The tower is founded on the bed-rock of the reef. Its shape is that of a frustum of a cone, 32 feet in diameter at the base and 18 feet in diameter at the spring of the cornice. The total height of the masonry is 93 feet. The tower is solid for the first 34 feet. Above this it is hollow, and divided into five stories or rooms. The walls are 5 ft. 6·3 in. thick at the base of the hollow portion, and 18 inches at the spring of the cornice. The tower is lined with a brick wall 4 inches thick, between which and the outer wall is an air-space of 2 inches.

Two important lighthouses have been built on the Pacific coast: one on Tillamook Rock, off the coast of Oregon, and one on Northwest Seal Rock, off the extreme northern end of the coast of California. These rocks lie exposed to the full force of the winds sweeping across the Pacific Ocean. The waves caused by gales break completely over them. While work was under way on each it was frequently interrupted by reason of the impossibility of reaching the site or of remaining on the rock when a landing had been made. Tillamook Rock is a bold basaltic mass, lying about 20 miles S. of the mouth of the Columbia river and about a mile from the promontory called Tillamook Head. The depth of water around the rock varies from 16 to 40 fathoms. Rising from the sea the west side of the rock slopes eastwardly, so that at the height of 40 feet the recession is about 30 feet; in the next 40 feet of rise the slope changes to an overhang of 25 feet; in the last 40 feet the rock again recedes. The appearance of the overhang is somewhat like that of a huge burl on a tree. The top of the rock is 120·55 feet above the lowest spring tides. From the top the rock slopes very abruptly to the eastward to a point 30 feet down, and from this point it runs down gradually to the sea at a slope of 1 vertical to 5 base. On the south side is a deep fissure about 25 feet wide, which divides the rock into two unequal parts. Waves break violently into this fissure during storms, and at times sweep down the opposite slope.

The principal division of the rock, before its surface was disturbed, was of exceedingly irregular shape, and about 100 feet square. Little needles projected everywhere above the surface, forming narrow and deep crevices, in and through which was a mass of large and small cubical blocks from 3 to 12 inches on a side, cemented together by a tough and unyielding matrix. The original columnar formation had been destroyed, and these were the remains.

The first landing for work on the rock was made on Oct. 21, 1879, and on Jan. 8, 1881, everything was finished, including the adjustment of the illuminating apparatus. Thirteen days later the light was shown for the first time. The great difficulty in the way of building this light was the great waves which rise on the Pacific without the slightest warning. Early in Jan., 1880, the water from the rebounding waves was carried up to and over the rock in such quantities and with such violence as to destroy the storehouse, which was at 30 feet above the level of the sea. The men's quarters were higher up. Although they were not destroyed, they were in great danger.

Fig. 4.—Tillamook Rock light.

The light at Tillamook Rock is 136 feet above the level of the sea.

Northwest Seal Rock is the outermost of a dangerous reef of rocks, called St. George's Reef, extending 6 or 7 miles into the ocean off the extreme northern end of California. The shape of the rock is a rough oval, with a ridge running from E. to W.; its area at the level of low water is about 40,000 sq. feet; the highest point is 54 feet above low water. The water around the rock is about 30 fathoms deep. The rock is exposed to the waves from any direction from the S. by way of the W. to N. It is very difficult to land at the rock. The structure proposed and adopted for the station is a pier of irregular oval form, having its top 70 feet above

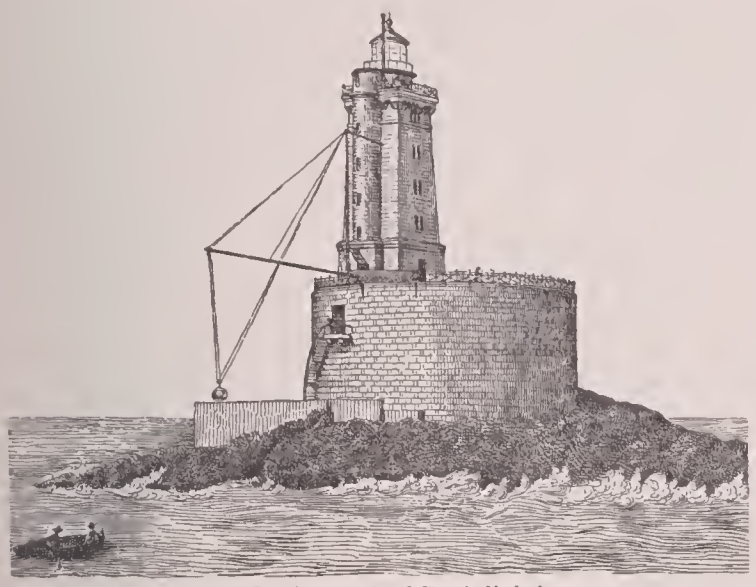

Fig. 5.—Northwest Seal Rock lighthouse.

the sea (Fig. 5). On this pier stands the keepers' dwelling, in the cellar of which are placed the fog-signal machinery and the hoisting-engines. In one side of the building stands the stone tower, from the top of which the light is shown, at a height of 145 feet above the sea. To receive the pier the outside of the rock had to be cut into four benches, and the part of the rock left standing had to be so prepared that the surrounding masonry could be bonded into it. The rock gave every indication of being, at times, completely swept by the waves, yet in order to have the area required for the pier the first benches had to be cut less than 25 feet above low water. There was no point of the rock where men or materials could find even a temporary lodgment beyond the reach of waves. As neither men nor materials could be kept on the rock, and as the nearest landing-point was 13 miles away, a vessel was used as a living-place for the men and as a storehouse for the tools, etc., required for the work. The vessel was moored a short distance from the rock by two lines leading to ring-bolts in the rock and by four lines fastened to mooring-buoys. A $2\frac{1}{2}$-inch wire-rope was made fast at one end to a ring-bolt in the rock, and at the other end to a mooring-buoy 180 feet from the vessel. The fore and main throat halyards were made fast to the strap of a block over which the wire-rope could work easily. By means of the halyards the part of the rope at the vessel could be raised or lowered. A traveler block moved by an endless rope was used to send the men and materials to the rock, and to bring the former back. The men were generally carried in an iron cage. In spite of all these difficulties the benches for the foundation courses were cut in the rock, and the cistern, of a capacity of 77,000 gal., was excavated, all during the season.

To prepare the rock for the bottom courses of the pier a bench 10 feet wide, having four different levels, was blasted out and accurately finished with patent hammers. The center cone was roughly stepped to receive the masonry. The outside courses of the pier are 2 feet and 2 ft. 6 in. high, built in Flemish bond. The headers are 5 feet long by 2 ft. 6 in. width of face; the stretchers are 5 ft. 8 in. long by 2 ft. 6 in. bed. All horizontal beds are connected by a 2-inch diameter dowel of gun-metal in each block, projecting half its length into the course below, except in the upper course, in which the dowels are omitted, but all the vertical joints of the outside stones of this course are dovetailed or joggled into each other. The top of the pier is laid with stone flagging 12 inches thick, finished with eight-cut patent hammers. This serves as a water-table with 3 inches fall from the center to gutters cut in the stone at the outer rim, whence the water is carried by a 4-inch pipe to the cistern in the base of the pier. To prevent leakage, all the joints in the top of the pier were cleaned to a depth of 2 inches, and thoroughly calked with sand and cement moistened with boiled linseed oil.

The lighthouses considered so far have been all founded on rock. We come now to foundations more or less unstable. These foundations may be divided into three classes: (1) Where the substratum may be regarded as stable so long as it is protected from the action of the sea; (2) where it is so soft that the pressure must be spread over a large area, so as to reduce that on the unit of area to a minimum; (3) where the material of the substratum is liable to be attacked by water.

As examples of the first class may be mentioned the towers at Cape Hatteras and Body's island, N. C., and at Mosquito Inlet, Fla. The first two rest each on a grillage which, at Hatteras, is 6 feet below the surface of the beach, while at Body's island it is 7 feet below. In each case the grillage is made of two courses of 6-inch by 12-inch timbers laid at right angles to each other, the timbers of each course being set close. At Hatteras there was laid on this grillage a massive octagonal foundation of large granite blocks set in cement mortar, the interstices being filled with smaller stones of the same kind. At the proper height the octagonal plinth courses were placed. At Body's island one course of dimension stone 18 inches thick was laid on the grillage. On this was set coursed rubble in large blocks, thoroughly breaking joints, and all grouted with one part of Portland cement to two parts of clean, sharp sand. At Mosquito Inlet the excavation for the foundation was carried to 12 feet below the level of the surface. In this excavation was placed a circular bed of concrete 48 feet in diameter. As the concrete foundation was built up, its diameter was reduced 2 feet at each 2 feet of height. On top of the concrete foundation was laid a belt course all around the base of the tower. From this belt course starts the tower proper, which is the frustrum of a cone of 30 feet outside diameter at the bottom and 18 feet outside diameter at a height of 120 feet.

As an example of the second class of foundation, the Southwest Pass lighthouse may be taken; it is the most important light in the Gulf of Mexico. The soil where this light stands is the mere sedimentary deposit of the Mississippi river, its components being clay, very fine sand, and vegetable matter. It is too soft to sustain any considerable weight. To obtain the foundation, piles were driven in rows over an area 60 feet in diameter. The piles in each row were $3\frac{1}{2}$ feet between centers, the rows being the same distance apart. The piles were all driven to a depth of 50 feet and cut off at 2 ft. 6 in. below low water. In the center of each of the squares thus formed was driven another pile to a depth of 50 feet, and cut off at 1 ft. 6 in. A grillage of 12-inch square timbers, laid at right angles and halved to each other, was laid on the first set of piles. The grillage was built up to a height of 1 ft. 6 in. above low water. The pockets of the grillage were filled with concrete, and the whole space occupied by the grillage was covered with 4 feet of concrete. To this concrete mass are anchored the socket disks from which the legs of the skeleton tower rise.

Under the third class may be grouped two kinds of structures: those in exposed positions where great strength is required, and those in safer places, or where the light required is such that a heavy structure is not needed. Those in exposed positions have either tubular or caisson foundations. The tubular foundation was first proposed by Maj. (now Colonel) G. H. Elliot, corps of Engineers, while he was engineer secretary of the lighthouse board. The lighthouse at Old Orchard Shoal, New York harbor, is constructed in this way. It consists of a cast-iron cylinder, open at the bottom, 33 feet in diameter and 45 feet high. A hole 7 ft. 8 in. deep was dug in the shoal by means of a dredge. The cylinder, made of seven courses of thirty-two plates in each, was set in the hole dredged for it. The bottom of the cylinder for a height of $13\frac{1}{2}$ feet was filled with concrete laid under water. Above this level the concrete was laid after the water in the cylinder had been removed. The concrete was continued up solid to a height of 3 ft. 10 in. above high water, except the hollow left for the freshwater cistern. The remaining height of the cylinder, 10 ft. 9 in., is occupied by the cellar, its floor, and the masonry which supports the superstructure. The top course of plates curves outward, so as to give a support to the balcony which surrounds the structure. When the concrete filling

was finished a mass of riprap was piled around the cylinder to give greater stability.

The best example of a caisson foundation in the U. S. is that of the Fourteen Foot Bank light in Delaware Bay, about 22 miles from its mouth. It is an important light, as it marks a turn in the channel. It is exposed to heavy shocks from ice when the latter goes out of the bay after a hard winter; hence it must have great stability. It stands on an oval-shaped shoal, on which the least depth of water at low tide is 20 feet. The foundation for the light is a mass of concrete which rises to a height of 13½ feet above high water. The bottom of the mass is 23 feet below the surface of the shoal. The difference between high and low water is 6 feet. The concrete mass is inclosed in a cast-iron cylinder, 35 feet in exterior diameter and 73 feet high; the top of the cylinder is 10½ feet above the top of the concrete. This part of the cylinder is lined with masonry and concrete, and forms the cellar of the lighthouse. The cylinder is made of twelve courses of cast-iron plates, thirty-six plates in each course. The plates are 1½ inches thick, 6 ft. 1 in. high, with horizontal and vertical flanges, 6 inches wide and 1¾ inches thick, on each plate.

The second kind of these foundations is found in the numerous forms of iron piles, which are much used at points where ice is rarely found. There are cases, however, where these structures have stood severe attacks of ice, but in other cases some have been carried away. If a tower be erected on this class of foundation, it is almost invariably what is known as a skeleton structure.

The first of these structures in the U. S. was the light at Brandywine Shoal, 8 miles from the mouth of Delaware Bay. The site is much exposed to waves from the ocean. The depth of water on the shoal being comparatively slight, 6 feet at low water of spring tides and 13½ at high water, the light is not exposed to serious attacks from ice, which generally grounds on the shoal above, and below the site. As this lighthouse was built before the lighthouse board was formed, nothing is known about the details of its construction except that it is founded on nine screw-piles. An ice-breaker also resting on screw-piles was added after the construction of the lighthouse. The top of the ice-breaker is planked over and forms a platform about the lighthouse.

Another sort of foundations of this class is that adopted for some of the towers of the Florida keys. The tower at Fowey Rocks may be taken as a model. The depth of water where it stands is 5 feet at low tide and 8 feet at high tide. The ground is coral rock. The structure stands on nine piles of solid wrought iron 12 inches in diameter, set at the center and angles of a regular octagon. The piles are pointed. A shoulder is made on each pile 10 feet above the point. Each pile is driven through a cast-iron disk, accurately placed on the bed of the ocean, until the shoulder rests on the disk. The piles are securely fastened together by braces and tie-rods, and on them the superstructure, a skeleton tower, is raised.

The foundation of the lighthouse at Race Rock, at the eastern entrance to Long Island Sound, presents some features peculiar to itself. The site is exposed to heavy wave-action from the E. and S. E. The tidal currents run with great violence in each direction; hence the name, "The Race," given to the waterway between Little Gull island and Fisher's island. The ice from the Thames river and from the adjacent waters of the Sound is also to be feared. For these reasons a large mass of riprap, 100 by 150 feet on top, was formed, the sides being protected by blocks of stone of 8 or 10 tons weight. The interior of this mass was removed and the concrete foundation laid in its place. The foundation was laid in steps 2 feet high, each layer being shaped by means of a cast-iron ring, which was placed in position by a diver.

The superstructures of lighthouse towers present no special difficulties. Where they are exposed to the violent action of waves, as at Minot's Ledge, they are built of masonry, the stones being cut so that each one has a firm hold on those on each side of and above and below it. Great dowels of metal also pass from one stone to those next above and below. Every means which ingenuity can suggest is used to insure the solidarity of the mass.

There are many points of the coast where the sea is encroaching rapidly. At some of these places towers have been built of such construction that they can be taken down if necessary and removed to safer sites. The tower at Hunting island, S. C., is a specimen of this sort of structure. It is built of cast-iron panels, each of which is flanged on all four sides, so that it can be bolted securely to those around it. This iron tower has a brick lining 9 inches thick. The lighthouse at Cape Canaveral, Fla., which is of similar construction, is (1894) in course of removal to a new site, about a mile farther inshore.

An iron skeleton superstructure presents many advantages in its lightness, the quickness with which it can be built, and its comparatively small cost. The lighthouse at Cape Charles, Va., has a tower 175 feet high from the top of the concrete blocks which form the foundation to the focal plane of the lens, and 192 ft. 7¼ in. to the top of the pinnacle of the lantern. The tower has a central cylinder, 9 feet in external diameter, made of cast-iron plates, and supported by eight hollow cast-iron legs. The cylinder contains an elevator, in which a load of 250 lb. can be carried to the watch-room, and a stairway surrounding the cylinder. The external diameter of the bottom sections of the legs is 13 inches. The remaining six sections have this diameter reduced successively by an inch, so that the top section is of 7 inches diameter.

The cost of these different structures is:

Minot's Ledge	$332,000
Spectacle Reef	406,000
Tillamook Rock	123,300
Northwest Seal Rock	730,000
Cape Hatteras	222,500
Body's island	177,200
Mosquito Inlet	135,600
Southwest Pass	270,700
Old Orchard Shoal	57,500
Fourteen Foot Bank	124,400
Brandywine Shoal	160,600
Fowey Rocks	163,000
Race Rock	285,700

Lighthouse Illumination.—It will be well to lay down a few principles before describing the apparatus used for lighthouse illumination. Any brilliant body emits rays of light which, if not arrested, go out in all directions. As an observer goes away from the body its brightness diminishes, as he comes near it increases. This change of brightness in an absolutely transparent atmosphere takes place according to "the law of the inverse squares," i. e. if the light be seen from a distance of 2, 3, 4, 5 . . . yards, its brightness at these distances is ¼, ⅑, 1/16, 1/25 . . . of what it is at a distance of 1 yard. In an ordinary atmosphere this law holds good only in part, because of the absorption of the light by particles of all sorts, vapor, dust, etc., which are in the air. The loss of light then becomes greater than the law of inverse squares indicates. In order to overcome this loss it is necessary to concentrate and make parallel with each other the rays of light given off by the body. This may be accomplished by a lens which refracts or bends the rays passing through it. This way is called the "dioptric" system. It may be accomplished by reflecting the rays back from a properly shaped mirror. This is called the "catoptric" system.

The simplest reflector which sends out the rays parallel to each other is that made by revolving a parabola on its axis. A parabola (Fig. 6) is a curve of which each point is situated at equal distances from a given point, called the focus, and from a given straight line. In Fig. 6 Y O Y is the given straight line, and F is the given point or focus. The curve A B C is a parabola. The straight line O A X is called the axis. If the curve be made to revolve about the axis it will make a hollow surface, which, if cut by any plane passing through the axis, will always show a line shaped like B A C. A marked character of this sort of mirror is this: every ray of light coming from the point F is reflected back in a line parallel with the axis O A X. Thus the rays F B, F*a*, etc., F C are reflected at B, *a*, etc., C, in the directions B*b*, *ab*, etc., C*b*.

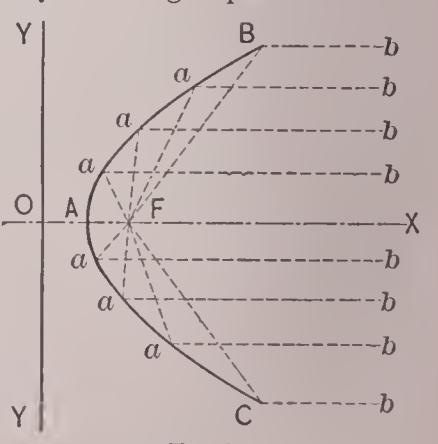

FIG. 6.

In Fig. 7 the small circle represents the flame of a lamp so placed that its center is at the focus of the reflector.

The rays from the side E of the flame are reflected along the lines E_1 and E_2; those from the side F are reflected along F_1 and F_2; the angle $Ea_1F = E_1 a_1 E_1$ is called the divergence of the reflector. It varies slightly from point to point of the curve, as the distance of each point from the flame changes.

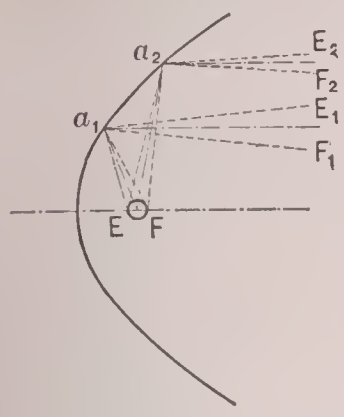

FIG. 7.

A third way of changing the direction of the rays rests on the optical fact that rays of light striking the plane face of a transparent body under a certain angle, which varies with the composition of the body, are totally reflected. This is called the principle of total reflection. The ray starting from F, Fig. 8, strikes the side of the triangular prism, of which A B C is a section, at L; here its course is changed to the direction L M; at M it is totally reflected from the face C B, and takes the direction M N; at N its course changes again to N H. By giving a proper position to the prism the final direction F H of the ray may be made parallel to the horizon. This system being a combination of reflection and refraction is called the "catadioptric."

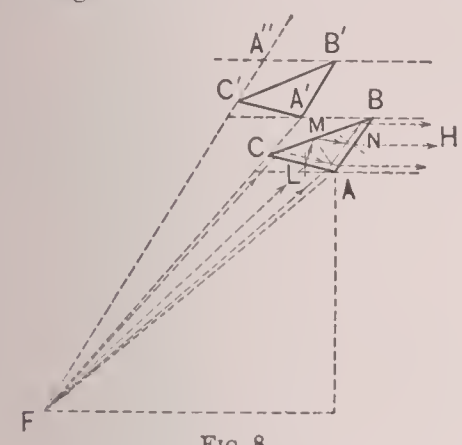

FIG. 8.

All three of these systems find their application in lighthouse illumination.

Nothing certain is known about how the lighthouses of ancient times were illuminated. It is probable that it was by means of burning wood, although some writers think that in the following lines of Lucanius's *Pharsalia*

> Sed prius orta dies nocturnam lampada texit
> Quam tutas intraret aquas . . .

the word *lampada* points to the use of some other illuminant. It is more likely that this is only a poetic expression for the tower and the light it carries. Pliny, in speaking of the lights at the tops of the towers, expresses the fear that the steadiness of these lights may cause them to be taken for stars, as they look much alike, "Periculum in continuatione ignium ne sidus existimetur, quoniam e longinquo similis flammarum aspectus est," and it has been thought that this fear would apply better to the light of a lamp than to the waving and unsteady flames of a wood fire. Outside of these vague presumptions there is nothing to show that the ancients used oil-lamps in their lighthouses. Be this as it may, it is well known that wood and coal were the usual illuminants for lighthouses until after the middle of the eighteenth century.

In the early part of 1674 the sum of 1*s.* 6*d.* was paid by the town of Hull, in Massachusetts, "for making fire-balls of pitch and oakum" wherewith to light the beacon.

When the Eddystone tower (Rudyerd's) was destroyed in 1755, the light was given by 24 candles weighing 2½ lb. each. It is not known certainly whether candles were used from the beginning of this light's service in 1708, but such is thought to be the case. The Cordouan light, one of the most celebrated on the French coast, was lighted by coal burned in a large open basket, until 1782, when the coal-basket was replaced by Sangrain reflectors. These were segments of spheres with an oil light given by one, two, or three flat wicks placed in the horizontal axis of each.

The Sangrain apparatus was so weak that great complaints were made, and mariners desired to have the old illuminant restored. M. Teulère, a distinguished engineer, was sent to examine into and report upon the defects, and to present a project for removing them. He showed that the Sangrain reflectors were defective in that the rays of light were greatly scattered; then he discussed the various methods for concentrating light into beams visible at great distances. He proposed a series of 24 lamps "of which the wick, instead of being flat, forms a cylinder of 2 inches diameter and 3 lines thick, leaving a tube through the middle for the passage of air"; these lamps to be placed each at the focus of a parabolic reflector, the reflectors to be distributed in three circles, one above the other, so as to spread the light uniformly over the horizon; the whole to be made to revolve by clockwork. The idea of the circular hollow wick had occurred to Argand between 1780 and 1782. Teulère made his report in 1783. There are strong reasons for believing that he knew nothing of Argand's invention, but if he did he at least deserves the credit of taking in at once its advantages.

The apparatus proposed by Teulère was made by Lenoir in 1790 under the direction of Borda. He made cast-steel parabolic reflectors 812 mm. wide and 325 mm. deep, the inside surface being covered with several sheets of silver. The lamp had a tubular wick 35 mm. in diameter, and a crystal chimney. The reflectors were put in place in 1791. The adoption of this apparatus (parabolic reflectors and Argand lamps) was an important advance. The system soon spread not only in France, but also in neighboring countries. It held its ground for years, and it is in use yet for the smaller range-lights and for lightships; but a reflector is inefficient and wasteful of light. Little more than half the strength of the rays which strike the reflector is given back, the rest being absorbed. All the light thrown out between the lines F B, F C (Fig. 6) is diffused rapidly, and produces but little effect.

On June 21, 1819, there was appointed to the French lighthouse commission a man, Augustin Fresnel, whose mission it was to revolutionize the lighthouse service of the world, and to found the principles on which the construction of lighthouse apparatus rests. He was led, by reason of the great absorption of light by reflectors, to propose lenses, because glass of ordinary thickness does not absorb more than one-tenth of the light which passes through. A lens made in a single piece would be of immense weight, and its great thickness would absorb much light. "But," he says, in his memoir of 1822, "if the lens were divided into concentric rings, and all the useless thickness of the small center lens and of the surrounding rings were removed, enough being left to admit of fastening their edges firmly together, it may be seen that the parallelism of the rays coming from the light may be obtained by giving to the surface of each ring a proper curve and inclination." Buffon had suggested this way of constructing ordinary lenses, but nothing seems to have been done with the idea. Condorcet had suggested a similar method of making large burning-glasses. Fresnel propounded the same idea in ignorance of the labors of the others, and to him is due the honor of finding the use to which it was best suited—the construction of lighthouse apparatus.

There is a limit to the useful size of a lens, because if the light strikes the surface of the lens at too small an angle

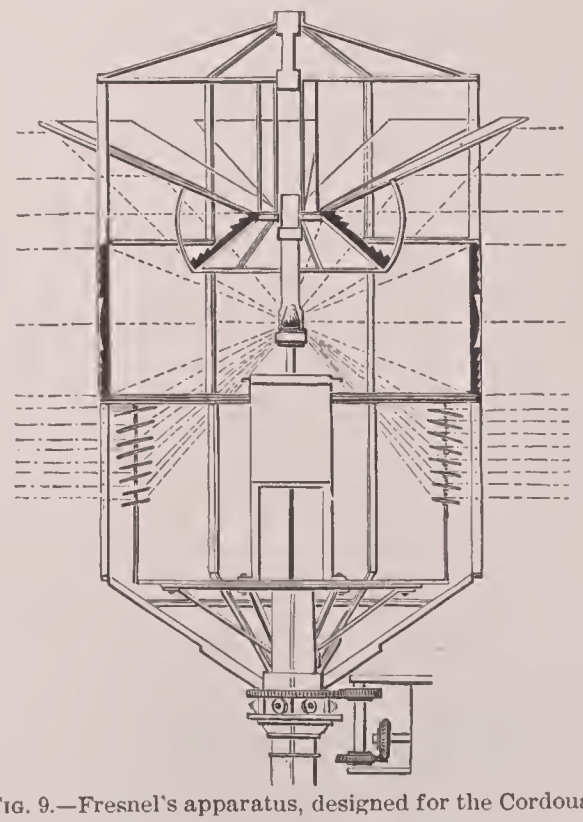

FIG. 9.—Fresnel's apparatus, designed for the Cordouan.

much of it will be lost by reflection. Fresnel thought of and actually used mirrors above and below the lens proper to utilize this light, which would have been lost without

them. Figs. 9 and 10 show the application of such reflectors to the light of the Cordouan tower, which replaced the reflectors in use up to 1823. This apparatus shows an octagonal frame supporting a middle belt of eight lenses,

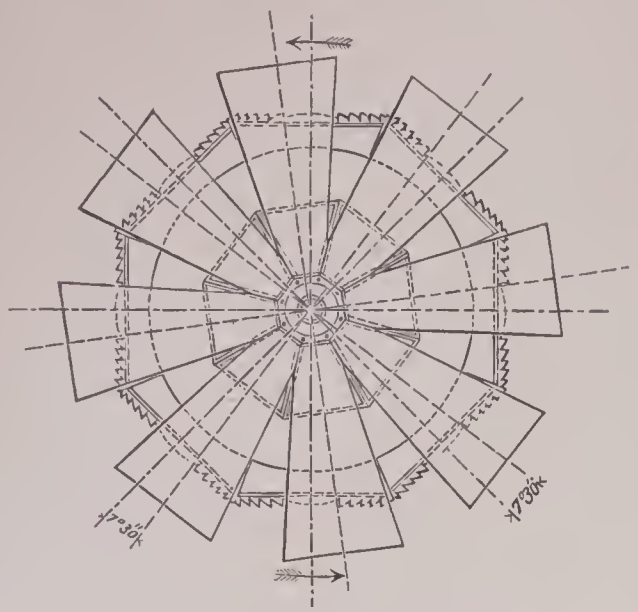

FIG. 10.—Plan of the Fresnel apparatus designed for the Cordouan.

eight small lenses above to catch the overhead rays and send them in parallel lines to the mirrors above, and eight series of small mirrors below to catch and send to the horizon the rays which would be lost below the central belt. Such an apparatus required a powerful lamp, and Fresnel was led to the construction of one with four concentric wicks, and to devising mechanical means to keep the wicks saturated with oil.

The lenses used for ordinary optical purposes have a focal length which is great when compared with their other dimensions. The lenses used for lighthouses are very different; their focal length is small. If in Fig. 11 the central lens A*l* B*m* be taken it will be seen that its height A B is small compared with its focal length F*l*. If a lens be taken like H*h i*I, its height is great in comparison with the focal length. With the increased height comes increase of thickness. With increase of thickness come loss of light, while

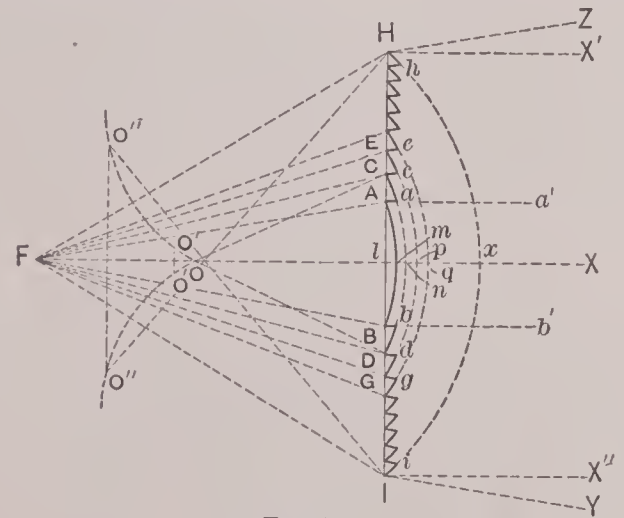

FIG. 11.

the ray traverses the glass, and increase of weight. With the lens of large dimensions the phenomenon of spherical aberration becomes more marked. The rays F H and F I, instead of taking the directions H X′ and I X″ parallel to F X, would take the directions H Z and I Y after passing through the lens. As the great thickness *lx* is only hurtful, it should be reduced to just what is necessary for proper strength and stiffness. The height A B of the central lens is such that no spherical aberration shall be evident; in other words, that the rays F A, F B shall take the directions A*a*′ B*b*′ parallel to F X after leaving the lens. If the next series of rays—those included in the angles A F C and B F D—be considered, they will be found to diverge a little from parallelism with F X. To correct this the shape of the next adjacent part of the apparatus is somewhat changed, and the face C*a* of the small triangle C*a* A is made with a curve, of which the center is at O′ below the axis of the apparatus. In like manner the center of the face D*b* of the triangle D*b* B is at O′ above the axis. Successive triangles are added. The outside face of each is constructed with a different radius, the centers of the arcs being on the line O O′ O″. The height of the dioptric belt is given by the condition of having the angle H F*l* one of 38°. This lens could be extended theoretically to an indefinite extent on each side of the axis, but as the distance therefrom is increased the rays from the source of light strike the inner face of the lens under a constantly decreasing angle, so that most of the light is reflected from the lens instead of passing through it. Hence after reaching a certain limit some other way of sending the rays to the horizon must be used. The catadioptric rings give the means of doing this. These rings are triangular in shape, as shown in Fig. 8. A luminous ray starting from the focus F strikes the surface C A of the ring at L; it is refracted along L M, and strikes the upper face at M, whence it is reflected away at an angle 80° to 84° along M N without experiencing appreciable loss; it goes out by the face A B in a horizontal direction if the cross-section be made with this in view. All the rays included in the triangle A F C act in the same way. If the dioptric belt end at A, A B C would be the first catadioptric ring. The next ring would be so placed as to catch the next ray above F C, and to send it out horizontally just above B. The proper position for A′ is therefore at the intersection of F C prolonged, and of a horizontal line through B. In like manner a third ring would have its summit at A″, and so on. A similar series of catadioptric rings is placed below the dioptric belt. In small apparatus the lower prisms are located in the same way as are the upper. In large apparatus they are placed vertically one below another. This arrangement must be made so that the keeper can enter the apparatus in order to clean it. All parts of the small apparatus can be cleaned from the outside.

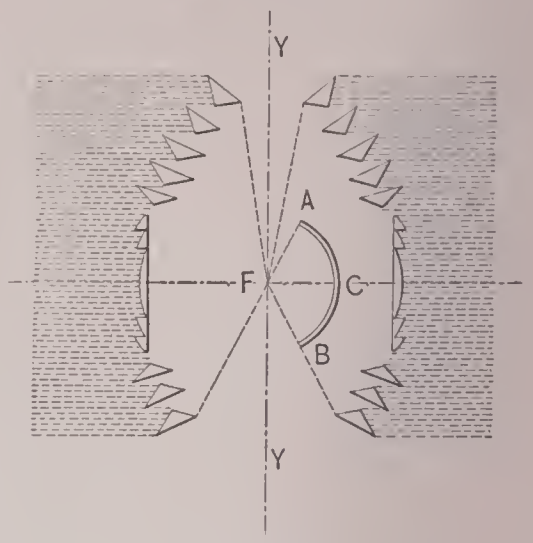

FIG. 12.

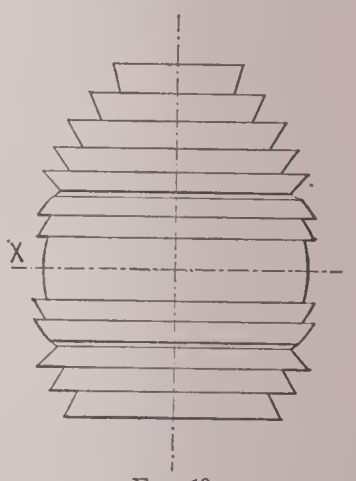

FIG. 13.

If all the dioptric and catadioptric sections mentioned above be assembled there will result a figure similar to Fig. 12, which is a section of a fourth-order apparatus. The rays of light after passing through the lenses and prisms follow the directions of the horizontal lines. If this section be revolved about the line F Y it would give a figure shown in elevation in Fig. 13. If revolved about F X the elevation would be as in Fig. 14. In the former case there would be a broad band of light distributed equally over the horizon; in the latter case there would be one large beam going out on each side. These two dis-

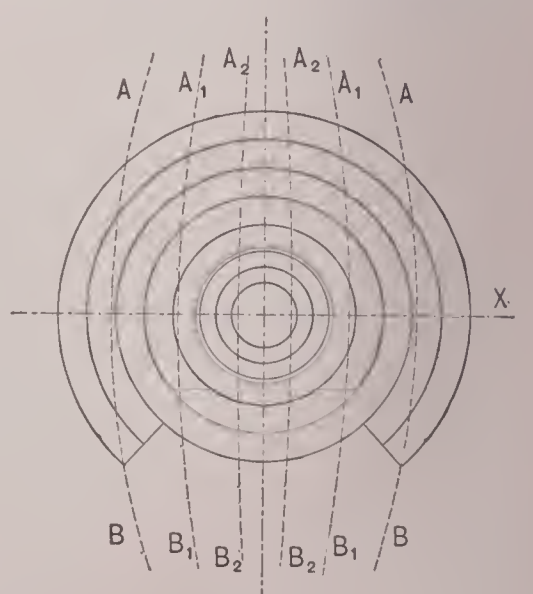

FIG. 14.

tributions of light are shown in Figs. 15 and 16. If a reflector, as A B C, Fig. 12, be placed so as to cut off and send back the rays going to the right, the apparatus standing still, the light would be called a range-light. If this apparatus with a reflector and one beam, or the one with a beam on each side, be made to revolve about a vertical axis, so that the beam or beams of light should fall successively on each point of the horizon, the light is called a flashing light. If the light be distributed steadily and constantly over the entire horizon the light is called a fixed light.

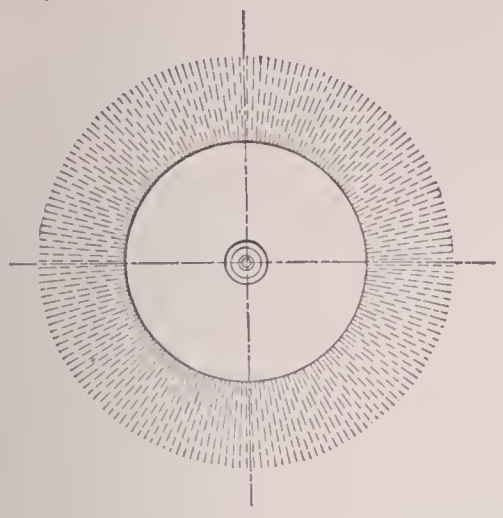

Fig. 15.

In the case of the flashing light it may be desirable to have the flashes succeed each other more rapidly than those given by the two beams. In such cases a part of the lens is taken. For example, if there are to be four beams of light, the part of the elevation, Fig. 14, included between the lines A B, A B only would be considered; if eight beams be desired, the part between A_1 B_1, A_1 B_1 would be used; if sixteen beams, the part between A_2 B_2, A_2 B_2.

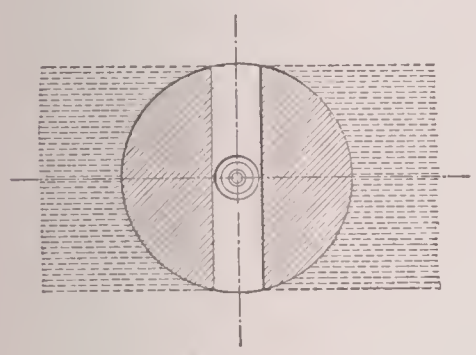

Fig. 16.

Each of these parts is called a panel. It is easily seen that with every increase in the number of beams the intensity of each is reduced. Each of the four beams has one-half the intensity of either of the two beams and double that of either of the eight beams.

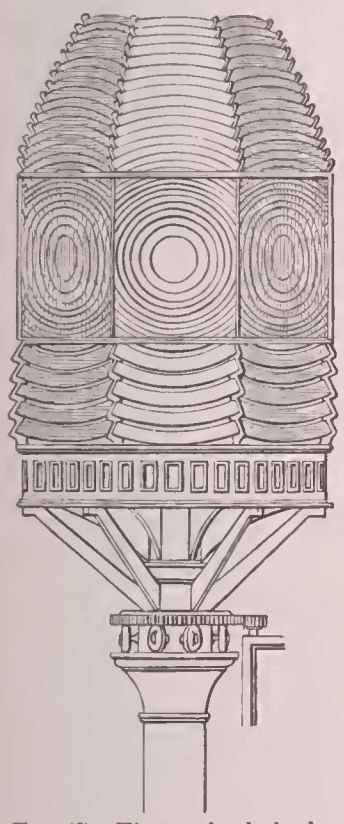

Fig. 17.—First-order holophotal catadioptric apparatus.

In order to turn the apparatus around it is mounted on a frame, called a chariot, which rests on rollers. (See Fig. 17.) This is driven by a clockwork. In small apparatus the chariot and rollers are replaced by a pivot. The friction is great in either case, and the motion is slow. One revolution in four minutes is about the fastest for a first-order light. If the interval between the flashes is to be short a number of panels has to be used; for example, to have a flash once in 15 seconds 16 panels are required if a revolution in 4 minutes be the rate of speed. Such flashes have long been recognized as lacking strength; but to increase the strength the number of panels has to be reduced, hence the speed of rotation has to be increased. New means of support are required for this. The solution of the problem has been found in the mercury float.

The frame supporting the apparatus rests on a vertical shaft firmly held at two points. Attached to the shaft is a collar which rests on and is securely fastened to a circular float, which is borne by quicksilver confined in a circular trough which surrounds the shaft. Fig. 18 shows this arrangement. L is the apparatus mounted on a plate, P, which is supported by the shaft S. The shaft is held securely in a vertical position by the sleeves C and D. The float F is fastened securely to the shaft by the collar K. It is set inside of the trough T, in which is placed sufficient quicksilver to support the whole apparatus. M is the clockwork which causes the plate P to revolve and carry with it everything attached to the shaft.

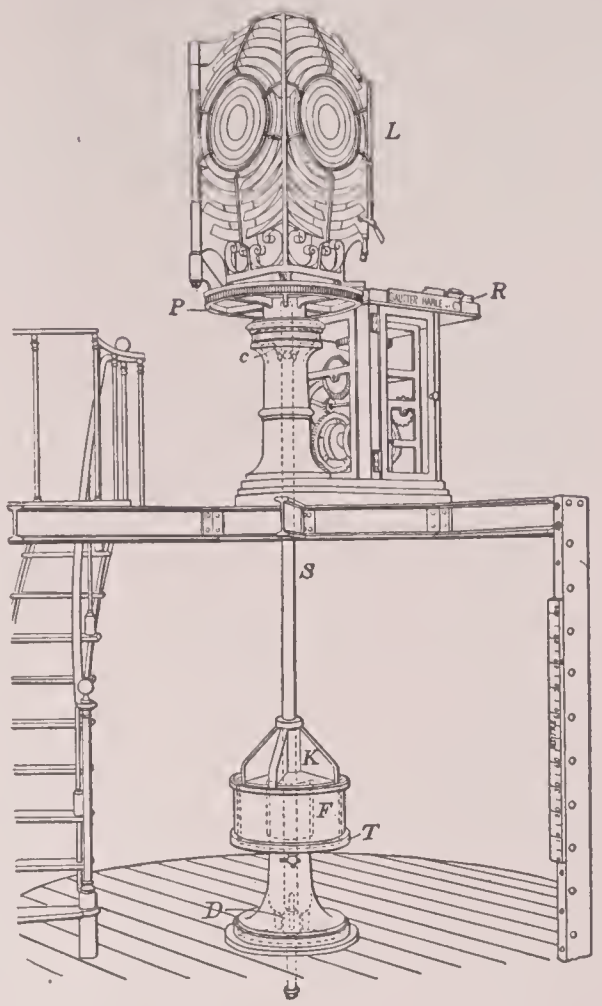

Fig. 18.—Apparatus with four lenses for lightning-light illumination.

Lighthouse apparatus is divided into several orders, depending on the focal length in each case. The orders are 1st, 2d, 3d, 3½, 4th, 5th, and 6th. Their use is governed by the importance of the site occupied by the lighthouse. The first-order lens is the largest. A light of this order is placed on very important points of the coast, such as a marked headland, the entrance to an important harbor, to mark some special obstacle, etc. The second and third order lenses are placed at less important points. The third-and-a-half and lower orders are rarely used as coast lights. They come under the general head of interior or harbor lights. The focal length of each size of lens is: Of the first order, 36·25 inches; of the second, 27·58 inches; of the third, 19·70 inches; of the third-and-a-half, 13·78 inches; of the fourth, 9·35 inches; of the fifth, 7·39 inches; of the sixth, 5·91 inches. Before the principles of illumination became so well understood as they are now increased brilliancy was sought by means of larger lamps. Larger lamps caused too great a divergence of the rays when used with the ordinary lenses, hence a large lens of 52·40 inches focal length was devised. It is called a hyper-radiant lens. Prof. Wigham, of Dublin, after increasing the size of his gas-burner (which is mentioned later), caused to be constructed what he calls a "giant" lens of 78·72 inches focal length. He uses only the dioptric belt of this lens, however, and therefore he wastes one-third of the light furnished by his burner. These immense affairs are very expensive. The new method of flotation on mercury, giving great speed of rotation, the exact suiting of the lamp to the lens, and the greater spread given to the latter, are gradually causing the old apparatus to disappear.

Until about a hundred years ago fires burning at the tops of lighthouses were the accepted guides for night. With the changes recommended by Teulère came the use of oil as an illuminant. The first oil burned in the U. S. was fish oil. This was succeeded by sperm oil in 1812. Sperm oil was the standard illuminant when the lighthouse board was organized in 1852. Its constantly increasing price caused the board to investigate the question of replacing it with some other. Careful analyses were made of sperm, whale, shark, fish, seal, colza, olive, lard, and mineral oils. Tests

of all sorts were applied to prove their adaptability to the use of the lighthouse service. The results of these analyses and tests showed that colza oil was undoubtedly the best. It was adopted in 1862 to a great extent, as much as 12,000 gal. having been bought in that year. Experiments were carried on with lard oil, and it was soon found that it was superior to the colza in some respects, while in price it was cheaper. Lard oil was then the standard illuminant until 1878–79. Since that time it has been displaced gradually by mineral oil, which is now universally adopted for all the lights of the U. S. In addition to the great brilliancy of its flame, the low price of this oil makes it an exceedingly economical illuminant. The consumption of this oil increased from 48,000 gal. in 1880 to 350,000 gal. in 1894.

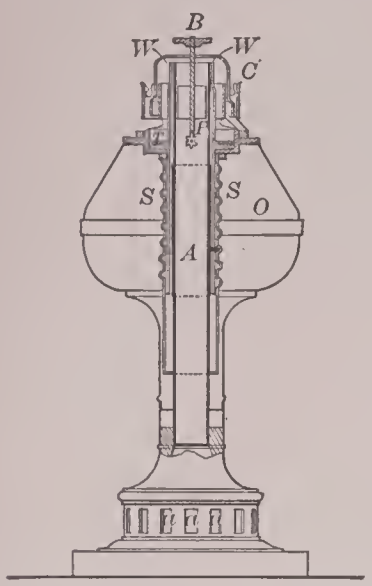

Fig. 19.—Funck-Heap fourth-order mineral oil-lamp, vertical section.

The lamps used in the lighthouse establishment of the U. S. are very simple. In the 4th, 5th, and 6th order lamps but one wick is used. This style of lamp is shown in Fig. 19. In this figure O is the oil-reservoir. The wick occupies the space W W. The lower end of the wick is attached to a brass tube, which carries a stud working in a spiral channel, S S. The pinion P moves the wheel T, and causes the tube to turn. The spiral channel causes the tube to move up or down. The flame is made to spread by the button B. Air for the inside of the flame enters through the openings *a a a* in the base of the lamp, and rises through the tube A. C is the chimney support.

Gas is used to only a limited extent in the U. S. It has practically no advantages over oil. If the place where it is used be not near a city or town whence the gas can be supplied, the construction of a special plant for making it would be so expensive as to put its price at a prohibitory figure. It is used, however, in a state of compression at some points—e. g. on Dry Romer Shoal, at the entrance to New York harbor, and at the Christiana beacon, mouth of Christiana creek, Del. At these places the gas-supply is compressed into tanks, which are securely fastened to the beacon. The illuminant is fed gradually to the burner by means of a special device.

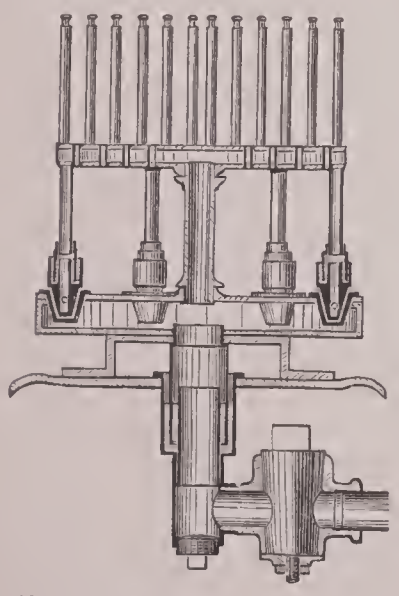

Fig. 20.—Wigham's gas-burner.

Prof. J. R. Wigham, the adviser of the Irish Lights Commission, has constructed a special burner, Fig. 20, composed of five series of jets arranged in five concentric circles, of which the innermost contains 28 jets. Each circle outside contains 20 additional jets, so that the total number of jets in use may be 28, 48, 68, 88, or 108, according to the number of series used. The diameter of the rings varies from 4 to 11¼ inches. The candle-power according to the jets in use is 250, 680, 990, 1,400, and 2,300. The jets are provided each with a fish-tail burner. The flame is 14 inches in diameter and 6 inches high. There is no glass chimney. The heat from the burner is so intense that the lenses and prisms of the apparatus are sometimes cracked. In order to increase the power of his light Mr. Wigham has proposed to superpose the dioptric portions of several flash panels in two, three, or four tiers, with a separate burner in each. These he calls his bi-form, tri-form, or quadri-form light, according to the number of tiers. Fig. 21 shows a vertical section of a tri-form apparatus.

Compressed gas is coming into extensive use in France for use in buoys. There are nearly a hundred of these lighted buoys on the French coasts. The French lighthouse board has recommended the replacing of six lightships by a large number of these buoys. The recommendation has been approved, and the replacement is now in course of execution. There are but few of these buoys in the U. S. They are run down so constantly through the carelessness of masters and pilots of vessels as to make their maintenance exceedingly expensive.

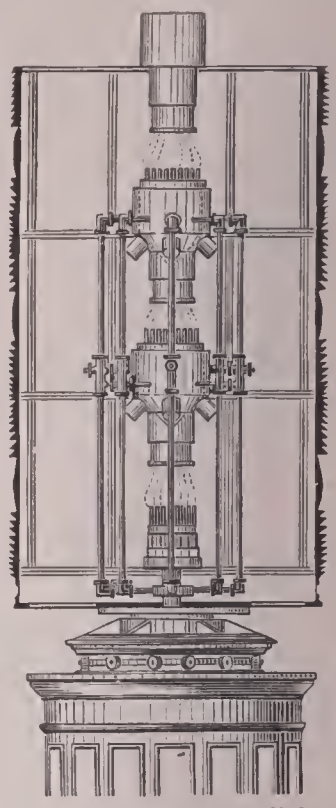

Fig. 21.—Tri-form gas-light apparatus.

The application of electricity to the lighting of lighthouses has received an immense development in recent years. The first attempt was made in France in 1863 at the La Hève light-station. Since then this kind of light has come more and more into use. It is extensively used in France and England. Even Italy and Spain have introduced it. Fig. 22 shows the essential arrangement of this kind of light, which is simply an arc light placed inside of a lens.

The whole theory of lighting a coast has changed greatly since 1889. Up to that time the changes made were very gradual. After the invention of the catadioptric apparatus by Augustin Fresnel, who died before he could see the full fruit of his labors, his work was carried on by his brother, Léonor Fresnel, who succeeded him in the French lighthouse establishment. The first lights made were fixed lights—i. e. lights which shine with a fixed intensity and illuminate equally all parts of the horizon. As it was manifestly impossible to tell one fixed light from another, duplicate and even triplicate lights were used to indicate certain places more clearly. Examples of this system are seen in the double first-order lights of Thatcher's island, Mass., and of the Navesink Highlands, N. J., and in the treble fourth-order lights of Nauset Beach, on the eastern side of the peninsula of Cape Cod, Mass. This method of distinguishing places was expensive, inasmuch as it required the duplication of everything, towers, lanterns, lenses, lamps, etc. It also requires double supplies of oil, wicks, chimneys, and other furnishings. With the introduction of flashing lights it was possible to do away with the cumbersome system of double and treble towers. By varying the number of panels in a flashing apparatus, or by changing the speed of revolution, it was possible to vary the rapidity with which the flashes were seen. The enormous friction developed by the great weight of the apparatus prevented a rapid motion of rotation, and this varied between 4 and 8 minutes to a revolution. This required a large number of flash panels if the flashes were to succeed each other rapidly. At Barnegat, N. J., for example, the lens revolves once in 4 minutes; as there are 24 panels the flashes follow each other at intervals of 10 seconds.

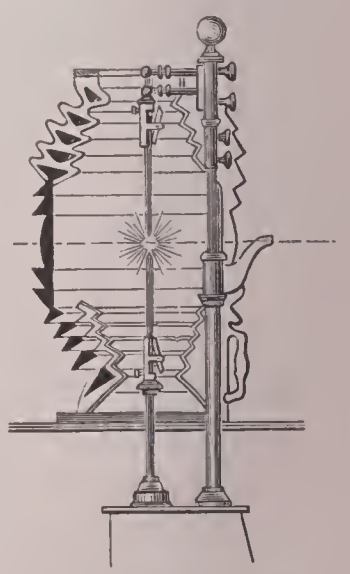

Fig. 22.—Electric-light apparatus.

Léonor Fresnel considered that the flashes should be about eight seconds in length from the time they began to show until they disappeared. A wide dispersion had to be given to the beam in order to make it last so long. Its power was therefore dissipated over a wide space. This dissipation, added to the small amount of light used by a narrow panel, caused the flash to be weak.

Studies made by Dr. Charpentier, of Nancy, in France, on the duration of impressions on the retina show that after the maximum impression is produced it is a waste of energy to hold that impression on the retina. Experiments in the laboratory and in the field show that as a rule so short a

space as 0·003 second is sufficient to produce a distinct impression on an acute eye, and that one-ninth or one-tenth of a second is sufficient for the average eye. The experiments have also shown that the more powerful the light the shorter the time required to produce the impression. As a lighthouse must be used as a point on which to take bearings, it is essential that the light shall be of such a nature that the bearings can be taken. A French nautical commission gave great attention to this subject during a period of many months. One result of their work was that it was perfectly practicable to take bearings with flashes of one-tenth of a second, provided that the interval between them was not more than five seconds.

These considerations of sharp, quick flashes coming at short intervals led to the devising of the lightning lights (*feux éclairs*) by M. Bourdelles, the present director of the French lighthouse service. The characteristics of these lights are an exceedingly small divergence of the beam, a wide opening of the panel, a swift revolution rendered possible by the mercury float, and a careful adjusting of the diameter of the burner to the focal length of the lens. These lights are the most scientific and carefully wrought out apparatus yet introduced into the lighthouse service. As yet they are little known outside of France, a country which has always been in the van of lighthouse improvement.

The lightning lights are made in many different forms. In some cases there is but one large lens with an opening of 180°. A reflector placed on the side of the focus opposite the lens prevents any waste of light. In this case the apparatus is said to be univalve. There may be a lens of 180° opening on each side of the focus, in which case the apparatus is bivalve. Three and four panels are sometimes used, as in the case of the new light at La Hève (Fig. 18), where there are four. The source of light may be either a lamp or an electric light. The flash of the La Hève apparatus, which is lighted by electricity, is of 23,000,000 candle-power. This power is obtained by a current of 45 volts and 100 ampères.

The subject of lighting the apparatus has also received great attention. The earlier idea was to obtain a great quantity of light. Large lamps were brought into use. The number of wicks was increased in some cases to ten and even twelve. Two objections to these lamps were found to exist. First, the great diameter of the burners placed so much of the flame outside of the focus that much of the light was useless. Second, the comparative lack of transparency of the flame of each wick caused the light of the inside wicks to be almost wholly lost. These large burners were fully tested in England and Scotland, and were finally abandoned in favor of the more compact flame of the five-wick burner. The same objection of size exists to the gas-burner of Mr. Wigham. The diameter (14 inches) of its flame is far too great for any ordinary apparatus. An enormous lens of 2 meters focal length (6·56 feet) has been constructed for use with this burner. Apparatus of such dimensions is exceedingly expensive and unwieldy.

In addition to these objections to the use of large burners, research has shown that the illuminating quality of a flame depends not on the total quantity of light given off, but on the intrinsic brilliancy; that is, on the brilliancy per square unit of surface. This has been shown in several ways. When tested in a heavy fog it was found that the great Wigham burner of 2,500 candle-power became visible at a distance of 80 feet, while a single jet of the burner was visible at 70 feet distance. Furthermore, when the gas-burner and a 100-candle-power electric incandescent lamp were tested in the same lens it was found that the resulting flash from the incandescent lamp was more than half as powerful as that from the gas-burner, and when a 50-candle-power incandescent lamp was used its flash had more than one-third the strength of the gas-flash. This arises from the fact that the incandescent lamp could be placed more nearly at the focus of the apparatus than could the gas-burner; the flash it threw was therefore more compact from having less divergence.

The electric arc-light has the double advantage of great brilliancy and concentration in small space. Its intrinsic brilliancy is great, and it is an exceedingly effective illuminant for lighthouses. A common objection has been raised against it on the ground that it is not able to penetrate fog so well as the light from an oil-lamp. The theory advanced is that the electric light possesses more blue rays than the oil light, and that these rays are more readily absorbed by fog than the red rays. Those making such an objection lose sight of three points: (1) The yellow ray enters into white light to the extent of 75 per cent., and is the predominant color, while red scarcely furnishes 11 per cent. (2) That light is merely a manifestation of energy, and in the gradual development of this energy the red light appears first, and when the development is greatest the blue comes in; but the blue does not destroy the red rays. They remain and produce their effect in the general whole. (3) The very great initial power of the electric light will admit of much loss and still leave the remaining power far greater than that of either an oil or a gas light. For example: A four-lens lightning light of 9·39 inches focal length gives a flash from an oil light of about 5,000 candle-power; the same lens with an electric light of 45 volts and 25 ampères would give a flash of 12,000,000 candle-power. Again, when the question of the diminution of light by atmospheric absorption is considered it is found that under all circumstances the electric light carries farther than any other. It is the illuminant recommended by the greatest lighthouse authorities for use at all important points. It has not yet been adopted in the U. S., except at the beacon at Sandy Hook and for the lighted buoys at the entrance to New York harbor.

At present (1894) oil is used almost exclusively in the U. S. for lighthouses. The following table gives data as to apparatus, oil-supply, etc.:

Light-vessels.—There are many places where lights are needed, but where the construction of a lighthouse would be impracticable or impossible. Such points are banks lying far out at sea or places near the entrance to a harbor whence vessels can take a good departure to make the mouth of the channel leading in. At such places the lights are shown from vessels of a certain class called light-vessels or light-ships. As the first condition of a light is that it shall remain constantly in one position, it follows that a light-ship must remain always at one spot; hence it must be anchored. Lying constantly at its moorings and exposed to the most severe gales, the hull of the vessel must be of the strongest possible build. As lights must have a certain elevation above the sea, there must be masts on which to carry them; and to distinguish the vessels at a distance by day they carry on the masts certain marks in the shape of disks, cages, or other easily recognized forms.

The hull of a light-vessel is arranged with quarters for the officers and crew and with storerooms of various sorts. There must always be carried spare lamps, chimneys, wicks, etc., and all the provisions required for the people on board. The crew of such a vessel includes generally a keeper, an assistant keeper, six or eight seamen, and a cook.

The illuminating apparatus is composed of a series of lamps with parabolic reflectors encircling the mast, and so arranged as to throw their light all over the horizon. To obtain a flashing light on a light-ship has always been a difficult problem, but the introduction of the electric light has given a simple solution. The only electrically lighted light-vessel in the world is the one off Cornfield Point, near the eastern entrance to Long Island Sound. On this vessel the ordinary apparatus has been replaced by four-lens lanterns on each mast. The lanterns are hung on gimbals, and each contains an incandescent lamp of 100 candle-power. The lantern increases the power of the light by ten, consequently the light from each of the four is about 1,000 candle-power, or 4,000 for the whole number. A duplicate electric plant on the vessel furnishes the current for the lamps. An ingeniously arranged four-armed cam makes and breaks the current alternately, and thus lights and puts out the lamps.

Light-vessels are expected to remain at their stations until they go down or are torn away from their moorings. In order that the mooring-chain can not be detached from the vessel by intention, its end is securely bolted to the keelson and no tools whereby it can be cut are allowed on board. If the vessels break adrift their only motive-power, as a rule, is their sails. The new vessels lately built in the U. S. have been provided with steam-propellers which can move them through the water at a speed of about 8 knots an hour.

Whenever it is possible to do it these vessels are provided with a sound-signal. In the U. S. the signal is generally a powerful steam-whistle; in France it is a siren. Every vessel carries a loud-toned bell to be rung by hand in case of accident to the more powerful signal.

Fog-signals.—Lights lose much of their efficiency in heavy weather. In a dense fog they may be so completely obscured as to become invisible at less than a quarter of a mile away from the observer. Signals which appeal to the ear are used under these circumstances. These signals are sirens or trumpets driven by compressed air, whistles blown by steam or compressed air, or bells. Signals have their special characteristics in their peculiar sounds: the length of the blast of the siren, trumpet, or whistle, and the length of the interval between the sounds. The siren is the most powerful and the bell the least powerful of all these instruments. The trumpet, for the same sonorous intensity, requires the development of less energy, but there is a pressure and consumption of air and an intensity which can not be exceeded. In other words, the trumpet, being a reed instrument of enormous size, should not be foreed. The reed is a steel plate from 8 to 12 inches long, 2 to 3 inches wide, and $\frac{1}{4}$ to $\frac{3}{8}$ inch thick. On the other hand, the air pressure and consumption of the sirens may be varied at will. In them the sonorous intensity can be increased and with it the range. Bells are useful only for short distances. Guns, rockets, and explosives of various sorts are not used in the U. S.

Buoys.—Buoys are small floating aids to navigation which mark the sides and turning-places of channels. They guide by sight and by sound. All buoys are sight-buoys. They direct by their shape and color. Those which appeal exclusively to the sight are the "can," or cylindrical, the "nun," or conical, the "spar," shaped like a ship's spar, and buoys lighted by gas or electricity. The U. S. alone has electrically lighted buoys. The electric buoy is a "spar" having a 100-candle-power incandescent light at its upper end. The current is supplied from a shore station. Buoys which appeal to sound as well as sight are the "bell" and "whistling" buoys. The former carries a bell at the top of an iron frame. As the sea tumbles the buoy about, a ball, carried on a plate or in a trough, strikes the side of the bell. The more violent the motion of the sea the louder the sound. The whistling-buoy has a pear-shaped body which floats on the large end; on top is an ordinary whistle; to the bottom is attached a long tube. Waves on the ocean are only superficial. At a depth of 30 or 35 feet the water is almost always still. This water is a fixed piston on which the tube of the buoy works up and down. As the buoy is raised by the waves a vacuum is formed by pulling away from the piston. Air rushes in through properly constructed valves. When the buoy descends the air drawn in is compressed by the water-piston and forced out through the whistle. This makes the whistle sound.

The following table shows the aids to navigation maintained by the U. S. lighthouse bureau on June 30, 1893:

F. A. MAHAN.

Lightning (atmospheric electricity) [deriv. of *lighten*, flash, deriv. of *light*]: the disruptive discharge occurring between clouds and the surface of the earth, or between two clouds, whenever sufficient differences of electrical potential arise. The connection between lightning and the electrostatic sparks obtained by artificial means were suspected at a very early day, but no definite evidence of the identity of the two phenomena was obtained until about the middle of the eighteenth century, when Benjamin Franklin undertook experiments for the purpose of verifying his hypothesis concerning the nature of lightning. The first actual attempts to carry out Franklin's suggestion were made in France in 1752. During the spring of that year sparks were drawn from the collector of atmospherical electricity which had been erected at Marly, near Paris.*

FIG. 1.

This collector was an iron rod 40 feet long, mounted upon a stool with glass legs and carefully supported by means of silk cords. In the same year a still longer collecting-rod, consisting of an iron bar 99 feet high, was used in Paris under the direction of the naturalist Buffon, by means of which sparks were obtained. Both of these experiments were quickly followed by Franklin's famous experiment with the electrical kite. Owing to the slow rate of ocean communication in those days, Franklin had not learned of the success obtained with the collectors erected in France at the time when he made his experiment.

From the time of Franklin atmospheric electricity has been persistently studied by means of a great variety of apparatus. The most successful methods were those of de Saussure, who made use of a collector consisting of a conductor ending in a metallic point exposed at a considerable elevation above the surface of the ground. With this instrument it was found that there were at all times indications of electrification of the atmosphere. Volta modified de Saussure's apparatus by attaching to the point a slow-burning match, as shown

* See *Report of Studies of Atmospheric Electricity*; Mendenhall, *Transactions of National Academy of Sciences*, vol. v. (1889).

in Fig. 1. The indicator used with these collectors was simply an ELECTROSCOPE (*q. v.*), of the type devised by Peltier. Improvements upon de Saussure's method were made by Dellmann, Lamont, and others; but all modern study of atmospheric electricity depends upon the much more refined method devised by Lord Kelvin (Sir William Thomson), whose apparatus has been used at the Kew Observatory since 1861. Kelvin's apparatus consists of a water-dropping collector (Fig. 2) and the Thomson quadrant electrometer. The former instrument consists of a metallic reservoir, carefully insulated from the earth, with a long nose or spout. The apparatus is so placed that the end of this spout extends into the open air, the electrification of which is to be investigated. The succession of drops issuing from the water-dropper serves to charge the reservoir. The electrometer, which is maintained in a constant condition of sensitiveness by means of a water-battery, or other convenient source of electromotive force, is used to measure the differences of potential between the collector and the earth, and affords an indication of the potential of the atmosphere.

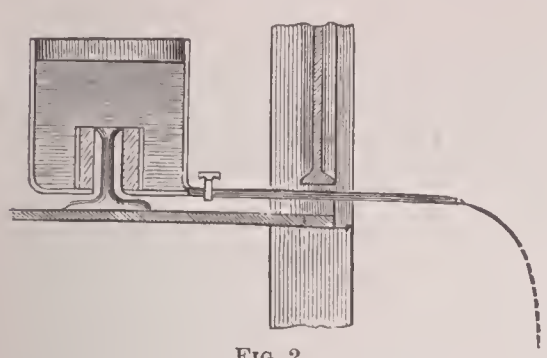

FIG. 2.

The Kew observations, together with those made at the meteorological observatory on Mt. Vesuvius, by Quetelet in Brussels, by Lamont in Munich, and by Dellmann, in Kreuznach, afford data concerning the electrical state of the atmosphere in various parts of Europe for a period of many years. In the U. S. Dr. Wislizenus began observations at St. Louis in 1861, and maintained a continuous record for eleven years. The work of these observers seemed to show a distinct connection between the electrical state of the atmosphere and the weather; but it was evident from the conflicting character of the data that the problem must be attacked in a more systematic manner. In 1884 the U. S. weather bureau, under the direction of Prof. T. C. Mendenhall, and with the co-operation of Johns Hopkins, Harvard, Yale, Cornell, and the Ohio State universities, undertook systematic observations of atmospheric electricity. It was the purpose of these researches to determine whether there was a sufficiently simple relation between the electrical condition of the atmosphere and the weather to make the indications of use in prognostication. The apparatus used in these experiments consisted of the water-dropper (Fig. 2), previously devised by Lord Kelvin, and of a modified form of the quadrant electrometer (Fig. 3). The large number of observations made at the stations just mentioned are recorded in Dr. Mendenhall's report, already cited. They establish many interesting facts, for the most part confirmatory of those already obtained at European stations. On account of the complexity of the phenomena observed, however, and the failure to discover an obvious and simple relation between the fluctuations in the electrical condition of the atmosphere and the weather, the Government abandoned the work. Of the results obtained by the study of atmospheric electricity, the following are perhaps the most important: (1) A collector of any form properly exposed will show marked electrification at all times. (2) The electrification is sometimes positive and sometimes negative. (3) Quiescence of electrical condition accompanies stability of weather. (4) Periods of storm are almost always accompanied by very marked fluctuations in the electrical potential in the atmosphere. (5) Nothing corresponding to the uniformity observed over wide ranges of territory in the records of fluctuations of the magnetic condition of the earth is met with in the comparison of the observations at the various stations for the study of atmospheric electricity.

That there is connection between weather disturbances and the electrical condition of the atmosphere seems to be well established, but it is unlikely that definite results will be attained until we have long-continued records from a large number of stations widely distributed over the world. Lightning is generally considered to be a phenomenon attending those fluctuations in the electrification of the atmos-

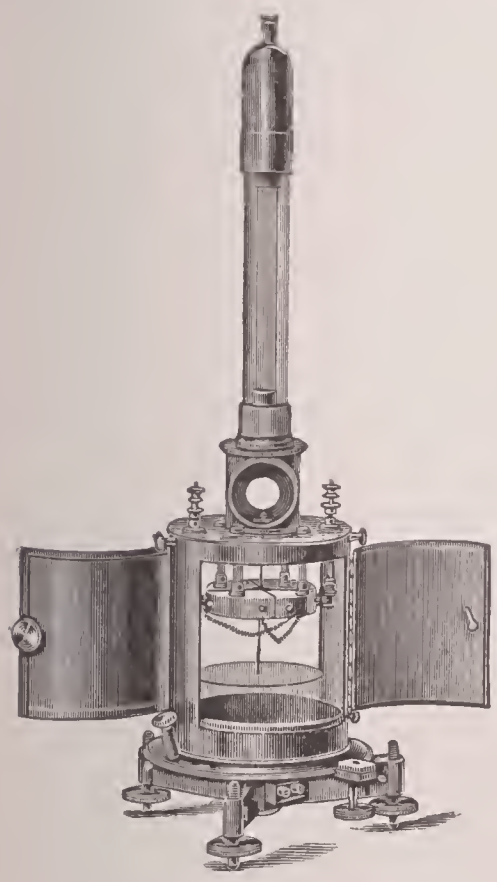

FIG. 3.—Form of electrometer used in the U. S. experiments on atmospheric electricity, 1884–88.

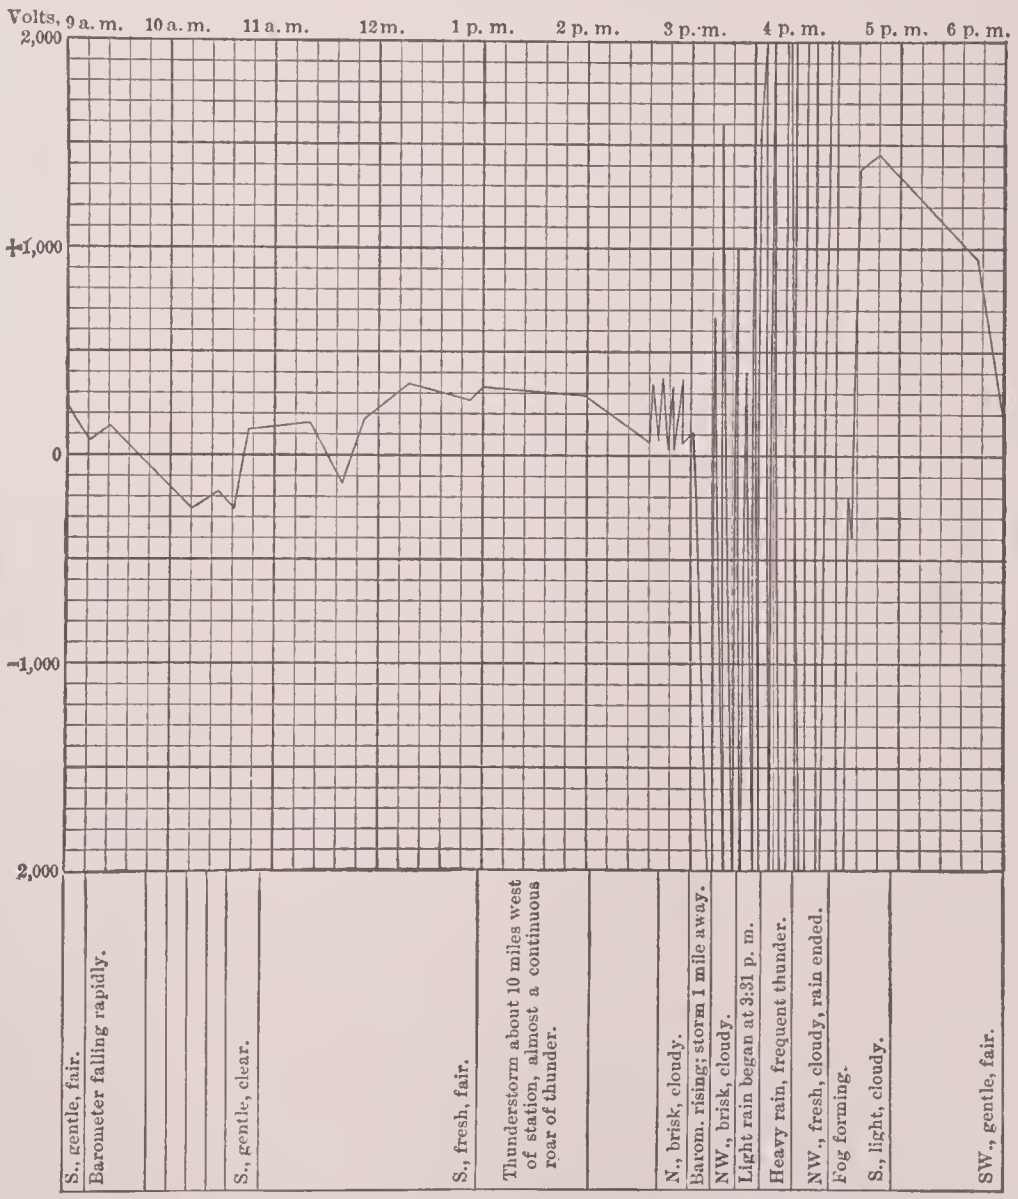

Curve showing variations of potential at Ithaca, N. Y., May 31, 1888, a day on which a thunder-storm occurred. Sparks passed from needle to quadrants almost continually from 3.15 to 4.30 p. m.

FIG. 4.

phere which are continually going on, a flash occurring whenever the differences of potential rise to values so great as to result in the breaking down of the dielectric intervening between a charged cloud and the surface of the ground, or between two differently charged clouds. That times when thunder-storms occur are times of great and sudden fluctuations in the atmospheric potential may be seen by inspection of the records of any electrical observing station. An example of the effect upon the electrometer of the passage of a thunder-storm is shown in Fig. 4.

The phenomenon is, in the nature of things, one with which it is extremely difficult to experiment, and, in spite of the very large amount of work which has been done, we are entirely ignorant of the method by which the enormous differences of potential necessary to the development of the lightning flash are produced. Many ingenious hypotheses have been put forth, and in some instances interesting attempts have been made to establish these by means of experimental devices for the imitation on a small scale of the phenomena of the thunder-storm. For a noteworthy example of this kind of research, the reader is referred to Gaston Planté's volume entitled *Phénomènes Électriques de l'Atmosphère* (Paris, 1888). Even in the hands of the most skillful experimental electricians, however, such attempts must remain in great measure futile.

Electrical sparks artificially produced rarely reach lengths greater than a meter, and our power of measuring differences of potential ceases with differences much smaller than those necessary to produce a discharge even through a meter of air. Under such conditions attempts to establish the potential differences between a cloud and the earth, where the thickness of the dielectric frequently exceeds a mile, must be regarded as altogether vague and indefinite. Even within the range of sparking distance obtainable experimentally, however, it has been shown that the potential differenee does not increase in proportion to the length of the spark. A curve plotted to express the relation between difference of potential and the distance in air over which disruptive discharge will occur seems to show a tendency toward a maximum value. It may be then that the potential difference necessary to break down a layer of the atmosphere a mile in thickness may not greatly exceed that which is necessary to produce a spark when the conductors between which the discharge takes place are near one another. Fig. 5 shows a curve of the kind just indicated. It is from measurements made by Steinmetz.* The sparking distances to which it refers are so short, as compared with those with which we have to deal in the case of lightning, that it would be absurd to draw any inference from them further than to say that the enormous values frequently assigned to the difference of potential between cloud and earth — values which are based upon the assumption of law of direct proportionality — are probably much too large. An example of such an estimate is given in a foot-note to page 9 of Lodge's book on lightning-conductors, in which he says: "The difference of potential for a spark a mile long between flat plates is, roughly, 16,000,000 electrostatic units, each one of which is equal to 300 volts; that is, nearly 5,000,000,000 volts."

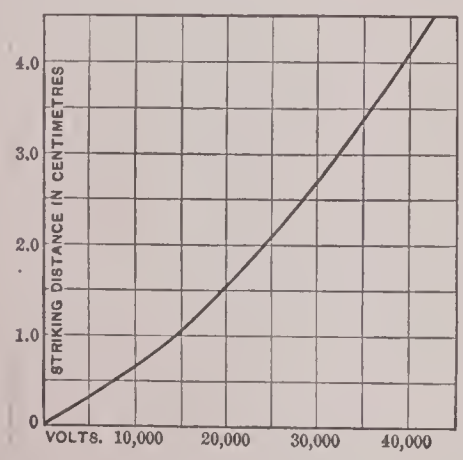

Fig. 5.

In certain other respects we are in a position to make more accurate estimates concerning lightning. The electrical strength of air considered as a dielectric is a well-established constant. From it we can compute in units of work the amount of energy necessary to strain the air lying between cloud and earth to the point of discharge. This is the energy released when the lightning flash occurs. Lodge makes such a computation in his book already cited. Translated into metric units his result is as follows:

For each cubic kilometer of air strained to the verge of electrical collapse, the storage of energy amounts roughly to 5,000,000,000 kilogrammeters. It would take a steam-engine

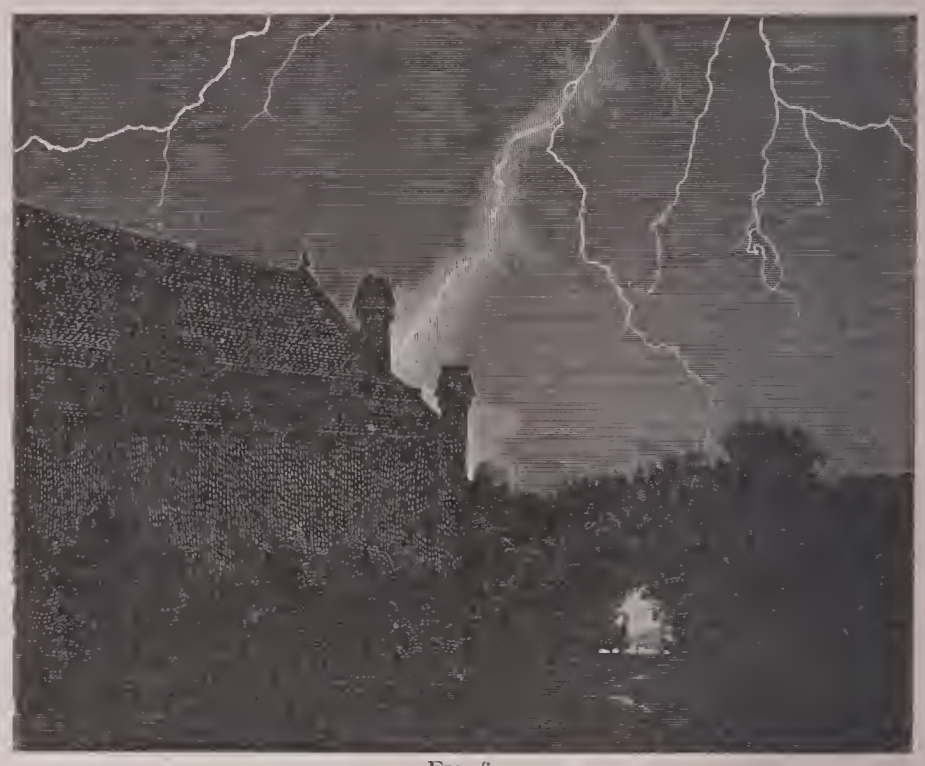

Fig. 6.

of 100 horse-power nearly twenty-four hours to develop this amount of energy. When we consider that all of it is liberated within a scarcely appreciable fraction of a second, by a flash which discharges a cloud 1 km. square, situated 1 km. above the earth, the effects produced where lightning strikes are easily explicable.

The most important advances in the study of lightning which have been made in recent times are due to the study of photographs of the lightning flash. Fig. 6 is from such a photograph, taken at Middletown, Conn., on June 14, 1892, by O. S. Blakeslee. It shows distinctly the crooked path of the discharge, and in many ways the very close relationship between lightning flashes and the sparks artificially obtained by such means as the Holtz machine. (See Electrical Machines.) The bright spot of light showing through the trees in the back-ground is from an arc-light, and is not, as might be supposed, due to what is termed globular lightning. Globular or ball lightning, indeed, is something the

Fig. 7.—The "black flash" (from a photograph by A. W. Clayden).

existence of which is very well substantiated by the evidence of the large number of observers. It has, however, hitherto almost entirely eluded all precise observation, so much so

* Steinmetz, *Transactions of American Institute of Electrical Engineers*, vol. x., p. 85 (1893).

that its very existence has frequently been questioned. The writer has never seen a photograph which contains anything which could be fairly classed as ball-lightning, although such photographs are said to have been taken.

Photographs of lightning frequently show phenomena which are difficult of interpretation. Fig. 7, taken from the frontispiece of Lodge's book, shows a phenomenon known as the *black flash*. It will be seen that of the several discharges recorded upon this plate, one, instead of being white, is densely black. This result is, however, undoubtedly due to an idiosyncrasy of the silver salts, well known to photographers. It is a familiar fact that when the photographic film is over-exposed there occurs a reversal. Under such circumstance one obtains, upon developing the film, a positive instead of a negative picture of the image in the camera. The simplest explanation, and the one which seems most probable, of the nature of the black flash in photographs of lightning is that certain flashes are of such extreme actinic intensity that even in the very short interval during which the exposure lasts they produce this reversal. The writer exposed a sensitive plate to the electric arc-light for the purpose of illustrating this effect, to which end the exposure for the brightest part of the image was over-timed. The result is shown in Fig. 8, in which it will be seen that the central part of the arc itself, and the crater of the positive carbon, and the tip of the negative carbon, appear black instead of white, while the less brilliantly incandescent regions surrounding these central portions are shown in the proper manner. The inspection of any photograph of lightning flashes will convince one that there is very great range of intensities. Given this range, reversal by over-exposure is a peculiarity of the photographic process which must be expected.

FIG. 8. — From photograph of an arc, over-exposed to show several of the brightest portions.

Fig. 9 shows another interesting phenomenon, the existence of which has been established by means of photography. It is what is known as the multiple flash. Owing to persistence of vision, the evidence of the eye is scarcely to be taken concerning such a phenomenon, but the photographic plate affords very good evidence of it. There is reason to believe that the multiple flash is simply an oscillatory discharge between cloud and earth. The question whether lightning is ever oscillatory is a mooted one; but the camera has furnished valuable evidence in the affirmative. Photographs of scenery taken from the window of a rapidly moving train during a thunder-storm at night, for instance, have shown a succession of images slightly displaced through equal distance with reference to one another upon the plate. Such an effect could be produced only by an oscillatory discharge. It has been held by the opponents of this theory that the multiple flash can not well be oscillatory, because the successive discharges would follow the same path. Photographs of an artificial spark known to be oscillatory have shown, however, that the various elementary discharges which come after the pilot spark do not all follow the same path. Fig. 10 is from such a photograph, made under the direction of the writer in 1893. The photograph shows one path of very great intensity and several others not so well marked. Prof. Trowbridge, of Harvard College, also has shown in the course of an extended investigation that in the case of the oscillatory spark the first two or three discharges occur along the same path as the pilot, but that the subsequent ones frequently take other paths. It is probable that in the case of the multiple flash we have to do with an oscillatory discharge in which the path followed is continually changing.

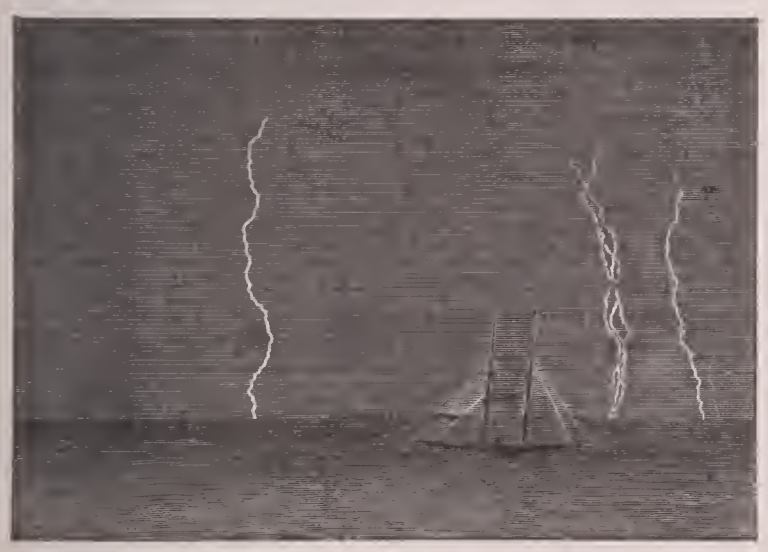

FIG. 9.—The multiple flash (from a photograph by Dr. H. S. Piffard).

FIG. 10.—From photograph of an artificial oscillatory discharge in which several distinct paths are shown.

There have been many theories promulgated with reference to the nature of lightning to touch upon which would exceed the limits of this article. For discussion of these, and of numerous other matters relating to this subject, the reader is referred to the works of Planté and Lodge, already cited.

E. L. NICHOLS.

Lightning-arrester (in applied electricity): a device for protecting dynamo-electric machinery, telephones, and other apparatus connected with systems of outdoor wires, from the ravages of lightning.

At times of electrical disturbance of the atmosphere, such apparatus as the above is particularly likely to suffer because its metal parts afford an easy path to the earth from a network of exposed wires. The quantity of electricity passing to earth through such channels at the time of thunder-storms is often very much too large for the carrying capacity of the wires and other parts of the apparatus which happens to form a portion of its path, and a sufficient amount of heat will therefore be generated to destroy the latter. The possibility of protecting such instruments from the effects of lightning depends largely upon the fact that they possess self-induction. An alternative path may therefore be provided which is free from self-induction, but which includes an air-space. To steady currents this path will be of infinite resistance; but to currents of a rapidly fluctuating character, the path afforded by the tortuous windings of dynamo coils, etc., offers a greater impedance than does the air-gap. The discharge therefore chooses the alternative path, leaping across the air-gap in the form of a spark, and in this way the machine or instrument is relieved from carrying an excessive amount of current to the earth.

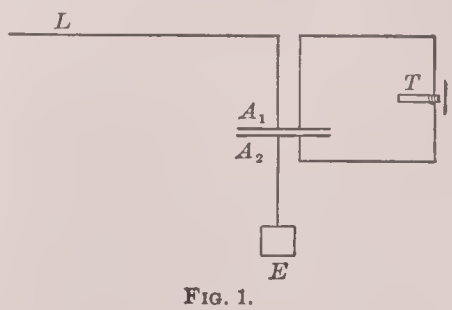

FIG. 1.

Sometimes parallel plates are used in lightning-arresters for the protection of a telephone circuit, as shown in Fig. 1. In the diagram, L is the line wire, T the telephone, E the earth connection. The pair of plates A_1 A_2 are introduced directly between the line and the earth, care being taken to reduce the impedance of this portion of the circuit to a minimum.

The telephone is in direct metallic connection with the earth by means of a circuit possessing considerable self-induction. For steady currents, or even for the undulatory currents used in telephony, the only path to earth is through T, while for the violent surges of current, of which the discharges during thunder-storms consist, the easier path is across the air-gap between A_1 and A_2. Lodge has shown that increased protection may be secured by placing several such air-gaps in multiple circuit, as in Fig. 2, and by using

points instead of plates. In the case of the latter, fusion sometimes leads to the building up of a metallic bridge across the air-gap. Such a contact would be more readily noticed between points and more easily remedied, while the

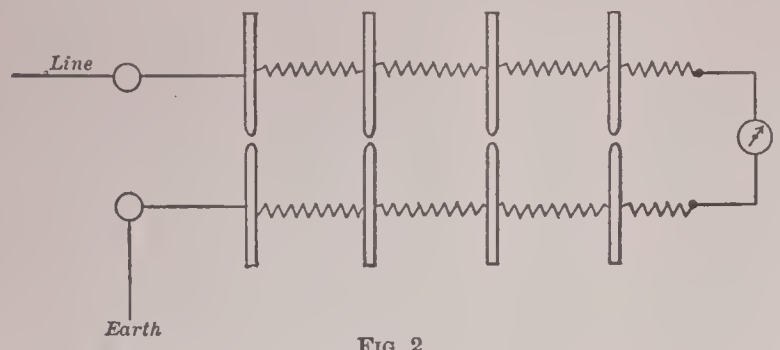

FIG. 2.

likelihood of its occurrence is greatly diminished. One source of difficulty in the construction of lightning-arresters based upon this principle lies in the fact that as soon as the air-space is traversed by the spark due to the lightning discharge, it becomes heated and loses its insulating power for steady currents. It is likely, then, to become a path for the currents generated by the dynamo or intended to supply the motor which it is the object of the lightning-arrester to protect. It becomes necessary, therefore, to extinguish the spark as soon as the lightning discharge has passed, thus permitting the air-space to resume its normal insulating power. This has been accomplished in a variety of ways, none of which, however, is more ingenious than that of placing the air-gap in a strong magnetic field. Under these conditions the arc is repelled strongly at right angles to the lines of force, and is almost instantly destroyed. Another successful device consists in employing metallic terminals composed of one of the so-called non-arcing metals. These metals are those which are readily oxidized, forming heavy solid oxides; for example, zinc, magnesium, etc. It is found that a permanent arc between poles of such metals can not be maintained, while the transient discharge following upon the inductive effects of lightning will still readily traverse the air-space.

Many mechanical devices for the temporary introduction of a shunt or alternative path to allow of the passage of lightning discharges have been constructed, but few, if any, of these are sufficiently prompt to afford adequate protection. Owing to the wide area over which the systems of wires of electric railway and telephone circuits extend, every passing thunder-storm induces upon some portion of such systems electrical fluctuations great enough to endanger the machinery with which these wires are connected. The lightning-arrester, indeed, in countries which, like the U. S., are exposed to violent electrical disturbances of the atmosphere, is an indispensable instrument. E. L. NICHOLS.

Lightning-bugs: See FIREFLIES.

Lightning-rods, or **Lightning-conductors**: metallic rods attached to buildings or ships for the purpose of protecting them from the effects of lightning. The famous experiments of Benjamin Franklin doubtless suggested the use of such devices. The principal ideas which have been in vogue with reference to protection from lightning, and upon which nearly all lightning-conductors since Franklin's day have been based, are two: The dissipation of the induced charge by the well-known action of points, and the carrying away to earth or water in a harmless manner of such portions of the discharge as may include in its path the building or vessel to be protected.

Owing to the great difficulties of experimenting with lightning, or of imitating its action artificially, the important question of the degree of protection afforded by lightning-rods is still an open one. Increasing knowledge of the phenomena of atmospheric electricity and of related phenomena in the domain of electrostatics, however, has made it possible to draw certain conclusions concerning lightning and protection from its action. Damages from lightning are of two distinct classes. The first includes damages arising from the direct action of the main discharge; the other class comprises the secondary effects, due to the restoration of equilibrium, temporarily disturbed, between bodies in the neighborhood of the main path. As regards the first class, it is a question whether any protective device short of a metallic shield surrounding the structure to be guarded would prove efficient. We are able to estimate with considerable precision the amount of energy which is liberated along the path of the lightning flash. (See LIGHTNING.) This quantity is very great, and it is set free within extremely limited regions. It is this energy suddenly liberated which produces the astounding mechanical effects noted when a building is struck by lightning. When a building is so situated as to form a portion of the path of the main discharge, lightning-rods, however well constructed, frequently fail to perform their functions. The cases in which lightning-rods have to deal with the main discharge are, however, comparatively rare; that is to say, the number of instances in which buildings lie in the neighborhood of the path of discharge without forming a portion of it are much more numerous than those in which the flash passes directly through the structure itself. For the protection of buildings from these secondary effects the efficacy of lightning-rods is unquestionable, and so far as this sort of protection is concerned, certain general statements as to their construction may be laid down:

First. The dissipating action of points is very small. It is doubtful whether points possess any practical efficacy, and the use of points constructed of such metals as platinum and gold is a useless expense.

Second. The lower end of the systems of rods should be well grounded. In buildings containing water-pipes a satisfactory connection with the earth can be obtained by attaching the system of lightning-conductors to these pipes.

Third. Gas-pipes should not be used as a means of establishing a connection with the earth. Gas-pipes, when connected with lightning-rods in such a way as to form a part of the path to the earth, are likely to cause fires by the ignition of their contents at any point where there is a leak.

Fourth. All portions of the structure containing considerable masses of metal, such as the sheathing of roofs, and systems of pipes not connected metallically with the earth, should be so connected by attaching them to the lightning-rods. One of the chief sources of danger from the secondary effects of lightning consists in the inducing of heavy electrostatic charges upon the surface of all such conducting bodies as may be insulated. In the production of these induced charges, either positive or negative electricity will be forced to seek a path to the ground; and if an unbroken path of good conductivity is afforded, it will be carried away without the production of sparks and without the danger of fire. If, however, the path is interrupted here and there by air-spaces, or by other bad conducting material, a series of sparks will leap across these spaces. Such sparks are frequently the cause of serious damage.

Fifth. As regards the material of which lightning-rods should be made, the metal of which they are constructed is of less importance than the form. Of course, metals readily fusible, such as lead, are not to be selected; and since lightning-rods are exposed to the weather, it is desirable to have them constructed of metals which will be permanent. Ordinarily the choice limits itself to copper and iron; and iron is, on the whole, probably the best available material. It is true that copper possesses a much higher conductivity than iron, but, as has been pointed out by Lodge in his volume on lightning-conductors, high conductivity is not altogether a desirable quality in the lightning-rod. For many years there was a controversy between those who held that the essential characteristic of lightning-rods was a sufficient cross-sectional area, and that the shape of the cross-section was a matter of indifference; and those, on the other hand, who held that the rod should be constructed so as to offer a large surface. It is now perfectly well established that sudden surges of current, such as pass over lightning-rods at the time of discharge, are not capable of being conducted save by the outermost layers of the metal. This fact is accounted for by the self-induction of the material. Owing to this inductive action, which confines the current to the outside, tubes with thin walls are as good carriers of lightning as solid rods of the same diameter, while a broad strip or tape weighing the same per linear foot as a rod or tube, is much better than either.

Sixth. Insulation of lightning-rods from the body of the structure which they are intended to protect is distinctly disadvantageous. The object of lightning-rods is not so much to convey a discharge from the sky to the earth without permitting the same to utilize the building itself as a conductor, as it is to connect all those portions of the building itself which are conductors of electricity with the earth, so as to allow the transfer of electricity, under the tremendous inductive action of passing clouds, to go on without the production of dangerous sparks. As has already

been indicated, the attempt to protect in the case of the direct discharge is probably futile in the great majority of instances; and at any rate the intervention of an inch or two of glass affords no appreciable obstacle to the passage of such a discharge as that which occurs when exchange takes place between earth and sky.

Seventh. Lightning-rods should be as nearly straight as possible. All coils and loops are to be avoided, because they possess self-induction sufficient to cause the discharge to leap across between the intervening portions of the conductor instead of going around through the metal. Although a metallic loop will afford a path of infinitely better conductivity for steady currents, it becomes useless whenever rapid fluctuations of electromotive force take place.

The desirability or undesirability of attaching lightning-rods to buildings is a question concerning which it would be difficult to lay down any general rule. In the case of ships at sea carrying wooden masts or spars there can be no question of the importance of such protection against lightning. In the case, on the other hand, of a building situated upon some stratum which in itself affords insulation from the surrounding regions of the earth's surface—and it may be noted that localities are frequently found where it is difficult to obtain a ground connection sufficiently good to serve for telephonic purposes—it is a serious question whether a system of metallic conductors connecting the house with the earth would be a source of protection or of added danger.

The development of extensive systems of overhead wires for telephone and electric-lighting service has greatly modified the problem of protection from lightning, and has compelled the introduction of apparatus quite as important as the lightning-rod. This apparatus is the lightning-arrester, the object of which is to afford a path to earth for the electric charges which gather by induction upon such systems of wires. The function of the lightning-arrester is primarily to protect the instruments (telephones, dynamos, motors, etc.) which are connected with the outdoor wires, but it also protects against fire the buildings which the wires enter. The system of wires pertaining to a telephone exchange, for example, gathers charges of electricity over a wide area, and the discharge to earth is likely to occur through the ground wire of some building remote from the disturbance. A properly arranged lightning-arrester will prevent this by keeping the potential of the entire system under control. Lightning-rods are ordinarily brought into service only at rare intervals; the lightning-arrester, on account of the extended network exposed to the inductive effects of thunder-clouds, will be in action with nearly every passing storm. See Anderson, *Lightning-conductors*; Lodge, *Lightning-conductors and Lightning-guards.* E. L. Nichols.

Ligne, leeñ, Charles Joseph, Prince of: soldier; b. in Brussels, May 12, 1735; was descended from one of the wealthiest and most powerful Belgian families; entered the Austrian army in 1752, distinguished himself in the Seven Years' war, and commanded the vanguard in the Bavarian war of succession. During the reign of Joseph II. he held the highest military and diplomatic positions, and the elegance of his manners and the brilliancy of his conversation made him a favorite with all European courts. Under Leopold he fell into disfavor, partly on account of his son's participation in the Belgian insurrection (1790), and though Francis I. made him field-marshal in 1808 he never regained his influence in the state. In the latter years of his life he was occupied in literary pursuits. D. in Vienna, Dec. 13, 1814. Of his *Mélanges militaires, littéraires et sentimentaires* (34 vols., 1795–1811), Malte-Brun has given a selection, *Œuvres choisies*, in 2 vols. His letters and memoirs have considerable historical interest.

Lignine: a synonym of Cellulose (*q. v.*).

Lig'nite [from Lat. *lignum*, wood. Cf. Fr. *lignite*]: the name originally given to bitumenized wood, but now applied to most coals which occur in the more recent geological formations; the term is therefore synonymous with brown coal. As stated in the article on Coal, lignite has no definite formula of composition, but different specimens vary much in physical and chemical character, shading into unchanged vegetable fiber above and true coal below. Lignites or brown coals are found chiefly in the Cretaceous and Tertiary formations. Here they occur in deposits which rival in area and thickness the coal-beds of the Carboniferous system. In general terms, it may be said that the lignites occupy an intermediate position, both in date and composition, between the peat which is now forming and true coals of Palæozoic age, and represent a stage in the progressive distillation which vegetable tissue passes through when buried. This process results in the formation of—1, peats; 2, lignite; 3, bituminous coal; 4, anthracite; 5, graphite. No sharp lines of demarkation separate these groups, as we find them shading into each other by all possible intermediate phases. Since they are successively derivatives one from the other, the series is necessarily continuous. It should also be said that the name *lignite* is applied to woody tissue in which the process of bitumenization has begun, and among the forms of recent and superficial bitumenized vegetation that which has been derived from the decomposition of mosses, grasses, etc.—generally a porous, spongy substance—is called peat.

The mode of formation of the great beds of so-called lignite of the Cretaceous and Tertiary systems seems to have been similar to that in which peat is now accumulating, and in which coal was formed in the marshes of the Carboniferous age. In some instances they are underlain by strata of fire-clay, and are overlain by shales, sandstones, and limestones, precisely as the coal-strata are; and it is evident that they have a common origin and history, except that in the lignites that history has not reached as far as in the coals. It frequently happens, however, that beds of lignite have by local causes been changed to the condition corresponding to bituminous coal, or even anthracite. Such instances are furnished by some of the best lignites of Colorado, Utah, and Alaska, which have reached the condition of bituminous coal, and by the anthracites of Crested Butte, Col., and that of Queen Charlotte's island. In the last two cases beds of Cretaceous lignite have been, by local volcanic action, converted into anthracite, as bright, hard, and useful as that of Pennsylvania. As the deposits of carbonized vegetation formed in the Tertiary and Cretaceous systems are classed as lignites, all the so-called coals of the great areas underlain by these formations come into this category.

It happens that the most important deposits of mineral fuel in Europe and Eastern North America are found in the Carboniferous systems, but it is not known that any important deposits of true coal exist in other parts of the world. So far as we know, all the great coal-fields of China, India, Borneo, and Western North America, are of Mesozoic or Tertiary age. Deposits of lignite are also known to exist in Greenland, Arctic America, and in Central and South America. The economic value of lignites is, as a general rule, considerably less than that of true coals. This is due both to their chemical composition and physical characters. They usually contain from 12 to 20 per cent. of oxygen and 10 to 16 per cent. of water. Their heating power is therefore usually from one-half to two-thirds that of bituminous coal. The different ingredients mentioned sometimes constitute as much as one-third of the mass—a third which probably contributes nothing to the heating power, the water even absorbing some portion of the energy of the combustible material in its vaporization. The calorific power of pure carbon being estimated at 8,000 units, and that of the best coals, in which the hydrogen is mainly neutralized by the oxygen, at from 7,000 to 7,500, the calorific power of lignite may be said to vary from 4,000 to 5,000. It should be said, however, that this is only a general rule. The calorific power of some of the Carboniferous coals of the U. S. hardly exceeds 6,000 units, and some of the best lignites reach and even pass this point. The physical character of lignites also frequently impairs their economic value. They are usually somewhat tender, and the waste in mining and transporting them is greater than in the bituminous coals. They are apt, also, to crack badly and frequently on exposure fall into a multitude of angular fragments. It rarely happens that they are capable of producing good coke. They are usually open-burning, i. e. do not adhere in the fire, and the proportion of volatile matter to fixed carbon is large. When this is driven off, the residual coke is spongy and pulverulent. To this rule there are, however, exceptions which will be mentioned further on.

In Europe the lignites or brown coals have been mined and used for years, and the practical tests to which they have been subjected have accurately determined their value.

The majority of the coals found in the western half of the U. S. are of modern age, and are classed as lignites. These occur in both the Cretaceous and Tertiary formations, but chiefly in the former; and although their extent and value

have been but imperfectly determined, it is known that very extensive deposits of this kind occur in New Mexico, Colorado, Wyoming, Utah, Nevada, California, Oregon, and Alaska. The lignites of New Mexico all belong to the Cretaceous formation, and are chiefly found in the lower portion of this series. They underlie a large area, including the northern portion of this Territory and Arizona, and on the San Juan river form strata altogether similar in appearance to true coal-beds, showing many miles of outcrop, and sometimes attaining a thickness of over 30 feet. These great beds, however, are not homogeneous, but consist of layers of a better quality, interstratified with those that are shaly and impure. The lignite beds of Colorado and Wyoming occupy a broad belt along the flanks of the Rocky Mountains, extending N. across the Missouri and reaching far into Canadian territory. It is not known how large an area in this belt is underlaid by workable beds of lignite, but it would probably not be extravagant to estimate that at least 50,000 sq. miles will prove to be productive coal area. The strata here vary in thickness from a few inches to 20 and even 30 feet. In Colorado and along the line of the Union Pacific Railway these beds have been opened in many places, and are extensively mined. The most important mines now worked are located at Trinidad, Cañon City, Golden, Carbon Station, Evanston, etc., and the coal is not only generally used by the resident population, but is largely consumed for locomotives on the railway. The lignites of Colorado have much the character of the best-known varieties used in the Old World, and hold about the same rank in comparison with the Carboniferous coals. Here, however, as in other countries, some localities furnish fuels of superior character; for example, the coal of Trinidad and Crested Butte, Col., can be coked and is capable of being successfully used in forging and smelting. The same may be said of the San Pete coal, which is found in Utah, S. from Salt Lake City. The geological age of the lignites of Colorado has been much discussed, but there is little doubt that they are for the most part Cretaceous. There are, however, Tertiary lignites in this region, and a part of those so extensively exposed along the Missouri river are of Tertiary age. Nevada and California are not so well supplied with mineral fuel as Colorado, Wyoming, and Utah, but beds of lignite have been found in both. In California they have been mined on the flanks of Mt. Diablo. The coal of this locality is Cretaceous. On the coast of Oregon the Coose Bay coal has been mined for many years. This is of Tertiary age, and may be taken as a typical example of Tertiary lignite. Its composition will be seen from the table given below. In physical character it is, when first mined, hard, bright, and pitchy, but on desiccation it is prone to break up into small fragments. Vancouver's island is well supplied with coal, and has been a source from which a large part of the coal used on the Pacific coast has been derived. This is of Cretaceous age; it has precisely the appearance of some varieties of bituminous coal, and has a higher heating power and bears exposure and transportation better than most of the western coals. In Alaska two varieties of lignite have been mined, both of which are reported to exist in large quantities. Of these, one (No. 7 of table) resembles closely the Coose Bay coal, and may be suspected, both from its composition and associated fossils, to be of Tertiary age. The other has been subjected to local metamorphism, and is much harder and more valuable.

The localities which have been mentioned are by no means all in which lignite is known to exist in the western part of the U. S., and there is every reason to believe, so far as quantity is concerned, that the deposits in this region are capable of supplying all the wants of its future population. In quality, however, these coals are not equal to the Carboniferous coals of the Eastern States.

The table of analyses here printed will show the composition of typical examples of the lignites of the western portion of America.

The material called *jet*, so largely used for ornaments, is a variety of lignite which is chiefly obtained from the Lias at Whitby, England. Lignite of similar character occurs in Texas, Utah, and Colorado, and some of it is equal in quality to the English jet. Revised by CHARLES KIRCHHOFF.

Lig'num Rho'dium [Mod. Lat., liter., rosewood; Lat. *lignum*, wood + Gr. *ῥόδον*, rose]: a commercial name for Canary island rosewood (see ROSEWOOD), which yields the so-called oil of rhodium; also for the wood of *Amyris balsamifera*, a tree of the West Indies, which yields an oil used as a substitute for that just mentioned. The name is also given to other fragrant woods.

Lignum Vitæ: See GUAIACUM.

Ligonier: town; Noble co., Ind. (for location of county, see map of Indiana, ref. 2–F); on the Elkhart river, and the Lake Shore and Mich. S. Railway; 25 miles S. E. of Elkhart, 108 miles W. of Toledo, O. It is in an agricultural region, has several manufactories, ships large quantities of grain and produce, and has 2 private banks and 2 weekly newspapers. Pop. (1880) 2,010; (1890) 2,195; (1900) 2,231.

Ligor': a state, town, and isthmus of the Malay Peninsula. The state is feudatory to Siam, lies between 7° and 9° N. lat., and extends across the peninsula; area, 17,000 sq. miles; pop. about 150,000, three-quarters Siamese, the rest Malays, Chinese, and the aborigines of the forests. The country is generally marshy, and the forest growths gigantic. The principal productions are rice, pepper, ratans, dyewoods, ivory, tin, and gold. The town and capital is in lat. 8° 25′ N., near the east coast, on a wooded plain, near the mouth of a small stream, forming a good harbor. Pop. about 12,000. The isthmus forms the northern part of the state; it has long been a favorite place for crossing the peninsula. Distance, 70 miles. MARK W. HARRINGTON.

Liguo'ri, Saint ALFONSO MARIA, de: priest; b. in Naples, Italy, Sept. 27, 1696; of a noble family; became a lawyer when sixteen years old; entered a religious congregation in 1722, and was ordained priest in 1726; devoted himself to the religious instruction of the poor; founded in 1732, at Villa Scala, the order of REDEMPTORISTS (*q. v.*), which received papal approbation in 1749, when Liguori was confirmed as its superior-general; declined the archbishopric of Palermo; was Bishop of Sant' Agatha 1762–75, when he resigned and devoted himself to theological studies and writing, giving up even his generalship of the Redemptorists. D. at Nocera dei Pagani, Aug. 1, 1787; was declared venerable 1796; beatified in 1816; canonized in 1839, and declared a doctor of the Church in 1871. Among his many works are *Theologia Moralis* (1755); *Homo Apostolicus* (1782); *Institutio Catechetica* (1768). As a moral philosopher he is equiprobabilist, teaching that in a balance of opinions that which is the less safe may be followed provided it be as probable, or nearly as probable, as its opposite. He was accused by the rigorists of leaning too much to the side favorable to liberty, but this charge was vigorously denied. According to him, moral theology may be either positive, speculative, polemical, or practical. Casuistry belongs to the last named, and is of two kinds. The first kind consists of a brief exposition of the principles of moral theology, but insists largely on the application of principles to cases. Casuistry of the second kind consists exclusively in the application of principles to cases real or imaginary. His complete works were often republished, especially by Marietti (Turin), and were translated into French. His letters were published complete in Italian, French, and German by the Redemptorists (3 vols., 1887–92). Revised by JOHN J. KEANE.

Liguorians: See Redemptorists.

Ligu'ria: in ancient geography, a district of Northern Italy; the land of the Ligures, the boundaries of which were not accurately defined until the time of Augustus. According to his division of Italy, it comprised the territory from the Ligurian Sea across the Maritime Alps to the Padus (Po) in the N., and from the Varus in the W. to the Macra in the E. When first mentioned in history, the Ligures occupied a much larger territory, extending far into Gaul, on the western side of the Rhône. They were a warlike, quick-witted, and enterprising people, whose origin and relations are entirely unknown. In the period between the first and second Punic wars the first encounter took place between them and the Romans, and about 125 B. C. they were wholly subjugated. Liguria formed the nucleus of the Roman province of Gaul. The name was renewed by Napoleon, June 6, 1797, when the republic of Genoa was transformed into the Ligurian republic, but the absorption of the little state in the French empire, June 4, 1805, destroyed its autonomy, and its territory became for a time the three French departments of Apennin, Genoa, and Montenotte.

Li Hung-Chang, lee-hoong-chaang: Chinese statesman; b. about 1823 (according to some authorities 1819) in the Hofei district, in the province of Ngan-hwuy; showed unusual talent as a student, and attained the degree of Chin Sze (the third) in 1847. He was afterward appointed a compiler of the second class in the Hanlin College, and in 1850 acted as compiler in the imperial printing-office. During the Taiping rebellion he served with honor, rose rapidly in rank, and conducted the final campaign that crushed the revolt. He was equally successful against the Nienfei rebels, whom he completely overthrew in the summer of 1868. In 1870 he was appointed Viceroy of Chihli and made Senior Grand Secretary of State. His policy has been liberal and progressive. In the face of opposition he has brought about the introduction of the telegraph, the reorganizing of the army on European models, the establishment of dockyards and arsenals, and prevailed upon the Government to permit the construction of railways. In his foreign relations he has worked steadily for peace, and by skillful diplomacy has generally contrived to secure it without sacrificing the interests or honor of his country. In 1896 he represented the Emperor of China at the coronation of the czar, and on his way back to China visited the principal countries of Europe and the U. S., and was well received everywhere. Note that *Li* is the surname, and is in Chinese custom invariably placed before the given name *Hung-Chang*. See Name.

Lilac [from Arab. *līlak*, from Pers. *līlaj*, *nīlaj*, indigo-plant; cf. *līlak*, *nīlak*, bluish]: the popular name of shrubs of the genus *Syringa*, family *Oleaceæ*. The best known is the common lilac, *S. vulgaris*, a native of Central Asia, half naturalized in Europe and the U. S. Its early-blooming flowers are commonly of the tint called *lilac*, but often are white or dark purple. *S. persica*, *S. chinensis*, with other species and their hybrids, are common in cultivation. Their bark has decided febrifugal powers.

Lil'burne, John: political agitator; b. at Thickney Puncharden, Durham, England, in 1618: imbibed in youth opinions extremely hostile to the Church of England, and having circulated pamphlets against the bishops, was condemned in 1638 to pay £500, to receive 500 lashes, to stand in the pillory, and be remanded to prison. In 1641 he received from the Long Parliament a handsome compensation (£3,000) for his sufferings. He fought in the Parliamentary army at Edgehill, Brentford, and Marston Moor, and was thrown into Newgate for libeling the Presbyterians. He afterward aided in organizing the Levelers (*q. v.*); accused Cromwell and Ireton of designs upon the sovereignty; was in 1649 tried for sedition and acquitted; took refuge in Holland; returned in 1653; joined the Quakers; died in 1657.

Lilia'ceæ: the Lily Family (*q. v.*).

Liliencron, Rochus, Freiherr von: b. at Plön, Holstein, Dec. 8, 1820; studied theology, jurisprudence, and German philology at Berlin and Kiel; became professor at Jena in 1852; went to Meiningen in 1855, and became editor-in-chief of the *Allgemeine Deutsche Biographie* in 1869. His researches are devoted chiefly to the history of the popular song and its music, the results of which are embodied in the large critical edition of *Die hist. Volkslieder der Deutschen vom 13–16 Jahrhundert* (1865–69), and in the exquisite little volume *Deutsches Leben im Volkslied* (1884).

Julius Goebel.

Liliuokalani, lēē-lēē-oo-ō-kăă-laa'nēē, Lydia Kamakeha: ex-Queen of the Hawaiian islands; b. Dec. 2, 1838; married John O. Dominis, a native of Boston, governor of Oahu, who died Aug. 26, 1891. She had been made vice-regent when King Kalakaua left Hawaii for the U. S., and soon after his death in San Francisco she was proclaimed queen, Jan. 29, 1891. She gave offense by her attempts to abolish the constitution of 1887, and restore the more absolute power of the crown. Though forced by the opposition to desist from these attempts, fear of their renewal and dissatisfaction with her government caused her overthrow Jan. 30, 1893, by a small portion of the population, consisting chiefly of the U. S. element. A provisional government was then set up and annexation to the U. S. proposed. The queen, on the other hand, alleging interference on the part of the U. S. minister on behalf of the revolutionists, requested the aid of that Government in restoring her to the throne. Soon after his inauguration, President Cleveland withdrew from the Senate the annexation treaty which had been negotiated, and in the following winter attempted unsuccessfully to mediate between the provisional government and the queen, with a view to her restoration to the throne, and a republic was proclaimed July 4, 1894. In connection with a rising of her supporters in Jan., 1895, she was arrested as an accomplice. Some days later she renounced her right to the throne, but was tried and sentenced to five years' imprisonment and a fine of $5,000. She was released, however, in September of the same year, and in Dec., 1896, visited the U. S.

Lilium [see Lily. O. Eng. *lilie*, from Lat. *li'lium*, from Gr. λείριον, lily]: a genus of the Lily Family (*q. v.*), comprising some of the commonest and most valued of hardy ornamental bulbiferous plants, natives of the northern temperate zone. Several are indigenous to the U. S., the more showy and common ones being *Lilium philadelphicum*, with an upright flower, and *L. canadense* and *L. superbum*, with nodding ones; these orange and orange-red. Related species of California are now coming into cultivation, as well as one or two with white or rose-colored blossoms. *L. candidum*, the common white lily of the gardens, came from the Levant and Caucasus. The large and choice Japanese lilies, white or partly so, came from *L. longiflorum*, with long and narrow flowers, and *L. japonicum*, *L. speciosum*, and *L. auratum*, with very broad and open ones. In the scarlet-flowered *L. chalcedonicum*, abounding in Palestine, we "behold the lilies of the field" of Scripture. The tiger and bulblet-bearing lilies of cultivation, all natives of the Old World, and producing bulblets in the axils of the leaves, belong to *L. tigrinum*, *L. croceum*, and *L. bulbiferum*, the last two known by their erect flowers. C. E. B.

Lille, or **Lisle** (Flem. *Ryssel*): the capital of the department of Le Nord, France; is situated in a fertile and well-cultivated plain on the Deule, and communicates by canals and railways with the sea and all the large commercial places of Northern France and Belgium (see map of France, ref. 1–F). It is the headquarters of the third military division, and is one of the strongest fortresses of Europe. Its fortifications were erected in the eleventh century; they were thoroughly reconstructed by Vauban. Since 1858 the ramparts on the south side have been demolished, and the town now includes the old communes of Esquarmes, Wazemmes, and Moulins-Lille. The city is well built, with broad and regular streets and numerous squares. It has a university, a lyceum, an academy of design with a celebrated collection of drawings—among which are 86 by Raphael and about 200 by Michaelangelo—a botanical garden, several literary societies, and many scientific and educational institutions. Its principal importance, however, it derives from its manufactures. Much flax is grown in the vicinity, and the linen manufactures of Lille are very extensive; the whole neighborhood is covered with bleaching-grounds. No less important is its cotton-spinning industry; about thirty-six large establishments are in operation. The tobacco-manufactory of the Government produces annually about 11,000,000 lb. Beetroot sugar, rape-seed oil, gloves, and gunpowder are also manufactured in large quantities, and an extensive trade is carried on. Lille was founded in the ninth century, belonged alternately to France or to the Counts of Flanders, came into the possession of the house of Burgundy at the end of the fourteenth century, passed from Burgundy to Austria and Spain, but was conquered in 1667 by Louis XIV., since which time it has been a French city. In 1792 the Austrians bombarded the city for nine days and nights, but had finally to raise the siege. Pop. (1891) 160,966; (1896) 216,276.

Lil'ly, John: See Lyly.

Lilly, William: astrologer; b. in Diseworth, Leicestershire, England, May 1, 1602; began the study of astrology in 1632, and in 1644 began the publication of an annual almanac, *Merlinus Anglicus Junior*, which contained some wonderful predictions, and was eagerly read by all parties. He instructed many pupils in his art, and practiced medicine. In his *Monarchy or No Monarchy* (1651) appeared two hieroglyphical figures subsequently claimed to refer to the plague and the great fire in London in 1666. He wrote an *Introduction to Astrology*, a *Grammar of Astrology*, and *Tables of Nativities*. D. in Walton-upon-Thames, June 9, 1681, leaving an *Autobiography*, published in 1715.

Lily [O. Eng. *lilie*, from Lat. *lilium*, from Gr. λείριον, lily]: any plant of the genus *Lilium*; by extension any one of various other lily-like flowers belonging to the same or related families (see Lily Family), and even to some dicotyledonous plants, as the water-lilies, *Nymphæa*, *Castalia*, etc.

Lily, or **Lilly**, William: See the Appendix.

Lily Family: the *Liliaceæ*, a group of monocotyledonous plants characterized by a regular complete perianth, free from the three-celled ovary, and six stamens. They are mainly herbaceous, and with the six divisions of the perianth colored alike and the leaves parallel-veined; but to all these characters there are exceptions. Many have bulbs, others tubers or root-stocks. A few are arborescent, such as the larger yuccas, and especially dragon-trees (*Dracæna*). The famous dragon-tree of Orotava, Teneriffe, described and figured by Humboldt (overthrown in 1868), was regarded as one of the oldest trees in existence. As now received, the family comprises fully 2,300 species, widely distributed throughout the world, and constituting a number of well-marked sub-families (sometimes regarded as families). To this family belong the tulips, lilies, crown-imperial, calochortus, and most of the well-known and highly prized ornamental plants of the order, as also the hyacinth and the onion tribe, the asparagus, and a popular conservatory climber, *Myrsiphyllum* (falsely called *Smilax*), *Convallaria* (the lily-of-the-valley), *Polygonatum* (Solomon's seal), the dragon-trees, the medicinal and ornamental *Colchicum* (meadow saffron, so called from a resemblance to *Crocus*), *Veratrum*, the white hellebore and its allies, which furnish *veratrine*, the last named having very active acrid-poisonous roots or corms. Such properties are not wholly absent from the first-named plants, as in the bulbs of *Gloriosa* and of crown-imperial. Those of squills are likewise very active, while those of garlics and leeks are well-known condiments, and those of onions and the young shoots of asparagus are staples of food. The bitter juice of one or two species of *Aloë* furnishes aloes, a common purgative. One of the strongest of fibers is New Zealand flax, from the leaves of *Phormium tenax*.

Revised by Charles E. Bessey.

Lilybæ'um (originally the name of the cape which forms the western extremity of Sicily): the modern Marsala (*q. v.*); built by the Carthaginians about 350 B. C. It was their last possession on the island. At the close of the first Punic war it was made over to Rome, and became the basis for her attacks on Africa. At the fall of the Roman empire it was still a flourishing place, and the Saracens valued its port.

Revised by G. L. Hendrickson.

Lily-of-the-Valley: a plant of Europe and Asia, also sparingly indigenous in the Alleghany Mountains, prized in garden and greenhouse cultivation for its beauty and fragrance. Its scientific name is *Convallaria majalis*. It is used by perfumers as the basis of *eau d'or*.

Lima, lē'mă: a coast department of Peru; bounded N. by Ancachs, E. by Junin, S. E. by Huancavelica, S. by Ica, and S. W. by the Pacific; area, 23,647 sq. miles. The port of Callao, with a few square miles of adjoining country, is sometimes separated as a distinct constitutional province. The western portion of the department lies in the Cordilleras, and has many peaks above the snow-limits; the eastern part is lower, but broken by many spurs of the mountains, some of them extending to the seashore. Between the spurs are the valleys of several small rivers, which widen out toward the sea and constitute the most fertile districts; in these a large portion of the inhabitants are gathered. Sugar-cane and grapes are the principal crops. Silver, gold, copper, coal, and other minerals are found in the mountains, but there are few mines. The coast valleys were long occupied by Indian tribes of the Quichua race, who were not conquered by the Incas until about 1420; at the time of the Spanish conquest they still retained many of their peculiar customs, and one of their idols, Pachacamac, was renowned throughout Peru. They had large cities and extensive irrigation-works, the ruins of which still exist; and their cemeteries, particularly that of Ancon, near Lima, have yielded enormous quantities of objects which they buried with their dead. The northern valleys were held by people of the Chimu race, to which some archæologists also refer the Ancon remains. Pop. of department in 1894, probably 350,000 (the confessedly imperfect census of 1876 gave 261,414).

Herbert H. Smith.

Lima [Span. corruption of Quichua *rimac*, an oracle: in allusion to an idol and temple formerly located here]: capital of Peru and of the department of Lima; at the head of a plain forming a plateau where the river Rimac emerges from the spurs of the Cordilleras; 512 feet above the sea; 6 miles from its port of Callao on the Pacific; in lat. 12° 2′ 34″ S., and lon. 77° 7′ 36″ W. (see map of South America, ref. 5–B). Historically it is the most important city in South America. It was founded in Jan., 1535, by Francisco Pizarro, who called it Ciudad de los Reyes (City of the Kings), probably in allusion to the feast of the Magi Jan. 6; this name was the official one during two centuries. It was the seat of the Viceroys of Peru, who, during most of the colonial period, ruled nearly all of Spanish South America; their court was the most magnificent in America, and attracted all the learning and riches of the continent; the Archbishop of Lima was the most powerful prelate in America, and here the religious orders and the Inquisition had their centers. Taken by San Martin July 9, 1821, it remained in the hands of the patriots with slight interruptions during the war for independence. It has always been an important point during the Peruvian civil wars, its possession generally indicating the party which is in power. The capital of the Peru-Bolivian confederation 1836–38, it was taken in the latter year by the Chilians, united with Gamana and other revolutionists. It was again occupied by the Chilians after several severe battles Jan. 17, 1881, and was held by them until Oct. 22, 1883; during this period great damage was done to the city, and especially to public institutions. Lima has suffered greatly at intervals from earthquakes; it was nearly destroyed by the great shock of Oct. 28, 1746, when more than 1,000 persons perished; and it was much injured in 1586, 1630, 1687, 1806, and 1828. It has always been an unhealthful place, and under the viceroys there were frequent severe epidemics, due to bad sanitary arrangements. The city now has an excellent system of underground drainage, and its water-supply is improved; but intermittent fevers and dysentery are still prevalent. Owing to the proximity of the mountains the temperature is low, the mean from June to November being only 56·4° F.; the remaining months are warmer (maximum 82°), and are characterized by long spells of thick mist, peculiarly trying to weak lungs: but rains are rare. Formerly the city included about 3 sq. miles on the southwest side of the Rimac, with a suburb, San Lazaro, across the river; it was surrounded by adobe walls, which were leveled in 1870 and replaced by fine boulevards; but these were destroyed during the Chilian invasion. The Rimac is crossed by three bridges. The city is regularly laid out, but has narrow streets and sidewalks; there are thirty-three public squares, many of them handsomely adorned with statues and fountains. Among the monuments are a fine equestrian statue of Bolivar (bronze); the marble group of Columbus discovering America; and the Dos de Mayo column, commemorating the defense of Callao against the Spaniards. The cathedral, on the Plaza Mayor, is one of the largest and finest in America. It was founded by Pizarro, destroyed in the earthquake of 1746, and rebuilt on the old foundations. Elevated on a marble terrace, it has the usual two towers, of exceptional height, and a portal in Moorish style. The older parts, including pillars of red marble and statues in niches, are finely wrought; but some of the modern additions are in brick, stucco, and wood. The interior is imposing and very rich, many of the adornments being of solid silver: there is a very fine organ. In the crypt are shown the coffins of Pizarro and of several of the viceroys. There are some seventy other churches, many of them of great interest, but some of them have been turned over to secular uses; most of the Church treasure was given to the Government during the Chilian invasion. The senate house is the old palace of the Inquisition, and Pizarro's palace is now used for Government offices. The mint has a coining capacity of $1,000,000

monthly. The University of San Marcos is the oldest in America, having been founded in 1551; it now includes the College of San Carlos (founded 1770), where most of the better class of Peruvian youth are educated. There are, besides, several national colleges (answering to high schools in the U. S.), medical schools, a mining and engineering school, naval and military institute, etc. Girls are very generally educated in nunneries, of which there are eight or ten. The national library was next to that of Rio de Janeiro, the finest in South America, and particularly rich in historical books and manuscripts relating to Peru; it was sacked by the Chilians in 1881, and, though it was reopened in 1884, only a small part of its priceless treasures has been recovered. The Dos de Mayo Hospital, built at an original cost of $1,000,000, has 700 beds, and is perhaps the finest edifice in the city. The exposition building, a kind of national museum, erected in 1872, is a very handsome edifice, and is surrounded by a beautiful pleasure-ground, now the favorite promenade. Another fine promenade is the Alameda, in the San Lazaro suburb; and there is a good botanical garden and a zoölogical garden in the outskirts. The Pantheon or principal cemetery is noted for its numerous fine marble monuments. The houses of Lima are generally made of sun-dried bricks, a sufficiently durable material in this dry climate; and the older ones have the second story projecting over the sidewalk; the better class are furnished with richness and taste. Clubs are numerous and popular. The society of Lima is noted through Spanish America for intelligence and culture. Many of the well-to-do families have residences at Miraflores by the seashore, a beautiful place which was destroyed during the Chilian invasion, but has been rebuilt; this and Chorillos, a favorite bathing-place, are connected with the capital by railway. The railway from Callao is continued in the Oroyo route, destined to open up Western Peru; and a line runs northward along the coast. Lima is the commercial metropolis of Peru, Callao being, for practical purposes, a portion of it; the most important exports are silver, gold, vicuña wool, hides, sugar, cotton, and cinchona. Population (1891) estimated at 103,556, which is probably below the truth. Paz Soldan (1877), rejecting the imperfect census of 1876, claimed a population of over 200,000. See Markham, *Cuzco and Lima*; Fuentes, *Estadística de Lima*; Vincent, *Around and About South America*; Childs, *Spanish American Republics.* HERBERT H. SMITH.

Lima: village; Livingston co., N. Y. (for location of county, see map of New York, ref. 5–D); on the Lima and Honeoye Falls Railroad; 4 miles S. of Honeoye Falls, 18 miles S. of Rochester. It is in an agricultural region; contains 4 churches, Genesee Wesleyan Seminary, 2 district schools, and a weekly newspaper; and has coal and lumber yards, wagon and blacksmiths' shops, and a machine-shop. Pop. (1880) 1,878; (1890) 1,003; (1900) 949.
EDITOR OF "RECORDER."

Lima: city; capital of Allen co., O. (for location of county, see map of Ohio, ref. 3–D); on the Ottawa river, and the Cin., Ham. and Dayton, the Erie, the Lake E. and W., and the Penn. railways; 130 miles N. by E. of Cincinnati. It is the center of the great Ohio petroleum and natural-gas fields, and since 1885, when petroleum was first discovered in the city, it has become one of the largest petroleum shipping-points in the country. It has one of the largest oil-refineries in the world, the shops of the Lake E. and W. and the Cin., Ham. and Dayton railways, and manufactures of straw-board, egg-case fillers, and of tools and machinery used in the petroleum and wood-working industries. There are 2 national banks with combined capital of $220,000, a State bank with capital of $50,000, a private bank, and 2 daily and 6 weekly newspapers. Pop. (1880) 7,567; (1890) 15,981; (1900) 21,723. EDITOR OF "REPUBLICAN-GAZETTE."

Limac'idæ [Mod. Lat., liter., those belonging to the slug family; *li'max* (= Lat. *li'max*, slug, snail), the typical genus + Gr. patronymic ending *-ίδαι*, plur. of *-ίδης*, descended from]: a family of gasteropodous mollusks of the order *Pulmonata*, distinguished by the elongated semi-cylindrical body, which is not distinguishable from the foot, the absence of any visceral sac, and the rudimentary character of the shell, which is concealed by the mantle; the respiratory orifice near the right posterior margin of the mantle; the anus close in front of the respiratory orifice; the jaws are ribless; the teeth of the radula in numerous rows. The family thus defined embraces the well-known slugs of the gardens, and in the U. S. includes two species introduced from Europe—viz., *Limax agrestis* and *L. flavus*. These are found in moist places under boards, stones, etc. They are herbivorous, and are frequently injurious to succulent young plants. Besides the introduced species, there is an indigenous form which is widely distributed in the U. S.—*Limax campestris*, Binney.

Lima e Silva, -ā-seel'vă, LUIZ ALVES, de (successively Baron, Count, Marquis, and from Mar. 23, 1869, Duke of Caxias): general and statesman; b. at Rio de Janeiro, Brazil, Aug. 25, 1803. His father, Francisco de Lima e Silva, was a distinguished soldier, subsequently general and regent in 1831. The boy entered the army as a cadet when only five years old, studied in the military academy, and in 1823 made his first campaign in Bahia. He fought in Uruguay 1825–28; was promoted to brigadier; was president of Maranhão Feb., 1840, to May, 1841, subduing a formidable rebellion; in May, 1842, was made vice-president and military commandant of São Paulo, which was also in rebellion, and finally defeated the insurgents at Santa Luzia Dec. 24, 1842. To subdue the formidable revolt in Rio Grande do Sul he was made president of that province Dec., 1842, and only retired in Oct., 1846, after complete peace was restored. In 1851–52 he was commander-in-chief of the Brazilian army which, in alliance with Urquiza, drove the dictator Rosas from Buenos Ayres. In June, 1855, he accepted the portfolio of war in the conservative ministry of the Marquis of Paraná, and by the death of that statesman Sept. 3, 1856, became premier, resigning May 3, 1857. Already in 1855 he had been chosen to the senate, and he was now acknowledged leader of the conservatives. From Mar. 3, 1861, to May 4, 1862, he was again premier. In Dec., 1862, he became marshal. When the war with Paraguay broke out he was at first excluded from active command owing to his political affiliations; but after the disaster of Curupaity he was made commander-in-chief of the Brazilian forces Oct. 13, 1866. During the ensuing operations he was twice left in command of the whole allied forces, and these intervals were marked by the great successes of the war, including the taking of Humaitá, Aug. 5, 1868; the victories before Asuncion Dec., 1868; and the occupation of that city Jan. 5, 1869. In Feb., 1869, he was relieved, owing to ill-health. The duke was again prime minister June 25, 1875, to Jan. 5, 1878, a period which included the absence of the emperor in the U. S. and Europe. D. at his estate of Santa Monica, province of Rio de Janeiro, May 7, 1880. He was the most distinguished soldier ever produced by Brazil, and the only duke created under the empire. See J. Pinto de Campos, *Vida do grande cidadão Luiz Alves de Lima e Silva* (Lisbon, 1878). HERBERT H. SMITH.

Limassol, lĕe-măă-sōl': port in Cyprus; on south coast; 40 miles S. W. of Nikosia; and chief place of the district of Limassol. Here the Ottomans landed in 1571 and took the island from the Venetians. Gypsum, raw umber, raisins, brandy, and an excellent wine are exported. Pop. (1891) 7,388. Three miles north are the ruins of Amathus, ancient capital of Cyprus, celebrated for its copper mines and its temple of Venus. E. A. G.

Limbo, or **Limbus** [from Lat. *lim'bus*, edge, border, *in limbo*, on the border—i. e. of hell]: the word limbus was first used by the scholastic theologians of the Middle Ages to designate, as being on the outskirts of hell, that place in which the souls of the just who died before Christ's resurrection were detained. In this sense it was, and still is, called the *limbus patrum*. It was a place of rest and joy, though imperfect, to the saints of the Old Testament, till Christ delivered them, and led them into heaven at the time of his ascension. It also means a place where the souls of infants that die without baptism are detained on account of original sin. In this sense it is called *limbus infantium*. Though the Church has not spoken on the subject, yet it is the common opinion of theologians that such infants suffer no "pain of sense," but are excluded from heaven. Some even hold that they know God by the use of their natural powers, and enjoy a certain degree of natural happiness.
JOHN J. KEANE.

Limborch, lim'bōrch, PHILIPPUS, van: theologian; b. at Amsterdam, June 19, 1633; studied theology under his uncle, Episcopius, and was appointed in 1657 minister of the Remonstrant congregation at Gonda, and in 1667 Professor of Theology at the Remonstrant College of Amsterdam, where he died Apr. 30, 1712. His *Theologia Christiana* (Amsterdam, 1686) gives a comprehensive and systematic exposition of the doctrines of Arminius. It was translated into English by W. Jones (London, 1702; 2d ed. 1713, 2 vols.).

His *Historia Inquisitionis* (1692) was translated by S. Chandler (*The History of the Inquisition*, London, 1731, 2 vols.). See his *Life*, by Van der Hoeven (Amsterdam, 1843).

Limbs, Artificial: artificial limbs are employed for two purposes—relief of deformity and restoration of function, so far as may be possible, after deprivation of a limb or part thereof. They first came into practical use during the early part of the sixteenth century, although in certain classical instances they had been resorted to before that. Of course the earlier forms were very imperfect, and could only be moved by the aid of the hands, or the one hand if only one were left. In a measure they served their purpose, and by their use men were enabled to engage in battle, guide their horses, and otherwise care for themselves. A little later efforts were made to permit natural movements of the lost parts, and thus for the iron hands which had been first used there were substituted contrivances of metal, leather, paper, etc. During 200 years or more the models were not materially altered. During the latter part of the eighteenth century a Carmelite monk made considerable progress by inventing a hand with movable joints, independent of assistance from the other hand. It was made of sheet-tin, and contained several springs. Since that time inventive spirit has produced very great improvements, and now artificial limbs are made with such perfection that under ordinary circumstances they not only do not attract attention, but give rise to no suspicion of their presence.

The chief materials in the construction of artificial limbs are English willow covered with strong rawhide, aluminium, rawhide, leather, and felt. The three latter materials are usually strengthened with steel or some other form of metal. The feet are of some firm material, such as wood or soft rubber. The best form of artificial limb is of English willow covered with rawhide, with a foot of the same material or of rubber. The construction of rubber feet is well shown by Figs. 5, 6, and 7. A wooden core is first carved of the desired shape and size. This is placed in an iron mold previously formed of proper dimensions and the rubber covering vulcanized over or around the wooden or inner portion. Feet constructed in this manner are firm, yet elastic, and give to the wearer many advantages in walking.

If the amputation be above the knee, a form like Fig. 1 is

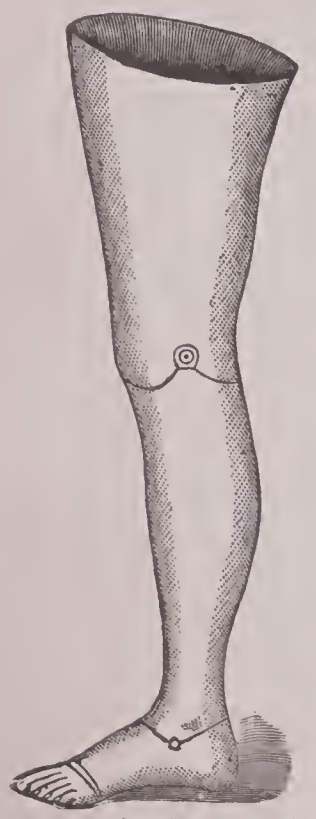

FIG. 1.—Showing an artificial limb for an amputation above the knee.

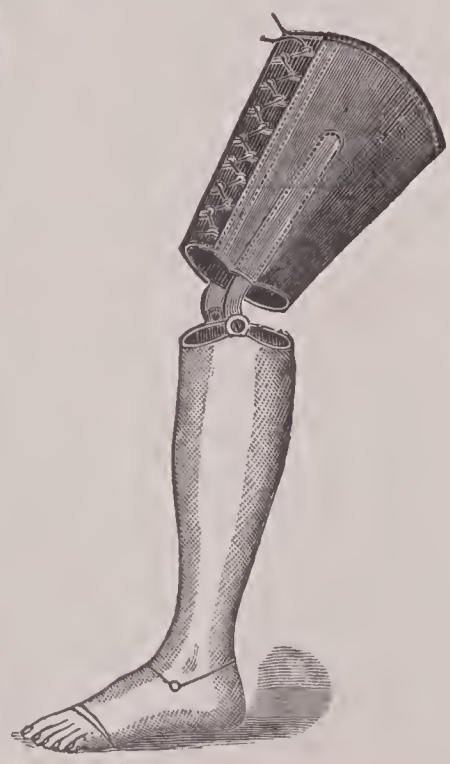

FIG. 2.—Showing an artificial limb for an amputation below the knee.

usually employed. It has plain antero-posterior movements both at the knee and ankle. If the amputation be below the knee, the upper socket or lacer is of leather, and is attached to the stump socket by means of lateral-joint irons as shown by Fig. 2. If the amputation has been made through or near the ankle, the apparatus need not reach above the knee, but may be constructed in some form resembling Fig. 3.

For amputations through the instep or arch of the foot an appliance like Fig. 4 may be used, and while it will not

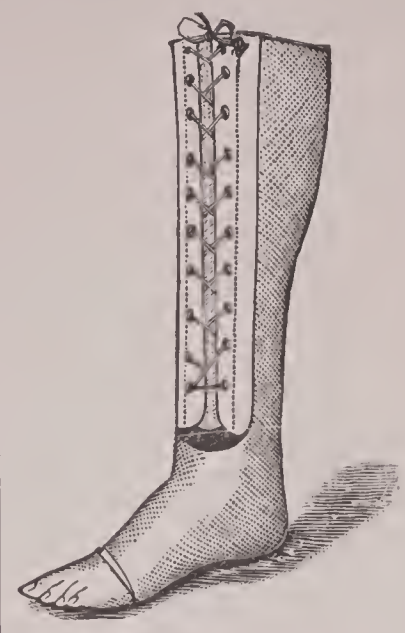

FIG. 3.—Showing an artificial leg for ankle amputations.

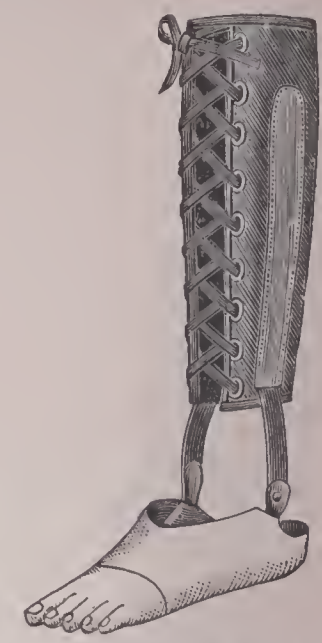

FIG. 4.—Showing an artificial limb for instep amputations.

prove so satisfactory as Fig. 2 or 3, it will be the best that, from the nature of the case, can be provided.

The weight of the patient is not, as many suppose, borne upon the end of the stump but is distributed over a large amount of surface by means of a conical-shaped socket fitting closely to the exterior of the stump. If, therefore, the patient be supplied with a painless stump that is absolutely conical—if it is of sufficient length to provide leverage with which to swing the limb, and has the firmness to bear the contact with the socket—the best of results may be expected.

In walking, the action of the natural leg is largely automatic. The limb is swung forward by such muscles as lie upon the pelvis, having their insertion in the upper portion of the femur. The knee is automatically self-locking, because the bearing of the ends of the bones forming this joint is posterior to a line drawn perpendicularly through the shafts of the tibia and femur. With the exception of the antero-posterior motion of the ankle, the latter is largely automatic in its movement, because independent of any attempt on the part of the patient the foot naturally accommodates itself to any inequalities of the ground.

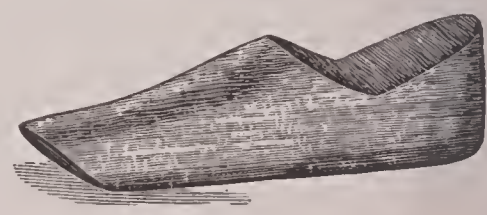

FIG. 5.—Showing the block of wood over which a rubber foot is molded.

In the construction of artificial limbs, these automatic movements are closely imitated, and many patients learn to accommodate themselves to the changed condition of circumstances to such an extent that their disability is unnoticed even among those with whom they associate daily.

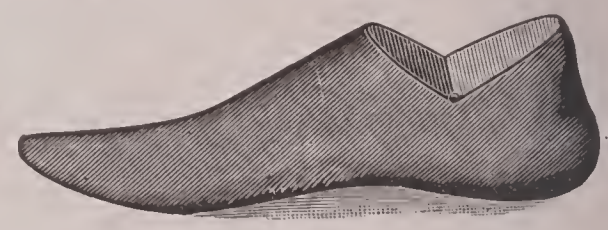

FIG. 6.—Showing a rubber foot.

Favorable cases do not exist among patients following amputations either in or near to an articulation. If an amputation is made through the knee-joint, the end of the stump necessarily occupies the space that should be employed for knee-joint mechanism. Fig. 8 shows the best form of a knee-bearing joint. It consists of a long, hollow cylinder supplied with a bushing of leather or other suitable material, and has a bearing throughout its entire length. If the amputation has been made through the joint, the instru-

ment-maker must make use of some form of a lateral-joint iron similar to Fig. 9. This pattern can not be made with

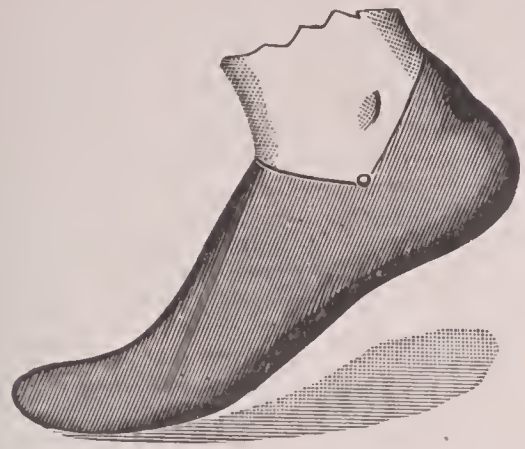

Fig. 7.—Showing how a rubber foot will bend in walking.

a bushing; it will not withstand much lateral strain, its bearing-surface is limited, and it will occasionally get out of order.

If an amputation has been made through the tibia nearer than 3 inches to the knee-joint, the short stump will contract, and the patient will be obliged to wear a knee-bearing or peg leg—one in which the weight is taken on the anterior aspect of the flexed limb. These are inefficient and usually unsightly appliances, and a patient supplied with an

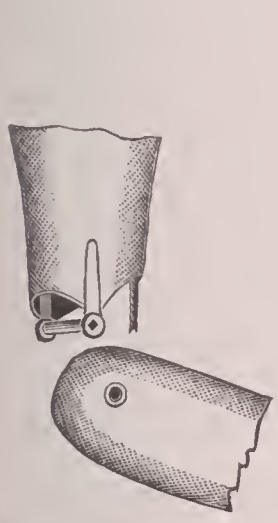

Fig. 8.—Showing a cylindrical or best form of knee-joint.

Fig. 9. — Showing a lateral knee-bearing joint iron.

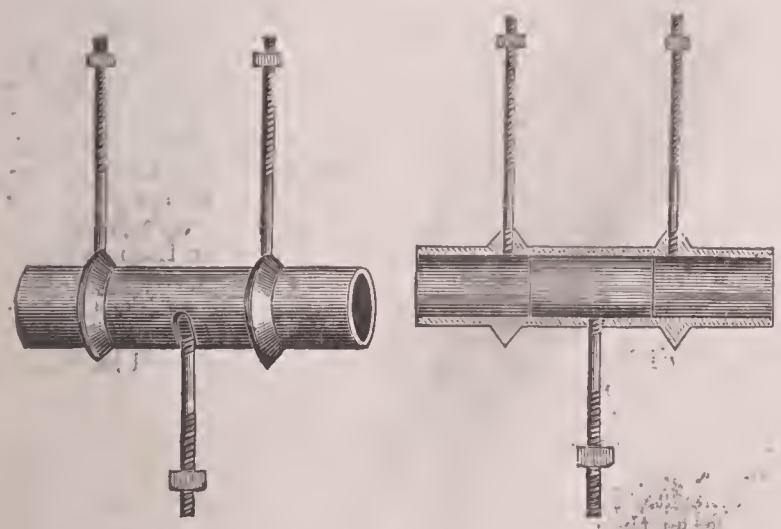

Fig. 10.—Showing the best forms of ankle-joint irons.

apparatus of this character will always walk with an awkward or clumsy gait.

The same rules that apply to amputations of the knee have equal force when considered in connection with amputations at the ankle; and in amputations at this point, unless there be sufficient space underneath the end of the stump for the insertion of a cylindrical form of joint similar to Fig. 10, the best of results can not be expected.

Natural walking is accomplished by exercising the lever principle illustrated in the extension of the foot. This principle is well exhibited in the flexion and extension of the foot while walking, the foot itself being the lever, the tendo Achillis or "hamstring" furnishing the power, the ground or floor the fulcrum, and the body the weight to be moved. To take a complete step forward necessitates the raising of the weight, because the trunk, at the time when the forward foot is planted on the ground (being then mid-

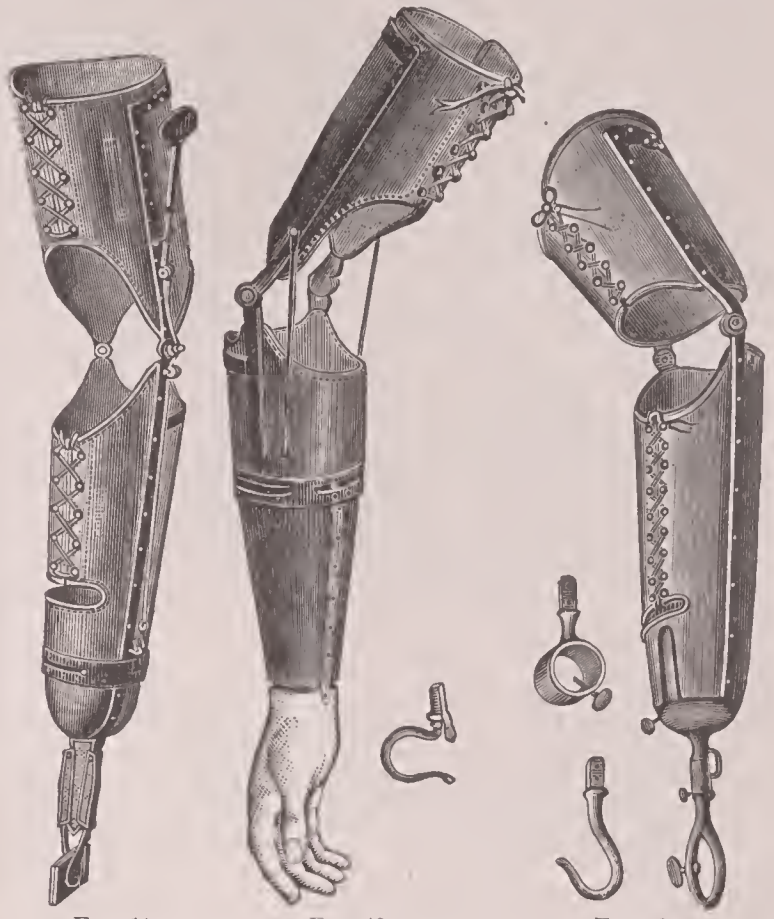

Fig. 11. Fig. 12. Fig. 13.

Figs. 11-13.—Showing forms of artificial arms and hands.

way between its two oblique supports), has dropped until the pelvis is on a lower plane than before the step was begun; the completion of the step requires the raising of the trunk to its original level. This elevation of the body is accomplished by the exercise of the lever power to which we have referred, because the extension of the foot then in the rear forces the body forward and raises it until the trunk is in a position perpendicularly over its advanced limb, and the step completed.

In walking, the heel and ankle rise on the ball of the foot, and by the lengthening of the limb caused by the extension of the foot the body is forced forward, and is raised by the changing of its supporting limb from an inclined to an upright position. This falling and raising of the trunk produce the undulating motion so noticeable in walking.

If one or both of these levers are amputated at points where they can not be artificially replaced, an awkward, limping gait will result. If one lever be removed it becomes necessary for the patient to take a shorter step with the sound limb, otherwise he would be unable, for the want of the extension previously referred to, to complete the movement—at least without undue exertion. It is evident that the longer the stride, the lower the level reached by the pelvis. The taking of a short step with the sound limb, however, does not entirely compensate for the loss of a foot, but usually compels the patient to adopt a lurching movement of the body. This lurching, due to rotation of the pelvis upon the hip of the sound limb, is frequently assisted by a greater flexion and extension of both knees. These movements, whether made use of singly or conjointly, are directed toward the accomplishment of the same result, viz., the forward propulsion of the body and the consequent elevation of the trunk until it has reached the level occupied by it before the step is begun. Patients who have suffered amputations of this class, after being provided with artificial substitutes, rarely walk so well (and to walk at all requires the outlay of more labor) as those upon whom the amputation has been performed through the tibia.

Owing to the manifold uses required of an arm, it has been impossible to furnish a good artificial substitute, and the surgeon should therefore exhaust the last resources of

conservative surgery in his endeavors to save every possible portion of this valuable member. When selected simply for dress an arm and hand closely resembling the natural one (see Fig. 12) should be adopted (the hands may be provided with articulations, and with them considerable work may be accomplished); if for a laborer, some form of a hook or clasp (see Figs. 11 and 13) will be found more serviceable than the complicated mechanism of an artificial hand. The former may be used as an assistant in performing a great deal of manual labor, and in point of utility it is much to be preferred.

Following amputations of a portion of the hand, appliances similar to Figs. 14, 15, and 16 can be constructed, many of which will prove of great satisfaction to the wearer. Where the surgeon has been enabled to leave a portion of a hand it is possible to construct an appliance that will afford the patient a fair degree of satisfaction, not only in point of utility but in general appearance.

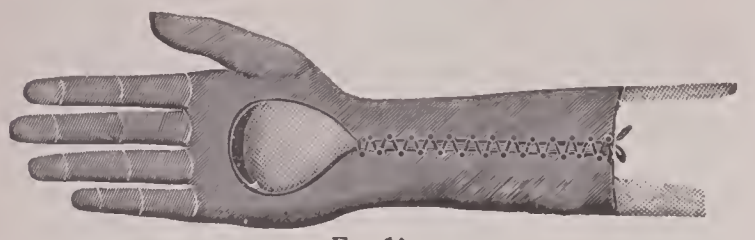

Fig. 14.

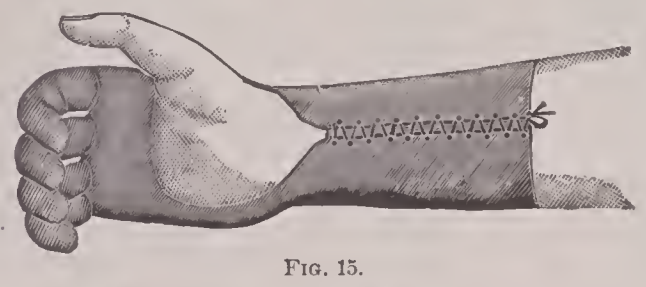

Fig. 15.

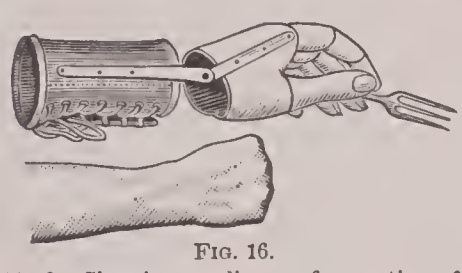

Fig. 16.

Figs. 14–16.—Showing appliances for portion of hand.

Most of the present devices are protected by patents, and are in the hands of a relatively small number of makers. To soldiers disabled while in U. S. Government employ the Government furnishes these artificial substitutes. Others procure them usually through dealers in surgical instruments, from whom catalogues, illustrations, and prices are easily obtained. It is of no small advantage nowadays both to surgeons and to patients to realize that the loss of a limb is not necessarily a disfiguring or mutilating affair, but that very frequently an artificial limb well fitted will be of vastly more service and less trouble and annoyance than a member already crippled by disease, or left in a condition where life even is thereby threatened. In other words, the art of the instrument-maker has done very much to assist the surgeon, and to make patients willing to undergo serious operations who otherwise would be very loath to lose so useful a part of their bodies as one or more limbs. It has done much also to atone for the horrible injuries and mutilation inflicted by railway and various other accidents.

Charles Truax.

Limburg (Dutch pron. lim'boorch), or **Limbourg** (Fr. pron. lăń'boor'): a territory extending along both sides of the river Meuse, which alternately belonged to the Netherlands, Belgium, France, and Austria, until it was finally divided between Belgium and the Netherlands in 1839. Along the Meuse the region is very fertile, affording excellent pasturage for large herds of cattle, but the rest of the country is sterile, the soil being either marshy or sandy. At Herve, not far from the city of Limburg, is made the celebrated Limburger cheese. *Dutch Limburg* comprises an area of 851 sq. miles, with 259,593 inhabitants, of whom nine-tenths are Roman Catholics; the principal towns are Maestricht and Roermond. *Belgian Limburg*, which contains some iron and coal mines, comprises an area of 932 sq. miles, with 223,531 inhabitants. Principal towns, Hasselt, St.-Trond, and Tongres.

Revised by S. A. Torrance.

Lime [O. Eng. *līm*, lime : O. H. Germ. *līm* > Mod. Germ. *leim* < Teuton. *lim-* < Indo-Eur. *limos* > Lat. *li'mus*, mud]: one of the alkaline earths, chemically the protoxide of calcium, symbol CaO. It forms the base of limestones, marbles, corals, and the shells of mollusks, where it is in combination with carbonic acid, forming the carbonate of lime. By the application of heat the carbonic acid is driven off, and the lime is left in the condition of "caustic" or "quick" lime. Lime is usually white, light gray, or cream-colored, porous, and soft. It rapidly absorbs water, uniting with it chemically, with the evolution of much heat. This process is called slaking or slacking. Pure or "fat" limes when slaked swell very much, and ultimately fall into a snow-white powder. If more water is added, what is called the "milk of lime" is formed. The lime is now in the condition of a hydrate, and if exposed to the action of the air it absorbs carbonic acid, and is again converted into the carbonate of lime. In the preparation of mortar, sand is added according to the richness or "fatness" of the lime—that is, according to the fineness and uniformity of the powder into which it falls when slaked. Where the powder is very fine it makes with water a fluid paste which will penetrate the interstices between the grains of sand, however closely they may be crowded. The thinner the film of paste between the grains of sand the stronger their adhesion will be. Hence the value of a lime is roughly measured by the quantity of sand it will serve to unite. Lime is largely used in agriculture as a dressing on soils which require calcareous matter, in the manufacture of bleaching-power (chloride of lime), in tanning, as a flux in smelting iron, etc. Lime is extremely infusible, and cylinders of this substance are commonly used in the oxyhydrogen or calcium light, a jet of the ignited gases being thrown upon a piece of lime, which when intensely heated emits a light so bright as to be almost unbearable to the eye.

The great consumption of lime, however, is in the production of mortar, and for this purpose it has been used in construction by all modern and most ancient civilized nations. In the earliest masonry of which any remains have been found, as the Etruscan, that of the island of Cyprus, and ancient Troy, walls were laid up with large stones without mortar ("cyclopean" masonry), or with smaller ones packed in clay, but by the Egyptians, Hebrews, Greeks, and Romans the use of lime for mortar was universal. In the manufacture of mortar from lime, as has been stated, the hydrate of lime is formed by the addition of water to quicklime. This is, in part, chemically combined with the lime, and produces the first "setting" of mortar. Subsequently, by the absorption of carbonic acid, it is converted into the hydrated carbonate. In process of time a combination is also formed between the lime and some of the silica of the sand with which it is associated, and silicate of lime is produced. By this the strength of the mortar is still further increased. This progressive change has been ascertained by careful analysis of many samples of older and newer mortars. These have shown that in the older mortars—which in some instances are as hard as the stones they join—the percentage of silicate of lime is much greater than in those more recently made.

The notion is commonly entertained by architects and masons that the best lime is produced from the purest carbonate of lime, and statements to that effect will be found in many books which treat of this subject. This theory, however, has been abundantly proved to be a fallacy, for it has been shown that nearly all the most extensively used and highly esteemed limes contain a large percentage of magnesia. Magnesian limes are preferred by masons, because, as they say, they are "cooler" and set more slowly. The pure lime is, in their language, too "hot" and "quick."

A similar fallacy prevails in regard to the use of magnesian limestones for fluxes in metallurgy. It is generally believed that pure limestones make much the best fluxes, but this is a mistake, as abundant experience has shown that magnesian limestones are quite as well adapted to this use as those which contain the carbonate of lime only.

Lime is manufactured from limestone, marbles, or shells, by calcination, which expels the carbonic acid. This is effected in kilns of various kinds. Formerly, lime-burning was done in kilns having the form of an inverted beehive, with a single opening at the bottom. In these the fuel and stone were mixed, the fire being lighted below. At the end

of three or four days, the fuel having been consumed and the limestone calcined, the charge was allowed to cool partially, and was then drawn out at the bottom. Now, lime-burning is nearly all done in what are called perpetual kilns. These are square or round towers, 25 to 30 feet in height, having a cylindrical cavity within, 5 or 6 feet in diameter. These kilns have usually two furnaces, one on either side, situated at about one-third of the height from the bottom. In these the fires are kept perpetually burning, and are fed with wood or soft coal, the flame and heat from which, passing up through the limestone, calcine it so that when it has descended to the level of the furnaces it is deprived of all its carbonic acid. From time to time the limestone is charged at the top and the calcined lime drawn out below. See KILNS.

When mortar freshly made from quicklime is placed in water, it softens and loses its form; but, on the contrary, the lime made from certain limestones which contain a large percentage of silica and alumina hardens under water, and forms what is known as hydraulic cement. When calcined, these hydraulic limestones yield a yellow or brown lime which does not slake or heat much on the application of water. From its hardness it must be ground in a mill before it can be used for mortar. Further particulars in regard to this class of lime will be found in the artiele CEMENT. See also Vicat *On Mortars* and Vicat's *Treatise on Mortars and Cements*; Pasley's *Limes, Mortars, and Cements*; Burnell's *Mortars, Limes, Cements, and Concretes*; and Gillmore's *Limes, Mortars, and Cements.*

Revised by CHARLES KIRCHHOFF.

Lime [from Fr. *lime*, from Pers. *līmū*, lime. Cf. LEMON]: the fruit of *Citrus acida* and *C. limetta* (the last called sweet lime), both probably mere varieties of *Citrus medica*, the citron-tree. The lime grows upon a dwarfish tree or shrub, and is a native of Asia, but is cultivated in nearly all warm regions. Limes are in nowise inferior to lemons, for which they are used as a substitute. The limes of the West Indies and those mostly known in the markets of the U. S. are the *sour limes*—the *Citrus acida* of many botanists. Pickled limes are prized as a condiment. Lime-juice is extensively employed in ships' stores as an antiscorbutic. Citric acid is largely manufactured from it. Lime is the usual English name of the linden-tree (genus *Tilia*).

Revised by L. H. BAILEY.

Lime, Chloride of: See HYPOCHLOROUS ANHYDRIDE and HYPOCHLORITES.

Lime-light, frequently called from its inventor, THOMAS DRUMMOND (*q. v.*), the **Drummond Light**: a source of illumination consisting of a cylinder of lime (Ca O) against which the flame of an oxyhydrogen burner plays. The refractory oxide becomes brilliantly incandescent, and affords a source of light inferior in whiteness, among artificial illuminants, only to the *arc-light* and to that of burning magnesium. When first ignited, indeed, the incandescent lime exceeds in brilliancy the arc, and nearly or quite equals the magnesium light. It very soon depreciates in quality, however, and when it reaches its permanent condition it gives light of a lower degree of incandescence than either of these.

Comparisons of the lime-light with gas-light show the following result, the data being reduced for the purpose so as to represent lights equally bright in the yellow ($\lambda = 0{\cdot}589$):

Relative intensities of lime-light and gas-light for various wave-lengths, both taken as unity in the region of the D. line ($\lambda = 0{\cdot}589$).

REGION OF THE SPECTRUM.	LIME FRESHLY IGNITED.	LIME IN FINAL STATE OF INCANDESCENCE.
	Lime-light / Gas-lamp.	Lime-light / Gas-lamp.
$\lambda = 7530$	0·65	0·49
6685	0·76	0·72
6562	....	....
6080	0·89	0·89
5890	1·00	1·00
5570	1·24	1·18
5185	2·10	1·32
5180	....	....
4920	3·84	1·62
4685	5·38	1·81
4500	10·80	2·08

The results given in this table are from measurements made by Nichols and Franklin in 1888 (*American Journal of Science*, vol. xxxviii., p. 100). They are shown graphically in curves of Fig. 1.

Owing to the cost of oxygen gas, the lime-light is used only for special purposes, viz., for producing spectacular effects upon the stage, for the projection of transparencies by means of the magic lantern, etc. For these purposes, too, it has been in some measure superseded by the more powerful electric arc-light. Other refractory oxides are sometimes substituted for the lime in the Drummond light, generally magnesium oxide and the oxide of zirconium. Of these the latter, zircon, is probably the best substance for the purpose, but its rarity has prevented it from coming into general use.

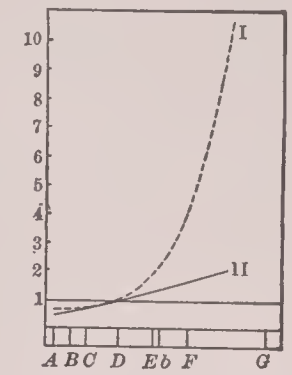

FIG. 1.—Curves of relative intensities in the spectrum of the lime-light as compared with gas-light. Curve I. gives results of measurements upon the freshly ignited lime. Curve II. upon lime in permanent state of incandescence.

The essential features of the simplest form of burner for the lime-light are shown in Fig. 2.

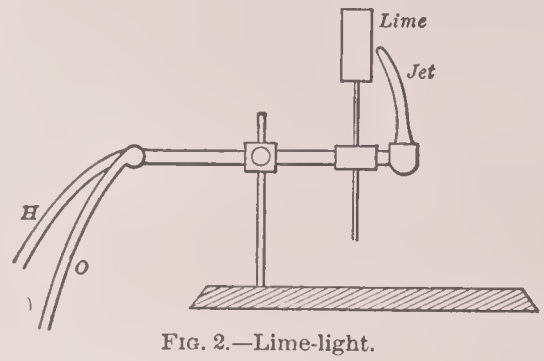

FIG. 2.—Lime-light.

E. L. NICHOLS.

Lim'erick: county; in the province of Munster, Ireland; bounded on the N. by the estuary of the Shannon and the counties of Clare and Tipperary, on the E. by Tipperary, on the S. by Cork, and on the W. by Kerry. Area, 1,064 sq. miles. The surface is mostly an undulating plain on a subsoil of limestone, trap, and sandstone, comprising the larger portion of the so-called Golden Vale, and watered by the Shannon, which is navigable up to Limerick, the Maig, which rises in the Galtees, flows into the Shannon, and is navigable up to the town of Adare, the Deel, and the Mulcair. Toward the S., however, the ground rises into the picturesque Galtee Mountains, which extend into the county of Tipperary and have in Galtymore an elevation of 3,015 feet. In the mountainous districts the soil is poor and incapable of improvement, but the Golden Vale comprises the most fertile districts in Ireland. Besides agriculture, some manufactures of coarse woolens and paper are carried on, and there is a considerable number of flour-mills; but the flax-spinning and weaving industry has become almost extinct. The population, which in 1841 amounted to 331,003, had in 1891 decreased to 158,912. This decrease was chiefly the result of emigration. The county belonged originally to the kingdom of Thomond, and was inhabited by the Coriandi; afterward it became an independent state, under the name of *Aine-Cliach*, and from the eighth to the eleventh century it was partially occupied by the Danes. The county is, however, not particularly rich in interesting antiquities.

Limerick: city of Ireland; capital of the county of Limerick, province of Munster; on both sides of the Shannon, which is crossed by five bridges and lined with docks (see map of Ireland, ref. 11–E). On the western bank of the river stands Irish Town, on the eastern Newtown Pery, and on an island in the river English Town; but the first and the last parts of the city are occupied by the poorer classes, and consist mostly of mean houses. All the principal buildings, streets, and squares are in Newtown Pery. The city has distilleries, tanneries, flour-mills, flax-spinning and weaving factories, and lace-manufactures, and its port is the fourth in importance in Ireland. It admits vessels of 1,000 tons. Limerick was taken in 1651 by Gen. Ireton, and was the last place in Ireland which surrendered to William III.; on that occasion a treaty was signed (1691) granting certain rights to Roman Catholics. Its prosperity dates mainly from the

founding of Newtown Pery, in 1769, by Sexton Pery. Pop. (1891) 37,155.

Limestone: a sedimentary rock composed chiefly of calcium carbonate. It may originate by precipitation of the mineral from solution in the water of ocean or lakes, but this process is usually supplemented or replaced by an organic process, the material being secreted by aquatic animals or plants to form their tests or other hard parts. These parts are not decomposed after death, but accumulate in layers which are afterward consolidated by the precipitation of calcium carbonate in the interstices. Such a deposit if incoherent, is called *shell marl* or *calcareous marl*, and a special variety of fine texture is called CHALK (*q. v.*). *Coquina* is a porous but coherent variety occurring in Florida. *Oölite*, or oölitic limestone, is composed of spherical grains believed to be secreted by algæ. When precipitated limestone, instead of crystallizing, gathers in successive coherent stony layers it is called *tufa*. Usually such deposits occur in springs or streams, but they may be formed in lakes. The ornamental stone called *Mexican onyx* is a tufa. Some limestones consist partly of magnesium carbonate, and are called *magnesian* or *dolomitic limestones*. All other substances contained in limestones are regarded as impurities. *Arenaceous* and *argillaceous* or earthy limestones are characterized severally by notable amounts of sand and clay. In *cherty* limestone silex is segregated in concretionary masses called chert or flint. Pure limestone is white, a yellow color is sometimes given by iron oxide, and gray, the ordinary color, is commonly due to organic matter. By metamorphism limestone becomes marble. The limestones constitute about one-fifth of all sedimentary rocks. They are extensively used as building material (see BUILDING-STONE), in the construction of roads (see ROADS), as a source of LIME (*q. v.*), and for the fluxing of ores (see FLUX).

G. K. GILBERT.

Limestone Sink: See SINK-HOLE.

Lime-tree: See BASS and LINDEN.

Limicolæ [literally "mud-dwellers," from Lat. *limus*, mud + *co'lere*, to dwell]: an order of birds containing those small waders comprehensively termed snipe or plovers, having slender, soft, and often long beaks. The palate is schizognathous, the nostrils usually schizorhinal; there are basipterygoid processes and the angle of the jaw is produced. The toes are only exceptionally, as in the avocet, webbed; the wings are generally long and pointed, the tail short. The eggs are usually four in number, pear-shaped; the young are born downy, and run about as soon as hatched. See AVOCET, LAPWING, PLOVER, and SANDPIPER. F. A. LUCAS.

Limitation of Actions: in law, the limitation of the time within which actions may be brought to enforce rights.

History of the Doctrine.—In the older *Roman law* all rights of action were in principle unlimited or perpetual. Actions *in rem*, for the recovery of land or movables, of course perished when the property had passed into the ownership of an adverse possessor by *usucapio*, but in this case the right of action was lost simply because the substantive right on which it rested had been extinguished. (See PRESCRIPTION.) The first true limitation of action was introduced by the prætors and ædiles when they began to give equitable actions unknown to the older law. (See ROMAN LAW.) Many of these new actions were limited or temporal, and limited to very brief periods—from sixty days to a year—but in computing these periods days on which the plaintiff could not have brought suit (e. g. legal holidays) were not counted. Even the prætorian actions, however, were usually perpetual when they ran for recovery of property or its value, and only the actions which aimed at imposing penalty upon the defendant were regularly limited. Later imperial legislation subjected all actions to shorter or longer periods of limitation, and in Justinian's time the so-called perpetual actions were merely actions that ran for the longer periods—thirty or forty years.

In the prætorian procedure the plea that an action was extinguished by limitation was a plea of *tempus*; and at the time of the classical jurists this plea was put at the head of the formula or abstract of pleadings sent to the referee (*judex*), and was therefore termed a prescription (*præscriptio longi temporis*). The same form was used in pleading right derived from long and undisturbed possession. Hence mediæval jurists treated the acquisition of title by adverse possessors and the loss of rights of action by limitation as a single legal institution—viz., prescription; and the same confusion exists in the *Code Napoléon*. Modern European jurists and later codes distinguish the prescriptive acquisition of rights in things from the limitation of actions, but they still use the word prescription (German *Verjährung*) to cover both classes of cases. It was partly because of the mediæval confusion of ideas that the *canon law* declared that "no prescription should be good without good faith," a principle which at Roman law did not apply to limitation of actions, but only to prescriptive acquisition of rights. Mediæval practice applied this canonical rule to the limitation of actions only in case the action was for recovery of tangible property from an adverse possessor, but even in this restricted interpretation the rule has been rejected in all the great modern codes.

Following the initiative of the *Code Napoléon*, modern legislations have considerably shortened the Roman periods of limitation for all actions that arise in the ordinary course of trade and in the dealings of daily life, adopting terms ranging from six months to five years; but for other actions they generally retain the subsidiary term of thirty years.

Roman and Modern European Rules.—At bottom it is the non-enforcement of the right, of which the action is only an expression, which entails the loss of the action. For this reason modern German jurists speak of limitation of claims rather than of actions. Limitation in fact begins to run not merely from the time when suit can be brought (*actio nata* in the concrete sense), but from the time when satisfaction of the claim can be demanded. Conversely, limitation is *interrupted* by any exercise of the right (such as the retention of a pledge by way of security, or the receipt of interest or of a payment on account), and in some modern legislations by any express recognition of the claim by the adversary. Limitation is also interrupted by bringing action.

At Roman law the loss of the action by lapse of time was viewed as a just punishment of the negligence of the party entitled to sue. Hence limitation did not run against those who could not sue—against lunatics, for example, or boys under fourteen years of age; nor did any but the longest limitations run against minors (youths between fourteen and twenty-five). Some of the modern codes declare that no limitation will begin to run against lunaties or minors, but that limitations already running may be completed. The general tendency of modern European legislation is to permit limitation to run against minors and lunaties, at least when they are under guardianship.

What effect the loss of an action has upon the substantive right of which it is an expression is a question differently answered in the case of rights *in rem* and in that of rights *in personam*. The loss of an action *in rem*, even against an adverse possessor, leaves the property right theoretically intact. (Not so, however, in the *Code Napoléon*. See PRESCRIPTION.) In the case of the right *in personam*, on the other hand, most European jurists hold that when the action is no longer enforceable there is nothing left. In other words, they hold that statutes of limitation, as far as actions *in personam* are concerned, destroy the right as well as the remedy.

Not all actions, according to the better opinion, are subjected to limitation. Actions that do not aim at the enforcement of a claim against a special defendant, but at determining *status* (the existence or validity of a marriage, the legitimacy of a child, etc.), and in general all actions the object of which is to ascertain the existence or non-existence of a legal relation, the genuineness of a document, etc. (Germ. *Feststellungsklagen*), are not, in principle, limited. At Roman law such suits were not termed actions, but *præjudicia*.

Grounds of Limitation.—Apart from the theory already noticed, that the loss of the action is a just punishment of the negligence of the person entitled to sue, other considerations have been urged. One is that old claims are very likely to be bad claims that have been purposely held back until it has become difficult for the defendant to disprove them. Another consideration is the increasing difficulty, as time goes on, of proving that a debt has been paid. From this point of view statutes of limitations are intended to protect honest defendants by raising a presumption that the claim, if originally good, has been satisfied. This was clearly the view of the French codifiers, at least as regards some of the briefer limitations of the code; for when such a limitation is pleaded the *Code Napoléon* permits the plaintiff to compel the defendant to take oath to the fact of payment (art. 2275). Short terms of limitation have also been defended by German writers on the ground that they discourage long credits and keep business on a solid basis.

The fundamental principle on which statutes of limitation and laws of prescriptive acquisition alike rest is the social necessity of doing away with uncertainties of title and disputed claims. If such matters are not settled by adjudication, they must be settled by time. Cicero expressed this thought in saying that there must at some time be "an end of litigation and the peril of suits," and the English courts have insisted upon the same idea in declaring that statutes of limitation are "statutes of rest."

LITERATURE.—Windscheid, *Die Actio* (Düsseldorff, 1856); Puchta, *Institutionen*, sec. 208 (8th ed. Leipzig, 1875); *Motive zum Deutschen bürgerl. Gesetzbuch*, i., 288–347.

MUNROE SMITH.

LIMITATION IN ENGLISH AND U. S. LAW.—At common law a presumption of payment or satisfaction arose after the lapse of twenty years. This presumption threw upon the complaining party the burden of proving that the debt had not been paid or the claim satisfied; but the fact that this presumption could be rebutted and the claim asserted, even after the twenty years had elapsed, rendered it a very inadequate rule of limitation. It has accordingly been supplemented by a considerable body of direct legislation, which has taken its place in our law alongside of the legal presumption referred to. Various statutes of this kind have been enacted in England at different periods, but those which were first adopted were narrow in scope, applying only to actions relating to real property. The first statute to be enacted of a comprehensive character, applying to civil actions in contract and in tort, as well as to actions concerning real estate, was passed in the reign of James I. (21 James I., ch. 16). Upon this statute the various statutes of limitation enacted by the different States of the U. S. have been chiefly based, its principal provisions having been frequently adopted with but slight if any modification.

The rules relating to actions of tort and to actions concerning real property, as well as the statutes of limitation which have been enacted with reference to suits in courts of equity and to criminal prosecutions, may with most convenience be considered separately from those relating to contract.

I. *Actions upon Contract.*—It is provided by the statute of James that "all actions of account and upon the case, other than such accounts as concern the trade of merchandise between merchant and merchant, their factors, or servants, all actions of debt grounded upon any lending or contract without specialty, all actions of debt for arrearages of rent, shall be brought within six years next after the cause of such actions, and not after." Before the enactment of this statute there was no limit to the period within which an action upon contract might be instituted. It was a maxim of the common law that a "right never dies," and it could therefore not be barred or extinguished by any lapse of time. The object sought to be attained by the enactment of these provisions limiting the right of action to a specific and comparatively brief period was to relieve debtors from the undue embarrassment and hardship naturally attendant upon harassing litigation at remote periods of time, when vouchers and other instruments of evidence are likely to be lost or destroyed, or it has become unreasonably difficult or impossible to procure the necessary testimony. The statute is in furtherance of the principle that "the law favors those who are vigilant, not those who sleep upon their rights," and aims to promote the diligence of creditors in enforcing their claims while an adequate defense, if any can be made, is reasonably practicable. The limit of time assigned is necessarily arbitrary, though it was undoubtedly fixed upon with reference to two important considerations: first, that the creditor should not be forced to undue haste in bringing action before time was given to collect all necessary testimony, to employ other means of effecting a settlement, or to wait until an impoverished debtor might become capable of satisfying the claim; and, secondly, that the debtor should not be unwarrantably prejudiced in his interests by the creditor's excessive delay. For these reasons the statute is commonly termed in law a "statute of repose," because its purpose and effect are to quiet old and stale claims, to extinguish causes of litigation, and to relieve debtors from oppressive suits. There has been, however, no little conflicting adjudication in the courts as to whether it should be deemed a statute of repose or one of presumption. The decisions sustaining the latter doctrine proceed upon the ground that a creditor's claim is not to be enforced at the expiration of the prescribed period, because it is then presumed in law that it has been satisfied. It is now to be considered as the generally established rule that the statute is one of repose, founded upon principles of expediency and public policy, and not one of legal presumption. It may be briefly stated as the substance of the statute that it requires actions upon simple contracts (i. e. contracts not under seal) to be brought within six years after the cause of action accrues. The time when the cause of action accrues and from which the six years are to be reckoned is the time when the creditor could have begun his action. Thus if credit be given, the statute begins to run when the term of credit expires. If a bill of exchange be payable at sight, the six years are computed from the date of presentment; but a note payable on demand is due at any time, and the statute runs from the making of the note. If, however, the note be drawn payable a certain time after demand, a demand must be made to fix the beginning of the period of limitation. If a bill or note have days of grace, the statute runs from the time of their expiration. If a debt be payable by installments, the statute begins as to each installment from the time when it becomes due.

It is a general principle applicable to statutes of limitation that they do not apply to actions brought by the crown or state, unless there be an express provision in the statute to that effect. It was a maxim of common law that "time does not run against the king." Special provisions are generally adopted at the present day barring the right of the state to recover real property after a certain specified interval; but the rule as applicable to actions upon contract is not so frequently changed.

The statute also provided that actions upon contracts under seal, or *specialties*, should not be included within the prescribed period of limitation. Accordingly, the defendant in such an action had only the imperfect protection afforded by the disputable presumption of payment after twenty years, which has been above described. It is now provided in England and in most of the U. S. by statute that actions upon sealed instruments shall be begun within twenty years after the cause of action accrued. The bar of the statute may be removed in any case by a new promise to pay the debt, or by a part payment of its amount or of interest thereon, made within six years before action is brought for its recovery. The statute begins to run anew from the time of the promise or payment. This is true whether the six years have wholly or partially expired. The new promise may be either express or implied. It will generally be implied from an unconditional and unqualified acknowledgment of the existence of the debt, if unaccompanied by any refusal to pay or by any declarations showing an intention to rely upon the statute as a defense. In former times, when the statute was generally held to be a statute of presumption, very slight and trivial admissions of the debtor from which the existence of a debt could be inferred were fastened upon by the courts as sufficient evidence of a new promise, because they served to repel the presumption of payment. It was even generally held that the debtor would be liable though his admission were accompanied by a refusal to pay; but when the statute came to be regarded as a statute of repose the natural deduction was that the debtor might take advantage of the statute, unless he voluntarily waived it by an express promise or by an acknowledgment so full and unequivocal as to be equivalent to a new promise; and this is now the established rule. It is provided in Great Britain by Lord Tenterden's act that no promise or acknowledgment shall be sufficient to take a debt out of the operation of the statute unless it be contained in some writing to be signed by the party chargeable thereby. This act, however, it is declared, shall not alter the effect of any payment of principal or interest. Similar statutes have been adopted in a number of the U. S.

The statute of James provides that if the plaintiff be under certain disabilities at the time when the cause of action accrues, he may bring his action within six years after the disability ceases or is removed. The disabilities enumerated are minority, coverture, or marriage, imprisonment, unsoundness of mind, or absence beyond the seas. The expression "beyond seas" means beyond the four seas surrounding Great Britain, and therefore is equivalent to "out of the realm or country." The same phrase, as contained in statutes of limitation in the U. S., has been usually interpreted to mean "out of the State," though in some States it has been held to mean "out of the U. S." It was also provided by the statute 4 Anne, ch. 16, that if the *defendant* in any action shall at the time when the cause of action accrues be "beyond seas," the action may be brought

against him within six years after his return. It has been generally held under this statute that the return must not be clandestine, and with an intent to set the statute in motion, and then depart without giving the creditor an opportunity to enforce his claim. It must be so public and made under such circumstances of notoriety as to render it presumable that the creditor might by ordinary diligence have acquired information of the return and set the machinery of the law in motion against the debtor. This exception is usually held to apply to foreigners as well as non-resident citizens, and they may be sued within six years after coming within a state, even though the debt may be barred by the statute of their own state; for it is a general principle in reference to statutes of limitation that they are controlled in their operation and effect by the *lex fori*, or the law of the place where a suit is brought to enforce a legal demand. (See INTERNATIONAL PRIVATE LAW.) Similar exceptions and disabilities are usually included in the statutes of limitation in force in the U. S. It is the general rule, also, that when fraud has been committed by the defendant under such circumstances as to conceal from the plaintiff all knowledge of the fraud, and prevent him from asserting his right, the bar of the statute may be avoided and the six years computed from the discovery of the fraud.

The statute of limitations is held to affect the plaintiff's remedy, but not his right. Hence, though the remedy be lost by the expiration of the prescribed time, any lien which the creditor may have will not be extinguished. So a promissory note may be barred, while a mortgage given as security for its payment may be enforced by foreclosure after the six years have terminated. Moreover, it is held that the enactment by a State of a statute of limitations barring a right of action after the lapse of a certain interval, and operating prospectively, is not in violation of that clause of the U. S. Constitution which provides that "no State shall pass any law impairing the obligation of contracts," since the "obligation" of the contract still subsists, though the creditor is deprived of the regular legal means of enforcing it.

II. *Actions of Tort.*—The common-law theory of the action in tort, as a purely personal action which could not survive the parties to it, afforded a certain, if somewhat indefinite, limitation upon actions of this nature. Whereas rights of action for breach of contract would usually devolve upon the executor of the person entitled, and rights of entry upon land would descend to the heir of the person who died without exercising such rights, the right of action for a tort died with the death of either party to the tort. Obviously, there was need of shorter periods of limitation for actions of this nature, and this need also was supplied by the statute of James. The periods of limitation prescribed by this statute in cases of tort are as follows: In actions of trespass for injuries to real or personal property, in actions of trover, of detinue, of replevin, and of case (except for slander), six years after the cause of action accrues; in actions of trespass for assault, battery, or false imprisonment, four years; and in actions for slander, two years. (See TRESPASS, TROVER, CONVERSION, DETINUE, REPLEVIN, and CASE.) These are the periods still established in Great Britain. In the U. S. similar statutes generally exist, applying to the same forms of action, or the same classes of tortious injuries, though there is no such general agreement among the various States in regard to the periods of limitation prescribed in these actions as in relation to actions upon contract.

III. *Actions Relating to Real Property.*—By the statute of James it was further provided that no person should make entry into lands, tenements, or hereditaments but within twenty years after his right should first accrue. This provision, supplemented by later legislation, has operated to set up an absolute bar against actions for the recovery of real property in all cases where the rightful owner has been excluded from the possession of the property for twenty years. By the English law persons under the disabilities of infancy, lunacy, or coverture, and those beyond seas are to be allowed ten years from the termination of the disability to enforce their rights, but no action can be brought by any one after forty years. Statutes of a similar character exist in all of the U. S., and though these American rules differ much in detail and in scope, the English period of twenty years has usually been adopted as the time of limitation. The list of disabilities has also been somewhat reduced in the U. S., coverture, or marriage, having by recent legislation in many States lost the character of a disability, and absence "beyond seas" not being generally regarded as a ground for claiming exemption from the general rule of limitation. It should be added that in Great Britain as well as in the U. S. the only disabilities which are permitted to delay the running of the statute are such as exist at the time the right of action first accrued. No subsequent or intervening disability will be regarded, and no original disability can be extended by "tacking" another subsequently incurred. Thus a woman who is disseised during minority can not prolong her period of disability by marrying before she comes of age. Disabilities under the statute relating to actions upon contract and in cases of tort are similarly dealt with; but whatever may be the differences between the several statutes of limitation, their practical operation is substantially the same. A person who is deprived of the possession of his land by an adverse occupant for the statutory period is forever prevented from recovering it, and is thus, to all intents and purposes, divested of his ownership. The apparent effect of the statute, then, is to vest an indefeasible title in the adverse possessor, or, as it is sometimes expressed, to transfer the title from the original owner to the one who has maintained the adverse possession against him. It would, however, be a more accurate description of the process to speak of it as confirming to the adverse possessor the undisturbed enjoyment of a title acquired by him by his original act of dispossessing the former owner. So important was the actual visible possession of lands deemed to be at common law that the mere disseisin of one man by another operated to transfer the freehold from the former to the latter. The person who had thus been deprived of his property had certain rights of entry and of action, by the exercise of which he might show that he was entitled to have the lands restored to him; but, in the meantime, not all of these rights together amounted to a title, nor even to an interest in the property, and they were so precarious in their nature that they might be lost or barred by a variety of circumstances. The true effect of limitation, therefore, on the interests of the parties is not to create any new property rights, but only to cut off certain rights of action which had survived the loss of property rights by disseisin. In either view, the property has, upon the expiration of the period of limitation, become so effectually vested in the disseisor, or adverse possessor, that he can divest himself of it only by the ordinary means of conveyance. Even an abandonment of the property to the original owner, after twenty years' adverse possession, will not have the effect of restoring the title to the latter.

This explanation will help to make clear the distinction between limitation and the related doctrine of *prescription*. The latter term designates the process of acquiring by lapse of time rights of user or enjoyment in the land of another. These rights, known variously as *easements* and *profits*, are properly conferred by grant, or deed; but the courts will, after the right has been exercised for a certain length of time, conclusively presume that it was originally conferred by grant. Of course this so-called conclusive presumption is only a clumsy fiction for the rule of law that rights in the nature of easements and profits may be acquired by their enjoyment during the period of prescription. The doctrine of prescription has been developed almost exclusively by judicial decision, and is not, in the U. S. at least, usually regulated by statute. (See PRESCRIPTION.) The doctrine of limitation is, in its present form, purely the creature of statute law, and is, properly speaking, confined to corporeal property.

The act of disseisin which, under the description of adverse possession, deprives the rightful owner of his lands consists in the taking possession of the property with the intention of claiming the same as owner, or, in the language of the common law, it is "possession as of the freehold." This intention is of the essence of the act; consequently no squatter or other trespasser, who enters upon the lands of another without this intention, is a disseisor, and no statute of limitation runs in his favor. The question of the motive or intention with which an entry is made is always one of fact for the jury. In order to raise this question of fact, however, there must first have been a distinct and unequivocal entry upon another's lands, under such circumstances that it shall at least be open to the construction of being a hostile or adverse act. Thus no length of time will render a tenant's possession adverse to his landlord. Neither can a tenant, by any declarations or conduct on his part during the continuance of his term, confer upon himself the rights of a disseisor. Even after the expiration of his term, if he continue in possession, he does not lose the character of a ten-

ant, and his possession is always in subordination to his landlord's title. In New York and some other States it is now provided by statute that a tenant may be deemed an adverse possessor after twenty years from the expiration of his term or the last payment of rent. In such cases the statute of limitations begins to run at the expiration of such twenty years. So, also, the disseisin, in order to confer upon the disseisor an estate in fee, must operate upon every freehold interest in the estate in question. In other words, the disseisin of a tenant does not in general set the statute running against his landlord until the tenant's term has come to an end. Until such time the landlord, who is deemed to have only a future estate in the lands (see LANDLORD AND TENANT), can not bring ejectment for the premises, and consequently his right of action has not, in the language of the statute, "accrued." He will usually, therefore, have twenty years after the tenant's term has expired in which to bring his action for the recovery of the property.

It has been observed that adverse possession in order to "ripen into title," as it is often expressed, must be accompanied with an intention to claim title to the land occupied as against any and all other persons claiming the same; but so long as this intention exists it is immaterial whether the adverse possessor acted with knowledge of any claim hostile to that asserted by him or not. Thus if a person innocently incloses a part of his neighbor's land with his own and occupies it as his own for the requisite time, he has as effectually displaced his neighbor's claim and title as though he had knowingly and wrongfully seized and occupied the land in question. This has been denied in a few States (especially Iowa and Kansas), but is the generally accepted and more reasonable doctrine.

There has been no little controversy as to what acts of occupancy shall be sufficient to raise a presumption of adverse possession. It is difficult to lay down any general rules on the subject, as the same acts may require a different construction according to the nature of the land upon which they are committed. Conduct which would amount to an assertion of ownership in the case of woodland or pasture land might amount to nothing more than occasional acts of trespass on a cultivated farm or a city lot. In general it may be said that in order to give possession the character of a disseisin it must be accompanied with the habitual cultivation of the land or by a substantial inclosure or other permanent improvement of the premises. In other words, it can not be a secret possession, but must be "actual, visible, and notorious." It is not necessary that the rightful owner shall know of the adverse possession, but it must be of such a character that he may with due vigilance become aware of it.

As would naturally be expected, a person will usually gain title by disseisin only to so much land as is actually held by him in the adverse possession above described. It must appear that he has actually cultivated, or inclosed, or improved all of the land so claimed by him; but there is one class of cases in which an adverse possessor may acquire title to more land than he has actually inclosed or reduced to possession, and that is where he claims under a deed or will which describes the tract or parcel of land claimed. In such cases the adverse possessor is said to occupy under "color of title," and has "constructive possession" of the whole tract described in the instrument under which he claims. There must, however, in every case in which this doctrine is invoked be actual possession of a part of the lot or parcel described, and the courts have refused to extend the principle so as to give constructive possession to very extensive tracts of land, especially where but a small portion of the tract claimed has been actually occupied. This doctrine of constructive possession does not prevail in England. Of course no "color of title" or claim of right, in the proper sense of that term, is requisite to confer title by disseisin where the possession relied upon is of the proper character. The only title which need be claimed in such cases is the title acquired by the disseisin.

It is obviously necessary that the adverse possession, in order to bar the rightful owner, shall be *continuous* during the whole period of limitation. Any abandonment of the possession by the disseisor before the period has run its course at once restores the title to the original, or "rightful," owner, and the return of the adverse possessor, or the entry of a stranger, constitutes a new disseisin and the beginning of a new period of limitation. It is a general rule that successive disseisins, even though there be no intervals of time between them, can not be "tacked" so as to make up the time of limitation, but subsequent occupants who are in "privity" with the original disseisor may tack their terms of possession to his. By privity is here meant "privity of estate," or the transfer of the lands from one to the other by will, or descent, or lawful conveyance. Thus the possession of an heir is, for the purposes of the statute, deemed to be continuous with that of his ancestor and the possession of a grantee with that of his grantor. Indeed, there is a marked tendency in some of the States to permit the tacking of consecutive possessions in all cases where the newcomer has entered under or by agreement with his predecessor, even though no relation of privity is thereby created between the parties. This is the rule in Connecticut, Ohio, and a few Western States. It seems that in England it is not necessary to have a continuous possession so long as the original owner is continuously excluded from the possession. See the Carter cases, 9 Q. B. 863 and 13 Q. B. 945.

IV. *Suits in Equity.*—The several statutes of limitation above considered were not enacted with reference to proceedings in the equity tribunals, and are of no binding force there. The equitable doctrine of LACHES (*q. v.*) and the broad discretion vested in the courts of equity to grant or refuse their aid, as justice might require, rendered unnecessary such arbitrary limitations on suits before them. It has, however, become the practice in equity to apply the statutory rules of limitation to all causes of action which come specifically within their provisions, and even to extend them to other analogous cases. Manifestly, however, the courts of equity are, as compared with the courts of law, capable of employing these rules with great flexibility, and they do, in fact, habitually apply them according to the "conscience" of each case. Accordingly they disregard them entirely when to do so would enable fraud to be committed or result in manifest injustice.

V. *Criminal Prosecutions.*—There have been several statutes of limitation enacted in England at different periods applying to prosecutions for certain crimes. Thus, by statute 7 Will. III., ch. 3, it was provided that no prosecution shall be had in cases of high treason whereby corruption of blood may ensue, except for an attempt to assassinate the king, unless the bill of indictment be found within three years after the offense was committed. So by the statute 31 Eliz., ch. 5, prosecution by information upon a penal statute was limited to a prescribed period. In New York it is provided that indictments for murder may be found at any time after the death of the person killed; in all other cases indictments are to be found within five years after the commission of the offense, but the time during which the defendant shall not have been an inhabitant of the State, or usually resident therein, shall not constitute any part of this period. Similar statutes exist in all the other States.

VI. *Actions against Public Officers, etc.*—In many of the U. S., as well as in England, statutes of limitation have been enacted defining and restricting the time within which actions shall be brought against certain public officials—as sheriffs, etc.—for malfeasance in office, and also for the recovery of penalties or forfeitures under a statute, etc. These miscellaneous causes of action are too numerous and the rules of limitation regulating them are too various to make more than a general reference to them possible or necessary in this place. The statutes of the several States should be consulted for further information regarding them.

On the general subject of limitation of actions, consult the treatises of Angell, Burrell, Banning, Wood, Buswell, and Wilkinson *On Limitations.* GEORGE W. KIRCHWEY.

Limitations, Statute of: See LIMITATION OF ACTIONS.

Limited Liability: a phrase used specifically to designate liability of copartners or shareholders in a joint-stock company upon the future debts of the company when limited to a fixed sum by virtue of compliance with statutes provided for that end. At the common law an individual is liable on his contracts and for his torts to the full amount of his property, and every member of a partnership is liable in the same way for all partnership obligations or liabilities.

In the case of individuals who act themselves or by their duly authorized agents in matters concerning themselves, and over which they have a personal supervision, this rule works no hardship; but in the case of a partnership consisting of a large number of individuals it often does. In such a case the total capital and the total liabilities are commonly larger than the entire capital of any individual partner, and the management is necessarily intrusted to a few individuals over whom no close personal supervision can be had. A failure may involve the loss of the entire property of many

small holders, and yet be due to no negligence or remissness on their part, but to the reckless borrowing or incurring of liabilities by their agents, which is made possible by the fact of the unlimited liability of the partners. To remedy this evil statutes have been passed both in Great Britain and in the U. S. providing for the formation of companies, usually joint-stock companies, whose members are shareholders with liabilities limited by the act of conforming to the formalities prescribed by law. (See JOINT-STOCK COMPANIES, CORPORATION, and PARTNERSHIPS.) In some cases the liability is regulated by the amount of capital stock subscribed for, in others by the amount guaranteed by the person who becomes a member of a company. The legislation on this subject in Great Britain began in the first half of the nineteenth century, and led up by gradual changes to the Companies Act of 1862, which is the basis of their present system. These statutes at first were not made to apply to banking companies, but the great hardships occasioned by the failure of the City of Glasgow Bank led in 1879 to a provision limiting the liability of shareholders in banking companies, except that the unlimited liability was continued with respect to the issuing of notes. The shareholders in the national banks of the U. S. are liable for twice the amount subscribed—that is, on paid-up stock for the amount paid in, and as much more when that is exhausted. This provision is very generally adopted with respect to banking and insurance companies. F. STURGES ALLEN.

Limits, Method of: in mathematics, a method of arriving at relations between certain quantities which do not admit of being directly compared. An example of such quantities is afforded by curved lines and surfaces. In geometry, two quantities are proved equal by showing that they may be so divided into parts that each part of the one may be brought into coincidence with a separate part of the other; but two bodies, bounded by different curved surfaces, such, for example, as a cone and a cylinder, can not be so divided. The circumference of a circle can not be divided into pieces of a straight line. To meet these difficulties, what is now called the method of limits was imagined by the older geometers, and has come down to us from the time of Euclid. The principles on which it rests are sometimes called the doctrine of limits. Examples of the reasoning may be found in any elementary treatise on geometry; reduced to its logical framework it may be presented in this form:

I can not prove these quantities equal by dividing them up in the usual way, because if I had to do so I should have to divide one or both of them into an infinite number of parts, which there is no possibility of my doing; but if they are not equal they must differ by a certain quantity, and by whatever quantity you suppose them to differ I can divide them up so as to show that they differ by less than this quantity. Hence they must be equal, for if they are unequal the difference must exist, and must have a certain value.

When we reduce the reasoning of the differential calculus to a rigorous form, we are always led to this mode of reasoning, and therefore to the method of limits. By establishing certain general propositions respecting limits, we are relieved from the necessity of going through this course of reasoning. Thus we define an infinitesimal as a quantity in the act of approaching zero as a limit. By the introduction of such a quantity we reach conclusions by simple and direct algebraic operations which it would be tedious or impossible to reach without it. S. NEWCOMB.

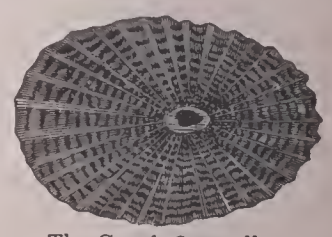
Limoges, lĕĕ′mōzh′ [Fr. < Lat. *Limo'vices*, the ancient name]: capital of the department of Haute-Vienne, France; on the Vienne river, 250 miles S. of Paris (see map of France, ref. 6–E). It is one of the seven places in which Christianity was planted about the middle of the third century, and it became an important ecclesiastical center. It was here, in 994, that the first attempt was made to establish the TRUCE OF GOD (*q. v.*). The noble Gothic cathedral was begun in the seventeenth century, and completed in 1851. The city has a famous breed of horses and extensive manufactures of porcelain, a very fine white porcelain earth having been discovered in the neighborhood in 1768. It has also cotton, paper, and woolen mills. Pop. (1896) 77,703.

Li'monite [from Gr. λειμών, meadow, moist grassy place]: the hydrated sesquioxide of iron, often called brown hæmatite, one of the commonest and most important ores of iron. The deposits of limonite are peculiarly local and irregular in character. They are never found forming continuous strata, but are (1) either the superficial deposits of chalybeate waters, filling fissures or cavities or incrusting slopes or accumulating in concretionary or botryoidal masses in sand, clay, or gravel; or (2) they are produced by the oxidation, at and near the surface, of beds of the carbonate of iron or iron pyrites. From their mode of formation the deposits of limonite are less extensive and reliable than those of other ores of iron, and their irregularities have often been a cause of disappointment and loss; but some of them are of great extent, and they are so numerous in many countries that they have always constituted one of the great sources from which the supply of iron has been derived. In the U. S. valuable deposits of limonite are found in a great number of localities. They occur perhaps in the greatest abundance in a belt which extends along the eastern flank of the Alleghanies from New England to Alabama. Here they rest on rocks of various kinds, such as gneiss, serpentine, crystalline limestone, slate, etc. From Pennsylvania southward their association with the Lower Silurian limestones and slates is such that they have by some writers been represented as holding a definite geological position in that series of rocks. It is quite certain, however, that they are altogether superficial in position, and form no part of the stratification of this or any other formation. It is probable, as suggested by Prof. Frederick Prime, that some of the brown hæmatites of Pennsylvania are formed from the decomposition of pyrites along the outcrops of pyritous slates; but some of the most important deposits of this belt are so far removed from the metamorphosed Palæozoic rocks of the Alleghanies that they can have had no connection with them—such as the limonites of Salisbury region of Massachusetts and Connecticut, and Staten Island, N. Y. In Alabama and Tennessee deposits of limonite of great extent and purity are found along the outcrops of the Lower Carboniferous limestone. In Missouri a belt of superficial limonite encircles the district which contains the great deposits of specular iron in the central part of the State, and may be supposed to have been formed from the ferruginous drainage of this district. The limonites which are formed by the oxidation of the stratified carbonates are best seen in Southern Ohio and Eastern Kentucky, where some of the calcareous orebeds of the coal-measures are oxidized along their outcrops, and are more or less deeply converted into the hydrated sesquioxide. A similar change is observable in some of the limonite beds of Eastern New York and Connecticut, which pass into siderite in depth.

Bog-iron ore is a spongy and usually impure limonite which accumulates in marshes from the leaching of surrounding beds of sand, gravel, etc., containing iron. *Lake ore* is the name given to limonite which gathers at the bottom of lakes and ponds that receive the drainage of ferruginous strata or soils. In some of the Swedish lakes and at Radnor Forges, Canada, this ore is dredged up periodically, the deposit being reproduced at intervals of one year or of several years. Revised by CHARLES KIRCHHOFF.

Limousin, lĕĕ′moo′săñ′: a former province of Central France, comprising the present departments of Corrèze, Creuse, Dordogne, and Vienne. Its capital was Limoges. It gave name to a mediæval dialect which prevailed through much of Southern France, and had a considerable poetic and romantic literature.

Limpet [< O. Eng. *lempedu*, from Lat. *lam'petra*, lamprey. See LAMPREY]: a name given to various GASTEROPODA (*q. v.*) in which the shell is low and the spiral obscure, and which adhere closely by the muscular foot to the rocks, etc., in the water. The different forms to which the name is given are not closely allied. Strictly speaking, the term belongs to the members of the group *Docoglossa*, which contains the genera *Patella*, the common limpets of Europe, and *Acmæa*, the common limpets of the east coast of the U. S. The keyhole limpets (*Fissurella*), which belong to another group (*Zygobranchia*), have an opening at the apex of the conical shell; the slipper limpets (also called bonnet or cup limpets) form the family *Calyptræidæ* (of the *Pectinibranchia*); specimens are common on the coasts of the U. S. adhering to the inside of deserted snail-shells, especially those inhabited by hermit crabs. The fresh-water limpets (*Valvatidæ*) are small forms, resembling the *Patellas* in general appearance, but belonging to a separate sub-order, the *Monotocardia*, of gasteropods.



The Greek fissurella.

J. S. KINGSLEY.

Limpo'po River: the second largest river in South Africa; so called by natives along its middle course. It has several other names given by various tribes; is also called by the Boers the Crocodile river. It rises on the Transvaal plateau, near Pretoria, flows N. W., N. E., and S. W., and reaches the Indian Ocean some distance above the Delagoa Bay. It forms a large part of the northern boundary of the South African republic. It has many tributaries, but loses much of its water in swamps. Its mouth is obstructed by a sandbar, and it is not important for navigation. Discovered in the third decade of the nineteenth century, it was not known for thirty years where the Limpopo reached the sea.

C. C. Adams.

Limulus: See Horseshoe Crab.

Lin'acre, or **Lynaker**, Thomas: physician and scholar; b. at Canterbury, England, about 1460; studied at Oxford and on the Continent; became fellow of All Souls', Oxford, in 1484, and afterward Professor of Physic; was an associate of Colet, Erasmus, and Lily in introducing into England a knowledge of Greek, which he learned from the celebrated Chalcondylas, and studied under Poliziano, from which language he made elegant translations of Galen into Latin; studied theology, and in 1518 became a prebendary of York; founded the College of Physicians at London (1518), was its president for life, and was physician to Henry VII. and VIII. D. in London, Oct. 20, 1524. His translation of Galen's *De Sanitate Tuenda* appeared in 1517, the *Methodus Medendi* in 1519, and the *De Temperamentis* in 1521. He published in 1524 a treatise on the rules of Latin prose composition, *De Emendata Structura Latini Sermonis, lib. vi.* See the *Life* by Dr. Noble Johnson (1835).

Linares, lĕe-naa'rās: a town of Chili; in the central basin or "valley," on a plain near a small southern affluent of the river Maule; 167 miles S. S. W. of Santiago, and about 500 feet above the sea (see map of South America, ref. 8–D). Population about 9,000. It is an important railway station on the line which runs southward from Santiago, and is the capital and commercial center of a province of the same name, having 3,488 sq. miles of area and a population of 115,646 (1891).

H. H. S.

Linares, José Maria: statesman; b. at Potosí, Bolivia, July 10, 1810. He was a distinguished jurist, was Minister of the Interior under Santa Cruz, subsequently minister to Spain, president of the senate in 1848, and for a short time acting president by virtue of that office. In 1857 he was elected president, and his term was one of the best and most progressive that Bolivia has ever known. Dr. Linares was deposed by a revolution in Jan., 1861, took refuge in Chili, and died at Valparaiso the same year.

H. H. S.

Lincoln, or **Lincolnshire**: county of England, extending along the North Sea from the Wash to the Humber. Area, 2,762 sq. miles. The ground is very low along the coast; in some places it is protected by dikes against inundations of the sea; but from the coast it gradually rises until it swells into high chalk hills in the northwestern part of the county, the so-called *Wolds*. The soil is generally very fertile and cultivated with great care. Large crops of wheat and oats are raised, and fine breeds of horses, short-horned cattle, and long-wooled sheep are reared. Immense flocks of geese are fed on the fens along the shore. Pop. (1901) 436,820.

Lincoln: the capital of Lincolnshire, England; on the Witham; 130 miles N. of London (see map of England, ref. 8–J). It is a parliamentary, county, and municipal borough, one member being sent to the House of Commons. It is an old city, the seat of a bishopric, with one of the finest cathedrals in England, built in the thirteenth century, 524 feet long, 250 feet wide, a theological college, and a school of science; large foundries and manufactures of agricultural implements, and an extensive trade in flour and wool. The famous bell Great Tom of Lincoln is hung in the central tower of the cathedral. Lincoln has a noted annual horse-fair and a celebrated race-meeting. Pop. (1901) 48,783.

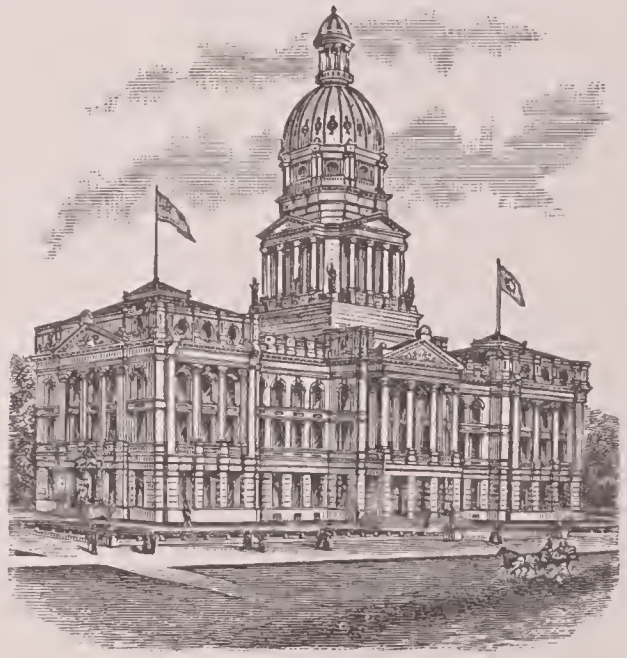
Lincoln: city; capital of Logan co., Ill. (for location of county, see map of Illinois, ref. 6–E); on the Chi. and Alt., the Peoria, Decatur and Evans., and the Ill. Cent. railways; 28 miles N. E. of Springfield, 157 miles S. W. of Chicago. It is in an agricultural and stock-raising region, and in a section underlaid with 27 feet of coal, and has four coal mines, several flour-mills, press-drill works, canning-factory, horse-collar factory, and excelsior-works. There are 17 churches, 3 national banks with combined capital of $210,000, public library, electric street-railway, and 2 daily and 4 weekly newspapers. It is the seat of Lincoln University (Cumberland Presbyterian, organized 1865), for both sexes, which in 1900 had 5 departments, 14 professors and instructors, 275 students, $50,000 invested in grounds and buildings, and $61,000 in productive funds. The city also contains the Odd Fellows' Orphans' Home of Illinois and the Illinois State Asylum for Feeble-minded Children. Pop. (1880) 5,639; (1890) 6,725; (1900) 8,962.

Editor of "Courier."

Lincoln: city; capital of Lincoln co., Kan. (for location of county, see map of Kansas, 5–F); on the Saline river, and the Union Pacific Railway; 220 miles W. of Kansas City. It is in a wheat and corn region; has large wool-growing interests, and contains 5 churches, a national bank with capital of $50,000, a State bank with capital of $50,000, and 2 weekly newspapers. It is the seat of the Kansas Christian College (Christian, chartered 1884), for both sexes, which has grounds and buildings valued at $15,000. Pop. (1880) 422; (1890) 1,100; (1900) 1,262.

Editor of "Republican."

Lincoln: city; capital of Nebraska and of Lancaster County (for location of county, see map of Nebraska, ref. 10–G); on the Burl. and Mo. River, the Chi., Rock Is. and Pac., the Fre., Elk. and Mo. Valley, the Mo. Pac., and the Union Pac. railways; 55 miles S. W. of Omaha. It is one of the most flourishing cities of the Missouri valley, and has an immense wholesale and distributing business in all lines of merchandise, lumber, coal, grain, and live stock. It has large stock-yards, seventy wholesale houses, and important manufactures. The census returns of 1890 showed that 117 manufacturing establishments (representing 38 industries) reported. These had a combined capital of $1,914,889, employed 1,518 persons, paid $936,675 for wages and $1,278,863 for materials, and had products valued at $3,018,837. The public buildings include the State Capitol (built of white limestone at a cost of $900,000), State Insane



State Capitol, Lincoln, Neb.

Asylum, State Penitentiary, U. S. Government building, and Home for the Friendless. Among the educational institutions are the University of Nebraska, Nebraska Wesleyan University (chartered 1887), Cotner University (Christian, opened as Christian University 1889, name changed 1890), Union College, Nebraska Conservatory of Music, Roman Catholic convent and three parochial schools, and five libraries (State, Public, Public School, State Historical Society, and University of Nebraska), which together have over 60,000 volumes. There are 3 national banks, a savings-bank, electric lights, electric street-railway, and 3 daily, 21 weekly, 10 monthly, and 2 other periodicals. The city has nearly one dozen old line and mutual fire and life insurance companies, some of them of much importance. Pop. (1880) 13,003; (1890) 55,154; (1900) 40,169.

Will Owen Jones.

Lincoln, Abraham: the sixteenth President of the U. S.; b. in a cabin on Nolin creek, 3 miles W. of Hodgensville, in Larue (then Hardin) co., Ky., Feb. 12, 1809. He was a grand-nephew of Daniel Boone. His parents were Thomas and

Nancy Hanks Lincoln. Of his ancestry and early years the little that is known may best be given in his own language: "My parents were both born in Virginia, of undistinguished families—second families, perhaps I should say. My mother, who died in my tenth year, was of a family of the name of Hanks, some of whom now remain in Adams, and others in Macon co., Ill. My paternal grandfather, Abraham Lincoln, emigrated from Rockbridge co., Va., to Kentucky about 1781 or 1782, where a year or two later he was killed by Indians—not in battle, but by stealth, when he was laboring to open a farm in the forest. His ancestors, who were Quakers, went to Virginia from Berks co., Pa. An effort to identify them with the New England family of the same name amounted to nothing more than a similarity of Christian names in both families, such as Enoch, Levi, Mordecai, Solomon, Abraham, and the like. My father, at the death of his father, was but six years of age, and he grew up literally without education. He removed from Kentucky to what is now Spencer co., Ind., in my eighth year. We reached our new home about the time the State came into the Union. It was a wild region, with many bears and other wild animals still in the woods. There I grew up."

The early residence of Lincoln in Indiana was 16 miles N. of the Ohio river, on Little Pigeon creek, 1½ miles E. of Gentryville, within the present township of Carter. Here his mother died Oct. 5, 1818, and in the following year his father married Mrs. Sally (Bush) Johnston, of Elizabethtown, Ky. She was an affectionate foster-parent, to whom Abraham was indebted for his first encouragement to study. He became an eager reader, and the few books owned in the vicinity were many times perused. He worked frequently for the neighbors as a farm-laborer, was for some time clerk in a store at Gentryville, and became famous throughout that region for his athletic powers, his fondness for argument, his inexhaustible fund of humorous anecdote, and his cleverness in speech-making. In 1828 he made a trading voyage to New Orleans as "bow-hand" on a flatboat; removed to Illinois in 1830; helped his father build a log house and clear a farm on the north fork of Sangamon river, 10 miles W. of Decatur, and was for some time employed in splitting rails for the fences—a fact which was prominently brought forward for a political purpose thirty years later. In the spring of 1831 he, with two of his relatives, was hired to build a flatboat on the Sangamon river and navigate it to New Orleans; the boat "stuck" on a mill-dam, and was got off with great labor through an ingenious mechanical device which led some years later to Lincoln's taking out a patent for "an improved method for lifting vessels over shoals." This voyage was memorable for another reason—the sight of slaves chained, maltreated, and flogged at New Orleans was the origin of his deep convictions upon the slavery question. Returning from this voyage, he became a resident for several years of New Salem, a recently settled village on the Sangamon, where he was successively a clerk, grocer, surveyor, and postmaster, and acted as pilot to the first steamboat that ascended the Sangamon. Here he studied law, interested himself in local politics after his return from the Black Hawk war, and became known as an effective "stump-speaker." The subject of his first political speech was the improvement of the channel of the Sangamon, and the chief ground on which he announced himself (1832) a candidate for the Legislature was his advocacy of this popular measure, on which subject his practical experience made him the highest authority. Elected to the Legislature in 1834 as a "Henry Clay Whig," he rapidly acquired that command of language and that homely but forcible rhetoric which made him more than a match in debate for his few well-educated opponents. Admitted to the bar in 1837, he soon established himself at Springfield, where the State capital was located in 1839, largely through his influence; became a successful pleader in the State, circuit, and district courts; married (1842) a lady belonging to a prominent family in Lexington, Ky.; took an active part in the presidential campaigns of 1840 and 1844 as candidate for elector on the Harrison and Clay tickets, and in 1846 was elected to the U. S. House of Representatives over the celebrated Peter Cartwright. During his single term in Congress, Lincoln did not attain any prominence. He voted for the reception of anti-slavery petitions, for the abolition of the slave-trade in the District of Columbia, and for the Wilmot proviso, but was chiefly remembered for the stand he took against the Mexican war. For several years thereafter he took comparatively little interest in politics, but gained a leading position at the Springfield bar. Two or three non-political lectures and a eulogy upon Henry Clay (1852) added nothing to his reputation. In 1854 the repeal of the Missouri Compromise by the Kansas-Nebraska act aroused Lincoln from his indifference, "like a fire-bell in the night," and in attacking that measure he had the immense advantage of knowing perfectly well the motives and the record of its author, Stephen A. Douglas, of Illinois, then popularly designated as the "Little Giant." The latter went to Springfield in Oct., 1854, on the occasion of the State fair, to vindicate his policy in the Senate, and the "Anti-Nebraska" Whigs, remembering that Lincoln had often measured his strength with Douglas in the Illinois Legislature and before the Springfield courts, engaged him to improvise a reply. This speech, in the opinion of those who heard it, was one of the great efforts of Lincoln's life, certainly one of the most effective in his whole career. It aroused great enthusiasm, and from that moment it was felt that Lincoln was the man to be pitted against Douglas. Lincoln was accordingly selected as the Anti-Nebraska candidate for the U. S. Senate in place of Gen. Shields, whose term expired Mar. 4, 1855. Trumbull was ultimately chosen, but the armed conflict on the soil of Kansas, which Lincoln had predicted, soon began, and the result was the disruption of the Whigs and the formation of the Republican party. At the Bloomington State convention in 1856, where the new party first assumed form in Illinois, Lincoln made an impressive address, in which for the first time he took distinctive ground against slavery in itself. At the national Republican convention at Philadelphia (June 17), after the nomination of Fremont, Lincoln was put forward by the Illinois delegation for the vice-presidency, and received on the first ballot 110 votes against 259 for William L. Dayton. He took a prominent part in the canvass, being on the electoral ticket. In 1858 Lincoln was unanimously nominated by the Republican State convention as its candidate for the U. S. Senate in place of Douglas, and in his speech of acceptance struck the keynote in the celebrated declaration that "a house divided against itself can not stand." When he was advised that the expression was an impolitic one, and would probably defeat him, he revealed his character by declaring: "I would rather be defeated with this expression in the speech, and uphold and discuss it before the people, than be victorious without it." (Herndon, ii., 67.) The same inflexibility of far-seeing purpose showed itself at a later period in the course of the campaign. At a conference held at Dixon between Lincoln and leading Republicans, he declared to them his purpose to propound to Douglas the following question: "Can the people of a U. S. Territory, in any lawful way, against the wish of any citizen of the U. S., exclude slavery from its limits prior to the formation of a State constitution?" All those present counseled Lincoln not to put that question to Douglas, because he would answer it in the affirmative, and thus probably secure a re-election. Lincoln replied that to draw an affirmative answer from Douglas was exactly what he wanted, and that his object was to make it impossible for Douglas to get the vote of the Southern States in the next presidential election. He considered the presidential fight much more important than the senatorial one, and he would be willing to lose this in order to win that. Arnold quotes him as saying: "I am after larger game; the battle of 1860 is worth a hundred of this." It turned out precisely as he predicted. Lincoln propounded the question at Freeport, and Douglas gave an affirmative answer. Had he answered in the negative, Illinois would surely have voted against him. His affirmative reply gave him the State, but hopelessly and permanently alienated the South. The great debate carried on at all the principal towns of Illinois resulted in the election of Douglas, but being widely circulated as a campaign document the speeches fixed the attention of the country upon Lincoln as the clearest and most convincing exponent of Republican doctrine. Early in 1859 he began to be named in Illinois as a suitable Republican candidate for the presidential campaign of the ensuing year; and a remarkable political address delivered at the Cooper Institute, New York, Feb. 27, 1860, followed by similar speeches at New Haven, Hartford, and elsewhere in New England, first made him known to the Eastern States in the light by which he had long been regarded at home. By the Republican State convention, which met at Decatur, Ill., May 9 and 10, Lincoln was unanimously indorsed for the presidency. The national Republican convention at Chicago, after spirited efforts made in favor of

Seward, Chase, and Bates, nominated Lincoln, with Hannibal Hamlin for Vice-President (May 18), at the same time adopting a vigorous anti-slavery platform. The Democratic party having been disorganized and presenting two candidates, Douglas and Breckenridge, and the remnant of the "American" party having put forward John Bell, of Tennessee, the Republican victory was an easy one, Lincoln being elected Nov. 6 by a large plurality, comprehending nearly all the Northern States, but none of the Southern. The secession of South Carolina and the Gulf States was the immediate result, followed a few months later by that of the border slave States and the outbreak of the great civil war. The life of Abraham Lincoln became thenceforth merged in the history of his country. None of the details of the vast conflict which filled the remainder of Lincoln's life can here be given; they will be found under appropriate headings. He reached Washington Feb. 23, and was inaugurated President of the U. S. Mar. 4, 1861. Lincoln called to his cabinet his principal rivals for the presidential nomination, Seward, Chase, Cameron, and Bates; secured the co-operation of the Union Democrats, headed by Douglas; called out 75,000 militia from the several States upon the first tidings of the bombardment of Fort Sumter (Apr. 15); proclaimed a blockade of the Southern ports (Apr. 19); called an extra session of Congress for July 4, from which he asked and obtained 400,000 men and $400,000,000 for the war; placed McClellan at the head of the Federal army on Gen. Scott's resignation (Oct. 31); appointed Edwin M. Stanton Secretary of War (Jan. 14, 1862), and on Sept. 22, 1862, issued a proclamation declaring the freedom of all slaves in the States and parts of States then "in rebellion against the U. S." from and after Jan 1, 1863. This was the crowning act of Lincoln's career—the act by which he will be chiefly known through all future time—and it decided the war. On Oct. 16, 1863, President Lincoln called for 300,000 volunteers to replace those whose term of enlistment had expired; made a celebrated and touching, though brief, address at the dedication of the Gettysburg military cemetery Nov. 19, 1863; commissioned Ulysses S. Grant lieutenant-general and commander-in-chief of the armies of the U. S. Mar. 9, 1864; was re-elected President in November of the same year by a large majority over Gen. McClellan, with Andrew Johnson, of Tennessee as Vice-President; delivered a very remarkable address at his second inauguration Mar. 4, 1865; visited the army before Richmond the same month, entered the capital of the Confederacy the day after its fall, and upon the surrender of Gen. Robert E. Lee's army (Apr. 9) was actively engaged in devising generous plans for the reconstruction of the Union, when on the evening of Good Friday, Apr. 14, he was shot in his box at Ford's theater, Washington, by John Wilkes Booth, a fanatical actor. He died early on the following morning, Apr. 15, 1865. Almost simultaneously a murderous attack was made upon William H. Seward, the Secretary of State. At noon on the 15th Andrew Johnson assumed the presidency, and active measures were taken which resulted in the death of Booth and the execution of his principal accomplices. The funeral of President Lincoln was conducted with unexampled solemnity and magnificence. He was buried at Oak Ridge Cemetery, near Springfield, Ill., on May 4, in an appropriate tomb, surmounted by a statue, Oct. 15, 1874. The leaders and citizens of the expiring Confederacy expressed genuine indignation at the murder of a generous political adversary; foreign nations took part in mourning the death of a great statesman; the freedmen of the South almost worshiped the memory of their deliverer; and the general sentiment of the great nation he had saved awarded him a place in its affections scarcely second to that held by Washington. The progress of time since his death has constantly increased the respect and admiration as well as the affection in which he is held by the people of the U. S. The most thorough investigations have made it more and more evident not only that he was the master-spirit of the great struggle in which the nation was engaged, but also that he was in very small measure indebted to the counsel and advice of those about him. See biographies by Dr. Holland (1865); Arnold (1868); Lamon (1872); Nicolay and Hay (1890); Schurz (1892); Herndon (1888; 2d ed. 1892).

