Foucault Currents.—If a mass of conducting material be moved in a magnetic field currents will, in general, be induced by the movement in it. These currents are called *foucault* or *eddy currents*, and always give rise to a waste of energy. Since the electromotive force induced by the motion is proportional to the speed, and since the eddy currents are proportional to the electromotive force, the heat developed must vary as the square of the speed, other things being equal. The loss of energy due to foucault currents is also proportional to the conductivity of the moving material. Eddy currents are developed in stationary masses by any change in the number of lines through them. The lamination of armature-cores, transformer cores, etc., is in order to prevent as far as possible the development of eddy currents and the consequent loss of energy. Steinmetz formulates an empirical law for the losses due to "eddy" or "foucault" currents induced in the iron by a reversal of magnetization: thus *eddy current* loss per cubic centimeter per cycle $= \epsilon n\left(\frac{\mathfrak{B}_1 - \mathfrak{B}_2}{2}\right)^2$, where ϵ is a constant dependent upon the material (about 75×10^{-6} for well-laminated soft iron), n is the frequency of complete reversal, and $\mathfrak{B}_1$, $\mathfrak{B}_2$ the limits of magnetization as before. The losses caused by the reversal of the magnetization of iron are of importance in connection with the construction of armatures for dynamos and motors. In these the magnetization is reversed for every revolution of the armature. Foucault currents and hysteresis are undesirable for two reasons: First, on account of the rise of temperature caused thereby; and second, on account of the energy dissipated and the consequent decrease in efficiency. Foucault currents may be reduced by lamination, but not so hysteresis, which can only be reduced by improving the quality of the iron. These losses due to reversal of magnetization become important in the case of alternating current apparatus in which the magnetization is reversed for every alternation, thus passing through a cycle perhaps in the one-hundredth of a second.

Effects of Physical Change upon Magnetic Substances.—Temperature changes have a marked effect which is different for different degrees of magnetization. Above a certain critical temperature iron is non-magnetic. At this point marked molecular changes take place, and the values of many of the physical constants change abruptly. In cooling, a generation of heat takes place as this critical point is passed, and for a short time the temperature remains steady or rises slightly and the iron becomes a brighter red, although it is all the time radiating heat. This phenomenon is called *recalescence*. Under a weak magnetizing force the permeability increases at first gradually, with the temperature, then suddenly, until the temperature 775° is reached, when

it quickly drops to zero at 785°. Beyond this point it is non-magnetic. This is shown in Fig. 8, curve I., for $\mathfrak{H} = 0{\cdot}3$.

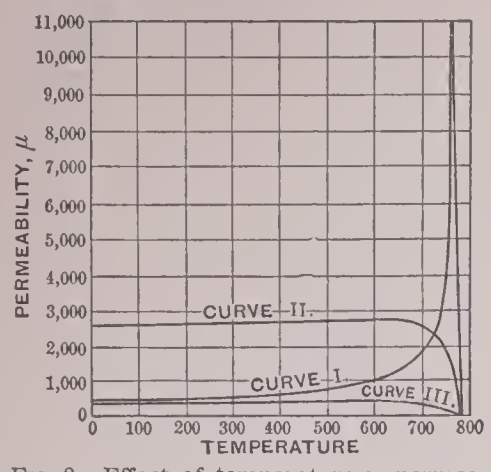

Fig. 8.—Effect of temperature on permeability.

For strong magnetizing forces the permeability changes but little with the temperature, but finally falls off to zero at 785°. In curves II. and III. in Fig. 8 is shown the variation in permeability for magnetizing forces of 4, and 45 C. G. S. units, respectively. Stress produces change in magnetic qualities, these effects being more marked in the case of hardened than annealed iron. A moderate pull increases the permeability when magnetization is weak, but decreases it when strong. A strong pull always decreases the permeability. After stretching the permeability is less. Pressure decreases permeability. Vibration diminishes all residual actions, and facilitates the rearrangement of the molecules so that the body is more free to assume a new state; thus there is little difference in the ascending and descending curves of magnetization. This effect is greater in soft than in hard iron. It is very great when the magnetizing force is small, but is scarcely noticeable in strong fields. Although an appreciable time is taken in changing the magnetization of a piece of iron, the *time-lag* is small, and is of little practical importance. Such effect is shown by the curves in Fig. 9 for the magnetizing force of $\mathfrak{H} = {\cdot}081$ and ·035.

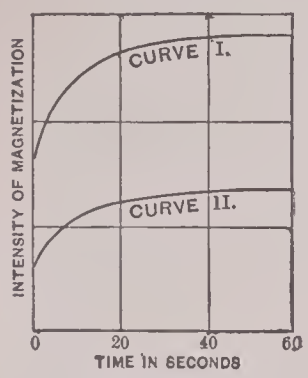

Fig. 9.—Increase of magnetization with time.

Experimental Determination of Curves of Magnetization.—The ways of determining the magnetic properties of a piece of iron are many and various, some being valuable for their accuracy and others for their convenience. They consist in determining, either directly or indirectly, the amount of magnetization produced by a certain magnetizing force. Pieces of various shapes are used in the different methods, and more or less error from the demagnetizing effects of the ends may be introduced. To avoid these errors we may employ (1) an endless piece, as a ring, with uniform section and winding; (2) a rod with ends far removed (for instance, with the length equal to 400 times its diameter), in which the effects of the ends are negligible; or (3) a long ellipsoid in which correction can be made for the demagnetizing effect. Ellipsoids are hard to shape and so are scarcely practicable, but when they are used they should be quite long, inasmuch as slight irregularities produce large errors in the case of short ones. The correction for a long rod is practically the same as for an ellipsoid.

Magnetometric Methods.—These methods are among the oldest, being due to Müller, but are now little used. A magnetized bar or an ellipsoid is placed near the magnetometer-needle, from the deflection of which the intensity of magnetization may be calculated. In these methods the forces due to the magnetized bar deflect the needle against the directive force of the earth's field, which must therefore be known for absolute measurement.

Balance Methods.—In these methods the magnetometer-needle is acted upon by an unknown force due to the piece of iron being tested, and also by a known force from a compensating magnet. These are usually adjusted differentially so as to give no deflection. In this class may be placed Hughes's magnetic balance, Eickemeyer's differential magnetometer, etc.

Edison's Magnetic Bridge.—A magnetic bridge similar to the Wheatstone bridge for measuring resistance has been devised by Edison for determining the magnetic properties of iron. The ends of the bridge are subjected to a difference of magnetic potential. The four arms are of iron and are adjusted until a magnetometer-needle across the middle of the bridge shows no deflection, and indicates no difference of magnetic potential.

Tractive Methods.—Various devices of divided rings and divided bars have been used by which the tractive force can be measured and the value of $\mathfrak{B}$ obtained. They are not capable of a high degree of precision, but are convenient for ready calculation. S. P. Thompson has devised an instrument, which he terms a permeameter, based upon this principle.

Ewing's Magnetic Curve Tracer.—Prof. Ewing has devised an automatic instrument for determining the relation between $\mathfrak{B}$ and $\mathfrak{H}$. The instrument is shown in Fig. 10, and consists of a mirror which may be given a vertical and a horizontal movement, shown by a spot of light on a screen. The horizontal movement is made to depend upon the magnetizing current of the test-piece, and is therefore a measure of $\mathfrak{H}$. The magnetization $\mathfrak{B}$ is shown by the vertical motion which is obtained by a wire carrying a constant current, which is drawn into a slit in the magnetic circuit as the induction increases.

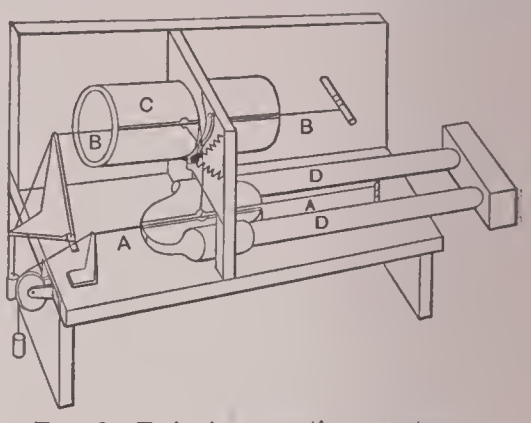

Fig. 10.—Ewing's magnetic curve tracer.

Ballistic Method.—This method is due to Weber, and is the one in most general use. The induction in the test-piece is made to vary through any cycle desired by a series of "steps," each change being produced by a sudden variation in the magnetizing current. The instantaneous current induced in a "secondary" coil surrounding the test-piece is then measured by means of a *ballistic galvanometer*, and is proportional to the change in N that produced it. The test-piece may be in the form of a long rod, but more commonly the magnetic current is completely closed and the sample is in the form of a ring. Now, if the rush of current takes place almost instantaneously (as will be the case unless the specimen is without lamination, and so large that the change in N is retarded by eddy currents), the throw of the ballistic galvanometer (for small deflections) will be proportional to Q. $\mathfrak{H}$ can be computed from the strength of the magnetizing current; $\mathfrak{B}$ can of course be obtained from N, if the cross-section is known. To reduce the specimen to a non-magnetic condition, before beginning the test it should be annealed; or, if this is not convenient, it may be *demagnetized* by *reversals*. The latter process consists in sending an alternating current through the magnetizing coil, beginning with a rather large value and gradually reducing it to zero by introducing resistance. The same result may be accomplished by using a continuous current, which is reversed by hand and at the same time gradually reduced in intensity. The maximum current should be greater than any current that has previously been used to magnetize the specimen. Unless the iron is quite hard, this treatment will reduce it to a neutral condition.

In determining hysteresis loops, the iron should be carried through several complete cycles before beginning the observations, in order to make sure that the curve will repeat itself. Preliminary demagnetization is unnecessary. For ordinary "ascending curves" of magnetization, however, it is very important that the specimen should originally be in a neutral condition, otherwise the curves obtained will be distorted and useless. Care must be taken in using the method of "steps" to make the changes of current continuous. While going up the curve, for example, the current should not be diminished or broken, even for an instant. The resistance-box by which the current is varied must be constructed with this point in view. A modification of the ballistic method is sometimes used, in which N is determined from the throw of the needle that is obtained when the magnetizing current is suddenly reversed. In this case the throw is proportional to $2N$. In the case of hard iron there is some danger of this method leading to incorrect results, but with soft specimens it is often more convenient than the "step" method. Hopkinson has devised an apparatus consisting of a divided bar and a yoke; the induction is measured by separating the two parts of the

bar and allowing the test-coil to be drawn suddenly away by means of a spring.

Theory of Magnetism.—Inasmuch as the phenomena of magnetization are manifested chiefly upon the surface, it is natural that one of the earliest theories should be that in which magnetism is considered as being caused by two fluids of opposite polarity distributed upon the polar surface. As in the theories of electricity, it was supposed that these fluids were equal in amount, and in an unmagnetized bar combined and annuled each other. In accordance with this fluid theory, magnetization consisted in the separation of the positive and negative magnetisms to the two poles. Such a theory is now abandoned, although commonly used to explain certain phenomena as forming a convenient mathematical conception in the solution of certain problems. It is now well known that the magnetic state is continuous throughout the whole magnet, for the smallest pieces into which a magnet may be broken will exhibit magnetic polarity. We may suppose, therefore, that if we subdivide the magnet into separate molecules, each will itself be a magnet with a north and south pole. The question then presents itself, of what does the process of magnetization consist? Poisson explains the process as consisting of the magnetization of each molecule separately; the molecules are fixed in position, and become magnets only when the bar is magnetized. According to Weber, each molecule is always a magnet, whether the bar as a whole is magnetized or not; in an unmagnetized bar, these have no regularity of arrangement, and therefore exhibit no resultant polarity. The application of a magnetizing force rotates these molecular magnets until their axes are more or less parallel. In the interior of the magnet the molecules are so arranged that each north pole is adjacent to the south pole of a neighboring molecule. This theory of Weber, or a modification of it, is the one now commonly accepted. As to the cause of the polarity of each separate molecule, we can reach no definite conclusion. Ampère, one of the earliest experimenters in electro-magnetism, conceived the idea that circular currents are continually flowing in each molecule. When the molecules are brought into an orderly arrangement by the application of a magnetizing force, the currents in any two adjacent molecules in the interior of the magnet will be in opposite directions, and will therefore neutralize each other. The currents on the outside of the magnetized bar will, however, be unneutralized, and the magnetization is seen to be the same in effect as a current of electricity flowing around the bar as a whole. Any theory of magnetization to be adequate must explain the observed phenomena, including saturation, residual magnetism, hysteresis, etc. Inasmuch as the application of a small magnetizing force does not immediately magnetize the bar to saturation, it is evident that the molecules are moved against some constraining force. Weber supposed the existence of some directive force by which the molecules were constrained to remain in the positions they originally occupied in the unmagnetized bar. Maxwell extended Weber's hypothesis by assuming that the deflected molecules acquire a permanent set, thus accounting for the phenomenon of hysteresis. Some have explained the resistance to molecular movement as being the resistance due to friction; but if this were so we would not expect any magnetization to result from small magnetizing forces, and we would expect that after a bar had been once magnetized the molecules would remain in their deflected position even after the removal of the magnetizing force.

Ewing's Theory.—Ewing explains the phenomenon of magnetization by means of the molecular magnets of Weber and Ampère, under the assumption of directive force due to their own mutual actions. By this hypothesis he explains the known facts and interprets the curve of magnetization

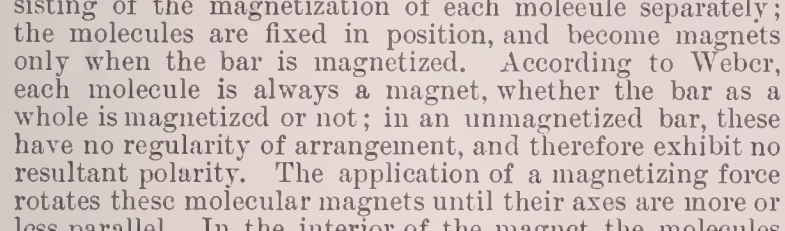

FIG. 11.—Stages of magnetization.

in a satisfactory manner. By this theory the molecules in an unmagnetized bar would be in a state of equilibrium, as far as their mutual attractions and repulsions are concerned, as is illustrated in Fig. 11(*a*), where the simple case of a group of four molecules is represented. Suppose now that a small magnetizing force $\mathfrak{H}$ be applied, as represented in Fig. 11(*b*), the magnets will be slightly deflected from their initial position, but will still be in a state of equilibrium. As the magnetizing force increases, this deflection increases until a point is reached, whereupon the molecules fly around into such a position as that in Fig. 11(*c*). As the magnetizing force is further increased the elementary magnets would tend to turn into a direction parallel with it, but would be restrained by their own mutual actions. Saturation would only be attained when this condition of parallelism is reached. Of course, in an actual magnet the grouping would be much more complex than the simple one here described. Certain groups of molecules would swing around from one state of equilibrium to another before other groups, according to their relative positions. This theory accords well with observed phenomena; for small magnetizing forces the magnetization is small, and there is scarcely any residual magnetism. This means that the molecules are turned but little from their initial position, and return to it when the magnetizing force is removed. This stage is one of equilibrium. The succeeding stage, for an increasing magnetizing force, is the one in which the several groups are swinging around into approximate parallelism with the magnetizing force, and is one of unstable equilibrium. The third stage begins after all the groups are more or less parallel with the magnetizing force, and here an increase in magnetizing force can increase the magnetization but little. When the magnetizing force is removed, many of the groups remain nearly in the position in which they were left, residual magnetism being thus accounted for. The ascending and descending curves of magnetization, therefore, do not coincide, that is, there is hysteresis. When a molecule is swung around from one position of stable equilibrium to another, it oscillates back and forth, and finally comes to rest when this motion has been damped by the eddy currents it set up. The energy lost by hysteresis is thus explained. The readiness with which a bar responds to a magnetizing force when tapped or vibrated is accounted for by the fact that the molecules are more free to move on account of the vibration. The increased permeability of a piece of iron when heated is due to the vibration of the molecules which the heat produces. As the heating is increased the vibration of each molecule increases, and finally becomes a rotation at that temperature at which the iron becomes non-magnetic. The *time-lag* in magnetization is explained by the fact that the molecular groupings are broken down by degrees, one molecule swinging around first, and then others in rapid succession. The theory of magnetism thus briefly outlined has been carefully worked out by Prof. Ewing. It is not necessary to explain the nature of the molecular magnets. Objection has been raised to Ampère's theory of circular currents; for, how are these currents maintained? They are not supplied with energy from any external source, and to maintain a flow of current against a resistance necessitates an expenditure of energy. To many this objection seemed fatal, but Lodge boldly explains it by saying that the resistance of a molecule is nil, and that it is no more preposterous to assign to a molecule an infinite conductivity than an infinite elasticity, as is universally done. We end, then, as we began, by recognizing the close correlation of magnetism and electricity. Our hypotheses explain not what electricity and magnetism actually are, but how they act and are manifested; that hypothesis is accepted as best which best accords with known facts, and any hypothesis must be considered simply as tentative, to be replaced by comprehensive theory, as we acquire increased ability to look into the secrets of nature.

FREDERICK BEDELL.

Magnetism, Terrestrial: In order that the development of the subject of terrestrial magnetism may be understood, since the time of the discovery of the directive influence of the earth on the compass-needle, it will be necessary to consider briefly the magnetic conditions surrounding a spherical magnet. It has been found that the earth may be treated as a great magnet, so far as its action upon a freely suspended needle is concerned. Take first an ideal sphere magnetized homogeneously throughout its substance, and the distribution of the magnetic forces will be as indicated in the diagram, which is the section of a magnetized sphere along its axis of polarization.

A polarized sphere may be treated as if it had one of its hemispheres, marked + in the figure, covered with positive

magnetic matter, and the other, marked —, covered with negative magnetic matter. The lines of magnetic force originate in the surface of the positive hemisphere, and proceed to the surface of the negative hemisphere along two sets of

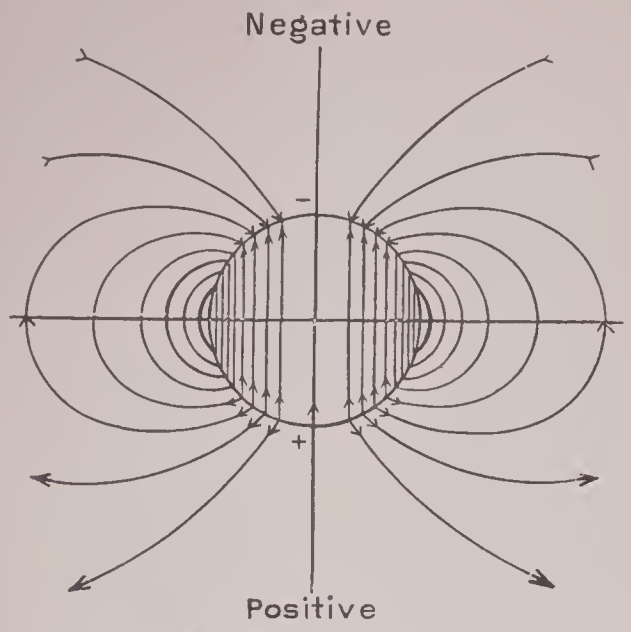

FIG. 1.—Section of a magnetized sphere along its axis of polarization.

paths, on the outside in wide sweeping curves, as indicated, and on the inside in straight lines parallel to the axis of magnetization.

If V_i represents the magnetic potential in the inside of the sphere, V on the surface, V_e in the space exterior to the sphere, (r,θ) the polar co-ordinates of any point, then

$V_i = \frac{4\pi}{3} Cr \cos\theta$ inside the sphere, $V = C \cos\theta$ on the surface of the sphere, $V_e = \frac{4\pi}{3} CR^3 \frac{\cos\theta}{r^2}$ outside the sphere, where C is a constant showing how strongly the sphere is magnetized, and R is the radius of the sphere. These satisfy the fundamental differential equation

$$\frac{dV_i}{dr} - \frac{dV_e}{dr} + 4\pi V = o.$$

The equation for the lines of force is

$$N = \frac{8\pi}{3}(\pi R^3 V_o)\frac{\sin^2\theta}{r};$$

and for the corresponding equipotential surfaces,

$$V = \frac{4\pi}{3}(R^3 V_o)\frac{\cos\theta}{r^2},$$

N representing the order of a line of force, and V_o the surface density of magnetic matter, on the axis at the surface of the sphere. Important derived formulas are, $\tan I = 2\cos\theta = 2\tan\phi$, where I is the angle with the tangent to the surface at which the line of force pierces it, called *the inclination*, ϕ the magnetic latitude, and θ the magnetic polar distance.

The tangential component of force, $F_t = \frac{4}{3}\pi.CR^3\frac{\sin\theta}{r^3}$.

The normal component of force, $F_n = \frac{8}{3}\pi.CR^3\frac{\cos\theta}{r^3}$.

The polar component of force $F_p = -\frac{4}{3}\pi.CR^3\frac{(1-3\cos^2\theta)}{r^3}$.

The equatorial component of force, $F_e = \frac{4}{3}\pi.CR^3\frac{3\sin\theta\cos\theta}{r^3}$.

The moment of the sphere, $M = \frac{4}{3}\pi Cr\cos\theta$.

The whole quantity of magnetism, $m = (2\pi R)^2 C$.

For the purposes of drawing a typical diagram these simple forms suffice, $V_i = r\cos\theta$, $V_e = \frac{\cos\theta}{r^2}$, as has been the case in Fig. 2 (given on page 469). This theoretical case is analogous to the magnetic condition of the earth. The southern hemisphere is positively magnetized, and the northern hemisphere is negatively magnetized, and hence the magnetism is called respectively austral magnetism in the southern and boreal magnetism in the northern. The property of a magnet, freely suspended in a magnetic field, is to take up a direction parallel to the lines of force of the field, and in such a position that the positive end of the magnet is nearest the region of negative potential, while the negative end of the magnet is nearest the region of positive potential of the field. Then starting at the surface of the earth in the southern hemisphere, the free magnet will point above the horizon, with which it will make an angle of negative inclination, called $-I$; on traveling along this line of force till it reaches its point of entrance at the surface of the northern hemisphere, the same needle would point downward, and make with the plane of the horizon an angle of positive inclination, $+I$. Thus the positive end of a free needle is called the north-seeking and the negative the south-seeking, because if disturbed from the direction of the line of force it will seek to resume the position just indicated.

There is another method of regarding this matter, related closely to the forces of repulsion involved. All the material in the universe seems to divide itself into two general classes, first, that in which the parts attract each other, in accordance with Newton's law of gravitation, $+\frac{mm'}{d^2} = f_a$; and second, that in which the parts repel each other, in accordance with the same law, $-\frac{mm'}{d^2} = f_r$, f_a and f_r representing the forces of attraction and repulsion, respectively. Electricity and magnetism include this latter case. Suppose an isolated positive pole (which it is impossible to produce in practice) were situated at any point of one of the lines of force indicated in the diagram, it would tend to travel along this line under the force of repulsion, just as an attractive particle of matter tends toward the center of gravitation. Thus it is proper to employ all the mathematics of the composition and the resolution of forces in the case of repulsion, just as in the case of attraction. Every line of force has a repulsion at each point peculiar to itself, and the equal repulsions may be marked out by equipotential surfaces. If we take a unit length of the line of force at the surface of the earth, in which the magnet lies, it may be considered as having a certain total intensity T, resolvable into two components, first, H, horizontal along the magnetic meridian, positive to the north continuously; and second, V, vertical along the normal, positive upward in the southern hemisphere, and positive downward in the northern hemisphere, as the preceding formulas indicate; or V may be best taken positive downward in the northern and negative upward in the southern hemisphere, to conform to the conventional values of the inclination I. There has been great diversity of use among magneticians regarding the choice of co-ordinates and absolute units of measurement, but it is believed that the system of co-ordinates here indicated is the most suitable. For systems of units there have been extensively used the following:

Foot-grain-second (F. G. S.), called the British units.

Millimeter-milligramme-second (M. M. S.), called the metric unit.

Centimeter-gramme-second (C. G. S.) unit.

There are also others which occur in Gauss and in German authors.

The following table gives the factors for transformation from one system to the other:

TABLE GIVING THE NUMERICAL FACTORS FOR PASSING FROM ONE SYSTEM OF UNITS TO ANOTHER.

SYSTEM OF UNITS.	Gauss.	Common use.	British.	Metric.	C. G. S.	Example.
Gauss.....	1·0	0·001	0·0075776	0·0034941	0·00034941	1357·0
Common use	1000·0	1·0	7·5776	3·4941	0·34941	1·357
British.....	131·97	0·13197	1·0	0·4611	0·04611	10·283
Metric.....	286·2	0·2862	2·1687	1·0	0·1	4·7414
C. G. S.....	2862·0	2·862	21·687	10·0	1·0	0·47414

It is agreed that the C. G. S. system shall be the one adopted in magnetic science for the future, and all values should be reduced to it. Modern observations are for the most part found in (F. G. S.) British, (M. M. S.) metric, and (C. G. S.) units, and hence the factors are 0·04611 for the (F. G. S.), and 0·1 for the (M. M. S.) systems. Great confusion exists in published magnetic observations by reason of the different systems of units, systems of time for observations, and systems of prineiple for the instruments. The latter will be explained in a later paragraph. Under time it is noted that some use: Local mean time; local mean time, astronomical reckoning; Göttingen mean time; local mean time, with correction to the nearest hour of even Göttingen time. The influence of Gauss and Weber was such that Göttingen received an undue prominence as the center from which magnetie times should be reckoned for the purpose of simultaneous observations, as in the stated intervals of the so-called "term days." It would be better to use Greenwich

mean time for such purposes, because of its adoption in astronomical and civil reckoning, and because magnetic phenomena have certainly an astronomical side to them.

In the same way magnetic latitudes and longitudes were taken on a different system from the astronomical and geographical co-ordinates, but they should be restored to the common system. Gauss used u = north polar distance, λ east longitude, and r distance from the earth's center, X in the meridian north, Y perpendicular east, Z positive upward. Maxwell uses X to the north, Y to the west, Z upward; but, as already indicated, the best system is $H = T\cos I$, $V = T\sin I$, the convention being that I is positive in the northern and negative in the southern hemisphere. At the same time the convention for D (declination) is positive to the west and negative to the east, so that the azimuth rotation is N. W. S. E.

The magnetic poles of the earth do not coincide with the poles on the axis of revolution, and therefore a complication is introduced into the conditions by the simultaneous existence of these two polar systems. The positions of the magnetic poles are not very well determined at any epoch, though several attempts have been made to define them both by computation and by observation.

It will be seen that the location of the poles is derived almost exclusively from computation, and that they are not accurately known. The poles themselves are supposed to be changing along the surface of the earth, and it is therefore necessary to locate them carefully at some epoch in order to know the rate of such motion.

The combination of the two systems is shown in Fig. 2.

Let NAS represent the meridian on which a northern station, A, is located; NBS the meridian on which the station B is situated, such that the same wide sweeping line of force, BOA, passes through each: If D is the declination, positive west; if I is the inclination, positive below horizon; if T is the total intensity, positive along the line of force; if H is the horizontal component, positive northward; and if V is the vertical component, positive downward, the relative positions at the two stations are illustrated on the diagram by the arrow-lines.

