. In the amphitheatre, where Perpetua was exposed to the fury of an enraged bull, she received several bruises from the animal, though none of immediate danger; and was finally dispatched by the hands of the public executioner, amidst the scoffs and exultations of the brutal spectators, A. D. 205.

St. Augustin records, that the day of Perpetua's martyrdom was commemorated in his time; but why, after

having been expunged from our calendar by the first reformers, it was again introduced, not any reason has been assigned. It stands, in our calendar, against the 7th of March.

PERPET'UAL, *adj.* [*perpetuel*, Fr. *perpetuus*, Lat.] Never ceasing; eternal with respect to futurity.—Under the same moral, and therefore under the same *perpetual*, law. *Holyday*.

Mine is a love, which must *perpetual* be,
If you can be so just as I am true. *Dryden*.

Continual; uninterrupted; perennial.—By the muscular motion and *perpetual* flux of the liquids, a great part of them is thrown out of the body. *Arbutnot*.

Within those banks, where rivers now
Stream, and *perpetual* draw their humid train. *Milton*.

A screw which acts against the teeth of a wheel, and continues its action without end; and hence called otherwise an endless screw.—A *perpetual* screw hath the motion of a wheel and the force of a screw, being both infinite. *Wilkins's Math. Magick*.

PERPET'UAL is sometimes also used for a thing that lasts, or holds, during a person's life. Thus offices, &c. held *durante vita*, are sometimes called perpetual offices. In this sense, M. Fontenelle was said to be perpetual secretary of the Royal Academy of Sciences; and the French called him absolutely, *M. le Perpetuel*.

PERPET'UAL PILLS, *Pilula perpetuae*, among physicians, are pills made of regulus of antimony; which, being swallowed and voided fifty times, will purge every time with undiminished force. *Chambers*.

PERPET'UALLY, *adv.* Constantly; continually; incessantly.—The bible and common prayer book in the vulgar tongue, being *perpetually* read in churches, have proved a kind of standard for language, especially to the common people. *Swift*.

To **PERPET'UATE**, *v. a.* [*perpetuer*, Fr. from *perpetuo*, Lat.] To make perpetual; to preserve from extinction; to eternize.—Medals, that are at present only mere curiosities, may be of use in the ordinary commerce of life, and at the same time *perpetuate* the glories of her majesty's reign. *Addison*.—To continue without cessation or intermission.—What is it, but a continued *perpetuated* voice from heaven, resounding for ever in our ears? to give men no rest in their sins, no quiet from Christ's importunity, till they awake from their lethargick sleep and arise from so mortiferous a state, and permit him to give them life. *Hammond*.

PERPETUA'TION, *f.* The act of making perpetual; incessant continuance.—Nourishing hair upon the moles of the face is the *perpetuation* of a very ancient custom. *Brown's Vulg. Err.*—Now the prophetic function consisteth in the promulgation, confirmation, and *perpetuation*, of the doctrine containing the will of God for the salvation of man. *Pearson on the Creed*.

PERPETU'ITY, *f.* [*perpetuité*, Fr. from *perpetuitas*, Lat.] Duration to all futurity.—For men to alter those laws, which God for *perpetuity* hath established, were presumption most intolerable. *Hooker*.—There can be no other assurance of the *perpetuity* of this church, but what we have from him that built it. *Pearson*.

Yet am I better

Than one that's sick o' the gout, since he had rather
Groan so in *perpetuity*, than be cur'd
By the sure physician, death. *Shakespeare's Cymbeline*.

Exemption from intermission or cessation.—A cycle or period begins again as often as it ends, and so obtains a *perpetuity*. *Holder*.—What the Gospel enjoins is a constant disposition of mind to practise all Christian virtues, as often as time and opportunity require; and not a *perpetuity* of exercise and action; it being impossible at one and the same time to discharge variety of duties. *Nelson*.—Something of which there is no end.—A morsel of pottage for a birthright;

birthright; a present repast for a *perpetuity*. *South*.—The ennobling property of the pleasure that accrues to a man from religion, is, that he that has the property may be also sure of the *perpetuity*. *South*.

The laws of God, as well as of the land,
Abhor a *perpetuity* should stand;

Eitates have wings, and hang in fortune's power. *Pope*.

PERPIGNAN, a city of France, and capital of the department of the East Pyrenees; before the revolution, the capital of Rouffillon, and the see of a bishop; situated on the Tet, about a league from the sea. The walls are of brick and stone, very high and thick, with several bastions; the citadel is upon an eminence, and commands the town. This town was founded in 1068 by Guinard earl of Rouffillon, and is said to have received its name from Bernard Perpignan, who kept an inn on the spot. The eastern and western divisions contain, each of them, 5550 inhabitants. The place has been often contested by the French and Spaniards, and under the present circumstances (April 1823) is likely to be so again. The climate is in general so mild here, that it was with no little surprise the inhabitants beheld a considerable fall of snow from Thursday the 19th till Saturday the 21st of December last, (1822), where snow had not been seen for 17 years before. Perpignan is 19 posts south-west of Montpellier, 224 south of Paris. Lat. 42. 41. N. lon. 2. 59. E.

To PERPLEX', *v. a.* [*perplexus*, Lat. from the Gr. *περιπλεωω*, to entangle, to involve.] To disturb with doubtful notions, to entangle; to make anxious; to tease with suspense or ambiguity; to distract; to embarrass; to puzzle.—Being greatly *perplexed* in his mind, he determined to go into Persia. *1 Mac. iii. 31.*—He *perplexes* the minds of the fair sex with nice speculations of philosophy, when he should engage their hearts. *Dryden*.—To make intricate; to involve; to complicate.—What was thought obscure, *perplexed*, and too hard for our weak parts, will lie open to the understanding in a fair view. *Locke*.

Their way

Lies through the *perplex'd* paths of this drear wood. *Milton*.

We both are involv'd

In the same intricate *perplex'd* distress. *Addison's Cato*.

To plague; to torment; to vex. *A sense not proper, nor used.*

Chloe's the wonder of her sex;

'Tis well her heart is tender;

How might such killing eyes *perplex*,

With virtue to defend her!

Granville.

PERPLEX', *adj.* Intricate; difficult. *Perplexed* is the word in use.—How the soul directs the spirits for the motion of the body, according to the several animal exigents, is *perplex* in the theory. *Granville's Seepsis*.

PERPLEX'EDLY, *adv.* Intricately; with involution.—He handles the question very *perplexedly*, which yet is very easily resolved upon the grounds already laid. *Bp. Bull*.

PERPLEX'EDNESS, *f.* Embarrassment; anxiety.—Be good without much noise: be provident without *perplexedness*: be merry without lightness: be bountiful without waste: live to the benefit of all, but to the service only of God. *Dr. Henshaw's Daily Thoughts, 1651.*—Intricacy; involution; difficulty.—Obscurity and *perplexedness* have been cast upon St. Paul's Epistles from without. *Locke*.

PERPLEX'ITY, *f.* Anxiety; distraction of mind.—The fear of him ever since hath put me into such *perplexity* as now you find me. *Sidney*.—*Perplexity* not suffering them to be idle, they think and do, as it were, in a phrenzy. *Hooker*.

The royal virgin, which beheld from far.

In pensive plight and sad *perplexity*,

The whole achievement of this doubtful war,

Came running fast to greet his victory.

Spenser.

Entanglement; intricacy.—Let him look for the labyrinth; for I cannot discern any, unless in the *perplexity* of his own thoughts. *Stillington*.

PERPLEX'LY, *adv.* Confusedly.—This is the sum of what past, set down so *perplexly* by the Saxon annalist. *Milton's Hist. of Eng.*

PERPOTATION, *f.* [*per* and *poto*, Lat.] The act of drinking largely.

PERPURA, a river of Brazil, which runs into the Atlantic in lat. 3. 50. S. lon. 38. 16. W.

PERQUA'IN, or PEL'HAM, a small island on the south coast of England, in Pool Harbour.

PERQUIMINS, a river of North Carolina, which runs into the Atlantic in lat. 36. 5. N. lon. 76. 32. W.

PERQUIMINS, a county of Edenton district, in North Carolina, bounded west by Chowan county, and east by Pasquotank, from which last it is separated by the river Pasquotank, a water of Albemarle Sound. It contains 6052 inhabitants, of whom 2017 are slaves.

PERQUISITE, *f.* [*perquisitus*, Lat.] Something gained by a place or office over and above the settled wages.—To an honest mind, the best *perquisites* of a place are the advantages it gives a man of doing good. *Addison*.

Tell me, perfidious, was it fit

To make my cream a *perquisite*,

And steal to mend your wages?

Widow and Cat.

In law, any thing gotten by industry, or purchased with money, different from that which descends from a father or ancestor; and so Bracton uses it, when he says, *Perquisitum facere*, lib. ii. cap. 30. and lib. iv. c. 22.

PERQUISITED, *adj.* Supplied with perquisites:

But what avails the pride of gardens rare,

However royal, or however fair,

If *perquisited* varlets frequent stand,

And each new walk must a new tax demand? *Savage*.

PERQUISITION, *f.* [*perquisitus*, Lat.] An accurate enquiry; a thorough search.—The acid is so fugitive as to escape all the filtrations and *perquisitions* of the most nice observers. *Bp. Berkeley's Siris*.

PERQUISITOR, *f.* A searcher. *Cole*.

PERRAHGUN'GE, a town of Bengal: seventeen miles north of Dinagepour.

PERRANGUN'GE, a town of Bengal: sixty-six miles north of Dacca.

PERRAULT (Claude), a physician, and an eminent architect, born at Paris in 1613, was the son of an advocate of parliament, originally from Tours. He was brought up to the medical profession, and was admitted a doctor of the faculty of Paris in 1641. He practised little, however, except among his friends and the poor, and made himself chiefly known by his architectural talents. He had studied mathematics in his medical course, and had acquired great skill as a draughtsman. When in 1666 the Academy of Sciences was founded, under the patronage of Colbert, Perrault, who was one of the first members, was appointed to select a spot for an Observatory; and he also gave a plan of the building, which was executed. When it was resolved, among the magnificences of Louis XIV. to proceed in completing the palace of the Louvre, all the eminent architects were invited to send designs for the façade, and that of Perrault was preferred. This is accounted the master-piece of French architecture; and it would alone suffice to transmit his name with honour to posterity. It was in vain that persons jealous of his reputation endeavoured to make the public believe that the real designer of this work was Le Veau: they entirely failed in their proof; and the glory of Perrault remained untarnished. When Colbert, after the king's first conquests, proposed to construct a grand triumphal arch to his honour, Perrault's design had the preference, and the edifice was commenced. It was, however, never finished; and the stones were all removed under the regency of the

duke of Orleans. In its masonry, Perrault employed the practice of the ancients, of rubbing the surfaces of the stones together with grit and water, so as to make them cohere without mortar; and he invented a machine for the purpose. Other works of this architect were the chapel at Sceaux, that of Notre Dame in the church of the Petits Peres in Paris, the water-alley at Versailles, and most of the designs of the vases in the park of that palace. By the king's command he undertook a translation of Vitruvius with notes, published in 1673, fol. All the designs for the plates of this work were drawn by himself, and were regarded as master-pieces of the kind. He afterwards published an abridgment of that author for the use of students. He likewise facilitated the study of architecture by a work entitled, "Ordonnance des cinq Especes de Colonnnes, selon la Methode des Anciens," fol. In its preface he maintains that there is no natural foundation for the architectural proportions, but that they may be infinitely varied according to taste and fancy; an opinion which has given much offence, though justified by the practice of the ancients themselves. A Collection of several Machines of his invention was published after his death in 4to. 1700.

Claude Perrault also holds a respectable place among the writers in his original profession. He employed himself assiduously in the dissection of animals; and, besides various memoirs on this subject communicated to the Academy of Sciences, he published "Memoires pour Servir à l'Histoire naturelle des Animaux," in 2 vols. fol. 1671-6, with fine plates. Du Verney assisted in the dissections and descriptions, which were from subjects in the royal menagerie. His other writings of this class are contained in his "Essais de Physique," 4 vols. 1680-88. One of these volumes relates entirely to the organ of hearing; and includes a Dissertation upon the Music of the Ancients, which is chiefly employed in proving that counterpoint was unknown to antiquity. He has manifested himself to have been perfectly master of the subject: he had read all the ancient authors who have written expressly upon it; he had examined the passages which have been thought the most favourable to it, in some authors who have only mentioned it occasionally; and had considered the marvellous effects attributed to it in others. He reasons forcibly, and the facts he alleges in support of the side he has taken are strong and well stated. He had indeed given his opinion upon the subject very freely in the notes to his excellent translation of Vitruvius in 1673; where, in his commentary of the chapter upon Harmonic Music according to the Doctrine of Aristoxenus, he declares that, "there is nothing in Aristoxenus, who was the first that wrote upon concords and discords, nor in any of the Greek authors who wrote after him, that manifests the ancients to have had the least idea of the use of concords in music of many parts." Another volume of the Essays relates to the mechanism of animals, in which he has anticipated Stahl in some of his opinions respecting the functions of the animal soul; and in other parts of them he treats on the peristaltic motion, on the senses, on nutrition, on the regeneration of lost parts, &c. on all which topics he has many good and ingenious observations, mixed with much hypothesis.

From this account of his labours in art and science, it appears that he was not a man to be rendered ridiculous and contemptible by the petulance of wit; and Boileau, who attempted it, has injured his own memory by the attack, rather than that of his foe. Claude, who was a man of a kind and gentle disposition, had expressed himself in disapprobation of the severities of the satirist; on which account Boileau, in his Art of Poetry, brought him forward under the fiction of a doctor of Florence, who, from a bad physician, became an able architect. Perrault's complaint of this outrage only produced a more flagrant insult from the poet, in an epigram in which he pretended not to have had him in his view, because, though an ignorant physician, he was not a skilful architect. But this double injustice was too gross for the

public feeling; and Boileau afterwards thought fit to retract part of his censure. Claude died in Paris in 1688, aged 75. His death is said to have been in consequence of dissecting a camel which had died of disease. His portrait was placed in the hall of the faculty of medicine, with an honourable inscription.

Claude had three brothers.—*Peter*, the eldest, receiver-general of the finances of the generality of Paris, wrote a Treatise on Fountains, and a translation of the *Secchia rapita* of Tassoni. Some of his papers are contained in the "Oeuvres Physiques de Claude et de Pierre Perrault," Leyd. 1721.

Nicholas, the second brother, was a doctor of the Sorbonne, and published "Theologie Morale des Jesuites," 4to. 1677. The youngest is the subject of the following article.

PERRAULT (Charles), younger brother of the preceding, and also a distinguished literary character, was born at Paris in 1633. He was placed at an early age in the college of Beauvais, where he soon attracted notice by his facility in making verses. He was still more addicted to scholastic disputation; but a quarrel with his master, which obliged him to quit the college, interrupted the ordinary course of his studies. He however by no means deserted literary pursuits; but, associating himself with a friend of the same age, they read good authors together, and discussed their merits; and this second education was, in his opinion, more useful to him than the first. They also indulged themselves in burlesque, which was then much in vogue; and they joined in a travesty of the 6th book of the *Eneid*, which juvenile task might, perhaps, produce a more permanent effect upon the taste of Perrault than he was aware of. He was brought up to the profession of the law; and, having been admitted an advocate, began to plead causes. He was, however, taken from this career by the minister Colbert, who chose him for secretary to a small society of men of letters which assembled twice a-week at his house. Their business was to plan devices for medals, and other memorials, at the king's requisition, and commemorative of the glories of his reign; and this was the germ of the celebrated Academy of Inscriptions and Belles-Lettres. Charles Perrault had a singular talent for inventions of this kind, and those which he proposed commonly obtained the preference. His influence with the minister was constantly employed in the service of science and literature. He procured, for the French Academy, apartments in the Louvre; and, with his brother Claude, shared in the establishment of the Academy of Sciences. When Colbert caused a sum to be set apart in the treasury, for pensioning, in the king's name, the most eminent men of letters, as well in foreign countries as in France, its distribution was principally confided to Perrault. This was an office likely to give him much consequence among the literati, and also to procure him much envy and ill-will. He seems to have executed his trust very honourably; yet the list of pensions granted in France was far from being a scale of relative merit.

The esteem of Colbert for Perrault was substantially proved by appointing him controller-general of the royal buildings, of which he was himself superintendent. In this post he conducted himself with equal disinterestedness and intelligence; and he was of great use to his patron, by suggesting to him, in conversation, much information on points which he had no time to study, and which he could afterwards display to advantage before the king, who was equally uninstructed with himself. During his possession of this office, he obtained the establishment of the Academies of Painting and Sculpture. The French Academy manifested its gratitude for his services, by admitting him as a member in 1671; and his discourse at reception gave so much satisfaction to that body, that it thenceforth became a custom to print admission-harangues.

His connexion with Colbert was at length interrupted

by some mortifications to which the minister exposed him; possibly because he could not condescend to servility. Perrault retired, and resisted the advances soon after made for recalling him. He withdrew to a house in one of the suburbs of Paris, in the neighbourhood of the colleges, which he chose for the purpose of superintending the education of his two sons. Here he passed his time in literary leisure, and the enjoyment of domestic happiness. He exercised himself in writing; and composed several poems, which are said to be remarkable for the exactness of their descriptions. One of these, entitled, "Le Siècle de Louis XIV." published in 1687, made the commencement of a controversy, which is one of the most remarkable circumstances of his life, and for a time divided all his wits in France. In enumerating the glories of the reign, he had enhanced them by a depreciation of the ancients in every point of comparison; and, as this was regarded by the votaries of antiquity in the light of a profanation, he supported his opinion by an elaborate prose work, entitled, "Parallele des Anciens et des Modernes," 4 vols. 12mo. Among other antagonists, he had to encounter the formidable satirist Boileau, who attacked him not only with all the powers of argument of which he was master, but with ridicule and invective. He, indeed, treated Perrault as a personal enemy; and, as he was of a much less forgiving temper than his adversary, he seems never, even after an apparent reconciliation, to have regarded him without a degree of malignity. The breach had been widened by a poem of Perrault's called "Apologie des Femmes," intended as a kind of reply to Boileau's virulent satire on the sex. He next occupied himself in drawing up his "Eloge Historique d'une Partie des Grands Hommes qui ont paru dans le xvii Siècle." Of this work he published two vols. folio, 1697, 1700, with the portraits of the subjects of his eulogy. The style of the work is simple and pleasing, and a tone of moderation reigns through the whole. Among the illustrious persons commemorated, he had not omitted Arnauld and Pascal; but the odious intrigues of the Jesuits excluded them from the collection, till after the death of Louis XIV. This estimable writer, who invariably maintained the character of a man of worth, died in 1703, at the age of 70. His poetry is less valued than his prose, which last is a model of elegant simplicity. Sixty years after his death appeared his "Memoirs," written by himself, valuable for their character of frankness, and curious for the anecdotes they contain. *D'Alembert Eloges Academ.*

PER'RE, in ancient geography, a town of Asia, in Comagene, situated at the confluence of two small rivers, which discharged themselves into the Euphrates south of this town.

PER'REL, a small island in the Gulf of Tonquin, near the coast. Lat. 20. 59. N. lon. 106. 58. E.

PER'RECY, a town of France, in the department of the Saone and Loire: ten miles north-north-west of Charolles, and sixteen east of Bourbon Lancy.

PER'RENOT (Antony), usually known by the name of *Cardinal Granvelle*, a distinguished statesman, was the son of Nicholas Perrenot, lord of Granvelle, chancellor to the emperor Charles V. He was born in 1517 at Besançon; and, after studying in the universities of Louvain and Padua with great reputation, entered into holy orders. He was brought to court by his father, and was employed by Charles V. in various embassies, in which he acquitted himself so well, that he was made bishop of Arras at the age of twenty-five; and, upon the resignation of Charles, was recommended so strongly by that sovereign to his son Philip II. that he became his most confidential minister. From the see of Arras he was translated to the archbishoprick of Mechlin, and in 1561 was created a cardinal by Pius IV. Cardinal Granvelle possessed great talents for business; and is said to have occupied five secretaries at once, dictating to them in differ-

ent languages, of which he thoroughly possessed seven. He was a master of crafty politics; and in the reign of Charles endeavoured to lull the Protestants into a state of security, with respect to the preparations that were making against them. When Margaret of Austria was placed by Philip at the head of the government in the Low Countries, Granvelle was her principal counsellor, and in reality exercised the whole authority. His character is by Grotius represented as a compound of industry, vigilance, ambition, luxury, and avarice; and as equally surpassing the common measure both in good and bad qualities. A zealous servant to the crown, his sole principle of government was the extension of the royal prerogative, whilst at the same time he was animated with professional hatred against the Protestants. He at length grew so odious to the nobles and people, that in 1566 public complaints against him were transmitted to Philip, who thought it prudent to recall him. His conduct, however, by no means lost him his master's favour and confidence. After having retired for some time to Besançon, of which city he was made archbishop, Philip again employed him in public affairs. He was sent to Rome at the election of Pius V. and was commissioned to negotiate a league against the Turks. After having resided some time at Naples in quality of viceroy, the king called him into Spain, and left him in charge of the affairs of that kingdom while he went to take possession of the crown of Portugal. He was finally nominated ambassador to conclude the marriage of the infanta Catharine with the duke of Savoy. The fatigue of this journey threw him into an illness on his return, which carried him off at Madrid in 1586, in the 70th year of his age. *Robertson's Charles V.*

PERREPTATION, *f.* [from the Lat. *per*, through, and *repto*, to creep.] The act of creeping through. *Colo.*

PERREUX, a town of France, in the department of the Rhone and Loire: three miles east of Roanne, and seven south of Charlieu.

PERRHÆ, in ancient geography, one of the twelve principal towns of Etruria.

PERRHÆBI, a people who inhabited the eastern part of Thessaly, in the vicinity of the sea and of the mouth of the river Peneus, according to Strabo, lib. ix. In the wars between these people and the Lapithæ, Ixion and his son Pirithous took possession of their country; many of them retired into Epirus, and the rest withdrew into the interior of the country near the river Peneus, and the environs of mount Olympus and the river Titaresse, where they were blended with the Lapithæ. Simonides calls them "Pelagiotes." The migration of the Perrhæbi into Epirus took place about thirty years before the last war of Troy.

PERRIER, *f.* [from *pierre*, Fr. a stone.] A kind of great gun for shooting stones.

PERRIER (Charles), a French writer, called by Menage "the prince of lyric poets," was born at Aix, and died 1692.

PERRIERS, a town of France, and seat of a tribunal, in the department of the Channel: eight miles north of Coutances, and nine south-west of Carentan.

PERRIN (Charles-Joseph), a French Jesuit, and an admired preacher, was born at Paris in the year 1690. He exercised his pulpit-talents with great success and applause in several of the principal cities in the kingdom, and particularly in the metropolis. Upon the disgrace of his society in France, the archbishop of Paris, who was favourable to the order, gave him a temporary asylum in his palace. His deportment as an ecclesiastic was regular and edifying, and his manners agreeable and conciliating; but, having rendered himself peculiarly obnoxious by the ardour of his zeal on behalf of his society, the ruin of which was irrevocably determined, he was under the necessity of retiring to Liege. In this city he died in 1767, when about 77 years of age. He published a Latin poem

on the Death of Louis XIV. and from his manuscripts were printed, at Liege, in 1768, 4 vols. of Sermons, 12mo. *Gen. Biog.*

PERRITIO, a river of Naples, which runs into the Crate in the province of Calabria Citra.

PER'RON, *f.* in architecture, a staircase lying open, or withoutside the building: properly, the steps before the front of the building, which lead into the first story when raised a little above the level of the ground.

PER'RON (James Davy du), a learned and celebrated cardinal, was descended from two ancient and noble families of Lower Normandy, which, on account of their adherence to the Protestant faith, had found it necessary to seek an asylum in Switzerland, and settled in the canton of Berne, where the subject of this article was born in the year 1556. Till he was ten years of age, his father, who possessed considerable learning and abilities, undertook the office of his tutor, and initiated him in the mathematics and the Latin language. At this period of his life his parents returned with their family into Normandy; but were for some years afterwards driven from place to place by persecution and the civil wars, till the Protestants obtained peace from Charles IX. During this time young Du Perron applied diligently to his studies, and with such success, that he taught himself the Greek language, and philosophy, commencing the science last mentioned with the logic of Aristotle. He then employed himself in studying the orators and poets; and afterwards cultivated an acquaintance with the Hebrew language, and became such a proficient in it, that he could read it with facility without the points, and was able to deliver lectures upon it before the Protestant ministers. In the year 1576, M. de Lancosme carried him to the court of Henry III. which was then at Blois, where the states were assembled, and introduced him to the king, as a young man of extraordinary abilities and acquirements. Here he afforded evidence of his talents and learning in public lectures upon the mathematics and philosophy; and obtained such celebrity as a disputant, that he was soon left without an opponent who would venture to enter the lists with him. Upon the breaking-up of the states he went to Paris, where he mounted the rostrum in the great hall of the Augustines, in the habit of a cavalier, and held public conferences upon the sciences.

He now seems to have entertained a disposition towards a change in his religious sentiments. This was strengthened by his perusal of the "Summa" of Aquinas, and by the intimate friendship which he cultivated with Philip Desportes, abbot of Tiron, who made him his substitute in the office of reader to the king, Henry III. From the perusal of Aquinas's Summa, M. du Perron was led to the study of the fathers, particularly of the works of St. Augustine; and at length he determined to embrace the Catholic creed. Having taken this resolution, he entered himself minutely into all the controverted points at issue between the two communions, and then formally made his abjuration. No sooner had he thus become a convert to the Catholic church, than, with a zeal not unusual in new proselytes, he laboured assiduously for the conversion of others; and this even before he had embraced the ecclesiastical profession, in a conference with the chaplain of the English ambassador, and on several other occasions.

In the year 1586, he was selected to pronounce the funeral oration for the celebrated poet Ronsard; and in the following year, the king appointed him to pay a similar tribute of respect to the memory of Mary queen of Scots. Afterwards he wrote, by his majesty's command, "A Comparison of moral and theological Virtues;" and two "Discourses," one concerning the soul, and the other upon self-knowledge, which he pronounced before that prince. He was in attendance upon the king when his majesty afterwards assembled the states of the kingdom at Blois; and after the murder of Henry III. he went to reside with cardinal Bourbon.

He now laboured more assiduously than ever in making converts from the reformed, and is said to have been the means of restoring great numbers of them to the Catholic fold. Among others, he converted Henry Sponde, afterwards bishop of Pamiez, as that prelate acknowledged, in a dedicatory letter prefixed to his Abridgment of Baronius's Annals. His Catholic biographers also claim for him the honour of having had a principal share in the conversion of king Henry IV. It is certain that, when the king had come to a determination to avow himself a Catholic, and expressed his willingness to receive instruction on the subject of religion, M. du Perron waited on him while he was engaged in the siege of Rouen, and followed him to Mante, where he maintained a famous dispute with four Protestant divines. Afterwards, when the king was resolved to hold a conference about religion with the principal prelates of the kingdom, he sent for du Perron to assist in it; and, as he was then only a layman, the king nominated him to the vacant see of Evreux, that he might be qualified to take his place among them. This conference was held at St. Dennis, and was followed by the king's abjuration of the Protestant faith.

After this sacrifice of his religion to views of state policy, Henry sent M. du Perron, together with M. d'Osat, to Rome, for the purpose of negotiating his reconciliation with that see; in which object they succeeded, when pope Clement VIII. found that the king was firmly fixed upon his throne, and might be tempted to follow the example of Henry VIII. of England, were his holiness to prove much longer implacable. While M. du Perron continued at Rome, in the year 1595, he was consecrated bishop of Evreux. After his return to France, he laboured ineffectually to convert some of the leading Protestants to the Romish faith, and frequently preached and wrote upon the points in controversy between them and the Catholics. Having read M. du Plessis-Mornay's treatise "On the Eucharist," he pretended that he had discovered in it more than five hundred errors and false quotations; which proved the occasion of a conference between our prelate and that gentleman at Fontainebleau, in the presence of the king, when the honours of victory were rewarded to each of the opponents by their respective parties. Afterwards the king made M. du Perron grand almoner of France, and in 1604 translated him from the see of Evreux to the archbishopric of Sens. In the same year, in consequence of a letter written by the king to pope Clement VIII. that pontiff conferred on the archbishop the dignity of Cardinal, with singular marks of esteem. The indisposition of Clement soon afterwards having determined the king to send the French cardinals to Rome, that they might be on the spot when the next conclave should be assembled, cardinal du Perron on his arrival was immediately employed by the pope in the most important councils and congregations. He supported the elections of Leo XI. and Paul V. and assisted at the congregation *de auxiliis*; and it was said to be chiefly owing to his advice, that the pope last mentioned dismissed the controversy between the Jesuits and Dominicans concerning *grace*, in such a manner as we have seen under his article, at p. 411 of this volume. Upon his return to France, at the request of the king, he wrote a Reply to King James of England's Letter concerning Differences in Religion, which that prince sent to Henry; and he was also employed by his majesty in various other affairs. Some time afterwards he was sent a third time to Rome, together with the cardinal de Joyeuse, for the purpose of bringing the differences between Paul V. and the republic of Venice to an amicable termination; and their endeavours were not ineffectual. Such weight had his advice with that pontiff, that he once said to those about him, "We ought to pray to God that he would inspire cardinal du Perron, for he will persuade us to do whatever he pleases."

It was the king's wish that the cardinal-archbishop should

should reside for some time at Rome, superintending the interests of France at the papal court; but the ill state of his health rendered it necessary for him to be recalled home. After the execrable murder of Henry IV. he devoted himself entirely to the interests of the court of Rome; and, by his subserviency to its policy, excited the indignation and hatred of the friends to the independence and liberties of the Gallican church. He rendered useless the arret of the parliament of Paris against Bellarmin's book, and the high notions of papal power maintained in it. He supported the notion of the infallibility of the pope, and his superiority over a general council, in a thesis which he held in 1611 before the pope's nuncio. He convened an assembly of his suffragans at Paris, in which he assumed an inquisitorial authority, and passed a sentence of condemnation on Edmund Richer's celebrated treatise "concerning ecclesiastical and political Power." At the meeting of the states-general in 1614, he opposed, under the pretence of its comprehending points of faith with which a secular body had no business to interfere, a motion introduced by the third estate, purporting, "that the assassinations of Henry III. and IV. called upon all good Frenchmen to condemn the doctrine which permitted the murder of tyrants, and gave the pope power to depose kings, and to absolve subjects from their oaths of allegiance." He was one of the presidents of the assembly of the clergy held at Rouen in 1615; and pronounced discourses before the king at the commencement and close of their sessions, which were much applauded. From this time he lived chiefly in retirement at Bagnolet, employed in putting the last hand to his works, which were printed in a press set up in his own house, that he might be satisfied of their correctness, by carefully revising every sheet before it was worked off. He died at Paris in 1618, in the sixty-third year of his age.

Du Perron possessed a lively penetrating genius, and a prodigious memory; had studied much, and was well versed in antiquity, sacred and profane; and he well knew how to avail himself of his acquaintance with the fathers, the councils, and the ecclesiastical historians, in refuting or puzzling his adversaries. He delivered his sentiments with ease and force, and wrote purely and eloquently. From his obsequiousness, however, to the lordly pretensions of the court of Rome, he has not been unjustly characterised by some of his Catholic critics as a bad Frenchman, a political priest, and an ambitious prelate. His works, which were printed separately in his life-time, were collected together after his death, and published in 3 vols. folio, in 1622 and 1623. In the year last mentioned, his secretary, Cæsar de Ligni, added to them a fourth volume, comprising his embassies and negotiations. Some years after his death, a volume was published under the title of "Perroniana," consisting of thoughts, maxims, observations, &c. relating to literature, history, &c. arranged in alphabetical order; which was composed by Christopher de Puy, prior of the Carthusian monastery at Rome; and has been repeatedly printed in a 12mo. volume. Some parts of this collection are useful in illustrating the literary and ecclesiastical history of the age in which Perron lived; but it also contains many puerile, imprudent, and absurd, remarks, which it is generally supposed he never uttered, and many of which were proved by M. Chevreau to have been the interpolations of his friends. Some of his assertions, as that Luther denied the immortality of the soul, and that every English peasant drinks from a silver goblet, are evidently false. Nor can much reliance be placed on the judgment or taste of an author, who has elsewhere declared, that a page of Quintus Curtius is worth thirty of Tacitus; and that, next to Quintus Curtius, Florus is the greatest Roman historian. The *Thuana*, or observations of the president De Thou, have usually been published along with the Perroniana. *Dupin. Moreri. Ency. Brit. Suppl. art. ANA.*

PERRON (Abraham Hyacinth Anquetil du), a very eminent literary character, was born at Paris, on the 7th of December, 1731. Having distinguished himself as a student at the university of that city, and acquired a considerable knowledge of the Hebrew language, he was invited to Auxerre by M. de Caylus, then the bishop of that diocese. This prelate made him study theology, first at the academy of his diocese, afterwards at that of Amersfort, near Utrecht; but Anquetil had no desire to embrace the ecclesiastical vocation, and devoted himself with ardour to the study of the different dialects of the Hebrew, and of the Arabic and Persian. Neither the solicitations of M. de Caylus, nor the hopes of rapid preferment, had the power to detain him at Amersfort, after he thought he had acquired every thing that was to be learnt there. He returned to Paris, where his diligent attendance at the Royal Library, and his ardour in the prosecution of his favourite studies, attracted the attention of the Abbé Sallier, keeper of the manuscripts, who introduced him to the acquaintance of his associates and friends, whose united exertions procured for him a small salary, as student of the oriental languages. He had scarcely received this appointment, when, having accidentally laid his hands on some manuscripts in the *Zend*, he formed the project of a voyage to India, with the view of discovering the works of Zoroaster. At this period, an expedition was preparing at Port l'Orient, which was destined for India. M. du Perron, however, applied in vain, through his protectors, for a passage; and, seeing no other means of accomplishing his plan, he enlisted as a common soldier, and set out from Paris, with a knapsack on his back, on the 7th of November, 1754. His friends procured his discharge; and the minister, affected by this romantic zeal for science, granted him a free passage, a seat at the captain's table, and a salary, the amount of which was to be fixed by the governor of the French settlements in India. After a passage of nine months, Anquetil landed, on the 10th of August, 1755, at Pondicherry. Here he remained no longer than was necessary to make himself master of the modern Persian; and then hastened to Chandernagore, where he thought to acquire the Sanscrit. But in this he was deceived; and he was on the point of returning, when a serious complaint threatened his life. He had scarcely escaped from this danger, when war was declared between France and England; Chandanagore was taken, and Anquetil resolved to return to Pondicherry by land. After a journey of a hundred days, in the course of which he encountered many adventures and suffered many hardships, he arrived at Pondicherry. Here he found one of his brothers who had arrived from France, and embarked with him for Surat; but, with the view of exploring the country, he landed at Mahè, and proceeded on foot. It was at Surat that he succeeded, by perseverance and address in his intercourse with the native priests, in acquiring a sufficient knowledge of the languages to enable him to translate the Dictionary called the *Vedidad-Sade*, and some other works. From thence he proposed going to Benares, to study the languages, antiquities, and sacred laws, of the Hindoos; but the capture of Pondicherry obliged him to return to France. He accordingly embarked on-board an English vessel, and landed at Portsmouth in the month of November, 1761. After spending some time in London, and visiting Oxford, he set out for Paris, where he arrived on the 4th of May, 1762, without fortune, or the desire of acquiring any; but esteeming himself rich in the possession of a hundred and eighty oriental manuscripts, besides other curiosities. The Abbé Barthelemy, and his other friends, procured for him a pension, with the title and emoluments of Interpreter for the Oriental Languages at the royal library. In 1763, the Academy of the Belles Lettres received him among the number of its associates; and from that period he devoted himself to the arrangement and publication of the materials he had collected during his eastern travels.

In 1771, he published a work in three volumes 4to. under the title of *Zend-Avesta*, containing collections from the sacred writings of the Persians, among which are fragments of works ascribed to Zoroaster; and he accompanied this work with an account of the life of that sage. This publication must be considered as constituting a very important accession to our stores of oriental literature. A recent historian, and very competent judge, refers to the *Zend-Avesta*, as certainly the most authentic source from which we can derive information regarding the religion and institutions of the great Persian legislator. (Sir John Malcolm's *Hist. of Persia*, vol. i. p. 193.) To the *Zend-Avesta* M. du Perron prefixed a Discourse, in which he treated the university of Oxford, and some of its learned members, with ridicule and disrespect. Mr. (afterwards Sir William) Jones replied to these invectives in an anonymous letter, addressed to the author, written in French, with uncommon force and correctness of style, but, at the same time, with a degree of asperity which could only be justified by the petulance of M. du Perron. In 1778, he published his *Legislation Orientale*, in 4to. a work in which he controverts the system of Montesquieu, and endeavours to prove, that the nature of oriental despotism has been misrepresented by most authors; that in the empires of Turkey, Persia, and Hindoostan, there are codes of written law, which equally bind the prince and subject; and that, in these three empires, the inhabitants possess both moveable and immoveable property, which they enjoy with perfect security. His *Recherches Historiques et Geographiques sur l'Inde*, appeared in 1786, and formed part of Thieffenthaler's Geography of India. They were followed, in 1789, by his treatise *De la Dignité du Commerce et de l'Etat du Commerçant*.

The Revolution seems to have greatly affected him. During that period, he abandoned society, shut himself up in his study, and devoted himself entirely to literary seclusion. In 1798, he published *L'Inde en Rapport avec l'Europe*, &c. in 2 vols. 8vo. a work which is more remarkable for its virulent invectives against the English, and for its numerous misrepresentations, than for the information which it contains, or the soundness of the reflections which it conveys. The spirit of the work, indeed, may be ascertained from the summary of its contents, stated in the title-page, in which the author professes to give a detailed, accurate, and terrific, picture of English Machiavelism in India; and he addresses his work, in a ranting bombastic dedication, "to the Manes of Dupleix and Labourdonnais." In 1804, he published a Latin translation from the Persian of the *Oupnek'hat*, or *Upanishada*; i. e. "Secrets which must not be revealed," in 2 vols. 4to. On the re-organization of the Institute, M. Anquetil was elected a member, but soon afterwards gave in his resignation. He died at Paris on the 17th of January, 1805.

Besides the works which we have already enumerated, M. Anquetil read to the Academy several memoirs on subjects connected with the history and antiquities of the East. At the time of his death, he was engaged in revising a translation of the Travels of Father Paulin de St. Barthelemy in India; which work was continued by M. Silvestre de Sacy, and published in 1808, in 3 vols. 8vo. He also left behind him a great number of manuscripts, among which, his biographers particularly notice the translation of a Latin treatise On the Church, by Doctor Legros, in 4 vols. 4to.

From the preceding narrative, our readers will be enabled to form some notion of the character of Anquetil du Perron. Among his countrymen, he is regarded as one of the most learned men of the eighteenth century. He certainly distinguished himself by a very ardent and disinterested zeal in the prosecution of those studies to which he dedicated the labours of a long life; but the lustre of his literary character was obscured by a very absurd vanity, and the most inveterate prejudices. In a Discourse addressed to the Asiatic Society at Calcutta, in

Vol. XIX. No. 1332.

1789, Sir William Jones speaks of him, as "having had the merit of undertaking a voyage to India, in his earliest youth, with no other view than to recover the writings of Zeratust (Zoroaster); and who would have acquired a brilliant reputation in France, if he had not sullied it by his immoderate vanity and virulence of temper, which alienated the good-will of his own countrymen." In the same Discourse, he affirms, that M. Anquetil most certainly had no knowledge of the Sanscrit. See Lord Teignmouth's *Life of Sir William Jones*, p. 101-110. *Gent. Mag.* 1762 and 1805. *Ency. Brit. Suppl.*

PERRONE, a town of Hindoostan, in Oude: seventeen miles south of Fyzabad.

PERRONET (John Rodolphus), director of the bridges and roads of France, was born in 1708. He was brought up to the profession of architecture in the city of Paris, and made great progress in the art. In 1745 he became inspector of the school of engineers, of which he was afterwards a director. France is indebted to him for several of its finest bridges and its best roads, the canal of Burgundy, and other great works. He was, for his public services, honoured with the order of St. Michael, and admitted a member of the Academy of Sciences at Paris, of the Royal Society of London, and of the Academy of Stockholm. He died at Paris in 1794. He wrote a description of the bridges which he had constructed, in 2 vols. 12mo. and *Memoirs on the Method of constructing Grand Arches of Stone from 200 to 500 Feet span*.

PERROQUET, or PARRAQUET. See PSITTACUS.

PERROT (Sir John), an eminent statesman, was born of an ancient family in Pembrokeshire, about the year 1527. He was bred up in the house of the marquis of Winchester, that he might profit by the discourses and example of that great man. He was one of the knights of the Bath at the coronation of Edward VI. who had a great partiality for him. At the beginning of the reign of Mary he was sent to prison for harbouring Protestants. He assisted at the coronation of Elizabeth, who sent him, in 1572, to Ireland, as lord president of Munster, which was in a state of rebellion, but by his promptitude was quickly reduced to obedience. He was next appointed admiral of a fleet on the coast of Ireland, which was threatened to be invaded by the Spaniards. In 1583 he was made lord deputy of Ireland, where he carried things with so high a hand as to give very great offence; and he was recalled in 1588, and sent to the Tower. In 1592 he was tried by a special commission, brought in guilty of high treason, and sentenced to die. He was, however, respited by favour of the queen, but died in confinement the same year. *Biog. Brit.*

PERROT D'ABLANCOURT (Nicholas), a distinguished French writer, descended from a considerable family in the law, was born in 1606, at Chalons sur Marne. His father, who was a convert to Protestantism, sent him for education to the college of that religion at Sedan. He afterwards studied philosophy at home under a private tutor; and then went to Paris, where, at the age of eighteen, he was admitted an advocate. Through the persuasion of an uncle, who was a counsellor in parliament, he solemnly abjured Calvinism at the age of twenty, but he refused to enter into the ecclesiastical state. He had passed five or six years in the dissipation common to youth, when serious thoughts respecting the religion in which he had been bred occupied his mind, and he studied controversial points with a Lutheran divine for three years: the conclusion was, that he renounced his new faith, and, retiring to Holland and England, again declared himself a Protestant. After a time, he returned to Paris, where he frequented the polite and literary world, and was generally well received. His acquisitions were, indeed, extraordinary. He was well versed both in the sciences and belles lettres, understood the ancient and several modern languages, and displayed quick parts and a penetrating judgment. He was keen in debate, but mild and easy in the com-

8 B

merce

merce of life. The French Academy admitted him among its members in 1637. He had set himself to work on a translation of Tacitus, when he was obliged to go to his province to take care of his small property. Retiring with his sister to his estate of Ablancourt, he passed the rest of his life upon it, only occasionally spending the winter at Paris, for the purpose of printing his works. When, in 1662, Colbert made a kind of muster of the men of letters in France, for the purpose of selecting those who in their several kinds were best qualified to labour for the *glory of the king*, (the leading object of that reign,) d'Ablancourt, who had now made himself known by numerous writings, was fixed upon for historiographer to his majesty, with a pension of 1000 crowns. But the king, when informed that he was a protestant, declared that he would have no historian who was not of his own religion; and the appointment was superseded: the pension, however, was continued to him as a man of learning; but he probably received little of it, since he is said to have died poor. After severe sufferings from the stone and gravel, which he bore with patience, he sunk under them in October 1664, in his 59th year.

It is chiefly as a translator that d'Ablancourt has obtained a name among polite writers, and his industry in this office was remarkable. He published versions of Minutius Felix, four of Cicero's Orations, Tacitus, Lucian, Xenophon's Anabasis, Arrian's Hist. of Alexander, Cæsar's Commentaries, Thucydides with Xenophon's Continuation, the Apophthegms of the Ancients, Frontinus on Stratagems, and Marmol's Description of Africa. In all these he was very careful as to style, and readily attended to the suggestions of his friends for its improvement; whence he was reckoned one of the best French writers of the age. With respect to the mode of translating, he adopted the splendid but hazardous principle of writing like an original author, with all the freedom and boldness of expression that would have been expected on such a supposition. This occasionally led him to great deviations from the sense of his originals, so that his versions acquired the title of *les belles infidèles*. On this account, as well as the alteration of language since the period in which he wrote, they are much fallen in estimation. D'Ablancourt had studied history at Leyden, and the Bible was one of the books on which he bestowed the closest attention. He read it with all the commentators, and was well acquainted with all its difficulties. With several other eminent men, he thought the natural arguments for the immortality of the soul were defective, and relied only on the faith inspired by revelation: on this subject he wrote a Discourse to his friend Patru, which is published in the works of the latter. *Bayle. Moreri.*

PER'ROT ISLAND, a small island in the river St. Laurence. Lat. 45. 24. N. lon. 73. 36. W.

PER'ROS GUERIC, a town of France, in the department of the North Coasts; four miles north of Lannion, and seven north of Treguier.

PER'RUKE, vulgarly PERIWIG, *f.* [*perruque*, Fr.] A wig. But the word was anciently used for a long head of natural hair, such, particularly, as there was care taken in the adjusting and trimming of. Menage derives the word, by a long detour, from the Latin *pilus*, hair. The several stages of its passage, according to the critic, are *pilus*, *pelus*, *pelutus*, *peluticus*, *pelutica*, *perutica*, *peruca*, *peruque*. The Latins called it *coma*; whence part of Gaul took the denomination of *Gallia Comata*, from the long hair which the natives wore as a sign of freedom.

PERRUKE is now used for a set of false or borrowed hair, curled, buckled, woven on strong thread, and sewed together on a frame, or cawl; anciently called *capillamentum*, or false perruque.

It is doubted, whether or not the use of perrukes was known among the ancients. It is true, they used false hair. Martial and Juvenal are merry with the women of their time, for making themselves look young with their borrowed hair; with the men, who changed their colours

according to the seasons; and with dotards, who hoped to deceive the Deities by their white hair.

But these seem to have scarcely had any thing in common with our perrukes; and were, at best, only composed of hair painted, and glued together. Nothing can be more ridiculous than the description Lampridius gives of the emperor Commodus's perruque; it was powdered with scrapings of gold, and oiled (if we may use the expression) with glutinous perfumes for the powder to hang by. In effect, the use of perrukes, at least in their present mode, is not more than two hundred years old: the year 1629 is reckoned the epocha of long perrukes; at which time they began to appear in Paris; whence they spread, by degrees, throughout the rest of Europe. At first it was reputed a scandal for young people to wear them, because the loss of their hair at that age was attributed to a disease, the very name of which is a reproach: but at length the mode prevailed over the scruple, and persons of all ages and conditions have worn them; foregoing, without any necessity, the conveniences of their natural hair. However, it was some time before ecclesiastics came into the fashion: the first who assumed the perruque were some of the French clergy, in the year 1660. Cardinal Grimaldi, in 1684, and the bishop of Lavaur, in 1688, prohibited the use of the perruque to all priests, without a dispensation, or necessity. M. Thiers has a treatise express, to prove the perruque indecent in an ecclesiastic, and directly contrary to the decrees and canons of councils. A priest's head embellished with an artificial hair curiously adjusted, he esteems a monster in the church; nor can he conceive any thing so scandalous as an abbot with a florid countenance, heightened with a well-curled perruque. See the article HAIR, vol. ix.

PER'RY, *f.* [*poiré*, Fr. from *poire*.] A drink made from pears, as cider from apples. See CIDER, vol. iv. — *Perry* is the next liquor in esteem after cyder; in the ordering of which, let not your pears be over ripe before you grind them; and, with some sorts of pears, the mixing of a few crabs in the grinding is of great advantage, making *perry* equal to the redstreak cyder. *Mortimer.*

The best pears for perry, or at least the sorts which have been hitherto deemed the fittest for making this liquor, are so excessively tart and harsh, that no one can think of eating them as fruit; for even hungry swine will not eat them; nay, hardly so much as smell to them. Of these the Bosbury pear, the Barelard pear, and the horse pear, are the most esteemed for perry in Worcestershire, and the squash pear, as it is called, in Gloucestershire; in both which counties, as well as in some of the adjacent parts, they are planted in the hedge-rows and most common fields. There is this advantage attending pear-trees, that they will thrive on land where apples will not so much as live; and that some of them grow to such a size, that a single pear-tree, particularly of the Bosbury and the squash kind, has frequently been known to yield, in one season, from one to four hogheads of perry. The Bosbury-pear is thought to yield the most lasting and most vinous liquor. The John-pear, the Harpary-pear, the Drake-pear, the Mary-pear, the Lullum-pear, and several others of the hardest kinds, are esteemed the best for perry; but the redder or more tawny they are, the more they are preferred. Pears, as well as apples, should be full ripe before they are ground.

Dr. Beale, in his general advertisements concerning cider, subjoined to Mr. Evelyn's Pomona, disapproves of Palladius's saying, that perry will keep during the winter, but that it turns sour as soon as the weather begins to be warm; and gives as his reasons for being of a contrary opinion, that he had himself tasted, at the end of summer, a very brisk, lively, and vinous, liquor, made of horse-pears; that he had often tried the juice of the Bosbury-pear, and found it both pleasanter and richer the second year, and still more so the third, though kept only in common hogheads, and in but indifferent cellars, without being bottled; and that a very honest, worthy,

and

and ingenious, gentleman in his neighbourhood, assured him, as of his own experience, that it will keep a great while, and grow much the stronger for keeping, if put into a good cellar and managed with due care. He imputes Palladius's error to his possibly speaking of common eatable pears, and to the perry's having been made in a very hot country: but he would have ascribed it to a more real cause, perhaps, had he pointed out the want of a thorough regular fermentation, to which it appears plainly that the ancients were entire strangers; for all their vinous liquors were medicated by boiling before they were laid up in order to be kept.

Mr. Knight states, that, in the making of this sort of liquor, the pears are ground and pressed in exactly the same manner as those of apples in the manufacturing of cider; but that it is not usual for the reduced pulp to be suffered to remain any length of time without being pressed. It has never been the practice in Herefordshire, or in the counties in the vicinity of it, to blend the juices of the different varieties of the pear, in order to correct the defects of one kind by the opposite properties of the other. It is, however, he allows, more easy to find the required portion of sugar and of astringency, as well as flavour, in three or four varieties than in one; hence, he supposes, a judicious mixture of fruits affords a prospect of great benefit. In grinding, the pulp and rind of the pear, as in the apple, should be perfectly reduced, and, though no benefit is said to have been derived from the reduced pulp remaining some hours unpressed, he has no doubt but that, where all other circumstances are the same, that portion of liquor will for the most part be found the best which has remained the longest under the power of the mill-stone.

The method of managing this sort of liquor during the process of fermentation, is nearly the same as that in cider; but it does not afford the same indications by which the proper period of racking it off may be known. The thick scum that collects on the surface of cider rarely appears on the juice of the pear; and, during the time of the suspension of its fermentation, the excessive brightness of the former liquor is seldom seen in the latter; but, where the fruit has been regularly ripe, its produce will generally become moderately clear and quiet in a few days after it is made, and it should then be drawn off from its grosser lees. An excess of fermentation is prevented by the means used in the making of cider, and the liquor is rendered bright by isinglass. The power this substance possesses of fining liquors appears to be purely mechanical: it is composed of innumerable fibres, which, being dispersed over the liquor, attach themselves to, and carry down, its impurities. For this purpose it should be reduced to small fragments by being pounded in a mortar, and afterwards steeped twelve or fourteen hours in a quantity of liquor sufficient to produce its greatest degree of expansion. In this state it must be mixed with a few gallons of the liquor, and stirred till it is diffused and suspended in it; and it is then to be poured into the cask, and incorporated with the whole by continued agitation for the space of two hours. This process must be repeated till the required degree of brightness is obtained, the liquor being each time drawn off, on the second or third day, from its precipitated lees. Not more than an ounce and a half or two ounces of isinglass are generally put into a cask of a hundred and ten gallons at once; but, were its mode of action purely mechanical, there could be no objection to a larger quantity; but it has also a chemical action on the liquor; it combines with and carries down the tanning principle, and hence, during the process of fining, the liquor is deprived of a large portion of its astringency. This substance is most readily diffused in liquors by boiling; but by this it is dissolved, and converted into glue; and its organization, on which alone its powers of fining depend, is totally destroyed. The application of it is sometimes also necessary in the manufacture of cider; though colour is seldom wanting

in that liquor. But, when the perry or cider can be made sufficiently bright without it, the above-cited writer would not by any means recommend its use. The liquor is rendered extremely agreeable to the eye by it; but has always appeared to him to become more thin and acid by its action.

In the after-management of perry, the method is the same as that of cider; but it does not bear situations where it is exposed to much change of temperature so well, and its future merit cannot so well be judged of by its present state. In the bottle it almost always retains its good qualities, and in that situation he would always recommend it to be put, if it remains found and perfect at the conclusion of the first succeeding summer. On the whole, the pear furnishes a less popular liquor than the apple; but the tree is capable of being grown on a greater variety of soil, and is more productive, furnishing in the proportion of 600 gallons of liquor to the acre, where the trees are full grown and in good bearing.

A kind of small perry, called *perkin*, as *ciderkin* from cider, is made of the murk or gross matter remaining after the perry is pressed out. To make this liquor, the murk is put into a large vat, with a proper quantity of boiled water, which has stood till it is cold again: if half the quantity of water be used that there was of perry, it will be good; if the quantities be equal, the perkin will be small. The whole is left to infuse forty-eight hours, and then well pressed; what is squeezed out by the press is immediately tunned up and stopped; it is fit to drink in a few days. It clarifies of itself, and serves in families instead of small beer. It will keep, if boiled, after pressure, with a convenient quantity of hops.

PER'RY (Captain John), an eminent English engineer, was recommended to the czar Peter the Great, during his abode in England, as a proper person to assist him in his favourite schemes of forming a navy, and promoting inland navigation within his dominions. He was taken into the czar's service at a liberal salary, and with promises of further reward; and was employed for three summers in making a communication between the rivers Don and Volga. The czar's ill success against the Swedes at the battle of Narva, and other circumstances of discouragement, caused an interruption of the work in 1707; and during the two following years he was engaged in refitting the ships at Voronetz, and making navigable the river of that name. Like most of the foreigners whom the czar's offers drew into Russia, he experienced many disappointments respecting the recompense for his labours; and finally was indebted to the protection of the English ambassador for the privilege of quitting the country in 1712. After his return, he published "The State of Russia," 8vo. 1716. In 1721 he was employed in stopping the alarming breach of the embankment of the Thames at Dagenham, which he successfully performed, and of which he published an "Account" in 1721, 8vo. He was also consulted about improving the harbour of Dublin, and printed an "Answer" to some objections made to his plan. He died in 1733. *Gen. Biog.*

PER'RY (James), a celebrated literary character, and long distinguished as a public journalist of the highest note for independence and political consistency, was a native of Aberdeen. His father was a builder, named *Pirie*. James was born on the 30th of October, 1756; and received the first rudiments of education at Chapel Garioch, of which parish the Rev. W. Farquhar, father of sir Walter Farquhar, was minister, and where, along with the youngest brother of sir Walter, he received from that venerable and learned divine, the most assiduous instruction. The Rev. Dr. Tait, who has long since risen to a dignified station in the church, was then master of the school of Chapel, and gave it celebrity by his erudition and abilities. From this, Mr. Perry was removed to the high school of Aberdeen, which he went through with credit to himself, under the Messieurs Dunn, then

its principal masters. In the year 1771, he was entered of Marechal College, Aberdeen; and was afterwards placed under Dr. Arthur Dingwall Fordyce, advocate, to qualify him for the profession of the Scots law. When his term had expired, his genius led him to associate with the actors in a company which visited Aberdeen; and, being at that time a good dancer, he was seduced by Digges, Mills, and others of the company, to engage himself in their pursuits. He accordingly appeared on the stage at Montrose, Arbroath, Dundee, and Perth, and, according to Mr. Holcroft, at Newcastle upon Tyne, where Mr. H. was of the same company. His performances consisted of Sempronius, and some second-rate characters, and of a hornpipe between the acts; but on the company's return to Edinburgh, Digges the manager candidly told Pirie (*Anglicè* Perry) that his brogue was an insuperable bar to his success on the stage. He continued some time at Edinburgh, in the hope of obtaining a situation in some professional gentleman's chambers, where he might at once pursue his studies and obtain a livelihood; but, after many ineffectual attempts to gain employment, he came to England, and was for two years engaged in Manchester, as clerk to Mr. Dinwiddie, a respectable manufacturer. In this situation he cultivated his mind by the study of the best authors, and gained the friendship and protection of the principal gentlemen of the town by the talents he displayed in a society which was then established by them for philosophical and moral discussions, and by several literary essays which obtained their approbation. In the beginning of 1777, he came to London, bringing with him recommendations from the principal manufacturers to their correspondents, but they all failed of procuring him any suitable introduction: it was, however, the accidental effect of one of them that threw him into the line of life which, from that period, he persevered in with such invariable constancy. The *General Advertiser* being then a new concern, it was the practice of the proprietors to exhibit the whole contents of it upon boards at the shop-window. Mr. Perry, being unemployed, amused himself with writing essays and scraps of poetry for this paper, which he flung into the letter-box of the printing-house, and which were always inserted. Calling one day at the shop of Messrs. Richardson and Urquhart, bookfellers, to whom he had letters of recommendation, he found the latter busily engaged in reading, and apparently enjoying, an article in the *General Advertiser*. After Mr. Urquhart had finished the perusal, Mr. Perry put the usual question to him, whether he had heard of any situation that would suit him; to which he replied in the negative; at the same time, holding out the paper, he said, "If you could write such articles as this, I could give you immediate employment." It happened to be a humorous essay, written by Perry himself. This he instantly intimated to Mr. Urquhart, and gave him another article in the same hand-writing, which he had proposed to drop into the letter-box. Mr. Urquhart expressed great satisfaction at the discovery, and informed him that he was one of the principal proprietors of the paper: that they wanted just such a person; and, as there was to be a meeting of the proprietors that same evening, he would propose Mr. Perry as a writer. He did so, and the next day he was engaged at a salary of one guinea per week, and an additional half-guinea for assistance to the *London Evening Post*, then printed by the same person.

Such was the incident that threw Mr. Perry into the profession of a journalist. He was most assiduous in his exertions for the *General Advertiser*; and, during the memorable trials of admirals Keppell and Palliser, he, for six weeks together, by his individual efforts, sent up daily from Portsmouth eight columns of the trials, taken by him in court; which, from the interest they excited, raised the paper to a sale of several thousands per day. At this time Mr. Perry wrote and published several political pamphlets and poems; and in 1782 he formed the

plan, and was the first editor, of the *European Magazine*, upon the design of combining, in one monthly publication, the usual miscellaneous contents of such a work, with a review of new books. He conducted it, however, only for the first twelve months, as, on the death of a Mr. Wall, he was chosen by the proprietors of the *Gazetteer* to be the editor of that paper, the proprietors of which consisted of the principal bookfellers in London, Payne, White, Nicol, Lockyer Davies, and Paul Vaillant; with sir N. Conant, Mr. Elmsley, &c. Mr. Perry undertook the editorship of the paper at a salary of four guineas per week, on the express condition that he was to be left to the free exercise of his political opinions, which were those of Mr. Fox.

On his commencing editor of the *Gazetteer*, he suggested to the proprietors the plan of employing several reporters to facilitate the publication of the debates in parliament. Up to that time each paper had but one reporter in each house of parliament; and the predecessor of Mr. Perry in the *Gazetteer*, had been in the habit of spinning out the reports of debates for weeks, and even months, after the session had closed; while Mr. Woodfall, in the *Morning Chronicle*, used to bring out his hasty sketch of the debate in the evening of the following day. Mr. Perry's plan was adopted; and, by a succession of reporters, the *Gazetteer* was published in the morning with as long a debate as Mr. Woodfall brought out in the evening, and sometimes at midnight.

It happened that, in the years 1780, 1781, and 1782, there were numerous debating societies in every part of the metropolis, where many persons that have since been conspicuous in parliament, in the pulpit, and on the bench, distinguished themselves as public speakers. Mr. Perry was a speaker in these societies, and is mentioned with great praise in the History of the Westminster Forum. Mr. Pitt used to attend these societies, although he never spoke at any of them; and it is not perhaps generally known, that the Lyceum was fitted up, and received that title, expressly for a superior school of oratory, by John Sheridan, esq. a barrister, with the view of enabling such young gentlemen as were designed for the senate and bar, to practise public speaking before a genteel auditory. It was opened for a few nights at five shillings as the price of admittance. Mr. Pitt and several of his friends frequented it; but the enterprise fell to the ground. It is positively stated, that afterwards, when Mr. Pitt came to be chancellor of the exchequer, having had frequent opportunities of witnessing Mr. Perry's talent in public speaking, and particularly in reply, he caused a proposal to be made to him of coming into parliament, which would have probably led on to high fortune. Mr. Perry, however, thought proper to reject it, as he did afterwards an offer of the same kind from the earl of Shelburne; and he uniformly maintained the principles with which he first set out in his political course.

Mr. Perry was for several years editor of *Debrett's Parliamentary Debates*, to the exclusion of advertisements and other extraneous matter. This work had fallen into disrepute, and the proprietors set it up to public sale. In the mean while, Mr. Woodfall undertook another paper, under the title of the *Diary*, and Mr. Perry bought the *Morning Chronicle*. He announced himself, in conjunction with his friend Mr. Gray, (who died soon after,) as joint proprietor and editor, and declared he would be responsible for its contents. From that time to the present day it has continued to be the organ of genuine Whig principles: and it is but justice also to remark, what is truly creditable to Mr. Perry, that he never suffered his paper to be degraded by private personalities or scandal, and that he never was suspected of venality. Twice in the course of forty years he was prosecuted by ex-officio informations: the first time for the resolutions of the Derby meeting; the second time for a paragraph copied from the *Examiner*, the substance of which was, that his present majesty (then prince of Wales) would have
a noble

a noble opportunity to be popular. On the first occasion he was defended by Erskine, and was acquitted in consequence of the strenuous stand of one of the jurymen. On the second occasion he defended himself with great skill, and so successfully, that the late lord Ellenborough, the judge, charged the jury in his favour. Though he never was condemned by a jury of his countrymen, he was committed for some months to Newgate, together with Mr. Lambert, the printer of the Morning Chronicle, by the house of lords, for a paragraph which that illustrious assembly pronounced a breach of its privileges.

Besides the Morning Chronicle, Mr. Perry embarked in a speculation of Mr. Booth's for Polygraphic paintings, which did not succeed; and he afterwards engaged and sunk much property in some mills at Merton, by which he was harassed for a considerable period. The Morning Chronicle, however, proved an inexhaustible mine of wealth, netting for many years from six to eight and ten thousand per annum, which enabled its proprietor to live in a style of the first respectability, and keep the best company, for which he was qualified by his mind and manners. In prosperity Mr. P. did not neglect his family. He cherished a widowed sister, who married the celebrated professor Porson; and supported his mother, who died at Richmond. He was twice married, and left six children. It merits notice, that Mr. Perry was not less distinguished by the admirers of black-letter literature, than by the public as a journalist; his library of rare books, at his house in Tavistock-square, being one of the most valuable and curious in the metropolis. It was lately brought to the hammer; and some of the articles fetched large sums of money.

Mr. Perry's declining health had long prevented him from taking an active part in the business of his paper; and for the last four months of his life he had resided entirely at a distance from London. He died at his house at Brighton, Dec. 4, 1821, having just entered the 66th year of his age; and was interred in his family-vault at Wimbledon. Mr. Perry was greatly beloved and respected by his numerous friends; he was generous and liberal to all who stood in need of his bounty; and, while he took care that the duties belonging to his extensive establishment were punctually fulfilled, he had the rare quality of securing the attachment, as well as the esteem, of all those who were in his employ. By none will his death be more sincerely lamented than by that benevolent body of men, the Freemasons of England, of whom he was a most distinguished member. For many years he was P. D. G. M. under the duke of Athol; and by his influence the late duke of Kent was elected G. M. for the purpose of effecting the union, which shortly after his royal highness's election took place, between the two societies of Scotland and England. Mr. Perry was most active in promoting that and all other events which had for their object the welfare of the fraternity. See the article MASONRY, vol. xiv. p. 492. Of late the declining state of his health had compelled him to relinquish the more active duties of a mason; but his benevolence was exerted to the benefit of his less opulent brethren, up to the latest period of his existence.

PERRYBAZAR', a town of Persia, in the province of Ghilan, on the Caspian Sea: two miles north of Reshd.

PER'SA, in ancient geography, a town of Asia, near the Euphrates, and in the vicinity of Samosata.

PER'SA, a town of Hindoostan, in Oude: sixty miles east of Bahraitch.

PER'SA, a town of European Turkey, in the province of Servia, on the Danube: forty-five miles east of Passarowitz.

PER'SAC, a town of Persia, in the province of Irak: twenty-five miles south-south-east of Sultania.

PER'SAH, a town of Hindoostan, in the circar of Surgooja: ten miles north-north-east of Surgooja.

PER'SAH, a town of Mocaumpour: thirty-six miles south-south-west of Mocaumpour.

VOL. XIX. No. 1332.

PERSA'IN, a town of Pegu, near a river of the same name: 132 miles south-west of Pegu, and 252 south-south-east of Aracan. Lat. 16. 45. N. lon. 94. 55. E.

PERSA'IN, a river of Pegu, which runs from the great river Ava into the Bay of Bengal a little to the south-east of Cape Negrais.

PERSAN'TE, a river which rises in a small lake about four miles north-west from New Stettin, crosses Pomerania, and runs into the Baltic a little below Colberg.

PERSAW', a town of Prussia, in Pomerelia: seven miles north-west of Marienburg.

PER'SCHLING, a river of Austria, which runs into the Danube three miles above Tulln.

PER'SCHLING, a town of Austria, on a river of the same name: eight miles south-west of Tulln.

PERSCOVA'RI, a town of Walachia: eight miles south-west of Brancovani.

To PERSCRIBE, *v. a.* [from the Lat. *per*, through, and *scribo*, to write.] To write out to the end. *Cole.*

PERSCRUTATION, *f.* [from the Lat. *per*, through, and *scruto*, to search.] A thorough search. *Cole.*

PER'SE, *f.* [perhaps from *Persian*.] A sky colour. *Scott.*

PER'SE, *adj.* Sky-coloured, having a bluish-grey colour. *Chaucer.*

PERSE-BRIDGE, is on the Tees, west of Darlington, Durham, where it is said that priests were formerly stationed to officiate for the devotion of travellers, as well as of the neighbours, in a chapel, the ruins of which remain, near to the bridge. This would tempt one to think the original name of this place was Priest's Bridge, especially if it be true, as tradition says, that the old bridge, which was of wood, was replaced with one of stone, by two neighbouring priests. A Roman altar, besides urns, coins, and other marks of antiquity, has been found here; and it is supposed that here the Roman highway from Catrick entered this county.

PERSE'A, *f.* in botany. See LAURUS.

To PERSECUTE, *v. a.* [*persecutor*, Fr. *persecutus*, Lat.] To harass with penalties; to pursue with malignity. It is generally used of penalties inflicted for opinions.—I *persecuted* this way unto the death. *Acts xxii. 4.* —To pursue with repeated acts of vengeance or enmity.—They might have fallen down, being *persecuted* of vengeance, and scattered abroad. *Wisdom, xi. 20.*

Relate

For what offence the queen of heaven began

To *persecute* so brave, so just, a man!

Dryden.

To importune much: as, He *persecutes* me with daily solicitations.

PERSECUTION, *f.* [Fr. *persecutio*, Lat.] The act or practice of persecuting.—The deaths and sufferings of the primitive Christians had a great share in the conversion of those learned Pagans who lived in the ages of *persecution*. *Addison.*

Heavy *persecution* shall arise

On all who in the worship persevere
Of spirit and truth.

Milton's P. L.

The state of being persecuted.—Our necks are under *persecution*; we labour, and have no rest. *Lam. v. 5.*

PERSECUTION is any pain or affliction which a person designedly inflicts upon another; and, in a more restrained sense, the sufferings of Christians on account of their religion. Historians usually reckon ten general persecutions; the first of which was under the emperor Nero, 31 years after our Lord's ascension; when that emperor, having set fire to the city of Rome, threw the odium of that execrable action on the Christians, who under that pretence were wrapped up in the skins of wild beasts, and worried and devoured by dogs; others were crucified, and others burnt alive. The second was under Domitian, in the year 95. In this persecution St. John the apostle was sent to the isle of Patmos, in order to be employed

ployed in digging in the mines. The third began in the third year of Trajan, in the year 100, and was carried on with great violence for several years. The fourth was under Antoninus the Philosopher, when the Christians were banished from their houses, forbidden to show their heads, reproached, beaten, hurried from place to place, plundered, imprisoned, and stoned. The fifth began in the year 197, under the emperor Severus. The sixth began with the reign of the emperor Maximinus in 235. The seventh, which was the most dreadful persecution that had ever been known in the church, began in the year 250, in the reign of the emperor Decius, when the Christians were in all places driven from their habitations, stripped of their estates, tormented with racks, &c. The eighth began in the year 257, in the fourth year of the reign of the emperor Valerian. The ninth was under the emperor Aurelian, A. D. 274; but this was very inconsiderable; and the tenth began in the 19th year of Dioclesian, A. D. 303. In this dreadful persecution, which lasted ten years, houses filled with Christians were set on fire, and whole droves were tied together with ropes and thrown into the sea. But, as to the dispute whether there were more or fewer of these persecutions, see the article MARTYR, vol. xiv. p. 451, 2.

PERSECUTOR, *f.* One who harasses others with continued malignity.—Henry rejected the pope's supremacy, but retained every corruption besides, and became a cruel persecutor. *Swift.*

What man can do against them, not afraid,
Though to the death; against such cruelties
With inward consolations recompend'd;
And oft supported so, as shall amaze
Their proudest persecutors.

Milton's P. L.

PERSEES, or PARSEES, the descendants of a colony of ancient Persians, who took refuge at Bombay, Surat, and in the vicinity of those cities, when their own country was conquered 1100 years ago by the Mahometan Arabs. They are a gentle, quiet, and industrious, people, loved by the Hindoos, and living in great harmony among themselves. The consequence is, that they multiply exceedingly, whilst their countrymen in the province of Keman are visibly diminishing under the yoke of the Mahometan Persians.

The Persees were till lately but very little known: the ancients speak of them but seldom, and what they say seems to be dictated by prejudice. On this account Dr. Hyde, who thought the subject both curious and interesting, about the end of the 17th century attempted a deeper investigation of a subject which till then had been but very little attended to. He applied to the works of Arabian and Persian authors, from whom, and from the relations of travellers, together with a variety of letters from persons in India, he compiled his celebrated work on the religion of the Persees. Other accounts have been given by different men, as accident put information in their way. But the most distinguished is by M. Anquetil du Perron, who undertook a voyage to discover and translate the works attributed to Zoroaster. Of this voyage he drew up an account himself, and read it before the Royal Academy of Sciences at Paris in May 1761. A translation of it was made and published in the Gentleman's Magazine for 1762, to which we refer our readers. The account begins at page 373, and is concluded at page 614. Remarks were afterwards made on du Perron's account by a Mr. Yates. See the same Magazine for 1766, p. 529.

We learn from Mr. Hanway, that the Persees worship the everlasting fire as an emblem of *Ormuzd*, or the supreme ineffable Creator; while the evil principle, believed to have sprung from matter, was styled *Ahriman*. Subordinate to Ormuzd, the *ferishtas*, or angels, are charged with the preservation of the material world. The sun, the moon, and the stars, the years, the months, and the days, have each their presiding angel; angels attend on every human soul, and an angel receives it when it

leaves the body. *Mithra* is the *ferishta* to whom this important charge is assigned, as well as that of judging the dead; he is also the guardian of the Sun, and presides over the sixth month, and the sixth day of the month. The good *ferishtas* have corresponding evil geni, who endeavour to counteract them in all their functions: they particularly encourage witchcraft, and willingly hold converse with enchanters of both sexes, sometimes revealing the secrets of futurity for malicious purposes. As in other countries, the old, the ugly, and the miserable, are stigmatized as witches, and the Indian Bramins are regarded by the Guebres as powerful magicians.

The most recent account we have of this singular people is that of Mrs. Maria Graham, who went to India in 1809, and published the "Journal of her Residence" there (for she was not a flying traveller) in 1812. Some extracts from her useful and authentic work we shall interweave with our selections from Stavorinus, Niebuhr, Hanway, Du Perron, and others.

"When the Guebres were driven from their own country by the Mussulmans, a considerable body of them resolved to seek a new land, and accordingly put to sea, where they suffered great hardships. After attempting to settle in various places, they at length reached Sunjum in Guzerat, and sent their chief *dustoor*, or priest, onshore to ask an asylum. This was granted by the rajah on certain conditions, and a treaty to the following effect was drawn up: The Guebres shall have a place allotted to them for the performance of their religious and burial rites; they shall have lands for the maintenance of themselves and their families; they shall conform to the Hindoo customs with regard to marriages, and in their dress; they shall not carry arms; they shall speak the language of Guzerat, that they may become as one people with the original inhabitants; and they shall abstain from killing and eating the cow. To these conditions the Persees have scrupulously adhered, and they have always been faithful to their protectors.

"Fire is the chief object of external worship among the Persees. In each *atsh-khaneh*, or fire-house, there are two fires; one of which it is lawful for the vulgar to behold, but the other, *atsh-baharam*, is kept in the most secret and holy part of the temple, and is approached only by the chief *dustoor*; it must not be visited by the light of the sun, and the chimneys for carrying off the smoke are so constructed as to exclude his rays. The *atsh-baharam* must be composed of five different kinds of fire, among which I was surprised to hear the *dustoor* mention that of a funeral pile, as the Guebres expose their dead; but he told me that it was formerly lawful to return the body to any of the four elements; that is, to bury it in the earth or in the water, to burn or to expose it, but that the latter only is now practised; consequently, if the *atsh-baharam* goes out, they must travel to such nations as burn their dead, to procure the necessary ingredient to rekindle it. When the last *atsh-khaneh* was built in Bombay, a portion of the sacred fire was brought from the altar at Yezd, in a golden censer, by land, that it might not be exposed to the perils of the sea. The death of a father is observed as an annual festival. The body must not touch wood after death; it is accordingly laid upon an iron bier, to be conveyed to the repository for the dead, where it is left exposed to the air till it is consumed. In Bombay these repositories are square inclosures, surrounded by high walls: the vulgar Persees superstitiously watch the corpse, to see which eye is first devoured by the birds, and thence augur the happiness or misery of the soul."

By marrying wives of their own nation, their race has been preserved pure and unmixed to the present day. Adultery and fornication they punish among themselves, and even by death, giving cognizance of any capital punishment to the Moorish government: the execution is performed in secret, either by lapidation, drowning in the river, castigation, or beating to death, and sometimes by

by poison. Their females are marriageable before they are twelve years old; but, though their marriages are contracted at a very early age, yet they are not consummated till the above-mentioned time of puberty. It is not customary to give any portion with the bride; but every relation and friend of the bridegroom is obliged to present him with some articles of household furniture, money, or clothes, as soon as the intended nuptials are announced to them.

The Persees live temperately; but, contrary to the custom of the Gentoos, they eat all kinds of flesh meat, except that of oxen and hares, that they may not give offence to that nation; but it must be killed and prepared by their own people. The Persees at Surat allege, that they possess a genuine copy of the Institutes of Zoroaster: they likewise pretend, that the holy fire, which they brought with them at the time of the flight from Persia, has remained burning to the present day, without being extinguished, in their largest and principal temple, which stands near the Portuguese city of Daman. This holy fire is exposed to the vulgar only once a-year, on a festival in the month of October, which marks the commencement of their year: besides this festival, they have one every month, of a religious nature; in which they offer up devout supplications to their divinity. Every Persee likewise offers up a prayer every morning, turning towards the rising sun, and another every evening, presenting himself towards the moon, if she be visible.

The element of water is also an object of reverence; and their reverence for fire is carried so far, that they will not extinguish it on any occasion, even by putting out a candle or lamp. When a fire takes place in the town, they do not endeavour to quench it with water, but pull down the houses and buildings liable to be consumed by the flames, that the fire may go out for want of combustibles to maintain it.

The Persees in British India enjoy every privilege, civil and religious. They are governed by their own *panchait*, or village-council. The word *panchait* literally means a "council of five," but that of the Guebres in Bombay consists of thirteen of the principal merchants of the sect; these were chosen originally by the people, confirmed by the government, and have continued hereditary. This little council decides all questions of property, subject however to an appeal to the recorder's court; but an appeal seldom happens, as the *panchait* is jealous of its authority, and is consequently cautious in its decisions. It superintends all marriages and adoptions, and inquires into the state of every individual in the community; its members would think themselves disgraced if any Persee were to receive alms or any assistance from a person of a different faith; accordingly, as soon as the children of a poor man are old enough to be betrothed, which, in conformity to the Hindoo custom, is at five or six years of age, the chief merchants subscribe a sufficient sum to portion the child; in cases of sickness, they support the individual or the family, and maintain all the widows and fatherless.

The *panchait* consists both of priests and laymen; all religious ceremonies and festivals come under its cognizance, together with the care of the temples, the adjusting the almanac, and the subsistence and life of the dogs. I could not learn with certainty (says Mrs. Graham) the origin of the extreme veneration of the Persees for this animal; every morning the rich merchants employ *koolis* to go round the streets with baskets of provision for the wild dogs; and, when a Persee is dying, he will have a dog in his chamber to fix his closing eyes upon. Some believe that the dog guards the soul, at the moment of its separation from the body, from the evil spirits; others say that the veneration for the dogs is peculiar to the Indian Guebres, and that it arose from their having been saved from shipwreck in their emigration to India, by the barking of the dogs announcing their approach to the land in a dark night.

The Persees use some solemnities when they name their children, which is done at five or six months old; when the muslin shirt is put on the first time, a sacred fire is lighted, prayers are repeated, and the name is given. Since their intercourse with Europeans, they call this ceremony *christening*, because it is performed when the first or proper name is given; the second name is a patronymic; thus *Norozejee Jumsheddje*, is Norozejee the Son of Jumsheddje.

"The Persees are the richest individuals on this side of India, and most of the great merchants are partners in British commercial houses. They have generally two or three fine houses, besides those they let to the English; they keep a number of carriages and horses, which they lend willingly, not only to Europeans, but to their own poor relations, whom they always support. They often give dinners to the English gentlemen, and drink wine, particularly Madeira. The Guebre women enjoy more freedom than other oriental females, but they have not yet thought of cultivating their minds. Perhaps this is owing in great measure to the early marriages which, in compliance with the Hindoo customs, they contract: by becoming the property of their husbands in their infancy, they never think of acquiring a further share of their affection, and, with the hope of pleasing, one great incitement to mental improvement is cut off.

"The Persees are in general a handsome large people, but they have a more vulgar air than the other natives; they are extremely active and enterprising, and are liberal in their opinions, and less bigotted to their own customs, manners, and dress, than most nations. Of their hospitality and charitable dispositions, the following is an instance. During the famine that desolated India in the years 1805 and 1806, the Persee merchant Ardeser Dadee, fed five thousand poor persons for three months at his own expense, besides other liberalities to the starving people. The Persees are the chief landholders in Bombay. Almost all the houses and gardens inhabited by the Europeans are their property; and Pestengue told me that he received not less than 15,000l. a-year in rents, and that his brother received nearly as much."

The Persees, we are told, never attempt to make proselytes. The Moors, Gentoos, and Persees, notwithstanding the difference of their religions, exercise toward one another the greatest toleration and indulgence. They may be seen together, in or near the river, offering up their respective prayers, without mutual contempt or molestation. When the holy fire of the Persees is exhibited to the people, no Gentoos will either approach or touch the fire, any more than the Persees themselves. This mutual forbearance exhibits an example worthy of imitation.

PERSEPHONE, a daughter of Jupiter and Ceres, called also Proserpine. See PROSERPINE.

PERSEP'OLIS, in ancient geography, a town of Persia, formerly the capital of Farsistan, or Persia Proper; but now known only by its ruins, which have been described by many travellers, from Chardin, Niebuhr, and Francklin, to Jones, Johnson, and Ker Porter. Of old it was called *Elymais*; its present name is ISTAKAR, which see.

Persepolis may be a faithful translation of the original name of the place, but it is not the native denomination. Herodotus calls the inhabitants *Pasargadae*, which is supposed by Chardin to be derived from the native name *Fars-abad*, City of the Persians. The author of the First Book of Maccabees (vi. 1.) mentions this city, or rather its district, by the name of *Elymais*; and so does the author of Judith (i. 6.) but the earlier and almost native authority of the book of Esther (supposing that Arioch wrote that book) gives the appellation (ix. 7.) *Parshandatha*: it was situated in the province of Elam, and had in the time of Darius (Daniel ii.) Arioch for its military governor.

The ruins of this celebrated city have been described (as we have said) by so many travellers, that we are almost

almost at a loss how to make a selection. Sir Robert Ker Porter and Colonel Johnson have been its latest visitors. From the Quarterly Review of Sir Robert's work we copy the following animated passages. "In the plain of Merdasht, which is watered on the south-west by the river Bend-emir, the ancient Araxes, stands "the Throne of Jimsheed," as the natives call these immense ruins, now generally believed to have belonged to the palace of Darius, to which "the Macedonian madman" set fire in a fit of drunken revelry, and which was beyond doubt one of the most magnificent structures of the ancient world. If there is nothing in the architecture of the buildings, or in the sculptures and reliefs on the rocks, that can be compared with the exquisite specimens of Grecian art, still it is impossible to behold the remains of Persepolis without emotions of rapture and surprise. The wealth of an unbounded empire was exhausted in their construction; they were adorned with every ornament that the art of the old world could supply, and their history yet lives in the imperishable materials of which they were built.

"The palace, the face of the mountain at the foot of which it is situated, and many of the rocks in its vicinity, are ornamented with a profusion of sculpture, and afford ample evidence, as Sir John Malcolm observes, that the Persians were in the habit of describing by the graving-tool both their religious ceremonies and the principal events of their history.

"The impression made on Sir Robert Ker Porter by the first sight of these celebrated monuments was that, both en masse and in detail, they bore a strong resemblance to the architectural taste of Egypt. The artificial plain which supports the ruins of this immense citadel, (as he calls it,) is of a very irregular shape; but nothing can transcend the strength and beauty of its construction. Its steep faces are formed of dark-grey marble, cut into gigantic blocks, exquisitely polished, and, without the aid of mortar, fitted to each other with such admirable precision, that, when first completed, the platform must have appeared as part of the solid mountain itself, levelled to become a foundation for a structure, many of whose proud columns still remain erect.

"A flight of steps, situated in its *western* face, leads to the summit of the platform, and is so stupendous, and on a scale of such astonishing magnificence, as fully to prepare the mind for the corresponding forms of vastness and grandeur to be met with above. On reaching the platform, the first objects that strike the eye are the lofty sides of an enormous portal, the interior faces of whose walls are sculptured into the forms of two colossal quadrupeds, that on nearer approach were found to represent bulls. The loss of the heads deprived Sir Robert of the means of knowing whether they had one or two horns; but he thinks, from what he has seen in other symbolical animals of the same kind in Persia, that they were represented with only one. Around the necks of these bucolic sentinels (as Sir Robert classically calls them) are broad collars of roses, executed with the most critical nicety, and, in the very spirited delineations which he gives of them, he has been elaborate, even to a hair, in copying the distinguishing marks of that proud epoch of Persian sculpture. At the distance of twenty-four feet, in a direct line from the portal, once stood four magnificent columns; they were all erect in the time of Chardin, but two only now remain. At an equal distance is another portal, the inner sides of which are also sculptured; but the animals represented are of very extraordinary formations, of gigantic proportions, and monstrous appearance. They have the bodies and legs of bulls, (with enormous wings,) and the faces of men. The blind zeal of the Moslems has miserably mutilated the features; yet enough remains to exhibit a severe and majestic expression of countenance, to which a long and carefully-curved beard does not a little contribute. Sir Robert asserts that this is the only specimen known to exist in Persia where the

human and bestial form are conjoined, and he thinks that this singular hieroglyphic may with great probability be attributed to Cyrus, whose empire over the East was prophesied by Ezekiel, under a similar figure, upwards of fifty years before his accession.

"An expanse of 162 feet lies between this portal and the magnificent terrace that supports the multitude of columns, from which the spot has derived its appellation of *Cheleh minar*, or the Palace of Forty Pillars. A superb approach, consisting of a double staircase, projects considerably before the northern face of the terrace, the whole length of which is 212 feet; at each extremity, east and west, rises another range of steps; again, in the middle, projecting from it eighteen feet, appear two smaller flights, rising from the same points. The whole front of the advanced range is covered with sculpture, which Sir Robert examined with great care, distinguishing the peculiarities of every figure, and copying them as distinctly and with as much fidelity as he could.

"The space immediately under the landing-place is divided into three compartments; the centre one has a plain surface; to the left are four standing figures, habited in long robes, holding a spear in an upright position in both hands; from the left shoulder hang a bow and quiver. The nicety with which the details are executed, render these sculptures particularly interesting to the historian. They mark the costume of the time and people; their progress in the form, variety, and use, of arms; and indicate with clearness the ancient method of stringing the bow, and the manner of attaching the leather cover to the quiver, to protect the feathers of the arrows from damage. All these peculiarities of archery, Sir R. Ker Porter, who says he is an old bowman himself, observed and transferred to his portfolio with great attention.

"On the right of the vacant tablet are figures only, without bows or quivers, but carrying spears, with large shields resembling Bœotian bucklers: these Sir Robert considers to have been intended to portray the royal guard. Two angular spaces on each side of the spearman are filled with duplicate representations of a fight between a lion and a bull, a most spirited and admirable performance. Sir Robert, after perplexing himself a good deal about the import of this combat, inclines to the opinion that it typifies the conquest of Cyrus over the two great empires of Assyria and Babylon. The beauty, and truth, and fire, with which these quadrupeds are executed, are above all praise; and it is remarkable, that, wherever any of the brute creation are represented amongst these relics, their limbs, muscles, and actions, are always given in a more perfect style than when the same sculptor attempts the human form; an observation that will be found to hold good with regard also to the antiquities of Egypt, Syria, and India. This consummate knowledge of the ancients in one respect, and their conspicuous ignorance in the other, our author attributes, justly enough perhaps, to the opportunities afforded by their daily sacrifices of witnessing the minute contortions and the dissections of the brute creation, and the superstition that universally prevailed against putting a hand on the human body.

"The rest of this highly-ornamented staircase is covered with figures, that, judging from their numbers, their uniform dresses, arms, and positions, are probably the representatives of the vast body-guard, the *doryphores*, who once held an actual station on this spot. The whole description of the procession that decorates the flight of steps which stretches to the east, is illustrated by drawings, executed with great spirit, and, we have no doubt, with great exactness."

As we cannot attempt to give an abstract of this elaborate portion of our subject, we must refer to the work for a conception of the marble terraces, stairs, portals, platforms, and colonnades, of Persepolis; and of the symbolical images and ornaments that enrich its superb though mutilated remains. The reader will be gratified and

PERSEPOLIS.

Ruins and Sculptures at Persepolis.

Engraved for the Encyclopædia Londinensis. 1823.

and instructed by that learned disquisition, in which the origin, signification, and uses, of the bull in oriental architecture, and its connexion with the religion of Egypt, Syria, and India, are briefly and intelligibly deduced. The remarks, however, concerning the lotos, are too generally interesting to be omitted. "Almost every one in the procession holds in his hand a figure like the lotos. This flower was full of meaning to the ancients, and occurs all over the east. Egypt, Palestine, Persia, and India, present it everywhere over their architecture, in the hands and on the heads of their sculptured figures, whether in statue or in bas-relief. We also find it in the sacred vestments and architecture of the tabernacle, and temple of the Israelites; and see it mentioned by our Saviour, as an image of peculiar beauty and glory, when comparing the works of nature with the decorations of art. It is also represented in all pictures of the salutation of Gabriel to the Virgin Mary; and, in fact, has been held in mysterious veneration by people of all nations and times. The old heraldic work of *The Theatre of Honour*, published in France about two hundred years ago, gives this curious account of the *lotos* or *lily*: 'It is the symbol of divinity, of purity, of abundance, and of a love most complete in perfection, charity, and benediction; as in Holy Scripture that mirror of chastity, Susanna, is defined *Susanna*, which signifieth the lily-flower; the chief city of the Persians bearing that name for excellency. Hence the lily's three leaves in the arms of France meaneth Piety, Justice, and Charity.' So far the general impression of a peculiar regard to this beautiful and fragrant flower; but the early Persians attached a particular sanctity to it. Water, according to their belief, was held in the next degree of reverence to fire; (see *PERSEES*;) and the white flower, which sprung from the bosom of the colder element, was considered an emblem of its purity, submissiveness, and, above all, of its fecundity, when meeting the rays of the great solar flame. These symbols, united in the lily their joint properties had produced, represented to the poetical conceptions of the East, first, the creative and regenerating attributes of the Supreme Being himself; and, secondly, the imparted powers of the great elements of earth, air, water, and fire, to act mutually on each other, so that, at the return of certain seasons, moisture should spread over the land from the clouds or the rivers, the air should dry the ground, the sun's beams fructify it, and the grateful earth, at the call of all united in the genial breath of spring, put forth her increase. Hence, as the sovereigns of the East have always been revered, according to a tradition of their being the express vicegerents of the Deity, it is not surprising to see the same emblematic flower carried in a procession to their honour, which would be found 'breathing sweet incense' amongst the symbols of an entirely religious festival." We agree with Sir Robert Porter, that our homage is due to these memorials of ages on other grounds even than those of their beauty, magnificence, or antiquity, we mean their utility: "Well might the ancients denominate sculpture an immortal art; for we find its monuments in Egypt, in Greece, in Rome, in Persia, bringing forth works to which hardly a date can be assigned; so deeply does their beginning lie in the obscurity of antiquity; while others present a clear commentary on the writings of the ancients, explaining some passages, connecting others, and often proving the doubted truth of certain recorded facts, by a happy discovery of some of these marble apparitions remaining stationary on the very spot where the substance and the action, of which they are the copy once had a purpose and abiding place."

Previous to Sir Robert's visit to Persepolis, i. e. in December 1816, a part of the bas-relievo of this magnificent building had arrived in England, having been transmitted by James Morier, esq. (who had been secretary of embassy and minister plenipotentiary to the court of Persia,) during his second voyage through Persia. Mr. Morier's account of his obtaining these precious relics is as

follows. "I went early in the morning to the ruins, which were situated about a mile from my habitation, attended by the stone-cutters. Considering the quantity of sculptured remains that had fallen from their original positions, and which were spread about the ruins in great profusion, I did not hesitate to appropriate such parts of them as seemed the most fitting to be sent to England. The most interesting part of the ruins, in point of sculptured detail, is certainly the front of the staircase, which leads to the great hall of columns; and here I found many fallen pieces, corresponding to those still erect. I caused one large stone to be turned, upon which was sculptured the busts of two large figures. It was impossible to carry away the whole block, as I had no other mode of conveyance than the backs of mules and asses; consequently, the two figures were obliged to be separated: but, unfortunately, a vein running across the upper part of the stone, the head-dress of one of the figures was broken off in the operation. The Persians do not know the use of the saw in stone-cutting; therefore my dissections were performed in a very rude manner. I was lucky to find the commencement of the arrow-headed inscription, the termination of which Le Bruyn has given in his drawings: so, if this character should ever be deciphered, we should be in possession of the whole of the inscription. I perceived the angle of a block just appearing on the surface of the ground, opposite to that part of the inscription which is now remaining, and concluded it must be the commencement of it. It may be imagined how happy I was to find, after the long toil of digging it up, that my conclusion was well founded. Both Le Bruyn and Chardin have only given one line of figures on the left of the staircase; but, as it was evident that, in order to complete the symmetry, there must have been the same number on the left as there are on the right, I hired some labourers from the surrounding villages, and made them dig. To my great delight, a second row of figures, highly preserved, was discovered; the details of whose faces, hair, dresses, arms, and general character, seemed but as the work of yesterday. The faces of all the figures to the right of the staircase are mutilated, which must be attributed to the bigotry of the first Mussulmans who invaded Persia; those of the newly-discovered figures are quite perfect, which shows that they must have been covered before the Saracen invasion: the nicety of their preservation would lead one to suppose that they had been so protected for many ages before that invasion. On comparing Le Bruyn's, Chardin's, and Niebhaur's, drawings with the sculptures, I found them in general correct in outline, but imperfect in the details of dress, arms, &c. Although the figures are in themselves ill-proportioned, inelegant, and deficient in anatomical drawing, yet they are prodigiously interesting in general character, and have not been done justice to in the works of those travellers. They furnish the best models of what were the nations that invaded Greece with Xerxes, and that were subdued by Alexander."

The annexed Plate is intended to give a general view of the ruins of Persepolis. The accompanying figures are exact copies of bas-reliefs on the insides of the jambs of the ruined portals. Fig. 1. is taken from under the portico towards the north; it represents a man contending with a lion: he seems to be stabbing him in the belly, having a sword in his left hand, and holding the forelock of the animal's mane with the right: the lion is in an erect posture, his head turned back, and one of his feet resting on the breast of the man. Fig. 2. from the southern portico, is a regal figure seated on a chair, with two figures behind him, one with the parasol, the other with the *choury*, which is a sea-horse's tail set in a gold handle, such as is used at the present time in Persia, to drive away flies. Above is the Persepolitan emblem, consisting of a winged bust with a ring.

After all, we are inclined to agree in opinion with Colonel Johnson, that these ruins are the remains of a temple, and not of a palace; and indeed the weightier

authorities of antiquity corroborate this destination. Thus Strabo, (lib. xv. p. 730.) though he calls the building *Βασιλεια*, says that Alexander destroyed it in revenge for the destruction of Grecian temples by the Persians; and Arrian tells us that Alexander seized there a treasure which had been laid up by Cyrus: now the treasures of antiquity were commonly in the temples. Diodorus Siculus, who is sometimes deficient in critical judgment, transcribes the testimony of the forged Ctesias as confidently as that of the genuine Herodotus; and, if he favours the opinion that *Parshandatha* was a royal residence, still he admits that it contained the sepulchres of the Persian kings, which would naturally be placed near a temple, and be guarded by a monastery of priests. No doubt, however, there were barracks, and a citadel, in the place of deposit for the imperial treasure. From Arrian it may be inferred, that the great Cyrus was the builder of this stupendous monument; in which case it was certainly a temple of Jehovah. Cyrus and Darius both originated among those Jewish tribes whom Shalmaneser transplanted into the cities of Media; and, when they obtained the upper hand of the idolaters, they established in Persia their hereditary worship. An edict of Cyrus for building a temple at Jerusalem to Jehovah, in which edict he recognizes Jehovah as his personal god, has been preserved by Ezra; and the *magophonia*, or slaughter of the idolatrous priests, ordered by Darius, was superintended by Daniel, Arioch, and other Jewish officers, and was anniverfarily commemorated in the temple at Jerusalem under the name of the Feast of Purim; which could not have been unless Darius also was a worshipper of Jehovah. Herodotus says, (i. 225.) that the people of Parshandatha were *Αχαμενιδαι*; and that this tribe or clan was the domineering one in Persia, and that Cyrus and Darius belonged to it. Hence it is highly probable that Herodotus wrote *Αβραχαμενιδαι*, Abrahamites, by which name all the Jewish clans would be proud to class themselves. It is not at Alexandria that the letters *βρα* would have been first dropped, but the scribes of European Greece readily corrupted barbarous names. Now, if the word *Αχαμενιδαι* be every-where rendered *Abrahamites* in Herodotus, it is not difficult to account for the ascendancy of the Jewish religion in ancient Persia; or for the patronage extended to the Jews of Jerusalem by Cyrus, Darius, and Artaxerxes; or for the curious fact that Ezra, the final collector of the Jewish canon, was, under the appellation Zerduscht or Zoroaster, as much the national saint of Persia as of Palestine. This equally important archæological inference will also become probable; that into the book of Leviticus has been grafted the entire code of the Persian empire; and that through its means may be rediscovered the jurisprudence of the first great civilized empire on earth, of whose legislation and opinions so much continues operative at the present day.

Among the arguments for considering the ruins of Parshandatha as the remains of the chief cathedral, or metropolitan temple, of the Persian empire, may be placed these circumstances, collected from Col. Johnson's narrative: 1. That the building precisely fronts the west, and is open on that side only, which is observable in other places of worship. 2. The local site, closely bounded by mountains, excludes many accommodations usually sought in the neighbourhood of palaces. 3. The single vast staircase is little worn, and is apparently adapted for the slow ascent of processions. 4. The stone-basin of water at the head of this staircase announces a place of ablution. 5. The burial-places of two kings are placed immediately behind and above the central hall of pillars, and looking into it. 6. This hall appears to have been *roofless*, the capitals of the columns being surmounted with an ornament which terminates in a point; and this was commonly the case with Persian temples. 7. Here are no contiguous ruins of smaller buildings, while all palaces attract towns around them; and monasteries affect to be complete within themselves and to stand apart.

8. The sculptures represent religious processions, apparently those connected with the proclamation of the *nouroos*, or new-year's day, at the vernal equinox.

The question, however, will probably never be set completely at rest, till we are able to decipher the inscriptions which abound here. Niebuhr seems to have represented them with great accuracy. The letters somewhat resemble nails, disposed in various directions, in which singularity they approach to what are called the *Heltingrunes* of Scandinavia; but the form and disposition seem more complex, and perhaps a clue might arise from comparing the Uchen character of Thibet. Chardin, who also observed the inscriptions on the spot, observes, that they bear no resemblance whatever to the letters used by the Gabres, in their copies of the Vendidad; whence sir William Jones inferred, that the Zend letters were a modern invention; and, in an amicable debate with a friend named Bahman, that friend insisted that the letters, to which he had alluded, and which he had often seen, were monumental characters never used in books, and intended either to conceal some religious mysteries from the vulgar, or to display the art of the sculptor, like the embellished Cufic and Nigari on several Arabian and Indian monuments. With regard to these inscriptions, sir W. Jones suggests, that it may be reasonably doubted, whether they contain a system of letters which any nation ever adopted: in five of them, the letters, which are separated by points, may be reduced to forty, or at least he could distinguish no more essentially different; and they all seem to be regular variations and compositions of a straight line and an angular figure like the head of a javelin, or a leaf (to use the language of botanists) "hearted and lanced." Many of the Runic letters appear to have been formed of similar elements; and it has been observed that the writing at Persepolis bears a strong resemblance to that which the Irish call "Ogham," (which see). The word "Agam" in Sanscrit means mysterious knowledge; but sir William Jones dares not affirm that the two words had a common origin; and he only means to suggest, that, if the characters in question be really alphabetical, they were probably secret and sacerdotal, or a mere cipher, perhaps, of which the priests only had the key. In all the other inscriptions of the same sort, the characters are too complex, and the variations of them too numerous, to admit of an opinion that they could be symbols of articulate sounds; for even the Nigari system, which has more distinct letters than any known alphabet, consists only of forty-nine simple characters, two of which are mere substitutions, and four of little use in Sanscrit or in any other language; while the more complicated figures, exhibited by Niebuhr, must be as numerous at least as the Chinese keys, which are the signs of *ideas* only, and some of which resemble the old Persian letters at Persepolis. The Danish traveller was convinced from his own observations, that they were written from the left hand, like all the characters used by Hindoo nations. Sir William Jones concludes with observing, that the square Chaldaic letters, a few of which are found in the Persian ruins, appear to have been originally the same with the Devanagari, before the latter were enclosed, as they are now seen, in angular frames. See Sir W. Jones's Sixth Discourse in vol. ii. of Asiatic Researches; or in his Works, vol. iii. Morier's Second Journey through Persia, between the years 1810 and 1816. PERSES, or PERSEUS, the last king of MACEDON. See that article, vol. xiv. p. 36, 7.

PERSEVERANCE, *J.* [Fr. *perseverantia*, Lat. This word was once accented on the second syllable.] Persistence in any design or attempt; steadiness in pursuits; constancy in progress. It is applied alike to good and ill.

—Wait

—Wait the seasons of providence with patience and *perseverance* in the duties of our calling, what difficulties soever we may encounter. *L'Estrange*.—Patience and *perseverance* overcome the greatest difficulties. *Richardson*.

The king-becoming graces,
Bounty, *perseverance*, mercy, lowliness. *Shakespeare*.

Continuance in a state of grace.—We place the grace of God in the throne, to rule and reign in the whole work of conversion, *perseverance*, and salvation. *Hammond*.

PERSEVE'RANT, *adj.* [Fr. *perseverans*, Lat.] Perfiting; constant.—How early was he [Job] and *perseverant* to look after his revelling children's exorbitances! to offer sacrifices for them, and sanctifie them! *Bp. Prideaux's Euchologia*.—What obedience do we yield to the whole law of our God? If that be entire, hearty, universal, constant, *perseverant*, and truly conscientious, we have whereof to rejoice. *Bp. Hall's Rem.*

PERSEVE'RANTLY, *adv.* With constancy.—That I may love thee strongly, purely, perfectly, *perseverantly*. *Spiritual Conquest*, 1651.

To PERSEVE'RE, *v. n.* [*persevero*, Lat. *perseverer*, Fr.] To persist in an attempt; not to give over; not to quit the design.—To *persevere* in any evil course, makes you unhappy in this life, and will certainly throw you into everlasting torments in the next. *Wake's Prep. for Death*.

Thrice happy, if they know
Their happiness, and *persevere* upright! *Milton's P. L.*
Thus beginning, thus we *persevere*;
Our passions yet continue what they were. *Dryden*.

This word was anciently accented, less properly, on the second syllable:

But my rude music, which was wont to please
Some dainty ears, cannot with any skill
The dreadful tempest of her wrath appease,
Nor move the dolphin from her stubborn will;
But in her pride she doth *persevere* still. *Spenser*.

And hence it was sometimes written without the final *e*:
And, though in vain thy love thou do *persever*,
Yet all in vain do thou adore her ever. *Britain's Ida*.

PERSEVE'RINGLY, *adv.* With perseverance.—The holy angels have constantly and *perseveringly* glorified him. *Bp. Bull*.

PER'SEUS, in mythology, the son of Jupiter and Danaë. Danaë, according to the fable, was the daughter of Acrisius, who, having learned from the oracle, that at a future time his grandson would bereave him of his life and crown, shut her up in a tower of brass, and declined attention to every proposal of marriage for her. In the mean time, Prætus his brother, being desperately in love with his niece, by means of money corrupted the fidelity of the keepers of the princess, and having gained access to her through the roof of the prison, made her the mother of Perseus. This fable has been comprised by Ovid (*Met.* 1. 6.) in a single verse; "Persea quem pluvio Danaë conceperat auro;" and those who have written the history of this adventure, wishing to palliate the disgrace which might be entailed upon the royal family, reported, that Jupiter, enamoured of Danaë, had transformed himself into a shower of gold: and this was the more probable, as Prætus, if we may believe Vossius, (*Dē Orig. Idol.*) assumed the surname of Jupiter. Pausanias mentions the tower, or rather apartment of brass, in which Danaë had been shut up, and assures us that it subsisted till the time of Perilaus, the tyrant of Argos, who demolished it; adding, that even in his time some remains were still to be seen of the subterraneous palace, of which Danaë's chamber formed a part. Such is the story of Perseus's birth, which, considering all the circumstances attending it, is not improbable.

When the princess was delivered of Perseus, Acrisius ordered her to be exposed upon the sea, with her child, in a mean barge, which, after long conflict with the winds

and waves, stopped near the little island of Seriphus, one of the Cyclades, in the Ægean Sea. Polydectes, king of the island, hospitably received the mother and child, and took great care of the education of the young prince. But afterwards falling in love with Danaë, and fearing the resentment of Perseus, advancing to maturity, he sought a pretext for dismissing him. Under a pretence of wooing one of the Grecian princesses, he determined to make a magnificent feast for the celebration of the nuptials, and actually invited the princes of the neighbouring isles, each of whom was to bring with him a present of the best things which his country supplied. Perseus was in the number of the invited, and the more particularly so, as Polydectes knew that he could not receive from him the present which he expected from all the rest. Nevertheless Perseus, who wished not to appear inferior to the others in magnificence, told the king that as he could not give him a present immediately, he would bring him the head of Medusa, the only one of the Gorgons who was subject to mortality. The offer was doubly agreeable to Polydectes, as it would remove Perseus from Seriphos, and, on account of its seeming impossibility, the attempt might perhaps end in his ruin. But the innocence of Perseus was patronized by the gods. Pluto lent him his helmet, which had the wonderful power of making its bearer invisible; Minerva gave him her buckler, which was as resplendent as glass; and he received from Mercury wings and the talaria, with a short dagger made of diamonds, and called *herpè*. According to some it was from Vulcan, and not from Mercury, that he received the *herpè*, which was in form like a scythe. With these arms Perseus began his expedition, and traversed the air, conducted by Minerva. He went to the Graia, the sisters of the Gorgons, who, according to the poets, had wings like the Gorgons, but only one eye and one tooth between them all, of which they made use, each in her turn. They were three in number, according to Æschylus and Apollodorus; or only two, according to Ovid and Hesiod. With Pluto's helmet, which rendered him invisible, Perseus was enabled to steal their eye and their tooth while they were asleep; and he returned them only when they had informed him where their sisters, the Gorgons, resided.

When he had received every necessary information, Perseus flew to the habitation of the Gorgons, which was situate beyond the Western Ocean, according to Hesiod and Apollodorus; or in Libya, according to Ovid and Lucan; or in the deserts of Asiatic Scythia, according to Æschylus. He found these monsters asleep; and, as he knew that, if he fixed his eyes upon them, he should be instantly changed into a stone, he continually looked on his shield, which reflected all the objects as clearly as the best of glasses. He approached them, and, with a courage which Minerva supported, he cut off Medusa's head at one blow. The noise awoke the two immortal sisters; but Pluto's helmet rendered Perseus invisible, and the attempts of the Gorgons to revenge Medusa's death proved fruitless; the conqueror made his way through the air, and from the blood which dropped from Medusa's head sprang all those innumerable serpents which have ever since infested the sandy deserts of Libya. Chrysaor, also, with his golden sword, sprung from these drops of blood, as well as the horse Pegasus, which immediately flew through the air, and stopped on mount Helicon, where he became the favourite of the Muses.

Mean time Perseus had continued his journey across the deserts of Libya; but the approach of night obliged him to alight in the territories of Atlas, king of Mauritania. He went to the monarch's palace, where he hoped to find a kind reception by announcing himself as the son of Jupiter, but in this he was disappointed. Atlas recollected that, according to an ancient oracle, his gardens were to be robbed of their fruit by one of the sons of Jupiter; and therefore he not only refused Perseus the hospitality he demanded, but he even offered violence to his person.

Perseus,

Perseus, finding himself inferior to his powerful enemy, showed him Medusa's head, and instantly Atlas was changed into a large mountain which bore the same name in the deserts of Africa.

On the morrow Perseus continued his flight; and, as he passed across the territories of Libya, he discovered, on the coasts of Æthiopia, the naked Andromeda, exposed to a sea-monster. He was struck at the sight, and offered her father Cepheus to deliver her from instant death if he might obtain her in marriage as a reward of his labours. Cepheus consented; and immediately Perseus, raising himself in the air, flew towards the monster, which was advancing to devour Andromeda, and plunged his dagger in his right shoulder, and destroyed him. This happy event was attended with the greatest rejoicings. Perseus raised three altars, to Mercury, Jupiter, and Pallas; and, after he had offered the sacrifice of a calf, a bullock, and a heifer, the nuptials were celebrated with the greatest festivity. The universal joy, however, was soon disturbed. Phineas, Andromeda's uncle, entered the palace with a number of armed men, and attempted to carry away the bride, whom he had courted and admired long before the arrival of Perseus. The father and mother of Andromeda interfered, but in vain; a bloody battle ensued, and Perseus must have fallen a victim to the rage of Phineas, had not he defended himself at last with the same arms which proved fatal to Atlas. He showed the Gorgon's head to his adversaries, and they were instantly turned to stone, each in the posture and attitude in which he then stood. The friends of Cepheus, and such as supported Perseus, shared not the fate of Phineas, as the hero had previously warned them of the power of Medusa's head, and of the services which he received from it.

Soon after this memorable adventure, Perseus retired to Seriphos, at the very moment that his mother, Danaë, fled to the altar of Minerva, to avoid the pursuit of Polydectes, who attempted to offer her violence. Dictys, who had saved her from the sea, and who, as some say, was the brother of Polydectes, defended her against the attempts of her enemies; and therefore Perseus, sensible of his merit and of his humanity, placed him on the throne of Seriphos, after he had with Medusa's head turned into stones the wicked Polydectes, and the officers who were the associates of his guilt. He afterwards restored to Mercury his talaria and his wings, to Pluto his helmet, to Vulcan his sword, and to Minerva her shield; but, as he was more particularly indebted to the goddesses of wisdom for her assistance and protection, he placed the Gorgon's head on her shield, or rather, according to the more received opinion, on her ægis.

After he had finished these celebrated exploits, Perseus expressed a wish to return to his native country, and accordingly he embarked for the Peloponnesus, with his mother and Andromeda. When he reached the Peloponnesian coasts, he was informed that Teutamias, king of Larissa, was then celebrating funeral games in honour of his father. This intelligence drew him to Larissa to signalize himself in throwing the quoit, of which, according to some, he was the inventor. But here he was attended by an evil fate, and had the misfortune to kill a man with a quoit which he had thrown in the air. This was no other than his grandfather Acrisius, who, on the first intelligence that his grandson had reached the Peloponnesus, fled from his kingdom of Argos to the court of his friend and ally Teutamias, to prevent the fulfilling of the oracle which had obliged him to treat his daughter with so much barbarity. Some suppose with Pausanias, that Acrisius had gone to Larissa to be reconciled to his grandson, whose fame had been spread in every city in Greece; and Ovid maintains that the grandfather was under the strongest obligations to his son-in-law, and through him he had been restored to his kingdom, from which he had been forcibly driven by the sons of his brother Proetus.

This unfortunate murder greatly depressed the spirits of

Perseus: by the death of Acrisius he was entitled to the throne of Argos; but he refused to reign there; and, to remove himself from a place which reminded him of the parricide he had unfortunately committed, he exchanged his kingdom for that of Tirynthus, and the maritime coast of Argolis, where Megapenthes, the son of Proetus, then reigned. When he had finally settled in this part of the Peloponnesus, he determined to lay the foundations of a new city, which he made the capital of his dominions, and which he called *Mycenæ*, because the pommel of his sword, called by the Greeks *myces*, had fallen there. Perseus had by Andromeda, Alceus, Sthenelus, Nestor, Electryon, and Gorgophone.

As our hero in his lifetime had been a patron of learning, and built an academy on mount Helicon; and as he was farther distinguished by his glorious exploits; he was advanced to heaven in the panegyrics made to his honour, and after his death became a demigod. Of this prince and all his wife's family, were also formed the constellations called Cassiopeia, Perseus, and Andromeda: and the very monster, which he was said to have killed, was placed in the heavens, where it formed the sign of the Whale. Pausanias says, this prince was worshipped as a hero at Argos, and still more in the isle of Seriphus and at Athens, where he had a temple, in which was an altar consecrated to Dictys and Clymene, who were reckoned his preservers. This Dictys was the brother of Polydectes; and he, together with his wife Clymene, had the care of his education by the king's order, when he was driven by the waves into the island of Seriphus. If we may place any dependance on the history of the fabulous ages, Perseus lived about 100 or 120 years before the Trojan war; he therefore preceded Bellerophon several years, since the latter lived only 40 or 45 years at most before the destruction of Troy.

PER'SEUS, in astronomy, a constellation of the northern hemisphere; whose stars, in Ptolemy's and Tycho's Catalogue, are 29; in Hevelius's, 46; and in the Britanic Catalogue, 59.

PER'SHORE, or PEARSHORE, an ancient market-town in Worcestershire, nine miles from Worcester, thirty-five from Birmingham, and 102 from London. It is a neat old town, on the north side of the Avon, near its junction with the river Bow, being a considerable thoroughfare in the lower road from Worcester to London. It consists of two parochial divisions; viz. the Vicarage of St. Andrew, and the Chapelry of Holy Cross. The road from London to Worcester passing through it, has occasioned a considerable increase in its size and population. Pershore is a town of great antiquity, and is said to have derived its name from the number of *pear-trees* which grew in its vicinity, and from its position on the *shore*, or bank, of a river. According to bishop Tanner, Oswald, one of the nephews of Ethelred king of Mercia, founded a monastery here in 686; but William of Malmshury asserts that Egelward, duke of Dorset, in the reign of Edgar, was the first founder. Gough, in his additions to Camden's Britannia, accounts for the discrepancy, by stating, that it was so considerably enlarged and increased in its endowments by Egelward, that he was considered a new founder. It consisted at first of secular clerks, then monks, who were dismissed by king Edgar in 984, from which time it became an abbey of Benedictine monks, dedicated at first to the Virgin and the apostles Peter and Paul, but afterwards to St. Edburga. Belonging to the abbey was a large church, called the Holy Cross, 280 feet in length, and 120 broad. Of the abbey itself there are but few vestiges; but the church has been modernized, repaired, and used for parochial purposes. It has a lofty square tower, and contains several antique monuments. The church and convent, being originally built of wood, were several times destroyed by fire: on St. Urban's day, in the year 1223, and again in 1287, when an accidental conflagration reduced not only the abbey to ashes, but also consumed the greatest part of the

PERSIA.

Engraved and Published by Wm. H. Miller, at No. 10, St. Paul's Churchyard, Strand.

town. In ancient times, the principal approach to the abbey was through Lice-street, a Saxon appellation derived from the corpses for interment being carried along that street. A small part of the gateway, on the north side, is still in existence; near it was the chapel of St. Edburga, the eighth daughter of king Edward the Elder, who reigned about the year 900. Pershore has two churches at present: that of the Holy Cross, above mentioned; and All Saints, which is small, but kept in neat order, and has a square tower. The parish is extensive, and contains several manors and chapelries. The town is principally situated in one street, about three-quarters of a mile in length, and has many respectable houses. It formerly sent members to parliament; but none have been returned since the 23d year of Edward I. Its chief manufacture is for stockings. Market-day, Thursday; fairs, Easter Tuesday, June 26, first Monday in August, and the Tuesday before the 1st of November. According to the census of 1811, the number of houses was 408, containing 1910 inhabitants.

In the neighbourhood of the town are several villages of minor importance.—Defford is a chapelry to Pershore, eight miles in circuit; wherein are some salt springs. Near it is Coppins-court, which formerly had a magnificent edifice, now razed.—Strensham is south-west of Pershore, not far from the influx of the Avon into the Severn. Here is an hospital for six poor widows, and a charity-

school. This parish contains 2000 acres; and was the birth place of Samuel Butler, author of Hudibras. The church has several fine monuments of the Ruffel family.—Wolborough or Wadborough, is three miles north-west of Pershore, where the abbots of that monastery had a park.—Walcot is about two miles north-east.—Stowton is to the north-west.—Breedon is a healthy pleasant village near Pershore; the parish, dedicated to St. Giles, contains three chapelries, viz. Norton, Mitton, and Cutfdean; and three hamlets, viz. Westmancot, Kelmesham, and Hardwick; it is one of the most valuable rectories in the diocese of Worcester. Here was formerly a monastery. The porch and west end of the church are Saxon edifices, said to have been built by the grandfather of King Offa. To the north-east of it is a hill, on which is a Roman encampment, with a double ditch; and it boasts one of the finest prospects in the county; on the top is a lofty summer-house, from which may be viewed the cities of Worcester and Gloucester; Cheltenham, &c.—At Wycton, near Wych, according to Tanner, a priory of canons of the order of St. Augustine was founded by Peter de Corbizon, alias Studley, in the parish-church of St. Peter, about the latter end of the reign of Henry I. It was afterwards removed to Studley in Warwickshire; and, excepting the parish-church, no traces of any ecclesiastical establishment remain. *Beauties of England and Wales*, vol. xv. *Wilkes's British Directory*, vol. v.

P E R S I A .

PER'SIA, a most ancient and celebrated empire of Asia, the limits of which have been various at different periods. Its ancient name was Elam, or Elymais; and its inhabitants were denominated Elamites, as the descendants of Elam, the son of Shem; and under this appellation they formed, about the time of Abraham, in the 18th or 19th century B. C. a powerful state. The name of Persia is derived from the oriental term *Pares*, which, originating with the province Pars or Fars, at length comprehended the whole mighty empire. It has been also sometimes called *Achæmenia*, from the name of Achemenes, one of its ancient kings; but more commonly by the natives, and also the more intelligent Mussulmans, IRAN, under which denomination were included all the wide regions to the south and west of the Oxus or Gihon; and the countries beyond that river subject to Persia were, in ancient times, denominated *Aniran*.

Persia extended; according to the geography of Ptolemy, between Media towards the north, and the *Sinus Persicus*, or Persian Gulf, on the south; it was separated from Babylonia by Susiana; and on the west was Carmania. In settling the largest boundaries between which it lies, sir William Jones directs us to begin with the source of the Euphrates, and thence descend to its mouth in the Persian Gulf, including in our line some considerable districts and towns on both sides the river; then coasting Persia, properly so named, and other Iranian provinces, we come to the delta of the Sindhu, or Indus; whence ascending to the mountains of Cashgar, we discover its fountains, and those of the Iaihun, down which we are conducted to the Caspian, which formerly perhaps it entered, though it loses itself now in the sands and lakes of Khwarezm; we next are led from the sea of Khorzar, by the banks of the Cur, or Cyrus, and along the Caucasian ridges, to the shore of the Euxine, and thence, by the several Grecian seas, to the point whence we took our departure, at no considerable distance from the Mediterranean. We cannot but include the Lower Asia within this outline, because it was unquestionably a part of the Persian, if not of the old Assyrian, empire. Thus, says our author, we may look on Iran as the noblest island, (for so the Greeks and the Arabs would have called

it,) or at least the noblest peninsula, on this habitable globe. The limits assigned by nature to Persia, and which naturally subsisted in the reign of Artaxerxes, the founder of the house of Sassan, are the Sea of Oman, or Persian Gulf, and Indian Ocean, to the south; the Indus and Oxus, to the east and north-east; the Caspian Sea, and Mount Caucasus, to the north; and the rivers Tigris and Euphrates to the west; which boundaries comprehend many extensive provinces; and several kingdoms.

The present extent of Persia, according to the statement of Pinkerton, is as follows. From the mountains and deserts, which, with the river Araba, constitute the eastern frontier towards Hindoostan, Persia extends more than 1200 miles in length, to the western mountains of Elwend, and other limits of Asiatic Turkey. From south to north, from the deserts of the Indian Sea, in all ages left to the Ichthyophagi, or wild tribes of Arabs who live on fish, to the other deserts near the sea of Aral, are about 1000 British miles. The dominion of the present king is restricted to the provinces of Fars and Irak, Lar, Chusistan, part of Curdistan, Adjerbijan, Ghilan, Mazanderram, the western parts of Chorasan, with the cities of Meshed, Nishapour, and Turshish, and the western division of Kerman, including the capital of that province. By a treaty with Russia, signed Oct. 12, 1813, Persia ceded to Russia the government of Karabag, Gannshin, Scheliin, Schirwan, Derbent, Kubin, Baka, Talischin, and the whole of Daglufstan; and renounced all claims to Georgia, with the province of Shuragil upon Imaretta, Guria, Mingrelia, and Abelcaise. By this treaty, the line of boundaries between the two empires commences from the plain of Adineh Bazar, and runs direct though the Sahara, or Desert of Moghan, to the west of Yediboluk on the river Araxes, and then on the uppermost northern bank of that river, until its junction at the Kapaneh chai, at the back of the hill of Megri. From the right bank of the Kapaneh chai, the boundaries of Karabag and Nakhjuwan are marked by a line drawn on the summits of the mountains of Pembeg and Aligez. The line then continues from the top of the Pembeg mountains to the angle of the boundary of Shuragil, then over the snowy mountains, and, passing through Aked, runs along the

limits of Shuragil and between the village of Miferi, until it reaches the river Arpachai.

This empire, or kingdom, is one of those which possess the double interest of ancient and modern celebrity. Situated near, if not actually embracing, the cradle of the human race, Persia was, according to the concurrent testimony of tradition and history, at an early period of the world a powerful empire. The ineffectual struggles of its despotic rulers to enslave the independent republics of Greece, and its rapid subjugation by the Macedonian conqueror, occupy a very prominent place in the annals of antiquity: while its reduction by the disciples of Mahomet, the many subsequent invasions of barbarous marauders, its frequent hostilities with Turkey, and the commercial relations which long subsisted between Persia and some of the European States, have in more recent ages rendered it an object of curiosity and attention. Little, however, was done, till near the close of the seventeenth century, towards making the western world acquainted with a country, with the name of which all that is most attractive, elegant, and tender, in oriental literature, romance, and poetry, is intimately associated. The work of the accurate Chardin then removed much of the profound obscurity in which the character and manners of the Persians were enveloped. That writer continued to be the only authority on those subjects till the commencement of the present century; since which the assiduity bestowed by our countrymen on the study of the language and letters of Persia, our frequent intercourse with that country, the repeated embassies sent to its sovereign, and the travels, researches, and labours, of Ouseley, Malcolm, Morier, Kinnier, Scott Waring, and Ker Porter, have furnished nearly as complete notions respecting the government, laws, manners, customs, and character, of the people of this empire, as we possess relative to those of any European nation. The reader will naturally conclude, that, in the compilation of this article, the valuable sources of information enumerated above have not been neglected. But we confess ourselves also very greatly indebted, particularly for correct engravings of costume and character, to a work published at Paris in 1814, in five small volumes, entitled "LA PERSE; ou, Tableau de l'Histoire, du Gouvernement, de la Religion, de la Littérature, etc. de cet Empire; des Mœurs et Coutumes de ses Habitans. Par Am. Jourdain. Ouvrage orné de Gravures faites d'après des Peintures Perjanes."

GENERAL HISTORY.

FROM THE EARLIEST RECORDS TO THE SUBJUGATION OF THE EMPIRE BY ALEXANDER THE GREAT.

The foundation of the kingdom of Iran, or Persia, dates back beyond the historic ages of Asia, and consequently of the whole world. Though we cannot fix with any degree of certainty the period of the establishment of the four fire-worshipping dynasties anterior to the invasion of the Mussulmans, still it seems indubitable, from documents recently discovered in various Persian historians, that those dynasties were preceded by several others. Notwithstanding the obscurity in which this subject is enveloped, there is every reason to suppose, that under these most ancient dynasties the Persians maintained a close intercourse with the inhabitants of Upper Hindoostan, or even sent a colony to that country: for it would appear that the Persians and Hindoos then had the same political system, professed the same religion, and spoke the same language. Hence, doubtless, arise the numerous coincidences that are to be found between the *Zend*, or ancient Persian language, and the *Sanskrit*, the sacred language of the Brahmins.

According to the Persians, the appellation of *Iran* is as ancient as the reign of Feridoun, one of their earliest monarchs. This great prince, whose empire had no other bounds than the globe, divided his dominion among his three sons, Salem, Touran, and Iradj. To the first he allotted Asia Minor, Africa, and Europe; to the second,

the countries lying beyond the Djihoun; to the third, who was his favourite, the space comprised between the Djihoun and the Euphrates, the Indian Ocean, and the Caspian Sea. These different kingdoms were named after their princes; and Persia was called *Iran*, either after Iradj, who was also named Iran, or after his mother Irandokt. The countries beyond the Oxus received the denomination of *Touran*. Such is the origin of the names of Iran and Touran which so frequently occur in oriental authors. This partition bears a striking resemblance to that of Noah, who divided the earth between his three sons, Shem, Ham, and Japhet.

Whatever hand the imagination or the national vanity of the Persians may have had in this etymology, so much at least is certain, that the term Iran is of very high antiquity: it occurs in the Sassanian inscriptions on the monuments of Nakhee Roustam, in the sacred books of the Persees, where it is sometimes written *Euraneh*, and is probably the *Elam* of the Bible, a name which seems to designate Persia.

Herodotus calls its inhabitants *Cephenes*; and in very ancient times the people are said to have called themselves *Artei*, and the country where they dwelt *Artea*. In the books of Daniel, Esdras, &c. it is called by the names of *Pars*, *Pharas*, or *Fars*, whence the modern name of *Persia*; but whence those names have been derived, is now uncertain.

That Persia was originally peopled by Elam the son of Shem, has been very generally admitted; but the truth is, that of the ancient history of this distinguished empire very little is perfectly known. For this ignorance, which at first seems strange, satisfactory reasons may easily be assigned; of which the principal are the superficial knowledge of the Greeks and Jews, and the loss of Persian archives or historical compositions. "That the Grecian writers before Xenophon had no acquaintance with Persia, and that their accounts of it are wholly fabulous, is a paradox too extravagant to be seriously mentioned; but (says sir William Jones) their connexion with it in war or peace had been generally confined to bordering kingdoms under feudatory princes; and the first Persian emperor, whose life and character they seem to have known with tolerable accuracy, was the great Cyrus." Our learned author, however, is so far from considering Cyrus as the first Persian monarch, that he thinks it evident a powerful monarchy had subsisted in Iran for ages before the accession of that hero; that this monarchy was called the *Mahebedian* dynasty; and that it was in fact the oldest monarchy in the world. The evidence upon which he rests this opinion, is the work of a Mahometan traveller, compiled from the books of such Persians as fled from their country upon the innovation in religion made by Zoroaster: and if these books, of which a few still remain, be genuine, and the Mahometan a faithful compiler, facts of which sir William has not the smallest doubt, the evidence is certainly sufficient to bear the superstructure which he has raised upon it.

If the Persian monarchy was thus ancient, it is natural to suppose that Persia, or *Iran*, was the original seat of the human race, whence colonies were sent out, or emigrated of themselves, to people the rest of the habitable globe. This supposition is actually made by our ingenious author, who strongly confirms it by remarks on the most ancient language of Persia, which he shows to have been the parent of the Sanscrit, as well as of the Greek, Latin, and Gothic. He therefore holds, as a proposition firmly established, "that *Iran*, or Persia in its largest sense, was the true centre of population, of knowledge, of languages, and of arts; which instead of travelling westward only, as it has been fancifully supposed, or eastward, as might with equal reason have been asserted, were expanded in all directions to all the regions of the world." He thinks it is from good authority that the Saxon Chronicle brings the first inhabitants of Britain from Armenia; that the Goths have been concluded to

come

come from Persia; and that both the Irish and old Britons have been supposed to have proceeded from the borders of the Caspian: for all these places were comprehended within the ancient Iran.

Of this first Persian monarchy we have no historical accounts; and must therefore, after having thus mentioned it, descend at once to the era of Cyrus. This prince is celebrated both by sacred and profane historians; but the latter are at no small variance concerning his birth and accession to the throne. According to Herodotus, Astyages, the last king of the Medes, being warned in a dream, that the son who was to be born of his daughter Mandane should one day be lord of Asia, resolved to marry her, not to a Mede, but to a Persian. Accordingly he chose for her husband one Cambyfes, a man of a peaceable disposition, and of no very high station. However, about a year after they were married, Astyages was frightened by another dream, which made him resolve to dispatch the infant as soon as it should be born. Hereupon the king sent for his daughter, and put her under confinement, where she was soon after delivered of a son. The infant was committed to the care of one Harpagus, with strict orders to destroy it in what manner he thought proper. But he, having acquainted his wife with the command he had received, by her advice gave it to a shepherd, desiring him to let it perish by exposing it. But the shepherd, out of compassion, exposed a still-born child which his wife happened to be then delivered of, and brought up the son of Mandane as his own, giving him the name of Cyrus.

When the young prince had attained the age of ten years, as he was one day at play with other children of the same age, he was chosen king by his companions; and having, in virtue of that dignity, divided them into several orders and classes, the son of Artembares, a lord of eminent dignity among the Medes, refused to obey his orders; whereupon Cyrus caused him to be seized, and whipped very severely. The boy ran crying to his father; and he immediately hastened to the king's palace, loudly complaining of the affront his son had received from the son of a slave, and intreating Astyages to revenge, by some exemplary punishment, the indignity offered to him and his family. Astyages, commanding both the herdsman and his son to be brought before him, asked the latter, how he, who was the son of so mean a man, had dared to abuse the son of one of the chief lords of the kingdom? Cyrus replied, that he had done no more than he had a right to do; for the boys of the neighbourhood having chosen him king, because they thought him most worthy of that dignity, and performed what he, vested with that character, had commanded, the son of Artembares alone had slighted his orders, and for his disobedience had suffered the punishment he deserved. In the course of this conversation, Astyages, happening to recollect that his grandson, whom he had ordered to be destroyed, would have been about the same age with Cyrus, began to question the shepherd concerning his supposed son, and at last obtained from him a confession of the whole truth.

Astyages, having now discovered Cyrus to be his grandson, sent for Harpagus, who also confessed that he had not seen Mandane's son destroyed, but had given him to the shepherd; at which Astyages was so much incensed, that, having invited Harpagus to an entertainment, he caused him to be served with the flesh of his own son. When he had done, the king asked him whether he liked his victuals; and Harpagus answering, that he had never tasted any thing more delicious, the officers appointed for that purpose brought in a basket, containing the head, hands, and feet, of his son, desiring him to uncover the basket, and take what he liked best. He did as they desired, and beheld the mangled remains of his only child without betraying the least concern, so great was the command which he had over his passions. The king then asked him, whether he knew with what kind of meat he had been entertained. Harpagus replied, that he knew

very well, and was always pleased with what his sovereign thought fit to ordain; and, having thus replied, with a surprising temper, he collected the mangled parts of his innocent son, and went home.

Astyages, having thus vented his rage on Harpagus, began next to consult what he should do with Cyrus. The magi, however, eased him of his fears with regard to him, by assuring him, that, as the boy had been once chosen king by his companions, the dream had been already verified, and that Cyrus never would reign in any other sense. The king, being well pleased with this answer called Cyrus, and, owing how much he had been wanting in the affection which he ought to have had towards him, desired him to prepare for a journey into Persia, where he would find his father and mother in circumstances very different from those of the poor shepherd and his wife with whom he had hitherto lived. Cyrus, on his arrival at his father's house, was received with the greatest joy. When he grew up, he soon became popular on account of his extraordinary parts; till at last his friendship was courted by Harpagus, who had never forgot the cruel treatment he received from Astyages. By his means a conspiracy was formed against Astyages; who, being overthrown in two successive engagements, was taken prisoner, and confined for life.

The account given by Xenophon of the rise of Cyrus is much more consonant to Scripture; for he tells us, that Babylon was conquered by the united forces of the Medes and Persians. According to him, Cyrus was the son of Cambyfes king of the Medes, and Mandane the daughter of Astyages king of Persia. He was born a year after his uncle, Cyaxares, the brother of Mandane. He lived till the age of twelve with his parents in Persia, being educated after the manner of the country, and inured to fatigues and military exercises. At this age he was taken to the court of Astyages, where he resided four years; when the revolt of the Medes and Persians from the Babylonians happened, and which ended in the destruction of the Babylonish empire, as related under the article BABYLON, vol. ii. p. 595.

While Cyrus was employed in the Babylonish war, before he attacked the metropolis itself, he reduced all the nations of Asia Minor. The most formidable of these were the Lydians, whose king Cræsus assembled a very numerous army, composed of all the other nations in that part of Asia, as well as of Egyptians, Greeks, and Thracians. Cyrus, being informed of these vast preparations, augmented his forces to 196,000 men, and with them advanced against the enemy, who were assembled near the river Pactolus. After long marches, he came up with them at Thymbra, not far from Sardis, the capital of Lydia. Besides the horse and foot, which amounted to 196,000, as already observed, Cyrus had 300 chariots armed with scythes, each chariot drawn by four horses abreast, covered with trappings that were proof against all sorts of missile weapons: he had likewise a great number of chariots of a larger size, upon each of which was placed a tower about eighteen or twenty feet high, and in each tower were lodged twenty archers. These towers were drawn by sixteen oxen yoked abreast. There was moreover a considerable number of camels, each mounted by two Arabian archers, the one looking towards the head, and the other towards the hinder part, of the camel. The army of Cræsus consisted of 420,000 men. The Egyptians, who alone were 120,000 in number, being the main strength of the army, were placed in the centre. Both armies were drawn up in an immense plain, which gave room for the extending of the wings on either side; and the design of Cræsus, upon which alone he founded his hopes of victory, was to surround and hem in the enemy's army.

When the two armies were in sight of each other, Cræsus, observing how much his front exceeded that of Cyrus, made the centre halt, but commanded the two wings to advance, with a design to enclose the Persian army, and begin the attack on both sides at once. When

the two detached bodies of the Lydian forces were sufficiently extended, Cræsus gave the signal to the main body, which marched up to the front of the Persian army, while the two wings attacked them in flank; so that Cyrus's army was hemmed in on all sides, and, as Xenophon expresses it, was inclosed like a small square drawn within a great one. This motion, however, did not at all alarm the Persian commander; but, giving his troops the signal to face about, he attacked in flank those forces that were going to fall upon his rear so vigorously, that he put them into great disorder. At the same time a squadron of camels was made to advance against the enemy's other wing, which consisted mostly of cavalry. The horses were so frightened at the approach of these animals, that most of them threw their riders, and trod them under foot; which occasioned great confusion. Then Artageses, an officer of great valour and experience, at the head of a small body of horse, charged them so briskly, that they could never afterwards rally; and at the same time the chariots, armed with scythes, being driven in among them, they were entirely routed. Both the enemy's wings being thus put to flight, Cyrus commanded his chief favourite Abradates to fall upon the centre with the large chariots above mentioned. The first ranks, consisting mostly of Lydians, not being able to stand so violent a charge, immediately gave way; but the Egyptians, being covered with their bucklers, and marching so close that the chariots had not room to penetrate their ranks, a great slaughter of the Persians ensued. Abradates himself was killed, his chariot overturned, and the greatest part of his men were cut in pieces. Upon his death, the Egyptians, advancing boldly, obliged the Persian infantry to give way, and drove them back quite to their engines. There they met with a new shower of darts and javelins from their machines; and, at the same time the Persian rear, advancing sword in hand, obliged their spearmen and archers to return to the charge. In the mean time Cyrus, having put to flight both the horse and foot on the left of the Egyptians, pushed on to the centre, where he had the misfortune to find his Persians again giving ground; and judging that the only way to stop the Egyptians, who were pursuing them, would be to attack them in the rear, he did so; and at the same time the Persian cavalry coming up to his assistance, the fight was renewed with great slaughter on both sides. Cyrus himself was in great danger; for, his horse being killed under him, he fell among the midst of his enemies; but the Persians, alarmed at the danger of their general, threw themselves headlong on their opponents, rescued him, and made a terrible slaughter; till at last Cyrus, admiring the valour of the Egyptians, offered them honourable conditions; letting them know, at the same time, that all their allies had abandoned them. They accepted the terms offered them; and, having agreed with Cyrus that they should not be obliged to carry arms against Cræsus, they engaged in the service of the conqueror, and continued faithful to him ever after.

The next morning Cyrus advanced towards Sardis, and Cræsus marched out to oppose him at the head of the Lydians only; for his allies had all abandoned him. Their strength consisted mostly in cavalry; which Cyrus being well apprized of, he ordered his camels to advance; by whom the horses were so frightened, that they became quite ungovernable. However, the Lydians dismounted, and for some time made a vigorous resistance on foot; but were at last driven into the city, which was taken two days after: and thus the Lydian empire was totally destroyed. See the article LYDIA, vol. xiii.

After the conquest of Sardis, Cyrus turned his arms against Babylon itself, which he reduced in the manner related under that article. Having settled the civil government of the conquered kingdoms, Cyrus took a review of all his forces, which he found to consist of 600,000 foot, 120,000 horse, and 2000 chariots armed with scythes. With these he extended his dominion all over

the nations to the confines of Ethiopia, and to the Red Sea; after which he continued to reign peaceably over his vast empire till his death, which happened about 529 before Christ.

The opposite accounts given by Herodotus and Xenophon of the death of CYRUS, (as noticed under his article, vol. v. p. 549.) has generally been regarded as one of the most extraordinary discrepancies to be met with in history; it has been urged as a proof of the slender credit due to the celebrated writers of antiquity; and it seems, indeed, to shake the very foundation of historic testimony. Herodotus, as is well known, represents that great conqueror as defeated and slain in an invasion of the country of the Massagetæ, a warlike nation of Scythia, bordering on the Persian empire; while Xenophon affirms, that he died peaceably in his palace in Persia, surrounded by his family and friends. This is the account almost universally preferred by modern writers. Bossuet thought it better, as he says, "to follow Xenophon, with St. Jerome, than Ctesias, a fabulous author, or even Herodotus himself, as more coherent and conformable to Scripture." Dean Prideaux asserts, and M. Rollin repeats, "that the account of Xenophon is much the more probable, it being by no means likely that so wise a man as Cyrus, and so advanced in years, should engage in so rash an undertaking." (Connection, vol. i. p. 210.) The authors of the Universal History concur in this sentiment; and Mitford, in his elaborate History of Greece, "doubts whether the strange story told by Herodotus was even heard of in Greece so late as the age of Æschylus;" quoting, in confirmation of this opinion, a passage from "The Persians," of that tragedian, and put by him into the mouth of the ghost of Darius:

—"Cyrus next, by Fortune graced,
Adorn'd the throne, and blest'd his grateful friends
With peace. He to his mighty monarchy
Join'd Lydia and the Phrygians. To his power
Ionia bent reluctant. But the gods
With victory his gentle virtues crown'd. *Potter.*

This passage, Mr. M. flatters himself, "though unnoticed by modern writers, adds considerable weight to Xenophon's more probable account."

On the other hand, the learned Freret declares "the conformity of Xenophon to Scripture to be wholly imaginary;" adding, what is equally true, though less obvious, "that the Anabasis is at variance with the Cyropædia; confirming the relation of Herodotus and Ctesias, as to the conquest of Media by the Persians." The Cyropædia of Xenophon, says the Abbé Millot, "is evidently the work of a philosopher, rather than an historian; a sort of moral and political romance." (Elem. vol. i. p. 110.) Voltaire compares it to the Telemaque of Fenelon; but, being confessedly blended with truth, it bears a nearer resemblance to the Belisarius of Marmontel. "Cyrus ille a Xenophonte, (says Cicero,) non ad historiarum fidem scriptus, sed ad effigiem justi Imperii."