Revised by C. K. Adams.

Lincoln, Benjamin: general; b. at Hingham, Mass., Feb. 3, 1733; was a farmer in his native town at the outbreak of the Revolutionary war in 1775; having aided in organizing and training the Continental soldiery, was appointed major-general of the Massachusetts troops; obtained the favor of Washington during the siege of Boston; commanded an expedition which in June, 1776, cleared Boston harbor of British vessels; led a body of Massachusetts militia at the battle of White Plains and in the ensuing engagements (1776); took a new levy of militia to the aid of Washington at Morristown, N. J., in Feb., 1777; was appointed by Congress, at Washington's request, a major-general in the Continental service Feb. 19; co-operated with Schuyler in the summer campaign against Burgoyne; joined Gates as second in command Sept. 29; was severely wounded at the battle of Bemis's Heights, near Saratoga, Oct. 8, and disabled from active service until Aug., 1778, when he joined, and was in September appointed to, the chief command of the Southern army. He warded off several demonstrations made by the British general Prevost against Charleston; lost one-fourth of his forces by the defeat of Gen. Ashe at Brier Creek Mar. 2, 1779; unsuccessfully attacked the enemy's works at Stone Ferry June 20; joined d'Estaing in September in his fruitless siege of Savannah, and after the bloody repulse of Oct. 9 returned to Charleston, which in the spring of 1780 was besieged by Sir Henry Clinton and Gen. Arbuthnot with greatly superior forces. The defense was skillfully and strenuously conducted, but Lincoln was obliged to capitulate May 12, and was allowed to go to his home at Hingham on parole. Exchanged in the spring of 1781, he joined Washington on the Hudson, took part in the siege of Yorktown, and was deputed to receive the sword of Cornwallis on his surrender. He received the degree of M. A. from Harvard in 1780. Elected by Congress Secretary of War in Oct., 1781, he held that office three years, after which he retired to his farm at Hingham. In 1786–87 he commanded the Massachusetts militia in the suppression of Shays's rebellion; was elected Lieutenant-Governor of Massachusetts in 1787; was appointed collector of the port of Boston in 1789, and held that office for twenty years. He was one of the commissioners who in 1789 made a treaty with the Creek Indians, and in 1793 was employed in an unsuccessful negotiation with the Ohio Indians. He wrote many papers on scientific subjects, some of which were published. D. at Hingham, May 9, 1810. See his *Life*, by Francis Bowen, in Sparks's *American Biography* (2d series, vol. xiii.).

Lincoln, Robert Todd: eldest son of Abraham Lincoln; b. at Springfield, Ill., Aug. 1, 1843; graduated at Harvard College in 1864, and then entered Harvard Law School, which he soon left to enter the army, where he served till the end of the civil war as a captain on the staff of Gen. Grant. He finished his law studies after the war closed, and was admitted to the Chicago bar; was Secretary of War Mar. 5, 1881, to Mar. 5, 1885; in 1884 was spoken of as a candidate for the presidency, but refused to be placed in opposition to President Arthur. From 1889–93 he was U. S. minister to Great Britain.

Lincoln University (Illinois): See Lincoln, Ill.

Lind, Jenny: "The Swedish Nightingale"; b. in Stockholm, Oct. 6, 1821, of humble parentage; her father was a teacher, and poor. Her precocious talent attracted the notice of Mme. Lundberg, a retired actress, who introduced her to Crælius and Berg, famous teachers in music, and to Lindblad, the composer. The manager of the court theater procured for her admission to the musical academy, where her progress was rapid. She acted and sang in children's parts till she was twelve years of age, when her voice failed her. Four years later it returned, and she sang the part of Alice in Meyerbeer's *Robert le Diable* with a brilliancy that insured her success. She soon became the operatic star of Stockholm, and sang with applause in the chief cities of Sweden and Norway. In 1841 she went to Paris and took lessons of Garcia. There she was introduced to Meyerbeer, who took a deep interest in her, and obtained from M. Pillet an opportunity to sing in opera; but she aroused no enthusiasm, and in her chagrin left Paris. Her next opportunity, also due to Meyerbeer, was in Berlin in 1845. There her success was distinguished. Previous to this she had sung with acceptance in Stockholm and Dresden. At Vienna she repeated her triumphs in *Norma*, *The Camp of Silesia*, and *The Daughter of the Regiment*. Her first appearance in London was in May, 1847. In *Robert le Diable*, *I Puritani*, and *Somnambula* she more than justified her claims as an artist, and covered herself with honors. In 1848 she sang for the first time in oratorio, *Elijah*, at Exeter Hall, to found musical scholarships in memory of Men-

delssohn. Henceforth this was to be her chosen field. In 1850 she went to the U. S., under contract with P. T. Barnum to give 150 concerts. The enthusiasm was unbounded, the profits were enormous, but the toil and irksomeness were excessive, and in June, 1851, after singing ninety-five times, the contract was terminated by Jenny Lind. In 1852 she married Otto Goldschmidt, soon after returned to Europe, and passed several years in Dresden, appearing only occasionally in public, and then for charitable purposes only. In 1858 she took up her residence in England, where she died Nov. 2, 1887. Jenny Lind's voice was a light soprano of remarkable sweetness, flexibility, and charm of expression, and she threw into it the feeling of a passionate soul. She sang out of a heart full of goodness. Both in Europe and in the U. S. she was as well known for her charities as for her genius.

Lindau, lin'dow, Paul: author and critic; b. at Magdeburg, Prussia, June 3, 1839; studied philosophy and literature at Halle, Leipzig, Berlin, and Paris; visited Italy, the Netherlands, etc.; founded *Die Gegenwart*, a weekly journal of politics and literature, in 1872, *Nord und Süd*, a monthly, in 1878, and contributed a great number of articles to various papers, besides publishing several critical essays—*Molière* (1872); *Beaumarchais* (1875); *Alfred de Musset* (1877); *Dramaturgische Blätter* (1875, 2 vols.); *Nüchterne Briefe aus Bayreuth* (1876); *Ueberflüssige Briefe an eine Freundin* (1877), etc.; several dramas—*Maria und Magdalena*, *Marion*, *Diana*, etc.; and travel sketches of Venice, Paris, etc. During later years Lindau tried in vain to make a reputation as a novelist by imitating French models of the realistic school. Though a witty and clever writer and a satirist of more than usual talent, he lacks the true poetic gift, the want of which he is unable to disguise.

Revised by Julius Goebel.

Lin'degren, Amalia: Swedish painter; b. May 22, 1814. She began painting portraits without a teacher, and in 1850 she was sent abroad at public expense, where she took lessons from Tissier in Paris and prominent masters in Munich and Rome. Her subjects are chiefly from family life and among children (*The Widow*, *The Girl with an Orange*, etc.). Her works all bear the mark of genius, and are characterized by great depth of feeling. Her portraits rank among the best ever produced in Sweden. R. B. A.

Linden [orig. an adj., deriv. of *lind*, linden < O. Eng. *lind*: Germ. *linde*]: the lime-tree, *Tilia europæa* (family *Tiliaceæ*); a large European forest tree, closely related to the bass of the U. S. Its wood is soft, but valued by carvers and turners, and used in making charcoal. Its bark makes the bass matting so extensively exported from Russia. Its flowers afford valuable bee-pasture. There are many varieties, some of which are well known in cultivation in the U. S. The name is often applied also to the Bass (*q. v.*) and other American species of *Tilia*.

Lindenthal, lin'den-tăl, Gustav: civil engineer; b. in Bruenn, Austria, May 21, 1850; was educated in Bruenn and Vienna, and during 1870–74 was employed on railway work in Austria and Switzerland. He is the designer of several large bridges, notably the great suspension bridge of 3,300 feet span proposed for the Hudson river between New York and Jersey City, and is the author of several valuable papers on long-span bridges and metal construction.

Lin'derman, Henry, M. D.: director of the U. S. mint; financier; b. at Lehman, Pa., Dec. 26, 1825; studied medicine under his father, and graduated at the New York College of Physicians and Surgeons; practiced his profession in Pike co., Nesquehoning, and Mauch Chunk, Pa.; took an active interest in politics as a Democrat; was chief clerk of U. S. mint at Philadelphia 1855–64; in 1864 resigned and went into business in a firm of stockbrokers in Philadelphia. He was director of U. S. mint at Philadelphia 1866–69; was sent to investigate the San Francisco mint; in 1871 was sent to London, Paris, and Berlin, to collect information concerning their mints; in 1872 made an elaborate report on the condition of the market for silver; projected the trade dollar to make a market for the great amount of silver produced in the U. S.; was author of the Coinage Act of 1873; Dec. 7, 1873, was appointed director of all the U. S. mints for five years, having entire charge of them; published *Money and Legal Tender in the United States* in 1877. His annual report for 1877 was an exhaustive review of the metallic standard and of the capacity of the mines of the U. S. to supply the world with the precious metals. D. at Washington, D. C., Jan. 27, 1879.

Lindh, Theodor: poet; b. in Finland in 1833; is magistrate of the town of Borgå; has published two volumes of *Dikter* (poems, 1862 and 1875), the versified tragedies *Konung Birger och hans Bröder* (1864) and *Maria of Skottland* (1865), and a translation of Byron's *Hebrew Melodies* (*Hebreiska Melodier*, 1862).

Lindisfarne: See Holy Island.

Lindley, John, Ph. D., M. D., F. R. S., F. L. S.: botanist; b. at Catton, Norfolk, England, Feb. 5, 1799; was the son of a nurseryman; began early to write upon botany, assisting in preparing Loudon's *Encyclopædia*; became in 1829 Professor of Botany in University College, London; appointed in 1860 examiner in Botany in London University; edited *The Gardener's Chronicle* 1841–65. D. near London, Nov. 1, 1865. Among his writings are *Introduction to the Natural System* (1830); *Structure and Physiology of Plants* (1832); *Vegetable Kingdom* (1846); *Flora Medica* (1838); *Fossil Flora* (with Hutton, 1831–37); *Pomologia Britannica* (1841); *Orchidaceous Plants* (1837–38); *Folia Orchidacea* (1852); *Theory of Horticulture* (1840), etc.

Lindley, Sir Nathaniel: See the Appendix.

Lindner, Albert: b. at Sulza, in the grand duchy of Weimar, Apr. 24, 1831; studied philology at Jena and Berlin, and became a teacher at the Gymnasium of Rudolstadt. In 1866 his tragedy *Brutus und Collatinus* was awarded the first prize at Berlin, and afterward successfully played on nearly all German stages. This success prompted him to go to Berlin and continue as a playwright. His subsequent dramas were, however, less favorably received, with the exception of *Die Bluthochzeit* (1871), which is still a standard play of the German stage. D. Feb. 2, 1888. Julius Goebel.

Lindo, Mark Prager: writer; b. in London, Feb. 19, 1819; d. at The Hague, Mar. 9, 1877. English by birth, he was as a boy sent to school at Boulogne in France; thence he went to Düsseldorf, where he attended the Realschule and gymnasium. In 1838 a chance advertisement for an English teacher took him to Arnhem, in Holland. The next year he became corresponding clerk in a counting-house at Amsterdam. Finding this employment irksome he went to Bonn for further studies. Before he had obtained his doctorate (finally won in 1853), he returned to Arnhem as teacher in English in the gymnasium (1842). Here he married a Dutch lady (1844), and definitely chose Holland for his country. In 1853 he was appointed Professor of Modern Languages in the Royal Academy at Breda, and here he remained until 1865, when his appointment as education inspector for South Holland took him to The Hague. His first literary venture was a sketch for children published in *Herfst-en Lentebloemen voor de Nederlandsche jeugd* (1844). From 1845 to 1850 he wrote for the *Algemeen Letterlievend Maandschrift*. In 1851 he began to publish in the *Arnhemsche Courant* the sketches upon which his fame mainly rests. He signed these *de oude heer Smits*; and in 1852 he issued a collection of them under the title *Brieven en Uitboezemingen van den ouden heer Smits*. The power of these sketches at once attracted attention and gave him a distinct place in Dutch letters. In 1856 he began the publication of a weekly journal, written entirely by himself, called *Nederlandsche Spectator*, which he continued in the same fashion until 1859, when others were associated with him. In its pages appeared several of his best-known works: *Clementine* (1857); *Le Saltimbanque* (1859); *De geschiedenis van een gentleman* (1862). Worth mentioning also are *Losse schetsen in en om Parijs in den zomer van 1852* (1853) and *Afdrukken van Indrukken* (with his friend Mulder, 1854). Besides these original works he wrote many school-books dealing with English, and translated into Dutch works of Sterne, Fielding, Scott, Kingsley, Dickens, Thackeray, and other English authors. An historical work, *De opkomst en ontwikkeling van het Engelsche volk in zijne geschiedenis tot op onzen tijd geschetst* (2 vols., 1868–74), has some value. In 1877 appeared *Kompleete werken van den ouden heer Smits* (5 vols., The Hague, 1877–79; 3d ed. 1886). A. R. Marsh.

Lindsay, lin'zi: capital of Victoria co., Ontario, Canada; a junction of several railways and on the navigable Scugog river (see map of Ontario, ref. 3-E). It has an extensive trade in lumber, grain, and flour. It has manufactures of castings, lumber, sash, blinds, hemlock extract, etc., and a brewery. The town is mostly built of brick, and contains the county buildings and several churches and schools. It has two weekly newspapers. Pop. (1891) 6,081.

Lindsay, Barons and Earls: a distinguished family in the Scottish peerage, descended from Sir Walter de Lindsay, an Englishman of Norman descent, who in the reign of David I. acquired Ercildoun and Luffness in East Lothian. In the twelfth century the lands of Crawford in Clydesdale came into possession of the family by an intermarriage with the royal line of Scotland. Sir James Lindsay of Crawford was distinguished at the battle of Otterburn. His nephew and heir, Sir David, married a sister of King Robert III., and was made by that monarch Earl of Crawford, while Sir William, David's younger brother, became ancestor of the Lords Lindsay of the Byres, Haddington, and, through a natural son, was also ancestor of the celebrated poet, Sir David Lindsay of the Mount. In the fifteenth century the Earls of Crawford were among the wealthiest, proudest, and most influential of the Scottish nobility, and took a large part in the civil warfare of that agitated period. David, the fifth earl, a trusted minister of James III., was made Duke of Montrose in 1488—a title never before bestowed in Scotland except upon princes. In 1644 the tenth Lord Lindsay of the Byres was created Earl of Lindsay, and soon afterward obtained also, by a new creation, the Earldom of Crawford, extinct in the elder line. John, fourth Earl of Lindsay and Crawford, b. in Oct., 1702, was a distinguished general in the Russian service, in the German campaign 1743–45, and the suppression of the movement of the Pretender in Scotland in 1746. D. in London, Sept. 20, 1749. A. W. Crawford Lindsay, Earl of Crawford and Lindsay (d. Dec. 13, 1880), wrote *The Lives of the Lindsays*. See Crawford, Earls of.

Lindsay, Sir David, of the Mount: poet; b. about 1490, either at Garmylton, East Lothian, or at the Mount, Fifeshire, Scotland. In 1511 he is mentioned as an amateur actor in a play performed at the court of James IV. to Scotland, and in 1512 was appointed keeper or tutor to the infant prince, who succeeded to the throne as James V. His important duties were discharged with an affectionate care, which the young king rewarded in 1528 with an appointment as king's herald, and in 1530 with knighthood and the office of Lord Lyon king-at-arms, in which capacity he accompanied embassies to the courts of England, France, Spain, and Denmark, and is introduced into Scott's poem of *Marmion*. He represented Cupar in Parliament (1542–43), contributed to the success of the Reformation, and died at an unknown place and date before May, 1555. As a poet Lindsay takes high rank, and his satires against the clergy are credited with having been the most effective preparation for the labors of John Knox. His principal works were *The Dreme* (1528); *Satyre of the Thrie Estaitis*, played at court in 1539; *Historie of Squyer Meldrum* (1548); and *The Monarchie* (1553). The best edition is that of the early English Text Society (1865–71), in 5 parts.

Lindsay, Thomas Martin, D. D.: a minister of the Free Church of Scotland; b. in Lesmahagow, Lanarkshire, Oct. 16, 1843; was educated in the University and New College of Edinburgh; has been Assistant Professor in Logic and Metaphysics and examiner in Arts in the University of Edinburgh; secretary of the board of local examination, Edinburgh; Professor of Church History in the Free Church College, Glasgow; convener of committee on foreign missions in the Free Church of Scotland; and was a delegate to the Pan-Presbyterian Council at Toronto 1892. He contributed to the *Encyclopædia Britannica*. He has published *Handbook of the History of the Reformation* (1882); *Commentaries on St. Mark's Gospel* (1883); *St. Luke's Gospel* (1887); and *The Acts of the Apostles* (1888).

Lindsey, Charles: See the Appendix.

Lindsey, Theophilus: clergyman; b. at Middlewick, Cheshire, England, June 20, 1723; studied at Cambridge; traveled on the Continent 1754–56 as tutor to the Duke of Northumberland; held various positions in the Church of England, but gradually adopted Unitarian views; resigned his position in 1772, and began in 1774 to conduct Unitarian service in Essex Street, London; and published *Unitarian Doctrine and Worship from the Reformation to our own Times* (1783). He was unique among protesting churchmen in his secession from the Established Church, as was Dr. Freeman in the U. S. among protesting Episcopalians in his distinct avowal of the Unitarian position. Lindsey's was the first society in England frankly called Unitarian. Lindsey's original church edifice is now the headquarters of the English Unitarians. He was a man of genuine spiritual force and of the most thorough intellectual and moral honesty. D. in London, Nov. 3, 1808.

Lindsley, John Berrien: See the Appendix.

Line [M. Eng. < O. Eng. *līne*, hawser, cable, from Lat. *li'nea*, linen thread, string line (deriv. of *li'num*, flax) > Fr. *ligne*, line, which also influenced the meaning of M. Eng. *line*]: a geometrical magnitude which has length, but neither breadth nor thickness. We may regard a line as the path of a moving point, in which case the nature of the line will depend upon the law of motion of the point. Two positions of the generating point are said to be *consecutive* when the distance between them is infinitesimal, and the corresponding portion of the line is called an *element*. We may suppose the point to move so that the elements shall be equal, or so that the projections of these elements on a given straight line shall be equal; the former is the method of plane geometry, and the latter is the method of analytical geometry and of the calculus. Lines may be either straight or curved. A *straight* line is a line whose elements all lie in the same direction; that is, it is a line whose direction is the same throughout; a *curved* line is one in which no two consecutive elements lie in the same direction. See Curve.

Revised by R. A. Roberts.

Line [from Lat. *linea*]: in music, a horizontal mark used not only in the formation of the stave and its extension by ledger-lines, but also for several other purposes. In a figured base a long unbroken line after a figure signifies the continuation or holding of the note indicated by the figure, while broken or short lines imply repeated strokes of a note, or sometimes the repetition of the same figure over the several notes of a moving bass. See Ex. 1:

Ex. 1.

A line drawn through a figure thus, 4 or 5, is equivalent to a ♯ and back. Figures stand for a sharp fourth, a sharp fifth, etc. When, in a condensed score, one part crosses another, its course is frequently marked by a slanting line, to avoid confusion or to explain an *apparent* false progression. See Ex. 2, where the crossing of the tenor and alto is pointed out by lines connecting the notes of the tenor.

Ex. 2.

In modern music for the organ, curved or straight perpendicular lines, with arrow-heads, are often used to mark the exact place where a change is to be made from loud to soft, or the reverse, or from one stop or set of keys to another. Instances of this are given in Ex. 3:

Ex. 3.

Two diverging or converging lines over a series of notes imply an increase or decrease of loudness, as otherwise expressed by the words *crescendo* or *diminuendo*, or their abbreviations, *cres.* and *dim.* Revised by Dudley Buck.

Linen [orig. an adj. <O. Eng. *līnen*, made of flax, deriv. of *līn*, flax; Germ. *lein*: Goth. *lein*, linen; cf. Gr. λίνον: Lat. *li'num*, flax, linen]: one of the earliest of textile manufactures. Its origin is lost in the cloudland of history. Pieces are still in existence which were woven 4,000 years ago. In the days of Herodotus it was an article of Egyptian export. The mummies are wrapped in cere-cloths of this material. Sir Gardner Wilkinson has fully described the linen-manufacture of Egypt. The term *linen* is a generic name for

cloths woven from the fibers of the flax-plant and hemp. (See FLAX.) The raw material of linen proper is the flax-plant (*Linum usitatissimum*), which thrives in latitudes ranging from Egypt to Russia. From the seed is expressed the linseed oil so much used in commerce. Cloth made from the hemp-plant was worn by the Thracians. This plant is extensively grown in various parts of Europe, and has been cultivated in Bengal from remote ages. The use of hemp in the linen-manufacture is smaller now than formerly. JUTE (*q. v.*) may also be commercially considered as a sort of linen, as it affords a cheap substitute for flax, the cultivation of which has not kept pace with the requirements of the makers. Of other substitutes which have been employed with varying degrees of success the nettle, china-grass, rhea, New Zealand flax, and Manilla hemp (*Musa textilis*) may be named. The garments of the Hebrew priests were chiefly of linen, and in the Bible there are many allusions which show the esteem in which this fabric was held. In Homer we read that the mother of Nausicaa in the early dawn spun by the hearth soft fleeces dyed with red purple. In many parts of the ancient world the manufacture of linen —chiefly, it may be presumed, carried on by the women as a household occupation—was common. Some parts of Spain and Italy were celebrated for the culture of flax and its subsequent conversion into textile fabrics. Linen has been made in England from an early date. The garments of the Anglo-Saxons were linen and woolen. The daughters of Edward the Elder were famous for their skill in spinning, weaving, and embroidering. The Bayeux tapestry is a linen cloth, with designs worked in wool. Although the flax-plant had been cultivated by the Saxons, it is not found in a list of tithable produce drawn up in 1070. Fine linen is said to have been first made in Wilts and Sussex in 1253. In 1272 Irish linen was used at Winchester. Flemish weavers were introduced into England in 1331, and in 1386 a guild of linen-weavers was established in London, but does not seem to have been very prosperous. Indeed, the manufacture was still in its infancy in the reign of Charles II. Yarranton, writing in 1677, proposed the establishment of spinning-schools, such as were then common in Germany. In these places perhaps 200 girls from six years old upward were assembled under the supervision of a woman who sat in a pulpit, and with a long white wand tapped any of the little workers who flagged in their attention. If this were not sufficient she rang a bell, and the offender was taken away and chastised. From the introduction of the cotton-manufacture until about 1773, while the weft was of cotton the warp was of linen yarn. Arkwright's invention changed this. In Ireland the history of linen-manufacture is mixed up with that of sectarian feeling, for the woolen-manufacture of the Roman Catholic S. and W. was ruined by heavy export duties, while the Protestant interest of Ulster was protected in 1699 by the act for the encouragement of the linen trade. A board was constituted which held sovereign sway over the trade until 1828, when its obsolete regulations and procedure led to its extinction. As early as the eleventh century linen was woven in Ireland, but it was Louis Crommelin, a refugee driven from France by the Revocation of the Edict of Nantes, who set it on a firm footing. The Duke of Ormonde in 1711 ordered linen hatbands and scarfs to be used for funeral purposes; fourteen years later machinery began to be used. Improvements in bleaching were introduced by Dr. Ferguson in the middle of the century. It was not until 1828 that flax-spinning machinery was started at Belfast. The pioneers were Messrs. Mulholland. For eighteen years there was a society for the promotion of the growth of flax in Ireland, but it came to an end in 1859. Linen was made in Scotland in the reign of Charles I., but on a very small scale and in a rude style. In 1688 Morer styles it the most noted and beneficial manufacture of the kingdom. As showing the unfriendly feeling between North and South, it may be mentioned that the Scotch packmen who traveled into England to sell linen were, about 1684, sometimes whipped as malefactors, and obliged to give bonds that they would discontinue their traffic.

On the Continent traces of the use and manufacture of linen are found at early dates. Charlemagne, who dressed after the manner of the Franks, had linen underclothes. In mediæval Italy it was an important article of commerce. In Spain the Moors paid great attention to textile manufactures, and linen was exported to India and Constantinople. In the fifteenth century Seville had 16,000 looms; a century later they had diminished to 300. Flanders, Brabant, and some of the German towns were notable for their linen-manufactures in the eleventh century. Louvain had 150,000 linen and woolen weavers in the fourteenth century. In Flanders, by the middle of the thirteenth century, the manufacture was very flourishing, and its products were largely exported to England and other countries. Ypres, which dates from 960, has left its impress in the word *diaper* (i. e. d'Ypres, cloth of Ypres), still used for table-linen. The soil of France is suitable for flax-growing, and since the time of the Roman rule linen has been made in that country. In 1394 it is said the king sent fine linen of Rheims to the sultan in ransom of some noble prisoners who had fallen into the hands of the paynims. The Revocation of the Edict of Nantes was disastrous in its effects on French industry, and the linen-trade suffered in common with all others from the loss of the Huguenots. Russia has long been the greatest flax and hemp growing country of the world.

There are more linens used in the U. S. in proportion to the population than in almost any other country.

We turn now to the history of the processes of the linen-manufacture. The flax-fiber is made up of a number of smaller filaments bound together. The primary operation in their separation was termed heckling. The heckle is a many-toothed steel comb which removes the coarser fibers of the tow and partially divides the filaments of the flax. The fineness of the flax depends upon the number of hecklings it receives by instruments of increasing delicacy. Machine heckling is now most commonly used, and there are various patented inventions for this purpose. The fibers require to be united into a continuous thread before they are capable of being woven. The earliest method of doing this was by the spindle. One was found at Thebes by Sir Gardner Wilkinson which had still some linen thread upon it. They were about 15 inches in length, usually of wood, with a circular head of gypsum, or composition. They were bulbous near one end, tapering to a point, while the other end lengthened into a handle. The thread was attached to the handle; and the spindle resting upon the right thigh, the right hand was drawn quickly over it, causing it to revolve or spin like a top. To this was afterward added the distaff, a piece of wood round which the flax to be spun was wrapped. The spinning-wheel was the next step forward. One was invented at Brunswick in 1553. That called Saxon had on the spindle a bobbin round which the thread was wound, a flyer going round faster than it, giving the requisite twist to the thread. The flax was loosely wrapped round a distaff or rock above the spindle. A treadle moved by the foot gave a rotatory motion to the wheel. It was only by slow degrees that this supplanted the older instrument, and a two-spindled wheel had not been very long in use when Arkwright's cotton-spinning machinery must have turned attention to the possibility of a similar revolution in other branches of human labor. In 1787 John Kendrew and Thomas Porthouse, both of Darlington (Durham), England, took out a patent for this purpose. Various mills in Scotland were worked under licenses from the patentees. It was long before the hand-made yarn was superseded by the machine-made article. In 1788 Alexander Robb invented a loom to be driven by water, and in 1810 Joseph Crompton, of Dundee, one to go by water or steam, but it is doubtful if they were brought into use. The first manufactory for weaving flax by power was set up in London about 1812 by Charles Turner & Co.

According to the modern method of treatment, the fibers are first *scutched* or combed; *broken* into three pieces, the inner section being the best; *heckled*, now usually done by a rotatory machine, the flax placed on the periphery being drawn through or against a series of teeth; the short fibers *drawn* into one continuous thread; after having been *roved* it is *spun*. The flax, however, has to be kept wet during this process, for which purpose warm water is now used. The spun yarn is used either for thread or for weaving, and such yarn is called wet-spun, but in modern times Dundee, in Scotland, and Lille, in France, produce a yarn made without the use of water. This is called dry-spun and is used principally for heavy fabrics such as sail-canvas, heavy sheetings, towelings, crashes, glass-cloths, etc. The quantity of *leas* (300 yards) contained in a pound is a method of indicating the quality of yarns. For information as to the processes of SPINNING, WEAVING, and BLEACHING, see the articles with those titles.

The greatest spinning centers for wet-spun yarns are Belfast, Ghent, Silesia, Bohemia, Westphalia, and Moravia.

The principal varieties of linens are *lawn* (Fr. *linon*), the finest qualities of which are now made in Ireland, for handkerchiefs, etc. Scotland furnishes sheetings, ducks, Osnaburgs, towelings, canvas, paddings, etc. *Diapers* are fabrics with patterns of geometrical regularity such as are produced by the kaleidoscope. *Dowlas* is a strong, coarse fabric, formerly much used by working people for shirts and trousers, and also made in jackets for soldiers. Large quantities of this cloth are exported to South America. *Damasks* are fabrics with figures of print and flowers, and free-hand ornament as opposed to the geometrical severity of diaper. The name is supposed to be taken from Damascus, an ancient seat of the art, which until the introduction of the Jacquard machine (see Loom) was a secret confined to a few localities. The towns of Dunfermline and Kirkcaldy, and the whole county of Fife, in Scotland, are the greatest centers of damask or Jacquard weaving in the world. Lately Belfast, Germany, and Austria have appeared as strong competitors, while Barnsley and France have both lost ground. Courtrai and Ghent are famous for sheetings and fine shirting linens. *Cambric*, which takes its name from Cambrai, once famous for its production, is the finest and thinnest of linen fabrics. Handkerchiefs made from this cloth range in price from $1 to $20 per dozen. The so-called Scotch cambric is a cotton fabric with the fiber twisted very hard.

Some velvets or plushes are also made from flax, and used in the printed state as curtains, table-covers, and upholstery goods. France furnishes most of these velvets.

Hessians or burlaps are made from jute, and are used for all kinds of bags, for packing purposes, and for making tarpaulins, and foundations for floor-cloth. *French canvas* is a coarse variety, much used by tailors for stiffening, etc. *Crumb-cloth* is made in Scotland on Jacquard looms, and is used for covering carpets in rooms and stairs; it is woven as wide as 4 and 5 yards.

The modern process of bleaching has somewhat lessened the durability of linen, but a greater destroyer is the prevailing system of laundry-work. The lessened cost of linen, however (50 per cent.), compensates for these evils.

For a time the rapid increase of cotton-manufactures endangered the prosperity of the linen-trade (and to some extent they are antagonistic), but, although the manufacture of linens has not kept pace with that of its cheaper rival, it has exceeded its former proportions as one of the great staple industries of the world.

The U. S. has not made any appreciable progress in the manufacture of linens, save a few coarse crashes and towelings. Practically, the manufacture of linens has not begun, and the outlook is not encouraging for many reasons, such as climate, unprofitable returns for very hard work in the preparation by the farmer of the flax fiber for market, and the difficulty of grass bleaching under a scorching sun. At present the flax is raised for the seed only. The imports of flax and flax-manufactures into the U. S. for the year 1891 had a value of $24,000,000. This included burlaps, about $6,000,000. Revised by Frederick S. Pinkus.

Ling [M. Eng. *lenge* : Germ. *länge* : Icel. *langa*. So called from its length. Cf. O. Eng. *lang*, long]: a sea-fish of the cod family (*Molva molva*), extensively caught in Europe. It is eaten fresh, or salted and dried. It is a rather tasteless fish, its value depending to a great extent upon the perfect manner in which it takes salt and the length of time during which it can be preserved in an eatable state. Split and salted on the spot, it is packed in flats at once. Its flesh is also preserved in air-tight cans; its sounds are used for isinglass and for food; its roe is a good fish-bait; its liver yields a valuable oil. The name *ling* is also applied to the burbot (*Lota lota*), a fresh-water fish of the cod family found in the rivers of all northern regions. It much resembles the true ling. Revised by D. S. Jordan.

Ling.

Ling, Pehr Henrik: poet; b. at Ljunga, in the province of Småland, Sweden, Nov. 15, 1776; led as a young man a rather adventurous life, traveling through Germany and France; became in 1805 fencing-master at the University of Lund, in 1818 teacher in fencing at the military school of Karlberg, and in 1814 director of the newly erected gymnastic institute of Stockholm. In 1825 he received the title of professor, and in 1835 he was elected a member of the Swedish Academy. Ling represents the same movement in Sweden as Turnvater Jahn in Germany. His poetical productions, the allegorical poem *Gylfe* (1812), the epos *Asarne* (1816–26), and the dramas *Agne* (1812), *Eylif* (1814), *Den heliga Birgitta* (1818), *Engelbrecht Engelbrechtson* (1819), dramatizing the whole of Swedish history, were intended to awaken among the Swedes that heroism of feeling and thinking which characterized the ancient pagan Scandinavians; and his gymnastic exercises were at first simply a means of developing and strengthening the body, but by the thought and study which Ling bestowed on his profession he developed the simple gymnastic practices into a medical cure, the so-called movement cure, which has proved very effective in many chronic diseases, and has made the Swedish gymnastic system popular in all civilized countries. D. in Stockholm, May 3, 1839. Revised by P. Groth.

Linga, or **Lingam** [*Lingam* is the neut. nom. of a Sanskrit crude form *linga*, meaning mark or token]: in Hinduism, the male organ of generation, the emblem of the reproductive power of Siva the Regenerator. It is worshiped in the form of a plain column of stone or cone of clay rising out of an oval stone representing the *yoni* or female organ of generation, set up in temples dedicated to Siva. At the time of the Mohammedan conquest of India, in the eleventh century, there were twelve celebrated lingas at different places, the best known of which was that at Soma-nātha in Gujarat. R. L.

Lin'gard, John, D. D., LL. D.: historian; b. at Winchester, England, Feb. 5, 1771; studied at Douai, and was ordained a Roman Catholic priest in 1795; was afterward connected with the seminary at Ushaw, near Durham; was (1811–51) parish priest of Hornby, Lancashire; declined a cardinal's hat soon after the publication of his great work, *History of England* (1819–30, 8 vols.; 6th ed. 1854–55, 10 vols.). This work is one of great ability and excellence, though somewhat colored by the religious views of the writer. Ultramontanists find it tainted with Gallicanism. It has been translated into German, French, and Italian, and should always be consulted for the view of a conscientious and erudite Roman Catholic. The work was vigorously assailed, especially by *The Edinburgh Review*; but the defense of the author showed so much moderation and learning, as well as desire for the truth, that the criticisms of his assailants tended to strengthen rather than weaken confidence in the work. Author of a *History and Antiquities of the Anglo-Saxon Church* (1806) and an English version of the New Testament (1836). D. at Hornby, July 17, 1851. Revised by C. K. Adams.

Lingg, Hermann: poet; b. at Lindau, Germany, Jan. 22, 1820; studied medicine at Munich; became a physician in the Bavarian army; was pensioned in 1851, and has since devoted himself entirely to literature. In 1854 his first collection of poems was published with an introduction by Emanuel Geibel, who had discovered Lingg's poetic talents. This collection established his reputation as a poet, and he became a member of the circle of poets whom King Maximilian II. of Bavaria assembled in Munich. Lingg's best-known work is the epic poem *Die Völkerwanderung* (1865–68). Besides, he published a number of dramas and novels which possess less poetic merit. Julius Goebel.

Lingual Ribbon: See Mollusca.

Linguals: a group of consonants called also cerebrals or cacuminals, whose articulation is formed with the tip of the tongue turned slightly up and back. They are commonly indicated as *ṭ*, *ḍ*, *ṣ*, *ṛ*, *ṇ*, etc. The Sanskrit has not only the dental series *t*, *th*, *d*, *dh*, *n*, articulated with the tip of the tongue against the backs of the upper teeth, but also the lingual series *ṭ*, *ṭh*, *ḍ*, *ḍh*, *ṇ*, called by the native grammarians *mūrdhanya*, head-sounds. These had their origin in the speech habits of the pre-Aryan, Dravidian population of India upon which the Sanskrit as the language of a conquering race was impressed. The English *t*, *d*, *n*, being articulated farther back in the roof of the mouth than the corresponding French and German sounds, often appear to French and German ears as cerebral. A cerebral *r* is spoken in some parts of America. See Phonetics. Benj. Ide Wheeler.

Linguatu'lida [Mod. Lat., deriv. of Lat. *lingua*, tongue]: a group of parasitic animals usually regarded as *Arachnida*. They have worm-shaped bodies, with two pairs of adhering

hooks near the mouth. There are no eyes, respiratory, or circulatory organs. In their sexually ripe condition they live in warm-blooded animals and reptiles, one species occurring in and near the nose of the dog and wolf. The young, passing out, find entrance into the bodies of rabbits, whence they again pass to the dog when the animal is eaten.
J. S. K.

Linguistics: See Ethnology and Language.

Lin'gula [dim. of Lat. *lingua*, tongue]: a genus of Brachiopoda (*q. v.*), in which the two valves of the horny shell are nearly equal, and are without a hinge. The animal has a long fleshy stalk or pedunele, which is buried in the sand. The living species of Lingula are few, but widely distributed, one occurring on the shores of the Carolinas, while others occur on the west coast of the U. S., in the Hawaiian islands, Australia, and the Asiatic shores. The genus acquires peculiar interest from its great antiquity, fossil Linguläe, much like those of to-day, occurring in the oldest rocks; and through all geological ages the genus has maintained itself unchanged. The living species have few points of general interest, but it may be mentioned that the recent forms exhibit a power of retaining life under adverse circumstances which is possibly correlated with the vitality of the race.
J. S. Kingsley.

Lingu'lidæ [Mod. Lat., liter., those belonging to the Lingula family; *Lin'gula* (liter., dimin. of Lat. *lingua*, tongue, named from the shape) + Gr. patronymic ending *-ίδαι*, plur. of *-ίδης*, descended from]: a family of the class Brachiopoda (*q. v.*) and order *Lyopomata*, distinguished by the more or less linguiform shape of the shells, the slightly unequal valves, the want of articulating apophyses, and the development of a long vermiform peduncle which passes between the apices of the valves; the shell has rather the appearance of horn than of true shelly matter. The family is very interesting, being one of the very few which have survived in comparatively unaltered forms from the Lower Silurian epoch, some of the types of the earliest period being scarcely generically distinct from the living *Linguläe*, although the apparent slight differences may be the result of the simplicity of the shell.

Liniers y Bremont, lĕĕ-nĕĕ-ār'ee-brā-mōnt', Santiago Antonio Marie, de (Span. form of his Freneh name, Jacques Antoine Marie Deliniers-Brémont): naval officer and administrator; b. at Niort, Deux-Sèvres, France, Feb. 6, 1756. He was of a royalist family, and after the Revolution took service in the Spanish navy, attaining the rank of captain. In 1806 he commanded a squadron in the Rio de la Plata, defended Montevideo against the British, and attacked the British force which had occupied Buenos Ayres, compelling its capitulation (Aug. 12, 1807). The weak viceroy, Sobremonte, was deposed on the demand of the people, and Liniers put in his place (May 16, 1808). Meanwhile the British had been strongly re-enforced and had taken Montevideo; they now attacked Buenos Ayres and gained a battle under the walls (July 1), but Liniers defended the city so well that they were forced to retreat with great loss and eventually agreed to leave the country. The Spanish Junta Central was opposed to Liniers, and in Aug., 1809, Cisneros arrived to take his place. His measures precipitated the revolution of May 10, 1810. Liniers, who had retired to Córdoba, on hearing of the revolt collected a small force and marched on Buenos Ayres, with the intention of restoring the royal authority; but he was captured (Aug. 6), and by order of the revolutionary junta was shot near Buenos Ayres, Aug. 26, 1810.
Herbert H. Smith.

Linlithgow, lin-lith'gō, or **West Lothian**: county of Scotland, bordering N. on the Firth of Forth, E. and S. on the county of Edinburgh. Area, 120 sq. miles. In the southern part the soil is swampy; elsewhere it is generally fertile, producing wheat, barley, and oats. Very little of the arable land has remained unreclaimed. Horses, cattle, sheep, and swine are reared. Great numbers of cattle are bought and fattened, and dairy-farming is briskly prosecuted, the fresh butter and buttermilk being sent partly to Edinburgh and partly to Newcastle. Very little cheese is made. Pop. (1901) 64,787.—Linlithgow, the principal town, has interesting monuments, among which is the castle in which Mary Queen of Scots was born. It was built at various times; the west side is probably the oldest portion of the structure, and is believed to date from the time of James III. In the history of Scotland the palace has been quite conspicuous. It was burned in 1746 by Hawley's dragoons. Pop. of town 4,154.

Linn, John Blair: clergyman and author; b. at Shippensburg, Pa., Mar. 14, 1777. He graduated at Columbia College in 1795; entered the law-office of Alexander Hamilton; published anonymously two small volumes of miscellanies in prose and verse. In Jan., 1797, he brought out at the John Street theater, New York, a "serious drama, interspersed with songs," entitled *Bourville Castle, or the Gallic Orphan*. Shortly afterward he abandoned the law and entered the Presbyterian ministry, and was assistant pastor of a church at Philadelphia from 1799 till his death there, Aug. 30, 1804. In 1800 he wrote an Ossianic poem on the *Death of Washington*, and in 1801 published his principal poem, *The Powers of Genius*. In 1803 he engaged in a theological polemic with Dr. Priestley. In 1805 his brother-in-law, the novelist, Charles Brockden Brown, published, with a brief memoir, *Valerian*, a narrative poem by Linn, incomplete, but extending to 1,500 lines of blank verse, treating of the early struggles of Christianity against paganism.

Linnæ'a [Mod. Lat., named from *Linnæus*]: a genus of plants containing but a single species, *L. borealis*, the twinflower, of the honeysuckle family, found by Linnæus in Lapland in 1732, and named by Gronovius. It is a small trailing evergreen herb, with round leaves occurring in pairs, as do also the flowers, which are bell-shaped, of a pinkish color, and very fragrant. It abounds in the more northern regions of Europe, Asia, and in North America, occurs as far S. as Maryland, and as far W. as Colorado and California.

Linnæ'us, the Latinized name of Carl von Linné: the father of systematic botany; b. at Råshult, in Småland, Sweden, May 12, 1707. He was the son of a Lutheran vicar, who, we are told, on account of poverty, apprenticed his son to a shoemaker, but soon afterward sent him to Wexiö to school, where his fondness for natural science made him so careless of his other studies that his teachers advised the father to put him to some trade; but Rothman, the doctor of the place, took the boy into his house and gave him books upon botany and medical science to read; and sent him in 1727 to Lund, where he read books of botany under Prof. Stobæus. In 1728 he went to Upsala, attracted by the fame of Rudbeck, Professor of Botany, but the young Linné suffered much from hunger and cold, and being without money or friends began to despair, when Olaf Celsius, Professor of Divinity, met him by accident, gave him congenial employment upon his *Hierobotanicon*, took him into his own house, and introduced him to Rudbeck, whose assistant he became. In 1732 he explored Lapland under the patronage of the Academy of Sciences, and gathered material for his *Flora Lapponica* (1737). In 1735 he took the degree of M. D. at Harderwyk, in the Low Countries; resided at Hartecamp 1735–38, under the patronage of George Clifford, a banker of Amsterdam; published his *Systema Naturæ* (1735); *Fundamenta Botanica* (1736); *Bibliotheca Botanica* (1736); *Critica Botanica* (1737); *Hortus Cliffortianus* (1737); *Genera Plantarum* (1737); *Classes Plantarum* (1738); returned in 1738 to Sweden; was appointed in 1739 physician to the king and Professor of Botany at Stockholm; became in 1740 Professor of Medicine at Upsala, and was Professor of Botany there 1741–78, giving the university a worldwide fame and attracting thither large numbers of students from foreign lands; was ennobled in 1757. He died at Upsala, Jan. 10, 1778. Besides the works above mentioned, his principal writings are *Philosophia Botanica* (1751); *Fauna Suecica* (1746); and *Flora Suecica* (1746); works on materia medica (1747–50); and above all the *Species Plantarum* (1753). It would be hard to overestimate the importance of the work of Linnæus in the establishment of modern systematic botany and zoölogy, to which he gave the binomial nomenclature of species. The botanists of the U. S. in 1892 agreed that "the botanical nomenclature of both genera and species is to begin with the publication of the first edition of Linnæus's *Species Plantarum* in 1753." His library and collections were bought, after the death of his son, in 1783, by J. E. Smith, the first president of the Linnean Society in London, who also translated his *Lachesis Lapponica* into English (1811).

Linnet [M. Eng. *linet* (confused with O. Fr. *linot*, linnet < O. Eng. *līnete*. Named from feeding on flax (O. Eng. *līn*: Lat. *linum*. See Linen); cf. Germ. *hänfling*, linnet, deriv. of *hanf*, hemp]: a name given to various birds of the family *Fringillidæ* (finches), but proper to those of the genus *Linota*, of which *L. cannabina*, the common European linnet, is the typical species. These birds are remarkable for

the changes in their plumage during the breeding season. North America has several birds allied to the European linnet and similar in food and habits. For green linnet see GREEN FINCH. Revised by D. S. JORDAN.

Lino'leic Acid: an acid of the formula $C_{16}H_{28}O_2$, found in combination in linseed oil and poppy oil, from which it is obtained by saponification. It is a limpid oil of specific gravity 0·92 at 14° C., of a faint-yellow color, a slight acid reaction, and a high refractive power. It absorbs 2 per cent. of oxygen by long standing, and thickens so that it will hardly flow, but remains colorless, and forms a varnish on wood. It is due to this power that drying oils have their property of hardening when exposed to the air. I. R.

Lino'leum: See CARPETS.

Linseed Oil: the oil of flaxseed; extensively used for all kinds of painting, for making oil-cloths, oil-silks, printer's ink, etc., its manufacture being a most important industry, and the parent of many others. The oil-mills not only consume the greater part of the seed raised in the U. S., but large quantities are imported, especially from the East Indies. The seed is crushed and submitted to great hydraulic pressure, by which the oil is for the most part removed. When the seed is not heated the oil is light colored, and is called *cold-pressed* oil. When, however, the seed-paste is heated after grinding, and pressed while still hot, the oil is of a little darker color, but it is much more rapidly and thoroughly removed. The paste in this operation is heated by steam, and brought to a temperature not much higher than 212° F. It is placed in strong cloths or bags of equal size and holding equal quantities, which are placed in iron cases and laid up under the presses, where they are subjected to a gradually increasing pressure, equivalent at length to a weight of 300 to 800 tons. The cakes from cold-pressed oil are reground and heated with the rest. The total product of seed grown in the U. S. in 1890 is estimated at 9,000,000 bush. The amount of linseed imported in the same year was 2,391,175 bush. Revised by IRA REMSEN.

Linton, ELIZA LYNN: wife of William J. Linton, engraver; b. at Keswick, Cumberland, England, in 1822; published a novel, *Azeth, the Egyptian* (1846); *Amymone, a Romance of the Days of Pericles* (1848); and *Realities*, a romance of modern life (1851). She had since been connected with the press, especially *The Saturday Review*, in which her papers on *The Girl of the Period* attracted great attention. Among her later novels are *Sowing the Wind* (1866); *The True History of Joshua Davidson, Christian and Communist* (1872); *Patricia Kemball* (1874); *The Rebel of the Family* (1880); *Paston Carew* (1886). D. in London, July 14, 1898.

Linton, WILLIAM JAMES: wood-engraver and author; b. in London, England, in 1812; was apprenticed to G. W. Bonner, and in 1842 became partner with Orrin Smith; was first engaged on *The Illustrated London News*, and did the work of illustrating Jackson's *History of Wood-engraving*, published by the proprietors of that journal. His hand is seen in *The Lake Country* (1864) and in the book of *Deceased British Artists*, issued in 1860 by the London Art Union; in Josiah G. Holland's *Katrina* (New York, 1869); and in Bryant's *The Flood of Years* and *Thanatopsis* (1878). Mr. Linton, though eminent as an engraver, is still better known as the author of a *Life of Paine*; *Claribel, and Other Poems* (London, 1865); *The English Republic*; *The Flower and the Star* (Boston, 1878); *Some Practical Hints on Wood-engraving* (1879); *Wood-engraving, a Manual of Instruction* (1887); *Poems and Translations* (1889); and papers in *The Westminster Review*, *Examiner*, and *Spectator*, mainly on social topics. He edited *Rare Poems of the Sixteenth and Seventeenth Centuries* (1882), and with Richard H. Stoddard *English Verse* (5 vols., New York, 1883). In youth a zealous Chartist, he was interested in the revolutionary plans of his time, was a friend of Mazzini, entered heartily into the cause of the British and European workingmen, and defended the French Commune against the accusations of its enemies. Since 1867 Mr. Linton had resided in the U. S. D. in New Haven, Conn., Dec. 29, 1897.

Li'num [Mod. Lat., from Lat. *li'num*, flax. See LINEN]: a genus of plants of which the common FLAX (*q. v.*) is the most important. It includes several flax-plants not cultivated for fiber, but sometimes grown in gardens for ornamental purposes. Among these are *L. perenne*, or perennial flax, found in the western parts of the U. S., growing 18 inches high, and forming tufts of slender stems with delicate blue flowers; *L. grandiflorum*, a beautiful annual found in Algiers, with abundant scarlet flowers; *L. flavum*, a greenhouse species, and *L. berlandieri*, growing in Texas, both of which have yellow flowers.

Li'nus (2 Tim. iv. 21): according to tradition, the first Bishop of Rome after St. Peter, but it is doubtful whether he succeeded the apostle, or whether St. Peter consecrated him bishop, perhaps long before his own martyrdom. The dates of his life are uncertain, some giving the year of his death as 80; others as 78 or 67.

Linus (in Gr. *Λίνος*): a personage in Greek mythology of uncertain antecedents. (1) In Argos he was a son of Apollo by the Princess Psamathe. To escape detection Psamathe exposed the child, who was reared by shepherds, but when growing into manhood he was torn to pieces by his own dogs. (2) In Thebes Linus was the son of Apollo and the muse Urania; he was killed by Apollo on Mt. Helicon, because he dared to dispute Apollo's supremacy in music. According to another version, Linus, a celebrated minstrel, was slain by Heracles, who was instructed by him in music, and in a fit of impatience killed him with the lyre. In each version of the myth Linus dies a violent death. It is conceded now that the word *Linus* did not refer to an individual person, but was the name applied to the dirges that were sung throughout Asia in commemoration of the premature death of the husband-son (Tammuz, Hadad-Rimmon, Sandan, Atys, Adonis, etc.) of the great Asiatic mother-goddess, known to the Greeks as Cybele, Rhea, etc. Some think that Linus was the personification of a flower like Narcissus and Hyacinthus. See Brugsch, *Die Adonisklage und das Linoslied* (Berlin, 1852); Gruppe, *Die Griechischen Culte und Mythen in ihren Beziehungen zu den Orientalischen Religionen* (Leipzig, 1887) p. 543 ff. J. R. S. STERRETT.

Linyau'ti: a native town on the Chobe tributary of the Zambesi river, Africa, containing, when Livingstone visited it (1851), about 15,000 people, and then the chief center of trade in South Central Africa. This fact drew to it a party of missionaries, men, women, and children, nearly all of whom fell victims to the pestilential climate. The annihilation of these pioneers made a deep impression, and is the sole reason why Linyanti, surrounded by swamps, is still remembered. C. C. A.

Linz: city; the capital of the province of Upper Austria, on the Danube; 117 miles by rail W. of Vienna (see map of Austria-Hungary, ref. 5–D). Its fortifications, built in 1828–36, consisted of thirty-two bombproof towers, connected with each other by subterranean alleys, a method of fortification invented by Archduke Maximilian of Este, but superseded by later improvements in artillery, and now entirely abandoned. It is the seat of the provincial government and of a bishopric, has a theological seminary and two cathedrals, one dating from 1670, and one dedicated to the Immaculate Conception (built 1862–90). It has some manufactures of cloth, carpets, silk, leather, gold-lace, paper, and tobacco. By the treaty concluded here Dec. 13, 1645, religious liberty was granted by the Emperor Ferdinand to Hungary. Pop. (1891) 47,560.

Lion [from O. Fr. *lion* < Lat. *le'o*, *leonis*, lion: Gr. *λέων*; cf. O. H. Germ. *lëwo* (> Mod. Germ. *löwe*), O. Bulg. *lĭvŭ*. The word is probably not Indo-Europ., but was obtained by the Europeans from some unknown source]: next to the tiger the largest and most powerful of the *Felidæ*, or cat family, a full-grown male being a little over 10 feet long from tip of nose to tip of tail. The female is smaller. The scientific name is *Felis leo*. The color of the lion, which is nearly uniform over the body, varies from pale yellowish gray to almost chestnut brown. This coloration is largely protective, assimilating with the sand, or sun-dried grass of the animal's favorite haunts. The young are born spotted, and remain so for some time. The tail is tufted, and the male usually has a dark mane, and dark fringes of hair along the flanks. The mane begins to grow when the animal is two or three years old, and attains its full development in about three years. Some males have no mane, and lions show great individual variation, not only in this respect, but in size and color. Lions are not gregarious, but parties of six or seven may be seen together, and while these are usually members of one family, yet several adults are now and then seen together. The lion is found over the greater portion of Africa, and in Mesopotamia, Persia, and parts of Northwestern Hindustan. In other parts of Southwestern Asia, as well as in portions of Africa, the lion has been exterminated. Within the historic period lions occurred in Asia Minor,

and in the adjoining part of Europe as far as the Isthmus of Corinth. Except when pressed for food, the lion is rather lazy and indolent. He rests during the day, and preys during the night. The testimony of the famous hunters who have written of the lion is that he is rather timid than courageous, and that he entertains great fear of man. Dr. Livingstone gives a singular account of the roar of the lion. He says, comparing it with the voice of the ostrich, "in general, the lion's voice seems to come deeper from the chest than that of the ostrich, but to this day I can distinguish between them with certainty only by knowing that the ostrich roars by day, and the lion by night." Gordon Cumming gives a graphic description of the imposing character of the nightly concerts which the lions perform when they meet, often in considerable numbers, at some spring where they all come in order to drink, and then stop and challenge one another with mighty roars of defiance. Revised by F. A. Lucas.

Lipans: See Athapascan Indians.

Lip'ari (Lat. *Meligu'nis*, the ancient name = Gr. Μελιγουνίς): (1) one of the Æolian islands, situated near the north coast of Sicily, and the most important and populous of the group. Area, 13 sq. miles. It was a volcano, as appears from Aristotle, but the period of its extinction is unknown. With the exception of certain very precipitous and rocky portions, this island is most fertile, and its fruits and wines are excellent. Pop. 14,000.—(2) A town on the above island, situated on a rocky eminence protected by a fort. It is an old town, and many interesting antiquities exist in the neighborhood. The modern town, which has suffered severely from earthquakes, is not well built, but it has a handsome cathedral and some respectable public buildings. The inhabitants are skillful sailors, and carry on an active commerce with Sicily, etc. The port affords good anchorage, though a mole is required to make it secure. Pop. 4,000.

Lippe, or **Lippe Detmold**, lip'pe-det'mōlt: a small principality of Germany, between Hanover, Brunswick, and Westphalia, and comprising an area of 469 sq. miles. It is hilly, but very fertile, well wooded, and watered by the Werre, an affluent of the Weser. The southern part is covered by the Teutoburger Wald, famous as the place where Arminius destroyed the Roman legions under Varus. The inhabitants, numbering 139,238, belong to the Reformed Church. The principal town is Detmold.

Lippi, lĕĕp'pĕĕ, Filippo, called Fra Lippo Lippi: painter; b. in Florence, probably about 1412. He was a monk in a Carmelite monastery throughout his youth; was made chaplain of a convent in 1452, and later rector of a church in Legraia, in Tuscany. Endless romantic stories are told of his adventures, all of which are doubtful and probably untrue. In some way he became a skillful painter, and an heir of the ways of work of the great Masaccio, whose power he could never attain, but whose straightforward way of looking at the visible world was natural to the pupil also. His most important remaining works are frescoes in the Cathedral of Prato, behind the principal altar—the *History of St. Stephen* on one side, the *Life of John the Baptist* on the other. In a picture gallery of the same town is a picture of the *Virgin giving her Girdle to St. Thomas*, and two others. In the Academy of Florence is a large *Coronation of the Virgin*, with many curious episodes introduced, and a portrait of the artist; also a *Nativity*. In the Uffizi Gallery in Florence is a beautiful and uninjured *Virgin and Child with Angels*, and a landscape background; and in the Pitti Palace a *Virgin with Two Saints*. The *Vision of St. Bernard*, a very fine *Annunciation*, and three other pictures, are in the National Gallery of London. The frescoes in the Spoleto Cathedral have been much injured. D. at Spoleto, 1469. Russell Sturgis.

Lippi, Filippo, the younger, called Filippino Lippi: painter; b. at Prato before 1460. He was a pupil of Fra Filippo Lippi; probably was adopted by him; and is said by Vasari to have been his son. His style seems to have been modified by study of the works of Botticelli. His most important existing work is the series of frescoes in the Brancacci chapel in the Church of the Carmine, at Florence; and, soon after, those in the Strozzi chapel in the Church of Santa Maria Novella. These were painted between 1482 and 1490, the work having been previously laid out by Masaccio. Some of the compositions contain many figures, and show much power of composition, though of not so stately a character as that of his great predecessor. In the Church of Santa Maria Sopra Minerva, at Rome, he painted the interior of a chapel, finishing it about 1493. In the Church of the Badia, at Florence, is the famous *Vision of St. Bernard*, often engraved. In the Uffizi is a *Madonna* with saints. In the Munich Pinakothek is a noble picture, *Christ appearing to the Virgin* after the crucifixion. In the National Gallery are a *Virgin and Child with St. Jerome and St. Dominick*, and several about which there is dispute, for several existing pictures are ascribed to Lippi and also to Botticelli. There is also an important picture at Berlin, and others at Bologna, Naples, and Lucca. D. at Florence, 1504 or 1505. Russell Sturgis.

Lippincott, Sara Jane (*Clarke*): author and lecturer; b. at Pompey, N. Y., Sept. 23, 1823; was educated at Rochester, N. Y.; removed in 1843 to New Brighton, Pa. She has lived chiefly in Philadelphia and New York. She is well known as a writer for children under the pseudonym of *Grace Greenwood*. In 1853 she was married to Leander K. Lippincott, of Philadelphia. Among her works are *Greenwood Leaves* (2d series, 1850); *History of my Pets* (1850); *Poems* (1851); *Haps and Mishaps of a Tour in England* (1854); *Merrie England* (1855); *Stories from Famous Ballads* (1860); *Records of Five Years* (1867); and *New Life in New Lands* (1873). She has been active in anti-slavery and reform movements by means of lectures, and has been a correspondent of leading New York newspapers.

Lip'sius, Justus (*Joest Lips*): classical scholar; b. at Oberrische, near Brussels, in 1547; was educated at Ath, Cologne, and Louvain; became the secretary of Cardinal Granvella in Rome in 1563; Professor of Eloquence at Jena in 1572, after renouncing the Roman Catholic faith; at Louvain 1576; at Leyden in 1579; resigned his position on again returning to Catholicism, taking the chair of History at Louvain in 1592. D. Mar. 23, 1606. Lipsius's religious tergiversation and general lack of ethical equipoise can not command respect for him as a man, but as a scholar he calls for unqualified admiration, his position among the greatest representatives of classical learning being undisputed. His erudition is phenomenal, and his critical acumen of the highest order. His edition of Tacitus, whom he knew completely by heart, is one of the immortal masterpieces in the field of classical philology. It was published for the first time in 1574, and repeatedly re-edited thereafter. Of his other works the best known are editions of Velleius, Valerius Maximus, and Seneca. Lipsius was but an indifferent Greek scholar, and, like his great contemporary Casaubon, he had but little sympathy for classical poetry. His works (4 vols.) appeared in 1675. See F. van der Haeghen, *Bibliographie Lipsienne, œuvres de Juste Lipse* (2 vols., pp. xxviii., 598–709, Brussels, 1885); Reiffenberg, *De Justii Lipsii vita et scriptis commentarius* (1823); Nisard, *Le triumvirat littéraire au XVI^e^ siècle* (Paris, 1852); L. Müller, *Geschichte der class. Philol. in den Niederlanden* (pp. 24–29, 32–35).
Alfred Gudeman.

Lipsius, Richard Adelbert, D. D.: theologian; b. at Gera, near Leipzig, Germany, Feb. 14, 1830; studied at Leipzig, where in 1855 he became privat docent, and in 1859 professor extraordinary; in 1861 ordinary professor of Theology at Vienna, in 1865 at Kiel, and in 1871 at Jena. D. at Jena, Aug. 19, 1892. His principal writings were *Chronologie der römischen Bischöfe bis zur Mitte des vierten Jahrhunderts* (Kiel, 1869); *Die Quellen der ältesten Ketzergeschichte* (1875); *Lehrbuch der evangelisch-protestantischen Dogmatik* (Brunswiek, 1876; 3d ed. 1893); *Die apokryphen Apostelgeschichten und Apostellegenden* (1883–87, 2 vols.); *Die Hauptpunkte der christlichen Glaubenslehre* (1889; 2d ed. 1891); and many minor articles.—His father, Karl Heinrich Adelbert (1805–61), was a professor at Leipzig, author of *Grammatical Studies on Biblical Greek*.—His brother, Justus Hermann (b. at Leipzig, May 9, 1834), became in 1866 rector of a gymnasium in that city, and has published critical remarks on Sophocles (1860 and 1867) and Lysias (1864). Revised by S. M. Jackson.

Liquefaction of Gases: the conversion of gases into the liquid form. Since the boiling-point of all liquids is raised by pressure, and since gases are to be considered simply as vapors existing at temperatures and pressures such that they are more or less remote from their boiling-point, it follows that by the application of pressure, accompanied by reduction of temperature, the liquefaction of gases may be accomplished. Faraday was of this opinion, and made extended experiments upon the liquefaction of the so-called permanent gases. In the case of certain of these he failed. Carbon monoxide (CO), methane (CH_4), oxygen, nitrogen, and hydro-

gen, he found it impossible to liquefy at the lowest temperature he was capable of producing. This temperature was —110° C., and it was produced by mixing ether and solid carbon dioxide. The resulting liquid evaporated with great rapidity when placed under the bell-jar of an air-pump, and the temperature fell to the point just indicated. Oxygen, nitrogen, and carbon monoxide, even under pressures of many atmospheres, remained in gaseous form at this low temperature. Natterer in 1854 repeated Faraday's attempt with an apparatus which allowed of pressures up to 30,000 atmospheres. Even under these conditions the so-called permanent gases retained their form. The reason for the failure of Faraday, Natterer, and of other early experimenters, became apparent when it was shown by the investigations of Andrews that above the critical temperature all distinction between liquid and vapor disappears. Above this temperature no amount of pressure will suffice to liquefy a gas. The critical temperatures of the gases already mentioned lay below the range attainable by the use of the cooling mixtures at the command of Faraday and of his contemporaries; consequently all attempts were necessarily unsuccessful. It was not until 1878 that these gases were finally liquefied. On Dec. 24 in that year it was announced by Dumas at the sitting of the Academy of Sciences, in Paris, that Cailletet in that city, and Pictet, in Geneva, had both succeeded in liquefying oxygen. The Cailletet method was a comparatively simple one. The gas was compressed in a glass tube with heavy walls to a pressure of about 300 atmospheres. The glass tube containing the compressed gas was cooled in a freezing mixture. It was then suddenly relieved from pressure by the opening of a stop-cock, and the resultant fall of temperature was sufficient to fill the interior of the tube for an instant with a dense fog consisting of particles of the liquefied and possibly of the frozen oxygen. Pictet's process was more complete, and the results obtained were much more satisfactory. A double cooling-bath was used consisting of sulphur dioxide in the liquid form, within which was placed a bath of compressed carbon dioxide. The apparatus was so constructed that the latter was entirely surrounded by the sulphur dioxide bath. By means of separate pumps the compression of these substances (CO_2 and SO_2) was kept up continually to feed these baths, while other pumps, also continuously in action, maintained a vacuum in the vessels in which they were placed. Under these conditions the sulphur dioxide fell by the cooling effect of its own evaporation to —65° C., while the carbon dioxide in the inner bath sank to —140°. The gas to be liquefied was compressed to over 300 atmospheres in a glass tube, this tube being cooled by contact with the carbon dioxide of the inner bath. When the pressure was suddenly reduced it was converted into the liquid form flowing from the tube in a jet. Subsequent development of these processes, with the introduction of a new cooling substance, ethylene, a liquid which boils in the open air at —105°, and which can be further reduced materially in temperature when made to boil at low pressures, have made it possible to liquefy both oxygen and nitrogen and their mixture (atmospheric air) in large quantities. Carbon monoxide and marsh-gas have also yielded to these methods, and hydrogen is the only substance concerning the liquefaction of which the evidence is in the least measure unsatisfactory. Cailletet, indeed, succeeded in 1884 in cooling compressed hydrogen in a bath of boiling oxygen, and he observed, when he reduced the pressure suddenly, a momentary formation of fog within the tube. Olszewski placed the tube of compressed hydrogen in a bath of nitrogen boiling in vacuo. When he suddenly diminished the pressure upon the hydrogen from 160 to about 40 atmospheres, it went over into the form of a colorless liquid. In 1895 the latter observer succeeded by this method in determining both the critical temperature and the boiling-point of hydrogen. He found the critical temperature to be — 234·5° C. and the boiling-point — 243·5° C. At the Royal Institution in London Prof. Dewar has an apparatus by means of which liquid oxygen and nitrogen are prepared in large quantities. The physical properties of these substances at their boiling-points (—184° C. and —193° C., respectively) have been studied, and they have been used for cooling other forms of matter for the same purpose. Liquid oxygen was found by Dewar to possess magnetic permeability inferior only to that of the metals of the iron group.

By placing boiling oxygen in a vessel with walls of a highly reflecting power, and therefore of poor radiating power, surrounded by a vacuum, so that no heat losses may occur by convection or conduction, the liquid evaporates very slowly. In 1893 nearly a pint of liquid oxygen was thus sent from London to Cambridge. It was placed in a flask, the outer surface of which was coated with a mirror-like film of frozen mercury. The flask was placed in an outer vessel, and the intervening space was exhausted. The loss of oxygen during transit was small. E. L. Nichols.

Liqueurs, lĕc-kĕrz′: strong alcoholic drinks, usually founded on distilled spirit, and very rich and sweet. This is the most common use of the term, and such liqueurs are very numerous and of varied flavor. Bitters (*q. v.*) are sometimes classed as liqueurs. Some distilled spirits not sweet nor highly aromatic are called by this name, especially when unfamiliar, such as kirschwasser and vodki; of these the best known is the famous Absinthe (*q. v.*). Liqueur wines, called also dessert wines, are those which are very sweet and rich, such as Cyprus wine of the kinds usually brought to Europe; Muscatel of different sorts; Lunel and Frontignan, from the south of France; and Allatico of Tuscany. Of the distilled liqueurs some have almost gone out of use, such as Parfait Amour and Noyau, which were both very fashionable in France and England before 1825. Others of old date have kept their favor, such as Maraschino, and especially Chartreuse and Curaçao. A number of popular liqueurs are made in certain great monastic establishments in Europe. Of these Chartreuse and Bénédictin are the best known; but the Certosa of Florence has its own product, and many others are of local repute.

Liquid Air: See the Appendix.

Liquidambar: See Gum-tree.

Liquid Assets: See the Appendix.

Liquidated Damages: See Penalty.

Liquidator: See the Appendix.

Liquid Diffusion: a phenomenon which occurs when liquids capable of mixing are brought into contact and allowed to stand. It is found under such circumstances that the two liquids, which at first may have possessed a clearly marked surface of division, mix very gradually with one another without being subjected to the action of any extraneous forces, such as the action of gravity causing a heavier liquid to settle down through a lighter one to the bottom of the containing vessel, or of heat acting through the agency of convection currents, or of any mechanical disturbance.

Diffusion is a slow process, and it seems to consist of a true movement of the molecules of the liquid masses among themselves. At any rate, the moving particles are small enough to permit of diffusion through all sorts of porous membranes, even through materials such as porcelain, the interstices of which are too small to admit of the passage of the most minute microbes. The laws of diffusion have been carefully studied by a variety of methods, and many interesting and important facts with reference to this phenomenon have been established. It has been found, for example, that at a given temperature each liquid possesses a definite rate of diffusion, so that when two liquids are brought together with a separating wall or septum the rate of transfer through the partition of the two liquids will in general be different, and mixture will occur more rapidly on one side than on the other. The consequence is that one of the liquids will gain in volume at the expense of the other. This difference is sufficiently marked to produce a considerable change of level on the two sides of the dividing wall. The liquid rises on the side toward which the motion is more rapid until the column thus raised in excess of that upon the other side of the partition exerts sufficient pressure to produce a counterbalancing flow back through the porous diaphragm, after which no further rise can occur and the two diffusing liquids come into a condition of equilibrium, with a permanent difference of level on the two sides.

The chief of the earlier authorities on the diffusion of liquids is Graham (*Philosophical Transactions*, 1850 and 1861), whose results may be stated in the following form: (1) The velocity of diffusion varies with the nature of the substance in solution. (2) The quantities of a salt carried by diffusion in a given time, by solutions varying in concentration, are proportional to the degrees of concentration. (3) The amount of a salt diffused by a given solution increases rapidly with the temperature. The diffusion of adjacent liquids not separated by a septum is sometimes denoted simple diffusion. Diffusion through a septum is termed osmosis. The method of separation of the components of a mixture, sometimes employed in chemistry, by taking advantage of differences of rate of diffusion through a septum, is called dialysis. E. L. Nichols.

Liquids: a term used in phonetics to denote the various sounds expressed by the symbols *r* and *l*. In function they are both syllabic and non-syllabic; thus *able* (pron. *abl*) and *let*. In acoustic value they are best classed with the consonants. The dental or alveolar *r* may be trilled as in French and German, or untrilled as in English *right, very*. A uvular *r*, produced by trilling the uvula above the raised back of the tongue, is in recent times establishing itself in the speech of North Germany and Paris, and is known in English, e. g. in the Northumbrian burr. The common dental or alveolar *l* is produced by breath, voiced or unvoiced, passing between the sides of the tongue and the back upper teeth, the point of the tongue being placed against the gums or front teeth. The guttural *l* of Russian is produced by raising the back of the tongue toward the soft palate. BENJ. IDE WHEELER.

Liquids: substances which, as distinguished from solids, are characterized by lack of stability of form and by greater freedom of motion between molecules, and as distinguished from gases are characterized by stability of volume and by less freedom of motion between the ultimate particles. A liquid may be defined as matter existing in the state between the melting-point and boiling-point. (See FLUIDS.) Although the liquid state is common to all forms of matter, no gases being known which can not be condensed by proper application of pressure and adequate reduction of temperature, and but few solids (such as carbon) which have not been rendered fluid by the application of heat, only two of the chemical elements, mercury and bromine, are liquids at ordinary temperatures and pressures.

Temperature and *pressure* are the two factors which determine the maintenance of the liquid state, and one of these being constant, changes of the other will in general suffice to condense a gas or to volatilize a liquid. There is, however, a critical temperature for each substance above which no increase of pressure will bring about liquefaction. The critical temperature has been determined only for a few substances, of which the most important are given in the following table:

TABLE I.—CRITICAL TEMPERATURES, ABOVE WHICH LIQUEFACTION CAN NOT BE PRODUCED BY PRESSURE.

Hydrogen	−174° C.	Ammonia (NH_3)	+130° C.
Nitrogen	−123° C.	Chlorine	+141° C.
Oxygen	−105° C.	Sulphur dioxide	+155° C.
Methane (CH_4)	−75·7° C.	Ether ($C_4H_{10}O$)	+195° C.
Ethylene (C_2H_4)	+1·5° C.	Alcohol	+234° C.
Carbon dioxide	+31° C.	Chloroform	+260° C.
Acetylen (C_2H_2)	+37° C.	Carbon disulphide	+272° C.
Hydrochloric acid	+51·2° C.	Water	+365° C.

The temperature at which liquids go over into gaseous form by ebullition (BOILING-POINT, *q. v.*) varies with the pressure. The law of this variation has been worked out experimentally by Regnault and others with great precision. The following table gives the boiling-point of water at various pressures above and below the normal:

TABLE II.—BOILING-POINTS AT VARIOUS PRESSURES.

PRESSURE.	Boiling-point.	PRESSURE.	Boiling-point.
1 cm.	11·4° C.	76 cm. = 1 atm.	100·0° C.
5 cm.	38·3° C.	2 atm.	120·6° C.
10 cm.	51·7° C.	3 atm.	133·9° C.
20 cm.	66·5° C.	4 atm.	144·0° C.
30 cm.	75·9° C.	5 atm.	152·2° C.
40 cm.	83·0° C.	6 atm.	159·2° C.
50 cm.	88·7° C.	7 atm.	165·3° C.
60 cm.	93·6° C.	8 atm.	170·8° C.
70 cm.	97·7° C.	9 atm.	175·7° C.
		10 atm.	180·3° C.
		12 atm.	188·4° C.
		14 atm.	195·5° C.

Melting points of solids are to a much less degree subject to change with pressure. The effect, however, is not altogether inappreciable, and it obeys the following law, viz.: substances the density of which increases by fusion have their melting-point lowered by pressure and *vice versa* Water and iron belong to the former class. Sulphur, phosphorus, and, indeed, nearly all substances as yet investigated, are of the latter class.

While in the case of water the change is small, 120·8 atmospheres being necessary to lower the melting-point one degree centigrade (see ICE), it is very marked in the case of many substances of the second class. Hopkins (see Wüllner, *Physik.*, iii., p. 556) found for spermaceti, beeswax, sulphur, and stearin the values shown in Table III.

TABLE III.—CHANGE OF MELTING-POINTS UNDER PRESSURE.

PRESSURE.	Spermaceti melts at	Beeswax melts at	Sulphur melts at	Stearin melts at
1 atm.	51·0° C.	64·5° C.	107·0° C.	72·5° C.
519 atm.	60·0° C.	74·5° C.	135·2° C.	73·6° C.
792 atm.	80·2° C.	80·2° C.	140·5° C.	79·2° C.

Although the liquid state is intermediate between the solid and gaseous conditions, the physical constants of liquids are not always intermediate between the constants of the same materials when frozen or in the form of vapor. The specific heat of ice, for example, is 0·50, that of water is 1·00, that of steam is 0·48. Bromine in the solid state has a specific heat of 0·08, when liquid 0·10, when in the form of vapor 0·05. The index of refraction of ice is 1·31, of water 1·332, of steam 1·00025. Liquids are frequently spoken of as the incompressible fluids. They are, however, capable of measurable compression. They possess, in fact, less resilience of volume than many solids.

The following table from Everett's *Units and Physical Constants* (2d ed., pp. 52, 53) gives the compressibility of certain liquids:

TABLE IV.

LIQUID.	Coefficient of resilience.	Compression for one megadyne per cm^2.
Mercury (at 15°)	$5·42 \times 10^{11}$	$1·84 \times 10^{-6}$
Water (at 18°)	$2·20 \times 10^{10}$	$4·55 \times 10^{-5}$
Ether (at 14°)	$7·92 \times 10^{9}$	$1·26 \times 10^{-4}$
Alcohol (at 13·1°)	$1·12 \times 10^{10}$	$8·91 \times 10^{-5}$
Carbon disulphide (at 14°)	$1·60 \times 10^{10}$	$6·26 \times 10^{-5}$
Sea-water (17·5°)	$2·33 \times 10^{10}$	$4·30 \times 10^{-5}$

In comparison with these may be cited:

Steel, resilience of volume = $1·841 \times 10^{12}$.
Copper, " " " = $1·684 \times 10^{12}$.

The case of sea-water is of special interest on account of the influence of its compressibility upon the ocean-level. Tait, in his extended investigation of this property, in connection with the deep-sea explorations of the famous Challenger expedition, computed the loss of volume due to the compression of each layer of ocean-water by the superincumbent mass, and found the level of the sea to be more than 600 feet below that which would exist in the case of a strictly incompressible fluid.

Heat of fusion is a term by which the fact is expressed that in passing from the solid to the liquid state definite quantities of heat-energy must be expended. The heats of fusion of some of the more important liquids are given in the following table:

TABLE V.

SUBSTANCE.	Heat of fusion.	SUBSTANCE.	Heat of fusion.
Water, at 0°	79·2	Bromine, at −7·3°	16·2
Acetic acid ($C_2H_4O_2$), at 3°.	44·3	Cadmium, at 320°	13·7
Glycerin ($C_3H_8O_3$), at 13°.	42·5	Tin, at 228°	13·3
Beeswax, at 61°	42·3	Bismuth, at 266°	12·6
Phosphoric acid (H_3PO_3), at 18°	37·4	Iodine	11·7
Naphthalene ($C_{10}H_8$), at 80°	35·7	Sulphur, at 115°	9·4
Benzol (C_6H_6), at 2°	29·1	Phosphorus, at 44·2°	5·0
Zinc, at 415°	28·1	Mercury	2·8

In order to convert liquids into vapor form further energy must be expended, which may be expressed in heat-units under the name of the heat of vaporization. This quantity, a variable one, diminishing at the boiling-point, is caused to rise by pressure, and vanishes altogether at the critical temperature. Table VI. contains some values of the heat of vaporization of various liquids:

TABLE VI.

SUBSTANCE.	Temperature of vaporization.	Heat of vaporization.
Bromine	58°	45·6
Iodine	....	23·9
Mercury	350°	62·0
Sulphur	....	362·0
Nitrous oxide (N_2O)	....	100·6
Ammonia (NH_3)	7·8°	294·2
Sulphur dioxide (SO_2)	....	88·3
Water	100°	535·9
Carbon disulphide (ES_2)	46·2°	86·7
Carbon dioxide (CO_2)	0°	49·3
Alcohol (C_2H_6O)	....	208·9
Ether ($C_4H_{10}O$)	34°	89·9

The following table, deduced from the results of Regnault, under the assumption that the specific heat of water in the liquid form is a constant, will serve to illustrate the falling off in heat of vaporization with rise of temperature:

TABLE VII.

Water vaporized at	Heat of vaporization.
0°	606·5
100°	537·0
230°	446·6

It will be seen that in Tables V. and VI. much the largest values are those for water, which substance also, as will be noted from Table VIII., possesses a very much greater specific heat than any of the ordinary liquids:

TABLE VIII.—SPECIFIC HEAT OF VARIOUS LIQUIDS.

SUBSTANCE.	Range of temperature.	Specific heat.
Lead (molten)	340° C. to 450° C.	0·040
Bromine	13° C. " 45° C.	0·107
Phosphorus	49° C. " 98° C.	0·204
Mercury	17° C. " 48° C.	0·033
Sulphur	119° C. " 147° C.	0·234
Bismuth	280° C. " 380° C.	0·036
Tin	250° C. " 350° C.	0·0637
Alcohol (C_2H_6O)	16° C. to 30° C.	0·612
Carbon disulphide (CS_2)	14° C. " 29·5° C.	0·247
Chloroform ($CHCl_3$)	18° C. " 30° C.	0·233
Ether ($C_4H_{10}O$)	25° C. " 35° C.	0·546
Acetic acid ($C_2H_4O_2$)	15° C. " 20° C.	0·462
Benzol (C_6H_6)	19·5° C. " 30·5° C.	0·4158
Water (according to Regnault)	0°	1·0000
	50°	1·0042
	100°	1·0130
	150°	1·0262
	200°	1·0440

Nearly all liquids, with the exception of molten liquids and certain solutions, are capable of transmitting light. Since rays penetrating them are retarded by different amounts, according to the wave-length, dispersion occurs as well as refraction. Table IX. presents the index of refraction of such liquids as have been systematically studied, for the wave-lengths corresponding to the Fraunhofer lines. The data given here are confined to the temperature of 15° C. For corresponding values applying to other temperatures, the reader is referred to Landolt and Boernstein (*Physikalisch-Chemische Tabellen*, pp. 206–209), from which work many of the numerical data of this article are taken. For the refractive index of certain liquids for longer waves, see Rubens (Wiedemann's *Annalen*, vol. xlv., 1892).

TABLE IX.—REFRACTIVE INDICES OF LIQUIDS AT 15° C.

WAVE-LENGTH.	CS_2.	$CHCl_3$.	C_2H_6O.	$C_4H_{10}O$.	C_6H_6.	H_2O.
A	1·6114	1·4440	1·3600	1·3529	1·4905	
B	1·6177	1·4458	1·3612	1·3545	1·4939	
C	1·6209	1·4467	1·3621	1·3554	1·4955	1·3316
D	1·6303	1·4492	1·3638	1·3566	1·5002	1·3339
E	1·6434	1·4525	1·3661	1·3590	1·5066	
b	.....	1·4532	.....	.....	1·5078	
F	1·6554	1·4554	1·3683	1·3606	1·5124	1·3379
G	1·6799	1·4611	1·3720	1·3646	1·5234	
H	1·7035	.....	1·3751	1·3683	1·5329	

Phenomena accompanying change of state are among the most interesting of those which the study of liquids afford. The properties of liquids differ so greatly from those of solids on the one hand and of gases on the other that the

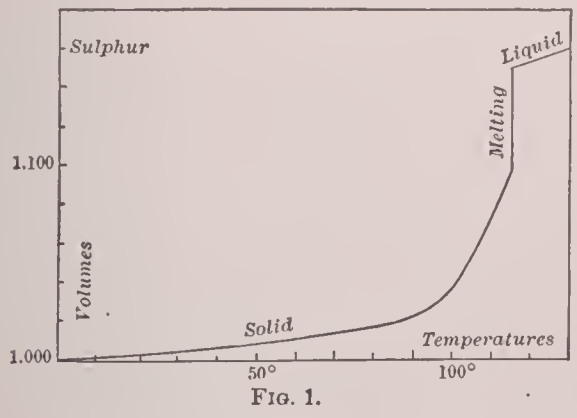


FIG. 1.

melting and vaporization points are points at which very sudden changes must occur, the abruptness in many cases amounting almost to discontinuity of condition. Actual discontinuity is the exception, however, the changes, so far as physicists have been able to trace them, tending to occur by rapid but continuous process. The difference of density between solids and the corresponding liquid has already been alluded to. A careful study of volume-changes near the melting-point often reveals this tendency to change by continuous process, the coefficient of expansion taking on abnormal values as the point of fusion is approached.

Kopp (*Liebigs Annalen*, vol. xciii.) has shown this in the case of sulphur. His results are presented graphically in

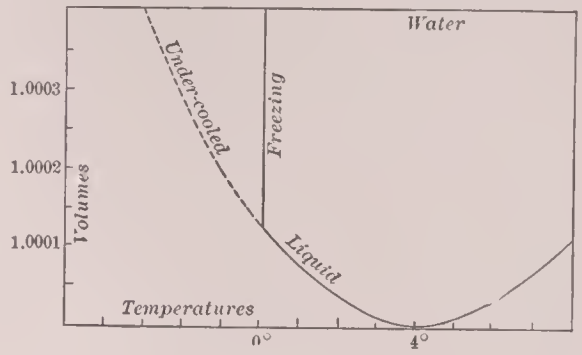

FIG. 2.

Fig. 1. Water affords a more familiar and more remarkable instance, the coefficient being reversed from a positive to a negative value at 4°, as if in preparation for the great increase in volume to be undergone at 0°. (See Fig. 2.) In vaporization also this tendency shows itself, particularly in proximity to the critical temperature, the coefficient of expansion of the liquid rising to extraordinary values just before the change of state occurs. The classical measurements of Andrews exhibit this property in the case of carbon dioxide in the most striking manner. (See Fig. 3.) This represents the changes of volume brought about by changes of pressure, the substance being maintained at a constant temperature. It will be noticed that at temperatures below 30° there is apparent discontinuity, but above that temperature the broken line of volumes becomes a curve, the double turn in which indicates a maximum value of the coefficient of expansion which is greater than the coefficient of either the gaseous or the liquid carbon dioxide.

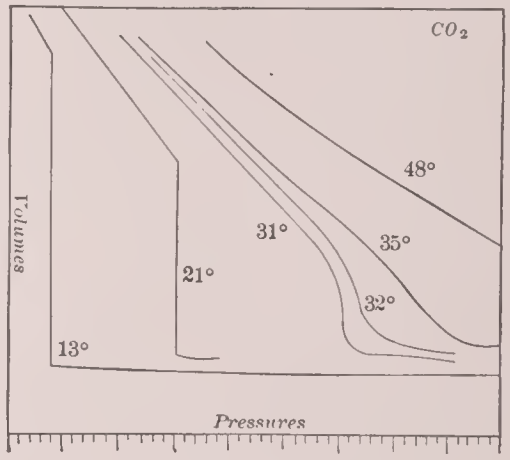

FIG. 3.

Superheating and Supersaturation.—It is probably on account of this difference of condition between the states of matter and the tendency to continuity of change that superheating and supersaturation are due. It is found that when a liquid is cooled below its melting-point in the absence of the corresponding solid of kindred crystallographic forms, it will sometimes maintain its fluidity, although in a condition of equilibrium increasingly unstable as the temperature falls. Such a liquid is said to be supersaturated. The same term is applied to any liquid which under analogous circumstances holds in solution a larger amount of some solid than it is capable of retaining in the presence of undissolved particles of the latter.

In the case of liquids and vapors an analogous phenomenon (superheating) is observed. Liquids from which all gases have been removed (by previous boiling or otherwise) are found capable of retaining their state when heated many degrees beyond the boiling temperature. When vaporization of the unstable superheated liquid finally takes place, the change is always sudden, and frequently of explosive violence. See experiments of Donny, *Ann. de Chimie et de Physique* (3), 16; of Dufour, *Pogg. Ann.*, 124; and of Krebs, *Pogg. Ann.*, 136. The last-named observer succeeded in heating water, previously freed from air, to 200° C. without boiling.

As has been pointed out by James Thomson (*Proceedings of the Royal Society*, 1871), the changes of volume brought about by the change of state are continuous when super-

heating occurs, following a curve (similar to *a b c d e f g* in Fig. 4) instead of a broken line, *a b d f g*, which is the

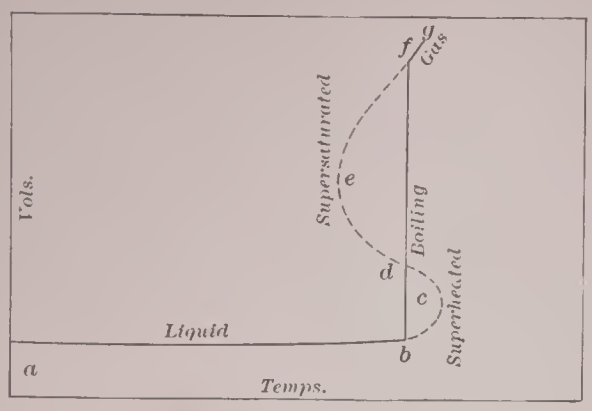

FIG. 4.

line indicating change of volume when a liquid is vaporized at the boiling-point.

Maxwell, in his *Theory of Heat* (p. 126), held that the counterpart of this phenomenon, supersaturation of a vapor, with return to the liquid state without discontinuity, might be looked for provided the necessary conditions could be fulfilled. The observation has since been recorded (*Trans. of the Kansas Academy of Science*, vol. ix., p. 91) in the case of isolated bubbles of the vapor of water or of carbon disulphide cooled in a surrounding liquid medium, respectively oil and water, to a point considerably below their condensing temperatures before liquefaction took place.

The spheroidal state is a name given to the condition assumed by any liquid when brought into contact with a surface the temperature of which is very high as compared with the boiling-point of the liquid. Under these circumstances rapid volatilization produces a cushion of vapor which effectually separates the liquid and the heated surface, and which by virtue of its very poor thermal conductivity protects the former. The cooling due to evaporation keeps the liquid permanently below its boiling-point. The surface film tends to gather the fluid mass within into spheroidal form, whence the name. That the spheroid of the liquid is not in contact with the neighboring solid may be shown in various ways; one of the most striking demonstrations is by means of a drop of water placed upon the bottom of an inverted crucible of platinum, which is kept in a state of incandescence by the flame of a blast-lamp. The thickness of the cushion of steam upon which the spheroid rests is sufficient to allow the observer to look through beneath the spheroid of water to any bright object beyond.

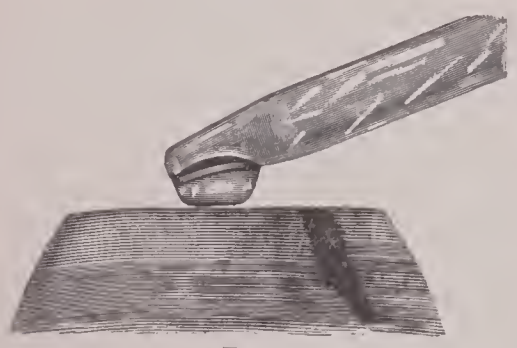

FIG. 5.

Fig. 5 is from a photograph, and shows a water-drop at the end of a pipette, and pressed down upon the face of the hot crucible so strongly as greatly to flatten the drop. The thickness of the intervening steam cushion is shown by the broad line of light beneath the drop. The photograph was taken by transmitted light for the purpose of displaying that feature.

Surface Tension.—Among the most interesting of the phenomena pertaining to liquids are those by which the properties of the surface film are made manifest. The domain is an extensive one, including all that goes under the name of capillarity, with a variety of allied phenomena familiar to the student of physics.

Experiments upon the Surface Film.—That the free surface layer of all bodies of liquid forms a film possessing remarkable properties may be shown in many ways. This film is composed of molecules in all respects identical with those situated below the surface. Its properties are due to the molecular forces between the individual particles of the outermost layer. These forces give to the surface layer the property of a stretched film or skin, perfectly flexible, yet always showing a marked contractile tendency. The presence of the film is shown in the well-known experiment which consists of floating steel sewing-needles upon the surface of water. In order to float the needles must displace their own weight of the liquid, or be supported by considerable forces from below. Observation shows that in point of fact a floating needle lies in a hollow produced by the bending of the film under it, and it is the elastic reaction of the film which finally becomes sufficient to overcome the action of the force of gravity. The considerable magnitude of these contractile forces is beautifully shown in the following experiment, due to the ingenuity of Prof. Ernest F. Nichols. (See *Physical Review*, vol. i., No. 4, 1894.) An ordinary rubber band is floated upon the surface of a vessel of water. The forces upon it due to the film of the region inclosed by the band are balanced by those of the surface surrounding the latter. A drop of oil upon the surface inclosed will, however, instantly weaken the film covering that portion of the liquid. The outer film immediately pulls the rubber band outward, tending to give it a circular form. The distortion is very marked when, finally, the elastic forces of the stretched vulcanite balance those of the stronger film. A drop of oil applied to the surface without will reduce its tension to equality with that of the inclosed region, whereupon the band is instantly relaxed and returns to its original form. Figs. 6 and 7 are from photographs. They show the rubber band before oil has been applied to the inclosed film, and after that operation. It is instructive to compare this with the celebrated experiment of van der Mensbrugghe, which in Figs. 8 and 9 is illustrated by means of photographs from the same band. Fig. 8 shows a flat soap film bounded by a metal ring, within which floats a looped thread of silk. This divides the film, as in Nichols's experiment, into two regions. Now in the case of the soap film the contractile strength of the inner region may not merely be reduced; we may go further and remove the in-

FIG. 6.

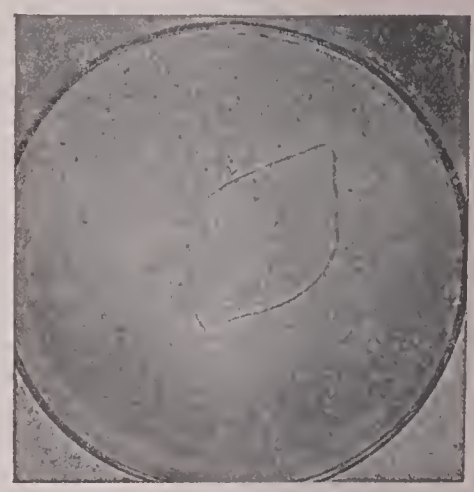

FIG. 7.

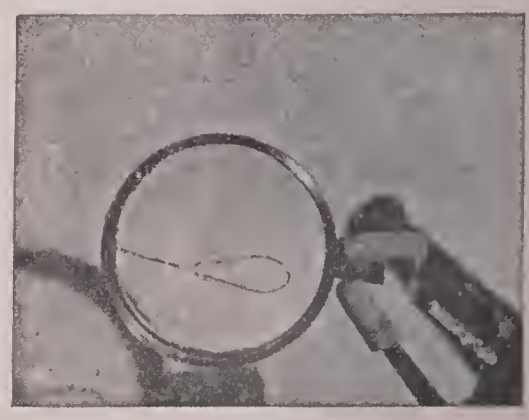

FIG. 8.

FIG. 9.

ner film altogether by piercing it with a splinter of wood. The outer film instantly draws the loop of thread, which now forms one of its boundaries, into a tense ring. (See Fig. 9.) The analogy between the two experiments is complete. When the surface film comes into contact with any solid and the molecular forces between, liquid and solid are brought into play, the result is *capillary action*, with the many striking phenomena that are classified under that head.

E. L. NICHOLS.

Liquorice, or **Licorice** [viâ O. Fr. from Lat. *liquiri'tia*, by analogy of *lique're*, etc. (see LIQUIDS), from Gr. γλυκύρριζα, licorice, liter., sweet-root; γλυκύς, sweet + ῥίζα, root; cf. Germ. *lakritze*]: the dried extract of the roots of *Glycyrrhiza glabra* and *echinata*, leguminous herbs of Southern Europe, Africa, and Asia, largely cultivated in Central Europe. The extract is a hard, black mass, containing a large percentage of an uncrystallizable sugar called glycyrrhizin. It is prepared very extensively in Spain, Italy, and Russia, and to some extent in France, England, Germany, and the U. S. It is a valuable demulcent and expectorant medicine, and is employed extensively in flavoring chewing-tobacco, as well as in pharmacy as an excipient in pill-masses. The hard, woody root is also used in medicine and in porter and stout breweries. *Glycyrrhiza lepidota* of the western parts of the U. S. has the flavor of true liquorice, as have *Galium circæzans*, *G. lanceolatum*, etc., rubiaceous herbs of the U. S., which are used in domestic medicine and called "wild liquorice."

Liquor Laws: See the Appendix.

Lisboa, BALTHAZAR DA SILVA: See SILVA LISBOA.

Lisboa, lĕĕs-bō'ăă, JOÃO FRANCISCO: author; b. at Iguará, Maranhão, Brazil, Mar. 22, 1812. He was destined for commercial life, but deserted it; managed to obtain an education, and was long a journalist, supporting the liberal party. In 1835 he was made secretary of the province, and in 1838 was elected to the provincial legislature. In 1852 he began the publication of a kind of literary magazine, written by himself, and called the *Jornal de Timon*. It consisted of political and satirical essays, aimed at both parties, and of historical papers—some of the latter of great importance. Twelve numbers, or volumes, were published, of which the last two, issued at Lisbon in 1858, are devoted to the history of Maranhão, and contain many original documents. In 1856 the imperial Government sent Lisboa to Europe to collect historical documents, and while thus engaged he died at Lisbon, Portugal, Apr. 26, 1863. He left several works in manuscript, of which one, *Vida do Padre Antonio Vieira*, was published in 1874. HERBERT H. SMITH.

Lisboa, JOSÉ DA SILVA: See SILVA LISBOA.

Lisbon [: Portug. *Lisboa* < Lat. *Olisipo*, the ancient name]: capital of Portugal and residence of its king; one of the most important commercial centers in the world; on the northern shore of a bay, Rada de Lisboa, 4 miles broad, formed by the Tagus at its influx into the Atlantic Ocean (see map of Spain, ref. 17–A). It is 9 miles from the mouth of the Tagus, and is 412 miles by rail W. S. W. of Madrid. Built on the declivities of seven hills, with numerous white cupolas and magnificent monumental buildings towering above the mass of 43,000 houses, interspersed with lovely terraces, Lisbon offers, when approached from the sea, an aspect at once charming and imposing. The bay forms a harbor large enough to accommodate at the same time all the fleets of Europe, and so deep that the largest ships can anchor immediately at its docks. The entrance to this harbor is defended by several forts, of which one, consisting of an interesting old Moorish tower called Torre de Belem, is situated on a sandbank in the bay. The city is 10 miles in circuit, and is divided into four quarters—Alhama, Rocio, Bairro Alto, and Alcantara—besides several extensive suburbs, including those of Belem and Olivaes, annexed in 1885. The old city, especially the quarter of Alhama, has irregular, narrow, and dark streets. The newer parts, built since the great earthquake (Nov. 1, 1755), which did not reach Alhama, are more regular and beautiful, and contain many palace-like buildings. The finest part is the quarter of Rocio, extending along the river and containing many splendid buildings and open places. Among the squares the Praça do Commercio is the most remarkable, situated on the Tagus, containing in the center the equestrian statue of Joseph I., and surrounded with magnificent buildings, the exchange, the royal library, the custom-house: the market-place is noteworthy also, and the immense place of Dom Pedro in the northern part of the quarter of Rocio, bordered on one side by the monastery of S. Domenico and the buildings formerly belonging to the Inquisition. Still farther to the N. stretches the public promenade. The most beautiful streets are Rua Augusta, which is the business center and contains many fine jewelry-shops, Rua do Oura, and Rua da Prata. The city has 64 churches and about 200 chapels; the former monasteries, mostly magnificent buildings, situated at the most elevated points, are now used for public purposes. The monastery of Belem is perhaps the most remarkable building of the city. It was founded in 1499 by King Emanuel the Great, on the spot where Vasco da Gama had embarked two years before, and its style is a mixture of Moorish, Byzantine, Norman, and Gothic elements. The material is white limestone, which has now become yellowish like old ivory. The least beautiful part of this building is the church, which contains the tombs of Camoens and Vasco da Gama. The whole building is used as a hospital for foundlings and orphans. The monastery of the Heart of Jesus is also an interesting structure, founded in 1770 and provided with a splendid cupola of white marble, an imitation of the Church of St. Peter in Rome: furthermore, the Church of the Patriarchs, with its gigantic cupola, situated to the N. E. of Monte do Castello; the marble Church of S. Roque; the basilica of S. Maria; the Church of Carmo, in Gothic style; and the Church of S. Vincent de Flora, the largest of the city, and the burial-place of the dynasty of Braganza. The most remarkable palaces are the royal palace of Ajuda, the palace of Nossa Senhora das Necessidades, and the palace of Bemposta. Other noteworthy buildings are the theater of S. Carlos; the national theater, which was formerly the palace of the Inquisition; the arsenal, the custom-house, the corn-market, and the polytechnic school. The educational institutions are very numerous; there are schools of every kind, including a military and a naval school, an academy of science, observatories, a geographical academy, a museum of natural history, and a conservatory of music. The city receives its water through the Alcantara aqueduct, constructed by Emanuel de Maya. The main stream comes from the village of Canassas, 2½ miles from Lisbon, and traverses the valley of Alcantara on thirty-five arches, of which the largest has a height of 230 feet and a diameter of 107 feet. The promenade on the top of the aqueduct offers a most beautiful view. The Gallegos (Spaniards from Galicia), who carry the water from the various fountains throughout the city, act as porters and perform other services, form a corporation of their own and number about 35,000. The hilly surroundings and the mountain region of Cintra are full of charming valleys, interesting peaks, and beautifully situated churches, monasteries, and mansions. The industries of the city are not considerable. Gold and silver ware and jewelry are manufactured, and spinning and weaving establishments, iron-foundries, and manufactures of silk, hats, boots, cutlery, stoneware, tobacco, chemicals, paper, soap, and steel are in operation. The commerce is very extensive. Lisbon is the largest port in the kingdom, and its custom-house is a substantial and spacious building, in which merchants are allowed to deposit their goods free of duty for one year, or for two years in the case of Brazilian produce. More than 2,500 vessels (including coasters) annually visit the port. The average value of the annual imports exceeds $30,000,000, and that of the exports $30,000,000. The most active commerce is carried on with Brazil and Great Britain, tropical products being imported from the former and manufactured goods from the latter, while wine and oil are exported to both. Lisbon had existed as a Roman *municipium* under the name of *Felicitas Julia*; later on it was taken by the Goths and by the Moors. When in 1147 Alfonso I., at the head of the crusaders, conquered and Christianized the city, it was called El-Oshbuna. In 1580 the Duke of Alva occupied it for Philip II. of Spain, and the Invincible Armada sailed from its port in 1588, but in 1640 the Spaniards were expelled and the dynasty of Braganza ascended the throne of Portugal. On Nov. 1, 1755, an earthquake destroyed the greater part of the city and killed 30,000 persons, but in an incredibly short time the place was rebuilt. In 1807–08, during the wars of Napoleon, the French held the city for a short time, but since then a long period of peace has greatly promoted its prosperity. Pop. (1892) 243,000.

Lisbon, OHIO: See NEW LISBON.

Lisburn: town; in the county of Antrim, Ireland; on the Lagan; 8 miles S. W. of Belfast (see map of Ireland.

ref. 5–J). It is celebrated for its manufactures of damasks and fine linen stuffs, a branch of industry established by a settlement of Huguenots after the Revocation of the Edict of Nantes. The parish church, which has a beautiful octagonal tower, was constituted the cathedral church of the united dioceses of Down and Connor and Dromore by Charles II., and contains a monument to Jeremy Taylor, who was bishop of the see. Pop. (1891) 9,517.

L'Islet: town of L'Islet County, Quebec, Canada; station on the Intercolonial Railway; 45 miles N. E. of Quebec (see map of Quebec, ref. 4–D); on the right bank of the St. Lawrence (which has here a width of about 20 miles) and opposite Crane island. Pop. 2,500.

Lisieux, lē̆ē′zi-ö′ [Fr. < Lat. *Lexobii*, *Lexovii*, a people at the mouth of the Lequana, or Seine]: town; in the department of Calvados, France; on the Touques, at the very point where it is joined by the Orbiquet; 30 miles by rail E. by S. of Caen (see map of France, ref. 3–D). Though its position at the junction of two rivers makes it subject to disastrous inundations, it is one of the most prosperous cities of Normandy, forming the center of a very considerable industrial activity, the arrondissement having more than 200 factories, producing linens (cretonnes), woolens, cottons, and flannels, besides spinning-mills, bleaching-fields, dye-works, etc. There is a large trade in grain, hemp, and cider. The Cathedral of Lisieux is one of the most interesting specimens of the transition from the Roman to the Ogival style. It was founded in 1045, and the greater part was finished in 1233. It is 360 feet long, 90 feet broad, 65 feet high, and its southern tower, rebuilt in the sixteenth and seventeenth centuries, rises 230 feet. It is dedicated to St. Peter. The Church of St. Jacques, dating from the fifteenth century, is also an interesting building. Pop. (1896) 16,349.

Lis pendens: a phrase meaning literally a pending or continuing suit or action, but used in general to designate a rule of law prevailing, with certain exceptions and restrictions, in courts of equity and in courts of law, that during the pendency of a suit neither party can alienate nor transfer property which is the subject of the action so as to affect the rights of his adversary; or, in other words, that all persons hold any rights acquired during the pendency of the action in the subject which it affects subject to the rights of the parties as settled by the result of the suit. The rule is in effect the same as that expressed in the maxim *pendente lite, nihil innovetur*, that is, during the pendency of an action no change will be allowed to be made (in the existing state of things).

Origin and Basis of the Rule.—The rule has been by some authorities supposed to have been adopted by analogy from proceedings in real actions at common law, but is more probably ultimately derived from the Roman or civil law. (Mackenzie's *Roman Law*, 329.) Although it had already been long acted upon as a principle of practice in the proceedings of courts, it was first formally stated and established by Lord Bacon in 1618 as one of his rules or ordinances governing the administration of justice in courts of chancery. Numerous authorities have referred the rule concerning the effect of a *lis pendens* (pending action) to the doctrine of constructive notice, but the better opinion now is that it is based upon the necessity that, in order to put an end to litigation, the decision of the court shall be binding not only on the parties to the suit, but on third parties who claim title or rights under them by alienation or transfer made during the pendency of the suit, whether such alienees had or had not notice of the pending action. The rights of the parties are the same in either case.

When the Rule Becomes and Ceases to be Operative.—The rule *lis pendens* is operative only when the court has full jurisdiction over the person and over the property, which must be of such a character as to be affected by the rule, and must be described with such certainty as to enable it to be identified by the description. For this purpose the court in general has full jurisdiction on the filing of the bill and the service of the subpœna; and its jurisdiction ceases upon the final dismissal of the action, either by decree or judgment or from any other cause. In the U. S. the rule also ceases to be operative in cases of negligent failure to prosecute, but the decisions are not uniform as to what constitutes such negligence as to destroy the *lis pendens*. The reasonable rule which has been followed in many of the cases would seem to be that the prosecutor should be estopped from claiming the benefit of *lis pendens* by such negligence as under the circumstances of the case justifies the belief that the suit has been abandoned. In the U. S. the question whether a *lis pendens*, valid in the State in which the action is pending, shall be recognized as valid under the laws of another State has been variously decided.

Property Subject to the Rule.—Real property has universally been held to be subject to the operation of *lis pendens*, and it is settled that the rule applies also to personalty, but the decisions of the different courts limiting the classes of personal property subject to it are not uniform. With the exception of a few cases in Pennsylvania, however, negotiable paper of all kinds has been held to be exempt from its operation. The rule is undoubtedly beneficial in its relation to real estate, but in its application to personal property, which is the subject of ordinary commerce, it is liable to work great injustice, and the courts will not aid in setting the rule into operation by presuming facts material to that end.

Statutory Regulation.—To alleviate the harshness of the "constructive notice" fastened upon a purchaser by force of this rule, the matter has been regulated by statute, both in England (2 Vict., c. xi., sec. 7) and in many of the U. S., so far as real estate is concerned. For a fuller statement of the law of *lis pendens*, see the treatises of Story, Adams, and Pomeroy *On Equity Jurisprudence*; Bennett, *On Lis Pendens*, and the various statutes. The substance of the legislation is that written notice of the pendency of the action is to be filed in a designated office, giving sufficient information of the names of the litigants, the property affected, and the object of the litigation. Constructive notice is given from the time of the filing. F. Sturges Allen.

Lis'sa (anc. *Issa*, Slav. *Vis*): an island in the Adriatic, in lat. 43° 1′ N., lon. 16° 6′ E., in the Dalmatian Archipelago. Area, 35 sq. miles. Pop. 7,900. The fortifications of its two harbors—especially of that upon the east side, near the small town of Lissa—are so strong that they almost rival those of Malta. This island was an important naval station under the Romans, a stronghold of the corsairs during the Middle Ages, an emporium of contraband British merchandise during the wars of Napoleon. Here the Italian squadron was defeated by the Austrian squadron in the war of 1866. Revised by M. W. Harrington.

Lissa: town; in the province of Posen, Prussia; 40 miles S. by W. of Posen (see map of German Empire, ref. 4–H). It has large liqueur, wax, and tobacco factories, a celebrated bell-foundry, and extensive manufactures of woolen and linen stuffs. In the sixteenth century it was the chief seat of the Bohemian Brethren. Pop. (1890) 13,116.

Lissencephala [Mod. Lat., from Gr. λισσός, smooth + ἐγκέφαλος, brain]: a name given by Owen to a class of mammals characterized by the comparative smoothness of the surface of the brain. The corpus callosum is well developed, but the cerebrum is small, leaving the cerebellum and part of the olfactory lobes exposed. The class includes the edentates, insectivores, rodents, and bats, and is the equivalent of Bonaparte's *Ineducabilia*. F. A. L.

List, list, Friedrich: economist; b. at Reutlingen, in Würtemberg, Aug. 6, 1789; was appointed Professor in Political Economy at the University of Tübingen in 1817, but gave up this position in 1819, in order to work in a more direct and practical way for the development of German industry and commerce. Having been elected a member of the diet of Würtemberg, he exposed in a petition to the Government the vices of the administration, and was condemned in 1822 to ten months' imprisonment. He fled, and lived for some time in Switzerland and Alsace, but returned home in 1824, and was imprisoned in the fortress of Asperg. As he declared that he wished to emigrate to the U. S., he was pardoned after a short time, and he then settled in Pennsylvania, where he soon attracted the attention of the most prominent men by his work, *Outlines of a New System of Political Economy* (1827), in which he attacked the ideas of Adam Smith, and advocated an economical development on an exclusively national basis. Having discovered a rich deposit of anthracite on his grounds, he aided in founding the two towns of Tamaqua and Port Clinton, and returned in 1833 to Europe in possession of an independent fortune. He was for a short time U. S. consul at Hamburg and then at Leipzig, but afterward settled in Augsburg, and began to agitate for the formation of a system of railway lines as the only suitable means of transportation. His writings—*Ueber das sächsische Eisenbahnsystem* (1833); *Ueber ein deutsches nationales Transportsystem* (1838); *Das nationale System der politischen Oekono-*

mie (1841); besides a large number of minor articles in the papers—had some weight, but his ideas were too far advanced to be fully appreciated. In 1846 he visited England in the hope of securing a comprehensive commercial alliance between that country and Germany, but failed in his mission. In a fit of despondency caused by this disappointment and by his ill-health and loss of property, he shot himself at Kufstein, in the Tyrol, Nov. 30, 1846.

Lista y Aragón, ALBERTO: poet; b. at Triana, a suburb of Seville, Spain, Oct. 15, 1775. After studying in the University of Seville, he became in 1796 Professor of Mathematics in the Colegio de San Telmo in that city. Compelled to flee to France during the political troubles of the beginning of the nineteenth century, he returned in 1817 and taught mathematics successively in Bilbao, Madrid (1820), Cadiz (1838), Seville, in which latter place he was made dean of the philosophical faculty of the university. In 1822 he published a collection of poems (2d ed., enlarged and revised, 2 vols., 1837). In 1828 he worked on the supplement to the edition of Mariana's *Historia de España*, published in that year. In 1829 he began to issue a translation of the historical works of the Comte de Ségur. D. at Seville, Oct. 5, 1848. He was a member of the Spanish Academy and of the Academy of History and edited *Trozos escogidos de los mejores hablistas castellanos en prosa y verso.* His poems are printed in vol. lxvii. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1875). See Ochoa, *Biografía del Señor D. Alberto Lista y Aragón* (1848). A. R. MARSH.

Lister, Sir JOSEPH, M. D., LL. D., F. R. S.: surgeon; b. at Upton, Essex, England, Apr 5, 1827; was educated in London, receiving M. B. degree in 1852; in 1855 passed the examinations for a fellowship in the Royal College of Surgeons of Edinburgh; was Professor of Clinical Surgery in Glasgow, in Edinburgh, and in 1877 in King's College, London. His early investigations in physiology and pathology suggested the idea that putrefaction and other fermentative changes were caused by germs; from this idea the more important thought developed that the bad results occurring in surgical operations were often due to germ or septic infection, and that if these operations should be performed with antiseptic precautions better results would be obtained. This principle has been gradually elaborated from the time of its announcement, in 1869, and it has revolutionized surgery and placed mankind under obligations to its originator. In 1878 Edinburgh University conferred the degree of M. D. on him; in 1880 both Oxford and Cambridge conferred upon him the degree of LL. D.; in 1883 he was created a baronet, and in 1897 was raised to the peerage as Lord Kinnear. His Croonian lectures in 1863 were on the coagulation of blood. In 1869 he published his observations on the ligature of arteries on the antiseptic system. Among his more important publications are *Remarks on a Case of Compound Dislocation of the Ankle, with other Injuries, Illustrating the Antiseptic System of Treatment* (Edinburgh, 1870); *On the Effects of the Antiseptic System of Treatment upon the Salubrity of a Surgical Hospital* (Edinburgh, 1870); *A Contribution to the Germ Theory of Putrefaction and other Fermentative Changes* (Edinburgh, 1875). S. T. A.

Listing, JOHANN BENEDICT: physicist; b. at Frankfort-on-the-Main, Germany, July 25, 1808; began his scientific career as assistant to von Waltershausen 1834–37; taught in the technical high school in Hanover for two years; was then appointed Professor of Physics in the University of Göttingen (1839), where he remained until his death on Dec. 24, 1882. He was known to science for his contribution to physiological and geometrical optics, and through his investigation of certain important properties of space. He was one of the first to elaborate the theory of thick lenses, and his work upon knots and linkages anticipated by nearly half a century the better known researches of Tait. He enunciated a law relating to the movements of the eye in vision, known as Listing's law. He was not a voluminous writer, and his work was published chiefly in the form of unpretentious communications to the local academy of sciences (*Akademie der Wissenschaften zu Göttingen*). They were of a high order, however, and when brought to the notice of other investigators, sometimes after the lapse of many years, they received recognition. His very important researches in the geometry of position (*Der Census räumlicher Complexe*, Göttingen, 1861) were first brought into general notice outside of Germany, twelve years later, by Maxwell (*Electricity and Magnetism*, vol. i., p. 16, 1873).

E. L. NICHOLS.

Liston, JOHN: actor; b. in London, England, 1776; was educated in Dr. Barrow's school, and became second master of St. Martin's School, whence he was expelled for taking part in stage-plays with the pupils. He then went upon the stage and became one of the best comic actors in England during the first third of the nineteenth century. His fame is celebrated by Lamb, Hood, and all the wits of the period. His reign at the Haymarket began in 1805, at Drury Lane in 1823, and at the Olympic in 1831. He left the stage in 1837, and died Mar. 22, 1846.—His wife (Miss TYRER), though of almost dwarfish stature, was a favorite actress as well as singer. Revised by B. B. VALLENTINE.

Liston, ROBERT, F. R. S.: surgeon; b. at Ecclesmachan, Scotland, in 1794; studied medicine in Edinburgh and London; practiced at Edinburgh 1818–35; was lecturer on Anatomy and Surgery and surgeon to the infirmary; became Professor of Clinical Surgery at University College, London, 1835; surgeon to the North London Hospital in 1843; examiner to the College of Surgeons 1846. D. Dec. 7, 1847. Dr. Liston was one of the ablest and most successful of operative and clinical surgeons, and wrote several able professional treatises, of which the most important were *Elements of Surgery* (in three parts, Edinburgh and London, 1831 and 1832), followed by a second edition in one volume in 1840, and *Practical Surgery* (London, 4 editions, 1837–46).

Listow'el: a village and railway junction of Perth co., Ontario, Canada; on the Maitland river (see map of Ontario, ref. 4–C). It is a very important trading center, and ships large quantities of grain. It has a weekly and a monthly publication. Pop. 2,587.

Liszt, list, FRANZ: pianist and composer; b. at Raiding, in Hungary, Oct. 22, 1811. His father, an accountant or steward of Prince Esterhazy, but of musical taste sufficient to appreciate the astonishing talent of his son, put him to the piano at six years of age. At nine he gave a concert, and so much interested certain noblemen that he was sent for instruction to Vienna. There he studied for eighteen months with Czerny and Salieri, making such progress that he gave a public concert in Vienna; emboldened by brilliant success, his father in 1823 took him to Paris; refused admission to the Conservatoire as a foreigner, he gave concerts and played before the Duke of Orleans till the musical world was wild with enthusiasm. Flattery might have spoiled him had not his father held him severely to his work, compelling him, it is said, to execute daily twelve fugues of Bach, transposing them in different keys. In 1824–25 the boy achieved triumphs in the provinces and in England. At this time (1825) he composed an opera, *Le Château des Amours*, which has disappeared. Again in Paris he took lessons in composition of Reicha. In 1827 his father died, and Franz fell into a morbid state, gave himself up to romantic fancies and religious enthusiasms, became a Saint-Simonian, and in 1830 composed a *Symphonie révolutionnaire*, which was never published. This condition lasted two or three years. The playing of Paganini revived his passion for art, and made him resolve to be the Paganini of the piano. His labors were renewed, and he astonished Europe with his mastery of the instrument and the ease with which he executed the most difficult works of Bach, Handel, Beethoven, and Weber. His gift at improvisation was as wonderful as his power of execution. In 1848 he was made Kapellmeister at Weimar. Honors came thick upon him. The cities of Odenburg and Pesth presented him with the rights of citizenship: the Hungarian nobles gave him a sword of honor; the King of Prussia made him a member of the Order of Merit; the faculty at Königsberg created him doctor of music; the Grand Duke of Saxe-Weimar appointed him chamberlain; in 1845 he was decorated with the Legion of Honor, and in 1861 was raised to the rank of commander. On Apr. 25, 1865, Liszt received the clerical tonsure in the chapel of the Vatican with the title of *abbé*, but belonged to the so-called secular clergy. Liszt was an admirer, patron, and friend of Richard Wagner, to whom he gave one of his two daughters in marriage; the other, wife of Émile Ollivier, is dead. Liszt died at Bayreuth, Bavaria, July 31, 1886. The works of the artist consist of fantasias, *poëmes symphoniques* (twelve in number), *Faust*, and the *Divina Commedia*, grand symphonies, two oratorios, *Die heilige Elizabeth* and *Christus*, and transcriptions innumerable. He was a writer as well as a musician, and has a position in literature as well as in art. In 1852–54 he published a life of Chopin (translated into English by Walter Cook, 1877) and essays on the *Tannhäuser*

and *Lohengrin* of Wagner; in 1859 a dissertation on *Bohemians and their Music in Hungary*. Liszt was a man of ardent impulses and lavish generosity. His instrumental music has more tumult than grace, more force and sound than delicacy, and often only the mastery of instrumentation saves it from the reproach of being grotesque and fantastical. His vocal compositions have less reputation than his instrumental, with the exception of two or three songs.

Revised by DUDLEY BUCK.

Litany [M. Eng. *letanie*, from O. Fr. *letanie* > Fr. *litanie* < Lat. *litani'a* = Gr. λιτανεία, prayer litany, deriv. of λιταίνειν, pray, pray publicly, deriv. of λιτέσθαι, λίσσεσθαι, beg, pray. Cf. λιτή, prayer]: a term originally used in a general sense to denote any sort of united prayer, whether public or private, whether penitential, intercessory, supplicatory, or deprecatory. It thus occurs in the writings of Eusebius and Chrysostom and in the laws of Arcadius. Some trace, however, of a more technical meaning is found in the epistle of Basil to the church of Neo-Cæsarea, where it seems to denote a religious proceeding somewhat similar to the so-called *rogationes* (*Litania, quæ Latine Rogatio dicitur, inde et Rogationes—Ordo Romanus*), which, according to Sidonius Apollinaris, came into use in Gaul in the beginning of the fifth century, and consisted in processions of the community, fasting and in sackcloth, for the purpose of procuring fine weather or rain, etc. The earliest and simplest form of litany is the *Kyrie Eleison*, repeated three, six, twelve, forty, or more times. Gradually both the form and the purpose of those *rogationes*, or litanies, were regulated by law. One of the *novels* of Justinian forbids litanies to be celebrated without the presence of the bishop and the clergy, and orders that the crosses which were carried about in procession should be borne only by priests and deposited nowhere but in the church. The synod of Orleans (511) prescribes for all Gaul that the litanies before Ascension shall be celebrated for three days, and that during those days all menials shall be exempt from work, so as to be able to attend divine service. A synod of Paris (573) ordered litanies to be held for three days at the beginning of Lent, and in 590 Gregory I., on account of the pestilence which had followed a great inundation, ordered that a *litania septiformis*, or sevenfold procession, should be performed by clergy, laity, monks, virgins, matrons, widows, poor, and children. In 747 the synod of Clovestoe prescribed that litanies or rogations should be celebrated by all the clergy and people on Apr. 25 and on the three days before Ascension, whence those days are still known in the English Church as rogation days. Thus in course of time litany became, in the liturgical services of the Christian churches, a name applied to various supplicatory acts addressed to God or to the saints, or both, but applied especially to solemn prayers in which the people take responsive parts. The principal litany of the Roman Catholic Church is the Litany of the Saints; the Anglican churches have a service called the Litany and Suffrages; the Lutherans and some other Protestants have litanies.

Litchfield: town; capital of Litchfield co., Conn. (for location of county, see map of Connecticut, ref. 8–E); on the Shepang, Litchfield and Northern Railroad; 30 miles W. of Hartford. It is between the Naugatuck and Shepaug rivers, 1,800 feet above sea-level; was for years the seat of one of the most celebrated law schools in the country; contained the first ladies' seminary established in the U. S.; and, from its invigorating climate, has been a popular summer resort. It derives power for manufacturing from Bantam Lake near by, has valuable beds of nickel ore, manufactures paper, oil, satinets, and nickel-ore smelters, and contains a national bank with capital of $200,000, a savings-bank with deposits of over $1,000,000, 2 libraries, 2 parks, and a weekly newspaper. Pop. (1890) township 3,304, borough 1,058; (1900) township 3,214, borough 1,120.

Litchfield: city (founded 1854, incorporated 1859); Montgomery co., Ill. (for location of county, see map of Illinois, ref. 8–D); on the Clev., Cin., Chi. and St. L., the St. L. and Chi., and the Wabash railways; 42 miles S. of Springfield, 47 miles N. E. of St. Louis. It is in a coal, natural-gas, and lubricating-oil region; has flour-mills, grain elevators, and a coal mine; and manufactures foundry and machine-shop products, cars, carriages, threshing-machines, paint, brooms, brick and tile, and cider and ginger-ale. There are gas and electric lights, Holly water-works, public library, public parks, an Ursuline convent, and 2 monthly and 2 daily newspapers. Pop. (1890) 5,811; (1900) 5,918.

Litchfield: village; capital of Meeker co., Minn. (for location of county, see map of Minnesota, ref. 9–D); on Lake Ripley and the Great Northern Railroad; 67 miles W. of Minneapolis. It contains 10 churches, woolen and flour mills, iron-foundry, and 3 weekly newspapers; is in an agricultural and stock-raising region; and has a popular summer resort, Brightwood, on the lake. Pop. (1900) 2,280.

Lithic Acid Diath'esis [*diathesis* is from Gr. διάθεσις, condition, liter., arrangement, deriv. of διαθεῖναι, put separately, arrange, distribute; διά-, apart + θεῖναι, τιθέναι, put]: that condition of the general system which favors the production of lithic acid or its salts in the urine. The diathesis is closely allied in many respects, and doubtless in nature, to gout. There is little certainty regarding the true pathology of the disease. Some look upon it as a disorder of the blood, a dyscrasia, primarily, with secondary affection of other organs; others believe the root of the trouble to lie in improper action of the stomach; while still others regard the disease as one of the liver. This condition is unquestionably a widespread one, and lies at the root of many of the vague disorders characterized as faulty assimilation, dyspepsia, and nervousness. Its symptoms are manifested in disorder of many organs; and, as different groups may be prominent in different cases, a very varied picture is presented. In one case gastric disturbances and dyspepsia are prominent; in others nervous disorders, headaches, nervousness, sleeplessness, and all sorts of undefined forms of depression; in still other cases the prominent manifestations are met with in the urinary system. There may be excess of uric or lithic acid in the urine, either free or combined with the bases ammonium, sodium, or lime, and all of these may be deposited as sediments. Frequently this excess of lithic acid causes deposition in the urinary passages themselves, and stone in the kidney may occur. The treatment of this condition is directed to the establishment of a better general tone of the system rather than to any particular organ. At times palliatives may be called for, but on the whole a general plan of hygienic treatment promises the best results. Most prominent in the curative measures is regulation of diet and especially the avoidance of certain substances known to produce an acid condition of the urine. Starches and sugars are particularly prone to occasion disturbance of the stomach as well as general disorders; and the patient is therefore warned to partake of as little farinaceous or saccharine food as may be possible. For lithic acid, see URIC ACID.

Lithifaction: See GEOLOGY.

Lith'ium [from Gr. λίθος, stone; cf. λίθειος, of stone]: a rare metal. The existence in the mineral petalite of an alkali differing from potassa and soda was discovered by Arfvedson in the laboratory of Berzelius in the year 1817. It occurs in *lepidolite*, *spodumene*, *amblygonite*, *triphylite*, some *tourmalines*, and other mineral species, and is a frequent constituent, in small proportions, of mineral waters. Lithium was first obtained by electrolysis of the fused chloride by Bunsen. It is a silver-white metal, somewhat softer than lead, and lighter than any other known solid body, having a density of only ·5835; so that it floats even on petroleum and naphtha. It has also the smallest atomic weight of any element except hydrogen, this weight being only 7. *Lithium hydrate*, corresponding to the hydrates of potash and soda, is a strongly caustic alkaline body like these, but is not deliquescent in the air, nor is it volatile at intense heats. The smallest traces of lithium are detectable by means of the spectroscope, which gives a spectrum consisting entirely of two lines—one a brilliant intense crimson, and the other a faint yellow. Lithium imparts to flame this beautiful crimson tint, and, were it cheap enough, would be a valuable agent in fireworks. An interesting practical application of the characteristic flame-color of lithium has sometimes been made. In cases of suspicion that a well or cistern is being poisoned by percolation from a privy or drain, a little lithium may be put into the supposed source of contamination. In case of percolation it will soon be easily detectable with the spectroscope, with chemical certainty, in the water of the well. *Lithium chloride*, corresponding to common salt, the chloride of sodium, is easily prepared. It crystallizes in regular octahedra, which taste like com-

mon salt. It is, however, deliquescent, unlike the chlorides of sodium and potassium, and is more soluble than these.

Revised by Ira Remsen.

Lithium, Medicinal Uses of.—*Lithium carbonate* and *citrate* are sometimes used in medicine as alkalies, and have been specially recommended in gout, because of their forming an easily soluble salt with uric acid. In reality, they are of little value in gout, as they unite more readily with the acid sodium phosphate of the blood than with the uric acid. The citrate, however, is preferable to the carbonate, from being more soluble and less disagreeable to the taste.

Lithofracteur: See Explosives.

Lithography: the art of drawing on stone with a chemically prepared ink or crayon, or engraving on stone with a needle or diamond point and printing therefrom with lithographic ink.

History of the Art.—The invention of lithography is commonly ascribed to Alois Senefelder, who in 1796 first practiced the art in the printing of music in Munich, where he was an actor, although it is claimed that Simon Schmidt, in Germany, and William Blake, in England, both utilized the same or a similar method for producing work as early as 1788. Neither of these two, however, fully appreciated the value of his invention. Senefelder devoted himself to the development of the art, and was the teacher of some of the earlier practitioners. Even the much later improvements are found suggested in his writings. In 1818 he published a somewhat complete account of his processes. About the same time those who had studied of him founded establishments in many cities of Europe, where very good lithography was done. Gottfried Engelmann, of Mulhouse, in Alsace, had been an assistant of Senefelder's in Munich. He established himself first in his native place, and then in Paris about 1817. He also published a book about the art and its possibilities. The Baron Lasteyrie started another workshop in Paris a short time afterward. Rémond Jules Lemercier was one of the earliest French lithographers. His connection with the art lasted till his death, and his relatives and successors, R. J. and Alfred Lemercier, have received honors and decorations for their services in this direction. In Germany Franz Hanfstängl grew up from boyhood in the practice of lithography. He went to Paris and worked with Lemercier, and in 1835 undertook to reproduce the pictures of the famous Dresden Gallery. This work went on for fifteen years, and resulted in the completion of a very considerable work—sixty parts, of three prints each. A similar work was undertaken at Berlin by Simion in 1840. Ferdinand Piloty established himself in Munich about 1830, and formed a partnership with an artist named Loehle. In the work of these lithographic establishments it was the custom to give the name of the draughtsman on stone, as well as that of the painter, showing that it was the custom to give to a specialist the duty of producing the lithograph; but many artists of great ability, and even some of celebrity, found it easy to express their thoughts in this medium. Adolf Menzel as early as 1833 produced his *Artist's Earth-pilgrimage.* Before that time Géricault, in Paris, had some successful lithographic drawings. Carle Vernet, father of the better-known Horace, was one of the earliest; then came Eugène Delacroix, the younger Fragonard, Tony Johannot, Alexandre Decamps, and Hippolyte Bellangé, and there grew up also some specially competent lithographers, trained to render on stone the work of the admired artists of the day, as, for instance, the celebrated Julien, afterward so well known for his *études à deux crayons*, and Mouilleron, who was especially successful with the pictures of Delacroix. Charles Samuel Girardet is another such artist of great ability. The triumph of lithography, however, was in the hands of some artists who devoted themselves to it principally as the medium best suited to their genius and to what they had to say. Such were Nicholas Toussaint Charlet (b. 1792; d. 1845) and Denis Auguste Marie Raffet (b. 1804; d. 1860). These two artists cherished the memories of the old armies of Napoleon, and loved to recall in vigorous prints sold cheaply the bravery and the humor of the "grumblers" of the empire. Then when the expedition to Africa and the subsequent wars there under Charles X. and Louis Philippe gave them a new military life to describe, Raffet turned to that, and published a great number of most spirited compositions—models of descriptive art.

The Materials Used.—The stone used in lithography is a closely grained limestone, which is found in different parts of Europe and America; the best stone, however, is found in Solenhofen, in Bavaria, Germany, from which place almost the entire world receives its supply, although in later years quarries have been opened in Canada and in some of the Southern and Western States, all of which promise good results. The lithographic stone before it is shipped from the quarry is sawn into slabs from 3 to 4 inches in thickness (thinner ones would be liable to break under the pressure which they have to undergo in printing), and in size from 6 by 8 inches to 44 by 62 inches, though these larger sizes are scarce when of good quality and without flaws, such as having open veins or soft lime-spots. The stones vary in color from a dull gray to light-creamy gray, the colder and darker the color the harder the stone.

The crayon or chalk, as it is sometimes called, which is used in lithography, is of a greasy composition, composed principally of wax, soap, tallow, shell-lac, turpentine, and lampblack, and most nearly resembles a small, hard, black tallow candle, and being exceedingly brittle it is sharpened from the point upward.

The ink which is used for drawing with the pen on the stone is composed of the same ingredients as the crayon, though containing a trifle more grease, and is rubbed dry on a plate or saucer, after which it is dissolved with water until it is sufficiently liquid to flow easily.

The Process.—The stone is carefully leveled and grained, or, if it be used for pen-work, polished; the graining being done by putting fine sand and water between two of the stone slabs and rubbing them together until the lower one has a grain as nearly as possible resembling the grain of fine drawing-paper; the polishing is done with pumice or Scotch stone. Sheets of glass, zinc, and aluminium are sometimes substituted for lithographic stone, but as yet no substance has been discovered which for perfect working surface equals the stone.

The lithographic stone when ready for the drawing is so sensitive to anything of a greasy nature that even to touch the surface with the fingers would smut it, and the places so touched would be liable to print almost the same as though they were a part of the drawing. After the stone has been grained or polished, the drawing is made thereon precisely as though it were being drawn on paper, though necessarily reversed; but it is of the greatest importance that no errors be made, for, while some slight corrections can be made after the drawing has been finished, there is always more or less risk in doing so, owing to the sensitiveness of the stone, or the fear of destruction of the grain.

When the drawing is completed it is bathed with a solution of nitric acid and gum arabic, the object of which is to keep the grease of the crayon or ink from spreading, and at the same time to render those parts of the stone having no drawing on them more porous and more capable of absorbing moisture. Great care has to be taken not to have the solution either too strong or too weak; if it contains too much acid the finer and more delicate parts of the drawing may be eaten away; on the other hand, should the solution be too weak, the drawing is apt to fill in and become heavy. It must here be explained that the whole principle of lithography rests on the antagonism of grease to water, and it is necessary to bear this continually in mind.

After the acid and gum have been allowed to dry the stone is first washed with water, and after this all indication of the drawing is washed off the stone with turpentine, leaving only the grease of the ink or crayon on the surface, which being again washed, this time with pure water, is now ready for printing.

The stone having been moistened either with a wet sponge or damp roller (the moisture of course being repelled by the grease of the drawing), the printing-roller, charged with ink, passes over the stone, the ink naturally adhering only to those places where the stone is dry, or, in other words, where the drawing is. A sheet of paper is then placed on the stone and run through the press. This process of dampening, rolling, and pulling through the press is necessary for each impression made, and while but from 200 to 500 impressions can be made per day on a hand-press, from 5,000 to 8,000 can be made on a large power-press.

Engraving on stone is done very much as engraving on steel or copper, but in printing the engraved lines are filled in with ink applied with a dabber in place of a roller.

When, about the year 1860, the demand for lithographs greatly increased, the process of transferring was invented. By this process it is possible to transfer any given number of smaller subjects (which at one time had to be printed

singly from the original stones) on a large stone, and thereby it has been made possible to print forty or sixty or more subjects at one time. This method of transferring is done by making from the original stones or from plates as many impressions as are desired on specially prepared sensitive transfer-paper, with an ink of the same general substance as the original lithographic ink or crayon, but of a semi-liquid consistency; then, after having fastened these impressions side by side on a large sheet of paper or zinc, this is placed face downward on a clean and smoothly polished stone of requisite size, and pulled through the press with sufficient pressure to transfer the carefully made impressions from the transfer-paper to the stone. The transfer is then prepared just as though it was an original drawing, and from 5,000 to 20,000 impressions can be made from it, according to the quality of the work. Engraved work can be transferred the same as crayon or ink work.

Colored or chromo lithographs, as they are more generally called, are often printed in as many as twelve or fifteen colors, which, when artistically handled, will produce twice or three times as many shades and tints, and it is not uncommon to use twenty or thirty colors to reproduce an especially fine water-color drawing or oil-painting, in order to give in facsimile every shade and tint of the original, each color used requiring a separate stone.

The ink used in lithographic printing is similar to ordinary printing-ink, but usually of a much finer quality. The paper also should be selected with great care, especially in cases where the work is to be printed in many colors, so that the danger from stretching, owing to successive moistenings as it passes over the dampened stone between each successive printing, and the consequent fear of misregistration of the colors, is as far as possible minimized.

In later years photography has been more or less applied to lithography, the result being not only the very common process of photo-lithography by which architectural and mechanical drawings, more especially, are accurately reproduced from pen-drawings at a small expense, but also the exquisite effects produced in comparatively few printings by transferring negatives to stone through the medium of the "half-tone" or screen process. G. H. Buek.

Lithology [from Gr. λίθος, a stone + λόγος, science]: See Petrology.

Lithosphere: See Geology.

Lithotomy, **Lithotrity**, or **Lithotripsy**, and **Litholapaxy** [*lithotomy* is from Gr. λιθοτομία, stone-cutting, deriv. of λιθοτόμος, cutting stone, stone-cutter; λίθος, stone + τέμνειν, cut; *lithotrity* is from Gr. λίθος, stone + Lat. *te're're*, *tri'tum*, rub, grind; *lithotripsy* is from Gr. λίθος, stone + τρίβειν, to grind; *litholapaxy* is from Gr. λίθος, stone + λάπαξις, evacuation]: surgical operations by means of which the extraction of a stone from the bladder is effected. The term *lithotrity* refers to the older method of crushing and removing a stone at several operations or "sittings," whereas the term *litholapaxy* refers to the modern improvement by which it is completely removed at one time or by a single operation, including its crushing and the evacuation of the fragments. Urinary calculi are composed most frequently of substances existing normally in a state of solution in human urine, such as uric acid, urate of ammonia, and the phosphates of calcium and magnesium. Sometimes, however, they are composed of substances met with only in morbid urine, such as oxalate of calcium, cystine, etc. Besides these ingredients, of which they mainly consist, calculi always contain more or less animal matter, such as dried blood, vesical mucus, etc. Occasionally they are found to consist almost entirely of a single ingredient, but more frequently of two or more different constituents arranged in irregular concentric layers. In certain conditions these ingredients solidify and form concretions. The initial process in their formation commonly takes place in the kidneys; the product then descends along the ureter (a fleshy tube for conveying the urine) into the bladder, from which it is often expelled in urinating, and thus got rid of. If, however, it remains in the bladder, it becomes a nucleus upon the surface of which successive deposits of solid matter take place, until a calculus is formed, which in process of time may attain a formidable size—too great, in fact, to admit of its safe removal by any surgical operation. Any foreign substance introduced accidentally or intentionally into the cavity of the bladder will also become a nucleus upon which incrustations of solid matter will take place. Instances have occurred where bullets, fragments of surgical instruments, and other foreign bodies have formed the nuclei of stone in the bladder. Calculi may exist single or multiple in the bladder; where multiple, there may be two or more of nearly equal size, or there may be a large number of every variety of size from a pin's head to a horse-chestnut. When there is but a single calculus, it is more generally of a flattened, ovoid shape, or globular, though sometimes it may resemble an hour-glass in shape, or have any irregular form. Its surface is sometimes smooth, sometimes rough, uneven, and studded with pointed eminences. When two or more are found in the same bladder, their surfaces are marked by smooth facets, produced by their contact with each other. If a concretion remain permanently in the cavity of the kidney, it may in the process of its growth become molded into the shape of the cavity. Calculi are met with in both sexes, though more frequently in males than females, owing in part to the greater facility with which the nuclear concretion can be expelled from the female than from the male bladder. No age is exempt from this malady; it has been met with in the infant at birth, and at all subsequent periods of life up to the most advanced age. Certain localities have been regarded as favoring the production of this malady by the properties of the drinking-water in use.

At all times there have been remedies advocated as possessing the property of dissolving the stone in the bladder, and patients afflicted with the disease, naturally shrinking as they do from the alternative of a surgical operation, have been too ready to give credence to the vaunted efficacy of such remedies, and by long perseverance in their use have lost precious time. The stone has increased in size, and the danger from a surgical operation has thereby been enhanced, while the chances of recovery have been diminished. The removal of a stone by a surgical operation is the only reliable means of cure, and the earlier it is resorted to the better the chance of recovery.

Lithotomy is a cutting operation by which an opening is made from the surface of the body into the cavity of the bladder at certain points where this organ lies nearest to the surface. Through the opening thus made an instrument (forceps) is introduced into the bladder, the stone seized and brought away. This operation has been in use since the earliest period in the history of surgical art. The operation is performed according to two principal methods: (1) The hypogastric or supra-pubic method, by means of which the cavity of the bladder is reached through an opening made at the lowest point of the abdomen, exactly in the median line of the body, and above the pubis. (2) The perineal or sub-pubic method, by which the bladder is reached through an incision made in front of the anus, between it and the scrotum, in the space known as the perineum. This method is more generally and frequently employed, as the safer and the one of wider application. It admits of three varieties in its mode of execution, distinguished from each other by the different directions in which the incisions required for its performance are made: First variety, known as the median operation, in which the incision is made exactly in the median line of the perineal space between the anus and scrotum. Second variety, termed the lateral operation, in which the incision, beginning at a point in the median line in front of the anus, is carried obliquely outward and backward to the left side of the anus. Third variety, known as the bilateral operation, in which the incision extends in a curved line across the perineal space in front of the anus, and to an equal distance on either side of the median line. Each of these varieties has had able and zealous advocates; the choice of operative methods must, however, be determined by a judicious discrimination of the conditions of each case that comes under consideration. By the suprapubic method a stone weighing as much as 34½ oz. has been successfully removed.

Lithotrity, or *lithotripsy*, is a bloodless operation by which a stone in the bladder is reduced to fragments small enough to be expelled through the natural canal in urinating. Though some traces of a conception of this method are found at an earlier period in the history of surgery, it was not till the second decade of the nineteenth century that Civiale, of Paris, undertook his experiments, which resulted in the developments of the method now in use, and which is ranked among the acknowledged resources of surgical art. On Mar. 22, 1824, a commission of the Academy of Medicine, of Paris, reported upon it as follows: "Desirous of avoiding, on the one hand, the enthusiasm which exaggerates everything, and on the other that prejudice which seeks to depreciate everything, we consider the new method

proposed by Dr. Civiale for destroying stone in the bladder without the use of lithotomy as alike creditable to French surgery, honorable to the author, and consolatory to humanity; that, notwithstanding its insufficiency in some particular cases, and the difficulty of its application in others, it can not fail to establish an epoch in the healing art, and to be regarded as one of the most ingenious and salutary resources." After a test of fifty years the expectations expressed in this report have been fulfilled, and lithotrity now holds an honorable rank among the resources of surgical art. The operation consists essentially in the introduction of an instrument known as a lithotrite, of adapted shape and size, through the natural canal into the bladder. With it the stone is seized and crushed by pressure exerted with the hand alone, or with a screw-power that may be applied at pleasure at the handle of the instrument. An old mode of crushing the stone was by percussion applied at the handle of the instrument by means of a hammer. A portion of the finer *débris* resulting from the crushing may be brought away in the jaws of the instrument. Unless the stone is quite small, the operation requires to be repeated at regulated intervals till the whole calculus is reduced to fragments small enough to be expelled with the urine. In his early experiments Civiale directed his efforts, after the seizure of the stone, to perforating its substance in different directions with drills, and thereby diminishing its resistance and facilitating its being crushed by pressure. Straight instruments alone could be employed for this purpose, and hence greater difficulty was encountered in their introduction into the bladder. These instruments, moreover, were complicated in their construction, and required a varied manipulation in their use, and were therefore more liable to injure the bladder and occasion serious accidents. These objections led to the early abandonment of the perforating process, and the substitution of the crushing process alone. This latter process is effected by means of curved instruments, which in their form more nearly resemble the catheters and sounds in common use among surgeons. The operation of lithotrity is particularly adapted to patients of adult age, in whom the expulsion of fragments is facilitated by the greater caliber of the urinary canal. In early life, under the age of fifteen years, and especially under ten years, the operation of perineal or sub-pubic lithotomy is successful in so large a proportion of the cases operated on that we scarcely need a better resource, especially as we now have the aid of anæsthetics, by which patients are spared the pain of the operation. The descent of a concretion from the kidney into the bladder is accompanied by an attack, usually violent, of kidney (renal) colic. Its presence in the bladder itself is characterized by disturbance of its functions, such as frequent calls to urinate, sudden arrest of the outflowing stream, pain felt on the close of the act, and referred to the neck of the bladder and end of the penis, pain also from the jolting of a vehicle, and the appearance of blood in the urine. A practical injunction should be borne in mind by patients suffering from symptoms of stone in the bladder: to wit, that in the early stage of the disease, while the stone is of small size, its removal by the operation of lithotrity may be regarded as almost entirely without danger, and sometimes can be accomplished by a single operation. Hence the importance of having its presence ascertained by a skillful exploration of the interior of the bladder at the earliest period. If patients suffering from this malady would early avail themselves of lithotrity, which has none of the terrors of a bloody operation, much suffering might be averted and many lives saved.

A still greater improvement on previous methods of crushing vesical calculi was devised by Jacob Bigelow, M. D., of Boston (d. 1879). It consists of complete removal of the calculus at one sitting. Its feasibility is based on facts which experience demonstrated, that the urethra was capable of a certain amount of dilatation, permitting the introduction of instruments of larger size than those heretofore in use, and that the bladder was not so resentful of prolonged manipulation as had been supposed. Accordingly, whereas sittings had been previously limited to ten minutes or thereabouts, and the stone crushed at intervals or piecemeal, now the patient is anæsthetized, or not, the lithotrite introduced, the calculus broken up, and then, after its withdrawal, a catheter or tube of large size is passed into the bladder, a stream of water driven in by a rubber bulb (the so-called washing-bottle apparatus), and then drawn out with some force. As the water returns it brings back with it such small fragments as may pass through the tube, which sink to the bottom of the apparatus by their weight. After thus flushing the bladder several times the tube is withdrawn, the lithotrite reintroduced, more calculous material broken up, which is to be again washed out, and so these manœuvers are alternately repeated until the last fragment of stone has been removed. In case of a stone of considerable size or hardness, this may take an hour or more of time. Large, soft calculi are quite amenable to this method. Choice as between the cutting or the crushing operation should be left to the surgeon and not decided by the patient. It must hinge on many things which no layman is capable of properly weighing; but this fact needs to be emphasized, that when once there is a stone in the bladder no time should be lost in effecting its removal, since the consequences of delay are often disastrous.

The lithotrite: *a b*, jaws; *c*, stone; *d*, screw; *e*, spring catch.

Revised by Roswell Park.

Lithua'nia (Lith. *Letura*; Pol. *Litwa*; Germ. *Litauen*): in the Middle Ages an independent and powerful state, comprising those large tracts of mostly low and level land which extend from the Baltic to the Black Sea, between the Niemen and the Düna in the N. and the Don and the Bug in the S. In the eleventh century the Lithuanians were tributary to the Russians, but in the twelfth they threw off the yoke. In 1235 Ringold formed the country into a grand duchy. In 1320 Gedemin conquered Volhynia, Kiev, and Tchernigov from Russia. In 1386 Jagellon united Lithuania with Poland, having married Hedwig, a daughter of King Lewis of Poland and Hungary. By the division of the Polish kingdom one small part of Lithuania went to Prussia, forming the government of Gumbinnen, while the rest was incorporated with the Russian crown, forming the present provinces of Vilna, Grodno, Moghilev, Vitebsk, and Minsk. The Lithuanians in race and language belong to the Lettic group. See Lettic Race.

Lithuanian Language: a language uniting with the Lettic and the extinct Old Prussian to form a compact language-group which belongs to the Indo-European family, and within that family holds peculiarly close relations to the Slavic languages. The Lithuanian territory as existing to-day may be roughly bounded as follows: From the Russian frontier town Polangen, in a southerly direction, somewhat back from the Baltic coast (which is here Lettic), to Memel, and from there along the east coast of the *Kurisches Haff* as far as Labiau; from Labiau in a southeasterly direction to Goldap, and from there at first easterly, then southeasterly, to Niemen; from here E. N. E. to within a few leagues of Wilna, and then circling about the city of Wilna northeasterly to the boundary of Kurland, which from that point on to Polangen forms the northern boundary of the Lithuanian territory. Within these limits until within about two generations ago the Lithuanian was the universal folk-speech, but since that time it has been rapidly repressed, especially in Prussian Lithuania, where it offers vigorous resistance to the German in the northerly portion only. The language is divided into a great variety of dialects, which may be arranged in the following groups: (1) The South Lithuanian, spoken in the north of the Russian province Suwalki and in the Prussian districts S. of Gumbinnen and Pillkallen; (2) the East Lithuanian, spoken to the E. and N. E. of the first group; (3) the dialect of Szaulen, spoken to the W. of the second group; (4) the Zamaitic, or Samogitic, the folk-speech of the Russian province Telsz and of the neighboring districts; (5) the Prussian North Lithuanian, spoken in the neighborhood of Memel; (6) a dialect limited to a narrow territory between the last mentioned and the next following group; (7) the dialect of Ragnit, spoken between the cities of Ragnit and Insterburg, and stretching obliquely across Prussian Lithuania; (8) S. of this and W. of the South Lithuanian, a dialect bearing no particular designation.

The South Lithuanian is clearly distinguished from all the other dialects by the retention of long *ê* and *â* at the end of words (the latter in the form of *ô*), whereas the others use instead *ĕ*, respectively *ă*. As its boundaries correspond approximately with those of the Jatwings or Sudaus, a tribe, according to the chroniclers, closely related to the Lithuanians, and is said to have been extirpated by the German orders, it is probable that it does not represent any proper Lithuanian idiom, but rather the Sudau tongue.

The Lithuanian preserves a remarkably primitive character particularly in its possession, like the Sanskrit, Russian, and to a certain degree the Greek, of a free accent not limited to any particular position in the word, and furthermore in the fact that this accent appears in two varieties, corresponding to the Greek circumflex and acute, and of like origin with them. Other primitive characteristics which it preserves are, for example, the dual, the future, and the inflectional endings of declension. The Lithuanian was not employed for literary records, with the sole exception of a volume in silk, from the year 1512, containing an interwoven fragment of a song, until the Reformation, and only, in fact, since the middle of the sixteenth century. The earliest Lithuanian book is a translation of Luther's Smaller Catechism, to which is added a primer and a number of hymns (Königsberg, 1547). Next followed a baptismal formulary (1559), and the Bible translation of Johannes Bretke (1579–90), which was, however, never printed. From this time on the continuity of Lithuanian literature has never been broken, though it has never flourished, consisting almost exclusively of translations of religious works or of compilations, and claiming but a limited degree of interest. None of its products can lay claim to artistic significance or importance for the history of literature, unless it be the numerous legends and songs of the Lithuanian folk. Several of the songs have been utilized by German poets; cf. Dortchen's song in Goethe's *Fischerin, Ich hab's gesagt schon meiner Mutter*; Chamisso's *Sohn der Wittwe*. The value of these songs has, however, greatly depreciated in the progress of time, and that of the legends was probably never very great. There exist also since the year 1849 Lithuanian newspapers, and one of these appears—or appeared—in New York (the *Lietuwiszkasis Balsus*).

A grammatical presentation of the Lithuanian was made as early as the seventeenth century in the work of Daniel Klein, *Grammatica lituanica* (Königsberg, 1653). A scientific treatment of the subject was, however, first attempted in the year 1837 in Pott's *de Lithuano-Borussicæ in slavicis letticisque linguis principatu* (Halle, 1837). Since then August Schleicher and Friedrich Kurschat, the latter a native Lithuanian, have rendered pre-eminent service in advancing the knowledge of the language. See Lettic Language and Literature.

A. Bezzenberger.

Translated by Benj. Ide Wheeler.

Lititz: borough (founded by the Moravians 1756); Lancaster co., Pa. (for location of county, see map of Pennsylvania, ref. 6–H); on the Phila. and Reading Railroad; 8 miles N. of Lancaster. It derived its name from the barony of Lititz, Bohemia, an ancient refuge of the Bohemian Brethren. It is in an agricultural region, and is principally engaged in the manufacture of cigars. There are 5 churches, a monthly and 2 weekly newspapers, and several educational institutions, including Linden Hall Seminary, opened 1794, which has a library of over 4,000 volumes, and grounds and buildings valued at $60,000. The borough, which contains a noted spring, is a popular summer resort. Pop. (1900) 1,637.

John G. York, "Express."

Litmus, or (sometimes) **Lacmus** [from Dutch *lakmoes*; *lak*, lacker + *moes*, pulp; cf. Germ. *lackmus*]: a peculiar coloring-matter derived from certain lichens, chiefly *Roccella tinctoria*. There are three of these coloring substances derived from plants of this character, namely, litmus, orchil, and cudbear. These lichens grow upon rocks in the Alps and in other mountainous portions of the world. Litmus, which is the coloring-matter most frequently employed, is prepared for use in the arts almost exclusively in Holland. It is reddened by acids and restored to its original blue color by alkalies. It is therefore largely used for the purpose of determining the reaction of the various liquids.

Litolff, Henri Charles: composer and pianist; b. in London of a French father and English mother, Feb. 6, 1818; studied under Moscheles, and made his first appearance in public as a pianist in his twelfth year. He married at the age of seventeen and eloped to France; returned to England in 1846, and subsequently led a wandering life, giving concerts, finally settling in Brunswick, where he married Madame Meyer, the widow of a music publisher, his first wife having obtained a divorce. Here he began the issue of the cheap publications with which his name is associated. He was divorced from the second wife also, and married, in 1860, a daughter of the Count de la Rochefoucauld, and resided in Paris till his death, Aug. 6, 1891. His principal compositions are his operas *Robespierre*, *Héloise et Abélard* (1872); *Les Templiers* (1886); *King Lear*, his last work; many piano solo pieces, some overtures, symphony concertos, and some smaller pieces. As a pianist he was brilliant, and Berlioz spoke of him as a composer of the highest rank, possessing inspiration, scientific knowledge, and judgment.

D. E. Hervey.

Litre, or **Liter** [from Fr. *litre*, liter, from Mediæv. Lat. *li'tra*, a measure of capacity, earlier a "pound" (weight, or money), from Gr. λίτρα, a measure of length, also of weight, also a silver coin]: the French standard measure of capacity in the decimal system. The liter is a cubic decimeter, i. e. a cube each of the sides of which is 3·937 English inches; it contains 61·027 cubic inches. Four and a half liters are nearly equivalent to the imperial gallon.

Little Colorado River, or **Colorado Chiquito**: a tributary of the Colorado river of the West, rising in Western New Mexico and Eastern Arizona and flowing about 225 miles toward the W. and N. W. It is not everywhere a perennial stream, but is in places absorbed by the sands of its bed during the dry season. In middle course it traverses a broad, arid valley, but, approaching its mouth, it plunges into a deep gorge. Some of its sources have long been utilized by the Zuñi Indians for the irrigation of small farms, and white settlers had in 1889 enlarged the cultivated area to 5,500 acres.

G. K. Gilbert.

Littledale, Richard Frederick, LL. D., D. C. L.: clergyman and author; b. in Dublin, Sept. 14, 1833; studied at Trinity College in his native city; was ordained in 1856, and held various curacies in the Church of England, but retired in 1862 on account of ill-health and devoted himself exclusively to literature. D. in London, Jan. 11, 1890. He was a zealous Anglican ritualist, and very learned. He published a new edition of Anselm's *Cur deus homo* (London, 1863) and the *Liturgy of St. Mark and Offices from the Service Books of the Greek Church* (1863–68); completed and edited John Mason Neale's *Commentary on the Psalms from Primitive and Mediæval Writers*; and wrote, besides, a great number of polemical, historical, exegetic, and other publications, among which were *Catholic Ritual in the Church of England, Scriptural, Reasonable, Lawful* (1865); *Church Reform* (1870); *Plain Reasons against Joining the Church of Rome* (1880), of which 36,000 copies were sold.

Samuel Macauley Jackson.

Little Exuma: See Exuma, Great and Little.

Little Falls: city; capital of Morrison co., Minn. (for location of county, see map of Minnesota, ref. 7–D); on the Mississippi river, and the N. Pac. Railroad; 108 miles N. W. of St. Paul. It has good water-power, several manufactories, and a daily and three weekly newspapers. Pop. (1880) 508; (1890) 2,354; (1900) 5,774.

Little Falls: city (1895; incorporated as a village 1813); Herkimer co., N. Y. (for location, see map of New York, ref. 4–H); on the Mohawk river, the Erie Canal, and the N. Y. Cent. and Hudson River and the W. Shore railways; 22 miles E. of Utica. It is built against the sides of an abrupt declivity which rises about 500 feet above the river, and is in a dairy, cheese-making, and lumber region. The river here falls about 70 feet within half a mile, forming picturesque cascades and rapids, whence the village derives its name. There are 8 churches, 4 graded public-school buildings, gas and electric-light plants, 7 knitting-mills, large tannery, paper-mills, manufactories of cheese-factory and creamery apparatus, dairy preparations, knitting-machines, heating-furnaces, carriages, a public-school library, several public parks, and a daily and 2 weekly newspapers. Pop. (1880) 6,910; (1890) 8,783; (1900) 10,381.

Editor of "Journal and Courier."

Little Glacé Bay: coal-mining settlement of Cape Breton island and County (Nova Scotia), 15 miles E. of Sydney. Pop. about 400.

Little Humboldt River: the most important tributary of the Humboldt, Nevada; flows W. and then S. through Paradise valley in Humboldt County. It has some 35,000

acres of excellent bottom-land, and 90,000 of bench-lands of the best character. The small brooks abound in trout. The elevation is some 4,500 feet.

Little Inagua: See INAGUA.

Littlejohn, ABRAM NEWKIRK, D. D., LL. D.: bishop; b. in Montgomery co., N. Y., Dec. 13, 1824; graduated at Union College in 1845; received deacon's orders in the Protestant Episcopal Church in 1848; officiated at Amsterdam, N. Y., Meriden, Conn., and Springfield, Mass.; took priest's orders in 1850; rector of St. Paul's, New Haven, 1851–60, and since then of Holy Trinity church, Brooklyn, N. Y. He was for ten years lecturer on Pastoral Theology in the Divinity School at Middletown, Conn. In 1868 he was consecrated Bishop of Long Island, and in 1874 undertook the charge of the American Episcopal Churches on the continent of Europe. He received the honorary degree of LL. D. from the University of Cambridge, England, on occasion of delivering a series of special sermons before the university. He is author of *Philosophy of Religion*, a series of lectures, *The Christian Ministry*, *Individualism*, and has written largely for *The Church Review*, and has published many sermons, charges, and addresses.

Revised by W. S. PERRY.

Little Kanaw'ha River: a river which rises in Upshur co., W. Va., and flows in a generally N. W. course, joining the Ohio at Parkersburg. It flows through the oil region, and has wide and fertile bottom-lands. The building of three dams has made it navigable 38 miles to Burning Springs. Great numbers of logs are floated to market upon its waters.

Little Rock: city (settled 1819); capital of Arkansas and of Pulaski County (for location, see map of Arkansas, ref. 3–C); on the Arkansas river, and the Little R. and Mem. and the St. L., Iron M. and S. railways; 125 miles S. W. of Memphis. It is built upon the first highland reached by ascending the river, which is here 400 yards wide, and navigable eight months of the year for large steamboats, smaller ones plying to Fort Smith, on the border of Indian Territory, 300 miles above. The rocky cliff on which the city stands, and from which it takes its name, is not more than 50 feet above the river, while the Big Rock, beginning 2 miles above, is a precipitous range rising abruptly some 500 feet. Little Rock is a commercial and manufacturing city, with more than fifty large wholesale houses. The census returns of 1890 showed that 93 manufacturing establishments (representing 31 industries) reported. These had a combined capital of $1,480,881; employed 1,070 persons; paid $587,415 for wages and $1,154,675 for materials; and had products valued at $2,454,831. Among the industrial establishments are 3 cottonseed-oil mills, 2 cotton compresses, a cotton-goods mill, a cotton-press factory, 4 foundries and machine-shops, 3 granite-quarries, 2 chair and 2 furniture factories, 3 railway machine-shops, 2 gin-factories, 4 plan-

State Capitol, Little Rock, Ark.

ing-mills, 2 ice-factories, and flour, stove, and candy works. There are gas and 5 electric-light plants, electric street-railways, granite, macadam, and vitrified street pavement, and good water and sewerage plants. The city contains 28 churches, 8 public schools, 2 colleges for colored youth, a military academy, a Roman Catholic Academy for boys, Little Rock University (Methodist Episcopal, opened 1882), Arkansas Female College (non-sectarian, opened 1874), Philander Smith College (Methodist Episcopal, opened 1877), Roman Catholic convent and academy, 5 libraries (State, 52,000 volumes; University, 2,000 volumes; Marquand, 4,500 volumes; Masonic, 3,000 volumes; and Supreme Court, 6,000 volumes), 2 national banks with combined capital of $500,000, 2 State banks with capital of $400,000, a commercial bank with capital of $100,000, a trust company, and 2 private banks, and 2 daily, 15 weekly, and 4 monthly periodicals. The public buildings include the State Capitol, Penitentiary, State School for the Blind, State Insane Asylum, Deaf Mute Institute, U. S. Government building, U. S. arsenal, Children's Home, Old Ladies' Home, and board of trade building. The assessed property valuation is over $12,000,000. Pop. (1880) 13,138; (1890) 25,874; (1900) 38,307.

EDITOR OF "GAZETTE."

Little Russia: Southwestern Russia N. of the Black Sea provinces. It extends in the middle Dnieper valley from Kharkof to Galicia in the empire of Austria. The people differ widely in character from the other Russians, and their language and literature are peculiar. The Little Russian language is common eastward to the Asiatic frontier, and is found westward in Bukovina and Hungary. See Isabel Morris's *A Summer in Kief*.

M. W. H.

Little Tibet: See BALTI.

Littleton, ADAM, D. D.: Oriental scholar; b. at Halesowen, Shropshire, England, Nov. 8, 1627; was educated at Christ Church, Oxford, taking high rank in the classics; became rector of Chelsea, chaplain to King Charles II., and prebendary of Westminster in 1674. D. at Chelsea, June 30, 1694. Dr. Littleton formed a library of rare books and manuscripts, so extensive that it brought him to bankruptcy. He wrote much on mystic numbers and other recondite subjects, and published many sermons; but his great work was the *Dictionary of the Latin, Greek, Hebrew, and English Languages* (1678; frequently reprinted). He was a descendant of Sir Thomas Littleton. See Wood's *Athenæ Oxonienses*, vol. ii., and the preface to Ainsworth's *Latin Dictionary*.

Littleton, EDWARD, Lord: See LYTTELTON.

Littleton, or **Lyttleton**, Sir THOMAS: jurist; b. at Frankley, Worcestershire, England, in 1402. He was the eldest son of Thomas Westcote, but was baptized in the name of his mother's family, she being sole heir of Thomas de Littleton, lord of the manor of Frankley. He was a member of the Inner Temple, and was in practice as a pleader in 1445, and in 1453 was called to the degree of sergeant-at-law. He held several public offices, among which were the shrievalty of Worcestershire and the recordership of Coventry. In 1455 he was made king's sergeant and acted as justice of assize in the northern circuit, and before the death of Henry VI. he was appointed steward of the Marshalsea court and justice of the county palatine of Lancaster. He appears to have been involved in the political troubles of the times, and on the accession of Edward IV. obtained a general pardon under the great seal, and was soon in favor with the new king, by whom he was made a justice of the court of common pleas (Apr. 27, 1466), and created a Knight of the Bath (Apr. 18, 1475). He died at Frankley, Aug. 23, 1481, and was buried in the nave of the Worcester Cathedral under a marble altar-tomb erected by himself, upon which was an effigy of himself in brass, which, however, was removed during the civil wars. Littleton's fame rests chiefly upon his treatise on tenures, which was a short work written in law (Norman) French. It was the first systematic exposition of the laws of England concerning real property, and, unlike the work of earlier writers, was based wholly upon English law, without drawing from the Roman or civil law. The work contained a clear and accurate account of the tenures and estates then known in England, and with Lord Coke's *Commentaries* long remained the principal authority on the English law of real property. It is almost wholly obsolete, and its chief value is historical. The first edition, in black letter, without title or date, is conjectured to have been published in 1481. It was first translated into English in 1538, and was published with Coke's authoritative commentaries in 1628, since which time there have been a large number of editions. An edition from the most ancient texts, with collations by T. E. Tomlins, was published in London in 1841, with the French and English in parallel columns.

F. STURGES ALLEN.

Little Turtle (*Me-che-cun-na-qua*): a Miami chief of great reputation for intelligence, shrewdness, and valor in warfare; is supposed to have received some education in Canada. He commanded in the battles which resulted in the defeat of Gen. Harmar on the Miami (Oct. 22, 1790) and of Gen. St. Clair at St. Mary's (Nov. 4, 1791); was pres-

ent, though not in command, at the battle of Fallen Timbers or Maumee Rapids, Aug. 20, 1794, in which the Indians were defeated by Gen. Wayne; was one of the signers of the treaty of Greenville, Aug., 1795, which ended the war and conveyed to the whites an extensive region in Ohio, and in 1797 visited President Washington at Philadelphia, where he also had an interview with Count Volney, the French philosopher, and received a pair of elegantly mounted pistols from Kosciusko. D. at Fort Wayne, Ind., July 14, 1812.

Littorale, lĕe-tō-raa'lā [*littorale* is from Ital. *litorale*, liter., coast country, deriv. of *littore*, shore. Cf. Germ. name *Küstenland*, liter., coast country]: a province of the Austrian empire, extending along the northern shore of the Adriatic from Venetia to Croatia; bounded N. and E. by Carinthia and Carniola. It consists of the counties of Görz and Gradisca, the margraviate of Istria, and the district of Trieste, and comprises an area of 3,085 sq. miles, with 695,384 inhabitants, mostly of Slavic descent.

Littré, lĕe-trā', Maximilien Paul Émile: philosopher; b. in Paris, France, Feb. 1, 1801. Though adopting medicine for his career, Littré combined with this philological labors in many languages—notably Sanskrit, Arabic, Modern Greek, and the principal Romance tongues. He had time also for political enthusiasms, and in 1830 he fought as a republican on the barricades in Paris. Soon after he was invited by Armand Carrel to write for the liberal journal *Le National*. He produced for this a series of articles on the physical sciences of such power that the critics saluted him as a new writer of importance. His larger reputation, however, dates from the publication of the first volume of his translation of Hippocrates in 1838 (not finished till 1861), containing a masterly introduction. This led immediately to his election to the Académie des Inscriptions et Belles-Lettres (Feb. 22, 1839). At the same time he was at work on other translations—one of Strauss's *Life of Jesus* (2 vols., 1839–40) and one of Pliny the Elder (not published till 1848). About 1840 an important change in his career was produced by the reading, at a friend's suggestion, of the so-called Positivist writings of Auguste Comte. Completely captivated by these, he was convinced that in Comte he had found his true master. He became one of the leaders of the Positivists, and continued firm in his faith to the end of his life, in spite of the fact that he was obliged to reject the later visionary doctrines of his teacher. He accepted the *philosophie positive*, but could never adopt the *politique positive*. His writings in this field, however, show Positivism at its best. These are *Analyse raisonnée du cours de philosophie positive* (1845); *Applications de la philosophie positive au gouvernement des sociétés* (1849): *Conservation, révolution, et positivisme* (1852); *Paroles de philosophie positive* (1859); *Auguste Comte et la philosophie positive* (1863); *La science au point de vue philosophique* (1873); *Littérature et histoire* (1875); *Fragments de philosophie positive et de sociologie contemporaine* (1876). In 1867 he founded with other Positivists the review *La Philosophie Positive*. His preoccupation with the new philosophy, however, did not interfere with the prosecution of his philological studies. In 1844, on the death of Fauriel, he was appointed to the latter's place on the commission of the Academy charged with the continuation of the great *Histoire littéraire de la France*; and volumes xxi. to xxix. of this work owe much to his wonderful erudition. In 1862 he gathered into two volumes various scattered articles on the French language—*Histoire de la langue française*. On Feb. 6, 1863, he presented to the Académie des Inscriptions et Belles-Lettres the first part of his remarkable *Dictionnaire de la langue française* (4 vols., 1863–72; supplementary volume, 1877), upon which he labored for years with great diligence, but at the expense of his health. In 1880 appeared *Études et glanures pour faire suite à l'histoire de la langue française*. In spite of the severity of these labors he had not ceased to interest himself in medicine. He wrote much for the *Dictionnaire de médecine, de chirurgie, etc.* (14th ed. 1877), and also many articles and monographs—e. g. *Médecine et médecins* (1871). Though he had withdrawn from political activity after 1848, the war of 1870–71 moved him deeply, and in 1871 he accepted an election by the city of Paris to the Assembly. In 1875 he was made life senator. An expression of his views at this time was his pamphlet *De l'établissement de la troisième république* (1880). In 1874 he was elected a member of the Académie Française, to succeed Villemain. D. June 2, 1881. Few men in the nineteenth century have had the modesty, the earnestness, and the many-sided erudition of Littré; and still fewer have succeeded in preserving to extreme old age, in spite of the most exhausting labors, an interest as fresh and unwearied as his in all that has to do with the intellectual life. See Sainte-Beuve, *Notice sur Littré, sa vie et ses travaux* (Paris, 1863), and the *Notice sur Littré* in the *Histoire littéraire de la France* (vol. xxix.).

A. R. Marsh.

Littrow, lit'trof, Joseph Johann, von: astronomer: b. Mar. 13, 1781, at Bischof-Teinitz, in Bohemia; studied at the University of Prague; became Professor of Astronomy at Cracow in 1807; removed in 1810 to Kazan, in 1816 to Buda, and in 1819 to Vienna, where he died Nov. 30, 1840. Under his direction the observatory of Vienna was much improved, and his lectures drew great audiences. His most prominent writings are *Die Wunder des Himmels* (1834), often republished; *Theoretische und praktische Astronomie* (3 vols., 1822–26); and *Atlas des gestirnten Himmels.*—His son, Karl Ludwig (b. at Kazan, Russia, July 18, 1811; d. in Venice, Nov. 16, 1877), was his assistant in the Vienna Observatory from 1831; succeeded his father as director in 1842, and was employed in 1847 in connecting Austria and Russia by triangulation.

Liturgics: in the specific sense, in which the term is employed in this article, the history of the origin and development of liturgies, and a description of the books treating of or containing liturgies. The words λειτουργία, λειτουργός are used all through the Septuagint version of the Old Testament to denote divine service and the priest. The same use of the word is continued in the New Testament, as in St. Luke i. 23, where we read of the "ministration" (λειτουργία) of the priest Zacharias, and by St. Paul it is probably used with reference to the sacerdotal functions of the Christian priesthood in Rom. xv. 16, where we find the three great sacrificial words all employed in the same verse—λειτουργὸν, ἱερουργοῦντα, and προσφορά. At all events, Clemens Romanus uses the word as referring to the acts of Christian worship, and by the fourth century this use was fully established. (Cf. Council of Ancyra, 314.) The general meaning of the word to denote all public services of the Christian ministry, which has been adopted in this article, was soon restricted, so that by "the Liturgy" was usually meant what we call the mass, and to the present day the celebration of the Holy Eucharist is called in the Greek Church the "Divine Liturgy." By liturgics, then, in this article we mean all the set forms of words used in the public worship of God and in the administration of the sacraments. See Dom Prosper Guéranger, *Institutions Liturgiques*, a book of great research, but written in a bitter, prejudiced, and partisan spirit.

Antiquity of Liturgies.—St. Paul is by some learned writers supposed to have quoted in several places the already existing liturgy, especially in 1 Cor. ii. 9. (See Neale's *Essays on Liturgiology.*) And there can be no doubt that the Lord's Prayer was used, and certain other formulas which are referred to by St. Luke in the Acts of the Apostles (Acts ii. 42) as "the apostles' prayers." How early these forms were committed to writing has been much disputed among the learned, and it would be rash to attempt to rule this question. Pierre Le Brun presents most strongly the denial of their having been written during the first three centuries, and Probst (*Liturgie der drei ersten Christlichen Jahrhunderten*) argues against this opinion. While it does not seem possible to prove that before the fourth century the liturgical books were written out in full, owing no doubt to the influence of the *disciplina arcani*, it seems to be true that much earlier than this there was a definite and fixed order in the celebration of divine worship and in the administration of the sacraments. The famous passage in St. Justin Martyr seems to point to the existence of such a form in his day, showing how even then the service for the Holy Eucharist began with the epistle and the gospel. St. Augustine and St. Chrysostom bear witness to the same thing. A sermon then followed, and the *Missa catechumenorum* was done. St. Ambrose tells us that those not yet in the number of the faithful were dismissed at this point of the service. There now began the mass of the faithful (*missa fidelium*) with the washing of the bishop's hands, referred to by St. Cyril of Jerusalem in his *Catechetical Lectures*, and the offertory was made, St. Justin expressly explaining that the cup was mixed. St. Cyprian tells us that verses of the Psalter were sung in Carthage as *Offertoria*. The *Sursum Corda* is spoken of by both St. Cyprian and St. Augustine, and St. Cyril and St. Chrysos-

tom refer to the *Sanctus* as following the preface. Now that we have come to the canon, there is almost entire silence, as we so often read in the Fathers, "the initiated know what I mean." The words with which the dread mysteries are consummated were too sacred to be committed to the ordinary reader's care. We know the words of institution were used, and that the faithful answered "Amen at the Eucharist" (1 Cor. xiv. 16). Just before the communion of the people the veil was drawn aside, so St. Cyril Alexandrinus tells us, and they received the sacrament under the form of bread into their hands, and then from the chalice the deacon gave them the precious blood. During the communion-time was sung "Oh, taste, and see how gracious the Lord is," as we learn from St. Cyril. The whole service ended with a blessing by the bishop—"Grace and peace be with you." (St. Chrysostom, *Hom. iii. ad Coloss.*) The foregoing would seem to be a fair outline of the communion office of the Church during the early centuries, and it will be noticed that it exactly agrees with that service as used by the Greek, Latin, and Anglican Churches to-day. Of the so-called primitive liturgies none in its present form is probably earlier than the seventh century, for although one bears the name of St. Mark, another of St. James, and so on, no real critical work has been done upon them, and even of the MSS. we have the most meager information. The Leonine fragment and the Gelasian and Gregorian sacramentaries may justly be considered as early as any liturgical remains we possess, for while the Apostolical Constitutions are in part certainly of an earlier date, the eighth book, which contains these liturgical forms, is in a very uncertain condition; we have no reason for supposing its text to be unadulterated, and it is admitted that it is much later than the other books.

There are, roughly speaking, three bodies of Christians which look upon their ministry as a priesthood, with sacerdotal powers and a substantial oblation to offer, viz., I., the Eastern Churches, II., the Latin Churches, and III., the Anglican Churches, and the liturgical books of each of these will be treated separately.

I. The Eastern Liturgical Books.—These books of "The Holy Orthodox Eastern Church," of which alone we treat, are in Greek and in Slavic, i. e. Old Russian (which differs from Modern Russian rather more than Old English does from Modern English). The services of all the Eastern Churches are (or once were) in the language of the people. Following is a list of the liturgical books of the Eastern Church:

1. The *Type* (τυπικόν). A series of rubrical directions. 2. The *Menæa*, i. e. the propers for festivals and saints' days. 3. The *Triodion* and the *Pentecostarion*, i. e. the canons of odes for Lent and Eastertide. 4. The *Paracleticon*, i. e. the tropes for the ferias. 5. The *Octoechus* contains the stichera and tropes for a ferial week. 6. The *Menology* is what we call the martyrology. 7. The *Euchologion* contains the forms for the administration of the sacraments and for the giving of various blessings. Besides these there are the *Horologion* and the *Divine Liturgy*, both of which must be spoken of more at length. 8. The *Horologion*.—This corresponds to the Breviary of the Latin Church and to the "Daily Morning and Evening Prayer" of the Anglican Church. An edition of the Great Horology was issued under the authority of the Patriarch of Constantinople at Venice in 1856, and since then there are other editions. Those who desire more information upon this subject are referred to *Synopsis of Prayers of the Orthodox Eastern Church*, translated and edited by Katharine, Lady Lechmere, with an introduction by J. Gennadius (London, 1891), and to *Euchology: a Manual of Prayers of the Holy Orthodox Church*, G. V. Shann (Kidderminster). See also the remarks of Dr. Neale in his *Introduction to the History of the Holy Eastern Church*. 9. The *Divine Liturgy*.—This is the order for the celebration of the Holy Eucharist. Two forms are in actual use, that of St. John Chrysostom and that of St. Basil; to these must be added the "Liturgy of the Presanctified," i. e. a form of service used in Lent (except on Saturdays and Sundays) in which there is no consecration of the holy gifts, but the communion is made from the reserved sacrament. For the sake of accuracy it should be added that the liturgy bearing the name of St. James is used in Jerusalem on St. James's Day, Oct. 23.

Literature.—Hammond, *Liturgies, Eastern and Western*; Duchesne, *Origines du Culte Chrétien*; Neale, *Introduction to the History of the Holy Eastern Church*; Daniel, *Codex Liturgicus*; Goar, *Euchologion*; Renaudotius, *Liturgiarum Orientalium Collectio*; Neale and Littledale, *The Primitive Liturgies*.

II. The Latin Liturgical Books.—The liturgical books now in use in the Roman Catholic Church will be enumerated, and afterward some account of their history given.

(1) The *Breviary* contains the choir offices for both night and day, and the Psalter is divided so as to be recited once each week. The present *Breviarium Romanum* dates from 1631, and was set forth by Urban VIII. It is usually in four volumes, one for each season of the year; when all in one volume it is called a *Totum*. When the day hours are printed separately, the volume is called *Horæ Diurnæ*. (2) The *Missal* contains the ordinary and canon of the mass and the propers (i. e. the introit, collect, epistle, sequence or gradual, gospel, offertory, secret, communio, and post-communio) for the Sundays and week days of the year. The present *Missale Romanum* dates from 1634, and was imposed by Urban VIII. (3) The *Rituale* contains the forms for those sacraments which a priest can administer, and various benedictions. The present *Rituale Romanum* was set forth in 1614 by Pius V. This book was in olden times called a manual, *sacerdotale*, *agenda*, etc. Many dioceses still use their own forms and not the Roman *Rituale*. (4) The *Pontificale* contains all those offices performed by a bishop. It was in its present form set forth in 1644, and imposed by Urban VIII. upon all bishops under his jurisdiction using the Latin rite. (5) The *Ceremoniale Episcoporum* gives directions for the ritual to be used by bishops on various occasions. The present *Ceremoniale* was set forth by Clement VIII. in 1600. (6) The *Martyrology* is a list of the saints and mysteries commemorated on each day of the year, with brief historical notices of their lives. All these books are of great antiquity, and the dates given above are those in which the last reformed edition (so to speak) was set forth. We only have space to speak of the history of two in detail.

The History of the Breviary.—The central idea of the choir offices is the recitation of the Psalter; around this all else gathers; and this is their characteristic in every part of the Church. As the service of mass is derived to some extent at least from the sacrificial worship of the temple, so the choir offices are certainly but the Christian continuation of the synagogue services. At first, no doubt, there was but little fixed in these offices, and we can trace the changes that gradually took place; but it is evident that hours of prayer were in use in the apostles' times, for we read expressly of the sixth hour and of the ninth hour as being such (Acts iii. 1, x. 9). The offices of the Greek Church are very long, and no doubt so, too, at first, were those of the West; but this was afterward changed. It is certain that, while in large part of great antiquity, the Breviary of to-day is not even in its skeleton older than the beginning of the fourteenth century. Until after the Council of Trent every diocese had its own breviary and missal, and some of them, which were at that time over 200 years old, have continued in use. This article would be incomplete if no notice were taken of the reformation of the *Breviarium Romanum* by Cardinal Quignon in the sixteenth century, which was allowed to be used for a number of years but afterward suppressed. Quignon's *Breviary* has been reprinted at Cambridge under the editorship of Dr. Wickham Legg.

Literature.—Gavantus, *Thesaurus Sac. Rituum*; Dom Guéranger, *Institutions Liturgiques*; Grancolas, *Commentaire du Bréviaire Romain*; Card. Bona, *Divina Psalmodia*; Batiffol, *Histoire du Bréviaire Romain*.

The History of the Roman Missal.—There would seem to be a consensus among the learned that the Christian Church in Rome at first was chiefly if not exclusively Greek. Granting that this may have been the case, it is nevertheless true that the Clementine liturgy as contained in the Apostolic Constitutions bears a close relation to the Roman ordinary and canon of the mass, and may be the somewhat incorrect description by a Greek of the then Latin service. At all events, one thing is certain, that the words "*Mysterium fidei*" found in the Roman canon as part of the form for the consecration of the chalice occur in no other place (so far as known) than in the account of the institution found in the Clementine liturgy, where we read "This is the mystery of the New Testament. Take of it, eat. This is my body, etc." To be sure, here it is used in connection with the consecration of the bread, and in the Roman canon in connection with the sacred chalice, but such a blunder is one that might easily be made by one not familiar with the service. There is no space here to enter upon the proof, which is abundant, of the extreme antiquity of the Gregorian canon,

and of the general arrangement of the parts of the ordinary of the mass; we can but say that all evidence points to the conclusion that here we have the order for the celebration of the Holy Communion of the greatest antiquity, in large part certainly as early as the fifth century, and probably of apostolic origin. We can trace the changes made during the centuries with considerable minuteness, especially from the comments of Walafrid Strabo and other early ritualists, and also from a collation of the various early MSS. extant. One serious change seems to have taken place. The invocation has disappeared (or been reduced to infinitesimal proportions). On this point and on the relation of the Ambrosian and Gallican missals to the Roman, and of each to the Mozarabic, we have no space to enter, but refer to the Abbé Duchesne's *Origines du Culte Chrétien*, warning the reader that thus far the abbé's theories are not universally accepted in regard to the effect of Charlemagne's action touching the service-books.

LITERATURE.—Muratori, *Liturgia Romana Vetus*; Swainson, *Liturgy*, in *Dict. Christ. Antiq.*; Probst, *Die ältesten römischen Sakramentarien.*

Besides the Roman liturgical books there are the Ambrosian, Mozarabic, and other cognate liturgies, and varieties of the Roman used by the various religious orders, and those used in the various dioceses; we can but refer to these in passing.

LITERATURE.—Mabillon, *De Liturgia Gallicana*; Gerbert, *Vetus Liturgia Alemannica*; *Missale mixtum-dictum Mozarabe* (Migne).

III. ANGLICAN LITURGIES.—Under this term is here included the liturgical books now used by those churches which are in visible communion with the see of Canterbury. All these churches have but one service-book, of a complex nature, being at the same time breviary, missal, ritual, and pontifical; it is called *The Book of Common Prayer and Administration of the Sacraments and Other Rites and Ceremonies of the Church.* This book contains first the choir offices compressed into two portions called "Daily Morning and Evening Prayer" and the Psalter divided, so that it is recited once each month. There is also the Litany to be said at certain times. The propers for the seasons and holy days follow, and the "Order for the Administration of the Lord's Supper or Holy Communion," corresponding to the ordinary and canon of the mass. The forms for the administration of baptism, confirmation, and the "Communion of the Sick," for the "Solemnization of Holy Matrimony," and for the "Visitation of the Sick," and the burial office come next, and at the end of the book are the forms for the ordination of the bishops, priests, and deacons. Besides these, there are some special services of less note, and varying in different parts of the world.

History of the Prayer-book.—The Church of England had always been provided with prayer-books in the vernacular for her people, but there does not appear to have been any public service in the English tongue until 1544, when the Litany was first translated into English and publicly used. In 1548 there was issued the "Order for Communion," being the preparation of the communicants, which in mass immediately precedes the administration of the sacrament. This now was to be said for the first time (so far as known) in English; and it was provided further that the chalice should be restored to the people, of which they had been deprived for some centuries; for the rest the mass continued to be celebrated as before.

The English Prayer-book.—In 1549 there was set forth the first English Prayer-book, in the preface of which it was declared that although before that time "there hath been great diversity in saying and singing in churches within this realm, some following Salisbury use, some Hereford use, some the use of Bangor, some of York, and some of Lincoln; now from henceforth, all the whole realm shall have but one use." This book, which is all in English, is taken chiefly from the service books of the different dioceses and from those of Rome, which were largely used by religious people and others. Of its history we unfortunately know very little, and perhaps nothing more than that Archbishop Cranmer was chiefly responsible for it, and that while he himself was at that time largely under the influence of the continental Reformers and chiefly of those of the Lutheran school, yet that he was obliged to make the book such as could be used with a good conscience by those who still held the old faith. On the whole subject, see Jacob's *Lutheran Movement in England* and Dom Gasquet's *Edward VI. and the Book of Common Prayer.* Two years later (1552) those urging radical change had gained ground, and it was determined that a new book should come out, more consonant with their doctrinal and ritual tenets. Accordingly, the second prayer-book in the reign of King Edward VI. was issued, and it is said that a third, still more Protestant and radical, was even then in contemplation. The king, however, died almost before the book was out of the printers' hands, and as Queen Mary came to the throne and restored the pre-Reformation office books immediately, it is probable that outside of the university towns and the city of London the book of 1552 was little used or known. When Queen Elizabeth renewed the breach with Rome, it was decided to take the book of 1552 and to incorporate into it certain parts of the book of 1549, especially the words "The body of our Lord Jesus Christ which was given for thee preserve thy body and soul unto everlasting life," used at the delivery of the Holy Sacrament, and the rubric ordering the vestments of the clergy and the fittings of the Church to be as they were in "the second year of the reign of King Edward VI.," i. e. the year before the first English Prayer-book came into use. This is substantially the Liturgy of the Anglican Churches to-day. It indeed underwent some slight changes in the beginning of King James's reign at the Hampton Court conference, and again after the great rebellion at the Savoy conference in 1661, but these alterations were very

minute. Speaking accurately, the Book of Common Prayer can not be said to be a distinct liturgy from that of Rome, but rather an adaptation, in which much of the Western service has been kept unchanged, but in which, on the other hand, strange and unaccountable changes in position and order of the parts have been made: e. g. while in each the *Gloria in excelsis* is found in the form for the celebration of the divine mysteries, in the Latin order it is at the beginning, in the English at the end of the service. One thing, however, is worthy of notice, that the sacraments have been continuously administered and divine worship continuously celebrated in the Anglican Church since 1559 in an unchanged form, and such an antiquity is worthy of the highest liturgical regard, even had the forms been at that time newly framed instead of being, as they are, modifications of forms already long in use.

Literature.—Keeling, *Liturgiæ Britannicæ*; Cardwell, *Conferences on the Book of Common Prayer*; Schudamore, *Notitia Eucharistica*; Parker, *Introduction to the Revisions of the Book of Common Prayer*; Blunt, *Annotated Book of Common Prayer*; Lathbury, *History of the Book of Common Prayer*.

The Irish Prayer-book.—This is the Book of Common Prayer of "The Church of Ireland" i. e. of what had been the Established Church. The Irish Prayer-book before the disestablishment differed from the English only in containing a few extra services and prayers, but after disestablishment had set it free from parliamentary control, the strong Protestant spirit asserted itself in the numerous radical alterations adopted by the Synod in 1870, despite the strenuous opposition of the famous Archbishop Trench, of Dublin, and of a few others.

The Scottish Prayer-book.—This is the Book of Common Prayer of the Nonjuring Episcopal Church in Scotland, commonly called the Scottish Episcopal Church. After episcopacy was abolished in Scotland by the authority of the Dutch princes and the Presbyterian religion had been established, despite the penal laws against them, the Scotch bishops and clergy (supported by many in England who had likewise refused to take the oath of allegiance to the newly chosen monarchs) continued in private to celebrate the sacraments and to keep up the succession. These clergymen, called Nonjurors, made some changes in the Prayer-book of the Church of England, the most important being in the prayer of consecration of the communion service. Further changes are under consideration. All these heretofore have been in the direction of a return to pre-Reformation use.

Literature.—Bishop Dowden, *The Annotated Scottish Communion Office*; Lathbury, *History of the Nonjurors*.

The American Prayer-book.—This is the Book of Common Prayer "according to the use of the Protestant Episcopal Church in the United States of America." Until the Revolution the Church of England in the American colonies had been part of the jurisdiction of the Bishop of London. After the independence of the country was secured, it seemed necessary for the prosperity of the Church of England here that it should be free from any foreign ecclesiastical jurisdiction. After some delay and difficulties this was accomplished by the hierarchy of the Church in England giving both Episcopal orders and also jurisdiction in this country to three American priests. Before, however, this was done, an attempt was made in 1785 to revise the Prayer-book in what is known as the "Proposed Book," but this (as Bishop White says) was seen to be a failure before it issued from the press. It was a very radical effort to simplify and popularize the Prayer-book. After the episcopate had been obtained, and with it the right to revise the Prayer-book, the work was entered into by the General Convention of 1789, and the result is the American Prayer-book as we know it to-day, which with but trifling changes and a few additions has been for over a century the public office book of the Episcopal Church in the U. S. The chief points in which it varies from the English book are the restoration of the rest of the Canon of Consecration (through the influence of Bishop Seabury), the omission of the Athanasian Creed, and of the indicative form of absolution from the Office of the Visitation of the Sick, and the addition of A Form for the Visitation of Prisoners (which was taken from the Irish Prayer-book), of a service of "Thanksgiving for the Fruits of the Earth," and of a number of separate prayers and collects. Several apparently anti-Catholic expressions and directions were omitted from the English book, notably the so-called "Black Rubric" and the rubrics prohibiting private masses. The Forms for Ordination were added in 1792, the Form for the Consecration of a Church in 1799, the Book of Articles of Religion in 1801, and last of all an Office of Institution in 1808. In 1880 a resolution was adopted appointing a committee to consider whether "the changed conditions of the national life do not demand certain alterations" in the Prayer-book. The committee, however, at the beginning practically decided to do nothing in the direction suggested by determining that "no alteration should be made touching . . . doctrine," and that "in all its suggestions and acts" the committee was to "be guided by those principles of liturgical construction and ritual use which have guided the compilation and amendments of the Book of Common Prayer, and have made it what it is." This work was only completed in the General Convention of 1892, and the changes made are of the most trifling nature, being principally the restoration of the *Magnificat* and of *Nunc dimittis* to evening prayer, the making of the recitation of the Nicene Creed obligatory in all churches, and the introduction of translations into English of three sets of propers from the unreformed service books.

Literature.—Fred. Gibson, *Introduction* to the American edition of Blunt's *Annotated Book of Common Prayer*; McGarvey and Gibson, *Liturgiæ Americanæ* (in the press, 1893).

H. R. Percival.

German and Lutheran Development of Liturgies.

The Reformers denied that the Mass is an expiatory sacrifice, and therefore that it can be offered by one man for another, or by the living for the dead. All believers are priests. Christ bade all drink of the cup. The Word of God is a means of grace; therefore it should be read and explained in the vernacular, and in the Holy Supper the words of institution should be recited in the vernacular in the hearing of the people. Christ is the only Mediator. Therefore, retaining the festivals of Christ and the order of the Church year, they gave up nearly all saints' days. Rites instituted by men are not obligatory, and do not merit grace. They are of value in training the young and illiterate in the Word of God.

Luther and Melanchthon taught that the Word is of prime importance, even in the sacraments, being "a means by which forgiveness of sins is distributed and given." (*Luther*, xxix., 134.) Under the idea of the Word, or the Gospel, they included not only the *lectiones* and the *sermons*, but the Word of God in Baptism and the Holy Supper, and in the parts of the service (as the *Alleluia*, *Absolution*, *Pax*). "God deals with us in two ways, outwardly and inwardly. Outwardly through the spoken word of the Gospel, and through tangible signs, as baptism and the sacrament. Inwardly through the Holy Ghost and faith and other gifts, but all this in such measure and order, namely, that the outer parts must precede, and the inner come afterward and by means of the outer; for He will give to no one the Spirit or faith without the external word or sign which He has ordained for that purpose." *Die ursprüngliche Gottesdienst-Ordnung in den deutschen Kirchen luth. Bekenntnisses* (Kliefoth, 2d. ed. 1858–61); Jacoby, *Die Liturgik der Reformatoren* (1871–77); Luther's works *passim*.

Zwingli denied that the sacraments bring or dispense grace. The Holy Communion was in his view "a common commemorative celebration of the New Testament by the atoning death of Christ, and an act of faith and confession which serves to quicken the congregational consciousness." (*Stähelin*, in Herzog's *Real-Encylopädie für protestantische Theologie und Kirche*.) He relegated the Holy Supper to great days, and made the sermon the center and normative principle of the chief Sunday service; while the Lutherans, rejecting the appointment of certain days on which the whole congregation was bound to commune, left the Holy Supper as the culmination of every chief service, though they forbade consecration where there were not communicants. To the proclamation of the Word of God they joined the appropriation of its gracious gift in the Holy Communion. See Schaff, *Church History*, vi., vii.; Horn, *The Christian Year* (1876); W. Loehe, *Haus- Schul- u. Kirchenbuch* (1877).

Lutheran Liturgies of the Sixteenth Century.—(Richter, *Die ev. Kirchenordnungen des 16 Jahrhunderts*, 1845; Daniel, *Codex liturgicus* II.; *Common Service*, preface, 1888.) In 1523 Luther published his *Formula Missæ*, a recension of the Mass. He would not banish the Latin tongue from worship. Changes should be gradual. Old service should be the basis of the new. The order was: *Introit*, *Kyrie*, *Gloria in Excelsis*, *Collect*, *Epistle*, *Graduale and*

Hallelujah, *Gospel*, *Nicene Creed*, sermon (or before *Introit*), *Preface*, *Words of Institution*, *Elevation* with *Sanctus*, *Lord's Prayer*, *Pax*, *Distribution* with *Agnus Dei*, *Communio*, *Prayers*, *Benedicamus*, *Benediction*. Altar, candles, vestments were retained. 1526, the *Deutsche Messe* followed, and was enjoined upon churches in Saxony. In it the Lord's Prayer, involved in a paraphrastic exhortation, preceded the *Words of Institution*, and the bread was given before consecration of the cup. This found little favor in later orders, but an *Exhortation* was introduced, and the *Lord's Prayer* before the *Words* became predominant Lutheran usage.

All the states published orders reforming the service and aiming at uniformity within their jurisdictions. 1. Those of Northern and Middle Germany followed Luther's orders. To this group belongs the first Prayer-book of Edward VI., except in introduction of the *Epiklesis*. (Jacobs, *The Lutheran Movement in England*, 1890; Gasquet and Bishop, *Edward VI. and the Book of Common Prayer*, 1890.) 2. Those of Southwestern Germany were influenced by the Swiss. (Herzog, *Real-Encyclopädie*, 2, x., 722; xvii., 595; Grüneisen, *Die ev. Gottesdienstordnung i. d. oberdeutschen Länden*, 1856.) 3. Brandenburg, 1540; Pfalz-Neuburg, 1543; Austria, 1571, while aiming at pure doctrine, retained as much as possible of the old rite.

Reformed.—Zwingli, more conservative than Calvin in this regard, shortened and revised the old service; Calvin essayed a new service on the basis of the Scriptures. The worship of German Reformed states is "Lutheranizing." 1. Zurich, 1525, 1535, 1675; Berne, 1528, 1581; Basel, 1529; Schaffhausen, 1592. 2. Forms of Prayer attached to Genevan Catechism, 1541–45; Neuchâtel, 1713; Liturgy of French Protestant Church, Charleston. 3. Palatinate, 1563; Hessen, 1539, 1566, 1657, 1748; Berg, 1769. See Ebrard, *Reformirtes Kirchenbuch* (2d ed. 1890); *Liturgie*, 1843; Daniel, vol. iii.; Harnack, *Real-Encyclopädie*, 2, vii., 723.

Later History of Lutheran Service.—The elevation (1539) and mass vestments (Nuremberg, 1801) were given up. The debates of the *Interim* period (1548–55) made the Roman Catholic antithesis distinct. Trent confirmed it. The *Thirty Years' war* destroyed all good order. Pietism undervalued externals. Rationalism had no heart in worship. *The New Prussian Liturgy* (1816, 1822) marked a revival of liturgical interest. Its author, Frederick William III., awakened by Napoleonic wars, said that "all the new liturgies have forsaken the historical foundation. We must go back to Father Luther. . . . I have the old liturgy with the old Bible. The Christian Church has had it from the beginning; Luther and his coadjutors reformed it." It is Lutheran in outline, but omits the Lord's Prayer in the Holy Supper, and inserts the *formula of distribution*: "*Jesus says, Take, eat*," etc., intended to serve both Lutherans and Reformed. It aroused debate (against it, Schleiermacher; Marheineke, Eylert, Ammon, Augusti defended it). New liturgies followed in Baden, 1831; Prussia, 1832; Saxony, 1842; Nassau, Würtemberg, 1843; Brandenburg, 1853; Bavaria, 1857; Saxony, 1878. Private compositions: Bunsen's Capitoline liturgy, 1828; Pasig, 1851; Löhe, 1844, 1884; Petri (Hanoverian). 1852; Frühbusz (Pomeranian), 1854; Hommel, 1851; *Allgemeines Gebetbuch* (Leipzig, 1884); of United Church, Stier, 1852: of Reformed Church, Hugues, 1846.

In United States.—Mühlenberg introduced a liturgy of pronounced Lutheran type in 1748. This was modified in 1786. The first English Lutheran liturgy was meager. At the Pennsylvania Synod of 1860, and in the *Church Book*, 1868, a return to the Lutheran type was made. So *Book of Worship*, 1864, Missouri Synod's German liturgy, is modeled on Saxon. The English-speaking bodies in 1878 united in the preparation of a Common Service Book for the use of Evangelical Lutheran congregations, published at Columbia, S. C., and Philadelphia, 1888. This aroused general debate, but finally has been adopted by all the Lutheran general bodies in the U. S. which use the English tongue, and up to 1893 had run through thirteen editions. It presents the "full Lutheran service with all its provisions," "according to the common consent of the pure Lutheran liturgies of the sixteenth century," and is in substantial agreement with the revised services of the Scandinavian churches (*Den Svenska Psalmboken*, Stockholm, 1873; *Kirkesalmebog*, Christiania, 1893). It has been published also in German (*Kirchenbuch*, Philadelphia, 1877; *Gemeinsame Gottesdienstordnung*, Philadelphia, 1893), and has been translated into Japanese for the use of Lutheran missions there (Saga, 1894). See *Lutheran Church Review* (Philadelphia) and *Lutheran Quarterly* (Gettysburg, 1878–92); Richards and Painter, *Christian Worship* (1892); Horn, *Outlines of Liturgies* (1890); *Feasibility of a Service for all English-speaking Lutherans*; *The Lutheran Sources of the Common Service* (1891); Schuette, *Before the Altar* (1894).

E. T. Horn.

Liudprand, or **Liutprand**: one of the principal chroniclers of the tenth century; b. about 922, belonged to a noble and distinguished Lombard family, and was educated at the court of Pavia as page to King Hugo of Italy. Under Hugo's successor, Berengarius, he was made chancellor and sent on a diplomatic mission to Constantinople in 949. Afterward he fell into disgrace, entered the service of the Emperor Otho I., and was by him made Bishop of Cremona in 961 and employed in important negotiations with the pope and the Byzantine court. D. in 972. Three works by him have come down to us, and have great value as historical sources: *Antapodosis*, in six books, a narrative of the events from 886 to 950, evidently written in order to avenge himself upon Berengarius and his queen, Willa; *De Rebus Gestis Ottonis Magni imperatoris* (960–64); and *Relatio de Legatione Constantinopolitana* (968). They are all found in Pertz, *Monumenta Germaniæ Historica*. See Köpke, *De Vita et Scriptis Liudprandi* (Berlin, 1842).

Livadia, lĕĕ-vaa'dee-ăă (in Gr. Λεβάδεια): town of Greece; in the nome of Attica and Bœotia; picturesquely situated on the Hercyna; was the principal town of Greece under the Ottomans. Near by are the cave of Trophonius, anciently famous for its oracle, and a curious castle of the thirteenth century in ruins. Pop. (1890) 6,465. E. A. G.

Liver [O. Eng. *lifer*: Icel. *lifr*: O. H. Germ. *lebara* > Mod. Germ. *leber*; Gr. ἧπαρ: Lat. *je'cur*: Fr. *foie*]: a large gland in the visceral cavity of all vertebrates. In man it weighs about 5 lb., and is situated on the right side, immediately below the diaphragm, but extends beyond the middle line to the left side. It reaches, superiorly, the sixth rib, while its anterior border inferiorly approaches the lower margin of the thorax. The form is flattened, broad and thick toward the right extremity, and thinner and narrower toward the left. The superior surface is convex, while the inferior surface is irregularly concave. Upon the posterior border the liver is thick and rounded, with a thin and sharp anterior border. In the abdomen the position is oblique; in the erect posture the convex surface is directed upward and forward, with the concave downward and backward. The diaphragm, covering the superior convex surface, separates the liver from the under surface of the right lung and from the heart. The inferior concave surface is in relation with the stomach anteriorly, a portion of the duodenum, transverse colon, and right kidney, and by its left extremity with the upper end of the spleen. The diaphragm intervenes between the vertebral column and posterior border of the liver, while the anterior border is free, and in relation with the anterior abdominal wall. The liver possesses five ligaments, by means of which it is retained in place, called the broad, the coronary, the two lateral, and the round ligament. By five fissures, named longitudinal, fissure for the ductus venosus, transverse fissure, fissure for gall-bladder, and fissure for the vena cava, the liver is divided into five lobes; these lobes are designated right and left lobe, lobus quadratus, lobus Spigelii, and lobus caudatus. The liver is covered by the peritoneum externally; the folds of this membrane as it passes from the surface of the organ form four of the ligaments above enumerated. The round ligament is the result of the obliteration of the umbilical vein of the fœtus. The proper coat of the liver is a dense but thin fibrous membrane, very adherent to the substance of the organ, and in intimate relation with the peritoneum, Attached to the liver, in the shallow fossa upon the under surface of the right lobe, lying parallel with the longitudinal fissure, is a membranous sac, the gall-bladder. The gall-bladder is divided into a body, fundus, and neck. The body is the middle portion; the fundus the expanded extremity which approaches the notch in the free border of the liver; the neck the portion which, narrowing, enters the right extremity of the transverse fissure and forms the *cystic duct*. The cystic duct is about 1½ inches in length, and has the diameter of a crow's quill. At the transverse fissure the duct unites with the excretory duct of the liver, *the hepatic duct*, forming by this junction the *ductus communis choledocus*. The ductus communis choledocus, with a length of 3 inches, passes downward and opens into the duodenum, passing obliquely between its coats. For the minute anatomy of the liver and gall-bladder, see Histology.

The Functions of the Liver.—The liver as a gland stands alone in the economy, on account of the complexity of function which it possesses. The physiology of glands in general points to but one function for each; in the case of the liver, however, may be enumerated (1) the secretion of bile, and (2) the glycogenic or sugar-producing property. Under the head of bile is included both a secretion of importance to digestion—in fact, necessary for life—as well as important excretion.

How is the Bile Secreted?—The old theory that the small glands in the lining membrane of the gall duct secrete the bile is incorrect, as these same glands are met with in all mucous membranes, and simply produce mucus. There is no anatomical or physiological evidence that the bile is secreted anywhere but in the lobules or acini by means of the hepatic cells. At this point the small bile-capillaries take up the material and carry it to the duodenum through the ductus communis choledocus, and a portion to the gall-bladder for future use. A question of interest arises as to whether the bile is formed from venous or arterial blood. The hepatic artery has been tied, and bile was secreted still. From the experiments of Oré it is shown that when the portal vein is obliterated bile continues to be formed from the blood of the hepatic artery. Hence we conclude that bile may be formed from either venous or arterial blood, but the portal blood is doubtless the more important, the hepatic circulation being designed more especially for the nutrition of the liver.

Quantity of Bile.—From experiments on animals, with a fistula in the gall-bladder and the ductus communis choledocus tied, it has been estimated that the quantity of bile secreted in twenty-four hours in a healthy man varies from 20 to 50 oz.

Flow of the Bile.—During the period in which the digestive functions are inactive the gall-bladder is constantly receiving bile from the liver. As soon, however, as stomach digestion is completed, and the food passes into the duodenum by means of the distended condition of the surrounding organs, a sufficient amount of pressure is exerted upon the walls of the gall-bladder to force out the bile, through the ductus communis choledocus, into the small intestine. The flow of bile continues during the period of intestinal digestion, after which no more passes into the duodenum; the gall-bladder still receives this fluid from the liver, and in this manner it is stored up for future use. The bile, then, is constantly formed by and discharged from the liver. This peculiarity belongs to the liver, for it is a well-established fact that *secreting* glands are only active at certain times, their functions not being constantly required. The quantity secreted, however, increases during the digestive processes.

Properties of the Bile.—See BILE. We have already referred to the functions of the liver, and have seen that it secretes bile and forms sugar. Let us first consider the functions of the bile. In the first place, it is a secretion formed from the blood by the liver, and discharged into the alimentary canal for purposes of digestion. Here, after modifying the digestive process, a part is absorbed into the system, and a part (cholesterin) passes out of the economy. That the bile is necessary to life is seen in the fact that when this fluid is allowed to escape through a fistula an animal will die of inanition in from twenty-seven to thirty-eight days. Physiologists are not yet certain of the exact action of the bile as a digestive fluid; some considering that it is for the purpose of causing the movements of the intestine (peristaltic action), others that it supplies alkalinity to the absorbing vessels of the villi, which hastens the introduction of fat into the blood; while, on the other hand, it has been claimed that the bile forms an emulsion with fats to a great extent, and in this manner aids the secretion from the pancreas, so as to completely digest fatty materials. We can only state that the bile performs some part in the digestive process, and it is probable that each theory represents part of the truth. The biliary salts, with certain other constituents of the bile, are absorbed in the intestine, as they can not be found in the fæces, and are not seen to accumulate in the blood when the liver is diseased or extirpated.

The Bile as an Excretion.—Although it is well known that cholesterin is found in small quantity in the crystalline lens and spleen, by far the larger amount is met with in the brain and nervous system. Experiments have shown that the blood acquires cholesterin in passing through the brain and nerves of the extremities, and therefore there can be no doubt that the blood takes up this substance from the nervous system generally; the cholesterin representing the worn-out nerve-tissue, as urea does that of muscle.

The Glycogenic or Sugar-forming Function of the Liver.—In 1848 Bernard, the illustrious French physiologist, showed that the blood coming from the liver contained sugar of the variety found in the urine of persons suffering from *diabetes mellitus.* When an animal is fed exclusively upon animal food, which contains no sugar, and the blood going to the liver is examined carefully, no sugar is to be found in it; but when the blood coming from the liver is analyzed, sugar is always present, even though the time were chosen when the digestive function was quiescent; in fact, in starving animals the blood of the hepatic veins always contain sugar. These experiments point to the fact that the blood acquires sugar in its passage through the liver. Bernard further examined the blood from various parts of the body, made extracts of all the tissues, and found sugar only in the tissue and blood of the liver. As the blood passes from the hepatic veins it becomes mingled with that of the vena cava, and in its passage through the lungs the sugar either entirely or in great part disappears. We can then conclude that the liver, unlike any other gland in the body, is a secreting as well as an excreting organ, and, like the ductless glands, it forms a substance (sugar) which is delivered directly into the blood. For diseases of the liver, see CALCULUS, HEPATITIS, and JAUNDICE.

Revised by WILLIAM PEPPER.

Livermore, ABIEL ABBOT, D. D.: religious writer; b. at Wilton, N. H., Oct. 30, 1811; educated at Exeter; graduated at Harvard College 1833, and at the Divinity School 1836; settled in Keene, N. H., 1836, in Cincinnati 1850; in 1857 removed to Yonkers and became editor of *The Christian Inquirer*, a Unitarian paper in New York; became 1863 president of the Theological School at Meadville, Pa., and continued in this office until 1889. D. at Wilton, N. H., Nov. 28, 1892. Mr. Livermore was a contributor to magazines, and the author of several works: *A Commentary on the New Testament* (6 vols., Boston, 1842–82); *Lectures to Young Men* (Keene, N. H., 1846); *The Marriage Offering*, a prize essay on the Mexican war (Boston, 1850); *Discourses* (1854). He was also one of the compilers of the book of hymns known as the *Cheshire Collection* (1845).

Livermore, MARY ASHTON: reformer; b. in Boston, Mass., Dec. 19, 1821; daughter of Timothy Rice and wife of Daniel P. Livermore, a Universalist minister; has written largely for periodicals, labored with much ability in behalf of the Sanitary Commission during the civil war, and has taken a prominent position as a writer and public speaker upon woman suffrage and various social and religious questions. In 1870 she was editor of *The Woman's Journal* at Boston, Mass. She is the author of *Pen Pictures* (Chicago, 1865); *Thirty Years too Late*, a temperance story (Boston, 1878); and *My Story of the War: a Woman's Narrative of Four Years' Personal Experience as Nurse in the Union Army* (Hartford, 1888).

Liverpool: city and port of Lancashire, England; situated in 53° 24′ lat. N., and 3° 0′ 1″ lon. W., on the eastern side of the estuary of the Mersey; 202 miles N. W. of London and 32½ miles W. of Manchester (see map of England, ref. 7–F). The etymology of the name of the city is uncertain. A plausible but doubtful derivation is that from the Welsh Llyvrpool, "the expanse of the port," or "the pool of the confluence." Liverpool is a parliamentary and municipal borough, also for certain purposes a county in itself and the seat of a bishopric created in 1880, when the town was erected by letters patent into a city. It covers an area of 5,210 acres, and sends nine members to the House of Commons, one for each of its nine divisions.

Streets.—Liverpool forms a kind of semicircle, with the Mersey for its base. The chief streets run mainly N. and S. Many are broad and handsome, while the houses in many others of them are commodious and well built. Church Street and Bold Street are full of handsome shops. Stanley Road, connecting Liverpool with its northern boundary, the municipal borough of Bootle, and Scotland Road are great thoroughfares. Some of the city parks have attracted to residence in their vicinity many of the wealthy inhabitants, but with a wide sea-range, speedily accessible by steamer and railway, numbers of business men have residences more or less distant from the city. Many business men are domiciled at Birkenhead, which, with nearly 100,000 inhabitants, is exactly opposite Liverpool, and separated from it by the estuary of the Mersey.

The Mersey and the Docks.—At Liverpool the Mersey is 3 miles from the open sea; at its narrowest parts, between the landing-stage and Birkenhead, it is three-quarters of a mile in width, but farther N. it widens considerably, and is navigable by vessels of the largest draught. A railway tunnel connects Liverpool and Birkenhead, the space between the bed of the river and the crown of the tunnel being at no point less than 25 feet. It was opened for traffic in 1886 by the Prince of Wales. The construction of the tunnel cost £1,250,000. Among the wonders of the world are the docks of Liverpool, some fifty in number, with their appurtenances, and it was in Liverpool that the system of floating docks originated. The great landing-stage, 2,063 feet in length and 80 feet in width, which rises and falls with the tide, is connected with the shore by seven hinged bridges. Between it and the shore is a floating bridge, 550 feet in length and 35 in width, for vehicles as well as pedestrians, available at all states of the tide. One-half of it is used for seagoing vessels and the tenders of the great "liners," the other for the Mersey ferries, of which there are eight. The docks extend along the Liverpool shore of the Mersey for more than 6 miles. The water area is 381 acres, with 25½ miles of quay space. The docks at Birkenhead, controlled by the corporation of Liverpool, extend for a mile along the shore and inland 2 miles, occupying a water area of 164½ acres and 9½ miles of quay space, in all 545½ acres of water area and 35 miles of quay. There are also twenty-three graving docks in which vessels are repaired. The fine Liverpool floating dock, the Salthouse Dock, still in existence, though partly rebuilt and enlarged, was opened in 1753. The largest Liverpool dock, the Alexandra, at the north end, was formally opened by the Prince and Princess of Wales in 1881. It has a water area of 44¼ acres and quay space of 2¼ miles, and is used chiefly by the largest class of steamships trading to the U. S. and the East Indies. The Albert Dock, opened by the Prince Consort in 1846, is surrounded with ranges of fire-proof warehouses, five floors each with vaults below the quays, the total superficial area of these five floors with quays and vaults being 25 acres. At the south end of these systems is the Herculaneum Dock, opened in 1866, and reopened after enlargement in 1881. The petroleum magazine here is said to be the largest in the world, and capable of holding 60,000 barrels. The total area of the dock estate in Liverpool is 1,104 acres, of which 732 are occupied by graving-docks, dock-quays, sheds, warehouses, etc. A double line of railway, about 6 miles in length, runs from N. to S. on the eastern margins of the dock-quays, with branches to the various railway stations. Over this ground railway runs the overhead electric railway, opened by the Marquis of Salisbury in 1893, with thirteen stations along the route. Between the docks and the city there is a continuous broad road with streets leading to the main city thoroughfares, and along the greater portion of the river-wall there is a marine parade which can be used as a public promenade.

Public Buildings.—The town-hall, reconstructed after a fire in 1795 at a cost, with the furniture, of £110,000, is Classical in style, and contains a spacious council chamber and a saloon for civic hospitality. The municipal offices (1866), a quadrangular edifice also in the Classic style, cost about £160,000. At the north end is a tower 210 feet high. The Exchange buildings (1864), in the French Renaissance style, have an inside colonnade surrounding a quadrangle, locally known as The Flags, in which the markets for cotton and general produce are held. The custom-house, post-offices, and dock offices occupy a pile of buildings in the Ionic style, with a fine dome. The Government buildings form a block in the Italian style, containing the offices of the Inland Revenue, the county and probate courts, etc. St. George's Hall is the finest edifice of the kind in the provinces. It was finished in 1854 at a cost of £400 000. The general style of the building is Corinthian. Its principal façade is more than 400 feet in length. Its great hall, 169 feet by 74, contains a fine organ and seats 2,500 persons. There is another hall which will seat 1,000. The rest of the building contains the assize and other law courts, with a law library. In the area in front are equestrian statues of the Queen and the Prince Consort, and between them a statue of Lord Beaconsfield.

Public and Other Institutions.—The Free Public Library and Museum (1857–64) occupy a stone building of the Corinthian order. The institutions themselves are maintained by local rates. The Picton reading-room, erected by the corporation, is to the Free Library what the reading-room of the British Museum is to its library. The reference library contains more than 102,000 volumes. The Picton reading-room connects the library and museums with the Walker Art Gallery (1874–77). The Royal Institution (1814–17) contains a natural history museum and a valuable collection of pictures. The Athenæum has a library of 40,000 volumes. The observatory, on Bidston Hill, is maintained by the Mersey docks and harbor board. The Philharmonic Hall, belonging to the Liverpool Philharmonic Society, will hold nearly 3,000 persons. The largest of the theaters, the Alexandra theater and opera-house (1866), is in the Italian style. The Wellington Rooms (1815) have been called the Almacks of Liverpool, and are managed by a committee. Belonging to the corporation are the Botanic Gardens, 11 acres, and there are seven parks covering several hundred acres, and the Mount, a public promenade of 4 acres. There are in Liverpool more than 130 hospitals and philanthropic institutions. Among them are the Sailors' Home (1852), with about 7,000 boarders; the Royal Infirmary, founded in 1745, and open to all; the Liverpool Infirmary for children (1851–70); the Northern Hospital (1833–34); the Royal Southern Hospital; and the Liverpool Stanley Hospital (1867).

Churches and Chapels.—There are 100 Anglican churches in Liverpool. The Church of St. Peter, in Church Street (1704), is used as the cathedral church of the diocese. The Roman Catholics have 44 churches and the Presbyterians 28, the Methodists, of all branches, 74 chapels, the Congregationalists 28 chapels, the Baptists 27, the Unitarians 6, the Friends have 2 meeting-houses, there is a Greek church, and there are 4 synagogues. Of the several cemeteries the most striking in its picturesque irregularity is St. James's.

Educational.—Liverpool University College (1882), forming part of the Victoria University, Manchester, is on Mt. Pleasant, and its buildings occupy 4 acres. It combines instruction in all the branches of a liberal education with the teaching of science, theoretical and practical, and with technical and industrial training. An important medical school is connected with it. Liverpool College (1840–43) is in connection with the Church of England. Among other educational institutions are Liverpool College for Girls, the Government School of Art (1837–83), Liverpool Nautical College (1892), and St. Edward's Roman Catholic College for young men (1842). The school board has established 25 board schools, but these are outnumbered by the 87 national schools (Church of England), and the Roman Catholic schools, of which there are 43. There are some 22 industrial and reformatory schools, with a few ragged schools. Sixteen newspapers (6 daily) and periodicals are published.

Government.—Liverpool is governed by a corporation consisting of a mayor (on whom in 1893 the dignity of lord mayor was conferred by letters patent) with forty-eight councilors, elected by the burgesses in sixteen wards, and sixteen aldermen elected by the council. It is a wealthy and progressive corporation.

Commerce and Shipping.—The commerce and shipping of Liverpool are larger than those of any other port in the United Kingdom. Its imports are less in value than those of London, but its exports are larger, and its exports and imports are more equally balanced. Its commerce with the U. S. is greater than with any other country. The total tonnage of all the vessels (exclusive of the coasting trade) which entered and cleared at Liverpool in 1892 was 11,119,976 tons and of these 5,346,263 tons represented vessels bound for or coming from the U. S. Besides its general commerce with the U. S., Liverpool sends to them large numbers of emigrants, for which it is the chief port of embarkation. The imports of foreign and colonial produce into the United Kingdom in 1892 were of the value of £423,793,882, of which Liverpool received £109,347,354. They included 14,863,493 cwt. of raw cotton, 20,376,294 cwt. of wheat, 8,917,203 cwt. of Indian corn, 271,686 live cattle and sheep, 3,220,831 cwt. of bacon and ham, 5,999,985 cwt. of unrefined sugar, 29,609,588 lb. of unmanufactured tobacco, 30,416,283 cwt. of leather. The amount of the custom duties paid at Liverpool in 1892 on the few articles on which they are leviable in the United Kingdom was £2,958,408, nearly a third of the sum received by the London custom-house. The value of the produce and manufactures of the United Kingdom exported from it in 1892 was £226,075,173. Of this produce to the value of £90,167,362 was exported from Liverpool. The value of the foreign and colonial merchandise exported from the United Kingdom in the same year was £64,563,113; the value of that exported by Liverpool alone was nearly a fifth, £13,147,483. The exports included cotton piece-goods valued

at £35,693,388; linen piece-goods valued at £2,148,946; woolen tissues and worsted stuffs valued at £7,165,941; iron, raw and manufactured, valued at £7,554,636; chemical products valued at £2,175,762; and salt valued at £432,671. Four thousand two hundred and seventy-two vessels (exclusive of the coasting trade) entered the port in 1892. They were mostly British vessels, and chiefly belonging to Liverpool, which is registered as possessing 2,333 vessels, of 2,095,491 tons collectively, and of these 987 are steam vessels of 1,087,388 tons collectively. Besides its foreign commerce, Liverpool has a large coasting trade. Of vessels engaged in this in 1892 there entered Liverpool 12,782, of 2,656,239 tons collectively, and there cleared from it 13,143, of 3,210,308 tons collectively.