In order to show the type of changes through which these elements pass in different parts of the earth, a table compiled for the most important observatories, where more or less continuous observations have been made, given for the epoch of the mean observations, is added.

Such observations with portable instruments have been made in widely extended regions of the earth as permit the construction of charts, showing by means of continuous curves the places where a given element has the same values. These curves of equal declination, and equal inclination, and of equal horizontal, equal vertical, and equal total forces, have been constructed by magneticians, notably by Gauss, Erman and Petersen, Airy, Schott, and Neumayer. Those for equal declinations are especially useful in navigation, and all the sailing charts furnished by hydrographic

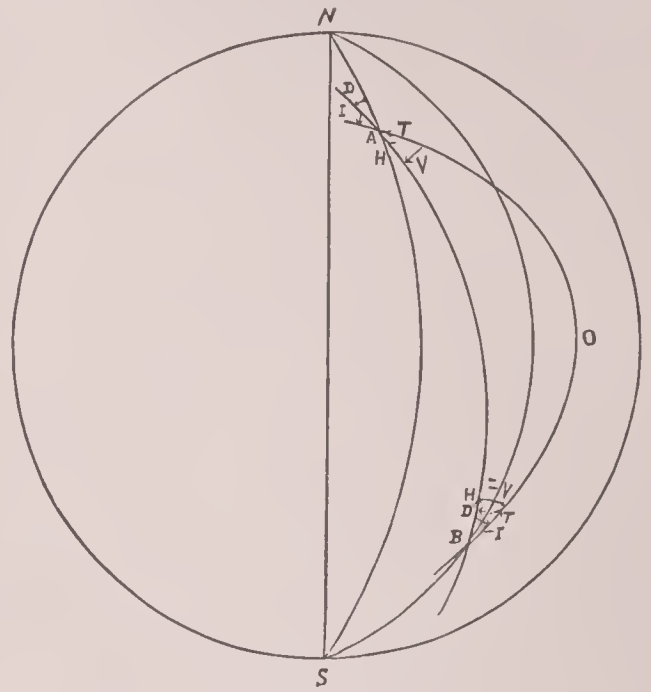

FIG. 2.

offices have the lines of equal declination marked upon them, so that the deviation of the compass direction, which is that of the horizontal component, may be allowed for in the navigation of vessels.

Neumayer's chart of equal declinations for the year 1890, which faces this page, will serve as a specimen.

The magnetic meridians form continuously varying angles

with the geographical meridians, as likewise the magnetic equator with the geographical equator. The maps from

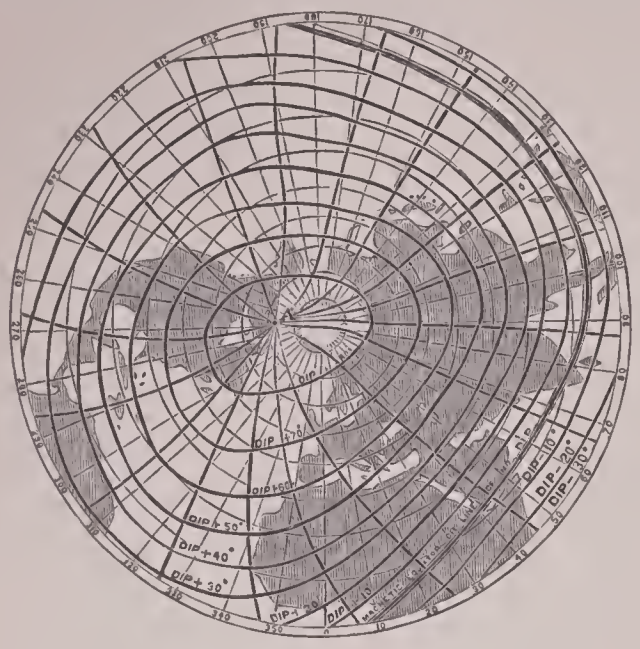

FIG. 3.—North magnetic pole.

Gauss for the year 1829 represent the magnetic meridians, and also the lines of equal inclination, or dip, as this angle is often called.

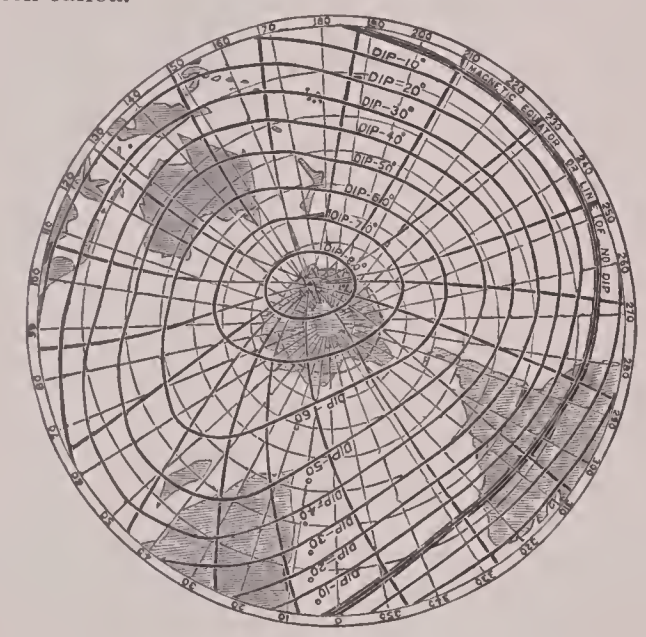

FIG. 4.—South magnetic pole.

The map by Airy exhibits the dip and the total intensity in a comparative way. Airy used the word blue to represent positive and red to represent negative magnetism.

The general magnetic distribution, as seen by the lines

FIG. 5.—Magnetic dip and intensity.

upon the charts, is a very complicated matter. The chief points in the phenomena may be briefly summarized:

1. The surface of the globe is divided into two hemispheres of easterly and westerly declination, the meridians of no declination being about 180° apart.

2. The declination increases with the latitude from the magnetic equator to the poles in latitude about 72° north and south.

3. There is a large area of small declination in the Asiatic continent called the Siberian area, and another in the Pacific Ocean near the equator called the Pacific area. These bear some relation to wide expanses of land and of ocean controlling the amount of the deflection.

4. The inclination is greater in the regions containing the magnetic poles than in regions of similar latitude on the opposite sides of the hemisphere.

5. The magnetic equator intersects the geographical equator in two nodes 180° apart, and has a maximum divergence of nearly 17° in latitude.

6. The tangent of the dip is double the tangent of the magnetic latitude within 20° of the equator.

7. The inclination has two maxima and two minima within the latitudes ± 17°, and but one maximum and one minimum outside of these limits.

8. The horizontal force diminishes in intensity from the equator to the poles, where it vanishes, while the needle loses all its directive energy at the same places.

9. In the northern hemisphere there are two unequal regions of increasing dip, and similarly in the southern hemisphere there are two unequal regions.

10. The inclination is greater in the regions embracing the magnetic and geographical poles than in the corresponding opposite symmetrical regions in each hemisphere.

11. The vertical intensity is less in the larger areas of small declination in high latitudes than in the opposite hemispherical regions.

12. The inclination and vertical intensity increase with the latitude from the magnetic equator to the poles.

13. The focus of greatest intensity in the northern hemisphere is in 52° 19′ N. lat., 92° W. lon.; the weaker focus in 59° 14′ N. lat., 118° E. lon. For the southern hemisphere the stronger focus is at 64° S. lat., 138° E. lon.; the weaker at about 64° S. lat. and 125° W. lon.

All the knowledge of the magnetic system of the earth has been obtained very slowly, and is the aggregate result of the activity of many able men. One of the most noted of these is the astronomer Halley (1656–1742), the author of an important theory, and of charts, showing the lines of equal declination (hence sometimes called the Halleyan lines). The charts, which were published in the year 1701, contained such lines at intervals of 5° through all points of the earth's surface. Other charts have been published by Mountain and Dobson for 1745 and 1756, by Hansteen for 1787, by Barlow for 1833, by Sabine for 1840, by Gauss for 1829, also revised by Erman and Petersen and by Neumayer for 1890. The lines of equal declination have little value compared with lines representing the true magnetic meridians, and in general it was a mistake to introduce them into the science, except possibly in the interest of navigation. Duperrey in 1836 and Airy in his treatise on magnetism published charts of magnetic meridians. The same authors included in their work other elements. Ross made a voyage of observation to the north and the south magnetic poles, and alone has attempted to determine the place of 90° inclination by the use of instruments.

Expeditions for determining the magnetic elements have played an important part in the progress of knowledge of the subject, viz., those of de Lamanon in 1785–87, Rossel in 1791–94, Humboldt 1798–1804, Lutke 1826–29, Hansteen, Due, Erman, 1827–29, Fitzroy 1831–36; the French expeditions 1835–38, and those of Ross 1840–43, Lefroy 1843–44, Elliot 1846–50. The two most important series of observations were carried on in fixed observatories established for a year or more, one set by the British colonial governments, under the supervision of Gen. Sabine, including stations at St. Helena Cape of Good Hope, Hobart, Toronto, and co-operating stations at Göttingen, Madras, Makerstoun, Bombay, etc., from 1840–50. In 1882–83 stations were simultaneously occupied in the extreme northern and southern latitudes, in accordance with the plan of the international polar commission, and at these stations the most accurate observations known to magnetic science were made. A table of the stations and of the governments under whose auspices they were established will be found on the following page.

TABLE OF STATIONS.

STATION.	Nation sending the expedition.	Observer's name.
Jan Mayen	Austria-Hungary	Wohlgemutte.
Godthaab	Denmark	Paulsen.
Lady Franklin Bay	U. S.	Greely.
Kingua Fjord	Germany	Geise.
Fort Rae	Great Britain and Canada	Dawson.
Point Barrow	U. S.	Ray.
Lena Mindg	Russia	Jurgens.
Dicksonhaven	Holland	Snellen.
Moller Bay	Russia	Andrejew.
Sodankyla	Finland	Briese.
Bossekop	Norway	Steen.
Spitzbergen	Sweden	Ekholm.
Süd Georgieu	Germany	Schrader.
Orange Bay	France	Courcelle-Seneuil.

There are also many finely equipped permanent observatories, about seventy-five in number, where extensive series of observations have been conducted, and about forty where continuous self-recording instruments are in use. A brief account of the magnetic instruments will be given, but a full description would involve an extended study of their many physical peculiarities.

Classifications of Magnetic Instruments.—Magnetic instruments are divided into two classes: I. for absolute measures; II. for differential measures. In the first, measurements are so conducted that by suitable computations the observed quantities can be reduced to the corresponding values of the elements in minutes of arc for declination and inclination, and to a system of absolute measures, as C. G. S., for the horizontal force, the vertical force, and the total force. In the second the variations of these angles and forces are recorded from time to time, so that by comparison of the observed values with the known absolute values for given instants the corresponding absolute values may be obtained also for intermediate intervals as required. The labor of obtaining the absolute measures is so great that in practice these are taken once a week in well-conducted observatories, and the values for the intermediate intervals are derived from the combination of the absolute and the differential measures.

TABLE OF TYPES OF INSTRUMENTS.

Elements.	I. Absolute measures.	II. Differential measures.
Declination.	Declinometer and theodolite. Declinometer and collimator. Azimuth compass.	Unifilar declinometer.
Inclination.	Dipping-needle circle. Earth-inductor (Weber).	
Horizontal force.	Sine unifilar magnetometer (Kew). Tangent unifilar magnetometer (Weber). Tangent compass and voltameter.	Bifilar suspension magnetometer. Unifilar deflection magnetometer (Lamont).
Vertical force.	Bifilar galvanometer. Balance magnetometer (Lloyd). $V = H \tan I$.	Lloyd's balance. Unifilar induction magnetometer (Lamont).
Total force.	$T = H \sec I$.	

There is great variety among these instruments both as to size of magnets and the parts. Also there are several forms of apparatus for field observations.

For a description of magnetic instruments, including a history of their development, reference is made to an article by Dr. Th. Edelmann, Munich, read before the Chicago meteorological congress, 1893, and published in *Bulletin No. 11*, part 2, of the U. S. Weather Bureau.

The Horizontal Force.—The determination of the intensity of the horizontal component of the earth's total force depends upon a double operation: (1) the determination of the time of vibration of the freely suspended magnet under the action of this component, and (2) the determination of the angle of deflection caused by a deflecting magnet against this same force. The formula may be given for vibrations:

$$T^2 = T_1^2 \left[1 + \frac{F}{Hm} - Q(t - t_o) + \frac{H\mu}{m}\right],$$

where T_1 is the true observed time of vibration, $\frac{F}{Hm}$, a correction for the effect of torsion, $Q(t-t_o)$, a correction for the effect of temperature, $\frac{H\mu}{m}$, a correction for the induction of the magnet.

$$T_1 = T_o \left[1 - \frac{s}{86400} - \frac{aa_1}{16}\right],$$

where T_o is the observed time of the vibration, $\frac{s}{86400}$, the correction for clock rate, $\frac{aa_1}{16}$, the correction for unequal arcs. Hence we have by theory $mH = \frac{\pi^2 I}{T^2}$, the moment of inertia being I.

For the deflections:

$$\frac{m}{H} = \left(1 - \frac{P}{r_o^2}\right) \left[1 + \frac{2\mu}{r^3} + Q(t - t_o)\right] \tfrac{1}{2} r^3 \sin u_o,$$

where r is the distance between the centers of the magnets, u the angle of deflection, $\left(1 - \frac{P}{r_o^2}\right)$, a term depending upon the distribution of magnetism, $\frac{2\mu}{r^3}$, a term depending upon the induction, $Q(t - t_o)$, a correction for temperature. Finally, $mH \div \frac{m}{H} = H^2$, by which the horizontal component is given. A good circumstantial account of the portable magnetometer is to be found in Stewart and Gee's *Practical Physics*, as of the dip circle and declinometer, pages 275–313, to which reference is made for a description of the accompanying figure.

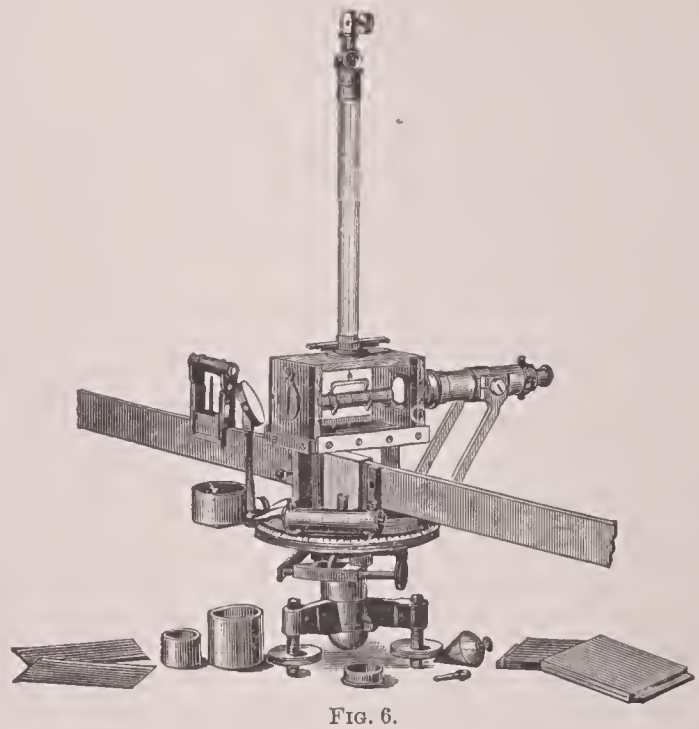

FIG. 6.

The Differential Apparatus.—There is one very important system that has been widely employed. It was introduced by Lamont into Germany, and depends upon the induction of soft iron in a varying magnetic field. If the force of the field changes, the attractive power of the magnet is assumed to vary in accordance with a law which gives a simple proportion to the relations of the field and the magnet. In spite of the great care expended upon this form of instrument, it has never given quite so satisfactory results as those which rely upon the simple mechanical forces of gravitation for their action. There are two reasons for this lack of precision: the first is that the mechanism and the magnetic action is more complicated, and therefore less reliable; and the second is that the doctrine of hysteresis shows that the induction of soft iron is not a simple function of the inducing force, but that it is a function depending upon the whole history of the molecular constitution of the particular piece of iron that is employed, and this is so complex as to be beyond our immediate knowledge. The other system of the apparatus for differential measures depends upon the bifilar suspension and the balanced horizontal needle. In the bifilar the magnet is suspended by two wires, which are twisted until the magnet hangs at right angles to the meridian, and is in equilibrium between the horizontal force and the torsional force of gravity. The balance is simply a magnet set on an agate edge, and weighted at one end, so that the action between it and the vertical component produces equilibrium. It is not quite sensitive enough to be as useful an instrument as

the declination or the bifilar magnets, but on the whole it is better than any induetion apparatus. For differential measures the majority of observatories use a unifilar suspension for deelination, a bifilar suspension for horizontal foree, a balanee for vertieal force, while a number employ, either alone or in eombination with the preeeding, a unifilar for deelination, a unifilar with deflectors for horizontal force, a unifilar with soft-iron inductors for vertical force.

The self-registering apparatus is of the Kew pattern, in which all the photographic rolls are inclosed in a single dark box, the three components having a separate cylinder for each, or of the Mascart pattern, where all the three traees are made upon the same sheet of paper. Wild has introduced certain improvements in registration. Upon these traees are recorded all the minute fluctuations through which the terrestrial field is continually passing.

Variations of the Magnetic Elements at the same Station.—It has been seen that the distribution of magnetism is of an asymmetric kind, and does not follow any mathematical law representing a homogeneous mass. This is no doubt due to the mixed nature of the material inside the earth, and it is in eonsequence a difficult subjeet to investigate. There are also large superfieial changes going on all the time, which it is one of the ehief objects of the scienee to elueidate. Before attempting to describe a law to aecount for these changes, it will be neeessary to pass some of them in review.

The Physical Cause of Magnetic Variations of the Terrestrial Field.—Through the long period of time during whieh the observations of the magnetic elements have been carried on, the causes that produce the periodic variations have eluded analysis. Many hypotheses have been advanced for their explanation, some aseribing them to changes originating inside the earth, others to changes in the atmosphere, and others to the direet magnetic action of the other bodies of the solar system. Probably the favorite hypotheses are those whieh associate the changes with the action of heating effects of the solar radiation, producing electrical currents through frietion and other physieal conditions.

It will not be necessary to explain these suppositions fully, because it is well known that they are wholly inadequate to the purpose for which they have been invented. In view of the laek of knowledge on this important subject, the writer has succeeded in placing the facts in such connection as to point very clearly to a definite solution, one which is in harmony with the best results of modern physics. The experimental and mathematieal researches of Faraday and Maxwell upon the nature of electro-magnetic energy in various conductors and dielectrics, combined with the later researches of Hertz and the wonderful development of the theory and praetice of alternating currents and oscillating electrieal discharges, render it almost certain that the solar radiations are themselves electro-magnetic forms of energy. They originate in the sun, by the oscillations of electric charges upon condensers of atomic dimensions, thereby producing variations of thousands of millions per seeond, and elosely associated with many physical phenomena observed in the solar corona, the solar spectrum, and other well-known phenomena. These vibrations, partly eleetrostatic and partly electro-dynamic, thus also being electro-magnetic, are propagated across the ether spaces with the velocity of light. Upon contact with the denser medium of the earth's atmosphere they undergo many peculiar transformations, which it is the province of meteorology to elucidate and which must be omitted here. These same electro-magnetic radiations, in one portion of their transformation, appear to behave to the earth as if it were a polarized magnetic body, and they assume in its neighborhood those peculiar curves and that complicated distribution, which is imperfectly understood, whenever a rotating spherical magnet is placed at varying angles of its axis of polarization to the direction of the magnetic field. Much of this subject remains as yet undeveloped on its analytical side, but it seems to be of great interest. From the unpublished material in the writer's possession, by permission of the U. S. Weather Bureau, which has the investigation in charge, some preliminary statement of the evidenee can be made. This is of a very complex character, and it is difficult to convey a just view of it in a short notice, and without the auxiliary apparatus that exhibits the phenomena at one view. It was found necessary to construct a model whieh should exhibit this magnetic system as it surrounds the earth all the time, beeause the eontinual variations of the directions made it impossible for the mind to construct a pieture from the study of the computations by themselves. What is here presented rests upon the best magnetic observations, whieh extend over fifty years. All the testimony is taken together, so that we do not introduee any theory into the statement. Our argument is simply to eall attention to the harmony existing between the model thus built up and the known mathematieal relations developed from wholly different sources. The conelusion is that the solar radiation field is magnetic, and that its lines of force pass through the earth in the proper curves, beeause the earth is a better transmitting medium for such rays than the surrounding space dieleetric. A simple law, which is sometimes called magnetic refraction, is at the basis of the phenomena. As rays of light are transmitted through a glass sphere in peculiar curves, so the magnetic rays are carried into the earth and through it in characteristic curves.

Treatment of the Observations.—The residual values of the elements H, D, V, as given in the reports of the thirty observatories whose mean elements have already been compiled for this article, taken month by month, are treated in the following way: These values, ΔH, ΔD, ΔV, are reduced as components of a deflecting force aeting on the normal force at the station, and their resultant determined in polar coordinates, $dx = \Delta H$, $dy = H \tan \Delta D$, $dz = \Delta V$, dx, dy, dz, being taken consistently, after all neeessary reductions, in units of the fifth decimal place of a dyne, C. G. S. units. Then $dS = \sqrt{dx^2 + dy^2 + dz^2}$, $\alpha = \frac{dz}{\sqrt{dx^2 + dy^2}}$, $\beta = \frac{dy}{dx}$, where S = the total deflecting force, α its angle with the plane of the horizon at the station, β its angle in azimuth, counted from the magnetic meridian. Now, instead of rotating the ball representing the earth about its axis in the presence of the sun, the magnetic system is supposed to rotate about the surface of the earth, so that when a station reaches a given hour-angle the deflecting force (S, α, β) will have its special value as given by the observations. It would be possible thus to construct a model for each month, but the mean of the twelve months was taken so as to produce a mean annual result. This is as if the sun were on the equator all the year, and the magnetic axis were perpendicular to the plane of the ecliptic. It will be seen upon consideration that the magnetic defleeting system acts instantaneously over all the surfaee of the earth, that each station takes up that part of it peculiar to its place and registers that by itself. Henee differences of longitude and differences of the years of the observations do not need to be regarded, which simplifies the problem, because it is not necessary to reduce observations to an epoeh, as in other physical functions depending upon the time. The observations therefore may include all available data that have ever been taken, though it is to be limited to those whieh have the twenty-four hourly readings, and stations may be considered as moved to the same meridian. Instead of constructing by order of geographical latitude, it is clearly proper to take magnetic inclinations, calculating the magnetic latitude corresponding to any inclination.

The Model.—The following description contains a statement of the main features of the instantaneous magnetic distribution as displayed by the model. The drawing (Fig. 7), however, contains some of the essential features. The two circles represent the magnetic equator, and the two magnetic hemispheres are orthographically projeeted upon that plane. The sun is on the meridian N. S., and an observer at any point, local hour-angle, will see the sun in its astronomical position.

The field is divided into two portions, the first containing the forces which enter the surface of the earth at suitable angles; the seeond eomprising those forces which emerge from the surface of the earth. The darker parts represent the entering forces, and the lighter parts the emerging forces. In the northern hemisphere these forces enter the dark side of the earth and emerge on the light side; in the southern hemisphere they enter on the light side and emerge on the dark side. Henee generally all the forces in the northern hemisphere are directed toward the sun, and all the forces in the southern hemisphere away from the sun; but the northern hemisphere is a negatively magnetized region, and the southern hemisphere a positively magnetized region, and therefore the northern hemisphere is pulled toward the sun and the southern is pushed away from the sun. In a word, the earth is acted upon by a magnetic couple, and the field is such that the magnetic potential diminishes in the direction from the sun outward past the earth. A magnet with-

in a magnetic field is acted upon by a couple; its positive pole is driven and its negative pole is drawn in the direction of the lines of force passing through them. The axis of the magnet tends to coincide as nearly as possible with a line of

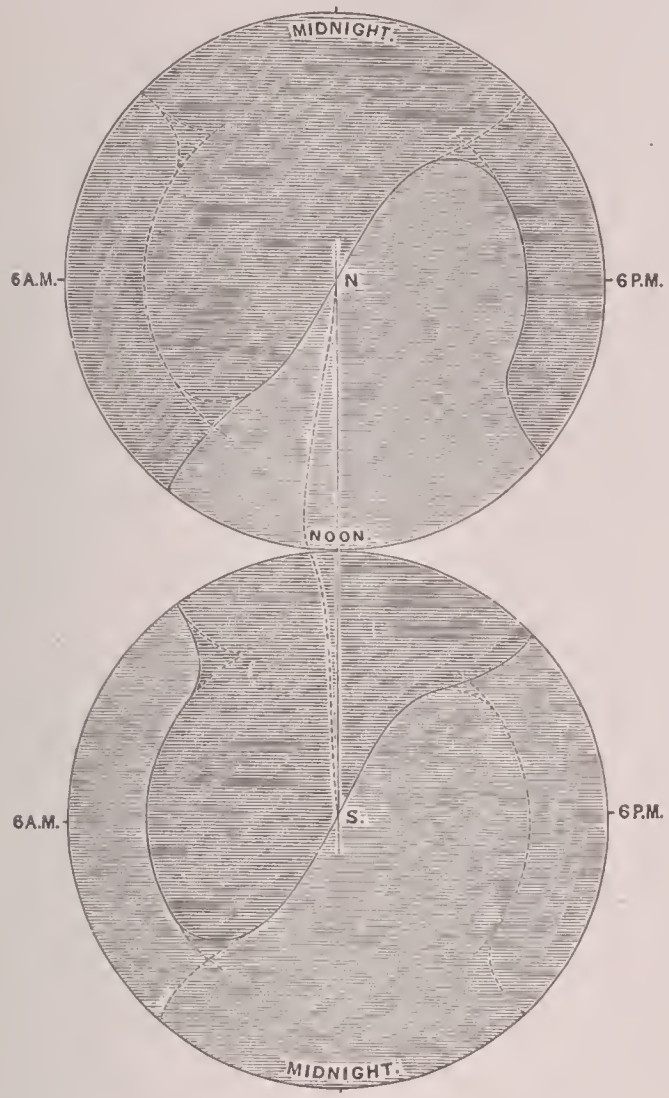

FIG. 7.

force passing through its center. We can hardly resist the conclusion that the radiations from the sun have the property, among others, of acting like magnetic lines of force, and that the earth is pulled by this force continuously. This magnetic force does not affect the solar constant of gravitation, because it acts only as a couple; it does not tend to alter the earth's angular velocity of rotation because the forces are distributed symmetrically about a plane passing through the center of the earth. This couple does, however, tend to draw the axis of rotation toward the plane of the ecliptic, being a force similar to that which produces precession of the equinoxes and nutation of the poles. It is also pointed out that it is of the right physical type to produce a change of latitude in the stations on the earth. It will be necessary here to state that these forces range in dynes per gramme from 0·00120 to 0·00005 C. G. S., and that they will average about 0·00050 if integrated over the surface of the earth. The attraction of the sun at the distance of the earth is, in the same units of absolute measure, 0·58940 C. G. S. Now, in the case of disturbances of the magnetic field it is known that the deflecting forces will increase from 0·00020 to at least 0·00200 at Washington, that is, tenfold. Hence we may say very roughly that the force 0·00050 may become 0·00500, or about one-thousandth of the sun's total attractive force. This is a fair estimate of the change in the forces of the couple.