Beloe, the translator of Herodotus, upon whom it seemed peculiarly incumbent to vindicate the credit of his author, has contented himself with transcribing on this subject a short and futile note from his French predecessor, Larcher, merely stating the difference between Herodotus and Xenophon; adding, "that Strabo inclines to the opinion of the latter, but till the passage is produced this may be doubted." (Beloe's Herod. vol. i. p. 235.) Dr. Gillies, the rival and liberal historian of Greece, entirely dissents, however, on this point, from Mitford, Bossuet, and St. Jerome; and has the courage to declare "that the plain relation of facts by Herodotus, is to be preferred to the moral embellishments of Xenophon;" (vol. i. p. 313.) In fact, the question will scarcely endure a serious discussion. Herodotus, who was occasionally deceived in his remote and recondite researches, but who never meant to deceive, and whose testimony is equal to that of any historian, where his means of information were

were adequate and accessible, was born less than half a century after the death of Cyrus: he fought with eagerness information on this subject at Babylon; and he affirms, that he gave that account of the end of Cyrus which seemed most consistent with probability, though there were many other and different ones; meaning to refer to the concomitant circumstances of this catastrophe, and not to the uncontroverted fact of his being killed in battle, to which he repeatedly alludes, and of which he never intimates the shadow of a doubt. The next authority, in point of time and weight, is that of Ctesias, who lived in the court of Cyrus the Younger, and afterwards in that of Artaxerxes Mnemon; a fabulous author, unquestionably, when treating of fabulous times, but not when speaking of such an event under such circumstances. Ctesias, far from aggravating an event which he would naturally be rather tempted to palliate, cautiously relates that Cyrus the Great died of the wounds he received in a great battle fought on the side of Hyrcania. Diodorus Siculus, and Justin, the excellent epitomiser of Trogus Pompeius, and also the Jewish historian Josephus, in his work on Jewish Antiquities, recite the same story with immaterial variations. To these testimonies, supported by the uniform credence of antiquity, can the romance of Xenophon be gravely and singly opposed? Plutarch and Arrian indeed say, that the tomb of Cyrus was shown to Alexander; and, no doubt, Cyrus was said to be buried at Pasargada, though the Scythians boasted that his body was found by them among the slain; and this was the account which appeared to Herodotus most probable. Cyrus was, from his youth, inured to scenes of blood and slaughter. His passion for war resembled that of other conquerors; and, had he been the vanquisher of the Scythians, no one would have talked of the rashness of the expedition.

In the time of Cyrus, the Persian empire extended from the river Indus to the Ægean Sea. On the north it was bounded by the Euxine and Caspian Seas, and on the south by Ethiopia and Arabia. That monarch kept his residence for the seven cold months at Babylon, by reason of the warmth of that climate; three months in the spring he spent at Susa, and two at Ecbatana during the heat of summer. On his death-bed he appointed his son Cambyfes to succeed him in the empire; and to his other son, Smerdis, he gave several considerable governments.

The new monarch immediately set about the conquest of EGYPT; which he accomplished in the manner related in the history of that country, vol. vi. p. 296. Having reduced Egypt, Cambyfes next resolved to turn his arms against the Carthaginians, Hammonians, and Ethiopians. But he was obliged to drop the first of these enterprises, because the Phœnicians refused to supply him with ships against the Carthaginians, who were a Phœnician colony. However, he sent ambassadors into Ethiopia with a design to get intelligence of the state and strength of the country. But the Ethiopian monarch, being well apprized of the errand on which they came, treated them with great contempt. In return for the presents sent him by Cambyfes, he sent his own bow; and advised the Persians to make war upon the Ethiopians when they could bend such a strong bow as easily as he did, and to thank the gods that the Ethiopians had no ambition to extend their dominions beyond their own country. Cambyfes was no sooner informed of this answer by his ambassadors, than he flew into a violent passion; and ordered his army immediately to begin their march, without considering that they were neither furnished with provisions nor any other necessary. When he arrived at Thebes in Upper Egypt, he detached 50,000 men, with orders to destroy the temple of Jupiter Ammon: but all these perished in the desert; not a single person either arriving at the oracle, or returning to Thebes. The rest of the army, led by Cambyfes himself, experienced incredible hardships; for, being unprovided with any necessaries, they had not

marched a fifth part of the way when they were obliged to kill and eat their beasts of burthen. When these failed, the soldiers fed on grass and roots, as long as any could be found; and at last were reduced to the dreadful necessity of eating one another; every tenth man, on whom the lot fell, being condemned to serve as food for his companions. The king, however, obstinately persisted in his design; till, being apprehensive of the danger he himself was in, he retreated to Thebes; after having lost the greatest part of his army.

Cambyfes was a man of a very cruel and suspicious temper, of which he gave many instances; and the following proved indirectly the cause of his death. We have already observed that the king of Ethiopia sent his bow in return for the presents brought to him by the ambassadors of Cambyfes. The only man in the Persian army who could bend this bow was Smerdis, the king's brother; and this instance of his personal strength so alarmed the tyrant, that, without any crime alleged, he caused him to be murdered. This gave occasion to one Smerdis, a magian, who greatly resembled the other Smerdis, to assume the name of the deceased prince, and to raise a rebellion against Cambyfes, who was generally hated for his cruelty; and this he could the more easily do, as the chief management of affairs had been committed to this Smerdis during the king's absence. Cambyfes, on receiving the news of this revolt, immediately ordered his army to march, in order to suppress it; but, as he was mounting his horse, his sword, slipping out of its scabbard, wounded him in the thigh. On this accident, he asked the name of the city where he was; and being told that it was Ecbatana, he said in the presence of all his attendants, "Fate has decreed that Cambyfes the son of Cyrus shall die in this place." For, having consulted the oracle of Butus, which was very famous in that country, he was told that he should die at Ecbatana. This he had always understood of Ecbatana in Media, and had therefore resolved to avoid it. Being now, however, convinced that his end approached, he assembled the chief Persian lords who served in the army, and, having told them that his brother was certainly dead, he exhorted them never to submit to the impostor, or suffer the sovereignty again to pass from the Persians to the Medes, to which nation Smerdis belonged, but to use their utmost endeavours to place one of their own blood on the throne. The king lived but a few days after this; and the assembly, supposing that he had spoken only out of hatred to his brother, quietly submitted to the impostor, who was thus for a time established on the throne. Indeed, from his conduct during the short time which he enjoyed the kingdom, he appears to have been not at all undeserving of a crown. He began with granting to all his subjects an exemption from taxes and military service for three years, and treated all of them in the most beneficent manner. To secure himself on the throne the more effectually, he married Atossa the daughter of Cyrus; thinking that, in case of a discovery, he might hold the empire by her title. She had before been married to her brother Cambyfes, on a decision of the Magi, "that a king of Persia might do as he pleased;" and, by virtue of this decision, Smerdis also married her. The extreme caution of Smerdis, however, promoted the discovery of his imposture. He had married all his predecessor's wives, among whom was one Phedyma, the daughter of Otanes a Persian nobleman of the first rank. Otanes, who suspected that the king was not Smerdis the son of Cyrus, sent a trusty messenger to his daughter, desiring to know whether he was so or not; but Phedyma, having never seen this Smerdis, could not give any answer. Her father then desired her to inquire of Atossa, who could not but know her own brother. However, he was again disappointed; for Phedyma acquainted him that all the king's wives were lodged in distinct and separate apartments, without being allowed to see each other. This greatly increased the suspicions

of Otanes; upon which he sent his daughter a third message, desiring her, the next time she should be admitted to the king's bed, to take an opportunity of feeling whether he had ears or not: for Cyrus had formerly caused the ears of Smerdis the Magian to be cut off for some crime of which he had been guilty; so that, if the king had ears, she might then be assured that he was Smerdis the son of Cyrus. The event showed that the suspicions of Otanes were just; and, Phedyma having acquainted her father that the king had no ears, a conspiracy was immediately formed against him.

While the conspirators were debating about the proper means of carrying their designs into execution, Darius the son of Hytaspes happening to arrive at Susa where his father was governor, they all agreed to make him privy to their design. He told them, at their first meeting, that he thought nobody in the empire but himself had known that Smerdis the son of Cyrus was dead, and the throne usurped by one of the magi; that he had come with a design to kill the usurper, without imparting his design to any one, that the glory of such an action might be entirely his own. But, since others were apprised of the imposture, he insisted that the usurper should be dispatched without delay. Otanes, on the other hand, was for putting off the enterprise till some better opportunity offered; but Darius protested, that if they did not make the attempt that very day, he would prevent any one from accusing him, by disclosing the whole matter to the impostor himself.

In the mean time, Smerdis and his brother had by great promises prevailed on Prexaspes (the executioner of the true Smerdis) to bind himself by an oath not to discover the fraud they had put on the Persians, and even to make a public speech, declaring that the present king of Persia was really the son of Cyrus. At the time appointed, he began his discourse with the genealogy of Cyrus, putting his hearers in mind of the great favours the nation had received from that prince. After having extolled Cyrus and his family, to the great astonishment of all present, he confessed the whole transaction with regard to the death of Smerdis; telling the people, that the apprehensions of the danger he must inevitably run by publishing the imposture had constrained him to conceal it so long; but now, not being able any longer to act such a dishonourable part, he acknowledged that he had been compelled by Cambyfes to put his brother to death with his own hand, and that the person who possessed the throne was Smerdis the Magian. He then begged pardon of the gods and men for the crime he had committed; and, fulfilling many imprecations against the Persians if they failed to recover the sovereignty, he threw himself headlong from the top of the tower on which he stood, and died on the spot.

In the mean time the conspirators, who were advancing towards the palace, were informed of what had happened; and Otanes was again for deferring the execution of their enterprise; but, Darius insisting upon the danger of delay, they proceeded boldly to the palace; and being admitted by the guards, who did not suspect them, they killed both the usurper and his brother; after which they exposed their heads to the people, and declared the whole imposture. The Persians at this were so enraged, that they fell on the whole sect, and killed every one of the Magi they could meet with; and, had not the slaughter been stopped by night, not one of the order would have been left alive. The day on which this slaughter happened was afterwards celebrated by the Persians with the greatest solemnity, and called by the name of *Magophonia*, or "the slaughter of the Magi." On that festival the Magi durst not appear abroad, but were obliged to shut themselves up in their houses. Smerdis the Magian reigned only eight months.

When the tumult was a little subsided, the conspirators, who were seven in number, met together in order to elect a new king, or to determine what form of government

they should next introduce. Otanes was for a republic; but, being overruled by the rest, he declared, that, as he was determined not to be a king, neither would he be ruled by one; and therefore insisted that he and his family should ever afterwards remain free from subjection to the royal power. This was not only granted, but it was further agreed by the other six, that whoever was chosen should every year present Otanes with a Median vest, a mark of great distinction among the Persians, because he had been the chief author of the enterprise. They further agreed to meet at a certain place next morning at sunrise on horseback, and that he whose horse first neighed should be king. This being overheard by Oebores, who had the care of Darius's horses, he led a mare over-night to the place, and brought his master's horse to her. The next morning, the horse, remembering the place, immediately neighed for the mare; and the five lords, dismounting, saluted Darius as their king.

Darius Hytaspes was elected king of Persia in the year 522 B.C. Immediately after his accession, he promoted the other six conspirators to the first employments in the kingdom, married the two daughters of Cyrus, Atossa and Artystona, Parmys the daughter of the true Smerdis, and Phedyma the daughter of Otanes, who had detected the imposture of the Magian. He then divided the whole empire into twenty satrapies or governments, and appointed a governor over each division, ordering them to pay him an annual tribute. The inhabitants of Colchis, with some others, were enjoined only to make annual presents, and the Arabians to furnish every year such a quantity of frankincense as equalled the weight of 1000 talents. Thus Darius received the yearly tribute of 14,560 Eubœic talents, upwards of 260,000l. sterling.

Under Darius, the building of the temple of Jerusalem, which had been obstructed by Cambyfes and Smerdis, went on successfully, and the Jewish state was entirely restored. The most remarkable of Darius's other transactions were his expeditions against Babylon; against Scythia, India, and Greece. The expedition against Babylon took place in the year 517 B.C. when the people, unable to bear the oppression of the Persians, and likewise discontented because the seat of government was removed from their city to Susa in Persia, took the opportunity of the troubles which happened in the reigns of Cambyfes and Smerdis, to store their city with all kinds of provisions sufficient to serve them for many years; after which they broke out into an open rebellion, and this quickly brought upon them Darius with all his forces. The Babylonians, perceiving themselves shut up by so numerous an army, turned all their thoughts towards the supporting of a long siege, which they imagined would tire out the king's troops. To prevent the consumption of their provisions, they took the most barbarous and cruel resolution that ever was put in execution by any nation. They agreed among themselves to get rid of all unnecessary mouths; and therefore, gathering together all the old men, women, and children, they strangled them without distinction; every one being allowed only to keep the wife he liked best, and a maid-servant to do the work of the house. The siege continued for a year and eight months; nor was there any likelihood of its being ended, when Zopyrus, one of Darius's chief commanders, put him in possession of it by the following stratagem. He cut off his nose and ears, and, having mangled his body with stripes in a most cruel manner, he fled to the Babylonians thus disfigured, pretending that he had been so treated by Darius for advising him to raise the siege. Being intrusted with the command of some forces, he cut off several parties of the Persian army, whom Darius thus sacrificed in order to raise the character of Zopyrus the higher among the Babylonians. In this manner he so much established his credit, that at last he was made commander in chief of all the Babylonish forces, and the guard of the city committed entirely to his care; and no sooner was this done than he delivered it up to Darius, who, to prevent, their

their rebelling a second time, beat down the walls of that metropolis to the height of fifty cubits. Three thousand of the most active in the rebellion, were impaled; the rest pardoned. As they had destroyed most of their women, the neighbouring nations were commanded to furnish them with wives, and 50,000 women were sent to that city, by which means it was prevented from being depopulated. Zopyrus was rewarded with the highest honours, and had the whole revenues of Babylon bestowed on him for life.

After the reduction of Babylon, Darius undertook a Scythian expedition, directed against those nations which lie between the Danube and the Tanais. His pretext for this war was, to revenge the calamities which these nations had brought upon Asia about 120 years before, when they invaded and subdued Media; keeping it in subjection for the space of twenty-eight years. In this expedition he was attended by an army of 700,000 men. With these he marched to the Thracian Bosphorus; which having passed on a bridge of boats, he reduced all Thrace. From Thrace he advanced to the Danube, where he had appointed his fleet to meet him. This river he passed on another bridge of boats, and entered Scythia. His enemies, however, were too wise to oppose such a formidable power, in the open field; and therefore retired before him, wasting the country as they went along, till at last the king, sensible of the danger he was in, resolved to give over the enterprise and return home. In order to do so with safety, he lighted a great number of fires in the night-time, and decamped; leaving behind him the old men and the sick, who fell into the hands of their enemies. The Scythians, perceiving that Darius was gone, detached a considerable body to the bridge over the Danube; and, as they were well acquainted with the roads, they got thither before the Persians. The Scythians had sent expresses before-hand to persuade the Ionians, whom Darius had left to guard the bridge, to break it down and retire to their own country; and this they pressed the more earnestly, that, as the time prescribed to Darius was now expired, they were at liberty to return home without breaking their word, or being wanting in their duty. Miltiades, prince of the Chersonesus of Thrace, was for embracing so favourable an opportunity of cutting off Darius's retreat, and shaking off the Persian yoke at once: all the other commanders agreed with him, except Hyllæus prince of Miletus; who represented to the Ionian chiefs, that their power was connected with that of Darius, since it was under his protection that each of them was lord in his own city; and that the cities of Ionia would not fail to depose them and recover their liberty, if the Persian power should sink or decline. This speech made a deep impression on the rest, and it was at last determined that they should wait for Darius; and, in order to deceive the Scythians, they began to break down the bridge, but advised them to return back and defeat Darius. They did so, but missed him; and he, having thus safely escaped so great a danger, immediately re-passed the Bosphorus, and took up his winter-quarters at Sardis, leaving Megabyzus, one of his chief generals, to complete the conquest of Thrace.

The king, having sufficiently refreshed his troops, who had suffered extremely in the Scythian expedition, began to think of extending his dominions eastward. With this view, he caused a fleet to be built and equipped at Caspatyrus, a city on the river Indus. The command of this fleet he gave to one Scylax, a Grecian of Caryandia, a city of Caria, who was well versed in maritime affairs. Him he ordered to sail down the current, and make the best discoveries he could of the countries lying on either side of the river, till he arrived at the Southern Ocean; from whence he was to steer his course westward, and that way return to Persia. Scylax, having exactly observed his instructions, and sailed down the river Indus, entered the Red Sea by the straits of Babelmandel, and, on the thirtieth month from his first setting out, landed at the same

place from which Necho king of Egypt formerly sent out the Phœnicians who circumnavigated Africa. From thence Scylax returned to Susa, where he gave a full account of his discoveries; upon which Darius, marching into India at the head of a powerful army, reduced that large country, and made it a province of the Persian empire, drawing from thence an annual tribute of 360 talents of gold.

Soon after the expedition of Darius against India, happened the revolt of the Ionians, which gave occasion to his expedition into Greece; an account of which is given under the articles ATTICA, GREECE, SPARTA, &c. The ill success which attended him here, however, was so far from making him drop the enterprise, that it only made him the more intent on reducing the Grecians; and he resolved to head his army in person, having attributed his former bad success to the inexperience of his generals. But, while he was employed in making the necessary preparations for this purpose, he received intelligence that the Egyptians had revolted, so that he was obliged to make preparations for reducing them also; and, before this could be done, the king died, after having reigned thirty-six years, leaving the throne to his son Xerxes.

This prince ascended the throne of Persia in the year 485 B. C. and his first enterprise was to reduce the Egyptians; which he effectually did, bringing them into a worse state of slavery than they ever had experienced before. After this he resolved on an expedition into Greece; the unfortunate event of which is related under the article ATTICA, vol. ii. p. 508, 9. By his misfortunes in the Grecian expedition, he became at last so dispirited, that he thenceforth abandoned all thoughts of war and conquests; but growing tyrannical, and oppressing his subjects, he was murdered in his bed, in the year 464 B. C. and twenty-first of his reign; and was succeeded by his third son Artaxerxes, surnamed Longimanus on account of the great length of his arms.

This prince is named *Ahasuerus* in Scripture, and is the same who married Esther, and during the whole of his reign showed the greatest kindness to the Jewish nation. In the beginning of his reign he was opposed by Hytaspes, the second son of Xerxes, whom however he overcame, though not without considerable difficulty. After this he applied himself to the settlement of the affairs of government, and reformed many abuses which had crept in; and then, being fully established on the throne, he appointed feasts and rejoicings to be made for 180 days in the city of Susa; at one of which he resolved to divorce his queen for disobedience; and afterwards married Esther, as we find it recorded in the sacred writings.

In the fifth year of the reign of Artaxerxes, the Egyptians revolted anew, and, being assisted by the Athenians, held out for six years; but were again obliged to submit, and continued in subjection during the whole of his reign. Nothing else remarkable happened during the life of Artaxerxes Longimanus, who died in the forty-first year of his reign; and was succeeded by Xerxes II. the only son he had by his queen, though by his concubines he had seventeen. Xerxes, having drunk immoderately at an entertainment immediately after his accession, retired to a chamber in order to refresh himself with sleep; but here he was murdered by Sogdianus, the son of Artaxerxes by one of his concubines, after he had reigned only forty-five days.

Sogdianus was scarcely seated on the throne when he put to death Bagorazus, the most faithful of all his father's eunuchs; by which, and the murder of his sovereign, he became generally odious. Upon this, sensible of the dangerous situation in which he was, he sent for one of his brothers named Ochus, whom he suspected, with a design to murder him the moment he arrived. Ochus, however, understanding his design, put off, by several pretences, his coming, till he had drawn together a powerful army, with which he advanced to the confines of Persia. Here he openly declared, that his design was to revenge his brother's death; which brought over to him many of the nobility.

nobility and governors of provinces, by whom he was immediately proclaimed king. Sogdianus, seeing himself thus deserted, contrary to the advice of all his friends, came to an accommodation with Ochus; who no sooner had him in his power than he caused him to be suffocated among ashes; a punishment invented on purpose for him.

Ochus, being firmly settled on the throne by the death of Sogdianus, changed his name to Darius; and is by historians commonly called *Darius Nothus*, or the Bastard. But Arsites, another of the brothers, seeing in what manner Sogdianus had got the better of Xerxes, and been afterwards driven out by Ochus, began to entertain thoughts of treating him in the same manner. He was not, however, so successful; for, being defeated in an engagement, he surrendered himself in hopes of mercy, but was immediately put to death by suffocation in ashes. Several other persons were executed: but these severities did not procure him the repose which he expected; for his whole reign was disturbed with violent commotions in various parts of the empire. One of the most dangerous was raised by Pisuthna governor of Lydia; but he, being deserted by his Greek mercenaries, was at last overcome, and put to death: however, his son Amorgus continued to infect the maritime provinces of Asia Minor for two years; till he also was taken prisoner by Tissaphernes, the new governor of Lydia, who put him to death. Other insurrections quickly followed this: but the greatest misfortune which befel Darius Nothus during the whole course of his reign was the revolt of the Egyptians, who could not be reduced. Before his death, he invested Cyrus, his youngest son, with the supreme government of all the provinces of Asia Minor. This was done through the persuasion of his mother Parysatis, who had an absolute sway over her husband; and she procured this command for him, that he might thereby be enabled to contend for the kingdom after his father's death. She even insisted that the king should declare him heir to the crown before he died; but this he could not by any means be induced to do. He died in the year 405 B.C. and was succeeded by his son Artaxerxes, by the Greeks surnamed *Mnemon* on account of his extraordinary memory.

The most remarkable transaction which happened during the reign of this prince was the revolt of his brother Cyrus, commonly called Cyrus the Younger. But the history of this fruitless expedition has been related under GREECE, vol. viii. p. 897, 8. and the article *ATICA* there referred to.

The war with Cyrus was scarcely ended, when another broke out with the Lacedemonians, on the following account. Tissaphernes, being appointed to succeed Cyrus in all his power, to which was added all which he himself possessed formerly, began to oppress the Greek cities in Asia in a most cruel manner. On this they sent ambassadors to Sparta, desiring the assistance of that powerful republic. The Spartans, having ended their long war with the Athenians, willingly laid hold of the present opportunity of breaking again with the Persians, and therefore sent against them an army under the command of Thimbro, who, being strengthened by the forces which returned under Xenophon, took the field against Tissaphernes. This war continued for several years; (see the article GREECE, vol. viii. p. 899-906.) but at length the Lacedemonians were reduced to the necessity of accepting such terms of peace as they could procure. The terms were—that all the Greek cities in Asia should be subject to the king of Persia, as also the islands of Cyprus and Clazomene; that the islands of Scyros, Lemnos, and Imbros, should be restored to the Athenians; and all the cities of Greece, whether small or great, should be declared free; and by the same treaty, Artaxerxes engaged to join those who accepted the terms he proposed, and to assist them to the utmost of his power against such as should reject them. This is called the Peace of Antalcidas; B.C.

387.

The Grecian war being ended, Artaxerxes turned his

arms against the Cadusians, a warlike race, who inhabited a mountainous tract between the Euxine and Caspian Seas. He accordingly (B.C. 384.) marched in person against them, at the head of 20,000 horse and 300,000 foot; but, the sterility of the country proving inimical to the subsistence of so numerous an army, they were soon compelled to feed upon the beasts of burden; and even these became so scarce, that an ass's head was valued at sixty drachmas. In this dreadful emergency Teribazus, who was at that time in disgrace, and followed the court as a prisoner, contrived a stratagem, which rescued the Persians from impending ruin. Understanding that the Cadusians had two kings, who were encamped apart, and had conceived a jealousy of each other's power, he prevailed on Artaxerxes to enter into treaty with them, and to entrust him with the management. Accordingly, he went in person to one of the kings, and sent his son to the other, assuring each that the other had sent a private embassy to the Persian camp, and advising him to make his peace as soon as possible, that the terms might be more advantageous. These artful negotiations were crowned with success; and Teribazus, on his return to Susa, was reinstated in his former honours.

Artaxerxes, having drawn some powerful auxiliaries from Greece, and exerted himself to compose the domestic troubles of that country, resolved to chastise the Egyptians, who had long before shaken off the Persian yoke. Accordingly, the forces were assembled at Ace, since called *Ptolemais*, where, upon a general review, the army was found to consist of 200,000 Persians under Pharnabazus, and 20,000 Greeks under the command of Iphicrates. The naval armament was also proportionate, for it consisted of 300 galleys, besides an incredible number of vessels laden with provisions. The war was intended to commence with the siege of Pelusium; and both the fleet and army began to move at the same time, that they might act in concert as occasion required.

Whilst the Persians were employed in making these arrangements, Nectanebis, king of Egypt, received intelligence of all their designs, and took such measures for the defence of Pelusium, that the approach to it was soon rendered impracticable by sea and land. Instead, therefore, of making the descent which had first been projected, the invaders failed to the Mendesian mouth of the Nile, where they landed their troops with little difficulty, reduced the fortress that defended it, and put the Egyptian garrison to the sword. Iphicrates then proposed to re-embark without loss of time, and attack Memphis, the capital, before the Egyptians could recover from their consternation; but, the main body of the army not being come up, Pharnabazus refused to undertake any thing before their arrival. The valiant Greek, exasperated at the thought of losing so favourable an opportunity, earnestly requested permission to attempt the place with the mercenaries who were under his command; but Pharnabazus obstinately withheld his consent, and thus gave the Egyptians time to provide effectually for the preservation of their liberty. Pharnabazus, perceiving his error too late, endeavoured to excuse the ill success of the expedition by throwing the blame on Iphicrates; and he, with more justice, recriminated upon Pharnabazus; but, as the latter might be reasonably expected to obtain the greatest favour at court, Iphicrates prudently hired a vessel, and retired to Athens.

About twelve years after this unsuccessful invasion, Artaxerxes sent another army against the Egyptians; but this proved equally unfortunate with the former, and Egypt still retained its independence.

The last years of the reign of Artaxerxes were greatly disturbed by dissensions in his family. He had a hundred and fifteen sons by his concubines; and three by his queen, viz. Darius, Ariaspes, and Ochus. He permitted Darius, his elder son, to assume the regal title and wear the tiara even in his life-time: but these honours were so far from satisfying the young prince's ambition, that he entered into a conspiracy with Teribazus against his father's

ther's

ther's life, and fixed a day for the perpetration of his unnatural design. His ingratitude, however, was timely discovered, and received its just reward. After the execution of Darius and his associates, the Persian court was again rent into factions: three of the princes, viz. Ariaspes, Ochus, and Arfames, becoming competitors for the succession. Ochus, prompted by a restless ambition, soon contrived the destruction of his two rivals; practising so effectually on the credulity of Ariaspes, that he poisoned himself to elude the imaginary resentment of the king; and causing Arfames to be assassinated by the son of Teribazus. These acts of cruelty overwhelmed Artaxerxes with such insupportable grief, as terminated his mortal existence, in the 94th year of his age and the 46th of his reign, B. C. 359.

Ochus, conscious of the veneration in which his father's justice and clemency were held throughout the whole empire, and apprehensive of the ill consequences that might result from an avowal of his accession while the people's minds were enflamed by the recent murder of their princes, prevailed on the officers of the household to conceal the king's death, and craftily assumed the administration of government in the name of Artaxerxes. Having continued this practice near ten months, and caused himself, as by his father's order, to be proclaimed king in all parts of the empire, he at length published the death of Artaxerxes, and publicly ascended the throne. The proclamation of the old king's death was immediately followed by an insurrection in several of the provinces, which diverted more than half the imperial revenues into different channels, and threatened the existing government with annihilation; but, the leaders of the confederacy disagreeing among themselves, the rebellion terminated without any effusion of blood, and Ochus was firmly established on the throne.

This monster of cruelty was no sooner possessed of absolute authority, when he began to fill his capital and the whole empire with carnage and misery. He caused Ocha, his own sister and mother-in-law, to be buried alive; shut up one of his uncles, with a hundred of his sons and grandsons, in a court of the palace, where they were massacred by a body of archers; and put all the branches of the royal family to death, without any regard to age, sex, or proximity of blood. Similar barbarities were exercised on all who afforded him the slightest pretence of anger; and the richest blood of Persia was frequently shed by the hands of the executioner.

Whilst the nobles groaned beneath this insupportable tyranny, and the commonalty shrunk with horror from the name of their sanguinary monarch, a laudable spirit of indignation began to appear in some of the provinces, and the smothered flames of discontent again broke out into open rebellion. Ochus, hearing that Artabazus, governor of one of the Asiatic provinces, had revolted, and engaged the assistance of Chares, an Athenian commander, sent an army of 70,000 men to quell the insurrection, but they were cut to pieces by the Athenian forces; and the king found it expedient to send a threatening message to Athens, in order to deliver himself from the opposition of the valiant Chares. Artabazus then procured a supply of 5000 men from the Thebans, and with this reinforcement gained two signal victories over the king's forces: but Ochus contrived to buy off the new allies, and Artabazus was compelled to seek an asylum in Macedonia.

This revolt was scarcely quelled, when the Sidonians and other natives of Phœnicia resolutely armed themselves against their oppressor, and, with the assistance of four thousand Greek mercenaries, chased the Persians out of their territories: the Cypriots also joined with the Phœnicians and Egyptians in the same confederacy, and the rebellion began to wear a formidable appearance. By reason, however, of the dissensions of the rebels among themselves, all of them were reduced, one after another; and among the rest, the Sidonians, finding themselves be-

trayed, burnt themselves to the number of 40,000, together with their wives and children.

Ochus, having quelled these insurgents, immediately set himself about reducing Egypt, and for this purpose procured a reinforcement of 10,000 mercenaries from Greece. On his march, he lost a great number of his men drowned in the lake Serbonis, which lies between Phœnicia and Egypt, extending about thirty miles in length. When the south wind blows, the whole surface of this lake is covered with sand, in such a manner that no one can distinguish it from the firm land. Several parties of Ochus's army were lost in it for want of proper guides; and it is said that whole armies have sometimes perished in the same place. When he arrived in Egypt, he detached three bodies to invade the country in different parts; each being commanded by a Persian and a Greek general: the first was led by Lachares the Theban, and Rosaces, governor of Lydia and Ionia; the second by Nicotratus the Theban, and Aristazanes; the third by Mentor the Rhodian, and Bagoas an eunuch. The main body of the army he kept with himself, and encamped near Pelusium, with the design to watch the progress of the war there. The event was successful, as we have related under the article EGYPT; and Ochus, having reduced the whole country, dismantled their strong holds, plundered the temples, and returned to Babylon, loaded with booty. See vol. vi. p. 297, 8.

The king, having ended this war with such success, conferred very high rewards on his mercenaries and others who had distinguished themselves. To Mentor the Rhodian he gave presents to a great value; appointing him also governor of all the coasts of Asia, and committing to his care the whole management of the war which he was still carrying on against some provinces that had revolted in the beginning of his reign; and all these, either by stratagem or by force, he at last reduced; restoring the king's authority in all these places.

Ochus now, finding himself free from all troubles, gave his attention to nothing but his pleasures, leaving the administration of affairs entirely to Bagoas the eunuch, and to Mentor. These two agreed to share the power between them; in consequence of which, the former had the provinces of Upper Asia, and the latter all the rest. Bagoas, being by birth an Egyptian, had a great zeal for the religion of his country; and endeavoured, on the conquest of Egypt, to influence the king in favour of the Egyptian ceremonies; but, in spite of all his endeavours, Ochus not only refused to comply, but killed the sacred bull, the emblem of the Egyptian god Apis, plundered the temples, and carried away their sacred records. This Bagoas supposed to be the highest guilt which a human creature could commit, and therefore poisoned his master and benefactor in the twenty-first year of his reign. Nor did his revenge stop here; for he kept the king's body, causing another to be buried in its stead; and, because the king had caused his attendants to eat the flesh of Apis, Bagoas cut his body in pieces, and gave it so mangled to be devoured by cats, making handles for swords of his bones. He then placed Arses, the youngest of the deceased king's sons, on the throne, that he might the more easily preserve the whole power to himself.

Arses had not long assumed the insignia of royalty before he was well apprised of the eunuch's wicked practices; but, whilst he was concerting measures to bring him to condign punishment, Bagoas effected his destruction, with that of his whole family, in the second year of his reign, B. C. 336.

Bagoas, having thus preserved his own life by the murder of another king, bestowed the imperial diadem on Darius Codomannus, a descendant of Darius Notlus, who was at that time governor of Armenia. Codomannus was the son of Arfames and Silygambis; but, in the reign of Ochus, he was only an *astanda*, or person employed in carrying dispatches to the governors of provinces;

having, however, valiantly engaged and vanquished, in single combat, a champion of the Cadusians, he was rewarded with the government of Armenia. This king had not, however, long enjoyed the sovereignty, when the ambitious eunuch determined to remove him, and with this design provided a deleterious potion; but Darius, being apprised of his danger, turned the mischief on the head of its author, and thus established himself on the throne without farther opposition, at least as far as security from internal enemies could do so; but in a very little time his dominions were invaded, and, we may say, the same moment conquered, by Alexander the Great. The particulars of that hero's conquest are related under the article MACEDON, vol. xiv. p. 24—6. See also the article GREECE, there referred to.

Thus ended the empire of Persia, 269 years after it had been founded by Cyrus, B. C. 330. After the death of Alexander, the Persian dominions became subject to Seleucus Nicator, and continued subject to him for 62 years, when the Parthians revolted and conquered the greatest part of them. To the Parthians they continued subject for 480 years; when the sovereignty was again restored to the Persians, as related under the article PARTHIA, vol. xviii. p. 678.

FROM THE REVIVAL OF THE PERSIAN EMPIRE UNDER THE SASSANIAN DYNASTY, TO ITS SUBJUGATION BY THE MAHOMETANS.

We now enter on a portion of Asiatic history in which we are accompanied by the Greek and Latin writers, whose accounts, in most respects, agree with the Persian records: of these, as we descend, the materials become more copious, the traditions less tinged with fable, and the proofs, from inscriptions on marbles, gems, and medals lately deciphered, sufficiently convincing.

The restorer of the Persian monarchy was Artaxerxes, or Artaxares, who was not only a private person, but of spurious birth: however, he possessed great abilities. He was no sooner seated on the throne, (A. D. 220.) than he took the pompous title of King of Kings, and formed a design of restoring the empire to its ancient glory. He gave notice to the Roman governors of the provinces bordering on his dominions, that he had a just right, as the successor of Cyrus, to all Asia Minor; which he therefore commanded them immediately to quit, as well as the provinces on the frontiers of the ancient Parthian kingdom, which were already his.

The consequence of this was a war with Alexander Severus, the Roman emperor; but this prince, being but a youth, and under the tutelage of his mother, was unwilling to engage in an expensive contest; and therefore wrote to Artaxares, advising him to keep within due bounds, and not, from a vain hope of conquest, undertake any thing against a people whose arms had frequently vanquished the most warlike nations. Artaxares, however, treated the letter with contempt, and began to make such formidable preparations for the reduction of the adjacent provinces, that the emperor was at length compelled to raise an army, in order to check the augmenting power of Persia.

Artaxares, receiving intelligence of Severus's approach, selected four hundred persons of extraordinary strength and stature, and, having furnished them with sumptuous habits and fine horses, sent them to the emperor with this message: "The great king Artaxares commands the Romans and their sovereign to depart immediately from Syria and Asia Minor, and to restore to the Persians all the countries on this side the Ægean and Pontic seas, which they claim in right of lawful inheritance." This insolent demand having roused the indignation of Severus, he caused the ambassadors to be stripped of their gaudy attire, and sent them into Phrygia, where he assigned them certain lands for their subsistence. He then advanced against Artaxares, who had entered Meso-

potamia at the head of a numerous army; and an engagement ensued, in which the Romans were victorious.

Whilst the Persian retired to his own dominions, for the purpose of recruiting his forces, Severus divided his troops into three bodies, the first of which marched through Armenia, with orders to invade Media; the second passed over the marshes, to enter the Parthian territories on the other side; and the third, commanded by the emperor, designed to have advanced into the centre of Artaxares's kingdom. But concerning the event of this war there are very different accounts. It is certain, however, that, on account of his exploits against Artaxares, Severus took the titles of *Parthicus* and *Persicus*; though, it would seem, with no great reason, as the Persian monarch lost none of his dominions, and his successors were equally ready with himself to invade the Roman territories.

Artaxares, dying after a reign of twelve or fifteen years, A. D. 240, was succeeded by his son Sapor; a prince of great abilities both of body and mind, but fierce, haughty, untractable, and cruel. He was no sooner seated on the throne than he began a new war with the Romans. In the beginning he was unsuccessful: being obliged, by the young emperor Gordian, to withdraw from the Roman dominions, and was even invaded in his turn; but, in a short time, Gordian was murdered by Philip, who assumed the purple as the prize of his crime. As it was necessary for the usurper to return, he made peace with Sapor, abandoning to him the countries he had invaded. Armenia was at this time possessed as an independent state by Chosroes, whom Sapor caused to be assassinated; and then, marching into the country at the head of an irresistible force, reduced it to the condition of a province. He now, availing himself of the distracted state of the Roman empire, renewed his incursions, obliged the strong towns of Carrhæ and Nisibis to surrender, and laid siege to Edessa. Valerian the Roman emperor, who was at this time 70 years of age, marched to its relief, and the two sovereigns encountered each other in the neighbourhood of that city. The result was the defeat and captivity of Valerian, A. D. 260. Sapor then crossed the Euphrates, and advanced to Antioch, which he took by surprise, and sacked. He next passed into Cilicia, and made himself master of Tarsus; after which he laid siege to Cæsarea in Cappadocia. This populous city was bravely defended by the governor, Demosthenes, but was at length betrayed into his hands, and the inhabitants were treated with great cruelty.

The tide of success was first turned by the Roman general Balistus, who, collecting the remains of the vanquished troops, harassed Sapor's army, and obliged him to retire towards the Euphrates. Odenatus the Palmyrene, whose embassy to Sapor had been treated with the utmost insolence, then appeared as the foe of the Persians, and after various successes, in which he carried off the king's treasures and concubines, drove him across the river. In the mean time Sapor tarnished the glory of his success against Valerian by his ungenerous and inhuman conduct towards his unfortunate captive, whom he carried about with him as a spectacle, and is said to have used as a footstool when he mounted his horse; and, when the dethroned emperor sunk under the weight of his calamities, his stuffed skin was placed as a trophy in the most conspicuous temple of Persia. Gibbon supposes that the tale of these indignities has been exaggerated by national animosity; but the unfeeling and arrogant character of Sapor renders it not improbable. Odenatus afterwards twice advanced as far as Ctesiphon, and reduced to his obedience all the countries between Palmyra and the Tigris. After his death, his widow, the celebrated Zenobia, maintained her independence against the Persian arms, but sunk under those of the Roman emperor Aurelian.

Sapor, amidst much variety of fortune, continued to aggrandise

grandise himself at the expense of the neighbouring barbarous sovereigns, till death closed his career A. D. 272, after a reign of about 31 years.

Hormisdas, his son, who succeeded him, appears to have been a prince of a pacific disposition. It was during his reign that the Palmyrenians incurred the displeasure of Aurelian, by asserting their right of creating emperors, and investing one Antiochus with the royal purple. But, as Hormisdas prudently refused to interfere, he escaped the Roman vengeance, and died in peace, after possessing the government one year and ten days.

Of Varanes, who next ascended the throne, we have no satisfactory account, except that he enjoyed the regal dignity for the space of three years without receiving any disturbance from the Romans, or attempting to extend the limits of his empire.

Varanes II. meditated an invasion of the Roman provinces on his first accession (A. D. 277.) but the approach of the emperor Probus induced him to abandon his design, and sue for peace. Some time after he began to think of recovering some of the provinces which had been wrested from his ancestors; but this intention was also frustrated by domestic troubles, and the exertions of Carus, successor to Probus, who entered Mesopotamia, and, surmounting all opposition, advanced beyond Ctesiphon, as if he designed the entire reduction of that province. However, the Persians were delivered from their fears by the death of Carus, and the retreat of the Roman army. Varanes now improved the absence of the enemy, by applying himself to the fortification of his frontiers; but, on his again attempting an invasion of the neighbouring provinces, Dioclesian marched a numerous body of troops into Armenia, and effectually terrified him from the execution of his project. Soon after this transaction the Persian monarch died, A. D. 294, after an unfortunate reign of seventeen years.

Varanes III. is honoured, by historians, with the epithet of *Segansaa*, or King of the Segans; but the occurrences of his reign are passed over in silence, and, at the expiration of four months, he was succeeded by Narses, a prince of great abilities and resolution.

The distracted state of the Roman empire presented a fair opportunity for the recovery of all those provinces which originally belonged to the Persians. Narses accordingly led a numerous army into Mesopotamia, and reduced several places of importance; but his progress was soon checked by Galerius, who advanced against him with a considerable body of forces, defeated him in two engagements, and followed him to the centre of his own kingdom. The Persian, however, acted with such circumspection, and kept so strict an eye upon his pursuers, that he at length retrieved his credit by a successful attack, and effectually revenged his recent losses. Galerius, having with much difficulty prevailed on Dioclesian to trust him with the command of another army, hastened to expiate his disgrace, by the destruction of Narses; and the Persian king assembled a numerous body of chosen cavalry to maintain his conquests. When the armies came within sight of each other, Galerius made a disposition for beating up his enemy's quarters; and this plan was executed so successfully, that the Persians were entirely routed: the royal treasures, baggage, papers, &c. fell into the hands of Galerius; the queen, concubines, and other relatives of the king, were taken prisoners; and Narses himself was compelled to flee, with a small remnant of his troops, to the adjacent mountains. Overwhelmed with grief at this sad reverse of fortune, and conscious of his inability to raise a fresh army, the vanquished prince was compelled to purchase a dishonourable peace; whilst his concubines, sisters, and other persons of quality, were doomed to grace a Roman triumph. These heavy calamities occasioned the death of Narses, in the seventh year of his reign.

Hormisdas II. next succeeded to the government, which he enjoyed about seven years and five months;

but none of his actions were sufficiently interesting to claim the attention of posterity.

Sapor II. posthumous son of Hormisdas II. was born in 310. He had the singular fortune of being declared king before his birth; for, at his father's death, when the ambition of the princes of royal blood was excited by the want of an heir apparent, the Magi ventured to assert not only the pregnancy of the widow but that she had conceived a son; and the satraps in consequence paid homage to their unborn sovereign. During the minority of Sapor, his capital was plundered by Thair, an Arabian prince, who carried away the king's aunt; but this insult was revenged by him as soon as he came to the age of maturity, and Thair and his people fell beneath his arms. The moderate use he made of this victory caused him to be acknowledged by the Arabs the protector of their nation. The instigation of the Magi induced Sapor to become a persecutor of his Christian subjects, whom those jealous rivals rendered suspected to him (probably not without reason) as being more attached to the emperor Constantine than to himself.

It was Sapor's early wish to recover from the Romans the provinces they possessed beyond the Tigris; and, for the purpose of gaining information of the military strength of the empire, he sent a solemn embassy to Constantinople under pretext of renewing the peace between the two nations. This was amicably received by Constantine, who returned a letter, in which he pleaded with the Persian king in favour of the Christians; and it is affirmed that his admonitions were effectual in obtaining better treatment for them. Sapor, however, gave such indications of his intention to make good his claims upon the provinces that once were a part of the Persian dominions, that Constantine is said to have been preparing for an expedition into the East when death put a period to his designs. Immediately upon this event, Sapor broke into the Roman border, laid siege to Nisibis, and made himself master of several important fortresses in Mesopotamia. The death of Tiridates in Armenia deprived the Romans of a firm ally, and eventually rendered that country dependent upon Persia. In a long series of actions on the Roman and Persian borders, between Constantius and Sapor, the arms of the latter had generally the advantage, as the numerous Persian cavalry could perform all their evolutions without impediment in the plains of Mesopotamia. At the battle of Singara, however, in 348, the Romans put the Persians to flight, and took possession of their camp, a son of Sapor's being made prisoner in the pursuit, and inhumanly massacred; but in the end the Persians rallied and repulsed the Romans with great slaughter. Nine victories in the field were claimed by Sapor; but he was unable by his utmost efforts, in three different attempts, to make himself master of the strong city of Nisibis (formerly conquered by Sapor I.) which was defended with insuperable constancy by its Christian inhabitants. With the usual contempt of human life, the Persian monarch urged the third siege amidst dreadful losses, till he was called away by an invasion of his eastern provinces by the Massagetæ. Against these barbarians he fought with success, and in the meantime he attempted to negotiate a peace with the Roman emperor; but his claims were so high, that no treaty could be agreed upon. The subsequent civil wars in the Roman empire gave Sapor an advantageous opportunity of again passing the boundaries; and in 359 he crossed the Tigris with a mighty host, and laid siege to Amida. This place, after a vigorous defence, was carried by storm, and all its remaining inhabitants were massacred, or sent into slavery. The capture of Singara and Bezabde followed, and Constantius himself advanced to stop the progress of the Persians; but nothing memorable occurred during the rest of the campaign.

Sapor was principally employed in securing his conquests, till the accession of Julian to the empire. The martial reputation that prince had acquired induced the Persian

Persian monarch to make overtures to him for a treaty of peace; but Julian, who had inflamed his ambitious spirit with ideas of the glory to be derived from oriental conquest, rejected his proposal, and declared his intention of speedily visiting the Persian capital at the head of an army. Accordingly he took every precaution that might contribute to the success of his project, and marched into the dominions of Sapor, who contented himself with acting on the defensive against so formidable an enemy. The emperor, having taken some fortresses by assault, and obtained admission into others by the treachery of their governors, came at length to Ctesiphon, which had been the bulwark of the Parthian empire. Here he met with a vigorous resistance from the garrison; and was so repeatedly harassed by skirmishes, that he at length resolved to raise the siege, and remove to the Tigris, on which he had a fleet of transports laden with provision. At this juncture a Persian nobleman repaired to his camp, on pretence of ill treatment, and assured him that his present intention would prove highly prejudicial to his affairs and reputation; whereas, if he would consent to quit the side of the river, burn his fleet, and march through an open road, into which he (the Persian) would conduct him, his difficulties would soon be terminated, and he might be justly styled the conqueror of the Persians. Notwithstanding the glaring absurdity of this proposal, and the repeated remonstrances of the Roman generals, Julian commanded his troops to furnish themselves with twenty days' provision, and caused the fleet to be set on fire. When the evil was past remedy, he began to listen to his friends, who loudly exclaimed that he was betrayed, and ordered the Persian nobleman, with his servants, to be put to the torture. This order was executed upon the servants, who boldly avowed the deceit, and exulted in the safety of their master, who had made his escape. Julian, however, obstinately resolved to take the road which had been pointed out by his enemies, and thus led his forces into the most imminent danger; for, after they had proceeded about four days, they found themselves skirted by the whole force of Persia; and having struggled for some time with the united inconveniences of intense heat, want of provision, and scarcity of water, they were suddenly attacked by the greater part of the Persian cavalry, who fought with extraordinary resolution, and continued the combat till Julian was mortally wounded. This event threw the Romans into consternation; and Sapor, improving the opportunity, obtained an honourable and advantageous peace of the new emperor Jovian, who had no other way of extricating himself from his difficulties than by accepting the terms of accommodation which Sapor offered. These were, the restitution to the Persian empire of the five contested provinces, and the strong city of Nisibis, which had proved impregnable to its arms. Sapor faithfully performed on his part the conditions by which the safe retreat of the Romans was secured; and the termination of this alarming invasion proved the most glorious event of his reign.

Having now obtained a respite from the toils of war, Sapor applied his thoughts to the settling the bounds of his empire toward Tartary and India. This plan served to exercise his soldiers for some time; but, on the death of the emperor Jovian, he made an irruption into Armenia, slew Arfaces king of that country, and reduced a considerable territory under his authority; yet on the approach of Arinthias, he was compelled to abandon his important conquests. However, being intently fixed on the aggrandisement of the Persian dominions, he remained in arms, and transferred the imperial residence to Ctesiphon, that he might be at hand to improve every opportunity. His future actions, however, being passed over in silence by historians, we can only observe, that he ended his days early in the reign of Gratian, (A. D. 380.) after having swayed the Persian sceptre seventy years, with great variety of fortune.

This restless and ambitious monarch was succeeded by

a prince called Artaxerxes, of whom the European historians merely observe, that he lived in amity with the Romans, and enjoyed the regal dignity without disturbance for the space of four years. Varanes IV. succeeded. He also maintained the peace with the Romans; and governed his dominions quietly for eleven years.

A. D. 401.—Iddigertes or Yezdegerd, a prince deservedly celebrated for his virtuous disposition, was contemporary with the emperor Arcadius who, at his death, entrusted him with the care of his son Theodosius II. and the Roman empire. The attention which Iddigertes paid to his pupil's improvement, and the zeal which he evinced on his behalf, laid the foundation of a friendship between the two empires; and delivered the Christian subjects of Persia from many inconveniences; for Marathas, a Mesopotamian bishop, being sent with other ambassadors from Theodosius, exerted himself so successfully to remove the prejudices of Iddigertes, that he was fully convinced of the loyalty of a people whom he had hitherto considered as heretical rebels. Some time after, the king was afflicted with a mental derangement, upon which Marathas, with the bishop of Persia, joined in solemn prayer to God for his recovery. Their petitions were soon answered, to the joy of the court; and the professors of the Christian faith were afterward treated with great indulgence. Iddigertes enjoyed the regal dignity twenty-one years, and was succeeded by his son.

A. D. 421.—Varanes V. seems to have ascended the throne with sentiments favorable to the Christians; but an occurrence soon took place which converted his friendship into the most implacable enmity, and produced a long series of calamities to the church. Abdas, the Persian bishop, having, in an unwarrantable fit of zeal, burnt one of the fire-temples to the ground, Varanes expostulated with him in private, and advised him to rebuild it. This, however, he peremptorily refused; and the Magi raised so dreadful a clamour among the populace, that the king was compelled to sacrifice the offender and all the Christian churches to their resentment. A cruel persecution ensued, upon the pretence that all who differed in religious principles from the sovereign were disloyal to the government; persons of distinction were deprived of their dignities and estates; the meaner sort were delivered into the hands of the exasperated Magi: and many were doomed to die in the most exquisite torments; but the barbarians were disappointed in the hope of making converts; and the glorious doctrines of Christianity received new lustre from the exemplary conduct and unshaken fortitude of expiring martyrs.

Theodosius was no sooner apprised of these proceedings, than he determined to avenge the cause of the persecuted Christians; and Varanes, hearing of this intention, made suitable preparations for the defence of his dominions. Having nominated Narses general of his troops, the king of Persia sent him to the frontiers, where he expected a numerous army; but, before they could arrive at the place of rendezvous, the Roman general Ardaburius had marched through Armenia, and begun to waste the province of Azazene with fire and sword. Narses immediately hastened thither to repel the invaders; but, finding his strength unequal to his design, he prudently retreated, and made an incursion into Mesopotamia, which compelled the Romans to abandon Azazene. Narses, however, was disappointed in his expectation; for Ardaburius, instead of offering him battle, blocked up the Persian fortresses of Nisibis. Resolved therefore to provoke him to an engagement, Narses sent a herald to avow his desire of taking the field; but Ardaburius wisely replied, that the Romans fought where they pleased, and not when an enemy requested it for his own advantage.

Meanwhile the Saracens, having been prevailed on to espouse the cause of Persia, passed the Euphrates, and broke like a torrent into the Roman provinces; but their rapacity rendered them so odious, that the inhabitants unanimously rose in arms, and, with the assistance of the Roman

Roman forces, cut to pieces a hundred thousand men; a disaster which compelled the remainder to flee precipitately to their own country. Varanes, being apprised of this defeat, and hearing at the same time that the fortrefs of Nisibis was closely invested, resolved to take the field in person, and accordingly marched at the head of a prodigious army toward the enemy, who immediately raised the siege and retired. However, on his return to his capital, the Romans, recovering their spirit, repulsed the Saracens a second time, and defeated the Persian troops with great slaughter.

Notwithstanding his repeated losses, the Persian monarch continued the war, and found means, by his military skill, to make even victory disadvantageous to the enemy: for, by granting his armies constant supplies, attending strictly to the preservation of his magazines, and keeping a court on the frontiers, he sustained the spirits of his troops; while the Romans were necessitated to act upon the defensive, and found it difficult to obtain timely succours. In this situation of affairs, Theodosius condescended to enter into a treaty; and Varanes, being again defeated with considerable loss, agreed to conclude a peace, and to put a period to the persecution of the Christians. The re-establishment of Christianity in Persia, may, however, be more properly attributed to the following circumstance. When the Romans penetrated into the province of Azazene, at the commencement of the war, seven thousand Persians were brought prisoners to the city of Amida, where they were soon reduced to extreme indigence. Acaes the Christian bishop of Amida, having assembled his clergy, represented to them in the most moving terms the deplorable condition of these prisoners, and used such forcible arguments on their behalf, that the clergy unanimously agreed to sell their consecrated vessels for the relief of the sufferers. Having reduced this plan to execution, they maintained the seven thousand Persians till the termination of the war, and then sent them home with money in their pockets; an instance of unfeigned charity which so astonished Varanes, that he immediately invited the benevolent prelate to court, and granted the Christians many important favours at his request. After this accommodation, the Persian monarch enjoyed an uninterrupted peace for the remainder of his life: and died, in full possession of his people's love, after he had swayed the sceptre twenty years.

A. D. 442.—Varanes VI. was next invested with the diadem; but the Greek historians make no farther mention of him, than to observe that he was contemporary with Theodosius II. and his successor Martianus, and that he enjoyed the government seventeen years and four months.

Peroses, his son and successor, a prince of a restless and turbulent spirit, was highly incensed against the Euthalites, or White Huns, who disturbed the commencement of his reign by several predatory incursions. To rid himself of these troublesome neighbours, he assembled a powerful army, and marched in person toward Gonza, their capital, hoping to put a speedy period to the war by a general engagement; but the Euthalites, having drawn him so far into their territories as to cut off the possibility of a retreat, convinced him of his error, and obliged him to swear that he would never more invade them. The ill success of this expedition, however, did not crush the design of Peroses, but merely induced him to take more prudent measures, and supply his troops with a greater stock of provision. When, therefore, he had settled his domestic concerns, appointed his son Cavades regent of the kingdom, and assembled his forces, he marched a second time toward the northern frontiers; but the Euthalites, having concealed their warriors behind certain mountains, rushed unexpectedly on his army, slew or took captive most of the soldiers of whom it was composed, and put Peroses himself to death, after he had worn the Persian diadem about twenty years.

When the news of this disaster was brought to Persia,

the nobles, being unwilling to trust their sceptre in the hands of so young a man as Cavades, bestowed the supreme authority on his uncle Valens, a prince of a virtuous and compassionate disposition, who used his utmost exertions for the space of four years to redress the grievances of his country, and at the expiration of that time fell a victim to the oppressive cares of government.

A. D. 486.—Cavades had no sooner ascended the throne than he took such vigilant measures against the Euthalites, who had overrun the greatest part of the kingdom, and exacted a tribute from their late sovereign, that their spirit was soon broken, and they were eventually compelled to do homage to him as their lawful king. Having effected this design, he undertook to alter the constitution of his kingdom, depriving the nobility of all their ancient privileges, and rejecting the advice of counsellors even in the most momentous transactions. As his enterprising genius impelled him to break through every restraint, he soon became an object of terror to his subjects; and at length the promulgation of an infamous edict, which seemed dictated by a spirit of insanity, determined the chief nobles of the realm to shake off their insufferable yoke. Accordingly they deposed Cavades, after he had reigned eleven years, and bestowed the crown on Zambades, a near relative of Peroses.

The conduct and abilities of the new king reflected the highest credit on the choice of his nobles, and promised the happiest effects to the empire at large; for he was equally just and compassionate, zealous for the rights of the crown, and solicitous for the welfare of the subject. But, whilst he was sedulously employed in redressing those evils which had arisen from the ill conduct of his predecessor, and restoring the affairs of government to their ancient order, Cavades found means to escape from prison, and, with the assistance of the king of the Euthalites, repossessed himself of the throne. The principal authors of the late revolution were then sentenced to death; and the unfortunate Zambades, after suffering the loss of his eyes, was thrown into close confinement.

Cavades had no sooner recovered the diadem, than he found himself pressed for the payment of a loan which he had received from the Euthalites. In this exigence he applied to the emperor Anastasius, requesting him to advance the money upon interest; but, his solicitation proving ineffectual, he made a sudden irruption into Armenia, laid the inhabitants under heavy contributions, and, after an obstinate resistance, reduced the important fortrefs of Amida. Upon the first intelligence of this invasion, the emperor sent a numerous army to the frontiers, in order to repel the Persians; but Cavades attacked them with such impetuosity, that Ariobindus, one of the Roman generals, shamefully abandoned his camp, and fled to an adjacent city; and another powerful division, commanded by Harpatius, who had cut off eight hundred Euthalites, were surpris'd unexpectedly, and slaughtered with scarcely any resistance.

Whilst Cavades was thus employed against the Romans, his attention was diverted by a formidable invasion of the Huns, which compelled him to march his forces immediately toward the northern provinces. The enemy prudently resolved to improve his absence, and accordingly laid siege to Amida, which obstinately resisted for some time, but was at length compelled to capitulate. Soon after this event a truce for seven years was concluded, and hostages were given on both sides for its due observance.

Justinian, having succeeded to the empire of the East, caused all the frontiers towards Persia to be surveyed, and ordered his commanders on the border of Mesopotamia to fortify Mindone, the nearest place in the Roman territories to Nisibis. The Persians, who regarded this work with an eye of jealousy, took an opportunity of attacking the labourers, with the troops who were appointed to protect them, and, having slaughtered the

Greatest part of them, demolished the building. This occasioned a new war, which was carried on for some time with different success; but, as neither party gained any considerable advantage, a second truce was proposed, and the hostile armies were mutually withdrawn.

Meanwhile the king of Persia, exhausted by the toils of war, and oppressed with many bodily infirmities, sent for Mebodes, his confidential minister, and expressed an earnest desire of leaving the crown to his third son Chosroes, whose warlike and ambitious disposition seemed better adapted to the affairs of government than that of his elder brothers. He then gave him his will, with a solemn injunction to use his utmost efforts for its execution; and shortly after died, A. D. 531, in the forty-fifth year of his reign. Upon the demise of Cavades, the elder prince Caoses assumed the regal title; but, a solemn assembly being convened, and the will of the late monarch produced, his claim was set aside, and Chosroes was immediately placed on the throne.

Chosroes, or Khosrou, who was afterwards celebrated throughout the east by the name of *Nushirvan*, or the Magnanimous, was no sooner confirmed king, than the emperor Justinian sent an embassy, consisting of Rufinus and several other persons of distinction, to compliment him on his accession, and to make proposals of peace. Chosroes received the ambassadors with every mark of respect, and readily agreed to the offered pacification, on condition that he should receive a certain sum of money; that the pretensions of the Romans and Persians should be finally settled; all places taken on either side restored; and this peace declared to be *perpetual*. Rufinus returned to Constantinople for instructions, and soon after arrived with the ratification of the peace.

The Persian nobility, perceiving that Chosroes possessed the same disposition which had disturbed the peace of the empire at the accession of Cavades, resolved to provide for their own safety by transferring the sceptre into the hands of a more tractable prince. Accordingly they formed a conspiracy for placing his second brother's son, Cavades the Younger, on the throne, proposing, however, to vest the regal authority in Zames as his tutor and protector; for Zames, the brother of Chosroes, having the misfortune to be blind of one eye, was, by the laws of Persia, incapable of wearing the crown. But, whilst they were making suitable preparations for the execution of their project, Chosroes was apprised of his danger, and caused all the conspirators to be put to death except young Cavades, who had the good fortune to escape the present danger, and afterward found an agreeable asylum at the court of Justinian. Another act of feverity which he thought necessary for the peace of his kingdom, was the execution of Mazdak, the head of a new sect, who preached a community of property and of women, and whose delusions had obtained great sway over the mind of Cavades. He next removed such governors of provinces as during his father's reign had made themselves obnoxious to the people; and for the better administration of justice, he divided his dominions into four great vicinships, those of Assyria, Media, Persia, and Bactriana.

The late peace proving beneficial to Persia, Chosroes faithfully observed it for some time: but on receiving a message from Vitiges, king of the Goths, relative to the dangerous augmentation of Justinian's power, he began to meditate fresh hostilities; and a subsequent embassy from the Arsacidæ, or petty princes of Armenia, fixed his determination. Accordingly, having assembled a formidable army, he marched, early in the spring of the year 540, toward the provinces of Syria and Cilicia; reduced Sura, a place of considerable strength on the banks of the Euphrates; levied heavy contributions on the adjacent country; and advanced by rapid marches to Antioch, which, after a bloody conflict, was added to his other conquests.

Whilst his army remained in the vicinage of this city,

he received an embassy from Justinian, who expostulated with him on the injustice of his conduct in violating the late treaty, and at the same time expressed a wish for an accommodation. Chosroes received the ambassadors with every mark of respect; listened attentively to their remonstrances; and answered them with language and gestures so well calculated to excite the passions, that they were totally confounded, and openly confessed that his eloquence was to be dreaded rather than his arms. However, as they hesitated to comply with his unreasonable demands, he reduced the city of Antioch to ashes, and took such measures for extorting new contributions, that the Romans were actually alarmed at his progress, and the Persians became intoxicated with success. After reducing several places of importance, the Persian monarch invested Dara, a rich and populous city, which he was very desirous of possessing; but, finding that the garrison were resolved to defend themselves to the last extremity, and perceiving the discontent which prevailed in his army, on account of fatigue and the advanced state of the season, he determined to abandon the siege, and return to his own dominions.

Soon after his return, Chosroes received an embassy from Gubazes, prince of the Lazi, complaining that Justinian had caused a new city to be built on the coast of the Euxine Sea, and fortified by a Roman garrison, for the express purpose of enslaving a people who had hitherto enjoyed the blessings of liberty without molestation. The king immediately resolved to espouse the cause of the Lazi, and accordingly led his forces into Colchis, where Gubazes met him, and, joining his army with a powerful reinforcement, accompanied him to Petra, which was immediately evacuated by the Romans.

Whilst the sword of Chosroes was bathed in the blood of his enemies, and his coffers were abundantly replenished with the spoils of conquered cities, the Roman general, Belisarius, led a numerous army against Nisibis, but was soon compelled to raise the siege. To console himself for this misfortune, he ravaged a few inconsiderable places, and, having carried off some spoil, sent a message to Constantinople, importing that he had triumphed over the Persians, though in reality his expedition was rather honourable than advantageous.

Early in the ensuing spring Chosroes marched his forces into Comagene, intending to advance into Palestine, and plunder the city of Jerusalem; but, finding himself opposed by Belisarius, and dreading the effects of a pestilence, which had recently passed from Egypt into those parts of the Roman territories, he retired hastily toward the northern provinces, where he recruited his army for the purpose of invading Armenia. Justinian, however, being apprised of his design, ordered his officers to assemble a numerous body of troops on that side, and Chosroes relinquished his projected attempt.

Next year the Persian monarch led his army against the city of Edeffa, which he had already besieged without success, but which he now determined to destroy. However, the citizens made so vigorous a defence, that he found his design impracticable, and was soon compelled to retire into his own territories, where he held a conference with the Roman ambassadors, and drew them into an insidious treaty, which was, in fact, more destructive to their master than open war.

Shortly after this event, he formed the design of transporting his new subjects, the Lazi, who were zealous Christians, from their own country of Colchis into the centre of Persia, having been persuaded by the Magi that their difference of religion would render them unruly and discontented beneath his government. To accomplish this intention, he deemed it requisite to build a navy in the port of Petra, which might guard the coasts, and prevent any intercourse with the inhabitants of the Roman provinces; but, whilst he was making the needful preparations, Gubazes, king of the Lazi, besought the protection of Justinian, and, with the assistance of a
Roman

Roman army, compelled the Persians to shut themselves up in Petra, which was immediately invested on one side by Gubazes, and on the other by the Romans. Chofroes, receiving intelligence of this transaction, commanded Mermeroes, one of his most experienced officers to hasten with a suitable force to the relief of Petra. Mermeroes accordingly set out for Colchis, at the head of a numerous army; and, having carried the straits of Chisurae, which the Romans had left too slenderly guarded, advanced directly to the city, where he found the garrison reduced to the most pitiable condition, nine hundred men only remaining out of five thousand, and the dead bodies being piled up against the walls of the citadel, that the enemy might not be acquainted with so fatal a loss. The walls being now broken in many parts, and the whole place in a manner dilapidated, the Romans regarded the approach of Mermeroes as nothing more than a slight reprieve; however, he contrived to reinforce the garrison, and put the citadel in a better state of defence. Having effected this purpose, the Persian general marched toward Iberia, in expectation of procuring an ample supply of provisions for his army. Here he encamped, with a rapid river behind him, supposing the situation extremely secure; but Gubazes, having devised a method of crossing the stream, came upon him unexpectedly, and, together with the Romans, made a dreadful slaughter. Mermeroes, however, repaired the mistake by his future caution, and, during the remainder of his life, preserved the superiority of the Persian arms; but his successor, Nachoraganus, acted with so little prudence, that, after a long and expensive war, Chofroes was compelled to conclude a peace with the emperor. Gubazes having been treacherously assassinated during the hostilities, his subjects were deprived of their liberties, and Nachoraganus was condemned to be slayed alive for his ill conduct.

During these transactions in the western parts of his empire, Chofroes and his son Hormouz, or Hormisdas, were also busily engaged in military operations on the eastern borders. The Euthalites were expelled from their usurpations on the Persian frontier; and the great khan of the Turks, who had burst like a torrent into the midst of Persia, was defeated by Hormouz, and obliged to retire with precipitation. Chofroes concluded his hostility with the khan by a treaty, and the marriage of his daughter. He moreover subdued the Hyrcanian rebels, conquered the provinces of Cabul and Zablestan on the Indus, and received ambassadors from the greatest potentates of the East, at his splendid palace of Madain, or Ctesiphon, one of the wonders of that part of the world. In the midst of his prosperity he had the mortification of seeing one of his sons in rebellion, by name Nushizad, the son of a Christian captive. This prince's attachment to his mother's religion had caused his father, who dreaded religious disputes in his empire, to keep him in a mild confinement. From this the prince had escaped, and, drawing together an army, raised the standard of rebellion; but in an engagement with the general sent against him by his father, he lost his life.

Chofroes, after his successful expedition to India, marched to the opposite quarter of his wide dominions, and entered Arabia Felix, in which country he dispossessed many usurpers of their illegal power, restored the ancient lords, and used the people with such kindness that he obtained from them the title of *al Mulek*, or the Just.

Towards the close of Justinian's reign, Chofroes was attacked with a dangerous disease, from which he sought relief from the physicians of Constantinople, whose aid he borrowed of the emperor. This friendly intercourse, however, did not prevent the renewal of hostilities between the two empires soon after the accession of Justin, in which that emperor appears to have been the aggressor. Chofroes, then in a very advanced age, took the field, and reduced and sacked the principal cities of Mesopota-

mia and Syria; after a spirited resistance, he made himself master of the strong fortresses of Dara, which he garrisoned. These losses caused the imperial court to solicit for an accommodation, and at length, after the receipt of an expostulatory letter from the empress Sophia, Chofroes consented to a truce for three years, excepting only the province of Armenia, which had first occasioned the war.

Early next spring the Persian monarch prepared to enter Arminia, designing to penetrate into Cappadocia, to reduce Caesarea, and such other cities as he deemed worthy of notice. Tiberius, who had now succeeded to the empire, sent an embassy to dissuade him from this expedition, and to make proposals for a durable peace; but Chofroes refused to admit the ambassadors to his presence, haughtily observing, they might follow him to Caesarea, where he should find leisure to attend to their proposals. This rough behaviour so irritated the Romans, that they resolved to give him battle, having assembled a powerful army, in case they should be compelled to enter upon hostilities. Chofroes, hearing of their determination, regarded it as a proof of their rashness, and quickened his march, as if desirous of the engagement; but when he perceived the excellent discipline of his opponents, and the admirable disposition of their cavalry, he heaved a deep sigh, and seemed much affected. Curtius, a Scythian, having commenced the attack on the left wing of the army, the adverse forces immediately joined in close engagement, and disputed the victory with intrepid gallantry, but at length the Romans were victorious; and the Persians, having lost the sacred fire, and the royal treasures, retired, overwhelmed with shame and confusion.

Next evening Chofroes received intelligence that his enemies were divided into separate encampments; upon which he sallied out against one of them at midnight, routed them with great slaughter, and, having set a village on fire behind their camp, marched with all possible expedition toward the Euphrates, that he might cross over into his own dominions. However, the Roman general pursued him with such celerity, that he was reduced to the necessity of passing the river on an elephant, and had the mortification to see many of his bravest soldiers perish in the general confusion. After this occurrence, the Romans took up their winter-quarters in the Persian provinces; and Chofroes was so deeply affected by his ill success, that, on his arrival at Seleucia, he sickened and died, after he had held the reins of government forty-eight years, A. D. 579.

Chofroes possessed many of those qualities which confer splendour on a despotic sovereign, and in some measure justify the high veneration with which his memory is to this day regarded in the East. His love of justice was proverbial, though it was a justice which did not exclude acts of cruelty and ingratitude towards those who incurred his suspicion or thwarted his will. He was a munificent encourager of the useful and ornamental arts, and paid great attention to the instruction of his subjects. He founded academies for literature and the sciences, and caused translations to be made into the Persian of the most celebrated writers of Greece and India. He himself obtained the reputation of proficiency in moral and philosophical studies; and a report of this kind which reached Greece obtained him a visit from seven sages who adhered to the religion and philosophy of antiquity. They were disappointed in their wild expectation of seeing the republic of Plato realised in the court of an eastern despot, and returned to their own country; but Chofroes deserved pure praise for the generosity with which he insisted, in a treaty with Justinian, upon their exemption from the penal laws enacted against the remaining professors of paganism. The oriental historians, who delight to dwell on the glories of the reign of Nushirvan, ascribe to him the completion of the great wall of Jagouge and Magouge, commencing

mencing at Derbeet, and running, like the Chinese wall, from mountain to mountain, so as to secure the Persian frontiers from northern invaders.

Chosroes was succeeded by his son Hormisdas III. whose cruel and obstinate disposition was but ill adapted to soothe the public troubles, or heal the wounds of his empire. A ridiculous curiosity relative to future events, a haughty forbidding carriage, and an impolitic mode of conduct toward foreign princes, were prominent traits in his character, and continually involved both himself and his subjects in the most serious embarrassments. His faith in the assertions of some old diviners caused him to regard the generality of his subjects as discontented and rebellious race; and his contumelious treatment of the ambassadors whom Tiberius sent to compliment him on his accession, occasioned a new war, which in the end proved very disadvantageous to both parties.

The first military operations were not of great consequence; but, when Philippicus arrived on the frontiers with a powerful army from Constantinople, the Persians were obliged to leave the open country to the invader's mercy, and consult their own safety by fleeing to the mountains. Philippicus accordingly gratified his troops with the plunder of all the places that fell into his hands; but, his thirst of pillage having drawn him too far into the country, he was reduced to the utmost extremity for want of water; a circumstance which induced him to put all his prisoners to the sword, except the children who were designed for slaves; but they died in the march, and thus escaped the miseries which they must otherwise have endured.

In the early part of this unpopular reign, the Turks made an inroad into Persia. This brought into action the talents of the celebrated Bahram, or Varamus, surnamed Giubin, a man descended from the ancient princes of Rei or Rages. From his youth he had served in the army of the late king. His gigantic size, fierce countenance, and signal valour, raised him to command in the reign of Nushirvan, and at length acquired him the government of Media, and superintendance of the royal palace. When Persia, therefore, was invaded by the great khan of the Turks, Bahram was sent for by Hormisdas to oppose him. Bahram took only 12,000 select soldiers; and, marching with equal celerity and secrecy, he fell unexpectedly upon the khan's numerous host, and defeated it with great slaughter, killing the khan himself, and taking all the rich treasures of his camp. His tyrannical master, though rejoiced at this deliverance, became jealous of his general's success, and gave ear to those who insinuated that he had kept the most valuable of the spoils to himself. Soon after, Bahram received orders to cross the river Araxes, and to attack the Roman territories on that side. This command was executed with all possible expedition, and Bahram had done incredible mischief to the enemy before they could assemble an army sufficient to take the field. At length, however, Romanus offered battle; and the Persian, relying on his own valour, eagerly embraced the proposal; but, his good fortune abandoning him at this juncture, his cavalry was totally defeated, and the utmost skill required to elude a general slaughter by retreat. Hormisdas, being apprised of this misfortune, was imprudent enough to insult him by the present of a wheel, a distaff, and a suit of woman's apparel. Bahram showed himself to the troops in this dress; and so inflamed their passions by the ignominy inflicted on the whole army in his person, that they unanimously joined him in a revolt against their king, and inspired him with the thought of effecting a general revolution. Upon the first intimation of this design, he received many assurances of assistance; the garrison of Nisibis openly declared for him; even the king's army began to exhibit signs of disaffection; and the inhabitants of all the royal cities shook off their allegiance; and the popular tumults continued to augment. But, in the mean time, Hormisdas met with another enemy in the person of Bindoes, his brother-in-law, who had been loaded with chains for a

slight offence, but was now liberated by the insurgents, who seized upon the king, and committed him to the same dungeon.

Hormisdas was publicly tried, and sentenced to be deposed. When he heard, moreover, that his son Chosroes was nominated his successor, he sent a message from his dungeon, requesting the liberty of speaking before an assembly of the nobles. This petition being granted, he made a very long and pathetic speech, in which he deplored his own misfortunes, inveighed bitterly against the authors of the rebellion, and earnestly entreated that Chosroes might not be permitted to ascend the vacant throne, as his vicious and turbulent nature would inevitably overwhelm the empire with misery and confusion. He recommended his younger son to the notice of his auditors, as a virtuous and ingenuous prince; and concluded with recapitulating the services he had himself rendered the Persians, by reducing many provinces, and compelling the neighbouring barbarians to pay them a regular tribute. At the end of this address, Bindoes stood up, and, in a long insulting answer, wrought so powerfully on the passions of the assembly, that they unanimously rejected the counsel of Hormisdas; caused the prince, whom he had recommended to their favour, to be cut in pieces; exercised a similar cruelty on his ill-fated mother; and ordered the eyes of the deposed monarch to be put out with a hot iron, that no turn of fortune might ever restore him to his former dignity. Such was the tragical termination of this reign, after it had continued twenty-one years. A. D. 592.

These objects of popular resentment being removed, Chosroes II. or Kosrou Parviz, ascended the throne, amidst the acclamations of the people, who celebrated his accession with every demonstration of joy, and made vows for his prosperity. For some time he treated his father with great lenity, sending him a daily allowance of food from his own table, granting him many amusements, and ordering him proper attendance; but, on the unhappy prince reproaching him with cruelty and unnatural baseness, he caused him to be beaten with cudgels till he expired. Having, by this diabolical act, delivered himself from the voice of upbraiding, and supposing himself sufficiently established in the kingdom, he gave splendid entertainments to his nobility, distributed the royal treasures with unexampled profuseness among the lower orders, and commanded all the prisons in his dominions to be thrown open, that the fame of his liberality might ensure the affection of his subjects.

Some historians represent Bahram as having produced this revolution; but it is certain, that, while Chosroes was taking measures for the security of his crown, Bahram advanced with his troops with the view of deposing him, and seizing the crown for himself. A bloody engagement ensued, in which Chosroes was defeated, and compelled to abandon his palace, and seek his safety in a precipitate flight. Bahram then entered the city of Ctesiphon with all imaginable pomp, and, after exercising the utmost severity on those who had evinced any affection for the royal family, invited the grandees of the kingdom to several sumptuous entertainments, and affected the greatest humanity, beneficence, and condescension; but, on his assuming the royal ornaments at a solemn festival, the sparks of discontent were blown into an open flame, and the nobles, pursuant to the advice of Bindoes, attacked the palace in the dead of the night. This attempt, however, was frustrated by the gallant defence of Bahram and his attendants, who, after a sanguinary conflict, slew most of the assailants, except Bindoes and a few of his friends, who fled towards Media for the purpose of raising forces for Chosroes.

Elated with this success, and impatient to assume the regal title, Bahram now sent an embassy to Constantinople, soliciting the friendship of the emperor Mauritius; but, Chosroes having already conciliated the emperor's esteem by a letter, in which he pathetically intreated his assistance

ance against a revolted people, the ambassadors were dismissed without any answer; and such formidable preparations were made against Bahram, that the Persians, ever ready to change, gradually went to serve under the banners of their lawful prince; so that Chosroes, having defeated the army of Bahram, and taken six thousand prisoners, re-ascended the throne. In order to express his sense of the obligation conferred on him by the Romans, the reinstated monarch sent a golden cross, enriched with precious stones, to the church of Sergius the martyr; married a Christian woman, on whom he bestowed the title of queen, in opposition to the laws of his country; and professed such friendship toward the Christians, that many supposed he intended to change his religion, though, in the course of a few years, he gave the most convincing proofs of an irreconcilable aversion to the true faith.

When he found himself firmly established in the supreme dignity, he laid aside all the foreign customs, which he had adopted to ingratiate himself with the Romans, and assumed the state and behaviour of a Persian monarch, as if he had never tasted the cup of adversity. He treated all who had any share in the favour or administration of Bahram with unparalleled severity; and, by restoring the ancient Persian constitution, rendered himself so terrible to his neighbours, that a barbarous prince, with whom Bahram had taken shelter, caused his guest to be poisoned, that himself might elude the vengeance of Chosroes. The renown of Bahram, however, still lives among the Persians, and some excellent laws are dated from his short reign.

During the life of his benefactor Maurice, Chosroes maintained peace and friendship with the Roman empire; but, when that prince had been murdered by Phocas, Chosroes made use of the pretext of revenging his death, to invade, in 605, the imperial territories. Accordingly, he assembled a powerful army, and made all the necessary preparations for entering the Roman frontiers, though Phocas used his utmost exertions to appease him by large presents, and more considerable promises. His first campaign was rather unsuccessful, the adverse troops making a gallant resistance; but, on the death of their general, he obtained a decisive victory, and laid all the frontiers under contribution. He then pursued his advantage with such unremitting assiduity, that, in the space of nine years, he plundered the provinces of Syria, Mesopotamia, Phœnicia, Armenia, Cappadocia, Galatia, Paphlagonia, and all the country as far as Chalcedon; he ravaged Judea, and pillaged the city of Jerusalem. To the ruin of this last city he was urged by the religious hatred of the Magi; and numbers of the Jews gladly joined him to retaliate the injuries they had received from their Christian masters. Many of the monuments of superstitious veneration for the holy place were destroyed, the true cross was carried away, and 90,000 Christians are said to have been massacred in Judea.

In the campaign of 618, Chosroes penetrated into and subdued Egypt, pushed his conquests to the frontiers of Ethiopia, and fixed the western limits of his empire in the vicinity of Tripoli. In the following year he pressed the Constantinopolitan empire still closer, extended his arms to the Thracian Bosphorus and the coasts of Pontus, and took the cities of Ancyra and Chalcedon. His power and greatness were now at their summit; and the description of the splendours of his favourite residence of Artemita, or Dastagerd, beyond the Tigris, has exercised all the exaggerating faculties of oriental pens. The recorded numbers of his elephants, his camels, his horses, and mules, his guards, and his concubines, with his subterraneous vaults in which were deposited his magazines of treasure and precious commodities, do not, perhaps, exceed the bounds of credibility; but the 40,000 silver columns that supported the roof, and the thousand globes of gold hung in the dome to imitate the planets and constellations, too much resemble the fictions of the Arabian Nights. It is no wonder that a mind, which appears to

have been originally haughty and tyrannical, was unable to preserve moderation under such a state of prosperity. The emperor Heraclius in vain by suppliant messages endeavoured to avert his hostility, and obtain peace for his almost ruined empire. To an embassy of this kind brought by officers of the highest distinction, and conducted by Sain the Persian general, Chosroes replied, "I will hearken to no terms from the Roman emperor, till he with all his subjects have renounced his crucified God, and embraced the worship of the Sun, the great deity of the Persians;" and he inhumanly caused Sain to be flayed alive for his presumption, and imprisoned the ambassadors. He afterwards, however, consented to accept of a heavy and ignominious tribute as the price of peace, and Heraclius subscribed the imposed terms. But that emperor in the mean time was preparing to recover his losses by force of arms. The latent qualities of a hero seemed to have been roused in him by distress. He conducted several campaigns with the greatest courage and skill; penetrated into the centre of the Persian dominions, and recalled the monarch from his conquests to the defence of all that was dearest to him. The palace of Dastagerd was pillaged and burnt; and the battle of Nineveh, in 627, rendered Chosroes a trembling fugitive. Regardless of the sufferings of his subjects, his pride would not submit to ask of Heraclius that peace which he still might have obtained on reasonable conditions. At length, weakened both in body and mind, he resolved to resign his crown to his favourite son Merdaza. But his eldest son Siroes, joined by a faction of nobles, prevented this disposition by a previous seizure of the sovereignty. Chosroes was stopped in his flight, eighteen of his sons were massacred before his face, and he himself was thrown into a dungeon, where he expired on the fifth day, after suffering (as it is asserted) every kind of barbarity at the command of his inhuman son. This event took place A. D. 628.

Siroes, having ascended the throne of Persia, concluded a treaty of perpetual peace with Heraclius; gave Zacharias, patriarch of Jerusalem, and all the Roman captives, their liberty; and sent back the wood which was supposed to have been part of the cross on which the Messiah suffered, and which had been carried in triumph, by Chosroes, from Jerusalem into Persia; but Siroes did not long enjoy the advantages resulting from the union between the two empires, as he was murdered by one of his generals after he had worn the crown about twelve months.

His son, Ardeser, was next invested with the government, but he was assassinated in the seventh month of his reign by Sarbas, commander in chief of the Persian forces; who, presuming on the affection of the soldiery, seized the diadem for himself. A civil war, however, was immediately kindled, which crushed the ambitious projects of the usurper, and elevated to the throne Ispigertes II. or Yezdegerd as he is called by the Arabian and Persian historians, grandson of Chosroes II.

This prince, the last of the Persian kings of the line of Artaxares and of the Sassanian dynasty, ascended the throne in 632, at which time commenced the Yezdegerdian æra, still observed by those who profess the religion of Zoroaster. Yezdegerd was contemporary with Omar, the second caliph after Mahomet; and his reign, though it lasted twenty years, is little more than a detail of battles between the Persians and the Arabs, or Saracens. He was scarcely seated on the throne, when he found himself attacked by a powerful army of Saracens under the command of one Sad, who invaded the country through Chaldaea. The Persian general took all imaginable pains to harass the Arabs on their march; and, having an army superior to them in numbers, employed them continually in skirmishes; which were sometimes favourable to him, and sometimes otherwise. But Sad, perceiving that this lingering war would destroy his army, determined to halt forward, and force on a general engagement. The

Persians declined this for a long time; but at length, finding a convenient plain where all their forces might act, they drew up in order of battle; and resolved to wait for the Arabs. Sad, having disposed his men in the best order he could, attacked the Persians with the utmost fury. The battle lasted three days and three nights; the Persians retiring continually from one post to another, till at last they were entirely defeated; and thus the capital city, and the greatest part of the dominions of Persia, fell into the hands of the Arabs. The conquerors seized the treasures of the king; which were so vast, that according to a Mahometan tradition, their prophet gave the Saracen army a miraculous view of those treasures before the engagement, in order to encourage them to fight.

After the loss of this battle, Yezdegerd retired into Chorasan, where he maintained himself as king, having under his subjection two other provinces, named Kerman and Segestan. But, after he had reigned in this limited manner for nineteen years, one of the governors of the few towns he had left betrayed it, and called in the Turks. This place was called Merou, seated on the river Gihon, or Oxus. Yezdegerd immediately marched against the rebels and their allies. The Persians were defeated; and the unfortunate monarch, having with much difficulty reached the river, found there a little boat, and a fisherman, to whom it belonged. The king offered him a bracelet of precious stones; but the fellow, equally brutal and stupid, told him that his fare was five farthings, and that he would neither take more nor less. While they disputed, a party of the rebel horse came up, and, knowing Yezdegerd, killed him. This was in the year 652.

Yezdegerd left behind him a son named Firouz, and a daughter named Dara. The latter espoused Bostenay, whom the rabbinical writers have dignified with the title of the "head of the captivity;" and who, in fact, was the prince of the Jews settled in Chaldea. As for Firouz, he still preserved a little principality; and, when he died, left a daughter named Mah Afrid, who married Walid the son of the caliph Abdalmalek, by whom she had a son named Yezid, who became caliph, and consequently sovereign of Persia; and, so far was this prince from thinking himself above claiming the title derived from his mother, that he constantly styled himself "the son of Khofrou king of Persia, the descendant of the caliph Maroan, and among whose ancestors on the side of the mother were the Roman emperor and the khacan."

Although a few petty chiefs maintained their religion and authority for many years after the death of Yezdegerd, the empire of Persia, which had maintained a second, or renewed, existence for 430 years, was transferred, by this catastrophe, to the victorious Mahometans.

We shall conclude this section with some particulars of the manners and religion of the ancient Persians, which could not conveniently be introduced before without breaking the thread of the history.

The Persian monarchs were not only absolute in their administration, but the obedience of their subjects resulted from the most enthusiastic veneration; and the homage they constantly received was little short of divine honours. None were permitted to enter the royal palace without express permission, nor to approach the seat of majesty without prostrating themselves on the ground. While they remained in the presence, they were obliged to hold their hands within their sleeves; a ceremony for the neglect of which, Mitreus and Autofaces were put to death, under the reign of Cyrus the Younger. The unbounded respect paid to the kings of Persia by their vassals is instanced by Herodotus, who says that, Xerxes being once in great danger by sea, many of his attendants strove who should first leap overboard to lighten the vessel, and sacrifice themselves for the preservation of their prince. They all, in fact, regarded the king's wrath as equally dreadful with the anger of the gods; and, on the least intimation given by him, would at any time become their own executioners.

The crown of Persia was hereditary, and generally bestowed on the eldest of the deceased king's legitimate children. When the reigning prince undertook a long journey, or any perilous expedition, he named the heir apparent previously to the commencement of his march, that no contest might arise respecting the succession. The ceremony of coronation was performed by the priests, in the temple of the goddess of war at Pafargada; where the new monarch used to clothe himself with the garment which Cyrus, the founder of the Persian empire, had worn before his elevation to the throne. Being thus attired, he ate some figs, with a small quantity of turpentine, and drank a cupfull of sour milk; and the solemnity concluded with his receiving the tiara or crown from one of the grandees, in whose family that prerogative was hereditary. The king's birth-day was always celebrated with the utmost pomp and magnificence; and his death was bewailed by shutting up the tribunals of justice, and extinguishing those fires which were universally worshipped as household gods.

The royal residence was, according to the seasons, seven months at Babylon, three at Susa, and two at Ecbatana. But Persepolis, at last, became the ordinary seat of the court. The king's palace was extremely magnificent, and furnished with utensils of inestimable value. The roofs and sides of the apartments were entirely covered with ivory, silver, gold, or amber. The throne was of fine gold, supported by four pillars, richly adorned with precious stones. The royal bed was likewise of gold; and two coffers were placed by it, the one containing five thousand and the other three thousand talents. Herodotus mentions a vine of gold, presented to Darius by Pythius, a Lydian, of which the body and branches were enriched with jewels of great value, and the clusters of grapes, which hung over the king's head as he sat on the throne, were all composed of precious stones. Adjoining the palace were five gardens, planted with the most beautiful trees and flowers; and extensive parks, stocked with all kinds of game for the king's diversion.

With respect to luxury, most of the Persian monarchs were so dissolved in pleasures, that they minded little besides the gratification of their sensual appetites. They drank no water but that of the river Choaspes, which was always carried about with them in silver vessels; no wine was brought to their tables but the Calybonian, made at Damascus in Syria; and no bread was set before them but what was baked from the wheat of Assos in Phrygia. The magnificence of their public feasts exceeded that of almost every other nation; and the most costly viands that could possibly be procured from the surrounding nations were constantly collected for the entertainment of their guests. Athenæus informs us, that among the prisoners taken by Parmenio at Damascus there were no fewer than 277 cooks, of whom twenty-nine provided the dishes, seventeen ministered water, seventy took care of the wine, forty were engaged in the preparation of sweet ointment, and fifty-six were employed in providing the garlands usually worn at the Persian banquets. During the repast, the company were entertained with vocal and instrumental music, and three hundred women of the most melodious voices constantly attended to divert their royal master in his hours of relaxation. It was but seldom, however, that the king admitted any persons to his table except his consort and mother; as it was thought in some measure a degradation of their majesty to appear subject to the same necessities with their guests. This ambition of appearing above the level of other mortals also confined them within the precincts of their palaces, and debarred them from the pleasures attendant on the more salubrious recreations. Tully informs us, that the revenues of whole provinces were lavished on the attire of their favourite concubines, one city being compelled to supply them with ornaments for their hair, another for their necks, &c. and Socrates mentions an ambassador, who, being sent into Persia, spent a whole day before

he reached the boundaries of a territory called the Queen's Head-dress, and another day in travelling through a country which was styled the Queen's Girdle.

The king's children, particularly the eldest, were committed, soon after their birth, to the care of certain eunuchs. At the age of seven years they were instructed in riding and hunting; and at the age of fourteen they were placed under the discipline of four learned tutors, the first of whom was to teach them prudence, the second justice, the third temperance, and the fourth fortitude.

The king's ordinary guard consisted of 15,000 men, who constantly attended his person, and were denominated the *king's relations*, and 10,000 choice horsemen, who attended him in all his expeditions, and were called *immortal*. These guards received no pay, but they were abundantly supplied with all the necessaries of life.

The Persian kings frequently heard causes both criminal and civil; and were generally very tender in respect of the administration of justice. After listening attentively to the merits of a cause, they took several days to reflect upon it, and to advise with their most learned judges before they pronounced sentence. When they sat on a trial of life and death, they considered, not only the crime of which the prisoner stood impeached, but all the actions of his life; and, accordingly as his crimes or virtues preponderated, they condemned or acquitted him.

The royal revenues of Persia, according to Herodotus, amounted to somewhat more than sixteen millions sterling: but this sum was, in later ages, greatly augmented by taxes drawn from Egypt, Syria, and several provinces of Europe.

The ancient Persians are said to have paid more particular regard to the education of their children than any other nation. A son was never admitted to the presence of his father till he had arrived at the age of five years, lest, if he should die before that period, his parent might be too heavily afflicted by his loss. At five years old, the children of reputable Persians were entrusted to the care of learned masters, who carefully implanted in their opening minds an aversion to every species of vice, and allured them rather by example than precept to the practice of all the moral virtues. Every parent had the power of life and death over his own children; but the exercise of this prerogative was only allowable for capital offences, or the repetition of great crimes.

No nation was ever more ready to adopt foreign customs than the Persians. They had no sooner vanquished the Medes than they assumed their dress. After the subjugation of Egypt, they used the Egyptian armour; and, as soon as they became acquainted with the Greeks, they imitated them in the worst of vices. They were indulged, by their laws, with a plurality of wives, besides as many concubines as they could conveniently maintain: and a numerous progeny was regarded as the greatest blessing which heaven itself could bestow upon mortals.

The punishments inflicted upon criminals were various. Those convicted of high treason were condemned to have the right hand struck off, and then to suffer decapitation; a sentence which Artaxerxes caused to be executed on the dead body of his brother Cyrus; and those who had terminated the existence of a fellow-creature by poison, were pressed to death between two large stones; which punishment was inflicted upon a woman called Gigis, for having conspired with Parysatis to poison queen Statira. But the most severe punishment known in Persia was the inhuman one of fastening the culprit between two boats in such a manner that he was unable to move, though his head, hands, and feet, were left uncovered. His face, exposed to the rays of the sun, was smeared with honey, which invited innumerable swarms of flies and wasps to torment him; while the worms that bred in his excrements devoured his entrails; and the executioners compelled him, by thrusting sharp iron instruments into his eyes, to receive nourishment, for the express purpose of

prolonging his excruciating agonies. Plutarch affirms, that Mithridates, whom Artaxerxes condemned to this punishment for pretending to have killed his brother Cyrus, lived under this complication of torments seventeen days; and that, when the uppermost boat was taken off, at his death, his body exhibited a spectacle too shocking for description.

The contempt of riches frequently expressed by the ancient Persians serves to show that they were entire strangers to trade and commerce, as objects of gain. Previously to the conquest of Lydia, they had no money, nor any clothing but the skins of beasts; but, after the reduction of Lydia, they seem to have applied themselves to trade and navigation, in order to barter such articles as they could easily spare for those commodities which their country wanted. Their learning appears to have been very inconsiderable to the time of Zoroaster, who is thought to have flourished under the reign of Darius Hystaspes, and was the most famous philosopher and mathematician of the age in which he lived.

Anciently, the Persians were all trained to military exercise, but more particularly to the use of the bow; whence the *bow of Elam* is mentioned, by the prophet Jeremiah, and the *quiver of Elam* by Isaiah, as weapons peculiar to this nation. Their armour consisted of a tiara, or head-piece of great strength and thickness; a coat of mail, wrought in likenesses of scales, and embellished with sleeves of various colours; and a wicker shield or target. Over this they wore great coats of purple; but the king's was white, by which he was known, and frequently singled out by the enemy. It was accounted disreputable among the grandees of this nation to appear in public but on horseback: hence the Persians strove to emulate each other in the richness of their caparisons, their very horses, as Dionysius expresses it, champing the purest gold: and they sometimes entered the field of battle in splendid chariots, drawn by four, six, or even eight, horses.

The magnificence of their expeditions may be learned from Herodotus, who gives the following description of the march of Xerxes's army. "The baggage, carried by servants on beasts of burthen, appeared in front, and was followed by a body of troops, consisting of men of all nations miscellaneously arranged; next advanced a thousand horsemen, and the like number of spearmen, with their spears pointing downward, preceding ten beautiful horses, caparisoned with sumptuous furniture, and consecrated to Jupiter. After these came the chariot of Jupiter, drawn by eight white horses, a conductor on foot holding the reins. The king immediately followed in a chariot drawn by Nisean horses, and attended by a thousand chosen spearmen. After these came a body of cavalry, consisting of a thousand chosen Persians, and they were followed by ten thousand Persian foot, of whom one thousand were armed with javelins, embellished with pomegranates of gold; and nine thousand had pomegranates of silver. The rest of the forces then advanced promiscuously, and closed the grand procession."

When they designed to make war upon any nation, they sent heralds to demand of them earth and water, thereby commanding them to acknowledge the king of Persia as sovereign lord of their country. In time of action, the king animated his forces by his presence and exhortations; and the signal, which was given by sound of trumpets, was always followed by an universal shout of the army. Those who died on the field were accounted peculiarly happy; and such as abandoned their posts, or evinced a cowardly disposition, were condemned to exemplary punishments. They never fought in the night, marched before sun-rise, nor used any stratagem independent of their own valour; whence Ammianus Marcellinus observes, "they deemed it base and unfair to steal a victory."

Previously to their taking the field, the forces passed in review before the king, or commander in chief, each man throwing an arrow into a basket. These were sealed up

up with the royal signet till the end of the campaign, when the soldiers again passed muster, every one taking an arrow out of the same basket. The remaining arrows were then counted; and thus the Persians ascertained the number of their dead.

With respect to their *religion*, the Persians are supposed to have been originally instructed in the worship of the true God by their progenitor Elam; and to have been recovered from certain heretical opinions by the patriarch Abraham, in whose time the oriental nations were overpowered with a false religion, commonly known by the name of Zabiism. If, however, this was the case, a second corruption must have ensued, and engaged the people in superstitious acts of reverence to the celestial bodies, and in other practices incompatible with the true faith.

The splendour of their religion, however, was never so far obscured as to admit any degree of comparison between it and the worship of the neighbouring heathen nations, for, while they abandoned themselves to the most absurd idolatry, and multiplied their representations of numerous deities, the Persians zealously adored one all-wise and omnipotent God, whom they held to be infinite and omnipresent: so that they abhorred the idea of representing him by images, or of circumscribing his presence within the narrow bounds of temples. The worship of Venus was indeed introduced in the decline of the ancient Persian empire; but it was boldly reprobated by the Magi, who remained firm to this article of their creed, "There is one God;" a principle which they carefully transmitted to their posterity.

The greatest religious objection to which the Persians have rendered themselves liable, results from their veneration of the sun and of fire; and from those symbolical representations, called Mithraic figures, which adorned certain caves, after the time of the learned Zoroaster. But, from the enquiries and researches of various impartial and literary men, it appears that even these things were formerly misrepresented. As to their peculiar respect for the Sun, it is founded on their belief that he is the noblest creature of the Almighty, and the immediate seat or throne of the Holy One; and with regard to their veneration for the element of fire, they avow that they have chosen it as the purest symbol of the Divine Nature. A declaration which must gain some degree of credit, if we take a retrospective view of certain events and customs in the *Jewish* history, such as the revelation of God to Moses in the *burning bush*; the pillar of *fire* which preceded the Israelitish host in their removal from Egypt; and the *never-dying fire* that was kept on the altar of burnt offerings at Jerusalem. As to the figures of the sun, the planets, and other heavenly bodies, which ornamented some of their retreats, they served only as mathematical symbols for preserving the true system of the universe among the Persians, though they were afterwards introduced into other nations as objects of idolatrous worship.

Though fire was deemed the symbol of divinity among the Persians, the other elements were also highly honoured by them; inasmuch that they suffered the bodies of their deceased friends to be devoured by birds and beasts of prey, to avoid polluting the *earth* or infecting the *air*; and they universally believed, that whoever wilfully polluted *water*, with the bones of dead creatures or other abominations, deserved punishment of the most dreadful kind both in this world and in the next. This attachment to purity, and especial regard to water, seems justified by the Mosaic precepts for corporal purification, and by the great advantage of preserving cleanliness in a climate so hot as that of Persia.

Their priests, who have been branded, by the prejudiced or misinformed, with the name of *fire-priests*, were in reality entitled to the appellation of *priests of the Almighty*, for they read every day certain public prayers, and performed other sacerdotal offices, exclusive of their attention to the sacred fire. They never confessed their

offences to any but the most High, nor besought a remission of them from any except him, though they inclined to perform those devotional acts before fire or before the sun, as a symbol of the Deity, and a witness of their actions. In like manner the Israelites confessed their sins to God in the temple while the sacred fire flamed on their altar; so that the religious practice of the Persians seems to have been in a great measure free from idolatry, though it was strongly tinged with superstition.

In the most ancient times the Persians were destitute of temples, but erected altars, for the preservation of their sacred fires, on the tops of mountains and other solitary places. At length Zoroaster persuaded them, for the sake of convenience, to build, over each, a *pyreum*, or fire-temple. This, however, had no relation to Mythra, or the Sun, towards whom they could better testify their respect in the open air; neither did it militate against their favourite principle, that the Lord of the universe should not be enclosed within walls; for the pyreum was not designed to circumscribe what they esteemed an *image* of the Deity, but only the *symbol* of his purity, or the *shadow* of his nature.

After the conquest of Persia by the Saracens, the religion of Persia became that of Mahomet, of the sect of Ali. The only remnant of fire-worshippers, or Zoroastrians, are perhaps the *PERSEES*. See that article, p. 648.

The ancient Persians did not measure the subdivisions of their months by weeks, but gave a particular name to every day in the month, and to every month in the year, which they adopted from certain angels, supposed to preside over, and to influence, all the actions of those periods, committed by Omnipotence to their care. The presidents of the months were regarded as a superior class to the rulers of the days. It was considered as a high disrespect to address to one angel the prayer proper to the day of another. The first month of the Persian year commenced, from high antiquity, at the vernal equinox, and was formerly named, together with its angel, *Fire*: but the sultan Jalaluddin, about the end of the eleventh century, reformed the Persian computation of time, and transposed the places of the months in the calendar.

Farwardin (March) is so named from an angel supposed to be treasurer of Paradise. On the first of this month, called *nouroos*, or new-year's day, began the principal festival among the Persians, which lasted six days. On the eve of the new year, a young man of elegant figure, personating the new year, was stationed at the door of the royal bed-chamber, which he entered, without ceremony, the moment the sun appeared above the horizon. The king immediately addressing him, said "What art thou? Whence dost thou come? Whither dost thou go? What is thy name? Wherefore dost thou approach? What dost thou bring?" To which he answered; "I am the fortunate and the blessed: I am sent hither by God, and bring with me the new year." Then sitting down, another appeared with a large silver dish, in which were wheat, barley, pease, vetches, sesamé, and rice, (seven ears and nine grains of each,) with a lump of sugar, and two new-coined pieces of gold, which, as an offering, were placed before the king. Then entered the prime minister, the general of the forces, the lord high treasurer, and the superintendent of war: after whom followed the nobles and people, according to their dignity and respective classes. A large loaf, made of the above-mentioned grains, being then presented to the king; after eating part of it, he offered some to those who were around him, saying "This is the new day, of the new month, of the new year, of new time; when all things consistent with time must be renewed." With these words, he gave robes of honour to his officers.

On the first of the six days of this festival, the king was wholly engaged with the welfare of his people, and the means of rendering them happy. The second he devoted to the astrologers and other learned men; the third to his priests and to his counsellors; the fourth to the princes

princes of the blood and the grandees; the fifth to the children of the royal family; and the sixth to his subjects generally, receiving on that day the presents which they were accustomed to make him.

Such were the ceremonies of the Persian new year, at court. At the autumnal equinox they were not wholly unlike, though somewhat differently conducted. The angel of the month *Mihir* (September) was supposed to be the intelligence which regulated the Sun, and to preside over love and friendship. On the 16th, being this angel's particular day, began one of their greatest festivals called *Mihrgan*. The king on the first day of this festival, after anointing himself with the oil of *ban*, (as did all his subjects who could procure it,) dressed in a superb robe of many colours, his head adorned with the royal *taj*, (diadem,) on which was a splendid figure of the Sun, seated himself on his throne; when the high-priest, entering alone, with a large silver dish, filled with sugar, peaches, quinces, apples, citrons, pomegranates, the jubbe, the lote, a bunch of white grapes, and seven myrtle berries, muttered over them a prayer, and presented them to the king, who ate of them all; after which the nobility and others, approaching according to their rank, followed the sovereign's example; when a variety of robes and other rich furniture, from the royal wardrobes, were distributed amongst them in proportion to their degree. On this day it was esteemed fortunate to wear or name children; and, if a son was then born to the king, he was immediately, with great solemnity, consecrated high priest of the Sun.

Murdad, (July.) This angel was one of the reputed guardians of trees, herbs, fruits, and seeds. *Murdad*, amongst other attributes, is supposed to be the presiding angel of Winter; but that must, apparently, have been when his month (now July) corresponded with November, for the same reason that the ridiculous parade of *Kusah nishin* (the procession of *Kusah*), mentioned to have been celebrated in the month Azur, must apply to it when coinciding with the vernal equinox. This festival, however whimsical it may appear to us, was solemnized in Persia, by all ranks, from the prince to the peasant. An old toothless beardless figure, representing Winter in his departure, was mounted on a mule or ass. He was generally some poor buffoon, (if one-eyed so much the better,) who, by ludicrous gesticulations afforded much mirth to the people; some sprinkling him with warm water and giving him hot victuals, whilst others were drenching him with cold; *Kusah* all the while fanning himself, and exclaiming, *Garma! garma!* O heat! heat! He had a crow in one hand, and a fan or scourge in the other; and was attended even by the family of the king, or of the governor of the city, who accompanied him on horseback through the whole of the fantastic ceremony. In this manner he paraded the streets, entering the house of every nobleman, who was obliged to give him a piece of money, if he did not wish to have his clothes bedaubed with a piece of red clay, which, dissolved in water, he carried by his side, in a little earthen vessel. He then went into every shop, the owners of which took especial care to have their money ready, for a moment's delay gave *Kusah* a right to seize all that was in them. Whatever was thus collected before the first prayers, became the property of the king, if in the metropolis, or of the governor in any other city; but from that hour until the second prayer, the receipts were reserved by *Kusah* himself, who then suddenly disappeared; for, if this representative of Winter was found in public after that time, any person might beat him with impunity.

On the same grounds, we must place in the month of *April*, another festival of a more dignified nature, which they celebrated anciently on the 8th of the month *Dajj* (December), called *khurm roz* (cheerful day); when, according to the Farhangi Jahanguiri and other authors, the king of Persia, clothed in white robes, descended from his throne, and seating himself on a white carpet, the

farapardah (or veil before the royal throne) was thrown open, and all his subjects were admitted to his presence. The husbandmen were treated with particular respect, some of their chiefs dining at the same table with their sovereign, when he addressed them in the following strain: "I am one of you; my subsistence, and that of my people, rests on the labour of your hands; the succession of the race of man depends upon the plough; without you we cannot exist; but your dependence upon me is reciprocal; we ought, therefore, to be brothers, and to live in perpetual harmony."

We cannot possibly be displeased with the attention paid by the sovereign to husbandry, or husbandmen; but we confess, that the following custom affects us still more closely. We have indeed heard, in our own country, of privileges appertaining to the ladies in leap-year, in the choice of their lovers; but it seems that in Persia every year has leap-year privilege, though restricted to one month, and to one day of that month; but then, in revenge, it extends to married women as well as to maidens; and includes husbands as well as bachelors, under its dominion. *Sapandarmuz*, (February, xiith month.) To this angel they assigned the care of the earthly globe, and also the guardianship of virtuous women; in consequence of which, the fifth, his peculiar day, was considered as highly auspicious to every circumstance relative to marriage. One of the names of this day, was *mard giran*, (taking or governing men,) founded, as they say, upon a custom which prevailed in ancient times of vesting the ladies on that day with despotic power, the husbands paying an implicit obedience to the most arbitrary commands of their wives; whilst the virgins, in their respective classes, had the singular privilege of choosing for themselves a husband from among the unmarried part of the male sex; who, they say, had too high a respect for this gallant institution to hesitate a moment in receiving their fair admirers. The pairing of the birds about this season might possibly have suggested those inducements to matrimony, as well to the west as to the east; Valentine's day, in old times, with some variation of ceremony, bearing a strong resemblance to this Persian festival. (From Wilkins's edit. of Richardson's Persian Dict.)

OF PERSIA UNDER THE MAHOMETAN DYNASTIES, TO THE PRESENT TIME.

The history of all the dynasties which we have enumerated, and those to which we are proceeding, will be found to be very nearly the same. A military leader, dissatisfied with the court, and of an enterprising genius, attaches to his standard companions of a similar character. His first successes are rewarded by an ample spoil, which generosity or policy induces him to divide. Numbers flock to his banners. Ambition and avarice are his auxiliaries; and he has only to contend against a feeble sentiment of attachment for an unknown prince, who possibly might not possess a single quality calculated to inspire it, and whose name had furnished a sanction to every species of misrule. The people remain passive spectators of the approaching contest: and the royal phantom vanishes as soon as it is attacked. The commander, who now ceases to be a rebel, commences the functions of sovereignty. Bred up in habits of business, and inured to the conflicts of active life; aware that he possesses power by a precarious tenure, he endeavours to make himself respected as well as feared: his discipline is severe; abuses in the administration are corrected, and every department of the state rigorously scrutinized. A comparison of his rule with the luxurious indolence and effeminacy of the preceding reign, is entirely to his advantage. At his death, he transmits to his successor a throne supported by the experience of its beneficial effects, and defended by an army formidable by its numbers, its discipline, and its attachment. His son, who probably fought and conquered by the side of his father, pursues the same policy, extends his dominions, enforces his regulations, and enacts

new ones, the result of experience. The kingdom becomes great and prosperous; and it is in this reign that it probably reaches the utmost elevation it is destined to attain. The third monarch of the dynasty, born to a throne, and enervated by sensual delights, retains the civil polity of his ancestors, but delegates to others the ruder task of fighting his battles. He is usually a great patron of literature, and aims at a different sort of fame. If his talents be considerable, his manners popular, and the state of the circumjacent countries favourable to tranquillity, he too is succeeded by his son, who is probably the last of the race who mounts the throne; and these Saturnian years roll round again. Such is the brief outline of an eastern dynasty, on the supposition most favourable to peace, viz. that the authority of a despot survives him long enough to regulate the succession.

Persia continued to be subject to the Arabs till the decline of the Saracen empire, when it was seized by various usurpers, till the time of Gengis Khan, who conquered it as well as almost all the rest of Asia. See the article HINDOOSTAN, vol. x. p. 17-21. After his death, which happened in the year 1226, Persia, together with the neighbouring countries, were governed by officers appointed by his successors, who reigned at Kæarakorom, in the eastern parts of Tartary, till the year 1253, when it became once more the seat of a mighty empire under Hulaku the Mogul, who in 1256 abolished the caliphate, by taking the city of BAGDAD, as related under that article, vol. ii. p. 618. After the death of Hulaku, his son Abaka succeeded to his extensive dominions; and his first care was to shut up all the avenues of his empire against the other princes of the race of Gengis Khan, who reigned in different parts of Tartary. His precautions, however, were of little avail; for in the very beginning of his reign he was invaded by Barkan Khan, of the race of Jagaty the son of Gengis Khan, from Great Bukharia, with an army of 300,000 men. Abaka was but indifferently prepared to oppose such a formidable power; but, happily for him, his antagonist died before the armies came to an engagement, upon which the invaders dispersed and returned to Tartary. In the year 1264, Armenia and Anatolia were ravaged by the Mamelukes from Egypt; but they were obliged to fly from Abaka, who thus seemed to be established in the possession of an empire almost as extensive as that of the ancient Persian kings. His tranquillity, however, was of short duration; for, in 1268, his dominions were invaded by Borak Khan, a prince likewise of the race of Jagaty, with an army of 100,000 men. He quickly reduced the province of Chorasan, where he met with little opposition, and in 1269 advanced as far as Aderbijan, where Abaka had the bulk of his forces. A bloody battle ensued; in which Abaka was victorious, and Borak obliged to fly into Tartary, with the loss of all his baggage and great part of his army. Abaka died in 1282, after a reign of seventeen years, not without suspicion of being poisoned; and was succeeded by his brother Ahmed Khan. He was the first of the family of Gengis Khan who embraced Mahometanism; but neither he nor his successors appear to have been in the least versed in the arts of government; for the Persian history, from this period, becomes only an account of insurrections, murders, rebellions, and poisonings, till the year 1335, when it split all to pieces, and was possessed by a great number of petty princes; all of whom were at perpetual war with each other till the time of Timour the Lame, or Tamerlane, who once more reduced them all under one jurisdiction. See the article MOGUL, vol. xv. p. 615.

The chief of the exploits of Tamerlane are related under HINDOOSTAN, vol. x. p. 23-32. His conquests, indeed, were so numerous and extensive, that in a work of this kind it is impossible they can be comprised in one article. This most celebrated of oriental conquerors, was born in the village of Sebzar, in the territory of Cash, forty miles to the south of Samarcand, in the year 1336. His ancestors were the hereditary chiefs of that district,

and derived their descent from a family related to the imperial throne of Gengis Khan. At the time of his birth, anarchy prevailed in that part of the east; and, after a series of domestic feuds, the khans of Cashgar, with an army of Getes, or Calmucks, invaded the kingdom of Transoxiana. In 1357, Timour, having lately lost his father, put himself at the head of his followers for the purpose of delivering his country, in which at length he succeeded; and was then, at a general diet, in 1370, seated on the throne of Zagatai, at the city of Balk; after which he repaired to Samarcand, which he made the seat of his empire. But this elevation, so far from satisfying his ambition, only opened farther prospects to it. In some succeeding years he reunited to Zagatai its former dependencies, Charizm and Candahar. He next turned his attention to the kingdom of Iran, or Persia, then divided, as we have just remarked, among several usurpers. He first reduced to submission Ibrahim prince of Shirwan. He then attacked Shah Mansour, prince of Fars, or Persia Proper, whom he defeated in a bloody battle under the walls of Shiraz, in which Mansour was slain; and the extirpation of all his male progeny secured the conquest. From Shiraz his troops advanced to the Persian gulf, and the rich city of Ormuz escaped destruction by the payment of a large contribution. Tamerlane then passed as a conqueror through the whole course of the Tigris and Euphrates from their mouth to their sources; entered Edessa, and reduced the Christians in the mountains of Georgia. He now resolved to retaliate upon the Getes their invasion of his native country; and, passing the Sihoon, he subdued the kingdom of Cashgar, and marched seven times into the heart of their territory. In his expeditions he penetrated to the distance of 480 leagues to the north-east of Samarcand, and his emirs crossed the river Irtysh into Siberia. Kipzak, or Western Tartary, was another great scene of his actions. Toctamish, a fugitive prince of that country, had been entertained in his court, and was sent back with an army which established him in the Mogul empire of the north. After a reign of ten years he turned against his benefactor, and with a mighty army entered Persia through the gates of Derbend, passed the Sihoon, burnt the palaces of Tamerlane, and obliged him to contend for his capital and empire. Toctamish was defeated, and his insult was retaliated by two invasions of Kipzak, with such mighty hosts that the wings of Tamerlane's army were thirteen miles asunder. After a march of five months through tracts in which the footsteps of man were rarely beheld, Toctamish was again encountered and routed. The pursuit carried the conqueror into the tributary provinces of Russia; and a duke of the reigning family was made captive in the ruins of Yeletz, his capital. In 1398, his insatiable ambition instigated him to the invasion of the rich country of Hindoostan, where the soubahs of the provinces were in a state of rebellion against the weak sultan Mahmood. He advanced to Dehli, overthrew the opposing army of Mahmood with its elephants, and made a triumphal entry into that capital, which he desolated with pillage and massacre. He had already made prodigious sacrifices of infidels and idolaters to his religious zeal; but, resolving still further to merit the rewards due to victors in a holy war, he advanced a hundred miles to the north-east of Dehli, passed the Ganges, and in various actions slaughtered great numbers of the Guebres, or fire-worshippers.

When on the banks of the Ganges, he was informed of great disturbances on the confines of Georgia and Anatolia, of the revolt of the Christians, and of the ambitious projects of the Turkish sultan Bajazet. He thereupon gave orders to his commanders to return in separate bodies by the routes marked out for them, distributed rich presents among them and the Indian lords who had accompanied him, and, quitting the main army, hastened back to Samarcand. After some months of repose, he proclaimed a seven-years' expedition to the western parts of Asia, granting to those who had served in India their option

option to accompany him or stay at home, but commanding all his Persian military subjects to assemble at Ispahan. He first proceeded, A.D. 1400, against the Georgian Christians, whom he reduced to the alternative of tribute or the Koran, offering however to those whom he had taken prisoners no other choice than death or abjuring their religion. On his return from this warfare he gave audience to the ambassadors of Bajazet; and some time was spent by these mighty monarchs in mutual complaints and menaces, expressed in terms of coarse provocation. At length Timour laid siege to Siwas or Sebaste, a city on the borders of Anatolia, which he took and destroyed, cruelly burning alive the Armenian garrison of 4000 men. He then invaded Syria, where Barkok, a Circassian, who had possessed the throne of Egypt some years before, had defied his power. His son Farage imitated his example, and his emirs were assembled at Aleppo to repel the hostile attack. They issued forth to the plain with a numerous and well-appointed force to engage Tamerlane, whose front was covered with a line of Indian elephants, carrying turrets filled with archers, and Greek fire. The terror they occasioned, with the rapid evolutions of the Mogul cavalry, threw the Syrians into disorder, who fled hastily to the city, which the enemy entered with them. The citadel after a short defence was surrendered, and Tamerlane became entire master of this opulent capital. While its streets were streaming with blood, and resounding with cries, the victor held a theological conference with the doctors of the law. He concluded it with saying, "You see me here, a poor, lame, decrepit, mortal; yet by my arm the Almighty has been pleased to subdue the kingdoms of Iran, Touran, and the Indies. I am not a man of blood; and God is my witness that in all my wars I have never been the aggressor, and that my enemies have always been the authors of their own calamity." At this instant, however, his soldiers were occupied in making up a certain tale of heads of the enemy, required by his peremptory orders, which, according to his custom, were afterwards piled up in columns and pyramids.

After the capture and pillage of some other places, the siege of Bagdad was entered upon. Tamerlane came before it in person, and, having entirely blockaded it, delayed an assault in expectation of a voluntary surrender. The inhabitants, however, held out in despair to the end of forty days, when a storm was ordered; and the death of some of the assailants was revenged by a massacre which produced a pyramid of 90,000 heads. The city was entirely razed, with the exception of mosques, hospitals, and colleges. The conqueror then revisited Georgia; and, having settled affairs in those parts, he declared his resolution of turning his arms against the Ottoman emperor.

Two years had passed since it had become manifest that an encounter between these powerful and ambitious sovereigns was to be expected, and the Syrian expedition of Tamerlane had given time for Bajazet to make adequate preparations for meeting the dreaded conflict. After a very sanguinary and well-disputed combat, the great contest was decided by the defeat and capture of the Turkish emperor. The battle of Angora was fought in July 1402. Concerning the treatment of the imperial captive, very different accounts are given by historians of different nations. See *BAJAZET I.* His death, however, in the next year, put him out of the reach either of the generosity or the arrogance of the conqueror.

The conquests of this Tartar now extended from the Irish and Volga to the Persian gulf, and from the Ganges to the Archipelago; and the terror of his name was felt beyond these limits. The want of shipping prevented him from crossing into Europe; but Soliman, the son of Bajazet, thought proper to soothe him by presents, and accepted a patent of investiture from him for his kingdom of Romania; and the Greek emperor submitted to pay him the same tribute which he had agreed to pay the Turkish sultan. The sultan of Egypt also, who thought himself in danger of an invasion, manifested his submission

by causing prayers to be read, and money coined, in Tamerlane's name, and sent an embassy with presents to bespeak his favour. The final conquest of Georgia, and the pacification of some disturbances which had occurred in Persia, employed the Tartar emperor for some time on his return from Turkey, and he did not arrive at Samarcand till the summer of 1404. In that capital he displayed his magnificence and power in dispensing rewards and punishments, attending to the complaints of his people, erecting palaces and temples, and giving audience to ambassadors from Egypt, Arabia, India, Tartary, Russia, and Spain. The marriage of six of his grandsons was celebrated with all the pomp of an eastern court, and the sovereign seemed happy in a temporary dereliction of his cares and his authority. But, though he had in a public assembly some time before expressed himself as satisfied with the wide limits of his empire, a project of ambition more vast than any he had hitherto entertained occupied his mind; which was no less than the conquest of China. The preparations made for this mighty enterprise were on a correspondent scale of magnitude. Two hundred thousand veteran soldiers were mustered, who were provided with ample means of conveying necessaries to serve them in their long march over the deserts which separate Samarcand from Peking. The aged emperor mounted his horse in the winter season, crossed the Sihoon on the ice, and advanced to the distance of three hundred miles from his capital, when at the camp of Otrar he was seized with a fever, which fatigue, and the imprudent use of iced water, soon rendered mortal. Aware of his condition, he summoned round him the empresses and principal emirs; and, having declared his grandson Mehemet Jehan Ghir his universal heir and successor, and exacted an oath of obedience to him, he expired on April the 1st, 1405, in the 70th year of his age, and the 35th from his elevation to the throne of Zagatai. He left fifty-three descendants, and a name still highly revered in the east; and his posterity are to this day invested with the title of the Mogul emperors, though the power and dominion have passed into other hands. Tamerlane was tall and corpulent, with a wide forehead and large head, a pleasing countenance, and fair complexion. He had broad shoulders and strong limbs; but was maimed in one hand, and lame of the right side. His eyes were full of fire; his voice was loud and commanding; his constitution hardy and vigorous; his understanding sound; and his mind firm and steadfast. In conversation he was grave and modest, and he prided himself in an attachment to truth. He delighted in reading history, and in discussing topics of science with the learned. His religion was fierce and fanatical, and he had, or affected, the superstitious reverence for omens and prophecies, fairs and astrologers, which is general in the east. He conducted his government alone, without favourites or ministers; and its spirit was absolute and uncontrolled rule. It was his boast to have introduced security and order throughout his wide dominions, and he challenged the praise of a benefactor to mankind; but no conquests have been attended with more destruction of human lives, and more desolation of flourishing cities and districts, than his were; and his ambition prompted him to extend his authority beyond the possible limits of a single government. He was not, however, a mere barbarian conqueror; but, if his code of laws can be relied upon as genuine, had enlarged ideas of the administration of a great empire. The "Institutions of Tamerlane" have been made known in Europe by two translations from a Persian version; one in English by Major Davy and Professor White, Oxford, 1783; the other in French, by M. Langles, Paris, 1787.

After the death of Tamerlane, Persia continued to be governed by his son Shah Rukh, a wife and valiant prince; but immediately after his death fell into the same confusion as before; being held by a great number of petty tyrants, till the beginning of the 16th century, when it

was conquered by Shah Ismael Sefi; of whose family we have the following account. His father was sheik Hayder, the son of sultan Juneyd, the son of sheik Ibrahim, the son of sheik Ali, the son of sheik Mufa, the son of sheik Sefi, who was the thirteenth in a direct line from Ali, the son-in-law of the prophet Mahomet. When Tamerlane returned to Persia from the defeat of Bajazet the Turkish sultan, he carried with him a great number of captives out of Caramania and Anatolia, all of whom he intended to put to death; and with this resolution he entered Ardebil, or Ardevil, a city of Aderbijan, about twenty-five miles to the east of Taurus, where he continued for some days. At this time lived in that city the sheik Sefi, above mentioned, reputed by the inhabitants to be a saint; and, as such, much revered by them. The fame of Sefi's sanctity so much moved Tamerlane, that he paid him frequent visits; and, when he was about to depart, promised to grant whatever favour he should ask. Sefi, who had been informed of Tamerlane's design to put the captives to death, requested of the conqueror that he would spare the lives of those unfortunate men. Tamerlane, desirous of obliging him, not only granted this request, but delivered them up to him to be disposed of as he thought fit; upon which the sheik furnished them with clothes and other necessaries as well as he could, and sent them home to their respective countries.

This generous action proved very beneficial to the family; for the people were so much affected with such an extraordinary instance of virtue, that they repaired in great numbers to Sefi, bringing with them considerable presents; and this so frequently, that few days passed in which he was not visited by many. These testimonies of gratitude continued to be shown to his descendants during three generations, until the time of Juneid, grandson of the sheik; when the reigning prince, being of a suspicious temper, forbade them to be continued. Juneid retired to the province of Shirwan, the sovereign of which put him to death. His son was killed in attempting to avenge him; and his two grandsons, named Ali and Ismael, were left exposed to the hatred of his enemies. The eldest of them fell a victim to their machinations: Ismael, the second, escaped, and was educated with great care in Ghilan by a sheik who had been his father's friend.

At this period, (A. D. 1500.) there were numbers of the sectaries of Ali among the Mohammedans of Asia; of these Ismael assembled about seven hundred who were attached to his family, and with them fell upon his father's murderer, slew him in battle, and took possession of his dominions. After this, he pursued his conquests; and, as his antagonists never united to oppose him, had conquered the greatest part of Persia, and reduced the city of Bagdad, by the year 1510. However, his conquests on the west side were soon stopped by the Turks; for, in 1511, he received a great defeat from Selim I. who would probably have crushed the empire of Ismael in its infancy, had not he thought the conquest of Egypt more important than that of Persia. After his defeat by Selim, Ismael never undertook any thing of consequence. He died in 1523, leaving the crown to his eldest son Tahmasp.

The new shah was a man of very limited abilities, and was therefore invaded by the Turks almost instantly on his accession to the throne. However, they were obliged to retreat by an inundation, which overflowed their camp, and which frightened them with its red colour, probably arising from the nature of the soil over which it passed. Tahmasp, however, reduced Georgia to a province of the Persian empire; that country being in his time divided among a number of petty princes, who, by reason of their divisions, were able to make little opposition. Tahmasp reigned fifty-three years. He is renowned for having been the first who desolated his own territories, to prevent the enemy from finding sustenance there. By this practice, the frontiers of Persia and Tur-

key, one of the most beautiful countries in the world, have been reduced to a desert. He was succeeded, A. D. 1575, by

Ismael II. his son, whom he had imprisoned twenty-five years; and who verified the observation, "that the reign of a prince who returns from exile, or escapes from captivity, is always cruel and sanguinary."

Mohammed, the brother and successor of Ismael, (A. D. 1577.) had spent his life in privacy, wholly devoted to religious duties. It was with the greatest difficulty that he was persuaded to assume the reins of government, and then only with the view of preventing the confusion which he was assured his refusal would inevitably occasion. The war with the Turks continued almost the whole of this reign, and was stained on both sides with acts of unnecessary cruelty. Mohammed was greatly distressed for want of sufficient forces to encounter the enemy, both in Georgia and Persia; so that at length the Othmans reduced Tauris, and built a strong fortress in the heart of that province.

Mohammed, at his death in 1584, left three sons. Hamzeh ascended the throne, and was assassinated at the instigation of his brother Ismael III. who succeeded him; but he was also conspired against by some lords of his court, who bribed his barber to cut his throat while shaving him; and the instant that the horrid act was perpetrated, the conspirators with their own hands cut the assassin to pieces, and burned his body, that no trace of the crime might exist.

Shah Abbas, surnamed the Great, was the third son of Mohammed, and was born about A. D. 1558. He was at first governor or king of Chorasan; but, on the murder of his brothers, he succeeded to the throne in 1585. One of his first actions was to put to death, partly with his own hand, his tutor Murshid, to whom he had been indebted for his life and crown, but who showed a disposition to keep him in subjection; and this bloody deed, in a barbarous and despotic country, was considered as an indication of the vigour of character, and ability for governing, which he afterwards displayed.

When he ascended the throne, Persia was divided among more than twenty princes, who had usurped their governments, and rendered themselves independent. There was also a body of troops, resembling the janizaries in Turkey, who kept all former sovereigns under control. These, as well as the leading families, were of the race of Kurchi, or Turknians; and were associated for mutual defence, so as to set the supreme authority at defiance. It was therefore the great object of Abbas to destroy all the ancient families, and reform the refractory troops; a design in the main justifiable, though he pursued it with all the perfidy and cruelty that have ever distinguished eastern policy.

Abbas began his public exploits by a warfare of three years against Abdallah, khan of the Uzbeks, who had invaded Chorasan. It terminated in the capture and death of the khan, and all his family. Abbas then visited Ispahan, with the situation of which he was so much delighted, that he made it the seat of his empire. He next undertook an expedition against the Othman Turks, from whom he re-took Tauris, and various cities and provinces in that neighbourhood; and by an act of the basest perfidy and ingratitude, he massacred all the chiefs of the Curds, who had assisted him in taking the strong town of Orumi. He next subdued the provinces of Shirwan and Ghilan, on the western coast of the Caspian Sea, and made roads through the most difficult parts of those countries. The Turks in the mean time advanced with a prodigious army to Tauris, but were driven back, after some bloody actions, by Abbas. And on a second invasion, two years afterwards, though they took Tauris, and gained several advantages, they were in the end compelled to retreat. An interval of twenty years ensued, during which Persia enjoyed tranquillity; but, at the expiration of this term, the Turks made a third irruption, in conjunction

junction with the Crim Tartars. They were, however, finally repulsed by one of the generals of the shah.

Abbas then made an expedition into Georgia. Finding his soldiers much addicted to the use of tobacco, he prohibited it, and enforced his order by causing the noses and lips of offenders to be cut off. A merchant, ignorant of the prohibition, coming into the camp with some bags of tobacco, was, by the shah's command, set upon a pile of faggots, and consumed in the midst of his merchandize.

This cruel disposition was soon after exercised in a very tragical manner on his own family. Besides a vast number of concubines, Abbas had three wives, who bore him as many sons. The elder, Sefi Mirza, had been instigated by some nobles, wearied with the father's tyranny, to join in a conspiracy against his life, and ascend the throne in his stead. Sefi, with filial duty, discovered the plot to his father; but he thereby infused an incurable suspicion into the mind of Abbas; and this was only to be removed by his death. The father proposed his son's execution to a brave old general, who at the hazard of his own life refused the deed. Another was not so scrupulous. He met the prince coming from the bath on a mule, attended only by a single page; and, seizing his bridle, bade him alight and die, in obedience to the royal pleasure. The prince exclaimed against the injustice of the sentence; but added, "Since it is God's pleasure thus to dispose of me, his will, and the king's, be done." He immediately received two stabs, and fell dead at the feet of his executioner. This act, even in Persia, occasioned a dangerous tumult of the people; and the mother of the murdered prince ran to the shah's apartments, and with bitter reproaches tore his face with her nails. Abbas bore it patiently, and was contented with vindicating his conduct, from the danger of his own life. He even felt poignant remorse. He shut himself up ten days with his eyes covered, lived a month upon spare diet, mourned a whole year, and never afterwards wore clothes which could distinguish him from those of the meanest condition. He likewise converted the place where his son was killed into a sanctuary. His bloody disposition, however, was rather irritated than softened by this disaster. He invited all the khans whom he suspected to a banquet, and caused them to die in his presence by poison; and after having, according to promise, rewarded his son's executioner by making him a khan, he obliged him to cut off his own son's head, that he might feel the wretchedness he had been instrumental in occasioning. That his grandson, of whom he was fond, might not cultivate popularity as his father had done, Abbas caused opium to be administered daily to him, in order to stupify and weaken his faculties.

Soon after the death of Sefi Mirza, the two remaining sons of Abbas were both deprived of sight by the cruel suspicions of their unnatural parent. The fate of one of these princes was (if we can credit the testimony of a cotemporary writer of our own nation) attended with circumstances of the most tragical nature. This youth, whose name was Khodah Bundah, was as much distinguished for his courage and talents as his elder brother; but he was more cautious to avoid that attention which he feared would rouse the jealousy of his father, and he not only kept flatterers at a distance, but hated to hear those just praises which his actions obtained him. This conduct only added to that fame which constituted his danger. The first act by which Abbas showed his suspicion was in ordering the tutor and attached friend of his son to be put to death. Conscious that the only crime of this officer was too great a regard for his master, the prince hastened to court, and, in giving vent to the honest indignation which the conduct of Abbas had kindled, he lost all consideration for his own safety. We are told, that he was provoked to madness, and, in the presence of his father and sovereign, drew his sword. The fatal signal for his death was given; but Abbas relented so far, as

only to deprive him of sight. Shut out from the light of day, the prince became gloomy and desperate; nothing could give him pleasure, and his life passed in venting curses and brooding over plans of vengeance against the author of his being and of his misery. He had two children; of whom the eldest, Fatima, a lovely girl, was a great favourite of her grandfather, over whose mind she had acquired the most astonishing influence. Abbas appeared miserable when little Fatima was not near him, and her voice alone could soothe him when ruffled by those violent passions to which he every day became more subject. The prince learnt, with savage delight, how essential his daughter had become to the happiness of his father; and seizing her, as she one day came to fondle upon his bosom, he in an instant deprived her of life. The astonished mother shrieked, and told him it was his darling daughter that he was destroying. Instead of attending to her, his next effort was to seize his infant son, that he might vent his fury upon him. The child was borne from him by the distracted princess, who sent immediately to inform Abbas of what had occurred. The rage and despair into which the sovereign was thrown gave a momentary joy to his son; who, glutted with his terrible vengeance, concluded the scene by swallowing a dose of poison, which in a moment terminated his miserable life.

Such were the domestic scenes which marked the latter days of Abbas; who, however, still proceeding in the career of conquest, took from the Curds the kingdom of Lar, comprising a considerable part of Fars, or Persia Proper. He also, in 1613, invaded Georgia, then shared between two princes, whom, by his deceitful policy, he detached from their mutual defensive alliance, and then, by means of various acts of perfidy, drove from their kingdoms and ruined. He secured the country by building numerous fortresses and filling them with Persians, and by transporting above 80,000 families of Georgians into different provinces of his own dominions, filling their places with Armenians and Persians. About the same time he took the city of Bagdat from the Turks, and next year repulsed the general who came to recover it. Two years afterwards, the shah's general gave a signal defeat to another Turkish army which advanced for the same purpose. This victory was so welcome to Abbas, that, going to meet his general, he dismounted, and compelled him to ride his horse, while he himself and his khans followed some paces on foot.

One of the most remarkable successes of Shah Abbas was the taking of Ormuz, in the Persian gulf, from the Portuguese; in which exploit he received great assistance from an English fleet, which thus retaliated on the Portuguese the molestation they had given to their trade. The place surrendered to the English, who delivered up the military stores and all the Mahometans to the shah's general, and in return obtained a very advantageous commercial treaty for their nation. This happened in 1622. See *ORMUS*, vol. xvii.

About the end of 1628, Shah Abbas, being at his favourite palace of Ferebad in Mazanderan, fell sick; and, perceiving the disease to be dangerous, he sent for four of the chief men of his council, and declared his grandson Sain Mirza, the son of Sefi, his successor. He commanded his death to be kept concealed till the succession was secured; and for this purpose directed that his body should be daily exposed in the hall of justice in a chair of state for six weeks, with the eyes open, and the back to the hangings, behind which an aga was to stand, who with a string should make a motion with the arm by way of answer to questions proposed from the other end of the hall. By this ridiculous farce his death was kept a secret for six weeks. In order to conceal the real place of his funeral from his subjects, probably through fear of violation of his remains, he ordered his obsequies to be celebrated in three places at the same time. It is probable that he was buried at none of them; but at Cufa,

near the sepulchre of Ali. He died in the seventyeth year of his age, after a reign of forty-three years over Persia, and fifty over Chorasan. Shah Abbas had a fine face, of which the most remarkable features were a high nose, and a keen and piercing eye. He wore no beard, but had large mustachios, or whiskers. In his stature he was rather low; but must have been uncommonly robust and active, as he was throughout life celebrated for the power of bearing fatigue, and to the last indulged in his favourite amusement of hunting.

By the Persians, who are accustomed to perfidy and cruelty, the memory of Shah Abbas is held in great veneration; and it is certain that he was in many respects an useful sovereign to his country. By destroying the power of the independent khans, and the standing army, he introduced peace and good order at home. He was fond of those acts of rigorous justice which render a prince popular, and are easy to a despot; but in these he displayed that cruel and ferocious disposition which appears in all his acts, and often punished the innocent with the guilty. His encouragement of commerce was beneficial to his subjects, though probably he was excited to it only by a desire of enriching himself. He made alliances with European princes against the Turks; and gave privileges to foreigners who were disposed to trade in his dominions. It was by means of his liberality that the Armenians were enabled to extend the silk trade through great part of the East. He settled them in Julfa, a suburb of Ispahan, which soon vied in riches and population with the city itself. An instance of his good sense appeared in the pains he took to substitute a religious pilgrimage to the tomb of the imam Rizza in his own country, to that of Mecca, which carried great sums of money among foreigners and enemies. He adorned his empire with many magnificent and useful works. In short, compared with the ignorant and weak despots who generally occupy the thrones of the East, he may merit the title of *Great*; if that be at all compatible with perfidy, injustice, and cruelty.

While the death of Abbas was concealed from his subjects, one of the principal ministers repaired to the apartments of the princess-mother of Mirza, to demand the young prince. She, suspecting it only to be a contrivance to get him murdered, refused to open her door, till at length force was threatened to be employed. She then delivered her son, with these words: "Go, my child, to join thy father; here are the murderers ready to dispatch thee." But, when she saw those lords prostrate themselves and kissing the prince's feet, her fright was turned into the most extravagant joy. The noblemen conducted the young prince to the royal palace, where they seated him in the divan on a stone table, on which there were as many carpets as there had been kings of Persia of his family; for every king, at his coming to the crown, has one of these carpets, called "carpets of justice," made for him; and, having sent for all the lords in the neighbourhood of Ispahan, they crowned him, kissed his feet, and wished him a long and happy reign. On his accession he assumed the name of Sefi.

The beginning of the reign of this emperor was remarkable for many great victories which he gained over his enemies. He defeated Karib Shah in the province of Kilan; he forced the Turks to raise the siege of Bagdad, and took by assault the fortress of Ervan. At this last place, finding the siege but little advanced after a duration of four months, he grew impatient, and resolved to make an assault on it in person, saying that he would rather die in the attempt than rise before a town which the Turks had formerly taken in three days. He had already put on the clothes of one of his attendants, to prevent him from being distinguished, and had given orders for a general attack; but he was dissuaded from the attempt, till the next day, when the whole army made the assault, and carried the place, though with the loss of fifty thousand men.

Happy would it have been for the world if the emperor

had been one of the slain; but he lived to prove a second Nero, scarcely falling short of that monster in his cruelty. Like him, he was the murderer of his nearest relations. The first object of his brutality was a half-brother, whom, according to the barbarous policy of the times, it was necessary for him to remove; he caused two of his uncles, first to be deprived of sight, and then dashed down a rock, saying, "Since they are blind, what use are they of in the world?" One of his aunts, an extremely beautiful woman, had three sons: she was frequently with the king her nephew, and once rallied him on account of his having no children; the next day he invited her to dinner, and caused the heads of her three sons to be served up in separate dishes; at the same time smiling, he said: "Console yourself, you are young enough to repair the loss." His own wife he stabbed, and his dearest friends he caused to be executed on the slightest pretences. But we will not disgust the reader with a further detail of facts which are a disgrace to human nature, and which the historian trembles in recording. He was the scourge of mankind for a period of thirteen years, though there was nothing in his countenance that indicated so foul a disposition.

He left a son named Abbas, who succeeded him, though only 13 years of age, and whom his father had ordered to be deprived of sight: but the compassion of the executioner had taught the prince to counterfeit blindness, without suffering the savage sentence. On his death-bed the king repented of the treatment which he supposed his son to have endured. The eunuch, perceiving that his grief was not feigned but sincere, promised to restore the prince to sight, and accordingly in a short time after, brought him to the king's bed-side, with his eyes open. The pleasure which Sefi felt on this occasion prolonged his life till the next day, and gave him time to settle the succession according to his mind.