General Industry.—There is some ship-building in Liverpool. The various processes connected with ship-building and ship-fitting employed 3,875 persons. There are also establishments for the construction of marine engines and of machinery generally. In 1893 they employed 4,473 persons. Although other industries are carried on, such as sugar-refining, tobacco-manufacturing, and watch and chronometer making, those connected with commerce, the docks, and navigation are the most important. Liverpool has fourteen banks.

Population.—The population in 1801 was 77,653. In 1891, through increase of area, the borough had a population of 629,548; in 1900, 685,276. The population of Greater Liverpool, as it may be called, which was 670,304 in 1881, had increased in 1891 to 708,742. In 1891 the total foreign population of the urban sanitary district, which is smaller than Greater Liverpool, was 7,402. In 1892 the death-rate was 25·9, being 5·7 higher than that of London.

History.—The earliest notices of Liverpool date from the English conquest of Ireland. King John founded it as a town, and made use of it for sending re-enforcements to Ireland. Its history for centuries was unimportant. It was not until 1709 that its population, having grown to a few thousand, the accommodation afforded by its little harbor was increased through the erection of a wet dock. Later in the century it embarked in the slave-trade, of which it became the headquarters, and it prospered greatly by nefarious traffic, exporting Negroes to the West Indies in exchange for their sugar and other products. When the slave-trade was suppressed a more legitimate channel for the energies of the merchants was opened by the development of the Lancashire cotton-manufacture and of cotton-growing in the U. S., Liverpool importing from the U. S. the cotton needed for that industry. The canal system, originated by the Duke of Bridgewater, gave Liverpool water communication with the chief marts of Northwestern England. The Liverpool and Manchester Railway, opened in 1830, added to its prosperity, and the growth of railways since then has placed it in communication with all parts of the United Kingdom.

See the authorities mentioned under LANCASHIRE; also Sir J. Allanson Picton's *Memorials of Liverpool* (1873); *Harbours and Docks*, by L. F. Vernon Harcourt (1885); Kelly's *Directory of Liverpool and Birkenhead* (1884); *County Council and Municipal Directory for 1884*; parliamentary papers, etc. F. ESPINASSE.

Liverpool: seaport of Nova Scotia; capital of Queen's County; has considerable trade in fish and lumber (see map of Quebec, etc., ref. 3–B). The town is well built and attractive. It has a good harbor, into which flows the river Mersey. It has one weekly newspaper, a bank, and a lighthouse on Coffin's island; lat. 44° 3′ N., lon. 64° 36′ W. Pop. (1891) 2,465.

Liverpool: village; Onondaga co., N. Y. (for location of county, see map of New York, ref. 4–F); on the Onondaga Lake, the Oswego Canal, and the Rome, Water. and Ogdens. Railroad; 4½ miles N. of Syracuse. It has several mills, willow-basket factories, cigar-factories, silver-metal factories, and solar salt-works. There are five churches and a weekly newspaper. Pop. (1880) 1,350; (1890) 1,284; (1900) 1,133.
EDITOR OF "TELEGRAPH."

Liverpool, CHARLES JENKINSON, First Earl of: statesman; b. in Oxfordshire, England, May 16, 1727; educated at Oxford; entered Parliament, and became Under Secretary of State in 1761. Having secured the favor of the king, he rose rapidly in the official service. He was Secretary of State for the War Department in Lord North's administration from 1778 to 1782, in which capacity he had much to do with determining the course of military operations in the U. S. during the closing years of the war of independence in North America. On retiring from this office he joined the party of the younger Pitt, by whom he was appointed in 1784 President of the Board of Trade. He held that post during the whole seventeen years of Pitt's first administration. He was created Baron Hawkesbury in 1786, and Earl of Liverpool June 1, 1796. D. in London, Dec. 17, 1808. He published a *Collection of all the Treaties of Peace between Great Britain and other Powers from 1648 to 1783* (3 vols., 1785).

Liverpool, ROBERT BANKES JENKINSON, Second Earl of: statesman; b. in London, June 7, 1770; educated at Oxford; entered Parliament in 1791, and took rank as a ready debater. He was appointed Secretary of State for Foreign Affairs in the Addington cabinet, and negotiated the Treaty of Amiens in 1801. He became Home Secretary under Pitt and on the latter's death in 1806 declined the premiership, but accepted it on the assassination of Mr. Perceval in 1812, and remained at the head of the administration until an attack of paralysis occasioned his resignation in Apr., 1827. These fifteen years were marked by a retrograde policy on the part of the ministry and by discontent on the part of the people. Though he was respected by his opponents for sincerity, Lord Liverpool's statesmanship was not of a high order, and his policy was completely reversed by his successor. D. Dec. 4, 1828. F. M. COLBY.

Liverworts: popular name of certain green plants related to the Mosses. They form one of the classes of MOSSWORTS (*q. v.*).

Livery of Seizin: See FEOFFMENT.

Liv'ia Drusil'la: the wife of the Emperor Augustus and the daughter of L. Livius Drusus Claudianus, who died by his own hand after the defeat at Philippi. Livia was married at an early age to Tiberius Claudius Nero, by whom she had two sons, Tiberius (afterward emperor) and Drusus. While still pregnant with the latter she was married to Octavian (Augustus), who had been captivated by her beauty and her talent, and who to bring about this union had divorced his own wife Scribonia, and compelled Tiberius Nero to divorce Livia. The union with Augustus seems to have been a happy one, but ancient historians make it appear that her ambition to secure the succession for her own sons caused her to commit many crimes in order to remove the members of the family of Augustus, to whom the succession would naturally have fallen. Thus the death of the young Marcellus, nephew and adopted son of Augustus (to whose memory a remarkable passage of the sixth book of the *Æneid* is devoted), and of Lucius and Gaius Cæsar, sons of Agrippa, was charged to her machinations, nor was she free from the suspicion of having hastened the end of Augustus himself. Meantime her surviving son, Tiberius, had been adopted by Augustus, who designated Livia and Tiberius as his principal heirs. On her son's succession to the imperial dignity Livia continued for a long time to exercise great influence, so much so that at first it seems to have been felt that Tiberius was subservient to her will; but in fact Tiberius, while considerate of his mother, always maintained an attitude of independence toward her in all affairs of state, and thus by degrees a spirit of alienation grew up between them which increased so much with years that Tiberius refused to visit her on her death-bed, or even to execute the directions of her will. She died at an advanced age (perhaps eighty-six) in the year 29 A. D. G. L. HENDRICKSON.

Livingston: city; capital of Park co., Mont. (for location of county, see map of Montana, ref. 6–G); on the Yellowstone river, and the N. Pac. Railroad; 100 miles E. of Helena, the State capital. It is connected with the National Park by a branch railway; contains 5 churches, 3 public schools, electric lights, water-works, 3 hotels, board of trade, and 3 weekly newspapers; and has railway-car shops, and large farming, stock-raising, and coal and gold mining interests. Pop. (1880) not in census; (1890) 2,850; (1900) 2,778. EDITOR OF "HERALD."

Livingston, EDWARD: jurist and politician; b. at Clermont, Columbia co., N. Y., May 26, 1764; was a son of Judge Robert R. Livingston (1718–75); graduated at Princeton in 1781, and began the practice of law in New York. Having the advantages of family influence and natural ability, he rapidly gained distinction in his profession, and became prominent in local and national politics; was twice mayor of New York; judge of a municipal court, and from 1795–1801 a prominent Jeffersonian member of Congress. Owing to pecuniary troubles he removed in 1804 to New

Orleans, where he attained a brilliant reputation as a lawyer, and acquired sufficient wealth to discharge all claims against him. Mr. Livingston spent many years in preparing civil and criminal codes for Louisiana, which were his chief literary labors, and won for him a wide fame in Europe and in Spanish America. He was a member of Congress 1822–29; U. S. Senator 1829–31; Secretary of State 1831–33; minister to France 1833–35. He afterward resided at Rhinebeck, N. Y., where he died May 23, 1836. His works on jurisprudence were published in New York in 1873. See his *Life*, by C. H. Hunt (1864); and *Recollections of Livingston*, by M. Davezac. Revised by F. Sturges Allen.

Livingston, Philip: a signer of the Declaration of Independence; b. at Albany, N. Y., Jan. 15, 1716; graduated at Yale in 1737; became a prosperous merchant and official of New York city; was Speaker of the House of the Colonial Legislature in 1768, a member of the Continental Congress 1774–78, and president of the provincial Congress 1775. Member of the New York General Assembly in 1776, and of the first State Senate 1777. He was one of the founders of the New York Chamber of Commerce and of the Society Library, and materially aided Yale and Columbia Colleges. D. at York, Pa., June 12, 1778.

Livingston, Robert R., LL. D., known as Chancellor Livingston: statesman; b. in New York, Nov. 27, 1747; a son of Judge Robert R. Livingston and a brother of Edward Livingston, jurist; graduated at King's (now Columbia) College in 1765; became a successful lawyer; was recorder of New York 1773–75; a member of the Continental Congress 1775–77 and 1779–81; was on the committee which reported the Declaration of Independence; was Secretary of Foreign Affairs 1781–83; chancellor of New York 1777–1801; was a prominent member of the New York convention of 1788 which adopted the Constitution of the U. S.; was instrumental, while U. S. minister to France (1801–04), in effecting the purchase of Louisiana; was the assistant of Fulton in perfecting steam-navigation; was one of the introducers of merino sheep into the U. S., and held various public positions with great efficiency. D. at Clermont, N. Y., Feb. 26, 1813.

Livingston, William, LL. D.: statesman; a brother of Philip; b. at Albany, N. Y., in 1723; graduated at Yale in 1741; became a prominent lawyer and journalist; removed in 1773 to Elizabethtown, N. J., and was elected in 1774 and 1775 to the Continental Congress. He became brigadier-general of militia in 1775, and in the following year was elected Governor of New Jersey, an office which he held until his death. During the war, when the British occupied the State, he fulfilled his duties with courage and ability. He was a member of the convention which in 1787 drew up the Federal Constitution. His writings, consisting of newspaper articles and pamphlets, prove him to have possessed considerable literary talent. See his *Life and Letters*, by Theodore Sedgwick, Jr. (New York, 1833). D. at Elizabethtown, N. J., July 25, 1790.

Livingstone, David, M. D., LL. D.: missionary and explorer; b. at Blantyre, near Glasgow, Scotland, Mar. 19, 1813. His parents were very poor, and could give him no aid to acquire a scholarly education. His religious enthusiasm, however, in connection with a passion for traveling in foreign countries, created early the idea of a missionary life in his mind; and first by attending an evening school while employed during the day in the cotton-mills, and later on by working hard during the summer and studying during the winter, he contrived to prepare himself thoroughly for his task. In 1838 he offered his services as a missionary to the London Missionary Society, and in 1840 was ordained and proceeded to Kuruman in South Africa. He was engaged in the service of the London Society for sixteen years, and meanwhile married the daughter of the Rev. Robert Moffat, the distinguished missionary. In 1849 he made his first journey of exploration, and discovered and surveyed Lake Ngami. He started (1853) on the great journey that made him famous. His salary was only £300 a year when the heathen Makololo chief, Sekeletu, gave him men, ivory, and trading commissions that enabled him (1853–56) to travel from the Zambesi to Loanda on the west coast and then to retrace his steps across the continent to the mouth of the Zambesi. He returned to England and wrote his *Missionary Travels and Researches in South Africa*, which made his name well known. In 1858 he returned to Africa, and, supported by the Government and accompanied by several scientific associates, he started on an exploring journey up the Zambesi and Shiré rivers, the greatest results of which were the discovery of Lakes Nyassa and Shirwa, and the salubrious Blantyre Highlands. His wife, who was with him, died at Shupanga (1864). He then spent nearly two years (1864–65) at home publishing *A Narrative of an Expedition to the Zambesi*. Livingstone returned to Africa (1866) to discover the ultimate sources of the Nile. Little was heard from him during the seven remaining years of his life, but they were years of great discoveries, and, in part, of great privations and suffering. He was destitute of means to send tidings to his friends, and the most direful rumors of his fate were spread abroad. *The New York Herald's* Livingstone search-party, commanded by Henry M. Stanley, found the explorer (1871) at Lake Tanganyika. He could not be induced to return home, but worked on till he died, having no resources part of the time except what the natives gave him. In these seven years he discovered and partly mapped the large eastern system of Congo sources, beginning with the Chambezi river near Lake Nyassa. Following these rivers for hundreds of miles, discovering Lakes Bangweolo and Moero, through which they run, and deterred at Nyangwe from following the Congo to the sea only by lack of means, he believed to his death that the large part of the upper Congo water-system he had traced belonged to the Nile. His map of Lake Bangweolo, derived chiefly from natives and long used in all maps of Africa, was very erroneous. Had he lived a few weeks after his return to Bangweolo he, and not Giraud, would have supplied a more correct map; but he died (May 1, 1873) on its southern shore. His heart was buried where he died, and his embalmed body was carried by his servants to the coast, whence it was taken to England and buried with imposing ceremony in Westminster Abbey. He was, as a rule, remarkably accurate in his geographical delineations, considering his imperfect instruments. His keen powers of careful observation gave his books enduring value. He never injured a native. To him is wholly due the first great impetus to African exploration and the first outburst of indignation against the Arab slave-trade. See *Livingstone's Last Journals* (1874); Blaikie's *Livingstone's Personal Life* (1880); and Stanley's *How I Found Livingstone* (1873). Revised by C. C. Adams.

Li'vius Androni'cus: author; lived in the third century before our era; was born at Tarentum, a slave of Greek descent. He received his liberty from M. Livius Salinator, and began to represent tragedies and comedies (which he composed after Greek models) in Rome about 240 B. C. He also translated the *Odyssey* into Latin, and did much to make the Romans acquainted with Greek literature. In the time of Horace his compositions were still used in the schools, but only a few insignificant fragments have come down to our time, edited by Düntzer (Berlin, 1835); O. Guenther, *Odyssiæ reliquiæ* (Stettin, 1864); Baehrens, *Frag. Poet. Rom.*, pp. 37–43 (Leipzig, 1886); and by Ribbeck, *Trag. Lat. Rell.* (Leipzig, 1871). Revised by M. Warren.

Livo'nia (Germ. *Liefland*): government of Russia; bordering on the Gulf of Livonia, and comprising, together with the island of Oesel, an area of 18,158 sq. miles. The surface is low, flat, and often marshy, dotted with numerous lakes, and covered with forests. Toward the S. E., however, it rises and forms a plateau about 500 feet high and intersected with numerous valleys. The soil is not very productive. Swamps and peat-bogs occupy a large portion of the ground, and vast sand-wastes stretch along the Baltic coast. Rye, barley, oats, buckwheat, flax, and hemp are raised, and many cattle reared. In the towns the inhabitants are mostly of German descent, mixed with Russians, Poles, and Jews; in the country they are of Finnish origin. Pop. (1890) 1,256,200. Capital, Riga. The country was a Swedish possession from the Peace of Oliva (1660), when it was conquered from Poland, to the Peace of Nystadt (1721), when it was ceded to Russia.

Livre, leevr' [Fr. pound < Lat. *lib'ra*, balance, pound]: the former French standard unit of weight; was to the pound avoirdupois as 17·267 to 16. Also, a former French coin, superseded in 1795 by the franc, which is to the *livre tournois* (the old standard) as 81 to 80, the Parisian livre being to these figures nearly as 100. Still other livres were in use.

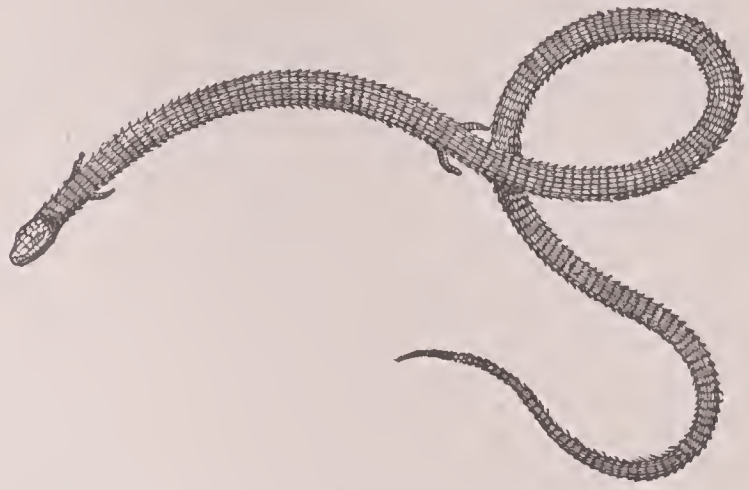
Liv'y (in Lat. Titus Livius): historian; b. at Patavium, in Northern Italy, in 59 B. C.; lived chiefly in Rome, where he enjoyed the favor of Augustus and maintained intimate intercourse with the young Claudius, but returned in his old age to his native city, and died there in 17 A. D. He was

married, had at least one son and one daughter, and enjoyed great celebrity among his contemporaries, but nothing further is known of his personal life. According to Seneca, he wrote several dialogues and essays on philosophy, which have been lost, but the work by which he won a lasting fame was his history of Rome from the foundation of the city to the death of Drusus 9 B. C. It consisted originally of 142 books, and the short introductions with which the first, twenty-first, and thirty-first open seem to indicate that it was divided into groups of ten books or *decades*, each decade comprising an independent epoch; but of these 142 books only thirty-five have come down to us—namely, the entire first decade, i.–x., embracing the period from the foundation of Rome to the year 293 B. C.; the entire third decade, xxi.–xxx., embracing the period from 219 B. C. to 201 B. C.; the entire fourth decade, and one-half of the fifth, xxxi.–xlv., embracing the period from 201 B. C. to 167 B. C. Of the rest only a few and inconsiderable fragments are still extant; all the so-called *epitomes*, however, short extracts of or indexes to each book, have been preserved except those to Books 136 and 137. The first printed edition (Rome, 1469) contained only twenty-nine books—namely, i.–x., xxi.–xxxii., xxxiv.–xl. The remaining six books were discovered in fragments in 1518, 1531, and 1616, and for more than two centuries the whole learned world was put into general commotion every now and then by a rumor that the entire work had been discovered, until in the seventeenth century all libraries had been ransacked in vain, and all hope of the recovery of the lost treasure was given up. The best modern editions are by Drakenborch (Leyden, 1738–46, and Stuttgart, 1820–28); Madvig and Ussing (Copenhagen, 1861, *seq.*; revised 1886, *seq.*); Weissenborn (Berlin, 1861, *seq.*); A. Zingerle (Prague, 1883, *seq.*); and A. Luehs (Berlin, 1888, *seq.*). There are English translations by Philemon Holland (1600); Baker (1797); John Hayes (1744); and in Bohn's Classical Library (1850). Considered as a work of science, modern scholars have not given the highest praise to Livy's history; the studies on which the representation rests are generally not exhaustive, and often not accurate. The chronology is sometimes confused, and the geographical and military descriptions are often inconsistent or misleading; nor is Livy strong in tracing the growth of the constitution and the evolution of the state. However, on account of the scarcity and in many cases the total lack of other historical documents, the work has an inestimable value, while in the matter of style it challenges our highest admiration. The narrative is fluent and picturesque, and full of variety, often dramatic and brilliant. No writer has shown a greater mastery of the period. The diction is tinged with a poetic coloring showing clearly the influence of Vergil. The author is dominated by a strong feeling of the greatness of the Roman people, and his ardent patriotism and warm sympathies captivate the reader. The result of the investigation of Livy's sources in the different decades can not be considered here. See Schanz, *Römische Lit. Geschichte 2ter Theil*, p. 184 ff. (Munich, 1892); Taine, *Essai sur Tite-Live* (Paris, 1888); Capes, *Livy* (London, 1879); Kühnast, *Die Hauptpunkte der Liv. Syntax* (Berlin, 1872); Riemann, *Études sur la langue et la grammaire de Tite-Live* (Paris, 1884).

Revised by M. WARREN.

Lixivia'tion and Lixiv'ium [from Lat. *lixi'vium*, lye, liter., neut. of *lixi'vius*, made into lye, deriv. of *lix*, ashes, lye]: Lixiviation is the method of extracting ingredients soluble in water from porous substances, like ashes or earth, by placing the latter in some receptacle, through which the water may be made to percolate. The vessel for lixiviation usually has a perforated bottom, upon which straw or coarse gravel is first spread, and then the material to be lixiviated is filled in. All the potash made in the U. S. is thus obtained from wood-ashes, and much of the saltpeter of commerce similarly from nitrous earth. Much economy is often arrived at by a construction which enables the first water poured on the mass to remain in it for some time until it has finished its solvent action, and then drawing off at the bottom. Sometimes then, on pouring through fresh water, it will be found soon to run nearly pure. Concentrated lyes are thus obtained without boiling down. The second water is not allowed to mix with the first, but kept to pour through a fresh mass of material.

Lizard [M. Eng. *lesarde*, from O. Fr. *lesarde* > Fr. *lézard* < Lat. *lacer'ta*, lizard (> Span. *lagarto*, whence Eng. *alligator*)]: a general name for any member of the order *Lacertilia*, often extended to include not only the crocodiles and many extinct saurians, but even, in popular parlance, tailed batrachians, such as newts and salamanders. A lizard is a tailed reptile, usually with an elongate body, having a scaly or granular skin, toothed jaws whose rami are firmly united



The anguine or snake lizard of South Africa.

in front, and, as a rule, eyelids and four limbs, although in exceptional cases, e. g. the blind worm, glass snake, and scheltopusic, the limbs may be rudimentary or absent. The serpent-like lizards may readily be distinguished from snakes by their fixed teeth and the united halves of the lower jaw. The tail may be very short, scarcely longer than the head, as in the Australian *Trachydosaurus*, or several feet long, as in the great *Hydrosaurus*. The iguanas have a dewlap and a fringe of high scales down the back, and the curious lace lizard, CHLAMYDOSAURUS (*q. v.*), has a wide frill about the neck. Owing to a peculiar arrangement of the muscles the tails of many lizards readily break off. When this happens the lost portion of the tail is reproduced, but although externally perfect the missing vertebræ are found to be replaced by a continuous strip of granular cartilage. Nearly 2,000 species of lizards are known, ranging in size from the great teguexin, 6 feet long, to species of 2 or 3 inches in length. Nearly all lizards are oviparous, depositing their eggs, which are covered with a shell or tough calcareous membrane, in the sand, to be hatched by the heat of the sun. A few species, however, are ovoviviparous, the eggs being retained in the oviduct until hatched, and the young brought forth alive. Lizards are most numerous in tropical

Nimble lizard (*Lacerta agilis*).

and warm countries; none are found in very cold regions, and in the temperate zone they pass the winter in a torpid state. As a rule, they prefer sandy or rocky localities, and are carnivorous, feeding on small mammals, insects, eggs, etc. Some species are arboreal and herbivorous, and the great *Amblyrhynchus* of the Galapagos islands enters the

sea and feeds on seaweed. With the exception of the HELODERMA (*q. v.*), none are poisonous. F. A. LUCAS.

Ljunggren, yoong'gren, GUSTAF HÅKAN JORDAN, Ph. D.: critic; b. in Sweden in 1825; studied at Lund; graduated 1844; was in 1847 appointed Assistant Professor of Æsthetics, and in 1859 Professor of Æsthetics and the History of Literature and Art. In 1865 he was elected a member of the Swedish Academy. Ljunggren's fame as a critic and writer upon the subject of literary history rests not only upon his thorough learning and studies, but also on his fascinating way of presenting his subject. Chief among his writings upon literary history are *Svenska dramat intill slutet af 17de århundradet* (The History of the Swedish Drama until the End of the Seventeenth Century, 1864); *Svenska vitterhetens häfder efter Gustaf III.'s död* (The Annals of Swedish Literature after the Death of Gustaf III., 3 vols., 1873–86), besides several smaller writings—*Bellman och Fredmans Epistler* (1867); 3 volumes *Smärre Skrifter* (Smaller Writings, 1872–81). Ljunggren has also written on topics of a purely æsthetic nature: *Framställning af de förnämsta esthetiska systemer* (The Chief Æsthetic Systems, 2 vols.; 2d ed. 1869–83), which is used as a handbook in the Swedish universities; *Studier öfver Holberg* (1864). Finally may be mentioned some sketches from Italy, *Från en resa* (1871). P. GROTH.

Llama: See LAMA.

Llandudno, lan-did'nō: a much-frequented watering-place in Carnarvonshire, North Wales; picturesquely situated on a sheltered bay of the Irish Sea, at the mouth of the Conway (see map of England, ref. 8–E). Two lofty promontories, Great Orme's Head and Little Orme's Head, protect the bay against the sea. The permanent population in 1891 was 7,333.

Llanel'ly: town of South Wales; 16 miles S. E. of Caermarthen (see map of England, ref. 12–D); on a creek of the Caermarthen Bay, at the mouth of the river Lougher, and has manufactures of copper, tin, and iron wares, pottery and chemicals, extensive docks, and a considerable trade in coal. Pop. (1891) 23,937.

Llano Estacado, lyaa'nō-es-tăă-kaa'dō [Span., palisaded plain. See LLANOS]: a large plateau in Northwestern Texas. On nearly all sides it stands above the surrounding country, from which it is separated by a cliff facing outward, and this cliff or palisade gave rise to its name, which has been misleadingly translated "staked plain," and supposed to refer to the stake-like boles of a yucca-plant which grows there. Its general form is quadrangular, with a length N. and S. of 400 miles, and a width of 75 to 150 miles, but its outline is irregular, including many salients and re-entrants. It is very smooth and apparently level, but there is an eastward slope averaging 15 feet to the mile. Its surface is constituted of a feebly coherent, sandy formation of Neocene age, resting unconformably on Triassic shales and other rocks. The sandstone absorbs all the rainfall, so that there are ordinarily no surface-streams; but the impervious rocks beneath retain the water in the lower part of the sand, whence it can be obtained by wells. There are no trees, but the nutritious gama-grass abounds, supporting an important grazing industry. The climate is so dry that in the absence of water for irrigation agriculture can not be pursued. G. K. GILBERT.

Llanos, lyaa'nōs [Span., liter., plains, plur. of *lla'no* < Lat. *pla'nus*, plane, level, whence Eng. *plain*]: in various parts of Spanish America, tracts of open land of very different character. In a special and geographical sense, the name has come to be used for a vast tract in Venezuela and Colombia, properly the llanos of the Orinoco or of Venezuela. Broadly speaking, they occupy the space between the river Orinoco, the coast mountains of Venezuela and the Eastern Cordillera of Colombia, extending eastward to the Orinoco delta, westward, by the Apure basin, nearly to Bogotá, and southwestward, around the bend of the Orinoco, to the Vichada branch of that river; beyond the Vichada the plain is broken by woods until it merges into the great Amazonian forest. The entire area has been estimated at more than 150,000 sq. miles, much the larger part being in Venezuela. All this region is characterized by immense stretches of perfectly flat grass land, and no part of it is more than a few hundred feet above sea-level; but it is a great mistake to suppose that the llanos are perfectly uniform in character throughout; in fact, they vary greatly. The natives always make a distinction between the *llanos bajos*, which are broad river-bottoms, subject to periodical overflows from the rivers themselves, and the *llanos altos*, which are above the reach of such floods, though portions may be inundated by the rains. Again, the llanos altos not only present inequalities (*bancos*), but are varied in many places by flat-topped hills, 500 or 600 feet high, evidently the remains of an old table-land. Along the southern edges of the Venezuelan mountains these *mesas* often form a continuous terrace; and in one place, at least, they pass entirely across the llanos, from the Orinoco, opposite the mouth of the Caura, to a break in the coast range near Barcelona. The llanos bajos are green throughout the year, and present, especially near the Apure, the largest extents of perfectly open, clean, and level grass-lands, often so great that the horizon is open in all directions; they are dotted with shallow lakes, some of which dry up in the winter months; during the rains they are overflowed in all directions; cattle wade after the floating grass or retire to the few spots left dry; and travelers pass for miles through water up to their saddle-girths; nevertheless, these are the best and most productive pastures. The llanos altos are green and beautiful during the rains (June to October), but dry and arid during the other months, the winds raising clouds of dust; cattle pastured on many parts of them must be driven to the river-bottoms at this season. The lakes of the llanos altos are little more than pools, but during the rains water frequently collects over large surfaces. Eastward, some portions under the lee of the Cumaná Mountains are so dry at all times that travelers over them are obliged to carry water, as in a desert. Trees, especially palms, grow scattered over many parts of the llanos, or are gathered into small clumps (*matas*) and lines along the streams. The mesas often have forest on their edges, but the tops are generally covered with bushy *rastrajo*, similar to the campo growth of Brazil. A multitude of streams, rising on the flanks of the mountains or of the mesas, flow over the llanos, and most of them are navigable at a short distance from their sources; thus they furnish a network of communication with the Orinoco. The climate in most parts is hot and damp, but generally healthful in the dry season; during the rains intermittent fevers and dysentery are prevalent, especially in the llanos bajos. Animals abound, jaguars, deer, wild hogs (both the native species and those from European stock), and a multitude of birds being most prominent; the jaguars frequently destroy cattle. Of the numerous Indian tribes which formerly occupied the llanos, only a few are left in a wild state, principally in the southwest. At present the plains are thinly inhabited, principally by a hardy race of mixed Indian, Negro, and white blood, the *llaneros*; they are trained to ride from infancy, and are wonderfully skillful herdsmen; quite unlettered, they are nevertheless intelligent, brave, and generous, and have done efficient service in the numerous wars of Venezuela. Though many parts of the llanos are fertile, they are used at present exclusively for grazing; immense herds of cattle run on them in a nearly wild state, being only driven together annually for branding, and to separate those intended for the market. Horses are also raised, but they have suffered greatly from a disease now common in swampy lands throughout South America. The houses of the *llaneros*, and even those of the best cattle estates, are little better than huts, and there are few towns. See Codazzi, *Geografía de Venezuela* (1841); Michelena y Rójas, *Exploración oficial* (1867); Carl Sachs, *Aus den Llanos* (1878); Humboldt, *Voyage dans les régions équinoxiales* and *Tableaux de la Nature*; Édouard André, *L'Amérique équatoriale* (1878); Ramon Paez, *Wild Scenes in South America* (1862). HERBERT H. SMITH.

Llanos de Chiquitos, or **Llanos de los Chiquitos**: See SANTA CRUZ, Bolivia (Department).

Llanos de Manso (so called from Andres Manso, who in the sixteenth century received authority to colonize this region): a plain in the extreme southeastern part of Bolivia, department of Chuquisaca. It forms a portion of the GRAN CHACO (*q. v.*). H. H. S.

Llanquihue, lyăăn-kee'wā: a southern province of Chili, S. of Valdivia; approximately between 40° 10′ and 42° 10′ S. lat.; but by some authorities the limits are extended to 47°. Area, by the former limits, 7,823 sq. miles. The Andes form the eastern boundary, and in general the surface is much broken; but in the northern part, which extends to the Pacific, there are considerable plains. The surface is covered with woods, largely of pine, interspersed with tracts of open land and with many beautiful lakes: of these, Lake

Llanquihue is the largest body of fresh water in Chili (area about 225 sq. miles), and is navigated by steamboats; it is 170 feet above the sea, and its great depth and clearness give the water a blue tint resembling that of the ocean. Above this lake rise the Osorno volcano (7,250 feet), and the Calbuco cone (5,550 feet), which was in eruption in Oct., 1893. The southern part of the province is a narrow strip facing the gulfs and channels which separate the Chiloé and Chonos archipelagos from the mainland; it is cut up by narrow fiords between rugged mountains, and the scenery is extremely grand and varied. The climate is temperate, but very rainy; average temperature at Puerto Montt (Gulf of Ancud), 53° F. Wood-cutting, the cultivation of wheat, barley, etc., and grazing are the principal industries. Llanquihue was separated as a territory in 1853, when it was a desert. In 1885 the population was already 62,809, and rapidly increasing; a large proportion of the people are German immigrants. Capital, Puerto Montt (pop. 1885, 2,787), at the head of the Gulf of Ancud; it is now connected by rail with Valdivia. Osorno, in the northern part, had 3,097 inhabitants in 1885. HERBERT H. SMITH.

Llewelyn (loo-el'in) **ap Griffith**: Prince of Wales; succeeded his uncle David in 1246; revolted from his allegiance to the English crown, and ravaged the frontier. He was joined by de Montfort in 1263, and defeated Mortimer in 1264; made peace with Henry III. 1267; was summoned to do homage by Edward I., but refused to appear, and demanded the release of his bride, Eleanor de Montfort, who had been captured by English vessels in the Channel 1275; war began, and Llewelyn was forced to surrender his territories 1277, but Eleanor was released and married to him. He became reconciled to his brother David, and renewed the war with the English 1282, but was surprised and killed by Mortimer Dec. 11, 1282. Revised by F. M. COLBY.

Llorente, lyō-rān'tā, JUAN ANTONIO: historian; b. at Rincon del Soto, near Calahorra, Spain, Mar. 30, 1756; studied theology at Tarragona and Madrid; was ordained priest (1779); became doctor in canon law, advocate in the royal councils, vicar-general of the bishopric of Calahorra (1782), chancellor of the University of Toledo, member of the principal academies, commissary (1785), and secretary-general of the Inquisition (1789). He made two unsuccessful attempts to correct the inveterate abuses of the Inquisition, the latter of which occasioned his relegation to a monastery for a short time, and the exile of his friend and protector, the minister of justice, Jovellanos. In 1806, however, he was employed by the favorite Godoy to write a work in opposition to the traditional privileges claimed by the Basque provinces—*Noticias históricas sobre las tres provincias Bascongadas* (5 vols., 1806–07). This work is an unjust attack upon the Basques and Fueros, in which, according to Ranke, he perverted the facts of history. Llorente adhered to the French intervention; was made a councilor of state by King Joseph, and director-general of national estates (1808), in which capacity he was charged with the suppression of the convents and the administration of the confiscated property. On the extinction of the Inquisition its papers were placed in his hands, with a commission to prepare its history. He fulfilled this task in his *Anales de la Inquisición de España* (2 vols., 1812–13). Charged with embezzlement of immense sums, he was removed from his offices, but was appointed to others; was exiled on the return of Ferdinand VII. in 1814; resided for a time in England, and afterward in Paris, where in 1817–18 was published a French version by A. Pellier of his celebrated *Historia Crítica de la Inquisición de España, etc.*, 4 vols., of which the original was printed in Madrid in 10 volumes in 1822 (German trans. by H. F. Eisenbach, 1824; abbreviated English version, 1826). At the same time he was at work on his *Mémoires pour servir à l'histoire de la Révolution d'Espagne*, published under the pseudonym *M. Nellerto* (3 vols., Paris, 1814–19). In 1818 he printed a brief autobiography, *Noticia biográfica . . . de J. A. Llorente, etc.* In 1821 appeared at San Sebastian his *Apología católica del proyecto de Constitución religiosa, etc.* In 1822 he edited the works of B. de las Casas, printed his *Observaciones críticas sobre el romance de Gil Blas de Santillana*, and issued a French version of his *Retrato político de los Papas desde S. Pedro hasta Pio VII.* (the Spanish was printed the next year in Madrid). The last of these works aroused great indignation among the French clergy, and obliged him to leave Paris and return to Madrid, where he was well received. D. Feb. 5, 1823. Llorente was a writer of considerable talent, and his works were once very popular with the anti-Catholic element in Europe; but they can not be trusted for the accurate statement of facts, and consequently have fallen into comparative discredit. See Hefele, *Life of Cardinal Ximenes* (London, 1860, c. xvii.).

Revised by A. R. MARSH.

Lloyd, CHARLES HARFORD: organist and composer; b. in Thornbury, Gloucestershire, England, Oct. 16, 1849; was educated at Oxford, graduating Mus. B. 1871, B. A. 1872, M. A. 1875. He became organist of Gloucester Cathedral in 1876, and conducted the Three Choirs festivals of 1877 and 1880. In 1882 he was appointed organist of Christ Church Cathedral, Oxford, and conductor of the Choral Society there. His compositions include many canticles and anthems for the Church, glees, madrigals, and part songs, choruses and incidental music to *Alcestis*, and the following cantatas: *Hero and Leander* (1884); *Song of Balder* (1885); *Andromeda* (1886); *The Longbeard's Saga*, men's voices (1887); *A Song of Judgment*, and *The Gleaner's Harvest*, women's voices. He has also written a few instrumental pieces. D. E. HERVEY.

Lloyd, WILLIAM, D. D.: bishop; b. at Tilehurst, Berkshire, England, Aug. 18, 1627; was educated at Oriel and Jesus Colleges, Oxford; became a fellow 1646; took priest's orders 1656; was prebendary of Ripon, Salisbury, and St. Paul's; chaplain to Charles II.; vicar of St. Mary's, Reading, and archdeacon of Merioneth; became Bishop of St. Asaph 1680, of Lichfield and Coventry 1692, of Worcester 1699, and died at Hartlebury Castle in Worcestershire Aug. 30, 1717. Lloyd took an active part in the troubles occasioned by the so-called Popish plot of 1678, and was one of the celebrated seven bishops who protested against the Declaration of Indulgence to Romanists and Dissenters by James II., for refusing to publish which they were committed to the Tower, tried, and acquitted (1688). He was almoner to William III. and to Queen Anne. He was noted as a rabid anti-papal leader and ardent student of prophecy: wrote *Considerations touching the True Way to Suppress Popery* (London, 1677); *An Historical Account of Church Government as it was in Great Britain and Ireland, when they First Received the Christian Religion* (1684); a *Dissertation on Daniel's Seventy Weeks* (1690); a *System of Chronology* (1690); a *Harmony of the Gospels*, and other theological works, and furnished valuable materials to *Bishop Burnet's History of His Own Time.*

Revised by S. M. JACKSON.

Lloyd's: the name by which the first floor of the Royal Exchange in London is known, being the center where the business of maritime insurance is transacted, and where the earliest shipping intelligence from all parts of the world is posted for the information of subscribers, whether merchants, shippers, or underwriters. The board of underwriters have rooms here, and receive reports from their agents in every port throughout the world visited by the ships they insure. The system is so arranged that the individual underwriters risk no more than £100 to £150 on any single vessel. Their concerns are administered by a committee of twelve members. There is a vast "merchants' room," provided with newspapers from all parts of the world, and a "captains' room," where ship-auctions are held and convivial gatherings frequently meet. The establishment derives its name from a coffee-house kept by Edward Lloyd in the seventeenth century. In 1692 the coffee-house was removed to Lombard Street, and became the headquarters of the board of underwriters. In 1774 the institution removed to rooms in the Royal Exchange. It was incorporated by act of Parliament in 1871. The name is now applied generically to similar institutions elsewhere, the most celebrated of which are the Austrian Lloyd at Trieste (established 1823 by Baron Bruck) and the North German Lloyd at Bremen. *Lloyd's List* was printed as a weekly from 1716 to 1800, since which time it has appeared daily, with the fullest shipping intelligence. Besides this various works are published by the corporation for the benefit of the mercantile community, including *Lloyd's Weekly Shipping Index*, *Lloyd's Confidential Index*, and the *Mercantile Navy List.* The Austrian Lloyd has a journal, established in 1834. See F. Martin's *History of Lloyd's* (1875).

Loach [from Fr. *loche*]: a name given to fishes of the family *Cobitidæ*, which is related to the carp family (*Cyprinidæ*). There are no representatives of the group in America. In England there are two species—*Cobitis tænia* and *Nemachilus barbatulus.* The *Nemachilus barbatulus*

or common loach, a European fish of the family *Cobitidæ*, is sometimes used as food. It lives at the bottom of clear

The loach.

streams. The lake loach (*Misgurnus fossilis*) of Central Europe buries itself in mud, and has a bad flavor.

Loadstone [*lode*, *load* (< O. Eng. *lād*, way, journey, carrying, related to the verb *lead*) + *stone*]: the natural magnet, a mineral consisting essentially of magnetic iron ore, which is a compound of the peroxide and protoxide of iron. It strongly attracts the magnetic needle, but does not itself always possess polarity.

Loam [O. Eng. *lām* : Germ. *lehm* (from Low Germ., for High Germ. form *leim*), clay]: a mixture of sand and clay, with an addition of about 5 per cent. lime and some animal and vegetable matter. A loamy soil is intermediate in character between sandy and clayey soils, and is that best adapted to general agriculture. It is lighter and warmer than a clay soil, and stronger and more retentive than a sandy one.

Loan [O. Eng. *lān*, deriv. of *lēon*, lend : Germ. *leihen*, lend : Goth. *leihwan*, leave < Teuton. *lihwan* < Indo-Euro. *liq-* > Gr. λείπειν, λιπεῖν : Lat. *lin'quere*, leave]: in law, either (*a*) a delivery of a chattel, as, for example, money or stock, by one person to another for the use of the latter, for which an equivalent, usually in kind, is to be returned at a future day; or (*b*) the species of bailment technically called *commodatum*, which consists in the delivery of an article to another for his gratuitous temporary use, on condition that the identical article delivered shall be returned to the lender.

I. If the loan be of the first kind the lender may bring an action in a court of law for the recovery of damages equal to its value, or of the sum agreed to be given in return, if default be made in rendering the equivalent at the time appointed according to the terms of the agreement; but the thing itself agreed to be given in return can not be obtained by action in a court of equity, except in certain cases where the recovery of money damages only would work injustice, or where the amount of damages can not be ascertained. (See Specific Performance.) Interest will usually be recoverable upon the value of the article loaned from the time of default. Loans of this kind are sometimes made with intent to evade the laws against usury; but, as usury statutes generally apply to loans of wares, merchandise, or other commodities, as well as of money, if the intent of the parties to a loan and the effect of the transaction are to violate the usury laws, the same penalties will be incurred as in the case of a loan of money. A loan of stock to be replaced by the same number of shares, however, will not be usurious, though the value of the stock may be subject to great fluctuations; and the same rule would apply in other analogous cases. (See Usury.) The most common loans of this class are loans of money to be repaid in money. The contract for repayment is usually evidenced by a promissory note, bill of exchange, bond, due bill, or other written obligation, although, of course, this is not necessary. In order to establish the relation of debtor and creditor in case of a loan of money, it is not necessary to prove that the defendant requested the loan, but the law presumes that when money is loaned to and received by another without any express agreement for its repayment, a lawful debt is created which may be recovered by an action. See Deposit, Interest, and Statutes of Limitations.

II. In case of a loan of the second kind, the property loaned may be used by the bailee only for the purpose for which it was loaned, and he will be responsible even for the slightest negligence if it be thereby lost or injured or impaired in value, the necessary degree of care in each case varying with the nature of the property loaned and the circumstances of the loan. If injury or loss be occasioned by inevitable accident, sudden disaster, theft, burglary, or other cause which could not be anticipated or provided against, the bailee will incur no liability, but the loss will fall upon the bailor. The gratuitous loan creates a trust relation of a personal nature, and the article loaned may be used only by the bailee in the absence of any special agreement to the contrary, or of an express or implied license by the owner that some person may use it. Thus it has been held that the loan of a horse to a person for him to ride did not justify him in allowing his servants to ride. The property loaned is to be returned to the owner at the expiration of the time agreed upon, or, if no such stipulation be made, at the expiration of a reasonable time; and if the bailor then refuses to deliver it on a proper demand being made, he is guilty of conversion, and may be sued in an action of trover for the value of the goods or in an action of replevin for the recovery of the goods themselves. (See Conversion, Trover, and Replevin.) He can not detain the property as a pledge for any demand he may have against the bailor. See Addison, Story, and Parsons *On Contracts*, and Story and Schouler *On Bailments*. F. Sturges Allen.

The Roman Law of Loans.—The Roman law distinguishes two forms of the loan, viz., the loan for use (*commodatum*) and the loan for consumption (*mutuum*). (1) *Commodatum* does not transfer ownership; it is understood that the very thing lent is to be restored to the lender. This form of loan is therefore limited to such things as can be used without being used up. Real property can be thus loaned, as well as movables. (2) *Mutuum* transfers ownership; it is understood that not the specific things lent, but an equivalent quantity, shall be restored. This form of loan is therefore limited to things that take their value (*functionem recipiunt*) from quantity; that belong to a class (*genus*) in which all the single objects are of equal value, so that the lender has no interest except in receiving the same "measure, weight, or number" that he has lent. Among such things the Romans classed money, wheat, wine, oil, etc. Mediæval jurists described these things as "fungibles"; modern jurists call them "representative" or "generic" things.

Both of these loans are in principle friendly, and therefore gratuitous. *Mutuum* does not carry with it any responsibility for interest, even in case of default. If interest is to be paid, it must be expressly stipulated. *Commodatum* does not even tolerate payment for the use of the thing loaned. If such payment is promised, the contract is no longer loan, but hiring (*locatio-conductio*).

Nearly related to *commodatum* is *precarium*. It differs from *commodatum* principally in that the thing loaned *precario* can be demanded by the lender at any time, even before the purpose is accomplished for which it was borrowed. See License.

Closely related to *mutuum* is the so-called "irregular deposit." The regular deposit is a transfer for safe-keeping. It is not a transfer of ownership; the specific things deposited are to be returned. It is in no sense a loan, for the things deposited may neither be used nor consumed. If now money (or other generic things) be deposited, and if the parties agree that the depositee may use the deposit and shall be responsible only for an equivalent amount, the contract is apparently *mutuum*; but the Roman jurists decided that in such cases the amount could be recovered *as deposit*. The principal reason for this decision was that in the action of deposit the referee (*judex*) could condemn the defendant in whatever sum was due *ex fide bona*, including interest informally promised and interest on default (*ex mora*). If, on the other hand, no interest was to be paid, the claim for money deposited was a privileged claim, i. e. the depositor was entitled to be satisfied before other creditors in case of the insolvency of the debtor. This rule was especially important when, as was often the case, money was deposited with a banker (*argentarius*).

In all cases of loan a real contract (*obligatio re contracta*) comes into existence with the delivery of the property lent. In the case of *mutuum* and the irregular deposit, the liability of the borrower is absolute; in the case of *commodatum*, he is liable for any loss or damage occasioned by his willful wrong (*dolus*) or negligence (*culpa*); in the case of *precarium*, he is responsible only for willful wrong. In certain cases counterclaims might arise against the lender. These were enforced by an *actio contraria*.

Loans to a person under paternal authority (*filius familias*) were not recoverable, even when the borrower was of full age, unless the father approved or ratified the contract. Such loans were of course praetically "post-obits."

Loan in the European Codes.—Modern European legislations have retained, for the most part, the distinctions and rules of the Roman law. The loan for use (*commodat*, *prêt à usage*, *Gebrauchsleihe*) is distinguished from the loan for

consumption (*prêt de consommation, Darlehen*). *Precarium*, however, is ordinarily treated as a special form of loan for use, differing from the ordinary loan for use only in being revocable at the lender's pleasure. *Mutuum* and the irregular deposit have practically been fused into a single legal institution. As regards interest informally promised and interest in default, the rules governing the loan for consumption are those of the irregular deposit; but the priority attached to the latter claim is not recognized in modern laws of bankruptcy. In many codes, therefore, the irregular deposit is either ignored or expressly declared to be an ordinary loan for consumption. Some writers, however, still maintain that the irregular deposit (especially the bank deposit) is a different thing from the ordinary loan of money. They assert that the deposit is characterized by a different intention; that the element of safe-keeping enters into it; and that there is therefore an advantage to the depositor that does not exist in the ordinary loan.

Loan and Building Associations: See BUILDING AND LOAN ASSOCIATIONS.

Loanda, or **Luanda**: See ST. PAUL DE LOANDA.

Loan'go Coast: the southwest part of the French Congo coast-line extending from 5° S. lat. about 100 miles N. W. It was the sea-front of the former province of Loango of the native empire of Congo lying chiefly S. of the Congo river. It was acquired by France (1883) through S. de Brazza's treaties with the chief of Loango and other native rulers. The Kwilu is the only considerable river, but far from the sea is not available as a trade-route. The most important place is Loango, which is visited by French, British, and German steamers, and does a fair business in rubber, palm oil, and ivory. It is little more than a collection of European trading-factories, though when it was under native control it had a population of about 15,000. Its importance is due to a sharp bend in the coast, sheltering the roadstead from the prevailing winds. C. C. ADAMS.

Lobau, lō'bow: an island in the river Danube; 6 miles below Vienna. It was taken by Napoleon I. May 19, 1809, occupied by the French army after the battle of Aspern, May 22; was the place whence the invading forces were concentrated in June, and where the celebrated passage of the Danube was made July 4 and following days, 1809. This island gave the title of count to Gen. Mouton, one of the French heroes of the campaign.

Lobau, lō'bō', GEORGES MOUTON, Count de: marshal of France; b. Feb. 21, 1770, at Phalsbourg, France; enlisted as a volunteer in the army in 1792; became aide-de-camp to Meusnier in 1793 and to Joubert in 1798. He took part with Masséna in the defense of Genoa, and was severely wounded in a sortie. Returning to France after the capitulation, he was made a member and later an officer of the Legion of Honor by Napoleon, who appointed him general of brigade and his aide-de-camp in 1805. Thenceforth he took part in all the important campaigns of the empire, distinguishing himself at Jena, at Friedland, and under Bessières in Spain, where he commanded a division. His title, Count of Lobau, was won in the campaign against Austria for the services which he rendered during the occupation of the island of Lobau, and for the storming of Essling, in the battle of Aspern. He was rough and blunt, but courageous and skillful. After the Russian campaign he was at the head of the organization of a new French army, and in the battle of Waterloo he commanded the Sixth Army-corps on the right wing. After the Restoration he was banished from France, and not allowed to return until 1818. In 1828 he was elected a member of the Chamber of Deputies, and he took a prominent part in the revolution of 1830, assumed the command of the national guard instead of La Fayette, was made a peer and marshal in 1831, and put down with great success the uprisings of 1832 and 1834. D. in Paris, Nov. 21, 1838. F. M. COLBY.

Lobby [viâ O. Fr. or Late Latin from Germ.; cf. O. H. G. *louba* > Mod. Germ. *laube*, bower, arbor]: the body of persons who, not being members of a legislature, are engaged in influencing legislators to vote for or against particular measures that come before them. This meaning is doubtless due to the fact that persons who wish to consult legislators are often to be met in the vestibules or lobbies of legislative chambers. Although the word is more often used in an evil sense, it is of course true that much of the influence exerted by lobbyists is entirely legitimate.

The *causes of the existence of the lobby* in connection with nearly all legislative bodies become evident on brief consideration. (1) The legislator needs the advice and assistance of specialists to enable him to form an intelligent judgment on very many of the questions that come before him for action. (2) The system of legislation in vogue in the U. S., under which all bills are referred to small committees for consideration before they are brought for final action before the full Legislature, furnishes a favorable opportunity for lobbying in the vicious sense of the word. (3) Under the U. S. system of legislation, bills that are purely local or private in their nature usually follow the same course as public bills, instead of being treated semi-judicially as in England. (See LAWMAKING, METHODS OF.) Consequently, it is often possible for an individual or for a corporation that has great interests at stake to push a measure quietly through before its real nature has been discovered. (4) For the same reason, a dishonest legislator may bring in a bill that if passed would seriously injure some corporation, and force the latter to pay him to drop the measure. A different system of treatment of private bills would enable such a corporation to expose the real nature of the injurious bill and the motive of the legislator more efficiently than is possible under the present system.

The *methods of the lobby* while, of course, almost numberless, will still vary more or less with the position and character of the lobbyist. At times members of the Legislature themselves will undertake, for pay, to carry measures through. They may employ, in addition to the methods used by others, that of "log-rolling," i. e. they may agree to vote for or against certain bills favored by other members in exchange for a vote given as they wish. Only members, too, can make to advantage a "strike," i. e. the introduction of an injurious measure for the purpose of being paid to drop it. Ex-members often make dangerous lobbyists from their complete acquaintance with legislative methods and men. The most dangerous, because most successful, lobbyists, however, are those ex-members or others who make it their regular business for pay to aid or hinder the passage of any measure whatever at the will of their patrons. Such men in the course of years come to know all the details of legislative business; they are personally acquainted with all the legislators, knowing their history, character, habits of life, and how best to secure their favor. As soon as a new member is elected, his record and life and personal character are studied, and the lobbyist soon learns what are the most effective means of influencing his vote. These means will, of course, vary with the individual; and they range all the way from bare-faced bribery, threats of exposing some past mistake or crime, or of preventing a re-election, to the most subtle and indirect methods of influencing the mind. Articles are written for the papers, letters and telegrams are secured from constituents, social attentions are lavished upon the legislator, loans of money are made him, entertainments are provided for him, anything is done that will probably affect his vote for or against, as may be desired.

The *remedies* for the evils of the lobby are difficult to find, because these evils consist in the abuse of privileges which must be granted in order to secure the most effective legislation, as the privilege of ready access to legislators to recommend new laws or give needed information. The experience of legislative bodies, however, seems to have established the following propositions: (1) It is clear that the separation of private measures from public, so far as is possible, and the treatment of the former in a semi-judicial manner, with full notice to all parties interested to appear to defend or oppose the measures, with due safeguards against hasty or secret legislation, would remove a large part of the evil. (2) The evil sometimes works its own cure in part. In New York, after the exposure of the Tweed corruptions, members were very fearful of being suspected of corruption, and to this day the report that a bill has money behind it is enough to cause many timid members to vote against it with little regard for its merits. (3) Of course, every measure or change in public sentiment that tends to raise the character of the legislators intellectually or morally lessens the evil influence of the lobby. (4) In many States of the U. S., in order to lessen the evil, the constitutions have restricted in many ways the power of the

Legislature, by forbidding special acts, charters, etc., and severe laws have been passed against bribery in any form. In California and Georgia lobbying is punishable as a felony, and a legislator if found guilty of taking a bribe is punishable as a felon, disfranchised, and forever disqualified from holding any office of public trust. (5) The Massachusetts Legislature has passed a law by which every promoter of any law in the interest of others is registered and known as the regularly employed attorney or lobbyist. Failure to register on the part of such an attorney is severely punished. The publicity thus obtained has seemed to give respectability to the work, and to have encouraged corporations and persons interested to secure the services of persons who would employ honest means only. See CRÉDIT MOBILIER and LAW-MAKING, METHODS OF.

AUTHORITIES.—Spofford, article *Lobby* in Lalor's *Cyclopædia of Political Science*; Bryce, *American Commonwealth* (vol. i., p. 673; vol. ii., p. 124, 129); H. C. Tanner, *The Lobby and Public Men, passim*; and *Report of United States Railway Commission* (p. 84), *First Report of Interstate Commerce Commission* (p. 7). As illustrating methods of work of the lobby may be cited various novels, e. g. Hamlin Garland's *A Member of the Third House* and Frances Hodgson Burnett's *Through One Administration*.

JEREMIAH W. JENKS.

Lobeck, CHRISTIAN AUGUST: Greek scholar: b. in Naumburg, Germany, June 5, 1781; was privat docent at Wittenberg 1802; conrector 1808; rector of the Lyceum 1809; professor extraordinary 1810; professor ordinary and librarian at Königsberg from 1814 till his death, Aug. 25, 1860. He is especially noted for his contributions to Greek grammar and mythology. His principal writings are *Paralipomena grammaticæ* (2 vols., 1837); *Pathologiæ sermonis Græci prolegomena* (1843); *Aglaophamus* (2 vols., 1829), in which his treatment of the Orphic sect is particularly valuable, its origin, doctrines, and history being traced out with great learning and acumen. We owe to Lobeck an excellent commentary to the Ajax of *Sophocles*. See *Biogr. Jahrb. xxxii.* (1882) p. 233 f.; Bursian, *Geschichte der class. Philologie in Deutschland*, pp. 572–575, 711–713. ALFRED GUDEMAN.

Lobeira, lō-bay'ĕe-răă, VASCO, de: Portuguese soldier and the reputed author of the famous romance AMADIS OF GAUL (*q. v.*). Little is known of his life. The chronicler Fernam Lopes informs us (*Chronica del Rey D. João I.*, p. ii., cap. 39, p. 97) that after the battle of Aljubarrota (1386), in which he fought, he was knighted by John I. The same writer (*Chronica de D. Fernando*, cap. 177) speaks of him as being already a knight in Elvas in the reign of Ferdinand IV. The contradiction has never been explained in a satisfactory manner. The currently accepted year of his death, 1403, rests upon no sure evidence whatever. No Portuguese version of the *Amadis* romance is in existence, and many scholars have doubted whether there ever was one. The latest, and in many ways the most plausible, theory on the subject, however—that of Carolina Michaëlis de Vasconcellos (in Gröber's *Grundriss der romanischen Philologie*, II. Bd., Abt. 2, p. 216 *seq.*, 1894)—supposes that the real author of the story was the great-grandfather of Vasco de Lobeira, João Pires Lobeira, who was a Galician troubadour living before and during the reign of the famous monarch, D. Dinis (1279–1325). In favor of this view is the fact that we have from this Lobeira a poem dealing with an episode later appearing in the *Amadis*. The confusion of the names is easily accounted for. The transference of the story to Spain is also explicable on plausible grounds. In various ways both João de Lobeira and the *Amadis* are connected with the Infante D. Affonso de Portugal, brother of D. Dinis (b. 1263; d. 1312); but this D. Affonso was married to the Spanish princess Violante Manuel, sister of D. Juan Manuel, one of the most distinguished statesmen and writers of his time. Through the latter and his friends it would be easy for the romance to become known at the Spanish court.

A. R. MARSH.

Lobel', MATTHEW (Lat. form LOBELIUS): botanist; b. at Lille, Flanders, in 1538; studied medicine at Montpellier; settled in England before 1570; made extensive botanical collections in England; devoted himself especially to vegetable physiology and the correction of errors made by Dioscorides; published *Stirpium Adversaria Nova* (London, 1570), containing nearly 1,300 species, with 272 small figures; *Plantarum seu Stirpium Historia* (Antwerp, 1576); *Icones Stirpium* (Antwerp, 1581); and a treatise on *Balsams* (London, 1598). D. at Highgate, London, Mar. 2, 1616.

Lobe'lia [named by Plumier in honor of Matthew Lobel, botanist to King James I.]: a genus of plants of the natural order *Lobeliaceæ*, of which the most important species is the *Lobelia inflata*, or Indian tobacco, as it is commonly called. This is a very common indigenous annual or biennial herb, growing wild in waste spots throughout Canada and the U. S. It has a fibrous root, and a solitary straight hairy stem rising about a foot high. The flowers are small and of a light-blue color; the leaves oval, serrated, and hairy. The entire herb, dried, is used in medicine under the name *lobelia*. Its properties depend on an alkaloid, *lobeline*, which is a thick, oily, transparent, volatile fluid, with a pungent taste resembling tobacco. Lobelia is a powerful nauseating emetic, producing in full dose an effect like that of tobacco—long-continued, distressing nausea and vomiting, with purging, copious sweating, and great muscular relaxation. In overdose it is a potent acro-narcotic poison. Lobelia is too severe an emetic to be used to produce vomiting, and its medicinal employment is in non-emetic doses as a relaxing agent in asthma and allied spasmodic diseases. If given at all as an emetic it should be used in one full dose rather than in several small ones, since under those circumstances vomiting takes place before enough is absorbed to cause serious symptoms.

Revised by H. A. HARE.

Lobelia cardinalis: scientific name of a species of lobelia, popularly called the cardinal flower, from the intense red color of the blossoms. It is the most showy of the species indigenous to North America, and is prized in cultivation. The low and bright-blue flowered lobelia, largely used as a bedding-plant, is *L. erimus*, from the Cape of Good Hope.

Loblolly Bay: See GORDONIA.

Lob Nor (LOB LAKE): a body of water in Eastern or Chinese Turkestan, just W. of 90° E. lon. from Greenwich. The fertile oasis it occupies is bordered on the S. by the Altin-tag range and surrounded on all other sides by the Gobi Desert. Known for centuries through old travelers and Chinese writers and map-makers, the first European to visit it in modern times was Prejevalsky (1876), who found that it is a reedy lake of no great depth, bordered by flat shores, the haunt of immense numbers of water-fowl, and inhabited by a few hundred human beings whose habits, tenements, and mode of life resemble those of the primitive lake-dwellers. It has no outlet, but its waters are quite sweet at its western end, where it receives the Tarim river. Gradual desiccation, assisted by the withdrawal of much water for irrigation purposes, presages the complete disappearance of the lake, which is now (Bonvalot, 1891) little more than a marsh.

C. C. ADAMS.

Lo'bo, FRANCISCO RODRIGUES: Portuguese poet. Almost nothing is known of his life; the date of his birth is nowhere preserved, and that of his death (by drowning in the Tagus) can only be fixed as somewhat after 1623. He was a native of Leiria, and seems to have been in the *entourage* of the Duque de Caminha. He is said to have studied at Coimbra, and then to have passed his life in comparative retirement at Leiria, occasionally paying a visit to Lisbon. By Portuguese critics he is acknowledged as one of the best of their writers. Coming at the beginning of the seventeenth century, a period of literary decay in Portugal, he still preserved the strength and beauties of the preceding century. He felt the influence of contemporary Spanish poetry, notably that of Góngora, and he was familiar with the work of the Italians; but he also loved the traditional and popular verse of his native land, and his greatest successes were obtained in his *Serranilhas*, in imitation of the naïve charm of this art. We have from him *Romances: Primeira e segunda parte* (with two exceptions written in Spanish; Coimbra, 1596); *A Primavera* (Lisbon, 1601); *As Eclogas* (Lisbon, 1605); *O Pastor peregrino: segunda parte da Primavera* (Lisbon, 1608); *O Desenganado: terceira parte da Primavera* (Lisbon, 1614). Also an attempted epic, *O Condestabre de Portugal* (1610), and an imitation in mingled verse and prose of Castiglione's *Cortegiano*, entitled *Côrte na Aldéa, e noutes de inverno* (Lisbon, 1610). The latter was long regarded as Lobo's masterpiece. The *Obras politicas, moraes e metricas de Francisco Rodrigues Lobo* were printed in Lisbon in 1723 (later, less complete edition, Lisbon, 1774).

A. R. MARSH.

Lobo, JERONIMO: missionary; b. at Lisbon about 1593; entered the order of the Jesuits in 1609, and went in 1622

as a missionary to Goa, whence he proceeded to Abyssinia in 1624. Here he worked with great success, but was at last expelled in 1634, and returned to Portugal to persuade the Christian powers to make a crusade against Abyssinia. Having failed in this, he went once more to Goa in 1640, whence he returned in 1656, and died at Lisbon, Jan. 29, 1678. Lobo wrote a narrative of his travels, which made a great sensation, and was translated into many foreign tongues—into French in 1673 and more fully by the Abbé Legrand in 1728, and into English by Dr. Johnson (1735).

Revised by F. M. Colby.

Lobo'sa [Mod. Lat., fr. Gr. λοβός, a lobe]: a sub-class of Protozoa belonging to the Rhizopoda, and characterized by the power of protruding lobe-like processes of protoplasm (pseudopodia). There is no cell-wall to these single-celled organisms, but in the protoplasm one can distinguish a clear outer layer gradually passing into the more granular central portion. A nucleus is always present, and there is frequently a clear space (contractile vacuole) which rhythmically expands and contracts, and is supposed to be for the excretion of nitrogenous waste. A few species, like the *Amœba*, are naked, but the majority form protecting cases, either as in *Arcella* by a hardened secretion of the body or, as in *Difflugia*, by cementing together grains of sand, etc. *Amœba* is possibly the best known member of the Protozoa. All of the Lobosa are microscopic, and most of the species occur in fresh water, only a few being found in the sea. The American species have been beautifully monographed in Leidy's *Fresh-water Rhizopods*, published by the U. S. Geological Survey.

J. S. Kingsley.

Lo'bos Islands [Span. *lobo*, seal], or **Seal Islands**: three small islands off the coast of Lambayeque, Peru, between 6° and 7° S. lat. The Lobo de Tierra is 12 miles from the mainland; the other two are about 35 miles out. They are rocky, but of no great height, and have a small population. They are important for their extensive deposits of guano, being among the few of the Peruvian guano islands which are not exhausted.

H. H. S.

Lobster [O. Eng. *loppestre*, perhaps corrupted from Lat. *locus'ta*, locust, shell-fish, lobster; cf. O. Eng. *lopust*, locust]: one of the largest and most valuable of all *Crustacea*, and second only to the oyster as an article of food among the marine invertebrates of the North Atlantic coast. It is classified with the *Macroura*, a sub-order of the *Decapoda*, which embraces lobsters, crayfishes, and shrimps. The European lobster, *Homarus vulgaris*, has its chief habitat on the southwestern coast of Norway, but is found throughout the British islands, on the coast of Iceland, and in the Mediterranean. It does not go into the Baltic. The langouste, or spiny lobster, *Palinurus vulgaris*, abounds in the Mediterranean, but is rare in the Atlantic. The Norwegian lobster, *Nephrops norvegicus*, is common in Norway, but less abundant on the coast of Sweden. It occurs sparingly in the British islands and in the Mediterranean Sea. The North American lobster, *H. americanus*, which is more important economically than all the preceding, is found in the coastal waters of the Atlantic Ocean from Labrador to Delaware, and in depths extending from the shore-line out to 100 fathoms.

The extreme northern limits of the North American lobster are the Straits of Belle Isle. Nova Scotia, Prince Edward Island, Newfoundland, New Brunswick, and Maine constitute the great lobster-producing territory of the Atlantic coast. A few lobsters have been detected as far S. as Johnstown, Va., and in 1884 the U. S. Fish Commission steamship Albatross obtained a good-sized specimen off Cape Hatteras, N. C., from a depth of about 30 fathoms. The lobster is a sedentary animal, its only migrations being to and from deep water. The spring movement toward shore occurs in April or May, when the temperature of the water has reached about 55° F., and the fall migration in October or November.

In Maine the summer fishing begins in May and lasts until November. During this time lobsters are caught in 3 to 10 fathoms of water. The winter fishing is conducted in 35 to 40 fathoms.

The lobster never swims at the surface of the water, but crawls or walks on the tips of its thoracic legs. By means of the flexible part of the body or "tail," it is able to dart backward with great rapidity, sometimes going 25 feet in less than a second. Its food consists of shell-fish, especially clams, fish, and all kinds of dead animals.

The sexes appear to be about equally divided. The female reaches maturity when from 8 to 12 inches long. Adult females produce eggs once in two years. The spawning period is mostly confined to June, July, and August, but it is a remarkable fact that a certain number (probably not large) lay eggs in the fall, winter, and spring months. The extruded eggs are attached by a viscous cement, which hardens in the water, to the swimming legs and to the under side of the tail. In this position they are carried about by the female, and are aërated by the fanning motion of her swimmerets for a period of from ten to eleven months, when the young are hatched and immediately dispersed. The latter rise to the surface, and begin life as free-swimming larvæ. At Wood's Hole, Mass., the majority of eggs always hatch in June; farther N. the hatching period is a little later, and a few may be hatched in the fall. The hatching of a single brood lasts about a week. Shortly after the hatching of her young the mother lobster molts, but does not produce eggs again until the following summer. The eggs are usually of a dark-green color, spherical, and measure about $\frac{1}{16}$ of an inch in diameter. Their number varies with the size of the animal producing them—from 3,000 to over 80,000. The law of production of ova may be expressed as follows: *The numbers of eggs produced by female lobsters at each reproductive period vary in a geometrical series, while the lengths of the lobsters producing these eggs vary in an arithmetical series.*

According to this law we have the following:

Series of lengths:	8 :	10 :	12 :	14 :	16
Number of eggs:	5,000 :	10,000 :	20,000 :	40,000 :	80,000

The adult lobster often falls a prey to fish of many kinds, such as the pollock, striped bass, and tautog, the sharks, rays, and skates. The cod and striped bass are perhaps its most formidable enemies, excepting always man, especially when it is young or in a soft condition. The pernicious destruction of spawn lobsters by fishermen and canners has been instrumental in hastening the decline of the fishery.

The lobster, like other arthropods, is surrounded by an external skeleton, which is a dead, inelastic product, and must therefore be cast off periodically in order to admit of growth. The frequency of this exuviation or molting depends upon the age and nutrition of the animal, and is the register of its growth. During the first four months of its life the lobster molts from eight to ten times, the adult female probably not oftener than once in two years, and the giants weighing upward of 20 lb. at much longer intervals. Hard-shell lobsters have the finest flesh, stand transportation best, and are therefore most valuable for the market. A large proportion of all lobsters taken in fall, winter, and spring are of this kind. The greatest number of soft-shell or new-shell lobsters appear from July to October. When the critical time has arrived the lobster turns over on its side, distends the membrane between the tail and the shell of the back until this finally bursts, and the whole body is then slowly drawn through the opening thus formed. The carapace is lifted up, the appendages are freed gradually from their old covering, and the tail comes out last. The old shell is thus discarded whole, the internal parts of the skeleton, including the lining of the stomach and intestine, being simply withdrawn from the folds in the external skin in which they are formed. This process occupies five or six minutes. Immediately after the molt the lobster is limp as wet paper, and perfectly helpless. The process of hardening of the new shell is very gradual, and it requires about two months to produce a shell as hard as the one cast off. Rubber shell, buckle shell, paper shell, and shadow are some of the names in use to designate lobsters with new soft shells. A store of lime is secreted during the molting period by the walls of the stomach in the form of two nodules, each about the size of a filbert. After molting these gastroliths are retained in the stomach, where they are absorbed. Young lobsters sometimes fill their stomachs with calcareous particles, such as fragments of mollusk-shells, immediately after molting, in order to obtain a large supply of lime for the hardening of the new shell. An adult lobster increases in length after molting from $\frac{3}{4}$ of an inch to $1\frac{1}{2}$ inches.

When the young lobster hatches from the egg it is about one-third of an inch long. It probably keeps near the surface, where it feeds on microscopic organisms. In two weeks it has molted four times. When three to four weeks old it molts again, and soon after goes to the bottom. It now has the general external appearance and many of the habits of the adult. The largest lobsters caught are invariably males, and attain a weight of probably not over 30 lb. One of the

largest with an authenticated record, in the museum of Adelbert College, Cleveland, O., weighed when alive between 27 and 28 lb. There is no constant relation between the length and weight of a lobster, on account of the variation in the size of the claws. A 10½-inch lobster will weigh about 1¾ lb.

The extruded eggs of the lobster when in an advanced stage of development may be successfully hatched by artificial means, and the young lobsters liberated. As no successful method of rearing the young lobster until it has passed its free-swimming stages and goes to the bottom has yet been devised, little good can be accomplished by this method on account of the enormous death-rate of the young. Not over two in every 10,000 eggs hatched survive and reach the adult state under present conditions.

Attempts to transport lobsters across the continent alive and plant them in the Pacific Ocean have been made by the U. S. Fish Commission: 590 lobsters, many of them egg-bearing females, have been safely planted on the Pacific coast. No evidence has yet appeared to show that the lobster has multiplied and thriven in this new environment.

Lobster-fishery.—As early as 1810, according to Rathbun, some fishing was done at the Elizabeth islands and in Connecticut, but the fishery in North America appears to have been first started on Cape Cod. While the lobster formed an important food-supply to the inhabitants of the New England coast in colonial times, the fishery did not become a distinct industry until about 1840, when it had extended to the coast of Maine. Here and in the Maritime Provinces this important industry has reached its greatest proportions. It is unfortunately in a decline, due to overfishing. The growth of the fishery was correlated with that of the canning industry, which is said to have been introduced from Scotland into the U. S. shortly after 1840. While in 1850 there were only 3 canneries in the U. S., in 1880 there were 23 in the State of Maine. In 1892 there were 212 canneries in Prince Edward Island alone, 186 in the province of New Brunswick, 46 in Quebec, and 182 in Nova Scotia.

Legislation for the protection of the lobster, however vacillating and unfounded on scientific knowledge, has probably helped to stay the decline of the fishery. In Maine (laws of 1893) it is unlawful to destroy female lobsters with extruded eggs, or lobsters less than 10½ inches long, from July 1 to May 1 following. In May and June the legal limit is set at 9 inches (measured from rostrum to end of tail-fin). Canning is allowed only between Apr. 20 and July 1 following, and no lobsters must be preserved under 9 inches in length. Somewhat similar laws are in force in the other States and in the British provinces.

Lobsters are caught in pots or traps made of laths with a funnel-shaped opening at either end. The pots are weighted with stones, and set either in single warps or in trawls of eight to forty pots each. The traps are baited with refuse fish, and the lobster, when once inside the pot, seldom escapes unless small enough to crawl between the slats. It has been estimated that half a million lobster traps have been used in the Maritime Provinces in a single year.

The pots are tended from small boats, and the catch is kept in floating "cars," moored in some protected spot near the shore. Welled fishing-smacks gather the lobsters from the fishermen and carry them to the canneries and to the large distributing centers, such as Portland, Boston, and New York. The lobsters are shipped alive in barrels, with ice in summer, to all parts of the U. S. Large quantities are immediately boiled for home consumption. The impounding of lobsters in large inclosures of salt water, where they can be kept during the winter, and taken up when needed for market, is now successfully practiced on a large scale. When lobsters are prepared for food the stomach, or "lady," and intestine must be removed. No other parts of the lobster are poisonous under ordinary circumstances. The "coral," or ovaries, and "tomally," or liver, are highly esteemed by epicures.

The average annual yield of the Norway lobster-fishery from 1879–84 is said to have been 1,175,000 lobsters, valued at $107,468, the greater portion being shipped to Great Britain. About 3,000,000 lobsters are said to be taken in Great Britain in a year, while on the shores of Prince Edward Island alone 26,000,000 lobsters were captured in 1885. The total number of lobsters caught in New England in 1887 was 1,960,939; total value, $120,307. The New England lobster-fishery in 1889 yielded 30,449,603 lb., valued at $833,736. The percentage of lobsters caught in the different New England States for the same year was: Maine, 68·86; New Hampshire, ·77; Massachusetts, 17·81; Rhode Island, 2·59; Connecticut, 9·97. More people were said to be engaged in Maine in the capture of lobsters than of any other single product, and the value of the output in 1889 was more than one-fourth of that of the entire yield of the fisheries of the State, being $574,165. *Bulletin United States Fish Commission*, vol. x., p. 108.

The total yield and value of the lobster-fishery of Canada in 1892 was: Cans of preserved lobsters, 12,524,498; value, $1,758,425; tons of lobsters shipped alive or fresh, 6,028; value, $238,300; total value, $1,996,725. Statistics for 1880 for the U. S. (New England, New York, New Jersey, Delaware): Lobster-traps, 147,018; pounds of fresh lobsters caught, 10,934,754; pounds of lobsters canned (in Maine), 9,455,284; value fresh lobsters, $408,005; value canned lobsters, $238,253; total value, $746,258.

In the lobster-fishery we have the anomaly of a declining industry, with a yearly increasing yield, but with a gradual diminution in size of the lobsters caught, and an undue increase in the number of traps and fishermen. As a result, the grounds have in many places been depleted. In Prince Edward Island, in 1879, from three to three and a half lobsters were required to fill a pound can, while in 1888 it required seven. It is said that the business is not profitable when five to six lobsters are required for this purpose. For an account of the lobster and the lobster-fishery, see *The Fisheries and Fishery Industries of the United States*, sect. 1 and 5 (Washington, 1884–87). FRANCIS H. HERRICK.

Lobworm: See LUGWORM.

Local Action (in the voltaic cell): chemical action which does not generate current in the external circuit, and consequently is a source of loss. See BATTERY.

Localization: the act of localizing, or of assigning a definite location or place to something. Specifically (*a*) in medicine, the determination of the site or organ in which physical and morbid processes originate, or the process by which a general physiological or pathological condition becomes concentrated in one particular locality. When pathological it is known as *morbid localization*. (*b*) In physiology and psychology, the principle according to which different regions of the brain and nervous system are concerned with different and exclusive functions, more particularly known as **Cerebral Localization**. Most important consequences flow from this principle in the sphere of brain physiology and anatomy, and also of psychology.

Facts of Localization or Nervous Specialization.—In the two halves or hemispheres of the brain we find a twofold or duplicate organ, analogous to the doubleness of the eyes while performing together a single function. In regard to the function of the brain as a whole, we may say that in the main it is performed equally well by either hemisphere alone. If one hemisphere be entirely removed or destroyed, there is no perceptible impairment of the mind, at least in its greater typical activities. The hemispheres are moreover capable of separate activities at the same time; the movements of organs on the right side of the body, which are governed by the "motor area" in the left hemisphere, may be different from simultaneous movements on the left side, governed by the "motor area" in the right hemisphere. Again, there are certain functions which are presided over by one of the hemispheres exclusively, the other having no part in them: the motor speech-center is in the left hemisphere in right-handed persons, and reversed in left-handed persons; and it is probable that there is a corresponding functional development for the delicate movements of one hand only, as in writing, etc. Accordingly, instead of considering the brain as two duplicate organs, either of which might be educated to perform all the cerebral offices, we have to consider it as a double organ whose functions are partly separate and partly conjoint. That is, the facts point to the conclusion that (*a*) there is a class of functions over which the hemispheres have conjoint dominion: functions which they may perform together and which either may perform alone, and functions which they must perform together and can not perform alone; and (*b*) there are functions which are peculiar to each alone: which one must perform alone, and in which the other has no share.

The great divisions of function may be stated in general terms under three heads in accordance with the facts now presented:

1. Purely reflex functions are presided over by the spinal cord and lower centers.

2. The automatic functions proceed out from the central and tegmental systems of centers beneath the cerebral hemispheres.

3. Sensation and voluntary movement have their seat in man in the cortex of the hemispheres.

If 1 and 2 be considered together as giving only one degree of complexity, and 3 be added as giving another degree, we may show their relation by Fig. 1.

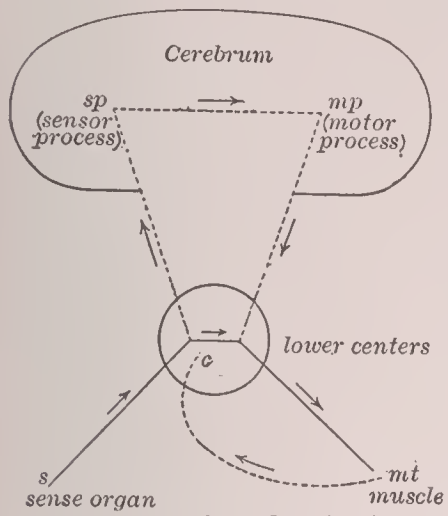

Fig. 1.—*s c mt* = reflex circuit ; *s c sp c mt* = voluntary circuit.

The degree to which the cortex serves the purposes of mind, above the bare reception of present stimuli and mechanical reaction upon them, is seen in the behavior of animals deprived of the cortex. Frogs and pigeons have been fully tested in view of this question. It is found, in brief, that the life and reactions of the creature are unimpaired so far as the *immediate* environment is concerned: it lives, breathes, flies, sees, eats, carries out all reactions of response to direct stimulation; but it fails to respond to remote stimuli: the reactions are for the most part uninfluenced either by the past or the future. The creature lacks spontaneity. Memory has disappeared; so have generalization and purpose. The creature has *sensations*, but not *perceptions*, as far as a line can be drawn between these states. It fails utterly to *recognize*, and it fails to *attend*. It is plain, then, that such a hemisphereless creature lacks largely the co-ordinating, retaining, relating, or, as it is often called, the "apperceiving," function. The terms *psychic*-blindness, *psychic*-deafness, etc., are given to this condition, in which there is no *physical* blindness, etc., but in which sensations have lost their mental *meaning*. As for particular reactions, however, the greatest difference is found in different animals. In dogs and birds many functions are performed by the lower centers which are presided over by the hemispheres exclusively in monkeys and in man. This illustrates the fact that reactions at one time reasonable and intelligent may become nervous and mechanical: and this consideration, based upon extended experimental proof, leads us to recognize the great elasticity of the system as regards specialization. When these maimed animals are kept alive, their condition improves, and they begin to get something of their intelligence back again.

Localization in Special Areas of the Cerebral Cortex.—The question as to whether there are local areas in the cortex or gray matter of the hemispheres which are especially active in the exercise of the sense and motor activities is of great importance for general psychology. Experiments have

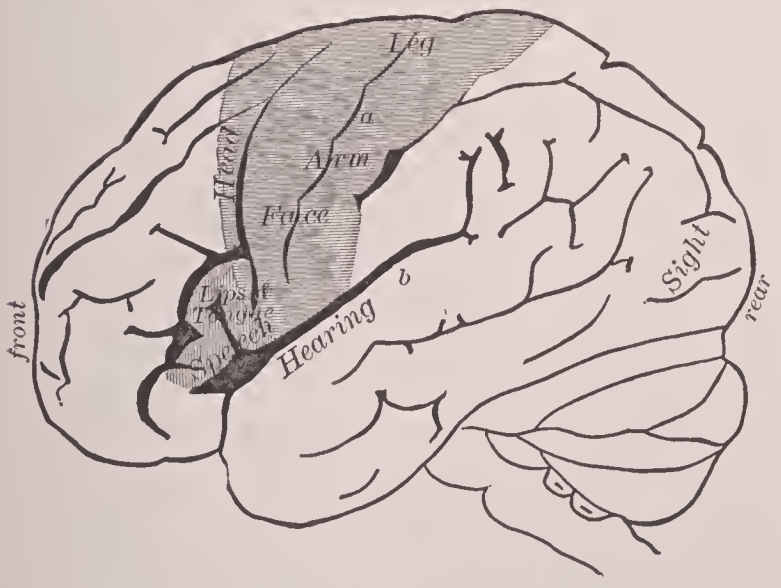

Fig. 2.—Outer surface of left hemisphere of the brain (modified from Exner): *a*, fissure of Rolando ; *b*, fissure of Sylvius.

been very conflicting in their results, but it is now generally admitted that there are a limited number of well-ascertained areas. The motor functions are grouped around the fissure of Rolando (see *a*, Fig. 2), extending roughly from the vertex of the skull downward and forward in a line which passes slightly in front of the orifice of the ear. The centers for the leg, arm, and face are in the order named, proceeding downward. The special muscular groups involved in the finer movements of these organs are distributed on both sides of the Rolandic fissure. Movements of speech have their center for right-handed persons in the third frontal gyre of the left hemisphere. The sensory area comprehends the region lying back of and beneath the motor zone; the fissure of Sylvius (see *b*, Fig. 2) being a rough horizontal boundary between the motor and sensory areas. Of the special senses, sight is located in the occipital lobe, including the so-called angular gyre at the upper end of the Sylvian fissure. The centers for hearing, taste, and smell lie, less exactly, in the temporo-sphenoidal lobe, the horizontal area below the fissure of Sylvius.

In man the destruction of the frontal lobes seems to bring about a higher kind of "psychic blindness": a loss of voluntary attention, co-ordination, and thought. According to a widely current hypothesis these lobes are the final center of convergence for the connections between the sensory and motor centers of the brain. The loss of connection between this seat and any other area cuts the latter with its store of memories off from its full *rôle* in the mental life. For example, speech may be impaired by the loss of any one of three functions located in different areas, i. e. word-seeing, word-hearing, and word-uttering.

One of the most difficult and important questions yet remaining open is the determination of the particular regions which contribute directly to consciousness, i. e. which are sensory. Are we conscious of the motor centers at all, or is all our consciousness of movement, as well as other sensibility, mediated by elements which are only sensory? May sensory areas be also motor? That motor and sensory functions may at least be performed by the same areas is shown by Schäfer and Munk, who find (in opposition to Ferrier) definite movements of the eyes following electrical stimulation of the sight (sensory) center (occipital lobe) in dogs and monkeys. It is possible (Munk) that this center controls reflex eye-movements, and that the eye-movement center in the Rolandic region is the seat of voluntary movements. This view agrees with the suggestion of Bianchi that the ordinary stimulation of the motor areas does not pass directly out to the nerves, but passes first through the sensory centers: a position supported by all cases of sensory effects following the stimulation of motor areas. Beaunis holds that the motor elements have an immediate element of consciousness. Schäfer is led to the position that the visual area represents in some detail a projection of the retina upon the cortex.

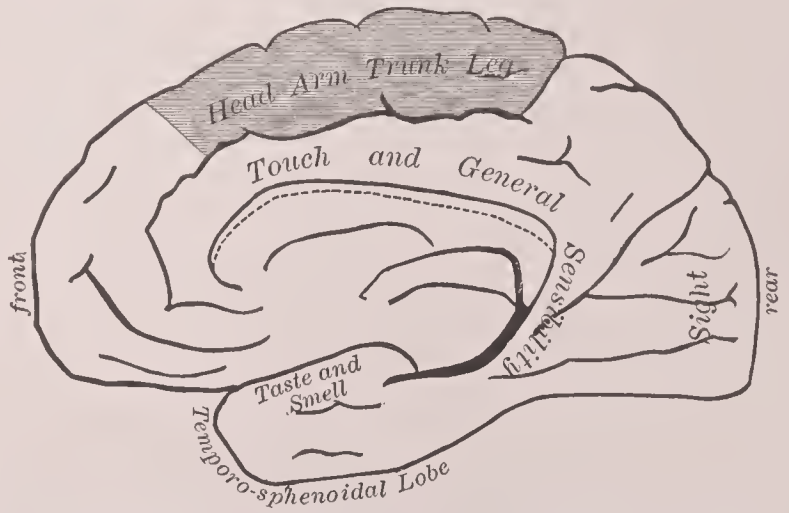

Fig. 3.—Inner (mesial) surface of the right hemisphere of the brain (modified from Schäfer and Horsley). In both figures the shaded area is the motor zone.

Principle of Indifference of Function.—The principle of indifference includes the class of facts which show that the nerve-courses are not the agents of different or specific forces, but parts of a common system and agents of a common life. As a matter of fact, we find that different courses can be made to perform each other's function. If a piece of sensor nerve be joined to a cut end of a motor nerve and grow in place, it will conduct the motor impulse continuously with the motor piece. The contrary is also true. The range of such experiments is very limited, since it is impos-

sible to exchange the end-connections of nerves either centrally or peripherally; but the facts at hand establish conclusively the principle of indifference as regards the sensor and motor nerve-tracts. In its application to the centers the same principle has a different name, since it takes a somewhat different form of manifestation, i. e. the principle of *substitution.*

Principle of Substitution.—The question further arises: Can the nerve-centers be made to take up each other's function? Researches in cerebral localization, chiefly upon animals, tend to show that such a substitution of function is possible, at least to a limited degree. The removal of a cortical center, which occasions loss of one of the special senses, say sight, or the loss of control over a certain muscular area, seems to be made good by the assumption of the deranged function by a contiguous or, at least, a connected center. At any rate, the animal recovers, if kept alive a sufficiently long period. The word "seems" is used advisedly, for it is still uncertain whether the loss of such a function is due to the destruction of the entire apparatus normally reacting to this function or to its partial loss, the remaining elements being temporarily inhibited by so-called "physiological shock," or, in the case of electrical stimulation, by diffusion of the current. The latter is known to be the case in many of the experiments on brain-tissue, especially when the surgical method is employed without the extremest care. This latter view is also supported by the remarkable fact that in the monkey and man these substitutions are exceedingly rare; a result we would expect on the shock theory, considering the higher degree of delicacy and differentiation attained by the system in these higher organisms. Yet in the case of rabbits and dogs such substitution, notably of the sight, is probably established on a firm basis.

Principle of Specific Connection.—The limits which the growth of the organism sets to the substitution of functions find their expression in what is called "specific connection" through the system. By this principle is meant, in general, two things: First, that nerve-courses are specific only according as they have certain well-defined connections at center or periphery. These connections keep the courses to an invariable function. The optic nerve has a specific connection with the retina and with the optic center in the brain; the auditory nerve with the ear and the center for hearing, and so on. In this case it is the end-organ or the center which is specific, not the nerve-tract; and, second, it means that nerve-centers are specific according as their connections necessitate their reacting to a specific stimulus. The optic center has specific connections with the retina through the optic nerve; the center for sounds with the ear, through the auditory nerve, and so on. Now there are as many of these specific connections as there are kinds of stimuli issuing in motor reactions. Consequently, the only specific things after all are the stimulus and the movement. For the bearing of all these facts and principles upon mental theory, see PHYSIOLOGICAL PSYCHOLOGY.

REFERENCES.—The physiologies generally, of which Foster, *Text-book of Physiology*, 5th ed., part iii., is very reliable (London and New York, 1890); Edinger, *Structure of the Central Nervous System*; Obersteiner, *Central Nervous Organs* (Eng. trans., 2d ed. 1893); Ferrier, *Functions of the Brain* (2d ed. London, 1886); Wundt, *Physiologische Psychologie* (4th ed. 1893, i., *erster Absch.*); Ladd, *Elements of Physiological Psychology* (New York, 1887, part i.); also *Outlines of Physiological Psychology* (New York, 1891); James, *Principles of Psychology* (i., chaps. ii. and iii., New York, 1890); Baldwin, *Handbook of Psychology* (vol. ii., chaps. i.–ii., New York, 1891).

J. MARK BALDWIN.

Localization, in Space: the mental act or function by which we perceive objects at certain definite localities. The physiological indications by which we do this are called *local signs.* By local signs are meant specific local differences in the arrangement or structure of the elements in the skin and retina. By reason of these differences localities are known to be in the positions they really occupy in space. I refer an excitation to my hand or foot; why do I give it such a reference? Why do I locate a pain in my right hand rather than in my left? Simple sensations, as tastes, sounds, are fused together; but such sensations from neighboring points of the skin and retina preserve their peculiar character and relation to one another, and we distinguish different localities because the sensations from them are really different. The first idea of our own body results from muscular sensations which arise from early movements, and these sensations are vague and confused; yet even here the feeling of extension is present, also vague and confused. Whence comes it? It can only come from initial differences of some kind which are perpetuated through transmission to the brain. These differences, probably in the skin or sensor nerves, and possibly a matter largely of association, afford a datum for the localization of sensations in different portions of the body.

The theory of local signs was first propounded by Lotze, who, however, varied it in its application to different orders of sensation. For sight he made the local sign consist in the fixed amount of muscular movement which any retinal point must undergo to be brought into the line of clearest vision. This is a different and definite quantity for every point in the retina. In the skin the local sign, for Lotze, was the combination of light accessory sensations which are provoked in immediate connection with the point of contact. There would be a varying amount of radiation of stimulus in the skin according to the varying structural consistency of the parts over which the skin is stretched, as bone, muscle, ligament. This hypothesis found development in the more natural position that the local sign was an implanted peculiarity in the structure of the skin itself. A further theory, very widely adopted, and suggested by Czermak, makes the local distinctions in the skin due to the ramifications of the spread-out nerve fibrils, each such nerve-end reacting for its own position and being thus a local sign. This position is most probable. It is supported by the fact that the sensibility of the skin to local differences varies greatly in different parts of the body and may be increased by the fixing of the attention, by exercise, and in the hypnotic state. These latter conditions tend to bring into play finer elements of the ramifying nerve, and thus to diminish the distance between the sensitive points. And the same facts tend to refute the theory that the units of tactual feeling are found in Weber's "circles of sensation."

Besides the general consideration that some such hypothesis as that of local signs is necessary to the case, there is direct evidence of the existence of these signs. The fact of varying local discrimination of the skin has been mentioned; it is also true of the retina. The relative discrimination of localities grows less delicate as we proceed from the center to the edge of the retina. The quality of massiveness or extensity of sensations of touch and sight depends upon the simultaneous independent excitation of units of sensation, and can be accounted for only on the assumption of some characteristic by which these units are kept distinct. If the skin of the forehead be bent down upon the nose and grow there, its irritation is felt still at the forehead. The same is seen in the retina in certain pathological affections, in which the retinal elements are displaced; the irritating points of light falling upon these elements are localized where they would be seen by the healthy eye.

J. MARK BALDWIN.

Local-option Laws: in general, laws empowering a political division of a state to decide upon a certain measure; in a special sense, laws authorizing the people of each locality to decide for themselves the question of permitting the sale of liquor within its limits. In the U. S. objection has been made to local-option laws as unconstitutional, in that they delegate legislative power to the locality by making their adoption depend upon the popular vote; but this objection has not been sustained by the courts, which have generally held that these laws merely involve the delegation of a power to determine some fact or state of things upon which the law-making body makes or intends to make its own action depend. (See Cooley on *Constitutional Limitations.*) Local option in the matter of the liquor traffic has been advocated in the U. S. chiefly by those who wish to suppress this traffic altogether, but think it easier to fight it in the localities than in the State as a whole. To these are added those who, while not in sympathy with the PROHIBITION (*q. v.*) movement, consider it fair that each locality should bear the responsibility of the continuance or suppression of the traffic within its limits. Acts authorizing local option have been passed by many of the State Legislatures, and its advocates claim that it has been at-

tended with a high degree of success, maintaining that it is more practicable than prohibition by legislative act or constitutional amendment, and less liable to evasion where it has resulted in forbidding the sale of liquors. Where this system has prevailed a large proportion of the localities have prohibited the traffic. Local-option enactments in the various States differ greatly in detail, but as a general rule provide that at stated intervals a certain proportion of the voters of the locality may, upon petitioning the Legislature, secure a special election to decide the question of prohibition. In some States, however, the question is periodically submitted for decision without requiring a preliminary petition. In Great Britain the leader of the local-option movement is Sir Wilfrid Lawson, author of the Permissive Bill, who introduced a local-option resolution in Parliament in 1879, and has since tried in vain to secure to the electors of a locality the power to veto the issue of licenses. The term local option in Great Britain includes schemes for the reform of the licensing system, and for securing to localities a wider range of powers than is demanded by Lawson and the United Kingdom Alliance, as the right not merely to accept or reject, but to regulate completely the liquor traffic within their bounds. Location: See the Appendix.

Lochleven, loch'lee'ven: a small lake in Fifeshire, Scotland; containing an island on which stood the castle noted as the place where Mary Queen of Scots was imprisoned from July, 1567, until her escape, May 2, 1568. The place is now of no military or strategical importance, but was in the sixteenth century a stronghold of the first rank.

Lock [O. Eng. *loc*, inclosure, door-fastening, deriv. of *lūcan*, lock, fasten]: an inclosed mechanism for fastening doors, drawers, lids, etc., by means of a movable bolt; usually operated by a portable instrument called a key, but sometimes by a turning knob or dial.

The ancients, although possessing great skill in many conspicuous arts, do not seem to have distinguished themselves as makers of locks, as clumsiness appears to have been the predominant characteristic of all their locksmithing, or rather lock carpentry, for the evidence accessible indicates that the earliest locks were made of wood, long before skill in the shaping of metals was applied to the construction of such articles. Without doubt, the first lock was made in Egypt, the birthplace and nursery of the arts and sciences. Wooden locks of a rude and primitive design—quite similar to those made 4,000 years ago—are still in use in Egypt and Syria. Thompson states that the steward of the convent on Mt. Carmel opened his magazine with a key as large as a club, reminding him of Isaiah (B. C. 758) xxii. 22, "The key of the house of David will I lay upon his shoulder." This suggests the statement of Callimachus (B. C. 260) who in his *Hymn to Ceres* speaks of the goddess taking the form of Nisippe, her priestess, carrying a "key fit to be borne upon the shoulder." Locks continued to be made large and clumsy for many centuries, for Eustathius, Bishop of Thessalonica (A. D. 1155), tells of keys that were curved like a sickle, and so large that they were often carried on the shoulder.

In the book of Judges, chap. iii. 23–25, we are told that "Ehud (B. C. 1330) locked the doors of the parlor," and that the servants of King Eglon "took a key and opened them." This is the earliest mention of a key in history. Homer's description of the opening of her wardrobe by Penelope is translated by Pope thus:

> A brazen key she held, the handle turned,
> With steel and polished ivory adorned.
> The bolt, obedient to the silken string,
> Forsakes the staple as she pulls the ring;
> The wards, respondent to the key, turn round,
> The bars fly back, the flying valves resound;
> Loud as a bull makes hill and valley ring,
> So roared the lock when it released the spring.

It is clear that this must have been a burglar-alarm lock; and the terribly sonorous character of the alarm is suggestive of possible improvements in the mechanism of modern alarm-locks.

The door-lock used in Egypt, which is the oldest known method for fastening doors, etc., is made of wood to-day precisely as when first invented forty centuries ago, and is a good example of the "persistence of a type" in mechanism. The bolt of the lock is rectangular in cross-section, open at one end, and hollow throughout the most of its length; on the upper surface of the hollow portion of the bolt are several vertical holes communicating with the hollow. The bolt slides in an inclosing box or case of wood secured to the inside of the door; when the bolt is pushed in locking (the key is not required for this operation), so that its solid end enters the mortise in the doorpost, a number of pins (having heads on their upper ends to prevent their falling too far), which occupy holes in the upper part of the bolt-case, drop into the holes in the upper surface of the bolt, and thus prevent its being drawn back without the use of its key—this consists of a flat bar of wood small enough to enter easily the hollow end of the bolt. On the upper surface of this key-bar are fixed a number of vertical pins, placed in the same relation to each other as the holes in the top of the bolt, and of the same height as the thickness of the wood through which they are bored. When this key is pushed as far as it will go into the hollow end of the bolt and then raised vertically, the pins in its upper surface will enter and fill the holes in the bolt, and so raise the pins which secured it in its locked position; then the key with the bolt attached is drawn back, thus unlocking the door. It will be noted from this description that there is no keyhole in the modern sense of the term, but as the lock is secured to the inside of the door, in order to lock it from the outside or use the key for unlocking, there is a round hole cut in the door through which the hand and arm can be thrust for that purpose. There are no springs in this lock, and if thieves had been as ingenious in Eastern as in Western nations it would have passed out of use many centuries ago.

The *tumbler lock* is, next to the Egyptian, the oldest type of lock, and there is evidence that the Chinese invented it very early in their history. It derives its name from a lever, latch, or slide, entering a notch in the bolt, which in consequence can not be moved until the *tumbler* is lifted by a key. There have been endless modifications of the tumbler lock, and it is very generally used, notwithstanding the fact that it can be picked by a skillful operator.

The *warded lock* was the next species of lock invented; it derives its name from certain obstructions of more or less irregular shape attached to the lock-case in the path of the key, which are intended to make it impossible to move the bolt unless the key has openings in its bit which will enable it to pass the wards. Locks of this kind were used by the ancient Romans long before the beginning of the Christian era, and are still very largely used when a cheap lock will answer the purpose. Their construction is very simple; the bolt has upon its top a flat spring, and in its lower edge are cut a pair of notches, one of which is acted upon by the key while passing the wards, and the other is provided with a projecting curve which when held in contact with the lower edge of one of the mortises in the case through which the bolt slides, by the pressure of the spring, serves to hold the bolt in its locked or unlocked position. The first action of the key is to lift the bolt slightly against the pressure of the spring, thus relieving it from the edge of the mortise, and as the key continues to turn the bolt is moved into the required position and the key released. This style of lock can be readily picked by the use of a stiff wire bent at the end in such a way as to avoid the intricacies of the wards.

The *letter* or *dial lock* was the fourth type of lock devised. Its invention has been attributed to M. Regnier (director of the Musée d'Artillerie at Paris) about 1650, but he was probably merely an improver or manufacturer of a style of lock invented by another, for in Beaumont and Fletcher's play, *The Noble Gentleman* (1615), we find

> A cap-case for your linen and your plate,
> With a strange lock that opens with A.M.E.N.

Thomas Carew, in 1620, writes:

> . . . As doth a lock that goes
> With letters; for, till every one be known,
> The lock's as fast as though you had found none.

Regnier's locks were for a time very popular, and were used for the fastening of diplomatic dispatch-boxes. They have been described as follows, viz.: "Broad steel rings four, five, or eight deep, upon each of which the alphabet was engraved, turned upon a cylinder of steel, and the lock only separated when the letters forming a particular word were in a straight line with each other. This word was selected from among a thousand, and the choice was the secret of the purchaser. Any one not knowing the words might turn the rings round for years without finding the right one." The concluding sentence of this description is erroneous, as these locks have been frequently opened in recent years without a previous knowledge of "the word," but the operation of unlocking inevitably disclosed it. Such locks are not now used to any considerable extent.

The four types of lock described are the foundation facts of lock construction, on which all subsequent improvements

in such mechanism rest; and it is difficult to conceive it possible to make a lock without employing one or more of the ideas involved in these four typical methods of construction. It is therefore to a combination of these primary lock mechanisms, with other details, whose sole object is to guard them from successful assault from criminal ingenuity, that we are to look for absolute security in lock construction, if indeed such a result is attainable. It generally happens that as soon as a lock seems to meet all requirements some burglar or enterprising business rival discovers some hitherto unimaginable method of picking.

It is supposed that locks were introduced into England by Phœnician traders, as locks similar to those originating in Egypt have been used from a remote antiquity in Cornwall. Locks were first manufactured in England in the reign of Alfred (A. D. 871–901). In the time of Richard I. (1189–99) there was an entry in a book of accounts belonging to the Manor of Savoy of the purchase of two "stocklokkes, price xx^{d}," and two "hang lokks, price xvj^{d}." During the reign of Queen Elizabeth the art of lock-making had evidently made considerable advance, for we are told that a certain Mark Sealiot made a lock "consisting of eleven pieces of iron, steel, and brass, all of which, with a pipe key of gold, weighed only two grains of gold." The Marquis of Worcester (1663), in his famous *Century of Inventions*, mentions several locks of Sealiot's design, and says of one of them: "If a stranger open it, it setteth an Alarm a-going, which the stranger cannot stop from running out; and besides, though none should be within hearing, yet it catched his hand, as a Trap does a Fox: and though far from maiming him, yet it leaveth such a mark behind it, as will discover him if suspected; the Escocheon or Lock plainly showing what monies he has taken out of the Box to a farthing, and how many times opened since the owner had been in it."

In the middle of the eighteenth century the main dependence for security in locks consisted of a combination of complicated wards, intricate keys, single tumblers, and a multitude of bolts shot simultaneously by the action of a single key from all sides and even the angles of the door or lid to which they were attached. Sometimes as many as twelve bolts were used.

Barron's lock was the first lock having multiple tumblers patented in England (1778), and its construction added very much to the difficulty of picking by the means known at that time. Bramah's lock (1784) and Chubb's (1818) were for many years regarded in Great Britain as absolutely secure from a successful attack of lock-picking tools and skill, but they were both repeatedly opened in 1851 by A. C. Hobbs (b. 1812; d. 1891), mechanician, and a native of the U. S., who was the exhibitor of the Day & Newell Parantoptic (inspection defying) lock at the Crystal Palace in London. On July 22, 1851, three months after his arrival in England, he opened a Chubb lock having three bolts and six tumblers which was affixed to the door of a strong room at 34 Great George Street, Westminster. This he accomplished with his instruments (never having seen the key) in twenty-five minutes, relocking the door in seven minutes, neither operation having occasioned the slightest injury to the door or lock. This success was followed by the triumph of opening the famous Bramah lock, with its eighteen slides, which had been hanging for many years in the window of Messrs. Bramah's shop as a challenge to a generation of locksmiths, and receiving from them, by order of the arbitrators, the 200 guineas reward offered for so doing. The actual time Hobbs was at work on the lock was nineteen hours, several of which were used in recovering the pieces of a broken tool from the interior of the lock. He afterward repeated the operation three times within an hour, and opened another lock having eight slides in four minutes. Hobbs established in England the manufacture of locks by machinery (all locks had previously been made there by hand-work) on the interchangeable plan.

The Parantoptic lock of Day & Newell (owing to his success in introducing it to the notice of purchasers this came to be called the Hobbs lock) had a functional combination of parts that had unsuccessfully been attempted in earlier locks, viz., the ability to adjust automatically its mechanism during the operation of locking to any arrangement of the removable pieces, or bitts forming the wing of its key, which of course must be used for unlocking; but this automatic adaptability enabled the lock to be operated with a key of new form whenever it was locked. This was an element of safety which none of its competitors for a time possessed, and, besides, the lock was so contrived as to defy the means of picking so successfully used by Hobbs on other locks. In consequence of the advantages named and the liberal advertising from the influence of Hobbs's connection with it, this lock was largely used for many years, but was finally opened by Linus Yale, Jr. (b. 1821; d. 1868), by a method which was not strictly mechanical, but rather a means of making the lock itself report to the operator graphically and in an unmistakable way the order in which the bitts were assembled in the key when it was used. This method consisted in smoking or otherwise discoloring the tumblers before the door was locked, then when the key was used its bitts would scrape off the substance covering the tumblers in proportion to the length of the several bitts; hence, by examining the tumblers by the aid of a small mirror introduced through the key-hole after the removal of the key, it was possible to measure the length of the abrasions on the tumblers, and from these measurements construct a key that would open the lock. This, while very ingenious and effective, can not be regarded as illustrating so high an order of skill as the purely mechanical methods which preceded and followed it. Linus Yale, Jr., was a highly ingenious and very fertile inventor of locks, and without doubt contributed more to the art of lock-making in its higher branches than any other individual. The well-known draw or post-office lock, having a thin flat key, is his invention, and is what is now popularly known as the Yale lock. One of the most ingenious locks of his design was called the magic lock. It had cylindrical bolts, was without springs, had a very small keyhole, and a key with a detachable bitt, which, when the key was inserted and turned, was automatically removed from the stem or handle and carried about 3 inches away from the keyhole and then made to act upon the tumblers, and thus enabled the continued movement of the handle to open the lock. This was followed by the invention by Yale of his treasury lock, which was a decided improvement upon the magic lock, inasmuch as it had two series of tumblers similar in idea to the Day & Newell lock, and thus the element of changeability was provided in the key in addition to detachability.

Chronologically we have now approached the year 1860. It had by that time become evident to experts in lock construction that no locks operated by a key were safe from being picked or opened by some ingenious artifice, and, further, that the increasing frequency of the use of gunpowder by professional burglars made it highly desirable that there should be no opening through the door into the lock. These considerations led to the invention of a large number of dial-locks, among which were the Sargent, with its roller bolt and tumblers changeable by a key, the Marvin magnetic lock, and several varieties invented by Linus Yale, Jr. Many of the poorer dial-locks readily yielded to the skill of operators, and finally the opening of the best of the Yale dial-locks by James Sargent, who used a micrometer for the purpose, which had also been invented by Mr. Yale, gave a rude shock to the feeling of confidence which had become very general in regard to the security of the best dial-locks, and for a time the belief seemed to be general that it was impossible for human ingenuity to devise a lock that could not be picked. This condition of affairs caused inventors to turn their attention to an old and neglected invention, the *time-lock*. The first suggestion for a lock that could only be unlocked at a certain time is contained in an English patent issued to William Rutherford in 1831. In this invention the lock mechanism was controlled by a clock secured to the inside of the door. This clock could be set to the hour at which it was desired to open the door, and at that hour and no other could the key or other means for moving the bolts be made to operate. In 1857 another time-lock was devised by Holbrook & Fish, of the U. S. Both of these locks anticipated the days of profitable appreciation by many years, but their inventors were far-seeing in their ingenuity, for their work embraced details which are now regarded as of the first importance.

About this period there were a number of abortive efforts to introduce time-locks to the favorable consideration of bankers and merchants, but it was not until the dial-lock had ceased to give confidence that the time-lock began to attract serious attention. The first successful lock of this kind was patented by James Sargent in 1875, and was soon followed by the Yale time-lock, in which the inventions of Little, Stockwell, and others were included, and at a later date by the time-locks of Pillard, Homes, Hall, and other ingenious inventors. No time-lock has ever been picked, as

the time allowed for operating with instruments upon the lock after its mechanism has been released and before it is again secured by the clock attached is too short for the employment of any instrument with success. Notwithstanding the security of the time-lock against picking there was still a vulnerable point in it as usually constructed at the time of its general adoption—the lock was not automatic; that is, it required to be unlocked by some form of dial mechanism operated from the outside of the door; this, of course, required that a spindle should pass through the door to communicate the movements of the dial to the mechanism of the lock. This gave a point of application for tools to destroy the lock and an opening through which some highly explosive liquid could be introduced. These objections have been overcome by the invention of the automatic time-lock, or, as it is sometimes called, the bolt-motor. This consisted of a case (similar to a lock-case) secured to the interior of the door. This case contains two very powerful springs which are set by a key (operated from the inside, as there is no opening of any kind through the door) before the door is closed; one of these springs is connected with a trigger which releases it as soon as the door is shut, and it immediately throws the heavy bolts into their locked position. The second spring in the case is acted upon by a clock movement (provided in duplicate to guard against accidental failure) at any determined hour to which the clock is set. As soon as the second spring is released by the clock it acts upon the door-bolts with great power, and immediately throws them into their unlocked position. There are various modifications and refinements on this general construction, all having for their object the automatic action of the bolts at a certain time by means of powerful springs released by a clock. W. F. Durfee.

Locke, David Ross: humorist; better known under his pseudonymn of *Petroleum V. Nasby*; b. at Vestal, Broome co., N. Y., Sept. 20, 1833; learned printing in the office of the Cortland *Democrat*; was successively editor and publisher of the Plymouth (O.) *Advertiser*, the Mansfield (O.) *Herald*, *The Bucyrus Journal*, and the Findlay (O.) *Jeffersonian*, and editor of *The Toledo Blade*. In 1861 he began to publish in *The Jeffersonian* his *Nasby* letters, finally collected in book form as *The Struggles—Social, Financial, and Political—of Petroleum V. Nasby* (1872). Among later productions are *The Morals of Abou Ben Adhem* (1875) and *A Paper City*, a novel (1878). D. at Toledo, O., Feb. 15, 1888. Revised by H. A. Beers.

Locke, John: philosopher; b. at Wrington, Somersetshire, England, Aug. 29, 1632. His first studies were pursued at Westminster School, London. In 1651 he became a member of Christ Church, Oxford, where he resided till 1664. Here his mind received that bent which gave him his subsequent renown as a philosopher. It was partly due to the reading of Descartes, whose clearness of exposition, so much in contrast with the crude instruction of the university, Locke admired greatly; but Locke owed his philosophical stimulus in part, and directly, to a discussion with five or six students in his rooms at Oxford, when, as he says, the thought came to his mind that the only sure ground of harmony in judgment must be found in a preliminary determination of the possibilities of the human mind. This "thought," which became the *Essay on the Human Understanding*, was taken up and laid aside, and written upon at intervals through a period of more than twenty years, and only finished in 1687. In 1664 Locke was secretary of legation at Berlin; in 1667 he became acquainted with Lord Ashley, afterward Earl of Shaftesbury, who, in gratitude for medical advice, received the young philosopher as a member of his family. During this time he directed the education of Shaftesbury's son, and that of his grandson, who became an elegant philosophical writer in Queen Anne's reign. Locke was brought, through his friend and patron, into the society of Buckingham, Halifax, and other distinguished men. When Shaftesbury became Lord Chancellor he gave to him the office of the presentation of benefices; but Locke and his patron soon fell into disfavor, and from 1675 to 1679 Locke was in France, mainly at Montpellier with Herbert, later Earl of Pembroke, to whom he dedicated his essay. From 1683 to 1688, on account of the state of his own country, he deemed it wise again to reside abroad. The revolution of 1688 enabled him to return from Holland to England, where he filled several civil offices, and was offered others, which on account of age and ill-health he declined. His last years, spent in the study of the Scriptures, were ministered to by Lady Masham, a daughter of Ralph Cudworth. He died at Oates, in Essex, a firm believer in the Christian religion, Oct. 28, 1704.

The Philosophy of Locke.—1. *Reasons for its Great Popularity and Influence.*—The *Essay on the Human Understanding*, which contains Locke's system, did not appear in London until 1690; but four editions, revised by the author, were issued before his death, and a fifth, with his last emendations, the year after, a tenth in 1731, and the thirteenth in 1748. Meantime it was translated into French, then becoming the universal language of scholars in Europe; and this translation, made in 1700, passed through five editions in fifty years. It was also translated into Latin, into Dutch and German several times, and since into modern Greek. These various editions and translations indicate the popularity and extensive influence of the *Essay*. As reasons for this may be mentioned—first, the author's public and social position, coupled with the clearness and assurance, if not always the self-consistency, of his utterances. Although wanting the condensation and critical power of such writers as Kant, his English ranks with the best prose of his time; and his familiar style, derived from the refined society in which he moved, was a help to his popularity, as his public life was already an introduction to his authorship. Second, his adherence to the cause of civil and religious liberty. In his work on *Civil Government* he advocated the rights of the people against the arbitrary rule to which they were being subjected. In 1684, by order of His Majesty, he was expelled from his benefice at Oxford, and was an exile on account of his too free opinions. He might have met with Sir Philip Sidney's fate if, instead of being secreted in Holland, he had fallen into the power of the king. On the accession of James II. William Penn proposed to procure for him a pardon, but the philosopher's noble reply was: "There is no need of pardon where there is no crime or fault." The above reasons, however powerful as anxiliaries, would not suffice to account for the influence of the *Essay* but for the third—that the times favored such a work. The psychological field was not much explored, and in attempting it Locke showed an independence which drew attention to him. At the same time good men, especially in England, were disposed to accept authority, and to assume that religion could find its support in faith, without any help from philosophy, or even against it. It followed, therefore, that unchristian thinkers found support for their favorite theories in the current and accepted philosophy of Locke. "Toward 1750," says Cousin, "the principles of Locke were spread through Europe; they were developed everywhere else, as well as in England." This indicates that the time was ripe for such a system as that announced by Locke. "Placed between the seventeenth and eighteenth centuries, he forms the transition from one to the other. In fact, run over all the sensualistic philosophers of the eighteenth century, there is not one who does not invoke the authority of Locke; and I do not speak merely of metaphysicians, but of moralists, publicists, and critics. Locke is the chief, the avowed master of the sensualistic school of the last century." (*Cousin.*)

2. *What the Lockian Philosophy is.*—Its aim is "to inquire into the original certainty and extent of human knowledge." With this in view, the author strives to show (Bk. i.) that there are no "innate ideas"—ideas being used for whatever is in the mind. If any of these are innate, then the expression of them—for example, "whatever is, is," or "it is impossible the same thing should be and not be"—must be accepted by all human beings, not a child or savage excepted; but, says he, idiots, children, and savages do not accept them; therefore they can not be innate. Such is the reasoning. The obstacles thus removed, the origin of knowledge is discussed (Bk. ii.). Fortunately, the author's positions can be given concisely almost in his own words: "Let us suppose the mind to be, as we say, white paper, void of all characters, without any ideas; how comes it to be furnished? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from experience; in that all knowledge is founded, and from that it ultimately derives itself." Again he says—and the passage is a fundamental postulate of this philosophy: "Our observation, employed either about external, sensible objects, or about the internal operations of our own minds, perceived and reflected on by ourselves, is that which supplies our understandings with all the materials of thinking. These two are the fountains of knowledge from whence all the ideas we have, or can naturally have, do spring." These

are called "sensation" and "reflection." And it is important to observe that the latter must wait on the former. "I see no reason to believe that the soul thinks before the senses have furnished it with ideas to think on." That is, the mind can only act upon what is given to it from without, furnishing nothing original from itself. In the last analysis the materials of knowledge are "ideas" due to "sensation" and "reflection."

Upon this basis the followers of Locke have developed his positions in two great directions. Some have proceeded to make a rigorous application of his theory of the origin of ideas, and what he calls sensation and reflection becomes sensation only. So a foundation was laid for sensationalism in England and materialistic naturalism in France. The other direction is seen in Berkeley, who used the "theory of ideas" to eliminate the external world from the sphere of reality and to give support to idealistic analysis. Historians of philosophy still disagree as to which of these tendencies represents the legitimate influence of Locke.

Lockhart: town; capital of Caldwell co., Tex. (for location of county, see map of Texas, ref. 5–H); on the Mo., Kan. and Tex., and the San Ant. and Aran. Pass railways; 30 miles S. by E. of Austin, the State capital. It is in an agricultural and stock-raising region, is noted for its springs, and has two weekly newspapers. Pop. (1880) 718; (1890) 1,233; (1900) 2,306.

Lockhart, JOHN GIBSON: author; b. at Cambusnethan, Lanarkshire, Scotland, in 1792; studied at Glasgow University 1807–10; graduated from Baliol College, Oxford, in 1817 as bachelor of law; passed advocate at Edinburgh 1816; became in 1817 a contributor to *Blackwood*, in which his articles were remarkable for vigor and scholarship; married in 1820 the daughter of Sir Walter Scott; was editor of *The Quarterly Review*, London, 1826–53; received in 1843 the sinecure auditorship of the duchy of Cornwall; was one of the writers of the *Noctes Ambrosianæ*. D. at Abbotsford, then the seat of his daughter, Lady Hope Scott, Nov. 25, 1854. His principal works are *Valerius* (1821); *Adam Blair* (1822); *Reginald Dalton* (1823); and *Matthew Wald* (1824), novels; *Don Quixote*, with notes (1822); *Spanish Ballads* (1824); *Life of Burns* (1825); of *Bonaparte* (1829); and of *Scott* (1837–39). Revised by H. A. BEERS.

Lock Haven: city; capital of Clinton co., Pa. (for location of county, see map of Pennsylvania, ref. 3–E); on the Susquehanna river, the Pennsylvania Canal, and the Beech Creek and the Penn. railways; 28 miles S. W. of Williamsport. It is in an agricultural region, and has several extensive manufactories, including tanneries, paper-mill, fire-brick works, sewer-pipe and clay works, machine-shops and cigar-factories. The city is the seat of the Central State Normal School (with 645 students, 22 teachers, and buildings valued at $275,000), is lighted by gas and electricity, has 2 libraries and a monthly, 2 daily and 2 weekly newspapers. Pop. (1890) 7,358; (1900) 7,210. EDITOR OF "EXPRESS."

Lockjaw: See TETANUS.

Lockland: village; Hamilton co., O.; on the Cleve., Cin., Chi. and St. L. and the Cin., Ham. and Dayton railways; 12 miles N. of Cincinnati (see map of Ohio, ref. 7–C). It has manufactories of cotton goods, paper, flour, bricks, and lumber. Pop. (1880) 1,884; (1890) 2,474; (1900) 2,695.

Lockout: See the Appendix.

Lockport: village (laid out 1837, incorporated 1853); Will co., Ill. (for location of county, see map of Illinois, ref. 3–G); one the Des Plaines river, the Illinois and Michigan Canal, and the Atch., Top., and S. Fé and the Chi. and Alton railways; 33 miles S. W. of Chicago. It is in an agricultural and productive limestone region; has a high school, graded public school, several Roman Catholic parochial schools, 10 churches, and 2 weekly newspapers, and manufactures flour, oatmeal, wire, straw-board, barbed wire, and brass goods. Pop. (1880) 1,679; (1890) 2,449; (1900) 2,659.

EDITOR OF "PHŒNIX."

Lockport: city (incorporated as a village in 1829); capital of Niagara co., N. Y. (for location of county, see map of New York, ref. 4–C); on the Erie Canal and the Erie and the N. Y. Cent. and H. R. railways; 25 miles N. by E. of Buffalo, 65 miles W. of Rochester. It is near the geographical center of one of the most profitable grain and fruit-growing counties in the State, and derived its name from five locks cut through solid rock to overcome a difference of 60 feet in the levels of the canal, and doubled in number on the enlargement of the canal in 1835. The surplus water at the upper level is discharged through two races, each with a fall of 53 feet to the lower level, thus supplying exceptional power for manufacturing. The industries include the manufacture of Holly water-works plants, milling machinery, indurated-fiber products, flour, steam-dredges, boilers, engines, railway trucks, aluminium, glass, carriages, furniture, paper, tackle-blocks, saws, reversible seats, and stave, broom, veneer, and chair-making machinery. There are 15 churches, a union, a high, and 5 public primary schools, 2 libraries (Union School, founded 1848, Young Men's Christian Association), Roman Catholic convent and young ladies' seminary, the Flagler Emergency Hospital, 2 homes for the friendless, 2 national banks with combined capital of $300,000, a savings, a private bank, and a weekly, 3 semi-weekly, and 3 daily newspapers. Pop. (1890) 16,038; (1900) 16,581. EDITOR OF "UNION."

Lockroy, lō'krwä', ÉDOUARD ÉTIENNE ANTOINE SIMON: journalist and politician; b. in Paris, July 18, 1838; accompanied Renan to Judea and Phœnicia in 1860–64; took part in Garibaldi's Sicilian expedition, and returning to France wrote for the newspapers some articles which caused his condemnation to four months' imprisonment. He was an original member of the National Assembly 1871. As editor of *Le Peuple souverain* he again got into trouble with the authorities, and was condemned to a brief imprisonment in 1872 for his duel with Paul de Cassagnac, and in 1873 for a newspaper article, *La Libération du territoire*, but in the latter year was elected to the Assembly. He voted with the extreme Left. Returned by successive elections, he became Minister of Commerce and Industry 1886–87; Minister of Public Instruction in 1888, and directed the organization of the Exposition of 1889. Besides his newspaper articles, he has published several volumes, among which are *À bas le Progrès* (1870); *La Commune et l'Assemblée* (1871); *L'Île révoltée* (1877); *Ahmed le Boucher* (1888); and *Journal d'une bourgeoise pendant la Révolution* (1881).

Lockwood, BELVA ANN BENNETT: lawyer; b. at Royalston, N. Y., Oct. 24, 1830; was educated in a district school; taught school at fifteen; was married at eighteen, but lost her husband next year; wrote for papers and magazines; graduated at Genesee College, Lima, N. Y., at twenty-seven; taught school eleven years; was married to Dr. Ezekiel Lockwood in 1868; studied law; graduated at the National University at Washington, D. C., and was admitted to the bar of the District in 1873. She was nominated in 1888 for President of the U. S. by the Equal Rights party.

SUSAN B. ANTHONY.

Lockyer, JOSEPH NORMAN, F. R. S.: astronomer; b. at Rugby, Warwickshire, England, May 17, 1836. He first became well known through the discovery, made independently by Janssen, that the solar protuberances were composed of glowing hydrogen, and could be observed on any clear day with a sufficiently powerful spectroscope. The French Academy commemorated this remarkable advance in the methods of investigating the gases around the sun by striking a medal bearing the effigies of the discoverers. Lockyer has principally devoted himself to ancient astronomy, solar physics, and spectroscopic observations generally, on which subjects he has written a number of works, including *Contributions to Solar Physics* (1873); *The Spectroscope and its Applications* (1873); *Studies in Spectrum Analysis* (1878); *The Meteoritic Hypothesis* (1891); *The Dawn of Astronomy* (1893); and is editor of *Nature*. S. NEWCOMB.

Locle, lōk'l: town; in the canton of Neuchâtel, Switzerland; on the Bied, 10 miles N. W. of Neuchâtel (see map of Switzerland, ref. 4–B). Its manufactures of clocks and watches are very celebrated, and the most extensive in the world. Its manufactures of lace are also important. The surplus water of the Bied is discharged into the Doubs through an artificial tunnel constructed to prevent inundation of the valley of the Bied. Pop. (1888) 11,312.

Lo'cock, Sir CHARLES, M. D., F. R. S., D. C. L. (Oxon.): physician; b. at Northampton, England, Apr. 21, 1799; studied at the University of Edinburgh, where he gradu-

ated in medicine 1821; established himself in his profession in London, and in 1840 was appointed, on the recommendation of Sir James Clarke, physician-accoucheur to the Queen, by whom, in recognition of his services, he was created a baronet Apr. 14, 1857, at which time he retired from the active practice of his profession. In the same year he was chosen president of the Royal Medical and Chirurgical Society, and became in 1863 honorary president of the Obstetrical Society. D. at Ryde, July 23, 1875.

Locomotion of Animals: See MECHANICS, ANIMAL.

Locomotive, or, more fully, **Locomotive Engine** [*locomotive* is from Lat. *lo'cus*, place + *move're*, *mo'tum*, move]: an engine mounted on wheels and capable of self-propulsion; commonly one operated by steam and intended for traction or propulsion on a railway. The railway locomotive engine illustrates better than any other form of motor the highest art of the engineer in the concentration of power into minimum space and weight. The machine consists of a steam-boiler of compact form, filled as completely as possible with tubes, which convey the furnace-gases to the smokestack and transfer heat from them to the water in the boiler. It is mounted on from four to twelve wheels, according to weight and special duty, and is driven by a pair of engines of the simplest construction, each coupled to its own set of wheels on either side of the locomotive. The whole combination, boiler, engines, and wheels, is connected by a frame of wrought iron in such a manner as to give maximum power in minimum space and weight. The steam pressure is often 150, sometimes 200, lb. to the square inch; the speed of piston and of revolution of engines and driving-wheels is as great as possible consistent with safety and freedom from serious risk of heated journals; the ratio of expansion of the steam is low, and the mean effective pressure high: and thus all conditions of design, construction, and operation are made to concur in the production of a compact and powerful machine capable of hauling trains of enormous weight or at very high speed. The smallest kinds of locomotive are those employed in mines for drawing small trains of light cars or wagons to the shafts; the heaviest are employed on the principal railways of the U. S. for hauling long and heavy trains or ascending steep gradients. The former weigh about 5 tons; the latter sometimes weigh 100 tons, e. g. the famous engine "999" of the New York Central Railroad, which first made a record in 1893 of 102, and later, in exceptionally favorable circumstances, of 112 miles an hour—the highest speed yet recorded. It has a cylindrical shell-boiler, with internal firebox and closely packed tubes, non-condensing engines, three-ported valves, with Stephenson links and gear, and a steam-blast produced by the action of the exhaust steam. The arrangement and number of wheels for fast and mixed traffic is usually as that shown in Fig. 1, but the size of the driving-wheels and their number vary with the duty for which the machine is constructed, the number being increased to a maximum and their diameter to a minimum for heaviest and slowest trains. Fast express engines have driving-wheels 6½ feet in diameter, and in special cases wheels as large as 8 feet in diameter have been adopted; the slow and powerful engines of long lines have wheels as small as 3½ and 4 feet in diameter. The forward end of the engine is often carried on a swiveling truck or bogie with four small wheels. The standard eight-wheeled engine usually distributes the total weight, two-thirds to the driving-wheels, one-third to the truck. The proportion carried by drivers increases with severity of duty up to a maximum, when all the weight is sometimes taken on driving-wheels, and the truck is displaced by the extended system of six, eight, or ten coupled drivers. The whole mass of engine and boiler is supported on heavy and very elastic springs, which prevent the jar and shock of the wheel on the roadbed reaching the machinery, and make the engine ride easily. Standard engines now weigh about 40 tons, often 45, for passenger traffic on the leading railways. Such engines have steam-cylinders 20 to 22 inches in diameter and 2 feet stroke of piston, their boilers containing from 25 to 35 sq. feet of grate surface and 1,500 to 2,000 sq. feet of heating surface. Many modifications of form are given the engine for special work. The Fairlie engine for narrow-gauge railways consists of a pair of engines set back to back, united by a common firebox with one or with two furnaces, and thus giving the hauling power of two common engines built for the same gauge. The Forney locomotive unites tender and engine on a common frame, and thus distributes weights of fuel and water to the driving-wheels to give adhesion and added hauling power. The "tank-engine," of which the last illustrates one form, is sometimes constructed on a very large scale. Thus locomotives built at the Baldwin locomotive-works, Philadelphia, for the Grand Trunk Railway, to be used in the St. Clair tunnel, under the bed of the St. Clair river, between Port Huron, Mich., and Sarnia, Ontario, have five pairs of 50-inch driving-wheels on each side of the boilers, the cab in the middle

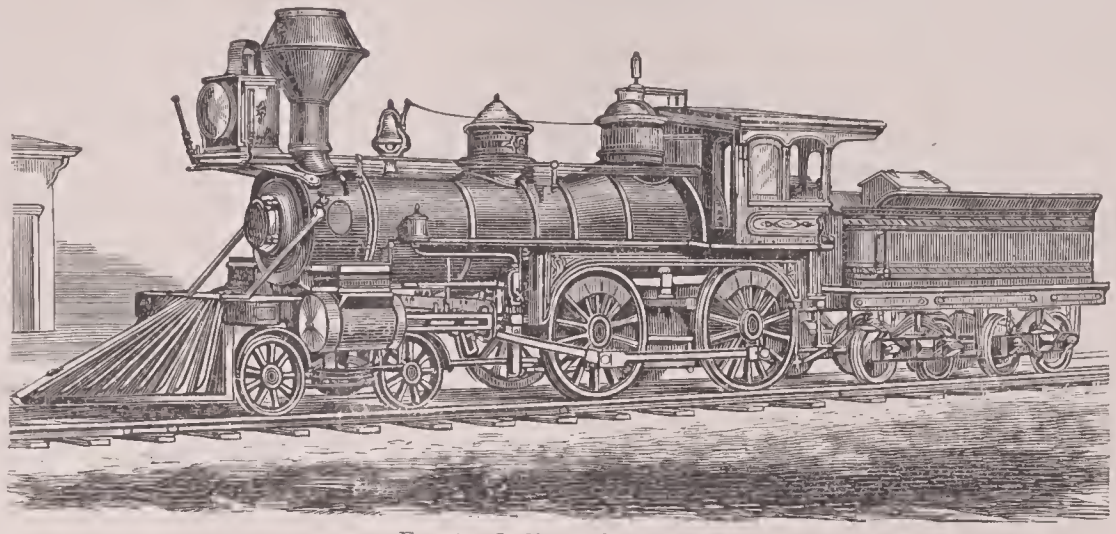

FIG. 1.—Ordinary locomotive.

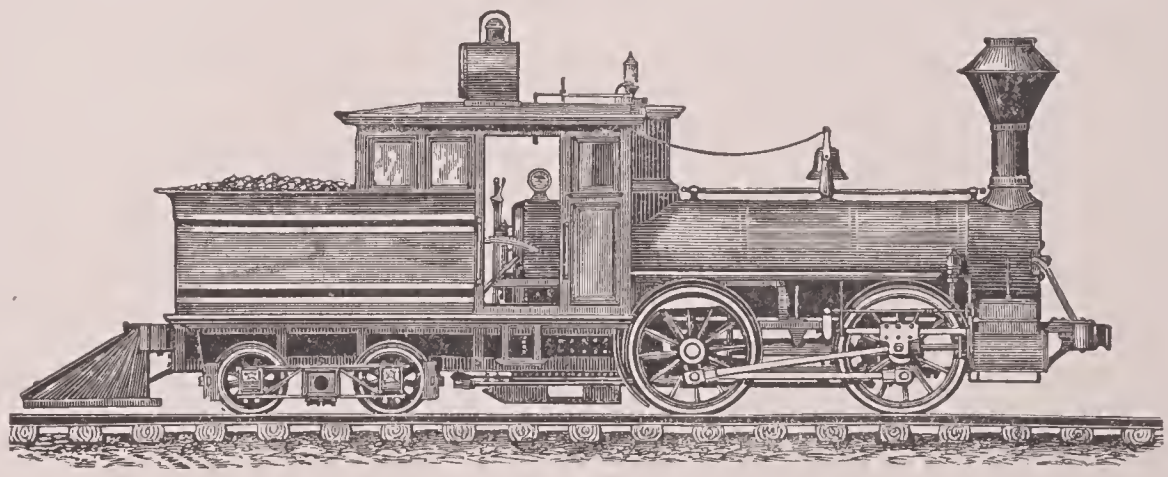

FIG. 2.—Forney locomotive.

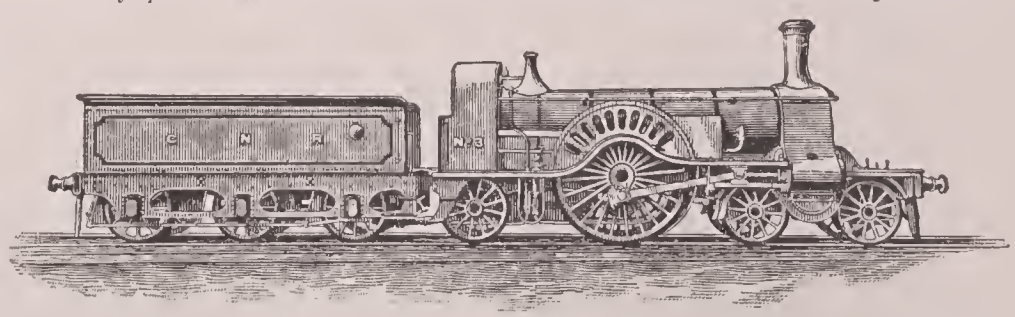

FIG. 3.—British express engine.

of the boiler extending out over the two tanks, one each side of the boiler. The cylinders are 22·28 inches, and the boiler 74 inches, in diameter, to carry 160 lb. of steam. Each locomotive with tanks filled weighs 200,000 lb., the average weight in running order, with tanks half filled, being about 180,000 lb.*

A favorite and successful type of engine used on British and continental railways is seen in the next figure. It has one pair of very large drivers, 7½ feet and sometimes 8 feet in diameter. British engines of this type have done extraordinary work. Such locomotives on the longer main lines, as between London and Glasgow, make an average of 50 miles an hour for 400 miles. The Midland Railway employs engines with cylinders 18 by 26, a single pair of drivers 7 ft. 4 in. diameter, with 1,240 feet of heating surface and 20 feet of grate, to haul trains of 225 to 250 tons weight, at nearly 50 miles an hour, and with a fuel expenditure of 26 lb. per mile. Compound engines of recent construction have wheels 7½ feet in diameter, and have made nearly 90 miles an hour. Compound locomotives are provided with arrangements by which the steam from the boiler, usually at comparatively high pressure, is conducted first into a small high-pressure cylinder, and then, after performing about one-half the total work in that cylinder, is passed into a second, larger, low-pressure cylinder, in which its work is completed with maximum expansion of the steam, and it thence enters the exhaust and blast pipes, and is rejected from the engine. This arrangement permits a more complete expansion of the steam, a larger thermodynamic transformation, and higher economy of operation without such serious exaggeration of thermal wastes consequent upon large expansion and wide range of temperature in the working cylinder, which, in the common, simple type of engine, places an early limit to gain by expansion. (See STEAM-ENGINE.) These amount often to nearly one-half of all the heat and steam and fuel in the simple engine and about one-fourth in the compound. The latter thus saves often one-fourth of all the steam used in the engine, and, by thus reducing the demand upon the boiler, makes the latter still more efficient, and the saving in fuel 30 to 35 per cent. Under unfavorable circumstances, however, the saving may be so small as to be unimportant. The average gain may be assumed to be above 20 per cent. of steam and not far from 25 per cent. in fuel in ordinary work.

The standard engine uses 30 to 35 lb. of steam per horse-power per hour, 4 to 5 lb. of fuel; the compound from 22 to 30 lb. of steam and from 2·5 to 3 lb. of good coal. Either engine hauling a train exerts a pull of from 1 to 2 tons on its draw-bar and from 500 to 1,000 horse-power. In exceptional instances, with heavy trains or extraordinarily high speeds, 1,500 to 1,800 horse-power has been attained. The engine has a life of about thirty years, costing 10 to 15 per cent. of its value for repairs and maintenance, and uses a quart of oil and a ton of coal usually for a run of 50 miles under average conditions.

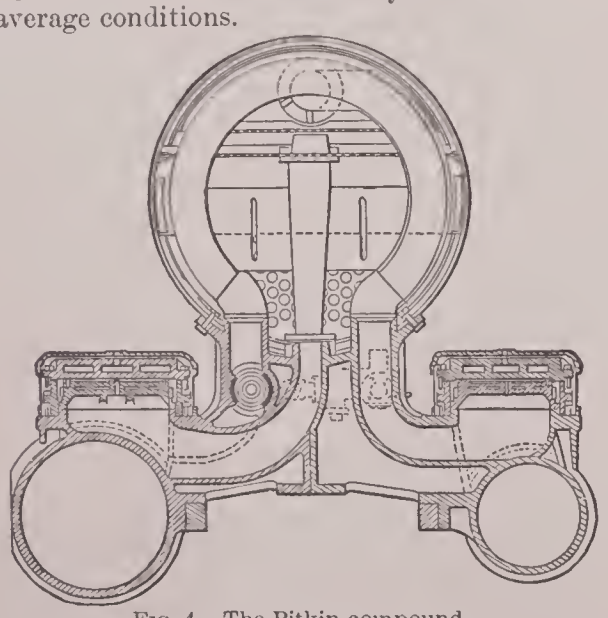

FIG. 4.—The Pitkin compound.

An illustration of the most common method of compounding the locomotive is seen in the accompanying engraving.†

It includes one high and one low pressure cylinder, with an ingenious intercepting-valve. The receiver has a volume 50 per cent. greater than that of the small cylinder, and the clearance in the latter is about 10 per cent., a proportion shown by the indicator to be desirable with the proportions of valves employed. The valves are arranged and the general disposition of parts is as in the standard engine of the old form.

The intercepting-valve is used to admit steam to the large cylinder before compound working begins. The ports, at starting, are closed, and no communication is open between the receiver and the large cylinder, which latter takes steam through a reducing-valve.

On starting, the exhaust from the small cylinder fills the receiver, and the back pressure taking effect on the intercepting-valve and destroying its equilibrium, it at once moves, and the large cylinder takes its steam properly for compound working.

This engine has the following dimensions: Cylinders, diameter, 20 and 29 inches; stroke of piston, 24 inches; ratio of cylinders, 2·1; diameter drivers (6), 68 inches; weight of engine, 126,800 lb.; heating surface, 1,677 sq. feet; grate surface, 28·57 feet. About 80 per cent. of the total weight is on the drivers.

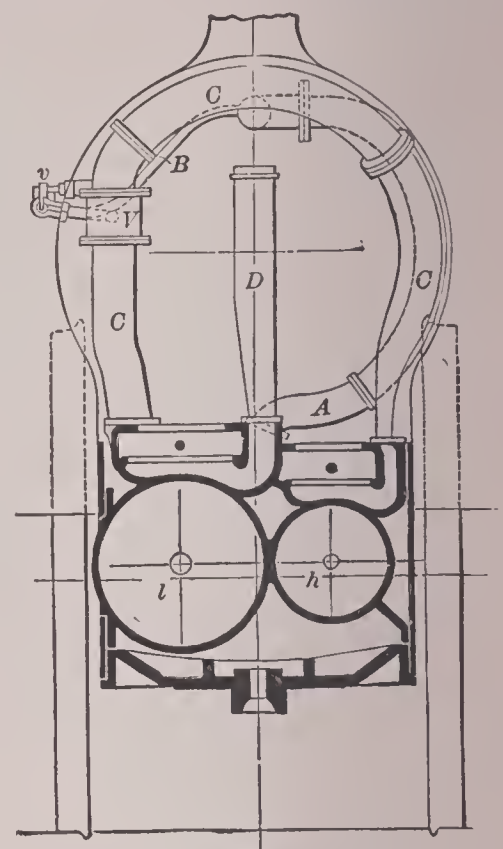

FIG. 5.—The Worsdell engine.

In the Worsdell form of engine the construction is as seen in the Fig. 5.* A is the steam-pipe, B the starting-valve connection, C the receiver, D the exhaust-pipe, and *v* and V are the starting and the intercepting valves. The engine here taken for illustration is an English passenger locomotive, having 16 and 26 inch cylinders, 24 inches stroke, drivers 80¼ inches in diameter. The steam-pressure is the same as the preceding, and the weight of engine 97,000 lb., of which 68,000 rests on the driving-wheels. The areas of heating and grate surface are respectively 1,323⅓ and 17⅓ sq. feet. Joy's valve-gear is employed.

In the Webb compound locomotive the steam enters two small, outside, high-pressure cylinders arranged like those of the standard engine, and is then discharged into a reservoir, from which it passes into a third, large, low-pressure cylinder set between the frames. The high-pressure cylinders drive one pair of wheels and the low-pressure cylinder is connected with the hinder of the two pairs of drivers, the two working independently, the usual side-rod connections being omitted. Where, as for heavy work, other drivers are added, they are coupled to the small engines and their wheels through the ordinary system of parallel rods. The locomotive with triple-expansion engines, three cylinders in series, is still in the experimental stage, but promises, with still higher steam-pressures than now customary, to give further economy.

The costs of operation of the locomotive average in the U. S. not far from 15 cents per "train-mile," nearly equally divided between expense for fuel, for attendance, for repairs, and miscellaneous minor items. R. H. THURSTON.

Locomotor Ataxia: See TABES DORSALIS.

Lo'cri, or **Locri Epizephy'rii**: an ancient city of Magna Græcia or Southern Italy; in the subsequent Roman province of Bruttium or Calabria, now Reggio. It was founded probably as early as 710 B. C. (according to Strabo) as a colony from Locris, in Greece, but whether from the eastern or western country of that name is uncertain. The

* *Manual of the Steam-engine*, R. H. Thurston, vol. i., p. 200.

† From *The Compound Locomotive*, Barnes & Woods. Also *Manual of the Steam-engine*, Thurston, vol. i., p. 208.

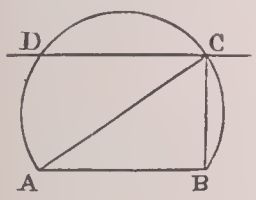
* *Engineering*, Mar. 30, 1888; Wood's *Compound Locomotives* Thurston's *Manual*.

original settlement was on Cape Zephyrium (Capo di Bruzzano), near the southeast point of the Calabrian peninsula, whence the name given to distinguish the colony from the mother-country. Ultimately the settlement was removed 15 miles farther N. Locri was celebrated as the first Greek state to adopt a written code of laws, the authorship of which was ascribed to a half-mythical legislator, Zaleucus. The Locrians were long in hostility with Rhegium and Crotona, and in alliance with Syracuse. The younger Dionysius seized upon the citadel at Locri on his expulsion from Syracuse (356 B. C.), and carried on a despotic government until expelled six years later. During the wars of the Romans with Pyrrhus and with the Carthaginians, Locri alternately favored all the contending parties, and consequently suffered by turns from all, especially from the Romans, who were finally victorious, and followed the example of Pyrrhus in plundering the famous temple of Proserpine. From this time Locri sank into insignificance; its very existence for many centuries is known only by passages in geographical treatises. Destroyed probably by the Saracens, its site remained unknown until the nineteenth century, when the remains of the walls of the two famous citadels and the foundations of the temple of Proserpine were discovered 5 miles from the town of Gerace.

Lo'cris (in Gr. Λοκρίς): the ancient name of two portions of the mainland of Greece, inhabited by a kindred people having the name of Locrians (Λοκροί). The eastern Locrians, divided by a projecting tongue of Phocian territory into two divisions, *Locri Epicnemidii* (from Mt. Cnemis) and *Opuntii* (from the town Opus), inhabited a narrow strip of land along the eastern coast of Greece opposite Eubœa. The western representatives, called—for what reason it is not clear—*Locri Ozolæ* (i. e. having an odor), occupied a territory shut in by mountains on the Corinthian gulf, between Ætolia, Doris, and Phocis. They were proverbially a wild and uncouth people. G. L. Hendrickson.

Locus [= Lat., liter., place]: in geometry, first, the line or surface generated by a point when moving according to a fixed law. Thus an ellipse is the locus of a point which moves in a plane in such a manner that the sum of its distances from two fixed points is always equal to a given distance. Second, the locus of a line is the surface generated by that line when moving according to a fixed law. Thus a hyperboloid of one sheet is the locus of a straight line which moves in such a manner as to touch three other straight lines, no two of which are parallel. To find the equation of a locus we have only to express the law of motion by one or more indeterminate equations.

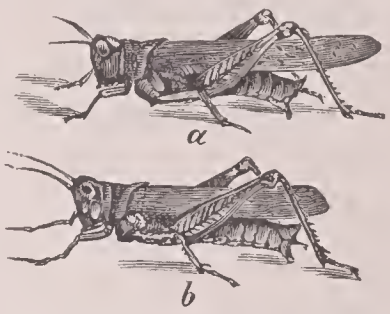
The following example illustrates the method of solving geometrical problems by the principles of loci: Let it be required to construct a triangle whose base is equal to a given line, whose area is equal to a given area, and whose vertical angle is equal to a given angle. Draw a line A B equal to the given base; on it, as a chord, construct an arc of a circle capable of containing the given angle; draw a line D C parallel to A B, and at a distance from it equal to the quotient of the given area by half the line A B; and from either point in which this line intersects the arc, as C, draw C A and C B; then will A C B be the required triangle. For D C is the locus of the vertices of all the triangles whose common base is A B and whose areas are equal to the given area, and the arc A C B is the locus of the vertices of all the angles whose sides pass through A and B, and which are equal to the given angle; hence the points of intersection are the vertices required. If D C cuts the arc in two points, there are two solutions; if it is tangent to the arc, there is but one solution; if it does not intersect the arc, and is not tangent to it, the solution is impossible.



Revised by R. A. Roberts.

Locust [from Lat. *locus'ta*, locust, grasshopper. Cf. Lobster]: properly, the migratory locust of the Old World (*Œdipoda migratorium*) and the locust of Western North America (*Caloptenus spretus*). The term "locust" is often wrongly applied to the cicada or seventeen-year locust. (See Cicada.) The transformations of the locust, as in all the grasshoppers, are very slight, the larva differing from the adult chiefly in wanting wings; but even in this state they are said by African travelers to travel great distances. The eggs are large, long, cylindrical, and laid late in the summer in packets of about seventy-five, resembling cocoons, in holes bored in the ground by means of their stout horny ovipositors. The voracity of the locust, and of grasshoppers generally, may be explained by the anatomy of the alimentary canal, which is highly developed, the gizzard being provided with from six to eight rows of horny denticulated plates, situated on ridges, the whole number of teeth in some species amounting to 270. The stomach and salivary glands are highly developed, the large jaws further adapting it for its vegetable diet. The air-tubes (tracheæ) dilate into numerous large air-reservoirs, which assist it in taking its long-sustained flights. The ears of the locust are two vesicles situated at the base of the hind-body or abdomen, each supplied by an auditory nerve sent from the third thoracic ganglion. The stridulating noise this and many other grasshoppers make is produced by rubbing the thighs against the wings. The migratory locust of the Old World is widely distributed, being found all over Africa, in Western Asia, and Southern Europe, sometimes occurring in Belgium and England. It is said to travel about 16 miles a day. It molts five times, at intervals of about six weeks. The locust is eaten and is considered nutritious by the natives of the country in which it is found.

The locust of North America is the widely distributed red-legged "grasshopper" (*Caloptenus femur-rubrum*, Harris, Fig. 1, *b*) with its allied species (*Caloptenus spretus*, Uhler, Fig. 1, *a*), which inhabits the U. S. W. of the Mississippi river, though occasionally found in New England. The eastern species does the most damage in Northern New England and Canada. The western species (*spretus*) breeds most abundantly in the elevated portions of Colorado and northward, and migrates to the plains below. It also breeds abundantly in Iowa and Minnesota, and is so voracious as to drive farmers from their lands. The young of the *spretus* are hatched in March, April, and early in May in Texas, Colorado, and Kansas, and at once begin their ravages. Late in the season, by the last of June, they acquire wings, becoming fearfully destructive, though most destructive before acquiring their wings. They are more active by night than by day. Late in summer so abundant do they become that an observer in Texas has seen "the whole surface of the earth so broken up by their borings that every inch of ground contained several patches of eggs."



Red-legged grasshopper, and its long-winged Western variety.

A. S. Packard, Jr.

Locust (in Lat. *locusta*): a tree technically named *Robinia*, in honor of John Robin, herbalist to Henry IV. of France, and of his son, Vespasian, who first cultivated it in Europe. The beautiful genus received its name from Linnæus, and belongs to the sub-family *Papilionaceæ*, of the family *Leguminosæ*. The five-toothed calyx is short and slightly two-lipped. The standard is large and rounded, turned back, and scarcely longer than the wings and keel. The stamens are in two bundles—i. e. diadelphous. The style is bearded next the free stamen; the pod linear, flat, several-seeded, margined on the seed-bearing edge, and with thin, flat valves. Leaves odd-pinnate, with stipels at the base of the leaflets. The flowers are very showy, in pendulous racemes, and in the common locust are exceedingly fragrant. *Robinia pseud-acacia*, the common locust of the U. S., is called false acacia from the resemblance it bears to the true acacia. The tree never attains great size in the New England or the Middle States, but reaches its perfection in Kentucky and Tennessee, where it sometimes exceeds 4 feet in diameter, and grows to a height of 80 feet.

The wood of the locust is close-grained and compact. Its medullary rays are close and numerous. The color varies, but the reddish-tinted is the most valuable for timber. The wood is remarkable for its strength and durability, and for its stiffness, hardness, elasticity, and weight. Fence-posts, railway-sleepers, and treenails in naval architecture are made of it. It is considered as durable as the live-oak. It is used to some extent in cabinet-making, but only slightly in house-building. For mill-cogs it is very valuable. Valuable as the wood is for many economic purposes, graceful as is the aspect and foliage of the tree, and beautiful as are the flowers, the locust is yet so infested by many kinds of

insects as to make it objectionable. Where it is grown for timber it should be planted in groves, as then only the trees on the margin seem to be affected. All parts of the tree—leaves, bark, wood, and seeds—are subject to insect ravages, almost threatening its extermination. The locust is considerably used for hedges, for which purpose it is one of the best plants where quick-growing and very hardy trees are needed. It is easily propagated by the suckers which spring from the roots, and still more readily by the seed, which is best preserved in the pod. It prefers a rich, loamy soil, and the young plants will often grow from 2 to 3 feet in the first season. There are two species of *Robinia* found in cultivation besides the *pseud-acacia*—viz., the *Robinia viscosa* and the *Robinia hispida*. The latter—a mere shrub—is known as the rose acacia, and is distinguished by its rose-colored, inodorous blossoms and hairy stems. It is apt to spread and become troublesome. The honey-locust is a different tree (*Gleditschia triacanthos*), although belonging to the same family. See GLEDITSIA. Revised by L. H. BAILEY.

Lodge, EDMUND, F. S. A.: historian; b. in London, England, June 13, 1756; served in the army in his youth, and afterward devoted himself to antiquarian pursuits, especially genealogy. He became a member of the Heralds' College; was promoted to the office of Lancaster Herald 1793, Norroy King-of-Arms 1822, and Clarencieux King-of-Arms 1838. D. in London Jan. 16, 1839. He published, among other works, *Illustrations of British History, Biography, and Manners in the Reigns of Henry VIII., Edward VI., Mary, Elizabeth, and James I.* (3 vols., 1791), and *Portraits of Illustrious Personages of Great Britain* (1821–34).

Lodge, HENRY CABOT: politician and author; b. in Boston, May 12, 1850; was educated in Boston at a private school; graduated at Harvard in 1871, and at the Harvard Law School 1875, and for the next few years applied himself chiefly to literary work. He was assistant editor of *The North American Review* 1874–76, of *The International Review* 1879–81, and in the meanwhile published *Life and Letters of George Cabot*. He served in the State Legislature 1880–81; published *Short History of English Colonies* (1881); edited two series of *Popular Tales*, and a volume of *Ballads and Lyrics*; published *Life* of Alexander Hamilton (1883), and *Life* of Daniel Webster; elected chairman of Republican State committee, and conducted campaign which resulted in defeat of Gen. Butler; 1884 published *Studies in History*; sent as delegate-at-large to Republican convention at Chicago; ran as Republican candidate for Congress in Sixth District, and was defeated by some 255 votes in a total of 30,000; edited an edition of *Works of Alexander Hamilton*, and published *Boston*, in the Historic Towns Series. He was representative to Congress from Massachusetts 1886–92, and in 1893 and 1899 was elected U. S. Senator.

Lodge, OLIVER JOSEPH, F. R. S.: physicist; b. near Stoke-upon-Trent, Staffordshire, England, June 12, 1851. He is a graduate of the University of London (B Sc. 1875, D. Sc. 1877). In the former year he became demonstrator in Physics in University College, London, and in 1877 was appointed assistant professor in the same institution. Since 1881 he has been Professor of Physics in University College, Liverpool. Dr. Lodge is the author of many important papers, chiefly electrical. He was a forerunner of Hertz in the domain of electric induction, and has done much to make clear the function of ether in propagating electro-magnetic and electrostatic disturbances. He has also written an elementary text-book on *Mechanics* (1877), well-known semi-popular volumes entitled *Modern Views of Electricity* (his best-known work, 1889), and *Lightning Guards*; also a series of biographical sketches under the title *Pioneers of Science*. Dr. Lodge is a member of the Institute of Electrical Engineers, and of the physical societies of London and Liverpool.
E. L. NICHOLS.

Lodge, THOMAS: dramatist; b. in Lincolnshire, England, about 1555; entered Oxford University in 1573; was a law-student at Lincoln's Inn in 1584; was for some time an actor; was a soldier in the expeditions of Clarke and Cavendish; studied medicine at Avignon, and practiced in London, where he died of the plague in Sept., 1625. He was the author of *Rosalynde*; *Euphue's Golden Legacie* (1590), a novel, the basis of Shakspeare's *As You Like It*; *True Tragedies of Marius and Sylla* (1594), a drama; *A Margarite of America* (1596), a tale; a *Treatise of the Plague* (1603); *Phillis*, a poem; and a number of charming madrigals. With Greene he wrote *A Looking-glass for London and England* (1594). Revised by H. A. BEERS.

Lodi, lō'dē: town; in the province of Milan, Northern Italy (see map of Italy, ref. 3–C). It lies 20 miles S. E. of Milan, on the right bank of the Adda, which is here crossed by a bridge, the river being navigable for large boats until it reaches the Po. Lodi was the theater of one of the most daring and brilliant exploits of the French under Bonaparte. On May 10, 1796, Napoleon, after the terrible passage of the long and narrow bridge under the full fire of the Austrian batteries, won the victory which secured him the possession of Lombardy. The streets and piazzas of Lodi are, for an old town, broad, spacious, well-paved, and clean, and many of the public buildings are worthy of notice. The cathedral dates from the twelfth century, and other churches contain fine marbles, bronzes, frescoes, and especially wood-carvings of much merit. The educational and charitable institutions of Lodi are numerous, and co-operative associations have proved very successful. Its majolica has a high reputation; also its silk and linen, but the chief article of the Lodi market is the famous Parmesan cheese, which is made in large quantities in the neighborhood. Pop. about 18,700.

Lodz: city: in the government of Piotrokow, Russian Poland (see map of Russia, ref. 8–A). It is well built, and has very extensive manufactures of cotton, woolens, and linens. In 1821 it had only 800 inhabitants, but the establishment of cotton-manufactures has made it the second town in Poland. Pop. (1897) 314,780.

Loess [= Germ. *löss*, from *lösen*, to loosen]: a name first used to designate certain superficial deposits along the Rhine, and subsequently extended to deposits of similar appearance in other countries, which were formed, however, under various conditions, and in some instances deserve individual names. At many localities the loess rests on or is included in glacial deposits, and in all cases is referred to Pleistocene or recent times.

Characteristics.—Loess is an exceedingly fine, usually light-yellow, unconsolidated deposit resembling clay. It is composed of angular or but slightly rounded grains of quartz, which make up from 60 to 75 per cent. of its mass, together with similarly unworn and undecomposed fragments of other minerals, and contains also sufficient calcium carbonate to cause it to effervesce with acids. The average size of the fragments composing it is less than ·005 of a millimeter. Although usually homogeneous, it sometimes grades into coarse deposits of various character, but in most localities the stratification is so obscure that it can not be recognized. The deposit is so soft that it crumbles between the fingers, but resists weathering in a remarkable manner, and stands in vertical walls under various climatic conditions for many years; this is due to its porosity, which enables it to absorb water and thus prevent erosion. Its retention of moisture, together with its physical and chemical composition, render it exceedingly favorable for agriculture. It is frequently traversed by small vertical tubes, and contains hard nodules or concretions, of various shapes. Fossils are usually scarce, but at times land shells occur in abundance, and fresh-water shells and the bones of land animals are sometimes found.

Distribution.—Loess occurs as an irregular fringe along the borders of the valleys of the Rhine and Danube, and in a similar position along the Mississippi, Missouri, Iowa, Ohio, etc., where it is known as the "bluff formation." It also covers vast areas in Central Asia, and has been reported in other countries. A deposit apparently undistinguishable from the loess of Asia floors many of the valleys of the arid region between the Rocky Mountains and the Sierra Nevada.

Origin.—The occurrence of loess along the border of river-valleys, together with other features, has led to the conclusion that in such localities it was deposited by the streams themselves when broader and more sluggish than now and highly charged with glacial silt. In many instances river valleys were filled in this manner from side to side to a depth of 200 feet or more, and the streams in re-excavating their channels left a bluff of loess on either bank. In Iowa loess occurs on the summits of eminences, and is thought to have been deposited in glacial lakes. In Asia loess in valleys inclosed by mountains occurs at various altitudes up to several thousand feet, and has been furrowed deeply by streams. These deposits have been studied by von Richthofen, who concluded that they are accumulations of dust blown from adjacent deserts. This explanation is not considered satisfactory, however, by all who have studied the deposits in question. In the arid region of the U. S.

the valleys are filled to the depth of many hundreds of feet with material having all the essential features of the loess of Asia. These deposits, named "adobe" by the present writer, are composed of fine angular mineral fragments, washed from the neighboring mountains, and are still in process of accumulation. Should they be dissected by streams, the peculiar topographic features of the loess region of Asia would be reproduced. (See PLAYA.) Surv.*; *Pleistocene History of Northeastern Iowa*, by W J McGee, in *Eleventh Ann. Rep. U. S. Geol. Surv.*; *Sub-aërial Deposits of the Arid Region of North America*, by Israel C. Russell, in *The Geological Magazine* (London), vol. vi.

ISRAEL C. RUSSELL.

Lofo'den, or **Lofo'ten**: a group of islands situated between lat. 67° 30′ and 69° 30′ N., and stretching along the northwestern coast of Norway. The largest are Andö, Langö, Hindö, East Vaagö, and West Vaagö. They are high and rocky, presenting wild, rugged, and deeply indented coasts, and rising in some places of the interior to the height of 4,000 feet. The inhabitants number about 30,000, partly of Norwegian, partly of Finnish descent. Sheep-farming is carried on, and along the coasts of the fiords a little barley, oats, and potatoes can be cultivated, but the islands derive their importance from the immensely rich fisheries, which each summer employ nearly 30,000 men, and form a source of national wealth to Norway. When the cod-fishing is over, at the end of April, the herring-fishing begins and continues the whole summer; also great numbers of lobsters are caught. This fishing is not without its dangers. The currents around and between the islands are so rapid and tortuous, and subject to such violent changes from ebb and flood, that during spring and fall, when hard weather sets in, these waters often become unnavigable. Even whales are sometimes dashed to pieces against the rocks of the coasts. See MAELSTROM.

Log: an apparatus for measuring the velocity of a ship at sea. Usually it consists of a wooden float, weighted on one side so that it will float upright, and having a line attached to it in such a manner as to bring the flat side of the float so as to offer the greatest resistance to a force tending to drag it through the water. The attached line is about 150 fathoms in length, and when not in use is wound on a light running reel. The line is divided into equal parts, each of which is equal to $\frac{1}{120}$ of a nautical mile, the points of division being marked by *knots*, formed by passing pieces of twine between the strands of the line, and leaving the free ends to project on each side of the line. The first knot is placed at a considerable distance from the float or log, and is very prominently marked. The part of the line between the log and the first knot is called the stray line; its use is to allow the log to become settled before the count is commenced. To use the log and line, the log is thrown over from the lee quarter of the vessel, and the line is then unwound from the reel as fast as the vessel sails. At the instant the first point of division passes from the reel a half-minute sand-glass is inverted, and when the last sand falls the reel is stopped. The number of equal spaces that have been unwound indicates the number of nautical miles the ship is sailing per hour, inasmuch as a half minute bears the same relation to an hour that one of the divisions of the line does to a nautical mile. The log is thrown from time to time, and the results are recorded in the logbook. To secure accurate results, the line should be so prepared as to prevent stretching. To guard against variations of length due to hygrometric changes, the line is usually saturated with oil. If it is found that the line has changed in length, a correction must be applied to the measured rate of the vessel, and the line must be graduated anew.

The so-called patent log consists of a light rod of metal with spiral flanges, which is attached to the end of a long line and thrown over the ship's taffrail, to be drawn through the water as she moves. The spiral form of the flanges causes the rod and line to revolve. At the other end the line is attached to a clockwork, which it moves around so that the miles made are indicated on a dial.

Logan: city; capital of Hocking co., O. (for location of county, see map of Ohio, ref. 7–F); on the Hocking river, the Hocking Canal, and the Columbus, Hock. Val. and Tol. Railway; 18 miles S. E. of Lancaster, 51 miles S. E. of Columbus. It is in a coal and iron mining region; manufactures flour, woolen goods, furniture, and foundry products; has a large trade, and contains a semi-weekly and three weekly newspapers. Pop. (1880) 2,666; (1890) 3,119; (1900) 3,480.

Logan: city; capital of Cache co., Ut. (for location of county, see map of Utah, ref. 2–M); on Logan river, and the Union Pac. Railway; 66 miles N. of Ogden, 90 miles N. of Salt Lake City. It is in an agricultural and mining region; is the seat of Brigham Young College (Latter-Day Saints), New Jersey Academy (Presbyterian), and the Utah Agricultural College and experiment station; and contains a Mormon temple, Presbyterian, Methodist Episcopal, and Protestant Episcopal churches, 7 public schools, Methodist Episcopal and Protestant Episcopal schools, and 3 semi-weekly newspapers. Pop. (1880) 3,396; (1890) 4,565; (1900) 5,451.

EDITOR OF "JOURNAL."

Logan: Indian chief; b. about 1725; the son of a Cayuga chief who lived at Shamokin, in Pennsylvania. He bore the name of Tah-gah-jute, but took also the name of his friend James Logan, acting Governor of Pennsylvania. He was a man of fine physical and mental powers, and was always friendly to the whites until 1774, when a party of ruffians murdered his wife and all his children. At that time he lived near the Ohio river, having removed there about 1767. For six years after the murder of his family Logan and his followers kept the West from Detroit to the Holston in terror, and slaughtered great numbers of settlers. A well-known and eloquent speech which Logan sent to the whites by the interpreter a few months after the murder of his family is preserved in Jefferson's *Notes on Virginia*, but its authenticity and the accuracy of its statements are open to serious question. Logan, while intoxicated, attacked a party of friendly Indians at Detroit in 1780, and was killed in the affray by one of his own kinsmen. A granite monument was erected to his memory at Fair Hill Cemetery, near Auburn, Cayuga co., N. Y. See *Ta-gah-jutè, or Logan the Indian, and Captain Michael Cresap*, by Brantz Mayer (New York, 1867).

Logan, GEORGE, M. D.: U. S. Senator; grandson of James Logan; b. at Stenton, near Philadelphia, Sept. 9, 1753; studied medicine in Edinburgh; returning to the U. S. in 1779, served in the Pennsylvania Legislature for several terms, and was a warm partisan of Jefferson and the Republican party under the administration of John Adams. In 1798, during the imminent peril of war between the U. S. and France, Dr. Logan, who was a strict member of the Society of Friends, went to Paris as a volunteer peacemaker, and was denounced for so doing by the Federalists, who procured the passage by Congress of the so-called Logan Act, Jan. 30, 1799, making it a high misdemeanor for a private citizen to take part in a controversy between the U. S. and a foreign power, and the law slightly modified remains on the statute books. (Revised Statutes of the U. S., section 5335.) Dr. Logan was a member of the U. S. Senate 1801–07; went to England in 1810 in the hope of contributing to preserve peace with that country; was a member of the Philosophical Society and of the board of agriculture, and author of several papers on scientific farming. D. at Stenton, Apr. 9, 1821.

Logan, JAMES: statesman and author; b. at Lurgan, Ireland, Oct. 20, 1674, of Scotch Quaker stock; was well educated, and became a merchant; removed in 1699 with Penn to Philadelphia; was long in public life as provincial secretary, chief justice, etc., of Pennsylvania; was president of the council and acting governor 1736–38; author of *Experimenta de Plantarum Generatione* (Leyden, 1739); a translation of Cicero's *De Senectute* (1744, printed by Franklin); and other works in Latin and in English prose and verse; was the founder of the Loganian Library. D. at Stenton, near Germantown, Pa., Oct. 31, 1751.

Logan, Gen. JOHN A.: U. S. officer and statesman; b. in Jackson co., Ill., Feb. 9, 1824; received a limited common-school education, and on the outbreak of the war with Mexico enlisted as a private in the First Illinois Volunteers, of which regiment he became quartermaster with the rank of first lieutenant. Returning at the close of the war, he was elected clerk of the court of his native county in 1849; in 1852 graduated at the Louisville University, and was admitted to the bar, attaining popularity and success in his profession; was elected to the State Legislature in 1852, 1853, 1856, and 1857, and was prosecuting attorney 1853–57; was elected to the U. S. Congress in 1858, and again in 1860, resigning his seat to enter the army; in Sept., 1861, was appointed colonel of the Thirty-first Illinois Volunteers,

which he led at the battle of Belmont in November; at Fort Donelson in Feb., 1862, was wounded, and the following month appointed a brigadier-general of volunteers; engaged at Pittsburg Landing in April, and in the West until Nov., 1862, when he was promoted to be major-general; throughout the Vicksburg campaign was in command of a division of the Seventeenth Corps, and was distinguished at Port Gibson, Champion Hills, and in the siege and surrender of Vicksburg; in Oct., 1863, was placed in command of the Fifteenth Corps, which he led with great credit until the death of McPherson, when he succeeded to the command of the Army of the Tennessee. He was, however, shortly after relieved by Gen. O. O. Howard, and returned to the command of his corps, which he led until the fall of Atlanta, when the eventful political crisis, involving the choice of a President, demanded his voice and influence at home, and consequently he did not rejoin his corps until the arrival of Sherman's army at Savannah, after its famous "march to the sea"; when, resuming his command, he retained it through the subsequent march through the Carolinas, and in May, 1865, succeeded Gen. Howard in command of the Army of the Tennessee. He resigned his position in the army in Aug., 1865, and in the November following was appointed minister to Mexico, but declined; subsequently was elected to the Fortieth and Forty-first Congresses, and in 1870, 1878, and 1885 to the U. S. Senate from his native State. He was nominated for Vice-President of the U. S. by the Republican national convention at Chicago, Ill., June 6, 1884; wrote *The Great Conspiracy; its Origin and History* (1885); also *The Volunteer Soldier of America*, published in 1887. D. in Washington, D. C., Dec. 26, 1886. See *Life and Services of Gen. John A. Logan*, by G. F. Dawson (1887).

Logan, Sir William Edmond, LL. D., F. R. S., F. G. S.: geologist; b. at Montreal, Canada, Apr. 23, 1798; graduated at the University of Edinburgh in 1817, and in 1818 became partner in a mercantile house in London; was 1829–38 manager of a coal-mining and copper-smelting enterprise at Swansea, Wales, and prepared geological maps and sections of that region for the ordnance survey; was director of the geological survey of Canada 1842–69, publishing valuable reports and many important scientific papers; was made a chevalier of the Legion of Honor in 1855, a knight by Queen Victoria in 1856, and received several valuable medals and other distinctions. D. in Wales, June 22, 1875. He was the first to apply physical, as distinguished from mineralogical, criteria in the classification of the crystalline rocks of Canada, grouping them by means of their physical relations into a number of great natural systems; and he thus not only initiated what modern science regards as the rational mode of investigation, but accomplished specific results of signal importance. Revised by G. K. Gilbert.

Loganiads: the *Loganiaceæ*, a family of dicotyledonous trees, shrubs, and herbs, mostly tropical, but having a few representatives in the U. S., and briefly characterized by regular gamopetalous flowers, opposite leaves, 4 or 5 partite calyx, hypogynous, regular or irregular, 4 or 5 or 10 cleft corolla, and 2-celled ovary. It contains a large number of poisonous plants. Strychnine, curare, etc., are among its deadly principles. Spigelia and gelsemium, both active poisons and valuable medicines, are the most important native loganiads of the U. S.

Logan, Mount: the highest summit in North America; situated in the Alaskan Alps on the Canadian side of the international boundary. It is visible from the Pacific Ocean at the south, but was not specially noticed until the year 1890, when the range was partially explored by an expedition sent out by the National Geographic Society and the U. S. Geological Survey. The chief of the expedition, I. C. Russell, recognized the peak as an important feature of the country, and named it in honor of Sir William Logan, formerly chief of the Canadian Geological Survey. Two years later the U. S. Coast and Geodetic Survey sent a party under J. H. Turner to make surveys in the same region, and it was through his triangulation that the altitude of the peak was determined and its supremacy discovered. It stands in N. lat. 60° 30′, W. lon. 140° 24′, and has an altitude of 19,500 feet. So far as authentic measurements show, its nearest rivals on the continent are Mt. Orizaba, Mexico, 18,300 feet, and Mt. St. Elias, 18,100 feet, a near neighbor of Mt. Logan, but standing within the territory of the U. S. The peak has not been ascended nor closely approached.

Two other peaks bear the same name. One in Northern Utah (10,000 feet) overlooks Cache valley; the other, in Northern Arizona (7,700 feet), stands near the Grand Cañon of the Colorado. G. K. Gilbert.

Logansport: city; capital of Cass co., Ind. (for location of county, see map of Indiana, ref. 4–D); at the junction of the Wabash and Eel rivers; on the Pitts., Cin., Chi. and St. L., the Vandalia, and the Wabash railways; 70 miles N. of Indianapolis. It is in an agricultural region, has valuable timber and building-stone in its vicinity, and derives large power for manufacturing from the two rivers. The principal manufactures are galvanized iron, linseed oil, wind-pumps, paper, hubs and spokes, flour, and plow-handles. The city contains improved water-works, natural and manufactured gas and electric-light plants, electric street-railway, 9 public-school buildings, public-school property valued at $200,000, a Universalist college, 2 national banks with combined capital of $450,000, and 3 daily, 6 weekly, and 2 other periodicals. The city has an extensive trade in grain, pork, and lumber, facilitated by 10 main and branch railways. Pop. (1880) 11,198; (1890) 13,328; (1900) 16,204. Editor of "Journal."

Logaœ'dic Meters [*logaœdic* is from Gr. λογαοιδικός; λόγος, prose or speech + ἀοιδή, song]: meters or verses containing in each colon one or more cyclic dactyls followed by one or more trochees, and sometimes preceded by one or two polyschematic feet regularly in three-eighths time, as – ⏑, – >, ⏑⏑, ⏑ – (in Greek even ⏑⏑). One of these latter feet is called a "basis," two a "double basis." The verse may have anacrusis besides double basis. In most logaœdic cola, especially in Latin, a basis is either a pure or an irrational trochee. Within a verse a colon often ends with the triseme syllable (⌙) instead of a trochee.

The chief logaœdic verses are the following:

I. Without basis.

1. *Adonic.*—Nomen imago.

—⏑ ⏑ | – ⏑ |

2. *Aristophanic.*—Temperat ora frenis.

—⏑ ⏑ | – ⏑ | ⌙ | – ∧ |

3. *Lesser Alcaic.*—Nec veteres agitantur orni.

—⏑ ⏑ | —⏑ ⏑ | – ⏑ | – ⏑ |

II. With basis.

4. *Pherecratean.*—Vis formosa videri.

– > | —⏑ ⏑ | ⌙ | – ∧ |

5. *Glyconic.*—Pulchris excubat in genis.

– > | —⏑ ⏑ | – ⏑ | – ∧ |

6. *Phalœcean.*—Passer mortuus est meae puellae.

(Not in Horace.) – > / – ⏑ / ⏑ – | —⏑ ⏑ | – ⏑ | – ⏑ | ⌙ | – ∧ |

III. With double basis.

7. *Sapphic.*—Pauca nuntiate meae puellae.

– ⏑ | – ⏑ | —⏑ ⏑ | – ⏑ | ⌙ | – ∧ |

(Horatian scheme: – ⏑ | – > | –, ⏑ | – ⏑ | ⌙ | – ∧ |)

IV. With double basis and anacrusis.

8. *Greater Alcaic.*—Non semper idem floribus est honor.

> ⋮ – ⏑ | – > | —⏑ ⏑ | – ⏑ | – ∧ |

V. Verses of more than one cola, containing "syncope" (⌙) within: so-called "choriambic rhythm." (The true choriambus, – ⏑ ⏑ –, is confined to higher lyric poetry in Greek.)

9. *Lesser Asclepiadean.*

Laudat rura sui, mox reficit rates.

– > | —⏑ ⏑ | ⌙ ‖ —⏑ ⏑ | – ⏑ | —∧ |

10. *Greater Asclepiadean.*

Quae mens est hodie, cur eadem non puero fuit.

– > | —⏑ ⏑ | ⌙ ‖ —⏑ ⏑ | ⌙ ‖ —⏑ ⏑ | – ⏑ | – ∧ |

11. *Greater Sapphic.*

Saepe trans finem iaculo nobilis expedito.

– ⏑ | – > | —⏑ ⏑ | ⌙ ‖ —⏑ ⏑ | —⏑ | ⌙ | – ∧ |

12. *Priapean* = Glyconic + Pherecratean.

13. *Eupolidean* (not in Latin): basis at the beginning of each colon:

ὦ θεώμενοι, κατερῶ πρὸς ὑμᾶς ἐλευθέρως.

– > / – ⏑ / ⏑ ⏑ ⏑ | – ⏑ | —⏑ ⏑ | ⌙ ‖ – > / – ⏑ / ⏑ ⏑ ⏑ | – ⏑ | – ⏑ | – ∧ ‖

VI. Some metricians, ancient and modern, include among logaœdic verses those that contain a dactylic followed by a trochaic colon, as

14. *Greater Archilochian.*

Solvitur acris hiems grata vice veris et Favoni.

$$- \overset{\sim}{\cup} | - \overset{\sim}{\cup} | - \overset{\sim}{\cup} | - \cup, \| - \cup | - \cup | \llcorner | - \wedge \|$$

VII. Sometimes a trochaic or iambic verse occurs among logaœdic verses in the same period, as the third line of the Alcaic stanza:

15. Descendat in campum petitor.

$$> \vdots - \cup | - > | - \cup | - \cup |$$

There is no definite limit to the variety of logaœdic cola and their combinations in lyric poetry. The following sample is from Pindar:

Ἐλατὴρ ὑπέζτατε βροντᾶς ἀκαμαντόποδος Ζεῦ τεαὶ γὰρ ὧραι.

$$\cup \vdots - \cup | - \cup \cup | \llcorner \| - \cup \cup | - \cup \cup | \llcorner \| - \cup | - \cup | - \cup \|$$

In modern languages the systematic use of logaœdic rhythm is almost restricted to imitations of classic poetry, such as Tennyson's *Phalaeceans*:

Look, I come to the test, a tiny poem
All composed in a meter of Catullus.

The name logaœdic is thought by some to be due to the prose-like irregularity; others believe it signifies "speech sung" (words set to music). Possibly it was first applied to verses with bases, which, like the lines in our chants, may have started without definite measure and ended metrically. See Meters, Prosody, and Rhythm. M. W. Humphreys.

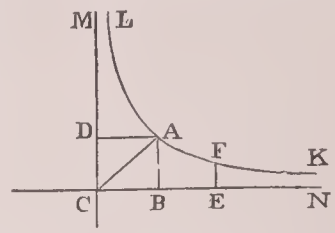
Logarithms [Gr. λόγος, reason, proportion, ratio + ἀριθμός, number (whence Eng. *arithmetic*)]: The logarithm of a number is the exponent of the power to which it is necessary to raise a fixed number to produce the given number. The fixed number is called the *base*. Thus in the equation $10^3 = 1{,}000$, 3 is the logarithm of 1,000, the base being 10. Any positive number except 1 may be taken as a base, and for each base there is a corresponding *system of logarithms*; there is therefore an infinite number of systems of logarithms, but only two of them are in general use—the *Napierian* and the *common* system. The Napierian system, named after its inventor, Baron Napier, is the system whose base is 2·718281828 . . .; the common system is the system whose base is 10. In what follows we shall designate Napierian logarithms by the symbol l, and common logarithms by the symbol *log*.

Uses.—Napierian logarithms are mostly employed in the higher branches of analysis and in scientific investigations. Common logarithms are used in practical computations, where they serve to convert the operations of multiplication and division into the simpler ones of addition and subtraction. In trigonometric computations their use is almost indispensable. Computations by means of logarithms are made in accordance with the following principles: 1, the logarithm of the product of any number of factors is equal to the sum of the logarithms of the factors; 2, the logarithm of a quotient is equal to the logarithm of the dividend diminished by that of the divisor; 3, the logarithm of any power of a quantity is equal to the logarithm of the quantity multiplied by the exponent of the power; and 4, the logarithm of any root of a quantity is equal to the logarithm of the quantity divided by the index of the root. In applying these principles the logarithms needed are taken from tables called tables of logarithms. The method of forming these tables will be explained hereafter.

General Properties of Logarithms.—In the exponential equation $a^x = n$ we may regard a as the base of any system of logarithms, in which case x will be the logarithm of n taken in that system. The discussion of this equation indicates the following general properties: 1, the logarithm of 1 in any system is equal to 0; 2, the logarithm of the base of any system, taken in that system, is 1; 3, in any system whose base is greater than 1 the logarithms of all numbers greater than 1 are positive, the logarithms of all numbers less than 1 are negative, the logarithm of 0 is $-\infty$, and the logarithm of ∞ is $+\infty$; 4, in any system whose base is less than 1 the logarithms of all numbers greater than 1 are negative, the logarithms of all numbers less than 1 are positive, the logarithm of 0 is $+\infty$, and the logarithm of ∞ is $-\infty$; 5, there are no real logarithms of negative numbers in any system. These general properties are used in analytical investigations.

Relations between Different Systems.—Every logarithm is composed of two factors. The first factor is constant for the same system, and depends for its value on the base of that system; the second factor is independent of the base of the system, but is dependent on the particular number in question, and changes with it. The constant factor corresponding to any system is called the *modulus* of that system. The modulus of the Napierian system is 1, that of the common system is ·4342945, and that of any system is equal to the reciprocal of the Napierian logarithm of the base of that system. Since the Napierian logarithms of all numbers less than 1 are negative, and of all numbers greater than 1 are positive, it follows that the modulus of a system whose base is less than 1 is negative, and that the modulus of a system whose base is greater than 1 is positive. A modulus may have any value from $-\infty$ to $+\infty$; it is to be observed that the modulus decreases algebraically as the base increases. If we multiply the Napierian logarithm of any number by the modulus of any system, the product is the logarithm of the same number in that system. This principle enables us to find the logarithm of any number in any system when we have a table of Napierian logarithms.

Geometrical Relations.—Napierian logarithms are sometimes called hyperbolic logarithms, on account of their relation to the equilateral hyperbola; there is, however, no good reason for this distinction, inasmuch as the same relation that exists between the logarithms of this system and a particular equilateral hyperbola exists also between those of any system whatever and some other equilateral hyperbola. To explain the nature of this relation, let LAK be one branch of an equilateral hyperbola, whose equation, when referred to its asymptotes, CN and CM, is $xy = m$; let A be the vertex and let F be any point on the curve; and let CB and CE be the abscissas of A and F, the latter being called the *terminal* abscissa. The square described on the co-ordinates of A is equal to m, as may be shown from the equation of the curve. Now it may be proved by means of the calculus that the area $CDAB$ is to the area $BAFE$ as 1 is to the Napierian logarithm of CE. Denoting the area $BAFE$ by A, and CE by x, we have



$$m : A :: 1 : lx, \ldots \quad \therefore A = mlx; \ldots (1).$$

Hence the area between an equilateral hyperbola and one of its asymptotes, estimated from the ordinate of the vertex up to any other ordinate, is equal to the logarithm of the terminal abscissa taken in a system whose modulus is the square described on the co-ordinates of its vertex. If we take the conjugate of the hyperbola LAK, whose equation is $xy = -m$, equation (1) will become

$$A = -mlx \ldots (2).$$

The numerical value of m in equations (1) and (2) depends upon the value of CB; by giving suitable values to CB, m may be made to have any value from 0 to $+\infty$; that is, $\pm mlx$ may be made to represent the logarithm of x in any system whatever. If we make $CB = 1$, we have $m = 1$, and equation (1) becomes $A = lx$, a result that conforms to the Napierian system. The value of the area A may be expressed by an infinite series in terms of x, and this series may be used as a means of computing a table of logarithms. Such a series was originally employed for this purpose, but its use has been superseded by others found to be more convenient.

Tables of Logarithms.—Tables of logarithms are tables from which we may find the logarithm corresponding to any number, or the number corresponding to any logarithm, within certain limits. Every logarithm consists of two parts—an entire part, called the *characteristic*, and a decimal part, called the *mantissa*. Either of these parts may be 0, and the characteristic may be either positive or negative, but the mantissa is always positive. The characteristic may be found by a very simple rule, and for this reason it is not given in the ordinary tables; the decimal point is also omitted in writing the mantissa. The manner of arranging the tables, as also the manner of using them, will be best learned from the explanations which precede each collection of tables: and to these the reader is referred for all information of that nature. In addition to the logarithms of natural numbers, the tables usually contain the logarithms of the principal circular functions—sine and cosine, the tangent and cotangent, from 0° to 90°. The inconvenience of negative characteristics is avoided by adding 10 to each log-

arithm ; an allowance is made in the final result for each 10 thus added. The same device is employed in using the logarithms of ordinary decimals.

Logarithms were invented by Baron Napier, who published an account of the same in 1614 in a work bearing the title *De mirifici Logarithmorum Canonis Constructione*. The first table of common logarithms was published by Briggs in 1624 under the title of *Arithmetica Logarithmica*. He calculated the logarithms of all the numbers from 1 to 20,000, and also from 90,000 to 100,000, carrying out his figures to 14 decimal places. In 1628 Adrian Vlack supplemented the work of Briggs by publishing a book bearing the same title, *Arithmetica Logarithmica*, in which he supplied the logarithms of the numbers from 20,000 to 90,000, but at the same time he reduced the number of decimal places to 10. Vlack included in his work the logarithms of the sines, tangents, and secants for each minute of arc from 0° to 90°. Five years later the same author published a table of the logarithms of sines and tangents, for every *hundreth* of a degree from 0° to 90°, which had been computed by Briggs. In 1797 Vega published an edition of Vlack's tables, but the work is out of print and copies are difficult to be found. Probably the best accessible tables are those of Bruhns, published at Leipzig, in both German and English.

Antilogarithms.—An antilogarithm is the number corresponding to a given logarithm. Thus 100 is the antilogarithm of 2 in the common system. Antilogarithms, in the common system, are denoted by the symbol $\log^{-1}$. Thus $\log^{-1} 2 = 100$ is equivalent to the expression, the number whose logarithm is 2 is equal to 100.

Revised by S. Newcomb.

Loggerhead Turtle: a large sea-turtle (*Thalassochelys caretta*) inhabiting the tropical Atlantic and Indian Oceans, so named from its large head, by which it can be readily distinguished from the green turtle. The flesh is not palatable, but the species, especially the smaller individuals, is often brought to market. In the Southern U. S. the name is often applied to the snapping turtle (*Chelydra serpentina*).

F. A. L.

Logic [from O. Fr. *logique*, Lat. *lo'gica*, from Gr. λογική (sc. τέχνη, art), logic, liter., fem. of λογικός, pertaining to thought or reasoning, deriv. of λόγος, word, reason, thought]: the science of the processes and laws of discursive knowledge. The processes involved are conception, judgment, and reasoning. Logic assumes the whole content of the unreflective consciousness, what Hodgson calls "the perceptual order," and also certain axioms and first principles on which reflection proceeds. *Conception* is the process through which we reach notions of the abstract properties and the genera and species of things. Notions when named are called *terms*, and are classified as abstracts and concretes, singulars and generals, absolutes and relatives, positives, negatives, and privatives, collectives and distributives, etc. They are also distinguished in view of their *extension* or object-reference, their *intension* or meaning, and also in view of their *denotation* and *connotation*, terms almost equivalent, respectively, to extension and intension. Terms indicating genera and species are also open to *definition* and *division*, the former process developing their meaning or generic and specific characters, the latter fixing their place in a logical classification. The principal rules for these processes are: for *definition*, that it shall be sufficient to indicate the genus and differentiæ of the term defined, and that the terms of the definition shall be clearer than the thing defined; for *division*, that cross-divisions shall be avoided, and that the sum of the species shall exhaust the class divided.

Judgment is the function through which we combine or separate the contents of two notions or terms by means of assertion, as when on contemplating the notional content of Athenian and Greek we assert that the Athenians are Greeks. Assertions when verbally stated become *propositions*. The logical treatment of propositions embraces their classification, distribution of their terms, and their interrelations. The classification of propositions on the basis of quantity and quality gives the four traditional forms, the universal and particular affirmatives and negatives, symbolized by the vowels A, E, I, and O. The terms in propositions are distributed or undistributed, according as the assertion includes *all* or only *part* of the class which the term names. The interrelation of propositions is called their *opposition*, and may be of three distinct species—contradiction or quantitative and qualitative opposition combined; contrariety or opposition of quality; subalternation or opposition of quantity. The properties of propositions lay the foundation for their inferential use.

Reasoning is the function by which the mind proceeds from a present content called data to other content which it reaches through inference. This is achieved either by connecting facts with principles or laws through generalization, that is, by Induction (*q. v.*), or by connecting a principle or genus with its species by means of specialization, that is, by *deduction*. Of deductive inference it is customary to distinguish two species, named respectively immediate and mediate. Immediate inference is the process by which the direct implications of judgments are drawn out. No assertion stands alone, but is a member of a logical community which is affected throughout by its action. Every judgment, besides what it explicitly asserts, both affirms and denies by implication. It is the business of immediate inference to develop these implications. Its principal methods are *opposition*, which proceeds on the relations of contradiction, contrariety, and subalternation; *conversion*, which transposes the terms of the judgment either simply, that is, without change of quantity and quality, or *per accidens*, that is, by a change of quantity from universal to particular. Of the four fundamental forms, E and I convert simply, while A is converted *per accidens*. O can be converted by being first changed into I. Other methods of immediate inference are *obversion*, which develops the assertion of the opposite quality that is implied in every judgment; *contraposition*, which gives the converse of this opposite; the addition or transposition of qualifying words or phrases and other devices of which special mention need not be made. Immediate inference is a most fruitful source of conclusions both in its popular use and in the stricter employment of it in science and philosophy.

Mediate inference is the process by which conclusions are indirectly reached through a comparison of assertions. It embodies itself in several types, namely, the *calculative*, which is founded on pure relations of quantity, and embraces all mathematical and quasi-mathematical reasoning; the *subsumptive*, which is founded on relations of genera and species, and includes all distinctively syllogistic reasoning; the *generalizing*, which is founded on relations of facts, and constitutes the special instrument of induction. The *subsumptive* type is the special instrument of the traditional logic. Subsumptive reasoning proceeds by so relating the contents of two terms to that of a third or common term in two propositions, of which one enunciates a general principle, the other a specification under it, as to render a conclusion as to their relation to each other possible.

The first judgment or proposition enunciating the general principle is called, technically, the major premise; the other is called the minor premise, and the two, together with the inference or conclusion drawn from them, constitute what is called a syllogism. Of these three parts all syllogisms consist; but for the most part we have in practice either (1) an omission of one of the premises, as A is B, therefore A is C, in which case we call the abridged form an enthymeme, or (2) several premises following each other in some regular order, and only one conclusion drawn from them, as A is B, B is C, C is D, therefore A is D. This is called a sorites. In such cases we have, in fact, two or more syllogisms condensed into one formula by the omission of some of the propositions that would have appeared if each of the syllogisms had been stated in full, each with its own premises, and the conclusion to each pair distinctly stated as such in due order. Thus, in the example just given, we have, in fact, (1) B is C, A is B, therefore A is C; (2) C is D, A is C, therefore A is D; that is, the second premise of the sorites becomes the major premise of the first syllogism; the first is the minor premise, and the conclusion is a proposition that did not appear in the sorites at all. Then for the second syllogism the third premise of the sorites is used for major premise, and the conclusion of the first syllogism is used for minor premise, and so on until we come to a syllogism that has for its conclusion the same proposition as the sorites itself. In the case of the enthymeme the premise is omitted, because it is a part of the common sense or the acknowledged science of mankind, and therefore needs no repetition or explicit statement. It is, however, a part of the syllogism or argument as truly and as really as though it were expressed, since without it no conclusion can be drawn from any proposition which would contain any term that was not contained in the prop-

osition used as a premise itself. Hence the means by which we can find the suppressed or omitted premise is one of the most important parts of logic in a practical point of view.

There are three species of syllogisms determined by the specific relations on which they are founded. The *categorical* syllogism rests on the relation of individuals or species to their genus. The major premise in the categorical syllogism is some proposition about genus. Since the individual and species are contained in the genus, any proposition about genus will be unqualifiedly applicable to them also. For example, if genus *homo* is fallible, then Socrates and the Athenians will be fallible also. Besides the categoricals there are two species of *hypothetical* syllogisms—the *conjunctive* and *disjunctive*, as they are styled by Fowler. The peculiar character of the *conjunctive* syllogism arises from the fact that it rests on a categorical proposition about genus, which is not enunciated. Thus in the conjunctive statement, if it rains the ground will be wet, is implied the categorical, rain wets the ground, and in the conjunctive, if Socrates is an Athenian he is a Greek, is implied the categorical, the Athenians are Grecks. The ground-prineiple of the conjunctive syllogism is therefore an unenunciated categorical proposition, on the strength of which we assume a relation of conditional dependence of subject or predicate, and say, if rain, then wet ground; if Athenian, then Greek. The *disjunctive* syllogism also rests on a categorical presupposition, namely, that of a genus or whole within which the disjunction takes place. Thus if we assert disjunctively that a triangle is either isosceles, right angled, or scalene, we do so on the presupposition of a containing figure of which these are the only alternative species. They are the possibilities among which the aetuality is to be found.

The rules of the hypotheticals may be briefly stated. In a conjunetive syllogism if we affirm the antecedent we prove the eonsequent, and *vice versa* if we deny the consequent we disprove the antecedent. Thus

If A is B, C is D.

A is B,	C is not D,
Therefore C is D.	Therefore A is not B.

Any other mode of completing the syllogism would be fallacious. This will be obvious from a simple example: "If John has a fever he is sick. John has a fever, therefore he is sick"; "John is not sick, therefore he has not a fever." This is right; but if we say, "John has not a fever, therefore he is not sick," or if we say, "He is sick, therefore he has a fever," it would be manifestly wrong.

In a disjunctive syllogism it is always safe to deny one of the parts or propositions as a means of proving the other, as "A is either B or C; A is not B, therefore A is C; or A is not C, therefore A is B." Polypes are either plants or animals: they are not plants, therefore they are animals; bnt the other method of completion, offering one proposition to disprove the other, is not always valid. Thus "Coleridge is either a poet or a philosopher; he is a philosopher, therefore he is not a poet." In this case poets and philosophers are not what are called co-ordinate parts or species, for a man may be both a poet and a philosopher at the same time. The *dilemma* is a complex hypothetical combining both conjunctive and disjunctive elements.

The most important and fundamental species of syllogism is the *categorical*, and it is in its elaboration that most of the machinery of logic has been developed. The categorical syllogism is formally a combination of three propositions, two of which are called *premises*, the third *conclusion*. For example, we argue, the causes of crime should be suppressed; ignorance is a cause of crime; therefore ignorance should be suppressed. Here the major enunciates a general principle, the minor makes a specification under it, and the conclusion applies the principle to the case specified in the minor. In the categorical syllogism three terms are employed, namely, a major and minor between which the reasoning is seeking a connection, and a middle term which stands so related to the major and minor as to show that one is wholly or in part included in or excluded from the other. Thus arise the different varieties of affirmative and negative conclusions. Now, it is manifest that with A for major premise we may have either A, E, I, or O for minor, and thus four pairs of premises, A A, A E, A I, and A O, and with each pair we can have either A, E, I, or O for a conclusion; and thus sixteen syllogisms differing from each other in what is called the mood of the syllogism. In like manner we may have sixteen with either E, I, or O for major premise, making in all sixty-four moods. Thus, for an example of A A A, we have, "All S are M, all M are P; therefore all S are P"; of E E E, "No S are M, no M are P; therefore no S are P." The former is at once seen to be valid, and the latter is about as obviously invalid or fallacious, actually proving nothing.

In the above example S was used to denote the subject of the conclusion, which is therefore called the minor term, and is found only in the minor premise. P was used for the predicate of the conclusion. It is therefore called the major term, and is found only in the major premise. M stands for what is called the middle term. It is found in both premises, but not in the conclusion. It may, however, occupy either of four positions in the premises, as (1) subject of the major premise and predicate of the minor; (2) predicate in both; (3) subject in both; or (4) the inverse of the first, predicate of the major premise, and subject of the minor. These varieties of position constitute what is called the figure of the syllogism. As each of these positions of the middle term may be found in either of the sixty-four moods, we may have 256 different categorical syllogisms.

Most of these 256 syllogisms are invalid—not only worthless, but actually delusive. Hence the discovery of some rules and practical tests of validity is of the utmost importance. *Fallacies* may be of two kinds—either (1) in form or (2) in diction. A fallacy is said to be in form when it is obvious on the mere inspection of the form of the syllogism, without considering or knowing the meaning of the propositions, or of its terms even; as "M is not P, S is M; therefore S is P"; but when there is no fallacy in form there may be one in diction, which renders the reasoning worthless. This can be discovered and exposed only by a consideration of the meaning of the several propositions considered separately. Thus "Light comes from the sun, feathers are light; therefore feathers come from the sun." In this case the form is faultless, but the diction is fallacious. The word "light" is ambiguous, and means one thing in one premise and something else in the other.

Besides these two classes of what are called logical fallacies there are one or two others, called extra-logical fallacies, of which we shall say a word in conclusion. First we shall speak of fallacies in form:

(1) There may be no more than three real terms. There may be any number of words, for nouns will often have several adjectives and modifying clauses, but for the purposes of logic a noun with all its adjectives may be considered as one word. As an example of the "fallacy of many terms," as it is called, we have the following: "My hand touches the pen, the pen touches the paper; therefore my hand touches the paper." Here, as we see on a careful analysis, we have four terms, four different things really spoken of: (1) my hand, (2) that which "touches the pen," (3) "the pen," and (4) that which "touches the paper"; and the syllogism *implies*, though it does not state, that whatever touches the pen is the pen, which is of course absurd. It will sometimes happen, however, that what is thus implied is not only not absurd, but is in fact quite true. In that case the apparent fallacy is only an abridged form of the sorites, of which we shall say more below.

(2) If both premises are negative, there can be no conclusion. Thus "S is not M, M is not P." After these premises we can have no conclusion. "Horses are not men, men are not birds." It is true that horses are not birds, but if we say "Horses are not men, and men are not quadrupeds," we can have no conclusion, although we know otherwise that horses are quadrupeds. It will sometimes happen, however, that there is an appearance of two negative premises when one or both of them is really affirmative. Thus "No one who has not enough can be called rich, but no miser has enough: therefore, no miser can be called rich." Here two of the negatives virtually correct each other, making for the middle term "person not having enough," and the inference is as valid as though the middle term were positive, "persons having enough," or "No S is M" (which is equivalent to "S is not M"). "Whatever is not M is P" (equivalent to "All not M is P"), "therefore S is P."

(3) It is found to be necessary that the middle term should be used once at least, as either the subject of a universal proposition or the predicate of a negative one. The failure to fulfill this condition constitutes what is called an undistributed middle. Thus "Horses are animals, foxes are animals; therefore horses are foxes"; but horses and foxes are co-ordinate species of animals, and therefore can not be

predicated of each other. Even this fact, however, is not proved by the premises, for we may have "Dogs are animals, spaniels are animals." Spaniels are a species or variety of dogs, so that in this case the major and the minor terms are subordinate rather than co-ordinate, and may be predicated of each other affirmatively.

(4) Neither the minor nor the major term may be used in the conclusion as subject of a universal proposition, or as predicate of a negative one, unless it had been used in one or the other of these ways in the premises. The violation of this condition constitutes what is called "illicit process," and the fallacy is called illicit process of the minor when the minor term is used in violation of this law, and when the major term is so used, the fallacy is called illicit process of the major. Here, again, the demonstration of the law would require more space than can be spared to it. As an example of illicit process of the minor term we may have the following: "Horses are quadrupeds, and horses are useful animals; therefore *all* quadrupeds are useful animals." It would be legitimate to say either "Some quadrupeds are useful animals," or "*Some* useful animals are quadrupeds." Then, for an example of illicit process of the major, we have, "Negroes have black skins, the Arabs are not Negroes; therefore the Arabs have not black skins." Here the negative term "black skins" is predicate of a negative conclusion, whereas it was not used as either subject of a universal or as predicate of a negative premise. It was predicate of an affirmative proposition in the major premise.

There are several other convenient rules known to the expert logician, but they are too abstruse and technical to admit of being given here. There are, however, two that may be given that are of great practical value, though resulting from the application of the preceding four: (1) After two particular premises there can be no conclusion, for it is found that in all such cases a conclusion would involve either an undistributed middle or an illicit process.* (2) After one particular premise there can be no universal conclusion, for the same reason as that just given in regard to any conclusion after two partial propositions. (3) It is also found that after one negative premise there can be no affirmative conclusion. We have seen that after two negative premises there can be no conclusion whatever, but if one of the premises be negative, any affirmative conclusion involves a violation of the fundamental conditions of validity.

Generally, however, the syllogism is left incomplete, and some premise is assumed without being stated. For this and for other reasons it becomes very important to know how to find and put into explicit statement the assumed premise. This can always be done by means of the principles and rules already laid down, but for the purpose now before us another set of rules is more immediately applicable. Of course we have in the enthymeme the conclusion and one premise. We have therefore all the terms that can be used, and the problem is to find the other and assumed premise, such in character as that it will complete the syllogism without violating any of the rules above laid down. The four rules are as follows: (1) If the conclusion be universal affirmative, both premises must be affirmative, and the minor and the middle terms must be distributed. (2) If the conclusion be particular affirmative, both premises must be affirmative, and only the middle term need be distributed. (3) If the conclusion be particular negative, one premise must be negative, and the middle and the major term must be distributed. (4) If the conclusion be universal negative, one premise must be negative, and all three of the terms must be distributed.

It is necessary to pass to the consideration of fallacies in diction. Logic assumes that the terms in any argument, like the letters in an algebraic equation, shall denote each one and the same thing throughout the argument or solution, and that language for the most part shall be used literally, each word describing its object or event as it is, and that no proposition shall have, either expressly stated or necessarily implied, two propositions in one, one of which may be true, while the other is false. Thus if I say, "A man has ceased to be a liar," I *imply* that he has been a liar, and I *assert* that he is not one now; but of course either of these assertions may be true, while the other is false, and they may therefore be both true at the same time. Subject to these conditions, all the fallacies in diction may be referred to four classes. (1) *Ambiguous Middle.*—In this one term (usually the middle term) is used to denote one thing in one proposition and something else in another. Thus in the example already cited, "*Light* comes from the sun, feathers are *light*," here both premises may be true separately if we shall take the word *light* to mean different things in each of them, but not otherwise. (2) *Variation.*—This may be in quantity, condition, etc. Thus "Money will buy whatever is for sale; a ten-cent piece is money," etc. Here the word "money" is not used ambiguously; it means the same thing in each premise, but it is used with reference to different quantities in each premise, and the premises will be assented to only as we so understand the words. (3) *Division and Composition.*—This fallacy consists in using a word (usually the middle term) as a collective term in one place and as a general distributive in the other. Thus in the proposition, "The Romans conquered Carthage," the word "Romans" is used as a collective term. If, now, we should say after the first, "Cicero was a Roman, therefore he conquered Carthage," our fallacy would be one of division; but if the word is first used as general distributive and then as collective, the fallacy takes the form which is called composition. (4) *Substance and Accidents.*—A property may be accidental in one premise, and yet used so as to make it essential in the other or in the conclusion; or it may be affirmed with regard to some property, mode, or accident in a premise, and then affirmed in reference to its substance in the conclusion, and *vice versa*. This constitutes what is called the fallacy of substance and accidents. Thus the example usually given is, "We eat what we buy in the market; we buy raw meat in the market; therefore we eat raw meat," or eat our meat raw. We buy our meat not because it is raw, but rather because it is meat; the "rawness" is merely accidental to the act of purchasing and to the premise, but in the conclusion it is so placed as to make it essential to its meaning. This is called the fallacy of accidents; but if we should say of a certain man, in reference to his pecuniary responsibility, "He is good," and should thus infer by means of a major premise that he is a good "man," we should have the fallacy in the other form, applying what is said in reference to some accidental mode, property, or attribute to the substance itself. This is called the fallacy *a dicto secundum quid ad dictum simpliciter*. Of all the fallacies in diction, those belonging to this class are the most subtle and difficult of detection and exposure.

Extra-logical fallacies are of two kinds—fallacies in matter and fallacies in method.

In regard to the matter, there are several forms of fallacy that are to be noted. The first is what is called *non vera pro vera*—the using a premise that is untrue as though it were true. This applies as well to those propositions that are implied, and can be formed only in the ways of completing imperfect formulas already spoken of, as to those that are expressly stated as premises. Of course, when a premise that is false is used as a real premise the argument fails to prove anything, and will be so regarded by all persons that know its falsity. Then, again, we have what is called *non causa pro causa*, which consists in using as a premise a proposition which, though true enough, is not a premise irrelevant to the conclusion. A proposition occurring in the course of an argument is always irrelevant, or *non causa*, when it can not be connected with the rest as one in a series that makes a sorites by having one of its terms in common with the preceding proposition and the other common to it and the succeeding proposition. Thus if we have "A is B, B is C, C is D, ∴ A is D," the propositions follow in logical order, and are logically connected, but if among them should occur "C is H or M is P," we could not connect such a proposition with the other premises, and although true it would be no premise to A is D.

The fallacies in method may also be of several kinds. First, we have what is called a begging of the question, or *petitio principii*. As a general rule, one of the premises is so evidently true that it may be assumed without proof and without remark, while all effort at proof should be directed to the other. If an orator, however, assumes as true or as conceded that which his auditors expect or desire to have proved, they accuse him of begging the question; that is, of assuming the very thing they want to have proved before they will assent to his proposition. Logically, both premises should be proved, but rhetoric requires that we should spare ourselves the labor and the audience the annoyance of listening to proof of what nobody doubts. In some cases this begging of the question takes the form of reasoning in a circle—*curriculum nefas*. Suppose we have

* An exception to this rule is the plurative judgment pointed out by De Morgan.

three propositions, 1, 2, and 3, and we use 1 and 2 as premises to prove 3, and then 1 and 3 to prove 2, or 2 and 3 to prove 1, we are in such a case reasoning in a circle; that is, we first deduce a conclusion from premises, and then use that conclusion as a premise to prove one or the other of its premises—that is, its own premises.

The other recognized form of fallacy in method is called mistaking the issue, or *ignoratio elenchi*. One first mistakes the real proposition that is to be proved, and then, seeking proof for his supposed conclusion, does not find the proof that is required for the real conclusion which should be established; and he is said to be ignorant of the proof or to have mistaken the proof, because he had first mistaken the proposition to be proved. A case is cited from Greek history: The Athenians were deliberating whether to put the Mitylenians to death. One orator had tried to show that it was *just* to do so. Another replied that that was not the proposition to be proved; it did not answer the question, for the question really was whether it was *expedient* to do so: nobody doubted the justice of the measure.

At the basis of logic are certain principles called laws of thought. These are identity and difference, and sufficient reason; the former governs by the deductive processes; the latter those of induction. These principles have both psychological and metaphysical roots, the development of which rests beyond the scope of this article.

Revised by ALEXANDER T. ORMOND.

Logistics [from Gr. λογιστικός, skilled in calculation, fr. λογίζεσθαι, to calculate, fr. λόγος, word, number, reckoning]: that branch of the art and science of war which deals with transporting and supplying armies. It includes arranging and timing marches, preparing and transmitting orders, directing railway and water transportation, selecting and regulating camps and cantonments, as well as the manufacture, purchase, transportation, and distribution of arms, munitions, and supplies of all kinds. It is intimately connected with strategy in the location of bases and dépôts with reference to collecting supplies; and in secrecy, in preparation of means of transport and destination of stores provided, etc., and with *tactics* in that the operations for collecting information, foraging, arranging and timing marches, locating camps, etc., should be so made that the best protective measures may be taken by the troops in accordance with tactical principles and with the least labor and fatigue. See WAR.

JAMES MERCUR.

Logog'raphers [Gr. λογογράφοι, literally, writers of prose]: a name applied to the older Greek chroniclers who mark the transition from the poetical narrative of the epos to true historical composition. Ionia was the home of the earliest Greek prose, and most of the logographers were Asiatic Greeks. Their style was simple and inartificial, though largely imbued with epic elements; there was no organization of the material, and the only criticism was the criticism involved in the incongruity of the legends recorded. The period of the logographers begins toward the end of the sixth century B. C., and straggling representatives of the class are found down to the time of the Peloponnesian war. See HECATÆUS, HELLANICUS, HERODOTUS, and PHERECYDES OF LEROS. The scant fragments are collected in Müller's *Fragmenta Historicorum Græcorum*.

B. L. GILDERSLEEVE.

Log'os [= Gr. ὁ Λόγος, the divine Reason or creative Word manifesting itself, a special use of λόγος, word, discourse, reason (i. e. either thought as actively expressing or manifesting itself or speech as the direct active expression of thought); deriv. of λέγειν, put, put together, reckon, speak (rationally), say, tell]: a term which has a peculiar significance in Philo, St. John, and the early Greek Fathers, and is important in the doctrine of Christ.

(1) Philo, a Jewish philosopher of Alexandria, who endeavored to harmonize the Mosaic religion with Platonism (d. about 40), derived his Logos view from the Solomonic and later Jewish doctrine of the personified *Wisdom* and *Word* of God, and combined it with the Platonic idea of *Nous*. The Logos is to him the embodiment of all divine powers and ideas (the ἄγγελοι of the Old Testament, the δυνάμεις and ἰδέαι of Plato). He distinguished between the Logos inherent in God (λόγος ἐνδιάθετος), corresponding to reason in man, and the Logos emanating from God (λόγος προφορικός), corresponding to the spoken word which reveals the thought. The former contains the ideal world (the κόσμος νοητός); the latter is the first-begotten Son of God, the image of God, the Creator and Preserver, the Giver of life and light, the Mediator between God and the world, also the Messiah (though only in an ideal sense—as a theophany, not as a concrete historical person). Philo wavers between a personal and impersonal conception of the Logos, but leans more to the impersonal conception. He has no room for an incarnation of the Logos and his real union with humanity. Nevertheless, his view has a striking resemblance to the Logos-doctrine of John, and preceded it as a shadow precedes the substance. It was a prophetic dream of the coming reality. It prepared the minds of many for the reception of the truth, but misled others into Gnostic errors.

LITERATURE.—Gfrörer, *Philo und die Alexandrinische Theosophie* (1831); Dähne, *Jüdisch-Alexandrinische Religionsphilosophie* (1834); Grossmann, *Quæstiones Philon.* (1841); Keferstein, *Philo's Lehre von dem Göttlichen Mittelwesen* (1846); Langen, *Das Judenthum zur Zeit Christi* (1867); and especially Emil Schürer, *Lehrbuch der Neu-Testamentlichen Zeitgeschichte* (1874, pp. 648, *seq*; 2d ed. under the title *Geschichte des jüdischen Volkes*, 1890).

(2) St. John uses Logos (translated *Word*) four times as a designation of the divine, pre-existent person of Christ, through whom the world was made, and who became incarnate for our salvation (John i. 1, 14; 1 John i. 1; Rev. xix. 13. The passage 1 John v. 7 is spurious, and omitted in all critical editions and in the Revised English Version). Philo probably suggested the use of the term (although there is no evidence that John had read a single line of Philo), but the idea was derived from the teaching of Christ, and from the Old Testament, which makes a distinction between the hidden and the revealed being of God, which personifies the Wisdom of God and the Word of God, and ascribes the creation of the world to the Logos (Ps. xxxii. 6, Sept.). There is an inherent propriety in this usage in the Greek language, where Logos is masculine and has the double meaning of thought and speech. Christ as to his divine nature bears the same relation to God as the word bears to the idea. The word gives shape and form to the idea, and it reveals the idea to others. The word is thought expressed (λόγος προφορικός), thought is the inward word (λόγος ἐνδιάθετος). We can not speak without the faculty of reason, nor think without words, whether uttered or not. The Christ-Logos is the Revealer and Interpreter of the hidden being of God, the utterance, the reflection, the visible image of God, and the organ of all his manifestations to the world (John i. 18; comp. Matt. xi. 27). The Logos was one in essence or nature with God (θεὸς ἦν, John i. 1), yet personally distinct from him, and in closest communion with him (πρὸς τὸν θεόν, John i. 1, 18). In the fullness of time he assumed human nature, and wrought out in it the salvation of the race which was created through him (i. 14). John, in the Prologue to his Gospel, prepared the Hellenic readers who were familiar with the Philonic Logos doctrine, for the history of Jesus.

LITERATURE.—See the commentaries of Lücke, de Wette, Olshausen, Hengstenberg, Meyer, Luthart, Godet, Lange (Schaff's ed.), Alford, Westcott, and Milligan on the Prologue of John's Gospel; also M. Stuart's *Examination of John i. 1–18*, in *Bibliotheca Sacra* for 1850 (pp. 281–327); Röhricht, *Zur Johanneischen Logoslehre*, in the *Theol.*

Studien und Kritiken for 1868 (pp. 299–315); and H. P. Liddon, *Bampton Lectures on the Divinity of Christ* (London, 1867, lect. v., pp. 310–411).

(3) The Logos doctrine of the early Greek Fathers—Justin Martyr, Clement of Alexandria, and Origen—is based upon Philo and the Prologue of John's Gospel, and was an important factor in the development of the Nicene Creed. See especially Baur, *History of the Doctrine of the Trinity and Incarnation*, and Dorner, *History of Christology*; also the monographs of Semisch and Engelhard on *Justin Martyr*.

PHILIP SCHAFF.

Logroño, lō-grōn′yō: province of Spain; situated between Alava, Navarre, Soria, and Burgos, in the basin of the Ebro. Area, 1,945 sq. miles. It produces an abundance of corn, wine, fruits, and vegetables; is also rich in ores and mineral springs. That part of the province which stretches along the southern bank of the Ebro is an undulating plain, very fertile, especially in its western parts—the so-called La Rioja—which produce excellent wine and oil. The southern parts of the province, however, are very much broken up by offshoots of the sierras which separate the basin of the Ebro from that of the Ducre, and which in Pico Santa Ives rises 7,380 feet. The mineral wealth of the province is completely undeveloped, and the manufacturing industry is inconsiderable. Pop. (1887) 181,465.

Logwood [named from being imported in logs; also called **Campeachy Wood**]: the red heart-wood of a leguminous tree (*Hæmatoxylon campechianum*), from 20 to 50 feet in height. This tree is a native of Mexico and Central America, but is naturalized to some extent in the West Indies. Logwood is the most important dyewood known, and is exported in great quantities. It makes many shades from black to red and lilac, according to the mordant employed. The extract or inspissated juice is largely prepared in its native countries, and is exported. In medicine, logwood is a mild astringent, from the presence of tannic acid. For use in the arts logwood is usually supplied in the form of chips, powder, or solid extract.

Composition.—Logwood contains a peculiar principle, *hæmatoxylin*, a volatile oil, fatty bodies, resinous bodies, tannin, or a body nearly allied to it, acetates, oxalates, chlorides, sulphates, and phosphates of potassium, sodium, magnesium, calcium, aluminium, iron, and manganese, with some silica. *Hæmatoxylin*, $C_{16}H_{14}O_6$, discovered by Chevreul in 1811, is the characteristic principle of logwood; though it is not itself a dye, it readily yields by oxidation (loss of hydrogen), the real logwood dye, which is hæmatein. *Hæmatein*, $C_{16}H_{12}O_6$, is the result of the action of the air on hæmatoxylin in the presence of bases, and exists, in combination with metallic oxides, in all fabrics dyed with logwood or its preparations. It is easily prepared by exposing to the air an ammoniacal solution of hæmatoxylin and drying the resulting precipitate at 130° C. It forms colored lakes with metallic bases; blue or violet with alumina, copper, and tin; black with iron and chromium.

Dyeing with logwood is accomplished with the decoction of the wood or with the extract. It is used for reddish, violet, blue, and black shades, but chiefly for black. Logwood was introduced into England in the time of Elizabeth, but, as the colors then obtained were very fugitive, its use was prohibited under severe penalties. The use of indigo was forbidden at the same time, as it interfered with the use of the native wood. A century later the restrictions on these most useful dyes were removed.

Logwood blacks are the most important shades produced by this dyewood. Cotton is dyed black by boiling in a decoction of logwood, to which a little quercitron is added to give a brownish shade to the black; it is then immersed in milk of lime, then in a cold solution of ferrous sulphate (copperas). It is then returned to the original logwood decoction, to which some soda-ash has been added in the meantime. It is taken out, some copperas is added to the decoction, and it is again submitted to the bath. Wool is dyed black by first boiling it in a solution of copperas, blue vitriol, and argol, then immersing in the logwood decoction. Silk, after being freed from gum by boiling with Marseilles soap, is mordanted with acetate of iron, washed, placed in a solution of quercitron and alum, and finished in a decoction of logwood, to which a little soap is added.

The *iron blacks* do not resist the action of acids, which withdraw the iron, leaving the hæmatein as a red spot; to obviate this defect, potassic bichromate, in combination with cupric sulphate (blue vitriol), is substituted. The resulting black, which is a compound of hæmatein with the oxides of chromium and copper, withstands both acids and alkalies better than the iron compound. Cotton is first boiled in the logwood decoction, with or without quercitron, then placed in the solution of bichromate and blue vitriol. After adding some soda-ash to the original logwood decoction, the cotton is again placed in it; finally, copperas is added to this bath, and the cotton is once more submitted to its action. Wool is first boiled in a solution of bichromate, blue vitriol, argol, and sulphuric acid, and then submitted to the action of the logwood. C. F. CHANDLER.

Lohardaʹga, or **Lohardúʹgga**: a district of the lieutenant-governorship of Bengal, India; between lat. 22° 20′ and 24° 39′ N.; area, 12,044 sq. miles, with 1,610,000 inhabitants. The central and southern portion of the district is an elevated table-land with undulating surface, and the slopes between the ridges are cut into terraces covered with rice. The northern and western portion is a tangled mass of insulated peaks, presenting nowhere a level area of any extent. The principal rivers are the North and South Koel. The native Christians are more numerous in Lohardaga than in any other Bengalese district. At the last census 60 per cent. were Hindus, and 1 per cent. Christians. The two missions are the German Lutheran and the Church of England, which harmoniously and successfully work side by side. The principal town is Ranchi, on the Koel, with (1891) 20,306 inhabitants. Revised by M. W. HARRINGTON.

Löhe, lö′e, or **Loehe**, JOHN CONRAD WILLIAM: Lutheran clergyman and author; b. near Nuremberg, Germany, Feb. 21, 1808; d. at Neuendettelsau, Jan. 2, 1872. Educated at Erlangen, he became pastor of the Lutheran church at Neuendettelsau in 1837, where he founded an institution for the training of missionaries, with especial reference to the supply of German pastors for the U. S. In 1853 he founded a deaconess institute, followed by asylums and hospitals of various kinds. He was the author of *Drei Bücher von der Kirche* (1845), and of several volumes of sermons, but was especially distinguished as a liturgical writer. See his *Agende für christliche Gemeinden des luth. Bekenntnisses* (3d ed., revised by J. Deinzer, 1884). H. E. JACOBS.

Lohenstein, lō′en-stīn, DANIEL CASPAR, von: author; b. at Nimptsch, Silesia, Jan. 25, 1635; studied law at Leipzig and Tübingen; was appointed syndic of the city of Breslau, and imperial counselor; d. Apr. 28, 1683. Lohenstein is a representative of the utmost decay of German poetry in the seventeenth century, a member of the second Silesian school. He wrote many poems, a number of tragedies, and a novel, the contents of all of which are shamelessly immoral and rude, while their language can not be surpassed in bombast. See Konrad Müller, *Beiträge zum Leben und Dichten Daniel Caspar von Lohenstein's* (1882). JULIUS GOEBEL.

Löher, lö′er, FRANZ, von: historian and jurist; b. at Paderborn, Westphalia, Oct. 15, 1818; studied law, history, natural science, and art at Halle, Munich, Freiburg, and Berlin; made extensive travels in Europe, Canada, and the U. S. (1846–47); took an active part in the political movements in Germany in 1848; founded the *Westphalische Zeitung*; was imprisoned by the Prussian Government for political agitation, but shortly after acquitted by the court; became assessor at the court of appeal in Paderborn in 1849, professor at the University of Gottingen in 1853, and was called to Munich in 1855 as secretary of the academy and professor at the university. His writings are partly judicial—*Das System des preussischen Landrechts* (1852); partly historical—*Fürsten und Städte zur Zeit der Hohenstaufen* (1846), *Geschichte der Deutschen in Amerika* (1848), *Jakobæa von Baiern* (1861), and *Kulturgeschichte der Deutschen im Mittelalter* (1891); partly sketches of travel—*Land und Leute in der Alten und Neuen Welt* (3 vols., 1857–58) and *Neapel und Sicilien* (2 vols., 1864). D. Mar. 2, 1892.

Loir, lwäär [Fr. < Lat. *Lide'ricus*, the ancient name]: a river of France; rises in the hills of Eure-et-Loir, flows S. W., and joins the Sarthe, an affluent of the Loir, 5 miles N. of Angers, after a course of about 200 miles, of which about 75 are navigable. It is a river of springs, pure, deep, tranquil, and very winding. It gives its name to two departments, Eure-et-Loir and Loir-et-Cher. M. W. H.