The argument for the magnetic action of the sun's rays is greatly strengthened by another phenomenon which is present in certain critical places of the field.

If θ is the angle that the ray makes with the normal outside the surface, and ω the angle with the normal inside the surface, then the index of refraction is $\mu = \dfrac{\tan \omega}{\tan \theta}$.

The lines at which the rays enter and emerge immediately, or, as it may be said, are tangential, occur along the unbroken line separating the red and blue regions. At N. and S. the forces are nearly perpendicular to the surface; following the heavy lines on either side of the poles, these angles become more and more inclined, till near the equator there is a region of conflict or uncertain directions where the two sets of forces from opposite hemispheres change places.

The normal magnetic field of the earth has also been shown to be subject to a system of periodic variations that have been first studied by the author. On combining the residuals obtained by subtracting the monthly from the daily means, in the horizontal, declination, and vertical components, the vectors that represent these disturbing forces are found to pass through periodic fluctuations represented by the following curve, in a period of 26·68 days, with epoch June 12·22, 1887, Greenwich mean time.

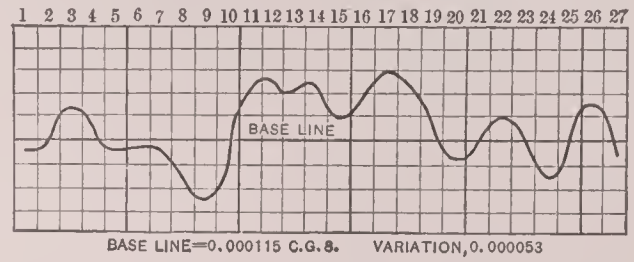

FIG. 8.—Variations of the solar polar magnetic field in the 26·68 day period.

This result depends upon the European observations, 1878–89, seven stations, reduced by a least square computation. The force is derived from the solar magnetic field, having its seat in the nucleus of the sun, emerging poleward and sweeping over through space till it approaches the earth at right angles to the ecliptic. It is concentrated chiefly in the ovals surrounding the magnetic and geographical poles, since the earth's axis of magnetic conductivity points in that direction. At the sun the lines of this field become in part visible in the coronal streamers about the poles. From the coronal observations and the study of this field at the earth it is concluded that the sun is a magnetic sphere, the magnetic poles being separated from the axis of rotation by $4\frac{1}{2}°$, the southern (negative) preceding the northern (positive) by about 100°. The true time of solar rotation is not that of the sun-spot belts at latitudes 10°–13° N. and S., but that derived from the sun-spot observations for the equator, being 13·4936° daily motion instead of 14·1844° (Carrington), the former corresponding to 26·68 days and the latter to 27·275 days in a synodic revolution.

At the earth this field manifests the changes taking place in it by outbursts of the aurora, by magnetic storms, by earth currents, and in variations in the meteorological elements of temperature, pressure, humidity, atmospheric electricity. These synchronous changes are much distorted by the convectional circulation of the atmosphere. On reducing the several elements by means of the ephemeris derived from this period, the typical change is found to survive in high and low pressures of the U. S. and the North Atlantic, U. S. and European weather curves, temperatures, atmospheric electricity, and relative humidity. The effect of convection is nearly eliminated by using for data the temperatures of the Northwestern States, and thereby taking sufficient data the original magnetic curve is found quite perfectly. This arises from the transformation of the impressed polar radiant energy into heat in the atmosphere of that region. It is

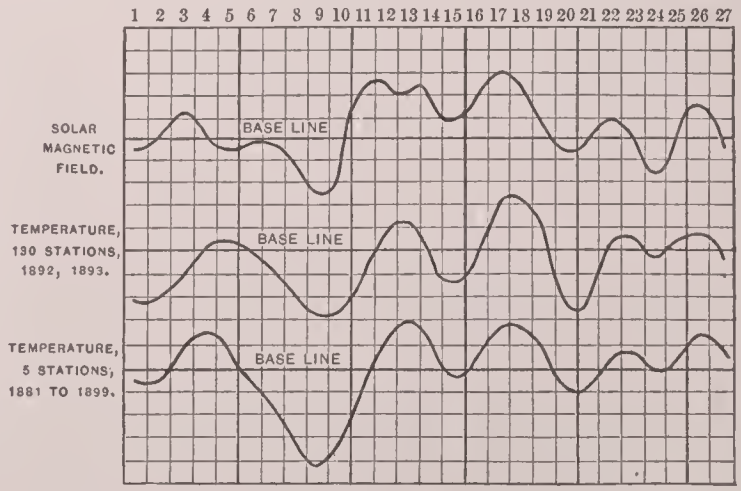

FIG. 9.—Variations of solar magnetic field and temperature changes in the U. S.

found that in some periods the curve of temperature agrees with the magnetic curve in its *direct* position and in others in the *inverse* position, that is, when turned over on its longer

axis. This points to an action of magnetic inversion, or polarization, not yet understood. The result of such comparison is seen in the following curves. The direct and the inverse periods are collected by themselves, and the direct *minus* the inverse gives the data for the temperature curves. All temperatures of the U. S. are arranged so as to eliminate the eastward drift of the waves, and are referred to an origin in lon. 115° W. and lat. 55° N.

Similar comparisons are extended to a sun-spot period within the years 1878–93, and the result shows that there is a distinct synchronous variation in the sun-spot numbers, the intensity of the European magnetic field, the movement in latitude of the mean tracks of low and high pressures in the U. S., the motion in longitude of lows and highs, the amplitudes of the temperatures, and the mean annual temperatures; also that the changes related as direct and inverse follow in the same sun-spots period, the direct varying with and the inverse varying inversely, as shown in Fig. 10.

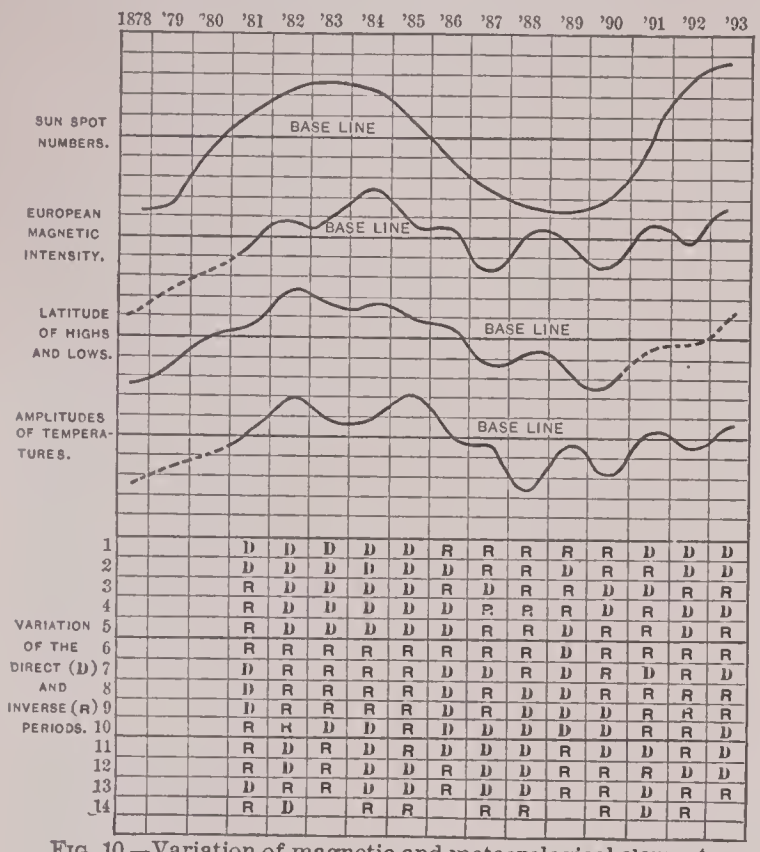

FIG. 10.—Variation of magnetic and meteorological elements in a sun-spot period.

It is inferred from the results of the computation, upon which these remarkable sets of curves depend, that two types of radiation traverse the space between the sun and the earth: (1) the electro-magnetic, or visible ray, falling upon the equatorial regions of the earth; (2) the magnetic, or invisible ray, falling upon the polar regions of the earth. The polar field is clearly the seat of that hitherto unknown system of forces which are displayed in the aurora, magnetic storms, earth currents, variations of the magnetic field, and some of the meteorological changes that make up the weather. Its full extension can not yet be seen, but evidently the cosmical conditions of the problem includes in its scope the nature of the sun that emits this magnetic energy, of the ether that transmits it in curved paths through such enormous distances, and the transformations in the atmosphere or at the surface of the earth. FRANK H. BIGELOW.

Magnif'icat [named from the first word in the Latin version *Magnificat anima mea, Dominum*, My soul magnifies the Lord]: the song of the Virgin Mary, as recorded in Luke i. 46–55. This song of praise by the Virgin Mother in thankfulness for the Incarnation, and uttered while yet she was the tabernacle of the Sun of Righteousness, must have formed a part of the worship of the Church from early times. It is first found prescribed about the year 506, when in France it was ordered to be sung at lauds. In the Eastern and Armenian Churches it is still a lauds canticle. In the West it has during the last 800 years been sung only at vespers. A prominent place is given to this hymn in the vesper and other services of the Roman Catholic Church and the Church of England. It was omitted from the evening service of the Protestant Episcopal Church in the U. S. at the revision of 1789, but it forms a part of the prescribed evensong in the Standard of 1892. Revised by W. S. PERRY.

Magnin, maăn'yăn', CHARLES: critic and poet; b. in Paris, Nov. 4, 1793; was appointed assistant at the National Library in 1813, and one of the directors in 1832. As early as 1815 he began to make himself known by his verses. In 1826 he produced a successful comedy, *Racine, ou la troisième représentation des "Plaideurs."* As contributor to the *Globe*, with Guizot, to the *National*, with Armand Carrel, and afterward to the *Revue des Deux Mondes*, he acquired great reputation as a spirited and acute critic, especially of dramatic poetry and art. A number of his articles he collected under the title *Causeries et Méditations historiques et littéraires* (2 vols., 1843). He also wrote *Les Origines du Théâtre moderne* (1838); *Le Théâtre de Hrosvitha* (1845), with translation and commentaries; and *Histoire des Marionnettes* (1852). D. in Paris, Oct. 8, 1862. See Wallon, *Notice sur la vie et les travaux de Charles Magnin* (Paris, 1875). Revised by A. R. MARSH.

Magnitnde [from Lat. *magnitu'do*, greatness, size, deriv. of *mag'nus*, great]: anything that can be measured. Originally the term was applied to signify a portion of space possessing the three attributes, length, breadth, and thickness; by extension of meaning it has come to signify any quantity that can be expressed in terms of a quantity of the same kind taken as a unit. Lines, surfaces, and volumes are called geometrical magnitudes. An angle is also a species of geometrical magnitude. Time, weight, and numbers are arithmetical magnitudes. See QUANTITY.

Magnolia: See MAGNOLIA FAMILY.

Magnolia: town; capital of Columbia co., Ark. (for location of county, see map of Arkansas, ref. 6–B); on the St. Louis S. W. Railway; 40 miles S. W. of Camden. It is in a region abounding in good water, fine timber, and valuable grasses, and though level and fruitful has been developed but little. The town has saw and grist mills, two weekly newspapers, and churches and public schools. Pop. (1880) 536; (1890) 1,486; (1900) 1,614. EDITOR OF "COLUMBIA BANNER."

Magnolia Family: a small group of dicotyledonous trees and shrubs (the *Magnoliaceæ*), numbering about eighty-five species, natives of America, tropical Asia, Australia, and New Zealand. They have simple, alternate leaves, and flowers usually composed of many separate sepals, petals, stamens, and pistils. They are therefore to be considered as among the lowest of the dicotyledons. Of the thirteen genera now recognized, four are represented in the U. S. by eleven species, viz.: *Liriodendron*, 1; *Magnolia*, 7; *Illicium*, 2; *Schizandra*, 1. Of the first there is but one species, *L. tulipifera*, the tulip-tree of the Eastern U. S., one of the most stately, as well as useful, of forest-trees. A variety of this species is found in China. The magnolias are remarkable for their fine foliage and large, beautiful flowers.

CHARLES E. BESSEY.

Magnus, HEINRICH GUSTAV: physician; b. in Berlin, May 2, 1802; studied natural science at the university of his native city, and chemistry under Berzelius in Stockholm, where he discovered the compound known as the green salt of Magnus; was appointed Professor of Physics and Technology at the University of Berlin in 1834. D. in Berlin, Apr. 5, 1870. The result of his numerous original researches he communicated in Poggendorff's *Annalen* and in the transactions of the Berlin Academy of Science. The most remarkable were his experiments on the coefficient of the dilatation of gases, published in 1841, a few days after Regnault's publication of the same results; and his experiments on the transmission of heat through gases, which gave rise to a controversy with Tyndall.

Magnus, HUGO FRIEDRICH, M. D.: ophthalmologist; b. at Neumarkt, Prussia, May 31, 1842; educated at the University of Breslau; has been Professor of Ophthalmology in the University of Breslau since 1876; is author of *Ophthalmoskopischer Atlas* (1872); *Geschichte des grauen Staares* (1876); *Die Geschichtliche Entwickelung des Farbensinnes* (1877; Fr. and Span. trans.); *Die Blindheit, ihre Entstehung und ihre Verhütung* (1883); *Die Sprache der Augen* (1885; Ital. trans.); *Die Erziehung des Farbensinnes* (1879; Eng. trans. Boston, 1882); *Augenärztliche Unterrichtstafeln* (1892); and numerous professional essays.

Mag'nusen, FINN: Icelandic antiquarian; b. at Skalholt, in Iceland, Aug. 27, 1781; studied at the University of Copenhagen; began to practice as a lawyer in Iceland in 1803, but returned in 1812 to Copenhagen; was appointed Professor of Northern Antiquities in 1815, and keeper of the archives in 1842. His principal works are a translation of

the older *Edda*, with accompanying commentaries (4 vols., 1821–23), a critical exposition of the Scandinavian mythology (4 vols., 1824–26), and *Priscæ Veterum Borealium Mythologiæ Lexicon* (1828); but besides these works he wrote a great number of minor essays relating to Icelandic literature, Scandinavian mythology, and Northern antiquities, remarkable as well for learning as for critical acuteness. D. at Copenhagen, Dec. 24, 1847. Revised by P. GROTH.

Magnússon, ARNI: historian and collector; b. in the western part of Iceland 1663; was educated at Hvamm by his uncle, Ketil the Priest, who was famous for his learning in Icelandic lore and as a copyist of old Icelandic manuscripts. In 1683 Magnússon went to Copenhagen and received employment first as secretary to Bartholinus, afterward in the royal archives. In 1701 he was made Professor of Philosophy and Northern Antiquity at the university, and in the following year he accompanied the royal commission of survey to Iceland, where he remained, with some interruptions, until 1712. During his ten years' stay in Iceland he made a unique collection of Icelandic manuscripts, which he bequeathed, together with his whole fortune, to the university library. A catalogue of the collection is in course of preparation by its custodian, Dr. Kr. Kålund (1894). In the fire of 1728 a large portion of the collection, including Magnússon's notes, copies, etc., was destroyed. He was the author of several works on Scandinavian history. D. Jan. 6, 1730. Revised by D. K. DODGE.

Magog: See GOG AND MAGOG.

Magog: river, lake, and town of Southern Quebec, near the borders of Vermont (see map of Quebec, ref. 6–C). The river drains Lake Memphremagog, traverses Lake Magog (10 miles long by 3 or 4 broad), and at Sherbrooke, after a course of 20 miles, empties into the St. Francis, a tributary of the St. Lawrence. It contains a considerable volume of water, and its fall affords large water-power to the towns of Magog and Sherbrooke. The town of Magog is on the river near where it leaves Lake Memphremagog, County Stanstead, 19 miles S. W. of Sherbrooke, on the Canadian Pacific Railway. Pop. 2,100, about half being French-Canadians.
MARK W. HARRINGTON.

Magot: See BARBARY APE.

Magpie [*Mag*, nickname of *Marguerite* + *pie*, magpie, from Lat. *pi'ca*, magpie, jay]: a name for the birds of the genus *Pica*, members of the crow family, the European magpie (*Pica pica*) being the most common species. It is of a lustrous black with green and bronze reflections, white on the belly, shoulders, and inner webs of many primaries. The bird is 15 to 20 inches long according to the length of the tail, which may be a foot or less in length. The magpie is social and omnivorous, wary and mischievous. It occurs throughout Europe and Northern Asia, and a local race (*Pica pica hudsonica*) is found in parts of Northern North America. The name magpie is sometimes applied to the long-tailed jays of the genera *Urocissa* and *Cyanopolius*.
F. A. LUCAS.

Magruder, JOHN BANKHEAD: soldier; b. in Virginia about 1810; graduated at West Point 1830; assigned to the infantry as second lieutenant July 1, 1830; transferred to the artillery Aug., 1831; first lieutenant Mar., 1836, and captain June 18, 1846. He was distinguished in the Mexican war in command of the light battery of Gen. Pillow's division, earning the brevet of major for gallantry at Cerro Gordo, and lieutenant-colonel for Chapultepec, where he was wounded; resigned from the U. S. army Apr. 20, 1861; entered the Confederate army; commanded at Yorktown until its evacuation; took part in the campaign on the Chickahominy; was appointed brigadier and major-general, and sent Oct. 16, 1862, to assume command of the western department, including Texas, Arizona, and New Mexico. He recovered Galveston from the Federal forces, and took an active part in military affairs in Texas throughout the war. He afterward resided for a time in Mexico, but soon returned to Texas. D. at Houston, Tex., Feb. 19, 1871.
Revised by JAMES MERCUR.

Maguire, JOHN FRANCIS: editor and politician; b. at Cork, Ireland, in 1815; was called to the bar in 1843; was a member of Parliament from 1852 until his death; was proprietor and editor of the Cork *Examiner*, a Roman Catholic organ, and was a leading exponent of Irish Roman Catholic interests in Parliament, in journalism, and in literature. He wrote *Rome and its Ruler* (1857), revised, enlarged, and republished in 1870, under the title *The Pontificate of Pius IX.*; *The Industrial Movement in Ireland* (1853); *The Irish in America* (1858); *Life of Father Mathew* (1863); and *The Next Generation* (1871), a political novel. Mr. Maguire was an advanced Liberal politician, an advocate of Home Rule, and was four times elected mayor of Cork. He stimulated the growth of flax in the south of Ireland by establishing linen-mills in Cork. D. at Cork, Oct. 31, 1872.

Magyars, mă̆a-jaars': the dominant people of Hungary, especially on the plain. Probably they are a Turkish people, though with decided Ugro-Finnish characteristics. They formerly occupied the steppes of Southern Russia, but in the ninth century were forced over the Carpathians into the vast plain of the Danube, driving before them the Slavs who had previously occupied it. They became the terror of Europe, but later were Christianized and became the bulwark of Europe against the Ottoman Turks. They number about 6,000,000. M. W. H.

Mahâ-bhârata: the name of the great epic of the ancient literature of India. The Aryan tribes of the Vedas lived about the middle Indus and its Punjaub affluents. Later they migrated southeastward and established themselves on the upper course of the Jumna and Ganges, in Madhyadeça, The Mid-land. Foremost among these tribes were the Bhâratas, the Kurus, and the Panchâlas. Indeed, so famous became the eponym of the first of these that ancient India was called after it Bhârata's Continent, or *Bhâratavarsha*. In this Gangetic Mid-land were fought the battles of the Bhâratas; and here, to ever-ready listeners, in school or forest hermitage, at a sacrifice or a funeral, were told the tales of these battles and their heroes. The Hindus were lovers of stories, even in early times, and Patanjali says "they will listen to them all night through, until sunrise." Stories (*itihâsas*) in mingled prose and verse were common in Vedic times, as is indicated by the fact that the metrical parts of some of them are still extant, as the "*itihāsa* hymns" of the Veda. The priests told stories and gave out riddles to each other to beguile the tedium of their sacrifices; and no less at the festivals of the chieftains or tribal kings were the tales of bygone times in order. These tales were probably first circulated in prose, until some more clever teller put them into simple and easily remembered metrical form. Such a teller was often made *sūta* or bard by his chieftain as a reward for his skill; and, as his skill passed on by inheritance to his son, so also did his office. Thus arose an hereditary order of bards or rhapsodists; and thus, too, the epos originated in the warrior caste, and belonged especially to it.

The eighteen-day battle of the Bhâratans forms the principal theme of the poem; and its full title, accordingly, is the *Great Bhâratan Story*; in Sanskrit, *âkhyânam bhâratam mahat*, or, as a compound, *mahâ-bhârata-âkhyânam*. By omission of the word for story, this last is abbreviated to *Mahâ-Bhârata*, which is the title usual in the Occident. The Hindus abbreviate it still more, and often speak of the poem as *Bhârata*, the Bhâratan, an example which it is rather a pity that Western scholars have not followed.

The simple heroic epics that formed the nucleus of the *Bhârata* probably existed several centuries before our era, although, of course, such a thesis is not matter of direct proof. Around this nucleus have been grouped additions—historical, mythological, theological, metaphysical, didactic, and prescriptive—until the *Great Bhârata*, as we now have it, and counting the *Harivança*, contains over 100,000 double verses, or about eight times as much as the *Iliad* and *Odyssey* together. In the printed editions it is divided into eighteen very unequal books or *parvans*. The seventeenth is the shortest, having only 312 double verses, and the twelfth is the longest, with 13,943; although, indeed, the appendix, called *Harivança*, is still longer (16,374).

Only about one-fifth of the whole poem is occupied with the principal story. This, in briefest summary, is as follows: The two brothers Dhrita-râshtra and Pându were brought up in their royal home of Hastinâ-pura, about 60 miles N. E. of modern Delhi. Dhrita-râshtra, the elder, was blind, and so Pându became king, and had a glorious reign. He had five sons, chief of whom were Yudhishthira, Bhîma, and Arjuna. They are called Pândavas, and are types of honor and heroism. Dhrita-râshtra's hundred sons, Duryodhana and the rest, are usually called the Kuru princes or Kauravas, and are represented as in every way bad. After Pându's death his sons are brought up with their cousins. The kingdom devolved on Dhrita-râshtra, who in turn made his nephew Yudhishthira the heir-appar-

ent. Yudhishthira's exploits aroused the ill-will of his cousins, and, to escape their plots, the Pându princes went away to the King of Panchâla, whose daughter, Draupadî, became their common wife. In view of this strong alliance with the Panchâlas, Dhrita-râshtra thought it best to conciliate the Pândus. So he divided the kingdom and gave Hastinâ-pura to his sons, and to his nephews a district to the S. W., where they built Indra-prastha, the modern Delhi. Here the Pândavas and their people lived happily under King Yudhishthira.

On one occasion Dhrita-râshtra held a great assembly of princes at his capital. The Pândavas were invited and came. Yudhishthira was challenged to play with Duryodhana, and accepted. The dice were thrown for Duryodhana by his uncle Çakuni. Yudhishthira loses everything—wealth, kingdom, brothers, wife. A compromise, however, is made, by which the Pândavas give up their part of the kingdom for twelve years, and agree to remain *incognito* for a thirteenth. With Draupadî they retire to the Kâmyaka forest, and there for twelve years they dwell. Many legends are told to divert and console them in their exile; and these stories, with the description of the forest-life of the princes, combine to make up the third or *Forest-book*, which is one of the longest in the poem.

The thirteenth year arrived and passed. "Then in the fourteenth the Pândavas demanded back their possessions, but received them not. From this arose the conflict. They overthrew the ruling house, slew Prince Duryodhana, and then, although losing most of their warriors, they got back again their kingdom." Thus ended the *Bhârata*, doubtless, in its oldest and simplest form.

The poem, as we now have it, spins out the story of the combat through several books and through thousands of distichs. At length Yudhishthira is crowned in Hastinâ-pura, and Bhîshma, the leader of the Kurus, although mortally wounded, instructs him, for about 20,000 distichs, on the duties of kings and on other topics, and then dies. In the seventeenth book the Pândus renounce the kingdom, and in the next—the last—they ascend to heaven with Draupadî.

The episodes and digressions often have only a very loose connection with the main thread of the *Bhârata*, but are not on this account less important or interesting. The first to become famous in the Occident was the story of *Nala and Damayantî*, published by Bopp in 1819, and often since, both in text and translation. *Sâvitrî, or the Glory of Wifely Devotion*, is also especially noted; less so, the *Story of the Deluge*, the *Rape of Draupadî*, and others. Worthy of mention, in part as a type, is the epic form of the Çakuntalâ legend, because it has served Kâlidâsa as the basis for his drama *Çakuntalâ*, the masterpiece of the literature, and in somewhat the same way as the Homeric for the Sophocleean Ajax. Of a very different kind are the philosophical episodes; among these the Bhagavad-gîtâ (*q. v.*) is by far the most celebrated. The appendix, *Harivança*, contains the history of Krishna, one of the most popular deities of India. For a brief account of him, see Monier-Williams, *Indian Wisdom*, lecture xii.

The origin of the epic nucleus of the poem is fairly clear. The completion of the nucleus is set by Jacobi at about the beginning of our era. Difficult is the question of the genesis of the poem in its present shape. See the solution given by E. W. Hopkins, *Journal of the American Oriental Society* (xiii., 68–69). Hindu tradition ascribes the gigantic work to the mythical sage Vyâsa. Certain parts are plainly very ancient; others much less so. The whole is the "precipitate of a long literary period." Holtzmann assumes several redactions and workings-over, and places the beginning of the final one at about 1000 A. D. The studies of Bühler, however, show that as early as Kumârila, 700 A. D., the *Bhârata* consisted in the main of the same divisions which it now has; and that it was not merely a narrative of the great war, but also a *smriti* or work belonging to the sacred tradition, and actually made use of in public readings for teaching to all Hindus the whole duty of man by sententious precepts and by most winning examples; and that is just what the poem now is and pretends to be; and again, an inscription of 600 A. D. from Cambodia states that the king erected a temple, gave it a library, including a complete copy of the *Bhârata*, and made an endowment for its daily recitation in perpetuity. To such sanctity had the book attained—and so early—in a remote Indian colony, 2,000 miles from the scenes of the poem! Finally, an inscription of A. D. 533 mentions the *Bhârata* as a work of 100,000 distichs, and in such a way as to imply that it was then a complete text.