A. D. 1642.—The joy which the people expressed at the change of sovereigns did not last long. Under Shah Abbas II. life was not more secure than under his brutal father. Abbas I. had banished from his court, to a commodious dwelling, a number of useless persons. These the present emperor destroyed, except fifteen whose age precluded them from the expectation of a long life. His sister's children he caused to be starved to death; and four of his wives were, by his command, burned alive.

His reign affords few memorable events. He assisted the prince of the Uzbek Tartars against his own children, who had risen in rebellion; and recovered the province of Candahar from the Great Mogul. His generals made some ineffectual attempts to reduce the prince of Jalkes, whose country lies on the coast of the Indian Sea. Several other military expeditions, of which little is known, took place in his reign. The Shah himself had the character of great capacity, and a good disposition; yet the stories related of him are little to his honour. He was much addicted to excesses in wine and women; and, if not naturally cruel, was however led by intemperance and the spirit of despotism into several acts of cruelty. He was fond of strangers, and had a taste for the arts; which may account for the encomiums he has received from some European travellers; yet Tavernier, who had near access to him, has little better to relate concerning him than some scenes of low debauch, and a trivial curiosity for works of European mechanism. After a reign of twenty-four years, he died miserably in consequence of a venereal disease caught from a dancing-girl, which his irregularity would not suffer to be treated properly. This was in 1666. He was buried at Koni under a magnificent sepulchre, of which a draught is given by the celebrated traveller, Chardin.

As soon as Abbas was dead, notice was sent of the event to his eldest son Sefi, who was immediately saluted emperor, and the ceremony of coronation was regularly performed; which consisted only of girding on the scymetar, and placing the bonnet on the sovereign's head.

Some

Some time after Sefi II. came to the crown, he was seized with a dangerous illness; and the physicians, not knowing the nature of the complaint, threw the blame on the astrologers, who they pretended had chosen an unfortunate moment for the king's enthronement. The ceremony was therefore repeated. A fire-worshipper, descended from the ancient kings of Persia, was fixed on, who was placed on a throne with his back against a wooden figure which was an exact resemblance of him; and to this the great lords did homage as to a king. The ceremony lasted till the arrival of the favourable hour, when an officer of the court came behind and cut off the wooden image, while the mock monarch fled with precipitation. The shah now appeared in the hall, where, being invested with a scymetar, in which consisted the ceremony of inauguration, he ascended the throne, and assumed the name of *Solyman*. From that time the shah recovering his health, the physicians grew in high repute, and the astrologers were disgraced.

An incident is recorded in this reign which must not be omitted here, relating to a daring action of Ali Kouli Khan, a brave man, but of a turbulent and dangerous disposition, on account of which he was often confined. He called himself the king's lion, "because," said he, "I am chained when useless, and let loose when I am wanted." He was a prisoner in a fortress at the death of Abbas, but was treated with so much lenity, that he was even permitted to go out on hunting-parties. Having received, during one of his excursions of this nature, the intelligence of Solyman's accession, as soon as he returned he fell upon the governor of the fortress and nearly killed him. At each stroke he exclaimed, "This is to teach you your duty, and to know better than to suffer a prisoner to go a-hunting whom the king has entrusted to your care." He then set off for court, and related his conduct to the king, who gave him a very gracious reception. The services of this man were afterward of great utility in the wars against the Uzbeks and the Cossacks, which happened during the reign of Solyman.

Solyman proved no less cruel than his predecessors. The acts of this nature recorded of him, and which must render him infamous to posterity, are too numerous to be all recited here. While the famous Chardin was at Ispahan, A. D. 1673, Solyman, being angry with a person who did not play on the lute to please him, ordered the poor man's hands to be cut off; and, as soon as he had pronounced this sentence, he threw himself on a heap of cushions to sleep. His women and domestics were often condemned by him to the most inhuman tortures. His tents were seldom removed in any of his journeys, without exposing to view the mangled bodies of the victims of his cruelty; and at Ispahan scarcely a day passed, but some of his attendants in the palace lost either life or limb; and these punishments he inflicted for the slightest mistakes. In a fit of displeasure against a female Circassian of great beauty and high rank, who had been his principal favourite, he ordered her to be married to a poor man of the lowest order of the populace. They lived together, however, happily; when the monarch, envying their enjoyment, sent for the husband, and demanded what feast or rejoicing he had made on his marriage. "Sire," replied the man, "I am a very poor man, and was not able to make even an illumination." "What!" returned the savage sopher, "that dog did not make an illumination! make one of his carcass." A thousand holes were pierced in his body, into which oil was poured, and wicks inserted; and these being lighted, he was left to expire in excruciating tortures.

This monster died a natural death, after a reign of twenty-nine years, A. D. 1694. He was succeeded by his son Shah Huseyn, the most merciful and most unfortunate prince of his race. He neglected the affairs of the state to such a degree, and suffered himself to be governed so much by his eunuchs, that some of his chief officers, after having reproached him with his inattention, resigned

their employments in disgust. He was wholly occupied with his pleasures, and did not bestow a thought upon any thing else. The number of his eunuchs exceeded, threefold, those of his predecessors. The ladies of his court rode on horses or mules, with each an eunuch to hold the bridle, and the female attendants on asses; while it was one of the emperor's highest amusements to scourge the beasts till they threw their riders. In a pilgrimage which he undertook, he was escorted by more than sixty thousand persons of both sexes, and of all ages. The only instance in which he showed any taste for greatness, was in his passion for magnificent buildings, and to this every thing else gave place: he built monasteries and hospitals, while his troops were perishing with hunger, or dispersed for want of pay. To what a degree he forgot his duty as a king, may be seen from the following instance. On the approach of a rebel army, his ministers endeavoured to rouse him out of his lethargy, by representing to him the magnitude of the danger. "It is your business," said he, "to look to that; you have armies provided: for my part, if they but leave me my house at Farabad, I shall be content."

For more than twenty years, which his reign lasted, he never once passed sentence of death, and consequently never put on the red habit, which was the colour worn by the kings of Persia when they were to pronounce judgment for capital offences.

There are few, if any, instances of a dissolution so entire as that of the kingdom of Persia under the feeble and inactive Huseyn. It began at the capital. The sopher resided there, who was unconscious of what was going on, till an event of importance awakened him from the stupor into which he had fallen. The province of Candahar, situated between the Mogul dominions and Persia, alternately became the possession of each of these empires. Its inhabitants were a warlike people, inured to fatigue, and divided into tribes, each under the government of a chieftain. The principal was that of the *Afghans*, or *Patans*. This people had been long treated ill by the Persians: they complained and fought for redress. Instead of attention being paid to their demands, every species of violence was committed on them; and Mir-Weis, one of their leaders, was apprehended and sent to Ispahan, as a fomentor of the discontents. Mir-Weis saw it necessary for him to act with caution and prudence. He attached himself to a party in the court, and had the address to render the governor, Gurchin Khan, himself an object of suspicion, and did not despair of becoming master of Candahar, by being appointed to watch his motions. His first attempts for this purpose were frustrated; after this disappointment he counterfeited devotion, and undertook a pilgrimage to Mecca. On his return the governor's doubts were entirely dissipated, and he was so firmly persuaded that nothing was to be feared from so holy a man, that he did not hesitate to insult him; he even commanded him to send his daughter to the haram, but this demand cost Gurchin Khan his life. No sooner was the governor thus massacred, than Mir-Weis presented himself at the gates of Candahar, which surrendered after a very slight resistance. During a period of fourteen years, Mir-Weis harassed the Persians; by his good conduct, his speeches, and his victories, he united the other tribes to that of the Afghans, of which he was the leader. He died king of Candahar, A. D. 1715, leaving his throne to Abdallah, his brother, as he thought his children too young for the duties of sovereignty.

Abdallah's love of peace made him willing to put the Persians once more in possession of Candahar. The treaty for this purpose was on the point of being signed, when Mahmud, his nephew, then but eighteen years old, heard of this intention with indignation, and at the head of thirty or forty of his father's friends he entered the palace, cut off Abdallah's head, and was proclaimed king. He then entered Persia, and laid siege to Ispahan. The misery of the people pierced the feeling heart of the unfortunate

fortunate Hufsey n; he offered Mahmud the most advantageous conditions, viz. his daughter in marriage, and the sovereignty of three fertile provinces: but this prince returned for answer, "The king of Persia offers me nothing that is not at my disposal already. The present dispute is, whether he or I shall have possession of the empire."

Such was the language of Mahmud the Afghan. The origin of the Afghan tribes, who inhabit the mountainous tracts between Chorasan and the Indus, is variously traced by different historians. Some assert that this people are lineally descended from the Jewish tribes made prisoners by Nebuchadnezzar, and the principal chiefs are said to trace their families to David and to Saul. Though their right to this proud descent is very doubtful, it is evident, from their personal appearance, and many of their usages, that they are quite a distinct race from the Persians, Tartars, and Indians; and this circumstance alone seems to give some appearance of credibility to a statement, which is contradicted by many strong facts, and of which no direct proof has yet been produced.

There is no doubt that the Afghan tribes were converted at a very early date to the Mahometan religion; they are of the sect of Omar. Their condition, from the first periods of which we have any authentic records of their history, has undergone very little change. Their chiefs have always been more anxious for personal independence than for the strength of the government under which they lived; and their followers have enjoyed a savage freedom, which made them hostile to every effort to reduce the clans into one mass, which it was obvious could never be effected without a subversion of that order of society in which they were born, and in which they gloried. It cannot be surprising that a nation so constituted should have been unable to resist any formidable attack; and we find that the Afghans made hardly any opposition to Mahmud of Ghizni, to Gengis, or Timour, and that their country was long divided between the monarchs of India and Persia; but they were always turbulent and dangerous subjects. They had triumphed over the ruins of the noble city of Ghizni, and a family of their chiefs had sat upon the throne of Delli. The next country doomed to fall by their arms was Persia.

The siege of Ispahan had been turned into a blockade. Two battles had been fought under the walls, in the first of which the Persians were successful; Mahmud's camp was forced, and all his treasures taken; which so dazzled the eyes of the Persian general Havoufa, that he was more anxious to secure this wealth than to pursue the enemy. This avarice cost Persia very dear; for the enemy took possession again of their camp, killed the Persians they found there, and pursued the main army so warmly, that they came up with their rear-guard, attacked them, and retook all the baggage and the treasure, and brought it back with them to their camp. The news of this defeat, in which more than 15,000 Persians perished, besides the loss of their baggage, and 25 pieces of cannon, soon spread all over Ispahan, and spread with it such a terror over the inhabitants, and the king himself, that if the rebels had followed their blow, they might immediately have been in possession of the city and the king; but Mahmud, who could hardly credit his own happiness, and fearful of an ambush, contented himself with advancing slowly; and resolved, moreover, to seize all the passages by which any provision or succours might enter; that so they might reduce it by famine, though they could not take it by force.

The besieged, beholding their town thus blocked up on every side, began to reflect on the miseries of the approaching famine, demanding earnestly that they might be permitted to ally and engage the foe: but Havoufa, who, it was afterwards discovered, was secretly in the interest of Mahmud, did all in his power to prevent it; telling them this was not a proper time, that he waited the command of the king; and that, as soon as ever there

was a favourable opportunity, he would not fail to advertise the king of it. This opportunity, however, was slow in coming; provisions began to fail, and several of the people were already dead by famine. The nobles, as well as the common people, were sensible how absolutely necessary it was to open a passage whereby necessaries might be brought into the city: but the king, whose fear and indolence had shut him up in his palace, would give no ear to any advice; on the contrary, he seemed to take offence, as if their petitions to save themselves by their arms had been an insult upon his authority; and behaved towards his people, in this distress, with imprudence and cruelty hardly to be paralleled. This unaccountable conduct of the king had certainly occasioned a general insurrection in the city, if Achmet Aga, a man valiant and generous, and extremely attached to the king, had not appeased the minds of the discontented, by putting himself at the head of the troops, to go forth immediately, and give battle to the enemy. In the beginning of July, 1722, this ally was made with about 30,000 men: though they were sustained but weakly by Havoufa, they had all the success they could hope for: they slew 2000 Afghans, and obliged more to retire; they seized on several of the avenues, and opened a passage for provisions to enter the city.

This fortunate expedition gave great joy to the inhabitants, but it was not long-lived; for Havoufa, who before only privately favoured the cause of Mahmud, now declared openly for him, and, joining his forces with the enemy, they charged Achmet Aga in front, drove him from the posts he had taken, and put all the Persians they found there to the sword, and pursued the rest so fast, that they could hardly save themselves in the city. This treason of Havoufa, and the defeat of Achmet Aga, damped at once the courage of the besieged, and took from them all hope of ever being relieved. The king, more sensible than any of this misfortune, and not knowing how to act, ordered Achmet Aga to be called, and publicly blamed him for giving too easily into the desires of the people; he charged him with imprudence, and want of duty, in attacking the enemy's intrenchments without special orders; and said, the revolt of Havoufa was occasioned by his rashness, in putting himself at the head of the troops, when the general might with reason believe himself injured and his authority slighted. Achmet Aga said what he could in his defence, and endeavoured to make the king sensible that necessity, the public welfare, and the safety of his majesty's person, were the sole motives that urged him to this enterprise; that, as to Havoufa, he was known a long time to have kept a secret correspondence with the rebel; that the little desire he always showed to oppose him, and his great application to remove every thing that might check his victories, were evident proofs of his infidelity. But, the king being unwilling to hear Achmet Aga on that head, the brave man, uneasy at his master's unjust reproaches, the next night, believing he could no longer live with honour, swallowed poison, of which he died in three or four days. The loss of this great man, whose composition was justice, generosity, and good nature, added to the general grief of the people; and of the king too, who, having too late corrected his prejudices against him, had resolved to intrust to him the care of defending the city, which had indeed need of such a governor, in the miserable situation to which it was now reduced by famine.

Nothing could be more deplorable, than to see to what extremities human nature was reduced by want of food. Imagine every thing painted by Josephus of the city of Jerusalem when besieged by Titus Vespasian, and behold all those horrors in the city of Ispahan. The king, who had but little experience in the art of war, and who gave in too easily to the opinions of people not only unworthy of his confidence but incapable of giving advice, had, in the beginning of the siege, published an edict, forbidding not only the citizens, but even strangers, to
leave

leave the city under any pretence: besides that, whatever people fled thither, through fear of the enemy, from the neighbouring villages, were all received into the city; so that there were within it a multitude of useless mouths; and not only all the houses, but the court-yards, gardens, streets, and every public building, was full; yet notwithstanding this, and after the city was invested, and the avenues stopped, provisions were for a little time at an easy rate, but they soon became excessively dear. Bread was sold in the month of July at nine or ten piafters the pound (about 20s. English), in the month of August it rose to thirty, in the month of September to 100, and in the month of October, when the city surrendered, it was at 200 piafters the pound. Horse-flesh, on which the king himself was obliged to feed, was 1200 piafters the pound, and cats and dogs were dainties, only to be eaten by a very few, and privately; in short, the misery became such, that at last, without horror or shame, the people nourished themselves with human flesh: and one might behold wretches, skeletons themselves, examining human carcases without flesh, of which the streets were full, to find a morsel to sustain the feeble remnant of their languishing lives, and which famine must soon make an end of: others running through the streets with weapons in their hands, and destroying the first they could meet, and greedily feeding upon them afterwards; and mothers, insensible to the cries of the very infants they bore, massacred and eat them. Nor was it only among the vulgar that these unnatural cruelties were used: people of the greatest distinction were obliged to come to the like extremities: some persons indeed of honour chose to die by poison, to prevent their being reduced to these inhuman necessities.

In this sad situation was the city of Ispahan during two long months and a half: the number of the people who died was very great; the gardens and public places were now all turned into cemeteries, and filled with dead bodies; and so many carcases were thrown into the river, that in that year after the siege, nobody could without horror think of eating fish. In a climate less pure and salubrious than that of Ispahan, the air must have been infected, and distemper would have destroyed those whom famine had spared: but no contagion arose, and the miserable remnants of the population of the fallen capital were reserved to witness the further disgrace and humiliation of their king and country. On the 21st of October, 1722, the king came out of his palace, clad in deep mourning; he walked, attended by the nobles of his court, through the principal streets of Ispahan: he bewailed aloud the misfortunes of his reign; imputed them to the bad advice he had received; proclaimed his intention to abdicate his throne; and tried to console the wretched multitude, by whom he was surrounded, with the hopes of more happiness under a better government than his had been. This language, from a prince whose faults (dreadful as their effects had been) were allied to the best virtues of our nature, whose kindness of heart, weak lenity, and extreme gentleness of temper, had brought him, after a reign of twenty-eight years, to the sad and humble condition in which he then appeared, excited a strong and universal feeling of sympathy: men forgot their own sufferings in contemplating those of their sovereign. The heart of Husseyn would have been wounded deeply by their reproaches; and he found, in the tears which they shed over his fate, all the consolation that his situation admitted.

The day after that on which Husseyn took this solemn leave of his subjects, he signed a capitulation, by which he resigned his crown to Mahmud; and, on the 23d of October, leaving Ispahan, attended by some of his nobles and three hundred of his troops, he moved towards the Afghan camp. His ungenerous enemy could not refrain from insulting the fallen monarch; and the melancholy procession was commanded to halt within a short distance of the tents, on the pretext that Mahmud was asleep.

After this delay, which would have been (according to the usage of the country) degrading to one of his subjects, he was at last permitted to proceed to the palace of Ferrahabad, where he was introduced into a great hall, or saloon, in which he found his conqueror seated; and he had reached the centre of this room before the haughty Afghan rose to receive him. Husseyn immediately addressed him in the following words: "Son, since the great sovereign of the universe does not will that I should reign any longer, and the moment has come which he has appointed for thy ascending the throne of Persia, I resign the empire to thee. May thy reign be prosperous!" After this speech, he took the *boorah*, or royal plume of feathers, from his turban, and gave it to the vizier of Mahmud; but that prince refused to accept it from any other but the monarch to whom it belonged. The meek Husseyn rose, took it from the minister, and, while his arrogant enemy remained in his seat, he placed the rich emblem of royal power in his turban, and exclaimed "Reign in peace!" After the usual refreshments of tea and coffee had been served, Mahmud deigned for the first time to speak to his captive. "Such," he observed, "is the instability of human grandeur. God disposes of empires as he pleases: he takes them from one to give to another: but I promise ever to consider you as my father, and to undertake nothing without your advice." The Afghans then took possession of the gates of the city and palace; and thus terminated the dynasty of the Sophis, which had been founded by Ismael Sofi two hundred and twenty-three years before.

In dispossessing Husseyn, Mahmud avenged himself of all those who had contributed to the ruin of the state. He confirmed the Persians in their dignities and employments, except the post of grand-vizier, in which he placed an Afghan. Husseyn gave him his daughter in marriage; and, on that occasion, addressed a circular letter or proclamation to all Persia, in which he enjoined the inhabitants to acknowledge Mahmud as their sole sovereign.

His son Tahmasp, or Thamas, however, did not think himself bound to obey his father's injunction on this head; on the contrary, he caused himself to be proclaimed king in Casbin, a town of Irak. Mahmud's conduct began to inspire the hatred of his subjects; he saw his projects defeated, and himself beginning to be treated with general hatred. He imputed these misfortunes to the anger of Heaven: to avert which, he imposed upon himself a sort of penance which continued fifteen days, and which had the effect of completely deranging his senses. His lunacy was accompanied with a very painful malady, which baffled the skill of his physicians; and in this condition his sufferings only served to increase his cruelty. His captives, seeing him at the point of death, turned their thoughts on Ashraf; but he refused the crown, except on the condition that the head of his cousin Mahmud should be brought to him. Mahmud was then in the last stage of frenzy, and had but a few hours to live: these, however, were abridged, and the destroyer of the dynasty of the shahs enjoyed his triumph but two years.

Ashraf ordered all Mahmud's guards, his ministers, and confidants, to be put to death; he did not even spare those who had placed him on the throne, lest they might do the same good office for another. Mahmud's only son and his mother suffered the same fate. As to the Persians, Ashraf pretended to show particular regard to them. The design he had to draw prince Thamas into his power, and by his death to secure the throne for ever to his family, made it necessary for him to dissemble, and to make an outward show of zeal to the royal family, and to discover a disposition to place the crown upon the head of the lawful prince. Therefore he began his reign with a visit to shah Husseyn, consoled him upon the bloody assassination of his family by Mahmud, and gave him what comfort he could; he caused the scattered bones of his relations to be collected, and placed them under a magnificent mausoleum in the town of Kan, the ancient place of sepulture

of the Persian kings. He sent likewise rich presents to the mosque in which they were placed, and 1000 tomans to be distributed among the poor. After this, with his crown and sceptre in his hand, he came in the most submissive manner, and threw himself at the feet of shah Huseyn, imploring him to take the government of the realm again, or to oblige prince Thamas to take it. Shah Huseyn, who seemed to understand the meaning of this offer, and who knew, if he discovered the least inclination of remounting the throne, his life must answer it, answered, that he was obliged to him for the zeal he expressed to his person; but that, having voluntarily quitted the government, he could not by any means think of taking it again; and, as to what regarded his son, he would not intermeddle, nor oblige him to accept a dignity which perhaps he might make a very ill use of.

Ashraf, still concealing his purpose, seemed as if he were uneasy at this determination of Shah Huseyn. However, that he might not be wanting, as he said, in his respect and duty, he sent a magnificent embassy to prince Thamas, with considerable presents, and horses richly caparisoned, inviting him to come and take possession of the throne, and praying that he would please to appoint a place where they might meet, and settle affairs in order to it. The prince, too easy to credit what pleased him, came blindly into the net, and appointed the little plain of Teheran for the rendezvous. Ashraf marched immediately at the head of 12,000 men, and arrived first in the plain, and posted his troops in such manner as they could most easily execute his purpose. The prince advanced with only 3000 men; but, having heard that Ashraf had a great number of troops with him, he began to suspect treachery; he therefore sent before him Allam Khan, with 2000 men, reserving only 1000 about his person. Allam Khan, perceiving not only a large army of Afghans, but likewise that all the avenues to the camp were guarded, found it was their design to seize the prince. Upon this he immediately gave him notice, and desired him to take care of himself; and it was time to give him notice, for Ashraf, advertised by his spies of the near arrival of the prince, had privately posted 2500 Afghans behind a hill to cut off every possibility of an escape; so that he was just upon the point of seizing him, when notice was given the prince to take care of his life. The unfortunate prince was therefore obliged to mount immediately, and take refuge with about 200 horse in the town of Teheran. But Allam Khan, foreseeing that Ashraf would besiege the town, advised the prince immediately to leave it; upon which, having refreshed their troops, they marched out, and the prince at their head, in the beginning of the night, and with such diligence, that at break of day they were six leagues from Teheran, on the side of Mezanderan. That which Allam Khan foresaw happened; for Ashraf had invested the town, to the great surprise of the inhabitants, before day-break; but, finding the prince escaped, he in great fury stormed the town, and ordered his soldiers to spare none, but to put all to the sword. After this, the town of Kam, or Sava, was taken; but this he treated with less cruelty than Teheran, for the soldiers only plundered the town, and saved the people.

Ashraf, not thinking it proper to push his conquests farther, returned to Ispahan, where, for the following reason, he meditated the destruction of those few of the nobility who had escaped the sword of Mahmud. The number of soldiers which Ashraf had taken with him to meet the prince, gave a jealousy to the nobles, that this interview was designed more for the benefit of Ashraf than of the prince; and the fears they had lest the prince, whom they tenderly loved, should be surprised, induced them to write to him. The letter was intercepted, and sent to Ashraf, who, to revenge himself of the nobles, caused them all to assemble in the royal palace, under the pretence of asking their advice; and there were they all murdered. At the same time he put out the eyes of an infant,

the grandchild of shah Huseyn; and some say he practised the same cruelty on Huseyn himself, but this is not certain; however, this weak and unfortunate monarch languished in prison about two years longer; when he was put to death, in 1729.

At this time, Nadir Khan, who afterwards became king of Persia and conqueror of the mogul empire, had already acquired a high reputation for valour and conduct. He was born in 1686 at Kallat, a fortress in Chorasan. His father was hereditary governor of a fortress built by his countrymen against the Tartars: he died when Nadir was thirteen years of age; and an uncle took possession of the office which should have devolved to the youth. He was obliged, in order to support himself and his mother, to employ an afs and camel, which were his sole property, in carrying for sale to the next town faggots which he collected in the woods. He was made a slave by the Usbeks, but escaped from them after a servitude of four years. In 1712 he entered the service of a beg, who sent him with dispatches to court; and it is said that he killed his comrade, assassinated his master on his return, carried off his daughter to the mountains, and subsisted for some time on robbery. In 1714 he became gentleman-usher to the governor of Chorasan, which seems to prove, at least, that the crimes imputed to him were not notorious. In this situation his conduct was so laudable, that he was intrusted with a company of cavalry to act against the Tartars. His courage and military talents soon raised him to the command of a thousand horse, in which station he obtained general esteem. When the Usbeks invaded Chorasan with ten thousand men, Nadir offered the governor to repulse them with only six thousand, and completely performed his promise, killing the Tartar chief with his own hand. For this success the governor proposed to procure for him from the court of Persia the post of lieutenant-general of Chorasan; but the shah, receiving an unfavourable impression of Nadir, gave the office to another. Nadir, irritated at his disappointment, reproached his patron in such insolent terms, that he was discharged from the service, after a severe bastinado. Fired with indignation, he retired to the fortress of Kallat, commanded by his uncle; and soon after joined a troop of banditti, at the head of whom he pillaged several caravans, and laid Chorasan and the surrounding provinces under contribution.

At this time the Afghans under Ashraf continued masters of Ispahan, while the Turks and Russians pressed upon Persia in other quarters, so that Shah Thamas, the lawful sovereign, was possessed only of two or three provinces. In 1727 one of the shah's generals in disgust had joined Nadir with fifteen hundred men, which increased his troop to a formidable body. His uncle now wrote to him, promising to obtain his pardon if he would engage in the service of Thamas. Nadir accepted the offer, and repaired to Kallat, which he seized, and murdered his uncle. Thamas was obliged to overlook this villany on account of the occasion he had for his services; and Nadir marched against the Afghans, defeated them, and took possession of Nisabour in the name of the shah. That prince made him a lieutenant-general; and he so well insinuated himself into the confidence of Thamas, that he was able to make him believe that the general in chief had formed a conspiracy against him. That officer was taken off by assassination, and Nadir in 1729 was appointed his successor.

He had now a free career for his ambition, and he began with rendering important services to his sovereign. He reduced the whole of Chorasan, and was recompensed by a title which in that despotic country was regarded as highly honourable: it was that of *Thamas Kouli Khan*, signifying the "Khan, or Lord Slave, of Thamas." His successes alarmed Ashraf, who marched towards Chorasan to oppose him, but was defeated and driven back to Ispahan, which he soon quitted. Kouli-Khan had then the satisfaction of re-instating his king in the capital of his empire; thus rising to the highest distinction

tion a subject could enjoy. He continued in the field; and, pursuing Ashraf, gave him a new defeat, followed by his death, and entirely cleared the country of the Afghans. Among the captives whom he rescued from this people were the aunt and sister of the shah, who gave the first in marriage to Kouli. The general then proceeded against the Turks, gained a complete victory over them, and recovered Hamadan and Tauris. While he was absent in another part, Thamas marched in person against the Turks, and met with a defeat, which induced him to make peace with that power. Kouli strongly opposed the peace; and being desired, after its ratification, to disband his army, instead of complying, he led 70,000 men, all devoted to his interest, to Ispahan, seized upon the shah, confined and deposed him, and proclaimed his infant son, Abbas III. in his stead. Every thing in Persia was now at his disposal. He renewed the war with the Turks, obtained two victories over them, and recovered all the provinces which they had wrested from Persia in the preceding war; thus justifying the opposition he had made to the inglorious treaty which had left them in their possession.

In the beginning of 1736 the young king died; and, all the great men being assembled to consider of a successor, Kouli proposed the restoration of Thamas. His real wishes were, however, too well known for the adoption of this hypocritical proposal; and he was himself desired to accept the crown. He accepted it on the condition that it should be hereditary in his family: and he annexed another condition which gives a favourable idea of his religious sentiments; this was, that they should forbear the anniversary curses, of the caliphs preceding Ali, and the fanatic commemoration of Husseyn's death, which keep up the animosity of the shiite Mahometans against the sunnites. The opposition of the head of the clergy to this innovation was punished with the bow-string; and on the next day Kouli-Khan was proclaimed king of Persia by the name of *Shah Nadir*. He then concluded an honourable peace with the Turks; and in December 1737 set out on an expedition to reduce Candahar, leaving his son Rizi Kouli to govern during his absence. After a long siege, the town of Candahar surrendered to his arms; but he found it necessary to confirm the former possessor in his government on terms of allegiance.

Whilst he was still in this country he received an invitation from some of the chief officers about the court of Mohammed-shah, the Mogul emperor, to come and take possession of that empire. Such an application he was not likely to reject; accordingly, in 1738, he began his march for the frontiers of India, at the head of 120,000 men. The details of this expedition, and of its wonderful success, have been given under the article HINDOOSTAN, vol. x. p. 65-67.

After the plunder of Delhi, and the massacre of about 120,000 persons, Nadir set out, April 14, 1739, on his return to Persia, laded with the spoils of the country. It is computed that he carried out of India to the value of 87,500,000. sterling in money, jewels, and effects, besides twelve millions shared by his officers and soldiers; and the loss to the Mogul empire by fire and devastation made a vast addition to those sums.

On his journey back, Nadir was accompanied by Khajeh Abdulkurream, a Cashmerian of distinction, who published a memoir on the conqueror's return. This was translated from the original Persian, and published at Calcutta, by Francis Gladwyn, esq. From his summary history of that predatory incursion, we shall extract his description of Nadir Shah's tent. "Nadir Shah, when at Delhi, had such a profusion of jewels, that he ordered the Moabir Basfia to make up arms and harness of every kind, inlaid with precious stones, and to ornament a large tent in the same manner. For this purpose, the best workmen that could be procured were employed a year and two months, during the march; and, when Na-

dir Shah arrived at Herat, the Moabir Basfia informed him that a great number of the following articles were prepared: horse-harness, sword-sheaths, quivers, shields, spear-cases, and maces, with chairs of different sizes; as also a large tent, lined with jewels. The tent was ordered to be pitched in the Dewan Khaneh, or hall of audience, in which were placed the *takht thauous*, or peacock-throne, brought from Delhi, the *tucht nadery*, with the thrones of some other monarchs; together with the inlaid fundelees. Publication was made, by beat of drum, throughout the city and camp, that all persons had liberty to come to this magnificent exhibition, such as had never before been seen in any age or country. Nadir Shah was not pleased with the form of the tent; and besides, from its being lined with green satin, many of the jewels did not appear to advantage. He therefore ordered it to be taken to pieces, and a new one to be made; the top of which, for the convenience of transportation, should be separate from the walls, such as in Hindoostan is called a *rowty*. This new tent, being finished, was displayed in the same manner as the former one; but its beauty and magnificence are beyond description. The outside was covered with fine scarlet cloth, the lining was of violet-coloured satin, upon which were representations of all sorts of birds and beasts, with trees and flowers, the whole made of pearls, diamonds, rubies, emeralds, amethysts, and other precious stones; and the tent-poles were decorated in like manner. On both sides of the peacock-throne was a screen, upon which was represented the figures of two angels in precious stones. The roof of the tent consisted of seven pieces; and, when it was transported to any place, two of these pieces, packed in cotton, were put into a wooden chest, two of which were a sufficient load for an elephant; and the screen filled another chest. The walls of the tent, the tent-poles, and the tent-pins, (which latter were of massy gold,) loaded five more elephants; so that for the carriage of the whole were required seven elephants."

Having now arrived at Candahar, Nadir marched with an army against the Uzbeks, who had made incursions into Persia during his absence. He brought the khan of Bokhara to submission, and took and put to death the prince of Khyeva, who had murdered his ambassadors. Returning to Meshed, he was shot at and wounded in the hand by an Afghan whom his son Rizi Kouli had employed to assassinate him. That prince, on a rumour of his father's defeat in Hindoostan, revolted, and murdered the deposed shah Thamas in the fortress in which he was confined. His father's affection was not extinguished by this criminality, and he would have pardoned him; but, provoked by his taunting language, he caused him to be deprived of sight.

Quelling revolts in different parts of his dominions, and a war with the Turks, to whom, in 1745, he gave a great defeat near Erivan, employed some succeeding years of his life. In the mean time Persia was suffering under all the evils of tyranny; and the avarice and cruelty of Nadir became insupportable to his subjects. The hatred he inspired at length proved fatal to him. As he was encamped on the plains of Sultan Meydan, a conspiracy was formed between the commander of his body-guard, another great officer, and his own nephew. The former, named Saleh-beg, with four chosen men, rushed one night into his tent after killing a woman and an eunuch, and roused him by the alarm. Nadir drew his sabre, and asked what they wanted, when Saleh answered him by a cut on the neck. He resisted, however, with so much vigour as to kill two of the soldiers; but, attempting to retire, he stumbled over the cords of the tent, and fell. Saleh repeated his blow, and to Nadir's cries for mercy, he replied, "You have shown no mercy, and deserve none." He was dispatched, and his head was struck off.

This successful usurper was of a tall stature and a robust form, with a comely aspect, a high forehead, large expressive eyes, and dark hair and complexion. He had
a tenacious

a tenacious memory, great presence of mind, and quick decision. So devoid of education as scarcely to be able to read, he yet acquired a thorough knowledge of business, and was acquainted with every particular of the revenue. He was simple in his diet, plain in his dress, except with respect to jewels, in which he took pride, and never was there a greater collector of them. He was attached to women, but an enemy to unnatural indulgencies; cruel, insolent, and rapacious. The variety of religious sects among his subjects made him indifferent to all. He heard their systems, and treated them with contempt; and it is said that he declared his intentions of giving to the world a better faith than any of them. He was cut off at the age of sixty-one, after a reign of eleven years and three months, anno 1749.

No sooner was Nadir's death known, than the Turcomans flew to arms, and rushed on the Persians, who valiantly defended themselves. Five thousand men fell in the struggle. The army dispersed, and spread themselves over the provinces, carrying with them the seeds of that tumult, confusion, and anarchy, which desolated that ill-fated kingdom, and rendered it a scene of the most horrible confusion for upwards of forty years.

The reader may form some notion of the troubles of this unhappy country from the following series of pretenders to the throne between the death of Nadir and the accession of Kerim Khan. We give it from Franklin's Observations. 1st, Adel Shah. 2d, Ibrahim Shah. 3d, Shahrokh Shah. 4th, Suleyman Shah. 5th, Ismael Shah. 6th, Azad Khan Afghan. 7th, Hassan Khan Cadjar. 8th, Ali Merdan Khan Bukhteari. 9th, Kerim Khan Zund.

Their reigns, or more properly the length of time they respectively governed with their party, were as follows: Adel Shah, nine months.—Ibrahim Shah, Nadir's brother, six months.—Shahrokh Shah, the grandson of Nadir, who had been deprived of sight like his father, was, during some years, suffered to support a petty court by the revenues of the city of Meshed and its immediate environs. But the compassion inspired by his misfortunes could not save him from a danger which continually menaced his precarious existence: he had the misfortune to possess, and he was unable to relinquish, some of the most valuable jewels which Nadir acquired in the plunder of Delhi; and the means adopted to force them from him, by the chief who ultimately succeeded to the fortunes of Nadir, terminated in his death in the year 1796, when he was about 90 years of age.—Suleyman Shah, and Ismael Shah, in about forty days were both cut off, almost as soon as they were elevated.—Azad Khan Afghan, one of Kerim's formidable rivals and competitors, was subdued by him, brought prisoner to Shiraz, and died there a natural death.—But the most formidable competitor for the supreme power was Mohammed Hassan Khan, whose grandson is the present reigning king of Persia. We must therefore devote a few lines to the origin of this family and tribe. During the reign of Shah Abbas I. considerable assemblages of Turkish families, collecting on the northern frontier of Persia, placed themselves under the protection of that monarch, and entered into his armies. Abbas received them cordially; but, apprehensive lest they might in process of time become too powerful, he dispersed them throughout his empire. Part of them repaired to Mazanderan, where they had to make head against the Uzbeks and Turcomans; while others defended the provinces of the Persian Gulf against the attacks of the Arabs. The Persians witnessed with mortification the reception given by the king to these new-comers, whom they contemptuously denominated *cadjars*, or "run-aways," an appellation which they still retain. In a short time, however, the horde of Mazanderan acquired great reputation for valour; it frequently signalized itself during the reigns of Husseyn and Thamas, and even formed part of the body-guard of the latter of those princes. The Cadjars were then commanded by Feth Ali Khan, father of

Mohammed. He obtained, in 1723, the government of Mazanderan, and was ordered to drive the Afghans from Teheran; but, being defeated by them, he retired to Aferabad. After the expulsion of the Afghans by Nadir Shah, Mazanderan was in a state of rebellion. Ibrahim, Nadir's brother, reduced it, took Feth Ali Khan, and put him to death. He is considered as the first chieftain who rendered his tribe renowned, and bore the title of Prince. Some time after this event, his son was taken into favour by Nadir, who appointed him governor of Aferabad, a city on the Caspian Sea. This was the celebrated Mohammed Hassan Khan, who was highly renowned at the time for his wars with Kerim Khan. In 1743 he commanded a corps of troops at the siege of Mousful. After the death of Adel, the successor of Nadir, and his brother Ibrahim, Mohammed marched from Aferabad against the governor of Mazanderan, whom he defeated and took prisoner; routed the Afghans, and in a short time found his ranks swelled with innumerable Turcomans and Uzbeks, whom success drew to his standard. In 1752, he was master not only of Mazanderan, but also of Taberistan and Ghilan. The same year he defeated Kerim Khan, and established his authority over the provinces contiguous to the Caspian Sea. A second victory, in 1756, put him in possession of Ispahan, where he found young Ismael, of the family of the Sofis, who had been invested with the title of Shah, and declared himself his protector. From that period it was apparently not self-interest by which he was actuated: he was influenced by a nobler sentiment, which prompted him to restore the crown to the family of the Sofis. About this time, Ared, just mentioned, who had made himself master of several towns of Irak, retired to Georgia, and his flight put Mohammed Khan in possession of Aderbajan and Irak Ajemi. The Cadjar prince even found himself strong enough to march against Shiraz, the seat of Kerim Khan's power. His army amounted to 80,000 men, though he had left 10,000 at Ispahan, and 10,000 more were distributed in the provinces. Never since Nadir's time had any chieftain been able to collect so formidable a force; but Mohammed Khan's successes had at length so inflated him with pride as to render him intolerably arrogant. He was detested by the officers; and the people, bowed down by his tyrannical yoke, and daily subjected to fresh oppressions, loaded him with execrations. Kerim Khan availed himself of this disposition to bribe his troops to desert. In a short time Mohammed had about him but a handful of Cadjars, with whom he fled with the utmost precipitation to Aferabad. This happened in 1758. In consequence of this reverse, Mohammed lost Ispahan and all the towns of Irak and Aderbajan, so that his possessions were reduced to the single province of Mazanderan, which is naturally defended by lofty mountains, and by desiles, where a small number of men may keep in check a whole army. Treachery smoothed these obstacles to Kerim's general. Sheik Ali, a brave man and able negotiator, contrived, by means of promises, money, and dignities, to bribe the officer to whom Mohammed had committed the defence of the passes. Mohammed, surprised in the very heart of his country, resisted in vain: all he could do, was to maintain the military reputation which he had acquired by selling his life at a dear rate; he was nevertheless defeated and slain, and his head was carried to Kerim. How his grandson came to attain the regal dignity will be shown in the sequel.—In the mean time, of the eighth and last pretender who intervened between Nadir Shah and Kerim Khan, we have little more than the name to mention. Ali Merdan Khan was killed by a musket-shot as he was walking on the ramparts of Meshed encouraging his men.

At length, after six years of anarchy and civil war, the domination of Persia fell to a chief whose birth and character seemed the least likely to succeed in the midst of political convulsions. Kerim Khan was of the Persian tribe of Zund. "This chief was not of high birth, and had

had obtained no command in the army of Nadir," says Sir John Malcolm, while Fraucklin tells us that he was one of the shah's "most favourite officers;" but both agree that he was distinguished for his good sense and courage. The moderation and humanity he displayed in a subordinate situation, were his chief recommendations to the highest. His soldiers respected the principles of their leader; and the eyes of all were directed with admiration and astonishment to a chief of a barbarous tribe, who refrained from plunder, and showed, amid scenes of violence and confusion, so marked a love of order and of justice.

The internal commerce of Persia, as well as its agriculture, greatly revived during the reign of Kerim Khan. This prince gave the most particular encouragement to all the industrious classes of his subjects, and to none more than the Armenians who were settled in his dominions. They enjoyed under Kerim as much consideration as he was able to give them; and he was, on all occasions, ready to redress the wrongs they suffered from the oppressions of the officers placed over them. All the cities in Persia flourished under this prince; but none in any degree to be compared with Shiraz. Kerim, perhaps, was first induced to make this city his capital, by the circumstance of its being central to the pasture-lands of those tribes on whose support he chiefly depended, and from the attachment which its inhabitants early showed to his interests. He was at great pains to strengthen its defences; and he improved and ornamented the city itself with a number of useful and magnificent buildings, and beautified its environs by the erection of some fine edifices, near which were planted luxuriant gardens. Under his auspicious sway, says his Persian biographer, "the inhabitants of that favoured city passed their leisure hours in the society of moon-faced damsels; the sparkling goblet circulated; and love and pleasure reigned in every breast." The following anecdotes are related of Kerim Khan by Sir John Malcolm:

"When I was a poor soldier," he often said, "in Nadir Shah's camp, my necessity led me to steal, from a saddler, a gold embossed saddle, which had been sent by an Afghan chief to be repaired. I soon afterwards learnt that the man, from whom it was taken, was in prison, and sentenced to be hung. My conscience smote me, and I replaced the saddle exactly in the place from whence I took it. I watched till it was discovered by the saddler's wife, who, on seeing it, gave a scream of joy, fell down upon her knees, and prayed aloud, that the person who had brought it back might live to have a hundred gold embossed saddles. I am quite certain, (he added, smiling,) that the honest prayer of the old woman has aided my fortune in the attainment of that splendour which she desired I should enjoy."

Writing was an accomplishment which this justly-celebrated chief never possessed; and he retained through life the dialect of his native tribe, which, from its rudeness, is universally denominated by the other inhabitants the *barbarous dialect*. This prince, as he was one day sitting in public, commanded his jester (a necessary appendage to a Persian court) to go and bring him word what a dog, which was barking very loud, wanted. The courtiers smiled at this sally of the monarch. The jester went as desired; and, after appearing to listen some time with a profound attention, he returned, and said with a grave air, "Your majesty must send one of the chief officers of *your own family*, to report what that gentleman says; he speaks no language except the barbarous dialect, with which they are familiar, but of which I do not understand one word." The good-humoured monarch laughed most heartily at this ridicule of his tribe, and gave the wit a present.

Kerim Khan sunk into the grave at an advanced period of life, being near 80 years of age, in the year 1779. He had reigned undisturbed for more than twenty years

over the whole of Persia, with the exception of the two eastern provinces, Chorasan and Candahar, which had been dismembered by the Afghan government of Cabul. Yet he never assumed the title of Shah; but merely that of Vakeel, or regent.

When the death of Kerim Khan was announced in the city of Shiraz, much confusion arose; two-and-twenty of the principal officers of the army, men of high rank and family, took possession of the citadel, with a resolution to acknowledge Abul Futteh Khan, the eldest son of the late vakeel, as their sovereign, and to defend him against all other pretenders; whereupon Zika Khan, a relation of the late vakeel by the mother's side, who was possessed of immense wealth, enlisted a great part of the army into his pay, by giving them very considerable bounties. Zika Khan was a man remarkably proud, cruel, and unrelenting. Having assembled a large body of troops, he immediately marched them to the citadel, and laid close siege to it for the space of three days; at the expiration of which, finding he could not take it by force, he had recourse to treachery. To each of the principal khans he sent a written paper, by which he swore upon the Koran that, if they would come out and submit to him, not a hair of their heads should be touched, and that they should have their effects secured to them. Upon this a consultation was held by them: and, it appearing that they could not subsist many days longer, they agreed to surrender themselves, firmly relying on the promises that had been made them. Zika Khan, in the mean time gave private orders, for the khans to be seized, and brought separately before him as they came out of the citadel. His orders were strictly obeyed, and these deluded men were all massacred in his presence; he was seated the whole time, feasting his eyes on the cruel spectacle.

Zika Khan's tyranny became soon intolerable, and he was cut off by his own body-guard, when Abul Futteh Khan, who was at the time in the camp, was proclaimed king by the unanimous voice of the troops, whom he immediately led back to Shiraz. On his arrival he was acknowledged as sovereign by all ranks of people, and took quiet possession of the government.

Mohammed Sadik Khan, only brother of the late Kerim Khan, who had during that prince's life filled the high office of beglerbeg of Fars, and had been appointed guardian of his son Abul Futteh Khan, was at this period governor of the city of Bassora, which had been taken by the Persians previous to the vakeel's death. Upon hearing the news of his brother's decease, he became ambitious of reigning alone, and from that instant formed schemes for the destruction of his nephew; but, as it was necessary for him to be on the spot for the advancement of his views, he determined to withdraw the Persian garrison from Bassora, who were all devoted to his interest: accordingly he evacuated that place, and marched immediately for Shiraz. The news of Sadik Khan's approach threw the inhabitants into the greatest consternation; but their minds were variously agitated on the occasion; for some, from his known public character, expected he would honestly fulfil the commands of his deceased brother; others, who had been witnesses to the confusion of former times on similar occasions, rightly imagined that he would set up for himself; and indeed this proved to be the case; for, having entered Shiraz a very few days after, he caused Abul Futteh Khan to be seized, deprived of sight, and put into close confinement.

Sadik Khan then openly assumed the government. As soon as the intelligence reached Ali Murad Khan, who was at Ispahan, that lord instantly rebelled: deeming himself to have an equal right to the government with Sadik Khan, he openly declared himself a competitor for the empire. Persia was by this means again involved in all the horrors of a civil war. Ali Murad Khan indeed took possession of Shiraz, assumed the government, and gave to the empire the flattering prospect of being settled

under the government of one man; but this prospect was soon obscured by the commanding genius of Aga Mohammed Khan.

When Mohammed Hassan was defeated and killed, as related in p. 686. his family was not extirpated, as might have been expected; but Sheik Ali, after seizing upon his treasures, carried his six sons to Shiraz, where their lives were spared, and they were kindly treated. What will appear still more extraordinary is, that, sixteen years after this event, Kerim Khan conferred on Hassan Khan, one of these sons, the government of Astarabad; nay more, that after he had rebelled, and been taken and put to death, his brother Murtafa Kuli Khan was appointed his successor. But it is no uncommon thing in Persia to see a family, several members of which have manifested a rebellious spirit, nay, even a rebel himself, obtain his confirmation in some high dignity. The court keeps numerous and trusty agents about such a person, and all his motions are known to the government.

Kerim's death set the other sons of Mohammed Khan at liberty, and they availed themselves of it to retire to Astarabad. Aga Mohammed, the most enterprising of them, expelled Murtafa from his government, and established himself in his stead. This act of violence sowed disharmony among the brothers, two of whom joined Ali Murad, while the two others espoused the cause of Aga Mohammed.

This man, who was destined to restore the prosperity of the Cadjars, and to seat them on the throne of Persia, was however an eunuch. He had been seized, when an infant, by one of the competitors for the throne of Nadir, who had the barbarity to command that he should be deprived of his virility. When his father was defeated and slain, he fell into the power of Kerim Khan, by whom he was treated with great kindness and indulgence. The whole of the time which he passed as a prisoner at Shiraz, was employed in preparing himself, by the study of men and books, for the great scene in which he was destined to act.

At the death of Kerim Khan he was thirty-six years of age. Though his frame was slender, he was, from his frugal diet and his habits of exercise, capable of suffering any fatigue or hardship. He might be said to live on horseback; for every moment that he could spare from other occupations, was given to the chase, which was, in fact, his only amusement. His heart is said to have been as hardened as his body; but the natural severity of his temper was, during the whole of his progress to that sovereign power which he attained, after a struggle of eighteen years, checked by his prudence, which led him not only to conciliate his friends by kindness, but to forget his wrongs, and even to forgive some of the most inveterate of his personal enemies.

Ali Murad, hearing of the success of Aga Mohammed, determined to go against him; but as he was previously proceeding to Ispahan to suppress a rebellion, he fell suddenly from his horse and expired on the spot.

At this period, Jaafar Khan, the eldest and only surviving son of Sadik Khan, was governor of Khum: he deemed this a favourable opportunity to assert his pretensions to the government, and immediately marched with what few troops he had to Ispahan: soon after his arrival he was joined by the greater part of the malcontents who were then in arms. In this situation he remained some time; but, Aga Mohammed coming down upon him with his army, he was obliged to risk his fate in a battle, and, being defeated, fled with the small remains of his troops, taking the road to Shiraz. Soon after, finding himself strengthened by an increase of his army, he determined to venture a second engagement; and for this purpose marched towards Ispahan: the two armies met near Yezdekhaft, when a battle ensued, and Aga Mohammed Khan's superior fortune again prevailing, Jaafar Khan was defeated, and retired to Shiraz, which he quitted on the 25th of June, 1787, and shortly after marched his army to the

northward, but returned in October without having effected any thing.

Here Mr. Francklin's narrative ends, and we are not informed of what afterwards became of this chief, who is well spoken of by Mr. F. as being of all the pretenders to the throne "the most likely, in case of success, to restore the country to a happy and reputable state." But, as we hear no more of him, we may conclude that his army melted away, and that he probably came to an untimely death; for sir John Malcolm informs us, that, in the year 1789, the only opponent to Aga Mohammed was Latif Ali Khan, who also was the only surviving representative of the house of Kerim Khan. He was grandson to the brother of that chief; and, by his military talents, and popular manners, appeared calculated to re-establish the fallen fortunes of the Zund family. But he imprudently disgusted the first magistrate of Shiraz, who was justly respected by the inhabitants. This officer, in the absence of Latif Ali, took possession of the city, and immediately applied to Aga Mohammed for assistance. This was instantly accorded; but the young chief, with a courage and heroism worthy of a happier fate, attacked and defeated two successive armies sent for the relief of Shiraz. But in 1792, Aga Mohammed, advancing in person at the head of a large army, compelled the young hero, after prodigies of valour, performed with a force altogether disproportioned to the occasion, to seek his safety in flight. From this period, until that of his death in 1795, Latif Ali continued an illustrious fugitive, occupied in the vain endeavour of collecting a force sufficient to resist the constantly-increasing strength of his more fortunate rival.

At the death of Latif Ali Khan, in 1795, we may pronounce that Aga Mohammed Khan was the actual as well as the acknowledged sovereign of the provinces of Astarabad, Mazanderan, of Ghilan, of the whole of Irak, of Fars, and of Carman. The situation of these countries, which extend from the Caspian Sea to the Persian Gulf, could only be deemed settled and obedient by a comparison of their condition to Chorasan, and other parts of the empire, which had been broken into a number of petty principalities at the death of Nadir Shah; and had, subsequent to that event, thrown off their allegiance to those rulers who assumed the title of sovereigns of Persia.

The principles and character of Aga Mohammed will be best developed by his conduct towards his own brother, Ali Kuli Khan. This chief had declined appearing at court for some time after his brother's elevation. The most pressing entreaties, the most solemn assurances of safety, were lavished, to induce him to repair to Teheran; and the government of Ispahan was to be the reward of compliance. When he reached Teheran, he was welcomed with every appearance of cordiality; and the night passed in peace. Next day, Aga Mohammed, after giving him some instructions regarding his conduct at Ispahan, said to him, with a cool indifferent air, "You have not, I believe, yet looked at my new palace; walk there with Baba Khan; and, after you have seen it, return to me." He went; and, at the moment he entered the portico, some assassins, who had been stationed there, fell upon him and slew him. The body was carried to Aga Mohammed, who mourned over it with the appearance of the most frantic grief. He desired Baba Khan (the name by which he always called the present monarch, who was then quite a youth) to approach. When near, he bade him observe the corpse of the bravest of men, and the best of brothers. Then, loading the young prince with abuse, he exclaimed, "It is for you that I have done this! the gallant spirit that lately animated that body would never have permitted my crown to rest upon your head! Persia would have been distracted with internal wars. To avoid these consequences, I have acted with shameful ingratitude, and have sinned deeply against God and man!" These sentiments, general Malcolm adds, might have been sincere; the public expression of them had the effect of mitigating the universal horror at this murder.

The

The tributary prince of Georgia, the aged Heraclius, taking advantage of the distracted situation of Persia, had, by a formal act, transferred his allegiance from the kings of that country, whose paramount authority his ancestors had acknowledged for centuries, to the sovereigns of Russia. His motive for this measure was declared to be a desire to release his Christian subjects from the violence and oppression of Mahometan superiors, and to place them under the protection of a great nation of their own religion. The empress Catharine accepted the overtures of Heraclius; and a formal treaty was executed in July 1783, by which she guaranteed to this prince all his possessions.

It was not till the year 1795, that Aga Mohammed Khan had leisure to punish this defection. He led on his army in person. At his approach, the cities of Ervan and Shisha submitted; and, advancing to Teflis, he encountered and defeated Heraclius, who fled to the mountains, whilst his capital exhibited a scene of devastation and carnage.

Aga Mohammed Khan had not yet been invested with the royal tiara, though long in possession of sovereign power. After the conquest of Georgia, he yielded, with well-disssembled reluctance, to the entreaties of his courtiers. "Recollect," said he, "that if I do, your toils are only commencing; for I cannot consent to wear the Persian crown, without as much power as has been enjoyed by the greatest sovereigns of that country."

In the year 1796, the empress Catherine again directed her armies to enter Georgia. They expelled the Persian garrisons left there by Aga Mohammed; made themselves masters of the coast of the Caspian, from the confluence of the Terek to that of the Cyrus, and reduced the principal strong-holds north of the Araxes, which general Zuboff crossed, and established his camp in the celebrated plains of Mogan. At this critical period, the death of the empress occurred; and the first act of her son and successor, the emperor Paul, was to recall the army under Zuboff.

Aga Mohammed told the assembled leaders of his army, that the Russians had presumed, during his absence in Chorasan, to invade the opposite frontier of his dominions. "But our valiant warriors shall be led against them; and we will, by the blessing of God, charge their celebrated lines of infantry, and batteries of cannon, and cut them to pieces with our conquering sabres." But Aga Mohammed had no opportunity of putting his tactics to the trial. He marched early in spring 1797; but the Russians had already disappeared, and the conqueror of Georgia was assassinated soon after by two of his domestics.

At this critical juncture, Feth Ali (whom we have already mentioned under the familiar title of Baba Khan) held a command in the army of his uncle Aga Mohammed, who had also invested him with the dignity of governor of Shiraz, which he held at the time of Mohammed's death. He was the son of the same Hassan, on whom Kerim conferred the government of Asterabad, after the downfall of Mohammed Khan, and who perished in consequence of his rebellion, if that term may be applied to the attempts of a number of ambitious men to seat themselves on a throne to which there was no rightful owner.

We have seen that Aga Mohammed intended Baba Khan (Feth Ali) for his successor, and had even murdered his own brother in order to smooth the way for him. Promptitude of action was now of the first importance. The moment that Feth Ali heard of the assassination of the king his uncle, he hastened from Shiraz to Teheran; and was so fortunate as to gain possession of that important place, where the treasures of the empire and the families of all the principal officers fell into his power. He thus ensured the attachment of the soldiery and the fidelity of the most important personages in the state. Hadjee Ibrahim, the most distinguished man in Teheran, declared in his favour; and it was in a great measure owing to his powerful and extensive influence that the prince met with so little resistance to the accom-

plishment of his wishes. Yet it was not long after, that Feth Ali *Shah* (for so we must now call him, as he was crowned king in 1798) commanded the murder of this same Hadjee Ibrahim, to whom he was so largely indebted for his elevation, who looked upon him as his own son, and was attached to him with the affection of a father. This is an indelible stain upon the king's character. It is said, indeed, that he used rather too freely those rights which his services gave him; that he spared neither advice nor rebuke; but, if it be frequently a crime to tell truth to princes, ought they to punish it by a crime still more heinous? Feth Ali nevertheless has not the reputation of being a tyrant. It is related on undoubted authority that the minister was aware of the designs against him, but declared he would not imbrue his hands again in blood: he could easily have destroyed the king, but relied on his gratitude, and conceived that the reward for giving away a crown would at least be mercy. He experienced the contrary, and his women even participated in the fate of their master. But the systematic treachery of the minister did not deserve a better fate. Hadjee Ibrahim experienced the same ingratitude he had shown to Latif Ali Khan. He had been raised to his situation by the family of the Zands, and he destroyed it; he was the principal instrument of the elevation of the Cadjars, and they destroyed him.

It is a generally-received axiom among the Persians, that he alone is worthy of reigning who has felt the edge of the sword, or at least exposed himself to it. Valour in the estimation of these people is the first of qualities. This must be the case in a country where war is in some measure permanent, and where it is thought as glorious to cut off the head of an enemy with a single stroke of the sabre as with us to perform the most virtuous action. Feth Ali Shah has not, however, displayed any very shining military qualities; nor is it likely that he will ever restore Iran to its ancient extent.

Three large provinces, each of which would form a kingdom, Chorasan, Candahar, and Georgia, have been rent from the empire. It must, however, be admitted that the sovereigns of Iran never were in peaceable possession of the two out of these three provinces which now seem to be irrecoverably lost to their sceptre. It is well known with what obstinacy the Grand Moguls contested the possession of Candahar with the Persians, who were not always successful enough to repulse the Indian armies. An officer of the too-renowned Nadir Shah's restored harmony between the competitors, Ahmed Shah, having made himself master of that mountainous province and the adjacent countries, there founded the kingdom of the Afghans, which is daily becoming more enlarged and consolidated. In the west, Georgia, situated between Turkey and Persia, had been, ever since the loss of its independence, a bone of contention with these two powers. The sovereignty of Chorasan has been for ages disputed with Persia by the Usbeks, who never either wholly subdued or were wholly dispossessed of it. Their invasions of that beautiful province, and the exploits of the Persian warriors against the Tartars, who frequently passed the Djihoun, as they still continue to do, have furnished a theme to many of their poets, and the celebrated Firdoufee with the subject of an epic containing 120,000 verses. The *Shah Nameh* (Book of Kings) has been famous for upwards of eight centuries throughout all the east, and is justly considered as the master-piece of Persian poetry. If, however, the Persians have been frequently disturbed in the possession of Chorasan, they have never wholly lost that rich and extensive province: and according to their own accounts, Feth Ali has made some progress in establishing his power over the greatest part of Chorasan: even the chiefs of that country who have not been subdued, yield a nominal obedience and an occasional tribute.

Notwithstanding the loss of these important possessions, the kingdom of Persia still extends from 26° to 40° north latitude,

latitude, and from 45° to 61° east longitude, being upwards of 1000 miles in length and 600 in breadth. The names of the provinces have been given at p. 655.

During the Marquis Wellesley's administration in India, Persia was an object of his particular notice. After the fall of Seringapatam in 1800, the first mission from any European nation to the Persian court, was under General (now Sir John) Malcolm, who concluded a treaty of amity with that power, by which she engaged to send 20,000 men against the Afghans, should those tribes attack the company's territory. The ambassador, who was afterwards sent by Persia to ratify the treaty, was unfortunately killed, with seven of his suite, in an accidental fray at Bombay. In 1807, Bonaparte dispatched a mission under General Gardanne to the Persian court, and another to Cabul, in Upper India. These missions were viewed with so much jealousy by the Supreme Government, that in 1808, Mr. Elphinstone, the present governor of Bombay, went on an embassy to Cabul, and succeeded in removing the French mission there; at the same time General Malcolm was sent on a similar errand to Persia; but, being insulted at Abushire by the governor of that place, he returned to Calcutta. In 1809 the English destined an expedition of 10,000 troops from Bombay against Persia, which placed itself in a posture of defence, and built forts on the coast of Abushire; but such was the dread of this intended expedition, that the Persians resolved on sending a plenipotentiary to India, with an offer to expel the French mission from Teheran, and to subsidize any number of British troops that could be spared to expel the Franco-Russian attack on the northern frontiers of Persia.

At this critical moment, Sir Harford Jones arrived on an ill-timed embassy from England, quite independent of any control, and without even the privity of the government of India. The proposals he was instructed to offer to Persia rendered the intended expedition nugatory, and prevented the departure of the plenipotentiary from Teheran. Sir Harford Jones concluded a treaty by which he engaged the East India Company to pay to Persia a subsidy of 200,000 tomans per annum; and she was also to receive, without any expense to her, as many British officers and non-commissioned officers as she might require to discipline her native troops in the northern provinces. Mirza Abul Hassan Khan, on the part of Persia, and James Morier, esq. on the part of the British minister, proceeded to England, and obtained a ratification of this treaty.

In 1810, General Malcolm again proceeded to Teheran on the invitation of the Shah, who desired to show him kindness for the treatment he had received at Abushire in 1808; but, differences arising between the general and Sir Harford Jones, the former was speedily ordered back to India, and the latter recalled to England. In May of the same year, sir Gore Ouseley left England as ambassador extraordinary and minister plenipotentiary to the Persian court, with a detachment of artillery and non-commissioned officers under major Darcy and major Stone: the latter died in a few months after his arrival. France and Russia were then in alliance; and Persia was at war with Russia, in consequence of her encroachments upon the Persian territory beyond the confines of Georgia, of which province Russia had possessed herself several years before. France, by general Gardanne's treaty, had engaged to assist the Persians with troops to recover Georgia from the Russians; but this was not attempted, in consequence of the subsequent alliance between the emperor Alexander and Napoleon. On the arrival of sir Gore Ouseley in 1811, the troops of Abbas Mirza, in the north of Persia, were in a bad state of discipline and wretchedly organized. They consisted of about six battalions, some acting under Persian words of command, others under French, English, and Russian. They had only 13 pieces of field-artillery, and were without wood

in the arsenal, or stores in the magazine. One of sir Gore Ouseley's primary objects appears to have been to effect an alteration in the existing treaty, whereby the expense to the East India Company might be materially reduced. He therefore proposed, that the British officers and non-commissioned officers in the service of Persia, who were to obtain one step of local brevet rank, should receive extra pay from Persia according to that rank, out of the subsidy granted by England, which was promised to be continued so long as the Russians retained the Persian territories of Lankaroon and Karrabaugh. The Persians, however, refused to accede to this proposition until after the affair of Sultonboud in 1812, when the Prince Royal's army attacked the Russians and obtained a complete victory. The Shah and Prince Royal ascribed the success to their having been led on by their English friends; and then signed the new treaty proposed by sir Gore Ouseley. The Persians, headed by English officers, were equally successful on the south-west shores of the Caspian Sea. They expelled the Russians from their posts at Taulish and Lankaroon; but Darcy, the English commander, was compelled to withdraw his party in consequence of the arrival of two Russian armed vessels bearing a flag of truce, with the London Gazette, announcing the preliminaries of peace between Great Britain and Russia.

Soon afterwards Persia lost the advantages she had obtained; and, in 1813, she acceded to terms of peace, by which she not only ceded to Russia the province of Taulish, as far as Astarria, but renounced all claim to Georgia and Mingrelia, as well as the right of navigating the Caspian Sea by armed vessels of any description. Though she still holds the port of Resht on that sea, she is restrained from even building a boat, notwithstanding there is a remarkably fine forest of timber in the province. Subsequently, the Russians conquered the entire province of Daghestan from the native tribes; and the garrisons of that nation now extend to the banks of the Araxes, and along the southern shores of the Caspian Sea.

In consequence of the before-mentioned treaty, sir Gore Ouseley, in May 1814, proceeded to St. Petersburg, leaving Mr. Morier in charge at Teheran. He was shortly joined by Mr. Ellis, with instructions to cut off the subsidy, and every other expense attached to England. This measure, effected against sir Gore Ouseley's assurance to the contrary, was the principal cause of Mirza Abul Hassan Khan's second embassy to England in 1819, when it was arranged by the late British minister for foreign affairs, that 100,000 tomans, or six months' arrear of subsidy, should be forthwith paid by the government of India to Persia. As a measure of economy, but in violation of the third article of the Persian treaty with England, Messrs. Morier and Ellis ordered all the British officers and non-commissioned officers to depart from Persia by the 1st of January following, notwithstanding they were entitled to pay, whether they remained in Persia or were in England or India. The Prince Royal remonstrated and protested against the measure without avail; but, this mistaken economy being persisted in, the prince resolved on procuring French officers to replace his English friends; a purpose that he abandoned solely on condition that Lieutenant-colonel Darcy would take a certain number of Persian youths from Tabriz to England, under his immediate charge, for the purpose of receiving liberal and scientific instruction. The prince applied to the British minister at Teheran to sanction his wishes, which were so far acquiesced in, that Darcy had no alternative but to proceed with his charge, or take upon himself the responsibility of seriously offending the prince by a direct refusal. They accordingly proceeded to England by way of Russia, "subject to the ulterior wishes of his majesty's government." The British officer intrusted with these youths had funds placed in his hands by the Prince Royal to pay the expenses of their journey, and a regulated allowance during one year's residence in England; which, in
the

the event of an objection by the British government, was to be applied in defraying the charges of re-conducting them to the Persian ambassador at St. Petersburg.

After the departure of sir Gore Ouseley, our affairs at the Persian court gradually assumed another aspect. When Mr. Morier and Mr. Ellis quitted Teheran, Lieut. Henry Willock, of the Madras cavalry, who had acted in the subordinate rank of aide-de-camp to sir Harford Jones, was left in the important situation of British chargé d'affaires: and from that moment our interest seemed to decline before the influence of Russia. In 1820, a Russian mission, splendidly fitted out, and attended with a considerable military guard, proceeded to Hurrat, Bokharrab, and such other places as were found most advisable for opening a new trade for Russian manufactures, and for procuring a direct supply of Cashmere shawls for the Russian market.

Latterly the British government appears to have considered Persia of little importance to this country; and the Russians readily stepped into our shoes. In 1817, general Yermaloff having been appointed governor of Georgia, he occupied that territory with 50,000 chosen Russian troops, personally surveyed its military posts, and entered Persia in the character of ambassador extraordinary from the court of St. Petersburg, with a suite composed of the flower of the Russian nobility: this embassy was dignified in the eyes of Persia by extraordinary magnificence and splendour. Yermaloff concluded a treaty of alliance and commerce, and at his departure left colonel Mazzaravich as Russian chargé d'affaires. This officer, with qualifications fully adequate to such an important station, takes every opportunity of cultivating the good-will and esteem of the Persians, and spares neither pains nor expense to conciliate their friendship. The 50,000 Russian troops in Georgia in 1817 were increased in 1820 to 100,000, and in the year 1822 there were 130,000; although during the war between Russia and Persia, the number rarely, if ever, exceeded 30,000. Colonel Mazzaravich keeps an open table for the Persian nobility; and his general style of living is worthy the representative of a great nation. England, to compete with this man, has been represented by an individual, whose subaltern rank in the army, rendered him, in the first instance, of little consequence in the eyes of the Persians; while his inferior style of living, his opposition to the wishes of the Prince Royal, and his general demeanour, made him personally obnoxious, and occasioned comparisons to the disadvantage of himself and the British interests.

At length, serious differences arose from the non-payment of the 100,000 tomans, which was to have been settled by the British East India Company, for arrears of subsidy due to the shah. The delay in fulfilling this engagement was attributed by the court of Persia to Mr. Willock. The money had been given up by the shah to the prince royal; and, to appease his royal highness, Mr. Willock had on one occasion advanced 10,000 tomans on account of it. The prince issued a second order upon Mr. Willock for 2,000 tomans, which he declined paying; and the shah, in a moment of irritation, prepared to enforce the payment from Mirza Abul Hassan Khan, by whose embassy to the court of London the arrangement had been concluded. Ultimately, cooling upon this resolve, he sent Aga Mahomud Kerreem to Mr. Willock to insist on payment of the prince's order. This messenger had incurred the shah's displeasure in a former transaction; and he determined to redeem his credit by succeeding, if possible, on the present occasion. Unluckily, he over-acted his part, and told the British chargé d'affaires, that, "if the prince's order was not paid in five days, he had the king's command to return at that period and cut off his head." The idea of this alternative, so common in despotic eastern courts, and delivered as a message from a gracious king who had already murdered his best friend, the instrument of his elevation, and all his family, was very alarming to Mr. Willock, as it probably would have been to the

reader. That gentleman immediately demanded his passports, and a guard to attend him to the frontiers. Assurances on the part of the shah himself, under his own seal, as well as explanations on the part of his ministers, were ineffectual to restrain Mr. Willock from leaving Persia. The shah condescended so far as to offer marks of his particular kindness to our chargé d'affaires, in atonement for the mistake; and the ministers stated the necessity which existed for his remaining, in consequence of negotiations then pending with the Porte. Mr. Willock, however, insisted on taking his departure, though the shah assured him, that if he left the court unpleasantly, or contrary to his wishes, Persia would feel it essential to her dignity to dispatch an envoy to England with a report of Mr. Willock's offensive conduct, and to require the appointment of another person in his stead. The chargé d'affaires, however, left Teheran; and Mirza Mohammed Saulah, one of the students formerly in England, was accordingly appointed envoy extraordinary from Persia to London. Mirza arrived here *by the way of Russia*; and his reception in that quarter must have formed a striking contrast to the neglect that he and his companions experienced during their residence in England. He was provided with an establishment and equipage by the Russian government, conducted to see every thing worthy his attention, and the emperor presented him with a diamond ring of great value. On his departure, a vessel was provided to convey him and his suite to England. The captain was commanded to pay them every attention, and not to suffer another passenger on-board, nor to take the slightest present from him, or any of his suite. In compliance with the express desire of the emperor, a young artist, who accompanied Mirza to England, was afterwards sent back to St. Petersburg for education at the emperor's expense. In the event of the British government or the East-India Company declining to advance a portion of the subsidy-money, the Mirza received a letter of credit on the Russian representative at the court of London for 30,000 ducats, that he might experience no difficulty to the making of purchases in England. These are strong indications of the importance attached by Russia to her Persian connexions.

The envoy's mission embraced several objects. He was the bearer of a firman of congratulation to his majesty on his accession to the throne: he was instructed to require payment in London of 15,000l. in part of the subsidy-arrear, which the court of directors has complied with: he was commissioned to purchase arms and clothing for the Persian army: he had orders to lay before the British government, the shah's disavowal of Aga Mohammed Kerreem's offensive message to Mr. Willock, and to submit the same explanations upon the subject, which were offered without effect to that gentleman in Persia; he was further instructed to exhibit a list of specific charges against Mr. Willock for improper conduct to the shah, the prince royal, and their ministers, and even to the whole nation, in the violation of a sacred religious rite; and he was especially required to protest against the re-appointment of Mr. Willock, and to solicit for his successor a gentleman whose personal demeanour may be the means of preserving harmony between the two powers.

We have reason to think that the issue of the Persian envoy's mission will determine whether it will be worth while for the East-India Company to continue their depots at Abushire, Bassora, and Bagdad, which were established principally for the supply of the Persian market, and where they have residents in charge at a considerable expense. It is understood that a proposition has been made to Persia, on the part of Russia, which, if acceded to, will ultimately secure the whole of the trade to the Russian merchants; a reply has been waved until the fate of the present mission is known. Mr. Canning will doubtless investigate this subject himself, and give it the calm consideration of his own mind. It is an affair of too much importance for management by others, who may

consult particular interests that by no means harmonize with the welfare of Great Britain as connected with the safety of her Indian possessions. Persia neither undervalues the friendship nor the manufactures of England. On the contrary, we may preserve our pre-eminence if we will. Should government, by a wise disregard of personal considerations, act liberally and justly towards Persia, our foreign trade will reap the benefit: by a contrary course, she will leave Persia to the influence of Russia, and our northern ally will enrich herself by ultimately excluding the English merchant and the East-India Company from participation in Persian commerce. Such was the political situation of Persia with Great Britain and Russia at the beginning of the present year 1823.

PRESENT STATE OF PERSIA.

OF THE KING; HIS COURT, GOVERNMENT, LAWS,
AND RELIGION.

If we neglect the fluctuating limits of transitory possession, and look only to the landmarks placed by nature, the boundaries of the Persian empire seem distinctly traced by the courses of the Indus, the Oxus, and the Tigris; the shores of the Caspian, and the arid tracts which skirt the Indian Ocean. The primitive inhabitants of this extensive region, too, have in all ages been advantageously distinguished from the adjacent nations. Their tall and graceful persons are neither disfigured by the harsh features of the Arabian physiognomy, nor the darker tints of their Indian neighbours. Their skill in horsemanship, their expertness at military exercises, the acuteness of their understanding, and the vivacity of their conversation, appear at all times to have merited praise; whilst their insincerity and falsehood, the usual vices of slaves, seem as justly to have attracted censure. In all these respects nothing is changed. They are still richly endowed with the gifts of nature; but the "invariable laws of the Medes and Persians" have decreed, that despotism, in its most pernicious form, should defeat the objects of her bounty; and that, with less glory, less wealth, and less enjoyment, the subjects of Feth Ali Shah, at the present day, should display the same natural talents, and the same inherent defects, which marked the slaves of Darius, dispersed through twenty satrapies.

Mr. Scott Waring is certainly not an adept in calculating the influence of government on the morals of a people, or he would not have said, in extenuation of Persian despotism, that he "doubted whether the moral character of the Persians qualified them for a better government." What else than government is it, we should be glad to know, that has engendered and disseminated these corruptions? Does the soil or the climate of Persia contain any quality more productive of vice than the soil and the climate of Europe? or what else than tyranny has created the distinction between the moral qualities of the Greek in the present day, and those of his ancestor in the age of Aristides?

Feth Ali Shah, the present king of Persia, is about fifty-three years of age, having been born in the year 1770. Sir Robert Ker Porter, to whom his majesty sat for his portrait, who seems to have been not a little flattered by his condescension, and to be not very sparing of flattery in return, describes in the following terms the personal character of this monarch: "His face seemed exceedingly pale, of a polished marble hue, with the finest contour of features, and eyes dark, brilliant, and piercing; a beard black as jet, and of a length which fell below his chest over a large portion of the effulgent belt which held his diamond-hilted dagger. This extraordinary amplitude of beard appears to have been a badge of Persian royalty from the earliest times; for we find it attached to the heads of the sovereigns in all the ancient sculptured remains throughout the empire. His complexion, as before observed, is extremely pale; but, when he speaks on subjects that interest him, a vivid colour rushes to his

cheek, but only for a moment, it passes so transiently away. His nose is very aquiline; his eye-brows full, black, and finely arched, with lashes of the same appearance, shading eyes of the most perfect form, dark and beaming, but at times full of a fire that kindles his whole countenance, though in general its expression is that of languor. The almost sublime dignity which the form of his beard adds to the native majesty of his features is not to be conceived; and the smile which often shone through it, ineffably sweet and noble, rather increased than diminished the effect." The portrait of his majesty given in the upper part of the annexed Engraving, where he is accompanied by his master of the ceremonies and one of the ladies of the harem, is copied from Monf. Jourdain's work entitled *La Perse*, to which we are indebted for all the Plates accompanying this article, and a great deal of the following information. This work has never been translated, though it has formed the groundwork of a neat publication now coming out in London, called the *World in Miniature*.

Though the reigning monarch has not been celebrated for that activity which demonstrates itself in ambitious projects, yet he manifests on every occasion that promptitude in the dispatch of public business, and vigilance in maintaining the laws he has enacted for the security of the persons and property of his people, which bear every testimony to the soundness of his judgment on the duties of a king; while his encouragement of Persian literature and his taste for poetry and the arts show him to be a scholar and a man of genius. That his views are liberally directed toward the improvement of his people, is still more evident from the many Persians sent by him to Europe, to study the arts and sciences most wanted in their own country. These men generally conduct themselves well when abroad; and, the quickness of their intellects soon making them masters of their objects, they return home in the prime of life, bringing back not merely the learning and practice for which they were sent out, but seeds of moral, mental, and national, improvements, which, being gradually sown in the minds of the people, nothing can prevent from producing their natural harvest.

Feth Ali Shah is not merely a lover of poetry but himself a poet, and the author of some pleasing compositions of that kind. The chief of the poets of his court is in high favour with him, and receives for his praises and the effusions of his genius more substantial remuneration. The governor of Kathan was indebted for his appointment to his being an excellent poet. On his sending the king a present of one of his compositions, he expressed greater satisfaction at the gift than at the sumptuous offering of Chiragh Ali Khan, which amounted to some thousands of pounds; but, adds Mr. Scott Waring, "he would be very sorry to have all his governors poets, and all their presentations, poems."

Persia has, properly speaking, no capital city. The seat of government has been changed according to the caprice or the convenience of the reigning monarch. Rages, Ispahan, Casbin, Tauris, Shiraz, Sultania, Ctesiphon, and even Samarcand, have been, at different times, the place of their residence. The present king keeps his court at Teheran; this must therefore be considered as the metropolis at the present time. It is situated in the Irak Ajemi, and province of Mazanderan, a league and a half from Rages, and about eight leagues south of the Caspian Sea. The surrounding scenery renders the approaches to this city highly interesting. To the south are the ruins of the celebrated Rages, the country of Haroun Alrashid; on the east is Mount Alboraz, famed in Persian mythology as having been the retreat of the *devas*, or evil genii; to the north is the elevated peak of Demavend, always capped with snow; while to the west we discover a vast plain well cultivated and covered with villages, charmingly contrasting with the frightful rocks on the east and north. The population amounts to 60,000 persons during nine months of the year; but in June, July, and August, when

The King of Persia, attended by his Master of the Ceremonies and one of the Ladies of the Harem.

Pass 50

The Queen of Persia on a Journey.

Engraved for the Encyclopædia Londinensis

the king and his court retire to the plains of Sultania, so many of the inhabitants follow him thither, or retire to the neighbouring mountains, that not more than 10,000 remain.

The king has probably, at this time, not fewer than 200 children. In the year 1819, the number was as follows: ten sons administering important governments of cities or provinces, 39 younger sons, and 140 daughters. It has sometimes happened that several women have made him a father in one and the same night. One day, while Mr. Morier was at Teheran, in his first visit to Persia, six of his women produced his majesty six children, four boys and two girls.

It has been customary with some of the Persian monarchs to deprive their children of sight lest they should prove rebellious subjects, leaving but one unmutated as heir to the throne: while others have been content with dooming them to perpetual imprisonment in the seraglio. Feth Ali has not imitated the barbarity of the former practice nor the injustice of the latter; several of his sons who have arrived at manhood occupy high posts in the empire, and are training in the art of government under experienced ministers, to whose guidance the king consigns them.

The king's eldest son, Mohammed Ali Mirza, is invested with the government of Kermanshah. The condition of his mother, who is a Georgian slave, or perhaps the partiality of his father for another son, has excluded him from the throne. He is thirty-five years of age, with a pleasing physiognomy, affable manners, courage and activity. Abbas Mirza, whose mother was of the tribe of the Cadjars, and whom Feth Ali has declared his successor, governs the province of Adherbijan. According to the concurrent testimony of all travellers, the qualities displayed by this prince justify the preference of his father. He is of middling size; his face, though pale, is full of majesty and good-nature, and animated by large black eyes, shaded by well-arched eye-brows which meet. He is an excellent horseman, distinguished for his skill in all military exercises, and passionately fond of war. The simplicity of his dress bespeaks the dignity of his mind. When one of his officers once appeared at his court clothed in stuff of gold and covered with rich ornaments, "What is the benefit of this luxury?" said the prince; "instead of this gold and this tinsel, why do not you buy a good horse, a good sword, and a good gun? Such finery as this belongs to women, and is unbecoming a man, and especially a soldier." The same spirit which dictated this rebuke is manifested in an anecdote recorded of this prince by captain Kotzebue, who accompanied the Russian embassy to Persia in 1817. When the ambassador offered him the presents sent for him by the emperor, among which were a service of porcelain, diamond plumes, &c. Abbas Mirza selected only a superb gun and a sabre: "This," said he, "belongs to me; the rest is too handsome for me, and belongs to the king."

Kotzebue, speaking of the reception of the Russian embassy, by this prince at Tabreez, says; We accidentally discovered an honourable trait in his character, which, in Persia, excited our astonishment. The ambassador observed in the garden a projecting corner of an old wall, which spoiled the beauty of the surrounding objects and disfigured the prospect. His excellency asked the prince why he did not order it to be pulled down. The prince replied, "With a view to the forming of gardens on a grand scale, I purchased the ground of several proprietors. The owner of that where the wall stands is an old peasant, who has absolutely refused to sell his property to me, because he will not part, for any price, with an ancient patrimonial possession of his family. His obstinacy, I must confess, vexes me exceedingly; and yet I cannot but honour him for his attachment to his forefathers, and still more for his boldness in denying me the ground. I must wait till the time when his heir will perhaps be more reasonable."

This anecdote will certainly surprize the English reader, who would not expect to find any eastern prince, from the days of Ahab, inclined to refrain from helping himself to Naboth's vineyard when it suited his convenience. We have heard other particulars much to the credit of Abbas Mirza, the declared heir, and also of some of the other princes who are governors of provinces; but we shall only observe, that cutting-off noses and ears, and putting out eyes, are now very little in use. With this comfortable reflection we shall dismiss the rest of the 59 sons of Feth Ali; and, as to enlarging upon the virtues and accomplishments of his 140 daughters, our readers will not be so unreasonable as to expect it.

We have noticed the alteration of the succession. Can that ill-adviced measure fail to produce a civil war at the decease of the present king? and will not those dreadful massacres, and emasculations, and blindings, which we have been forced so repeatedly to describe in the course of this article, be repeated? Sir Robert Ker Porter informs us, that, on the day for naming the successor, all the royal brothers, with the ministers and great khans, were present; and, when the king presented Abbas Mirza to them as their sovereign, every one bowed the head of submission, excepting Mohammed Ali Mirza; and he told his royal father, that, while he lived, he would acknowledge no other sovereign than himself; then, laying his hand on his sword, he added sternly, "After that, *this* shall decide who is to be the king of Persia."

This may be sufficient to bear us out in our melancholy forebodings. But we have also to add, that, in the treaty of 1813, (alluded to p. 655.) by which Georgia was ceded to Russia, the emperor Alexander agreed to a stipulation, by which both "himself and his successors are bound to acknowledge, and to maintain on the throne, by force should it be necessary, the prince who is destined to succeed, in order that no foreign power shall interfere in the internal concerns of Persia." Now may not our jealousy of the influence of Russia induce us to support what may be called the legitimate succession, and thus greatly enlarge the theatre of the war? for otherwise, should the resistance to the new succession be very obstinate, what can hinder the Russians, when once they get footing in the country, from overrunning the greater part of it, and, after all, from leaving their own favourite candidate with a divided and dependent kingdom? and, supposing that a second Alexander should, after overcoming a second Darius, find himself on the banks of the Hydaspes or the Tigris, and in a situation to invade India from the north; would not the natives avail themselves of the opportunity to shake off their yoke? or rather, might they not be forced into (what we should call) a harder servitude; but, at any rate, might they not cease to be slaves to us?

We will not pursue this subject any farther; but proceed to state what *is*, instead of what may be.

The ordinary title of the Persian monarchs is *Shah*, which corresponds with our Emperor; or *Padjshah Iran*, Great Emperor of Iran. His subjects, however, dare not give him so simple a denomination: they must not write his name without adding, "The most exalted of men; the source of majesty, of grandeur, of power, of glory; the equal of the sun; the chief of the great kings, whose throne is the stirrup of heaven; the centre of the globe of the earth; the master of the conjunctions; the asylum of the world; the shadow of God, diffused over the face of all sensible things," &c. But these denominations vary according to the eloquence of the writer.

In Persia there are no nobility according to the acceptation of that term in Europe. In that country no dignity, no office, is hereditary; yet there are titles which denote the birth or rank of the persons who bear them: such are those of *Mirza* and *Khan*.

Mirza is a Persian compound word, a contraction from *mirzadeh*, which signifies "son of an *emir*, or prince." This title is very common in Persia: but it would be wrong to suppose that all who assume it are of high birth.

It is applied alike to the lawyer, the physician, and the son of the king: its position before or after the name constitutes its value. The princes alone can subjoin it to their proper names, as Abbas Mirza, Huseyn Mirza: but as a prefix to the name, it may be assumed by, or conferred on, any person. It is right, however, to observe, that none but well-educated men, or such as follow respectable professions, or hold honourable posts, take the title of *mirza*.

The title of *Khan*, was formerly given to the governors of provinces only. It is of Tartar origin, and very ancient. Quintus Curtius mentions several princes conquered by Alexander, who bore it, as *Portican*, *Oxican*, *Mesican*, which shows that it was subjoined to the name in those times as at present. The number of Persians now honoured with the title of *khan* is very great. It is conferred by the king either on his own subjects to reward their services, or on foreigners as a mark of honour and esteem. Feth Ali bestowed it by letters patent on some of the members of the French embassy sent to Persia under Gen. Gardanne. So much is certain, that it ought to be borne exclusively by military men, and that those who have obtained it by martial achievements despise others who are indebted for it solely to the favour of the prince. The ceremony attending the creation of a *khan* is very simple. The king sends a *khilaut*, or robe of honour, to the person whom he honours with this title, accompanied with a *firman*, or two letters, the one relating to the present of the *khilaut*, and the other conferring the title. This *firman* the receiver must wear three days attached to the top of his turban.

The king's household consists, like that of European monarchs, of a great number of officers, each having his particular duties and functions. The chief of these is the *high chamberlain*, who is superintendent of the king's finances, manager of all the royal domains, and inspector of all the other officers. On him all the persons engaged in the arts and sciences at the expense of the royal exchequer are dependent; and to him such persons as come to Persia on commercial business have to address themselves. It is his duty also to make suitable provision for ambassadors, to assign them quarters, and to supply all their wants. Hence some idea may be formed of the influence attached to this dignity.

The second officer is the *Ichic-Agasee Bashee*, whom Morier calls the *master of the ceremonies*: he superintends the porters, ushers, door-keepers, and other officers of that class belonging to the palace. Before him is borne a gold stick covered with precious stones, which is the mark of his dignity: and, when the king quits his *seraglio*, he takes it in his hand, standing at some distance from his majesty's person, and endeavouring to anticipate his commands from his looks. As soon as the king looks at him, he advances, takes his orders, lays down his stick, causes the orders to be executed, resumes his stick, and returns to his place. He receives all petitions presented to the king, delivers them into his hand, and either reads or reports the substance of them to his majesty. His office by right requires him to lie every night at the door of the palace; but, instead of performing this service in person, he places guards there. The annexed engraving represents the costume of the master of the ceremonies, from Jourdain, tom. iii.

The *Yesaools* and the *Yesaools-sohbet* are immediately dependent on the *Ichic-Agasee-Bashee*. The former are a kind of messengers who carry the orders of the king; the latter are a sort of assistants to the master of the ceremonies: they form a body composed of the sons of nobles. When on duty they carry painted and gilt sticks, and impose silence and keep order wherever the king may be. When the king gives audience to ambassadors, they go to the entrance of the palace to meet them, introduce them, and lay their presents before his majesty.

The *Meer-akhor*, or chief equerry, and the *Chikkiar-Bashee*, or chief huntsman, come next. They have each

subordinate officers, as the *Djeladar-Bashee*, chief of the grooms; the *Zindarthee-Bashee*, chief of the faddlers; the *Oozengoo-coortshidjy-Bashee*, or chief of the stirrup-holders; the *Taoos-Kaneh Agasee*, head-keeper of the birds of prey; the *Sekban-Bashee*, keeper of the hounds.

Next in importance are the *Hakim-Bashee*, or chief physician; and the *Monaddjem-Bashee*, or chief astrologer. The reader need not be surprised to meet with such an officer as the latter in a country where the sway of astrology is omnipotent among all classes. Such are the places which confer the right of sitting in the presence of the king. The chief of those to which this privilege is not attached is the post of *Mesheldar-Bashee*, or chief torch-bearer, who rides before the king, carrying a golden torch in his hand, and superintends the flambeaux for lighting the interior of the palace. These torches are brass cups fixed to the end of rods of the same metal, which are filled with oil, and in the middle of which is burned a cotton wick. The Persians seldom make use of wax, and never of tallow or rosin. In Chardin's time the *Mesheldar-Bashee* had the superintendance of taverns, public prostitutes, musicians, and buffoons of all kinds. The *Mehmandar-Bashee* comes next; he is the chief of the officers whose duty it is to go out of the city to meet ambassadors, to conduct them to the quarters prepared for them, and to accompany them in their journey: for every foreigner of distinction, on entering the Persian territory, is furnished with an officer whose duty it is to attend him, to protect him from insult, and to procure for him whatever he wants.

The post of *Mihtur*, or chamberlain, is always filled by a white eunuch: it is considered as one of the most important in the royal household. In Persia, as in Turkey, there are two sorts of eunuchs, black and white. The latter are very rarely, if ever, admitted among the women; whereas the former never quit the palace. The chamberlain has not a right to enter the women's apartments, unless he be sent for; but he seldom leaves the king. He waits upon him at table on his knees, and tastes the dishes; he dresses and undresses him; and is entrusted with the care of the jewels and precious stones commonly worn by the sovereign. In Europe, gold keys or wands form the characteristic insignia of the office of chamberlain: in Persia, the *Mihtur* wears suspended from his waist a small gold box in the shape of a gondola, enriched with precious stones, and containing two or three exquisitely-fine white handkerchiefs, opium, perfumes, and cordials.

Of the *SERAGLIO*.—We apply, in our language, the term *seraglio* to that part of the oriental palaces which is inhabited by the women, and to which the prince alone has access. The idea attached to this term does not precisely agree with its meaning: *serail*, or *serai*, signifies merely "a house." Thus the public buildings at which caravans stop are called *caravan-serais*. The spot which we call *seraglio*, the orientals denominate *harem*; that is, "the sacred place," the place to which access is forbidden. The harem is in general the most magnificent portion of the palaces of Persia and the east, for here the princes spend the greatest part of their time. All that here passes is enveloped in profound mystery: the harem is the theatre of pleasure, intrigues, and crimes; and there, too, the most important matters are irrevocably decided upon. Chardin, that minute and faithful observer, notwithstanding his familiarity with the great, could not gain much information concerning the harem. The same offices and places exist there as at court; but they are filled by women. The king has his chief and under equerry who carry his arms, the captain of the gate, the captain of the guards, ushers, and *gentlemen*, all of whom are females: while others read public prayers and perform the rites of religion. These follow professions useful in common life; those practice medicine; and others inter the dead: for a harem contains a mosque, a cemetery, in short, all that is to be found in a city; in fact, it is a colony of Amazons.

In the harem there are three classes of females distinguished by different appellations: the princesses of the blood are called *begum*, and such of the king's women as have brought him children, are called *kanoom*; under the denomination of *katoon*, are comprehended the women of inferior rank; and all those not belonging to any of these three classes are termed *slaves*, which indeed might be applied to the whole of them.

Each female of the harem, one of whom is represented in the Engraving on the king's left hand, has an apartment to herself, or lodges with some aged woman, and cannot visit her fellow-prisoners without permission. Besides subsistence, she receives an allowance, half of which is paid in money, and the rest in stuff for wearing apparel. The number of her attendants increases with her rank. But, alas! when the king dies, the harem is filled with mourning, consternation, and dismay; yet the tears that are shed are not those of regret for the lost object: what these women deplore is the loss of the shadow of liberty, and of the illusory pleasures which charmed their captivity: they are shut up for the remainder of their lives in the most retired part of the harem, and a guard of ferocious eunuchs will prohibit the entrance of all who are not brought thither by the natural wants of the victims.

According to the report of the Persians, the king's harem contains the most beautiful women in the East. In any other country, the manner of supplying it would be the most execrable tyranny: in Persia it is an honour courted by the most distinguished persons. No sooner does a beauty spring up in any part of the kingdom, and the rumour of her charms reach the court, than she is taken from her family, or, more properly speaking, her parents are anxious to offer her for his majesty's acceptance, and she is transferred from the paternal habitation to the royal harem. The favour and fortune of the parents keep pace with the king's fondness for his new mistress; and, when she becomes a mother, the most elevated dignities are conferred on her father. The name of *mother*, however, though it confirms the influence of her who presents the monarch with the first son, becomes to the others a source of apprehension and sorrow. Confined with their infants in a corner of the seraglio, they live in continual fear lest a supreme order should deprive them of life, or at least of sight. Hence the crimes of which the seraglio is the theatre. When the number of children is too great, the queen-mother, who rules with despotic sway in the harem, coolly orders a certain proportion of them to be dispatched; and custom stifles all remorse in her soul.

There are three sorts of guards to the harem. The white eunuchs guard the outside, without ever entering the interior; the black eunuchs, mostly brought from the coast of Malabar, dwell round the second inner inclosure; within which women are on duty night and day, relieving each other by turns.

We have just seen what precautions are taken to ensure the fidelity of the women of the harem, and to prevent the access of strangers. From these precautions we may infer the strictness of those which are practised when they appear abroad. When the king's women are about to remove from one place to another, public notice is given five or six hours before-hand of the road which they are to pursue. Woe then betide the unfortunate wretch who should happen to be found in that road, or in any place from which he could perceive the camels or horses which carry these ladies. The very inhabitants of the villages through which this road passes, must quit their habitations. When the hour for their departure is arrived, troops of horsemen ride forward at a great distance before the cavalcade, crying: *Coorook! coorook!* "Prohibition!" which is a notice for every one to retire. Between these horsemen and the females come eunuchs also on horseback, who with thick sticks belabour such as have not retired with sufficient dispatch.

The ladies commonly travel on horseback, riding

astride, after the fashion of the East, like men; "the most natural and safest seat for a lady," gravely observes a recent traveller. Some of them, the favourite, for example, are carried in a species of litter called by the Persians *takhtirevan*. It consists of a cage of lattice-work covered with cloth, borne by two camels, the one before and the other behind, and conducted by two men, one of whom rides before on a mule, and the other leads the front camel. The lower part of the Engraving represents the queen, or favourite, in her litter, with her female attendants on horseback.

The court of Teheran exhibits a luxury and a magnificence that bespeak a great monarch. When Feth Ali Shah appears in all his royal ornaments, it is impossible to look at his person if the sun shines on him. The throne, known by the appellation of *takht-thaous*, the peacock-throne, is particularly superb; it is said to have cost a hundred thousand tomans, or upwards of 130,000 sterling. It seems to have been made in imitation of Nadir's, which has been described at p. 685. This throne, as Morier informs us, is raised three feet above the floor, and seems to be an oblong square, twelve feet in length and eight in breadth: a high balustrade runs round it, and its extremities are adorned with vases and other ornaments. The back is very high: on each side there is a pillar supporting a bird, probably a peacock, glistening with precious stones and holding a ruby in his bill. The canopy of this throne consists of an oval ornament, from which diamonds throw a thousand brilliant rays. On this throne the king is seated upon a cushion embroidered with fine pearls. His appearance at the *nouroos*, or festival of the new year, when he receives the homage of all his subjects, is thus described by Sir Robert Porter: "He was one blaze of jewels, which literally dazzled the sight on first looking at him. A lofty tiara of three elevations was on his head, which shape appears to have been long peculiar to the crown of the great king. It was entirely composed of thickly-set diamonds, pearls, rubies, and emeralds, so exquisitely disposed as to form a mixture of the most beautiful colours in the brilliant light reflected from its surface. Several black feathers, like the heron-plume, were intermixed with the resplendent aigrettes of this truly-imperial diadem, whose bending points were finished with pear-formed pearls of an immense size. His vesture was of gold tissue, nearly covered with a similar disposition of jewellery; and crossing the shoulders were two strings of pearls, probably the largest in the world. I call his dress a vesture, because it sat close to his person from the neck to the bottom of the waist, showing a shape as noble as his air. At that point it devolved downward in loose drapery like the usual Persian garment, and was of the same costly materials with the vest. But for splendour nothing could exceed the broad bracelets round his arms and the belt which encircled his waist; they actually blazed like fire when the rays of the sun met them; and, when we know the names derived from such excessive lustre, we cannot be surpris'd at seeing such an effect. The jewelled band on the right arm was called the *mountain of light*, and that on the left, the *sea of light*; which superb diamonds the rapacious conquests of Nadir Shah placed in the Persian regalia."

On the right of the king, on occasions of extraordinary state, stand several of his sons magnificently dressed, in respectful attitudes. At some distance in front are ranged the great officers of the crown, according to their dignities. Five young pages habited in velvet and silk, bear different articles. One holds a crown similar to that worn by the king; the second a superb sword; the third a buckler and a mace of gold and pearls; the fourth a bow and arrow enriched with precious stones; and the fifth a spitting-pot, adorned in the same manner.

Contrasting with all this magnificence are the humble looks of the assembly. The presence of the king fills all with fear and respect; and Jupiter making heaven tremble at his nod is not more awful than a Persian monarch amidst

his court. Whoever approaches the throne must previously put off his shoes and make frequent obeisances. None is allowed to sit excepting poets, persons of extraordinary sanctity, and ambassadors: the king's ministers never enjoy this privilege. The monarch, in fact, seems a sharp secluded from society, whom all are fearful of approaching: whether he speaks or is addressed, every thing demonstrates the influence of despotism or the meanness of servitude. (Jourdain, tom. iii.)

Of the ARMY.—Although it is evident from Homer, that, at the period of the siege of Troy, the Asiatics were not at all inferior to the Greeks in military knowledge; and equally clear, from the extent of the Persian empire afterwards, that considerable advances must have been made in the science among that people before their invasion of Greece; we are yet almost entirely without information on the state of the Persian armies; and it is impossible not to wish, with Mr. Mitford, that we possessed their own histories of events, for which Herodotus, a stranger to their country and manners, is our only authority. With our defective means of judging what the Persians were in the best days of their empire, we can only assert, positively, that their monarchs were the first who maintained a regular and disciplined force.

The Persians have, in all ages, been distinguished for a military character: but, though valiant, they possessed no regular discipline. Being, however, not so jealous as the Turks on the score of innovation in military and religious matters, they have recently made considerable advances towards improvement. It is true, that it is chiefly by the enterprise and liberal views of the heir-apparent, prince Abbas Mirza, that the system has been brought to its actual state of perfection: but it would appear that attempts to effect the same object had been made by former rulers of the country. The corps of infantry which Shah Abbas the Great raised, in 1602, to render himself independent of his turbulent chiefs, and to oppose the Turkish Janissaries, probably owed its discipline to the counsel and aid of two English knights, sir Robert and sir Anthony Sherley, and their military followers. The following passage, written by a contemporary, appears to prove this fact. "The mighty Ottoman, terror of the Christian world, quaketh of a Sherley fever, and gives hopes of approaching fates: the prevailling Persian hath learned Sherleian arts of war; and he, which before knew not the use of ordnance, hath now five hundred pieces of brass, and sixty thousand muketiers: so that they, which at hand with the sword were before dreadful to the Turks, now also in remoter blowes and sulfurian arts are growne terrible." Purchas's Pilgrims, vol. ii.

About a century after this, Nadir Shah, reflecting that the advantages obtained by the Europeans over the Turks resulted from the order and regularity with which they made war, secretly procured some French officers, and began by placing the artillery under their management. He reformed his cavalry; divided his army into brigades, battalions, and companies; created inferior officers, and separated his infantry into regiments of the line and sharpshooters. After his death the troops fell again into disorganization: and, had it not been for the war with Russia, it is probable the military skill which they had acquired would have been lost, and the Turks regained possession of Aderbijan, from which they had been driven by Nadir. Aga Mohammed Khan, though he signalized himself in his various expeditions into Chorassan and Georgia, did little for the discipline of the army: a short time after his decease, however, some Russian deserters were received into the service of the governor of Tabreez, where they attempted to organize a few battalions; but, as it would seem, with indifferent success. Hitherto the Persian armies were solely composed of irregular infantry and some bands of cavalry; their artillery consisted of what are called zumbooruki (swivels) fixed to the backs of camels, and carrying balls from one to two pounds weight; but, in the year 1800, Abbas Mirza, who had

been sent into Aderbijan to direct the military operations of that province, employed a few Russian deserters, who had recently come over to him, to form and organize different corps. His first essays in discipline were not, however, attended with much success, as he had to combat the prejudices of the Persian recruits, who unanimously rejected the proposal of being assimilated in any manner to the Firenges, (Europeans,) and above all to the Russians, whom they more especially affected to despise. The prince therefore began by setting the example: he adopted the dress of a soldier, and submitted to learn the military exercise from a Russian. He had hardly, however, succeeded in teaching a few of his men the platoon exercise, to march abreast, and to wheel at the word of command, when the opportune arrival of the French embassy from Bonaparte supplied him with a number of able and active officers, who, being put in command of large bodies of troops, advanced his views to the utmost of his expectations. The prince subsequently raised a corps of artillery under the command of lieutenant Lindsay, of the Madras army, (who accompanied the mission of sir Harford Jones,) to whom he gave full power to fashion and equip his recruits in any manner he chose, with the single exception of cutting off their beards. On this point he was inexorable; nor would the sacrifice ever have taken place had not a powder-horn exploded in the hands of a gunner luckily gifted with a more than ordinary length of beard, which was in an instant blown away from his chin. The lieutenant produced the scorched and mutilated wretch before the prince, who was so struck with his woeful appearance, that he conceded the long-contested curtailment.

The character of this prince, as given by Mr. Morier, is highly favourable both to his talents and disposition. We are indebted to this gentleman for the following amusing anecdote related to him by Abbas Mirza, in a conversation on the policy of declaring hostilities against the Ubeek Tartars. It was suggested that an easy victory might be obtained over these people, possessed, as the Persians now were, of a good artillery. Ah! said the prince, "it would indeed be an easy matter. What do they know of guns or manœuvres, and of firing ten times in a minute! I recollect the time when the Persians were as bad as they. My father, Ali Shah, once besieged a fort, and had with him one gun, with only three balls, and even this was reckoned extraordinary. He fired off two balls at the fort, and then summoned it to surrender. The besieged, who knew that he had only one ball left, sent him this answer; For God's sake, fire off your other ball at us, and then we shall be rid of you altogether."

The Persian army is at present divided into the king's troops and those of the state: the former are regulars; the latter might not inaptly be termed militia.

The king's guards, those of the princes, and the garrisons of the towns, compose the *regular troops*, to whom we apply this term because they are under a particular discipline, and are permanently employed. In the first rank of the troops composing the military household of the king must be placed the *gholam-shahee*, or king's slaves. A very numerous corps formed of the sons of nobles and of young Georgians. The name of *gholam* (slave) denotes not so much a state of servitude as a blind devotedness to the service of the prince. According to Mr. Scott Waring, the *gholam-shahees*, who are considered as the choicest troops in Persia, amount to about 20,000. They have charge of the king's person, receive greater pay and are clothed in a more expensive manner than the regular cavalry. The flower of this corps is formed into a body of about 4000, who are distinguished by the excessive richness of their dress and the insolence of their behaviour. Messrs. Morier and Kinneir, however, state the number of *gholams* as being much lower: according to them, it does not exceed three thousand in the whole.

Besides these troops, who may be called the life-guards, there are four regiments of *kechikdjee*, each composed of three thousand

thousand men, and commanded by a *fer-kechikdjee*. These are selected from among all the tribes, but more particularly from that of the Cadjars. Half of these troops are disciplined in the European manner, and half in the Persian. The former, who belong to the king's household, are called *djan-baz*, in contra-distinction to those trained by the princes, and especially by Abbas Mirza, who are denominated *fer-baz*. The first of these appellations signifies "one who plays with his soul," and the latter "one who plays with his head." Both are expressive of devotedness and valour. The *gholam shahees* form the cavalry of the royal guard, and the *kechikdjees* the infantry. These troops are clothed, equipped, and maintained, at the expense of the king.

The wandering tribes, of which we shall presently have occasion to speak, form the real military force, and furnish what we have termed the *militia*. When the king is going to war, he intimates his intention to their different chiefs, who are obliged to repair with their contingents to the royal camp: the number of these contingents is governed by the population of the tribe. Each town and village has to furnish its quota. In this manner Feth Ali Shah might raise probably from 150,000 to 200,000 men, in case of emergency.

By way of pay, each officer and soldier receives a grant of land; but, when they take the field, they have pay, and a *juryofat*, or allowance of barley and straw for their horses, and wheat, rice, and butter, for themselves. They find their own arms, horses, and clothing; and are supplied with nothing but ammunition.

The Persian armies are composed of infantry and cavalry. The infantry are generally employed at sieges; but, as their services are seldom required, they are for that reason very indifferent soldiers. It was to its cavalry that Persia in ancient times owed its military glory, and it still constitutes the chief force of the kingdom. The Persian is less ostentatious in the harness of his horse than the Turk. Luxury has given place to utility and convenience. Nadir Shah substituted to the Arabian stirrups and bit a very simple bridle and iron stirrups. The Persian saddle, though lighter than that of the Turks and Mamelukes, is not broad enough in the seat: it requires great practice to keep upon it, especially as the stirrups also are very narrow.

The troops are commonly divided into regiments of one thousand men; and each regiment has its standard. These standards are of every colour, and of every sort of rich stuff, and cut to a point: they bear for a motto either the Mahometan profession of faith or a passage of the Koran; and many of them display a lion with a rising sun, or the two-edged sword of Ali. It is a point of honour with them, as with our troops, to preserve the standard from falling into the hands of an enemy. The bearer of it is styled *alemдар*. The *alemдар-bafhee*, or chief standard-bearer, is an important personage in the military hierarchy of the Persians.

The arms of the Persians are the scimitar, the carbine, the lance, the bow, and the noose. A horseman, when fully equipped, usually carries a pair of pistols either in his girdle, or at the saddle-bow, a carbine or bow slung at his back by a transverse shoulder belt, and a lance. The latter, which is very light, being made of bamboo, he carries in his right hand, and uses the bow with great dexterity and promptitude. The use of the *hemend*, which is a long rope with a noose at one end, is of great antiquity in Persia. There exist paintings, in illustration of the Shah Nameh, in which Roustam is represented catching his enemies with this noose, and dragging them after him. It is well known that the ancient Slavonians and Bulgarians employed this species of offensive weapon in war. At present the *hemend* is but little used.

The Persians are greatly deficient in the soldier's first art, the art of *dying*. A Persian, talking to one of our officers on that subject, said very ingenuously: "If there were no dying in the case, how gloriously the Persians

would fight!" Their ideas of courage, indeed, are totally different from ours: they look upon it as a quality which a man may have or not, as he may feel at the moment; and one of the king's generals, who has the reputation of being a courageous man, was not ashamed to own that he and a large body of troops had been kept at bay by two Russian soldiers, who alternately fired their muskets at them, and at length obliged them to move away. In talking of the Russians, they say "that they are so divested of *feeling*, that rather than run away they will die on the spot." Thus much of the Persian armies.

GOVERNMENT and LAWS.—The first personage of the kingdom, next to the sovereign, is the *itimad-ad-dowlah*, whose dignity corresponds with that of grand vizir among the Turks, or our prime minister. In petitions addressed to him he is styled *Visir azem*, Supreme Vizir; but in familiar language he is denominated *Itimad-ad-dowlah*, a compound word signifying "Pillar of the Empire." This minister is in fact the axis round which the enormous mass of the affairs of the state revolves. His favour is the only way to obtain appointments and emoluments from the prince: no application reaches the royal ear, unless transmitted through and supported by him. He negotiates with the ambassadors of foreign powers, and concludes or breaks treaties at pleasure. The finances are under his direction, and no public or royal domain can be alienated, no innovation made in the government, and no point whatever decided, without his participation. No document is valid unless it be furnished with his seal, and the governors of provinces act only by his instructions.

No sooner has the favour of the sovereign exalted a subject to the dignity of *itimad-ad-dowlah*, no sooner is his utmost ambition gratified, than he becomes a stranger to peace and happiness. His days belong to the state; he passes them in the palace, away from his women, his children, and the objects of his affection. His nights are disturbed by the constant apprehension lest some courtier who is his enemy, and has contrived to win the good graces of the monarch at an entertainment; some eunuch whom he has affronted; some female who shares the king's couch, and whose parents have met with some refusal from him; or lastly, the queen-mother, whose schemes he has thwarted; may be secretly preparing his downfall. He frequently owes his high fortune to chance: why then may not his disgrace be the work of intrigue? This apprehension identifies itself with his being, haunts him wherever he goes, and shows him the elevation of his rank merely as a measure of the depth of his possible fall. He has two methods of retaining his dignity; and the duration of his power depends on the address with which he employs them. These are, to remove by exile or death those from whom he has any thing to fear; and to flatter the vanity and the passions of the sovereign by magnifying his most insignificant exploits, ascribing to him qualities which he does not possess, and administering to his pleasures.

Kotzebue has given some anecdotes tending to show that the situation of prime-minister in Persia is not always a very enviable post. We shall relate only one, for which we are indebted to Sir Robert Ker Porter. The late prime minister Mirza Sheffea, who died so lately as the year 1819, at the advanced age of 82, held the same post under Aga Mohammed Khan, the predecessor of the reigning monarch; indeed he had been prime minister seven-and-forty years. Among the variety of cruel punishments with which that tyrant visited those who offended him, pulling out their tongues, cutting off their ears, and digging out their eyes, were his most lenient sentences. One morning, some of the royal gholams having just returned from an errand of this kind to an unfortunate village under the displeasure of the king, and its doom having been to lose a certain number of eyes extracted from the heads of its inhabitants, the people in attendance produced the fatal bag, and the sightless organs were poured out before his majesty.

Scrupulous

Scrupulous as to the execution of his orders, the shah instantly began to separate them deliberately one by one with the point of his dagger, to ascertain if his sentence had been punctually obeyed. Mirza Sheffea, his faithful minister, who had long regarded his master's repeated acts of violence with secret horror, now hoping to make some impression on his conscience, seized this opportunity. "Does not your majesty think it possible," said he, "that God may one day not be pleased with this?" The king slowly raised his head, keeping the dagger in its place among the heap, and as solemnly replied: "By my head, if there should be one eye too few here, I myself will make up the number with yours." The rash philanthropist awaited his fate in shuddering silence, well knowing that the word of his master was irrevocable: but, happily for him, the sentence had been too scrupulously executed to call for the forfeit of his compassion; and he even remained in favour.

Hadjee Mohammed Huslain Khan, the present *itimad-ad-dowlah*, was originally a green-grocer in Ispahan, of which city he is a native. From this humble station he rose successively to be deputy of his division, mayor of the city, and chief of a rich and extensive district near Ispahan, where he acquired great reputation for his good government. He afterwards made himself acceptable in the eyes of the late king by a large *pehkeesh*, or present; and, as the then governor of Ispahan was a man of dissolute life, oppressive and unjust, he succeeded in deposing him, and was himself appointed *beglerbeg*. Here, from his intimate knowledge of the markets, and of all the resources of the city and its inhabitants, he created a larger revenue than had ever before been collected. He became the partner of every shopkeeper, of every farmer, and of every merchant; setting up those with capitals who were in want, and increasing the means of others who were in trade. He thus appeared to confer benefits when by his numerous monopolies he was raising the price of almost every commodity. As, however, this revenue was apparently acquired without oppression, his reputation as a financier greatly increased: in spite of the opposition of his enemies he advanced rapidly in the favour of the reigning monarch, and in the honours to which it led. On the accession of the present king, his zeal, his devotedness, and above all his presents, secured to him a continuation of the royal favour; and he rose, in 1807, to the dignity of *ameen-ad-dowlah*, or second minister; and at length, upon the death of Mirza Sheffea in 1819, he became prime minister.

How he acquired the wealth which enabled him to emerge from the green-grocer's stall is not exactly known. His enemies assert, that, during the last civil wars in Persia, a string of Jiafar Khan's mules were passing close to his house in the middle of the night, when two of them were accidentally detached from the rest, and strayed into his yard: they happened to be loaded with precious stones and other articles of great value, which, on the subsequent destruction of that prince, he appropriated to himself. And it is asserted, that, impressed with the precarious nature of court-favour, he is in the habit of annually remitting considerable sums to his father, who lives near Bagdad, in order to provide a resource for himself in case of disgrace.

There cannot be a stronger instance than he is of the few qualifications requisite to become a statesman in Persia. Illiterate as any green-grocer may well be supposed, necessity has obliged him since his elevation to learn to read and write: but he has succeeded so ill, that he can scarcely make out a common note, or join two words together in writing. In his particular department, however, that of raising money to feed the king's coffers, perhaps no man in Persia has ever surpassed him; and, with all this, the people of Ispahan, from whom the greater part of his riches are derived, are in general very well disposed towards him. He takes great pride in the improvement of the city and its environs, and with evident

success. The public buildings have been repaired and beautified during his administration; the cultivation has considerably increased, and there is a more general appearance of affluence and prosperity.

The second minister in Persia is now known by the title of *ameen-ad-dowlah*. This title is a new one, and not to be found in the older travellers. It seems probable that this minister has superseded the *nazir*, who, in Charadin's time, was the steward of the domains and effects of the crown, and whose functions have perhaps been extended. Morier calls him *lord-treasurer*, and says that he has a *nazir*, or deputy. According to the same traveller, the *ameen-ad-dowlah* defrays the expenses of the royal household, clothes the king's servants, furnishes the *khilauts*, or robes of honour, and provides for the princes and the women. It is also the duty of this minister to have apartments constructed or repaired in the seraglio for the new-comers admitted into it, and to furnish them with all the requisite utensils, which must be of silver. This statement is confirmed by Kinnier; who farther informs us, that the *ameen-ad-dowlah* is charged with the administration of the interior, or the home-department, including the collection of the revenues, the cultivation of the lands, &c.

The next great officer is the *vaca-neviz*, or secretary of state. We have not met with any mention of this dignity in modern travellers, though it still exists. Morier introduces among the Persian ministers the "secretary-in-chief;" and Kinnier informs us, that the events of Feth Ali's reign are regularly written by the royal historiographer, who is no other than the *vaca-neviz*, or "writer of occurrences." Kämpfer calls him chief secretary of state; and adds, that he is styled *viziri-chep*, or "vizir of the left," because his place is on the left of the king. The duty of the *vaca-neviz* consists in keeping an accurate register of all the decisions and decrees of the king; in examining all the acts of his authority; in reporting, either to his majesty in person or to his ministers, all the important events which occur throughout the empire, and in carefully committing them to writing. He is also keeper of the archives of the state, and of the letters and notes of foreign potentates and their ministers, of treaties of peace, and all diplomatic papers. Thus the *vaca-neviz* is both secretary, keeper of the archives, and historiographer of the state. It is said, that on the first day of the year he reads, before the king and the whole court, a sketch of the events of the preceding year. In this respect, the dignity must be of very high antiquity, as its origin must date at least so far back as the time of Ahasuerus. See the Book of Esther, chap. vi. and Journal iii. 138.

The kingdom is at present divided into several extensive departments, over which are placed princes of the blood, who have under them officers with the title of *Beglerbeg*, or Beg of Begg. They are also styled *Arkan-ad-dowlah*, or Pillars of the Empire.

These governors of districts may be considered as the *civil officers* of the state: they have no authority over the troops; but the commanders, in case of exigence or alarm, are subject to their requisitions. The commandant of the citadel is another independent authority; so that the office of *beglerbeg*, which was formerly committed to the charge of one person, is now divided among a considerable number; and, as it is impossible for so many interests to coalesce, the king is sure to be informed of whatever may be done contrary to his orders. His government has been disturbed by only two rebellions; and it is probably owing to this system of counteracting the power and authority of his ministers and officers of state, that his reign has been of longer duration than is usually the case in despotic monarchies.

Each of the *beglerbegs* is to the utmost extent of his power a despot; and the connivance of the king is purchased with extraordinary presents. This system of tyranny descends in a successive series from the king to the

servants of his governors and officers of state; it returns, however, to its first source, and the government requires pecuniary satisfaction for the oppressive administration of its servants.

These beglerbegliks, or grand divisions, are subdivided into districts called *balook*, under officers bearing the title of *khan*, *zabit*, or *hakim*, according to the extent of their jurisdiction. Each considerable town has, besides its governor, a *kelaunter*, or mayor, whose business it is to collect the taxes. He is a magistrate of high rank, who holds his office of the crown, and appears once a-year before the king, an honour not granted to magistrates of an inferior class. His salary is paid out of the royal exchequer. The *kelaunter* is the channel through which the petitions of the people are presented and their wants made known to the king; he is on all occasions the representative of the *rayas*, or subjects. He is obliged by his office to ascertain the amount of the property possessed by persons under his jurisdiction, for he has to prepare the list of assessments; and, if the paper fixing the sum at which each is assessed were not furnished with his seal, the individual would pay no attention to it at the time of collecting the imposts. The *kelaunter*, moreover, acts as judge in cases of theft or quarrels: his decisions, which are, or ought to be, agreeable to established usage, are given on the spot. On this account he is styled *hakim-ourf*, judge of the common law. It is his duty also to carry into execution the sentences of the civil magistrate.

The cities of Persia are usually divided into *mahals*, or quarters. Each *mahal* is under the superintendance of a *ket-khoda*, who is accountable to the *kelaunter*. There is no salary attached to this office, which is merely honorary, and is filled by the most reputable person in the quarter. The duties imposed by it consist in rendering an accurate account even of the most trifling circumstances, such as births, marriages, natural deaths, robberies, quarrels &c. and in ascertaining the occupations and means of subsistence of all the inhabitants of the quarter. When troops arrive in a town, the governor assembles the *ket-khodas*, and informs them of the number for whom lodging and subsistence are required: and it is their business to quarter the troops and levy the rations in such a manner that the charge shall fall equally on every inhabitant.

It is a custom that has been followed ever since the most ancient times, not to commit the custody of the citadel of a town to the governor, but to an officer called *kut-wall*, who is appointed by the king or the beglerbeg, and wholly independent of the *kelaunter*.

Besides the *kelaunter*, the *ket-khoda*, and the *kut-wall*, there are in every town other officers for the maintenance of order, such as the *darogha*, the *meer-usus*, and the *mohtufib*. The *darogha*, or superintendent of the bazars or markets, holds his office from the government. He settles the disputes that occur in the markets, hears complaints, and decides without appeal. If a shopkeeper refuses to execute, or violates, his agreement, and complaint is made to the *darogha*, he obliges him to perform it; or, if a debtor should prove that he is totally unable to satisfy claims made upon him, he grants a certain time for the fulfilment of his contract. This magistrate also superintends the morals of the people; and, if he detects any of them drinking wine, or in the society of courtisans, he compels them to purchase his connivance at no small expense. Hence the office of *darogha* is extremely lucrative: for, in addition to the presents and bribes which he is in the habit of receiving, the shopkeepers supply him gratuitously with every thing he requires, that they may ensure his protection and favour.

The appointment of the *meer-usus*, or head of the watch, who is also styled *kecheekhjee-bajhee*, nearly resembles that of *darogha*; the latter superintending the police in the day-time, and the former at night. It is his office to preserve the peace of the city; to apprehend persons found in the streets at improper hours, and to prevent

robberies. He has under him, for this purpose, a number of people, who patrol the streets, and keep watch on house-tops. Each shopkeeper contributes two-pence or three-pence, monthly, to defray the expenses of this establishment. If a housekeeper is robbed, the *meer-usus* is accountable for the robbery, and is obliged either to recover the property stolen, or to pay the amount. The latter rarely happens; for this officer is generally connected with all the thieves in the city, and can answer for their obedience to his orders. They rob, therefore, in places not under his protection; and, as he is commonly supposed to participate in their plunder, they are connected together by a common interest.

The *mohtufib* is an inspector, whose business it is to regulate the price of every article which is sold in the bazaar, and to see that the weights are of the proper standard. This duty is usually performed once a-week; and, if he convicts any person of using false weights, the punishment frequently is death.

Small towns and villages are governed by a *ket-khoda*, who has under him a *pak-kiur*, or deputy. The latter attends to the details of the duty, and reports to his principal. Lastly, there is no place, how insignificant soever, but what is under the superintendance of a *reis*, or chief.

As to the taxes which are levied in Persia, they are of three kinds; called *malieh*, *jadveer*, and *pehkegh*.

1. The *malieh* are the taxes levied, in money or in kind, on land and towns. They are paid in kind on corn, silk, cotton, and other articles of that sort; and in money on vegetables, fruit, and other less considerable productions of the soil. These taxes were formerly only one-tenth, but are now one-fifth, of the produce: they are regulated by the number of oxen kept by the cultivator: thus it is assumed that one ox is sufficient to do the work of a certain quantity of land, and this quantity is multiplied by the number of cattle. For the taxes in kind, the produce of a *jureeb*, or acre, is calculated; and the amount of the tax is deduced from this estimate. The amount of the taxes paid by towns is governed, not by the number of the inhabitants, but of the houses. In general a town is taxed for a whole district, and its magistrates fix the quota to be paid by the dependent villages. The collector is called *moustoufee*: it is his duty to keep a register of the value, the produce, and the annual amount, of the taxes of the lands within his jurisdiction, and a regular statement of the receipts and disbursements made on account of government. In the various parts of Persia there are royal granaries established for receiving the rents and taxes in kind, which are entrusted to the management of an officer called *umbardar*. Another depot, called the *hakim*, who is invested with the general control over these officers, enforces the claims of government, either by punishing or confining the cultivators. These officers of course have under them a number of subordinate agents, who are dispersed among the different villages within the circuit of their authority.

When government is in want of money, it applies to the *hakim* or to the *moustoufee*, stating the sum required. These officers have a right to increase it for their own profit, and are at no loss for means of extortion. Besides, most of the offices of this kind are sold by government, and the price paid for them regulates the degree of oppression that is exercised: this practice is general down to the very lowest stages. The whole body of collectors is a poisoned spring, and every stream that flows from it is infected. Let the payment of a certain sum be required of the humblest agent, and it matters not how it is levied: he has no other standard than his conscience. "I have repeatedly seen," says Mr. Scott Waring, "the servants of the prince's dependents enter a village and seize whatever they require, without making the smallest remuneration to the inhabitants. If the villagers evinced the least reluctance, they were threatened with the *bastinado*, the usual recompence which a poor man in Persia receives from his superior."

2. The *fadeer* is an arbitrary tax raised on extraordinary occasions, such as the passage of a prince, grand dignitary, ambassador, or body of troops. The *fadeer* is fixed upon the same system as the *malieh*.

3. The *pefhkeesh*, or presents which the governors are obliged to make the king at certain festivals, are also levied upon the towns and villages.

From the preceding statement it appears, that the cultivator is in the worst situation in Persia, and that the tradesman or shopkeeper fares much better. The latter pays a particular tax, it is true; but the merchant is not liable to any other than the duty of customs. The *customs* are under the direction of several officers independent of one another, being farmed out by government to the highest bidder. No difference is made in favour of the produce of Persia, nor are the duties upon the manufactures of one country higher than upon those of another: but the rate is not invariable. At Bushire the duty on goods imported into Persia amounts to about five per cent. and at Shiraz a duty of two and a half per cent. is levied. A caravan going to any of the cities of Irak from Bushire must pay the duties at Shiraz; if it passes Ispahan, at that city; and, in short, at every city it may pass through where duties are levied: so that, by the time it reaches the Caspian Sea, the merchants may probably have paid thirty per cent. on their goods.

The classes of people who pay the heaviest tax to government are the female dancers and the votaries of pleasure. They exercise their professions under the immediate patronage of the governor: their names, ages, and places of abode, are carefully registered; and, if one should die or marry, another instantly supplies her place. They are divided into classes, agreeably to their merits and the estimation in which they are held; and each class inhabits a separate street. (Jourdain iii. 146 & seq.)

Kinnier is of opinion that the revenue arising from land and merchandise does not exceed three millions sterling; meaning, no doubt, that such may be the amount of what is paid into the royal treasury; but how much this sum is increased upon the payers by the extortion of the collectors is not even to be guessed at. We are now to enquire if any, and what, code of laws is provided to protect the subject in Persia in what remains to him after these exactions.

In considering the general character of the Persian legislation, we shall find the connexion between church and state very intimate indeed. The Koran is both a religious and civil code; just in the same manner as the sacred books of many nations of antiquity, and of the Israelites in particular, furnished rules for the various circumstances of life. The legislator, in thus stamping his works with the seal of the Deity, undoubtedly had recourse to this expedient, as the only one calculated to ensure to them the veneration and obedience of men.

The Persians have but a single term, *cheriet*, to express the canon law and the civil law. That they have a legislation cannot be questioned; but there is every reason to believe that its application is frequently perverted or evaded, and that, though there exist laws, there is no justice.

The Mussulman legislation takes the *lex talionis* for its basis. It is the development of the principle, Do not to others what you would not have them do to you; or, receive an equivalent for whatever you do to them. Murder is accordingly punished by murder, and one wound by another, provided the latter be not more dangerous than the former. Such is the rule, but its application is subject to various modifications.

One of the peculiar features of Persian jurisprudence is its exemption from judicial forms. The most important suit is terminated in a few days; so that the parties are not reduced to beggary by the law's delay. A Persian cannot form any idea of our system of procedure, and the delays attendant on it: he prefers arbitrary but

speedy justice to the tediousness of a regular investigation. Still less has he any conception of the equality of all men in the sight of the law, though it is inculcated in the Koran, and though despotism and venality alone have destroyed it. The protection which the law affords to the poor against the oppression of the rich appears to him as but a dream; because in Persia the humbler classes are always sacrificed to the opulent and the powerful; and the man of quality there enjoys a number of privileges, which are denied to people of low condition. A servant must not complain of the dishonesty or cruel treatment of a grandee; nor must a tradesman demand of him the payment of a debt. This is a species of injustice which custom has erected into a principle; but there is an infinity of other circumstances in which the laws are violated. Hence arises the aversion of the Persians to law-suits; they are too well acquainted with the iniquity of judges to wish to expose themselves to its effects.

In Persia there is no profession corresponding with that of attorney or notary. When a contract is made, the only way to ensure its validity, is to obtain the signatures of several witnesses: for it is right to observe, that in this case the system of evidence in civil and criminal matters is generally pursued agreeably to the Koran: but the sacred book also recommends to the faithful to be sincere in their testimony, were it even against themselves or their parents that they had to give evidence. The Persians are at no loss for reasons for evading this precept; and giving evidence is with them a profession, which, like any other, they will exercise for money.

Since religion, as we have said, serves as a foundation to the laws, the administration of justice is committed to magistrates whom we may, without impropriety, term ecclesiastical. The chief of these magistrates is the *Sheik-ul-Islam*, an appellation which signifies the "elder, teacher, or high-priest, of the Mahometan religion." This title was created in 1423, by the Turkish emperor Mahomet II. to be conferred on the celebrated Djelalzadeh, whom he raised to the dignity of mufti and cadi of Constantinople. Shah Ismael, founder of the dynasty of the Sofis, having instituted a new religious dignity in Persia, gave to the person who filled it, the same title; and this prelate is now regarded as the head of religion in that country. The *sheik-ul-islam* is the judge of all civil causes, the decision of which is governed by the text of the divine law, or the Koran. He also determines all religious causes. The great cities of the empire, such as Teheran, Ispahan, Shiraz, Tabreez, &c. have each a *sheik-ul-islam*: we believe, however, that they are not all of equal rank, but that the magistrate of the first of these cities is superior to the others.

The *Cadi*, whose authority was formerly very great, is subordinate to the *sheik-ul-islam*: his functions are of the same nature. Scrupulous Mussulmans apply in preference to the *cadi*, in consideration of the antiquity of that dignity, which has existed ever since the time of the first caliphs, whereas that of *sheik* is of modern creation.

The *Mufti* seems to be rather a lawyer than a magistrate, as is implied by his name, which is an Arabic participle, signifying "one who gives decisions founded on the Koran." He seems, in fact, to combine the characters of doctor of divinity and doctor of law; for he is consulted on litigated matters, on points relative to religious doctrines and ceremonies, or to morality, and in civil and criminal causes. In Persia the mufti enjoys respect rather than authority: the *sheik*, the *cadi*, the ministers, and the king himself, defer to his decisions.

These are the only magistrates whose judgments are founded on the text of the Koran. Each of them has his separate tribunal; for there is no place set apart for the administration of justice. This tribunal is in general a large room open towards a court or garden, and raised two or three feet above the ground. A kind of alcove of lattice-work is constructed in it for the accommodation of females.

males. The judge sits at the extremity of the apartment in the eastern fashion: his head is covered with a large turban; the lower part of his face is concealed by a very black bushy beard, while his body is wrapped in an ample robe. Long experience has given him a correct eye; and, before he has even heard the parties, he can discover from their dress which of them is right and which wrong. Not a motion, not a gesture, escapes him; he readily comprehends their signification, and in his decision he is guided much less by conscience than the expectation of a present. It is, indeed, the custom to make him one: the wealthy give stuffs, confessionary, or coffee; the artisan or the husbandman, a lamb, a sheep, or fruit; and it is necessary to conciliate the favour of his servant also by some gift or other. (Jourdain, vol. iii. p. 199.)

It has been already observed that the Persians have no idea of our law-proceedings; they have therefore neither counsel nor attorneys. Every man pleads his own cause.

The first step towards what we should call bringing an action against a person is to present a petition to the judge, who writes on the margin of it an order for bringing before him the party against whom complaint is made. One of his officers immediately puts this order in execution. It is customary for the defendant to pay this officer for his trouble by the way; for he has no other salary than what arises from fees of this kind, and even these he has to divide with his employer. The parties commonly appear together with their witnesses: both insist on being in the right; they warmly maintain their point; the altercation becomes violent, and they abuse one another in the grossest terms. When they are people of fortune or distinction, the judge lets them go on; but, if they belong to the lower classes, a few thumps on the head or back from his attendants allay the warmth of the dispute. The uproar is twice as great when the parties are of the female sex; for it is to be observed that women also personally defend themselves. They appear before the court covered with a veil, and remain in the small separate apartment already mentioned.

For want of witnesses, the Koran is brought. The judge, after respectfully kissing and raising it to his forehead, presents it to the defendant, to do the same, and receives the oath of the latter on the open book. If the defendant swears, he gains his cause, as it is not to be supposed that the allurements of worldly and perishable lucre would induce a man to incur the punishment reserved for perjury in a future life. When the defendant is summoned on account of debt, and he is unable to pay it, the Koran enjoins that a delay be allowed him: but, if he has several times availed himself of this indulgence without fulfilling his engagements, or if he has betrayed in his conduct a want of integrity, he is delivered to his creditor, who has a right to do with him what he pleases, except maiming or putting him to death. He may then sell him, as well as his wife, detain him prisoner, maltreat him, and beat him publicly in the streets of the town.

Quarrels and assaults in the streets are usually punished with a fine and the bastinado. Whenever any disturbance takes place, an officer of the police rushes among the combatants, striking indiscriminately the aggressors, the persons assaulted, and the lookers-on, who take to their heels. Such of them as he can secure he carries before the judge, driving them along and belabouring them with his staff. On reaching the tribunal, the judge enquires their names and professions. The sentence is usually the infliction of the bastinado as well on the complainant as on the aggressor; and they are moreover obliged to pay a fine. As the money goes into the coffers of the judge, the fine is never remitted; but it is possible to avoid the beating, by paying another fine to the officer.

The slightest faults are severely punished in Persia. The venality which prevails among the judges ensures,

if not the administration of justice, at least the diligent exercise of their functions. The repression of irregularities of every kind is a source of profit to the magistrate. The drunkard caught at a tavern, and the debauchee found in the house of ill fame, purchase impunity for their transgressions. Even murder may be compounded for. When a man has been killed, his relatives run with loud cries to the residence of the judge, and demand the blood of the murderer, for whose apprehension the magistrate issues orders. If the murderer be opulent, a negotiation is opened. The judge proposes the requisite indemnification to the complainants, setting down a handsome sum for his own trouble as mediator; but, if the relatives persist in demanding the murderer, the judge delivers him into their hands with these words: "I deliver up to you, agreeably to the law, the murderer of your kinsman: pay yourselves for the blood which he has spilled; but remember that God is generous and merciful." The officers then conduct the culprit to the spot directed, and inflict on him such torments as they are directed by the relatives, unless the latter prefer glutting their rage on him themselves; but, if the murderer, after enduring all their tortures, and being left for dead by his executioners, should nevertheless recover, he is free both in regard to his liberty and his life, and the family of the person whom he killed has no right to persecute him any more. The compromising mulct paid to the family of a murdered man is usually rated at from fifty to one hundred tomans; but, if a Christian happen by any evil chance to kill a Mussulman, the sum commonly exacted is two hundred tomans. A toman is 11. 7s. sterling.

Criminal justice is administered by the civil magistrates, according to the *owf*, or common law. There is neither public prison nor public executioner: the only places of confinement are dark and filthy apartments in the houses of magistrates, whose servants perform the office of executioners. The kinds of punishment are numerous, and vary according to the nature of the crime, and the quality of the culprit. The bastinado is the most common. The legs of the sufferer are tied together and raised by means of a cord fastened to a tree or stake: the soles of the feet are then beaten with a stick. The rule is to give at least thirty strokes, but never more than three hundred. When a person is convicted of perjury, his throat is crammed with tow or rags, and melted lead poured into his mouth. Swindlers are branded on the forehead with a red-hot iron; house-breakers and coiners of counterfeit money have a hand cut off. Tradesmen using false weights are put into a kind of walking pillory. A thick plank, with a hole in the middle to admit the head, rests upon the shoulders of the culprit; to this plank is fastened a bell: a straw cap is placed on his head, and thus accoutred he is paraded through the streets of the town.

The most common capital punishment, called *shekeh-kerden*, consists in cutting the body in two lengthwise with a sword, beginning between the legs and terminating on the side of the neck above the shoulder. For this purpose the criminal is fastened by the heels to a pack-saddle on the back of a camel, with his head hanging nearly to the ground. After the horrid sentence has been executed, the camel with the bisected body is led through the whole town, preceded by an officer who proclaims the nature of the crime. The remains of the culprit are then hung to a pole or a tree, either in the country or in the suburbs, or even in the *meidan*, or open place before the palace.

Mr. Morier relates, that, during the residence of the embassy which he accompanied at Shiraz, the report of a gun was one day heard; and on inquiry it was found to be the execution of a thief, who had been blown from the mouth of a mortar. Three men had been condemned to death by the prince-governor for robbery: one was beheaded; the second blown up; and the third was cut in half, and the two parts of his body hung over two of the

most

most frequented gates of the city, as a warning to other thieves. This horrid spectacle was displayed for three days.

Another cruel punishment reserved for robbers, who, since the accession of Feth Ali Shah, have been treated with peculiar severity, is the following: The tops of two young trees are pulled down by means of a rope; one of the legs of the criminal is fastened to each of them, and the ropes are suddenly loosed: the force with which the trees return to their original erect position, tears the body of the unfortunate wretch in two. Impaling, cutting off the hands and legs, and immuring between four walls, were punishments usual in Persia in Chardin's time.

The death inflicted on grandees who have incurred the anger of the king varies according to his pleasure. The most common is beheading: but, if the fault be attended with aggravating circumstances, ingenious cruelty easily finds out refinements of suffering. As to females, they frequently owe the preservation of their lives to the notion entertained by the Persians that their blood produces ill-luck. This notion has probably given rise to the punishment reserved for them, which consists in muffling them up closely in their veils, and precipitating them from the top of a tower. (Jourdain, tom. iv. p. i.)

RELIGION.—We have already (p. 673) stated the readiness with which the Persians adopted foreign customs, even from those they had conquered. We shall not be surprised therefore, that, having been themselves vanquished by the Saracens, they should have adopted, without trouble or persecution, the Mahometan religion. But, as this conquest took place during the caliphate of *Omar*, the second caliph after Mahomet himself, we are not so well able to account for the Persians being of the sect of *Ali*.

The principles of MAHOMETANISM have been fully given under that article, vol. xiv. We shall therefore endeavour to confine ourselves to these particulars wherein the Persians differ from the Turks. The chief of these is, their belief "that *Ali*, the son-in-law of the Prophet, is the lieutenant of God." This article of faith, which is rejected with horror by the Turks, is the grand schism which divides the Mussulmans; the partisans of *Ali* being called *Shiites*, or Heretics; and the followers of *Omar* *Sunnites*, or Believers.

The hatred of the Sunnites and Shiites increased in the sequel. Under the caliphs of the dynasty of the Abbassides, it frequently degenerated into fury; and it was considered a meritorious action in a man to kill another of a contrary opinion to his own. The Shiites found warm protectors among the Abbassides, whose zeal, however, only paved the way to fresh scenes of carnage. How often have the streets of Bagdad, "the City of Peace," the Rome of the Mahometan world, been drenched with the blood and strewed with the carcases of its inhabitants!

The destruction of the caliph of Bagdad by Hulagou, put an end to the religious dissensions, or at least to the fanaticism which kept them up: a million of inhabitants perished by the hand of that Tartar. Among his successors, however, there were some who adopted the doctrine of the Shiites: such were Gazan Khan, and his brother Mohammed-Koda-bendeh, though the latter, indeed, afterwards recanted. At length Ismael Ardebili, founder of the house of the Sofis, embraced it; he spread it with his victories, and in his zeal laid sacrilegious hands on the tombs of the Sunnites, destroyed their mosques, and cruelly persecuted such of his subjects as rejected his doctrine. Selim I. who then occupied the throne of Turkey, availed himself of the pretext of religion, to declare war against Ismael: and in the letter which he addressed to the Persian monarch, previously to this declaration, he gives a curious exposition of the motives of piety and zeal by which he professed to be influenced. Ismael was vanquished in the battle of Tchaldiran, but nevertheless continued his efforts for the propagation of the tenets of the Shiites, which the majority of the Persians have ever

since his reign espoused. This difference of creed has laid the foundation of that antipathy which prevails between them and the Turks to this day.