Loire [Fr. < Lat. *Liger*, the ancient name]: the largest and longest river of France. It rises in the Cévennes, and flows in a northwestern and western direction through the center of France to the Bay of Biscay, receiving from the

right the Sarthe, and from the left the Allier, Cher, Indre, and Vienne rivers. It is 620 miles in length, and is navigable 450 miles from its mouth. It is connected by canals with the Seine, the Saône, and the harbor of Brest. The Loire is lined with high embankments, and has a lateral canal completed in 1838 along its lower course, as it is liable to rise considerably, occasioning destructive inundations. In the volume of its water there is almost the irregularity of a mountain-torrent. During the droughts of summer it shrinks into thin and feeble threads winding their way between the sandbanks of the channel, and for about six months of the year navigation is practically impossible. At other times, and often very suddenly, tremendous floods pour down and submerge large tracts of land. Attempts to control the river were made at a very early date. At the close of the Middle Ages the bed between Orleans and Angers was inclosed by dikes, from 10 to 13 feet high, and in 1783 a double line of dikes, 25 feet high, was completed from Bec d'Allier downward. So much sediment has been deposited by the Loire that the depth of water at its mouth at low tide is only 6½ feet. The basin of the Loire comprises one-fourth of the area of the republic, and is so fertile that it is called "the garden of France." In several wars carried on within the boundaries of France the river formed an important strategical element—e. g. in the wars with the English in the fifteenth century, in the wars of 1814, and in the war of 1870–71 against the Germans. In the last instance the Loire formed the boundary between the territory occupied by the Germans and those parts of France which remained unharmed by the invaders. The river is so broad that its passages become very important military positions. The towns of Nantes, Tours, Blois, Orleans, and Nevers are on its banks.

Loire: a department of France, comprising the old province of Forez and portions of Beaujolais and Lyonnais, including part of the basin of the upper Loire and spurs of the Cévennes and Forez Mountains. Area, 1,838 sq. miles. Iron is mined, marble, granite, porphyry, and flint are quarried, and there are extensive manufactures of silk, cotton, iron, steel, and flint glass. In the vicinity of St.-Étienne are rich coal-beds, which yield some 3,000,000 tons annually. Pop. (1896) 625,336. Capital, Montbrison.

Loire-Inférieure, lwăär′ăn′fā′ri-ėr′: a department of France; on both sides of the mouth of the Loire. Area, 2,654 sq. miles. The surface is low, containing extensive lagoons, but the soil is generally fertile. Wine and wheat are produced. Fine horses, good sheep, and many bees are reared. Salt, preserved meats, pickles, and sugar are exported. Capital, Nantes. St.-Nazaire is an important seaport. Pop. (1896) 646,172.

Loiret, lwăä′rā′: a department of France; situated between the Seine and the Loire; consisting of a low, sandy, and unproductive tract on both sides of the Loire, and a more elevated and fertile plain called the plateau of Orleans. Area, 2,614 sq. miles. The principal products are grain, wine, hemp, saffron, timber, and apples. Far more wheat and oats are raised than necessary for home consumption. Sheep and cattle, both of good breeds, poultry and bees, are reared. Pop. (1896) 371,019. Capital, Orleans.

Loir-et-Cher, lwăär′ā-shār′: a department of France; situated on both sides of the Loire, and traversed by several of its affluents, which form extensive lagoons. Area, 2,452 sq. miles. The surface is low and level, but the soil is generally fertile. Wheat, hemp, and vines are extensively cultivated; sheep, horses (the Percheron breed is celebrated both for strength and lightness), poultry, and bees are reared, and some woolens, cottons, leather, and glass are manufactured. Pop. (1896) 278,153. Capital, Blois.

Loja, or **Loxa**, lō′hăă: a southwestern city of Ecuador; on the plateau of the Andes, 5,064 feet above the sea (see map of South America, ref. 4–B). It is favorably situated for commerce, the Cordilleras at this point being lower than elsewhere, and offering a comparatively easy communication from the coast to the Amazon valley, while the Peruvian frontier is but a short distance away. Cinchona bark was first obtained in quantity from the forests E. of Loja, and for a long time the town had an active trade in this article; but little is now obtained, and communication with the Amazon has almost ceased. Loja was founded in 1546, and was long the center of an important gold-mining region. It is somewhat unhealthful, and has suffered severely from earthquakes. Pop. (1893) about 9,000. It is the capital of a province of the same name, having an area of 3,706 sq. miles and a population of about 66,000. HERBERT H. SMITH.

Loki: See DEVIL.

Lokman′: an Arabian fabulist of very early times, concerning whose real epoch and life the traditions are conflicting and untrustworthy. His fables were published at Leyden by Erpenius in 1615, with a Latin translation, and they have since been one of the commonest text-books for learning the Arabic language—a distinction they by no means merit on the score either of elegance or of originality, as most of them may be traced through the Syriac to a Greek original. Among modern editions those of Caussin de Perceval (Paris, 1818), Helot (Paris, 1847), and Derenbourg (Berlin, 1850) may be mentioned.

Loligin′idæ [Mod. Lat., named from *Loli′go*, the chief genus, from Lat. *loli′go*, cuttlefish]: a family of dibranchiate cephalopods of the sub-order *Sepiophora*, with the eyes covered by skin; the internal shell horny and lanceolate; the body oblong, and with a more or less pointed terminal fin; the head is free from the front of the mantle; and the teeth of the radula are in seven regular longitudinal rows, the median and inner lateral teeth being broad and fringed, and the outer long and fang-like. To it belong the most common "squids" of the eastern coast of the U. S. The gigantic cuttlefishes of the North Atlantic (*Architeuthis*) are nearly allied, but differ greatly in the teeth of the radula. Revised by D. S. JORDAN.

Lol′lards [probably from Germ. *lallen*, to sing in a murmuring strain + *-hard*, an affix, signifying one who sings the praises of God or funeral dirges and the like, and probably connected with Eng. *lullaby*]: a term of reproach applied at first to a half-monastic sect which originated in 1300 at Antwerp. The sect was designed to furnish ministrants for the care of the sick. In 1374 and 1377 its members were placed under the protection of Gregory XI. In 1472 Pope Sixtus IV. recognized them as a religious order. Their proper designation was *Cellites* or *Alexians*. A few Alexian houses still exist in Europe. The name was afterward applied especially to the English and Scottish followers of Wycliffe, who were sorely persecuted during the reigns of Henry IV. and Henry V. in England, and in the same and somewhat later times in Scotland, where they were called "Lollards of Kyle." The chief center of Wycliffe's teaching was the University of Oxford, and after the condemnation of his doctrine of the sacraments, in 1382, Archbishop Courtenay proceeded to silence the Wycliffite teachers in the university. There was a strong party in the university which tried to resist the archbishop's interference, but he was supported by the crown, and in the space of five months he succeeded in reducing to silence the Lollard party in Oxford and in securing the orthodoxy of the university. Wycliffe used to send out itinerant preachers, who met with considerable acceptance among the people; and in that field the contest threatened to become both more violent and more protracted. Nevertheless in the course of time the most famous of those itinerant preachers were compelled to recant or were driven into exile—a result which was largely due to a reaction against novelties which was produced by the peasants' rising under Wat Tyler, in 1381. From its beginning the Lollard movement always wore a political aspect, which weakened its religious significance. It was an opposition not only to the doctrinal system of the Church of Rome, but also to her organization. It culminated early in the fifteenth century. See Stubbs, *Constitutional History of England*, Oxford, vols. ii. and iii.; Lechler, *Johan von Wiclif* (Eng. trans. by Lorimer, ed. by S. G. Green, London, 1884); Matthew, *English Works of John Wyclif*.

Lomax, LINDSAY L.: See the Appendix.

Lombard, LOUIS: See the Appendix.

Lom′bard, PETER [*Petrus Lombardus*]: theologian; b. of humble parentage at Lugelogno, near Novara, in Lombardy about 1100; studied theology at Bologna and Rheims, and in Paris under Abelard; taught theology there with great success, and was appointed in 1159 Bishop of Paris, where he died July 20, 1163 (or 1164). He was one of the founders of the scholastic theology of the Middle Ages. His principal work, *Sententiarum Libri IV.*, from which he received the title of *Magister Sententiarum* (master of sentences), is a collection of passages from the Fathers, with accompanying commentaries, bearing on the various doctrines of Christianity. It was first printed in Venice (1477); an edition was pub-

lished in Paris (1841). His works are found in Migne, *Patrologia Latina*, cxci., cxcii. Until the Reformation it was the most common handbook used in all theological schools. See his *Life* by F. Protois (Paris, 1881).

Lombardini, lom-baär-dee'nĕe, Elia: hydrologist; b. Oct. 11, 1794; graduated at the University of Pavia, and devoted himself to the study of fluviatile hydrology; in 1847 was appointed director-general of the public works in Lombardy, and held that position for nine years; in 1860 was nominated senator of the kingdom. Among his numerous and highly important professional writings, most of which appeared in scientific journals, are: *Cenni Idrografici*; *Memoria sull' Importanza degli studii sulla Statistica dei Fiumi*; *Memoria sui cangiamenti nell' idraulica Condizione del Po*; *Sulle Inondazioni avvenute nella Francia*; *Dell' origine e del progresso della Scienza Idraulica in Italia*; *Saggio Idrologico sul Nilo*; *Studii sul grande estuario Adriatico*; several essays on the hydrology of the Po and the Tiber, and the very valuable *Guida allo Studio dell' Idrologia fluviale e dell' Idraulica pratica*, published separately in 1870.

Lombar'do, Pietro: architect and sculptor; b. about 1438, either at Venice or at Carona, near Lugano. His school predominated in Venice till Palladian architecture came into vogue. His first important work was the cloister of the monastery of the Benedictine monks of St. Justina in Padua, the now destroyed Church of St. Christopher in Venice, the statues of St. Anthony and St. John the Baptist, and St. Jerome in St. Stephen's church. At Treviso in the year 1474 he sculptured the lion at the door of St. Thomas's church, and with the help of his sons Anthony and Tullius, he enlarged the cathedral, which he enriched with several statues of saints. He also executed two lions for the Church of St. Nicholas, and designed the monument of the senator Agostino Onigo. On his return to Venice he began the building of St. Andrea alla Certosa, one of his finest works, of which no trace remains. In 1482 Lombardo, having already erected two columns on the public place of Ravenna, the lion of St. Mark of Venice on the one, St. Apollinaris on the other, received a commission for the monument to contain the ashes of Dante. In 1484, assisted by artists of his own family, he executed the splendid monument to the doge, Mocenigo, in the Church of SS. Giovanni and Paolo in Venice. His brother Martin co-operated with him in the building of the Scuola di San Marco (now a civil hospital). The masterpiece of Pietro Lombardo's skill is the Church of Santa Maria dei Miracoli, begun in 1481 and completed in 1489. He designed the Church of Sta. Maria Mater Domini which Sansovino completed; also the clock-tower of St. Mark's. In 1499 he became architect in chief of the Ducal Palace, and for twelve years directed all the architectural work of the republic. The Cathedral of Cividale in Friuli is his work. He also designed the Procuratie Vecchie which have been attributed to Buono, who superintended the building. The chapel in St. Giobbe is also considered Lombardo's work. One hears no more of him after the year 1511. He left three sons, a brother, and nephews, all belonging to his school, who continued working in the manner of their master Pietro. He is supposed to have died at Venice about 1511. W. J. Stillman.

Lombards [from O. Fr. *Lombards* < Lat. *Langobar'di*, apparently from the Teuton. name, meaning long-beard. Cf. Eng. *long-beard*]: a family of the Suevic or Suabian branch of the great Teutonic race. According to their own legends they had once dwelt in Scandinavia, but early emigrated to Northern Germany, and previous to the invasion of Italy were occupying the lands about the middle course of the Danube. Like most of the other Teutonic tribes they became Arian Christians, but in the middle of the sixth century were backward in civilization, having but recently come in contact with the Romans. In 552 5,000 of their warriors under their king, Audouin, joined Naeres in his war against the Ostrogoths in Italy, but at that time gained no foothold there for themselves, and for the next fifteen years the tribe was chiefly occupied in fighting the neighboring Gepidæ. Alboin, the son of Audouin, having conquered the Gepidæ and killed their king with his own hands, married his daughter Rosamond. He was thus free to undertake the conquest of Italy, and entered the Venetian plains at the head of the entire Lombard nation. Encountering but slight resistance, except in the city of Pavia, which he took after three years' siege, Alboin took possession of the valley of the Po, and founded the kingdom of Lombardy in 568. Ravenna under its exarch remained Greek, but the remainder of the country was divided into duchies. Alboin at the height of his power, while intoxicated at a grand orgy, compelled his wife to drink wine from her father's skull. She revenged herself by inducing two soldiers to murder him during his sleep. He was succeeded by Cleph (572), who during his short reign of eighteen months greatly extended his dominion. After ten years of anarchy, in which the Lombards under thirty-five dukes ravaged the greater part of Italy, they chose Authari for king. Under this leader the Lombard empire was extended, though during his reign the Franks made ravaging expeditions into his dominions. Freed from these invaders, Authari consolidated the kingdom. After his death (590) his widow, Theodelinda, married Agilulf, who became a Catholic and in the course of his reign was followed into the orthodox Church by most of his people. Adaloald, who succeeded him (615), was deposed by the dukes, or peers, who elected Ariovald of Turin, his brother-in-law. Rothari (636) crushed the turbulent aristocracy, which threatened the stability of the empire, extended his dominions, and became famous by the compilation of the great code of Lombard laws in 643, embodying the traditional usages of the nation. From the reign of Rothari the royal succession presents the usual scenes of murder, debauchery, intrigue, and dethronements common to all governments of the time under weak monarchs, until the accession of the great Luitprand (712). He united the kingdom by subduing the refractory aristocracy, and would have united Italy but for the intrigues of the Church of Rome, which then, as at all subsequent periods, opposed the union of Italy. He greatly weakened the power of the Eastern emperor in Italy, adding a large part of the exarchate to the Lombard territories. Ratchis, who succeeded Luitprand (744), was so far influenced by the pope as to become a monk. Aistulf, his brother, who became king in 749, endeavored to carry out the old Lombard ideas, but was checked by Pepin, who twice forced him to sue for peace, and on the second occasion seized the exarchate and transferred it to the pope. Desiderius or Didier, his successor, had for co-regent Ratchis, who was taken from the cloister. Getting rid of Ratchis, Desiderius ruled alone. His daughter married Charlemagne, but as soon as the latter was on the throne he divorced his wife and sent her back to her father. For revenge, Desiderius supported the claims of the heir of Carloman, Charlemagne's brother, and marched upon Rome, which had supported the outrage committed by Charlemagne, leaving his throne in charge of his son, Adelchis. Charlemagne invaded Italy (773) and conquered Adelchis, who fled to Constantinople. Desiderius, who was made prisoner, ended his days as a monk in the abbey of Corbeia. The Lombard government of dukes was replaced by that of the Franks, but in the south the duchy of Beneventum maintained a semi-independence. Thus perished the Lombard rule after a duration of over 200 years. The Lombard laws and architecture, art and culture, were of a high order, and no race of the Transition or Romanesque period developed greater energy or originality, or exercised a greater influence upon the Teutonic races of Europe.

The name *Lombards* also was given during the Middle Ages to a vast number of shrewd and intelligent Italians, principally from Lombardy, who abounded in London and Paris during the twelfth century. They were principally brokers, bankers, and usurers, who advanced money on all kinds of securities. Lombard Street in London derived its name from them, and there is in Paris another, once entirely occupied by Lombards, which bears the same designation. That of London still is to Great Britain what the Lombard Street of Paris was to France, the financial center of the country. Both in France and England the Lombards were regarded, though in less degree, like the Jews, as a despised race, and were accordingly oppressed by the sovereigns of those countries. Revised by F. M. Colby.

Lombard University: an institution which, as the Illinois Liberal Institute, was founded at Galesburg, Ill., by Universalists, and was incorporated in 1851. In 1855 Benjamin Lombard made a liberal donation to the institution, and its name was changed to Lombard University. It was the second college in the U. S. to admit young women into its classes on equal terms with young men, Oberlin College being the first. In its college of letters it offers students three courses of study, classical, scientific, and literary, leading respectively to the degrees of bachelor of arts, bachelor of science, and bachelor of literature. It maintains a pre-

paratory department for students preparing for college or for business. The Ryder Divinity School connected with the university, gives the degree of bachelor of divinity to students who complete the prescribed course of study. The university possesses spacious grounds in the southeastern part of the city of Galesburg. In 1900 it had 116 students in all departments. J. V. N. Standish.

Lom'bardy: a territory of Northern Italy; extending from the Alps to the Po, and from Lago Maggiore and the Ticino, which separate it from Piedmont, to Lago di Garda and the Mincio, which separate it from Venetia. It consists of an alpine region to the N. covered with picturesque mountain ranges and containing beautiful valleys, and a large and exceedingly fertile plain to the S., extending along the Po, and watered by the Ticino, Lambro, Adda, Oglio, and Mincio. This plain, with its rich soil and mild climate, is not only one of the most fertile, but also one of the best-cultivated and most prosperous parts of the kingdom of Italy. Large crops of wheat, maize, rice, and millet are raised. Melons, oranges, figs, citrons, peaches, olives, and mulberry-trees are extensively cultivated; also vines, though the wine produced is of inferior quality. The principal industry is dairy-farming, which annually produces about 50,000,000 lb. of excellent cheese. The principal manufacture is silk, which is produced in large quantities and of excellent quality; the annual value of this single product is estimated at $15,000,000. The hilly region is rich in beautiful marbles. The territory, comprising an area of 9,075 sq. miles, with a population of 3,957,261 (1890), does not form a political unit at present, but is divided into the provinces of Bergamo, Brescia, Como, Cremona, Milan, Pavia, and Sondrio. It received its name from the Lombards (*q. v.*), who in 568 conquered Northern and Central Italy and established an independent kingdom, which flourished till 774, at which time it was incorporated with the Carlovingian empire. By the treaty of Verdun in 843, Lombardy, together with a long but narrow strip of country situated between France and Germany, and inhabited by Frankish tribes, was formed into a kingdom under a ruler of the Carlovingian house, and it remained a Frankish possession till the death of Charles the Fat, in 888. After this time several independent duchies arose in the eastern portion of the old Lombardian dominions, and in 961 the western and central parts, Lombardy proper, fell under the feudal authority of the German empire. In the beginning of the eleventh century it succeeded in separating itself from Germany, and a number of small republics, generally consisting of one city only, with a dependent territory, were formed. This period of its history, which lasted to the middle of the sixteenth century, is the most interesting and prosperous. Twice united into powerful leagues, the Lombard cities defeated Frederic Barbarossa in 1176 and Frederick II. in 1225; and after the dissolution of the league Milan (*q. v.*) still remained a power which commanded some respect under the sway of the Viscontis and Sforzas (*qq. v.*). The duchy of Milan was the disputed prize in the long wars between Charles V. and Francis I. (1521–44), but Spain maintained her claim and held the country till 1706, when it fell to Austria. During the wars between France and Austria at the end of the eighteenth and the beginning of the nineteenth centuries, Lombardy successively belonged to the Cisalpine republic, the Italian republic, and the kingdom of Italy, but in 1815 it was restored to Austria, which ceded it to the King of Sardinia in 1859 by the treaty of Villafranca.

Lombok': one of the group of the Sunda islands; in the Malay Archipelago; situated between Bali and Sumbawa, and belonging to the Netherlands. Its area is 2,100 sq. miles; its population is estimated at 300,000, mostly indigenous Mohammedans. Its coasts are mountainous, containing several active volcanoes; the interior is a low and fertile plain. Rice and cotton are extensively cultivated. The capital is Mataram; the seaport Ampanam, much frequented to obtain provisions. Lombok marks the eastern limit of the Australian fauna, as Bali marks the western limit of the Asiatic, though they are separated only by a narrow strait.
Revised by M. W. Harrington.

Lom'briz [corruption of Span. *lombrici*, intestinal worms]: a term used in the southern and western parts of the U. S., including the Territories, meaning a disease of sheep and goats caused by the presence of a small worm (*Strongylus contortus*). This parasite is of a reddish color, about a tenth of an inch long, and attaches itself to the mucous membrane of the fourth stomach. When present in large numbers the worms cause diarrhœa, anæmia, weakness, and death. The eggs of the worm pass from the host with the fæces, fall upon the grass, and are eaten by the sheep or goats, which thus become infected. Prevention is best accomplished by keeping sheep away from infected pastures until after freezing weather, which destroys the egg. The most highly recommended treatment is to administer one or two drachms of turpentine with twenty times the volume of milk.
Leonard Pearson.

Lombroso, Cesar: criminologist and alienist; b. in Venice in Nov., 1836; from his early youth he was an ardent and versatile student, turning his energies first to literature and linguistics, and later to the study of Roman and religious antiquities, and to the subject of medicine; received degree of doctor of medicine from the University of Turin; entered the army in the campaign of 1859 as a soldier, but was soon made army-surgeon; took professorship in Diseases of the Mind in the University of Pavia (1862), and later became director of an establishment for the insane at Pesaro, from which place he went to the University of Turin as Professor of Medical Law and of Psychiatry. He has written a very large number of books and monographs, the most important of which are those upon criminology, to the study of which he has given a great impetus. His works are marked by originality and suggestiveness rather than by critical discernment or well-weighed conclusions. His theory of criminality is fatalistic, and regards the criminal as chiefly the result of atavism, or the result of heredity and climatic environment. Some of his most important works are *The Criminal, an Anthropological and Medico-legal Study* (vol. i., 1875; 4th ed. 1886; vol. ii., 1889); *The Man of Genius* (5th ed. 1888); *Anthrometry of Four Hundred Criminals* (1872); *Epileptic Insanity* (1863); *Psychiatrico-legal Investigations by Experimental Methods* (1867).

Lome, Enrique Dupuy, de: See the Appendix.

Loménie, lō'mā'nee', Louis Léonard, de: author; b. Dec. 3, 1815, at St.-Yrieix, Haute-Vienne, France. He studied at Avignon; then went to Paris, where, after writing for the *Revue des Deux Mondes* and *La Patrie*, he began in 1846 the publication of the *Galerie des Contemporains illustres, par un Homme de Rien* (10 vols., finished in 1847), which attracted much attention. He was appointed Professor in French Literature at the Collège de France in 1845, and at the École Polytechnique in 1864. Another series of biographies, *Hommes de '89*, was never finished. In 1855 he published *Beaumarchais et son Temps* (2 vols.; republished in the U. S.), rich in original researches. Besides this excellent work, he wrote *La Comtesse de Rochefort et ses amis*, *Études sur les mœurs en France au XVIII^e siècle* (1871); *Esquisses historiques et littéraires* (1878); *Les Mirabeau* (2 vols., 1879). He was elected to the French Academy in 1871. D. at Menton, Apr. 2, 1878.
Revised by A. R. Marsh.

Lomnický z Budče, lom'ñits-kĕez bood'che, Šimon (*Šimon Žebrák*): poet; b. at Lomnice, near Budweis, Bohemia, in 1552; was educated at Krumlov (Krummau); became head teacher at Kardašova Řečice in 1571; retired in 1585. He was a clever rhymester and a profuse writer, endowed, however, with but little talent. His first literary work, *Písně nové*, etc., a collection of Roman Catholic religious songs, was printed at Prague in 1580. Then followed his best work, *Krátké naučení mladému hospodáři* (Short Adviec to the Young Husbandman, Prague, 1586); *Hádání mezi knězem a zemanem* (A Priest's Quarrel with a Nobleman, 1589); several religious dramas; and the *Kupidova střela* (Cupid's Shot, 1590), in which he censured licentiousness and other evils of his times. The poem so pleased the Emperor Rudolph II. that he ennobled the poet and bestowed an annuity upon him. Governed by pecuniary considerations Lomnický usually dedicated his works to rich aristocrats, and though himself a Roman Catholic, praised in his songs the new Protestant king, Frederic (1618), in hope of securing royal favors. After Frederic's defeat he bitterly denounced him and his Protestant adherents, the Bohemian noblemen. In 1618 he removed to Prague, where he died in poverty about 1622. J. J. Král.

Lomond, Loch, lokh'lō'mond: the largest lake of Scotland; situated between the counties of Stirling, Perth, and Dumbarton. It is 21 miles long, and has an area of 45 sq. miles. It receives the Endrick, Luss, and Fruin, and sends its waters through the Leven to the Firth of Clyde, and is studded with islands and surrounded by grand and beautiful scenery.

Lomono'sov, Mikhail Vasilevich: surnamed the Peter the Great of Russian literature; son of a poor fisherman; b. on an island in the government of Archangel in 1711. He acquired the rudiments of an education, but having heard from the village priest that to be learned a man must know Latin, at the age of seventeen he ran away from home, joining a train of carts with fish bound for Moscow, nearly 1,000 miles away. After his arrival he found protectors, who put him to school, first in Moscow, then in St. Petersburg. In 1736 he was sent to Germany on a scholarship, studied in Marburg and Freiburg, married and fell into debt, and into habits of intemperance, which clung to him for the rest of his life. In 1741 he fled back to his native country. After this time his success was rapid, thanks to his tireless energy and his many-sided talents. He made a great reputation, but his violent temper involved him in perpetual feuds, especially with the Germans who then controlled the Russian Academy. He died June 28, 1762. The numerous works of Lomonosov cover many branches of science, on each of which he wrote works of considerable value. He was also the author of the beginnings of a history, several orations, two worthless tragedies, an unfinished epic, and a number of short poems. His greatest service to his country was as a reformer and purifier of the language and literature. He wrote a Russian grammar, and it was he that first drew the lines of the modern vocabulary, formed by the mixture of the old church Slavonic and of the popular dialect; besides which he introduced modern poetical forms, as his ode on the *Capture of Khotin* is usually regarded as the earliest example of tonic versification in Russian poetry. There have been seven editions of his works, the last in 1867. Some of his writings have been translated into German, and there are renderings of three of the best of his poems in Bowring's *Russian Poets* (2d vol., 1823). The best biographies of him are those of Aksakov and Pekarskiĭ. In English, see *Studies in Russian Literature*, by C. E. Turner (1882), and *The Peasant Poets of Russia*, by W. R. Morfill (1880). A. C. Coolidge.

Lom'za: town; in the government of Lomza, Russia; on the Narev, a tributary of the Vistula; is 80 miles N. E. of Warsaw (see map of Russia, ref. 7–A). It has a college, a gymnasium, and was formerly one of the most important towns of Poland, but was destroyed by the Swedes, and never recovered. In 1795 it became subject to Prussia; in 1807 to Russia. Pop. 15,000.

Revised by M. W. Harrington.

London [cf. Lat. *Londi"nium*, the ancient name, under which it is first mentioned in history]: the capital of England and of the British empire; situated on both banks of the Thames about 50 miles from its mouth, the center of the City proper being in lat. 51° 30′ 48″ N., and lon. 0° 5′ 48″ W. (see map of England, ref. 12–J). London is not only a city, but for administrative purposes a county, three-fourths of which are in Middlesex, with the remainder chiefly in Surrey, while a considerable portion is in Kent, and a small part in Essex. The straggling county of London extends from N. to S. about 10 miles, and from W. to E. about 14 miles. London stretches from N. to S. between two lines of heights, of which the southern range rises to 370 feet and the northern to 441 feet above sea-level. The surface of the whole London district is mainly one of clay, with here and there a superficial bed of sand or gravel.

Area and Population.—London proper and the City proper make up the statutory county of London. The county, which will be referred to as London simply, occupies, according to the census of 1891, generally followed in this article, an area of 75,442 statute acres, and contains 4,232,118 inhabitants, a population larger than that of Scotland, and nearly as large as that of Ireland. Its population in 1901 was 4,536,034. This area and population include those of the City proper, which has a government of its own, with an area of 671 acres and a population of 37,705. Of the population somewhat less than two-thirds were born within its boundaries. The immigrants include 53,390 natives of Scotland, 66,463 natives of Ireland, and 95,053 European foreigners. Of these last 26,920 are Germans and 10,360 natives of France, while 26,742, from Russia and Poland, are mostly Jews. The Jewish population is estimated at from 60,000 to 70,000. In 1891 there were 4,903 natives of the U. S., very evenly proportioned as regards sex. The death-rate in 1892 was 20·6 to 1,000 persons living, while in Paris it was 22·4, and in Vienna 24·3. In 1891 the annual ratable value of property was £31,819,412.

Parliamentary and other Divisions.—For parliamentary purposes London is divided into 27 metropolitan boroughs. The more populous of these are subdivided into electoral districts. Each undivided borough and each subdivision of a borough returns one member to the House of Commons, in which London is represented by 59 members or by 60 if the one member returned by London University is included. On account of its wealth and commercial importance the City proper returns 2 of these 60 members, although the undivided borough of Wandsworth, with three times the population of the City, returns only one member.

The Thames divides London into two unequal parts, North London on its left and South London on its right bank. In common parlance, North London is subdivided into three regions, the West End, the City, and the East End. At the West End, that part of London which lies W. of old Temple Bar, are the residences of the aristocratic, fashionable, business, and professional classes, with the shops and other establishments which minister to their wants. The City is the center of the mercantile, commercial, and financial activity of London. The East End is the home of vast masses of the industrial population of North London.

Government and Administration.—The City proper is governed by a corporation, consisting of its head, the lord mayor, the court of aldermen, 26 in number, and a court of common council, of which there are 206 members. The lord mayor is elected annually by the liverymen, that is, citizens free of the various City companies, themselves survivals of the trade-guilds of old London. He is chosen from among the aldermen elected by the 26 wards into which the City is divided, an alderman for each ward, the electors being citizens possessing the parliamentary franchise. The lord mayor is the chief magistrate and official representative of the City. He has a salary of £10,000, and an official residence, the Mansion House, where, and at the Guildhall, the great council hall of the citizens, he dispenses a hospitality for the cost of which his salary seldom or never suffices. While the court of aldermen is the House of Peers of the city, the court of common council is its House of Commons, and does most of the hard work of the corporation. It disposes of a revenue of nearly £800,000 a year, most of which is spent on public improvements. The whole of London outside of the City proper is governed by the county council, which in 1888 succeeded to the jurisdiction of the metropolitan board of works, the institution of which gave London for the first time a central and representative government. It was elected indirectly by the vestries, but the county council is elected directly and practically by the ratepayers. Women are allowed to vote, but their claim to be elected to the county council has been disallowed by the courts of law, after being sanctioned by the council itself. The area of the council's jurisdiction is, on the whole, coincident with that of the 27 metropolitan boroughs. Each sends 2 representatives to the council, and the City proper sends 4, as there are certain general funds to which both London and the City contribute. Apart from the administration of these funds the jurisdiction of the council and of the City corporation exclude each other. The county council has already done much for the improvement of London by the exercise of the very important powers intrusted to it by the imperial Parliament. Its revenue in 1893 was about £2,000,000.

Thoroughfares, Streets, and Squares.—Out of the thoroughfares which connect the West End proper with the City proper, two may be selected as the most frequented and the most interesting. The more northerly of the two, some 3 miles in length, starting near the Marble Arch, at the northeast corner of Hyde Park, begins with Oxford Street, which a mile or so eastward becomes New Oxford Street, and this merges into Holborn, whence by the Holborn Viaduct and Newgate Street Cheapside is reached. The other, shorter by more than a mile, leads from Charing Cross by those busy streets, the Strand and Fleet Street, and proceeding up Ludgate Hill and through St. Paul's Churchyard also reaches Cheapside. Thence by the Poultry is but a step to the very heart of the City proper, where the Royal Exchange faces on one side the Bank of England and on the other side the Mansion House. From the Bank eastward there are two principal thoroughfares to Aldgate. From Aldgate the Commercial Road leads to the West India Docks, and the Whitechapel Road to Mile End.

One of the most attractive thoroughfares of the West End proper is Piccadilly, running eastward from Hyde Park Corner to Piccadilly Circus. For a part of its course it is lined on one side by stately mansions and on the other it

looks on the Green Park. Three notable thoroughfares connect Oxford Street West with Piccadilly: Park Lane, skirting Hyde Park from the Marble Arch to Hyde Park Corner; New and Old Bond Streets, noted for their shops, and skirting the eastern boundary of the aristocratic region known as Mayfair; and last, not least, Regent Street, the most frequented shopping-ground of the dwellers at the West End. A continuation of Regent Street, Waterloo Place, leads from Piccadilly Circus to Pall Mall, which is also reached farther west in Piccadilly by St. James's Street. In Pall Mall and St. James's Street are the principal clubs. The road from Hyde Park Corner westward through Knightsbridge passes Sloane Street (which leads to Chelsea) and then divides into two, the more northerly conducting through Kensington to Hammersmith, and the other through Brompton to Fulham.

London is dotted with squares. At the West End are Grosvenor, Berkeley, St. James's, and Belgrave. The last-named square gives its name to the fashionable region known as Belgravia. These are S. of Oxford Street, N. of which are Portman, Manchester, Dorset, Cavendish, and Montagu Squares. Near the northwest corner of Regent Street is Hanover Square, and near the northeast corner of Oxford Street is Soho Square. Coventry Street, a continuation of Piccadilly, leads into Leicester Square, in the vicinity of which the foreign element is abundant. A little to the S., and close to Charing Cross, is treeless Trafalgar Square with its fountains and Nelson Monument. In the middle-class peopled region between Tottenham Court Road and Gray's Inn Road are Gordon, Bedford, Tavistock, Russell, Bloomsbury, Brunswick, and Mecklenburg Squares. Finsbury Square is one of the few in the City proper.

The Thames also is a thoroughfare, numerous passenger steamers plying its course. At high tide at London Bridge it is 800 feet wide. Below London Bridge is the Pool, crowded with vessels up to 400 tons. Below the Tower, at the great docks (see Docks), deep-sea navigation begins, while vessels of any tonnage can ascend to Deptford, 4 miles below London Bridge. Besides railway bridges, on one of which, Charing Cross, there is a footway for pedestrians, the Thames is spanned by more than twelve bridges, of which the Westminster, Waterloo, and London are the finest. A little below London Bridge there is a narrow subway for foot passengers. The huge new Tower Bridge for vehicles and foot passengers, formally opened by the Prince of Wales, June 30, 1894, has its central span filled with a bascule or drawbridge which can be raised to allow the passage of large vessels. Two miles below London Bridge is the Thames Tunnel, utilized by railway trains, which connects North and South London lines of railway. A new tunnel, to be both a carriage and footway between Blackwall and the vicinity of Greenwich and Woolwich, is in course of construction. Noble thoroughfares bordering the Thames are the Albert embankment, nearly a mile in length on the right bank of the river; on the left the Victoria embankment, extending for 1⅓ miles from Blackfriars Bridge to Westminster Bridge, continued farther westward by the Chelsea embankment.

The Parks.—Hyde Park (388 acres), the chief recreation-ground of the West End, stretches from Park Lane to Kensington Gardens. A road to these gardens from the main (southern) entrance of Hyde Park is the favorite drive of the upper classes. Another a little to the N. is Rotten Row, reserved for equestrians. N. of this again is a large sheet of water, the Serpentine. W. of Hyde Park are Kensington Gardens (210 acres), the largest and most beautiful pleasure-grounds in London. They were originally the pleasure-grounds of Kensington Palace. The Green Park (69 acres), the most open and least wooded of the West End parks, fronts the western section of Piccadilly. S. of it is the picturesque St. James's Park (91 acres). Its western boundary faces the front of Buckingham Palace. Regent's Park (472 acres) is the largest of the West End parks, but is also more broken up than any of them by public roads and private villas. It lies to the N. of Oxford Street, and to the N. W. of it rises Primrose Hill, laid out as a public ground. Victoria Park (300) is modern, and is the chief recreation-ground for the toiling masses of such densely populated regions of the East End as Bethnal Green and Spitalfields. It includes two picturesque sheets of water. There are several parks and commons in South London, of which Battersea Park (180), on the right bank of the Thames, opposite Chelsea Hospital, and also quite modern, is far the largest. The sub-tropical garden in this park has a remarkable collection. The northern heights of London are crowned by Hampstead Heath (240 acres), the park of all Londoners, and unlike other London parks, a natural one with picturesque undulations. It lies between 400 and 500 feet above the sea-level. Greenwich Park (174 acres), with its fine old chestnuts, is an ancient royal demesne. On the summit of a hill in its center, 180 feet high, is the famous Royal Observatory.

Palaces and Royal Residences.—Fronting the western end of St. James's Park is Buckingham Palace, an unattractive modern building, where the Queen resides when she spends more than a day in London, and where she always holds her drawing-rooms and gives her balls and concerts. St. James's Palace, an irregular brick building at the foot of St. James's Street, was a palace of the Tudors, among the few remains of which is the Chapel Royal where the Queen was married. Levees, at which gentlemen only are received, are held here, usually by the Prince of Wales. Marlborough House, built by Wren for the great Duke of Marlborough, is E. of St. James's Palace, and is separated from it only by a carriageway, in which is the entrance to Clarence House, the residence of the Duke of Edinburgh (now the Duke of Saxe-Coburg-Gotha). Kensington Palace, the birthplace and early home of the Queen, is now occupied by the Prince and Princess of Teck. Gloucester House, in Park Lane, is the residence of the Queen's uncle, the Duke of Cambridge. Lambeth Palace, on the south side of the Thames, nearly opposite the houses of Parliament, has been for five centuries the residence of the Archbishops of Canterbury. See Lambeth.

Public Buildings (secular).—The Tower, originally a royal palace, then a fortress, and afterward a prison with which are linked numerous historical associations, is a group of irregular buildings of many dates, on the northern bank of the Thames, a little below London Bridge. Since the time of the Conqueror its government has been intrusted to a high officer called the constable. The isolated square keep in the center, called the White Tower, was built by William the Conqueror about 1078. This is now surrounded by a rampart and moat, with inner wall (the Inner Bail), flanked by half-circle towers, each of which has a distinctive name, as the Bell Tower, the Beauchamp Tower, Wakefield Tower, Bloody Tower, Bowyer Tower. The most noticeable is the Bloody Tower, so called because it was supposed to have been the scene of the murder of the two infant princes, sons of Edward IV., at the instance of Richard III. On its upper floor is a splendid collection of old armor. In the Record or Wakefield Tower the public records of the realm were formerly kept, and the crown jewels, valued at three millions sterling, are now exhibited. The list of celebrated persons buried after execution in the Chapel of St. Peter ad Vincula and the little cemetery attached to it is a long one, ranging from Sir Thomas More (1535) to Simon Fraser, Lord Lovat (1747). So-called traitors were usually beheaded on Tower Hill, N. W. of the Tower. The houses of Parliament are on the northern bank of the Thames between Westminster Abbey and the river. The New Palace at Westminster, as it is sometimes called, covers an area of nearly 8 acres, and contains 11 courts, 100 staircases, more than 2 miles of corridors, and 1,100 apartments, with 18 distinct residences for high officials of the two houses. Of the three principal towers, the Clock Tower, on the north side, contains the clock known as Big Ben, by which London regulates its time. The Victoria Tower contains the royal entrance, and the Central Tower a grand octagon hall. From this corridors adorned with frescoes lead right and left to the lobbies of the houses of Lords and Commons respectively. The whole is so arranged that when the doors of both houses are opened the Queen, sitting on her throne in the House of Lords, can see in a direct line the speaker of the House of Commons in his chair. The House of Lords, one of the most richly decorated chambers in the world, 97 feet long, 45 wide, and 45 high, is adorned with frescoes and statues. The House of Commons, 70 feet long by 45 feet broad, is much more simple in character than the House of Lords. The public entrance to the central octagon hall is through St. Stephen's hall, which is lined with statues of distinguished parliamentary statesmen. Beneath it is the restored crypt of St. Stephen's chapel, which dates from the thirteenth century. The entrance to St. Stephen's hall is through Westminster hall, the old hall of the palace of the Kings of England, built originally in the reign of William Rufus. This noble hall is 290 feet long, 68 feet broad, and 92 feet high. With the exception of the Hall of Justice at Padua and of some railway stations, it is the largest covered space in the world not supported by pillars. The

chief Government offices are in the thoroughfare, Whitehall, continued as Parliament Street, which leads from Charing Cross to the houses of Parliament. Among them are the Admiralty, the headquarters of naval administration, the Horse Guards, the headquarters of the commander-in-chief, the Treasury, with the education and privy council offices. Then intervenes Downing Street, in which are the official residences of the First Lord of the Treasury (who until later days was generally Prime Minister) and the Chancellor of the Exchequer. Beyond Downing Street is a vast group of modern buildings, comprising the India, Foreign, Home, Colonial, and Local Government offices. The War Office, the headquarters of the Secretary of State for War, is in Pall Mall. At Somerset House, in the Strand, are the offices of the Inland Revenue and of the registrar-general of births, deaths, and marriages, with the wills office, the general depository of testamentary writings, where they may be inspected by the public. The Patent Office, with its fine library of technical and scientific works, is in Southampton Buildings, Chancery Lane. In the city, besides the Mansion House and the Guildhall, are the General Post-office at St. Martin's-le-Grand, the Bank of England, and the new St. Paul's Royal Exchange. The Bank of England is an isolated building, with only one story above ground, covering an area of nearly 4 acres. The Royal Exchange is a quadrangular covered court surrounded by colonnades. Just above London Bridge, on the left bank of the Thames, is the custom-house, fronting the river, with a façade 490 feet in length. The Royal Mint, where the coinage of the United Kingdom is produced, is on Tower Hill.

National and Public Institutions.—The Imperial Institute, at South Kensington, projected as a memorial of the Queen's Jubilee and opened by the Queen in 1893, is a vast building, the prevailing style of which is a free rendering of the Renaissance. Its contents are mainly intended to exhibit the natural and industrial products of the British colonies and foreign possessions and of the Indian empire. The Record Office, between Chancery and Fetter Lanes, is a great fire-proof edifice containing the public records and state papers of the kingdom. The British Museum, fronting on Great Russell Street, has been described under British Museum (*q. v.*). Its great circular reading-room, with accommodation for nearly 600 readers, is surmounted by a dome 140 feet in diameter and 106 feet above the floor, being slightly larger than the dome of St. Peter's at Rome. The Natural History Museum, at South Kensington, is a branch of the British Museum, and contains the whole of the collections illustrative of natural history and natural science. The South Kensington Museum covers 12 acres, and comprises costly collections of art and art manufacture, with art and educational libraries. The Soane Museum, in Lincoln's Inn Fields, includes a collection of Egyptian antiquities. The Museum of Practical Geology in Jermyn Street, Piccadilly, has large collections, with concrete illustrations, of all the apparatus used in the working of mines. The Guildhall Library, belonging to the corporation of London, contains 80,000 volumes, including a unique collection of books on London, and in the Guildhall Museum are exhibited Roman, Saxon, and mediæval remains found in the city proper. The Bethnal Green Museum was instituted for the benefit of the toilers of the East End, and from time to time there are lent to it, by public bodies and private individuals, collections of various kinds. Of public art collections, the chief is the National Gallery, in Trafalgar Square, a magnificent collection of paintings arranged according to schools in twenty-one rooms, five of which are devoted to British art. For the contents of the National Portrait Gallery, a collection of portraits of royal personages and distinguished natives of the United Kingdom, a suitable edifice has been built by the side of the National Gallery. The Royal Academy is domiciled in Burlington House, Piccadilly, in salons where are held annual exhibitions of the works of contemporary painters and sculptors. In Burlington House are also located several societies of high reputation, among them the Royal Society, the most important and one of the oldest scientific societies of the kingdom, with the still older Society of Antiquaries. The Royal Institution, in Albemarle Street, combines the encouragement of scientific research with the popularization of science. The Society of Arts, in the Adelphi, established in 1753, holds meetings at which lectures are given and papers read and discussed on subjects relating to arts, manufactures, and commerce. At the meetings of the United Service Institute, the members of which are naval and military men, papers are read on subjects of interest to both services. Its museum contains memorials of British military achievements on sea and land, and interesting relics.

Churches.—There are some 850 places of worship belonging to the Church of England in the London districts, and more than 600 Nonconformist, of which 240 are Congregational (or Independent), 130 Baptist, 150 Wesleyan, and 50 Roman Catholic. Westminster Abbey (*q. v.*), the architectural glory of ecclesiastical London, has been called "English history in stone" from its numerous monuments to and memorials of distinguished personages. It stands probably on the site of a church built by Edward the Confessor. The oldest portions of the present abbey church, the choir and transepts, were built by Henry VII. and are Early Pointed in style, while the additions by Edward I. are Early Decorated. Henry VII.'s chapel is Late Perpendicular, and the ill-conceived western towers designed by Wren are in a debased style of Grecian and Gothic. The abbey is in the form of a Latin cross, the length 416 feet, of transepts 203 feet, of choir 155 feet, height of roof from pavement 101 feet, height of towers 225. A few yards N. of Westminster Abbey is St. Margaret's church, the church of the House of Commons, in which were interred Caxton and Sir Walter Raleigh. The beautiful west window was subscribed for by citizens of the U. S. as a memorial of Raleigh, the founder, among other achievements, of the State of Virginia. St. James's, Piccadilly, the fine interior of which contrasts agreeably with its unattractive exterior, is the only West End church designed by Wren. The Chapel Royal, Whitehall, built by Inigo Jones, formerly the banqueting-hall of the royal palace of Whitehall, is now the museum of the United Service Institution. St. Paul's, Covent Garden, where Butler, the author of *Hudibras*, was buried, is said to have been designed by Inigo Jones. St. Bartholomew's, Smithfield, or a portion of it, dates from the twelfth century; opposite was the stake at which many Protestant martyrs suffered during Marian persecution, and near it are a church and tablet to their memory. St. Clement Danes, in the Strand, Dr. Johnson's church, was designed by Wren. The Chapel of the Savoy, between the Strand and the Thames, belongs to the crown, and its walls date from the thirteenth century. The Temple church, very much altered since it was built for the Knights Templars, contains fine specimens of Early English architecture; in its burial-ground Oliver Goldsmith was interred. St. Bride's, Fleet Street, is one of Wren's architectural triumphs. Further eastward his colossal masterpiece, St. Paul's Cathedral, towers over the city. It is in the form of a Latin cross, 500 feet in length, 118 feet broad, and the transept is 250 feet long. The upper part of the exterior is of the Composite, the lower of the Corinthian order. The vast interior is surmounted by a double dome; the inner dome is 225 feet, the outer one from the pavement to the top of the cross 364 feet in height. Nelson, the Duke of Wellington, and Sir Joshua Reynolds, with Wren himself, were buried in St. Paul's, and a large number of the statues and monuments which it contains are memorials of distinguished men. Among Wren's city churches are such masterpieces as St. Mary-le-Church, commonly called Bow church, in the belfry of which are the proverbial "Bow Bells"; St. Michael's, Cornhill; St. Stephen's, Wallbrook; St. Swithin's, Cannon Street, in which Dryden was married, and into the street walls of which the famous London stone is built. In St. Giles's, Cripplegate, one of the oldest London churches, Milton was buried and Oliver Cromwell married. On the southwest side of London Bridge is St. Saviour's, Southwark, which next to Westminster contains the finest specimens of Early English architecture to be found in London. In it were buried Edmund Shakspeare, the dramatist's younger brother, John Fletcher, the dramatist, and Philip Massinger. St. George's (Roman Catholic) Cathedral is in Southwark, opposite Bethlehem Hospital.

Courts of Justice, Inns of Courts, etc.—For a period of about 800 years the higher administration of civil justice was centered at Westminster Hall; in 1882 new law courts in the Strand were opened. Their architecture is Gothic. The building is a square of about 500 feet each way. The great central hall is 230 feet long, 47 feet wide, and 80 feet high. On three sides of it are grouped the eighteen law courts. The Strand front has a massive clock-tower with a projecting clock and gable summit, and at the west side another tower of different design 160 feet high. There are four Inns of Court, Inner Temple, Middle Temple, Lincoln's Inn, and Gray's Inn. To have been entered as a stu-

dent at one of the Inns and to have dined a certain number of times "in hall" are conditions that must be performed before a student of law can be called to the bar. They contain numerous "chambers," chiefly tenanted by barristers, some of whom reside in them. They are governed by benchers, who are chosen from the most distinguished members of the bar. The Temple lies on the south side of Fleet Street. The Temple church, the Temple library, and the Temple gardens, which look on the Thames embankment, belong to the Middle and Inner Temple alike. Both have fine halls, used as dining-rooms. Lincoln's Inn has a very old gate-house, giving entrance to and from Chancery Lane, in which there are many firms of solicitors. The hall and library of Lincoln's Inn form a noble structure in the Gothic style. The chapel was built by Inigo Jones. Lincoln's Inn Fields is a long garden surrounded by houses. Gray's Inn was Lord Bacon's inn. Its Elizabethan hall was built in 1560. (See INNS OF COURT.) The central criminal court, in the Old Bailey adjoining Newgate, is the chief court for trial by jury of offenses commited within 10 miles of St. Paul's. For summary treatment of accused persons there are twenty-two police courts in London proper. The City has police courts at the Mansion House and at the Guildhall, the lord mayor generally presiding at the former and one of the aldermen at the latter.

Educational Institutions.—The University of London, which has its headquarters in Burlington House, is not a teaching body, but grants degrees to all who pass its rigorous examinations. The universities of London which teach while not empowered to grant degrees are King's College, Somerset House, affiliated to the Church of England, and University College, Gower Street, a purely secular institution. To both of these day-schools are attached. The chief public schools are Westminster, founded by Queen Elizabeth; Christ's Hospital, Newgate Street, commonly called the Bluecoat School, founded by Edward VI.; St. Paul's, now at West Kensington, founded in 1512 by Dean Colet; Merchant Taylors' School, founded in 1561 by the Merchant Taylors' Company, and now at the Charterhouse (the school at which, founded in 1612 by Thomas Sutton, has been removed to Godalming, Surrey); and the City of London School on the Thames embankment, founded in 1835 by the City corporation. To most of these schools exhibitions to the universities are attached. Various technical schools are affiliated to the City and Guilds of London Institute at South Kensington. Of educational institutions for the working classes the chief are the London Workingmen's College in Great Ormond Street, and the People's Palace in the Mile End Road, opened in 1887. The latter, besides furnishing rational recreation to the artisan class at the East End, has classes for technical, scientific, and other education, attended by some 3,000 scholars. There are some twenty free public libraries, all having reading-rooms.

The London School Board.—Up to 1870 primary education in London, as elsewhere, was left to voluntary effort, chiefly that of the Church of England and other religious denominations, assisted by parliamentary grants. The consequence was that in London and everywhere there was an enormous deficiency of school accommodation. The Elementary Education Act of 1870 created school boards throughout the country to provide elementary schools, which were to be established and supported mainly by local rates, and from which dogmatic religious instruction was to be excluded. The school boards are chosen by the ratepayers, women being allowed both to vote and to become members of boards, in the election of which cumulative voting was sanctioned. The only difference between the election of the London school board and of other boards is that in the City proper the electors are those who elect the common council. School fees have been abolished, and the education given in board schools has by legislative enactment become gratuitous. Since the passing of the act in 1870, accommodation in permanent schools has been provided by the school board for 448,749 children. In 1892–93 the income of the school board was £2,718,789.

Hospitals and Charitable Institutions.—The number of charities of all kinds is not less than 2,000, and their total annual revenue from subscriptions, donations, and bequests is estimated at five millions sterling. Of non-medical hospitals, two are national: (1) Chelsea Hospital, nominally founded by Charles II., and built by Wren, for old and disabled soldiers. It has 540 indoor and nearly 70,000 outdoor pensioners. (2) Greenwich Hospital (on the site of an old royal palace) was from 1694 until comparatively recent years a home for aged and disabled seamen, who had served in the navy. They now receive outdoor pensions, and the hospital has been converted into the Royal Naval College for the instruction of naval officers. In and about London there are a number of asylums for the aged, in connection with the City companies and other bodies, such as the Licensed Victualers and the Freemasons. In the Charterhouse, at the upper end of Aldersgate Street, there are domiciled eighty "poor brethren." The Foundling Hospital, in Guildford Street, founded by Captain Coram in 1769, maintains and educates about 500 children. The chief general medical hospitals are St. Thomas's, founded by Edward VI. and now on the south bank of the Thames, opposite the houses of Parliament; St. George's, Hyde Park Corner, which dates from 1723; St. Bartholomew's, Smithfield, founded by Prior Rahere in 1102; Guy's Hospital, in Southwark, founded in 1721 by Thomas Guy, a wealthy London bookseller; and the London Hospital, in Whitechapel, which dates from 1746, and ministers to the medical and surgical wants of the East End. Bethlehem Hospital, in Lambeth, so well known as Bedlam, has been a hospital for the insane since 1547.

Places of Amusement and Recreation.—There are some forty theaters, and perhaps four hundred music halls. It is symptomatic of great changes of taste that, of two of the largest and oldest of these theaters with a traditional reputation as the homes of the legitimate drama, Drury Lane is now devoted to pantomime and sensational melodrama, while Covent Garden, which when rebuilt in 1858 was designed for Italian opera, has become an arena for variety entertainments and promenade concerts. Italian opera, once so fashionable, is without a domicile in London. Except when Shakspeare is revived at the Lyceum, with a certain success greatly due to the *mise-en-scène* and spectacular effects, the legitimate drama has almost vanished from the London stage. Not only has London become unable to support a single Italian opera-house, but a very handsome and well-appointed theater, built for the performance of English opera, has from want of support been transformed into a music hall. Though of quite modern growth the music hall is the most strictly popular of all places of amusement. The so-called popular concerts at St. James's Hall, Piccadilly, are very well attended, though the music heard at them is of a much higher class than their title would indicate. Oratorios never fail to attract, whether given at St. James's Hall or at the magnificent Albert Hall, South Kensington, which easily holds 8,000 people, or at the Crystal Palace, Sydenham. The grounds of this last, which with the palace cover 200 acres, are a famous resort, and indoors it offers besides permanent attractions, concerts, dramatic entertainments, with flower shows and shows of live stock. The Zoölogical Gardens, in Regent's Park, contain the largest and most complete collection of living animals in the world. During the London season Lord's cricket-ground, W. of Regent's Park, draws crowds on the occasion of such stirring matches as those between Oxford and Cambridge Universities and Eton and Harrow Schools. Kennington Oval, in the South of London, is another important cricket-ground.

Markets.—The Metropolitan Cattle Market, Copenhagen Fields, from which is obtained most of the live stock required for the consumption of London, is the largest of the kind in the world. More than 4,000,000 cattle, sheep, and pigs are sold in it yearly. From the London Central Meat Market, N. of Smithfield, 250,000 tons of meat are delivered yearly. By its side are the Central Markets for poultry, vegetables, and fruit. Leadenhall Market, Leadenhall Street, is one of the chief marts for poultry, game, and hides. Billingsgate, a little E. of London Bridge, is the great fish-market, as Covent Garden Market is for fruit, vegetables, flowers, and herbs. The largest horse-market is Tattersall's, Knightsbridge Green, the headquarters of the racing and betting world.

Cemeteries.—For the great majority of the 90,000 or so persons who die yearly in London numerous cemeteries are provided. The principal are Highgate Cemetery, where Coleridge and George Eliot are buried, from which there is a fine view of London; Kensal Green Cemetery, Harrow Road; Brompton Cemetery; and S. of the Thames, Norwood and Nunhead Cemeteries. There is a crematorium at Woking, in Surrey.

Communications by Road and Rail.—In 1892 there were upward of 11,000 cabs. The hansoms (two-wheeled vehicles) were to the four-wheeled vehicles in the proportion of about 7 to 4. There were about 200 omnibus lines in all

directions, traversed by 1,100 omnibuses, of which 1,000 were owned by two companies, and carried more than 150,000,000 passengers during the year. Some 80 miles of tramways were traversed by some 750 cars, carrying during the year more than 70,000,000 passengers. The pressure in accommodation is lightened by railways, chief among them the Metropolitan and Metropolitan District Railways, which mainly run in tunnels under the street or through cuttings behind stone walls. Thus a complete belt of railway is formed round the inner part of London, while various branch lines from them run to the suburbs. Some of the great railway companies with termini in London also run suburban trains in connection with the metropolitan lines. The whole number of passengers by railway in and about London annually may be computed at 520,000,000.

Police.—The metropolitan police district extends within 15 miles of Charing Cross. Exclusive of the City, its area, 442,750 acres, and its population, 5,596,101, are larger than those of the county of London. The metropolitan police, alone in the kingdom, is controlled by the Home Secretary, who appoints for its government a chief commissioner responsible to him solely. In 1892 the total force of all grades numbered 15,044, whose pay absorbed £1,280,130. The number of the City police, which is under the control of the corporation of London, is 903, and its total annual cost is about £320,000.

Banks and Banking.—The Bank of England is a proprietary institution, but some of the functions which it discharges are of a national kind. It is divided into an issue department and a banking department. It is the only bank of issue in London, and the only bank of issue in the kingdom the notes of which are a legal tender. As a bank proper it receives the Government balances, pays the dividends on the Government stocks, and makes advances to the Government when needed. The issue of notes which are payable in gold on demand, and none of which are of less value than £5, is strictly regulated by the Bank Charter Act of 1844. Against securities held by the bank nearly to the amount of £16,450,000, of which the larger part is a debt due to it by the Government, it may issue notes without a metallic basis, but for every note issued above that sum it must have in its coffers an exact equivalent in gold coin or bullion. For its management of the public debt it receives from the Government an allowance proportionate to the amount of the national debt on which it has to pay the dividends. It is administered by a governor, a deputy-governor, and twenty-four directors, who are chosen from commercial men of high standing in the city, without any admixture of professional bankers. Apart from its issue departments, it performs all the functions of an ordinary bank, receives deposits and discounts bills. Its practice differs, however, from that of most other banks, inasmuch as it discounts only short-dated bills and allows no interest on deposits of any kind. The majority of the London joint-stock banks allow interest on deposits at short notice, and therefore the amount of deposits of all kinds held by each of several of the greater London joint-stock banks is larger than the private as distinguished from the public deposits of the Bank of England. In Oct., 1893, the private deposits of that bank were £32,092,000, while those of one London joint-stock bank were £34,405,116, and of another £41,838,276. The Bank of England rate of discount varies from time to time according to circumstances, and changes are announced publicly. These changes are much influenced by the amount of the reserves in its banking department. When bullion is flowing out of the country, a rise in the Bank rate checks the flow. The London joint-stock banks, having to pay interest on large deposits, while the Bank of England pays none, are forced, as it were, to discount more freely than the Bank of England, and this, with the keen competition among themselves, makes the rate of discount in the London market generally lower than the Bank rate. Therefore the greatest among them do a larger discount business than the Bank of England, and their profits are in some cases larger. In 1893 the dividend of the Bank of England was 10 per cent., while one of the two London joint-stock banks already referred to paid a dividend of 18 per cent., and the other 20 per cent. The Bank of England remains at the head of the banking establishments of the nation, partly because the reserves of the other London banks are directly, and through them the reserves of the provincial banks are indirectly, deposited with it. It has thus become the one holder of the banking reserves of the kingdom. The importance of this position is enhanced by the statutory obligation imposed on it to issue weekly an account of its assets and liabilities. The amount and character of its assets are keenly scrutinized as the barometer of the money market, and the smallness, even at the best of times, of its reserves is a subject which has led to a great deal of discussion. Thus on Jan. 3, 1894, while its private deposits were £34,152,556, it had in hand a cash reserve of £15,351,479, of which only £1,966,869 was in gold and silver coin, the rest being its own notes. It has happened on several occasions that during a monetary crisis its reserve has been so depleted that the Bank of England has had to appeal to the Government, which has restored confidence by sanctioning an infraction of the Bank Charter Act, and allowing the Bank of England to issue an adequate number of notes without a metallic basis. The mere permission, whether acted on or not, has always had the effect of putting an end to panic.

Of the London joint-stock banks there are nine which are purely metropolitan and nine others which, while also metropolitan, have country branches. All of them have adopted the system of limited liability. These eighteen principal banks, with five or six others, which from being private banks have also adopted limited liability, constitute the body of clearing banks, that is, those which are admitted to the clearing-house, a modern and most useful institution. Formerly a bank holding checks and bills payable by another bank presented them for payment to that bank, an operation which caused a vast multiplicity of transactions. Now all such checks and bills are daily settled at the clearing-house, where the difference between each bank is received or paid by a single check on the Bank of England. The total amount thus settled in 1893 was £6,478,013,000.

The Stock Exchange.—This "ready-money market of the world" is held in a building in Capel Court, close to the Bank of England. Its members buy and sell all stocks and shares, dealings in which are sanctioned by the committee of management, elected by the members annually. The number of members is nearly 3,000. Each pays an entrance-fee of 300 guineas (reduced to 150 guineas in the case of those who have for four years been clerks to members, and such clerks need to be recommended by only two members guaranteeing £300 each), with an annual subscription ranging from 20 to 30 guineas, according to the date of admission. No stranger enters except at his personal peril the room in which the members transact their business, but the clerks of members are admitted.

Commerce and Shipping.—The commerce of London is the largest of any city or port of the United Kingdom. London has the lion's share of the trade with France, British India, Australasia, China, Japan, and the West Indies. The total value in 1892 of both the exports from and imports into Liverpool, the commerce of which ranks next after that of London, was £212,662,149, and of London £226,749,916. In the same year the amount of customs duties levied on imports into London was £9,138,767, on imports into Liverpool £2,958,408. The figures would tell still more in favor of London if there were taken into account the value of the imports into Southampton, New Haven, Folkestone, and Dover, as most of the foreign and colonial produce received at these ports is consigned to London. In 1892 the imports at these four ports were valued at £35,441,813. As London, besides supplying the demands of its own consumption, is a great emporium for distribution, while Liverpool receives and ships the products of vast manufacturing and otherwise industrial districts, the imports of London are larger and her exports smaller. In 1892 the direct imports of London were valued at £144,273,415, those of Liverpool at £109,347,354. On the other hand, in 1892 London's exports were valued at £82,476,501, those of Liverpool at £103,314,845. Some of these exports from London indicate the use made of her as an emporium. Nearly all the tea and cocoa exported from the United Kingdom in 1892 was shipped from London. Of cotton-manufactures London exported to the value of £5,401,870; of woolen-manufactures, £3,532,756; of machinery, mill-work, steel rails, etc., £4,598,074.

The commerce of London employs great fleets of merchantmen, and the figures are largely in favor of the capital. The coasting trade, in which naturally London far exceeds Liverpool, being excepted, in 1892 the number of British and foreign vessels which entered the port of London with cargoes and in ballast from foreign countries and British possessions was 10,350, with a tonnage of 7,866,946; there cleared from it for foreign countries and British pos-

sessions 7,850 vessels, with a tonnage of 6,049,503. The figures for Liverpool were: Entered, 4,272 vessels, with a tonnage of 5,913,866, and cleared, 3,709, with a tonnage of 5,206,116. Liverpool employs more vessels than London in the British commerce with the U. S.; in 1892, however, there entered the port of London from the U. S. 609 vessels, tonnage 1,135,438, and there cleared to the U. S. from London 463 vessels, tonnage 948,449. For shipping in the Thames there is provided, chiefly on the north side, a magnificent series of docks, mostly with extensive bonded warehouses attached, where goods can be stored free of customs duties until removed. These docks stretch eastward from the Tower, beginning with St. Katharine's Docks (24 acres); then come London Docks (120 acres), the West India Docks (300 acres), the Millwall Docks (100 acres), the smaller East India Docks (27 acres), and at Blackwall the noble Albert and Victoria Docks, 2¾ miles in length, receiving vessels of the largest size. To save miles of navigation on the Thames large docks, chiefly for ocean steamers, have been constructed at Tilbury, nearly opposite Gravesend. On the south side of the Thames, E. of the Thames Tunnel, are the large basins of the Surrey and Commercial docks (350 acres), chiefly used for timber and corn. Lloyd's subscription-rooms (generally known as Lloyd's) occupy a first floor at the east end of the Royal Exchange, and are the great center for all interested in shipping, especially for the underwriters who insure vessels against casualties. The members form a corporation, in which some 460 are underwriters and about 160 non-underwriters, besides annual subscribers. (See LLOYD'S.). A separate society domiciled in a court off Cornhill is known as Lloyd's Register. It employs more than 100 surveyors at home and abroad, among whose duties it is to classify ships in course of building or when leaving the yards.

Trade and Industry.—Publishing and bookselling are very important factors in London's industry. According to the census of 1891 there were in London 4,682 publishers, booksellers, and librarians, 2,147 authors, editors, and journalists, and 35,009 persons engaged in the printing-trade. In the same year there were published 5,706 separate works, of which 1,271 were new editions, and 1,216 were novels. The publishers are located chiefly in Paternoster Row and its immediate neighborhood, but several of the most important firms belong to the West End. The number of newspapers published in London can not be much less than 700, upward of thirty of which are issued daily. Of other periodicals of all classes the name is legion. A very great industry is that of the brewers, of whom there are about 170 scattered throughout London. Of the beer and ale, valued at £1,651,486, exported from the United Kingdom in 1892, quantities valued at £730,460 were shipped from London. The necessaries of life are dispensed by 14,365 butchers and 15,613 bakers. The innkeepers, hotel-keepers, and publicans number 6,688, and the coffee-house and eating-house keepers 4,605. The building, fitting, and furnishing of houses occupy 600,000 of the population, coach and carriage 9,000, watch-making and philosophical-instrument making upward of 12,000, goldsmith work and jewelry more than 7,000. An enormous industry is the cheap and second-hand clothing, the trade of which is mainly in the hands of the Jews in Whitechapel. Of the "apparel" exported from the United Kingdom to the value of £4,874,091 in 1891, £3,096,152 was derived from London. Whitechapel, too, is one of the principal seats of the cigar-making industry. At Bermondsey, on the south bank of the Thames, are tanneries and what are said to be the largest leather-factory and the largest hat-manufactory in the world. At Battersea are candle and chemical works, while Lambeth is famous chiefly for its potteries. In machinery, engine, and boiler making, mainly by the river-side on both banks of the Thames, 20,665 persons are engaged. How vast is the demand for female labor in London is indicated by the fact that, besides some 250,000 women servants, there are upward of 120,000 women employed in millinery, shirt-making, and tailoring.

History.—The name London was derived, it is supposed, from the Celtic Llyn-din, the Lake-fort, erected by the Britons when the Thames at London was a great lagoon. The Latinized form, *Londinium*, the name given it by the Romans, is first distinctly mentioned by Tacitus, who says that in A. D. 61 traders and their merchandise abounded in it. During a brief period of the Roman occupation it was called *Augusta*. In 809 it was in the possession of the East Saxons, who had made it their capital. At the Conquest (1066) London was the capital of England. William the Conqueror gave London a special charter, and another, giving the citizens the right to elect their principal officials, was granted by Henry I. in 1101, and the first mayor was chosen in 1189; but for centuries there was a struggle between London and the sovereigns of England for the free exercise of rights nominally conceded to the citizens. All along the citizens of London have proved themselves champions of public liberty as well as of their own privileges. They adhered to the Reformation when Queen Mary was persecuting the Protestants. They sided with the Parliament against Charles I., and they powerfully aided William III.'s accession to the throne. Though in the reign of Elizabeth the population of London did not, it is probable, exceed 150,000, she and afterward Charles I. endeavored but fruitlessly to arrest its growth. The migration of great noblemen as far W. as Piccadilly had begun before the great fire of London in 1666 led to the substitution of brick for wood in the general rebuilding of the city. During the eighteenth century London was greatly extended, but it was reserved for the nineteenth century to see it absorbing distant suburban hamlets and open spaces, covering with houses what were fields from Bloomsbury to Hampstead and Highgate, and making integral parts of itself—Sydenham and Dulwich on the south side of the Thames, and on the north side Chelsea, Kensington, Hammersmith, and Fulham. So great an extension of London has been partly caused by the migration of large numbers of the upper middle class to domiciles in the suburbs. This migration is strikingly exhibited in the statistics of the inhabitants of the city which swarms by day with a busy population of 1,000,000, while its residents, who even as late as 1861 were 112,069, had sunk in 1891 to 37,705.

BIBLIOGRAPHY.—Books about London form a library in themselves. Of those published up to 1881 a list is given in the *Book of British Topography*, by J. P. Anderson, which was issued in that year. The best modern account of London and its growth from the earliest to recent times is W. J. Loftie's *History of London* (1883), the historical part of which is abridged in his *London City, its History, Streets, Traffic, Buildings, and People* (1891). Walter Besant's *London* (1892) and smaller *History of London* (1893) are full of picturesque writing about the past of the great city. Extremely copious and in popular style is Thornbury and Walford's *Old and New London*, with maps (6 vols., illustrated, 1879–85). Timbs's *Curiosities of London* is interesting and instructive. Peter Cunningham's invaluable *Handbook of London*, alphabetically arranged and therefore very convenient for consultation, has been excellently edited and brought up to date of issue in M. H. B. Wheatley's *London, Past and Present* (3 vols., 1891). Augustus C. Hare's *Walks in London* (2 vols., 1878) is very pleasing and trustworthy. Since 1879 there has unfortunately been no edition of P. Cunningham's useful *Handbook of London as it Is* (one of the John Murray series), so that for contemporary London the recent issue of Baedeker is to be recommended, with Herbert Fry's *London in 1893*. The *Dictionary of London*, by Charles Dickens, a son of the novelist, issued annually, is less satisfactory than its title would indicate, but has some good points. The article *London* in the ninth edition of the *Encyclopædia Britannica* contains an immense mass of facts and figures. Great light is thrown on the economic condition of the industrial classes of London in Charles Booth's various works on the subject, especially his *Life and Labor of the People in London* (4 vols., 1892).

F. ESPINASSE.

London: city, port of entry, and capital of Middlesex co., Ont., Canada; at the junction of the north and south branches of the Thames river; on the Canadian Pac., the Grand Trunk, and the Mich. Cent. railways; 61 miles E. of Sarnia (see map of Ontario, ref. 5–C). The site was selected in 1793 by Gov. Simcoe for a city to become the capital of Canada, but the home Government never recognized the choice, and no attempt was made to improve it till 1826, when the first building was erected. The city is in a fertile, cultivated region, is laid out with wide intersecting streets, and many of its public buildings, bridges, streets, squares, and markets, and its public park (Hyde Park) are named after those in London, England. It is the seat of the Anglican Bishopric of Huron and of a Roman Catholic bishopric, and contains two cathedrals, Hellmuth College, Hellmuth Ladies' College, Huron College, a mercantile college, orphan asylum, hospital, insane asylum, 6 banks, 3 libraries (Middlesex Law Association, Mechanics' Institute, and Western

University) containing over 10,000 volumes, and 3 daily, 6 weekly, 4 monthly, and 2 other periodicals. The industries include the manufacture of furniture, agricultural implements, engines, machinery, railway cars, oil, chemicals, boots and shoes, cigars, tobacco, stoves, and pottery. The city elects one member of the Dominion Parliament. Pop. (1881) 19,763; (1891) 31,977. NEIL MACDONALD.

London: city; capital of Madison co., O. (for location of county, see map of Ohio, ref. 5–E); on the Cleve., Cin., Chi. and St. L., and the Pitts., Cin., Chi. and St. L. railways; 20 miles E. of Springfield, 25 miles W. S. W. of Columbus. It is in an agricultural region, has been an important live-stock market for years, and has a daily, a semi-weekly, and three weekly newspapers. Pop. (1890) 3,313; (1900) 3,511.

Londonderry: county of Ireland, in the province of Ulster, bordering on the Atlantic. Area, 816 sq. miles. The surface is mostly hilly and rugged, with fertile tracts along the rivers Bann, Foyle, Faughan, Roe, and Mayola, with their numerous affluents. Oats, barley, potatoes, and flax are the common crops; linen is the principal manufacture. A great part of the ground is held by the inhabitants by lease under the Irish Society and the twelve London companies. Pop. (1891) 151,666.

Londonderry: city; capital of the county of Londonderry, Ireland; on the Foyle, which is crossed by an iron bridge 1,200 feet long (see map of Ireland, ref. 3–G). The city is built on a hill, on whose top stands the cathedral of Derry, and was formerly fortified, has many breweries and distilleries, and considerable manufactures of linen and ropes. The salmon-fisheries of Lough Foyle are very productive. Derry was the old name of the city, but in the reign of James I. the resistance of its inhabitants to the royal authority caused the forfeiture of the land on which it stood to the crown, and its government was then administered by the Irish Society in London, which rebuilt the city and gave it its present name. In the revolution of 1688 it sided with William of Orange, and sustained a memorable defense against the forces of James II. Under its governor, George Walker, it held out against the besiegers for 105 days, enduring the extremes of privation until a man-of-war brought relief and the siege was raised. Pop. (1891) 32,893.

Londonderry, SECOND MARQUIS OF: See CASTLEREAGH, ROBERT STEWART.

Londonderry, CHARLES WILLIAM STEWART VANE, Third Marquis of: soldier and statesman; b. in Dublin, Ireland, May 18, 1778; served on the Continent both as a soldier and a diplomatist during the wars of the French Revolution; aided in suppressing the Irish rebellion of 1798; accompanied Abercrombie to Egypt in 1801, in which year he entered Parliament; became colonel, aide-de-camp to the king, and under secretary for the war department in 1803; distinguished himself at the head of a brigade of hussars under Sir John Moore in Spain (1808–09); was adjutant-general to Sir Arthur Wellesley (1809–13), distinguishing himself at Talavera and other battles, for which he received the thanks of Parliament and the order of the Bath; went as ambassador to Berlin in 1813, to Austria in 1814, and was a member of the Congress of Vienna in 1815; was made privy councilor, lieutenant-general, and Baron Stewart in 1814; assumed the surname of Vane in 1819 on his marriage with the heiress of that title; succeeded his half-brother Robert as Marquis of Londonderry in 1822; was made Earl Vane and Viscount Seaham in 1823, general in 1837, colonel of Life Guards in 1843, Knight of the Garter in 1852. D. in London, Mar. 6, 1854. Under his original name of Stewart he was author of a *History of the Peninsular War* (1808–13), and as Marquis of Londonderry he edited the *Correspondence* of his brother, Lord Castlereagh (1850). In developing the vast estates of his wife in Durham he constructed at his own expense the harbor of Seaham.

London, University of: an institution which owes its origin to an agitation started in 1825 by the poet Thomas Campbell for a university of equal rank with Oxford and Cambridge, which should be free from denominational control. The university was incorporated in 1826, and the corner-stone of University College was laid in 1827, but the fact that the new institution made no provision for instruction in religion caused serious thought, which resulted in King's College, founded 1829, opened 1831, in which provision was made for teaching religion according to the forms of the Church of England. The agitation continued; finally in 1837 the University of London was incorporated by royal letters patent as an examining body pure and simple, with which King's and University Colleges were affiliated. The corporate body of the university includes the chancellor, vice-chancellor, fellows, and graduates. The university proper consists of a senate and a board of examiners. It does not instruct, but examines, confers degrees, certificates, and prizes, and sends one member to Parliament. There are now several colleges and schools in various parts of the kingdom affiliated with the university. The chancellor is (1894) Lord Herschell. C. H. THURBER.

Long, CRAWFORD W., M. D.: discoverer of anæsthesia; b. Nov. 1, 1815, in Danielsville, Madison co., Ga.; educated at the University of Georgia, graduating with honor in 1835; graduated at the medical department of the University of Pennsylvania in 1839; soon after began to practice medicine in Jefferson, Ga. In 1842 he performed the first operation on a patient fully etherized that the world has any account of. His discovery of anæsthesia in surgery antedates the claims of Horace Wells two years and eight months, and those of Morton four years and six months. In 1790 Priestley discovered nitrous oxide gas. In 1799 Sir Humphry Davy experimented with it, and in 1800 he published his *Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide Gas and its Respiration*, in which he distinctly announced his belief that it might be used as an anæsthetic in surgical operations. It is well known that sulphuric ether was used sportively ever since the beginning of the nineteenth century by the students in New England colleges; and in certain sections of the South its use as an excitant was at one time very common. In 1842 Dr. Crawford W. Long had four students—viz., P. A. Wilhite, D. I. Long, H. R. P. Long, and John S. Groves. They all occasionally indulged in "ether frolics." On several occasions Dr. Long became furiously excited under the influence of ether, and could not be controlled. After recovering from the intoxication he often noticed that his arms were badly bruised, and he was not conscious of having felt any pain at the time. From this fact he inferred that it might be used as an anæsthetic in surgery. Accordingly, for this purpose he administered the ether to a young man named Venable, putting him profoundly under its influence, and then exsected a tumor from his neck. The operation, entirely painless, was witnessed by the four medical students above named and by others. His operations were known to medical men in the neighborhood; but Dr. Long did not communicate his discovery to any scientific body, nor did he write it out for any medical journal till the year 1849, when he sent it to *The Southern Medical and Surgical Journal*, which was long after the labors of Wells, Morton, Jackson, and Simpson in this direction were fully recognized. In a communication by Dr. Charles T. Jackson to *The Boston Medical Journal*, Apr. 11, 1861, he says: "From the documents shown me by Dr. Long it appears that he employed sulphuric ether as an anæsthetic agent—first, on Mar. 30, 1842, when he extirpated a small glandular tumor from the neck of James W. Venable, a boy [Mr. Venable was just twenty years old when the operation was performed], in Jefferson, Ga., now dead. Second, on July 3, 1842, in the amputation of the toe of a Negro boy belonging to Mrs. Hemphill, of Jackson, Ga. Third, on Sept. 9, 1843, in the extirpation of a tumor from the head of Mary Vincent, of Jackson, Ga. Fourth, on Jan. 8, 1845, in the amputation of a finger of a Negro boy belonging to Ralph Bailey, of Jackson, Ga. Copies of the letters and depositions proving these operations with ether were all shown me by Dr. Long. He also referred me to physicians in Jefferson who knew of the operations at the time." Revised by S. T. ARMSTRONG.

Long, GEORGE: classical scholar; b. at Poulton, Lancashire, England, in 1800; educated at Macclesfield School and at Trinity College, Cambridge. In 1824 he was appointed Professor of Ancient Languages in the University of Virginia, then being organized by the care of Thomas Jefferson. Returning to England in 1826, he was Professor of Greek in London University until 1831, when he devoted himself to the literary enterprises of the Society for the Diffusion of Useful Knowledge, editing for that association *The Penny Cyclopædia* (1833–46), the work by which he will be best remembered. He was called to the bar at the Inner Temple in 1837, became Professor of Latin at University College, London (1842–46), lecturer on Jurisprudence and Civil Law at the Middle Temple (1846–49), and Professor of Classical Literature in the Proprietary College at Brighton from 1849 to 1871. He was general editor of a *Bibliotheca*

Classica. Among his publications are an edition of Cæsar's *Gallic War*, of *Sallust*, and orations of Cicero; translations of *Select Lives from Plutarch*, *The Thoughts of the Emperor Marcus Aurelius*, and *Epictetus*. D. Aug. 10, 1879.

Long, John Davis: See the Appendix.

Long, Stephen Harriman: officer and engineer; b. in Hopkinton, N. H., Dec. 30, 1784; graduated at Dartmouth College 1809; was appointed second lieutenant of engineers Dec., 1814, and in the spring of 1815 was placed on duty at the Military Academy as Assistant Professor of Mathematics. In the following year he was appointed topographical engineer, and explored the Illinois and Arkansas rivers in a flatboat or canoe. This led to his subsequent expedition to the Rocky Mountains, which extended over a period of nearly five years, and embraced the country between the Mississippi river and the Rocky Mountains, one of the loftiest peaks of which great chain still bears his name. An account of this expedition was published in 1823 by E. James, and in 1824 W. H. Keating published in two volumes the history of Long's exploration of the sources of the Mississippi, both works being largely from notes of Col. Long. He had charge of the surveys and construction of the Baltimore and Ohio Railroad, and introduced great improvements in the construction of Bridges (*q. v.*). In the improvement of Western rivers and harbors he had a long experience, and devised valuable plans for the removal of obstructions. After serving on a board for the improvement of the lower Mississippi, he was in 1856 placed in charge of that work, and under his supervision the contracts for deepening the mouths of this river were conducted prior to the civil war. Col. Long was retired (June, 1863) from active service, but continued charged with important duties until his death, Sept. 4, 1864.

Long Branch: town; Monmouth co., N. J. (for location, see map of New Jersey, ref. 4–E); on the Atlantic Ocean, a branch of the South Shrewsbury river, and the Cent. of N. J., the N. J. South., and the Penn. railways; 11 miles S. of Sandy Hook, 30 miles S. of New York. It was formerly a fishery for the Indians and a resort for wreckers, but has become one of the most noted summering-places in the U. S. It is easy of access from New York and Philadelphia, and during the summer has almost hourly communication with the former by rail and water and with the latter by rail. The town is famous for its magnificent beach, which extends nearly 5 miles within corporate limits, and is overlooked by a bluff averaging 20 feet in height. The main thoroughfare is Ocean Avenue, which skirts the bluff for about 4 miles, and is kept in excellent condition. Some distance back from the ocean is the great Hollywood estate, laid out by John Hoey, and kept open to the public. The town is divided into several small places, such as North Long Branch, West Long Branch, West End, and Elberon, and has many fine driveways, leading to quaint suburban villages. The famous Monmouth Park race-course is about 4 miles inland. Long Branch contains nine first-class hotels, many boarding-houses, and a large number of beautiful private cottages. There are several churches, a U. S. life-saving station, a national bank with capital of $50,000, a State bank with capital of $90,000, a public library and reading-room, and a monthly and three daily periodicals. A street-railway connects the town with Pleasure Bay on the Shrewsbury river, a popular resort for fishing and yachting. Resident pop. (1880) 3,833; (1890) 7,231; (1900) 8,872.

Editor of "News."

Longet, lōn′zhā′, François Achille: physician and physiologist; b. at St.-Germain-en-Laye, department of Seine-et-Oise, France, in 1811; studied medicine, and especially physiology; gained twice the Montyon prize of physiology at the Academy of Sciences; was Professor of Physiology in the Faculty of Medicine at Paris; member of the Academy of Medicine, and consulting physician to Napoleon III. His principal works are *Traité d'Anatomie et de Physiologie du Système nerveux* (1842) and *Traité complet de Physiologie* (1850–59). D. at Bourdeaux in 1871.

Longevity [from Lat. *longæ′vitas*, length of life, deriv. of *longæ′vus*, long-lived; *lon′gus*, long (: Eng. *long*) + *ævum*, period of time, age, life (whence Lat. deriv. *æ′tas*, for **æ′vitas*, age, whence Eng. *age*)]: the length of time during which an individual lives. The term is also often used to express the more than usual prolongation of life, especially of human life. The average longevity of a particular group of individuals is the average duration of life of all the individuals in that group; this is what is called the expectation of life at birth, and is usually considered in connection with the subject of mortality. In speaking of the longevity of different species of living beings, we usually mean the potential longevity—that is, the greatest length of life attained by any individual of the particular group. This again is divided by Ray Lankester into "normal potential longevity," or that which belongs to the species in its normal conditions, and "absolute potential longevity," or that which can be obtained for a few individuals under special and unusual conditions. This distinction is useful as applied to plants and the lower animals, but is not of much importance as applied to man. The longevity, whether average or potential, of different species of living beings varies greatly, the range being from a few hours or days for certain minute plants or complete forms of insects to 2,000 years and more for a few individual yews and baobabs.

For the majority of animals, accurate information as to longevity is wanting. Pike and carp have been known to live 150 years; tortoises about the same. Eagles, ravens, and parrots, 100 years and over. The elephant lives from 100 to 150 years. The rhinoceros, 70 years; the camel, 50 to 80 years; the horse, 20 to 40 years; the ox, 15 to 20 years; the sheep, 12 years; lion, 20 to 40 years; dog, 12 to 34 years; cat, 10 to 18 years. From the number of layers of whalebone found in the jaws of certain large whales, it is computed that the longevity of this animal is at least 400 years. In mammals there appears to be some relation between the duration of gestation and longevity, but to this there are many exceptions. A more constant relation exists between the period required for completion of growth and the longevity. Buffon supposed that the ratio of length of growth to length of life was 1 to 7. Flourens gave it as 1 to 5, and defined the end of the period of growth as being that when the epiphyses form a bony union with the bones throughout the skeleton. The most interesting questions in longevity relate to man, and may be stated as follows: 1. What is the greatest age that any human being has ever attained? 2. Upon what does the great longevity of different individuals depend? 3. What is the average longevity of different groups of men? 4. How can this average longevity be increased?

The greatest age ever attained by a human being in an authenticated case is that of a man named Rives, who was living at Tarbes, France, in June, 1888, and whose baptismal certificate stated that he was born in Aug., 1770, thus making him out to be 118 years old. The claims that Thomas Parr reached the age of 152, the Countess of Desmond 145, and other similar cases, are unsupported by satisfactory evidence, and there is no proof that any one in England or the U. S. has ever reached the age of 110 years. The longevity of man is usually given as 100 years, but there are several well-authenticated cases in which it has been between 100 and 108 years. There is no reason to suppose that the potential longevity of man has diminished since he first appeared upon the earth. Several investigations have been made to determine the characteristics, habits, and modes of life of persons attaining a great age, one of the most complete of which is that made by the collective investigation committee of the British Medical Association, the results of which—including data from nearly 900 persons, of whom 74 were centenarians—have been published by Sir George Humphrey in his treatise on old age. The general result of this, as of similar inquiries undertaken in the U. S. and elsewhere, is that the chief requisite for individual longevity is a special constitution of the body, often inherited, including sound and well proportioned organs, and sufficient and persistent powers of reparative force and of resistance to disturbing agencies. The fact that each individual has his own potential longevity implies that there is something in his structure which is an inherent and necessary cause of death. The common idea is that each fertilized ovum possesses a fixed and definite amount of a peculiar kind of energy, or source of energy, known as vital force or as the physical basis of life; that this may be wasted by excessive use in a given time, or may be partially or wholly destroyed by accident or disease, but that it can not be added to. If this be stated in the terms of modern biology it would be that each essential unit of nuclear tissue has a certain definite capacity for metabolism, growth, and multiplication, and no more; that this is true of the germinal nuclear substance of each organ and tissue; that in most men this capacity is less in some organs and parts than the amount required to keep those parts alive for the same length of time, as certain other parts which have a normal

or perhaps an exeessive capaeity; and that in sueh eases death oecurs by failure of the weak part before the vitality of all the parts is exhausted—the ehain snaps in its weakest link. In this statement, nuclear substanee is distinguished from what is commonly called protoplasm. Aecording to Minot, the amount of protoplasm inereases in proportion to that of nuelear substanee as age advances, so that the possession of a large relative quantity of protoplasm is a sign of age. His observations on guinea-pigs show that from the period of birth there is a steady loss of vitality as indieated by the rate of growth; that is, that as the animal grows older, the time it takes to add 10 per cent. to its weight eonstantly inereases. It would be a more aecurate statement from the faets observed to say that there is a loss of vitality for a given weight of tissue, but there is no doubt that there is an absolute progressive loss of vitality after the period of reproduetion sets in, if not from birth. In the eentenarian all the parts had at birth a properly proportioned amount of vitality, or at all events an amount not below the normal, and unless a man begins life with this sort of physical structure he can not attain extreme old age; but the possession of such a structure at birth, or in growth, does not guarantee longevity; it is also necessary that the life of the individual be sueh that he is not exposed to aeeidents or to eertain eauses of disease. The greater longevity of women than of men is probably due, in part at least, to the faet that after fifty-five years of age they are less exposed to causes of disease or injury than men. The great majority of centenarians have been persons of regular habits, not large eaters, with good appetite and digestion, and good sleepers; their arteries are usually eomparatively soft, the sostal eartilages are not ossified, and the joints of their hands show no traee of gouty or rheumatic disease. Some of them have used alcoholic drinks and tobaeco freely, but the majority have been temperate or abstainers. They are usually of medium height; the average pulse in the man over eighty is 73, in the woman 78.

There is no definite evidence that there is any greater tendency in one race or community than another to produce persons capable of becoming centenarians if different liabilities to accidents or exposures to causes of disease be put aside, yet there may be differences in such tendency, since they appear to exist in certain families and to be hereditary.

As regards average longevity or duration of life, it varies considerably in different places and at different times. It appears to have increased in most civilized countries since the beginning of the nineteenth century, but the positive proof of this is in most cases wanting, owing to the absence of data from which it can be aeeurately calculated. According to the table of Ulpian in the *Pandec's* of Justinian, it was about 30 years among the Romans at the beginning of the third century A. D. In Geneva during the first half of the eighteenth century it was about 28 years. In England from 1838 to 1854 it was, for males, 35·9 years, and from 1871 to 1880 it was 41·35 years; for females it was, in the first period, 41·85, and in the second 44·62 years. It is noteworthy, however, that this increase in the average duration of life was due to the fact that more children survived to live lives of from 15 to 20 years' duration, but after the age of 19 in the male and 45 in the female the average expectation of life was, if anything, less in the latter period.

The following table shows the expectation of life in Massachusetts as derived from the statistics of the years 1883–87, inclusive:

AGES.	Persons.	Males.	Females.
0	40·87	39·72	42·03
1	49·77	49·43	50·12
2	52·67	52·36	52·98
3	53·02	52·73	53·31
4	52·96	52·70	53·23
5	52·70	52·43	52·97
10	49·61	49·27	49·95
15	45·53	45·13	45·94
20	41·93	41·41	42·45
25	38·76	38·24	39·28
30	35·54	34·94	36·15
35	32·33	31·65	33·02
40	28·98	28·26	29·71
45	25·64	24·88	26·41
50	22·29	21·55	23·04
55	18·95	18·23	19·68
60	15·98	15·32	16·64
65	13·01	12·42	13·60
70	10·74	10·27	11·21
75	8·47	8·12	8·83
80	7·24	7·03	7·45
85	6·00	5·94	6·07

The expeetation of life is greater in Jews than it is in the Anglo-Germanic races, and is less in the colored people of the U. S. than it is in the whites. For males it is in Massachusetts 39·7, in New York eity 33·3, in the Society of Friends of England 45·3, in the colored people in Baltimore 21.

If we take a large number of normal individuals who have eseaped the special dangers of infancy, sueh, for instanee, as those whose lives are insured in various companies, we find that the tendency to death at different ages can be fairly represented by mathematical formulas, which may be said to represent the law of mortality. The basis of this law, as established by the investigations of Gompertz and Makeham, is that the liability to death at any age is a result of two factors, one being liability to aeeident, the other a progressive neeessary deterioration expressed by the statement that eaeh person loses an equal proportion of his vital foree in equal times, and that the proportion of vital force so lost by eaeh is always the same. The result of this is that if we know the death-rate for two or three age-groups, we ean calculate the death-rates for other age-groups with great accuracy. For further considerations upon average death-rates, see VITAL STATISTICS.

The methods of inereasing the average longevity in a eommunity are discussed under the head of HYGIENE. They consist mainly in the prevention or removal of what may be called aeeidental eauses of death, for while it is theoretically possible by careful seleetion in marriage to produee children who will have few weak points, and will be better able to resist causes of disease, yet sueh selection is impossible for any considerable proportion of a eommunity, and, if made, probably it would be necessary to combine with it an artifieial limitation of the birth-rate to secure any marked results. Whether the potential longevity of man could be thus inereased we do not know, and probably it would not be desirable to do this if we could.

J. S. BILLINGS.

Longfellow, HENRY WADSWORTH: poet; b. at Portland, Me., Feb. 27, 1807; graduated at Bowdoin College in 1825 in a class which included Nathaniel Hawthorne and John S. C. Abbott. During his college days he distinguished himself in modern languages, and wrote several short poems, published chiefly in *The United States Literary Gazette*, at Boston; one of these was the well-known *Hymn of the Moravian Nuns*. After graduation he entered the law offiee of his father, but in the following year accepted the professorship of Modern Languages at Bowdoin, with the privilege of spending three years in Europe in preparation for that post. After studying in France, Spain, Italy, and Germany, he entered upon his professorship in 1829, and began to publish the results of his careful researches into European languages and literature, both mediæval and modern. His first volume was a small *Essay on the Moral and Devotional Poetry of Spain* (1833), which included translations of the *Coplas de Manrique* and of several sonnets of Lope de Vega. A volume of prose sketches of travel appeared in 1835 under the title *Outre Mer, a Pilgrimage beyond the Sea*, and numerous essays and critiques on literary topies were contributed to *The North American Review*. In 1835 he was elected to the chair of Modern Languages and Literature in Harvard College, as successor to George Ticknor, and spent a year in European travel and study, especially in Denmark, Sweden, and Switzerland, cultivating a knowledge of early Scandinavian literature. Entering upon his professorship in 1836, he soon beeame a resident in the historic Craigie House (Washington's headquarters), which he afterward purchased and made his home. In 1839 he published *Hyperion, a Romance*, and *Voices of the Night*, his first volume of original verse, comprising the selected productions of nearly twenty years; it procured him immediate recognition as a poet, and the *Psalm of Life* took rank as a popular favorite. *Ballads and Other Poems* and a small volume of *Poems on Slavery* appeared in 1842: *The Spanish Stu-*

dent, a drama in three acts, in 1843; *The Belfry of Bruges* in 1846; *Evangeline, a Tale of Acadie*, in 1847, the latter being a spirited introduction of hexameter verse, and generally considered as Longfellow's masterpiece. In 1845 he published a large volume of *The Poets and Poetry of Europe*; in 1849 *Kavanagh, a Tale* (in idyllic prose); in 1850 *The Seaside and the Fireside*; in 1851 *The Golden Legend*; in 1855 *The Song of Hiawatha*; in 1858 *The Courtship of Miles Standish*; in 1863 *Tales of a Wayside Inn*; in 1866 *Flower de Luce*; in 1867–70 a masterly poetical translation of *Dante*; in 1869 *New England Tragedies*; in 1871 *The Divine Tragedy*; in 1872 *Three Books of Song*; in 1874 *Aftermath*; in 1875 *The Masque of Pandora*; in 1878 *Keramos*; in 1880 *Ultima Thule*; in 1882 *In the Harbor*; in 1883 *Michael Angelo* (posthumous). Prof. Longfellow resigned his chair at Harvard in 1854, but continued to reside at Cambridge; he traveled in Europe in 1841–42 and 1868–69, on which latter occasion he received the degree of D. C. L. from the University of Oxford, and in 1874 received a large complimentary vote for the lord rectorship of the University of Edinburgh. Some of his poetical works have been translated into many languages; complete editions have enjoyed wide circulation, not only in the U. S., but in an equal degree in England, where their popularity rivals that of the best modern English poetry. D. at Cambridge, Mar. 24, 1882. See *Life* of the poet, edited by his brother Samuel, and published in Boston 1886–87, and *Final Memorials*.

Revised by H. A. Beers.

Longfellow, Samuel: clergyman and author; b. at Portland, Me., June 18, 1819; brother of Henry W. Longfellow; graduated at Harvard College 1839, and Divinity School 1846; was first settled in Fall River in 1848; in 1853 became pastor of the Second Unitarian church in Brooklyn, N. Y.; resigned his pulpit in 1860, and went abroad. He did not settle again till 1878, when he went to Germantown, Pa., and remained there five years. After that his residence was in Cambridge, Mass. In 1848, in association with Rev. Samuel Johnson, he compiled *A Book of Hymns*, which was afterward revised and called *Hymns of the Spirit*; and in 1859 he published a book of *Hymns and Tunes for Congregational Use*, and a small volume for the vesper service which he instituted. His best essays were printed in *The Radical* 1866–71. He edited in 1883 *Lectures, Essays, and Sermons of Samuel Johnson, with a Memoir*, and in 1886 a *Life* of his brother Henry, in two volumes, to which a volume of *Final Memorials* was added in 1887, and in the same year he published *A Few Verses of Many Years*. A complete collection of his hymns and other poems is (1894) being made by his niece, Alice M. Longfellow. No other hymnist among Unitarians has written so many favorite hymns. He died in Portland, Me., Oct. 3, 1892. See his *Memoir and Letters* and *Essays and Sermons*, edited by Joseph May (Boston, 1894).

Revised by J. W. Chadwick.

Longford: county; in the province of Leinster, Ireland; bounded by the counties of Leitrim, Westmeath, and Roscommon. Area, 421 sq. miles, with a level or slightly hilly surface, and a fertile soil suited both for tillage and grazing. Some linens and coarse woolens are manufactured. Longford is the county-town. Pop. (1891) 52,553.

Longhi, lon'gĕe, Alessandro: painter; b. in Venice in 1733. His work, chiefly portraits, is only to be seen in Venice. He was distinguished also as an etcher. He published the *Lives of Venetian Painters* of his own century, with steel engravings of their portraits. He was one of the original members of the Venetian Academy. D. in Venice in 1813.

W. J. S.

Longhi, Giuseppe: engraver; b. at Monza, Italy, in 1766. He studied for the priesthood, but as soon as he left the seminary he devoted himself to art, and soon became very successful as a miniature-painter, but at the age of twenty-five chose engraving as his specialty, and studied this art in Milan and Rome. The plate of Galatea and a portrait of Bonaparte established his fame, and at the death of Vangelisti, the school of engraving at Milan was intrusted to him. He was a most industrious engraver, and worked after Rembrandt, Rubens, Crespi, Gherardo dalle Notti, Raphael, Correggio. Among his most famous plates are *Jesus in the Arms of St. Joseph*, the *Marriage of the Virgin*, a *Holy Family* after Raphael, and portraits of Napoleon, Michaelangelo, the Doge Dandolo, George Washington, and the artist's brother. Bonaparte commissioned him to engrave certain pictures by Appiani of Napoleonic ceremonials while he was at Milan, of which he executed five. He was also an excellent writer on the fine arts, and was elected member of all the European academies. When about to begin a plate of Michelangelo's *Last Judgment*, he was stricken with apoplexy, and died at Milan in 1831.

W. J. Stillman.

Longhi, Luca: painter; b. at Ravenna, Italy, in 1507. He was successful with portraits and historical subjects. His works are chiefly to be seen at Ravenna. He also painted at St. Benedict's in Ferrara, and in Milan at the Abbey (*abbazia*). His son and daughter were painters, but did not equal their father in merit. D. at Ravenna in 1580.

W. J. S.

Longinus, Cassius (in Gr. Λογγῖνος): one of the most highly esteemed Greek rhetoricians of the third century after Christ, called by Eunapius "a living library and a walking museum." Alike distinguished as a philosopher and as a rhetorician, he counted Porphyry, the Neo-Platonist, among his pupils, and his school at Athens enjoyed great reputation. An intimate and a partisan of Zenobia's, he was involved in her revolt, and was executed by Aurelian in 273. There are extant under his name sundry fragments on meter and rhetoric, of value disproportionate to his great repute, and a famous treatise, *On the Sublime* (περὶ ὕψους), which belongs to an earlier period, and is evidently intended to supplement and correct a celebrated work on the same subject by Cæcilius of Calacte, the contemporary of Dionysius of Halicarnassus. This treatise is a most valuable document of antique æsthetic criticism, and is interesting not only by reason of its remarkable insight, but because of the wide range of its illustrative quotations. The author compares Cicero and Demosthenes, and draws upon Genesis for an illustration of the sublime. No trustworthy conclusion has been reached as to authorship, and the book is generally assigned to the first century A. D. Editions: Weiske (1820), *cum notis variorum*; Egger (1837), with valuable commentary; critical ed. by Jahn (1867), re-edited by Vahlen (1887).

B. L. Gildersleeve.

Longipen'nes [Mod. Lat.; Lat. *lon'gus*, long + *pen'na*, feather, wing]: a group (sometimes called an order) of swimming birds, including the gulls, terns, albatrosses, and petrels. They are remarkable for their long and often very narrow wings, and their great powers of flight. They are also good swimmers, are usually pelagic, but as a rule do not dive under water. The group is not a natural one, and is now usually divided into two, *Gaviæ*, including the gulls and terns, and *Tubinares*, containing the albatrosses and petrels.

F. A. L.

Long Island: the extreme southeastern portion of the State of New York; bounded on the N. by Long Island Sound, E. and S. by the Atlantic Ocean, W. and N. W. by the Narrows, New York Bay, and the East river, an estuary connecting New York Bay with Long Island Sound. It lies between parallels 40° 34′ and 41° 10′ N. lat., and 71° 51′ to 74° 02′ lon. W. from Greenwich, and on the line of greatest length measures 118½ miles. In shape it resembles a fish with its head opposite New York city; gradually broadening from the west end eastward for 40 miles to its greatest width of about 23 miles, and then gradually narrowing for about 70 miles to its point of smallest width of 12 miles, opposite the head of Peconic Bay it again spreads in two peninsulas, the northerly one terminating in Orient Point and the southerly one in Montauk Point. Area, 1,682 sq. miles.

Topography.—A range of hills called "the back-bone of the island" extends for some 60 miles lengthwise of the island, varying in height from 150 to 384 feet, and from 3 to 7 miles S. of its north shore-line. From these hills the island slopes gently southward toward the ocean, while toward the north it is elevated, undulating and very broken, ending abruptly in bold precipitous bluffs at the shores of Long Island Sound. A series of fiords, eight in number, of great natural beauty, penetrates this north shore to the central hills flanked on either side by highlands covered with fine growths of oaks and pines, and affording with their deep waters excellent harbors for fishermen and coasting vessels, and producing shellfish in great quantities. The central part of the island is a vast nearly level plain where for miles the roads pass over great prairie-like reaches covered with forests of cedar and pine. Along the south side of the island for nearly its entire length there is a series of remarkable lagoons separated from the ocean by a broad belt of sand broken through, here and there, by inlets. These are navigable by small craft and abound in fish. Along the inner shore of these bays are inlets, bays, and coves; into them

run numerous streams, and along them, in one almost continuous chain, are villages, once the quiet homes of farmers and fishermen, now grown into prosperous seaside resorts filled with handsome villas and great hotels. The beaches shutting them off from the ocean are magnificent and are unsurpassed by any in the world; they, too, are dotted with great hotels and attractive cottages, and some of these, as Coney Island, Rockaway, and Long Beach, are visited daily during warm weather by large numbers of people. The surf bathing is excellent nearly the whole length of the island. The city of Brooklyn occupies the greater part of the west end of the island, the east end of which is bifurcated, so that it resembles the tail of a fish, by an inlet of irregular shape extending from the ocean westward into the island about 22 miles. Across the east end lies Gardiner's island, 7 miles long, varying in width from 3 miles to a few rods. It has been owned by the Gardiner family since 1640. Several miles westward from this island lies Shelter island, across the mouth of Peconic Bay, dividing it from Gardiner's Bay, irregular in outline, with high cliffs and promontories, its shore broken into small bays and coves. The southerly arm of the island terminates in Montauk Point, a hilly peninsula containing about 9,000 acres. Its bluffs, ranging from 50 to 100 feet in height, are exceedingly bold and picturesque. At Fort Pond Bay is a magnificent harbor, and on the extreme point of the island stands Montauk light. On this peninsula Wyandance, chief of the thirteen tribes of the island, resided at the time it was first settled by whites.

Geology.—Long Island is part of the terminal moraine of the great North American glacier that in the ice age extended downward from the arctic regions, burying a part of the continent under 4,000 or 5,000 feet of ice; its geological structure is glacial drift, the detritus brought by the ice in its downward movement, and filled with materials brought from afar. The bed rock, a dark micaceous gneiss, is visible only at Astoria, and is the same as that of the opposite shore. Common rocks like granite, trap, slate, schist, sandstone, limestone, and conglomerate, are abundant in different parts of the island, and also many kinds of minerals are found. The collection of minerals and rocks in the museum of the Long Island Historical Society has 500 specimens gathered from all parts of the island. Along the north side the drift is underlaid by deep beds of clay and kaolin. Among the drift many bowlders are found, some of them very large, one, for instance, near Manhasset, being 54 feet long by 40 broad and 16 high. These all have worn surfaces without sharp angles or edges, and are many of them covered with glacial scratches. A peculiarity of the formation is the many bowl-shaped depressions which occur upon the surface at different parts of the island, filled with clear water, forming beautiful lakes and ponds.

Soil and Productions.—The soil of Long Island along the slope S. from the hills is for the most part modified drift, sandy, easily cultivated, very productive. Portions of it, as that called Hempstead Plains covering about 60,000 acres, are nearly level, and have a dark rich soil with a deep sub-soil, underlaid with hard gravel or sand. The ridge and northern part has a rich and fertile loam. The island has many small lakes, and across it run many shallow streams, while underneath the hard-pan which forms the main body of the island, especially in the middle and at the west end, is found an inexhaustible supply of clear, fresh water. From these sources Brooklyn and many of the larger towns get their water-supply. Long Island is virtually a large market garden to New York city, furnishing its markets and the summer hotels and villas along its shores with great quantities of fresh produce. Its farms cover an area of 485,000 acres, valued at over $45,000,000, and have a yearly product aggregating about $7,500,000. Queens County leads in market stuff, producing nearly double that of Kings and ten times as much as Suffolk; this county produces about one-half of the potatoes raised on the island, and also leads in quantity of rye, buckwheat, and milk. Suffolk County leads in hay and other farm crops. Large quantities of apples, grapes, and other fruits, also of poultry, eggs, and dressed meat, come from the island; it is also noted for its fruit, flower, and tree nurseries.

Fisheries.—The fisheries of the island have always been an important part of its industries. At one time Sag Harbor sent out from her docks seventy whaling-vessels, and in 1847 the whale oil and bone it marketed was valued at $996,500. This industry came to an end in 1862. The menhaden fishing employs 35 steam and sail vessels and about 700 men. The annual catch is about 150,000,000, valued at $1,250,000. The shell-fishery gives work to upward of 2,000 men and about 350 vessels. About 785,000 bush. of oysters, 200,000 bush. of hard-shell and 300,000 bush. of soft-shell clams are taken annually. The most complete and best-fitted fish-hatching station of the Fish Commission of New York State is at Cold Spring harbor, on the north shore of the island. It has planted on the island over 35,000,000 fishes, including trout of various kinds, salmon, shad, smelts, whitefish, lobsters, etc.

Political Divisions, Population, etc.—Long Island is divided into three counties. Kings County, with an area of 48,800 acres, occupies the west end; Suffolk, with an area of 626,000 acres, the east end; and Queens, with 253,100 acres, the section between. The population and its growth is shown by the following table.

COUNTY.	1810.	1830.	1850.	1870.	1880.	1890.	1900.
Kings...	8,303	20,535	138,882	419,921	599,495	838,547	1,166,582
Queens.	19,336	22,460	36,833	73,803	90,574	128,059	152,999
Suffolk.	21,752	26,780	36,922	46,924	53,888	62,491	77,582
Totals.	48,752	69,775	212,837	540,648	743,957	1,029,097	1,397,163

Kings and Queens counties comprise Brooklyn and Queens boroughs respectively of New York city. The larger villages with their populations in 1900 are: Patchogue, 2,926; Greenport, 2,366; Southampton, 2,289; Babylon, 2,157; Amityville, 2,038; and Sag Harbor, 1,969.

History.—The Dutch name of the island was Lange Eylandt, converted into Long Island by the English, who in 1693 changed it to the Island of Nassau, but this name never came into popular use. Its Indian names were Panmaneke, Sewanhacky, Wamponomon, and Matouwacks. The island was visited in 1609 by Hendrick Hudson, who probably touched at Coney Island. It was included in the grant in 1620 by James I. to the Plymouth Company of all the land between 40° and 48° N. lat. between the Atlantic and Pacific Oceans. The company granted a patent of the island to Earl Stirling, who died in 1640, and the same year his son surrendered the patent to the Duke of York. Settlements began at the east and west ends about the same time—at Gowanus (Brooklyn) in 1636; Gardiner's island, Southold, and Southampton in 1639–40; Hempstead, in Queens County, in 1643. The island was at that time occupied by thirteen tribes of Indians, all having the same general characteristics and habits. They belonged to the Algonquin nation and were of the Lenni-Lenape subdivision of that nation. But little is known of their language or customs. They lived mainly on fish and shell-fish, and by hunting. The island Indians in their pristine character are long extinct. A few individuals remain, who show some traces of aboriginal blood. About 100, called Shinnecocks, occupy a reservation on Shinnecock Neck about 2 miles from Southampton, and the State supports a school among them. In the vicinity of Forge are also a few families descended from the Poosepatuck Indians, a sub-tribe of the Patchogues. There are some evidences in remains discovered near Aquebogue that another and different race had occupied the island earlier.

The first purchase of land on the island was of 930 acres in the southern part of Brooklyn in 1636 by Jacques Bentyn and Adrianse Bennet, the latter of whom erected the first house known to have been built. The first female child born in Suffolk County was Elizabeth, daughter of Lyon Gardiner, on Gardiner's island, Sept. 14, 1641. Many of the farms at the east end keep their original boundaries and the greater part of Queens and Suffolk Counties remain in the possession of descendants of the early settlers.

The battle of Long Island was fought over the ground now occupied by Brooklyn Aug. 26, 27, and 28, 1776, and the island suffered greatly by incursions from the mainland, from British vessels, and by its occupation by foreign troops. In the war of 1812 preparations were made in anticipation of an attack on New York, and in the civil war Long Island did her full duty. Revised by GERRIT SMITH.

Long Island, or **Outer Hebrides**: a name given to a group of the Hebrides, Scotland, embracing Lewis, Harris, North and South Uist, Benbecula, Barra, and a number of small islands, all of which are supposed to have been formerly united. Length, about 130 miles.

Long Island City: city (incorporated in 1870), now a part of the borough of Queens, New York city, on the East river, and the Long Island and the N. Y. and Rockaway Beach railways. It is opposite that part of New York

city which extends from Thirty-second Street to Mott Haven, Blackwell's island lying between; is separated from the city of Brooklyn by Newtown creek; has a water-front of over 10 miles and an area of about 8 sq. miles, and comprises the former villages of Hunter's Point, Ravenswood, Dutch Kills, Blissville, and Astoria. The census returns of 1890 showed that 313 manufacturing establishments (representing 49 industries) reported. These had a combined capital of $6,871,629; employed 3,344 persons; paid $2,313,889 for wages and $3,233,296 for materials; and had products valued at $7,694,369. The principal industries are oil-refining, terra-cotta work, and the manufacture of pianos, carpets and rugs, asphalt, and chemicals. The city has water-works, gas and electric light plants, 3 hospitals, a children's home, 13 public schools, with an enrollment of 6,000 pupils, 10 principals, and 126 teachers; 3 parochial schools, and a daily and 6 weekly newspapers. The annual revenue and expenditure are about $570,000; annual expenditure for educational purposes, $120,000; property valuation, $60,000,000; and bonded indebtedness, $1,600,000. Both Jamaica (*q. v.*) and Long Island City claim to be the capital of Queens County. In 1894 Jamaica had the offices of county clerk and the surrogate, while Long Island City had the court-house and jail, and the offices of sheriff and district attorney. Pop. (1880) 17,129; (1890) 30,506.

Horatio S. Sanford.

Long Island Sound: an arm of the Atlantic Ocean between Long Island and the State of Connecticut, 115 miles long and generally 20 or 25 miles wide. A chain of small islands extends N. E. from Long Island across the Sound to the S. W. of Rhode Island. The Sound is an important thoroughfare for steamers and coasting vessels, and when the channel of the East river at Hell Gate has been sufficiently improved the largest ships will be able to reach New York harbor through the Sound, thus saving many hours' travel, and in heavy weather some danger. It has important fisheries.

Longitude, Terrestrial [liter., length of the earth, from Lat. *longitu'do*, length, deriv. of *lon'gus*, long, and *terres'tris*, pertaining to the earth, deriv. of *ter'ra*, earth]: The longitude of a point on the earth is the angle between the meridian plane through that point and the meridian plane through some other point, taken for the origin of longitudes. This angle is measured by the part of the equator intercepted by the meridians, and may be expressed in angular measure or in time, as we suppose the equator divided into 360° or into twenty-four hours. The origin oftenest used by English-speaking peoples is the Greenwich Observatory. Any plane through the earth's polar axis cuts out of the celestial vault (supposed spherical and very distant) an hour-circle. If it passes through a point on the earth's surface, it is the meridian plane of that point, and cuts the earth's surface and the celestial vault in the terrestrial and celestial meridians. The latter, moving with the earth's rotation, sweeps from W. to E. over the heavens every twenty-four hours. The angle included at any instant between the plane of the meridian at a place and the plane of an hour-circle through any point of the heavens is the hour-angle of that point. If the point be the vernal equinox, its hour-angle measured toward the W. expressed in time at any place at a given instant is the local sidereal time; while if the point were one called the mean sun (which starts from the vernal equinox with the true sun, and moves in the equator with his mean motion), its hour-angle is the local mean solar time.

From these definitions it follows that at any instant the difference of local times at two places is their difference of longitudes, since each difference is the angle between the meridian planes of the two places. The problem of terrestrial longitudes is then to find at any instant of absolute time the difference of the local times of two places. It requires, first, the determination of the local time at each place; second, the comparison of those local times at some instant.

There are many methods of determining local time, but, as they will be considered elsewhere, only the one which is theoretically simplest will be mentioned here. As already indicated, it is 0h. 0m. 0s. sidereal time when the vernal equinox crosses the meridian, and a clock so adjusted as to mark 0h. 0m. 0s. at that instant, and to count twenty-four hours between two such crossings, is a sidereal clock. Such a clock will at any instant give the hour-angle of the vernal equinox Now, the angle between an hour-circle through any point in the heavens and the hour-circle through the vernal equinox counted eastward from the equinox is called the right ascension of the point. Hence, if the sidereal clock is perfectly correct, when a star crosses the meridian the clock-time will be its right ascension, since the latter is then equal to the hour-angle of the vernal equinox. *The Nautical Almanac* gives for every tenth day in the year the right ascensions of a number of stars. If the instant by the sidereal clock at which one of these stars crosses the meridian be noted, the difference between that time and the star's tabular right ascension is the error of the clock.

The local time or error of a clock being found at each station, the problem proper of terrestrial longitudes reduces itself to that of finding the difference between the clocks.

A. If observers at different places note by their clocks the occurrence of some instantaneous phenomenon visible at the same instant to both, the difference of the clock-times corrected for clock-errors is the difference of longitude. (*a*) Thus two observers many miles apart may determine with precision by star transits the errors of their timepieces, and then observe repeatedly at night the instant some powder is flashed on a hill visible to both. From many flashes the difference of longitude can be obtained with great accuracy. In the work of the U. S. Lake Survey flashes made with a pound of powder have been observed for longitude at a distance of 100 miles. (*b*) When in a lunar eclipse the moon passes into the earth's conical shadow and again emerges, the phenomena are seen at the same time by all persons to whom they are visible. Unfortunately, it is difficult to fix the instant when the moon enters or leaves the shadow, as the earth's shadow is not sharply defined on the moon, and the errors in estimating the time may amount to a minute. The eclipses of Jupiter's satellites are seen by all observers at the same instant, and that of the first, which has a rapid motion, is best fitted for precise observation; but the gradual disappearance of the satellite makes it difficult to observe the time of disappearance with precision. That time varies with the power of the telescope used. The Washington times of immersion and emersion are given in *The American Nautical Almanac*. Shooting stars have also been proposed as signals to be observed for difference of longitude.

B. There are several methods of determining differences of longitude, depending on the fact that the moon has a relatively rapid motion among the stars. If observers at two points determine some co-ordinate of the moon's position as seen from the center of the earth, and also their local times, the change in this co-ordinate in passing from one meridian to the other is determined; and from this change and the known rate of change the time required for so much change can be computed. This time is the difference of longitude. It may be said here that while two observers are constantly spoken of, in practice one observer, supposed to be stationed at a fixed observatory, is replaced by a nautical almanac, giving the results he should obtain in all cases save those in which the highest accuracy is required. (*a*) If at two places observers note the sidereal time of the moon's transit, thus determining the moon's right ascension at those transits, then from the difference of the right ascensions and the moon's known rate of change in right ascension the time required for so much change, which is the difference of longitude, can at once be found. This is the method of moon culminations. The moon's average change of right ascension is about one second of time in twenty-seven seconds, so that an error of 0·1s. in its observed right ascension would give 2·7s. error in the resulting longitude. Instead of determining the moon's right ascension by meridian transits, it may be obtained from transits across a near vertical circle, or by observing its altitude or azimuth. (*b*) Another method is that of lunar distances. *The Nautical Almanac* gives for every three hours Greenwich time the distance of the moon from several fixed stars, some of the planets, or the sun as seen from the earth's center. If an observer at any point measures one of these angular distances with a sextant, and also the altitudes of the two bodies, he can compute their distance at the moment of observation as seen from the center of the earth. Should this corrected distance agree with one in *The Nautical Almanac*, the corresponding time in the *Almanac* is the Greenwich time of his observation, and the difference of that time from his local time is the longitude. Should his observed distance fall between two tabular distances, he can find the corresponding Greenwich time by interpolation.

C. If at any place on the earth whose position is approximately known the phases of a solar eclipse be observed, the corresponding time at a known meridian can be computed, thus giving the difference of longitude. The same is true of occultations of stars by the moon. The data for both are given in *The Nautical Almanac*. Occultations of Jupiter's satellites by the planet, their transits across his disk, and the transits of their shadows are similar phenomena, and may be used in determining longitudes.

D. Another method of determining differences of longitude is that by transportation of chronometers. If a perfect timekeeper were compared with the true time at Greenwich, and then taken to any other part of the world, from its error and rate at Greenwich before starting the true Greenwich time at any instant could be computed, and its difference from the local time of the traveler's position would be the difference of longitude. So important is this method to sailors that the English Parliament gave £20,000 to Harrison, who first made chronometers with a tolerably steady rate; but as no rate is perfectly constant, and as a traveling rate usually differs from the rate when at rest, when the greatest accuracy is required the chronometer is carried back to the starting-point, so that its traveling rate becomes known. By using many chronometers and making many trips accuracy can be obtained if the distance is not too great. Struve found the difference of longitude of Pulkova and Altona to be 1h. 21m. 32·52s., with a probable error of only 0·04s. by seventeen trips of 81 chronometers. Bond determined (1849) the difference of longitude of Liverpool and Cambridge, Mass., from 175 chronometers, and again (1855) from 52. The results differed by 1·23s.

E. Of all methods of determining differences of longitude, that by telegraphic signals, especially over long lines, is the most precise. The following is the simplest form of the method. If the local time of pressing on the key at the first station and of the click at the second station (supposed to be produced instantly) be observed, the difference of those local times is the difference of longitude. It takes a few thousandths of a second for the signal to travel to a distant station, and a few thousandths of a second to make the click, so that if the second station is W. of the first the resulting difference of longitude is too small by these small quantities; but if, retaining the same adjustments and equal battery strength, signals be sent from W. to E., the resulting longitude will be as much too large, and the mean of the two values will be correct. This simple method, requiring, first, the precise determination of local times, second, their comparison (which should be repeated several times) by the telegraph line, gives a higher precision over long lines than any of the preceding. Still higher precision is reached by causing the timepiece to make or break the circuit at each beat, instead of requiring the observer's finger to do it. The method becomes perfect when in addition each timepiece is made to write its own record of time on a chronograph, thus avoiding the necessity of noting signals received by the ear. By the telegraphic method differences of longitude can be determined so precisely that their probable errors do not exceed a few hundredths of a second.

To show the errors which may still remain in longitudes determined from many observations and with great care by other methods than the telegraphic one, the following values of the longitude of the Naval Observatory, Washington, are given. The telegraphic value is undoubtedly very nearly correct, having been obtained by the Coast Survey by three routes, whose results agree closely:

Longitude of Washington.

Telegraphic		5h. 08m. 12·09s.
Moon culminations	1846–60,	5h. 08m. 11·6s.
" "	1862–63,	5h. 08m. 9·8s.
Bond, 175 chronometers	1849,	5h. 08m. 12·26s.
" 52 "	1855,	5h. 08m. 13·49s.
Occultations of Pleiades,	1856–61,	5h. 08m. 13·13s.

Revised by S. Newcomb.

Longmont: town (laid out 1871); Boulder co., Col. (for location of county, see map of Colorado, ref. 2–E); on the St. Vrain river, and the Burl. and the Union Pac. railways; 35 miles N. of Denver. It is in an agricultural region; manufactures flour and canned goods; and has 6 churches, 2 public school buildings, an academy, water-works, electric lights, public library and free reading-room, 2 national banks with combined capital of $110,000, a private bank, and 3 weekly newspapers. Pop. (1880) 773; (1890) 1,543; (1900) 2,201. Editor of "Ledger."

Longobards: See Lombards.

Long Parliament: the name given to the fifth Parliament of Charles I.'s reign in England, summoned Nov. 3, 1640, and continued throughout the period of the Civil War. The so-called Short Parliament had been dissolved after a three weeks' session, and Charles's attempt during the next few months to govern without a parliament had failed on account of the war with the Scots. The body that met in November began at once to remove the accumulated abuses of the king's personal government, abolishing the Court of High Commission, the Star Chamber, and the Council of the North, checking the illegal exactions of the court, and impeaching Strafford, who was finally brought to the block by a bill of attainder. Starting out with legitimate reforms, it soon became in effect a revolutionary body, while, on the other hand, tyranny and duplicity continued to mark the course of the king, who at length by his violation of privilege in the attempted seizure of the five members in Jan., 1642, made war inevitable. With the defeat of the king power passed into the hands of the army, which by the lawless act known as "Pride's Purge" cleared the Parliament of all members displeasing to the military. The remnant, called in derision the "Rump" Parliament, organized the High Court of Justice, which condemned the king. It remained in session till turned out by Cromwell, Apr. 20, 1653. As the only body in the state having anything like legal authority after the death of Cromwell, it reassembled, issued writs for a new election, and dissolved itself Mar. 16, 1660, after an existence of nearly twenty years. F. M. Colby.

Longstreet, Augustus Baldwin: lawyer, clergyman, educator, and author; b. in Augusta, Ga., Sept. 22, 1790; graduated at Yale College in 1813. He studied law at Litchfield, Conn., and was admitted to the bar in Georgia in 1815. He was in 1821 elected to the General Assembly of the State, and promoted to the bench in the Ocmulgee judicial circuit in 1822, a position which he soon resigned, removing to Augusta; continued the practice of the law and established the Augusta *Sentinel*, consolidated in 1838 with the Augusta *Chronicle*. In 1838 he entered the Methodist Episcopal ministry, and in 1839 was elected to the presidency of Emory College at Oxford, Ga., which position he filled with great ability until 1848, when he accepted a similar post in Centenary College, La., and shortly afterward in Mississippi University at Oxford, Miss. He became president of the South Carolina College in 1857, and just before the war returned to the presidency of the University of Mississippi. The best known of Judge Longstreet's writings was his *Georgia Scenes* (1840), a series of humorous sketches which gained a wide popularity. D. at Oxford, Miss., Sept., 9, 1870. Revised by H. A. Beers.

Longstreet, James: general; b. in Edgefield district, S. C., Jan. 8, 1821; removed at an early age with his parents to Alabama, from which State he was appointed to the U. S. Military Academy in 1838; graduated in 1842, entering the army as lieutenant of infantry; served in the war with Mexico; in 1847–52 was on frontier duty in Texas; in 1858 was transferred to the staff as paymaster, with the rank of major. In June, 1861, Longstreet resigned to enter the Confederate army, and commanded a brigade at Bull Run the following month. Promoted to be major-general in 1862, he thereafter bore a conspicuous part and rendered valuable service to the Confederate cause. In command of the rear guard of the army falling back from Yorktown, he had passed through Williamsburg May 5, 1862, when he was called back to oppose the hastily advancing Union forces, a battle lasting nearly nine hours resulting, thus allowing the escape of the main army to Richmond, himself following rapidly under cover of night. At Seven Pines he directed the main attack, and in the subsequent fighting at Gaines's Mill, Frazier's Farm, Malvern Hill, etc., his division fought bravely, losing nearly one-half its numbers in killed and wounded. At the second battle of Bull Run he skillfully made the passage of the Thoroughfare Gap, and on the second day held the right of the line and contributed largely to the success of the day. At Antietam he commanded the right wing, and at Fredericksburg the left wing and center, where the assault was so fatal to the Federal army. After the latter battle he was temporarily detached with three divisions of his corps to operate below the James, and in April attacked Gen. Peck at Suffolk, Va., which place he invested until recalled by Gen. Lee after the battle of Chancellorsville. In the organization of the army with which it was designed to invade the North, Longstreet was

assigned to the command of one of its three corps, with the rank of lieutenant-general, and in the ensuing battle of Gettysburg commanded the right of the line during the second and third days of the fight. The importance of impending operations in the West caused Lee, who felt seeure against attaek, to detaeh Longstreet again, and on this occasion the change was timely and precious. for he arrived with his corps in time to decide the fortunes of the day at Chiekamauga. The following month Bragg assigned Longstreet to lead a movement against Burnside in East Tennessee, and in November he compelled that officer to seek the intrenchments of Knoxville with his army, which place Longstreet beleaguered, but was compelled to abandon the siege upon Grant's victory at Chattanooga, and hastily moved eastward to Virginia, where he rejoined the army of Gen. Lee. In the ensuing campaign he was severely wounded by his own troops in the Wilderness battle (May 6), and disabled for months. Returning to duty in Oetober, he commanded the defenses of Riehmond N. of the James, and was partially engaged in the action around Petersburg the day of evacuation. The war ended, Gen. Longstreet aeeepted the result, and, having renewed his allegiance to the general Government, labored earnestly to promote an era of good feeling between all seetions of the country. Taking up his residence in New Orleans, he was appointed (in 1869) surveyor of the port, resigned in 1871; was appointed commissioner of engineers for Louisiana, and served four years. In 1875 he settled in Georgia, where he became inspeetor of internal revenue; was U. S. minister to Turkey 1880–81, and U. S. marshal of Georgia 1881–84.

Longstreet, William: inventor; b. in New Jersey in 1760; in early life moved to Augusta, Ga. As early as Sept. 26, 1790, he addressed a letter to Thomas Telfair, Governor of Georgia, stating that his plan of applying steam to vessels was completed, and expressing his "thorough confidence in its suecess" if he had means to perfeet it. These he asked of the Governor or the Legislature, to which the matter was submitted. No action, however, was taken. This was three years before Fulton's letter to the Earl of Stanhope announeing his ideas "respecting the moving of ships by the means of steam." Longstreet's plan was very different from Fulton's. Failing to obtain public aid at the time, several years afterward he proeured funds from private sources which enabled him in 1807 to put his boat in operation on the Savannah river, and it moved against the current of the stream at the rate of 5 miles an hour a few days after Fulton's like sueeess on the Hudson. He also invented and patented the "breast roller" of cotton-gins, whieh was of very great value to the growers of the long staple or sea-island cotton. D. in Georgia in 1814.

Longueuil, lōn′gŏl′: a town of Chambly co., Quebec, Canada; on the right bank of the St. Lawrence, 4 miles below and opposite Montreal (see map of Quebec, ref. 5–B). It contains many summer villas of the residents of Montreal. Permanent population 4,000, mostly French-Canadians.

Longueville, lōn′gvĕl′, Anne Geneviève de Bourbon-Condé, Duchess of: one of the leaders of the Fronde in France; b. at Vineennes, 1619, and married the Duc de Longueville 1642. Her beauty and charm of manner won her many admirers; but her favorite was the Duc de la Rochefoucauld, the author of the *Maximes*, whose influenee drew her into the political strife of the time. Sharing in the hatred of Mazarin, she sided with the Parliament, and during the insurrection in Paris held the Hôtel de Ville, whence she aided the movement by her direction and advice. She consented to the peace with Mazarin, but on the imprisonment of her husband and brother, fled to Stenay, induced Turenne to turn traitor to the court, and forced the Government to release the prisoners. After a brief interval of apparent reconciliation, she was again in revolt, aiding aetively in the defense of Bordeaux, but her party was hopelessly divided in its counsels and was soon overthrown. After peace was made in 1659 she eeased to meddle in polities, and became a religious devotee, spending much of her time at the cloister of Port Royal des Champs. Strongly sympathizing with Jansenism herself, she saved this institution from perseeution by the orthodox Church. Her last years, saddened by the death of her son, were passed at the convent of the Carmelites, where she died Apr. 15, 1679. See Cousin, *Madame de Longueville* (Paris, 1859). F. M. Colby.

Longus (in Gr. Λόγγος): author of the Greek pastoral romance *The Story of Daphnis and Chloë* in four books, one of the most popular among the productions of the *scriptores erotici Græci*. His time is uneertain except that he must have belonged to the pagan world; his very name has been disputed, and his home can only be divined from his familiarity with the island of Lesbos, which is the scene of his romance. Longus is the last of the bucolic poets, for he is essentially a poet in spite of the prose form, and his pictures of pastoral life, in the Freneh translation of Amyot (*q. v.*), are largely responsible for the revival of that species of literature in modern times. Unfortunately, the idyllic sweetness of his narrative is a manufactured sweetness, and the simplicity of his style is a manufactured simplicity. The trail of the sophist is over it all, and the enjoyment of his pastoral scenes is marred by passages of unmitigated sensuality.

Editions.—Villoison, with a rich eommentary (1778); Courier, a famous edition (1810); Seiler, *cum notis variorum* (1843); Hercher, in the first volume of the *Erotici Scriptores Græci* (Teubner Library). There is an English translation by Rev. Rowland Smith (*The Greek Romances*) in the Bohn Library. See Rohde, *Der griechische Roman*, p. 502 fol. B. L. Gildersleeve.

Longview: town (incorporated in 1871); capital of Gregg co., Tex. (for location of county, see map of Texas, ref. 2–J); on Sabine river and the Int. and Gt. N., the Tex. and Pac., and the Tex., Sab. Val. and N. W. railways; 60 miles W. of Sabine. It is in a cotton and lumbering region, has numerous sawmills in its vicinity, and has beeome an important shipping-point. Pop. (1880) 1,525; (1890) 2,034; (1900) 3,591.

Lönn′rot, Elias: Finnish scholar; b. at Sammatti, in Nyland, Apr. 9, 1802; d. there Mar. 19, 1884. Apprentieed first to a tailor, then to a druggist, in 1822 he began the study of philology and natural scienee at the University of Åbo. In 1827 he took up the study of medicine at the University of Helsingfors, and in 1832 he obtained a doetor's degree. In 1833 he began to practiee as a physieian at Kajana. He had already, however, become deeply interested in the language and popular poetry of his native land, and had published his *Kantele, etc.* (The Lyre, or Runes and Songs, Ancient and Modern, of the Finnish People, 4 parts, Helsingfors, 1829–31). The passion for eolleeting these songs constantly grew upon him, and he traveled extensively on foot throughout Finland, writing down whatever he could get the popular poets (*runojat*) to recite to him. The most important result of these labors was the Finnish epic, the Kalevala (*q. v.*). In the composition of this out of the great mass of Finnish popular songs, Lönnrot was inspired first by the similar attempt of von Bekker; then by the example of the runoja, Vassili, whom he heard at Vuonninen (Russian Cavelia) in 1833; and finally by the theories in regard to epie poetry then generally aeeepted on the authority of Wolf and Laehmann. The first version of the *Kalevala* was submitted to the Society of Finnish Literature, and published by it in 1835. Subsequently Lönnrot made use of extensive further colleetions of his own and of others, and in 1849 brought out the second and final edition of the poem, containing fifty runes and 22,800 verses. In the meantime he had published several other collections of popular verse. From 1836 to 1840 he edited a little periodical, *Mehiläinen* (The Bee), devoted to sueh matters. In 1840 he issued his *Kanteletar, etc.* (Lyric Art), eontaining a large number of lyric and epic-lyrie songs (3d ed. 1887; Germ. trans. of the most interesting songs by H. Paul, *Kanteletar, die Folkslyrik der Finnen ins Deutsche übertragen*, Helsingfors, 1882). In 1842 appeared *Suomen Kansan sananlaskuja* (Proverbs of the Finnish People), containing over 7,000 proverbs. In 1844 was printed *Suomen Kansan arwoituksia, etc.* (Riddles of the Finnish People; 2d enlarged ed., with 2,224 riddles, 1851). In 1853 he was appointed Professor of the Finnish Language and Literature at Helsingfors, but gave up the place in 1862 and devoted himself to studies and the preparation of his great *Finskt-Svenskt Lexikon* (Finnish-Swedish Dictionary, 2 vols., 1874–80; suppl. 1886). In 1880 he issued his important collection of Finnish magic songs, *Suomen Kansan loitsurunoja*. (See English trans. of many of these by Abercromby, in *Folk-lore*, i., 1890.) For Lönnrot's biography, see A. Ahlquist, *Elias Lönnrot biografiskt uttkast* (Helsingfors, 1884). A. R. Marsh.

Lons-le-Saulnier, lōn′le-sō′ni-ā′: town; in the department of Jura, France; beautifully situated among vine-clad hills at the confluence of the Seille, Vallière, and Solman (see map of France, ref. 5–H). Its famous salt-works have been converted into mineral baths. An important industry is the manufacture of sparkling wines. The town was the

birthplace of Rouget de Lisle, the composer of the *Marseillaise*. Pop. (1896) 12,116.

Lonyay, lawn′yī, Meinhard, Count: statesman; b. in Hungary, Jan. 6, 1822; descended from an old Magyar family; was elected a member of the Diet in 1843, and afterward appointed a secretary in the Ministry of Finance; fled in 1849 when the Hungarian rebellion was put down, and lived in London and Paris; returned in 1850 in consequence of a general amnesty, and devoted himself to questions of political economy and the relations of the Church to the schools in Hungary. He was one of the most prominent members of the Diet of 1865; was very active in 1866 and 1867 for the settlement between Hungary and Austria accomplished by Beust, and accepted the Ministry of Finance in the Hungarian cabinet which Andrássy formed in 1867. He was very successful in his financial policy, but disagreeing with Andrássy, retired in May, 1870, and entered then the imperial cabinet as Minister of Finance. When Andrássy became president of the imperial cabinet instead of Beust (Nov. 16, 1871), Lonyay was appointed president of the Hungarian cabinet, but (Nov. 18, 1872) he was accused by his adversaries in the lower house, especially by Deputy Csernatony, of having misused his official position for personal purposes, in consequence of which he resigned Dec. 2, 1872. He published *Recent Works on Political Economy* (1863); *Survey of the Finances of Hungary* (1873); *The Banking Question* (1875); a collection of his speeches, etc. D. Nov. 3, 1884.

Loochoo Islands: known to the Japanese as Riu-Kiu, and pronounced Doochoo by the natives; a chain of small islands, of coral formation, lying between 127° and 130° E. lon. and 26° 30′ N. lat. They form the Okinawa-Ken of Japan, and consist of four groups—the Linshoten islands, ten in number (frequently considered as an independent group); the Northern Loochoo, nine islands; the middle Loochoo, twenty-five islands; and the Southern Loochoo, fifteen islands, separated from the foregoing by a broad strait and situated near Northern Formosa; total area about 940 sq. miles. The climate is singularly mild and equable, though typhoons are frequent; the soil so fertile as to produce two crops of rice yearly. In the twelfth century Japan, according to its annals, had a Loochooan ruler, Shunten, son of a famous Japanese archer. The Loochooans owed a nominal subjection to the Princes of Satsuma, and sent presents to the Shogun of Japan; but at the same time paid tribute to the Chinese court, and received investiture for their rulers at Peking. When Japan in 1868 was restored to a centralized imperialism, her rights to the islands became a burning question. In 1879 the king was brought captive to Tokio, and the islands were thereafter organized into the Japanese prefecture of Okinawa, an action which threatened to prove a *casus belli* between China and Japan. The inhabitants, akin in race to the Japanese, wear their hair in a top-knot, fastened by a pin with a star-shaped head, distinctive of their rank. Dr. Guillemard characterized them as "a short race, better proportioned than the Japanese, with, as a rule, extremely well-developed chests. The face is less flattened, the eyes are more deeply set, the nose is more prominent in its origin. The forehead is high, the cheek bones are somewhat less marked than the Japanese; the eyebrows are arched and thiek." In character they are extremely gentle, and in manners particularly courteous, so as to have earned for their country the name of "The Land of Propriety." They have long excluded foreigners. The people are Buddhists in religion. Their mode of burial is peculiar, the massive white funeral vaults scattered everywhere being the feature of the islands. Here the dead are allowed to repose two years, when they are taken out and the bones washed by the nearest of kin, who deposits them in earthenware urns. The urns are ranged round the interior of the vault on shelves. The marriage customs also are peculiar. Looehooan ladies keep themselves in the strictest privacy; women of the lower classes, however, go about freely and transact business. Pigs are extensively reared, and pork is a favorite article of diet. The islands are infested with deadly snakes of the genus *Trimeresurus*. The language is allied to Japanese closely enough to allow of the Japanese syllabary being employed. Okinawa, the largest island, has a population of 125,000. It contains the capital, Shuri, to which a road 3 miles long leads from Nafa, its port. The total population of the islands, 373,146, shows an excess of 288 females, while the returns for the whole Japanese empire show an excess of males. J. M. Dixon.

Loofs, (Armin) Friedrich: See the Appendix.

Loom [M. Eng. *lome* < O. Eng. *gelōma*, tool, implement, instrument]: a machine for weaving textile fabrics. The two sets of threads or fibers of which a fabric may be composed are known as warp and filling; the set running throughout the length is the warp, and those threads extending from side to side, and interlacing with it, the filling, or weft. The interlacing of these two sets of threads is called Weaving (*q. v.*). This art is so ancient that its beginning can not be traced.

To Dr. Edmund Cartwright, of Manchester, England, belongs the merit and honor of originating and producing the first practical power-loom, from which the present looms have developed. This invention, the patents for which were issued Apr. 4, 1785, and Nov. 13, 1788, has proved one of the greatest in textile manufacture. Cartwright recognized that there were "three movements which were to follow each other in succession," and he arranged his power-loom to produce these movements in proper order and time.

Three Movements.—The first separates the threads of the warp longitudinally into two sets, leaving a space through which to pass the weft; the second passes this filling through that space; the third presses the thread of filling up against the one preceding it.

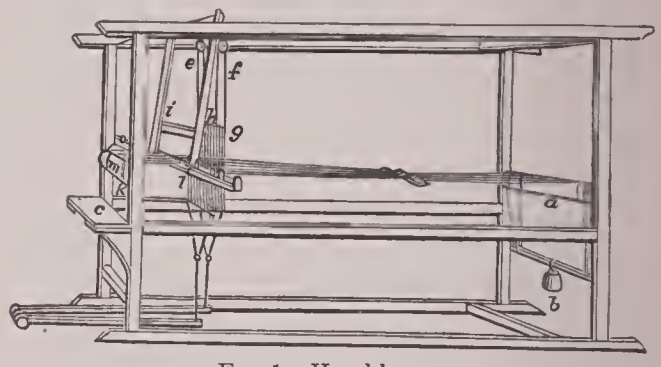

Fig. 1.—Hand-loom.

Plain Loom.—The plain loom is built for producing the simplest fabrics, and is capable of but two movements for the warp-threads; it may be for weaving with but one color of filling, or for as many as six colors. Fig. 1 gives a representation of a hand-loom for plain weaving. Fig. 2 is the

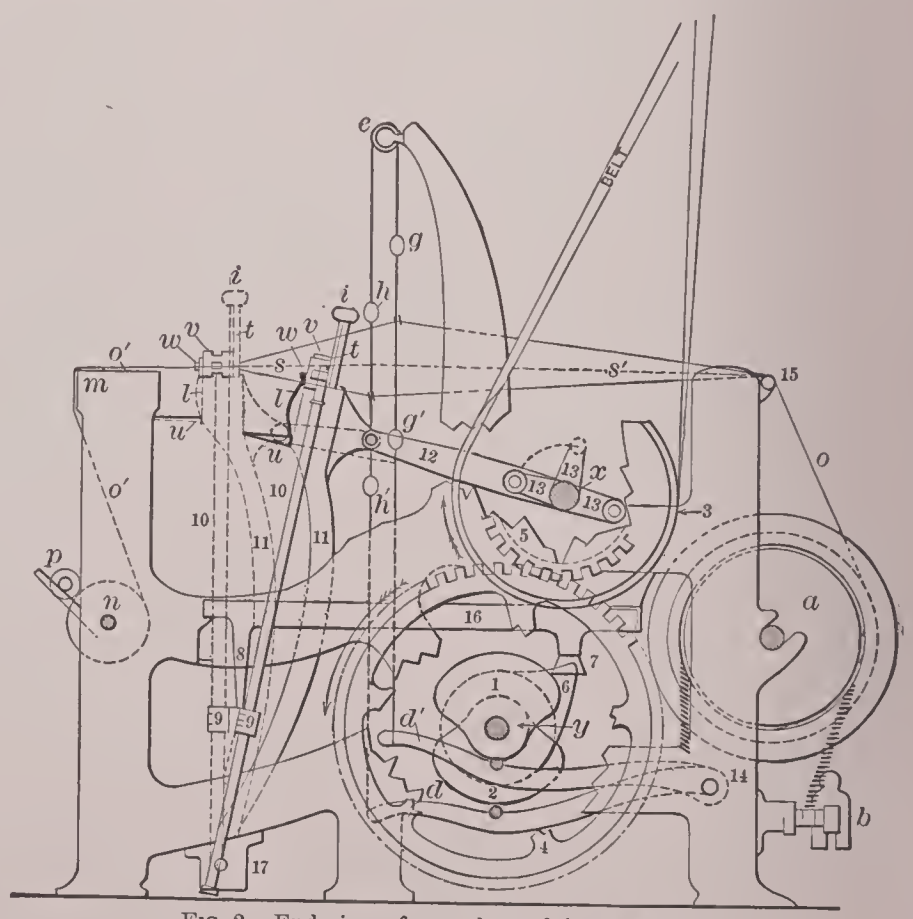

Fig. 2.—End view of a modern plain power-loom.

end view of a modern plain power-loom. A comparison of the two designs will show similarity in the essential movements.

Construction and Operation.—The plain power-loom is usually built with two parallel horizontal shafts extending across the loom-frame from end to end, one above, *x*, and a little back of the other, *y*. The upper shaft is in most cases the driving-shaft, and has a pulley, 3, at one end. This shaft is geared, 4–5, to the lower shaft in such a manner that two revolutions of the former must be made to one of the latter. The threads of the warp *o* are arranged, wound upon the warp-beam *a*, and passed through the eyes of the harness *h h' g g'*, also through the reed *t*, before coming to the loom. Each harness, after the warp has been placed in the loom, is fastened to certain straps which pass over an elevated roller, *e*; also connected with one of two levers below, *d d'*; these levers are each in contact with revolving cams, 1, 2, so placed on the lower shaft that, as the shaft revolves, one cam depresses the lever in contact with it, and the lever in contact with the other is allowed to rise. These cams, as aforesaid, being connected directly with the loom-harness, and indirectly with each other by the straps passing over the top roller *e*, cause the harness which they control to work simultaneously and in the same direction with them. The threads of the warp, being some on one harness and some on the other, usually alternating, are separated as the harnesses are brought into different relative positions, and a space formed between the two sets of warp-threads; this space, *s*, is called the shed, and is produced by the first of the three recognized movements. Through this shed the shuttle containing the weft is passed, leaving a strand of the weft in its path, and the second movement is complete. In most power-looms the shuttle is thrown across the loom, through the shed, on the shuttle-race, from a shuttle-box at one end to one at the opposite end by a lever, 10, hinged at or near the floor, 17, and called a picker-stick. This picker-stick is usually propelled by the quick stroke of a cam, 6, on the lower shaft against the arm, 7, of a short rocker-shaft, 16, placed at right angles to the cam-shaft and in a horizontal plane several inches above it; a second arm, 8, on this rocker-shaft is connected by a short rod and strap, 9, to the picker-stick. The action of the cam on the rocker-shaft throws the picker-stick toward the fabric, and at the same time the shuttle through the shed previously formed.

The third movement, the beating up of the filling-thread, is accomplished by the quick stroke of the lathe, *l*—that part of the loom which holds the reed—which is connected with a crank, 13, on the driving or the upper of the two shafts; as the shaft revolves the lathe receives a reciprocating motion, and, being connected with and movable on a rocker-arm, 17, at the lower part of the loom-frame, swings in a small arc, the chord of which would be twice the length of the crank before mentioned. As the lathe is propelled forward the filling-thread is beaten up against that part of the fabric already produced.

The continued repetition of these three movements is the process of weaving complete.

Hand-loom.—The hand-loom (Fig. 1) in principle is the same as the power-looms, but the harnesses are controlled by the action of the weaver's feet on the treadles; the shuttle is propelled by the hand, and the stroke of the lathe or batten, usually hung from an elevated stand, is also made by hand. Great skill is required with such a machine to produce fine textures, yet some of the most delicate fabrics are manufactured by hand-loom weavers.

Fancy Loom.—Looms which may have more harness capacity than a cam-loom would allow of, used for weaving fancy patterns, are called fancy looms. The cam-loom may be used with a limited number of harnesses—from two to five, and occasionally with more. The fancy loom has often as many as thirty-six harnesses, the twenty to twenty-four harness looms being most in use aside from the plain looms. The looms have a "head-motion," so called, or a "head," which is composed of a revolving shaft over which passes a pattern-chain, so built that each bar of the chain will control the harness for one entrance of the filling; also certain lifting or vibrating bars which raise or lower the harness, the harness being connected to certain pieces of the mechanism which are brought into contact with one or the other of the bars by rolls on the pattern-chain. These rolls may be so placed on the bar of chain that any of the individual harnesses may be raised; wherever no roll is placed on the chain the harness will lower. Thus the chains may be built to raise or lower any of the harnesses and in any order.

Box-motion.—The shuttle-boxes of the power-loom are placed at each end of the lathe, and may be one box at each end, one box at one end with from two to six at the opposite, or with from two to four boxes at each end. For one color of filling one box at each end is used; with several colors, each is placed in a different box, which may be called when needed by the action of rolls placed on a chain similar to the pattern-chain, on certain fingers which in turn engage the mechanism for raising or lowering the boxes.

Jacquard Machine.—This machine is used for such designs as are so extensive that a sufficient number of harnesses could not be placed in the loom to produce the patterns. It is simply a "head," which controls the shed, and may be applied to almost any make of loom. The machine consists of a set of knives, *a*, *a'* (Fig. 3), called a "griffe,"

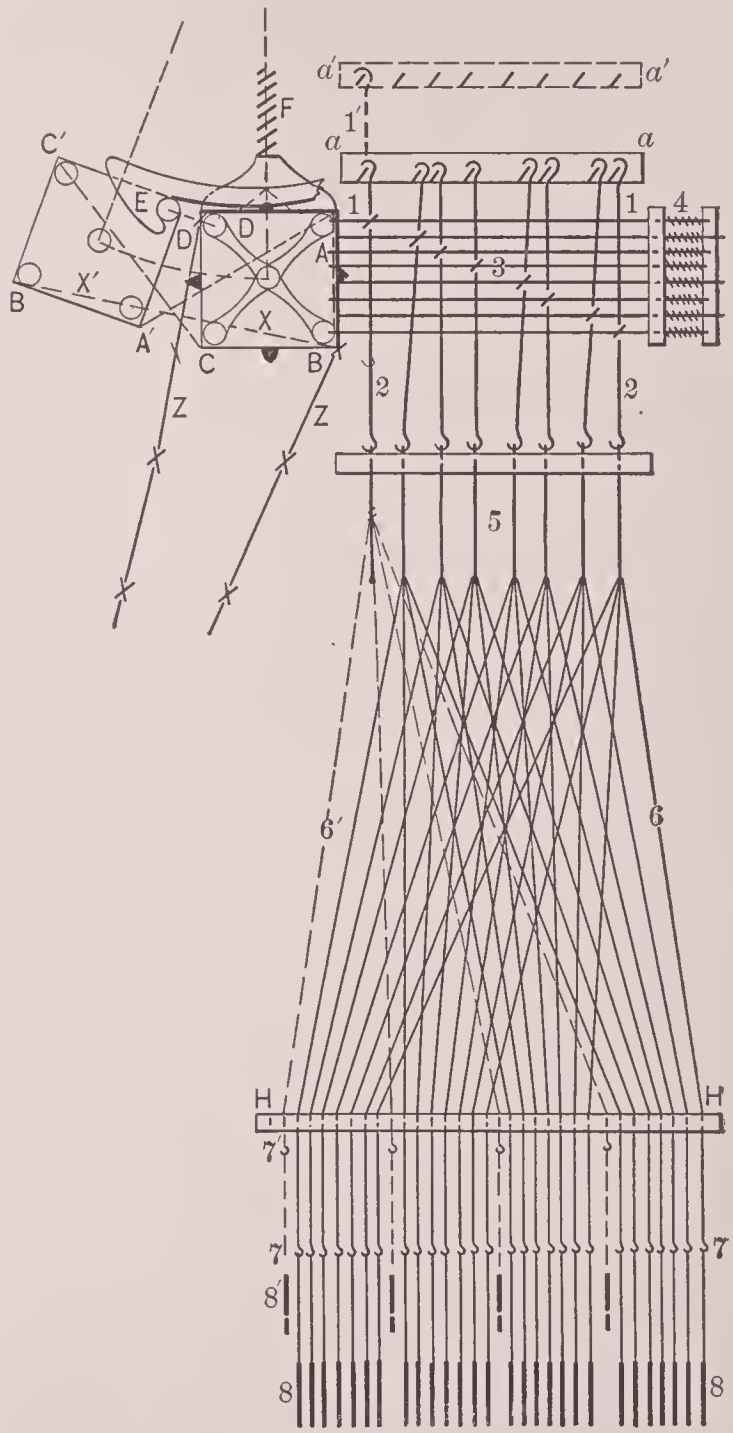

Fig. 3.—Jacquard machine.

capable of being raised and lowered; a set of perpendicular hooks, 1–2, in connection with and governed by a set of horizontal needles, 3, these hooks having attached to them the leash-strings 6, 6', mail 7, 7', and lingo 8, 8'—the mail being the eye through which the warp-thread is passed, the lingo the weight which draws down the leash. The pattern is controlled by a set of pattern-cards, Z, Z, fastened together, which pass over an intermittently revolving, perforated cylinder, X, X. This cylinder swings in a small arc, and presses against the needles, 3. Whenever a hook is to be raised a hole cut in the pattern-card allows the needle to enter the perforation in the cylinder, also the hook 1 to be engaged by the knives as they lift. The card, when no hole is cut, will press against the needle, throwing the hook which it

governs back until the knives lift. The raising of a hook raises also all the leash-strings connected with it, which may be from one to half a dozen. A machine may have from 100 to 1,200 hooks, and each hook may be worked independently of the others.

This machine was originated by Joseph Marie Jacquard, a native of Lyons, France, born in July, 1752. He first came into prominence by perfecting a machine for making fish-nets, for which he received 3,000 francs and a gold medal offered by the Society of Arts, London, and with this came an engagement in the Conservatoire des Arts, Paris. Here he had opportunity to study the inventions for weaving-machinery already made. Bouchon in 1725, Falcon in 1728, and Vaucanson in 1745 had each improved on the looms then in use, but none of their inventions, while in some respects similar to what Jacquard produced, proved practical. "He was an experienced workman, combining the best parts of the machines of his predecessors in the same line, and succeeded as the first person to obtain an arrangement sufficiently practical to be employed." There was great opposition to the introduction of his machine as a labor-saving device, and many of them were broken up. The model from which the others were made was destroyed in the square where his statue has since been erected. It is said that 30,000 Jacquard machines were in operation in his native city at the time of his death, 1834.

Draw-loom.—This was the nearest approach to the Jacquard up to the nineteenth century, but required two persons to attend it. The pattern was governed by a boy, who raised the warp-threads by "drawing" certain strings attached to the various groups of leash-cords. William Cheape patented a mechanical "draw-boy" in 1779, but the loom was superseded by Jacquard's invention.

Loom-harness.—This is usually a skeleton frame, on which are placed wire heddles with eyes at the center for the warp-threads. Cotton-harness, used mostly on the plain or cam looms, consist of two parallel rods on which is a series of cotton heddles. The frame or rods, with the attached heddles, constitute a harness.

Loom-reed.—The reeds are two parallel strips, into which are inserted at right angles thin strips of flattened wire; these are spaced equally, and the reed is numbered according to the number of spaces per inch. The reed not only beats up the filling, but keeps the warp-threads of the various textures at the required number to the inch.

See Ashenhurst, *Weaving and Designing for Textile Fabrics*; Alexander Brown, *Practical Treatise of the Construction of the Power-loom*; Porselt's *Jacquard Machine Analyzed and Explained*; also Patent Office reports.

LOUIS W. CLARK.

Loomis, ALFRED LEBBEUS, M. D., LL. D.: clinician; b. at Bennington, Vt., June 10, 1831; entered Union College, from which he graduated in 1851, and received the degree A. M. in 1856; graduated M. D. from the College of Physicians and Surgeons, New York, in 1852; served two years in hospitals before commencing general practice in New York city; in 1859 was appointed visiting physician to Bellevue Hospital; in 1862 was appointed lecturer on Physical Diagnosis in the College of Physicians and Surgeons; in 1866 was appointed Adjunct Professor of Theory and Practice of Medicine in the University of the City of New York, and was promoted professor in 1868; in 1874 was appointed visiting physician to Mt. Sinai Hospital; was president of New York Academy of Medicine 1889–90 and 1891–92, and president of the congress of American physicians and surgeons 1894; received LL. D. from the University of the City of New York 1886. D. Jan. 23, 1895. He was recognized as one of the foremost clinicians and teachers in the U. S. Among his works are *Lessons in Physical Diagnosis* (New York, 1870); *Lectures on Fevers* (New York, 1877); *A Text-book of Practical Medicine* (New York, 1884); and he edited *An American System of Medicine* (Philadelphia, 1894). S. T. A.

Loomis, ELIAS, LL. D.: astronomer; b. in Tolland co., Conn., Aug. 7, 1811; graduated at Yale College in 1830; was for several years tutor in that institution (1833–36); made important researches in astronomy, magnetism, and meteorology, both in the U. S. and in Paris, where he resided in 1836–37, attending lectures; became Professor of Natural Philosophy in Western Reserve College 1837; was called to the University of the City of New York 1844, and to Yale College 1860. He has made many contributions to the exact sciences, most of which were communicated to the American Philosophical Society and to *The American Journal of Science*. The most important work of his later years was his series of *Meteorological Researches*, published in the last-named journal. He also published mathematical text-books, and a genealogical work, *The Descendants of Joseph Loomis* (1870). D. in New Haven, Aug. 16, 1889.

Loomis, SILAS LAURENCE: See the Appendix.

Loon, or **Great Northern Diver**: popular name of a swimming bird of the family *Urinatoridæ*, found in both hemispheres. Its scientific name is *Urinator imber* or *Eudytes torquatus*. It is a large, solitary bird, 32 inches long, very difficult to shoot. It is a fine diver, perfectly at home in air or water, but by no means so on the land, its feet being set so far back that it can not walk at all, but scrambles along scraping its breast on the ground.

Loos, lōs, CHARLES LOUIS: educator; b. at Woerth-sur-Sauer, in the department of Basse-Alsace, France, Dec. 22, 1823. In 1834 he removed to the U. S. and settled at New Franklin, O., where he studied English, and in 1840–42 taught in the common schools. He became identified with the Disciples of Christ in 1838, and began to preach at the age of seventeen. In 1842 he entered Bethany College where he graduated in 1846. He remained three years after graduation as teacher in the primary department. After serving as pastor at Wellsburg, Va., Somerset, Pa. (where he also conducted an academy and edited *The Disciple* for two years), and at Cincinnati, O., he removed to Eureka, Ill., to take the presidency of the college. In the following year he was elected to the chair of Ancient Languages and Literature in Bethany College. He filled this position until 1880, when he became president of Kentucky University. He was for seven years co-editor of *The Millennial Harbinger*; is a contributor to the leading publications of the Disciples; has been for many years president of the Foreign Christian Missionary Society. J. H. GARRISON.

Loosjes, lōs'yes, ADRIAAN PIETERSZOON: novelist; b. in 1761 on the island of Texel, Holland. He was a bookseller, thoroughly middle class in tastes and sympathies. His reputation as a writer also was mainly of the same kind. He strove to render historical subjects in a way to appeal to the sentiment and patriotism of the average reader. He began with historical sketches in dialogue, or, as he said, dramatic form: *Frank van Borselen en Jacoba van Beijeren* (1790–91); *Charlotte van Bourbon* (1792); *Louise de Coligny* (1803); *Johan de Witt* (1805), etc. Other sketches of a more independent kind appeared in 1804–05 under the title *Zedelijke Verhalen*. He now attempted a longer flight, and adopting the English Richardson as his model wrote in epistolary form his *Historie van Mejufvrouw Susanna Bronkhorst* (6 vols., 1806–07). This was followed in 1808 by his greatest success, *Maurits Lijnslager*, an attempt to reproduce the life of a patriotic Dutch burgher of the seventeenth century in detail. Subsequent novels failed to meet with the favor of this: *Hillegonda Buisman* (1808); *Lotgevallen van den Heere R. J. van Golstein* (1809–10); *Leven van Robbert Hellemans* (1815); *Johan Wonter Blommesteyn* (1816). Loosjes wrote also in his youth love-songs, *Minnezangen* (1783); an epic, *De Ruyter* (1784); and several plays. He died at Haarlem in 1818.

A. R. MARSH.

Lope de Aguirre, lō'pā-de-ăă-gee'rā: an adventurer; b. at Oñate, Asturias, Spain, about 1508. He early went to Panama, and thence to Peru, where he led so scandalous a life that he was known as Aguirre the Madman. It appears that he was once publicly whipped, and that he murdered the official who had punished him. After engaging in several rebellions he was outlawed and, like many other wild characters, he joined the expedition of Pedro de Orsua, which was to search for El Dorado in the region watered by the upper Amazon (1559). Descending the Huallaga in boats they reached the Amazon, where, near the present site of Tabatinga, Orsua was murdered by Aguirre and others (Jan. 1, 1561). Fernando de Guzman was then made general, with Aguirre as his lieutenant; the band declared themselves rebels and pirates, and proceeded down the river, plundering Indian villages, quarreling with each other, and committing every possible crime. Near the mouth of the Rio Negro Aguirre murdered Guzman and made himself chief; he killed many others whom he suspected, or from mere caprice. The course taken after Guzman's death is a matter of dispute, some authors supposing that the band ascended the Negro to the Cassiquiare, and thence descended the Orinoco; but it is more probable that they continued down the Amazon. Finally reaching the island of Margarita, off the coast of Venezuela, Aguirre murdered the gov-

ernor and others and robbed the royal treasury; thence, passing to the mainland, he wrote, from Valencia, a letter to King Philip II., which has been preserved, in which he tells the story of his own crimes and declares himself a rebel until death. The authorities of the coast, in great alarm, gathered a force, which finally encountered him near Barquisimeto; many of his men at once deserted him, and Aguirre, in despair, killed his own daughter "that she might not be called the child of a traitor." He was captured the same day, and shot (Oct. 27, 1561). Aguirre's band was the second company of Spaniards which descended the Amazon, the first having been that commanded by Orellana. See Markham, *Expedition of Pedro de Ursua* (1861); Southey, *The Expedition of Orsua and the Crimes of Aguirre* (1821).

HERBERT H. SMITH.

Lope Felix de Vega Carpio: See VEGA CARPIO, LOPE FELIX, DE.

Lo'pes, or **Lopez**, FERNÃO: historian; b. in Portugal about 1380; was made chief archivist of the kingdom by King Dom João I. in 1434, and devoted his life to the collection and study of materials for the history of his country and the composition of chronicles of several of her kings. Like Froissart, he personally visited the scenes of battles and of other important events, and conferred much with eminent soldiers and statesmen who had participated in the wars and other public affairs of Portugal. He died after 1459. The chronicles of Lopes possess great literary and critical value, and are probably surpassed in merit by no historical works of the century in which they were written. The field of action and the period of time embraced by the narratives of Lopes are narrower than those covered by the immortal work of Froissart; and doubtless this is one of the reasons for the much greater accuracy of Lopes in point of date, detail, and attending circumstances. The style of Lopes is generally less picturesque than that of Froissart, but in some cases—as, for instance, in the description of the battle of Aljubarota, known in Portuguese history as *the* battle, fought in the year 1386—the Portuguese writer has a decided superiority over the French chronicler. Lopes is always animated with a patriotism which much enlivens his annals. The works of Lopes are *Chronica do Senhor Rei Dom Pedro I.*; *Chronica do Senhor Rei Dom Fernando*, both printed in vol. iv. of the *Collecção de Livros Ineditos de Historia Portugueza* (Lisbon, 1816), and the very rare and important *Chronica del Rey Dom João I.* (Lisbon, 1644, 2 parts, folio), with a third part or continuation by Gomes Eannes d'Azurara.

Lopez, CARLOS ANTONIO: president of Paraguay; b. near Asuncion about 1795 (the exact date is apparently unknown). He studied at the schools of Asuncion, and acquired a reputation for learning, especially in law. After the death of Francia (Sept. 20, 1840) an irregular junta seized the government; this was deposed after three months by another junta, of which Lopez was nominally secretary, but really the leading spirit. A congress elected him first consul and Roque Alonzo second consul, Mar. 12, 1841; the latter was a cipher in the administration, and from this time Lopez was practically dictator of Paraguay, though he never took that title; the successive congresses simply obeyed his directions. In Mar., 1844, the congress adopted a constitution which he had written, giving unlimited powers to the executive; it then elected him president for ten years, and he was re-elected for three years in 1854, and for seven years, with the right of naming his successor, in 1857. In the main he continued Francia's policy of isolation, though he permitted a restricted foreign commerce, and allowed a few foreigners to enter the country. Less cruel or more timid than Francia, he generally banished suspected or obnoxious persons instead of imprisoning or executing them; but there was practically no law except his will. Some improvements were initiated, and a short railway was started; but much of the trade of the conntry was kept in his own hands. He greatly strengthened the army, fortified the river Paraguay at Humaitá, and formed a small navy. His ill-treatment of foreigners and insults to envoys and consuls brought about quarrels with Great Britain, France, and the U. S., only the isolated position of Paraguay saving him from punishment. In 1859 the U. S. sent a squadron to the Plata to enforce claims against him. He consented to submit the matter to arbitration, but subsequently evaded it. Lopez declared war on the dictator Rosas of Buenos Ayres, but there was little actual fighting. D. at Asuncion, Sept. 19, 1862.

HERBERT H. SMITH.

Lopez, FRANCISCO SOLANO: eldest son and successor of Carlos Antonio Lopez; b. at Asuncion, July 24, 1827. His early education was almost entirely neglected; but after his father attained power he was successively intrusted with the most important offices. When only nineteen years old he was made commander-in-chief of the Paraguayan army, then engaged against Rosas; and though he saw little actual fighting, he doubtless obtained some ideas of the art of war through association with the Argentine general Paz, in Corrientes. Later (1853–54) he spent eighteen months in Europe as special minister to the courts of London, Paris, and Turin. During this time he purchased large quantities of arms and materials of war, with several steamers, contracted for the building of a railway, and engaged the services of engineers; he even sent a colony of French emigrants to Paraguay, giving them promises which were shamefully broken. At Paris he met Madame Lynch, an Irish adventuress, who followed him to Paraguay as his mistress, and had great influence on his future career. In 1855 he was made Minister of War, a position which greatly stimulated his desire to make Paraguay a military power. On the death of his father (Sept. 19, 1862) he assumed the executive by virtue of a will in which he had been nominated vice-president, this strange power having been granted to the elder Lopez by his subservient congress. Having convoked another congress, Lopez was duly elected by it president for ten years (Oct. 16). Ambition to be a military leader was, from the first, the motive-power of his rule. Large stores of arms and ammunition were secretly imported, and the fortifications which he had built when Minister of War were greatly strengthened. Having thus prepared himself, Lopez took advantage of the Brazilian intervention in the civil war of Uruguay to make his power felt. In Sept., 1864, he summoned Brazil to withdraw her troops from Uruguay; and before an answer to this demand could reach him, he began hostilities by seizing at Asuncion a Brazilian mail and passenger steamer which was ascending the river Paraguay to Matto Grosso. Following this a powerful squadron was sent to Matto Grosso, easily taking Coimbra and Corumbá, where the invasion came as a complete surprise. Another force was sent into the Brazilian province of Rio Grande do Sul, and as this had to pass across Argentine territory, it provoked a vigorous protest from the government at Buenos Ayres. On this Lopez summoned his obedient congress (the members nominated by himself) and caused it to make a formal declaration of war against Brazil and Argentina, receiving at the same time the title of marshal (Mar., 1865). Before this declaration could be known in Buenos Ayres Lopez seized several Argentine vessels, including two men-of-war, and occupied Corrientes (Apr. 14). On May 1 the representatives of Brazil, the Argentine Republic, and Uruguay signed, at Buenos Ayres, a treaty of alliance against Paraguay. The struggle which followed (the war of the Triple Alliance, or simply Paraguayan war) lasted for five years, and was one of the most important in South American history. The Paraguayans who had invaded Rio Grande do Sul were speedily cut off, and 6,000 of them finally surrendered to the Emperor of Brazil at Uruguayana (Sept. 18, 1865). The forces of Lopez were driven from Corrientes, which then became the base of operations of the allies, but the isolated position of Paraguay, surrounded as it is by wide stretches of forest or unsettled land, made its invasion almost impossible except by the rivers, and Lopez had prepared for this by greatly strengthening his fortifications at Humaitá and Curupaity, on the Paraguay, just above its junction with the Paraná. These were the objective points of the allied operations and of a long series of battles, until July, 1868, when they were captured. The Paraguayans then established other lines of defense farther N., which were successively taken after much hard fighting. Beaten at all points Lopez fled into Northern Paraguay; but at the river Aquidaban he was overtaken by a Brazilian force, and in the *mêlée* was killed, with his eldest son (Apr. 1, 1870). Madame Lynch was allowed to retire to Europe. During the war she had acquired, by forced purchase or confiscation, a large amount of property, much of which was never recovered. See Washburn, *History of Paraguay* (2 vols., 1871); Thompson, *The War in Paraguay* (1869); Masterman, *Seven Eventful Years in Paraguay* (1869); Schneider, *Der Krieg der Triple-Allianz* (3 vols., 1872–75); *A guerra da Triplice Alliança* (Portuguese translation of Schneider's work, with notes by J. M. da Silva Paranhos, 1875–76); Burton, *Letters from the Battle-fields of Paraguay* (1871).

HERBERT H. SMITH.

Lopez, Narciso: soldier and filibuster; b. in Venezuela, 1798 or 1799. He fought with the Spanish troops against the patriots of Venezuela, and when that country achieved its independence (1823) went to Spain, where he served with distinction against the Carlists. In 1839 he was made *mariscal de campo* and governor of Valencia; in 1840 he was one of the principal leaders of the *Progresista* party, which then came into power, and he was promoted to the rank of general. The next year he went to Cuba, where, for a time, he held important military offices, but subsequently was neglected by the government, and, undertaking private speculations, became bankrupt. About 1848 he engaged in revolutionary plots, which were discovered, and in 1849 he fled to the U. S. The same year he organized a filibustering expedition, which was stopped by order of President Taylor. In May, 1850, he left New Orleans in the steamer Creole, with 610 men, and made a descent on Cuba, but met with no support, and was speedily forced to retire. A third attempt was made from New Orleans, Aug., 1851, in the steamer Pampero, with 600 men; among these was a nephew of the U. S. Attorney-General, and the Hungarian general Pragay. The expedition resulted disastrously; a large number of the participants were captured, and as the U. S. Government had outlawed them, they were executed by the Cuban authorities; Lopez was shot at Havana, Sept. 1, 1851.

Herbert H. Smith.

Lophi'odon [Mod. Lat.; Gr. λόφιον, dimin. of λόφος, crest + ὀδούς, ὀδόντος, tooth]: a genus of Tertiary mammals, first described by Cuvier from remains occurring in the Eocene of France. These animals were allied to the tapir. They derive their name from the structure of the true molars or grinding teeth, which have their crowns crossed transversely by two crests or ridges of dentine covered with a layer of enamel. The last lower molar has also a small posterior lobe. The premolars are more simple in structure, and compressed, resembling the first premolar of the tapir. The upper molars also resemble those of the tapir, but approach in some respects those of the rhinoceros. The diastema or toothless interval beween the canine and molar teeth was much shorter than in the tapir. Several species of *Lophiodon* have been found in the Eocene of France and Great Britain, but very little is really known of the skull or skeleton. The species of tapiroid mammals formerly referred to this genus from the early Tertiary deposits of the U. S. are now regarded as belonging to other genera.

O. C. Marsh.

Lophi'omys: scientific name of a very rare and remarkable rodent (*Lophiomys imhausi*) from Northeast Africa, the sole member of the family *Lophiomyidæ*. Lophiomys is unique among mammals from the fact that the temporal fossa is roofed over by bony plates, as in the turtles. The thumb is opposable, and the animal climbs well. The general color is blackish brown; the forehead, a streak under each eye, and the tip of the tail are white. The hairs down the center of the back and tail are about 3 inches long, and can be erected into a crest. The animal is about the size of a large North American muskrat. F. A. Lucas.

Lophobran'chii [Mod. Lat., from Gr. λόφος, tuft + βράγχια, gills]: an order of fishes distinguished by the fibrocartilaginous skeleton, the development of the bones of the head, and especially by the presence of but a single large operculum on each side, and by the production of the snout and lower jaw into a tube, at the end of which is the mouth. The name refers to the tuft-like form of the gills, which are contracted to a brush-like form. The order contains the sea-horses, pipe-fishes, and their allies.

Revised by D. S. Jordan.

Lo'quat [Chin., a corruption of Cantonese *lukwat* = Mandarin *luh kiuh*, rush orange]: a handsome fruit-bearing shrub (*Eriobotrya japonica*) of the order *Rosaceæ*, a native of China and Japan, cultivated in parts of the U. S. and other warm temperate regions. Its fruit is very early, has a yellow color, and resembles a very small apple.

Lorain: village; Lorain co., O. (for location of county, see map of Ohio, ref. 2–G); on Lake Erie, at the mouth of the Black river, and on the N. Y., Chi. and St. L., and the Cleve., Lorain and Wheel. railways; 26 miles W. of Cleveland. It has an excellent harbor, is in a natural-gas region, has considerable general trade and manufactures of brass goods, and is an important shipping-point for the coal of Central Ohio. Has 2 daily and 4 weekly newspapers. Pop. (1880) 1,595; (1890) 4,863; (1900) 16,028. Editor of "Times."

Lor'ca (anc. *Eliocroca*, or *Ilorcum*): city; in the province of Murcia, Spain; on the Sangonero—which is here called the Guadalentin—36 miles S. W. of Murcia (see map of Spain, ref. 18–H). It is an old but well-built and prospering place, and has large manufactures of soap, dyestuffs, leather, paper, cloth, and gunpowder. In the vicinity are lead and sulphur mines. Pop. (1887) 58,327.

Lord, John: See the Appendix.

Lord Howe Island: a small isolated island under the supervision of New South Wales; in lat. 31° 30′ S., lon. 159° E., 400 miles E. of the Australian coast. Area, 3 sq. miles. Pop. (1891) 55; in 1859 the population was 300. It is volcanic and very fertile. Its flora and fauna are Australian.

Lord's Day: a name for the first day of the week, derived from Rev. i. 10. The rendering "Lord's Day" is Wycliffe's (1380). In all of the editions of Luther's New Testament previous to his revision of 1541 he renders *Am Sontage*, and Tyndale (1526–34), Coverdale (1534), Cranmer (1539) follow him, and translate "on a Sondaye." The Æthiopic renders it "the first day." The word κυριακός is found also in 1 Cor. xi. 20; "*the Lord's* supper." The day of our Lord's resurrection was observed in the apostolic times, and the title "Lord's Day" is applied in Ignatius, Irenæus, the Clementine Constitutions, and Tertullian, and at a later period universally. (Suicer, *Thesaurus Ecclesiast. Ed. Sec.*, 1728, ii., 184.) See Sabbath and Sunday.

Lord's Supper: See Eucharist.

Lorelei, lō′re-lī, **The**: an imposing cliff on the eastern bank of the Rhine, half a mile above St. Goar. It is 447 feet high, and is now penetrated by a railway tunnel. At its foot is a whirlpool and a famous salmon-basin. The tradition is that a cave in the rock is the abode of the Lorelei, a wicked siren, whose beauty and sweet song distracted the boatmen upon the river and caused them, through their negligence, to be wrecked in the whirlpool. The scenery at this point is regarded as the most attractive on the Rhine.

Lorenzet'ti, Ambrogio: painter; b. at Siena, Italy; the year is unknown. He studied painting with his father, a painter known as *Lorenzo*. Ambrogio Lorenzetti was the founder of the Sienese school as distinguished from the Florentine. An important work of this artist is in the town-hall at Siena. His frescoes and pictures are mostly to be studied in his native city. The smaller ones are marvelously beautiful, and seem to be precursors in sweetness and feeling of the works of Fra Angelico. Lorenzetti was already aged when the Florentines commissioned him to paint for the Church of St. Procolo some stories from the life of St. Nicholas, which have been transferred to the abbey in Florence. Pietro, his brother, also a painter, helped him in the fresco of the *Marriage of the Virgin* in the hospital of Siena. Vasari mistakenly declares him to have been a pupil of Giotto's, and calls him *Laurati*. In the Campo Santo at Pisa there are frescoes by him formerly attributed to Orcagna. Pietro was still painting in 1355, but the date of his death is unknown. His son Lorenzo was a sculptor who studied and worked in Pisa. W. J. Stillman.

Loreta, lō-rā′tăă, Pietro, M. D., Count: surgeon; b. in Ravenna, Italy; studied medicine in the University of Bologna in 1847, but the Austro-Italian war interrupted his studies, and he did not graduate until 1858; practiced in the country until 1861, when he became anatomical prosector for Prof. Calori in Bologna; in 1865 took charge of the surgical clinic in Bologna University, but his work was interrupted by Garibaldi's campaign; in 1868 became Professor of Surgery in the university. He was a surgeon of great skill and originality, and the method of dilatation of the pylorus for cancer was invented by him. Among his published writings are *Conferenze cliniche sulle lussazioni traumatiche* (Milan, 1884); *La divulsione digitale del piloro* (Bologna, 1884). D. July 23, 1889. S. T. Armstrong.

Loreto: city of Italy; in the province of Ancona; 15 miles by rail S. W. from the town of Ancona and 3 from the sea (see map of Italy, ref. 4–E). It contains a small church called the Holy House, which for centuries has been the resort of pilgrims, amounting to about 800,000 annually. This building, according to a legend, is the house in which the Virgin Mary was born and brought up. It is said that, after having been consecrated by the apostles, it was transferred by the ministry of angels from the power of the Turks—first to Dalmatia in 1291, and then to Loreto in 1294. The sole industry of the city itself is the manufacture of rosaries, crucifixes, etc., which are sold to the pilgrims.

Loreto, lō-rā′to: a department of Peru, occupying all the northeastern part of the republic. On the W., S. W., and S. it borders on the departments of Amazonas, Libertad, Ancachs, Huanuco, Junin, and Cuzco; to the E. it is separated from Brazil and Bolivia by the river Javary and a line of uncertain position (see JAVARY and PERU): to the N. it includes all the territory to the Marañon or Amazon, and beyond that river claims a large region which is disputed by Ecuador, Colombia, and Brazil. With all these uncertainties it is impossible to calculate the area, even approximately, but probably it is not less than 225,000 sq. miles, or more than half of Peru. Portions of this vast territory are sometimes ascribed to Cuzco, Apurimac, Junin, and other departments, thus greatly increasing the confusion. Even the settled districts of Loreto are very imperfectly known, and the eastern part is entirely unexplored. The western boundary is formed by the main chain of the Andes (Cordillera of Peru), and there is a branch chain, the Cordillera Oriental, farther E. The space between these ranges is occupied by the broken and more or less mountainous valley of the upper HUALLAGA (*q. v.*), and the river, emerging from it, flows over lower land to the Marañon. Farther E. the great river UCAYALI (*q. v.*) crosses the department from S. to N., and also joins the Marañon. The Ucayali flows through flat land, and, so far as known, these flat lands, portions of the Amazon depression, are almost continuous in the eastern and northern portions of the department. It would appear, however, that there are also higher lands, probably outlying portions of the great Brazilian plateau of no great altitude; such probably are the so-called Conomamas Andes, which vague reports locate E. of the Ucayali. From the base of the main Andes eastward a vast forest stretches over Loreto; it is interrupted by some tracts of grass-land in the upper Huallaga valley, and on the Pampas del Sacramento, an extensive but little-known region W. of the Ucayali; but E. of that river the forest is probably unbroken. Rubber and other forest products are obtained about the great rivers; rich salt-beds exist in the Huallaga, and are worked on a small scale, and gold and other minerals are reported; but the future of the department probably lies in its fertile soil. At present about 65,000 inhabitants, mainly civilized Indians, acknowledge the Government of Peru. These are mostly gathered in the upper Huallaga valley and along the Marañon. The remainder of the department is inhabited only by wild Indians, vaguely calculated at 300,000, but probably less than half that number. The capital is Moyobamba. Steamers ascend the Marañon to Nauta, and have explored the region above, the Ucayali and the lower Huallaga. See J. W. de Mattos, *Diccionario topographico do departamento de Loreto* (Para, Brazil, 1874), and the travels of Herndon, Smyth, Mawe, Castlenau, and Orton. HERBERT H. SMITH.

Loreto, Sisters of, or "Friends of Mary at the Foot of the Cross": a Roman Catholic religious order for women, founded in 1812 in Kentucky by Charles Nerinckx (1761–1824), a priest. They have many establishments in the western parts of the U. S., and devote themselves to the cause of education and the care of destitute orphans.

Lorette, lō-ret′: post-village of Quebec County, Canada; 7 miles from Quebec (see map of Quebec, ref. 4–D). It is a beautiful place, resorted to for the view of its waterfall, and has some manufactures of paper and flour. The inhabitants are partly Christianized Huron Indians. At this place are water-works for the supply of Quebec.

Lorgues, ANTOINE FRANÇOIS FELIX ROSELLY, de: See ROSELLY DE LORGUES.

Lorica′ta [Mod. Lat., liter., neut. plur. of Lat. *lorica′tus*, cuirassed, deriv. of *lorica′re*, clothe in mail, deriv. of *lorï′ca*, cuirass, leather corselet, deriv. of *lo′rum*, thong]: a term applied to those reptiles which are "loricated," or furnished with a coat-of-mail formed by an epidermal exoskeleton of bony scales, as in the crocodiles. The name was originally given to the armadillos, and has been used for very different groups of animals, including some of the ganoids and gurnards among fishes, certain mollusks, and a group of infusoria. The term is, however, generally used in reference to the Crocodilians. Revised by F. A. LUCAS.

Lorient, lō′ri-äṅ′, or **L'Orient**: town; in the department of Morbihan, France; at the mouth of the Scorff, in the Bay of Biscay (see map of France, ref. 4–B); founded in the middle of the seventeenth century by the French East India Company, whence its name, Port de l'Orient. It at one time had a very large trade. In 1770 it was made one of the four stations of the French navy, and has a capacious and safe harbor lined with handsome quays, and protected with strong fortifications at its entrance. Its dockyards and arsenals are extensive, and its manufactures of all kinds of naval equipments are very important. Pop. (1896) 41,894.

Lorillard City: See CENTRAL AMERICAN ANTIQUITIES.

Lorimer, JAMES: See the Appendix.

Loring, EDWARD GREELY, M. D.: ophthalmologist; b. in Boston, Mass., in 1837; studied medicine in Italy, and at the Harvard Medical School, where he graduated in 1864; studied diseases of the eye and ear for a year; practiced in Baltimore one year; settled in New York city in 1867. He was one of the founders of the Manhattan Eye and Ear Hospital. His chief work is *Text-book of Ophthalmoscopy* (New York, 1886). D. in New York city, Apr. 23, 1888.

Loring, GEORGE BAILEY, M. D.: agriculturist; b. at North Andover, Mass., Nov. 8, 1817; graduated at Harvard College 1838, and at the Harvard Medical School 1842; was physician to the Chelsea Marine Hospital for some years; devoted himself after 1850 entirely to scientific agriculture and the preparation and delivery of speeches, lectures, and occasional addresses upon political, historical, scientific, educational, and agricultural topics, and the writing of reports and essays on similar subjects. He took up his residence at Salem; represented that city for several terms in the Massachusetts House of Representatives and Senate; was for three years president of the latter body, and for many years president of the State Agricultural Society, and was a member of the Republican national conventions of 1868, 1872, and 1876. Dr. Loring had a wide reputation as an orator, and was frequently invited to deliver addresses upon memorial occasions. An address at the opening of the scientific course of the American Institute, New York, 1870, was widely copied. He contributed largely to Flint's *Agricultural Reports*, to Murray's work *On the Horse*, and wrote a serial for the Boston *Globe*, called *The Farmyard Club of Jotham*, dealing with New England life and modes of thought. He was a member of Congress 1876–81; U. S. commissioner of agriculture 1881–85; U. S. minister to Portugal 1889–90. D. in Salem, Mass., Sept. 14, 1891.

Loring, WILLIAM WING: general; b. in Wilmington, N. C., Dec. 4, 1818; entered the U. S. army as private soldier in a detachment of mounted volunteers, and served in the Florida war 1835–42; became second lieutenant in 1837, captain of mounted rifles 1846, major in 1847, lieutenant-colonel in 1848, and colonel in 1856; commanded a regiment in the battles in the valley of Mexico; was breveted lieutenant-colonel for gallantry at Contreras and Churubusco, and colonel for gallantry at Chapultepec; lost an arm at the Belen gate of Mexico; commanded an expedition on the Gila river, New Mexico, 1857, where he fought the Mogollan Indians; resigned his colonelcy May 13, 1861; became a brigadier-general, and subsequently a major-general, in the Confederate army, serving in West Virginia 1862, at Vicksburg 1863, and with Gen. Bragg at Chattanooga and in the ensuing campaign. In 1869 he went to Egypt, and became pasha and chief of staff of the army of the khedive; returned to the U. S. in 1879, and published *A Confederate Soldier in Egypt* (New York, 1883). D. Dec. 30, 1886.
Revised by JAMES MERCUR.

Lo′rinser, KARL IGNAZ; physician; b. at Niemes, in the Bohemian Mountains, July 24, 1796; studied medicine at Prague and Berlin, where he took his degree in 1817; held several medical offices in Prussia, from which he retired to private life in 1850. D. at Patschkau, in Silesia, Oct. 2, 1853. His *Untersuchungen über den Rinderpest* (Berlin, 1831) proved of great benefit to the farmers, and his *Zum Schutz der Gesundheit in den Schulen* (Berlin, 1836), which caused a long and vehement controversy, occasioned the re-establishment of *Turn-places* at the Prussian schools.—His son, FRANZ LORINSER (b. in Berlin, Mar. 12, 1821), has acquired a name as a Roman Catholic theologian, and as well versed in Spanish literature, from which he has made several successful translations. He is author of *Aus meinem Leben* (2 vols., 1891).

Loris-Melikoff: See MELIKOFF.

Lormian, BAOUR: See BAOUR-LORMIAN, PIERRE MARIE FRANÇOIS LOUIS.

Lorne, JOHN GEORGE EDWARD HENRY DOUGLAS SUTHERLAND CAMPBELL, Marquis of: b. in London, Aug. 6, 1845; was educated at Eton, St. Andrews University, and Trinity

College, Cambridge. He represented Argyllshire as a Liberal member of Parliament 1868–78; was married to the Princess Louise in 1871; and was Governor-General of Canada, 1878–83. Both he and the princess were popular in Canada, and contributed much toward fostering and inducing sentiments of loyalty to the mother-country. The marquis was an unsuccessful candidate for Hampstead in the Liberal interests in 1885; again defeated in 1892, when he stood for the central division of Bradford. He has contribnted to American and British magazines, and has published *A Trip to the Tropics, and Home through America* (1867); *Guido and Lita: a Tale of the Riviera*, a poem (1875); *The Psalms Literally rendered in Verse* (1877). The Princess Louise has displayed talent as a painter and sculptor, and drew the illustrations for one of her husband's works. Succeeded his father as Duke of Argyll in 1900. NEIL MACDONALD.

Lorrain, CLAUDE: See GELÉE.

Lorraine, lor'rān' (Germ. *Lothringen*): a territory between the rivers Rhine, Saône, Meuse, and Scheldt; forming a plateau from 500 to 800 feet high, which leans against the Vosges, with a northern and northwestern inclination. Originally it was that portion of the empire of Charlemagne which, with Northern Italy, was assigned to Lothaire in the treaty of Verdun, 843. It then constituted the border-land between the eastern and western Franks, and stretched all the way from Switzerland to the North Sea. Its name was derived from Lothaire II., son of the Emperor Lothaire I., who received this territory at the division of his father's dominions, and called it *Lotharii Regnum* (Lotharingia). Under the Carlovingian dynasty the country was an object of perpetual strife between France and Germany. After the extinction of the Carlovingian house the Emperor Otho I. gave it to his brother Bruno, Archbishop of Cologne, who divided it into two parts—Upper Lorraine, between the Rhine, Saône, and Meuse, and Lower Lorraine, between the Rhine, Meuse, and Scheldt. The latter received the name of the duchy of Brabant, became a part of Burgundy, fell to the house of Austria, and the greater part of it is now incorporated with Belgium. Upper Lorraine was ruled for centuries by a dynasty of its own, subject, however, either to French or to German authority, but by the peace of Westphalia in 1648 the three bishopries of Toul, Metz, and Verdun were ceded to France. In 1733, in the Polish war of succession, the duchy was conquered by the French, and in 1737 the legal heir, Frantz Stephan IV., the husband of Maria Theresa, exchanged it for the grand duchy of Tuscany. Stanislaus, the ex-King of Poland and father-in-law to Louis XV., was then made duke, and on his death in 1776 Upper Lorraine became a part of France. The inhabitants, however, although they became very much attached to France, remained German in language and customs in the eastern and northern districts, and this part of the country, with the fortress of Metz, was ceded to Germany May 10, 1871. It is now governed, in connection with Alsace, as a province of the German empire. See ALSACE-LORRAINE.

Lorris, lō'rees', GUILLAUME, de: poet; b. at Lorris, not far from Orleans, France, soon after 1210; d. about 1237. He received an excellent education for his time, probably at Orleans, then a center of classical studies. He is famous as the author of the first part of the ROMANCE OF THE ROSE (*q. v.*), which he composed at the age of twenty-five. After his premature death, his work was left for forty years incomplete, until Jean de Meung continued it at great length and in a very different spirit. A. R. M.

Los Altos, lōs-aal'tōs: a portion of Western Guatemala which, from Feb. 2, 1838, to Jan. 29, 1840, constituted a sixth state of the Central American republic. It was formed of the departments of Sololá, Totonicapan, and Quezaltenango, embracing also (nearly) the present departments of Huehuetenango, San Marco, Retalhulen, and Suchitepequez. Dissatisfied with the condition of affairs, the people of this region seceded from Guatemala; a constitution was adopted in May, 1839, and Marcelo Molina was elected first president; a treaty was celebrated with Salvador. Guatemala at first pretended to be friendly to the new state, but pretexts for a quarrel soon arose. Carrera invaded the territory at the head of Guatemalcan forces, and defeated the troops of Molina Jan. 29, 1840. Los Altos was then reincorporated with Guatemala. The secessionists were treated with great cruelty. HERBERT H. SMITH.

Los Andes: a western state of Venezuela; between Zulia, Lara, Zamora, Armisticio territory, and Colombia, with a short coast on the east side of Lake Maracaibo. Area, 14,719 sq. miles. The Cordillera Oriental of Colombia, entering it from the southward, traverses the state and joins the Venezuelan coast range; these mountains, locally known as the Sierra Nevada de Merida, are the highest in Venezuela, some peaks attaining, it is said, over 15,000 feet; many rise above the snow limit. They include valleys and elevated plains noted for their fertility and delightful climate. The chief products are coffee, cacao, and, in the lower valleys, sugar; maize and even wheat are grown to some extent on the high plains. Pop. (1891) 336,146. Capital, Merida. Other important towns are Trujillo, Bocono, La Grita, and San Cristobal. HERBERT H. SMITH.

Los Angeles, lōs'aan'je-lēez; Span. pron. lōs'aang'haă-lās [Span., liter., the angels]: city (founded Sept. 4, 1781, "under the patronage of Our Lady, the Queen of the Angels," by eleven families of Indian, Negro, and mixed blood, with whom a contract for that purpose had been made by the Viceroy of Mexico); capital of Los Angeles co., Cal. (for location of county, see map of California, ref. 12–F); on both banks of the Los Angeles river, and the Los A. Terminal, the S. Pac. and the S. Cal. railways; 482 miles S. E. of San Francisco. It is the center of a region characterized by an excellent climate and a soil that produces in profusion many of the fruits of semi-tropical as well as temperate climes. The region is also rich in gold, silver, coal, and other minerals, and has rich veins of petroleum, of which a large amount is used for fuel. The city is 30 miles from the mouth of the river and 24 miles N. of San Pedro, its seaport. Vessels of the Pacific Coast Steamship Company, while *en route* between San Francisco and San Diego, touch at San Pedro, and the port is visited by vessels from all maritime countries. In the calendar year 1900 the imports of foreign merchandise amounted in value to $26,809, and the exports of domestic merchandise to $123,148. The census returns of 1890 showed that 747 manufacturing establishment (representing 83 industries) reported. These had a combined capital of $6,807,088; employed 4,950 persons; paid $3,474,618 for wages and $5,008,162 for materials; and had products valued at $9,877,905. There are 3 national banks, 10 commercial banks, and 7 savings-banks. The combined resources of the banks are $28,000,000, and the deposits $23,000,000; clearings for the year ended Nov. 1, 1900, $116,856,762. The city is lighted with gas and electricity, and has over 175 miles of electric street-railway. There are 68 churches, 55 public schools, 8 colleges, 2 high schools, a branch of the State Normal School, 3 Roman Catholic seminaries, the Roman Catholic College of St. Vincent, the University of Southern California, a public library, 7 hospitals, 2 orphan asylums, 6 cemeteries, a crematory, and 5 daily, 23 weekly, and 7 monthly periodicals. The assessed valuation of all taxable property in 1900 was $67,576,074, real estate being assessed at about one-half of actual value. Pop. (1880) 11,183; (1890) 50,395; (1900) 102,457. FRANK WIGGINS.

Los Gatos: town; Santa Clara co., Cal. (for location of county, see map of California, ref. 8–C); on the S. Pacific Railway; 10 miles S. W. of San José, the county capital. It is in an agricultural and an olive and grape growing region; manufactures brandy and wines; and has 2 weekly newspapers. Pop. (1880) 555; (1890) 1,652; (1900) 1,915.

Los Reyes, CIUDAD DE: See LIMA.

Los Rios, lōs'ree'ōs: a western inland province of Ecuador, between Guayas, Bolivar, Tunguragua, and Leon; area, 2,295 sq. miles. Pop. (1889) 32,800. It lies mainly on the western slope of the Andes, and Chimborazo is on the eastern frontier. Agriculture and cattle-raïsing are the only industries. Capital, Babahoyo; pop. 5,000.

Los'sing, BENSON JOHN, LL. D.: historian; b. at Beekman, Dutchess co., N. Y., Feb. 12, 1813; was employed as a watchmaker in Poughkeepsie from 1826 to 1835; was next a journalist at that place for several years, and in 1838 became a wood-engraver in New York, where he edited *The Family Magazine*, an illustrated periodical. He conducted *The Young People's Mirror* (1848–49), and from 1872 to 1875 edited at Philadelphia *The American Historical Record*. He wrote a large number of historical works, most of which were illustrated by himself. Among them were *Pictorial Field-book of the Revolution* (1850–52); *History of the United States* (1854–56); *Mount Vernon and its Associations* (1859); *Lives of the Presidents*; *Pictorial Field-book of the War of 1812* (1868); *The Civil War in America* (3 vols., 1866–68); *The American Centenary*, 2 vols., a work illustrating American progress from 1776 to 1876 (1875);

Cyclopædia of United States History (1881); *History of the City of New York* (2 vols., 1884); *The Two Spies: Nathan Hale and John Andre* (1886); *Mary and Martha, Mother and Wife of George Washington* (1886); *The Empire State, a Compendious History of the Commonwealth of New York* (1887). D. June 3, 1891.

Lossini, los-sce′nēe [Ital., whence Germ. name *Lussin*]: an island in the Gulf of Quarnero, an inlet of the Adriatic Sea, belonging to the government of Triest, Austria; 19 miles long and 3 miles broad, with (1890) 11,848 inhabitants, mostly engaged in agriculture, fishing, and commerce. The principal town is Lossini Piccolo, a thriving place, with 4,975 inhabitants, an excellent harbor capable of receiving the largest men-of-war; has an active trade in wheat, wine, olive oil, fruits, etc.

Lot: a tortuous river of France, which rises in Mont Lozère, in the Cévennes, becomes navigable at Entraigues, and joins the Garonne at Aiguillon after a course of 270 miles.

Lot: department of France; on both sides of the river Lot. Area, 2,012 sq. miles. The surface is elevated and mountainous, traversed by a range of hills, the sides of which are covered with vines, while the valleys abound in wheat, hemp, tobacco, and fruits. Some iron is mined. Of the entire area of the department, 691,920 acres are arable and 222,402 acres are forest-land; 168,038 acres are occupied by vineyards. Wine is the principal product of the department, that of Cahors being the most valued. Sheep are the most abundant live stock; poultry and bees are reared in great quantities. Pop. (1896) 240,403. Capital, Cahors.

Lotbinière, lōt′bēe′ni-ār′, Michael Eustace Caspard, Marquis de: Canadian officer; b. in Canada in 1723. He was appointed engineer to the French colony in 1753; soon after the defeat of Baron Dieskau in 1755 he constructed Fort Carillon (Ticonderoga), with the object of preventing the British from entering Canada, and contributed more than any other person to the defeat of the British at that place. For this and other services he was appointed a chevalier of St. Louis, and soon afterward a marquis. He was a member of the Institute of France. D. in New York in 1799.—His son, Eustace Gaspard Michael Chartier, de (b. in Canada; d. there in 1821): was elected to the Assembly and in 1793 appointed Speaker. An effort to abolish the French language in the Legislature was defeated by his efforts. Neil Macdonald.

Lot-et-Garonne, lōt′ā-gaă′rŭn′: department of France, extending along the Lot and the Garonne, and comprising an area of 2,067 sq. miles. The soil is exceedingly fertile in the river basins; hemp here reaches an extraordinary height; the wine is strong and rich, and capable of being transported across the sea without losing its fine qualities; more wheat is raised than used, but outside of the river basins the soil consists of a ferruginous clay or of sandy tracts which are entirely unproductive. Much iron is manufactured in this department. The forges, high furnaces, and foundries are important. Brazier's ware is manufactured; also agricultural implements and other machines. Plaster, lime, cement, bricks, tiles, etc., are made. Pop. (1896) 286,377. Capital, Agen.

Lothaire (Fr. pron. lō′tār′) **I.**: Roman emperor from 840 to 855; b. about 795, a son of Louis le Débonnaire; shared, together with his two younger brothers, Pepin and Louis, in the government of the empire, and with them resisted the claim of their half-brother Charles to a portion of the territory. On the death of Louis in 840 Lothaire claimed the whole empire, but his two brothers Louis and Charles (Pepin being dead) united against him, and Lothaire was defeated in the battle of Fontenay June 25, 841. In 843 the famous treaty of Verdun was concluded between them, according to which Lothaire retained the imperial title and dignity, Italy, and a strip of land between Germany and France, stretching from the Mediterranean to the North Sea, and extending between the Rhine on the one side and the Rhône, Saône, Meuse, and the Scheldt on the other. Lothaire was a weak, violent, and treacherous character, and utterly unable to defend and govern his land. The Saracens attacked him in Italy, the Norsemen in the Netherlands, while the clergy, the dukes, and his own sons filled the interior with violence and bloodshed. Dividing the country between his sons, he retired to the monastery of Prüm in the Ardennes, where he died a few weeks afterward, Sept. 29, 855.

Lothaire II., The Saxon: King of Germany and Roman emperor from 1125 to 1137; b. about 1060 (according to some authorities in 1075) of a family not very conspicuous; married in 1100 Richenza, the heiress of the wealthy house of Brunswick, and received in 1106 Saxony as a fief of Henry V. At the death of the prince in 1125, Lothaire was elected King of Germany, chiefly through the intrigues of Bishop Adalbert of Mentz, who hated and feared the Hohenstaufen house. His reign was vigorous and fortunate. Bohemia was again brought under German authority; the refractory dukes, especially the Duke Frederick of Suabia, were compelled to submit, and the two Italian campaigns undertaken in defense of Innocent II. were successful. Nevertheless, he bought his crown and the assistance of the Church by the concession of important imperial rights to the pope, and in order to retain Henry the Proud of Bavaria and other dukes in his party, he allowed the principle of heredity to establish itself with respect to the crown fiefs. Thus he weakened the imperial power, and made it incapable of consolidating and governing Germany. D. near Trent, Dec. 4, 1137.

Lo′thian: an old Scottish name now applied to Haddington, Edinburgh, and Linlithgow as East, Middle, and West Lothian respectively. Though now confined to the south shore of the Forth, it formerly extended S. to the Tweed and W. to the Cheviots and Lowthers.

Lothrop, Harriett Mulford: See the Appendix.

Loti, lō′tee′, Pierre, pseudonym of Julien Viaud: novelist; b. at Rochefort, France, Jan. 14, 1850. He was educated in the naval academy and entered the French navy, in which he is an officer. His novels and sketches—*Aziyadé*, *Le Mariage de Loti*, *Le Roman d'un Spahi*, *Fleurs d'ennui*, *Mon frère Yves*, *Pêcheur d'Islande*, *Japoneries d'automne*, *Propos d'exil*, *Madame Chrysanthème*, *Au Maroc*, *Le Roman d'un Enfant*, *Le Livre de la pitié et de la mort*, *Fantôme d'Orient*, *Matelot*—produced in rather rapid succession since 1877, are very simple in construction, often without plot, dealing with few characters and choosing them from simple sailors and fishermen, or from the representatives of the exotic civilizations of the lands whose life and nature they describe—Japan, Tahiti, Senegal, Morocco. His special gifts are an extreme sensitiveness to sensuous impressions, and a rare power of recording and imparting these impressions in a language whose charm is remarkably free from literary reminiscences. He was elected to the Academy in 1891. An edition of his *Œuvres complètes* was published in 1893–94 (8 vols). A. G. Canfield.

Lotoph′agi, or **Lotus-eaters** [*Lotophagi* = Lat. = Gr. λωτοφάγοι; λωτός, lotus + φαγεῖν, eat]: a people first mentioned by Homer as feeding upon the sweet fruit of the lotus, the quality of which was such that all who ate of it immediately forgot their native land and lost all desire to return. The ancient geographers placed the lotus-eaters on what is now the coast of Tripoli, near the Lesser Syrtis, as well as on the island of Meninx. At the present day the cave-dwellers on that coast subsist upon jujubes, and drink a sirup made of that fruit, perhaps the lotus-wine of the ancients. See Lotus.

Lototen: See Athapascan Indians.

Lottery [Germ. *lotterie*, from Fr. *loterie*, deriv. of *lot*, lot, share (ultimately from the Teutonic word equivalent to Eng. *lot*]: a game of chance; a scheme for the distribution of prizes by lot or chance, usually in return for a consideration. The awarding of duties and privileges by lot formed a distinct feature in the political and religious customs of all ancient peoples. The division of land among the children of Israel by lot illustrates the religious usages, while the choice of public officers in Athens by lot illustrates the political usage. The Emperor Augustus is credited with having made the lottery a feature in the Roman social life by the distributing of favors among the guests at the great public entertainments, at which each guest received a sealed packet, which contained a present. The packets were all alike, but the contents would vary from a pea-bean to a diamond.

The Lottery as a Business Enterprise.—Through the social institution thus established, the lottery as a business institution is said to have been developed. Certain it is that the Italian merchants made use of the popular craving for the distribution of prizes as a means of selling their goods, and from Italy the lottery as a means of making money was introduced into Northern Europe, where it had previously existed only as a religious and political institution. It was in the sixteenth century that the institution thus spread, the first lottery-drawing in France taking place in 1539 and the first in England in 1569. The Church

used the lottery for the building of cathedrals, the state used it for the construction of public works, while private individuals found that there was no means so easy of making money as by ministering to the craving for sudden enrichment. The form of lottery generally most common consisted in drawing from a wheel of fortune as many numbers as there were prizes, and then the prizes assigned to each. This was known as the Dutch lottery, though it originated in Italy. The form of lottery most common in France but popular throughout Europe was what is known as the Genoese lottery. It had its origin in the custom at Genoa of selecting the five members of the great council by putting the names of ninety candidates into a wheel of fortune and drawing but five. Bets upon the names that would be drawn became a popular form of gambling, and as elections did not take place often enough to satisfy the demand for this form of excitement, numbers were substituted for names. While there was but one chance in eighteen that any one number named would be drawn, there was but one chance in several hundred that any two numbers named (an *ambe*) would be drawn, and but one chance in several hundred thousand that any four numbers named (a *quaterne*) would be drawn. Yet, by making the prize for the *quaterne* 60,000 times the amount risked (as in the Austrian lottery), people were fairly crazed by the thought of the great prize, and ignored the fact, plain to every one of them, that vastly less money was returned to them than they deposited. The lottery was a kind of savings-bank which paid no interest, and returned but a fraction of the principal. Yet such is the element of irrationality in our nature that the desire to invest savings in these lottery banks became a mania. The Genoese lottery was introduced into nearly all European countries, and the drawings were held as often as two or three times a week. In the large cities in which the lotteries were drawn a great portion of the population lived in a perpetual excitement, which made men unfit for serious business, and generally ended in thoroughly demoralizing them.

Free Lotteries, Licensed Lotteries, Government Lotteries.—In every country the lottery business was at first free, but private lotteries multiplied so rapidly and were so frequently fraudulent in their character, that government supervision was soon of necessity introduced. In England from 1709 to 1823 lotteries were annually licensed. Generally the licensed lotteries were conducted in the interest of some partly public undertaking, being used, for example, for the founding of the British Museum and the building of the Westminster Bridge. The evils resulting from such lotteries, however, were so marked that Parliament, in 1778, partly for the sake of revenue, but avowedly for the purpose of protecting the people, levied an annual tax of £50 a year upon every one conducting a lottery. This measure reduced the number of lotteries from 400 to 41, but did not reduce the business in anything like the same proportion. In 1823 it was decided that the only way to protect the people was to prohibit the business, and lotteries were accordingly suppressed. In France the Government very early imposed a slight tax on lotteries, and in 1700 Louis XIV. established a national lottery, which in 1776 was made a monopoly upon the principle that the money taken from the public by means of the lotteries ought not to go to the enrichment of private individuals, but to the state. The edict establishing the royal lottery did not, however, admit the evils that came to the public. It ran as follows: "His Majesty having noticed the natural inclination of his subjects to vest their money in private lotteries, and desiring to afford them an agreeable and easy means of procuring for themselves a sure and considerable revenue for the rest of their lives, and even of enriching their families by vesting sums so small that they can not cause them any inconvenience, has judged it opportune to establish at the Hôtel de Ville at Paris a royal lottery." To the statesmen of the French Revolution belongs the credit of having first refused to raise a public revenue through an institution so demoralizing to the public and so impoverishing to the very poor. On Nov. 12, 1793, the Convention abolished the lottery of France, "as an invention of despotism to make men silent about their miseries and enslave them with a hope which aggravates their distress." A few years later the lottery was restored for revenue purposes, and with the re-enthronement of the Bourbons came to yield an annual revenue of 14,000,000 francs. After the next democratic revolution in 1831, however, this peculiarly iniquitous method of raising revenues from the poor was again attacked, and in 1836 was prohibited. The French Parliament has since permitted lottery bonds to be issued, as in the scandalous case of the Panama Canal Company; but public sentiment in France has come to believe with J. B. Say, that "the legislators who sanctioned such a tax vote a certain number of thefts and suicides every year. There is no pretext of expense that can justify provocation to crime." In the remaining countries of Europe this sentiment is rapidly gaining, though Prussia is still (in 1894) realizing a revenue of 10,000,000 marks from its lotteries, Austria a revenue of 40,800,000 crowns, Italy a revenue of 75,300,000 lire, and Spain (according to ex-Minister Curry) a revenue of 75,000,000 pesetas.

Early Lotteries in the United States.—In the American colonies lotteries were very frequently resorted to as a means of raising revenue. "It was with the money collected from the sale of lottery tickets," says McMasters, "that Massachusetts encouraged cotton-spinning and paid the salaries of many of her officers; that the city-hall was enlarged in New York; that the court-house was built at Elizabeth; that the library was increased at Harvard College; and that many of the most pretentious buildings were erected in the Federal city." Some of the buildings at Yale University also were erected by the aid of lotteries, and Columbia College about the middle of the eighteenth century received aid from the same source. During the Revolutionary war the Continental Congress tried to raise money by this means, and for a half century after the Revolution lotteries were frequent in the U. S. As early as 1699, however, an assembly of Boston ministers attacked lotteries as cheats, and their agents as "pillagers of the people." The fact that lotteries seemed to gain about the time of the Revolutionary war was due to the need of public revenue. The fact that lotteries continued to gain after the close of that war, when the growth of cities made easier the operations of the lotteries, was what awakened the public conscience to the evil. In 1833 appeared at Philadelphia Job R. Tyson's *A Brief Survey of the Great Extent and Evil Tendencies of the Lottery System of the United States*, and a society was formed in Pennsylvania with the purpose of working for the abolition of the institution. It was indeed abolished in Pennsylvania and Massachusetts in the very same year, in Connecticut in 1834, in Maryland in 1836, etc.

The Rise of the Louisiana Company.—At the beginning of the civil war in 1861 the lottery business in the U. S. was of slight importance, but in 1868 the Louisiana Legislature granted a lottery charter for twenty-five years, and despite serious opposition in several quarters the business flourished during the entire period of the "carpet-bag" *régime*. During Gov. Nichols's first administration the Legislature abolished the lottery, but the act was invalidated by a decision of a U. S. district court declaring it an impairment of the obligation of contract, and consequently in violation of the Constitution. It was now a great social and political power in the State, and having secured as inspectors Gens. Beauregard and Early, men of national reputation, it became known throughout the country. Having full confidence in the fairness of the drawings all classes were tempted to take chances, and the earnings of the poor especially were invested in the hope of securing prizes. Before each drawing the company offered $28,000,000 worth of tickets, of which $14,767,000 was promised in prizes ranging from petty sums to $15,000, while the balance, or about 47 per cent., was to be retained by the company. Thus the public paid 28,000,000 earned dollars in order to get back 15,000,000 unearned dollars, and required no account of the balance. While the expenses of the company were very heavy, including 15 per cent. to the agents, who broke the laws of other States in selling the tickets, and large sums devoted to advertising the drawings, silencing the press, and contributing to campaign funds, charities, etc., its profits were enormous, enabling dividends estimated at 170 per cent. to be declared in 1889.

The Campaign of Extermination.—The owners were naturally loath to part with their profitable privileges, and in the spring of 1890 it was announced that the company would apply to the people of Louisiana for the renewal of the charter, offering as the people's share of the profits the sum of $500,000 instead of the $40,000 which had hitherto constituted their portion. Not until this offer had been increased to $1,250,000, however, could the requisite two-thirds of the Legislature be secured to vote that the company's proposition be submitted to the people. This was of the nature of a bribe equivalent to $5 for every legal voter in Louisiana for each of the twenty-five years for which the new charter was asked. It was, moreover, most skillfully distributed, so as to seem a grant in aid of the most worthy objects; but in-

stead of destroying the anti-lottery sentiment, it stirred up an enthusiastic campaign against the re-chartering of the company. An anti-lottery league was formed in New Orleans; an anti-lottery newspaper was started in the face of the bitterest opposition, and the Churches throughout the State took up the agitation. In the following campaign the anti-lottery movement gathered such force that its supporters claimed the majority in the Democratic State convention, but the machinery being in the hands of the regular Democracy, who refused to insert an anti-lottery plank in the platform, the anti-lottery delegates withdrew. The contest was then between the regular or McEnery Democracy and the anti-lottery Democracy. Meanwhile interest was aroused in the North. Mass meetings were held in New York and Boston, the great magazines and weekly newspapers joined in the crusade, and the clergy vehemently denounced the attempt to fasten the lottery anew upon the State of Louisiana. Fearful of losing the election, the company withdrew its demands for a re-charter, and the regular Democracy now called upon the "bolters" to return. The latter would only consent to new primaries to determine which candidate was in reality the choice of the party. The result was favorable to the anti-lottery interest, and the regular Democrats now became in their turn the "bolters." The election gave an overwhelming victory to the anti-lottery ticket, and the new Legislature promptly passed an act declaring it a felony to conduct a lottery in Louisiana after Dec. 31, 1893. With this act the last refuge of the lottery business was lost, and it became an outlaw in every State of the Union. C. B. Spahr.

Lot'to, Lorenzo: painter; b. in the latter part of the fifteenth century. A Venetian, or perhaps born at Treviso, in the Venetian territory; erroneously supposed to have been a native of Bergamo. He was a pupil of Giovanni Bellini, but successfully imitated all the masters of his day. He established himself in Bergamo in 1513, and executed his best works there, of which the most famous are the altar-piece in San Bartolemmeo and a *San Giovanni Battista* in the Church of Santo Spirito. At Venice also there are three important works by Lotto: *St. Antonino*, at the Church of St. Giovanni and Paolo; *St. Nicholas*, at the Carmine; and *The Madonna with Two Angels*, at St. Jacopo dall' Orto. In his later years he painted at Recanati, and at Loreto, where he ended his life about 1554 or soon after, in the service of the Madonna in her Holy House (Chiesa della Casa Santa), which he had adorned with his work. W. J. Stillman.

Lo'tus, or **Lotos** [from Gr. λωτός, lotus]: a name applied in literature to many widely different plants: (1) To the *Zizyphus lotus*, a kind of jujube-tree of Barbary (family *Rhamnaceæ*), whose fruit is extensively gathered as food. It is the subject of much Arabic poetry. (See Jujube.) It is probably the tree whose fruit beguiled the Lotophagi (*q. v.*) (2) The *Melilotus messinensis*, a valuable forage-plant of the Levant (see Melilot), and of the family *Leguminosæ*. (3) The ebenaceous date-plum or pishamin (*Diospyros lotus*) of Europe and Asia, much resembling our persimmon, and producing a valuable fruit. (4, 5) The fragrant blue and white Nilotic water-lilies (*Castalia cærulea* and *C. lotus*), which were greatly honored by the Egyptians, and were everywhere worshiped. They were mystically connected with their mythology. The stalks and roots furnished food. (6) The *Nelumbo speciosa*, or sacred Egyptian bean, another beautiful pink water-lily, mystically honored in China and India, as well as in ancient Egypt. Its large seeds and roots were, and are still, eaten. This is the lotus-flower (*padme*, lily-pad) of India. (7) A North African and European hackberry-tree, *Celtis australis*, whose wood is prized by carvers, and whose fruit is edible. Most of the above, with other trees, have been claimed as the source of the food of the fabled lotus-eaters. (8) There is a large genus of clover-like leguminous plants called *Lotus* by Linnæus, and still bearing that name. It includes the bird's-foot trefoils and other Old World plants, which in Europe are cultivated as forage-herbs. The pods of some kinds are used as food; others are well known as garden flowers. (9) In the U. S. botanical writers apply the name lotus to the *Nelumbo lutea*. It closely resembles No. 6 of this article. It is known as the water-chinquapin, and its seeds and roots, if cultivated, would yield a valuable supply of food. Many writers believe that the Homeric lotus was *Nitraria tridentata* (family *Zygophyllaceæ*), a thorny shrub of Northern Africa.

Lotze, lot'se, Hermann Rudolf: philosopher; b. at Bautzen, Saxony, May 21, 1817; studied medical science, natural philosophy, and metaphysics at Leipzig, and was appointed Professor of Mental Philosophy there in 1843. In the following year he accepted a call to Göttingen, and in 1881 to Berlin, where he died July 1 of the same year. He very early pronounced against the Hegelian philosophy on the one side and materialism on the other, and joining the small circle of theistic philosophers—Charles Philip Fischer, I. H. Fichte, Jr., H. Weisse, Ulrici, etc.—he gradually developed his own conception of theism. His principal works are *Mikrokosmus* (1856–64, 3 vols.; Eng. trans., 3d ed. Oxford, 1888); *System der Philosophie* (1874–79, 2 vols.: *Logik*, Eng. trans., 2d ed. Oxford, 1888, and *Metaphysik*, Eng. trans., 2d ed. Oxford, 1887); *History of Æsthetics in Germany* (1868); *Medicinische Psychologie* (1882); *Dictaten* from lectures (translated in six small volumes of *Outlines*, Boston, 1884, *seq.*).

His Philosophy.—In the development of German philosophy Lotze represented a reconstruction of elements drawn from speculative idealism on one hand, and from natural and empirical science on the other. The task of metaphysics is to find what reality is, not "how it is made." This amounts to an assumption of reality as that which is, and limits philosophy to the recognition of the real and the systematic arrangement of all our thoughts of reality—whether drawn from objective science, from psychology, or from logic—in a self-consistent system. The method of philosophy is therefore empirical, as its main assumption is realistic.

In constructing his system on this basis Lotze reached several conclusions which have strongly influenced contemporary thought. Inquiring into the nature of external reality, he establishes by lines of argumentation of astonishing subtlety and power, and with equally astonishing mastery of the modern sciences of mathematics, mechanics, and biology, a theory of immanent causation which postulates theoretical monism of world-ground, together with a form of monadology in the atomic constitution of the world. He then banishes the thing in itself of Kant as well as the ontological "reals" of Herbart, finding in phenomenal change, or "becoming," the mode of self-manifestation of the world-principle. The reality of things consists in their "standing in relations"; but this standing in relations gets its permanent meaning in the dynamic interplay—in and through modes of relationship—of qualitative changes in regular and recurring series, as apprehended by consciousness. Things to be what they are must appear to a consciousness; but what appears to finite consciousness is not the whole of reality. "Reality is richer than thought."

The theory of knowledge, therefore, is a critique of our thoughts about reality. In this critique he reaches the subjectivity of space, though rejecting Kant's proofs of it. Space is our translation of the logical relationships of reality. Time, as universal form, is also subjective; but succession is in the nature of reality. The logical timeless dialectic of Hegel is thus replaced by a real progress, or becoming, in the nature of the absolute.

The inquiry as to the nature of the world-principle leads to the view that qualitative change with permanence of being can only be conceived after analogy with consciousness. The ultimate becomes therefore a spiritual theistic principle; all beings are spiritual, and the human soul is the highest form of finite reality. The course of the world thus becomes the teleological plan of the realization of the theistic principle, and the criterion of reality becomes worth in this plan. In the ethical consciousness, where "worth" is the criterion of judgment, the essential teleology of the universe becomes evident. So the dynamic realism of natural science and empirical evolution is harmonized with the ethical idealism of Fichte.

Lotze thus combines in a coherent and organic system of philosophy the leading philosophical and scientific conceptions of the century. In the U. S. his influence is stronger in academic philosophy, perhaps, than that of any other author; and in several ways: (1) He gave impulse to the recent development of physiological psychology both by his doctrine of the relation of body and mind and by his positive contributions of psycho-physical theory (i. e. the theory of "local signs"); (2) his philosophy has tended to replace the theological natural realism inherited from Scotland; (3) his more adequate treatment of positive science, as affording basis for philosophical construction, has brought metaphysics into closer touch with the empirical disciplines.

J. Mark Baldwin.

Loudon, low'dŭn, John Claudius: writer on horticulture; b. at Cambuslang, Lanarkshire, Scotland, Apr. 8, 1783; was educated at Edinburgh University; became a landscape-gardener near London 1803; traveled extensively as an observer and student of horticulture, and became a practical instructor in the art. The best of his numerous works are the *Encyclopædias*—of Gardening (1822), of Agriculture (1825), of Plants (1829), of Architecture (1832)—and the *Arboretum et Fruticetum Britannicum* (1838); was editor of *The Gardener's Magazine* (1826–43), of *The Magazine of Natural History* (1828–36). D. Dec. 14, 1843.—His wife, Jane Webb Loudon (1808–58), was an able and pleasing writer, chiefly upon botanical and horticultural subjects.

Revised by L. H. Bailey.

Loudonville: village; Ashland co., O. (for location of county, see map of Ohio, ref. 3-G); on the Mohican river, and the Penn. Railroad system; about 20 miles from the capitals of Ashland, Richland, Wayne, Holmes, and Knox Counties. It is in a grain-growing and stock-raising region, and has 7 churches, electric lights, and 2 weekly newspapers. Pop. (1880) 1,497; (1890) 1,444; (1900) 1,581.

Louis I.: King of Bavaria. See Ludwig I., Karl August.

Louis II.: Roman emperor from 855 to 875; b. in 822; the eldest son of Lothaire I. After the death of Louis le Débonnaire, the empire was divided between his three sons, Lothaire I., Louis the German, and Charles the Bald, by the treaty of Verdun. This division of the empire of Charlemagne was carried still further on the death of Lothaire I., his part being subdivided between his three sons, Louis, Lothaire, and Charles. Louis II. received Italy and the title of emperor; Charles, Provence and Lyons; and Lothaire II. the territory between the Rhine, Saône, Meuse, and Scheldt, called Lotharingia (Lorraine). Louis II. fought successfully against the Saracens in Italy, defeated them at Benevento in 848, and expelled them from Bari. He also understood how to vindicate his authority over the great Italian families, of which many steadily conspired with the Byzantine empire. Charles died without children in 863, and Louis II. and Lothaire II. divided his dominions; but when in 869 Lothaire II. also died childless, Charles the Bald and Louis the German took advantage of the emperor's engagement in a new and less successful war with the Saracens in Italy, and divided Lothaire's dominions between themselves. Louis II. died at Brescia, Aug. 13, 875.

Louis II.: King of Bavaria. See Ludwig II.

Louis III., The Child: Roman emperor from 908 to 911; b. in 893; a son of Arnulf, and raised to the throne of Germany on his father's death in 899 by Duke Otto of Saxe, Margrave Luitpold of Austria, and Archbishop Hatto of Mentz, who wished to govern the country during his minority, but the state of Germany while under their rule was miserable; the Hungarians invaded the country, and devastated it as far as Thuringia. In 908 Louis assumed the title of Roman emperor, but he died in 911, and with him the Carlovingian dynasty became extinct in Germany.