The bibliography is given with great detail in parts ii. and iii. of Holtzmann's work, and in the *Catalogues* by Haas and by Bendall, of the Sanskrit books in the British Museum. Text editions of the entire work: *Editio princeps*, very important because the citations of the great lexicon, etc., refer to this (Calcutta, 1834–39, 4 quarto volumes and index volume); the best recent edition, with Nîlakantha's comment, but without *Harivança*, and with separation of the words and convenient numbering of the chapters, was published in Bombay, 1890. Translations: The nearest approach to a complete English translation is that instituted by Protap Chunder Roy (Calcutta, 1883–94, to date 88 parts), embracing about nine-tenths of the whole, excluding *Harivança*. Translations of parts of the poem are enumerated by Holtzmann, as also by Haas and by Bendall. We may mention *Nala*, translated by H. H. Milman (Oxford, 1860); *Çakuntalâ*, in Sanskrit and French, as an appendix to A. L. Chézy's edition of the drama (Paris, 1830). Sir Edwin Arnold's *Indian Idylls* (Boston, 1883) contains *Sâvitrî*, *Nala*, the *Great Journey* (bk. xvii.), the *Entry into Heaven* (xviii.), and several other stories. Summaries of the main story: One of the best in English, in Talboys Wheeler's *History of India* (vol. i., London, 1867), abridged in his *Short History of India* (New York, 1884); perhaps the very best, by Theodore Goldstücker, *Westminster Review*, Apr., 1868, reprinted in his *Literary Remains* (ii., 96–119, London, 1879); very convenient, that by Monier-Williams, *Indian Epic Poetry* (pages 91–133, London, 1863); see also his *Indian Wisdom*, lecture xiii. (London, 1871). General works: *Das Mahâbhârata*, by Adolf Holtzmann [Jr.]; vol. i., *Zur Geschichte und Kritik des Mahâbhârata* (Kiel, 1892); vol. ii., *Die neunzehn Bücher des Mahâbhârata* (1893); vol. iii., *Das Mahâbhârata nach der nordindischen Recension* (1894); very important criticisms by Jacobi, *Göttingische gelehrte Anzeigen*, 1892, No. 16, and 1893, No. 16; *Indian Studies*, by Bühler and Kirste, *Sitzungsberichte der phil.-hist. Classe der Wiener Akademie* (vol. cxxvii., No. 12, 1892). C. R. Lanman.

Mahaffy, John Pentland: classical scholar; b. at Chafonnaire, on Lake Geneva, Switzerland, Feb. 26, 1839; received his early education in Germany; studied in Dublin (1856); since 1871 Professor of Ancient History in the University of Dublin. He is a prolific author and an elegant stylist. Among his numerous works may be mentioned *The Flinders Petrie Papyri* (Cunningham Memoirs, Royal Irish Academy, 1890–94); *Commentary* to Kant's *Critique* (1866); *Social Life in Greece, from Homer to Menander* (1877, 3d ed.); *Rambles and Studies in Greece* (1878, 2d ed.); *Greek Life and Thought, from the Age of Alexander to the Roman Conquest* (1888); *Greece under Roman Sway* (1890); *Story of Alexander's Empire*; *Old Greek Education*; *History of Classical Greek Literature* (3 vols., 1892, 2d ed.).

Alfred Gudeman.

Mahākalpa [Sanskr., a great kalpa]: in Hindu and Buddhist chronology, the period which elapses from the moment one universe is formed to the moment it is replaced with another. It is divided into four kalpas, which are compared with the four seasons of the year, and is equal to 1,344,000,000 mortal years.

Mahan', Alfred Thayer: U. S. naval officer; b. Sept. 27, 1840, at West Point, N. Y., where his father, Dennis H. Mahan, LL. D., was Professor in Civil Engineering; graduated at the U. S. Naval Academy, 1859; served in the civil war in the South Atlantic and in the Gulf squadrons; was head of the department of gunnery, Naval Academy, 1877–80; president of the U. S. Naval War College, Newport, R. I., 1886–89; president of a commission to select a site for a navy-yard on the northwest coast of the U. S., north of 42° N. latitude, 1889; again president of the War College 1890–93; assigned to command of the U. S. cruiser Chicago and attached to the European squadron May 11, 1893. He was accorded a hearty welcome in European capitals, and received many honors, among them the degree of LL. D. from Cambridge University and of D. C. L. from Oxford. He is author of *The Gulf and Inland Waters* in *The Navy in the Civil War* (New York, 1863) and *The Influence of Sea Power upon History, 1660–1783* (1890), which gave him a wide reputation among naval and historical students in all countries. Author also of *Life of Admiral Farragut* (1892).

C. H. Thurber.

Mahan, Asa, D. D., LL. D.: minister, educator, and author; b. at Vernon, N. Y., Nov. 9, 1800; was educated at Hamilton College and Andover Theological Seminary; was pastor of Congregational churches at Pittsford, N. Y., and

Cincinnati, O.; president and Professor of Philosophy and Theology in Oberlin College 1835–50; president of Cleveland University 1850–56; pastor of the Congregational church, Jackson, Mich., 1856–57; of the Congregational church, Adrian, Mich., 1857–60; and president of Adrian College 1860–71. After 1871 Dr. Mahan spent much of his time in England, where he died at Eastbourne, Apr. 4, 1889. He was a prominent advocate of the views called Perfectionist, which he set forth in the work *Scripture Doctrine of Christian Perfection* (Boston, 1839). He published other works, including *Intellectual Philosophy* (New York, 1845); *The Will* (Oberlin, 1846); *Moral Philosophy* (Oberlin, 1848); *Logic* (New York, 1857); *Theism and Anti-theism in their Relation to Science* (Cleveland, 1872); *Mental Philosophy* (Chicago, 1882); *Critical History of Philosophy* (New York, 1883). C. K. Hoyt.

Mahan, Dennis Hart, LL. D.: soldier and scientist; b. in New York, Apr. 2, 1802. He removed with his parents to Virginia and in 1820 entered the U. S. Military Academy, graduating at the head of his class in 1824, and was appointed a second lieutenant of engineers, but retained at the academy as Assistant Professor of Mathematics and of Engineering until 1826, when he was sent to Europe on professional duty, passing four years, including one year as a student at l'École d'Artillerie et du Génie at Metz, in visiting and studying fortifications and the institutions connected with his profession. Returning to the U. S. in 1830, he was in 1832 appointed Professor of the Department of Civil and Military Engineering, of which he had been in charge since 1830, and at the head of which he continued until 1871. Failing health brought on continued insomnia, resulting in temporary insanity, during an attack of which he drowned himself in the Hudson near Stony Point, N. Y., Sept. 16, 1871. His works on engineering and the art of war are largely used as text-books in the U. S. In 1836 he published a *Treatise on Field Fortifications*, to which was added in 1865 *Military Mining and Siege Operations*, the whole now comprising part i. of *An Elementary Course of Military Engineering*, of which *Permanent Fortifications* constitutes part ii.; *Advanced Guard, Outpost, and Detachment Service of Troops* (1847, enlarged in 1862); *Industrial Drawing* (1853); *Fortification-drawing and Stereotomy* (1865); Mahan's American edition of *Moseley's Mechanical Principles of Engineering and Architecture* (1856; 2d ed. 1869). His *Course of Civil Engineering* (1837) was largely improved and extended up to 1868, when it was almost entirely rewritten; at the time of his death a new revised edition was in preparation and partly printed. He was a member of the Geographical Society of France (1828) and of many other scientific societies, and corporator of the National Academy of Sciences, 1863. Revised by James Mercur.

Mahan'adi, or **Mahānadī** [= Sanskr., liter., great river; *mahā*, great + *nadī*, river]: a river of Hindustan. It rises in lat. 20° 20′ N. and lon. 82° E., flows with an eastward course 520 miles through Berar and Orissa, into the Bay of Bengal, forming a large delta, which is subject to destructive inundations by the ocean. Navigable for 300 miles during the rainy season, it becomes almost dry during the remaining half of the year. The river-bed is celebrated for the fine quality of diamonds found in it.

Mahanoy City: borough; Schuylkill co., Pa. (for location of county, see map of Pennsylvania, ref. 5–H); on Mahanoy creek, and the Lehigh Valley and the Phila. and Read. railways; 80 miles N. W. of Philadelphia. It is in the anthracite coal region; has several valuable mines, and iron-foundries and potteries; and contains a high school, public-school property valued at over $60,000, public library, 2 national banks with combined capital of $200,000, and 4 weekly and 3 other periodicals. Pop. (1890) 11,286; (1900) 13,504.

Mahāyāna [Sanskr. *mahā-*, great + *yāna*, a vehicle or conveyance]: the expanded form of Buddhist doctrine which prevails in the northern school of Buddhism, and is characterized by "an excess of transcendental speculation tending to abstract nihilism, and the substitution of fanciful degrees of meditation and contemplation in place of the practical asceticism of the Hināyāna school" (Eitel's *Handbook of Chinese Buddhism*). See Hināyāna, and Monier-Williams' *Buddhism*, etc. (1889).

Mahdi, El [= Arab. *mahdī*, liter., the guide, or leader]: the name applied by the Mussulmans to Mohammed, twelfth and last Imâm (high priest) of the family of Ali. In 873 he entered a cave at Serinen Rey, and was never seen again. His disappearance gave rise to wild conjectures and theories by which more than once the Mussulman world has been convulsed to its center. The Shiite Mussulmans believe he still exists in the cave, and daily look for him to issue from it in pomp to rule over the earth. The orthodox Mussulmans say he will appear only at the end of the world, when he will be attended by 360 celestial envoys, will convert all mankind to Islam, and reign universally as the vicar of Jesus Christ. Many claiming to be El Mahdi have arisen at different times, and some have attained great power. The last of these pretenders, commonly called The Mahdi by Europeans, was Mohammed Achmet, who was born at Dongola, in Nubia, in 1842. He studied Mussulman theology at Khartum and Berber, and in 1868 was consecrated to the service of Islam by the brotherhoods of Sid Abd-el-Kader and Sid-es-Senoussi. Retiring to the island of Abba in the White Nile, he rapidly won veneration from the neighboring Bagarrah Arabs by his learning, austerities, and apparent piety. In 1880 the Sid-es-Senoussi announced that he was the long-expected Mahdi, and ordered him to undertake the holy war. The Arabs and Ottomans treated his claims with derision; the grand sherif of Mecca in a proclamation branded him as an impostor, but the Mussulmans of the Sudan—then nominally a province of Egypt—accepted him with delirious enthusiasm. He defeated four expeditions sent against him by the Egyptian Government, captured El Obeid, capital of Kordofan, in Sept., 1883, and a few weeks later annihilated the Anglo-Egyptian army commanded by Gen. Hicks Pasha, composed of 10,000 soldiers with 40 European officers. Only two persons escaped death. In Jan., 1885, he captured Khartum, where Gen. Gordon Pasha was killed. The energetic interference of Great Britain then prevented the further spread of the insurrection. The Mahdi died of smallpox in June, 1885. His authority was supposed to be transmitted to a successor, who exercised his functions under the same name. See Ohrwalder, *Ten Years' Captivity in the Mahdi's Camp* (1892). E. A. Grosvenor.

Mahé, maa-hā′: principal island of the Seychelles, belonging to the French; N. N. E. of Madagascar, in lat. 4° 45′ S., lon. 55° 30′ E. It is of irregular form, 20 miles long by 5 broad. It is mountainous, and rises abruptly from the ocean. The village of Mahe, or Victoria, is in the N. E., on an open roadstead which serves as a port. The soil is scanty, but fertile; the climate is hot, but healthful. Pop. 8,000, speaking a corrupt French. M. W. H.

Mahé: French town and colony on the Malabar coast, India, 35 miles N. of Calicut; lat. 11° 42′ N., lon. 75° 31′ E. Area of colony, 23 sq. miles (see map of S. India, ref. 6–D). Pop. (1889) 8,349. The town is a picturesque one, but the colony is in decadence. It was taken in 1726 by Mahé de la Bordonnais, who gave it his own name, which is like the former native name of *Mahi* or *Maihi*. The town was taken by the British in 1761, 1779, and 1793. M. W. H.

Mahi Kanta: a group of fifty-two feudatory states, associated into one political agency, in Bombay, adjoining Southern Rajputana, between the Mahi and Sabarmutti rivers. Combined area, 11,049 sq. miles. Pop. 520,000. The principal states in order are Edar, Danta, and Pol. The feudal lords are mostly Rajputs, though there are some Kulis from Gujerat. The people are Bhils. M. W. H.

Mahmud: the name of two Ottoman sultans. Mahmud I. (1730–54), b. 1696, son of Mustapha II., succeeded his uncle Achmet III.; was an inefficient but kindly prince. D. in 1754.—Mahmud II. (1808–39), b. 1785, second son of Abd-ul Hamid I. His cousin Selim III., who reigned from 1789 to 1807, allowed him a degree of freedom in his youth unusual for an Ottoman prince, and inspired him with zeal for progress and reform. Selim was hated by the Janissaries, who deposed him and raised Mustapha IV., elder son of Abd-ul Hamid, to the throne. Baïractar Pasha, of Rustchuk, a devoted partisan of Selim, rose in revolt, captured Constantinople, stormed the Seraglio, and proclaimed Mahmud as sultan (July 28, 1808), Selim having been strangled by Mustapha's orders during the attack. Mahmud, with Baïractar as grand vizier, impetuously began his reforms. A sudden and desperate insurrection of the Janissaries broke out (November). The grand vizier was slain and the Seraglio about to surrender when Mahmud ordered that Mustapha be bowstrung and his dead body thrown to the rebels. He thus made himself the sole surviving descendant of Osman, and so rendered his person inviolable, it being universally believed among the Ottomans that their empire will end when the dynasty of Osman becomes extinct.

In 1808 the Ottoman empire seemed on the point of dissolution. The Wahabees held Arabia; Mehemet Ali was virtual sovereign of Egypt; in more than half the other provinces the pashas were practically independent; the Janissaries were the real masters of the state; all improvement or application of remedy seemed impossible on account of the fanatic spirit of the Mussulmans, who were bitterly opposed to any innovation. Mahmud's reign of thirty-one years was a constant struggle of one man against a whole people, against all the evils inherent in the Ottoman system and the political circumstances of the empire. At home he attained partial success. By means of Mehemet Ali he crushed the Wahabees and regained Arabia; he brought the pashas to semi-submission, destroyed the Janissaries, and somewhat consolidated the empire. He forced the officials to adopt the European dress and established an official gazette. He introduced a regular police system, put the army on a European footing, and founded military, naval, artillery, and engineering schools. In consequence of these innovations, and specially of his effort to better the political condition of his Christian subjects, he was detested by the vast majority of his coreligionists, who denounced him as a giaour. His two wars with Russia were disastrous. He could not put down the Greek revolution, and was rescued from his rebellious vassal, Mehemet Ali, in 1832 only by the intervention of Russia. A second rebellion of Mehemet Ali seemed about to give the deathblow to the empire when Mahmud died (July 1, 1839). Though a reformer, Mahmud was an Oriental; hence his best efforts were often sanguinary and always despotic. He was pliant, yet persistent even to obstinacy, generous, and brave. Full success in his undertakings was a practical impossibility. The marvel is rather that he accomplished so much as he did. No other Ottoman sultan since Souleïman I., who died in 1566, so nearly deserves the title sometimes accorded him of The Great. E. A. Grosvenor.

Mahmud of Ghazni, Abul-Kasim-Yemin-ed-Daulah: Sultan of Persia; first Mussulman Emperor of India and founder of the Ghaznevide dynasty; b. at Ghazni (Ghizni or Ghuzni), in Candahar, Oct. 2, 971. His father, Subuktigin, who claimed descent from the Sassanian kings of Persia, became governor of the province of Khorassan after the death of his father-in-law, Alptigin, of whom he had formerly been a slave. He owed a nominal allegiance to Persia, but was really independent and extended his frontiers on every side. Mahmud distinguished himself in youth under his father's command against the Tartars, who had invaded Khorassan, and received from Noh, the Samanide sovereign of Persia, the title of Seif-ed-Daulah, sword of the state, together with the government of the province of Segestan. His father died in 997, having appointed Ismaïl, a younger son, his successor. Mahmud overthrew Ismaïl and captured Ghazni in 998; then made alliance with the rulers of Turkistan and Kashgaria against Mansur, the new Persian monarch, and divided the Persian kingdom with his confederates. From 1001 to 1030 he made fourteen generally successful expeditions, in which he accumulated enormous treasures, massacred vast numbers of Hindus, and extended his empire from the Caspian to the Ganges. Though not specially favorable to letters, he founded an academy, library, and fine museum of natural history at Ghazni. Firdausī (*q. v.*), the chief Persian poet, was his subject and friend. Mahmud was the first ruler to take the title of sultan. D. at Ghazni in 1030. Many of his descendants bore the same name. See histories of India by Caldwell, Elliot, and Elphinstone. E. A. Grosvenor.

Mahog'any [from the S. Amer. name]: a noble forest tree of the West Indies and Central and South America, growing also to some extent in Florida. Its scientific name is *Swietenia mahogoni*. It belongs to the order *Cedrelaceæ*. Its wood is of very beautiful reddish color, extremely hard, strong, and heavy, and so costly that for a long time it has been used almost entirely as a veneering. It has for nearly 300 years been a staple article of commerce, and is exported from Honduras, Cuba, Haiti, Jamaica, and South America. The Honduras mahogany is now the most abundant and the largest, but also the coarsest and least handsome variety. The better sorts are called Spanish mahogany. Considerable quantities of the timber of *Khaya senegalensis* from Africa and *Soymida febrifuga* from Calcutta (both cedrelaceous trees) are imported into England as mahogany, but the wood is generally inferior to true mahogany. Madeira mahogany is the wood of *Persea indica*, and is coarse and inferior. Australia and other countries also furnish spurious though often valuable mahoganies. The bark of the true mahogany abounds in an active febrifugal principle. The mountain mahogany of Utah is the *Cercocarpus ledifolius*, of the order *Rosaceæ*.

Mahomet: See Mohammed.

Mahon, Lord: See Stanhope, Earl of.

Mahone, ma-hōn', Gen. William: soldier and politician; b. in Southampton, Va., Dec. 1, 1826; graduated at the Virginia Military Institute 1847; devoted himself to civil engineering; was the constructor of the Norfolk and Petersburg Railroad; took part in the capture of the Norfolk navy-yard Apr. 21, 1861; raised and commanded the Sixth Virginia Regiment; was engaged in most of the battles of the Peninsular campaign, those on the Rappahannock, and those around Petersburg; was appointed brigadier-general Mar., 1864, and major-general Aug. 12, 1864; commanded a division in Hill's corps, and at Lee's surrender was in command at Bermuda Hundred. After the war he devoted himself to the development of Virginia railways, and became president of the Norfolk and Tennessee Railway. He entered actively into politics, and was soon conspicuous as the organizer and leader of the so-called Readjuster party. He was U. S. Senator 1881–87, and failed of re-election. D. in Washington, D. C., Oct. 8, 1895. F. M. Colby.

Ma'hony, Francis: author; b. in Cork, Ireland, about 1805; studied at Jesuit colleges in Paris and Rome, and took orders in the Roman Catholic Church; abandoned the Church about 1831 to connect himself with *Fraser's Magazine*, in which he published an amusing series of articles over the pseudonym of *Father Prout*. These were collected in 1836 as *Reliques of Father Prout*. He was also a contributor to *Bentley's Miscellany* (1837), traveling correspondent, and afterward Roman correspondent, of *The Daily News*, and for many years Paris correspondent of *The Globe*. He advocated the unity of Italy in the powerful letters published as *Facts and Figures from Italy, by Don Jeremy Savonarola, Benedictine Monk* (1849). In 1864 he retired to a monastery in Paris, where he died May 19, 1866. Some of his later essays were edited by Blanchard Jerrold as *Final Reliques of Father Prout* (1874), and an edition of his works by Charles Kent was published in 1880.

Mahopac', Lake: a summer resort in Carmel township, Putnam co., N. Y.; 14 miles from Peekskill. It has many residences and several hotels. The lake is about 3 miles across, has three beautiful wooded islands, and is about 800 feet above the sea-level.

Mahrattas: a people of Central and Western India, who in the eighteenth century overran the greater part of the peninsula, placed the Mohammedan empire of Delhi under tribute, and were for half a century the most formidable obstacle to British supremacy in India. Their origin, geographical and ethnological, and their early history are alike unknown, but the evidence of physical characteristics, customs, religion, and language, combined with the feeble indications of tradition, would point to one (or several) of the numerous irruptions of Turanian races from Central Asia prior to the rise of Mohammedanism (seventh century A. D.). This supposed race must have found its chief seat in the N. W. of the Deccan, along the Indian Ocean southward from the Nerbudda river to the neighborhood of Goa, and by intermarriage with Sudras and other low-caste Hindu women acquired at once a language and a religion, the latter, however, being distinctive in ignoring caste and in permitting the use of meats. See India, and Grant Duff's *History of the Mahrattas*, and, for a comprehensive though brief *résumé* of Mahratta history, Meadows Taylor's *Student's Manual of the History of India*.

Mai, mī, Angelo: classical scholar; b. at Schilpario, near Bergamo, Italy, Mar. 7, 1782; was educated by the Jesuits; was appointed custodian of the Ambrosian Library of Milan in 1813; chief keeper of the Vatican Library in Rome in 1819; secretary to the Propaganda in 1833; cardinal in 1838. D. at Albano, Sept. 9, 1854. When in Milan he acquired great reputation from his publications of fragments of long-lost classical works, chiefly discovered on palimpsests. The most remarkable of these were the fragments of Cicero's *Orationes*, Fronto's *Letters*, Eusebius's *Chronicon*, *Dionysius of Halicarnassus*, *Themistius*, *Isæus*, *Philo*, and others; but by far the most important were very considerable portions of Cicero's *De republica*, published in 1822, and the so-called Ambrosian codex of *Plautus* of the fifth century,

which apart from its paramount critical value proved that the plays of Plautus which we possess are those which Varro pronounced genuine. In 1825 he began the publication of those series of ancient works, Greek and Latin, partly *inedita*, which have made his name celebrated among scholars, namely, *Scriptorum Veterum Nova Collectio e Vaticanis Codicibus edita* (10 vols., 1825–38); *Auctores Classici e Vaticanis Codicibus editi* (10 vols., 1828–38); *Spicilegium Romanum* (10 vols., 1839–44); and *Nova Patrum Bibliotheca* (6 vols., 1845–53). Revised by A. GUDEMAN.

Mai'a (in Gr. Maîa): in Greek mythology, the eldest daughter of Atlas and Pleione, and therefore one of the Pleiades. She was beloved by Zeus, and in a cave of Mt. Cyllene, in Arcadia, she bore to him Hermes. The story of his birth and infancy is told in the beautiful hymn to Hermes sometimes ascribed to Homer. J. R. S. S.

Maidenhair-tree: See PLANTS, FOSSIL.

Maidenhead: town; in the county of Berks, England; 26 miles W. of London (see map of England, ref. 12–J); on the southern bank of the Thames, here crossed by a stone bridge erected in 1772. It is picturesquely situated, and trades in malt, meal, and timber. Pop. (1891) 10,607.

Maid of Kent: a name commonly applied to ELIZABETH BARTON, a religious enthusiast; b. about 1506 and employed for some time as a servant in the village of Aldington, Kent. Left by a serious illness in a state of partial derangement, she saw strange visions, and uttered delirious speeches which the superstition of the people invested with the sanctity of prophecies. Archbishop Warham hearing of her alleged revelations sent Edward Bocking or Bockling, a canon of Canterbury, to investigate them. Whether persuaded of her divine mission or wishing to use her as a tool, Bocking encouraged her to continue prophesying. How far conscious imposture entered into her speeches, or how far they were due to epileptic conditions, or genuine religious enthusiasm can not be determined. It was revealed to her that if Henry VIII. obtained his divorce from Catharine he would come to a miserable end within seven months. Many Roman Catholics upheld her, and among those who showed great interest in her were Sir Thomas More, Warham, and Bishop Fisher, but the king's wrath soon made itself felt. She was arrested and after a public recantation and a confession that her visions were all "feigned of her imagination," she was executed at Tyburn with Bocking and four others on Apr. 21, 1534. F. M. COLBY.

Maidstone: town; in the county of Kent, England; 34 miles E. S. E. of London (see map of England, ref. 13–K); on the Medway, here crossed by a fine stone bridge of three arches, erected in 1879. It is a handsome old place, with a fine church, many good educational institutions, a museum and public library, two hospitals, cavalry and militia barracks, extensive oil and paper mills, breweries, and manufactures of hats and blankets. The Church of All Saints is one of the largest parish churches in the kingdom, and contains several interesting monuments and other antiquities. The surrounding country is famous for the wheat, and especially for the hops, it produces. Pop. (1891) 32,150.

Maignan, mān'yăn', ALBERT: historical and genre painter; b. at Beaumont, Sarthe, France, Dec. 15, 1844. He was a pupil of Luminais; was awarded a third-class medal at the Salon of 1874; a second-class medal in 1876; a first-class medal in 1879; received the decoration of the Legion of Honor 1883; a first-class medal at the Paris Exposition of 1889. He is a strong draughtsman and an excellent colorist. His *Departure of the Norman Fleet* (1874) and *Dante Meeting the Countess Matilda* (1881) are in the Luxembourg Gallery, Paris; *Assault on Pope Boniface VIII. at Agani* is in the Metropolitan Museum, New York.
WILLIAM A. COFFIN.

Maigre, mā'ger [Fr., liter., lean, slender]: popular name of a fish (*Sciæna aquila*) of the family *Sciænidæ*, inhabiting the Mediterranean Sea and the east Atlantic Ocean. It sometimes attains the length of 6 feet, and is much sought as a food-fish. It emits a groaning sound, which often guides the fishermen to its shoals. The maigre is taken with the net. Its large ear-bones are worn by some as charms against colic. The ear-bones of related American species, being marked with a rude imprint of the letter L, are in some quarters esteemed as "lucky-stones." Revised by D. S. JORDAN.

Mai'kop: a rapidly growing city of Kuban province; in the Caucasus, Russia; 63 miles S. E. of Ekaterinodar; on Bielaya river, an affluent of the Kuban (see map of Russia, ref. 10–E). It is a favorable point for the concentration of troops operating in the Caucasus, is in a rich and fertile district, and has become the chief market of that region. Pop. (1886) 27,945.

Maïkov, mă-ee'kōv, APOLLON NIKOLAEVICH: poet; son of a distinguished painter, and great-grandson of Vasilii Maïkov, a poet of the eighteenth century; b. in Moscow, Russia, May 23, 1821. He studied at the University of St. Petersburg, and turned to literature, publishing in 1842 a small volume of poems that was favorably reviewed by the great critic Belinskiï. In the same year he traveled and spent several months in Italy; and during a stay in Bohemia he became a disciple of Panslavism. Since then his life has been that of an author, though he was also for many years in the service of the Government as one of the censors of foreign books. On Apr. 30, 1888, the fiftieth anniversary of his earliest literary production was celebrated. Maïkov probably is the first among living Russian poets. His works, idealistic in tone, are characterized by great perfection of form. He has drawn from classical antiquity many of his subjects, among them those of his two plays, *Tri Smerti* (Three Deaths) and *Dva Mira* (Two Worlds), on which he labored for years. During the Crimean war he composed patriotic pieces, and besides a modern rendering of *The Tale of the Troop of Igor* and other excellent translations, he has written fine poems of divers sorts. A number of them have been put into German (H. Roskoschny, Leipzig), and a few not very successfully into English. See E. T. Wilson, *Russian Lyrics* (1887), and J. Pollen, *Rhymes from the Russian* (1891). His complete works were published in St. Petersburg in 1884 (3 vols., 4th ed.). A. C. COOLIDGE.