When Nadir Shah had contrived that the crown should be offered to him, he accepted it only on condition that the Shiites should in future abstain from anathematizing the first three caliphs, and holding festivals in honour of *Ali* and *Hussey*n. (See p. 685.) It must have been a singular spectacle, though not unparalleled in history, to see that ferocious conqueror assembling the doctors, entering into theological discussions, and arguing like a casuist: he exhorted the Persians to return to more moderate opinions, to adopt merely the explanation of the Koran by the Imam *Djafar-el-Sadik*, one of *Ali*'s descendants, and to assume the name of *Djafari*. These indications of extraordinary moderation were at first persuasive; but it was not, as may easily be conceived, either philanthropy or pity that had actuated this barbarian. His object was to conciliate by this conduct, the Arabs, the Curds, and the Turcomans, who composed the greater part of the army, and who were Sunnites. It was probably his intention also, to pave the way to the more easy conquest of Turkey, by removing the cause of religious animosity. These designs he thwarted by the impolicy of his own conduct: he imagined that a new point of faith may be established by force of arms, and that it is not more difficult to rule consciences than to govern men. He increased the hatred of his subjects, shook his power, and perished without obtaining the least success. Had he been better informed, the history of past ages would have taught him, that a religion never shines with brighter lustre than when it is furiously attacked, and that periods of persecution furnish occasions for its proudest triumphs.

The Persians are the most decided Unitarians in the world. They not only profess the unity of God, but they insist also on a singleness of person in his essence, and charge the Christians with blasphemy in adoring a deity composed of three persons. All their divines agree upon this point, as well as on the omniscience and omnipotence of the Divinity: they differ only in this particular, that some consider these qualities as attributes, while others hold them to be part of the essence of God.

They believe in the resurrection, the last judgment, and a future state. As soon as the body is deposited in the tomb, the two angels of death, *Monkyr* and *Nekyr*, appear and question the deceased respecting his religion, faith, and works. His answers are inscribed in a great book, which will be delivered in at the day of judgment. After this examination, the souls of the good proceed to *Barzak*, and those of the wicked to the valley of *Bairouth*: there they abide till the general resurrection, neither enjoying nor suffering, but by anticipation of their eternal happiness or misery. An intermediate place between paradise and hell receives for eternity the spirits of those who have not done either good or evil. On the day of resurrection the souls will appear, together with the bodies which formerly belonged to them: they will assemble in a vast plain near Mecca. The judgment will take place by means of a pair of scales, each of which will be as large as the superficies of the heavens. In one, called the *scale of light*, will be placed the book of good actions; in the other, or the *scale of darkness*, the book of bad actions. After this examination, the spirits will cross the famous bridge, *Ponli-firath*, laid over hell, on which the separation will take place. The good will traverse it with the rapidity of lightning which flashes and disappears, but the wicked will be tumbled from it into the infernal regions.

We have seen that it is an article of the Persian confession of faith, that *Ali* was the lieutenant of God: in an axiom which is very common with them, they demonstrate the respect which they pay him. "*Mahomet* (say they) is a City of Knowledge, and *Ali* is the Gate to it."

Setting

Setting no bounds to their veneration or their fanaticism, they exalt him above human nature, attribute miracles to him, and almost deify him: nay, there is a sect, whose members inhabit the countries contiguous to the sources of the Djihoun and the Sind, to the north of Candahar, who regard him as God, though they admit the divine character of the Koran, and follow its precepts. It is chiefly among the lowest class of the people that these exaggerated notions are current: this caliph's name always figures in their oaths, and instead of commending themselves to the divine protection, they invoke that of Ali. The superior orders, however, make a great difference between Mahomet, the apostle of God, and Ali, the son-in-law of that apostle; and, though they regard Ali as his legitimate successor, they are far from making him his equal.

Not only do the Persians maintain the justice of Ali's rights to the crown to the exclusion of the first three caliphs, rights which he derived from Mahomet himself, but they admit no legitimate princes excepting his descendants. These princes are twelve in number. Ali is the first, and Mehdi the last. They bear the title of *Imam*, that is "spiritual and temporal guide, or chief." From the nobleness of their origin may be inferred the qualities with which they are endowed. Supernatural knowledge, perfect sanctity, and the power to perform miracles, are some of the most remarkable of their attributes. The twelfth imam was but five years old when he succeeded to the *imamat*; and he disappeared at the age of twelve years. Opinions are divided respecting him. The Sunnites consider him as destined to appear again towards the end of time, to call all the nations of the earth to the knowledge of Islamism; adding, that three hundred and sixty celestial spirits will assist him in this mission, and that he will be the vicar of Jesus Christ, in the august office of the *Imamat*. The Shiites, on the other hand, believe, that he still dwells in this world, living unknown by men in a sequestered cave: his return is the object of their wishes and expectations; for he is to reassert the rights of his house, to establish a universal caliph over the whole surface of the earth, and to bring all mankind to the true faith, as is denoted by the surname of *Medhi*, or Director, which he bears. His proper name is Mohammed. This opinion has favoured the ambition of a multitude of impostors, who have given themselves out for this imam, and who, by the assumption of so sacred a character, have collected numerous partisans.

Purifications form one of the most essential practices of the Mahometan religion: "The body appears before God as well as the soul; it must therefore be cleansed from all stain previously to the performance of any religious act." Such is the principle on which purifications are enjoined. But bigotry has so increased the number of objects which make a person unclean, and carried its scruples relative to legal purity to such a length, that the half of life might be occupied with purifications. "Religion," says Mahomet, "is founded on cleanliness of the body." No pretext, not even want of water, can excuse the Mussulman from the duty of purifying himself before he says his prayers. For want of running water he will use such as is stagnant and muddy, earth, or even camel's dung. Hence it may easily be supposed that a Persian is frequently more dirty after than before his purifications. Thus all institutions, how useful soever originally, in process of time become corrupted. Moses, in making purifications a religious duty, designed to prevent those diseases which are engendered by neglect of cleanliness, especially in a hot climate where perspiration is profuse. Mahomet adopted this principle and for the same purpose. Such was the cause of this institution, but what is its effect? If personal cleanliness be the emblem of internal purity, it must be confessed that the Persians have very filthy souls indeed.

Mahomet, having received from God the principles of his new religion, promised, in behalf of himself and his

followers, to say prayers fifty times in the course of each day: the lukewarmness of men, however, soon obliged him to reduce the number to thirty. But the occupations of civil and military life were incessantly interrupted by these devotions; and the enemy availed themselves of the fervour of the piety of the Mussulmans to destroy their works. Mahomet, therefore, entered into a second negotiation with God; and the number of prayers was reduced to five. The first of these five prayers should be said at noon, at which hour the civil day of the Mussulmans commences; the second, when half the sun's disk is below the horizon; the third when it is so dark that a white thread cannot be distinguished from a black one; the fourth at bed-time; the fifth between the moment when the stars disappear and noon. As, however, the precept was somewhat obscure, these prayers have been reduced to three; those for noon and evening, and those for bed-time and night, being said together.

The Koran in several places commands the *giving of alms*. Every Mussulman who has acquired wealth generally devotes part of it to the foundation of establishments of public utility, and that independently of the tithe required by religion to be given in charity, if he would ensure himself a quick passage over the *Pouli-sirat* on the day of judgment. Ostentation, indeed, is more frequently his motive than piety; but, be the cause what it may, the effect is beneficial. Charity may be said to be the pre-eminent virtue of Mahometan nations: there is not a moralist, not a poet, but recommends the practice of it, and sounds its praises. "Be ye like the trees laden with fruit and planted by the road-side," says Djami: "they give shade and fruit to all, even to those who pelt them with stones." Most of the caravanserais of Persia, as well as the bridges, cisterns, mosques, colleges, and baths, are pious foundations.

Fasting is no less an obligation than purifications and prayer: it is termed by the doctors, the gate of religion. The fast of Ramazan alone is of divine command; the others are of human institution. It consists in abstaining from every kind of food from day-break till night, *from all sin*, and from temporal concerns and the cares of life, during the thirty days contained in that month: hence a perfect dervise is described to be "a man living in this world in a perpetual Ramazan." This month is the ninth in the year of the Persians, which is lunar: thus it runs through the different seasons, and falls in winter as well as in summer. But this fast must be extremely distressing in summer, when the days are long. Let the Catholic, who murmurs against lent, which merely enjoins abstinence from certain articles of food, consider the Persian, summoned betimes to his daily avocations, overpowered with heat, fatigue, and hunger, taking as it were by stealth a few drops of water to quench his thirst, abstaining even from smoking, and waiting till the tardy departure of the sun shall allow him to break a fast of nearly seventeen hours!

The only pilgrimage enjoined by the Mahometan religion, is to the *caabah*, or temple of Mecca, the object of the veneration of all true Mussulmans. The Persians, however, are far from strict in their observance of this precept. They think, and justly too, that this act of piety cannot well be performed but by those who are in good health, and whose circumstances will allow them to take such a journey without injury to their families. Many, however, acquit themselves of this duty by substitute. You meet in Persia with numbers of Arabs, who sell the title of pilgrim which they have acquired, or who travel to Mecca instead of another for a certain sum of money. To prevent fraud, their employers require them to bring back the certificate which the sheriff of Mecca delivers to pilgrims. The Persian who has visited the sacred city bears for the rest of his life the honourable title of *hadjee*, or pilgrim. On his return from Mecca, he usually passes through Jerusalem and Hebron, which he also considers as sacred places, on account of his veneration for

Abraham; and in his way back to Persia he traverses the Arabian Irak, where he pays his devotions at the tomb of Ali and his son Huseyn.

The Persians have a great number of religious festivals in celebration of the birth and death of their prophets and saints, the principal mysteries of their faith, and the most memorable events of their religion. It would be too long to enumerate all these festivals; we shall therefore confine our notice to a few of them.

The conclusion of the Ramazan gives occasion for one religious festival called the *Beiram*, which lasts five or six days, and is kept with the greater enthusiasm because it terminates the strictest fast. "The Ramazan was now over," says Mr. Morier: "the new moon, which marks the termination, was seen on the preceding evening just at sun-set, when the ships at anchor fired their guns on the occasion; and, on the morning of our visit, the Beiram was announced by the discharge of cannon. A large concourse of people, headed by the Peish Namuz, went down to the sea-side to pray; and, when they had finished their prayers, more cannon were discharged. Just before we passed through the gates of the town in returning from our visit, we rode through a crowd of men, women, and children, all in their best clothes, who, by merry-making of every kind, were celebrating the feast. Among their sports, I discovered something like the round-about of an English fair, except that it appeared of a much ruder construction. It consisted of two rope-seats suspended, in the form of a pair of scales, from a large stake fixed in the ground. In these were crowded full-grown men, who, like boys, enjoyed the continual twirl, in which the conductor of the sport, a poor Arab, was labouring with all his strength to keep the machine."

The *Aid-el-Corban*, or Festival of the Sacrifice, is also attended with great rejoicings. It was instituted in commemoration of Abraham, who, out of obedience to the Almighty, would have sacrificed his son *Ishmael*, whom the Arabs regard as their progenitor, and whom they substitute in this instance to Isaac. Some days before the *corban*, every family buys a sheep without spot or defect, an emblem of the corporeal and spiritual purity of *Ishmael*. On the day of the festival, this victim is decorated with ribbons, pearls, and ornaments of every kind; its forehead, feet, and other parts of the body, are stained with *henna*, a powder made of the leaves of the cyperus; after being thus adorned and paraded about, it is slaughtered, and pieces of the flesh are sent by the family to its friends and the poor. On the return of the people from the sacrifice, scaffolds are erected before the governor's palace, in the public places, and in the streets; and rope-dancers, wrestlers, musicians, singers, and dancers, amuse the multitude there during the rest of the day.

On the 21st of Ramazan, a solemn festival is held in honour of Ali. For this purpose, a covered gallery is constructed somewhere out of the town, where the chief men of the place take their station. In front of this gallery is a kind of pulpit, eight feet high, covered with cloth. Here the preacher appointed to pronounce the panegyric of the sacred personage, reads for an hour or two in a book intitled *Moctel Nameh*, Book of the Murder, containing a history of the death of Ali, chanting without intermission in a loud and doleful voice. There are certain passages of which he pronounces only the first word, leaving some of the congregation to finish. At the end of each passage they repeat this imprecation; "May the curse of God be upon the murderer of Ali!" and all the people respond, "Rather more than less." After the sermon, the people return in procession to the town: three camels bear representations of the tombs of Ali, and his two sons, Hassan and Huseyn. These are followed by three chests covered with blue cloth, containing the spiritual treatises which they wrote; horses carrying bows, turbans, and flags; and men bearing on their heads little boxes covered with feathers and flowers, and containing the Koran. The procession is closed by musicians and young men performing a variety of dances.

The first ten days of the month of Moharrem are devoted to a solemn mourning, in memory of the death of Huseyn, the son of Ali. During this period the Persians dress themselves in mourning, affect all the external appearances of sorrow, abstain from shaving their heads, from bathing, and even from changing their clothes. On the eve of the first of Moharrem, the mosques are hung with black. The next day the pulpits are dressed in the same manner; the *akhond* and *pih-namaz*, inferior ministers of religion, ascend them, and narrate the particulars of the murder of Huseyn with all the inflexions of voice that are calculated to render them more pathetic. The congregation from time to time heat their breasts, ejaculating "O Huseyn! Alas, Huseyn!" Parts of the history of this imam are in verse, and are chanted to a doleful tune. Various episodes of this history are daily represented by itinerant minstrels, (as the circumstances of the Passion of Christ are exhibited in the catholic countries of Europe;) and banners, to which are fastened pictures relating to it, are carried about the streets, followed by a concourse of men and boys, some personating Huseyn's soldiers, and others his enemies. The two parties sometimes come to blows, and these sham-fights terminate in the death of one or two of the combatants.

The representation of the marriage of young Cassem, Hassan's son, with the daughter of his uncle Huseyn, forms one of the amusing incidents of this funeral festival. A young man acts the part of the bride, who is attired in a rich wedding dress, and accompanied by her relatives, who sing a mournful elegy on the death of the bridegroom; for it should be observed that Cassem was slain before the consummation of the marriage. At parting from his bride to go to the fight, Cassem takes the most affecting farewell of her; and, with a presentiment of his fate, he gives her, in token of his love, a mourning robe which she puts on. At this moment the people, transported with rage, rush upon the effigy of the caliph Yezid, the murderer of the Ali family, and tear it in pieces.

Mr. Scott Waring mentions a festival celebrated by the Persians for the death of the caliph Omar. They erect a large platform, on which they fix an image, disfigured and deformed as much as possible. Addressing themselves to the image, they begin to revile it for having supplanted Ali the lawful successor of the Prophet: at length, having exhausted all their expressions of abuse, they suddenly attack the image with stones and sticks, till they have shattered it into pieces. The inside is hollow and full of sweetmeats, which are greedily devoured by the mob who attend the ceremony.

We shall say nothing of the festivals instituted in commemoration of some of Mahomet's miracles; such as the cleaving of the moon, the parturition of the stone, the speaking camel, &c. because these are common both to Persians and Turks, and we shall have occasion to resume the subject under the article TURKEY.

But we shall advert to a very pleasing topic whereon these two nations differ widely, as indeed they do in many others. The Persians, unlike other professors of the Mahometan faith, manifest a spirit of *toleration* towards those whom they regard as infidels, worthy of the imitation of many a Christian community. To show how this spirit is encouraged by the present government, either from a principle of justice or from political motives, we shall adduce a circumstance that happened some years since in the province of Adherbijan; under the administration of Abbas Mirza, heir-apparent to the throne. One day, in the month of January 1807, a Persian belonging to the household of the prince-royal thought fit to insult publicly an Armenian merchant in the city of Tabreez, and to abuse him in the grossest manner, for no other reason than the difference of their religions, the Armenian being a Christian. Not content with personally affronting the Christian merchant in an outrageous manner, this Persian servant launched out into the most atrocious language against Christ, his gospel, the sign of

the cross and other emblems of our religion. These blasphemies roused the indignation of the Armenian to such a degree, that, to punish the aggressor and to avenge his religion before the public, he laid hands on him, and, after giving him a sound beating, left him extended on the ground, and returned to his own house. The man, covered with dirt and blood, presently got up, and went to the palace of the prince his master, to prefer his complaint against the Armenian merchant, by whom he had been so roughly handled. He took good care to conceal from the prince the real cause of their quarrel, and interlarded his story with many false allegations against the merchant. Abbas had too much penetration not to perceive the means by which his servant hoped to strengthen his complaint; he nevertheless, listened with patience to his whole deposition, which embraced a variety of circumstantial details that had all the appearance of truth, but in reality were nothing but fictions. He then summoned before him the Armenian merchant, and determined to examine him in full divan, and hear what he had to say in his defence. At the same time he ordered the persons who had witnessed the fray to attend. After hearing their declarations and evidence, the divan was convinced that the servant had without provocation attacked the Armenian, and uttered blasphemies against the Christian religion, and that for these causes only the merchant had beaten the Persian.

With a view to prevent similar offences in future, to give satisfaction, as it were, to the Christians resident in the country, and to administer justice with the sanction of those who are the guardians of the laws of Mahometan states, Abbas convened a divan composed of the Sheik-ul-Islam, and the principal ulemas of the city of Tabreez, and proposed the following questions, which he required them to answer.

1. Was the Lord Jesus (Hazreti-Iyfa) a real prophet by God?—*Answer.* Yes.
2. Are the laws contained in his noble Gospel (Indjil-sheryf) just or not?—They are just.
3. Is it permitted by our laws to blaspheme the Lord Jesus and his noble Gospel?—No, it is unjust.

Upon these unanimous decisions of the ulemas, called in such cases *fetva*, or sentence, the prince-royal ordered the merchant to be set at liberty, and his own servant to be punished with a hundred strokes of the bastinado; moreover he dismissed him from his service, as a warning to all who should be disposed to insult the professors of a different religion from their own.

Similar sentiments were displayed by the monarch himself on a more recent occasion. In April 1815, the vicinity of the capital was visited with an extraordinary drought. The Sheik-ul-Islam of that city imagined that he was performing an action well pleasing to God and his majesty, in persuading the populace, that the drought and the consequent dearth of the productions of the soil, were a punishment inflicted by the Almighty, because people frequented the taverns kept by the Armenian Christians; and that, to appease the divine wrath, they ought to destroy those haunts of impiety. By such language, the Sheik-ul-Islam inflamed the minds of his hearers, who tumultuously proceeded to that quarter inhabited by the Armenians, and, in the presence of the Sheik, demolished one of their churches, and pulled down the houses of several dealers in wine. It was not long before the king was informed of this outrage. He ordered the Sheik-ul-Islam, and the persons whom he had instigated to its commission, to be brought before him. "Audacious wretches!" said he, "who commanded you to act thus? What law authorises such proceedings? Is the Sheik-ul-Islam your sovereign, or the ruler of this country? Ye have violated the laws of my dominions; by them I condemn you: depart from my presence." The legal penalties were immediately enforced, and the culprits were obliged to pay the Armenians an indemnification of a thousand tomans. His majesty then sent for the principal persons of the Armenian nation: "It

is my wish," said he to them, "that all my subjects, of what religion soever they be, should enjoy a just liberty and live unmolested under the protection of my royal authority." He then promised to inflict condign punishment on the Sheik-ul-Islam; and exhorted them to pray to God for the preservation of his life. At the same time he ordered his treasurer to pay to these notables the sum of three thousand tomans out of his privy purse, as a compensation to the Christians for the injury they had sustained. He moreover commanded that the Armenian church should be repaired at the expense of government, and that restitution should be made for such furniture and effects as had been damaged or destroyed.

If the preceding facts exhibit a laudable relaxation of Mahometan rigour towards those whom they regard as infidels, the following whimsical anecdote proves the Persians to be the least fanatic of all Mussulmans, in permitting doubts to be publicly raised among themselves against points of faith inculcated by their own religion. A mollah, preaching one day in a mosque, strongly insisted on the examination which the deceased have to undergo from the angels of death, Nekyr and Monkyr, as soon as they are deposited in the tomb. "Don't believe a word of it!" cried one of the congregation; "for one of my slaves died a few days since; I filled his mouth with rice, and, on digging him up again to-day, the rice was just as I left it. Now it is morally impossible for a man to give answers, even to angels, with his mouth full."

But, in an absolute government, so much depends upon the caprice of the monarch, upon the whim of the moment as we may say, that we do not take upon us to affirm that every Christian, Jew, or Pagan, is, or has cause to be, quite at his ease in the kingdom we are treating of. It is certain that the Sosis, a very ancient sect, the origin of whose name is veiled in obscurity, have been treated with great rigour by the present most gracious, most merciful, most tolerant, monarch, Feth Ali Shah.

The name, as sir R. K. Porter informs us, is spelt by different writers in a variety of ways; for instance, Suffi, Sooffee, Sefi, and Sophi. The Arabic term, which bears all these spellings, means wise, holy; and is supposed to be derived from a root-word, signifying "be pure, clean;" and the sect who assume that title arrogate a peculiar degree of wisdom and purity beyond all other believers. But the Monthly Reviewers inform us, that "the Arabic word is erroneously understood by sir R. Porter. It is a noun signifying *wool*, and the sect is said to be so named from an allusion to the coarse mantles affected by its teachers: but the *σοφοι* or *σοφισα* of the Greeks is the most probable derivation." (M. R. Jan. 1823.) We think so too; but, be that as it may, and whatever be the name they bear, whether in old or in modern philosophy, the same common vanity of human reason, that has misled enthusiastic and self-confident minds from the beginning of man's history until now, may be recognised in the self-denying theories of these wild deists. Inflamed by the poetic fancies of an ardent imagination, nothing seemed to them too exalted for their conceptions, too sublimely pure for their participation; in fine, deriving their existence from God himself, not by creation, but by emanation, they set forth with so peculiar and mystical a pretension to holiness, that the ignorant vulgar, confounded with the excess of light to which they pretended, yielded implicit credit and consequent homage to such superior sanctity. Indeed, the great reputation acquired by Sooffee (or Sefi)-u-deen, one of the most eminent of these philosophic devotees, smoothed the road for his descendants to mount the throne of Persia. (See p. 678.) Ismael the First, of the posterity of this celebrated ascetic, became king A. D. 1500; and, in honour of his holy ancestor, the dynasty he founded took the name of Sooffee, Sefi, or Sophi; and hence came the monarchs of that race to be designated, even in European courts, by the name of *the Sophi*, without any additional title. But the princes of the Sooffee descent were too sensible of the value of stationary laws, moral and religious, to support

support those vague dreams abroad, which attracted so mysterious an interest about the enthusiast in his cell. Most of the Sooffee professors kept within the formal pale of the established religion, for the sake of security, and the facility of making proselytes. They avowed themselves believers in one God, that Mahomet was his prophet, and Ali the legitimate successor of the prophet, to the exclusion of Omar. So far they were perfectly orthodox according to the Persian rule of faith; but the creed was only from their lips, while their real tenets were as much calculated to charm a vivid imagination as to mislead it into consequences unsuspected and dangerous.

The Sosis of the present day are often confounded with the Dervises of Turkey, whom in some particulars they resemble. Their doctrine and practices are still covered with profound mystery. A Sosis, according to the idea to be formed of him from the works of the Persian poets, is a pious man living in seclusion from the world, whose morality is pure; whose doctrine is mild and tolerant; whose soul is plunged into the depths of mysticism; who spiritualizes all the ceremonies of religion, and constantly keeps a vigilant eye over himself. Universal indifference, the extinction of every worldly wish and desire, the presumptuous hope of an imaginary perfection, constitute the essence of his contemplative life. It was in this acceptance of the term that Saadi, Senai, Hafiz, Djelal-eddin, and Djami, aspired to the rank of Sosis: but mysticism approaches too near to the illusions of fanaticism for the mind to pause at any middle point; and, when the imagination has once passed that point, it sets no bounds to its extravagance. Thus there arose in Persia, a particular sect of Sosis, which were called *impious*, and who derived no other fruit for their crude meditations than the belief that there is no God. They gleaned from the Mahometan religion, the relics of the Grecian philosophy, and the reveries of the Indian gymnosophists, materials for an insensate doctrine, which rather encouraged than checked the passions. These Sosis have a book called *Gulshen-raz*, the *Mysterious Garden*, containing their opinions on theology, philosophy, and morals. As secrecy is the first precept of the order, it is difficult to ascertain its principles. It is said, however, that their doctrine is founded on that of Pythagoras; that they acknowledge one only essence, and believe in the transmigration of souls. They repeat among themselves this distich, which they style the mystery of the Sosis: "There is only one essence, but there are a thousand forms or figures; And, how numerous soever these forms may be, they are not worthy of engaging our attention." There is a striking resemblance between this distich and the following passage of the *Baghavat* of India: "He who considers all the different species of beings as forming but a single essence diversified to infinity, that man knows Brahma." It would not be difficult to prove that these sects of Persian Sosis derived most of their doctrines and practices from India.

But the Reviewer we have quoted above is of opinion, that the philosophy of the Sosis is Chaldean, not Persian or Indian, in its origin; and of a far higher antiquity than the doctrines of Zoroaster. "The opinions of the sect are precisely those of the Jewish Cabalists; who, in common with the Sosis, maintained the existence of one pure and perfect substance only; denying the entity of matter as distinct from spirit, and believing that whatever exists is of the same essence as the Deity, has emanated from him, and must at length be re-united with him. Creation, according to the Cabalists, is a development and modification of the divine nature, while destruction is the removal of the forms communicated to things created, and the re-absorption of the portion of Deity which resided in them." The pious Sosis, who is influenced by this faith, (if absolute Spinozism can be regarded as faith,) beholds around him the wonders of the visible world, and professes to discover God in all that he sees, and all that surrounds him. We are, however, much in-

clined to doubt whether the disavowal of individual responsibility for good or evil actions can be strictly chargeable on the whole sect; for we believe that the doctrine of an actual union with God, from which the present author justly deduces the most pernicious consequences, has been professed only by madmen or impostors. The better class of Sosis, according to an extract from one of their own works, inserted by Sir John Malcolm in vol. ii. of his *History of Persia*, confine the highest privileges of their saints, during this life, to the contemplation of God's essence, and a perfect knowledge of his will; a dreadful tenet, if it were practically influential; for no spiritual power which the world has yet witnessed, could be more dangerously operative on the mind of man than that of teachers pretending to be the sole depositaries of the will of the Almighty. It fortunately happens, however, that the innate feelings of mankind triumph over absurd tenets of theology; and that common sense, as well as the necessities of human affairs, counteracts the influence of wild and pernicious opinions. The Sosis appear for the most part to be a harmless race of enthusiasts; and the ascetic exercises of their devotion have had the good effect at least of detaching them from worldly ambition. *As about studia in mores*, and it is almost impossible for men not to become at last what they have long affected to be, their exterior humility and self-denial are, we make no doubt, for the greater part sincere and genuine." M. R. as above.

Yet the devout Mahometans charge the Sosis with atheism; while the latter not only deny the accusation, but pretend to hold intercourse with God: they assemble at night and perform the exercises of turning round, jumping and shouting, till they drop down from weakness and exhaustion. Owing to these practices, they are obnoxious to the Persians, who, hating every thing Turkish, confound them with the Dervises of that country, whose habits of whirling round are well known.

But our object was to show that toleration is not extended to every sect, and at all times, in this country. The following is the translation of a letter addressed by Feth Ali Shah to one of his governors, enjoining him to punish two Sosis accused of having endeavoured to excite sedition: "Whereas for some time the Sosis have spread their opinions in a truly alarming manner, and gained a great number of credulous and silly proselytes, who blindly adopt the faith and the habit of those preachers; as nothing can be more hostile to the interests of the true religion; as the subject has been deemed worthy of the attention of our wisest counsellors, and you have yourself addressed to us your observations upon it; we have deemed it advisable to take this matter into consideration, and to write to our governors and officers to punish these Sosis, unless they amend their conduct; to take from them what they have craftily obtained from the credulous and people of weak minds; and, in case the owners of these things cannot be discovered, to distribute them among the poor. We have lastly ordered this sect to be *extirpated and destroyed*, that the true faith may flourish. Aga Mehdy and Muza Mehdy have misled the people in the neighbourhood of Hamadan, where they were regarded as holy doctors; they have been sent prisoners into our presence. We now deliver them into your hands considering you as the most learned, the wisest, and the most virtuous, of the doctors of this kingdom. Put them to death, imprison them, or punish them in any manner most agreeable to the laws of our holy religion." The two unfortunate Sosis were immediately put to death by "the most learned, the wisest, and the most virtuous, of the doctors of this kingdom."

CLIMATE, SOIL, PRODUCE, POPULATION; MANNERS AND CUSTOMS, DRESS, AMUSEMENTS, &c. OF THE MODERN PERSIANS.

The climate of this country varies considerably according to its situation; some parts being parched with insufferable

ſufferable heat, whilſt others are frozen with cold, at the ſame time of the year. The air, wherever it is cold, is dry; but, where it is extremely hot, it is ſometimes moiſt. All along the coaſt of the Perſian Gulf, from weſt to eaſt, to the very mouth of the river Indus, the heat for four months is ſo exceſſive, that even thoſe who are born in the country, unable to bear it, are forced to quit their houſes, and retire to the mountains; ſo that ſuch as travel in theſe parts, at that ſeaſon, find none in the villages but wretched poor creatures left there to watch the effects of the rich at the expenſe of their own health. The eaſtern provinces of Perſia, from the river Indus to the borders of Tartary, are ſubject to great heats, though not quite ſo unwholeſome as on the coaſts of the Indian Ocean and the Perſian Gulf; but in the northern provinces, on the coaſt of the Caſpian Sea, the heat is full as great, and, though attended with moiſture, as unwholeſome as on the coaſt before mentioned. From October to May there is no country in the world more pleaſant than this; but the people carry indelible marks of the malign influence of their ſummers, looking all of them of a faint yellow, and having neither ſtrength nor ſpirits; though, about the end of April, they abandon their houſes, and retire to the mountains, which are twenty-five or thirty leagues from the ſea. But this moiſtneſs in the air is only in theſe parts; the reſt of Perſia enjoys a dry air, the ſky being perfectly ſerene, and hardly ſo much as a cloud ſeen.

Perſia has juſtly been termed the Country of Mountains. Beſides thoſe which interſect the interior in all directions, branches of the Taurus encompass it on the north, weſt, and ſouth. The Taurus, after traſverſing Armenia and Adherbijan, after uniting on the one hand with ramifications of the Caucasus, and forming on the other the various ranges of Media, ſkirts the ſouthern ſhore of the Caſpian Sea, and conſtitutes that lofty barrier which ſeparates Ghilan and Mazanderan from the central provinces. Mount Zagros, which runs parallel to the courſe of the Tigris, ſtretches to the eaſt of Suſter, enters Louriſtan, coaſts the Perſian Gulf at ſome diſtance from the ſea, and terminates beneath its waters below Gombroon. A few leagues from Hamadan, the Alwend, the ancient Orontes, divides into two branches; the one, running north-eaſt, paſſes to the weſt of Caſbin, and unites to the ſouth-weſt of the Caſpian Sea with the Elborz, which is a continuation of the Taurus; the other, purſuing a contrary direction, and joining the ramifications of the Zagros, forms the high-lands of Louriſtan and Perſia, or the ſnow-covered mountains inhabited by the Bakhtiaree and the Louree tribes.

From this diſpoſition of the grand features of the country reſults the variety of temperature. The ſhores of the Perſian Gulf, the Kermanſhab, for inſtance, are uninhabitable in ſummer. From the 15th of June to the 15th of Auguſt, the ſeaſon of extreme heat in that country, blows the malignant *Samiel*, whoſe breath, ſwift as lightning, is equally deſtructive. The northern provinces, Mazanderan and Ghilan, reſreſhed by the winds that regularly blow from the Caſpian Sea and are repelled by the mountains, enjoy a temperate climate in winter as well as ſummer. Here the atmosphere is cooler, and the vegetables are ſucculent; mountains clothed with wood remind the European of the Alps and the Pyrennees; but, as he riſes from theſe low tracts in his progreſs to the central platform of Perſia, the wind becomes colder, the productions of the earth are changed, and he would almoſt imagine that he was tranſported into ſome diſtant region. Thus the variation of climate depends more on the elevation of the ſoil than the difference of latitude; ſo that you may paſs in a few hours from the climate of Montpellier to that of Siberia. The order of the ſeaſons is nearly as follows: From the middle of May to the end of September the heat is exceſſive along the Gulf and the Indian Ocean in the Chufiſtan, the deſerts of Kerman and even in ſome parts of the interior, as at

Teheran. The ſummers are generally temperate in tracts of middling elevation. Mr. Kinnier found the mountains covered with ſnow in July 1810; and the cold was ſo ſevere in ſome of the valleys between Shiraz and Iſpahan, that two or three blankets were ſcarcely ſufficient to protect him from it in the night. The winter, nevertheless, generally begins in November, and laſts till March. To the north of Shiraz, in the vicinity of Teheran and Tabriz, that ſeaſon is very cold, and frequently interrupts for months the communication between thoſe cities and their dependencies. From May till September the atmosphere is ſerene, and cooled by the breezes which blow morning and evening.

The climate of Shiraz, the capital of Perſia Proper, is repreſented by a traveller who lately viſited it, as one of the moſt agreeable in the world, the extremes of heat and cold being ſeldom felt. "During the ſpring of the year the face of the country appears uncommonly beautiful. The flowers, of which they have a great variety, and of the brighteſt hues, the fragrant herbs, ſhrubs, and plants, the roſe, the ſweet baſil, and the myrtle, all here contribute to reſreſh and perfume the natural mildneſs of the air. The nightingale of the garden (called by the Perſians *boobul hezar daſtaan*), the goldfinch, and the linnet, by their melodious warblings at this delightful ſeaſon of the year, ſerve to add to the ſatiſfaction of the mind, and to inſpire it with the moſt pleaſing ideas. The beauties of nature are here depicted in their full eſt extent; the natural hiſtorian and the botaniſt would here meet with ample ſcope for purſuing their favourite investigations. With ſuch advantages, added to the ſalubrity of the air, how can it be wondered at that the inhabitants of Shiraz ſhould ſo confidently aſſert the pre-eminence of their own city to any other in the world? or that ſuch beauties ſhould fail of calling forth the poetical exertions of a Haſiz, a Sadi, or a Jami? Their mornings and evenings are cool, but the middle of the day is very pleaſant. In ſummer the thermometer ſeldom riſes above 73 in the day-time, and at night it generally ſinks as low as 62. One thing which is moſt to be eſteemed in this country, and renders it preferable to any other part of the world, is their nights, which are always clear and bright; and the dew, that in moſt places is of ſo pernicious and dangerous a nature, is not of the leaſt ill conſequence here: there is none at all in ſummer, and in the other ſeaſons it is of ſuch a nature, that, if the brighteſt ſcimitar ſhould be expoſed to it all the night, it would not receive the leaſt ruſt. This dryneſs in the air cauſes their buildings to laſt a great while, and is undoubtedly one of the principal reaſons that the celebrated ruins of Perſepolis have endured for ſo many ages, and, comparatively ſpeaking, in ſo perfect a ſtate."

As to rivers, except the Araxes, which riſes in the mountains of Armenia, and falls into the Kur or Cyrus before it reaches the Caſpian Sea, there is not one navigable ſtream in this country. The Oxus divides Perſia on the north-eaſt from Uſbek Tartary. The Indus alſo may be reckoned among the rivers of Perſia, as the provinces lying to the weſt of that river are now in poſſeſſion of that crown: this river is ſaid to run a courſe of more than 1000 miles, and overflows all the low grounds in April, May, and June.

The ſoil of Perſia is in general ſtony, ſandy, barren, and everywhere ſo dry, that, if it be not watered, it produces nothing, not even graſs; but, where they can turn the water into their plains or valleys, it is not unfruitful; and hence the leaſt rill is a bleſſing of heaven; the ſmalleſt reſervoir for collecting rain-water is a treaſure which each would ſtrive to appropriate to himſelf excluſively, did not government regulate the diſtribution of its contents. The neceſſity for this has occaſioned the institution of an office the like of which is not to be found in any kingdom whatever. The *Meer-aub*, or "Prince of the Waters," is an agent appointed by the ſupreme power to ſuperintend this diſtribution of the water of the

rivers or springs, which is made monthly in the following manner. On the canal which conducts the water into the field is put a circular bowl of very thin copper, with a small hole in the middle: at this hole the water slowly enters. When the bowl sinks to the bottom, the measure is complete. This operation is repeated till the necessary quantity is furnished. The proprietor pays in proportion to the number of bowls thus filled. The price of the water varies according to the nature and situation. River-water is dearer than spring-water. Each province has its *meer-aub*, under whom there are numerous agents for conducting streams from district to district, and from field to field. His income is immense, for his extortion has no other bounds than his avarice. His favour is of greater importance to the cultivator of the soil than that of the prime minister. His patronage is therefore purchased, and his probity is assailed in a thousand ways by those who are solicitous to obtain a little more water than their neighbours, or to induce him to change the direction of a canal. Jourdain, tom. i. ch. 2. and tom. iii. p. 143.

There is a great difference in point of fertility in the different provinces of the empire; and those of Media, Iberia, Hyrcania, and Bactria, are now in a great measure what they were formerly, and surpass most of the others in their productions. All along the Persian Gulf, the soil is still more barren, cattle less plenty, and every thing in a worse condition than anywhere else.

Though there is scarcely a province in Persia which does not produce wine, yet the wine of some provinces is much more esteemed than that of others; but Shiraz, or, as it is written by Mr. Francklin, *Shirauz*, wine is universally allowed to be the very best in Persia; insomuch, that it is a common proverb there, "That to live happily one must eat the bread of Yezd, and drink the wine of Shiraz."

The grain most common in Persia is wheat; which is wonderfully fair and clean. As for barley, rice, and millet, they only make bread of them in some places, as in Curdistan, when their wheat-bread is exhausted before the return of harvest. They do not cultivate either oats or rye; except where the Armenians are settled, who make great use of the latter in Lent. Rice is the universal aliment of all sorts of people in Persia; for this reason they are extremely careful in its cultivation; for, after they have sown it in the same manner as other grain, they in three months time transplant it, root by root, into fields which are well watered, otherwise it would never attain that perfection in which we find it there; since it is softer, sooner boiled, and more delicious, than the same grain in any other part of the world. Perhaps its taste is, in some measure, heightened by a practice which they follow to give it a glossy whiteness, viz. by cleansing it, after it is beaten out of the husks, with a mixture of flour and salt. Corn ripens exceedingly in this country; so that in some parts they have a threefold crop in the year. The Persian bread is generally very thin, white, and good; and commonly cheap enough.

Metals of all sorts have been found in Persia. Since the reign of Shah Abbas the Great, iron, copper, and lead, have been very common; but there are no gold or silver mines open at present; though, as Persia is a very mountainous country, such might very probably be found, if pains were taken to search them out. There are silver mines in Kerman and Mazanderan, and one not far from Ispahan; but they cannot be worked for want of wood. Minerals are also found in Persia in abundance; especially sulphur, salt-petre, salt, and alum. Nothing is more common in this country than to meet with plains sometimes ten leagues in length, covered entirely with salt, and others with sulphur or alum. In some places salt is dug out of mines, and even used in building houses. Marble, freestone, and slate, are found in great plenty about Hamadan. The marble is of four colours,

viz. white, black, red and black, and white and black. Persia yields two sorts of petroleum, or naphtha; namely, black and white. In the neighbourhood of Tauris they find azure, but it is not so good as that brought from Tartary. Among the most valuable productions of Persia are the precious stones called *turquoises*, of which there are several rocks or mines.

The horses of Persia are the most beautiful of the East, though they are not so much esteemed as those of Arabia. They are higher than the English saddle-horses; straight before, with a small head, legs wonderfully slender, and finely proportioned; they are gentle, good travellers, very light and sprightly, and do good service till they are eighteen or twenty years old. The great numbers of them sold into Turkey and the Indies, though none can be carried out of the kingdom without special license from the king, is what makes them so dear. Next to horses we may reckon mules, which are much esteemed here, and very fine; and next to these we may justly place asses, of which they have in this country two sorts; the first bred in Persia, heavy and doltish, as asses in other countries are; the other originally of an Arabian breed, the most docile and useful creature of its kind in the world. They are used wholly for the saddle; being remarkable for their easy manner of going, and are very sure footed, carrying their heads lofty, and moving gracefully. Some of them are valued at 20l. sterling. The mules here are also very fine; they pace well, never fall, and are seldom tired. The highest price of a mule is about 45l. sterling. Camels are also numerous in Persia, and very serviceable; they call them *hechty-krouchkouion*, i. e. "the ships of the land;" because the inland trade is carried on by them as the foreign is by ships. Of these camels there are two sorts, the northern and southern: the latter, which is much the smaller, but swifter, will carry a load of about 700 weight, and trot as fast as a horse will gallop; the other will travel with a load of 1200 or 1300 weight; both are profitable to their masters, as costing little or nothing to keep. They travel without halter or reins; grazing on the road from time to time, notwithstanding their load. They are managed entirely by the voice; those who direct them making use of a kind of song, and the camel moving brisker, or at its ordinary pace, as they keep a quicker or slower time. The camels shed their hair so clean in the spring, that they look like scalded swine; but then they are pitched over, to keep the flies from stinging them. The camels hair is the most profitable fleece of all the tame beasts: fine stuffs are made of it; and in Europe, hats, with a mixture of a little heaver.

As beef is little eaten in Persia, their oxen are generally employed in ploughing, and other sorts of labour. Hogs are nowhere found in Persia, if we except a province or two on the borders of the Caspian Sea. Sheep and deer are very common throughout all Persia. Of wild beasts, the number is not great in this country, because there are few forests; but where there are any, as in Hyrcania, now called Tabristan, abundance of lions, bears, tigers, leopards, porcupines, wild boars, and wolves, are to be found.

In Persia may be seen all the several sorts of fowls which we have in Europe, but not in such plenty; excepting, however, wild and tame pigeons, of which vast numbers are kept all over the kingdom, chiefly on account of their dung, which is the best manure for melons. It is a great diversion among the lower sort of people in town or country to catch pigeons, though it be forbidden; for this purpose they have pigeons so taught, that, flying in one flock, they surround such wild ones as they find in the field, and bring them back with them to their masters. The partridges of this country are the largest and finest in the world, being generally of the size of our fowls. Geese, ducks, cranes, herons, and many other sorts of water-fowl, are common here; as are likewise nightingales;

gales, which are heard all the year, but chiefly in the spring; martlets, which learn whatever words are taught them; and a bird called *nowra*, which chatters incessantly, and repeats whatever it hears. Of birds of a larger size, the most remarkable is the pelican, by the Persians called *tacab*, or water-carrier; and also *misc*, i. e. "sheep," because it is as large as one of these animals. There are in Persia various birds of prey. Their falcons are the largest and finest in the world: the people take great pains to teach them to fly at game; the Persian lords being great lovers of falconry, and the king having generally a great quantity of them, (some say 800,) with officers or keepers, of course, to attend upon and train them, the chief of whom is called *taoos-kaneh-agafee*, or head-keeper of the birds of prey.

The seas on the south of Persia are, the Gulf of Persia or Bassora, the Gulf of Ormus, and the Indian Ocean. The only sea on the north is the Caspian or Hyrcanian sea; which is more properly a lake, having no communication with any other sea. These seas, together with the lakes and rivers, supply Persia with plenty of fish. The Caspian Sea contains very fine fish on one side; and the Persian Gulf, on the other, is believed to have more fish than any other sea in the world. On the coasts of this gulf is taken a sort of fish, for which they have no particular name: its flesh is of a red colour, very delicious, and it sometimes weighs 200 pounds. The river-fish are chiefly barbels; but far from being good; those of the lakes are carps and shads. In the river at Ispahan are a great number of crabs which crawl up the trees, and live night and day under the leaves, whence they are taken; and are esteemed very delicious food.

But few kinds of insects occur in this country; which may be ascribed to the dryness of the climate. In some provinces, however, there is an infinite number of locusts, which fly about in such clouds as to darken the air. Mr. Morier, in his Second Journey, gives the following curious account of them. "On the 11th of June, whilst seated in our tents about noon, we heard a very unusual noise, that sounded like the rushing of a great wind at a distance. On looking up we perceived an immense cloud, here and there semi-transparent, in other parts quite black; that spread itself all over the sky, and at intervals shadowed the sun. This we soon found to be locusts, whole swarms of them falling about us: but their passage was only momentary; for a fresh wind from the south-west which had brought them to us, so completely drove them forwards, that not a vestige of them was to be seen two hours after. The locusts which we saw at Bushire were like those which Shaw saw in Barbary in 1724, with legs and body of a bright yellow, and the wings spotted brown. These were larger, and of a red colour; and, I should suppose, are the real predatory locust, one of the Egyptian plagues: (see *GRYLLUS migratorius*, vol. ix. p. 57.) They are also the *great grasshopper* mentioned by the prophet Nahum, no doubt in contradistinction to the lesser, (iii. 17.) As soon as they appeared, the gardeners and husbandmen made loud shouts, to prevent their settling on their grounds. The strength and agility of these animals made me suppose that this was their first flight, and that they could not have come from any great distance. They seemed to be impelled by one common instinct, and moved in one body, which had the appearance of being organized by a leader. As all was dry in the plain of Shiraz, the same instinct seemed to propel them forwards to countries of more vegetation; and, with a small slant of the wind to the westward, they would get into the mountains of Louriston, where the corn was not ripe; and where, as the prophet Joel says after comparing them to a great army, they had *the garden of Eden before them*; ii. 3. Their strength must be very great, if we consider what immense journeys they have been known to make. Pliny says they came from Africa to Italy: they have been known in Scotland. Mandelsoe saw them in the island of Madagascar, the

nearest point of which, from Mofambique, on the continent, is 120 leagues. This proves them to exist in the southern hemisphere; and, if Arabia be their native country, as naturalists affirm, they do not always travel northward, as Shaw seems to think; but, perhaps, take the impulse which the first wind may give them after they are ready to fly.

"I have had opportunities, from time to time, to make observations on the locust, particularly at Smyrna, where, in 1800, they committed great depredations. About the middle of April the hedges and ridges of the fields began to swarm with young locusts; which then wore a black appearance, had no wings, and were quite harmless. About the middle of May they had increased triple the size, were of a grey cindery colour, and had incipient wings about half an inch long. They still continued to be harmless: but, at the end of June, they had grown to their full size, which was three inches and a half in length; the legs, head, and extremities, red; the body a pale colour, tending to red. They appear to be created for a scourge; since to strength incredible, for so small a creature, they add saw-like teeth, admirably calculated to *eat up all the herbs in the land, and devour the fruit of the ground*. Psalm cv. 34. They remained on the face of the country during the months of July and August; sometimes taking their flight in vast clouds, and, impelled by a strong wind, were either lost in the sea, or were driven into other countries. It was during their stay that they showed themselves to be the real plague described in Exodus. They seemed to march in regular battalions, crawling over every thing that lay in their passage, in one straight front. They entered the inmost recesses of the houses, were found in every corner, stuck to our clothes, and infested our food. It is an extraordinary circumstance, that the barn-door fowls eat them before they are quite full grown; and that, when such was the case, the yolk of the eggs which the hens laid was of a dark reddish colour, partaking of that of the locust. The locusts lay their eggs in the autumn, which they do frequently before they take their flight. Sometimes they deposit them in countries where they alight after their flight; gestation and generation going on during their excursion: for, even on the wing, the male and female locust are frequently found together.

"The operation of the female locust in laying her eggs is highly interesting: she chooses a piece of light earth, well protected by a bush or hedge, where she makes a hole for herself, so deep that her head just appears above it. She here deposits an oblong substance, exactly the shape of her own body, which contains a considerable number of eggs, arranged in neat order, in rows against each other, which remain buried in the ground, most carefully and artificially protected from the cold of winter. The eggs are brought into life by the heat of the sun. If the heats commence early, the locusts early gain strength; and it is then that their depredations are most feared; because they commence them before the corn has had time to ripen, and they attack the stem when it is still tender. Harmer would probably have derived some help from what has happened to fall under my observation on this subject in his illustration of the 17th verse of the 3d chapter of prophet Nahum; for I conjecture, that *camping in the hedges in the cold day*, may be explained by the eggs being deposited during the winter; and, *when the sun ariseth they flee away*, may also be illustrated by the flying away of the insect as soon as it had felt the sun's influence."

The POPULATION of Persia, very much diminished by the civil wars of 1722 (the epoch of the overthrow of the dynasty of Ismael Sophi), and of 1743 (the year of the assassination of the celebrated Shah Nadir), is estimated at twenty-two millions of souls. But, as Persia has been overrun alternately by the Gaznevides, the Carizmians, the Seljuks, the Moguls, the Tartars, Turcomans, Usbeks, Afghans, Courds, &c. these successive invasions could

not fail to produce such a mixture in the population, that it would now be difficult to find the Persian blood in its original purity. Chardin estimated the population at forty millions of souls: Kinnier considers this number as greatly over-rated; and doubts whether the space between the Euphrates and Indus could furnish more than eighteen or twenty millions. This population, be its number what it will, may be divided into two classes: the stationary inhabitants or those resident in towns and villages, and the migratory or wandering tribes.

1. The native Persians, who style themselves *Tadjik*, are a medley of all nations, Arabs, Guebres, and Jews, who have voluntarily or by compulsion embraced the religion of Mahomet.

2. The Elauts, or wandering tribes, are mostly of Turkish origin, speak the Turkish language, and retain the custom of their ancestors, the Scythians. The tribes of the southern provinces may be considered as the descendants of those savage hordes which dwelt in the same parts in the time of Alexander.

Almost all these tribes lead a pastoral life. Some of them have fixed habitations, but they are mostly rovers. The latter, however, have districts to which they confine themselves. They live in tents surrounded with mats and covered with coarse black cloth. In winter they reside in the plains; but in summer they move about in quest of pasturage, retiring during the intense heats to the summits and slopes of mountains. In winter some of these tribes, such as the Caraguzloo and the Afshars, dwell in villages. In Daghistan, at Asterabad, and in the northern part of Chorasan, they have small portable wooden huts instead of tents. They subsist chiefly on the produce of their flocks and herds, pay of course very little attention to agriculture, and are almost utter strangers to the mechanic arts, though they make cloth and various other articles for their own use.

The wandering tribes collectively are divided into four great classes, according to the language which they speak and from which they are denominated. Collectively they amount to about 685,500 persons; but in this estimate are included only the tribes that are best known, while many others, concerning which we have no positive information, are wholly omitted.

Each of the principal tribes is divided into several *divaz*, or branches, all having their respective chiefs, subordinate to the supreme chieftain of the tribe. These chiefs are, as to birth and the power they possess, the highest personages of the state; hence the king is anxious to keep them about him, by giving them offices at his court, that he may hold some pledge for the fidelity of their tribes; and, as they are in general extremely jealous, and of a martial disposition, he consults his own security and that of the empire, by habitually fomenting quarrels among them, and keeping their power nicely balanced. The son commonly succeeds his father in his dignity; but, if he proves himself unworthy of it, it is transferred to the younger brother.

The military force of Persia resides in these tribes; their fondness for war, and their intrepidity, form the safeguard of the kingdom, when it is not convulsed by the spirit of rebellion, which too often seizes them. They all pay tribute, and are bound to furnish the king with succours in the wars in which he is engaged; each tribe being obliged to assemble at the first summons, and to bring into the field a quota proportionate to its number. (See p. 697.) They all profess the Mahometan religion.

3. Let us now proceed to the dissenters from the Mahometan religion. The *Guebres* are a remnant of the ancient Persians, who have retained the fire-worship and the doctrine of Zoroaster, amid all the revolutions which have so frequently changed the face of their country. In Chardin's time, but a small number of them remained: the late wars have nearly completed their extermination: the villages which they inhabited to the south of Ispahan

are swept away; and a few families, which escaped death, have sought refuge at Yezd, and in Kerman. Kinnier informs us, that there are still at Yezd four hundred Guebre families, who groan under the tyranny of Persian agents. Each family pays a capitation-tax of twenty piastres, and is nevertheless liable to all sorts of extortions. See PERSEES.

The *Christians* settled in Persia are mostly Armenian schismatics, and chiefly dwell in the northern provinces. Their patriarch resides at the convent of Etschmiazin, near Erivan. These Armenians, so opulent under the Sofys, and especially under Abbas the Great, who planted a colony of them at Julfa, near Ispahan; the same people who had at one time nearly monopolized the commerce of all Persia, and part of its manufactures; now lead, most of them, a vagrant life, bowed down by oppression and indigence. Julfa, formerly so populous, is now but a heap of ruins, and contains no more than five hundred inhabitants. Some Armenians are likewise to be met with in Adherbijan, and in the districts of Meragah, Ourmiah, Salmas, Tabriz, Carabagh, and Erivan. Their total number is computed at 60,000 souls, which perhaps exceeds the truth. The catholic churches of Nakshivan, and other places in Persian Armenia, no longer exist: the catholics who live in the kingdom are in very small number, and are natives of India or Turkey.

It is the lot of the *Jews* in Persia, as in all the rest of the East, to live in degradation, poverty, and contempt. There are Jews at Ispahan, at Shiraz, and at Kashan in Adherbijan: their number in these different places is estimated at about 35,000. Poverty depresses them more and more, and familiarizes them with vice and infamy. Some of them are artificers, brokers, and usurers; the rest live by selling wines, procuring women, and all sorts of intrigues. Many addict themselves to medicine and magic; and, as the populace of all countries have a great deal of credulity, derive a great profit from their impostures. The Jewesses gain admittance into the seraglios, of which they are the oracles. From them beauty purchases the art and means of withstanding the ravages of time; the coquette, the gift of pleasing and of exciting love in her tyrant; the female, solicitous to become a mother, the speedy accomplishment of her wishes. They also foretell future events, and sell potions possessing virtues of all kinds, to produce love and hatred, to ruin a rival, and so forth. These Jews are the most ignorant in the world. Travellers distinguish two classes of them: the one descended from the wretched Samaritan captives, whom the Assyrians carried from Judea during the reign of Hosaia king of Israel, and who were dispersed over Media and Parthia; the other from the Jews who were led into captivity to Babylon. Both wear external marks by which they may be known: these are caps of a particular colour, or square patches of cloth of a different hue from their garments. At Ispahan the Jews are not permitted to wear cloth stockings.

Making allowance for the wandering tribes not enumerated, we now venture to sum up the population of this interesting kingdom in round numbers as follows:

Fixed inhabitants of the Mahometan religion	20,000,000
Wandering tribes, ditto	700,000
Christians and Jews	100,000
Guebres, or fire-worshippers	2,000
	20,802,000

It would, perhaps, be impossible to give to an inhabitant of London a correct idea of the first impressions made upon the European stranger on his landing in Persia. Accustomed, as his eye has been, to neatness, cleanliness, and a general appearance of convenience in the exteriors of life, he feels a depression of spirits in beholding the very contrary. Instead of houses with high roofs well glazed and painted, and in neat rows, he finds them low, flat-

flat-roofed, without windows, placed in little connexion. In vain he looks for what his idea of a street may be: he makes his way through the narrowest lanes, incumbered with filth, dead animals, and many dogs. He hears a language totally new to him, spoken by a people whose looks and drefs are equally extraordinary. Instead of our smooth clins and tight drefles, he finds rough faces, masked with beards and mustachios, and long flapping clothes. He fees no active people walking about, with an appearance of something to do; but here and there he meets a native juft crawling along in flip-fhod shoes. When he seeks the markets and shops, a new and original scene presents to him. Little open sheds in rows, between which is a passage, serving as a street, of about eight feet in breadth, are to be seen, instead of our closely-shut shops with windows gaily decked. Here the vender fits, furrounded with his wares. In a country where there is fo little apparent security of property, it is furprising how a man fo easily exposes his goods to the pilfer of rogues. Comparifons might be made without end; but, however distressing the transition from great civilization to comparative barbarity may be, yet it is certain that first impressions soon wear off, and that the mind receives a new accession of feelings adapted precisely to the situation in which it is placed.

There are noises peculiar to every city and country; and none are more distinct and characteristic than those in Persia. First, at the dawn of day, the *muezzins* are heard in a great variety of tones, calling the people to prayers from the tops of the mosques; these are mixed with the sounds of cow-horns, blown by the keepers of the *hummums*, to inform the women, who bathe before the men, that the baths are heated, and ready for their reception. The cow-horns fet all the dogs in the city howling in a frightful manner. The asses of the town, generally beginning to bray about the same time, are answered by all the asses in the neighbourhood; a thousand cocks then intrude their shrill voices, which, with the other subsidiary noises of persons calling to each other, knocking at doors, cries of children, complete a din very unusual to the ears of an European. In the summer season, as the operations of domestic life are mostly performed in the open air, every noise is heard. At night, all sleep on the tops of their houses, their beds being spread upon their terraces, without any other covering over their heads than the vault of heaven. The poor seldom have a screen to keep them from the gaze of passengers; and, as we generally rode out on horseback at a very early hour, (says Mr. Morier,) we perceived, on the tops of the houses, people either still in bed, or juft getting up; and certainly no sight was ever stranger. The women appeared to be always up the first, whilst the men were frequently seen lounging in bed long after the sun was risen. This universal custom of sleeping on the house-top speaks much in favour of the climate of Persia; and indeed repose in the open air is much more refreshing than in the confinement of a room.

As to the character, manners, and customs, of the Persians, though they differ in many particulars from the Turks, yet they differ fo much more from Europeans, that we think our readers will admit the justice of the following quotation from *Las Cafes' Journal*, vol. iii. now publishing. "In the course of the conversation in the evening, the emperor, speaking of different nations, said he only knew of two, the Orientals and the inhabitants of the West. The English, the French, the Italians, &c. said he, compose one family, and form the western division; they have the same laws, the same manners, the same customs, and differ entirely from the Orientals, particularly with respect to their women and their servants. The Orientals have slaves; our servants are free: the Orientals shut up their women; our women share in all our rights: the Orientals keep a seraglio; but polygamy has never been admitted in the West at any period: with the Orientals every thing is calculated to enable them to

watch over their wives, and make sure of them; all our institutions in the West tend, on the contrary, to put it out of our power to watch over our's, and to make it necessary for us to rely upon them alone. There are several other distinctions, said the emperor: some aver that as many as eighty have been reckoned. The inhabitants of the East and the West are therefore really two distinct nations."

Yet something of an approximation may in time be made. We have seen that the Persians, influenced by the discernment of Abbas Mirza, the heir apparent, have been willing to adopt European tactics; for instructing them in which, we may perhaps one day repent. It seems, moreover, that the heir of that splendid monarchy has discernment enough to appreciate the superiority of more civilized states in other particulars; and that he has, on several occasions, shown an anxiety to introduce into his native country a taste for the more advanced stages of the ornamental and useful arts. We are told that he has ordered, through the mirza now resident in London, different specimens of that beautiful manufacture of china in which England now surpasses all other countries. We are fully aware of the exceeding beauty of colour, and of the transparent delicacy of material, for which the real Chinese ware is remarkable. Take the manufactory, however, as a whole, as an union of elegant forms, of skilful drawing, of beautiful colours, and of delicate materials, and we do not hesitate to say that the English china is the best. The mirza, before he decided, inspected the two best depositaries in Europe, that of Seves in France, and that of Messrs. Flight and Barr in England; and he decided in favour of the latter. The first order has been fo well executed, that we have no doubt it will create a demand for much larger supplies. It consists of two parts; a set of small portraits, or enamelled medallions, and a complete service of banquetting-cups. The medallions represent the Shah of Persia, and his heir apparent. The paintings are as well executed as oil or water-colour miniatures, and the material in which they are fet has all the appearance of the purest pearl, though, of course, it is nothing but porcelain. The cups are ornamented with portraits and bouquets of flowers, done in that style which has long made this manufactory rank among the fine arts. We may add, as a much stronger illustration of the prince royal's wish to adopt the advantages of more civilized states of society, that he has an English woman to instruct his daughters according to the plan of English education: thus declaring, perhaps for the first time in an oriental court, that a woman has a mind to be cultivated, as well as a body to be adorned.

In delineating the character of the Persians, we can scarcely have a better guide than Chardin, whose long residence in the country, and whose intercourse with the great, enabled him to make himself intimately acquainted with the character of the nation, rather than with that of the lower classes, the number of whose vices is increased by the want of education.

The Persians, as he informs us, are pre-eminent for intellectual qualities, while their moral character exhibits a compound of the most odious defects. They have a sound understanding, a quick imagination, a ready memory, and a happy capacity for the sciences and the liberal and mechanical arts. Under the appearance of a proud indifference, they derive information from the society of foreigners, and profit by their knowledge: they receive them kindly, patronize them, tolerate their religion, and regard them with pity rather than contempt. In illness and affliction they even solicit the prayers of infidels; but this may proceed from superstition rather than from toleration.

In conversation, the Persians affect elegant language, and are fond of introducing quotations from the works of their best poets, such as Saadi, Hafiz, and Djami. This love of quotations is common alike to persons of

distinction and to the dregs of the people; because those who have received no education, and cannot even read and write, take advantage of the readiness and retentiveness of their memory to learn by heart a great number of striking passages, which they omit no opportunity of bringing forward. They are also very clever at irony and punning. Endowed with a supple and intriguing disposition, they have agreeable manners and extreme politeness: but this politeness is little better than a jargon of high-flown compliments, and hyperbolic expressions, equally destitute of sense and feeling: hence it is, no doubt, that they have been denominated "the French of Asia."

Mr. Morier gives several examples of this propensity of the Persians to hyperbole and exaggeration; and he adds, that, however impertinent this sort of barefaced flattery may appear to Europeans, in the eyes of the Persians the omission of it would be a neglect of the common forms of politeness. Mr. M. was once present when the prime-minister gave instructions to a man who was sent to greet a Russian officer on his arrival; and his principal injunction was, "Be sure you give him plenty of flattery." They know, however, the real value of it as well as we; for at the same time he turned round to our countryman and said: "You know it is necessary *refsh-khundi/sh beku-neem*, to laugh at his beard, or, in other words, to humbug him." Among themselves they practise the same sort of deceit; and, though they are in general aware of the value of the praise they receive, yet it does not fail to stimulate their vanity, which, as far back as the time of Herodotus, appears to have been a national vice; for, he says, "they esteem themselves the most excellent of mankind."

I have repeatedly heard them compliment a person, observes Mr. Scott Waring, either in his hearing, or in the presence of some one who would convey this adulation to his ears; and, the instant that he has departed, their praises have turned into abuse, and they have, with malicious pleasure, exposed the character which not a moment before they praised with fervent servility. I recollect, says the same writer, that the Sheik at Bushire was declaiming against the rapacity of Chiragh Ali Khan, the governor of Shiraz; and just at that moment he was informed of the arrival of his principal secretary. He began by inquiring after the governor's health; and, when he was told that he had quitted the city, he readily observed, that "now Shiraz was worthless, and that it had lost the only ornament it possessed." Is not this something like an approximation to European manners?

The spirit of exaggeration and insincerity is not confined to their personal intercourse with one another: it insinuates itself into public affairs, as well as into the humbler relations between man and man. Not long after the arrival of the English embassy, under sir Gore Ouseley, at Teheran, the confidential secretary of the grand-vizir, accompanied by Mirza Abul Hassan Khan, who had been ambassador from Persia to the British court, came one morning in great agitation to announce a victory gained by the prince-royal over the Russians. Their account was, that the Persians had killed 2000, and taken 5000 prisoners and 12 guns. We soon afterwards heard the real truth, says Mr. Morier, which reduced their account to 300 killed, two guns taken, and 500 made prisoners. On questioning them why they exaggerated so much, when they knew how soon the falsehood must be discovered, they very ingeniously replied: "If we did not know that your stubborn veracity would have come in our way, we should have said ten times as much. This is the first time our troops have made any stand at all against the Russians; and you would not surely restrict so glorious an event in our history to a few dry facts." This, also, is a trait not quite unknown or unexampled in the West.

M. Olivier, who travelled in Turkey and Persia during the first six years of the French republic, by order of the

government, has drawn a very laboured parallel between the Turkish and the Persian character and usages. The whole of this we find translated to our hand in the Monthly Magazine; but we shall only quote a few passages.

"In Turkey every thing bears the stamp of barbarism and cruelty: in Persia every thing bespeaks a mild and civilized nation. The Turks are vain, supercilious, inhospitable: the Persians polite, complimentary, and obliging.

"The Persian loves to be informed, and to interrogate foreigners concerning the manners and customs of their respective countries, the sciences cultivated, and the arts practised, in them. He discovers in them that superiority of intelligence which causes him to esteem them, although they are of a religion different from his own. The Turk, on the other hand, is pleased with his own ignorance, and thinks it quite beneath him to receive instruction from other nations, all of which he despises. He believes that the Koran contains all that ought to be learned.

"The Turk is fanatical. The Persian is superstitious without having religion, and more tolerant, though more strongly attached to the trifling forms of worship. The Christians in Persia enjoy almost as much liberty as the Mussulmans of the lower classes. If they are insulted or struck, they may not only complain, but may also defend themselves. Of this we have already given an instance or two. In Turkey, and especially in Romelia, a Greek would be punished with death who should dare to lift his hand against a Mahometan. The Turk does not permit an infidel to enter his mosques, except with a supreme order, and bare-footed. The foreigner, accompanied by an officer of the government, has free access, in Persia, to the mosques, and may enter them in his boots; nay, in the course of our travels, lodgings were appointed us, in several villages, in these edifices consecrated to public worship. On the other hand, the Persian is superstitious in the highest degree. He never eats with a Christian, touches no food prepared by the hands of an infidel, and is fearful of desiling himself by drinking from the same cup or smoking with the same pipe. Taking a ride one day in Isphahan, and being extremely thirsty, I begged a Persian, who was passing on foot, to give me a little water from a neighbouring fountain: he filled me an earthen cup, which he broke immediately afterwards, because my impure lips had touched it. Now the Turk would have drank out of the cup after me without ever rinsing it. At his table he drinks, without reluctance, what a European may have left in his glass. Nevertheless, he speaks of a Christian with contempt. The Turkish flag bears the arms of the empire on a ground of green, which is the colour consecrated by their religious traditions: they have a term to express this naval ensign, but they take especial care not to use the same word when speaking of European colours: for their own they make use of the word *baïrue* (flag), and for those of foreign nations of *patchoura* (dishclout).

"The Persian barbers never shave an infidel. The Turkish ones serve an European with pleasure.

"The Persian distinguishes every people, whether tributary or not, by their national denomination; while the Ottoman confounds them all under the emphatic appellation of *Giaour*, which is continually in his mouth.

"Equally brave with the Turk, more active, but less patient, the Persian is, like the other, cruel in battle and implacable towards his armed foe; but more tractable after the combat, and more sociable after peace.

"In Persia, the first vizier is not expected to command the armies. In Turkey, he is most frequently a man who has risen from nothing, and is obliged to put himself at the head of the troops whenever war is declared.

"The Persian is as confident in politics as the Turk is suspicious. If an European, excited by the desire of information, or by mere curiosity, traverses any remote province of the Ottoman empire, the Turk sees in him nothing

thing but a spy, sent to reconnoitre his country, and to serve as a guide to an army coming to drive him from it. This distrust scarcely ever troubles the minds of the Persians. A stranger may go through the countries which they inhabit, and examine them with attention, without exciting the least suspicion by his curiosity. The government even carries its confidence so far, that, during the war subsisting against the Russians, the communications were not interrupted. The caravans continued to go from the interior of Persia into Georgia; the Russian vessels touched on the coasts of Guilan and Mazanderan; the Russians had secret correspondences with Armenians, and even with Persians; and yet the government testified no inquietude. To what is this tranquillity to be attributed? to the constitution of the government, or to its supineness? It is certainly a very remarkable difference, when we consider that these are two neighbouring empires, both absolute, and both professing the same religion.

"In commercial transactions the Turk is just, and rarely breaks his word; the Persian barter his oath like any other commodity. We read in Plato and Herodotus, that the ancient Persians had a horror of lying: how much their descendants have degenerated! The Persians of the present day are the most lying people upon earth. They are accustomed in their infancy to dissemble, and to get out of a scrape by any subterfuge. Cunning and deceitful, the Persian is never afraid to break his engagements: when he keeps his word, it is only because it is impossible to do otherwise. The crime of theft, which is very rare among the Ottomans, is frequent with the Persians, who commit it without scruple.

"The Turk is magnificent in his presents, whether guided by ostentation, gratitude, or humanity. But the hand of the Persian, always open to receive, is never open to give: when he cannot do otherwise than give, his gifts are confined within very narrow limits. He ruins himself only in promises, and in these he may, indeed, be said to be munificent. If you extol the beauty of a horse, a sabre, or any other article, he immediately says, 'I give it you.' If you are delighted with a field bearing a rich crop, or with a smiling valley, he says, 'I make you a present of it.' But this is all mere ceremony, and never turns out to mean any thing. The Spaniards have the same custom, which they have no doubt derived from the Arabs.

"The Persians and Turks of the present day are not, as their forefathers were, rigid observers of the precept which forbids the drinking of wine. Nevertheless, those who transgress are still obliged to do it in secret. In every part of Persia where the vine grows, the Armenians and Jews make the wine, and sell it to the Persians. The Turks are more addicted than their neighbours to the vice of drunkenness.

"Under an able government, the Persians would rebuild their cities, re-establish their commerce, and repair the injuries which their agriculture has sustained. With a vigorous, active, and intelligent, government, the Turk would perhaps once more strike terror into Europe.

"From these different traits we are authorized to conclude, that the society of the Persians is agreeable, if the connexion between the parties is disinterested; but we must not expect from them either sincere friendship, strict integrity, or refined delicacy." Monthly Mag. vol. liii. liv.

To judge from the Guebres, the relics of the ancient Persians, they were originally a coarse-looking race of people; but their blood has since been refined by the intermixture with that of Georgia and Circassia. There are few Persians of quality who are not sprung from women of those nations; and, as this intermixture has been practised for several centuries, both sexes have been greatly improved by it. The men are tall and well-proportioned, vigorous, active, and comely. The women,

without being qualified to vie with those of Georgia in beauty, are in general handsome in face and figure.

But the Persians differ as much from us in their notions of beauty as they do in those of taste. A large soft and languishing black eye constitutes with them the perfection of beauty, and diffuses an amorous softness over the whole countenance, infinitely superior to the piercing and ardent glance of majestic beauty. It is chiefly on this account that the women use the powder of antimony, which, while it adds to the vivacity of the eye, throws over it a kind of voluptuous languor which makes it appear dissolving, as it were, in bliss. Thus the chief characters of beauty with them are eyes like the antelope's, a full-moon face, and the stature of the cypress; but there are secondary ones which the poets are fond of celebrating. Ferdousee, in the Shah Nameh, thus describes the females of Touran: "Their stature is tall, like that of the cypress, and the locks of their hair black as musk. Their cheeks are covered with roses, and their eyes full of languor; their lips are sweet as sugar and fragrant as the rose."—"How admirable is thy form!" exclaims Hafiz; "how delightful thy converse! Thy heart is as tender as the bud of the rose is fresh; thy beauty is equal to that of the cypress of the eternal garden!"—Djami describes the charms of Leilah in these terms: "Her figure was tall and elegant, and in her graceful gait she resembled the partridge of the mountains. Beautiful without the assistance of art, nature had given the most delicate rosy tinge to her cheeks, radiant with freshness; her eyebrow was like a delicate bow, formed of precious amber, and her eyelashes, like so many little darts of musk, pierced all hearts; her lips had the lustre of rubies without their hardness. Her enchanting smile displayed teeth as white as the purest pearls; you would imagine you beheld the bud of the rose gemmed with the tears of morning."

Many of the women of Persia are as fair as those of Europe, but confinement robs them of that lovely bloom so becoming and so essential to female beauty. The Persian women have a curious custom of making their eyebrows meet; and, if this charm be denied them, they paint their forehead with a kind of preparation made for the purpose.

The Persian ladies not only dye their hair and eyebrows, but also stain their bodies with a variety of fantastic devices, not unfrequently with the figures of trees, birds and beasts, sun, moon, and stars, as we read was the practice of our ancient British ancestors. This sort of pencil-work spreads over the bosom, and continues down as low as the navel, round which some radiated figure is generally painted. All this is displayed by the style of their dress, every garment of which, even to the light gauze chemise, is open from the neck to that point, as may be seen in the figure of a Persian lady of the royal seraglio, in Plate I. in which, however, the appearance of the tattooing is omitted.

The occupations of the Persian women are more diversified than might be supposed. They spin, embroider, work with the needle, and make their own apparel. They superintend also whatever relates to the interior of the house; they keep an account of the daily expenditure, deliver out the provisions to the servants, pay their wages, adjust their disputes, and even see that proper attention is paid to the horses. In every house of any consequence, there is a eunuch, called *nazir*, steward, with whom the mistresses of the house daily consult, and decides on every thing relating to the servants and domestic concerns.

Sir Robert Porter gives the following lively picture of the employments of women belonging to what may be called the middling class. The originals after whom it was delineated, were the four wives of a man in whose house he was entertained. "From the hour of rising," says this traveller, "to that of going to rest, the house founded with one continual clatter of female voices, mingling

mingling with the cries of children, and the bustling clamour of varied occupation. These women do all the laborious part of the household establishment, each having her own especial department, such as baking the bread, cooking the meat, drawing the water, &c. and, though the latest espoused is usually spared in these labours and the best dressed, still the whole party seem to remain in good humour, no appearance of jealousy disturbing the amicable routine of their proceedings. When their lord shows himself among them, it is like a master coming into a herd of favourite animals: they all rush forward, frisking about him, pleased with a caress; or frisking still if they meet with a pat instead. The four wives of my worthy host retire at sun-set from their domestic toils, and each, taking her infant and cradle to the roof of her division of the house, not forgetting the skin of water she has brought from the spring or well, deposits her babe in safety, and suspends the water-case near her bed on a tripod of sticks, in order that the evaporation may cool it for the night or next day's use. To preserve the amity between these ladies, which had so excited my admiration, our communicative host told me, that himself, in common with all husbands who preferred peace to passion, adhered to a certain rule, of each wife claiming in regular rotation the connubial attentions of her spouse. Wherever this monopoly of many women exists, there we find the softer sex regarded by man with a contempt which gives the loveliest bride, or the most respectable mother of his children, scarcely a higher rank in his esteem than the best mare in his stud, or the dog that is his favourite to-day and totally neglected to-morrow. In proof of this Mahometan disparagement of women in general, it would be deemed the height of impropriety, while addressing a person of noble quality here, to hint at the female part of his family; and, were even the most beloved wife of his bosom at the extremity of some dangerous illness, if a male friend were to make the slightest inquiry after her health, it would be deemed the grossest insult."

To this remark we find a striking illustration in a subsequent part of the work of the same entertaining traveller. In his journey from Persia through Asiatic Turkey, he fell in with a party belonging to Abdul Hassan Khan, then Persian ambassador in London. These people were returning from England to Teheran; and under their charge, mounted on a sorry post-horse, was the *Fair Circassian*, whose appearance both in Paris and in London excited at the time so strong a sensation. She was noticed by our European ladies with much kindness; but the style in which our countryman now beheld her must have formed a sad contrast to what she had then experienced. "When the poor creature (says Sir Robert) discerned, on approaching, my Frangy (European) appearance, she was riding forward to address me; but in a moment the rough fellow who was her conductor laid his whip over her shoulders, with so terrible an admonition into the bargain, that, closing both her lips and her veil, she travelled on, doubtless with heavy recollections. To interfere in behalf of a woman so situated, would cast a sort of contamination on her, and only redouble her stripes."

DRESS.—"If the prudence of a nation (says Chardin) were manifested in a steadfast adherence to its costume, the Persians could not be too highly praised for that quality; for their dress never alters; they never make any change either in the colour or fashion of the stuff. I have seen dresses belonging to Tamerlane which are preserved in the royal treasury at Ispahan, and which are cut in the very fashion of the present day, without the slightest difference." Such was the remark of Chardin, nearly two hundred years ago: but we are not to suppose that fashions never alter; and, could the same traveller now revisit Persia, he would fancy himself in another country, such are the changes effected by the late revolutions in the state of the kingdom and the costume of its inhabitants. In Chardin's time, all colours, black excepted, were worn

indiscriminately. Under the dynasty of the Zends, light colours were preferred; but, since the family of the Cadjars has filled the throne, the darker hues have been the fashion. The form of garments also has undergone great change; inasmuch that we have been obliged to discard certain drawings and engravings which we had treasured up for the illustration of this article; and we again claim the help of Mons. Jourdain, who informs us, that the garments composing the dress of a modern Persian are the following:

1. The *zeer djameh*, a species of very wide trowsers, made of cotton cloth or silk, which reach down to the ankles, and are tied at the waist in front.

2. The *peerahum*, or shirt, of silk, comes over the trowsers and falls a little below the hips. It is shaped at top like a woman's chemise, having no collar, and is fastened by means of two buttons over the left shoulder.

3. The *erkalig*, a very tight vest, which falls to the bend of the knee; the sleeves descend to the wrist, but are open from the elbow. It is made of Mahometan chintz, or fine shawls.

4. The *caba*, a long robe reaching to the ankles, fits close down to the hips, and buttons on the sides. The sleeves of the caba cover those of the *erkalig*, and are held together from the elbow downward by a row of buttons, so that they may be opened for the performance of the prescribed ablutions previously to prayers. The caba is made of various kinds of cloth, some of which are very magnificent and expensive.

5. The *bagalee* is another kind of robe, which folds over the breast, and buttons on the side down to the hip. This garment is generally made of cloth, shawl, or cotton stuff folded; and is worn in winter only.

6. The outer robe is always of cloth; it is worn or not, according to the weather. The robe has as many names as there are forms of which it is susceptible. It is called *tikhme*, when the sleeves are open as high as the elbow, and when it is round, buttons before, and falls like a petticoat over the shawl that serves for a girdle; *omeh*, when it is open on both sides from the hips; and *biroone*, when it is loose, with wide sleeves hanging carelessly from the shoulders.

7. The *shalee-kemr*, or shawl-girdle, fastened round the waist over the caba. This girdle is, according to the circumstances of the wearer, either a real Cashmere, a Kerman shawl, or a piece of flowered muslin. In this girdle is stuck the *caudjar*, a kind of dagger, the handle of which is sometimes enriched with precious stones, and at others merely of ivory or wood.

8. The Persians have also pelisses of very rich stuff, trimmed with furs; such as the *catabee*, which covers the whole body, and is trimmed with fur down the back, at the shoulders, at the elbows, and in the inside. This is the richest and most showy garment of the whole Persian costume.

9. The *coordee*, a sort of jacket, which fits close to the body, and the skirts of which fall over the thighs. The *catabee* and *coordee* were worn in Chardin's time.

10. The *kolah*, or cap, worn by the Persians, while more convenient, keeps the head not less warm than the turban. It is made of lamb-skin, with short curly black wool, lined with a greyish skin of not so fine a quality, terminating in a skull-cap of red or azure-blue cloth, or merely of white sheep-skin. The only distinction there is in this species of head-dress, consists in a shawl wound about the *kolah*; and this distinction is reserved for the king, the princes of his family, and a few of the nobles, the great officers of state, and the magistrates.

11. The inhabitants of the town wear in winter socks of worsted or cotton. The country people wear no stockings in summer; and in winter they wrap pieces of cloth about their legs.

12. The Persians have three sorts of shoes or slippers, and two of boots. People of the higher classes wear green slippers with heels an inch thick. A low slipper

Costume of the modern Persians.

of red or yellow leather, having an iron in shape of a horse-shoe at the heel, was formerly worn. The lower classes use strong shoes of leather or quilted cotton, with flat soles, and turned up at the toes. One of the sorts of boots has high heels, turns up at the toe, and covers the whole leg. The others are smaller, tighter, and only reach up to the calf.

13. When a Persian is going to ride, he puts on a pair of wide cloth trowsers, called *shalwar*, into which he introduces the skirts of the *erkalig* and the *zeer-djameh*. A Persian of distinction, thus equipped and mounted, is represented in the lower part of Plate III.

The drefs of the Persians of the superior classes is very expensive, frequently amounting to sixty or one hundred guineas. It is admirably calculated for either a hot or cold climate: it imposes no restraint on the limbs, and may be put on or thrown off in five minutes. The poor people wear no cap, and but little clothes, in summer; but, when the cold weather comes, they make dresses of sheep-skins. The merchants never wear scarlet or crimson cloths, or use silver or gold buttons to their robes: this may not possibly amount to a prohibition, but the effect is the same. Shah Abbas, who wished to make this class of his subjects very frugal, issued an order that they were always to wear shawl turbans and robes of broad cloth. This would be, in his opinion, the cheapest dress they could wear; as the shawl would serve them for their lives, and descend to their children; and the cloths would last several years.

It should be observed, that the wearing of silk is interdicted by the Mussulman law, on account of its being an excrement. The Persians, however, evade this prohibition by mixing with the silk a very small portion of cotton. A large quantity of this kind of cloth is imported into Persia from Guzerat.

The Persians have a high esteem for the beard, which is an object of their incessant care and attention. In Egypt it indicates a state of liberty; in Persia it is worn alike by master and slave: there the condition of the eunuch is too much despised for any one to wish to resemble him in any particular. Black bushy beards are held in the greatest estimation: accordingly all are of this colour; for men of a fair complexion dye their beards, as well to please the women as to give themselves a look of youth and vigour. It is more difficult to make them bushy: ointments, pomatums, drugs of all sorts, are early employed to impart to them this species of beauty; but nature is seldom to be overcome by such applications.

Of all the habits of a Persian, the most common is that of smoking. Whether he is with his women, or in the company of his friends; whether he is going abroad or to court; he is never without his pipe, which fills the intervals of silence, relieves him from the fatigue of talking, and frequently causes him to be deemed more intelligent than he really is. The Persian pipe, called *halioun*, or *nargally*, is totally different from ours, as may be seen in the portrait of the emperor, Plate II. It is shaped like a bottle terminated by the neck, at the top of which is a bowl for receiving the tobacco. The tube is attached to the bottom of this bowl, and frequently makes several windings in the bottle. The latter, which is of blown glass, has a curious appearance to a stranger: it is ornamented in the inside with representations of trees, flowers, and sometimes with small medallions. When the glass is just blown, these ornaments are fixed in the bottle with small pincers; and so neatly are the pieces joined together, as entirely to escape observation. A handsome *halioun* costs, we are told, nearly fifty guineas. To use this pipe, the bottle is filled with water, and the tobacco lighted. The smoke, after thus passing through the bottle, arrives at the mouth cool and disengaged from the coarser vapours.

The *poshkedmats* are a class of servants who take charge of the smoking apparatus when the master rides out. A

couple of cylindrical leather cases are fastened on each side of his saddle, at the places usually destined for the holsters; one contains the *kallioun* with its tubes, &c. and the other the tobacco. On the left side of the beast, and suspended by a chain long enough to clear the belly, hangs an iron pot with live charcoal, and as an opposite pendant we see a large leather bottle, holding water; fire and water being essentials to the enjoyment of the *kallioun*. The attendant must be ready to serve the *kallioun* instantly at the call of the master; and Plate III. represents a grandee smoking on horseback, attended by a servant on foot.

The drefs of the females is very simple, being composed of a much smaller number of garments than that of the European women. A Persian lady, when at home, does not load herself with clothes; and in her finery she seems to attach very little value to beauty of form. Very ample trowsers of thick velvet cover the whole of the lower part of the body down to the heels. Over these trowsers is worn a *peerahun*, or chemise of muslin, silk, or gauze, which is open in front nearly down to the waist, and buttons down the bosom by means of a number of loops and small buttons of silk, gold, or silver. Over the *peerahun* is generally fastened a girdle of skin, covered with cloth or silk, embroidered, and decorated with a plate of gold or silver and precious stones. Such is the summer costume. The winter drefs is the same, with the addition of a short upper garment resembling a jacket, and shawls in which the women wrap themselves as a protection from the cold. The covering for the feet is a kind of slipper, with a sole of ivory, metal, or some hard sort of wood. See the upper part of Plate III.

When they leave the house, they put on a cloak which descends from the head to the feet, and their faces are concealed with oriental scrupulosity. The veil which they wear, is sometimes worked like a net, or else two holes are made in the cloak for their eyes. It is curious to see a number of tall and elegantly-formed figures walking in the streets, and presenting nothing to your view but a pair of sparkling black eyes, which seem to enjoy the curiosity they excite. The veil seems to be essential to their virtue; for, as long as they can conceal the face, they care not how much they expose the rest of their person. The women in Persia are the only people who wear jewels and use perfumes; and this is a privilege in which they take much delight.

The hair is almost always arranged in tresses, which fall down behind. That in front is cut short and turned up from the forehead. On the sides it descends in ringlets over the ears and cheeks. The ends of the tresses are adorned with pearls, clusters of precious stones, or ornaments of gold or silver. The bandeaux, diadems, and caps, vary in form, according to the caprice of the inventor, or the taste of the wearer: they are more or less costly according to the circumstances of the individual. Shawls alike cover and adorn the head in a thousand different ways; they fall down the back over the shoulders, twist round the neck, or are fastened on the crown of the head, without any other rule than taste to determine their position, as may be seen on comparing the figures of the contiguous females on the same engraving.

In the foregoing account of the costume of the modern Persians, Mons. Jourdain has acknowledged his obligations to a small tract published at Paris in the year 1818, in the Persian, Armenian, and French, languages, by Myr Daoud Zadour, a native of Persian Armenia, who was envoy from the king of Persia to the court of France.

DOMESTIC HABITS.—The Persians have no other guide for the division of time than the sun. They divide the day into three parts; from sun-rise to noon, from noon till three o'clock, and from three till sun-set. Thus if you ask what time it is, a Persian will tell you how many hours have elapsed since sun-rise or mid-day. The *muezzin*, who summons the people to prayers, pro-

claims the arrival of noon ; but, as he waits till the shadow has traversed the whole length of the meridian, he is frequently an hour later than the real time.

A Persian, of what condition soever, rises as soon as it is light, and performs his morning devotions. Then comes the *nachtah*, or breakfast, which consists of grapes and other kinds of fruit that are in season, cheese, and goat's milk, and finishes with a cup of very strong coffee. The artisan then goes to his master's, and begins his work; the tradesman applies to business; the great man repairs to the apartment in which he receives company, and, while smoking his *kallioun*, chats with his inferiors or visitors; gives directions relative to his domestic affairs; adjusts the quarrels, or listens to the reports, of his dependents. At nine o'clock he visits the prince or the governor. At noon he returns home, and takes his *schacht*, or dinner, usually consisting of bread, cheese, butter, and different sorts of fruit. After dinner he says his noon-tide prayers, and retires to the inner apartments to enjoy the society of his women. At three o'clock he goes abroad to pay visits, or receives visitors at home. At four he recites the afternoon prayer. When night comes on, his carpet is spread in the open air, and he prepares to spend the evening in the company of his friends or dependents. They converse upon the events of the day, or the news of the court; they relate extraordinary adventures, for the Orientals are admirable story-tellers, or repeat passages of the most eminent poets. The hour for the fourth prayer arrives, but without causing the slightest interruption in the conversation. Each rises in turn, goes to a corner of the room, places himself on a small carpet with his face turned towards Mecca, and performs this religious duty with much greater dispatch than devotion. Such indeed is their precipitation, that the duty of prayer seems to be quite as irksome as it is indispensable. At ten o'clock a servant announces that supper, *shamee*, is ready: at the same time he brings with him a ewer of water; each of the party washes his hands; and they then seat themselves round the tray on which the dishes are placed. Eleven o'clock usually breaks up the company, and puts an end to the occupations of the day.

The Persians are too much addicted to etiquette and ceremony not to be fond of visiting. The dependent would not on any account allow a day to pass without paying his respects to his patron, the courtier without presenting himself before the sovereign, and friends without mutually visiting one another.

The ceremonies and compliments differ with the rank of the visitor. If an inferior is honoured with a visit from his superior, he does not sit down till the latter is seated, nor rise till he has risen. The master of the house commonly occupies the upper end of the cushion or carpet; but, if he wishes to do honour to the stranger, he gives up his place to him, or makes him take a seat by his side.

A visit between persons of distinction and of equal rank consists of three acts. In the first the visitor is furnished with a *kallioun*, or pipe, the smoke of which is cooled by water, and a cup of very strong coffee without sugar. In the second another pipe is given with *sweet* coffee, so called because it is composed of rose-water and sugar. A fresh pipe, sweetmeats, and sherbet, make up the third act. These sweetmeats are generally brought on silver, plated, or japanned, trays, adorned with painted flowers or other ornaments. The Persians are passionately fond of sweetmeats, and excel in the art of making them.

The manner in which the Persians take their meals is totally different from ours: they are strangers to the use of tables, knives, and forks; and such is the power of habit, that articles with which we cannot dispense are to them most troublesome and inconvenient. Thus Abu Taleb, in the Narrative of his Travels in Europe, complains bitterly more than once of the necessity of eating with a knife and fork.

The method of proceeding at a Persian entertainment will be best explained by the descriptions of some recent travellers.

At an entertainment given to Mr. Morier by Mohammed Nebbee Khan, the routine was as follows: "We did not go till the khan had sent to the envoy to say, that the entertainment was ready for his reception, a custom always observed on such occasions. When we arrived at his tent, the same ceremonies passed as in the morning, except that we sat upon the ground, where the inflexibility of our knees rendered the position more difficult than can be described. The khan, who seemed to commiserate the tightness of our pantaloons, begged that we would extend our legs at their full length: fearing, however, to be rude, we chose to be uncomfortable, and to imitate their fashion as faithfully as possible; and really, with respect to my own feelings, I thought complaisance was never carried further. The guests besides ourselves, were our mehmandar and the Persian secretary. After having sat some time, *kalliouns* were brought in, then coffee, then *kalliouns*, then sweet coffee (the composition already noticed of sugar and rose-water), and then *kalliouns* again. All this was rapidly performed, when the khan called for dinner. On the ground before us was placed the *soufra*, a fine chintz cloth, which perfectly entrenched our legs, and which is used so long unchanged, that the accumulated fragments of former meals collect into a musty paste, and emit no very savory smell; but the Persians are content, for they say that changing the *soufra* brings ill-luck. A tray was then placed before each guest; on these trays were three fine china bowls, which were filled with sherbets; two made of sweet liquors, and one of a most exquisite species of lemonade. There were besides, fruits ready cut, plates with elegant little arrangements of sweetmeats and confectionary, and smaller cups of sweet sherbet; the whole of which were placed most symmetrically, and were quite inviting, even by their appearance. In the vases of sherbet were spoons made of the pear tree, with very deep bowls, and worked so delicately, that the long handle just slightly bent when it was carried to the mouth. The *pillaus* succeeded, three of which were placed between each two guests; one of plain rice called the *chillo*, one made of mutton with raisins and almonds, the other of a fowl, with rich spices and plums. To this were added various dishes with rich sauces, and over each a small tincture of sweet sauce. Their cooking, indeed, is mostly composed of sweets. The business of eating was a pleasure to the Persians, but it was misery to us. They comfortably advanced their chins close to the dishes, and commodiously scooped the rice or other victuals into their mouths, with three fingers and the thumb of their right hand; but in vain did we attempt to approach the dish; our tight-kneed breeches, and all the ligaments and buttons of our dress, forbade us; and we were forced to manage as well as we could, fragments of meat and rice falling through our fingers all around us. When we were all satisfied, dinner was carried away with the same state in which it was brought; the servant who officiated, dropping himself gracefully on one knee, as he carried away the trays, and passing them expertly over his head, with both his hands extended, to the lacquey, who was ready behind to carry them off. We were treated with more *kalliouns* after dinner, and then departed to our beds." This was in 1809. We have the description of a banquet by Sir Robert Porter in 1819, in nearly the same words.

At a dinner given by the Ameen-ed-dowlah to Sir Gore Ouseley, that gentleman and his suite enjoyed better fortune, but at the expense of the *native* guests. An attempt was made to lay out the entertainment in the European manner. On a number of rude unpainted tables, some high, some low, arranged in the horse-shoe fashion, were heaped all the various dishes which compose a Persian feast, not in symmetrical order, for their number made that impossible, but positively piled one upon another;

ther; so that stewed fowl lay under roasted lamb, omelet under stewed fowl, eggs under omelet, rice under all, and so on. Every European was provided with knife, fork, napkin, and plate: but the poor Persians made useful work of it. Some were seated upon chairs so high that they towered far above the alpine scenery of meats and stews; others again were seated so low that they were lost in the valleys, their mouths being brought to about the level of the table. When a Persian eats his dinner in his ordinary way, the dishes are placed on the ground before him, and, crouching himself down, he brings his mouth so close to them as commodiously to transfer the victuals from the dish to his mouth: but here, his mouth being placed at a great distance from the good things, and his fingers being the only medium of communication between both, their commerce was but slow and uncertain. There was much amusement in observing how awkwardly they went to work, and the indignation expressed in the faces of the most ravenous, who, out of compliment to the British guests, were deprived of their full range over such a scene of good cheer."

Kotzebue has given a humorous account of the manner in which the gentlemen of the Russian embassy were entertained by the *ferdar* of Erivan. After describing the preliminary arrangements, he thus proceeds: "I shall only mention the things on the table which stood opposite to Dr. Müller and myself; from these some idea may be formed of the other dishes. First came a large pancake, which not only covered the whole table, but hung over it on all sides nearly half a yard deep; it is called *shurek*, and serves the Persians both for bread and napkin: then half a sheep, the leg of an ox, two dishes with various roasted meats, five dishes of ragouts sprinkled with saffron, two dishes of boiled rice, two of boiled fowls, two of roast fowls, two roasted geese, two dishes of fish, two bowls of four milk, a large quantity of sherbet, and four jars of wine; but with all these there was neither knife, fork, nor spoon. One dish was piled upon another with such rapidity, that Dr. Müller and myself suddenly found ourselves stationed behind an entrenchment of viands which concealed all view of the court, and only allowed us a peep at our friends opposite through the interstices of the multiplied dishes. Through one of these openings I endeavoured to observe what the *ferdar* was doing. With his left hand resting upon his dagger, for the Persians never eat with the left, he gravely stretched out his right into a dish of greasy rice, of which he kneaded a small portion with three fingers, and conveyed it with great address into his mouth, seldom soiling either his beard or his mustachios. After repeating this operation several times, he broke a piece off the enormous pancake, and having wiped his fingers with it, swallowed it with an air of placid satisfaction. In the same manner, he poked into a variety of dishes which he fancied; and at last seized a goblet of sherbet, and, drinking it off, smiled around upon his wondering guests. Very few of the party had tasted any of the dishes, from the impossibility of getting at them; for not one of them could have been removed from the middle without demolishing the structure of the whole. The signal for clearing the tables was at last given, and the removal of the dishes occasioned some curious scenes. The dish of ragouts could not be separated from the plate of sour cream, upon which it so conveniently reposed; the butter had entered into close alliance with the pancake; and the fish would not dissolve partnership with the roasted fowls. Force, however, succeeded at last in effecting the desired separation, and the eatables were delivered up to the persons waiting outside. It is the custom in Persia to give the remains of a feast to the attendants, or such persons as may happen to be in the way; for, in a great house, they daily cook treble the quantity consumed by its inmates."

At another entertainment given at Sultania, by the prime-minister, to the Russian ambassador and his suite, we are told by the same traveller, that "a mound of

earth had been raised in the middle of a tent, as a substitute for a table, but so very high, says he, that we could but just see the noses of those who sat opposite to us. This table, which was of immense breadth, was covered with different sorts of dishes and fruit. In the middle a narrow space had been left open, and I could not imagine for what purpose, until, when we were seated, I saw the servants jump upon the table, and stand there, handing round such dishes as might be agreeable to us. I would have given much to be allowed to laugh heartily; but we were obliged to repress our risibility. One of the men, however, having stepped into a dish of four milk, and his neighbour having, in the attempt to relieve him, nearly fallen over another dish, it was no longer possible to refrain from laughing outright; and, luckily, the conversation of the ambassador and the minister, who did not observe the accident, having turned upon a circumstance of a ridiculous nature, our laughter could not excite particular observation. The clumsy servant modestly withdrew, leaving marks of his footsteps on the table.

"The minister sent to several gentlemen *bonnes bonches* from his own plate, which is considered the highest honour that a person of distinction can show to a foreign guest. With the Persians that degree of ceremony is dispensed with: he throws the food at once into their mouths, and they evince much dexterity in catching it. Should a great man happen to take a liking to his neighbour, he nicely kneads a portion of greasy rice with three fingers into a lump, and with a condescending smile conveys it into the mouth open to receive the honour."

The furniture of a Persian house is extremely simple when compared with ours. We find in them neither beds sumptuously decorated, nor tables and chairs of costly wood, nor chandeliers and lustres, nor those numberless articles of various forms and materials with which European luxury decorates our apartments. In Persia the furniture consists of a thick coarse felt which covers the floor, and over which is spread a rich Persian carpet. People in middling circumstances content themselves with the felt alone. Instead of chairs, small mattresses about a yard wide are placed on the floor round the room, and covered with chintz, silk, or cloth of gold. Cushions set on end close to the wall serve to lean against. When it is time to retire to rest, a mattress is spread upon the carpet, with a blanket or counterpane, and two pillows of down. This is all the bed used by the Persians, and they lie in it without undressing. The mattress is of velvet, and the counterpane of silk brocade, or cloth of gold or silver. Articles of this kind are not changed perhaps for a century; for these velvets and brocades never wear out, owing in part to the extreme dryness of the atmosphere.

In Persia a native never enters a room in boots or slippers; and, when a foreigner attempts any transgression of this usage, it is looked upon as the height of ill-breeding, if not quite a premeditated insult. As these people use the carpet not merely for domestic purposes, but to kneel down on when they say their prayers, it is considered in some measure sacred, and hence arises the custom of a visitor leaving his slippers at the room-door. The term *door* here means whatever denotes the way of ingress to the apartment; for though, in general, there is a double door of carved or painted wood, which may be closed at pleasure, yet it is so seldom shut in the day, that we usually find a silk curtain filling the vacant space of the entrance; its light drapery being not only a cooler but a more elegant appendage than a thick heavy door. An attending servant raises the curtain at the approach of a visitor, and drops it on his having entered. That the custom of such draperies is of great antiquity we find in various authors. Plutarch, for instance, informs us that "Alexander, snatching a spear from one of his guards, and meeting Clytus as he was drawing back the *door-curtain*, ran him through the body."

The Persians have no candles for lighting their houses. For this purpose they use brass cups fixed upon rods of the same metal, which they fill with pure white tallow, having a cotton wick in the middle. Sometimes they burn scented tapers, the wax of which has been mixed up with oil of cinnamon or cloves, or some other aromatic.

The mode of warming houses is economical but unwholesome. The Persians are strangers to the use of fire-places and chimneys. In their stead, a sorry expedient presents itself in the shape of a large jar, called a *hourcy*, which is sunk in the earth, generally in the middle of the room, with its mouth on a level with the floor. This the people fill with wood, or, as that is very scarce, with dung, or any other combustible; and, when it is sufficiently charred, the mouth of the vessel is shut in with a square wooden frame, shaped like a low table. The whole is then covered with a thick wadded quilt, under which the family, ranged round, place their knees, to allow the hot vapour to insinuate itself into every fold of their clothing. When very cold, they draw the borders of the quilt up as high as their chins, and form a group something resembling our ideas of a wizard incantation. This mode of warming is very disagreeable, and often dangerous; owing to the immoveable position necessary to receiving the full benefit of the glowing embers, and to the nauseous and often deleterious effluvia from the smoke, which may cause dreadful head-aches. This singular kind of *chauffoir* answers also the purpose of preparing the frugal meal of the family, either as an oven, or to admit on its embers the pot which boils the meat or pottage. Barbarous as the usage may seem, the *hourcy* is not confined to the peasantry; it is found in the noblest mansions of the cities, only burning more agreeable fuel. (Jourdain iv. 266.)

EDUCATION.—Persians of high rank have their children instructed by *mollahs* (priests) and other preceptors, at their own houses. The lower orders, and often considerable Persians who are under the condition of nobles, send their sons to the public schools established in every town. They are commonly held in the mosques, and sometimes in the houses of the teachers, who are mostly *mollahs*. The expense of each child's education annually amounts to scarcely a toman, a price greatly in favour of the advancement of learning. The scholars sit round their master on the matted floor, all conning their lessons aloud as they learn them, and not stopping their noise even when the teacher is hearing one of the other pupils read. This little seminary presents a curious sight to an European; for, besides the rapid motion of their lips, they keep their bodies in one continued see-saw, without which movement a Persian conceives it would be impossible to learn anything. When idleness or any other misdemeanour requires chastisement, the young culprit undergoes the same punishment as that which royalty at times inflicts on any offending nobleman; namely, the bastinado on the soles of the feet. The children are taught reading and writing; and, as soon as they can commit to memory, they learn passages from the favourite poets of the country, many of which are fraught with the noblest sentiments and the most amiable feelings of human nature. At the same time they are taught prayers from the Koran in Arabic, a language which they do not in general understand; but the meaning of the prayer is explained to them, in the same manner as Latin prayers to ignorant Catholic Christians, and they are directed on what occasions to repeat it. Youth of the higher classes often add a knowledge of the Arabic, and also the Turkish language, to their deeper studies. The usual list is, arithmetic, geometry, moral philosophy, astronomy, and not infrequently astrology, all of which are cultivated with considerable assiduity and success by most of the Persian gentlemen, who never fail to add the manly exercises to these liberal acquirements. This being the case, it is difficult to comprehend the ruin and neglect into which

the colleges of nearly all the great cities have fallen: the once noble establishments of Ardebil, Casvin, Ispahan, Shiraz, &c. being mere shadows of what they were.

A youth quits his preceptor at the age of eighteen. He then learns to bend the bow, to wield the sabre, and to manage a horse. Marriage releases him from all restraint, but not from the respect which he owes to his father. The sacred rights of paternity are never violated in the east: there a son, whatever be his age or condition, never sits in the presence of his father; but his movements and whole demeanour are marked with filial submission.

The children of the lower classes are never seen running about the streets, getting corrupted by bad examples and bad language, contracting a fondness for play, quarrelling and fighting. They usually begin to go to school at the age of six years, and attend it twice a-day. On their return, their parents keep them at home to accustom them early to the business for which they design them.

The girls, however, receive no moral education whatever. When they have learned reading, writing, and embroidery, their education is finished; and those things they are taught either by females hired for the purpose, or at the schools, which they frequent till they have attained such an age as not to be permitted to go abroad without a veil. Neither dancing, music, and other accomplishments, nor reading and study, ever develop and heighten their natural graces, or enrich their minds. Destined to be shut up in a harem, visiting and being visited by none but females, society never forms their manners; the power of human respect opposes no barrier to their passions, to the vices of their hearts, and to the extravagancies of their disposition: the intercourse with women perverts rather than purifies their morals. The mother exclusively superintends the education of her daughter, and faithfully transmits to her defects which were not corrected when she was herself young: virtue and modesty are terms which she never utters in her hearing, for they are terms as unmeaning to the one as to the other. She familiarizes her with but one idea; that she is one day to belong to an absolute master, whose love she must strive to acquire, not by practising the virtues of her sex and condition, but by the arts of refined coquetry, which, though they may excite passion, are an antidote to true conjugal tenderness, which is founded on mutual esteem and regard. She does not teach her how to become a good wife and mother, or inculcate that modesty, and that chaste reserve in all her motions, language, and actions, which adorn beauty and embellish plainness; but she enjoins her not to go abroad without muffling up her face and her whole person; not to look at a man, nor to engage in any intrigues; if however she does not instruct her in the art which she has herself learned by experience, of bringing them to a fortunate conclusion. (Jourdain, tom. iv. p. 159.)

AMUSEMENTS.—The opinions of the Mahometans in general respecting music and dancing tend much to contract the circle of their amusements. They are strangers alike to the pleasures of the ball, the concert, theatrical exhibitions, and those sports in which the assembled youth of both sexes indulge the flow of gaiety natural to their time of life. Their disposition on the contrary is grave and taciturn; and, though the Persian may possess polished manners, extensive information, and a memory well stored with anecdote, yet his cheerfulness is never brisk and animated like ours.

Several *grandees* keep for their amusement a number of young Georgians who can sing, play on different instruments, and perform feats of tumbling and agility. Persons of inferior rank employ hired musicians and dancers. Besides these, there is a class of people called *looties*, who go from house to house, amusing their auditors with relating numberless stories, either true or fictitious, but always grossly indecent. They also perform a variety of tricks similar to those of our jugglers and tumblers. Though they have no theatre, the Persians are not with-

out

out a species of dramatic exhibition. There are persons who recite and act passages of the Shah Nameh of Ferdoufee, such as the battle between Roustam and Sohrab, and between the same hero and Isfendiar.

In summer, when the approach of night terminates the labours of the villagers, they assemble around a fountain or on the margin of a stream, spread their mats, and highly enjoy the supreme delight of breathing a fresh and pure air. To the Persian there is no enjoyment equal to this: yet there are other amusements which enliven the village circle, and banish from it lassitude and care. Sometimes an itinerant bard charms his auditors with the recital of the loves of Medjnoun and Leilah; at others a *kiffeh-kon*, or story-teller, declaims the history of the heroes of Persia. Here a dervise edifies his hearers with a delineation of the virtues, misfortunes, and miracles, of Ali and his family; there the *reisi-deh*, or village bailiff, relates the history of the great men of the province, and considers the motionless attitude, the fixed gaze, the stupefaction of his auditory, as the most flattering tribute to his rustic eloquence. In another place a *mollah*, at once a minister of religion and a priest of the muse, repeats, with due emphasis, pieces from the Gulistan of Saadi, or the Divan of Hafiz; while a few paces distant a buffoon by his sallies, or a juggler by his tricks, excites the laughter and admiration of the junior classes.

When night has shrouded the earth, and its refreshing coolness has succeeded the heat of day, the villagers join in the dance accompanied by instruments: at other times the peasants remain spectators, and leave the exercise to troops of dancers of both sexes who stroll about the country for hire.

Other amusements of the Persians consist in shooting with the bow, managing the sabre, and playing at *jureed-bazee*, a game very common among the military men. It is played in the following manner. A number of men on horseback, each armed with a *jureed*, or dart, three cubits long, divide into two opposite troops. Two or three gallop away from their troop, and are pursued by the like number of the other party, who throw the jureed at them while going at full speed. The person at whom the jureed is thrown, either catches it in his hand, or, slipping under the horse's belly, allows it to fly over him. This feat, which is by no means easy, at the rate the horse is going, they perform very expertly. The jureed comes with sufficient force to break an arm. They also amuse themselves with riding at full speed, throwing the jureed on the ground, and catching it as it rebounds.

The king's cavalry are also trained to an exercise called the *heykaj*, which consists of turning about on the saddle at full speed and firing a carbine backward. This they learn from their childhood, and it gives them great confidence and dexterity on horseback. It is probably a remnant of the old Parthian custom, so frequently alluded to in ancient authors; with this difference, that fire-arms are now used instead of bows and arrows.

The modern exercise of the bow is likewise performed on horseback: The horseman gallops away with a bow and arrow in his hand, and, when he has reached a certain point, he inclines either to the right or left, and discharges his arrow, which, to win the prize, must hit a cup fixed at the top of a pole one hundred and twenty feet high.

Another species of exercise, which seems to be less cultivated than the preceding, is thus mentioned by Kotzebue: "When the review was ended, the master of the horse came forward, standing upon a wild Arabian, and turned himself round while the horse was bounding about in every direction at full speed, not in the measured canter of our riding-schools. Sometimes he would suspend himself by either foot, while his head and arms hung down to the ground; then, swinging himself on the horse, he would stand in the saddle upon both legs or one: in short he went through a great variety of feats, the sight of which was really alarming. This man's perform-

ances certainly surpassed any thing of the kind that I had ever witnessed in my own country; and, when the minister asked my opinion of them, I assured him that we had nothing equal to them in Russia. 'And yet,' added he, 'that is not our best tumbler; the best is sick.' I did not, however, give much credit to this assertion; and I afterwards learned that this man was the only performer at the king's court, and indeed superior to any in Persia.

The game of the mall is also known to the Persians, who play at it on horseback. At the extremity of the place appropriated to this exercise, there are two posts which serve for a wicket. The ball is thrown down in the middle of the place, when the players, provided with a short stick, pursue and strike it while going at a gallop, and endeavour to drive it between the two posts. Scarcely any but people of superior rank play at these games, in which they display great skill as well in the sport itself as in riding.

In many cities of Persia, particularly at Shiraz, there are houses called *zour-kaneh*, where bodily exercises are practised. They may be compared with the gymnasiums of the ancients. The *zour-kaneh* consists of a room, the floor of which is sunk two feet below the level of the soil. They have no air or light but what is admitted at small apertures in the dome; and hence it is unwholesome to remain long in them. A broad smooth terrace is the arena where the exercises are performed, while the spectators and musicians are stationed in a kind of boxes or rather niches.

Niebuhr, who visited these gymnasiums, gives a faithful description of their different kinds of exercises, all of which were designed to develop the physical powers and natural dexterity. The champions enter the arena stark naked with the exception of a pair of light drawers. They begin with a short prayer and prostration, for the Mussulman never engages in any thing, not even amusement, without praying. Having performed this duty, some extend themselves at full length, but without allowing the belly to touch the ground, and in this posture describe a circle with the head, yet without stirring either hands or feet by which they are supported. Others take thick wooden clubs, about a foot and a half long, and cut into the shape of pears, place one on each shoulder, brandish them about in cadence with the music, at the same time stamping with their feet, and continuing this exercise for half an hour. Some stand on their hands, with their heels in the air, and leap up by a plank set against the wall, or even without the assistance of the plank; others dance to the sound of lively music, sometimes turning round, sometimes leaning against the wall, sometimes standing on one hand, sometimes on the other. Some lie down on their backs with cushions under the head and arms, and raise in cadence heavy pieces of wood; while others, standing upright, shake their bodies in every direction, up, down, forward, and backward. These postures are varied to infinity, and they are generally succeeded by wrestling. The combatants never try their strength till they have paid each other a thousand compliments. They first clap their hands one against another, then cross them over their foreheads; they next lie down on the ground, each seeking the means of attacking his antagonist to the greatest advantage. The contest is thus prolonged till the victory is decided, and the vanquished party kisses the hand of the conqueror. When the champion has beaten all his adversaries, he solicits some donation of the spectators. If he can prove that he has overcome the most eminent champions of the great cities, he has a right to have a lion placed on his tomb.

These gymnasiums, like those of antiquity, have each their gymnasiarch, who is called *pehlevan*, hero. Superior strength, skill, and dexterity, are the qualifications for this office. The *pehlevan* must have vanquished all competitors in the different exercises. He is then invested with the superintendence over them, adjudges the victory, encourages

encourages emulation, keeps good order, and in eloquent harangues, in which the names of Ali and Huseyn frequently occur, he reminds them of the good-humour, friendship, and respect, which, though rivals, they ought mutually to show to each other.

The Persians are passionately fond of the chase; it is an exercise to which they are addicted from their youth, and in which they excel. They, however, make but little use of dogs in hunting, considering them as the most impure of animals; hence they employ birds in their stead. They have brought their hawks to a great degree of docility, particularly one class which they call the *churkh*, and which is trained to catch antelopes. It is hunted with in this manner: When a herd of deer is discovered, one is separated from the rest by the dogs, and the bird, being let loose, almost immediately pounces upon it, flapping its wings over the eyes of the antelope. The animal endeavours to rid itself of the *churkh* by beating its head against the ground; but, as the bird is perched on the upper part of the head, this attempt is of no avail. As the antelope stops the instant the *churkh* pounces on it, the dogs soon come up to secure their prey. One of these birds will kill two, and sometimes three, antelopes in a day.

The wild ass is sometimes hunted, though rarely, on account of its very great speed. Whenever it is, horses are stationed in places where it is most likely to run, and by continually changing horses the hunter sometimes overtakes this surprisingly fleet animal.

Near Khoi are to be seen two pillars, called *kelleh minar*, or pillars of skulls, which are the memorials of an extraordinary hunt of Shah Ismael, who is said to have killed in one day a multitude of wild goats, the heads and horns of which were arranged round two massive pillars of brick, where they still remain. Some, less credulous, affirm, that these heads were the produce of the sport of a year, which seems much more probable; though it is allowed that the flocks of goats and antelopes on the mountains to the northward of Khoi are more numerous than it is easy to conceive.

Quails abound in some parts of Persia. This bird the Persians hunt in a very curious manner. They stick two poles in their girdle, and place upon them either their outer coat or a pair of trowsers, which are intended to look at a distance like the horns of an animal. They then with a hand-net prowl about the fields; and the quail, seeing a form more like a beast than a man, permits the hunter to approach so near that he can throw his net over it. The rapidity with which the Persians catch quails in this manner, is truly astonishing. Mr. Morier says, that, in one of his rambles with a gun, he met a shepherd-boy, who, laughing at the few birds he had killed, erected his horns, and presently caught more birds alive than he had shot.

The horse-races of the Persians are very different from ours. The horses start at the distance of perhaps fifteen miles, and pursue a direct course to the post. No care is taken to level the ground; and, as it often happens that more than twenty horses start together, there are frequent accidents. Purse of gold are given to the first, second, and third, horses. They take great pains in training their horses, which they do for a much longer time than is practised in Europe.

The Mahometan religion interdicts games of chance, and the police fines those who transgress this prohibition: the Persians, nevertheless, pay but little attention to this precept. They cannot, however, be charged with a particular fondness for gambling, which they never pursue to excess. The Persians are acquainted with tennis and dice; the game of backgammon is common among them, but they know little of chess. Their cards, called *hand-jafeh*, are of wood, ninety in number; they are very cleverly painted, and marked with eight colours. They have also a game which is common also in Turkey, by the name of *mangala*. Most of these games are confined

to the lowest classes of the people. The priests hold persons who play, especially if for money, in little estimation, and believe that they will suffer in a future world for these acts of impiety.

The ancient festival of *nouroos*, or new year's day, has been explained at p. 674. The conversion of Persia to Islamism was followed by the suspension of this festival, for the fanaticism of the first Mussulmans would not have suffered a solemnity commemorative of any other religion than that of Mahomet, which was to overturn all other creeds and to reign ever the whole earth. The Guebres alone continued to celebrate the *nouroos*. But, when Malek Shah resolved to reform the calendar, and instituted the era called after his name, the astronomers having observed to him that he ascended the throne on the first day of the spring equinox, and that it would be but right to revive the solemnity of that day in honour of such an important event, the Seljuk monarch, delighted with a proposal so flattering to his vanity, eagerly adopted the idea. Ever since his time, that is, since the end of the fifth century of the hejira, or the eleventh of our era, the *nouroos* has been celebrated with great pomp throughout all Persia.

This festival, though no longer connected, as in the early ages, with the religion of the country, has nevertheless retained many ceremonies similar to those of antiquity. On the day when the festival is to begin, the astrologers, magnificently dressed, repair to the palace of the king, or of the governor of the province, and station themselves on a terrace or in a belvedere, to watch the moment of the sun's entrance into the sign Aries. As soon as they have announced it, numerous volleys of musketry are fired; horns, kettle-drums, and trumpets, rend the air: all sorts of sports and amusements commence throughout the whole city; and high and low give themselves up to the wildest joy. During the three days that the *nouroos* lasts, there is nothing but feasting, horse-racing, exercises and exhibitions of various kinds; every one appears in his best apparel, pays and receives visits, makes presents to his acquaintance, and receives their's in return. The day before the *nouroos*, they mutually send one another eggs, painted and gilt, which sometimes cost two or three guineas. This practice of presenting eggs on new year's day seems to derive its origin from India. When the moment of the equinox is past, all the grandees repair to court, and present their offerings to the king; those of the princes, and the governors of provinces and cities, are presented by their agents. These presents consist of jewels, rich stuffs, precious stones, perfumes, horses, and even money. Their value is proportionate to the rank and fortune of the giver: for the lowest officer is obliged to make his present, just as well as the beglerbeg. Sir Robert Porter states, and, as he assures us, from unquestionable authority, that the personal present made every *nouroos* to the king by Hadjee Mohammed Houssein Khan, while he governed the province of Ispahan, amounted to not less than 200,000 tomans.

Bathing, though enjoined by the religious code, may be considered among the amusements of the Persians. The baths in this country are numerous and magnificent, and the price of admission to them is moderate. They are open to persons of all classes and of both sexes; to the men five days in the week, and to women the other two. These buildings consist of two very spacious rooms; the one where you undress, smoke, talk, and hear the news of the day; the other contains the bath. Along the walls of the former, are placed seats of marble or stone two feet high, covered with mats and carpets, on which the bathers sit to strip off their clothes. A narrow passage leads to the bathing-room, which is an octagon surmounted by a cupola, at which air and light are admitted, and paved with marble. At the upper end of this room is a large reservoir of water heated by means of boilers.

The process of the bath, when applied by either sex, is much

much the same: it is thus described by sir Robert Porter. The bather, having undressed in the outer room, and retaining nothing but a piece of loose cloth round his waist, is conducted by the proper attendant into the hall of the bath: a large white sheet is then spread on the floor, on which the bather extends himself. The attendant brings from the cistern, which is warmed from a boiler below, a succession of pails full of water, which he continues to pour over the bather till he is well drenched and heated. The attendant then takes the employer's head upon his knees, and rubs in with all his might a sort of wet paste of henna-plant into his mustaches and beard. In a few minutes this pomade dyes them a bright red. Again he has recourse to the little pail, and showers upon his quiescent patient another torrent of warm water. Then, putting on a glove made of soft hair, yet possessing some of the scrubbing-brush qualities, he first takes the limbs and then the body, rubbing them hard for three quarters of an hour. A third splashing from the pail prepares for the operation of the pumice-stone. This he applies to the soles of the feet. The next process seizes the hair of the face, whence the henna is cleaned away, and replaced by another paste, called *rang*, composed of the leaves of the indigo-plant; which brings the beard to a dark-blue or black colour. To this succeeds the shampooing, which is done by pinching, pulling, and rubbing, with so much force and pressure, as to produce a violent glow over the whole frame. Some of the natives delight in having every joint in their bodies strained till they crack; and this part of the operation is brought to such perfection, that the very vertebræ of the back are made to ring a peal in rapid succession. This has a very strange effect on the spectator; for, in consequence of both bather and attendant being alike unclothed, the violent exertions of the one and the natural resistance of the joints in the other, give the two the appearance of a wrestling-match. This over, the shampooed body, reduced again to its prostrate state, is rubbed all over with a preparation of soap, confined in a bag, till it is one mass of lather. The soap is then washed off with warm water, when a complete ablution succeeds, the bather being led to the cistern and plunged in. He passes five or six minutes, enjoying the perfectly-pure element; and, then emerging, has a large dry warm sheet thrown over him, in which he makes his escape back to the dressing-room.

The Persian ladies regard the bath as the place of their greatest amusement. They make appointments to meet there, and often pass seven or eight hours together in the carpeted saloon, eating sweetmeats, telling stories, &c. &c.

But, although the Persians bathe so often, says Mr. Scott Waring, they are a very dirty people. They very rarely change their garments, and seldom before it is dangerous to come near them. It is thought nothing in Persia to wear a shirt a month, or a pair of trowsers half a year. We are well justified, therefore, in considering bathing as one of the amusements, the luxuries, of a Persian, rather than as a religious duty. All ranks delight in it so much, that they have a saying, that "No man should visit a foreign country, where there is not a magistrate, a physician, and a bath." We have already seen the blessings they derive from the integrity of their magistrates; and, though rather out of place, we shall devote a very few lines to the skill of their physicians. The science of medicine among the Persians, not being founded either on anatomy or physiology, has nothing but conjecture for its guide. This profession, which is despised by the Turks, is considered honourable in Persia. It is not taught in academical institutions as in Europe, but each of its professors takes a number of pupils to whom he communicates the results of his experience. Their system of practice is derived from the Greeks, and has descended to them with very little alteration. According to their theory, things are either hot or cold in certain degrees; and the only question they have to resolve is, whether the disease proceeds from too much heat or

too much cold. Heat must be repelled by cold, and cold by heat; and hence, as Olivier remarks, the affusion of cold water, in cases of fever, appears to have been long practised among them, and he found that powerful diuretics were commonly prescribed to dropical patients. Tavernier mentions, that they give horse-flesh for the cholick; and Mr. Scott Waring was witness to nearly as curious an experiment. A poor man was violently afflicted with heart-burn; and, instead of prescribing an internal medicine, they heaped on his breast a great quantity of ice and snow, which they said was an effectual cure. Kotzebue relates a similar instance in the treatment of one of the musicians belonging to the Russian embassy. This man, being a Mahometan, had not sufficient confidence in the physician to the embassy, and desired that a Persian doctor might be called in. His disorder was an inflammatory fever. The Persian doctor appeared, and prescribed for the patient a large quantity of ice, which the poor fellow swallowed with ecstacy, and died on the third day.

MARRIAGES and FUNERALS.—"There is no celibacy in Islamism: your wives are to you, and you are to your wives, what the garment is to the body." Such are the terms in which the Koran speaks of marriage. Every male, on attaining the proper age, is therefore expected to take a female companion; whether it be a slave that he purchases, a woman whom he hires, or a legitimate wife whom he marries. His religion allows him the choice of these three modes; but at the same time forbids him to hold intercourse with loose women, or to covet the wife of another.

A female slave, when purchased by a man, becomes his sole and entire property: he can dispose of her life and even of her honour, as he pleases; and he may raise her from servitude to the condition of a free woman, and even of a legitimate wife, without incurring any censure: such is the custom.

The Persians have a connexion of a singular nature called *moutah*, which signifies "the use of any thing for a certain time." It is, in fact, a temporary marriage, the duration of which is fixed by the taker. A man whose circumstances do not permit him to form a jointure for a legitimate wife, takes one on lease. The contract is executed before the Cadi or the Sheik-ul-Islam. Legitimate marriage is called *nucnah*, and is contracted before the same magistrates. The Koran authorises a man to marry four lawful wives, provided he can maintain them. The same book proscribes marriages between relatives within a certain degree. A man may not marry his mother, his aunt, his daughter, his sister, his niece, his nurse, his foster-sister, his wife's mother or daughter, his son's wife, two sisters, or the wife of another.

The mode of matrimonial courtships in Persia does not allow the eyes of the parties to direct their choice till they are mutually pledged to each other. An elderly female is employed by the relations of the youth to visit the object selected by his parents or friends, or guessed at by himself; and her office is to ascertain the damsel's personal endowments, and all other subjects suitable to their views in the connexion. If the report be favourable, the friends of the proposed bridegroom dispatch certain sponsors to explain his merits and pretensions to the relations of the lady, and to make the offer of marriage in due form. If accepted, the heads of the two families meet, when the necessary contracts are drawn up; the presents, ornaments, and other advantages proposed by the bridegroom's parents, discussed and arranged; and, when all is finally settled, the papers are sealed, and witnessed before the cadi.

On the morning of the day fixed for the wedding, the lover sends a train of mules, laden with the promised gifts for his bride, to the house of her parents; the whole being attended by numerous servants, and preceded by music and drums. Besides the presents for the lady, the procession carries all sorts of costly viands on large silver trays, ready prepared to be immediately spread before the inmates

inmates of the house. The whole of the day is spent in feasting and jollity: towards evening, the damsel makes her appearance enveloped in a long veil of scarlet or crimson silk; and, being placed on a horse or mule splendidly caparisoned, is conducted to the habitation of her affianced husband by all her relations, marching in regular order to the sound of the same clamorous band which had escorted the presents. When alighted at the bridegroom's door, the lady is led to her future apartments within the house, accompanied by her female relations and waiting-maids. Her friends of the other sex meanwhile repair to those of the bridegroom, where all the male relations on both sides being assembled, the feasting and rejoicing recommences; with the drums and other musical instruments still playing the most conspicuous part. When the supper-feast is over, the blushing bride is conducted to the nuptial chamber; and there the impatient lover first beholds his love, and the marriage is consummated without farther ceremony. The bridegroom, not long after, returns to his party, and an ancient matron in waiting leads the lady back to her female friends. A prescribed time is allowed for both sets of relations to congratulate the young people on their union; after which they repair to the bridal chamber for the night, leaving their separate companies to keep up the revelry, which generally lasts for three days.

The marriage-contract stipulates the settlement on the bride of such jointure as may be agreed upon. It consists of a sum of money, proportionate to the fortune of the bridegroom, and other presents. If he is in middling circumstances, he presents her with two complete dresses, a ring, and a mirror. This jointure, called *mihir* or *kavin*, is destined for the support of the wife in case of divorce. The husband also supplies the requisite furniture, carpets, mats, culinary utensils, and other necessaries.

When any misunderstanding arises between husband and wife, they each choose an umpire out of their respective families, and refer the matter to his decision: but, if their dispositions or tastes cannot be reconciled, a divorce is solicited and granted by the judge. The wife then receives back her portion, and sometimes keeps half her jointure. A man may marry again after such separation, and be a second time divorced; but the third marriage, though allowed, must not be contracted till the woman has married another man. A wife who has been put away, cannot marry for three months after her repudiation; neither can a widow till four months and ten nights after the decease of her husband.

If a wife commits adultery, and the fact is attested by four witnesses, the husband has a right to keep her a prisoner for life; "but the chastity," says M. Olivier, "or the address, of the married women, renders the infliction of such punishment extremely rare." M. Olivier adds, that, though four wives are allowed, people in low circumstances seldom have more than one.

In Persia, and throughout the East, there is no such thing as illegitimacy: all the children are equal and legitimate in the eye of the law. The first-born is heir of right, even though he received life from a slave.

When a wife dies, half her property belongs to her surviving husband, if she has no children: in the contrary case he has but one-fourth. When the wife survives, she can claim one-fourth of her husband's property, but one-eighth only in case there are children.

Funerals are conducted with very little splendour; and the day of death is commonly that of sepulture. The dead are perfumed with incense, and buried in a kind of shroud open at both ends, that the deceased may be able to sit up and reply to the interrogatories of the angels of death. (See p. 702.) The burial-grounds are near the highways; and, as one grave does not intrude upon another, they are very extensive. Though the Mahometan religion forbids graves to be covered with any structure whatever, yet the ostentation of the great has violated this precept, and left the observance of it to the very low-

est class, who have only a piece of stone set up vertically at the end of the grave, with a moral inscription, or a passage from the Koran. The tombs of the middling sort of people are built with bricks, with a small piece of marble at the head to contain the epitaph. Stone lions and rams rudely sculptured are very frequently seen in Persian burial-grounds; and are placed over the tombs of soldiers, or those famed for their courage. The rich have over their tombs small cupolas resting on four pilasters: the largest and most considerable are called *takieh*, and are built over the remains of holy and learned men. Around these and such-like monuments, are in general to be seen collections of minor tombs; for it is a received opinion, that those who are buried in the vicinity of a holy personage will meet with his support at the day of resurrection. The Persians, however, do not take the same care of their dead as the Turks. Their tombs are trampled on; paths frequently lead directly over them; and epitaph, tomb-stone and all, are often carried away to be used as materials for building.

Mourning lasts forty days at the utmost. Black is not the livery of sorrow: that colour is abhorred by the Persians. They express grief, and mark the state of mourning, by sighs and moans, by abstaining from food for eight days, and by wearing garments of a brown or pale colour adapted to the state of the mind. For ten days their friends pay them visits, and afford them all the consolation in their power. They then go to the bath, have their heads shaved, and put on fresh clothes. Here ends the full mourning; but their lamentations continue till the fortieth day, and they renew them twice or thrice a-week, always at the hour when the deceased expired.

The grief of the women is more strongly expressed, and of longer continuance. Endowed by nature with keener sensibility than the other sex, and left by the death of a husband in a state of forlorn widowhood, to which they are generally doomed for the rest of their lives, they mourn for many months, paying daily visits to the grave, and watering it with their tears.

AGRICULTURE and COMMERCE.—We have repeatedly noticed the extreme dryness of the climate and the great deficiency of rivers. These circumstances have obliged the Persian husbandmen to turn all their ingenuity to the discovery of springs, and to the art of bringing their streams to the surface of the earth. When a spring has been discovered, they dig a well until they come to water; and, if they find that the quantity is sufficient to repay them for proceeding with the work, they dig a second well, at such a distance from the other as to allow a subterranean communication between them. They then ascertain the nearest line of communication with the level of the plain upon which the water is to be brought into use, and dig a succession of wells with a subterranean communication between the whole series, till the water at length comes to the surface, when it is conducted by embanked channels to the place of its destination. The extent of country through which such streams are sometimes conducted is truly astonishing; and such is the consequence of a new *kanaut*, or aqueduct, that the day when the water is brought to its ultimate destination is a day of rejoicing among the peasants. The astrologers are consulted to name a fortunate hour for the appearance of the stream; and, when it comes forth, it is received with songs and music, attended by shouts of joy and exclamations of *Mobatrek bashed!* "Prosperity attend it!"

The labour and expense of a *kanaut* of course depends greatly upon the distance whence the water is to be brought. The mode of making the well is very simple. A shaft is first dug, then a wooden trundle is placed over it, from which is suspended a leather bucket which is filled with the excavated matter by a man below, and wound up by another above. Where the soil is soft, the mouth of the well is secured by masonry. The mode of drawing water from these wells is as follows: Two posts support a cylinder which turns on an axis and is placed over

over the mouth of the well. From this cylinder descends a cord of a sufficient length to reach the bottom, having a bucket fastened to one end, and being tied at the other to the collar or yoke of an ox. To ease the labour of the animal as much as possible, he is made to go along a direct path down a slope; and, to prevent his deviating from it, the lateral ring of his collar runs upon a rope, one end of which is fastened to one of the posts mentioned above, and the other to a stake fixed at the farther end of the path. Thus when the ox draws, the slope naturally hurries him along, and the vessel full of water is raised with much less exertion of strength than would otherwise be required. The buckets are no other than large skins, the mouth of which is held open by a wooden hoop with two cross-bars. They are used of two shapes: some being formed almost like a funnel, terminating in a curved tube closed by a cock; the others resembling a large tub: but the use of the former requires a second contrivance, consisting of two upright posts and a cylinder on an axis, placed over a reservoir situated near the well. A cord fastened to the end of the tube winds round this smaller cylinder, passes over the larger, and is tied to the collar of the ox: the purpose of this cord is to draw the skin filled with water out of the well, to be emptied by the tube into the reservoir. M. Jourdain has furnished an engraving of this process.

In spots more favoured by nature, situated at the foot of snow-covered mountains, the industry of the Persian is successfully exerted. In the defiles of the mountains, wherever the situation permits, the snow-water and rain-water are detained by walls; and, when their quantity is sufficient to form streams, channels are dug by which they may be drawn off.

The ploughing is performed by means of a share drawn by two oxen, harnessed not by the horns but to a yoke that passes over the chest. This share is very short, and its coulter but slightly cuts the ground. As the furrows are made, the clods are broken with large wooden beaters, and the surface is smoothed with the spade and a harrow that has very small teeth. Thus prepared, the ground, divided into squares, looks like garden-beds, with borders a foot or more in height, according to the quantity of water required for irrigating it.

The sickle used in Persia is unlike ours, being scarcely bent in the blade. Threshing is performed by a machine composed of a large square wooden frame, which contains two cylinders, placed parallel to each other and having a rotatory motion. They are stuck full of spikes with sharp square points, but not all of a length. These rollers have the appearance of the barrel of an organ; and their projections, when brought in contact with the corn, break the stalk, and disengage the ear. They are put in motion by a couple of cows or oxen yoked to the frame, and guided by a man sitting on the plank that covers the frame which contains the cylinders. He drives this agricultural equipage in a circle round a heap of corn, keeping at a certain distance from its verge, close to which a second peasant stands, holding a long-handled pronged fork, shaped like the spread sticks of a fan; and with which he throws the unbound sheaves forward to meet the rotatory motion of the machine. He has a shovel also ready to remove at a distance the corn that has already passed the wheel. Other men are on the spot with the like implement, with which they throw the corn aloft in the air, when the wind blows away the chaff, and the grain falls to the ground. This process is repeated till the corn is completely winnowed; it is then gathered up and deposited for use in large earthen jars.

Sir R. Porter mentions one district, where he remarked as a singularity a very clumsy sort of cart employed for carrying corn. It moves on two solid wheels, while the body and pole take the shape of a long triangle; and is drawn by oxen or buffaloes. In no other part of Persia did he find so useful an assistant to husbandry as even this rude vehicle.

VOL. XIX. No. 1338.

The vale of Khoi, about fifteen miles in length and ten in breadth, is described as equal to any spot of similar extent, either in Persia or any other country, for richness of cultivation. It produces great quantities of corn, cotton, and rice. The soil is so stiff, that it sometimes requires ten pair of buffaloes to drag the plough-share through it. When the plough is at work, two or three men, according to the length of the team, are seated upon the yokes, exciting their cattle by a loud song, which, in the stillness of the morning, has a very pleasing effect. Their plough is an instrument of more mechanism than that of the south of Persia, and furrows the earth much more effectually. The corn grows thicker and better than in any other parts, owing, doubtless, to the superiority of this implement, and also to the abundance of water with which this plain is blessed.

Pigeon-houses are erected in Persia at a distance from human habitations for the sole purpose of collecting pigeons' dung for manure. There are many such in the environs of Ispahan. They are large round towers, rather broader at the bottom than at the top, and crowned with conical spiracles through which the pigeons descend. Their interior resembles a honeycomb, pierced with a thousand holes, each of which forms a snug retreat for a nest. More care appears to have been bestowed upon their outside than upon the generality of the dwelling-houses, for they are painted and ornamented. The extraordinary flights of pigeons, and the compactness of their mass, give them the appearance of clouds which actually obscure the sun in their passage. The Persians do not eat pigeons, keeping them solely for their dung, which is the dearest manure in this country; and, as they employ it entirely in the rearing of melons, it is probably on this account that the melons of Ispahan are so much finer than those of other countries. The revenue of a pigeon-house is about one hundred tomans per annum; and the great value of this dung, which rears a fruit indispensable to the existence of the natives during the great heats of summer, may probably throw some light upon that passage of Scripture which relates, that, during the famine in Samaria, *the fourth part of a cab of doves' dung was sold for five pieces of silver.* 2 Kings, vi. 25.

Sir Robert Porter describes a method by which the villagers who keep bees take the honey without destroying the industrious insects. The hives are constructed like long thin barrels thrust through the mud walls of the house; one end opens to the air for the entrance of the bees, and the other, which projects more than a foot into the inhabited rooms, is closed with a cake of clay. When the owner wishes to take the honey, he has only to make a continued noise for some little time at the closed end, which causes all the bees to take flight at the other. During their absence he removes the clay, and clears the hive of honey, leaving, however, sufficient for their winter-supply. The inner end is then re-closed; and the little labourers soon return to their home, and re-commence their operations. *Jourdain*, tom. v. p. 284.

The little commerce that Persia now enjoys is principally carried on by the Armenians, whose habits, migrations, and industry, bear some resemblance to those of the Jews. They are scattered over the kingdom, and are held in greater respect by the Persians than seems consistent with the intolerant precepts of the Koran. They seldom intermarry with any other sect, and preserve inviolate the religion and customs of their ancestors.

Persia, indeed, was never an essentially-commercial country at any period of its history, unless when under the dominion of the Arabs. The caravans from the western provinces of the Saracen empire then passed through it on their way to Tranfoxana and some parts of India. The laws of Zoroaster, which encouraged agriculture, naturally checked commerce; and, as most of the rivers were unnavigable, there was not much internal traffic. The soil produces few things in sufficient quantity to be exported: some wheat, barley, rice, dates, and

almonds, are, however, shipped at Bushire, Muscat, and other parts of the Persian Gulf. The principal manufactured articles are gold brocade, silks, cotton stuffs of different kinds, leather, shawls of inferior quality, and rich carpets. With respect to shawls, observes Kotzebue, "the Europeans are under a great mistake: those which are worn in Persia are the very worst I ever saw. We have seen people there admire shawls which no lady in our country would think of wearing; and I am therefore not surprised that the Persian ambassador at the court of Petersburg, who took a fancy to make a present of one to the countess Orloff, should have had the mortification to see it worn by her maid, while the countess herself had on a shawl of such value as absolutely astonished his excellency. The Persians cannot afford to pay the prices that are given for them at Constantinople and in Russia."

The cloths of Ispahan, Yezd, and Kasan, are exported to Russia by way of Astrachan, and exchanged for broad cloths, velvets, satins, and hardware. At Meragah and Shiraz there are glass-manufactories; and guns and pistols are made in almost all the large towns. The lances of Chorasan are in the highest estimation; they are made by descendants of those skilful cutlers whom Tamerlane transplanted from Damascus into that province.

Persia produces many species of gum and drugs, and among others *assa-foetida*, great quantities of which are exported to India: it receives in exchange sugar, indigo, spices, and several European commodities. The inhabitants of the Persian confines still extract a sweet oil from the fruit of the turpentine-tree; a practice to which Xenophon alludes in his narrative of the Retreat of the Ten Thousand. Excellent turpentine also is procured by the incision of the trunk, and forms a considerable article of commerce, as the tree abounds on all the heights.

The shah, or sovereign of Persia, is the chief merchant; and his agents must have the refusal of all merchandise, before his subjects are permitted to trade. It is computed that Persia produces yearly upwards of 22,000 bales of silk, chiefly in the provinces of Ghilan and Mazanderan, each bale weighing 263 lbs. Vast quantities of Persian silk are imported into Europe, especially by the Dutch, English, and Russians. The goods exported from Persia

to India are, tobacco, all sorts of fruits, pickled and preserved, especially dates, marmalade, wines, distilled waters, horses, Persian feathers, and Turkey leather of all sorts and colours, a great quantity whereof is also exported to Russia and other European countries. The exports to Turkey are, tobacco, galls, thread, goat's hair, stuffs, mats, box-work, &c. &c.

As there are no posts in the east, and trading by commission with the use of bills of exchange, is little known, traffic must proceed in a very awkward heavy manner, in comparison of that of Europe. The most current money of Persia are the *abassees*, worth about 1s. 4d. sterling; they are of the finest silver. An *abassée* is worth two *mahmoudes*; a *mahmoude*, two *shahees*; and a *shahee*, ten single or five double *casbeghes*: these last pieces are of brass, the others of silver; for gold is not current in trade. The *shahees* are not very common; but *mahmoudes* and *casbeghes* are current everywhere. Horses, camels, houses, &c. are generally sold by the *toman*, which is an imaginary coin, worth 200 *shahees*, 50 *abassés*, or 3l. 6s. 8d. sterling.