Louis IV., The Bavarian: Emperor of Germany from 1314 to 1347; b. in 1286; a son of Duke Louis the Severe of Bavaria and Matilda of Hapsburg. On the death of Henry VII. of Luxemburg in 1314 he was chosen emperor by a majority of the electors, while a minority chose his cousin, Frederick III. of Austria. A long and devastating war began between the two emperors, but Frederick was at last defeated in the battle of Mühldorf Sept. 28, 1323, taken prisoner, and compelled to renounce his claims. Having supported the Viscontis in Milan against Pope John XXII., a quarrel arose between the pope and the emperor. Louis IV. was excommunicated, but went in 1327 with an army to Italy; was crowned in Milan and Rome, deposed John XXII., and established Nicholas V. as antipope. In spite of his success, he was soon compelled to leave Italy, and John XXII. and his successors, supported by French intrigues, continued to oppose and harass him; Germany was placed under interdict. A diet at Rhense on the Rhine (July 16, 1338) declared that an emperor legally chosen by a majority of the electors needed no confirmation from the pope, nor was he in any way subject to his authority. Thus supported by the German princes, and having strengthened his position by large acquisitions of personal property, the emperor prepared for a new campaign against the pope, when he died suddenly at Fürstenfeld, near Munich, Oct. 11, 1347.

Louis: the name of eighteen kings of France; (1) Louis I., le Débonnaire (*q. v.*), Roman emperor, 814–840.—(2) Louis II., le Bégue (877–879), b. in 846, a son of Charles the Bald.—(3) Louis III. (879–882), b. about 864, a son of Louis II., divided the country with his brother Carloman, who inherited the whole after his death.—(4) Louis IV., d'Outremer (936–954), b. in 921, a son of Charles the Simple; was educated at the court of King Athelstane of England, a brother to his mother, Ogive. In 936, on the death of Raoul of Burgundy, he was called to the French throne by Hugh of Paris and William of Normandy, but his reign was only a series of contests with these two vassals, who in the war with Otho I. of Germany even allied themselves with the enemy.—(5) Louis V., le Fainéant (986–987), b. in 966, a son of Lothaire and Emma: was the last king of the Carolingian dynasty.—(6) Louis VI., le Gros (1108–37), was b. about 1078, a son of Philip I. The possessions of the French king were at that time the cities of Paris, Orleans, Étampes, Melun, and Compiègne, with their territories, and the kingship itself was a rank rather than a power, but Louis VI. declared that his royal precedence among the princes of France involved a public charge, and he began to act according to this idea. Under him the *oriflamme* was first used as a national banner, and a feeling of national unity became prevalent in the population.—(7) Louis VII., le Jeune (1137–80), b. about 1119, a son of Louis VI., married Eleanor of Aquitaine, thereby uniting this large territory to the possession of the crown. He quarreled vehemently with Pope Innocent II. and with Henry II. of England. In 1147 he placed himself at the head of the second crusade, but was unsuccessful.—(8) Louis VIII., surnamed le Lion (1223–26), b. in 1187, a son of Philip Augustus, was stopped by the pope in his progress against the English, who at this time were nearly driven out of France. He twice invaded England, and then made a crusade against the Albigenses, which contributed much to the development of the royal power by assembling the vassals under the royal banner.—(9) Louis IX., Saint (1226–70), b. in 1215, a son of Louis VIII., was only eleven years old when his father died; during his minority the country was governed by his mother, Blanche of Castile, a woman of great energy, sagacity, and virtue. In 1236 Louis assumed the throne himself, and shortly after the Count of Marche rose in insurrection, supported by Henry III. of England. But Louis defeated them at Taillebourg and Saintes in 1242, and after the victory he treated the rebellious count with so much magnanimity that he won not only the respect, but the good will, of all his vassals. The most prominent trait in the character of St. Louis was his piety. His conscience, and not his ambition, governed his will. Religious enthusiasm was the motive-power in most of his actions. When the massacre of the Christian inhabitants of Jerusalem in 1244 became known in Europe, St. Louis took the cross in spite of all the remonstrances of his mother and councilors, and in Aug., 1248, he departed with an army of 80,000 men from Aigues-Mortes, on the Mediterranean, for the island of Cyprus. In June, 1249, he landed in Egypt and took Damietta, but when, after five months' postponement, he began to push forward to Cairo, he was stopped by the Egyptians in the battle of Mansoorah, and on Apr. 5, 1250, was compelled to surrender himself and his whole army, whose number meanwhile had been reduced to about 30,000. After paying a large ransom he was liberated and sailed for Syria, where he remained several years laboring to do something for the cause of Christianity in these regions. In 1254 he returned to France with about 500 followers. The following fifteen years of his reign were marked with many wise and vigorous reforms, such as "La Quarantaine de Roi," by which a truce of forty days was established from the committal of an offense, during which term the case was tried by the royal courts, and any attempt at private revenge was prohibited; "La Pragmatique Sanction," by which it was forbidden to levy money in France for the pope without the consent of the king, and those cases were defined in which ecclesiastics were to be tried by the secular courts; the foundation of the Sorbonne, of the library of Paris. The University of Paris under his inspiration and direction now acquired international fame. The general wisdom and energy of his rule entitle him to recognition as one of the greatest and noblest of French kings. In June, 1270, the king embarked with an army of 60,000 men for a new crusade. He landed in Tunis, and formed a camp near the ruins of Carthage; but the plague broke out in the army, and he died Aug. 25. He was canonized by Pope Boniface VIII. in 1297.—(10) Louis X., le Hutin, The Quarreler (1314–19), b. in 1289, a son of Philip IV. His reign, of less than two years, was unimportant.—(11) Louis XI. (1461–83), b. in 1423, a son

of Charles VII. His private character was harsh, grasping, and suspicious, but his talent as a ruler was of a high order. He consolidated the territory of France and the authority of the French crown in this territory, and founded numerous institutions which were of great benefit to the public in general; but the means by which he curbed the feudal houses of France and brought them into absolute dependency on the crown were without scruple. The Count of Armagnac was murdered in 1473; the Duke of Alençon died in prison in 1474; the Count of Luxembourg was beheaded in 1475; the Duke of Nemours was kept for years in an iron cage, and beheaded in 1477; in all, he is said to have put about 4,000 persons to death, most of them secretly. By intrigue he came into possession of Provence, Maine, Anjou, Perpignan, etc., but his principal acquisition was the inheritance of Charles the Bold. Charles was a member of the league which was formed against Louis in the beginning of his reign by all the principal vassals of the French crown, among whom was the king's own brother, the Duke of Berry. After the battle of Mont l'Héry in 1465, Louis made great concessions to all the members of the league, but having succeeded in disuniting some of the associates, he had the whole treaty annulled in 1466 by the States-General of Tours, and recommenced the quarrel. He now invited Charles to an interview at Péronne, and while this took place he incited the citizens of Liège to revolt against him. As soon as Charles heard of this treachery he seized the king, and liberated him only on very hard conditions. Louis now allied himself with the Duke of Lorraine and the Swiss, and when Charles fell in the battle of Nancy (in 1477) he at once incorporated Champagne, Artois, Picardy, and parts of Flanders with France, and managed to keep them in spite of the protest of Charles's heirs. In his internal policy he favored the lower and middle classes, especially the cities, encouraged learning, art, manufactures, and trade, improved public roads and canals, established the first post system, made the administration of justice regular and cheap, etc.; nevertheless, he was feared and hated, not only by the feudal lords, but by all, and he spent the last years of his life in the fortress of Plessis-les-Tours, where he died in 1483. He did much to break down the feudal nobility and centralize the government. Though unlearned, he favored the universities, and promoted general order.—(12) Louis XII. (1498–1515), b. in 1462, a son of Duke Charles of Orleans, succeeded Charles VIII. As a descendant of Valentina Visconti he laid claim to Milan, and in 1500 conquered the city and took Ludovico Sforza prisoner. In connection with Ferdinand of Aragon he soon after conquered Naples, but, disagreeing about the partition of their conquest, war broke out between the two allies, and in 1503 Gonsalvo de Córdova expelled the French from Southern Italy. In 1508 Pope Julius II. formed the League of Cambray between Ferdinand of Aragon, Louis XII., and the Emperor of Germany against the republic of Venice; but Venice having satisfied the pope by ceding several towns to him, and the pope having become much alarmed at the progress of the French in Italy, the league was suddenly dissolved, and a new one, the so-called Holy League, was formed in 1511 between the pope, the emperor, Venice, Ferdinand of Aragon, and Henry VIII. of England against France. Defeated at Novara, the French were driven out of Italy in 1513. At the same time Henry VIII. landed in France with an army of 45,000 men, and having joined the imperial army pushing forward from the Netherlands, he defeated the French at Guinegate. Thus hard pressed on all sides, Louis began to negotiate, and succeeded in escaping from the difficult situation without any great loss. One of his last acts was a marriage with Mary Tudor, the young sister of Henry VIII. of England.—(13) Louis XIII. (1610–43), b. in 1601, a son of Henry IV. and Marie de Médicis. His education was much neglected. During his minority the country was governed by his mother and her favorite, Concini, who was made a marshal and Marquis of Ancre, but the government was only a mixture of weakness, violence, and intrigue. After the murder of Concini in 1617, Albert de Luynes, a favorite of the king, who was made a duke and peer of France, grasped the reins, but his government was little better. After his death in 1621, Cardinal Richelieu (*q. v.*) arose into great prominence; in 1624 entered the council, and guided the affairs of the government for the next eighteen years. The king lived mostly in seclusion, occupied in hunting, drawing, and quiet social enjoyments; but the affairs of state both at home and abroad were conducted by the great minister with such consummate skill that the power and importance of France were greatly increased during the reign.—(14) Louis XIV. (1643–1715), b. at St.-Germain-en-Laye, Sept. 5, 1638, a son of Louis XIII. and Anne of Austria. During his minority his mother and Cardinal Mazarin (*q. v.*) governed the country, and brought to a final close the contest between the royal power and the wealthy and ambitious aristocracy, represented at this period by the league of the Fronde. To this minister belongs the chief credit for the great gains secured by France in the Peace of Westphalia at the close of the Thirty Years' war in 1648. Mazarin died Mar. 9, 1661, and the next day, when the chiefs of the different departments of the administration asked the king to whom they had to address themselves in the future on questions of business, he answered, "To me." He was from this moment his own prime minister, and in the dispatch of business he developed, besides an almost Asiatic despotism, great energy and much sound judgment. He surrounded his person with a magnificent splendor, and guarded his dignity with the most minute forms of etiquette, but his haughtiness did not offend people; it dazzled them, and while his brilliant personal gifts fascinated all who came in contact with him, and attracted to his court all that was eminent in France, the extraordinary prosperity of his government during the first half of his reign made him the idol of the nation. Colbert brought order not only in the finances, but in the whole internal administration, and under his leadership great enterprises were undertaken with signal success. The harbors and ship-yards of Brest, Rochefort, Lorient, Havre, Dunkirk, Cette, and Toulon were constructed and fortified; the Canal of Languedoc, uniting the Atlantic with the Mediterranean, was built, and other canals and public roads were improved; commercial treaties were concluded with Holland and Italy; manufactures of different kinds were established; and while the condition of the people improved, the revenues increased and the king grew rich. No less successful was Louis XIV. in the organization and development of the intellectual life of the French people. The Academy of Inscriptions and Belles-Lettres was founded in 1663, the Academy of Sciences in 1666, the Academy of Painting and Sculpture in 1667; nineteen new professorships were founded at the Royal College; the Royal Library was greatly increased; an observatory was built at Paris; and all these institutions were not only amply supported, but the interest the king showed for them gave their social position dignity and influence. A new taste was created—not in the sense of a new fashion, but of a new ideal of beauty—and this taste was actually imposed on the whole civilized world by Racine, Molière, Boileau, Fénelon, Bossuet; by Lebrun, Poussin, Claude Lorrain; by Perrault, Mansard, Blondel, and others. To these successes it must be added that Louvois, Vauban, and the Duke of Beaufort created a powerful army and navy, which under the leadership of Turenne, Condé, Luxembourg, Vendôme, Duquesne, Tourville, and others made any movements of the king with respect to his foreign policy most effective. His ambition was fired by his imagination, not by any passion. The theatrical effect seemed to satisfy him. His first wars had for their principal purpose the establishment of a safe frontier to the N. and N. E., and France certainly needed a reconstruction of her boundaries on these sides. They are blamable, nevertheless, on account of the arrogance and entire disregard of all international rights with which they were begun, and the almost unexampled barbarity with which they were conducted. In 1665 Philip IV. of Spain died, and Louis, who in 1660 had married his daughter, Maria Theresa, now claimed the Spanish possessions in the Netherlands, and overran the country with a large army. A triple alliance was formed between England, Holland, and Sweden for the purpose of establishing peace between France and Spain, but by the treaty of Aix-la-Chapelle (May 2, 1668) Louis obtained the so-called French Flanders, besides a number of places along the frontier. His first object after the peace was to separate England from Holland; a master in intrigue, he completely succeeded in seducing the weak Charles II., and when in 1670 he began the war against Holland, England was his ally. In Holland, William of Orange was appointed stadtholder and commander-in-chief, and by his diplomatic skill a new league was formed against France between Holland, Brandenburg, the Emperor of Germany, and Spain. By the Peace of Nymwegen (in 1678) Louis nevertheless obtained the whole of Franche-Comté and Alsace. Not content, however, with that which he gained by actual wars, he now

began to seize cities and territories during time of peace and under the most futile pretexts. Thus in 1681 he took Strassburg, in 1684 Luxembourg, and so on. In order to put an end to such proceedings, a league was formed at Augsburg in 1686 between Holland, Austria, Spain, Bavaria, and Savoy, but although the king opened the war with his usual energy, overrunning the Palatinate and transforming this beautiful country into a desert, and although his armies gained one brilliant victory after the other, yet the victories proved sterile, and by the Peace of Ryswick (Sept. 20, 1697) he had to give up all the conquests he had made during the war, make considerable commercial concessions to Holland, and, what was most humiliating to his pride, recognize William III. as King of England. A great change had taken place during this period in Europe, in France, and in Louis himself. The accession of William III. to the throne of England indicates the turning-point of the fortune of Louis XIV. William was his equal in diplomatic craftiness, and far his superior in statesmanship. In France, Colbert died Sept. 6, 1683, Louvois July, 1691, and the government passed into the hands of Madame Maintenon, whom the king married secretly in 1685. The Revocation of the Edict of Nantes (Oct. 22, 1685) threw the internal affairs of the country into a most disastrous confusion. The building of Versailles and the expensive armaments for the re-establishment of James II. in England completely exhausted the finances; and while the means of realization became more and more limited, the plans of the king became more and more arrogant. His pride and egotism assumed the most odious forms. He maintained a bloody war along the whole frontier merely for the whims of his vanity. He banished, persecuted, and ruined his own subjects merely because they did not hold the same creed. He sanctioned by his example crimes utterly destructive of the very foundation of civilized society, merely because they suited his passions, and at last he dragged the exhausted and already suffering people into misery for a mere dynastic purpose. The failure of his policy in the East seemed to make him willing to stake everything upon an effort to secure the succession in Spain. Anticipating the death of Charles II., Louis devoted the last years of the century to preparations for war. The question of the succession was so complicated that it involved England as well as Germany and Spain. The war of the Spanish Succession which continued from the year 1700 to the Peace of Utrecht in 1713, is memorable not only for the great victories of Marlborough at Blenheim and Malplaquet, but also for the general impoverishment of France. The results of the war were in every way disastrous. In point of territory France was shorn on almost every side. The glories that characterized the first half of the reign were lost, and nothing less than the great Revolution would now restore France to its former place among the nations. Overwhelmed during the last years of his life with domestic calamities, he died Sept. 1, 1715.—Louis XV. (1715–74), a great-grandson of Louis XIV., b. at Versailles, Feb. 15, 1710. During his minority the country was governed by the Duke of Orleans (*q. v.*), during whose regency the country was plunged into the deepest financial embarrassment by the failure of the great Mississippi scheme. (See Law, John.) After the death of the duke in 1723, Cardinal Fleury, who had been the teacher of the young king, became Prime Minister, and his parsimony restored some order to the finances, which had been brought to the very verge of bankruptcy by the prodigality of Louis XIV. and the wild schemes of the regent. The young king, who had married in 1725 Maria Leszczynski, a daughter of Stanislaus, ex-King of Poland, seemed to be a noble and honest man, and the war with Saxony, Russia, and Austria, which France began in 1733 for the purpose of reinstating Stanislaus on the Polish throne, was conducted with success, and brought the country the beautiful province of Lorraine by the Peace of Vienna (1738). These encouraging prospects were soon changed in the saddest manner. During the Austrian war of succession Cardinal Fleury died in 1743 at the age of ninety, and in the mean time the frivolous and corrupted court had succeeded in seducing the young king, whose profligacy and dissipation soon assumed an extent and openness hitherto unheard of. Michelet aptly described the tendency of affairs by saying that "to the government of an old priest succeeded that of a young mistress." Madame de Pompadour now rose to power as the king's mistress. Her authority, well-nigh absolute, lasted for twenty years. The profligacy of the court became the scandal of Europe. Meanwhile foreign affairs were becoming more and more complicated through the claims and the energy of Frederick the Great. In the first and second Silesian wars France was in alliance with Prussia; but in the third, or Seven Years' War (*q. v.*), the influence of Maria Theresa and Kaunitz upon Madame de Pompadour led the French Government to an Austrian alliance against Prussia and England. The result was disastrous, for France had to cope with the statesmanship of William Pitt as well as with that of Frederick the Great. The consequence was that France suffered the immeasurable calamity of losing India and Canada. Thus the scandals of the profligate court, the feeble and unskillful administration of domestic affairs, and the failures of foreign undertakings, conspired to weaken the power of the nation and strengthen the forces of discontent. The king was conscious of the perilous state of affairs, but he thought, "Après moi le déluge," and went on. The popular opposition to the horrible abuses of the royal authority began to show itself through the Parliament of Paris, whose privilege it was to countersign the royal tax-edicts, but which refused to do so. The resistance, however, was curbed with violence. The Parliament was broken up, its members punished and replaced by more willing tools. Society was disorganized. The nobility lost its courage and its love of country by giving itself up to the vices and frivolities that had been encouraged by the example of the court. The clergy was divided into two antagonistic interests; for the higher prelates had the rank of nobles and were able to impose heavy burdens upon the people, while they were exempt from the necessity of bearing burdens themselves. The lower clergy were generally devoted to their duties. The burgher or citizen class had grown in prosperity since the death of Louis XIV., but the peasantry was in a most wretched condition. About a quarter of the soil was in their hands; but the burdens of taxation were so excessive and the lack of capital so universal that every year thousands of them were reduced to the point of famine. Matters grew worse until the king's death, which occurred May 1, 1774. His reign, which extended over forty-nine years, was one uninterrupted calamity to the nation.—(16) Louis XVI. (1774–93), a grandson of Louis XV., b. Aug. 23, 1754, was a good-natured, well-meaning, honest man, of pure morals, and capable of making a sacrifice for the public weal, but his will was weak and his intellect narrow. He was unable to comprehend the situation, and he was entirely destitute of political instincts. Thus he hastened the approach of the Revolution. The finances, burdened by a new debt of 1,500,000,000 francs, contracted by the participation of France in the war of independence in North America, formed the point of issue. The annual budget showed a deficit of 140,000,000 francs. There were two remedies—restriction of the expenses, which the queen and the court opposed, and taxing the privileged classes, which the Parliament opposed. The king, incapable of deciding in such a dilemma, hoped to find a third expedient by appealing to the people; and thus it came to pass that he himself appealed to the Revolution. When he summoned the States-General, which had not met in 175 years, he afforded the opportunity for outbreak. When the representatives of the Third Estate (*q. v.*) were refused a seat with the other estates, they determined to take matters into their own hands. The Assembly became a prey to faction. The hopelessness of the situation led to all manner of excesses. The king was finally tried, condemned, and executed Jan. 21, 1793. (See France—*History.*)—(17) Louis XVII., a son of Louis XVI. and Marie Antoinette, b. at Versailles, Mar. 27, 1785; shared at first the imprisonment of his parents in the tower of the Temple, but was after the decapitation of his father separated from his mother, and died of ill-treatment and neglect in his cell (June 8, 1795). A number of impostors pretended to be Louis XVII., and excited some attention, but their claims were easily disproved.—(18) Louis XVIII. (1814–24), b. at Versailles, Nov. 17, 1755, a brother of Louis XVI., received at his birth the title of Count of Provence. In 1791 he fled, and lived in Coblentz, Verona, Milan, and England. After the death of Louis XVII. he assumed the title of King of France, but his pretensions elicited generally only a smile, and the court of emigrants he assembled around him often excited disgust. Nevertheless, after the fall of Napoleon he was called to the French throne. Both the French people and the foreign powers wished peace, and the re-establishment of the Bourbons was considered its only safe guaranty. There was, however, only one fraction of the French people with which the king was in full harmony—

from Greenwich

namely, the old emigrants, who hoped through him to get not only restitution, but also vengeance; and even these partisans he was compelled to disappoint in order to preserve his throne. His reign was a time of confusion and dullness, and in the actual process of restoration and reorganization, which went on silently and instinctively, he took no part. Personally, he was indolent, apathetic, good-humored, and shrewd in a small way. D. Sept. 18, 1824.

Revised by C. K. Adams.

Louis, Pierre Charles Alexander, M. D.: clinician; b. at Aï, Champagne, France, Apr. 14, 1787; graduated M. D., School of Medicine of Paris, in 1813; at the time of the French Restoration went to Russia, returning in 1820; worked in the Charité Hôpital with his friend Chomel, there conducting extensive investigations that gave the data for his famous works *Recherches pathologiques et thérapeutiques sur la phthisie* (Paris, 1825) and *Recherches anatomiques, pathologiques et thérapeutiques sur la maladie connue sous les noms de fièvre typhoïde, putride, etc.* (Paris, 1829). These researches served to establish the identity of typhoid fever as a separate disease. In 1828 he went to Spain with Chervin and Trousseau, commissioned by the French Government to study the effects of an epidemic of yellow fever. On his return he was appointed a physician to the Pitié Hópital, and later to the Hôtel Dieu. He was one of the foremost teachers in the world, and science and humanity are under great obligation for his investigations. His writings have been translated into many European languages. D. Aug. 22, 1872. S. T. Armstrong.

Louisa, Queen of Prussia: See the Appendix.

Louisburg: a famous fortress built by the French soon after the Peace of Utrecht (1713) upon the eastern coast of Cape Breton island, in lat. 45° 53′ 30″ N., lon. 60° W., receiving its name in honor of Louis XIV. The works constructed here were of the heaviest and most complete description, and were built of stone (see map of Quebec, ref. 1–D). A large and well-built town of some 3,000 inhabitants sprang up, favored by the spacious and excellent harbor. Since the existence of so strong a place threatened the colonial and British fisheries, it was determined in 1745 by the Legislature of Massachusetts Bay (France and Great Britain being then at war) to strike a blow at the town. Accordingly, a force of colonists, consisting of 3,250 Massachusetts militia, aided by 516 men from Connecticut and 304 from New Hampshire, set sail in 100 vessels, and landed near the town Apr. 30, 1745. An active but irregular siege (though the men were without tents and the proper means of conducting such operations) was terminated June 17, 1745, by the capitulation of the French under Duchambon —an event that caused the greatest joy throughout the British empire, but the Peace of Aix-la-Chapelle (1748) gave back all Cape Breton to France. The town was invested in 1758 by Gen. Amherst with 14,000 British troops, twenty line ships, eighteen frigates, and other vessels. After a tremendous bombardment, which quite destroyed the town and breached the walls badly, the garrison and French fleet surrendered July 26, 1758. The ruins still remain.

Louis d'Or, loo′ee′dōr′ [= Fr., liter., golden louis]: a French gold coin, first struck in 1641 under Louis XIII., not coined since 1795, but the name is often given to the twenty-franc piece or gold Napoleon, and to certain German five-thaler pieces. The value of the louis fluctuated considerably, but may be roughly stated to be about $5 in U. S. money.

Louisiade Archipelago: a group of islands off the southeast angle of New Guinea, of which they form an extension. They have belonged to Great Britain since 1885. The group extends about 300 miles, and consists of three large islands and numerous islets. The large islands are St. Rignan (nearest New Guinea; area, 106 sq. miles), Southeast island (area, 380 sq. miles), and Rossel (area, 300 sq. miles). Total area of group, 850 sq. miles. The inhabitants are Papuans. See Macgillivray, *Narrative of the Voyage of H. M. S. Rattlesnake* (2 vols., 1851). M. W. H.

Louisiana, loo-ee′zĕĕ-aa′na: one of the U. S. of North America (South Central group).

Situation and Area.—It lies between 89° and 94° W. lon. and 28° 56′ and 33° N. lat.; has an extreme length from E. to W. of 298 miles, and from N. to S. of about 280 miles; and is bounded on the N. by Arkansas and Mississippi, on the E. by Mississippi, on the S. by the Gulf of Mexico, and on the W. by Texas. It includes the entire delta of the Mississippi river, and within its area of 48,720 sq. miles are embraced 1,060 sq. miles of landlocked bays, 1,700 sq. miles of inland lakes, and 540 of river surface, leaving 45,420 sq. miles of land area.

Seal of Louisiana.

Physical Features.—The geology of the State reveals the Cretaceous, Tertiary, and post-Tertiary formations. The Cretaceous underlies the whole State, and crops out from N. to S. in St. Landry, Sabine, Winn, and other parishes; the Tertiary embraces the larger portion of the upland; while the post-Tertiary is represented in the loess found in elevated ridges and in the alluvial lands which form from one-third to one-half of the entire area. The highest measured point is 387 feet above sea-level, and is near Arcadia, Bienville parish. The land surface has been classified by Commissioner Poole as, good upland, 5,250,000 acres; pine hills, 5,500,000; bluff lands, 1,500,000; prairie, 2,500,000; arable alluvial, 2,250.000; pine flats, 1,500,000; coast marsh, 3,500,000. From an agricultural point of view there is very little waste land in the State. The pine flats are generally sandy and sterile, but, with irrigation and fertilizers, yield fair profits. The timber upon them is of great and increasing value, and is now rapidly marketed. The pine flats are noted as resorts in pulmonary cases for their sanitary results. The only lands not susceptible of culture, except at great cost, are portions of the coast marsh-lands, which, however, afford range and pasture for large herds of cattle and innumerable flocks of water-fowl. The uplands are fertile and healthful. The alluvial lands are of an inexhaustible fertility, the soil varying from 10 to 40 feet in depth. Lying, for the most part, along the banks of the Mississippi and its tributaries, they are liable to overflow unless protected by dikes or levees. Through the aid of the general Government in its efforts to improve navigation, and with the direct and vigilant care of the local authorities under State laws, the cultivation of these lands is yearly becoming more secure and remunerative. The prairies on the right, or south, bank of the Bayou Teche have, however, been considered the most favored and attractive section of the State. In fertility, health, climate, and exemption from overflow, they enjoy a peculiar combination of advantages.

Rivers, Lakes, etc.—The great river of Louisiana is the Mississippi, which traverses the State from N. to S. for nearly 600 miles. Indeed, the State is the creation and product of the river. In geological periods the whole State was covered by an arm of the sea. As the continent was upheaved, the waters of the inland sea to the N. were discharged through a vast channel many leagues wide; but as the upheaval continued, and the sources of supply were drained, the river gradually shrank to narrower limits and cut a deeper channel to the gulf. Then along the lowered banks of its final channel it deposited the fine loam which now constitutes the alluvial lands. Red river, one of the great tributaries of the Mississippi, after flowing along the northern boundary of Texas and traversing about half the length of Louisiana diagonally from the N. W., discharges its waters into the Mississippi. It is navigable for large steamboats throughout a great part of its course. In seasons of high water its floods are diverted into the Atchafalaya river, thus interfering with navigation and affording a problem that so far has baffled the best hydraulic engineers. Other navigable rivers are the Ouachita or Washita, the Bœuf, the Tensas, the Pearl, the Sabine, and the Calcasieu. The bayous are, properly speaking, outlets of larger streams, and to this class the Atchafalaya belongs. These bayous often broaden into lakes, and again contract to narrow streams, which at their mouths are lost in the frequent estuaries or bays, as Barataria, Atchafalaya or Berwick's, Vermilion, etc. The bayous are generally navigable, and with the indentations of the coast-line constitute an important system of commercial waterways, unsurpassed in the U. S. The total river front-

age is estimated at 4,258 miles. Several canals connect important streams.

Soil and Productions.—With its rich alluvial delta and fertile uplands, and a heavy rainfall well distributed, the State presents an agreeable contrast to the arid appearance of many States in the South and West, both in the extent and variety of its forest growths and in the luxuriance of its grasses. The conditions are highly favorable to varied and productive agriculture and horticulture. Almost all the fruits of the temperate and sub-tropical belts flourish, and orange-culture, principally carried on in Plaquemines parish, yields about 450,000 boxes annually. The banana, guava, and some other tropical fruits do well and bear in sheltered spots. The palmetto and date palm are abundant in New Orleans. More Northern fruits, as the apple, quince, and pear, are cultivated. The strawberry is grown successfully for the Northern market, and the blackberry and dewberry grow in profusion and are indigenous. The principal crops are sugar, cotton, and rice. Indian corn occupies a considerable place in the agriculture of the State, with an annual yield valued at from $12,000,000 to $16,000,000; but this is insufficient for home needs. Tobacco, also, of a very high quality, known as perique, is grown, but in limited quantities. Sugar-culture is the most important industry in the State, and is carried on in the southern belt. Under the Sugar Bounty Act the number of producers licensed to manufacture sugar in 1891 was 697, which was diminished in 1892 to 618, and in 1893 to 552, in both instances with a large increase in the crop. These changes were due to the establishment of central factories and improved methods of manufacture, requiring larger investments and better machinery. The production has been, in hogsheads of 1,000 lb. each, 1880, 218,314; 1890, 420,426; 1893, 445,857; 1894, 640,000; (1899) 295,680.

The cotton crop, which in 1879–80 was 508,569 bales from 864,789 acres, increased in 1889–90 to 659,583 bales from 1,270,885 acres; in 1891–92 to 780,000 bales from 1,283,000 acres; and in 1892–93 it was 435,000 bales from 1,155,000 acres. In 1891–92 Louisiana was the fifth among the ten cotton States in cotton production, and the second in yield per acre; in 1892–93 it was the seventh in production, and the third in yield per acre. 1891–92 was the unprecedented 9,000,000-bale year, and the year following was one of disaster. In 1898–99 it was the seventh in production and the second in yield per acre, with a production of 717,747 commercial bales from 1,281,691 acres. In 1900 there were 5 mills, with 62,220 spindles in operation, and 3 new mills building. Rice-culture was seriously undertaken in Louisiana on plantations that had failed in sugar from crevasses, low prices, or other misfortunes after the civil war. In 1885 the rice crop on the Mississippi and Bayou Lafourche amounted to 1,100,000 barrels, but in 1889 it had fallen to 477,000 barrels, owing to the restoration of plantations to sugar-culture. In the meantime, through the introduction of rice-culture in Southwest Louisiana by Western immigrants, the crop there amounted to 302,000 barrels; in 1890 to 700,000 barrels; and in 1891 and 1892 to three-fourths of the total output. Low prices in 1893 somewhat depressed this industry. The production of the State in 1898–99 was 107,792,000 lb.

Timber.—Louisiana, next to Arkansas, is the most heavily wooded State in the Union. The long-leaf pine lumber standing is estimated at 25,643,000,000 feet; the short-leaf pine at 20,978,000,000 feet. It is of very fine quality, and will average 4,000 feet to the acre, often running up to 10,000 and even 15,000 feet. The swamp cypress, a wood of the very best quality, is becoming an important industry. The rough boards have a value about double that of white pine. Live oak is found in abundance on the Gulf coast, and white oak is extensively used in the manufacture of barrel-staves, etc. The forests contain a great variety of valuable timber-trees, such as ash, sweet gum, hickory, black walnut, magnolia, many varieties of oak, cottonwood, willow, cedar, and elm.

Minerals.—There are marbles supposed to be of much value, but as yet they are not quarried to any great extent. A large and valuable deposit of sulphur exists in Calcasieu parish, but the engineering difficulties are so great that it has never been successfully worked. The well-known salt mine at Avery's island, in Iberia parish, is a deposit lying about 20 feet below the surface. It has been bored for 1,000 feet in depth without finding any change in the character of the deposit, which has a purity of 99·67 per cent. The output has been about 36,000 tons per annum, but it is capable of yielding ten times that quantity without difficulty. Lignite, carnelians, agates, fire-clay, and sandstone are also found on Avery's island, which is an isolated loess deposit in the alluvium. Ocher, marl, fire-clay, gypsum, kaolin, lead, sulphate of soda, sulphate of iron, and carbonate of lime occur in considerable quantities in the State. Petroleum is found at various points, but not in quantities to give it a commercial value. Copper has also been found. Quartz crystals, jasper, agates, carnelians, onyx, sardonyx, and feldspar abound in the Tertiary and loess.

Fauna.—The native fauna differs little from that of adjoining States. Black bears, wolves, wild-cats, and a few panthers are still found in the woods and swamps. Raccoons, opossums, squirrels, and hares, and all the smaller forest animals abound. The reptiles are very abundant, but hunters have rendered the alligator scarce. Birds, and especially water-fowl, are more numerous and of greater variety than in any other State in the Union. Game birds are found in great plenty, and attract many sportsmen in the winter season. The waters of the Gulf afford an abundant supply of the choicest varieties of fish. The pompano, Spanish mackerel, sheepshead, red snapper, redfish, sea trout, croaker, and many others are noted for flavor and abundance. In the inland waters a black bass is caught which is much esteemed. The oysters are of the finest quality, and very abundant. Shrimp, crabs, crayfish, and other shellfish are a common article of diet. The live stock does not constitute so important an interest relatively as formerly, or as it deserves. With some drawbacks, the country is favorable to animal life, especially if it receives due attention. The number and value of the live stock in 1899, exclusive of swine, which were not returned, was as follows:

ANIMALS.	Number.	Value.
Horses	145,029	$5,228,953
Mules	92,722	5,837,072
Milch Cows	123,232	2,704,942
Oxen	171,729	2,296,702
Sheep	113,205	179,203
Totals	645,917	$16,246,872

Climate.—The climate is mild and genial and little exposed to extremes in temperature. The greatest extremes of temperature, with the least annual rainfall and earliest and most frequent frosts, are naturally found in the north belt, while the coast district shows the greatest average annual rainfall, the lowest summer and highest winter maximum temperatures, and highest winter minimum temperatures. The difference between the several sections amounts to as much as twenty degrees in the annual range of temperature; for while the Gulf section has a highest maximum on record of 97°, the interior parishes have 103°; and while the minimum of the coast district in 1888–94 was 26°, for the interior and northern sections it was 13° and 11° respectively. The coast district has an average annual rainfall of 56·50 inches; grouped with the remainder of the southern section the average is 54·19; while the northern section has 48·20, or 6 inches less. The average for the State is 51 inches. The average precipitation at New Orleans in 1872–94 was 61·56 inches. The average date of the earliest frost in New Orleans, Dec. 19, is a month later than in the northern section. The annual range of temperature in the Gulf district is 62° and in the interior parishes 83°. While the rainfall greatly exceeds that of the interior States and the Northwest, the State has a very large percentage of clear days, 200 of the 365, or nearly 55 per cent. On only eighty-five days does rain fall at all. The prevailing winds of April to August inclusive are from the S. In October, December, January, and February N. and N. E. winds prevail. In February, March, September, and November they alternate, at the turn of the seasons. Considering the low levels, extent of swamp-lands, and moist, warm atmosphere, it is generally assumed that the climate is necessarily miasmatic and unhealthful. These conditions do not apply at all to the uplands, and in the southern belt the malarial influences are largely modified, even at sea-level, by the Gulf breezes, which blow constantly. The Acadians, French peasants, who have been settled on this coast for more than a century, are a stalwart race, and the other white inhabitants have health and strength above the average people of the country. By a rigid and continually improved system of quarantine and disinfection, pronounced by experts the most effective in the world, the yellow fever has been almost entirely excluded. There have been but two epidemics since 1859; one in 1867, the other in 1878.

Divisions.—For administrative purposes Louisiana is divided into fifty-nine parishes (which correspond with the counties of other States), as follows:

PARISHES.	* Ref.	Pop. 1890.	Pop. 1900.	PARISH-TOWNS.	Pop. 1900.
Acadia	10-C	13,231	23,483	Crowley	4,214
Ascension	10-E	19,545	24,142	Donaldsonville	4,105
Assumption	11-E	19,629	21,620	Napoleonville	945
Avoyelles	9-D	25,112	29,701	Marksville	837

Totals		1,118,587	1,381,625		

* Reference for location of parishes, see map of Louisiana.

Principal Cities and Towns, with Population in 1900.—New Orleans, 287,104; Shreveport, 16,013; Baton Rouge, 11,269; New Iberia, 6,815; Lake Charles, 6,680; Alexandria, 5,648; Monroe, 5,428; Crowley, 4,214; Donaldsonville, 4,105; Plaquemine, 3,590; Lafayette, 3,314; Thibodaux, 3,253; Houma, 3,212; Opelousas, 2,951; Franklin, 2,692; Natchitoches, 2,388; and Morgan City, 2,332.

Population and Races.—In 1860, 708,002; 1870, 726,915; 1880, 939,946; 1890, 1,118,587 (white, 558,395; colored, 560,192, including 333 Chinese, 39 Japanese, and 627 civilized Indians; native, 1,068,840, foreign, 49,747; males, 559,350; females, 559,237); 1900, 1,381,625.

Industries and Business Interests.—In 1890 there were 2,613 manufacturing establishments reported in the census, which employed $35,754,121 capital and 31,901 persons who received $13,159,564 as wages. There were 7 large mills employed in sawing swamp cypress, 189 in sawing other lumber, 132 planing-mills, 43 shingle-mills, and many other establishments employed in dressing lumber. The mills have a capacity of nearly 5,000,000 feet per day, and saw lumber to the value of $8,225,000 annually. The total forest products amount in value to $15,878,000 annually.

Finance.—The assessed valuation was $235,768,969 in 1890, and $276,568,507 in 1900. The total revenues derived from all privilege tax turned in by the sheriffs was $329,157.62. The license fees paid direct to the State treasury not embraeed in this statement were about $70,000.

Banking.—On Sept. 5, 1900, there were 21 National banks with a capital of $3,285,000, and deposits of $20,308,027.80; on June 30, 1900, 56 State banks, capital $3,630,210, deposits $12,683,333; and 2 savings banks, capital $200,000, deposits $3,284,892.

Railways.—The leading railway systems are the Illinois Central, the Southern Pacific, the Louisville and Nashville, the Texas and Pacific, the New Orleans and Northeastern, and the Vicksburg, Shreveport and Pacific. In 1850 the railway mileage was 80; 1860, 335; 1870, 450; 1880, 672; 1890, 1,739; 1900, 2,123.

Churches.—The French who settled Louisiana brought the Roman Catholic religion with them, and that was the only denomination there till the cession of the territory to the U. S. The first religious exercises under the auspices of Methodism were held in 1804; the first Protestant church in New Orleans was founded by the Episcopalians in 1805; the first Baptist church in the State was established in 1812; and the first Presbyterian in 1819. The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	206	204	211,763	$1,568,200
Baptist, colored	876	885	68,308	616,390
Baptist	482	477	27,736	333,977
Methodist Episcopal South	316	318	24,874	483,470
Methodist Episcopal	218	216	15,073	303,302
African Methodist Episcopal	81	115	13,631	193,115
Colored Methodist Episcopal	138	133	8,075	134,135
Protestant Episcopal	85	70	5,162	387,950
Presbyterians in the U. S.	64	54	4,926	433,985

While an occasional congregation is found dissenting from the principal Protestant organizations, Louisiana has probably fewer small sects than any other State.

Schools.—The first educational institution was a Roman Catholic convent and school for girls, established in New Orleans in 1727 by a party of Ursuline nuns who were sent from France for the purpose at the request of Bienville. In 1804 the College of Orleans was opened. This was in operation till 1825, when it was superseded by the College of Louisiana, which has since become Centenary College, under charge of the Methodist Episcopal Church South. The State was quite liberal in appropriations to literary institutions in 1812–45, granting them over $1,600,000, and to 1894 probably $3,000,000. The institutions of real college grade for white students are TULANE UNIVERSITY (*q. v.*), the Louisiana State University and Agricultural and Mechanical College, the State Normal School, Centenary College, and Jefferson College (Roman Catholic). There are four universities in New Orleans for colored students): the Southern (State institution); Straight (Congregational); Leland (Baptist); and the New Orleans (Methodist Episcopal North). The State University at Baton Rouge is endowed with the national land grant, was originally established in Rapides parish in 1860, under the superintendence of Gen. W. T. Sherman, and is doing useful work after many reverses. The State Normal School at Natchitoches was opened in 1885. Under the present constitution, the Legislature is required to provide public schools free for all children six to eighteen years of age. The State school fund was sold at auction and virtually confiscated during the reconstruction period, but the present constitution recognizes a free school fund of $1,130,867, bearing 4 per cent. interest, and the seminary fund of $136,000. The funds derived from the poll-tax, from the interest on sales of public lands and the proceeds of other real estate coming to the State, as well as from the general taxation for educational purposes, are set apart for the support of the public schools. In 1899 the total population of school age was 404,757; the enrollment in the public schools was—white children, 121,936; colored, 74,233; average attendance—white, 90,187, colored, 56,136; and the number reported in attendance in private schools—white, 11,896, negroes, 2,798. There were 4,157 teachers, as follows: white males, 1,455; white females, 1,617—total white, 3,072; colored males, 566; colored females, 549—total colored, 1,085. The total revenue for school purposes was $1,242,026.

Libraries.—In 1892 there were 32 public libraries of 1,000 volumes and upward each, which contained 200,618 bound volumes and 25,284 pamphlets. They were classified as follows: General, 4; school, 4; college, 14; college society, 3; law, 1; medical, 1; public institution, 1; Young Men's Christian Association, 1; scientific 1; art, 1; and society, 1. The State Library, founded in 1838, contained 41,000 volumes and 3,500 pamphlets, obtained chiefly by exchange.

The Howard Memorial Library was founded in 1889 by Annie T. Howard, with a building valued at $100,000, an endowment of $115,000, and 8,000 volumes, valued at $12,000, and has since received liberal donations from the Howard family. The libraries of Tulane University contain 27,000 volumes.

Charitable and Penal Institutions.—The charitable institutions of the State and of New Orleans especially, founded and supported in whole or in part by private charity, are very numerous. Among the public institutions are the Louisiana Institution for the Deaf and Dumb at Baton Rouge, founded in 1852, and receiving from the State an annual appropriation of $14,000; the State School for the Blind at Baton Rouge, established in 1851; the State Insane Asylum at Jackson, established in 1847, and receiving an annual State appropriation of $90,000; the Soldiers' Home at New Orleans, authorized in 1866 and in operation since 1883; the State Penitentiary at Baton Rouge, established in 1822, and conducted on the leased-labor plan; and the Touro Infirmary, established on a bequest of Judah Touro, supported chiefly by Israelites, with buildings valued at $100,000, unsectarian in its benevolence, and costing annually for maintenance about $30,000. One of the most noted institutions is the Charity Hospital in New Orleans, founded in 1786 by Don Andres Almonaster y Rosas, and receiving an annual appropriation from the State of $80,000. In fifty-eight consecutive years, excepting 1863, its admissions aggregated 449,453, discharges 374,864, and deaths 66,134.

Political Organization.—The political organization of the State closely resembles that of its sister States. Still the constitution adopted in 1879 presents some peculiarities. The executive department consists of the Governor, lieutenant-governor, auditor, treasurer, and secretary of State, all elected for four years. The Governor has the veto power, subject to a reversal by the Legislature; has the pardoning power, on the recommendation of a board of pardons; has unusually large powers in the appointment of officers; appoints the five judges of the Supreme Court, who hold office for twelve years, and also appoints all officers whose selection is not otherwise provided for in the constitution, and the patronage under this clause is immense. Five courts of appeals, with two judges each and a jurisdiction of from $100 to $2,000, were created, but have been found cumbrous and useless. The judges are elected by the General Assembly in joint session. There are twenty-six district courts, with original civil jurisdiction of all matters over $50, and unlimited original jurisdiction in all criminal, probate, and succession matters. They try appeals from justice in cases involving more than $10. District judges are elected by a plurality of qualified voters in their respective districts. The legislative power is vested in a Senate of not more than 36 nor less than 24 Senators, and a House of Representatives of not more than 98 nor less than 70, elected for four years, which causes some anomalies in the election of U. S. Senators. The General Assembly has no power to contract, or authorize the contraction of, any debt or liability on behalf of the State, except to resist invasion or insurrection; and it can not pass any local or special law except for a few specified objects, such as general appropriations for the ordinary expenses of government, for interest on the public debt, and for public schools and charitable institutions. All other appropriations are made by separate bills, each embracing but one object. A liberal homestead exemption is provided for.

History.—The first Europeans who set foot on the soil of Louisiana were Alvarez de Pineda and his companions, who in 1519 entered the mouth of the Mississippi, and spent six weeks on its banks. They found the Indians friendly and living in large towns. Ten years later the ill-fated expedition of Pamphilo de Narvaez touched at the mouth of the Mississippi. In 1541 Hernando de Sota, after three years' wanderings, crossed the Mississippi to perish, after incredible hardships, in the wilderness. This was the end of Spanish exploration. Robert Cavalier de la Salle made several attempts to explore the great river, but it was not until 1682 that he succeeded in descending it to its mouth. Then he took possession of the land for his king, Louis XIV. of France, and named it in his honor. La Salle's success gained him such credit that the king granted him the right to found a colony, and furnished him four ships and 280 colonists for his expedition. On New Year's Day, 1685, they came in sight of land, but their bearings had been too far to the W., and a landing was made in Matagorda Bay. The expedition wholly failed in its purpose. In 1698 the Count de Pontchartrain, Minister of Marine to Louis XIV., and his son Jérôme, Count de Maurepas, projected an expedition to colonize Louisiana, which was placed in charge of Pierre le Moyne d'Iberville. D'Iberville, with his younger brother, Jean Baptiste Le Moyne, Sieur de Bienville, made a landing at Pensacola Bay, which he found occupied by the Spaniards, whence he proceeded to explore Mobile Bay and the shores to the W. of it, and on Feb. 27, 1699, entered the mouth of the Mississippi and established a colony at Biloxi. Here the history of Louisiana really begins. For years Iberville, and after him his brother Bienville, maintained the infant colony against difficulties and embarrassments beyond the usual measure of colonial settlement. In 1718 he founded the city of New Orleans, named in honor of the Duke of Orleans, regent of France. In 1712 a royal charter granted Louisiana to a rich merchant, Antoine Crozat, as a trading establishment, but he surrendered his charter in 1718, and another was granted to the Company of the West, a monopoly under the control of JOHN LAW (*q. v.*), who obtained various privileges of trade and colonization, which, however, finally inured to the benefit of the colony. In 1722 Bienville was authorized to remove the capital from Biloxi to New Orleans, and in 1724 he was recalled to France. In 1731 Louisiana was declared a royal province; in 1733 Bienville was again made Governor, and in 1743, at his own request, he was relieved and returned to France after forty-five years of service to the colony. He was succeeded by the Marquis de Vaudreuil. In 1763 France, by the Treaty of Paris, surrendered to Great Britain all her territory E. of the Mississippi, except New Orleans and the adjacent district. On the same day, by a secret treaty, France ceded to Spain all the rest of her territory in America. When the latter fact became known in Louisiana the colonists sent petitions to the king imploring him not to expatriate them, but without avail. Noxious regulations, promulgated by Don Antonio de Ulloa, the Spanish governor, who landed in 1767, led to open revolt, a second petition to the king, and the sudden appearance of Count O'Reilly, lieutenant-general of the Spanish army, with a strong fleet and military force. New Orleans was seized, a Spanish code substituted for existing forms of government, and a year of tyranny ensued. O'Reilly was succeeded by Don Luis de Unzaga, who gave the colonists a mild and judicious administration from 1770 till 1777. He was followed by Don Bernardo Galvez, who, after the declaration of war by Spain against Great Britain, captured Baton Rouge, Natchez, Mobile, and Pensacola, and secured the surrender of all West Florida to Spain. In 1785 Miro became Governor, and in 1792 Baron Carondelet, who remained till 1797. The wealth and culture of the province were greatly increased under both of these administrations. From 1797 till 1803 Gayoso de Lemos, Don Francisco Bouligny, the Marquis de Casa Calvo, and Don Juan Manuel de Salcedo succeeded each other as Governors.

On Oct. 1, 1800, Napoleon made a secret treaty with Spain by which Louisiana was restored to France, with its former boundaries, and on Apr. 30, 1803, he sold the province to the U. S. for $15,000,000. The territory was formally transferred on Dec. 17 following; the part now known as Louisiana was organized by Congress as the Territory of Orleans on Mar. 26, 1804, and it was admitted to the Union as a State on Apr. 30, 1812. (For the military operations in Louisiana in the war of 1812–15, see NEW ORLEANS.) In 1845 a new constitution was adopted, abolishing the property qualification for voters and introducing other important features, including an anti-duelling clause, which was made more stringent in the constitution of 1852.

At the beginning of the civil war the importance of New Orleans as a strategical point was self-evident, and its possession was one of the earliest objects of the Federal Government. (For the naval operations, see FARRAGUT, DAVID GLASGOW, and PORTER, DAVID DIXON; for military operations, see BANKS, NATHANIEL PRENTISS; BUTLER, BENJAMIN FRANKLIN; and TAYLOR, RICHARD). During the reconstruction period New Orleans was the scene of long-continued excitement, of conflicts between the White League and the metropolitan police, and of Federal military intervention. In 1877 President Hayes withdrew the support of the U. S. troops from the State government, headed by Stephen B. Packard, whereupon the government, headed by Francis T. Nicholls, assumed the administration of State affairs. In 1879 a new constitution was adopted, the chief provisions of which are given above. In this year also JAMES B. EADS (*q. v.*) completed his jetties in the South Pass, which have opened

the mouth of the Mississippi to vessels of the heaviest draught. The levees, which had been greatly neglected and broken, were taken in hand, and much progress was made; but in 1882 a great flood produced 284 crevasses, and swept away 56 miles of levees. Unusual efforts were, however, put forth by the localities directly affected and the State, and aid was liberally given by the U. S. Government, so that in the flood of 1890, which was higher than that of 1882, in 1,100 miles of levees there was only a breakage of 4½ miles. In 1878 4,000 persons died of yellow fever in Louisiana. This was the last epidemic. A sanitary system of disinfection of vessels was established by Dr. Joseph Holt at the quarantine station at the mouth of the Mississippi river, which has since effectually excluded this pestilence, and is considered the best in the world. In 1884 a centennial exposition, to celebrate the export of the first shipment of cotton in 1784, was held in New Orleans. Though its glories pale before those of the World's Columbian Exposition, and the season was the most unpropitious on record, it contained notable features and had valuable results. In 1891 a very bitter political contest occurred over granting a renewal of charter to the Louisiana Lottery Company. When the U. S. Government refused the use of its mails to the lottery company, that corporation withdrew its offer to pay a large sum for its privileges, and the anti-lottery party elected its candidates.

GOVERNORS OF LOUISIANA.

Territory of Orleans.	
W. C. C. Claiborne	1804–12

Murphy J. Foster	1896–1900
William Wright Heard	1900

AUTHORITIES.—The earliest history of Louisiana is that of Le Page du Pratz, who lived in the colony in 1717 (London, 1774). For original authorities, see Pierre Margry's *Mémoires et Documents* (6 vols., Paris); also *Notes et Documents*, in MSS., belonging to the Louisiana Historical Society; and B. F. French's *Historical Collections of Louisiana*. The most extended history is that of Charles Gayarre (4 vols., New Orleans, 1879), which is very full as far as 1815, and contains the annals of Louisiana to the civil war. Another valuable work is F. X. Martin's *The History of Louisiana from the Earliest Period* (2 vols., New Orleans, 1827). It extends to 1815. The latest work is *A History of Louisiana*, by Grace King and J. R. Ficklen (New Orleans, 1893). For complete bibliography of works on certain periods of Louisiana history, see *Narrative and Descriptive History of America*. WILLIAM PRESTON JOHNSTON.

Louisiana: city; Pike co., Mo. (for location of county, see map of Missouri, ref. 3–I); on the Mississippi river, and Burl. and the Chi. and Alton railways; 115 miles N. W. of St. Louis. It is in a fruit-growing and lumber region; has steam flour, planing, and lumber mills, machine-shops, tobacco-factories, stone-quarries, lime-works and nurseries, and contains McCune College (Baptist, opened 1880), high school, public-school library, gas and electric light plants, and a weekly and two semi-weekly newspapers. Pop. (1880) 4,325; (1890) 5,090; (1900) 5,131. EDITOR OF "PRESS."

Louis le Débonnaire, loo'ee'le-dā'bō'nār', or THE PIOUS: Roman emperor from 814 to 840; b. at Casseneuil in 778; a son of Charlemagne by his third wife, Hildegard. His elder brothers having died, he succeeded his father Jan. 28, 814, and the first years of his government were quite successful, but in 817 he yielded to the wishes of his sons, and gave each of them a share in his dominions, and hence arose complications which resulted in the dissolution of the empire. Lothaire received Austrasia and the title of emperor; Pepin, Aquitania; and Louis, Bavaria, Bohemia, and the Avarian districts on the eastern frontier. Bernard, a nephew of Louis, who had inherited Italy after his father, received nothing, and revolted, but the emperor allured him to Châlons, took him prisoner, put out his eyes, and gave Italy to Lothaire. As soon as done the atrocity of the deed struck the mind of the emperor with horror; he went to the Church to be comforted, and from this period he was merely a tool in the hands of the clergy. In 819 he married a second wife, Judith of Bavaria. In 823 she bore him a son, Charles, who later received the surname of THE BALD, and in 829 he proposed to undertake a new division of the empire in favor of his youngest son. The three elder brothers were unwilling to lose anything, and a war broke out which, often stilled, always reopened, and lasted to the death of the emperor. Twice the father was defeated, taken prisoner, deposed, and subjected to various indignities by his three sons, but both times the avarice and ambition of Lothaire, who wished to reign alone, disunited the brothers, and Louis and Pepin again raised their father to the throne. Pepin died in 838, and the emperor proposed to give his dominions to Charles the Bald, thus excluding his sons from their inheritance; but when he at the same moment gave Italy and Austrasia to Lothaire and nothing to Louis, the latter revolted immediately, together with the sons of Pepin. During this war the unhappy emperor died at Ingelheim, near Mentz, June 20, 840, and was buried at Metz.

Louis Napoleon: See NAPOLEON III.

Louis Philippe: King of the French from the revolution of July, 1830, to that of Feb., 1848; b. in Paris, Oct. 6, 1773; the eldest son of Duke Louis Philippe Joseph of Orleans, known as Philippe Égalité. From his father and governess (Madame de Genlis) he imbibed the revolutionary ideas of the period, entering the National Guard and the Jacobin Club, and renouncing his titles for the name of Citizen Égalité. He greatly distinguished himself as General de Chartres in the battle of Jemappes, and, what is not so well known, made the journey to Paris to dissuade his father from voting for the death of Louis XVI. Though the edict which banished the Bourbon family exempted him and his father, his position became difficult, especially as his commander, Dumouriez, was suspected by the Convention of intriguing to place him on the throne. Orders of arrest were issued both against him and Dumouriez, and on Apr. 4, 1793, they fled across the Austrian frontier. For more than twenty years he was an exile, often contending with very hard circumstances, as shortly after his flight his father was executed, his mother banished from France, and all the property of the family confiscated. He lived for some time in Switzerland, where he taught mathematics in a school; passed some time traveling in the north of Europe; lived from 1796 to 1800 in the U. S.; from 1800 to 1807 at Twickenham near London; and after 1809 at the court of Ferdinand I. of Sicily, whose daughter, the Princess Marie Amélie, he married. He twice attempted to join the adherents of the Bourbon family in Spain, but was both times foiled by British diplomacy. After the fall of Napoleon he returned to Paris, was reinstated in the possession of the immense property of the Orleans family, taking up his residence in the Palais Royal; but, although a reconciliation had taken place between him and the elder line of the Bourbon family, the king, Louis XVIII., disliked, suspected, and feared him. The Duke of Orleans, as was now the title of Louis Philippe, was a man of great gifts and of great attainments, eloquent, accomplished, fascinating, with vivid instincts and large views, shrewd and sound in his judgment of persons and things. Alexander of Russia marked him out as the most prominent member of the Bourbon family, and although he lived in a rather retired manner in Paris and took very little part in politics, he soon became very popular. On the outbreak of the revolution of July, 1830, the Chamber of Deputies, after deposing the king, chose him lieutenant-general of the realm, Charles X. recognizing him as such and hoping through him to preserve the throne for the Count of Bordeaux. Whether this could have been done is doubtful; the crown was offered by the Chamber of Deputies to Louis Philippe, who accepted it, though henceforth he was considered by the pure legitimists disloyal to the cause of legitimacy. His reign of eighteen years shows a series of commonplace events, but France received some substantial benefits from his government. The foundation of the kingdom of Belgium, which protected the northern frontier, and the conquest of the large and beautiful colony of Algeria are among the most notable, and may well be set off against what have been considered the reproaches of his reign. Louis Philippe

was both a statesman and a shrewd administrator, but his government was too little in sympathy with the feelings of the French people; many causes of discontent arose, accompanied with charges of corruption in the ministry. An extension of the elective franchise was demanded. Resisted by the king, the revolution broke out which deprived him of his throne and banished him from the country. As the revolution was without adequate reason, it paved the way for lawlessness and discontent and the consequent advent of Napoleon III. D. at Clermont, near London, Aug. 26, 1850. The best authorities on the reign are Guizot, *Memoirs*; Blanc, *History of Ten Years*; Hillebrand, *Geschichte Frankreichs*; Lamartine, *History of the Revolution of 1848*; Normanby, *A Year of Revolution*.

Revised by C. K. Adams.

Louis the German (Germ. *Ludwig der Deutsche*): b. about 805; a son of the Emperor Louis le Débonnaire; received by the first division of the empire of Charlemagne (in 817) Bavaria and the Slavic countries on the eastern frontier, but by the treaty of Verdun in 843, which ended the war between the heirs of Louis le Débonnaire, he obtained the whole territory E. of the Rhine, and became the founder of the German empire. Invited by the discontented vassals of Charles the Bald, he broke into France in 858, and conquered the country, but the difference between the Eastern and Western Franks—that is, between the Germans and the French—were at this period so great that a union of the two tribes proved impossible, and Louis was compelled to give up his conquests. Against the Bulgarians in the southeast and the Normans in the northwest he fought with valor, though not always with success; the bishopric founded at Hamburg in 834 he was compelled to remove to Bremen in 858, as the pagans burned down the former city. After his death in 876 his sons divided the empire between them.

Louis the Great: King of Hungary from 1342 to 1382; b. 1326; a son of Charles Robert of Anjou; was one of the most successful of the elective monarchs of that country. Although he failed in his expeditions to Naples for the purpose of avenging his brother Andrew, who had been murdered by his wife Joanna, Queen of Naples, he extended the boundaries of Hungary to the S. E., and united Poland to it on the death of Casimir the Great in 1370. He expelled the Jews, but by decreasing the duty on merchandise he greatly encouraged the commerce of the country. On the general development of civilization in his realm he exercised great influence. He founded a rich college in Fünfkirchen, and Buda became one of the most splendid capitals of Europe. D. in 1382.

Louisville: the chief city of Kentucky and capital of Jefferson County; situated at the falls of the Ohio river, in lat. 38° 15′ N., and lon. 8° 45′ 52″ W. from Washington (for location, see map of Kentucky, ref. 3-G).

Situation and Area.—The city has an area of 20.28 sq. miles. It stands on the south bank of the river, 441 feet above sea level, 70 feet above low water, and beyond the reach of hurtful inundations, in a rich agricultural country, kept perennially productive by the decay of underlying Silurian and Devonian rocks, and within easy reach of inexhaustible forests of timber and mines of coal and iron.

Plan and General Appearance.—Viewed from the Indiana shore its river-front presents a graceful crescent, 8 miles in length, and from a central elevation on its northern boundary the perspective of broad streets lined with handsome houses and beautiful shade-trees for 4 miles to the S. is very striking. Its plan is that of a series of named streets parallel with the river from E. to W., and numbered streets cutting them at right angles from N. to S. Except Broadway, which is 120 feet wide, and Main, Market, and Jefferson, each of which is 90, nearly all of the streets are 60 feet wide. They are well paved with granite blocks or asphaltum, and electric cars run to all parts of the city.

Louisville is one of the most healthful cities in the world. The death-rate in 1900 was 15.52 to the thousand, and it has not been more in a long series of years, while in some years it has been much less.

Parks and Squares.—The original plan of Louisville embraced parks and public squares, but the early trustees sold all of them except enough for the court-house and jail. In 1892 a wiser policy prevailed, and grounds were purchased for parks and public squares. In the E. is Cherokee Park, containing 333 acres; in the W., Shawnee Park with 167 acres; and in the S., Iroquois Park, embracing 673 acres. Shawnee Park is a level plain on the bank of the Ohio, Cherokee Park is riven by waterways into plains, undulations, and ravines, and Iroquois Park is richly wooded. Baxter and Boone Squares and Kenton and Logan Places are in the thickly settled parts of the city.

Public Buildings.—A characteristic of the buildings is the ample ground on which they stand and the shade-trees which adorn the grounds of the private residences. The court-house in the Doric, the city-hall in the Renaissance, and the post-office in the mixed style of architecture are imposing structures. Among the more notable buildings may be mentioned the Columbia building, the American National Bank, the Louisville Trust Company, the Louisville Medical College, and the Lonisville Male High School.

Churches.—Louisville has 212 churches. Of these the Baptists have 56, the Disciples 14, the Episcopalians 17, the Evangelical Associationists 11, the Israelites 6, the Lutherans 8, the Methodists 39, the Presbyterians 23, the Roman Catholics 28, the Spiritualists 4, Unitarians 2, and the Christadelphians, Seventh-day Adventists, United Brethren in Christ, and Congregationalists one each. Some of them, especially the Warren Memorial, the Calvary, St. Paul's, the Cathedral, and the Broadway Baptist, are fine specimens of ecclesiastical architecture.

Education.—The city maintains 55 public schools in large brick buildings, attended by 27,000 pupils, at a cost per year of $608,774. The male and the female high schools are really colleges of a superior order. Others are the Normal School and a manual training-school. There are as many private schools as public. There are also 8 medical colleges, 4 theological seminaries, a law school, a school of dentistry, 2 schools of pharmacy, an art school, a number of music salons, and various other schools. The State school for the blind is located here. Attached to it is the Printing House for the Blind, supported by a Federal appropriation. It prints books for all the institutions for the blind in the Union.

Libraries.—The only public library is that of the Polytechnic Society, which has about 50,000 volumes. There are however, such libraries as that of the Baptist Theological Seminary, the Louisville Law School, and the medical department of the University of Louisville, which almost serve the purposes of public collections. There are several large and valuable private libraries, one of which has 50,000 books, pamphlets, periodicals, maps, and manuscripts.

Hospitals, Asylums, etc.—Louisville is well provided with hospitals, asylums, infirmaries, orphanages, homes, etc., having no fewer than thirty-five.

Finance.—The property within the city limits was assessed for 1901 at $124,100,000. A tax-rate of $1.50 per $100 laid on this sum yields $1,733,056.50 net for the expense of the city government. In addition to this tax a considerable sum is raised from licenses, etc., for the sinking fund. This income, added to the cash assets already accumulated in the sinking fund, to the amount of $1,087,202, enables it to meet the annual interest of the bonded debt of the city, amounting to $8,206,000, and to liquidate the principal as it falls due.

Manufacturing and Business Interests.—The census of 1890 showed that 1,622 manufacturing establishments (representing 131 industries) reported. These had a combined capital of $30,542,947; employed 24,807 persons; paid $11,034,028 for wages and $22,879,000 for materials; and had products valued at $45,452,209. In one year the Dennis Long Foundry uses 90,000 tons of iron in making water and gas pipes; the Avery Works manufacture 400,000 plows; the Kentucky Works make 30,000 wagons; and the Ballard Mills make an average of 1,000 barrels of flour each day. The tanners use in a year 320,000 Kentucky hides, out of which they make 12,800,000 lb. of leather, with Kentucky bark; the distillers make 28,000,000 gal. of Bourbon whisky; the mills make 2,000,000 barrels of hydraulic cement; the looms weave 7,500,000 yards of jeans; and the warehouses handle 175,000 hogsheads of tobacco.

There are thirteen banks with a capital of $6,373,600, a surplus of $2,679,500, and an average daily deposit of $31,194,780. There are also 3 trust companies with a capital of $2,806,100 and a surplus of $1,034,400.

Means of Communication.—Three bridges across the Ohio connect Louisville with the neighboring cities of Jeffersonville and New Albany; and a canal around the falls, 2½ miles long, removes all serious obstructions to the navigation of the Ohio river. Its position on the bank of the Ohio connects it with 2,000 miles of navigable rivers in Kentucky, and 33 navigable rivers in the Mississippi valley. The five railways that enter it on the Kentucky side give it connec-

tion with 3,629 miles of railway in this State, while the five that enter it from the Indiana side extend its connections to the great railway system of the U. S.

History.—On May 27, 1778, Gen. George Rogers Clark, on his way to the conquest of the Illinois country, landed on a little island in the Ohio river, at the falls, forty-nine white men, women, and children, and one Negro, who had come on his boats from Redstone as emigrants to Kentucky. In the fall of 1778 and the spring of 1779 these families moved from the island to the shore, and on Apr. 17, 1779, with others who had joined them, established the town of Louisville, and placed it under the government of seven trustees. The Legislature of Virginia, in whose county of Fincastle the new town was located, passed an act which took effect May 1, 1780, recognizing this town of Louisville and giving it corporate existence. The town continued to be governed by trustees until 1828, when the Legislature of Kentucky granted it a charter, which lodged the governing power in a mayor and council. This first charter lasted until 1851, when it was superseded by a second, and this second, in 1870, was abolished by a third. A fourth charter which made radical changes in all previous organic law went into effect under the new constitution of Kentucky in 1892. By it was inaugurated a board of public works and a board of public safety, which will take much of the power of the city heretofore vested in the mayor and council.

Population.—The U. S. census of 1790 does not give the population of Louisville, and that of 1800 gives it only 359. Its population from other sources is reliably estimated at 100 in 1780, and 600 in 1800. The census of 1830 gives it as 10,341, of 1880 as 123,758, of 1890 as 161,129, and that of 1900 as 204,731, an increase over that of 1890 of 27.06 per cent. In 1890 it was the twentieth city in population. In 1900 it was the eighteenth. J. Stoddard Johnston.

Lounsbury, Thomas Raynesford: scholar and author; b. at Ovid, N. Y., Jan. 1, 1838. He graduated at Yale in 1859, and was engaged upon *The American Cyclopædia* until 1862. In the latter year he was commissioned first lieutenant in the 126th Regiment of New York Volunteers, and served until the close of the civil war. In 1870 he was appointed instructor and in 1871 Professor of English in the Sheffield Scientific School of Yale University. Among his publications are editions of Chaucer's *Parliament of Foules* (1877); a biography of James Fenimore Cooper (1883); a *History of the English Language* (1879); and exhaustive *Studies in Chaucer* (3 vols., 1892). H. A. Beers.

Lourdes, loord: a town of the department of Hautes-Pyrénées, France; the capital of a canton, the seat of the civil court of the arrondissement of Argèles; 12 miles S. W. of Tarbes, on the Gave de Pau (see map of France, ref. 9–D). Marble and slate quarries are extensively worked in the vicinity. The town is chiefly noted for the grotto of Massavielle, in which Roman Catholics believe the Virgin Mary revealed herself frequently in 1858 to a peasant girl. A large church has been built above the grotto, and the place is visited by pilgrims from all parts of the world. The town has considerable trade in rosaries and in the water of its miraculous fountain. See Zola's *Lourdes* (Paris, 1894). Pop. (1896) 7,758.

Lourenço Marques, loo-ren'sō-maar'kās: the most southern settlement of the Portuguese in East Africa (see map of Africa, ref. 9–G). The present town was founded (1867) on the site of an old village of the same name on Delagoa Bay, which affords the best harbor on the east coast S. of Zanzibar. It is a regular port of call for steamers from Lisbon, Hamburg, and Dartmouth, is connected with Europe by the cable laid along the East African coast, and is the terminus of the Delagoa Bay and East African Railway, completed in 1887 to the Transvaal frontier, 57 miles, and extended by the South African Republic, 200 miles farther west to Pretoria, in the summer of 1895. C. C. Adams.

Louse [M. Eng. *lous* < O. Eng. *lūs* : O. H. Germ. *lūs* > Mod. Germ. *laus*, louse]: any wingless insect that infests animals or plants. The plural of louse is Lice (*q. v.*).

Louth, lowth: county; in the province of Leinster, Ireland; bounded E. by the Irish Sea and S. by the Boyne. Area, 316 sq. miles. The surface is mostly level or slightly undulating, except in the northern part, where it is traversed by a mountain range ending in Mt. Carlingford, 1,935 feet high. Wheat, oats, barley, and potatoes are raised, and cattle of a good breed are reared. Pop. (1891) 71,038. The seacoast is mostly low and sandy. The most important rivers are the Fane, Lagan, Glyde, and Dee, all of which flow eastward. The principal towns are Drogheda and Dundalk.

Louvain, loo'văñ' (Flem. *Leuven*; Germ. *Löwen*; anc. (Lat.) name *Lova'nia*): city of Belgium; in the province of Brabant, on the Dyle; 19 miles by rail E. of Brussels (see map of Holland and Belgium, ref. 10–E). In the fourteenth century it had 200,000 inhabitants, and was one of the largest manufacturing cities in the world, employing 15,000 workmen in cloth-manufacturing alone, but its attempt to vindicate its independence with the other towns of Flanders was defeated, and it lost most of its wealth and importance. In the sixteenth century its university, attended by 6,000 students, was one of the first scientific institutions in Europe, celebrated especially for its department of Roman Catholic theology, but during the French Revolution the university was suppressed, and although it was reconstituted in 1817 it has not regained its past glory. It has about 1,600 students. Many buildings attest the former splendor of the city; as, for instance, the town-hall, one of the richest existing structures of Gothic architecture, and the cathedral. Generally speaking, Louvain is a quiet place, but it has important breweries, bell-foundries, paper-mills, and tanneries. Pop. (1891) 40,698.

Louverture, or **L'Ouverture**, Toussaint: See Toussaint Louverture.

Louvet de Couvray, loo'vā'de-koov'rā', Jean Baptiste: politician and author; b. in Paris, June 11, 1760; received a very insufficient education, and was clerk in a bookseller's store when his romance, *Les Aventures du Chevalier Faublas* (13 vols., 1787–89), suddenly made him famous. In 1790 followed another romance, *Émilie de Varmont*, dealing with the question of divorce—less frivolous than *Faublas*, though more radical. Under the ministry of Roland he began the publication of a periodical, *La Sentinelle*, noted for its violent attacks on royalty. Having been elected a member of the Convention, he proved one of the greatest orators of that assembly. He attacked Robespierre with eminent courage as the originator of the September massacre, but after the defeat of the Girondists, his allies, he was compelled to flee and to hide himself till the fall of his great antagonist. He then returned to the Convention, and was member of the Council of Five Hundred. He had made many enemies, however, and these attacked him with great virulence, both in his public career and in his private life. An especial handle against him was made of his relations to a beautiful woman, whom he called Lodoiska, who deserted her husband for him, and whom he subsequently married. Before he died he wrote an autobiographic account of the most perilous part of his life: *Quelques notices pour l'histoire et le récit de mes périls depuis le 31 mai, 1793* (1795). D. Aug. 25, 1797. His wife, who was much devoted to him, attempted to poison herself, but was saved.

Revised by A. R. Marsh.

Louvois, loo'vwăa', François Michel le Tellier, Marquis de: statesman; b. in Paris, France, Jan., 1639; bought the right of succeeding his father in the office of Secretary of War; applied himself with great energy and assiduity to the study of all the details of the business, and took charge of the whole department in 1668; in a few years created the largest, most effective, and most brilliant army modern Europe had seen, introduced perfect discipline, established regular grades of rank in the command, and gave each of the different arms its perfect development by founding separate schools of engineering, artillery, and cavalry. His genius showed itself still more brilliantly when this army came to be used in war. All its movements were accomplished with an order, rapidity, and precision which doubled its effect and led to astonishing successes. He was extremely ambitious; to keep himself in office, and to make his office the most important in the kingdom, was his sole aim, and the advice, political and military, which he offered in the king's council was exclusively governed by this aim, often to the great detriment of the country. Still more detestable were the means he applied. The devastation of the Palatinate, one of the greatest barbarities of modern times, was his plan, as also the idea of using dragoons for converting the Huguenots. After the death of Colbert in 1683 he also assumed the administration of the finances, but, knowing no other expedients than extortions and loans, he soon ruined the finances and exhausted the country. The last years of his life were spent in great anxiety. He had become very exacting and overbearing, and the king, who was

easily irritated by any want of submission, treated him coldly and even slightingly; and had just made up his mind to throw Louvois into the Bastile when the latter died suddenly, July 16, 1691.

Louvre, loovr, **The** (transl. of Fr. *Palais du Louvre*): an ancient palace of the Kings of France, which throughout the nineteenth century has been used chiefly as a museum of art, in Paris, close to the north bank of the Seine. Throughout the Middle Ages the Louvre was a strong castle, which owed its chief character to the Kings Philip Augustus and Charles V. Francis I. destroyed the old keep, and his successors began and carried on a structure on all sides of a square court, and four times the size of the old castle, besides some galleries carried southward and westward along the river. The palace of the Tuileries stands a third of a mile farther W., and the kings from Henry IV. on were always aiming at the extension of the one building to connect with the other, but this was difficult on account of the crowd of small houses, churches, and narrow streets which were in the way, and it was only completed under Napoleon III. During the Communist revolt of 1871 the buildings of the new galleries were very seriously damaged by fire.

The museum of the Louvre is the most extensive and varied of Europe. It includes almost everything that has ever been considered material for a public collection of works of art; paintings both ancient and modern, and in immense number and great variety of schools and epochs; a splendid collection of drawings by the greatest masters; sculpture, Egyptian, Assyrian, Greek (though not very rich in this), Roman and Græco-Roman, mediæval, Renaissance, post-Renaissance, and modern; Greek and Etruscan vases in great numbers; vases and cups of rich material and in splendid mountings (the finest collection in the world); an immense Egyptian collection; majolica, carved wood, bronze, ivory, furniture, and tapestries. It is open free every day in the year except Mondays, when the galleries are closed for cleaning. The catalogues are very incomplete, but some of the volumes are of great utility as books of general reference. RUSSELL STURGIS.

Lovat, SIMON FRAZER, Lord: b. in Scotland about 1667, grandson of the ninth and cousin of the tenth lord, by whose will he succeeded to the title and estates; but in order to strengthen his title he endeavored to get possession of the sister of the late lord, and failing in the attempt seized upon the widow, whom he compelled to marry him. These daring acts provoked reprisals, and Lord Lovat was for several years obliged in self-defense to maintain an attitude of insurrection against the constituted authorities. On the accession of Queen Anne he was outlawed and forced to flee to the Continent, where he led a mysterious life for twelve years. On the outbreak of the Jacobite insurrection of 1715 he was invited by his clansmen to espouse that cause, but preferred to take the opposite course, inducing them to follow his guidance, for which service he was restored to his estates. In the insurrection of 1745 he sent his clan under his son to fight for the Pretender, while he protested his own loyalty to the house of Brunswick. This double dealing was unsuccessful, and made him especially obnoxious to the Government, which brought him to trial for treason, and he was executed on Tower Hill, London, Apr. 9, 1747.

Love [Anglo-Sax. *lufe*; Germ. *Liebe*]: the sentiment or emotion of strong attraction toward persons or other animate things. Psychologists divide the great movements of the emotional life into two great classes called respectively emotions of attraction and emotions of repulsion. The popular word "love" covers the former, as "hate" covers the latter.

Theories of Attractive Emotion.—Two great classes of theories have arisen having reference especially to the explanation of personal attachment or love. The *first* of these, led by Prof. Bain (*Emotions and Will*, 3d ed. New York, 1888), holds that the origin of all attachment is sexual, that all love arises by association, through many refining indirect influences, of the object of attachment with the reproductive impulse. This theory is open to very evident objections. In the first place, it is difficult to see how the reproductive instinct itself could have arisen except on the basis of earlier sensibility to attractive qualities in other individuals. Again, the phenomena of emotions of attraction generally extend into the ideal life so thoroughly, and these sentiments attach so directly to objects with which no sexual association can be traced, that all presumptions are in favor of the *second* general view, i. e. that emotions of attraction and repulsion represent the opposite modes of reaction of the organism and of consciousness upon all objects which are pleasure or pain giving. These emotions then become exponents of the value of certain objects in experience, both physical and mental, and of course the reproductive life which dictates a large part of what may be called sensuous attractiveness is included in this formula. Consequently the phrase *expressive* emotion serves best to distinguish all the feelings of this class. They are an expression of the reaction or behavior of consciousness when given objects are presented. They represent the reactive, outgoing side of consciousness, as the affective emotions or feelings of self represent the receptive or reflective side.

Looked at from this point of view, emotions rest upon impulses and exhibit the two great directions which appear in impulse, i. e. toward or from an object as fitted to satisfy, or the contrary. Careful distinction in terminology—more careful and exact, no doubt, than the facts warrant—gives over the active, impelling factor in a state of high emotion to IMPULSE (*q. v.*), and reserves for emotion only the mental excitement, agitation, felt disturbance of consciousness. This, at any rate, serves to cover both aspects of the case, and gives us a terminology which may be consistently maintained.

It is in view, therefore, of the direction of the impulses which the expressive emotions accompany that emotions of love are distinguished from emotions of hate.

The Development of Emotions of Attraction and Repulsion.—Under the general head of attraction we may include all tendencies toward an object or individual, or satisfaction in its presence; from the slight feeling of approval to the boisterous expression of social enjoyment, or to the quieter but stronger movings of affection and love. The progress of this emotion in degree and closeness of attachment is an interesting and typical chapter in the natural history of feeling.

Beginning with interest, an object becomes attractive as it comes into clear relation with one's self. Both simple association, by its egoistic reference, and increasing knowledge of attractive qualities in the person or thing in question tend to increase its attracting force. Further, any effort which may have been put forth in connection with such an object increases its hold upon us, and, by strengthening our interest, makes its presence a matter of need. We get interested in persons by assisting them.

In this increased attractiveness of an object, however, we discriminate clearly between persons and things. Familiarity with things always leads to *attachment* to them simply by association and interest. If the thing is useful we become further attached to it; if it turn out useless, we simply neglect it; but it still has its place in its interesting environment. Things never arouse in us the opposite, repellent emotion except by some kind of association with persons.

In the case of persons, on the other hand, the simple attachment which now becomes, in its earliest form, *admiration*, passes over, on further acquaintance with the person, into a more positive and vigorous emotion. Strengthen the ties of association and self-relation (kinship, partnership, etc.) sufficiently and the emotion of attachment becomes *affection* and *love*. There is a line in the growth of the emotion of attraction beyond which all revelations of character or action, however damaging, only deepen and strengthen the earlier tie; but if this line has not already been reached when damaging discoveries are made—if the attractive emotion has only reached the stage of admiration arising from intellectual interest and casual association—then there comes a revulsion to emotion of repulsion.

Around these three stages in the growth of emotions of attraction the varieties of such feelings may be grouped. *Admiration*, the feeling of deep interest in persons, is *veneration* when its object is elderly, superior, or of high rank; *awe* when it is obscurely grand and imposing. *Attachment*, the feeling of close association with and dependence upon persons and things, has distinct colorings when felt toward inanimate objects, animals, inferior or superior persons, etc. *Affection*, the feeling of profound attraction toward persons, arising from the deeper ties of family or common life interests, parallel opinions and aims, or congenial dispositions, takes on innumerable forms known by name as distinct emotions—feelings of *confidence*, *patience*, *security*, *help*, *congratulation*, *self-surrender*, *self-denial*, *tenderness*—in short, all the infinite emotional phases of past, present, and future reference which poets have sung and women have

felt since one human heart first learned to enlarge its borders to include another. It is the important function of fiction and the drama to depict the subtle movements of such emotions and the social situations to which they give rise. Sympathy is also an interesting and extremely important element in the whole development.

The repelling impulses also supply us with a group of emotions of enormous range and importance. What has been said about the development of the feeling of attraction applies with some modification to this class also. Simple interest and some knowledge is necessary to induce the feeling of *unattractiveness* in the first instance; it grows to be *objectionableness* in things (mainly) or persons. The feelings toward things do not pass into stronger emotion except through association with persons; but with persons it passes into *distaste*, a positive feeling which becomes intense in *abhorrence*. At any stage, except that of extreme repulsion, an attracting motive—kinship, pride, intellectual admiration, etc.—may assert itself so strongly as to cause a revulsion of feeling over to the attractive side; and attachments thus formed are often most lasting and intense.

Many modifications of the so-called feeling of *objectionableness* might be mentioned: feelings of *inferiority*, of *poor breeding*, of *bad faith*, *disdain*, *distrust*, etc. So positive *distaste* may take form as *impatience*, *scorn*, *rebellion*, *impertinence*, *malice*, *vengeance*, *present fear*, *anger*, *hatred*, etc.; and *abhorrence* has varieties in *detestation*, *contempt*, *disgust*, *loathing*, etc. Cf. Baldwin, *Handbook of Psychology*, vol. ii., pp. 180 ff.

Social Considerations.—The importance of this topic in its social bearings has never been overlooked. It is evident that in theory love must be viewed very largely as the expression of instinct. Recent Italian writers (Lombroso, Forri, Mantegazza) have developed the theory that woman is in her constitution less developed than man, and so more instinctive. While woman's love is undoubtedly more instinctive than man's, it is also more ideal. Men calculate more—that is, are more reasonable—in the life of affection; but just in so far the claim of lower indulgence is more apt to be recognized by them. This is shown both by the fact that men make more suitable marriages as respects wealth, social standing, etc., and by the fact that they are oftener than women faithless to the tie of matrimony. The instincts by which women are moved in this matter are generally those which respond to moral character, calls for sympathy, pity, and direct service or self-denial, while among the "reasonable" considerations which appeal to men the claims of social or personal self-indulgence are more apt to be influential. At the same time it seems to be proved that in women in whom the ideal instincts of refined affection are weak the lower life of passion reveals itself in greater excesses of moral degradation. It seems also to be true that the restraints of a purely social kind—public opinion, custom, etc.—are stronger with men. Woman is more a law unto herself, more whimsical, impulsive, independent—and unreasonable. The deeper social problems which arise about this class of sentiments will probably be among the gravest questions of the future, both to social reformers and to religious teachers.

References.—On the general nature of these emotions, see the "general works" cited under Psychology. On the social side, Plato, *Republic*; Ibsen, *Collected Plays*; Mantegazza, *Fisiologia di Amore*; Lombroso, *La donne delinquente*.

J. Mark Baldwin.

Love-bird: a popular name for the small Old World parrots of the genus *Agapornis*, given them on account of their affection for one another. They are among the smallest of the parrots, being only 5 or 6 inches in length.

Love, Courts of: institutions of mediæval France, in which offenses against the laws of chivalric love were tried before judges (generally ladies), whose decisions were binding upon all knights, and upon the ladies in whose service they were. The belief in the existence of such courts has been prevalent since the appearance in 1575 of the pleasant, fantastic book of John of Nostradamus (brother of the famous impostor Michael Nostradamus), entitled *Les vies des plus célèbres et anciens poètes provensaux, etc.* This work first called the attention of the post-Renaissance world to the poetry of the troubadours, and its popularity was widespread. Its entire untrustworthiness, however, made it a most fruitful source of all kinds of fantastic notions about the French Middle Ages. Perhaps no other of these notions has been so generally accepted as that of the courts of love. For a long time there was no question as to their reality, and even when in the rationalistic eighteenth century some few scholars doubted them on grounds of inherent improbability (cf. Abbé de Sade, *Mémoires pour la Vie de François Pétrarque*, vol. ii., p. 44, n., and p. 60, n. (3 vols., 1764–67), and also *The Plays of Philip Massinger*, ed. by W. Gifford, 1805, introductory note to *The Parliament of Love*, vol. ii., p. 235), still no one made a critical examination of the evidence with a view to disproving their existence. It was still possible for the President Rolland, in his *Recherches sur les prérogatives des Dames chez les Gaulois, les Cours d'Amours, etc.* (1787), to treat them as indubitable, and for von Aretin, in his *Aussprüche der Minnegerichte, etc.* (1803), to give as authentic a collection of decisions pronounced in them. Indeed, they seemed gradually to be gaining in substantiality. In 1817 Raynouard published in the second volume of his famous *Choix des poésies originales des Troubadours* (p. lxvii., *seq.*) an essay upon them, in which he made use of new and seemingly conclusive documents in their favor, notably the Latin treatise of a certain André, a chaplain at the French royal court in the twelfth century, entitled *Liber de arte amandi et de reprobatione amoris*, which contains a large number of judgments purporting to have been given at such courts, presided over by Eleanor of Aquitaine (later wife of Henry II. of England); her daughter, Marie, Countess of Champagne; Ermengard, Viscountess of Narbonne; the Countess of Flanders; and ladies of Gascony. The first serious note of critical protest came from the great scholar Friedrich Diez (*q. v.*), who in his essay *Ueber die Minnehöfe* (1825) undertook to destroy the whole fabric raised by Raynouard and his predecessors. He concluded that courts of love in a formal sense had never existed; that the work of André le Chapelain was composed in the fourteenth instead of the twelfth century; and that the most that can be admitted is that in Provence and France it was a social diversion to discuss questions of amorous casuistry in the manner in which the contemporary theologians were disputing about points of philosophy. Quarrels of lovers also, he thinks, were at times submitted to the arbitration of others. The formal spirit of the time gave the conclusions or decisions thus arrived at the appearance of judicial decrees. Since the publication of this work of Diez, many scholars have occupied themselves with the question, notably Trojel, in his *Middelalderens Elskovhoffers* (Copenhagen, 1880); Gaston Paris, in the *Journal des Savants* (1888); Pio Rajna, *Le Corti d'Amore* (Milan, 1890); Vincenzo Crescini, *Per la questione delle corti d'amore*, Padua, 1891 (extract from vol. vi. of the *Atti e Memorie* of the Academy of Padua). In its main lines, however, Diez's conclusions have remained firm. It has been shown conclusively that on certain points he was in error, the chief being his view of the date of the treatise of André le Chapelain. (Cf. P. Rajna, *Tre studj per la storia del libro di Andrea Cappellano*, in *Studj di Filologia Romanza* (Fasc. 13, 1890), and *Andreae Capellani . . . De amore libri tres*, Rec. E. Trojel, Copenhagen, 1892.) This was certainly written very early in the thirteenth, if not in the end of the twelfth, century. In spite of this deduction, nevertheless, Diez's theory has not suffered serious harm.

Some explication, however, will be expected by the reader of the manner in which a notion at first sight so preposterous as the old romantic one of the courts of love could for so long a time maintain itself. Something of apparent evidence there must have been to mislead a scholar of the erudition of Raynouard. Such there really is, and of two different kinds. In the first place, the name courts of love is not to be charged as a mere invention against Nostradamus. It had existed and been abundantly employed for more than three centuries before he wrote. We even know the work from which he directly got it. This was the *Arrests d'Amours* of Martial d'Auvergne, a writer of the second half of the fifteenth century; but the court of love of which Martial d'Auvergne talks is something very different from what Nostradamus imagined or described. It is merely an allegorical court of the god Love himself, and has nothing to do with human institutions. Furthermore, it is not primarily a court of justice, but rather a royal court like any other, though naturally the decrees of Love have somewhat the appearance of judicial decrees. The allusions to such an allegorical court of love during the fourteenth and fifteenth centuries are innumerable, not only in French, but in other literatures of Europe. Nothing could better illustrate the passion for allegory which after the appearance of the *Romance of the Rose* ran riot among the poets. On occasion this passion was felt by others than the poets, and

the court of love seemed to be realized on earth. We have several accounts of festivals in which the court was actually instituted, and Love was represented in the person of a president or lord. Such was the famous festival described by Giovanni Villani (*Cronaca Fiorentina*, vii., ch. 89) as lasting for two months at Florence in 1283—a festival in which a *Signore dell' Amore*, surrounded by a band of more than a thousand white-clad followers, spent the time in uninterrupted feasts, balls, and pleasures of all kinds. Clearly, however, it would be wrong to infer from such amusements as these the existence of courts of love with judicial functions.

These, however, were not the only evidences on which Raynouard relied. In his reading of Provençal and Old French literature he had found that nothing was more common among poets and in society than the discussion of intricate questions about love. For reasons that need not be given here, this was the all-engrossing theme of mediæval knights and ladies. From the poets we have numerous examples of such discussions in poetical form (the *tensos*, or *tenzone*), in which after each poet has defended his side of the proposed question appeal is made to a third party, commonly a lady, for a decision as to which has attained a victory. Who was this third party? Was she not a formal president of some tribunal? And then there is the indubitable fact that André le Chapelain gives us a series of decrees, which he declares to have emanated from the noble ladies mentioned above. Were they also not formal decisions of organized and well-recognized institutions? A detailed study of the documents shows us nothing of the kind. The inherent improbability of such institutions is borne out by the facts. What does seem clear, however, is that in the society in which these great dames moved the discussion of the true nature and practice of love was treated with the greatest seriousness, and the conclusions arrived at in particular cases were eagerly passed from hand to hand, so that there finally established itself a kind of code upon the subject (*dreg d'amor*), which all true knights and ladies felt bound to recognize and adopt. In short, we have here a manifestation of the manner of development of mediæval and modern social ideals, which on the one side can not be regarded as too ridiculous, but which on the other has the most serious interest for the student of culture. From the confusion and misinterpretation of these phenomena proceeded the fantastic, romantic notion of the courts of love.

A. R. Marsh.

Lovedale: a town in the division of Victoria East, Cape Colony, Africa, wholly given up to the literary and industrial training-schools of British missionaries. Natives from far and wide are taught various trades and fitted for missionary service. The Bible and other books are printed by native craftsmen in various languages, and have extensive circulation in South Africa. C. C. A.

Love-feast: a modern restoration of the ancient Agapæ (*q. v.*). The Moravian Brethren, the denominations of Methodists, and some other bodies of Christians observe this custom. In some places the love-feast is a simple meal, at which prayer, singing, and religious conversation are in order. Generally, among the Methodists, bread and water alone are used, and all church members are allowed to participate. The Sandemanians have a weekly love-feast, eaten on Sunday.

Lovelace, Richard: poet; b. at Woolwich, Kent, England, in 1618; graduated at Oxford in 1636; became courtier of Charles I., and colonel in the royal army during the great rebellion; served also in the French army; was twice imprisoned in England, and solaced his lonely hours by the composition of amatory verses, the most familiar of which are the fine lyrics *To Althæa, from Prison*, and *To Lucasta, on going to the Wars*. D. in London in 1658. An edition of his *Poems*, edited by W. C. Hazlitt, was published in 1864.

Lovell, James: educator; son of "Master Lovell"; b. at Boston, Mass., Oct. 31, 1737; graduated at Harvard 1756; was assistant teacher of the Latin School under his father 1757–75; delivered the official address before the city authorities Apr. 2, 1771, in commemoration of the "Boston massacre," thus inaugurating a custom which has continued to the present time. He was imprisoned by Gen. Gage after the battle of Bunker Hill; exchanged in Nov., 1776; was a member of the Continental Congress Dec., 1776–82; receiver of taxes 1784–88; collector of the port of Boston 1788–89; and naval officer 1790–1814. He was at one time master of the North Grammar School, Boston, and published some tracts. D. at Windham, Me., July 14, 1814.

Lovell, John: educator; b. at Boston, Mass., June 16, 1710; graduated at Harvard 1728; became usher of the Boston Latin School 1729, and was its master from 1734 to its suppression by the siege of Boston, Apr. 19, 1775. During this long period "Master Lovell" was the instructor of many men eminent in the Revolutionary annals, but he was himself a loyalist, and embarked with the British troops Mar. 14, 1776, for Halifax, Nova Scotia, where he died in 1778. He was an excellent classical scholar, and, though rigid in discipline, was popular for his genial disposition. He delivered the address at the dedication of Faneuil Hall, Mar. 14, 1743, and was the author of miscellaneous publications.

Lovell, Mansfield: general; b. at Washington, D. C., Oct. 20, 1822; graduated at West Point 1842, and entered the artillery; served under Gen. Taylor in the war with Mexico, and was wounded at Monterey; transferred to the army of Gen. Scott, he was aide and assistant adjutant-general of Quitman's division, and was severely wounded in the assault on the city of Mexico; resigned from the army in 1854, settled in New York, and was (1858–61) superintendent of street improvements and deputy street commissioner; in the civil war served as major-general of the Confederate army, and was in command of the department of the South at the time of the capture of New Orleans; subsequently served in the North Mississippi and Georgia campaigns; at the close of the war was in command in South Carolina. After spending a few years on a plantation in Georgia he went to New York city, and assisted Gen. Newton in removing the obstructions to navigation in the East river. D. in New York city, June 1, 1884. Revised by James Mercur.

Lov'er, Samuel: author; b. in Dublin, Ireland, Feb. 24, 1797; early attained some distinction as a painter, poet, and singer. His earliest work, excepting contributions to the journals, was *Legends and Songs of Ireland*; in 1828 he became a member of the Royal Hibernian Academy, giving successful attention to portraits and miniatures. His *Rory O'More* (1837), *Handy Andy* (1842), and *Treasure Trove* (1844), comic Irish tales, widely extended his fame. *Songs and Ballads* (1839), *Lyrics of Ireland* (1858), *Metrical Tales* (1859), and several successful dramatic works were written by him. He also gave public exhibitions and lectures in Great Britain, Ireland, and North America with much success. D. at St. Helier's, island of Jersey, July 6, 1868. Revised by H. A. Beers.

Lover's Leap, The: See Cape Ducato.

Low: a barbarous substantive used in connection with weather-maps as an abbreviation for an area of low pressure. It is equivalent to cyclone, without the popular associations of violence connected with the latter.

Low, Seth, LL. D.: educator; b. in Brooklyn, N. Y., Jan. 18, 1850; received his early education at the Brooklyn Polytechnic Institute, and graduated at Columbia College in 1870 at the head of his class. During his last year in college he attended lectures at Columbia Law School, although he did not regularly complete the course. He entered the tea-importing house of his father, and finally became a member of the firm and of the Chamber of Commerce, serving upon some of its most important committees. He was also a member of many other important commercial bodies, and was very prominent in the organization of the Brooklyn Bureau of Charities. He was elected mayor of Brooklyn in Nov., 1881, and was re-elected Nov., 1883. His endeavors to purify and elevate the government of Brooklyn gave him a national reputation. He was elected president of Columbia College in 1890, and has added much to its prosperity by personal gifts and through his influence. He was nominated for mayor of New York in 1897, but not elected.

Low, Will Hicock: figure and genre painter; b. in Albany, N. Y., May 31, 1853; pupil of Carolus-Duran, Paris; member of the Society of American Artists 1878; member of the Architectural League, New York; National Academician 1890; was awarded second-class medal for drawings, Paris Exposition, 1889. The subjects of his pictures include classical figures and scenes of American life. Mr. Low is widely known as an illustrator, especially for his drawings for Keat's *Lamia* and *Odes and Sonnets*. He has executed decorative work in various buildings in New York, and designs for stained-glass windows. He designed the diploma of awards for the World's Fair, Chicago, 1893. Studio in New York. William A. Coffin.

Lowe, Sir Hudson: soldier; b. at Galway, Ireland, July 28, 1769; entered the army; served in the expedition to

Egypt, in the Peninsular war, in Naples, and Sicily; aided in the conquest of the Ionian islands; became their first governor; was employed in secret missions to Portugal and Sweden; was present at the battle of Bautzen, and carried to London the news of the abdication of Napoleon, to which circumstance he was perhaps indebted for being knighted and promoted to the rank of major-general; served during the following year as quartermaster-general of the army of the Netherlands, until removed by the Duke of Wellington; is now remembered chiefly as governor of the island of St. Helena during the whole imprisonment of Napoleon; afterward served in India; became lieutenant-general in 1830; and died in London, July 10, 1844. *A History of the Captivity of Napoleon from Lowe's Journal* was published in 1853.

Lowe, Robert, D. C. L., LL. D.: statesman; b. at Bingham, Nottinghamshire, England, in 1811; graduated at Oxford in 1833; became a fellow of Magdalen 1835, and private tutor 1836; was admitted to the bar, and settled in Australia in 1842, taking a prominent part in the politics of that colony; returning to England with a considerable fortune in 1851, he entered Parliament as a Liberal, and rose to high office, becoming Chancellor of the Exchequer in the second Gladstone ministry 1868–73, and Home Secretary 1873–74; raised to the House of Lords as Viscount Sherbrooke in 1880; G. C. B. 1885. D. in London, July 27, 1892.

Lowell: city; one of the capitals of Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); at the junction of the Merrimack and Concord rivers; on the Boston and Me. and the Old Colony railways; 26 miles N. W. of Boston. It derives a large water-power from Pawtucket Falls, in the Merrimack. In 1823 the first mill was built, and the industry has since grown to such proportions that the city has a world-wide reputation for its textile manufactures. The census returns of 1890 showed that 828 manufacturing establishments (representing 94 industries) reported. These had a combined capital of $40,457,-399; employed 28,086 persons; paid $10,695,545 for wages and $21,613,680 for materials; and had products valued at $39,638,062. The textile industry, which included the manufacture of cotton, woolen, felt, hosiery, suit, and worsted goods, and of carpets and rugs, and the dyeing and finishing of various textiles, had 31 establishments and $33,491,997 capital; employed 20,253 persons; paid $6,711,488 for wages and $16,086,684 for materials; had $16,750,578 invested in plants; and had products valued at $27,253,026. The next largest industry was the manufacture of foundry and machine-shop products, which had 37 establishments, and $2,536,025 capital; employed 2,100 persons; paid $1,107,-618 for wages and $1,050,861 for materials; had $888,-389 invested in plants and had products valued at $2,554,-111. Another important industry was the manufacture of patent medicines, which had 12 establishments, $589,334 capital, and $1,278,087 in value of annual products. The city has 8 national banks with combined capital of $2,300,-000, 7 savings-banks, 4 libraries (House of Employment and Reformation, City, Rector's, and Young Men's Catholic Association), and 6 daily, 1 weekly, and 3 monthly periodicals. It owns the water-works, which cost $2,387,672, real estate valued at $2,042,324, and other property, total holdings $5,109,384 in value, and had in 1890 an assessed property valuation of $62,353,612. Pop. (1880) 59,475; (1890) 77,696; (1900) 94,969.

Lowell: village; Kent co., Mich. (for location of county, see map of Michigan, ref. 7–H); at the junction of the Flint and Grand rivers, and on the Det., Gr. Hav. and Mil., and the Low. and Hastings railways; 18 miles E. of Grand Rapids, the county-seat, 139 miles W. of Detroit. It is in an agricultural region, and has excellent water-power, two flour-mills, a cutter-factory turning out 20,000 cutters per annum, saw and planing mills, furniture-factories, barrel and ox-bow factories, and electrical works which generate by water-power 5,000 horse-power of electrical energy and transmits it to Grand Rapids. Pop. (1880) 1,538; (1890) 1,829; (1900) 1,736.

Editor of "Journal."

Lowell, Charles Russell: officer; b. at Boston, Mass., Jan. 2, 1835; son of Rev. Charles Lowell; was educated at the Boston Latin School and at Harvard University, graduating in 1854 with the highest honors; after a time passed in European travel and study, returned to the U. S. and engaged in business pursuits; at the outbreak of the civil war was superintendent of iron-works in Maryland; immediately tendering his services to the Government, he was appointed (May, 1861) a captain in the Third U. S. Cavalry, transferring to the Sixth Cavalry in August; served with his company in the Peninsular campaign in Virginia, and subsequently in Northern Virginia and Maryland on the staff of Gen. McClellan; on the recruitment of the Second Massachusetts Cavalry was appointed its colonel, and stationed in the vicinity of Washington, and afterward assigned to command a brigade, and rendered valuable services against Mosby's guerrilla bands, and in the repulse and subsequent pursuit of the Confederate army under Gen. Early from before Washington 1864; assigned to Gen. Sheridan's command, his military services in the Shenandoah valley were conspicuous and brilliant in all the engagements of that army, including the battle of Cedar Creek, where he was wounded while in advance of Getty's division, but would not leave his command, remaining until the final attack was made, in which he was mortally wounded at the moment of victory. In recognition of his services he was appointed brigadier-general of volunteers, to date Oct. 19, 1864. D. at Middletown, Va., Oct. 20, 1864.

Revised by James Mercur.

Lowell, James Russell: author and diplomatist; b. at Cambridge, Mass., Feb. 22, 1819; son of Rev. Charles Lowell (1782–1861); graduated at Harvard College in 1838 as class poet, and at Harvard Law School in 1840; began practice in Boston, but soon devoted himself entirely to literature. He printed in 1841 a small volume of poems entitled *A Year's Life*; edited with Robert Carter in 1843 *The Pioneer, a Literary and Critical Magazine* (monthly), which reached only three numbers; published in 1844 *A Legend of Brittany*; in 1845 *Conversations on some of the Old Poets* and *The Vision of Sir Launfal*; in 1848 *A Fable for Critics*, a literary satire, and *The Biglow Papers*, satirical essays in dialect poetry directed against slavery and the war with Mexico, which acquired wide popularity both at home and in England; a collective edition of *Poems* was issued in 1849. In 1851–52 he traveled in Europe, residing for a considerable time in Italy; delivered in 1854–55 a course of lectures on the British poets before the Lowell Institute, Boston; succeeded Longfellow in Jan., 1855, as Professor of Modern Languages and Literature at Harvard College, and spent another year in Europe, chiefly at Dresden, in qualifying himself for that post. From 1857 to 1862 he was editor of *The Atlantic Monthly*, and from 1863 to 1872 of *The North American Review* (quarterly), in both of which many of his miscellaneous writings appeared. He published in 1864 *Fireside Travels*; in 1866 a new series of *Biglow Papers*; in 1869 *Under the Willows*, with which was included his noble *Commemoration Ode* in honor of the alumni of Harvard who had fallen in the civil war, and *The Cathedral*; in 1870 and 1871 two volumes of essays, *Among my Books* and *My Study Windows*. He again visited Europe in 1872–74, receiving in person the degree of D. C. L. at Oxford and LL. D. at the University of Cambridge, England. A new edition of his complete works was published in 1881. He was U. S. minister to Spain in 1877, and U. S. minister to England 1880–85. He was elected lord rector of St. Andrews University, Glasgow, Scotland, Jan. 2, 1884, but soon after resigned the position as incompatible with his office as U. S. minister to the court of St. James. *Democracy and other Addresses* was published in 1887; *Heartsease and Rue* and *Political Essays* in 1888; *American Ideas for English Readers*, *Latest Literary Essays and Addresses*, and *Old English Dramatists* were issued posthumously in 1892, Mr. Lowell having died at Cambridge, Mass., in 1891 (Aug. 12). His collective writings were published in 1890–91 (10 vols.).—His wife, Maria White Lowell (b. July 8, 1821; d. Oct. 27, 1853), wrote verse of considerable merit. A privately printed volume of her poems was issued in 1855.

Revised by H. A. Beers.

Lower California: See California, Lower.

Low'estoft: town; in the county of Suffolk, England; 118 miles N. E. of London; on the German Ocean (see map of England, ref. 10–M); is much visited during the summer for its excellent sea-bathing, and carries on some ship-building and fishing of herrings and mackerel. It has a good harbor, two piers 1,300 feet in length, a hospital, large fish-markets, and a park. Pop. (1891) 23,347.

Low German: those Germanic dialects spoken on the continent of Europe, which, in distinction from High German and Midland German, have not undergone a second shifting of consonants. Low German is divided into Low Saxon and Low Frankish, the latter being confined to the

Netherlands (see Dutch Language) and to the northern part of Belgium (see Flemish Language and Literature). In Germany the term *Niederdeutsch* (i. e. Low German) is often used for Low Saxon or Plattdeutsch (*q. v.*) alone, in distinction from Niederländisch (i. e. Netherlandish, or Low Frankish); while in England (and occasionally in Germany) it is sometimes applied also to Frisian and Anglo-Saxon, so as to include all of the West Germanic dialects except High German. Both of these usages, however, are better avoided. The former is objectionable, because it is too narrow. There is need of a common name to designate those continental dialects, which were closely connected with High German until their separation by the second shifting of sounds; and Low German is the only one which covers this whole field. This term, on the other hand, ought not to be extended to Frisian and Anglo-Saxon, since both of these are distinguished from Low Saxon and Low Frankish by several important peculiarities (e. g. the change in many Frisian and Anglo-Saxon words of original gutturals into palatals). The non-existence of the second shifting of consonants in Frisian and Anglo-Saxon is not sufficient to justify the extension to these dialects of the term Low German, as the second shifting is lacking also, e. g. in Gothic and Norse.

Hermann Collitz.

Lowrie, John Cameron, D. D.: Presbyterian minister; b. at Butler, Pa., Dec. 16, 1808; graduated from Jefferson College in 1829, and from Western Theological Seminary in 1832, and studied at Princeton Theological Seminary. He was a missionary in Upper India 1833–36; returned in broken health to the U. S.; was assistant secretary of the board of Foreign Missions 1838–51; corresponding secretary 1851–91; and was then made secretary *emeritus*. In 1845–51 he was in charge of the Presbyterian church in Forty-second Street, New York; in 1865 he was moderator of the Old School General Assembly at Pittsburg. He was editor of *The Foreign Missionary Chronicle* (1838–49), of *The Foreign Record* (1850–53, 1861–86), and of *The Foreign Missionary* (1842–65), and published *Travels in Northern India* (1842; 2d ed., *Two Years in Upper India*, 1850); *Manual of Foreign Missions* (eds. of 1854–55–68); *Missionary Papers* (1882); *Presbyterian Missions* (New York, 1893); and many pamphlets and review articles. D. May 31, 1900.

Low Saxon: See Plattdeutsch.

Lowth, Robert, D. D.: biblical scholar; b. Nov. 27, 1710, at Winchester, England, where his father, Rev. William Lowth, a distinguished theologian (1661–1732), was chaplain to the bishop and prebendary in the cathedral; was graduated B. A. 1733, M. A. at New College, Oxford, in 1737; took holy orders 1735; in 1741 became Professor of Poetry at Oxford, and delivered a course of lectures on the *Sacred Poetry of the Hebrews*, the foundation of his later work on the same subject; after filling numerous minor benefices became Bishop of St. David's in 1766; was translated to the see of Oxford the same year, and was appointed Bishop of London in 1777; declined the archbishopric of Canterbury in 1783. D. at Fulham Palace, London, Nov. 3, 1787. His principal works were *Prælectiones de Sacra Poesi Hebræorum* (Oxford, 1753; Eng. trans. London, 1787; 3d ed. 1847) and a poetical *Translation of Isaiah* (1778; 11th ed. 1835), both much esteemed and frequently reprinted. See the *Memoir of the Life and Writings of Bishop Lowth* (1787).

Lowther, James: politician; b. in Leeds, England, in 1840; was educated at Westminster School and Trinity College, Cambridge (B. A. 1862); was called to the bar 1864; was a (Conservative) member of Parliament 1865–80 and 1881–85; Chief Secretary for Ireland 1878–80, in Lord Beaconsfield's Government; again returned to Parliament in 1888 and 1892.

Lowville: village (settled 1797, incorporated 1847); capital of Lewis co., N. Y. (for location of county, see map of New York, ref. 3–H); near the Black river, on the Rome, Water. and Ogdensburg Railroad; 26 miles S. E. of Watertown, 59 miles N. by W. of Utica. It is in an agricultural and dairy region, and contains 4 churches, improved water-works, electric lights, public school, 2 national banks, and 3 weekly newspapers. It has large butter, cheese, and hop interests. Pop. (1880) not separately reported in the census; (1890) 2,511; (1900) 2,352.

Editor of "Journal and Republican."

Loxa: See Loja.

Loy, Matthias, D. D.: theologian; b. in Cumberland co., Pa., Mar. 17, 1828; studied at Columbus, O.; was pastor at Delaware, O., 1849–65; editor of *The Lutheran Standard*; and from 1865 Professor in the Lutheran Theological Seminary at Columbus. He has edited *The Columbus Theological Magazine*, and, besides being a prolific author of articles, has published a volume of sermons; *The Doctrine of Justification* (Columbus, 1862); *Life of Luther* (trans. 1869); and *Essay on the Ministerial Office* (1870). Julian's *Dictionary of Hymnology* gives the titles of twenty hymns of which he is author.

H. E. Jacobs.

Loyal Temperance Legion: an organization of children formed under the direction of the Woman's Christian Temperance Union. Previous to 1886 the various local juvenile societies were at liberty to select their own local names, and there was no very definite plan of work; but in that year a uniform organization was decided upon, and they were consolidated into one great army. They are organized in every State and Territory of the U. S., and the work is extending into other countries. The U. S. division has some 200,000 pledged members, besides many who are in training but are not yet pledged. The aims are to train children in temperance principles, grounded upon scientific knowledge of the effects of alcohol, tobacco, and other narcotics upon the human system, and among means for accomplishing this end is a course of study. The graduates are organized into State legions, with full corps of juvenile officers, holding annual State conventions.

Helen G. Rice, national superintendent.

Loyalty Islands: a chain of islands about 60 miles E. of New Caledonia, running parallel to the latter; a dependency of the French Government of New Caledonia. The larger islands (beginning at the N. W.) are Uvea, or Halgan, which forms one part of the circumference of a lagoon about 20 miles across—it is about 30 miles long, and in some places 3 miles across; pop. 2,500—Lifu, or Chabral, 50 miles long by 25 broad—pop. 7,000, but decreasing—and Marc, or Neugone, triangular and about 80 miles around; pop. 6,000. The islands are of coral, surrounded by reefs, have a thin soil, and are not very fertile. The climate is mild and salubrious; rains occur from December to April, but in the other months the climate is dry; fresh water can be obtained almost anywhere by digging down to sea-level. The primitive race is negrito (dark Melanesian), but the olive Polynesians have migrated to the islands in considerable numbers. The first named are superior, and make excellent sailors. The French took possession of the islands in 1864. British missionaries have been established there for some years, and attempts by the French to interfere with them in 1864 and 1875 have led to British protests. See Macfarlane, *Story of the Lifu Mission* (1873). Mark W. Harrington.

Loyo'la, Ignatius, de: founder of the order of Jesuits (*q. v.*); b. in Guipuzcoa, Spain, in 1491, in the castle of Loyola, whence his surname, his original name being Inigo Lopez de Recalde; was of a noble Spanish family, and the youngest of eleven children. In his youth he served as a page in the court of Ferdinand the Catholic; afterward entered the military service, remaining till his thirtieth year, always giving proof of a valorous, chivalric, and adventurous spirit. Having been wounded in the leg at the siege of Pamplona by the French in 1521, while feeble and suffering he read a life of Christ and various sacred legends (among them probably that of St. Francis d'Assisi, the beginning of whose history is very like that of Loyola), and by degrees the man of the world was transformed into the Christian disciple. When scarcely recovered he divided his goods among the poor, made a pilgrimage to a shrine of the Virgin Mary, to whom he dedicated his armor, declaring himself at the same time her knight, and then retired to the hospice of Manresa. There, and in the neighboring caves, he so macerated his body that one day he was found insensible. Ten months later he embarked from Barcelona for Palestine, but being maltreated by the guardian of the Sepulchre, the provincial of the Franciscans, he returned in 1524, by way of Venice, to Barcelona, where he applied himself to the study of the Latin grammar. Two years afterward, having entered the superior schools, he prepared himself for giving popular instruction. Being accused of witchcraft before the Inquisition, he was arrested; on his release, in 1528, he went to Paris to study theology. There in 1534, together with several more, both Frenchmen and Spaniards, such as Laynez, Bobadilla, Rodriguez, Pierre Lefèvre, and others, he formed the project of founding a new Catholic religious order. Some of his companions not having finished their studies, he returned to Spain and waited for

them. In 1537 the company met again in Venice, and thence Ignatius made his first journey to Rome to obtain permission to establish the new order and receive a blessing upon it. According to some legends, Ignatius was favored at Storta, near Rome, with a vision, in which Christ, bearing a banner, appeared to him and said, "Fear not! I will befriend thee in Rome." Others state, more simply, that Loyola, as he was drawing near to the Eternal City, and in uncertainty as to the reception that awaited him, felt his heart fail him. Stopping before an old chapel which stood by the wayside, he entered it and implored the Divine protection; after which, full of courage, he said to his companions, "Truly, dear brethren, I know not how God may see fit to dispose of us—whether we shall be hung, tortured, or in any other way suffer martyrdom in Rome—but what I can tell you certainly is, that Christ Jesus will be gracious and merciful to us in whatsoever straits we may be." He and his friends resumed the pilgrim's staff, and with their books of theology on their shoulders and huge rosaries about their necks continued their journey, and finally reached Rome. Pope Paul III., "thinking that the pious zeal of these Fathers for the general good of souls would be of no small advantage and honor to the harassed Church," received them with kindness, and on Sept. 27, 1540, gave to Ignatius and his companions the provisory, and in 1543 the definitive, approbation of the order of Jesuits. Loyola was named first general of the order in 1541, although his fellow worker, Laynez, had not been less efficient in founding it. The head of the new company soon gave himself to the religious training of the young, and he was very successful in bringing Jews over to the Christian faith and in reforming erring women. He died July 31, 1556, was beatified in 1599, and canonized by Pope Gregory XV. in 1622. His feast is celebrated by Roman Catholics on July 31, the anniversary of his death. Although Loyola met with much persecution in his own time from bad men whose faith he peacefully sought to quicken and whose morals he tried to reform, yet posterity has never questioned the sincerity of his professions nor the purity of his life. He wrote two small works in Spanish—*The Constitution of the Order of Jesus* and *Spiritual Exercises*. His *Life* has been written many times, but those of Rosweide, Maffei, and Bonhours are specially quoted. The most elaborate *Life* in English is by Stewart Rose (New York, 1891).

Revised by JOHN J. KEANE.

Loyola, MARTIN GARCIA OÑEZ, de: cavalier; nephew of Ignatius Loyola; b. in Guipuzcoa, Spain, about 1548. In 1568 he went to Peru with the viceroy Toledo, and was there intrusted with various important commands. During the campaign against Inca Tupac Amaru (1572) he led the vanguard, pursued the Inca into remote fastnesses, and eventually captured him. After the execution of the Inca, Loyola married his niece, and through his influence she received large grants as heiress of the Inca family. In 1592 he was appointed captain-general of Chili, taking possession of the post Aug. 6. He brought strict orders to prosecute the Araucanian war with vigor, but his resources were very inadequate, and he was still further hampered by the descent of the English corsair Hawkins on the coast (1594). He relieved Arauco in 1593, and established forts in the Araucanian country. In Nov., 1598, while at Imperial, he was warned of an Indian uprising; starting for Angol with sixty officers, he was set upon at a night camp and killed with all his companions (Nov. 22, 1598). A general Indian rising followed, and all the Spanish towns S. of the Biobio were destroyed. HERBERT H. SMITH.

Loyson, CHARLES: See HYACINTHE, CHARLES LOYSON.

Lozère, lō′zãr′: department of France; comprising an area of 1,996 sq. miles, and consisting mainly of an elevated plateau resting on the Cévennes, whose central mass, the so-called Margaride Mountains, covers the whole southern and western part of the department; the highest peak, Mont Lozère, rises 4,884 feet. These mountains are rich in iron, lead, silver, copper, and antimony, and their southern slopes are covered with vines, mulberry, and olive trees. The soil is not generally fertile or suited to tillage; sheep and cattle are extensively reared, and large quantities of chestnuts are raised. The general character of the department is pastoral. Silkworms are reared in the valleys. Pop. (1896) 132,151. Capital, Mende.

Lualaba River: a river which rises on the southern frontier of the Congo Free State, a little W. of 26° E. lon. from Greenwich. It was long thought that it might be the head source of the Congo, but the explorations of Delcommune and Bia (1892) show that the more eastern Luapula has its head fountains much farther from the mouth of the Congo and contributes to it a much larger volume of water than the Lualaba, which is regarded (1894) merely as a tributary of the Congo. C. C. A.

Luang-Prabang, loo-ăng′pra-băng′: a semi-independent Shan state of Indo-China; lying on the middle Mekong, and inclosed by the French territories of Annam and Tonquin; lat. 18° to 22° N., lon. 101° to 104°. It is a mountainous country peopled by Laos, with many wild tribes and numerous immigrant Burmans, Siamese, Tonquinese, and Chinese. Population about 150,000. The capital is Luang-Prabang, or simply Luang, on the left bank of the Mekong, in lat. 19° 54′ N., lon. 102° 5′ E. Pop. 15,000 to 20,000. It was formerly much larger. Pallegoix, in 1830, estimated its population at 50,000. M. W. H.

Lubbock, Sir JOHN, M. P., D. C. L., LL. D., M. D., F. R. S., F. S. A.: scientist; son of Sir John William Lubbock; b. in London, Apr. 30, 1834; educated at Eton; became a banker in London, honorary secretary to the London bankers, and introduced improvements into the system of banking, especially the "country clearing" and the publication of the clearing-house returns; became early interested in ethnology, physics, and natural science; was one of the first scholars who elucidated the significance of the lake-dwellings of Switzerland and the "kitchen-middens" of the Danish coast concerning which he wrote several articles in the reviews about 1860; succeeded to the baronetcy on his father's death in 1865; in the same year published *Prehistoric Times, as Illustrated by Ancient Remains and the Manners and Customs of Modern Savages* (5th ed. revised, 1889), a work which was translated into many languages, was republished in the U. S., and which was truly characterized as epoch-making in the anthropological sciences. In 1870 he issued the complement of the former work, *The Origin of Civilization and the Primitive Condition of Man*, which had a similar popularity, and made good its author's claims to be regarded as one of the chief exponents of the great modern science of which it treats. It is not alone in anthropology, however, that Sir John Lubbock has rendered distinguished services to science; his *Origin and Metamorphoses of Insects* (1874), *On British Wild Flowers considered in Relation to Insects* (1874), *Monograph on the Thysanura and Collembola, Ants, Bees, and Wasps* (1882), *The Senses and Instincts of Animals* (1888), and more than fifty memoirs in the *Transactions* of various learned societies, bear witness to the versatility of his researches. *The Pleasures of Life*, a volume of essays (1887; 20th ed. 1890), was followed by a second series in 1889. He has been president of the Ethnological and Entomological Societies and of the Anthropological Institute, vice-president of the British Association and of the Royal and Linnæan Societies, is an active member of the Society of Antiquaries and the Geological Society, and of the commissions on international coinage, public schools, and the advancement of science, and was vice-chancellor of the University of London 1872–80. In 1865 and 1868 he was an unsuccessful candidate for Parliament in the Liberal interest; was elected for Maidstone in 1870; lost the seat in 1880, but was immediately returned for London University, and still represents it—since 1886 as a Liberal-Unionist. He has spoken on financial and educational topics, and procured the passage of several acts, one of which, the Bank Holiday Act, added four statute holidays to the two previously existing.—Lady LUBBOCK (*Ellen Frances Hordern*) participated in the scientific tasks of her husband, and wrote admirable articles in the scientific and literary periodicals, especially *The Academy*. D. Oct. 20, 1879.

Lubbock, Sir JOHN WILLIAM, F. R. S.: astronomer and mathematician; b. in London, Mar. 26, 1803; graduated M. A. at Trinity College, Cambridge, in 1825; became F. R. S. in 1829; became a baronet by inheritance in 1840; was a successful banker, and sheriff and lieutenant of Kent, but his fame was won by astronomical researches; wrote many valuable papers upon lunar and planetary perturbations, upon tides, eclipses, etc., and also published *Researches on Physical Astronomy* (1830); *Classification of Branches of Human Knowledge* (1838); various papers upon the *Theory of the Moon* (1833); *Treaties on Tides* (1831–37), and other works. D. June 20, 1865.

Lu'beck (= Germ. *Lübeck*): a free Hanse town and an important commercial port of the German empire; situated on

the Trave, 10 miles from its entrance into the Baltic (see map of German Empire, ref. 2–E). It is almost wholly surrounded with water. To the W. and N. the Trave makes a large curve, forming an extensive harbor; to the S. and E. runs the Wakenitz, joining the Trave to the S. of the city. It is still partly surrounded with walls, and contains many old-fashioned houses and churches, which remind one of the Middle Ages. It is egg-shaped in its ground-plan, and divided into four quarters—that of Jacobi to the N. E., of Maria Magdalena to the N. W., of Maria to the S. W., and of Johannis to the S. E. The suburbs, consisting of separate groups of houses, stand on the other side of the rivers. The most important square is the market-place, situated in the center of the city. Here stands the town-house, a large structure built of red and black glazed brick, with five towers, finished in 1517. This building contains the Hansehall, in which in olden times, when Lubeck stood at the head of the Hansa, the representatives from eighty-five German cities held their assemblies, but which is now divided into a number of smaller rooms; and the town-cellar, built in 1443 and stocked with excellent wine. Among the churches (9 Lutheran, 1 Reformed, and 1 Roman Catholic) the Lutheran Marienkirche is the most striking, built between 1286 and 1310, in a severe Gothic style, with three naves and two tall belfries. The whole structure is 354 feet long and 197 feet broad; the middle nave is 134 feet high, the towers 430 feet. In contains a very ingenious clock and several remarkable chapels, one with a *Dance of Death* (1463), and another of black marble (1607). The cathedral, built between 1170 and 1341, the Jacobikirche of the thirteenth century, and the Petrikirche from the beginning of the twelfth, are interesting. The Katharinenkirche, built in the earliest Gothic style, is not used now for worship, but contains a collection of art and antiquities. Noteworthy among the other buildings are the house of the Merchants' Company, with excellent wood-carvings; the Hospital of the Holy Ghost, with a beautiful chapel in the earliest Gothic style; the theater, the lunatic asylum, the Katharineum, an educational institution, the school of navigation, the mercantile academy, etc. Breweries, manufactures of tobacco, cloth, linen and cotton, and silk-weaving factories are in operation. Still more important is the commerce, on account of the location of the city, between Hamburg and the Baltic; about 2,300 vessels, of 443,000 tons burden, enter the harbor annually. The principal items of importation are wool, potash, tar, hemp, copper, and tallow from Russia; timber, iron, copper, and steel from Sweden; corn and spirits from Prussia; wine from France. The wine-trade is very important.

Lubeck has a democratic constitution. Its government consists of a senate of 14 members and a municipality of 120. This government rules a territory of 115 sq. miles, with 76,485 inhabitants, which forms a separate state, an independent member of the German empire. Lubeck has a budget of 3,564,846 marks, and a debt of 9,843,361 marks. It carried on an important commerce as early as the beginning of the twelfth century, and the culmination of its prosperity falls between 1200 and 1500. The Emperor Frederick II. made it a free city of the realm in 1226. It waged successful wars against the Danes, and defeated them in 1227, 1234, and 1249. It was the head of the Hansa, and its fleets swept the Baltic during the thirteenth, fourteenth, and fifteenth centuries; but its power decreased with the Hansa. The burgomaster Wullenweber succumbed when he tried in 1530 to restore to Lubeck its old influence in the affairs of the Scandinavian countries. From 1563 to 1570 it waged its last war, against Sweden. The Thirty Years' war almost crushed it. In 1806 the French captured and sacked it. In 1810 it was incorporated with the French department of the Bouches d'Elbe. In 1813 the Russians expelled the French, but the French returned once more, and held it for a short time, until Bernadotte, the Crown Prince of Sweden, liberated it. Since 1815 its prosperity has developed once more. In 1866 it sided with Prussia, and sent one battalion to the army of the Main. On June 27, 1867, it concluded a military convention with Prussia. May 15, 1868, it entered the Zollverein, and in 1871 the German empire. Pop. of city (1890) 63,590; of territory (area, 115 sq. miles) 76,485; (1900) 96,775.

Lubicz, loo'bits: See BRODY.

Lübke, lüp'ke, WILHELM: writer on art; b. at Dortmund, Westphalia, Jan. 17, 1826; studied at Bonn and Berlin; published in 1853 *Die mittelalterliche Kunst in Westfalen*, and in 1855 *Geschichte der Architektur* (6th ed. 1884); was appointed Professor of Architecture at the Building Academy of Berlin in 1857; traveled in 1858–60 through Italy, France, and Belgium; was Professor of Art History at Zurich in 1861–66 and at Stuttgart 1866–85, when he accepted a similar position at Carlsruhe. His *Grundriss der Kunstgeschichte* (Outline of the History of Art, 1861) and *Geschichte der Plastik* (1863) have been often republished, and are very useful handbooks. His *History of Art* was translated into English by Clarence Cook (New York, 1880). In 1891 he published an autobiography (*Lebenserinnerungen*). He completed the *Geschichte der Baukunst* of FRANZ THEODOR KUGLER (*q. v.*). D. at Carlsruhe, Apr. 7, 1893.

Lublin, loob'lin: town; in the government of Lublin, Russia; on the Bistritza; 96 miles by rail S. E. of Warsaw (see map of Russia, ref. 8–A). It is an old town, and, next to Warsaw, the handsomest and most important in Poland. Among its buildings are notable the Church of St. Nicholas, founded in 986; the Sobieski palace, the cathedral, and the town-hall. A considerable trade in cloth, grain, and Hungarian wines is carried on, and three annual fairs are held, each lasting one month. The chief manufacture is woolens. Pop. (1891) 48,475. The government of Lublin has an area of 6,499 sq. miles and a population of 996,551.

Lubowski, loo-bov'ski, EDWARD: dramatist and novelist; b. at Cracow, Poland, in 1839; was educated in that city; was a regular contributor to the journals *Dziennik Literacki*, *Gazeta Narodowa*, and *Newiasta*. In 1865 he removed to Warsaw, and has since devoted himself exclusively to literature. He wrote a number of dramas and novels. His early dramatic efforts, *Karyery* (The Careers, a comedy in five acts, 1863), *Protegowany* (The Protégé, comedy in four acts, 1864), *Żyd* (The Jew, 1867), and *Ubodzy v salonie* (The Unhappy Ones in the Salon, 1867), attracted little attention; but the satiristic comedy *Nietoperze* (The Bats, 1875) made him famous. It is based upon the conflict of personal dignity and public opinion, and exposes the slanderers. His other dramatic works are mostly character comedies: e. g. *Gonitwy* (The Races); *Przesądy* (Prejudices, 1876); *Pogodzeni z losem* (Reconciled to their Fate, 1878); *Sąd honorowy* (The Court of Honor, 1880); *Jacuś* (1884); *Obsaczony* (1886). Of his novels, the best are *Silni i slabi* (The Strong and the Weak, 2 vols., Cracow, 1865, under the pseudonym *Spirydion*); *Aktorka* (The Actress, Warsaw, 1869), showing the influence of French models; *Na pochylości* (On the Decline, 2 vols., Warsaw, 1874), which portrays Galician nobility living above its means and wasting its estates; *Krok daléj* (One Step Farther, 1885). He also published essays on Mary Stuart, Don Carlos, Wallenstein, the Borgias, Alfred de Musset, etc., and translations from Shakspeare (*Timon of Athens*, *The Taming of the Shrew*), Dumas, Weilen, etc. J. J. KRÁL.

Lubricants, or **Unguents** [*lubricant* is from Lat. *lubrica're*, make slippery, deriv. of *lu'bricus*, slippery; *unguent* is from Lat. *unguen'tum*, fr. *un'guere*, *un'gere*, anoint]: materials used to lessen the friction of the working parts of machinery. As a solid lubricant, plumbago, graphite, or black lead is the only material in common use. It is carefully prepared for use by the removal of all earthy or other foreign substances, and is usually applied mixed with tallow or oil. It is best adapted for lubrication of bearings moving slowly under very heavy pressures. Tallow alone, or mixed with plumbago, or with red or white lead, is an excellent lubricant under similar conditions. Lard is sometimes applied in such cases. All of the animal and vegetable non-drying oils are good unguents. The best organic oil for heavy pressures is summer-strained sperm; winter-strained sperm oil is a good lubricant. The cost of sperm oil, however, usually makes it impracticable to employ it on ordinary machinery, or even in admixture with petroleums. Lard oil, although not capable of withstanding such extreme pressures as the preceding, is excellent for the bearings of machinery, and its comparative cheapness has brought it into common use. Neat's-foot oil is also used as an unguent. Of the vegetable oils, olive is one of the best, and is very extensively used in European countries, and sometimes has been imported into the U. S. for this purpose. Colza and rapeseed oils are good lubricants. The siccative or drying oils, of which linseed oil is an example, can not be used as unguents. Mineral oils are in extensive use as lubricants. They have less body than the best vegetable, and particularly than the best animal oils, but have enough for ordinary purposes, and possess the great advantage of neither drying like the siccative vegetable oils,

nor absorbing oxygen from the atmosphere and becoming gummy like the other animal as well as vegetable oils. They are prepared especially for this purpose, and are found exceedingly well adapted to the application. They are frequently mixed with the heavier lubricants, and the resulting compound is found better adapted than either of its constituents to the use for which it has been prepared; possessing at the same time the required body and the necessary lubricity, as well as the power of retaining its properties indefinitely in the presence of oxygen. The best mineral lubricating oils are those which, having been subjected to fractional distillation, have been freed from all of the more volatile constituents. These are at the same time the safest illuminating oils. Crude petroleum is a good unguent under light pressures. The majority of the lubricating oils sold under trade-names or trade-marks are mixtures of oils having a good body with others of less value. A mixture of mineral and lard oils is very commonly used, and is a good lubricator. A solid unguent, composed of 3 parts tallow, 3 parts palm oil, ½ lb. caustic soda, and a gallon of water, thoroughly mixed at a temperature of 140° F., is recommended for car-axles. A mixture of 2 parts paraffin, 1 of lard, and 3 of lime-water is said to work well under heavy pressures in rolling-mills. The organic oils of commerce frequently contain traces of the acids used in their purification. When this is the case, they are likely to injure delicate machinery if applied as a lubricant. They may be purified by chemical treatment, or they may be clarified by placing in the vessel containing them a quantity of rusty iron or of other neutral absorbent of acids. Soap is used as an unguent between surfaces of wood; water may answer a good purpose in dissolving any glutinous or mucilaginous substance, but it is not itself a true unguent. See *Friction and Lost Work in Machinery and Mill-work* (New York).

R. H. Thurston.

Lubricators [from Lat. *lubrica're*, make slippery, deriv. of *lu'bricus*, slippery]: apparatus by means of which lubricating materials are applied to rubbing surfaces in machinery. Lubricators intended for applying solid lubricants, such as tallow, lard, or axle-grease, consist frequently of a simple box above the part to be lubricated, with a hole of a size which is greater or less, according to the greater or less viscosity of the material employed and the freedom with which it is desired to apply it, leading down to the bearing, through which the lubricant gradually finds its way. With hard tallow it is sometimes found advisable to apply a plate above the mass, which, being pressed down by a spring, forces the lubricant downward more rapidly; as, for example, in the Weston box. On car-axles, where a peculiar compound of grease and lime-water is often used, the latter form is not required. A plain tallow-box, with a small oil-hole, answers for an unguent of slight viscosity. Fig. 1 exhibits a simple form of lubricator in which it is intended to use tallow or suet. The cock at A is used as a means of adjusting the rate of supply. This is only used upon steam cylinders, where the heat of the steam melts the unguent.

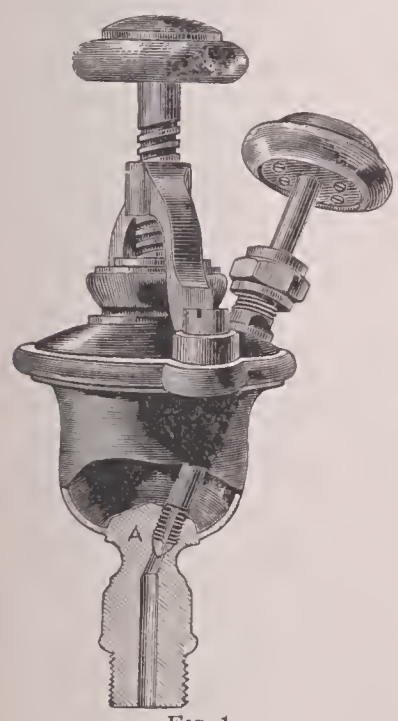

Fig. 1.

For the animal and vegetable oils, which are the most common lubricating materials, an entirely different style of lubricator is used. For ordinary journal-bearings the usual form consists of a brass or glass vessel (Fig. 2), of a capacity varying from less than a gill to sometimes a quart. It is screwed upon the cap of the journal-box or otherwise conveniently attached. At the bottom is a hole of from one-eighth to a quarter of an inch in diameter, into which is secured a vertical tube rising nearly or quite to the top of the oil-cup. A channel of proper size leads from the cup down to the bearing to be oiled. The cup is filled with oil, and a leader (A) made of loosely twisted lamp-wick is inserted partly in the vertical tube, and the remainder is allowed to fall into the oil within the cup. This wick thus acts as a siphon, drawing the oil up, and leading it then down into the tube, from which it finds its way to the bearing. This is the most generally used form of lubricator. By bending a small bit of wire into the form of a ∩, and lapping the wick around it, a removable siphon is made, which, being taken out when the journal is not moving, permits a considerable saving of oil in many cases, as on marine engines. These siphons are quickly reinserted.

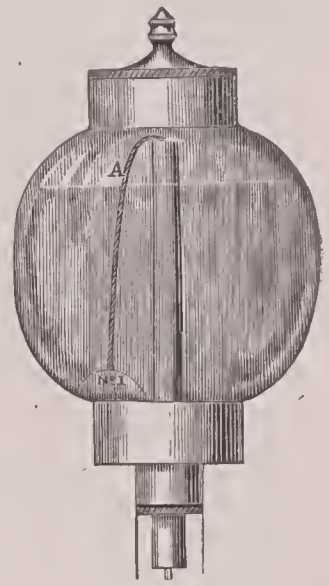

Fig. 2.

Where continuous lubrication over the rubbing surface is desired, an oil-pump is employed, drawing the oil from a reservoir and forcing it in a continuous stream through the journal; other engineers have attached to the revolving shaft a piece of mechanism operated by the movement of the shaft itself, which by means of small spoons dips up the oil and pours it upon the bearing. In these arrangements a reservoir is required, from which the oil may be taken, and to which it may return as it drips from the bearing.

Many ingenious and some very useful devices have been invented, having for their object the convenient and economical distribution of the lubricant. In the crank-pin lubricator of Howe the oil-cup is screwed into the strap of the connecting-rod from beneath; a wick is carried up to the surface of the pin, and kept in contact with it by a small wire or stick, around which it is wound, and which is held up against the bearing by a spring. The oil is drawn up by capillary force, and, reaching the bearing, lubricates it freely; the excess flows back into the oil-cup. In the needle oil-cup of Dreyfus (Fig. 3) there is no inner tube, but a small rod or needle (A) is inserted into the hole through which the oil descends, fitting it so closely that no oil can flow past it when at rest. Whenever the machinery is in motion, however, the jar and the friction of the shaft, against which the needle bears at its lower end, causes a slight but a sufficient tremor of the needle, and the oil is fed to the bearing uniformly and unceasingly so long as the machinery continues to move.

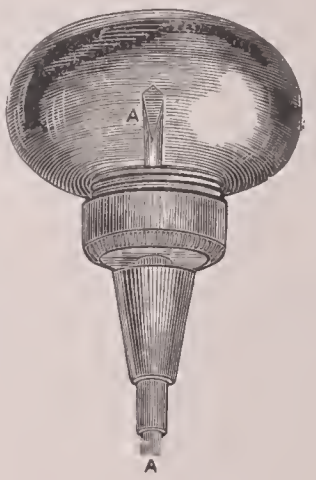

Fig. 3.

For lubricating the interior of the cylinders of steam-engines, where the unguent must be forced in against the pressure of the steam, two classes of lubricators are largely used. One consists of a small force-pump, sometimes with, and sometimes without, an attached reservoir. In the first case the pump has sufficient capacity to contain the full charge which it is desired to force into the cylinder at one time; in the other case the pump draws from the reservoir one or more charges as may be required. The second kind of lubricator consists merely of a reservoir for oil, connected at the top with the steam-pipe, and at the bottom with the steam-chest below it. Each small pipe is provided with a small cock, which may be used to close the communication with the steam-pipe. These cocks being closed, the reservoir is filled with oil, and the cocks are then again opened. Steam-pressure then comes upon both top and bottom of the oil in the cup, but no motion of the fluid takes place, as the lower pipe is at its highest point on a level with the surface of the oil. Gradually the steam condenses in the upper part of the reservoir, and, being of greater specific gravity than the oil, it settles to the bottom, displacing it and slowly filling the cup. It raises the oil until the latter flows out at the top of the reservoir, through the pipe for that purpose, and trickles down into the steam-chest.

On shafting reservoir-boxes are sometimes used. These "self-oiling boxes," as they are also called, have a reservoir formed within the journal-box, in which is placed a quantity of oil. On the shaft is a collar which dips into the oil,

and, as the shaft turns, takes up a portion, and this, trickling back over the shaft, produces a constant lubrication of the rubbing surfaces. These boxes only require filling at long intervals, as the oil is used over and over again. These compositions often contain plumbago, and thus substitute a solid for a liquid lubricant. See *Friction and Lost Work in Machinery and Mill-work* (New York) R. H. THURSTON.

Lucan, GEORGE CHARLES BINGHAM, G. C. B., Third Earl of: b. in London, Apr. 16, 1800; educated at Westminster; entered the army in 1816; accompanied the Russian army as a volunteer in the Turkish war of 1828–29; succeeded to the title and large estates in Ireland in 1839; became a representative peer in 1840; was commander of a cavalry division in the Crimea, and made himself memorable by his connection with the charge of the light brigade at Balaklava, Oct. 25, 1854. He became lieutenant-general in 1858 and general in 1865; field-marshal 1887. D. Nov. 10, 1888.

Luca'nia: an ancient division of Magna Græcia; extended from the Tarantine Gulf in the E. to the Tyrrhenian Sea in the W. The most remarkable of its cities were Sybaris, Heraclea, and Pæstum. It now corresponds to the provinces of Basilicata and Principato Ultra.

Luca'nus, MARCUS ANNÆUS: poet; b. at Cordova, Spain, in 39 A. D.; a nephew of the philosopher Seneca; went early to Rome; received an excellent education; distinguished himself by his poetical talent, and became a favorite with Nero, but happened to excite his jealousy, and was forbidden to recite in public. Thus stopped in the midst of a brilliant career, he joined the conspiracy of Piso, was betrayed, turned informer in order to save his own life, and began by denouncing his own mother; but was nevertheless ordered to be put to death by the emperor, and committed suicide in 65 A. D. Of his works, only the *Pharsalia*, or *De Bello Civili*, a heroic poem in ten books, is still extant, but it is either unfinished or incomplete; it treats of the civil wars between Cæsar and Pompey, and begins with the passage of the Rubicon, breaking off abruptly in the midst of the Alexandrian war. The tone is very unequal, first flattering and then reviling the emperor, and the style seems to indicate that it needed a last revision by the poet. The first book was translated into English by Christopher Marlowe in 1600; the whole by Rowe, in verse, and by Riley in 1853. There are French and German translations in verse and prose, and the poem has found warm admirers. The best editions are those by C. Fr. Weber (Leipzig, 1821–31, 3 vols.); Haskins, with notes and an introduction by Heitland (London, 1887); C. Hosius (Leipzig, 1892). Revised by M. WARREN.

Lucaris, CYRILLUS: See CYRIL LUCAR.

Lucas, Fr. pron. lü'kaa', PAUL: traveler; b. at Rouen, France, Aug. 31, 1664; son of a goldsmith; visited Greece, Asia Minor, Syria, and Egypt as a dealer in precious stones; engaged in the naval service of the Venetians; participated in the siege of Negropont 1688; became captain of an armed vessel which cruised against the Turks; returned to France 1698; again visited Egypt, and ascended the Nile 1700; went by sea to Tripoli; joined a caravan which traversed Armenia and Persia; was taken prisoner by a Dutch privateer; reached Paris 1703; published his adventures under the title *Voyage au Levant* (1704); traveled again in the East; published a second volume of his travels 1714; was sent by the Government on new antiquarian expeditions to the East 1714 and 1723; went to Spain 1736; was employed by Philip V. in arranging his cabinet of antiquities. D. in Madrid, May 12, 1737. Besides his principal work he published a *Voyage dans la Grèce, etc.* (1710), a *Voyage dans la Turquie, etc.* (1719), and left a MS. account of his last journey. His works are valuable in many respects.

Lucas van Leyden: See LEYDEN.

Lucayos: an old name for the BAHAMA ISLANDS (*q. v.*).

Lucca, Ital. pron. loo'kăa: formerly a duchy, which at some periods formed an independent republic and at others was given as a kind of pension to royal or semi-royal persons. It is now a province of the kingdom of Italy, comprising an area of 576 sq. miles, and keeps exactly its old boundaries, between Tuscany, Modena, Massa, and the Gulf of Genoa. Its soil is exceedingly fertile, and probably better cultivated than any other part of Italy. The principal products are wine, oil, and silks. Paper, glass, linens, and cottons are largely manufactured. Pop. (1891) 289,053. Capital, Lucca.

Lucca: city of Central Italy, the chief town of the province of Lucca (see ITALY); on the Serchio, about 15 miles N. E. of Pisa (see map of Italy, ref. 4–C). Lucca is situated in a most fertile plain, surrounded, except on the E., by spurs of the Apennines, and the views from the ramparts of the town are charming. The streets, generally narrow and crooked, are well paved, and the private dwellings are often spacious and elegant. The public buildings, highly interesting in themselves, contain many choice works of art, especially pictures by Fra Bartolomeo and other great masters. The cathedral was erected in the eleventh century; the rich façade was added in 1204. The town is supplied with water by a superb aqueduct, about 3 miles in length, begun in 1823 and finished in 1834. Lucca, originally Etruscan, passed first to the Ligurians, then to the Romans (about 180 years B. C.); it was governed by a duke under the Lombards, became a free state in 1055, was again under a duke (the renowned Castruccio Castracani) in 1327, and in 1370 once more recovered its liberty. Its territory then embraced a great part of what was the later duchy of Lucca —namely, the fertile district, abounding in grain, grapes, olives, chestnuts, etc., lying between Modena on the N. Tuscany on the E. and S., and the sea on the W. Though for the most part an independent republic until 1556, the history of Lucca during the Middle Ages is intimately connected with that of Pisa and Florence. In 1805 Napoleon made it a principality for the benefit of his sister Eliza, who had married a Bacciocchi, and in 1815 it fell to Maria Theresa of Spain, whose son ceded it to Tuscany. In 1860 it was annexed to Sardinia, and is now one of the fairest portions of the kingdom of Italy. Silk was manufactured here as early as the latter part of the eleventh century. In 1300 the republic had her emporiums of silken stuffs at Paris, Lyons, Bruges, etc., and somewhat later 30,000 of the inhabitants of Lucca, already known as the *Industriosa*, were said to live by this manufacture. Even to this day the silk and olive oil of Lucca are especially prized. Beautiful villas abound in the neighborhood, and the celebrated Bagni di Lucca, about 15 miles farther up the valley of the Serchio, in the midst of the most picturesque scenery, though no longer much frequented for medicinal purposes, are a favorite summer resort for foreign residents in Italy. Pop. of the commune (1893) 76,500.

Lucca, PAULINE: opera-singer; b. in Vienna, Austria, Apr. 25, 1842. The original name was LUCAS. Her parents were Jews of humble origin and condition. She owed her musical instruction to the kindness of a professional singer, made her first engagement at the Kärnthner Thor theater, and assisted in the choir at the Karls Kirche. In 1859 she appeared at the Olmütz theater as Elvira in the opera of *Ernani*, and at once became famous. At Prague she appeared as Norma, and as Valentine in *Les Huguenots*; she was the first to sing, at Berlin, the part of Selika in *L'Africaine*. In 1863 and 1865 she was enthusiastically received in London. She was particularly successful as Cherubino in *Le Nozze di Figaro*, Zerlina in *Fra Diavolo*, and Margaret in *Faust*. In Nov., 1865, she married Baron von Rhaden, who was killed in the Franco-Prussian war of 1870, and thenceforth divided her time between London and Berlin. In Sept., 1872, Lucca appeared in New York at the Academy of Music, and continued her triumphs. Her second husband was a major in the Prussian Life Guards. She had an illness in 1886 which impaired the quality of her voice, and her farewell performance in Vienna, in *L'Africaine*, in Jan., 1889, was a failure.

Revised by B. B. VALLENTINE.

Luce, STEPHEN BLEECKER: rear-admiral U. S. navy; b. in Albany, N. Y., Mar. 25, 1827; entered the navy as midshipman Oct. 19, 1841; was in action several times in 1864 and 1865, while commanding the monitor Nantucket and the steamer Pontiac of the South Atlantic blockading squadron; from Apr. 25, 1881, to June 30, 1884, was in command of the U. S. naval training squadron; Sept. 20, 1884, president of the U. S. naval war college, Coaster's Harbor island, R. I. Was appointed to the command of the North Atlantic station June 18, 1886; retired Mar., 1889. In 1892 he was commissioned by President Cleveland commissioner-general of the U. S. for the Columbian Historical Exposition in Madrid. He is the author of a work on seamanship, which is used as a text-book in the Naval Academy.

Lucera, loo-chā'răa [Ital. < Lat. *Luce'ria*, the ancient name]: a large town of Southern Italy; in the province of Foggia; 12 miles by rail N. W. of the town of Foggia (see map of Italy, ref. 6–G). The public and private buildings are handsome. The cathedral, erected by Charles II. on the

ruins of a splendid Saracen mosque, is a fine Byzantine-Gothic church. Lucera is an industrious and commercial town, the trade in home products being very active. The town possesses a large library, containing some rare books. *Luceria* was a town before the Pelasgic immigration. It retained its importance under the Lombards, the Greeks, and the Normans; and under Frederick II., who brought thither the Saracens from Sicily, its population rose to 77,000. It continued to flourish even after Charles I. and II. of Anjou drove out the Saracens, but Charles V. destroyed the prosperity of the town by his cruelty. Pop. 14,070.

Lu'cerne [cf. Fr. *luzerne*], or **Purple Medick** [*medick* is from Lat. *me'dica* = Gr. μηδική (sc. ποά, grass), medic, liter., Median grass or clover, so called because introduced from Media]: a leguminous forage-plant (*Medicago sativa*); a native of Europe, where, as in the U. S. and other regions, it is extensively sown. It should be planted in drills, and hoed to keep down the weeds. Considerable care is requisite in the early stages of its growth, but when well established, if sown on good but light soil, it will produce a greater amount of green forage than almost any other plant, and the quality is unsurpassed. It is perennial, and is cut several times in the season. In California it is known by the Spanish name of *alfalfa*, and is much prized.

Lucerne, Fr. pron. loo'sărn': canton of Switzerland; situated nearly in the center, bordering on the Lake of Lucerne and traversed by the Reuss. It comprises an area of 579 sq. miles, and is covered with mountains, which, however, rise only to the height of 6,900 feet. The soil is generally fertile, and much grain and more fruit are produced, but rearing of cattle is the main industry of the inhabitants, and is carried on to a greater extent in this canton than in any other part of Switzerland. Pop. (1888) 135,360, most of whom are of German descent and speak the German language; they are almost all Roman Catholics.

Lucerne (Germ. *Luzern*, or *Lucern*): one of the most beautiful cities of Switzerland; capital of the canton of Lucerne; on the Reuss; at the northern end of Lake Lucerne (see map of Switzerland, ref. 4–F). In the middle of the city rises an old tower which is believed to have been once a lighthouse, *lucerna*, and given name to the town. It has some remarkable churches and a celebrated monument called the Lion of Lucerne, carved in the solid rock after a model of Thorwaldsen, in remembrance of the Swiss guard butchered in Paris, Aug. 10, 1792. A very brisk transit trade is carried on here. Pop. (1888) 20,314.

Lucerne, Lake of (Germ. *Vierwaldstädter See*, liter., Lake of the Four Forest Cantons): a lake of Switzerland; inclosed by the cantons of Uri, Unterwalden, Schwytz, and Lucerne. It is 22 miles long, from ½ to 2 miles broad, and perhaps the most beautiful sheet of fresh water in Europe.

Lucia, St.: See St. Lucia.

Lu'cian, Saint: b. at Samosata, in Upper Syria, about 250; became a Christian teacher at Edessa and Antioch, inculcating a doctrine similar to that afterward known as Arianism; was three times excommunicated as a heretic; ultimately retracted his heterodox doctrines, and died a martyr at Nicomedia in the persecution of Maximin, in 312. He was the author of a revision of the Septuagint much valued by the Eastern churches.

Lucian (in Gr. Λουκιανός): Greek wit, humorist, satirist, essayist; b. at Samosata, in Syria, about 125 A. D. Little is known of his personal history except what can be gathered from his own writings. He was first apprenticed to his uncle, a sculptor, and though he abandoned the handicraft for letters, he never lost interest in matters of art, and some of his essays show remarkable insight in that domain. Greek was not his native tongue, and had to be acquired before he could enter upon the legal profession, which he practiced at Antioch. From law he turned to rhetoric and became a "sophist," or lecturer, traveling from city to city, through Asia Minor, Greece, Italy, and Gaul, and gaining both fame and fortune. At the age of forty he grew weary of this also, and betook himself to the study of philosophy, of which he appropriated only the negative side, contempt for the shams of life. "Vanity of vanities" is the burden of the dialogues and essays and sketches by which he is best known. His temper is Epicurean, but he belongs to no school and mocks at them all. It is as a free-lance that he "shoots folly as it flies" with mischievous glee and unequaled deftness, and his airiness, joyousness, sparkling wit and lambent humor, his mocking grace and inexhaustible inventiveness, make him the most modern of all the writers of antiquity. The impression of originality is doubtless heightened by the loss of his models and sources, by the loss of Menippus, by the loss of the Attic poets of the middle and the new comedy; but after making all possible deductions, Lucian is a remarkable figure in the history of literature. In his old age he returned to the futile sophistic business of his earlier career, and finally became an office-holder under Commodus, and died in Egypt toward the end of the century. No Greek author has been more copied than Lucian, and modern literature, from Rabelais to the present day, is full of imitations and adaptations of his work. Once much used as a school-book, Lucian is regaining popularity, but his Greek is not a faultless pattern. Of the eighty-two pieces attributed to him, among the best and best known are *The Dream*, *The Cock*, *The Dialogues of the Dead*, *The Dialogues of the Gods*, *Charon*, *Timon*, *The Auction of Philosophers*, *The Death of Peregrinus*, *Alexander the False Prophet*, *The Hireling Philosophers*, *How to Write History*, *The True Story*. The famous novel *Lucius, or the Ass* (see Apuleius) is not accepted as his by most Lucianic scholars. Collected editions of his works by Hemsterhuis and Reitz (1730–45, 4 vols.); Lehmann (1822–29); Jacobitz (1836–41), also in the Teubner Series; W. Dindorf (1840). Fritzsche's great critical edition (1882–85) is incomplete. Sommerbrodt's is in progress (1892). There are English versions by Francklin (1781) and by Tooke, and there is an admirable German translation with notes and introduction by Wieland. The best recent book is by M. Croiset, *Essai sur la vie et les œuvres de Lucien* (1882).

B. L. Gildersleeve.

Lu'cifer [= Lat., liter., light-bearer; *lux*, *lu'cis*, light + *fer're*, bear]: primarily, the planet Venus, as the morning star. By an error of the commentators the name has been often applied to Satan. The prophet Isaiah (xiv. 12) addresses the Babylonian king as the morning star, and commiserates him on his fall. Some of the early Christian writers imagined that reference was had to the fall of Satan, whence the error.

Lucifer: religious leader; was Bishop of Cagliari, Sardinia; appeared at the Council of Milan in 354 as the legate of Pope Liberius, but opposed the Arians in so violent a manner that the Emperor Constantius, much offended, threw him into prison and carried him from place to place for several years. After the death of Constantius he was liberated, and took up his residence in Syria, but here too he deepened, instead of healing, the controversy which took place in the Church of Antioch between the Catholic Church and the Arians. Disapproved by his own former friends, he left Antioch and retired to Sardinia, where he founded the sect of the Luciferians, and where he died in 371. He held, in opposition to the Synod of Alexandria (352), that no bishop who had in any way yielded to the Arians could enter the bosom of the Church without forfeiting his ecclesiastical rank, even though he repented and confessed his errors; and that all who admitted the claims of such persons to a full restoration of their privileges became themselves tainted and outcasts. The Luciferians, never numerous, died out soon after the death of their leader.

Revised by S. M. Jackson.

Lucifer Matches: See Matches.

Lucil'ius, Gaius: Roman poet; b. at Suessa of the Aurunci in 180 B. C.; served in the Numantine war under Scipio; lived on familiar terms with Africanus and Lælius, and died at Naples in 103 B. C. He was the founder, if not the inventor, of the *satira*, that peculiarly Roman form of poetry, in which Horace, Persius, and Juvenal excelled, and was highly appreciated in olden times; but of his thirty books of *Satiræ* only about 940 small fragments, mostly consisting of single lines, have come down to us. They were collected by R. and H. Stephens in 1564, in *Fragmenta Poetarum Veterum Latinorum*. See also the editions by L. Mueller (Leipzig, 1872); Lachmann and Vahlen (Berlin, 1876); and Baehrens's *Fragmenta Poet. Rom.*, pp. 139–266 (Leipzig, 1886); also L. Mueller, *Leben und Werke des Gaius Lucilius* (Leipzig, 1876). Revised by M. Warren.

Luci'na [= Lat., deriv. of *lux*, *lucis*, light]: the goddess of light, almost invariably used as an epithet of Juno as the goddess presiding over women in childbirth. See Juno.

Lücke, lü'ke, Gottfried Christian Friedrich, D. D.: theologian; b. at Egeln, near Magdeburg, in the Prussian province of Saxony, Aug. 24, 1791; studied theology at

Halle and Göttingen, and became professor at Bonn in 1818, and in 1827 at Göttingen, where he died Feb. 14, 1855. His most prominent works are *Grundriss einer neutestamentlichen Hermeneutik* (Göttingen, 1817) and *Commentar über die Schriften des Evangelisten Johannes* (Bonn, 4 vols., 1820–32), in part translated into English as *Commentary on the Epistles of St. John* (Edinburgh, 1837). His theological library was purchased for Harvard College.

Luckey, George W. A.: See the Appendix.

Luckner, lŏŏk'ner, Nicolaus, Count: marshal of France; b. at Kampen, Bavaria, Jan. 12, 1722; adopted very early a military career, and served first in the Bavarian army, then in the Prussian army, distinguishing himself in the Seven Years' war, especially in the battle of Rossbach, and at last in the French, which he entered in 1763 as a lieutenant-general; in 1791 was made a marshal of France, and in Feb., 1792, was appointed commander, first of the army of Alsace, then of that of the North. In June he took Menin and Courtray, but retired then suddenly to Lille, none understood why. In July he was appointed commander-in-chief of the corps of Biron and La Fayette, and fought successfully against the Austrians at Longwy (Aug. 19), but a few days afterward he was replaced by Kellermann, for reasons unknown, and called before the bar of the Convention, because he had not punished Gen. Jarry, who, when evacuating Courtray, had set fire to the city. He was ordered not to leave the city, and lived quietly for some time; but in Sept., 1793, the payment of his pension of 36,000 francs was suspended, and when he made demands for his money, he was dragged before the revolutionary tribunal, convicted of conspiring with Louis XVI. and the foreign foe against France, and guillotined Jan. 4, 1794.

Lucknow [from Hind. *Laksmanavate*, the native name]: city of British India; the capital of the province of Oudh; in lat. 26° 53′ N., lon. 80° 58′ E.; on the Gumti, an affluent of the Ganges, 610 miles from Calcutta, at an elevation of 360 feet above the sea (see map of N. India, ref. 6–F). At some distance the city presents a magnificent aspect, but it disappoints on a nearer approach. The whole central part of it consists of narrow and crooked streets, sunk several feet into the ground, and lined with huts of mud or bamboo, thatched with straw or palm-leaves. The commercial part of the city along the river, which here is 100 yards wide, navigable for large boats, and crossed by three bridges, is better built; it has brick houses surrounded with gardens. In the east quarters are several mosques and palaces, among which the Imambara is the most remarkable; it is an extensive structure, containing a mosque, the sepulcher of Asof-ud-Dowla, a college, etc.; but several parts of it are of a most beautiful architecture. The buildings erected under the auspices of Claude Martin, a Frenchman, who went to India as a poor soldier, but rose to great power in the former kingdom of Oudh, such as the Constantia, Martinière, etc., are very gorgeous. Lucknow manufactures much gold and silver brocade, and its muslins and other fabrics are held in high esteem. Its jewelry was once famous, and its glass-work is still prized. It is a railway junction. From 1775, and to the incorporation of the kingdom of Oudh with the British dominions, Lucknow was the capital of the country. The mutiny of 1857 broke out at Lucknow early in May, and from July 1 to Sept. 25 the feeble garrison of European forces under Sir Henry Lawrence withstood the large besieging party of mutineers, during which time Sir Henry was killed. On the latter date they were relieved by the forces under Gen. Outram and Gen. Havelock, who cut their way in, but were in turn themselves besieged by the still greatly superior force of the natives; and it was not until Nov. 17 that Sir Colin Campbell arrived to their relief with re-enforcements. The city, however, could not be held, and was secretly evacuated on the 22d. Three days later Gen. Havelock died of dysentery. It was not until Mar. 19, 1858, and after much hard fighting, that the city, which had been fortified by the insurgents, was repossessed by the British. Pop. (1891) 273,090.

Revised by Mark W. Harrington.

Lucre'tia: a daughter of Spurius Lucretius Tricipitinus, and the wife of Lucius Tarquinius Collatinus; celebrated as much for her virtue as for her beauty. Sextus Tarquinius, a son of Tarquinius Superbus, the King of Rome, and a kinsman of her husband, became passionately enamored of her, and once, having been hospitably received in her house during the absence of Collatinus, he entered her bedchamber in the night with a drawn sword, threatened to lay a slave with his throat cut beside her, and say that he had killed him in order to avenge her husband's honor, thus compelling her to yield to his wishes. As soon as he had departed she sent for her father and husband, told them what had happened, made them swear to avenge her, and then stabbed herself. When the infamous deed became known it aroused the whole people, and Lucretia's funeral became the occasion of a general revolution, by which the Tarquins were expelled from Rome and the republic was established.

Lucre'tius, Titus Lucretius Carus: poet; b. probably in 97 B. C. and died 53 B. C. His death seems to have been sudden, and is supposed to have been by suicide, through derangement occasioned by the effects of a philter administered to him. (For the current theory on the motives of this, see Tennyson's poem, *Lucretius*.) Very little is known in regard to his education, career, residence, or fortune. He was a Roman citizen of noble extraction, and probably studied at Athens, obtaining there his intimate acquaintance with the Greek poets and philosophers. His poem, *De Rerum Naturâ*, which received Cicero's revision, has come down to us entire, although apparently unfinished by its author. It has been called the greatest of didactic poems, on account of the scientific precision and clearness of its statements and the grandeur and beauty of its poetic dress. The poem contains six books, with upward of 7,000 lines in all, and is dedicated to C. Memmius, prætor 58 B. C., as a personal friend of the author. It is regarded as the completest exposition of the physical system of Epicurus, and embodies the theories of Democritus, together with the hedonic doctrine of Aristippus. Lucretius was the representative apostle of *éclaircissement* in the ancient world, and he has remained the favorite poet of rationalism to this day. His great object was to free mankind from the fear of death, arising, as he thought, from superstition inherent in the popular religion. He fills with poetic fire the dry atomistic physics of his master, and there naturally arises an inconsistency between his scientific conviction and the form of his exposition. This has been pointed out by Bayle, Montaigne, and others. He denies all design in nature, and accounts for the universal prevalence of law and arrangement in the universe through the so-called "theory of natural selection": "Atoms wrought on by impulse and gravity, and excited in every mode to cohere, and having been tried in all possible aggregations, motions, and relations, *fell at last into those that could endure*." His sublime poetic feeling, however, led him on from the use of trope and metaphor to the employment of mythological machinery and allegory. He apostrophizes Venus as the personification of nature, but does not forget her mythological relation to the Roman people. He also recognizes the other gods as existing, although different from the popular representation of them. The following brief analysis of his poem will indicate to the reader his chief views: Book I. opens with an invocation of Venus, and is followed by an invective against superstition; the logical consequence of his doctrine is the destruction of mythology and allegory—in fact, of all sensuous embodiment of ideas. The principles of his cosmogony are (*a*) nothing comes from nothing; (*b*) matter is eternal; (*c*) its elements are the atom and the void; he repudiates Heraclitus with his doctrine of fire, and also Empedocles and Anaxagoras. Book II. treats of atoms, their form, number, and development into life and generation, growth, and decay. Book III. treats of the soul, making it to be identical with the body, explicitly denying immortality, and offering his consolations thereon. Book IV. treats of sensations and perceptions, explaining their origin in physical emanations from bodies, causing images to arise in the sensory of the one who perceives; sleep, dreams, and love are explained. Book V. gives his views of the origin of the world, and of the rise of the institutions of human civilization: (*a*) marriage and the family, (*b*) society, (*c*) the state, (*d*) religion, (*e*) music and poetry. This book is the most impressive part of his poem, inasmuch as it deals with human relations. Book VI. treats of meteorology, phenomena attributed directly to the agency of the gods being shown to have a natural cause—e. g. thunderbolts, instead of being the weapons of Jove, are developed by the friction of clouds, and the thunder is the noise occasioned by their (i. e. the clouds) flapping together, etc. A poetical rendering of the story of the plague at Athens, as told by Thucydides, closes his work. Lucretius was greatly admired in the fifteenth and sixteenth centuries, and traces of his influence are found in the works of the best English poets; for example, Spenser in the fourth book of his *Faerie Queene*

paraphrases the address to Venus already mentioned. His influence upon Giordano Bruno was extraordinary; also upon Immanuel Kant, notwithstanding the contrast between the ethical theory of Kant and that of Epicurus. The edition of this poem with notes and prose translation by H. A. J. Munro (Cambridge, 1886), is especially to be mentioned. See also Lachmann's ed. (Berlin, 1871); Martha's *Le poëme de Lucrèce* (Paris, 1885); and Schanz, *Röm. Lit. Geschichte*, pp. 135–141 (Munich, 1890).

WILLIAM T. HARRIS. Revised by M. WARREN.

Lucul'lus: the surname of a plebeian family of the gens Licinia, which first appears in history at the close of the Second Punic war. The most famous member of this family was Lucius Licinius Lucullus, the conqueror of Mithridates. The exact dates of his birth and death are not known, but he was still a young man when he distinguished himself in the Social war and gained the favor of Sulla, whom he accompanied as quæstor to Greece and Asia on the breaking out of the First Mithridatic war, in 88 B. C. On the return of Sulla, in 84, he was left in charge, and for four years administered affairs so successfully that Sulla, on his deathbed, confided to him his *Commentaries* and appointed him guardian of his son Faustus. In 79 he was made curule ædile, in 77 prætor, and in 74 consul. Although the new province of Bithynia and the conduct of Eastern affairs had fallen to Cotta, the colleague of Lucullus, the latter was called in to share these responsibilities on the renewal of the conflict with Mithridates, etc. Mithridates, who had invaded Bithynia, defeated Cotta and besieged him at Chalcedon. Lucullus, who in an astonishingly short time had reorganized and thoroughly disciplined his army, hastened to the support of his colleague, threw Mithridates back into Pontus, routed his army at Cabira in 72 B. C., and his fleet at Tenedos in 71 B. C., took Eupatoria, Amisus, and Sinope, compelled the king to seek refuge with his son-in-law, Tigranes, King of Armenia, and brought his country under Roman authority. The troops were tired of the war, and intrigues at Rome secured a decree placing Acilius Glabrio in command; but Glabrio was inefficient, and Lucullus was subjected to the mortification of seeing Mithridates once more in possession of the territory. In 66 he was recalled, and the credit of bringing the war to a successful close was given to Pompey; but Lucullus was given a triumph in 63, though he never again entered into the active affairs of political and military life. He had amassed enormous wealth, and now gave himself up to a life of luxury. His gardens in the suburbs of Rome were fitted up with extraordinary splendor, and his villas at Tusculum and Naples were of such magnificence as to become proverbial. He collected a valuable library, and was the generous patron of letters. D. about 57 B. C. Revised by C. K. ADAMS.

Lu'den, HEINRICH: historian; b. at Loxstedt, near Bremen, Germany, Apr. 10, 1780; studied theology, philosophy, and history at Göttingen, and was appointed Professor of Philosophy in 1806, and of History in 1810, at Jena, where he died May 23, 1847. His *Ansichten des Rheinbundes* (1808) attracted much attention, and exercised some influence on public opinion in Germany concerning Napoleon's policy. His later and larger works, *Allgemeine Geschichte des Alterthums* (1814), *Allgemeine Geschichte des Mittelalters* (1821–22), and *Geschichte des deutschen Volks* (12 vols., 1825–37, reaching only to 1237), have also had influence, though the views which they propound have led to much controversy.

Lü'ders, ALEXANDER NICOLAJEVICH, Count: general; b. in 1790 of a German family settled in Russia; entered the Russian army in 1807; was made a brigadier-general in 1826; distinguished himself in 1831 at the storming of Warsaw; fought in the Caucasus from 1844–45 against Schamyl, and took Dargo; put down the revolution in Roumania in 1848; fought in Hungary in 1849, and won a complete victory over Bem, which rapidly led to the pacification of the country; was commander-in-chief in the Crimea when Sevastopol was taken; and was appointed lieutenant-general of Poland in 1861, but was recalled in 1862, on account of his too severe disposition. Before he left Poland an attempt was made to assassinate him, but he only received a severe wound. He retired from service, was made a count, and died at St. Petersburg, Feb. 13, 1874.

Ludhiana, loo-dĕĕ-aa'na: district of British India; Umballa division, Punjaub; on the eastern bank of the Sutlej; comprising an area of 1,375 sq. miles, with 620,000 inhabitants. Its capital, Ludhiana, lies in lat. 30° 55′ N. and lon. 75° 54′ E.; has large manufactures of shawls of an inferior quality, and carries on a considerable banking business and transit trade. Pop. about 44,000.

Ludington: city; capital of Mason co., Mich. (for location of county, see map of Michigan, ref. 5–H); on Lake Michigan, and the Flint and Père Marq. Railroad: 84 miles N. E. of Milwaukee, with which it has regular steamboat connection. It is in a fruit and salt region, and has an excellent lake harbor, numerous lumber-working establishments, foundry and machine-shop, union school library, and a daily and four weekly newspapers. Pop. (1880) 4,190; (1890) 7,517; (1900) 7,166.

Ludlow, lŭd'lō: town; in the county of Shropshire, England; at the confluence of the Corve and Teme; 28 miles S. of Shrewsbury (see map of England, ref. 10–F). Its castle, formerly an important stronghold against the Welsh, was the residence of Henry VII. (1485–1509), and of Mary Tudor before her accession to the throne, and is still more memorable as the scene of the representation of Milton's *Comus*. It was held for Charles I. (1646), but surrendered to the parliamentary forces, soon after fell into decay, and is now a ruin. There is a grammar school, founded in 1282. Pop. (1891) 4,460.

Ludlow, EDMUND: statesman and soldier; b. at Maiden-Bradley, Wiltshire, England, in 1620; was educated at Oxford; entered the parliamentary army as a volunteer on the outbreak of the civil war; became a colonel of cavalry; was one of the members of the high court which condemned Charles I.; protested against Cromwell's assumption of the protectorate, and agitated against him in favor of a republic; retired to Switzerland at the approach of the Restoration, and spent the remainder of his life there, returning to England only for a brief period in 1688; resided at Vevay, where he wrote his valuable *Memoirs* (3 vols., 1698–99), and died in 1693.

Ludlow, JAMES MEEKER, D. D., L. H. D.: minister and author; b. in Elizabeth, N. J., Mar. 15, 1841; was educated in the College of New Jersey and Princeton Theological Seminary; was pastor of the First Presbyterian church of Albany, N. Y., 1865–69; of the Collegiate Reformed Dutch church of New York 1869–77; of the Westminster Presbyterian church, Brooklyn, 1877–86; and since 1886 of the First Presbyterian church, East Orange, N. J. He devised and constructed the *Concentric Chart of History* (1885), and has published *The Captain of the Janizaries* (1886); *A King of Tyre* (1891); *That Angelic Woman* (1891); *My Saint John*; addresses, and many contributions to periodicals.

Ludlow, WILLIAM: See the Appendix.

Ludol'phus, JOB: Orientalist; b. at Erfurt, in the Prussian province of Saxony, Jan. 15, 1624; studied languages in his native place and at Leyden; traveled in 1647 in France and England; accompanied Queen Christina of Sweden in 1649 to Rome, where he made the acquaintance of some Abyssinians, by whose aid he studied the Ethiopic language; visited Sweden and Denmark; settled in 1652 in Gotha; and died Apr. 8, 1704, at Frankfort. He wrote *Historia Æthiopica* (1681, and often since); *Amharic Grammar and Dictionary* (1698); *Lexicon Æthiopicum* (2d ed. 1699); and *Æthiopische Grammatik* (1702). He was the founder of the study of Ethiopic in Europe. Revised by C. H. TOY.

Ludwig (lood'vich) **I.**, KARL AUGUST: King of Bavaria; b. at Strassburg, Aug. 25, 1786; was highly educated, and while prince gave his time and attention to literature and art instead of politics. The famous collection of sculpture, the Glyptothek, was made by him, and many of the finest buildings of Munich were constructed under his direction. He came to the throne in 1825, and, though he introduced some economic reforms and continued his patronage of fine arts, his subjection to ultramontane influence, his disregard for constitutional rights, and the scandal caused by his *liaison* with Lola Montez made his rule most unpopular. After the revolutionary disturbances in the spring of 1848 he resigned in favor of his son, Maximilian Joseph. D. at Nice, Feb. 29, 1868.

Ludwig II., OTTO FREDERICK WILLIAM: King of Bavaria; b. at Nymphenburg, Aug. 25, 1845; succeeded his father, King Maximilian II., Mar. 10, 1864. He was a man of romantic nature, an artist, with very fantastic ideas of his personal dignity as a king, and rather capricious opinions concerning political questions. In the affairs of Germany, however, he played an important and noble part. At the outbreak of the Franco-German war in 1870 he sided imme-

diately with Prussia, and during the negotiations concerning the new organization of Germany he spoke with enthusiasm for the establishment of the German imperial throne. He showed considerable insight into internal politics, but he disliked to devote himself steadily and with consistency to the daily business of governing. He showed himself very seldom to his people, and public festivities were disagreeable to him. He lived mostly in solitude in his magnificent palaces, of which he seemed to prefer Hohenschwangau, situated amid beautiful mountain scenery, and here he busied himself with art, especially with music. On account of this passion for music he became the patron and admirer of Richard Wagner; but there broke out among the people frequent riots against Wagner, and in 1866 the king was compelled to send the composer from the court. Another peculiarity was his enthusiasm for Louis XIV. After the war with France he visited Paris and Versailles, in order to study their works of art, and especially the remembrances they contain of Louis XIV. He also sometimes arranged great theatrical performances in the most expensive style, at which he himself was the sole spectator. At length it became evident that he was insane. He was deposed, June 10, 1886, and drowned himself three days afterward.

Ludwig, KARL, M. D.: physiologist; b. in Witzenhausen, Germany, Dec. 29, 1816; was educated in the Universities of Marburg and Erlangen; became professor in the University of Marburg 1846, of Zurich 1849, of Vienna 1855, and of Leipzig 1865; and published several investigations of great importance. D. Apr. 25, 1895. His chief work is *Lehrbuch der Physiologie des Menschen*.

Ludwig, OTTO: dramatist and Shakspearean critic; b. at Eisfeld, in the principality of Saxe-Meiningen, Germany, Feb. 11, 1813; studied music at Leipzig under Mendelssohn-Bartholdy, but was compelled by ill-health to give up his career; devoted himself to literature, and settled in 1855 at Dresden, where he died Feb. 25, 1865. His tragedies, *Der Erbförster* (1853), *Die Makkabæer* (1854), and *Agnes Bernauer* (1857), were enthusiastically received, since they disclosed a poet of unusual dramatic power, who had carefully schooled himself by the study of Shakspeare. Ludwig was equally successful as a writer of fiction, his tale *Zwischen Himmel und Erde* (1856) being one of the best stories in the German language. The results of his studies of Shakspeare are embodied in a series of essays under the title *Shakspeare-Studien* (1871), and contain probably the best analysis of Shakspeare's dramatic art that was ever written. See Gustav Freytag, *Gesammelte Aufsätze*, i., 20; Adolf Stern, introduction to the *Gesammelte Schriften von Otto Ludwig* (Leipzig, 1892). Revised by JULIUS GOEBEL.

Ludwigsburg, lood'vichs-boorch: town of Würtemberg, 8 miles from Stuttgart; with an immense palace, beautiful parks and promenades, a military academy, and barracks (see map of German Empire, ref. 7–D). It is the second royal residence of Würtemberg, and was founded in the beginning of the eighteenth century, as a rival to Stuttgart, by the Duke Eberhard Ludwig. It was greatly enlarged by his successor, Duke Charles, who resided there from 1764 to 1785, but it never acquired very great importance beyond that of being a royal residence and a military dépôt. Some manufactures, however, of woolen and linen cloth, of japanned tinware, picture-frames, organs, etc., are carried on. Pop. (1890) 17,418.

Ludwigshafen, -haa'fen: town of Germany, in Rhenish Bavaria, on the left bank of the Rhine, opposite Mannheim; founded in 1843 by Louis I. of Bavaria (see map of German Empire, ref. 6–D); has direct railway communication with Paris, Mentz, and Frankfort. In 1802 it was simply the *tête-du-pont* of Mannheim and grew up very slowly. In 1843 it received its present name, and in 1859 it was made a town. It is a rapidly growing manufacturing and commercial place, producing wagons, aniline dyes, soda, tartaric acid, alum, artificial manures, and lime. Pop. (1890) 28,768. In 1895 the population was 39,801.

Lugano, loo-gaa'nō: town; in the canton of Tieino, Switzerland; on the northern shore of the Lake of Lugano, whose southern part stretches into Italy. It is one of the three alternating capitals of the canton, and carries on a considerable transit trade between Switzerland and Italy (see map of Switzerland, ref. 8–H). The inhabitants, numbering (1888) 7,097, are Italians by descent, and Italian is the language exclusively spoken. During the Italian struggle for independence (1848–66) Lugano was the headquarters of Mazzini.

Lugano, Lake of: a body of water situated on the frontier between Switzerland and Italy, and between Lago Maggiore and Lago di Como. It is of a very irregular shape, 20 miles long, but nowhere more than 1½ miles broad. The surrounding scenery is grand and wild. The lake is fed by a number of short torrents which issue from the surrounding mountains, and through the river Tresa sends its waters into Lago Maggiore, which lies 200 feet lower.

Lugo, loo'gō: a town in the province of Ravenna, Italy; about 14 miles W. of the city of Ravenna (see map of Italy, ref. 3–D). It lies in a very fertile plain between the Senio and the Santerno, and is connected by good roads with the chief towns of the Romagna. The great square of the Padiglione presents a lively appearance during the annual September fair, when dealers from every part of the Romagna gather to trade in grain, wine, cattle, hemp, silk, etc. It possesses a savings-bank, and a town library partly composed of books from suppressed convents. Pop. 9,200.

Lugo: province of Spain, bordering N. on the Atlantic; comprises an area of 3,787 sq. miles, with (1887) 431,644 inhabitants. The northern part is mountainous, rich in iron and lead, and covered with forests; the southern part is a large and fertile plain, producing wheat, wine, fruits, etc.

Lugo: capital of the province of Lugo, Spain; on the Miño; 72 miles by rail S. E. of Corunna (see map of Spain, ref. 12–B). It is an old but regularly and substantially built town, with a fine cathedral of the twelfth century, and celebrated sulphur springs. There are manufactures of linen and leather. Pop. 19,952.

Lugworm, or **Lobworm**: a popular name for the worm known to science as *Arenicola marina*, which is found in European waters and upon the northeastern coast of the U. S. In Europe it is used extensively for bait.

Luini, loo-ee'nĕe, BERNARDO: Italian painter; b. at Luino, on Lago Maggiore, in 1470; erroneously said to have been a pupil of Leonardo da Vinci. He is supposed to have visited Rome, because at Santa Croce in Lombardy frescoes of his have been discovered, representing the story of Europa, quite Raphaelesque in grace and style, and also some monochromes, which show a knowledge of Roman statues, of which some are represented, the Laocoön, for instance. His most important frescoes are at Lugano, in the Capuein church, at Saronno, and the Monastero Maggiore in Milan. Many from other churches are now to be seen in the Brera Gallery of Milan. He worked with less ease in oil, but the *Magdalen*, at the Ambrosiana, the *Madonna*, and also a *St. John Caressing a Lamb*, are masterpieces. There are many of his easel-pictures in private collections in Milan. His *Madonna of the Rocks*, in the Brera, as also his *Herodias*, in the Louvre, and *Modesty and Vanity*, lately in the gallery of Prince Seiara, Rome, have been erroneously ascribed to Leonardo da Vinci. He was a poet and wrote a treatise on painting. His fame was not great in his own time, as he remained in Lombardy all his life, and Vasari writes of him briefly. He was still living in 1530. W. J. STILLMAN.

Luitpold, lwĕĕt'polt, Prince CHARLES JOSEPH WILLIAM LUDWIG: regent of Bavaria; b. at Würzburg, Mar. 12, 1821; married Apr. 15, 1844, Princess Augusta, Archduchess of Austria; was appointed regent June 10, 1886, on the deposition of the insane King Ludwig II. Prince Otto, the nominal successor of Ludwig, was also insane, and Luitpold continued as regent.

Lukaszewicz, loo-kaă-shev'itch, JÓZEF: historian; b. at Krąplewo, Poland, Nov. 30, 1799; studied at the gymnasium of Posen; 1829 became librarian to the Count Raczyński, for whom he examined the archives and libraries of Warsaw, Cracow, Breslau, Königsberg, Dantzic, Thorn, etc., and especially the archives of the Bohemian Brethren at Leszno, in search of rare books and MSS. For several years he taught Latin at the gymnasium of Posen, and, with Popliński, edited two journals, *Tygodnik Literacki* (1838–40) and *Orędownik Naukowy* (1840–46). He became, in 1852, owner of the Targoszyce estate, to which he retired, giving up his position as librarian, yet continuing his literary labors until his death, Feb. 18, 1873. Most of his works are devoted to the history of Protestantism in Poland. They are *Wiadomość historyczna o Dyssydentach w mieście Poznaniu w XVI i XVII wieku* (The Protestants of Posen in the Sixteenth and Seventeenth Centuries, Posen, 1832; German trans. Darmstadt, 1843); *O kościołach Braci Czeskich w dawnéj Polsce* (Churches of the Bohemian Brethren in Ancient Poland, Posen, 1835); *Dzieje kościołów wyznania hel-*

weckiego na Litwie (History of Calvinist Churches in Lithuania, 2 vols., Posen, 1841–43; German trans. Leipzig, 1848; same, in Little Poland, 1853). His history of the Catholic Church in Posen is given in *Krótki opis historyczny kościolów parochialnych . . . w dawnéj dyecezyi poznańskiéj* (2 vols., 1858–63). His master-work is a history of schools in Poland and Lithuania, *Historya szkól w Koronie i W. Ks. Lit. od najdawniejszych czasów do 1794 r.* (2 vols., 1849–51). He also wrote an historico-statistical sketch of Posen, *Obraz historyczno-statystyczny miasta Poznania* (2 vols., 1839; German trans. Leszno, 1845); a geography of ancient Poland, *Geografia starożitnéj Polski* (1842, under the pseudonym *J. Andryszowicz*); and translated Pliny's *Natural History* (1845). J. J. KRÁL.

Luke, SAINT [from Lat. *Lu'cas* = Gr. Λουκᾶς]: the author of the third Gospel. He was the only author of Gentile descent who took part in the composition of Holy Scripture. In the Epistle to the Colossians (iv. 10–14) Paul distinguishes him, together with Epaphras and Demas, from all his assistants of Jewish descent, Aristarchus, Marcus, and Justus. An old tradition, mentioned by Eusebius and Jerome, maintains that he was from Antioch, the capital of Syria, where for the first time Christianity took root in a heathen country, which became the cradle of the mission to the Gentiles. It has been assumed, though unjustly, that this tradition was only a misunderstanding of Acts xiii. 1, in which a certain Lucius, with whom Luke might have been confounded, is mentioned as one of the prophets and teachers of Antioch; but Eusebius and Jerome must have written carelessly, in order thus to confound the name of Luke (Lucas, abridged from *Lucanus*) with that of Lucius (derived from *lux*), and still more so to conclude from a passage, in which Lucius is mentioned as descending from Cyrene, that Luke was from Antioch. The narrative of the foundation of the church of Antioch (Acts xi. 19–26) is written with so much vividness and freshness that we seem to recognize the emotion of a personal remembrance; and it is quite remarkable that in a work of the second century, which probably still contains some authentic traditions, "the most excellent Theophilus," to whom the two writings of Luke are dedicated, is mentioned as a man living in Antioch: "Thus Theophilus, the most powerful man of the city, consecrated to the worship and under the name of a church the palace which he inhabited." Paul calls Luke (Col. iv. 14) "the beloved physician." This expression proves that Luke belonged to the lettered class of the people, and was possessed of a certain amount of scientific knowledge. It is, indeed, certain that at this epoch there existed in the empire a medical superintendence quite severe. A supreme authority, *collegium archiatrorum*, awarded the diploma of medicine, and examined in every city those who exercised the medical art. The cures were rigorously scrutinized, and grave mistakes were punished by the loss of the right of practicing. Of all Paul's companions Luke was probably the only one who was possessed of a scientific and literary education.

Some old writers maintain that Luke had been a disciple of Jesus, and was one of the seventy disciples whom the Lord sent to the places of Galilee in order to prepare for his own visit (Luke x. 1, *seq.*); but the introduction to the Gospel is not in favor of this supposition. In i. 2 Luke ranks himself among those who owe their knowledge of the gospel history to the teachings of eye-witnesses, which proves that he was not an eye-witness himself; but it is possible that, in accordance with an old supposition, he was one of the two disciples whom Jesus accompanied to Emmaus on the day of his resurrection. One of them is mentioned by name, Cleopas. The anonymity of the other may indicate that he is the author himself; and this circumstance would correspond well with the dramatic character of the whole narrative, and especially with the following words, which seem to refer to a personal experience: "Did not our heart burn within us, while he talked with us by the way, and while he opened to us the Scriptures?" (Luke xxiv. 32). If, as the whole tradition testifies, Luke is the author of the Acts, and if he always speaks of himself in this book when he says "we," we meet him for the first time at the moment when Paul, having arrived at Troas on his second missionary voyage, prepares to cross over to Europe and undertake a missionary journey through Greece, beginning with Macedonia (Acts xvi. 10): "And after he had seen the vision, immediately we endeavored to go into Macedonia." It is improbable that Luke thus should have placed himself as immediately co-operating with the mission from the very beginning, and the supposition has been made that the author of the Acts here inserts a fragment of a journal of one of the companions of Paul; as, for instance, Timotheus or Silas; but it is not probable that the author of the Acts, who shows himself an able writer in both his books, should have committed such an awkwardness as to insert in his own work a passage from another one in this way, though it would be very easy for him to change the "we" to "they." He who speaks thus in this passage is evidently the same as he who calls himself "I" in the first words of the book: "The former treatise have I made, O Theophilus" . . . (Acts i. 1). The exact study of the style of the Acts has proved that this book was written from the beginning to the end by the same hand, and that this hand is the same which composed the third Gospel. The objection raised falls if we admit that Luke was originally from Antioch, a member of the church of that city, and long acquainted with St. Paul. It seems as if, after the foundation of the church in Philippi, Luke remained in that city, probably in order to take care of the young church, while Paul, Silas, and Timotheus continued their journey; for the "we" disappears in the narrative of the mission from this moment, and until the epoch when toward the end of his third journey St. Paul passed once more through Philippi, on his way to Jerusalem. At this point it reappears. "These going before," it reads in the Acts xx. 5, with reference to the deputies of the churches of Greece and Asia who accompanied Paul to Jerusalem, "tarried for *us* at Troas." The "we" then continues until the arrival at Jerusalem; and as it begins again at the moment when Paul, after two years' imprisonment at Cæsarea, departs for Rome, it is natural to conclude that Luke had remained in Palestine during these two years of Paul's captivity. It was during this time that he gathered on the very theater of the evangelical history the information and the materials with which he composed his two works. He alludes himself to this information in his Gospel (i. 1–4). After these two years he went with Paul to Rome, and participated in the shipwreck, which he has described in a graphic manner in Acts xxvii.; and he arrived at Rome with the apostle in the spring of 62. In the Epistles to the Colossians and to Philemon, which probably are the first letters written by Paul from Rome, he addresses salutations which prove that Luke lived with him during the first period of that captivity, with which the book of the Acts ends. The Epistle to the Philippians, written toward the close of these two years, contains no salutation from Luke to this church, with which he was so closely connected; from which circumstance we must infer that he had left Paul and returned, for the time being, to the Orient. We find him once more in company with Paul, and as a prisoner, in the Second Epistle to Timothy (iv. 11), where the apostle says of him: "Only Luke is with me." Probably the second captivity is here referred to, which Paul suffered in the year 66 or 67, and which terminated with his martyrdom, the first having ended in the beginning of 64. According to a tradition mentioned by Jerome, Luke preached the gospel in Achaia and Bœotia. Gregory Nazianzen speaks first of his martyrdom, and Nicephorus Callistus in the fourteenth century asserts that he was hanged on an olive-tree in Greece at the age of eighty years. From the testimony of Jerome it seems certain that his ashes, as well as those of Andrew, were brought from Achaia to Constantinople by orders of Constantius in 356. Thus we may consider Luke as an educated Greek, and as one of St. Paul's most faithful assistants among the Gentiles of Greek nationality.

Works.—Christian antiquity has ascribed to Luke the Acts of the Apostles as well as the third Gospel. As these writings have never borne the name of any other author than that indicated by the title given them by the primitive Church, there is no reason for doubting the tradition. As Luke is for us one of the most conspicuous and most frequently mentioned of Paul's companions, one might perhaps think that on this point the Church has proceeded by way of supposition. This is not so, however. It is only on account of his works that the name of Luke is so well known in the Church. The rarity of this name in the writings of the New Testament speaks in favor of the truth of the tradition. It is incontestable that the author of the third Gospel and the Acts must be sought among the assistants of St. Paul. To prove this the striking analogy suffices between the form of the institution of the Lord's Supper in Luke and in Paul (1 Cor. xi.). There is, furthermore, the closest relation between the enumeration of the appearances of Jesus

after the resurrection in Luke (xxiv.) and in Paul (1 Cor. xv.). The whole history of Jesus by Luke is a demonstration of the reality of those two great principles which form the basis for all of St. Paul's preaching—namely, the universality of the salvation and its entire gratuity. That is the reason why Luke traces the genealogy of Jesus to Adam, the father of mankind, and not only to Abraham, the father of the Jews, as Matthew does; why he loves to tell the parables of grace (ch. xv., the lost sheep; the piece of silver; the prodigal son) and other narratives of a similar bearing, as, for instance, the forgiven sinner (ch. vii.) and the Pharisee and the publican (ch. xviii.); why, furthermore, he has completed the narrative of the Gospel by a picture of the foundation of the Church by the apostles, especially by St. Paul, whose grand missionary labor among the Gentiles he follows until his arrival at Rome, the center of the empire. From the fact that the writings of Luke give a support to the ideas of Paul it has been inferred that in several points he has modified the teaching of Jesus in favor of this particular aim, but that is to lower the intention of the sacred writer in a strange manner. In his two writings he defends a cause much higher than that of St. Paul: he pleads the cause of God himself. In chaps. ix. and xi. of the Epistle to the Romans we are told that the Jews even claimed that God had not the right to withdraw the salvation from them and give it to the Gentiles, since he had bound himself to them by inviolable promises. The aim of the whole work of Luke is to demonstrate that God has faithfully accomplished his promises, by the apostles preaching first to the Jews and then to the Gentiles, and that, consequently, it is not God who has broken his engagements with his people, but the people who have rejected their God.

Among all the assistants of St. Paul, Luke the physician was probably the only one who was able to write such a work. The introduction, contained in the four first verses of ch. i., presents a striking analogy to the introductions of the great Greek historians; as, for instance, Herodotus and Thucydides. The style of these verses is classical, but from verse v. Arameanisms abound, which show from this point that the author is reproducing certain documents in that language, and reproducing them with scrupulous exactness. The pure Greek of the author, although always with certain forms of language of his own, does not reappear until the second part of the book of the Acts, where it comes in quite naturally, as at this point he begins to narrate what he has seen and heard himself. All these traits correspond perfectly with the character designated by tradition—a friend of Paul, and a Greek of classical education. Luke must have composed this Gospel for the Gentiles at nearly the same time when St. Paul founded the Church of the Gentility. This circumstance also proves the purity of the traditions which are given here, and which in no point resemble those legends which we meet in the Fathers even from the beginning of the second century; as, for instance, in Papias. Most admirable is the manner in which Luke knows how to place the words of Jesus so as to make them striking—a quality which proves the exactness of the information he had gathered concerning the circumstances under which the words were spoken. Clemens of Alexandria places the composition of the Gospel of Luke even before that of the Gospel of Mark, according to a tradition due to the ancient presbyters. With respect to the locality in which the composition took place, we have only a tradition stated by Jerome, according to which it was in the countries of Achaia and Bœotia, but this tradition has nothing certain; Macedonia or Antioch would be as probable a supposition, as Greek literature and language reigned in both countries. The question has often been raised why Luke ends the book of the Acts with the two years' captivity of St. Paul in Rome. Why did he not relate the martyrdom of the apostle if thus his captivity terminated, or if not, then his liberation? To these questions it has been answered that he may have treated this subject in a third book, which has not come down to us, or that he died before finishing his work. More generally it has been supposed that the reason why he did not continue his narrative further was that he finished his book just when the imprisonment of the apostle terminated. This supposition is the least improbable. It is nevertheless not certain. The idea of the book of the Acts is by no means to give the biography of Peter or Paul, or any other man. Like the whole Scripture, the book refers to the great subject of the *reign of God*. It contains the history of the apostolical foundations: (1) the foundation of the Church among the Jews by Peter (i.–v.); (2) the providential preparation for preaching among Gentiles (vi.–xii.); the foundation of the Church among Gentiles by Paul (xiii.–xxviii.); and these foundations had been accomplished at the end of Paul's first captivity, with which the Acts end. Thus the plan of the two works is—from Nazareth to Capernaum; from Capernaum to Jerusalem; from Jerusalem to Antioch; and from Antioch to Rome. Luke traces the progress of faith in Christ from the individual to the Church, and from the Church to the center of the world's scene. FREDERIC GODET.

Lukens, HERMAN T.: See the Appendix.

Lul, Lull, or **Lully**, RAIMON (in Lat. RAIMUNDUS LULLIUS): philosopher and poet; b. at Palma, in Majorca, in 1235. His father (of the same name) had accompanied Jaime I. of Aragon in 1229 on his expedition for the conquest of the Moslems of Majorca, and when this was accomplished had received as a fief lands confiscated from the Arab possessors. The peculiar conditions of life in the midst of a large conquered but still unconverted population without doubt had a considerable influence upon the development of the son's mind. The young Raimon, however, received an indifferent education, and to the end of his life, and after his death, his ignorance of Latinity was used as a reproach against him. Up to the age of thirty, as he himself tells us, he was dissolute, to put a stop to which his parents married him to a certain Doña Blanca Picany. Even this, however, did not check him, and it was not until he had five times seen a vision of the crucified Christ that he turned from his evil ways. From this time on (anno 1266) the facts of Lull's life are known to us in the main from a brief autobiographical piece, which seems to have been prepared by him shortly before the Council of Vienne (1311), and which has been several times printed (best edition by Salzinger, *Lulli Opera*, i., prol.). In this he tells us that convinced of his iniquity he sold most of his possessions, and gave himself to Christ. For nine years he devoted himself to ascetic practices and to the study of Arabic, buying a Saracen slave for the latter purpose. At the end of this time, as a curious document shows us, he had entirely ceased to interest himself in the affairs of ordinary life. This document is a petition of his wife for the appointment of an administrator of his property for her benefit and that of her children. This was in 1275, and the petition was granted. At this very time Lull was formulating the two dominant ideas of his life. The first of these was the conversion of the Moslems to Christianity through an appeal to their own higher reason, in pursuance of which we find him in 1276 obtaining the establishment of a college for thirteen Minorite friars at Miramar, in Majorca, in which they should be taught Arabic and fitted for missionary work. The second idea was the invention of a universal and infallible intellectual method, by means of which doubtful questions in regard to the faith might be solved. This was no other than the famous *Ars Major* (later *Ars generalis*), which Lull believed to have been revealed to him by God upon the Mount of Randa, to which he had retired for contemplation. To the exposition and diffusion of this a large part of his later life was given, and his name is indissolubly connected with it still. It is impossible here to give even a faint idea of its character, but the curious will find an outline of it in Prantl's *Geschichte der Logik* (vol. iii., p. 145–177, Leipzig, 1867). Lull himself believed it to be destined to supersede the puerilities of scholastic logic; but he had had no real intellectual training, and failed to see that he had essentially kept all the fundamental notions of the schoolmen, but made confusion worse confounded by his juggling methods.

For about ten years he seems to have remained at Miramar, writing much in Catalan, Arabic, and perhaps Latin. He has left a description of his spiritual joys in the curious romance in Catalan, *Blanquerna*. Now also he began to compose those devotional poems in Catalan which are perhaps the only abiding part of his enormous production (ed. by G. Rosselló, *Obras Rimadas de Ramon Lull*, Palma, 1859); but at last he began to dream of a larger field, and about 1285 we find him setting out for Rome, in order to persuade Pope Honorius IV. to establish other colleges like Miramar. The pope had just died, however, and so Lull went to Paris to expound his *Art*. Now began that incessant wandering that was to fill the rest of his days. After two years in Paris (1287–89) we find him at Montpellier; then at Genoa (1291), whence he made an unsuccessful expedition to Tunis, to convert the Moslems. Leaving Tunis in 1292 he went to Naples, whence in 1294 he was

called to Rome by the election of Celestine V., whom he hoped to interest in his scheme for colleges. He tarried in Rome till 1296, trying, after Celestine had made *il gran rifiuto*, to win Boniface VIII. to his plans. All was in vain, as we learn from the pathetic poem *Desconort*; so, by way of Genoa and Majorca, he returned to Paris (1298), only to go back to Majorca in 1299. In 1300 events stirred in him the desire to visit the East; and from this time till his death his journeyings become too intricate to follow. He visited Cyprus, Armenia, then Genoa again, Majorca, Paris, Vienne (during the council of 1311), Montpellier, Messina; and finally in 1315, having ventured once more to try the conversion of the Moslems in Africa, he was stoned to death by a mob at Tunis or at Bougiah, in Algeria, June 29 of the same year.

The number of Lull's works in Arabic, Catalan, and Latin is enormous. In vol. xxix. of the *Histoire littéraire de la France* (Paris, 1885) no less than 313 are analyzed, though many of these are undoubtedly spurious. Those dealing with alchemy, in particular, were almost certainly of later composition, and simply issued by their authors under cover of his name, as was the case with many similar works bearing the great names of the Middle Ages. The authentic treatises, however, are very numerous, though they fall into comparatively few groups. The chief of these naturally has to do with the exposition of the wonderful *Ars Magna*. Then we have a group dealing more directly with theology proper, though always with reference to the *Art*. Next come treatises upon various aspects of logic and the discipline of the schools, medicine, physics, etc.; then edifying works of a more popular kind; then the devotional works in Catalan already mentioned; and, finally, a number of very curious books in Catalan, showing the results of Lull's familiarity with Arabic literature. Among these last the most remarkable is the *Libre de les maravelles*, based largely upon the *Kalilah and Dimnah* (ed. by Aguiló in the *Biblioteca catalana*, and in part by K. Hofmann, *Ein Katalanisches Thierepos*, Munich, 1872). The Latin works of Lull, collected and edited by Salzinger, were printed at Mayence, 1721–42, in an edition which was to contain ten folio volumes, but the seventh and eighth seem never to have been issued. A new and complete edition, edited by G. Rosselló, is being issued at Palma, in Majorca (1886, *seq.*). For the bibliography of the Catalan works, see A. Morel-Fatio, *Katalanische Literatur* (in Gröber's *Grundriss der romanischen Philologie*, ii., 2, p. 105, *seq.*, Strassburg, 1893).

Besides the works already cited, see Helfferich, *R. Lull und die Anfänge der Katalanischen Literatur* (Berlin, 1858); F. de P. Canalejas, *Las doctrinas del Doctor iluminado Raimundo Lulio* (Madrid, 1870); Erdmann, *Grundriss der Geschichte der Philosophie* (Bd. i., § 206, 2d ed. Berlin, 1869). A. R. Marsh.

Lully, lü'lee', Jean Baptiste: composer; b. at Florence in 1633; went early to Paris as scullion in the household of the Princess of Montpensier; made himself noticed by his skill on the violin; received some regular instruction by the aid of the princess, and obtained a place in the orchestra of Louis XIV., the famous *bande de vingt-quatre*. Having gained the favor of the king by some airs he composed, a new orchestra, *les petits violons*, was organized and placed under his direction, and he managed it so well that it soon entirely eclipsed its elder rival. He was made director of music at the court, composed all the ballets, a sort of entertainment for which Molière often wrote the text, and in which the king himself often performed, and gained such an ascendency over the taste of the king that no other music was heard at the court than his. In 1672 he obtained the privilege of opening an opera theater at Paris. Académie Royale de Musique, and by the success of this enterprise he became the founder of the French Opera. He wrote nineteen large operas, to which Quinault generally furnished the text, and for nearly a century—up to the time of Gluck—he was considered the greatest opera composer. At present his music is practically never heard—not because it lacks musical inspiration, but because the technics of the art have so developed that his manner of instrumentation, harmonizing, etc., would appear awkward. His *Miserere*, written for the funeral of Séguier, his *Bisogna Morire, peccatore*, and some minor pieces of sacred composition, are still heard in France occasionally. D. in Paris, Mar. 22, 1687, leaving an immense fortune. Revised by Dudley Buck.

Lumba'go [= Lat., deriv. of *lumbus*, loin, whence Eng. *loin* (viâ O. Fr. *logne* < Lat. **lum'bea*)], or **Crick in the Back**: a very painful ailment; a kind of subacute rheumatism, often very severe, and seated in the lumbar region. Strong liniments, rubbing with the hand, the application of the electrical brush, and cupping are all useful. A mild diaphoretic often affords relief.

Luminais, lü'mĕĕ'nā', Evariste Vital: genre and historical painter; b. at Nantes, France, Dec. 14, 1822; pupil of Léon Cogniet and of Troyon; was awarded third-class medals at the Salon 1852, and Paris Exposition 1855; decoration of the Legion of Honor 1869; first-class medal, Paris Exposition, 1889. Many of his subjects are taken from early French history and from legends of the Gauls. His style is vigorous and broad. Works by him are in the museums in Angers, Nantes, Bordeaux, Laval, and Nancy.

Luminescence: See the Appendix.

Lummi: See Salishan Indians.

Lummis, Charles Fletcher: See the Appendix.

Lumniczer, loom'nits-*er*, Alexander, M. D.: surgeon; b. at Kapuvár, in the county of Sofron, Hungary, in 1821; pursued his professional studies in the Universities of Budapest and Vienna, and in Berlin, Paris, and London; became surgeon in the Hungarian revolutionary army, and eventually director-in-chief of the field hospitals. In 1861 he was appointed second surgeon to the Rochus Hospital in Budapest, and in 1864 chief surgeon. In 1868 he became docent, in 1872 professor extraordinary, and in 1880 full Professor of Surgery in Budapest University. In 1880 he was chosen president of the Royal Medico-Chirurgical Society of Budapest. In 1885 he was appointed a member of the House of Magnates. In 1869 he was elected chief physician of Budapest. His most important publication is *Chirurgische Erfahrungen* (Budapest, 1878). D. Jan. 30, 1892.

Lumpfish, or **Lump Sucker**; also called the **Sea-owl**, or **Cock-paddle**: a fish (*Cyclopterus lumpus*) found in the North Atlantic, from Long Island and France northward. It has an elevated ridge along the back, which is covered with a notched and tuberculated skin not unlike the comb of a cock. It is of clumsy shape, and has its ventral fins formed into a sucker, by means of which it can cling to any solid substance so firmly that it can with difficulty be removed. Its flesh is edible. It is asserted by fishermen that the lumpfish makes a kind of home, clearing out a hollow in the stony bottom, in which it deposits its eggs, and that it remains hovering about the spot until the eggs are hatched, for the purpose of guarding them against enemies. When thus engaged it becomes combative, permitting no other fish to pass near its charge, and in cases of necessity biting fiercely with its short but sharp teeth. When freshly taken from the sea the colors of the lumpfish are very bright. Revised by D. S. Jordan.

Lumpkin, Joseph Henry, LL. D.: jurist; b. in Oglethorpe co., Ga., Dec. 23, 1799; graduated at Princeton in 1819; was admitted to the bar in Oct., 1820, and opened an office in Lexington, Ga.; in 1825 was a member of the Legislature, and sustained Gov. Troup in his controversy with the Federal authorities growing out of the conflicts between the "old" treaty and the "new," as they were termed, with the Creek Indians. He was most successful in his profession, and in 1845 was elected associate justice, and afterward chief justice, of the State Supreme Court, which was then for the first time organized. The term of office was six years, but receiving three successive re-elections without opposition, he continued to hold this position as long as he lived. He was for many years a trustee of the State University, and founded the Lumpkin Law School, connected with the university. In 1860 he was elected chancellor of the university, but declined this position owing to his strong attachment to the Supreme Court, over which he had so long presided. D. at Athens, Ga., June 4, 1867.

Lu'na [= Lat. for earlier *luc'na*, deriv. of *lux, lucis*, light: Teut. *liuh-* > Goth. *liuhaþ* : Eng. *light*]: the Latin name for the moon, and in Roman mythology the goddess of the moon. Her worship was common to the Romans with other Italic peoples. At Rome there were two old temples to Luna, one on the Palatine, called *Noctiluca* (i. e. which is illuminated by night), and another on the Aventine above the Circus Maximus, founded apparently by Servius Tullius. As the goddess of the months, Luna was worshiped on the last day of March, which was the first month of the old Roman year. G. L. Hendrickson.

Luna, Alvaro, de: courtier and politician; b. in Spain about 1390; was educated with the infant king, John II., with whom he escaped from the custody of the Infante of

Aragon in 1418; headed a successful revolution in behalf of the rights of the crown; was made constable of Castile 1423; received ample endowments, and became the favorite minister of the king; was temporarily driven from court in 1426, and again in 1439, by the efforts of his enemies; was victorious in a war against the Infantes of Aragon 1445, and was rewarded with the grand-mastership of Santiago, which he held in addition to the dukedom of Truxillo and the lordship of sixty towns and fortresses. The powerful favorite was at last overthrown by means of intrigue, condemned to death, and executed at Valladolid in June, 1453. He was a patron of letters, and wrote poetry and plays. See *La Cronica del Condestable Don Alvaro de Luna* (1546).

Luna, Pedro, de: antipope. See Benedict XIII.

Lunacy: See Insanity.

Lunacy Laws: See the Appendix.

Lunalilo, loo-naă-lee'lō: King of the Hawaiian islands 1873–74; b. in 1835. With his cousins, Kamehameha IV. and Kamehameha V., he received a good education, but afterward his dissipated life made him unfit for offices of trust. His tendencies were to great liberality in government—greater than the intelligence and general condition of his people fitted them for. Soon after the establishment of his administration his health failed, and he became indisposed to give much attention to important business. D. Feb. 3, 1874, without an heir and without appointing a successor.

Lunar Caustic: See Nitrate of Silver.

Lund, loond: city of Sweden; 25 miles E. of Copenhagen (see map of Norway and Sweden, ref. 14–D). In 1060 it was made the seat of a bishopric, and in 1104 of an archbishopric. It has a cathedral, built in 1145, a university, founded in 1668, a library of 150,000 volumes, and a gymnasium. Pop. (1896) 15,735.

Lund, loont, John Reinhold: musician; b. in Hamburg, Germany, Oct. 20, 1859; was educated at Leipzig Conservatory; was chorus-master at the Opera-house, Bremen, Germany, 1880–83; musical director, Opera-house, Stettin, Germany, 1883–84; assistant musical director, German opera, Metropolitan Opera-house, New York, 1884–85; director of Orpheus Singing Society and Symphony Orchestra, Buffalo, N. Y., 1886; is author of several songs and pieces for orchestra and piano.

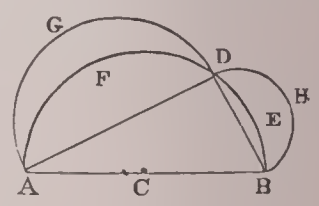
Lund, Troels: historian; b. in Denmark in 1840. His *Danmarks og Norges Historie i Slutningen af det 16de Aarhundrede* (History of Denmark and Norway at the Close of the Sixteenth Century, Copenhagen, 12 vols., 1880–92) was at first viewed with suspicion by critics, but it is now generally recognized as the most valuable contribution to the *Culturhistorie* of that period. It combines keen insight and careful investigation with a finished and brilliant style. D. K. D.

Lundgren, loond'gren, Egron Sellif: painter; b. in Stockholm, Sweden, Dec. 18, 1815. He studied in France, Italy, and Spain. In Spain he began painting in water-colors. The sale of some of his aquarelles in England led him to visit that country in 1851. He executed several works for Queen Victoria, and in 1858 was urged by her personally to go to India to paint scenes from the war being waged there. He consented, and accompanied Lord Clyde's army to Lucknow, returning to England the following year with about 500 sketches. In 1860 he was elected one of the thirty members of the Society of Painters in Water-colors. Nearly all of Lundgren's works are in England. D. in Stockholm, Dec. 16, 1875. He was the author of an autobiographical work called *En Målares Auteckningar* (Notes of a Painter), published after his death. R. B. Anderson.

Lundy, Benjamin: anti-slavery agitator; b. in Hardwich, Sussex co., N. J., Jan. 4, 1789. His parents, as also their ancestors, were members of the Society of Friends. After receiving a limited education he served an apprenticeship at the saddler's trade in Wheeling, Va.; and the frequent spectacle of slave-coffles driven through the place impelled him to consecrate his life to the work of abolishing chattel slavery in the U. S. He settled in St. Clairsville, O., where he pursued his trade as a saddler for a little more than four years, accumulating a competency for his growing family; but the thought of the wrongs of the bondmen in the Southern States continued to destroy his peace of mind. He accordingly formed, with five others, the Union Humane Society, which in a few months enrolled nearly 500 members. This was followed by an appeal from his pen to the philanthropists of the U. S. on the subject of slavery, recommending the formation of kindred societies for mutual conference and action. Soon afterward he became a contributor of original and selected anti-slavery articles to a paper published at Mt. Pleasant entitled *The Philanthropist*. In the fall of 1819 he took his entire business stock to St. Louis, Mo., that by its sale he might give himself to the cause which he had so disinterestedly espoused, but he lost by the venture nearly all the property he had accumulated. It was at that time that the Missouri question was agitating the nation, and he devoted himself to an exposition, in the newspapers of Missouri and Illinois, of the evils of slavery, in the hope of averting the impending calamity. Returning to St. Clairsville, he removed to Mt. Pleasant, and there began a monthly publication, *The Genius of Universal Emancipation* (Jan., 1821), then the only anti-slavery periodical in the U. S. It was afterward transferred to Jonesborough, Tenn., and thence (in 1824) to Baltimore, Md., where it became a weekly. In the latter part of 1825 Lundy visited Haiti to make arrangements with the Haitian Government for the settlement of such manumitted slaves as might be sent thither. In the winter of 1828–29 he was assaulted and nearly killed in Baltimore by Austin Woolfolk, a slave-dealer, for an editorial reproof of his conduct. In the spring of 1829 he went a second time to Haiti, taking with him a number of slaves emancipated for that purpose. In 1836 he started a weekly anti-slavery journal in Philadelphia entitled *The National Enquirer*. In 1837 he relinquished the charge of *The Enquirer*, intending to go to one of the Western States; but previous to his leaving Philadelphia all his papers, books, clothes, etc., deposited in one of the rooms of Pennsylvania Hall, were destroyed by fire—an act of pro-slavery incendiarism. In the winter of 1838–39 he removed to Lowell, La Salle co., Ill., intending to publish *The Genius* in that locality, but died on the 22d of the ensuing October. See *The Life, Travels, and Opinions of Benjamin Lundy* (Philadelphia, 1874). Revised by C. K. Adams.

Lundy's Lane, Battle of: called also that of Bridgewater or Niagara; fought in Canada near Niagara Falls, between the British and American forces, July 25, 1814. Col. Winfield Scott, who had been sent by the American Gen. Brown to make a demonstration before Queenstown, met at sunset the British Gen. Riall with a superior force and a battery of seven, afterward nine, guns in a strong position 1½ miles from Niagara Falls. Scott attacked, turned the British left, captured Riall and his staff, and succeeded in holding his ground in the face of a heavy fire from the battery until Brown came up at nightfall, increasing the American force to 3,000. The battery was captured, and three attempts by the British to regain it were repelled; but the guns were finally left for want of horses to drag them off. Brown and Scott were wounded, as was also Gen. E. W. Ripley, who succeeded to the command. The American loss in killed and wounded was 743; that of the British 878.

Lune [from Lat. *lu'na*, moon, named from its resemblance, in perspective, to a crescent. See Luna]: in spherical geometry, the portion of a spherical surface included between two great semicircles. The two semicircles are the sides of the lune, and the angle of the lune is the angle between the planes of its sides. This angle may have any value between 0° and 360°. In plane geometry a lune is the portion of a plane included between the arcs of two circles that intersect. The lune of Hippocrates is famous as being the first curvilinear space whose area was exactly determined. The construction of the lune of Hippocrates is as follows: On a line A B as a diameter describe a semicircle A D B, and in it inscribe a right angle A D B; then on the sides A D and D B as diameters describe the semicircles A G D and D H B. The two figures A G F D and D H B E are lunes, and the sum of their areas is equal to the area of the triangle A D B. For the areas of any two semicircles are to each other as the squares of their diameters, and from the right-angled triangle A D B we have $\overline{A\,B}^2 = \overline{A\,D}^2 + \overline{D\,B}^2$; hence the sum of the semicircles on A D and D B is equal to the semicircle on A B; diminishing both members of this equality by the sum of the segments A F D and D E B, we have the sum of the lunes equal to the triangle. If we make A D = D B, the lunes will be equal to each other, and the triangle will be equal to half the square on either. Revised by R. A. Roberts.



Lüneburg, lü'ne-boorch: a town of Prussia, Hanover; on the left bank of the Ilmenau, 14 miles from its confluence with the Elbe, and at the foot of a small hill called the Kalkberg (see map of German Empire, ref 3–E). It is an old town surrounded with walls, contains many characteristic buildings, and was an important member of the Hanseatic League. It still has a considerable trade. The Kalkberg is remarkable on account of its large gypsum and lime quarries, and still more on account of the salt-springs at its base, from the waters of which 20,000 tons of salt are yearly manufactured. Pop. (1890) 20,665.

Lu'neuburg: a town on the east coast of Nova Scotia; capital of Lunenburg County and terminus of a branch railway from Middleton (see map of Quebec, ref. 3–B). It is a thriving German town of 5,000 inhabitants, and, though settled in 1753, the German language and customs still prevail. The chief interests are ship-building, mining, and fishing. The gold-field of Ovens Head Peninsula is about 10 miles distant. Ovens Head is a sea-face with remarkable caverns, called the Ovens. M. W. H.

Lunéville, lü'nā'veel': town of France; in the department of Meurthe; at the confluence of the Vezouse and the Meurthe (see map of France, ref. 3–H); is one of the largest cavalry stations of France; the former palace of the Dukes of Lorraine has been transformed into cavalry barracks. It is historically notable from the Peace of Lunéville (Feb. 9, 1801), by which the Rhine became the frontier of France. Aug. 15, 1870, it was the headquarters of the Crown Prince of Prussia. It is noted for its manufactures of gloves and cotton, and has an extensive trade in corn, wine, brandy, and hemp. Pop. (1891) 20,906; (1896) 22,599.

Lung-chow: a town of Kwangsi, China; on the frontier of Tonquin; opened by treaty to foreign trade June 1, 1889. Pop. 20,000.

Lung Fever: See Pneumonia.

Lungfishes: See Dipnoi.

Lungs [plur. of *lung* < O. Eng. *lunge*: Icel. *lunga*: Germ. *lunge*]: the organs by which, in air-breathing vertebrate animals, the blood is aërated and certain gaseous impurities are removed from it. In the Invertebrata and fishes and the larvæ of Batrachia the lungs are functionally represented by Gills (*q. v.*) and by other analogous organs. In many fishes there is in addition to the gills a "swim-bladder," which structurally represents the lungs, and which, in a few species, appears to share in the function of the true respiratory organs. In the perennibranchiate batrachians there are both gills and lungs. The true reptiles all have sacculated lungs, and many of them breathe by gulping down a large quantity of air by a kind of swallowing process not much like the breathing of mammals. The left lung of serpents is either wanting or very rudimentary. In birds the respiratory function appears to be shared by the lining membranes of the extensive air-chambers in the bones, etc. The lungs of all the Mammalia are in plan much like those of man. The human lungs (*pulmones*, *pneumones*) are two, one being placed in each of the lateral cavities of the thorax, and they are separated from each other by the mediastinum and its contents. The apex of each lung extends above the first rib. The right lung is larger and broader, but shorter, than the left. It has three lobes—the left but two. The blood-vessels, air-tubes (bronchi), nerves, lymphatics, etc., enter each lung at a point called the *hilum*; and these structures, with the connective tissue, constitute what is called the *root* of the lung, a part of the mediastinum. The lungs are of light, spongy texture. The *outer* covering is a reflection of the pleura, and is a *serous* membrane. The *inner* membrane of the air-passages and cells is embryologically derived from the alimentary canal, and hence is a *mucous* membrane. The substance of the lungs is composed of a parenchyma consisting of lobules, each containing a branch of the bronchial tube and a cluster of air-vesicles or *alveoli*. The function and minute structure of the lungs are further illustrated in the articles Histology and Respiration (*qq. v.*).

Lungwort, or **Oak Lungs**: a lichen found in North America and Europe on trunks of trees in mountainous regions, sometimes almost entirely covering them with its shaggy, leathery, spreading thallus, which, when fresh, has an olive-green color, but becomes brown when dry. Its scientific name is *Sticta pulmonaria*. It derives its name from a fancied resemblance of the spotted thallus to diseased lungs, for which reason, upon the doctrine of signatures, it was formerly employed as a remedy in pulmonary diseases. It is nutritious, and when properly prepared affords a light diet capable of being used as a substitute for Iceland moss; yet it is bitter enough to be used as a substitute for hops. There is another plant (*Pulmonaria officinalis*) with the name lungwort, a perennial flowering herb of the borage family, also found in the northern parts of Europe, where it is used as a pot-herb. It is cultivated in gardens, has a creeping root and rose-colored flowers changing to blue. It is mucilaginous and slightly emollient. It contains niter in considerable abundance. It, too, was at one time extensively used as a remedy in pulmonary diseases. Revised by Charles E. Bessey.

Luperca'lia [= Lat., liter., neut. plur. of *luperca'lis*, pertaining to *Luper'cus* (who as guardian deity of shepherds kept the wolves from the flock); *lu'pus*, wolf]: an ancient Roman festival, celebrated on Feb. 15, in honor of a god whose name is given variously as Faunus, Inuus, and Lupercus, with ancient rites of peculiar character, the significance of which is for the most part a matter of conjecture, though in general it may be said that they are those of a primitive pastoral people, performed for the sake of securing fertility to human beings, flocks, and lands. On the day of the festival the members of the two colleges of the Luperci met at a cave on the Palatine called the Lupercal, and there offered sacrifices of goats and young dogs and cakes, made of the first fruits of the last harvest. Then the foreheads of two young men were smeared with the fresh blood of the victims, which was wiped away again with a piece of wool dipped in milk, whereupon the young men were required to laugh. The sacrificial feast followed, after which the Luperci, naked, ran around the Palatine hill, striking women who placed themselves in their path with thongs cut from the skins of the slaughtered victims—a rite efficacious, it was believed, to remove the curse of barrenness. These thongs were called *februa* (from an obsolete verb, *februare*, to purify), and hence the month was called February. G. L. Hendrickson.

Lupine [from Lat. *lupi'nus*, lupine, deriv. of *lu'pus*, wolf. Cf. Germ. *wolfsbohne*, lupine, liter., wolf's bean]: any herb of the large genus *Lupinus* of the family *Leguminosæ*. There are numerous species in the U. S., chiefly found W. of the Rocky Mountains. These species are prized mostly in cultivation for their handsome papilionaceous flowers. Many of the Old World species are cultivated as forage-plants, and their seeds are used as food for man. The cultivation of the lupine in Portugal (*Lupinus albus*) has proved a national blessing, and has regenerated great tracts of worn-out land. It is given to cattle as food, and also plowed into the ground as a fertilizer.