Maïkov, LEONTIÏ NIKOLAEVICH: editor and author; brother of Apollon Maïkov, poet; b. in 1839. After studying at the University of St. Petersburg he entered the service of the Government, and in time was appointed vice-director of the Imperial Library. He has also been editor of *The Journal of Public Instruction* as well as president of the ethnographical section of the Imperial Geographical Society. He has contributed valuable articles to journals and reviews on such subjects as geography, ethnography, and folk-lore, besides studies of Russian authors. In 1885–87 he edited with excellent notes and biography the works of the poet Batiushkov. A. C. COOLIDGE.

Maimaichin, mī'mī'cheen' (literally, buy-sell-mart): a Chinese commercial station on the frontier of Mongolia; situated immediately opposite the Siberian frontier trading-post, Kiakhta, from which it is separated by a neutral strip 650 feet in width. It is clean and well kept and has a population of 3,000. Since the treaty of Peking (1860), which opened the whole Russian-Chinese frontier to commerce, it has lost much of its importance.

Maimbourg, măn'boor', LOUIS: Church historian; b. at Nancy in 1610; entered the Society of Jesus in 1626, and was for some years Professor of Rhetoric at Rome. He enjoyed a great reputation as a Church historian, and his *Histoire de l'Arianisme*, *Histoire des Iconoclastes*, *Histoire du Calvinisme*, etc., were much read in their time; but he wrote with one eye fixed upon his friends and the other upon his foes, totally blind to truth, and having incautiously entered into the contest between Louis XIV. and the pope, and taken the side of the king in his *Traité historique sur les prérogatives de l'Église de Rome*, 1682, he was expelled from his order on demand of the pope (1682). He retired, protected by the king, who gave him a pension, to the abbey of St. Victor in Paris, where he died Aug. 13, 1686.

Maimene: khanate and town now in Northwest Afghanistan and tributary to its ameer. The town is 190 miles N. E. of Herat, lat. 35° 49′ N., lon. 64° 33′ E., on the Sanghalyk or Nari river, which loses itself in the sandy deserts to the N. The town has an important strategic position in case of a war between Great Britain and Russia. It was an important commercial place, with a population estimated at as high as 60,000 down to the year 1874, when it was subjected to a siege of six months, terminated by a massacre of 18,000 persons. It is now a small town of about 2,500 inhabitants. The khanate covers the surrounding territory, and has a population estimated at 100,000, mostly Uzbek Tartars. See Grodekov, *From Samarcand to Herat* (translated from the Russian, 1880). MARK W. HARRINGTON.

Maimensingh', or **Mymensingh**: a district of the Dacca division, Bengal, British India; between the Jamuna (the

continuation of the Brahmaputra) and the Meghna, and S. of the Garo hills of Assam. It is crossed obliquely by the Old Brahmaputra and many other streams between the Jamuna and Meghna. It is a large, marshy, but fertile plain, hilly toward the S., with many great, insalubrious jungles. Rice and jute, the best in Bengal, are the principal crops. Area, 6,287 sq. miles. Pop. 3,100,000. There are 7,600 villages, but only five with a population of over 6,500. The capital is Nasirabad, on the Old Brahmaputra. Pop. 10,500.

MARK W. HARRINGTON.

Maimon'ides (in Heb., *Moses ben Maimon*; in Arab., *Abu Imram Musa ibn Maimūn ibn Abdallah*): the most important figure in mediæval Jewish literature; b. in Cordova, Mar. 30, 1135. He is also known as *Rambam*, a word formed from the initial letters of his names. Among Christian authors of his time he is known as *R. Moyses*. He came of a family well and honorably known in the Jewish community. Under his father's guidance he was at an early age initiated into the study not only of the Bible and Talmud, but also of mathematics, astronomy, and medicine. When he was thirteen years old the Moravid dynasty in Spain gave way before the Almohid (Unitarian) invaders from Africa. Their chief, Almu'min, took possession of Cordova and immediately instituted a reign of religious persecution. Those who refused to change their religion were exiled. It has been asserted that the family of Maimonides did, for a time, outwardly profess Islam; but decisive proof for this statement is wanting, and the authorities differ in opinion. (See a *résumé* by S. M. Simmons, *Jewish Chronicle*, London, Jan. 27, 1882.) A few years later we find them exiled from their native country. In 1159 they were in Fez, in 1165 in St. Jean d'Aere. Moses traveled still farther, and settled in Fostāt (Cairo). At first he earned his livelihood as a jeweler; but the Jewish community recognized his worth as a scholar, and soon looked upon him as their spiritual head. He came to be widely known also as a physician, and in this capacity entered into the service of the reigning sultan and of his vizier, al Fadhil. D. Dec. 13, 1204.

Maimonides was a prolific writer, but, at the same time, he was careful and systematic. His works, written in Arabic with one exception, were very soon translated into Hebrew, notably by members of the Tibbon family. They may be divided into three classes: Talmudic, philosophical, and scientific works.

I. TALMUDIC. *a. Commentary to the Mishnāh*; or, according to its Arabic title, *Al Sirāj* (The Luminary).—In writing this commentary Maimonides wished to spare those who studied the Mishnāh the trouble of wading through the endless discussions of the Gemara. (See TALMUD.) He has therefore carefully noted only the decisions reached by the rabbis. He gives his own explanations only where no rule of practice is concerned. At times he goes into long philosophical or religious discussions; e. g. attached to his notes on the treatise *Sanhedrin* we find the so-called *Thirteen Articles of Faith*, which, though not intended by Maimonides as authoritative and binding, have found their way into the orthodox Jewish prayer-book. (See the literature in Schechter, *The Dogmas of Judaism*, *Jew. Quart. Rev.*, i., pp. 60, *sq.*). This work, which occupied its author for ten years, was soon translated into Hebrew, and is found (since 1523) in the ordinary editions of the Talmud. On the editions of the Arabic text see Steinschneider, *Die Hebraeischen Uebersetzungen des Mittelalters* (Berlin, 1893), § 554, p. 922. A Latin translation of the introduction was given by POCOCKE (*q. v.*), *Porta Mosis* (Oxford, 1655); a Latin translation of the whole by Surenhus (1698–1703). Extracts in German may be found in Winter and Wünsche, *Die Jüdische Literatur* (1892, ii., pp. 385, *sq.*).

b. Book of the Commandments (Arabic, *Kitāb Ashariya*; Hebrew, *Sefer Hammitswōth*) contains a list of the 613 precepts deduced by the rabbis from the Pentateuch. In his love of order Maimonides classifies the principles upon which these laws are deduced under fourteen heads. See M. Peritz, *Das Buch der Gesetze* (Breslau, 1881); M. Bloch, *Le Livre des Précepts* (Paris, 1888). On the discussion aroused by this work, see Jellinek, *Kontres Taryag* (Wien, 1878). This compilation was simply an introduction to

c. The Repetition of the Law (*Mishnāh Thorah*, or *Yad Hachazākāh*), in which Maimonides has gathered all the Halachōt (legal and religious decisions) which are to be found in the whole Talmudic literature, as well as in the works of the Gaonim. It was his intention that this should be a civil, religious, and moral guide for the Jew who wished to live according to the Law, as understood by rabbinical Judaism. Several similar works were compiled during the Middle Ages. (See JEWISH LITERATURE.) The *Mishnāh Thorah* is written in pure Hebrew, and is arranged, not according to the treatises of the *Mishnāh*, but according to certain philosophical principles which Maimonides has laid down in his *Guide of the Perplexed*, iii., chap. xxxv.

d. Several smaller works, for example, *Treatise on Compulsory Conversion*, in which the author attempts to show that, "according to Talmudic teaching, the acknowledgment of Mohammed as prophet is permissible"; and that in certain cases a Jew may outwardly profess Islam. (See the eds. of A. Geiger, 1850, and H. Edelmann, *Chemdāh Genūzāh*, 1851.) *The Epistle to the Jews in Yemen* (Iggereth Tēman, ed. by D. Halub, Vienna, 1874) treats of a pseudo-Messiah who had appeared in that part of Arabia. (See also *Jüd. Literatur Blatt*, 1893, No. 40.) For the literature of Maimonides's correspondence, see Steinschneider, *Hebr. Uebersetz.*, ii., pp. 930, *sq.*

II. It is, however, as a philosophical writer that Maimonides has exerted the greatest influence upon Judaism. His *Guide of the Perplexed* (Arabic, *Dalālat al Hāirīn*; Hebrew, *Mōrēh Nebhūchīm*), finished in 1190 and dedicated to his pupil Joseph ibn Aknin, is the most comprehensive attempt made to combine Aristotelian philosophy in its Neoplatonic form with orthodox Jewish theology. His admiration for Aristotle was unbounded. He studied his works with the aid of the commentaries of Alexander of Apodisia, Themistius, and Averroës. Maimonides may be considered, in general, to be a rationalist. Where he forsakes philosophy, he does so knowingly, and in order to satisfy the demands of the religious feeling.

According to Maimonides, "the study of philosophy is the highest degree of divine worship," and Scripture must be brought into harmony with it. He explains numerous expressions as figures, homonyms, and hybrid terms. From a misunderstanding of such terms has resulted the apparent conflict between religion and science. All the attributes of God mentioned in the Bible are thus explained away. They would be a limitation of the Deity as the Primal Cause or Ever-active Intellect. The Mohammedan *Kalām* he declares to be unphilosophical.

In the second part Maimonides endeavors to prove the existence of an infinite, incorporeal, eternal Primal Cause. He divides the spheres into four groups, each sphere having a soul of its own. These are a descending series from the Primal Cause, and through them emanations are transmitted to the Active Intellect. This is to a certain extent Aristotelian; but Maimonides holds that the spheres are created. He teaches also the doctrine of the *Creatio in nihilo*, contrary to Aristotle. He holds that it can be proved as well by philosophical reasoning as from Scripture. The universe can be destroyed again only by a fiat of the divine will. Miracles do not really exist, for the laws once laid down by the Creator can not be changed. Prophecy, likewise, is explained as a purely natural phenomenon—an emanation from the active intellect upon the intellect and imagination of such persons whose mental and moral powers predispose them to such a reception. That which was potential is brought into actuality.

The third part opens with an exposition of the first chapter of Ezekiel, which had always formed a subject of speculation among the Jews. According to Maimonides, it contains an exposition of the sublunary world, of the spheres, and of the intelligences. The rest of the book treats of theological and ethical matters. Evil is simply the negation of good, and arises through the material elements which are in man. The purpose and end of the world can not be ascertained; they are determined purely by the will of God. Maimonides is a firm upholder of the doctrine of free will, though he is ready to confess "this theory is not established by demonstrative proof; it is based upon the authority of the Bible." The same is the case with his belief in the resurrection of the body.

The *Mōrēh Nebhūchīm* has been twice translated into Hebrew—by Samuel ibn Tibbon (twelfth century) and by Juda Charisi (1216). It has been many times commented upon. The Arabic text, with French translation, was published by S. Munk, *Le Guide des Égarés* (Paris, 1850–66). A Latin translation was done by J. Buxtorf, *Doctor Perplexorum* (Basel, 1629); a German one by Fürstenthal (part i., Krotoschin, 1839); M. Stern (part ii., Vienna, 1864); and S. Scheyer (part iii., Frankfort-on-the-Main, 1838). An Italian rendering was made by D. J. Maroni, *Guida degli*

Smtarriti (Florence, 1870); a Hungarian by M. Klein (Budapest, 1880–89); and an English one by M. Friedländer, *The Guide of the Perplexed* (3 vols., London, 1885).

The position assigned by Maimonides to philosophy appeared to many to be dangerous to Jewish doctrine, and a fierce controversy arose between Maimonists and anti-Maimonists which lasted for many years, and ended in a victory for the followers of the philosopher. See Friedländer, *Guide* (vol. iii., pp. xxiv., *sq.*); Geiger, *Wissent. Zeitschrift* (v., pp. 98, *sq.*); Grätz, *Geschichte der Juden* (vii., pp. 31, *sq.*); *Jew. Quart. Rev.* (i., pp. 60, *sq.*).

Several smaller treatises were also written by Maimonides, such as the *Letter on the Resurrection* (1291); *Logical Terminology* (about 1160); *Treatise on the Unity of God*, etc. See Steinschneider, *Hebr. Uebers.* (i., pp. 341. *sq.*).

III. While living in Fostāt a great part of Maimonides's time was taken up with his duties as a physician. His interest in the study of medicine is seen in the eight treatises which he wrote. They exist, still in MS., in many of the European libraries. A complete account may be found in Steinschneider, *Hebr. Uebers.* (i., § 481, pp. 762, *sq.*).

Authorities.—In addition to those mentioned above, Steinschneider, *Catalogus Librorum Hebræcorum in Bibliotheca Bodleiana* (Berlin, 1852) col. 1860; Grätz, *Geschichte der Juden* (vi., pp. 363, *sq.*); S. B. Scheyer, *Das psychol. System des Maimonides* (Frankfort-on-the-Main, 1845); Geiger, *Moses Ben Maimon* (Breslau, 1850); M. Joel, *Die Religionsphilosophie des Moses ben Maimon* (Breslau, 1859); *Albertus Magnus und sein Verhältniss zu Maimonides* (Breslau, 1863); S. Rubin, *Spinoza und Maimonides* (Vienna, 1868); Ad. Jaraczewsky, *Zeitschr. f. Philos. und Philos. Kritik* (vol. xlvi., pp. 5–24, Halle, 1865); M. Eisler, *Vorlesungen über die Jüdische Philosophen* (ii., Vienna, 1870); D. Rosin, *Die Ethik des Maimonides* (Breslau, 1876); D. Kaufmann, *Gesch. der Attributenlehre* (pp. 363, *sq.*, Gotha, 1877); I. Münz, *Die Religionsphilosophie des Maimonides* (Berlin. 1887); Steinschneider, *Mōrēh Mekōm Hammōrēh* (Berlin, 1885).

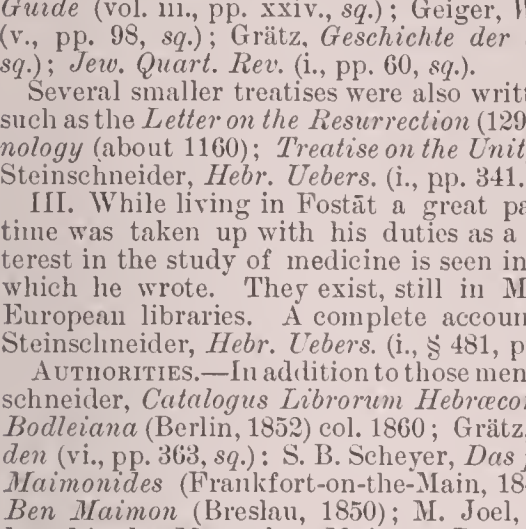
Richard Gottheil.

Main, mīn: a river of Germany which rises in the Fichtelgebirge, flows westward with a tortuous course for a distance of 300 miles, and joins the Rhine opposite Mayence. It is navigable nearly 200 miles, and is connected with the Danube by the Ludwig's canal. The principal cities on its banks are Würzburg, Offenbach, and Frankfort.

Main, Hubert Platt: See the Appendix.

Maine: an ancient province of France, lying S. of Normandy, and comprising the present departments of Mayenne and Sarthe, and parts of Eure and Orne.

Maine: one of the U. S. of North America (North Atlantic group); the most northeasterly of the U. S., and the largest of the New England States; name used by early explorers to designate the mainland as distinct from the numerous islands which skirt the coast.



Seal of Maine.

Situation and Area.—It lies between 43° 04′ and 47° 27′ N. lat., and between 66° 56′ and 71° 06′ W. lon., and is bounded on the N. W. by the province of Quebec, on the N. by Quebec and New Brunswick, on the E. by New Brunswick, on the S. E. and S. by the Atlantic Ocean, and on the W. by New Hampshire. Its extreme length is 302 miles; extreme width, 285 miles. The gross area is 33,040 sq. miles, of which 3,145 are water surface. By the census of 1900 Maine ranked thirtieth among the States in population.

Topography.—The surface is disposed in two great slopes. The northern or St. John slope, drained by the St. John river, is 117 miles in length and about 90 miles in breadth, and has an area of 7,400 sq. miles. The divide which separates this from the southern slope is in general quite flat, and in many instances lakes and swamps near it have outlets in both directions. The region is a great monotonous plain, abounding in swamps, with but few mountain peaks, and some low rolling highlands. The average fall per mile toward the N. and E. is from 2 to 3 feet. The southern slope has an area of 24,100 sq. miles, with an average width of 140 miles. The elevation above the sea of the northern border varies from nearly 2,000 feet on the W., to less than 1,000 feet on the E. The average slope per mile is 7 feet.

Mountains.—The main mountain region crosses the State northeastwardly in a nearly straight line from the White Mountains, past Mt. Abraham and Mt. Katahdin, to Mars Hill near the St. John river. Mt. Katahdin, in the center of the State, is 5,385 feet high.

Rivers.—The rivers rise high among the mountain peaks—the Saco at an altitude of 1,890 feet, the Kennebec at 2,000, the Penobscot at 2,500, the Androscoggin at 3,000—and flow swiftly, with frequent falls and rapids, to the sea. Large lakes at their sources give abundant opportunity for storage, and the location of many of the best falls at the head of tide-water gives them an exceptional value. The available water-power of the State has been estimated at 2,656,200 horse-power.

Lakes.—Maine has more than 1,500 lakes situated at the head of the river systems and at the bases of the scattered mountain peaks. Together with the rivers they cover an area of 3,145 sq. miles, or one-eleventh of the area of the State. Moosehead Lake, the largest in the State, is 35 miles long, 10 miles wide, and 1,023 feet above the level of the sea, and Rangely Lake is 1,511 feet above it.

Seacoast.—Although the coast-line measured direct is only about 225 miles long, yet such is its irregularity and indentation that Maine has 2,486 miles of seacoast. In the western portion of the State the seacoast for 10 or 20 miles inland is flat, low, sandy, and at some points marshy. The only exception is Mt. Agamenticus in the extreme southwest. E. of the Kennebec, in the Camden Hills and the peaks of Mt. Desert island and vicinity, the shore rises abruptly from the sea to a height of from 1,000 to 2,800 feet.

Geology.—The rocks are highly crystalline and much disturbed. Metamorphosis has been carried to such an extent that only in a few cases are they fossiliferous. Consequently, the geological age of large areas is conjectural, and admits of no absolute statement except the general one that they are very old. The Devonian areas in the northern part of the State and in the vicinity of Perry and Pembroke, and the Silurian area at North Haven on Penobscot Bay, have been established beyond question. The entire surface, including Katahdin, is glaciated. Striæ and bowlders are found in all parts of the State. There are thirty-one systems of kames, having a general northerly and southerly direction. Through the southern part of the State are finely stratified fossiliferous clays of the Champlain period.

Soil and Products.—Maine presents a great variety of soils—clay, clayey loam, sandy loam, mountain interval, river bottom, salt marsh, and fresh meadows. The soil in the river valleys, and between the Penobscot and the Kennebec, and in the cultivated portions of Aroostook County, is of good quality. In the mountainous districts and along the seacoast it is sterile, and does not repay cultivation. Farms of alluvial soil, on the Androscoggin, Sandy, and Kennebec rivers, are the best for the cereals; the uplands for grazing and orchards; and the clay loam for hay. The forests are a great source of wealth. In the northern part of the State they are composed chiefly of pine, spruce, hemlock, and fir. Farther south there is an admixture of white and red oak, maple, beech, birch, and ash. There are cedar swamps in the northeast. In the south are found poplar, elm, basswood, dogwood, sassafras, juniper, buttonwood, alder, and willow. Butternut and hickory are found, but are not abundant; chestnut is found only on the southwest border. The apple is the leading fruit-tree. The plum, cherry, and pear are native. The blackberry, strawberry, raspberry, and blueberry grow in great profusion.

The moose, deer, caribou, bear, wolf, catamount, wolverine, wild-cat, fox, beaver, raccoon, marten, sable, weasel, mink, woodchuck, porcupine, rabbit, and squirrel inhabit the forests. Seals are found in many of the bays. Wild geese, ducks, brant, and teal inhabit the lakes and ponds. Gulls and fish-hawks are found on the coast. Eagles, hawks, owls, crows, partridges, pigeons, quails, robins, king-fishers, plover, woodcock, blackbirds, orioles, bobolinks, bluebirds, yellowbirds, humming-birds, swallows, and sparrows are common. Salmon, salmon-trout, trout, sturgeon, bass, and pickerel abound in the streams and lakes; and the cun-

ner, flounder, rock-cod and sculpin, the cod, pollack, haddock, hake, herring, menhaden, mackerel, porgy, and halibut are found in great numbers along the coast. Clams, mussels, and lobsters are abundant.

The minerals of chief economic value are granite, limestone, and slate. In 1899 the State ranked second in granite, the production being valued at $1,321,082, and Dix island (solid rock) and Hallowell being the principal sources; sixth in limestone, with production, chiefly burned into lime, valued at $1,028,375; and fourth in slate, with product of 24,676 squares of roofing slate, valued at $121,640, and other State products, $60,126. Other valuable minerals worked are iron, copper, gold, silver, lead, zinc, tin, manganese, arsenic, antimony, pyrites, freestone, marble, quartz for glass, brick clay, feldspar, garnet, beryl, and tourmaline.

The following from the U. S. census reports of 1880 and 1890 shows the extent of farming operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	64,309	62,013	3·6
Number of acres in farms	6,552,578	6,179,925	5·7
Value of farms, including buildings and fences	$102,357,615	$98,567,730	3·7

* Decrease.

The following table shows the acreage, yield, and value of the principal crops in 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	12,229	440,244 bush.	$242,134
Wheat	2,090	40,755 "	36,680
Oats	140,203	5,257,612 "	1,997,893
Barley	11,508	315,319 "	195,498
Rye	993	17,080 "	14,006
Buckwheat	23,992	719,760 "	352,682
Potatoes	49,208	6,200,208 "	3,038,102
Hay	937,774	843,997 tons	10,929,761
Totals	1,177,997	.....	$16,806,756

The farm animals on Jan. 1, 1900, comprised 109,747 horses, value $6,432,826; 203,814 milch cows, value $5,890,225; 112,723 oxen and other cattle, value $2,973,863; 254,027 sheep, value $787,484; and about 80,000 swine, estimated value $695,000; total value $16,779,398.

Two leading industries, though not directly agricultural, are of great benefit to the farmers of the State. The cutting of ice gives employment to a large number of men and teams at a time when they otherwise would be idle, and the development of the coast and lake regions as summer resorts gives a market for garden products. The canning of vegetables has recently grown to be an important and valuable industry. The value of the output of the 175 canneries in operation in 1900 was $5,000,000. In ordinary years $350,000 is paid to farmers for sweet corn alone.

Climate.—The climate, though severe and subject to great extremes, is moderately uniform during each season, and is favorable to health. Snow lies on the ground from three and a half to five months. Excellent drainage and winds from sea, mountain, and forest render the State almost free from malarial disease. The following table, compiled from reports by the U. S. Weather Bureau at Portland on the basis of observations made in that city, is fairly representative of the temperature and rainfall during 1893 in the thickly settled portions of the State. A considerable difference is shown by observations in the northern section, caused by conditions of its own:

MONTHS.	Highest temperature.	Mean temperature.	Rainfall, inches.
January	48° F.	15° F.	2·19
February	53	20	4·51
March	52	29	3·58
April	61	39	3·71
May	83	52	7·59
June	88	60	3·62
July	93	68	0·96
August	90	67	2·74
September	74	56	2·33
October	75	51	5·13
November	58	38·5	1·83
December	46	22	5·42

Divisions.—For administrative purposes Maine is divided into sixteen counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.
Androscoggin	9-B	48,968	54,242	Auburn	12,951
Aroostook	3-E	49,589	60,744	Houlton	4,686
Cumberland	10-B	90,949	100,689	Portland	50,145
Franklin	7-B	17,053	18,444	Farmington	1,251
Hancock	8-E	37,312	37,241	Ellsworth	4,297
Kennebec	9-C	57,012	59,117	Augusta	11,683
Knox	9-D	31,473	30,406	Rockland	8,150
Lincoln	10-D	21,996	19,669	Wiscasset	1,273
Oxford	8-A	30,586	32,238	Paris	3,225
Penobscot	6-E	72,865	76,246	Bangor	21,850

Somerset	6-C	32,627	33,849	Skowhegan	4,266
Waldo	9-D	27,759	24,185	Belfast	4,615
Washington	7-G	44,482	45,232	Calais Machias	7,655 2,082
York	11-A	62,829	64,885	Alfred	937
Totals	.....	661,086	694,466		

* Reference for location of counties, see map of Maine.

Principal Cities and Towns, with Population for 1900.—Portland, 50,145; Lewiston, 23,761; Bangor, 21,850; Biddeford, 16,145; Auburn, 12,951; Augusta (capital), 11,683; Bath, 10,477; Waterville, 9,477; Rockland, 8,150; Calais, 7,655; Westbrook, 7,283; Brunswick, 6,806; South Portland, 6,287; Saco, 6,122; Oldtown, 5,763; Gardiner, 5,501; Eastport, 5,311; Brewer, 4,835; Belfast, 4,615; Ellsworth, 4,297; and Skowhegan, 4,266.

Population and Races.—In 1850, 583,169; 1860, 628,279; 1870, 626,915; 1880, 648,936; 1890, 661,086 (native, 582,125; foreign, 78,961; males, 332,590; females, 328,496; white, 659,263; colored, 1,190, including 73 Chinese, 1 Japanese, and 559 civilized Indians); 1900, 694,466. The majority of the foreign population are French-Canadians. There is an important Swedish settlement at New Sweden. Maine has the largest proportion (more than three-quarters) of purely native stock among the New England States.

Industries and Business Interests.—The following table gives a summary of the manufacturing and mechanical industries of the State, as reported by the census of 1890:

INDUSTRIES.	Year.	Number of establishments.	Capital.	AVERAGE NUMBER OF EMPLOYEES AND TOTAL WAGES PAID.		Cost of materials used.	Value of products.
				Employees.	Wages.		
Total for the State	1890	5,010	$80,419,809	75,780	$26,526,217	$51,509,678	$95,690,760
	1880	4,481	49,988,171	52,954	13,623,318	51,120,708	79,829,793
Increase	.....	529	$30,431,638	22,826	$12,902,899	$388,970	$15,860,967
Totals for selected industries:

Ship-building.—The close proximity of ocean and forest, the deep-water inland harbors, the skilled labor the result of generations of ship-builders, combine to make ship-building a leading interest of the State. At Bath alone since 1781 there have been built more than 4,000 vessels, having a total tonnage not far from 1,500,000. In 1899 about 50,000 tons of new shipping were launched, Bath furnishing 40,009 tons. Bath has a yard large enough to allow the construction of eight or ten large wooden ships at once, and a very large yard for iron ship-building.