Though, in the progress of this article, we have mostly quoted our authorities, we shall conclude by bringing into one view the titles of the principal works to which we have been indebted. 1. Ancient and Modern Universal History. 2. Historical Register for 1727. 3. Aikin's General Biography. 4. Francklin's Observations on a Tour in Persia, in 1786, 7. 5. Olivier's Travels in Turkey, Egypt, and Persia, from 1793 to 1797. 6 vols. 8vo. the two last published at Paris in 1807. the two first only, we believe, have been translated. 6. Morier's Journey through Persia, Armenia, &c. in 1808, 9. 7. Second Journey, 1810 to 16. 8. Sir John Malcolm's Hist. of Persia, 2 vols. 1815. 9. La Perle, 5 tom. Paris, 1814. 10. Present State of Persia; Paris 1818. 11. L'Europe et ses Colonies en Decembre 1819, 2 vols. Paris, 1820. 12. Sir Robert Ker Porter's Travels in Georgia, Persia, &c. 13. Las Cafes' Journal of Conversations at St. Helena; Lond. 1823. 14. Richardson's Persian Dict. Wilkins's edit. 15. Times newspaper 1822, 3; together with sundry volumes of the Edinburgh and Quarterly Review, Monthly Magazine, Monthly Review; &c. &c.

INDEX to the Article PERSIA.

ADAKA, son of Hulaku the Mogul, 676.
 Abbas the Great, his successes and cruelties, 678; cruelties still more horrible, dies, 679; his character, 680.
 Abbas II. his reign, 680.
 Abbas III. 685.
 Abbas Mirza, prince royal of Persia, 693; improves the army, 696; protects the Christians, 705; has an English governess for his daughters, 711.
 Achmet Aga, kills himself, 682.
 Afghans, or Patans, 681; Mahometans of the sect of Omar, 682.
 Aga Mohammed, an eunuch, becomes king of Persia, and cruel like all before him, 688; crowned, and afterwards murdered, 689.
 Agriculture, 722, 3.
 Ahmed Khan, the first of the race of Gengis who became a Mahometan, 676.
 Alexander Severus, emperor of Rome, 664.
 Ali, the son-in-law of Mahomet, highly honoured by the Persians, 702, 3; festivals in memory of him and his son, 704.
 Amusements of the Persians, 718.
 Ardefer reigns seven months, 671.
 Armenian Christians, 705, 710; the chief traders in Persia, 723.
 Army, improvements in, 696; present state of, 696, 7.
 Arses, reigns two years, 663.

Artaxerxes Longimanus, the Ahafuerus of Scripture, subdues Egypt; his death, 661.
 Artaxerxes Mnemon, his wars in Greece, peace of Antalcidas, unsuccessful against the Egyptians, 662; vexations and death, 662, 3.
 Artaxerxes, otherwise Artaxares, the restorer of the Persian empire, 664.
 Artaxerxes, son of Sapor II. 666.
 Ashraf, dissembles with the deposed king, 683; defeated, 684; and killed, 685.
 Astyages, grandfather of Cyrus, 657.
 Attorneys unknown in Persia, 700, 701.
 Baba Khan. See Feth Ali Shah.
 Babylon, revolts from Darius, 660; recovered by a stratagem, 661.
 Bahram, or Varames, a famous Persian general, aspires to the crown, 670; expelled, and at length poisoned, 671.
 Baths, 720, 1.
 Beard, carefully dressed and anointed, 715.
 Bee-hives, how managed, 723.
 Beglerbegs, or governors of departments, 698.
 Beiram, festival of, 704.
 Belisarius, the famous general, opposes Chofroes in Palestine, 668.
 Cadi, a magistrate or judge, 700.
 Cadjars, or Runaways, the name of the tribe to which the reigning family belongs, 686.

Cambyfes king of Persia, his fruitless expedition against Ethiopia, and death, 659.
 Cavades king of Persia, deposed and restored, 667; his wars and death, 667, 8.
 Chamberlain of Persia, 694.
 Chofroes the Great, king of Persia, suppresses a conspiracy at the beginning of his reign, reduces Antioch and other places, 668; espouses the cause of the Lazi, whom he afterwards subdues, 668, 9; his reverses, death, and character, 669.
 Chofroes II. obliged to quit his palace, 670; reinstated, his successes in war, magnificence, pride, arrogance, and miserable death, 671.
 Christians in Persia, 710; the chief traders, 723.
 Commerce, not considerable, 723, 4.
 Courtisans taxed in Persia, 700.
 Cræsus, king of Lydia, his immense army to oppose the Persians under Cyus, 657; his empire destroyed, 658.
 Custom-duties on goods, 700.
 Cyus, the first king of Persia named in authentic history, 656; contradictory accounts of him by Herodotus and by Xenophon, 657; attacks Cræsus, and destroys the Lydian empire, 657, 8; his other conquests, 658; contradictory accounts of his death, 658, 9.
 Cyrus the Younger, 662.

Darius

- Darius Hiftaspis, elected king by the contrivance of his groom, 660; reduces Babylon, 660, 1; successful in Scythia and India, his death, 661.
- Darius Nothus, or Ochus, 662.
- Darius Codomannus, 663; subdued and deposed by Alexander the Great, 664.
- Dress, not according to Chardin's rule, 714; of the women, 715.
- Education of the Persians, 718.
- Euthalites, or White Huns, 667.
- Falconry in Persia, 709.
- Fasting in Persia, very strict, 703.
- Feasting, anecdotes of, 716, 17.
- Feridoun, one of the earliest monarchs of Persia, 656.
- Festivals and amusements of the ancient Persians, 674, 5; of the modern, 704.
- Feth Ali, chief of the tribe of the Cadjars, and great-grandfather of the present king, 686.
- Feth Ali Shah, adopted by his uncle as heir to the throne, 688; ascends the throne, and murders his benefactor, 689; his personal appearance, and character, 692; family, 693; officers of state, 694; women, 694, 5; brilliancy of his court, 695; liberal to the Christians, 705; but not to the Sosis, 705, 6.
- Fish plentiful in Persia, 709.
- Funerals, monuments, and mourning, 722.
- Gaming forbidden, but practised, 720.
- Gengis Khan, 676.
- Georgia, often conquered and re-conquered, at length given up to Russia by treaty, 689, 690.
- Guebres, or fire-worshippers, 648.
- Gymnastic exercises, 719.
- Hadjee Khan, prinie minister, 698.
- Harpagus, saves the life of Cyrus, and is betrayed to eat the flesh of his own son, but is afterwards revenged, 657.
- Havoufa, a Persian general, his avarice and treachery, 682.
- Heraclius, emperor of the East, 671.
- Heraclius, prince of Georgia, 689.
- Hormidas, king of Persia, his short and peaceable reign, 665.
- Hormidas II. 665.
- Hormidas III. defeats the Turks, 669; ascends the throne at the death of his father, his unjust behaviour occasions him to be deposed, 670.
- Horses and other cattle, 708.
- Horsemanship, feats of, 719.
- Horseracing, 720.
- Houses, 710, 11; how furnished, 717; how lighted and warmed, 718.
- Hulaku the Mogul, 676.
- Hunting in Persia, 720.
- Husfeyn the Weak, 681; betrayed by one general, and disgraces another, 682; his degradation, 683; and death, 684.
- Husfeyn, the son of Ali, 685, 702, 704.
- Jews, state of, in Persia, 710.
- Iran, the ancient name of Persia, 656.
- Idigertes, or Yezdegerd, king of Persia, 666.
- Idigertes II. the last king of the race of Artaxares, 671; his son and daughter, 672.
- Ismael Sefi, and Ismael II. and III. 678.
- Ispahan, made the seat of empire by Abbas the Great, 678; besieged by the Afghans, 682; dreadful sufferings of the people, 683.
- Julian, the Roman emperor, his foolish conduct occasions his death in the war against Sapor II. 666.
- Justinian, emperor of the East, 667; at war with Chofroes, 668, 9.
- Kerim Khan, after overcoming many opponents, becomes king of Persia, 686; his prosperous reign, 687.
- Khan, that title explained, 694; governor of a balook, or canton, 699.
- Khodah Bundah, son of Abbas the Great, 679.
- Khoi, remarkable hunt there, 720; noted for its fertility, 723.
- Koran, the source of law as well as of religion, 700.
- Kouli Khan. See Nadir Shah.
- Latif Ali, the last representative of the house of Kerim Khan, 688.
- Locusts in vast quantities, 709.
- Lotos, or lily, venerated by the Persians, as well as by the Egyptians, Hindoos, &c. 651.
- Magi, slaughter of, 660.
- Mahmud the Afghan, murders his brother, 681; besieges Ispahan, 682; his arrogance, insanity, and death, 683.
- Marriage-ceremonies, and treatment of wives, 721, 2.
- Master of the Ceremonies, 694.
- Medicine, as practised by the Persians, 721.
- Meer Aub, or prince of the waters, 707, 8.
- Mir-Weis, king of Candahar, 681.
- Mirza, that title explained, 693, 4.
- Mirza Sefi, a monster of cruelty, 680.
- Mirza Sheffea, late prime minister, 697, 8.
- Mohammed king of Persia, 678.
- Mohammed Hassan, grandfather of the present king, 686.
- Mountains of Persia, 707.
- Mufti, his office and authority, 700.
- Nadir Shah, or Kouli Khan, becomes commander-in-chief under the king Tahmasp, whom he restores to his crown, 684; but soon afterwards deposes him, and ascends the throne; his expedition to India, and is murdered on his return, 685; his character, 686; improvements made by him in the army, 696, 697; pretended moderation in religious matters, 702.
- Narfes king of Persia, 664, 5.
- Narfes, general of the troops of Varanes V. 666.
- New-year's day, as celebrated by the ancient Persians, 674; by the modern, 720.
- Ochus, brother of Sogdianus king of Persia, 661; murders Sogdianus, mounts the throne, his reign and death, 662.
- Ochus, son of Artaxerxes, his cruelty, successes against the Sidonians and Egyptians, poisoned, 663.
- Omar, second caliph from Mahomet, 671, 702; festival of imprecation, 704.
- Otanes, 659; occasions the detection of the impostor Smerdis, and lives independent of kings, 660.
- Peacock-throne built for Nadir Shah, 685; a similar one for Feth Ali Shah, 695.
- Peroses, killed by the White Huns, 667.
- Persees, or Parsees, a set of primitive Persians in British India, 648; their mild and benevolent habits, 649.
- Persepolis, 649; description of the ruins, 650; part of the sculptures brought to England, 651; supposed to be the ruins of a temple, rather than of a palace, 652; characters of the inscriptions, ibid.
- Persia, ancient and modern boundaries, 655; originally peopled by Elam, the son of Shem, 656; Cyrus, the first king of whom we have any authentic account, 657; the empire overturned by Alexander the Great, transferred to the Parthians, and at length restored by Artaxares, 664; end of that dynasty, 671, 2; manners and religion of the Persians to that period, 672;
- Mahometan dynasties, 675; present power and extent, 689; recent politics, 690; has no metropolis properly so called, 692; the king and his family, 692, 3; officers of state, 694; women of the harem, 695; army, 696; prime-minister, 697; other officers of the government, 698; divisions and subdivisions of the kingdom, 698, 9; revenue, 699, 700; laws, 700; administration of justice, 701; religion, 702; religious festivals, 704; climate, 707; produce, 708; population, 709, 10; character, 711; contrasted with that of the Turks, 712; of the women, 713; dress, 714; of the females, 715; domestic habits, 716; education and amusements, 718; medicine, 721; marriages, 721; funerals, 722; agriculture, 722; commerce, 723.
- Pigeons-dung, the chief manure, 723.
- Pilgrimage to Mecca, 703, 4.
- Population, 709, 10.
- Poultry and game, 708.
- Prayers and almsgiving, 703.
- Punishments, 701, 2.
- Purifications, 703.
- Ramazan, the principal fast, 703, followed by the feast of Bairam, 704.
- Religion of the ancient Persians, 674; of the moderns, 702.
- Russia, particularly anxious to conciliate the Persians, 691.
- Sadik Khan, brother of Kerim, deposes and blinds his nephew, and usurps the government, 687.
- Salt extremely plentiful, 708.
- Sapor king of Persia, his successes against the Romans, 664; reigns thirty-one years, 665.
- Sapor II. declared king before he was born, 665; his great success against the Romans, 666.
- Saracens, assist the Persians against the Romans, 666; lose a vast number of men, 667.
- Sculpture, advantages of, 651.
- Scythia invaded by Darius, 661.
- Seraglio, or harem, 694; how supplied, 695.
- Shahrokh, grandson of Nadir Shah, 686.
- Shawls, the Persian not equal to those from Turkey, 724.
- Sheik-ul-Islam, high-priest and chief justice, 700.
- Shiites and Sunnites, 702.
- Shiraz, particularly distinguished by Kerim Khan, 687; its climate, 707.
- Silk forbidden to be worn, 715.
- Siroes, son of Chofroes II. his short reign, 671.
- Smerdis the Magian, usurps the throne of Persia, 659; betrayed and killed, 660.
- Smoking used on foot and on horseback, 715.
- Sosis, an account of that sect, 705; ordered to be rooted out, 706.
- Sogdianus, murders the king his brother, and ascends the throne, 661; smothered in ashes, 662.
- Solyman, as cruel as his predecessors, 681.
- Tahmasp, king of Persia, reduces Georgia, 678.
- Tahmasp II. 683; escapes from the usurper Afshaf, and takes Nadir Khan into his service, 684; who first reinstates and then deposes him, murdered by Nadir's son, 685.
- Tamerlane, his rise and wonderful progress, he subdues Persia and Hindoostan, 676; destroys Sebaste, reduces Bagdad, defeats Bajazet emperor of the Turks, and plans the conquest of China, his death and character, 677.

Taxes, how raised, 699, 700.
 Teheran, the present metropolis of Persia, 692.
 Teribazus, his stratagem with the Cadusian kings, 662; conspires against Artaxerxes, 663.
 Turks, their character contrasted with that of the Persians, 712, 13.
 Vaca-neviz, or writer of occurrences, a very ancient post, 698.
 Valens, king of Persia, 667.

Valerian emperor of Rome, taken prisoner by Sapor king of Persia, and dies in captivity, 664.
 Varanes I. II. and III. 665. IV. 666.
 Varanes V. cause of his persecuting the Christians, 666; his prudent behaviour in war and peace, 667.
 Varanes VI. 667.
 Well-digging, &c. 722, 3.
 Willock, lieut. chargé d'affaires at the court of Teheran, 691.

Women, character and occupations of, 713, 14; dress, 715; education, 718; marriages, 721, 2.
 Xerxes, his reign and death, 661.
 Xerxes II. his short reign, 661.
 Zambades, king for a short time, 667.
 Zika Khan, an usurper at the death of Kerim, 689.
 Zopyrus, his stratagem to put Darius in possession of Babylon, 660, 1.

P E R.

PER'SIAH, a town of Hindoostan, in Baglana: eighteen miles east-south-east of Bassen.

PER'SIAN, *f.* A native of Persia. The language of the Persians. A kind of silk.

PER'SIAN, or PERSIC, *adj.* Belonging to Persia; distinguishing that order in architecture in which the statues of men are introduced instead of columns, as the Caryatic order has the figures of women for the same purpose. This was first used by the Athenians in token of a victory which their general Pausanias gained over the Persians. Le Clerc says, that Persian columns are not always made with the marks of slavery; but are frequently used as symbols of virtues and vices, of joy, strength, valour, &c. See the article ARCHITECTURE, vol. ii. p. 72.

PERSIAN GULF, a sea or inland lake, bounded on the north by Persia, and elsewhere by Arabia, except at the eastern extremity, where it communicates with the Arabian Sea: about 500 miles from east to west, and from 120 to 250 in breadth, from north to south; the principal river which runs into it is the Euphrates. The southern coast in particular is celebrated for its pearl-fishery. Most part of the coasts, both on the north and south, belong to colonies of Arabians.

PERSIAN LILY. See FRITILLARIA.

PERSIAN WHEEL. See the article MECHANICS, vol. xiv. p. 761.

PER'SICA, *f.* in botany. See AMYGDALUS.

PER'SICA TER'RA, *f.* An earth of the ochre kind, known in the colour-shops of London by the name of INDIAN RED. It is a very fine purple ochre, of a considerably compact texture, and great weight: while in the earth, it is of a pure blood-colour, and is not to be cut with the spade, but is dug with iron crows, and falls in irregular masses. It is of a rough dusty surface, and full of considerably-large bright glittering particles: these are white, and of a fine lustre. It adheres firmly to the tongue, is rough and harsh to the touch, stains the hands very deeply, and is of a rough astringent taste, and makes a very violent effervescence with acid menstruums. It is dug in the island of Ormus, in the Persian gulf, and in some parts of the East Indies.

PER'SICE SIM'ILIS. See MANGIFERA.

PERSICA'RIA. See POLYGONUM.

PERSICA'RIA SILOQUO'SA. See IMPATIENS.

PER'SIMON. See DIOSPYROS.

PER'SIS, a Roman lady, whom St. Paul salutes in his Epistle to the Romans (xvi. 12.) and whom he calls the *beloved*. He says she has *laboured much in the Lord*. Nothing else of her life is come to our knowledge, nor do we know that she is honoured by any church; which is something singular.

To PERSIS'T, *v. n.* [*persisto*, Lat. *persister*, Fr.] to persevere; to continue firm; not to give over.—Nothing can make a man happy, but that which shall last as long as he lasts; for an immortal soul shall *persist* in being, not only when profit, pleasure, and honour, but when time itself, shall cease. *South*.

PERSISTANCE, or PERSISTENCY, *f.* [from *persist*. PERSISTENCE seems more proper.] The state of persisting; readiness; constancy; perseverance in good or bad.—The love of God better can consist with the indeliberate

P E R

commitments of many sins, than with an allowed *perseverance* in any one. *Gov. of the Tongue*.—Obstinacy; obduracy; contumacy.—Thou think'st me as far in the devil's book, as thou and Falstaff, for obduracy and *persistency*. *Shakespeare*.

PERSISTANT, or PERSISTENT, *adj.* [*persistens*, Lat.] In botany; continuing a long while green with respect to the other parts of the same flower or plant.

PERSISTIVE, *adj.* Steady; not receding from a purpose; persevering:

The protractive trials of great Jove,

To find *persistive* constancy in men.

Shakespeare.

PER'SIUS, or AULUS PERSIUS FLACCUS, a Roman poet, is said to have been born at Volterra, in Tuscany, A. D. 34. Others have supposed Liguria to have been his native country, where he had a house at the Portus Lunæ. His family was of equestrian rank, and his education was that of a person of birth and fortune. He studied at Rome under the grammarian Palæmon, the rhetorician Virginius Flaccus, and the stoic philosopher Cornutus. He lived in intimacy with several of the most eminent persons of his time, and was generally beloved for the modesty of his disposition, and the suavity of his manners. He died at the early age of 28, and bequeathed to his preceptor Cornutus his library of 700 volumes, with a considerable sum of money; but the philosopher accepted only the books, and divided the money among Persius's sisters. These are all the circumstances of his life with which we are acquainted, and which are chiefly derived from a brief notice of him ascribed to Suetonius.

As a poet, Persius is only known by his Satires, six in number, which were in high reputation among his countrymen; for both Martial and Quintilian mention the applause he acquired by his *single* book. They are of the grave and sententious kind, chiefly turning upon topics of general morals. The philosophy of his excellent preceptor Cornutus, to whom one of them is dedicated, has given them an elevation and purity of sentiment, which in some parts places them in the first rank of moral poetry; but their extreme obscurity almost destroys the pleasure of a perusal. This may undoubtedly be partly ascribed to our incapacity of entering into many allusions to persons and things which would be plain enough to his contemporaries, but it is also to be imputed to his harsh and abrupt style, and extreme conciseness. There are supposed to be several strokes against Nero in his satires, and four bombast lines are thought by critics to be transcribed from that imperial poetaster; but this is mere conjecture, and not very probable. Persius is generally edited with Juvenal. Isaac Casaubon is his best commentator: his editions are Paris 1605, and London 1647, 8vo. Brewster's metrical English version is much esteemed.

PER'SKENSTEIN, a town of Silesia, in the principality of Neisse: three miles north-north-east of Ortmutchau.

PER'SO, a town of Italy, in the country of Friuli: ten miles north-west of Udina.

PERSOLA'TA, *f.* in botany, a word used by Pliny, as the name of a kind of burdock, different from the *personata*. He has, in the beginning of the chapter, spoken

ken of the *Arctium* of the Greeks, which he says the Latins sometimes called *perfonata*; and afterwards adds this *perfolata*; which, he says, was a plant vulgarly known, and called by the Greeks *arctium*. He seems to allow, that the Greeks called both these plants by the same name; but he distinguishes the *perfolata* from *perfonata*, by saying that the former has leaves like those of the great gourd, but larger and more hairy. It is probable, therefore, that he distinguishes, under these two names, the two different species of the great burdock common with us; the one with simple, the other with woolly, heads. See *ARCTIUM*.

PERSON, s. [*perfonne*, Fr. from *perfonna*, Lat.] Individual or particular man or woman.—A *perfon* is a thinking intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing, in different times and places. *Locke*.—Man or woman considered as opposed to things, or distinct from them.—A zeal for *perfon*s is far more easy to be perverted than a zeal for things. *Sprat*.—To that we owe the safety of our *perfon*s, and the propriety of our possessions. *Atterbury*.—Individual; man or woman.—This was then the church, which was daily increased by the addition of other *perfon*s received into it. *Fearfon*.—Human being; considered with respect to mere corporal existence.—The father and son are reputed in law as the same *perfon*; an ambassador represents the *perfon* of his prince. *Chambers*.

'Tis in her heart alone that you must reign;
You'll find her *perfon* difficult to gain. *Dryden*.

Man or woman considered as present, acting or suffering.—The rebels maintained the fight for a small time, and for their *perfon*s showed no want of courage. *Bacon*.

If I'm traduc'd by tongues which neither know
My faculties nor *perfon*;
'Tis but the fate of place, and the rough brake
That virtue must go through. *Shakespeare's Hen. VIII*.

A general loose term for a human being; one; a man.—Be a *perfon*'s attainments ever so great, he should always remember that he is God's creature. *Richardson's Clarissa*.—One's self; not a representative.—When I purposed to make a war by my lieutenant, I made declaration thereof to you by my chancellor; but now that I mean to make war upon France in *perfon*, I will declare it to you myself. *Bacon's Hen. VII*.—Our Saviour in his own *perfon*, during the time of his humiliation, duly observed the sabbath of the fourth commandment, and all other legal rites and observations. *White*.

The king in *perfon* visits all around,
Comforts the sick, congratulates the sound,
And holds for thrice three days a royal feast. *Dryden*.

Exterior appearance:

For her own *perfon*,
It beggar'd all description. *Shakespeare*.

Man or woman represented in a fictitious dialogue.—All things are lawful unto me, saith the apostle, speaking as it seemeth, in the *perfon* of the Christian Gentile, for the maintenance of liberty in things indifferent. *Hooker*.—The name and part of an actor; or of him presented by the comedian.—The ancient tragedy was only a simple chorus: Thespis was the first who introduced a *perfon* to relieve the chorus; and Æschylus added a second. *Bosfu* observes, that, in the epic and dramatic poem, the same *perfon* must reign throughout; i. e. must sustain the chief part throughout the whole piece; and the characters of all the other *perfon*s must be subordinate to him. *Chambers*.—Character.—He hath put on the *perfon*, not of a robber and murderer, but of a traitor to the state. *Hayward*.—Character of office.—How different is the same man from himself, as he sustains the *perfon* of a magistrate and that of a friend! *South*.

VOL. XIX. No. 1339.

I then did use the *perfon* of your father;
The image of his power lay then in me:
And in th' administration of his law,
While I was busy for the commonwealth,
Your highness pleased to forget my place. *Shakespeare*.

[In grammar.] The quality of the noun that modifies the verb.—Dorus the more blushed at her smiling, and she the more smiled at his blushing; because he had, with the remembrance of that plight he was in, forgot, in speaking of himself, the third *perfon*.—*Sidney*.—If speaking of himself in the first *perfon* singular has so various meanings, his use of the first *perfon* plural is with greater latitude. *Locke*.—Formerly, the rector of a parish. See *PERSON*.—For all curates, *perfon*s, and vicars. *Lib. Festiv.*—Jerom was vicar of Stepnie, and Garrard was *perfon* of Honie-lane. *Hollinshed*.

PERSON, a county of America, in Hillsborough district, North Carolina; containing 6442 inhabitants, of whom 2573 are slaves.

PERSONABLE, adj. Handsome; graceful; of good appearance.—Were it true that her son Ninias had such a stature, as that Semiramis, who was very *perfonable*, could be taken for him; yet it is unlikely that she could have held the empire forty-two years after by any such subtily. *Raleigh*.

PERSONABLE in law, implies the being able to hold or maintain a plea in court. Thus they say, the defendant was judged *perfonable* to maintain this action. *Old Nat. Brev. 142*.—The tenant pleaded, that the demandant was an alien, born in Portugal, without the ligeance of the king: and judgment was asked, Whether he should be answered? The plaintiff said, he was made *perfonable* by parliament. *Kitch. 124*.

PERSONAGE, s. [Fr. from *perfonna*, Lat. which also signifies a mask.] A considerable person; man or woman of eminence.—It is not easy to research the actions of eminent *perfonages*, how much they have blemished by the envy of others, and what was corrupted by their own felicity. *Wotton*.—Exterior appearance; air; stature.—The lord Sudley was fierce in courage, courtly in fashion, in *perfonage* stately, in voice magnificent, but somewhat empty of matter. *Hayward*.

She hath made compare
Between our statures, she hath urg'd his height;
And with her *perfonage*, her tall *perfonage*,
She hath prevail'd with him. *Shakespeare*.

Character assumed.—The great diversion is masking: the Venetians, naturally grave, love to give into the follies of such seasons, when disguised in a false *perfonage*. *Addison on Italy*.—Character represented.—Some persons must be found out, already known by history, whom we may make the actors and *perfonages* of this fable. *Broome on Epick Poems*.

Our friend and correspondent the Etymological Gleaner reminds us, that the Latin word *perfonna* has its second syllable long, (*Eripitur perfonna, manet res, Perfus*;) although the word originally comes from *perfonnare*, "to sound through" the mask which the actors on the stage placed before their faces in order to increase the intensity of their voices. We, as well as the French, have retained, in the derivatives of this word, the ancient quantity, and pronounce the second syllable short, *perfonage, perfonal, &c.* The beautiful expression of the Roman satyrist has been most happily hit by J. B. Rousseau:

Le masque tombe; l'homme reste,
Et le héros s'évanouit.

PERSONAL, adj. [*perfonel*, Fr. from *perfonalis*, Lat.] Belonging to men or women, not to things; not real.—Every man so termed by way of *perfonal* difference only. *Hooker*.—Affecting individuals or particular people; peculiar; proper to him or her; relating to one's private actions or character.—It could not mean, that Cain as el-

der had a natural dominion over Abel, for the words are conditional: "If thou doest well," and so *personal* to Cain. *Locke*.—Public reproofs of sin are general, though by this they lose a great deal of their effect; but in private conversations the application may be more *personal*, and the proofs when so directed come home. *Rogers*.

I know no *personal* cause to spurn at him;
But for the general. *Shakespeare's Jul. Cas.*

Present; not acting by representative.—This immediate and *personal* speaking of God Almighty to Abraham, Job, and Moses, made not all his precepts and dictates, delivered in this manner, simply and eternally moral; for some of them were *personal*, and many of them ceremonial and judicial. *White*.

The favourites that the absent king in deputation left,
When he was *personal* in the Irish war. *Shakespeare*.

Exterior; corporal.—This heroic constancy determined him to desire in marriage a princess, whose *personal* charms were now become the least part of her character. *Addison*.

PERSONAL ACTION, in law, is an action levied directly and solely against the person; in opposition to a real or mixed action.

PERSONAL GOODS, or CHATTELS, in law, signifies any moveable thing belonging to a person, whether alive or dead.

PERSONAL VERB, in grammar, a verb conjugated in all the three persons; thus called in opposition to an impersonal verb, or that which has the third person only.

PERSONAL, *f.* Any movable possession; goods: in opposition to lands and tenements, or real estate.

PERSONALITY, *f.* The existence or individuality of any one.—Person belongs only to intelligent agents, capable of a law, and happiness and misery: this *personality* extends itself beyond present existence to what is past, only by consciousness, whereby it imputes to itself past actions, just upon the same ground that it does the present. *Locke*.—Reflection upon individuals, or upon their private actions or character.

PERSONALITY, or PERSONALTY, in law.—An action is said to be in *personality*, when it is brought against the right person. *Chambers*.

To PERSONALIZE, *v. a.* To personify. *Scott*.

PERSONALLY, *adv.* In person; in presence; not by representative.—Approbation not only they give, who *personally* declare their assent by voice, sign, or act, but also when others do it in their names. *Hooker*.—There are many reasons, why matters of such a wonderful nature should not be taken notice of by those Pagan writers who lived before our Saviour's disciples had *personally* appeared among them. *Addison*.

I could not *personally* deliver to her
What you commanded me, but by her woman
I sent your message. *Shakespeare's Hen. VIII.*

With respect to an individual; particularly.—She bore a mortal hatred to the house of Lancaster, and *personally* to the king. *Bacon's Hen. VII.*—With regard to numerical existence.—The converted man is *personally* the same he was before, and is neither born nor created anew in a proper literal sense. *Rogers*.

PERSONATA, *f.* in botany. See PERSOLATA and ARCTIUM.

PERSONATÆ, *f.* The fortieth natural order among the Fragmenta of Linnæus; nearly analogous to the Scrophulariæ and the Vitices of Jussieu, embracing more-over some that are subjoined to his Solanææ. Many of the plants are fetid and poisonous, few of them aromatic, though the flowers of some are fragrant. Giseke well observes, that there is no order in which so many genera bear the names of botanists as in this of the *Personatæ*. See the article BOTANY, vol. iii. p. 297, 8.

To PERSONATE, *v. a.* [from *persona*, Lat.] To represent by a fictitious or assumed character, so as to pass

for the person represented.—This lad was not to *personate* one that had been long before taken out of his cradle, but a youth that had been brought up in a court, where infinite eyes had been upon him. *Bacon's Hen. VII.*—To represent by action or appearance; to act:

Herself awhile she lays aside, and makes
Ready to *personate* a mortal part. *Cresshaw*.

To pretend hypocritically, with the reciprocal pronoun.—It has been the constant practice of the Jesuits to send over emissaries, with instructions to *personate* themselves members of the several sects amongst us. *Swift*.—To counterfeit; to feign. *Little in use*.—Piety is opposed to that *personated* devotion, under which any kind of impiety is disguised. *Hammond on Fundamentals*.—Thus have I played with the dogmatist in a *personated* scepticism. *Glanville's Scepssis*.—To resemble.—The lofty cedar *personates* thee. *Shakespeare's Cymbeline*.—To make a representation of, as in picture. *Out of use*.

Whose eyes are on this sovereign lady fixt,
One do I *personate* of Timon's frame,
Whom fortune with her ivory hand wafts to her. *Shakespeare*.

To describe. *Out of use*.—I will drop in his way some obscure epistles of love, wherein, by the colour of his beard, the shape of his leg, the manner of his gait, the expression of his eye, forehead, and complexion, he shall find himself most feelingly *personated*. *Shakespeare*.—To celebrate loudly; [*persono*, Lat.] *Not in use*.

They loudest sing
The vices of their deities and their own,
In fable, hymn, or song, so *personating*
Their gods ridiculous, and themselves past shame. *Milton*.

To play a fictitious character.—He wrote many poems and epigrams, sundry petty comedies and enterludes, oftentimes *personating* with the actors. *Sir G. Buck's Rich. III.*

PERSONATE, *adj.* in botany, applied to the corolla when it is irregular, having the mouth closed by a kind of palate, as in *Antirrhinum*, or toad's flax. The term is derived from *persona*, a mask; and its application in the present instance, whether intended or not by Linnæus, is peculiarly happy; the plants furnished with such a corolla being, as it were, of the regular pentandrous tribe, under a mask, which they occasionally lay aside. See PELORIA and PERSONATÆ.

PERSONATION, *f.* Counterfeiting of another person.—This being one of the strangest examples of a *personation* that ever was, it deserved to be discovered and related at the full. *Bacon's Hen. VII.*

PERSONATOR, *f.* One who personates a fictitious character.—Expressing a most real affection in the *personators*. *B. Jonson's Masques at Court*.—One who acts or performs.—The most royal princes, and greatest persons, are commonly the *personators* of those actions. *B. Jonson's Masques at Court*.

PERSONIFICATION, *f.* Profopœia; the change of things to persons: as, "*Confusion* heard his voice." Milton's P. L.—Boethius's admired allegory on the Consolation of Philosophy introduced *personification* into the poetry of the middle ages. *Warton's Hist. E. P.*—When words naturally neuter are converted into masculine and feminine, the *personification* is more distinctly and forcibly marked. *Louth*.

Dr. Blair in his Lectures on Rhetoric gives this account of personification. "It is a figure, the use of which is very extensive, and its foundation laid deep in human nature. At first view, and when considered abstractly, it would appear to be a figure of the utmost boldness, and to border on the extravagant and ridiculous. For what can seem more remote from the track of reasonable thought, than to speak of stones and trees, and fields and rivers, as if they were living creatures; and to attribute to them thought and sensation, affections and actions? One might imagine this to be no more than childish conceit,

PERSOONIA.

Persoonia pinifolia.

Persoonia hirsuta.

J. Pass 50

ceit, which no person of taste could relish. In fact, however, the case is very different. No such ridiculous effect is produced by personification when properly employed; on the contrary, it is found to be natural and agreeable; nor is any very uncommon degree of passion required in order to make us relish it. All poetry, even in its most gentle and humble forms, abounds with it. From prose it is far from being excluded; nay, even in common conversation, very frequent approaches are made to it. When we say, the ground *thirsts* for rain, or the earth *smiles* with plenty; when we speak of ambition's being *restless*, or a disease being *deceitful*; such expressions show the facility with which the mind can accommodate the properties of living creatures to things that are inanimate, or to abstract conceptions of its own forming.

“So strong is that impression of life which is made upon us by the more magnificent and striking objects of nature especially, that I doubt not in the least of this having been one cause of the multiplication of divinities in the heathen world. The belief of Dryads and Naiads, of the Genius of the Wood and the God of the River, among men of lively imaginations, in the early ages of the world, easily arose from this turn of mind. When their favourite rural objects had often been animated in their fancy, it was an easy transition to attribute to them some real divinity, some unseen power or genius which inhabited them, or in some peculiar manner belonged to them. Imagination was highly gratified, by thus gaining somewhat to rest upon with more stability; and, when belief coincided so much with imagination, very slight causes would be sufficient to establish it. From this deduction may be easily seen how it comes to pass that personification makes so great a figure in all compositions where imagination or passion have any concern.”

To PERSONIFY, v. a. To change from a thing to a person.—The poets take the liberty of *personifying* inanimate things. *Ld. Chesterfield*.—The poets have *personified* all the passions; and even made divinities of them, which were worshipped by the heathens; as the goddess Persuasion, the god Sleep, the Furies, Envy, and Discord, and Fame, Fortune, Victory, &c. *Chambers*.

To PERSONIZE, v. a. To personify.—Milton has *personized* them, and put them into the Court of Chaos. *Richardson's Notes on Milton*.

PERSOONIA, *f.* [so named by Sir J. E. Smith, M. D. president of the Linnæan Society, in honour of his friend and correspondent, Christian Henry Perfoon, author of many valuable works on Fungi. He has also edited a Synopsis of the vegetable kingdom, on the plan of the Linnæan Systema Vegetabilium.] In botany, a genus of the class tetrandria, order monogynia, natural order proteaceæ. Generic characters—Calyx: none, except a slight border. Corolla: petals four, equal, linear-oblong, recurved, deciduous; nectary of four distinct glands, at the base of the germen. Stamina: filaments scarcely any; antheræ four, inserted about the middle of each petal, linear, erect, prominent, at length reflexed. Pistillum: germen superior, stalked, ovate; style thread-shaped, on a level with the antheræ, permanent; stigma obtuse. Pericarpium: drupe ovate, pulpy. Seed: nut of one or two cells.—*Essential Character*. Petals four, recurved, bearing the stamens about their middle; nectary of four glands; germen superior, stalked; stigma obtuse; drupe with a nut of one or two cells.

This genus was instituted by Dr. Smith in the Linn. Transf. vol. iv. p. 215. anno 1798. and it may now be considered as firmly established. Mr. Brown, in a very long paper on the Proteaceæ of Jussieu, Linn. Transf. vol. x. 1807. has enumerated twenty-two species; and Mr. Rudge, in the same volume, has more fully described and figured two of them, which are copied on the annexed Engraving. These plants are for the most part shrubby or arborescent, with yellow flowers.

1. *Perfoonia teretifolia*: leaves thread-shaped, without

furrows; stalks solitary, single-flowered; antheræ pointed; style shorter than the germen. Gathered by Mr. Brown, on stony hills, at Lewin's Land, on the south coast of New Holland.

2. *Perfoonia microcarpa*: leaves thread-shaped, channelled; stalks solitary, in pairs, or ternate; antheræ pointless; style longer than the germen; stigma drooping. Native of marshy heaths, in the same country.

3. *Perfoonia pinifolia*: leaves thread-shaped, lax; spike pyramidal, elongated, leafy; floral leaves shorter than the rest, flowers yellow. Found by Mr. Brown on heaths, and about the banks of rivulets, at Port Jackson, New South Wales. This species is shown of the natural size at fig. 1. and, underneath, *a* exhibits the flower and its bractæ magnified; *b*, the petal; *c*, back and front view of the anther; *d*, the pistillum.

4. *Perfoonia juniperina*: leaves awl-shaped, straight, pungent, flowers axillary, solitary; germen smooth, with two kernels. Found on dry heaths and about the sides of hills, in Van Diemen's Land, as well as on the south coast of New Holland. The stem, according to Labillardiere, is a yard or more in height, determinately branched, round, and leafy; leaves rigid, above an inch long, rather hairy, as are the short axillary flower-stalks; petals clothed externally with rigid hairs, yellowish. Fruit red, eatable; its nut usually with two kernels.

5. *Perfoonia hirsuta*: leaves linear, hairy and rough; flower-stalks axillary; germen silky, single seeded. Native of moist heaths about Port Jackson, New South Wales. The flowers are yellow, very hairy externally, and full as long as the leaves. See fig. 2, which represents this plant of the natural size; *e*, the flower magnified; *f*, the petal; *g*, anther, front and back view; *h*, pistillum.

6. *Perfoonia mollis*: leaves lanceolate, elongated, villosous, very soft beneath; corolla bearded; germen smooth, with two kernels. Gathered by Mr. Brown near Port Jackson, about the sandy banks of rivers.

7. *Perfoonia linearis*: leaves linear, elongated, smooth; flower-stalks straight; corolla downy; stalk of the germen without a joint; stem arboreous; bark smooth. On hills and in open fields about Port Jackson, from whence specimens and seeds were first sent by Dr. White in 1792. The plant was raised by the late Mr. Robinson of Stockwell, in 1794. It proved a hardy greenhouse-shrub, flowering copiously in the latter part of summer. The young branches, as well as the flower-stalks, and backs of the petals, are downy. Leaves copious, spreading, two inches or more in length, and not a line wide. Fruit globose, smooth.

8. *Perfoonia lucida*: leaves linear, somewhat lanceolate, elongated, smooth; flower-stalks downy; straight; corolla downy; stalk of the germen without a joint; stem arboreous, bark flaky. Found near Port Jackson, by the sides of mountain-rivers, by Mr. Ferdinand Bauer. It seems nearly related to the preceding.

9. *Perfoonia virgata*: leaves linear, or somewhat oblong, scattered, vertical, very smooth in every part; flower-stalks smooth, straight; corolla smooth; stem arboreous; bark even. Gathered by Mr. Brown on the sea-shore near Sandy Cape, on the east coast of New Holland.

10. *Perfoonia flexifolia*: leaves nearly linear, pointed, crowded, twisted at the base, smooth on both sides, besprinkled with shining dots; their edges rough; corolla smooth; stem shrubby. Native of the stony sides of hills, on the south coast of New Holland.

11. *Perfoonia scabra*: leaves linear-lanceolate, pointed, rough on both sides, besprinkled with shining as well as minute opaque dots; corolla downy. In the same country and situations as the preceding.

12. *Perfoonia spatulata*: leaves lanceolate-spatulate, pointed, rather concave, very rough on both sides with crystalline points. Gathered by Mr. Brown in the same places as the two preceding species.

13. *Perfoonia nutans*: leaves linear, smooth; flower-stalks axillary, recurved, smooth as well as the corolla. Found by Mr. Brown near Port Jackson, in woods on a sandy soil, at the foot of the mountains.

14. *Perfoonia falcata*: leaves lanceolate, elongated, tapering at the base, somewhat stalked, falcate, reversed, coriaceous; antheræ pointed; stem arboreous; bark flaky. Gathered by Sir Joseph Banks, near Endeavour-river, on the east coast of New Holland; and by Mr. Brown, at Carpentaria, on the north coast, near the sea-shore.

15. *Perfoonia lanceolata*: leaves elliptic-lanceolate, pointed, smooth and even; stalks axillary, single-flowered; corolla silky, with close-pressed hairs; stalk of the germen without a joint. Native of fields and heaths towards the sea-coast at Port Jackson, from whence seeds were very early sent to this country. Plants are said to have been first raised in 1791, by J. Wilson, esq. at Ilington. The leaves are about two inches long. Flowers yellow, as in all the rest. Fruit globose, the size of a black currant.

β. *P. latifolia* (Andr. Repos. t. 280) is proposed, not without hesitation, by Mr. Brown, as a variety of this. It differs in having larger and obovate leaves, which in our native specimens, sent from Port Jackson by Dr. White, appear somewhat glaucous. The flowers exactly agree.

16. *Perfoonia falcata*: leaves lanceolate-oblong, unequal, reversed; stalks axillary or racemose; corolla nearly smooth; stem arboreous; bark flaky. Native of fields, hills, and woods, in the neighbourhood of Port Jackson. The leaves are three inches long, their sides more or less unequal, giving them a falcate aspect. Flower-stalks and young branches silky. Fruit elliptical; its nut with two kernels.

17. *Perfoonia ferruginea*; leaves elliptical, acute, veiny; stalks axillary, many-flowered, clothed, as well as the backs of the petals, with rusty silky hairs. Native of fields near Port Jackson, from whence it was originally sent dried by Dr. White. The stem is shrubby, three or four feet high, with smooth branches. Leaves for the most part nearly opposite, two or three inches long, and about one broad, smooth, shining. Flowers in short dense axillary clusters, accompanied by small bractes, which, as well as the stalks; and the backs as well as margins of the petals, are densely clothed with shining silky hairs of a deep rusty orange-colour. This shrub flowers in its native country in November.

18. *Perfoonia prostrata*: leaves oval, obtuse, downy at the margin; stalks axillary, with one or more flowers; stem procumbent. Gathered by Mr. Brown in fruit, the flowers being all past, near Sandy Cape, on the east coast of New Holland, growing in sand near the sea-shore.

19. *Perfoonia elliptica*: leaves elliptical, veiny; clusters lateral; petals smooth; stalk of the germen jointed. Gathered by Mr. Brown on the stony sides of hills at Lewin's Land, on the south coast of New Holland.

20. *Perfoonia articulata*: leaves lanceolate, elongated, equal, smooth; stalks axillary, with one or more flowers; corolla nearly smooth; lower joint of the stalk of the germen as long as the glands. Gathered by Mr. Brown in Lewin's Land, with the foregoing.

21. *Perfoonia longifolia*: leaves linear, elongated, falcate; stalks axillary, with one or more flowers; corolla downy, with close-pressed hairs; lower joint of the stalk of the germen longer than the glands. From the same country.

22. *Perfoonia graminea*: leaves of the branches linear, very long, revolute; clusters many-flowered, turned one way; corolla smooth; stem short, somewhat shrubby. Found by Mr. Brown, about the sandy margins of standing pools in Lewin's Land.

PERSOY'AH, a fort of Hindoostan, in Bahar: sixty-six miles south-south-west of Patna.

PERSPECTIVE, *f.* [*perspicivus*, Fr. *perspicio*, Lat.] The art of representing objects on a definite surface, so as to affect the eye, when seen from a certain position, in

the same manner as the object itself would, when the eye is fixed in the point in view.—Medals have represented their buildings according the rules of *perspective*. Addison on Medals. See the article OPTICS, vol. xvii. p. 663.—A glass through which things are viewed.—They turn about the *perspective*, and show it so little, that he can scarce discern it. Denham.—It may import us in this calm to hearken to the storms raising abroad; and by the best *perspectives* to discover from what coast they break. Temple.

You hold the glass, but turn the *perspective*,
And farther off the lessen'd object drive. Dryden.

Faith for reason's glimmering light shall give
Her immortal *perspective*. Prior.

View; visto:

Lofty trees with sacred shades,
And *perspectives* of pleasant glades,
Where nymphs of brightest form appear. Dryden.

PERSPECTIVE, *adj.* Relating to the science of vision; optical.—We have *perspective* houses, where we make demonstrations of all lights and radiations; and, out of things uncoloured and transparent, we can represent unto you all several colours. Bacon.

This vizard, wherewith thou would'st hide thy spirit,
Is *perspective*, to show it plainlier.

Beaum. and Fl. Hon. Man's Fortune.

PERSPECTIVELY, *adv.* Optically; through a glass; by representation. Hulot.—My lord, you see them *perspectively*, the cities turned into a maid. Shakespeare's Hen. V.

PERSPICABLE, *adj.* [*perspicabilis*, Lat.] Discernible. Not in use.—Albeit there be but nineteen pillars at this day extant, yet the fractures and bases of other one-and-twenty more are *perspicable*. Sir T. Herbert's Travels.—The sea rather stable, and to the eye without any *perspicable* motion. Ibid.

PERSPICACIOUS, *adj.* [*perspicax*, Lat.] Quick-sighted; sharp of sight.—It is as nice and tender in feeling, as it can be *perspicacious* and quick in seeing. South.

PERSPICACIOUSNESS, *f.* Quickness of sight.

PERSPICACITY, *f.* Quickness of sight.—He that laid the foundations of the earth cannot be excluded the secrecy of the mountains; nor can there any thing escape the *perspicacity* of those eyes, which were before light, and in whose optics there is no opacity. Brown.

PERSPICACY, *f.* [*perspicacia*, Lat.] Quickness of sight; discernment.—Lady, do not scorn us, though you have the gift of *perspicacy* above other. B. Jonson's Every Man out of his Humour.

PERSPICIENCE, *f.* [*perspicens*, Lat.] The act of looking sharply.

PERSPICIL, *f.* [*perspicillum*, Lat.] A glass through which things are viewed; an optic glass. Little used.—The *perspicil*, as well as the needle, hath enlarged the habitable world. Glanville's Scepstis.

Let truth be

Ne'er so far distant, yet chronology,
Will have a *perspicil* to find her out,
And, through the night of error and dark doubt,
Discern the dawn of truth's eternal ray. Crashaw.

PERSPICUITY, *f.* [*perspicuitas*, Fr. from *perspicuus*.] Transparency; translucency; diaphaneity.—As for diaphaneity and *perspicuity*, it enjoyeth that most eminently, as having its earthy and salinous parts so exactly resolved, that its body is left imporous. Brown.—Clearness to the mind; easiness to be understood; freedom from obscurity or ambiguity.—The verses containing precepts have not so much need of ornament as of *perspicuity*. Dryden.—*Perspicuity* consists in the using of proper terms for the thoughts which a man would have pass from his own mind into that of another's. Locke on Reading.

PERSPICUOUS, *adj.* [*perspicuus*, Lat.] Transparent; clear;

clear; such as may not be seen through; diaphanous; translucent; not opaque.—As contrary causes produce the like effects, so even the same proceed from black and white; for the clear and *perspicuous* body effecteth white, and that white a black. *Peacham*.—Clear to the understanding; not obscure; not ambiguous.—All this is so *perspicuous*, so undeniable, that I need not be over industrious in the proof of it. *Sprat*.

The purpose is *perspicuous* even as substance, Whose grossness little characters sum up. *Shakespeare*.

PERSPICUOUSLY, *adv.* Clearly; not obscurely.—The case is no sooner made than resolved; if it be made not unwrapped, but plainly and *perspicuously*. *Bacon*.

PERSPICUOUSNESS, *f.* Clearness; freedom from obscurity; transparency; diaphaneity.

PERSPIRABLE, *adj.* [from *perspire*.] Such as may be emitted by the cuticular pores.—In an animal under a course of hard labour, aliment too vapourous or *perspirable* will subject it to too strong a perspiration, debility, and sudden death. *Arbuthnot on Aliments*.—Perspiring; emitting perspiration. *Not proper*.—Hair cometh not upon the palms of the hands or soles of the feet, which are parts more *perspirable*: and children are not hairy, for that their skins are most *perspirable*. *Bacon*.

PERSPIRATION, *f.* The office of the skin, by which it forms and discharges various matters, principally fluids, from the blood; or the matters themselves so discharged. It is distinguished into *sensible* and *insensible*; and here sensible perspiration is the same with sweating, and insensible perspiration that which escapes the notice of the senses.—*Insensible perspiration* is the last and most perfect action of animal digestion. *Arbuthnot on Aliments*.

To ascertain the quantity of matter perspired through the skin, various experiments have been made, particularly by Sanctorius, who continued them for thirty years. More recently Lavoisier and Seguin instituted some very ingenious experiments in elucidation of this subject. Seguin was inclosed in a silk bag with a slit for the mouth, to which it was cemented; so that every thing was confined within the bag, except what passed off by the lungs. By weighing himself in a delicate balance at the beginning of the experiment, and again after he had been some time in the bag, he ascertained the loss by perspiration. By weighing himself without the bag, and repeating the operation after the same interval of time had elapsed as in the former experiment, he found the loss of weight by perspiration and respiration. By subtracting from this sum the loss of weight indicated by the first experiment, he obtained the quantity of matter which made its escape by perspiration in a given time. The following were the facts he ascertained. That the greatest average loss by perspiration in twenty-four hours was 4 lb. 4 oz. or fifty-two ounces, Troy. It was increased by drink, but not by solid food; at its minimum after a repast, at its maximum during digestion. The quantity perspired is greatly increased by heat, whether directly applied, or induced by exercise. The substances constantly perspired are water, carbon, an oily matter, and occasionally phosphoric acid, phosphate of lime, and urea.

Mr. Cruikshank introduced his hand into a glass jar, and tied a bladder, fixed to the mouth of the jar, round his wrist. In less than a minute the inside of the bottle was rendered dim, as if it had been held over the steam of warm water: small drops appeared in less than ten minutes, and a tea-spoonful of transparent and perfectly insipid fluid, weighing 30 gr. was collected in an hour. Assuming that the hand is to the whole body as 1 to 60, and that the whole surface perspires equally, the exhalation at this rate would be 7 lb. 6 oz. in 24 hours. When the experiment was repeated after taking exercise, 48 gr. were collected in an hour, which is at the rate of 12 lb. in 24 hours. By breathing into a bottle for an hour, this gentleman collected 124 gr. of insipid transparent fluid: the produce in 24 hours at this rate would be

6 oz. 1 dr. 36 gr. If this be added to the former statement of the cutaneous exhalation, the sum will be 8 lb. 1 dr. 36 gr. Mr. Abernethy collected from his hand and wrist, inclosed in a glass jar for six hours, about 3 dr. of fluid. He estimated the surface from which this was collected at $\frac{1}{2}$ th of the whole body: hence, if the perspiration be equal at all times and in all parts, the produce in one day would be about 2½ lb. This result is so different from that of Mr. Cruikshank, that there must be some signal error on one side or the other.

It appears, says Mr. Brande, that the function of the skin is in many respects analogous to that of the lungs; for in both cases, carbonic acid and water are evolved and oxygen absorbed. Some have doubted whether the skin does absorb. In favour of it, it is stated, that sometimes the quantity of urine passed is greater than the whole ingesta of solid and liquid food, as in diabetes. But it should be recollected, that in this disease the solid matter of the body is constantly consuming, and may be converted into urine. Captain Bligh ordered his companions, when deprived of fresh water, to bathe in the sea, and it always allayed their thirst and cooled their bodies. Here we might have presumed, that absorption must have taken place, as thirst was allayed by the application of water to the skin; but this effect may be accounted for by the collapse of the outer vessels of the skin; and it should be remarked, there was no increase of weight. Dr. Currie had a patient with stricture of the œsophagus, which prevented his swallowing; and his thirst was always alleviated by bathing; but no increased weight could be detected after coming from the bath. Seguin observed, that no effect was produced on a person that he submitted to a bath in which some mercurial salt was dissolved; but, when a part of the skin was abraded, the effects of mercury on his constitution were evident. Though these experiments appear decisive, that the skin cannot absorb water while in the fluid form, yet it does not follow that it may not be absorbed in the form of vapour, or that air may not be absorbed. Van Mons kept a patient alive for many days, who could not swallow, from a wound in the throat, by applying to different parts of the body with a sponge, strong soups, or wine. But Dr. Watson's experiment is more conclusive of the fact of absorption. A Newmarket jockey, that had been sweated down to a weight to qualify him for riding a race-horse, was weighed on the morning that he was to ride; he was weighed also an hour after the race, and was found to have gained thirty ounces of weight. In the interval, he had drank but half a glass of wine. Hence Mr. B. thinks, that the doctrine of absorption by the skin was just, although further experiments are required to establish this point upon satisfactory evidence. Brande's Lecture on Digestion and Perspiration, at Apothecaries' Hall, March 1814.

Bichat enquires whether the nerves have any influence on the cutaneous discharge. He observes, that in palsied patients sweat takes place on the diseased as well as on the sound side. "I lately," says he, "attended at the Hôtel Dieu a patient, in whom the left side of the body was rendered perfectly paralytic, in consequence of an apoplectic attack: yet he sweated only on this side. Examples of the opposite phenomenon are adduced; but they cannot invalidate the common observation, that the discharge is equal on both sides. Is it not well known, that when the nervous action is entirely annihilated in a paralytic limb, blisters affect it in the usual manner? Do convulsions, in which the nervous action is increased, augment the cutaneous exhalation? Have the states of acute sensibility, where there is in the cutaneous nerves so great a susceptibility of impressions, any known influence on perspiration? Let us then confess, that in cutaneous exhalation, as well as in secretion, we are entirely ignorant of the nature of the nervous influence, if any such exist."

The *Perspiration of Plants* takes place chiefly from the surface of their leaves. In order to collect the liquor perspired, it is only necessary to introduce a branch of the

plant into any sufficiently-capacious glass vessel; when the fluid which exudes will trickle down the sides of the glass in great abundance, especially if the experiment be made in sun-shine. The liquor thus obtained is of a clear watery nature, scarcely distinguishable to our senses, or to our chemical enquiries, from the sap of the same plant, whatever it may be, procured by wounding its branches before the foliage expands. This, which may be termed the insensible perspiration of plants, becomes in some cases sensible; as when it runs down, like a slight shower, from willow or poplar trees, in hot sunny weather; or when it collects in drops on the leaves of plaintain-trees in a stove.

Hales and others have made experiments to ascertain the quantity of insensible perspiration in various plants. The great annual sun-flower was found to perspire about seventeen times as much as the ordinary insensible perspiration of the human skin. The *Cornus mascula*, or cornelian cherry, is said to discharge, in twenty-four hours, as much fluid as is equal to twice the weight of the whole shrub. Succulent leaves perspire much slower than others, though they absorb in a far more rapid proportion.

This watery perspiration is the only excrementitious discharge of the vegetable body. The sap, being carried up into the leaves, where it is acted upon by air and light, for the most important purposes, yields those various and highly-curious secretions, which, being carried down into the bark, afford matter for the increase of the tree, as well as for the manifestation of its various qualities. The great bulk of the sap which remains, as it does not return to the root, like the blood of animals to their heart, can be disposed of no otherwise than by a copious evaporation. Dr. Darwin was of opinion that this watery perspiration rendered a further service to the plant, by being acted upon by light, so as to give out oxygen, which was immediately absorbed by the air-vessels. But this hypothesis is inadmissible on many accounts.

The sensible perspiration of many plants is of a far different nature from the above watery evaporation, and is to be considered as an actual secretion. Such are the mucilaginous exudation found on the leaves of the *Tilia europæa*, or lime-tree; the saccharine matter perceptible on orange-trees, hops, beech, and other plants, which is one kind of honey-dew, and either owing to some injury to their roots, or to the sudden influence of a cold, or otherwise noxious, atmosphere. The *Cistus* genus, and many other shrubs of warm countries, afford a resinous exudation from their leaves and young twigs. The *Distamnus albus*, or fraxinella, is very remarkable for a highly inflammable vapour, which in hot still weather issues from, and hovers around, the plant, exploding on the approach of a lighted taper. Manna is said to have been scraped from the leaves of *Fraxinus ornus*, though usually procured only from the sap of that tree. A kind of wax may in like manner be obtained, as some report, from the leaves of rosemary. A copious glutinous perspiration is observable on young leaves of many kinds, as the cherry, plum, various poplars, and abundance of aromatic herbs. *Pelargonium inquinans* is singular for its exudation of a soft oily matter, that stains the fingers with a red or vermilion-like tinge.

PERSPIRATIVE, *adj.* Performing the act of perspiration.

PERSPIRATORY, *adj.* Perspirative.—The finest capillaries and *perspiratory* ducts. *Bp. Berkeley's Siris.*

TO PERSPIRE, *v. n.* [*perspiro*, Lat.] To perform excretion by the cuticular pores. To be excreted by the skin.—Water, milk, whey, taken without much exercise, so as to make them *perspire*, relax the belly. *Arbutnot.*

TO PERSPIRE, *v. a.* To emit by the pores.—Firs grow and thrive in the most barren soil, and continually *perspire* a fine balsam of turpentine. *Smollet.*

PERSTAIN, a town of Bohemia, in the circle of Boheſlaw: fourteen miles north-west of Jung Buntzel.

TO PERSTRIN'GE, *v. a.* [*perstringo*, Lat.] To touch

upon; to glance upon.—In those verses of Callimachus he *perstringeth* the impiety of Eumerus. *Fotherby's Atheom.* 1622.—Men from this text of Scripture would *perstringe* philosophy. *More's Conj. Cabb.*—The womanishness of the church of Rome in this period is *perstringed*. *More on the Seven Churches.*

Look out, look out, and see,
What object this may be,
That doth *perstringe* mine eye. *Burton's Anat. of Mel.*

PERSUA'DABLE, *adj.* [from *persuade*.] Such as may be persuaded.

PERSUA'DABLY, *adv.* So as to be persuaded.
TO PERSUA'DE, *v. a.* [*persuadeo*, Lat. *persuader*, Fr.] To bring to any particular opinion.—Let every man be fully *persuaded* in his own mind. *Rom.* xiv. 5.—We are *persuaded* better things of you, and things that accompany salvation. *Heb.* vi. 9.—Joy over them that are *persuaded* to salvation. 2 *Esd.* vii. 61.—Let a man be ever so well *persuaded* of the advantages of virtue, yet, till he hungers and thirsts after righteousness, his will not be determined to any action in pursuit of this confessed great good. *Locke.*—Men should seriously *persuade* themselves that they have here no abiding-place, but are only in their passage to the heavenly Jerusalem. *Wake's Prep. for Death.*—To influence by argument or expostulation. *Persuasion* seems rather applicable to the passions, and argument to the reason; but this is not always observed. *Johnson.*—Philoclea's beauty not only *persuaded*, but so *persuaded* as all hearts must yield: Pamela's beauty used violence, and such as no hearts could resist. *Sidney.*—They that were with Simon, being led with covetousness, were *persuaded* for money. 2 *Mac.* x. 20.—To sit cross-legg'd, or with our fingers peffinated, is accounted bad, and friends will *persuade* us from it. *Brown.*—I should be glad if I could *persuade* him to write such another critick on any thing of mine; for when he condemns any of my poems, he makes the world have a better opinion of them. *Dryden.*—To inculcate by argument or expostulation.—To children, afraid of vain images, we *persuade* confidence by making them handle and look nearer such things. *Bp. Taylor.*—To treat by persuasion. *Not in use.*

Twenty merchants have all *persuaded* with him;
But none can drive him from the envious plea
Of forfeiture. *Shakespeare.*

PERSUA'DE, *f.* Persuasion. *Not in use.*

Indeed, Lucina, were her husband from her,
She happily might be won by thy *persuades*.
Soliman and Perseda, 1599.

PERSUA'DER, *f.* One who influences by persuasion; an importunate adviser.—The earl, speaking in that imperious language wherein the king had written, did not irritate the people, but made them conceive by the haughtiness of delivery of the king's errand that himself was the author or principal *persuader* of that counsel. *Bacon's Hen. VII.*

Hunger and thirst at once,
Powerful *persuaders!* quicken'd at the scent
Of that alluring fruit, urg'd me so keen. *Milton's P. L.*

PERSUASIBILITY, *f.* Capability of being persuaded.—It is sufficient that the Gospel suggests and offers such rational arguments and motives as are proper to beget belief in moral agents; but the *persuasibility*, or the act of being persuaded, is a work of men's own. *Hallywell's Saving of Souls*, 1677.

PERSUASIBLE, *adj.* [*persuasibilis*, from *persuadeo*, Lat.] To be influenced by persuasion.—It makes us apprehend our own interest in that obedience, makes us tractable and *persuasible*, contrary to that brutish stubbornness of the horse and mule, which the Psalmist reproaches. *Gov. of the Tongue.*—Having power to influence.—My speech and my preaching, was not with enticing

[in

[in the margin, *persuadable*] words of man's wisdom.
1 Cor. ii. 4.

PERSUA'SIBLENESS, *f.* The quality of being flexible by persuasion.

PERSUA'SION, *f.* [Fr. from *persuafus*, Lat.] The act of persuading; the act of influencing by expostulation; the act of gaining or attempting the passions:

It's prove thy fortune, Polydore, to conquer,
(For thou hast all the arts of fine *persuasion*,)
Trust me, and let me know thy love's success. *Otway.*

The state of being persuaded; or opinion.—The most certain token of evident goodness is, if the general *persuasion* of all men does so account it. *Hooker.*—When we have no other certainty of being in the right, but our own *persuasions* that we are so; this may often be but making one error the gage for another. *Gov. of the Tongue.*—The obedient and the men of practice shall ride upon those clouds, and triumph over their present imperfections; till *persuasion* pass into knowledge, and knowledge advance into assurance, and all come at length to be completed in the beatific vision. *South.*

PERSUA'SIVE, *adj.* Having the power of persuading; having influence on the passions.—In prayer, we do not so much respect what precepts art delivereth, touching the method of *persuasive* utterance in the presence of great men, as what doth most avail to our own edification in piety and godly zeal. *Hooker.*

PERSUA'SIVE, *f.* Exhortation; argument or importunity employed to direct the mind to any purpose or pursuit.—These were the arguments here used by this great Apostle; arguments, in comparison of which he knew that the most flowing rhetoric of words would be but a poor and faint *persuasive*. *South.*

PERSUA'SIVELY, *adv.* In such a manner as to persuade.—Many who live upon their estates cannot so much as tell a story, much less speak clearly and *persuasively* in any business. *Locke on Education.*

The serpent with me
Persuasively hath so prevail'd, that I
Have also tasted.

Milton's P. L.

PERSUA'SIVENESS, *f.* Influence on the passions.—An opinion of the successfulness of the work being as necessary to found a purpose of undertaking it, as either the authority of commands, or the *persuasiveness* of promises, or pungency of menaces, can be. *Hammond on Fundamentals.*

PERSUA'SORY, *adj.* [*persuasorius*, Lat. from *persuade*.] Having the power to persuade.—Neither is this *persuasory*. *Brown.*

PERSU'E, *f.* [used by *Spenser* for] Pursuit:

By tract of blood, which she had freshly seene
To have besprinkled all the grassy greene;
By the great *persue* which she there perceav'd
Well hoped she, the beast engor'd had beene,
And made more haste the life to have bereav'd. *F. Q.*

PERSULTA'TION, *f.* [from the Lat. *per* through, and *sulto*, to leap.] An eruption of blood through the vessels. *Scott.*

PERSUR', a town of Hindoostan, in Allahabad: ten miles east-north-east of Gazypour.

PER'SWAR, a town of Hindoostan, in the circar of Gurrah: fifteen miles south of Mahur.

PERT, *adj.* [Welsh and Dutch; *impertinent*, French.] Lively; brisk; smart.—Awake the *pert* and nimble spirit of mirth. *Shakespeare.*

From *pert* to stupid sinks supinely down;
In youth a coxcomb, and in age a clown. *Spectator.*

Saucy; petulant; with bold and garrulous loquacity.—All servants might challenge the same liberty, and grow *pert* upon their masters; and, when this sauciness became universal, what less mischief could be expected than an old Scythian rebellion? *Collier on Pride.*

She scarcely list'ned to their chat,
Further than sometimes by a frown,
When they grew *pert*, to pull them down. *Swift.*

PERT, *f.* An assuming, over-forward, or impertinent, person:

O then how blind to all that truth requires,
Who think it freedom when a *pert* aspires! *Goldsmith.*

PERTABGUR', a fort of Hindoostan: thirty miles north-east of Allahabad. Lat. 23. 58. N. lon. 82. 23. E.

PERTABPOUR, a town of Hindoostan, in Oude: fifty-two miles north-east of Manickpour.

PERTABPOUR, a town of Hindoostan, in Bengal: fifteen miles north-west of Midnapour. Lat. 22. 35. N. lon. 87. 10. E.

To PERTAIN, *v. n.* [*pertineo*, Lat.] To belong; to relate.—A chevron or rafter of an house, a very honourable bearing, is never seen in the coat of a king, because it *pertaineth* to a mechanical profession. *Peaeham.*

PER'TELS, a town of Austria: six miles north of Bohmish Waidhofen.

To PERTER'EBRATE, *v. a.* [from the Lat. *per*, through, and *terebo*, to bore.] To bore through. *Cole.*

PERTEREBRA'TION, *f.* The act of boring through.

PERTH, a royal burgh, and the county-town of Perthshire, Scotland, is situated in the middle of a verdant plain, on the western bank of the river Tay, at the distance of forty miles and a half north by west from Edinburgh. This plain is divided by the town into two parts, called the North and South Inches, or Islands, each of which measures about a mile and a half in circumference, and both are appropriated for the benefit and amusement of the inhabitants of the place.

Perth is a town of very high antiquity, and is generally allowed to have owed its origin to the celebrated Roman general Agricola, who penetrated into this part of the country about the year 70. He is said to have fixed on this spot as the site, originally of a winter-camp, and afterwards of a colonial town, from the resemblance its scenery bears to that in the vicinity of ancient Rome. So striking is the similitude, indeed, that the Roman soldiers, when they first saw the river Tay, and the adjacent plain, are recorded to have exclaimed with one consent, "*Ecce Tiber! Ecce Campus Martius!* Behold the Tiber! Behold the field of Mars." Hence the Tay was called *New Tiber* by the Italians for many centuries; and Fordun, a Scottish historian, gives the name of *Tyber-Mere* to an extensive moor which lies west from the town. An aqueduct, said to have been constructed here by Agricola, is still in existence, and supplies the mills and wells with water. In ancient times, when the town was fortified, it also supplied the ditches by which the latter was surrounded.

Of the history of Perth during its Roman occupation, and for several centuries after the retreat of that people from Britain, nothing certain is known. Neither is it recorded at what period it became a chartered town. Alexander Necham, an English writer, who read lectures on history at Paris in 1180, described Perth as a place of great opulence. In 1210, according to the Scottish historians, it was strongly fortified by king William, who also renewed its former charters, and granted it many additional privileges. At that time Perth was reckoned the capital city of Scotland; and even at the present day it ranks inferior only to Edinburgh and Glasgow. Between the years 1201 and 1459, no fewer than fourteen great national councils were held here. During the same period, Perth was also the usual residence of the Scottish monarch, and consequently of the nobility, many of whose ancient mansions still adorn its streets. It was then likewise, as it is still, an extensive commercial town. Fordun informs us, that the merchants of Perth visited, in their own ships, the Hanse-towns; and it is a part of the eulogium conferred on Alexander III. who died in 1286, that he devised successful measures for securing the trading-ships of

that nation against pirates, and against being detained on slight pretences in any foreign port. "In consequence of the care which he exercised about the trade of the kingdom, which, for some years during his minority had been on the decline, multitudes of ships soon came from divers regions loaded with goods of various kinds to be exchanged for the commodities of this country." The German merchants, or Flenings, also early frequented the port of Perth with mercantile views; and many individuals of that nation conversant in the linen and woollen manufactures, and in staining of cloth, appear to have fixed their abode in the town, and to have been received as burghesses. King William, however, following the example of his grandfather king David, put the foreign merchants of Perth under great restrictions; and, to prevent the settlement of foreign manufacturers there, granted in his charter already mentioned, that the burghesses might have a merchant-guild of their own, "fullers and weavers excepted."

Edward I. of England added greatly to the importance of Perth, by increasing the strength of its fortifications, and making it the residence of his deputies. King Robert Bruce, conceiving its occupation to be of signal importance to his cause, attacked this town in 1306, but was repulsed by the earl of Pembroke, who sallied out, and defeated the king at Methven. In 1311, however, Bruce renewed the attack; and, after an obstinate siege of six weeks, succeeded in storming the fortifications, which he levelled with the ground. After the battle of Duplin, these were re-edified by Edward Baliol, but were soon again razed by the patriotic Scots. In 1335 king Edward III. took possession of Perth, and resided in it for a considerable period. According to the English historians, John earl of Cornwall, brother to that monarch, died here, in October 1336; but they omit a singular circumstance mentioned by Fordun, which is, that he received his mortal wound from the king's own hand. In 1339 Perth stood a long siege against the regent Robert, but was taken by draining the ditch. In 1437 king James I. of Scotland was murdered at the Black Friars monastery, by Robert Graham, who wounded him in twenty-eight different places, and the queen twice, during the scuffle between them. At this period the town-walls seem to have been in a state of demolition; as we find them repaired, at a very considerable expense, by king James II. from whose reign nothing of a political nature worthy of notice occurs on record, till the year 1600, when the earl of Gowrie's house here was the scene of one of the most problematical events in Scottish history. We allude to the execution of what is commonly designated the "Gowrie conspiracy," by John Ruthven, the then earl, and his brother Alexander. These two young men, according to the story published by the court, having prevailed upon king James VI. to visit Perth, (on the pretence of showing him a suspicious person whom they had apprehended,) attempted to murder him, but were foiled in the attempt and both slain by his majesty's attendants.

After the battle of Tibermoor, in 1644, Perth was seized by the marquis of Montrose; and in 1651, it was taken by Cromwell, and fortified with a citadel on the South Inch, capable of containing a garrison of five hundred men. In 1715 the earl of Marr, at the head of a detachment of the rebels, obtained possession of it, and occupied it as a place of arms till after the battle of Dunblane, on Sheriffmuir, when they were dislodged by the duke of Argyle, and compelled to retreat further to the north, with the Pretender. The same party likewise held this town in 1745, when prince Charles was proclaimed king, and new magistrates were appointed. The modern prosperity of Perth may be dated from this period; for, being the centre of the rebellion, it was the resort of all the disaffected from the north during a considerable length of time. Thus its ancient activity was in some degree revived. The march and residence of the contending armies produced a market here for all sorts of goods;

capital was gained by industrious persons; and advantage taken of its favourable situation to render it a place of trade. Hence it has been remarked, that Perth is a singular instance of a town that owes its prosperity in a great measure to the calamities attendant on rebellion and civil war. Since that turbulent period it has increased nearly one half in extent and population.

Perth, in its municipal capacity, is a royal borough, and joins with Dundee, Forfar, Cupar of Fife, and St. Andrew's, in sending one member to parliament. It is governed by a provost, three bailies, a dean of guild, a treasurer, and nineteen counsellors, most of whom are elected from the incorporated trades. The funds of the corporation are very considerable, and of late years have been expended with great judgment in various improvements. Perth being the county town, the sheriff's court meets here; and the lords of justiciary hold a court here every six months, when they go on their circuits. The provosts have been sheriffs within the town since the time of king Robert III. They bear also the office of coroner, which office however is never exercised in Scotland.

This town, considered in reference to its buildings, is one of the handfomest in Scotland. It occupies a site which might, indeed without impropriety, be selected as the seat of government, and the emporium of commerce. The Tay, which is navigable up to the quays at common tides for sloops and small craft, and in spring-tides for vessels of large burden, admits of great extension of trade. This river flows here in a direction nearly north and south; but at a short distance below Perth it runs to the westward, and is lost behind the hill of Kinnoul. Over it is a handsome bridge of ten arches, which cost about 25,000*l.* It is 906 feet 9 inches in length, and 22 in breadth, with the parapets. The piers are founded ten feet beneath the bed of the river, upon oaken and beechen piles. The architect of this magnificent structure was Mr. Smeaton. It connects Perth with Kinnoul, which is a borough of barony under the superiority of the nobleman who holds that title.

The two chief streets in Perth are called the High-street and South-street, both of which run from east to west, and are nearly parallel to each other. Along the side of the river runs another considerable street. The new town, which was begun in 1798, contains a circus and a terrace of very handsome appearance. This portion of Perth is situated on a plot of ground, where formerly stood the monastery of black friars, in which James I. of Scotland was murdered, as has been already mentioned. The king was buried in a very stately monument in this place, which was called *monasterium vallis virtutis*, one of the most magnificent buildings in the kingdom, which with the rest was destroyed by the populace. James VI. created George Hay commendator of the Carthusian priory, giving him all its emoluments, with a vote and seat in parliament; but, these not being sufficient to support the title, he surrendered it back to the king. The only remains of this magnificent structure is to be seen in the carved stones with which the south-east porch of St. John's church is built, now greatly decayed. The king's garment full of stabs was preserved here after the reformation.

Among the public buildings are several worthy of attention. The town-house, which forms the eastern termination of High street, is a large well-built structure, as is likewise the guildhall, which stands about the middle of the same street. Several of the incorporated trades have halls, of which that of the glovers is the most elegant. The parish-church, which was formerly the property of the abbey of Dumfermline, is a large and ancient edifice, but now separated into three divisions, called the East, Middle, and West, Kirks; besides there is another parish-church, dedicated to St. Paul, a chapel of ease, and a variety of chapels and meeting-houses appropriated to the public worship of dissenters. St. John's church is remarkable from the circumstance of the reformation in Scotland

land having first publicly broke out here, on the 11th of May, 1550, when John Knox preached a sermon against idolatry; after which, the priest being imprudent enough to display his images and relics, he was attacked by the audience, who broke the images in pieces, tore the pictures, overthrew the altars, and entirely defaced every implement of Catholic superstition in the church. This done, they proceeded to the different monasteries in the town and its neighbourhood, and pillaged or demolished every edifice that had given shelter to the worshippers of the church of Rome: it being one of his maxims, "to pull down the nests, and then the rooks would fly away." The venerable remains of this kirk, supposed to be the most ancient stone church in Scotland, were levelled to the ground, by order of the inspectors of public works, in the month of November, 1817. Perth was very anciently called *St. Johnston's*, from this church, which was dedicated to St. John, as the patron of the place.

The castle of Perth stood near the red bridge, which terminated the narrow street called Skinner-gate. At the end of the Castle-freet another narrow street leads west to the black-friars, called *Couure-feu-row*, where the curfew-bell was. The kings of Scotland before James II. were crowned at Scone, only two miles north, and resided at Perth as the metropolis of the nation. James resided and was educated in the castle of Edinburgh, and was crowned there 1437. The parliaments and courts of justice were removed from Perth to Edinburgh; but Perth kept its priority till 22 James III. 1482. It gave the title of *Earl* to the family of Drummond, which is now forfeited. James Drummond, 4th earl, was created Duke of Perth by James II. for adhering to whose interests he was outlawed. His two grandsons were attainted in 1745.

The chief institutions in Perth of a public nature are a grammar-school, an academy, and a literary and antiquarian society. The grammar-school has long been regarded as one of the best in Scotland. Many celebrated statesmen and scholars have received the early part of their education here; and, among others, the admirable Crichton, and the late celebrated and excellent William earl of Mansfield. The academy is of much more recent establishment than the school, having been commenced about the year 1761. It is, however, in a very flourishing condition, and is usually attended by from eighty to a hundred students, who are instructed in various branches of learning. The literary and antiquarian society was founded 16th December, 1784. Belonging to this institution is a general library, besides a large collection of rare books, original essays, ancient manuscripts, coins, medals, and other subjects of antiquity, suitable to the design of the establishment; and sir David Moncrieff, bart. has presented the Literary and Antiquarian Society of Perth with a very handsome donation of two beautiful coins of Robert II. two gold (St. Andrew's) of Robert III. and six silver coins of Robert III. two of the latter struck at Perth, and all in the finest preservation. They were turned up by the plough on the farm of Balgony, in the parish of Abernethy, belonging to the baronet.

Perth at present is a place of very considerable trade. There is a constant intercourse by water between Perth and London. Every four days, during the fishing-season, a smack sails, and usually makes the passage within a week. A number of merchant-vessels likewise frequent this port; and those of heavier burden are loaded or discharged in the river, by means of hoys. In 1806 there belonged to the port of Perth 35 vessels, of 2635 tons in all, with 155 seamen. The staple manufacture of the town is linen; but the cotton-trade is rapidly on the increase. The number of looms employed in the town and suburbs is estimated at about two thousand. Cotton-mills, bleach-fields, and print-fields, have been established in different situations. Leather is also one of the manufactured products of Perth; and great quantities of that article are made into boots, shoes, and gloves, for foreign

consumption. From the vicinity of the Highlands, the manufacture of doe-skins and buck-skins has long been established in this town. Here is a respectable banking-establishment, under the firm of the Perth Bank; besides a branch of the Bank of Scotland.

We copy the following from Cruttwell's Gazetteer: "In the river here are found pearls, of which 10,000l. worth were sent to London between the years 1761 and 1764, and sold from 10s. to 36s. per ounce; but the avarice of the owners exhausted the fishery."

In 1801, the number of inhabitants was 14,878; of whom 3535 were employed in trade and manufactures. According to the parliamentary returns of 1811, it was divided into four parishes, and contained in the aggregate 4510 houses, and 16,948 inhabitants; in 1821 the population had increased to 19,068. The markets are well supplied with all kinds of provisions and luxuries. The annual fairs are eight in number, and are usually well attended. Lat. 56. 54. N. lon. 3. 26. W.

Of the ancient importance of Perth, while it was a royal residence, few traces remain; with the exception of the parliament-house, and some modernized mansions of the old nobility; such as the houses of the bishop of Dunkeld, earl of Errol, and earl of Athol. The original fortresses belonging to the town is now a ruin; and not even the scites of its monastic institutions are discoverable to the eye. Gowrie-castle, already mentioned as the residence of the earls of Gowrie, is situated on the south-east side of the town. It was built, or, perhaps more properly speaking, rebuilt, in 1520, by the countess of Huntly. After the forfeiture of the Gowrie estates, it became the property of the corporation, and was presented in 1746, by the magistrates, together with the freedom of the burgh, to William duke of Cumberland, who afterwards sold it to the board of ordnance for the sum of 5000l. and it has ever since been appropriated as barracks for a company of the royal artillery. In the pleasure-grounds attached to this house is a curious structure, called the Monk's Tower, the origin and former uses of which are not correctly ascertained. This structure is of an oval figure, and measures internally 24 feet by 13. The roof is very lofty, and vaulted; and on the ceiling are coarsely painted the twelve signs of the zodiac, the heathen gods and goddesses, and the arms, crest, and ciphers, of the Hay family. From its style, this painting does not appear to be more ancient than the reign of Charles I. and some even think it has been executed by the same artist who painted the ceilings of the palace of Scone: hence it is conjectured, that the tower has been erected for a banquetting-house, at that period. But others refer its origin to the 14th century, and assert that it obtained its appellation of Monk's Tower from having been built at the expense of the monasteries of Lindores, Balmerinnoch, Aberbrothick, and Coupar-in-Angus; which expense, Fordun says, "in a manner ruined these monasteries."

In digging the foundation of the house here, belonging to colonel Mercer of Aldie, the remains of an ancient British temple were discovered. This edifice is mentioned by Holinshed, and by Jeffrey of Monmouth; the latter of whom says, it was erected by a British king, son to Regan, the second daughter of king Lear. It was dedicated to Mars; and, as we presume, must have been of later date than the Roman invasion, as the architecture of its ruins exhibited considerable advancement in the building art.

The parish of Perth, without the town, extends about four miles in length, and three miles in breadth. The soil varies, but is extremely fertile, and well cultivated. The adjacent scenery is highly beautiful; but, owing to most of the estates here being entailed, gentlemen's seats are less numerous than otherwise might have been expected. The most remarkable houses are the Castle of Balhousie, an ancient seat of the earls of Kinnoul; the Castle of Pit-theveles, an ancient seat of the lords Olliphant; and Few-house, a seat belonging to Mr. Marshall

of Hill-Cairney. The barracks, in the immediate vicinity of the town, likewise deserve to be mentioned among its ornaments. *Beauties of Scotland*, vol. iv.

PERTH AMBOY'. See AMBOY, vol. i.

PERTHES, a town of France, in the department of the Seine and Marne: six miles south-south-west of Melun.

PERTHES, a town of France, in the department of the Upper Marne: six miles north-west of St. Dizier.

PERTHSHIRE, a county in Scotland, having the shire of Inverness and Aberdeen on the north; Angus or Forfar, Fife, and Kinross, on the east; Clackmannan and Stirling on the south; and Dunbarton and Argyle on the west; contains, according to the latest authorities, 2638 square miles, of which 50 are occupied by lakes; or, in all, 1,688,320 English acres; being, next to Inverness-shire, the largest county in the mainland of Scotland. It is situated between $56^{\circ} 7'$ and $56^{\circ} 35'$ north latitude, and between $3^{\circ} 6'$ and $4^{\circ} 47'$ west longitude, from Greenwich. Its greatest extent, from east to west, is about 77 miles, and from north to south 68. It was anciently, and is still, popularly divided into eight districts: Atholl on the north, Stormont on the north-east, Perth Proper and Gowrie on the east, Strathearn on the south, Monteith on the south-west, Breadalbane on the west, and Rannoch on the north-west. It is under the jurisdiction of one sheriff, who has substitutes in the towns of Perth and Dunblane, and is divided into seventy-nine parishes.

In a general view, this extensive county may be divided into Highlands and Lowlands; the former occupying a space so much greater than the latter, that not quite so much as a third part of the whole is fit for cultivation. This last portion is chiefly, though not without considerable exceptions, situated on the eastern and southern extremities, which contain some of the richest tracts in Britain; and in the great plain of Strathmore which has the Grampians on the north-west and the Ochils and Sidlaw Hills on the east; varying in breadth from ten to fifteen miles, and extending through this and the contiguous counties, from sea to sea, a distance of 100 miles. To the west, where the Grampians, at first rising gently, rear their rocky or heath-covered summits to the height of 4000 feet, and for almost the whole breadth of the county, the high grounds are penetrated by straths and glens, some of them of considerable extent, each traversed by its own mountain-streams, and diversified by numerous lakes, many of which, having their wild and lofty banks covered with natural wood, present scenes singularly romantic and beautiful. At least seven of these mountains are upwards of 3000 feet high: the three highest being Benlawers, on the west side of Loch Tay; Benmore, south-west; and Scheshallion, north-east: the latter noted as the station chosen by Dr. Maskelyne, Astronomer Royal, to make observations on the attraction of mountains. The most considerable lakes are, Loch Tay, almost in the centre of the Highland district, about fifteen miles long, and one broad, with a depth varying from fifteen to one hundred fathoms; Loch Erich, on the north-west, extending into Inverness-shire, still longer, but not so broad; Loch Rannoch, south-east of the former, twelve miles long; Loch Earn, south from Loch Tay; and Lochs Vennachar, Achray, and Katrine, on the south-west: the last of which, with the wild mountain scenery around it, has acquired deserved celebrity, from Sir Walter Scott's *Lady of the Lake*. Most of the streams either have their source in these lochs, or receive, as they flow through them, a great accession to their waters. The rivers are the Tay, the Forth, the Earn, the Teath, and the Isla; of which the two first are by far the most considerable, though the Forth does not attain its full size till it has left this county. The Tay, the largest river in Scotland, and the Earn, belong exclusively to Perthshire. The Tay, under the name of the *Dochart*, has its source on the western confines, and soon after entering Loch Dochart, flows from thence north-east till it

falls into Loch Tay. After leaving Loch Tay, from which it now takes its name, it pursues first a north-easterly and then a southerly course towards Dunkeld, from which it proceeds eastward, and then south, through a very rich country, till it falls into the Frith of that name, a little below the town of Perth; having been joined by the Almond and many other streams in its course, which, with all its windings, is not less than ninety miles. The salmon-fishery on this river yields a rent of about 7000*l.* a-year. South of Loch Tay is Loch Earn, where the river of that name has its source, and which, flowing east and south, through Strathearn and by the town of Crieff, after a course of twenty-four miles, falls into the Frith of Tay at Rhind. On the banks of this river, near its confluence with the Tay, is the village of Pitcaithly, long celebrated for its mineral springs, which have lately found a rival at Dunblane, on the southern side of the county.

The climate of this extensive district, so different in elevation and exposure, varies considerably. In the central parts, the winters are stormy and very severe, the snow lying long, attended with keen frost; and on the banks of the rivers in this quarter, hoar-frosts are frequent in summer, and very injurious to the crops. On the east, the climate is mild and salubrious. At Longforan, in the Carse of Gowrie, on the banks of the Frith of Tay, the thermometer on an average of twelve years, stood at 50° , and the mean annual quantity of rain was $24\frac{1}{2}$ inches; and at Belmont, in Strathmore, for a period of ten years, the average height of the thermometer was $46\frac{3}{5}$, and the yearly quantity of rain during thirty years' observation $30\frac{1}{4}$ inches.

Perthshire, as far as yet known, does not abound in useful minerals. There is no coal but at Culrofs, on a small detached tract lying on the Forth, south-east from the rest of the county; and, for want of coal, limestone, which is found in many parts, is of little value, though it is sometimes imperfectly calcined by means of peat. Some years ago, a machine was erected for pounding limestone, with the view of employing it in that state as a manure; but the experiment was not persisted in. In the higher grounds, the prevailing rock is granite, and, in the lower, sandstone. Slates are found in many parts of the Highlands, but none in the low country. Copper, lead, and ironstone, occur in some parts; and mines of the two former were once worked, but are now abandoned. Shell-marl, which has been long used as a manure, abounds in Stormont and Strathearn, on the east side of the county. The hill of Kinnoul has been long known as a repository of those nodules of agate and chalcidony which are commonly called *Scotch pebbles*. Dr. Mac Culloch, who has surveyed it with his usual sagacity as well as with his usual freedom from pre-conceived theories, traces the outlines of its singular structure, which is reconcilable to the conditions either of the Huttonian or the Neptunian hypothesis. It results from his observations, that this ridge is principally composed of trap-rocks, of which the least abundant is a black amorphous basalt, and the most prevalent an amygdaloid, which assumes various aspects according as it contains green earth, calcareous spar, quartz, or chalcidony. Heliotrope, without the red spots for which it is so much prized, and a green quartz, occasionally approaching to the nature of the plasma, have been detected in the same repository: the portion of a bed of trap-conglomerate rests on the top of the mass of trap. At the eastern end of Kinnoul a sandstone breccia may be observed, apparently lying below the trap, and similar to that which is the lowermost of the secondary strata throughout the whole of this district. See *Transf. of the Geological Society*, vol. iv. part 2. 1818.

On so great a variety of surface, every description of soil occurs that is to be found in Scotland; and the methods of cultivating it must be also various. In these respects, then, Perthshire is naturally divided into three districts, which differ from each other very materially.

These

These divisions are termed the Highland District, the Lowland District, and the District of the Carse of Gowrie.

1. The Highland District, which comprehends by far the larger portion of the county, is included within, or rather formed by, the Grampian mountains. In relation to the whole extent of the Scottish Highlands, it constitutes what are usually denominated the Central or *Southern* Highlands, in contradistinction to those of Argyleshire, or the *Western* Highlands, and those of Invernessshire, or the *Northern* Highlands. It may also be regarded as the central district of the whole kingdom of Scotland; and is subdivided into small portions, marked by glens or valleys, called Rannoch, Glenlyon, Glenlochie, Glendochart, Glenqueich, Glenshee, the environs of Loch Tay, and Strath-Tay. Throughout this vast tract of country, contrary to what might be supposed from its northern latitude, the elevation of its valleys, and the altitude and naked aspect of its towering mountains, the climate is not less mild than in the moor-lands of York-shire. Indeed, the mountains of Perthshire may even claim an equality in temperature with those of Cornwall and Devonshire, and certainly surpass them in dryness of climate, excepting on the western margin of the district, where the quantity of rain which falls is immense. The soil in the valleys here consists in general of a brown loam, of uncommon fertility, lying on a sound, dry, gravelly, or sandy, bottom. A similar soil prevails on the sides of the hills to a considerable height, and is not unfrequently found under the black moory earth of the heaths. What is remarkable, the slopes of the mountains facing the north are much more productive than those which possess a southern exposure. This phenomenon is accounted for, by the supposition that the soil suffers more exhaustion on the south than on the north, because of the greater alternation of rain and snow, and of heat and cold, to which the surface of the former is liable, from the action of the sun-beams, and the greater frequency of southern rains. In this district few of the valleys contain large areas of free cultivable land, like those found in the south; and even the scanty areas that do exist have required in general the aid of human industry to clear them of the rocks which have been torn from the impending mountains. Yet, as the glens are numerous, it happens here, as in most parts of the Highlands where modern sheep or cattle farming is not prevalent, that each farm possesses its pittance of hill and dale, and its share of every description of land, as arable, meadow, green pasture, and moor. The arable lands have a two-fold distinction, the infield and outfield lands; the first of which, lying near the farm-yard, is kept constantly in tillage, and receives all the manure the possessor can collect; while the latter, consisting of such plots at the lower parts of the valleys, are level enough to be ploughed, are kept in corn and natural ley, or weedy wastes alternately, without the smallest assistance of manure. The wet plots in the vales are termed "meadow," and kept uniformly under the scythe, for a scanty supply of hay. The faces of the "braes," the roots of the hills, the wood or rough stony wastes of the bottoms, and a small plot near the house, are generally appropriated to cattle in summer, and sheep in winter; the sheep and horses being kept in summer "above the head-dyke," upon the hill or moor lands.

Such is the general description of the Highland farms of Perthshire; whence it may reasonably be concluded, that the husbandry of this district is not in a very advanced state. This, however, does not arise from a want of knowledge, or even of industry, among the farmers, but from the peculiar constitution of society in the more northern portions of our island. Before it can be remedied, the farms, now in general small, would require to be increased greatly in extent, and the farmer assisted with capital, should he be deficient in means of his own. The pride of clan-ship among the proprietors ought to be laid

aside, and the eventual interests of the country studied, instead of the misapplied philanthropy which constitutes the ruling motive for continuing the small-farm system. That useless and idle race of occupiers or sub-tenants, called acre-men or crofters, must likewise be extirpated, to facilitate the agricultural improvement of this district. The only crops raised here are oats, bear or bigg, flax, and potatoes, and on some spots pease. Wheat is never sown. The business of the flax-harvest, in particular, is well conducted. Indeed, in the management of that article, the Highlanders may be said to excel.

2. The Lowland District includes all that portion of Perthshire which lies to the south of the Grampians, with the exception of the Carse of Gowrie, to be afterwards noticed; viz. part of Strathmore, and those districts of the county the streams of which flow into the Forth, or the Earn. Along the Forth, for an extent of eighteen miles from Garthmore to the bridge of Allan, the soil of the level lands is a deep rich clay, of various degrees of fertility. This soil, however, is still covered, for about four miles, by a tract of moss from six to fifteen feet deep, called the *Moss of Kincardine*, because chiefly situated in the parish of that name. The moss is supposed to have once covered the whole valley, and was well worthy the investigation of the naturalist. By the exertions of the late lord Kaimes, however, and by the judicious liberality of its proprietors, it now rapidly diminishes in size, and will doubtless be entirely cleared in a few years. (See vol. xi. p. 723, 4.) In the low grounds of Strathearn, wheat is the great object of husbandry, generally after summer-fallow, but frequently also after clover-ley. In the upper parts of the district, barley and oats are the principal crops. The culture of flax is universal over the whole district, but is not carried to a great extent in any one place. Potatoes are raised in vast quantities on the light soils; as are likewise turnips, especially within the last ten years. Farms here vary in size, from 30 to 400 acres. The greater part of this district, however, is yet uncultivated. The manures chiefly in use here are lime and marle, of which last article there is great abundance found in the small lakes, and in the landlocked bogs and mosses.

3. The third agricultural district of Perthshire, or the Carse of Gowrie, is situated along the northern shore of the frith of Tay. It is a long narrow plain, and extends sixteen miles in length: it contains about 18,000 acres of extremely rich and fertile soil. This district, indeed, may be justly styled the boast of Great Britain for natural productiveness, and yields to no portion of the globe in the intelligence and skill of its farmers. Like the Delta-land of Egypt, and those fertile tracts adjacent to the mouths of the Ganges, the Indus, and the Mississippi, the Carse of Gowrie has been formed in a long course of ages, and has grown rich by the spoils of the Highlands. The heavy rains which fall near the sources of the Earn, the Tay, the Tummel, the Garry, the Isla, and their tributary streams, have washed down great portions of soil, and have laid bare the rocks of the highest mountains to give exuberance to the banks of the Tay. The Carse, in fact, is evidently nothing more than what is called, in other quarters, sea-mud, or slesch, consolidated by time and gradual deposition. The substrata here are various, and might form a subject of curious and interesting investigation. The soils also differ. On the banks or braes of the Carse, which slope gently with a southern aspect, the soil is a hazle-coloured loam, except in the higher part of the ascent, where it is a sharp gravelly kind. In the Low Carse, clay is the prevailing soil. Here the farms are classed into six divisions, as nearly equal as the nature of the ground will admit, and the following rotation is that most generally approved of: 1st year, summer-fallow, the land dunged; 2d, wheat; 3d, pease, or pease and beans; 4th, barley, with clover and rye-grass; 5th, clover; 6th, oats. Sometimes, however, fallow is excluded, and some green crop substituted. This happens al-

most universally on the banks or braes of the Carse; and on the higher grounds the raising of wheat is only very partial, and the third, fourth, fifth, and sixth years are generally appropriated to hay or pasturage, the seventh to oats, and the eighth to barley. The climate of this district is mild, and favourable to vegetation, beyond perhaps any other in Scotland, as it is completely sheltered, on all sides, by lofty mountains, and by plantations of various kinds of trees. Farms are generally from 100 to 300 acres in extent, and are let on leases of nineteen years, at as high a rent as any field-land in Great Britain. The only artificial manure used is lime; for which nearly 2000*l.* is paid annually to the lime-works in Fife or in England.

In ancient times a great proportion of this county was covered with thick forests of oak. In the mosses are found vast collections of trees, some of them of immense size, which have evidently been cut from their trunks by the hand of art, and, as tradition reports, by the Romans, when they first crossed the Forth under Agricola. The Forest of Blackironside, on the banks of the Earn, is particularly noted in history, as the scene of many of the exploits of the celebrated sir William Wallace and his gallant followers. In the Highland district was the forest of Manlorn, now converted into sheep-farms, besides other large forest tracts, which it is unnecessary to particularize, as the whole of them have been in a great measure destroyed. Perthshire, however, still contains many extensive woods, formed within the last fifty years, of which those of the duke of Athol, in the Highlands, are by far the largest and most valuable, and abound with deer and a variety of other game. Most of the gentlemen's seats in the county are also shaded by plantations. Indeed the spirit of planting has gone abroad here, with a degree of energy seldom paralleled in any country in Europe; and will, no doubt, eventually produce the happiest effects.

Perthshire, like every other county in Scotland, is placed under the jurisdiction of a lord lieutenant or high-sheriff, and a sheriff depute, who has the privilege of appointing a substitute to hold courts in his absence. The whole is ecclesiastically divided into sixty-seven parishes, of which nineteen belong to the Highlands and forty-eight to the Lowlands. Of these, nineteen are included in the presbytery of Dunkeld, twenty-one in the presbytery of Perth, fifteen in that of Auchterarder, and eleven in that of Dunblane; all in the synod of Perth and Stirling. In this county are two royal boroughs, Perth and Culrofs, and a number of considerable towns and villages, of which the principal are, Downe, Callender, Scone, Dunblane, Comrie, Crieff, Auchterarder, Dunning, Abernethy, Dunkeld, Alyth, Cupar, Angus, Blairgowrie, and Longforgan. The county of Perth sends one member to parliament; and the towns of Perth and Culrofs have a share in the election of other two for the burghs; Perth being classed with St. Andrew's, Cupar, Fife, Dundee, and Forfar; and Culrofs with Stirling, Dunfermline, Inverkeithing, and Queensferry.

The manufactures of Perthshire are linen, cotton, leather, paper, and a variety of minor articles. It has extensive bleachfields, printfields, and cotton-mills, with mills for extracting oil from the seeds of flax and rape, and for the spinning of flax and wool. Its exports are corn, linen, and linen-yarn, cottons, boots and shoes, salmon, with coals from the ports of Kincardine and Culrofs on the Frith of Forth; and it imports some of the materials of its manufactures, lime in great quantities, and articles required for domestic consumption.

The territory of Perthshire was divided, in 1811, into 755 estates, of which 621 were under 500*l.* Scots of valuation, and 95 above 2000*l.* the valuation of the whole being 339,892*l.* 6*s.* 9*d.* Scots, the highest of any of the Scottish counties excepting Fifeshire. The real rent, as returned under the property-tax act in 1811, was, for the lands, 460,738*l.* 13*s.* 11*d.* sterling, and for the houses, 36,697*l.* 19*s.* 7*d.* This land-rent, which is more than that of any

of the other counties by almost one-third, is equal to about a tenth part of the rent of all Scotland; yet it is only at the rate of about 5*s.* 6*d.* the English acre. In the same year, the number of freeholders entitled to vote in the election of a member for the county was 178. The duke of Athol is the patron of the county; and his son-in-law, James Drummond, esq. of Strathallan, represents the duke in the house of Commons. The number of inhabitants, according to the government census, is 135,093 persons, consisting of 64,034 males, and 71,059 females; houses, 27,290.

Perthshire displays a field of great interest to the antiquary, as well as to the historian. Lying north of the Roman wall, it was the scene of many conflicts, fought in support of the last gleam of Caledonian independence in the Lowlands. From a passage in Claudian, we learn, that the Earn was frequently dyed with blood; "*Scotorum cumulos flevit glacialis Ierne.*" And Tacitus informs us, that, at the foot of mount Grampius, Agricola encountered and overthrew the heroic Galgacus. The precise spot on which this battle took place is not certain; but a variety of conjectures have been hazarded upon the subject, of which the most probable is that which fixes it in Stormont, where a large Roman encampment is still visible, together with a numerous collection of cairns, the indubitable memorials of Caledonian strife. At Ardoch is another encampment, probably the most perfect example of ancient castrametation in Great Britain; and near it are two smaller ones, less perfect in their construction. There is likewise a Roman encampment at Ochil, which communicates with Ardoch by a raised road, or causeway. Vestiges of a strong military earthen work are also to be traced about two miles from Monzie; and on the hill of Dunmore is another fortification, said to have been Fingal's place of residence, after the destruction of his house in the vale by Gara. This fort is defended by a deep ditch and rampart; and is double walled, each wall measuring twenty feet in thickness, and consisting of immense stones piled up without cement of any kind. A similar fort, of still larger dimensions, is situated two miles eastward from Fienteach; and on the moor adjacent to it are numerous cairns and tumuli, one of which is assigned to Comhal, the father of Fingal. Near Culloquhey is a small fort, called in Gaelic *Comhal Kulte*, i. e. Comhal's Battle. At this place, tradition reports that Ossian was buried; and a stone vault, or coffin, is still visited as his.

Druidical monuments are frequent in this county; such as circles, rocking-stones, and single upright stones, denominated "*Stones of Worship*," to which the common people yet pay no inconsiderable degree of superstitious regard. Indeed some remnants of the druidical worship may be said to linger here, as many of the Highland customs have an unquestioned reference to that religion. The first day of May, held sacred by the worshippers of the Sun, continues to be distinguished by the appellation Beltan, or Baal-tein, "*The Fire of Baal*;" and in some parts of the country is still celebrated by festivals of milk and eggs.

In the church-yard of Meikle are the remains of the grand sepulchral monument of Vanora, also called Vanora, Wanor, and Guinevar, the British Helena, according to Prideaux. This princess was the wife of Arthur; but, being taken prisoner by the Scots and Picts, she lived for some time, in miserable captivity, on Barry-hill. Some assert that she was one of the most abandoned debauchees of her sex; and that, having been torn to pieces by wild beasts, this tomb was raised to perpetuate her infamy, and the manner of her death. The truth of this story, however, is extremely doubtful; and has perhaps arisen from the symbolic characters on the monument, most of which are of the monstrous kind, and represent various acts of violence on the person of a woman. This tomb is described in Pennant's Tour, and the description is accompanied by several plates.

Religious houses were frequent in this county; some of which still exhibit fine specimens of ancient architecture. At Culrofs are the ruins of a Cistercian abbey, founded in 1217 by Malcolm earl of Fife; and at Scone was a celebrated Augustine monastery. The cathedral of Dunblane stands on an eminence above the town; and part of it is kept in repair as the parochial church. That of Dunkeld is one of the finest piles of ancient building in Scotland, and is now undergoing a thorough repair. It is of mixed architecture, having been erected at different periods.

Perth, Scone, and Abernethy, having been early royal residences, were each adorned with stately palaces, which are now entirely demolished. Those of the two first mentioned towns fell a prey to the fanatical fury of the reformists. Many castellated mansions, however, yet exist in different districts of the county, and would be well worthy of description, would our limits allow. The most remarkable among them are Castle Campbell, Finlanrig Castle, Castle Comrie, Doune Castle, Ballumbri Castle, Garth Castle, Elcho Castle, Kinnaird Castle, Gowrie House, Murthly House, Kinfaun's Castle, Macbeth's Castle of Dunfinnan, Hunting-Tower, or Ruthven Castle, Balloch Castle; Blair Castle and Dunkeld House, seats of the duke of Athol; Taymouth Castle, seat of the earl of Breadalbane; Dupplin Castle, of the earl of Kinnoul; and Dunira, belonging to lord Melville. Some of these are in ruins; and some have been so much modernized as to alter in a great measure their original appearance. *Beauties of Scotland*, vol. iv. *Ency. Brit. Supplement*.

PERTI (Gio. Antonio), a composer of church-music *alla Palestrina*, was born in 1656. With his theatrical style we are unacquainted; but, as he long continued to be employed, not only for the operas of Bologna, but Venice and other cities of Italy, we may reasonably imagine that it was good. Paolucci has printed a good duet by this master, in the church-style; and Padre Martini has given several admirable specimens of his science in his *Saggio di Contrappunto*. This great harmonist, however, does him still more honour, by calling himself his disciple. Perti, before his decease, must nearly have attained the age of 100; for his name appears as the composer of *Atide* in 1679, and, according to Quadrio, he was living in 1744. *Burney*.

PERTICA, *f.* [Latin.] A pole or perch; a pole to beat down fruit. A tall candlestick to be set on an altar in a church.

PERTICATA, *f.* in our old law-books, is the fourth part of an acre, or a piece of ground containing one perch in breadth, and forty in length.

PERTICI, a comic singer and admirable actor, came hither in 1748 with Larchi, another excellent comic singer and actor, and Guadagni for the first time, when he was very young, as serious man in a troop of burletta singers, brought over upon speculation by Sig. Croza, whose calculations were so erroneous, that he became a bankrupt and a fugitive in a year's time. *Burney*.

PERTICULAS, *f.* [Latin.] In old records; a pittance, a small portion of alms, a small portion of victuals. *Cole*.—The same term is used for certain poor scholars of the Isle of Man. The king granted to "L. Macguin de Infula de Man, scholari quendam elemosynam vocatam *Perticulas*, ad sustentationem cujusdam pauperis scholaris, de infula predicta ad exercend. scholas, per progenitores nostros quondam reges Angliæ datam et concessam." Pat. Hen. IV.

PERTIGI, a town of the island of Sardinia: nineteen miles south-east of Castello Aragonese.

PERTINACIOUS, *adj.* [from *pernix*, Lat.] Obstinate; stubborn; perversely resolute.—One of the dissenters appeared to Dr. Sanderfon to be so bold, so troublesome and illogical in the dispute, as forced him to say, that he had never met with a man of more *pertinacious* confidence and less abilities. *Walton*.—Resolute; constant; steady.—Diligence is a steady, constant, and *perti-*

nacious, study, that naturally leads the soul into the knowledge of that, which at first seemed locked up from it. *South*.

PERTINACIOUSLY, *adv.* Obstinate; stubbornly.—They deny that freedom to me, which they *pertinaciously* challenge to themselves. *King Charles*.—Others have sought to ease themselves of all the evil of affliction by disputing subtilly against it, and *pertinaciously* maintaining that afflictions are no real evils, but only in imagination. *Tillotson*.—Metals *pertinaciously* resist all transmutation; and, though one would think they were turned into a different substance, yet they do but as it were lurk under a vizard. *Ray*.

PERTINACIOUSNESS, or PERTINACITY, *f.* Obstinate; stubbornness.—In this reply was included a very gross mistake, and, if with *pertinacity* maintained, a capital error. *Brown*.—Resolution; constancy.—Fearing lest the *pertinaciousness* of her mistress's sorrows should cause her evil to revert. *Bp. Taylor's Holy Dying*.

PERTINACY, *f.* [from *pernix*, Lat.] Obstinate; stubbornness; persistency.—Their *pertinacy* is such, that, when you drive them out of one form, they assume another. *Duppa*.—It holds forth the *pertinacy* of ill fortune, in pursuing people into their graves. *L. Éstrange*.—Resolution; steadiness; constancy.—St. Gorgonia prayed with passion and *pertinacy*, till she obtained relief. *Bp. Taylor*.

PERTINAX, Emperor of Rome after the death of Commodus. See ROME.

PERTINENCE, or PERTINENCY, *f.* [from *pertere*, Lat.] Justness of relation to the matter in hand; propriety to the purpose; appositeness.—I have shown the fitness and *pertinency* of the apostle's discourse to the persons he addressed to, whereby it appeareth that he was no babbler, and did not talk at random. *Bentley*.

PERTINENT, *adj.* [*pertere*, Lat.] Related to the matter in hand; just to the purpose; not useless to the end proposed: apposite; not foreign from the thing intended.—I set down, out of experience in business and conversation in books, what I thought *pertinent* to this business. *Bacon*.—Here I shall seem a little to digress; but you will by and by find it *pertinent*. *Bacon*.

My caution was more *pertinent*
Than the rebuke you give it. *Shakespeare's Coriol.*

Relating; regarding; concerning. In this sense the word now used is *pertaining*.—Men shall have just cause, when any thing *pertinent* unto faith and religion is doubted of, the more willingly to incline their minds towards that which the sentence of so grave, wise, and learned in that faculty, shall judge most sound. *Hooker*.

PERTINENTLY, *adv.* Appositely; to the purpose.—Be modest and reserved in the presence of thy betters, speaking little, answering *pertinently*, not interposing without leave or reason. *Bp. Taylor's Rule of Holy Living*.

PERTINENTNESS, *f.* Appositeness.

PERTINENTS, *f.* [*pertere*, Lat.] The Scotch term for APPURTENANCES, which see.

PERTINGENCE, or PERTINGENCY, *f.* The state of being *pertingent*. *Scott*.

PERTINGENT, *adj.* [*pertere*, Lat.] Reaching to; touching.

PERTISTA'GNO, a town of Italy, in Friuli: seven miles north-north-west of Friuli, and nine north-east of Udina.

PERTLY, *adv.* Briskly; smartly.—I find no other difference betwixt the common town wits and the downright country fools, than that the first are *pertly* in the wrong, with a little more gaiety; and the last neither in the right nor the wrong. *Pope*.—Saucily; petulantly.—Yonder walls that *pertly* front your town. *Shakespeare*.

When you *pertly* raise your snout,
Flee, and gibe, and laugh, and flout;
This, among Hibernian asses,
For their wit and humour passes.

Swift.

PERT'

PERT'NESS, *f.* Brisk folly; sauciness; petulance:
Dullness delighted ey'd the lively dunce,
Remembring the herself was *pertness* once. *Pope.*

Petty liveness; sprightliness without force, dignity, or solidity.—There is in Shaftesbury's works a lively *pertness* and a parade of literature; but it is hard that we should be bound to admire the reveries. *Watts on the Mind.*

PERTRAN'SIENT, *adj.* [*pertransiens*, Lat.] Passing over.

PERTUI'S, a town of France, in the department of the Mouths of the Rhône, near the Durance: nine miles north of Aix, and twelve south-south-east of Apt.

PERTUIS D'ANTIO'CHE, a strait or narrow part of the sea, between the Isle of Oleron and the Isle of Rhé.

PERTUIS BRETON', a narrow strait of the sea, between the Isle of Rhé and the coast of France.

PERTUIS DE MAUMUSSON', a strait between the Isle of Oleron and the coast of France, south of the island, about one mile wide.

To PERTUR'B, or PERTURBATE, *v. a.* [*perturbo*, Lat.] To disquiet; to disturb; to deprive of tranquillity.—Rest, rest, *perturbed* spirit. *Shakespeare's Hamlet.*

His wasting flesh with anguish burns,
And his *perturbed* soul within him mourns. *Sandys.*

To disorder; to confuse; to put out of regularity.—The accession or secession of bodies from the earth's surface *perturb* not the equilibration of either hemisphere. *Brown.*

Corruption
Hath then no force her blifs to *perturbate*.
More's Immortal. of the Soul.

PERTURBA'TION, *f.* [*perturbatio*, Lat.] Disquiet of mind; deprivation of tranquillity.—The soul, as it is more immediately and strongly affected by this part, so doth it manifest all its passions and *perturbations* by it. *Ray on the Creation.*

Love was not in their looks, either to God
Nor to each other, but apparent guilt,
And shame, and *perturbation*, and despair. *Milton's P. L.*

Restlessness of passions.—Natures that have much heat, and great and violent desires and *perturbations*, are not ripe for action till they have passed the meridian of their years. *Bacon's Essays.*—Disturbance; disorder; confusion; commotion.—Although the long dissensions of the two houses had had lucid intervals, yet they did ever hang over the kingdom, ready to break forth into new *perturbations* and calamities. *Bacon.*—Cause of disquiet:

O polish'd *perturbation!* golden care!
That keep'st the ports of slumber open wide
To many a watchful night: sleep with it now,
Yet not so sound, and half so deeply sweet,
As he, whose brow with homely biggen bound,
Sleeps out the watch of night. *Shakespeare's Hen. IV.*

Commotion of passions:

Restore yourselves unto your temper, fathers;
And, without *perturbation*, hear me speak. *B. Jonson.*

PERTURBA'TOR, *f.* [Latin.] Raifer of commotions.
PERTURBA'TRIX, *f.* A woman who breaks the peace. *Scott.*

PERTUR'BER, *f.* A disturber.—It was high time for the archbishop and state to look strictly to these *perturbers* of our church's happy quiet. *Sir G. Paul's Life of Abp. Whitgift.*

PERTU'SED, *adj.* [*pertusus*, Lat.] Bored; punched; pierced with holes.

PERTU'SION, *f.* [from *pertusus*, Lat.] The act of piercing or punching.—The manner of opening a vein in Hippocrates's time was by stabbing or *perfusion*, as it is performed in horses. *Arbuthnot.*—Hole made by punching or piercing.—An empty pot without earth in it, may be put over a fruit the better, if some few *perfusiones* be made in the pot. *Bacon.*

PERTUS'SIS, or WHOOPING COUGH. See the article PATHOLOGY, p. 183, 4, of this volume.

P E R U.

PERU', a considerable province of South or Spanish America.

Peru, when first discovered by the Spaniards, was a large and flourishing empire, including two kingdoms, Peru and Quito. It extended along the shores of the South Pacific Ocean from Chili even to Popayan, embracing the vast chain of mountains which, arising in the Terra Magellanica, passes onwards to Mexico, and thus unites South and North America. Peru, therefore, when first reduced to the obedience of the crown of Spain, was the largest of any of the governments founded in America. It has since been reduced, at two periods, in order to give such extension to other provinces as should entitle them to the rank of viceroalties. In the year 1718, the province or kingdom of Quito was separated from Peru, and added to the government of New Granada. In the year 1778, when the court of Madrid had resolved on erecting the province of Buenos Ayres into a viceroalty, the province of Potosí, the district surrounding it, the cities of La Paz, La Plata, and the fertile district of Cochabamba, were separated from Peru, to form a part of the newly-extended government. As, during the civil wars, which have raged from 1810 to the present time, those provinces have been wrested from the dominion of Spain, they are likely, in future, to appertain to that division of South America which will be included in the territories of Buenos Ayres or La Plata, rather than to that which will include either Peru or Chili.

The present boundary of Peru to the north is the small river Tumbes, in latitude 3. 26. south, and longitude 80. 6. west from Greenwich; which river divides it from

New Granada. To the south the boundary is the chain of mountains of Vilca-Nota, which terminates at the river Loa in latitude 15. The extent of the coast of Peru is thus about 700 geographical miles; but, as the sinuosities of the shore are considerable, the whole frontage to the ocean is upwards of 1000 miles. The eastern boundaries of Peru are not clearly defined. They extend to the vast plains claimed by Portugal, as a part of Brazil, denominated the Pampas del Sacramento, and farther north to Colonna, or the Land of the Missions, inhabited by unreclaimed Indian tribes. The medium breadth is about 80 leagues, according to Humboldt, who estimates the whole area of Peru to be 30,000 square leagues.

Peru may be considered as divided into three districts. The first, called *Lower Peru*, is a narrow slip of sandy plain, varying in breadth from six to twenty leagues, which bounds the whole of the western coast. It is extremely barren except in the neighbourhood of rivers, which, though few and small, are in some places met with. They are chiefly formed by torrents from the high lands. This sterility is however remedied in a great degree by the vast quantities of manure which are deposited on the shore by aquatic birds, and conveyed thence over the country to the inlands. This ordure, which is peculiar to the coast of Peru, is said by Sir H. Davy to contain a greater quantity of ammonia than any other known species of manure. This is partly to be attributed to the total absence of rain; for, in the district under consideration, the lofty mountains to the eastward intercept the clouds from the Atlantic Ocean, and the constant winds from the south drive the clouds that collect in the Antarctic

arctic Circle beyond the limits of Peru before they discharge their waters. Now this want of moisture of course prevents that dilution and washing-away of the saline particles which is detrimental to the manures of our own and other wet climates. It is said that the quantity of this manure used by the Peruvians is very small, and is minutely divided; but that its effects on vegetation, particularly in regard to the *capsicums*, is astonishing. The lack of rain in this district is in some measure compensated by the fall of very heavy dews during the night. The medium heat of Lower Peru throughout the year is 64°, and the thermometer rarely rises to 75°. Thunder and lightning are unknown. Most of the tropical plants flourish here. The plantain, banana, pine-apple, sugarcane, vine, cocoa, olive, coffee, and cotton, as well as the most delicious fruits, some, such as the chiremoia and the frutilla, peculiar to the country, arrive at great perfection.

The next division of Peru consists of that range of the Andes nearest to the Pacific Ocean, commencing generally with hills of moderate elevation, but in some parts with bold projecting and abrupt precipices. The sides of these hills are covered with forests, rendered almost impenetrable by the numerous parasitical plants which twine round the lofty trees; and, we meet with acacias, mangotrees, arboresecent brooms, and ferns; aloes and other succulent plants; cedars, cotton or Cuba trees of gigantic magnitude, many kinds of ebony and other useful woods, many species of palms, and the *maria*, a tree of enormous size, used in ship-building. The valleys between these hills afford most of the trees which are natives of the tropics; few of them are well calculated for the purposes of building.

This district, called *Higher Peru*, commencing at the termination of the sands on the shore, continues increasing gradually in height towards the eastward, till the ridge of the Andes or the Cordilleras is attained. The line of perpetual snow is about 14,000 feet above the level of the sea, and from that line upwards vegetation necessarily ceases; below it, the plants, by regular gradations, display the nature of the climate, and its adaptation to the various families of vegetables; and, in different parts, exhibit every species of production which can be found, from the dwarf plants of Lapland to the odoriferous spices of Sumatra; but extensive and fertile plains occur at 9000 feet above the level of the sea.

This portion of Peru contains the sources of those vast rivers which traverse the whole continent of South America. Their streams, for the most part, run to the Atlantic Ocean. The few that run to the Pacific are of short course, and do not yield copious supplies.

This mountainous district is the chief seat of the mineral wealth of Peru. The mines are, for the most part, situated at great elevations, and consequently in a climate so severely cold as to be unfavourable both to the health of the labourers, and to the raising food for their subsistence. The most abundant silver mines, those of Pasco and Guancavelica, are between 13,000 and 14,000 feet above the level of the sea. Baron Humboldt asserts, that beds of coal have been found near Guanaco, at an elevation of 14,700 feet above the level of the sea; and fossil shells at the height of 14,120 feet, where they are also accompanied with sandstone; but granite is scarcely known in Peru.

The third district of Peru commences on the eastern summit of the Andes, and proceeds eastward till it reaches the territories of Portugal, towards their northern part; and the provinces of La Plata, or Buenos Ayres, towards the south. The descent from the Andes, on the eastern, is much more abrupt than on their western side. They terminate in vast plains called sometimes *Pampas del Sacramento*, or more usually, collectively, *Colonna*, or the Land of the Missions. The Jesuits succeeded in collecting in villages many of the rude inhabitants of this country; and, according to the relation of one of that body, Father Girval, the tribes are numerous, small, and scatter-

ed; with as many various languages as tribes, and differing much from each other in the degree of civilization to which they had attained. These Pampas are represented as being covered with trees and verdure; and yielding balsams, oils, gums, resins, cinnamon, cocoa, cascarilla, and many valuable drugs, spices, and other rare productions. The trees are lofty, and form impenetrable forests, in which wander all the animals peculiar to the torrid climate of America. The heat is excessive, and accompanied with humid fogs.

Amidst the other circumstances which distinguish Peru, we have to mention the most terrific earthquakes. These are frequently felt in every part, and are sometimes accompanied with most extensive and fatal effects. The lofty chain of the Andes is a collection of volcanos, some in constant activity, others occasionally ejecting inflammable substances; while there are many whose fires, in the lapse of ages, seem to have been burnt out.

DISCOVERY AND CONQUEST OF PERU.

To the dauntless and persevering spirit of three Spanish adventurers of the sixteenth century we are indebted for the discovery of Peru. Their names were Francisco Pizarro, Diego de Almagro, and Hernando Luque. Pizarro, however, has the chief glory of the discovery. The talents of Almagro were exerted chiefly in sailing to his associate with supplies and reinforcements. The part which Luque performed was that of furnishing money, with which the double employment of priest and schoolmaster had amply furnished him. The last was however not the least efficient agent in the discovery, since Pizarro, a bastard (and in early life a swine-feeder), and Almagro a foundling, could not have raised the funds requisite for so arduous an undertaking without his assistance.

Pizarro set sail from Panama on the 14th of November, 1524, with a single ship and 112 men; and, so little was he acquainted with the peculiarities of the climate, that he spent two years in sailing from Panama to the northern extremity of Peru, a voyage which is now frequently performed in a fortnight. He landed, and found that the wealth of the country was as great as he imagined; and that the resistance he was likely to meet in endeavouring to possess himself of it would be full as considerable. At *Tumbes*, a place about three degrees fourth of the line, Pizarro and his companions feasted their eyes with the first view of the opulence and civilization of the Peruvian empire. This place was distinguished for its stately temple, and a palace of the *incas*, or sovereigns of the country. But what chiefly attracted their notice was such a show of gold and silver, not only in the ornaments of their persons and temples, but in several vessels and utensils for common use, as left no room to doubt that they abounded to profusion there. Having explored the country sufficiently to satisfy his own mind, Pizarro procured two of their *llamas*, or tame cattle, to which the Spaniards gave the name of sheep, some vessels of gold and silver, and two young men whom he intended to bring up as interpreters; and with these he returned to Panama towards the close of the third year from the time of his departure. No adventurer of the age suffered hardships or encountered dangers which equalled those to which he was exposed, during this long period. The patience with which he endured the one, and the fortitude with which he surmounted the other, are said to exceed whatever is recorded even in the history of the New World, where so many romantic displays of those virtues occur. But neither Pizarro nor his associates were deterred from the prosecution of their scheme.

The confederacy of the three adventurers had originally been sanctioned by Pedrarias, the governor of Panama; but, cold and cautious, he now refused further assistance. With his characteristic boldness, Pizarro repaired to the court of Spain; and conducted his suit with so much address, that he obtained from Charles (king of Spain and emperor

emperor of Germany) the most liberal concessions. He was made chief governor of all the country he subdued; Almagro *adelantado*, or king's lieutenant; and Luque was appointed the first bishop of Peru.

Thus encouraged, Pizarro returned to Panama, whence he soon after sailed with three small vessels, containing only 186 soldiers, and arrived at the bay of St. Matthew in thirteen days. He advanced by land as quickly as possible towards Peru. At the province of Coaque he surprised the natives, and seized their vessels of gold and silver to the amount of several thousand pounds sterling. He continued his march along the coast, meeting with scarcely any resistance till he arrived at the island of Puna in the bay of Guayquil. Here he spent six months in reducing the inhabitants to subjection. From Puna he proceeded to Tumbes, and from thence to the river Piura, near the mouth of which he established, A.D. 1532, the first Spanish colony in Peru, to which he gave the name of St. Michael. Before, however, this colony was founded, Pizarro received two reinforcements amounting to about thirty men each; the one commanded by Benalcazar, the other by Soto; both distinguished officers.

At the time when the Spaniards first visited Peru, Huanca Capac was seated on the throne. He was the twelfth of a line of *incas*, or kings, of whom Mango Capac (the founder of a city and inventor of many useful arts) was the first. In the course of his reign, Huanca Capac subjected to his rule the kingdom of Quito, a conquest of such extent and importance as almost doubled the power of the Peruvian empire. He married the daughter of the vanquished monarch of Quito, by whom he had a son named Atabalipa, whom, on his death at Quito, he appointed successor in that kingdom, leaving the rest to Huascar, his eldest son, by a mother of the royal race. Huascar, discontented with his father's will, required his brother to renounce the government of Quito, and to acknowledge him as his lawful superior, which Atabalipa refused, and marched against Huascar in hostile array. Victory declared itself in favour of Atabalipa, who made a cruel use of his success, seizing the crown of Peru, and attempting to exterminate the royal race by putting to death all the children of the Sun descended from Mango Capac.

When Pizarro landed in the bay of St. Matthew, this civil war raged between the brothers with the greatest fury. His alliance and assistance were sought by Atabalipa, which he readily promised, and thus was allowed to march his troops in safety across the sandy desert between St. Michael and Motupe, where their career might easily have been stopped. He then sent messengers inviting Atabalipa to visit him in his quarters; which he readily promised. On the return of these messengers, they gave such a description of the wealth which they had seen, as determined Pizarro to seize upon the Peruvian monarch, in order that he might more easily come at the riches of his kingdom.

The next day the inca approached Caxamalca without suspicion of Pizarro's treachery. But, as he drew near the Spanish quarters, Vincent Valverde, chaplain to the expedition, advanced with a crucifix in one hand, and a breviary in the other, and in a long discourse attempted to convert him to the catholic faith. This the monarch declined, avowing his resolution to adhere to the worship of the Sun; at the same time he wished to know where the priest had learned the extraordinary things which he had related. "In this book!" answered Valverde, reaching out to him his breviary. The inca opened it eagerly, and turning over the leaves raised it to his ear: "This," says he, "is silent, it tells me nothing," and threw it with disdain to the ground. The enraged monk, running towards his countrymen, cried out, "To arms, Christians, to arms! the word of God is insulted; avenge the profanation on these impious dogs." Pizarro immediately gave the signal of assault, which terminated in the destruction of 4000 Peruvians, without the loss of

a single Spaniard. The plunder of the field was rich beyond any idea which even the conquerors had yet formed concerning the wealth of Peru.

The inca, who was taken prisoner, quickly discovered that the ruling passion of the Spaniards was avarice; he offered, therefore, to recover his liberty by a splendid ransom. The apartment in which he was confined was 22 feet long by 16 in breadth; this he undertook to fill with vessels of gold as high as he could reach. Pizarro closed with the proposal, and a line was drawn upon the walls of the chamber to mark the stipulated height to which the treasure was to rise. Atabalipa performed his part of the contract, and the gold which his subjects brought in was worth between three and four hundred thousand pounds sterling. When they assembled to divide the spoils of this innocent people, procured by deceit, extortion, and cruelty, the transaction began with a solemn invocation to heaven, as if they expected the guidance of God in distributing those wages of iniquity. In this division, above eight thousand pesos, at that time not inferior in effective value to 10,000. sterling in the present day, fell to the share of each horse-soldier. Pizarro and his officers received dividends in proportion to the dignity of their rank.

The Spaniards having divided the treasure among them, the inca insisted that they should fulfil their promise of setting him at liberty. But nothing was further from Pizarro's thoughts; he was even at that very moment planning schemes to take away his life: an action the most criminal and atrocious that stains the Spanish name, amidst all the deeds of violence committed in carrying on the conquest of the New World. In order to give some colour of justice to this outrage, and that he might not stand singly responsible for the commission of it, Pizarro resolved to try the inca with all the formalities observed in the criminal courts of Spain. The charges exhibited against him were "the deposition and death of his brother; the permission of offering up human sacrifices; the keeping of a great number of concubines; and the exciting his subjects to take arms against the Spaniards." On these he was found guilty, as his infamous judges had predetermined, and condemned to be burnt alive. Friar Valverde prostituted the authority of his sacred function to confirm the wicked sentence, and by his signature warranted it to be just. Pizarro ordered him to be led to execution; and the cruel priest offered to console, and attempted to convert, him. The dread of a cruel death extorted from the trembling victim a desire of being baptized. The ceremony was performed; and Atabalipa, instead of being burnt, was strangled at the stake. (A.D. 1533.)

The death of the inca was no sooner known, than the principal nobility at Cuzco proclaimed the brother of Huasca as his successor: but Pizarro set up a son of Atabalipa; and two generals of the Peruvians claimed the sovereign power for themselves. Thus was this wretched country torn to pieces at once by foreigners, and by a domestic war among themselves. The Peruvians, however, gained some considerable advantages over the Spaniards even in this distracted condition, which induced Pizarro to make peace with them, which he knew how to violate when his affairs required it. Accordingly, he shortly after renewed the war; and made himself master of Cuzco, then the capital of the empire. New grants and supplies now arrived from Spain, by which Pizarro obtained 200 leagues along the sea-coast to the southward of his former government; and Almagro a grant of 200 more to the southward of Pizarro's. It soon became a contested point in whose territory the city of Cuzco lay; but it was at length awarded to Pizarro, and a reconciliation was effected between these two ruffians.

Almagro then set out on an expedition against Chili; and the Indians, seeing the Spaniards thus divided, gained courage to attack them. The inca, under pretence of holding a sacred festival, repaired to an assembly

of the state of the kingdom, and excited his countrymen to avenge themselves of the Spanish wrongs and cruelty. They laid siege to Cuzco with a large army; but the garrison under Ferdinand Pizarro, though it consisted of only seventy men, was victorious; chiefly by means of their artillery.

News was brought to Almagro of the danger to which Cuzco was exposed, and the general insurrection of the Peruvians. Relinquishing his new conquests, he hastened back with great expedition. At his approach the Indians raised the siege, to the joy of the garrison, who were almost exhausted by the length of the defence. Almagro resolved to renew his claims to Cuzco; he had now a fort of right to it by having raised the siege, and he had strength sufficient to support that right. Ferdinand and Gonzalo, the two brothers of Pizarro, making some opposition, were thrown into prison; and their little army either joined the conqueror, or shared the same fate.

Pizarro, unacquainted with the arrival of Almagro, had got together an army for the relief of Cuzco, who were near the town before they found that they had any other enemy than the Indians to contend with. Almagro, after having in vain tried to seduce their fidelity, engaged and routed them. His friends represented to him that now was the hour of his fortune, and that he was bound to employ it by establishing himself beyond all possibility of being removed. That he ought to put the Pizarros, his prisoners, to death, and march directly to Lima, and seize his rival. Almagro rejected this advice; and, while he was deliberating what course he should pursue, Gonzalo Pizarro made his escape, with a hundred of those who were affected to his cause. Shortly after, by the solicitations and art of Pizarro, he released his brother Ferdinand. The treaty which they entered into with Almagro was now forgotten: they attacked him, gained a complete victory, and took him prisoner. In spite of Almagro's age, which ought to have excited pity; in spite of their common warfare, their dangers and triumphs; in spite of every sentiment of gratitude, for what this unfortunate man had contributed to his greatness; and in spite of his late mercy to his brother; all which were pathetically and strongly urged by Almagro; Pizarro had him formally tried, condemned, and strangled in prison. He left one son by an Indian woman of Panama, whom, though at that time a prisoner at Lima, he named successor to his government, pursuant to a power which the emperor had granted him.

Pizarro, considering himself now the unrivalled possessor of that vast empire, proceeded to parcel out its territories among the conquerors, but with an unequal hand. Of course, all who were disappointed in their expectations exclaimed loudly against the rapaciousness and partiality of the governor. The partisans of Almagro murmured in secret, and meditated revenge. This party was yet numerous, though dispersed about the country. Their frequent cabals did not pass unobserved, and the governor was warned to be on his guard against men who meditated some desperate deed. He disregarded the admonitions of his friends: "Be in no pain," said he, "about my life; it is perfectly safe, as long as every man in Peru knows that I can, in a moment, cut off any head which dares to harbour a thought against it." This security gave the Almagrians full leisure to ripen every part of their scheme; and Juan de Herrada, an officer of great abilities, who had the charge of young Almagro's education, took the direction of their consultations, with all the zeal which this connexion inspired, and with all the authority which the ascendant that he was known to have over the mind of his pupil gave him.

On Sunday the 26th of June, 1541, at mid-day, the season of tranquillity and repose in all sultry climates, Herrada, at the head of eighteen of the most determined conspirators, sallied out of Almagro's house in complete armour, and, drawing their swords as they advanced hastily towards the governor's palace, cried out, "Long live

the king, but let the tyrant die!" Though Pizarro was usually surrounded by such a numerous train of attendants as suited the magnificence of the most opulent subject of the age in which he lived; yet, as he was just risen from table, and most of his domestics had retired to their own apartments, the conspirators passed through the two outer courts of the palace unobserved. Pizarro, with no other arms than his sword and buckler, defended the entry of his apartment; and, supported by his half-brother Alcantara, and a little knot of friends, he maintained the unequal contest with an intrepidity worthy of his past exploits, and with the vigour of a youthful combatant. But the armour of the conspirators protected them, while every thrust they made took effect. Alcantara fell dead at his brother's feet; his other defenders were mortally wounded. The governor, receiving at length a deadly thrust full in his throat, sunk to the ground, and expired.

As soon as he was slain, the assassins conducted young Almagro in solemn procession through the city of Quito; and, assembling the magistrates and principal citizens, compelled them to acknowledge him as lawful successor to his father in his government. But the officers who commanded in some of the provinces refused to recognize his authority until it was confirmed by the emperor. In others, particularly at Cuzco, the royal standard was erected, and preparations were begun in order to revenge the murder of their ancient leader.

In this state of things, the new governor, Vaca de Castro, appointed by the court of Spain, arrived. This man had been chosen to the important trust, at the instance of the emperor alone, on account of his high reputation for justice and integrity. He immediately assumed the supreme authority; and, by his influence and address, soon assembled such a body of troops, as not only set him above all fear of being exposed to any insult from the adverse party, but enabled him to advance from Quito with the dignity that became his character. Encouraged by the approach of the new governor, the loyal were confirmed in their principles, and avowed them with greater boldness; the timid ventured to declare their sentiments; the neutral and wavering, finding it necessary to choose a side, began to lean to that which now appeared to be the safest, as well as the most just.

De Castro had scarcely landed, when Almagro sent an embassy to him, proposing terms; to which the governor replied, that he was come under the emperor's authority, to do justice to all; of which, if a good subject, he could have no room to complain; if a bad one, he must prepare for the result. This was new language to those who held the supreme power in this part of the world, who almost forgot that they had a superior. Almagro resolved to abide the fortune of war; but victory was on the side of Castro, not however without considerable loss. The superior number of his troops, his own intrepidity, and the martial talents of Francisco de Carjaval, his principal officer, triumphed over the bravery of his opponents, though led on by Almagro with a gallant spirit, worthy of a better cause, and deserving another fate. The carnage was great, in proportion to the number of combatants. Of fourteen hundred men, five hundred lay dead on the field, and the number of wounded was still greater.

If the military talents displayed by De Castro, both in the council and the field, surprised the adventurers in Peru, they were still more astonished at his conduct after the victory. He proceeded directly to try his prisoners as rebels. Forty were condemned to suffer death, others were banished from Peru. Their leader made his escape from the field of battle; but, being betrayed by some of his officers, he was publicly beheaded at Cuzco; and in him the name of Almagro and the spirit of the party became extinct.

During the above-mentioned violent commotions, the attention of the emperor-king and the statesmen of Spain

had been naturally directed to the growing importance of the colony in Peru. It became obvious, that, governed by a band of rapacious, ignorant, and cruel, adventurers, the arts or manufactures could not flourish; and consequently that Peru could form no important, or at least permanent, addition to the power and revenues of the mother-country. It was also apparent that the Indians suffered much from their horrid task-masters; and fortunately they found a warm advocate in Bartholomew de las Casas, who, both in his writings and in his appeals to the emperor, set forth in the strongest colours their misery and depopulation. Independent of the natural pity which was excited in Spain by the accounts of the cruelty of the invaders towards the native Indians, it was urged that, in consequence of this ill usage, the slaves who worked at the mines died so rapidly, and bred so slowly, that it was apprehended they might in a short time be totally extinct. The natural consequence of a continuance of this treatment would have been that no one would be left to work the mines or cultivate the lands; and therefore the newly-acquired territory would be a perpetual drain on the population and resources of Spain. Impressed with these facts, the emperor, with decision, but perhaps with too much abruptness, framed a system of government for Peru, which went the length of enfranchising the native Indians; for it enacted that "the stated tribute due by them to their superior should be ascertained, and that they should be paid as servants for any work they might *voluntarily* perform." Considering, moreover, that the vast tracts of land possessed by the early adventurers might, when cultivated and peopled, render their proprietors too powerful for subjects, the emperor further ordained that they might, where excessive, be reduced to a moderate extent by the court of royal audiences, and that they should revert to the crown on the decease of the possessor, and not descend, as before, to his wife and children. Besides these important regulations, the emperor appointed Blasco Nunez Vela viceroy of Peru; and established, under the title of "royal audience," a council which might strengthen his administration.

The enfranchisement of their slaves, and the dismemberment and eventual confiscation of their estates, were not measures to be tamely submitted to by the fierce and ungoverned settlers of Peru. They did not fail to exclaim loudly and fiercely against a government which tore from them those possessions which had been granted as the reward of hardships and dangers almost unparalleled; the women also, who saw the inheritance of their children torn away, and themselves liable to be plunged from the highest prosperity to the deepest poverty, fanned with their stimulating voices the flame of rebellion. This disaffection was rather increased than diminished by the haughty conduct of the new viceroy; and, the malcontents having found a skilful leader in Gonzalo Pizarro, (brother of the discoverer,) a civil war broke out. The rebellious party soon overpowered that of the Spanish government; for, in the latter, dissensions arose even between the viceroy Nunez Vela and the judges. The viceroy interfered with the decisions of the judges; they in their turn thwarted all his measures, and even went so far as to justify the general disaffection his conduct excited, and to imprison him on a desert island until he could be sent to Spain.

The vicerealty thus broken up, the judges in vain endeavoured to exact obedience from Pizarro. He marched boldly to Lima; and Carjaval, the prompter of all his actions, entered the city in the night and hanged several persons who were obnoxious to his party. The next day the court of audience appointed Pizarro governor and captain-general of the province.

But in the mean time Nunez Vela again appeared in arms. The officer who had been intrusted to convey him to Spain, influenced either by fear or remorse, gave up to

his prisoner the command of the vessel, and promised to follow his fortunes and support his authority. The viceroy landed at Tumbes, and was soon joined by numbers who were well affected towards the mother-country, or were dissatisfied with the harsh and arbitrary sway of Pizarro. Vela obtained at first some advantages; but the decisive battle was fought at Quito in January 1545, which ended in his defeat and death.