Lupuline, or **Lupulite**: See Hops.

Lu'pus [from Lat. *lu'pus*, wolf: Gr. λύκος: Eng. *wolf*]: a term comprising two distinct diseases of the skin, which most commonly attack the face, and begin as red and slightly or considerably elevated spots, afterward growing slowly to considerable dimensions. Both forms are found most frequently in youthful females. The benign form, *Lupus erythematosus*, occasions red and well-defined areas of slight elevation, and causes little local or general disorder. It is amenable to treatment. The severer disease, *Lupus vulgaris*, is now known to be simply tuberculosis of the skin, but its effects on the general health are far less severe than are those of tuberculosis of internal organs. It is characterized by dull-red nodules, which later break down and cause destructive ulcers. The treatment in both cases consists in the use of tonics and the application of stimulating remedies to the diseased areas in the milder, or of caustics in the severer. In the severer form it is often advisable to scrape out or remove the diseased tissues with the knife. William Pepper.

Lupus Servatus: See Servatus Lupus.

Luray: village; capital of Page co., Va. (for location of county, see map of Virginia, ref. 4–G); near the Shenandoah river, on the Norfolk and Western Railroad; 100 miles S. W. of Washington, 136 miles N. W. of Richmond. It is in a picturesque valley; has become a noted summer resort; and contains two seminaries for girls, an academy for boys, a large sole-leather tannery, woolen-factories, and three weekly newspapers. About a mile W. of the village is a remarkable cavern, discovered in 1878. The whole area occupied by the cavern, with its innumerable chambers, often arranged in tiers, is about 100 acres, of which, however, only a

comparatively small part has been fully explored; but such parts as have been opened to the public are illuminated by electric lamps, and the effect of the stalactitic display is very fine. The temperature is uniformly 54° F., and the air is pure. Though there are no streams or true springs, there are hundreds of basins, varying from a foot to 50 feet in diameter, and from 6 inches to 15 feet in depth. The water is pure, but destitute of life. A few bats, rats, mice, spiders, flies, and small centipedes are found in the chambers; and when first entered the floors of the cavern showed thousands of tracks of raccoons, wolves, and bears, probably made centuries ago. A single human skeleton was found, embedded in stalagmite; also some pieces of charcoal, flint, etc. Pop. of village (1880) 632; (1890) 1,386; (1900) 1,147.

EDITOR OF "PAGE COURIER."

Lurgan: town; in the county of Armagh, Ireland; 20 miles S. W. of Belfast by rail (see map of Ireland, ref. 5–I). It is a neatly built town, and has extensive manufactures of linens, muslins, and damasks. Pop. (1891) 11,447.

Luristan' (i. e. country of the Louri): a Persian province, adjoining Turkey, with Kurdistan on the N., Khuzistan on the S., and Irak-Ajami on the W. Area, 15,100 sq. miles. Pop. estimated at 300,000. The capital is Burujird, on the borders of Irak-Ajami. The chief element of the population is the Luris, a people closely related to the Kurds. The country is mountainous, but grows less rugged toward Mesopotamia. M. W. H.

Lusa'tia (in Germ. *Lausitz*; Fr. *Lusace*): an ancient territory of Germany, bounded by Bohemia, Saxony, Brandenburg, and Silesia. Originally it formed two independent margraviates, Upper and Lower Lusatia, which in 1635 came into the possession of Saxony, but by the Congress of Vienna in 1815 the greatest part of the territory was transferred to Prussia, Saxony retaining only the portion which forms the present circle of Bautzen.

Lushington, STEPHEN, D. C. L.: jurist; b. in London, England, Jan. 14, 1782; was second son of Sir Stephen Lushington; was educated at Eton and Oxford; called to the bar at the Inner Temple in 1806; admitted advocate at Doctors' Commons in 1808; appointed judge of the consistory court in 1828, and of the high court of Admiralty in 1838. He sat in Parliament many years between 1807 and 1841, in the Liberal interest; was counsel for Queen Caroline in 1820, and legal adviser of Lady Byron upon her separation from her husband the poet. He retired from the bench in 1867, and died Jan. 19, 1873. He is not to be confounded with his relative, Stephen Rumbold Lushington, D. C. L., governor of Madras, b. 1776, d. Aug. 5, 1868.

Lusita'nia: the name of the southwesternmost of the three provinces into which the Iberian Peninsula was divided by the Romans, comprising the present Portugal S. of the Douro and a considerable portion of the adjacent provinces of Spain. It derived its name from the Lusitani, who dwelt between the Tagus and the Douro, and were turbulent and warlike.

Lusk, WILLIAM THOMPSON, A. M., M. D.: obstetrician; b. at Norwich, Conn., May 23, 1838; entered Yale College in 1859, but remained only one year; studied medicine in Heidelberg and Berlin 1858–61; returned to the U. S., and during the civil war served in the Union army 1861–63; graduated M. D., Bellevue Hospital Medical College, in 1864; subsequently studied in Edinburgh, Paris, Vienna, and Prague; began to practice in New York city in 1865; was Professor of Physiology in the Long Island College Hospital from 1868 to 1871; was lecturer on Physiology, Harvard Medical School, 1870–71; appointed Professor of Obstetrics and Diseases of Women in Bellevue Hospital Medical College in 1871; was visiting physician to Charity Hospital 1870–71; held a similar position in Bellevue Hospital since 1871; was coeditor of *The New York Medical Journal* 1871–73. He was a member of various medical societies in the U. S. and Europe. His principal work, *The Science and Art of Midwifery* (New York, 1882), has passed through several editions, and has been translated into several foreign languages. Yale College conferred the degree of A. M. on him in 1872. D. in New York, June 12, 1897.

Lustration [from Lat. *lustra'tio*, purification, lustration, deriv. of *lustra're*, purify, deriv. of *lus'trum*, lustrum, a purification]: among the ancient Romans, ceremonial purification by water, blood of sacrificial victims, or other means. Similar rites were performed by the Greeks (κάθαρσις) and other peoples of antiquity. Such symbolical purificatory rites have their origin doubtless in the requirements of bodily ablution, a relation which appears very clearly in some of the most important forms of lustration, such as were undertaken after bloodshed, burial, or childbirth. Of the various occasions of lustral rites reported by Greek and Roman writers, some of the most important were purifications from blood-guiltiness, purificatory rites performed at momentous epochs in the individual or family life, such as marriage, birth, death, as well as purifications of people, city, and fields by officers of the state (see LUSTRUM) or by individuals. G. L. HENDRICKSON.

Lus'trum [= Lat. Cf. LUSTRATION]: a ceremonial purification (see LUSTRATION) of the Roman people, performed by the censor every five years with peculiar rites, as follows: All men of military age were collected in the Campus Martius, and about them was carried on spears a sacrifice consisting of a boar, a sheep, and a bull (*suovetaurilia*), which was then offered to Mars by the censor in fulfillment of the vows made by his predecessor. The completion of this rite, including the deposit of a register of citizens in the public treasury and the driving of a nail into the wall of the temple of Mars as a record of the event, was looked upon as necessary to give validity to the acts of the censor. From the fact that the lustrum was performed every five years the word came to mean a similar period.

G. L. HENDRICKSON.

Lute [from O. Fr. *leut* (> Fr. *luth*) : Ital. *liuto* : Span. *laúd* : Portug. *alaúde*, from Arab. *al'ūd*; *al*, the + *'ūd*, trunk, wood, stick, lute]: an ancient instrument consisting of a table, a body, a neck (for fingering) with frets, a head with screws for tuning, and a bridge on which ran the strings, from six to twenty-four in number. The frets were touched with the left hand, the strings with the right. It was long a favorite instrument in nearly all parts of Europe.

Lutes [from Lat. *luta're*, bedaub with mud, deriv. of *lu'tum*, mud, clay, whence Eng. *lute*, kind of clay cement]: compositions used for two purposes—the one being the making gas-tight or vapor-tight joints in apparatus used for holding or conveying gases or vapors, as in processes of distillation; and the other the coating externally of fragile vessels that are to be exposed to high heats. For the first use modern chemists are enabled to substitute almost altogether tubes, bands, and sheets of India-rubber, so that luting compositions are seldom used. There is one highly important case, however, in the arts in which they are still employed. This is for the lids of gas-retorts. (See GAS-LIGHTING.) In the laboratory, in cases in which the heat to be applied is below 400° or 500° F., *linseed meal* is much used; with water it makes a very plastic adhesive mass; with *glycerin*, instead of water, this mass will not dry and crack. If pressure is to be resisted, the composition may be applied in some mass to the joint, a band of cotton cloth rolled around it, and the whole then bound around with twine. Clay and glycerin make a useful lute also. Great numbers of similar compositions are known in the laboratory. See the *United States Dispensatory* of Wood and Bache, pp. 928, 929, for comprehensive and reliable information on this head.

Luthardt, loot'haart, CHRISTOPHER ERNST, D. D.: Lutheran theologian; b. at Maroldsweisach, Bavaria, Mar. 22, 1823; studied at Erlangen and Berlin; after beginning his career as theological instructor at Erlangen, was for two years professor extraordinary at Marburg, and in 1856 became Professor of Systematic Theology and New Testament Exegesis at Leipzig. He is editor of the *Allgemeine Ev. Luth. Kirchenzeitung* and the *Theologisch-Literaturblatt*, is distinguished as a popular lecturer and preacher, and is a voluminous author of sermons and works on exegesis (especially on the Gospel of John), apologetics, dogmatics, and ethics. H. E. JACOBS.

Luther, Germ. pron. loo'ter, MARTIN: religious reformer; b. Nov. 10, 1483, at Eisleben, Saxony. He has himself stated that all his ancestors were peasants. His father was a miner of the better class, who acquired some property, and was one of the council of the town of Mansfeld. Both father and mother were severe disciplinarians. The straitened circumstances of his father during Luther's youth rendered his education a matter of no little sacrifice and struggle. He attended school in Magdeburg in 1497; the next year he was transferred to Eisenach. His resort to singing at the doors of citizens in order to gain the necessary support, and his introduction thereby into the house of the

Cotta family, belong to this period. In 1501 he entered the University of Erfurt, where he devoted himself chiefly to philosophy and the study of the classics, Trutvetter having been his chief instructor, and Spalatin, afterward one of his most faithful colaborers, one of his fellow students. At the same time he cultivated music, which was almost his sole recreation. His first degree was taken in 1502, and his second, or the master's degree, early in 1505. He then began the study of law, but was interrupted by a change in his inner religious life, and, without his father's consent, entered the Augustinian monastery July 16, 1505. His two years' course there was distinguished by his rigid observance of every rule, his conscientious efforts to meet every demand of the confessional, the diligent study of Holy Scripture under the impulse of the Vicar-General Staupitz, and the still further reading of later scholastics, especially Occam. He was ordained priest in 1507. The next year he was called by Staupitz, then dean of the recently (1502) founded University of Wittenberg, to a professorship of philosophy. In 1509, after becoming bachelor in theology, he was called to the University of Erfurt; but eighteen months later returned to Wittenberg as Professor of Theology. In 1511 he was sent to Rome on business connected with the Augustinian order, and remained there for one month. In 1512 he became Doctor of Theology, and instead of lecturing, as was the custom, on the School Theology, expounded first the Psalms, and afterward the Epistles of St. Paul to the Romans and Galatians. Besides performing his professional work, he became in 1515 provincial vicar of his order for Meissen and Thuringia, having the supervision of eleven convents and conducting the customary visitations, preaching regularly in the convent at Wittenberg, and during the disablement of the town priest, preaching a course of sermons on the Lord's Prayer and the Ten Commandments in the town chapel. His reading brought him at this period under the influence of such mystical writers as John Tauler and the author of *The German Theology*.

His conflict with the ecclesiastical authorities was not self-determined. The Dominican Tetzel, acting as the agent of Archbishop Albert of Mayence and Magdeburg, had been pushing the sale of indulgences at Jüterbok, on the borders of Saxony, where the elector forbade his entrance. Among those who confessed to him Luther found persons who had bought indulgences. He preached against the practice and he protested to the bishops, but in vain. Then proposing a public discussion, Oct. 31, 1517, he nailed ninety-five theses to the door of the castle church in Wittenberg. Their moderation, and the mediæval dogmas they still approve, must surprise all who know their history, before undertaking to read them; but the result was as unexpected as it was important. In fourteen days they were diffused throughout all Germany, finding advocates everywhere, and also encountering just as violent condemnation. The discussion was more public than Luther intended. Assailed not only by Tetzel, but by Prierias, he promptly replied, growing still more confident, and receding further from the mediæval principles as the controversy progressed. His regard for the pope was as yet not shaken, when May 30, 1518, he wrote a humble letter of apology, without receding from his position; nor even, Mar. 3, 1519, when he wrote a second letter. The Elector of Saxony interposed his authority against his citation to answer at Rome for his course, demanding that he be tried on German soil. The breach widened with the Diet of Augsburg of Oct., 1518, where Luther appeared before the papal legate Cajetan, and with the Leipzig disputation, where Luther and Eck were pitted against each other from July 4 to 13, 1519. Then in 1520 (June 16) came the excommunication, and the burning in various places of Luther's writings, followed on Dec. 10 by Luther's burning of the bull in the presence of his students near the Elster gate at Wittenberg. On the succeeding Apr. 17 and 18 he appeared before the Emperor Charles V. at the Diet of Worms, and refused to recant, ending with the words: "Here I stand. I can not do otherwise. God help me." On his return from Worms (May 4) he was seized by friends in disguise and carried to the Wartburg Castle for security, where he employed his time in preparing various works for publication, chiefly his lectures on the Gospels and Epistles, until Dec. 1, when he appeared among his most intimate friends at Wittenberg for much-needed conference, and remained for three days. On his return to the Wartburg Castle he devoted himself to the translation of the New Testament, finishing it before he left in the beginning of March. A fanatical outbreak had occurred at Wittenberg in consequence of the radical measures of Carlstadt and the arrival of "prophets" from Zwickau. Luther, feeling that his presence was necessary, reached Wittenberg Mar. 5, 1522, and, after preaching every day, succeeded in quelling the disorder. Besides resuming his duties in the university, he devoted himself diligently, with Melanchthon's aid, to the revision of his translation of the New Testament, the first edition of which was published Sept. 21; but before it had left the press Luther was at work on the translation of the Old Testament, finishing the Pentateuch before Christmas. During the same time he wrote his vigorous answer to the attack that was made upon him by King Henry VIII. of England. In 1523 began Luther's efforts for the reformation of the mass, or public church service, which are embodied in his *Formula Missæ*, published that year. This was followed by his publication of hymns, translated and original, for public worship, twenty-four out of his thirty-six hymns having appeared in 1524. The next year he was occupied in suppressing more outbreaks of fanaticism and in opposing the war of the peasants. He married Catherine von Bora (b. 1499), who had been a nun, June 13, 1525. The plague at Wittenberg, during which he remained, although the university was removed to Jena, and the visitation of the Saxon churches under the direction of the elector were prominent events of 1527. The visitation was the occasion of new literary work. New volumes of sermons were published as models for the pastors, as well as for the edification of laymen. The two catechisms originated from Luther's discovery of the great ignorance among both pastors and people. The "large" catechism was first written, but it was unwieldy, and the short catechism embodies the best effort of Luther in this sphere. Both were published in 1529. In Oct., 1529, an unsuccessful attempt to form a union between Luther and Zwingli took place at Marburg. (See MARBURG, THE CONFERENCE OF.) Luther co-operated with his colleagues in the Wittenberg faculty in the preparation of the memoranda to be presented at the Diet of Augsburg (Torgau Articles). During the Diet he remained at Coburg in close communication with Melanchthon at Augsburg, and revised the confession during the progress of its preparation. In succeeding years repeated negotiations were held among the Protestant parties, in which Luther participated. Prominent among these were the negotiations with Bucer and others at Wittenberg in 1536, resulting in the so-called Wittenberg Concord, in which Bucer acknowledged the doctrine of the real presence, but not the communion of the unbelieving. There were also conferences with the Anglican theologians Fox, Heth, and Barnes, at Wittenberg in 1536, which, while attaining no immediate result, powerfully influenced both the confession and reformation of worship in the English Church (see Jacobs, *The Lutheran Movement in England*, Philadelphia, 1890); and at Schmalkald in 1537, in anticipation of the promised general council, resulting in the Schmalkald Articles, in which he discarded all irenic methods, and determined to dispel forever any hopes of reconciliation with the papacy. He continued incessantly active until the end of his life in the completion and revision of his translation of the Bible (the Old Testament having been completed in 1534, and a thorough revision of the entire translation having been made in 1541, with other corrections in 1545), in the preparation of Church orders, in the writing of various practical, exegetical, and controversial treatises, and in adjusting various Church difficulties and disputes. He died Feb. 18, 1546, at his birthplace, Eisleben, while absent from home, acting as arbitrator between the Counts of Mansfeld. His remains are buried in front of the pulpit in the castle church at Wittenberg.

The leading principles of Luther's theology are: (1) The entire corruption of human nature by sin, the consequent divine wrath and condemnation, and natural inability for self-recovery or response to the first approaches of divine grace. (2) God's grace and mercy proceed entirely from his free will, and not from any preceding disposition of sinful man. In his earlier years Luther taught absolute predestination. (3) The vicarious sufferings of Christ as the price of man's redemption, the suffering of the human nature having acquired infinite efficacy by its union with the divine nature in the one divine human person. (4) Justification is not an internal change in man, but is an external act of God alone, whereby, for the sake of Christ's merits received by faith, he forgives sin and pronounces sinful man righteous. (5) Faith is a work of the Holy Ghost in man wrought through the means of grace, and its essential factor is per-

sonal confidence in the merits of Christ. (6) The means of grace are the Word and sacraments, which are inseparably attended by the Holy Spirit; so that they are never without efficacy, although this efficacy does not work so as to save those who repel the Spirit's approaches. (7) Baptism is a means both of regeneration and renewal. Those who, after baptism, fall from baptismal grace, return by faith to the covenant first made in baptism. All repentance is a return to baptism. (8) The presence of the body and blood of Christ and its reception with the bread and wine are the surest pledge of the accomplished fact of redemption and its application to the individual believer. Like absolution, its effect is the individualization of the general promise of the Gospel; only the Lord's Supper accompanies the individualization, with the elements, and with the heavenly gifts attending them, as seals and pledges of the promise. (See EUCHARIST.) (9) The Holy Scriptures of the Old and New Testament are the final judge of all controversies; but everything in the constitution and worship of the Church not contrary to Scripture is to be retained and thankfully used. (10) In the New Testament, besides the priesthood of our High Priest, Jesus Christ, there exists only the spiritual priesthood of all believers since they have access to Christ directly and without the mediation of saints, angels, or any priestly order. (11) The ministry and the priesthood are therefore distinct institutions. The ministry belongs to the whole Church, but its duties are to be exercised only by those who are duly called and set apart to this purpose. In exceptional cases, however, the power inherent in any Christian congregation may admit of the ministry arising anew from within.

The principal editions of his collected works are that of J. G. Walch (1740–53), 24 vols. 4th ed. (German), which is in process of reprint at St. Louis, Mo.; the Erlangen (12mo), the German portion of which in 67 vols. was completed in 1857, but the Latin portion, of which 33 vols. have been published, is not yet complete; the Weimar edition (large 4to), which is very critically edited, and is being published in a luxurious form, by the generosity of the King of Prussia. The best edition of Luther's *Letters* is that edited by de Wette (Berlin, 1825, 5 vols.), to which a sixth volume, edited by Seidemann, was added in 1856.

The best biography of Luther is that by Julius Köstlin (Elberfeld, 1875; 2d ed. 1883; 3d ed. since but unchanged). A briefer and more popular *Life* by the same author, profusely illustrated, was published in 1883. Two translations into English appeared the same year, one in London and New York, and the other, by Dr. J. G. Morris, in Philadelphia. See also Krauth's *Conservative Reformation and its Theology*, and vol. vi. of Dr. Schaff's *History of the Christian Church*, both for biographical data and also for the literature of the subject. Prof. Köstlin has written an excellent and thorough treatise on Luther's theology (2 vols., Stuttgart, 1863; 2d ed. 1883). Th. Harnack has also written on the same subject (vol. i., Erlangen, 1882; vol. ii., 1886). Monographs on particular doctrines treated by him have been written by Köstlin, Weisse, Luthardt, Monckeberg, and Dieckhoff. The Luther jubilee in the U. S. especially called forth the eloquent oration of Dr. J. A. Seiss, published in book form, *Luther and the Reformation* (Philadelphia, 1884), and a very interesting volume of *Tributes to Luther*, edited by Rev. P. C. Croll (Philadelphia, 1884).

H. E. JACOBS.

Lutheranism and the Lutheran Church: The result of the union of the conservative with the progressive in reformation, as distinct from revolution, was the Lutheran Church, whose essential characteristics constitute *Lutheranism*. Lutheranism is the system of faith and life taught in God's word and confessed in the Augsburg Confession and in the creeds consonant with it. The Lutheran Church has never by any general official act taken the name Lutheran. Art, history, and popular usage have practically determined its title. Said the Marquis of Brandenburg when ridiculed as a Lutheran: "If I be asked whether with heart and lip I confess that faith which God has restored to us by Luther as his instrument, I have no scruple, nor do I feel a disposition to shrink from the name Lutheran. Thus understood, I am, and shall to my dying hour remain, a Lutheran." This is the only sense in which any Lutheran tolerates the name.

DISTINCTIVE CHARACTERISTICS OF LUTHERANISM AND OF THE LUTHERAN CHURCH.—The distinctive characteristics of Lutheranism, as over against the Church of Rome, belong to PROTESTANTISM (*q. v.*). A searching analysis of the elements which characterize it in opposition to the Reformed or Calvinistic portions of Protestantism has been made by both friend and foe.

They may be stated and numbered thus:

1. The material principle or foundation of the matter of Lutheran Protestantism is the saving truth of Christianity as it lies centered in the doctrine of justification for Christ's sake alone (*propter . . . um willen*), by faith alone (*per . . . durch*).

2. The formal principle, that which prescribes the form in accordance with which the material is shaped, is the sole authority of Holy Scripture as the rule of faith and guide of life.

3. The Lutheran method of using the rule of faith is historical. The pure Church catholic, or Christian Church, is the living witness of the truth.

4. The doctrines of God's word, the means of establishing which Holy Scripture contains within itself, and of which the Church is witness, shape the individual assurance of faith and the confession of the Church, and originate and develop her polity, worship, and practical life.

5. The Protestantism of the Reformed or Calvinistic Churches, on the other hand, has laid as its fundamental doctrine the absolute and sole primary causality of God. In it there is but one real cause of whatsoever comes to pass, the foreordination of God. Election is therefore the material principle. "The Lutheran doctrine," says Schneider, "comes, through the Gospel, to God—the Reformed, through God to the Gospel."

6. While Calvinistic Protestantism holds with the Lutheran Church that Holy Scripture is normative, it has yet isolated the Scriptures from the historic development of the Church, and subjected its interpretation far more to an undefined subjectivism.

7. "In Reformed Protestantism the formal principle is controlling—in Lutheranism, the material. In the Reformed system Scripture is regarded more as the exclusive source of doctrine—in the Lutheran system, as the norm of the doctrine, which grows out of the analogy of faith. In consequence of this, a pure tradition possesses in Lutheranism a greater validity." Goebel (Reformed), *Die relig. Eigenthümlichkeit*, 1837; Nitzsch (Consensus), *Prakt. Theolog.*, 1847, i., § 74, *seq.*; Heppe (Melanchthonian Reformed), in *Studien u. Kritiken*, 1853, 3.

8. "Lutheran Protestantism is the antithesis to the Judaism of the Roman Church, and thereby the doctrine obtained a Gnosticizing character; the Reformed is the antithesis to the paganism of the Romish Church, and thus the doctrine received a Judaizing ethical character." Herzog (Reformed).

9. "Reformed Protestantism is the protestation against all deification of the creature. Hence it emphasizes the absoluteness of God and the exclusiveness of His will—its material principle—with which coheres the exclusive emphasizing of Scripture as the positive normal principle." Schweizer (Mediating Reformed), *Glaubenslehre*, 1844.

10. "The material principle of Zwingli is the glory of God; his formal principle is the Scripture, yet in such sense that he explains that the internal word is independent of the external, and denies all creaturely causality on the part of the creature in salvation." Dorner (Mediating Lutheran), *Prinzip.*, 1841; *History of Protestant Theology*, 1867.

11. "The Reformed system begins at the top, and goes downward; the Lutheran begins below, and ascends." . . . The center of gravity in the one was the objective, in the other the subjective. . . . Calvinism is the proper Protestant counterpart of Catholicism. The whole system of the dependence of the individual on a power which absolutely determines him in his willing and doing, the system which is set up by Catholicism in its doctrine of the Church, is bound up by Calvinism in its absolute decree. In the one everything saving and salutary lies in the Church; in the other, it lies in the decree. The Lutheran system, with its faith reposing on the historical fact of the redemption, holds the mean between Calvinism and Romanism—between the transcendent idealism of the one, the external realism of the other." *Baur, F. C.*

12. "All these diverse presentations," says Luthardt, "have as their basis the common supposition that the difference is not merely an external one, is not one which turns merely on particular doctrines—as, for example, the Lord's Supper—but pervades the systems and is a difference in principle. The essential part of the difference hinges upon

the elements of the Reformed doctrine, which reciprocally condition each other: the absolute causality and the sole primary causality of God, which excludes means of grace in the strict sense, on the one side, and on the other side an assurance of a state of salvation, grounded in an inscrutable decree—an assurance reached by the individual actual life as the result of the divine operation." Hundeshagen, *Der Deutsche Protestantismus* (1847; 3d ed. 1850); Lücke (*On the True Formulating of the Distinction and Union of the Lutheran and of the Reformed Churches*), *Deutsche Zeitschr.* (1853, 22–53); Schneckenburger, *Vergleich. Darstell. d. Luther. u. reformirt. Lehrbeg.* (Güder, 1855); Baur, F. C., *Lehrb. d. Rise and Early History of the Lutheran Church.—The earliest annals of the Lutheran Church are interwoven with the personal and official history of Luther. His internal conflicts, his theses, the meetings with Cajetan and Miltitz, the Leipzig disputation, the attraction of Melanchthon into his mighty orbit, his era of storm and pressure (1520–21), the bull, the efforts of Charles V. at repression, the Diet of Worms, the hiding at the Wartburg, the outbreak of radicalism at Wittenberg under Karlstadt (1522–25), the Peasant war and Anabaptist sedition (1529), the controversies with Henry VIII. and Erasmus (1523–26)—all had within them potencies for the future of the Church, on which Luther's name, in the face of his protest, was to be fixed. The Lutheran Reformation showed its unfolding strength in the empire at the Diet of Nuremberg (1522–23); in the extension of the evangelical doctrine (1522–24); at the second Diet of Nuremberg (Jan. 14, 1524); at the convention of Ratisbon (1524), called to resist it; in the growing decision of the evangelical states (1524); in the Torgau confederacy (1526). With the year 1526 the estates began to use the right, successfully claimed at the Diet of Spires, to regulate ecclesiastical matters in their own territories. In the years following (1526–29) a number of the Lutheran state churches began to be established and organized. Electoral Saxony, by Luther's advice, began with a thorough visitation of the churches. The church constitution and Luther's two catechisms (1529), which grew out of this visitation, became guides in the organization and training of other state churches. The first martyrs were two young Augustinian monks of Antwerp (1523), whose memory is kept green by Luther's hymn.

Early Ecclesiastical Conflicts.—The Reformation in German Switzerland, under the leadership of Zwingli, had been advancing with many elements of generic affinity with the work of Luther, and with no few marks of specific diversity from it. It was not the purely personal peculiarities of the two leaders, but the origin and internal tendencies of their systems, which led to the sacramental controversy (1525–29). The Lutheran doctrine of the Lord's Supper is one which depends upon methods of interpretation with whose validity the whole distinctively Lutheran system, and indeed the entire biblical churchly system, stands or falls. (See Eucharist and Luther.) The Catholic party hoped at the Diet of Spires (1529) to regain what they had lost three years before. The bitter anger which had been aroused by the affair of Pack (1527–28), the excitement of their fears by the rapid progress of the Reformation, the stimulation of their hopes by the improved political prospects of the emperor—which he largely owed to the Lutherans, to whom he was about to show himself so ungrateful—encouraged them to revoke the decision of the Diet of 1526, and to roll back the wave of Reformation as completely as the new decision of a diet could do it. Against this the evangelical (Lutheran) princes made their solemn protestation (Apr. 19, 1529), which gave them the name of *Protestants*, and appealed to the emperor, to a free council, and an assembly of the German nation. For the Diet of Augsburg and the confession which resulted, see Augsburg Confession.

Political and State Movements (1530–55).—The Protestants now formed a defensive alliance at Schmalkald (1530) to last six years. This aided in bringing about the religious Peace of Nuremberg (July 23, 1532). Würtemberg became Lutheran 1534–35. The Reformation was carried through in Anhalt, Pomerania, and Westphalia in 1532–34. The Schmalkald League was enlarged so as to embrace the new Lutheran states; subscription to the Augsburg Confession was the indispensable condition of reception into the league. Bucer brought the Oberland cities to subscribe. The way for this had been prepared by the Wittenberg Concord (May 25, 1536). Paul III. (1534–49) professed to call that general free council which had been so ardently desired. It was convoked for May 23, 1537, at Mantua. In anticipation of the possibility of a council there or elsewhere, Luther, by order of the elector, drew up certain articles of the points which were not or were to be held above all concession—the Lutheran ultimatum. These were considered at Schmalkald, and take their name from it (Feb., 1537). The Schmalkald Articles form the third of the distinctive confessions of the Lutheran Church. The council was never held, and was never meant to be held. The Nuremberg Holy League (July 10) of the Catholic princes might have brought on a bloody war had not the political difficulties of the emperor made it absolutely necessary that he should conciliate the Protestants. There is no denying that the Turk, who threatened Christendom, was often the best friend Protestantism had on earth. All processes against the Protestants were arrested for eighteen months by the Frankfort Suspension (1539). A profound confidence in the ability of Protestantism to maintain itself began to fill the minds of men. The Reformation in Albertine Saxony had been violently held in check by Duke George (1500–39). On his death without issue, his brother Henry was received with jubilation, and the Reformation swept all before it. The March of Brandenburg and several of the neighboring territories received the Reformation in 1539.

All hope of a better understanding, of a possible union between the conflicting parties, had not yet vanished. Many colloquies were held (Worms 1540, Ratisbon 1541), but they served only to show more clearly the invincible character of the cause of separation. Politically, the prospects of the Lutheran states were very brilliant (1539), but the guilty passions and follies of some of the princes were preparing the way for their own humiliation and for deadly injuries to the cause of truth. Under the lowering of the great storm which was coming Luther died Feb. 18, 1546. The pope had finally consented to call a general council in Trent, a German city, but as little German as possible. The emperor was earnestly desirous of a Reformation in some important particulars, but was determined that it should be in accordance with his own ideas. He used the rivalry and unholy ambition of some of the Protestant princes to separate them from the Schmalkald confederacy. The power which would have been ample to overthrow him was divided. The war of Schmalkald was sprung upon the Protestants. The campaign on the Donau (1546) left the emperor master of all South Germany. Hermann of Cologne was deposed, and the country of the Rhine was lost (1547). The campaign of the Elbe (1547) ended in the overthrow and imprisonment of John Frederick and the landgrave Philip. Then came the imposition of the humiliating and distracting Interim (1548), and the political prospects of the Lutheran Church in Germany reached their hour of profoundest darkness. At this hopeless crisis deliverance came from the man who more than any other was responsible for the evil. In the heart of the Elector Maurice, the betrayer for a time of the Reformation, the slumbering sense of honor was aroused. The German and Protestant feelings to which he had been so treacherous again asserted themselves. He was indignant at the continued confinement of his father-in-law. Breaking from the bonds of the emperor, who had used him as his right hand in the repression of Protestantism, he turned fiercely upon him. Like a hunted fox the emperor fled for his life, in darkness, through pelting rain, on the snow-covered mountains. The treaty of Passau (1552) guaranteed the Lutheran states equal rights with the Catholic till a new council should be convened. The religious Peace of Augsburg (Sept. 25, 1555) withdrew the limitations as to time. The Lutheran Reformation had proved itself incapable of repression alike by the arts and arms of Rome, by the sagacity of its foe, and the follies of its friends. See Walch, *Geschichte* (History of the Evangelical Lutheran Religion as a Proof that it is the True Religion, 1753); Koecher, *Wahrheit*, chaps. xix., xx. (Truth and Perfection of the Evangelical Lutheran Religion, 1755); Ranke, *Deutsche Geschichte im Zeitalter d. Reformation* (4th ed. 1867–68, 6 vols. 8vo); Weber, *Das Zeitalter der Reformation* (1873); Horn, *The Three Interims* (1893).

The Lutheran Reformation Outside of Germany.—Had the conflict been one of purely moral means, the Reformation would have triumphed throughout Europe. Even the resources of courts and the terrors of persecution could not prevent its wide acceptance. In Northern Europe the Lutheran Confession found a home among the Scandinavian races. In Eastern Europe Lutheranism and Calvinism reached the Slavic and Magyar races together. The causes of the preference for the one or the other type of reformation were partly personal and local, but were far more associated with national, race, and political characteristics, which corresponded with the more radical tendency of Calvinism on the one side, and the more conservative character of Lutheranism on the other. The Lutheran Reformation was triumphant in Sweden (1527) under the influence of Gustavus Vasa. In Denmark and Norway the Lutheran organization was confirmed by the Diet of Odense (1539), and by the middle of the century the lands of the Baltic coast and Courland, Livonia, and Esthonia were embraced in the great Lutheran family. See Münter, *Kirchengeschichte v. Dänemark und Norwegen* (1834); Fryxell, *Gustav Wasas Leben* (1831); Weber. *Zeitalter d. Ref.* (530–573).

Doctrinal Controversies in the Lutheran Church in the Sixteenth Century.—See articles Adiaphorites, Antinomians, Crypto-Calvinists, Major, Osiander, and Predestination. For literature, see Kurtz, *K. G.*, 1874, § 141, and see the works of Dorner (1867), Frank (1862–63), Heppe (1852 s.), Planck (1791–98), Loescher (1722–24), Thomasius (1848), Walch (1730–39), Krauth. *C. Ref.*, 147. The internal questions which agitated the Lutheran Church were determined in the Formula of Concord (1577), which closes the collection of the confessions which appeared under the title of Book of Concord (1580). See both these articles.

Church Polity.—In her ecclesiastical constitution the aim of the Lutheran Church was to avoid the hierarchical subjection of the State to the Church, and the Cæsareopapal lording of the State over the Church. The former, which depended on herself, she perfectly secured; in the latter, which was influenced by state plans, she was not always so happy, and in various ways the political complications of the time embarrassed the practical application of her principles. (See the articles Consistory and Episcopal System.) Consult also *Die Kirchenordnung* (The Church Order of the Evangelical Lutheran Church of Germany in its First Century, 1824); Richter, *Geschichte* (History of the Evangelical Church Polity in Germany, Leipzig, 1851); Stahl. *Die Kirchenverfassung* (Erlangen. 1862); Haupt, *Der Episcopat der deutschen Reformation* (Frankfort-on-the-Main, 1863).

Worship and Art.—The worship and the range of art in the Church were meant to meet the wants both of the judgment and of the emotions. A perfect freedom was claimed for the Church in all the purely human regulations of worship. She could add, drop, or change, prudently and in love, according to her judgment of what was best. Her essential unity was that of faith, not of forms; but the spirit of her faith pervaded all her forms. A thorough conservatism was observed. The legitimate results of the historical growth of the Church were treasured. The expressive ornaments of the altar and the innocent usages dear to the people were retained. The Romish perversion of the mass, all rites that taught or insinuated unsound doctrine, were thrown out, and the evangelical mass, the pure communion service, remained. The pulpit became a power. The people took part everywere in worship, which as of old was responsive. They heard God's Word and uttered his praises in their own tongue. The biblical festivals of the Church year were retained. Painting (Cranach, the Holbeins, Dürer) and statuary hallowed their gifts for the sanctuary. See Jacoby, *Liturgik d. Reformation* (1871); Kliefoth, *Ursprüngl. Gottesdienstordnungen in l. K.* (1847); *Liturg. Abhandlungen* (1854, *seq.*); Schöberlein, *Ausbau* (1859); Krauth, *Evangelical Mass and Romish Mass*; *Sunday Services according to the Liturgies of the Churches of the Reformation*; *Jubilee Service* (1867); Köstlin, *Geschichte des christlichen Gottesdienstes* (Freiburg, 1887); Jacobs, *The Lutheran Movement in England* (1890); Horn, *Outlines of Liturgies* (1891); also articles in *Lutheran Church Review* and *Lutheran Quarterly* (1890–93), by Horn, Wenner, and others.

Hymns.—The hymns for the people were one of the grandest achievements of the Lutheran Reformation. They are full of simplicity, unction, and divine objectivity. Holy song was as wide-reaching, as incapable of exclusion, as soft and wooing, as mighty and irresistible, as the air on whose pulsations it spoke heart to heart. Among the greatest hymn-writers are Luther; Speratus, d. 1554; Decius; Eber, d. 1569; Spengler, d. 1534; Mathesius, d. 1565; Alber, d. 1553; Weisse, d. 1540, of the first half of the century; in the latter half we have Ringwaldt, d. 1597; Selnecker, d. 1592; Herberger, d. 1627; Nicolai, d. 1608. "In worship the austere Old Testament psalmody of the Reformed presents a striking contrast with the cordial internality of the Lutheran Church song, gushing from the living spring of the spirit of poesy." (*Baur.*) See Koch, *Geschichte* (History of Hymns and Church Song, especially in the Evangelical Church, 3d. ed. 7 vols., 1866, *seq.*); Wackernagel, *German Hymns from Luther to Hermann* (1841); *From the most Ancient Times to the Beginning of the Seventeenth Century* (1867, *seq.*).

Church Music.—The congregational singing was a revival of the Ambrosian choral over against the priestly Gregorian chant. It was choral, for the people and the choir blended into one in this noble form of song. Among the composers of this era are Luther and his familiar friends Rhau and Walter. Eccard (d. 1611) did much for church music.

Practical Life.—The Christian life was one of humble, joyous assurance. The clergy were marked by devotion to the pastoral work, and by fidelity in the pulpit and in the religious instruction of the young. Without a severe Church discipline they trained the people in the fear of God, in personal honor, and in the domestic and civil virtues. "In the administration of Church discipline the Lutheran Church is beyond dispute very much behind the Reformed; on the other hand, the moral life in the Lutheran Church has a character of greater freedom, of more heart and soul, resting more on internal motives." (*Baur.*) "That there were painful exceptions is not only the necessary general result of the common infirmities of human nature, but is connected with this fixed law, that the times following great struggles, warfare, and change, even of the most hallowed character, are times of reaction and relaxation. The immediate sequence of a successful war for truth and virtue is a revival of the potency of many elements of falsehood and vice."

Theological Science.—The nature of the times gave great prominence to polemic theology. Whatever part of theology was taken up was handled with special reference to its availableness as a means of defense or enlargement of the restored truth. The plowshares were beaten into swords. Luther, Melanchthon, Flacius, Brentius, Chemnitz, and the co-workers in the *Magdeburg Centuries* are still unforgotten names. The centers of theological culture were the Universities of Wittenberg, Tübingen, Strassburg, Marburg (1527), and Jena (1557). See Dorner, Frank, Gass, Heppe.

Transitions of Lutheran Established Churches in the Sixteenth Century.—The Crypto-Calvinistic designs had contemplated a general removal of the Lutheran Church from its first foundations. Crypto-Calvinism was concerned mainly with the sacramental doctrines. It was really further from what is now considered as by pre-eminence Calvinism than Lutheranism itself had been. It was unionism, deriving its special features from the times. Its designs were thwarted, yet the Palatinate under Frederick III. (1560), Bremen (1562), and Anhalt (1597) were transferred by their civil rulers to the Calvinistic communion.

The Lutheran Church in the Seventeenth Century.—1. Hesse-Cassel (1604), the earldom of Lippe (1602), the court (but not the people) of the electoral house of Brandenburg (1613), became Calvinistic. Various attempts at union (Leipzig, 1631; Thorn, 1645; Cassel, 1661) accomplished nothing. The ardor for union was so great that its representatives drove Paul Gerhardt and others from their flocks into poverty and exile for declining to treat the distinctive faith of the Lutheran Church as a thing indifferent.

2. The peril of peace is the peril of stagnation. The Lutheran Church had undergone the ordeal of a war of polemics; she was to undergo the trial of a comparative internal repose. She now reached her mediæval period, rich in construction, comparatively poor in origination, not by declension, but by the ordinary law of historic progress. Within the determined orthodoxy rose various questions, but in many of them the interest was confined to theologians. The controversy on syncretism originated in the views of George Calixtus. With pietism in its early stages are associated the names of Spener and Francke.

3. In theological literature are found among the names still treasured Glassius, Pfeiffer, the Schmidts (Erasmus

and Sebastian), Baier, Calovius, Hutter, Gerhard, Quenstedt, Hunnius, and Musæus.

4. The age is brightened also by the works of many of the noblest representatives of a living, internal Christianity. Among them are Arndt (*True Christianity*), Gerhard (*Meditations* and *Schola Pietatis*), Heinrich Müller, Scriver, and Andreæ. The lovers of mysticism and theosophy treasure Jakob Böhme and Gottfried Arnold.

5. The century was rich in hymn-writers. Those of the earlier part were marked by the old objectivity—those of the later, by the growing tendency to subjectivity. There was an intermediate school, whose greatest representative, Paul Gerhardt, harmonizes both tendencies. Church music was nobly represented by the great composers Crüger, d. 1662; Rosenmüller, d. 1686; Hammerschmidt; Ahle, d. 1673.

The Lutheran Church in the Eighteenth Century.—1. *Before "the Illumination."* After the death of Spener (1705) and Francke (1727) pietism degenerated very rapidly. That this was not the absolutely necessary outgrowth of the principles of the great leaders in the pietistic movement is shown by the fact that out of Halle there also went forth forces into the Church the beneficence of which is beyond all dispute. There arose a generation of Lutheran divines as pious as the pietists, as orthodox as their opponents—who neither arrayed piety against orthodoxy nor orthodoxy against piety, but showed by pen and life that true piety is orthodox, and that true orthodoxy is pious. Of this school, though not in equal degrees, may be named Hollazius, Starck, Buddeus, Cyprian, J. C. Wolff, Weismann, Deyling, J. G. Carpzov, J. H. and C. B. Michaelis, J. G. Walch, Pfaff, Mosheim, Bengel, and C. A. Crusius. Of the philosophical Leibnitzo-Wolfian school were S. J. Baumgarten, Reinbeck, Carpov.

2. *Church Polity.*—The (politico-) episcopal system of polity had claimed at first to be simply a necessity. This transmuted itself into the assertion of a principle (Carpzov, 1645). It was supplanted by the territorial system (Thomasius and Böhmer, beginning of the eighteenth century). A third system, the collegial, was the outgrowth of Spener's views, and found an able exponent in Pfaff (1719). (See Polity, Ecclesiastical.) Also see Richter, *Gesch. d. ev. Kirchenfass* (1851, 208); Lechler, *Gesch. d. Presbyt. und Synod. Verfassung* (1854, 228); Stahl, *Die Kirchenverfassung* (1862).

3. *Worship.*—The hymn-writers of this era show the influence of the spirit of Spener in the earnest piety which is their strength, and in the individualism which is their weakness. The early hymns were hymns for men to sing together—the later hymns were hymns to be sung by men in separateness, and sometimes of the sort that men are not likely to sing at all. The degenerating pietism corrupted the music of the Church. This tendency was met by John Sebastian Bach, who in many of the highest attributes of his art was "the greatest master of all times," the lover and the glorifier of the ancient choral. Handel (d. 1759) gave his ripest years to oratorio, and in his *Messiah* reached by the inspiration of music a height Milton had failed to attain in *Paradise Regained.*

4. *Missions.*—The new life of the purer pietism showed itself in establishing missions among the heathen. At the Danish mission at Tranquebar (1704) labored Ziegenbalg (d. 1719). From Halle went forth Schwarz (d. 1790). Callenberg founded at Halle (1728) an institution for the conversion of the Jews. Hans Egede (1721) went to Greenland, and when in 1736 he returned to Denmark and established a mission seminary for Greenland, his son Paul took his place. On Lutheran missions, see Francke, *Berichte d. dän. Miss. in Ostind.* (1708–72); Egede, *Description of Greenland*, transl. from the Danish (London, 1745); Wiggers, *Gesch. d. evang. Miss.* (2 v., 1845); Wiggers, *Statistik* (2 v., 1842–43); Plitt, *Kurze Gesch. d. luth. Miss.* (1871).

5. *The Rationatistic "Illumination."*—From the middle of this century rationalism, claiming the title of "Illumination," or enlightment, made rapid progress. Rationalism, arising from the abuse of the freedom of investigation demanded by the nature of Christianity, and enunciated as a vital principle by Protestantism, has coexisted in some shape with the Church from its first hour to the present. In the eighteenth century it was intensified by causes of wide extent and great potency, and revealed itself in every great communion of Western Christendom. Lutheranism had been charged by Rome with giving undue weight to human reason—not indeed as over against the Word, but as against Church authority—and Rome was assailed through the whole Reformation, by both the great Protestant parties, as rationalistic and Pelagian in many of her doctrines. The great leader in rationalistic criticism of the eighteenth century was the Roman Catholic Oratorian, Simon, who died 1712, nearly ten years before Semler, the father of rationalism in the Lutheran Church, was born. The Reformed tendency was resisted by Lutheranism as unconsciously rationalizing; but the unequivocal tendency had been shown first in Socinianism, and afterward in the advanced Pelagianism of Arminians of the school of Le Clerc (d. 1736). England contributed her deistic writers. In France, naturalism and atheism became fashionable, and Frederick the Great helped to domesticate them in Germany. Freemasonry as it had been transferred from England in 1733, the Wolfian philosophy, and the perversions of philosophy in general, the later pietism, and the separatism it engendered, aided in the work of mischief. Rationalism is infidelity in various degrees, under the forms of Christianity. The supranaturalism which met it was more or less under the latent influence of the thing it combated, as the English apologetics of the century showed tinges of the deism with which it fought. The higher philosophy and national literature, though in seeming affinity with rationalism on the surface, were yet in their antagonism to its prosy doctrines, its plausible shallowness, emptiness, and self-sufficiency, its invincible foes in their deepest and final workings. See Rationalism and Philosophy, German.

6. *Opponents of Rationalism.*—In the darkest time some were "among the unfaithful faithful found." Imperfect as was the work of the supranaturalists, the best of them did noble provisional service. They at least kept a polar twilight where there might have been a midnight. Outside of the ranks of the theologians, Claudius, Hamann, and Oberlin, the pastor of the Ban de la Roche, are among the unforgotten names. Under a common pressure the faithful hearts of the separate communions were drawn closer to each other.

7. *Influence of Rationalism.*—Under the baleful influence of rationalism every sacred interest declined. The pulpit lost its power; no living hymns were produced, and the old were unsung. In music the ancient beauty and glory of the choral vanished; men sought the concert-room and the theater, for which the music of the time was better suited than for the church. The oratorio gave way to the opera. The conservation of Rome itself yielded, and Palestrina's noble school sank before the self-sufficiency of operatic organists and choirs. The liturgies which were offered, too frequently with success, for the historical services of the Church, are beneath the ludicrous. They are too dreary to awaken the smile which their absurdity seems to challenge. Rationalism had shown that its problem is not as between forms of religion, but as between religion and irreligion.

The Lutheran Church in the Nineteenth Century.—1. *Reaction of Church Life.*—The revolutionary excesses of France, and the awe-inspiring providences growing out of them by development or counteraction, which marked the fifteen opening years of the nineteenth century, had tended to sober men, to turn their eyes to God, and to show them how poor are the substitutes which had been offered for the simple, deep, and earnest faith of the olden times. All deep thinking tends as a finality against skepticism. Reason is the cure of unreason. Kant, Fries, the Fichtes, Schelling, Hegel, Herbert, Schopenhauer, Ulrici, Lotze, von Hartmann, in simple virtue of helping to earnest thinking, work in one school. The earnest thinking instantly showed itself as a better thinking. Pietism renewed its better youth. The ninety-five theses of Claus Harms (1817, the close of the third centenary of the Lutheran Church) recalled the Reformation to the minds of all, to the hearts of many.

2. *Union and Separation.*—Frederick William III. began in 1817 the movements looking to the union of the Lutheran and Reformed in one state Church. Strong opposition rose on the side of many earnest Lutherans. Among them may be mentioned Scheibel (d. in exile, 1843), H. Steffens (1831), Kellner, whose church was opened by military force for the Agenda (1834), Guericke (1835). Frederick William IV. released the clergymen who were imprisoned, and a free Lutheran Church was organized 1841, and received the royal concession 1845. Separation also arose within the separated, on questions affecting the constitution of the Church. A decision of the general synod of 1859 adverse to the view of Diedrich led to his separation from the

synod (1861). A free Lutheran conference of the friends of separation from the unionistic state churches was held Oct. 28, 1874, at Eisenach, the object of which was to promote a better understanding and a more perfect sympathy and mutual support. In the discussion of the questions raised by the union, see Rudelbach, *Reformat. Luth. u. Union* (1839); Müller, *Evang. Union* (1854); Nitzsch, *Urkundenbuch* (1853); Stier, *Unlutherische Thesen* (1854); Schenkel, *Unionsberuf* (1855); Schulz, *Die Union* (1868). See citations under § II. of this article.

3. *Confederations.*—Various confederations attempted to co-operate with or supplement the union, so as to bring into practical co-working the elements which had been joined but not united in it. Among them are the Gustavus Adolphus Association (Oct. 31, 1841), the Evangelical Church Diet (1848), at whose meeting in Berlin (1853) the Augsburg Confession received a qualified recognition as the common confession of Protestant Germany; the Eisenach Conference (1846, 1852).

4. *Distinctive Lutheranism within and without the Union.*—Within the union distinctive Lutheranism still remained a great and active power. Many Lutherans remained within the union to fight the battle for truth there, and to obtain, if possible, a restoration of the solemnly guaranteed rights of the Church. Lutheranism outside of the union was represented in the general Lutheran conference, among whose distinguished names are Harless, Kliefoth, and Luthardt. Its chief organ is Luthardt's *Kirchenzeitung* (1868).

5. *Hymns and Music.*—The awaking consciousness of the Church led to noble and successful efforts to correct the wretched state into which the rationalistic Vandalism had brought the hymns, the music (the choral has been the pulse of the Church), the service, and the popular religious literature. Moritz Arndt, von Raumer, Bunsen, Stier, A. Knapp, Daniel, Layritz, the Eisenach Conference (1853), and Waekernagel have labored in the revival of hymnology. Natorp, Thibaut, Grüneisen (1843), Winterfeld (1843), and V. Tucher (1848) have done valuable service in restoration.

6. *The theology of the nineteenth century* could only have risen in a land which had received the ineffaceable impression of Lutheran life and thought. The grandeur of the wildest perversions of this theology and the ruins of its most unsparing destructiveness were only possible on the presupposition of eras of gigantic building. The ancient Lutheran theology, after the storm of war had swept over it, stood like Tadmor in the wilderness. Its ruthless foes could not build, and could only destroy because the greater generations had builded; but they could not perfectly destroy—they could only dismantle what was too massive to be overthrown. The Protestant theology of Germany is represented (1) in the older and in the historico-critical rationalism; (2) in the old supranaturalistic schools, embracing rational supranaturalism, the strieter or suprarational supranaturalism, and the pietistic supranaturalism; (3) the mediating theology whose father is Schleiermacher. Among its representatives from the Lutheran side have been Lücke, Bleek, Nitzsch, Muller, Ullmann, Twesten, Dorner, Liebner, Martensen, Ehrenfeuchter, Beyschlag, and Köstlin; (4) *Lutheran Theologians of the Confession.* The patriarch among these was Claus Harms (d. 1855). Among its representatives in what might be called a first generation have been Sartorius, Rudelbach of Denmark, and Guericke. The divines of a second generation show certain divergencies of view on parts of the theory of the ministerial office and of the Church, and on the construction, spiritualistic or realistic, of prophecy, especially on the parts in which Chiliasm is involved. In a first group may be placed Harless, Höfling, Thomasius, Keil, Caspari, Krabbe, Philippi, Dieckhoff, Zöckler, Wuttke, Harnack, Oettingen, Frank, and Grau. In a second group, distinguished by its strong views of the Church and ministry, have been Löhe, Vilmar, Kliefoth, and Zezschwitz. In a third group, distinguished by its realistic tendency in the interpretation of prophecy, are placed C. K. v. Hofmann, Drechsler, Delitzsch, Luthardt, M. Baumgarten, and Oehler. In their earlier position Kahnis and Thiersch were strictly confessional. See GERMAN THEOLOGY.

The great jurists Gösehel (d. 1862) and Stahl (d. 1861) were also theologians of the Lutheran Confession. The works of the great writers on Church polity, Eichhorn (d. 1854), Jakobson, Puchta, Richter (d. 1864), Dove, Bickell, and others, are of great importance in many of the discussions which have been specially characteristic of the Lutheran Church in the nineteenth century—whose problem is the embodiment of the soul of her doctrine in a sound polity, a constitution which shall as adequately conform to her common life as her confessions to her common faith.

7. *Practical Life.*—With the reviving doctrinal life came the spirit of missions. The outgrowths of the life of inner missions are so numerous that their names would fill pages. Wichern founded the Rauhe Haus 1833, the institute for girls at Berlin 1858, and has been the father of a great number of beneficent institutions and reforms. With the deaconess institutions are associated the names of Fliedner, Löhe, and Th. Schäffer. Among the associations and schools for foreign missions may be mentioned the Society of the Rhein (1829), the North German (1836), Jänekes (1800), and Gossner's, all of which have a predominantly Lutheran character. The Dresden Missionary Society has a positive Lutheran character (1836). It transferred its seminary in 1848 to Leipzig, to give its pupils the advantages of the university. It has taken up again the ancient mission-work of the Lutheran Church in India. All the Lutheran lands have mission societies. The Hermannsburg Mission Institute, under the direction of Louis Harms (d. 1865), has developed great energy. See MISSIONS.

8. *Statistics.*—The total number of Lutherans is probably about 52,000,000, including the Lutherans in the union churches. The purely *local history* and *statistics* of the Lutheran Church properly belong to the different countries and states in which the Church exists—America (North and South), Anhalt, Austria, Baden, Bavaria, Belgium, Bohemia, Bremen, Brunswick, Carinthia, Carniola, Darmstadt, Denmark, England, France, Hamburg, Hanover, Hesse-Cassel, Holland, Hungary, Iceland, Lippe, Lubeck, Moravia, Mecklenburg, Norway, Oldenburg, Poland, Prussia, Russia, Saxony, Styria, Silesia, Sweden, Thuringia, Transylvania, Westphalia, Würtemberg. In all these the Lutheran Church has a historical record. For confessions, see the article CONCORD, BOOK OF, and the creeds there enumerated. For special doctrines and controversies, see CONCOMITANCE, SACRAMENTAL; CONSUBSTANTIATION, EUCHARIST, SACRAMENT, SYNCRETISM, SYNERGISM, etc. See also the articles POLEMICS, PROTESTANTISM, and REFORMATION.

Revised by H. E. JACOBS.

Lutheran Church in the United States: *The Era of Beginnings.*—The earliest Lutherans in America came from Holland, and were among the first settlers of New Amsterdam. Their worship was at first in private houses, and their nonconformity with the Calvinistic religion of the large majority of their countrymen subjected them to severe penalties. J. E. Götwater, their first pastor, was promptly sent back by the city authorities, in 1657, to Holland. They obtained religious freedom only with the capture of the city by the English in 1664. They had congregations along the Hudson and in New Jersey, where some of their descendants are still found in the English Lutheran churches. There were Dutch Lutherans on James Island, S. C., in 1674.

Swedish Lutherans followed in 1536–37, in connection with the Swedish settlement on the Delaware. Torkillus was their first pastor (d. 1641). His successor, Campanius, began mission work among the North American Indians, and translated Luther's Catechism into the Delaware language. His labors enabled William Penn, in after years, to carry out his pacific policy. The first Lutheran church in Pennsylvania was built in 1646. For a century and three quarters the six Swedish Lutheran congregations on the Delaware were served by thirty-five pastors, the last of whom died in 1831. As the Swedish was replaced by the English language, they were gradually transferred to the Episcopal Church. The most prominent of these churches is Gloria Dei, built in 1700 in Philadelphia, and the church at Wilmington, Del., built in 1699. Three of the Swedish pastors in 1703 ordained Rev. Justus Falkner, a minister of German congregations in Montgomery County.

The German emigration to Pennsylvania began in 1680. Lutheran Palatinates settled at Newburg, N. Y., in 1708, and Newbern, N. C., in 1710. Others settled about the same time in Schoharie, N. Y. Three of the congregations in Pennsylvania sent a deputation to Germany in 1733, in order to procure pastors. The result was the sending in 1742 of Henry Melchior Muhlenberg, who is very appropriately called the patriarch of the Lutheran Church in America. Meanwhile, in 1734, a large number of Salzburger refugees had colonized Ebenezer, Ga. By the middle of the eighteenth century a foothold had also been gained in the Shenandoah valley and in Madison co., Va.

Era of Synodical Organization.—Muhlenberg's arrival was followed by a succession of faithful colaborers from Halle (Brunnholtz, Kurtz, Schaum, Handschuh, Hartwig, Bager, Helmuth, Schmidt, Kunze), and an era of great activity among the scattered churches. An attempt had been made by Berkenmeyer to found a synod, and a session, with three pastors and representatives from nine congregations, had been held, beginning Aug. 20, 1735, at Raritan, N. J., but it had failed to become a permanent organization. The Lutheran Synod of North America, afterward known as The Evangelical Lutheran Ministerium of Pennsylvania and adjacent States, was organized in Philadelphia, Aug. 14, 1748, comprising in the beginning both Swedish and German pastors. Another synod was founded in New York in 1785. The entire number of synods now in existence is 61. Their sizes are very unequal, from the Joint Synod of Missouri with 1,237 ministers and 330,000 communicants in 1893, to the Rocky Mountain Synod with 11 ministers and 297 communicants. The Synod of Missouri has had a most significant influence in the development of the Lutheran Church in the U. S. It originated in a colony of Saxon Lutherans who emigrated in 1839 to Perry co., Mo., in order to carry out the separatistic Church ideas of their leader, Martin Stephan. He was accompanied by six earnest and devout pastors and followers, who sincerely believed that they were following a Divine call in leaving their old home for conscience sake. When Stephan was found to be a deceiver, there was no hesitation in excommunicating and renouncing him. C. F. W. Walther, one of the young Saxon pastors, was next regarded as their leader, and, with wonderful ability as preacher, theologian, author, debater, and church organizer, guided the synod through an unparalleled career of development until his death in 1887. The synod is divided into 14 districts, extending from Canada to Texas. The Joint Synod of Ohio, with 353 ministers, founded in 1818, as the result of mission work by the Synod of Pennsylvania, is also divided into districts extending over many States, from Washington to North Carolina. The German Iowa Synod, with a similar organization and nearly 400 ministers, was founded in 1854 by German missionaries sent from the seminary of Löhe at Neuendettelsau, after an estrangement had occurred between Löhe and the Missouri Synod. The three Norwegian synods in the West have together 566 ministers, 1,748 congregations, and 171,595 communicants. The Norwegian emigration to the U. S. began about 1835. Their oldest synod was founded in 1846, and for years was closely connected with the German Synod of Missouri, their students having been educated at the seminary of the latter synod. The largest of the Norwegian bodies is the recently formed United Norwegian Church, the result of a union of three synods. It has its center at Minneapolis, Minn., and numbers very nearly 100,000 communicants. Swedish immigration began about 1845. The Swedes first belonged to an English Synod (Northern Illinois). Afterward, with Norwegians and Danes, they formed in 1860 the Augustana Synod; but it was finally deemed best for the nationalities to be separate, and the Norwegians and Danes withdrew. The Swedish Augustana Synod, with its chief institutions at Rock Island, Ill., extends over the entire country, and numbers 370 ministers, 719 congregations, and 95,068 members (1893). Besides these, the Danes, Finns, and Icelanders have their own synods. The last named have over 7,000 members in North Dakota and Manitoba.

Efforts at General Organization.—Most of these synods have united in general organizations. Of these the oldest is the *General Synod*, formed by the efforts of the Ministerium of Pennsylvania in 1821, of which it has been a member only for two short periods (1821–23, 1853–66). Its strength is mainly in the Middle States. Its congregations are mostly thoroughly Anglicized. It has theological seminaries at Gettysburg and Selinsgrove, Pa., Hartwick, N. Y., Springfield, O., and Chicago, Ill. (German). It accepts the Augsburg Confession, but with a diversified degree of strictness in adhering to it. The latest statistics give the General Synod 1,226 ministers, 1,568 congregations, and 194,442 communicants—i. e. about one-eighth of the whole number of Lutherans in America.

The General Council was organized in 1866, and includes the two oldest synods in the U. S., viz., the Ministeriums of Pennsylvania and New York, the Pittsburg, Texas, Detroit, Ohio, Swedish Augustana, Canada, Indiana, and Northwest Synods. Its congregations are almost equally divided among the three languages, German, Swedish, and English. Its theological seminaries are at Philadelphia, Rock Island, Ill., and Chicago, Ill. Its doctrinal position is set forth in its *Fundamental Principles of Faith and Church Polity.* "The unaltered Augsburg Confession in its original sense" is declared to be "throughout in conformity with the pure truth, of which God's Word is the only rule," while the other confessions included in the *Book of Concord* are indorsed as "in the perfect harmony of one and the same scriptural faith" with the Augsburg Confession. There has been some controversy concerning the degree, according to which consistency with this subscription required a renumeration of all pulpit and altar fellowship with other denominations, and a succession of declarations on the subject which are mutually interpretative was adopted at Pittsburg (1868), Akron (1872), Galesburg (1875), and Pittsburg (1889). The General Council has been the center of protracted discussions, largely from its attempt to bring into one body the representatives of different nationalities who had to learn to know and to respect each other, and the historical development through which each element has passed. As a consequence the General Council lost in 1869 the Illinois and Wisconsin, in 1871 the Minnesota, and in 1886 the Michigan synod—all German bodies—because of alleged dissatisfaction with the exceptions permitted within the other synods to the strict confessional position of the council. For the same reason the German Synod of Iowa has held only an advisory relation. Of late years much missionary activity has been developed. It embraces 1,156 ministers, 2,019 congregations, and 370,409 communicants (including congregations in the Dominion of Canada), about one-fourth of the membership in the country.

The Synodical Conference, organized in 1870, consists of the large synods of Missouri and Wisconsin, with the small synods of Minnesota, English Missouri, and Michigan—all German. It is the most rigid in its confessional requirements. A controversy on the subject of predestination, in which the Missouri Synod maintained that believers are "elected to faith" and not "with respect to faith," occasioned the withdrawal from the conference of the Joint Synod of Ohio and the Norwegian Synod, and the separation of the latter body into two sections. It embraces 2,029 ministers, 2,650 congregations, and 581,029 communicants, about one-third of the sum total in the U. S.

The United Synod of the South, formed in 1886, is composed of the English-speaking synods of the South that were cut off from the Northern General Synod by the civil war, together with the Tennessee Synod. Its confessional basis is the same as the General Council, with less consistency in practice. The United Synod has 215 ministers, 390 congregations, and 38,639 communicants.

A movement was begun in 1878 in the General Synod South, the predecessor of the United Synod, to provide a common order of service for all Lutherans who use the English language. After considerable difficulty the General Synod and General Council accepted the proposition, and the service appeared in 1888. Since then other bodies have joined in the work of providing ultimately one common book of worship. The meetings of the joint committee which are convened biennially are attended by representatives from all the general bodies and the chief Independent synods, thus securing a practical co-operation between the various synods.

Church Work.—All these bodies are active in various forms of benevolent and missionary work. There were in 1900 43 orphanages, 19 homes for the aged, 18 hospitals, 8 deaconesses' institutions, and 11 immigrant and seamen's missions. The chief of these is the Milwaukee Hospital, under the directorship of Rev. Dr. Passavant, and the magnificently equipped Mary J. Drexel Home, erected and furnished by John D. Lankenau at an expense of over half a million. They reported 115 educational institutions with 12,854 students. The General Synod sustains a very prosperous mission among the Telegus in India, founded in 1842 by Rev. C. F. Heyer, as well as a misson on the west coast of Africa. The General Council has a misson-field in India among the Telegus, adjacent to that of the General Synod. The United Synod has two missionaries in Japan. The Synodical Conference, in addition to an enormous work among the German immigrants, is prosecuting missions among the Negroes.

Organization.—The organization of the congregations differs somewhat in the various bodies. Ordinarily there is a church council, composed of lay elders and deacons, or deacons alone, and the pastor, who are charged by the congregation with the administration of its affairs. The lay

eldership was accepted by Muhlenberg and defended by Walther, but rejected by the General Council, under the leadership of Krauth. In the Synodical Conferences the government approaches that of the purer forms of Congregationalism, while in the General Synod, United Synod, and a large part of the General Council it has more points in common with Presbyterianism. Synods have, according to the Missouri conception, a purely advisory power; but outside of the Synodical Conference greater weight is placed upon their decisions. The oversight of the pastors and congregations belongs to the president of the synod, and is exercised in many of the synods through visitors whom he appoints, and who report the result of their visits. Missionary superintendents and missionary presidents are charged by some synods with the care of home missions.

Worship.—The worship is approaching a higher degree of uniformity than has previously been found. The Lutheran churches on the continent of Europe exhibit great diversity, which was intensified by the influence of other denominations in the U. S. Muhlenberg provided a full liturgical service, even for the country congregations in their rude beginnings, and diligently followed the Church Year, as his letters in the Halle *Reports* show. During the beginning of the nineteenth century there was an almost universal disuse of all liturgical forms except for ministerial acts; but since 1850 a movement has gradually progressed, until the common service has practically united the various Lutheran bodies in the formal adoption of the "consensus of the pure Lutheran liturgies of the sixteenth century." The immediate use in all congregations of what has been thus adopted can not, in the nature of the case, be expected, especially as it is well known that in parts of Germany (e. g. Würtemberg), from which many of the Lutherans in the U. S. come, there is much antagonism to read prayers.

The following table exhibits the growth of the Lutheran Church in the United States.

YEAR.	Ministers.	Congregations.	Communicants.
1862	1,366	2,575	270,780
1872	2,175	3,826	458,607
1882	3,299	5,865	838,302
1893	5,302	9,069	1,293,163
1900	6,710	11,123	1,665,878

Historical Sources.—The chief sources for the early history of the Lutheran Church in the U. S. are Acrelius's *History of New Sweden* (1759, translated by Reynolds, 1874); the Halle *Reports* (1728–87; reprint with extensive notes by Mann, Schmucker, and German, 1886–92); the *Urlsperger Reports*, from the Salzburg pastors in Georgia (1744); Mann's *Life and Times of Muhlenberg* (1887); Nicum's *History of the New York Ministerium* (1888). The history by Wolf (1899), and its translation into German with extensive additions by Nicum (1891), and the extensive work of Prof. Graebner of St. Louis (1892); the Danish history by Andersen (1890); the *History of the German Settlements in North and South Carolina* (1872); the *History of the Tennessee Synod*, by Henkel (1890); and numerous articles in *The Evangelical* and *Quarterly Reviews* of Gettysburg and *The Lutheran Church Review* of Philadelphia, and the *Proceedings of the First and Second Lutheran Diets* (1878–79) contain much information. Cf. *History of Lutheran Church in the United States*, by Jacobs (1893).

Revised by H. E. Jacobs.

Luther League of America: See the Appendix.

Lütke, lüt'ke, Fedor Petrovitch: explorer; b. in Russia in 1797; was educated in the Russian navy; accompanied Capt. Golownin on his circumnavigation of the earth 1817–19, and undertook from 1821 to 1824 four expeditions to Nova Zembla, of which he published a description in 1828. From 1826 to 1829 he explored Bering's Strait and the Sea of Kamchatka, of which he gave a description (1834–36); in 1835 was made an admiral and appointed tutor to the Grand Duke Constantine; in 1850 was made military governor of Revel, and in 1853 of Cronstadt. He was the founder of the Russian Geographical Society, and attained the seat in the French Institute which had stood vacant since the death of Franklin. D. Aug. 20, 1882. A biography in Russian of Lütke, by Besobrasow, was published in 1889.

Lu'ton: town; in Bedfordshire, England; on the Lea, near its source, and 31 miles N. W. of London (see map of England, ref. 11–J). It has a fine Gothic church, dating from the fourteenth century, and is the principal seat of the straw-plait manufacturing industry in England. Pop. (1890) 30,000.

Lutti, loo'tĕe, Francesca: poetess; b. at Campo, near Trent, in the Italian Tyrol, in 1831. The daughter of the Cavaliere Vincenzo Lutti, she began early to write, though with more impetuosity than correctness. Later, however, she fell under the influence of her fellow Tyrolese, Andrea Maffei, and the beauty as well as the power of her work gave her an honorable place in Italian literature of the nineteenth century. She published first, under the title *Cantiche*, the poetical tales *Giovanni*, *Maria*, and *Rosa e Stella*. Then in 1851 appeared the charming narrative poem *Alberto*, with an introduction by Maffei. Later she published *Novelle e Liriche* (2 vols., 1862) and *Un Proverbio* (1874). D. at Brescia, Nov. 6, 1878. A. R. Marsh.

Luttringhausen, loo'tring-how-zen: town of Rhenish Prussia; 5 miles S. E. of Elberfeld (see map of German Empire, ref. 4–D); manufactures silk, woolen, linen, and cotton fabrics, cutlery, hardware, and brandy. Pop. (1891) 10,498.

Lutuamian Indians: a family of North American Indians, so named from the Pit river or Achomawi word lutuami, *lake*, because the Modocs had their habitat on Modoc or Tule Lake. There are but two tribes in this family—the Klamath Lake Indians or E-ukshikni, E-ukshikni maklaks, and the Modoc Indians or Modokni, Moatokni maklaks, which signifies Southern Indians. They live in Southwestern Oregon, E. of the Cascade Range and N. of the California boundary, the Klamath Lake Indians upon upper Klamath Lake and in Sprague river valley, the Modocs in the same valley on Lost river and the lakes south of it. Some Modocs, who took part in the revolt of 1872–73, were exiled to the Indian Territory. They are a healthy, warlike nation of mountaineers, who in former times held in terror several of the circumjacent tribes. The Klamath Lake Indians are taller and of lighter complexion than the Modocs. The most important event in their history is the Modoc war against the U. S. Government in 1872–73, which ended with their defeat. Including the 140 Snake Indians upon the Klamath reservation, the whole population amounts to about 1,000. (See Indians of North America.) See Gatschet, *The Klamath Indians of Southwestern Oregon* (2 parts, quarto, Washington). A. S. Gatschet.

Lützen, lüt'sen: small town of Prussia; about 10 miles S. E. of Merseburg, province of Saxony; famous for the two battles which were fought in its vicinity (see map of German Empire, ref. 4–F). On Nov. 16, 1632, the Swedish king Gustavus Adolphus fell here in a battle with Wallenstein, the general of the imperial army; the Swedes were victorious. (See G. Droysen, *Die Schlacht bei Lützen in Forschungen zur deutschen Geschichte*, Göttingen, 1862.) On May 2, 1813, Napoleon defeated the Prussian and Russian armies near Lützen. Pop. (1890) 3,564.

Luverne: village (founded 1872); capital of Rock co., Minn. (for location of county, see map of Minnesota, ref. 11–A); on the Rock river, and the Chi., St. P., Minn. and Om., and the Burl., Cedar Rap. and N. railways; 30 miles E. by N. of Sioux Falls, S. D. It is in an agricultural region, has several quarries of building-stone, and contains 7 churches, high school, several public schools, water-works and electric-light plant, owned by the village, and a monthly and 2 weekly newspapers. Pop. (1880) 679; (1890) 1,466; (1900) 2,223. Editor of "Rock County Herald."

Luxation: See Dislocation.

Luxembourg, lük'saăn'boor', François Henri de Montmorency-Bouteville, Duke de: marshal of France; b. in Paris, Jan. 8, 1628; the posthumous son of François de Montmorency, Count de Bouteville, who was beheaded June 27, 1627; was educated by his aunt, the Princess of Condé; entered early on a military career under the auspices of the great Condé, and distinguished himself so much in the battle of Lens (Aug. 20, 1648) that Anne of Austria made him a *maréchal-de-camp*. In the wars of the Fronde he sided with the aristocracy and fought against the court, but after the Peace of the Pyrenees (Nov. 7, 1659), which ended these wars, he was pardoned, and through the mediation of the Prince of Condé he married (Mar. 17, 1661) the heiress of the house of Luxembourg, whose name he assumed. In the wars against Spain and Holland he fought under Turenne; was made a lieutenant-general, and displayed great military talent, though also great severity. He was one of the eight marshals created after the death of Turenne in 1675, and, having received an independent command, captured Va-

lenciennes and Cambrai, and defeated William of Orange at Mont Cassel, Apr. 11, 1677, and at St.-Denis, near Mons, Aug. 24, 1678. After the Peace of Nymwegen, Louvois, who was jealous of his talent, and still more of his influence, removed him from service, and accused him of having sold himself to the devil and attempting to poison his wife. The case lasted fourteen months, during which time the marshal was treated with the utmost harshness, and although he was acquitted (May 14, 1680), yet he was banished from the court and from Paris. After nearly ten years of disgrace he was appointed commander-in-chief of the army of Flanders (Apr. 19, 1690), and made three brilliant campaigns, defeating the Prince of Waldeck at Fleurus, July 1, 1690, and William III. of England at Steenkerke, Aug. 3, 1692, and at Neerwinden, July 29, 1693. The campaign of 1694 brought no great results, and on Jan. 4, 1695, he died at Versailles. With him ceased the victories of Louis XIV.

Lux'emburg: a territory situated between Rhenish Prussia, France, and Belgium; consisting of an elevated tract on the slope of the Ardennes, with a rugged surface covered in many places with dense forests of oaks, and with a soil not very fertile. The region is rich in minerals; coal, iron, copper, and lead are mined; marble, slate, and freestone are quarried. Tolerably good crops of corn, flax, hemp, hops, and wine are raised, and horses, cattle, and sheep of good breed are reared; cloth, earthenware, nails, and leather are manufactured, and much cheese, oak-bark, and timber exported. This territory formed originally a duchy which alternately belonged to Burgundy, Spain, Austria, France, and Holland. By the Congress of Vienna, in 1815, it was made a grand duchy, and, forming a part of the Germanic confederation, it was given to the King of the Netherlands as a compensation for Nassau. When (in 1830) Belgium organized itself into an independent kingdom, a large part of the territory was transferred to this kingdom, of which it now forms a province. The Belgian province of Luxemburg contains the three districts of Arlon, Neufchâteau, and Marche, and comprises an area of 1,706 sq. miles, with (1890) 212,041 inhabitants, most of whom speak French. The grand duchy of Luxemburg comprises an area of 998 sq. miles, with 211,088 inhabitants, most of whom speak German. It was joined to Holland by a personal union, the King of the Netherlands being also Grand Duke of Luxemburg. On the death of William III., Adolphus, Duke of Nassau, became Grand Duke of Luxemburg. It is governed by a chamber of deputies consisting of forty-two members elected directly by the districts for six years, and by a governor appointed by the king. For commercial purposes it is included in the German Zollverein. In military respects it was declared neutral territory by the Treaty of London in 1867. In 1891 the revenues amounted to 11,519,924 francs, and the expenses to 9,000,824 francs. There is a public debt of 16,170,000 francs.

Luxemburg: capital of the grand duchy of Luxemburg; on the Else or Alsette; 42 miles by rail N. of Metz (see map of German Empire, ref. 6–C). It was at one time the strongest fortress in Europe, next to Gibraltar. The main part of the city stands on a rocky table-land which rises abruptly 200 feet from the valley of the Alsette, while the modern suburbs, Pfaffenthal, Clausen, and Grund, are situated below, on the shore of the river. This location, so remarkable both for its natural beauty and for its military strength, was early used for fortifications—probably from the tenth century—and since the days of Vauban all the resources of modern engineering art have been employed to make it impregnable. By the Treaty of London in 1867 it was declared neutral ground, the fortifications were demolished, and the space was laid out in streets and promenades. The city has cotton-manufactures, distilleries, tanneries, and trade in leather and woolen goods. Pop. (1890) 18,187.

Luxemburg, Adolphus William Charles Augustus Frederick, Grand Duke of: b. at Biebrich, July 24, 1817. He was Duke of Nassau and became Grand Duke of Luxemburg on the death of William III. of Holland in 1890. He is one of the wealthiest princes in Europe. His children are Prince William Alexander, the only son, born in 1852, and Princess Hilda, married in 1885 to the Crown Prince Frederick of Baden.

Luxor [Arabic, *el-Kaṣr*, plur. *el-Kuṣur*, the castles]: a considerable village in Upper Egypt, on the east bank of the Nile, at which steamers stop to allow tourists to visit the site of ancient Thebes. It contains one of the five large temples for which Thebes was noted, but its splendor is overshadowed by its greater neighbor at Karnak, 2 miles to the N. E. Both temples were dedicated to the god Amon, and are the results of the architectural labors of several Pharaohs. To this fact and to reasons of symmetry in the case of the temple at Luxor is due the irregularity of its plan, seen in the three axial directions upon which it is constructed. The north extensions of the original building are inclined away from the river in order to bring them more into line with the temple at Karnak, with which Luxor was connected by an avenue of sphinxes. The sanctuary at the south end of the temple at Luxor was built originally by Amenhotep III. (eighteenth dynasty), and, having been damaged or destroyed, it was restored in the reign of Alexander. Next to the N. is a hypostyle hall, 20 yards deep and 35 wide, containing two sphinxes, bearing the name of Sebekhotep (thirteenth dynasty). Adjoining is a peristyle hall, 48 yards long by 58 broad, with a double row of columns on three sides. At this point the first change of direction occurs, and the succeeding colonnade, 58 yards long, turns at an appreciable angle toward the E. It also dates from the eighteenth dynasty. The most northern portion is the great peristyle court, 185 feet long, built by Ramses II. (nineteenth dynasty), and it inclines still more to the E. It contains a double row of columns, and formerly the obelisk now in Paris stood in this court. Inside the same inclosure stands a mosque. At the entrance to this court is a great pylon 75 feet high, with a doorway in the middle 55 feet high. The whole edifice is 284 yards in length. The outer wall of Ramses's court is inscribed with the so-called *Poem of Pentaur*, which records the valiant deeds of the builder in his war against the Hittites and the capture of Kadesh. The same epic is found on the temples at Karnak and Abydos, and in two papyri, one in the Louvre (*Raifet*) and the other in the British Museum (*Sallier II.*).

Charles R. Gillett.

Luynes, lü'een', Charles d'Albert, Duke de: b. at Pont St.-Esprit, department of Gard, France, Aug. 5, 1578; was descended from a Florentine family, Alberti by name, which having bought the estate of Luynes in Touraine had assumed its name and title. Having been educated as a page at the court of Henry IV., he became the favorite of the dauphin, afterward Louis XIII., and it was at his instigation that the young king gave orders for the imprisonment of Marshal d'Ancre and the queen Apr. 14, 1617. After this court revolution Luynes was made a duke and peer of France. He married the daughter of the Duke of Montbazon, was made constable and chancellor, and exercised for a short time absolute control over the whole Government. He was fortunate enough, however, to die Dec. 15, 1621, before the king became aware of his incapacity and avarice.—One of his descendants, Honoré Théodoric Paul Joseph d'Albert, Duke de Luynes (b. in Paris, Dec. 15, 1802, d. in Rome Dec. 14, 1867) became celebrated for the liberal and judicious support he gave to science and art, of which he was himself a cultivator. He wrote *Metaponte* (1836); *Description de quelques Vases peints* (1840); *Essai sur la Numismatique des Satrapies et de la Phénicie* (1846); *Voyage d'Exploration à la Mer Morte* (published after his death). In 1854 he superintended the publication of the catalogue of the National Library of Paris.

Luys, lü'ee', Jules Bernard, M. D.: alienist; b. in Paris, France, in 1828; graduated at the Paris School of Medicine in 1857; passed the *concours* in 1862 for the position of physician to the hospitals; in 1863 became physician to Salpêtrière hospital and to the Ivry asylum. At those institutions he paid particular attention to the structure of the brain, and published in 1872 an atlas, *Iconographie photographique des centres nerveux*. In 1881 he founded a journal of nervous and mental diseases, *L'Encéphale*, and was one of its editors until 1888. Among his works are *Études de physiologie et de pathologie cérébrales* (Paris, 1874); *Le cerveau et ses fonctions* (Paris, 1878), a work that has been translated into English and German; and *Traité clinique et pratique des maladies mentales* (Paris, 1881). D. in Paris in Aug., 1897. S. T. Armstrong.

Luzerne, lü'zărn', Chevalier Anne César, de la, LL. D.: b. in Paris, France, in 1741; educated for the military service, and was aide-de-camp to his relative, the Duke de Broglie, during the Seven Years' war, attaining the rank of major-general of cavalry (1762), with the colonelcy of the Grenadiers de France. He afterward abandoned the military career for diplomacy; was sent as minister to the court of Bavaria 1776, and to the U. S. as successor to Gerard after the recog-

nition by France of the independence of the united colonies in 1778. He arrived at Philadelphia Sept. 21, 1779, where he resided four years, giving proofs of prudence and friendship for the struggling colonists, which were highly appreciated, and gave him a considerable influence in the direction of affairs. In 1780 he contracted on his own responsibility a loan for the relief of the army then suffering the utmost destitution. In 1782 he obtained the postponement of the ratification by Congress of the treaty of peace with Great Britain until that between Great Britain and France should be signed. On his return to France in 1783 he bore with him the most honorable testimonies of esteem from Congress and from individuals. Harvard College conferred upon him the degree of LL. D., and Pennsylvania gave his name to one of her counties. On the organization of the Federal Government (1789) the Secretary of State, by direction of Washington, addressed a letter to Chevalier Luzerne conveying the thanks of the nation for his services. He died in London, Sept. 14, 1791, being then French minister to the British court.—His elder brother, CÉSAR GUILLAUME (b. July 7, 1738, d. June 21, 1821), became Bishop of Langres 1770, and Cardinal 1817; was a distinguished theological writer, and defender of the liberties of the Gallican Church.

Luz, La, Guanajuato, Mexico: See LA LUZ.

Luzon, loo-zōn′, or **Luçon**: the largest of the Philippine islands, in the Malayan Archipelago, belonging to the U. S.; situated between the Chinese Sea and the Pacific Ocean, between lat. 12° 30′ and 18° 40′ N., and between lon. 119° 45′ and 124° 10′ E. Area, 39,650 sq. miles. Like all the Philippine islands, it is of volcanic origin, having several active volcanoes, among which is Mayon; earthquakes are frequent and destructive; the city of Manilla was nearly destroyed by one in 1863. The ground is mountainous, several ranges of a height from 4,000 to 7,000 feet traversing the island from N. to S. The soil is of exceeding fertility, and the climate being hot and moist, the luxuriance of the vegetation is almost unequaled. Immense forests of ebony, cedar, gum-trees, and iron-wood, interspersed with orange, citron, cocoa, breadfruit, and tamarind trees, cover the mountains to their very tops. Myriads of climbing plants and parasites wind from tree to tree, cover every twig, and form a forest growing on the forest. Rice, wheat, maize, sugar, cotton, indigo, tobacco, coffee, ginger, pepper, and vanilla are raised in continuous crops without difficulty and in great abundance. Luzon is entirely free from beasts of prey; oxen and buffaloes are employed in agriculture; sheep, goats, and swine are reared. Pheasants, ducks, and brilliantly colored birds swarm all over the island, and fish are abundant both in the rivers and the surrounding sea. Of minerals, gold, iron, copper, coal, and marble are found. Mother-of-pearl, amber, coral, and tortoise-shell are exported, together with rice, sugar, hemp, and tobacco; the last article is a Government monopoly, and yields a clear annual profit of nearly $5,000,000. The population of Luzon, which numbers 3,400,000, consists partly of Negritos, who live as nomades in the mountains of the interior in a savage state. They are idolaters, and are believed to be the original inhabitants of the island. Around them are the "Indios" or Indonesians (the Polynesians of Malaysia). These people are Roman Catholics, and form the bulk of the population. Around them on the coasts are the Malays (Tagals, Bicols, Ilocanos, etc.). These are industrious, hospitable, and open to progress and civilization, and, besides being good agriculturists, possess some manufactures: they build ships with which they sail to Spain. Many Chinese have settled here, but comparatively few Spaniards. The trade, which is very considerable and increasing every year, is mostly in the hands of English and American merchants established at Manilla, the principal town of the island. Luzon was discovered by Magallanes in 1521; Manilla was built in 1581. See PHILIPPINES.

Revised by MARK W. HARRINGTON.

Lu′zula [Mod. Lat., from O. Ital. *luzziola*, glow-worm (whence Ital. *lucciola*, firefly)]: a genus of perennial pseudo-glumaceous plants, commonly called wood-rushes, belonging to the family *Juncaceæ*, and differing from the *Juncus*, or rush proper, in the form of the leaves, which are flat, soft, usually hairy and grass-like, and in the three-seeded capsule. Numerous species are found in the woods of Europe and nine in the U. S., among which are *L. pilosa* and *L. parviflora* or *melanocarpa*, which have the flowers loosely long-peduncled, umbelled, or corymbed; *L. campestris*, *L. arcuata*, and *L. spicata* having the flowers crowded in spikes or close clusters.

Luzzatto, loot-saa′tō, SAMUEL DAVID: Old Testament scholar; b. at Trieste, Austria, in 1801, of Jewish descent; received a brilliant education, and became the most popular historian of his people, bringing to light the forgotten episodes of Jewish history. He was liberal in his views of Old Testament exegesis, of which science he was professor in the rabbinical school at Padua from 1829 to his death Sept. 29, 1865. He wrote Hebrew, German, French, and Italian with great elegance, and is justly regarded as one of the chief restorers of Hebrew literature. He wrote a *Hebrew Grammar*, *Grammar of Biblical Aramaic*, *French Notes on Isaiah* (1834), *Hebrew Notes on the Pentateuch* (1850), and Italian translations of Job (1844) and of Isaiah (1850), with a Hebrew commentary, besides *Dialogues on the Cabala, the Zohar, and the Antiquity of the Vowel-points and Accents of the Bible* (1852), and a work on the Aramaic version of Onkelos (1830). See Grätz, *History of the Jews*, vol. xi.

Ly′all, Sir CHARLES JAMES: See the Appendix.

Lyall, EDNA: pseudonym of Miss ADA ELLEN BAYLY; b. and educated at Brighton, England; author of *Won by Waiting* (1879); *Donovan* (1882); *We Two* (1884); *In the Golden Days* (1885); *Knight Errant* (1887); *Autobiography of a Slander* (1887); *Derrick Vaughan, Novelist* (1889); *A Hardy Norseman* (1889); *Doreen* (1894); etc.

Lycanthropy [from Gr. λυκανθρωπία, lycanthropy; λύκος, wolf + ἄνθρωπος, man]: a kind of madness in which the patient fancies that he is a wolf. The old and very widespread belief in the existence of man-wolves possessed of the devil has in many instances led deluded persons to fancy themselves thus possessed; and in not a few instances this fancy has become epidemic, and hundreds of persons have become cannibals, going upon all fours, living in the forests, and howling like wolves. In 1600 hundreds of people in the Jura were executed for lycanthropy. Likewise persons may imagine themselves dogs, and go about snarling at every passer. In some cases they bark and froth at the month, and simulate rabies in their actions. This spurious hydrophobia is in nowise related to true rabies, but is simply a form of mental perversion. Revised by WILLIAM PEPPER.

Lyca′on [= Gr. Λυκάων, cf. λύκος, wolf]: in Greek mythology, (1) a King of Arcadia, whose fifty sons were personifications of Arcadian cities, and surpassed the rest of mankind in insolence and impiety. In order to test them Zeus assumed the garb of a beggar and accepted from them an invitation to dinner, at which, on the suggestion of Mænalus, they served up to him, along with the sacred offerings, the entrails of a boy murdered for the purpose (the story points to the offerings of human sacrifice to Zeus Lycæus in ancient times). Zeus detected the crime and slew Lycaon and all of his sons except Nyctinus, the youngest, whom Gaia (Earth) saved by seizing the uplifted hand of Zeus. Nyctinus became King of Areadia, though the vengeance of heaven still pursued him, for it was in his reign that the flood of Deucalion was sent to devastate the world. (2) The father of Pandarus, who led the forces of Zelea to the support of the Trojans against the Greeks. (3) A son of Priam and Laothoë, half-brother of Hector. He was slain by Aehilles.

J. R. S. STERRETT.

Lycao′nia (in Gr. Λυκαονία): a province of Asia Minor, situated between Galatia, Cappadocia, Cilicia, Pisidia, and Phrygia. Its boundaries changed often, according to the fortune of war or the caprice of the Romans, and it was not until 321 A. D. that it became a fixed and separate province. In Byzantine times it was included in the Anatolic Theme. It afterward became the center of the Seldjuk empire. Its principal town was Iconium (now Koniah). Other important towns were Lystra (near Khatyn Serai), Derbe (at Güdelissin), Laranda (at Karaman), and Laodicea (Catscecaumene, now Ladik). The country is for the most part a plain whose soil is impregnated with salt, but supports vast herds of fat-tailed sheep. Salt is the chief product of the country. It is gained from Lake Tatta (now Tuz Giöl).

J. R. S. STERRETT.

Lyce′um [= Lat. = Gr. τὸ Λύκειον, named from the neighboring temple of Apollo Lyceus (Gr. Ἀπόλλων Λύκειος, liter., the wolf-slayer), deriv. of λύκος, wolf. See WOLF]: the largest of the three great gymnasia of ancient Athens. None but well-born youth, whose parentage on both sides was Athenian, were allowed to be trained here. In 335 B. C. Aristotle was permitted to make use of the Lyceum as a place for teaching philosophy. His instruction was given while he walked in the groves which surrounded the Lyce-

um; hence his philosophy was called *Peripatetic* (walking about). The Lyceum stood on the east side of the city, outside the gates, just S. of the Cynosarges, and near the fountain of Panops. It was surrounded by a grove of lofty plane trees.—In France the public schools for secondary instruction have the name of lyceum (*tycée*).

Lychnis, lik'nis [Mod. Lat., from Lat. *lych'nis*, a kind of red flower = Gr. λυχνίς; cf. λύχνος, lamp]: name of a genus of annual or perennial plants found in Europe and the U. S., the commonest species of which is the corncockle (*L. githago*). It belongs to the pink family, and received its name from a scarlet or flame-colored Grecian species. Several species are cultivated as garden-flowers in the U. S., the best known being the scarlet lychnis (*L. chalcedonica*), sometimes called the Maltese cross, a native of Northern Asia, the tints of which vary from scarlet to rose-color and white. The common mullein pink or rose-campion (*L. coronaria*) is of this genus. The genus differs from *Sitene*, or catchfly, only in having five (rarely four) styles, and a pod opening by as many or twice as many teeth. The corncockle is too common in wheat-fields, the black seeds being injurious to the quality of the flour.

Lycia, lis'i-a (in Gr. Λυκία): an ancient region of Asia Minor of small extent, lying on the Mediterranean, between Mts. Taurus on the N., Climax on the E., and Dædala on the W., the adjoining regions across the mountains being Phrygia, Pamphylia, Pisidia, and Caria; the chief rivers, Xanthus, Limyrus, and Glaucus; and the most noted cities, Xanthus, Patara, Pinara, Olympus, Myra, Tlos, and Telmissus. The most ancient name of the country, according to Herodotus, was Milyas, the inhabitants being of two races, Solymi and Termilæ or Tremilæ. Extended accounts of Lycia have been given by the Greek poets, historians, and geographers. It was a favorite region with Homer, who assigns to the Lycian heroes, Glaucus and Sarpedon, the place of honor among the Trojan allies. Apollo was often called Lycian Apollo, from his temple at Patara, second in renown only to that at Delphi, and regarded by some as the place of his birth. The Solymi, doubtless the earliest inhabitants, and of Semitic stock, were conquered by the Tremilæ, who are said to have come from Crete and took the name of Lycians. They appear as *Leka*, a seafaring people, in the Egyptian inscriptions of the fourteenth century B. C. It is to be noted that the only mention of writing found in the Homeric poems is in connection with the Lycian legend of Bellerophon. The Lycians were conquered by Harpagus, the general of Cyrus, notwithstanding the heroic and memorable resistance of the inhabitants of Xanthus, who burned themselves with their wives, slaves, and treasures in their citadel. They took part in the revolt of the Asiatic Greeks, were subdued and made a satrapy of Persia, and furnished fifty ships to Xerxes for his invasion of Greece. Alexander the Great subdued the country almost at the outset of his Asiatic career; it was afterward attached to the Syrian empire, and was given to the Rhodians by the conquering Romans. Soon afterward it became independent as a republican confederation of cities, but ultimately became a Roman province, with Myra as the capital. In the great civil war on the death of Cæsar, Lycia espoused the cause of Octavius and Antony, and was conquered by Brutus after a desperate resistance, in which the city of Xanthus repeated its act of self-immolation by fire. In modern times Lycia had fallen into complete oblivion, no traveler had explored it, and the sites of its celebrated cities were unknown, when in 1838 and 1840 it was visited by Mr. (afterward Sir Charles) Fellows, who found there vast ruins of temples, fortresses, and tombs, and inscriptions in an unknown character. An expedition under his leadership was sent in a British vessel of war 1846, which conveyed to London the remarkable sculptures now occupying the "Lycian room" of the British Museum. The Lycian alphabet consists of twenty-five single and several double letters. A few of the characters are peculiar; thirteen are identical with the Cypriote in form, and consequently related to the Phœnician, while three were borrowed from the Greek. The inscriptions in this collection are chiefly from tombs cut in the rock, the Lycians having been remarkable for the honors shown to the dead, as well as for the cyclopean character of their architecture, which in its later period showed traces of Grecian influence. See Sir Charles Fellows, *Account of Discoveries in Lycia* (1841) and *Coins of Ancient Lycia* (1855); Benndorf and Niemann, *Reisen in Lykien und Karien* (Vienna, 1884); Petersen and von Luschan, *Reisen in Lykien, Milyas und Kibyratis* (Vienna, 1888); Kiepert, *Lykia* (Vienna, 1887); Benndorf and Niemann, *Das Heroon von Gjölbaschi Trysa* (Vienna, 1888); Treuber, *Geschichte der Lykier* (Stuttgart, 1887), and his *Beiträge zur Geschichte der Lykier* (Tübingen, 1888); Hirschfeld, *Ueber die Griechischen Grabschriften welche Geldstrafen anordnen* (Königsberg, 1887), and his *Gebiet von Aperlai*, in the *Archæol. Epigraph. Mittheil. aus Oesterreich*, ix., pp. 192–201; von Warsberg, *Das Reich des Sarpedon*, in his *Homerische Landschaften* (Vienna, 1884); Perrot and Chipiez, *History of Art in Phrygia, Lydia, Caria, and Lycia* (London and New York, 1892).

Revised by J. R. S. STERRETT.

Lycian Language: the ancient language of Lycia; preserved in a few inscriptions, which have been as yet but partially deciphered. Though some scholars, notably Savelsberg and Deecke, have sought to establish for the language a place among the Indo-European tongues, no such relation has been satisfactorily demonstrated. Savelsberg attempted to prove a close connection with Avestan, and Deecke, connecting the language closely with the Carian, asserts for the Carian-Lycian an intermediate position between the Iranian and Hellenic groups. Schmidt, *Corpus of Lycian Inscriptions* (1868); Savelsberg, *Beiträge zur Erklärung der lykischen Sprache* (1875–78); Deecke, *Lykische Studien*; Bezzenberger's *Beiträge* (xii., xiii., xiv., 1887–89).

BENJ. IDE WHEELER.

Lycon (in Gr. Λύκων): one of the successors of Aristotle and Theophrastus as the head of the Peripatetic school of philosophy, over which he presided from 270 to 226 B. C. He was born in the Troad, was distinguished for health of body and mind, while the charm of his language was so great that he was called Γλύκων. He was courted by the kings Antigonus, Antiochus, Attalus, and Eumenes. Though he was the immediate successor of Strato, he imitated Theophrastus in character sketches. J. R. S. S.

Lycoper'don [Mod. Lat., from Gr. λύκος, wolf + πέρδεσθαι, to break wind]: name of the principal genus of the PUFFBALLS (*q. v.*).

Lyc'ophron (in Gr. Λυκόφρων): grammarian and poet; b. at Chalcis in Eubœa; lived at the court of Ptolemy Philadelphus, who intrusted him with the arrangement of the works of the comic poets contained in the Alexandrian library. His extensive work on comedy and his many tragedies have been lost. Only his *Cassandra* or *Alexandra*, a monologue of 1,474 iambic verses, is still extant. It has the form of a prophecy uttered by Cassandra relating to the later fortunes of Troy, the Trojan and the Greek heroes, and winding up with a reference to Alexander the Great, who should unite Asia and Europe in one universal empire. The style is overwrought and the expressions enigmatical, and even in antiquity the poem was considered very obscure. It swarms with obsolete words and long-winded compounds, and seems to have been written for the purpose of displaying the author's mythological learning. By reason of its learning and obscurity it was much studied in the Byzantine period, nor is one surprised to find that in modern times it has been carefully conned by scholars, notably by Milton. There is a considerable body of scholia, and sundry paraphrases have been preserved. Anachronous references to the domination of Rome are clearly later interpolations, and do not affect the genuineness of the work as a whole. Editions: Bachmann (1820), Scheer (1881), and Kinkel in the Teubner Library (1880); an English translation by Lord Royston. Revised by B. L. GILDERSLEEVE.

Lycopo'dium [Mod. Lat., liter., wolf's foot; Gr. λύκος, wolf + *ποδίον, dimin. of πούς, ποδός, foot]: a genus of FERNWORTS (*q. v.*). In botany, the name of the typical genus of the family *Lycopodiaceæ*, several species of which are popularly called club-moss. The powder called lycopodium is composed of the spores of *Lycopodium clavatum* (which is common in both the Old and the New World) and of other species. It is extremely inflammable, is used in fireworks for making a white flame, and in theaters for artificial lightning. In pharmacy it is used as a pill-powder, and in the nursery as a dressing-powder for infants. The spores of many species form a powder which is beneficial in ulcerations, etc. The species are evergreen, and two or three are extensively sold at Christmas-time for decorative purposes, especially in the U. S. the "ground-pine" (*L. dendroideum*).

Lycopods: the common name of the highest class (*Lycopodiaceæ*) of the FERNWORTS (*q. v.*).

Lycop'olis (Egypt. *Saut*; sacred name *Pa-Anub*, place of Anubis; modern, Siut or Assiut): a city of Middle Egypt (27° 15′ N. lat.) of great antiquity, the seat of powerful princes of the Middle Kingdom, and to-day one of the most important places in the Nile valley. Of ancient structures little is left except some fragments of columns. The interesting remains are the tombs cut in the Libyan hills, which, with those at Bersheh and Beni-Hasan, are our main sources of information concerning the history and conditions of the Middle Kingdom (say 2100–1900 B. C.). One of them contains a peculiar contract made by a nomarch of Siut for the making of funeral offerings for himself in perpetuity. Opposite Siut are other tombs constructed during the sixth dynasty. The local god was Anubis, to whose emblem, the jackal, the Greeks applied the name of "wolf," whence the name Lycopolis. A peculiarity of the temple service at Siut was the employment of lay priests as late as the Middle Kingdom. Siut was the birthplace of Plotinus, the Neo-Platonic philosopher, and here Christian hermits and ascetics were found as early as the beginning of the fourth century. CHARLES R. GILLETT.

Lycur'gus: Spartan legislator; lived, according to the most common tradition, in the ninth century B. C., and was a son of King Eunomos; ruled the country for some time during the minority of his nephew, Charilaos, but was afterward compelled to emigrate; visited Asia Minor, where he became acquainted with the Homeric songs; Crete, where he studied the laws of Minos; Egypt and other countries; and became on his return the founder of those institutions by which one of the most striking types of national character which history contains was developed in Sparta. All details of his life are very uncertain, however, and some modern scholars even consider him a mythical person; but the Spartans themselves built a temple to his honor, and said that he brought his laws from Crete, and introduced them with the sanction of the Delphic oracle. The most prominent feature of Spartan society was the division into two classes or castes—the slaves, helots, who performed all the labor and had absolutely no rights; and the citizens, Spartans, who were completely exempted from labor, and owned and ruled the land. The most prominent feature of this privileged class was its military discipline. The individual was absolutely subordinate to the state, and lived only for the state. The Spartan had no talent, no passion, no plan of his own; he was merely a tool. Only strong and well-formed children were allowed to live; the weak or deformed were exposed to die on Mt. Taygetus. At the age of seven years the boy was taken from his mother and educated by the state, which subjected him to the severest discipline. When he was thirty years old he was allowed to marry, but the state chose his wife, and, although married, he continued to live in garrison till his sixtieth year. By the establishment of this social order Lycurgus succeeded in transforming the Spartans from one of the rudest and wildest to the most quiet and dignified of all the Greek peoples, and was worshiped by them as a god.

Lycurgus (in Gr. Λυκοῦργος): one of the ten Attic orators; flourished in the second half of the fourth century B. C.; was an eminent statesman and patriot of the Anti-Macedonian party, and closely associated with Demosthenes. He was especially distinguished for his administration of the finances of Athens (338–326 B. C.) and for his exertions in beautifying the city. As an orator he was active in prosecuting defaulters and traitors, and the only extant speech of his—that against Leocrates (331)—is a prosecution of a man who forsook Athens in her time of need (338). Lycurgus was highly honored by the Athenians, who refused to surrender him at the demand of Alexander. D. some time before Demosthenes. The ancient critics had much fault to find with the bad arrangement, the harsh style, the excessive digressions of the speeches of Lycurgus, and modern critics see a confirmation of those strictures in the only oration we have; and yet all agree that this speech against Leocrates is instinct with exalted patriotism, and that the interest of the matter far outweighs the defects, real and imaginary, of the manner. Editions: Mätzner (1836), Kiessling and Meier (1847), Rehdantz (1876), Thalheim, critical (1880). See, further, Blass, *Attische Beredsamkeit*, vol. iii. B, pp. 1–72, and Dürrbach, *L'orateur Lycurgue* (1890). B. L. GILDERSLEEVE.

Lyd'da (in Gr. τὰ Λύδδα): an ancient town of Palestine; within the tribe of Ephraim; on the road from Jerusalem to Joppa, 9 miles E. of the latter. In the Old Testament it bears the name of Lod, as also in the Apocrypha. It was the scene of Peter's miracle of healing Æneas (Acts ix. 32, 35); was destroyed by Cestius Gallus in his march against Jerusalem, rebuilt as capital of one of the nine toparchies of Judæa, and became the seat of a celebrated Jewish school of the law. Later it received the name of Diospolis; was one of the principal places of Palestine for several centuries; was the seat of a bishopric, and the birthplace of the celebrated martyr St. George, the patron of England. It figured largely during the crusades, and is still an extensive town under the name of *Lud*.

Lyd'gate, JOHN: poet; b. at Lydgate, Suffolk, England, about 1370; studied at Oxford; traveled in France and Italy, and became the head of a school at Bury St. Edmunds. He wrote several poetical works—*The Fall of Princes*, *The Storie of Thebes*, and *The Historie, Siege, and Destruction of Troye*—which are chiefly valuable as monuments of the English language in that obscure period. D. at Bury St. Edmund's about 1450.

Lyd'ia (in Gr. Λυδία): a country of Asia Minor, whose boundaries varied much in different periods, though it may be bounded by Mysia, Phrygia, Caria, and Ionia (or the Ægean Sea). Of the three dynasties of Herodotus, the Atyadæ, the Heraclidæ, and the Mermnadæ, the first two are purely fabulous. With the Mermnadæ (founded by Gyges 687–653 B. C., according to Gelzer), the last of whom was Crœsus (overthrown by the Persians in 546 B. C.), we begin to touch historical times. Lydia was famous for its wealth, which was gained not so much from the gold sands of the celebrated Pactolus (now Sarabat) as by trade, for which they had a natural aptitude which clung to them for centuries after the collapse of the empire of Crœsus. The name of Crœsus is proverbial to this day, because he was benevolent as well as wealthy. "The loving kindness of Crœsus fadeth not away," says Pindar. The *gifts* presented by Crœsus to the shrine of Apollo at Delphi are estimated at $6,000,000, and even the private citizen Pythius, of Celænæ, was worth $16,000,000. The Lydians invented coined money by imprinting upon the rude ingot of gold or silver the official stamp of the state along with the mark of the king. The capital of Lydia was Sardes (now Sart), other cities of importance being Magnesia ad Sipylum (now Manissa), Thyateira (now Ak Hissar), Philadelphia (now Ala Shehir), and Hypaipa (now Birghe). The country is still very fertile, and produces a fine quality of tobacco.

LITERATURE.—Perrot and Chipiez, *History of Art in Phrygia, Lydia, Caria, and Lycia* (London and New York, 1892, pp. 232–301); Curtius, *Beiträge zur Geschichte und Topographie Kleinasiens* (Berlin, 1872); Stark, *Nach dem Griechischen Orient* (1874); Sayce, *Notes from Journeys in the Troad and Lydia*, in the *Journ. Hell. Studies* (1880); Schmidt, *Aus Constantinople und Kleinasien* in the *Athenische Mittheilungen* (1881); Gregorovius, *Kleine Schriften zur Geschichte und Cultur* (Leipzig, 1887, vol. i., p. 1–47); Tehlatcheff, *Le Bosphore et Constantinople* (1864, pp. 232–242); Lenormant, *La Monnaie dans l'Antiquité* (i., pp. 93–124); Head, *The Coinage of Lydia and Persia* (London, 1874–77). J. R. S. STERRETT.

Lydian [from *Lydia*]: in music, the designation of one of the ancient ecclesiastical modes. Its scale is that of F, and it differs from the modern scale on that letter by having B *natural* instead of B♭.

Lydian Stone: a siliceous slate or flinty jasper of a velvet-black color, used as a touchstone for testing the quality of gold and silver. See JASPER.

Ly'ell, Sir CHARLES: geologist; b. at Kinnordy, Scotland, Nov. 14, 1797; studied at Exeter College, Oxford, and graduated in 1819; prepared himself for the practice of law, which he soon abandoned for scientific research, especially in geology. His first studies were in Great Britain, but he afterward traveled much in Europe, besides visiting Canada and the U. S. in 1841–42 and 1845–46. He became Professor of Geology in King's College, London, in 1832; was president of the Geological Society of London in 1836 and 1850; was knighted in 1848 and created baronet in 1864. D. in London, Feb. 22, 1875. His great work *Principles of Geology* (1830–33) passed through eleven editions, receiving its final revision in 1870. Other important publications were the *Student's Manual of Geology* (1838 to 1870); *Travels in North America* (1845); *A Second Visit to the United States* (1849); and *Geological Evidences of the Antiquity of Man* (1863 to 1873). Though his direct contributions to knowl-

edge were of great value, he is most widely known as the apostle of "uniformitarianism," the doctrine that the stupendous changes demonstrated by the structure of the earth's crust were accomplished slowly by the cumulative action of agencies still at work with undiminished energy. This theory did not, indeed, originate with him, but before his time it was little known, and most geologists explained the revolutions of the earth's surface, whereby mountains were uplifted, valleys were opened, ocean beds were desiccated, provinces were submerged, and faunas were destroyed, as the results of sudden and violent catastrophes. The substitution of a more rational view was so largely due to the ability with which he discussed the subject and the great body of observations by which he illuminated it, that the geologic philosophy of modern times is often characterized as Lyellian.

G. K. Gilbert.

Lyenceph'ala [Mod. Lat., from Gr. λύειν, loose + ἐγκέφαλος, brain]: in Owen's classification, a class of mammals so named from the loose connection of the two hemispheres of the brain, which are united by the round and hippocampal commissures, the corpus callosum being rudimentary or absent. The cerebral hemispheres are usually without folds and leave the cerebellum, olfactory lobes, and part of the optic lobes exposed. This class includes the Monotremes and Marsupials. The term is contrasted with Lissencephala, Gyrencephala, and Archencephala. F. A. Lucas.

Lygo'dium [Mod. Lat., from Gr. λυγώδης, flexible, liter. willow-like; λύγος, willow twig + suffix -ωδης, having the form of]: name of a genus of climbing ferns found in New Zealand, Japan, and America. One species only, *L. palmatum*, is found in the U. S., from Massachusetts to the Gulf States. It is much prized for purposes of decoration. One or two species are cultivated in greenhouses.

Lykens: borough (incorporated 1871); Dauphin co., Pa. (for location of county, see map of Pennsylvania, ref. 5–G); on the N. Cent. Railway; 43 miles N. E. of Harrisburg. It is in a coal-mining region, and has 7 churches, 10 schools, public library, several manufactories, and a weekly newspaper. Pop. (1880) 2,154; (1890) 2,450; (1900) 2,762.

Editor of "Register."

Lyl'y, or **Lilly**, John: author; b. in the Weald of Kent, England, in 1553 or 1554; was educated at Magdalen College, Oxford, and graduated in 1573. His *Euphues, or the Anatomy of Wit* (1579) and *Euphues and his England* (1580) attained great popularity in his own times. They are novels of that half-sentimental, half-didactic description which the time adored. It was, however, not so much their contents as their style which made them popular. This "new style" became extremely fashionable. Its characteristics depend more upon syntax and construction than upon phraseology, and consist in "a peculiar combination of antithesis with alliteration, assonance, rhyme, and play upon words, a love for the conformity and correspondence of parallel sentences, and a tendency to accumulate rhetorical figures—such as climax, the rhetorical question, objections and refutations, the repetition of the same thought in other forms," etc. (see Landmann, *Der Euphuismus, sein Wesen, seine Quelle, seine Geschichte*, Giessen, 1881). The books ran through thirteen editions before 1636, and then fell into utter oblivion. In 1868, however, they were again edited among the Arber reprints. Prof. Rushton, of Cork, discovered that *Euphues and his Euphœbus*, the most valued portion of the *Euphues*, is a rather close paraphrase of Plutarch *On Education*. Lyly also wrote nine court-plays, which contain fine passages and songs. He was perhaps the author of *Pap with an Hatchette*, a once famous pamphlet. His life was mostly spent at Elizabeth's court. Burghley seems to have been his special patron; he obtained, however, no substantial patronage either from him or from the queen. D. in Nov., 1606.

Lyman, Chester Smith: astronomer and physicist; b. at Manchester, Conn., Jan. 13, 1814; studied astronomy and the kindred sciences in boyhood without a teacher, constructing astronomical and optical apparatus with his own hands, and computed complete almanacs for 1830 and 1831, and tables of eclipses for fifteen years ahead. He graduated at Yale College 1837, taught school at Ellington two years, studied theology at Union Seminary, N. Y., and at New Haven 1840–42; was pastor of a Congregational church at New Britain, Conn., 1843–45; went to the Sandwich islands on account of failing health in 1845; taught the Royal School, having as pupils four of the subsequent occupants of the Hawaiian throne; became a surveyor in California 1847; was one of the earliest to send to the Eastern States authentic accounts of the discovery of gold; settled in New Haven 1850, where he engaged in scientific pursuits, and was one of the revisers of *Webster's Dictionary* (edition of 1864), taking charge of the scientific terms; became in 1859 Professor of Industrial Mechanics and Physics in Yale College, and took an active part in organizing the Sheffield Scientific School, in which he also taught astronomy, both theoretical and practical. From 1871 to 1884 his professorship was that of astronomy and physics. In 1884 he was relieved of the charge of physics, and in 1889 was made emeritus professor of astronomy. He published articles in *The American Journal of Science*, *The New Englander*, and elsewhere, and made various useful inventions; e. g. his wave apparatus, his pendulum apparatus for acoustic curves, etc. He was an honorary member of the British Association for the Advancement of Science, and filled positions in several scientific bodies in his own country. D. in New Haven, Jan. 29, 1890.

Lyman, Henry Munson, A. M., M. D.: physician; b. in the Sandwich islands, Nov. 26, 1835, of New England parents; was educated at Williams College, where he graduated in 1858; studied medicine at Harvard Medical School and at the College of Physicians and Surgeons, New York, graduating M. D. in 1861; was interne in Bellevue Hospital 1861–62; acting assistant surgeon U. S. army 1862–63; went to Chicago to practice in 1863; was Professor of Chemistry 1870–76, Professor of Nervous Diseases 1876–84, Professor of the Theory and Practice of Medicine 1885 to date, in the Rush College, Chicago. He is an able teacher and clinician, and has been a frequent contributor to current medical literature. Among his more important works are *Insomnia and other Diseases of Sleep* (Chicago, 1885); *Practice of Medicine* (Philadelphia, 1892). S. T. Armstrong.

Lyman, Phineas: soldier; b. at Durham, Conn., about 1716; graduated at Yale College in 1738; was tutor there till 1741; became a lawyer at Suffield, and was influential in securing that town to Connecticut; was appointed major-general and commander-in-chief of the Connecticut forces in the French war; built Fort Lyman (since called Fort Edward), N. Y.; succeeded Sir William Johnson in command at the battle of Lake George; was engaged in the attack upon Ticonderoga, the capture of Crown Point, the surrender of Montreal, and the expedition against Havana (1762); spent several years in England as agent to solicit lands for a colony in Florida, and died in West Florida (now Mississippi), near Natchez, Sept. 10, 1774.

Lyman, Theodore: philanthropist; b. in Boston, Mass., Feb. 20, 1792; graduated at Harvard College 1810; inherited an ample fortune; visited Europe 1812–14; wrote a small volume, *Three Weeks in Paris* (1814); made a second European tour 1817–19, on returning from which he published *The Political State of Italy* (1820); studied law; delivered the Fourth of July oration at Boston 1820; wrote an *Account of the Hartford Convention* (1823), in defense of that celebrated political demonstration; and published a useful work, *The Diplomacy of the United States with Foreign Nations* (1826). He took an active part in politics, served in both branches of the Legislature, became brigadier-general of militia, and was mayor of Boston 1834–35. In the latter year he was prominent in disapproval of the early popular meetings of the abolitionists, and incurred obloquy on that account. D. in Boston, July 18, 1849. He was a liberal benefactor to the State Horticultural Society and the Farm School, and was the founder of the State Reform School at Westborough, to which he gave $72,500.

Lyman, Theodore: naturalist; b. at Waltham, Mass., Aug. 23, 1833; son of Theodore Lyman, philanthropist; graduated at Harvard College 1855; studied zoölogy and geology under Louis Agassiz at the Lawrence Scientific School, where he graduated B. S. 1858; afterward continued the pursuit of science in the U. S. and in Europe, and since 1860 had been assistant in geology at the Museum of Comparative Zoölogy. His principal attention was given to the Radiata, on which he published many papers. His chief work is *Ophiuroidea of the Challenger Expedition* (4to, 400 pp., and 48 plates, 1882). From 1865–82 he was commissioner of inland fisheries of Massachusetts, and made the first scientific experiments in fish-culture undertaken by any State. From Sept. 2, 1863, to Apr. 20, 1865, he served as lieutenant-colonel and volunteer aide-de-camp on the staff of Maj.-Gen. Meade, commanding the Army of the Potomac. He was a member of the American Academy of

Arts and Sciences and of the National Academy of Sciences. He was interested in the administration of charities, was president of the Boston farm-school, a trustee of the Peabody education fund, and of the Peabody Museum of Archæology. He was one of the overseers of Harvard University in 1868–80 and 1881–87, and was a member of the Forty-eighth Congress. D. in Nahant, Mass., Sept. 10, 1897.

Lyman, Theodore Benedict, D. D., LL. D.: bishop; b. at Brighton, near Boston, Mass., Nov. 27, 1815; graduated at Hamilton College, Clinton, N. Y., in 1837, and from the General Theological Seminary in the city of New York in 1840; was ordained deacon in Christ church, Baltimore, Sept. 20 of the same year, and early the next month became rector of St. John's church, Hagerstown, Md., where he remained until he entered upon the rectorship of Trinity church, Pittsburg, Pa., in Apr., 1850; continued in charge of that parish until May, 1860, when he went to Europe, and remained there nearly ten years. During that time he had charge for a short period of an American church in Florence, and later was for several years rector of the American Episcopal church in Rome. Upon his return to America, in 1869, he became rector of Trinity church, San Francisco, and was in charge of that church when elected assistant Bishop of North Carolina in May, 1873. He was consecrated to that office in Christ church, Raleigh, Dec. 11, in the same year. On the death of Bishop Atkinson, in 1881, he became Bishop of North Carolina. He received the degree of D. D. from St. James's College, Md., and that of LL. D. from his *alma mater*, Hamilton. He published a few occasional sermons and addresses. D. at Raleigh, N. C., Dec. 13, 1893. Revised by W. S. Perry.

Lymington, lim'ing-tŭn (in Doomsday Book called *Lentune*, which was afterward changed to *Limentum*): a seaport-town of Hampshire, England; on the Lym, near its confluence with the Solent, just opposite the Isle of Wight, and 94 miles S. W. of London (see map of England, ref. 14–H). Its manufactures of salt and Epsom salt were once important. It is much frequented, however, as a summer resort and for its sea-bathing, and from its yards some of the best racing-yachts have been launched. The parish church dates from the time of Henry VI. Pop. (1891) 4,551.

Lymph [from Lat. *lympha*, clear water]: the clear, faintly straw-colored fluid contained within the system of lymphatic channels which, in addition to the blood-vessels, permeate all parts of the body, either as clefts or as definite vessels. Since the relation between the lymphatic radicles and the tissues and the organs is most intimate, the terms "tissue juices" and "white blood" are often applied to designate the lymphatic fluid. The lymph resembles the blood in being composed of two parts—the clear limpid *plasma*, or *liquor lymphæ*, and the small granular cells, the *lymph corpuscles*, which float about in the fluid. The lymph-plasma closely corresponds in its constituents with blood-plasma, from which it really is largely derived, since as the blood circulates in the capillaries a certain amount of the *liquor sanguinis* diffuses through the thin walls of the vessels, and thus directly supplies nutrition to the elements of the tissues. This escaped fluid collects within the tissue spaces as lymph, and thence it passes to the larger and more definite lymphatic channels. Certain extensive cavities within the body, as the peritoneal, the pleural, the pericardial, the cerebro-spinal, and the intra-articular, very closely related to the lymphatic system, are occupied by various accumulations of lymph. When the amount of this fluid becomes excessive, as in certain forms of disease, the condition is known as dropsy.

Lymph possesses a specific gravity of between 1,012 and 1,022, being essentially the watery exuded blood plasm; its chemical composition closely resembles that of the *liquor sanguinis*; it is, however, less rich in organic constituents (except urea, which is increased) and in fibrin. The composition of lymph-plasma is as follows:

Water	93·99
Fibrin	0·05
Other proteids	4·27
Fats, etc	0·38
Extractions	0·57
Salt	0·73

The morphological elements of lymph, the *lymph-corpuscles*, present the same appearances as the colorless cells of the blood (see Histology and Blood), with which they are identical; the lymph collected from the entire body is poured by the great lymphatic trunks—the thoracic duct and the right lymphatic duct—directly into the venous blood-current, the lymph-cells thereafter being known as the colorless blood-corpuscles. The lymph-cells are irregularly round, nucleated masses of protoplasm about $\frac{1}{2500}$ of an inch in diameter, whose principal source of origin is the lymphatic tissue through which the lymphatic current passes on its course to larger channels. The lymph contained within the absorbent vessels of the digestive tract during certain stages of digestion becomes mingled with the particles of oil taken up from the intestinal contents; the emulsion thus formed produces the temporary milky appearance of the fluid within the intestinal lymphatics, which, in recognition of this condition, is designated as chyle and the vessels often as lacteals. After the digestive processes are completed, the milky appearance disappears and the lymph within the absorbents of the intestines returns to its usual limpid condition. See Histology.

G. A. Piersol.

Lymphat'ics: See Histology.

Lynch, Patricio: naval officer; b. at Santiago, Chili, in 1824. His father was an Irish merchant. He studied at the Chilian Military Academy, served with the Chilian navy in Peru 1838, and from 1839 to 1847 was in the British navy, taking part in the Chinese war 1841–42. Re-entering the Chilian service 1847, he rose to be commander of frigate, but retired 1854–65. In the latter year he served against the Spaniards. In 1880, during the war with Peru, he commanded a flotilla and military force which ravaged the coast regions from Callao to Payto in the most ruthless manner, doing a great amount of wanton damage. In the attack on Lima he commanded one of the Chilian divisions, and on May 4, 1881, was appointed military commandant of the captured city, and practically of all the conquered district in Northern Peru. By his orders the provisional Calderon government was deposed Sept., 1881, and Calderon himself was sent a prisoner to Chili, an act which provoked a vigorous protest from the U. S. minister. Subsequently he directed operations against Caceres, and finally, having invested Iglesias with supreme power, evacuated the city Oct. 22, 1883, taking a vast amount of plunder. In 1884 he was made minister to Spain, and while returning died at sea May, 1886. Herbert H. Smith.

Lynch, Patrick Wilson, D. D.: bishop; b. at Cheraw, S. C., Mar. 10, 1817; studied theology in the Roman Catholic Seminary at Charleston and in the College of the Propaganda at Rome; was ordained priest in 1840; became principal of the collegiate institute at Charleston, vicar-general of the diocese in 1850, and Bishop of Charleston in 1858. He built several churches, including the fine cathedral of St. Michael; founded an Ursuline convent, an orphan asylum, and many schools. Some of these establishments having been destroyed during the civil war, he chiefly devoted himself to their restoration, for which purpose he made extensive tours through the Northern States, preaching and collecting funds. He wrote some theological and scientific essays, and participated in the Vatican Council of 1869–70, supporting the dogma of infallibility. D. in Charleston, S. C., Feb. 26, 1882.

Lynch, Thomas, Jr.: one of the signers of the Declaration of Independence; b. in Prince George parish, S. C., Aug. 5, 1749; was educated at Eton and Cambridge, England, and studied law in the Temple, London. In 1772 he returned to South Carolina; became in 1775 a captain in the provincial troops; was sent in 1776 to Congress to succeed his father, who died in that year, but, his own health failing, he soon left Congress. In 1779 he sailed for the West Indies, intending to proceed to France, but the ship never reached its destination, being probably lost in a storm.

Lynchburg: city (laid out 1786): Campbell co., Va. (for location of county, see map of Virginia, ref. 7–F); on the James river, and the Ches. and O., the Rich. and Dan., and the Norfolk and West. railways; 147 miles E. by N. of Richmond. It is situated on the sides of a hill rising abruptly from the river, and presents a picturesque appearance with its numerous terraces and ornamental villa-residences, which command a splendid view of the Blue Ridge and the Peaks of Otter, 20 miles distant. It is a central point for an extensive shipping and distributing business, has numerous manufactories of tobacco, several iron-foundries, railway machine-shops, cotton and flouring mills, and possesses a magnificent water-power, while in the immediate vicinity vast deposits of coal and iron are found. The reservoir

constructed in 1828 is situated 253 feet above the river. There are 4 national banks with combined capital of $705,300, 3 State banks with capital of $350,000, a trust and savings-bank with capital of $150,000, a private bank, and 2 daily, 3 weekly, and 3 other periodicals. The city was an important base of supplies for the Confederates during the civil war, but early in 1865 Gen. Sheridan destroyed the canal and the railways leading into it, Pop. (1880) 15,959; (1890) 19,709; (1900) 18,891. EDITOR OF "NEWS."

Lynch Law: the practice of trying and punishing men, by unauthorized persons, without due process of law, and in violation of the right of the proper legal authorities to bring alleged offenders to trial for alleged crimes and offenses with which they are charged. In times of especial turbulence and disorder, when the duly constituted legal authorities are powerless to enforce the laws, there may be some justification for a resort to lynch law, but, while in some such instances lynch law has been productive of advantage, it is ordinarily an unmixed evil. The legal safeguards which serve to protect an innocent man from unjust conviction are almost invariably disregarded, and the excitement and passion under which the self-constituted judges usually labor render conviction almost a certainty in all cases, and often results in the infliction of inhuman cruelties by way of punishment. The origin of this phrase has been variously accounted for, but it is usually derived from a Virginian farmer named Lynch, who is said to have exercised unauthorized judicial functions in the early history of the State. This origin is very doubtful, however. Revised by F. STURGES ALLEN.

Lyndhurst, lind'hŭrst, JOHN SINGLETON COPLEY, Baron: statesman; b. in Boston, Mass., May 21, 1772, son of the artist John Singleton Copley; went to England in 1775; graduated with high honors at Cambridge University in 1794, and became a fellow of Trinity College; visited the U. S. in company with Volney; was called to the bar at Lincoln's Inn in 1804: became a sergeant-at-law in 1813; chief justice of Chester 1817; entered Parliament as a Tory in 1818; was knighted and made solicitor-general 1819; was counsel of George IV. in 1820 in the trial of Queen Caroline; became attorney-general in 1824; sat in Parliament for Cambridge University 1826, and was made master of the rolls; opposed Catholic emancipation; was raised to the peerage as Baron Lyndhurst and appointed lord chancellor in 1827, holding that office until 1830, a second time from 1834–35, and again from 1841–46; was chief baron of the exchequer 1830; and lord high steward of Cambridge University 1840. He originally entertained very advanced views. Before he became prominent in politics he was a republican and a Jacobin, but when, in 1817, he was taken up by the leaders of the Tories, on account of his brilliant defense of Dr. Watson, who was on trial for his participation in the Spa Fields riot, and when he shortly after entered Parliament by their support, he became a steady, and often a violent, opponent of all liberal measures. He was possessed of great eloquence, and continued to astonish the House by his speeches up to his ninetieth year. His denunciation of the aggressive policy of the Emperor Nicholas in 1853 created a European sensation, and in 1859 he attacked the policy of Napoleon III. with equal effect. D. in London, Oct. 12, 1863. See *Lives of the Lord Chancellors* (1869).

Lyndsay, lin'zi, Sir DAVID: statesman and poet; b. about 1490, probably in the old mansion-house of the Lyndsays, at Garleton, near Haddington, in East Lothian, Scotland; entered the University of St. Andrews in 1505; traveled in France and Italy 1509–11, and received in the latter year some position at the court of James IV. When James V. was born, in 1512, he was appointed his personal attendant, and he remained with the young king until the Douglasses came into power, in 1524, when he was banished from the court. He was recalled, however, in 1529, and afterward often served in important diplomatic missions to the Netherlands, to France, to Denmark, etc. He died early in 1555. It is, however, not as a courtier and a statesman, but as a poet, that he acquired his great fame. Indeed, he was for two centuries and a half the most popular poet Scotland produced. His principal works are *The Dreme*, a half-didactic poem, and *The Satire of the Three Estates*. The poetical merits of these productions are not so very great, but a vigorous spirit of reform, especially in the domain of the Church, is alive in them and gives them a considerable interest. The best editions of his works are those by George Chalmers (3 vols., London, 1806) and David Laing (3 vols., Edinburgh, 1879).

Lynn: city (settled by the English in 1629; incorporated as a city in 1850); Essex co., Mass. (for location of county, see map of Massachusetts, ref. 1–I); on Massachusetts Bay and the Boston and Me., and the Boston, Revere Beach and Lynn railways; 9 miles N. E. of Boston. It has an area of 11⅛ sq. miles, a coast-line of about 3 miles, and a shallow but well-sheltered harbor: is built mainly on a plain; and is noted for its manufactures of boots and shoes. The census returns of 1895 showed that 915 manufacturing establishments (representing 26 industries) reported. These had a combined capital of $11,046,779, employed 14,778 persons; paid $7,587,445 for wages and $20,401,311 for materials; and had products valued at $34,444,091. The boot and shoe industry had 284 establishments and $5,362,547 capital; employed 9,391 persons; paid $4,801,892 for wages and $14,270,721 for materials, and had products valued at $22,698,877. The next industry in importance was the manufacture of morocco leather, which had 20 establishments and $891,082 capital: employed 637 persons; paid $290,152 for wages and $1,925,585 for materials; and had products valued at $2,566,011. The city has 5 national banks and 2 safe-deposit companies with combined capital of $1,340,000, 3 savings-banks with assets of over $8,000,000, 2 libraries (free public, founded 1862, and a subscription circulating, founded 1881), and 2 daily, 4 weekly, and 5 monthly periodicals. It owns property valued at over $1,500,000, and its water-works in 1900 had cost over $2,427,561. The assessed valuation in 1900 was $51,091,948, and the net funded debt $3,107,397.59. Pop. (1890) 55,727; (1900) 68,513.

Lynn Re'gis, or **King's Lynn**: town; in the county of Norfolk, England; 100 miles N. of London, on the estuary of the Great Ouse, 9 miles from its mouth (see map of England, ref. 9–K). It is well built, has a good harbor, a fine church of the twelfth century, and beautiful public walks, and carries on a very extensive trade with Spain, the Baltic, and North America. Coal, timber, and manufactured goods are imported; corn, wool, and oil-cake exported. It has also large breweries, iron-foundries, ship-yards, and manufactures of tobacco, cork, and rope. Pop. (1891) 18,265.

Lynx [Mod. Lat. = Lat. = Gr. λύγξ, lynx]: the common as well as generic name for several good-sized members of the cat family (*Felidæ*), distinguished by the absence of the first upper premolar, by their tufted ears, and, with one exception, by their short, truncated tails. The fur is soft, gray, or reddish gray, more or less spotted and marbled, very thick and soft in northern specimens. With the exception of the CARACAL (*q. v.*), the lynxes are all inhabitants of the northern hemisphere. They climb well and prey

The lynx.

upon birds and small mammals. The exact number of species is still in dispute, but two well-marked species, *Lynx borealis* and *L. pardina*, occur in Europe and two in North America, the bay lynx (*L. rufus*) and the Canada lynx (*L. canadensis*). Except that it is smaller, measuring about 3 feet in length, this last is very similar to the animal found in Northern Europe. F. A. LUCAS.

Lyon, DAVID GORDON, A. B., Ph. D.: Orientalist and Assyriologist; b. at Benton, Ala., May 24, 1852; was educated at William Jewell College (Missouri), Howard College (Alabama), Southern Baptist Theological Seminary, and the University of Leipzig; has been Hollis Professor of Divinity in Harvard University since 1882, and recording secretary of the American Oriental Society since 1886. He has

published *Keilschrifttexte Sargons Koenigs von Assyrien* (Leipzig, 1883); *An Assyrian Manual for the Use of Beginners in the Study of the Assyrian Language* (Morgan Park, 1886; new ed. New York, 1892).

Lyon, Mary: educator; the founder of Mt. Holyoke College; b. at Buckland, Mass., Feb. 28, 1797; became a school-teacher at Shelburne Falls, Mass., in 1814; taught 1821–24 in the academy at Byfield, Mass.; 1824–28 in the Female Academy at Londonderry, N. H.; and then until 1834 in the ladies' seminary at Ipswich, Mass. Her great work was the founding of the Mt. Holyoke Female Seminary at South Hadley, Mass., of which she was principal from 1837 to 1849. Her practical sagacity was as remarkable as her unconquerable energy and sublime faith. D. at South Hadley, Mar. 5, 1849. See her *Life*, by President Hitchcock (Northampton, Mass., 1851), and *Recollections of Mary Lyon*, by Fidelia Fiske (Boston, 1866).

Lyon, Matthew: politician; b. in Wicklow co., Ireland, in 1746; emigrated to New York in boyhood; worked on a farm in Connecticut for some years; removed to Vermont; became in 1776 lieutenant in a company of "Green Mountain Boys"; became paymaster-colonel of militia, member of the Legislature, and assistant judge; founded the town of Fairhaven in 1783; built saw and grist mills; established a forge; made paper from basswood; manufactured types, and issued a paper called *The Scourge of Aristocracy and Repository of Important Political Truth*; took an active part in politics; was elected to Congress in 1797 as a Jeffersonian; was in Oct., 1798, convicted of libel against President Adams, fined $1,000, and imprisoned four months in Vergennes jail, during which time he was re-elected twice; narrowly escaped expulsion, first as a convicted felon, and afterward on account of an altercation on the floor of the House with Roger Griswold, of Connecticut, resulting in blows; removed to Kentucky in 1801; was immediately elected to the Legislature, and to Congress from 1803 to 1811; built gunboats on speculation for the war of 1812, and became bankrupt; was appointed by President Monroe in 1820 U. S. factor among the Cherokee Indians in Arkansas, and was elected delegate to Congress from that territory, but soon after died at Spadra Bluff, Ark., Aug. 1, 1822.

Lyon, Nathaniel: U. S. soldier; b. at Ashford, Windham co., Conn., July 14, 1819; graduated at West Point in 1841; served honorably in the Mexican war; was stationed in Kansas during the period of the slavery agitation, and remained actively engaged on frontier duty until Feb., 1861, when he was placed in command of the U. S. arsenal at St. Louis. Here he distinguished himself by surrounding and capturing the "State guard," and was appointed a brigadier-general of volunteers May 17. Soon after this he led his army to Springfield where he was compelled to remain by the superior force of the Confederates who were now overrunning Southern Missouri. After vainly waiting for re-enforcements he learned of the advance of the Confederates in two columns. Hoping to defeat the column from the S. before it united with that coming from the W., he moved out from Springfield, Aug. 1, and in the following morning defeated McCulloch at Dug Spring, who retreating now united with the other wing, and the whole body advanced toward Springfield, to which place Lyon had fallen back. Arriving at Wilson's Creek on the 7th, Lyon proposed to surprise them here; but this plan failed, and on the 9th he again moved out from Springfield and fought the battle of Wilson's Creek on Aug. 10. This battle is said to have been fought against his own judgment; but the evil to be apprehended from abandoning Southwestern Missouri without a battle being strongly represented, determined him to risk the engagement, throughout which he displayed the most daring courage, and it was after being twice wounded that, placing himself at the head of a regiment whose colonel had fallen, he was struck by a minie ball and almost instantly killed. The Union forces were repulsed, but retired in good order. By will Gen. Lyon left almost his entire property to the U. S. Government to aid in preserving the Union. A series of able letters written by him during and subsequent to the Kansas troubles was published in 1862, entitled *The Last Political Writings of Gen. Nathaniel Lyon.*

Lyon King-of-arms: the chief herald of Scotland. When the office is held by a nobleman certain of its duties must be performed by Lyon depute, one of his subordinates. Lyon also appoints messengers-at-arms for the courts and counties of Scotland. He is the chief officer of Lyon court, the heraldic college of Scotland. His subordinates are Lyon depute, Lyon clerk, Lyon clerk-depute, the procurator-fiscal, a herald painter, and a macer. The proper heralds and pursuivants of Scotland perform duties which are chiefly ceremonial, and do not relate to the blazoning of arms. These last duties are performed by the Lyon court, and are even more elaborate and formal than those of English heraldry.

Lyonnais, lē̆ē′ō′nā′: an ancient province of France, which is now divided into the departments of Loire, Haute-Loire, Puy-de-Dôme, and Rhône.

Ly'ons, Fr. pron. lē̆ē′ōn′ [from Fr. *Lyon*, Lyons < Lat. *Lugdu'num*, the ancient name]: next to Paris the largest city of France, and the most important manufacturing place of the country; situated in lat. 45° 45′ 44″ N., lon. 4° 49′ 43″ E., at the confluence of the Saône and the Rhône, 315 miles by rail S. S. E. of Paris (see map of France, ref. 6–H). It consists of a central part, covering a peninsula formed by the two rivers, and a number of suburbs scattered over the hills on the right bank of the Saône and on the left bank of the Rhône. It is the capital of the department of Rhône, the headquarters of the seventh military division of France, and is very strongly fortified. Eighteen detached forts which defend and command it form a circle around it 16 miles in circuit. The quays along the Rhône and the Saône are surprisingly beautiful; they are planted with magnificent trees and lined with elegant houses. Twelve bridges span the Saône, seven the Rhône. Some other quarters of the city and several of the many public squares are also handsome. Place Bellecour is one of the largest squares in Europe; on Place des Terreaux stood the guillotine in 1794; from the summit of the hill of Fourvières, on the right bank of the Saône, where stands the Church of Notre Dame de Fourvières, a most magnificent view is presented of the city, the Alps to the one side and the Cévennes to the other. Other parts of the city contain nothing but narrow, crooked streets, lined with tall gloomy houses, and have a squalid and dismal appearance. Among the public buildings the most remarkable are the Hôtel de Ville, one of the most interesting and beautiful buildings of its kind in Europe; the Palais des Beaux-Arts, on the Place des Terreaux; the cathedral, on the declivity of the hill of Fourvières, in Gothic style of the time of Louis XI.; the Church of St. Nizier, of the fourteenth century, etc. The educational and benevolent institutions of the city are numerous and good. The Royal College was founded in 1519, and enjoys a great reputation. The School of Drawing and the Veterinary School are model establishments. In the Martinière 220 sons of artisans receive gratuitous education. There is a public library with over 66,000 volumes, a botanical garden, several scientific associations, etc. The dye-works, foundries, glass-houses, potteries, tanneries, and breweries of Lyons are very extensive, especially the latter. Its manufactures of jewelry, hats, fine liqueurs, and chemicals also are important, and its trade in its own manufactures and in the produce of the surrounding country, especially in wine, is very brisk; it communicates by canals with Bordeaux, Paris, Marseilles, Geneva, and the Rhine. Its principal business is its silk manufacture, in which branch of industry it is hardly surpassed by any other place in the world. The average annual value of raw silk imported is estimated at $60,000,000; of manufactured silk exported, at $76,000,000. Silk-weaving was first started here in the reign of Louis XI. by artisans from Florence, Lucca, and Genoa; in the latter part of the seventeenth century between 9,000 and 12,000 looms were in operation, but the Revocation of the Edict of Nantes bereft the city of many of its most skilled workmen, and the number of looms decreased to about 4,000. In the latter part of the eighteenth century it had risen again to about 18,000, but the Revolution interfered sadly with the industry. At present more than 100,000 looms are worked in and around Lyons. An international exposition was held here in 1894.

The city is very old. The ancient *Lugdunum*, on the hill of Fourvières (*Forum vetus*), was colonized in 43 B. C. by Munatius Plancus. Under Augustus it became the capital of the province of Gaul, and the center of the different roads which the Romans built in the country. Germanicus, Claudius, Marcus Aurelius, Caracalla, and Geta were born here. During the early Middle Ages it belonged to the Archbishop of Lyons, and was very much disturbed by feuds between its municipal council and its ecclesiastical ruler, but in 1312 it was incorporated with the kingdom of

France by Philip the Fair, and its prosperity increased very much after that period. During the Revolution it suffered terribly; its insurrection against the Convention was punished by Collot d'Herbois and Fouché with an unheard-of cruelty. A great many of its buildings were demolished, and its very name was changed from Lyons to *Vitte-Affranchie*. Of its inhabitants many fled, while their property was confiscated, and many more perished on the scaffold or were mown down by grapeshot. After the fall of Robespierre the horrors were repeated. The terrorists and their adherents were drowned in the Rhône. Again in 1814, 1815, 1830, 1831, and finally in 1870–71, it was much disturbed by riots. Here President Carnot, while leaving a banquet given in his honor at the Exhibition of Arts, Sciences, and Industries, was assassinated on June 24, 1894, by an Italian anarchist.

Lyons has suffered severely by inundations, especially in 1840 and 1856, the result of the injudicious felling of the forests of the Vosges Mountains. Since 1856, however, extraordinary precautions have been taken, and the city is now free from danger of this character. Pop. (1881) 376,613; (1896) 466,028. Revised by C. H. Thurber.

Lyons: city; Clinton co., Ia. (for location of county, see map of Iowa, ref. 5–L); on the Mississippi river, and the Chi. and N. W. and the Chi., Mil. and St. P. railways; opposite Fulton, Ill., with which it is connected by a steel highway bridge. It is in an agricultural and nursery region; has an electric railway connecting it with Clinton, the county-seat; and contains saw, flour, and wrapping-paper mills, steamboat-ways, machine-shops, and sash-factories, several public parks, 2 libraries (German Association, founded 1859, and Young Men's Association, founded 1863), and 2-weekly newspapers. Pop. (1880) 4,095; (1890) 5,799. Annexed to Clinton since 1890.

Lyons: city; capital of Rice co., Kan. (for location of county, see map of Kansas, ref. 6–F); on the Atch., Top. and S. Fé, the Mo. Pac., and the St. L. and San Fran. railways; 21 miles E. of Ellinwood, 250 miles W. of Kansas City, Mo. It is in a highly productive salt region, is an important supply-point for the miners in Colorado and New Mexico, and has a monthly, a semi-weekly, and three weekly newspapers. Pop. (1880) 509; (1890) 1,754; (1900) 1,736.

Lyons: village; capital of Wayne co., N. Y. (for location of county, see map of New York, ref. 4–E); on the Erie Canal, and the Fall Brook, the N. Y. Cent. and H. R., and the W. Shore railways; midway between Syracuse and Rochester. It has excellent water-power, manufactures silverware, peppermint oil, and agricultural implements, fans, tool-handles, and various iron goods; and contains a large union school, the library of school district No. 6, and three weekly newspapers. Pop. (1880) 3,820; (1880) 4,475; (1900) 4,300.
Editor of "Republican."

Lyons, Gulf of: a large bay formed by the Mediterranean on the southern coast of France. It receives the Rhône. Marseilles and Toulon stand on its shores.

Lyons, Edmund: first Baron Lyons of Christchurch; naval officer and diplomat; b. at Burton, Hampshire, England, Nov. 21, 1790; was descended from Gov. John Winthrop of Massachusetts; entered the British navy in childhood; became a midshipman in 1803; served in the East Indies; became commander in 1812, and post captain in 1814. In 1828 he was engaged in the blockade of Navarino, Greece, then held by the Turks, and conveyed King Otho to Athens on the formation of the new kingdom; was knighted, and resided there as minister for fourteen years. In 1849 Sir Edmund became minister at Berne, and in 1851 at Stockholm. At the outbreak of the Crimean war he was appointed second in command of the Black Sea squadron, became commander-in-chief in Jan., 1855, and distinguished himself by brilliant services, which procured him a peerage in 1856 under the title of Baron Lyons of Christchurch. In 1857 he became successively vice-admiral and admiral. D. Nov. 24, 1858.

Lyons, Richard Bickerton Pemell, G. C. B., D. C. L.: second Baron Lyons; diplomat; b. at Lymington, England, Apr. 26, 1817; educated at Winchester School and Christ Church, Oxford; appointed *attaché* at Athens 1839, at Dresden 1852, at Florence (residing in Rome) 1853; secretary of legation there 1856, and envoy to Tuscany 1858; was envoy at Washington Dec., 1858–65; became ambassador at Constantinople Aug., 1865, and at Paris July, 1867; resigned in 1887. He was sworn a member of the privy council 1865. D. in London, Dec. 5, 1887.

Lyra, lē̆'raa', Nicholas, de: Hebrew scholar; b. at Lyre, Normandy, France, about 1270; studied in the Franciscan college at Verneuil and at the University of Paris; became a doctor of theology and an eminent lecturer upon biblical interpretation. He held the most important posts in the Franciscan order, and his commentaries upon the Scriptures were approved and used by the Reformers, whence the punning couplet—

Si Lyra non lyrasset,
Lutherus non saltasset—

"If Lyra had not piped, Luther would not have danced." His great work was the *Postitlæ perpetuæ in universa Biblia*, printed very early at Rome (5 vols. folio, 1471–72), which earned him the title of *Doctor planus et utilis*. In it he follows Rashi, and adopts the four Jewish modes of interpretation, the literal, the allegorical, the moral, and the anagogical or mystical. It is the only exegetical work of any merit produced by the Middle Ages before the revival of letters. His knowledge of Hebrew gave him a great advantage over the expositors of his time, although he made a modest plea for indulgence in the prologue to his commentary, "because," he said, "I am not so well skilled in the Hebrew or Latin language as to prevent me from failing in many particulars." He also wrote a work in defense of Christianity and against Judaism, entitled *Tractatus fratris Nicolai de Lyra de Messia ejusque adventu, una cum responsione ad Judæorum argumenta quatuordecim contra veritatem Evangetiorum* (1309). Whether he was a Jew by birth is disputed. D. in Paris, Oct. 23, 1340. See Davidson, *Sacred Hermeneutics*; Graetz, *Geschichte der Juden*. Revised by C. H. Toy.

Lyre [viâ O. Fr. from Lat. *ly'ra* = Gr. λύρα, lyre]: a musical instrument of unknown origin and antiquity, famous in mythology and poetry. Diodorus ascribes its invention to the Egyptian Hermes (Mercury). According to the tradition, the Nile in its subsidence left on its bank a tortoise-shell, the contents whereof were so dried by the sun that the hard-strained cartilage was like stretched catgut. This gave the hint of an instrument. The Greek tradition does not materially differ from the Egyptian. The improvements in the lyre were made by the Greeks, who increased the capacities of the instrument by adding to the number of the strings. The most ancient lyre had three; the lyre of Terpander (B. C. 680) had seven; the lyre of Pythagoras (B. C. 600) had eight. The number was afterward increased to eleven, and even to thirteen. In its perfected form the lyre consisted of two side-pieces set upright, like horns, connected together near the top by a wooden cross-piece; the strings were attached to this, and stretched perpendicularly, the lower end being fastened to the bottom of the resonant shell. They were struck either with the fingers or a plectrum, a stick of polished wood or ivory. When played, the lyre was held between the knees. The form of the instrument varied slightly, as can be imagined, in different epochs and among different peoples. It was used chiefly as an accompaniment to the voice in passionate, pathetic, and heroic song. For this reason it has given the name *lyric* to a class of poetry that expresses the mood of private and personal emotion. Literature celebrates the lyre of Sappho, the Lesbian lyre, and the lyre of Apollo. The Abyssinians and neighboring peoples of the present day use an instrument of seven strings that closely resembles the lyre of ancient Greece.

Lyre-bird: a name given to three Australian birds (*Menura superba*, *M. victoriæ*, and *M. alberti*) on account of the peculiarly shaped tail of the male. The outermost feather on either side curves outward like the sides of an ancient lyre, while the effect is heightened by the fact that the two inner tail-feathers are little more than mere shafts, and the twelve others have very sparse, slender barbs, thus suggesting the strings of the instrument. The lyre-bird is about the size of a small fowl, has long, strong legs, and short weak wings. The general color is olive brown. It has a striking song, is very shy, and inhabits the dense thickets of New South Wales. The *Menuridæ*, the family of passerine birds to which the lyre-birds belong, are distinguished by the peculiar form of the vomer, which, according to Huxley, is "broad and rounded off in front and deeply cleft behind. The maxillo-palatines are long and slender. The sternum has a well-developed and forked manubrium, but its posterior edge is strongly convex, and only exhibits a slight notch on each side. The furcula has no median process, and its scapular ends are comparatively little expanded." The bill is moderately slender and pointed; the gape quite well cleft; the nostrils linear, and advanced beyond the

middle of the bill. Owing to numerous anatomical peculiarities, the lyre-birds have been by some authors considered

Lyre-bird.

as a super-family, or even as forming a separate order, *Menuræ*. F. A. Lucas.

Lyre-turtle: a name applied to the largest of the sea-turtles, *Dermochelys coriacea*, on account of its somewhat lyre-shaped outline, the strings of the instrument being suggested by the dorsal keels. The peculiar leathery appearance of this species and its high, arched carapace have earned for it the names of leatherback and trunk turtle. The carapace of the lyre-turtle is broad and high in front, and tapers to a point behind; there is a well-marked ridge or keel down the center of the back, on either side of which are two others. The neck is short, head large and rounded, front flippers long and narrow, hind flippers short and wide. The skin is tough and leathery; the color is black above, white, mottled with black, below. There are no nails. This turtle differs from all other living species in the fact that the carapace, instead of being composed of large, regular plates of bone, related and united to the vertebræ and ribs, is formed of large numbers of thin, irregularly shaped pieces of bone, having no relation to the skeleton. This turtle attains a weight of 1,000 lb. It is very oily, and the flesh is said to be poisonous. It is an inhabitant of tropical seas, and is occasionally brought to the shores of the Eastern and Northern U. S. by the Gulf Stream. F. A. Lucas.

Lyric Poetry [*lyric* is from Lat. *ly'ricus* = Gr. λυρικός, liter., pertaining to the lyre, hence to songs or poems intended to be accompanied by the lyre; deriv. of λύρα, lyre, whence Eng. *lyre*]: a kind of poetry which in modern usage can hardly be more exactly defined than as that which is most closely related to music. In classic Greek the word *lyric* seems always to have been used literally. Finding favor in Latin and in modern languages, the term has persisted with great extension of meaning and corresponding loss of precision. It is now used to cover a range of literature wide enough to include not only all verses written to be sung under any conditions, but also poetry so diversified as the Psalms, Pindar, Horace, Petrarch, Villon, Burns, and the libretti of the operatic stage. Little as at first sight they seem to have in common, it will appear on reflection that their relation to actual music is far closer than that of distinctly epic or dramatic poetry. It seems probable indeed that all poetry which may properly be termed lyric, may be classified under one of four heads, whose relation to music is traceable. The first includes all verse which is written for musical accompaniment of any kind, such as the Psalms, the odes of Pindar, or one of Gilbert's libretti. The object of this primary lyric poetry is clearly to phrase in words certain aspects of that great variety of human emotion which is properly the subject also of purely musical expression. The second includes all verse, such as an ode of Gray or of Wordsworth, or any modern sonnet, whose conventional form is traceable to the musical conditions of former times. Here, too, in this secondary lyric poetry the inherent nature of the form involves some attempt on the part of the poet to formulate in words phases of emotion that at least once were held to be primarily within the province of music. The third, which involves a less precise use of the term, includes all passages in poetry generally of another character—epic, for example, or dramatic—which impress the ear as subtly musical in sound. One hears much, and properly, of the lyric beauty with which many speeches in Shakspeare's plays are permeated. In this tertiary lyric poetry it is clear on reflection that the poet, perhaps with no conscious effort to conform to actually or historically musical conditions, has been to some degree influenced by emotions which under other circumstances might have found primarily musical expression. The fourth, which involves a distinctly modern use of the term lyric, much in favor among the Germans, includes all verse, whatever its form or sound, whose object is to express the personal emotion of the poet, as distinguished from the impersonalities of epic poetry or dramatic. Lyric poetry indeed is sometimes defined as subjective poetry, in distinction from objective. A little consideration will show that this quaternary lyric poetry, like the other kinds, has distinctly musical traits. Without detailing any theory of pure æsthetics, we may safely say that music is generally the vehicle of that great, unformulated body of human emotion which, in spite of its general existence, presents itself to the individual as primarily personal. In this sense such poetry as that of Heine is conspicuously lyric. Under these four heads all lyric poetry may probably be included. In each case, as we have seen, there remains a perceptible trace of that aspect of the original meaning of the term lyric which connects it, not with a specific musical instrument, but with music in general. So far, then, as any effort to phrase thought and emotion in written words endeavors, either in substance or in form, to phrase that indefinitely subtle range of emotion whose normal expression is purely musical, the result of that effort may be said to possess lyric quality.

If this view of the essential nature of lyric poetry be accepted, we may see at once why so many efforts to classify lyric poetry—as sacred, patriotic, erotic, convivial, etc.—are confusingly unsatisfactory. Whatever is properly the subject for musical expression is properly also the subject of lyric verse; and this clearly includes the whole range of emotional experience. Anything approaching a complete topical classification of lyric poetry, then, would amount to a complete tabulation of emotional psychology. In a very general way, however, we may say that at certain periods of human history certain phases and forms of lyric poetry have so developed as to be historically characteristic. Among the earliest phases of emotion to seek lyric expression was certainly the religious. In the Vedic hymns, in the Psalms, and by far the greater part of other biblical poetry, this fact clearly appears. It is perhaps typical of the essentially lyric nature of religious emotion that to the present day religious poetry is still actually associated with music. The Psalms are chanted still; so are the Latin hymns of the mediæval Church; and Luther's hymns, and those of Dr. Watts, and Cardinal Newman, and Mr. Moody are known as familiarly by their tunes as by their names. Perhaps quite as early came that sort of national lyric, in English generally called Ballad Poetry (*q. v.*), which has everywhere existed as the predecessor of formally epic verse. So, too, the folk-song, the immemorial nursery rhyme, the war-song, and the love-song emerge from the highest antiquity. In no literature that survives has any general lyric subject been quite neglected. In the great literatures that still consciously influence us, however, certain kinds of lyric poetry have from time to time developed so highly as permanently to survive in their

original form. In this sense certain kinds may be called peculiarly typical of certain of these literatures. In this sense the typical Hebrew lyric—in spite even of so superb an erotic work as the Canticles—must be pronounced the spiritually religious. The typical Greek lyric—in spite even of the philosophic choruses of classic tragedy and what else—must be pronounced either the passionately local, occasional odes of Pindar, or the frankly erotic songs of Sappho and of Anacreon. The typical Latin lyric—in spite of all the rest—must be pronounced the urbanely convivial odes of Horace. The typical lyric of the early Middle Ages—for all their ballads and folk-songs—probably remains the rhyming hymn of Latin Christianity, no longer spiritually but now dogmatically religious. The typical lyrics of the later Middle Ages or of the early Renaissance may perhaps be pronounced the *canzone* and Petrarchan sonnet, no longer frankly erotic but now idealized and romantic love-songs. The typical modern lyric, in all European languages is—for all the vagaries of the operatic stage—the consciously subjective.

From the middle of the sixteenth century English literature has been exceptionally rich in lyric poetry. In Palgrave's *Golden Treasury* there exists a remarkably compact and typical collection of English lyrics. This anthology is useful both as a general example of the range and nature of lyric poetry in modern times and as a guide to the development of this kind of literature in English. It is divided into four books, roughly corresponding to the sixteenth, seventeenth, eighteenth, and nineteenth centuries, and roughly grouping themselves about the work of Shakspeare, Milton, Gray, and Wordsworth. Very generally we may say that the lyric poetry of the sixteenth century in England, which groups itself about the sonnets and the songs of Shakspeare, deals either with idealized love, or with simple and elementary emotions, joyous or sorrowful, such as are apt to coincide with alert intensity of personal affection. In equally general terms, we may broadly describe the three successive periods. The English lyrics of the seventeenth century, which group themselves about the lesser poems of Milton, are distinctly more various. With decidedly less spontaneity, they are more definite. The moods expressed by such poems as *L'Allegro* and *Il Pensoroso* are more mature than those expressed by earlier poetry, or at least far more modern; the songs of the cavaliers, the sternly Puritan sonnets of Milton, express specific, not general, phases of intense emotion; while such an elaborate ode as Dryden's *Alexander's Feast* exhibits a deliberate mastery of technical composition very different from that shown in such earlier occasional verse as the nuptial poems of Spencer. The general term for this period, then, is perhaps *articulate*. The English lyrics of the eighteenth century—which group themselves about the odes and the *Elegy* of Gray—may perhaps be most comprehensively described as *conscious*. Amid considerable variety, they are apt at first to be sentimental, always to be deliberate, and, finally to show marked traces of the spirit which in our own time is called romantic. The English lyrics of the early nineteenth century—which group themselves about the verses of Wordsworth—exhibit romantic feeling to the full in the verses of Scott, of Byron, of Shelley, of Keats, of Coleridge. These very names, however, will have suggested other motives, too, far less evident in any of the earlier periods. The most notable of these are perhaps the profound sense of Nature so characteristic of Wordsworth, and a growing sense of philosophic insight which gives this period a far more valid claim to the term metaphysical than is possessed by the period so termed by Dr. Johnson. The best single name for the poetry in question, then, is perhaps the broadly general name, *philosophic*. To sum up, we have said that in four successive stages, English lyric poetry has been first spontaneous, then articulate, then conscious, finally philosophic.

In comparing the work of these four periods, one can hardly fail to remark a palpable, though hardly definable, difference between the earlier work, which we have called spontaneous, and the work which follows. The earlier work has a subtle quality of its own, more inevitably, essentially musical than any of the rest. A comparison of Elizabethan music with that of our own time, then, becomes very suggestive. In the sixteenth century musical art was not so developed as to drown in emotional sound the words which the singer uttered. In our time the art of music has reached such a stage that whoever would thoroughly appreciate verses that are sung must consider them again apart from their musical setting. The lyric poets of the sixteenth century, in short, were forced to make in their verses a great part of their own music. The lyric poets of the later periods have been forced, by the very growth of pure music about them, either consciously to adapt their work to the changed conditions of musical art, or consciously to write independently of musical considerations. In the earlier work, then, the quality we have called spontaneity is probably due to the fact that the older poets were called upon to express phases of emotion that in our own day have long been recognized as more properly subjects for musical composers. If this is true, it goes far to confirm the definition we have given of lyric poetry.

In modern English there are various conventional lyric forms—ballades, rondeaus, triolets, etc. There are only two, however, which have so fully developed, and which have lasted so long as to be surely permanent in our literature. These are the so-called Pindaric ode and the sonnet. Like the ballad and the hymn, however, the ode and the sonnet demand more specific discussion than is here possible.

BARRETT WENDELL.

Lys, lees: a river which rises in France, in the department of Pas-de-Calais, flows in a northeastern direction into Belgium, and joins the Scheldt at Ghent after a course of 125 miles, of which 45 have been changed into a canal.

Lysan'der (in Gr. *Λύσανδρος*): a Spartan general; received in 407 B. C. the command of the Spartan fleet, and defeated the Athenians off the promontory of Notium. His term of command having expired, he was replaced by Callicratidas, but Callicratidas was defeated in 406 B. C. in the battle of the Arginusæ; and as it was against the Spartan laws that the same person could hold an office twice, Aracus was nominally placed at the head of the fleet, while in reality Lysander held the command. His campaigns were very brilliant. He routed and captured the Athenian fleet at Ægospotami, and early in the next year (404 B. C.) took Athens, thus ending the Peloponnesian war. At this moment he was the most prominent man in Greece, but his arrogance and enormous ambition made it impossible for him to hold any office. When in 395 B. C. he was sent at the head of an army against the Bœotians, during which campaign he was killed while besieging Haliartus, it is said that he was deeply involved in a conspiracy for the subversion of the dynasty of the Heraclidæ in Sparta. It seems very probable that at the time of his death he was deeply implicated in various revolutionary schemes, but he had, nevertheless, committed no overt act. He was buried on the road from Delphi to Chæronea, and a monument was erected on his tomb. Revised by J. R. S. STERRETT.

Lys'ias: a Syrian nobleman of the blood-royal, whom King Antiochus Epiphanes, on setting out for Persia, appointed guardian of his son and regent of the kingdom, and as such he waged a formidable war with the Jews. His vast forces were defeated by Judas Maccabæus near Emmaus (B. C. 166); he was himself repulsed near Bethsura in the following year, but took that fortress B. C. 163, and laid siege to Jerusalem, but by an insurrection at Antioch was forced to treat with the Jews. Shortly afterward Lysias was put to death by the populace of Antioch, who had rebelled in favor of Demetrius Soter. Revised by J. R. S. STERRETT.

Lysias: one of the ten canonical Attic orators, model of the "plain style"; son of Cephalus, a wealthy Syracusan, who had settled in Athens. The year of his birth is a matter of dispute. The earliest date given is 459 B. C.; the latest advocated makes him only a little older than Isocrates (b. 436). He went in his youth to Thurii, where he studied rhetoric under Teisias. In consequence of the issue of the Athenian expedition to Sicily he returned to Athens in 412; but during the Reign of Terror (404–403) the thirty (see THIRTY TYRANTS), whose cupidity was stirred by the wealth of the heirs of Cephalus, put Polemarchus, the brother of Lysias, to death, and Lysias himself had a narrow escape to Megara. Lysias returned with the victorious democracy, and though not a full citizen had a privileged position, which qualified him to prosecute Eratosthenes, one of the thirty, as the murderer of his brother. D. not long after 380 B. C. With the exception of this speech against Eratosthenes and the show-pieces, all the extant speeches of Lysias were composed to be spoken by others, and the adaptation of each speech to the character and circumstances of the speaker is an important element in the study of his oratory. The excellence of Lysias lies in the simplicity, clearness, vividness, point of his narrative, in the keenness of his argument, and in the consummate art with which he wins the interest and sympathy of the jury by the subtle, self-delineation of the speakers, who however else they differ, are all

frank and candid souls. The authorship of the funeral oration attributed to Lysias is much disputed. If not his, it is a good sample of the other side of Lysias's profession, the making of show speeches for public occasions. There are editions by Reiske (1772), Bekker (1828), Baiter and Sauppe (1850), Cobet (1863) with an interesting critical preface, and Scheibe (in the Teubner Series); selections with German notes by Rauchenstein-Fuhr in the Haupt and Sauppe Series (Weidmann), and by Frohberger, and with English notes by Shuckburgh, American school editions by Whiton, Stevens, and Bristol. The English translation by Gillies is loose. See Blass, *Attische Beredsamkeit*, vol. i., 338–644 (2d ed.); Jebb, *Attic Orators*, vol. i., 142–312; Girard, *Études sur l'éloquence attique*, pp. 1–91.

B. L. GILDERSLEEVE.

Lysim'achus (in Gr. Λυσίμαχος): b. at Pella, Macedonia, about 360 B. C.; served as a general in the army of Alexander the Great, and received Thrace on the division of the empire at the death of Alexander in 323. In 306 he assumed the title of king, and having defeated Antiochus in the battle of Ipsus in 301, he united a large part of Asia Minor to his dominions. An expedition he undertook in 292 against the Getæ, N. of the Danube, was very unfortunate; he was taken prisoner with his whole army, and received his freedom only by giving his daughter in marriage to the king of the Getæ. After the murder of his son Agathocles, who was much loved, the population of Asia Minor rose in insurrection, and was supported by Seleucus, and in the battle of Corupedion (281) Lysimachus was defeated and killed. Revised by J. R. S. STERRETT.

Lysip'pus (in Gr. Λύσιππος): statuary; originally a coppersmith of Sicyon, who by his careful study of the human form and of the canon of Polyclitus became one of the most celebrated artists. His aim was to make his statues as beautiful as possible without detracting from their charm as portraits, and so he elaborated a new canon, according to which the figure became taller and more slender, while the head became smaller than was natural, and thereby added to the impression of height and slender proportions. He claimed to represent the human figure as it seemed to be to the eye, and not as it actually was. He attained great distinction by his statues of Zeus, Heracles, and Helios. In fact he created a new type of Heracles. He became especially celebrated for his statues of Alexander the Great, whom he represented in every conceivable way, beginning with his youth. Alexander would sit for but three artists: Lysippus (artist in bronze), Pyrgotiles (sculptor), and Apelles (painter). Lysippus worked only in bronze, in which he fashioned no less than 1,500 statues, all of which have perished, though we have an antique copy in marble of at least one of his works, the *Apoxyomenos* in the Vatican. The colossal Heracles of Lysippus was taken to Rome after the conquest of Tarentum, and stood for centuries on the Capitol, whence it was removed to adorn the Hippodrome of Constantinople. It was melted down in 1022 A. D. Other celebrated colossal statues of Lysippus were the statue of Helios in Rhodes, Zeus in Tarentum, Poseidon in Corinth, and Kairos (an allegory representing the Favorable Moment).

J. R. S. STERRETT.

Lyskander, KLAUS: historian; b. in Skaane, Denmark, 1557 or 1558. His *Danske Kongers Slægtebog* (Chronology of the Danish Kings, 1622), which attempts to trace the royal line back to Adam, is absolutely unreliable, but *De Scriptoribus Danicis*, the first attempt at a history of Danish literature, is still of great value. D. 1623. See H. F. Rördam, *Lyskanders Levned, etc.* (Copenhagen, 1868). D. K. D.

Ly'sons, DANIEL, F. R. S.: antiquary; b. at Rodmarton, Gloucestershire, England, Apr. 28, 1762; graduated M. A. at Oxford in 1785; took holy orders, and became curate of Putney about 1790, rector of Rodmarton 1804; published, under the patronage of Horace Walpole, *The Environs of London, being an Historical Account of the Towns, Villages, and Hamlets within Twelve Miles of that Capital* (5 vols., 1792–1800), and in conjunction with his brother Samuel, *Magna Britannia, being a Concise Topographical Account of the Several Counties of Great Britain* (6 vols., 4to, 1806–22), a colossal work, left unfinished, containing the counties in alphabetical order up to Derby inclusive. The materials collected for this vast enterprise are now deposited in the British Museum, forming sixty-four MS. volumes. D. at Rodmarton, Jan. 3, 1834.—His son, Maj.-Gen. Sir DANIEL LYSONS, C. B., b. 1816, a distinguished officer, became commander of the northern military district of Great Britain.

Lysons, SAMUEL, F. S. A.: antiquary; b. at Rodmarton, England, May 17, 1763; aided his brother Daniel in the preparation of the *Magna Britannia*, and published several splendid works on British antiquities, among which were *An Account of Roman Antiquities discovered at Woodchester* (1797, colombier folio), *Reliquiæ Britannico-Romanæ, containing Figures of Roman Antiquities discovered in Various parts of England* (1813–17, folio, with 156 colored plates), and *The History and Antiquities of Devonshire* (2 vols., 4to, 1822), in which he was aided by Dean Buckland, the Bishop of Cloyne, and other distinguished archæologists. He was called to the bar in 1798; became keeper of the records in the Tower 1803, and vice-president of the Society of Antiquaries 1812. D. in London, June 29, 1819.

Lyssa: See HYDROPHOBIA.

Lys'tra (in Gr. τὰ Λύστρα): an ancient city of Asia Minor; placed by Pliny in Galatia and by Ptolemy in Isauria, while in the Acts of the Apostles it is placed in Lycaonia. It belongs naturally either to Isauria or Lycaonia, whose confines varied greatly at different epochs. It was the native place of Timothy, the scene of Paul's miracle of healing a lame man, of the attempted worship of Paul and Barnabas as Jupiter and Mercury, and of the stoning of St. Paul (Acts xiv). The site of Lystra, which was placed by modern travelers at different localities, has been fixed definitely by the writer of this article at Zoldera, a short distance above the village of Khatün Serai. The site was identified by means of the following Latin inscription: *Divum Aug(ustum) Col(onia) Jul(ia) Felix Gemina Lustra consecravit d(ecreto) d(ecurionum)* on a pedestal upon which once stood a statue of the Emperor Augustus. The pedestal is still *in situ*, but the city has entirely disappeared. Lystra was turned into a colony by the Romans, who gave it the composite name seen in the Latin inscription quoted above, and on coins of Lystra, four of which are in existence. See Sterrett, *Wolfe Expedition to Asia Minor* (Boston, 1888), p. 142 ff.

J. R. S. STERRETT.

Lyte, ELIPHALET ORAM: See the Appendix.

Lyte, HENRY FRANCIS: hymn-writer; b. at Ednam, near Kelso, Scotland, June 1, 1793; was educated at Trinity College, Dublin; ordained in 1815, and appointed to the curacy of Lower Brixham, Devon, in 1823. D. at Nice, Nov. 20, 1847. He published *Tales Illustrative of the Lord's Prayer* (1826); *Poems, chiefly Religious* (1833); *Miscellaneous Poems* (1868), etc., and wrote many popular hymns, among them, "Abide with me; fast falls the eventide," etc.

Lyt'telton, EDWARD, D. C. L., Baron: jurist; b. at Mounslow, Shropshire, England, in 1589; graduated at Oxford 1609; became chief justice of North Wales 1621; entered Parliament 1626; recorder of London 1631; solicitor-general and knight 1634; chief justice of common pleas 1640; lord keeper of the great seal 1641; raised to the peerage Feb. 18, 1641; escaped with the great seal to Charles I. at York May, 1642; required by Parliament to return it or lose his place 1643; first commissioner of the treasury Mar., 1644; commissioned to raise a regiment of foot-soldiers May, 1644. D. at Oxford, Aug. 27, 1645.

Lyttelton, GEORGE, First Baron: statesman and man of letters; son of Sir Thomas Lyttelton, Bart.; b. at Hagley, Worcestershire, England, Jan. 17, 1709; was educated at Eton and at Christ Church, Oxford; traveled in France and Italy; entered Parliament in 1735; joined the young "Patriots," who eventually drove Walpole from power, and soon figured by the side of Pitt and Pulteney among the most formidable opponents of the ministry; took part in most of the debates, exhibiting great fluency of speech and elegance of expression; wrote *Letters from a Persian in England to his friend at Ispahan* (1735–36), an imitation of Montesquieu, which had an immediate success; became secretary to Frederick, Prince of Wales, when that prince formed his little court as head of the opposition; was intimate with Pope and his literary school, and proved himself the official patron and private benefactor of Thomson, Fielding, and Mallet; married, in 1741, Lucy, sister of Lord Fortescue, and on the fall of Sir Robert Walpole in 1744 became one of the lords of the treasury. He is said to have been a skeptic in early manhood, and in 1747 produced his celebrated *Observations on the Conversion and Apostleship of St. Paul*, which was considered a masterly treatise upon the evidences of Christianity, and as such has been frequently reprinted. The death of his wife, to whom he was tenderly attached, in the preceding year, gave occasion

to his pathetic *Monody to the Memory of a Lady lately Deceased* (folio, 1747), considered the best of his poetic efforts. On the death of his father in 1751 he succeeded to the baronetcy and to the vast family estates, when he gave free scope to his artistic tastes, and made Hagley one of the most beautiful seats in England. He became successively cofferer of the king's household, privy councilor, and Chancellor of the Exchequer (1755); in 1756 gave up the office of Chancellor and was raised to the peerage with the title of Baron Lyttelton of Frankley. In 1760 he published his *Dialogues of the Dead*, and in 1764–67 his *History of Henry II.* (4 vols.), a work upon which he had been engaged more than twenty years, and which was highly commended for accuracy and research, but is now forgotten. D. Aug. 22, 1773. His *Miscellaneous Works* (2 vols.) appeared in 1774, and his *Poetical Works* in 1785. See also *Memoirs and Correspondence of Lord Lyttelton* (1845).

Lyttelton, Thomas, Lord: son of George, the first Baron Lyttelton; b. in 1744; exhibited extraordinary precocity in youth; at the age of sixteen was regarded almost as a prodigy by several of the ablest writers and most erudite scholars in England; became dissipated and dissolute in his habits; lost the favor of his father; an alienation between them ensued; his marriage proved to be unhappy, and a separation followed. He was returned to the House of Commons in 1768; lost his seat on a contest early in Jan., 1769, and on the death of his father in 1773 took his seat in the House of Lords. While in the House of Commons, as well as in the House of Lords, he was greatly distinguished for vigor of thought, elegance of language, and for the force and power of his speeches. His style, tone of political sentiments, and other points of coincidence have led to the hypothesis, entertained by many, that he was the author of the *Letters of Junius*. A strong article sustaining this view was published in the London *Quarterly* for Dec., 1851. A very important fact, however, in support of the hypothesis was not presented with its due force in that article. It was that during the life of Lord Lyttelton he was voted out of his seat in the Commons by the Tory administration early in Jan., 1769, and just before the appearance of Junius's first letter to *The Public Advertiser*. D. in 1779.

Revised by C. K. Adams.

Lyttleton, Thomas: See Littelton, Thomas.

Lytton, Edward George Earle Lytton Bulwer, First Baron: See Bulwer.

Lytton, Edward Robert Bulwer-Lytton, Earl: poet and statesman; eldest son of the eminent novelist; b. in England, Nov. 8, 1831; was educated first at Harrow, then under private tutors, and afterward at Bonn, Germany, where he devoted himself especially to modern languages; entered the diplomatic service in 1849 as *attaché* and private secretary to his uncle, Sir Henry Bulwer, minister at Washington; was transferred in the same capacity to Florence in 1852, and to Paris in 1854. As paid *attaché* he was sent to The Hague in 1856, to St. Petersburg in 1858, to Constantinople in the same year, and to Vienna in 1859. He was acting consul-general at Belgrade in 1860, and was employed on a special confidential mission for preventing the renewal of hostilities between the Turks and the Servians (1862). He was in the same year made second secretary of legation, and in Jan., 1863, was sent to Constantinople as first secretary; was *chargé d'affaires* for brief intervals in 1863 and 1864; secretary of legation at Athens in 1864, and at Lisbon in 1865, where he was *chargé d'affaires* several times, and at Madrid in 1868; became secretary of embassy at Vienna in the same year; at Paris in 1872, where he acted twice in 1873 as *chargé d'affaires*; received the appointment of ambassador at Lisbon in Dec., 1874; in May, 1875, declined the governorship of Madras, and was Viceroy of India 1876–80. He married in 1864 a niece of the Earl of Clarendon, succeeded to his title as Baron Lytton on the death of his father Jan. 18, 1873, and was promoted to an earldom on his return from India. His first appearance as an author was under the pseudonym of *Owen Meredith* with *Clytemnestra and other Poems* (1855). *The Wanderer, a Collection of Poems in Many Lands* (1859), and *Lucile* (1860), a novel in elegant verse, established his reputation as a popular poet. In 1861 he published anonymously *Tannhäuser, or the Battle of the Bards*, in collaboration with an intimate friend, whose biography he wrote in 1871 under the title *Julian Fane, a Memoir*. In 1861 he issued *Serbski Pesme*, a translation of the national songs of Servia; in 1863 a prose romance, *The Ring of Amasis* (rewritten 1886); in 1868 *Chronicles and Characters*; in 1869 *Orval, or the Fool of Time*, a dramatic poem paraphrased from the Polish, with imitations of authors in several other languages; in 1874 *Fables in Song* (2 vols.) and *Speeches of Edward, Lord Lytton, with some of his Political Writings hitherto Unpublished, and a Prefatory Memoir*; in 1883 *Life, Letters, and Literary Remains of Edward Bulwer, Lord Lytton*; in 1885 *Glenaveril* (2 vols.); in 1887 *After Paradise, or Legends of Exile*. In 1867 a collected edition of the *Poetical Works of Owen Meredith* appeared. Without attaining the mark of creative genius, all the poems of Lord Lytton are fluently and elegantly written. He became British ambassador at Paris in 1887. D. in Paris, Nov. 24, 1891.

Revised by H. A. Beers.

M

: the thirteenth letter of the English alphabet.

Form.—The form is derived through the Latin alphabet from the Greek, where it was M or ⋀⋀, retrograde ⋁⋁, the last being essentially the Phœnician form. With the discontinuance of the use of the sibilant *sam* M and the general adoption of *sigma* Σ in its place, the fifth stroke of ⋀⋀ was omitted as no longer necessary for discrimination.

Name.—The Greek name *mū* (also *mō*), following the analogy of the next name, *nū*, replaced the inherited Phœnician name *mēm*, water, which expressed probably the supposed resemblance of the letter to the ripples of water. The English name *em* comes through Old French from the Latin name *em*; cf. *el*, *en*, *er*, *es*.

Sound.—It denotes a labial nasal, the voiced breath being diverted through the nasal cavity by closing the lips. It is, however, often pronounced as labio-dental before *f*, as in *symphony*, *nymph*. It is written double in the middle of a word after a short vowel, *summer*, *hammer*.

Source.—The sound has been a peculiarly permanent one, and in general represents in genuine English words a Teutonic and Indo-European *m*; thus *mother*: Lat. *māter*: Skr. *mātar-*; *smile*: Skr. √ *smi-*; *mm* may represent *fm* as in *women*, earlier spelling like present pronunciation *wimmen* < O Eng. *wīfmenn*, *Lammas* < *hlāfmæsse*; *mp* may represent an *-np*, as in *hemp* < O. Eng. *hœnep*. The *m* often develops an excrescent *b* before liquids, as in *gamble*, *timber*, *embers*.

Value as Symbol.—M represents in Roman notation 1,000. In Latin M. = Marcus, M'. = Manius. In French M. = Monsieur. Also M. A. or A. M., Master of Arts; A. M. *ante meridiem*, forenoon; M. C., member of Congress; M. P., member of Parliament; M. E., Methodist Episcopal. See Abbreviations.

Benj. Ide Wheeler.

Maa: Egyptian deity. See Mat.

Maartens, Maarten: pseudonym of J. van der Poorten-Schwartz (*q. v.*).

Maas: See Meuse.

Maas, Hermann, M. D.: surgeon; b. in Stargard, Pomerania, Jan. 3, 1842; entered the University of Greifswald in 1861 and of Breslau in 1863, graduating from the latter in 1865; from 1866 to 1868 was assistant in Middledorpf's surgical clinic in Breslau; in 1869 was appointed docent in surgery: in 1876 was appointed Professor Extraordinary of Surgery in Breslau University; in 1877 became Professor of Surgery in the University of Freiburg; in 1883 succeeded von Bergmann as Professor of Surgery in the University of Würzburg. Among his publications are *Kriegschirurgische Beiträge aus dem Jahre 1866* (Breslau, 1870); *Mittheilungen aus der chirurgischen Klinik in Freiburg*; and he was the author of the section entitled *Die Krankheiten der Harn- und Geschlechtsorgane* in Koenig's *Chirurgie*. D. July 23, 1886.

Maas, Joseph: See the Appendix.

Maas, Louis: See the Appendix.

Mabie, Hamilton Wright: See the Appendix.

Mabillon', Jean: b. at St.-Pierremont, in Champagne, France, Nov. 23, 1632; educated at the theological seminary of Rheims, and entered in 1653 the order of the Benedictines. D. in Paris, Dec. 27, 1707. His collections and editions of historical documents, *Vetera Analecta* (4 vols., 1675–85) and *Musæum Italicum* (2 vols., 1787–89), gathered in Germany and Italy, and based on critical researches, are very valuable; and his *De Re Diplomatica* (1681), in which he set forth and defended his method, and which was violently attacked by the Jesuits, exercised a wholesome influence on the study of history. He also wrote *Acta Sanctorum Ordinis S. Benedicti* (9 vols., 1668–1702) and *Annales Ordinis S. Benedicti* (6 vols., 1703–39).

Mabinogion: the name commonly but inaccurately given to all mediæval Welsh tales or fairy-stories. This use of the word has been general ever since Lady Charlotte Guest published under this title her translation of the tales in the famous manuscript of Jesus College, Oxford, known as the *Red Book of Hergest* (*The Mabinogion from the Llyfr Coch o Hergest, etc.*, 7 parts, 1838–49, containing both text and translation; reprint with translation only, London, 1877). The word has even been adopted into modern Welsh in this sense. More accurately, however, *mabinogion* signifies not tales for children, but the body of knowledge imparted by a professional bard to his *mabinog*, or apprentice. Etymologically, it is either the plural of *mabinog*, meaning "pupils of bards" and "things concerning such pupils," or it serves as a plural for the abstract noun *mabinogi*, signifying "condition of pupilage" or "matters reserved for pupils." According to Welsh usage, each professional bard must take three of these apprentices and train them in all the essentials of the bardic art. When the *mabinog* had so mastered these essentials as to be able to conquer in three public competitions, he became a bard and could take pupils in his turn. Apparently there were certain special themes reserved for the use of such pupils, who probably had the privilege of reciting them at a price fixed by law or custom. In the *Red Book of Hergest*, which is a kind of *corpus* of later bardic material, only four of the tales are really *mabinogion*, as the manuscript itself clearly points out, calling each of them a "branch of the *mabinogi*." These tales are *Pwyll, Prince of Dyved*; *Branwen, Daughter of Llyr*; *Manawydan, Son of Llyr*; and *Math, Son of Mathonwy*. The remaining tales have no title to the name *mabinogion*, nor are they indeed even all Welsh in their origin. The manuscript was written in the latter part of the fourteenth century, when the Welsh poets had come to borrow extensively from the French, and accordingly many of the themes are of French and even indirectly of Oriental origin. This is an extremely important fact for those who have to use the so-called *Mabinogion* for the elucidation of the intricate and difficult Arthurian cycle. Besides Lady Guest's edition, we have the fine diplomatic edition of the text of the *Mabinogion*, by John Rhŷs and J. G. Evans (2 vols., Oxford, 1887–90). A more complete and reliable translation than hers is the French one of J. Loth (2 vols., Paris, 1889, being vols. iii. and iv. of the *Cours de littérature celtique* of d'Arbois de Jubainville and Loth). See also John Rhŷs, *Studies in the Arthurian Legend* (Oxford, 1891); A. Nutt, *Studies on the Legend of the Holy Grail* (London, 1888), with the review by H. Zimmer in *Göttingische gelehrte Anzeigen* (1890, p. 488); G. Paris, *Histoire littéraire de la France* (vol. xxx., 1888, with the review by H. Zimmer in *Gött. gel. Anz.*, 1890, p. 785, *seq.*). A good but not entirely complete bibliography of other works on the subject is given by H. O. Sommer in his edition of Sir Thomas Malory's *Morte d'Arthur* (vol. iii., pp. 4–5, London, 1891).

A. R. Marsh.

Mably, mȧȧ'blee', Gabriel Bonnot, de: author; a brother of Condillac; b. at Grenoble, France, Mar. 14, 1709; was educated in the college of the Jesuits at Lyons; served for some time as secretary to his relative, the minister-cardinal Teucin, but gave up this position, and lived afterward in retirement, solely occupied with literary pursuits. D. in Paris, Apr. 23, 1785. He was an enthusiastic admirer of the ancient republics of Greece and Rome, as is shown by his works, *Observations sur l'Histoire de la Grèce* (1766) and *Observations sur les Romains* (1751), but his understanding of their social and moral order was incomplete, and the conclusions he arrived at with respect to modern societies in his *Parallèle des Romains et des Français* (1740) were very erroneous and superficial. He enjoyed a great reputation, however, with his contemporaries, and he was invited by the Polish Diet to prepare a code of laws for Poland. *Du Gouvernement de Pologne* (1781) embodied the results of his study of the subject, and *Observations sur le Gouvernement et les Lois des États-Unis d'Amérique* (1784) summarized his views relative to self-government in the U. S. The singular, often ludicrous, enthusiasm for antique ideas and forms which prevailed during the Revolution was largely due to him, and later philosophers have generally agreed in tracing

the rudimentary ideas of modern communism in his *Entretiens de Phocion* (1763), *De la Législation* (1776), and *Principes de Morale* (1784).

Macabre: See DANCE OF DEATH.

Macad'am, JOHN LOUDON: inventor of the system of road-making called macadamizing; b. at Ayr, Scotland, Sept. 21, 1756; went to New York in 1770 to reside with an uncle; during the Revolution was a loyalist: made a considerable fortune as agent for the sale of vessels brought into port as prizes, but lost most of it by his forced withdrawal at the peace of 1783; returned to Ayrshire, Scotland; became a magistrate and deputy lord-lieutenant of the county, and a trustee of roads. He was engaged for much of the time during many years in traveling at his own expense through Great Britain to examine the condition of the roads, addressing in 1811 a memorial on the subject to the House of Commons, which led to the adoption of his system and to his own appointment as surveyor of roads in the Bristol district, where in 1816 he began to improve the highways. Within a few years he had personally supervised the road-making in twenty-eight counties of England. No patent was solicited for his system, which consists in the application of a layer of broken stones to the center of the road, and no remuneration asked beyond the payment of the expenses of his personal supervision; he refused knighthood, on account of his age, but accepted £2,000 voted him by Parliament. D. Nov. 26, 1836. He wrote *A Practical Essay on the Scientific Repair and Preservation of Public Roads* (1819); *Remarks on the Present State of Road-making* (1820); and *Observations on Roads* (1822).

McAdoo, WILLIAM GIBBS: See the Appendix.

McAll, ROBERT WHITAKER: founder of the McAll Mission; b. in Macclesfield, England, Dec. 17, 1821; son of a Congregational minister; took his B. A. degree at London University in 1847, and was for twenty-three years pastor of Congregational churches in England (at Manchester, Birmingham, and elsewhere). While visiting Paris after the downfall of the Commune, in Aug., 1871, he was assured by a workingman that the common people of France were ready to hear a gospel of true belief, and, with his wife, decided to undertake a mission to this people. With the approval of prominent Protestant pastors, they began their labors on Jan. 21, 1872, in a small shop in an obscure street in Belleville, the communistic quarter of Paris, and devoted their energies to the work, without compensation, until Mr. McAll's death, May 11, 1893. Mr. McAll was an accomplished musical critic, and in collaboration with his wife he gave to the French Protestant Church a hymn-book of great value. A few years after the founding of the mission the French Society for the Promotion of Education and the Society for the Encouragement of Well-doing bestowed gold medals upon Dr. McAll, and in 1892 the French Government conferred upon him the cross of the Legion of Honor. Mr. McAll was a skilled botanist, and was for years a member of the Linnean Society.

The mission now (1894) has 119 halls—39 in Paris and its suburbs and 80 in the departments, Corsica, and Algiers—and a mission-boat which plies on the inland waterways of France. The work is carried on in small halls, where fundamental religious instruction is given, highly evangelical in character and strictly undenominational, with the addition of dispensaries, soldiers' reading-rooms, and industrial schools. Volunteer workers are largely employed, the thorough yet flexible organization making this practicable to a high degree. Five-sixths of these workers are French; the rest are from Great Britain, the U. S., and other countries. Twenty-two of the mission stations are carried on in connection with some one of the five great missionary societies of France. The mission founds no churches and administers no sacraments, but sends its converts to strengthen the neighboring churches of their own choice. Except for a brief period in Corsica, the Roman Catholics have never been hostile to the movement; indeed, in several instances Roman Catholics have provided halls or contributed money toward the support of stations. The prefect of the Seine and mayors of provincial towns welcome the opening of new halls, as experience has proved that where there is a McAll station fewer police are required. The mission is managed by a board of directors—French, English, and American—sitting in Paris. The office of honorary president is now held by Louis Sautter, a banker, and the executive head is the Rev. Charles E. Greig. The expenses of the mission are met exclusively by voluntary contributions. In 1883 the American McAll Association was founded for the collection of funds. It now has about sixty auxiliaries, and sends to France about $50,000 annually.

LITERATURE.—A quarterly journal, *The McAll Mission*, is published in Paris, and *The American McAll Quarterly* in Philadelphia. Also see *The White Fields of France*, by Rev. Horatius Bonar; *Among the French Folk*, by Miss E. H. Moggridge: *The McAll Mission and its Workers*; and *The Cruise of the Mystery in McAll Mission Work*, by Mrs. L. S. Houghton. LOUISE SEYMOUR HOUGHTON.

McAlpine, WILLIAM JARVIS: engineer; b. in New York city in 1812; received his education in New York, and began engineering in 1827 under John B. Jervis, with whom he remained until 1839, having been employed upon the Delaware and Hudson Canal and Railroad, and upon the State canals and other hydraulic works planned and constructed by that engineer, and incidentally on the St. Lawrence canals, under Benjamin Wright. He succeeded Mr. Jervis as engineer of the Erie Canal enlargement, continuing until 1846, when he was called upon to construct the dry-dock at the Brooklyn Navy-yard; in 1851 was elected State engineer of New York; in 1855–57 was railroad commissioner of the State, and made a valuable report on the principles and practice of railway construction and management; for two years was acting president and engineer of the Erie Railway, and later engineer of the Galena and Chicago and of the Ohio and Mississippi railways; constructed the Albany and Chicago water-works, and planned those for Brooklyn, New Bedford, and other cities; in 1870 presented plans for the improvement of the cataracts of the Danube ("the Iron Gates"), which were adopted by the Austrian Government. In 1873–74 he was superintendent of the new State Capitol of New York at Albany. During 1869 he was the president of the American Society of Civil Engineers. In 1879–80, as engineer of the department of parks, he constructed the Riverside drive in New York and made plans for the Washington bridge at 181st Street. D. at New Brighton, Staten Island, Feb. 16, 1890.

Macao, maa'kow' (known to the Chinese as Ngao-mŭn): a Portuguese settlement and port on the south coast of China; 40 miles W. of Hongkong, and situated like it in the estuary of the Chukiang or Pearl river; area, 4½ sq. miles; lat. 22° 11′ N., lon. 113° 33′ E. (see map of China, ref. 8–I). It occupies a tongue of land which was formerly an island, but is now connected on the north with the island of Hiangshan by a narrow sand-spit, across which a barrier has been built by the Chinese. The town, which is defended by several forts, occupies an irregular table-land which connects several low hills (200 to 300 feet in height) on the extreme south with other low hills of similar height on the north and northeast. Pop. about 68,000. The settlement dates from 1557, when certain Portuguese merchants who had established themselves at Lampaco received permission from the Chinese Government to remove to *A-ma-ngao*, the port of the goddess Ama, as the place was then called. It is conveniently situated for trade, and down to the cession of Hongkong to the British in 1842, and the opening of the treaty-ports, it enjoyed a monopoly of the European trade with China. Its trade, which is now insignificant, is mostly with Hongkong and is chiefly in the hands of the Chinese and Parsees.

Macao has never been a possession of Portugal, though many attempts have been made to have it recognized as such. Until 1886 an annual ground-rent of 500 taels was paid to the Chinese Government. In 1846 the custom-house which the Portuguese had established was abolished, and three years later the Chinese custom-house was forcibly closed and the Chinese mandarin expelled. Since that date the settlement has been governed exclusively by Portuguese officials. Its chief source of revenue is a tax on the gambling-tables for which it is noted. Until 1873 it was the central dépôt for the coolie traffic.

Camoëns resided in Macao for eighteen months, and a grotto is pointed out where he is said to have composed part of the *Lusiad*. Here also is the tomb of Robert Morrison, the first Protestant missionary to China. R. LILLEY.

Macaque, ma-kăk': a common name for various Old World monkeys of the genus *Macacus*, characterized by a projecting muzzle, cheek-pouches, and large ischial callosities. In some macaques the tail is longer than the body, but in many it is very short, while in the Barbary ape, *Inuus ecaudatus*, it is entirely wanting. This species is a native of Africa, but a few are found on the Rock of Gibraltar, being

the only monkeys found wild in Europe. These apes, which probably were introduced by the Moors, were, about 1860, reduced to three, when others were brought over from Africa. In 1893 the colony numbered sixty. All other macaques are found in Asia or the adjacent islands. The most northern monkeys belong to this group, and the Tibet and Japanese macaques (*M. tibetianus* and *M. speciosus*) gambol about in the snow, the odd effect being heightened by the animals' bright red faces. About thirty species have been recognized, but some authorities place certain species under other genera, such as *Inuus*, *Cynopithecus*, and *Theropithecus*. F. A. L.

Macareo River: See the Appendix.

Macaro'ni [Ital. *maccare*, to bruise or crush], **Vermicel'li**, Ital. pron. vãr-mēe-chel'lēe [Ital., liter., little worms], **Fedelini**, and **Italian Paste**: articles of food made from very white and glutinous varieties of wheat, such as are grown in Russia, Italy, and California. The wheat is ground by a peculiar process, being first wet and then heated. The flour resulting is very coarse. It is mixed with warm water and carefully worked into a uniform paste. This paste is forced by a press through holes in an iron plate. If the holes are very small, *vermicelli* is thus formed. A still finer and smaller sort is *fedelini*. Large pipe-shaped cylinders of this paste constitute *macaroni*. When the paste is rolled thin and cut into various shapes, *Italian paste* is the result. After molding the macaroni is partially baked. Italy is the principal seat of this manufacture. France and England produce a considerable quantity, and a few firms in the U. S. produce an article equal to any of the imported kinds.

Macaron'ic Verse [for etymology of *macaronic*, cf. Fr. *macaronique* and Ital. *maccheronico*, liter., pertaining to macaroni (orig. a mixed dish), hence mixed, confused, medley. Cf. *macaroni* in sense of a medley]: a kind of humorous verse in which Latin and Latinized words are mixed with the vernacular. This kind of literature is very old, but apparently the name was first used in its present sense by Teofilo Folengo (1491–1544), called Merlino Coccajo, a Benedictine, who published in 1521 a satiric poem entitled *Maccaronea*, republished as *Opus Macaronicum* in 1651. See Delepierre, *Macaroneana* (1852); *De la Littérature Macaronique* (1856); and Morgan's *Macaronic Poetry* (New York, 1872).

McArthur, Duncan: frontiersman and soldier; b. in Dutchess co., N. Y., June 14, 1772; removed in childhood to Western Pennsylvania; was a volunteer in Harmar's and the succeeding Indian campaigns in Kentucky and Ohio from 1790 until Wayne's victory (1794), after which he settled near Chillicothe, O., as a surveyor; acquired large property in land; was chosen to the Legislature 1805, became major-general of militia 1808, colonel of Ohio volunteers May 7, 1812; was second in command at Hull's surrender; made brigadier-general in the U. S. army Mar. 12, 1813; was second in command of the Army of the West under Gen. Harrison, whom he succeeded in 1814, when he projected and partially executed a plan for the conquest of Upper Canada; was joint commissioner with Gen. Cass to treat with the Ohio Indians for the sale of their lands within the State 1816–17; served in the Legislature 1815–21, was Speaker 1818; member of Congress 1823–27, and Governor of Ohio 1830–32. D. near Chillicothe, Apr. 28, 1839.

MacArthur, Robert Stuart, D. D.: clergyman, editor, and author; b. at Dalesville, P. Q., Canada, July 31, 1841; was educated at the Canadian Literary Institute, Woodstock, Ontario, at the University of Rochester, and at Rochester Theological Seminary. In 1870 he was chosen pastor of Calvary Baptist church, New York city. Dr. MacArthur also is connected editorially with *The Christian Inquirer* and *The Baptist Quarterly Review*. In 1890 he published a volume of sermons entitled *The Calvary Pulpit*. In connection with Rev. Charles S. Robinson, D. D., he edited the *Calvary Selection of Spiritual Songs* (1878) and *Laudes Domini* (1891). With Miss Kate S. Chittenden he edited *The Calvary Hymnal* (1891). W. H. Whitsitt.

Macartney, George Macartney, First Earl of: statesman; b. at Lissanoure, near Belfast, Ireland, May 14, 1737; educated at Trinity College, Dublin, and graduated 1757; studied law at the Middle Temple, London; was appointed envoy to Russia in 1764; sat in the English Parliament, and in 1769 became chief secretary to the Viceroy of Ireland, where he took a prominent part in the debates of the Irish Parliament for the ensuing period. He wrote *A Sketch of the Political History of Ireland* (1773). He was governor of Grenada from 1775 to 1779, but in the latter year was forced to surrender the island to d'Estaing and was himself carried as prisoner of war to France. Securing his release, he was appointed political resident at Madras 1780; governor of that province June 21, 1781, and afterward, on account of his distinguished services, promoted to the office of governor-general, an honor which ill-health forced him to decline. He returned to England in 1786. A few years later he was selected as first British ambassador to China; sailed from Portsmouth with a brilliant suite Dec. 26, 1792; was received by the Emperor of China, Sept. 14, 1793, and opened negotiations at Peking for a commercial treaty, demanding the right to establish factories at Peking and three other cities, free trade between Macao and Canton, and a fortified post in the latter port. Offended at the pressure put upon him, or perhaps (according to French authorities) acceding to the advice of the Jesuit missionaries, the emperor suddenly broke off the conferences and ordered the British embassy to leave the capital within forty-eight hours. After experiencing some dangers the embassy reached Portsmouth Sept. 26, 1794. Lord Macartney was made an earl in the Irish peerage Mar., 1794; was sent as minister to Italy 1795; became a baron of the United Kingdom 1796; went as first British governor to the Cape of Good Hope 1797; returned in feeble health 1798, and lived thenceforth in retirement until his death at Chiswick, Surrey, May 31, 1806. An official account of Earl Macartney's embassy to China was published by Sir George L. Staunton, his secretary (2 vols., 1797), and was of great value in diffusing more exact information upon the history, political and natural, and the social condition of the Chinese empire. Macartney's *Journal of the Embassy* and a selection of his other writings was edited by Sir John Barrow, with a memoir (2 vols., 1807). C. K. Adams.

Macartney Pheasant: See Pheasant.

Macas'sar: town of Celebes; on the southern shore of the island; on the Strait of Macassar; in lat. 5° 7′ S. and lon. 119° 24′ E. (see map of East Indies, ref. 8–G). It is the capital not only of the government of Macassar, but of all the Dutch possessions in Celebes and of many neighboring islands. Next to Batavia it is the most important Dutch center in the East Indies. The residence of the governor is surrounded by walls and ditches, and defended by Fort Rotterdam. Its harbor is spacious and safe, and its trade, especially in tortoise-shell, edible nests, ebony, sandal-wood, rice, and spices, is large. The native inhabitants of the town and government of Macassar are Mohammedans, and are considered the most gifted and civilized tribe of the Malayan race. They carry on agriculture, commerce, and ship-building with success. Pop. of town, 15,000 to 20,000.

Macassar, Strait of: a passage of water separating Borneo from Celebes, varying in breadth from 50 to 150 miles. Its navigation is difficult on account of shoals and rocks.

Macaulay, Sir James Buchanan: jurist; b. in Niagara, Ontario, Dec. 3, 1793; was educated at Cornwall, Ontario, and joining the Ninety-eighth Regiment as an ensign fought during the war of 1812. He was admitted to the bar in 1822; was an executive councilor during the administration of Sir Peregrine Maitland; became judge of the court of queen's bench in 1829; was chief justice of the court of common pleas 1849–56, and shortly before his death, which occurred in Toronto, Nov. 26, 1859, was appointed judge of the court of error and appeal. The statutes of Upper Canada were consolidated in 1858 under his supervision and largely by his aid. He was knighted in 1859.

Neil Macdonald.

Macaulay, Thomas Babington, Baron Macaulay of Rothley: historian; b. at Rothley Temple, Leicestershire, England, Oct. 25, 1800; son of Zachary Macaulay, eminent as a philanthropist, and grandson of the Rev. John Macaulay, a Presbyterian minister at Inverary in the Scotch Highlands. The family was originally from the island of Lewis, Outer Hebrides. The mother of Lord Macaulay was Selina Mills, daughter of a bookseller at Bristol, of Quaker descent. His early education was of an austere religious type, but this influence was modified by frequent visits to the celebrated authoress, Hannah More, who took great interest in the precocious boy, of whose early traits of character and literary tastes she gave valuable notices in her *Letters to Zachary Macaulay* (published in 1860). At the age of twelve years he was placed under the tutorship of a Mr. Preston at Shelford, made surprisingly rapid progress in the classics,

and in 1818 entered Trinity College, Cambridge, where he gained the chancellor's medal in 1819 for a poem on *Pompeii*, and again in 1820 for a poem on *Evening*; took the second Craven scholarship in 1821, and bore off the palm at the Union Debating Society from many brilliant competitors, among whom were his intimate friends, W. M. Praed and Nelson Coleridge. Having a distaste for mathematics, he did not compete for honors in scholarship, but the extent and variety of his classical and literary reading while at college was probably never surpassed by any undergraduate. He took his bachelor's degree in 1822, was chosen to a fellowship the same year, and passed his time until 1826 alternately at London and Cambridge, engaged in adding to his stores of miscellaneous information. His *début* as a writer was made in the columns of *The Quarterly Magazine*, published by Charles Knight, and edited by his college friends Praed and Coleridge, to which he contributed his fine poems *Ivry* and *The Spanish Armada* and several prose articles (1824); but his brilliant essay on *Milton*, published in *The Edinburgh Review* for Aug., 1825, first revealed him to the world as an aspirant for the highest honors in the modern science of criticism. For twenty years thereafter he was a constant writer for the *Review*, chiefly upon subjects involving a wide range of historical knowledge, as well as an almost unexampled mastery of ancient and modern literature, and his essays were soon regarded as the leading feature of a periodical which counted many celebrated names among its contributors. Macaulay took his master's degree in 1825; was called to the bar at Lincoln's Inn Feb., 1826, but seems never to have practiced law, and soon devoted all his splendid energy to the service of the Whig party, to whose doctrines he adhered with a fervent conviction which quickly advanced him to a place in its councils. In 1828 he was appointed by the Whig government a commissioner of bankruptcy, and in 1830 Lord Lansdowne procured his election to Parliament from the pocket borough of Calne. His first public appearance as an orator had been made in 1826, at the annual meeting of the Anti-Slavery Society; his first speech in Parliament was in favor of the repeal of the civil disabilities of Jews (Apr. 5, 1830), and his second against slavery in the West Indies (Dec. 13). In the great debates on the Reform Bill Macaulay took a prominent part, making eight speeches on the subject, and in the election to the reformed Parliament was returned for the town of Leeds. As a parliamentary orator he took high rank for real eloquence and for the exhaustive manner in which he treated his subjects, though his delivery was too rapid and monotonous to produce upon the audience the full argumentative effect of his speeches, which was better understood when they appeared in print. In 1833 he was appointed secretary to the board of control, but in 1834 resigned that office and his seat in Parliament to accept the post of legal member of the supreme council of India. One of his letters gives an interesting account of the motives which led to the acceptance of this position. He states that it is impossible to be independent as a member of Parliament so long as one is indebted to personal favor for position. He had not an independent fortune. The position offered was accompanied with a salary of £10,000. As a bachelor he believed he could live in India on £5,000 a year, and by remaining five years accumulate a competence of £25,000. His object was attained sooner than he had anticipated, and consequently he remained at Calcutta only three years. While there he was chiefly engaged in the preparation of a new penal code, which embodied the most liberal principles. It established in many respects an equality of rights between natives and Europeans, and was therefore unpopular with the latter. This code was published in 1838, but never put in operation, though later many of its features were adopted with good results. During his residence at Calcutta he continued the main line of his historical studies, writing several of his most brilliant essays upon European topics, his only Oriental essays, those on Lord Clive and Warren Hastings, not having been written until some years afterward. Returning from India in 1838, he was elected to Parliament from Edinburgh, and was Secretary of War in the Melbourne ministry, with a seat in the cabinet (1839–41), taking, as before, a prominent part in the parliamentary debates, but finding leisure to write his *Lays of Ancient Rome* (1842). An imperfect collection of his essays having been printed in the U. S., where they attained an enormous circulation, he issued an authorized edition in 1843, and thenceforth directed his studies to the higher task of a history of his native country. He was an active member of the opposition during the five years of Tory supremacy (1841–46), and on the return of the Whigs to power (1846) received the lucrative post of paymaster of the forces, but having incurred the disfavor of his Edinburgh constituency by his course in support of the Maynooth grant, he was defeated at the election of 1847, and thus found himself at leisure to give definite form to his long-projected *History of England*. Two volumes appeared in 1848, and were immediately sold by scores of thousands, both in England and the U. S., and hailed as the great work of the age. The third and fourth volumes did not appear until 1855, when they had an equal success. In 1849 Macaulay was chosen lord rector of the University of Glasgow, and announced his retirement from political life, but was returned to Parliament in 1852 by his former constituency of Edinburgh. Owing to feeble health he took no part in debate. In 1857 he was made a peer of the realm under the title of Baron Macaulay of Rothley, and in the same year was chosen a foreign associate member of the French Academy of Moral and Politica Sciences. He died at his residence, Holly Lodge, Kensington, Dec. 28, 1859, and was buried in Westminster Abbey. As he was never married, the title expired with him. A posthumous volume of his *History* brought it down to the death of William III., but the great work was destined to remain a mere fragment of that originally projected, which was to have included the reign of George III. A collection of Lord Macaulay's *Speeches* first appeared in the U. S. in 1853, and an authorized edition followed in 1854. Biographies of Dr. Johnson, Atterbury, Bunyan, and Goldsmith, contributed to the eighth edition of the *Encyclopædia Britannica* (1857–58), were among the latest productions of Macaulay's pen. His characteristics as a historian are well known, and his interesting volumes will remain one of the English classics; but the view of English history which they present will require constant correction by the perusal of annalists of humbler name, less governed by partisan interests. The mind of this brilliant essayist was so peculiarly constituted, and so devoted to antithesis and paradox, that it is a rare occurrence to find any speculative opinion in his pages which can maintain itself intact against a searching criticism. His *Letters*, edited by his nephew, Sir George Otto Trevelyan (2 vols., 1876), are among the most delightful in the English language. In selecting an edition of Macaulay's works care should be taken not to procure a reprint of an early issue. In revising his work, the author made many changes of importance.

Revised by C. K. Adams.

Macaw': a name applied to the large parrots of the genus *Ara* or *Sittace*, forming the sub-family *Arinæ*, a group peculiar to South America. With one or two exceptions they are readily distinguished by their size, their enormous beaks, long tails and gaudy colors, in which brilliant red, blue, and yellow are conspicuous. Their voice is loud and harsh, and they do not learn to talk well. The great blue macaw (*Ara ararauna*), which is about 3 feet long, bright blue above and equally vivid yellow below, is a well-known example of the group. F. A. Lucas.

Maçayo: See Maceio.

Macbeth', or **Macbeathad MacFinlegh**: a King of Scotland in the eleventh century; immortalized as the hero of one of Shakspeare's tragedies. Little is positively known concerning him. He was the son of Finlegh, a chieftain from whom he inherited the rule of the province of Moray, and married Gruoch MacBoedhe, a granddaughter of King Kenneth MacDuff. In a war with King Duncan MacCrinan, Macbeth defeated and killed that prince at Bothgouanan, near Elgin, in 1040, after which he was proclaimed King of Scotland, probably as a vassal of Thorfinn of Norway. His reign is chronicled as a time of plenty and prosperity. He made grants to the Culdees of Loch Leven, and made a pilgrimage to Rome in 1050. In 1054 Malcolm MacDuncan (or Ceanmore), eldest son of King Duncan, invaded Scotland with a force collected by the aid of Siward, Earl of Northumberland, and near Dunsinane defeated Macbeth, who fled north of the Grampians, and resisted, until he was killed at Lumphanan, Aberdeenshire, Aug. 15, 1057, by Malcolm and MacDuff. Malcolm was crowned king at Scone in the following April. Many fabulous circumstances attributed to Macbeth were compiled from early chronicles by the Scottish historian Hector Boece or Boethius (1526), from whose pages they were taken by Holinshed, and thus became known to Shakspeare.

McBurney, Robert R.: See the Appendix.

McCabe, CHARLES CALDWELL, D. D.: clergyman; b. at Athens, O., Oct. 11, 1836; was educated at Ohio Wesleyan University; joined the Ohio conference in 1860; entered the Union army as chaplain of the 122d Ohio Volunteer Infantry in 1862; was captured in 1863, and spent four months in Libby prison; returned to the army, but was soon sent by the Christian commission to speak in its behalf in the large cities of the Northern States. In 1865 he was selected as agent of the centenary cause (1866) for the Ohio conference and afterward for the State of Ohio. From 1868 to 1884 he was assistant secretary of the board of church extension, and since 1884 he has been the corresponding secretary of the missionary society of the Methodist Episcopal Church. A. OSBORN.

McCabe, JAMES DABNEY: See the Appendix.

Mac'cabees: a family consisting of the father, Mattathias, and his five sons, Jochanan, Simon, Juda, Eleazer, and Jonathan, who were the first to make a determined stand against the attempt of Antiochus Epiphanes, the Syrian king, to destroy the Jewish nation. The name Maccabee was originally given to Juda, and is probably derived from *Makkābhā*, a hammer. (Cf. Carl Martel; but see Curtis, *The Name Machabee*, Leipzig, 1876.) Great dissatisfaction had arisen in Judæa because of the manner in which the office of high priest had been bought and sold. Antiochus fell upon Jerusalem in 169 A. D., and in order to break all opposition ordered the Jews to refrain from the observance of their religious ceremonies. The temple was given over to the service of the Olympian Jupiter; Mattathias, of priestly family, revolted in Modiim. With his five sons and a few followers he fled to the mountains. He encouraged others to join him and to obey the laws of their religion. When he died Juda (166–160) assumed command of the small army. He defeated Apollonius, then Seron at Beth Choron (165). He was successful against Ptolemäus, Nicanor, and Gorgias at Emmäus, with 6,000 men against 47,000. In 164 he again defeated the Syrians under Lysias at Beth Zur. Juda now pressed forward to Jerusalem, purified the temple, and on the 25th of Kislev, 164, celebrated for eight days the re-dedication of the temple (Feast of Chanukkah). The cause of the Jews was largely assisted by disturbances in Syria which took the leaders away from the seat of war. Juda was able to subdue some of the neighboring tribes. He sent Simon to Galilee, while he and Jonathan went to Gilead. Antiochus Eupator and Lysias made a last attempt (162), with a force of 120,000 men, to quell the rebellion. The outcome of the battle of Beth Zur would forever have silenced the Maccabean cause had not Antiochus been compelled to return to Syria to defend himself against Philip. In 161 Juda had to defend himself against Nicanor, the general of Demetrius. He even made a treaty with the Roman senate. He met his death at Adasa, fighting against great odds, under the leadership of Bacchides. Jonathan succeeded as commander, and kept up the guerrilla warfare. In 159 Baechides returned to Syria, and shortly afterward was willing to make peace. In 152 Jonathan entered Jerusalem and assumed the office of high priest. He lost his life in 142, being involved in the quarrels concerning the Syrian throne. Simon (142–135) completed the work of his brothers. He finally drove out the Syrian garrison from the citadel of Jerusalem, and renewed the treaty with the Roman senate. He turned his attention to internal affairs, and succeeded in securing the right to coin money in his own name. He was declared hereditary high priest and prince, thus founding the Harmonean dynasty. Simon was murdered by his son-in-law in Dok near Jericho.

RICHARD GOTTHEIL.

Maccabees, Books of [from Lat. *Maccabæ'i* = Gr. **Μακκαβαῖοι**, plur. of **Μακκαβαῖος**; from Heb. name, prob. deriv. of *maqqābhā(h)*, a hammer, or perhaps deriv. of *makbī*, the extinguisher]: are four in number. The first two are received as canonical by the Roman Catholic Church, and are found also in Luther's translation, as well as, at times, in Protestant Bibles. The first three are regarded as canonical by the Greek Church. None of the books are received as canonical by the Jews.

The First Book of the Maccabees is generally regarded as trustworthy, and is our authority for the history of the Jews from 175 to 135 B. C. It relates in well-chosen language the history of the perseeutions set on foot by Antiochus IV. (Epiphanes), the uprising of the Jews under Mattathias and his five sons, and their sueeessful struggle for independence. It ends with the death of Simon Maeeabee. The chronology is fixed according to the Seleucid era. It was probably written in Hebrew, by a Jew of Palestine, between the death of John Hyrcanus (B. C. 106) and the capture of Jerusalem (B. C. 63). It has come down to us in a Greek translation, which was probably known to Josephus. According to Origen, the title was **Σαρβὴθ Σαβαναιέλ**, the meaning of which is not clear. Of this we have two translations in Latin, and two in Syriac, one contained in the Polyglots and the other in the Ambrosian MS. of the Peshitta. (See Grimm, *Das Erste Buch der Maccabäer erklärt* (Leipzig, 1853); Bissell, *The Apocrypha of the Old Testament* (New York, 1880); Reuss, *Gesch. des Alten Testaments* (1881, § 501); Schürer, *Gesch. der Juden zur Zeitalter Christi* (ii., pp. 579, *sq.*); *Apocrypha* (ed. Wace, ii., pp. 373, *sq.*).) *The Second Book of the Maccabees* is of a little later date, and is evidently an epitome (2 Macc. ii., 26, 28) of an historical work in five books written by Jason of Cyrene. Beginning with the year 175 B. C., it gives the history of the Maccabean uprising, and carries the story down to Juda's victory over the Syrian general Nicanor (160 B. C.). Though it runs parallel to the account contained in the first book, it supplies us with numerous details which bear evidence of being founded on facts. It was, however, written with a more religious or didactic design. At the beginning are added (i.–ii. 18) two letters, in which the Jews in Egypt are invited to join their brethren in Palestine in the celebration of the Feast of Dedication. (See Grätz, *Das Sendschreiben der Palästinenser an die ägypt.-jud. gemeinden, Monatsschrift für Geschichte*). This epitome was known to Philo, but the exact date of its author can not be determined. It was originally written in Greek. There are two ancient Latin translations and two in Syriac (see above). (See Grimm (1857); Bissell (1880); Reuss (1881, § 583); Schürer (ii., pp. 739, *sq.*); *Apocrypha* (ed. Wace, ii., pp. 539, *sq.*).) *The Third Book of the Maccabees* (so called) was probably written in Greek by a Jew of Alexandria. It has nothing to do with the Maccabees, but gives a marvelous and distorted account of the sufferings and deliverance of the faithful Jews of Alexandria during the reign of Ptolemy IV. (Philopator), 217 B. C. The historical basis may be found in a similar event which took place in the reign of Ptolemy VII. (Physkon), and which is mentioned by Josephus (*Contra Apion*, ii., 5). Schürer places the date of its compilation between 100 B. C. and 100 A. D. It seems to have been received into the Syrian Church, as it is found in their MSS. of the Old Testament. (See Grimm; Bissell; Reuss, § 574; Schürer, ii., pp. 743, *sq.*) *The Fourth Book of the Maccabees* is an ethical treatise written probably during the first century A. D. by an Alexandrian Jew. It is cited under the title **περὶ αὐτοκράτος λογισμοῦ**, and has for its theme the Stoical idea **αὐτοδέσποινός ἐστι τῶν παθῶν ὁ εὐσεβὴς λογισμός** (i., 1). The author dwells upon this theme, taking his illustrations from the feats performed by the Maccabean brothers. He is a strict Jew, with a leaning toward Phariseeism. Eusebius and others say that Josephus was the author, and the work is found in most of the MSS. and printed editions of that historian; but there are weighty internal reasons for doubting this. Scholars agree in placing its composition during the first century A. D. See especially Freudenthal, *Die Flavius Josephus beigelegte Schrift ueber die Herrschaft der Vernunft* (Breslau, 1869); also Grimm (as above); Reuss, § 570; Selürer, ii., pp. 766, *sq.*

Reference is made occasionally to a *Fifth Book of the Maccabees*, a title invented by Cotton. It is sometimes called *Second Book of the Maccabees*. It is a compilation treating of the history of the Jews from the time of Heliodorus to that of Herod (184 B. C.–6 B. C.). It thus runs parallel with the First and Second Books of the Maccabees and Josephus, *Antiq.* (xiii.–xvi.). It is evidently based upon earlier works, and its historical value is not great. It exists only in an Arabic translation, which is incorporated in the Paris and London Polyglots, together with a Latin rendering. Grätz identifies it with an Arabic chronicle written about the year 900 A. D., and which he thinks formed the basis of the Hebrew *Josippon* by Joseph ben Gorion. A French translation has been made by de Saey and others. (See Cotton, *The Five Books of the Maccabees* (London, 1832); Grätz, *Geschichte der Juden* (v., p. 281); Davidson, *Introduction to the Old Testament* (iii., p. 466); McClintock and Strong's *Biblical Cyclopædia*, v., p. 614.) In the Ambrosian Peshitta there is also a *Fifth Book of the Maccabees*, but that is a Syriac translation of the sixth book of Josephus's *Wars*. See *Hebraica* (1887, p. 137); *Studia Biblica* (iii., p. 229). RICHARD GOTTHEIL.

Maccalub'ba [Arabic]: a mud-volcano 6 miles N. of Girgenti, Sicily; rises 138 feet above the plain and 804 feet above the sea; has numerous small craters, and occasionally casts up stones and mud. Gas is continually pouring out, and there are signs of petroleum.

McCall, George Archibald: See the Appendix.

McCallum, Daniel Craig: See the Appendix.

McCarthy, Justin: political leader and author; b. in Cork, Ireland, Nov. 22, 1830; received a liberal education; became connected with a Liverpool newspaper 1853; parliamentary reporter for the London *Star* 1860; was its chief editor 1864–68; spent three years (1868–70) traveling and lecturing in the U. S., where he became connected editorially with the New York *Independent*, and wrote much for the leading magazines, as he had previously done in England. Returning to London, he became a radical writer, novelist, and historian; was elected to Parliament in 1880, and became a leader of the Irish Home-rule party. He was re-elected to Parliament in 1886, and became vice-president of the Irish National League of Great Britain. Upon the breach in the Home-rule party he became the official leader of the anti-Parnell group, but resigned his leadership in Feb., 1896. He revisited the U. S. in 1886. Among his works are *Con Amore*, essays (1866); *Critical Notice of George Sand* (1870); *Prohibitory Legislation in the United States* (1872); *Modern Leaders* (1872); *History of Ireland from the Union to the Introduction of Mr. Gladstone's Bill*; *A History of our own Times* (4 vols., 1879–80); *The Epoch of Reform* (1882); *History of the Four Georges* (4 vols., 1889, *et seq.*); *Ireland's Cause in England's Parliament* (1888); *Reminiscences* (1899); besides several novels, including *Lady Judith* (1871); *Dear Lady Disdain* (1875); *Maid of Athens* (1883); and with Mrs. Campbell-Praed, he is the author of *The Right Honourable* (1886), and other novels.

McCheyne, mac-chān', Robert Murray: preacher and hymn-writer; b. in Edinburgh, Scotland, May 21, 1813; studied at the University of Edinburgh, and prepared for the Presbyterian ministry under Dr. Chalmers; was licensed in 1835; preached for some years at St. Peter's, Dundee, until his health failed, when he undertook, with three other ministers, a "mission of inquiry" to the Jews in Palestine, and on his return was engaged as an evangelist in the north of England until his death, Mar. 25, 1843. He had fine literary tastes, and was learned in the sacred languages. See his *Life and Remains*, by Rev. A. A. Bonar (New York, 1844 and 1857), and his complete works (2 vols., New York, 1847).

Macchiavelli: See Machiavelli.

McClellan, Ely: See the Appendix.