Quarries.—The roofing-slate produced from the quarries of Piscataquis County is almost free from impurities, perfectly granulated, and consequently is flexible and not easily broken. Its remarkable cleavage renders its capable of being split into very thin plates, and its color is a deep black, unchangeable by exposure to weather. Maine stands first among the States in the amount of capital invested and persons employed in granite quarries, and second in amount and value of product. The New York State Capitol at Albany and the Metropolitan Museum of Art, New York, are constructed of Hallowell, Kennebec co., granite. Maine heads the list of States in the value of lime produced. In Knox County large quarries of very pure limestone are operated exclusively for the purpose of burning the product into lime.

The following is a summary of the quarrying industry of the State according to the census of 1890:

CLASSIFICATION.	No. of quarries.	Capital.	Persons employed.	Wages paid.	Value of product.
Lime	60	$1,120,500	1,063	$679,825	$1,523,499
Slate	4	641,000	309	160,300	214,000
Granite	153	3,192,317	3,737	1,517,026	2,225,839
Totals	217	$4,953,817	5,109	$2,357,151	$3,963,338

Fisheries.—In 1898 239 men and 300 boats were employed in mackerel fishing; number of pounds of fish sold fresh, 814,130; value $47,125; number of barrels salted, 665; value, $9,450; canned, 6,591. The total capital invested in seashad fishing was $2,363,374; the number caught in 1898, 1,152; value $23,720. In the herring fisheries 1,470 men were employed, and the amount received from the herring sold was $730,058. Sardine packing gave employment to 5,839 persons; wages received for labor, $811,775; value of the 178,694 cases put up, $2,727,781; of the oil, $4,635; of the fertilizer produced, $6,820. The number of men employed in lobster fishing was 3,103; number of lobsters handled, 8,178,332; number of seed lobsters furnished to the U. S. hatchery in 1897, 21,365; eggs resulting, 25,207,000; fry hatched, 22,875,000; number planted in Maine, about 21,875,000. In the menhaden industry 869 men were engaged and 83 steamers, at an expense of $105,000 paid employees; number of tons of pomace procured as fertilizer, 9,120 tons. In digging clams and scallops 550 men were employed; product of the canneries, 40,933 cases; in the shell, 1,109,936 bushels. The catch of smelts was 1,156,684 pounds; persons engaged, 1,095. In ground fishing, 819 boats and 1,291 men were employed; fish taken, 32,952,619 pounds, value $565,271.

The following is a summary of the fisheries of the State, according to the census of 1890:

DESIGNATION.	Number.	Value.
Persons employed	12,537	.....
Fishermen	10,944	.....
Shoremen	1,593	.....
Capital invested	.....	$2,562,709
Vessels	422	591,520
Boats	9,397	295,320
Minor apparatus	.....	597,344
Other capital, including shore property	.....	1,078,525
Products	.....	3,046,989
General fisheries	.....	3,024,686
Menhaden-fishery	.....	14,053
Oyster-fishery	.....	8,250

Commerce.—Maine has twelve U. S. customs districts and ports of entry—Aroostook, Bangor, Bath, Belfast, Castine, Frenchman Bay, Kennebunk, Machias, Passamaquoddy, Portland and Falmouth, Waldoboro and Wiscasset. For the 9 months ending March, 1901, the imports of merchandise at these ports (excepting Frenchman Bay) amounted to $1,928,553, and the exports to $13,005,282. The domestic traffic of the State by rail and water is very large.

Finance.—The total assessed valuation in 1880 was $235,978,716; in 1890, $309,129,101. The total valuation of real and personal property Jan. 1, 1900, was $287,691,790; the bonded indebtedness $2,203,300. The tax-rate is about 2¾ mills on each dollar of valuation. The receipts for the two years ending Dec. 31, 1900, were $3,798,923.03; the disbursements, $3,754,767.75. On Jan. 1, 1901, the bonded indebtedness of the State was $2,103,000, and the outstanding temporary loans $350,000. The payments on the public debt in 1899 and 1900 aggregated $100,000, and the reduction since 1890 $516,300.

Banking.—Sept. 5, 1900, there were 82 national banks in the State, with combined capital of $10,846,000, individual deposits of $21,833,792.67, and surplus and profits of $4,838,480.71. June 30, 1900, 51 savings-banks, which together had 183,103 depositors, $66,132,677 in individual deposits, and $3,577,578 in surplus and profits; and 17 loan and trust companies with a capital of $1,601,700, individual deposits of $9,058,640, and surplus and profits of $729,907.

Means of Communication.—There were 1,905·25 miles of railroads in operation Nov. 30, 1899, of which 154·17 miles were narrow gauge. The gross earnings of the steam roads were $8,723,218.62, and the number of passengers carried 4,908,971; amount of freight carried 6,539,200 tons. They employed 7,036 persons at wages aggregating $3,242,411.31. There were 240·20 miles of street railways June 30, 1899, employing 864 persons at wages aggregating $390,250.50 and carrying 18,496,374 passengers. The gross earnings for the year were $1,090,417.69 and the operating expenses $686,419.96.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	88	89	57,548	$597,550
Methodist Episcopal	355	337	22,996	1,152,875
Congregational	240	277	21,523	1,512,030
Baptist	232	242	18,492	915,550
Free-will Baptist	280	273	16,294	584,750
Universalist	86	84	3,750	542,900
Christians	60	36	3,451	76,380
Protestant Episcopal	38	37	3,291	406,590
Spiritualist	21	21	2,562	15,650
Unitarian	22	25	2,421	216,700
Advent Christian	65	62	2,317	38,100
Friends	23	23	1,430	35,975

To prevent excessive multiplication of feeble churches in small towns, and to promote comity between denominations in missionary work, an interdenominational commission was formed in 1892, composed of representatives of the Baptist, Free Baptist, Methodist Episcopal, Congregational, and Christian denominations, who agreed to hold consultations before beginning Christian work which might affect each other's interests, and to refer all cases of friction to the executive committee of the commission.

Schools.—Children between the ages of nine and fifteen years are required to attend school twelve weeks in each year. Every city and town is required to raise and expend for schools a sum not less than 80 cents per annum for each inhabitant. The State, from the income of a permanent school fund, from a tax of one mill per dollar of valuation on property in the State, and from a tax of 1 per cent. on the annual average deposits in savings-banks, distributes school money in proportion to the number of children of school age in each town. The total revenue for school purposes in 1899 was $1,507,345; the total expenditure $1,513,125. There were 3,966 school-houses, the estimated value of school property being $4,222,395. The total number of teachers employed during the year was 6,447—1,020 males and 5,427 females. The average monthly salary of a male teacher was $39.03, of a female teacher $27.20. The number of children of school-age in the State was 210,192, of whom 131,588 were enrolled in the public schools, with an average daily attendance of 97,706. School was held an average of 126 days during the year. The average expenditure per pupil, based on the average daily attendance, was $15.48. The schools are supplied with free text-books, at an annual cost of about $200,000. The district system, by which weak and inefficient schools under a management divided between the town committee and the district agent were maintained at disproportionate expense, has prevented the progress of education in the rural regions. The system was abolished by the Legislature in 1893. A system of free high schools was established in 1878, by which the State contributes $250 to each town which raises a sum not less than $250 for the support of a free high school. As the

support of the high schools is voluntary on the part of the towns, the constant and uniform increase in the number of such schools is a gratifying indication of increased interest in education.

Since the establishment of free high schools in all the principal towns the academies, which were important factors in the education of the State during the earlier portion of its history, have relatively declined, as they can not draw enough pupils to support them by tuition. In 1891 the State came to the temporary relief of several of these academies by the appropriation of $500 annually for ten years. There are five State normal schools: at Farmington, with an attendance in 1898–99 of 244 students; Castine, with 360; Gorham, with 276; Springfield, with 122; and Fort Kent, with 112.

The following table shows the condition of the institutions of higher education in the school year 1898–99:

NAME.	Founded.	Location.	Instructors.	Male students.	Female students.	Total students.
Bowdoin College	1802	Brunswick	35	360	0	360
Colby University	1818	Waterville	16	127	68	195
Bates College	1863	Lewiston	24	187	120	207
State College	1865	Orono	46	329	0	329
Bangor Theological Seminary	1816	Bangor	6	23	0	23
Cobb Divinity School	1840	Lewiston	7	36	4	40
Medical School of Maine	1821	Brunswick	16	126	0	126

Charitable, Reformatory, and Penal Institutions.—These comprise a State prison, at Thomaston, in which the prisoners are employed in various industries, and are given instruction in reading, writing, spelling, book-keeping, arithmetic, geography, and history; a State reform school, at Cape Elizabeth, which has a farm of 184 acres, a mechanical school, a library, reading-room, and an entertainment-hall (where the cottage system has been introduced); a State Industrial School for girls, at Hallowell, which is not a house of correction, but a refuge for girls between the ages of seven and fifteen years who are in danger of falling into vice and immorality, where they are taught to become self-supporting; a State insane asylum, at Augusta, which is inadequate to meet the needs of the State; a military and naval orphan asylum, at Bath; the Maine General Hospital, at Portland; the Maine Eye and Ear Infirmary, at Portland; and Good Will Farm, at East Fairfield, where boys of good character and promise are given homes in attractive cottages and trained for lives of usefulness.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 1,262 post-offices in the State, of which 69 were presidential (3 first-class, 15 second-class, 51 third-class) and 1,193 fourth-class. There were 545 money-order offices and 8 money-order stations. Of periodicals, there were 16 daily, 6 semi-weekly, 101 weekly, 2 semi-monthly, 33 monthly, and 1 quarterly; total, 159.

Libraries.—A U. S. Government report on public libraries of 1,000 volumes and upward each, in 1891, showed for Maine a total of 93 libraries, which contained 448,598 bound volumes and 90,562 pamphlets. The libraries were classified as follows: General, 44; school, 14, college, 6; law, 5; theological, 3; medical, 1; government, 1; public institution, 3; Y. M. C. A., 1; State, 1; social, 10; scientific, 2; historical, 1; and garrison, 1.

Political Organization.—The legislative power is vested in a House of Representatives of 151 members representing the towns, and a Senate of 31 members representing the 16 counties. The supreme executive power resides in a Governor, elected by a plurality vote of the people, and a council of seven members, representing as many districts, elected, as are also the treasurer and secretary of State, by joint ballot of the two houses. The judicial power is vested in a supreme judicial court of eight members, and superior courts in such counties as require them. State elections and sessions of the Legislature are biennial. Every male citizen of the U. S. of the age of twenty-one years and upward, excepting paupers, persons under guardianship, and Indians not taxed, having his residence established in the State for the term of three months next preceding any election, who is able to read the Constitution in the English language and write his name, is allowed to vote. The voluntary militia consists of 93 commissioned officers and 1,165 non-commissioned officers, privates, etc., all in the infantry arm of the service. Total authorized strength, 2,051; total liable to military service, 110,000.

History.—Maine was probably visited by Northmen about the year 1000 A. D., and was seen by the Cabots during their voyages in 1497 and 1498. In 1524 Verrazano named the whole coast New France. The voyages of Gosnold in 1602, Pring in 1603, and Weymouth in 1605 brought this region to the attention of the English. In 1603 Henry IV. of France granted a charter, embracing all North America between 40° and 46° N. lat., to de Monts, a French Protestant. In 1606 James I. of England granted the territory between 34° and 45° N. lat. to a company of Englishmen. Thus the whole coast of Maine was subject to a double grant, and became the scene of a prolonged contest between the English and French settlers; the French occupying the vicinity of the St. Croix and the Penobscot, the English occupying the vicinity of the Saco and the Kennebec, and each taking every opportunity to encroach upon the other. The first English settlement in New England, with the single exception of the slight and speedily abandoned attempt of Gosnold at Cuttyhunk, was made by a colony under the leadership of George Popham and Gilbert Raleigh at the mouth of the Kennebec in 1607, thirteen years in advance of the Pilgrims, and twenty-one years before the Puritans of Massachusetts Bay. Here they initiated what has since been the leading industry of Maine by building a 30-ton vessel, which they named the Virginia of Sagadahoc. The colony lacked a sound basis in family life and diversified industry; and after a winter of hardship, privation, and misfortune, the settlement was abandoned.

In 1620 the charter of New England was granted to forty noblemen, knights, and gentlemen. Two years later a patent under this charter gave to Sir Ferdinando Gorges and Captain John Mason the country between the Merrimac and the Kennebec for 60 miles inland. By a division in 1629 Gorges received the portion between the Piscataqua and the Kennebec. The Plymouth council, eager to settle the country, made numerous small grants inconsistent with previous grants, introducing much confusion and giving rise to protracted litigation. When the council surrendered their charter in 1635 Gorges retained what he had already possessed, and Sir William Alexander, the Earl of Stirling, received the region between the Kennebec and the St. Croix. In 1639 Gorges received a new charter, confirming the old boundaries on the coast, extending his territory twice as far inland, giving it to him as the province of Maine, under the feudal tenure of a county palatine, and investing him with vice-regal powers. In 1641 he established his government, under a kinsman, at Georgiana, now York, which in the following year became the first chartered city in America. Gorges died in 1647. Massachusetts laid claim to more and more extended jurisdiction in Maine; and finally, her claims being disallowed, in 1677 she purchased the entire Gorges interest for £1,250.

In 1691 the charter of William and Mary included Maine in the province of the Massachusetts Bay. This relation existed for the following 130 years. During the French and Indian war Maine suffered severely, both in loss of property and drain upon population, but contributed her share of men and means to the maintenance of the English cause. The period from the capture of Quebec in 1759 to the outbreak of the Revolution in 1775 was one of rapid growth for Maine. Deserted towns along the coast were repeopled, and new towns were established along the Saco, the Androscoggin, the Kennebec, and the Penobscot.

Maine bore an honorable part with Massachusetts in the war of the Revolution, suffering again severely in the devastation of the towns along the coast. The close of the war was followed by a large accession to the population. Many of the discharged soldiers came to take up the new eastern lands. From a population of 96,540 in 1789 Maine had grown to 151,719 in 1800, to 228,694 in 1810, and to 298,334 in 1820. The growth between 1810 and 1820 was greatly retarded by the Embargo Act, passed in 1807, and the war of 1812, which together with a succession of severe winters, almost destroyed the industries of the State. In 1815 and 1816 more than 15,000 people emigrated to Ohio. In 1820 Maine became a separate State. Politically Maine was an Anti-Federalist, or, as it was later called, a Democratic State, with but one or two exceptions, from 1810 to 1853; but the Democratic party lost control of the State first through its advocacy of prohibiting the liquor traffic in 1853; and again in 1855 when Anson P. Morrill carried the State as a representative of the advocates of the prohibitory law, and of the Knownothing party. In 1856 the Democratic and Anti-Maine Law candidate was chosen by the Legislature. The year 1856 marks the rearrangement of

parties with reference to the question of slavery. On this issue the State became strongly Republican, and for twenty-two years elected Republican governors. In 1879 Dr. Alonzo Garcelon, the Democratic candidate, was chosen by the union of the Democratic and Greenback members of the Legislature. The election in the fall of 1879 resulted, as in the previous year, in no election by the people, and it again devolved upon the Legislature to elect the Governor. Gov. Garcelon and his council, acting as the returning board, refused certificates of election to several Republican members on the ground of informality in the returns, without giving the customary opportunity for the public correction of such informalities; thus giving the Democratic and Greenback members a majority of the Legislature. The situation was complicated by charges of bribery brought against Republicans. Rival legislatures were organized, and rival candidates claimed the governorship. Gen. Joshua L. Chamberlain, as commander of the militia, preserved order and protected the property of the State; and by his firmness and impartiality brought about a peaceful settlement of the contest. In accordance with a decision of the Supreme Court of the State, a Republican Governor was inaugurated. In the following year a Fusion Governor was elected by a slender plurality. Since 1883 the Republicans have carried the State continuously by large majorities.

Soon after the treaty of 1783 with Great Britain there arose a dispute about the northeastern boundary of Maine, which was carried on with increasing bitterness until in 1842 the boundary was settled by the Ashburton Treaty. At this time Maine lost 5,500 sq. miles of territory, for which she received but a meager compensation from the national Government.

Maine has been a pioneer in the prohibition of the liquor traffic. In 1846 an ineffectual attempt was made to restrict the selling of liquor to sales for medicinal and mechanical purposes. In 1851 the first effective prohibitory law was enacted. Since that time the law has been frequently amended and strengthened. In 1884, by popular vote, prohibition was embodied in the constitution of the State. In 1891 the law was still further strengthened by making the penalty for keeping a drinking-house or tippling-shop $100 and costs, and in addition imprisonment for sixty days; and by making the payment of a U. S. special tax as a liquor-seller *prima facie* evidence that the person paying this tax is a seller of intoxicating liquor. In some sections of the State, under some officers and at some times, the law has been fairly successful in preventing the sale of intoxicating liquor. At other times and places, under other officers, the violation of the law has been open and flagrant. While during the greater portion of the time both political parties have been nominally in favor of prohibition, neither of them has given the law that consistent and persistent support which is necessary for its complete success. The prohibitory law has in great measure made it impossible for the liquor-dealers to control political parties. It has not, however, prevented political parties, when in power, from seeking to control the liquor-dealers in their own political interests. Prohibition in Maine has been neither a perfect success nor a complete failure.

In the civil war Maine met every call of the general Government promptly and generously, and furnished to the Union army 70,107 men, of whom 9,398 died during the war.

In 1891 Maine adopted a form of the Australian ballot system.

GOVERNORS OF MAINE.

Wm. King (resigned)	1820-21	Israel Washburn, Jr.	1861-63
W. D. Williamson (acting)	1821-22	Abner Coburn	1863-64
Albion K. Parris	1822-27	Samuel Cony	1864-67
Enoch Lincoln (died)	1827-29	J. L. Chamberlain	1867-71
Nathan Cutler (acting)	1829-30	Sidney Perham	1871-74
Jonathan D. Hunton	1830-31	Nelson Dingley, Jr.	1874-76
Samuel E. Smith	1831-34	Selden Connor	1876-79
Robert P. Dunlap	1834-38	Alonzo Garcelon	1879-80
Edward Kent	1838-39	Daniel F. Davis	1880-81
John Fairfield	1839-40	Harris M. Plaisted	1881-83
Edward Kent	1840-41	Frederick Robie	1883-87
John Fairfield	1841-43	Joseph R. Bodwell	1887
E. Kavanagh (acting)	1843-44	Sebastian S. Marble	1887-89

WILLIAM DE WITT HYDE and GEORGE J. HAGAR.

Maine, Sir HENRY JAMES SUMNER, LL. D., K. C. S. I., F. R. S.: jurist; b. Aug. 15, 1822; educated at Pembroke College, Cambridge, graduated 1844, and received a fellowship; was Regius Professor of Civil Law at Cambridge 1847–54; reader on Jurisprudence at the Middle Temple 1854–62; was engaged in India on the great legislative reform 1862–69; became in 1870 Corpus Professor of Jurisprudence at Oxford, and in 1871 entered the council of the Secretary of State for India; in 1877 was elected master of Trinity Hall, Cambridge, and in 1887 Professor of International Law; wrote an essay on *Roman Law* (1856); *Ancient Law* (1861); *Modern Theories of Succession to Property after Death, and the Corrections of them suggested by recent Researches*, and *Village Communities in the East and West*, six lectures delivered at Oxford in 1871; *Early History of Institutions* (1875); *Early Law and Custom* (1883); *Popular Government* (1885); and *International Law* (1888). D. at Cannes, Feb. 3, 1888.

Maine de Biran, mān′de-bēĕ-rāăn′, MARIE FRANÇOIS PIERRE GONTHIER: philosopher; b. near Bergerac, France, Nov. 29, 1766; served in the French army in the reign of Louis XVI. In 1803 his memoir *Influence de l'habitude sur la faculté de penser* won a prize from the French Institute. His *Sur la décomposition de la pensée* (1805), *Essai sur les fondements de la psychologie, Nouveaux essais d'anthropologie, Examen des Leçons de M. de Laromiguière* are all important contributions to philosophy. During his own lifetime only a few of his minor essays were printed. After his death, which occurred July 16, 1824, Cousin obtained access to his papers and published *Nouvelles considerations sur les rapports du physique et du moral de l'homme* (1834) and *Œuvres philosophiques de Maine de Biran* (3 vols., 1841). A complete edition of his works did not exist, however, until the *Œuvres inédites* appeared (1846–59, 3 vols.), edited by E. Naville. See Merten, *Étude critique sur Maine de Biran* (1865); E. Naville, *Maine de Biran, sa vie et ses pensées* (2d ed. 1874); Gérard, *Maine de Biran, essai sur sa philosophie* (1870). Maine de Biran is considered the founder of modern French Spiritualism, his works having inaugurated the reaction against the sensationalism of Condillac. He held that mental activity is a matter of immediate consciousness. Revised by J. MARK BALDWIN.

Maine-et-Loire, mān′ā-lwăăr′: western department of France; on the Mayenne and Loire, the second of which traverses the department from E. to W. by a valley varying in breadth from a mile to 5 miles. The bed of the Loire is here very wide, but the river is very shallow and crowded with islands. Area, 2,749 sq. miles. The surface is undulating and hilly, and the soil very fertile. The wine, of which the department annually produces 11,000,000 gal., is much esteemed, especially the white kinds. Large crops of wheat and excellent fruits are raised, and iron and coal are mined. Many cattle, sheep, and pigs are brought from the adjacent department for fattening. Horticulture is highly developed, and the fruits and vegetables of Saumur and Angers are much prized. The manufactures produce linen cloth, flannel, and cotton goods, worsted and cotton thread. Pop. (1896) 514,870. Capital, Angers.

Maine State College: an institution established by an act of the Legislature in 1865; located at Orono, on the

Penobscot river, 8 miles N. of Bangor. It is the easternmost college in the U. S. The college is a school of science and technology. It offers eight courses of study: the scientific, the civil, mechanical and electrical engineering, the chemical, the agricultural, the preparatory medical, and the pharmacy. Short courses, summer course, and extension courses are offered. Military drill is required of all male students. The college is supported chiefly by the State and the general Government. The endowment is $220,000. The income is $93,631. Tuition and rooms are free. There are eighteen buildings, of which the most important are Oak Hall, a dormitory, Wingate Hall for engineering, the laboratory for chemistry, Machinery Hall for mechanic arts, and Coburn Hall for biology. In 1900 the faculty numbered 46 and the students 329. The president is A. W. Harris. A. W. Harris.

Mai'notes (in Gr. Μανιάται): the people of Maina (Mani; ἡ Μάνη); a mountain district of Laconia, in the Peloponnesus, between the Messenian and Laconian gulfs, so called since the reign of Constantine Porphyrogennetus (944–959 A. D.). They boast of their descent from the ancient Spartans, although some consider them Slavic. They remained pagan until the reign of Basil (867–886 A. D.). They were virtually independent for many years before the rest of modern Greece. They are handsome, warlike, superstitious, and were formerly notorious robbers. Their number is about 60,000. See Walpole, *Memoirs relating to European and Asiatic Turkey* (London, 1817, pp. 33–63); Leake, *Peloponnesiaca* (London, 1846, pp. 138, note, 335 ff.); Curtius, *Peloponnesos* (Gotha, 1851), consult the index; Bartholdy, *Bruchstücke* (i., 246); Gell, *Journey* (246); Schafarik, *Slavische Alterthümer* (Leipzig, 1844, ii., 229); Leake, *Researches in Greece* (p. 416); Fallmerayer, *Geschichte der Halbinsel Morea* (i., 294); Ross, *Königsreisen* (ii., 223); Ῥαγκάβης, τὰ Ἑλληνικά (ii., 401 ff.); also see the histories of Finlay and Hertzberg. Revised by J. R. S. Sterrett.

Mainpuri: the capital of the district of Mainpuri, which forms part of the Northwestern Provinces, India (see map of N. India, ref. 6–E). It stands in lat. 27° 14′ N., lon. 79° 3′ E., and consists of two parts—the old town which dates back to the time of the Mahâbhârata, and the new town which was founded in the beginning of the nineteenth century. It carries on a considerable trade in cotton, indigo seed, opium, iron, etc. Pop. 23,000. The district is a part of the monotonous plain of the Doab, but is well-watered by rivers and canals. It is noted for its cereals, cotton, and sugar-cane. Area, 1,697 sq. miles. Pop. 820,000. M. W. H.

Maintenance [O. Fr. *maintenance*, deriv. of *maintenir*, to hold by the hand < Lat. *ma'nus*, hand + *tene're*, hold]: as defined by Lord Coke, is "a taking in hand, bearing up or upholding of a quarrel or side, to the disturbance or hindrance of common right." It was a common-law offense, although also made the subject of legislative prohibition and punishment as early as 1275. (3 Ed. I., c. 28). During the next three centuries many rigorous statutes were enacted for the suppression of this evil, which was felt to be a serious one. Its origin and the state of society which fostered it, are graphically described in Stubbs's *Constitutional History of England*, vol. iii., chap. xxi. "A man who wished to maintain his own right, or to attack his neighbor's," sought "to secure the advocacy of a baron, who could and would maintain his cause for him, on the understanding that he had the rights of a patron over his client." So great was the danger of the oppression of the poor and the weak by the barons and their retainers during several centuries, that the courts felt forced to hold many acts to be maintenance that are considered perfectly harmless now. If a person attempted "to persuade a lawyer to act as counsel for another gratis," or went with the other "to inquire for a person learned in the law," or testified as a witness without being subpœnaed, he was guilty of maintenance. Some authorities declare that an assignment of a chose in action was not permitted by the common law because it amounted to maintenance, but the statement is incorrect. (Pollock *On Contracts*, p. 207.) As the power of the barons diminished, and the various classes attained more nearly to equality before the law, the tendency of judicial decision was reversed, and the limits of this offense were narrowed. Persons who had a pecuniary interest in the subject of litigation, or were closely related to one of the parties, were allowed "to take a hand" in the controversy. The same exemption was made in favor of persons sustaining the relations of master and servant, or of landlord and tenant. Even a rich man could give assistance to a poor litigant as a matter of charity; and in such a case, if the aid is given in good faith, it does not matter that the rich man is unreasonably duped, or that he acts thoughtlessly and inconsiderately. *Harris* vs. *Brisco*, 17 Queen's Bench Division 504.

Because of the changes in social conditions and of the judicial reaction against the stringent rules of the early law, maintenance as a crime has become practically obsolete in Great Britain. That it is still a subject of importance, however, as a tort, is shown by the case of *Bradlaugh* vs. *Newdegate*, 11 Queen's Bench Division 1, decided in 1883. Bradlaugh having sat and voted in the House of Commons without taking the oath required by statute, was subject to a penalty of £500. Newdegate, a member of Parliament, supposing he could not bring a suit in his own name, requested one Clark to institute an action for the penalty, and gave him a bond of indemnity against all costs and expenses he might incur. Clark was defeated, on the ground that he had no right to sue for the penalty. As he was unable to pay the costs of the action, Bradlaugh sued Newdegate for maintenance, and recovered as damages all the costs and expenses of the Clark suit. Chief Justice Coleridge, in rendering the decision, spoke of the action as of the rarest in modern times, but declared he had no wish to abolish an action which might be in some cases the only way of redressing a cruel wrong. According to this case, maintenance consists in inducing or assisting another to bring or prosecute an illegal action.