The companions of Pizarro now advised him to throw off all allegiance to Spain; to marry the *Coya*, or Daughter of the Sun next in succession to the crown, (by which measure he might insure the fidelity of the native Peruvians,) and to declare himself sovereign of the country. But Pizarro had not a soul fashioned to pursue this brilliant course; a course which, if pursued in, would in all probability have detached Peru for ever from Spain, even at that early period. Pizarro was not formed to be a king, but a robber: he confined his views to obtaining a confirmation of his authority from the Spanish court, that he might enrich himself by plunder. This was hopeless. The first impulse of the Spanish ministry was to declare Pizarro a traitor; and it was only the consideration of the great skill and power of the rebel, the remoteness of the seat of warfare, the difficulty of transporting troops, and the absence of the Spanish veterans who were engaged in Germany, that determined them to adopt a milder and more temporizing plan. Without replying directly to Pizarro, they dispatched to Peru, under the title of President of the Court of Audience at Lima, an old and infirm man named Pedro de la Gasca. He was merely a priest in the Inquisition, and until this occasion had been employed only in offices of negotiation. To Gasca was entrusted full and unlimited power, not only to act as circumstances might require in regard to Pizarro, but to punish with death, to pardon, or to reward, any one as he might judge expedient; and moreover to call to his assistance all or any of the governors of the settlements in Spanish America. With this authority, but without either money or troops, he set out to quell a rebellion which already had baffled a brave and distinguished commander. On his arrival at Nombre de Dios, July 27, 1546, he found Herman Mexia, an officer of note, posted there, by order of Pizarro, with a considerable body of men to oppose the landing of any hostile forces; but Gasca appeared in such pacific guise, with a train so little formidable, and with a title of no such dignity as to excite terror, that he was received with much respect. From Nombre de Dios, he advanced to Panama, and met with a similar reception from Hinojosa, whom Pizarro had entrusted with the government of that town, and the command of his fleet stationed there. In both places he held the same language, declaring that he was sent by their sovereign as a messenger of peace, not as a minister of vengeance; that he came to redress all their grievances, to revoke the laws which had excited alarm, to pardon past offences, and to re-establish order and justice in the government of Peru. His mild deportment, the simplicity of his manners, the sanctity of his profession, and a winning appearance of candour, gained credit to his declarations. The veneration due to a person clothed with legal authority, and acting in virtue of a royal commission, began to revive among men accustomed for some time to nothing more respectable than an usurped jurisdiction. Hinojosa, Mexia, and several other officers of distinction, to each of whom Gasca applied separately, were gained over to his interest, and waited only for some decent occasion of declaring openly in his favour.

This was not long wanting. Pizarro opposed the entry of the new president into Lima; offered him 50,000 pesos to go back to Spain; and instructed Hinojosa, that, if he refused, he should forthwith assassinate him. But this officer, fearing to oppose the orders of the king of Spain, and disgusted at the atrocious mandate of Pizarro, publicly recognised the title of the president. His officers followed

followed his example; and Gasca suddenly became master of the fleet, of Panama, and of all the troops stationed there.

The insinuating manners of Gasca, his mildness, and his clemency, failed not to increase his party in a rapid and astonishing manner. This prosperity seemed somewhat obstructed by the defeat of Centeno, to whom the chief of his force was entrusted. This officer was beaten in a most bloody battle at Huarina, Oct. 20, 1547; and, as this was effected by Pizarro at the head of a comparatively small force, it raised his reputation, and consequently the number of his adherents, in no mean degree. Still, however, the good qualities of Gasca contrasted in so favourable a manner with the profligacy and unrelenting cruelty of Pizarro, that he scarcely passed a day without some addition to his force.

After spending some months in thus strengthening his party, Gasca began to move towards Cuzco, Dec. 29, 1547. Pizarro, confident of victory, suffered the royalists to pass all the rivers which lie between Guamanga and Cuzco without opposition, and to advance within four leagues of that capital, flattering himself that a defeat in such a situation as rendered escape impracticable would at once terminate the war. He then marched out to meet the enemy; and Carjaval chose his ground, and made the disposition of the troops with the discerning eye and profound knowledge in the art of war conspicuous in all his operations. As the two armies moved forwards slowly to the charge, the appearance of each was singular. In that of Pizarro, composed of men enriched with the spoils of the most opulent country in America, every officer, and almost all the private men, were clothed in stuffs of silk, or brocade, embroidered with gold and silver; and their horses, their arms, their standards, were adorned with all the pride of military pomp. That of Gasca, though not so splendid, exhibited what was no less striking: he himself, accompanied by the archbishop of Lima, the bishops of Quito and Cuzco, and a great number of ecclesiastics, marching along the lines, blessing the men, and encouraging them to a resolute discharge of their duty.

When both armies were just ready to engage, Cepeda, one of Pizarro's chief officers, set spurs to his horse, galloped off, and surrendered himself to the president, Garcilasso de la Vega, and other officers of note, followed his example. The revolt of persons in such high rank struck all with amazement. The mutual confidence on which the union and strength of armies depend, ceased at once; distrust and consternation spread from rank to rank. Some silently slipped away; others threw down their arms; and the greatest number went over to the royalists. Pizarro, Carjaval, and other leaders, employed authority, threats, and entreaties, to stop them, but in vain. In less than half an hour, a body of men which might have decided the fate of the Peruvian empire was totally dispersed. Pizarro, seeing all irretrievably lost, with a tameness disgraceful to his former fame, surrendered to one of Gasca's officers. Carjaval, endeavouring to escape, was overtaken and seized. Gasca, happy in this bloodless victory, did not stain it with cruelty. Pizarro, Carjaval, and a small number of the most distinguished or notorious offenders, were punished capitally. Pizarro was beheaded on the day after he surrendered. He submitted to his fate with a composed dignity, and seemed desirous to atone by repentance for the crimes which he had committed. Carjaval, a more able warrior, and more ferocious than Pizarro, was quartered. This man, when he was expiring, boasted that he had massacred with his own hand 1400 Spaniards and 20,000 Indians.

Such was the last scene of a tragedy, of which every act had been marked with blood; and such was the fate of all those who had taken a lead in the reduction of Peru. Almagro beheaded; his son sharing the same fate; Pizarro murdered in his own palace; his brother Ferdi-

nand kept a prisoner twenty-three years; and his other brother Gonzalo suffering death as a traitor.

The new governor, having by these few necessary severities quieted his province, took effectual care to heal its disorders by the arts of peace. He settled the civil government, the army, and the mines, upon such a basis, as to ensure, under a wise administration, the most important advantages to his country. He issued regulations concerning the treatment of the Indians, well calculated to protect them from oppression, and to provide for their instruction in the principles of religion, without depriving the Spaniards of the benefit accruing from their labour.

Having now accomplished the object of his mission, Gasca, wishing to return to a private station, committed the government of Peru into the hands of the court of audience, and set out for Spain, (Feb. 1, 1550,) carrying three hundred thousand pounds of public money to his native country. And yet, such was his disinterestedness, that, while he brought this vast recruit to the royal treasury, he was obliged to apply by petition for a small sum to discharge some petty debts which he had contracted during the course of his service. Charles was not insensible to such merit: he received Gasca with the most distinguishing marks of esteem; and, being promoted to the bishopric of Palencia, he passed the remainder of his days in the tranquillity of retirement, respected by his country, honoured by his sovereign, and beloved by all.

Notwithstanding Gasca's wise regulations, the tranquillity of Peru was not absolutely permanent. Successive insurrections desolated the country for some years. During these contests, many of the first invaders of Peru, and many of those licentious adventurers whom the fame of their success had allured thither, fell by each other's hands. Each of the parties gradually cleared the country of a number of turbulent spirits, by executing, proscribing, or banishing, their opponents.

With regard to the Peruvians, the most cruel measures were taken to render it impossible for them to rebel. Tupac Amaru, the heir of their last king, had taken refuge in some remote mountains, where he lived in peace. There he was so closely surrounded by the troops which had been sent out against him, that he was forced to surrender. The viceroy Francis de Toledo caused him to be accused of several crimes that he had not committed, and for which he was beheaded in 1571. All the other descendants of the incas shared the same fate, under pretence that they had conspired against their conquerors. The horror of these enormities excited so universal an indignation both in the Old and the New World, that Philip II. thought himself obliged to disavow them; but the infamous policy of this prince was so notorious, that no credit was given to this appearance of his justice and humanity.

For the space of upwards of 200 years, Peru offers nothing worthy of notice to the historian. No country, perhaps, ever enjoyed so long a period of tranquillity as Peru has experienced; for though occasionally, when Spain has been at war with England, a few places on the coast have suffered from predatory attempts, and the navigation may have been interrupted by our cruisers, yet in the interior, so complete was the subjugation, so passive was the obedience, that nothing but a few trifling local dissensions occurred, after the events we have just mentioned, till the year 1781, when an insurrection of an extensive and alarming nature suddenly burst forth.

Jose Gabriel Condercanqui was a descendant of the last sovereign of the Peruvian race. He had been carefully educated by his father, and exhibited considerable talent. The title of Marquis of Oropesa had been conferred on one of his ancestors. On the death of his father, he petitioned to have that title renewed in him; but, being refused, he retired to the mountains, and announced himself by the name of *Tupac Amaru*, which the last of the incas had borne, as the true sovereign of Peru. The Indians

Indians flocked to him in crowds, the sacred fillet was bound on his brow, and he was proclaimed emperor, by the title of Tupac Amaru the Second. An overwhelming army was speedily collected by him, which subdued the country, and invested Cuzco. At the commencement of his reign, though he declared vengeance against every native of Old Spain, he professed to favour equally the ecclesiastics and all of the white race who were born in America. Adhering to this system, he continued to prosper; but his followers, elated with the success that everywhere attended them, and being in an undisciplined state, commenced a war of extermination against all who were not of the Peruvian race, which was attended with scenes of the most horrid barbarity. Diego his brother, and Andres his nephew, favoured the cruel disposition of the Indians, and perpetrated deeds which Jose Gabriel vainly strove to prevent. The insurrection continued two years, and extended over most of the districts around Cuzco. But the proceedings against the Whites, Mulattoes, and Negroes, at length united these castes against the Indians. Jose was surprised, and, with his family, taken prisoner; and, shortly after, the whole were executed in the city of Cuzco. So great was the veneration in which this Tupac Amaru was held by the Peruvians, that, when he was led to execution, they prostrated themselves in the streets, and uttered the most piercing shrieks and execrations whilst the last of the Children of the Sun was torn to pieces by his executioners. With this event terminated the struggles of the Peruvians for independence; and on late occasions they are reported to have shown more disposition to adhere to the government of Spain than to the newly-created independent states that have sprung up around them.

During the recent events which have caused the division of Spanish America into separate republics, Peru long maintained her allegiance to Spain. When the revolution in New Granada began in 1810, the first steps were such as threatened no disturbance to the neighbouring provinces; but, its spirit at length approaching the confines of Peru, the viceroy dispatched an army towards Quito, under the command of general Molina, who had been nominated president by the Junta of Cadiz. As the revolutionists were divided among themselves, he easily gained that city; but, after practising some cruel measures, the army was compelled to retreat before the different partisans, who were previously at variance, but who had united in their operations against the Peruvians. After a bloody contest, they were driven from the viceroyalty of New Granada by the republican general Marino; but, as his attention was strongly engaged in watching the events in the north, he could not follow up his victory by pursuing the royalists; who, on their part, had such calls for their exertions towards the frontiers of Buenos Ayres, and in Chili, that, without any formal treaty, hostilities ceased between Peru and New Granada in 1814, and have not been since renewed.

As soon as the inhabitants of Buenos Ayres had formed an independent government, an army of 5000 men was marched to invade Peru, under the command of general Balcarce. He was opposed before he had reached the frontiers by Goynche, a royalist commander. Before hostilities were begun, a treaty for an armistice was made, but soon broken, when the Peruvians repulsed their invaders, became invaders in their turn, and overran the country as far as Salta; having in their possession, in 1812, the rich mining countries of Potosi and La Paz; while the republicans, being embroiled among themselves, and invaded by the Portuguese, had no means of recruiting, till early in the year 1813, when their general Belgrano attacked the royalists near Salta, and gained a complete victory, which compelled them to abandon their conquests, and retire within their own territory. In November of the same year, the Peruvians, being reinforced, fought another battle on the frontiers, near Potosi, with such decided success, that they again occupied

those rich districts, which, in the early part of the year they had been compelled to abandon.

The unfortunate republican general Belgrano was, in 1814, superseded by the celebrated San Martin, who collected the fugitives, organized a new army, formed various corps of Guerillas, and compelled the royalist general Pezuela once more to retreat from the contested country, and concentrate his forces in High Peru. In the year 1815, the contests among the different parties of republicans having weakened their army on the frontiers, Pezuela again attacked them, on the 14th November; gained a hard-fought battle at Sipe-sipe; and, in consequence of it, the mining-districts of Buenos Ayres, for the third time, came into the hands of the royalists.

The calls on the viceroy of Peru for troops to maintain the royal cause in Chili weakened his frontier forces at the time that San Martin was collecting his army to invade that country on the part of the republicans. By the course of events, the theatre of the war thus became changed. The republicans kept up a small force to watch the motions of the royalists, whose troops and stores were so much diminished, that they ultimately withdrew from the conquered countries; which, by the operations of the remorseless contest, had become reduced to the extreme of misery, and the mines, once so highly productive, had nearly ceased to be worked.

Chili had thrown off the government of Spain, and declared its independence. It was torn by factions, violently irritated against each other, and a civil war had commenced. The viceroy of Peru thought the occasion favourable for bringing it again under the royal authority. A force of 4000 men, under general Paneja, was dispatched to that country. Helanded at Talcahuano early in the year 1813, and took possession of Concepcion and Chillan. The Spanish troops appear to have remained in the positions they occupied, in a state of great inactivity; whilst the Chilians, divided into rancorous factions, were exhausting their means, and impoverishing their country. The Spanish commander availed himself of the circumstances to make an attempt on the capital, in the beginning of March 1814; but, not succeeding; entered into a treaty for evacuating the country. Before the treaty was concluded, general Oforio arrived, as commander from Lima, with considerable reinforcements. This changed the face of affairs. The Chilians were wearied with the evils they had experienced; the forces of the king gave them confidence; and after a few skirmishes, rather than battles, with the different parties, who never ceased hostilities towards each other, the whole country submitted to Oforio, who entered the capital in October 1814. The royalists were in quiet possession of Chili till the beginning of the year 1817. The fugitive republicans had retreated over the Andes, and found an asylum in Mendoza. There others joined them, in the following years. The government of Buenos Ayres supplied them with stores; and at length general San Martin, with the addition of some tolerably disciplined troops, was appointed to the command. This force passed the Cordilleras in January 1817, and descended towards the level country; and, after a most complete victory over the Peruvian army at Chacabuco, in which their commander was made a prisoner, and his troops dispersed, occupied, with little difficulty, the whole of Chili. The government there having assumed a more consistent and regular form than before, became a collecting point to which adventurous spirits, from Europe and from America, resorted. Armaments were equipped there, both naval and military. The former were successful in making prizes; and, in combination with the latter, Valdivia, the only remaining fortrefs in Chili, under the command of the viceroy of Peru, and ultimately Lima itself, was captured.

The conquest of Peru seemed to be indispensably necessary to the preservation of that independence, and those republican institutions, which the inhabitants of Chili had established. It had early attracted their regards; and

and the project for achieving it, which was widely circulated, drew to them many of those military adventurers who, by the peace in Europe, were deprived of occupation. Among others, lord Cochrane and several English officers who had distinguished themselves in the naval service, found employment in the fleet which was speedily equipped, and which, in discipline though not in force, soon attained such a superiority over the navy of Spain as to give it the command of the navigation of the South Sea. Being to windward of the Spanish ports, it was easy at any time to choose the point of attack. An army of 5600 men was formed under San Martin, which, with the fleet, consisting of one ship of 64 guns, one of 50, one of 36, and one of 32, besides some corvettes and transports, sailed from Valparaiso in the latter end of 1820, and reached Lima in February of the following year. The troops were landed to the north of Callao, and continued without any great exertion till May, when, the garrison of Lima being much straitened, an armistice was concluded.

Pezuela, then viceroy of Lima, was opposed by the audiencia and the municipality, who censured him for not adopting measures sufficiently energetic to repel the invaders. The same disposition to censure prevailed among the officers of the army; and at length they resolved to depose Pezuela. He made no resistance, but, quitting the government and country, the command was placed in the hands of Don José de La Serna on the 29th January, 1821.

The troops of La Serna were not much superior to the invaders numerically; but some of them having gone over to San Martin, gave the latter a superiority. Lima continued to be straitened by the general, and Callao to be blockaded by lord Cochrane, who performed one of those acts of desperate valour which struck astonishment into the Spaniards. With the boats of his little squadron he entered the port of Callao, and, under the guns of its tremendous batteries, boarded, captured, and carried off, one of their largest ships of war, with more men on-board than were in all the boats that attacked her.

After some months had elapsed, a convention was agreed on, when La Serna with his army marched out, and San Martin with his forces entered Lima, on the 10th of July, 1821. A garrison was, however, left by the royalists in Callao. The protracted operations had given time to remove the most valuable property, which, with the females of the best families, and the non-combatants, reached the mountainous districts. San Martin, in the possession of Lima, was in the same condition as La Serna had been for some months before; with many mouths besides those of his army to fill, and his intercourse with the country that furnished provisions intercepted; but he had the advantage of naval superiority, and could draw supplies from the coast, though, till Callao was taken, the difficulty of landing made the arrival of such supplies precarious. At length the garrison of Callao agreed to evacuate, on being allowed to join La Serna, which was effected. San Martin was thus in full possession of the capital and its port, when a dispute between him and lord Cochrane, about the division of the plunder, caused the latter to sail away, and leave the commander of the land-forces to secure his conquest as well as he could; and it appears that San Martin, by various judicious proclamations, and very moderate behaviour, succeeded, apparently, in reconciling all orders to their new liberators. He proclaimed himself "Protector of the Independence of Peru, until Peru was free, and a National Congress assembled," when he declared he would be ready to seek the quiet he had long sighed after, by resigning his authority to a Governor or Director of their own appointment. By this proclamation, all slaves born after the 28th of July, 1821, are declared free; the tribute of the Indians is abolished; and the natives of Peru are no longer to be called Indians or Natives, but Peruvians.

VOL. XIX. No. 1340.

San Martin kept his word. On the 20th of September, 1822, he issued the following proclamation at Lima, after which he retired to Valparaiso in Chili. "Peruvians! I have witnessed the declaration of the independence of the states of Chili and Peru: I have in my possession the standard which Pizarro bore in subjugating the empire of the Incas; and I cease to be a public man. Thus are recompensed with usury ten years of revolution and war. My promises to the people, where I have waged war are fulfilled; they were to make them independent, and to leave the choice of their government to themselves. The presence of a successful soldier (however disinterested he may be) is alarming to newly-constituted states; and, on the other hand, I am vexed to hear it said that I wish to become a sovereign. I shall indeed be always ready to make the last sacrifice for the liberty of the country, but in the character of a private citizen, and *nothing more*.

"Peruvians! I leave you the national representation established: if you give it your entire confidence, you may sing a song of triumph; if not, anarchy will devour you. May wisdom preside over your destiny; and may it be the height of felicity and peace.

JOSE DE SAN MARTIN."

In the mean time, La Serna, after uniting with the garrison of Callao, had retired towards the mountains, where he intercepted all communication between Lima and the mining districts, and drew supplies of men and stores from the countries in his rear. The whole of the treasure captured in Lima did not exceed 300,000 dollars, not a tenth part of what was usually to be found in that city. Lord Cochrane having carried away the money, San Martin, before his retirement, was compelled to have recourse to violent measures to subsist his army. He stamped paper dollars to pay his troops, and issued decrees commanding the inhabitants to take them in payment. A civil war is thus existing, which, as far as the latest intelligence reaches, leaves it doubtful if the conquerors or the conquered are in the worst condition. We have seen a letter from Lima, dated so lately as Jan. 10, 1823, which says, "The state of this country is most deplorable; impoverished to that degree, that the government has not the means of carrying any object into effect. Little else but paper money circulating, which, depreciating in value daily, it is difficult to exchange any quantity of it for hard dollars, even at a sacrifice of 30 per cent. and without the walls of the city it is not passable. There is a great want of energy in the government, which, together with the total want of money or credit, renders it probable that the war in the interior will be protracted a considerable time. The only thing in favour of the patriots, is the little dependence the royalists can place in the Indians, who I believe, universally detest the name of a Spaniard."

The new government, therefore, cannot by any means be considered as firmly established; and, whatever may be the ultimate issue, it must probably be a long time before tranquillity can be restored to such a degree as to give that security to property which is more essential to mining than to any other of the operations of human industry. In whatever manner the present contest may terminate, it is not possible to conceive that Peru, or any part of South America, will be again subjected to the condition of a Spanish colony. Nor is it desirable that it should; for it is notorious that the court of Madrid ruled those vast countries with a partiality which prevented the natives from developing their natural talents. Of 170 viceroys who have governed America, 166 were Spaniards, and only four Natives. Of 602 captains-general, 588 were Spaniards, and only fourteen Americans. The same remark is applicable to the high ecclesiastical dignities, which were almost always reserved for Spaniards, and almost always inaccessible to American priests. For farther particulars as to the revolted colonies, and of

9 E their

their treatment by the mother-country during the course of the late general war, see the article MEXICO, vol. xv. p. 308. and the article LONDON there referred to.

In one respect, the revolutionary authorities in these revolted colonies, appear to us to have acted unwisely; namely, in issuing letters of marque, and encouraging an extensive practice of privateering. All the profit of these predatory expeditions passes into the hands of American and English adventurers, who are progressively reviving a pernicious bucaneeing system, and converting the Gulf of Mexico into a nest of pirates. These illicit gains may be acquired at the expense of loyal Spaniards, and thus in some degree cripple the resources of an opponent party; but still they are all made at the cost of the country which grants the letters of marque, and must considerably retard the regular natural progress of opulence in the various sea-ports whose shipping is thus offered as the prize of courage, indeed, but also as the premium of robbery. Surely, it would have been more worthy of the cause of independence to endeavour to confine the mischiefs of warfare to organized armies and fleets; and, if possible, wholly to exempt from it the lives and fortunes of private individuals.

Venezuela, Buenos Ayres, Chili, and Peru, have found it necessary to make their local governments independent of each other, but they have found in a common danger from the same mother-country, a sufficient motive for federal union, and for co-operating in purposes of external defence and interior improvement. Should this union endure, it will prepare the growth of one of the most important empires which the world has ever seen.

ANCIENT CUSTOMS, CIVIL INSTITUTIONS, GOVERNMENT, &c.

We possess little information concerning the manners and government of the native Indians previous to their conquest by the Spaniards; a circumstance which does not seem surprising, when we recollect, that the only modes of preserving the memory of events among the aborigines were the *quipos*, traditions, and the rude sculptures and paintings of emblematical symbols. The first, however, was nothing (as it seems from the best historians) but a bundle of knots of various colours; the colour of the knots designating the nature of the substance to be described, and multiplicity of objects being denoted by their number. Nor have the rude specimens of sculpture furnished more information; with their paintings, they have been neglected or destroyed by their barbarous invaders. To traditions only we therefore look for the early history of the Peruvian race; and of these one only is worthy of record, and that merely because it is connected with the civil policy of their government.

The Peruvians affirmed, that their earliest state was that of small independent tribes who knew of none of the arts or comforts of social life. They had struggled for several ages with the hardships and calamities which are inevitable in such a state; and, when no circumstance seemed to indicate the approach of any uncommon effort towards improvement, we are told that there appeared on the banks of the lake Titicaca, a man and woman of majestic form, and clothed in decent garments. They declared themselves to be Children of the Sun, sent by their beneficent parent, who beheld with pity the miseries of the human race, to instruct and to reclaim them. At their persuasion, enforced by reverence for the divinity in whose name they were supposed to speak, several of the dispersed savages united together, and, receiving their commands as heavenly injunctions, followed them to Cuzco, where they settled, and began to lay the foundations of a city.

Mango Capac and Mama Ocollo, for such were the names of those extraordinary personages, having thus collected some wandering tribes, formed that social union, which, by multiplying the desires and uniting the efforts of the human species, excites industry and leads to im-

provement. Mango Capac instructed the men in agriculture, and other useful arts. Mama Ocollo taught the women to spin and to weave. By the labour of the one sex, subsistence became less precarious; by that of the other, life was rendered more comfortable. After securing the objects of first necessity in an infant state, by providing food, raiment, and habitations, for the rude people of whom he took charge, Mango Capac turned his attention towards introducing such laws and policy as might perpetuate their happiness; and it is clear that in the performance of this task he left great and incontestible evidence of his powers as a legislator. In all early states of society, we observe that it is impossible to influence mankind by motives of expediency, or to make them comprehend (much less act on the conviction) that the convenience of the few must ever be subservient to the good of the many. Law, therefore, was always at first leagued with religion; and, united, their effect was powerful and salutary.

It seems that this was understood by the first civilized ruler of the Peruvians. He described himself and consort as *Children of the Sun*. The law, and the right of governing, he professed to have received from the great luminary which the Peruvians worshipped as the Eternal Being. He fixed clearly the right of descent; and, to preserve the sacred majesty of the royal blood, the sons of the inca always married their sisters. The sway of the inca was of course absolutely despotic, for his word was the mandate of heaven; and, for the same reason, treason or faction could not possibly arise in the state. Even the punished criminal could scarcely murmur against a sentence which his creed must have taught him came directly from the Ruler of all. This system of government (impregnable while religion held its sway) released the Peruvians from all civil dissensions and calamities, and was in the highest degree calculated to ensure the gradual progress of civilization; and fortunately this improvement acquired strength from the happy disposition of the succeeding incas; for, though twelve in number, the uniform character of their reign was that of mildness and clemency.

Agriculture, so essential to the well-being of the community, was much encouraged by the incas. The children of the sun cultivated a field near Cuzco with their own hands. All the lands capable of cultivation were divided into three parts: one was consecrated to the Sun and to the rites of religion; the second belonged to the inca, for the support of government; the third and largest share was reserved for the maintenance of the people, among whom it was parcelled out. Neither individuals, however, nor communities, had a right of exclusive property in the portion set apart for their use. They possessed it only for a year, at the expiration of which a new division was made in proportion to the rank, the number, and exigencies, of each family. All those lands were cultivated by the joint industry of the community. The people, summoned by a proper officer, repaired in a body to the fields, and performed their common task, while songs and musical instruments cheered them to their labour. Even the calamity of an unfruitful season was but little felt; for the product of the lands consecrated to the Sun, as well as that of those set apart for the incas, being deposited in storehouses, it remained as a stated provision for times of scarcity.

The progress of the Peruvians in the arts was rapid. Their skill in architecture is exemplified in the temple of PACHACAMAC, (which see,) and in the great roads from Cuzco to Quito, extending above 500 miles in length, and their aqueducts. They displayed much ingenuity in smelting ore, and refining; in making mirrors, and various implements both for war and labour.

Considering these happy constitutions, the mild and gentle disposition of this people, so favourably contrasted with that of the sanguinary Mexicans; the frank and generous spirit with which they admitted into their bosoms the deceitful Spaniards; we cannot sufficiently regret the early

early discovery of their country. Had it been reserved for later periods, what a high degree of civilization might the natives have attained, and how much valuable information might have been obtained by conquerors less barbarous and ignorant than were the Spanish adventurers.

It is not to be supposed that the Peruvian system was free from faults. Their advancement in the arts was much retarded by their detached and independent mode of life. Their only city was Cusco; every-where else they lived in detached and distant habitations; consequently every man exercised the known arts indiscriminately. The separation of professions did not obtain; and therefore improvement was slow. A great defect in their criminal jurisprudence was the capital punishment of all offences indiscriminately. This arose from the religious nature of their legislature. All offences being considered as insults to the Deity, and an insult to the Deity being of course a crime worthy of death, the slightest offence cost the life of the offender. The cruel custom, too, of immolating the attendants of a grandee at his funeral, under the absurd notion of their waiting on him in the next world, was prevalent in Peru. On the death of Huana Capac, above a thousand victims were doomed to accompany him to the tomb.

There were four orders of people in Peru; viz. 1. The royal race, or children of the sun. 2. The *orejones*, or nobles, who were allied to the first, and were so named either from the ear-rings they wore, or from the largeness of their ears, which was a mark of royal descent; for Garcilasso de la Vega, himself a descendant from the incas, says, that "Mango Capac was particularly remarked on account of his ears, which were so large as to be hardly credible to those who had not, as I have, noted them in the persons of his descendants." 3. The commonalty, or freemen. 4. The *yanacunas* or slaves, whose garb and houses were of a form different from those of the freemen, or bulk of the people.

The religion of the Peruvians consisted chiefly in the worship of the Sun; but some have asserted that the belief in another and superior Being obtained very generally among them. It is not easy, at this period of time, to establish the truth: but certain it is, that they built a magnificent temple and worshipped a deity under the title of *Pacha Camac*, a word which, according to Garcilasso, signifies the "Soul of the World." On the other hand, they offered to this deity, even if distinct from the Sun, the same sacrifices and prayers as were offered to that luminary. Upon the whole, therefore, we should consider that there was latitude and variety of belief, according to the ignorance or information of the different worshippers; but that the common people did very generally worship, as the great God, the Sun only.

Besides the Sun, the Peruvians worshipped the Moon (according to their creed his wife and sister), under the title of *Mama Quilla*; but they did not hold feasts, or prepare sacrifices, for her especial honour. They contented themselves with simple prostrations and prayer; a species of adoration which they likewise paid to the planet *Chajca* (Venus), an attendant of the Sun; to Thunder and Lightning, the ministers of his anger; and to the Rainbow, with which likewise he seemed to have some immediate connexion. The priests were all the younger sons of the incas; and consequently, as they were descended from the Sun, received in their own persons some portion of the public worship. Many were the ceremonies which were performed in honour of the Sun by these his reputed children; and, though they had effectually abolished the sacrifices which some have feared were practised among the Peruvians before their civilization by Mango Capac, yet they consecrated their altars with the blood of animals. Their chief ceremony was called the *Great Raymi*, or Feast of the Sun; this was so curious, that we shall detain our readers with a short account of it.

It began by the priest procuring fire from the "hand of

the Sun." This was done in the same way as we create fire by condensing the solar rays into a focus by the means of a lens. The instrument used by them was a concave and highly-polished vessel, which reflected the solar rays towards a little mass of cotton, which of course took fire. The fire thus obtained was used to burn the victims, and to cook the food which was eaten during that day's festival; and was then taken to the Temple of the Sun, and to the house of the Chosen Virgins, whose care was to preserve it unextinguished. If the Sun did not shine on the first day of the feast, the Indians kindled fire in the ordinary way, but not without dire prefaces as to the anger of the Sun, who had thus refused them fire "from his own hand."

The next step was the procession. This was formed by the chief officers, *curacas* or *paciques*, of the empire, and was at once grand and grotesque. Some of them were clothed in vestments embroidered with gold, and their heads were crowned with garlands of the same. Some were clothed in the skins of lions. Some represented angels, being adorned with feathers of a very large and sacred bird called *Cuntur*, so as to appear as if they had wings. There were some also who disguised themselves in a variety of masks, some comic, others horrible, and who, making hideous and discordant sounds both with their voices and by instruments, displayed in antics and ridiculous postures the most laughable fooleries. Lastly, all the nobles wore their arms, as bows, javelins, battons, &c. and the spoils of war. The sacrifices then took place in the presence of the assembled people, and of strangers or visitors. Afterwards, with much ceremony, the inca, having awaited the first dawn of day, and kneeling, having kissed the air in the direction of the Sun, he offered to that luminary a libation in a ponderous golden vase. The procession now moved towards the temple, but stopped within two hundred paces of its gate: the inca alone and his family advanced, and offered vases to the deity of the temple. The priests then received vessels or presents from all the nobles in the procession, which they likewise deposited in the temple. The sacrifices having been resumed, and auguries established from them, the Feast of *Raymi* ended by eating a peculiar and sacred bread called *cancu*, and the flesh of the slaughtered victims. Drink was abstained from until some hours after the repast. We present our readers with an engraving of the above-mentioned grotesque procession.

The most magnificent of all the Temples dedicated to the Sun was that erected at Cusco, a city which had been founded by Mango Capac himself. According to Garcilasso (from whom the following description is taken), this temple, for its beauty and richness, exceeded all that imagination can conceive. It was built, however, of wood, and was covered with thatch, (for tiles and bricks were unknown;) but the walls were completely wainscoted with plates of gold. The great altar was situated towards the eastern wall of this superb edifice, and was surmounted by the figure of the Sun. This figure, which covered the whole of the eastern wall, was a large and massive golden plate, carved so as to resemble the painting commonly made by artists of this day, viz. a round human visage surrounded with flaming rays.

On each side of the temple were arranged, in the order of their succession, the bodies of the deceased kings, embalmed in such a manner (it is said) as to appear alive. They were seated on thrones of gold, raised on pedestals of the same metal; and had their countenances directed towards the floor of the building; excepting however Huana Capac, the twelfth and last inca of the race of Mango Capac, whose eminent virtue and kingly qualities had procured him the honour of sitting on the western side of the building; that is to say, with his face turned directly towards the image of the sun. The gates of the temple were many, and all covered with plates of gold; and the principal entrance was from the north. Round
the

the walls was carried an immense mass of gold in the form of a garland, or crown, not less than an ell deep.

Near the temple stood a cloister or gallery of four sides, the roof of which was surmounted by a large golden crown, similar to that which surrounded the temple. Surrounding this building were five large square tents, or tabernacles, surmounted with roofs of a pyramidal form. The first of these, which was nearest to the great temple, had its gates and walls covered with plates of silver; and here the Moon, "the wife and sister of the sun," under the name of *Mama Quilla*, was worshipped. Her figure was similar to that of the Sun, except that it was made of silver, and had the face of a woman, instead of a man. As, in the temple of the sun, the embalmed incas occupied the spaces to the right and left of the father, so here the wives of the incas occupied each side of "Mother Moon," excepting only *Mama Ocollo*, who sat opposite the Moon, as her son did opposite the Sun; an honour conferred on this female in consideration of her being the mother of *Huana Capac*.

The next apartment was for the worship of *Chasca*, or Venus, also called the Page of the Sun, because she was said to appear sometimes before and sometimes after him; also for that of the Pleiades, and of the other stars, who were all called the "Servants of the Moon." This apartment and its portal were covered with silver, like that of the Moon; and its roof resembled the heavens, some with stars of various magnitudes.

The third apartment was for the reception of Thunder and Lightning; and, as these were called the "Servants of the Sun," their habitation was decorated in the manner of his temple; that is to say, with plates of gold. They could not of course paint or carve any figure of these phenomena; but they worshipped them under the name of *Yllapa*, the meaning of which is not known.

The fourth apartment they dedicated to the Rainbow. As they found the Sun produced this appearance, they clothed its habitation in the solar splendour of gold; but they farther adorned it with an image of the rainbow itself, painted with various hues, and extending from one end of the wall to the other. The Peruvians always shut their mouth when the rainbow appeared, because they believed that, if they did not, their teeth would presently decay, and become rotten.

The fifth apartment was for the use of the high priest and the other priests, who were all to be of the royal blood of the incas. Here the sacrifices and other concerns of the temple were arranged; and here also audience was given by the inca; but it never was used to eat, drink, or sleep, in.

One remarkable circumstance remains to be noticed; which is, that the gods of Quito, and of all the other nations which had been subdued by the incas of Peru, were lodged in this grand temple at Cusco. These gods might be worshipped even in the presence of the Sun; but upon certain conditions. It was required that the votary should first worship the Sun as the Supreme Being; and afterwards he might pray to his own peculiar divinity. Such was the politic toleration of the incas. They were of opinion, that, if not persecuted, the vanquished nations would insensibly withdraw from their absurd worship, and conform to the established religion. In fact, the worship of the Sun had increased, and would have soon annihilated that of the foreign idols, had not the invasion of the Spaniards involved all in one common ruin. And we are of opinion, that some of the figures in the procession, which we cannot otherwise explain, might represent, either seriously or ludicrously, the symbols of the ancient worship of the barbarous nations, then fast decaying, since all these went to worship in one grand temple.

After the conquest of Peru by the Spaniards, these processions, as it may be supposed, were first discouraged, and afterwards prohibited; for the Spaniards would naturally wish to obliterate all remembrance of the former customs and religion. Add to this, the decline of the numbers

of native Peruvians by persecution, and the forced conversion of many more to *Spanish* Christianity. Still they cherished a love for these processions, and were sometimes indulged in the renewal of them, though at length they may be said to have lost their object; for there are now very few worshippers of the Sun at Lima or at Cuzco; and indeed the native unmixed Indians are reduced from eight millions, of which they consisted in 1551, to little more than half a million. (Present State of Peru, 1805.)

However, as the kings of Spain still call themselves Incas of Peru, it is upon the accession of a monarch to the crown of Spain and of the Indies, that the Peruvians are more particularly indulged with the permission to celebrate the inca-king's accession by a revival of some of their ancient ceremonies. The last of these was in the year 1789, upon the coronation of the late Charles IV. Willing to preserve some traces of costumes highly beautiful, but which will soon be unheard of, we have selected some of the most picturesque figures displayed in that procession for separate engravings.

Plate II. represents the Inca and his Queen.

Plate III. A Virgin or Priestess of the Sun; together with an Amazon or Female Warrior of the Yurimagua tribe, who formed part of a Procession at the Entry of a new Viceroy into Lima, July 14, 1544; and a female Indian habited as the Minerva of Peru, introduced in the festival of 1789.

Other drawings we have seen of personages who have figured in the recent processions, particularly that of 1789; but we are obliged to confess, that in them (as indeed in the last-mentioned figure on our Plate) the Spanish costume is so mixed with the Peruvian, that the reader would not admit them as representations of what they profess to be. This is not to be wondered at; for the Peruvian dress is now rarely seen; and we therefore refrain from giving any more figures of Spanish Peruvians or Peruvian Spaniards.

After the abolition of the Peruvian government, and that long reign of anarchy, or of military despotism, which succeeded, the Spanish government was settled in the following form. The sovereign power was delegated to a *viceroy*; he enjoyed all the privileges of royalty, appointed his own officers, and gave audiences like a king. He resided usually at LIMA, (which see.) The viceroy was also president of the *royal audience*. This was a court formed on the model of the court of chancery in Spain. We have already alluded to its establishment by the emperor in 1543. To the cognizance of this court, both civil and criminal causes were subjected; and for each peculiar judges were set apart. The Spanish viceroys have often attempted to intrude themselves into this seat of justice, and, with an ambition which their distance from the control of a superior rendered bold, have aspired at a power which their master did not venture to assume. In order to check an usurpation which must have annihilated justice and security in the Spanish colonies, by subjecting the lives and property of all to the will of a single man, the viceroys have been prohibited; in the most explicit terms, by repeated laws, from interfering in the judicial proceedings of the courts of audience, or from delivering an opinion, or giving a voice, with respect to any point litigated before them. In some particular cases, in which any question of civil right is involved, even the political regulations of the viceroy might be brought under the review of the court of audience, which, in those instances, might be deemed an intermediate power placed between him and the people, as a constitutional barrier to circumscribe his jurisdiction. But, as legal restraints on a person who represented the sovereign, and was clothed with his authority, were little suited to the genius of Spanish policy, the hesitation and reserve with which it conferred this power on the courts of audience are remarkable. They might advise, they might remonstrate; but, in the

J. Pass sc

Virgin of the Sun.

Female Warrior.

event of a direct collision between their opinion and the will of the viceroy, what he determined must be carried into execution, and nothing remained for them but to lay the matter before the king and the council of the Indies. But to be entitled to remonstrate, and inform against a person before whom all others must be silent and tamely submit to his decrees, was a privilege which added dignity to the courts of audience. This was farther augmented by another circumstance. Upon the death of a viceroy without any provision of a successor by the king, the supreme power was vested in the court of audience resident in the capital of the viceroyalty; and the senior judge, assisted by his brethren, exercised all the functions of the viceroy while the office continued vacant. In matters which come under the cognisance of the audiences, in the course of their ordinary jurisdiction, as courts of justice, their sentences are final in every litigation concerning property of less value than six thousand pesos; but, when the subject in dispute exceeds that sum, their decisions are subject to review, and may be carried, by appeal, before the royal council of the Indies. In the year 1776, an officer called the *regent* was attached to the royal audience. It was then composed of this officer, eight *oidors* or judges, four *alcaldes* of the court, and two *fiscals*; the governor, as before, being president. It was also divided into three chambers. There was also a superior junta of the royal treasury, composed of the viceroy, the regent of the court of audience, the dean of the tribunal of accounts, and other officers. The tribunal of accounts was for determining causes of the revenue. For the government of the remoter provinces, which we shall presently describe, the governor had under him seven intendants and fifty-two sub-delegates.

As we have mentioned the Council of the Indies, as a court of appeal, we must devote a few words to that important tribunal, though it was not held at Lima, nor even in America. In this council, one of the most considerable in the Spanish monarchy for dignity and power, was vested the supreme government of all the Spanish dominions in America. It was first established by Ferdinand V. in the year 1511, and brought into a more perfect form by Charles V. in the year 1524. Its jurisdiction extends to every department, ecclesiastical, civil, military, and commercial. All laws and ordinances relative to the government and police of the colonies originate there, and must be approved of by two-thirds of the members, before they are issued in the name of the king. All the offices, of which the nomination is reserved to the crown are conferred in this council. To it each person employed in America, from the viceroy downwards, is accountable. It reviews their conduct, rewards their services, and inflicts the punishments due to their malversations. Before it is laid whatever intelligence, either public or secret, is received from America; and every scheme of improving the administration, the police, or the commerce, of the colonies, is submitted to its consideration. From the first institution of the Council of the Indies, it has been the constant object of the catholic monarchs to maintain its authority, and to make such additions from time to time, both to its power and its splendour, as might render it formidable to all their subjects in the new world.

As the king is supposed to be always present in his Council of the Indies, its meetings are held in the place where he resides. Another tribunal has been instituted, in order to regulate such commercial affairs as required the immediate and personal inspection of those appointed to superintend them. This is called *Casa de la Contratacion*, or the house of trade, and was established in Seville, the port to which commerce with the new world was confined, as early as the year 1501. It may be considered both as a board of trade and as a court of judicature. In the former capacity, it takes cognizance of whatever relates to the intercourse of Spain with America; it regulates what commodities should be exported thither, and has the inspection of such as are received in return.

VOL. XIX. No. 1341.

It decides concerning the departure of the fleets for the West Indies, the freight and burden of the ships, their equipment and destination. In the latter capacity, it judges with respect to every question, civil, commercial, or criminal, arising in consequence of the transactions of Spain with America; and in both these departments, its decisions are exempted from the review of any court but that of the Council of the Indies.

Such is the great outline of that system of government which Spain had established in her American colonies. To enumerate the various subordinate boards and officers employed in the administration of justice, in collecting the public revenue, and in regulating the interior police of the country; to describe their different functions; and to inquire into the mode and effect of their operations; would prove a detail no less intricate than minute and uninteresting.

In the early periods of their subjugation, the Peruvians were much distressed by the parcelling out of the country into *encomiendas*, a sort of feudal benefices which were distributed on certain conditions to the Spaniards. The *encomendero*, or holder of the benefice, besides owing military service to the state, was bound to reside on his *encomienda*, to protect and defend the Indians living upon it, and to see them properly instructed in the principles of religion. The Indians were bound in return to pay him a stipulated tribute; but so far were they from being reduced to slavery, that he could not lawfully exact from them any personal service whatever. The system of *encomiendas* was introduced by the emperor Charles V. and, though variously modified and changed by his successors, it was not finally abolished till the reign of Philip V. All accounts agree, that, however well intended, it was in its effects oppressive and injurious to the Indians. The *encomendero* was continually exacting from them more than he was entitled to demand, and doing for them less than he was bound to perform.

The system of *encomiendas* was followed by the still more fatal plan of *repartimientos*; according to which the government, in consideration of the limited faculties and improvident character of the Indians, directed the *corregidor* or judge of the district in which they lived, to supply them with cattle, seed-corn, instruments of agriculture, and even clothes and other necessaries of which they were in want, according to his discretion and opinion of their necessities; but at a price regulated by law, and without any profit to himself. The abuses to which this system must have led, may easily be conceived. They became at length so enormous, as to call again for the interference of the government, which, after mature deliberation, determined on abolishing the *repartimientos*. This was accordingly done in 1779, and the Indians were left to manage their own concerns as they pleased. A personal tax or tribute alone was exacted, which was extremely moderate, and was regarded rather as a distinctive mark and token of vassalage than as a serious burden. Indians of noble birth enjoyed an exemption from tribute, and were equally qualified with Spaniards to fill all kinds of offices under the crown. Where the Indians were the sole inhabitants, they were governed by their own magistrates or *caziques*; and none of the other casts were permitted to encroach upon their lands, or to settle among them, without their consent.

The Indians were subject to another burden, the *mita*, or compulsory labour in the mines. But this was declared abolished by the Cortes in the year 1812. It was not considered so hard an impost as might be expected; for the wages allowed were often high. See the article LONDON, vol. xiii. p. 305.

The language of Peru is still retained by this greater portion of the inhabitants, who discover so strong an aversion to that of their conquerors, that the clergy and the other Spaniards settled among them learn and commonly use their dialect, with the addition of such Castilian words as signify things not known in Peru at

the period of the conquest. The language, called the *Quichua*, or Language of the Incas, is said to be harmonious, and its grammar as variegated and artificial as that of the Greek, though the sounds *b, d, f, g,* and *r,* are not to be found in it. A grammar of the tongue has been composed for the instruction of the clergy who are destined to labour in their conversion. From this it appears, that the nouns are declined by altering the termination; as *runa*, a man; *runap*, of a man; *runapac*, to a man, &c. The verbs have also moods and conjugations, the terminations extending to great length.

The *population* of Peru, as now constituted, is quite of a mixed kind. The Spaniard, the native Indian, and the Negro imported from Africa, form by their union a motley race. Of these, the Mestee, or Mestizo, the offspring of the Indian and Spaniard, holds the next rank to the Spaniard, and with the Indian forms the chief population of Peru. The following Table exhibits the most accurate view we can obtain of the population of Peru, and of the proportion the different races bear to each other.

Intendencias.	Number of Departments.	Missions.	Pueblos, or Parishes.	Clergy.	Male Religions.	Female Religions.	Nuns.	Spaniards.	Indians.	Mustees.	Free Negroes.	Negro Slaves.	Total.

Although the number of Spaniards is here stated at 136,311, nearly one-eighth of the whole population; it must be considered, that in this number is included those who, after five mixtures with the white race, acquire the privileges of whites, though their complexions are as dark as those of the Indians or Negroes. Of those denominated Spaniards, it is not estimated that one-tenth are natives of Europe.

Of the number of Negroes given in the Table, more than one half are free blacks; for, to the honour of the Spanish character, it ought to be stated, that in all their American possessions it has ever been the established practice to encourage manumissions. A slave had a right by law to his freedom as soon as he could repay to his master the sum he had cost. In order to enable the slave to do this, he was not only allowed the undisturbed enjoyment of the Sabbath, either for rest, or for religious purposes, or for his own emolument, as he might like best, but he was allowed also one day in the week for the cultivation of his provision-grounds; his master being entitled to the labour of the other five. As soon, however, as the slave, by his industry and frugality, had accumulated the fifth part of his value, it was usual for the master, on being paid that amount, to relinquish to the slave another day of the week, and so on till he had repaid the whole of his original cost, and thus became altogether free. He continued, however, in some cases, during the days which were his own, and even after his complete emancipation, to labour for hire in his master's service. By this process, not only was the master's capital replaced without loss, but a peasantry was formed around him which had learned by experience the happy effects of industry and frugality, and were therefore industrious and provident. Notwithstanding this liberal policy, the enfranchised slaves have never been known in the Spanish possessions to rise against their former masters, or to excite those who were still slaves to seek any other method of deliverance than they themselves had pursued; whilst they formed, by their number and hardihood, a valuable means of defence from foreign aggression. In consequence of this admirable system, the whole negro population of the Spanish possessions were so rapidly approximating to emancipation, that, about the year 1790, the number of free blacks and people of colour somewhat exceeded, in all of them, the number of slaves. Since that time, in Cuba alone, in consequence of the immense importations from Africa into that island, has this proportion been diminished; but

even there the free black and coloured population amounts to from a third to a half of the number of the slaves. In the other transatlantic possessions of Spain, their number has gone on progressively increasing, until now slavery can hardly be said to have an existence there. And this happy consummation has been effected without any commotion, and with the ready concurrence of the master, who has not only not been a loser but a gainer by the change. This is one of the regulations which Mr. Fowell Buxton has proposed to be adopted in our West-India colonies for the relief of the slaves, and preparatory to the total abolition of slavery itself.

As the names of the different *intendencias*, or provinces of Peru, are seen in the preceding Table, it remains to give some particulars relating to them.

1. The intendency of *Lima* is chiefly remarkable for containing within its limits the capital of the vice-royalty, from which it derives its name, and the excellent port of Callao, the chief mart for the commerce of Peru. The capital is situated in latitude $12^{\circ} 2' 25''$ S. and in longitude $77^{\circ} 7' 15''$ W. from Greenwich. The buildings are spacious but low, having only one story; they are built of wooden frame-work, interlaced with canes, plastered over with clay, and painted to imitate stone. The city is supplied with fresh water by a rapid stream that passes through it, which is received into reservoirs and fountains in various parts of the city. The viceroy's palace, the cathedral, the town-house, and archiepiscopal palace, form a square, and are said to be magnificent piles. In former times, the entrance of a new viceroy was celebrated by a display of ingots of silver, with which one of the streets was completely paved; and the quantities of the precious metals displayed in the churches, and in their religious processions, are said to have exceeded what was to be seen in any of the Catholic countries of Europe. The country immediately around the city, being well irrigated, is fruitful; and fish, meat, and poultry, are abundant.

Callao, formerly called *Bellavista*, is the port of Lima, and, as has been before mentioned, the only good harbour in Peru. It is defended from the winds, which blow always from the south, by the Island of St. Lawrence; to the north of which, in smooth water, is good anchorage, under the protection of the guns of the strong forts. The depth of water is sufficient for the largest ships; the means of loading and discharging them are easy; and from the river Rimac the shipping easily obtain a supply of fresh water. As there is but little rise of tide, there are

are no docks; and vessels that need repair can only be careened. It is in south latitude $12^{\circ} 3' 42''$, and west longitude from Greenwich $77^{\circ} 14'$.

The other towns are Guara, Chancay, Canete, Ica, Pisco, and Nasca, none of which, except Ica, contain more than 1500 inhabitants, of all descriptions. There are few mines in the intendency of Lima that are worked; the chief is that of Conchaputa, in the mountains of Guara-chiri, which yields some silver, and which would also, if the roads would allow of it, supply the capital with coals. Antimony and cobalt are likewise to be found in the same district.

2. The intendency of *Cusco* lies on both sides of the Andes, and partakes of that great variety of climates which is produced by the different elevations and aspects of that prodigious range of mountains. Though the cold is so intense as to forbid human residences on the summits, or cordilleras, yet the chief places which are inhabited enjoy a mild and temperate climate. It is bounded on the north by the great river Apurimac, on the east by unreclaimed countries, on the west by the provinces of Tarma, Guancavelica, and Guamanga, and on the south by Arequipa and the vice-royalty of La Plata. This is the chief seat of what manufactures of woollens and of leather exist in Peru; as both sheep and cows are here more abundant than in any other part of it. The district of Cannas is celebrated for breeding mules; of which animals more than 30,000 are annually sent to the towns on the coast. The agricultural productions generally partake rather of the character of those of the temperate than the torrid zone; wheat, barley, and other European grains, forming the chief articles of cultivation. There are many silver-mines, and some few washing-places for gold. The principal of the former are at Carahuasi, near the capital, in the district of Cotabamba, in Condonoma, Aymaraez, and especially in the province of Lampa.

The chief city of the intendency of Cusco has the same name, and is in south latitude $13^{\circ} 25'$ and west longitude $71^{\circ} 15'$. It is surrounded by the mountains of Sanca on its north and west sides, and has a beautiful plain to the south, through which the river Guatanay, which passes the city, runs. On the mountain to the north of the city are the remains of a famous fortress of the incas. The internal works are in ruins, but a great part of the wall is still standing. Cusco is at this time a large city, containing 32,000 inhabitants, three-fourths of whom are Indians, who are industriously employed in the manufactures of woollen baize, of cotton, and of leather. The number of Spanish families is small. The cathedral is a noble pile of building, of stone; and there are also six parish-churches, nine convents, and four nunneries. The chief of these towns are Abancay, Urcos, Calca, Cotabamba, Tinta, and Lampa, none of which contain so many as 1500 inhabitants. The difficulty of communication between these places is such as to forbid much intercourse. The rapid streams descending from the Andes have worn such numerous and such deep ravines, as are only to be crossed, with great risk, by bridges of ropes; and frequently are passed by suspending the travellers in large baskets from cables stretched across fissures, along which they descend from the higher to the lower banks of the tremendous precipices.

3. *Arequipa* is an intendency stretching along the borders of the Pacific, but extending sufficiently inwards to contain a large mountainous district within its limits. Its southern boundary is the inhospitable desert of Atacama. Its plantations yield maize, sugar, and coffee. The vineyards are extensive, especially those of Moquehua, which produce a delicious red wine, and the brandy distilled in this district supplies an extensive circle of the mountainous countries. The most celebrated of the silver-mines are situated on the southern part of this intendency; those of Huantajaya, near the small port of Yquique, are surrounded with vast beds of rock-salt, in

a district totally destitute of water, and where provisions are scarce; but, as the silver is found in native masses, it has produced usually about 100,000 marks annually. The district of Caylloma contains several mines of silver, but they are very imperfectly worked; for they are in a very high elevation, and consequently in a climate most intensely cold; and the surrounding country produces but few means of subsisting the labourers.

The city of Arequipa, the capital of this intendency, is situated in the beautiful valley of Quilca, about 60 miles due east from the port of Atranta. It is in $16^{\circ} 16'$ of south latitude, and $71^{\circ} 58'$ west longitude. See *AREQUIPA*, vol. ii.

In Condesuyos are mines both of gold and silver, though slightly worked; as many of the inhabitants have found more profitable labour than mining, by raising silk-worms, and by breeding the cochineal-insect. The other towns of most consideration are Camana, Ocana, a small bad port, Caylloma, Moquehua, Arica, and Tacna; none of which are either populous or rich, and are chiefly inhabited by Indians.

4. The intendency of *Truxilla* is the most northern, as well as the most extensive, division of Peru. The face of the greater part of the district has all the predominant features of the Arabian desert. From Tumbes, the boundary, to the capital of its department, Piura, a distance of more than 200 miles, there is but one small Indian village. No water is to be found in any other place; and that indispensable article must be conveyed in skins, on mules, for the use of travellers. In this sandy desert, the most experienced guides sometimes lose their way, and the bodies of passengers are occasion-buried under the waves of shifting sand. There are, however, some spots within the intendency that enjoy a high degree of fertility; as is the district of Caxamarca, situated between two ridges of the Andes. At this place are the remains of the ancient Palace of Atabalipa, from whence Pizarro directed his operations, and where that monarch was killed; and a family descended from the incas, reduced to a state of comparative indigence, occupies this ancient residence of their royal ancestors.

The chief mines within the intendency are those of Chota, near the limit of perpetual snow, being 13,800 feet above the level of the sea; of Micuipampa, 12,000 feet; and some at Patay which yield both gold and silver.

There are two cities in the intendency. Truxillo, the capital, is the see of a bishop, and the seat of the courts of justice. The inhabitants are about 6000, principally rich Spaniards, who indulge in considerable show and luxury. Piura contains about 7000 inhabitants, chiefly Indians. The other towns, Tumbes, Lechura, Payta, and Lambayeque, scarcely contain 1000 inhabitants each, who are in a low state of indigence.

5. *Guamanga*, or Huamanga, is an intendency wholly internal, surrounded by other parts of Peru. From its elevation on the sides of the Andes, it enjoys a mild and temperate climate. It is much intersected with streams, or rather torrents, which have worn deep chasms in the friable soil, and prevent easy communication between its several districts. It yields excellent corn and fruits, and the wool of the sheep is here made into baize for clothing the inhabitants of the colder districts. In the mountains are found herds of huanucos, or Peruvian camels, employed as beasts of burden in the colder regions, and whose wool is used in the manufactories. There are also many cows and sheep of the European breeds, reared within the district. It is the chief country for the growth of the coca, which serves to the natives of Peru the same purpose as the betel does to those of the East Indies. There are mines of lead, gold, and silver; but their products have much declined of late years. The capital, Guamanga, situated in south latitude $12^{\circ} 50'$, and west longitude $77^{\circ} 56'$, is a well-built city, of considerable extent. Its population amounts to about 26,000, of whom the greater

part are Indians. It is the see of a bishop, contains a cathedral, a university well endowed, and several churches and convents. There is no other place in the intendency meriting the name of a town, as three-fourths of the inhabitants are either occupied in cultivation or in pasturage.

6. The whole of the intendency of *Guanacavelica*, or Huancavelica, is situated in the mountains in a climate severely cold, and is thinly peopled. The chief value of this province is derived from the important mines of quicksilver which it contains. The celebrated mine of Santa Barbara is 13,800 feet above the level of the sea. In the process of excavating it, three stories of galleries, one over the other, have been constructed, which penetrate the mountain in different directions, according as the veins of the mineral are found to run. The lowest of these was found to contain red and yellow sulphureted arsenic, which, proving fatal to many of the labourers, was forbidden to be worked. The chief produce of the mine has been obtained in the form of cinnabar, from which, by distillation, the mercury is extracted at the rate of one pound of mercury from every fifty pounds of cinnabar. But the top of the mine has partly fallen, and has intercepted all communication with the interior. The capital, which gives name to this intendency, is in south latitude $12^{\circ} 45'$, and west longitude $74^{\circ} 46'$. It was, when the mine was actively worked, a populous place, but at present contains only 5000 inhabitants. It is built almost wholly of tufa, which is found in abundance in its vicinity. There are scarcely any places that deserve to be called towns; as the few inhabitants are scattered at great distances from each other in thinly-peopled villages or hamlets.

7. The intendency of *Tarma* is chiefly situated on the Andes, and generally partakes of the severity of climate which lofty elevation creates. The small portion of it which is on the plain yields wine; but the great portion of the inhabitants are supplied with animal and vegetable food from the mountainous regions, which, at a moderate height, produce corn and potatoes, and at a greater elevation breed considerable flocks and herds. The mines most productive of silver are within this intendency. The most eminent are those of Lauricocha, or, more properly called, collectively, the Mines of Pasco. Nearly one-half of the silver which Peru yields is extracted from these mines. They are at an elevation of 13,000 feet above the sea. The veins of the mineral are near the surface, the shafts being only from 90 to 400 feet in depth; the metalliferous bed is stated to be more than 15,000 feet in length, and upwards of 7000 in breadth, and is capable of yielding more silver than any even of the mines of Mexico.

The favourable circumstances attending these mines, and the belief, that, if the water could be cleared by a steam-engine, the profits would be immense, induced a party of Englishmen to convey a powerful engine to the spot. After many interruptions and much delay, it at last reached these mines; but the country was in too turbulent a state to admit of the operations being carried on; which, with the unpopularity attached to the undertaking, from supposing it would lessen the employment of labourers, has caused it to miscarry; and the water has so gained, that the produce has declined very much since the commencement of the civil wars.

The greatest portion of the gold found in Peru is taken from the mines of Pataz, and of Huilias, in this province. Tarma, the city which gives its name to the intendency, is in $11^{\circ} 35'$ south latitude, and $75^{\circ} 17'$ west longitude. It contains about 5500 inhabitants, some of whom find employment in making baize. No other place contains so many as 1000 people.

The Peruvians seem to have degenerated since their subjection. They appear timid, dispirited, and melancholy in their temperament; but severe and rigid in the exercise of their authority; wonderfully indifferent to

the general concerns of life, and neither anxious nor careful to avoid death. They stand in awe of their white masters, but secretly dislike and shun their society. They are reputed to be of a distrustful disposition; and, though robust, and capable of enduring great fatigue, excessively indolent. Their habitations are destitute of every convenience and accommodation, and very filthy. Their dress is poor and mean; their food coarse and scanty; and their greatest gratification seems to be an excessive indulgence in the use of spirituous liquors. They observe with docility the external rites and ceremonies of the Catholic worship, though it is said they indulge in secret an attachment to the ancient superstitions of their nation.

As to the manners of polished society in Peru, we are told, that at the theatre at Lima the most fashionable ladies stand up in the front boxes, and light their cigars by the chandeliers; so that the house is continually filled with smoke.

The country is observed to abound more in women than in men, which is somewhat remarkable, as those causes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from Europe than women. But there are many families in which there are a number of daughters, without one son among them. The women enjoy a better state of health than the men, which may be owing in some measure to the climate, and more particularly to the early intemperance and voluptuousness of the other sex.

There is no malady peculiar to these countries, and those of our climate seldom prevail there. An European vessel, however, in 1719, brought thither an epidemic disorder, which carried off a great number of Spaniards and Mestees, and above 200,000 Indians. A more fatal present still, which these people have received in exchange for their gold, is the small-pox. It showed itself here, for the first time, in the year 1588; and has not failed since to make, at intervals, inexpressible ravages. But the practice of vaccination has at length been extended to them.

The Creoles are well made, of a proper stature, and of a lively and agreeable countenance. The Mestizos are also in general well made, often taller than the ordinary size, very robust, and have an agreeable air. The Indians, both men and women, are commonly low of stature, though strong and well-proportioned; but more natural defects are to be found among them than in any of the rest. Some are remarkably short, some idiots, dumb, or blind. Their hair is generally thick and long, which they wear loose on their shoulders; but the Indian women plait theirs behind with a ribbon, and cut that before a little above the eyebrows, from one ear to the other. The greatest disgrace that can be offered to an Indian of either sex is to cut off their hair; for whatever corporal punishment their masters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interposed, and limited this punishment to the most enormous crimes. The colour of the hair is generally a deep black: it is lank, harsh, and as coarse as that of a horse. On the contrary, the male Mestizos, in order to distinguish themselves from the Indians, cut off their hair; but the females do not adopt that custom.

Rum is commonly drunk here by persons of all ranks, but their favourite liquor is brandy. The disorders arising from the excessive use of spirituous liquors are chiefly seen among the Mestizos; and the lower class of women, both among the Creoles and Mestizos, are also extremely addicted to the same species of debauchery. Another liquor much used in this country is *mate*, which is made of an herb known in all these parts of America by the name of Paraguay, as being the produce of that country. Some of it is put into a calabash tipped with silver, with cold water and sugar. After it has continued there some time,

time, the calabash is filled with boiling water, and they drink the liquor through a pipe fixed in the calabash. It is also usual to squeeze into the liquor a small quantity of the juice of lemons or Seville oranges, mixed with some perfumes from odoriferous flowers. This is their usual drink in the morning fasting, and many use it also at their evening regale. The manner of drinking it appears very indelicate, the whole company taking it successively through the same pipe, it being carried several times round the company till all are satisfied. This among the Creoles is the highest enjoyment: so that, when they travel, they never fail to carry with them a sufficient quantity of it, and till they have taken their dose of mate they never eat.

The vice of gaming is here carried to an extravagant height, to the ruin of many families, some losing their stocks in trade, others the very clothes from their backs, and afterward those belonging to their wives, which they hazard, stimulated by the hope of recovering their own. The common people, the Indians, and even the domestics, are greatly addicted to stealing. The Mestizos, though arrant cowards, do not want audacity in this way; for, though they will not venture to attack any one in the street, it is a common practice to snatch off a person's hat, and immediately seek their safety in flight. This acquisition is sometimes of considerable value; the hats worn by persons of rank, and even by the wealthy citizens when dressed, being of white beaver, worth fifteen dollars, besides the hatband of gold or silver lace, fastened with a gold buckle set with diamonds or emeralds. Robberies on the highway are seldom heard of.

The sumptuous manner of performing the last offices for the dead, demonstrates how far the power of habit is capable of prevailing over reason and prudence; for their ostentation is so great in this particular, that many families of credit are ruined by preposterously endeavouring to excel others; and the people here may be said to toil and scheme to lay up wealth, to enable their successors to lavish honours upon a body insensible of all pageantry.

Their sloth is so great, that hardly any thing can induce them to work. Whatever therefore is necessary to be done is left to the Indian women, who are much more active; they spin and make the half-shirts and drawers which form the only apparel of their husbands; they cook the provisions, grind barley, and brew the beer called *chicha*; while the husband sits squatting on his hams, the usual posture of the Indians, looking at his busy wife. They are indeed an instance of that stupidity in which it is in the power of tyranny to plunge men. They are fallen into a listless and universal indifference. The riches which their country hath offered them, do not tempt them; luxury, to which nature invites them, has no attraction for them. They are even insensible to honours. They are whatever one pleases, without any ill-humour or choice, caciques or matayos, the objects of distinction, or of public derision. They have lost all their passions. That of fear itself has often no effect on them, through the little attachment they have to life. Indolence is their predominant habit. "I am not hungry," they say to the person who would pay them for their labour. They are lively only in parties of pleasure, rejoicings, entertainments, and especially dancing; but in all these the liquor must circulate briskly, and they continue drinking till they are entirely deprived both of sense and motion.

The *chicha* is a liquor made from maize by the following process. The maize, after being soaked in water till it begins to grow, is dried in the sun, then parched a little, and at last ground. The flour, after it has been well kneaded, is put with water into a large vessel, and left for two or three days to ferment. Its taste is nearly that of the most indifferent kind of cider. It is a refreshing, nourishing, and aperitive, liquor; but it will not keep

above a week without turning sour. This, therefore, is a reason for not suffering the liquor to remain long in the cask when once it is tapped. But it is remarkable that the Indian women, whether maids or married, and young men before they are of an age to contract matrimony, are never guilty of excess in this way; it being a maxim among them, that drunkenness is the privilege of none but masters of families, who, when they are unable to take care of themselves, have others to take care of them.

The agricultural productions of Peru are at this time barely sufficient for the subsistence of its inhabitants. In the interior, corn is grown to feed the population; but on the coast the supply has been in a great measure drawn from Chili. Sugar, cocoa, coffee, rice, maize, and the various fruits, suffice for the consumption; but there is no surplus, nor any stimulus to produce it, since in all the countries to which the Peruvians can have access the markets can be as well, if not better, supplied from their own soils. Nearly as much wine is produced as is needed, though some is imported from Chili. Oil, brandy, and rum, are made. The former is, however, generally rancid, from the olives being suffered to become too ripe before they are expressed. The spirituous liquors are strong, fiery, and impure, being distilled in the rudest manner. The various kinds of capscums are cultivated with more attention and skill than any other plants; and, dressed in various ways with garlic, form the most important article of food to the greater portion of the inhabitants. As a substitute for drink, the Indians make use of the leaf of a very pungent plant called *coca*. A small portion of quick lime is wrapped up in it and carried in the mouth. The pungent qualities of these two substances excite a most abundant flow of saliva, and serve to allay the thirst of those who travel over the mountains, or the vast plains of sand, where, for days in succession, no water can be obtained. The natives are so much attached to this mode of allaying thirst, and have such confidence in the general salubrious effect of the plant, that they will not commence the labours of mining till they are satisfied that their employers have in store a quantity sufficient for their use.

The demand for animal food is but small, and hence but little attention has been paid to the breeding, and none to the fattening, of cattle. Neither cows nor sheep are numerous: what are found in the country are the progeny of those brought originally from Europe. In the mountainous districts, between Guamanga and Cusco, both butter and cheese are made; but in the lower country, oil is the universal substitute for the former. Pigs are bred in great numbers in the more hilly districts. The whole coast is well stored with fish of every kind. The natives of the Indian villages on the shore are very dexterous in catching them; and with the addition of capscum and garlic, they form the chief part of their subsistence.

The manufactures of Peru are inconsiderable, and consist chiefly of those homely articles which are required by the poorer classes of the community. On the high land, where warm clothing is necessary, the want is chiefly supplied by a species of long-wooled baize, made from the fleeces of the aboriginal sheep, and in some instances from the wool of sheep of the European breed. In the valleys, and on the coast, where the heat forbids the use of woollens, cotton cloths are made; but of a very inferior texture, from their having yet been no gins introduced, which effectually clear the cotton wool from the seeds of the plant. In dyeing the cloths, whether of woollen or cotton, the natives make use of plants that are scarcely known in Europe, or at least have not been applied to the same purpose. They have a root called *reilbon*, resembling madder, but with a smaller leaf, an infusion of which dyes a good red. A plant called *poquel*, a kind of female southernwood, with green checkered leaves,

leaves, is used for dyeing yellow, as is also the item for dyeing green, both of which are fast colours. A wild indigo yields them a blue dye, and the panque a good black.

What we have to say upon the *commerce* of Peru cannot apply to any period more recent than the beginning of the French revolution, about the year 1789, 90; for, since that time, many ships from Europe, that have failed to the ports of Peru, have found no productions there which would pay any return freight; and they have almost uniformly, after discharging their outward cargoes, proceeded to the port of Gyaquil, where a return cargo of cocoa could be generally obtained on such moderate terms as to pay a profit in Spain, where the demand for that commodity is very extensive.

The Pacific Ocean is by no means favourable to commerce. On the whole extent of coast in Peru there is no harbour except that of Callao, the port of Lima, which can be entered by a vessel of such a size as is fit for the navigation from Europe round Cape Horn. As the wind constantly blows from the southward, varying only as the coast trends, wherever there is a high projecting headland there is shelter, and sometimes good anchorage to the northward of it; as at Ylo, Iqueque, and some other parts. On every part of the shore, the uninterrupted swell from the sea causes such a tremendous surf on the beach, that no communication can be had with the shore, by any such boats as are carried by European ships. The natives have long ago contrived a means of passing this surf, on what is called a *balsa*, whose buoyancy is such as to carry them over the most terrific breakers in perfect security. It is constructed of two skins of the largest-sized seals, which are inflated and lashed side by side. On a small platform fixed on them, the native sits, with a pipe made of the entrails of the seal, communicating to each of the inflated skins, with which he fills them by his breath, as frequently as the evaporation of the wind makes it necessary. On these contrivances, which resemble two enormous bladders, the natives fear no waves or breakers, and frequently proceed to such a distance as to lose sight of land. By the assistance of a paddle, and occasionally of a small sail, these vessels become perfectly manageable at sea; and they have the advantage of being easily carried to their own habitations when not employed on the ocean. The trade, then, up to the time we have mentioned, may be considered under three divisions; viz. that by Cape Horn, that with the ports on the Pacific, and that of the interior with the southern provinces. Since the freedom of commerce in 1778, the principal trade of Peru has been carried on by Cape Horn. The exports and imports have been nearly doubled since the freedom of commerce has been allowed, though several rich provinces have been withdrawn from the viceroyalty.

The *exports* of Peru, in a general view of them, are gold and silver, wine, brandy, sugar, pimento, Jesuits' bark, salt, Vicuna wool, coarse woollens, and some other manufactures of little value; and it receives, in return, European goods, live stock, provisions, tallow, cacao, Paraguay tea, coca-leaf, indigo, timber, cordage, pitch, and copper. As luxury of dress is the predominant passion in Peru, and especially at Lima, silks, superfine cloths, fine linen, &c. form considerable articles of *imports*. Iron is also indispensable in the mines and in agriculture. Most of the linens are from Brittany, with a few from other parts of France and Holland: the cottons, woollens, and silks, are chiefly Spanish. The annual demand for rough iron is 6000 cwt. besides many articles of hardware. Mercury, wax, paper, pepper, saffron, medicines, liqueurs, books, glass, and furniture, form also principal articles of import.

Lima carries on a considerable commerce with various ports of the Pacific. The fertile and opulent kingdom of Chili supplies abundance of grain and fruits, so that its mines, though they produce annually 1,400,000 dollars, are regarded as of secondary importance; the three havens of Valparaiso, Concepcion, and Coquimbo, furnish

convenient outlets for its opulence. Lima annually imports from Chili vegetable products amounting to more than 1,100,000 dollars. Wheat forms the chief article sent by Chili to Peru; but slaves from Africa, salted meat, soap, wine, copper, dried fruits, saffron, &c. &c. form also considerable articles. The returns from Peru are European goods, sugar, cloths of home manufactory, pita, which yields a kind of flax, rice, chocolate, &c.

The chief markets and most populous towns are on the coast, Piura, Lambayeque, Truxillo; and, in the Sierra, Caxamarca, the royal station of the mines of Chota; towards the south, Ica, Arequipa, and the royal station of Tarapaca; and towards the interior, Pasco, which is a mineral station belonging to the intendency of Tarma, Guanacha, Jauja, Guancavelica, Guamanga, and Cuzco. At these and other places, as Guarochiri, Caxatanbo, &c. traders or agents sell for the merchants of Lima, European goods, liquors, and other articles sufficient for the consumption of the neighbourhood; and the returns are generally in bullion or coin, but sometimes in articles of food for the use of the capital. The trade may yearly amount to 1,500,000 dollars in products; while that in bullion and money may amount to 4,000,000. Upon the whole, according to Liguanda, cited by Pinkerton, the viceroyalty loses, during five years, in the balance of maritime commerce, more than 6,500,000, but gains a balance with the viceroyalty of La Plata of nearly 1,200,000, annually; so that, the amount being deducted, the loss will be reduced to about 700,000 dollars, without mentioning the interior commerce, which cannot enter into the account.

From the *Mercurio Peruano* we learn, that the exports of Peru to Potosi, and the other provinces of the Rio Plata, are valued at more than 2,000,000 of dollars annually, and the imports at 860,000 dollars; so that the balance in favour of Peru is near 1,200,000, independent of the profits on the carriage of the goods, which belongs also to Peru, as the carriers are Peruvians. Cusco and Arequipa are the routes through which this trade passes. The chief exports to the Rio Plata are brandy, wine, maize, sugar, pimento, indigo, and woollens. The brandy alone amounts to near 1,000,000 of dollars. The woollens, which are next in value, are chiefly made in Peru, but part of them are brought from Quito. The provinces of the Rio Plata used formerly to take woollens, to a great amount, from Quito; but it is now found more economical to procure these articles from Europe by the way of Buenos Ayres. The indigo exported from Peru is previously imported from Guatimala. The chief imports from the Rio Plata, are mules, sheep, hams, tallow, wool, coca leaf, paraguay leaf, and a small quantity of tin from Oruro: 20,000 mules are imported annually from Tucuman, for the service of the mines.

The chief exports from Peru to Chili are European goods, previously imported at Callao. Sugar, coarse woollens made in Peru, indigo from Guatimala, salt, cotton, pita, yarn, and some other trifling articles. The imports are chiefly wheat, copper, tallow, wine, paraguay-tea, salt meat, timber, cordage, and leather. Part of the copper is used in the mint at Lima; and the remainder, except a small quantity sent to Guayaquil, re-exported to Spain. The ports of Chili that trade with Peru, are Valparaiso, Concepcion, and Coquimbo; but Valparaiso alone carries on three times as much trade as the other two. The timber is brought from the life of Chiloe.

The trade with Panama, which was formerly of such magnitude, has declined since the middle of the last century, and is now reduced to a small importation of timber and cacao, and to the remains of a slave-trade which is every day diminishing. The exports from Peru to Panama are coarse woollens, sugar, flour, and brandy. There is also a remittance of 300,000 dollars a-year from the treasury of Lima, to pay the garrison and civil government of Panama; without which that city must have fallen to still greater insignificance.

Indigo is the principal article of import from Guatemala. Small quantities of logwood, pitch, timber, and cacao, are also imported. The exports, which are very trifling, consist chiefly of wine and woollens. The wines and brandies of Peru might be exported with advantage to San Blas, for the consumption of Cinaloa, Sonora, and California; but, though permission has been frequently solicited from the government, it has been constantly refused from an apprehension of interfering with the trade of the mother-country in these articles.

The trade of Peru with Spain was carried on by Porto Bello and Panama till 1748, when register-ships were substituted for galleons, and the voyage by Cape Horn, for the circuitous route formerly in use. It is amusing to consider the progress made since that time in the art of navigation. The first Spanish vessels which sailed by Cape Horn, were insured against sea-risk at Cadiz, at the exorbitant rate of 20 per cent. of their value; but the vessels which perform the same voyage at present are insured for two. The register-ships, though liable to objections, were preferable in every respect to the galleons. They shortened the intercourse between the mother-country and the colony, and lessened the expense attending it. By affording quicker returns they led to more frequent adventures; and by meeting more effectually the demand they diminished the inducements to contraband. But the trade was still clogged and impeded with much useless expense, and unnecessary delay, and subjected to an arbitrary licence, which was withheld or burdened with restrictions at the caprice of the minister.

The register-ships continued to be employed in the trade of Peru with the mother-country, till the war for American independence, during which there was little intercourse between Spain and this distant colony. At the peace of 1783, the system of free trade, the order for which had been issued at Madrid some years before, began to be carried into effect in the South Sea. According to this system, the most wise and liberal that Spain had ever laid down for her colonies, an unlimited intercourse, without licences or other restrictions, was permitted between certain ports of Spain and certain ports of Spanish America; and among the privileged ports of America, are Callao and Arica, both situated in Peru. The result of these innovations was highly favourable to Peru. Its inhabitants enjoy foreign luxuries and conveniences at a cheaper rate, and in greater abundance, than before; while their industry has been excited, the value of their exports increased, and the produce of their mines nearly doubled. Nor was the change of system less beneficial to the mother-country, though some individuals suffered by it. From 1714 to 1739, a period of twenty-five years, the whole exports to Spain from Peru, Chili, the Rio Plata, and Santa Fé, did not exceed 34,000,000 of dollars. But, from 1785 to 1789, the exports from Peru and Chili alone exceeded 6,000,000 annually; and the imports from Europe increased in the same proportion. For some years, indeed, after the opening of the free trade, the merchants of the mother country, ignorant of the real state and resources of Peru, poured into that country a greater quantity of goods than its effective demand

required, or enabled it to consume; and, by the consequent want of sale, the depreciation of these goods, the importers paid dearly for their rashness; but, though some merchants suffered by their over-speculation, the manufactures of the mother-country were benefited by it; and, with regard to Peru, it would be difficult to show how the abundance and low price of goods could be injurious to the consumer. On the contrary, the spirit of industry was awakened in that kingdom, by the sight of luxuries and accommodations formerly unknown to its inhabitants, or placed beyond their reach; and the increase of its exports since the free trade, was the surest proof of its growing prosperity.

But, to form a just estimate of the commerce of Peru, we must take Buenos Ayres into the account, and consider these two countries, and Chili, as part of the same commercial system. It will then more fully appear, how small were the means, and limited the resources, of these extensive colonies, and what false and exaggerated notions have been circulated in this country with regard to them.

	Dollars.
Annual coinage of Lima, from 1790 to 1794	5,593,513
Coinage of Potosi in 1791	4,365,175
Annual coinage of Chili, estimated at	1,400,000
Annual export of produce from Callao, from 1785 to 1789	724,931
Export of produce from Buenos Ayres in 1796	1,328,840
	13,412,459

Although, in the present unsettled state of Peru, the amount of its revenues, and the armed force which it maintains, become matters of but little importance, yet it may be noticed, that, under the colonial government of Spain, the revenues of the crown amounted, *communibus annis*, to about 6,000,000 dollars, and the expenditure to about 3,200,000; the balance was annually remitted to the parent state. The armed force consisted of the regulars, who were 2200, including 280 cavalry and 40 artillery. The disciplined militia were 8000 infantry, 2280 cavalry, and 490 artillery. Besides these there were 85 regiments, known as provincial militia, amounting to 21,700 men; but these had no arms, were rarely mustered, and then exercised only with sticks instead of muskets, and were of little use except as the means of gratifying the vanity of the natives by conferring on them the military titles of colonels, majors, captains, &c. as is said, to the great emolument of the viceroy and the officers of his establishment.

The works to which we have been chiefly indebted in the compilation of this article, are—The Modern Universal History; Robertson's Hist. of America; Annual Registers; Ency. Brit. Suppl. Picard's Cérémonies Religieuses. Mercurio Peruano, a periodical work, published at Lima, twice a-week, from Jan. 1791; Present State of Peru, 4to. 1805; Pinkerton's Geography, vol. iii. and the Edinburgh Review, N^o 18. Geography of America; Philadelphia, 1822; Macauley on Negro Slavery, 1823.

PERU', a post-town of North America, in Clinton-county, state of New York, on the west side of Lake Champlain; containing 1347 inhabitants.—A town of Berkshire-county, Massachusetts, containing 912 persons.—A town of Bennington-county, in the state of Vermont; with 239 inhabitants.

PERU', *f.* in botany. See DOLICHOS.

—, Balsam of. See BALSAM and MYROXYLUM.

—, Marvel of. See MIRABILIS.

To PERVA'DE, *v. a.* [*pervado*, Lat.] To pass through an aperture; to permeate.—Paper dipped in water or oil, the oculus-mundi stone steeped in water, linen-cloth oiled or varnished, and many other substances soaked in such liquors as will intimately pervade their little pores, become by that means more transparent than otherwise. *Newton's Optics.*

The labour'd chyle pervades the pores
In all the arterial perforated shores.

Blackmore.

To pass through the whole extension.—Matter, once bereaved of motion, cannot of itself acquire it again, nor till it be struck by some other body from without, or be intrinsically moved by an immaterial self-active substance, that can penetrate and pervade it. *Bentley.*

What but God

Pervades, adjusts, and agitates, the whole? *Thomson.*

PERVA'SION, *f.* The act of pervading or passing through.—If fusion be made rather by the ingress and transursions of the atoms of fire, than by the bare propagation of that motion, with which fire beats upon the outside of the vessels, that contain the matter to be melted; both those kinds of fluidity, ascribed to saltpetre, will appear to be caused by the pervasion of a foreign body. *Boyle.*

PERVA'SIVE, *adj.* Having power to pervade:

Or suits him more the winter's candied thorn,
When from each branch anneal'd, the works of frost
Pervasive, radiant icicles depend? *Shenstone's Econ.*

PERVENCHE'RES, a town of France, in the department of the Orne, and chief place of a canton, in the district of Mortagne. The place contains 771, and the canton 9728, inhabitants.

PERVER'SE, *adj.* [*pervers*, Fr. *perverfus*, Lat.] Distorted from the right:

Where nature breeds

Perverse, all monstrous, all prodigious, things. *Milton.*

Obstinate in the wrong; stubborn; untractable:

Thou for the testimony of truth hast born
Universal reproach; far worse to bear
Than violence; for this was all thy care
To stand approv'd in sight of God, though worlds
Judg'd thee *perverse*. *Milton's P. L.*

To so *perverse* a sex all grace is vain,
It gives them courage to offend again.

Dryden.

Petulant; vexatious; peevish; desirous to cross and vex;
cross:

If thou dost love, pronounce it faithfully;
Or, if you think I am too quickly won,
I'll frown and be *perverse*, and say thee nay,
So thou wilt woo: but else not for the world. *Shakespeare.*

PERVER'SELY, *adv.* With intent to vex; peevishly; vexatiously; spitefully; crossly; with petty malignity.—Men *perversely* take up piques and displeasures at others, and then every opinion of the disliked person must partake of his fate. *Decay of Chr. Piety.*

A patriot is a dangerous post,
When wanted by his country most,

Perversely comes in evil times,
Where virtues are imputed crimes.

Swift.

PERVER'SENESS, *f.* Petulance; peevishness; spiteful crossness.

Virtue hath some *perverseness*, for she will,
Neither believe her good, nor others' ill.

Donne.

When a friend in kindness tries
To show you where your error lies,
Conviction does but more incense;
Perverseness is your whole defence.

Swift.

Perversion; corruption. *Not in use.*—Neither can this be meant of evil governors or tyrants; for they are often established as lawful potentates; but of some *perverseness* and defection in the nation itself. *Bacon.*

PERVER'SION, *f.* The act of perverting; change to something worse.—Women to govern men, slaves free-men, are much in the same degree; all being total violations and *perversions* of the laws of nature and nations. *Bacon.*

PERVER'SITY, *f.* [*pervertisse*, Fr. from *perverse*.] *Perverseness*; crossness:

What strange *perversity* is this of man!

When 'twas a crime to taste th' enlightning tree,
He could not then his hand refrain.

Norris.

PERVER'SIVE, *adj.* Having power to corrupt, or turn from right to wrong.

To PERVERT, *v. a.* [*perverto*, Lat. *pervertir*, Fr.] To distort from the true end or purpose.—If thou see the oppression of the poor, and violent *perverting* of justice in a province, marvel not. *Eccles.* v. 8.—Porphyry has wrote a volume to explain this cave of the nymphs with more piety than judgment; and another person has *perverted* it into obscenity; and both allegorical. *Broome.*

If then his providence

Out of our evil seek to bring forth good,

Our labour must be to *pervert* that end,

And out of good still to find means of evil. *Milton's P. L.*

To corrupt; to turn from the right; opposed to *convert*, which is to turn from the wrong to the right.—The subtle practices of Eudoxius, bishop of Constantinople, in *perverting* and corrupting the most pious emperor Valens. *Waterland.*

The heinous and despiteful act

Of Satan, done in Paradise, and how

He in the serpent had *perverted* Eve,

Her husband she, to taste the fatal fruit,

Was known in heav'n.

Milton's P. L.

PERVERTER, *f.* One that changes any thing from good to bad; a corrupter.—Where a child finds his own parents his *perverters*, he cannot be so properly born as damned into the world. *South.*—One who distorts any thing from the right purpose.—He that reads a prohibition in a divine law, had need be well satisfied about the sense he gives it, lest he incur the wrath of God, and be found a *perverter* of his law. *Stillingfleet.*

PERVERTIBLE, *adj.* That may be easily perverted.—There are many passages that have an evident character of harmless mirth and jollity; which, although they are piquant, yet are not easily *pervertible* to any disparagement of our neighbour. *W. Montague's Dev. Eff.* 1648.

To PERVESTIGATE, *v. a.* [*pervestigo*, Lat.] To search very carefully in order to find out.

PERVESTIGATION, *f.* A diligent inquiry, or search after.—In the *pervestigation* of the true and genuine text, it was perspicuously manifest to all men, that there was no argument more firm or certain to be relied on. *Chillingworth's Rel. of Protestants.*

PERU'GIA, anciently *Perusina*, one of the most ancient and distinguished cities of Etruria. The era of its foundation long preceded that of Rome, and, like the origin of Clusium, Cortona, &c. is almost lost in distance of time. In conjunction with all the other Etrurian states, it long resisted the Romans; and, when subjected, or rather reconciled to them, it became a faithful and courageous ally. It defied the power of Hannibal, and flourished in peace and opulence till the reign of Augustus, when unfortunately it engaged in the rebellion of Lucius Antonius, uncle of the triumvir, and under his command shut its gates against Augustus, who took it, and, as it is

asserted, wished to spare it; but, one of its principal citizens setting fire to his own house, which he intended as a funeral pile for himself and his family, the flames communicated to the neighbouring buildings, and, spreading rapidly, reduced the city to ashes. Perugia, however, rose immediately from its ruins; and, on its restoration, by a strange inconsistency, chose for its patron Vulcan, a divinity to whom it seems to have had very few obligations, as the god had spared his own temple only in the general conflagration. In the Gothic war it displayed much spirit, and stood a siege of seven years against these barbarians. It afterwards, with the whole Roman state, submitted to the pope; and, with some intervals of turbulent independence, has remained ever since attached to the Roman see.

Perugia is now a large, clean, well-built, and well-inhabited, city. Seated on the summit of a mountain, it commands from its ramparts, and particularly from its citadel, an extensive view over a vast range of country, fertile, covered with hill and dale, and enlivened with villages and towns. There are many churches, convents, and palaces, in this city, most of which were adorned with the paintings of Pietro Perugino, the master of Raphael: of these the French carried off a considerable number, and defaced others, particularly such as were painted on walls, and could not be removed. The cathedral is in itself a very indifferent edifice, and its deformity is increased by the bad taste that seems to have prevailed in its repair and decorations. Several other churches merit attention, particularly that of St. Pietro, belonging to a Benedictine abbey: it is supported by eighteen pillars of fine marble, and adorned with an altar of the same materials, very rich and well disposed. Perugia has an university supplied with able professors; and several academies, all of which can boast of illustrious names; and it is upon the whole an interesting city, capable of entertaining the curious and inquisitive traveller for several days. It is sixty miles south-east of Florence, and seventy-two north of Rome. Lat. 43. 6. N. lon. 12. 17. E.

PERUGIA'NO, a province which takes its name from the above city; bounded on the north by the duchy of Urbino, on the east by Umbria, on the south by the Orvietan, and on the west by Tuscany: the greatest extent from north to south twenty-eight miles, and about as much from east to west: the Tiber crosses it from north to south, and is the only river of consequence. In it is a large lake which abounds in fish, formerly called *Lacus Thrafinemus*, near which Flaminius was defeated by Hannibal. The country of Perugia is exceedingly fertile, and abounds in corn and wine. Perugia is the capital.

PERUGINO (Pietro), an eminent Italian painter, whose family name was *Vannucci*, was born at Perugia in 1446. His father, who was in low circumstances, placed him with an ordinary painter, under whom he worked with great diligence, labouring to perfect himself in his art in the midst of severe hardships. At length he became a disciple of Andrea Verocchio at Florence, with whom he soon made an extraordinary proficiency. The first piece by which he acquired fame, was a St. Jerome before a crucifix, in which the mortified and emaciated figure of the saint was represented with admirable force and nature. A dead Christ, with a number of surrounding figures, painted as an altar-piece for a monastery at Florence, also gained him great applause. He went to Rome, where he was employed by Sixtus IV. to execute several pieces in his chapel. Returning to Florence, he found Michael-Angelo there in the height of his celebrity. His quarrel with that great man, and his avaricious character, exposed him to so much satire from the Florentine poets, that he was obliged to quit that city, and retire to Perugia. His hoardings in a long life rendered him opulent; and it was his practice, when he went abroad, to carry with him a casket of gold by way of security. Of this treasure he was once robbed; and, although he re-

covered the greatest part of it, the accident was thought to be the cause of his death, which took place in 1524, at the age of 78.

Though Perugino obtained distinction as a painter, and very honourable employment, having considerably improved upon the style of his masters; yet he was dry and hard in design, and too laboriously minute in finishing. His greatest glory arises from having been the first instructor of Raphael; but his pupil, as soon as he beheld the grander style of Michael Angelo, Leonardo da Vinci, and Fra. Bartolomeo, burst the bonds of the meaner style in which he had been educated, and left his master at a very humble distance. The most capital work of Pietro Perugino in oil-colour, is in the church of St. Peter at Perugia. It is an altar-piece, and the subject is the ascension of our Saviour, with the disciples observing and adoring.

PERVICA'CIUS, *adj.* [*pervicax*, Lat.] Spitefully obstinate; peevishly contumacious.—May private devotions be efficacious upon the mind of one of the most *pervicacious* young creatures. *Richardson's Clarissa*.

Gondibert was in fight audacious,
But in his ale most *pervicacious*.

Denham.

PERVICA'CIUSLY, *adv.* With spiteful obstinacy. PERVICA'CIUSNESS, PERVICA'CITY, or PERVICACY, *f.* Spiteful obstinacy.—It is *pervicaciousness* to deny, that he created matter also. *Bentley*.

PERVIGILIA, *f.* in antiquity, an appellation given to nocturnal festivals, celebrated in honour of several deities, as Ceres, Venus, Fortune, &c.

PERVIN'CA, *f.* in botany. See VINCA.

PERV'IOUS, *adj.* [*pervius*, Lat.] Admitting passage; capable of being permeated.—The Egyptians used to say, that unknown darkness is the first principle of the world; by darkness they mean God, whose secrets are *pervious* to no eye. *Bp. Taylor*.

Leda's twins

Conspicuous both, and both in act to throw
Their trembling lances brandish'd at the foe,
Nor had they mis'd; but he to thickets fled,
Conceal'd from aiming spears, not *pervious* to the steed.

Dryden.

Pervading; permeating. This sense is not proper.

What is this little, agile, *pervious* fire,
This flutt'ring motion which we call the mind? *Prior*.

PERV'IOUSNESS, *f.* Quality of admitting a passage.—The *perviousness* of our receiver to a body much more subtle than air, proceeded partly from the looser texture of that glass the receiver was made of, and partly from the enormous heat, which opened the pores of the glass. *Boyle*.—There will be found another difference besides that of *perviousness*. *Holder's Elem. of Speech*.

PERU'PE, a river of Brasil, which runs into the Atlantic in lat. 18. 20. S.

PERVIS. See PARVIS, vol. xviii.

PERVISS'E, a town of France, in the department of the Lys: six miles west-north-west of Dixmude.

PER'UKE, *f.* [properly PERRUKE, which see, p. 644. from *perruque*, Fr. Wachter derives this word from the Gr. *πυρρος*, yellow; the first perukes consisting of hair of this light colour, which was anciently much esteemed.] A cap of false hair.—Neither was the use of *perruques* unknown in those times, as may appear by this of Martial, "Calvo turpius est nihil comato." *Hakewill on Providence*.—The deformity of their hair is usually supplied by borders and combings; also by whole *perukes*, like artificial skulls, fitted to their heads. *Bp. Taylor's Artif. Handjorn*.
To PER'UKE, *v. a.* To dress in additious hair.

PER'UKE-MAKER, *f.* A maker of perukes; a wig-maker.

PER'ULA, *f.* [altered by Schreber from *Pera*, the name given by Mutis; and alluding to the form of the capsule, which resembles a little bag or satchel.] In botany,

9 H tany,

tany, a genus of the class dioecia, order polyandria, natural order of tricocceæ, *Limn.* (euphorbiæ, *Juss.*) Generic characters—Male. Calyx: perianthium two-leaved, very small: leaflets opposite, oblong, somewhat concave, spreading, the upper one twice as big as the other. Corolla: petal one, semiglobular-concave, hanging down, heart-shaped at the base, scarcely emarginate at the tip. Nectary: membranes multifid, somewhat plaited, erect, inserted into the receptacle between the rows of stamens. Stamina: filaments very many (24 to 30), set transversely in a double row, thickish, upright, the height of the nectary; antheræ thickish, four-cornered, oblong, blunt, upright, raised above the nectary. Pistillum: germs four, barren, very small, subglobular, very shortly pedicelled, placed at the angles of the receptacle above the nectary; style very short, upright. Stigmas three: with segments peltate, standing out at the tips.

Female, on a separate tree. Calyx: perianthium as in the male, deciduous. Corolla: as in the male. Nectary as in the male, with the membranes approximating, somewhat inflated, filling the disk of the receptacle. Pistillum: germs four, fertile, inserted into the receptacle, as in the male, a little larger, shortly pedicelled. Style to each, upright, short, three-cornered. Stigmas as in the male. Pericarpium: capsule obovate, subtrigonal, hanging down from the elongated pedicel, three-celled, three-valved: valves bifid, at length two-parted. Seeds solitary, obovate-truncated, smooth, small.

Mutis suspects, that what he has called calyx may be bractes. The part in question is, according to him, globose before its expansion, with a longitudinal suture, by the bursting of which the original or proper orifice becomes transverse, the receptacle projects almost out of this corolla (or calyx), the flower becoming pendulous from the slightly-drooping summit of the incurved flower-stalk.—*Essential Character.* Male: Calyx concave, of one leaf; petals none; nectary a plaited membrane; antheræ quadrangular, simple; germens four, abortive. Female: Calyx concave, of one leaf; petals none; nectary a plaited membrane; capsule stalked, obovate, of three cells and three valves; seeds solitary.

Perula arborea, the only species. Native of New Granada, about Mariquita, where it was found by Mutis, and described by him in the Stockholm Transactions for 1784, p. 259.

PERUM, a town of Persia, in the province of Mecran, on the Nehenk: sixty miles south-west of Kelveh, and 170 north-north-east of Kidge.

PERUSAL, *f.* The art of reading.—As pieces of miniature must be allowed a closer inspection, so this treatise requires application in the *perusal*. *Woodward.*—If upon a new *perusal* you think it is written in the very spirit of the ancients, it deserves your care, and is capable of being improved. *Atterbury.*—Examination.—The jury, after a short *perusal* of the staff, declared their opinion by the mouth of their foreman, that the substance of the staff was British oak. *Tatler*, N^o 265.

PERUSE (La), a town of France, in the department of the Charente: nine miles south of Confolent.

To PERUSE, *v. a.* To read.—Carefully observe, whether he tastes the distinguishing perfections or the specifick qualities of the author whom he *peruses*. *Addison's Spect.*

Peruse this writing here, and thou shalt know
The treason. *Shakespeare's Rich. II.*

To observe; to examine:

I've *perus'd* her well;
Beauty and honour in her are so mingled,
That they have caught the king. *Shakespeare.*

PERUSER, *f.* A reader; examiner.—Marke herein his laboriouse and fruteful doinges, and ye shal fynde him no lesse profitable to us in the descrypcion of this particular nacyon, than were Strabo, Pliny, Ptholome, and

other geographers, to their *perusers*, in the pycuringe out of the universall worlde. *Bale's Leland's New Year's Gift.*—The difficulties and hesitations of every one will be according to the capacity of each *peruser*, and as his penetration into nature is greater or less. *Woodward.*

PERUSSEAU' (Silvan), a French Jesuit in the 18th century, who is spoken of as an ornament to the society by his virtues, and was greatly admired and followed as a preacher, and director of consciences. He was confessor, at first to the dauphin, and afterwards to the king; and he retained the office last mentioned till his death in 1751, at an age which is not specified. He published only A Funeral Oration for the Duke of Lorraine, and A Panegyric on St. Louis; but after his death, two volumes of Select Sermons were printed from his manuscripts, in 1758, 12mo. It is acknowledged, that these sermons do not rival those of Bourdaloue for powerful and forcible reasoning, nor those of Massillon for striking and inimitably pathetic passages; they are said, however, to merit distinction from the ordinary class of pulpit-compositions, and to be recommended by importance and weight of sentiment, order and regularity of method, liveliness of imagination, and an easy, noble, and varied, eloquence.

PERUSS'ICK, a castle of Dalmatia: twenty-four miles east of Zara.

PERUVEL'S, a town of France, in the department of the North: five miles north of Condé.

PERU'VIAN, *f.* A native of Peru.

PERU'VIAN, *adj.* Appertaining to Peru.

PERU'VIAN BAR'K. See CINCHONA.

PERU'VIAN MAS'TIC-TREE. See SCHINUS.

PERUVIA'NA, a general name given to that vast peninsula, extending itself form the Isthmus of Darien to Cape Horn, in the form of a triangle, of which the *Terra Magellanica* and the Cape from the vertex. It includes the whole of South America, although, as is well known, all the countries included within these limits did never acknowledge the dominion of the crown of Spain. See TERRA FIRMA.

PERUVEL'Z, a town of the Netherlands, in the province of Hainault; containing 5302 inhabitants.

PERUZZI (Baldassare), an eminent Italian painter, was born at Accajano, in the territory of Sienna, in 1481, in poor and distressed circumstances; his father having been reduced from a state of comparative affluence, by the civil wars which ravaged Florence and its territory. Baldassare exhibited his genius at a very early age; first by imitation of the works of others, and afterwards by original productions in the city of Volterra, where his family resided. Thence he went to Rome, and placed himself with the father of Maturino; and, becoming conspicuous for ability, was at length employed by pope Alexander VI. and also in many churches and convents in that city, in which he produced pictures justly entitled to exalted praise.

Together with painting, he studied architecture; and practised it with considerable success. He was also renowned for his knowledge of perspective; and the works he produced in imitation of architectural projections, excited even the surprise and admiration of Titian. But his highest renown is founded upon the works of a much more elevated class; viz. his paintings in fresco and in oil; in which he exhibited a taste and style not unworthy of Raphael. His Judgment of Paris in the castle of Belcaro, and his Sibyl at Fonte Giusta in Sienna, are very greatly admired. His genius, however, particularly led him to architecture, and to painting as connected with it. He remarkably excelled in perspective views of streets, palaces, porticoes, the insides of apartments, and the like; and was the first modern artist who renewed the ancient decorations for theatres. By Leo X. he was employed to give a new model of St. Peter's, in which he improved in many respects upon the original design of Bramante. This was not executed; but it is preserved in an engraving in Seplio's Architecture, and merits the notice

notice of artists. Peruzzi was at Rome at its sack in 1527, where he ransomed himself by a portrait of the Constable Bourbon, made after he was killed; but, in returning to Sienna, he was completely stript by some marauders. He again returned to Rome, where he was much employed, but miserably remunerated; and he died in poverty in 1536. He composed a Treatise on the Antiquities of Rome, and a Commentary on Vitruvius, but did not live to publish them. There is at Wilton a picture of his of the Four Evangelists in Glory, with their peculiar characteristic accompaniments, which bears ample testimony to the truth of this remark; and perhaps it is the only real specimen of his pencil in England.

PER'WIS, a town of the Netherlands: six miles north-east of Gemblours.

PERZA'GNO, a town of Albania, on the canal of Cattaro.

PERZE'NE, a town of Italy: eight miles north-east of Bologna.

PES, *f.* [Latin.] The foot. A long measure of 12 inches.

PES ANSERINUS, *f.* in botany. See CHENOPODIUM and ATRIPLEX.

— CAL'PRÆ. See CONVULVULUS and OXALIS.

— COLUMBINUS. See GERANIUM.

— EQUINUS. See HYDROCOTYLE.

— LEO'NIS. See ALCHEMILLA.

— TIGRIDIS. See IPOMÆA.

PE'SA, an old law-term for a *weigh*, or certain weight, of cheefe, wool, &c.

PESA'DE, *f.*—*Pesade* is a motion a horse makes in raising or lifting up his fore quarters, keeping his hind legs upon the ground without stirring, so that he marks no time with his haunches till his fore-legs reach the ground. This motion affords the true means of fixing his head and his haunches, to make him ply and bend his fore-thighs, and to hinder him from stamping and clattering with his feet. *James's Mil. Dict.*

PES'AGE, *f.* [*pesagium*, Lat.] A custom, or duty, paid for weighing goods and merchandise. *Jacob.*

PESAGOON'DAN, a town on the west coast of Borneo. Lat. 2. 12. N. lon. 109. 58. E.

PESAN', a small island near the coast of China. Lat. 26. 52. N. lon. 120. E.

PESA'RO, or PEZARO, a town of Italy, in the Papedom, at the mouth of the Foglia, on the Adriatic; the see of a bishop, suffragan of Urbino. It contains eight churches and twelve convents. The figs and olives which grow in the environs are in great estimation. This city was anciently called *Pisaurum*, and was made a Roman colony about the year of Rome 568, and a temple was built here to Jupiter Pisaurus. Plutarch, in his Life of Anthony, says, Pisaurum was laid in ruins by an earthquake, a little before the battle of Actium; but that Augustus caused it to be rebuilt as soon as he was at peace. Totila king of the Goths, having taken and ruined it; it was rebuilt by Belisarius, general to the emperor Justinian. This city came successively under the dominion of the Malatesta, the Sforza, and the Borgia families; and at last under the power of the popes. It is situated upon a small rising ground near the Adriatic Sea, and is pretty well fortified. L. Attius or Accius, one of the most excellent tragic poets in ancient Rome; and Pandulfus Collenutius, author of a History of Naples, were natives of Pesaro; as was likewise Æmilius Mancinus, who wrote the history of his own country, and another book concerning its laws: fifteen miles north-east of Urbino, thirty-eight north-west of Ancona. Lat. 43. 56. N. lon. 12. 52. E.

PESA'RO (John), doge of Venice in the year 1658. He reigned only eighteen months. A mausoleum of extraordinary beauty is placed to his memory in the church of the Brethren at Venice: in this monument is the statue of Pesaro, seated under a canopy of state, all of the finest marble, and ornamented with many other figures,

particularly four blacks who support the canopy; there is also a long inscription to his memory. He prosecuted the war successfully against the Turks, over whom he gained several victories in the Levant and in Dalmatia.

PES'CA PAGA'NI, a town of Naples, in the Basilicata: six miles north-west of Muro.

PESCA'RA, a town of Naples, in Abruzzo Citra, situated at the mouth of a river of the same name, which runs into the Adriatic; fortified and defended by a castle. It was once the see of a bishop: ten miles north of Civita di Chieti. Lat. 42. 27. N. lon. 14. 6. E.

PESCA'RA, a river of Italy, in the kingdom of Naples, which runs into the Adriatic at Pescara.

PESCARO'LO, a town of Italy: nine miles north-east of Cremona.

PESCAT'AWAY, a town of North America, in Maryland: twenty-five miles south-west of Annapolis.

PESCENNIUS NIGER. See NIGER, and the article ROME.

PESCHIE'RA, a town of Italy, on the south coast of Lake Garda. This is a small but important fortress, built by the Venetians in the year 1549. It has but few houses, and an arsenal for some light galleys on the side of the Lake: fifteen miles west of Verona, seventeen north-west of Mantua. Lat. 45. 7. N. lon. 10. 42. E.

PESCHI'VE, a town of Naples, in Capitanata: eleven miles north-west of Vieste.

PES'CIA, a town of Etruria, the see of a bishop. It contains three parochial, seven other churches, and five convents. The oil made here is much esteemed: ten miles south-west of Pistoja.

PES'CIA, a town of Italy, in the Trevisan: seven miles south of Treviso.

PESCI'NA, a town of Naples, in Abruzzo Ultra: five miles south-east of Celano.

PESCI'NA DE FRA'TRI, a town of Naples, in the province of Capitanata: eight miles west of Vieste.

PESCI'NA POMPE'IA, a town of Naples, in the province of Bari: nine miles north of Matera.

PES'CO CASTRA'RO, a town of Naples, in Abruzzo Ultra: eleven miles north-east of Aquila.

PES'CO COSTAN'ZO, a town of Naples, in Abruzzo Citra: seven miles south-east of Sulmona.

PES'CO LAURINO, a town of Naples, in Principato Citra: eighteen miles north-west of Policastro.

PES'CO PAGA'NO, a town of Naples, in the province of Otranto: eleven miles north-east of Tarento.

PES'CO VERRA'RO, a town of Naples, in Principato Ultra: twelve miles from Benevento.

PESCOT'TOR, a river of South-Wales, which runs into the Towy in the county of Caermarthen.

PESE'NAS, an ancient town of France, in Languedoc, and in the diocese of Agde; delightfully seated on the river Pein: twelve miles north-east of Bessiers, and eight north of Agde. Lat. 43. 28. N. lon. 3. 34. E.

PES'ENBACH, a river of Austria, which runs into the Danube eight miles above Lintz.

PESEQUEIRO, a small island in the Atlantic, near the coast of Portugal. Lat. 37. 40. N. lon. 8. 52. W.

PESHAW'ER, the capital of the kingdom of Caubul, a country lying between Persia and Hindoostan. This territory has become known to us in consequence of an embassy that was sent there, by the East India Company, during the last war.

It appears that an opinion was entertained by the British government at Calcutta, in 1808, resulting from the embassy of the French general Gardanne to Persia, that Bonaparte had views of penetrating by land to Hindoostan, and of thus attempting the conquest of that wealthy and important portion of our oriental dominions. It was therefore deemed necessary to sound the dispositions, and to conciliate the co-operation, of those ruling princes of the East, through whose territories the troops of the French were to march. (See p. 690.) Among these independent sovereignties, the court of Caubul held a high rank;

rank; and, as its known character was haughty, and it was suspected of rather undervaluing the European nations, our government determined that a mission to it should be fitted out in a style of importance and splendour. At Delhi were made the principal preparations for its equipment; and thence began the escorted procession, more resembling a triumphal solemnity than a journey of negotiation or discovery. Mr. Elphinstone was placed at the head of it, in the character of Envoy to the King of Caubul; and his excellency afterwards published a narrative of his fruitless journey, from which we shall select a few particulars.

The embassy left Delhi on the 13th of October, 1808; passed through Canound, which is a hundred miles westward; and quitted the British dominions on the 21st, in the Shekahwuttee district, where the desert begins. At Chooroo, the women who had accompanied the mission were sent back, with a guard. Six hundred camels were laden with leathern bags of water, and the travellers with their thirteen elephants entered the dry country: but copper-veffels, two of which formed a load for a camel, were soon found to answer better than the *muthks*, or bags of sheep-skin or ox-hides, which cracked and spilled much water. Such was the dread of the desert entertained by the people of the country, that servants of all descriptions absconded by twenties and thirties, until the march was so far advanced that the return became as difficult as the progress.

Bikaner was the first striking object. This town, which is surrounded by a fine wall, strengthened with round towers, and crowned with jagged battlements, stands in the midst of a plain of more than ordinary nakedness. Some high houses, some temples, (one of which had a lofty spire,) and at one corner an eminent and showy fort, give to this city an imposing exterior; but its beauty is merely external, and mud-walls, painted red or white, constituted the mass of building. Five armies had at this time invaded the country; and the rajah had ordered all the wells within ten miles to be covered over with sand, or filled up, trusting for his defence to the desolation which surrounded him. In these circumstances, it was not easy to supply the wants of our envoy: but, after a halt of eleven days, he contrived to proceed on the 16th of November. At Pooggul, where rain-water could be purchased, the party arrived on the 19th, at dark; and, on the 21st, they reached the confines or frontier of the king of Caubul's dominions. Here they were met by a hundred and fifty soldiers on camels, belonging to Bahawl Khan, the governor of this eastern province: escorting a present of four hundred skins of water laden on a hundred camels, with four brazen jars of water from the Hyphafis, sealed with the king's signet, and intended for the private drinking of the ambassador and his particular friends. At each successive stage on the road to Moujghur, fresh presents of water brought from that city announced the attention and hospitality of the sovereign. The embassy arrived at that city on the night of the 22d. A conspicuous mosque stands over the gateway; and a tomb, of which the cupola is ornamented with painted tiles, also attracts distant notice. After a stay of two days, the caravan of embassy proceeded; and on the 26th reached the banks of the Gharra, which includes the Hyphafis, or Begab, and the Hyfudrus, or Sutledge; and the Europeans gazed with interest on a stream which had borne the fleet of Alexander.

December 11, the mission reached Moultaun, which stands about four miles from the left bank of the Che-naub, or Acesines. It occupies nearly five miles in circumference, and is encompassed by a fine wall above forty feet high, with towers at regular distances, and a citadel on a rising ground. These oriental towns have generally that character of fortification which preceded in Europe the use of artillery in sieges. Two magnificent tombs, with very high cupolas covered with glazed and painted tiles, form conspicuous ornaments of the city, viewed

from whatever direction. The country around is fertile, well cultivated, and amply watered from wells. The embassy lingered during many days in the neighbourhood of Moultaun, amused with shooting, hunting, and hawking, but not negligent of statistical observations; indeed, it was necessary to wait thus long for the arrival of a *Mehmandaur*, or official welcomer, from the king of Caubul. On the 21st of December, the Acesines was crossed; and on the 7th of January, the Indus.

At Dera Ismael Khaun, a delay of a month occurred: the ambassador still awaiting a mehmandaur. This town is situated in a large wood of date-trees, within a hundred yards of the Indus, and has a ruinous wall of unburnt bricks, a mile and half in circumference. At length, about the end of January, the long-expected welcomer arrived, Moolla Jaffer Seestaunee, who had originally been a schoolmaster, but who, by literary talent and financial dexterity, was become a sort of Chancellor of the Exchequer at Peshawer. Under his guidance, the mission left Dera Ismael Khaun, February 7, and proceeded to ascend the right bank of the Indus towards the metropolis. In the progress of the journey, it appeared that the road had in many places been widened and repaired for the express accommodation of the embassy, and hence arose the delay of reception. At Calla-baugh, where the Indus breaks through the Salt-range in a channel only three hundred and fifty yards broad, the road quits the plain country, and climbs rapidly among successive stages of mountains into an Alpine climate.

At Budabeer, about six miles from the metropolis, the mission made a farther halt to arrange several ceremonies of introduction; and, after a more than Spanish definition of etiquette, permitted itself to arrive. "On the morning of the 25th Feb. after some confusion about the mode of our reception, we made our entry into PESHAWER. There was a great crowd all the way. The banks on each side of the road were covered with people, and many climbed up trees to see us pass. The crowd increased as we approached the city, but we were put to no inconvenience by it, as the king's horse, that had come out to meet us, charged the mob vigorously, and used their whips without the least compunction. One man attracted particular notice: he wore a high red cap, of a conical shape, with some folds of cloth round the bottom, and a white plume; he had a short jacket of skin, black pantaloons, and brown boots: he was an uncommonly fine figure, tall and thin, with swelling muscles, a high nose, and animated countenance: he was mounted on a very fine grey horse, and rode with long stirrups, and very well. He carried a long spear without a head, with which he charged the mob at speed, shouting with a loud and deep voice. He not only dispersed the mob, but rode at grave people sitting on terraces with the greatest fury, and kept all clear wherever he went. His name was *Ruffool Dewauneh*, or Ruffool the Mad. By the time we had entered the town, the roads were so narrow that our progress became very slow, and we had time to hear the remarks of the spectators, which were expressive of wonder at the procession, and of goodwill towards us; but the crowd and bustle were too great to admit of any distinct observations. At length we reached the house prepared for us, and were ushered into an apartment spread with carpets and felts for sitting on. Here we were seated on the ground in the Persian manner, and trays of sweatmeats were placed before us. They consisted of sugared almonds, and there was a loaf of sugar for making sherbet in the midst of each tray. Soon after, our conductors observed that we required rest, and withdrew.

"On the day of our arrival, our dinner was composed of the dishes sent us by the king, which we found excellent. Afterwards we had always our English meals; but the king continued to send breakfast, luncheon, and dinner, for ourselves, with provision for two thousand persons (a number far exceeding that of the embassy),

and two hundred horses, besides elephants, &c. nor was it without great difficulty that I prevailed on his majesty, at the end of a month, to dispense with this expensive proof of his hospitality.

"On the morning of the 5th of March, we set out in procession for the palace. We passed for about three quarters of a mile through the streets, which, as well as the windows and roofs of the houses, were crowded with spectators. At length we reached an open space under the palace, or castle, in which the king resides: this space was filled with people, who covered the side of the hill on which the castle stands, like the audience at a theatre. When we reached the gate, over which the king's band was playing, we were requested to leave the greater part of our attendants behind, and here our drums and trumpets were required to cease playing. Some time after we entered this gateway, we dismounted, and, after walking about one hundred yards, we ascended a flight of steps, and entered a long narrow room, where about a hundred and fifty persons were seated in great order along the walls. This was called the *kishik khauneh*, or guard-room. It was spread with carpets and felts. We were led straight up to the head of the room, where several men, richly dressed, rose as we approached; and we were received by a fair and portly personage, whom I afterwards understood to be the king's imaum, and the head of the religious establishment. He bowed as I came up, took my hand between his, and placed me by him, after which he went through the usual forms of welcome and inquiries. Opposite to me were many of the chief lords of the court, some of whom had their caps ornamented with jewels, and surmounted by plumes: lower down were many persons, some like Persians, and some like Dooranees; and still lower were some of the chiefs of the hill-tribes near Peshawer; at the bottom were several persons in the strange fanciful caps which are employed to distinguish the officers of the household. They are generally black and red, but their variety and their whimsical shapes baffle all description; little taste is displayed in them, and the effect is not good.

"We were now left for some time in the *kishik khauneh*, during which Meer Abool Hussun conversed with us, and discovered a most extraordinary ignorance of every thing concerning us. He had at first thought that Calcutta was in England; and now discovered his belief that the gentlemen of the embassy were born in India, though of English parents. At length the chaos baushee came to us: he had been labouring hard at a list of our names, and gave it up, with the appearance of extreme vexation, in despair of mastering such a collection of strange words. He now explained the ceremonies to be observed, in a very courteous manner, and then entreated us severally to whisper our names to him when he should touch us. He then conducted us up a sloping passage, and through a gate; after which we passed behind a sort of screen, and suddenly issued into a large court, at the upper end of which we saw the king in an elevated building.

"The court was oblong, and had high walls, painted with the figures of cypresses. In the middle was a pond and fountains. The walls on each side were lined with the king's guards, three deep; and at various places in the court, stood the officers of state, at different distances from the king, according to their degree. At the end of the court was a high building, the lower story of which was a solid wall, ornamented with false arches, but without doors or windows; over this was another story, the roof of which was supported by pillars and Moorish arches, highly ornamented. In the centre arch sat the king, on a very large throne of gold or gilding. His appearance was magnificent and royal: his crown and his dress were one blaze of jewels. He was elevated above the heads of the eunuchs who surrounded his throne, and who were the only persons in the large hall where he sat: all was silent and motionless. On coming in sight of the

king, we all pulled off our hats, and made a low bow: we then held up our hands towards heaven, as if praying for the king, and afterwards advanced to the fountain, where the chaos baushee repeated our names, without any title or addition of respect, ending, "They have come from Europe as ambassadors to your majesty." The king answered in a loud and sonorous voice, "They are welcome;" on which we prayed for him again, and repeated the ceremony once more, when he ordered us dresses of honour. After this, some officer of the court called out something in Turkish, on which a division of the soldiers, on each side, filed off, and ran out of the court, with the usual noise of their boots on the pavement, accompanied by the clashing of their armour. The call was twice repeated, and at each call a division of troops ran off: at the fourth, the khans ran off also, with the exception of a certain number, who were now ordered to come forward. The king, in the mean time, rose majestically from his throne, descended the steps, leaning on two eunuchs, and withdrew from our sight. The khans who were summoned ran on as usual, while we walked on to the foot of a staircase, covered with a very rich carpet: we paused here till the khans had run up, and were arranged; after which we ascended, and entered the hall, where the king was now seated on a low throne opposite the door.

"We stood in a line, while the king of Caubul asked after the health of his majesty and the governor-general, inquired into the length of our journey, and expressed his wish that the friendship betwixt his nation and ours might be increased; to all which I made very brief replies. The gentlemen of the embassy now retired, leaving me and Mr. Strachey, who were desired to seat ourselves near his majesty. The imaum and the moonshie baushee (or head secretary) stood near us, and other khans stood along one side of the hall. The governor-general's Persian letter was now opened, and read with striking distinctness and elegance, by the moonshie baushee; and the king made a suitable answer, declaring his friendship for the English nation, his desire of an intimate alliance, and his readiness to pay the utmost attention to any communication with which I might be charged. After I had replied, his majesty changed the subject to inquiries respecting our journey, and questions about our native country. When he understood that the climate and productions of England greatly resembled those of Caubul, he said, the two kingdoms were made by Nature to be united, and renewed his professions of friendship. I then inquired whether it was his majesty's pleasure to enter on business at that time? To which he replied, that I might consult my own convenience respecting the time, and might communicate with his ministers, or with himself, as I chose. I then explained the objects of my mission at length; to which his majesty made a very friendly and judicious reply, and soon after I withdrew.

"The king of Caubul was a handsome man, about thirty years of age, of an olive complexion, with a thick black beard. The expression of his countenance was dignified and pleasing: his voice clear, and his address princely. We thought at first that he had on armour of jewels; but, on close inspection, we found this to be a mistake, and his real dress to consist of a green tunic, with large flowers in gold, and precious stones, over which were a large breast-plate of diamonds, shaped like a flattened fleur de lis, an ornament of the same kind on each thigh, large emerald bracelets on the arms (above the elbow), and many other jewels in different places. In one of the bracelets was the *Cohi Noor*, known to be one of the largest diamonds in the world. There were also some strings of very large pearls, put on like cross-belts, but loose. The crown was about nine inches high, not ornamented with jewels as European crowns are, but to appearance entirely formed of those precious materials. It seemed to be radiated like ancient crowns, and behind the rays appeared peaks of purple-velvet: some small

branches with pendants seemed to project from the crown; but the whole was so complicated, and so dazzling, that it was difficult to understand, and impossible to describe. The throne was covered with a cloth adorned with pearls, on which lay a sword and a small mace, set with jewels. The room was open all round. The centre was supported by four high pillars, in the midst of which was a marble fountain. The floor was covered with the richest carpets; and round the edges were slips of silk, embroidered with gold, for the khans to stand on. The view from the hall was beautiful. Immediately below was an extensive garden, full of cypresses and other trees, and beyond was a plain of the richest verdure: here and there were pieces of water and shining streams; and the whole was bounded by mountains, some dark, and others covered with snow. When I left the king, I was re-conducted to the kishik khauneh, where all the gentlemen of the mission received rich dresses of honour.

"Our presents for the king were carried into the palace while we were in the kishik khauneh. Nothing could exceed the meanness and rapacity of the officers, who received charge of them. They kept the camels on which some of them were sent, and even seized four riding-camels, which had entered the palace by mistake. They stripped the elephant-drivers of their livery; and gravely insisted, that two English servants, who were sent to put up the lustres, were part of the present."

Until the presentation to the king was over, none of the gentlemen of the mission went out; but after that time they rode freely through the country. Peshawer stands in the midst of a circular plain about thirty-five miles in diameter. In March, the distant mountains were covered with snow, the plain with the brightest verdure, and the climate was delicious. The trees were enough in leaf to give grace and richness to the prospect; and a fortnight completed the new foliage, which exceeded in brilliancy that of Hindoostan. "Many streams ran through the plain: their banks were fringed with willows and tamarisks. The orchards scattered over the country, contained a profusion of plum, peach, apple, pear, quince, and pomegranate, trees, which afforded a greater display of blossom than I ever before witnessed; and the uncultivated parts of the land were covered with a thick elastic sod, that perhaps never was equalled but in England. The greater part of the plain was highly cultivated, and irrigated by many water-courses and canals. Never was a spot of the same extent better peopled. From one height, Lieut. Macartney took the bearings of thirty-two villages, all within a circuit of four miles. The villages were generally large, and remarkably clean and neat, and almost all set off with trees. There were little bridges of masonry over the streams, each of which had two small towers for ornament at each end. The greater part of the trees on the plain were mulberries, or other fruit-trees. Except a few picturesque groupes of dates, the only tall trees were the *Ficus religiosa* and the tamarisk, which last grows here to the height of thirty or forty feet. Its leaves being like those of the cypress, and very thick, the groves composed of it are extremely dark and gloomy. The town of Peshawer itself stands on an uneven surface. It is upwards of five miles round; and contains about 100,000 inhabitants. The houses are built of brick (generally unburnt), in wooden frames: they are commonly three stories high, and the lower story is generally occupied by shops. The streets are narrow, as might be expected where no wheeled-carriages are used: they are paved; but, the pavement sloping down to the kennel, which is in the middle, they are slippery, and inconvenient. Two or three brooks run through different parts of the town; and, even there, are skirted with willows and mulberry-trees. There are many mosques in the town; but none of them, or of the other public buildings, deserve notice, except the balla hisaur and the fine caravanera. The balla hisaur is a castle of no strength, on a hill, north of the town: it contains

some fine halls, commands a romantic prospect, and is adorned with some very pleasing and spacious gardens; but, as it is only the occasional residence of the king, it is now much neglected. On the north it presents a commanding aspect; but a view of it from the side nearest the town discloses strong signs of weakness and decay. Some of the palaces of the great are splendid; but few of the nobility have houses here.

"The inhabitants of Peshawer are of Indian origin, but speak Pushtoo as well as Hindkee. There are, however, many other inhabitants of all nations; and the concourse is increased during the king's visits to Peshawer. We had many opportunities of observing this assemblage in returning from our morning rides; and its effect was heightened by the stillness and solitude of the streets, at the early hour at which we used to set out. A little before sunrise, people began to assemble at the mosques to their morning devotions. After the hour of prayer, some few appeared sweeping the streets before their doors, and some great men were to be seen going to their early attendance at court. They were always on horseback, preceded by from ten to twelve servants on foot, who walked pretty fast, but in perfect order and silence: nothing was heard but the sound of their feet. But, when we returned, the streets were crowded with men of all nations and languages, in every variety of dress and appearance. The shops were all open. Dried fruits, and nuts, bread, meat, boots, shoes, saddlery, bales of cloth, hardware, ready-made clothes, and potheens, books, &c. were either displayed in tiers in front of the shops, or hung up on hooks from the roof. Amongst the handsomest shops were the fruiterers, (where apples, melons, plums, and even oranges, though these are rare at Peshawer, were mixed in piles with some of the Indian fruits;) and the cook-shops, where every thing was served in earthen dishes, painted and glazed, so as to look like china. In the streets were people crying greens, curds, &c. and men, carrying water in leathern bags at their backs, and announcing their commodity by beating on a brazen cup, in which they give a draught to a passenger for a trifling piece of money. With these were mixed people of the town in white turbans, some in large white or dark blue frocks, and others in sheep-skin cloaks; Persians, and Afghans, in brown woollen tunics, or flowing mantles, and caps of black sheep-skin or coloured silk; Khyberes, with the straw sandals, and the wild dress and air, of their mountains; Hindoos, uniting the peculiar features and manners of their own nation to the long beard and the dress of the country; and Hazarehs, not more remarkable for their conical caps of skin, with the wool appearing like a fringe round the edge, and for their broad faces and little eyes, than for their want of the beard, which is the ornament of every other face in the city. Among these might be discovered a few women with long white veils that reached their feet, and some of the king's retinue, in the grotesque caps, and fantastic habits, which mark the clans to which each belongs. Sometimes, when the king was going out, the streets were choaked with horse and foot, and dromedaries bearing swivels, and large waving red and green flags; and, at all times, loaded dromedaries, or heavy Bactrian camels, covered with shaggy hair, made their way slowly through the streets; and mules, fastened together in circles of eight or ten, were seen off the road, going round and round to cool them after their labour, while their keepers were indulging at an eating-house, or enjoying a smoke of a hired cullecaun in the street. Amidst all this throng we generally passed without any notice, except a salam from a passenger, accompanied by a bow, with the hands crossed in front; or an application from a beggar, who would call out for relief, admonish us that life was short, and the benefit of charity immortal, or remind us that what was little to us was a great deal to him."

During the stay of the embassy at Peshawer, an alarming rebellion against the king of Caubul was undertaken by
shah

shah Mahmud; and the king's minister, Akram Khan, who was known to be on good terms with the English, was singularly unsuccessful against the enemy. Before the first alarm created by the bad news was over, a Hindoo letter-carrier was seized in one of the passes on the way to Caubul; and a report was spread, that he was charged with a treacherous correspondence between the English and the rebels. This story was accompanied by a rumour, that the king of Caubul meant to give up to plunder the quarters and property of the embassy. The whole town was consequently in a ferment; people were running up and down in all directions, getting their arms in order, and lighting their matches; and a great mob angrily assembled at the gates of the caravanera. The gentlemen of the embassy continued to sit quietly in the hall, and to receive company: but Capt. Pitman silently doubled the guards, and took other measures of defence. At length, the king's minister made a visit to the ambassador, which put an end to any suspicions of disloyalty: the crowd dispersed; and the English, after having been threatened with massacre, became the hope of the nation. Meanwhile, the strength of the rebels continuing to increase, and also the poverty of the king's exchequer, he was advised to hoist the royal standard, to quit Peshawer, which was indefensible, and to march for Caubul. This determination, being taken, necessarily interrupted the negotiation, and decided the embassy to return. An application was made by the king of Caubul in his necessity to the British for a loan of money: but the ambassador thought that his powers did not extend to the making of such advances. Perhaps there would have been more statesmanship and magnanimity in granting them; since, at an expense which would not have doubled the cost of the embassy, the throne of Caubul would thus probably have been secured to a friendly sovereign, who would have indemnified the government of Calcutta by the cession of some frontier-province. Even if the money had been expended in vain, it would have secured cessions of claim, which future opportunities might have changed into valuable rights.

On the 14th of June the embassy began its retreat by another road, through Chumkuny, along the Caubul river to Acora, and thence to Attock, a fort near the junction of the Caubul and the Indus. Many persons were seen crossing the river, or floating down the stream, seated astride on the inflated hides of oxen; a contrivance which was used in these countries, as Arrian observes, in the time of Alexander. Above Attock, are rapids which interfere with navigation; and to the east of Attock the region assumes a Hindoo character. The embassy passed the Hydaspes at Jellalpoor in detachments between the 22d and 26th of July; and the rest of the journey back to Delhi was performed without any remarkable occurrence.

"The present kingdom of Caubul," says Mr. Elphinstone, "extends from the west of Herat in longitude 62, to the eastern boundary of Cashmeer in longitude 77 E. and from the mouth of the Indus in latitude 24, to the Oxus in latitude 37 N. The whole space included between those lines of latitude and longitude, does not belong to the king of Caubul; and it is generally understood, that of those which may be considered as annexed to his crown, many pay him but a nominal obedience. This kingdom is bounded on the east by Hindoostan, in which it however comprehends Cashmeer, and the countries on the left bank of the Indus. On the south it may be said to have the Persian Gulf; and, on the west, a desert extends along the whole of the frontiers. Its northern frontier is formed by the mountains of the eastern Caucasus, which are, however, included within the western part of the boundary there formed by the Oxus. According to the nomenclature of our latest maps, it comprehends Afghanistan and Segistan, with part of Chorasana and of Makran; Balk, with Tokarestan and Kilan; Kuttore, Caubul, Candahar, Sindy, and Cashmeer; together with a portion of Lahore, and the greater part of

Moultan. The whole population of the kingdom cannot be under fourteen millions. This was the number fixed by one of the gentlemen of the mission, on a calculation of the extent and comparative population of the different provinces. All extensive deserts were excluded; no greater rate of population than a hundred to the square mile was allowed to any large tract except Cashmeer, and sometimes (as in the whole country of the Hazaurehs) only eight souls were allowed to the square mile. The different nations who inhabit the kingdom of Caubul were supposed to contribute to the population in the following proportions:

Afghans	4,300,000
Beloches	1,000,000
Tartars of all descriptions	1,200,000
Persians (including Taujiks)	1,500,000
Indians (Cashmeerees, Juts, &c.)	5,700,000
Miscellaneous tribes	300,000
	<hr/>
	14,000,000

If a man could be transported from England to the Afghan country, without passing through the dominions of Turkey, Persia, or Tartary, he would be amazed at the wide and unfrequented deserts, and the mountains covered with perennial snow. Even in the cultivated part of the country, he would discover a wild assemblage of hills and wastes, unmarked by enclosures, not embellished by trees, and destitute of navigable canals, public roads, and all the great and elaborate productions of human industry and refinement. He would find the towns few, and far distant from each other; and he would look in vain for inns or other conveniences, which a traveller would meet with in the wildest parts of Great Britain. Yet he would sometimes be delighted with the fertility and populousness of particular plains and valleys, where he would see the productions of Europe mingled in profusion with those of the torrid zone; and the land, laboured with an industry and a judgment no where surpassed. He would see the inhabitants following their flocks in tents, or assembled in villages, to which the terraced roofs and mud-walls give an appearance entirely new. He would be struck at first with their high and even harsh features, their sun-burnt countenances, their long beards, their loose garments, and their shaggy mantles of skins. When he entered into society, he would notice the absence of regular courts of justice, and of every thing like an organized police. He would be surprised at the fluctuation and instability of the civil institutions. He would find it difficult to comprehend how a nation could subsist in such disorder; and would pity those, who were compelled to pass their days in such a scene, and whose minds were trained, by their unhappy situation, to fraud and violence, to rapine, deceit, and revenge. Yet he would scarcely fail to admire their martial and lofty spirit, their hospitality, and their bold and simple manners, equally removed from the suppleness of a citizen, and the awkward rusticity of a clown; and he would, probably, before long discover, among so many qualities that excited his disgust, the rudiments of many virtues. Clanship is established among them, as in most pastoral nations; but a high independent spirit animates the chiefs of families. Mr. Elphinstone observes; "To an old man of the tribe of Meeankhail, I was urging the superiority of a quiet life under a powerful monarch, to the discord, the alarms, the bloodshed, attending the present independence. The old man replied with great warmth; We are content with discord, we are content with alarms, we are content with bloodshed; but we will never be content with a master."

The origin of the name of *Afghan*, now so generally applied to this nation, is entirely uncertain; but is, probably, modern. It is known to the Afghans themselves only through the medium of the Persian language. Their own

own name for their nation is *Pooftoon*; in the plural, *Pookhtauuch*. The Berdooranees pronounce this word *Pookhtauuch*; whence the name of *Pitan*, by which the Afghans are known in India, may probably be derived.

The following is the course of study pursued about Peshawer, and other large towns. A child begins its letters (in conformity to a traditional injunction of the prophet) when it is four years, four months, and four days, old; but its studies are immediately laid aside, and not resumed till it is six or seven years old, when it learns its letters, and is taught to read a little Persian poem of Saadis, which points out the beauty of each of the virtues, and the deformity of each of the vices, in very simple and not inelegant language. This takes from four months to a year, according to the child's capacity. After this, common people learn the Koran, and study some books in their own language; people of decent fortune proceed to read the Persian classics, and a little of the Arabic grammar: boys who are to be brought up as mollahs, or priests, give a great deal of their time to this last study, which, as the Arabic grammars are very elaborate, and comprehend a great deal of science that we do not mix with the rudiments of a language, sometimes occupies several years. When a young mollah has made sufficient proficiency in this study, he goes to Peshawer, Huhstnagur, or some other place famous for its mollahs, and begins on logic, law, and theology. No further knowledge is required to complete a mollah's education; but many push their researches into ethics, metaphysics, and the system of physics known in the East, as well as history, poetry, and medicine, which last is a fashionable study for men of all professions. For those studies, and for the more advanced branches of theology and law, they often travel to distant cities, and even to Bokhara, which is a great feat of Mahomedan learning; but Peshawer seems, on the whole, to be the most learned city in these countries, and many more students come thither from Bokhara than repair to that city from Peshawer.

The Afghans are Mahometans of the Sunnite or orthodox sect, which occasions a great hatred between them and the Persians. (See PERSIA, p. 702.) The unlearned part of the Afghan nation certainly consider a Shiite as more an infidel than a Hindoo, and have a greater aversion to the Persians for their religion than for all the injuries the country has suffered at their hands. They hold, like all other Mussulmans, that no infidel will be saved; that it is lawful and even meritorious to make war on unbelievers; and to convert them to the Mussulman faith, or impose tribute on them.

The Afghans are a sociable people: besides the large entertainments which are given on marriages and similar occasions, they have parties of five or six to dine with them, as often as they can afford to kill a sheep. When all the guests have arrived, the master of the house, or one of his family, serves every one with water to wash his hands, and then brings in dinner. It generally consists of boiled mutton, and the broth in which the meat is boiled, with no addition but salt, and sometimes pepper. This soup, which they generally eat with bread soaked in it, is said to be very palatable. Their drink is buttermilk or sherbet. In some places, they drink a liquor made from sheep's milk, which has an enlivening, if not an intoxicating, quality. During dinner, the master recommends his dishes, presses the guests to eat, and tells them not to spare, for there is plenty. They say a grace before and after dinner; and, when all is done, the guests bless the master of the house. After dinner, they sit and smoke, or form a circle to tell tales and sing. The old men are the great story-tellers. Their tales are of kings and viziers, of genii and fairies; but principally of love and war. They are often mixed with songs and verses, and always end in a moral. They delight in these tales and songs. All sit in silence while a tale is telling; and, when it is done, there is a general cry of "Ai Shawah!" their usual expression of admiration. Their songs are

mostly about love; but they have numerous ballads, celebrating the wars of their tribe, and the exploits of individual chiefs. As soon as a chief of any name dies, songs are made in honour of his memory. Besides these songs, some men recite odes, or other passages from the poets; and others play the flute, the *rubaub* (a sort of lute or guitar), the *camauncheh* and *jarindeh* (two kinds of fiddles), or the *soornaun*, which is a species of hautboy. Mr. Elphinstone gives the character of the Afghans, or Caubulists, in the following terms. "I know no people in Asia who have fewer vices, or are less voluptuous or debauched; but this is most remarkable in the west: the people of towns are acquiring a taste for debauchery, and those in the north-east of the country are already far from being pure. The Afghans themselves complain of the *corruption of manners*, and of the decline of sincerity and good faith; and say that their nation is assimilating to the Persians. Their sentiments and conduct towards that nation greatly resemble those which we discovered some years ago towards the French; for their national antipathy, and a strong sense of their own superiority, do not prevent their imitating Persian manners, while they declaim against the practice, as depraving their own. They are fully sensible of the advantage which Persia has over them at present, from the comparative union and vigour of her councils; and they regard the increase of her power with some degree of apprehension, which is diminished by their inattention to the future, and by their confidence in themselves. To sum up the character of the Afghans in a few words: their vices are revenge, envy, avarice, rapacity, and obstinacy; on the other hand, they are fond of liberty, faithful to their friends, kind to their dependants, hospitable, brave, hardy, frugal, laborious, and prudent; and they are less disposed than the nations in their neighbourhood to falsehood, intrigue, and deceit." Elphinstone's Account of the Kingdom of Caubul, &c. 4to. 1815.

PESH'WA, or PESHWA, the hereditary title of the head of the Poona, or Western Mahrattas. The word has a meaning analogous to our first or prime minister; but has been retained by the persons who, for several generations, have hereditarily succeeded to the sovereignty. The history of the peshwas, according to the best authorities, is briefly this. About the year 1740, the peshwa and bukshi, minister and paymaster-general to the Ram Rajah, acknowledged sovereign of the whole Mahratta empire, threw off their allegiance to the weak successor of the great Sevajee, and divided his extensive empire between them. (See MAHRATTAS, vol. xiv.) The bukshi was of the military tribe, out of which, in strictness of Hindoo law, all sovereigns must spring; and he assumed the title and authority of Rajah of Berar, and fixed his capital at Nagpour, where, with that title, his successors continue as sovereigns of the Berar, or Eastern Mahratta state. The peshwa was a Brahman, to which tribe sovereignty is positively prohibited by the laws of Menu; and, in obedience, no Brahman hath ever become a king; for, although the peshwa have, in fact, the power, he by a political fiction professes to be only peshwa to the reigning family at Sattara, where the descendant of Sevajee is kept a state-pageant, whose patent and dress of investiture are still thought or feigned to be essential to the peshwa's authority, though that authority has been hereditary for several generations, each of which has kept the rajah in honourable thraldom at his ancient capital.

At the close of lord Wellesley's memorable splendid war, (see the article HINDOOSTAN, vol. x. p. 114.) four considerable Mahratta powers continued to occupy a high rank among the native states. The Peshwa, the nominal head of the national confederacy, had been restored by British arms, and maintained, though also controlled, by a British subsidiary force. The Rajah of Berar had ceded his maritime province of Cuttack, and would have received a subsidiary force, if means could have been found of supporting it from his own revenues. Both

thief

these chiefs were, in fact, dependent allies of the English government. Scindia had submitted to a peace which deprived him of his conquests. Holkar continued for some time to wage a predatory war against the English provinces. Scindia and Holkar had in truth ceased to exercise the powers of civil government, and had become the mere leaders of military bands. For many years they had quitted their capitals, lived in tents, and moved about with their armies, to extort contributions from neighbouring countries, or to practise the like rapine, under the name of revenue, on the countries which for this purpose only they treated as their own. The countries situated between Bengal, the basis of the peninsula, and our acquisitions in Hindoostan, were for ten years the scene of their wars, and the rajpoot princes were their most conspicuous victims. After the death of Holkar in 1811, his legitimate rights were exercised by his widow, called the Baeè, for an infant son; but his army and his spirit devolved on Meer Khan, a Mahometan general in his service, who separated from his master's nominal state, and became perhaps more formidable, because no pretences or recollections of territorial sovereignty disguised his true character of a military adventurer.