McClellan, George Brinton: soldier and scientist; b. in Philadelphia, Dec. 3, 1826; son of Dr. George McClellan; passed two years at the University of Pennsylvania; graduated from West Point 1846, and commissioned brevet second lieutenant of engineers; served in the Mexican war at the siege of Vera Cruz and in the battles of Cerro Gordo, Contreras, Churubusco, Molino del Rey, and Chapultepec, and capture of city of Mexico, winning the brevets of first lieutenant and captain for gallantry. At the close of the war he returned to West Point, where he remained until 1851, when he was assigned to duty in the construction of Fort Delaware; subsequently, in his engineering capacity, accompanied the expeditions to explore the sources of the Red river and the Northern Pacific Railway; promoted first lieutenant of engineers 1853, and captain of cavalry in 1855; in the latter year he went to Europe as a member of a military commission to visit the seat of war, and upon his return prepared an official report upon the *Organization of European Armies and Operations in the Crimea*, which was published by order of the Government. In 1857 he resigned from the army, and was chief engineer and vice-president of the Illinois Central Railway 1857–60, being chosen president of the St. Louis and Cincinnati Railway in the latter year. On the outbreak of the civil war in 1861 his services were enlisted by the Governor of Ohio in organizing the volunteers called for by the first proclamation, and he was placed in command of the department of the Ohio, and commissioned major-general of Ohio volunteers Apr. 23, 1861. On May 14 following the President appointed him a major-general in the U. S. army, and directed him to disperse the Confederate force occupying and threatening to overrun West Virginia. By a well-executed movement he met and defeated the enemy, and on July 14 reported his task accomplished and West Virginia clear. The thanks of Congress were tendered him for these services, and after the battle of Bull Run he was called to Washington and (July 25) placed in command of a division comprising the departments of Washington and of Northeastern Virginia; three weeks later he was assigned to command the department of the Potomac, and Aug. 20 the Army of the Potomac. Upon the retirement of Lieut.-Gen. Scott the command of the army of the U. S. fell upon him, which he retained until Mar. 11, 1862, when he was relieved of command of all military departments except that of the Potomac. On Mar. 6 he had made an advance upon Manassas, only to find the enemy gone, and returning, embarked his army for Fortress Monroe; the siege of Yorktown lasted until May 5, when followed the disastrous campaign known as the Peninsular campaign, resulting in the retreat of the army to the James, June 26 to July 2, 1862, and its final withdrawal the following month to the relief of Gen. Pope in Northeastern Virginia, leaving McClellan for a short time without any distinct command. After the defeat of Pope (Aug. 29–30), McClellan was (Sept. 2) placed in command of the capital and the troops for its defense, which were reorganized by him, and followed Lee into Maryland, the battles of South Mountain and Antietam ensuing Sept. 14–17. On Nov. 7 he was relieved of his command at Warrenton, and Gen. Burnside ordered to succeed him. Proceeding to New Jersey, he took no further part in the war. On Aug. 31, 1864, he was nominated by the Democrats for the presidency. The election occurred on Nov. 8, when Lincoln was almost unanimously re-elected by the States participating, McClellan receiving only the votes of New Jersey, Kentucky, and Delaware. On the day of election he resigned his commission as major-general, and in the spring of 1865 sailed for Europe, where he made an extended stay. Returning in 1868, he superintended the construction of the Stevens floating battery, and from 1870 to 1872 was chief engineer of the department of docks of New York city. Author of various military reports, text-books, and manuals; Governor of New Jersey 1878–81. D. Oct. 29, 1885. *McClellan's Own Story* (of the war for the Union) was published in 1887. Revised by James Mercur.

McClenachan, Charles T.: See the Appendix.

McClernand, John A.: See the Appendix.

Mac'clesfield: town; in Cheshire, England; on the Bollin; 15 miles S. S. E. of Manchester (see map of England, ref. 7–G). Its silk fabrics are of the finest quality, and more than 8,000 operatives are employed in this branch of industry; its cotton-manufactures are also considerable. It has a grammar school, a modern free school, a school of science and art, a technical school, a public library, an infirmary, and a public park. Its vicinity is rich in coal. Pop. (1891) 36,009. Macclesfield received its first charter in 1261. It did not attain its importance as a manufacturing town until the beginning of the nineteenth century.

McClintock, Sir Francis Leopold, D. C. L., LL. D., F. R. S.: explorer; b. at Dundalk, Ireland, in 1819; entered the navy at the age of twelve; accompanied Sir James Ross in his Arctic expedition of 1848; was engaged in Capt. Austin's expedition of 1850 in search of Sir John Franklin, with the rank of lieutenant, and made a sleigh-journey of 760 miles along the north shore of Perry Sound; was made commander the following year, and sent on the expedition of five vessels under Sir Edward Belcher; rescued Capt. McClure from a three years' imprisonment in the ice near Melville island, but subsequently had to abandon his own ship and three others; returned to England Sept., 1854, and in 1857 took command of the expedition dispatched by Lady Franklin to ascertain the fate of her husband, for which he received many deserved honors. He was knighted in 1860, was employed in 1861 in surveying a route for a North Atlantic telegraph, became a rear-admiral Oct., 1871, and a vice-admiral in 1877. He was commander-in-chief in West India waters 1879–82; became full admiral 1884; received an admiral's pension 1887. He published *The Voyage of the Fox in the Arctic Seas to Discover the Fate of Sir John Franklin and his Companions* (1860).

McClintock, John, D. D., LL. D.: educator; b. in Philadelphia, Oct. 27, 1814; graduated at the University of Pennsylvania 1835, and began preaching as an itinerant in the New Jersey conference of the Methodist Episcopal Church; was Professor of Mathematics in Dickinson College at Carlisle, Pa., 1836–39, Professor of Ancient Languages 1839–51; aided in translating Neander's *Life of Christ* (1847); prepared (in connection with Prof. G. R. Crooks) several ele-

mentary classical text-books upon the system of "imitation and repetition"; was editor of *The Methodist Quarterly Review* 1848–56; was sent to Europe with Bishop Simpson in 1856 as delegate to the Wesleyan Methodist conference of England, and to the Evangelical Alliance at its Berlin meeting; was pastor of St. Paul's M. E. church, New York, 1857–60; became pastor of the American chapel in Paris, France, in 1860; and while the civil war in the U. S. was in progress used both pen and voice to give the French an intelligent idea of the causes of the contest. Returning to the U. S. in 1864, he was again for a few months pastor of St. Paul's, New York, resigning the position on account of broken health; became in 1866 chairman of the Central Centenary committee of the Methodist Episcopal Church, which organized the celebration of the completion of the first century of American Methodism; was chosen first president of Drew Theological Seminary, and superintended its opening at Madison, N. J., in 1867. D. at Madison, N. J., Mar. 4, 1870. In the management of *The Quarterly Review*, in his *Analysis of Watson's Theological Institutes* (1850), his essay on *The Temporal Power of the Pope* (1851), his *Sketches of Eminent Methodist Ministers* (1863), and his translation of Bungener's *History of the Council of Trent* (1855), he gave proof of versatile scholarship. The great work of his life, projected as early as 1853, was the *Cyclopædia of Biblical, Theological, and Ecclesiastical Literature* (10 vols., 1867–82), which he edited with the co-operation of Dr. James Strong. A volume of his sermons, *Living Words*, was published in 1870, and a course of *Lectures on Theological Encyclopædia and Methodology* in 1873. See his *Life and Letters*, edited by Rev. George R. Crooks (New York, 1876). Revised by A. OSBORN.

McClos'key, JOHN, D. D.: cardinal; b. in Brooklyn, N. Y., Mar. 20, 1810; received his early classical training in New York; graduated at Mt. St. Mary's College, Emmittsburg, Md.; studied theology in the Roman Catholic seminary connected with the same institution; was ordained a priest in St. Patrick's Cathedral, New York, Jan. 9, 1834; spent two years attending lectures at Rome, and another year in France; became on his return assistant pastor, and soon afterward pastor, of St. Joseph's church, New York; was appointed by Bishop Hughes in 1841 first president of St. John's College, Fordham, N. Y.; returned the following year to his pastoral charge; was appointed coadjutor to Bishop Hughes Nov. 23, 1843; consecrated under the title of Bishop of Axiere *in partibus infidelium* Mar. 10, 1844, and on the division of the diocese of New York was installed in Sept., 1847, as first Bishop of Albany. He administered that diocese seventeen years with signal ability, erected a splendid cathedral, founded at Troy a well-equipped theological seminary, built a large number of churches, founded many charitable and religious institutions, and introduced numerous monastic orders and lay communities. On the death of Archbishop Hughes he was appointed his successor, May 6, 1864, and took possession Aug. 21, after which time he repeated upon a larger scale the activity shown at Albany. For the completion of the magnificent cathedral on Fifth Avenue he was very active, and visited Rome in 1874 to procure materials for it. Raised to the princely dignity of cardinal-priest Mar. 15, 1875, he received the biretta in May, after which he visited Rome to obtain the investiture. D. in New York city, Oct. 10, 1885. J. J. KEANE.

McClure, Sir ROBERT JOHN LE MESURIER, C. B.: Arctic discoverer; b. at Wexford, Ireland, Jan. 28, 1807; was educated at Winchester and Sandhurst; entered the navy as a midshipman; joined the Arctic expedition under Capt. Back (1836) as a volunteer; was appointed lieutenant on his return, and served on the Great Lakes during the Canadian rebellion 1838–39; took part in Sir John Ross's Arctic expedition (1848), and took command in 1850 of another exploring expedition, which discovered the Northwest passage. For this service he was knighted, received a captaincy and a reward of £5,000. From his journals Capt. Sherard Osborne published in 1856 *The Discovery of the Northwest Passage*. He afterward served in the China squadron, became rear-admiral 1867, and vice-admiral on the retired list 1873. D. in London, Oct. 17, 1873.

McClymont, JAMES ALEXANDER, M. A., B. D.: minister of the Church of Scotland; b. in Girvan, Ayrshire, May 26, 1848; educated in the Universities of Edinburgh and Tübingen; pastor of Holburn parish, Aberdeen, from 1874; translator, with Dr. Nicol, of Dr. J. T. Beck's *Pastoral Theology of the New Testament*; editor, with Prof. Charteris, of *The Guild and Bible Class Textbooks*; author of *The New Testament and its Writers* in that series (Edinburgh and New York, 1892); editor of *The Church of Scotland: What she has done for the People of Scotland, and what she expects in Return* (1893). C. K. HOYT.

MacColl, MALCOLM: clergyman and author; b. at Glenfinan, Inverness-shire, Scotland, Mar. 27, 1838; was educated in Edinburgh and appointed assistant curate of St. Paul's, Knightsbridge, 1861, chaplain to the British ambassador in St. Petersburg 1862, curate of St. Paul's 1864, and rector of St. George's, in the city of London, 1871. He published *Mr. Gladstone and Oxford* (2d ed. 1865); *Science and Prayer* (4th ed. 1866); *The Reformation in England* (2d ed. 1869); *The Ober-Ammergau Passion Play* (6th ed. 1870); *Who is Responsible for the War?* (Franco-Prussian) (1871); *Lawlessness, Sacerdotalism, and Ritualism* (1875); *The Eastern Question: its Facts and its Fallacies* (1877); *Three Years of the Eastern Question* (1878); *Christianity in Relation to Science and Morals* (3d ed. 1890), comprising lectures on the Nicene Creed delivered as canon residentiary of Ripon Cathedral, besides numerous contributions to periodical literature. Canon McColl was present at the Old Catholic conference at Bonn, 1875, representing Mr. Gladstone at this meeting of representative theologians of the Eastern and Western Churches. Revised by W. S. PERRY.

McComb: village; Hancock co., O. (for location of county, see map of Ohio, ref. 2–D); on the Cin., Ham. and Day., and the N. Y., Chi. and St. L. railways; 10 miles N. W. of Findlay, the county-seat. It is in a natural-gas belt; contains a private bank and a weekly newspaper; and has saw and grist mills, sash and blind factories, and grain elevators. Pop. (1880) 417; (1890) 1,030; (1900) 1,195.

McComb City: town; Pike co., Miss. (for location of county, see map of Mississippi, ref. 9–F); on the Illinois Cent. Railroad; 7 miles N. of Magnolia, the county-seat, 105 miles N. of New Orleans, La. It is in a cotton and corn growing region, and has a State bank with capital of $25,000, and a weekly newspaper. Pop. (1880) 1,982; (1890) 2,383; (1900) 4,477.

McConnelsville: village; capital of Morgan co., O. (for location of county, see map of Ohio, ref. 6–H); on the Muskingum river, and the Zanesville and Ohio River Railway; 27 miles S. of Zanesville. It is in an agricultural region; has natural gas; and contains 6 churches, an opera-house that cost $40,000, manufactories of flour, tobacco, and agricultural implements, many choice residences, and 2 weekly newspapers. Pop. (1880) 1,473; (1890) 1,771; (1900) 1,825. EDITOR OF "HERALD."

McCook: city; Red Willow co., Neb. (for location of county, see map of Nebraska, ref. 11–D); on the Republican river, and the Chi., Burl. and Quincy Railroad; 10 miles W. of Indianola. It is in a farming and stock-raising region, and contains the division headquarters and repair-shops of the railway company, and three weekly newspapers. Pop. (1880) not in census; (1890) 2,346; (1900) 2,445.

McCook, ALEXANDER MCDOWELL: soldier; b. in Columbiana co., O., Apr. 22, 1831; graduated at West Point, and entered the army as brevet second lieutenant of infantry in 1852; after a brief term of service in garrison, he was actively engaged against hostile Indians until 1857, when after a year's leave of absence he was assigned as instructor of infantry tactics at West Point. On the outbreak of the civil war he was appointed colonel of the First Ohio Volunteers, which regiment he commanded at the first battle of Bull Run. Reorganizing his regiment on the expiration of its term of service, he was recommissioned colonel in August; was appointed brigadier-general of volunteers in Sept., 1861, and assigned to the command of a brigade in the department of the Cumberland; commanded a division at the battle of Shiloh and siege of Corinth, and First Army-corps at the battle of Perryville; Twentieth Army-corps at Stone river and Chickamauga, and the troops for the defense of the capital at the time of Early's attack on it, July, 1864. Received the various brevets from major to major-general. Resigned his commission as major-general Oct., 1865, and in Mar., 1867, was promoted to be lieutenant-colonel of infantry; colonel in 1880; brigadier-general July 10, 1890, and major-general Nov. 9, 1894. Retired Apr. 22, 1895.

McCook, HENRY CHRISTOPHER, D. D.: Presbyterian minister and a naturalist; b. in New Lisbon, O., July 3, 1837; graduated at Jefferson College, Pennsylvania, 1859; Western Theological Seminary, Allegheny, Pa., 1859–61; lieu-

tenant, and afterward chaplain, in Forty-first Regiment Illinois Volunteers 1861–62; minister in Clinton, Ill., 1861, and 1862–63; home missionary in St. Louis, Mo., 1863–70; pastor of Tabernacle Presbyterian church, Philadelphia, from 1870. He has been active in the work of the American Entomological Society and in the Philadelphia Academy of Natural Sciences, publishing many papers in the *Proceedings* of the latter. He has also published *Object and Outline Teaching* (St. Louis, 1871); *The Last Year of Christ's Ministry* (Philadelphia, 1871); *The Last Days of Jesus* (1872); *The Tercentenary Book* (edited 1873); *The Mound-making Ants of the Alleghenies* (1877); *The Natural History of the Agricultural Ant of Texas* (1880); *Historical Decorations, Presbyterian Council, Philadelphia* (Philadelphia, 1880); *Garfield Memorial Sermons* (1881); *Honey Ants and Occident Ants* (1882); *Tenants of an Old Farm* (New York, 1884); *The Women Friends of Jesus* (1885); *American Spiders and their Spinning Work* (Philadelphia, vol. i., 1889; vol. ii., 1890). WILLIS J. BEECHER.

MacCormac, HENRY, M. D.: physician; b. in Belfast, Ireland, in 1800; studied medicine in the Universities of Dublin, Paris, and Edinburgh, graduating M. D. at the University of Edinburgh in 1824; licentiate of Royal College of Surgeons, Edinburgh, 1824; traveled in Africa and North America, returning to Belfast to practice his profession; was visiting physician to several local hospitals; in 1866 gave up the active duties of his profession for literature. Among his more important writings are *A Treatise on the Cause and Cure of Hesitation of Speech, or Stammering* (London, 1828); *Observations on Spasmodic Cholera* (London, 1832); *An Exposition of the Nature, Treatment, and Prevention of Continued Fever* (London, 1835); *Methodus medendi, or the Description and Treatment of the Principal Diseases Incident to the Human Frame* (London, 1842); *Metanoia: a Plea for the Insane* (London, 1861); *The Painless Extinction of Life in Animals Designed for Human Food* (London, 1864); *Translation of Antoninus Epictetus.* D. at Belfast, May 26, 1886. S. T. ARMSTRONG.

McCosh, JAMES, D. D., LL. D., Lit. D.: philosopher; b. at Carskeoch, Ayrshire, Scotland, Apr. 1, 1811; educated at the Universities of Glasgow 1824–29 and Edinburgh 1829–34; wrote, while a student in the latter, an essay on the Stoic philosophy, which obtained for him, on motion of Sir William Hamilton, the honorary degree of M. A.; was ordained a minister of the Church of Scotland at Arbroath in 1835; removed to Brechin in 1839; was actively concerned in the disruption of the Scottish Church and in the organization of the Free Church 1843: appointed Professor of Logic and Metaphysics in Queen's College, Belfast, 1851; elected president of the College of New Jersey at Princeton 1868, which post he filled with great ability and success. His resignation of the presidency was accepted in 1888, and he became president emeritus, retaining his professorship of Philosophy until 1890. D. at Princeton, N. J., Nov. 16, 1894. His principal works are *The Methods of the Divine Government, Physical and Moral* (1850), which laid the basis of a wide reputation both in Great Britain and America; (in connection with Prof. G. Dickie) *Typical Forms and Special Ends in Creation* (1856); *Intuitions of the Mind inductively Investigated, being a Defense of Fundamental Truth* (1860); *The Supernatural in Relation to the Natural* (1862); *An Examination of Mill's Philosophy* (1866); *Logic* (1869); *Christianity and Positivism* (1871); *The Scottish Philosophy, Biographical, Expository, and Critical, from Hutcheson to Hamilton* (1874); *The Development Hypothesis* (1876); *The Emotions* (1880); *Psychology* (2 vols., 1886); *Realistic Philosophy Defended in a Philosophic Series* (2 vols., 1887); *The Religious Aspect of Evolution* (1888); *The Prevailing Types of Philosophy: Can They Logically Reach Reality?* (1890); *The Tests of Various Kinds of Truth* (1891); *Our Moral Nature* (1893); *Philosophy of Reality* (1894). Dr. McCosh, both by his writings and by his personal work as president, teacher, and preacher, has had great influence on American philosophy, theology, and education. His philosophy is a development of the Scottish realism, but he goes further than Reid in asserting the direct cognition of realities of all kinds. He very early accepted the doctrine of biological evolution, and interested himself in the newer problems of psychology and education. The present important rank held by Princeton University was largely reached during his administration. Revised by J. MARK BALDWIN.

MacCracken, HENRY MITCHELL, D. D., LL. D.: educator and author; b. at Oxford, O., Sept. 28, 1840; was educated at Miami University, the United Presbyterian Theological Seminary, Xenia, O., Princeton Theological Seminary, and Tübingen and Berlin Universities. He was teacher of the classics and school superintendent 1857–61; pastor of Westminster church, Columbus, O., 1863–68; of the First Presbyterian church, Toledo, 1868–80; chancellor of the Western University, Pittsburg, Pa., 1880–84; vice-chancellor and Professor of Philosophy in the University of the City of New York 1884–91, and chancellor since 1891. In 1867 he was deputy to the General Assembly of the Free Church of Scotland and to the Irish Presbyterian General Assembly; on July 4, 1884, was the orator at the reunion of the Scotch-Irish at Belfast, Ireland. Besides many other pamphlets, he has published *Tercentenary of Presbyterianism, Kant and Lotze*, and *A Metropolitan University*, and is editor and author of *Leaders of the Church Universal* (3 vols., 1879). C. K. HOYT.

McCrary, GEORGE W.: See the Appendix.

McCrie, THOMAS, D. D.: historian and divine; b. at Dunse, Scotland, in Nov., 1772; became pastor of a church in Edinburgh 1795; took a prominent part in the agitations within the Scottish Church. In 1804, he, with three others, formed the Constitutional Associate Presbytery, commonly known as the Old Light Antiburgher body. (See PRESBYTERIAN CHURCH.) He was the author of an esteemed *Life of John Knox* (1811), and of *The Life of Andrew Melville* (1819), important for the history of the Reformation in Scotland. He also wrote a *History of the Progress and Suppression of the Reformation in Italy* (1827) and a *History of the Reformation in Spain* (1829); lives of several Reformers in *The Christian Magazine* (1802–06); vigorously criticised Sir Walter Scott for his treatment of the Covenanters in *Old Mortality*; published several controversial and political tracts and discourses, and left unfinished a *Life of Calvin.* D. in Edinburgh, Aug. 5, 1835. A posthumous volume of *Sermons* appeared in 1836, his *Miscellaneous Writings* in 1841, and his *Works* in 4 vols. in 1855–57. See *Life of Thomas McCrie* by his son, Thomas McCrie, Jr. (Edinburgh, 1841; 2d ed. 1843); Allibone's *Dictionary of Authors*; *Lord Cockburn's Journal* (vol. i., p. 100); Blackie's *Preachers of Scotland*, vol. ii., p. 269); Hugh Miller's *The Headship of Christ* (p. 77) and *My Schools and Schoolmasters* (ch. xvi.). C. K. HOYT.

McCrie, THOMAS, Jr., D. D., LL. D.: son of Thomas McCrie; Professor of Systematic Theology in the English Presbyterian College in London; b. in Edinburgh in 1798, d. in 1875; wrote *Life of Thomas McCrie* (1841); *Sketches of Scottish Church History* (1841); edited *The Provincial Letters of Blaise Pascal, a New Translation* (1846).

McCulloch, BEN: See the Appendix.

McCulloch, HUGH: financier; b. at Kennebunk, Me., Dec. 7, 1808; was educated at Bowdoin College; removed to Indiana in 1833; was president of the State Bank of Indiana from May, 1855, till May, 1863, when, at the instance of the Secretary of the U. S. Treasury, Mr. Chase, he was called to the newly created office of Comptroller of the Currency; he succeeded Mr. Fessenden as Secretary of the U. S. Treasury until Mar., 1869, when he returned to Indiana. His reports as Secretary of the Treasury are held in high esteem by financiers. He engaged in the banking business in London in 1870; was again Secretary of the Treasury 1884–85. He published *Men and Measures of Half a Century* (1888). D. May 24, 1895.

McCulloch, JOHN RAMSAY: economist; b. at Whithorn, Scotland, Mar. 1, 1789; became editor of *The Scotsman*, an organ of Liberal political opinions at Edinburgh, and one of the editors of *The Edinburgh Review*; wrote the article on political economy in the supplement to the *Encyclopædia Britannica* (1824), in which he anticipated the opinions of the Manchester school of advocates of free trade; republished this article in 1825, with additions and modifications, under the title *Principles of Political Economy: with a Sketch of the Rise and Progress of the Science*; and was professor of that science in the University of London 1828–32. During this time he expounded the wage-fund theory (1826), which, after constituting for years the accepted doctrine on the subject, was completely overthrown by the opponents of the *laissez-faire* system. He edited Adam Smith's *Wealth of Nations* (1828); published *A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation* (1832); *A Statistical Account of the British Empire* (1837); *A Dictionary, Geographical, Statistical, and Historical, of the Various Countries, Places, and Principal Natural Objects in the World*

(1841; revised ed. 1866–67); *The Literature of Political Economy* (1845); and numerous other valuable treatises on economical topics. His great *Dictionaries* were long standard authorities upon their respective subjects. Prof. McCulloch received in 1843 the high honor of an election as one of the eight foreign associates of the French Institute of Moral and Political Sciences. He was appointed in 1838 comptroller of the royal stationery office, and received a pension of £200 for eminent services to literature. D. at Westminster, Nov. 11, 1864. Revised by F. M. Colby.

McCullough, John Edward: actor; b. in Coleraine, Ireland, Nov. 2, 1837; removed to the U. S. with his parents in 1853, and was apprenticed to a chairmaker. In 1855 he made his first appearance in a minor character in *The Belle's Stratagem* at the Arch Street theater in Philadelphia, and adopted the stage as a regular profession. From 1866 he traveled with Edwin Forrest, filling the second part in the plays. In 1869, in connection with Lawrence Barrett, he managed the Bush Street theater in San Francisco. Forrest, when he died in 1872, left his manuscript plays to McCullough, looking upon him as his legitimate successor. From 1873 until 1883 he played throughout the U. S. the parts of Brutus, in John Howard Payne's tragedy by that name, Jack Cade, the Gladiator, Virginius, Damon and Pythias, Othello, Coriolanus, and King Lear. While playing the Gladiator in Chicago he broke down. He appeared in England in 1881, but his acting was not admired. D. in Philadelphia, Nov. 8, 1885. Although a powerful actor, he was in every way inferior to his model, Forrest, especially in his lack of originality and literary culture.

MacCunn, Hamish: See the Appendix.

McCurdy, James Frederick, Ph. D.: philologist and professor of languages; b. in Chatham, New Brunswick, Feb. 18, 1847; was educated at the University of New Brunswick and Princeton Theological Seminary, where he was instructor in the Semitic languages 1873–82; studied in Göttingen and Leipzig 1882–84; was Stone lecturer at Princeton 1885–86; and since 1886 has been Professor of Oriental Languages in the University of Toronto. He has contributed many articles, linguistic, archæological, and exegetical, to journals and to the transactions of philological societies. For the American edition of Lange's commentaries he wrote the *Commentary on Haggai* (1876), and translated and supplemented from the German edition *Books III.–V. of the Psalms* (1872) and *Hosea* (1876). He has published *Aryo-Semitic Speech* (Andover and London, 1881), and *The Assyrian and Babylonian Inscriptions, with Special Reference to the Old Testament* (New York, 1886).
C. K. Hoyt.

Macdonald, Andrew Archibald: statesman; b. in Three Rivers, Prince Edward Island, Feb. 14, 1829; was educated at a grammar school and privately. He sat in the provincial House of Assembly 1854–60; in provincial legislative council 1863–73; was postmaster-general 1873–84, lieutenant-governor 1884–89, and was called to the Dominion Senate in 1891. He was a delegate to the Charlottetown and Quebec union conferences 1864; to the International convention at Portland, U. S., 1868; and is a public trustee under the Land Purchase Act of 1875. Neil Macdonald.

MacDonald, Arthur: See the Appendix.

Macdonald, Etienne Jacques Joseph Alexandre, Duc de Tarente: soldier; b. at Sancerre, in the department of Cher, France, Nov. 17, 1765; descended from a Scottish family which went to France with the Stuarts; entered the army in 1784; fought at Jemappes in 1792, after which he rose rapidly in rank and became general of division in 1795. Having been appointed governor of Rome and the Papal States in 1798, he commanded the principal corps in the successful battle at Otricoli, and was afterward made general-in-chief of the army of Naples. After considerable success against the Neapolitans he was beaten by Suwarow on the banks of the Trebbia June 17, 1799; was wounded; returned to Paris, and took the side of Napoleon in the revolution of 18 brumaire, but afterward lost the confidence of the emperor on account of his stanch defense of Gen. Moreau. In 1809, however, Napoleon again gave him a command, and he distinguished himself so much in the battle of Wagram that he was created Duke of Tarente and made a marshal of France. In the campaigns of 1812–14 he rendered distinguished services, but was defeated by Blücher at Katzbach Aug. 26, 1813, and adhered firmly and honestly to Napoleon till his abdication. Having taken service with the Bourbons, he refused to accept any office during the Hundred Days, and lived, much honored, though in retirement, during the second Restoration. D. at Courcelles, near Guise, Sept. 24, 1840. Revised by F. M. Colby.

Macdonald, Flora: heroine; b. at Milton, in the island of South Uist, one of the Hebrides, in 1720; became celebrated in 1746 as the heroine of some of the remarkable adventures of Prince Charles Edward, the Young Pretender, whom she assisted in escaping pursuit from South Uist to Skye. She was imprisoned on board vessels of war and in London for several months; released in 1747; married Allan Macdonald in 1750, and settled in Fayetteville, N. C., in 1775. During the Revolutionary war her husband served as an officer in the British army, and Flora returned to the island of Skye, where she died Mar. 4, 1790.

MacDonald, George: novelist and poet; b. in Huntley, Scotland, in 1824; was educated at the University of Aberdeen; studied for the ministry at the Independent College, Highbury, London; preached in the counties of Surrey and Sussex for some time, but ultimately became a lay member of the Church of England and devoted himself entirely to literature, settling in London. He published volumes of poems in 1855, 1857, 1864, 1868, and 1882. He has published several novels, including *David Elginbrod* (1862); *Alec Forbes of Howglen* (1865); *Annals of a Quiet Neighborhood* (1866); *Guild Court* (1867); *Robert Falconer* (1868); *Wilfred Cumbermede* (1871); *Malcolm* (1874); *The Marquis of Lossie* (1877); and *What's Mine's Mine* (1886); also several successful juvenile books, and two theological works. He has been principal of a ladies' seminary in London; lectured in the U. S. (1872–73). Revised by H. A. Beers.

MacDonald, James: jurist; b. at East River, Pictou, Nova Scotia, July 1, 1828; was educated at New Glasgow, and was admitted to the bar in 1861. He represented Pictou in the Nova Scotia Assembly 1859–67, 1871–72, and the same constituency in the Dominion Parliament 1874–81; was railway commissioner for Nova Scotia 1863–64; financial secretary 1864–67; Minister of Justice of Canada 1878–81; and was appointed Chief Justice of Nova Scotia May 28, 1881. He was one of the commissioners appointed to open up trade relations with the West Indies, Mexico, Brazil, and the British American provinces 1865–66. N. M.

Macdonald, Sir John Alexander, G. C. B., D. C. L., LL. D.: Canadian statesman; b. in Glasgow, Scotland, Jan. 11, 1815. His father, Hugh Macdonald, a native of Sutherlandshire, removed to Canada with his family in 1820, and settled in Kingston, where his son was educated at the Royal Grammar School. Admitted to the bar in 1836, John soon established a lucrative practice, and became noted for his knowledge of criminal and commercial law, and for his ability as a pleader. In 1844 he was elected to represent Kingston in the Canada Assembly, and sat for this constituency almost continuously until his death. Soon after entering Parliament he began to display those talents which secured for him so great an ascendency in Canadian politics, and in a few years became the virtual leader of the Upper Canada Conservatives, even before he had displaced Sir Allan MacNab as chief of the party. He assumed office for the first time May 21, 1847, entering the cabinet as Receiver-General; became commissioner of crown lands Dec. 7, 1847; and was Attorney-General for Upper Canada from Sept. 11, 1854, to July 29, 1858, when, as Prime Minister, he and his cabinet resigned. He returned to office Aug. 6, same year, as Postmaster-General; resigned this portfolio on the following day, on his reappointment as Attorney-General, a position he held until the defeat of the administration, May, 1862, when he and his colleagues again retired from office. He led the opposition in the Assembly, together with Sir George E. Cartier, until the defeat of the Sandfield Macdonald-Dorion government, when, with Sir Étienne Taché, he formed an administration Mar. 30, 1864. He resumed his former office of Attorney-General, and was Government leader in the Assembly from that date until the union of the provinces in 1867. To the consummation of this union he contributed more than any other person in Canada. He was a delegate to the union conferences held at Charlottetown and Quebec in 1864; and was chairman of the London colonial conference 1866–67, when the act of union known as the British North America Act was passed by the British Parliament. On July 1, 1867, he was called upon to form the first Government for the new Dominion, and was appointed Minister of Justice and Attorney-General of Canada, an office which he held until he and his ministry resigned on the Pacific Railway charges Nov. 6, 1873. During this administra-

tion negotiations with the Hudson's Bay Company respecting the transfer of the Northwest region to Canada were successful, and that vast domain was united to the Dominion largely through his efforts. Shortly after retiring from office he removed to Toronto and engaged in the practice of law, and many of his political opponents and others regarded his public career as ended. In the meantime, however, he introduced his scheme of protective duties, known since as the National Policy, to the notice of the public, and appealing to them upon that issue was successful at the polls. He was not, however, in favor of protection as a permanent fiscal policy, but was led to adopt it by the exigencies of trade with the U. S. He resumed office in Oct., 1878, as Minister of the Interior; resigned this portfolio and became president of the council and superintendent-general of Indian affairs Oct. 17, 1883. He resigned those offices Nov. 28, 1889, and became Minister of Railways and Canals, which post he retained until his death at Ottawa, June 6, 1891. In 1871 he was appointed one of the British joint high commissioners and plenipotentiaries, together with Earl de Grey (now Marquis of Ripon), Sir Stafford Northcote, Sir Edward Thornton, and the Right Hon. Montague Bernard, to act in connection with five commissioners for the U. S. for the settlement of the Alabama claims and of other matters in dispute between Great Britain and the U. S., the labors of the commissioners resulting in the Treaty of Washington, signed May 8, 1871. During the summer of 1880 Sir John visited London in company with Sir Charles Tupper and the Hon. J. H. Pope (members of his cabinet), when they arranged the terms for the construction of the Canadian Pacific Railway. He again visited London in 1884, and attended the conference held there Nov. 18, at which the Imperial Federation League was formed, and was regarded as the chief originator of the movement. The measures which Sir John carried through Parliament comprise the most important features of Canadian legislation from 1854 up till the period of his death. He received the degree of D. C. L. from Oxford University in 1865; LL. D. from Queen's University, Kingston, and McGill University, Montreal; was created a Knight Commander of the Bath in 1867, Knight Grand Cross of the Royal Order of Isabel la Catolica (of Spain) 1872; sworn in as a member of Her Majesty's Privy Council 1879; and received the decoration of the Grand Cross of the Bath in 1884.

Sir John possessed natural abilities of the highest order. He held no mean rank as an orator, and had no equal in Canada as a parliamentary debater. A master of repartee, witty, persuasive, and engaging, he had but few superiors anywhere as a conversationalist. He seemed to have an intuitive knowledge of human nature, and possessed in an eminent degree those special talents whereby he rendered this gift serviceable in promoting his public policy. He displayed the commanding character of his intellect and his statesmanship by welding opposing factions, creeds, and nationalities into a harmonious political unity of action.

He was twice married—first to his cousin, Isabella Clarke, who died in 1856, and second, in 1867, to Susan Agnes, daughter of the Hon. T. J. Bernard, a member of the Queen's Privy Council of the island of Jamaica. She, surviving Sir John, was soon after his death created Baroness Earnscliffe, in consideration of her husband's distinguished services.

His son Hugh John, Q. C. (b. in Kingston, Ontario, Mar. 13, 1850), was educated at Queen's College, Kingston, and the University of Toronto, and admitted to the bar in 1872. He served in the Red river expedition (1870) under Sir Garnet (now Lord) Wolseley, and again in 1885. He is president of the Manitoba Rifle Association, and in 1891 was elected to the Canadian Parliament for the city of Winnipeg.

Neil Macdonald.

Macdonald, John Sandfield: statesman; b. in St. Raphael's, Glengarry, Ontario, Dec. 12, 1812. He was self-educated, was admitted to the bar in 1840, and achieved an immediate success; elected for Glengarry County in Parliament of Canada in 1841; re-elected in 1848, 1852, and 1854 without opposition; was Solicitor-General 1849–51, Speaker 1852–54, and in 1858 was Attorney-General in the Brown-Dorion or "two-days" ministry. He was elected for Cornwall in 1857, was called upon to form a government after the defeat of the Cartier-Macdonald government, which he succeeded in doing, and was Premier till his resignation in 1864. He became Premier of the province of Ontario in 1867, which office he resigned in 1871; but he retained a seat in Parliament till his death in Cornwall, Ontario, June 1, 1872. —His brother Donald Alexander (b. in St. Raphael's, Feb. 17, 1817) represented Glengarry in the Canadian Parliament 1867–75. He became a member of the Privy Council Nov. 7, 1873, and was Postmaster-General from that date till appointed lieutenant-governor of Ontario May 18, 1875; this last office he held for five years. N. M.

McDou'gall, Alexander: soldier; b. in Scotland in 1731; went to North America with his father about 1755, and settled near New York; was in 1769 a printer, and imprisoned by the colonial government (1770) for an alleged libelous address. He took an active part in the popular movements preliminary to the Revolution; was appointed colonel of the first New York regiment; brigadier-general Aug., 1776, and major-general Oct. 20, 1777; was engaged in the battles of Long Island, White Plains, and Germantown, and in the New Jersey campaign; commanded the posts on the Hudson 1778–80; was Minister of Marine for a short time early in 1781; was elected a delegate to Congress from New York in that year, and again in 1784; was elected to New York Senate 1783. D. in New York, June 8, 1786.

MacDougall, William, C. B.: statesman; b. in Toronto, Canada, Jan. 25, 1822; was educated there and at Victoria College, Cobourg, and was admitted as an attorney in 1847. He founded (1848) *The Canada Farmer*; in 1850 *The North American*, of which he was editor until it was merged into the Toronto *Daily Globe* in 1857, and was a political writer on the latter 1857–60. He represented Canada at the New York exhibition 1853; was a member of the executive council and commissioner of crown lands 1862–64; provincial secretary 1864–67; acting Minister of Marine 1866–67; and Minister of Public Works from 1867 until appointed lieutenant-governor of Rupert's Land and Northwest Territory in 1869. He was chairman of the commission appointed to open up trade relations with the West Indies, Mexico, and Brazil 1865–66; delegate to the Charlottetown and Quebec union conferences 1864; to the colonial conference in London 1866–67; to confer with British Government on defenses of Canada and for the acquisition of the Northwest Territory 1868–69; and was sent to London (1873) as a special commissioner to confer with British Government respecting fisheries and to make arrangements in Scandinavia and Baltic provinces for emigration to Canada. He is author of *Six Letters on the Amendment of the Provincial Constitution* (Toronto, 1872). N. M.

MacDowell, Edward A.: composer; b. in New York city, Dec. 18, 1861; began the study of the piano very early; went to Paris in 1876, remaining three years in the conservatory there; then went to Wiesbaden and Frankfort, and in 1881 was appointed first piano-teacher in the conservatory at Darmstadt, but resigned in 1882. In 1884 he married an American lady, and took up his residence at Wiesbaden. He returned to his native country about 1889, and resides in Boston. His compositions are important, and include piano concertos and suites, symphonic poems for orchestra—viz., *Hamlet*, *Ophelia*, *Launcelot and Elaine*, *Lamia*—a symphony, a suite for orchestra, and similar large works. D. E. Hervey.

McDowell, Irvin: soldier; b. at Columbus, O., Oct. 15, 1818; educated at the Collège de Troyes, France, and at the U. S. Military Academy, at which he graduated July 1, 1838. Appointed second lieutenant of artillery in the army; adjutant at West Point 1841–45; aide-de-camp to Gen. Wool 1845, as adjutant-general of his division, in the war with Mexico, and subsequently of the army of occupation. At the battle of Buena Vista he gained the brevet of captain, and in May, 1847, was appointed brevet captain and assistant adjutant-general. Served as adjutant-general of various departments until 1861, having been promoted to brevet major in 1856. Ordered to Washington in Feb., 1861, he served until May as inspector of troops, in organizing and mustering volunteers. Appointed brigadier-general May 14, he was three days later assigned to the command of the department of Northeast Virginia and the defenses of Washington on the Virginia side of the Potomac, and on May 27 to the Army of the Potomac, which he commanded at the battle of Bull Run July 21. On the accession of Gen. McClellan to command, McDowell was placed at the head of a division of the Army of the Potomac, and on its reorganization (Mar., 1862) of the First Corps of that army. He was made major-general of volunteers Mar. 13, 1862; was in command of the department of the Rappahannock Apr., 1862; of the Third Army-corps (Army of Virginia) Aug., 1862, and during Gen. Pope's campaign in Northern Virginia was

engaged at Cedar Mountain, Rappahannock Station, and second Bull Run. In July, 1864, placed in command of the department of the Pacific; of department of California June, 1866, department of the East 1868; became major-general U. S. army in Nov., 1872; in command of the division of the South 1872–76, and then of the division of the Pacific till his retirement, Oct. 15, 1882. D. in San Francisco, May 4, 1885. Revised by JAMES MERCUR.

McDowell, WILLIAM FRASER: See the Appendix.

Mace [from Lat. *ma'cis*, *ma'cir*, from Gr. μάκερ, mace]: the dried arillus or inner coat investing the shell of the nutmeg, which is the kernel of the nut of *Myristica fragrans*, a tree of the Spice islands (family *Myristicaceæ*) now naturalized in other hot regions. Mace of inferior quality is also produced by *Myristica fatua* of the same regions. Mace is used as a spice, and as an aromatic stimulant in medicine. It has also the slight narcotic power of the nutmeg, in a milder degree. It yields a volatile oil upon distillation, and a buttery, fixed oil when subjected to pressure. The oil of mace of commerce is, however, generally the fixed oil of the nutmeg, which is harder than the true oil of mace. Mace, in the fresh state fleshy and of a beautiful crimson, appears in commerce as a mass of flat, dry branching plates of an orange-brown color, and a taste and smell resembling those of nutmeg, but rather milder and pleasanter.

Mace [from O. Fr. *mace* (> Fr. *masse*) : Ital. *mazza*: Span. *maza* < Lat. **matea*, club; cf. *mate'ola*, mallet]: (1) A weapon consisting of a wooden handle about 5 feet long with metal head, usually a spiked ball, sometimes of other forms. It was much used by knights in the days of plate armor, against which it was particularly effective, as a strong blow would frequently drive a spike through the plates. It was also used as a weapon by priests, who were forbidden to carry a sword. Ornamented maces, sometimes of copper or silver, are now used as badges of authority by magistrates and in legislative assemblies. (2) A substitute for the cue in billiards. (3) A currier's mallet used in dressing leather.

Macé, mȧȧ'sā', JEAN: author and educator; b. in Paris, France, Apr. 22, 1815; the son of a laborer, he was educated at the Collège Stanislas; served in the army 1842–45; was secretary to Théodore Burette 1845–47; editor of *La République* 1848; retired to Alsace after the *coup d'état*, and there for ten years taught in a school: founded in 1864 *Le Magasin d'Éducation*, and in 1866 a league of instruction after the Belgian model. D. Dec. 13, 1894. He wrote a number of extremely popular books for young people, of a semi-educational kind: *Histoire d'une bouchée de pain* (1861); *Contes du Petit-Château* (1862); *Les serviteurs de l'estomac* (1866); *L'anniversaire de Waterloo* (1868); *Les premiers livres des petits enfants* (1869); *Les idées de Jean-françois* (1872–73); *La grammaire de Mlle. Lili* (1878); *La France avant Les Francs* (1881). A. R. MARSH.

Macedo, mȧȧ-sā'dō, JOAQUIN MANOEL, de: poet and statesman; b. at São João de Itaborahy, province of Rio de Janeiro, Brazil, June 24, 1820. He studied medicine, and took his doctor's degree in Rio; but he early began to write, and was soon made Professor of Brazilian History in the college of Dom Pedro at Rio de Janeiro. He has been one of the chief forces in the literary and scientific life of Brazil in the nineteenth century. He has also interested himself in political affairs, being elected to the Brazilian chamber in 1854. His first literary work to attract attention was his novel *Moreninha* (1844; 5th ed. 1877). This was followed by *O Moço louro* (1845; 5th ed. 1877); *Os dous amores* (1848); *Vicentina* (1853); *Rosa* (1854); *A Carteira de meu tio: Viagem phantastica* (1855). In 1855 he made a hit in a new literary *genre* by his extremely successful national tragedy *Colé*, having in 1849 brought out with less success *O Cézo*. Hardly less pleasing were his vaudevilles: *O primo da California* (1855; published 1858); *O Fantasma branco* (1856); *Lujo e vaidade* (1859); besides *A torre em concurso* and *O novo Othelo*. Macedo's greatest literary success, however, has been his lyric-epic poem *A Nebulosa*, published in 1857. In spite of some exaggerations of style and sentiment, this remains on the whole the best Brazilian poem of the century. It consists of six cantos and an epilogue, in unrhymed hendecasyllables. The scene is laid in Brazil, and felicitous descriptions of the tropical nature of the country abound. The story is of an essentially romantic kind, somewhat alien from the taste of the present; but the reader has to acknowledge that in many of the situations both power and truth are to be found. Macedo later has devoted himself mainly to scientific studies. A. R. MARSH.

Macedo, JOSÉ AGOSTINHO, Padre de: poet and writer; b. at Beja, Portugal, Sept. 11, 1761. Destined for the Church, he took his vows Nov. 15, 1778, rather from motives of expediency than from a real call to the life. As a consequence his conduct poorly conformed to his professions, and on Feb. 18, 1792, he was formally expelled from the monastery da Graça at Lisbon, of which he was a member. This disgrace, contrary to all expectations, incited him to maintain himself in society, and even in the Church, despite the condemnation of his superiors. He became a kind of unconnected preacher, and at the same time began his extraordinary career as a writer. Having great abilities and entire disregard for the feelings of others, he succeeded in making himself almost a literary dictator for a time. His sermons drew great crowds, and in 1802 he even became court preacher. At the same time he tried his hand at almost every kind of literary production, poetry, philosophy, criticism, etc. Later he took part in political affairs, and in 1822 was elected to the chamber of deputies. Toward the close of his life, however, his friendlessness, due to his own unsparing bitterness, grew more and more marked, and he died in neglect and disesteem. The year before his death, which occurred at Pedrouços in 1831, he had been appointed chronicler to the usurper Dom Miguel, but he never undertook the duties of the office. His chief poetical works are *Contemplacão da natureza* (1801); *O Novo Argunauta* (1809); *Obras de Horacio* (translation, 1806); *Gama* (an epic, 1811; later enlarged under the title *O Oriente*, 1814); *Os Burros ou o reinado da Sandice* (a comic-heroic, 1812); *Meditacão: Poema philosophico* (1813); *Newton: Poema* (1813; 2d corrected and enlarged edition 1815); *A lyra anacreontica* (1819); *Viagem extatica ao templo de sabedoria* (1830); *A Natureza: Poema en 6 cantos* (1846). Among his philosophical works may be mentioned *O Homem ou os limites da razão* (1815); *Cartas filosoficas a Atico* (1815). His critical ability and his bitter, sarcastic, witty manner appear in his *Cartas a Manoel Mendes Fogaça*; *As Pateadas do theatro investigadas* (1812); *Censura dos Lusiadas* (1820); *Exorcismos contra periodicos e outros maleficos* (1821). It must be said that this vast productivity prevented Macedo from knowing any subject profoundly, and the personal bitterness that kept him involved in controversies all his life gives a singularly unpleasing quality to almost everything he wrote. A. R. MARSH.

Macedo'nia (in Gr. Μακεδονία): an ancient and at one time very famous kingdom of Southeastern Europe; originated from a small and obscure beginning, and comprised, when it first became known to history, the districts extending between Epirus and Illyria on the W., Pæonia on the N., Thracia, from which it was separated by the river Strymon, on the E., and Thessaly on the S. The country was fertile, rich in gold and silver, and produced excellent wheat, wine, and oil. The capital was Pella. The Macedonians were originally an Illyrian race, though the kingdom was a composite one—something like the Austria of to-day—including various tribes of barbarians, Pæonians, Brygians, Edonians, Pierians, and others, who met at Pella and mingled with Thracians from the north and Greeks from the south. Greece had very early planted many flourishing colonies in these regions, as, for instance, Potidæa, a colony of Corinth, Chalcidice of Eubœa, and Amphipolis of Athens. Greek became the prevailing language, and Greek civilization the ruling spirit, but the dominant race was not Hellenic, and the Macedonians were never acknowledged by the Greeks as countrymen. When Xerxes invaded Greece he compelled Alexander, King of Macedonia, to follow him as his vassal, but after the battle of Platæa the country once more became independent. A century and a half later Philip II. (359–336) conquered Greece, and his son, Alexander the Great (336–323), made Macedonia the most powerful empire of the time; but on the death of Alexander his empire dissolved into four kingdoms, and the splendor of Macedonia declined very rapidly. A quarrel between Philip V. and Athens gave the Romans an opportunity of interfering, and Philip was utterly defeated at Cynoscephalæ in 197 B. C., as was Perseus at Pydna in 168 B. C. After an unsuccessful uprising against the supremacy of the Romans, Macedonia was finally made a Roman province in 146, and included as such parts of Illyria, Pæonia, and Thracia. In the Middle Ages the name gradually went out of use, and in the present administrative division of Turkey it has no place.

Revised by J. R. S. STERRETT.

Macedonian Language: the native idiom of Macedonia, the country of Philip and Alexander. It was never em-

ployed for literary record, and is known only through scanty glosses in the lexicographers and a few loan-words and proper names. Plutarch tells us that it was displaced entirely by Attic Greek at the court of Philip, and it is apparent that the Macedonian generals and the nobility adopted Attic Greek as the general language of intercourse, though the common Macedonian soldiery spoke among themselves their native tongue. This language was, if not a Greek dialect as some hold, an independent branch of the Indo-European closely related to the Greek. Some of the words which are handed down to us as Macedonian may have been merely Greek words in Macedonian pronunciation—i. e. virtually Greek loan-words in Macedonian, and this may in some measure account for the apparently close resemblance between the languages in some points and great divergence in others. Greek φ is represented in Macedonian by β, and θ by δ; thus Maced. βίλιππος (φίλιππος), βερενίκη (φερενίκη), ἀβροῦτες (ὀφρῦς, pl.), κεβαλή (κεφαλή), καδαρὸν (καθαρόν), κάναδοι (γνάθοι), Δάρρων (Θάρσων?). Cf. Sturz, *De dialecto Macedonica et Alexandrina* (1808); Fick, *Zum makedonischen Dialekt*, *Kuhns Zeitschrift*, xxii., 193 ff. BENJ. IDE WHEELER.

Maceio, maa-sā-yō′ (sometimes, but incorrectly, written Maçayo): capital, principal city, and port of the state of Alagoas, Brazil; on the Atlantic Ocean, at the mouth of a little stream which forms the outlet of the Lagôa do Norte; lat. 9° 39′ 35″ S., lon. 35° 44′ 36″ W. (see map of South America, ref. 4–I). The city proper is situated a little inland, at the base of bluffs which form the edge of a low table-land; it is well built, and peculiarly picturesque, owing to the great number of cocoanut and *dendé* palms which grow about it. The heat of the climate is modified by regular sea-breezes, and the place is generally healthful, but the water-supply is poor. The port is a suburb called Jaragua, connected with the main city by a horse railway. The harbor is formed by a coral reef about half a mile off shore, is open to south winds, and of late years has tended to fill up with drifting sands. Maceio is the terminus of a branch of the Recife and São Francisco Railway. It has a thriving and growing trade, the most important exports being sugar and cotton. Pop. (1893) about 15,000. The Lagôa do Norte, a short distance inland from the town, is a salt lake of considerable size, and is navigated by small steamboats. It abounds in fish. HERBERT H. SMITH.

McEntee, JERVIS: painter; b. at Rondout, N. Y., July 14, 1828; studied under Frederic E. Church in 1850–51; a few years later opened a studio in New York; exhibited a picture at the Academy of Design in 1853; was elected an associate of the academy in 1860, and a full member in 1861. He visited Europe in 1869. Among his important works are *Indian Summer* (1861); *October Snow* (1870); *Cape Ann* (1874); *The Kaatskills in Winter* (1884). D. at Rondout, Jan. 27, 1891.

Macerata, maă-chă-raa′tăa: town; in the province of Macerata, Central Italy; about 30 miles N. W. of Fermo (see map of Italy, ref. 5–F). This town, one of the finest in the Marches, is surrounded by strong walls crowned by thirty-three towers, and at one of its six gates stands a triumphal arch. The aspect of the town itself is striking, and the panorama to be seen from it is beautiful. Among the public buildings are the cathedral, modern, but containing old mosaics and pictures of interest; the Churches of Santa Maria delle Vergini, of much architectural merit, and that of Santa Maria della Pace, of the fourteenth century, and a palace of the thirteenth century, which is one of the finest specimens existing of the architecture of that age. There is a university founded in 1824 by Pope Leo XII. Macerata was built about 408 A. D. on the ruins of Ricina, a celebrated town of the territory of Piceno. It was generally faithful to the pope during the Middle Ages; in 1799 it was sacked by the French. The bishopric of Macerata dates from the suppression of the see of Recanati in 1320. Murat retired here for a few days in 1815, and here his demoralized troops forsook him. Macerata was among the foremost to declare for popular freedom in 1848–49, and its citizens are distinguished for intelligence. Pop. (1891) about 10,000.

McEvoy, JOHN MILLAR: See the Appendix.

Macfarlane, CHARLES: historian; b. in Scotland early in the nineteenth century; traveled extensively in the East and resided many years in Italy; wrote, among other works, *Constantinople in 1828–29* (1829); *Civil and Military History of England*, contributed to Knight's *Pictorial History*, edited by G. L. Craik (8 vols., 1838–44); *Our Indian Empire* (1844); *The French Revolution* (1845); *The Pictorial History of Scotland*, with G. L. Craik (8 vols., 1849); *Turkey and its Destiny* (1850); *Memoir of the Duke of Wellington* (1851); *Life of the Duke of Marlborough* (1852); and a *History of British India* (1852). D. in 1858.

Macfarlane, ROBERT: editor and author; b. in the Highlands of Scotland in 1734; was educated at the University of Edinburgh, and is alleged to have assisted Macpherson in the preparation of *Ossian*. He published a Latin translation of *Temora* (1769), one of the Ossianic epics; wrote vols. i. and iv. of a *History of the Reign of George III.* (4 vols., 1770–96); edited *The Morning Chronicle* and *The Morning Packet*; published an *English and Gaelic Vocabulary* (1795) and *The Poems of Ossian in Gaelic, with a Literal Translation into Latin* (1807). He was engaged upon a vindication of the genuineness of *Ossian* at the time of his death, which occurred in 1804.

Macfarren, GEORGE ALEXANDER: musician; b. in London, Mar. 2, 1813; educated entirely in that city. He was a prolific and for a time a highly popular composer. In opera he produced *Don Quixote*, *The Devil's Opera*, *Robin Hood*, *Jessy Lea*, *Helvellyn*, *She Stoops to Conquer*, *Charles II.*, *El Malechor*, and *The Prince of Modena*. In oratorio may be mentioned *St. John the Baptist*, *Joseph*, *The Resurrection*, *King David*; in cantatas, *The Sleeper Awakened*, *Leonora*, *Mayday*, *Christmas*, *The Lady of the Lake*, *Around the Hearth*, *Songs in a Cornfield* (these last two for female voices only), *Outward Bound*, and music to Sophocles's *Ajax*. He also composed five symphonies, several overtures, much church music, many songs and smaller works. He wrote a number of theoretical musical works, musical biographies, analyses of great compositions, etc. In 1875 he was appointed Professor of Music at Cambridge University, to succeed Sir William Sterndale Bennett, whom he also succeeded as principal of the Royal Academy of Music in London. In May, 1883, he was knighted. D. Oct. 31, 1887. During the greater part of his life he was blind, and most of his compositions were written from dictation by his wife. He was a musician of the old, conservative school, and was strongly opposed to Wagner. See his *Life and Works* (1891). D. E. HERVEY.

MacGahan, JANUARIUS ALOYSIUS: newspaper correspondent; b. in Perry co., O., June 12, 1844; visited Europe in 1868, and during the Franco-German war was correspondent for *The New York Herald*, describing the defeat and retreat of Gen. Bourbaki. He accompanied the Russian expedition against Khiva in 1873, and afterward published an account of his experiences in *Campaigning on the Oxus and the Fall of Khiva*. In 1875 he took part in the Arctic expedition of the Pandora, which he described in *Under the Northern Lights*, published on his return. Leaving *The Herald* he entered the service of the London *Daily News*, and in 1876 wrote for that paper a series of stirring letters about the Bulgarian atrocities. The effect of these was to arouse the keenest sympathy of the people of Great Britain with the victims, and to remove the danger of British opposition to Russian intervention. He followed the entire course of the war in his letters, which are the best journalistic correspondence of the time. D. in Constantinople, June 10, 1878.

McGarvey, JOHN WILLIAM: theologian; b. at Hopkinsville, Ky., Mar. 1, 1829; was educated in Bethany College, where he graduated with honors in 1850. He was ordained to the ministry among the Disciples in 1851, and preached in Missouri until 1862, when he accepted a call to Lexington, Ky. In 1862 he published a *Commentary on Acts*, which he has since thoroughly revised. Since 1865 he has held a chair in the College of the Bible, Kentucky University. In 1879 he made a tour in Palestine, and in 1881 published *Lands of the Bible*. In 1886 he published vol. i. of a work on Christian Evidence, *Text and Canon*, and in 1891 vol. ii., *Credibility and Inspiration of the Bible*. J. H. GARRISON.

McGee′, ANITA NEWCOMB: See the Appendix.

McGee, THOMAS D'ARCY: politician and writer; b. at Carlingford, Louth, Ireland, Apr. 13, 1825; went in 1842 to Boston, Mass., where he wrote for the Boston *Pilot*, and became its chief editor; became London correspondent of the Dublin *Freeman's Journal*, and afterward was secretary of the Irish confederation and an editor of *The Nation*. In 1848 he fled to New York, where he was, 1848–50, editor of a paper advocating the independence of Ireland. Displeased with the Knownothing movement, he went to Montreal, Canada; edited *The New Era*, disavowed republicanism, became an ardent royalist; entered the provincial Parliament

in 1857; beeame in 1864 president of the executive eouneil, and in 1867 Minister of Agrieulture. He denounced the Fenian movement, and was assassinated at Ottawa, Canada, Apr. 7, 1868. His principal works are *O'Connell and his Friends* (Dublin, 1845); *Canadian Ballads* (1858); *Irish Settlers in America* (1851); *Protestant Reformation in Ireland* (1853); *History of Ireland* (New York, 1862); *Catholic History of North America* (1854); *Speeches and Addresses on the British American Union* (London, 1865). A volume of his poems appeared in 1870 (New York).

McGee, W J: anthropologist and geologist; b. near Dubuque, Ia., Apr. 17, 1853; was self-educated. In 1879 he began a geologic map of his own and neighboring counties, and eventually the geologic mapping was expanded into a systematic survey of an area of 17,000 sq. miles in Northeastern Iowa. The maps and other results were published in 1891 in the *Eleventh Annual Report* of the U. S. Geological Survey. In 1881 he examined and reported on the building-stone and quarry industries of Iowa for the tenth census, and in 1882 beeame conneeted with the U. S. Geological Survey. In 1885 he laid the plans for surveys and mapping by the U. S. Geologieal Survey before the International Geologie Congress at Berlin; and a year later made a study of the Charleston earthquake, on the ground, immediately after its oeeurrenee. On the organization of the Geologieal Society of Amcriea in 1888 he beeame its editor, and held the position for four years; he has also edited *The National Geographic Magazine* for several years. In 1885 and again in 1892 he compiled geologic maps of the U. S., and he has prepared a geologic map of the State of New York. In 1893 he resigned from the Geological Survey, and was appointed ethnologist in eharge in the Bureau of Ethnology. His published writings exeeed 100 titles.

McGiffert, Arthur Cushman, Ph. D., D. D.: theological professor; b. at Sauquoit, N. Y., Mar. 4, 1861; was edueated at Western Reserve College, Union Theological Seminary, the Universities of Berlin and Marburg, in Paris, and in Rome. In the department of ehureh history, in Lane Seminary, he was instruetor 1888–1890, and professor 1890–93; and in 1893 he became professor in the same department in Union Seminary, New York. He has published *Dialogue of Papias and Jason* (1889); and a translation, with prolegomena and notes, of the *Church History of Eusebius Pamphilus*, in *Nicene and Post-Nicene Fathers* (1890).

McGiffin, Philo N.: See the Appendix.

McGill, James: founder of McGill College, Montreal; b. Oct. 6, 1744, in Glasgow, Seotland and was edueated there; removed to Canada about 1770. For some time after his arrival he was engaged in the Northwest fur-trade; subsequently beeame a merehant in Montreal; was for many years a member of the Lower Canada Parliament, and afterward of the legislative and exeeutive eouneils. He held the rank of brigadier-general of militia during the war of 1812, and was mainly instrumental in founding the eollege (now university) in Montreal whieh is named after him. He died in Montreal, Dee. 19, 1813. Neil Macdonald.

McGil'livray, Gen. Alexander: a Creek ehief, son of Laehlan McGillivray, a Scoteh trader, by the half-breed daughter of a Freneh officer; b. in Alabama about 1740; was well educated at Charleston, and was for some time engaged in eommercial pursuits at Savannah, but returned to his tribe, in whieh, at the time of the Revolution, he had beeome a prominent leader and head of the royalist party. After the war, in whieh he took little part, he indueed the so-called Museogee Confederaey, embracing Creeks, Seminoles, and other tribes, to beeome allies of the Spanish colonial government of West Florida; was the eommissary of that government among his countrymen, and coneentrated their trade at Pensaeola. In 1790 he visited New York by invitation of Washington; was reeeived with honor; signed a treaty eeding to the U. S. the disputed territory on the Oconee river, and by a secret artiele of the same instrument reeeived the appointment of U. S. agent, with the rank and pay of brigadier-general. D. at Pensaeola, Feb. 17, 1793. McGillivray was a man of culture and politieal talent, and exereised a splendid hospitality. He was unele to the eelebrated ehief William Weatherford.

McGillivray, William, LL. D.: naturalist; b. in the isle of Harris, Seotland, in 1796; beeame in 1823 Assistant Professor of Natural History at the University of Edinburgh; was afterward eonservator of the museum of the Royal College of Surgeons in that city, and in 1841 was appointed Regius Professor of Natural History in Marischal College, Aberdeen. He published *Lives of Eminent Zoölogists from Aristotle to Linnæus* (1834); *A History of British Birds, Indigenous and Migratory* (5 vols., 1837–62); and wrote the major part, if not all, of the systematic portion of the text of Audubon's *Birds of America*. D. at Aberdeen, Sept. 5, 1852. He left unfinished a treatise on *The Natural History of Deeside and Braemar*, illustrating the vieinity of Balmoral. The manuscript was purehased by Queen Victoria and printed in 1856. Revised by F. A. Lucas.

McGlynn, Edward: clergyman; b. in New York city, Sept. 27, 1837; was edueated at the College of the Propaganda in Rome, and in 1866 beeame pastor of St. Stephen's ehureh in New York eity, where he rapidly gained great influenee over his eongregation. His opposition to the establishment of parochial schools and his championship of the doetrines of Henry George brought him into disfavor with the Chureh authorities, and he was removed from his eharge and summoned to the Vatiean. On refusing to obey he was excommunicated. In 1887 he aided in founding the Anti-Poverty Society, and became its president. A reconeiliation was effeeted betweeu McGlynn and the Chureh in 1893, and he was restored to his rank and dignity. D. Jan. 7, 1900.

McGoun, Archibald: See the Appendix.

McGready, măk-grā'di, James: clergyman; b. in Western Pennsylvania about 1760; was edueated at Jefferson College; beeame a Presbyterian minister in North Carolina; removed to Southwestern Kentucky in 1796, where he direeted a remarkable revival of religion, whieh, begun in 1797, lasted for some years, and led to the organization in July, 1800, of the first camp-meeting. The religious movement thus begun was carried on by young men who were ordained to the ministry without a regular edueation in theology. This step gave rise to opposition, and the eeclesiastieal difficultics eulminated in 1810 in the organization of a new Church, whieh took the name Cumberland Presbyterian Church (*q. v.*) from the region of its origin. Two years later he withdrew from the new body and returned to his former presbytery. He died in Kentucky in 1817. His *Collected Sermons* appeared in 1831–33 (Nashville). See his *Life* by Rev. J. B. Lindsley (Nashville).

Revised by C. K. Hoyt.

McGreg'or: city; Clayton co., Ia. (for loeation of eounty, see map of Iowa, ref. 3–J); on the Mississippi river, and the Chi., Mil. and St. P. Railway; opposite Prairie du Chien, Wis., 55 miles N. W. of Dubuque. It is in a picturesque valley in an agrieultural region; has large grain and live-stock interests; contains railway ear and repair shops, carriage and wagon faetory, blank-book manufactory, bindery, and two weekly newspapers; and is an attractive summer resort. Here are eurious pietured roeks and Pike's Peak, the highest point on the Mississippi river. Pop. (1880) 1,602; (1890) 1,160; (1900) 1,498. Editor of "News."

MacGregor, James MacNaughtan, D. D.: minister of the Free Church of Seotland; b. in Callander, Perthshire, Jan. 6, 1830; edueated in the University and the New College of Edinburgh; minister of the Barry Free ehurch 1857–61; of the Paisley Free High ehureh 1861–68; Professor of Systematic Theology, New College, Edinburgh, 1868–81; minister of Columba church, Oamaru, New Zealand, from 1882. Besides pamphlets, reviews, and articles on *Hegel* and *Jacobi* in the eighth edition of the *Encyclopædia Britannica*, Dr. MacGregor has published *Text-book on Christian Doctrine* (Edinburgh, 1861); *The Sabbath Question* (1865); *Handbook on Galatians* (Edinburgh, 1875); *Handbook on Exodus* (Edinburgh, 2 vols., 1889); *Presbyterians on Trial by their Principles* (Dunedin, 1890); *The Apology of the Christian Religion* (Edinburgh, 1892); *The Revelation and the Record* (Edinburgh and New York, 1893); in press, *The Catholic Doctrine of the Person of Christ*, and *Studies in the History of Christian Apologetics*.

C. K. Hoyt.

MacGregor, John: author; b. in Stornoway, Ross-shire, Seotland, in 1797; emigrated to Canada in youth, and was long engaged in commereial pursuits; published *A Sketch of British America* (1828); *Emigration to British America* (1829); *My Note-book* (1835); *Commercial and Financial Legislation of Europe and America* (1841); *Commercial Statistics of all Nations* (5 vols., 1844–50); *Progress of America from the Discovery by Columbus to 1846* (2 vols., 1847); *Holland and the Dutch Colonies* (1848); *Germany and her Resources* (1848); and a *History of the British Empire from*

the Accession of James I. (2 vols., 1852). Returning to England, he was employed on commercial missions to several European governments; was in 1840 a secretary of the Board of Trade; advocated free-trade measures: was elected to Parliament for Glasgow 1847; was made governor of the Royal British Bank, on the failure of which he retired to Boulogne, France, where he died Apr. 23, 1857.

MacGregor, John: traveler and author; b. at Gravesend, England, Jan. 24, 1825; entered Trinity College, Dublin, but removed to Trinity College, Cambridge, where he graduated 1844; entered at the Middle Temple 1847; made a tour of Europe, the Levant, Egypt, and Palestine 1849–50; was called to the bar 1851; visited Russia and every country in Europe, as well as Algeria, Tunis, the U. S., and Canada; wrote and sketched for *Punch* and other periodicals; made in 1865 a canoe-voyage, and in the following year published his log-book, under the title *A Thousand Miles in the Rob Roy Canoe on Rivers and Lakes of Europe*; in later years made other voyages, recorded in the volumes *The Rob Roy on the Baltic, The Voyage Alone in the Yawl Rob Roy*, and *The Rob Roy on the Jordan*, all of which have been very popular and have found numerous imitators. Mr. MacGregor was captain of the Royal Canoe Club (1866); was a prominent member of the London school board, and was active in philanthropic work. D. at Bournemouth, England, May 16, 1892.

Mácha, maa'kă, Karel Hynek: poet; b. at Prague, Bohemia, Nov. 15, 1810; studied philosophy and law at the University of Prague. In 1836 he finished his legal studies, and entered a lawyer's office at Litoměřice, where he died Nov. 7, 1836. His fame rests upon his lyrico-epic poem *Máj* (May, Prague, 1836), which introduced into Bohemian poetry the Byronian pessimistic view of life. It contains passages of great beauty, and its language is highly musical. He also wrote a number of short lyric poems and stories: *Křivoklát* (in the *Květy*) and *Cikáni* (The Gypsies, Prague, 1857). His collected works were published in 1862, at Prague, by Kober. A German translation, by A. Waldau, appeared in 1862, at Prague. Mácha's genius, misunderstood by his contemporaries, was fully recognized by the succeeding generation. J. J. Král.

Machæ'rodus [Mod. Lat., liter., knife- or saber-toothed; Gr. *μάχαιρα*, knife, curved dagger + *ὀδούς*, tooth]: an extinct genus of carnivorous mammals allied to the cats, and distinguished by the enormously developed canines of the upper jaw. These teeth are long, curved, and compressed, with a trenchant and usually serrated edge behind and before, whence the name "saber-toothed tigers" applied to the group, which has been divided into three genera—*Drepanodon* (from *δρεπάνον*, a scimitar), *Smilodon* (from *σμίλη*, a chisel or graver), and *Machærodus*. Many species have been described from the Middle and Later Tertiary and the Quaternary deposits of Europe, Asia, North and South America. *Machærodus primævus*, from the Bad Lands of Dakota, was somewhat smaller than the cougar or American panther, and the skull resembles that of that animal in many respects. *M. sivalensis* is another Miocene species from the Sewalik Hills, India. *M. cultridens* from the Tertiary of the Val d'Arno is a large species, the upper canines measuring 8½ inches along the anterior curve. *M. latidens* from the Quaternary of Kent's Hole, England, was scarcely smaller, and equaled the largest living tiger in size, while *M. neogæus* from the Quaternary of the caverns of Brazil was a still larger species, the canines projecting about 8 inches from their sockets. The later species of *Machærodus* were doubtless contemporary with man, but the group became extinct before the beginning of the historic period.
O. C. Marsh.

McHale', John, D.D.: archbishop; b. in 1791 at Tubbernavine, Mayo, Ireland; studied for the Roman Catholic priesthood at Maynooth College, where he became Professor of Theology (1814); was appointed coadjutor Bishop of Killala in 1825; became titular bishop in May, 1834, and Archbishop of Tuam in August of the same year. He took an active part in the agitation which led to Roman Catholic emancipation, writing two series of letters on the subject; published in 1827 a treatise on the *Evidences and Doctrines of the Catholic Church*; built a cathedral at Ballina; built or rebuilt more than 100 churches; established numerous convents and Roman Catholic parish schools; preached at Rome in 1832 a series of sermons, which were translated into Italian; obtained from the pope in 1848 the condemnation of the queen's colleges in Ireland, and in 1869 procured from a council of Irish bishops a vote of censure against mixed education. He did much to revive the literary use of the Irish language, translating in the original meters sixty of Moore's *Irish Melodies*, published Irish translations of six books of the *Iliad* (1861) and of the *Pentateuch* (1863), etc. D. Nov. 7, 1881.

Macha'on (in Gr. *Μαχάων*): in Greek mythology, a son of Asclepius and Epione, and himself a skillful physician. Along with his brother Podalirius he conducted thirty Thessalian ships to Troy, where they acted as the physicians of the Greeks. He was wounded by Paris, but was saved from death by Nestor. He was one of the heroes in the wooden horse. He was killed afterward by Eurypylus, the son of Telephus. His friend Nestor brought his body to Messenia and buried it in Gerenia, where a heroum was built in his honor, and in a sanctuary connected therewith cures were effected in his name. J. R. S. Sterrett.

Machias, mā-kī'as: town; capital of Washington co., Me. (for location of county, see map of Maine, ref. 7–G); at the head of navigation on the Machias river, 12 miles from its entrance into Machias bay; 70 miles E. by S. of Bangor. It is engaged in the coasting trade, lumber business, and in ship-building, and has 3 banks, the Porter Memorial Library, and 2 weekly newspapers. Pop. (1880) 2,203; (1890) 2,035; (1900) 2,082.

Machiavel'li, Niccolò di Bernardo: historian and publicist; b. in Florence, Italy, May 3, 1469, of a respectable middle-class family; d. in Florence, June 22, 1527. Of his early life or occupation before his secretaryship hardly anything is known, and of his private life and family relations in later years we have only an occasional glimpse. His education was not that of a scholar; although he uses Latin as easily as Italian, and is thoroughly familiar with the authors he knows, his reading was not wide, and his acquaintance with Greek writers was almost certainly obtained through Latin and Italian translations. What we find in him is the practical and ready knowledge of the busy man of affairs. In 1502 he married Marietta Corsini, who bore him six children and apparently was attached to him; but his own sentiments toward her do not appear in his letters, in which he speaks of all that interests his active mind, and while he shows that he was not free from the gross licentiousness of his times, he is ever reticent as to his family affairs. Though the human and domestic side of the man eludes us, we have a complete picture of his public activity and intellectual development from the time he takes office to his death. He had grown to manhood in the Florence of Lorenzo the Magnificent, the brilliant center of the great revival of learning; had seen the rise of the new tyrannies in Italy, the ravages of the mercenaries, the invasion of the French under Charles VIII.; had seen the Medici driven out and Savonarola burned at the stake, when, after the re-establishment of the republic, he was in 1498 appointed chancellor, or secretary, of the second chancery in Florence, which transacted the business of the commission in charge of war and foreign affairs (*dieci di libertà e pace*). He continued in this office till the end of the republic and the return of the Medici in 1512. His position was that of a high subordinate official who must possess great technical knowledge, and who retains his place in spite of all changes in his superiors. He is trusted and consulted in matters of the greatest moment, but nowhere does he take a leading part or represent the state. This takes from him the responsibility of acting, and leaves him as an observer, high enough in rank to be present on important occasions and to have knowledge of all secrets of state, yet low enough not to be noticed. Machiavelli's years of public life were years of ceaseless activity and labor. The archives of Florence contain thousands of official papers in his handwriting, but his functions were not limited to the walls of his office. Almost yearly he was sent out with some embassy to guard the interests of Florence; to Cesare Borgia (*il duca Valentino*), whom he had abundant opportunity to study carefully, both at the height of his power and after his fall; to the Emperor Maximilian; twice to Pope Julius II.; four times to King Louis XII. of France; repeatedly to the little states of Italy. Of all these embassies he sent home elaborate reports, full of minute knowledge of politics, of shrewd observations, of suggestions of all kinds, and written in the simple, direct style which marks him as the foremost master of Italian prose. From this close contact with affairs, furthermore, he was constantly deriving those general views which appear again and again in his discussion of the larger problems of his time. Thus during his whole official

life Florence was engaged in an effort by the use of mercenaries to reduce rebellious Pisa. Machiavelli early perceived the evils of the system, and advocates in his reports the substitution of a national militia. He is convinced that no state can be strong save by the use of its own troops, which it must obtain by arming and drilling the whole population, and his never-failing example is republican Rome. Of this plan he never tires; it appears again and again in all his political writings. He had influence enough with Piero Soderini, the gonfaloniere, to have the experiment tried, but the troops when put to the test proved utterly inefficient. The failure did not discourage Machiavelli, and after his removal from office he fully developed his views in the book *Dell' arte della guerra* (1520). That system all the powers of continental Europe are now trying to maintain. Again, the interference of Charles VIII. and of Louis XII. in Italy filled him with horror, as the ravages of the French soldiery were even more brutal than those of the mercenaries. The remedy in his eyes is the formation of a united Italy that shall be able to protect itself. A republic like Rome can not be hoped for, so he looks for the prince who should be skillful and strong enough to bring about the union, and sees the needed qualities in Cesare Borgia.

After fourteen years of indefatigable activity the return of the Medici in 1512 put an end to Machiavelli's public life. In the following year, on the occasion of a conspiracy against the new government, he was arrested, subjected to torture, and imprisoned for a while, but soon set free, with the injunction not to leave the territory of Florence. He withdrew to the country, and in his enforced leisure engaged in the composition of the works that have made him famous. He continued to watch public affairs eagerly, as is shown by his *Lettere familiari*, almost all of which belong to this period. Here and there in these we find a charming description of his rural pleasures or of his intercourse with his literary friends, but the greater part, especially those to Vettori and Guicciardini, are filled with political news, criticism, and advice.

While in office he had produced a rhymed chronicle of the events of the ten years preceding 1504, the *Decennale primo* (followed by an incomplete *Decennale secondo*), which, though valuable for the historical information and judgments contained in it, is wretched doggerel in the form of *terza rima*. The purely literary verse which he wrote later is uniformly bad. His tale of *Belfegor* is bright and amusing, but hardly to be distinguished from the hundreds of similar productions in Italian. He wrote a few comedies in prose, of which one, *La mandragola* (1513 ?), is considered the masterpiece of the Italian stage in that century, some critics even thinking it the best in Italian. The piece is little more than a *novella* told in scenes in which the plot hardly admits of dramatic action and is highly immoral; but the dialogue is natural and sparkling, the characters fairly breathe with life, and are drawn with the realistic truth and accuracy of observation which mark all his writings and make even his official reports works of literature. His other plays are far inferior in merit.

In the year 1513 Machiavelli began to put into shape the results of his reading and reflection upon politics, and of his long experience in the affairs of state. Within the year, probably, he finished *Il Principe*, the book which is irrevocably connected with his name, and which has made *machiavellism* a synonym for evil. At the same time he was at work on the *Discorsi sopra la prima deca di Tito Livio*, and in each work refers to the other, so that the two can not be considered apart. The only forms of government which he understood and thought possible were the rule of the many and the rule of one; the republic (of which the most perfect example to him was Rome) and the absolute monarchy. The *Discorsi*, whose title is misleading, are his reflections on republican government—how it can be made to succeed, to what dangers it is exposed, how such governments grow and decay, with examples drawn from classical antiquity, from the history of the Italian states, and from what he himself had seen. In the *Principe*, in the same way, he investigates the rule of a single person—how it may be acquired, how retained, how made to succeed, and the qualities necessary to a prince. The most brilliant example of such a prince in his eyes is Cesare Borgia, of whose attempt to subdue the cities of Romagna he had been an eyewitness. The book is a purely scientific examination of the forces that come into play in the successful establishment of a strong and durable personal government; and from the problem are eliminated all extraneous factors like the rights of the persons affected and the morality of the acts committed. The investigation is carried out with the pitiless logic of a mathematical demonstration; every step is proved by examples from contemporary history, which unfortunately were abundant; and the conclusions reached are profound principles, of which many, however startling when expressed plainly and stripped of their conventional dress, are accepted as true by all statesmen and historians, and are followed by practical men in daily life. Some, however, if unmodified, would demand the ideal villainy of Machiavelli's model in order to be put into practice. The book was dedicated first to one, then to another of the Medici; but there is no evidence that it was ever presented. The dedication was intended rather to bring to public notice a work containing the author's ripest thought, which was not written for a special occasion. Like the *Discorsi* (published in 1531), it appeared after the author's death (in 1532). The *Principe* has given birth to an endless controversial literature, dating from its publication, in which it is attacked, defended, excused; in which question is raised as to what Machiavelli really meant, whether the book expresses his real convictions, whether it is not a satire—questions that are likely to remain matters of opinion. In his bold breaking away from all mediæval and even humanistic traditions of the state, and from all scholastic forms of thought, in his purely objective treatment of his question, as a purely scientific one, in his thoroughly modern way of looking the facts in the face, Machiavelli produced a work of genius, which at once made politics a science, and will stand forever as a masterpiece of Italian prose style. In 1521 Machiavelli, who had long been trying to draw closer to the Medici in the hope of again entering the active life for which he was so well fitted, was commissioned by them to write the history of Florence, and by 1525 had completed the work to the death of Lorenzo the Magnificent; his intention to continue it to his own time was prevented by death. Anxious to give his story a form worthy of it, in the *Istorie Fiorentine* Machiavelli turns to older historical models, and departs in some degree from his usual simple style; but it is the new method of treating history that gives the book its merit. No trace of the ancient chronicler is left; careless and often inaccurate in matters of detail, not always critical in the choice of authorities, with little sympathy for the Middle Ages and dead institutions, the author seeks everywhere for motives, for causes and results, for lessons to be drawn, for what can be of use in the present and the future, and applies to the task the clear, judicious, dispassionate intelligence that is his chief characteristic. This it is that makes him the first of modern historians, and places his name by the side of those of Tacitus and Thucydides.

The end of Machiavelli's life was clouded. He had acquired the esteem of the Medici, but hardly had they begun to make use of his talents when in 1527 they were again driven out of Florence and the republic was re-established. It was not to be hoped that Machiavelli would be restored to his office; yet he seems to have been bitterly disappointed that he was not; and in that same year he died, and was buried in the family chapel in Santa Croce, leaving his family in great poverty.

The change of party, the desire to serve both the republic and the Medici, has been made a reproach against Machiavelli, but not with entire justice. In all his public life he was first and foremost a citizen of Florence; his loyalty, his patriotism were for his city alone. In all his writings he shows his preference for a republic, and he had served his republic faithfully; but when the government changed he continued a Florentine and was ready to serve his country under the Medici. A practical man of business, he sought for good government first; he was constantly striving against the disorders that weakened the state, and so was ready to accept a tyranny, which was strong and preserved order, in place of a republic which retained only the form of liberty. From the conviction that Florence could be free and powerful only if foreigners were kept out of Italy, he was led to think out the remedy, and found it in the idea of a united Italy. In seeking the cure of the evils which afflict his country he goes to the very foundation of things, and deduces principles that apply to all states at all times. Living in an age when individual effort, for good and for bad, produced results which have never been equaled, his name stands among the foremost as a thinker; while as a writer of prose he is acknowledged as the greatest that Italy can boast. The Giunti published an edition of his complete works, the *Testina*, in 1551, and they have often been reprinted since.

The best modern edition is that printed at Milan, 1810–11, or *Italia*, 1813, in eleven volumes. An edition begun in 1873 by Passerini and others was never completed. An English translation by Detmold appeared in 1882. Of the *Principe* there is an excellent edition by E. A. Burd (Oxford, 1892). The best and latest biography is by Pasquale Villari, *N. Machiavelli e i suoi tempi* (3 vols., 1877–82; English trans. by Linda Villari, new ed. 2 vols., London, 1892). The literature on the *Principe* will be found in Mohl, *Geschichte und Literatur der Staatswissenschaft* (vol. iii.) See also O. Tommasini, *La Vita e gli scritti di N. Machiavelli* (Turin, 1882); Nitti, *Machiavelli nella vita e nelle opere* (1876, *seq.*); Nourrisson, *Machiavel* (Paris, 1883).

G. Bendelari.

Machines and Machinery [viâ O. Fr. from Lat. *machina*, from Gr. μηχανή, device, expedient, contrivance, deriv. of μῆχος, means, expedient]: combinations of fixed and moving parts contrived with an intent to utilize force and motion for the attainment of a desired result. Mechanical machinery may be classified in general terms as follows: First, the machinery of prime movers, which includes every kind of machine by which natural forces are controlled and made available; second, the machinery of transmission, which includes every means for the transmission of power from a prime mover to the place where it is to be used; third, the machinery or apparatus which utilizes power in the doing of work.

The active elementary constituents of machinery, arranged in the order of discovery, are: 1, sliding contact; 2, rolling contact; 3, links or connecting-rods; 4, hoisting-tackle, etc.; 5, wrapping connections, belts, etc.; 6, fluid connections. The elementary movements employed in machinery are: 1, rectilinear motion; 2, circular motion; and 3, combination of the two kinds of motion. A well-known illustration of the three kinds is supplied by the connecting-rod of a steam-engine. The end of the rod coupled to the crosshead has a rectilinear movement, while the other end coupled to the crank moves in a circle, while any other point on the rod describes a closed curve whose form and proportions are determined by the position of the point on the rod. The results produced by machinery are accomplished by the combination of suitable constituents of operation with force and motion in one or more of the three elementary ways named.

Machines may be classified in a general way as follows: 1, machines for use as prime movers, such as water-wheels, windmills, steam-engines; 2, for moving solid bodies: 3, for moving fluids; 4, for cutting or dividing bodies; 5, for making textile fabrics; 6, for pressing or squeezing: 7, for printing; 8, for acoustic purposes; 9, for optical purposes; 10, for calculation; 11, for measuring; 12, for weighing; 13, for recording; 14, for copying; 15, for developing and storing up electricity; 16, for miscellaneous purposes. Many of the items in this list may be subdivided into a large number of special types, each representative of certain peculiarities of construction intended to adapt the machine to particular situations or uses. The general considerations which should be kept in view by the constructors of machines are: Sufficient strength, wearing surface, and accessibility of parts; their adaptation to their functional requirements, with special reference to a silent smoothness of action in the moving elements, convenience of lubrication, safety to the attendants, and avoidance of complication. Noise and vibration in machines are usually evidences of a waste of power.

W. F. Durfee.

Machine-tools: machines used in shaping materials, as distinguished from tools used for such purposes which are worked by hand. The term is ordinarily restricted to those machines employed in working metals. Machine-tools commonly change the form of the stock upon which they work by cutting, as in turning, planing, drilling, and milling; but many important machine-tools, as grinding-machines, steam-hammers, and drop-presses, employ other processes.

The most familiar standard cutting machine-tools are the lathe, planer, and drill-press. By means of the lathe a piece may be turned (shaped externally) or bored (shaped internally) to almost any desired figure of revolution; flat surfaces can be faced, screw-threads can be cut, and, by special devices, various irregular forms can be produced. The hand-lathe, or speed-lathe, is the simplest form of the metal-working lathe, and it differs little in its essentials from the wood-turning lathe. The lathe-tool is held in the hands of the workman and simply supported on a rest. To facilitate such operations as those indicated above, upon stock of various sizes and shapes, many additional features are applied to the metal-working lathe in its more complete forms. The live spindle is driven by a stepped cone, so that by placing the belt upon different steps a speed appropriate to the material and size of stock is obtainable. For all but the smaller lathes it is desirable to have greater changes of speed than could be conveniently obtained in this way, and back-gears are applied. A lathe with back-gears is *double geared*. The *self-acting lathe* has a carriage with a feed along the bed. The tool is secured to this carriage, and cylindrical work can be produced automatically by this arrangement. This feed is usually derived from a spindle-rod or a screw parallel to the bed and driven by the spindle. When the screw is used, it is connected to the spindle by positive gearing, thus insuring a definite relation between the feed or longitudinal motion of the tool and the rotation of the work. This arrangement constitutes a *screw-cutting lathe*. The rod-feed is used for less exacting work, thus saving the lead-screw from unnecessary wear. Besides the screw-cutting lathe there are many modified forms, as pulley-lathes, shafting-lathes, turret-lathes, screw-machines, etc., designed to operate very efficiently upon limited classes of work.

For many operations, such as boring and turning large wheels, cylinders, etc., the *boring-mill* is advantageously employed. It has an adjustable vertical tool-support above a horizontal turning-table, upon which the work is placed.

The *planer* is used principally for dressing flat surfaces, though it is also employed for producing other ruled surfaces. The work is mounted upon a moving-table or platen, and the tool is held stationary during the cutting stroke, and fed horizontally, vertically, or at an angle during the return stroke. The time lost in the return stroke seriously affects the cost of work done on the planer. Various expedients have been tried to reduce this effect, but the one generally employed is that of returning the platen at a higher speed than would be permissible in cutting. The ratio of time required in cutting to that of the return stroke is about three to one, though five to one is sometimes employed, and higher ratios have been attained, but are extreme and unusual.

The size of work which can be operated upon in the ordinary type of planer is limited by the distance between the vertical supports or housings, and by the clear height under the cross-rail. For planing surfaces on wide work, without the use of excessively large planers, the open-side planer has been designed.

To avoid moving very heavy or unwieldy pieces, special forms of the planer, as the *plate-planer* and *shaping-machine*, are used; in these the tool is moved while the work remains stationary.

The *pillar-shaper* is very convenient for dressing small, light work; it resembles the shaping-machine, but has more limited capacity.

The *slotter* or *slotting-machine* resembles the shaper in its operation, but the cutter-bar has a vertical stroke, and the table upon which the work rests is placed below the cutter; so that the general design of the machine is somewhat suggestive of the drill-press.

The *drill-press* is largely restricted to drilling; but it is employed advantageously in tapping, reaming, and simple boring operations.

The *milling-machine* is used for a great variety of operations, and in its most general form—the "universal" milling-machine—it probably has a wider range than any other machine-tool. The cutter is a piece of steel having the general form of some figure of revolution, with teeth at the outer edge or along the faces. In the simplest form the cutter is similar to a circular saw, but the meridian section may be of almost any desired form. The cutter is mounted on a rotating arbor, and the work is fed toward the cutter. Plane surfaces are produced on the milling-machine by a long cylindrical cutter. The teeth of gears are cut on the milling-machine by giving the cutter the form of the space between two teeth of the gear. Most of the gear-cutting machines in use are only special forms of the milling-machine. The head of the universal milling-machine is used for subdividing circles, as in cutting gear-teeth and the flutes of taps and reamers; and the spindle is also capable of continuous rotation by the screw which imparts the longitudinal feed to the table. By this combination of motions the stock held by the head can be given a spiral movement under the cutter, with any desired pitch, and such grooves as are seen on twist-drills, spiral-reamers, and milling-ma-

chine cutters are thus produced. Many other (1,100) operations of a peculiar character may be carried on by the milling-machine, with proper devices. J. H. Barr.

Machine-work: work done and objects made or partly made by machinery, as distinguished from work produced by simple tools guided by the workman's hand. The term is especially used to denote what is intended for ornamentation, but, being made by machinery, has of necessity all its successive parts or members alike—a succession of parts exactly similar; whereas hand-work has not and can not have such close resemblance of its parts to one another. What is called the tame and lifeless character of machine-work is caused by this exact similarity of parts, as in machine-made lace, carpets woven on power-driven looms, wood-carving, and that which is called so, but is really carbonized or burnt work done by swift-moving patent appliances. All these fail to be pretty or interesting because of the constant succession of parts mechanically exact in their likeness to one another. There is no other cause for the general ugliness of machine-work that can not be done away with. The pattern may be as carefully designed for the steel die as for the workman to follow with his tools; the design for lace may be made as delicate and refined for the mill as for the needle-workers of Belgium or the bobbin-workers of Auvergne. If a design which is made for the machine is not generally so good as that used by the hand-workmen, this is because the same indifference to beauty of result which allows of the use of the machine at all governs also the choice of the design. There is no insuperable difficulty in getting fine designs ready for machine-work—some special patterns only, or some peculiar effects, are out of its reach. The real difference is that, whereas no two leaves, no two sprays, scrolls, curves, no two roundings, or sinkings, or notches are exactly the same in hand-work, machine-made ornament is always a series of exact repetitions.

A partial remedy for the stiffness and feebleness of machine-work is, then, to increase the length of the unit. In a machine-carved scroll, for instance, let the pattern which has to be repeated be 10 inches long and made up of four successive different whirls, or clusters, or "bouquets," rather than half as long and made up of two units only; then, when the fifth of these follows, and resembles the first one exactly, it will be so far from it, and will have so much differing work between, that the monotony of repetition will be greatly diminished. Another partial remedy is to make the pattern very irregular, very unsymmetrical, as is done, indeed, with many of the cheap laces of 1892–94, or to use a Japanese irregular sprinkle of flowers or sprays instead of an equally spaced arrangement of the same figures.

Russell Sturgis.

Machine and Rapid-fire Guns: A machine-gun is one that is loaded and fired by machinery. A rapid-fire gun is distinguished from a machine-gun by the fact that it is loaded by hand, and may be fired either by hand or by machinery; it is generally of larger caliber, and has but one barrel, while the machine-gun may have more. In both classes there is practically no recoil. The fire of the machine-gun is more rapid than that of the rapid-fire gun, but the latter delivers a comparatively rapid, well-aimed fire of large, armor-piercing projectiles, with relatively small weight of gun, while the former is generally limited in caliber to the small-arm ammunition; or, if it goes beyond this, as with the Hotchkiss revolving cannon, the weight of the gun becomes very great for the caliber. For these reasons machine-guns are restricted to infantry fighting, and can not cope with artillery. At present machine-guns are preferably used on land for defensive purposes in fixed positions, such as the defense of ditches or defiles, and on shipboard they are mounted in the tops, and are intended to sweep the decks of the adversary. Rapid-fire guns are almost exclusively used in the navy against torpedo-boats. By their power they are enabled to penetrate any armor that torpedo-boats can carry, and by their rapidity and accuracy the chances of hitting in a given time are greatly increased. The development of both machine and rapid-fire guns has been rendered possible by the development of metallic ammunition, and the limit of caliber of rapid-fire guns appears to be the weight of ammunition that can be conveniently handled by one man.

Machine-guns.

Mitrailleuse.—Probably the best known of the early machine-guns is the French mitrailleuse. This gun had twenty-five barrels, grouped in parallel rows of five. They were loaded by a single breech-block, which was movable, and contained twenty-five short chambers corresponding to the different barrels. Each gun had several of these breech-blocks, which were loaded beforehand. Each barrel had a separate firing-pin, and these pins were released in succession by mechanism operated by a crank.

Passing over a number of machine-guns which were tried during the civil war in the U. S. (1861–65), and which were generally unsuccessful, the next one to claim attention is the Gatling gun.

Gatling Gun.—This consists of a group of barrels (caliber 0·45 inches) around a central shaft. This shaft and the barrels are caused to rotate by a crank, which may be applied directly to the shaft, or indirectly, by means of a worm-gear. In rear of the barrels, and in prolongation of them, is a brass cylinder, whose surface contains a series of grooves, one for each barrel. Each of these grooves carries a bolt, which is made to slide in its groove parallel to the axis by the action of a fixed cam in rear of the bolts. Each bolt carries a firing-pin, a spiral mainspring, and an extractor. As the barrels and cylinder rotate, the bolts are pushed forward in their grooves. A cartridge being dropped from the magazine in front of a bolt, is pushed forward by the latter into the barrel. When it reaches this position the barrel is closed by the bolt, while the firing-pin, which has been drawn back during the forward motion, is released, and fires the cartridge. By a reversal of the motion of the bolts, caused by a change in the direction of the fixed cam, the empty case is now removed from the barrel and ejected. This process goes on continually, the bolts on one side advancing toward, and on the other side retiring from, the barrels.

The ammunition was formerly fed from a tin case in which the cartridges rested one above the other, and, the case being held vertically over the grooved cylinder, the cartridges were deposited in the grooves and in front of the bolts by the action of gravity. This was open to many serious objections, and is now abandoned.

For low angles of elevation the Bruce feed is used. This consists of an upright standard of brass, on the front of which is hinged a plate having two grooves into which the heads of the cartridges fit. By removing the top from the paper box in which the cartridges are packed, they can be slipped into the grooves of the swinging plate, and the box pulled off. One column of cartridges is then ready to feed into the gun. When this column is exhausted, the weight of the second column causes the hinged plate to swing over, and brings the opening of its groove over the magazine. A wheel is mounted below the mouth of the feed, which rotates with very little friction. The cartridges strike this and are delivered to the grooves parallel to the barrels, and thus jamming is avoided.

For high angles of elevation a positive feed, and one independent of gravity, is required. For this purpose the Accles feed is designed. It consists of a drum whose heads are separated by a distance a little greater than the length of the cartridge. The cartridges are held in spiral grooves in this drum, the pole of the spirals being at the center of the drum. Radial arms revolve about the center of the drum, the rotation being caused by projections on the grooved cylinder of the gun engaging with the extremities of the arms. By this rotation the arms push the cartridges along the spiral grooves of the drum, and deliver them to the barrels. The cartridges being held by the grooves are always fed parallel to the axis of the barrels, no matter what the angle of elevation may be.

The latest model feed consists of a strip of tin, to which the cartridges are attached by punching long, narrow pieces out of the strip, and wrapping these pieces around the cartridges. This strip of tin with the cartridges attached is fed into the gun, the cartridges acting as the teeth of a rack, and the fluted cylinder which carries the locks as a toothed wheel to move the strip transversely. A wedge-shaped projection frees the cartridges from the strip, and they are then pushed into the barrels by the locks as before. This feed is simple, light, and independent of gravity.

The Gardner Gun.—This has two barrels, which are parallel and side by side. Each barrel has its own bolt, as in the Gatling, and these bolts move backward and forward alternately in rear of the barrels and parallel to them, by the action of two cams, which are rotated by a crank. These cams are 180° apart, and, consequently, while one bolt is moving forward, the other is moving back. When the cams are on the center, one barrel is fired, while a cartridge

is dropped in front of the other bolt, ready to be pushed home. From the nature of eircular motion, the bolt is drawn baek slowly at first, thus giving power for the extraction of the empty ease. The feeding of the ammunition is somewhat similar to that of the Bruce in the Gatling gun. As the bolt moves forward it opens a valve and allows a cartridge to drop from the feed-guide in front of the opposite barrel, at the same time shutting off the feed from the barrel whose bolt is advaneing. This gun is not capable of delivering so many shots in a given time as the Gatling, owing to its smaller number of barrels.

The Nordenfelt Gun.—This is eomposed of a number of parallel barrels, varying from two to seven, arranged as in the Gardner gun. Eaeh barrel has its bolt, and the bolts are moved forward or backward together by a horizontal hand-lever on the right. Above each barrel is a magazine. When the bolts are drawn baek the eartridges drop in front of eaeh, and when the bolts are moved forward the cartridges are pushed by them into the barrels. As the bolts move forward the hammers are retained by a eomb. When the barrels are elosed by the bolts, and loeked by loeking bolts, the eomb whieh retains the hammers moves sidewise and releases them one after the other, so that the barrels fire sueeessively and not simultaneously. The effeet is that of a volley, but the shoek to the gun is not so great. This gun is used prineipally in England.

The Hotchkiss Revolving Cannon.—This differs from the Gatling, however, in having but one loading, one firing, and one extracting meehanism, whieh aet in turn on eaeh barrel. The caliber is 1½ inehes, and the projectiles steel shot, shell, or eanister. The breech is solid, and is of east iron and very heavy, to resist the shoek of discharge and assist in overcoming recoil. The barrels are made to revolve by the aetion of a peculiar gearing, driven by a erank on the right-hand side of the pieee. This gearing is for one-half its eireumferenee a screw, and for the other half the screw-threads become planes parallel to the axis of the gun. This gearing engages with heavy studs on the rear end of the central shaft, and by its arrangement, while the crank makes one continuous revolution, the barrels revolve during one-half of the revolution and remain still during the other half. While the barrels are rotating the firing-pin and loading-piston are moving to the rear, and the extractor to the front. While the barrels stand still the cartridge is fired, the empty case extraeted, and a new cartridge inserted. The rotation of the barrels then begins again as before. This gun is used principally in the U. S. navy, and was originally intended to act against torpedo-boats, but its relatively great weight and small caliber have caused it to be replaced for this purpose by the rapid-fire gun.

The Maxim Automatic Machine-gun.—This gun differs from those previously described in being, as its name indicates, automatic; that is, after firing one shot, if the finger be kept on the trigger, the gun will load and fire automatically till the supply of ammunition is exhausted. The inventor is Hiram S. Maxim, of the U. S. The gun consists essentially of a barrel attaehed to a frame. This barrel and frame are mounted in a casing, and have a sliding motion in it. The breech-block has a motion with reference to the barrel and frame. When the cartridge is fired, the barrel and frame reeoil together in the casing for a short distanee. At the end of this recoil a eam attached to the sliding frame strikes a fixed cam attached to the casing. The action of these cams draws back the breech-block from the rear end of the barrel. As it moves back it withdraws the empty shell from the barrel and draws a fresh cartridge from the magazine. The reeoil of the barrel and frame has also compressed a strong spiral spring, which now acts to pull the barrel and frame forward to its firing position. The block having extraeted the empty shell and drawn out a new cartridge, as above explained, its front portion or carrier, which slides vertieally, is caused to drop. The new cartridge is now in prolongation of the barrel, and the empty shell opposite the ejeetor-tube. The strong spiral spring before mentioned now moves barrel and block forward, and at the same time moves the bloek forward relatively to the frame, pushing the new cartridge home and the empty shell into the ejector-tube. As a final operation, when the block is in place the firing-pin will be released automatieally and the cartridge be fired, if the pressure on the trigger be maintained. After the insertion of the cartridge and just before the breech is closed, the front portion of the block or carrier rises and engages with a new cartridge. The cartridges are fed from belts, which may be hooked together end to end, and the supply thus made eontinuous. The belt is fed automatically, in a direction at right angles to the axis of the gun, and just above the chamber.

Rapid-fire Guns.

The Hotchkiss Rapid-fire Gun.—This is made of various ealibers, from the 1-pounder, 1·46 inehes, to the 100-pounder, 6·10 inehes. In all rapid-fire guns the distinguishing feature is the breeeh meehanism, and henee speeial attention will be given to that. The ballistic qualities are about the same for all guns of the same ealiber. In the Hotehkiss gun the breech-bloek moves vertieally in a slot in the breeeh. A lever with two handles projeets from the right side of the breeeh, and when rotated by the hand it moves a erank-arm on the inner faee of the breech, which arm earries a stud. This stud moves in a groove in the side of the breech-bloek, which groove is at first concentrie, and afterward eeeentric with referenee to the center of motion of the crank-arm. While the stud is moving through its coneentrie groove, the hammer is eoeked by the motion of the lever; when the stud reaehes the eeeentrie part of its groove, it causes the block to fall vertically in the breech-slot. In falling, the bloek draws baek an extraetor, whieh throws out the empty eartridge-ease as soon as the bloek falls far enough to uneover the rear end of the barrel. A new cartridge is then inserted by hand, and by reversing the motion of the hand-lever the block rises, pushing the eartridge home and elosing the breeeh. The gun is then fired by pulling the trigger. A shoulder-pieee is attaehed to the gun or to the carriage by whieh it may be aimed.

The Driggs-Schroeder Gun.—This was invented in the U. S. The breech-bloek has a combined sliding and rotating movement, and the upper part of the breeeh is not cut through as with most of the other systems. The breech-bloek has, on its upper convex surfaee, projeeting ribs, which fit into corresponding grooves in the upper part of the breeeh, and thus resist the reeoil. After firing, a handle is rotated, and this moves a cam which aets upon the block and forees it downward. This downward motion of the block continues until the ribs are disengaged from the grooves in the breeeh-reeess, when the bloek revolves to the rear. During the downward motion of the bloek, the hammer is coeked by the action of this eam, and when the breeeh is open the eartridge is ejected by the action of the breech-bloek upon the extractor. The cartridge being inserted by hand, a reversal of the motion of the lever first revolves and then raises the block, thus elosing the breech. The advantage of this rotatory motion of the block is that the cartridge need not be inserted by hand so far into the breeeh as in the ease of a sliding bloek, for the rotation tends to push the cartridge home, while the sliding tends rather to guillotine it.

The Nordenfelt Rapid-fire Gun.—In this gun the same object is sought as in the Driggs-Schroeder, but by different means. The breeeh-block is divided into two parts by a plane transverse to the axis of the gun. The rear part acts as a wedge and the front part as the block proper. The whole has a combined vertical sliding and rotatory motion in a slot in the breeeh. By moving a hand-lever, the rear seetion of the breeeh-block slides downward, the front section remaining fixed. When the rear section has moved down a certain distanee, by the aetion of the eam on the hand-lever, the whole bloek revolves together to the rear. In this revolution the hammer is eocked and the empty cartridge-case ejeeted. A reversal of the motion of the lever-handle eauses the bloek first to rotate as a whole, thus pushing the cartridge into its place, and then the rear or wedge part of the bloek rises vertically and presses the front part firmly against the breeeh.

The Maxim Rapid-fire Gun.—This differs from the other guns of its class by being semi-automatic—that is, after the first fire all the operations are performed by the gun itself, except that it is neeessary to introduee the cartridge by hand. The act of introducing it completes the cycle, and the gun fires and returns automatically to the position for the insertion of the next cartridge. The gun eonsists of a barrel and breech-block, which slides in a jacket. The motion of barrel and bloek to the rear is caused by the discharge; the motion to the front, by a strong spiral spring aeting on the barrel.

The breeeh-block slides vertically in the barrel. When a cartridge is fired, the barrel and block slide together to the rear. As they move forward again under the action of the spiral spring, a projecting arm on a shaft which passes

through the barrel strikes a spring catch attached to the jacket. This causes the shaft to rotate, and on this shaft is an arm that acts on the breech-block, thus causing the latter to fall. The fall of the block acts on the extractor and causes it to eject the empty cartridge-case. The rotation of the shaft above described compresses a spring. This spring, after the cartridge-case is ejected, causes the block to rise vertically till it is caught by projections on the extractor fitting into corresponding cuts in the front of the block. In this position the insertion of the cartridge causes it to strike against the extractor, and move it forward. This disengages the latter from its hold on the block, when the latter rises and closes the breech. As in the case of the machine-gun, if the trigger be kept pressed the gun will fire automatically at the instant the breech is closed.

These descriptions include the best-known rapid-fire guns. Among others not described are the Albini, Armstrong, Canet, Gruson, and Krupp, but the principal types are included in the above descriptions.

As an illustration of the characteristics of each caliber, as regards weight, projectile, velocity, power, etc., the following data relating to the Hotchkiss rapid-fire gun is given:

Caliber of gun, inches.	Weight of projectile, pounds.	Weight of powder, pounds.	Muzzle velocity, feet per second.	Penetration into wrought-iron plate, with steel shell, at muzzle, inches.
1·49	1·87	0·70	1,968	3·43
1·85	3·31	1·76	2,001	4·13
2·24	6·00	2·03	1,968	5·08
2·99	14·11	7·06	2,034	7·36
3·93	33·07	13·22	1,968	9·84

For detailed descriptions of all these guns, see *Reports* of the chief of ordnance of the army and navy, *Reports* on naval progress for 1887 and subsequently, and the handbooks published by the manufacturers giving very full and complete data. LAWRENCE L. BRUFF.

Machray, măk-rā′, ROBERT, D. D., LL. D.: Anglican archbishop: b. in Aberdeen, Scotland, in 1832; was educated at King's College, Aberdeen, and at Cambridge, where he graduated in 1851. He was ordained priest in 1856, and appointed vicar of Madingley the same year; became dean of Sidney Sussex College, Cambridge, in 1858; was university examiner 1860–61; Ramsden university preacher in 1865; and in that year was consecrated Bishop of Rupert's Land. The diocese at that time included the present Manitoba and the Northwest Territories, and the new bishop suffered many privations in visiting the mission stations scattered over this vast territory. In 1874 the diocese was subdivided and Bishop Machray was appointed metropolitan of the Northwest country. In 1881 he became chancellor of the University of Manitoba; in 1888 Professor of ecclesiastical History in the Theological College of Manitoba; and in 1893 archbishop of the Northwest country. N. M.

Maciejowski, mă-tsyĕe-yov′ski, WACLAW ALEKSANDER: Polish historian; b. at Kalwarya, 1793; educated at the Piarist schools at Piotrkow; in 1812 entered the Academy of Cracow; studied philology, history, and law at the Universities of Breslau, Berlin (under Savigny), and Göttingen, and upon his return was appointed Professor of Greek and Roman Literature at the Lyceum, and later Professor of the History and Institutions of the Roman Law at the University of Warsaw; lectured on the Pandects 1825–31; became Professor of Ancient Literatures at the Catholic Academy, and a member of the appellate court in 1838. D. at Warsaw, Feb. 10, 1883. Besides numerous essays, he wrote *Pamiętniki o dziejach, piśmienictwie i prawodawstwie Slowan* (Notes on Slavonic History, Literature, and Jurisprudence, 2 vols., Warsaw, 1839); *Polska aż do pierwszéj połowy XVII. wieku pod względem obyczajów i zwyczajów* (Poland down to the First Half of the Seventeenth Century, its Customs and Manners, 4 vols., Warsaw, 1842); *Pierwotne dzieje Polski i Litwy* (Early History of Poland and Lithuania, 1846); *Piśmienictwo polskie od czasów najdawniejszych aż do roku 1830* (Polish Literature since the Earliest Times down to 1830, 3 vols., 1851); *Historya prawodawstw słowiańskich* (History of Slavonic Legislation, 4 vols., 1832–35; 2d ed. 6 vols., 1856–65; a history of peasants' uprisings in Poland, Warsaw, 1874), etc. Maciejowski is a Panslav writer, whose theories have aroused considerable opposition. J. J. KRÁL.

MacIlvaine′, CHARLES PETTIT, D. D., LL. D., D. C. L.: bishop and educator; b. at Burlington, N. J., Jan. 18, 1798; graduated at Princeton in 1816; took orders in the Protestant Episcopal Church 1820; officiated at Georgetown, D. C.; was chaplain at West Point, N. Y., and Professor of Ethics and History 1825–27; became rector of St. Ann's, Brooklyn, N. Y., in 1827; was Professor of the Evidences of Revealed Religion in the University of the City of New York in 1831; was consecrated Bishop of Ohio in 1832, on the resignation of Bishop Philander Chase; was president of Kenyon College 1832–40, and afterward president of the theological seminary at Gambier, O. His *Evidences of Christianity* (1832) has gone through many editions. Among his other works are *Oxford Divinity* (1841): *The Holy Catholic Church* (1844); *Valedictory Offering* (1853); *The Truth and the Life* (1855). D. at Florence, Italy, Mar. 12, 1875.

McIlvaine, JOSHUA HALL: See the Appendix.

Mc'Intosh, Gen. LACHLAN: soldier; b. at Borlam, Inverness, Scotland, Mar. 17, 1727. His father, John More McIntosh, the head of the Borlam branch of the clan McIntosh, accompanied Oglethorpe to Georgia in 1736 with 100 of his tribesmen, and settled in New Inverness (now Darien), in what is now McIntosh County. Lachlan had few opportunities for education, but, aided by Gov. Oglethorpe, studied mathematics and surveying; became a clerk at Charleston in the counting-house of his friend Henry Laurens; was afterward a surveyor in the Altamaha region; studied military tactics; became colonel of the First Georgia Regiment, and brigadier-general in the war of the Revolution (1776); killed Button Gwinnett in a duel May, 1777; commanded the Western department 1778, and led an expedition against the Indians of the Ohio valley; was actively engaged in the siege of Savannah 1779, and in the defense of Charleston 1780, where he became a prisoner of war. He was a member of the Continental Congress 1784, and commissioner to treat with the Southern Indians 1785. D. in Savannah, Feb. 20, 1806.

McIntosh, MARIA JANE: author; grand-niece of Gen. Lachlan McIntosh; b. at Sunbury, Ga., in 1803; was educated at Sunbury Academy; removed to New York in 1835; suffered a reverse of fortune in the financial crisis of 1837, when she determined to earn a support by authorship: published in 1841 a juvenile story entitled *Blind Alice*, which was followed by other juveniles (1843); the whole series was issued in 1847 in one volume as *Aunt Kitty's Tales*. They were republished in London, as also her later works, among which were *Conquest and Self-conquest* (1844); *Woman an Enigma* (1844); *Two Lives, or to Seem and to Be* (1846); *Woman in America, her Work and her Reward* (1850); *The Lofty and the Lowly* (1853); and *Meta Gray* (1858). D. at Morristown, N. J., Feb. 28, 1878. Revised by H. A. BEERS.

Mackar'ness, JOHN FIELDER, D. D.: bishop; b. in England, Dec. 3, 1820; educated at Merton College; became a fellow of Exeter College, Oxford; took holy orders in 1845; was vicar of Tardebigge, Worcestershire, 1845–55; rector of Honiton, Devonshire, 1855–58; prebend of Exeter 1858; proctor in convocation for the clergy of the diocese of Exeter 1865; favored the disestablishment of the Irish Church, and was appointed in Dec., 1869, Bishop of Oxford. Owing to failing health he took measures for the resignation of his see in 1888, but before the legal formalities had been fully carried out he died at Cuddesdon, near Oxford, Sept. 16, 1889. Revised by W. S. PERRY.

Mackay′, CHARLES: author; b. in Perth, Scotland, in 1812; was educated in London, Brussels, and Aix-la-Chapelle; was employed on the staff of *The London Morning Chronicle* 1834–43; editor of *The Glasgow Argus* 1844–47; was long editorially connected with *The Illustrated London News*; founded *The London Review* in 1860; contributed a series of poems—*Voices from the Crowd*—to the London *Daily News*; lectured in the U. S. in 1858, and was a war-correspondent of the London *Times* in the U. S. 1862–65. Is best known by his songs, some of which were set to music composed by himself. Among his numerous works are *Songs and Poems* (1834); *History of London* (1837); *The Thames and its Tributaries* (1840); *Longbeard*, a romance (1840); *Memoirs of Extraordinary Popular Delusions* (1841); *Legends of the Isles* (1845); *Education of the People* (1846); *The English Lakes* (1846); *Town Lyrics* (1848); *Under Green Leaves* (1857); *Studies from the Antique* (1864); *Lost Beauties of the English Language* (1874); *Poetry and Humor of the Scottish Language*; *The Founders of the American Republic*; and for some time preceding his

death was occupied in writing a book on *The Gaelic Etymology of the English Language*. He died in London, Dec., 1889. His son Eric, author of *The Love-letters of a Violinist*, *Nero and Actea*, a tragedy, etc., wrote an introduction for the *Posthumous Poems* of his father. The sister of the latter, under the pseudonym *Marie Corelli*, has written popular novels.

Mackaye, James Steele: See the Appendix.

McKean, Thomas, A. M., LL. D.: a signer of the Declaration of Independence: b. at Londonderry, Pa., Mar. 19, 1734; was admitted to the bar, and early held important public trusts in Delaware and Pennsylvania. He was sent to the general Congress of 1765, where he took a bold stand for the rights of the colonies. He became in 1765 judge of the quarter sessions and the orphans' court, and sole notary and tabellion public for Delaware. In 1771 he was made collector of the port of Newcastle, and was 1774–83 a member of Congress from Delaware, president of Congress in 1781, and president of Delaware in 1777, although he had for some years been a citizen of Pennsylvania. He wrote the constitution of Delaware in a single night, with no book for reference, and it was adopted unanimously on the following day. He was (1777–99) chief justice of Pennsylvania, and its Governor 1799–1808. He was one of the ablest and most determined of the Revolutionary patriots. D. in Philadelphia, June 24, 1817.

McKeesport: city; Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5–B); on the Monongahela river at the mouth of the Youghiogheny river, both of which are here navigable for steamboats, and on the Balto. and O., the Penn., and the Pitts. and Lake Erie railways; 14 miles S. E. of Pittsburg. It is the center of the greatest bituminous coal region in the country and of the natural-gas wells. The census returns of 1890 showed that 116 manufacturing establishments (representing 40 industries) reported. These had a combined capital of $10,942,537; employed 6,283 persons; paid $3,433,029 for wages and $10,610,618 for materials; and had products valued at $17,383,125. The principal industry was the manufacture of iron and steel, which had 3 establishments, $10,191,652 capital, and 5,665 persons employed; paid $3,114,845 for wages, and had products valued at $16,235,177. Among these establishments were the largest wrought-iron pipe-works in the world. Other manufactures are sawed lumber, locomotives, cars, and glass. There were 7 public-school buildings, and public-school property valued at $140,000. The city has 3 national banks, with combined capital of $500,000, a State bank with capital of $100,000, and 3 daily and 2 weekly newspapers. Pop. (1880) 8,212; (1890) 20,741; (1900) 34,227. Secretary of Board of Trade.

McKee's Rocks: village; Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5–B); on the Pitts., Chartiers and Youghiogheny Railway; 4 miles from Pittsburg, the county-seat. It contains iron, steel, and planing mills, iron-bridge works, glass-factory, machine-shops, and railway repair-shops, and has two weekly newspapers. Pop. (1880) not in census; (1890) 1,687; (1900) 6,352.

MacKel'lar, Thomas: poet; b. in New York, Aug. 12, 1812; entered at the age of sixteen years the printing establishment of the Harpers; removed to Philadelphia in 1833; became proof-reader in the great stereotype foundry of Lawrence Johnson & Co.: rose to be foreman, and ultimately a partner. He published several volumes of poetry —*Droppings from the Heart* (1844); *Tam's Fortnight Ramble* (1847); *Lines for the Gentle and Loving* (1853); and *Rhymes Atween-times* (1873). He published a typographical manual, entitled *The American Printer*, in 1866, and a volume of *Hymns and Metrical Psalms* in 1883. His best-known poem is the popular song *Let Me Kiss Him for His Mother*. D. Dec. 29, 1899. Revised by H. A. Beers.

McKen'dree, William, D. D.: the first bishop of the Methodist Episcopal Church born in America; b. in King William co., Va., July 6, 1757. At the beginning of the Revolutionary war, 1775, he entered the Continental army; was an adjutant and commissary, and witnessed the surrender of Cornwallis. He joined the Methodist itinerant ministry in 1778. In 1801 he was sent over the Alleghanies into Kentucky, and became one of the principal founders of his denomination in the Western States. His travels were extensive, his labors extraordinary, his eloquence remarkable, his success general, and his endurance of privation and suffering heroic. In 1808 he was elected bishop. McKendree College was founded at Lebanon, Ill., in the year of his death. D. near Nashville, Tenn., Mar. 5, 1835.

Mackenna, Benjamin Vicuña: See Vicuña Mackenna.

McKenna, Joseph: See the Appendix.

McKenzie: town; Carroll co., Tenn. (for location of county, see map of Tennessee, ref. 6–C); on the Louis and Nash. and the Nash., Chat. and St. L. railways; 113 miles N. E. of Memphis, 119 miles W. of Nashville. It is in an agricultural region, has considerable trade, and contains Bethel College (Cumberland Presbyterian, opened in 1849), which in 1890 had 6 instructors, 281 students, and $10,000 invested in grounds and buildings, and McTyeire Institute (Methodist Episcopal, founded in 1882), which in 1890 had 3 instructors, 110 students, and $90,000 invested in grounds and buildings. Pop. (1900) 1,266.

Mackenzie, Sir Alexander: b. at Inverness, Scotland, about the middle of the eighteenth century; removed to Canada when young; entered the service of the Northwest Fur Company; passed eight years at Fort Chippewyan on Lake Athabasca, where he formed a project of an exploring expedition to the Northern Ocean; spent a year in England in the study of astronomy and navigation; set out from Fort Chippewyan June 3, 1789, with four canoes and a party of twelve persons; discovered and explored to lat. 69° the great river to which he gave his name; and in a second expedition from Fort Chippewyan, begun in Oct., 1792, reached the Pacific Ocean at Fort Menzies in July, 1793. Returning to England in 1801, he published *Voyages from Montreal through the Continent of North America to the Frozen and Pacific Oceans in the Years 1789 and 1793* (4to, with maps); was knighted in 1802, and died at Dalhousie, Scotland, Mar. 12, 1820.

Mackenzie, Alexander, P. C.: Canadian statesman; b. near Dunkeld, Scotland, Jan. 28, 1822; was educated there and at Perth; removing to Canada in 1842, became a contractor and builder. He represented East York in the Canada Assembly 1861–67; the same constituency in the Dominion Parliament 1867–92; sat for West Middlesex in the Ontario Assembly 1871–72, and was treasurer of the province during that period. He declined a seat in the Canadian cabinet in 1865; led the Ontario opposition in the Dominion Parliament from 1867 till 1873, when he was elected leader of the entire reform opposition of Canada. Upon the resignation of Sir John Macdonald, Mr. Mackenzie was called on to form a new administration, which he succeeded in accomplishing Nov. 7, 1873, taking the positions of Premier and Minister of Public Works, which he held till he and his cabinet resigned in 1878, in consequence of the Conservatives being returned to power. He proceeded to Scotland in 1875, and while there was presented with the freedom of Irvine, Dundee, and Perth; and during a subsequent visit in 1881 was presented with the freedom of Inverness. He visited the Queen at Windsor, and was thrice offered the honor of knighthood, which he declined. He was instrumental in securing the enactment of various important measures; possessed great administrative abilities; was a fluent and convincing speaker. D. at Toronto, Apr. 17, 1892. He was the author of *Life and Speeches of Hon. George Brown* (Toronto, 1882). Neil Macdonald.

McKenzie, Alexander, D. D.: clergyman; b. in New Bedford, Mass., Dec. 14, 1830; was educated at Harvard College and Andover Theological Seminary; was pastor of the South Congregational church, Augusta, Me., 1861–67; pastor of the First church (Congregational), Cambridge, Mass., in 1867; was an overseer of Harvard College 1872–84; is trustee of Phillips Academy, Andover, Wellesley College, Hampton Institute, and Cambridge Hospital; lecturer at Andover Theological Seminary and Harvard University; is author of *History of the First Church in Cambridge* (1873); *Cambridge Sermons* (1883); *Some Things Abroad*; *The Two Boys*; and numerous addresses.

Mackenzie, Alexander Campbell: composer; b. in Edinburgh, Scotland, Aug. 22, 1847; was educated at first by his father, himself a fine violinist, and then at Schwarzburg-Sondershausen, Germany, where he entered the Grand Ducal orchestra as a violinist when fourteen years old. In 1862 he removed to London, and became a king's scholar in the Royal Academy of Music; in 1865 returned to his native city, and began a professional career as violinist and teacher. His first composition was a quartet for piano and strings in B flat, which was published in Leipzig; soon after came his overture *Cervantes* and other orchestral compositions. His

first choral composition was the cantata *The Bride* (1880), followed by *Jason* (1882), which was performed at the Bristol festival in that year; then came *The Rose of Sharon* for the Norwich festival of 1884; *The Story of Sayid* for the Leeds festival of 1886; *Jubilee Ode* (1887); *The New Covenant* (Glasgow, 1888); *The Cottar's Saturday Night* (1890); *The Dream of Jubal* (London, 1889); *Veni Creator Spiritus* (1891); *Bethlehem* (1894); and the two operas *Colomba* (1883) and *The Troubadour* (1886), both composed to order for the Carl Rosa Company. He has also composed much excellent orchestral music and many songs, part songs, piano and organ pieces. He received the degree of Mus. Doc. from the University of St. Andrews in 1886, and was elected principal of the Royal Academy of Music in Feb., 1888, to succeed Sir George A. Macfarren. D. E. Hervey.

Mackenzie, Alexander Slidell: originally named Slidell, brother of Senator John Slidell; naval officer and author; b. in New York, Apr. 6, 1803; entered the navy in 1815; cruised in the Mediterranean and on other stations; became lieutenant 1825, commander 1841, serving on the West Indian, Brazilian, Pacific, and Mediterranean squadrons, and took in 1837 the name of Mackenzie. In 1842 Commander Mackenzie was placed in charge of the U. S. brig Somers, sent to the West African coast, manned chiefly by naval apprentices, and on the return voyage an intention of mutiny said to have been discovered on board led, by a decision of council of officers, to the hanging from the yardarm (Dec. 1, 1842) of three young men, one of whom, a midshipman, was a son of John C. Spencer, the Secretary of War. This tragical event naturally created a great sensation, and Mackenzie's conduct was severely criticised and as warmly defended. Though his conduct was approved by a court of inquiry, and he was acquitted of blame by a court martial, the difference of opinion was not set at rest, and the affair embittered the subsequent life of Mackenzie. He was ordnance officer at the siege of Vera Cruz during the Mexican war, and commanded the artillery division which stormed the town of Tabasco June 16, 1847. D. at Tarrytown, N. Y., Sept. 13, 1848. Mackenzie had considerable literary ability, and published *A Year in Spain* (1829; revised ed. 1836); *Popular Essays on Naval Subjects* (1833); *The American in England* (1835); *Spain Revisited* (1836); *Life of John Paul Jones* (1841); *Life of Oliver Hazard Perry* (1841); and *Life of Stephen Decatur* (1846).

Mackenzie, Charles Frederick, D. D.: bishop; b. in Peeblesshire, Scotland, Apr. 10, 1825; graduated at Cambridge in 1848; took orders in the Church of England; labored for some time as a parish minister; obtained a fellowship and lectured at Cambridge; went to South Africa in 1854 with Bishop Colenso, and officiated as Archdeacon of Natal until 1859, when he returned to England to urge the establishment of other African missions; was consecrated Bishop of Central Africa at Cape Town Jan. 1, 1861; sailed for the Zambezi with a corps of missionaries, and began operations at a village named Magomero, where the climate soon undermined his constitution, and he died Jan. 31, 1862. His *Life* (2d ed. 1865) by Harvey Goodwin, D. D., Dean of Ely (afterward Bishop of Carlisle), is a work of deep interest.

Revised by W. S. Perry.

Mackenzie, Sir George: lawyer and statesman; b. at Dundee, Scotland, in 1636; was educated at the Universities of Aberdeen and St. Andrews; studied law three years at Bourges, France; was admitted to the bar in Edinburgh in 1656, and soon became celebrated as an advocate; warmly but unsuccessfully defended the Marquis of Argyle on his trial for treason 1661; was knighted, became judge of the criminal court, member of Parliament, and king's counsel (1677), in which capacity he maintained the doctrine of passive obedience. His conduct as criminal prosecutor in the persecution of the Covenanters caused him to be stigmatized by the title of Bluidy Mackenzie. He was also memorable for the witchcraft trials over which he presided. Mackenzie was a friend of Dryden and other poets, was himself an elegant scholar, and one of the first Scotchmen to write the English language correctly. He published *Religio Stoici* (1663), *A Moral Essay upon Solitude* (1665), *Moral Gallantry* (1667), a *Discourse on the Laws and Customs of Scotland in Matters Criminal* (1678), and *Institutions of the Laws of Scottand* (1684), besides *A Vindication of the Government of Charles II.* He was the chief founder of the Advocates' Library in Edinburgh. In 1688 he retired to Oxford. D. in London, May 8, 1691. His complete *Works* were published in 1716–22.

Mackenzie, Henry: author; b. in Edinburgh, Scotland, Aug. 26, 1745; was educated at the university of that city; became an attorney of the Scottish court of exchequer; published anonymously in 1771 a novel, *The Man of Feeling*, which enjoyed great popularity, and led to the composition of a second part, which was issued under the author's name in 1773 as *The Man of the World*. Another novel, *Julia de Roubigné*, appeared in 1777. In 1779–80 Mackenzie edited a weekly literary paper, *The Mirror*, for which he wrote a series of admired essays; in 1785–87 he conducted *The Lounger*, a paper of a similar character; wrote political tracts espousing Tory principles; made a report to the Highland Society adverse to the genuineness of the Ossianic poems; wrote three tragedies and biographical sketches of Thomas Blacklock, John Home, Lord Abercromby, and William Tytler, besides various minor publications. In 1804 he received the appointment of comptroller of taxes for Scotland; gave to the world his collected works in 8 vols. (1808); and made his house in Edinburgh the center of the most distinguished literary and political society. D. Jan. 14, 1831.

Mackenzie, James Cameron: See the Appendix.

Mackenzie, Sir Morell, M. D.: laryngologist; b. at Leytonstone, Essex, England, July 7, 1837; was the son of a physician; entered London University, where he took M. B. in 1861 and M. D. in 1862; in 1858 studied in Paris, and in 1859 in Budapest, where he met Czermak, who was introducing the laryngoscope, in the use of which Mackenzie soon became expert, and which he introduced into London. In 1860 he became resident medical officer to the London Hospital, holding the office eighteen months, then became its first registrar; in 1866 became assistant physician and in 1873 physician, resigning the latter in 1874. In 1863 he founded the Throat Hospital. His skill and dexterity in operating and the fertility of his resources combined to give him the largest practice in his specialty in England, and to necessitate his services for the Crown Prince, subsequently Frederick III., of Germany. For these latter services he was knighted in 1887 by the Queen of England, and had conferred on him the Grand Cross and Star of the Hohenzollern Order of Germany. He was president of the laryngological section of the international medical congress held at Copenhagen in 1884, and was the first president of the British Laryngological Society. His treatise on the *Use of the Laryngoscope* (London, 1866) passed through several editions. His *Essay on Growths in the Larynx* (1871) raised him to the front rank of laryngologists. His other important works are *A Manual of Diseases of the Throat and Nose* (New York, 1880); *The Hygiene of the Vocat Organs* (London, 1886). D. in London, Feb. 13, 1892.

S. T. Armstrong.

Mackenzie River: one of the largest streams on the globe. It rises in Great Slave Lake, and flows in a N. N. W. direction to the frozen ocean. It is navigable in the open season from its mouth to Fort Simpson, where there are rapids; above which it is again navigable to Great Slave Lake. Its three great head-streams are the Peace, Athabasca, and English rivers. Its extreme length is 2,300 miles; its area of drainage, 590,000 sq. miles. Lignite-beds occur upon its banks, and a large part of its upper basin is fertile and habitable land.

Mackerel [from O. Fr. *maquerel* > Fr. *maquereau*; cf. Lat. *ma'cula*, spot]: a name of various salt-water fishes of the genus *Scomber* (family *Scombridæ*). The most important species is the common mackerel, *Scomber scombrus*, found in the North Atlantic, and caught on the shores of both continents in immense numbers, both by hooks and nets. As a fresh fish, the mackerel is of rich and excellent

Mackerel.

flavor; it is also salted in great quantities. Gloucester and Yarmouth, Mass., are the great centers of the mackerel-fishery in the U. S. Their fleets visit all parts of the coast from the Carolinas to the Bay of Chaleurs, according to the season of the year. Spain, Spanish America, and the South

and West of the U. S. are the great markets for salted mackerel. The name mackerel is also applied to various other species of *Scombridæ*, as the chub-mackerel (*Scomber colias*), the Spanish-mackerel (*Scomberomorus maculatus*), and the frigate-mackerel (*Auxis thazard*). See also SCOMBRIDÆ and FISHERIES. Revised by D. S. JORDAN.

Mackerel-gull: a popular name for the terns (see TERN), given them on account of their habit of hovering over schools of mackerel in search of fish driven to the surface, or to pick up scraps of food left by the fishes.

Mack'ey, ALBERT GALLATIN, M. D.: writer on Freemasonry; b. in Charleston, S. C., in 1807; graduated in 1832 at the Medical College of South Carolina, where he became demonstrator of anatomy in 1838, but in 1844 devoted himself wholly to literature, chiefly in connection with Masonry. He wrote for several periodicals in Charleston; published a *Lexicon of Freemasonry* (1845); *The Mystic Tie* (1849); *Principles of Masonic Law* (1856); *The Book of the Chapter* (1858); *Text-book of Masonic Jurisprudence* (1859); *Cryptic Masonry and Masonic Ritualist* (1867); *The Symbolisms of Freemasonry* (1868); and *Manual of the Lodge* (1870). He also edited the *Ahiman Rezon*, or *Book of Constitutions of the Grand Lodge of Ancient Freemasonry of South Carolina*. He established a Masonic monthly in Charleston in 1850, and a quarterly in 1858; lectured on the Middle Ages, and was active in politics after the civil war. A much enlarged edition of the *Lexicon* appeared in 1875, called *Encyclopædia of Freemasonry*. D. June 20, 1881.

McKibbin, CHAMBERS: See the Appendix.

Mackinac, măk'-i-naw: village; Mackinac co., Mich. (for location see map of Michigan, ref. 2–I): on the Mackinac island, in Lake Huron, N. E. of Mackinac Strait, which connects Lake Huron with Lake Michigan; nearest railway, the Duluth, S. Shore and Atlantic; 300 miles by water N. by W. of Detroit. The island, which is 3 miles long by 2 miles wide, contains a post-office and a telegraph-station, and was a place of much importance in the colonial period. It was settled by the French; made a missionary station in 1669; captured and its inhabitants massacred by Pontiac in 1763; and captured by the British in 1812. The island is a popular summer resort, has a good harbor, and has large exports of fish. Pop. of village (1890) 750; (1900) 665.

McKinley, WILLIAM, twenty-fifth President of the U. S.; b. in Niles, Trumbull co., Ohio, Jan. 29, 1843; d. in Buffalo, N. Y., Sept. 14, 1901. The long low two-story frame building in which he was born was a country store and dwelling. His birthplace stood until late in 1895, when it was torn down, and the hard woods of the mantels and baseboards were made into canes and sold among his admirers. Authentic records trace the McKinlays in Scotland to 1547, and it is believed that James McKinlay, "the trooper," was one of William's ancestors. The crest of the McKinlay clan was a mailed hand holding an olive branch, and its motto "Not too much." The Rev. James McKinlay—mentioned by Burns in his poems *The Ordination* and *Tam Samson's Elegy*—was a kinsman, contemporary with the McKinleys of the Revolution in this country. The change in spelling the final syllable from *a* to *e* is explained by the reply that Major McKinley himself made at a meeting of the descendants of the clan in Chicago, in 1893, to a lady of the same name but spelled in the old way. "Your ancestors of the McKinlay clan," said he, "came to this country directly from Scotland, while mine came from the north of Ireland; but we are probably of the same original Covenanter stock." About 1743 one of the Scotch-Irish McKinleys settled in Chanceford Township, York co., Pa., where his son David (the McKinley of the Revolution, great-grandfather of the President) was born in May, 1755. He served as a private in the Pennsylvania line about two years, and participated in the capture of Paulus Hook and in the engagements of Amboy and Chester Hill. After the Revolution he resided in Westmoreland and Chester counties, Pa., until 1814, when he went to Ohio, where he died in 1840, at the age of eighty-five. James McKinley, son of David, moved to Columbiana co., Ohio, in 1809, and in that State the family has since mainly resided, although James and his wife, who died on the same day, are buried in the same grave at South Bend, Ind. The grandmother of the President, Mary Rose, came from a Puritan family that fled from England to Holland and emigrated to Pennsylvania with William Penn. Her father, Andrew Rose, Jr., was also a patriot of the Revolution, who participated in the battle of Monmouth and manufactured ammunition for the American army. William McKinley, Sr., father of the President, born in Mercer co., Pa., in 1807, married in 1829 Nancy Campbell Allison, of Columbiana co., Ohio, whose father, Abner Allison, was of English extraction, and her mother, Ann Campbell, of Scotch-German. Of their nine children, William was the seventh. Both the grandfather and the father of the President were iron manufacturers. His father was a devout Methodist, a stanch Whig and Republican, and an ardent advocate of a protective tariff. He died in November, 1892. The mother of the President died Dec. 12, 1897.

Birthplace of William McKinley, Niles, Ohio.

William received his first education in the public schools of Niles, but when he was nine years old the family removed to Poland, Ohio, where he studied at Union Seminary until he was seventeen. He excelled in mathematics and the languages, and was the best equipped of all the students in debating public questions of the day. In 1860 he entered the junior class of Allegheny College, Meadville, Pa. Intense application to his studies weakened his system and he was obliged to return home for rest. But as soon as he was able, he sought a change by engaging as a teacher in the public schools. A friend says of him at this time: "He was always studying, studying—studying all the time." He was fond of athletic sports, and was a good horseman. At the age of sixteen he became a member of the Methodist Episcopal Church in Poland, and was noted for his study of the Bible and his interest in discussions in the Bible class. When the civil war broke out, in the spring of 1861, he was a clerk in the Poland post-office, and he was among the first to enlist. He went with the recruits to Columbus, and was mustered in as a private in Company E of the Twenty-third Ohio Infantry, June 11, 1861. This regiment numbered among its field and staff officers Gen. William S. Rosecrans, Gen. E. Parker Scammon, Gen. Rutherford B. Hayes, Gen. James M. Comly, minister to Hawaii, Col. Stanley Matthews, United States Senator and Associate Justice of the Supreme Court, Gen. Russell Hastings, Dr. Joseph T. Webb, a noted surgeon, and Robert P. Kennedy and William C. Lyon, Lieutenant-Governors of Ohio. From the date of its organization, June 1, 1861, to the time it was mustered out, July 26, 1865, its rank and file included 2,095 men, of whom 169 were killed in battle and 107 died of wounds or disease. It was engaged in nineteen battles, marched hundreds of miles, endured great privation, and encountered all the perils and hardships of war with bravery and fidelity.

Young McKinley found the drill, discipline, and out-of-door life of the soldier beneficial to his health, and emerged from his four years' arduous service stronger than when he entered the army. Concerning this period of his life, he said: "I always look back with pleasure upon the fourteen months I served in the ranks. They taught me a great deal. I was but a schoolboy when I went into the army, and that first year was a formative period in my life, during which I learned much of men and facts. I have always been glad

that I entered the service as a private and served those months in that capacity." He participated in all the early engagements in West Virginia. The first of these was at Carnifex Ferry, Sept. 10, 1861, and its effects were of much consequence to the regiment. "It gave the boys confidence in themselves," he once said, "and faith in their commander. We learned that we could fight and whip the enemy on their own ground." In the winter's camp at Fayetteville he received his first promotion, commissary sergeant, Apr. 15, 1862. "Young as McKinley was," said ex-President Hayes in 1891, "we soon found that in business and executive ability he was of rare capacity, of unusual and surpassing capacity, for a boy of his age. When battles were fought or a service to be performed in warlike things, he always took his place. When I became commander of the regiment, he soon came to be on my staff, and he remained on my staff for one or two years, so that I did literally and in fact know him like a book and love him like a brother." He participated in the engagements at Clark's Hollow, May 1, and Princeton, May 15, 1862. In the summer the regiment went to Washington, and a few days after its arrival joined McClellan's forces and drove the enemy out of Frederick, Md. On Sept. 14 and 17 it participated in the battles of South Mountain and Antietam. The Twenty-third made three successful charges in the first of these battles, and lost heavily in both. "During the day [at South Mountain] the Twenty-third," says Whitelaw Reid in *Ohio in the War*, "lost nearly 200 men, of whom almost one-fourth were killed on the field or afterward died of their wounds. Only seven men were unaccounted for at the roll-call after the action. The colors of the regiment were riddled, and the blue field almost completely carried away by shells and bullets." At Antietam the regiment held its position in the hottest of the fight. It was engaged from dawn until nearly night without food or refreshment of any sort, save that brought by the youngest of the comrades. Sergeant McKinley was in charge of the commissary department of his brigade, and necessarily his post of duty was with the supplies, about two miles from the firing line where his famished comrades were fighting to hold their advanced position. As is the case in all hot fights, some stragglers found their way back to the supplies, and these McKinley utilized to get together provisions and coffee and carry them to the front. It was nearly dark when suddenly there was tremendous cheering along the front of the Twenty-third Ohio. McKinley had filled two wagons, and in the midst of the desperate fight had hurried the cans of coffee and other supplies to his comrades, who took fresh courage after the refreshment. The mules of one wagon became disabled under the terrific fire, but this boy of nineteen pushed on and got the other wagon safely through to the regiment. Col. Hayes was badly wounded at South Mountain, and when he went home to Ohio he told Gov. Tod the story. "Let McKinley be promoted to lieutenant," said the Governor, and it was accordingly done, his commission dating from Sept. 24, 1862. In his speech at the Lakeside Chautauqua, in 1891, Gen. Hayes described this incident and said: "From Sergeant McKinley's hand every man in the regiment was served with hot coffee and warm meats, a thing which had never occurred under similar circumstances in any other army in the world. He passed under fire and delivered with his own hands these things so essential for the men for whom he was laboring."

The regiment returned to winter quarters near Parkersburg. During the year it had marched more than 600 miles. It intercepted the Confederate raider John Morgan at Buffington's Ford, July 19, 1863, and assisted in his capture. In May, 1864, it took part in the battle of Cloyd's Mountain, from whose summit the enemy was driven, after a long march by what was supposed to be an impassable route. "It was a rough and trying march over mountains and through deep ravines and dense woods," McKinley once described it, "with snows and rains that would have checked the advance of any but the most determined. We penetrated a country where guerrillas were abundant, where it was not an unusual thing for our men to be shot from the underbrush—murdered in cold blood."

He had been promoted to first lieutenant, Feb. 7, 1863, and under his leadership his company was the first to scramble over the enemy's fortifications and silence their guns. His only reference to this achievement is to be found in his address upon President Hayes, at Delaware, Ohio, in 1893. "The advance across the meadow, in full sight of the enemy," said McKinley, "and in range of their guns, through the creek, and up over the ridge, was magnificently executed, and the hand-to-hand combat in the fort was as desperate as any during the war. Still another charge was made, and the enemy again driven back. On we hurried to Dublin depot, on the Virginia and Tennessee Railroad, burning the bridges there, tearing up the track, and rendering the railroad useless. There the New River bridge was destroyed, and then, with frequent encounters, we went to Staunton, Va." They again advanced until within two miles of Lynchburg, where the regiment camped so near the enemy that men of both sides took rails for their fires from the same fence. Four days later they were attacked by a superior force, which they at first repelled, but were compelled to retire. "All our commissary supplies were consumed," says McKinley; "but almost without food we marched and fought our way back, closely pursued by the enemy." It began on June 19, near Lynchburg, and continued until June 27, when a supply train was reached on Big Sewell Mountain, and there, to quote Col. Hayes's diary, "we stopped and ate, marched and ate, camped about dark, and ate all night." In these nine days the Twenty-third marched 180 miles, fighting nearly all the time. They had crossed three ranges of the Alleghanies four times, the ranges of the Blue Ridge twice, and marched several times all day and all night without sleep. In this memorable expedition the Twenty-third participated in engagements at Cloyd's Mountain, New River Bridge, Buffalo Gap, Lexington, Buchanan, Otter Creek, Lynchburg, and Buford's Gap, and finally got back to camp and fought under Gen. Crook in the battle of Kernstown, near Winchester, July 24, 1864. Lieut. McKinley had conducted himself with gallantry in every emergency, and at Winchester won additional honors. Crook's army was attacked by the whole of Early's, the National forces being 6,000 strong, and the Confederate 20,000. Hayes had charge of the first brigade on the extreme right, and was soon attacked with such fury that he was obliged to fall back. The movement was successfully executed, except that the Thirteenth West Virginia Regiment failed to retire and was in imminent danger of capture. McKinley was directed to go and bring it away, and, putting spurs to his horse, he galloped obliquely toward the advancing enemy. Russell Hastings, then major of the Twenty-third, said: "None of us expected to see him again as we watched him push his horse through the open fields, over fences and across ditches, while the fire from the enemy poured upon him, with shells exploding around and over him. Once he was completely enveloped in the smoke of an exploding shell, and we thought he had gone down; but no, out of this smoke emerged his wiry little brown horse, with McKinley still firmly seated and erect as a hussar. Now he had passed under cover from the enemy's fire, and a sense of relief came to us all. McKinley gave the colonel the orders to fall back, and added, 'I supposed you would go to the rear without orders.' The colonel replied: "I was about concluding I would retire, and am now ready to go wherever you lead; but, lieutenant, I p'intedly believe I will give them fellows a volley or two before I go.' McKinley commanded, 'Then up and at them as quickly as possible,' and as the regiment arose to its feet the enemy came into full view. Col. Brown's boys gave them a crushing volley, and, following it with a rattling fire, retreated toward some woods in their rear. As Crook and Hayes saw the regiment safely off, they turned, and following the column, with it moved slowly to the rear, down the Winchester pike. At a point near Winchester, McKinley brought the regiment to the column and its place in the brigade." Continuing the retreat, they came upon a battery of artillery of four guns and their caissons, which had been left in the way. McKinley asked permission to bring it off, but his superior officers thought it impossible, owing to the exhausted condition of the men. "The Twenty-third will do it," said McKinley, and called for volunteers. Every man of his company stepped out, and the guns were hauled off to a place of safety. The next day, July 25, 1864, McKinley was promoted to captain.

The brigade continued its fighting up and down the Shenandoah valley, skirmishes occurring almost daily. A fierce engagement took place at Berryville, Sept. 3, 1864, in which Capt. McKinley's horse was shot under him, and the fighting between Crook's and Longstreet's forces continued until nightfall, when both commanders withdrew their men.

Hayes dispatched McKinley for this purpose with the proper orders, but he encountered a strange situation, which is best described in his own words: "This engagement," he

once said, "will not soon be forgotten. It was a brilliant scene; the heavens were illuminated by the flashes of our own and the enemy's guns. Later, when both armies determined to retire, it became my duty to direct a regiment at some distance from the others to move. A stranger, and in the darkness, I knew nothing of the country. When I started on my mission some one on the other side was doing just what I was, as I could tell from what I could hear. I had not gone far when I was halted by a sentinel with 'Who comes thar?' The distinct Southern brogue was warning enough, and I hastened the other way. Very soon I was stopped by a voice with a shrill Western accent demanding, 'Who comes there?' and recognized friends. I gave the countersign, and soon had the regiment moving."

At Opequan and Fisher's Hill McKinley again distinguished himself. In the former battle as an aide on Gen. Crook's staff, he was sent with an order to Gen. Isaac H. Duval to move his command quickly to a position on the right of the Sixth Corps; but Duval, not knowing the topography of the country, asked the young aide, "By what route shall I move my command?" Capt. McKinley was without definite orders or knowledge of the country, but having a general idea of the direction of the water courses and location of the troops, replied, "I would move up this creek." Duval then said, "I shall not move without definite orders." McKinley knew that any delay was hazardous, and so, acting on his own view, at once replied: "This is a case of great emergency, general, and so I order you, by command of Gen. Crook, to move your command on the road up this ravine to a position on the right of the army." The movement proved exactly right; Duval's command was soon in position, and it drove the enemy from their works and contributed to the victory of the day.

In describing the fight at Fisher's Hill, McKinley called it "one of the most brilliant of the many brilliant achievements of Gen. George Crook. It was a flank movement through the mountains and woods to the enemy's right. Never did troops advance with greater difficulty, on what appeared to be an impassable route, over the mountain side, where it seemed the foot of man had never trod. Hayes led the charge down the gorge and up the hill. He led repeated charges. I can see him now, encouraging his men to make another and still another charge—until we had captured the whole of the enemy's works and every piece of their artillery. Nothing was more brilliant or decisive during the entire war, considering the numbers in the affair."

Soon after this battle the regiment was detailed as train guard to Martinsburg and marched to Winchester, where a brigade of the enemy's cavalry was reported to be. On the march (Oct. 11) the men voted in the election that decided whether the war should be continued to success or abandoned and acknowledged a failure. Capt. McKinley's first ballot was cast for Lincoln.

On the morning of Oct. 19, 1864, the National forces at Cedar Creek were surprised by Early's army, and for a time were thrown into confusion and routed. Gen. Sheridan had been at Winchester, "20 miles away," but, hearing the roar of the artillery, rode rapidly to the scene of action. On working to the front, he met Capt. McKinley, who, with other officers, had been striving to keep the men in line and establish a position. He had just returned from planting a battery. "Where's Crook?" asked Sheridan. Capt. McKinley turned, and together they rode off to find the general, and as Sheridan dashed down the line he yelled to the troops, amid their enthusiastic cheers: "Never mind, boys, we'll whip them yet. We'll sleep in our quarters to-night." Gens. Crook and Wright soon came up and briefly described the events of the morning to Sheridan, and under his leadership the National forces eagerly attacked and badly defeated the confident enemy.

A short time after this battle a successful cavalry raid by the Confederates on the Baltimore and Ohio Railroad, at New Creek, caused Gen. Crook to move one of his divisions to that place. He admired Capt. McKinley and took him along. Here Gens. Crook and Kelley were captured, and Gen. Hancock took charge of the department. He retained McKinley on his staff several months. McKinley was then assigned as acting assistant adjutant general on the staff of Gen. Samuel S. Carroll, commanding the Veteran Reserve Corps at Washington, where he remained through that exciting period which included the surrender of Lee to Grant at Appomattox and the assassination of Lincoln. Just a month before this tragedy, or on Mar. 14, 1865, he had received from the President a commission as major by brevet in the volunteer U. S. army, "for gallant and meritorious services at the battles of Opequan, Cedar Creek, and Fisher's Hill," signed "A. Lincoln." He participated in the last great act of the war, the final grand review in Washington, where the armies of Grant, Sherman, and Sheridan were united in May, 1865, with the same modest deportment that had characterized his entrance into the service in 1861. He was urged to remain in the army, but, wisely deferring to the judgment of his father, he was mustered out July 26, 1865, and returned to Poland, where the family was again reunited, his younger brother, Abner, having been a volunteer in the National army. He never was absent a day from his command on sick leave; he had only one short furlough in his four years of service; he never asked or sought promotion; he was present and active in every engagement in which his regiment participated; and he performed bravely and well every duty assigned him. On his return to Poland with his old company, a complimentary dinner was given to them, and he was selected to respond to the welcoming address, which he did in a speech of rare eloquence.

He at once began the study of law under the preceptorship of Judge Charles E. Glidden and his partner, David M. Wilson, of Youngstown, Ohio, applying himself diligently during the week at Poland, and going to their office on Mondays for review and examination. He completed his course at the law school in Albany, N. Y., and in Mar., 1867, was admitted to the bar at Warren, Ohio. On the advice of his elder sister, Anna, he settled in Canton, Ohio, where she was for many years a teacher in the public schools. Here he soon attracted attention, and by his exemplary life and devotion to his profession achieved success at the bar and great popularity. In the autumn of 1867 he made his first political speeches in favor of negro suffrage, a most unpopular doctrine throughout the State. Republican nominations in Stark County were considered empty honors; but when, in 1869, he was placed on the ticket for prosecuting attorney he made an energetic canvass and was elected. He discharged the duties of this trust with fidelity and fearlessness, but in 1871 he failed of re-election by 45 votes. He thereupon resumed his practice, and was remarkably successful.

He married, Jan. 25, 1871, Miss Ida Saxton, daughter of James A. and Catherine Dewalt Saxton. Her father was a banker of large means, who, after giving Ida, his youngest daughter, many advantages of education and travel, began her business training as cashier in his bank. At this time Mr. McKinley was superintendent of the Methodist Sunday-school, and his bride was a teacher in the Presbyterian. Two daughters were born to them—Katie on Christmas, 1871, and Ida in 1873—but both were lost in early childhood. Mrs. McKinley's health, not robust at any time, never has rallied from the terrible blow of these two deaths in quick succession. Her comfort, her wish, her happiness, under every conceivable circumstance, was her husband's first thought and constant concern. At home no hour passed that he did not see her; and she rewarded this homage with all the intensity of a proud, ardent, unselfish affection.

In the gubernatorial campaign between Hayes and Allen, in 1875, at the height of the greenback craze, he made numerous effective speeches in favor of honest money and the resumption of specie payments. The Hon. Stewart L. Woodford, of New York, spoke at Canton that autumn, and McKinley was prevailed upon to close the meeting. Animated by the eloquence of their visitor, McKinley captivated both the audience and the orator who had preceded him. On his return to Columbus, Mr. Woodford made it a point to see the State Committee and urge them to put McKinley upon their list of speakers. They had not heard of him before, but they put him on the list. The next year, 1876, McKinley was nominated for Congress and was elected over Leslie L. Lanborn by 3,300 majority. During the progress of the canvass, while visiting the Exposition in Philadelphia, he was introduced by James G. Blaine to a great audience at the Union League Club, and scored so great a success that he was at once in demand throughout the country. He spoke hundreds of times, and in almost every State and Territory, to more of his fellow-countrymen than ever were addressed by any other public man in the history of the republic. He was more like Webster in personal appearance, style, and delivery than any other American orator.

He entered Congress on the day when his old colonel as-

sumed the presidency. He delivered a notable address that year at the dedication of a soldiers' monument at Fremont, Ohio. But he devoted himself strictly to his congressional duties, and on Apr. 15, 1878, made a speech in opposition to what was known as "the Wood tariff bill," from its author, Fernando Wood, of New York, the first of the measures designed (according to its opponents) to cripple our protective system. He not only exposed the incongruities and absurdities of the proposed law, but the impolicy and recklessness of such legislation, and, although the House was Democratic, the measure was postponed until the short session, and then was abandoned altogether. His speech was widely circulated by the Republican Congressional Committee. Mr. Blaine, in his "Twenty Years of Congress," says, in reviewing the Forty-fifth Congress: "William McKinley, Jr., entered from the Canton district. The interests of his constituency and his own bent of mind led him to the study of industrial questions, and he was soon recognized in the House as one of the most thorough statisticians and one of the ablest defenders of the doctrine of protection."

In 1877 Ohio went strongly Democratic, and the Legislature gerrymandered the State, so that McKinley found himself confronted by an adverse majority of 2,580 in a new district. His opponent was Gen. Aquila Wiley, who had lost a leg in the National army, and was competent and worthy. McKinley entered the canvass with great energy, and after a thorough discussion of the issues in every part of the district, was re-elected to Congress by 1,234 majority. As chairman of the Republican State Convention of Ohio of 1880, he made an address devoted principally to the Federal election laws. Speaker Randall gave him a place on the Judiciary Committee, and in December, 1880, appointed him to succeed Garfield as a member of the Ways and Means Committee.

The Ohio Legislature of 1880 restored his old congressional district, and he was unanimously nominated to the Forty-seventh Congress. His election was assured, but he made a vigorous canvass, and was chosen over Leroy D. Thoman by 3,571 majority. He was chosen by the Chicago convention as the Ohio member of the Republican National Committee, and accompanied Gen. Garfield on his speaking tour through New York. He opened the State campaign at Portsmouth, Ohio, in July, and also spoke in Maine, Indiana, Illinois, and other States.

The Forty-seventh Congress was Republican, and it proceeded to revise the tariff. After much discussion it was agreed to constitute a commission, who should report at the next session. In the debate on this project McKinley delivered an interesting speech, Apr. 6, 1882, in which, while not giving his unqualified approval to the creation of a commission, he insisted that a protective policy should never for an instant be abandoned or impaired.

The elections of 1882 occurred while the tariff commission was still holding its sessions, and the Republicans were defeated. The Democracy carried Ohio by 19,000, and elected 13 of the 21 congressmen. McKinley had been renominated, after a sharp contest, and was elected by eight votes over his Democratic competitor, Jonathan H. Wallace. At the short session an exhaustive report by the tariff commission was submitted, and from this the Ways and Means Committee framed and promptly introduced a bill reducing existing duties, on the average, about 20 per cent. McKinley supported this measure in an explanatory and argumentative speech, Jan. 27, 1883, but it was evident from the start that it could not become a law, and the Senate substitute was enacted instead. In contrasting the respective advantages of the two revenue systems, he said: "If labor was degraded on this side of the Atlantic as on the other, we might compete with the best manufacturers of the world in any market. No lover of his race, no friend of humanity, wants reduced wages. I do not speak for capital. Capital can take care of itself. Rob it of its profits in any of the so-called protected industries, and it will seek other avenues of investment and profit. I speak for the workingmen of my district, the workingmen of Ohio, and of the country." Here Mr. Springer, of Illinois, interjected: "They did not speak for you very largely at the last election." McKinley replied, amid great applause on both sides of the Chamber: "Ah, my friend, my fidelity to my constituents is not measured by the support they give me! I have convictions upon this subject which I would not surrender or refrain from advocating if 10,000 majority had been entered against me." He delivered a speech on the Morrison tariff bill, Apr. 30, 1884, which was everywhere accepted as the strongest and most effective argument made against it. At the conclusion of the general debate, May 6, 41 Democrats, under the leadership of Mr. Randall, voted with the Republicans to defeat the bill.

At the Ohio Republican State Convention of that year, 1884, McKinley presided, and was unanimously elected a delegate at large to the National convention. He disliked to oppose Senator Sherman, but he was an avowed supporter of Mr. Blaine for the presidency, and did much to further his nomination. He served on the Committee on Platform, drafted its tariff planks, and read it to the convention. In the campaign he was equally active and prominent. The Democrats had carried the Ohio Legislature in 1883, and he was again gerrymandered into a district supposed to be strongly against him. He accepted a renomination, made a diligent canvass, and defeated David R. Paige, then in Congress, by 2,000 majority. He accompanied Mr. Blaine on his Western tour, speaking constantly with him from the same car or platform, and, after the October election in Ohio, devoted his time to the campaign in West Virginia and New York.

In the Ohio gubernatorial canvass of 1885 Major McKinley was equally active, conspicuous, and popular. He also went to Virginia in October and spoke for Mahone and Wise at Petersburg, urging the people of the Old Dominion to declare for protection as the best promoter of their material prosperity. "Make it possible," said he, "to break down the prejudices of the past. Get out from under your ancestral tree. Recognize and give force to the Constitution, permit every man to vote for the party of his choice, and have his ballot honestly counted. Push to the front where you belong as a State and a people. Be assured that the Republicans of the North harbor no resentments—only ask for the results of the war. They wish you the highest prosperity and greatest development." His district had been restored in 1886, and he was again unanimously nominated for Congress for the sixth time, and elected by 2,550 majority over Wallace H. Phelps.

In Congress, Apr. 2, 1886, he made a notable speech on arbitration as the best means of settling labor disputes. "I believe in arbitration as a principle," said he. "I believe it should prevail in the settlement of international differences. It represents a higher civilization than the arbitrament of war. I believe it is in close accord with the best thought and sentiment of mankind; I believe it is the true way of settling differences between labor and capital; I believe it will bring both to a better understanding, uniting them closer in interest and promoting better relations, avoiding force, avoiding unjust exactions and oppression, avoiding the loss of earnings to labor, avoiding disturbances to trade and transportation; and if this House can contribute in the smallest measure, by legislative expression, or otherwise, to these ends, it will deserve and receive the gratitude of all men who love peace, good order, justice, and fair play."

The State of Ohio designated James A. Garfield as one of the two of her sons, "illustrious for their heroic renown or distinguished by civic or military services," whose statues should be placed in the Statuary Hall at the Capitol, and he delivered a memorial address on the occasion of its presentation to Congress, Jan. 19, 1886. "Great in dealing with all public questions," he said of Garfield, "dull and commonplace in none, to me he was the strongest, broadest, and bravest when he spoke for honest money, the fulfillment of the Nation's promises, the resumption of specie payments, and the maintenance of the public faith. He contributed his share, in full measure, to secure National honesty, and preserve inviolate our National honor. None did more, few, if any, so much to bring the Government back to a sound, stable, and constitutional money. He was a very giant in those memorable struggles." At the second session, Feb. 16, 1887, he delivered a memorial address on Gen. John A. Logan, of Illinois, much admired for its beauty and tenderness. "The old soldiers will miss him," said he; "the mighty oak around which their hearts were entwined, to which their hopes clung, has fallen. The veterans have lost their steady friend, Congress one of its able counselors, the Republican party one of its great leaders, the country one of its noble defenders."

He advocated the passage of the dependent pension bill, Feb. 24, over President Cleveland's veto, as a "simple act of justice," and "the instinct of a decent humanity and our Christian civilization."

The attention not only of Congress, but of the country,

was sharply arrested by Mr. Cleveland's third annual message, Dec. 6, 1887, for it was devoted to an assault on the protective tariff laws, upon which he was previously thought to hold a conservative position. A bill was immediately introduced in the House by Mr. Mills, embodying the President's views and policy, and the two parties were arrayed in support or opposition to it. Then occurred a most remarkable debate. Absenting himself from Congress a few days, Mr. McKinley returned to Canton, Dec. 13, 1887, and delivered a masterly address before the Ohio State Grange on "The American Farmer." In this he declared against alien landholding, and advised his hearers to remain true to their faith in protection. "We must avoid in this country," said he, "the holding of large tracts of land by nonresident owners for speculative purposes, and set our faces against alien landholding in small or large tracts. Our public domain must be rededicated to our own people, and neither foreign syndicates nor domestic corporations must be permitted to divert it from the hallowed purpose of actual settlement and cultivation by real farmers." He also went to Boston and discussed before the Home Market Club, Feb. 9, 1888, the question of "free raw material," upon which the majority in the House counted confidently to divide their Republican opponents, with such breadth and force that the doctrine was abandoned in New England, where it was supposed to be strongest.

On Feb. 29 he addressed the House on the bill to regulate the purchase of Government bonds, not so much in opposition to the measure, for he heartily favored their retirement as speedily as possible, but because of the wrong impression sought to be conveyed. The President and the Secretary of the Treasury, he said, had always had abundant authority to buy bonds as fast as the revenues admitted, and "their ulterior motive in piling up a surplus of $60,000,000 in the Treasury, without retiring any of them, was evidently for the purpose of creating a condition of things in the country which would get up a scare and stampede against the protective system." He was willing to do anything to help "put in circulation the millions they had been hoarding, and pay off that amount of Government debt, but he would first have the country understand why the Administration had not done this long ago."

On April 2 he presented to the House the views of the minority of the Ways and Means Committee on the Mills tariff bill, which he had himself mainly prepared. In concluding this report, they said: "The minority regard this bill not as a revenue reduction measure, but as a direct attempt to fasten upon this country the British policy of free foreign trade. So viewing it, their sense of obligation to the people, and especially the working people employed in manufacturing and agriculture in all sections of our common country, impel them to resist it with all their power. They will assist the majority in every effort to reduce the redundant income of the Government in a direct and practicable way; but every effort of fiscal legislation which will destroy or enfeeble our industries, retard material development, or tend to reduce our labor to the standard of other countries will meet with their persistent and determined opposition." On May 18, the day the general debate was to close, McKinley delivered what was described at the time as "the most effective and eloquent tariff speech ever heard in Congress." In a well-turned illustration, at the expense of his colleague, Mr. Morse, of Boston, he showed, by exhibiting to the House a suit of clothes purchased at the latter's store, that the claims of Mills as to the prices of woolens were absurd, and by equal tact he convinced his hearers of the bad policy of our Government importing foreign blankets for the army, at the expense of domestic manufacturers and home labor, for the sake of saving about 30 cents apiece on them. Some of his objections to the bill, as it was then before the House, were so conclusive that its authors felt constrained to amend it in the particulars enumerated. He held that protection was from first to last a contention for labor, whether it should be well paid and independent, as befitted citizens of the republic, or poorly paid and degraded, as was conspicuously the case in governments where its opportunities and privileges were most contracted. "The hope of the country," said he, in conclusion, "is in the ballot. The future, and, as I conceive, the welfare and progress of the republic, the future condition of the wage-earners, depends upon the issue to be settled in November. Americans who love their country must be on guard on that day of supreme concern; it is their duty, their one great opportunity. Parties must be subordinated to the great interests of the masses. No party necessity is great enough to force its adherents against the country's best interests. I care not what in the future may be the party name which stands for this system, which stands for the people, I will follow its flag under whatever designation or leadership, because it is my country's flag and represents its greatness and its glory." Both Congress and the country heartily applauded this speech. The feeling among his colleagues may be shown by an incident of the day. Judge Kelley, the Republican leader of the House, had chosen McKinley to close the debate, but Mr. Haskell had begged that privilege, and McKinley at once conceded it to him. When McKinley sat down, Haskell leaned over his desk, just back of McKinley's, and, clasping the latter's hand enthusiastically, declared, "Major, I shall speak last, but you have closed the debate." The press of the country gave it unusual attention, Republican committees scattered millions of copies of it, and it became a text-book of the campaign.

At the Ohio convention of 1888 McKinley was elected a delegate at large to the Republican National Convention, and took an active part in its proceedings. As chairman of the Committee on Resolutions he had a large share in the preparation of the platform, reported it to the convention, and secured its unanimous adoption. He was from the start the choice of many delegates for President, and when it was ascertained that Mr. Blaine would not accept the nomination, a movement in his favor began. All the Republican congressmen then in Washington, considering his availability greater than that of any name presented, united in a telegram urging his selection. But he had gone to the convention committed to John Sherman, and viewed with abhorrence the idea of himself accepting an honor which he was earnestly seeking for another. The first day's balloting was indecisive, but on Saturday morning it was evident that sentiment was rapidly centering upon him, and this the next roll call soon developed. McKinley leaped upon his chair at the head of the Ohio delegation, and in the hush of the moment was heard by every man in the hall. "I am not insensible to the honor you would do me," he said, "but in the presence of the duty resting upon me I can not remain silent with honor. I can not consistently with the wish of the State whose credentials I bear and which has trusted me; I can not with honorable fidelity to John Sherman, who has trusted me in his cause and with his cause; I can not consistently with my own views of personal integrity, consent, or seem to consent, to permit my name to be used as a candidate before this convention. I would not respect myself if I could find it in my heart to do, or permit to be done, that which could even be ground for any one to suspect that I wavered in my loyalty to Ohio, or my devotion to the chief of her choice, and the chief of mine. I do not request. I demand, that no delegate who would not cast reflection upon me shall cast a ballot for me." The effect on the convention was as he intended; but the pressure from the country for his nomination was by no means abated. The Connecticut and New Jersey delegations both determined to vote for him unanimously; but he went to their rooms and, in the words of a delegate, implored them "almost with tears in his eyes" not to do so. To one who suggested that he had done as noble a thing as was ever known in politics, he simply asked, "Is it such an honorable thing not to do a dishonorable act?" Although Congress remained in session through most of the campaign, he spoke throughout the country as widely and frequently as his official duties admitted. His best address, perhaps, was at Atlanta, Ga., Aug. 21, on the benefits of protection to the South, ever a favorite topic with him. "The protective system must stand as a whole or fall as a whole," he declared. "As Burke said of liberty, it is the clear right of all or of none. It is only perfect when universal. Men of Georgia, upon this great industrial question there should be no North or South. To us of every section the interests of our homes are uppermost; we have not been intrusted with the care of other nations and other peoples. We will not interfere with them; we bid them not to interfere with us. In this conflict, influenced by patriotism, National interest, and National pride, let us be Americans."

He was for the seventh time nominated and elected to Congress in the following November, defeating George P. Ikert by 4,100 votes.

In the Ohio campaign of 1889 he made about 60 speeches in half as many counties. One of the best of these was on "Protection and Revenue," before a great audience in Cleveland, Oct. 5. At the organization of the Fifty-first

Congress he was a candidate for Speaker, but was beaten on the third ballot in the Republican caucus by Thomas B. Reed. He resumed his place on the Ways and Means Committee, and on the death of Judge Kelley became its chairman.

Thus devolved upon him, at a most critical juncture, the leadership of the House, under circumstances of peculiar difficulty, his party having only a nominal majority, and it requiring always hearty concord and co-operation to pass any important measure. The minority had resolved upon a policy of obstruction and delay, declaring they would clog the wheels of legislation, and, by refusing to participate in business, prevent anything being done. They held that, though actually present, they were constructively absent whenever they refused to respond to roll call, and could not then be counted to make up a quorum. The Speaker proceeded nevertheless to count them, and this brought about a bitter contest over the rules of procedure, upon which McKinley spoke (Jan. 30, 1890) with moderation, thoroughness, and strength, and with his usual effectiveness. His argument in favor of the Republican position was pronounced the ablest made, and has been characterized as "more like the brief of a great lawyer than a speech in a heated political controversy." The Republican side had wavered in the first attack of the opposition, but they now rallied solidly to McKinley's support, and the cause was won, the Speaker himself heartily thanking him for his great and timely assistance. On Apr. 24, 1890, he spoke in favor of sustaining the civil-service law, to which there was decided opposition. "The Republican party," said he, "must take no step backward. The merit system is here, and it is here to stay."

On Dec. 17, 1889, he introduced the first important tariff measure of the session—a bill "to simplify the laws in relation to the collection of the revenue." Its object, as explained by him, was "to protect the honest importer in the U. S. against the unscrupulous and dishonest importer; to protect American producers and dealers from the undervaluations and frauds that had long been practiced upon them; to take the business of importing out of the hands of dishonest men and place it, as it once was, in the hands of honest agents, factors, and merchants." The bill passed the House Mar. 5, and the Senate, as amended, Mar. 20, went to a conference committee, and was approved June 10, 1890. It is known as the "customs administration bill." Meanwhile (Apr. 16) he introduced the general tariff measure that has since borne his name, and that for four months had been under constant consideration by the Ways and Means Committee, during which time every interest in the country that had asked for it had had a hearing. All this entailed a burden of work and trouble upon the chairman that it is impossible to conceive, but it was borne with patience and consideration. His speech in support of the measure, May 7, sustained his high reputation, and, despite the many sharp differences of opinion as to the particular schedules or items, its reception by the House proved conclusively that the passage of the bill was assured. The bill was passed by the House on May 21, but was debated for months in the Senate, that body finally passing it, as amended, on Sept. 11. The House accepted the reciprocity amendment, proposed by the Senate, which McKinley had unavailingly supported before the House Committee, the Senate accepted the internal-revenue sections insisted upon by the House, and the bill became a law Oct. 6, 1890. This bill received the support of all the Republicans in Congress who voted upon it, except three. Its passage was hardly effected, however, before the general election occurred, and in this the Republicans were, as anticipated, badly defeated. His own district had been gerrymandered again, so that he had 3,000 majority to overcome. He accepted the nomination for Congress, and entered the fight with the determination to deserve success, even though the odds against him were invincible. His competitor was Hon. John G. Warwick, a wealthy merchant and coal operator, who was ably supported by the strongest Democratic leaders of the country. Despite the fact that the tide of public sentiment was clearly against his party, and that the most outrageous imposition was practiced upon the people in the outcry about the prices of all kinds of goods being advanced by the new tariff, McKinley still ran largely ahead of his ticket and came within 300 of being elected. No Republican had ever received nearly so many votes in the counties composing the district. Immediately after the election a popular movement began in Ohio for his nomination for Governor, and the State convention in June, 1891, made him its candidate by acclamation. In Congress he spoke and voted for the eight-hour law; he advocated efficient antitrust and antioption laws; he supported the direct-tax refunding law, in an argument that abounds with pertinent information; and he presented a resolution declaring that nothing in the new tariff law should be held to invalidate our treaty with Hawaii. On the occasion of the seventieth anniversary of the birth of Judge Thurman, at Columbus, in Nov., 1890, Mr. Cleveland spoke upon "American Citizenship," and "made cheapness the theme of his discourse, counting it one of the highest aspirations of American life." McKinley, replying to this address at the Lincoln banquet in Toledo, Feb. 12, 1891, held that such a boon as "cheap coats" meant inevitably "cheap men," with all the evils of cheap and degraded labor. He spoke of the future most confidently, and, while not arrogating to himself undue credit, he in nowise shirked responsibility for the new tariff law, which was then condemned throughout the country by both the Democratic and independent parties and press, as well as by many wavering Republican leaders and journals.

His popularity with the old soldiers was great. He spoke frequently at their National Encampments—at San Francisco, Indianapolis, Washington, and Pittsburg—and made many patriotic addresses by their special request, such as that on "The American Volunteer Soldier," Memorial Day, 1889, in New York, or on "Pensions and the Public Debt," Canton, Ohio, May 30, 1891. He opened the Ohio campaign at Niles, Aug. 22. In this speech, as in every other of the 134 made by him in that campaign, during which he visited all the eighty-eight counties in Ohio but three, and often spoke to three or four audiences at different points in a single day and night, he declared his unalterable opposition both to free trade and free silver. "My opponent, Gov. Campbell," said he, "declared in a recent newspaper interview that, while he had his doubts about it, he was 'willing to chance the free and unlimited coinage of silver.' I am not willing to 'chance it.' Under present conditions, the country can not afford to chance it. We can not gamble with anything so sacred as money, which is the standard and measure of all values. I can imagine nothing which would be more disturbing to our credit and more deranging to our financial affairs than to make this the dumping-ground of the world's silver." McKinley polled the largest vote ever cast for Governor in Ohio. Campbell had been elected in 1889 by 11,000 plurality in a vote of 775,000; McKinley now defeated him by 21,500 in a total of 795,000. His inaugural address, Jan. 11, 1892, was devoted exclusively to State topics, except in its reference to congressional redistricting, in which he advised that "partisanship should be avoided." He declared that "free suffrage was of little service to the citizens if its force could be defeated by legislative machinations in the form of gerrymanders."

Soon after his inauguration as Governor the presidential campaign began, and he was importuned to allow the use of his name as a candidate. To every such suggestion he promptly replied that he believed Gen. Harrison justly entitled to another term, and heartily favored his renomination. He was again a delegate at large from Ohio to the national convention, and was its permanent chairman. The opponents of the president persisted in urging his name, and the delegations from Kansas and West Virginia told him that they intended to vote for him. He asked them not to do so, but urged them to support Harrison, and made the same request of every individual delegate who approached him on the subject. His wishes were so well known that no delegate ventured to present his name, knowing he would immediately withdraw it; but when the ballot was taken many persisted in voting for him, the Ohio delegation responding 44 to 2 for him. He at once challenged this vote, from the chair, and put himself on record for Harrison, who on the entire roll call received 535 votes; Blaine, 182; McKinley, 182; Reed, 4; and Lincoln, 1. During the canvass McKinley spoke in Maine, Massachusetts, New York, Pennsylvania, Michigan, Illinois, Indiana, Missouri, Kansas, Nebraska, Iowa, and Ohio, to great and enthusiastic audiences. His principal political addresses of the year were those at Ann Arbor, Mich., May 17, to a national convention of college clubs; on "The Triumph of Protection," before the Nebraska Chautauqua at Beatrice, Aug. 2; and on "The Issues of 1892" at Philadelphia, Sept. 23.

The fight was lost, the people seemed to have repudiated protection, and, as in 1890, the law bearing his name, as well

as he himself, was the subject of sneers and jests from every quarter. But he lost neither courage nor confidence. He had no apologies or excuses to offer. He had not sought credit for his efforts for protection, and he feared no criticism.

In his first annual message, Jan. 3, 1893, he called attention to the financial condition of the State, enjoined economy in appropriations, and the application of strict business principles in every part of the public service. His sympathy with laboring men is apparent in his recommendation of additional protection to steam and electric railroad employees, and his interest in the problems of municipal government by his approval of what is called the "Federal plan" of administration. On the seventy-first anniversary of the birth of Ulysses S. Grant he delivered an address in Galena, Ill., and on June 20 a memorial address on Rutherford B. Hayes in Delaware, Ohio, both of which were admired for their research and beauty. At the Republican convention in Ohio he was unanimously renominated for Governor, and he was re-elected by an overwhelming majority, the greatest ever recorded (with a single exception during the war) for any candidate up to that time in the history of the State. His competitor was Lawrence T. Neal, who, as a member of the Committee on Resolutions at the Democratic National Convention of 1892, had written the plank denouncing the new tariff law as a "fraud," as "unconstitutional," as a "sham," and as "the culminating atrocity of class legislation." The issues discussed were National, and McKinley's voice was again heard in every locality in the State in earnest condemnation of "those twin heresies, free trade and free silver." In his second annual message he recommended biennial sessions of the Legislature; a revision of the tax laws by a commission created for the purpose; condemned any increase of local taxation and indebtedness; enjoined the necessity for economy; and warned his party, which had elected three fourths of the Legislature, that the greater its power the vaster were its responsibilities, and the less excusable was needless or reckless legislation.

On Feb. 22, 1894, McKinley delivered an address on the life and public services of George Washington, under the auspices of the Union League Club in the Auditorium at Chicago, which gave much gratification to his friends and admirers. He reluctantly consented to speak in Minneapolis on the tariff question Mar. 28, fearing it would be impossible to procure a representative audience at so early a season. Every county and town in the State was represented, and the large exposition hall in which the National Convention had been held was filled to its utmost capacity by an enthusiastic audience. Beginning at Bangor, Me., Sept. 8, and continuing through the next two months, he was constantly on the platform. The Wilson-Gorman tariff law had just been enacted, and to this he devoted his chief attention.

At Indianapolis, Sept. 26, Gen. Harrison introduced him to an audience such as had never before assembled in that city on the occasion of the opening of a State campaign, in the following felicitous words: "Major McKinley has endeared himself to all by his record as a gallant soldier, battling for the flag. He has honored himself, his State, and the country by his conspicuous services in high legislative and executive places. No man more than he is familiar with the questions that now engage public thought. No man is more able than he lucidly to set them before the people. I do not need to invoke your attention to what he shall say. He will command it." After returning to Ohio to open the State campaign at Findlay, Gov. McKinley set out for the West, and in a series of speeches through Missouri, Kansas, Nebraska, Iowa, Minnesota, Wisconsin, Illinois, Indiana, Michigan, and again in Ohio, was greeted apparently by the entire populace. He proved himself one of the most remarkable campaigners the country ever has known. His meetings began at daybreak and continued until nightfall or later from his car, or from adjacent platforms, crowds greeting him at every station, and, whether stops had been arranged or not, blocking the track until he appeared and addressed them. He frequently spoke a dozen times a day, and two, three, or four times at night. In his trip through Wisconsin he spoke twenty-three times in sixteen hours. At Chicago the greatest political meeting in the history of the city greeted him; and at daylight he was speeding through Ohio, to conclude the campaign by a tour of his own State. On undertaking the journey he had agreed to make 46 speeches. He made them, and 325 more, in 300 towns. For more than eight weeks he averaged seven speeches a day, ranging in length from ten minutes to an hour; and in this time he traveled over 16,000 miles and addressed 2,000,000 people. Never were more effective speeches delivered, for at every point visited his party achieved phenomenal victories, and it carried the popular branch of Congress by more than a two-third majority.

During the ensuing winter his official duties as Governor were made the more arduous by the prevalence of great distress in the mining districts of the Hocking valley. Gov. McKinley, by appeals to the generous people of the State, raised by voluntary contributions sufficient funds and provisions to meet every case of actual privation, the bulk of the work being done under his personal direction. Several serious outbreaks occurred during his administration, at one time requiring the presence of 3,000 of the National Guard in the field and entailing an outlay of more than $60,000, but this extraordinary expense was met by most advantageous arrangements with private capitalists without the expense and delay of an extra session of the Legislature. On three occasions prisoners were saved from mobs and safely incarcerated in the State prison. His declaration that "lynchings must not be tolerated in Ohio" was literally made good for the first time in any State administration. In Feb., 1895, he delivered notable addresses at Albany, N. Y., before the Unconditional Republican Club, on Lincoln, and at Rochester, on "The Business Man in Politics." In the following April he visited Hartford, Conn., and spoke to a State club that bore his name, and on Memorial Day he delivered an oration on Grant at his tomb in Riverside Park, New York city. In the ensuing political canvass he confined his speaking to Ohio, where, under his leadership, a decisive Republican victory was won.

On the expiration of his term as Governor he returned to his old home at Canton, at which he quietly remained during the next six months, except for a visit to Chicago to address the Marquette Club on Lincoln, Feb. 12, 1896. The country was already ablaze with political excitement, and many friendly advisers urged him not to speak there, as he might give his rivals the advantage of any possible mistake on such an occasion. But he spoke with his usual candor and sincerity, and, using Lincoln's views on the tariff as a text, boldly advanced his views upon what should constitute the Republican platform in the pending campaign. Simultaneously throughout the country began a movement in his favor that proved almost irresistible in every popular convention. State after State and district after district declared for him, until, when the National Convention assembled, he was the choice of more than two-thirds of the delegates for President, on the very platform that four months before he had so clearly outlined. Early in the contest he announced his determination not to engage in the speaking campaign, his only contribution to the cause to be his letter of acceptance. This proved to be one of the strongest papers of its kind in the annals of American politics, but the people were not content. Realizing that they could not induce him to set out on what he thought an undignified vote-seeking tour of the country, they began to flock by thousands to his modest home in Canton, and here from his doorstep he welcomed and spoke to them. In this manner more than 300 speeches were made from June 19 to Nov. 2, 1896, to the more than 750,000 strangers who came in from all parts of the country for that express purpose. His only departure from home during the campaign was a hasty trip to Cleveland to speak at the centennial anniversary of that city.

Enthusiastic visitors from States as distant as Nebraska, Kansas, Missouri, Tennessee, Virginia, Maryland, Vermont, and New York came daily to mingle with the shouting thousands from all parts of Illinois, Indiana, Michigan, Kentucky, West Virginia, Pennsylvania, and Ohio. About thirty States sent such delegations, and more than thirty times as many political clubs and organizations were represented in them. Men of both old parties and both old sections, and equally enthusiastic women and children, with every species of music and decorations. More than 50,000 came at the formal opening of the speaking campaign, and nearly as large crowds on three other great days. They tore down and carried away the wooden fences piecemeal, but were always good-natured and devoted to the leader, whose charming personality attracted them. His speeches were as remarkable for their good sense, originality, versatility, and effectiveness as these pilgrimages were unique and unprecedented. In spite of the enormous strain upon Major

McKinley's mental resources, his physical powers were put to the sorest trial, yet no visitor was ever repelled or disappointed. Not only was every delegation satisfied, but the country each morning was given some new text for contemplation and conversation, always patriotic and encouraging to the cause he espoused. Nothing like it was ever before known.

In the Republican National Convention in St. Louis in June, 1896, he was nominated for President on the first ballot, and in the ensuing election he received a popular vote of 7,104,779, and a plurality of 601,854 over his principal opponent, William J. Bryan. In the electoral college McKinley received 271 votes, against 176 for Bryan. The prominent issues in the canvass were the questions of free coinage of silver and restoration of the protective tariff system.

He was inaugurated Mar. 4, 1897, and appointed as his cabinet: John Sherman, Secretary of State: Lyman J. Gage, Secretary of the Treasury; Russell A. Alger, Secretary of War; John D. Long, Secretary of the Navy; Joseph McKenna, Attorney-General; James A. Gary, Postmaster-General; Cornelius N. Bliss, Secretary of the Interior; James Wilson, Secretary of Agriculture. Before the term ended Secretary Sherman retired and was succeeded by William R. Day, and he by John Hay. Secretary Alger was succeeded by Elihu Root, Attorney-General McKenna by John W. Griggs, Postmaster-General Gary by Charles Emory Smith, and Secretary Bliss by Ethan Allen Hitchcock.

President McKinley immediately called an extra session of Congress, to meet Mar. 15, for the purpose of revising the tariff. Mr. Nelson Dingley, of Maine, introduced the new measure on the first day of the session, and it was reported from the Ways and Means Committee on the 19th. It passed the House Mar. 31, and the Senate July 7; and after the question of amendments had been settled between the two Houses it received the President's signature July 24. The most important event of this administration was the war with Spain in 1898, which was brought on primarily by the condition of affairs in Cuba, and was perhaps hastened by the destruction of the battle-ship Maine in Havana harbor (Feb. 15). The President exhausted the resources of diplomacy to prevent the war, but, seeing the probability of it, hastened every preparation for a conflict. The result was the defeat of the Spanish forces in every battle, the end of Spanish dominion in Cuba, and the acquisition by the United States of Porto Rico and the Philippine Islands.

A treaty for the annexation of the Hawaiian Islands was signed on June 16, 1897, and was confirmed by the Senate July 7, 1898, and on Aug. 12 the formal transfer of sovereignty was made.

In 1900 the Republican National Convention unanimously renominated President McKinley, and placed Theodore Roosevelt on the ticket for Vice-President. The President's principal opponent, as before, was William J. Bryan, and the issues were the same. In the election, Mr. McKinley received a majority over all of 443,054, and a plurality over Mr. Bryan of 832,280. In the electoral college he received 292 votes, against 155 for Mr. Bryan.

At the Pan-American Exposition, held in Buffalo in the summer of 1901, Sept. 5 was set apart as President's day. The attendance was very large, and President McKinley spoke to an audience estimated at 30,000 persons. His address was not only appropriate to the occasion, but significant of his policy for his new term, and it at once attracted attention and excited comment, mainly favorable, all over the world. The chief interest centered in these passages:

"Expositions are the time-keepers of progress. They record the world's advancement. They stimulate the energy, enterprise, and intellect of the people, and quicken human genius. They go into the home. They broaden and brighten the daily life of the people. They open mighty storehouses of information to the student. Every exposition, great or small, has helped to some onward step. . . . Comparison of ideas is always educational and, as such, instructs the brain and hand of man. Friendly rivalry follows, which is the spur to industrial improvement, the inspiration to useful invention and to high endeavor in all departments of human activity. It exacts a study of the wants, comforts, and even the whims of the people, and recognizes the efficacy of high quality and low prices to win their favor. The quest for trade is an incentive to men of business to devise, invent, improve, and economize in the cost of production. Business life, whether among ourselves, or with other peoples, is ever a sharp struggle for success. It will be none the less in the future. . . . Without competition we would be clinging to the clumsy and antiquated processes of farming and manufacture and the methods of business of long ago, and the twentieth would be no further advanced than the eighteenth century. But though commercial competitors we are, commercial enemies we must not be. The Pan-American Exposition has done its work thoroughly, presenting in its exhibits evidences of the highest skill and illustrating the progress of the human family in the Western Hemisphere. This portion of the earth has no cause for humiliation for the part it has performed in the march of civilization. It has not accomplished everything; far from it. It has simply done its best, and without vanity or boastfulness, and recognizing the manifold achievements of others it invites the friendly rivalry of all the powers in the peaceful pursuits of trade and commerce, and will coöperate with all in advancing the highest and best interests of humanity. The wisdom and energy of all the nations are none too great for the world work. The success of art, science, industry, and invention is an international asset and a common glory. . . . My fellow-citizens, trade statistics indicate that this country is in a state of unexampled prosperity. The figures are almost appalling. They show that we are utilizing our fields and forests and mines, and that we are furnishing profitable employment to the millions of workingmen throughout the United States, bringing comfort and happiness to their homes, and making it possible to lay by savings for old age and disability. That all the people are participating in this great prosperity is seen in every American community and shown by the enormous and unprecedented deposits in our savings-banks. Our duty in the care and security of these deposits and their safe investment demands the highest integrity and the best business capacity of those in charge of these depositories of the people's earnings. . . . We have a vast and intricate business, built up through years of toil and struggle in which every part of the country has its stake, which will not permit of neglect, nor of undue selfishness. No narrow, sordid policy will subserve it. The greatest skill and wisdom on the part of manufacturers and producers will be required to hold and increase it. Our industrial enterprises, which have grown to such great proportions, affect the homes and occupations of the people and the welfare of the country. Our capacity to produce has developed so enormously and our products have so multiplied that the problem of more markets requires our urgent and immediate attention. Only a broad and enlightened policy will keep what we have. No other policy will get more. In these times of marvelous business energy and gain we ought to be looking to the future, strengthening the weak places in our industrial and commercial systems, that we may be ready for any storm or strain. . . . By sensible trade arrangements which will not interrupt our home production we shall extend the outlets for our increasing surplus. A system which provides a mutual exchange of commodities is manifestly essential to the continued and healthful growth of our export trade. We must not repose in fancied security that we can forever sell everything and buy little or nothing. If such a thing were possible it would not be best for us or for those with whom we deal. We should take from our customers such of their products as we can use without harm to our industries and labor. Reciprocity is the natural outgrowth of our wonderful industrial development under the domestic policy now firmly established. . . . What we produce beyond our domestic consumption must have a vent abroad. The excess must be relieved through a foreign outlet, and we should sell everywhere we can and buy wherever the buying will enlarge our sales and productions, and thereby make a greater demand for home labor. . . . The period of exclusiveness is past. The expansion of our trade and commerce is the pressing problem. Commercial wars are unprofitable. A policy of good-will and friendly trade relations will prevent reprisals. Reciprocity treaties are in harmony with the spirit of the times; measures of retaliation are not. If, perchance, some of our tariffs are no longer needed for revenue or to encourage and protect our industries at home, why should they not be employed to extend and promote our markets abroad? Then, too, we have inadequate steamship service. New lines of steamships have already been put in commission between the Pacific coast ports of the United States and those on the western coasts of Mexico and Central and South America. These should be followed up with direct steamship lines between the western coast of the United States and South American

ports. . . . We must build the Isthmian canal, which will unite the two oceans and give a straight line of water communication with the western coasts of Central and South America and Mexico. The construction of a Pacific cable can not be longer postponed. . . . Let us ever remember that our interest is in concord, not conflict; and that our real eminence rests in the victories of peace, not those of war. We hope that all who are represented here may be moved to higher and nobler effort for their own and the world's good, and that out of this city may come not only greater commerce and trade for us all, but, more essential than these, relations of mutual respect, confidence, and friendship which will deepen and endure. Our earnest prayer is that God will graciously vouchsafe prosperity, happiness, and peace to all our neighbors, and like blessings to all the peoples and powers of earth."

The next afternoon (Sept. 6) a reception was held in the Temple of Music, on the Exposition grounds, at which all who wished were invited to pass in line and shake hands with the President. In the line was a man whose right hand was wound about with a handkerchief. This concealed a revolver, and as the President offered his hand, turning it to accommodate the left hand of the stranger, the miscreant fired through the handkerchief and inflicted a slight flesh wound on the President's breast. Before the assassin could be knocked down or disarmed he fired a second bullet, which passed through the stomach. Surgical aid was close at hand, and very soon the wounded President was on the operating-table in the emergency hospital. The surgeons sewed up both wounds in the stomach, and as the shock appeared to be comparatively light Mr. McKinley was removed in the evening to the home of John G. Milburn, president of the Exposition. The patient progressed so rapidly toward apparent recovery that in five days he was pronounced out of danger; but the next day he showed signs of a relapse, and from that point he failed rapidly until he breathed his last 2:15 Saturday morning, Sept. 14. His bearing in that sorrowful week was in keeping with his whole life and character—courageous and charitable. When he was shot, fearing that the bystanders would take summary vengeance on the assassin, he exclaimed, "Let no one hurt him," and the only time that he inquired about the felon it was to be assured that he had not been lynched. When the surgeons announced to him that an operation was necessary, he said, "Gentlemen, I wish you to do whatever in your judgment is best." He was cheerful as he lay helpless during the days that followed, often speaking of his plans for the future. Forty-eight hours before the end came his physicians informed him what it must be. He took an affecting farewell of his wife, and then softly chanted portions of his favorite hymns—"Abide with me" and "Nearer, my God, to Thee." His last words were, "It is God's way—His will be done," and "Good-bye, all! Good-bye!" The story of his last hours, considered in connection with his character and the history of his life, reads like the close of some great Shakespearean drama.

The body was taken to Washington, where it lay in state in the Capitol, and thence to Canton, Ohio, where the funeral services were held on Thursday, Sept. 19—the twentieth anniversary of the death of President Garfield. The assassin had declared himself an anarchist, and when the President died it required a large force of militia as well as police to protect him from the crowd that surrounded the Buffalo jail.

The assassin was tried speedily, two eminent lawyers being assigned by the court for his defense, and was found guilty of murder in the first degree. On Sept. 26 he was sentenced to be executed by electricity in the week beginning Oct. 28—the earliest date permitted by law. He declared in court that he had no accomplices whatever.

A volume of Mr. McKinley's speeches, compiled by Joseph P. Smith, was published in New York in 1893, and a campaign life by Robert P. Porter in Cleveland in 1896.

McKinney: city (founded in 1846; named after Collin McKinney, an early settler); capital of Collin co., Tex. (for location of county, see map of Texas, ref. 2-I); near the east fork of Trinity river; on the Houston and Tex. Cent. and the Sherman, Shreve. and S. railways; 32 miles N. of Dallas, 135 miles N. E. of Austin. It is in an agricultural and cotton-growing region; contains 5 churches, McKinney Institute, a public-school building, and 4 weekly newspapers; and has a cotton-compress, cotton-oil mill, flour-mill, ice-factory, planing-mill, important live-stock interests, and electric lights. Pop. (1880) 1,479; (1890) 2,489; (1900) 4,342.

EDITOR OF "DEMOCRAT."

Mack'intosh, Sir JAMES, M. D., LL. D., F. R. S.: philosopher and politician; b. at Aldourie, Inverness-shire, Scotland, Oct. 24, 1765; graduated M. A. in 1784 at King's College, Aberdeen, and M. D. at Edinburgh 1787; went to London, and in 1791 published his *Vindiciæ Gallicæ*, an eloquent defense of the French Revolution against the strictures of Burke's *Reflections*, which at once won him the favor of the Whig leaders; supported himself by literary work, and in 1795 was called to the bar at Lincoln's Inn; delivered in 1799–1800 at Lincoln's Inn his brilliant *Lectures on the Law of Nature and of Nations*; won a splendid fame at the bar; was knighted 1803, and was recorder of Bombay 1804–06; judge of admiralty 1806–11; returned to England after a highly honorable career in the East, and entered Parliament in 1813 from Nairn; was Professor of Law and General Politics at Haileybury College 1818–24, still taking an important place in parliamentary business; in 1830 became a commissioner of Indian affairs. D. in London, May 30, 1832. Among his more important works are a brief *History of England* (1830), extending only to the reign of Elizabeth, but completed by Wallace and Bell (10 vols.); a *Dissertation on the Progress of Ethical Philosophy* (1830), written for the *Encyclopædia Britannica*; a *Life of Sir Thomas More*: a posthumously published *History of the Revolution in England in 1688*, which was a fragment of a projected history in several volumes; and a great number of miscellaneous articles, chiefly published in *The Edinburgh Review*, containing a mass of valuable criticism, especially regarding questions of psychology and ethics. They were collected into volumes and published in the U. S. in a series entitled *Modern British Essayists*. As a parliamentary orator he did not fill the expectations based upon his forensic achievements, among which the memorable defense of Peltier (Feb. 21, 1803) was perhaps the greatest effort of British eloquence at the bar. See his *Memoirs*, by his son, containing journals, etc. (1835).

McLane', LOUIS: Congressman and diplomat; son of Col. Allen McLane (1746–1829), jurist; b. at Smyrna, Del., May 28, 1786; entered the navy as midshipman at the age of twelve years, and cruised a year in the Philadelphia; pursued studies at Newark College, Delaware; studied law with James A. Bayard, and was admitted to the bar 1807; served as a volunteer in 1814 in a company commanded by Cæsar H. Rodney, which marched to the defense of Baltimore from the threatened attack by the British; was representative in Congress 1817–27, voting against the admission of slavery in Missouri or in the Territories: was chosen Senator 1827; sent by President Jackson as minister to England May, 1829; returned in 1831 to accept the post of Secretary of the Treasury; was transferred in 1833 to the department of State in consequence of his refusal to sanction the removal of the deposits from the Bank of the U. S.; retired to private life June, 1834, settling in Maryland; was president of the Baltimore and Ohio Railroad during its completion and early management 1837–47; accepted the mission to London to settle the Oregon difficulty June, 1845; was a delegate to the constitutional convention of Maryland 1850–51. D. in Baltimore, Oct. 7, 1857.

McLane, ROBERT MILLIGAN: son of Louis McLane, diplomat; b. in Wilmington, Del., June 23, 1815; resided with his father in London 1828–31; studied in colleges in Baltimore, Md., and Paris, France; graduated at West Point Military Academy 1837; served in the army in Florida, in the Cherokee country, and in the Northwest; resigned 1843; was admitted to the bar in Baltimore the same year; was a member of the Maryland Legislature 1845–47; member of Congress 1847–51; commissioner to China 1853–55; and minister to Mexico. While in Mexico he negotiated a treaty giving President Juarez the benefit of a U. S. loan and other substantial advantages, and purchasing Lower California for a sum of several millions of dollars. The treaty was never ratified, but the policy of intervention in Mexican affairs was carried out by the U. S. navy in capturing several vessels of war belonging to the reactionary government of Miramon. After his return from Mexico he practiced at the Baltimore bar. He was a delegate to the national Democratic conventions of 1856 and 1876; member of the Forty-sixth and Forty-seventh Congresses; Governor of Maryland 1884–85; U. S. minister to France 1885–89. D. April 16, 1898.

Maclaren, JOHN JAMES: See the Appendix.

MacLa'ren, William, D. D.: minister in the Presbyterian Church of Canada; b. in Tarbolton, Carleton County, Canada, Jan. 26, 1828; edueated in Knox College and the University of Toronto; pastor of the Church of Amherstburg, Ontario, 1853–57; then pastor of Knox church, now the Columbus Avenue Presbyterian church, Boston, Mass.; pastor of John Street church, Belleville, Canada, to 1870; of Knox church, Ottawa, 1870–73; lecturer on Apologetics in the Presbyterian College, Montreal, 1872; Professor of Systematic Theology in Knox College, Toronto, from 1873. He was moderator of the General Assembly of the Presbyterian Church of Canada 1884. Besides other articles and pamphlets he has published a series of theological monographs, including *The Inspiration of Scripture*, *The Romish Doctrine of the Rule of Faith*, *The Rule of Truth and Private Judgment*, *Calvinism in Relation to other Theistic Systems*, *Conditional Immortality*, and a volume *The Unity of the Church and Church Unions* (Toronto, 1890). C. K. Hoyt.

McLaren, William Edward, S. T. D., D. C. L.: bishop; b. Dec. 13, 1831, in Geneva, Ontario co., N. Y.; graduated at Jefferson College in 1851, and at the Western Theological Seminary, Pittsburg, in 1860; was ordained to the Presbyterian ministry in the same year, and went to South America as a missionary; returned in 1863, and became pastor to the Second Presbyterian church, Peoria, Ill.; moved in 1866 to Detroit, Mich., as pastor to the Westminster church; entered the Episcopal Church in 1872; became rector of Trinity church, Cleveland, O., and was elected Bishop of Illinois in 1875. The dioeese of Illinois having been divided into three sees—Illinois, Quincy, Springfield—in 1877 the name of the see of Illinois was changed to Chicago. Bishop McLaren has published *Catholic Dogma the Antidote of Doubt* (New York, 1884), and many sermons, charges, and addresses.

McLaws, Lafayette: See the Appendix.

MacLean, George Edwin: See the Appendix.

McLean, John, LL. D.: jurist; b. in Morris co., N. J., Mar. 11, 1785; settled with his parents in Warren co., O., in childhood; began studying law in 1803; was admitted to the bar, and began practice in 1807 in Lebanon; served in Congress from 1813 to 1816, when he became a judge of the Supreme Court of Ohio; was commissioner of the general land office in 1822, Postmaster-General in 1823, associate justice of the U. S. Supreme Court in 1829; was distinguished for the eloquence and ability of his charges to grand juries, of which a notable example was one delivered in Dec., 1838, concerning unlawful combinations against a foreign government, elicited by certain aspects of the Canadian "patriot war." His decision in the celebrated "Dred Scott case" (1857) was given to the effect that slavery has its origin in force, not in right, nor in general law, to which it is opposed, but in local law, which can not be respected by the national courts. In 1848 his name was brought before the Buffalo "Free Soil" convention as a candidate for the presidential nomination, and in 1856 he was the leading competitor of Fremont for the Republican nomination at Philadelphia. He again received some votes in the Chicago convention of 1860. D. Apr. 4, 1861. He published 6 vols. of *Reports of United States Circuit Court* (1829–55).

Maclean, John: See the Appendix.

Maclean, Letitia Elizabeth Landon: poet; b. in Brompton, England, Aug. 14, 1802; acquired considerable reputation by a number of poems published in 1820 in *The Literary Gazette* over the signature L. E. L., by which she was thenceforth known. She soon became a regular contributor of reviews, essays, poems, and miscellaneous articles to *The Gazette* and other newspapers, and to the annuals, and for fifteen years supported her family by her pen. She published several volumes of poems and four novels, of which many were reprinted in the U. S. In June, 1838, she married George Maclean, appointed governor of Cape Coast Castle, West Africa, and accompanied him to that place. D. Oct. 15, 1838. See *Life and Literary Remains of L. E. L.*, by Laman Blanchard (1841).

McLellan, Isaac: See the Appendix.

MacLeod, măk-lowd', Donald, D. D.: a minister of the Church of Scotland; b. in Campsie, Berwickshire, Scotland, Mar. 18, 1831: was educated at Glasgow University; was minister at Lauder 1858–62; at Linlithgow 1862–69; and since 1869 of the Park church, Glasgow. He is chaplain to the Queen, and since 1873 has been editor of *Good Words*. He has published *Memoir of Norman McLeod*, his brother (2 vols., London, 1872; 1 vol., 1876; New York, 1876); *The Sunday Home Service* (1885); *Christ and Modern Society* (1893); and has edited a *New Illustrated Bible* (1892).
C. K. Hoyt.

McLeod, Henry Dunning: financier; b. in Edinburgh, Scotland, in 1821; was educated at Eton and the University of Cambridge; was admitted to the bar in 1849; published *Theory and Practice of Banking* (1856); *Elements of Political Economy* (1858); and a *Dictionary of Political Economy* (1859). He was employed by the British Government 1868–70 in codifying the laws relating to bills of exchange.

MacLeod, James Farquharson, C. M. G.: military and civil officer; b. in Toronto, Canada, in 1836; graduated at Queen's University, Kingston, and became a barrister-at-law. He served as brigade-major of militia with the Red river expedition in 1870, and was created a Companion of the Order of St. Michael and St. George for his services; appointed captain in Northwest mounted police in 1873; commissioner in command of this force and member of Northwest Council in 1876; and stipendiary magistrate, with civil and criminal jurisdiction over the entire Northwest Territory, in 1880. D. at Calgary, Sept. 5, 1894. N. M.

MacLeod, Malcolm: Canadian explorer; b. in Stornoway, island of Lewis, Scotland, in 1788; removed to British North America in 1811, and entered the service of the Hudson's Bay Company. In 1815 he was detailed to assist the Selkirk settlement in its first establishment; commanded a small force which defeated, on the present site of Winnipeg, a larger force of a rival, the Northwest Company, and erected forts, houses, and barns on the territory he had secured. In 1822, on the coalition of the two companies, he was selected as a partner, and was appointed to the perilous task of crossing the Rocky Mountains by the Athabasca Pass, to organize an extended trade in furs and other products, to the Pacific Ocean, in conjunction with a projected line of shipping to and from England, Mexico, the Sandwich islands, and Russian America. He spent four years in this work, and opened trade routes by the Yellow Head Pass, the Thompson and Fraser rivers, and elsewhere, and removed the main post of the company on the Pacific from Astoria to Vancouver, where he established a large farm and erected grist and saw mills, the first on the Pacific coast N. of Mexico. In 1826 he returned to York Factory, on Hudson's Bay, to report to the general council of the company, and from that date till 1830 was stationed at the head of Lake Winnipeg, having a general supervision of the company's field of work in North America. In 1834 he retired on leave of absence, and died in Montreal, July 24, 1849.

MacLeod, Malcolm: lawyer and author; b. at Green Lake, Athabasca, Northwest Territories, Oct. 21, 1821; son of Malcolm MacLeod, the explorer; was educated in Edinburgh, Scotland; admitted as a barrister of Lower Canada in 1845; was judge of the distriet of Ottawa 1873–76, and appointed a queen's counsel in 1887. In addition to many contributions to the periodical press, he published *The Peace River*, descriptive of the Northwest and British Columbia, in 1872; sundry pamphlets in promotion of the Canadian Pacific Railway in 1869–80, and *Problem of Canada* in 1880. His writings on the Northwest directed public attention to the resourees of that region, and greatly facilitated the labors of surveyors in determining upon a route for the Canadian Pacific Railway. Neil Macdonald.

MacLeod, Norman, D. D.: b. at Campbelton, Scotland, June 3, 1812; educated in Edinburgh, Glasgow, and Germany; became minister of the National Kirk; parish minister of Loudoun 1838–43, of Dalkeith 1843–51, in Glasgow (Barony parish) 1851—a very large and difficult field; established schools and meetings for the workingmen, and labored with zeal and success; was a founder of the Evangelical Alliance 1847; took a leading part in the advoeacy of foreign missions; beeame chaplain to the Queen for Seotland 1857; edited *The Christian Magazine* (Edinburgh, 1850–60), *Good Words* (1860–72); was author of *The Earnest Student* (a biography of John Mackintosh, 1854), *Parish Papers* (1862), *Eastward* (1866), and *Peeps at the Far East* (1871, a narrative of travels in India), and several other works. D. in Glasgow, June 16. 1872. Dr. MacLeod made *Good Words* an important educational organ and a great literary success. He was noted for breadth and versatility. See *Memoirs* by his brother, Rev. Donald MacLeod (2 vols., London and New York, 1876).

Maclise, mak-lees', Daniel (real name perhaps McLeish or McLish): painter; b. at Cork, Ireland, probably Feb. 2,

1806; early displayed a remarkable versatility of talent in art. His first successes were gained by sketches of Irish scenery and life taken on a pedestrian excursion among the peasantry of Wicklow. He studied art at Cork Academy. In 1828 he went to London, was admitted to the Royal Academy, gained a medal in the antique school, and was made a member of the life school, where he also gained a medal for the best copy of a painting by Guido; was a contributor of drawings and verses to *Fraser's Magazine*; studied a year in Paris; won the gold medal of the Academy in 1831, by his historical painting, *The Choice of Hercules*, and from that time devoted his pencil mainly to subjects of a blended historical and romantic character—*All-Hallow Eve, Henry VIII. and Anne Boleyn, Francis I. and Diana of Poictiers, Charles I. and Cromwell, Puck Disenchanting Bottom, Macbeth and Witches, Bohemian Gypsies, Gil Blas Dressing as a Cavalier, The Sleeping Beauty, Origin of the Harp, Alfred in the Danish Camp*, and many others. His most important works were huge frescoes and water-glass paintings in the houses of Parliament, *The Death of Nelson* and the *Meeting of Wellington and Blücher after Waterloo*, both in the Victoria Gallery. He was a poor colorist, and his conception of incidents, gesture, and expression was theatrical and unreal; but he knew how to compose a large number of figures. Maclise was elected associate of the Academy in 1835, and academician in 1840. In 1866 he declined the presidency. D. in London, Apr. 25, 1870.

Revised by Russell Sturgis.

Maclure', William: geologist; b. in Ayr, Scotland, in 1763; visited New York in 1782; settled in London soon after as partner in a commercial house; gained a considerable fortune; emigrated to the U. S. in 1796; was one of the commissioners on the French spoliation claims in 1803; became interested about this time in geology, which he studied in Europe; conceived the plan of making a geological survey of the U. S., and for that purpose crossed the Alleghanies fifty times, and visited nearly every State of the Union, traveling chiefly on foot. He presented geological memoirs to the American Philosophical Society in 1809 and 1817. The second was accompanied by the first geological map of the U. S., and he thereby gained the title of "father of American geology." Settling in Philadelphia, he gave his books and collections to the Academy of Natural Sciences of that city, an institution of which he was president from 1817 until his death. He resided in Spain 1819–24; engaged in an unsuccessful attempt to establish a college on an agricultural basis; made an attempt of the same kind at New Harmony, Ind., where he bought a large tract of land and resided several years; went to Mexico for his health in 1827, returned there in 1828, and resided there until his death, which occurred at San Angel, near the city of Mexico, Mar. 23, 1840. He left $20,000 to the Academy of Natural Sciences, besides his library as already mentioned, and was a liberal benefactor of the American Geological Society, of which he was president in 1828. While in Mexico he wrote a work entitled *Opinions on Various Subjects* (2 vols., New Harmony, 1837).

MacMahon, măăk'măă'ōn', Marie Edme Patrice Maurice, de: Duke of Magenta, marshal of France, president of the French republic; b. at the château of Sully, near Autun, June 13, 1808; descended from an Irish family which took refuge in France after the fall of the Stuarts; entered in 1825 the military school of St.-Cyr; served in Algeria; returned after the July revolution to France, and was present at the siege of Antwerp. Once more transferred to Africa, he distinguished himself as a captain at the storming of Constantine; received the command first of a battalion, then of a regiment, of the foreign legion; became colonel in 1845, and brigadier-general in 1848. As such he stood at the head of the administration, first of the province of Oran, and then of that of Constantine. In 1852 he became general of division, and in 1855 he was recalled in order to assume the command of a division in the Crimean war. He arrived just in time to take part in the storming of Malakoff, and distinguished himself by an act of courage bordering upon disobedience. The French commander gave the order for MacMahon's return. His reply became historic "J'y suis; j'y reste." He remained in the Malakoff and drove out the Russians. For this heroic success he received the Grand Cross, and was created a senator. In this position he evinced a rare independence of character; he was the only senator who refused to vote for the Safety Bill which was proposed in consequence of the Orsini conspiracy (June, 1858), and placed France under the intolerable rule of the bayonet. In 1857 he fought again in Algeria, and in 1859 he made his name famous in the campaign against Austria. He commanded the Second Corps, and led the left wing of the army in the battle of Magenta, June 4, 1859, while Napoleon commanded the center. At the head of the guard the emperor was very hard pressed by the enemy, and there was danger of his being driven into the Ticino, but MacMahon came to his support, and by throwing himself on the right flank of the Austrian corps, which threatened the French center, he won the battle. For this brilliant exploit the emperor made him on the battle-field marshal of France and Duke of Magenta. In the battle of Solferino (June 24, 1859) he also played a conspicuous part. After the war he received the command of the division stationed at Lille, and in 1864 he succeeded Pelissier in the important position of governor-general of Algeria, where great reforms were to be introduced, and so far as the reigning system allowed the administration of MacMahon was beneficial. During the famine of 1867–68 he took good care of the poor people, and defended them with great energy against the clergy, who tried to use the aid which was given to the Arabs as a means by which to convert them. At the beginning of the war against Germany in 1870 the marshal received the command of the First Corps, consisting chiefly of African troops, and forming the right wing of the first line, nearest to the frontier, with headquarters at Strassburg. When (on Aug. 4) his advanced body, the division of Douay, was defeated at Weissenburg by the Crown Prince of Prussia, he drew re-enforcements from other corps, and occupied an excellent position at Wörth in order to detain the enemy. In spite of his brilliant valor, he was defeated in the bloody battle, and his army was almost completely routed in consequence of the long and obstinate resistance it made. The remnants he gathered at Châlons, and here he formed out of the First, Fifth, Seventh, and Twelfth Corps the army of Châlons, to which the emperor repaired after the defeat at Metz. From the regency in Paris he repeatedly received orders to push on toward Metz by a circuitous way, in order to extricate Bazaine. He understood the futility of this plan, and remonstrated, but at last he obeyed. Soon, however, his army was driven by the Germans out of its direction and toward Belgium, and at Sedan it was compelled to give battle. At the beginning of the contest, in which the French army, together with the emperor, was surrounded and taken prisoner, early in the morning (Sept. 1, 1870), MacMahon was severely wounded, and gave up the command. While a prisoner of war in Germany he was almost the only superior officer who was not accused of treason by his countrymen; both the purity of his character and his brilliant valor being generally acknowledged. Immediately after the conclusion of the armistice in the spring of 1871 he was intrusted by Thiers with the command of the army at Versailles, the only organized army of France at that moment. In political respects he enjoyed the confidence of all parties. He seemed to be nothing but a soldier, indifferent to politics, and without those qualities which make a man a blessing or a danger to his country. Nevertheless, events soon raised him to the most important political position. Having put down the revolution of the Commune in Paris in 1871, after which he published *L'Armée de Versailles depuis sa formation jusqu'à la complète pacification de Paris*, he became the man on whom those parties of the National Assembly which feared radicalism and revolution rested their hopes, and in May, 1873, the legitimists, clericals, and Bonapartists agreed in overthrowing Thiers, and MacMahon accepted the presidency of the republic, which was offered him by a deputation from the National Assembly. The hopes, however, which the Bonapartists entertained of a restoration of the dynasty of Napoleon, and the legitimists and clericals of a complete suppression of all liberty, were not realized. His government was one of order, aiming at the re-establishment of the power of France; and although the influence conceded to the Church was larger than the liberals considered sound, yet the stability of his own power seemed in his eyes the principal means of reaching his aim. On Nov. 19, 1873, his term of office was prolonged by the National Assembly to seven years. He resigned Jan. 30, 1879, occupying the leisure hours of several years in preparing his military memoirs, which are (1894) soon to be published. D. on his estate at Montcresson, Oct. 17, 1893, and had a national funeral, being buried in the Hôtel des Invalides, Paris.

Revised by James Grant Wilson.

McMas'ter, Guy Humphreys: jurist and poet; b. at Clyde, N. Y., Jan. 31, 1829; graduated at Hamilton College, and became a practicing lawyer, county judge, and surrogate in Steuben co., N. Y., a history of which county he published in 1849. He is chiefly remembered, however, as the author of the famous *Carmen Bellicosum*, originally contributed to *The Knickerbocker Magazine* in 1849. D. at Bath, N. Y., Sept. 13, 1887. H. A. B.

McMaster, John Bach, C. E., Ph. D.: professor of history; b. in Brooklyn, N. Y., June 29, 1852; educated in the public schools of New York city, graduated 1872, College of the City of New York; studied civil engineering; was instructor in civil engineering at Princeton College 1877–83; became Professor of American History, University of Pennsylvania, 1883; author of *The People of the United States* (1883, fifth vol. 1900): *Benjamin Franklin as a Man of Letters* (1887).

McMillan, Charles: civil engineer; b. in Moscow, Russia, Mar. 24, 1841; was educated at the Rensselaer Polytechnic Institute, Troy, N. Y., where he graduated in 1860 with the degree of C. E. He filled the positions of assistant engineer on the Brooklyn water-works and on the Croton water-works, Professor of Engineering in Rensselaer Polytechnic Institute and in the Lehigh University. Since 1877 he has been Professor of Civil Engineering in the College of New Jersey, Princeton, N. J. He was the editor of the revised edition of Smith's *Topographical Drawing* (1885).

MacMillan, Conway, M. A.: botanist; b. at Hillsdale, Mich., Aug. 26, 1867; educated in the Universities of Nebraska, Johns Hopkins, and Harvard; was appointed assistant in geology in the University of Nebraska 1886; entomologist to the Nebraska agricultural experiment station 1887; instructor in botany in the University of Minnesota 1888; Professor of Botany and State botanist, 1891. He has published *Twenty-two Common Insects of Nebraska* (1888), *The Metaspermæ of the Minnesota Valley* (1892), besides many articles in botanical journals.

Charles E. Bessey.

MacMillan, Hugh, D. D., LL. D., F. R. S. E., F. S. A. Scot.: minister and author; b. at Aberfeldy, Perthshire, Scotland, Sept. 17, 1833; educated at Edinburgh University; was minister at Kirkmichael, Perthshire, 1859–64; of Free St. Peter's, Glasgow, 1864–78; and since 1878 has been minister of the Free West church, Greenock. He has published among others the following books, most of them in several editions, some of which have been translated into several of the European languages: *First Forms of Vegetation* (1861; 2d ed. 1874); *Bible Teachings in Nature* (1866; 24th ed. 1886); *Holidays in High Lands* (1869; 2d ed. 1875); *The True Vine* (1871; 5th ed. 1886); *The Ministry of Nature* (1872; 5th ed. 1886); *The Garden and the City* (1872; 2d ed. 1873); *Sun-glints in the Wilderness* (1872); *Our Lord's Three Raisings from the Dead* (1875); *Sabbath of the Fields* (1875: 5th ed. 1886); *Two Worlds are Ours* (1880; 4th ed. 1880); *The Marriage in Cana* (1882; 2d ed. 1886); *The Riviera* (1885); *The Olive Leaf*; *Roman Mosaics*; *My Comfort in Sorrow*; and *The Gate Beautiful*; and contributed largely to periodicals. C. K. Hoyt.

McMillan, James: U. S. Senator; b. at Hamilton, Ontario, Canada, Mar. 12, 1838; prepared for college, but removed to Detroit, Mich., and entered business in 1855; with others established the Michigan Car Company 1863; has since been largely interested in manufacturing, railway and shipping business; was elected to the U. S. Senate as a Republican, Mar. 4, 1889, and re-elected in 1895.

McMillan, Samuel J. R.: See the Appendix.

McMinnville: city (founded in 1855, incorporated in 1876): capital of Yamhill co., Ore. (for location of county, see map of Oregon, ref. 2–B); at the head of navigation on the Yamhill river; on the S. Pac. Railway; 23 miles N. W. of Salem, 50 miles S. W. of Portland. It is in an agricultural, lumbering, and fruit-growing region, and has a large trade in wheat, wool, hops, and green and dried fruit. It is the seat of Oregon Baptist College, and has 6 churches, 2 public-school buildings, electric lights, water-works, 2 flour-mills, planing-mill, sash and door factory, and 2 weekly newspapers. Pop. (1880) 670; (1890) 1,368; (1900) 1,420.

Editor of "Yamhill County Reporter."

McMinnville: town; capital of Warren co., Tenn. (for location of county, see map of Tennessee, ref. 6–G); on the Nash., Chat. and St. L. Railway; 35 miles N. E. of Tullahoma, 75 miles S. E. of Nashville. It is in a farming and fruit-growing region; is the seat of Cumberland Female College; has 2 libraries, 2 weekly newspapers, public park, and manufactories of cotton and woolen goods and foundry products. Pop. (1880) 1,244; (1890) 1,677; (1900) 1,980.

McMur'rogh, Dermot: King of Leinster, Ireland, from 1140 till 1168, when he was expelled by his subjects; applied unsuccessfully for aid to Henry II. of England; obtained the services of Richard de Clare, Earl of Pembroke (surnamed Strongbow), by whom he was restored to power in 1170. Dermot gave Strongbow his daughter Eva in marriage, and dying in the same year was succeeded by the invader as a vassal to the English king, this being the foundation of the English claim of supremacy in Ireland.

McMurry, Charles Alexander: See the Appendix.

McMurry, Frank Morton: See the Appendix.

McNab, Sir Alan Napier: soldier and statesman; b. at Niagara, Canada, Feb. 19, 1798; became a midshipman in 1813; served under Sir James Yeo in the naval expedition against Sackett's Harbor and other U. S. ports of Lake Ontario; joined the army as an ensign; was present at the capture of Fort Niagara and at the battle of Plattsburg; studied law; practiced at Hamilton; was elected a member of the Assembly of Upper Canada in 1830; later became its Speaker; commanded the Canadian militia on the Niagara frontier during the insurrection of 1837–38, as colonel; routed the insurgents near Toronto Dec. 7, 1837; seized, burned, and sent over Niagara Falls the steamer Caroline; was knighted July 14, 1838; Speaker of the Legislature of Canada in 1844; Prime Minister 1854–56; made a baronet Feb. 1857. D. Aug. 8, 1862.

McNair, Frederick V.: See the Appendix.

Macnaughton, Edward: See the Appendix.

McNeill, măk-neel', Sir John, G. C. B., D. C. L., LL. D.: ambassador and commissioner; b. at Colonsa, Scotland, in 1795; was appointed assistant envoy at court of Persia in 1831, and envoy in 1836, in which capacity he became prominent through his prediction of aggressive designs on the part of Russia, a subject to which a great part of his career was devoted, and which he treated in numerous pamphlets and essays in the English and Indian periodicals, as well as in a volume entitled *Progress and Position of Russia in the East* (1854). Returning from Persia in 1844, Sir John was employed in many civil and military commissions in England and Scotland, and became a member of the privy council (1857) and chairman of the poor-law board. D. May 16, 1883.

Macneill, John G. S.: See the Appendix.

Macomb, ma-koom': city; capital of McDonough co., Ill. (for location of county, see map of Illinois, ref. 5–C); on the Chi., Burl. and Quincy Railroad; 58 miles N. E. of Quincy, 206 miles S. W. of Chicago. It is in an agricultural and fire-clay region; has manufactures of pottery, tile, and sewer-pipe, and contains a normal college (established 1833), high school, public library (founded in 1885), and three weekly newspapers. Pop. (1890) 4,052; (1900) 5,375.