In most of the U. S. maintenance, both as a crime and as a tort, has been abolished, or has never existed. (*Schomp* vs. *Schenck*, 40 N. J. L. 195; *Richardson* vs. *Rowland*, 40 Conn. 565.) Even in those States where it still maintains a foothold, a corrupt motive, or the hindrance or perversion of justice, is believed to be an essential element of the offense. Wherever maintenance is illegal, a contract involving it is void. See Stephen's *History of the Criminal Law*, vol. iii., ch. xxxi. Francis M. Burdick.

Maintenance of Way: the department of a railway organization which has charge of the repairs and renewals of the road-bed, track, bridges, and buildings. The field operations of this department are usually under the charge of civil engineers called roadmasters, who subdivide their divisions into sections, on which gangs of men are continually at work. The expenses of the maintenance of way of the railways of the U. S. is, including taxes, about 30 per cent. of the total expenses. See Rails and Railways. Also Parsons's *Track* (New York, 1886). M. Merriman.

Maintenon, măñt'nōn', Françoise d'Aubigné, Marquise de: wife of Louis XIV.; born of noble Protestant parentage in the prison of Niort, France, Nov. 27, 1635; went in 1639 with her parents to Martinique, her father not being allowed to remain in France on account of his alleged treason. She returned in 1646; was sent by her relatives to be educated at an Ursuline convent. Under its influences she became a Roman Catholic after a long resistance. She was (1651–60) the wife of Scarron, a comic poet of inferior position; and in 1669 she became governess to Louis XIV.'s children by Madame de Montespan, whom she supplanted in the king's affections. She acquired and long maintained a powerful influence over the king, but it is not believed that she was ever his mistress. In fact, it is stated that she persistently refused to listen to his solicitations, and used her influences to reform his character so that his life might no longer be a public scandal. His affection for her continued to the end of his life, but in the later years of the reign she seems to have grown utterly weary of court life, and in her impatience to be off to St.-Cyr she deserted the bedside of the dying king. In 1683 the king married her in private, but she was never publicly acknowledged as his wife. Her religious influence was largely responsible for his increasing zeal for persecution, and especially for the Revocation of the Edict of Nantes; but she was probably not in sympathy with the violent measures that followed that unfortunate act. D. Apr. 15, 1719. She had considerable literary talent, and her *Letters* (9 vols., 1759; improved ed. 1865) are valuable. Revised by F. M. Colby.

Mainz: See Mentz.

Maiolica, or **Majolica**: enameled earthenware decorated in colors, and made in Italy. It is *faïence* (see Keramics), that is, it has a coarse earthenware body and an opaque smooth enamel, which covers and conceals the body, and upon which the painting is applied. In Italy the term is applied to all such wares, or to all except the coarsest and plainest; but it is used by collectors and students of keramic art in two special senses: first, by some writers for those

wares which are decorated with metallic luster, and for those only; second, for all the richly decorated wares of the fifteenth and sixteenth centuries and since that time, of which the lustered wares are only a portion. This last is the sense in which the word is most commonly used in English. Della Robbia ware (see Robbia) is not classed among majolica, because it has a far more solid and hard body. Some modern English wares of hard terra-cotta, covered with colored opaque or partially opaque glazes, are called *majolica*, in which case the term is rather a trade-name than one fixed by common usage. The term *mezza-maiolica*, that is, half or half-way maiolica, is applied to certain Italian wares of less beauty and importance than the fine pieces, and especially to those which are covered, not with real tin-glaze, but with *slip*, or potter's clay made very thin and liquid, or in some cases with lead-glaze.

The towns in which the famous and beautiful maiolica was made are situated in the northeastern part of Italy, with few exceptions. The most famous are as follows: Faenza, in the Marches, near Ravenna; Urbino, Pesaro, Gubbio, and Castel Durante (now Urbania), in the ancient duchy of Urbino, now in the province of the Marches; Caffagiolo, in Tuscany, on the old road from Florence to Bologna; Deruta near Perugia. A score of towns dispute the palm of excellence with these, and their wares all have merit and beauty. Castelli, in the Abruzzi, is remarkable for having kept its fine work going to a much later date than the northern towns.

The pieces most commonly decorated in an elaborate way are drug-pots, made for the dispensing establishments of convents and princely residences; plates and round platters, some having the rim or marly very broad, and a small, deeply sunken center, and others nearly flat, slightly concave or saucer-shaped; bowls, vases, pitchers of various forms, and some few special and unique pieces, such as an object like a large tortoise-shell, a pilgrim bottle or flask with rings to hold a cord, a plaque so richly painted as to be a picture on pottery instead of canvas or paper. These portable objects, with square tiles for floors and walls, make up the chief part of the finer wares. Some of these are of light ground, covered with arabesques and grotesques in dark green, dull red, dull yellow, and similar colors; the wares of Urbino are often of this character. Others have a dark-blue ground, upon which are relieved grotesque figures, masks, and scrolls in densely crowded patterns, very rich and strong in color. Others are painted in white on a white ground, the two tints differing slightly. Others are covered with splendid compositions of figures, with architectural or landscape backgrounds, all in full color. No pottery is more beautiful or more worthy of study than fine maiolica. Fine ancient pieces bring enormous prices. Many of them have been copied with some success in Italy in the latter half of the nineteenth century. Russell Sturgis.

Maiorescu, mă̆a-yō-res'koo, Titu: statesman and writer; b. at Krajova, Roumania, in 1840; studied at Vienna, Berlin, and Paris; became in 1862 Professor of Philosophy at Jassy; was chosen a representative in 1871; was Minister of Public Instruction 1874–76, and in 1876 envoy to Berlin. He holds a prominent position as a critic in recent Roumanian literature. Among his writings are *Einiges Philosophische in gemeinfasslicher Form* (in German, 1861); *Poesia rumână* (1867); *Observări polemice* (1869); *Despre scrierea limbei române* (1874); *Critice* (1874); *Logica* (2d ed. 1886); translations from Schopenhauer (1890). E. S. Sheldon.

Maipo, or **Maipu**, mī'poo, often written and pronounced **Maipú**, mī-poo': a river of Chili, rising in the Andes, and flowing W. to the Pacific, which it reaches in lat. 33° 39′ S. On its banks, about 8 miles S. of Santiago, was fought the decisive battle of Maipo, which secured the independence of Chili, and, more remotely, opened the way to the invasion of Peru and the final defeat of the Spaniards. After the defeat of Cancha Rayada (Mar. 19, 1818), San Martin concentrated the patriot force of 5,000 men on a plain to the N. of the Maipo. The Spanish general Osorio, advancing from the S. with 5,500 men, encountered him Apr. 5, 1818, and was defeated. Osorio fled, but Ordoñez, whom he left in command, surrendered with nearly all the principal officers and 2,200 men, 1,000 having been killed. The entire patriot loss in killed and wounded was about 1,000.

Maisch, John Michael: See the Appendix.

Maistre, mātr, Joseph, Count de: political and philosophical writer; b. at Chambéry, in Savoy, then a part of the kingdom of Sardinia, Apr. 1, 1754. His family was of French extraction, but had become thoroughly attached to the house of Savoy. Completing his law studies at the University of Turin, he entered the civil service of Savoy, was advanced rapidly, and in 1788 became senator. When under the Revolution Savoy was united to France he joined the emigrating nobility, and took up his residence at Lausanne (1792). There he wrote the *Considérations sur la France* (1796), which clearly foreshadows his later political thinking, and views the Revolution as a providential chatisement, to be followed by the restored and re-enforced authority of monarchy and the Church. In 1799 he was called by Charles Emmanuel IV. to Turin to be chancellor of the kingdom of Sardinia, and withdrew with him to Sardinia when the revolutionary movement took away his territory upon the mainland. In 1802 he was minister plenipotentiary to Russia, and represented the almost vanished kingdom of Sardinia at St. Petersburg throughout the Napoleonic era till 1817. He then returned to Savoy, and in 1819 was again called to Turin to his old post, with the title of Minister of State. D. Feb. 26, 1821. His principal works were written at St. Petersburg, though most were not published till after his return, some not till after his death. They are *Essai sur les principes générateurs des constitutions politiques* (1810), upholding the theory of absolute monarchy; *Du Pape* (2 vols., 1819), maintaining the necessity for the absolute supremacy of the pope; *Les soirées de Saint-Pétersbourg* (2 vols., 1821), philosophical conversations on the divine order in the world; and *De l'Église gallicane* (1821). They are all directed to upholding his conception of society as a divine order to be realized by an absolute authority. What he presents as of supreme importance is not individual liberty, but social order and unity, and this demands a single and unrestricted governor. This order and unity to be complete must be universal, and in this sense are to be realized by the supremacy and infallibility of the pope. This conception is defended with great power, learning, and polemical vigor. His intellectual force and his eminent qualities of style, which for brilliancy and fervor recalls that of Jean Jacques Rousseau, make him the most important of the apologists of traditional authority who attacked the ideas of the Revolution. Besides the works already mentioned, we have from him an *Examen de la philosophie de Bacon* (2 vols., 1836); *Lettres et opuscules inédits* (2 vols., 1851); *Correspondance diplomatique* (2 vols., 1860). There is an edition of *Œuvres complètes* (4 vols., Lyons, 1864) and *Œuvres posthumes* (Lyons, 1864). Cf. S. Rocheblave, *Joseph de Maistre* (Paris, 1893); Fr. Paulhan, *Joseph de Maistre et sa philosophie* (Paris, 1893); G. Cogordan, *Joseph de Maistre* (Paris, 1894). A. G. Canfield.

Maistre, Xavier, Count de: author; b. at Chambéry in 1763; entered the military service of Sardinia; emigrated to Russia after the conquest of Sardinia by the French; participated in the campaigns against Persia. D. in St. Petersburg, June 12, 1852. In 1794 he published at Turin *Voyage autour de ma chambre*, a very pleasant and original book, which in 1825 was followed by *Expédition nocturne autour de ma chambre*. He also wrote *Le Lépreux de la cité d'Aoste* (1811); *Les Prisonniers du Caucase* (1825); and *Prascovie, ou la Jeune Sibérienne* (1825).

Revised by A. G. Canfield.

Mait: Egyptian deity. See Mat.

Mait'land: town of New South Wales, Australia; on the navigable river Hunter, which divides it into East and West Maitland (see map of Australia, ref. 6–I). It is a prosperous place, has extensive manufactures of tobacco, active trade in wool, and rich coal mines in the vicinity. Pop. (1891) 9,907.

Maitland, Sir Richard, Lord Lethington: poet and lawyer; b. in Scotland in 1496; was educated at St. Andrews and in Paris; became a distinguished lawyer; and was successively employed in public affairs by James V., the regent Arran, and Mary Stuart. He became blind in 1560, but in spite of his infirmity was sworn a member of the privy council, and in Dec., 1562, nominated keeper of the great seal. D. in Edinburgh, Mar. 20, 1586. He made a MS. collection of early Scottish poetry, and wrote original poems of considerable merit, his *Satire on Town Ladies* being among the best known. The Maitland Club, established in Glasgow in 1828, published his poems in 1830. He also wrote a *Chronicle and Historie of the House and Surname of Seaton*, etc., and his MS. collection of ancient poetry is preserved in the Pepysian Library, Magdalene College, Cambridge. Revised by F. M. Colby.

Maitland, Samuel Roffey, D. D.: historian; b. in London, England, in 1792; was educated at Trinity College, Cambridge; was called to the bar in 1816; took orders in the Church of England in 1821; was perpetual curate of Christ church, Gloucester, 1823–29, and became in 1838 keeper of MSS. at Lambeth and librarian to the Archbishop of Canterbury; he retained both posts until his death at Lambeth Palace, Jan. 19, 1866. He wrote several works on propheey, on the eataeombs, on the history of the Albigenses and Waldenses, on the state of religion and literature in the Middle Ages, and on English eeclesiastieal history. A new edition of his valuable treatise on *The Dark Ages*, edited by Prof. Frederiek Stokes, M. A., was published in 1889. Revised by W. S. Perry.

Maitland, William, of Lethington, known as Secretary Lethington: statesman; eldest son of Sir Richard Maitland; b. in Scotland about 1528; was edueated at St. Andrews and on the Continent; beeame a eonvert to the doctrines of the Reformation about 1555; was in the serviee of the queen regent, Mary of Lorraine, 1554–59, when he joined the "Lords of the Congregation"; was one of the commissioners who met the Duke of Norfolk at Berwick 1559; was Seeretary of State of the queen regent; was made an extraordinary lord of session 1561; opposed the ratifieation of the *Book of Discipline*, and conducted the prosecution of Knox for treason 1563; had a debate with Knox on the independence of the Chureh 1564; was at least eognizant of the conspiracy against Rizzio; was exiled in consequenee, but soon recalled; was present at the eoronation of James VI. 1567; fought against Mary at Langside 1568; attended the conferences at York in the same year; was arrested, but soon liberated, and joined Kirkcaldy of Grange in support of the queen 1569; assisted in the defense of Edinburgh Castle 1572–73; surrendered May 29; died in prison at Leith, June 9, 1573. See J. Skelton's *Maitland of Lethington, and the Scotland of Mary Stuart: a History* (2 vols., London, 1887–88).

Maitreya [Sanskr., full of love toward all beings]: the coming Buddha, the fifth of the present age. He now lives in Tushita, the fourth Deva-loka (*q. v.*), where Gautama Sakyamuni is said to have met him and appointed him his suecessor. He will not appear until 5,000 years after the enlightenment of Gautama, when Buddhism has deeayed, and its preeepts are no longer obeyed. He is the only one of all the Bodhisattvas who is worshiped by Buddhists everywhere. R. L.

Maize, or **Indian Corn** [*maize* is from Span. *maíz*, from Haitian *mahiz*, maize]: the most important grain raised in North America; belonging to the tribe *Phalaridæ* of the natural order *Gramineæ*, or grasses. Its seientifie name is *Zea mays* (Linn.). It is indigenous to America, where it has always formed the ehief food of the Indian races, and from this eireumstanee its common name is derived. Its eultivation was introdueed from America into Southern Europe and Asia, and into Northern Afriea, where it spread with great rapidity. Indian eorn properly is a sub-tropieal grain, probably a native of the table-lands of Mexico or Peru, the great height of which gives them a distinet eharaeter from the lowlands in the same latitude. It thrives best under a hot summer sun, and its rapid growth and ripening give it a peculiar value for high northern latitudes, where the summer heat is as intense as the winter eold. In Great Britain the summer heat is not sufficiently intense to favor its produetion, and maize is very little grown in any part of Europe. Not only does maize require a high summer temperature, but it is a rapid and gross feeder and needs a large amount of moisture; it therefore flourishes best in a loose, fertile, well-eultivated, thoroughly drained soil, for though it requires a large amount of water in its growth, it will not thrive in a heavy, sodden, wet soil. It is grown both for its grain and the forage in its leaves and stalks. The grain is used for human consumption and as a food for animals. Large quantities of the grain are also used in the manufacture of distilled liquors, in the manufacture of starch, and of glucose-sugar.

Cultivation.—In order that the largest amount of grain may be produeed, it is necessary that abundant room be given to the individual plants for eomplete and full development. For this reason it is usually grown in hills of three or four plants each, 3 to 4 feet apart each way according to the size of the variety, or in drills 3 to 3½ feet apart, with single plants a foot to a foot and a half apart in the row. Maize can use to advantage a large amount of erude fertilizing material (coarse farm-yard manure), whieh is usually applied during the winter or early spring to the land. As soon as the land is well settled in the spring the manure is turned under to a moderate depth, and the land brought into a fine condition of eultivation by means of the harrow, eultivator, and roller. Planting is not done until the ground has become somewhat warm—usually in the maize belt from May 15 to 25, or even June 1. The old rule was that "maize should not be planted until the white-oak leaves were of the size of a squirrel's ear." In modern times scientific agriculture has changed this rule to "sueh a time as the soil has attained at one inch in depth a temperature of 50° at 7 o'eloek A. M." The young maize is carefully cultivated, the ground being kept loose and free from weeds until the plants have taken complete possession of the soil. After this cultivation is often continued in order to prevent loss of moisture by evaporation. In those portions of the U. S. where the stalks and leaves are of value as food for animals the crop is eut and gathered into stooks when the kernels are well glazed. When the stalks have cured the grain is removed from its husk and the fodder preserved in barns or stacks. All of the operations of eultivating maize, including even cutting the stalks and husking the grain, are now done successfully on a large scale by horse-power, so that the cost of labor in produeing a bushel of eorn has been much redueed. In the great maize-growing regions the grain is stripped from the standing stalks, little attempt being made to utilize the fodder exeept to turn it into the ground as manure.

Where maize is grown wholly for forage formerly it was the custom to plant it mueh thicker than is the case where it is grown for grain, the result being a larger amount of somewhat finer material with no grain, and of somewhat reduced feeding value. With the advaneement of the practice of preserving maize in pits or silos (see Ensilage) the system of growing maize for fodder has been very mueh changed, and now it is the eustom by the more advaneed growers to raise fodder-eorn for preserving in silos in practically the same way as if it were to be raised for grain, and when the plant has arrived at its full development the whole mass, grain, stalks, and leaves, is put into the silo.

Composition of Maize.—While maize has always been largely used as an artiele of human food in North America, it has never been made use of to any extent in Europe, and the exportation of maize from North America has been very small. Sinee 1890 the U. S. Department of Agrieulture has taken especial pains to bring the value of maize as a human food to the attention of the various European countries with considerable success, and the exportation of maize has been greatly inereased in consequenee. Maize does not differ greatly from the other eereals in the proportion of its food eonstituents, and it contains large amounts of the more important nutrients in a state of easy digestibility and availability. Below are given analyses of maize, wheat, oats, and barley, taken from the latest eompilation of analyses of American feeding-stuffs by Jenkins and Winton:

CONSTITUENTS.	Maize.	Wheat.	Oats.	Barley.
Water	10·9	10·5	11·0	10·9
Ash	1·5	1·8	3·0	2·4
Protein (albuminoids)	10·5	11·9	11·8	12·4
Crude fiber	2·1	1·8	9·5	2·7
Nitrogen-free extract (starch, sugar, etc.)	69·6	71·9	59·7	69·8
Ether extract (crude fat)	5·4	2·1	5·0	1·8

It will thus be seen that the ehief difference between maize and the other cereals is in its smaller proportion of ash and albuminoids, and in its larger proportion of fats. Sinee maize is so eheaply and so readily grown, not only the grain but the stalks and leaves form a most important source of fodder material for domestie animals. Maize fodder, i. e. stalks and leaves, is considerably laeking in its proportion of albuminoids or flesh-making materials, but in this respect it is not more so than timothy hay, as will be seen from the analyses appended, taken from the source already quoted:

CONSTITUENTS.	Maize fodder.	Maize stover.	Maize silage.	Timothy.
Water	42·2	40·1	79·1	13·2
Ash	2·7	3·4	1·4	4·4
Protein (albuminoids)	4·5	3·8	1·7	5·9
Crude fiber	14·3	19·7	6·0	29·0
Nitrogen-free extract (starch, sugar, etc.)	34·7	31·9	11·1	45·0
Ether extract (crude fat)	1·6	1·1	0·8	2·5

The maize-plant is an extremely variable one, and during its long period of cultivation it has sported into a large number of varieties. These varieties can be classified in a general way into five well-marked groups or races, as follows: Soft-corn, pop-corn, sweet-corn, flint-corn, and dent-corn. Probably the original maize was furnished with a husk about the kernel as well as about the ear, and it is thus occasionally grown in gardens as a curiosity, but it is of no practical value. The kernel of maize is made up of an outer corneous or horny portion, an inner softer or starchy portion, and the germ or cotyledon at the base. The distinction between the races is founded mainly upon the difference in the proportion of the corneous and starchy portions of the kernels. In one race the whole interior of the kernel is made up of starchy matter, to the exclusion of the corneous. This race is called soft-corn, and the best known variety of it is the Tuscarora. It is the kind most commonly used by Indian tribes at present, and probably it is one of the first variations from the original type.

In pop-corn the whole of the kernel is made up of corneous material with little or no starchy material. The peculiar quality of this class of varieties is that when heated rather quickly the kernel explodes with considerable force, and the corneous matter becomes expanded into a white floury mass. The sweet-corns also have a kernel largely made up of corneous matter, but when dry they present a much shrunken and wrinkled appearance. They contain a much larger per cent. of fat, and the kernels remain green for a much longer period than the other classes of corn. While in the green state they are much esteemed as a table vegetable. In flint-corn the corneous portion makes up from one-half to two-thirds of the whole bulk of the kernel enveloping on the outside the starchy material. Dent-corn differs from flint-corn in that at the top of the kernel there is a characteristic depression, and the starchy material reaches to the outside. Flint-corn and dent-corn are the two kinds most grown for market. Below are given the averages of all the analyses of the different varieties, taken from the same source as that previously mentioned. It will be seen that the main difference between the races comes in the larger proportion of fat in the sweet-corns:

CONSTITUENTS.	Dent-corn.	Flint-corn.	Sweet-corn.	Pop-corn.	Soft-corn.
Water	10·6	11·3	8·8	10·7	9·3
Ash	1·5	1·4	1·9	1·5	1·6
Protein (albuminoids)	10·3	10·5	11·6	11·2	11·4
Crude fiber	2·2	1·7	2·8	1·8	2·0
Nitrogen-free extract (starch, sugar, etc.)	70·4	70·1	66·8	69·6	70·2
Ether extract (crude fat)	5·0	5·0	8·1	5·2	5·5

Variation and Distribution.—While the varieties are easily classified into these well-marked races, hybridization easily takes place, not only among varieties of the same class, but between the classes as well, and new varieties are constantly being formed. The varieties vary in the height of the stalk and the size of the ears and kernels. In general, the dent-corns are the largest growing varieties, and the pop-corns the smallest. The flint varieties are grown largely in the northern and eastern portion of the U. S. and are considerably smaller than the dents. The dents are grown almost universally in the Southern and Western States. The corn that is grown in the extreme northern localities is usually of the soft type, notably the variety grown by the Mandan Indians in Northern Dakota, Minnesota, and Manitoba.

While maize is more generally cultivated over the whole area of the U. S. than any of the other cereals, still the great bulk of the crop is produced in a comparatively few States. In the States of the Central West, N. of the 36th parallel, maize finds soil and climate best adapted to its needs, and it is in these localities that it is mostly grown. The total yield of maize in the U. S. in 1900 was 2,105,102,516 bush., raised on 83,320,872 acres of land. Of this amount the State of Iowa produced 305,859,948 bush.; Illinois, 264,176,226 bush.; Nebraska, 210,430,064 bush.; Missouri, 180,710,404 bush.; Kansas, 163,870,630 bush.; Indiana, 153,200,800 bush.; and Ohio, 106,890,188 bush.; or all these States together produced about 70 per cent. of the whole. None of the other States produced so much as 100,000,000 bush. While the great bulk of the crop is produced in these few States, it is not in these States that the largest yields per acre are usually found. In small areas in fertile localities and with thorough cultivation, in the Eastern and Middle States, are usually found the largest yields per acre. The average yield per acre, as reported in the Year Book of the Dept. of Agriculture for 1900, varied from 7 in S. Carolina to 40 bush. in Wisconsin and Vermont. In the States S. of the 36th parallel the average yield is less than in those N. of that parallel. Though the highest average is given as 40 bush. per acre, this does not indicate the yield under favorable conditions of soil, climate, and good cultivation. Yields of over 100 bush. of shelled corn per acre are occasionally reported, and a yield of 60 to 80 bush. is common. See MAIZE in the Appendix. HENRY H. WING.

Majesty [from O. Fr. *majeste* > Fr. *majesté* < Lat. *majestas*, greatness, dignity, splendor, majesty]: a title which, as applied to royalty, is a reminiscence of the *majestas* claimed by the Roman emperors—a peculiar dignity, or literally *greatness*, which was held to have directly descended to the Emperors of Germany. Henry VIII. was the first English king to assume the style of His Majesty. The French kings after Louis XI. were by papal bull authorized to take the title of Most Christian Majesty; those of Spain, after Ferdinand and Isabella, Most Catholic Majesty; the Kings of Hungary, His Apostolic Majesty; the Kings of Portugal, Most Faithful Majesty. The monarch of Austria-Hungary is called His Imperial Royal Majesty.

Majolica: See MAIOLICA.

Major [from Lat. *ma'jor*, greater, compar. of *mag'nus*, great]: in music, a term used to designate any mode, interval, or key which is in certain respects *greater* than others. The major mode is that in which the third above the tonic is major, as from C to E, G to B, or D to F♯. On analysis, this interval of a major third will be found to embrace four semitones, whereas in a minor third there are only three. From this arises the distinction of greater and lesser, i. e. major and minor. Several of the intervals are thus variable in their contents, viz., the third, sixth, seventh, and ninth, not comprising in all cases the same number of semitones, and hence needing the discriminating names of major, minor, diminished, etc. The major intervals always contain one semitone more than the minor. See INTERVAL.

Major, properly **Meier**, GEORG, D. D.: theologian; b. at Nuremberg, Germany, Apr. 25, 1502; studied theology under Luther and Melanchthon; became rector at Magdeburg 1529, pastor at Eisleben 1535, Professor of Theology and court preacher at Wittenberg 1536; was a representative of the Protestants in the colloquy at Regensburg 1541; was for a few months in 1547, during the Smalcaldic war, superintendent and court preacher at Merchburg; returned to his post at Wittenberg 1548, became superintendent of the Mansfeld churches 1552; again returned to Wittenberg; d. there Nov. 28, 1574. By the active support he gave to the Leipzig Interim (Dec. 22, 1548), which asserted that good works are necessary to salvation, he separated from the strict Lutherans, and became involved in a controversy with Amsdorf (1552), who declared good works prejudicial to salvation, and his doctrine was rejected by the Formula of Concord (1580). In his later years he was involved in the Crypto-Calvinistic controversy, and was forced to sign the Torgau Articles. His principal works, being homilies and commentaries on the New Testament, were printed at Wittenberg (1569). The "Majoristic controversy" gave rise to the formation of a theological circle called Majorists.
Revised by S. M. JACKSON.

Major, RICHARD HENRY: geographer and historian; b. in London, England, Oct. 3, 1818. In 1844 he was appointed assistant in the British Museum in charge of the maps and charts, and from 1867 to 1880 was keeper of the department of printed maps and plans. From 1849 to 1858 he was honorary secretary of the Hakluyt Society, editing for it the *Select Letters of Christopher Columbus* (1847) and several other works. His best-known work, *Life of Prince Henry of Portugal, surnamed The Navigator*, appeared in 1868, and was followed by *The Discoveries of Prince Henry, the Navigator, and their Results* (1877). *The Bibliography of the First Letter of Columbus* was published in 1872. Major was vice-president of the Royal Geographical Society. His discoveries in relation to early Portuguese and Italian navigators were rewarded by decorations from the sovereigns of Portugal, Italy, and Brazil. D. at Kensington, June 25, 1891. HERBERT H. SMITH.