The *Pindarrees*, or Mountaineers, (from *Pinda*, a Sanscrit word for mountain, which obviously recalls also the *Pindus* of Greece, *Pindarissus* in Asia Minor, and *Pen*, or *Ben*, the Celtic word for height or head, which occurs in the names of so many mountains,) were, however, more avowed and undistinguished plunderers. They are the remains of the native armies (especially that of Scindia), which were necessarily disbanded when lord Wellesley, by the establishment of a general peace, had for the first time since the beginning of authentic history, condemned to inaction those innumerable chiefs, who with their bands of followers had always found plunder and advancement, sometimes power and fame, amidst the distractions of the Indian states. About the year 1806, they encamped on the south bank of the river Nerbuddah, which continued to be their principal station. Recruited by multitudes of similar character, they made perpetual inroads into the fertile countries to the southward; the dominions of the Nizam, the Rajah of Berar, and the Peshwa, into the company's province called the Northern Circars; and they carried fire and sword almost within sight of the ramparts of Bombay. A defensive system was found to afford no protection against them. A line from Surat to Gangam is too long for defence. They made their attack or effected their escape through passes in the mountains, unknown to Europeans, or impassable by them. The governments of India justly represented that the only remedy was to carry war into the seats of the Pindarrees, and finally to disperse a destructive banditti. The government at home very naturally shrunk from the expense and discredit of new wars; and the hostilities with Nepal occupied for two years all our disposable force. See NEPAUL, vol. xv.

Among the secondary Mahratta chiefs, the principal is the Guicawar Rajah, whose authority extends over great part of the opulent province of Guzurat. He had become a dependent ally of our government, and a subsidiary force was accordingly stationed at his chief city of Baroda. The mixture of territories among the Mahratta chieftains was as minute and intricate as among the members of the old germanic body. Three chiefs, sometimes divided a village, while one might have no land within a hundred miles. Scindia, for instance, had a town and fort within twelve miles of the Peshwa's capital of Poonah. From this system, so fertile in disputes, considerable differences had arisen between the Peshwa and the Guicawar respecting some intermingled land in Guzurat. The English government, as the ally of both, became the mediator. A minister from the Guicawar, on his way to Poonah to negotiate an accommodation,

was murdered at the instigation of Trimbeckjee, a favourite of the Peshwa, probably with the view of precipitating his master, a superstitious and effeminate voluptuary, before he was aware, into a quarrel with the British government. Mr. Elphinstone, the British minister at Poonah, having obtained proofs of the guilt of Trimbeckjee, required that he should be given up. He was in consequence sent prisoner to Tannah, a little neglected fort on the island of Salfette, twenty miles north of Bombay, and separated only by a channel of about a hundred yards wide from the Mahratta shore. From this place, as might have been expected, he made his escape about the beginning of the year 1817, and soon collected a body of followers, who, in India, never fail to flock round a leader who calls them to plunder. Intercepted letters are said to have proved that the Peshwa was privy to the escape and the revolt; and at this moment, had he been permitted to have reached his minister's camp, a general war would have been inevitable. Strengthened by the apparent authority of the state, that able adventurer would have been joined very speedily by the numerous petty chiefs of his nation, whose appetite for plunder long restraint had rendered ravenous. The Pindarrees would have immediately poured down their cavalry to his aid. If he could have maintained himself but a few months, Meer Khan and Scindia might have returned from Hindoostan, or might have occupied the British forces there by inroads into our territory. All these evils were averted in a single night, without spilling a drop of blood, by the sagacity and resolution of Mr. Elphinstone. The danger had arisen so suddenly, that his instructions must have been very general; but he determined, on his own responsibility, to perform his duty, which evidently was to extinguish the first spark that threatened to spread the flame of war through India. Having directed the subsidiary force to occupy the avenues of Poonah, and the fortified temple of Parbulthy, which commands it from the south, he laid before the Peshwa the proofs of his minister's revolt, and required him to receive British garrisons into the famous hill-fort of Lowghur, which might interrupt the communication with Bombay into Poorunde, where his treasure and archives were deposited, and two other hill-forts, the chief strong holds of his dominions. From that moment, and by that vigorous policy, all apprehension of general war was removed. The very name of a Mahratta war became absurd. Trimbeckjee kept up local revolts for a short time, and then escaped to the Pindarrees at the close of the year 1817.

The political difficulties which attended the administration of the state of Poonah, the danger of continuing to trust the Peshwa, or of attempting to establish a new government, were doubtless very considerable. This, however, has been effected. The military efforts of the governor-general were then directed to the reduction of the Pindarrees. Wherever they have been brought to action, they have been defeated; but finally to expel them from all their fastnesses, and effectually to impose upon their dispersed remains the habits of obedience and industry, will be a work of much time and labour, if ever to be accomplished. For an account of the subsequent proceedings, see the article NAGPOUR, vol. xvi. p. 504.

Dangers of a permanent nature doubtless attend the unprofitable and invidious extension of territory in the East, and the subsidiary system which that extension rendered unavoidable. But it is too late for any practical purpose, to inquire whether that policy ought originally to have been adopted, or could have been avoided. British India has grown into a great though subordinate state, which has its own political system, and all those relations towards neighbours which arise from a natural union or opposition of interest. At a vast distance from Europe, it formerly moved in a system of states altogether different from that to which the parent-state belonged.

Whatever brings it more near to contact with a powerful European nation, both exposes it to more formidable enemies, and entangles the Indian policy of this country with the nearer and more important principles of her western system. Circumstances have now rendered such an approach the most critical part of Indian politics. Thirty years ago the Mahrattas and Tippoo Sultaun were the most powerful of our immediate neighbours. The same station is now occupied by Caubul and Persia. Nor would this change be alarming, if the last of these powers were left to her own strength, and moved by no external force. But it cannot be doubted that an European nation, occupying Georgia with a disciplined army, and maintaining no contemptible marine on the Caspian, must have a most prevailing influence with the Court of Teheran. Russia, the most powerful empire of Christendom now occupies that commanding position; and the magnificent embassy of general Yermalow manifests no intention to neglect this advantage. (See p. 691.) Emboldened by their new alliance, and aware of the ancient hostility of Russia to Turkey, the Persians have made inroads into the Turkish territory, on every point of the frontier from Erivan to Bagdad. They even compelled the pacha of Kars (a government far within the Turkish frontier) to do homage to the king of Persia. Thus Turkey has been made to feel, that in a new war a new enemy is ready to be let loose against her on her eastern frontier.

PESINGAN', a town of Candahar: ninety miles south-east of Candahar.

PES'ME, a town of France, in the department of the upper Saône: ten miles south of Gray, and eight north-east of Auxonne. Lat. 47. 17. N. lon. 5. 39. E.

PES'NITZ (Upper), a river of Stiria, which rises near Schmierenberg, and runs into the Salm near Wipplerspach.

PES'NITZ (Lower), a river of Stiria, which rises near Schmierenberg, and runs into the Drave two miles west of Fridau.

PESO'LA, a lake of Naples, in Basilicata, at the foot of the Appenines.

PESOE'GA. See **POSEGA**.

PESQUE'RA, a town of Spain, in the province of Léon, near the Duero: twenty-eight miles south-east of Leon.

PESS'AC, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Bourdeaux. The place contains 1336 inhabitants.

PESS'AN, a town of France, in the department of the Gers: three miles south-east of Auch.

PESS'ARY, *f.* See the article **PATHOLOGY**, p. 332, 3, of this volume.

PESS'ER, a mountain of the county of Tyrol.

PESS'INUS, a town of Phrygia, famous for a temple and a statue of the goddess Cybele, who was from thence called *Pessimuntia*.

PEST, *f.* [*peste*, Fr. *pestis*, Lat.] Plague; pestilence:

Let fierce Achilles

The god propitiate, and the *pest* assuage. *Pope.*

Any thing mischievous or destructive.—Wretches, the common poisoners of youth, equally desperate in their fortunes and their manners, and getting their very bread by the damnation of souls. So that, if any unexperienced young novice happens into the fatal neighbourhood of such *pests*, presently they are upon him, plying his full purse, and his empty pate, with addresses suitable to his vanity. *South's Sermons.*

Of all the virtues, justice is the best;
Valour without it is a common *pest*.

Waller.

The *Pest* a virgin's face and bosom bears,
High on her crown a rising snake appears,
Guards her black front, and hisses in her hairs. *Pope.*

PEST, or **PESTH**, a royal and free town of Hungary, on the east side of the Danube, opposite Buda. Here is held the supreme court of appeal: a large military hospital;

fix convents, and several churches. The town is surrounded with a wall and moat. In the year 1526, and again in the year 1541, it was taken by the Turks, who held it till 1602, when it was retaken by the Hungarians, and defended by them against a fresh attack of the Turks. But in the following year, being abandoned through fear, it fell once more into the hands of the Turks, who, in 1684, set fire to it, and marched to Buda. The Imperialists, upon this, indeed, took possession of the town, but abandoned it again, not returning till two years after, when it was reduced to a very poor condition, but was raised by the liberality of the emperor Leopold.

For farther particulars of these sieges, &c. we refer to the article **BUDA**, vol. iii. for Pest and Buda form almost one city, which is the capital of Hungary. They are separated by the Danube, here seen in all its majesty; over which is an easy communication by a bridge formed of forty-seven large boats, united by chains and covered with planks. The length of the bridge is nearly three hundred yards; and it is so constructed, that two or three boats, with their planks and railings, may at any time be removed; and every morning and evening, at stated hours, the vessels and the rafts of timber which navigate or float down the Danube, are permitted to pass. Buda, the seat of the Hungarian government, and the residence of the Palatine, contains 30,000 inhabitants. Pest, the *Tranfaccinum* of the Romans, occupies the left bank of the river. It is the seat of commerce, and contained 41,882 inhabitants in the year 1817. It is built upon a plain where it extends itself more and more every day, and is one of the very few towns upon the continent which seems to have suffered little during the late periods of disturbance. It may be divided into the Old and New Town, of which the latter has by far the most regularity in its structure. In many different parts of the town are seen large buildings, facing to the streets, entered by covered gateways, and known by the name of the nobleman to whom they belong, which is often inscribed above the chief entrance.

Four annual fairs are held here, each lasting a week. Dr. Bright was at Pest during the great spring-fair in 1814; and has explained to us the mode in which trade is conducted in Hungary. "The fair was held in a large open space within the town, where a great quantity of manufactured goods, of various kinds, were exposed to sale. Almost the whole of these, however, were brought from Vienna, for no country in Europe is perhaps less indebted to her own manufactures than Hungary. An extension of the market, where agricultural produce, the true riches of the country, was chiefly seen, occupied some streets in the suburbs. The Greeks, and a few Turkish merchants, had taken up their stations in different parts; and the whole presented a picture of that bartering traffic which marks the early stages of commercial intercourse. The manner in which the Hungarian peasant conducts himself in the sale of his produce is, when compared to that of the Slavonian, the German, and the Jew, with whom he is surrounded, remarkable and interesting. The Slavonian enlarges on the excellence and cheapness of his ware, with palpable and suspicious eagerness. The German dresses out his merchandise, turns it from one side to the other, and presents himself to the purchasers with a commanding self-sufficiency. The Jew swears with heart and soul that he will injure no man; and the Raitzer is stern, silent, and unaccommodating: but, on that account, his characteristic and fiery eye pleads with the greater eloquence. The Hungarian alone keeps himself perfectly passive in his dealings. He allows his goods to be inspected, answers shortly and directly to the question, and attempts not to impose either by words or artifice. You perceive by his embarrassment that he is unaccustomed to low arts: his good temper evidently counteracts the feeling of poverty, which is therefore borne with ease and content." Travels through Lower Hungary, by Rd. Bright, M. D. 4to. 1821,--

1821.—Pest is ninety miles south-east of Presburg, and 103 south-east of Vienna. Lat. 47. 28. N. lon. 19. 14. E.

PEST-HOUSE, *f.* An hospital for persons infected with the plague.—Which kind of reasoning is just as if a man should go into a *pest-house* to learn a remedy against the plague. *South.*

Are we from noisome damps of *pest-house* free?
And drink our souls the sweet ethereal air? *Thomson.*

PEST'DON, a town of Prussia, in Pomerelia: ten miles south of Marienburg.

To PES'TER, *v. a.* [*pester*, Fr. to inveigh against.] To disturb; to perplex; to harass; to turmoil.—We are *pestered* with mice and rats, and to this end the cat is very serviceable. *More against Atheism.*—A multitude of scribblers daily *pester* the world with their insufferable stuff. *Dryden.*

Who then shall blame
His *pester'd* senses to recoil and start,
When all that is within him does condemn
Itself for being there? *Shakespeare's Macbeth.*

He hath not fail'd to *pester* us with message,
Importing the surrender of those lands. *Shakespeare.*

To encumber; [*pesta*, Ital. a crowd or throng.]—Cloistered monks, which fill and *pester* every city. *Harmar's Tr. of Beza*, 1587.—The people crowding near within the *pester'd* room. *Dryden.*

The churches, and new calendere,
Pester'd with mongrel faints. *Bp. Hall's Sat.*

Confin'd and *pester'd* in this pifold here,
Men strive to keep a frail and feverish being. *Milton.*

PESTERER, *f.* One that pesters or disturbs.

PESTEROUS, *adj.* Encumbering; cumbersome.—In the statute against vagabonds, note the dislike the parliament had of gaoing them, as that which was chargeable, *pesterous*, and of no open example. *Bacon's Hen. VII.*

PESTI, a town of Naples, in Principato Citra, situated near the ruins of the ancient Pæstum or Possidonia, which was ruined by the Guiscards, and abandoned in the 11th century. Among the ruins are three temples, a theatre, an amphitheatre, a church, &c. twenty miles south-east of Salerno.

PESTIC'CIA, a town of Naples, in Basilicata: nine miles north of Turfi.

PESTIDUCT, *f.* [Lat. *pestis*, and *duco*, to lead.] That which conveys or brings contagion.—When I am but sick, and might infect, they [the friends of the diseased] have no remedy but their absence and my solitude. It is an excuse to them that are great, and pretend, and yet are loth to come; it is an inhibition to those who would truly come, because they may be made instruments and *pestiducts* to the infection of others, by their coming. *Donne's Devot.*

PESTIFEROUS, *adj.* [from the Lat. *pestis*, and *fero*, to bear, &c.] Destructive; mischievous.—Beware of the *pestiferous* see of Rome, that the make you not drunke with her pleasaunte wyne. *Abp. Cranmer's Answer to Bp. Gardiner.*

Such is thy audacious wickedness,
Thy leud, *pestiferous*, and dissentious, pranks,
The very infants prattle of thy pride. *Shakespeare.*

Pestilential; malignant; infectious.—It is easy to conceive how the steams of *pestiferous* bodies taint the air, while they are alive and hot. *Arbutnot.*

PESTILENCE, *f.* [*pestilence*, old Fr. from *pestilentia*, Lat.] Plague; pest; contagious distemper.—The *pestilence* that walketh in darkness. *Psaln xci. 6.*—There shall be famines, and *pestilences*, and earthquakes, in divers places. *Matth. xxiv. 7.*

The red *pestilence* strike all trades in Rome,
And occupations perish. *Shakespeare.*

When my eyes beheld Olivia first,
Methought the purg'd the air of *pestilence*. *Shakespeare.*

PESTILENT, *adj.* Producing plagues; malignant.—Great ringing of bells in populous cities dissipated *pestilent* air, which may be from the concussion of the air, and not from the sound. *Bacon's Nat. Hist.*—To those people that dwell under or near the equator, a perpetual spring would be a most *pestilent* and insupportable summer. *Bentley.*—Mischievous; destructive: applied to things.—There is nothing more contagious and *pestilent* than some kinds of harmony; than some, nothing more strong and potent unto good. *Hooker.*

Which precedent, of *pestilent* import,
Against thee, Henry, had been brought. *Daniel.*

Mischievous; applied to persons.—We have found this man a *pestilent* fellow. *Acts xxiv. 5.*—In ludicrous language, it is used to exaggerate the meaning of another word:

One *pestilent* fine,
His beard no bigger though than thine,
Walk'd on before the rett. *Suckling.*

PESTILENT WORT. See TUSSILAGO.

PESTILENTIAL, *adj.* Paraking of the nature of pestilence; producing pestilence; infectious; contagious.—These, with the air passing into the lungs, infect the mass of blood, and lay the foundation of *pestilential* fevers. *Woodward.*

Fire, involv'd
In *pestilential* vapours, stench, and smoak. *Addison.*

Mischievous; destructive; pernicious.—If government depends upon religion, then this shows the *pestilential* design of those that attempt to disjoin the civil and ecclesiastical interests. *South.*

PESTILENTLY, *adv.* Mischievously; destructively.—In ludicrous language, so as to exaggerate the meaning of another word.—The pretence of making people sagacious, and *pestilently* witty! *Echard of the Cont. of the Clergy.*

PESTILLA'TION, *f.* [from *pestile*.] The act of pounding or breaking in a mortar.—The best diamonds are comminable, and so far from breaking hammers, that they submit unto *pestillation*, and resist not any ordinary pestle. *Brown's Vulg. Err.*

PESTIVIEN', a town of France, in the department of the North Coasts: nine miles south-south-west of Guingamp, and twelve north of Rostrenen.

PEST'LE, *f.* [*pestail*, old French; *pestillum*, Latin.] An instrument with which any thing is broken in a mortar.—What real alteration can the beating of the *pestle* make in any body, but the texture of it? *Locke.*—Upon our vegetable food the teeth and jaws act as the *pestle* and mortar. *Arbutnot on Aliments.*

PESTLE OF PORK, *f.* A gammon of bacon. A very old expression. Huloet and Barret give it. And the Exmore dialect yet calls a leg of pork by this name.—With shaving you shine like a *pestle of porke*. *Damon and Pythias.*

To PES'TLE, *v. n.* To use a pestle.—It will be a *pestling* device: it will pound all your enemy's practices to powder. *B. Jonson's Epicoene.*

PESTOV'SKOI, a town of Prussia, in the government of Viatka, on the Suran: forty-eight miles north-north-east of Slobodskoi.

PE'SU, or SI'U, a city of China, of the second rank, in Kiang-nan, on the river Hoang: 317 miles south of Peking. Lat. 34. 10. N. lon. 117. 0. E.

PE'SVER, a town of Persia, in the province of Irak: sixty miles west of Kermansha.

PE'SUMSCUT, a river in the province of Maine, which runs into Portland Bay.

PET, *f.* [of doubtful etymology; from *depit*, Fr. or *impetus*, Lat. or perhaps it may be derived some way from *petit*, as it implies only a little fume or fret. *Dr. Johnson.*—Serenius derives it from the Su. Goth. *pett*, an interjection expressing dislike or contempt. It may be from the Italian

Italian *petto*, the breast, Dr. Jamieson says; to be in a *pet*, thus signifying to retain something in one's breast. Huloet renders *pettish* into the Lat. *impetuofus*; thus seeming to countenance the proposed Lat. etymon, *impetus*. Todd.—Rather from the French *péter*, (*crepare*, Lat. whence *petard*;) to make a sudden and noisy burst. "To be in a *pet*" is to be on the point of bursting into a passion; *prêt à péter*, *prêt à crever*, as does a bladder when too much pressed. "*Tanquam vesica pepedi*, I bursted like a bladder." Horace.—Or it may be an abbreviation of *petulance*, which comes from *petere*, Lat. to attack; as, *corum petit*, "he attacks with the horn;" &c. *Etymological Gleanings*.] A slight passion; a slight fit of peevishness.—If we cannot obtain every vain thing we ask, our next business is to take *pet* at the refusal. *L'Esfrange*.—Life, given for noble purposes, must not be thrown up in a *pet*, nor whined away in love. Collier.

If all the world
Should in a *pet* of temperance feed on pulse,
Drink the clear stream, and nothing wear but frieze,
The All-giver would be unthanked, would be unprais'd.
Milton.

A lamb taken into the house, and brought up by hand; a cade-lamb: hence any creature that is fondled and indulged; [probably from the Fr. *petit*, little.] The other has transferred the amorous passions of her first years to the love of cronies, *pets*, and favourites, with which she is always surrounded. Tatler, No. 266.—Formerly spelt *peat*.—Deliro's wife and idol; a proud mincing *peat*, and as perverse as she is officious.

A citizen and his wife the other day
Both riding on one horse, upon the way
I overtook, the wench a pretty *peat*.
Donne.

To PET, *v. a.* To treat as a pet; to fondle; to indulge.

PET-EN-L'AIR, *f.* A fart-in-gale, or farthingale.—A hoop to spread the petticoats. One of our recent travellers says, that the reason why long trains belonging to the gowns of great men were carried up in state was "to let out offensive vapours."

PET DE RELIGIEUSE, or PET DE NONNE, a kind of puffed fritters, common in France. Previous to the batter being thrown into a deep pan of melted butter, the cook blows them with a tube like soap-bubbles; they are generally round, and empty; of a fine fawn-colour, and sprinkled with sugar.—No wonder that our finical gentry should be so loose in their principles, as well as weak in their bodies, when the solid substantial protestant mince-pie has given place among them to the Roman-catholic amulets, and to the light, puffy, heterodox, *pets de religieuses*. *Connoisseur*, N^o 48.

PETACCIA'TA, a town of Naples, in Abruzzo Citra: twenty-two miles south-east of Civita Borella.

PETAGLOS'SUM, *f.* in botany. See LYTHRA.

PETAG'UEL, a territory of South America, in Brasil, bounded on the north by Dele, on the east by the sea, on the south by the captainship of Rio-Grande, and on the west by Tupuya.

PETA'JA, a town of Sweden, in Tavastland: twenty-two miles north of Jamfio.

PET'AL, *f.* [*petalum*, Lat.].—*Petal* is a term in botany, signifying those fine coloured leaves that compose the flowers of all plants: whence plants are distinguished into monopetalous, whose flower is one continued leaf; tripetalous, pentapetalous, and polypetalous, when they consist of three, five, or many, leaves. Quincy.—Linnæus observes, that, when the nectary is a distinct organ from the petals, flowers so constructed are to be suspected as poisonous. Both together constitute the *corolla*.

PETALIONS, a cluster of small islands, in the Grecian Archipelago, near the south-west coast of the island of Negropont. Lat. 37. 59. N. lon. 24. 16. E.

PET'ALISM, *f.* [Gr. from *πεταλον*, a leaf.] A form or

sentence of banishment among the Syracusans, by writing the name of one whom they would be rid of in an olive-leaf.—I wonder why Mr. Harrington did not mention the *petalism* of Syracuse, as well as the ostracism of Athens, in imitation of which it was invented. *Ep. Wren's Monarchy asserted*, 1659.—The *petalism* at Syracuse was nearly the same thing as the ostracism at Athens; except that the latter was for ten years, the former only for five. Chambers.

This mode of banishment was introduced in Syracuse about the year before Christ 460, in order to prevent the tyranny of the richer citizens, who had often about that time aimed at the diadem. To bring down, therefore, the aspiring minds of the wealthy citizens, the Syracusans made a law not unlike that of the Athenian ostracism; for, as at Athens every citizen was to write on a shell the name of the person whom they conceived to be the most likely, on account of his wealth and adherents, to aspire to the crown; so at Syracuse they were to write on a leaf the names of such as they apprehended powerful enough to usurp the sovereignty. When the leaves were counted, he who had the most suffrages against him was, without any further inquiry, banished for five years. This law was attended with many evil consequences; for those who were most capable of governing the commonwealth were driven out, and the administration of public affairs committed to the meanest of the people; nay, many of the chief citizens, who were able to render their country great service, fearing to fall under penalties of this law, withdrew from the city, and lived private in the country, not concerning themselves with public affairs: whence, all the employments being filled with men of no merit or experience, the republic was on the brink of ruin, and ready to fall into a state of anarchy and confusion. The law therefore of *petalism*, upon more mature deliberation, was repealed soon after it had been enacted.

PETALITE, *f.* A mineral recently discovered in the mine at Utoen in Sweden. Externally, it nearly resembles some varieties of quartz; but the cleavage is two-fold, parallel to the sides of a rhomboidal prism; two of the planes are splendid, and two dull. The planes meet at angles of 100° and 80°, forming a four-sided prism with a rhomboidal base. Its colour is white with a slight tint of pink; it scratches glass, but yields with difficulty to the knife. When exposed to the flame of a blow-pipe it remains for some time infusible, but by continual heat it exhibits a glazed surface, which, on examination with a lens, appears full of minute bubbles. When triturated, the powder has the whiteness of snow. It is partly soluble in highly-concentrated nitric acid, losing its colour, and changing to a dingy hue; the acid at the same time becomes clouded. The prussiated alkali threw down a green precipitate, and the solution assumed an amethystine colour, which afterwards changed to brown. The constituent parts of this mineral are stated to be,

Silex	80
Alumine	15
Manganese	3
And a new alkali	2

This alkali proves to be the oxyd of a new metal. The new alkali has been called Lithia and Lithion. It is readily obtained by fusing the mineral with potash, dissolving the whole in muriatic acid, evaporating to dryness, and digesting the alcohol. The exact quantity of Lithia in the Petalite is doubtful, but it cannot contain much more than 5 per cent. A more abundant source has however been found in the Triphane, or Spodumene, which according to M. Arfwedson, who also first pointed out in it the existence of lithia, contains 8 per cent. of the new alkali. The same chemist has likewise ascertained its existence in another mineral from Utoen, which is called crystallised lepidolite, in the proportion of 4 per cent.

The pure alkali is very soluble in water, has a very acrid caustic taste, like the other fixed alkalies, and acts powerfully on blue vegetable colours. When heated on platinum

platinum, it acts on it. It has a strong affinity for acids, and a very high neutralizing power, even surpassing that of magnesia. Placed in the voltaic circuit, Sir H. Davy showed that it was decomposed with the same phenomena as the other alkalis. A portion of its carbonate being fused in a platinum capsule, the platinum was rendered positive, and a negative wire brought to the upper surface. The alkali decomposed with bright scintillations, and the reduced metal, being separated, afterwards burnt. The small particles which remained a few moments before they were reconverted into alkali, and allowed a short examination, were of a white colour, and very similar to sodium. A globe of quicksilver made negative, and brought into contact with the alkaline salt, soon became an amalgam of lithium, and had gained the power of acting on water, and evolving hydrogen, an alkaline solution resulting.

The chloride of lithium obtained by evaporating the muriate to dryness, and fusing it, is a white semi-transparent body, analogous in its appearance to the chlorides of potash and soda, but very different from them in its general properties. It is extremely deliquescent, whereas they are not so: in this respect it almost equals muriate of lime. Its solution crystallizes with great difficulty, but by evaporation affords minute needle-form crystals. It is very soluble in alcohol; but the chlorides of potash and soda very little so. Its solution, or the moist salt, has the property of tinging the flame of alcohol of a fine red, somewhat like strontian, but the other alkaline muriates have not this power. It fuses below a red heat; and, when heated powerfully in the open air, it gradually loses chlorine, absorbs oxygen, and becomes strongly alkaline.

All its salts are very fusible, but in some cases a singular degree of infusibility belongs to them. The nitrate is a very soluble salt, deliquescent, and capable of crystallizing in rhomboids. It has a very aigre taste: heated, it readily fuses, and is then decomposed with the same phenomena as nitre.

The sulphate of lithia is a salt which crystallizes readily in small rectangular prisms; they are perfectly white, and possess much lustre; have a saline taste, very different from potash or soda; are more soluble in water than sulphate of potash; perhaps not so soluble as sulphate of soda: the crystals contain no water; they fuse and become very liquid below a red heat; their solution does not precipitate the muriate of platina, nor is it precipitated by tartaric acid. M. Vauquelin gives an experiment on its constitution, the result of which is as follows:

Sulphuric acid	69.18
Lithia	30.82
	100.00

The sub-carbonate of lithia is but little soluble in water, and effloresces in the air. It may even be precipitated from its sulphate by adding a strong solution of carbonate of potash to it. It is readily fusible; and, when fused, requires repeated additions of water with boiling to dissolve it again. Cold water dissolves about one one-hundredth part of its weight of this salt; and the solution acts powerfully on vegetable colours, and effloresces with acids. According to Vauquelin, it attracts carbonic acid very rapidly from the atmosphere. The carbonate, heated on platinum, acts on it almost as powerfully as the fixed alkaline nitrates. It separates ammonia from its combinations, but is decomposed by lime and barytes, and rendered caustic. The solution of the carbonate precipitates the muriate of lime, the sulphates of magnesia and alumina, and the salts of copper, silver, and iron, just as the other alkaline carbonates do; but it does not precipitate the muriate of platinum, as is the case with the sub-carbonate of potash.

With respect to the proportions of the elements of the

alkali, they do not appear exactly determined. M. Arfwedson states, that lithia contains 43.9 per cent. of oxygen; M. Vauquelin concludes that it contains 44.84 per cent. See Journal of Science, No 10. and London Med. Journal, vol. xl. p. 109 and 134.

PETALO'MA, *f.* [so named by Swartz; from the Gr. *πέταλον*, a petal, and *λομα*, a border; because the petals are inserted into the margin of the calyx, between its teeth.] In botany, a genus of the class decandria, order monogynia, natural order of calycanthemæ, *Limn.* (onagræ, *Juss.*) Generic characters—Calyx: perianthium superior, of one leaf, cup-shaped, permanent, with five acute, equal, slightly-spreading, teeth. Corolla: petals five, oblong, spreading; their claws inserted between the teeth of the calyx, deciduous. Stamina: filaments ten, inserted into the rim of the calyx, longer than the corolla; antheræ oblong, incumbent, opening by two pores at one end. Pistillum: germen inferior, ovate; style elongated, awl-shaped; stigma simple, acute. Pericarpium: berry globose, fleshy, crowned by the calyx, of one cell. Seeds from one to four, angular on one side, convex on the other.—*Essential Character.* Calyx pitcher-shaped, five-toothed; petals five, inserted between the teeth of the calyx; stamens inserted into its border; berry of one cell. It is separated from Myrtus, on account of the form of the calyx, and the insertion of the stamens. There are two species.

1. *Petaloma myrtilloides*, or silver-wood; (*Swartz. Prodr.* 73. *Ind. Occ.* 833. *Myrti-folio arbor, cortice argenteo, Sloane Jam. t. 187. f. 3.*) Stalks solitary, single-flowered; leaves nearly sessile, ovate, taper-pointed, oblique at the base. Native of Hispaniola and Jamaica, in low woods. Swartz describes it as a shrub, two or three feet high; Sloane says the trunk is twenty feet in height, straight and undivided. Both agree that the bark is spotted with white, whence arose the English name. The leaves are opposite, entire, thin, smooth, and inodorous, one and a half or two inches long. Flowers axillary, solitary, rarely opposite, on shortish stalks, white, smaller than a currant-blossom, but with long projecting stamens and style. Berry ovate, crowned with the calyx, black and shining when ripe, with seldom more than one seed. The aspect of the whole plant is like some species of myrtle; but it wants the strong taste and smell of that genus, and the structure of the flowers is totally different.

2. *Petaloma mouriri*, (*Sw. Ind. Occ.* 835. *Mouriri Guianensis, Aubl. Guian. t. 180.*) Stalks clustered; leaves stalked, broad-ovate, pointed; berries with four seeds. Native of woods in Guiana, near the river of Sinemari, where Aublet found it flowering in November, and bearing ripe fruit in January. The trunk of this tree is thirty or forty feet high, and eighteen inches in diameter, bearing at the top numerous branches, spreading in every direction. The bark is grey; the wood whitish, hard, and close-grained. Leaves longer, and much broader, than those of the foregoing, as well as of a firmer texture; paler underneath, but smooth and shining on both sides. Footstalks short and thick. Flower-stalks axillary, clustered, and somewhat umbellate, with small, opposite, acute bractes. Flowers yellow; berry yellow, minutely dotted with red, containing four seeds. Nothing is recorded of the qualities or use of this tree; but the inhabitants of the country where it grows name it *mouririchira*.

PETALOSTEMUM, *f.* in botany, so called by Michaux, from the Gr. *πέταλον*, a petal, and *σημαν*, a stamen; on account of the union of those two parts of the flower into a tube. See DALEA.

PET'ALOUS, or PETALLOID, *adj.* Having petals.

PETAMINARIUS, *f.* in antiquity, a name given to certain persons who performed extraordinary feats of activity; took perilous leaps, vaults, &c. The word is formed from the Gr. *πέταμαι*, I fly; but some authors write it *petiminarius*; and derive it from *petimen*, which,

according to Servius, signifies the bunch of a camel; alluding to the manner in which these operators bend the body in exhibiting postures.

PETAPA', a town of Mexico, in the province of Guatimala: twenty miles south-east of Guatimala.

PETAPOLLY, a town of Hindoostan, in the circar of Rajamundry: twenty-six miles north-east of Rajamundry.

PETAR', or PETARD, *f.* [*petard*, Fr. *petardo*, Ital.] A machine applied to gates or barriers to blow them up: they are also used in countermines to break through into the enemies galleries. See the article ARTILLERY, vol. ii. p. 233.

'Tis sport to have the engineer
Hoist with his own *petar*.

Shakespeare's Hamlet.

The conjugal *petard*, that tears
Down all portcullices of ears.

Hudibras.

PETARDIER, *f.* He who loads and fires the petard.

PETASITES, *f.* [Greek.] The BUTTER-BUR. It owes that name to its large round leaf, resembling a very broad hat or umbrella, *πελασος*. See TUSSILAGO; also CLERODENDRUM and GUNNERA.

PET'ASUS, *f.* [Greek.] Among the Romans, a covering for the head, not unlike our hats; it had a broad brim, and was used in journeys, to save the face from being sun-burnt. The *pileus* differed from the *petasus*, as having no brim.—The *petasus* is observed upon the head of ancient figures of Mercury; who wore it in the quality of the god of travellers and merchants. *Chambers.*

PETAT'LAN, a town of Mexico, in the province of Culiacan, on a river of the same name: 120 miles north-west of Culiacan. Lat. 25. 30. N. lon. 104. 34. W.

PETAT'LAN, a town of Mexico, in the province of Mechoacan: seventy miles south-east of Zacatula, 135 south-south-east of Mechoacan. Lat. 18. N. lon. 102. 6. W.

PETAT'LAN, a river of Mexico, which crosses the north part of the province of Culiacan, and runs into the Pacific Ocean in lat. 25. 30. N.

PETAU', an ancient town of Germany, in the circle of Austria, and in Stiria. It is a handsome place, and is seated on the river Drave, thirty-five miles north-east of Cilly, and 109 south of Vienna. Lat. 46. 40. N. lon. 15. 36. E.

PETAU', or PETA'VIUS (Denis, or Dionysius), a very learned Jesuit, was born at Orleans in 1583. He was remarkable, from childhood, for a singular propensity to letters; and is said to have composed verses with great facility at the commencement of his tenth year. As he grew up, he would pass whole days in study, to the neglect of all the usual amusements of his age. He entered into the society of Jesuits at the age of twenty-two, and taught rhetoric and theology at their college in Paris with extraordinary reputation. He was perfectly versed in the learned languages, and was well acquainted with the sciences; but his particular study was chronology, and it is upon his writings on that topic that his literary fame is chiefly founded. After he had made himself known by several learned publications, Philip IV. of Spain applied to the general of his order to send him to occupy a professorship in the imperial college of Madrid. Petau remonstrated that his state of health would not permit him to travel, nor to reside in so hot a climate; and his excuse was admitted. In fact, France was a much sifter residence for him than Spain, in which last country he could neither have written with any degree of freedom, nor have got his works printed. He afterwards refused a more tempting invitation to Rome, from Urban VIII. who had a design of raising him to the purple. Devoting himself entirely to letters, he continued to live in his cell in the college of Clermont, where he died in 1652, in his 70th year. He had been a great sufferer from the stone, so that he regarded death as a desirable release; and, when the physician, Guy Patin, informed him that his end was just at hand, Petau caused a copy of his Ratio-

narium Temporum to be brought, and presented it to him as a recompense for his good news.

Although of a warm temper, and subject to occasional sallies of passion, Petavius was much esteemed in the commerce of life, both as a man and an ecclesiastic. He was disputatious, and liable to exceed the bounds of moderation in his literary controversies; yet he retained many friends among the learned. One of these was the illustrious Grotius, though of a different communion: on the other hand, one of his warmest antagonists was Salmasius. The writings of Petavius are numerous and various. He appeared as a translator and critical editor in his Latin versions and editions of several pieces of St. Epiphanius, of Synesius, Themistius, the emperor Julian, and the historical abridgment of the patriarch Nicephorus. In these works he exhibits himself as an elegant and successful interpreter, though Spanheim finds him occasionally mistaking the sense of his author. He exercised himself in poetry both in the Greek and Latin languages, in the former of which he gave a Version of 'all the Psalms and Canticles. His verses are as good as could be expected from vast reading and a prodigious memory, without a poetical genius. His more important works are, 1. De Doctrina Temporum, 2 vols. fol. 1627; a very learned and profound system of chronology, of great use to writers and students of history. It is generally accompanied by his "Uranologia, in quo Græci Auctores varii de Sphæra ac Sideribus commentati sunt, &c." fol. 1630. 2. Rationarium Temporum, an abridgment of his Doctrina Temporum, with an abstract of general history: of the various editions of this useful work, the best is reckoned that of J. Conrad Rungius, 2 vols. 8vo. 1710. 3. Dogmata Theologica, 3 vols. fol. 1644—1650; a very elaborate system of dogmatical theology, much esteemed by Protestants as well as Catholics. The fairness of its statements, indeed, drew censure upon the author, as being too favourable to the Arians in his account of the opinions of the early centuries of the Christian church: the Sorbonne obliged him to counteract this effect in an orthodox preface, which however has only made him appear inconsistent with himself. In like manner, his representation of the opinions of St. Augustine having given offence to his brethren of the society, he was forced to retract, and adopt the Molinist sense of those doctrines. It is reported that he said to a friend, as a reason for this alteration, "I am too old to change my lodgings," intimating that he must otherwise have quitted the society: such was its tyranny in matter of opinion! The style of Petau, when writing upon these abstruse and thorny subjects, is much admired for its purity and clearness. His life is written at length by Father Oudin, in the "Mémoires du Niceron."

PETAWONTAKAS, an Indian nation of America, formerly in alliance with the Hurons.

PETAYANG', a small island in the Chinese Sea. Lat. 26. 2. N. lon. 119. 49. E.

PETCHELI', or PE-CHE-LEE, called also *Tcheli* or *Lipa-fou*, the principal province of China. It approaches to the form of a right-angled triangle; and is bounded on the north by the great wall and part of Tartary, on the east by the sea of Corea, on the south by the provinces of Chang-tong and Ho-nan, and towards the west by the mountains of Chan-si. It contains nine cities of the first class, with their respective jurisdictions, which comprehend a great number of other cities, less considerable, but all surrounded with walls and ditches. Cities of the first rank are distinguished by the appellation *fou*; those of the second rank by *tcheou*; and those of the third rank by *kien*. The capital of this province is Pekin, which see.

Petcheli is very much a level country, and has few mountains; and therefore it allows of the use of a singular kind of carriage, with one wheel, and constructed so that there is room in the middle for only one person, who

who sits as if he were on horseback; the driver pushes behind, and, by means of wooden levers, makes the carriage, which is a sort of chariot, advance with safety and expedition. The soil of this province is sandy, and produces very little rice; but all other kinds of grain are abundant, as well as most of the fruit-trees which we have in Europe. The rivers supply abundance of fish, and the mountains have mines of coal. The temperature does not seem to agree with its latitude; for, though it extends no farther than to 42° N. lat. yet all the rivers are frozen during four months in the year, from the middle of November to the middle of March, to such a degree, that horses and waggons, with the heaviest load, may safely pass over them. It is remarked, as a singular circumstance, that the whole body of ice is formed in one day, and that several days are requisite to thaw only the surface. The rainy season occurs towards the end of July, and the beginning of August: there is little rain at any other time, but the night-dew supplies the want of it. It is observed by Grosier, that the people of this province have not the same aptitude for acquiring literature and science as those who inhabit the southern provinces of the empire; but they are more robust and warlike, and better fitted for enduring the hardships and fatigues of war. The same observation applies to the Chinese of all the northern countries. This province is distinguished from all others, by being, as it were, the depot of the richest productions of the whole empire. According to the statement of Sir George Staunton, this province contains 38,000,000 of people. See CHINA.

PETCHORA, or PETSHORA, a river of Russia, called also *Bol'shaia*, or *Great Petchora*, by way of distinction from the *Vishera*, which the Siryanes call *Petshoyra*, takes its rise on the western side of the Ural mountains, in the government of Vologda, follows a north-west course, and falls into the Frozen Ocean in the government of Archangel, (lat. 67. 40. N. lon. 50. 34. E.) after dividing into several powerful arms. It now flows through a low, foresty, and almost uninhabited, country. At first, when Siberia was conquered, the way thither was generally by the Petchora: those who visited that country sailed up the Duina, the Vichegda, and the Vim, then went a short space by land to the Petchora, then up that river, and by land over the Ural mountains to the Sofva; hence into the Tavda, the Tobol, the Irtysh, the Oby, the Ket, and from the Ket into the Yenissey, &c.

PETE'CHLÆ, *f.* [derivation unknown.] Small purple, reddish, livid, or blackish, spots upon the skin, occasioned by the effusion of a minute portion of blood under the cuticle, or scarf-skin. When these spots are very minute, like small points, they are called *stigmata*; when they are large, and spread into broad irregular patches, like the effusions occasioned by a bruise, they are called *ecchymoses* and *ecchymonata*; and when they occur in stripes, like the effects of the strokes of a whip, they are denominated *vibices*.

Petechiæ occur under various circumstances; but are most frequently seen in severe fevers, of a dangerous and malignant character, especially in typhus, when it exists in gaols, hospitals, and the ill-ventilated habitations of the poor; they are occasionally seen intermixed with the pustules of small-pox, especially of the confluent kind, and with the worst species of scarlet fever. Whence they have generally been accounted indications of great danger, and have been considered as signs of the general putrefecency of the circulating fluids, and as demanding the exhibition of the most powerful stimulants and antiseptics, whenever they appear. On the contrary, however, petechiæ of the largest dimensions, and even extensive ecchymoses and vibices, together with actual hæmorrhages, are occasionally seen, unaccompanied by fever, and sometimes with but little derangement of the health. Whence authors have written of "Petechiæ sine febre" as a distinct disease, which has been also called PURPURA, and by Dr. Good PORPHYRA. See the article PATHOLOGY, p. 295.

PETE'CHIAL, *adj.*—*Petechial* fevers are those varieties of typhus, in which petechiæ occur in considerable numbers, constituting one of the most prominent features of the disease. *Chambers*.

PETELAN'GE, a town of France, in the department of the Moselle: nine miles south-west of Sarguemines, and thirteen north-east of Morhange.

PETELIA, or PETILIA. See STRONGOLI.

PETELMA, *f.* The procurator-general of the effects of the Janizaries. When any one dies under the protection of this body, he seals up their houses, to secure the tenth part of their effects; which is due to the Janizaries.

PETER (Saint), an eminent apostle of Christ, originally known by the name of *Simon*, was a native of Bethsaida, a town on the western shore of the Lake of Gennefareth, or the Sea of Galilee. He was brought up to the occupation of a fisherman, as was his brother Andrew, another apostle of Christ; and it seems probable that their father Jonas, or John, was of the same calling. Which was the elder of his sons, Andrew or Simon, is a point which antiquity does not enable us to determine with any certainty. They appear to have become disciples of John the Baptist, and by that means to have had their minds in some measure prepared for the reception of his doctrine, of whom John was only the fore-runner. In our article ANDREW, (vol. i.) we have seen, that he was probably the first disciple of Christ, in whom he believed as the expected Messiah, upon hearing John's allegorical declaration concerning him, that he was "the Lamb of God which taketh away the sin of the world." This joyful information he communicated to his brother, and introduced him to Jesus; who, foreseeing the fortitude which he would display in preaching his religion, gave him the surname of *Cephas*, or *Peter*, signifying "a stone, or rock," (the former in Syriac, the latter in Greek,) by which he was afterwards most commonly distinguished. From this time, Andrew and Peter frequently attended on Jesus, and heard his discourses, and were witnesses to the first miracles performed by him, which confirmed them in the persuasion that he was the Messiah. Yet they still occasionally continued their occupation of fishermen, till he called them to a more stated attendance; when they left their nets, and followed him, encouraged by his magnificent promise, that he would make them *fishers of men*, or qualify them to recover mankind from ignorance and error, folly and vice, and to form them to just sentiments of religion, and the practice of virtue. Afterwards, upon his choosing twelve of his disciples to be with him always, and to sustain the character of his apostles, the two brethren were selected to be of that number. About this time Peter, who was a married man, removed from Bethsaida to Capernaum, where his wife's relations seem to have lived; and he was accompanied by his brother Andrew, who took up his abode in the same house; on which account it is sometimes called in the evangelical history *Simon's house*, and sometimes *the house of Simon and Andrew*. With them also Jesus resided, when he left Nazareth and came to Capernaum, as we learn from different passages in the Gospels; and in this house the tribute-money for the use of the temple was levied upon him, which he directed Peter to discharge, after furnishing him with the means by an exertion of his miraculous power.

Peter, now appointed an apostle, showed on various occasions the strongest faith in Jesus as the Messiah, and the most extraordinary zeal in his service. On the evening of the day on which Jesus had performed the miracle of the five loaves and two fishes, he directed his disciples to enter a vessel, and to cross over to the other side of the sea, while he dismissed the multitudes who had been witnesses of that event. As they were on their passage, struggling against a contrary wind, in the fourth watch of the night, or near morning, Jesus came towards them, walking on the sea as on dry land. Alarmed at such

such a supernatural appearance, they imagined that they saw a spirit, and cried out for fear, till Jesus quieted their apprehensions by an assurance that it was himself who approached them. Upon this, Peter took courage, and said, *Lord if it be thou, bid me come unto thee on the water.* And he said, *Come.* Presuming on the strength of his faith, Peter immediately left the vessel, and walked on the sea to go to Jesus; but, finding the waves becoming boisterous, his courage failed, and, *beginning to sink, he cried, Lord, save me.* And immediately Jesus stretched forth his hand, and caught him, and mildly reprov'd him for doubting of his safety while acting under his orders. The circumstances of this adventure, at the same time that they must have operated as a salutary check on Peter's excessive confidence, and taught him the necessity of being upon his guard against future instances of weakness, could not but serve powerfully to confirm his faith in Jesus as the Messiah. Of this he gave proof on the following day, when many who had hitherto followed Jesus, and professed themselves his disciples, under the expectation that he would set up a worldly kingdom, were offended with his discourse in the synagogue of Capernaum, in which he spake of the spiritual design of his mission, and *went back, and walked no more with him.* After noticing their conduct, which showed them to be governed by secular and interested views, Jesus said to his twelve apostles, *Will ye also go away?* Without hesitation, and with the utmost zeal and fervour, Peter immediately replied in all their names, *Lord, to whom should we go? thou hast the words of eternal life. And we know and are sure, that thou art the Christ, the Son of the living God.* The same answer was given by Peter to our Lord some time afterwards, when he enquired of his disciples in private what opinion the people entertained of him; and, in the next place, whom they themselves thought him to be? When to the latter question Peter had replied as above, Jesus pronounced him *blessed* on account of his faith, which was founded on a rational persuasion, produced by an attention to the astonishing works which he wrought to confirm the divinity of his mission. He afterwards added, in allusion to the meaning of his name, that upon this *rock*, or confession which Peter had made, his church should be established, and prove ultimately triumphant over all opposition.

Our Lord's subsequent declarations, *And I will give unto thee the keys of the kingdom of heaven; and whatsoever thou shalt bind on earth shall be bound in heaven, &c.* have been differently understood by different interpreters. The former, in the opinion of many, was addressed by our Lord particularly to Peter, and contained a promise that he should have the honour of beginning to preach the Gospel, after his resurrection, to Jews and Gentiles, and of receiving them into the church. Others suppose, that, as Peter made his confession in the name of all the apostles, so Christ's declarations were intended for them all; and that the honours and powers granted to Peter by name, were conferred on them all equally. It is at least certain, that the power of *binding* and *loosing*, or of pronouncing what things were forbidden or allowed to Christ's disciples, was not conferred exclusively upon Peter, since it was afterwards declared by our Lord to be a privilege which belonged to all the apostles.

Peter, however, was honoured on several occasions with distinguished marks of his Master's confidence and regard. He was one of the three disciples whom our Lord permitted to be present at the raising of Jairus's daughter; and before whom he underwent his glorious transfiguration on the mountain. He was one of the four apostles to whom our Lord addressed himself, when he foretold the destruction of the Temple, and the calamities which should attend it. He was one of the three whom Jesus took with him apart from the other disciples, when he retired to pray in the garden on the night before he suffered. After the institution of his supper, when Christ warned

Peter of his danger, he also assured him, that he had prayed for him that his faith might not fail, but that, when his hour of trial should be past, he might recover his firmness of mind, and steadily persevere in avowing and defending his cause, notwithstanding the persecutions and sufferings which he should endure. When Peter replied that such was his resolution at present, and that he was ready to go with his Master both into prison and to death, Jesus assured him, without questioning the sincerity of his intention, that he should exhibit such a proof of human weakness, as, on that very day, before the crowing of the cock, to deny three several times that he even so much as knew him. Out of the fervour of his zeal, when the Jewish officers were about to apprehend his Master, *Peter, having a sword, drew it, and smote a servant of the high-priest, and cut off his right ear;* but Jesus checked his ardour, ordering him to sheath his sword, since he was determined to submit to his enemies without resistance, that the Scripture-prophecies relating to him might be fulfilled. *Then all the disciples forsook him, and fled,* though they had only a few hours before concurred with Peter in declaring their determination to adhere to him, even at the expense of their lives. Peter, however, and John, anxious to see what would become of Jesus, followed him at some distance to the high-priest's palace, into which they gained admittance. Here Peter, hoping to escape undiscovers, mixed with the servants and officers who were assembled round a fire in the hall; but he was soon challenged with being one of the followers of Jesus, when he forgot at once all his late professions, and denied that he ever had known him. Being charged with the same thing again, he a second time most pe-remptorily disowned his Master. At last, the charge having been brought against him the third time, he once more denied its truth, with oaths and imprecations. Immediately afterwards the cock crew; and Jesus directed an expressive look towards Peter, which pierced him to the heart, and excited in him the most pungent remorse on account of his weakness and defection. Unable, with these feelings, to stand any longer in the sight of his injured Master, he *went out, and wept bitterly.* By a repentance as sincere and humble as his crime was aggravated, he obtained the divine pardon of his offence, and ever afterwards showed the greatest zeal and courage in his Master's cause.

That Peter's repentance was genuine and accepted, may be concluded from the distinguished marks of favour with which he was soon honoured by Jesus. On the morning after our Lord's resurrection, when Mary Magdalene and other women came to his sepulchre, with spices which they had prepared for embalming him, they saw an angel, who informed them that he was risen from the dead, and directed them to carry the joyful tidings to the Apostles, and to *Peter* in particular. On the same day, Jesus showed himself to this apostle, before any of his brethren were honoured with the sight of him, though none of the circumstances of this appearance are anywhere related. At another appearance of Jesus to several of his disciples, which is described in the 21st chapter of St. John's Gospel, an interesting scene took place, in which Peter was particularly noticed. There our Lord renewed to him the apostolical commission, requiring him, as the best testimony of his attachment to his person and cause, to *feed his sheep* with fidelity and tenderness. He also gave Peter reason to hope, that in his future conduct he would prove an illustrious example of resolution and fortitude under the most formidable trials, and at length glorify God by his death, in the service to which he had been appointed. Afterwards Jesus met Peter, in company with the other apostles, several times at Jerusalem, where he discoursed with them concerning the affairs of his kingdom, and commanded them to remain till they had received the promised baptism of the Holy Spirit, or that communication of supernatural powers which should

fully

fully qualify them to be his witnesses, *both in Jerusalem, and in all Judea, and in Samaria, and unto the uttermost part of the earth.*

We now proceed to notice the principal circumstances in the history of St. Peter after our Lord's ascension. And we find that, in the meetings of the apostles, or the assemblies of the apostles and brethren in general, he filled the place of president. Not that by holding such an office in the apostolical college he possessed any dignity superior to that of his fellow-apostles, or was invested with any jurisdiction over them, or was endowed with any power or privilege not conferred upon the rest. It is justly observed by Dr. Macknight, that "all the apostles were equal in office and authority; as is plain from our Lord's declaration: *One is your Master, even Christ, and all ye are brethren.* The only distinction among the apostles was that which arose from personal talents and qualifications: a distinction which never fails to take place in every society. Because, if one distinguishes himself by his superior ability in the management of affairs, he will be respected in proportion to the idea which his fellows entertain of him. In this manner, and in no other, Peter, whose virtues and talents were singularly conspicuous, acquired a pre-eminence among the apostles: but it was only of the sort founded on personal esteem. And therefore, in their meetings to deliberate on any important affair, the brethren may have wished to hear him speak first; and he commonly did so; but that was all. In like manner, in their intercourse with their adversaries, Peter often spake in the name of such of the apostles and brethren as were present: which they willingly allowed, perhaps desired, as thinking him best qualified for the office."

Not many days after the ascension of Jesus, in an assembly of the apostles and other believers, Peter proposed that in the room of Judas another apostle should be chosen, from among those persons who had associated with them from the commencement of their Master's ministry, and were witnesses of what he said and did. To this proposal they all assented; and Matthias was accordingly elected by lot, and numbered with the eleven apostles. On the day of Pentecost following, the communication of miraculous powers which had been promised, was made to the apostles and their company, attended with extraordinary circumstances, an account of which was soon spread abroad, and attracted numerous crowds to the place where they were assembled. On this occasion, Peter addressed himself to the multitude, vindicating the miraculous effects of which they were witnesses against the exceptions of some individuals; and he then took the opportunity of preaching to them concerning the resurrection of Jesus, and his claim to the character of the Messiah, with so much force, that about three thousand persons were converted and baptized on the same day. Soon afterwards, Peter and John miraculously restored to the use of his limbs, a poor well-known beggar at the gate of the temple, who had been lame from his birth, and was forty years of age. The news of this event having drawn a crowd around them, Peter delivered to them an affecting discourse on the pretensions and treatment of Jesus; and so powerfully exhorted them to repentance and faith in him, that numbers were awakened and convinced. But, while he and his fellow-apostle were speaking to the people, the Jewish priests and rulers sent officers, who took them into custody, and imprisoned them till the following day. On the morrow, being brought before the Sanhedrim, and questioned by what power, or in whose name, they had cured the cripple, Peter undauntedly declared, that the man was healed in the name of Jesus Christ of Nazareth, whom they had lately crucified, but whom God had raised from the dead; thereby confirming the truth of his mission, and of the doctrine promulgated by them, that *there is none other name under Heaven given among men, whereby we must be saved.* Struck by the boldness of the apostles, the

members of the council deliberated for some time in private what steps to pursue; but, finding themselves utterly unable to contest the genuineness of a miracle which was so notorious, they contented themselves with laying an injunction on the prisoners to teach the people no more in the name of Jesus. To this command Peter and John replied, with a freedom which reflected honour on their cause, *Whether it be right in the sight of God, to hearken unto you more than unto God, judge ye: for we cannot but speak the things which we have seen and heard.* Upon this, after being repeatedly threatened with the severest punishments in case of their disobedience, the apostles were dismissed. Notwithstanding this discouragement of the Sanhedrim, the number of believers increased at Jerusalem, and soon amounted to about five thousand.

As many of the converts to Christianity were in low circumstances, some of their wealthy brethren, actuated by a noble spirit of generosity, sold their estates, and delivered the money which they received for them to the apostles, to be distributed among the believers in common, according to their necessities. Their conduct suggested to one of the professors of the Gospel, named Ananias, and his wife Sapphira, a scheme for enjoying the reputation arising from such a benevolent action, and for gratifying, at the same time, their covetous spirit. With this view, they sold a possession, and, after keeping back a part of the price, brought the rest to the apostles, declaring it to be the whole of what the sale had produced; and intimating, most probably, the hope that, as they gave up their all, they should for the future be taken care of among the rest of the brethren. But the fraudulent part which they acted was divinely disclosed to Peter, who was commissioned to expose the enormity of their crime in the severest language, and afterwards to pronounce the sentence of an instantaneous miraculous death upon each of them. These awful examples of the punishment of covetousness and hypocrisy were considered by many as unequivocal proofs of a divine interposition, and induced them to become converts to the religion which the apostles preached. Numerous profelytes were also made by the various miracles which Peter and his fellow-labourers performed, particularly in the cure of sick and insane persons, who were brought to them, not only from among the inhabitants of Jerusalem, but out of the cities and countries round about. In the mean time, the high-priest and council, enraged at the disregard shown to their menaces, and the perseverance of the apostles in preaching Christ, caused them all to be apprehended and thrown into the common prison. On the following day, a full sanhedrim having been convened, officers were sent to bring the prisoners before them; who soon returned with the intelligence that they were not to be found, though every precaution had been used to prevent their escape. Their deliverance was effected by supernatural agency, an angel having during the night opened the prison-doors, brought them forth, and directed them to repair in the morning to the Temple, and persevere in delivering their important commission to the people. While the members of the sanhedrim were pondering upon the report of their officers, word was brought to them that the apostles were in the Temple, teaching the people. They therefore ordered the officers to bring them into court, but without any violence, left the people, who were persuaded that their cause was approved of by heaven, should rise tumultuously in their defence. As soon as they made their appearance, the high-priest demanded how they dared to break the order which had been so recently given, that they should teach no longer in the name of Jesus. To whom Peter replied, in the name of them all, *We ought to obey God rather than men.* He then repeated their testimony to the resurrection and divine commission of Christ, and their resolution firmly to adhere to it. Enraged at their courageous behaviour and declaration, some of the council consulted

how they might put them all to death, upon a charge either of blasphemy or of sedition. But from this design they were dissuaded by Gamaliel, a learned Pharisee, of high reputation for wisdom and piety, who, after commanding that the apostles should be taken out for a little while, argued powerfully against adopting any intemperate resolutions respecting them, concluding in these memorable words: *Refrain from these men, and let them alone: for if this counsel, or this work, be of men, it will come to nought: but, if it be of God, ye cannot overthrow it; lest haply ye be found even to fight against God.* To his advice the assembly yielded; and, after ordering the apostles to be scourged, dismissed them, with threatenings of severe punishment if they should persist in propagating their notions concerning Jesus.

Upon the death of the proto-martyr Stephen, the church at Jerusalem was cruelly harassed by persecution, which caused the believers, in general, excepting the apostles, to be dispersed throughout the countries of Judea and Samaria. Among those who came to the last-mentioned place, was Philip the deacon, who preached Christ to the inhabitants of that city, and gained many converts to his religion. No sooner were the apostles informed of this state of things, than they deputed Peter and John to go to Samaria, that they might confirm the new believers in their profession, by communicating to them the extraordinary gifts of the spirit. While they were thus engaged, Peter severely reprov'd and expos'd the insincere profession of one Simon, commonly called the Magician, who had formerly gained a high reputation by practising the pretended arts of magic. Afterwards, having executed their commission, the two apostles returned to Jerusalem, preaching the Gospel by the way in many villages of the Samaritans. In the year of Christ 40, owing to some circumstances in the civil state of the Jews, the church began to enjoy a respite from persecution, which probably continued twelve months or more. This peaceful interval, as it may be supposed, was zealously improved by all the apostles in spreading the knowledge of the Gospel. Of Peter, in particular, it is said, that he pass'd through all parts of the country, and visited the Christian converts at Lydda, a considerable town not far from the coast of the Mediterranean Sea. Here, in the name of Jesus, he performed a wonderful miraculous cure on a person called Æneas, who had been confined to his bed by the palsy for eight years. By this miracle great numbers of the inhabitants of the place and the adjoining districts, who personally knew the subject of it, or had the opportunity of gaining unquestionable information concerning the particulars of his case, were convinced that he in whose name the cure was performed must be the promised Messiah, and immediately embraced his Gospel. A vast increase in the number of believers in these parts was speedily produced by another and more astonishing event which took place about the same time. At Joppa, a sea-port within a few miles from Lydda, resided a female disciple called Tabitha, who was a woman of an excellent character, and distinguished for her deeds of beneficence and charity to the poor. While Peter was at Lydda, this worthy person fell sick, and died; upon which event, the Christians in that town sent to Peter, requesting that he would come to them without delay, and impart to them consolation and advice in their great distress for the loss of such a kind and useful friend. With this request Peter complied; and, when he arrived at Tabitha's house, he was introduced into the apartment where she was laid out, in which were many widows lamenting the death of their benefactress, who showed him the coats and garments which she had made to distribute among the necessitous. But Peter, sending them all out of the room, and finding himself moved by a supernatural impulse, kneeled down and prayed; and then, turning towards the body, said, *Tabitha, arise.* And she opened her eyes; and, when she saw Peter, she sat up. He then took her by the hand, and presented her alive to

her assembled friends. A knowledge of this wonderful fact soon spread through Joppa, and caused so many to believe in Christ upon the credit of such a signal miracle, that Peter spent many days in that city, confirming them in the faith which they had received.

While Peter continued at Joppa, Cornelius, a centurion of the Italian cohort, stationed at Cæsarea, a worshipper of the true God, and a man of distinguished piety, though a Gentile, being directed in a vision to send for the apostle, in order to receive from him important instruction in matters of religion, dispatched two of his servants and a pious soldier, to request that Peter would accompany them to the place of his residence. A little before their arrival at Joppa, the apostle went to the top of the house to pray, about the time of noon, when he felt the cravings of hunger, and his dinner was preparing. While he was engaged in his devotions, he fell into a trance, or extasy, in which an instructive vision presented itself to him. He seem'd to see the Heavens open, and something resembling in form a great sheet suspended at the four corners descend to the earth, in which, were various wild and tame four-footed beasts, reptiles, and fowls. While these things were before him, he heard a voice calling upon him to kill such of them as he chose, and satisfy his hunger. As, however, he saw none among them but such as were forbidden by the ceremonial law, he said, *Not so, Lord; for I have never eaten any thing that is common or unclean.* And the voice spake unto him again the second time, *What God hath cleansed, that call not thou common.* To make the stronger impression upon him, the vision was represented three times successively. While Peter was pondering concerning what it might be intended to point out to him, he was informed, by divine suggestion, that the messengers from Cæsarea were enquiring for him, and directed to go with them to that city, as Cornelius's message was sent in obedience to a divine command. On the following morning, therefore, he set out with them, accompanied by certain believers from Joppa; and, when he came to the house of Cornelius, he found that the centurion had convened several of his relations and intimate friends, to be present at their interview. After premising, that it had been generally considered unlawful by the Jews to hold intimate intercourse and conversation with Gentiles, but that God had lately shown him that he was not to make such distinction, or to call *any man common or unclean*, Peter desired to be informed of the reason why Cornelius had sent for him. Upon this the centurion mentioned the circumstances of his vision, and declared that he and his friends were assembled with a serious disposition to listen to those important truths which the apostle was commissioned to unfold. When Cornelius had given this answer, Peter began his address to the persons present with a frank and liberal declaration, which was expressive of no little triumph over his prejudices as a Jew. *Of a truth I perceive,* said he, *that God is no respecter of persons; but in every nation, he that feareth him, and worketh righteousness, is accepted with him.* He then expatiated on the divine mission of Jesus Christ, the evidence which supported its truth, and the inestimable offer of remission of sins which was made in his name. While he was yet speaking, similar extraordinary circumstances with those which attended the communication of preternatural powers to the apostles and Jewish believers on the day of Pentecost at Jerusalem, showed that Cornelius and his company were invested with the same distinguished privileges; and, to the astonishment of the disciples who came from Joppa, convinced them that the uncircumcised Gentiles were to be partakers in the blessings of the Gospel. Immediately after this, Cornelius and his friends were baptized, and Peter, at their entreaty, remained several days with them, for the purpose of instructing them farther in the faith of which they had made profession. This memorable event, of opening the kingdom of heaven to the Gentiles, or of receiving them into the Christian church, the honour of which

which was conferred upon Peter, took place most probably in the year 41.

Upon Peter's return to Jerusalem, whither general intelligence of the transactions at Cæsarea had preceded him, some of the brethren warmly expostulated with him, for having been a guest, and freely joined in their meals, with men who were uncircumcised; but, after he had given them an account of the visions which were seen by himself and Cornelius, and of the extraordinary occurrences which took place while he was preaching, they were satisfied with what they heard, and glorified God for extending the boundaries of his kingdom, and granting *also to the Gentiles repentance unto life*. From this time, Peter appears to have continued his apostolic labours in Judea with great success, till the persecution of the church arose towards the end of the reign of Herod Agrippa. By that prince, James the brother of John, who with him and Peter had been honoured by Jesus with his peculiar intimacy, was ordered to be apprehended, and afterwards to be beheaded; and, as Herod saw that by causing that apostle to be put to death, he had gratified the Jews, whom he was particularly desirous of obliging, he proceeded to seize Peter also, during the feast of the passover, in the year 44. Having been taken into custody, the apostle was committed to prison, where sixteen soldiers were appointed to be guards over him, four of whom were by turns to watch him constantly by day and night, till the festival was ended, when the king intended that he should be publicly executed, as his Master had been before him, on the first day of unleavened bread. In the mean time, the church at Jerusalem engaged in earnest prayer to God, that he would spare for a longer period such a valuable life; and the event showed that their supplication was not in vain: for, during the night preceding the day fixed for his execution, while Peter was calmly sleeping between two soldiers, to each of whom he was fastened by a chain, an angel of God entered the prison, which was filled with a glorious light, and having awakened the apostle, his chains immediately fell off from his hands, while the soldiers were miraculously kept in profound sleep. The angel then directed Peter to follow him; and, having conducted the apostle undiscovered through the guards and gates, and a street of the city, he suddenly departed. As soon as Peter had satisfied himself that what had passed was a real and not visionary scene, he repaired to the house of Mary, the mother of Mark the evangelist, where many Christians were assembled, spending the night in prayer for his deliverance; and, after informing them of the wonderful interposition by which he had obtained his liberty, withdrew to some place of greater secrecy, where it is probable that he lived in retirement till the death of Herod, which happened before the end of the year. Some learned men are of opinion, that he now went to Antioch, or Rome; but, if that had been the case, St. Luke would probably have made some mention of it.

In the year 49 or 50, when the council assembled at Jerusalem, for the purpose of determining on the question, Whether it was necessary that the Christian converts from among the Gentiles should be circumcised, and commanded to observe the law of Moses? Peter was present, and declared on the side of liberty, giving it as his opinion, that the yoke of the law should not be laid upon the neck of the Gentile believers; and, to add weight to what he advanced on the subject, he reminded the assembly that he had been divinely appointed to preach the Gospel to Gentiles at Cæsarea; and that God, to whom all hearts are known, had declared his acceptance of them, by communicating to them supernatural gifts, though they were uncircumcised. Whence he drew the conclusion, that God had made it clearly manifest that they might be saved by faith in Jesus Christ, without submitting to the rituals of the law. In this conclusion, which was ably supported by James the son of Alphaeus, the council acquiesced, only enjoining some

easy restrictions, to avoid giving unnecessary offence to their circumcised brethren. While Paul was on this occasion at Jerusalem, James, Peter, and John, gave to Paul and Barnabas the right hands of fellowship, that they might proceed in preaching to the Gentiles; while they and the other apostles continued in Judea, to preach to those of the circumcision. Soon after the meeting of this council, and most probably in the year 50, Peter paid a short visit to Antioch, being desirous of witnessing the success of the Gospel by means of the apostolic labours of Paul and Barnabas in that city. This appears to have been his first excursion out of Judea into Gentile countries. Upon his first coming to Antioch, Peter had eaten and conversed freely with the Gentile converts who had not submitted to circumcision; but, on the arrival there from Judea of some Jewish believers, who were zealous for the observance of the Mosaic law, he withdrew from that freedom of converse, fearing lest his perseverance in it should give displeasure to the latter. In this proceeding, however, he acted contrary to his own judgment, and declared opinion. Paul, therefore, with a noble indignation, and becoming zeal for Christian liberty, withstood him to the face, because he was to be blamed; and so powerfully represented his conduct to be chargeable with dissimulation, as well as productive of the most injurious consequences, that Peter acquiesced in the justice of his reproof; nor is there any reason to think, that he ever afterwards betrayed any want of steadiness and consistency in his Christian profession.

After this journey to Antioch, we are no-where furnished with any very distinct account of St. Peter's travels. Eusebius informs us, that Origen, in the third tome of his Exposition on Genesis, wrote to this purpose; "Peter is supposed to have preached to the Jews of the dispersion in Pontus, Galatia, Bithynia, Cappadocia, and Asia; and, at length coming to Rome, was crucified with his head downwards, himself having desired it might be in that manner." Some learned men think, that in the latter part of his life he went into Chaldea, and there wrote his First Epistle, because the salutation of the church at *Babylon* is sent in it; and their opinion, though unsupported by the testimony of ancient writers, is not devoid of probability. The books of the New Testament, indeed, afford no light for determining where he was for several years after receiving the reproof of St. Paul already mentioned. The learned, therefore, have been obliged to content themselves with conjectures on this subject. Among their various hypotheses, not one appears to us to be upon the whole more reasonable, or less open to objections, than that of the able and dispassionate Lardner. "It appears to me not unlikely," says he, "that Peter returned in a short time to Judea from Antioch; and that he staid in Judea a good while before he went thence any more. And it seems to me, that, when he left Judea, he went again to Antioch, the chief city in Syria. Thence he might go into other parts of the continent, particularly Pontus, Galatia, Cappadocia, Asia, and Bithynia, which are expressly mentioned in the beginning of his First Epistle. In those countries he might stay a good while. It is very likely that he did so; and that he was well acquainted with the Christians there, to whom he afterwards wrote two Epistles. When he left those parts, I think he went to Rome: but not till after Paul had been in that city, and was gone from it. Several of St. Paul's Epistles furnish out a cogent argument of Peter's absence from Rome for a considerable space of time. St. Paul, in the last chapter of his Epistle to the Romans, written, as we suppose, in the beginning of the year 58, salutes many by name, without mentioning Peter; and the whole tenor of the Epistle makes it reasonable to think, that the Christians there had not yet had the benefit of that apostle's presence and instructions. During his two year's confinement at Rome, which ended, as we suppose, in the spring of the year 63, St. Paul wrote four or five Epistles; those to the Ephesians, the

Second Epistle to Timothy, to the Philippians, the Colossians, and Philemon; in none of which is any mention of Peter. Nor is any thing said or hinted whence it can be concluded that he had ever been there. I think, therefore, that Peter did not come to Rome before the year 63 or 64; and, as I suppose, he obtained the crown of martyrdom in the year 64 or 65. Consequently St. Peter could not reside very long at Rome before his death."

Jerome, in his book *De Vir. Illust.* cap. 1. says, that Peter was bishop of Rome during five-and-twenty years; but such a statement is totally irreconcilable with the history in the Acts of the Apostles. On the other hand, several learned men, particularly Scaliger, Salmasius, Frederic Spanheim, and others, have denied that Peter ever was at Rome at all. But their opinion is satisfactorily opposed by a great majority of critics, Protestants as well as Catholics. In Lardner, as referred to below, the reader may meet with a concentrated view of the evidence from antiquity, on which Peter's having been at Rome rests. Among the ancient writers, who testify to the same fact, we may enumerate Clement of Rome, in his Epistle to the Corinthians, written before the year of Christ 70, or, as some think, about the year 96; Ignatius, about 108; Dionysius, about 170; Irenæus, about 178; Clement of Alexandria, about 194; Tertullian, about 200; Caius, about 212; Origen, about 230; Cyprian, about 248; Lactantius, about 306; Eusebius, Athanasius, Ephrem the Syrian, about 370; Epiphanius, Jerome, Chrysostom, Sulpicius Severus, about 401; Prudentius, about 405; Orosius, about 416; Theodoret, about 423; Augustine, &c. &c. The "Preaching of Peter," or of Peter and Paul, quoted by several ancient writers, though not as a book of authority, composed about the middle of the second century, or sooner, makes mention of Peter's being at Rome.

In our life of St. PAUL (p. 400.) we have already shown it to be most probable, that he and St. Peter were both put to death at Rome, in the year 64 or 65. With respect to what is said in the passage cited from Eusebius, concerning Peter's desire that he might be crucified with his head downwards, as the circumstance is not noticed by some ancient writers who speak of his martyrdom, its accuracy has been questioned. There is no doubt but that, among the Romans, some were so crucified, to add to their pain and ignominy; and Lardner admits that Peter might be crucified in that manner, and that it might be owing to the malice of those who put him to death. He adds, however, "the saying that it was at his own desire may have been at first the oratorical flight of some man of more wit than judgment; but the thought was pleasing, and therefore has been followed by many." Marcellinus the Presbyter embalmed his relics, which were buried in the Vatican, near the Triumphal Way; and over his grave a small church was erected, which having been destroyed by the emperor Heliogabalus, the holy remains were removed to the Appian Way, two miles from Rome. About the year 250, Cornelius, the twentieth bishop of Rome, re-conveyed them to the Vatican; and Constantine the Great, the first Christian emperor, caused a stately church to be raised on the spot, which has since increased so much in splendour and magnificence, as justly to become the wonder and admiration of the world. The present fabric is indisputably the largest building that was ever erected; the stupendous Temple of Solomon, that of Herod at Jerusalem, and the great Pyramid of Egypt, excepted. His festival is celebrated with that of St. Paul, on the 29th of June. (See the article PAUL.) It is very remarkable, that, while the Roman Catholics consider Peter to have been the first bishop (or pope) of Rome, not one of the popes has assumed that name: on the contrary, some who had it originally have changed it upon gaining the popedom: the first instance which we recollect was in 884, when Pietro de Bocca Porca, or Hog's-snout, took the name of

Sergius the Second, thinking himself unworthy to bear the name of the great apostle and martyr.

The character of St. Peter may be sufficiently collected from the preceding narrative. In the canon of the New Testament are two Epistles bearing the name of St. Peter, the first of which has been universally acknowledged to be authentic and genuine, from the earliest Christian times, though some doubts were anciently entertained concerning the second. However, both these Epistles were generally received, in the fourth and following centuries, by all Christians excepting the Syrians. And, if we consult the Epistles themselves, and endeavour to form our judgment by internal evidence, we shall find strong grounds for believing that they must have been both written by the same author. For an ample discussion of this point, we refer our readers to what is said on the subject by Lardner and Michaelis. The First Epistle, as appears from the conclusion of it, was written at *Babylon*; the meaning of which word has been differently understood by commentators, some giving it a figurative and mystical interpretation, and others taking it in its literal and proper sense. By the majority of learned men, both among the ancients and moderns, it has been understood figuratively, and supposed to mean *Rome*; but others contend, we conceive with advantage over their opponents, that such a sense is forced and unnatural, and that the word should be taken literally, as intended either for *Babylon* on the Euphrates, or *Seleucia* on the Tigris, but most probably for the former city. The arguments on both sides of the question may be seen in Lardner and Michaelis. With respect to the date of this Epistle, likewise, the learned widely differ; some placing it under the year 54, others about 60, and others between 63 and 65. The Second Epistle of St. Peter was addressed to the same communities with the first, and written only a short time before his death; but whether before or after his arrival at Rome, is wholly uncertain. The design of these Epistles was to point out to the Christian converts the invaluable advantages which they enjoyed in common under the gospel-dispensation; to exhort them to patience under the sufferings which they endured from their persecutors, to avoid whatever might give offence to the magistrates or their fellow-citizens, and to cultivate the important duties of civil and social life, particularly brotherly love; and also to combat some false opinions which, at so early a period, had arisen among the professors of Christianity; particularly those of some teachers who were advocates for a loose system of morality, and denied the doctrines of a general judgment and the dissolution of the world. Besides these Epistles, several spurious writings were circulated in an early age of the church, under the name of St. Peter, of which the reader may meet with an account either in Mill's *Prolegomena*, or in *Cave's Hist. Lit.* vol. i. *Lardner's Suppl.* vol. iii. ch. xviii. *Marsh's Michaelis*, vol. vi. ch. xxvii. xxviii. *Sherlock's Diss. on Peter*.

PETER, a saint in the Roman martyrology, and one of the most illustrious prelates of his time, if not a native of Alexandria, was educated there, under the instructions of Theonas, the bishop of that see; and acquired a high character for his proficiency in sacred literature, his exemplary manners, and distinguished piety. On the death of Theonas, in the year 300, he was chosen his successor; and, according to Eusebius, "he obtained great honour during his episcopate, which lasted twelve years. He was a most excellent teacher of the Christian doctrine; an ornament to the episcopal character, both for holiness of life, and laborious application in studying and explaining the Scriptures. He governed the church three years before the persecution. The rest of his time he passed in a more strict and mortified course of life, but without neglecting the common good of the churches." By a comparison of Eusebius's language in the last sentence, with Sozomen's statement that he fled, or withdrew, in the time

time of the persecution which commenced under the emperor Dioclesian, it seems probable that during a considerable part of that distressing period he resided in some private place, unknown to the instruments of the persecution; where, however, the Christians had access to him, and received his advice and instructions. Whether he was at length discovered in this retreat, or was induced to quit it when the times were becoming more tolerant, we are not informed; but Eusebius tells us that, "without any crime of any kind laid to his charge, beyond all expectation, on a sudden, for no other reason but the will of Maximin, he was taken into custody, and beheaded." His martyrdom took place in the year 311. Of his quarrel with Meletius bishop of Lycopolis, which produced a long schism in the Egyptian church, we have given an account in the life of that prelate. He is the reputed author of "A Book on Penance," thirteen canons of which are inserted, in Greek and Latin, in the first vol. of the Collect. Concil. Some fragments also of another treatise attributed to him, "Concerning the Divinity," may be met with in the third and fourth vols. of the same collection. In Cave the reader will find farther particulars concerning his supposed productions. *Eusebii Hist. Eccl. lib. vii. viii. Cave's Hist. Lit. vol. i.*

PETER, surnamed CHRYSOLOGUS, a saint in the Roman calendar, and a celebrated Italian prelate in the fifth century, was of noble extraction, and born at Imola, anciently known by the name of Forum Cornelii. He was educated by Cornelius, bishop of his native city, who admitted him into holy orders, and appointed him to the office of his deacon, which he retained for many years. Without noticing the legendary tales which are related concerning him, we have only to state, that he was elected bishop of Ravenna in the year 433, and died before 451. His eloquence was greatly admired; whence he had the surname of *Chrysologus*, meaning Golden Speaker. What remain of his productions consist chiefly of Sermons or Homilies, containing short explanations of portions of the Scriptures, accompanied with moral reflections. They are drawn up in a perspicuous and pleasing style; and are distinguished by a happy union of conciseness and elegance. They were collected together two hundred and fifty years after his death, by Felix, one of his successors in the see of Ravenna; and were first printed, to the number of 176, at Cologne, in the year 1541. Afterwards they underwent repeated impressions at the same place, Antwerp, Paris, Lyons, Venice, and Bologna, and were inserted in the seventh vol. of the Bibl. Patr. Six others, on the Lord's Prayer, are given by d'Achery in his *Spicilegium*. There is also still extant "A Letter to Eutyches the Archimandrite," from our prelate, in which he declares against the sentiments of that monk, and expresses his approbation of the conduct of the patriarch Flavianus: it was first published in Greek and Latin, by Gerard Vossius, at the end of his edition of the Works of St. Gregory Thaumaturgus, printed at Mentz in 1603; and it may also be seen in the fourth vol. of the Collect. Concil. *Cave's Hist. Lit. vol. i.*

PETER of SICILY, so called from the island which gave him birth, was a man of noble descent, and of some learning, who flourished in the latter part of the ninth century. He was taken into the service of the emperor Basil, who, in the year 870, sent him into Armenia for the purpose of negotiating an exchange of prisoners. This business, which he performed to the satisfaction of the emperor, having occasioned him to spend nearly nine months at Tibrice, the capital of Armenia, he embraced several opportunities of holding conferences with the Paulicians, a branch of the Manichæans, who were numerous in that country, and undertook the task of drawing up, in Greek, "A History of the Rise, Progress, and Decline," of that sect. The work to which he gave this title was dedicated by him to an archbishop of Bulgaria. Part of it was translated into Latin by Father Sirmond,

and inserted by Baronius in his Annals. Afterwards the same father transmitted to Ingoldstadt a copy taken by himself from a manuscript of the original in the library at the Vatican, where a Latin version of the whole was completed by Matthew Rader, a Jesuit, who published it, together with the original, in 1604, in 4to. under the title of "Historia de Varia et Stolidâ Manichæorum Hæresi," &c. The work is certainly so far an object of curiosity, as it presents us with a view of the sentiments of the Paulicians at the time when the author lived; but, when it is appealed to as an authority for ascertaining what were the precise opinions of the ancient Manichæans, the lateness of its date may justly be excepted against, and its testimony refused as of no weight, when contradicted by much older evidence. It is remarkable that Photius and Peter, who were both writers in the ninth century, have agreed so exactly in what they have said concerning the Manichæans, that one is supposed to have been the copyist of the other; but which of them was the original writer on this subject, cannot, perhaps, now be determined. *Cave's Hist. Lit. vol. ii.*

PETER THE HERMIT, a celebrated person in the annals of fanaticism, was born in the 11th century at Amiens in Picardy, of a good family. He entered into the army, and served under the counts of Boulogne; but, having imbibed the holy zeal of the age, he quitted the world, and devoted himself to a life of religious solitude and austerity. About the year 1095 he made a devout pilgrimage to Jerusalem, then in the hands of the Turks, and was deeply impressed with the oppressions sustained by the Christian inhabitants, and the visitors of that memorable city. In the warmth of his emotions, he promised the Greek patriarch to use his endeavours to rouse the western nations to arms in his behalf; and, upon his return, he waited on the pope Urban II. (not Martin II. as erroneously printed in our account of the *CROISADES*, vol. v. p. 374.) with letters from that prelate. The appearance of Peter was mean, his stature small, his body meagre, his countenance shrivelled; but he had a keen lively eye, and a ready eloquence. The pope received him as one who had a call from heaven, and encouraged him to proceed in his design; and Peter immediately set out on his travels as a missionary through the provinces of Italy and France. He rode on an ass, his head and feet naked, and bearing a weighty crucifix; he prayed frequently, fed on bread and water, gave away in alms all that he received, and by his saintly demeanour and fervid address drew innumerable crowds of all ranks to listen to his preaching. When he painted the indignities offered to the true believers at the birth-place and sepulchre of their Saviour, every heart was melted to compassion and animated to revenge. His success in raising recruits for the holy war was such as might be expected from the rude enthusiasm and martial spirit of his age. Collecting above 60,000 persons, in which number both sexes were included, from the borders of France and Lorraine, he proceeded with them along the banks of the Rhine and Danube, whilst the crusaders of better rank and appointment waited to be led by Godfrey of Bouillon. Peter marched at the head of his motley band in the costume of a hermit, and covered with a long tunic of coarse wool. He placed his vanguard under the command of Walter the penniless, a poor but valiant soldier of his acquaintance. Their progress was marked by pillage and disorders of all kinds, and by the massacre of all the Jews who fell in their way. As they approached the confines of Hungary and Bulgaria, the fierce natives of those countries rose upon them, and cut them off in such numbers, that only a third part, with Peter himself, having taken refuge in the Thracian mountains, at length escaped to Constantinople. Almost all these were afterwards slain by the Turks in the plain of Nice, while Peter had prudently withdrawn from the camp, and remained in the Greek capital. He, however, accompanied the better-disciplined army of Godfrey, and was present

at the siege of Antioch in 1097. But his fanatical ardour seems now to have deserted him; for, during the hardships attending that enterprise, he attempted to make his escape. He was, however, brought back by Tancred, who obliged him to swear that he would never desert an expedition of which he was the first mover. He afterwards distinguished himself at the siege of Jerusalem, on which account he has obtained immortal renown from the muse of Tasso. After the capture of that city he was appointed by the patriarch, during his absence in Godfrey's army, to act as his vicar-general. Peter died at the abbey of Neu-Moutier near Huy, of which he was the founder. *Gibbon.*

PETER of Blois, a learned French ecclesiastic, and writer of some note, was born about 1120, in the city whence he derived his surname. Having been intrusted in the classics and polite learning at Paris, he went to the university of Bologna, where he acquired great reputation by the proficiency which he made in the study of civil and canon law, and the various branches of profane literature. He then returned to France, and devoted himself wholly to the study of divinity, under the instructions of the celebrated John of Salisbury, bishop of Chartres, of whose church it seems probable that he was made a canon. In the year 1167, he travelled into Sicily with Stephen, son of the count of Perche, cousin to the queen of that island, where he was appointed tutor, and afterwards secretary, to William II. king of Sicily. When, however, Stephen, who had been made chancellor of the kingdom, and archbishop of Palermo, was sent into banishment, Peter was involved in his fortune, and found it necessary to take refuge in his native country. Hence he was invited into England, by king Henry II. at whose court he continued some time, and was nominated archdeacon of Bath. He next entered into the service of Richard archbishop of Canterbury, who appointed him his chancellor, and deputed him to negotiate business of importance relating to his metropolitan see, with king Henry II. and the popes Alexander III. and Urban III.

After the death of Henry, he resided for a time at the court of queen Eleanor. Late in life he was deprived of his archdeaconry of Bath; though he was afterwards in some degree compensated for his loss, by obtaining that of London, the duties of which he discharged with the utmost fidelity, and no little labour, for a very inadequate revenue. He died in England in the year 1200. The word *transubstantiation* is said to have been first of all made use of by him, to express the doctrine of the Catholic church on the subject of the eucharist. The most considerable of his remains consist of "Letters," one hundred and eighty-three in number, which he formed into a collection by order of Henry II. and which will be found useful in illustrating the civil and ecclesiastical history, but more particularly the state of manners and church-discipline at the period when he wrote. There are also still extant several Sermons of this author, and various treatises which he wrote on doctrinal and moral topics. In the earliest editions of the works attributed to him, published at Mentz and at Paris in the 16th century, sermons by the subject of our next article were inserted, instead of the author's own. This error was corrected by Peter de Goussainville, who in 1667 published a new edition of all Peter of Blois's works, in folio, with notes and various readings; which is inserted in the 24th vol. of the *Bibl. Patr. Cave's Hist. Lit.* vol. ii.

PETER, surnamed *Comestor*, or the Eater, another eminent French ecclesiastic in the 12th century, was a native of Troyes in Champagne. Having embraced the clerical profession, he became canon, and afterwards dean, of the cathedral in that city. In this situation he acquired such celebrity, that he was invited to Paris, where he was appointed dean of the metropolitan church. Some time after this he resigned his benefices, renounced the world, and entered among the canons-regular of St. Victor at Paris, where he gave himself up wholly to study

and exercises of devotion. He died in the year 1198. He was a man of learning for the age in which he lived, and, what reflects credit on his memory, had the hardihood publicly to condemn some of the abuses and corruptions of the Romish church. This we learn from the testimony of Girald Barry, more generally known by the name of Giraldus Cambrensis, who was his disciple, and most probably imbibed from him the enmity which on all occasions he discovered against the monks. In a manuscript of that author preserved in the archiepiscopal library at Lambeth, he tells us that he heard Peter declare before his whole school, in which many persons of distinguished literature were present, that the old enemy, meaning the Devil, never insidiously devised a more injurious measure against the church of God, than the law which enjoined a vow of celibacy on the clergy. The following epitaph upon his tomb has been thought not unworthy of preservation, by different authors who have communicated notices of him to the public:

*Petrus eram, quem Petra tegit, dictusque Comestor.
Nunc comedor. Vivus docui, nec cesso docere
Mortuus; ut dicant, qui me vident incineratum.
"Quod sumus, iste fuit, erimus quandoque quod hic est."*

He was the author of "*Historiæ Ecclesiasticæ, Lib. xvi.*" containing a summary of sacred history, from the beginning of Genesis to the end of the Acts of the Apostles, intermixed with numerous passages from profane history, and some fabulous narrations. It was first published at Reutlingen, in 1473, and afterwards underwent repeated impressions at Strasburg, Basil, Lyons, and other places. Our author also wrote the "Sermons" which, as we have already seen, made their first public appearance among the works of Peter of Blois; and manuscripts of several others still remain in the libraries at Lambeth and Pembroke-hall, Cambridge. To his pen, likewise, has been attributed a work, entitled, "*Catena Temporum,*" &c. consisting of an indigested compilation of universal history, published at Lubeck in 1475, in 2 vols. folio; of which a French translation was printed at Paris, in 1488, in 2 vols. folio, under the title of, "*Mer des Histoires,*" &c. *Cave's Hist. Lit.* vol. ii.

PETER MAURICE, surnamed the *Venerable*, an eminent and worthy French abbot in the 12th century, was descended from the counts de Monboissier, a noble family of the province of Auvergne, and born in the year 1093. When very young he was dedicated by his parents to the religious life in the monastery of Cluni, the principal house of a reformed branch of the Benedictine order. Here he acquired so high a character for talents and virtue, that in 1121, when only twenty-eight years of age, he was made prior of Vezelay, and soon afterwards prior of Domnus. From this situation he speedily removed to a higher dignity, being elected to fill the vacant place of abbot of Cluni in the year 1123, and at the same time chosen general of his order. Immediately upon these promotions he applied with diligence to restore the state of discipline in the community at Cluni, and throughout the congregation in general, which under Pontius, one of his predecessors, had been suffered to become exceedingly relaxed; and, though he had many difficulties to encounter, he succeeded in his object without having recourse to excessive severity. Afterwards he met with much trouble from the above-mentioned Pontius, who had resigned the abbacy upon his undertaking a visit to the Holy Land; but, on his return from that expedition, and during the absence of Peter, endeavoured to obtain re-possession of the dignity which he had abdicated. Finding, however, that the monks opposed his design, with a band of soldiers he forcibly entered the monastery, suffered it to be pillaged, and dispersed the society. For this violent proceeding, he was excommunicated by the legate of pope Honorius II. who confirmed the sentence, and cited Pontius before his tribunal at Rome, where he died in the year 1126.

Having

Having been reinstated in his abbacy, and restored matters once more to order, Peter employed himself in writing against Peter de Bruys, a zealous reformer, who had many followers in Languedoc, Provence, and Gascony. It were to be wished, considering the general excellence of our abbot's character, that he had confined his efforts to argument and persuasion, and could be vindicated from the charge of having joined his clerical brethren in persecuting that unhappy martyr. See *PETROBRUSIANS*.

In the year 1130, pope Innocent II. paid a visit to Cluni, where he was entertained by Peter with great magnificence; and, in the year 1150, having occasion to take a journey to Rome, on business relating to his monastery, Peter was received there with the highest honours by pope Eugenius, and the Roman citizens. He died at Cluni in 1156, when he was about 63 years of age.

His temper was mild and amiable, his disposition benevolent and charitable, and he possessed a most compassionate heart. He acquired the surname of *Venerable* from the great seriousness and gravity of his demeanour. He procured the Koran to be translated out of the Arabic into Latin, and wrote a treatise in four books against the Mahometans. He was also the author of several other polemical pieces, against the Jews, Protestants, &c. and various miscellaneous writings, in prose and verse, which are enumerated in the works of Cave, Dupin, &c. Many of his "Letters," which have been collected together in six books, are curious and interesting, and serve to throw light on the civil as well as ecclesiastical history, manners, and discipline, of those times. His works were first published at Ingoldstadt, in 1546; and afterwards at Paris, with the notes of Duchesne and Marrier, in the year 1614. The edition last-mentioned has been inserted in the 2d vol. of the *Bibl. Patr.* Two of his Letters, not before edited, were printed by Father Mabillon, in the 2d vol. of his *Analec'ta*; and a third by d'Achery, in the 2d vol. of his "Spicileg." *Cave's Hist.* vol. ii.

PETER, surnamed *de CELES*, an eminent French prelate in the 12th century, was descended from an honourable family in Champagne. He pursued his studies at Paris, where he appears to have embraced the religious life in the monastery of St. Martin des Prez. About the year 1150, he was elected abbot of a monastery in the suburbs of Troyes, commonly called Montier-la-Celles, whence he had his surname. In the year 1162, he was translated from his preferment at Troyes to the abbey of St. Remy at Rheims. In this house he filled the post of abbot for about twenty years; and at length, in 1182, succeeded John of Salisbury in the bishopric of Chartres. After presiding over that see five years, he died in 1187, having distinguished himself as one of the most able of the Bible-doctors, or supporters of the ancient theology against the scholastics. His works, consisting of mystical and moral Treatises, Sermons, Letters, &c. were collected together by Father Ambrose Janvier, a Benedictine of the congregation of St. Maur, and published in 1671, 4to. Father Sirmond had before separately printed his Letters, with notes, in 1613, 8vo. to which should be added two others given in the 2d vol. of d'Achery's *Spicileg.* Most of the author's pieces may be seen in the 23d vol. of the *Bibl. Patr.* *Cave*, vol. ii.

PETER NOLASQUE, a Saint in the Roman calendar, and founder of the order for the redemption of captives, commonly called the Order of Mercy, is entitled to have his name recorded with honour, for the benevolence and humanity which prompted him to devise and establish that useful institution. He was of noble descent, and born in the Lauraguais in Languedoc, about the year 1189. Having lost his father when he was only fifteen years of age, he attached himself to Simon count de Montfort, who placed him in the service of James king of Arragon. By his talents and virtues he recommended himself to the favour of that prince; which circumstance proved of no little importance, when he afterwards un-

dertook the foundation of his order. The first design of it was suggested to him by a private society of gentlemen at Barcelona, who made a common purse for the purpose of redeeming Christian captives, and relieving the sick. Struck with the generosity of their undertaking, he meditated a plan for converting this private society into a religious and military order; and availed himself of the advice of Raymond de Pegnafort, canon of Barcelona, in completing it. He then laid his plan before the king, who sanctioned it with his approbation, and directed Berenger de la Pale, bishop of Barcelona, to give every necessary assistance in carrying it into execution. The order was established in the year 1123, under the title of "The Confraternity of Mercy;" and at first consisted of six priests and seven laymen, who, besides the three customary monastic vows, bound themselves by a fourth to devote their personal exertions to the task of redeeming captives from Mahometan slavery. Peter Nolasque was appointed the first superior-general; but this office did not exempt him from engaging in the common duties of the society. And by the statutes, he, as well as the other lay-members, were to partake with the clergy in all the divine offices enjoined by their rule. Peter is said to have been so successful in his two first expeditions into the kingdoms of Valentia and Grenada, as to redeem upwards of four hundred captives from their oppressive bondage. He afterwards passed over into Africa, where he met with much ill treatment, while employed in zealously pursuing the object of his benevolent mission. In the year 1249, he resigned the office of superior-general; and he died in 1256, when about 67 years of age. His order was approved by pope Gregory IX. in 1230, and the number of members rapidly increased, several houses being founded in France, and other countries; but its principal establishments have always been in Spain. Peter Nolasque was canonized by Urban VIII. in 1628; and such an honour might have been considered as an enviable mark of distinction, had it never been lavished on less deserving objects. *Morevi*.

PETER the *CISTERCIAN*, a monk in the 13th century, belonging to the house of that order in the valley of Cernay, within the diocese of Paris. He was selected to accompany his abbot Guy, who was one of the twelve dignitaries of that class whom pope Innocent III. ordered to join in the crusade against the Albigenes in Languedoc. Having been an eye-witness of the barbarous and sanguinary proceedings for the extirpation of those innocent reformers, he received the commands of the pontiff to write an history of that war, and of the sect against which it was directed. Such a work cannot but be curious, and interesting to the ecclesiastical historian; but he must not expect to find it in the detail of an impartial narrator, or imagine that it will furnish him with either a just delineation of the character of the Albigenes, or a faithful view of their distinguishing tenets. Indeed his Catholic critics acknowledge, that he is chargeable with the reproach of having exaggerated the irregularities of the heretics, while he refrained from doing justice to their virtues. This work was printed in Latin at Troyes, in 1615, 8vo. and is inserted in the *Bibliothèque de Cîteaux de D. Tissier*. A translation of it, from the Latin into French, was published at Paris by Arnaud Sorbin, in 1659, 8vo. *Gen. Biog.*

PETER the *CRUEL*. See the article *SPAIN*.

PETER, the name of three Emperors of *RUSSIA*. See that article.

PETER the *WILD BOY*. This extraordinary creature occasioned great speculation among the learned; but we do not know that any satisfactory causes have been assigned for the striking difference between him and other human beings. The following account of him is extracted from the parish-register of North-church, in the county of Hertford.

"Peter, commonly known by the name of *Peter the Wild*

Wild Boy, lies buried in this church-yard, opposite to the porch. In the year 1725 he was found in the woods near Hamelen, a fortified town in the electorate of Hanover, when his majesty George I. with his attendants, was hunting in the forest of Hertswold. He was supposed to be then about twelve years of age, and had subsisted in those woods upon the bark of trees, leaves, berries, &c. for some considerable length of time. How long he had continued in that wild state is altogether uncertain; but that he had been formerly under the care of some person, was evident from the remains of a shirt-collar about his neck at the time when he was found. As Hamelen was a town where criminals were confined to work upon the fortifications, it was then conjectured at Hanover that Peter might be the issue of one of those criminals, who had either wandered into the woods and could not find his way back again; or, being discovered to be an idiot, was inhumanly turned out by his parents, and left to perish or shift for himself. In the following year, 1726, he was brought over to England, by the order of queen Caroline, then princess of Wales, and put under the care of Dr. Arbuthnot, with proper masters to attend him. But, notwithstanding there appeared to be no natural defect in his organs of speech, after all the pains that had been taken with him, he could never be brought distinctly to articulate a single syllable, and proved totally incapable of receiving any instruction. He was afterwards intrusted to the care of Mrs. Titchbourn, one of the queen's bedchamber-women, with a handsome pension annexed to the charge. Mrs. Titchbourn usually spending a few weeks every summer at the house of Mr. James Fenn, a yeoman farmer at Axter's End, in this parish, Peter was left to the care of the said Mr. Fenn, who was allowed 35l. a-year for his support and maintenance. After the death of James Fenn, he was transferred to the care of his brother Thomas Fenn, at another farm-house in this parish, called Broadway, where he lived with the several successive tenants of that farm, and with the same provision allowed by government, to the time of his death, Feb. 22, 1785, when he was supposed to be about 72 years of age.

"Peter was well made, and of the middle size. His countenance had not the appearance of an idiot, nor was there any thing particular in his form, except that two of the fingers of his left hand were united by a web up to the middle joint. He had a natural ear for music, and was so delighted with it, that if he heard any musical instrument played upon, he would immediately dance and caper about till he was almost exhausted with fatigue; and, though he could never be taught the distinct utterance of any word, yet he could easily learn to hum a tune. All those idle tales which have been published to the world about his climbing up trees like a squirrel, running upon all-fours like a wild beast, &c. are entirely without foundation; for he was so exceedingly timid and gentle in his nature, that he would suffer himself to be governed by a child. There have been also many false stories propagated of his incontinence; but from the minutest inquiries among those who constantly lived with him, it does not appear that he ever discovered any natural passion for women, though he was subject to the other passions of human nature, such as anger, joy, &c. Upon the approach of bad weather he always appeared sullen and uneasy. At particular seasons of the year he showed a strange fondness for stealing away into the woods, where he would feed eagerly upon leaves, beech-mast, acorns, and the green bark of trees; which proves evidently that he had subsisted in that manner for a considerable length of time before he was first taken. His keeper therefore at such seasons generally kept a strict eye over him, and sometimes even confined him, because, if he ever rambled to any distance from his home, he could not find his way back again; and once in particular, having gone beyond his knowledge, he wandered as

far as Norfolk, where he was taken up, and, being carried before a magistrate, was committed to the house of correction in Norwich, and punished as a sturdy and obstinate vagrant, who would not (for indeed he could not) give any account of himself: but, Mr. Fenn having advertised him in the public papers, he was released from his confinement, and brought back to his usual place of abode.

"Notwithstanding the extraordinary and savage state in which Peter was first found greatly excited the attention and curiosity of the public; yet, after all that has been said of him, he was certainly nothing more than a common idiot without the appearance of one. But, as men of some eminence in the literary world have in their works published strange opinions and ill-founded conjectures about him, which may seem to stamp a credit upon what they have advanced; that posterity may not through their authority be hereafter misled upon the subject, this short and true account of Peter is recorded in the parish-register by one who constantly resided above thirty years in his neighbourhood, and had daily opportunities of seeing and observing him."

PE'TER (St.), a town of the duchy of Stiria: four miles south-east of Landsberg.—Also, a town of the same duchy: three miles west-north-west of Windisch Weiftritz.—Another town in the same duchy: six miles west of Cilley.—A town of Austria: twelve miles west-south-west of Freustadt.—An island on the river Rhine, strongly fortified, near Mentz.—A town on the south-west coast of the island of Cape Breton, in a bay to which it gives name, and which is a very commodious place for carrying on the fishery.—A small island in the West Indies, among those which form the cluster called Virgin Islands, dependent on Virgin Gorda.—A town of the island of Antigua.—A town of the island of Stronsa. Lat. 59. N. lon. 2. 31. W.

PE'TER'S (St.), a river on the coast of Labrador, about four leagues from the island of Belle-isle, in the straits of that name.—A river of Louisiana, being one of the north-western branches of the Mississippi river, which it joins in about lat. 45. 6. N. lon. 94. 22. W.

PE'TER'S (St.), a small island on the west coast of St. John's Island, near to, and north-by-west of, Governor's island, in the narrowest part of the strait between New Brunswick and St. John's island.

PE'TER'S BAN'K, a large fishing-ground off the south end of Newfoundland, extending from Cape Race to St. Peter's-island, opposite Placentia, St. Mary, and Trepassy, bays. It has on it from forty-five to thirty fathoms of water.

PE'TER'S BA'Y, a bay on the south coast of Cape Breton island.

PE'TER'S FO'RT, a fort in the island of Martinico, in the West Indies. Lat. 14. 44. N.

PE'TER'S HAR'BOUR, on the north coast of the island of St. John, in the gulf of St. Lawrence, about eight leagues west of East-point. Lat. 46. 25. N. lon. 62. 20. W.

PE'TER'S HAVEN, a harbour on the east coast of Labrador. Lat. 56. 31. N. lon. 60. 42. W.

PE'TER'S ISLAND, in the lake of Bienne, in Switzerland, remarkable for being one of the retreats of Rousseau; whence it has also got the name of *Rousseau's Island*. It lies towards the south side of the lake, and produces a great variety of shrubs and trees, particularly large oaks, beech, and Spanish chestnut. The southern shore slopes gradually to the lake, and is covered with herbage; the remaining borders are steep and rocky; their summits in a few places thinly covered with shrubs; in others their perpendicular sides are clothed to the water's edge with hanging woods. The views from the different parts of the island are beautiful and diversified; that to the north being the most extensive and pleasing. It commands the prospect of the lake, which is of an oval form; its cultivated borders, interspersed with villages and castles, with the towns of Nidau and Bienne standing upon the farther extremity. Agreeable walks are carried through

through the woods, and terminate in a circular pavilion placed in the centre of the island. On Sunday, and particularly the vintage-time, this island is resorted to by parties who amuse themselves with wandering about the woods or dancing in the circular pavilion. There is only one farm-house on the island, in an apartment of which Rousseau was lodged.

PETER'S LAKE, an expansion of the river St. Lawrence, into which are discharged from the south and east Sorel river from lake Champlain, the river St. Francis and some smaller rivers from the north-west. The Masquinonge, Omachis, &c. enter the lake. The centre of it is sixty-eight miles above Quebec, and 205 north-east of Kingston, at the mouth of lake Ontario.

PETER-MAN, *f.* [from *St. Peter*. It once meant] Any fisherman poaching in the Thames.—His skin is too thick to make parchment; 'twould make good boots for a *pete-man* to catch salmon in. *Esward Hoc.*

PETER-PENCE, *f.* An ancient levy, or tax, of a penny on each house throughout England, paid to the pope. It was called *Peter-pence*, because collected on the day of *St. Peter ad Vincula*; by the Saxons it was called *Rome-feoh*, *Rome-foot*, and *Rome pennyng*, because collected and sent to Rome: and lastly, it was called *hearth-money*, because every dwelling-house was liable to it, and every religious house, the abbey of St. Alban's alone excepted.

It was not intended as a tribute to the pope, but chiefly for the support of the English school or college at Rome; the popes, however, shared it with the college; and at length found means to appropriate it to themselves.

At first it was only an occasional contribution; but it became at last a standing-tax; being established by three laws of king Canute, Edward the Confessor, the Conqueror, &c. Edward III. first forbade the payment; but it soon after returned, and continued till the time of king Henry VIII. when Polydore Virgil resided here as the pope's receiver-general. It was abolished under that prince, and restored again under Philip and Mary; but was finally prohibited under queen Elizabeth. *Chambers's Cyclopædia.*

PETER'S POINT, a cape of England, on the coast of Lincolnshire: four miles south-east from the mouth of the Witham.

PETER LE PORT, or PORT St. PIERRE, a market-town in the south-east part of Guernsey, in the British Channel, consisting of only one long narrow street. The mouth of the harbour is well set with rocks, and is, on each side, defended by a castle; one called the Old Castle, and the other Castle Cornet. The governor of the island generally resides here, who has the command of the garrison in this and all the other castles. See GUERNSEY, vol. ix. p. 75.

PETER-SA-MEE'NE, *f.* A kind of Spanish wine.—A pottle of Greek wine, a pottle of *Peter-sa-meene*, a pottle of Charnico, and a pottle of Ziatticæ. *Deh. Hon. Whore.*

PETERBOROUGH, a city at the eastern extremity of the county of Northampton, bordering on the great fens of Lincolnshire, at the distance of 81 miles north by west from London. It is built on the north bank of the river Nen; and the country adjacent has been termed, from its fertility, the "Nile of England."

This spot was originally called *Medeshamstede*, and here was at least a village, if not a considerable town, early in the 6th century. Though not made a city till the reign of Henry VIII. yet at a very remote period this place was distinguished for its monastery, which was large in its establishments, and extensive in its jurisdiction. So closely is the interest which Peterborough possesses interwoven with the history of this conventual foundation, that in describing the one, it is requisite to enter into a short account of the other. The foundation of this abbey was laid by Peada, eldest son of Penda, king of the Mercians, in 655 or 656; but, dying in the fourth year of

his reign, it was completed, in 664, by Wolfere his brother, who succeeded him, assisted by Ethelred the remaining son, Kynefburga and Kynefwitha the two daughters, of Penda, and Saxulf, a pious and prudent earl, who was made the first abbot. It was dedicated to St. Peter at an assembly of nobles and bishops, and endowed with large immunities and possessions, which were confirmed by the charter of Wolfere in the 7th year of his reign. Pope Agatha ratified these endowments, and constituted it a vice-papal see, where persons might "pay their vows, be absolved from their sins, and receive the apostolical benediction." The monastery flourished for nearly two hundred years, under a succession of seven abbots, when the Danes, commanded by Hubba, in 870, after desolating the abbeys of Croyland and Thorney, almost annihilated Medeshamstede, plundered its dependencies, destroyed the library, and slaughtered the venerable abbot, Hedda, together with the friars and the country people, who were flying to its altars for protection: they were overtaken and murdered in a court of the monastery, called the Monks Churchyard, because they were all buried here; and to this day is to be seen the tombstone with their effigies, which had been erected over their common grave. Soon after this the Danes destroyed both the monastery and friars, so that it lay desolate for above 100 years, till Athelwold bishop of Winchester, in 970, assisted by king Edgar, and the archbishops Dunstan and Oswald, rebuilt it on an enlarged scale, and confirmed its former privileges and possessions. At this period the name of the town was changed to *Burgh*; and, from the splendour and privileges of the monastery, it was generally called *Gilden-burgh*; but, in reference to the saint to whom the dedication was made, this name was afterwards changed to *Peter-burgh*. Under several succeeding abbots the fortunes of the establishment were variously chequered; but nothing remarkable happened until the abbacy of Thoroldus, when the Danes, under Sweyn, destroyed the town, but were unsuccessful in their repeated attacks against the monastery. In the year 1116, it was consumed again, by an accidental conflagration, which left only the chapter-house, dormitory, and refectory, standing. By the same fire, the greater part of the town was likewise destroyed. In 1118, John de Salisbury, the reigning abbot, commenced a new church, which was finished under Martin de Vecchi in 1144. Under William de Waterville various architectural improvements and additions were made in the church, &c. Benedictus was abbot of Peterborough in 1177; and Gunton, in his History of Peterborough, says, "It seems the nave or body of the church did not please him; therefore he built it after a better manner from the lantern (the transept tower) to the porch, as now it is."

The style of architecture prevalent in this building is that denominated Norman, of which the circular arch and large column, with analogous mouldings, form the leading characteristics. It has been erroneously termed Saxon, although no part of the existing cathedral was erected antecedent to the year 1118, when the monastery was destroyed by fire. The plan, like that of most other cathedrals, consists of a nave with side-aisles, a transept, a choir terminating at the east end semicircularly, with a continuation of the side-aisles of the nave. The whole is finished at the east by what is called the new building, or St. Mary's Chapel. In the centre is a tower rising from four large arches, at the intersection of the nave, choir, and transept. The west front is formed by a recessed portico of three lofty arches, surmounted by pinnacles, and spires. In the centre arch is a small chapel. The dimensions of the cathedral, with its several parts, are—Length externally, including the buttresses, 471 feet; of the nave, from the west door to the entrance into the choir, 267; of the choir, 117; and from the altar of the choir to the east-window, 38; making in the whole, from the west door to the east window, 422 feet. Length of the transept, from north to south, 180 feet.

Height of the nave, from the floor to the ceiling, 81 feet; of the central tower, from the floor to the summit, 135; whilst its whole height externally is 150 feet. The breadth of the nave and aisles, from the north wall to the south, is 78 feet, and the breadth of the west front 156. The periods of erecting the various parts of the cathedral may be assigned thus: the choir, with its aisles, from the circular extremity at the east to the commencement of the transept on the west, was begun in the year 1118, and finished in 1144. Between the years 1155 and 1177, the transept was erected; and between 1177 and 1193, the nave, with the aisles, were completed to the termination of the pillars. A farther addition was made about 1288, when the space between the extreme western pillar and the door of entrance was finished, forming a projection on each side of the western extremity, and terminated by two towers. The Lady's Chapel, said to have been on the east side of the north transept, was built by William Parys, the prior, in the 14th century. At what period the west portico, with its three arches, was erected, is not precisely known, but we presume before the year 1274, as abbot Richard de London raised one of the western towers before that year. The new building, at the eastern extremity of the choir, was erected by Richard Ashton in the middle of the 15th century, and probably completed by abbot Kirton about 1518. This building formed the last addition made to the church before the dissolution of the monastery by Henry VIII. making a period of 400 years from the foundation of the present church to its final completion. On the south side were the cloisters, which are nearly destroyed. The annexed engraving of the West Front of the Cathedral is copied from the Gentleman's Magazine, accompanied with the following remark by the late Mr. Carter, who furnished the drawing. "The building (chapel, or song-school) raised within the centre arch (which arch is less in the opening than those on each side) is a later construction; probably of the 14th century, done, it is imagined, to act as a sustainment to some visible injury the arch itself might have undergone. The three grand arches, the receding walls, with their enrichments of door-ways, windows, groins, columns, pediments, compartments, niches, statues, ornaments, attending towers, pinnacles, and spires, constitute a gigantic and gorgeous west porch: the tower on the right restored according to Gunton. In the distance, centrally, is the transept tower, on which, to give an assimilating effect to the whole contour, I have introduced a spire. Whether the tower originally was so adorned, is not certain; but it is not beyond a reasonable supposition to conclude, that it once had such a glorious termination."

The abbots of the monastery were called to the house of peers in the time of Henry III. and were mitred in 1400. Queen Catharine, the first wife of Henry VIII. was interred here in 1535. In 1541 the monastery was converted into an episcopal see, and the conventual church into a cathedral. The government of it was entrusted to a bishop, a dean, and six prebendaries, whose jurisdiction extended over the city of Peterborough, and nearly the whole of the counties of Northampton and Rutland. In 1587, the funeral of the hapless Mary, queen of Scots, was here solemnized, unattended by splendour or ceremony: her remains were translated to Westminster in the reign of James I. 1612. During the rebellion of 1643, the cathedral experienced various acts of violence from the parliamentary forces; the stalls, organ, books, monuments, and every ornamental decoration, shared an equal destruction. After remaining eight years in a state of ruin and desolation, its damages were in some measure repaired, and the whole edifice restored for the performance of divine service.

On the left hand, as you enter the cathedral, stands the figure of Robert Scarlet, the sexton, who died at the age of 95, after he had buried all the housekeepers of

the town twice over. The following verses appear underneath:

You see old Scarlet's picture stand on high,
But at your feet there doth his body lie;
His grave-stone doth his age and death-time show,
His office by these tokens you may know.
Second to none for strength or sturdy limb,
A scare-babe, mighty voice, with visage grim.
He had inter'd two queens within this place,
And this town's householders in his life's space
Twice over; but at length his own turn came,
What he for others did, for him the same
Was done. No doubt his soul doth live for aye
In heav'n, though here his body's clad in clay.

The Close, to the west of the cathedral, is nearly surrounded by ancient monastic buildings, the south side of which presents several fine and interesting parts of ancient architecture. On this side is also the bishop's palace; north of the cathedral is the deanery, the entrance gateway to which was built by abbot Kirton, as the sculpture and arms plainly indicate.

There is but one parish-church besides the cathedral. It stands nearly in the centre of the city, is dedicated to St. John, and is said to have been originally erected about the year 1400, by abbot Genge, assisted by the citizens. The church is spacious, and contains several monumental slabs. Over the altar-table is a large picture, painted by sir Robert Ker Porter.

Peterborough is the only city in England without mayor and aldermen. The civil government of the city is vested in seven magistrates, and in the bailiffs to the lords of the manor. The jurisdiction of this place, commonly called the liberty or soak of Peterborough, is something particular, and extends over thirty-two towns and hamlets in the neighbourhood; in all which places the civil magistrates appointed by commission for the king for that purpose are invested with the same power as judges of assize, and accordingly hold in this city their quarterly sessions of the peace, oyer and terminer, and general gaol-delivery, and hear and determine all criminal cases, of what nature or kind soever within themselves.

It sends two members to parliament; the dean and chapter are lords of the manor, and appoint the returning-officer. The present members are sir R. Herne, bart. and Mr. Scarlett the barrister. This city is entirely independent in the exercise of its elective franchise. The inhabitants who pay scot and lot, and who are in number between four and five hundred, have all votes at elections for their members of the legislative assembly. This is reckoned the least city and poorest bishoprick in England. It first sent members to parliament anno 1547, 1 Edward VI.

The river Nen, which divides the counties of Northampton and Huntingdon, is navigable to Northampton, forty-two miles above Peterborough, and below empties itself into the sea. It is a noble river, and barges of considerable burthen are navigated thereon: it abounds with pike, eels, perch, bream, &c. To this day it remains a doubt by whom the bridge over the river leading into Peterborough should be kept up and repaired. It appears from history, that abbot Godfrey, elected in 1299, built of his own free will the bridge leading into the city, in the fourth year of Edward II. There was an inquiry made concerning the said bridge, which being gone to decay, the question was, how or by whom it should be repaired. To determine this there was a jury impanelled, six out of Northamptonshire and six out of Huntingdonshire, who, upon examination, returned an ignominious in the following manner: "That there was none of right bound to repair or sustain the same." But, the king and queen coming to Peterborough, the said bridge was repaired by abbot Adam for their passage into the city. The bridge has for many years been kept up by the

feoffees,

PETERBOROUGH.

West Front of Peterborough Cathedral.

Engraved for the Encyclopædia Londinensis, Aug. 1823.

feoffees, who, much to their credit, in the year 1790, undertook a thorough repair of the same. An act passed about the same time for the paving, lighting, and otherwise improving, the city.

Here is a plentiful market on Saturday, which is well stored with the best of meats, fish, and fowl, wild and tame, and at more reasonable prices than many neighbouring markets. Fruit is in general plentiful and cheap; as is firing, coals being seldom higher than 30s. a-chaldron. There are two chartered fairs; the first by king Richard, upon the feast of St. Peter, for eight days, but now contracted to two, on the 10th and 11th of July, which is noted for home-spun cloth, beast, horses, wood, haberdashery, and toys: the second fair, chartered by Henry VI. is called Brigg-fair, holden on the 2d and 3d of October: considerable sums are then turned in the articles of wood, cheese, cabinet-goods, haberdashery, upholstery, braziers, &c.

There is a charity-school in this city, founded by Thomas Deacon, esq. who endowed it with a freehold estate of a hundred and sixty pounds per annum. A very stately monument is erected on the south-east of the altar in the cathedral, sacred to the memory of that pious and benevolent man.

Mr. Wortley, who was formerly one of the representatives of this city, gave a very good house, with extensive grounds, as a workhouse for the poor. Their chief employ is spinning of wool, which is sent to Norwich and there manufactured. There being no manufacture in the city or neighbourhood, the number of idle and abandoned children was immense; but, since the excellent institution of Sunday-schools, the morals of the lower class of children are much mended.

By the census of 1801, Peterborough was stated to contain 727 houses, and 3449 inhabitants; in 1811, the numbers are given at 900 houses, and 3614 inhabitants; but the increase in the last ten years is very great indeed if our figures are correct, for the number of inhabitants in 1821 is noted as 8558; this perhaps includes some hamlets not numbered in the preceding returns.

Symon Gunton, author of the History of the Cathedral which we have quoted, was a native of this place, resided here the greatest part of his life, and died here in 1676.

At Helpstone, near this place, lives John Clare, called the Northamptonshire Peasant, who has published a volume of Poems. He was born July 13, 1793, of parents who are in a state of great poverty. He himself has partaken of their penury, and still continues a day-labourer, for low wages. By extra work, and helping his father early and late at threshing, he earned sufficient to procure for himself the benefit of being taught to read, and then procured a few books, among which he was peculiarly delighted with Thomson's Seasons. Through the assistance of a kind friend, he at length learned writing and arithmetic. His passion for poetry appeared very early, and flourished in spite of the discouragement of poverty and neglect. A singular accident led to the publication of the poems. In December 1818, Mr. Edward Drury, bookseller, of Stamford, met with a "Sonnet to the Setting Sun," written on a piece of paper in which a letter had been wrapped up, and signed J. C. Having ascertained the name and residence of the writer, he went to Helpstone, where he saw some other poems, with which he was much pleased. At his request Clare made a collection of the pieces he had written, and added some others to them. They were sent to London, and the publishers selected those which form the present volume. They have been printed with the usual corrections only of orthography and grammar, in such instances as allowed of its being done without changing the words: the proofs were then revised by Clare, and a few alterations made at his desire.

In mentioning a peasant-poet, we immediately remember Burns: but Clare must not be ranked with him whose talents would bear a comparison with the noblest

intellects of modern times, and whose compositions, though perpetually enriched with illustrations from the beauties of nature, were filled with the deepest and truest sentiment, or lighted up with the most brilliant wit. Clare, moreover, possesses but a small share of the acquirements of Burns, whose mind was well stored with much useful knowledge.

The last notice of Clare informs us, that he was living with his parents, working for any one who would employ him, without any regular occupation. His father is a helpless cripple, and a pauper, receiving 5s. a-week from the parish of Helpstone. (Gent. Mag. Feb. 1820.)

Fotheringay-castle is situated on a branch of the Nen-famous for the imprisonment and decollation of the unfortunate Mary queen of Scots. It seems to have been very strong, and it had a high mount or keep, environed with a deep ditch; it is mostly demolished, and the materials carried off; some say it was destroyed by order of king James I. in revenge of his mother's sufferings. They pretend to show the ruins of the hall where that princess was beheaded. It was the seat of Edmund Langley duke of York, whose body was buried in the collegiate church here; a very neat building, founded by Edward duke of York, likewise interred here. The chancel, in which they were buried, was entirely demolished at the suppression; but these monuments were restored by queen Elizabeth. The church-windows are filled with handsome painted glass, saved by a sum of money in the civil war, and represent St. Denys, St. Guthlac, Archbishop Scrope, &c.

Earl Fitzwilliam has a seat at Milton, about three miles from Peterborough, on the right of the road to Stamford. About one mile from Milton is Thorp-house, once sir Robert Barnard's, but now the property of earl Fitzwilliam also. At this seat, in the year 1720, a Mosaic pavement was found. This was undoubtedly a villa of some Roman of distinction. In the garden are some fine antique marble statues, from the Arundel collection, which suffer more from the weather than from age. In the middle is a Livia of a Colossean proportion: in the four quarters, Diana, Amphion, an Orator, and a Gladiator: upon the terrace, an admirable Hercules killing the Hydra: over most of the doors of the house are placed busts of Bavianus, Caracalla, and others; and, in the court, are two equestrian figures in copper, Henry IV. of France, and Don John of Austria.

Castor, a village three miles from Peterborough, and one from the river Nen, is supposed, from the chequered pavements found there, together with the Roman copper coins and urns, to have been part of the ancient city called by the Romans *Durobrivæ*, and by the Saxons *Dornanchester*. The Roman highway, called Erming-street, goes from hence to Lincolnshire. Its church, which appears to have been consecrated in 1174, stands on a hill where the castle stood which was the residence of the Roman governor. Some Roman discoveries have recently been made at Castor, by Mr. Artis of Milton. The scene of his labours is an isosceles triangle, two sides being about two miles long, the third about a mile and half, and the church-yard of Castor the vertex. In the church-yard and adjoining hill he has satisfactorily traced fifty-six rooms in a villa which appears to have covered between five and six hundred feet square. In Mill-field, at the south-east angle of the triangle, is another villa, about 300 feet long by 230 feet wide, containing twenty-two rooms; and at the south-west angle is a third villa, about 300 feet square, with thirty-seven rooms. In the portions of the intermediate space which have been explored, tessellated pavements, foundations of small houses, and a variety of miscellaneous curiosities have been brought to light. Between the base of the line and the river, probably the suburbs of a city, several skeletons have been dug up. Mr. A. purposes publishing by subscription, in numbers, a series of plates illustrative of his discoveries, consisting of plans and sections of the build-

ings and hypocausts, tessellated pavements, pottery, paintings in fresco, sculptured stones, coins, &c. *Monthly Mag.* Aug. 1822. *Beauties of England and Wales*, vol. xi. *Wilkes's British Directory*, vol. iv. *Genl. Mag.* 1814, 1818, 1820. *Monthly Rev.* Mar. 1820. *Ganton's Hist. of the Church of Peterborough*, 1670.

PETERBOROUGH, a town of New Hampshire: twenty-two miles east of Chesterfield.

PETERDORF, a town of Germany, in the duchy of Stiria: four miles north-north-east of Muckrau.

PETEREL, or **PETREL**, *f.* A kind of sea bird. See **PROCELLARIA**.—The *petereles*, to which sailors have given the name of Mother Carey's chickens: *Hawkejworth's Voyages*.

PETERFFI, (Charles), an Hungarian Jesuit who flourished in the 18th century, was descended from a noble family, but concerning the time of his birth we have no information. He entered the society in the year 1715; and, when he had finished his course of academical studies, was appointed professor of the belles lettres in the seminary belonging to his order at Tyrnaw. From that office he was removed by his superiors, to fill the philosophical chair at Vienna. Afterwards he devoted himself entirely to the study of the history of his country; and in the year 1742 he presented the public with the fruits of his application, in a work entitled, "Sacra Concilia in Regno Hungariæ celebrata, ab anno 1016 usque ad annum 1715," in folio, published at Vienna and Presburg. This collection comprises, besides the councils of Hungary, the ecclesiastical constitutions of the kings of Hungary, and of the legates of the papal see. It comes recommended to the reader by great beauty of style, as well as excellence of arrangement, and is accompanied by a variety of curious researches. It is also illustrated with engravings of the ancient monuments, &c. He died in the year 1746. *Gen. Biog.*

PETERHEAD, a market-town and sea-port in the county of Aberdeen, Scotland, is seated upon a peninsula projecting into the German Ocean, and connected with the main land by an isthmus about 800 yards in breadth. It is built in the form of a cross, and is divided into four wards. The town-house, placed at the head of the principal street, is a fine building of hewn stone, surmounted by a spire upwards of an hundred feet in height. Many of the private houses are also handsome in their exterior appearance. Peterhead is a borough of barony, under the superiority of the Merchants' Maiden Hospital; and is governed by a baillie and eight counsellors: the baillie is in the nomination of the superiors, and has his commission from them; but the counsellors are chosen by the feuars, at a general meeting called for that purpose. The revenue of the burgh, which is considerable, is expended in various improvements. The market day is Friday; and there are two annual fairs.

Peterhead occupies the most westerly point of Scotland; and is the nearest land to the northern continent of Europe. It lies within 300 miles of the cape which is called the Naze of Norway. Through this channel the grand body of the herrings pass in their annual migrations from Shetland and the North Seas to the more southern latitudes, attended with the all-devouring cod and ling; on which account Peterhead, or, as it is sometimes called, *Buchanefs*, hath always been the second station of the Dutch buffes after leaving the Shetland islands. Tradition says, that some hundred years ago the Dutch offered the Earl Marischal, then the proprietor of the coast, to cover a small island called Inch-Keith with silver for the purchase of it to carry on their fisheries; which for obvious reasons could not be accepted. Be that as it may, the Dutch, in time of peace, still frequent the coast in July and August, and sometimes a hundred sail are seen within sight of land, busily employed in the herring and white fisheries. The natives, to whom this treasure properly belongs, have lately made some attempts towards the white fishery, of which they cure and vend,

chiefly at the London market, 4000 barrels of delicate small cod and ling annually. They also fit out some vessels for the Hebride fishery off Barrahead for the Barcelona market; and they claim the merit of having taught the islanders how to take and cure the large fish which abound on their coasts. They have often gained the highest premiums allowed by government for curing white fish.

Few harbours in Great Britain are of more importance to navigation than this of Peterhead, as, in case of violent storms from the easterly points, large vessels embayed betwixt this and the mouth of the Forth have not a port that they can safely take at every time of the tide, that of Aberdeen excepted. If therefore they cannot make their way to sea in the teeth of a strong easterly wind, or double this headland that they may gain the Murray frith, they must inevitably come on-shore. This harbour lies on a spacious bay, where vessels of any burden may ride in all other winds; and is therefore the general rendezvous of the shipping which frequent the northern seas, where they cast anchor on clean ground, and ride safely till the storms have abated. But, though nature hath done so much for the benefit of navigation, something is left for the exercise of human aid. The harbour can at present contain in perfect safety forty or fifty sail of vessels drawing twelve feet water; but is capable of being extended so as to admit a greater number of ships drawing twenty feet; by which means not only casual merchantmen, but small ships of war with their convoys, would find this a most desirable refuge when pursued by superior force. The harbour is defended by a good battery. A mineral well in the summer-months gives great gaiety to the place; its salutary virtues have long, and we believe very justly, been celebrated. The waters of this spring are powerfully diuretic, and are thought to be efficacious in removing complaints in the bowels. Twelve pounds avoirdupois of this water were analyzed by Dr. Laing, who found it composed of

Muriate of iron, . . .	30'75 grains.
Carbonate of iron, . . .	3'25
Muriate of lime, . . .	7'00
Siliceous earth, . . .	2'00
Sulphate of lime, . . .	2'00
—————soda, . . .	13'25
Muriate of soda, . . .	7'5

Peterhead has long been a place of considerable trade; and has an extensive manufacture of thread, woollen cloth, and cotton, besides a large salt-work. Here is a respectable parochial school; also a school for writing and arithmetic, endowed by Dr. Anderson's trustees, with a salary of 20l. sterling. The town, with the lands in the vicinity, were formerly the property of the abbey of Deer, which was erected into a temporal lordship in 1589 in favour of Robert Keith, then commendator of Deer, by the title of Lord Altree. This peerage becoming extinct in 1593, the superiority of the town became the property of the Earl Marischal, by whom it was constituted a burgh of barony, under the name of Keith Inch. In 1715 it was sold to an English fishing-company, whose trustees transferred it to the present proprietors.

The parish of Peterhead, anciently called Peter Ugie, extends about four miles along the coast, and comprises nearly seven thousand acres of land, of which five thousand are arable, and the remainder consists of moor and moss ground. In this parish are the ruins of Old-Craig or Raven's-Craig castle. In 1793, the population was reckoned at 4100; and has been gradually increasing since. According to the first parliamentary returns, the number was 4491; in 1811, the returns were, 919 houses, and 4707 inhabitants; and by the last census, in 1821, the number of inhabitants is stated to be 4783. *Beauties of Scotland*, vol. iv.

PETERHOFF, in Russia, is situated about 20 miles from Petersburg, and is distinguished for its palace and gardens.

gardens. The palace was begun by Peter I. and finished by Elizabeth. As it is placed upon an eminence, it commands a most superb view of Cronstadt, Petersburg, the intervening gulf, and the opposite coast of Carelia. The palace is most magnificently furnished, and the suite of apartments are truly princely. The presence-chamber is richly ornamented with portraits of the sovereigns of the house of Romanof, who have reigned in Russia since 1613.

"The gardens of Peterhoff (says an intelligent traveller) have been celebrated for their taste and elegance; and from the number of jets-d'eau, fountains, basins, cascades, parterres; &c. they have been compared to those of Versailles: and indeed in one respect they are far superior; for the water-works of the latter only play upon particular occasions, while those of Peterhoff are perennial. These gardens, which at the time of their formation were greatly admired in this country, though not congenial to the present taste, are suffered to remain." A vast number of silver dolphins and gilded statues are scattered through them; but the most remarkable figures are those of two gladiators placed in a basin of water. These are represented, not with the sword and buckler, the ancient implements of war, but with a brace of pistols. These they point to each other in a threatening posture, while the water gushes impetuously from the barrels. In that part of the garden which lies between the palace and the gulf, close to the water, is a building which was the favourite retreat of Peter I. It is preserved, together with its furniture, entirely in its original state with a kind of religious veneration. Its plainness shows the frugal simplicity in which that monarch was accustomed to live. In the same celebrated gardens there is a remarkable building called the *mountain for sledges*, and often by travellers the *flying mountain*. "It stands (says Mr. Coxe) in the middle of an oblong area, inclosed by an open colonnade, with a flat roof, which is railed for the convenience of holding spectators. The circumference of this colonnade is at least half a mile. In the middle of the area stands the flying mountain, stretching nearly from one end to the other. It is a wooden building, supported upon pillars, representing an uneven surface of ground, or a mountain composed of three principal ascents, gradually diminishing in height, with an intermediate space to resemble valleys: from top to bottom is a floored way, in which three parallel grooves are formed. It is thus used: A small carriage containing one person, being placed in the centre groove upon the highest point, goes with great rapidity down one hill; the velocity which it acquires in its descent carries it up a second; and it continues to move in a similar manner until it arrives at the bottom of the area, where it rolls for a considerable way on the level surface, and stops before it attains the boundary: it is then placed in one of the side grooves, and drawn up by means of a cord fixed to a windlass. To a person unacquainted with the mechanism, this entertainment would appear tremendous; but, as the grooves always keep the carriage in its right direction, there is not the least danger of being overturned. At the top of the mountain is a handsome apartment for the accommodation of the court and principal nobility; there is also room for many thousand spectators within the colonnade and upon its roof. Near the flying mountain is a spacious amphitheatre, in which tournaments are usually exhibited." Coxe's Travels, vol. i. 1784.—These *Montagnes Russes*, as they are called, were introduced into Paris, as an amusement, a few years ago; and were exhibited at Sadler's Wells, London, in the present year 1823.

PETERKIN'GEN, a town of Swisserland, in the canton of Berne: nine miles north of Berne.

PETERS, a town of North America, in Franklin county, Pennsylvania; containing 1749 inhabitants.

PETERS (Rev. Charles, A.M.) Rector of St. Mabyn, in Cornwall, was one of the most elegant and vigorous polemic of the last century; but we are not acquainted

with the date of his birth or death. His "Critical Dissertation on the Book of Job" is the finest commentary in our language, whether it be considered with respect to verbal criticism, literary research, or evangelical illustration. In language it is elegant, and in learning profound: the argumentative part is unanswerable, and the wit is equally pleasant and good-natured. Bishop Warburton never had such an adversary as Mr. Peters, who completely succeeded in demolishing the ideal system advanced in the prelate's famous work on the Divine Legation of Moses. The bishop, however, affected to treat his acute antagonist with contempt, and in his usual coarse language designated him by the illiberal appellation of the Cornish Critic. Bishop Lowth, in his letter to the author of the Divine Legation, quotes the passage, and in a note subjoined observes thus: "The very learned and ingenious person of whom this decent language is used, is the Rev. Mr. Peters. I mention his name because the readers of the Divine Legation will hardly know it from thence, where he passes by the style and title of the Cornish Critic. What the true meaning and import of this title may be I cannot say: I suppose it may allude to some proverbial saying relating to Cornwall, perhaps like that of the Jews, equally false, concerning Galilee, that out of Cornwall ariseth no critic; but this is mere conjecture; I have never heard of any such proverb. I was thinking of explaining it by another common saying; but then the title would imply a commendation, and, what is worse, would have too great a propriety. Every one has heard of a *Cornish hug*; which, if a man has once felt it to the purpose, he will be fore of as long as he lives." Mr. Peters was also the author of a volume of admirable Sermons. *New Monthly Mag.* 1815.

PE'TERSBACH, a town of Bavaria, in the principality of Aichstatt: five miles north of Aichstatt.

PE'TERSBERG, a town of the duchy of Magdeburg: forty-eight miles south-south-east of Magdeburg.

PE'TERSBURG, or St. PETERSBURG, a city of Russia, and capital of the whole empire, situated on the river Neva. The beginning and increase of this great city were very extraordinary; for, till the year 1703, the only buildings on the spot where this flourishing metropolis now stands, were two small fishing-huts. But Peter the Great, having in that year taken the town Nyenschanze, seated on the river Neva, and made himself master of this country, its commodious situation for the Baltic trade determined him to build a town and fortrefs here. He immediately began to put his project in execution, calling the town by his own name. At first it was designed only for a place of arms, to which all kinds of military stores might be conveniently brought from the interior parts of the empire; so that, by that means, the war with Sweden might be carried on with more vigour and dispatch. At this time both the public edifices and private houses were built only with timber. The dock and the town had no other fortifications than a mean rampart of earth; nor were the streets paved. In short, if the czar had been then deprived of the place, the loss of it would not have been great. But the victory of Pultowa, and the conquest of Livonia, inspired Peter with hopes that he should be able to preserve his conquests, and to render Petersburg the capital of his empire. His fondness for maritime affairs, a desire for perpetuating his name, and his aversion to Moscow, where, in his younger years, he had received so much ill treatment, were the chief motives that induced him to lay the foundation of this new seat of empire; to which some add another inducement, namely, the pleasure of mortifying the Russians, who were so strongly attached to the city of Moscow. Upon this, Peter ordered the castle to be built with stone, the admiralty to be walled in with the same materials, and all the buildings to be erected in a handsome and more durable manner, and gardens to be laid out. In the year 1714, he removed the council to Petersburg; and handsome edifices were erected in a straight

line for the public offices, which, in 1718, were also translated hither. The principal families, likewise, were ordered to make this their residence, and build houses according to their abilities. But all this occasioned an irregularity in the buildings; for the situation of the town was not precisely laid out till the year 1721. The nobility and burghers had been directed to build their houses on the island of Peterburg; and not a few buildings, both public and private, were accordingly erected there. But afterwards, the emperor determined that the whole town should stand on the island of Wasili-Ostrow. The streets were marked out; canals were dug; the island was to be fortified with 57 bastions, and the nobility had their houses to begin a second time. Notwithstanding these changes, no metropolis in Europe can come in competition with Petersburg, with regard to regularity and embellishment. The diameter of the city, from east to west, from the Volkresenkoi monastery, is nine versts; and from south to north, from the town fosse across Kamennoi-ostrof to the Nevka, eight versts; the circumference, taking the Vyborg side by the right bank of the Neva, measures twenty-four versts, or somewhat more than twenty English miles. Of this space, however, much must be subtracted for the water; and the land is not yet completely built upon.

By the police ordinance of the year 1782, Petersburg is divided into ten precincts, each containing several quarters. The site of these primary divisions is generally determined by the natural boundaries formed by the river and its subordinate channels. The space between the left bank of the Neva and the river Moika is called the first Admiralty Quarter; between the Moika and the Katarina canal the second; and between the Katarina canal and the Fontanka, the third. The part lying beyond the Fontanka, along the Neva, is denominated the Styckhof; below the Styckhof, along the Fontanka, lies the Moskoffkoi; and along the Ligova canal, the Rojestvenskoi, to which the Yæmkoï quarter adjoins. Then follow the Vassilieofftroï, the Petersburgskoi, and the Vyborgskoi.

What the Quartier du Palais Royal is to Paris, the First Admiralty Quarter is to St. Petersburg; the heart of the city, in which luxury and opulence have established their seat, diffusing themselves around with increasing energy to the remotest borders of the town; the centre of amusement and business, the brilliant resort of pleasure and fashion. Within its circuit are between twenty and thirty structures of the first magnitude, of which the imperial *winter-palace* is the most conspicuous. The colossal dimensions of this edifice, being five hundred English feet in length, and three hundred and fifty in breadth, the magnificence which reigns within and around it, the treasures of costly works of art and curiosities of every kind that are here collected, render it the most striking object of the city. The exterior of this palace, which, including the Hermitage, occupies the space of a small town, is imposing by its huge and ponderous mass, though not remarkable for elegance of architecture. The style and the exuberance of decoration sufficiently betray the period when it came into being. The whole height, amounting to seventy feet, comprises only a basement-floor, with one grand story and an entresol. The situation of this palace is truly majestic. In front of it stands a magnificent crescent of lofty and superb edifices, forming a larger span than is to be seen in any other capital, and behind it flows the beautiful Neva within its granite banks. The left wing to which the Hermitage adjoins, has, by means of a projection, the prospect up the great Millione, one of the finest streets of the city; and on the right stands the admiralty.