Macomb, Alexander: soldier; b. in Detroit, Mich., Apr. 13, 1782; entered the army, and at the time of the declaration of war with Great Britain (June, 1812) was acting adjutant-general of the army; but preferring active field-service, he was appointed in July colonel of the Third Artillery, and distinguished himself at Fort Niagara and Fort George; promoted to be brigadier-general in Jan., 1814. On Sept. 11, with 1,500 men and a small number of militia from New York and Vermont, he fought the battle of Plattsburg, defeating a largely superior force of British veterans under Sir George Prevost, for which service he received the thanks of Congress and a gold medal: was also breveted major-general and commanded a military department in the Northwest 1815–21. Upon the reorganization of the army in the latter year he was retained as chief engineer, with the rank of colonel. In May, 1828, he succeeded Gen. Brown as major-general in command of the army. D. in Washington, June 25, 1841. He wrote a *Treatise on Martial Law* and *Courts Martial as practiced in the United States* (1809).

Mâcon, mă'kōn' (Lat. *Matis'co*, the ancient name): town of France; capital of the department of Saône-et-Loire; on the river Saône, which is lined with beautiful quays and crossed by a bridge of twelve arches (see map of France, ref. 5–G). Otherwise the town is ill built, with narrow, crooked, and dirty streets, but its trade in timber and Burgundy wine is considerable, as also its manufactures of

watches. It is a railway center of importance, the lines from Paris, Marseilles, and Mont Cenis meeting here. In the Quai du Midi there is a bronze statue of Lamartine, who was born in Mâcon in 1790. Pop. (1896) 18,739.

Ma'con: city; capital of Bibb co., Ga. (for location of county, see map of Georgia, ref. 4–H); at the head of navigation on the Ocmulgee river, and on the Ga., the Cent. of Ga., the Ga. S. and Fla., the E. Tenn., Va. and Ga., the Macon and N., and the Macon, Dublin, and Savannah railways; 80 miles S. E. of Atlanta. It is on both sides of the river, in an agricultural and fruit-growing region, with granite hills, hard-wood forests, and brick-clay deposits in the vicinity. The city is laid out with streets 130 and 180 feet wide and beautifully shaded, and has a public park of 237 acres, in which the State Agricultural Society has its buildings and holds its fairs. Water for domestic purposes is supplied from eighteen natural springs, 2 miles S. of the city, and is distributed from a reservoir on the top of the highest hill in the vicinity. There are about 30 churches, 45 public schools, public library, the Alexander Free School, the Julia Parkman Jones Home for Indigent Women, Methodist Episcopal and Protestant Episcopal Orphans' Homes, an academy of music, and a Roman Catholic academy for young ladies. The city is the seat of Mercer University (Baptist, founded 1831), Wesleyan Female College (chartered 1836), St. Stanislaus College (Roman Catholic, for preparatory education for the priesthood), and of the State Academy for the Blind (incorporated 1852). The census returns of 1890 showed that 161 manufacturing establishments (representing 40 industries) reported. These had a combined capital of $3,608,977; employed 3,142 persons; paid $1,085,716 for wages and $2,534,144 for materials, and had products valued at $4,974,914. The principal industry was the manufacture of textile fabrics, which had 4 establishments, $1,430,391 capital, and 1,038 employees; paid $219,135 for wages and $722,356 for materials; and had products valued at $1,115,366. The city has a wholesale trade of about $50,000,000 annually, and handles a large amount of cotton and lumber. There are 2 national banks with combined capital of $450,000, 5 State banks with capital of $1,050,000, and 2 private banks, and 2 daily, 3 weekly, and 2 other periodicals. Pop. (1880) 12,749; (1890) 22,746, with suburbs, 35,746; (1900) 23,272. EDITOR OF "TELEGRAPH."

Macon: town (founded in 1832); capital of Noxubee co., Miss. (for location of county, see map of Mississippi, ref. 6–H); at the head of navigation on the Noxubee river; on the Mobile and Ohio Railroad; 198 miles N. of Mobile, Ala. It is in an agricultural and cotton-growing region, and contains 5 churches for white and 3 for colored people, 2 public schools, a business and commercial college, railway machine-shops, cotton-compress, and 3 weekly newspapers. Pop. (1880) 2,074; (1890) 1,565; (1900) 2,057. EDITOR OF "BEACON."

Macon: city; capital of Macon co., Mo. (for location of county, see map of Missouri, ref. 2–G); on the Chi., Burl. and Quincy and the Wabash railways; 170 miles N. W. of St. Louis. It is in an agricultural and coal-mining region, has important trade interests, and contains St. Agnes Hall for young ladies (Protestant Episcopal, opened in 1885), St. James's Military Academy (Protestant Episcopal, opened in 1875), and three weekly newspapers. Pop. (1880) 3,046; (1890) 3,371; (1900) 4,068.

Macoy'a, called also **Macahuba Palm** and **Great Macaw-tree**: native name for a South American and West Indian palm-tree (*Acrocomia sclerocarpa*), which yields a pleasantly perfumed palm oil used in soapmaking, and, in its native regions, employed as an unguent in rheumatism.

McPher'son: city; capital of McPherson co., Kan. (for location of county, see map of Kansas, ref. 6–G); on the Atch., Top. and S. Fé, the Chi., Rock Is. and Pac., the Mo. Pac., and the Union Pac. railways; 84 miles W. of Emporia. It is in a wheat, corn, and dairy region, has live-stock interests, and is a shipping-point for a large territory. There are water-works, electric lights, street-railway, McPherson College (Dunkard), 2 national banks with combined capital of $100,000, a State bank (capital $20,000), and a daily, monthly, and 4 weekly newspapers. Pop. (1880) 1,590; (1890) 3,172; (1900) 2,996. EDITOR OF "REPUBLICAN."

Macpherson, Sir DAVID LEWIS: statesman; b. in Inverness, Scotland, Sept. 12, 1818; educated at Royal Academy, Inverness, and removed to Canada in 1835 He was a member of the firm of Gzowski & Co., constructors of several Canadian railways and other important works; a director of Molson's Bank and of Western Canada Permanent Loan and Savings Company: president of the Interoceanic Railway Company, and arbitrator for the Province of Ontario under the British North American Act. He represented Saugeen district in Legislative Council of Canada 1864–67; was called to the Senate May, 1867; Speaker of that body and member of cabinet, without portfolio, from Feb. 11, 1880, until Oct. 17, 1883, when he resigned the speakership and was appointed Minister of the Interior, which office he resigned Aug. 5, 1885. He was knighted in 1884. D. at sea, Aug. 16, 1896. He was the author of a pamphlet on *Banking and Currency* (Toronto, 1869) and of several political pamphlets between 1877 and 1882. NEIL MACDONALD.

McPherson, EDWARD, LL. D.: journalist and statistician; b. at Gettysburg, Pa., July 31, 1830; graduated at the University of Pennsylvania in 1848; was for a time a journalist; was a member of Congress 1859–63; clerk of the U. S. House of Representatives 1863–75; secretary of the Union national committee 1860–64; he engaged in journalism at Gettysburg, Pa. He published a *Political History of the United States during the Civil War*, a *Handbook of Politics*, and other works, including some admirable literary and other papers; was afterward editor of the Philadelphia *Press*, and was clerk of the House of Representatives in 1882 and 1883. D. Dec. 14, 1895.

Macpherson, JAMES: author; b. at Ruthven, Inverness-shire, in the Highlands of Scotland, in 1738; entered King's College, Aberdeen, 1752; studied also at Marischal College, Aberdeen, and at the University of Edinburgh, where he gave evidence of his literary taste by the publication of a heroic poem in six cantos entitled *The Highlander* (1758), which is admitted to be beneath criticism. After teaching at the Ruthven school he became a tutor in the family of Mr. Graham, of Balgowan, and made some essays in versification, which he showed to the celebrated John Home as translations of Gaelic poetry which he alleged that the Highland minstrels had preserved by memory from a remote period. The circumstance was communicated by Home to Drs. Hugh Blair and Alexander Carlyle, and by their advice Macpherson published a small volume of *Fragments of Ancient Poetry collected in the Highlands of Scotland, and translated from the Gaelic or Erse Language* (1760). The book met with great success and a subscription was raised to enable the "editor" to travel through the Highlands and recover all extant remains of early minstrelsy. Thus encouraged, Macpherson, whose knowledge of Gaelic was never more than a smattering, produced in quick succession *Fingal, an Ancient Poem in Six Books, together with Several other Poems composed by Ossian, Son of Fingal, translated from the Gaelic Language* (1762), and *Temora, an Ancient Epic Poem, in Eight Books*, etc. (1763), by which he gained £1,200 and a European reputation. These so-called "poems" were received with the utmost enthusiasm in Scotland, and even on the Continent they were immediately translated into the chief modern languages, and the mythical bard, Ossian the son of Fingal, at once took his place in biographical dictionaries as the rival of Homer and Vergil. Not long after the English critics began to call for the original Gaelic of Ossian in order to test the correctness of the translation, but it was not forthcoming, and the flimsy excuses put forth for its absence were sufficient evidence to impartial inquirers that, as Dr. Johnson said, the poems "never existed in any other form than that which we have seen." The Scotch enthusiasts, who had staked their reputation upon the genuineness of Ossian, took up the cudgels in behalf of Macpherson, and the battle raged with great bitterness for fifty years; even in 1875 there appeared an elaborate vindication of Ossian's genuineness. Macpherson accepted the post of private secretary to Gov. Johnstone, of West Florida, and spent nearly two years at Pensacola and in traveling through the American colonies; took up his residence in London (1766), wrote an *Introduction to the History of Great Britain and Ireland* (1771), and issued a prose translation of the *Iliad* of Homer (1773) cast in Ossianic mold, which was received with coldness by his friends and with contempt by his adversaries. In 1775 Macpherson published a *History of Great Britain from the Restoration to the Accession of the House of Hanover* (2 vols. 4to, 1775), in which he attacked the motives of the statesmen who effected the revolution of 1688. The copyright of this work brought Macpherson £3,000. He was employed by the Government to write a pamphlet, *The Rights of Great Britain asserted against the Claims of the Colonies* (1776), and another entitled *A Short History of the Opposition*

during the Last Session of Parliament (1779). Macpherson was an able pamphleteer, and in reward for his services he obtained the lucrative agency for the Nabob of Arcot in his negotiations with the Government. He wrote several pamphlets on Indian affairs, sat in Parliament for Camelford 1780–90, and built a handsome residence at Belleville, Inverness, where he resided for several years until his death, Feb. 17, 1796. At his own request he was buried in Westminster Abbey, the monument being erected at the expense of his estate. Upon the Ossianic controversy the standard work is that by Malcolm Laing, under the title *The Poems of Ossian, containing the Poetical Works of James Macpherson, with Notes and Illustrations* (1805), in which the memory of Macpherson is handled without gloves by a brother Scotchman. This masterly criticism disposed of the more or less plausible theories of Blair, Kames, Gregory, and the rest, but did not prevent Sir John Sinclair from publishing *Ossian in the Original* (1806), from the posthumous papers of the "translator," all of which, however, were in the handwriting of Macpherson himself or of his secretaries. Notwithstanding some modern counter-pleas, the verdict of the Highland Society of London, that no poems of the kind could be found to exist in the memories of the Highlanders, ought to be conclusive. At the same time, candid criticism must admit that a work which elicited the unbounded admiration of such dissimilar minds as Dr. Parr, Sir Walter Scott, Klopstock, and Napoleon Bonaparte must have in it elements of poetic excellence which escaped the prejudiced judgment of Macaulay and Sir James Mackintosh. See also Campbell's *Popular Tales of the West Highlands* (4 vols., Edinburgh, 1862); and Rev. Archibald Clerk's *Poems of Ossian in the Original Gaelic, with a Literal Translation into English* (2 vols., Edinburgh, 1870). Revised by H. A. Beers.

McPherson, Gen. James Birdseye: officer and engineer; b. in Sandusky co., O., Nov. 14, 1828; graduated at the U. S. Military Academy at the head of his class July 1, 1853, and was appointed to the Engineer Corps; in Aug., 1861, was made captain of engineers, and in November of that year was chosen by Gen. Halleck as aide-de-camp and assistant engineer of the department of the Missouri, with the rank of lieutenant-colonel; and was chief engineer on the staff of Gen. Grant, Feb. to Apr., 1862, being engaged in the operations against Forts Henry and Donelson and the battle of Shiloh, and as assistant engineer in the siege of Corinth. In May, 1862, he was promoted to be colonel and aide-de-camp, brigadier-general U. S. volunteers, and major-general in Oct., 1862. His brilliant career from the capture of Fort Henry in 1862 up to the surrender of Vicksburg in 1863 won the admiration of Gen. Grant, who recommended him for promotion to the rank of brigadier-general. The actions in which he had especially distinguished himself during this period were the siege of Corinth, the second battle of Corinth, the siege of Vicksburg, and the battles of Port Gibson, Raymond, and Champion Hill. On Aug. 1, 1863, he was appointed a brigadier-general in the regular army, and soon after surprised the Confederate camp at Canton, Miss. In Feb., 1864, he accompanied Gen. Sherman's famous raid to Meridian as second in command, and in March was assigned to command the department and army of the Tennessee, to the reorganizing of which he devoted several weeks, preparatory to the invasion of Georgia. During this famous campaign his services were invaluable; at Resaca, Dallas, and the almost daily severe fighting up to and including Kenesaw Mountain, he was conspicuous and greatly distinguished himself; in the battles before Atlanta he commanded the left grand division, and it was here on July 22, 1864, he was shot and almost instantly killed.

McPherson, John Roderic: Senator; b. in Livingston co., N. Y., May 9, 1833; engaged in farming and stock-raising, and settled in 1859 in Hudson City, N. J., where he established a stockyard in 1863. He was the originator, designer, and constructor of the great buildings used by the Central Stockyard and Transit Company at Harsimus Cove, N. J.; also of the abattoir and stockyard of Philadelphia; and the inventor of a new stock-car. Alderman of Hudson City 1863–69, and State Senator from Hudson County 1872–74. Elected U. S. Senator for New Jersey Jan. 24, 1877; re-elected 1883 and 1889. D. Oct. 8, 1897.

Macrauche'nia [Mod. Lat., fr. Gr. *μακρός*, long + *αὐχήν*, neck]: a genus of mammals of the order *Ungulata*, including one species from the Tertiary pampas deposits of Buenos Ayres and Patagonia. It had the body of a tapir, but a long neck and somewhat horse-like head. The dental series was almost uninterrupted. The canines were small. It may also be added that, while belonging to the perissodactyl (or odd-toed) division of the ungulates, it presents, especially in the skeleton, many points of resemblance to the even-toed camels and llamas. Thus in the elongated cervical vertebræ the canal for the vertebral artery instead of perforating the transverse processes, as in most mammals, is confluent with the neural canal in the posterior part of the vertebræ, and anteriorly perforates the walls of that canal. The radius and ulna are ankylosed together. The bones of the feet resemble those of the odd-toed ungulates, and, as in the rhinoceros, there were three toes both before and (probably) behind. These toes, in the fore feet at least, were nearly equal in size. The femur is long, and has a third trochanter. The fibula is entire, but confluent with the tibia. The astragalus is of the characteristic perissodactyl type. The single known species (*Macrauchenia patagonica*) has been made the subject of an elaborate monograph by Burmeister, who has almost completely restored the skeleton. It was originally described by Prof. Owen from remains brought by Charles Darwin from Patagonia, and on account of peculiarities of the cervical vertebræ compared with the camels. The *Macrauchenia* equaled in size the largest hippopotamus, but probably had a less broad and bulky body, and the neck was elongated. O. C. Marsh.

Macready, ma-kree'di, William Charles: actor; b. in London, England, Mar. 3, 1793; was sent by his father, a theatrical manager, to Rugby to be liberally educated, but his projected career was cut short by pecuniary embarrassments, and at the age of seventeen he essayed the stage, making his first appearance at Birmingham in *Romeo* (June 7, 1810). He first undertook Hamlet in 1811; played with Mrs. Siddons at Newcastle in *The Gamester* and *Douglas*; played at Glasgow, Bath, Berwick, and Dublin; was seen in London at Covent Garden as Orestes (Sept. 16, 1816). His success was slow, but steady, and was due to hard work rather than to genius. In 1822 his engagement began at Covent Garden, and his reputation rose in parts like Virginius and Mirandola till 1826, when he went to Drury Lane. From this time he took rank with the illustrious of his profession. The same year he visited the U. S.; the next year he made a continental tour; in 1828 played in Paris; returned to England, and for several years played in London and all the chief cities of the kingdom; revisited the U. S. in 1843–44, and made a long and successful professional tour; made another engagement in Paris, and performed in *Hamlet* at the Tuileries before Louis Philippe; returned to the U. S. again in 1849, during which year the Astor Place riot in New York occurred; in 1850 began the long series of "farewells" to the theaters in England which terminated at Drury Lane Feb. 26, 1851. Till 1860 he lived in retirement at Sherborne, enjoying society, taking an interest in public institutions, and occasionally giving readings. The last years of his life were spent at Cheltenham, where he died Apr. 27, 1873. Macready was one of the last of the great Shakspearean actors, a good scholar, a man of fine literary taste, of high professional ambition, of elevated character, generous, humane, modest, and just. See *Reminiscences and Diaries*, 1875. Revised by B. B. Vallentine.

Macri'nus, M. Opelius: Roman emperor from Apr., 217, to June, 218; b. in 164 of humble parentage at Cæsarea, in Mauritania; entered the service of Plautianus, the favorite of Septimius Severus; received different appointments in the imperial household; became prefect of the prætorians, and was chosen emperor by them after the assassination of Caracalla. Shortly after his accession he was defeated by the Parthians, and lost his influence with the army. The prætorians rose in rebellion, instigated by Elagabalus, and the emperor fled in disguise, but was discovered and put to death. G. L. Hendrickson.

Macro'bius, Ambrosius Theodosius: grammarian; flourished at the beginning of the fifth century, but of his personal life nothing is known. Of his writings there are still extant *Conviviorum Saturnaliorum Libri VII.*, containing much valuable historical and mythological information, as well as critical and grammatical disquisitions, four books being devoted to Vergil; *Commentariorum in Somnium Scipionis Libri II.*, a series of philosophical discourses based on Neoplatonic views (the *Dream of Scipio*, which suggested them, having formed a part of the sixth book of Cicero's *De Republica*); and an extract or abridgment of *De Differentiis et Societatibus Græci Latinique Verbi.*

Macrobius is the first pagan writer who mentions the massacre of the children of Bethlehem by Herod. The best editions of his works are those by Jan (2 vols., 1848–52) and Eyssenhardt (1893). There is no English translation.

Revised by M. Warren.

Macrochires [Mod. Lat. from the Gr. μακρόχειρ, long-handed]: a group, usually considered an order, of birds, distinguished by the great length of the bones of the hand as compared with those of the arm. The name was originally given by Nitzsch to a family of birds containing the humming-birds and swifts, but to these Huxley and others have added the goatsuckers (*Caprimulgidæ*). F. A. L.

Macropod'idæ [Mod. Lat., named from *mac'ropus*, the typical genus; Gr. μακρός, long + πούς, foot]: a family of mammals of the order *Marsupialia* and sub-order *Syndactyli*, containing the kangaroos and kangaroo-rats of Australia and New Guinea. They have immensely enlarged hind limbs, by means of which they progress by great leaps, and much reduced fore limbs, while the large thick tail serves as a fulcrum for support, etc.; the head is comparatively small, and somewhat deer-like; the teeth in the full series are as follows: molars, $\frac{5}{5}$; canines, $\frac{0}{0}$ or $\frac{1}{1}$; incisors, $\frac{3}{1}$; the second molar in each jaw in the young is deciduous, and followed by a permanent successor; all except the first are two-ridged; the canines are small or absent in the upper jaw, always absent in the lower; the incisors of the upper jaw (3+3) trenchant and nearly vertical, of the lower (1+1) large and horizontal; the stomach is large and sacculated and a long simple cæcum is developed; the marsupial pouch opens forward. The family is peculiar to Australasia and the islands of the Papuan Archipelago, and is quite rich in genera and species. It has been divided by systematists into two sub-families and many genera.

Macrospore: See Embryology.

Macru'ridæ [Mod. Lat., named from *macru'rus*, the typical genus; Gr. μακρός, long + οὐρά, tail]: a family of fishes of the order *Teleocephali* and sub-order *Jugulares*, distinguished by a body which gradually terminates in a tapering, long, and compressed tail, and is covered by keeled or ornamented scales. The family is related to the *Gadidæ* or codfishes, and contains numerous species, mostly of the deep seas or of the Arctic regions.

McTyeire, măk-teer', Holland Nimmons, D. D.: bishop; b. in Barnwell co., S. C., July 25, 1824; graduated at Randolph-Macon College, Virginia, in 1844; joined the Virginia conference in 1845; in 1846 took charge of St. Francis Street church, Mobile; served the churches at Demopolis, Ala., and Columbus, Miss.; was then transferred from the Alabama to the Louisiana conference, and was stationed in New Orleans; in 1854 was elected editor of the New Orleans *Christian Advocate*; in 1858 was elected editor of the Nashville *Christian Advocate*. During the war he was transferred to the Montgomery conference, and was pastor in Montgomery, Ala., when in 1866 he was elected to the episcopate. He became president of the board of trust of the Vanderbilt University, which owes its existence largely to his influence upon its founder. He is the author of *Manual of the Discipline*, *Duties of Masters*, *Catechism of Church Government*, and *A History of Methodism*. D. at Nashville, Feb. 15, 1889.

McVeagh, măc-vā', Wayne: lawyer and publicist; b. at Phœnixville, Pa., Apr. 19, 1833; educated at Yale College; admitted to the bar 1856; became district attorney of Chester co., Pa.; captain of cavalry 1862, when invasion of Pennsylvania was threatened; chairman of Republican central committee of Pennsylvania 1863; appointed by President Grant minister to Constantinople in 1870; leading member of U. S. "McVeagh commission" to Louisiana 1877, to investigate political affairs; appointed U. S. Attorney-General by President Garfield, Mar. 5, 1881; resigned same year; appointed ambassador to Italy by President Cleveland, Dec. 19, 1893.

McWhorter, Alexander, D. D.: clergyman; b. near Newark, Del., July 15 o. s., July 26 n. s., 1734; graduated at Princeton 1757: studied theology under William Tennent; was installed pastor of the Presbyterian church at Newark 1758; went on a mission to North Carolina in 1764, returned to Newark in 1866, and was sent again to North Carolina in 1775 by Congress to persuade the royalists of the western counties to join with their brethren in the Revolution; became in 1778 chaplain of Knox's artillery brigade; accepted in 1779 the pastorate at Charlotte, Mecklenburg co., N. C., and the presidency of Queen's Museum College, then called Liberty Hall; lost his library by the invasion of Cornwallis; returned to Newark in 1781; aided in drawing up the constitution of the American Presbyterian Church in 1788; was for thirty-five years a trustee of Princeton College; took a leading part in collecting funds in New England for rebuilding the college after the conflagration of 1802; published a centennial sermon at Newark in 1800, and two volumes of sermons in 1803. He was in charge of the Presbyterian church at Newark for twenty-six years till his death July 20, 1807.

Revised by C. K. Hoyt.

Madagas'car [called by the Arabs *Komr* or *Kamr*. The people themselves used to name the island *Izao rehetra Izao*, "this whole," because it was supposed to be the principal part of the world. In the time of Radama I. it was called *Ny anivon ny riaku*, "The [land] in the midst of the Flood." Madagascar, the name used by foreigners, is a corruption of *Magadaxo*]: the largest of the African islands, 975 miles long, 358 miles broad at the widest part, and comprising an area of about 228,500 sq. miles; is in the Indian Ocean, between lat. 11° 57′ and 25° 42′ S., and between lon. 43° 10′ and 50° 25′ E. It is separated from Africa by the Mozambique Channel, 250 miles broad. The fossils of Madagascar and its existing flora and fauna leave no room for doubt that it once had land connection with Asia, and probably also with Africa. The coast, much indented on the western side, and although more regular, affording several good harbors also on the eastern side, is generally low, presenting a belt of sand-plains or swamps, and containing many lagoons and lakes. From the coast the surface rises in the same manner as on the African continent, in terraces, broader and more gently sloping on the western, narrower, and divided by wall-like cuts on the eastern side. The interior forms a plateau from 3,000 to 4,000 feet high, traversed from N. to S. by a mountain-chain whose peaks rise from 6,000 to 12,000 feet, and which in the northeastern part of the island separates into many ranges, and forms mountainous regions of considerable extension. Of the rivers flowing down the eastern slope none is navigable, but of those descending the western slope the Tsidsubu (or Menabe) and the Mangooka (or St. Vincent's) are navigable, the former to the foot of the mountains. The climate of much of the interior plateau is comparatively healthful, but is very different in the low coast regions, where the heat is intense and a fever prevails, dangerous not only to Europeans, but even to the natives of the interior. The rainy season lasts from December to April. Iron, rock-salt, coal, and gold are found in quantities that will pay for development. Generally the soil is very productive; the vegetation is exceedingly rich. Ebony, mahogany, different kinds of gum-trees, figs, cocoanuts, bread-fruit trees, plantains, and bananas are frequent. Rice is extensively cultivated, and forms the principal article of food; also yams and arrowroot. The cotton-plant has been introduced from Fiji, the sugar-cane from Mauritius, and the coffee-tree from Java, and they thrive well. The silk-worm is indigenous, and is reared on the *Tapia edulis*; the cocoon is often used by the natives as an article of food. The inhabitants, numbering about 3,500,000, fall, ethnologically, into two groups—the black, or African, on the western slope, and the light-colored, or Malayan, on the eastern; and politically into four sections—the Hovas, Sakalavas, Betsileos, and Betsimisarakas. Of these, the Hovas are the ruling tribe, a race of middle height, but well-proportioned, with black, straight or curled hair, and hazel eyes, well-gifted and active. The Hova government was an absolute monarchy until wholly supplanted by the French government Feb. 27, 1897, and proclaimed a French colony. The island was mentioned in the thirteenth century by Marco Polo, but not actually known to the Europeans until the beginning of the sixteenth century, when in 1506 it was visited by Lorenzo de Almeida, the first Portuguese Viceroy of India. Not long afterward the Portuguese formed a colony on the river Franchere, in the province of Anosy, on the eastern coast, but the settlers were massacred by the natives. In 1642 the French, and in 1644 the English, planted colonies on the eastern coast, but these too failed, and for a long time Madagascar was known to the Europeans chiefly as the hiding-place of pirates and buccaneers, whom it took considerable force to finally suppress. In 1745 the French East India Company founded a colony on the island of St. Mary, and in 1768 another at Fort Dauphin. These succeeded better, but a lively and efficacious intercourse

with European civilization did not begin until the reign of Radama I. (1808–28). He received the British missionaries and artisans well who came to the country. The native language was reduced to writing, the Bible was translated and printed, a large number of the inhabitants were taught to read and converted to Christianity, the slave-trade, infanticide, and polygamy were abolished, at least nominally, etc. Under his successors the progress of civilization was several times stopped, and the people threatened to relapse into paganism and barbarity. Such was the case under the successor of Radama, one of his wives, Ranavalona I., 1828–61. In 1835 the profession of the Christian religion was declared illegal, and in the following year the missionaries were compelled to leave the country. Christian worship was to cease, Christian books were to be burned, etc. The time of persecution, however, ceased with the accession of Radama II., and under Queen Ranavalona II., who ascended the throne in 1868, Christianity became the state religion. The queen herself was baptized, the royal idols were burned, and a chapel was built in the palace. She died July 13, 1883, and was succeeded by Queen Ranavalona III. About 1,200 congregations have been formed in the island, and about 900 schools, with nearly 50,000 scholars, are in operation. By treaty of Dec. 12, 1885, Madagascar was nominally placed under French protection, but the Hova government soon disavowed the protective feature of the treaty. Much friction, therefore, prevailed, and France, desiring to make her protectorate more effective, dispatched an expedition to the country (Nov., 1894). In the face of many difficulties the French force made their way to the capital, Antananarivo (*q. v.*), which they captured Sept. 30, 1895. In the treaty then made the Hovas fully recognized the protectorate. Aug. 6, 1896, however, France promulgated a law declaring Madagascar and its dependencies a French possession, and in 1897 the queen was exiled to Réunion. Tamatave, on the eastern coast, in lat. 18° 10′ S., trades with Europe, Museat, Zanzibar, and the Cape of Good Hope. See Madagascar in the Appendix; Ellis, *History of Madagascar* (1838); *Three Visits to Madagascar* (1858); *The Martyr Church* (1870); McLeod, *Madagascar and its People* (1865); S. P. Oliver, *Madagascar and the Malagasy* (1866); W. Ellis, *Madagascar Revisited* (1867); J. Sibree, *Madagascar and its People* (1870) and *The Great African Island* (1880); and *The Quarterly Review*, July, 1896. Revised by C. C. Adams.

Madar′, or **Mudar** [= Hind. *madār*]: a large plant of the East Indies, *Calotropis asclepias gigantea*, now naturalized in the West Indies. Its fiber is used for making cloth and cordage, and the bark of its root is employed with apparent advantage in leprosy, elephantiasis, syphilis, and other diseases.

Maddalo′ni [Ital. < Lat. *Magdalo′num*, the ancient name]: town; in the province of Caserta, Southern Italy, about 18 miles N. from Naples (see map of Italy, ref. 7–F). Its chief interest for the visitor is the grand Carolino aqueduct, built about 1755, which brings the waters of the Tiburno to Caserta (3 miles from Maddaloni), where they form a fine cascade that supplies the lakes and fountains of the royal palace gardens. The whole length of this aqueduct is 30 miles, the tunnels and bridges being very numerous, the latter alone having cost nearly $1,000,000. The longest, the Ponte della Valle, consists of three tiers of arches, the upper of 43 arches; the second, 28; the lower, 19. It was at Maddaloni that Gen. Bixio in 1860 met the flying Bourbon troops after the battle of Volturno, and drove them into the fortress of Capua. Pop. 17,080.

Madden, Richard Robert, M. D.: author and traveler; b. at Dublin, Ireland, in 1798; traveled in Turkey, Asia Minor, and Egypt in 1824–27; became a fellow of the Royal College of Surgeons; was sent to Jamaica in 1833 as a special magistrate to supervise the working of the Emancipation Act; became superintendent of liberated Africans at Havana in 1836; was commissioner of arbitration in the mixed court of justice at Havana 1836–39; member of the commission of inquiry into the slave-trade on the west coast of Africa 1841; colonial secretary of Western Australia 1847, and secretary of the loan-fund board at Dublin Castle 1850–80. He published some volumes of travels in Turkey and the West Indies, *Lives* of Savonarola (1854) and Galileo (1863), and several works upon Ireland, of which the most important are *The Lives and Times of the United Irishmen* (1842–46; republished 1874), *Historical Notice of the Penal Laws against Roman Catholics* (1865), and *History of the Irish Periodical Literature* (1867). D. Feb. 5, 1886.

Madder [M. Eng. *mader* < O. Eng. *mædere*, Fr. *garance*, Germ. *krapp*]: a dyestuff obtained from the root of different species of *Rubia*, chiefly *Rubia tinctorum*. The main supply of commerce is from Holland, though the plant was originally a native of Southern Europe and Asia Minor, where it is still cultivated to a large extent. In Ohio, Delaware, and elsewhere in the U. S., the cultivation of the plant has been followed. Hindu madder, called *munjeet*, is the root of *Rubia munjista*, and gives the bright colors to the East India chintzes and calicoes. The term *Turkey red*, applied to one of the tints produced from this material, arose out of its importation from the Levant, where a common species, *Rubia peregrina*, has the popular name *alizari*, whence we get our chemical name for the chief tinctorial principle of madder, Alizarin (*q. v.*). A concentrated form of madder is called *garancin*. H. Wurtz.

Madder Family: the *Rubiaceæ*; one of the largest of the families of dicotyledonous plants, including about 4,500 species of mostly tropical herbs, shrubs, and trees. They have opposite or whorled leaves, and regular, gamopetalous flowers, with inferior two to several celled ovaries. The

Rubia tinctorum.

madder (*Rubia tinctorum*), a native of the south of Europe, and Western Asia, is grown in many parts of the world for its roots, which yield a red dye. Several species of South American trees of the genus *Cinchona* yield Peruvian bark, from which is extracted the well-known drug quinine. The coffee-tree (*Coffea arabica*) is a native of Abyssinia, now grown in many tropical countries. The emetic drug ipecacuanha is derived from the roots of a semi-shrubby Brazilian species of *Uragoga*. Bedstraw (*Galium*), bluets (*Houstonia*), and button-bush (*Cephalanthus*) are common representatives in the U. S.

Madeira, maă-dā′raă [Portug., timber, in allusion to the floating logs brought down by its current; Span. *Madera*]: a river of South America; the most important of the southern tributaries of the Amazon, draining, according to Keller, an area of 755,000 sq. miles, including nearly all of Northern Bolivia, with portions of Southeastern Peru and Western Brazil. Its length, to the head of its most remote affluent, the Guapay, is over 2,000 miles, and according to Keller it discharges, at medium flood, 517,000 cubic feet of water per second. The Madeira and its tributaries occupy a broad southern extension of the Amazonian depression, practically confluent with the Paraguayan depression, and separating the Brazilian plateau from the highlands of Bolivia and Peru. This region forms a vast low plain cov-

ered in great part with forest; the climate is warm (mean temperature at São Antonio 79° F.) and damp; from October to April rains are very frequent and heavy, and from this cause, as well as the melting of snow about the Andean affluents, the river during those months is subject to heavy floods, the difference between low and high water being from 25 to 40 feet. The lower Madeira, to which the name is generally restricted, is formed by the united waters of four great rivers—the Madre de Dios, rising in Peru; the Beni and Mamoré, flowing from Bolivia; and the Guaporé from Western Brazil. The Madre de Dios joins the Beni 125 miles above the mouth of the latter, and in a similar manner the Mamoré receives the Guaporé; the Beni and Mamoré finally unite to form the Madeira. The least known of these great tributaries is the Madre de Dios, which rises on the eastern slope of the Peruvian Andes, E. of Cuzco, and has a length of at least 700 miles to its junction with the Beni. The Beni rises on the Nevado de Chacaltayo, near La Paz, Bolivia, flowing as a rivulet through that city; after making a great curve to the S. and E. it turns N. and finally N. E. to its junction with the Mamoré. Its whole length is probably 950 miles; close to the mouth it is obstructed by rapids, but beyond is navigable for 620 miles. The Mamoré (called in its upper course the Guapay or Rio Grande) rises near Cochabamba, Bolivia, and after making a great eastern curve around Santa Cruz turns N. to its junction with the Beni. For about 45 miles above its mouth it is obstructed by rapids, beyond which it is freely navigable to Exaltacion, 375 miles, and above that small vessels go much farther; it is said that by removing obstacles it could be easily opened to beyond Santa Cruz. The extreme length to the head of the Guapay is between 1,300 and 1,400 miles. The Guaporé or Itenez rises on the Brazilian plateau (Serra dos Parecís), E. of the town of Matto Grosso, and very near streams which flow to the Paraguay (lat. 14° 43′ 3″ S., lon. 59° 50′ 21″ W., according to Almeida Serra). It soon takes a northwesterly course, joining the Mamoré in lat. 11° 54′ 13″ S., lon. 64° 40′ 12″ W., with a length of over 900 miles. It is navigable for light-draught vessels to the town of Matto Grosso, 150 miles from its source. From near lat. 14° S. (junction of the Rio Verde), the Guaporé and Mamoré form the boundary between Brazil and Bolivia. All these rivers receive numerous affluents, some of them hundreds of miles long, and navigable, but very little known. Finally, through the Beni and Mamoré, the whole system unites to form the Madeira proper, on the northern frontier of Bolivia (lat. 10° 22′ 30″ S., lon. 65° 22′ 6″ W.). From this point it flows entirely in Brazilian territory, and reaches the Amazon in lat. 3° 25′ 43″ S. and lon. 58° 47′ 41″ W. The length of this lower portion is about 935 miles, and the average width half a mile, increasing in parts to more than a mile. During the period of high water (November to July) ocean steamers of any size can ascend to São Antonio, 715 miles; and vessels drawing 8 feet reach that point at any season. The Madeira and its affluents flow through regions well fitted for agriculture, but almost deserted. The wild Indians are reduced to a few savage hordes, wandering in the forest, and the few settlements along the rivers owe their existence almost entirely to the rubber-gatherers, the Madeira basin being a chief source of the rubber-supply of the world. The banks are nearly everywhere low, and large areas are covered during the annual floods; it is on these lowlands that the rubber-trees grow; and as such regions and the vicinity of the falls are often malarious, the Madeira valley has acquired the reputation of being unhealthful. The scheme for building a railway around the falls of the upper Madeira and lower Mamoré, thus opening communication with the navigable upper rivers, has never been carried out; but careful surveys have been made, and several miles of the railway were constructed by U. S. contractors in 1877. See Gibbon, *Exploration of the Valley of the Amazon* (1854); Keller, *Vom Amazonas und Madeira* (1874; English translation, *The Amazon and Madeira Rivers*, 1875); Mathews, *Up the Amazon and Madeira Rivers* (1879); various pamphlets and papers by G. E. Church; F. B. de Sonza, *Commissão do Madeira* (1874); Julio Pinkas, *Relatorio da Commissão de estudos da estrada de ferro do Madeira e Mamoré* (1885); Fonseca, *Viagem ao redor do Brazil* (vol. ii., 1881).

HERBERT H. SMITH.

Madei'ra: an island belonging to Portugal, and situated in the North Atlantic Ocean, between lat. 32° 36′ and 32° 53′ N., and between lon. 16° 40′ and 17° 20′ W. It is about 360 miles from the coast of Africa, 535 from Lisbon, 1,215 from Plymouth, 240 from Teneriffe, and 480 from Santa Maria, the nearest of the Azores. By the Brazilian submarine telegraph, which touches it at Funchal, it is connected with Lisbon and Rio de Janeiro. Area, 315 sq. miles. The island is of volcanic origin, though earthquakes occur very seldom. The ground is high, the average elevation being 2,000 feet, and the surface mountainous. The coasts are steep, precipitous, and afford but few harbors. In the interior the land rises still higher until it reaches its greatest height in Pico Ruivo, 6,050 feet; but it is everywhere intersected by deep, well-watered, and fertile valleys, which, however, it has cost, and still costs, an immense amount of labor to cultivate, as the ground has to be terraced and the soil prevented by walls or other devices from being washed away by the rain, while the limited supply of water makes necessary a very intricate and expensive system of irrigation. The climate is equable, the average heat in the summer being 74° and in the winter 64°. In the valleys tropical plants are grown—rice, sugar, coffee, bananas, pineapples, and oranges; on the more elevated fields vines, chestnuts, and wheat are cultivated, and the table-land is covered with fine forests and extensive pastures. The inhabitants, numbering 135,000, are a mixture of Portuguese, Moors, and Negroes, and described as a vigorous, healthy, and industrious race. Since the grape disease in 1852 the vine cultivation, which formerly made the island celebrated, has declined very much, but the coffee-tree has taken the place of the vine, and succeeds very well. There is, however, still produced excellent wine in the vineyards of Madeira (Bual, Sercial, and Malmsey, strong in body and with a fine bouquet); about 300,000 gal. are annually exported. Sugar is also cultivated with success. The capital is FUNCHAL (*q. v.*). Madeira was discovered in 1416, and soon after colonized by the Portuguese. The conjecture that the Phœnicians discovered Madeira at a very early date has been formed on insufficient evidence, though the position in which Pliny places the Mauritanian islands with reference to the Canaries seems to indicate the Madeiras. The romantic story of the two lovers cast on the shores of the island in 1346 is hardly more than fiction; but it seems probable that Genoese captains had visited Madeira before the Portuguese came. Revised by M. W. HARRINGTON.

Madeira-nut: See WALNUT.

Maderno, CARLO: architect; b. at Bissone, in the Correo district in 1556. He studied painting at first, but being called to Rome by his uncle Domenico Fontana, he practiced architecture and acquired great but undeserved fame. He succeeded Giacomo della Porta as architect to St. Peter's, and altered the designs of Bramante, Peruzzi, and Michaelangelo. He preferred the Latin cross to the Greek, which entirely destroyed the proportion and harmony of the project of Michaelangelo. Nothing was done in Rome without his advice or co-operation. The choir and cupola of St. Giovanni dei Fiorentini, the façade of Santa Susanna, the Church of La Vittoria, and that of Sta. Chiara are his works. He finished the Quirinal Palace, the Borghese Palace, the tribune of Sta. Maria della Pace, and numerous others, besides making designs which were carried out in other cities of Italy, France, and Spain. D. in Rome, 1629.

W. J. STILLMAN.

Madison: city; capital of Morgan co., Ga. (for location of county, see map of Georgia, ref. 3–H); on the Georgia and the Macon and N. railways; 63 miles E. by S. of Atlanta, 104 miles W. of Augusta. It is an important shipping-point for cotton; has steam cotton-gins, steam sawmill, and a cotton-compress, and contains the Madison Male and Female Institute (non-sectarian, opened in 1875), a State bank with capital of $75,000, a private bank, and two weekly newspapers. Pop. (1890) 2,131; (1900) 1,992.

Madison: city; capital of Jefferson co., Ind. (for location of county, see map of Indiana, ref. 9–G); on the Ohio river, and the Pitts., Cin., Chi. and St. L. Railway; 90 miles S. W. of Cincinnati. It has daily steamboat communication with Cincinnati and Louisville; is engaged in ship-building and the manufacture of cotton and woolen goods, tanned leather, starch, machinery, foundry products, and brewery products, and has a large trade in provisions. There are 2 national banks with combined capital of $250,000, and 3 daily and 3 weekly newspapers. Pop. (1880) 8,945; (1890) 8,936; (1900) 7,835.

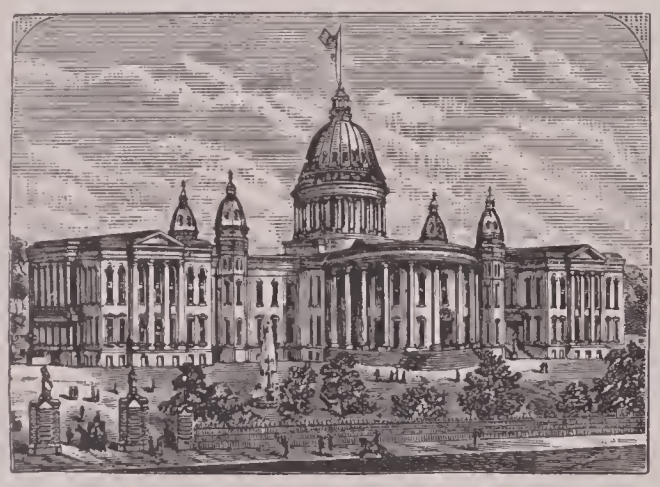
EDITOR OF "COURIER."

Madison: borough; Morris co., N. J. (for location of county, see map of New Jersey, ref. 2–D); on the Del.,

Lack. and W. Railroad: 26 miles W. of New York city. It is in a noted peach and rose growing region; is the seat of Drew Theological Seminary (*q. v.*); and contains the permanent and summer residences of many New York and Newark business men. The principal industry is rose-growing for New York flower-dealers. There are some minor manufactures and two newspapers. Pop. (1880) 1,756; (1890) 2,469; (1900) 3,754. Editor of "Eagle."

Madison: city; capital of Lake co., S. D. (for location of county, see map of South Dakota, ref. 7–G); on the Chi., Mil. and St. P. Railway; 40 miles N. W. of Sioux Falls, 60 miles S. of Watertown. It is in an agricultural region, is the seat of the State normal school (founded in 1883), and has a daily, a semi-weekly, 3 weekly, and 2 monthly periodicals. Pop. (1880) 96; (1890) 1,736; (1900) 2,550.

Madison: city; capital of Wisconsin and of Dane co. (for location of county, see map of Wisconsin, ref. 7–D); on the Chi. and N. W., the Chi., Mil. and St. P., and the Ill. Cent. railways; 82 miles W. of Milwaukee. It is built on an undulating isthmus between Lakes Mendota and Monona, 788 feet above sea-level and 210 feet above Lake Michigan, and has Lakes Waubesa and Kegonsa in its immediate vicinity. The city is the seat of the University of Wisconsin (*q. v.*), and contains 2 commercial colleges, 10 public schools, a high school, several select schools, 21 churches, 4 State banks, a national bank, and a savings, loan, and trust company with an aggregate capital, surplus, and undivided profits of $775,000 and deposits of $4,280,000, and 3 daily, 10 weekly, 5 monthly, and 3 other periodicals. It has improved water-works, gas and electric light plants, electric street-railways, 25 hotels, and State Supreme Court, State Historical Society, university, high school, public, and law libraries. The industries comprise the manufacture of agricultural implements, machinery, printing-presses, bicycles, flour, beer, carriages and wagons, and foundry and machine-shop products. The State Capitol is in an attractive park of 13 acres, and the State Hospital for the Insane is in the suburbs. Madison has wide repute as a charming summer resort. Pop. (1880) 10,324; (1890) 13,426; (1900) 19,164.
Editor of "State Journal."



State Capitol, Madison, Wis.

Madison, James, D. D.: bishop and collegiate professor; b. near Port Republic, Va., Aug. 27, 1749; was a second cousin of President Madison; graduated at William and Mary College 1768; studied law and was admitted to the bar, but abandoned that profession for the ministry of the Protestant Episcopal Church. In 1773 he was chosen Professor of Mathematics in William and Mary College, and became president of that institution in 1777. He visited England in 1775 and again in 1777, where he pursued a course of study at London in several advanced branches of science, kept the college open during the war of the Revolution, became Professor of Natural and Moral Philosophy 1784, was consecrated first Bishop of Virginia by the Archbishop of Canterbury in Lambeth Palace Sept. 19, 1790, and continued to discharge his duties as collegiate president and professor until his death Mar. 6, 1812. He published several addresses, a *Eulogy on Washington* (1800), a large map of Virginia, and some papers in Barton's *Journal* and in the *Transactions* of the American Society, vols. ii., iii., and iv.

Madison, James: fourth President of the U. S.; b. at Port Conway, Prince George co., Va., the residence of his maternal grandparents, Mar. 16, 1751; was the eldest of the seven children of a prosperous planter, Col. James Madison, of Montpellier, Orange County, by his wife Eleanor Conway; studied Latin, Greek, French, and Italian under the tutorship of the parish minister, Rev. Thomas Martin; entered the college of New Jersey at Princeton in 1769, and graduated in 1771, but remained for several months pursuing a course of reading under the guidance of President Witherspoon. At this time he seriously and permanently injured his health by allowing himself but three or four hours of sleep; returned to Virginia in 1772, and continued for two years in incessant study, nominally directed to the law, but really including extended researches in theology, philosophy, and general literature. His attention was then absorbed by the impending struggle for independence, with which was closely connected in Virginia a local controversy on the subject of religious toleration. The Church of England was the established State religion in the Old Dominion, and other denominations labored under serious disabilities, the enforcement of which was characterized by them as persecution. Madison took a prominent stand in behalf of the removal of all disabilities, repeatedly appeared in the court of his own county to defend the Baptist Nonconformists, was elected from Orange County to the Virginia convention in the spring of 1776, and signalized the beginning of his public career by procuring the passage of an amendment to the Declaration of Rights as prepared by George Mason, substituting for the word "toleration" a more emphatic assertion of religious liberty. In the same year he was elected to the Virginia Assembly; was chosen in Nov., 1777, a member of the council of State, and in Mar., 1780, took his seat in the Continental Congress, where he first gained prominence through his energetic opposition to the issue of paper money by the States. He was made chairman of the committee on foreign relations, and as such wrote an able memorandum for the use of the American ministers in France and Spain, establishing the claims of the young republic to the territories between the Alleghany Mountains and the Mississippi, and to the free navigation of that river. In 1783 he was chairman of the committee on ways and means, was the principal author of the system of revenue then adopted, and wrote on that subject the address to the States adopted by Congress. As a member of the Virginia Legislature 1784–86, Madison rendered important service by promoting and participating in that revision of the statutes which effectually abolished the remnants of the feudal system subsistent up to that time in the form of entails, primogeniture, and state support given to the Anglican Church; and his *Memorial and Remonstrance* on the latter subject was one of his ablest State papers. In Jan., 1785, he took the initiative in proposing a meeting of State commissioners to devise measures for more satisfactory commercial relations between the States; represented Virginia at the Annapolis meeting which issued the call for the national constitutional convention (Sept., 1786); was a delegate to that convention, which met at Philadelphia May, 1787; was one of the chief framers of the Constitution of the U. S., and perhaps its ablest advocate in the pages of The Federalist (*q. v.*). He was a member of the first four Congresses, 1789–97, in which he maintained a moderate opposition to Hamilton's financial policy; declined the mission to France and the secretaryship of State, and, gradually identifying himself with the Republican party, became from 1792 its avowed leader, and in 1796 was its choice for the presidency as successor to Washington, but declined to be a candidate. During the stormy administration of John Adams, Madison remained in private life, but was the author of the celebrated "Resolutions of 1798" adopted by the Virginia legislature, in condemnation of the Alien and Sedition Laws, as well as of the *Report* (1800) in which he defended those resolutions, which is by many considered his ablest State paper. The great reaction in public sentiment which seated Jefferson in the presidential chair was largely owing to the writings of Madison, who was consequently well entitled to the post of Secretary of State, which he filled during the whole administration of his friend with such ability as to make him the natural successor in the chief magistracy. Chosen President by an electoral vote of 122 to 53, Madison was inaugurated Mar. 4, 1809, at a critical period, when the relations of the U. S. with Great Britain were becoming embittered, and his first term was passed in diplomatic quarrels, aggravated by the act of non-intercourse of May, 1810, and finally resulting in a declaration of war on June 18, 1812. In the autumn Madison was re-elected to the presidency by 128 electoral votes to 89 in favor of George Clinton. The war

was prosecuted three years, marked by alternate success and defeat in Canada, by glorious victories at sea, by the burning of the national Capitol at Washington, Aug., 1814, by the opposition movement in New England, which culminated in the HARTFORD CONVENTION (*q. v.*) in 1814, and by the celebrated battle won at New Orleans (Jan. 8, 1815) after a peace had been signed at Ghent (Dec. 24, 1814) which left the original cause of dispute in abeyance. The conflict of 1812–15 was indecisive, and the check received by the Western States in their openly declared intention of annexing Canada by right of conquest might furnish a motive of humiliation, as well as a valuable lesson, had not the popular historians of the war conveniently forgotten to chronicle that original intention. In 1815 a commercial treaty was negotiated with Great Britain, and in Apr., 1816, a national bank was incorporated by Congress, the germ of a financial conflict not yet decided. Madison yielded the presidency Mar. 4, 1817, to his Secretary of State and intimate friend, James Monroe, and retired to his ancestral estate at Montpellier, where he passed the evening of his days surrounded by attached friends and enjoying the merited respect of the whole nation. He took pleasure in promoting agriculture as president of the county society, and in watching the development of the University of Virginia, of which he was long rector and visitor. In extreme old age he sat in 1829 as a member of the convention called to reform the Virginia constitution, where his appearance was hailed with the most genuine interest and satisfaction, though he was too infirm to participate in the active labor of revision. He died at Montpellier, June 28, 1836. James Madison was pre-eminently a statesman of a well-balanced mind. His attainments were solid, his knowledge copious, his judgment generally sound, his powers of analysis and logical statement rarely surpassed, his language and literary style correct and polished, his conversation witty, his temperament sanguine and trustful, his integrity unquestioned, his manners simple, courteous, and winning. By these rare qualities he conciliated the esteem not only of friends but of political opponents, in a most unusual degree.—He had a worthy helpmate in his wife, DOROTHY PAYNE (b. in Virginia, 1767), whom he married in Philadelphia in 1794, she being then Mrs. Todd, a widow celebrated in society for beauty and accomplishments. During her long residence in Washington, Mrs. Madison was a conspicuous ornament of the "republican court" over which she ultimately presided; she returned to Washington after her husband's death, survived until July 12, 1849, and was long admiringly remembered in Washington as "Dolly Madison." (See *Memoirs and Letters of Dolly Madison*, 1886.) A valuable diary kept by Madison at the time of the formation of the Federal Constitution was purchased from his heirs for $30,000, and printed by order of Congress as *Reports of the Debates in the National Convention of 1787* (3 vols., 1840); a second edition of this journal of the convention of 1787 was published in one volume, Chicago, 1893; his *Complete Works* have been published in 6 vols. See his *Life and Times*, by W. C. Rives (3 vols., 1859–69, unfinished); the *Letters and other Writings of James Madison* (4 vols., 1865); and Gay's *Life* in the American Statesmen Series.

Madison University: See COLGATE UNIVERSITY.

Madisonville: town; capital of Hopkins co., Ky. (for location of county, see map of Kentucky, ref. 4–D): on the Louis. and Nash. Railroad; 36 miles N. of Hopkinsonville, 38 miles S. of Henderson. It is in the heart of the tobacco-growing region, and also in a valuable coal-mining district, and has flour and planing mills, cotton-gin, tobacco-stemmeries, and several manufactories. Pop. (1880) 1,544; (1890) 2,212; (1900) 3,628.

Madisonville: village; Hamilton co., O. (for location of county, see map of Ohio, ref. 7–C): on the Pitts., Cin., Chi. and St. L., and the Balt. and O. S. W. railways; 13 miles N. E. of Cincinnati. It has several manufactories, considerable trade with the surrounding country, and a weekly newspaper. Pop. (1880) 1,274; (1890) 2,214; (1900) 3,140.

Mäd'ler, JOHANN HEINRICH: astronomer; b. in Berlin, Prussia, May 29, 1794. While holding a position in the normal school of his native city he made astronomical observations together with Wilhelm Beer, and they published in 1829–36 the celebrated chart of the moon, in four leaves, and in 1837 the explanation of the chart (*Allgemeine vergleichende Selenographie*, 2 vols.). In 1836 he obtained an appointment at the observatory of Berlin, and in 1840 he was made director of the observatory of Dorpat, in Russia. While there he published a long series of *Untersuchungen über die Fixsternsysteme*, setting forth his hypothesis of the existence of a great central celestial body. An eye disease compelled him to resign in 1865. He returned to Germany, and died at Hanover, Mar. 14, 1874. Among his other works are *Leitfaden zur mathematische und allgemeinen physischen Geographie* (Stuttgart, 1844); *Die Zentralsonne* (1846); *Der Fixsternhimmel* (1858); *Geschichte der Himmelskunde* (1872–73).

Madoc: a Welsh prince; son of Owen Gwynedd; flourished in the twelfth century. According to some annalists he sailed westward with a fleet A. D. 1170, discovered a vast and fertile continent, returned to Wales, sailed again with ten vessels, and was never after heard of. Many passages in Welsh bardic and historical writings have been cited in support of the story, but these passages are, for the most part, extremely vague, and their reference to Madoc's alleged discovery is a matter of mere conjecture. The earliest extant narrative of Madoc's voyage is in the work of one Humfrey Llwyd, or Lloyd, who wrote in 1559. The new land was supposed to be Nova Hispania or some part of Florida, since the Spaniards are said to have found there the traditions of a previous settlement by a strange race which had honored the cross. Substantially the same account of the discovery was given in the writings of Powel, Herbert, Howell, Hakluyt, Raleigh, Purchas, and many others, and to this evidence was added the testimony of travelers who professed not only to have found traces of the Welsh settlement in Mexico, but to have learned of a certain tribe of Indians that spoke the Welsh tongue. All these claims, which created among patriotic Welshmen a widespread belief in the story of Madoc's voyage, have been subjected to a careful and critical analysis by Thomas Stephens in *Madoc, an Essay on the Discovery of America by Madoc ap Owen Gwynedd in the Twelfth Century* (1893). After a thorough presentation of the evidence relating to the subject, the author decides against the theory of Welsh discovery. For arguments in favor of the theory, see the publications of the Llangollen Eisteddfod, held in September, 1858, and for a bibliography of the subject, see R. B. Anderson's *America not Discovered by Columbus* (1874).

F. M. COLBY.

Madon'na [Ital., originally equivalent to *madame*]: a title of the Virgin Mary, and given especially to artistic representations of her. In mediæval times the Madonna was the symbol of glorified womanhood and maternity, and feelings of chivalric devotion, blended with religious reverence, made her a prominent subject of Christian art. See Mrs. Jameson, *Legends of the Madonna* (1852).

Madoz', PASCUAL: statesman and author; b. at Pamplona, Spain, May 17, 1806; studied at the University of Saragossa; volunteered for the defense of the castle of Mouzon against the French in 1823; was taken prisoner and held for seventeen months, after which he resumed the study of law at the university, but was expelled soon after for liberal opinions; resided several years in Tours, France; was pardoned by the regent Christina and returned to Spain. Taking up his residence at Barcelona he edited a *Diccionario Geografico Universal* in 10 vols. (1829–34), a *Colección de Causas Celebres* (20 vols.), and a liberal newspaper, *El Catalano*; became a lawyer and a judge; and fought against the Carlists as colonel of a battalion of volunteers. In 1836 he was elected to the Cortes, in which he sided with the progressive party, refusing to accept office from the Government. During this time he was at work on his *Diccionario Geografico, Estatistico y Historico de España* (Madrid, 16 vols., 1848–50). He became governor of Barcelona 1854; was leader of the Progressists in the Cortes, and as Minister of Finance in 1855 he showed most radical tendencies. In the following year, after a vain resistance to the Government, he was forced to leave Spain, but soon returned, and was re-elected to the Cortes. Took part in the revolution of 1868, became governor of the province of Madrid, and deputy to the Constituent Cortes, and died in 1870 on the journey to offer the crown of Spain to Amadeo.

F. M. COLBY.

Madras' Province: the southernmost province of the Hindustan peninsula; extends from Cape Comorin, lat. 8° 4′ N., to Nagpur, lat. 21° 10′ N., and is bounded N. by the presidency of Bombay, Curg, Haidarabad, the Central Provinces, and Bengal, E. and S. E. by the Bay of Bengal, S. by the Indian Ocean, and W. by the Arabian Sea. Area,

140,172 sq. miles. Pop. (1901) 38,208,609. The surface forms a plateau sloping down from the center on both sides, inclosed E. and W. by the Ghats and S. by the Nilgiri Hills, and traversed by three large rivers, the Godavari, Kistna, and Cauvery, besides several minor ones. The rivers, which flow westward to the Arabian Sea, expand at their mouths, become shallow, and form lakes. The soil is sandy along the coast, and much mixed with salt in the interior; there are, nevertheless, many very fertile districts; for instance, Tanjor, which is rich in grain. The great forests, which since 1859 have been under regular cultivation, yield teak and many other valuable kinds of wood. Sugar, cocoanuts, tobacco, indigo, and cotton are produced. Considerable quantities of iron, copper, lead, manganese, silver, and coal are found. Revised by M. W. Harrington.

Madras (derivation unknown; native name *Chennapatnam*, "Chenappa's City"; official name *Fort St. George*): the third city of India; capital of the presidency or "administration" of the same name; situated on the Bay of Bengal, along the shores of which it extends for 10 miles; lat. 13° 4′ N., lon. 80° 15′ E. (see map of S. India, ref. 6–F). The city, which has an area of 27 sq. miles and extends inland for about 4 miles, is built on a sandy plain only a few feet above sea-level, and the drainage is consequently bad. It consists of Fort St. George (the first British possession in India) and of twenty-three villages, which have grown together into one municipality. The streets are macadamized, but the street-lighting, sewerage, means of transit, etc., are so poor that the city is often nicknamed "The Benighted." The water-supply is obtained from wells and the Red Hill Tanks or reservoirs. The Cooum river, which traverses the center of the city, is little better than an open sewer, the mouth of which is silted up from the sea for a large part of the year. A similarly sluggish stream, the Adyar, flows across the city on the S. In the center of the town, but immediately on the sea, stands Fort St. George, which, besides the barracks for the British troops and other military institutions, contains the council-house, in front of which stands the marble statue of Lord Cornwallis, the arsenal, St. Mary's church (more than 100 years old), and other public buildings. To the N. of the fort, but separated from it by a large esplanade, is Blacktown, the native town, poorly built, but densely populated. To the E. along the shore it is lined with handsome public buildings and business offices. On the south side of the fort, but separated from it by the Cooum river, is the Mohammedan quarter, with the Chepak Gardens and the palace of the former nabobs of the Carnatic. W. of the palace stands the government-house. Other noteworthy buildings are the new High Court; the lighthouse, 128 feet high and visible 20 miles; the Church of St. Andrew (founded in 1818); St. George's Cathedral; the mint (in Blacktown); the Madras Club; the observatory; the Military Orphan Asylum; the hospital, etc. The numerous residences of the European officials, civil and military, are generally palatial structures, the polished chunam used in their construction giving them the appearance of marble. Parks and gardens usually surround the houses and contribute much to the beauty of the city. Madras is progressing industrially and has several large cotton-mills, tanneries, etc., and an ice-factory. It has several canals, the most important of which is the Buckingham, extending northward for 196 miles, and is an important railway center. Though destitute of any natural harbor, and thus unfavorably situated for commerce, Madras is in direct steam communication with Europe and the principal ports of the East. It exports hides, spices, tea, coffee, indigo, cotton, and saltpeter, and imports cotton goods, canned goods, liquors, metals, horses, etc. Recently a commodious artificial harbor has been constructed at great expense, and vessels are now comparatively well sheltered from the terrible hurricanes to which they were formerly exposed in the open roadstead, and passengers are no longer landed through the surf on catamarans and the native *massulah* boats, consisting of planks bound together with string. In calm weather the surf breaks about 300 feet from the shore, with waves 3 feet high, while in stormy weather the break is 1,000 feet from the shore and the height of the waves is 15 feet. The heat is great but comparatively dry, and an invigorating seabreeze called "the doctor" blows the greater part of the year from about noon to sunset. Madras was founded in 1639 by Francis Day, of the East India Company, who obtained a grant of land from the Rajah of Chandragiri in that year, and was made a presidency in 1653. The fort has often been attacked—in 1702 and 1741 by the natives. In 1746 it was captured by the French, but restored two years later, and in 1758–59 it was unsuccessfully besieged by them. In 1803 it was swept by a great fire which consumed 1,000 houses, and it suffered greatly in the great hurricane of 1872. Pop. (1891) 452,518.

Madrazo, mäă-draa′thō, Don Raimundo, dc: portrait and genre painter; b. in Rome, Italy, July 24, 1841; pupil of his father, Don Federico de Madrazo, and of Léon Cogniet, in Paris; was awarded first-class medals, Paris Exposition, 1878–89; decoration of the Legion of Honor 1878. D. in Madrid, June 11, 1894. He was a brilliant technician, and his portraits in oil and in pastel are most cleverly painted. His *Fête during the Carnival* is in the collection of Mrs. W. H. Vanderbilt, New York, and is a representative work.

William A. Coffin.

Madre de Dios: river of Bolivia. See Madeira.

Madre de Dios: archipelago. See Magallanes.

Madrepore: a group of coral-forming polyps (see Scyphozoa) belonging to the order of *Hexactinia*. The term is usually restricted to the tree-corals of tropical seas, but in the broader sense it includes the greater portion of the reef-building forms.

Madrid′: the capital of Spain and of the province of Madrid, a part of New Castile; situated nearly in the center of the country, in lat. 40° 25′ N., lon. 3° 42′ W., on the left bank of the Manzanares, a small stream which joins the Jamara and flows to the Tagus (see map of Spain, ref. 15–F). The site offers no commercial or industrial advantages, nor has it any special military importance; and the surrounding plateau—2,200 feet high, and once covered with forests, but now, with the exception of the immediate neighborhood of the city, naked and arid—suffers from a very harsh climate. In the streets of the city the thermometer sometimes falls in the winter to 18°, and rises in the summer to 105° in the shade. Changes are frequent, sudden, and violent, and the difference in temperature between the sunny and shady sides of the street often amounts to 20°. The city is first mentioned in history as a Moorish outpost, called *Majerit*, but was captured in 1083 by Alfonso VI. of Castile. Henry III. of Castile resided there often for the pleasure of hunting; Charles V. went there occasionally, and in 1560 Philip II. made the place his capital. From this time it grew rapidly into a magnificent city, and became the center of the Spanish people, political and literary. Pop. (1892) 480,000.

The city is surrounded by a brick wall 20 feet high and pierced by fifteen gates, of which the most remarkable is Puerta de Alcalá, 72 feet high, built in the form of a triumphal arch with five openings, and standing at the foot of the street of Alcalá, which, three-fourths of a mile long, traverses the city from N. E. to S. W., and forms one of the most magnificent streets in Europe. The southwestern (or old) part of the city contains many narrow, crooked, and ill-kept streets, but the central and eastern parts consist of straight, broad, well-kept thoroughfares, lined with handsome houses, magnificent palaces, and elegant public buildings. Notable among the public squares, of which Madrid numbers seventy-two, is Puerta del Sol, once forming the eastern entrance of the city, but now occupying nearly its center. The government palace, the post-office, and other public buildings are situated here; also the best hotels, clubs, and reading-rooms; and thus the place has become a general rendezvous both for business and pleasure. Plaza Oriente, situated between the royal palace and the royal theater, contains an equestrian statue in bronze of Philip IV., 19 feet high, designed by Montañes; in the promenade skirting the plaza stand forty-four colossal statues of kings and queens. Plaza Mayor, 398 feet long by 306 feet wide, contains an equestrian statue in bronze of Philip III.; here the so-called *autos-de-fe* were formerly celebrated, and from the Real Casa de la Panaderia the king and the court used to witness the burning of heretics. The bull-fights take place in Plaza de Toros, just outside Puerta de Alcalá, erected by Philip V., and accommodating 14,000 persons. In Plaza de las Cortes stands a fine bronze statue of Cervantes. Among the numerous promenades and gardens, the Prado is the most remarkable; 2½ miles long, divided into parts—the Prado proper, the Salon, the Fuente Castellana, formerly the Delicias de Isabel—finely laid out, planted with beautiful trees, and in part adorned with magnificent fountains and statues. The view which these

grounds present on a fine evening, when thronged with people, is very brilliant and characteristic.

Although Madrid is one of the handsomest modern cities, it contains, properly speaking, only one striking building, the royal palace. Its cathedral was begun in 1885. It forms only a suffragan bishopric of Toledo. Many of its churches, of which it numbers ninety, are beautifully decorated with paintings of the old masters, but none of them has any architectural merit. The same is the case with the convents and monasteries, which formerly were so numerous in Madrid, but which now mostly are used for other purposes; forty-four monasteries were suppressed in 1836. The royal palace was built between 1737 and 1750, of granite and white marble, forming a square 470 feet long, 100 feet high, inclosing a court 240 feet square, occupying an area of 220,900 sq. feet, and surrounded with magnificent gardens. It contains a library of 100,000 volumes, an interesting collection of arms, consisting of 2,533 specimens, among which are the armor of Columbus, Gonsalvo de Cordova, and Don John, and a numismatic collection of 150,000 pieces. The collection of pictures in the royal museum in the Prado is one of the largest and richest in Europe, and contains 65 pictures by Velasquez, 58 by Ribera, and 46 by Murillo, besides numerous and excellent works of the Italian and Dutch schools. The educational institutions of the city are good, from the elementary schools, among which the Protestant Sunday-schools begin to play a conspicuous part, to the university and the learned societies. There are, besides the national library, containing over 300,000 volumes, several minor libraries accessible to the public, an observatory, a botanical garden, a medical school, military and engineering schools, a theological seminary, normal schools, and schools of art, law, etc. Its hospitals and other charitable and benevolent institutions are also good.

The industry of the city is not considerable. Of its manufactures only those of plated ware, coaches, tobacco, furniture, carriages, tapestry, earthenware, gloves, and fans have acquired any prominence; but the commerce is important. The retail business is mostly in the hands of foreigners, especially Frenchmen; but wholesale transactions are carried on by native houses, and are very large, the city forming the entrepôt for all the interior provinces.

Revised by C. K. Adams.

Madrid, José Fernandez: See Fernandez Madrid.

Mad'rigal [Fr. *madrigal*, from Ital. *madrigale* < O. Ital. *madriale*, *mandriale*, pastoral poem, madrigal; cf. Ital. *mandra*, flock < Lat. *man'dra*, stall, herd, from Gr. μάνδρα, fold, stable]: in music, the name of a certain species of composition, originally of a light, airy, joyous, and pastoral character. Madrigals are often of complex and elaborate structure, usually for voices alone, and consist of four, five, or more parts, in which the skill of the composer exhibits itself in fugues, canons, imitations, and other highly labored styles of writing. Compositions of this kind abounded in the sixteenth and seventeenth centuries, and in their production the best masters appear to have found a congenial field for the exercise of their ability. It is supposed by some writers that the madrigal originated in Flanders, was subsequently taken up with success by the Italians, and finally became popular in England about the middle of the sixteenth century. Numerous collections of these compositions were published in that century and the following, and these give evidence not only of the popularity of the madrigal in England, but also of the high rank attained by the English masters in this style of composition. In 1741 the well-known Madrigal Society was founded in London—an institution which has had a wide influence in the cultivation of a taste for madrigal music, and for glees, canons, rounds, catches, and national airs. The derivation of the name "madrigal" is merely conjectural. By some it has been traced to *mandra*, a sheepfold, as the early madrigal was of a pastoral character; Dr. Burney derives it from *Alla madre*, "the first words of certain hymns addressed to the Virgin"; Sir John Hawkins connects it with the name of a town in Spain; but no satisfactory etymology has yet been reached. Revised by Dudley Buck.

Madu'ra: an island of the Malay Archipelago, N. E. of Java, comprising an area of 1,700 sq. miles, and belonging to the Netherlands. The inhabitants, numbering 800,000, are Mohammedans, and live in three kingdoms governed by native princes under Dutch superintendence. They are brave and honest; but, although they cultivate sugar, indigo, rice, and tobacco to some extent, they have no disposition for agriculture, and the island is a possession of inferior importance. Its chief product is salt, the manufacture of which is a government monopoly. Petroleum is found in small quantities in all the departments. The principal industry is cattle-rearing. The breed of oxen is small, but very highly esteemed in Java, and exported in considerable numbers. The island contains some hot springs and a mud-volcano called Banju Ening. Among the most important towns of Madura are Kamul, Bangkalang (the flourishing chief town of Madura proper), Arisbaya, Ajermata (named from its salt springs), Pamakasan (containing the residence of the regent), Sampang (an important market-town), Sumenep, and the European town of Maringan.

Madura: a city of British India; in the province of Madras; capital of the district of Madura, which, comprising an area of 8,401 sq. miles, with a population of 2,175,000, occupies the southeastern part of Hindustan (see map of S. India, ref. 7–E). The city is fortified, carries on a considerable trade in cotton and tobacco, and contains some of the most remarkable Hindu buildings, among which are the magnificent Pandiyan palace, the great temple of Mahadeva, and a celebrated choultry or inn for pilgrims, 312 feet long and 125 feet broad, resting on six rows of columns of gray granite, and 25 feet high. A Roman Catholic mission was started here in 1606 by the Portuguese Jesuit Roberto de Nobili, and continued with great success till the middle of the eighteenth century, when the wars between France and Great Britain stopped and nearly annihilated the work. It was resumed in 1837. In 1834 a Protestant mission was established by the American Board of Commissioners for Foreign Missions, which has under its charge numerous churches and schools, besides several dispensaries. Pop. (1891) 87,420.

Mad'vig, Johan Nikolai: statesman and scholar; b. at Svaneke, Denmark, Aug. 7, 1804; studied from 1820–25 in Copenhagen; became privat docent in 1826; Professor of the Latin Language and Literature in 1829; was elected to the Rigsdag in 1848; was Minister of Education till 1851; since 1855 frequently elected president of the Rigsdag. Madvig was one of the greatest text-critics of modern times. D. Dec. 13, 1886, having lost his eyesight some years previously. His most famous works, characterized no less by a brilliant Latin style than by critical learning, are *Emendationes Livianæ* (1876, 2d ed.); *Adversaria critica ad scriptores Græcos et Latinos* (3 vols.); *Opuscula Academica* (1887, 2d ed.); *Kleine Schriften* (1875); *Latin Grammar* (1843) and *Greek Syntax* (1847), both frequently re-edited; *Verfassung und Verwaltung des römischen Staats* (2 vols., 1882); and his masterpiece, the critical commentary to Cicero's *De Finibus* (1839; 1876, 3d ed.). Together with his pupil Ussing, he also published a complete text edition of Livy (4 vols., 1879, 3d ed.). See Heiberg, *Biogr. Jahrbücher* (ix., 1886, pp. 202–221), and, for a complete list of his writings, *Wochenschrift für classische Philologie* (iv., 1887, p. 285). Alfred Gudeman.

Mæan'der (in Gr. Μαίανδρος): a celebrated river in Asia Minor; rises in Phrygia at Celænæ (later Apamea-Cibotus, now Dineir). Numerous large springs burst forth from the mountain-side at Celænæ, and when united form a large river at once. The water comes through the mountain that separates Celænæ from Aulocrene (now Bunarbashü), celebrated both in myth and history. After leaving the Baklan Ovasü at Demirdjikieui, it falls rapidly and cuts its way in a deep cañon through the mountains, emerging at Tripolis into the great fertile valley of the Mæander, whose soil is from 30 to 60 feet deep. Besides the so-called Smyrna figs, this valley furnishes most of the licorice used in Christendom, and has been wealthy and populous at every period of history. The river is noted for its winding and tortuous course through this valley, and because of this peculiarity it has given its name to one of the most beautiful patterns of Greek ornamentation. It has numerous tributaries. It is narrow and deep, and carries with it a large quantity of mud, which, being deposited at the mouth, has extended the coast many stadia farther into the sea, and connected it with some adjacent islands. It is navigable only for small craft. For a discussion of the rivers that rise at or near Celænæ, the Marsyas and the Mæander, see the literature cited under Marsyas. J. R. S. Sterrett.

Mæce'nas, Gaius Cilnius: was born between the years 74 and 64 B. C. of a noble family of Etruscan origin, and died in 8 B. C. His historical significance is twofold, as a statesman and as a patron of literature. He was a friend of the young Octavian, and became his most trusted adviser. His services were employed especially for diplomatic negotia-

tions, in which he displayed rare tact and discretion. We first hear of him as mediating between Sextus Pompeius and Octavian, in the year 40 B. C., bringing about the marriage of Scribonia, a connection of Pompeius, with Octavian. A diplomatic mission of reconciliation was the purpose of a trip to Brundisium a few years later, which Horace has so drolly described in one of his satires (i., 5). During the absence of Octavian in 36 B. C. he was his official representative at Rome, and again in 31 B. C. he shared this responsibility with Agrippa; but all of his influence in the establishment and organization of the new *régime* was exercised as a private citizen, and it almost seems to have been a matter of family pride and tradition to keep aloof from public life as a magistrate. His private life was sensual and inert, and ancient authors repeat much gossip concerning his table extravagances, his passion for pantomimes, and his association with actors. He is well characterized by Velleius as one who "in emergencies was tireless, far-sceing, and never at a loss what to do, but who, when the pressure of business or duty had relaxed, was more effeminate and luxurious than a woman"; but it is as the creator and center of a literary circle at Rome, of a brilliancy unparalleled perhaps in the world's history, that he is best known—a circle composed of such men as the tragic poet Varius, Vergil, Horace, and Propertius. His patronage did not merely consist in the alleviation of their wants and the granting of means for the enjoyment of a literary leisure, but it had a direct influence on many of their compositions, and we learn that the *Georgics* of Vergil and portions of the works of Propertius were due to his suggestion. As a patron of literature his name became proverbial, and a century after his death Martial wrote, *sint Mæcenates non deerunt, Flacce, Marones* (let there but be Mæcenases, and Vergils shall not be lacking). His own literary efforts were inconsiderable and unimportant, arousing a temporary interest chiefly because of their authorship and the strained and unnatural style in which they were written. A striking and characteristic fragment is preserved by Seneca, which reveals with painful vividness his almost hysterical fear of death: "Maim me in hand and foot and hip, make me hunchbacked, shake the teeth from my mouth—while life but lasts, it is well; hang me on the cruel cross, but only preserve my life." G. L. HENDRICKSON.

Maelström, māl'strŭm, or **Malström** [from Norweg. *malstraum*, a whirlpool; *mala*, grind + *straum*, stream]: according to legend, a tremendous whirlpool on the western coast of Norway, immediately S. of Mosköe, the southernmost island of the Lofoden group, in lat. 67° 48′ N. The legend tells us that whales, men-of-war, etc., when caught by the vortex, are ground to pieces as fine as dust. There is, however, no whirlpool at all; but the currents, which run here for six hours from N. to S., and then for six hours from S. to N., are very strong: and when, as often happens, the wind blows from just the opposite direction to that of the current, the agitation of the sea may become very heavy, and even dangerous to small vessels. The origin of the legend is unknown.

Maerlant, maar'lăant, JACOB, van: mediæval writer; b. about 1235 in the district of Bruges, a city of the Netherlands. When still young he removed to the village of Maerlant, on the island of Voorn, in the North Sea. Hence came the name he is known by, and here he was for a time a sacristan, or parish clerk. Here also several of his earlier works seem to have been written. In 1266 he settled in Damme, the haven of Bruges, where he is said to have been clerk of the city chancery. His later years seem to have been passed mainly here, and here he was buried under the belfry of the parish church. Maerlant was called by his own pupil and imitator, Boendale, "Vader der dietscher dichtren algader," and by this name he continues to be known in the history of Dutch literature. In him first appear on a large scale those qualities which have ever since been characteristic of the Dutch genius—moral energy, didactic fervor, erudition, and middle-class rather than aristocratic ideals of life. When he appeared his countrymen were completely under the influence of the literary works of France. Romances of chivalry such as were rife at Paris and at Troyes had been eagerly translated into Dutch, and the vogue of them seemed complete. Maerlant himself began his career as a writer by treating precisely such matters. His first works were a version of the *Alexandreis* of Gauthier de Chastillon (written between 1257 and 1260; ed. by Snellaert 1860–61, and J. Franck 1882); a *Historie van Troyen*, based upon the *Roman de Troïe* of Benoît de Sainte-More (about 1264, ed. in part by J. Verdam 1874; a complete ed. has been undertaken by Nap. de Pauw and E. Gaillard, vol. i., Ghent, 1889); a rendering of the double Arthurian romance of Robert de Borron, *Historie van den Grale* and *Merlijns Boeck* (ed. by J. van Vloten, Leyden, 1880–82); a translation of a lost French romance, *Torec* (ed. J. te Winkel, Leyden, 1875). In all these works Maerlant permits himself great freedom with his originals, abbreviating and adding wherever it seems good to him. Here and there also passages show the tendencies of his mind; but, on the whole, he accepts the romantic and chivalric theories of France as he finds them. A change, however, gradually came over his spirit, and he began to find these same theories exceedingly pernicious. This appears first in a strophic poem known as the *Eerste Martijn* (or *Wapene Martijn*, from its opening words), in which he discusses bitterly with his friend Martijn the corruptions of the world in which they live. This was followed by the similar *Dander* (The Second) *Martijn*, and the *Derden Martijn*, of much the same character (all three ed. by E. Verwijs, 1880). About the same time with the last two of these Maerlant wrote the first of his didactic works, the *Heimelijkheid der Heimelijkheden* (ed. by J. Clarisse, 1838; and by E. Kansler in his *Denkmäler altnied. Sprache u. Lit.*, 1844–66), as it is conjectured, for the benefit of Floris V. when he became Count of Holland (1266). This is a treatise on the art of governing, based upon the work attributed wrongly by Maerlant to Aristotle, the *Secreta Secretorum*. Soon after this he prepared his version of the *De Rerum Natura* of Thomas of Cantimpré, known as *Der Naturen Bloeme* (ed. by E. Verwijs, 1878). This was followed by the most famous of his works, the *Rijmbibel*, based on the *Scolastica* of Petrus Comestor, but amplified by an account of the fall of Jerusalem (*Die Wrake van Jherusalem*), taken from Flavius Josephus (ed. by J. David, 1858–69). This was completed in 1271, and at once brought upon the poet the charge of having made the Bible accessible to the laity. He had to defend himself from the charge, probably before the Bishop of Utrecht. Soon after, at the request of a Franciscan of Utrecht, he translated into Dutch St. Bonaventura's life of St. Francis, *Leven van St. Franciscus* (ed. by J. Tideman, 1848). In 1283 Maerlant set his hand to his chief work, the *Spiegel Historiael*, based upon the *Speculum Historiale* of Vincent of Beauvais (ed. by de Vries and E. Verwijs, Leyden, 1857–63). This enormous task he did not live to finish. In his last years he wrote a number of shorter pieces of a devotional character, among them a beautiful crusade song, *Van den Lande van Oversee*. Though a list of his works makes Maerlant appear chiefly as a translator, yet in reality his originals were to him little more than general guides. He seldom followed literally, and he showed everywhere the ideals that were his and those of the serious part of the Dutch people. Hence his great vogue and influence. See C. A. Serrure, *Jacob van Maerlant en zijne werken* (2d ed. 1867); Karel Versnaeven, *Jacob van Maerlant en zijne werken* (1861); J. te Winkel, *Maerlants Werken beschouwd als Spieghel van de 13ten eeuw* (1877); *id.*, *Geschiedenis der nederlandsche letterkunde* (Deel i., 1887).
A. R. MARSH.

Mæ'sa, JULIA: sister-in-law of the Emperor Septimius Severus and grandmother of the Roman Emperors Elagabalus and Alexander Sĕverus; b. at Emesa, a city of Syria, about 150 A. D., and died about 225 A. D. She has a place in history as having brought about the elevation to the imperial dignity of her grandsons Elagabalus (emperor 218–222) and Alexander Severus (emperor 222–235). G. L. H.

Maestricht, maas'tricht [Dutch, *Maastricht*; anc. *Trajectum ad Mosam*]: city of the Netherlands; capital of the province of Limburg, on the Meuse; 19 miles by rail N. N. E. of Liège (see map of Holland and Belgium, ref. 10–G). It was founded in the fifth century, is regularly and well built, and contains several fine buildings. It was formerly considered one of the strongest fortresses in Europe and the principal defense of Holland, as parts of the surrounding ground can easily be put under water, but during the years 1871–78 the fortifications were razed. In the wars between the United Provinces and Spain and France it often formed the center of the contest, and suffered much. It has an extensive transit trade, manufactures of carpets and earthenware, and immense subterrancan quarries of sandstone in the Pietersberg. These have been worked since the ninth century, and the excavated passages cover an area of 12 by 7 miles. Pop. (1896) 33,834.

Maeterlinck, maa'ter-link, Maurice, or (in Flemish) Mooris: poet; b. in 1864. He is the most remarkable representative of the school of poets calling itself *La Jeune Belge* and working under the device *Pro Arte*. The distinctive character of his work dates from a nine months' residence in Paris in 1886, where he came much under the influence of Villiers de l'Isle-Adam. He owes something also to his study of English literature, particularly Shakspeare and the Elizabethan dramatists on the one hand, and De Quincey, Poe, and Rossetti on the other. He has produced a series of *soi-disant* dramas that have created a veritable sensation by reason of the strangeness of their manner and a certain indubitable power they show. These are *Les Aveugles*, *L'Intruse*, *La Princesse Maleine* (5th ed. 1891), *Les Sept Princesses* (1891), *Pelléas et Mélisande* (1892), *La Quenouille et la Besace* (announced Sept., 1893). Besides these dramas he has also published a volume of poems, *Serres chaudes*, and *L'Ornement des noces spirituelles, de Ruysbroeck l'Admirable, traduit du Flamand et accompagné d'une introduction.* See the London *Academy* for Mar. 19, 1892, and *The Nineteenth Century* for Sept., 1893.

Maffei, maă-fā'ĕe, Andrea, Cavaliere: poet; b. at Riva di Trento, Italy, in 1802; studied literature under Paolo Costa, and then went to Munich for the study of German. At the age of sixteen, encouraged by Monti, he began to publish his finished metrical translation of the *Idyls of Gessner* (Milan, 1818). This was followed by a translation of Schiller's *Bride of Messina* (1827) and *Mary Stuart* (1829), and later by that of all the dramatic works of this great German (Milan, 1844), on whose manner Maffei formed his own poetic style. After this he made admirable translations of numerous poems of Moore; the *Childe Harold*, *Sardanapalus*, *Bride of Abydos*, and other poems of Byron; Milton's *Paradise Lost* (Turin, 1857); and three plays of Shakspeare. He also rendered into Italian Goethe's *Faust*, *Iphigenia*, and *Hermann und Dorothea*, several German romances, and the *Odes* of Anacreon. In 1854 he published a small collection of original verses, entitled *Dal Benaco*. Four years later he began to print a larger collection of the same kind, *Versi editi e inediti* (3 vols., Florence, 1858–60). Among these are poems of rare lyrical beauty. He led a retired and uneventful life in his native place, and died in Milan, Nov. 27, 1885.

Revised by A. R. Marsh.

Maffei, Francisco Scipione, Marquis: scholar and poet; b. at Verona, Italy, June 1, 1675; educated by the Jesuits at Parma, he joined his brother, a general in the Bavarian service, in the war of the Spanish Succession. Returning to Italy, he published in 1710 a treatise, *Della scienza cavalleresca*, directed against the duel. The same year he helped to found the *Giornale dei letterati*, the first Italian literary journal, to which he made many contributions. Becoming interested in the revival of the Italian drama, he published a collection of the best examples of it, with a prefatory dissertation (3 vols., 1723–25). He had already, however, rendered a better service by his tragedy *Merope* (first represented June 12, 1713); his comedy, *Le cerimonie*, and several melodramas were worth far less. Turning now entirely to scholarship, he published, after several lesser works, his *Verona illustrata* (1732), a splendid monument of erudition and civic pride. Traveling soon after through Southern France, he interested himself greatly in Provençal matters, and published in Paris in 1733 a series of letters on the subject, entitled *Galliae antiquitates*. For three years he resided in Paris, and becoming engaged in the Jansenist controversy he wrote his *Istoria teologica delle dottrine . . . della divina grazia, del libero arbitrio e della predestinazione* (published in Trent, 1742), which, with other theological treatises, brought upon him many savage attacks. After journeying in England, Holland, and Germany, he returned to Italy, where he wrote his *Trattato de' teatri antichi e moderni*, in reply to the attack of the priest Concina on all forms of theatrical representation. Interested also in science, he published a *Lettera sopra i fulmini* (1747), and treatises on electricity, etc. He died Feb. 11, 1755. His works were published in twenty-one volumes in Venice (1790). See G. B. C. Giulari, *Bibliografia maffeiana* (in *Propugnatore*, 1885).

Maffei, Giovanni Pietro: historian; b. at Bergamo, Italy, in 1535; became Professor of Rhetoric at Genoa 1563; secretary of the republic 1564; entered the order of Jesuits 1565; taught rhetoric several years at Rome; visited Spain and Portugal in quest of materials for his Latin *History of the Indies* (1588), a work of great value upon which he bestowed twelve years' labor. He had previously published a *Commentary on the Achievements of the Society of Jesus in the East up to 1568* (1571) and a *Life of Ignatius Loyola* (1585). He edited a collection of missionary *Letters from the East* (1588), wrote the history of the pontificate of Gregory XIII. (not published till 1742), and had commenced those of later popes, but had brought the story down only to the death of Sixtus V. (1590) at the time of his own death, at Tivoli, Oct. 20, 1603. His complete works in Latin were published at Bergamo (1747) with a *Life*.

Maffia: a Sicilian secret society having for its aim the substitution of its own authority for that of the law. Though depending upon community of sentiment among its members rather than upon effective organization, it has nevertheless proved a powerful influence in the social and political affairs of the island, often controlling elections, affording protection against the officers of justice, and forcing landlords to employ none but members on their farms. Boycotting is the usual weapon, but violence has been resorted to in many instances. Italian emigrants have founded branches in New York, New Orleans, and other cities of the U. S., where their members are thought to foster and protect crime. In New Orleans the suspicion felt for the Maffia broke out into open and violent hostility on the occasion of the murder of the chief of police by members of the society in 1890. Enraged at the acquittal of some of the accused, a mob broke into the jail and murdered eleven of the prisoners, including those who had been acquitted. In consequence of the delay in bringing to justice the authors of the disturbance, the Italian Government protested against this violation of the rights of Italian residents, but the matter was amicably arranged, the U. S. agreeing to indemnify the relatives of the victims.

F. M. Colby.

Mafra, maa'fraă: small town of Portugal, 20 miles N. W. of Lisbon (see map of Spain, ref. 17–A); famous for the immense building which John V. erected here in 1717–31, which comprises a royal palace with 866 rooms, a cathedral 186 feet long and 135 feet broad, surmounted with a magnificent dome, and a monastery with 300 vaulted cells, the whole of white marble from Carrara, and surrounded with magnificent gardens.

Magalhães, maă-gaăl-yĭns', Benjamin Constant Botelho, de, commonly known as Benjamin Constant: statesman; b. in Brazil in 1838. He was director of the military academy at Rio de Janeiro, and early adopted republican principles, upholding them in the press and in congress. As one of the leaders of the revolution by which the emperor was deposed (Nov. 15, 1889), he took part in the formation of the provisional government in which he was Minister of War and, for a time, of the Post-office. Two days after the constituent assembly had met, he died at Rio de Janeiro, Jan. 22, 1891. The Brazilian constitution, adopted soon after, provided that his house should be purchased and preserved by the Government as a memorial of his services.

Herbert H. Smith.

Magalhães, Domingas José Goncalves, de, Visconde de Araguaya: poet and publicist; b. at Rio de Janeiro, Brazil, Aug. 13, 1811. He studied law and was admitted to the bar, but in 1836 became attached to the diplomatic service, and in later life was successively *chargé d'affaires* at Naples and Turin, and minister at Vienna (1859–62), Washington (1868–72), and Rome; he was several times elected to congress. In literature Magalhães stands at the head of the Brazilian romantic poets. Among his earlier works are *Suspiros poeticos e saudades*, and several tragedies which were acted with success. His *Confederação dos Tamoyos*, a heroic poem founded on episodes connected with early Brazilian history, appeared in 1857, and is his best-known work. It was followed by *Mysterios* (1858); *Urania*, a collection of shorter poems (1862); and several prose works on philosophical questions. A collected edition of his writings, in eight volumes, appeared in 1876. D. in Rome, July 10, 1882. See F. Wolf, *Ueber D. J. G. de Magalhães: ein Beitrag zur Geschichte des brasil. Literatur* (Vienna, 1862).

Herbert H. Smith.

Magalhães, Fernão, de (Span. Fernando de Magallanes; by English and French authors commonly called Ferdinand Magellan): discoverer; b. in the village of Saborosa, Traz-os-Montes, Portugal, about 1480. From 1505 to 1512 he served in the East Indies (returning once to Portugal in 1508), and accompanied expeditions to Malacca,

the Moluccas, Sumatra, Amboyna, the Malabar coast, etc., acquiring much knowledge of those regions and of navigation. In 1514 he fought with the Portuguese in Morocco. About this time he conceived the plan of finding a western route to the East Indies. America was then a barrier on the western route to Asia, and so far all attempts to find a passage through or around it had failed, although Balboa's discovery had shown that there was an ocean beyond it. A cosmographer named Ruy Faleiro offered to join him in the enterprise; but to carry it out it was necessary to have the sanction of some government, and at this time Magalhães was on bad terms with the Portuguese court, which, as he claimed, had not properly rewarded his services. He therefore determined to apply to Spain, and before doing so, according to a custom of the nobility, formally renounced his allegiance to Portugal. He reached Seville in Oct., 1517, living there in the house of an exiled Portuguese, Diego Barboza, a man of position and influence, whose daughter he married shortly after. The *Casa de Contratación* at Seville had the superintendence of colonial affairs, and to it Magalhães first applied, but obtained little encouragement. Later he and Faleiro were admitted to an audience at Valladolid with Charles V., then a young man just taking possession of the Spanish throne; Charles was greatly interested in the scheme, and by good fortune Bishop Fonseca, who had so persistently opposed Columbus, Balboa, and Cortés, warmly seconded this enterprise. Without definitely fixing on a route, Magalhães offered to take a Spanish flotilla to the Moluccas by a route different from that used by the Portuguese. The partners, having been joined by a rich merchant, offered to make the expedition at their private expense, as was the general custom; but Charles finally agreed to fit out a Government squadron, under the joint command of Magalhães and Faleiro, who were to receive important honors and privileges in case of success. There was the usual opposition and delay in preparing the ships, but all obstacles were overcome by the steady support of the king. The Portuguese court protested vigorously against the proposed expedition, as likely to infringe on its rights; and its envoys endeavored by every means to ruin the enterprise, even offering brilliant inducements to Magalhães and Faleiro to return to Portugal, which they very properly refused. The two partners frequently quarreled; and at length Charles, seeing the inconvenience of a divided command, ordered that Faleiro should remain at Seville to fit out a second expedition. This and the spiteful report of one of the Portuguese envoys originated the frequently repeated statement that Faleiro went crazy at this time. The five ships and 265 men were placed under the full command of Magalhães; but the usual policy of curtailing authority was shown in giving extraordinary powers to Juan de Cartagena, one of the captains, with the title of *veedor*, or inspector. The squadron left San Lucar Sept. 20, 1519, touched at Madeira, thence sailed to the Brazilian coast, and on Dec. 13 entered the bay of Rio de Janeiro, where the Spaniards remained trading with the Indians until the 26th. From Jan. 10 to Feb. 7, 1520, they explored the Rio de la Plata, already made known by the expedition of Solis. Thence following the unknown coast of Patagonia, they reached (Mar. 31) the port of San Julian, where Magalhães decided to winter. Soon after leaving Madeira, Juan de Cartagena had attempted to assert his position by refusing to obey Magalhães, and had been promptly arrested by the latter, and placed in the custody of one of the ships' captains. The prospect of wintering on this bleak coast caused much discontent, and at length the captains and crews of three ships mutinied, releasing Cartagena, and announcing their intention of returning to Spain. By a prompt and unexpected attack Magalhães subdued the mutineers; one of their leaders was killed in the fight, another was executed, and Cartagena and a priest who had joined the revolt were condemned to be abandoned on the coast; thereafter the authority of Magalhães was never questioned openly. Soon after this one of the ships was lost in an attempted reconnoissance toward the south. The Spaniards had some slight encounters with the Indians, whom they described as a race of giants, perhaps from having seen an individual of unusual size. Leaving San Julian Aug. 24, they spent two months more at the Rio de Santa Cruz; and on Oct. 21 discovered the entrance to the strait which Magalhães called Todos los Santos, but which has since borne his name. Two ships sent to explore the inlet could find no end to it; and at length Magalhães, convinced that he had found the desired passage, ordered the whole squadron to sail through. As they often stopped for fishing or exploration, a month was occupied in the passage. During this time one of the ships became separated, the crew mutinied, and returned to Spain. With the remaining three vessels Magalhães reached the western end of the strait Nov. 28, and sailed out on the ocean, which he called the Pacific, on account of the pleasant weather prevailing there. From this point he kept at first well to the N., and later to the N. W. and W., the crew suffering greatly from insufficient and bad food and water, and from scurvy. A few islands were seen, among others those which Magalhães called the Ladrones or Robber islands, because the natives stole one of the ship's boats—a name still retained for the group. Seeking the Moluccas, but misinformed of their position, the Spaniards kept too far N., and on Mar. 16, 1521, discovered Samar, one of the Philippines. The King of Zebu, on a neighboring island, received them with great hospitality, even making an act of formal allegiance to Spain. The natives of the island of Mactan were hostile; Magalhães attacked them, and was defeated and killed, with eight of his men, Apr. 27, 1521. It was long before the Strait of Magellan became a practical highway; but this expedition gave to the world the first distinct knowledge of the Pacific, and the Spanish discovery of the Philippines led to their colonization soon after, and the development of the rich commerce, through Mexico, with the Asiatic islands.

Magallanes, mă̆a-gă̆al-yaa′nāz: a territory of Chili, including all the mainland and islands of the republic S. of lat. 47° to Cape Horn; bounded W. by the Pacific and E. by the main ridge of the Andes as far as lat. 52° S., beyond which the Chilian territory extends to the Atlantic, thus embracing the whole of the Strait of Magellan and most of the Fuegian archipelago. The area, as officially estimated, is 75,292 sq. miles, but as the eastern boundary-line is very imperfectly known, this is to some extent a matter of conjecture. The whole region is mountainous, and the coast is broken by a multitude of inlets, channels, and fiords, resembling those of Norway. The almost numberless islands and peninsulas are fragments of greater or less size cut off by these channels, and partaking of the high and rocky character of the mainland; explorations are continually revealing new passages in this labyrinth, and it is often found that what was supposed to be a single island is in fact a conglomeration of several, while the supposed peninsulas may be really islands cut off by some undiscovered passage. The fiords penetrate far inland, with numerous ramifications. Nearly all these channels are very deep, and this adds to the danger of navigating them, owing to the difficulty of finding anchorage. The scenery of this region is extremely grand and varied, the rocks often rising perpendicularly to great heights, while in other places the mountains are clothed with dense pine-forests. Glaciers are numerous, some of them attaining the sea-level. The islands on the Magallanes coast were nearly all named by English explorers. The line begins at the N. with the Wellington group, in which the principal mass is Wellington island, 140 miles long from N. to S., and separated from the mainland by a channel which in parts is hardly 300 feet wide; it is surrounded by a multitude of smaller islands and rocks. South of this is the Madre de Dios archipelago, then Queen Adelaide island, separated by a channel which leads to the Strait of MAGELLAN (*q. v.*), the latter cutting off the group known as TIERRA DEL FUEGO (*q. v.*). Small islands to the S. of Tierra del Fuego are the most southerly outlying fragments of South America, Horn island, the extreme southerly rock, being the so-called Cape Horn. The southernmost point of the continent is Cape Froward on the Magellan Strait. The interior of Magallanes, so far as known, has little land fitted for agriculture, but portions can be used for pasturage; small lakes and peat-marshes are numerous. The climate is damp and stormy, snow-storms being frequent in winter. Three or four thousand colonists are gathered in a few set-

tlements on the coasts, the most important being Punta Arenas on the Strait of Magellan. A coal mine and gold-washings are worked in the vicinity, and considerable herds of cattle are kept; pop. (1894) 1,500. For bibliography, see MAGELLAN, STRAIT OF. HERBERT H. SMITH.

Magazine-guns: small-arms which deliver projectiles in rapid succession, the cartridges being delivered automatically from a magazine or hopper.

The earliest magazine-guns had tubular magazines in which the cartridges were placed end to end, the magazine being situated in the butt-stock, as in the Spencer (Fig. 1), or

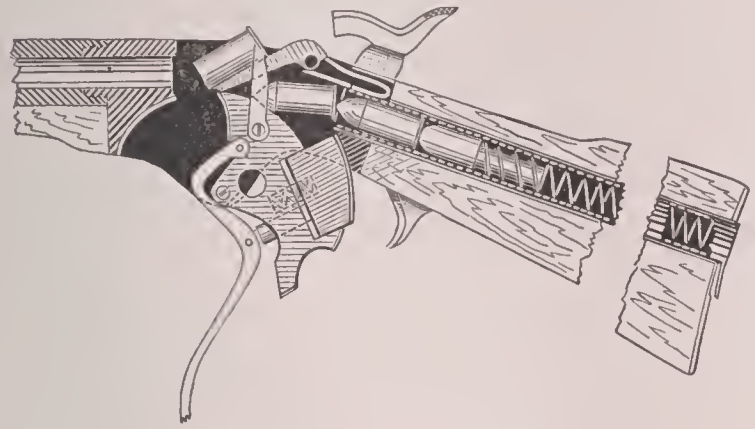

FIG. 1.—Spencer magazine-gun.

under the barrel, as in the Henry. These two guns were invented in the U. S., and were the earliest adopted for actual use in war. They were used during the civil war in the U. S.

From the Henry magazine-gun was developed the Winchester (Fig. 2), still in use for sporting purposes, and a magazine-gun of this nature, the Vetterlin, was soon after used in Switzerland.

Though the tubular magazine is still used in one or two countries, the approved modern military magazine is of entirely different type. It is a "box magazine," so called, in which the cartridges are placed side by side instead of end to end, thus making a magazine of compact and convenient form which can be rapidly refilled when empty, or which can be readily detached from the gun and replaced.

Out of nearly forty guns presented for trial in 1882 before the U. S. Magazine-gun Board there were only two systems of box magazine, the Lee and the Livermore-Russell, while in 1892, out of about fifty guns presented, all but two or three were of the box magazine type. These and all later box magazines are more or less modifications of the Lee or of the Livermore-Russell system.

FIG. 2.—Sectional cut of Winchester rifle.

With the tubular magazines the operation of filling was generally slow and tedious, as the cartridges had to be pushed in one at a time, endwise; so that magazines of such form were practically useful only as a reserve, for being once emptied they were no better than single-loaders, unless

FIG. 3.—Lee magazine-gun.

time was allowed for refilling. With box magazines, however, the operation of refilling or replacing the magazine is so rapid that it is not necessary to keep a large reserve of cartridges in the magazine. The accepted form of breech mechanism for military magazine-guns is the bolt system, the box magazine being so placed as to feed through the breech-housing into the "receiver"—the space just in rear of the barrel and in front of the bolt, when the bolt is drawn back.

The Lee gun (Figs. 3 and 4) had a detachable magazine holding five cartridges, arranged side by side like the fingers of the hand. The magazine consisted of a box, which was pushed up from below through a slot under the bolt and just in rear of the barrel, feeding the cartridges up from below by means of a spring, so that they were caught successively by the bolt and pushed forward into the cartridge-chamber. A number of these magazines, already filled, were carried on the waist-belt, so that when the magazine on the gun was emptied it could be replaced by a full one. Each magazine was provided with a spring and a cartridge-pusher or "follower."

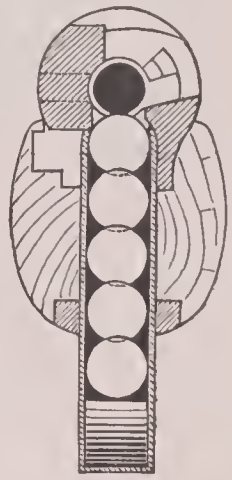

FIG. 4.—Section of Lee gun and magazine.

The Livermore-Russell gun had a fixed magazine extending downward just in rear of the barrel, as in the Lee, but placed at the side instead of underneath; and it was arranged to be rapidly refilled, when emptied, without removing it from the gun. A "follower," moved by a spring below, forced up the cartridges to the receiver. An outside mouth at the top of the magazine allowed cartridges to be pushed in from above; a spring gate at this filling-mouth admitting cartridges, but preventing their exit through this mouth, and guiding them sidewise to the "receiver." This magazine could be filled by inserting cartridges one at a time, but the special method adopted for rapidly refilling the magazine was the use of a cartridge-holder or magazine-filler, from which, when placed

FIG. 5.—Gun used in British service.

over the mouth of the magazine, all the cartridges could be pushed together into the magazine.

In the gun adopted for the British service (Fig. 5) a Lee detachable magazine holding ten cartridges is used.

The Schulhoff magazine (Fig. 6) consists of a drum placed under the receiver, the cartridges being inserted through a mouth at the side and forced round by a revolving plate

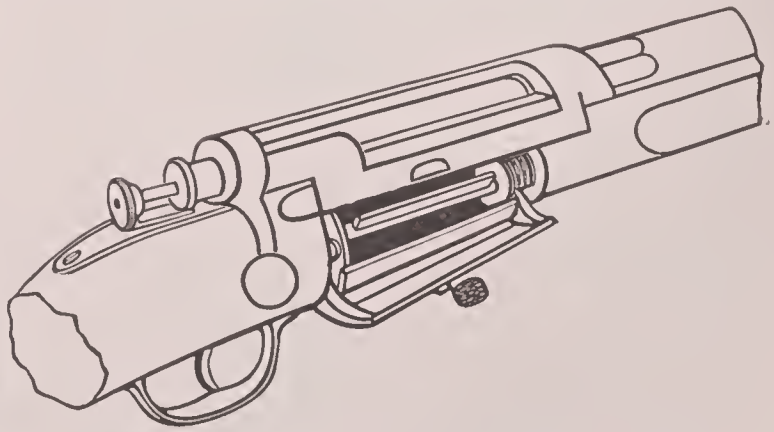

FIG. 6.—Schulhoff magazine-gun (Austrian invention).

until presented at the bottom of the receiver. This magazine, holding nine cartridges, could be filled by dropping in loose cartridges, or by using the original form of magazine-filler described above. Opening the lid of the filling-mouth turns back the revolving plate or "follower," compressing the follower-spring and leaving the way clear for the cartridges.

In the Mauser system (Fig. 7) the cartridge-holder, or clip, consists merely of a strip of metal curved at its edges to enfold the flanged or cannelured heads of the cartridges. The magazine is placed centrally under the receiver, and

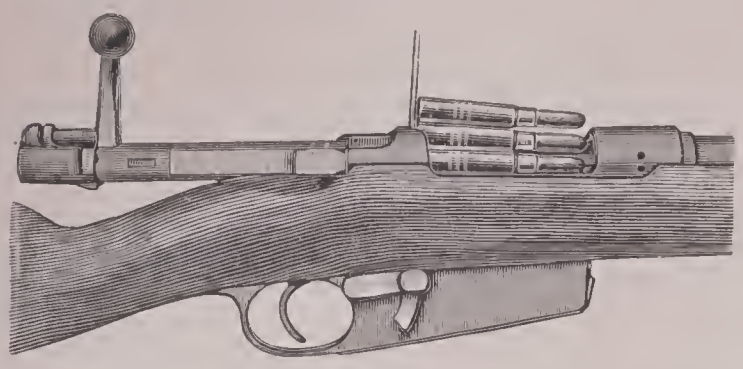

Fig. 7.—Mauser gun.

the cartridges are forced from the clip into the magazine from above. This system has been adopted by Belgium, Spain, Sweden, Turkey, and the Argentine Republic; and Switzerland has adopted the Schmidt system, which uses a magazine-filler resembling the old form.

Another fixed magazine, intended to be filled by pushing in cartridges from a clip or magazine-filler, is the Krag-Jorgensen. This feeds into the side of the receiver, but the

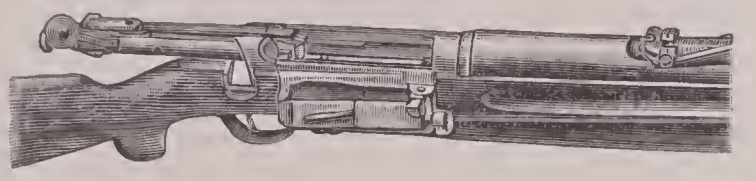

Fig. 8.—Krag-Jorgensen gun (Norway and U. S. services).

magazine, instead of projecting downward, is bent to extend under the bottom of the receiver to the opposite side, where there is a mouth for the insertion of cartridges. This mouth is closed by a lid which in opening withdraws the

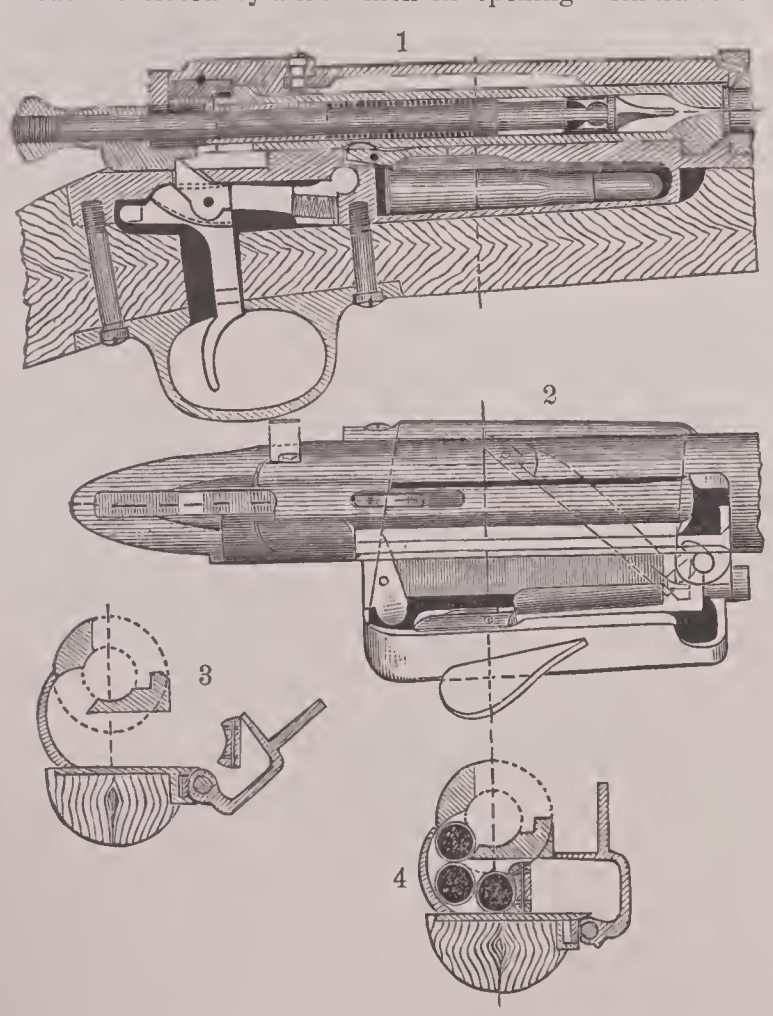

Fig. 9.—U. S. magazine-rifle (Krag-Jorgensen): 1, longitudinal section of breech and magazine mechanism in firing position; 2, plan view, with bolt removed, of receiver and magazine—gate open, ready for insertion of cartridges; 3, cross-section, corresponding to 2; 4, cross-section of receiver and magazine, with latter partly full.

magazine-spring and cartridge-follower, allowing the cartridges to be dropped in without obstruction. In the Danish form of this gun the lid is hinged at the front, so that in opening it swings out and forward; but in the forms adopted by Norway and the U. S. this lid is hinged at the bottom, so that in opening it swings out and downward. Fig. 8 gives the general view of this gun, and Fig. 9 plan and sections.

A special peculiarity of the Mannlicher magazine (Fig. 10) is that the clips in which cartridges are packed, are inserted

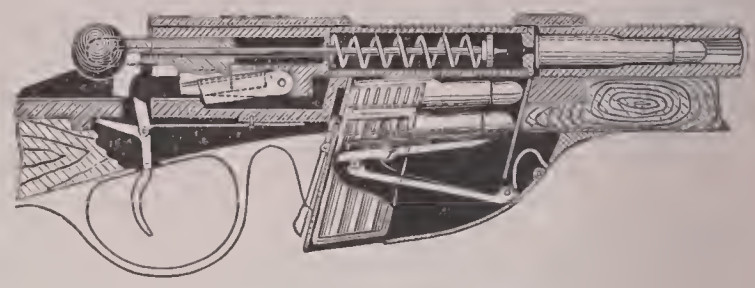

Fig. 10.—Mannlicher gun (Austrian).

with the cartridges into the magazine cavity, so that the clip forms one of the working parts of the magazine. Unlike the detachable magazine proper, the Mannlicher clip (Fig. 11) does not contain in itself the spring and cartridge-follower, these being fixed in the magazine cavity on the gun, and made to push the cartridges up through the clip and feed them into the receiver. When the cartridges are all fed out of the magazine, the clip falls from the bottom and a new full clip is inserted. Fig. 12 shows the form of Mannlicher magazine adopted in Germany. Magazines of the Mannlicher type have been adopted in Austria, Bulgaria, Chili, France, Holland, Mexico, and Roumania.

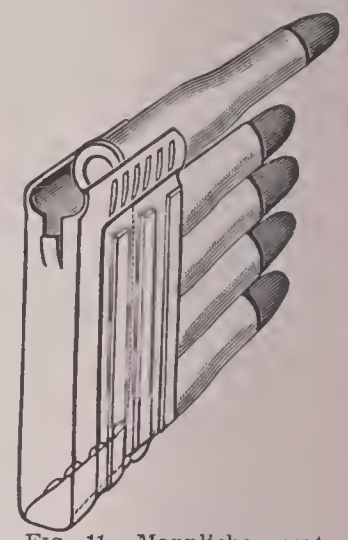

Fig. 11.—Mannlicher cartridge-clip.

The use of box magazines has been greatly facilitated by the introduction of cartridges having shells with grooves or cannelured heads in place of the flanged heads of the older cartridges, which had to overlap in the magazine to prevent their catching. The new form, illustrated in the German Mannlicher,

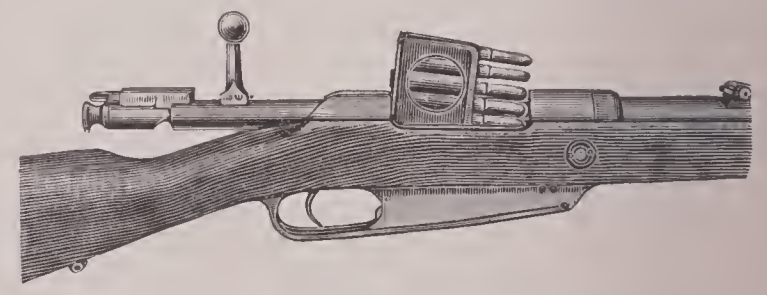

Fig. 12.—Mannlicher gun (German form).

allows the cartridges to be arranged symmetrically in the clip, so that it can be placed either way up in the magazine. The clip of the old form used in the Austrian Mannlicher is shown in Fig. 11.

Most of the bolts used in the breech mechanism of magazine-arms have been the ordinary sliding and turning bolts —of the general type of the German needle-gun as improved in the Mauser single-fire gun and other well-known bolts— but the Austrian Mannlicher rifle illustrates a form in which the bolt is moved by the direct forward and back action of the hand, the object of this system being to increase the rapidity of manipulation of the arm. The Swiss and Mexican guns also illustrate this system of bolt action, and they have adjustments for firing the gun automatically on closing the bolt.

The Freddi recoil rifle is an automatic magazine-gun in which the barrel is made to slip to the rear in the stock, under the action of the discharge, and actuate mechanism for withdrawing the bolt and closing it again, at the same time forcing in a new cartridge in place of the empty shell ejected. With the Freddi gun continuous fire can be maintained by keeping the finger on the trigger until the magazine is exhausted.

For sporting purposes tubular magazines are still much used, especially those which are operated by slides in place of the levers of older types. Two forms of this class are

popular on shotguns and even on rifles. The first, illustrated by the Spencer repeating shotgun, the earliest gun acting on this principle, has a handle operated by the left hand, sliding along the barrel underneath, and this method has been adopted by the Winchester and Colt arms companies. In the second form, the Burgess, the handle, which carries with it the trigger, slides along the small of the stock, being operated by the right hand, leaving the left hand in place to steady the barrel. A. H. Russell.

Magdala: a mountain-fortress of Abyssinia, situated on one of the three peaks of the spur which King Theodore defended against the British. (See Abyssinia.) The three peaks are called Fâla, Selassye, and Magdala. They rise about 9,000 feet, and are separated from each other by saddle-like depressions. On Apr. 13, 1868, the British took the fortress standing on the top of the steep peak, and Theodore committed suicide. Gen. Napier, commander-in-chief of the British expedition, was created Baron of Magdala.

Magdalena: the northernmost department of Colombia; bounded N. by the Caribbean Sea, E. by Venezuela, S. by Santander, and W. by the Magdalena river, separating it from Bolivia; area, including the Goajira Peninsula (see Goajira), 26,900 sq. miles. It was formed from the old provinces of Rio Hacha, Santa Marta Valle-Dupar, and part of Ocaña; Goajira was attached to it for administrative purposes in 1871, but is still claimed by Venezuela. A branch of the Eastern Cordillera stretches northward along the eastern frontier, with the local names of Sierra de Motilones and Sierra de Valle-Dupar; and in the northern part near the sea there is an entirely isolated group of mountains, including the Sierra Nevada de Santa Marta, 17,018 feet high. Surrounding this group and occupying all the central and western portions of the department are low plains partly covered with forest and partly with extensive grassy stretches or llanos; large portions of them are swampy, and those properly belonging to the Magdalena delta are subject to annual floods; they contain numerous lakes and several large rivers which flow to the Magdalena. Agriculture (cacao, coffee, sugar, maize, etc.) and grazing are the only important industries, though the department is said to be rich in minerals. The population is in a backward state, and hardly a third of the territory is inhabited. Pop. (estimated 1890) 125,000. Capital, Santa Marta.

Herbert H. Smith.

Magdalena: the most important river of Colombia, forming, with its branches, the principal fluvial system of Northwestern South America. The main river is about 1,050 miles long, and lies between the Central and Eastern Cordilleras of the Colombian Andes. It rises where these chains join, near lat. 2° S., in a high *paramo*, close to streams which flow to the Pacific, to the Cauca, and to the Caqueta, a branch of the Amazon. The general course is from S. to N. The upper portion is a series of falls, rapids, and narrow defiles, continued, with short interruption, to Neiva, about 300 miles; and far below that the Magdalena has the character of a highland river, flowing between steep banks and often in narrow passes; just below the junction of the Bogotá (700 miles from the sea) the whole flood is crowded into a defile 400 feet broad, which has been bridged; and the *Angostura*, or Narrows of Carare, below Honda, is less than 600 feet broad, though the river here attains a depth of 150 feet during the floods. The last 500 miles lies in an alluvial plain, an unhealthful region, cut up by numerous channels, lakes, and swamps, and very thinly inhabited. The current of the river in this lower region is still very swift, and the navigation is difficult, owing to numerous shifting sandbars and islands. It finally discharges into the Caribbean Sea by two principal mouths. Seagoing vessels ascend to Barranquilla, at the parting of these mouths. Light-draught steamboats ascend to Honda, about 600 miles, in from ten to fifteen days. For a distance above Honda there is a dangerous series of rapids; beyond them small steamers have ascended with much trouble to Neiva, 200 miles farther, this stretch being known as the upper Magdalena. Notwithstanding its difficult navigation, the Magdalena is the main highway to the populous plateaus of Central Colombia, and must remain so until railways are built. Of the many affluents, the most important is the Cauca (*q. v.*). The whole area drained by the Magdalena river system is estimated at 96,000 sq. miles. See Crevaux, *Voyages dans l'Amérique du Sud* (1883); von Schenk, *Reisen in Antioquia* (in Petermann's *Mittheilungen*, 1883); Vergara y Velasco, *Geografía de Colombia*.

Herbert H. Smith.

Magdalene, or **Mary Magdalene**: a woman who stood by Jesus at the cross; was present when Joseph of Arimathea laid him in the sepulcher; came early on the first day of the week to the tomb and found it open; went to Peter and John, and saw the two angels sitting in the sepulcher when she returned with the apostles. Jesus himself appeared to her shortly after, and announced his approaching ascension. The derivation of her surname probably is from "Magdala," the name of a town of Galilee. She is gratuitously identified with the "woman who was a sinner" (Luke vii. 37). She is the "Mary called Magdalene, out of whom went seven devils" (Luke viii. 2).

Magdalene Islands: a group of islands in the Gulf of St. Lawrence, nine in number, formerly, with one exception, united into one and called Magdalene island. The group is 57 miles long by 14 broad, and is about 50 miles from Prince Edward Island and 60 from Newfoundland. They consist of steep cliffs of freestone rising 200 or 300 feet above the sea. Area, 156 sq. miles. Pop. about 5,000, mostly of French origin. Fishing is the chief occupation. The soil is good, but few crops are raised, and the domestic animals are poor. The climate is relatively cool in summer and mild in winter. In winter the islands are connected by ice so firm that ponies can be ridden over it. For about five months there is no communication with the outer world except by telegraph.

Mark W. Harrington.

Magdalla Red: See Naphthalene Colors.

Mag'deburg, Germ. pron. *măăkh'de-boorch*: city of Prussia, capital of the province of Saxony; on the Elbe; 72 miles by rail N. of Leipzig (see map of German Empire, ref. 3–F). It was founded in the tenth century by Otto the Great, and consists, besides its two suburbs, Neustadt and Sudenburg, of four parts—Altstadt and the Sternschantze on the left branch of the Elbe, the citadel on an island in the river, and Friedrichstadt on the right bank. Each of these parts is strongly fortified, and together they form a fortress of the first rank, making Magdeburg one of the strongest places in Europe. Most of the streets are crooked and narrow, but the houses are generally neat and substantial, and there are several fine buildings, among them a Gothic cathedral of the thirteenth century. There are many beautiful promenades, such as the Fürstenwald and the Friedrich-Wilhelms Garten. The manufactures comprise woolens, cotton, ribbons, leather, soap, and glass; the breweries and distilleries are very extensive. On account of its position on the Elbe and at the junction of four principal railway lines, Magdeburg is one of the commercial centers of Northern Germany. It has many benevolent institutions, and several good military, scientific, industrial, and commercial schools. During the Thirty Years' war it was besieged by Wallenstein (1629), and in 1631 was captured by Tilly, who sacked and burned the city and massacred many thousands of the inhabitants. Pop. (1900) 229,663. Revised by W. B. Shaw.

Magdeburg Centuries: See Centuries of Magdeburg.

Magee, William Connor, D. D.: bishop; b. at Cork, Ireland, in 1821; studied at Trinity College, Dublin; went to Malaga, Spain, for his health, 1846, remaining there two years; obtained the curacy of St. Saviour's, Bath, 1848; became incumbent of the Octagon chapel, Bath, 1850; took a leading part in organizing the Church Defense Society in opposition to the Liberation Society; became minister of Quebec chapel, London, 1860; rector of Inniskillen 1861; dean of Cork 1864, and shortly afterward dean of the Chapel Royal, Dublin; was Donellan lecturer in Dublin University 1865–66, and was appointed Bishop of Peterborough 1868. He was translated to the archiepiscopal see of York in 1887. D. in London, May 5, 1891. He acquired a great reputation for eloquence, preached on public occasions in various parts of Great Britain, and took an active part in the debates of the House of Lords, especially in opposition to the disestablishment of the Irish Church. Many of his sermons have been published, both in Great Britain and in the U. S. Revised by W. S. Perry.

Magellan, Ferdinand: See Magalhães, Fernão, de.

Magellan (Span. Magallanes), Strait of: a channel between the southern end of the South American continent and the islands of Tierra del Fuego, connecting the South Atlantic and Pacific Oceans. From the Atlantic end (lat. 52° 28′ S.) it runs W., then S. W. and S. to lat. 53° 54′ S., and from Cape Froward keeps a nearly straight N. W. course to the Pacific, which it reaches in lat. 52° 36′ S.; the extreme length is about 370 miles, and the width varies from over 20

miles to hardly 2½ miles. There are few obstructions from rocks and islands. It is similar in character to the numerous channels and fiords along the coast of Southern Chili (see MAGALLANES); like them it is bordered by high and often precipitous and imposing lands, and has numerous branches, some of which end in a *cul-de-sac*, while others form channels between the Fuegian islands; some of the latter offer shorter routes to the Pacific, but are obstructed by rocks. The strait lies entirely within Chilian territory, but is a free waterway; its only port of importance is Punta Arenas. The passage was discovered in 1520 by MAGALHÃES (*q. v.*), and has been celebrated from the voyages of Drake, Hawkins, Dumont d'Urville, Darwin, Fitzroy, and many others. At present it is much used by steamers, but its baffling winds, sudden gusts, currents, and high tides render it dangerous to sailing vessels; these generally take the longer passage around Cape Horn, or through the short Strait of Lemaire (discovered in 1615). See Darwin, *Voyage of a Naturalist*, and the reports of Fitzroy and King; *Information Relating to Magellan Straits* (British hydrographic office); and Cunningham, *Natural History of the Straits of Magellan* (1878). HERBERT H. SMITH.

Magellanic Clouds: See NEBULÆ.

Magendie, mă'zhăn'dĕe', FRANÇOIS: physiologist and physician; b. at Bordeaux, France, Oct. 15, 1783; received a medical education in Paris; was admitted to the Academy of Sciences 1819; became Professor of Anatomy in the Collège de France 1831; president of the consulting committee on public health 1848. D. in Paris, Oct. 7, 1855. He practiced vivisection extensively, and in far less humane methods than are now in use; but by this and other means of observation he made numerous and highly important discoveries in physiology, especially in that of the nervous system, and also in other departments of medical science. Among his works are *Formulaire* (1821) for new medicines; *Éléments de Physiologie* (1816–17); *Leçons sur les Phénomènes physiques de la Vie* (1836–42); *Leçons sur les Fonctions et les Maladies du Système nerveux* (1839); and *Leçons sur le Sang* (1839), which have been several times reprinted, and were translated into German. He founded and for ten years edited the *Journal de la Physiologie Expérimentale.*

Magen'ta: town; in the province of Milan, Northern Italy; about 18 miles W. of the city of Milan, in a fertile district watered by the Naviglio Grande (see map of Italy, ref. 3–C). Its topographic position has made it the theater of many battles, the last and most memorable being that known as the battle of Magenta, fought on June 4, 1859, in which the Austrians were defeated by the Italians and French, and thus forced to evacuate Lombardy. Napoleon III. gave the title of Duke of Magenta to Marshal MacMahon, afterward president of the French republic. Pop. 5,570.

Ma'gi [= Lat., plur. of *Ma'gus* = Gr. Μάγος, one of a Median tribe, or perhaps of the priestly class. Cf. MAGIC]: the sacerdotal caste of ancient Media, and priests of Persia in antiquity. Originally the name was a tribal one, designating a single division of the race of the Medes. (Cf. Herodotus 1, 101; Ammianus Marcellinus 23, 6, 32.) The term Magian, *Magu-*, occurs several times in the Old Persian inscriptions, in connection with the usurpation of Bardiya, the false Smerdis. The form of the appellative is found once or twice in the *Avesta* as *Mazu-*. The Greeks called this priestly sect Μάγοι; the English version of the Bible (Matt. ii. 1) renders Μάγοι by "wise men." The origin and meaning of *Mozu-*, *Magu-*, Μάγος, however, are uncertain. The familiar though unfavorable association of the name from earliest times with "magic," black arts, and astrology seems to have arisen from the peculiar tenets and rites of the Magians, and from their dreaded power as priests.

The Magi presumably became priests of Persia proper through the Median supremacy over the country. This religious supremacy continued even though the Median yoke was thrown off at the time of Cyrus the Great. One of the reasons probably for the hatred felt by the Persians at the Magian usurpation of the government by the false Smerdis in the time of Darius Hystaspes was the fear that this move might lead to a restoration of the Median sway. This opposition to the Magians (cf. *Old Persian Inscriptions*, Bh. 1, 63–64; 4, 81) and the resulting "massacre of the Magi," (Μαγοφόνια, Herodotus 3, 79), was presumably political and anti-clerical rather than religious. Regarding the connection of Zoroaster's name in antiquity with the Magi, it may be added that although the scene of his activity was Bactria (see ZOROASTER) there are nevertheless strong grounds for believing that he was originally a Magian from Media. As he was a reformer, however, his religion must have differed somewhat from the older faith. On the question of the relation between the Zoroastrian and the Magian faiths, see ZOROASTER. The name of the Magi, furthermore, is sometimes coupled with the Babylonians and Chaldæans, as in the Bible, Jer. xxxix. 3, 13: Rab-Mag—i. e. chief of the Magi. In this connection their name is commonly associated with Chaldæan magic.

The general religious tenets of the Magi priests may be gathered from Herodotus 1, 140, Plutarch, *Is. et. Os.* 47, from other classical writers, and by inference from the *Avesta* and from passages in the *Old Persian Inscriptions*. The Magian faith was characterized by a belief in the principles of dualism, Ormazd and Ahriman; by a belief in the resurrection and a future life; by certain peculiar rites and practices, such as exposing the dead to be torn by dogs and birds; and by religious scruples against taking animal life, with the exception of destroying noxious animals, which was regarded as a meritorious and sacred duty.

The fame of the Magi for learning and for the power of divination was widespread in antiquity. It was in this sense that the Magi who came to worship at the manger in Bethlehem (Matt. ii. 1–12) are regarded as the wise men from the East. Later tradition represents these Magians as three kings, Gaspar, Melchior, and Balthasar, coming from different places in Persia. The supposed remains of their hallowed bodies, it is claimed, were removed from Constantinople to Milan, and thence in A. D. 1162 to a shrine in the cathedral at Cologne, where they are still preserved as sacred relics. A. V. WILLIAMS JACKSON.

Maggots: See DIPTERA.

Magic [from Lat. *ma'gice* = Gr. μαγική (sc. τέχνη, art), magic, liter., fem. of μαγικός, pertaining to the Magi, hence (since these were thought to possess magical powers) magical]: the pretended art of working wonders by supernatural power. Though popularly derived from the arts of the Magi, or Old Persian priesthood, the belief in magic is inherent in man, and history presents no instance of any race at any time in which pretenders to it have not existed. It is evident that before exact science was founded, yet while students were unwearied in searching into the mysteries of mind and of matter, and of the self-development of a First Cause, and while they were led astray at every step by the wonderful in nature, it was impossible not to believe that there existed some primal clew by which all knowledge, both of the sensible and the spiritual world, could be gained and all power attained. All that they knew indicated the existence of such a science of sciences and power of powers. As all that was positive and intelligible could be represented by numbers or expressed geometrically, it was natural enough to assume that the mysterious and spiritual was subject to the same laws. Hence a belief in the occult power of numerals and proportions, derived from the East, and taught by Pythagoras, Plato, and their followers. The heavenly bodies had certain influences, as of the moon on the tides, the sun in giving light, heat, and health. This was exaggerated as a matter of course, until it was believed that all the planets in their conjunctions had peculiar effects on individuals. The study of astronomy was closely allied to that of mathematics, and in this spirit they mutually became more and more magical. Such methods applied to natural philosophy naturally made chemical investigation reduce matter to a few elements and to a *prima materia* which, once apprehended, could enable man to develop or make any later forms, such as gold or diamonds, an elixir of immortality, and a universal panacea, just as the first principle in astronomy, also divine, was believed to give the illimitable godlike knowledge of all that the stars governed. The next step was to bring chemical principles into harmony with astrology and the lore of God and spirits. So H. Cornelius Agrippa, whose work on occult philosophy (which he afterward declared was nonsense) was the cornerstone of magic in the sixteenth century, declares: "There are four elements without the perfect knowledge whereof we can effect nothing in magick. Now, each of them is threefold, that so the number of 4 may make up the number of 12; and by passing by the number of 7 into the number of 10, there may be a progress to the Supreme Unity upon which all virtue and wonderful operations depend." As spirits were innumerable, they were classified, especially by Paracelsus,

according to this chemico-astrologic theosophic philosophy. At the base of all was the fifth element, "the divine astral spirit," the *intelligentia abscondita* of Vaughan, the transeendental principle or power, "that spirit which God himself breathed into man, and by which man is united again to God." The powers of this spirit, aeeording to Agrippa, "are full of wonders and mysteries, and are operative as in Magick Naturall, so Divine. For from these proceed the bindings, loosings, and transmutations of *all* things, the knowing and foretelling of things to eome, the driving forth of evill and the gaining of good spirits." Objectively, this subtle spirit streamed through all nature as the spirit or very being of stars, mountains, rivers, trees, fountains, flowers, leaves, gems, metals, herbs, establishing between them wonderful affinities or a grand *signatura rerum*, bestowing on them oceult properties, either medieal or magieal, and impressing on them by divine art in their eurves, lines, colors, or spots a seeret alphabet and written language. The stars in the heavens considered as points, when eonnected, made Hebrew letters, "these having," says Agrippa, "the greatest similitude with celestials and the world." This poetic and picturesque prineiple of magic, which made forests, fountains, and gardens, with the stars above, a literal library, was curiously set forth by Jacques Gaffarel in the *Curiositez inouyes* (Rouen, 1632). *Subjectively*, this astral light becomes in man the *intellectus illustratus*, or magic perceptive power, which, united to a transcendent will proceeding from illumination or penance, enabled him to grasp all the mysteries and power hidden in the divine life of nature. As certain gems, metals, etc., were virtually the same with certain planets or certain divine numbers or times (time itself being a form of divinity), all of them consisting of matter (i. e. a lower form of God), impressed by the same astral element, it followed that these gems especially, when marked at fit times with signs of the proper planets, spirits, names of God, etc., became amulets or charms which protected the bearer from disease, evil spirits, or death. Hence the endless charms, talismans, and written spells founded on the theo-magic philosophy. From learning to know, and from conferring with the spirits of nature by means of prayer, will, and communion with God, there was but a step to eommune with the dead and call up their spirits by the art of necromancy, which was professed from the earliest times in the East. Good or harmless spirits were drawn by pleasant charms and ceremonies; the dark and evil powers were won by horrors, by midnight incantations among graves, with such disgusting spells as we read of in *Macbeth*. See ANIMISM.

When the *Tarot*, or infinite Spirit of God, or God in nature, was supposed to be in all things, with a reciprocal appreciative spirit in man, it was soon believed that inspired books eoncealed deep mysteries. This was the secret of the Cabbala, or "the mystical explanation of the Bible, the art of finding sense by the decomposition of words, and that of working miraeles by virtue of these words pronounced in a particular way." This kind of magic probably existed in Egypt and India, and it was known to Pythagoras. The rabbis by means of it deduced universal categories of the spirit-world, which they classified aecording to the elements, the art of governing them by spells, that of making talismans, and all manner of magic, great and small. The names of God properly pronounced were the highest spells; among these *Agla* was greatly revered. The Cabbala was much studied in the fifteenth and sixteenth centuries in Europe. Among its greatest expounders were Akiba, Philo, Avicenna, Raymond Lullius, Mirandola, Paracelsus, Reuehlin, H. More, Robert Fludd, Postel, and Knorr von Rosenroth. The Rosierucians, an imaginary sect of magicians, in whose name many books were written, were an offshoot of the Cabbala, allied to the peculiar views of the alchemists and Christian mystics.

As magic embraeed a mutual harmony of all that exists, it ineluded good and evil. Henee white or holy magic, and also black magic or sorcery, which works by the aid of demons. Soreery was closely conneeted with witchcraft. Celestial magic was founded on prayer and communion with God or mysticism. Natural magic is the art of working wonders simply by scienee—e. g. by mechanics or ehemistry. Ceremonial magic is chiefly eabbalistical, and treats of raising spirits, exorcising, finding treasures, and eonseerating talismans by reeiting sacred formulas when in cireles drawn at eertain hours with the aid of peculiar perfumes. Works on this subject are innumerable. As a specimen the reader may consult the *Heptameron, or Magical Elements* of Peter di Abano, or the *Magus* of Franeis Barrett (London, 1824). Soreery involved many horrible iniquities. Aeeording to Philo and Eliphas Levi, some of the old Hebrew works of magie are enough to cause their writers to be execrated by all the world. Magic was a passion—we might say the prineipal study—in Egypt and Assyria; several papyri and eylinders in the British Museum treat of it. In Alexandria, from the second to the fourth century, where the relics of old Egypt combined with Neoplatonic doctrines and many strange seets, magic revived, as it did subsequently at Cairo in the ninth century under the Arabs. The Knights Templar are believed to have bronght Oriental magie to the West. The Renaissanee, as well as the Reformation, had its sehool of devotees to oeeult philosophy; and sinee the doetrine is essentially religious, the movement of Luther, which made religious diseussion eommon to all, also popularized the study of magie, and books up to that time kept in Latin for the learned were now translated, so that everybody eould raise the devil in his native tongue. The last grand revival of such studies took plaee with that of Masonry, Illumination, and the extraordinary fancies of the eighteenth century. The lives of Cagliostro and Casanova, the works of Pierre le Brun, of Lasearis, the Count de Saint-Germain, and the Marquis d'Argens throw mueh light on the follies of this period. As astrology and the Cabbala lost ground in popular faith, and witches and devils grew dim, magic took refuge in mesmerism, and more reeently in its nearly related Spiritualism. As of old, its professors did not disdain to aid their sacred lore with marvels which modern scienee claims were mere juggling, as many of the miracles of modern magieians from their very humble and useless nature appear to be prineipally based on "hankey-pankey." (See JUGGLERS AND JUGGLERY.) Among the immense number of works on magie are *Histoire et Traité des Sciences occultes*, by Count de Résie (Paris, 1857); *Histoire du Merveilleux dans les Temps modernes*, by Louis Figuier (Paris, 1860); *Réalité de la Magie*, by Collin de Plancy; *Von der alten und neuen Magie, Ursprung, Idee, Umfang und Geschichte*, by Horst (Mentz, 1820); *Curiosités des Sciences occultes*, by the Bibliophile Jacob (Paul Lacroix); *Dialogus in Magica Arte*, by Symphorien Champier (Lyons, 1506); *Entretiens du Comte de Gabalis, etc.*, by de Villars (Abbé de Montfaucon); *System of Magic*, by Defoe; the works of Delrio; *La Magie*, by L. F. Alfred Maury; *La Magie au XIX^e^ Siècle*, by the Chevalier Gougenot; the *Clavis Solomonis*, by Rabbi Hawa (1714); *Trois Livres de Charmes*, by du Vair; *Bibliotheca Magica*, by Johann Geo. Th. Grässe (Leipzig, 1843); *Arcanes de la Vie future, Magie magnétique*, and other works, by Cahognet (Paris, 1848–56); *Sammlung der merkwürdigsten Visionen, etc.*, by Carl von Eckhartshausen (Munich, 1792); *Le Diable Rouge* (Paris, 1843); *Das Siebente Buch Mosis* (the eommon hand-book of magic in Germany); *History of the Supernatural*, by William Howitt (1863); Fabart, *Histoire philosophique et politique de l'occulte magie, etc.* (1885); J. Bodinus, *Demonomania* (Paris, 1501); Johannis Macarei, *Abraxas: a Treatise on Talismans*, by Jean Chifflet (Antwerp, 1657); Johann Wierus, *De Præstigiis* (Frankfort-on-the-Main, 1566).

CHARLES G. LELAND.

Magic Lantern: an optical contrivance for producing enlarged images of transparent or translueent objects, usually paintings, drawings, or photographs on glass. It is the device of Father Athanasius Kircher, a German Jesuit of the seventeenth eentury. Optically considered, it eonsists of two distinet parts. an illuminating apparatus and a magnifying apparatus. The illuminating apparatus embraees a source of light (in the original construetion a lamp) inclosed in a tightly shutting box or chamber opening on the side, a condensing lens some inches in diameter adapted to an opening in the front of the box, and a eoncave mirror behind the light within and opposite to the lens. Properly, this is the lantern; the magnifying apparatus is external to it, and eonsists of one or more converging lenses fixed in a sliding tube. Fig. 1 shows the entire apparatus in section. M is the mirror, here shown as attached to the oil-chamber of the lamp, whieh is secured to the baek of the lantern by means of bracket-hooks; L is the condensing lens; *a b* is a figure upon a glass plate, supported by a frame which slides in the grooves or ways shown in the diagram; *m* is the magnifying system of lenses; and A B is the magnified image as received upon a plane white surface, or screen. In order to give distinetness to this image, the tube carrying the lenses *m* is

drawn out or pushed in till the true focus is found. The mirror M, in this design, is parabolic, and is supposed to be perforated, or notched, at the top to accommodate the lamp-chimney; but in the simpler forms it is of spherical curva-

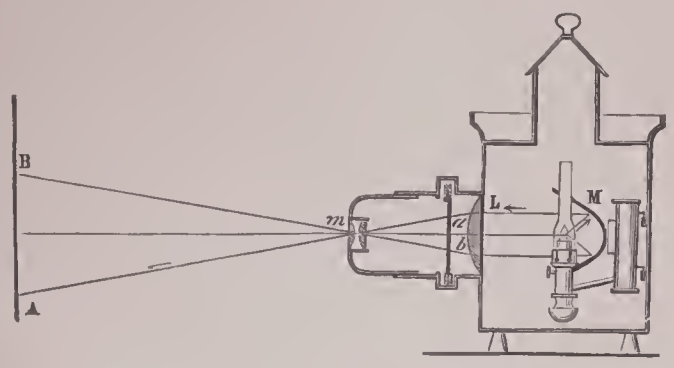

Fig. 1.—The magic lantern.

ture, and is entirely behind the lamp. In order to exhibit the optical effects of this apparatus the room must be darkened; and inasmuch as there must be provision for the admission of air to the lantern, and for the escape of the gaseous products of combustion, care must be taken that the apertures so provided are screened against the entrance of light into the apartment.

For a very long time after its invention, the magic lantern was employed for no more important purpose than to surprise or to amuse. It was in high esteem with professional conjurers and jugglers, who found in it a means of producing startling effects. A construction much employed by them was the phantasmagoria lantern, represented in Fig. 2. This is a lantern supported by a stand on wheels, and designed to run upon a horizontal table. One of these wheels carries a pulley, R, which is connected by a band with another pulley, R′, higher up. On the axis of the pulley R′ is a cam, against which one extremity of a lever, *l*, rests, the other extremity acting on a sliding tube carrying the magnifying lenses within the larger tube, T. The proportions of the cam and lever are such that if, when the magnifiers are at the nearest practicable approach to the object, and the size of the image is therefore a maximum, the lantern be placed at the distance from the screen which gives a distinct image, then on rolling the apparatus toward the screen the magnifier will be drawn backward at precisely the rate necessary to preserve the distinctness of the image, while this will rapidly diminish in size till it vanishes in a point. In preparing designs for phantasmagorial displays, the ground is made absolutely black, so that no light may pass except that which exhibits the figures. The lantern is also placed behind the screen, so as to be invisible to the spectators of the display, the screen being of dampened or varnished muslin, and translucent. Under these circumstances, the sudden increase of size of the image irresistibly creates the impression that the object represented is rapidly approaching the observer; and the sudden diminution of size of the same image causes the object to seem to recede. It contributes to the force of these impressions that, by means of another simple contrivance, not here represented, the aperture of the lantern is gradually closed as the image diminishes in size, and gradually reopened as it again increases, so as to preserve a harmony, such as we see in nature, between the brightness of the image and the imagined distance. When the image has dwindled to so minute a point as to be unrecognizable, the exhibitor often avails himself of the opportunity to change the slider in the lantern; so that when the object, after apparently receding into the distance, returns again, it appears with a new and often formidable aspect. Thus a being of angelic beauty may seem to fade away almost to vanishing, and then come suddenly rushing back in the character of a gorgon or a fiend.

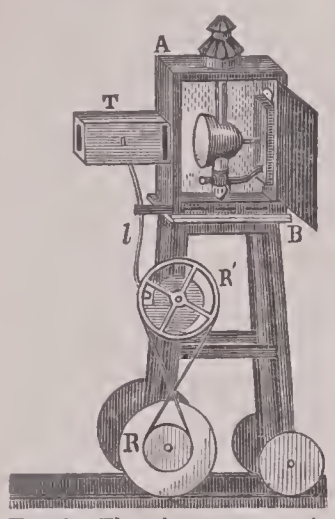

Fig. 2.—The phantasmagoria lantern.

The magic lantern has been greatly improved. Designs on glass of objects of every kind in nature and art are so expeditiously, accurately, and cheaply produced by means of photography as almost indefinitely to have increased its resources and to have made it an invaluable auxiliary to the teacher and public lecturer. The substitution also of the calcium light, or, better still, of the electric light, for the oil-lamp, as a source of illumination, has added immensely to the power and brilliancy of its displays. Both the mechanical and the optical arrangements have been carried to a high degree of perfection. See Lime-light.

A very popular use of the magic lantern is for the production of the optical illusions called "dissolving views." For these, two lanterns are necessary, placed either side by side or one above the other. They must be adjusted in position so as to have a common luminous field upon the screen. Each has a different object, and the two images when superposed to a great extent obliterate each other. A sliding or rotating stop placed before the lanterns is so constructed as, on being moved to left or right, to close the aperture of the one while it opens that of the other. At the mean position, both are half open and half closed; at either extreme position, one is wholly open and the other wholly closed. The movement of this stop therefore causes the images alternately to come out distinctly and to melt away. Advantage is taken of the moments when the lanterns are successively closed to change the objects, so that each dissolution is followed by the presentation of a new picture. When the calcium light is used, a stop is not necessary for the dissolving effect; but this is produced more simply by gradually and alternately shutting off and turning on the gases which feed the light in the lanterns severally. For this purpose a six-way cock is sometimes employed. A form originally introduced by B. G. Malden, of the Royal Polytechnic Institution, London, and called the "Malden tap," is represented in Fig. 3. The gases enter from the reservoirs through H and O; they pass to one of the lanterns through H^1 and O^1, and to the other through H^2 and O^2. When the lever is upright, as in the figure, the gas flows to both lanterns freely; when it is turned down to the right the supply to the left-hand lantern is cut off; when to the left, the supply to the right is cut off. A small cock at C allows a small quantity of hydrogen to flow constantly into either lantern, serving to prevent extinction when the light is cut off.

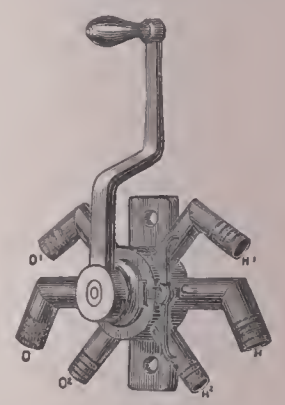

Fig. 3.—The Malden tap.

In the illustration of scientific subjects by means of lantern views, it is frequently desirable to present objects which can not be secured in a vertical position, as, for instance,

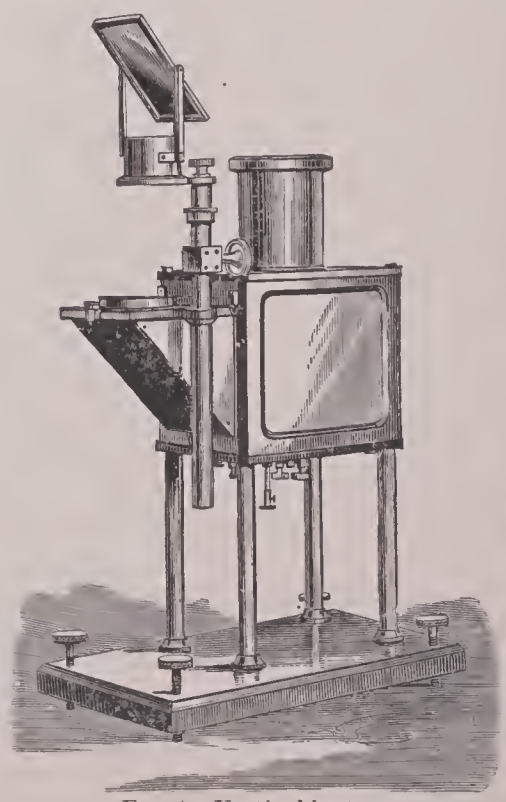

Fig. 4.—Vertical lantern.

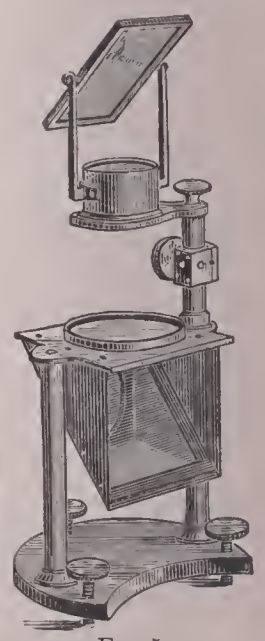

Fig. 5.

objects immersed in a liquid. This case may be provided for by removing the magnifying apparatus from the lantern, and placing before the condensing lenses a diagonal mirror mounted as in Fig. 5, by which the illuminating beam is

thrown vertically upward, passing through a horizontal stage of glass, intended to receive the objects. Immediately above this is fixed the magnifying apparatus, as represented; and above this still is a second diagonal mirror which restores

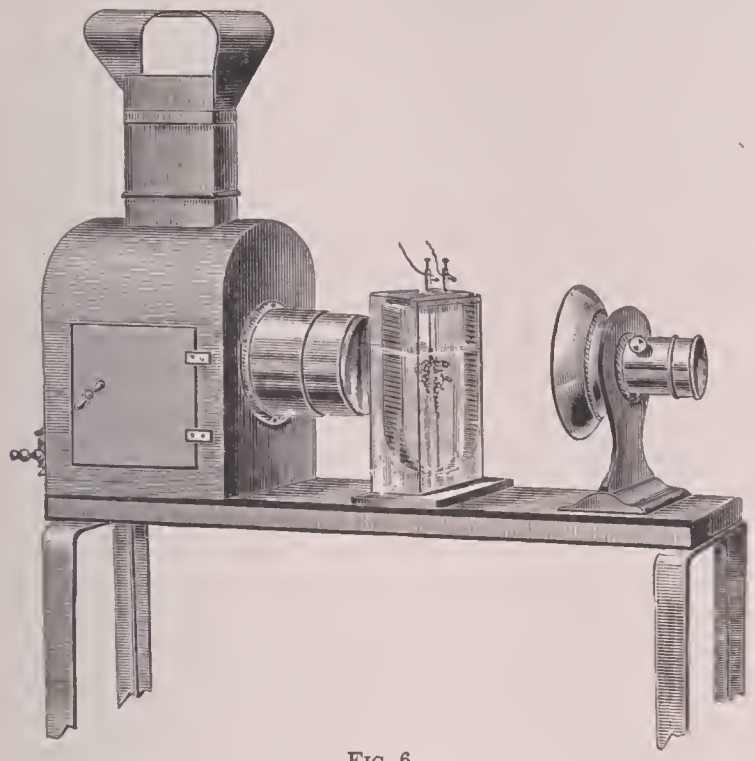

FIG. 6.

the beam to the horizontal direction. Prof. Henry Morton, of the Stevens Technological Institute, Hoboken, N. J., constructed a lantern which admits of being used either as a horizontal or vertical lantern at pleasure, the transformation being effected very expeditiously and easily. This is shown in Fig. 4, arranged as a vertical lantern. In lanterns for use in scientific demonstration, it is customary to mount the objective upon a separate stand leaving space between it and the condensing lens for the various pieces of apparatus used in the art of projection. Fig. 6 shows the typical arrangement of such an instrument. For details concerning the manipulation of the lantern, etc., see Dolbear, *The Art of Projection*; Wright *On Light*; and Hopkins, *Experimental Science*.

Revised by E. L. NICHOLS.

Magic Square: an arrangement of numbers from 1 up to 9, 16, 25, or any other square number in the form of a square, so that the sum of those contained in any straight line, horizontal, vertical, or diagonal, shall be the same. The most familiar form of magic square is that made with the nine digits, arranged as in the diagram. Here the digits are placed in a square, with three on each side. It will be seen that, in whatever way they are added, the sum of any three which lie in a straight line amounts to 15.

6	1	8
7	5	3
2	9	4

The following shows how a magic square with five numbers on a side may be formed: Write the five numbers 1, 6, 11, 16, 21, in five of the squares, putting 1 anywhere we please, 6 in the square two lines to the right, and one below from 1; then write in 11 at the same distance from 6, and so on with 16 and 21, but going back or up five lines when a number falls in lines outside of the diagram. Then fill in the numbers 2, 3, 4, 5 by continually counting two lines below and one to the right from 1. Start from 6, 11, etc., in the same way. The same system may be applied to squares of any prime number of sides.

S. NEWCOMB.

Magill, EDWARD HICKS, A. B., LL. D.: educator; b. at Solebury, Bucks co., Pa., Sept. 24, 1825; graduated at Brown University in 1852; was principal of the classical department of Providence High School 1852–59; sub-master Boston Public Latin School 1859–67; spent some time in foreign travel; was president of Swarthmore College from 1871 till 1889, when he became Professor of French Language and Literature in that institution. He is the author of *French Grammar*; *Introductory French Reader*; *French Prose and Poetry*; *Key to French Grammar*; *Reading French Grammar* (1892); and *Modern French Series* (begun 1892).

C. H. THURBER.

Magliabecchi, maăl-yaă-bek′keē, ANTONIO: bibliographer; b. at Florence, Oct. 28, 1633, of poor parents; followed the trade of goldsmith until forty years of age, but his eagerness to acquire book knowledge triumphed over all obstacles, and by diligent study he made himself one of the most learned men of his time. The librarian of Cardinal Leopold de Medici finally brought him to public notice, and he was appointed to take charge of the library of the Grand Duke of Tuscany. Though possessing but scanty means, he contrived by his frugal mode of life to gratify his absorbing passion for the collection of books, and amassed a library of over 30,000 volumes, including many works of great value. Many anecdotes illustrate his vast knowledge and the high esteem in which he was held by contemporary savants, but, with the exception of his correspondence and editorial work, he left no record of his extraordinary learning. On his death, which occurred at Florence, July 4, 1714, he bequeathed his library to the grand duke, and since 1859 it has formed a part of the National Library. A portion of his correspondence was published by Targioni in 1745, and many of his letters are given in Valery's *Correspondance de Mabillon et de Montfaucon avec l'Italie*.

F. M. COLBY.

Magna Charta, măg′na-kaar′ta [Lat., the Great Charter]: a charter of liberties originally granted by King John (A. D. 1215) to the clergy, barons, and freemen of England, and repeatedly confirmed by subsequent monarchs, and justly regarded as forming the most important part of the British Constitution. The tyrannical character and oppressive acts of King John, and his open violation of all law, aroused an opposition among the clergy and barons at an early period in his reign. This opposition, which at length became well organized and extensive, was headed and guided by Stephen de Langton, cardinal of the Roman Catholic Church and Archbishop of Canterbury, to whose wisdom, firmness, and patriotism the successful issue of the great struggle between the people of the realm and the crown was largely due. On Aug. 25, 1213, a council of the prelates and barons was held in London for the purpose of concerting measures by which the royal authority might be confined within legal bounds, and the rights and liberties of all estates in the kingdom might be secured and guaranteed. The contest which was thus openly begun lasted through the two succeeding years. On the one side were arrayed the freemen of England, the clergy, the barons, and the commons, united in one common cause and contending for rights which belonged to them all. On the other side was the king, standing almost alone, but using every artifice to divide and weaken his opponents. He applied for aid to Pope Innocent III., who, as a reward for his previous surrender of the English crown and reception of it again as a vassal of the papal see, openly sided with him, censured the barons, and ordered the archbishop to excommunicate them. He also endeavored to detach the clergy from their union with the laity by granting (Jan. 15, 1215) a special charter to the English Church. All these manœuvers were unsuccessful: the clergy, as well as the nobility and the commons, remained firm in their demands for such fundamental guarantees as should secure their rights and liberties, and the king was forced to yield, after much delay and even violence in attempting to overthrow the organization which had been formed against him. The barons, with whom had collected a large force of armed knights and yeomen, proclaimed their array to be the "army of God and Holy Church." On May 24, 1215, they entered London, the king having fled from the Tower to Odiham, in Hampshire. From this place he sent word that he would comply with the petitions, and asked that a time and place should be appointed for a conference. The barons named Runnymede as the place and June 9 as the day. The conference actually began on the 15th, and lasted until the 19th. An outline was first drawn up and assented to in the form of articles (*articuli magnæ chartæ*), upon the basis of which, although differing in some particulars, the more complete and formal instrument was prepared. The Great Charter itself was finally consummated and the royal seal affixed at Runnymede on Friday, the 19th, although it bears the date of June 15, 1215, the day on which the negotiations were begun. At the death of John the charter was at once renewed by the Earl of Pembroke, who administered the government as protector on account of the minority of Henry III. In the next year it was again

renewed, and again in the ninth year of Henry's reign, and on five subsequent occasions before the death of that monarch. The Great Charter as it was promulgated in the ninth year of Henry III. was most solemnly re-established and confirmed by the king and Parliament A. D. 1300, being the twenty-fifth year of the reign of Edward I., and in the form as thus finally adopted, although differing in several particulars from the original, it appears in the English statute-book, and has been again confirmed by kings and Parliaments more than thirty times. The original charter of King John contained 61 chapters or articles. All of these after the 49th, except the 54th, were entirely temporary, relating to certain personal acts of the king, and establishing a means of enforcing its provisions by a commission of twenty-five, to be elected by the barons from among their own number, in case the king should refuse or neglect to carry it into effect. This portion was of course omitted in every subsequent renewal. Of the permanent articles a few only related to the clergy. The charter which had been granted to the Church earlier in the same year was deemed sufficient, and was expressly confirmed. By far the greater part of these chapters had reference to the laity, and they may be separated into two groups—namely, those which legislated for certain designated classes, and especially for the barons as tenants *in capite* of the crown, defining, regulating, and limiting their feudal burdens and duties; and those which legislated for the whole nation, for the entire body of freemen. The former were based upon the then existing social condition; and, with the exceptions hereafter mentioned, they all ceased to be operative with the extinction of the feudal system. The latter remain in full force and effect as the very foundation and security of civil liberty in Great Britain, and the most important and comprehensive of the clauses has been incorporated into all the constitutions, national and State, of the U. S. Among the articles defining the feudal relations of the barons to the crown, the 12th enacts that "no scutage or aid shall be imposed in our kingdom unless by the general council of our kingdom," except for three specified purposes; while the 14th provides for the summoning and holding of the general council in order to assess such "aids." In these clauses are to be found the germs of the constitutional principle that no taxes shall be laid except by the consent of the persons to be taxed expressed through their representatives—a principle which involves the entire theory of representative government. These clauses were omitted in the charter of Henry III., but were re-enacted with even more explicitness in the confirmatory statute of 25 Edw. I. The most important articles by far of the Great Charter—since they contain a sure guaranty of every civil right and liberty belonging to freemen—are the 39th and 40th, the original text of which is: "39. *Nullus liber homo capiatur, vel imprisonetur, aut utlagetur, aut exuletur, aut aliquo modo destruatur; nec super eum ibimus, nec super eum mittemus, nisi per legale judicium parium suorum, vel per legem terræ.* 40. *Nulli vendemus, nulli negabimus, aut differemus rectum aut justitiam.*" The corresponding article of the charter of 9 Hen. III. and 25 Edw. I. is the 29th, the language of which is slightly varied and expanded: "*Nullus liber homo capiatur vel imprisonetur, aut disseisiatur de aliquo libero tenemento suo vel libertatibus vel liberis consuetudinibus suis, aut utlagetur aut exuletur aut aliquo alio modo destruatur; nec super eum,*" etc., the remainder of the clause being exactly the same as in the original form given above. The following is the authoritative translation of this capital provision, as found in the English book of statutes: "No freeman shall be taken, or imprisoned, or be disseised of his freehold, or liberties, or free customs, or be outlawed or exiled, or any otherwise destroyed; nor will we pass upon him nor condemn him, but by lawful judgment of his peers, or by the law of the land. We will sell to no man, we will not deny or defer to any man, either right or justice." To this text it is appropriate to add a sentence from the eloquent eulogium of Lord Chatham: "These three words, '*nullus liber homo*,' have a meaning which interests us all; they deserve to be remembered, they deserve to be inculcated in our minds, *they are worth all the classics.*"

AUTHORITIES.—Thompson's *Magna Charta* treats the history of each of the chapters at length. The significance of the charter at different periods of British history will be found fully presented in Stubbs's *Constitutional History*, Hallam's *Middle Ages*, and in Taswell-Langmead and Creasy. See Stubbs's *Select Charters* (1870).

Revised by C. K. ADAMS.

Mag'na Græ'cia [= Lat., liter., Great (i. e. Greater) Greece]: the name given to the ancient Greek settlements along the southern coast of Italy, such as Tarentum, Croton, Sybaris, Locri, Rhegium, etc. These cities were nearly all founded in the eighth century B. C., by mercantile cities of Greece, as trading-stations, and by means of their commerce attained to great wealth. They possessed a loose confederation, which did little more than keep alive a consciousness of their common origin, and they maintained a certain amount of literary and athletic association with the mother-country, although they did not take any considerable part in its military and political movements. Internal decay and strife between the cities of Magna Græcia were the first causes of a decline in its prosperity, which was further hastened by the aggressions of foreign enemies—Syracusans, native Bruttians, and Lucanians, and, from the third century B. C. on, the Romans. In Cicero's time Tarentum was almost the only city of Magna Græcia which still retained vestiges of earlier importance. The significance of the designation *Magna* Græcia is not altogether clear, but may have arisen from the superior wealth of these cities in the sixth and seventh centuries B. C. to the cities of Greece from which they came. See Lenormant, *La Grande-Grèce, Paysages et Histoire* (3 vols., Paris, 1881–84).

G. L. HENDRICKSON.

Magnan, măăn'yăăn', VALENTIN, M. D.: alienist; b. at Perpignan, France, in 1835; studied medicine in Lyons and Paris, graduating M. D. from the school in Paris in 1866; settled in Paris and devoted himself to nervous diseases; was appointed physician to St. Anne Asylum. Has written a number of papers on subjects connected with diseases of the mind and of the nervous system. His more important works are *De l'alcoolisme, des diverses formes du délire alcoolique, et de leur traitement* (Paris, 1874); *Recherches sur les centres nerveux* (Paris, 1876).

S. T. ARMSTRONG.

Magne, maañ, PIERRE: statesman; b. at Périgueux, France, Dec. 3, 1806; studied jurisprudence at Toulouse; was appointed councilor of the prefecture in 1835; elected deputy in 1843, and Under Secretary of State in the ministry of War in 1847, but resigned this office during the revolution of February, and returned to Périgueux. Napoleon, however, called him back in 1849, and made him a secretary in the ministry of Finance, and in 1851 Minister of Public Works. In 1855 he became Minister of Finance. Questions relating to the internal policy caused Magne to change his office several times, but his great financial talent always brought him back to this department. In 1863 he retired on account of a controversy with Fould, but (Nov. 13, 1867) he was again appointed Minister of Finance in order to effect the new great loan. When Napoleon formed the cabinet of Ollivier (Dec. 27, 1869), Magne retired into private life. Once more, however, he took charge of the ministry of Finance, from May 25, 1873, to May 16, 1874, in the cabinet of Broglie, but withdrew on account of a vote of the National Assembly which went against the ministry. D. Feb. 18, 1879.

Magne'sia: the name of two ancient cities in Asia Minor—(1) a city of Ionia lying on the Mæander, not far from Miletus and Ephesus, famous for its temple of Artemis (Diana), of which excavations have disclosed some remains; and (2) a city (the modern Manisa) of Lydia, N. E. of Smyrna, at the foot of Mt. Sipylus, celebrated for the battle which was fought here in the year 190 B. C. between the two Scipios and Antiochus the Great, of Syria, by which the Romans laid the foundations of their rule in the East.

G. L. HENDRICKSON.

Magnesia: magnesium oxide. See MAGNESIUM.

Magne'sium: a light, silver-white metal. Its ores are the magnesian minerals and rocks, among which *serpentine* is the richest, as it contains 25·8 per cent. of the metal. Other widely distributed and abundant natural compounds of magnesium are *magnesite*, $MgCO_3$; *kieserite*, $MgSO_4.H_2O$; *kainite*, $MgSO_4.KCl.6H_2O$; *carnallite*, $MgCl_2.KCl.6H_2O$; *talc*, *meerschaum*, *augite*, *olivine*, etc. Each cubic foot of the ocean contains 1·34 oz. of metallic magnesium, or over three-fifths of a cubic inch. A cube of 30 feet of sea water contains 2,240 lb. of the metal magnesium.

Properties, Chemical and Physical.—Magnesium is silver-white and very brilliant, malleable, and ductile. It melts at a red heat, and is readily cast into ingots. At a higher heat it volatilizes and distills, like zinc. One of the most remarkable characters of magnesium is its combustibility in

the form of filings, wire, or ribbon, with a light of dazzling brilliancy. In this also it is like zinc, which will burn in the same way if in sufficiently thin foil.

Magnesium does not rust rapidly in damp air, a thin, white film of carbonate forming, which, from its insolubility, protects the metal. Carbonate of magnesium is devoid of toxic qualities, and not destructive to organic matter like that of iron. Being by far the lightest substance of equal strength that is known (except possibly calcium, which is comparatively little known), and obtainable in unlimited quantities, magnesium would seem to be, next to aluminium, the most important of the metals of the future.

Manufacture of Magnesium.—The manufacture of magnesium is dependent on that of sodium. The improved method of Sonstadt consists in heating in a closed crucible 6 parts of chloride of magnesium, 1 of dry common salt, 1 of powdered fluor-spar, and 1 of metallic sodium to a bright-red heat. The granules of magnesium thus formed are separated from the mass, and purified by distillation in a current of dry hydrogen gas, at a white heat, in an apparatus composed of carbon. It is incorporated into a body for casting into ingots by fusing, under a flux composed of the same ingredients as above—mixed chlorides of magnesium and sodium. Magnesium is employed principally in the form of ribbon and powder for producing bright lights for photography, as in the flash-light, for signaling at sea, and for pyrotechny. *White fire* is made by melting together 1 part shell-lac and 6 parts barium nitrate, grinding, and mixing with 2·5 per cent. of powdered magnesium. *Red fire* is made by using 5 parts strontium nitrate in place of the 6 parts barium nitrate used in making white fire, the other ingredients being used in the same proportions.

Compounds of Magnesium.—The principal ones are *magnesia*, which is the *oxide*, MgO; *magnesite*, or the carbonate, $MgCO_3$; *Epsom salt*, or the sulphate, $MgSO_4.7H_2O$; and the chloride, $MgCl_2$.

Magnesia, MgO, is usually made by gently igniting the carbonate, and is called *magnesia usta*, the carbonate being known as *magnesia alba*. Magnesia is a white powder, which is very difficultly soluble in water, forming with it the hydroxide $Mg(OH)_2$. It is used for the purpose of protecting vessels subjected to a high temperature. Mixed with water and exposed to the air, it becomes very hard. A mixture of magnesia, water, and magnesium chloride forms Sorel's cement, which hardens to an oxychloride as hard as marble. Magnesia and the carbonate are valuable in medicine; in the first place as alkalies to neutralize acidity in the alimentary canal, both from their high saturating power and from the absence of any corrosive properties of their own. Hence in poisoning by the mineral acids and in acid dyspepsia they are very useful, but from their low diffusion power they are little absorbed, and hence can not be employed to alkalize the blood. All soluble magnesium salts are purgative, producing watery discharges, while at the same time not irritating the intestinal mucous membrane. Thus magnesia and magnesium carbonate combine the virtues of an alkali and a mild purge, and are accordingly useful in acid dyspepsia with constipation. *Magnesium sulphate*, *Epsom salt* (Germ. *Bittersalz*), was discovered in the springs at Epsom, in England. It is used in medicine as a powerful though safe neutral purge, and, from its less offensive taste, has superseded Glauber's salt. If infused into the blood, it acts as a dangerous poison. It is used, further, in the manufacture of sodium sulphate and potassium sulphate, and as a fertilizer in place of gypsum. Its chief use is in the Lancashire cotton-trade for warp-sizing. The chloride is used in the preparation of the metal. Magnesium citrate may also be mentioned. It is used in medicine as an agreeable laxative and mild purge in the form of the officinal effervescing solution of the U. S. Pharmacopœia.

Revised by Ira Remsen.

Magnet [viâ O. Fr. from Lat. *mag'nes*, *magne'tis*, from Gr. **Μαγνῆτις λίθος**, or **Μαγνησία λίθος**, liter., Magnesian stone. Cf. Lat. *la'pis Heracle'us*, magnet, liter., Heraclean stone, named from *Heracle'a*, capital of Magnesia]: a name which from early times has been applied to the loadstone or native magnet, an ore consisting of the magnetic oxide of iron, Fe_3O_4, more properly termed magnetite. This ore is extensively distributed over the globe, and its peculiar property of attracting metallic iron has been known from the remotest antiquity. Some (following Pliny) trace the derivation of the name from Magnes, a Greek shepherd, who, on Mt. Ida, observed the attractive power of a large mass of loadstone on his iron crook. It was this power of the loadstone to attract to itself small particles of iron that made it famous, being referred to by Plato, Euripides, Aristotle, Pliny, and others. The power of the loadstone to impart its properties to iron or steel rubbed or even touched by it was likewise known at an early date, but it was not until the twelfth century or thereabouts that it was discovered that the loadstone when freely suspended would assume a north and south direction. The philosophy of the loadstone was a favorite subject for discussion by many writers, most of whom were led astray by conceptions handed down from generation to generation. William Gilbert, of Colchester, in a scholarly work entitled *De Magnete, Magneticisque Corporibus, et de Magno Magnete Tellure* (London, 1600), treats the subject of the loadstone exhaustively; he states all that was previously known about it, and adds important discoveries of his own. It was he who first understood the nature of the polarity of the magnet, which he refers to as follows in the introductory chapter of his book: "The loadstone has from nature its two poles, a northern and a southern, fixed definite points in the stone. . . . It is to be understood, however, that the force of the stone does not emanate from a mathematical point, but from the parts themselves, and from all of these parts. . . . These poles point toward the poles of the earth, and move toward them, and are subject to them. . . . Whether its shape is due to design or to chance, . . . the loadstone ever has and ever shows its poles." Dr. Gilbert was careful in all his work and scientific in his methods, and much credit is due to him for his clear ideas concerning the magnet. It was he who discovered that midway between the poles there was a place of no attraction, which he calls the equator. The line connecting the imaginary poles he called the magnetic axis. He furthermore pointed out the distinction between magnets and magnetic substances. A magnetic substance (such as a mass of soft iron) has no poles nor equator, and will attract either pole of a magnet to whatever part the magnet is presented. A magnet, on the other hand, attracts only at its poles which display opposite properties, the one attracting and the other repelling a given pole of another magnet brought near, like poles repelling and unlike attracting. If a piece of iron or steel be rubbed by a magnet it will become magnetized. This method of magnetizing, or of producing an artificial magnet, was formerly of great importance, particularly in constructing the mariner's compass, and various modifications of the method have been used since the magnetizing effects of a current have been known. These have been supplanted for the most part by methods in which an electric current is used. The method of *simple touch* consists in passing the pole of a powerful magnet along the bar to be magnetized, and repeating this operation several times, always moving the pole of the magnet in the same direction until the magnetization is complete. In the method of *double touch*, two bar magnets are placed upon the bar to be magnetized with opposite poles in proximity, but separated by a small piece of wood. (See Fig. 1.) The magnets are then moved back and forth until the bar is magnetized. A slightly different method is that of *separated* or *divided touch*, in which two magnets with opposite poles together are placed at the middle of the bar to be magnetized, and drawn apart from the middle of the bar toward its end and back several times. All these methods, however, have been replaced, except for special cases, by the methods described further on, in which an electric current is employed. Laminated magnets (see Fig. 1) have been used where a strong permanent magnet is wanted, and are found to be more powerful in proportion to their weight than those consisting of one piece. A magnet is less liable to deteriorate in strength if it forms part of a closed magnetic circuit, and for this reason a *keeper* or *armature* is often placed so as to connect the two poles. A sudden slamming on of the armature will weaken the strength of the magnet, but not so the sudden pulling off, as is commonly supposed.

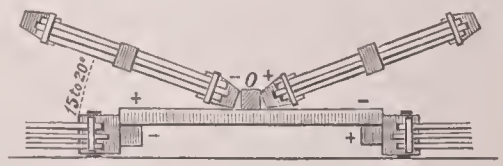

Fig. 1.—Method of double touch.

The Electro-magnet.—The discovery of Oersted (1819), that magnetic influences surrounded a conductor carrying an electric current, led to the discovery by Arago that a needle placed at right angles to the conductor becomes magnetized, and the further discovery by Ampère that if a

number of turns of wire be substituted for the straight conductor, the magnetizing power will be increased. These principles led to the electro-magnet, first constructed by William Sturgeon, and described by him before the Society of Arts in 1825. After the invention of the electro-magnet, the determination of its laws received the attention of Sturgeon, Henry, Joule, and Faraday, and additions have since been made to our knowledge of the subject by various men of science. An electro-magnet is simply a piece of iron surrounded by a magnetizing coil of wire carrying a current. (See Fig. 2.) The polarity of an electro-magnet depends upon the direction of the current magnetizing it, as in Fig. 3. The tractive power of a magnet depends upon the magnetic induction (lines per square centimeter) and the polar surface, and is equal to $\mathfrak{B}^2A \div 4\pi$ dynes, where $\mathfrak{B}$ is the *induction* or number of lines per square centimeter (see MAGNETISM OF IRON) and A the polar surface in square centimeters. Expressed in grammes, this becomes $\mathfrak{B}^2A \div 4\pi \times 981$; and in pounds, $\mathfrak{B}^2A \div 11{,}183{,}000$. These formulas are strictly true only when the induction is uniform; where $\mathfrak{B}$ is not uniform, for $\mathfrak{B}^2A$ in above we should write $\int \mathfrak{B}^2 dA$. This law holds in all cases for permanent magnets as well as electro-magnets. A full account of the electro-magnet may be found in *The Electro-magnet*, by S. P. Thompson. The properties of an electro-magnet depend upon the magnetic properties of the iron which constitutes the core, and these, together with the laws of the magnetic circuit, are discussed at length under MAGNETISM OF IRON (*q. v.*).

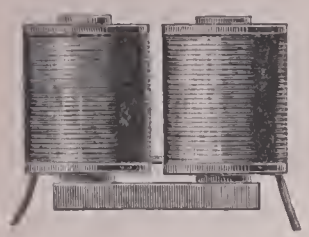

FIG. 2.—Electro-magnet.

FIG. 3.—Direction of currents around the poles of an electro-magnet.

FREDERICK BEDELL.

Magnetism: a term applied to the phenomena observed in the region surrounding a magnet and in the neighborhood of a conductor conveying an electric current. In these regions there exists a magnetic force which acts upon a magnetic substance (such as a compass-needle or iron filings) or upon a wire carrying a current of electricity.

If fine filings of soft iron be uniformly sifted over a plate of glass, we shall observe that the distribution of the filings is influenced by the position of a magnet introduced beneath. The approach of the magnet is first indicated by a bristling of the iron filings. If the plate be gently vibrated the filings will arrange themselves in a system of lines, more or less regular, as shown in Fig. 1, each particle of iron taking a direction according to the direction of the magnetic force to which it is subjected. The study of these curves, in connection with the action of magnets on magnetic and diamagnetic bodies, led Faraday to the adoption of the terms "magnetic field" and "lines of magnetic force." We see that these lines of force extend throughout the whole region surrounding a magnet. A magnetic field may be defined as any space throughout which there exists a magnetic force, while a line of magnetic force is a line drawn through a magnetic field in the direction of the force at each point through which it passes. The magnetic field set up by a current is similar to that in the neighborhood of a magnet, and may also be shown by means of iron filings which arrange themselves in circles about the conductor, as illustrated under ELECTRICITY (*q. v.*). Although earlier experiments showed that the magnetism of a piece of iron was influenced by the flow of electricity in a neighboring conductor, it was not until 1819 that these phenomena were definitely pointed out. In that year Prof. Oersted, of Copenhagen, made known the fact that if a compass-needle be placed near a conductor carrying a current and parallel to it, it turns, and tends to set itself in a direction at right angles to the current. This first announcement of the relation between electricity and magnetism attracted considerable attention in the scientific world. During the following year Arago, in France, and Davy, in England, showed that iron filings placed in the vicinity of an electric current became magnetized, and Ampère, of the French Academy, published his generalizations, which formed the foundation of the science of electro-magnetism. He showed that not only were magnetic bodies influenced by the passage of a current, but that there were mutual forces between neighboring currents; that parallel currents flowing in the same direction attract, and that those flowing in opposite directions repel. These early experiments demonstrated the fact that a current of electricity establishes about itself a magnetic field possessed of the same properties as the field surrounding a magnet. The direction of the lines of force in this magnetic field form concentric circles with the conductor at the center, as shown in Fig. 2. The phenomena of magnetic fields containing iron are fully discussed under MAGNETISM OF IRON (*q. v.*), where also are given the technical meanings assigned to *a line of force*, *unit pole*, etc.

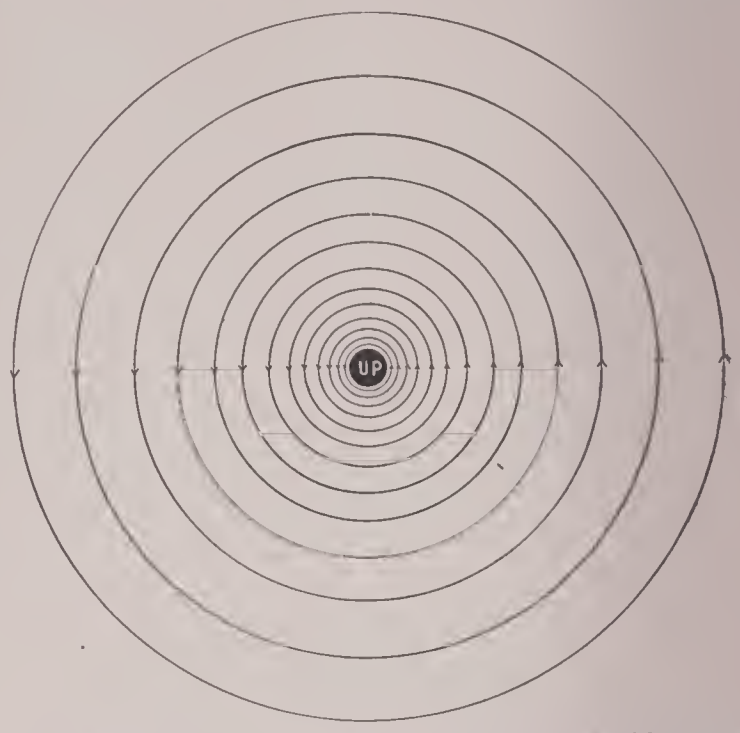

FIG. 2.—Magnetic lines of force around a straight wire with current flowing upward.

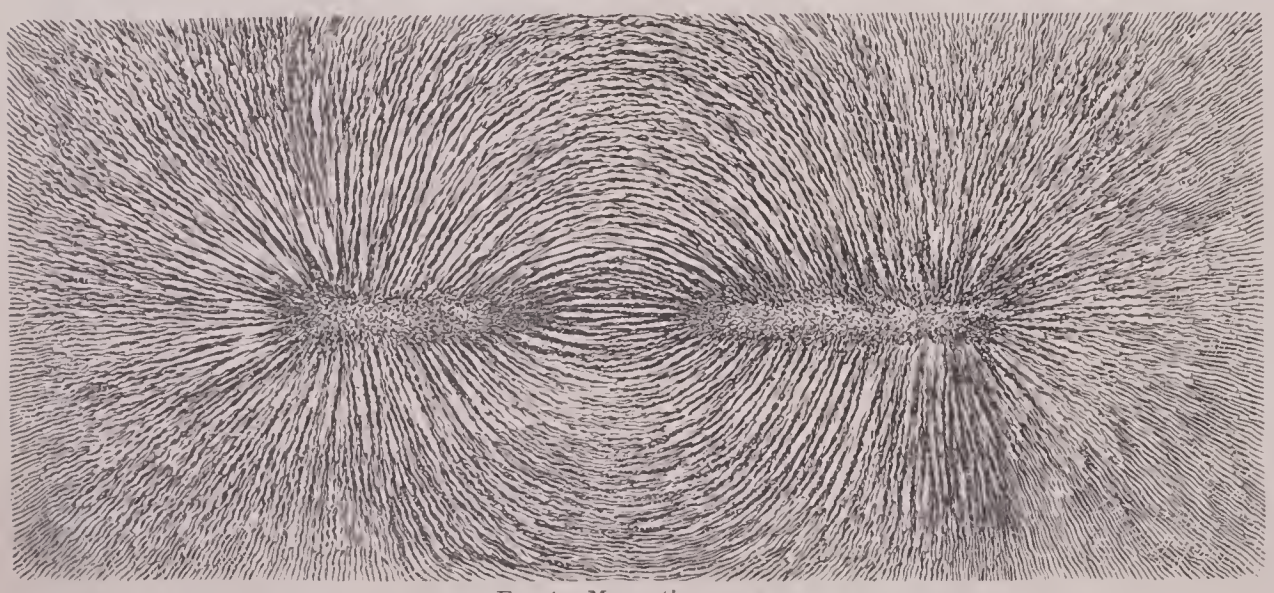

FIG. 1.—Magnetic curves.

Magnetic Field Produced by a Current.—We have seen that a current of electricity flowing in a circuit produces a magnetic field in the surrounding region, and that the lines of force which constitute this field are always closed lines encircling the conductor. The total number of lines passing through the area bounded by a closed electric circuit is the total magnetic induction of the circuit. As the current

is increased in strength, the intensity of the magnetic field at every point is increased, and, if there is no magnetic substance in the region, the intensity of the field is increased in direct proportion to the strength of the current. A *unit current* is defined in terms of the magnetic field which it generates. A unit current is that which, flowing in a circuit of a centimeter radius, acts on a unit magnetic pole, placed at the center, with the force of a dyne per centimeter length of the circumference. This is the C. G. S. unit of current; but the practical unit, the *ampère*, is one-tenth of the C. G. S. unit. It has been found, as the result of experiment, that the magnetic effect of a current is the same as that of a magnetic shell of suitable strength, having for its boundary the circuit in which the current flows. By a magnetic shell is meant a very thin sheet of magnetic material magnetized in the direction of its thickness. The strength of shell, j, is equal to the magnetic moment per unit of area, i. e. $j = \frac{ml}{A}$, where m is the pole strength and l the distance between the poles of the magnet with cross-section A. A shell of uniform strength, j, having the same boundaries as a circuit in which the current I is flowing, will exactly replace the current, so far as magnetic effect is concerned, when I and j are numerically equal. The magnetic potential at a point P, at which a closed circuit carrying a current I subtends a solid angle Ω, is $I\Omega$. (See POTENTIAL.) The direction of the magnetic force set up by a current is shown by Figs. 2 and 3.

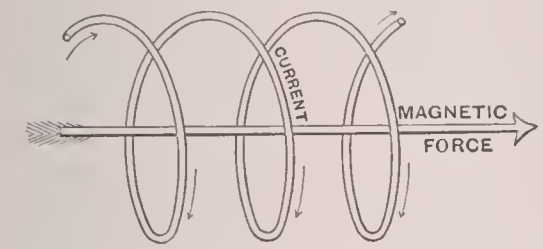

FIG. 3.—Direction of magnetic force set up in a solenoid.

Electro-magnetic Induction.—We have seen that a magnetic field is set up by a current of electricity. Of equal importance is the fact discovered by Faraday that an electromotive force (E. M. F.) is produced in a conductor which is moved through a magnetic field so as to cut the magnetic lines of force. This electromotive force is directly proportional to the rate at which the lines are cut, and is in a direction at right angles to the direction of motion and also to the direction of the lines of force. Faraday further showed that if the magnetic induction, N, throughout any closed circuit be varied by *any* means, an E. M. F. is developed in the circuit proportional at any instant to the rate of change (increase or decrease) of the induction at that instant. This change in magnetic induction may be produced by an alteration in the position of the circuit in its relation to magnets or other circuit, or to a variation in the intensity of the current in a neighboring conductor or in itself. However the change in the induction is produced, the law always holds, and may be expressed by the equation $E = -\frac{dN}{dt}$. The negative sign indicates that an electromotive force is induced in such a direction as to oppose the change in number of lines threading the circuit. A C. G. S. unit of E. M. F. is developed when there is a change in the induction of the circuit at the rate of one line per second, or when the conductor is *cutting* one line per second. The practical unit of E. M. F., the *volt*, is 10^8 times the C. G. S. unit just defined. If the circuit in which the induction is changing is closed, the E. M. F. produced by this change will cause a current to flow in a direction so as to oppose the change producing it (Lenz's law); for example, if the field is increasing in strength, the current developed will tend to weaken it by sending lines in the opposite direction. Again, if the electromotive force is produced by the motion of a wire, the current induced will exert a force which tends to resist this motion. This law is a particular case of the general law of the conservation of energy. An E. M. F. is induced, as explained above, whenever the number of lines inclosed by a circuit is varied, no matter what may be the source of the lines or the cause of the variation. Any variation in the strength of the current itself will produce a variation in the field which will induce an E. M. F. in the circuit, called the E. M. F. of self-induction, in such a direction as to oppose the change in the current. The effect of self-induction is to make a current act as if it possessed inertia, but this apparent inertia is a function of the shape of the circuit and the magnetic properties of the bodies near it. The spark observed on breaking a circuit in which a heavy current is flowing is due to self-induction. If the circuit contains iron, and has a large number of turns, a considerable spark may be obtained with a very small current. The E. M. F. of self-induction may be expressed as a function of the rate of change of current thus: $e = -L\frac{dI}{dt}$. The coefficient L is called the *coefficient* of *self-induction*, and has been defined as the ratio between the counter E. M. F. of self-induction in any circuit and the time rate of variation of the current producing it. If the current is changing at the rate of one unit per second, and the E. M. F. caused thereby is unity, then L is unity. The practical unit of self-induction is the *henry*, and is equal to 10^9 times the C. G. S. unit. This definition of L is in accordance with the Chicago congress (1893). The E. M. F. of self-induction may be written in terms of the change in magnetic induction thus: $e = -\frac{dN}{dt} = -L\frac{dI}{dt}$. If the permeability of the medium surrounding the conductor is constant, the value of L is constant for all values of current, and $N = LI$. From this equation the coefficient of self-induction has been defined as the ratio of the total induction threading the circuit to the current producing it. When there is iron, this is approximately true when a high degree of saturation is not reached. The *quantity* of electricity which will flow in a circuit on account of the change in the number of lines which thread it is equal to the change in the number of lines divided by the resistance, i. e. $Q = \frac{N_2 - N_1}{R}$. This is entirely independent of the manner of the change and the time occupied in making it. This principle is illustrated in the use of the earth inductor and the ballistic galvanometer.

Energy of a Magnetic Field.—When a current is caused to flow in a conductor it produces a magnetic field in the surrounding region, and stores up a certain amount of energy in this magnetic field which depends upon the value of the current and the self-induction of the circuit, and is equal to $\frac{1}{2}LI^2$. This energy is kinetic, and when the current decreases this energy is *returned* to the circuit, and tends to maintain the flow of current, just as the kinetic energy of a revolving fly-wheel tends to maintain the rotation of the wheel when slowing down. The energy of the field increases and decreases with the current, and its rate of change depends upon the value of the current and also upon its rate of change. Thus in the time dt the change in the field energy is $LI\frac{dI}{dt}dt$, which is positive when the current is increasing and negative when it is decreasing. No energy is lost in the magnetic field when in air, i. e. it is *all* restored to the circuit; but when the field contains iron the energy is not entirely returned to the circuit, part of it being lost due to *hysteresis*. (See MAGNETISM OF IRON.) In air the energy of the magnetic field is $\frac{\mathfrak{H}^2}{8\pi}$ ergs per cubic centimeter[3]—(where $\mathfrak{H}$ is the intensity of the field); in iron it is much greater, increasing almost directly with the permeability until saturation is reached.

Properties of Lines of Force.—Many facts in connection with electro-magnetism are more readily understood by assigning certain "properties" to the lines of force. Lines of force in the same direction repel each other, while those in opposite directions attract and tend to neutralize each other. Lines of force exert a tension which tends to shorten them. This tension explains the tractive power of magnets, and is equal to $\frac{\mathfrak{H}^2}{8\pi}$ dynes per square centimeter. The tension is only displayed at the points where the lines enter the iron, just as the tension of a stretched rubber band is evident only at the points at which it is attached. If a conductor carrying a current, I, be placed at right angles to the lines of force in a uniform field of intensity, $\mathfrak{H}$, it will be acted upon with a force, $l\mathfrak{H}I$, where l represents the length of the conductor in the field. This electro-dynamic action

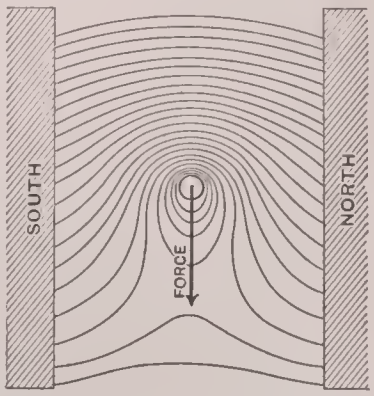

FIG. 4.—Conductor in uniform field carrying current upward.

may also be explained by the tension of lines of force. Fig. 4 shows the lines of force which result when a conductor carrying a current is placed in a uniform magnetic field. The direction in which the conductor is urged is indicated by the arrow. Upon this principle depend the action of the electric motor and the resistance offered to the rotation of the armature of a dynamo.

The subject of magnetism is so intimately connected, both logically and by association, with that of the magnetism of iron, that a treatment of this latter subject is rendered necessary for a complete understanding of the more general subject of magnetism. Therefore, further discussion of magnetism will be taken up under MAGNETISM OF IRON. Classical works on magnetism are those by Maxwell, Mascart and Joubert, and Gray.

FREDERICK BEDELL.

Magnetism of Iron: although many substances possess magnetic properties to some extent, iron (and steel) possesses these properties to a greater extent than any other body, and is by far the most important of the magnetic metals. Nickel and cobalt possess similar properties to a lesser degree. In addition to these three may be named chromium, cerium, and manganese, and a few other substances which are appreciably magnetic. If a magnetized needle be thrust into iron filings, it will be found that these cling in clusters near the ends which are called *poles*, which, however, as Gilbert pointed out (see MAGNET) are never mathematical points. For convenience in the study of magnetism, however, we may suppose that a magnetic pole may be concentrated at a point, and we define a *unit magnetic pole* as one which exerts a force of a dyne upon another equal pole at the distance of a centimeter. Such a pole forms the basis of our study of magnetism and the foundation upon which is based the whole system of electro-magnetic units. By *strength of pole* (m) we mean the number of unit poles to which a magnetic pole is equivalent; this is measured by the force (in dynes) that the pole exerts upon a pole of unit strength placed a centimeter away. In this definition it is assumed that the pole is concentrated at a point; whereas, in the case of actual magnets, the attractive power is found to be distributed over considerable area, called the *polar surface* of the magnet. Each element of this surface, however, may be treated as a pole in the sense used above, with its attractive power varying as the inverse square of the distance. The combined action of these infinitesimal poles is equivalent to the actual effect of the magnet. Coulomb investigated the action between magnetic poles, and established the following law of force from experiments performed with a torsion balance. The attraction or repulsion between two poles is inversely as the square of the distance between them, and directly as the product of their strengths; that is, $f \propto \frac{m\,m'}{r^2}$, where m and m' are the strengths of the poles and r the distance between them. A unit pole being defined as above, the sign of variation may be changed to one of equality if r is measured in centimeters and f in dynes. The force between two magnetic poles is then $= \frac{m\,m'}{r^2}$. When the two poles have the same sign, the product $m\,m'$ is positive, and, inasmuch as the poles repel, a force of repulsion has a positive sign. Similarly, a force of attraction has a negative sign. It is not possible for an isolated pole to exist, but this condition may be practically obtained by using a long, uniformly magnetized needle with one pole so far removed that measurements upon the other are uninfluenced by it.

Magnetic Force ($\mathfrak{H}$).—If we could place a free magnetic pole in a magnetic field, it would always be urged in a certain direction, and if free to move would actually move in this direction. The direction in which a + pole would be urged is called the positive direction of the line of force which passes through the pole. The value of the magnetic force, $\mathfrak{H}$, at any point in a magnetic field is measured by the force (in dynes) that would be exerted on a unit pole placed at that point. When dealing with induced magnetism, $\mathfrak{H}$ is frequently called the *magnetizing force*, since it measures the tendency of the field to magnetize a piece of iron placed in it. Usually it is found that $\mathfrak{H}$ varies at different points in the field; but if $\mathfrak{H}$ has the same value at every point, both in magnitude and direction, the field is said to be uniform. *A line of force* is an imaginary line which shows by its direction at any point the direction of the magnetic force $\mathfrak{H}$. If the uniform field be one of *unit intensity*, then $\mathfrak{H}$ equals 1, and there is said to be one line of force per square centimeter; and when the intensity is $\mathfrak{H}$ there are $\mathfrak{H}$ lines of force per square centimeter. Thus the intensity of a magnetic field is considered as being determined by the number of lines which pass through a centimeter of a surface normal to the direction of the lines of force. When lines of force are imagined as drawn in this way so as to give the magnitude as well as the direction of the force, they are commonly spoken of as C. G. S. lines. By the definition of a unit pole the intensity of field $\mathfrak{H}$ is unity at a distance of a centimeter from the pole. If a sphere be described about the unit pole as center, having a radius of a centimeter, there is consequently one line of force passing through the surface of the sphere for every square centimeter. As the surface of a sphere contains 4π sq. cm., there are in all 4π lines of force that emanate from a unit pole, and $4\pi m$ lines from a pole whose strength is m. The *magnetic moment* ($\mathfrak{M}$) of a magnetized piece of iron is defined as the distance between its two poles multiplied by the strength of one pole; thus $\mathfrak{M} = ml$. Generally the two factors m and l can not be separated, for it is the effective strength of pole that is required. If a magnet of moment $\mathfrak{M}$ is suspended in a uniform field of intensity $\mathfrak{H}$, so as to make an angle θ with its position of equilibrium, the moment of the couple tending to restore the magnet to equilibrium is $\mathfrak{M}\mathfrak{H}\sin\theta$. Magnetic moment is accurately defined by this relation.

Magnetic Induction in Iron.—When a piece of iron is placed in a magnetic field, that is, when it is subjected to a magnetizing force, it becomes magnetized, and if the iron is isotropic this magnetization is in the direction of the magnetizing force. The amount of this magnetization may be expressed in various ways—for instance, in terms of its magnetic moment, already defined, intensity of magnetization, magnetic induction, etc., each of which ways has its advantages. Magnetism is sometimes considered as consisting of two hypothetical fluids, positive and negative, equal amounts of which appear at the ends of the magnetized bar. The middle portion of a uniformly magnetized bar shows no positive or negative magnetism, for the poles of successive elementary magnets neutralize each other. Although magnetism is only displayed at the ends of a bar where its unneutralized poles exist, the magnetic state is continuous throughout the bar. If we cut the uniformly magnetized bar into pieces of any shape whatsoever, the magnetic moments of the separate pieces are proportional to the volumes. The magnetic moment per unit volume is taken as a measure of the magnetization, and is called *the intensity of magnetization* ($\mathfrak{I}$). For a magnet of uniform cross-section A and length l, $\mathfrak{I} = \frac{\mathfrak{M}}{\text{vol.}} = \frac{ml}{la} = \frac{m}{A}$; that is, the intensity of magnetization is equal to the pole strength per unit of polar surface. The intensity of magnetization is a function of the magnetizing force; the ratio of the intensity of magnetization to the magnetizing force is called the *magnetic susceptibility* (κ), and is dependent upon the quality of the iron; thus, $\kappa = \frac{\mathfrak{I}}{\mathfrak{H}}$.

We have seen above that $4\pi m$ lines of force emanate from a pole of strength m. From the polar surface, A, of a bar of iron with intensity of magnetization $\mathfrak{I}$, there will emanate $4\pi\mathfrak{I}A$ lines, or $4\pi\mathfrak{I}$ lines per square centimeter. These lines are called *induced lines of magnetization*, and are added to the lines of force $\mathfrak{H}$ which magnetized the bar. The total number of lines of force which now pass through each square centimeter is $\mathfrak{H} + 4\pi\mathfrak{I}$; that is, it is the sum of the magnetizing force (lines of force per square centimeter) before iron was placed in the field and the induced lines of magnetization due to the presence of the iron. This quantity, the total number of lines of force per square centimeter, is usually called the *induction* or the *magnetic induction*, designated by the letter $\mathfrak{B}$: or $\mathfrak{B} = \mathfrak{H} + 4\pi\mathfrak{I}$. The total induction N throughout any area A is $\int \mathfrak{B}\,dA$; and when the iron is uniformly magnetized we have $N = \mathfrak{B}A$. In air or other non-magnetic substance the magnetic induction is equal to the magnetizing force, that is, $\mathfrak{B} = \mathfrak{H}$; but in a magnetic substance such as iron the number of lines is increased by $4\pi\mathfrak{I}$ lines due to the presence of the iron. The ratio of the induction to the magnetizing force is called the *magnetic permeability* μ; that is, $\mathfrak{B} = \mu\mathfrak{H}$. The permeability is, so to speak, a multiplying factor the value of which depends upon the magnetic properties of the iron. The relation between permeability and susceptibility may be obtained by dividing the equation $\mathfrak{B} = \mathfrak{H} + 4\pi\mathfrak{I}$ by $\mathfrak{H}$. We then have $\frac{\mathfrak{B}}{\mathfrak{H}} = \frac{\mathfrak{H}}{\mathfrak{H}} + \frac{4\pi\mathfrak{I}}{\mathfrak{H}}$, or $\mu = 1 + 4\pi\kappa$.

Meaning of $\mathfrak{B}$ *and* $\mathfrak{H}$.—Suppose a narrow crevasse cut in the iron perpendicular to the direction of magnetization. The force on a unit pole in this crevasse is due to the magnetizing force $\mathfrak{H}$, and the induced lines of magnetization $4\pi\mathfrak{I}$, and is a measure therefore of $\mathfrak{B}$ for $\mathfrak{B} = \mathfrak{H} + 4\pi\mathfrak{I}$. Now, suppose a hole drilled through the magnet in the direction of magnetization. The force upon a unit pole in this hole is a measure of $\mathfrak{H}$, for in this hole there are no induced lines of magnetization. $\mathfrak{B}$ and $\mathfrak{H}$ are *vector* quantities, and equations in which they occur should be so interpreted; they become algebraic when the medium is isotropic.

Work done in Moving a Magnetic Pole.—In moving a magnetic pole in a magnetic field, work is done either by the magnetic force or against it. Suppose that we have two magnetic poles of strengths m and m', and that r_1 is the distance between them. If m' is moved from the point P_1 to P_2 so that the distance between m and m' is increased from r_1 to r_2, work is done. The work done in thus moving m' from P_1 to P_2 can be found by first ascertaining the work done in moving m' over an element of distance ds with an increase dr in the distance r from the magnetic pole m. The force between two poles of strengths m and m' at a distance r apart is $f = \frac{m\,m'}{r^2}$. This force may be considered constant while the pole m' is moving through an element of distance ds. The distance through which the pole is moved *against* this force is dr; hence the work done is $dW = mm'\frac{dr}{r^2}$. To find the work *done by* the magnetic force in moving m' from P_1 to P_2, this expression must be integrated between the limits r_1 and r_2; thus $W = mm'\left(\frac{1}{r_2} - \frac{1}{r_1}\right)$. The work *done against* the magnetic force is $mm'\left(\frac{1}{r_1} - \frac{1}{r_2}\right)$. This work is independent of the path, depending simply upon the pole strengths and upon the initial and final distances.

Magnetic Potential.—If the distance r_2 is infinite (meaning that the pole m is carried from an infinite distance to a point at a distance r_1), the work done against the magnetic force becomes $W = \frac{mm'}{r_1}$. If m' is unity, meaning that a unit pole is moved, the work done becomes $W = \frac{m}{r_1}$. It is seen that each point in the region surrounding a magnetic pole possesses a certain characteristic which determines the amount of work done in bringing a unit magnetic pole from infinity to that point. This characteristic of the point has been called its *magnetic potential.* The magnetic potential V at a point is therefore defined as the work done in moving a unit positive pole from an infinite distance to that point; thus, $V = \frac{m}{r}$. This potential is positive when the work done is positive; that is, when work is done, in moving the pole, by some agent external to the system. The potential at a point due to a number of magnetic poles is the sum of the potentials at that point due to each pole independently; thus $V = \Sigma\frac{m}{r}$. We have seen under the head of Magnetism that the magnetic potential at any point due to a current flowing in a closed circuit is $I\Omega$, the product of the current and the solid angle which the circuit subtends as seen from the point. It may be shown that the work done in carrying a pole around a wire in which a current I is flowing is $W = 4\pi I$ ergs. If, instead of one wire, there are S turns around which the pole is carried, the work will be S times as much, and $W = 4\pi SI$ ergs.

Magnetizing Force of an Ampère Turn.—When a unit pole is moved in a magnetic field, the work done is the product of the magnetic force and the distance through which the pole is moved against the force. If l is the length of the path described by the pole and α the angle at any point in the path between the direction of motion and the direction of the force $\mathfrak{H}$, the work in moving a unit pole, being the product of the force and the distance through which the pole moves, is $W = \int\mathfrak{H}\cos\alpha\,dl$. Therefore $\int\mathfrak{H}\cos\alpha\,dl = 4\pi SI$ in C. G. S. units. In case the path of the pole is coincident with the direction of force, $\cos\alpha = 1$ at all points. This is the case when the medium is isotropic and there is no residual magnetism in a direction inclined to the magnetizing force. If the current be expressed in ampères (and not in C. G. S. units as above) and $\cos\alpha = 1$, then $\int\mathfrak{H}dl = \frac{4\pi SI}{10}$. If $\mathfrak{H}$ has a constant value, $\mathfrak{H}_1$, through a portion l_1 of the path, another value $\mathfrak{H}_2$ through the distance l_2, etc., then $\mathfrak{H}_1 l_1 + \mathfrak{H}_2 l_2 + \text{etc.} = \frac{4\pi SI}{10}$. This is the form in which the equation is generally used, and is the basis for most magnetic computations. The "line integral of magnetic force," $\int\mathfrak{H}dl$, is called the *magnetomotive force.* In the case of a torus, or anchor ring, wound uniformly with wire carrying a current I, the force is constant along any circle concentric with the ring. If l is the circumference of such a circle, $\int\mathfrak{H}dl = \mathfrak{H}l$, and $\mathfrak{H} = \frac{4\pi SI}{l}$, where I is in C. G. S units. If r is the distance from the center, $l = 2\pi r$ and $\mathfrak{H} = \frac{2SI}{r}$. At any point within the winding $\mathfrak{H}$ is evidently inversely proportional to the distance from the center, and $\mathfrak{H} = 0$ for all points outside of the winding. At a distance r from an infinite straight conductor with current I, $S = 1$, $l = 2\pi r$, and $\mathfrak{H} = \frac{2I}{r}$, for C. G. S. units. In the case of a long solenoid $\mathfrak{H}$ is very nearly uniform throughout the length, and is much greater at points within the solenoid than at points outside. By far the greater work is done in carrying the pole through the solenoid. If $\mathfrak{H}_1$ is the force inside and l_1 the length, we have therefore $\mathfrak{H}_1 l_1 = \frac{4\pi SI}{10}$, approximately. $\mathfrak{H}_1$, as computed from this formula, will always be somewhat greater than the true value. The approximation is close only when the length is great as compared with the diameter. For short solenoids it does not hold.

The Magnetic Circuit.—We see that a current flowing in a conductor creates a magnetizing force in the surrounding region, and the value of this force is given in the equations above. Now, the total number of lines which will be set up through this surrounding medium which constitutes the magnetic circuit depends not only upon the magnetizing force $\mathfrak{H}$, but also upon the permeability of the material composing the magnetic circuit and upon its dimensions.

Electric Analogy.—The analogy between magnetic lines of force and the lines of flow of electric currents was first pointed out by Faraday. So many magnetic phenomena may be more clearly explained by this electric analogy that it is very generally used. If a voltaic cell consisting of a tube with electrodes at each end is placed in a poorly conducting liquid, such as salt water, the current in flowing between the two poles of the cell will be distributed throughout the whole liquid. *If lines of flow*, or *stream lines*, be drawn so that they indicate the direction of the current at every point in the liquid, these lines will be exactly similar to the lines of force of a magnet having the same shape and size as the cell. The number of stream lines per square centimeter will be a measure of the *current density*, just as the number of lines of force in a magnetic field gives the value of $\mathfrak{H}$ or $\mathfrak{B}$. If a good conductor is placed near by, the currents will flow through it in preference to the water, on account of its greater *conductivity*, and the stream lines will be deflected. Similarly a piece of soft iron in a magnetic field will converge lines of force toward itself on account of its greater permeability, as shown under Electricity. A coil of wire carrying a current tends to produce lines of force, just as an electromotive force tends to develop a current. A coil may therefore be said to produce a *magnetomotive force.* The electromotive force in a circuit is equal to the sum of all the differences of electrical potential. The magnetomotive force in a magnetic circuit should therefore be equal to the sum of all the differences of magnetic potential, so that the magnetomotive force of a coil must be equal to $\frac{4\pi SI}{10}$. In a magnet circuit the total induction is equal to magnetomotive force divided by the reluctance, or magnetic resistance. This law for the magnetic circuit is analogous to Ohm's law for the electric circuit.

Law of the Magnetic Circuit.—Prof. Rowland first expressed this law in its mathematical form. The analogy to Ohm's law is obvious. The first member is the analogue of electric current—i. e. the magnetic flux or induction. The second member is the magnetomotive force divided by the *reluctance* or magnetic resistance, and corresponds to electromotive force divided by Ohm's resistance. The *specific*

magnetic resistance (sometimes called reluctivity) of each portion of the circuit is $\frac{1}{\mu}$; when multiplied by the length and divided by the sectional area, this gives the magnetic resistance for each particular portion. The total magnetic resistance, first called *reluctance* by O. Heaviside, is found by summing up these partial resistances; that is, $\mathfrak{B} = \Sigma \frac{l}{A\mu}$. In words the law is: Magnetic flux equals magnetomotive force divided by reluctance, or $\mathcal{N} = \frac{M.M.F.}{\mathfrak{B}}$. The Greek letter ρ is used to denote the specific magnetic resistance $\frac{1}{\mu}$. The word *permeance* or *magnetic conductance* is sometimes used to denote the reciprocal of reluctance. The American Institute of Electrical Engineers (1894) has adopted the following magnetic units: The *gilbert* for the C. G. S. unit of magnetomotive force, the same being produced by 0·7958 ampère-turn approximately; the *weber* for the C. G. S. unit of magnetic flux, sometimes described as the C. G. S. line of flux; the *oersted* for the C. G. S. unit of reluctance; the *gauss* for the C. G. S. unit of flux density, or one weber per square centimeter. Although the laws of the electric and the magnetic circuit are similar in many respects, it must not be supposed that the analogues hold throughout. It requires no energy to maintain the magnetic flow when once established; there is therefore no analogy to Joule's law for the energy which is continually dissipated in heat during the flow of current. There is a difference, too, between electric resistance and magnetic resistance or reluctance, inasmuch as the former is approximately constant for ordinary ranges of current, while the value of the reluctance of a magnetic current depends upon the value of the magnetic flux.

If two paths are open for lines of force they will divide just as an electric current would do between two wires. In a circuit made up of masses of iron of different dimensions and qualities, the total magnetic resistance, *for the particular induction used*, may be computed by summing up the separate resistances, just as in the case of an electric circuit.

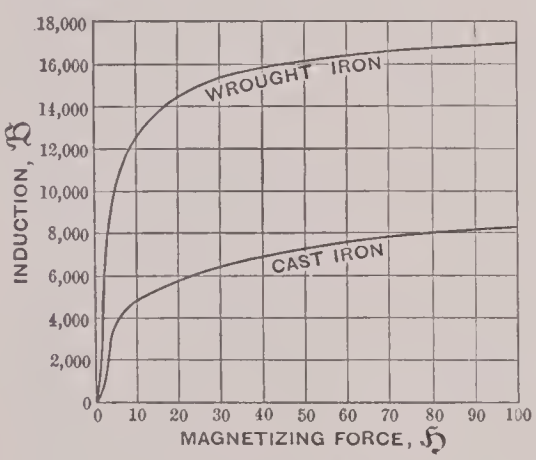

FIG. 1.—Curves of magnetization.

The Magnetic Properties of Iron.—(For complete treatment see Ewing, *Magnetism of Iron.*) The magnetic properties of iron are best shown by curves of magnetization which show the relation between the magnetic induction and the magnetizing force. Such curves for cast and wrought iron are shown in Fig. 1, from experimental data obtained by Hopkinson and given in the accompanying table:

Wrought iron.			Cast iron.		
$\mathfrak{B}$	μ	$\mathfrak{H}$	$\mathfrak{B}$	μ	$\mathfrak{H}$
5,000	2,500	2·0	4,000	800	5·0
9,000	2,250	4·0	5,000	500	10·0
10,000	2,000	5·0	6,000	279	21·5

For any point on one of the curves the abscissa represents the value of the magnetizing force $\mathfrak{H}$ in C. G. S. units, and the ordinate the corresponding value of the induction $\mathfrak{B}$. If a line be drawn from a point on the curve to the origin, the tangent of the angle which this line makes with the horizontal is a measure of the permeability; that is, the ratio of $\mathfrak{B}$ to $\mathfrak{H}$. In the case of wrought iron, we see from the curve that as $\mathfrak{H}$ increases from 0 to 1 C. G. S. units, the induction increases in about the same ratio, the permeability being comparatively small and nearly constant. As $\mathfrak{H}$ becomes still greater, $\mathfrak{B}$ is found to increase more rapidly, and the permeability increases suddenly to a very high value. This continues until $\mathfrak{H}$ has reached the value of about 15, after which the permeability begins to diminish, and any further increase of $\mathfrak{H}$ produces only a comparatively small increase of $\mathfrak{B}$. When this condition of affairs is reached, the iron is said to be *saturated*. Up to the present time no experimenter has succeeded in producing absolute saturation, although the induction has been carried to over 40,000 with the permeability between 1 and 2. There are theoretical reasons for believing that a limit exists to the intensity of magnetization which can be reached. The induction can always be increased with the increase of $\mathfrak{H}$, for $\mathfrak{B} = \mathfrak{H} + 4\pi\mathfrak{J}$. If, after a piece of iron has been magnetized, the magnetizing force is gradually reduced again to zero, and the corresponding change in $\mathfrak{B}$ observed, we obtain what is known as the *descending curve of magnetization*. It is found that the value of $\mathfrak{B}$ corresponding to a given value of $\mathfrak{H}$ is always greater when the magnetization is decreasing than when it is increasing—i. e. the descending curve lies above the ascending. The amount of magnetization remaining in a piece of iron after the magnetizing force is removed is called the *residual magnetism*. Its amount in the case of any given sample of iron is found to depend not only on the quality of the iron, but on the shape of the specimen. A short bar, for example, on account of the demagnetizing influence of its induced poles, will show very little residual magnetization; while a ring of iron, even though quite soft, will remain strongly magnetized for a long time after the magnetizing force has been withdrawn. Since, in the latter case, the magnetic circuit is closed, there are no poles to exert a demagnetizing influence. Fig. 2 shows the behavior of a ring of soft iron when carried through a complete cycle of magnetization; i. e. $\mathfrak{H}$ is first carried to a maximum in the positive direction, then reduced to zero and carried to an equal negative value, and finally brought again to zero. After this process has been repeated several times the curve will be found to repeat itself. The residual magnetism of the specimen is shown by the line OM or OM′. The value of $\mathfrak{H}$ which is required to destroy this residual magnetism is called the *coercive force*, and is given in the figure by ON or ON′. The residual magnetism of soft iron is very high (from 70 to 90 per cent. of the total induction), but on account of its small coercive force a short bar of iron will retain scarcely any magnetization after the magnetizing force is removed. Cast iron and steel show considerably less residual magnetism than soft iron when in the form of rings (40 to 60 per cent.); but when in the form of bars, their high coercive force enables them to retain more residual magnetism than iron. For small magnetizing forces (less than 1 C. G. S.) the permeability of soft iron is very small, e. g. about 150 in one case. The residual magnetism in such cases is also a very small fraction of the total induction. The residual magnetism for a wrought-iron ring is shown in Fig. 3. The magnetic properties of a metal may also be shown by curves which show the value of the permeability for different values of the magnetizing force or the magnetic induction. In

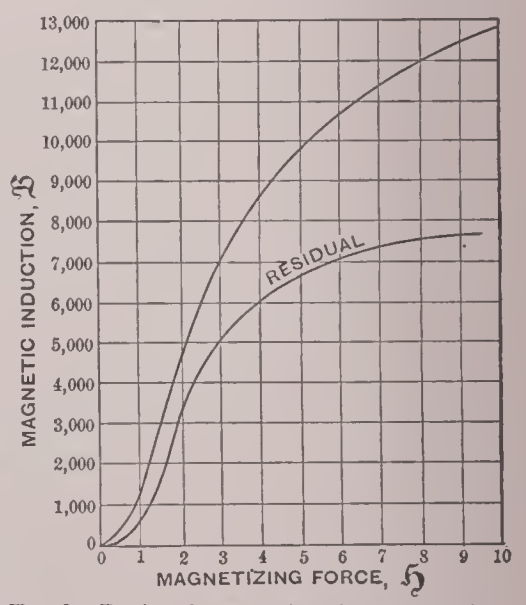

FIG. 3.—Residual magnetism in wrought-iron ring.

Fig. 4 a curve (Rowland) is given showing the permeability of a ring of Norway iron for different values of the induction. The specific magnetic resistance (the reciprocal of μ) may likewise be plotted as a function of $\mathfrak{B}$ or $\mathfrak{H}$. Curves are sometimes used showing the relation between the intensity of magnetization $\mathfrak{I}$ and the magnetizing force, but these differ but little from those showing the relation between $\mathfrak{B}$ and $\mathfrak{H}$. The curves here given are typical, but the results will, for different specimens of iron, vary through more or less range according to the chemical composition and process of manufacture.

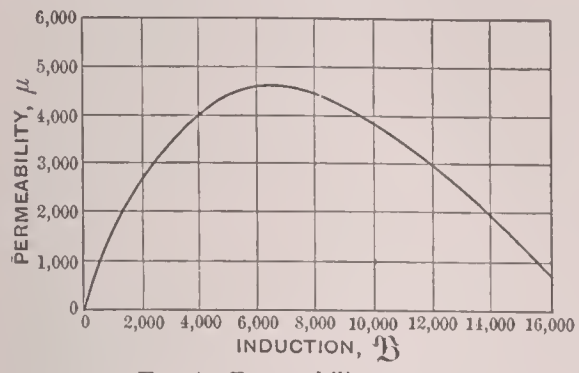

Fig. 4.—Permeability curve.

Hysteresis Loss.—When a current flows in a circuit, energy is stored up in the magnetic field. When the current ceases to flow, all this energy is restored to the circuit if there is no neighboring magnetic material; but if the field is in part set up through iron or other magnetic substance, some of the energy is dissipated in hysteresis, increasing the molecular energy of the iron, and only part is restored to the circuit. For any cyclic change in the magnetization of iron, the curve showing the relation between the intensity of magnetization and the magnetizing force forms a loop, the area of which, namely, $\int \mathfrak{H} d\mathfrak{I}$, is a measure in ergs of the energy dissipated per cycle per cubic centimeter. If the curve is drawn so as to show the relation between $\mathfrak{B}$ and $\mathfrak{H}$, as in Fig. 2, then the energy dissipated per cycle is $\frac{1}{4\pi}\int \mathfrak{H} d\mathfrak{B}$. The persistence of the magnetic state due to hysteresis causes the rate of change of magnetization to be slow immediately after a reversal of the magnetizing force. This is shown by the nearly horizontal direction of the curve after reversal; at this time $\frac{d\mathfrak{B}}{d\mathfrak{H}}$ may be less than 200, whereas it is often over 14,000 at the steepest portion of the curve. After a loop is formed (Fig. 5) by the removal and reapplication of the magnetizing force, when the magnetizing force is increased up to its old value, the magnetization usually has a higher value than before. A loop higher than the first is found by a second removal and reapplication of the force; the process becomes cyclic after several repetitions. Evidently, on account of hysteresis, $\mathfrak{B}$ and $\mathfrak{I}$ are not simple functions of $\mathfrak{H}$. For one value of $\mathfrak{H}$ we may have any value of $\mathfrak{B}$ and $\mathfrak{I}$ within the hysteresis loop. Moreover, the gradient at any point is not fixed. When iron is perfectly demagnetized the direction of the curve, i. e. its initial permeability, depends upon the direction by which it was brought to zero. In Fig. 6 compare the solid curve A′ B′ O C′, in which B′ O C′ is reversed at zero, and A B O C, in which B O C is continuous through zero. The greater permeability, indicated by the slope O C being greater than that of O C′, shows a greater readiness of the curve to pass continuously through zero. This *prejudice* of the iron can not be known without a knowledge of its previous history. It may be removed by demagnetization by reversals. Steinmetz has experimentally investigated the subject of hysteresis loss, and has formulated the following experimental law: The hysteresis loss per cubic centimeter per cycle $= \eta\left(\frac{\mathfrak{B}_1 - \mathfrak{B}_2}{2}\right)^{1.6}$, where η is a constant coefficient dependent upon the material, and $\mathfrak{B}_1$ and $\mathfrak{B}_2$ are the limits of magnetization. For soft iron η is ·002 approximately. With the value $\eta = ·002$ above, the energy lost per cubic centimeter per cycle for $\mathfrak{B} = 16{,}000$ is 10,657 ergs $= \frac{1}{4\pi}\int \mathfrak{H} d\mathfrak{B} = \int \mathfrak{H} d\mathfrak{I}$. The rate of expenditure of energy depends upon the rapidity of reversal. Let n = complete reversals per second; then watts $= \frac{\text{ergs per sec}}{10^7} = \frac{n}{10^7}\int \mathfrak{H} d\mathfrak{I}$. If $n = 100$ reversals per second, and $\int \mathfrak{H} d\mathfrak{I} = 10{,}000$ ergs per cubic centimeter per reversal, the expenditure of energy is ·1 watt for each centimeter of volume, or 13 watts per kilogramme, or 59 watts per pound. These figures apply to good soft iron taken through the complete range of magnetization 100 times per second. In exceptionally good specimens the loss is below these figures, and in some cases is half as much again. The losses in cast iron magnetized to saturation are three or four times as much. The losses for nickel and cobalt are between wrought and cast iron. Steel losses vary from those given above to five or six times as much. Hopkinson found loss twenty times as much in an exceptional piece of oil-hardened steel containing carbon, tungsten, and manganese. These last data are for high magnetization reversals. *The amount of energy stored in a field* at any time is shown by the area $\int \mathfrak{H} d\mathfrak{B}$, included between the $\mathfrak{B}$-axis and the curve of magnetization, as shown by the shaded area in Fig. 7. $W = \frac{1}{4\pi}\int \mathfrak{B} d\mathfrak{H}$ per cubic centimeter.