The Hermitage is, strictly speaking, formed by three divisions of buildings fronting the river Neva, to the eastward of the winter-palace, from which you enter it through St. George's Hall. This hall, though not a part of the Hermitage, deserves a place in this sketch. A more splendid, or so large a saloon, there is not in Europe.

Its dimensions colossal; its materials variegated marble; a gallery for music and spectators on great occasions. The gallery has a rich balustrade, which, with the cornice, capitals, and base of the columns that support it, are of bronze. The throne magnificent, crimson velvet and gold; the chandeliers beyond description for size and lustre; the floor inlaid Mosaic of coloured stones and mother-of-pearl. At each end are *entre-jalles* for the court-officers, guards, and servants, in the same style. Through this hall, you enter the Hermitage, and find yourself in a long gallery, between which and a corresponding one on the other side is the summer-garden, built on vaulted arches, open to the sky, and having a loose wire net drawn over it, to prevent the escape of its winter inhabitants. The south end of the galleries leads to the apartments in the winter-palace; indeed, at one time, these apartments might be said to constitute the palace of prince Potemkin. The opposite or eastern gallery, when the empress Catharine grew old and feeble, was converted into a slope admirably constructed, going down to the apartments devoted to public-affairs, drawing-rooms, levees, &c. this reiterated slope allowing her, in her last years, to walk up and down without encountering any stairs, or to be wheeled up and down in a chair. A description of the slope may not be unacceptable to our readers, as many of the residences of the rich are large enough to adopt its comforts when ill-health or age may require them. Say its length was 100 feet, its breadth 20 feet: divide the breadth equally in three parts, the whole length, so that one-third of the floor forms a very easy descent, say of one inch in ten: then take the other third for the return; then again, if required; so that in four returns you get to the bottom, on inclined planes, not in the least abrupt. Indeed, in walking down or up, it was almost imperceptible.

It was in this vast palace, raised by the empress Elizabeth, though first inhabited by Catharine II. that the latter monarch displayed, through her long reign, that magnificence and liberality which made her court the admiration of foreigners, and obtained for her the just eulogiums of all literary travellers. It was here likewise that she ended her days on the 4th of November, 1796.

The summer-gardens likewise, or the principal public promenade, lie within the bounds of this Admiralty Quarter. By their original destination they belonged to the imperial *summer-palace*, a spacious wooden edifice, since demolished; but are now entirely devoted to the public. They are well laid out, and ornamented with fountains and statues. The balustrade by which they are entered, is a truly surprising work of art; it runs in a line with the houses on the bank of the Neva, and consists of thirty-six massy columns of granite, connected together by an iron palisade of exquisite workmanship, designed and executed by a Swede. The columns are two fathoms in height, and their diameter exceeds three feet, the shafts resting on granite pedestals of six cubic feet, and the pillars are decorated at top by a regular interchange of urns and vases. The huge masses of stone, the wonderful ingenuity displayed in the iron-work, the ornaments of which are highly gilt, the connexion of the whole with the superb edifices ranging at either extremity, and the view of the Neva with its noble granite quay, fill the beholder with astonishment and delight.

The winter-garden is about fifty feet square, in which there is a regular supply of exotic native plants and flowers, forming at the same time an aviary peopled with the most beautiful and rare birds, either for song or plumage, that are to be met with in the four quarters of the globe. Often would the empress amuse herself by feeding them, and then pursue her walk through the hermitage, which might, with great propriety, be denominated her exercise-house: indeed, its dimensions fully justify the title.

This quarter contains four public squares. In one of them stands the justly-famous monument of Peter the Great.

PETERSBURG.

Statue of Peter the Great.

Engraved for the Encyclopædia Londinensis 1823.

J. Pass 32

Great. This statue is truly a master-piece. It is of a colossal size, and is the work of Stephen Falconet, the celebrated French statuary, cast at the expense of Catharine II. in honour of her great predecessor. Falconet has succeeded in the resemblance to admiration; the features of the czar's countenance are admirably expressed. The artist represents the hero on horseback, as in the act of ascending a steep rock, the summit of which he proposes to attain. Peter is in an Asiatic dress, and crowned with laurels; he extends his right arm with graceful dignity, while with the left he holds the bridle of his horse, whose beauty of form, and elegant attitude, captivates the admiration of all spectators. The design is masterly, and the attitude is bold and spirited. If there be any defect in the figure, (says Mr. Coxe,) it consists in the flat position of the right hand; and for this reason the view of the left side is the most striking, where the whole appearance is graceful and animated. The fiery courser rises on his hinder feet, and is in the attitude of stretching to attain the summit of the rock. To combine solidity with excellence was therefore a difficult task; but this the ingenious artist found a way to accomplish. The brazen serpent, which is trampled on by the horse, is emblematical, doubtless, of opposition to the views of the monarch; but it artfully serves likewise to give the proper equipoise to the statue; the point of bearing being by this means not perceived, which is the full and flowing tail of the horse gently falling on the serpent writhing with pain.

The expense of this grand monument was truly imperial. When Falconet had conceived the design of his statue, the base of which was to be formed by a huge rock, he had to enquire where one could be found of magnitude correspondent to the dimensions of the equestrian figure. After considerable research, he discovered a stupendous mass half buried in the midst of a morass at Lachta in Finland. The expense and difficulty of transporting it were no obstacles to Catharine II. By her order the morass was drained, a road was cut through a forest, and carried over the marshy ground; and the stone, which, after it had been somewhat reduced, weighed at least 1500 tons, was removed to Peterburg. This more than Roman work was, in less than six months from the time of its first discovery, accomplished by a windlass, and by means of large friction-balls alternately placed and removed in grooves fixed on each side of the road. In this manner it was drawn, with forty men seated upon its top, about four miles to the banks of the Neva; there it was embarked in a vessel constructed on purpose to receive it, and thus conveyed about the same distance by water to the spot where it now stands. When landed at Peterburg, it was 42 feet long at the base, 36 at the top, 21 thick, and 17 high; a bulk greatly surpassing in weight the most boasted monuments of Roman grandeur. The pedestal, however, though still of prodigious magnitude, is at present far from retaining its original dimensions, as, in order to form a proper station for the statue, and to represent an ascent, the summit whereof the horse is endeavouring to attain, its bulk has been necessarily diminished. But the artist has been desirous to improve upon nature: and, in order to produce a resemblance of an abrupt broken precipice, has been too lavish of the chisel: the effect would have been far more sublime, if the stone had been left as much as possible in its rude state, a vast unwieldy stupendous mass. Be this as it may, the cost of placing it where it is, and as it is, was 70,000 rubles. Stephen Falconet, the statuary, received, during his nine years' stay, about 48,000 rubles; for his maintenance, 26,800 rubles; apart for the casting, 17,500 rubles; his three subordinate artificers, 27,284; the founder Chailof, 2500 rubles, besides incidental charges; the whole amounting, according to the report of the board of works, to 424,610 rubles, or near 70,000l. sterling. The statue is a bell-metal of copper, with a small mixture of tin and zinc, and weighed 44,041 Russian pounds. The figure of

the horse is seventeen feet in height; that of the king eleven; the head of the hero was modelled by Mad. Collet, who was afterwards married to Peter Falconet, son of the statuary. The whole was erected on the pedestal on the 27th of August, 1782. The ceremony was performed with great pomp, and was accompanied with a solemn inauguration. At the same time the empress issued a proclamation, in which, among other instances of her clemency, she pardons all criminals under sentence of death; all deserters who should return to their respective corps within a limited time; and releases all criminals condemned to hard labour, provided they had not been guilty of murder.

We have given an Engraving of this stupendous and beautiful monument, from a book published before the statue was fixed on its pedestal; and the defect noticed by Mr. Coxe, the flatness of the right hand, is very evident. This, however, is a very small drawback upon the general excellence of the work. The simplicity of the inscription (says Mr. Coxe) corresponds to the sublimity of the design, and is far preferable to a pompous detail of exalted virtues, which the voice of flattery applies to every sovereign without distinction. It is elegantly finished in brass characters, on one side in Russian, and on the opposite in Latin:

PETRU PERVOMU
EKATERINA VTORAIA.
LIETA 1782.

PETRO PRIMO
CATARINA SECUNDA.
MDCCLXXXII.

“Dedicated to Peter I. by Catharine II.”

In this quarter of the town, moreover, is the *marble palace*. This superb edifice, built originally by Catharine for the mansion of Gregory Orlof, at his death reverted to the empress, and during her life-time it remained uninhabited; but her son and successor Paul, having invited Stanislaus Poniatowky king of Poland to St. Peterburg, assigned him this palace for his residence; and here, by a singular turn of fortune, he terminated his troublesome and inglorious life.

The college of foreign affairs, the post-offices, the senate, and the loan-bank, are among the public structures; which, either from their magnificence or style of architecture, deserve to be reckoned remarkable objects in this quarter of the town; and the number of which is augmented by sixteen palaces of noblemen, and a multiplicity of other beautiful and spacious buildings.

A very important rank in the topography of the same district is also maintained by the Admiralty, with its lofty tower, from which it affords a view up the streets diverging from it as radii from their centre, and especially that called the Great Perspective, extending at least five miles in length. The body of the building is an oblong square, and, as is justly observed by M. Storch, remarkable for nothing so much as its ugly appearance. The side of the admiralty to the Neva occasionally presents the public with a magnificent spectacle; here being the wharf and dock-yard from whence ships of war of sixty to a hundred guns are built, and every launch is a great holiday.

The grand church dedicated to St. Isaac, which was intended by the empress Catharine II. to be the most sumptuous of all the city, was not completed in her reign. Like the marble palace, it is erected on a basement of granite, the superstructure, both within and without, being of marble, jasper, and porphyry. This church, which at the decease of Catharine had been building upwards of twenty-six years, was raised to the top of the walls, and a beginning had been made with the dome. Her successor, impatient to see the edifice completed, to the amazement of all who were not acquainted with his imperial taste, caused it to be finished of brick.

The square, contiguous to the summer-gardens, is remarkable for nothing except the ponderous monument erected to the memory of field-marshal Romanzof. Isaac
Place,

Place, on which the church of that name is built, is in the form of an obtuse triangle, and is enclosed by handsome houses. Peter's Place, in which the famous statue of that monarch stands, is the grandest of all, whether we consider it in itself, or in the prospect from it, composed of the noble river, the passing ships and boats, the thronged bridge, and the opposite shore of Vassily-ostrof, bordered by palaces, the imperial academies, and sumptuous houses. In this quarter of the town originate three straight, long, and elegant, streets, denominated Perspectives, because from their several points of view they afford a prospect of the admiralty's gilded spire. It proceeds in a direct line, one little curvature excepted, from the admiralty to the monastery of St. Alexander Neusky; and in breadth it may vie with the finest streets in Europe; being, according to the above-mentioned author, by one-half broader than Oxford-street, in London. Rents in this part of the town are considerably higher than in every other; and even the price of provisions and other necessaries is here much enhanced by the readiness wherewith the luxury of the inhabitants complies with the most exorbitant demands.

The principal public edifices of the Second Admiralty Quarter are the court-stables, the college of medicine, and the opera-house. This last is a spacious massy structure in a noble simplicity of style, in the construction of which, due regard was had to the several requisites of its destination. Within the purlieus of this quarter of the town stand two of the principal Greek churches. In that dedicated to God's Mother of Kazan, containing her portrait, which is held in the highest veneration, the solemn thanksgivings for the success of public affairs are usually celebrated, at which the sovereign is occasionally present in person. The church of Nicolai, or the Sailors' Church, consists of two stories, whereof the lower may be heated in winter. Its five cupolas are richly gilded.

The greatest curiosity of the Third Admiralty Quarter is the Bank, perhaps the most elegant building in all Petersburg. Of the churches in this quarter, only the Catholic and the Armenian are deserving of specification; both of them are rather conspicuous for the taste displayed in their structure, than for their grandeur and magnificence. The inhabitants of the two last-mentioned quarters belong chiefly to the trading classes.

Among the public buildings of the Styckhof, the Arsenal is the most remarkable. It forms an open quadrangle of three stories, is built in a grand style, and wears an aspect of dignity, correspondent to its design. Facing the Styckhof-road it has a magnificent portico, and the roof is ornamented with trophies and allegorical figures of excellent sculpture. Opposite the principal front, on the other side of the street, is a large square court filled with piles of cannon-balls and bombs. Remarkable of itself, and from the vicissitudes it has undergone, is the edifice that was formerly the Pantheon of prince Potemkin, which the empress Catharine II. afterwards purchased, and destined for her autumnal residence, denominating it the Tauridan Palace. At that time, this superb edifice consisted properly of only one floor; but the body of the building, having wings extending along the street, had over the grand portal, supported upon columns, two stories furnished with a large cupola. The left wing was greatly lengthened by the empress, by a series of additional erections, taking in one entire street, fitted up as dwellings for her retinue, orangeries, &c. She likewise changed the whole interior of the principal structure, and augmented it by the addition of a theatre. Above fifteen hundred labourers were employed in this work, which was even prosecuted during the night by the light of torches, as the empress had resolved to pass the ensuing autumn there. Dying a few years after its completion, this gorgeous palace was by her son and successor converted into barracks.

In this compartment are the Italian Gardens, the Tapestry-manufactory, the Foundry of Cannon, the Impe-

rial Brewery, and the Slobode of the Horse-Guards. Here are likewise the churches of St. Sergius and of the Preobajenskoi-guards, dedicated to the transfiguration of Christ, with the church of St. Pantaleon and Simeon on the Fontanka, and the subaltern Yæger church on the Ligova canal, which is the only one of timber. The Lutheran church of St. Anne, belonging to the Germans, stands here in the Third Artillery-street. The Styckhof contains likewise the palaces of the princes of Wurtemberg, and on the Fontanka that of prince Sheremetof, with its spacious court ornamented with statues and a pleasure-garden in the Dutch taste.

The Rojestvenskoi Quarter, though comparatively small and inconsiderable, yet contains the only monastery and the only convent within the city. The Volkresenkoi nunnery, or convent, was originally built and inhabited by the empress Elizabeth, while grand-duchess; and on her accession to the throne it was, in 1744, converted into a convent for twenty nuns. The building and walls inclose a large quadrangle, in the centre of which stands the church. Catharine II. suffered the nunnery to remain, but enlarged the structure, and founded in it a seminary for young ladies of noble families. The monastery of Alexander Neuski is built in the shape of a spread eagle, and contains in its ample bounds the palace of the metropolitan, the cells of sixty monks, five churches, a school, &c. The famous shrine of St. Alexander, composed entirely of wrought solid silver, occupies a considerable space in the elegant church, erected expressly for that purpose. Beneath the pavement is the vault constructed by Catharine II. for her relics, and those of her imperial successors.

Among the public edifices of the Moskoffkoi Quarter, is the imperial Yægerhof for the corps of chaffeurs. This spacious and noble edifice was just finished at the demise of Catharine II. and her son Paul converted it into barracks. The town-hospital is likewise situated here, and deserves notice from the grandeur of its architecture.

Vassili-ostrof is the seat of commerce and of literature. The Exchange and Academy of Sciences stand on this island. The Academy of Arts also here raises its majestic front on the shore of the Neva, over-against the Galherenhof. Ascending the river, the coast is lined with the spacious edifices of the land-cadet-corps; and the eastern promontory of the island is decorated with the three large structures which form the Academy of Sciences, at the extremity of which appears the superb Exchange. Among the numerous churches situate on the Vassili-ostrof, the Lutheran church of St. Catharine is principally conspicuous for the neatness and simplicity of its architecture, the portico of which is from the model of the Temple of Concord.

The Petersburg Quarter of the town consists of several islands; and, though it has no sumptuous edifices to boast of, yet contains the parent of all that exist in the imperial residence, namely, the original wooden palace or cottage of Peter the Great, over which is erected a brick building, on arches, to preserve it from the inclemencies of the weather, as a sacred relic of that creative genius. These islands are Petrofski-ostrof, which, besides a small wooden summer-house belonging to the grand duke Constantine, has nothing worth mentioning, and is partly covered with forest-trees. Of the same description is the Apothecary-island, which has its name from the garden upon it belonging to the medical college. Another petty island is occupied by the hemp-magazines, on which account, during the summer, a numerous fleet of barks and galleots are constantly collected about it. Kammenoi-ostrof, belonging to one of the imperial family, has upon it an elegant villa, a hospital for invalids, and a number of beautiful pleasure houses. The island Yelagin, so designated from the name of its proprietor, is highly embellished by art, and laid out in walks, parterres, and avenues, with plantations and shrubberies, so as to resemble the pleasure-grounds of an English nobleman.

nobleman. Krestoffski-ostrof, the largest of these islands, belongs to count Razumowski; and, though less transformed by art, is however, by reason of its delightful prospects arising from the noble vistas and walks, and the shores of the surrounding isles, very much frequented by the inhabitants of the city.

The last and greatest curiosity of this quarter is the citadel, which stands on the island in the Neva, four hundred fathoms long and half as much in breadth, near the Petersburg-isle, a little above Vassili-ostrof, and therefore nearly opposite to the marble palace. The date of its construction is memorable in the annals of the empire, as marking at the same time the era of this city. In the year 1703, while Peter the Great was causing an earthen rampart to be thrown up on this spot, little could he foresee that the hamlet, consisting entirely of a few fishermen's huts, would within the course of a century be garnished with marble temples and gorgeous palaces. Even his rampart of mud has met with a brilliant lot, being faced on the Neva side with a magnificent quay of granite. This was the work of the empress Catharine II. The fortress has two gates; one looking towards the Petersburg island, with which it has communication by a drawbridge, the other fronting the admiralty-side, to which the only access is by water. The most striking edifice within the walls is the church of St. Peter and St. Paul, which owes its origin to the ductile genius of the famous czar. It stands in an open place nearly in the centre of the whole enclosure; having, contrary to the usual custom, no more than one cupola, with a tower fifty fathoms in height, furnished with a chiming clock, for which no less than forty-five thousand rubles were paid by Peter the Great. From this tower the spire rises twelve fathoms, is gilt with ducat-gold, and the whole presents a beautiful object from various points of view. This church contains the bones of its heroic founder, and several of his successors. Among the other curiosities of the castle are to be noted the imperial gold and silver assay-offices, and the mint.

Lastly, the Vyborg Quarter has the most rural appearance of all; since, excepting the street along the bank of the Neva, it is entirely occupied by cottages of the peasantry, and its small population is chiefly employed in rustic labours. Notwithstanding this characteristic, it however numbers amongst its buildings two noble mansions. That belonging to the late count Besborodko, standing on the Neva, has wings of colonnades, which form an amphitheatre, and has an elegant garden in the English taste. The other of these villas, remarkable for its curious style of architecture, is the property of count Stroganof, and has likewise extensive gardens. The wharf for merchant-ships of all descriptions, in this quarter of the town, is the last particular we shall mention.

The population of St. Petersburg is computed at 250,000 persons, consisting of Russians, Germans, Finns, French, Swedes, English, Dutch, Poles, Italians, Spaniards, Portuguese, &c. St. Petersburg is therefore a colonial city, of the motley mixture of which the Russians form by far the major part of the people, though they are not the aborigines of the region which the sovereigns of the Russian empire have fixed upon as their imperial residence.

The revenue which the state draws from the traffic of the city, may at present be estimated at about five millions of rubles. If to this be added the tax on the sale of houses, on contracts, &c. on the lowest probable calculation, the total will perhaps be increased by one-half.

Bread-corn is brought to St. Petersburg from the countries bordering on the Volga. Both rye and wheat bread are eaten here; the latter is the common food of even the lowest and poorest classes. The rye-bread is well tasted, and yields more nourishment; it is universally eaten, and even in families of good condition, where they have the choosing between this and the other. The

poorer sort use what is called black bread, prepared of rye-meal unbolled, and is extremely nutritious.

To strangers, unaccustomed to the various changes produced in men and things by the influence of intense frost, nothing appears more wonderful than that part of the city dedicated to the sale of frozen provisions. Your astonished sight is there arrested by a vast open square, containing the bodies of many thousand animals, piled in pyramidal heaps on all sides; cows, sheep, hogs, fowls, butter, eggs, fish, all stiffened into granite. The fish are attractively beautiful, possessing the vividness of their living colour, with the transparent clearness of wax imitations. The beasts present a far less pleasing spectacle; most of the larger sort being skinned, and classed according to their species; groups of many hundreds are seen piled upon their hind legs against one another, as if each were making an effort to climb over the back of its neighbour. The apparent animation of their seemingly-struggling attitudes (as if suddenly seized in moving, and petrified by frost,) gives a horrid life to this dead scene. Had an enchanter's wand been instantaneously waved over this sea of animals during their different actions, they could not have been fixed more decidedly. Their hardness, too, is so extreme, that the natives chop them up for the purchasers like wood, and the chips of their carcasses fly off in the same way as splinters do from masses of timber and coal. The provisions collected here are the product of countries many thousand miles distant. Siberia, Archangel, and still remoter provinces, furnish the merchandise, which, during the frost's severity, is conveyed hither on sledges. In consequence of the multitudes of these commodities, and the short period allowed to the existence of the market, they are cheaper than at any other period of the year; and are, therefore, bought in large quantities to be laid up as winter stock. When deposited in cellars, they keep for a length of time.

Fish is here a very common article of consumption. The sterlet is one of the most esteemed kinds of fish, and is consequently the dearest. Of these about twenty-five thousand are every year brought alive to St. Petersburg from the Volga; which river moreover sends upwards of a million of sizeable fish of various other kinds. The town is supplied with the ordinary sorts of live fish from the Ladoga lake. Frozen, salted, and dried, fish are mostly the food of the lower classes. The Neva abounds with salmon, which however is inferior in point of flavour to those of Riga. Cray-fish are also caught in the Neva; besides which the Volga furnishes annually about a million. Vegetables are the sole article of consumption which the city obtains for the most part from its environs. The culture of the kitchen-garden is here brought to such perfection, that the most delicate exotics of this kind are to be had at every season of the year, and of uncommon excellence. Several of these, such as cauliflowers, asparagus, &c. are very common, and not dear. Sour cabbage, which the Russians call *schtschi*, the salutary antiscorbutic virtues of which have procured it a welcome reception also in other countries under the name of *four crout*, is a daily dish of the common people; it is even served up at great tables as a national delicacy. Salted cucumbers are eaten in equal abundance, and are extremely cheap. The fruit reared in the orchards and forcing-houses in and about St. Petersburg, is not nearly adequate to the demands of taste and luxury. Fruit of the country comes from the Ukraine, and from the regions of the Volga and the Occa; foreign fruit, especially apples, from Rostock and Stettin, to the amount of about a hundred thousand rubles annually. The first ships that arrive here in the spring import oranges of both kinds, and lemons in such abundance, that the sale of these goods often scarcely pays the freight. A chest containing four hundred lemons is usually to be had, at that season, for two or three rubles. Of the ordinary liquors, *quas* is an acidulous, cooling, and wholesome, beverage, peculiarly national, and is offered for sale at the

corners of all the streets. In summer it is customary to cool it with ice. The juice of the cranberry yields an excellent and refreshing liquor, in very frequent use under the appellation of *klukva*. By a mixture of *klukva*, it is by no means uncommon not only to improve the quass and other drinks, but it is used, even in good houses, for making punch, when lemons are at a high price, or not to be had. *Sbitten* is prepared of honey and pepper boiled in water, and hawked about the town by people who make it their trade, and are therefore called *sbittenshiks*. In the public houses may be had beer, mead, and brandy. Among the more delicious sorts of national liquors, the *vishnefca* and *malinfca* must not be forgot, a sort of wine made from cherry-juice put into fermentation by sugar and brandy; *kisljshih*, a species of quass of a superior quality, and several others. Their consumption, however, falls very short, when compared with that of foreign liquors. Wine, porter, and ale, are in general use. Of the first, upwards of 250,000 hogheads are imported every year, and of the two last to an amount exceeding 260,000 rubles, the greater part of which is here consumed. The wood for firing produced in the circumjacent district is not sufficient for the prodigious demand of this city; about 150,000 fathoms, mostly of birch, being annually brought in from other parts of the country.

No capital, except London, is perhaps so well supplied with water as this city. The Neva, with its numerous branches and canals, conveys it through every part of the town; so that no family can have far to fetch it. Sometimes indeed they have too much of it; for the Neva is apt to overflow, and inundate the city in a very distressing manner. On the 9th of September, in the evening, while Mr. Coxe was at Petersburg, a violent storm of wind blowing at first south-west and afterwards west, raised the Neva and its various branches to so great a height, that at five in the morning the waters poured over the town, but more particularly the Vassili Ostrof and the Island of St. Petersburg. The torrent rose in several streets to the depth of four feet and a half, and overturned, by its rapidity, various buildings and bridges. About seven, the wind shifting to north-west, the flood fell as suddenly; and at mid-day most of the streets, which in the morning could only be passed in boats, became dry. For a short time, the river rose ten feet seven inches above its ordinary level.

Mr. Kraft, professor of experimental philosophy to the Imperial Academy of Sciences, has written a judicious treatise upon the inundation of the Neva, from which the following observations were extracted by Mr. Coxe: "These floods are less alarming than formerly, as the swelling of the river to about six feet above its usual level, which used to overflow the whole town, has no longer any effect, excepting upon the lower parts of Petersburg; a circumstance owing to the gradual raising of the ground by buildings and other causes. Upon tracing the principal inundations, the professor informs us that the most ancient, of which there is any tradition, happened in 1691, and is mentioned by Weber, from the account of some fishermen inhabiting near Nieschauts, a Swedish redoubt upon the Neva, about three miles from the present fortress of Petersburg. At that period the waters usually rose every five years; and the inhabitants of that district no sooner perceived the particular storms which they had been taught by fatal experience to consider as forerunners of a flood, than they took their hovels to pieces, and, joining the timbers together in the form of rafts, fastened them to the summits of the highest trees, and repaired to the mountain of Duderof, which is distant six miles from their place of abode, where they waited till the waters subsided. The circumstances most liable to promote the overflowings of the Neva, are when, at the autumnal equinox, three or four days before or after the full or new moon, that luminary being near her perigæum, a violent north-west wind drives the waters of the Northern Ocean, during the influx of the tide, into

the Baltic, and is accompanied or instantaneously succeeded by a south-west wind in that sea and the gulf of Finland. All these circumstances concurred at the inundation of 1777: it happened two days before the autumnal equinox, four before the full moon, two after her passing through the perigæum, and by a storm at south-west, which was preceded by strong west winds in the northern ocean, and strong north winds at the mouth of the Baltic." See *Remarques sur les Débordemens de la Néva à St. Petersbourg, accompagnées d'une Carte représentant la Crue et la Diminution des Eaux, &c.* in Nov. Act. Pet. for 1777.

The benediction of the waters of the Neva, is a very interesting ceremony which takes place annually at Petersburg. The late celebrated Dr. Clarke was present at this spectacle; and in the last volume of his *Travels*, just published, he had described it in the following terms. "The benediction of the waters of the Neva, takes place on the 6th of January (Old Style), and was formerly celebrated with great splendour and magnificence, on the river. At present, a small temple, of an octagon form, made of wood, painted and adorned with crosses and pictures, representing parts of the history of John the Baptist, is erected on the Admiralty Canal: an inclosure is formed around it, and within is a hole cut in the ice. A platform, covered with scarlet cloth, leads from the palace to the temple; along which the procession advances, consisting of the archbishop, accompanied by bishops and dignitaries of the church, the imperial family, and persons attached to the court. Having arrived at the temple, different prayers are recited; after which, the archbishop descends a ladder placed within the octagon building, and dips the cross thrice in the water; the benediction being pronounced at the same time. Some of the water is then taken up in a vessel, and sprinkled on the surrounding spectators. The military with their standards, the religious orders in their different dresses, the presence of the imperial family, and the crowds of people assembled together, form a very striking scene. The last occasion on which Peter the Great appeared in public, was at the celebration of this ceremony. He was previously indisposed; a severe cold attacked him on the day of the benediction of the waters, increased his disorder, and in a short time brought on his death. At the celebration of a ceremony of the same kind, which was instituted in the early period of the empire, at Moscow, an image of the Holy Virgin was plunged into the river; the water was blessed by the patriarch, and the tsar, and the persons of the court who were present, were sprinkled with it."

The inhabitants of this large city, besides Russians, consist of all nations; so that a person hears a great variety of languages, and sees an infinite diversity of fashions and customs, at St. Petersburg. The splendour of the court is imitated by the inhabitants in general; though every thing belonging to apparel, and especially if made by foreign artificers, is very dear; and likewise furniture, and houses in an eligible situation, bear sometimes an extravagant price. The police is well regulated, and liberty of conscience is enjoyed to its utmost extent.

Peter the Great has been much censured for transferring the seat of the empire from Moscow to St. Petersburg; the former of which lay nearer to the centre of his dominions. But these objections will have little weight with those who consider the consequences of the removal. The new city is nearer than Moscow was to the more civilized parts of Europe; and from an intercourse with them the manners of the Russians have been improved, and the nobility in particular have lost much of their feudal importance. Above all, the grand object of Peter, that of having a formidable navy in the Baltic, has certainly been obtained; and the emperor of Russia is now the arbiter of the north, and, in some degree, the mediator of all Europe. In short, the erection of St. Petersburg was perhaps one of the best acts of Peter's reign, and has

in its consequences been the most beneficial. Indeed it is at least probable, that, if through any revolution the seat of government should be again transferred to Moscow, we should nowhere see the traces of those memorable improvements, which the passing century has given birth to, but in the annals of history; and Russia would again, in all probability, relapse into her original barbarism.

The chief publications consulted in this article are—Tooke's Translations from MM. Falconet and Diderot, particularly on the celebrated Statue of Peter the Great, now finishing by the former at Petersburg, with a Plate of the Statue; 1777. Coxe's Travels in Poland, Russia, &c. 1784. Clarke's Travels, 1823. Gent. Mag. 1775, 1777, 1782, 1783. Monthly Review for 1784. Times, Apr. 3, 1823.

PE'TERSBURG, a town of Westphalia, in the bishoprick of Osnabruck: one mile south of Osnabruck.

PE'TERSBURG, a post-town of Virginia, of considerable trade, in Dinwiddie county, on the south-east bank of Appamatox river, twenty-five miles south of Richmond. It contains about 400 houses, irregularly built, an episcopal church, a court-house, and a gaol. The Freemasons' hall is a handsome building. Here are several tobacco-warehouses, stores of dry goods, and some few neat and commodious dwelling-houses. In 1790 it contained 2828 inhabitants, including 1265 slaves. Its situation is rather low and unhealthy. The whole exports of this town, valued at the usual peace-prices, amount to 1,389,300 dollars, besides the value of peach and apple brandy, whiskey, &c. It is 80 miles west by north from Norfolk. Like Richmond, Williamsburgh, Alexandria, and Norfolk, it is a corporation; and, what is singular, Petersburg city comprehends part of three counties. The celebrated Indian queen, Pocahontas, from whom descended the Randolph and Bowling families, formerly resided at this place. In July 1815, a dreadful fire took place here, which consumed 300 houses, destroying two-thirds of the town, the office of discount, deposit, tobacco-warehouse, and its contents. Many lives were lost, owing to several houses being blown up. Lat. 37. 14. N. lon. 78. 8. W.

PE'TERSBURG, a very flourishing post-town of Georgia, in Elbert county, in a pleasant and salubrious situation, on the point of land formed by the confluence of Broad river with the Savannah. Several respectable merchants have settled in this town: twenty miles north by east from Washington. It contains, together with the county and Elberton-town, 12,156 inhabitants; the slaves of the county being 4291, those of the town 225, and those of Elberton 58. Lat. 33. 46. N. lon. 81. 32. W.

PE'TERSBURG, a town of the state of Kentucky, on the river Kentucky: twelve miles south-east of Frankfort. Lat. 37. 52. N. lon. 85. 4. W.

PE'TERSBURG, a township of America, in New York, in Rensselaer county, east of the village of Troy, incorporated in 1793, and containing 4322 inhabitants.—A post-town of Pennsylvania, in York-county, two miles north of the Maryland line; containing a Roman Catholic church, and about eighty houses: twenty-five miles north-west of Yorktown.—A town of Pennsylvania, in Huntingdon-county, with 194 inhabitants.

PE'TERSDORF, a town of Prussia, in the province of Siamland: twenty-four miles east of Königberg.

PE'TERSDORF, or PETRAMSTORFF. See BERCHTHOLDSORFF, vol. ii.

PE'TERSFIELD, a borough-town, in the county of Southampton, or Hampshire: fifty-five miles south-west from London. Though but a chapelry to the parish of Buriton, Petersfield is a market and borough town of considerable antiquity. Its first charter of incorporation was granted by queen Elizabeth, who vested its government in a mayor and commonalty, and empowered them to return two members to parliament; but two returns

had been previously made, one in the thirty-fifth of Edward I. the other in the time of Edward VI.

The right of election, as determined by the house of commons in 1727, is "in the freeholders of lands, or ancient dwelling-houses or shambles, or dwelling-houses or shambles built upon ancient foundations, within the said borough." The right has been more clearly stated by a committee of the house of commons, May 29, 1821, to belong to "the burgesses, and the freeholders of lands, houses, and tenements, within the borough." It signifies little, however, in what manner the right is expressed, as the whole property of the borough is in the hands of Hylton Jolliffe, esq. lord of the manor; and the titular mayor, who is the returning officer, is appointed by him at his court-leet. This gentleman, therefore, appoints the returning officer, and names both the members: he has named himself for one; sir Philip Musgrave, bart. is the other. The dwelling-houses and shambles give the right of voting, not to the occupiers or proprietors, but to the individual who has purchased the freeholds of those places, and conveys a few of them on the day of election to his servants or dependents, who thereby become voters for the day, and return the person they are directed. The members are never seen in this borough, nor known to any person connected with it, except the proprietor. There are thirty-six of these close or nominal boroughs in England, which send seventy-two members to the imperial parliament, some of them destitute of a single house or inhabitant: their establishments all existing in fiction. The borough itself, like Old Sarum, is a fiction, there existing no such place but by name. The electors in all these boroughs are fictitious named upon parchment for the day. The returning officer is also a fictitious character, called a bailiff, steward, portreve, or titular mayor, having no office, function, or power, but that of setting his name to the instrument which concludes these fictitious proceedings. These burgage-tenure boroughs are a greater abomination than even the corporation boroughs; for *there*, there are a certain number of individuals with an efficient officer at their head; but *here*, every thing is nominal except the members.

The regular place of worship is a chapel of ease, and near it stands an equestrian statue of William III. erected by William Jolliffe, esq. with an inscription on the pedestal. The passage of travellers from London to Portsmouth, forms the principal support of Petersfield. It has a market on Saturday; and two annual fairs, July 10 and December 11. The petty sessions are holden here. The number of houses is stated to be 192, of inhabitants 1159. But this town, which if it has not been going to decay, has experienced no improvement for some time past, is now, we are told, once more rearing its head, by the removing of nuisances, the repairing of houses, and the building of new ones; and it is confidently anticipated that, when the bridge and causeway between Havant and Hayling-island are finished, Petersfield will once more become a flourishing town. It was formerly a very considerable manufacturing place for woollen-cloths, at which upwards of a thousand persons were employed.

Mapledurham, about two miles south of Petersfield, was some time the seat and residence of the historian Edward Gibbon, esq. At Butser-hill, a short distance from Mapledurham, Aubrey places a considerable encampment.

A few miles to the west of Petersfield are the villages of East and West Meon, mentioned in the *Domesday-book* as the property of the bishop of Winchester, and then known by the general name of *Menes*. In the church at East Meon is a very ancient font, bearing an exact resemblance to that in Winchester cathedral, and most probably the work of the same artist, and given by the same bishop. The upper part, or basin, is placed on a circular shaft of three large single stones, and its corners

are

are supported on circular pillars without bases, and having capitals of plain upright leaves.

Six miles north-east from Petersfield, but a little out of the road, and in Suffex, is *Milland-house*, (now the residence of the Rev. John Coles,) which was for several years the seat of JOHN WILKES, esq. the original author and publisher of this work, and where the first ten volumes of it were almost wholly written. This gentleman died at Milland, on the 31st of March, 1810. For twenty years he had a warehouse in Ave-Maria-lane, London; but never published any works except those of his own writing or compiling; among which we may mention, 2. The British Directory, 5 vols. 8vo. containing a history of almost every town and village in England, with a list of the gentry and principal tradesmen. 3. Britanic Magazine, 13 vols. 4. Zoologic Magazine, 5 vols. 5. History of the Wars of England, 8 vols. 6. History of France, 4 vols. 7. Natural History, 14 vols. with 300 very handsome engravings.

PETERSHAGEN (formerly HOCKLEVE), a town of Westphalia, in the county of Minden, and once the residence of the bishop of Minden.

PETERSHAGEN, a town of Hinder Pomerania: twelve miles south-west of Corlin.

PETERSHAM, a pleasant post-town of America, in Worcester county, Massachusetts, formerly called by the Indians "Nichewang;" twenty-eight miles north-west of Worcester. It is traversed by Swift-river, a branch of Chickapee-river. The soil is rich, and here are large and excellent orchards; it contains 1490 inhabitants.

PETERSHAM, in Surrey. See vol. xi. p. 750.

PETERSHAUSEN, a princely Benedictine abbey near Constance, on a branch of the lake, late under the protection of the house of Austria; founded in the year 980. In 1802 it was, with the diocese of Constance, given as an indemnity to the margrave of Baden.

PETERSKIRCHEN, a town of Austria: five miles north of Sonneberg.

PETERSON (Joseph), was an actor long attached to the Norwich company, and of great versatility of talent. He looked the perfect gentleman on the stage, fenced and danced elegantly, excelled in the parts of Sciolto (Fair Penitent), and Sir Charles Raymond (Foundling), and was also a very good harlequin. He made his debut (as Lord Foppington) at Goodman's Fields theatre, under Mr. Giffard; and played the part of Buckingham when Mr. Garrick made his *entrée* in Richard the Third. His end was somewhat remarkable. In October 1758, he was performing the Duke in Measure for Measure, which he played in a masterly style. Mr. Moody was the Claudio; and in the third act, where (as the Friar) he was preparing Claudio for execution the next morning, at these words—

Reason thus with life:

If I do lose thee, I do lose a thing!

That none but fools would keep: a breath thou art—

he dropped into Mr. Moody's arms, and never spoke more!

He was in private life a gentlemanly, affable, and good-natured, man, and much beloved. He was interred at Bury, in Suffolk; and on his grave-stone are the words of his final exit. Mr. Peterson wrote one drama, entitled, the Rarer Show, or the Fox trap, an opera; printed at York in 1739. *Biographia Dramatica*.

PETERSTHAL (St.), a town of Germany, in the circle of the Upper Rhine: six miles south of Oppenau.

PETERSWALD, a town of Bohemia, in the circle of Leitmeritz: eighteen miles north-north-west of Leitmeritz.

PETERSWALDAU, a town of Silesia, in the principality of Schweidnitz: nine miles south of Schweidnitz.

PETERWARDEIN, a fortress of Hungary, on the north side of the Danube, opposite Peterwardein in Slavonia.

PETERWARDEIN, a town of Slavonia, on the Danube, strongly fortified. It is chiefly remarkable for the glorious victory obtained near it over the Turks, in the year 1716, by prince Eugene. It is 216 miles south-south-east of Vienna, and thirty-eight north-west of Belgrade. Lat. 45. 26. N. lon. 19. 37. E.

PETESIA, *f.* [derivation unknown.] In botany, a genus of the class tetrandria, order monogyna, natural order of rubiaceæ, *Juss.* Generic Characters—Calyx: perianthium one-leaved, bell-shaped, superior; with the mouth toothed. Corolla: one petalled, funnel-form: tube cylindrical, longer than the calyx: border four-parted; lobes rounded, blunt. Stamina: filaments four, awl-shaped, the length of the tube. Antheræ somewhat oblong. Pistillum: germ inferior; style filiform; stigma bifid, acute. Pericarpium: berry globular, crowned, two-celled. Seeds very many, roundish.—*Essential Character.* Corolla: one-petalled, funnel-form; stigma bifid; berry many-seeded.

1. *Petesia stipularis*: leaves lanceolate-ovate, tomentose underneath; flowers in lateral thyrses. This is a shrub. Leaves opposite, quite entire, two inches long. Racemes axillary; brachiate, shorter than the leaf. Native of Jamaica. According to Swartz, it is allied to *Rondeletia*, and should be referred to the class pentandria, as appears from Browne's figure and description.

2. *Petesia carnea*: leaves oblong-lanceolate, even; flowers in terminating trifid cymes. Native of the island of Namoka, in the great Southern Ocean.

3. *Petesia tomentosa*: leaves oblong, tomentose on both sides. Native of the woods about Carthagena in New Spain. Leaves three inches long.

4. *Petesia lygistum*. See MANETTIA.

5. *Petesia villosa*: leaves ovate, somewhat villous; stipules tipped with a bristle. Gathered by Mr. Browne along with the first species.

Loureiro has two other species, natives of Cochinchina, which he names *simplicissima* and *trifida*. Swartz's *P. spicata*, (Ind. Occ. 1945.) having numerous seeds and a cloven stigma, cannot belong to this genus.

PETESIOIDES. See WALLENTIA.

PETEUS, a son of Orneus, and grandson of Erechtheus. He reigned in Attica, and became father of Mnestheus, who went with the Greeks to the Trojan war. He is represented by some of the ancients as a monster, half a man and half a beast.

PETHER (Abraham), an ingenious and self-taught artist, born in the year 1756. Of his early life we know nothing; but the latter part of it he spent at Southampton, where a lingering disease, which had confined him during the space of three years under the most calamitous sufferings, terminated his existence, at the age of 56, April 13, 1812. Few men ever attempted, and at the same time attained perfection in, so many branches of science. As a landscape-painter, his abilities were striking, particularly in effects of fire and moon-light. The peculiar softness of his distances, and the brilliancy of his afternoon-scenes, conferred on him the appellation of the British Claude. He had a thorough knowledge of music, and at the age of nine years performed the organist's duty at Chichester cathedral. His philosophical and mathematical researches deserve every praise: he was an admirable mechanic, and had constructed telescopes, microscopes, and almost every instrument relative to science, upon the most improved principle. With an ardent pursuit after knowledge, he possessed such a happy and contented disposition, and was so unassuming and affable, that his company was courted by all classes. *Hampshire Chronicle*.

PETHERTON (North), a town in the hundred of North Petherton, in Somersetshire, 144 miles west by south from London. The town consists chiefly of one street, which is built along the road from Bridgewater to Taunton, and contains many good houses. It was formerly called *Pedredan*, or *Pedred's-town*, from its situation

ation on the river Pedred, now written Parret. It was formerly in the possession of the Saxon kings, and of such consequence, that it never was assessed to the Danegeld, nor rated to any other subsidy. The parish is extensive; and contains several hamlets. The church is dedicated to St. Mary, and is a large handsome structure, consisting of a nave, chancel, and side-aisles. At the west end is an embattled tower, richly embellished with sculpture, and open ornaments towards the summit. The pinnacles are particularly light and elegant. The market is on Saturday, and there was formerly a large market-place for corn. Here is one annual fair. By the census of 1801, the number of inhabitants was 2346; by that of 1811, the number of houses was 546, and of the inhabitants 2615.

Within the parish are several places, of little note now, but which at former periods have been the residence of great and eminent families. Mansel, or Maunsel, is the seat of John Slade, esq. the possessor of the manor and hundred of North Petherton. This estate had been the inheritance of the family of the Maunsels for many generations.

PETH'ERTON (South), a town in the hundred of South Petherton, Somersetshire, 137 miles from London, six from Ilminster, and (according to Wilkes's British Directory) above twelve miles south-east from North Petherton. It is the first considerable parish which the river Parret traverses in its way to the sea. It passes here under a stone bridge of three arches, a mile southward of the parish-church, at the intersection of the Roman fosse-road, coming from Ilchester. The bridge was formerly of wood, which having become ruinous, two children were drowned in the river near it; the parents of the children rebuilt it of stone, and caused their infant effigies to be placed thereon, to commemorate the circumstance. In a field near this bridge a large quantity of Roman coins, to the amount of six pecks, was dug up about the year 1720; and near Jailer's-mill, in the tithing of Southarp, a little below the surface of the ground, are the remains of Roman buildings, which the common people, from the name, suppose to be the foundation of an old prison. In this spot, also, coins, fragments of urns, pateræ, and pieces of terras, have been discovered. It is undisputed that South Petherton and its vicinity were known to, and occupied by, the Roman people, as it lies so near to one of their principal roads, and as their reliques have here been so frequently discovered. At Watergore, a small hamlet southward of the town, a Roman pavement was discovered in 1673; and Wigborough, not far distant, is supposed to have been a Roman town, not only from its name, but from the extensive foundations of buildings which have been traced there.

When that people relinquished this country, South Petherton became the possession and seat of the Saxon kings of Wessex. King Ina had a palace here, which was long ago destroyed; there is, however, an old house near the church, with ancient windows, and armorial shields, which bear that prince's name, but it is unquestionably the erection of more modern times. King Athelstan is reported to have occupied this place, which was thought an object of importance by all his successors, till after the Norman conquest. The parish-church stands on a little eminence near the centre of the town, and is dedicated to St. Peter and St. Paul. It is a large structure, built in the form of a cross; having two side-aisles, and a north and south transept, with an octangular tower at their intersection, crowned with a spire. Behind the altar is a vestry-room, which was formerly a confessional: many of the monuments, with the organ, were spoiled in the civil wars. The parish is divided into four tithings. A market is held here on Thursday, and there was formerly a large market-hall and cross, both which, with several houses, were destroyed in the last century. The annual fair is on the 5th of July, for bullocks, lambs, sheep, and

wool. A considerable manufacture of dowlas is carried on here. By the census of 1801, the number of inhabitants was 1674; in 1811, the parish contained 352 houses, and a population of 1867 inhabitants.

Crewkherne, five miles distant, is the nearest post-town; and Bridport, eighteen miles, the nearest sea-port.—The village or hamlet of Watergore is adjoining to South Petherton; Over Straton, just at the town's end; Lower Straton, one mile distant; Lopen, two miles; Hinton St. George, where earl Powlet has a seat, three; Dillington-house, seat of the earl of Guilford, four.—Norton under Hambden-hill, two miles from Petherton, and three from Crewkherne, is a royalty of 133l. a-year, and has large quarries of free-stone, (as good for use as Purbeck stone,) as well as of tile-stone, &c. *Collinson's Hist. Somersetshire*, vol. iii. *Wilkes's British Directory*, vol. iv. *England's Gazetteer*.

PE'THOR, in scripture-geography, the native place of Balaam, situated in Mesopotamia, about the east bank of the Euphrates, and not far from Thapsacus. *Num.* xxii. 5.

PETIC'ULÆ, *f.* The same as *petechiæ*, purple spots appearing on the flesh in malignant fevers.

PETIGLIANO, a town of Etruria: fifty miles south-east of Sienna, and twenty-seven north-east of Orbitello.

PETIL'IA, in ancient geography, now *Strongoli*, a town of Magna Græcia, the capital of Lucania, built or perhaps only repaired by Philoctetes, who, after his return from the Trojan war, left his country Melibœa, because his subjects had revolted. See *STRONGOLI*.

PETIL'IUM, *f.* in botany, a name given by Linnæus, in the first edition of his *Genera Plantarum*, to the crown imperial, which he at that time considered as a distinct genus from *FRITILLARIA*; see that article.

PETIMBUA'BA, *f.* in ichthyology. See *FISTULA tabacaria*, vol. vii.

PE'TIN, a small island in the Eastern Indian Sea. *Lat.* 2. 20. *S. lon.* 99. 27. E.

PETINA (La), a town of Naples, in Principato Citra: six miles south-west of Cagiano.

PETIOLE, *f.* in botany, the footstalk, or leafstalk; the stalk supporting a leaf.

PETIOLULE, *f.* A partial petiole, connecting the leaflet of a compound leaf with the main petiole. *Turton*.

PE'TIS DE LA CROIX (Francis), a learned French orientalist, born in 1654, was the son of the king's interpreter for the oriental languages, and received an education to qualify him for the same employment. At the early age of sixteen, he was sent by the minister Colbert to reside in the East. He passed several years at Aleppo, visited Ispahan and Constantinople, and employed himself in the most diligent study of oriental literature. He returned to Paris in 1680, and in two years afterwards he was sent to Morocco, as secretary under M. de Saint-Amand, to Muley Ishmael, king of that country. He pronounced before that sovereign the ambassador's harangue in Arabic, with an elegance and purity which excited the admiration of the whole court. In the two following years he accompanied the French armament against Algiers, in quality of secretary-interpreter of the marine, and was employed to translate into the Turkish language the treaty of peace in 1684. He performed the same office with respect to the negotiations with Tunis and Tripoli. When the latter power was engaged to pay the king of France the sum of 600,000 livres, by way of reimbursement, a considerable bribe was offered to Petis de la Croix, to put in the treaty crowns of Tripoli instead of French crowns, which would have made the difference of 100,000 livres; but his fidelity to his sovereign was incorruptible. In 1687 he was employed at Morocco under the duke de Mortemar; and, in short, it was through his intervention that all the affairs between the French ministry and the eastern courts were transacted, from the year 1680 to the time of his death. In 1692 he was appointed to the professorship of Arabic in the college

royal, and the survivorship of his father's office of oriental interpreter was conferred upon him. From this period he never left the kingdom, but employed himself in translations from the eastern languages, of which he was acquainted with the Arabic, Turkish, Persian, Tartarian, Ethiopic, and Armenian. He died at Paris in 1713. His principal publications are, 1. The Oriental Library of Hadji Calfa. 2. The History of all the Mahometan Monarchies, (from the Turkish.) 3. General State of the Ottoman Empire, from the foundation to the present time, with abridged lives of the emperors; (from the Turkish.) 4. The History of Gengis Khan, and The History of Timur-Bec, (from the Persian.) 5. The Thousand and One Days, (from the Persian;) besides other tracts, geographical and descriptive, and some grammars, dictionaries, &c. *Gen. Biog.*

PETISTAGUIT, a river of Canada, which runs into the river St. Laurence in lat. 50. N. lon. 66. 26. W.

PETIT, *adj.* [French.] Small; little; inconsiderable. —Do but view what *petite* things swell men up; the stage never presented the pride of a constable so really, as it is frequently to be found in men under that burdensome honour! I dare say Solomon, nay kings at this day, hold their scepters with more humility, than those small officers their staves! *Whitlock's Mann. of the Eng.*—By what small *petit* hints does the mind catch hold of, and recover, a vanishing notion! *South's Serm.*

PETIT (Samuel), a French Protestant divine, was born in the year 1594. He was the son of a respectable minister at Nîmes in Languedoc, from whom he received the elements of an excellent education. While a child, he discovered a powerful inclination for learning, and astonished the masters under whose tuition he was placed, by the rapidity with which he became a proficient in the Greek and Latin languages. Having laid a good foundation of grammar-learning, he continued to extend his acquaintance with the ancient languages, and afterward to applied his attention to rhetoric and philosophy. Being intended for the ministry, he spent three years at Geneva in attending the divinity-lectures of Diodati, and those of the other learned professors of that celebrated school. At the same time he applied himself to the study of the oriental tongues. The zeal with which he applied to learning is almost incredible: for a whole year he allowed himself rest only on each alternate night, the others being devoted to study. Such was his progress, that at the age of seventeen he was admitted to the ministry. Almost immediately after this, he was chosen to fill the chair of professor of divinity in the academy of Nîmes, to which was added the professorship of the Greek and Hebrew languages. These posts he retained with very high reputation during the remainder of his life; while he pursued his various learned studies with uncommon diligence. He was likewise eminent as a preacher, and devoted much of his time to the charitable duties of visiting the sick. To the deep regret of all who knew him, and to the loss of the learned world, he died in 1643, when he was only in the 49th year of his age.

He was a man of vast and profound erudition, and particularly excelled in his acquaintance with ecclesiastical antiquities. To the languages already mentioned, in which he was an adept, we ought to add, that he acquired an intimate knowledge of the Coptic. His learning, however, was accompanied with modesty and humility; and he is said to have exhibited a bright and amiable pattern of unaffected piety, and of all the moral virtues. His temper was uncommonly placid, as may be concluded from the following anecdote which is told of him. Having one day entered a Jewish synagogue at Avignon, accompanied by some friends, he heard one of the rabbis uttering the grossest abuse and invectives against them, but in the Hebrew language, which the Jew did not imagine that any of them understood. But, when he heard M. Petit mildly remonstrating with him, in that tongue, on the incivility and malignity which he discovered, he

was thrown into the utmost confusion, and in the most suppliant manner entreated forgiveness. This our author readily granted, and took no other revenge on the rabbi, than by exhorting him, in pure and elegant Hebrew, to renounce Judaism and embrace Christianity. Petit was the author of numerous works, for a list of which we refer to the General Biography. He also left behind him in manuscript, two large volumes of Notes upon Josephus, which, though imperfect, were purchased by lord Clarendon, it is said, for a hundred and fifty louis-d'ors, and presented to the university of Oxford, where they were deposited in the Bodleian Library. In that place they were consulted by our countryman Hudson, when he was preparing his valuable edition of the Jewish historian; and he acknowledged his obligations to them in his general preface.

PETIT (Peter), a celebrated French mathematician and natural philosopher, was born in the year 1598. He cultivated from a very early period the study of the mathematics and physics, in which he made considerable progress, and which recommended him to the acquaintance of M. Pascal. His father was comptroller of the elections in the district in which he lived, an office to which he succeeded, but which, in 1633, he sold, and removed to Paris. Here he distinguished himself by his writings, and became intimate with the most eminent men of his time. On several occasions he was employed by cardinal Richelieu, who gave him a commission to visit the sea-ports, with the title of engineer and geographer to the king. He was afterwards sent into Italy by his majesty, on special affairs. After his return, he became a convert to the principles of Des Cartes. About the year 1640, he received the appointment of intendant of the fortifications of France. During a part of the year 1645 and 7, he was stationed at Rouen, where, in conjunction with M. Pascal, he went through the same experiments on the subject of a vacuum, which Torricelli had made before in Italy. From this time there are no farther particulars relating to the life of M. Petit, though he lived to the year 1677, when he was about 79 years of age. He is described as having excelled particularly in astronomy, and as having a singular passion for experimental philosophy. He was author of many treatises on mathematical, physical, and astronomical, subjects, of which a long list is given in the *Gen. Biog.*

PETIT (Peter), a learned physician, was born at Paris in the year 1617, and obtained the degree of doctor in the university of Montpellier, and of bachelor of medicine in that of Paris. He was also elected a member of the academy of Padua. Although he had acquired an extensive acquaintance with the medical science in the course of the studies by which those degrees were obtained, yet the bias of his mind was not so much directed to the practice of the profession as to philosophical and literary pursuits, and especially to the study of history, and to the cultivation of Latin poetry. It was by the excellence of his poems that he obtained the honour of admission into the Paduan academy; and the same merit occasioned him to be ranked as one of the Pleiades of Paris, an appellation given to a party of seven of the most accomplished Latin poets of that capital. A collection of his poems was published in 1683, dedicated to M. Nicolai, president of the chamber of accounts, and prefaced by a curious dissertation on the mania of poetry. His poem of "Codrus," and that entitled "Cynomagie," are much praised for the elevated sentiments, the elegance of expression, and the strength and harmony of the verse, which they exhibit. One of his poems was on the subject of tea, and was printed at Leipzig, in 1685, with the title of "Thée, five de Sinensi Herba Thé," with an epigram of Nicholas Pechlin respecting this herb, and the descriptions of several other authors. The writings of Petit, however, were not limited to poetical essays; he was the author of several curious tracts, of which the following are the titles. 3. De Motu Animalium Spontaneo, Par. 1660, in which

which he defended Aristotle against Descartes. 4. De Lacrymis, Libri tres, 1661, 12mo. 5. Exercitationum de Ignis et Lucis Natura Defensio, 1664, 4to. 6. Dissertatio de novâ Renati Cartesii Philosophia, 1670, 8vo. 7. Miscellanearum Observationum, Libri quatuor, 1682, 8vo. 8. De Amazonibus Dissertatio, 1685, 12mo. 9. De Sybilla, Libri tres; Lipsi. 1686, 8vo. 10. De Natura et Moribus Anthropophagorum; Traj. 1688, 8vo. 11. Homerî Nepenthes; five, de Helenæ Medicamento luctum avolente Dissertatio, ibid. 1689, 8vo. 12. Commentarii in tres priores Aretæi Cappadocis Libros, Lond. 1726. 13. Traité de la Nourriture qui peut se tirer de l'Eau. *Eloy Dict. de la Med.*

PETIT (Francis), a distinguished physician, who is better known by this name than by that of *Pourfour du Petit*, was born at Paris on the 24th of June, 1664; and lost his parents, who were engaged in trade, during his childhood. He is said to have been slow of apprehension, and weak in memory, when a boy; so that, though he laboured much at school, his progress was extremely slow, until his mind was interested, and his faculties called forth, by the philosophy of Descartes, which his tutor put into his hands. That subject became the leading object of his pursuits; and he began his travels early, with the view of increasing his knowledge. At Rochelle he became intimate with M. Blondin, who had a valuable library, a garden of medicinal plants, and a museum of natural curiosities, and who instructed him in anatomy, and recommended him to study medicine. He adopted this counsel, and in 1687 repaired to Montpellier, where he graduated, and returned to Paris in 1690. Here he studied anatomy under du Verney, botany with Tournefort, and chemistry with Lemery; and obtained the friendship of these celebrated men. After three years of study, and attendance on the hospital of La Charité, he became attached to the army; and, in his superintendance of the hospitals at Mons, Namur, and Dinant, he obtained considerable distinction, and established in them dissecting rooms and chemical laboratories, and directed the studies of the pupils in botany. After the peace of Ryſwick, in 1697, he returned to Paris: but the war of the Spanish succession called him again to the military hospitals, and it was not till the peace of Utrecht took place, in 1713, that he settled in Paris. In 1722 he was elected a member of the Academy of Sciences; and three years afterwards he was appointed pensionary anatomist, on the superannuation of M. du Verney. His reputation obtained for him this honourable appointment, and he was now extensively employed in the practice of his profession. He was particularly successful in the treatment of diseases of the eye, which he illustrated by various models, and remedied by improving the instruments and operations of his predecessors, in relation to this delicate organ.

This ingenious man died at Paris on the 18th of June, 1741, aged 77. He left several works behind him, besides the papers which he communicated to the academy. They were written in a negligent style; for the constant occupation of his time in observation and experiment rendered him careless about the turn of his phrases. His works are; 1. *Trois Lettres d'un Medecin des Hospitaux du Roi à un autre Medecin de ses Amis, sur un Nouveau Systeme du Cerveau*; Namur, 1710, 4to. 2. *Dissertation sur une Nouvelle Methode de faire l'Operation de la Cataracte*; Par. 1727, 12mo. 3. *Lettre dans laquelle il est démontré que la Crytallin est fort près de l'Uvée, et où l'on rapporte de nouvelles preuves de l'Operation de la Cataracte*; 1729, 4to. 4. *Lettres contenant des Reflexions sur ce que M. Hecquet, M.D. a fait imprimer touchant les Maladies des Yeux*, 1729, 4to. 5. *Lettres contenant des Reflexions sur les Decouvertes faites sur les Yeux*, 1732, 4to. He invented an *ophthalmometer*, to measure exactly all the parts of the eye, and direct the course of the needle in the operation, and also other machines to illustrate his doctrines and assist the operator. Some of

his essays, printed in the *Mem. de l'Acad. des Sciences*, related to the comparative anatomy of the eye, which he examined in various animals with great nicety of dissection. *Gen. Biog.*

PETIT (John Louis), a celebrated surgeon, was born of a respectable family at Paris, on the 13th of March, 1674. From his childhood he displayed an acuteness and penetration beyond his years, which gained him the attachment of M. de Littre, a celebrated anatomist, who resided in his father's house. This kindness of M. de Littre, and his own curiosity, sometimes attracted the boy to the dissecting-room of the former, where he soon evinced an interest in anatomical pursuits. This able anatomist did not fail to cultivate this inclination; and from the age of seven years, his young pupil regularly attended at his demonstrations; and made such rapid progress, that he had scarcely attained the age of twelve, when M. de Littre confided to him the superintendance of his anatomical theatre. He afterwards studied surgery under Castel and Marechal, and was admitted master at Paris in 1700. He was born, it has been said, for the art which he practised; and would have created surgery, if it had been previously unknown. He became the first practitioner, and, as it were, the oracle, of surgery in Paris; he was consulted in all cases of importance; and there were few operations of difficulty and delicacy which he did not superintend, or actually perform; and his hand and his counsels were alike successful. Such a reputation was of course not limited to his native city, but extended throughout Europe. In 1726 he was sent for by the king of Poland; and again, in 1734, by Don Ferdinand, afterwards king of Spain. He re-established the health of both these princes, who endeavoured to retain him near their persons with the offer of great rewards: but he preferred his native place to the most brilliant situations, and found there a sufficient number of persons who properly estimated his merits. He became a member of the Academy of Sciences in 1715, and was appointed director of the academy of surgery, and censor and royal professor at the schools. He was likewise chosen fellow of the Royal Society of London. He died at Paris on the 20th of April, 1750, aged 76.

Petit was equally beloved for the qualities of his heart, as he was admired for those of his understanding; for his disposition was naturally lively and hospitable, and his manners were indicative of openness and warmth of heart, rather than the result of a studied politeness. He was extremely animated in every thing that concerned his profession; and an oversight irritated him more than an insult. But his anger was of short duration, and he entertained no enmities. His benevolence towards the suffering poor was unbounded, and he spared no labour or exertions for their relief. He communicated many memoirs to the Academy of Sciences, and several to the Academy of Surgery, which were printed in their first volume. His only separate publication was, his "*Traité des Maladies des Os*," printed at Paris in 1705, in 12mo. and frequently reprinted, with additions: an edition, in 1758, in two volumes, 12mo. was published by M. Ant. Louis, with an Historical and Critical Essay. His pupil, M. Lesne, published his posthumous works in 1774, with the title of "*Traité des Maladies Chirurgicales et des Opérations qui leur conviennent*," in three volumes, 8vo. with many plates of surgical instruments. His Treatise on the Bones involved him in several controversies; but the only chagrin which he felt arose from finding Winslow, who, as censor royal, had approved the work, retract his approbation, in a letter inserted in the *Journal des Savans* for May 1725. *Eloy Dict. Hist.*

PETIT (Anthony), an eminent physician, accoucheur, and anatomist, was a native of Orleans. He was admitted a doctor of the faculty of Paris in 1746, and became a member of the Academy of Sciences in 1760. He acquired great reputation as a practitioner; and in 1768 was appointed inspector of the military hospitals through-

out France. In the following year he was made professor of anatomy and surgery at the Royal Garden, in which office he was attended by an extraordinary course of auditors. He finally retired on business, and died at Olivet near Orleans, in 1794, at the age of 92.

This physician published the following works. 1. Lettre d'un Medecin de Montpellier, au Sujet de l'examen public que le Sieur Louis a subi à Saint Côme, en 1749, pour servir d'Eclaircissement à ce qu'en dit M. Fréron, 4to. 1749. 2. Discours sur la Chirurgie, an introductory lecture delivered at the schools of medicine, 1757. 3. Consultation en faveur des Naissances tardives, 1764, 8vo. 4. Premier et second Rapport en faveur de l'Inoculation, 1766, 8vo. 5. Deux Consultations Medico-legales; relative to a case of supposed self-murder, and to a supposed infanticide, 1767. He also edited, "Anatomie Chirurgicale, publiée ci-devant par Jean Palfin," 2 tom. 8vo. 1753, and some early experiments of his on submersion are related in Hist. de l'Acad. des Sciences, 1740. *Gen. Biog.*

PETIT CA'PE. See CAPE, vol. iii. p. 747.

PETIT CO'DIAK, a river of America, which falls into an arm of the bay of Fundy, called Chegnecto-channel. The Indians have a communication from the head of it with St. John's river, by a portage across to the head of Kennebecus.

PETIT-DIDIE'R (Matthew), a learned French monk, and a titular prelate, was born in the town of St. Nicholas in Lorraine, in the year 1659. He received the first part of his education in the College of the Jesuits at Nancy; and, when he was sixteen years of age, took the monastic habit in the abbey of St. Michael, belonging to the Benedictines of the Congregation of St. Vannes and St. Hydulphus. He distinguished himself so highly by his assiduity and improvement, that in the year 1682, when he was only sub-deacon, the chapter-general of his congregation devolved on him the office of lecturing in philosophy and divinity to the young members of the community. Some time afterwards he was placed at the head of a kind of academy, consisting of several of the monks, with whom he undertook to read all the early fathers of the church. At the same time they read M. Dupin's Account of Ecclesiastical Writers, making notes and remarks on his work as they proceeded. As father Petit-Didier thought them of sufficient importance to be laid before the public, he corrected and enlarged them, and sent them into the world under the title of "Remarks on the first Volumes of M. Dupin's Bibliotheque Ecclesiastique," in 3 vols. 8vo. the first of which appeared in 1691, and the third in 1696. These remarks discover extensive reading, are sometimes very judicious, and display no little portion of critical acumen. M. Dupin himself has done ample justice to the author's learning and abilities, while he has vindicated his work against some of the remarks which he considered to be cavils rather than reasonable or fair objections. In the mean time father Petit-Didier was occupied in drawing up an Answer to the Dialogues between Cleander and Eudoxus, written against the celebrated Provincial Letters of M. Pascal, and attributed to Father Daniel the Jesuit. This answer is under the form of seventeen letters, with the title of "An Apology for the Provincial Letters of Louis Montalte, against the last Reply of the Jesuits, &c." 12mo. Though this work was well known to come from his pen, and was often acknowledged by him to his friends, his wish to secure the good opinion of the papal court led him some years afterwards to disavow it. This disavowal is contained in a letter to cardinal Corradini, and printed at Rome in 1726, in a collection of pieces entitled, "Documenta sanæ et orthodoxæ Doctrinæ P. Matthæi Petit-Didier," in folio. In 1699, he was elected abbot of Bonzonville; but was obliged to resign, owing to the interference of the duke of Lorraine, who nominated his brother prince Francis to that dignity. About the year 1700, our author published, in Latin, "Critical, Histori-

cal, and Chronological, Dissertations on the Sacred Scriptures of the Old Testament," 4to. In 1715, he was chosen abbot of Sennones, and, after a contest for some years with the bishop of the diocese, was finally confirmed in the possession of that benefice. His next publication, which appeared in 1724, was "A Theological Treatise in Defence of the Authority and Infallibility of the Pope," 12mo. This piece was attacked by different writers, Catholic and Protestant, and defended by him in several tracts; the titles of which, as well as some of his other polemical publications, the reader may meet with in Moreri. In the year 1725 he paid a visit to Rome, where he was very favourably received by Benedict XIII. on account of his writings, in which he had maintained the infallibility and highest pretensions of the papal see, and declared hostility against the liberties of the Gallican church. As a reward for such obsequiousness, in 1726, the pope nominated him bishop of Macra, in *partibus infidelium*, and performed in person the ceremonies of his consecration. He also granted him an indulgence to retain the possession of his abbey. Our prelate's episcopal honours, however, were but of short duration; since he died suddenly at Sennones in 1728, in the 69th year of his age. He is supposed to have been the author of an anonymous "Historical and Dogmatical Treatise on the Subject of Ecclesiastical Privileges and Exemptions," which was printed at Metz in 1699, in 4to. *Dupin. Moreri.*

PETIT JU'RY. See JU'RY, vol. xi.

PETIT LAR'CENY. See LARCENY, vol. xii.

PETIT-PIE'D (Nicholas), a French clergyman and magistrate, was descended from an honourable family, and born at Paris about the year 1630. Having been educated for the church, he took orders, and obtained the living of St. Martial, in his native city. In 1658, he was admitted to the degree of doctor by the faculty of the Sorbonne; and, in 1662, was appointed a clerical counsellor of the Chatelet. Afterwards he was made sub-chanter and canon of the church of Paris; and he died in 1705, when he was about the age of 75. He had for several years held the post of clerical counsellor at the Chatelet, and officiated, during the same time, as incumbent of the parish of St. Martial, till one day in the year 1678, when the lieutenants were absent, he, being the senior counsellor present, was proceeding to take the chair. In this design he was opposed by the lay-counsellors, who maintained that, being a clergyman, he had no right to preside in a secular court. After entering his protests, M. Petit-Pied commenced a legal process against them, which lasted about four years, and was terminated by a definitive arret in favour of clerical counsellors. This contest induced him to compose and publish "A Treatise on the Right and Prerogatives of Ecclesiastics in the Administration of secular Justice," in a large 4to. volume; which is said to be an excellent work of the kind, to display much curious research, and to reflect great honour on the learning and abilities of the author. *Moreri.*

PETIT-PIE'D (Nicholas), nephew of the preceding, and a very voluminous writer in the Janesist controversy, was born at Paris in the year 1665. He was early destined to the ecclesiastical profession, and prosecuted his studies in the university of Paris with great diligence and reputation, particularly distinguishing himself when entering upon his licentiate. In 1692, he was admitted doctor of the house and society of the Sorbonne; and, in 1701, he was appointed professor of the sacred scriptures in the schools of that faculty. In the year last mentioned, together with thirty-nine other doctors, he gave his signature to the famous *Case of Conscience*, the History of which has been published in 8 vols. 12mo. The part which he took on this occasion, involved him in the proscription which was issued out against the opposers of the bull *Unigenitus*; and, in 1703, he received an order from

from the king, which exiled him to Beaune in Burgundy. Afterwards he withdrew from Beaune to a place of secret retirement, whence he wrote a letter to his brother, M. de Vaubreuil, explaining the reasons for his conduct in the affair of the Cafe of Conscience, which was printed, and is inserted in the history above mentioned. Tired, at length, of the confinement to which he was obliged to submit, in 1705 he retired from France and joined his friend Quesnel in Holland. Here he remained till the year 1718, when he obtained permission at first to come to Troyes, and afterwards to Paris. During the following year, the Faculty of Theology, by unanimous consent, re-established M. Petit-Pied in his place as doctor, and in all the rights and privileges attached to it; upon which he took his seat among them according to his rank of seniority. This proceeding, however, gave displeasure at court; and, within a month, the king gave orders for reversing all the measures which had been taken in favour of our divine. Thus circumstanced, he was taken under the protection of the bishop of Bayeux, who made him his chaplain. In this asylum M. Petit-Pied continued till the death of the bishop in 1728; when, finding that he was in danger of being arrested, he once more withdrew privately into Holland. Having been recalled to his native country in 1734, he spent the remainder of his life in tranquillity at Paris, where he died in 1747, at the age of 82. He was the author of a great number of well-written pieces in French and Latin, against the constitution Unigenitus, and in defence of the principles of the bishop of Ypres; of which no fewer than eighty-one are particularized by *Moreri*.

PETIT PORT, a harbour on the west coast of Newfoundland. Lat. 47. 52. N. lon. 59. 15. W.

PETIT PORT, a harbour on the coast of Peru, near the Equator.

PETIT SER/JEANTY. See SERJEANTY, and the article TENURE.

PETIT SES'SION. See SESSION.

PETIT TREASON. See TREASON.

PETITES CHIEF/LES, a town of France, in the department of the Jura, and chief place of a canton, in the district of Saint Claude. The place contains 578, and the canton 11,923, inhabitants.

PETITE GUER'RE, [French.] The minor operations of war; the operations of detached parties, and the war of posts. See the article WAR.

PETITE PIER'RE. See LUTZELSTEIN.

PETITE RIVIER'E, a town of Hispaniola: fifteen miles east-north-east of St. Marco.

PETITE RIVIER'E, a town of Canada, on the St. Laurence: sixty-five miles north-east of Quebec.

PETITE TER'RE, a small island in the West Indies, near Defeada.

PETITE TROU', a town of the island of Hispaniola: nineteen miles east of Jeremie.

PETITIA, *f.* [so named by Jacquin, in memory of Francis Petit; see p. 797.] In botany, a genus of the class tetrandia, order monogyna, natural order of vitices, *Juss.* Generic characters—Calyx: perianthium one-leaved, small, upright, four-toothed, inferior, permanent. Corolla: one-petalled; tube cylindrical, upright, long; border four-cleft; segments ovate, acute, flat, reflex, half the length of the tube. Stamina: filaments; four, awl-shaped, very short, in the upper part of the tube; antheræ upright. Pistillum: germ roundish, superior; style awl-shaped, upright, the length of the stamens; stigma simple. Pericarpium: drupe roundish. Seed: nut ovate, blunt, two-celled; kernels solitary, oblong. The flowers are often three-stamened, with the calyx and corolla trifid.—*Essential Character.* Calyx four-toothed, inferior; corolla four-parted; drupe with a two-celled nut.

1. *Petitia Domingensis*, a solitary species. This is a small tree, with four-cornered striated branches. Leaves ovate-oblong, acuminate, quite entire, opposite, smooth, veiny

underneath, six inches long, on slender footstalks. Flowers numerous, white. Dr. Mæter, whose discoveries, though not acknowledged, have greatly enriched the Vienna gardens, has observed, that this plant is truly a species of *CITHAREXYLUM*. It was found in the island of St. Domingo, in woods, by Jacquin.

PETITIO PRINCIP'II, in logic, the taking a thing for true, or for granted, and drawing conclusions from it as such, when it is really dubious, perhaps false, or at least wants to be proved before any inferences ought to be drawn from it.

PETITION, *f.* [*petitio*, Latin.] Request; intreaty; supplication; prayer.—We must not only send up *petitions* and thoughts now and then to heaven, but must go through all our worldly business with a heavenly spirit. *Laur.*—Thou didst choose this house to be called by thy name, and to be a house of prayer and *petition* for thy people. 1 *Mae.* vii.—Let my life be given at my *petition*, and my people at my request. *Ezther* vii. 3.

My next poor *petition*

Is, that his noble grace would have some pity
Upon my wretched women. *Shakespeare.*

Single branch or article of a prayer:

Then pray'd that she might still possess his heart,
And no pretending rival share a part;
This last *petition* heard of all her pray'r. *Dryden.*

PETITION of RIGHT, was a parliamentary declaration of the liberties of the people, assented to by king Charles I. in the beginning of his reign: in which it is enacted, that none should be compelled to make or yield any gift, loan, benevolence, tax, and such-like charge, without consent by act of parliament; nor, upon refusal so to do, be called to make answer, take any oath not warranted by law, give attendance, or be confined or otherwise molested, concerning the same, &c. And that the subject should not be burthened by the quartering of soldiers or mariners; and all commissions for proceeding by martial law to be annulled, and none of like nature issued thereafter, lest the subject (by colour thereof) be destroyed or put to death, contrary to the laws of the land, &c. See stat. 3 Car. I. cap. 1.

To PETITION, *v. a.* To solicit; to supplicate.—The mother *petitioned* her goddess to bestow upon them the greatest gift that could be given. *Addison.*

You have *petition'd* all the gods
For my prosperity.

Shakespeare's Coriol.

PETITIONARILY, *adv.* By way of begging the question.—This doth but *petitionarily* infer a dextrality in the heavens, and we may as reasonably conclude a right and left laterality in the ark of Noah. *Brown.*

PETITIONARY, *adj.* Supplicatory; coming with petitions.—Pardon thy *petitionary* countrymen. *Shakespeare.*

It is our base *petitionary* breath
That blows 'em to this greatness.

B. Jonson.

Containing petitions or requests.—*Petitionary* prayer becometh only to such as are in themselves impotent, and stand in need of relief from others. *Hooker.*—I return only yes or no to *questionary* and *petitionary* epistles of half a yard long. *Swift.*

PETITIONER, *f.* One who offers a petition.—When you have received the petitions, (and it will please the *petitioners* well to deliver them into your own hand,) let your secretary first read them, and draw lines under the material parts. *Bacon.*—What pleasure can it be to be encumbered with dependences, thronged and surrounded with *petitioners*? *South.*

His woes broke out, and begg'd relief
With tears, the dumb *petitioners* of grief. *Dryden.*

PETITORY, *adj.* [*petitorius*, Lat. *petitoire*, Fr.] *Petititioning*; claiming the property of any thing:

Of't have I feason'd favoury periods
 With fugar'd words, to delude Gustus' taste:
 And oft perfum'd my *petitory* fyle
 With civet-ſpeech, to entrap Olfactus' noſe! *Brewer.*

PETITOT (John), an artiſt at the ſummit of excel-
 lence in his particular branch, that of painting in enamel,
 was born at Geneva in 1607. His father, a ſculptor and
 architect, placed him with a jeweller. In this employ-
 ment, having frequent occaſion to make uſe of enamel,
 he found means to give it ſo fine a tone of colour, that
 his friend Bordier, a painter, (who was afterwards his
 brother-in-law,) thought that, if he would apply to por-
 trait, he might carry the art farther than had hitherto
 been done. Petitot took his advice, and was ſucceſſful:
 he executed the heads and hands, whiſt Bordier painted
 the hair, drapery, and grounds. The two friends tra-
 velled together for improvement, viſiting not only the
 workſhops of painters, but the laboratories of chemiſts,
 for the purpoſe of diſcovering new colours. It was in
 England that Petitot acquired the greateſt addition to
 his knowledge in this point, from his fellow-countryman,
 ſir Theodore Mayerne, then phyſician to Charles I.
 Mayerne introduced him to the king, who took pleaſure
 in ſeeing him work, and honoured him with knighthood,
 and an apartment in Whitehall. Vandyke gave him in-
 ſtructions in portrait-painting; and ſome of Petitot's beſt
 works are copies from that maſter. The whole-length of
 Rachel de Rouvigny, counteſs of Southampton, from
 Vandyke, is aſſerted to be the moſt capital piece in enamel
 any where extant; its execution is bold, and its colour-
 ing the richeſt and moſt beautiful conceivable. There
 are ſeveral other fine works of his in England, conſiſting
 of the king and royal family, ſeveral of the nobility, &c.
 After the death of Charles, Petitot accompanied the
 exiled family to Paris, and ſhewed great attachment to
 them. His aſſociate, Bordier, however, ſtaid ſome time
 longer, for it appears that he executed an enamel of the
 battle of Naſeby, as a preſent from the parliament to Gen.
 Fairfax. Charles II. during his reſidence in France, took
 great notice of Petitot, and introduced him to Louis XIV.
 who retained him in his ſervice, and gave him a penſion
 and apartments in the Louvre. He married in 1651; and,
 being much employed by the king and court, obtained
 great emoluments. He continued to work in conjunc-
 tion with Bordier, who was become his relation by mar-
 riage. They lived together till their families grew too
 numerous for one houſe; and, during their long connex-
 ion (fifty years), they never had the ſmalleſt difference.
 Petitot was a ſtrict proteſtant; and, at the revocation of
 the edict of Nantes in 1685, he requeſted permiſſion to
 retire to Geneva. The king, however, who had now a
 paſſion for proſelyting, reſolved to try the effect of a little
 coercion, and confined the reſpectable old man in Fort-
 l'Eveque, giving him Boſſuet for an inſtructor. The elo-
 quence and arguments of this celebrated prelate were,
 however, loſt upon him, and his uneaſineſs at being con-
 fined threw him into a fever. He was thereupon liberated,
 and immediately withdrew with his wife from the land of
 perſecution to Geneva. His children threw themſelves
 at the feet of the monarch, deprecating his reſentment
 for this exerciſe of natural liberty; and he graciouſly
 pardoned "an old man who had the fancy of being bu-
 ried with his anceſtors." Petitot continued to exerciſe
 his art, notwithstanding his advanced years; and the re-
 port to ſee him was ſo great, that he retired for quiet and
 privacy to Vevay. There, as he was employed on the
 portrait of his wife, he was taken ill, and died on the
 ſame day, in 1691, at the age of 84, univerſally reſpected,
 as well for his moral worth as his profeſſional talents.

He had a numerous family, of whom one ſon followed
 the ſame branch of art, and ſettled in London. Though
 he was not by any means equal to his father, yet he ob-
 tained very conſiderable employment and repute. His
 age and the period of his death are alike unknown. *Wal-
 pole's Anecdotes.*

PETIVARS, a tribe, inhabiting towards the north-eaſt
 of Braſil, who are ſaid to be benevolent and hophitable.
 They bore their lips, and adorn them with a green ſtone,
 of which they are ſo vain as to deſpiſe all other nations.
 When the wife has brought forth a child, the husband
 confines himſelf to his bed for a month, and receives viſits
 of congratulation. Eſtalla obſerves, that this cuſtom is
 not only common in many parts of America, but was
 alſo known to the ancient Spaniards, as mentioned by
 Strabo. The reaſon of this fooliſh cuſtom is, that if any
 accident were to befall the father, the new-born babe muſt
 ſuffer.

PETIVER (James), an induſtrious naturaliſt, eſpe-
 cially in the botanical branch, was probably a native of
 London, as Dr. Pulteney has aſcertained that he ſerved
 an apprenticeship to Mr. Feltham, apotheary of St.
 Bartholomew's Hoſpital. He entered into buſineſs for
 himſelf in Alderſgate-ſtreet, became apotheary to the
 Charter-houſe, and obtained a conſiderable ſhare of prac-
 tice. He manifeſted an early propenſity to the collection
 of natural curioſities, for which purpoſe he engaged the
 ſervices of captains and ſurgeons of ſhips in bringing him
 from diſtant parts dried plants, ſeeds, ſtuffed ſpecimens of
 animals, inſects, &c. He thus became proprietor of a
 muſeum which made him well known to naturaliſts both
 at home and abroad; and ſuch was its extent, that a
 ſhort time before his death ſir Hans Sloane offered him
 4000l. for it. He was elected a fellow of the Royal So-
 ciety, to which he was a very uſeful member, on account
 of his frequent communications of curious intelligence.
 He was an early correſpondent of the excellent Ray, to
 whom he gave ſome valuable aſſiſtance in the compoſition
 of his *Hiſtory of Plants*. Petiver in 1692 made a botani-
 cal tour through the midland counties of England, and
 ſoon after began the publication of his firſt work. This
 was entitled "*Muſæi Petiveriani ſecuræ decem*," 1692-
 1703, 8vo. containing the names and ſynonymes of vari-
 ous rare animals, foſſils, and plants: among theſe were
 ſeveral new plants of the cryptogamous claſs, in the in-
 veſtigation of which he was very ſucceſſful. His next
 publication was "*Gazophylacii Naturæ et Artis decades
 decem*," 1702-1711, tab. 100. fol. This was a work of
 great value at that time, containing engravings with ſhort
 deſcriptions of animals, vegetables, and foſſils, among
 which were many American ferns and plants from the
 Alps and Cape of Good Hope, all very rare or non-de-
 ſcript. He communicated in 1695 a Catalogue of the
 Middleſex Plants for Gibſon's edition of Camden's *Britan-
 nia*; and he furniſhed the third volume of Ray's
Hiſtory of Plants with a Catalogue of rare Plants of
 China, Madraſpatan, and Africa; another, of the Plants
 in his *Hortus Siccus*; and a third, of Indian and Ameri-
 can plants of uncertain origin. In 1712 he publiſhed
 "*Pterigraphia Americana*," being figures of more than
 400 ſpecies of the fern tribe, with ſome ſubmarine pro-
 ductions. He performed a valuable ſervice to Engliſh
 botany by the publication of "*A Catalogue of Ray's
 Engliſh Herbal, illuſtrated with figures*," 1713-1715, fol.
 the figures are arranged in the order of Ray's *Synopſis*;
 they are little more than outlines, and final, but neat.
 A new impreſſion of them was given by Sloane in 1732.
 Petiver was alſo the author of a great number of ſmaller
 publications, conſiſting chiefly of ſmall catalogues and
 ſingle prints of rare plants, by which he extended an ac-
 quaintance with the vegetable creation, and kept up an
 intereſt in botanical reſearches. He wrote more than
 twenty papers for the Royal Society, printed in its *Tran-
 ſactions* from 1697 to 1717. In one of theſe he purſues
 the idea that the virtues of plants may in general be de-
 termined by their botanical affinities. This occurs in
 vol. xxi. N^o 255, under the denomination of "Some at-
 tempts made to prove, that herbs of the ſame make, or
 claſs, for the generality, have the like virtue, and ten-
 dency to work the ſame effects." The idea had indeed
 been ſuggeſted by Cæſalpinus, but it was firſt exemplified
 by

by Petiver. Linnæus afterwards carried it further, nor can any reflecting person doubt of the soundness of the doctrine.

It would be impossible as well as useless to particularize the publication of every one of Petiver's lists and catalogues. They were all, as far as could be collected, re-published in two vols. folio, under the title of *Jacobi Petiveri Opera*, by John Millan in 1767, price plain six guineas; or with the insects coloured, which is the best, seven guineas; and with the whole coloured, which must chiefly have been done from imagination, twenty guineas.

It does not appear that Petiver had any family, or that he was ever married. He died at his house in Aldersgate street, on the 20th of April, 1713; but of his age we find no mention. His body lay in state at Cooke Hall, and was probably interred at his parish-church, to the charity-school attached to which he left fifty pounds, and five guineas to Dr. Brady for preaching his funeral sermon. His pall was supported by Sir Hans Sloane, Dr. Levit, physician to the Charter-house, and four other physicians. We know not that any portrait of him is extant. The collections of dried plants, and other natural productions, which belonged to Petiver, and after his death were bought by Sir Hans Sloane, now make a part of the British Museum. *Pulteney's Sketches of Botany.*

PETIVERIA, *f.* [named by Plumier in honour of the subject of the preceding article.] GUINEA-HEN WEED; in botany, a genus of the class hexandria, order tetragynia; or, according to Swartz, class heptandria, order monogynia; natural order of holoraceæ, (atriplices, *Juss.*) Generic characters—Calyx: perianthium four-leaved; leaflets linear, blunt, equal, spreading, permanent. Corolla: none (except the coloured calyx.) Stamina: filaments six or eight, unequal, awl-shaped, converging; antheræ erect, linear-sagittate, bifid at top. Pistillum: germen ovate compressed, emarginate; style very short, lateral, in the groove of the germen; (styles four, permanent, finally bent outwards, spinescent, *Gærtner.*) Stigma: pencil-shaped. Pericarpium: none, except the crust over the seed. Seed single, oblong, narrower below, roundish, compressed, emarginate: with four barbed hooks, bent back outwards, rigid, acute, the middle ones longer: (naked, but armed above with reflex spines; *G.*) The flowers have mostly seven stamens.—*Essential Character.* Calyx four-leaved; corolla none; seed one, with reflex awns at top. There are two species.

1. *Petiveria alliacea*, or common Guinea-hen weed: flowers six-stamened. Root strong, striking deep into the ground. Stems from two to three feet high, jointing and becoming woody at bottom. Leaves oblong, three inches long and an inch and a half broad, of a deep green and veined, placed alternately on short foot-stalks. The flowers are produced in slender spikes at the ends of the branches; they are very small, and make no figure. Seed cuneiform-oblong, round-flatted, with an obscure ridge on one side and a depressed line on the other, armed at top with four pungent spines, at first almost upright, but afterwards reflected to the back; of a bay or pale-green colour. It is a common plant in most of the islands in the West Indies, where it grows in shady woods, and all the savannas, in such plenty as to become a troublesome weed. As this plant will endure much drought, it remains green when others are burned up: the cattle then feed on it, and it gives their milk the taste of garlic, and an intolerable rankness to their flesh. It flowers here in June. Browne informs us that it is very common in all the lower lands of Jamaica, and that it is so remarkably acrid, as to render the smell and taste hardly tolerable. On chewing a little of the plant, it burns in the mouth, and leaves the tongue black, dry, and rough, as it appears in a malignant fever. It is however thought to be coveted by Guinea-hens, and hence its name. It thrives most in a dry gravelly soil and a shady situation. Cultivated in 1758 by Mr. Miller.

2. *Petiveria octandra*, or dwarf Guinea-hen weed: flowers eight-stamened. This is very like the first, but differs in having a shorter and narrower stalk, and in the flowers having eight stamens; but, except to a nice observer, they may both pass for the same species. Linnæus adds, that the leaves are more rigid and quite smooth, the filaments purple and not white. It is a mere variety of the preceding, according to Swartz. Jacquin describes it differing from the common sort only in having eight filaments, which are all unequal, and the pencil-shaped body placed on the germen red, whereas in the other it is white. Native of the West Indies: according to Jacquin, frequent in Martinico and the other Caribbee Islands, flowering almost all the year.

Propagation and Culture. These plants may be increased by slips or cuttings, as well as seeds; which must be sown on a hot-bed early in the spring. When the plants are come up, transplant each into a separate pot, and plunge the pots into a moderate hot-bed. When the plants have obtained a good share of strength, inure them by degrees to the open air, into which remove them towards the end of June, placing them in a warm situation where they may remain till autumn, when they should be placed in the stove, and during winter have a moderate degree of warmth. They will produce flowers and seeds every summer, and will continue several years, remaining constantly green throughout the year.

PET'KUM, a town of East Friesland: three miles south-east of Emden.

PET'NHOFEN, a town of Bavaria, in the principality of Aichstatt: seven miles south-south-east of Aichstatt.

PETOLA, *f.* in botany. See **MOMORDICA**.

PETOM'BO. See **TUMBO**.

PETOUNE HO'TUN, a town of Chinese Tartary, in the government of Kirin Oula: 485 miles north-east of Peking. Lat. 45. 15. N. lon. 124. 34. E.

PETOUNE KIA'MEN, a post of Chinese Tartary: nine miles north-west of Petouné Hotun.

PETRA, in ancient geography, has been slightly mentioned under the word **KRAC**, in vol. xi. It is supposed to be the same with *Rekem*, so called from *Rekem* king of the Midianites, slain by the Israelites (Num. xxxi. 8.) Ptolemy places it in lon. 66. 45. from the Fortunate islands, and lat. 30. 20. It declines therefore eighty miles to the south of the parallel of Jerusalem, and thirty-six miles, more or less, from its meridian to the east. Josephus says, that the mountain on which Aaron died stood near Petra; which Strabo calls the capital of the Nabatæi; at the distance of three or four days' journey from Jericho. This Petra seems to be the *Sela* of Isaiah xvi. 1. and xlii. 11. the Hebrew name of *Petra*, "a rock;" though some imagine Petra to be no older than the time of the Macedonians.

Under the Romans, at any rate, it gave the name of *Petræa* to the surrounding district. It is the chief town of the Nabatæi, and is laid down by Burckhardt in latitude 30. 20. a position which accurately agrees with Ptolemy, Eratosthenes, Strabo, and Pliny. Mr. Burckhardt also confirms the testimony of Josephus, that near to this city was the sepulchre of Aaron in Mount Hor; and it is now evident that the present object of Mussulman devotion, the *tomb of Haron*, occupies the very spot which has always been regarded as the burying-place of Aaron: consequently, that the mountain west of Petra is the Mount Hor of the Scriptures.

The ruins which have acquired the name of *Wadi Moosa*, from that of a village in their vicinity, are the wreck of the city of Petra, which, in the time of Augustus Cæsar, was the residence of a monarch, and the capital of Arabia Petræa. The country was conquered by Trajan, and annexed by him to the province of Palestine. In more recent times, Baldwin king of Jerusalem, having made himself also master of Petra, gave it the name of the Royal Mountain.

Mr. Banks, who has very recently visited some of the most

most celebrated scenes in Arabia, intends, it is understood, to publish an account of his excursion to Wadi Moofa (the Valley of Moses), with engravings of the drawings which he made, of the hitherto-undescribed excavated temples there; as well as of the ruins of Jerrafsch, which excel in grandeur and beauty even those of Palmyra and Balbec. This gentleman, in company with several other English travellers, left Jerusalem for Hebron, where they viewed the mosque erected over the tomb of Abraham. They then proceeded to Karrac, along the foot of mountains, where fragments of rock-salt indicated the natural origin of that intense brine, which is peculiarly descriptive of the neighbouring waters of the Dead Sea. Karrac is a fortress situated on the top of a hill. The entrance is formed by a winding passage, cut through the living rock. It may be described as a mass of ruins. The inhabitants of the place are a mingled race of Mahometans and Christians, remarkably hospitable, and living together in terms of free intercourse than at Jerusalem. The women were not veiled, nor seemed to be subject to any particular restraints. They passed into the valley of El-lasar, where they noticed some relics of antiquity, which they conjectured were of Roman origin. They pursued their journey partly over a road paved with lava, and which was evidently a Roman work, to Shubac. In the neighbourhood of this place, they encountered some difficulties from the Arabs. The travellers, however, after some captious negotiation, at last obtained permission to pass, *but not to drink the waters.*

On crossing a stream, they entered on the wonders of Wadi Moofa. The first object that attracted their attention, was a mausoleum, at the entrance of which stood two colossal animals, but whether lions or sphinxes they could not ascertain, as they were much defaced and mutilated. They then, advancing towards the principal ruins, entered a narrow pass, varying from fifteen to twenty feet in width, overhung by precipices, which rose to the general height of two hundred, sometimes reaching five hundred, feet, and darkening the path by their projecting ledges. In some places, niches were sculptured in the sides of this stupendous gallery; and here and there rude masses stood forward, that bore a remote and mysterious resemblance to the figures of living things, but over which time and oblivion had drawn an inscrutable and everlasting veil. About a mile within this pass, they rode under an arch, perhaps that of an aqueduct, which connected the two sides together; and they noticed several earthen pipes, which had formerly distributed water. Having continued to explore the gloomy windings of this awful corridor for about two miles, the front of a superb temple burst on their view. A statue of Victory, with wings, filled the centre of an aperture in the upper part, and groups of colossal figures, representing a centaur, and a young man, stood on each side of the lofty portico. This magnificent structure is entirely excavated from the solid rock, and preserved from the ravages of the weather by the projections of the overhanging precipices. About three hundred yards beyond this temple, they met with other astonishing excavations; and, on reaching the termination of the rock on their left, they found an amphitheatre, which had also been excavated, with the exception of the proscenium; and this had fallen into ruins. On all sides the rocks were hollowed into innumerable chambers and sepulchres; and a silent waste

of desolated palaces, and the remains of constructed edifices, filled the area to which the pass led. The travellers, having gratified their wonder with the view of these stupendous works, went forward to Mount Hor, which they ascended, and viewed a building on the top, containing the tomb of Aaron, a simple stone monument, which an aged Arab shows to the pilgrims. They finally proceeded to view the ruins of Jerrafsch, which greatly exceed in magnitude and beauty those of Palmyra. A grand colonnade runs from the eastern to the western gates of the city, formed on both sides of marble columns of the Corinthian order, and terminating in a semi-circle of sixty pillars of the Ionic order, and crossed by another colonnade running north and south. At the western extremity stands a theatre, of which the proscenium remains so entire, that it may be described as almost in a state of undecayed beauty. Two superb amphitheatres of marble, three glorious temples, and the ruins of gorgeous palaces, with fragments of sculpture and inscriptions, mingled together, form an aggregate of ancient elegance, which surpasses all that popery has spared of the former grandeur of imperial Rome. *Burchhardt's Travels in Syria, 1823. Gen. Mag. Aug. 1819.*

PE'TRA, a river of Naples, which runs into the sea 13 miles north-east of Bova.—A town of Sicily, in the valley of Mazara; two miles north-north-west of Girgenti.—A sea-port town, in the island of Metelin, situated on a rock almost inaccessible. Lat. 39. 27. N. lon. 26. 14. E.

PETRÆUS (Theodore), a learned Dane in the 17th century, the time of whose birth is unknown, was a native of Flensburg, in the duchy of Sleswic. He was particularly attached to the study of the oriental languages, which he prosecuted with great success at Leyden and other universities. That he might perfect himself in them, Frederic III. king of Denmark, sent him to travel through Greece, Syria, Palestine, and Egypt. Having spent several years in those countries, he returned to Denmark with a number of valuable manuscripts which he had collected, and which he began to publish at Leyden, in conjunction with George Nisselius, in 1654. In 1660 he went to London, where he remained two years; and he was afterwards invited to be professor of the oriental languages at Leyden, Kiel, Copenhagen, and other places; but all these offers he declined, and lived in great poverty, as a private individual, sometimes at Amsterdam, and sometimes at Copenhagen, till the year 1673, when he died. His publications consist of four separate volumes of Ethiopic, Arabic, Coptic, and Armenian, translations of parts of Scripture, with Latin versions annexed. 5. *Doctrina Christiana Armenice, cum versione Latina, 1667, 8vo.* 6. *Dissertatio Guelphica de Linguarum Orientalium studio, 1669, 8vo.* 7. *Mensa Solis, seu Animæ dapes salutiferæ, ab Æthiopicibus supra Ægyptum petita, 1669, 4to.* *Gen. Biog. vol. viii. and x.*

PETRAHA'R, a town of Hindoostan, in Bahar: twenty miles east of Ramgur.

PETRA'LIA, a town of Sicily, in the Valley of Demona: seventeen miles south of Mistrella.

PETRAL'TA, a town of Naples, in Calabria Citra: five miles east-south-east of Colenza.

PETRAN'TA, a town of Etruria, near the sea-coast: fifteen miles north-west of Lucca. Lat. 43. 58. N. lon. 10. 21. E.

INDEX to the Article PATHOLOGY.

- A**BERNETHY's classification of tumours, 86; his directions for diet and exercise, 104, 5; his blue-pill, 146.
- Abcesses, 230.
- Abforbents, 96.
- Absorption, how increased or diminished, 99.
- Achilles, skilled in medicine, 4.
- Acids forming calculi, 348.
- Acron of Agrigentum, 4.
- Acrotica, diforders affecting the surface of the skin, 350.
- Actuarius, his era doubtful, 17.
- Æsculapius, or Afclepias, and his descendants, 3; when first worshipped at Rome, 9.
- Aesthetica, difeases affecting sensation, 299.
- Aetius, his practice in gout and palsy, 15.
- Agathinus, founder of the Eclectic sect, 12.
- Agnesia, impotence, 331.
- Agrypnia, wakefulness, 310.
- Ague, cured by pepper, 55.
- Air, an important agent in the cure of indigestion, 141; cautions about exposure to, 141, 2.
- Albinos, 289, 364.
- Albucæus, an Arabian surgeon, 19.
- Alcmæon of Crotona, 4.
- Alexander Trallianus, 15.
- Alexandrian school, 9.
- Alphofis, white leprosy, 289.
- Alusia, illusion, 299.
- Anatomical Museum of Hunter, 36; at Straßburg, 72.
- Anatomy, early cultivated, 1; improvement of, by Vesalius, 21; by Fallopius and Eustachius, 22; modern system by Bichat, 39, 45; present state of, in England, 45; in France, 45, 6.
- Anetus, intermittent fever, or ague, 224.
- Aneurifm, le Roux's method of operating, 47; various species of, 297, 8.
- Angina pectoris, 190; caufes and treatment, 192.
- Anthelmintics, 96.
- Anthrax, the plague, 279.
- Antidote of Mithridates king of Pontus, 8; the ingredients, 25; of the theriaca, 25, 6.
- Antipathia, antipathies, 310.
- Antispasmodics, 96.
- Antyllus, an eye-doctor, 12.
- Apalotica, diforders of the soft parts, 365.
- Aphexia, reverie, 299.
- Aphonia, dumbness, 178.
- Aphoria, sterility, 331.
- Apoplexy, nervous, 136; sanguine and ferrous, 319; general symptoms, 320; treatment, 321.
- Apostema, or deep-seated abcess, 230.
- Appetite, wonderfully great, 119; depraved, 122, 3.
- Arabians, or Saracens, preserved the knowledge of physic and surgery in the dark ages, 18; exclusively, 19.
- Arachnoiditis, characters of, 47; the progress of the disorder fully detailed, 236, 7; appearance on dissection, and treatment, 238.
- Archagathus, the first practitioner at Rome, 10.
- Archigenes and Aretæus, 12.
- Aristæus, king of Arcadia, 4.
- of Cilicia, founder of the pneumatic sect, 12.
- Aristotle, his universal knowledge, 8; not acquainted with the circulation of the blood, 29.
- Armstrong's system of congestion in fever, 211, 213.
- Arteries, contractility of, 192; inflammation, 246, 7.
- Arthrosis, the gout, rheumatism, &c. 268.
- Afclepiades, an eminent physician of ancient Rome, 10.
- Pharmacion, 11.
- Apellius, his discoveries, 33.
- Asthma, the theory of Dr. Bree, 185; dry, 186; moist, 189; treatment, 187, 189.]
- Astringents, 96.
- Astrology connected with medicine by the Arab physicians, 18.
- Attalus, king of Pergamus, 8.
- Avenzoar and Avicenna, 19.
- Authors quoted, 372.
- Bancroft's description of the yellow fever, 216, 17.
- Barrenness from various caufes, 331.
- Bateman on Cutaneous Difeases, 86.
- Bathing recommended by Hippocrates, 6; for indigestion, 146, 7.
- Beer, an eminent German lecturer on the eye, 67.
- Bell, a very eminent writer on surgery, 37.
- Berengar, 22.
- Berberia, a term for two diforders, 310.
- Bevan, Mifs, without legs or arms, 367.
- Bex, cough, 181.
- Bezoar of the intestines, 162.
- Bichat, his excellent system of anatomy, 39, 45.
- Black vomit, 216.
- Bladder, inflammation of, 263; protrusion of, 334.
- Bleeding, the chief remedy in fever, 209, 10; in inflammation, 236.
- Blennorrhœa, clap and gleet, 327.
- Blood, action of, how accounted for by Hippocrates, 13; by Galen, 14; by Nemesius, 16; circulation of, 22; steps which led to the discovery, 28; morbid changes in, 94; difeases of, 191; from quantity, 192; from quality, 194.
- Blumenbach and his museum, 59, 60; a collector of skulls, but not a craniologist, 60.
- Boer, professor of midwifery at Vienna, 68; his practice, 69.
- Boerhaave, 34; his high reputation, 35.
- Borelli, his mechanical calculations, 33.
- Bougies, first invention of, 22; their use, 329.
- Brain, particularly the object of attention at present in France, 46, 7; how it acts on the stomach, 106; and the stomach upon it, 132; principally affected in fever, according to Dr. Clutterbuck, 195; not at all, according to Dr. Lind, 196.
- Bremser (Dr.), and his cabinet of worms, 63.
- Briffot of Poitou, 21.
- Bronchitis, 266.
- Bronchocele, two kinds, 288.
- Brouffais, his theory of inflammatory difeafe, 43; examined à la Moliere, 46; à la Rabelais, 50; his theory of fever, 197, 205; followed by Harrison, 198.
- Brown's system of diseased action, 40; examined and refuted, 41; improved by Darwin, 43.
- Bucnemia, Barbadoes leg, 292.
- Cachexies, whence they arise, 280.
- Cælius Aurelianus, 11.
- Cæfalpinus, 22; approached very near to the discovery of the circulation, 30.
- Calculus of the intestines, 161; composition of, 162; of the kidney, 346; bladder, 347; composition of, 348, 9; treatment, 348, 350; how to be extracted from women, and occasionally from men, 350.
- Calomel, action of, 156.
- Camphis, a bent bone or cartilage, 366.
- Canine madness, 311.
- Carcinus, cancer, 291; treatment, 292.
- Carditis, or inflammation of the heart, 243, 4; how to be distinguished from pericarditis; 244, 5; chronic carditis, 247.
- Carlisle (Mr. A.) his remarks on cathartic medicines, 96, 7.
- Carpotica, difeases affecting impregnation, 335.
- Carus, fuspended animation, 318.
- Cassius the Iatrophist, 12.
- Catacaufis, internal burning, 292; curious cafes, 293.
- Catagma, fractures, 365, 6.
- Catalepsy, or trance, 319.
- Catarrh, 264; common, 265; as distinguished from pneumonia, 266; treatment of, 267; epidemic, 267, 8.
- Cathartics, 96.
- Catotica, internal diforders of the fluids, 338.
- Caufes of difeafe, 90; proximate or local caufes, 91.
- Cauteries, bold use of by Oribafius, 15.
- Celfus, improves upon Hippocrates, 12; his enlightened practice, 13; remarks on the pulse, 93.
- Cenotica, diforders affecting the fluids, 322.
- Cephalæa, head-ache, 315.
- Cephalitis, or phrenitis, 238; caufes and cure, 239.
- Chamberlaine's remedy for worms, 166.
- Charlemagne, founds the celebrated school of Salerno, 19.
- Charms for the ague, 226.
- Chemical system of Sylvius, 31.
- Chicken-pox, 276; perhaps a modified small-pox, 277.
- Chilblains, treatment of, 235.
- Children, difeases of, 89, 90.
- China, degraded state of medicine, there, 3.
- Chiron the centaur, 3, 4.
- Chlorosis when proceeding from indigestion, 139; two species of, 330.
- Cholera morbus, 159; Indian, 159, 60; extremely fatal, 161.
- Chololithus, gall-stones, 160.
- Chordee, 328.
- Chryfippus, fonder of cabbage than of physic, 8.
- Cinetica, diforders of the muscles, 303.
- Clap, not followed by secondary symptoms, 327; but degenerates into gleet, 328.
- Clark's account of the remittent fever of Bengal, 220.
- Classification of difeases, 101.
- Clergy, at first physicians, afterwards had dominion over the physicians, 20.
- Clinical lectures at Vienna, 64.
- Clonus, hiccough, sneezing, &c. 309.
- Clutterbuck's theory of fever, 195; opposed by Dr. Bateman, and Dr. Lind, 196.
- Clysters, their use, 97.

- Cœliaca, or diseases of the digestive organs, 101.
- Colchicum, for the cure of gout, 272.
- Colica, or griping of the guts, 149.
- Columbus (Realdus), 30.
- Constantine the African, 20.
- Consumption, 282.
- Contagion, not the only cause of fever, 207; how to guard against, 208.
- Coprostasis, or retention of the fœces, 154.
- Cordova, university of, 19.
- Corns, to cure, 343, 4.
- Corpulence, nature and causes of, 336; not easily got rid of, 337.
- Corvisart, funeral of, 51.
- Coryza, cold in the head, 177, 8.
- Costiveness, 154.
- Coughing, phenomena of, 180; common, 181; dry, 182; whooping, 183.
- Cow-pox, 276.
- Cramp, or spasms, 308.
- Craniology, loses ground at Paris, 49.
- Cretinism, 287, 8.
- Crichton's Table of Diseases, 84.
- Croup, 241, 2.
- Crufades, their effect on the study of medicine, 21.
- Cullen's theory of diseases, 39; particularly of fever, 40; his classification, 83; why abandoned by us, 80, 1; 83, 4; his arrangement of the *materia medica*, 95.
- Cutaneous diseases, as arranged by Plenck and Willan, and completed by Bateman, 86; general remarks, 141, 351.
- Cuvier, the anatomist, 49.
- Cyrtosis, cretinism and rickets, 288.
- Dandelion, a remedy for indigestion, 148.
- Dandriff, 353.
- Darwin, a poet in medicine, 43; his sympathetic theory, 43, 4; farther descanted upon, 85.
- Democetes of Crotona, a travelling physician, 4.
- Democritus of Abdera, 4.
- Default, an eminent French surgeon and anatomist, 38.
- Diabetes, 344; causes of, 345.
- Diaphoretics, 96; action of, 98.
- Diarrhœa, 156; symptoms and cure, 157, 8; a peculiar kind, 158, 9.
- Diathosis, separation of hard parts, 366.
- Diet, or regimen, first noticed by Hippocrates, 6; of great importance in medicine and surgery, 37; well regulated, and properly considered, in the hospitals of Vienna, 64, 5; examination of its effects on the stomach and general health, 102-106, 143.
- Digitalis, the first in the class of sedatives, 236; its use in consumption, 287.
- Dinus, dizziness, 315.
- Diocles of Carystus, 8.
- Dioscorides of Anazarba, 11; his Herbal enriched by the Saracens, 18.
- Diplosis, morbid thirst, 118.
- Dissention, facility of, in Germany, 57.
- Diuretics, 96; their peculiar action, 97, 8.
- Dogmatists, sect of, 7.
- Dolichos, or cowhage, a destroyer of worms, 165.
- Dover's powder, 98.
- Drinking at meals, 102.
- Dropsy, nature and causes of, 338; of the chest, belly, womb, &c. 339; of the head, 340; of the spine, 342.
- Drowned or hanged persons to restore, 319.
- Dubois, an excellent lecturer, 50.
- Dutens, a French writer, endeavours to deprive Harvey of the honour of his discovery, 28.
- Dysentery, 154; symptoms and cure, 153; compared with diarrhœa, 156.
- Dyspepsia, or indigestion, 128.
- Dysphagia, stoppage in the throat, 115.
- Dysphonia, imperfect speech, 179.
- Dysphoria, reflexiveness, 310.
- Dyspœna, or difficulty of breathing, 184, 5.
- Dysthetica, or cachexies, 279.
- Ear-ache, 239; treatment, 240.
- Eccritica, diseases of the excrement functions, 336.
- Eccyefia, extra-uterine gestation, 336.
- Eclêtic sect, founded by Agathinus, 12.
- Echphlysa, blains, or blebs, 355, 6.
- Echphonia, insanity, 298.
- Echphyma, corns, warts, &c. 363.
- Ecpyesis, the running tetter, 358.
- Egyptians, origin of medicine among them, 3.
- Electricity and galvanism, 99, 100.
- Elephantiasis, a peculiar kind of leprosy, 292.
- Emetics, 96; their action considered, 97.
- Emmenagogues, 96, 98.
- Emollients, three kinds of, 96.
- Empathema, passion, 299.
- Empirics, sect of, 7; not founded by Serapion, 8.
- Emplyphis, miliary fever, &c. 276.
- Emphyma, tumours, 337.
- Emphysema, wind-dropsy, 342.
- Empresna, internal inflammation, 235.
- Empyefis, small pox, 277, 8.
- Enanthesis, scarlet fever, measles, &c. 273.
- Enecia, continued fever, including typhus, nervous, putrid, &c. 227.
- Entasa, spasm, 303.
- Enterica, or disorders of the alimentary canal, 101, 108.
- Enterolithus, or stones in the bowels, 161, 2.
- Enthesis, obstructions, 365.
- Epanetus, or remittent fever, 226, 7.
- Ephemera, or simple fever, 222.
- Ephialtes, or night-mare, 189, 90.
- Ephidrosis, diseases from sweat, 350.
- Epichrosis, discolorations of the skin, 364.
- Epilepsy, how treated, by Oribasius, 14, 15; its nature little known, 137, 317; symptoms, 317; treatment, 318.
- Erasistratus, 8; his skill in noting the cause of disease, 9; his practice, *ibid.*
- Erithism, as it affects infants, 132; torpid, 133; of the brain, 136.
- Errhines, 96, 98.
- Erysipelas, 234, 277.
- Erythema, to be distinguished from erysipelas, 234.
- Esquirol, his practice with the insane, 51; his account of madhouses throughout France, 51, 2.
- Eudoxus of Cnidos, 8.
- Eustachius, his anatomical figures, 22.
- Exanthematica, eruptive fevers, 273.
- Exangia, aneurism, 297.
- Exanthesis, cutaneous bluish, 350, 1.
- Exarthrema, dislocation, 366.
- Exercise, moderate, recommended by Hippocrates, violent by Herodias, 5; as a cure for indigestion, 142; for gout, 172; for consumption, 287.
- Exormia, pimples, 352.
- Expectorants, 96.
- Eye, discoveries as to its functions by Kepler, Scheiner, &c. 33; much studied in Germany, 62; lectures on, 66; inflammation of, 264.
- Fabricius ab Aquapendente, 22.
- Falconer (Dr.), his remarks on the pulse, 93, 94.
- Fallopian, 22; anatomist and surgeon, 23.
- Faking, remarkable instances of, 120, 1; from the Harl. Misc. 121, 2.
- Feeling, depraved, 302, 3.
- Feline madness, 311.
- Fever, Cullen's theory of, 40; Brown's, 41; Darwin's, 43, 44; the subject farther examined, 194, & seq. Dr. Clutterbuck's theory, 195; Broussais's, 197; Harrison's, 198; Nicholls's, 108, 9; 205; general course of, 200; crises, 203; fatal symptoms, 204; gastric theory, 204, 5; nervous or capillary theory, 205, 6; 210; Park's explanation, 206; Clutterbuck's, 207; not always from contagion, 207, 8; treatment of simple fever, 209; Dr. Armstrong's hypothesis, 211; more particular account of the epidemic fevers of England, 211; attended with bronchitis and gastritis, 212; with disorder of the liver, 213, 14; treatment, 214; yellow fever, 215; simple fever, three species, 222; intermittent, 224; its three stages, 225; remittent; 226; hectic and continued, 227; of the brain, 236; scarlet, 273; miliary, 276; vesicular, 277.
- Fire, its effect in purifying the air, and curing fever, 208, 9.
- Flatulence, three kinds of, 124.
- Food of man, 102; its chemical qualities, 105.
- Foundling-hospital at Vienna, 69.
- France, state of surgery there in the 17th century, 37, 8; eminent surgeons of the 18th century, 38, 9; schools of surgery and medicine; 38; present opinions and systems, 45, 6; surgery, 47; pharmacy, 47, 8; new Pharmacopœia, 48; new school, 50; lunatic asylums, 51, 2; lying-in hospitals, 74; their regulations recommended for adoption in England, 75.
- Franco, Peter, first uses the high operation for the stone, 23.
- Frank's description of gastric fever, 212, 13.
- Frederic II. a royal author, 61.
- Fumigations with sulphur, by De Carro at Vienna, 71; by Affalini at Naples, 72.
- Galactia, disorders of the milk, 329, 30.
- Galvanism, as applied to humoral asthma, 189.
- Galen, and his system of four qualities and three faculties, 13; found blood, not air, in the arteries, 14; his works do not contain all the knowledge of the ancients, 17; acquainted with the small pox, 19; his errors corrected by Vesalius, but defended by Sylvius, 21, 22; how far he advanced towards the discovery of the circulation of the blood, 29.
- Gall-stones, 160.
- Galvanic electricity, 99, 100.
- Gangrene, 229, 268.
- Gases, their use in medicine, 100.
- Gastritis, a rare disease, 107; attends fever, 205, 256.
- Geber, the father of chemistry, 18.
- Geoffroy de St. Hilaire, 50.
- General hospital at Vienna, 61; its great extent, 63; lectures, 64.
- Genetica, diseases of the sexual function, 322.
- George IV. presents books to the library at Göttingen, 58; visits the place, 60, 1.
- German surgeons in the 18th century, 37; universities and schools of medicine in the nineteenth century, 56; general character, 57.
- Gleet, 328, 329;
- Goitre and bronchocœle, 288.
- Gonorrhœa. See *Blenorrhœa*.
- Good (Dr. Mason), his nomenclature and medical nomenclature, 81; his review of Cullen's classification, 83.
- Göttingen, university of, 37; its professors, lectures, library, &c. 58; visit of the king, 60, 1.

- Gout, ancient remedies for, 15; similar to the modern, *ibid*; arising from indigestion, 137, 267, 8; its varieties, 170; detail of symptoms, 171; treatment, 172.
- Granville (Dr.), his classification of the diseases of children, 86, 7.
- Gravel, arising from indigestion, 138.
- Greece, the early physicians there, 3; or rather surgeons, 4; modern, 75.
- Gum-bile, causes of, 111; treatment, 112.
- Hæmatica, diseases of the blood, 191; causes of, 192.
- Hæmorrhagia, flux of blood from various parts, 280, 282.
- Hair, diseases of, 364.
- Haller, a most enlightened physiologist, 35.
- Hamilton's directions in salivation, 113.
- Harrison's theory of fever, 198, 205.
- Harvey, discovers the circulation of the blood, 22; history of the discovery, 28; under what circumstances, 30; opposes Aësius, 33.
- Haygarth's rules for preventing infection or contagion, 208.
- Head-ache, dizziness, &c. 315.
- Hearing, defects in, 301, 2.
- Heart, action of, 80; how affected by indigestion, 133; diseases of, 244, et seq.
- Heart-burn, 123.
- Heberden's remarks on the pulse, 93, 4.
- Heliiodorus, an early surgeon at Rome, 12.
- Helminthia, worms of the intestines, 162.
- Helmont (Van), his curious tenets, 26.
- Hepatitis, 160.
- Heraclides of Tarentum, 8.
- Herennius, Philo, of Tarsus, 11.
- Hernia, rupture, 365.
- Herodius, made his patients take violent exercise, 5.
- Herophilus, his cruel practice, 9.
- Hiccough, 309.
- Hildenbrand of Vienna, 63, 4; an excellent lecturer and writer, 65.
- Himley of Gottingen, 59.
- Hindoos, cultivated medicine very early, 3.
- Hippocrates, a descendant of Esculapius, styled the father of medicine, 4; his system, 5; practice, 6, 7; opposed by Asclepiades, 10; his theory of the blood's motion, 28; his skill in diagnosis, 92; his practice and opinions now tacitly acted upon, *ibid*.
- Hoffman and his opinions, 34.
- Hospital for sick children at Vienna, 69, 70.
- Hospital gangrene, supposed cause of, 70.
- Humoral pathology, 90.
- Hunter (John), a most distinguished anatomist, 35; his museum, 36; character, by Mr. Lawrence, *ibid*.
- Hunter (William), 36.
- Hydrocephalus, symptoms of, 340, 1; treatment, 341, 2.
- Hydrocyanic acid, 149.
- Hydrophobia, 311; cases, 312; symptoms, 313; treatment, 314, 15.
- Hydrops, dropsy, 338.
- Hypertrophy, or enlargement of the heart, 249, 50; combined with dilatation of the ventricles, 252.
- Hysterics, from uterine irritation, 316.
- James's observations on inflammation, 45.
- Jaundice, 171; black, 174, 5.
- Ibis instructs mankind in the use of clysters, 2.
- Icterus, yellow jaundice, 171; causes, 172, 3; treatment, 174.
- Ignis sacer, 234; treatment, 235.
- Iliac passion, 150.
- Impotence from various causes, 331.
- Incubus, or nightmare, 189, 90.
- Indigestion, causes of, 101, 2; more fully traced, 128; first class of diseases arising from, 129; treatment, 141; second class of disorders, 133; treatment, 147.
- Inflammation, 193; inquiry into the causes and phenomena of, 194; the effect, not the cause, of fever, 197; diseases connected with, 227; external, 230; internal, 235; of the brain, 236; of the lungs and pleura, 242; of the heart, 244; of the arteries, 246; of the bowels, 259; liver, 260; spleen and kidneys, 262; bladder, 263; womb, 263, 4; testicles, 264; eye, *ibid*; bronchia, 265.
- Injections, first used in anatomy by Vesalius, 21.
- Ionthus, tubercles in the face, 232.
- Josephine academy, connected with the military hospital, at Vienna, 70.
- Italy, surgery there in the 18th century, 57; mad-houses in the 19th, 52, 3; Dr. Sir Charles Morgan's account of the present state of medicine there, 53, 4, 5.
- Itch, varieties of, 362.
- Kepler, applies mechanical principles to explain vision, 33.
- Kern, and his surgical clinic, 65; his very singular practice, 66.
- Kidneys, inflammation of, 262; cure, 263; gravel or stone in, 346.
- Lagnesis, inordinate desire, 330.
- Lallemand, his work on the brain, 46; his opinion as to the cause of delirium, 47.
- Langenbeck, 58; an excellent surgeon at Gottingen, 59.
- Larrey, his opinions on the yellow fever, 215.
- Lacteals and lymphatics, 33.
- Lawrence, his character of Hunter and Cuvier, 30.
- Le Dran, his improvement in lithotomy, 23; his works, 38.
- Leeuwenhoek's microscopical discoveries, 33.
- Leonides of Alexandria, 12.
- Lepidus, scaly diseases, 353.
- Leprosy, common, 353; white, 289, 354; black, 354.
- Lethargy, or somnolency, 319.
- Leucanthropia, or wolf-madness, 14.
- Leucorrhœa, or whites, 323; mucous, 324; watery, 325; distinguished from Blenorrhœa, 327.
- Libraries, &c. in Germany, 57.
- Limosis, morbid appetite, 119.
- Linnaeus, his modification of Sauvage's system, 82.
- Lithia, stone and gravel, 346.
- Lithotomy, improvements in during the 16th century, 22; the high operation, 23.
- Liver, its effects on the head, 106, 7; how affected in indigestion, 148; abscess in, 230; inflammation of, 160.
- Lobstein, his account of the anatomical museum of Strasburg, 72-4.
- Lower, Margaret, curious and incredible case of, 151.
- Lues, the venereal disease, 292.
- Lunatic Asylum at Charenton, how regulated, 50, 51; the Salpêtrière, &c. 51; treatment of the insane in the provinces, 52; in Italy, 52, 3.
- Lungs, how affected in indigestion, 139, 40; their action, 180; inflammation of, 242.
- Lying-in hospital at Vienna, 68; where all the children die, 69; at Paris, 74.
- Lyssa, feline and canine madness, 311.
- Macbride's system praised by Dr. Good, 84.
- Machaon, son of Esculapius, 3.
- Majendie, a French physiologist, 46.
- Maggi, refutes an error as to gunshot wounds, 22.
- Malis, lousy disorder, 363.
- Marasmus, atrophy, 282.
- Marinus, the restorer of anatomy, 11.
- Materia medica, arrangement of by Cullen, Murray, and Parr, 95; by Kirby, 96; alphabetical list, 369.
- Measles, 274; how distinguished from scarlet fever, 274, 5; treatment, 275.
- Mechanical principles absurdly applied to the functions of the human frame, 26, 32; the system not, however, useless, 33.
- Mediate auscultation. See Stethoscope.
- Medical magazines, first publication of, 37.
- Medicines distinguished into chemical and galenic, 26.
- Melæna, black jaundice, 174.
- Melampus discovers the virtues of the melampodium, 2; his skill, 4.
- Menecrates, author of 155 books, 11.
- Menses, obstructed, 322; profuse, &c. 323.
- Mercury, various preparations of, 146; cautions in the use of, 148.
- Mefotica, disorders of the parenchyma, 336.
- Metafis, or transmission of diseases, 90, 99.
- Methodics, or Methodists, 10; their tenets, 11; compared with Brown's, 40.
- Metrocelis, mother's marks, 366.
- Midwifery in the 16th century, 23.

- Nemesius bishop of Emisa, said to have discovered the circulation of the blood, 16; his pretensions examined, 29.
- Nervous system, 80, 94.
- Nettle-rash, 275, 353.
- Neuralgia, tic doloureux, 308.
- Neurotica, nervous disorders, 298.
- Nicanor of Culophon, 8.
- Nicholls's theory of fever, 198, 9; some of his positions not proved, 205.
- Nightmare a common disease, 190.
- Nose restored, 23; ulcerated, 178; polypus in, *ibid*.
- Nutology, or classification of diseases, 80; Good's, 81, 101; Plater's, 81; Sauvages's, 81, 2; Linnaeus's, Vogel's, and Sagar's, 82; Cullen's, 83; Selle's, Plouquet's, &c. 84; Darwin's and Parr's, 85; Young's, Willan's, &c. 86; Granville's of the diseases of children, 87.
- Nonifer's remedy against worms, 165.
- Nymphomania, 330, 1.
- Odontia, disorders of the teeth, 108.
- Oedoptosis, protrusion of some of the genital organs, 331, 2.
- Cefoplasia, obstructions in, 115; cases, 116, 17.
- Oil as a remedy against worms, 167; oil of turpentine, 167.
- Olophonia, defect of voice, 366.
- Omentum, enlargement of, 176, 7.
- Ophthalmy, curious cases of, 71.
- Opium, its constituent parts, 48.
- Orgastica, diseases affecting the organs, 330.
- Oribasius, one of the chief physicians after Galen, 14; his discoveries and practice, 14, 15.
- Oñander and his museum, 60.

- Ossification of the heart, 249; of various parts, 337, 8.
 Ophthalmia, ossification of certain parts, 337, 8.
 Oxygen gas, 100.
 Painter's colic, 150; remedies for, 151.
 Palamedes, the Greek physician, 4.
 Palladius the Sophist, first wrote satisfactorily upon urine, 16.
 Palpitation of the heart, 244, 309.
 Pally, three varieties of, 322.
 Parabysma, internal tumours, 175, 6; treatment, 177.
 Paracelsus, his doctrines, 25.
 Paracusis, defect of hearing, 301, 2.
 Paracyesis, morbid pregnancy, 335.
 Paræsthesis, defects in the senses, 366.
 Parageusis, depraved taste, 302.
 Paramenia, disordered menses, 322.
 Parapsis, depraved feeling, 302, 3.
 Paré (Ambrose), a very eminent French surgeon, 22.
 Paris, present state of medical opinions there, 48, 9.
 Pariset, his account of the yellow fever at Cadix, 49.
 Park's pathology of fever, 206.
 Parodynia, difficult labour, 335, 6.
 Paroniria, morbid dreaming, 299.
 Paropsis, diseased vision, 299, 300.
 Parosmia, depraved smell, 300.
 Parostia, diseased bones, 337.
 Parr (Dr.), his nosological arrangement, 85; its merits and defects, 86.
 Paruria, diseases of the urine, 343.
 Pathology, as distinguished from physiology, 1; early history of, 2; among the Egyptians, Jews, Hindoos, and Chinese, 3; in Greece, 3; gymnastic system, 4; under Hippocrates and his followers, 4-7; dogmatic and empirical sects, 7; Alexandrian school, 9; among the Romans, 9, 10; methodic sect, 10, 11; pneumatic and eclectic sects, 12; chemical system, 31; mechanical, 32; Bichat's system, 39; Cullen's, 39, 40; Brown's, 40, 41; Rastor's, 41, 2; 53, 4; Broussais's, 43, 46, 50; Darwin's sympathetic system, founded on physiology, 43, 4; present state of in England, 44, 5; in France, 45, 74; Italy, 52; Spain and Portugal, 55; Germany, 56; Greece, 75; Turkey, *ibid*; general principles, 79, 80; nosology, 80-87; causes of disease, 88-91; symptoms, 91-94; materia medica, 94-96; alphabetical list of therapeutics, 96-100; classification, 101-367; materia medica, 369.
 Paulus of Ægina, the last of the Greek classical physicians, 15, 16.
 Pectoriloquism, 285.
 Pediluvium, 460.
 Pepper (black), a cure for intermittent fever, 55.
 Pericarditis, 245, 6; sub-acute, 247, 8.
 Peripneumony, or inflammation of the lungs, 242; treatment, &c. 243.
 Peritonitis, acute, 253; chronic, 254, 5.
 Perspiration, or sweat, 206.
 Perosplanchnia, internal defects, 366, 7.
 Pessary, 332; different kinds, and how to apply them, 333.
 Petit, an eminent French surgeon, 38.
 Peromelia, defects in the limbs, 367.
 Phimosis and paraphimosis, 231.
 Phlebotomy taught by the hippopotamus, 2; much used by Hippocrates, 6, 7; edict respecting it, 21; stimulative and sedative, 99.
 Phlegmon, or abscess near the surface, 230.
 Phlogotica, or inflammatory diseases, 227.
 Phlysis, whitlow, 233.
 Phonica, disorders of the vocal organs, 177.
 Phosphates in calculi, 349.
 Phrenica, disorders of the mind, or brain, 298.
 Phrenitis. See Cephalitis.
 Phyma; boil, carbuncle, &c. 231.
 Physicians, quarrel with the surgeons and patronize the barbers, 27; their oath, 28.
 Physiology, necessary to be studied previously to pathology, 1, state of at the present time, 45.
 Pica nasi, or snuff-taking, 123.
 Piles, blind, 168; bleeding, 169, 70.
 Pinel's system, 84.
 Plater, first arranged diseases by their symptoms, 81.
 Plenck's arrangement of the diseases of the eyes and skin, 86.
 Plethora, 280.
 Pleuralgia, or pain in the side, 191.
 Pleurisy, 242, 3.
 Pleuritis verminosa, 140; three other varieties, 242.
 Pliny the elder, 11.
 Plouquet's outlines of a system, 84.
 Pneumatic sect, 12.
 Pneumatica, disorders of the respiratory functions, 177.
 Pneumonia, disorders of the lungs, 180.
 Polyperia, monstrosities, 367.
 Polypodia, a remedy against worms, 165.
 Polypus in the nose, 178; uterus and vagina, 335.
 Polyfarcia, corpulence, 336.
 Portugal, state of pathology there at present, 55, 6.
 Port, an excellent English surgeon, 37.
 Praxagoras, a bold practitioner, 8.
 Prickly heat, 352.
 Priests, whether originally physicians among the Egyptians and Jews, 2, 3; by being permitted to marry, the connection between physic and divinity was destroyed among the Catholics, 20.
 Pring's "Indications," extracts from, 89, 90.
 Prochaska and his museum, 63.
 Proctica, diseases of the anus, 166.
 Præotia, premature puberty, 330.
 Professorships in the French schools, sold, 49.
 Prussic acid in consumption, 287.

 Pseudismus, stammering, lisping, &c. 179, 80.
 Pfellus, contradictory accounts of him, 17.
 Pseudocyesis, spurious pregnancy, 336.
 Ptyalismus, or spitting disorders, 113.
 Pulse, phenomena of, 93; influenced by stature, time of day, &c. 94; cessation of, curious case, 307.
 Purgatives, 96; various kinds, 97.
 Pyretica, or fevers, 195.
 Pythagoras, and his sect, 4.
 Quinly, 240; treatment of the malignant putrid kind, 241.
 Rabies canina, 46.
 Raphania, contraction of the joints, 310.
 Rastor's contra-stimulant system, 41; wherein it differs from Brown's, 42; explained by Dr. Morgagni, 53, 4, 5.
 Rectum, disorders of, 170; cure, 171.
 Refrigerants, 96.
 Retching and vomiting, 125.
 Rhazes, an Arabian physician, 18; proves that the small-pox was known to Galen, 19.
 Rheyma, laceration, 365.
 Rheumatism, 168; acute, 169; chronic, 170.
 Rhoncus, hoarseness, 178.
 Richerand, 50.
 Rickets, 288, 9.
 Ringworm, 357, of the scalp, 359.
 Riolan, endeavours to disprove the circulation of the blood, 30.
 Robiquet, his experiments upon opium, 48.
 Romans, long without physicians, 9.
 Rose-rash of summer and autumn, 352.
 Roux, his success in a curious and difficult operation, 50.
 Royer-Collard, some curious anecdotes of him, 48, 9.
 Rudbeck (Olaus), discovers the absorbents of the large intestines, 33.
 Rufus of Æphesus, 11.
 Rumination in the human subject, 125; curious cases, 126, 7; dissection, 123.
 Ruft (of Berlin), on ophthalmia, 70.
 Sagar's arrangement of diseases, 82.
 Saint Vitus's dance, 309.
 Salerno, its celebrated school of medicine, 19; first confers degrees, 20.
 Salivation, 113; its uses, 114.
 Sanctorius, 31; his theory of disease, 32.
 Sarpi (Paul), 30.
 Sauvages, 81; his classification, 82.
 Scalled head, 359.
 Schirrhus, as distinguished from cancer, 291.
 Schmidt (John Adam), a writer on diseases of the eye, 66, 7.
 Scotch surgeons in the 18th century, 37.
 Scrofula, or king's evil, 289; symptoms of cure, 290, 1.
 Scurvy, sometimes confounded with syphilis, 21; in the gums, 111; history of the disease, 294; land, 295; sea, 296; treatments, 297.
 Secretion and absorption, 80.
 Sedatives, how they act, 99.
 Seleucus, gives up his wife to his son, 9.
 Selle's classification of diseases, 84.
 Serapion the empiric, 8.
 Servetus, 22; a good philosopher and divine, burnt for his religion, 29; approached very near to the full discovery of the circulation of the blood, 29, 30.
 Sharp, an eminent English surgeon, 37.
 Shields's account of the yellow fever of Batavia, 219.
 Shingles, 356.
 Sialogogues, 96.
 Simeon of Antioch, 17.
 Small-pox, of greater antiquity than commonly supposed, 19; its varieties, 277; treatment, 278, 9.
 Smell, depraved or wanting, 302.
 Sneezing, 309.
 Soranus, an eminent teacher of the methodic sect, 11.
 Spain, its public libraries in the 12th century, 19; present state, 53.
 Sparganosis, milk-spread, 268.
 Spasm, 308; convulsive, 309.
 Speechlessness, 178, 9.
 Spermorrhæa, involuntary emission of seed, 329.
 Spinal marrow, inflammation of, 47.
 Splaunchica, disorders of the viscera, 33.
 Spleen, inflammation of, 262.
 Squinting, 301.
 Stahl, his theory of life founded on the Cartesian philosophy, 34.
 Stephen the Athenian, 16.
 Stereotica, fractures, dislocations, &c. 365.
 Sternalgia, or angina pectoris, 190, 1.
 Stethoscope, 244; described, 245; its action in diseases of the heart, 248; of the lungs, 285; in dropsy of the chest, 339.
 Stimulants, 96; general, 98, 9.
 Stomach, how affected by disease, 101; more particularly, 107; by eating too fast, 142; inflammation of, 256.
 Stones in the bowels, 151.
 Strangury, 343; from worms, 344.
 Stricture in the rectum, 151, 2; 166, 7; how to be treated, 153, 167, 8; in the urethra, 328; treatment, 329.
 Struma, scrophula, or king's evil, 289.
 Stuttering, or stammering, 179, 80.
 Sugar first used in medicine by the Arabians, 18.

- Surgery, the first branch of pathology that was cultivated, 1; evidenced in the practice of Patroclus, 4; at Rome, 12; military in the 16th century, 23; of France in the 16th century, 27; separated from barbarism, 27, 8; in the 18th century, 37, 8, 9; in France in the nineteenth, 47.
- Syncope, or fainting, 315.
- Sweat, of various colour and smell, 350.
- Sweating-sickness, first appearance of in England, 21; history of, 222, 3; treatment, 223; cause of, 223, 4.
- Swine-pox and hives, 277.
- Sydenham, a very enlightened author, 31; his judicious practice, 32; praised by Sauvages, 81.
- Sylvius, his absurd defence of Galen, 21; alluded to by Moliere, 22.
- Sylvius de le Boe, a supporter of the doctrine of the circulation, and founder of the chemical system, 31.
- Symptoms of diseases, 91; as explained by Dr. Marshall Hall, 92.
- Synclonus, general spasm, 307.
- Syncope, or fainting, 315.
- Syphasia, convulsions, 315.
- Syftatic, diseases of the senses, 310.
- Taliacotius, the restorer of noses, 23.
- Tarare, the wonderful eater, 119, 120.
- Taste, depraved, 302.
- Taylor, Martha, the Derbyshire fasting-woman, 122.
- Tea, praised by Dr. Reid, and why, 103.
- Teeth and teething, disorders of and from, 108.
- Tenefmus, as distinguished from scirrhus rectum, 167; description and cure, 168.
- Testicle, inflamed, 264, 328.
- Tetanus, a nervous malady, 303; its dreadful symptoms, 304; diagnostics, 305; treatment, 306; in the Tonga Islands, 307.
- Tetter, 356; running, 358; milky, 359; honeycomb, 360; dry and scurfy, 361.
- Themison, the founder of the methodic sect, 10, 11.
- Therapeutics, 94, 5; 367, 3.
- Theriac Andromachi, or Venice treacle, 25; a very famous remedy, 26.
- Theflalus of Trallis, a conceited physician, 11.
- Thirst, excessive, 118, 19; want of, 119.
- Thlafma, bruises, 365.
- Thomas (Mary), a fasting-woman, 121.
- Thrush, white and black, 276.
- Tic douloureux, 308.
- Tocolof, a curious remedy for tetanus, 307.
- Tongue, sometimes too large, 117, 18; wanting, 178; yet not occasioning the party to be absolutely dumb, 179.
- Tonics, 96.
- Trefis, wounds, 365.
- Trichosis, disorders of the hair, 364.
- Tubercles, common to scrofula and consumption, 283.
- Tumours, internal, 175, 6; symptoms and treatment, 177; external, 337.
- Turkey, state of pathology there, a few years back, 75, 6; an account of the first publication on anatomy at Constantinople, 76, 7, 8; present state of the hospitals there, 78, 9.
- Tychica, accidental disorders, 365.
- Tympany, or wind-dropsy, 342; of the abdomen and womb, 343.
- Vaccination in Turkey, 78; varieties of, 276.
- Vauquelin, an excellent chemist, 50.
- Veneral disease, 21, 292.
- Vesalius, his great discoveries in anatomy, 21, 22.
- Vis medicatrix nature, 40.
- Vision, defects of, 300.
- Ulcus, ulcer, 298.
- Universities of Italy, 55; of Germany, 56; Protestant, 56-60; Catholic, of which the chief is that of Vienna, 61.
- Vogel's arrangement of diseases, 82.
- Vomits much commended by Hippocrates, 6.
- Vomiting, or nausea in action, 125.
- Urine, first treated of by Palladius, 16; diseases of, as stranguary, diabetes, &c. 343 et seq.
- Uterus, inflammation of, 263, 4; protrusion of, 331; treatment, 332; application of the pessary, 333; inverted uterus, 334; prolapsus of, 335.
- Warner, a good English surgeon, 37.
- Warts, how to destroy, 363.
- Water, used by Kern instead of ointments, 66.
- Water-brash, 123.
- Weaning-brash, 158.
- Werneck on hospital gangrene, 70.
- White, of Manchester, 37.
- White-swelling, 272, 3.
- Whitlow, 233, 4.
- Whooping-cough, 21; symptoms and treatment, 183, 4.
- Willan's work on cutaneous diseases, completed by Dr. Bateman, 86.
- Willis, gives some hints at a system of craniology, 33.
- Wind-cholera, 159.
- Wind-colic, its cause and cure, 151.
- Worms in the intestines, 162; symptoms, 164; treatment, 165.

P E R U.

- AGRICULTURE encouraged and honoured, 748.
- Almagro, one of the first discoverers of Peru, 741; lays claim to Cuzco, put to death by his friend Pizarro, 743.
- Almagro the younger, assists in the murder of Pizarro, is himself put to death, 743.
- Arequipa, and its mines; 753.