Major, or **Mair**, JOHN: theologian and historical writer; b. at Cleghorn, near North Berwick, Scotland, about 1470; was educated at the University of Paris, where he subsequently lectured, and gained for himself a great reputation

as a teacher. He taught at the University of Glasgow from 1518 to 1523, and at St. Andrews from 1523 to 1525. After spending several years in Paris, he returned to St. Andrews and was appointed provost of Salvator's College, an office which he held till his death in 1550. Among his pupils at Glasgow and St. Andrews, respectively, were John Knox and George Buchanan, who are thought to have derived some of their radical political ideas from their master. Major set himself against the Reformation and the spirit of the Renaissance, but he wrote on behalf of the liberties of the people against absolutism, whether in Church or state, and he is considered by some the foremost literary Scotchman of his time. His *History* has been translated by the Scottish Historical Society (1891). Among his other works are *In Librum Sententiarum Commentarius* (Paris, 1509–19) and *In Quatuor Evangelia Expositiones Luculentæ* (Paris, 1529). F. M. Colby.

Major'ca [Span. *Mallorca*; from Lat. *ma'jor*, greater, the greater. Cf. Minorca]: an island of the Mediterranean, belonging to Spain, and forming the largest of the Balearic group. Area, 1,310 sq. miles. Pop. (1877) 230,396 (with three small islands). The northern part of the island is mountainous, Silla de Torellas rising 4,596 feet. The southern and western parts are lower, and afford several good harbors. The soil is very fertile, and the climate a perpetual spring. All the products of Southern Spain, more especially of the province of Valencia, are raised here to perfection. Capital, Palma. Two volumes of Archduke Ludwig Salvator's *Die Baltaren in Wort und Bild* (1869–80) are devoted to Majorca. Revised by M. W. Harrington.

Major-general: See General Officer.

Majorists: See Major, Georg.

Major Scale: in music, with a major third and seventh. See Mode and Scale.

Makal'lah: town of the Hadramaut, Southern Arabia; situated on its southern coast, in lat. 14° 31′ N., lon. 49° 12′ E. (see map of Persia and Arabia, ref. 10–G). It has a good harbor, and many vessels visit it to take in provisions. It has a large trade, and is the market for the fertile valleys and numerous villages around it. The temperature is very high, and the climate trying to Europeans. Pop. estimated at 18,000, comprising besides Arabs, Somalis, Abyssinians, Negroes, Zanzibarites, and Hindus. M. W. H.

Makart', Hans: figure-painter; b. at Salzburg, Austria, May 29, 1840. He was a pupil of the Vienna Academy and of Piloty in Munich; traveled and painted in Italy, France, and England 1865–69, and in 1869 settled permanently in Vienna at the request of the Emperor Francis Joseph; became professor in the Vienna Academy 1879; honorary member of Munich and Berlin academies; was awarded gold medals at Vienna in 1857 and 1882; medal of honor, Paris Exposition, 1878; was made an officer of the Legion of Honor 1884. He became insane in Aug., 1884, and died in Vienna, Oct. 3, the same year. His compositions, several of which are executed on very large canvases, are notable for florid and striking color schemes. He possessed a fine sense of decorative possibilities in painting, and his works are good in general aspect. *Caterina Cornaro* (1873) was exhibited at the Centennial Exhibition, Philadelphia, 1876, and is now in the National Gallery, Berlin. His *Diana's Hunting Party* (1880) is in the Metropolitan Museum, New York, and *The Five Senses* (1879) and *Abundantia* have been shown in New York and elsewhere. His most successful work is *The Entry of Charles V. into Antwerp*, which he painted in 1875–78, and is now in the Kunsthalle, Hamburg. William A. Coffin.

Makau: See Chimakuan Indians.

Makrîzî, or **Makree'zee**, Ahmed Al: b. in 1360 at Makreczee, near Baalbee, in Syria; lived most of his life in Cairo, and died there in 1442. He wrote in Arabic several works on the history and topography of Egypt from the time of the Mohammedan conquest down to 1327 A. D., parts of which, as well as his essay on Egyptian weights and measures, have been translated into French by Quatremère and Sylvestre Sacy. He drew largely from Elmacinus, a Christian writer, who preceded him. He left unfinished a large work on the important persons who had visited Egypt. The original manuscript of the first volume is in the National Library in Paris.

Malabar': district of British India; in the province of Madras; extending from lat. 10° 15′ to 12° 18′ N., along the Arabian Sea; comprising an area of 5,765 sq. miles, with a population of 2,500,000. The principal products of the district are timber, especially teak, and pepper. The teak-tree grows on the plateau formed by the Western Ghats at an elevation of 5,000 feet. The pepper is cultivated on the coast-land. The name *Malabar* is often applied to the whole western coast of the peninsula.

Malac'ca: an old geographical name still used occasionally for the Malay Peninsula (*q. v.*).

Malacca: a small territory on the west coast of the Malay Peninsula; a part of the British Straits Settlements, formerly a part of the confederation of Negri-Sembilian, 100 to 150 miles N. W. of Singapore. Area, 640 sq. miles. Pop. 92,170, of whom 40 are whites, 1,647 natives of India, 18,161 are Chinese, and 70,325 Malays. The country is flat on the coast, rising to mountains in the interior. The eastern mountains afford some gold and large quantities of tin. The climate is hot and unhealthful. The principal crops are rice, pepper, and sago. M. W. H.

Malacca: a city; capital of the British territory of Malacca; lat. 2° 11′ N., lon. 102° 5′ E.; on the west coast of the Malay Peninsula (see map of East Indies, ref. 6–B). It is a picturesque place, formerly a very important port, but now in decadence in consequence of the rivalry of Singapore and Penang. It is a very ancient city, and was frequented by Arabian and Persian merchants as early as the eighth century. It fell into the hands of the Portuguese in 1511, into those of the Dutch in 1641, and, definitely, into those of the British in 1824, who received it in exchange for their rights in Sumatra. Pop. 20,000. M. W. H.

Malacca, Strait of: a channel which separates the Malay Peninsula from the island of Sumatra. It is 500 miles in length; its breadth varies from 35 to 180 miles.

Mal'achi [from Heb. *Mal'ākhī*, liter., my messenger, but supposed by some to be contracted from *Mal'ākhiyyāh*, messenger of Jehovah, whence Gr. Μαλαχίας]: the latest prophetic book of the Old Testament. The scene is laid during the second administration of Nehemiah, later than 433 B. C. (See Neh. xii. 27–xiii.) The people have neglected to provide for the support of the priests and the temple, and the priests have in turn become negligent, both in their care of the worship and in allowing illegal sacrifices from others (i. 6–ii. 9; iii. 7–12). The nation, in the person of its leading citizens, and even of its priests, is intermarrying with foreigners (ii. 10–16), and is committing this offense "a second time" (ii. 13). Especially in view of these offenses, the prophecy insists upon the promise made to Israel in the wilderness, "Behold I send my Angel" (Mal. iii. 1; cf. Ex. xxiii. 20, 23; xxxii. 34; xxxiii. 2), and applies this to existing and future conditions. It depends upon the men to whom he comes whether Jehovah's covenant Angel will be a blessed helper (Ex. xxiii. 20) or a relentless judge (Ex. xxiii. 21). Whether the name Malachi (My Angel) is that of the prophet who wrote the book or simply that of the book itself, in either case it connects itself with this most prominent idea in the book. Mal. iii. 1, or rather the Exodus text referred to in Mal. iii. 1, is cited in the Gospels in connection with John the Baptist and Christ; and Mal. iv. 5 is applied directly to John the Baptist. Willis J. Beecher.

Malachite [from Gr. μαλάχη, mallow, from its resemblance to the green color of the mallow-leaf]: a natural green carbonate of copper, occurring at many places, sometimes so abundantly as to be a valuable ore of copper. It differs only slightly in composition from Azurite (*q. v.*). Its brilliant color made it a favorite ornamental stone, though now little in use; it is rarely employed as a gem. The finest specimens come from Arizona, Australia, and Russia, where the celebrated Demidoff mines in Nijni Tagilsk, in the Urals, have yielded nearly all the malachite used in the arts for the nineteenth century. It is chiefly wrought in Russia, where it is used for inlaid work, ornaments of various kinds, and even paneling, as in some of the apartments in the Winter Palace and the Church of St. Isaac in St. Petersburg. G. F. Kunz.

Malachite Green: See Aniline Colors.

Mal'achy, Saint O'Morgair: archbishop and papal legate; b. at Armagh in 1094; became in youth a rigid ascetic, and when twenty-five became a priest; restored the monastery of Bangor; became in 1124 Bishop of Connor; in 1134 Archbishop of Armagh, Primate of all Ireland, and labored with much zeal to bring the Irish Church, thus far independent, under the papal sway. In 1137 he resigned the

primacy to its legal possessors (for that see was then a family possession), and became Bishop of Down. He soon afterward made a journey to Rome, visiting Bernard of Clairvaux on the way, and was named legate for Ireland by the pope. He brought back with him some Cistercian monks, with whom he established a monastery of that order in Ireland. In 1148 he induced the synod of Inis Padrig to request the pope to bestow the pallium upon the Irish bishops. D. at Clairvaux, Nov. 2, 1148, in the arms of St. Bernard, his biographer and friend. He was one of the most learned, eloquent, and influential men of his time.

Malacol'ogy [Gr. *μαλακός*, soft + *-logy*, science, from Gr. *λόγος*, discourse, reason]: a term given to the study of the molluscs. See MOLLUSCA.

Malacos'traca [Mod. Lat., from Gr. *μαλακός*, soft + *ὄστρακον*, shell of a testacean]: a name given to the higher CRUSTACEA (*q. v.*), embracing the lobsters, shrimps, crabs, beach-fleas, sow-bugs, and the like. These forms agree in having a body composed of twenty segments, all of which except the last are usually provided with appendages. Frequently more or fewer of the anterior somites are united with the head to form a cephalothorax. The Malacostraca are subdivided into the TETRADECAPODA, STOMAPODA, SCHIZOPODA, and DECAPODA (*qq. v.*). J. S. KINGSLEY.

Mal'aga: province of Spain, bordering on the Mediterranean, and bounded by the provinces of Cadiz, Seville, Cordova, and Granada. Area, 2,824 sq. miles. Pop. (1887) 519,377. It produces excellent and abundant wine, grain, and fruit, and is rich in metals and mineral springs.

Malaga: the capital of the province of Malaga, Spain; on the Mediterranean; 65 miles N. E. of Gibraltar (see map of Spain, ref. 19–E); is beautifully situated at the foot of a lofty mountain range, whose highest peak is crowned with the old Moorish castle Gibralfaro, and whose undulating sides are covered with vines producing the famous Malaga wine. The climate of Malaga is remarkably dry, sunny, and equable. It is an old city, founded by the Carthaginians, having lived through long periods of Roman and Moorish dominion. Many of its streets are narrow, crooked, and quaint, but the newer part, extending along the harbor and the beautiful *alameda*, has a thoroughly modern appearance. It has a cathedral, two fine theaters, and an immense amphitheater for bull-fights. Its harbor is spacious and safe, lined with quays, and provided with excellent dockyards. Its trade in wine, oil, figs, almonds, raisins, and grapes is extensive, and its manufactures of cloth, silk, ropes, and leather are prosperous; besides, it has several large iron-foundries, breweries, and distilleries. Pop. (1887) 134,016.

Malakans: a religious sect in Russia. See RASKOLNIKS.

Malakoff: one of the principal works of the fortress of SEVASTOPOL (*q. v.*), taken, with the Redan, by the united British and French armies Sept. 8, 1855.

Malan, măă'lăăn', CÉSAR HENRI ABRAHAM, D. D.: clergyman and author; b. at Geneva, Switzerland, July 7, 1787, of French Protestant descent; was bred a Socinian, and ordained in 1810; became a Trinitarian under the guidance of Robert Haldane and of Rev. Dr. John M. Mason, of New York, and was (1820–63) the pastor of an independent church at Geneva. His sect were called *Mômiers* (comedians) by the people. He was the author of many religious works. His hymns, *Les Chants des Sion* (1826; with original music 1841) and *Les Grains de Sénevé* (1846), are noteworthy. Many of his works have been translated into English. D. in Geneva, May 18, 1864. See his *Life* by his son, César (Geneva, 1869). Revised by S. M. JACKSON.

Malan, SOLOMON CÆSAR, D. D.: son of César Malan; b. in Geneva, Apr. 22, 1812; educated at St. Edmund Hall, Oxford, where he graduated with honors in 1837; senior classical professor in the Bishop's College, Calcutta, 1838–40; returned to England; was ordained priest 1843; vicar of Broadwindsor, Dorset, 1845–85; and in 1870 became a prebendary of Sarum, but resigned in 1875. He has written several original books on ecclesiastical subjects, ornithology, travels, etc., composed sacred and other music, designed illustrations for his own and other's works, and translated from Eastern and other literatures many books, mostly religious, including *The Gospel of St. John* in translations from the Syriac, Armenian, Geez, Georgian, Slavonic, Memphitic, Gothic, Sahidic, Anglo-Saxon, Persian, and Arabic. Among his most interesting translations are *The Conflicts of the Holy Apostles* and *The Book of Adam and Eve*, both from the Ethiopic. D. Nov. 25, 1895. Revised by S. M. JACKSON.

Malaria and **Malarial Fever**: See INTERMITTENT FEVER, MIASMA, REMITTENT FEVER, and CHILL.

Mä'larn, or **Mälar**: the most beautiful and one of the largest of the lakes of Sweden. With breadth of from 2 to 20 miles, it stretches 70 miles inland from the Baltic Sea, with which it is connected by a small but deep channel. It contains over 1,260 islands, fertile and well cultivated, or covered with forests of pine and birch. Stockholm is situated on both sides of the channel and on a number of islands in the Mälar lake, and several other towns are on its shores or on its islands.

Malayalam Language: See DRAVIDIAN LANGUAGES.

Malay Archipelago: See EASTERN ARCHIPELAGO.

Malay Peninsula, or **Malacca** [anc. *Aurea Chersonesus*]: the long peninsula extending southward from Indo-China. It begins properly about the latitude of Bangkok (13° 30′ N.), but the name is usually applied only to the peninsula beyond the Isthmus of Kra, about lat. 10° 30′ N. It ends in Cape Romania, lat. 1° 22′ N. Thus limited it is about 850 miles long, 210 miles broad at its broadest part, contains an area of 82,000 sq. miles, and a population of 1,400,000. The coast is flat, unhealthful, flanked with many islands, and has few good harbors. The interior is but little known. At the Isthmus of Kra it is low, but farther S. there are one or more ranges of mountains, parallel to the axis of the peninsula, and many isolated peaks. The greatest elevation known is about 9,000 feet. The rivers have a strong tendency to parallelism with the coast, and thus attain a greater length than seems consistent with the breadth of the peninsula. The climate is hot, humid, and unhealthful. The west coast is subject to sudden high winds of short duration, called sumatra, from the point whence they seem to come; the east coast is sometimes affected by the typhoons of the Gulf of Siam.

The mountains are rich in tin, which has been mined from time immemorial. Silver is common, especially on the west coast, and the peninsula has had a reputation for gold from the earliest times. Mt. Ophir, N. E. of the city of Malacca, received its name from the reputation for gold in its vicinity. The vegetation is very luxuriant; the forest growth of the mountains is one of the greatest in the world, and includes a great number of species of trees, such as teak, sandalwood, areca, ebony, camphor, and gutta-percha trees. Rice, sugar-cane, cotton, pepper, tobacco, tea, and coffee are among the cultivated plants. The fauna is very rich, especially in monkeys.

The human races represented are: (1) The Negritos, existing in small numbers in the mountains. (2) The Siamese, especially N. of the parallel of 7° N. (3) The civilized Malays, occupying the territory S. of 7° N., except the mountains of the interior, and savage tribes of Malays found in the latter localities with the negritos. (4) Among the immigrants the Chinese occupy the first place. Then come in order the Hindus, Arabs, Armenians, Jews, and Europeans.

Politically the territory is divided as follows:

STATES AND SETTLEMENTS.	Area, sq. m.	Pop. 1891.
I. SIAMESE TRIBUTARY STATES:		
Legor and Sengora	17,000	150,000
Keddah	3,600	30,000
Patani	5,000	30,000
Kelantan	7,000	20,000
Tringanu, etc	6,000	50,000
Totals	38,600	280,000
II. STRAITS SETTLEMENTS (British):		
Singapore	206	184,554
Penang and Wellesley	270	235,618
Malacca	640	92,170
Dingdings	210	2,000
Totals	1,326	514,342
III. STATES PROTECTED BY THE BRITISH:		
Perak	10,000	214,254
Selangor	3,000	81,592
Sungei Ujong	660	23,602
Negri Sembilan	2,000	41,617
Pahang	10,000	57,462
Johore	9,000	100,000
Totals	34,660	518,527

There is, besides, a considerable space sparsely occupied by wild tribes.

See STRAITS SETTLEMENTS, SINGAPORE, PENANG, MALACCA, KRA, etc. See also for a complete list of works published on

the Malay Peninsula, Dennys, *A Contribution to Malayan Bibliography*, in the *Journal* of the Straits Branch of the Royal Asiatic Society (Singapore, 1880 and 1881). Also Isabella Bird, *The Golden Chersonese* (1883); Keane, *Eastern Geography* (1887); Skinner, *The Eastern Geography, a Geography of the Malay Peninsula and Surrounding Countries* (1884); Godinho de Eredia, *Malacca, l'Inde méridionale et le Cathay* (manuscript reproduced and translated by Janssen, 1882). MARK W. HARRINGTON.

Malay Race [called by themselves *Malayu*]: the dominant race of Malacca (the Malay Peninsula) and the East Indian islands (Malay Archipelago). In a larger sense, the inhabitants of the greater part of the islands of Polynesia are said to be of Malay race, since physically and in language they are kindred, and the Malay traditions assume an insular origin for their people. Some ethnologists have made the Malays the type of a fifth or brown race of mankind, but others regard them as essentially Mongolian. They are of a brown color, have black and often curled hair, and prominent facial bones, are short of stature, and as a rule courageous, but unstable and subject to fits of uncontrolable rage. They are treacherous and unforgiving enemies and inconstant friends, idle and revengeful, but are active and useful sailors. Gambling, cock-fighting, and intoxication are the national vices. The Malays are inveterate liars. Some observers, however, give the Malays a much better character than the one here drawn. It is probable that intercourse with unscrupulous Europeans and Chinese has degraded them, as it has most other rude peoples, and the injustice and cheating of traders have done much to make them treacherous and deceitful. Fortunately, the Malays have a patriarchal system of living which has prevented them from becoming an aggressive and far-conquering race. In religion they are Mohammedans. Fondness for music and disregard of death are almost universal. Their so-called civilization is small. There are manufactures of weapons, of ornamental gold and filigree work, and of fast-sailing but small vessels of peculiar construction. The people are largely engaged in agriculture and trade. The standard Malay language, which belongs to the Malayo-Polynesian family, is written in the Arabic character. It is the commercial language of the East, and has been called, for its euphony, the Italian of Asia. The literature is abundant, and bears strong marks of Sanskrit and Arabian influence. See the *Dictionary* of Marsden (1812); Crawfurd, *Malay Grammar and Dictionary* (1852); Wallace, *The Malay Archipelago* (2 vols., 1869).

Malcolm: the name of four kings of Scotland. MALCOLM I.'s reign (943–54) is noteworthy for the cession of Cumbria by the Anglo-Saxon king Edmund to the King of the Scots. The latter was killed while trying to suppress a revolt in the north of Scotland.—MALCOLM II. (1005–34) successfully resisted the attempts of the Danes to conquer Scotland, and secured possession of Lothian.—MALCOLM III. (1059–93), surnamed Canmore, was reared at the court of Edward the Confessor. After the Norman conquest Edgar Atheling, the Anglo-Saxon claimant to the throne of England, sought refuge with his family at the court of Malcolm. The latter received him hospitably and married his sister Margaret, an alliance which involved the Scottish king in a quarrel with the Normans. After an unsuccessful invasion of England Malcolm was forced to acknowledge William the Conqueror as his suzerain. The war broke out anew in 1093, and the Scottish king crossed the border, but was slain near Alnwick.—MALCOLM IV. (1154–65) had to contend with many insurrections. Somerled, the Scots of Galloway, and the men of Moray successively revolted, but were subdued. After the suppression of a second rebellion of Somerled, the king died in the twenty-fourth year of his age.

Malcolm, Sir GEORGE: See the Appendix.

Malcolm, Sir JOHN: soldier and diplomatist; b. at Burnfoot, near Langholm, Dumfriesshire, Scotland, May 2, 1769; entered the army at the age of twelve years; became a cadet in the military service of the East India Company, and having familiarized himself with several Oriental languages, successfully performed a political mission to Persia in 1799, and became president of Mysore in 1803, and in the same year accompanied Gen. Arthur Wellesley in the Mahratta campaign, and signed the treaty of peace with Scindia after the latter's defeat at Assaye. During the ensuing years Malcolm was employed in high civil functions under the successive Indian administrations; was again sent as envoy to Persia in 1807 and 1809, but with less diplomatic success than before, and returned to England in 1812. He was knighted, wrote his elaborate *History of Persia* (2 vols., 1815), still an authority, and visited Paris during its occupation by the allied forces. He returned to the East in 1817; engaged in the Mahratta and Pindaree wars in the Deccan as second in command, with the rank of brigadier-general; distinguished himself at the battle of Mehidpur (Dec. 21, 1817), in which he broke the power of the Mahrattas; was governor of Malwa 1818–22; published his *Memoir of Central India* (1823) and his *Political History of India from 1784 to 1823* (1826); was governor of Bombay 1827–30; was member of Parliament for Launceston 1831. D. in London, May 31, 1833. A monument was erected to his memory in Westminster Abbey, and an obelisk 100 feet high at his native place. See his *Life and Correspondence*, by J. W. Kaye, 1856.

Malczewski, mäl-chev'ski, ANTONI: poet; b. at Warsaw, Poland, June 3, 1793. His father, a Polish general, gave his son a French education. He began his military career in 1811, but resigned in 1816; traveled in France, Italy, and Switzerland; studied English literature, and particularly the works of Byron. In 1821 he returned to Warsaw. At that time he had written a number of short stories and poems, a satire entitled *Karnawal Warszawski*, and several scenes of a tragedy, *Helena*. From Warsaw he retired to Wolhynia, where he wrote his celebrated epic, *Marya, powieść ukraińska* (Maria, a Story of the Ukraine, Warsaw, 1825), which he dedicated to Niemcewicz. The public, however, failed to appreciate the beauties of the poem, no one would buy his books, and Malczewski died in poverty, May 2, 1826, at Warsaw. His productions were original throughout, but his talent was not recognized until after his death. *Marya* has since been repeatedly edited, and translated into English (London, 1836), French, German, and Bohemian. Though occasional reminiscences of Byron may be found in his works, Malczewski differs from the English poet in the deep religious spirit which pervades his poems. J. J. KRÁL.

Maldah': town; in the province of Bengal, British India; on the Mahanadi, an affluent of the Ganges (see map of N. India, ref. 7–I). It is poorly built, with narrow and filthy streets lined with decaying houses. Its weaving-factories, once very active, have fallen into decadence since 1810, being transferred to English Bazar, 3 miles S. The surrounding districts, which in the rainy season are completely inundated, lie uncultivated. Pop. 5,000.

Mal'deghem: town; in the province of East Flanders, Belgium; 12 miles by rail E. of Bruges (see map of Holland and Belgium, ref. 9–C); with celebrated lace-manufactures. Pop. 8,600.

Malden, mawl'den: city; Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); on the Malden river, and the Boston and Maine Railroad; 4 miles N. of Boston. The census returns of 1890 showed that 627 manufacturing establishments (representing 47 industries) reported. These had a combined capital of $7,050,416; employed 4,415 persons; paid $2,161,650 for wages and $5,428,785 for materials; and had products valued at $8,694,807. The principal industries were the manufacture of rubber boots and shoes, various kinds of leather goods, carpets and rugs, cotton goods, boot and shoe lasts, and sand and emery paper. In 1890 the city had 13 public-school buildings, and school property valued at over $362,800, and expended $80,867 for public education. There are 4 libraries (Bazar, Ladies' Exchange, High School, and Public), with over 25,000 volumes; a national bank, capital of $100,000; a savings-bank (deposits, $1,800,000); and 2 daily and 2 weekly newspapers. Pop. (1880) 12,017; (1890) 23,031; (1900) 33,664.

Malden Island: a solitary coral island of the South Pacific, in lat. 4° S., lon. about 155° W.; area, 35 sq. miles. It is without population or fresh water. It has supplied a large amount of guano. Great Britain took possession of it in 1866.

Maldive (măl'dīv) **Islands**: the larger part of a remarkable line of coral islands extending from off the Malabar coast southward for 20° of latitude, and consisting of the Laccadives, Minikoi, the Maldives, and the Chagos Archipelago. The Maldives extend from 7° 7′ N. to 0° 42′ S. lat., between the meridians 72° 27′ and 73° 50′ E. The Maldives form a double series of large atolls (nineteen in number), arranged like a closed chain hung on a peg. The whole group is thus one great compound atoll. The lagoons of the atolls

are dotted and margined by small islands, each one being a minute atoll. The total number of islets is popularly estimated at 12,000. There are 600 charted on the maps and 200 are inhabited. The islets rise in no case more than 6 feet above high water. At low water about 2,000 sq. miles of area are exposed, but at high water this is reduced to 350 sq. miles. The population is estimated at 20,000 to 30,000.

The larger islands are covered with wood, the cocoa-palm being the characteristic tree. Land animals are very scarce, but turtles and fish are common. There is no running water, but fresh water can be easily obtained by digging. The climate is temperate for the latitude, but is very unhealthful to immigrants because of the numerous lagoons and swamps. Violent fevers, the dropsical *beri-beri*, and dangerous dysenteries are sure to attack the newcomers.

The people are like the Singhalese, and speak a Singhalese dialect, but they have some characteristics in common with the people of Malabar, and also betray some African intermixture. They are short, dark copper-colored, gentle, hospitable, cleanly, domestic, and affectionate. They are divided into six classes or castes.

These islands were apparently known to Ptolemy and Ammianus. They have formed a little kingdom from the earliest times, and are now governed by a sultan of ancient lineage. They were converted to Islam about 1200 A. D. They have since been in Portuguese, French, and Dutch hands, and now form a nominal dependency of Ceylon. The people depend for food chiefly on fish and rice, the latter imported. The chief exports are coir, cocoanuts, and copra, cowry-shells, and dried bonito-fish. The sultan lives on the island of Mali, near the center of the group, a mile long by half a mile broad. Pop. 2,000. See *Voyages d'Ibn Batoutah* (trans. by Dufréméry and Sanguinetti, iv., 1858); *Voyage de François Pyrard de la Val* (1679); Bell, *The Maldive Islands* (1883). MARK W. HARRINGTON.

Maldon, mawl'dŭn: town; in the county of Essex, England; at the confluence of the Chelmer and the Blackwater; 38 miles N. E. of London (see map of England, ref. 12–K). It has manufactures of salt and silk, and breweries and iron-foundries. Pop. (1891) 5,397.

Maldonado, maăl-dō-naa'dō: a department of Uruguay, on the mouth of the Rio de la Plata; E. of Montevideo. Area, 1,610 sq. miles. Pop. (1891) 20,600. The capital, Maldonado, is a port-town, on a bay protected from E. winds by a projecting point, but open to the S. (see map of South America, ref. 8–E). Founded in 1762. It was formerly of considerable importance, but is now little used except for local trade and as a harbor of refuge. Pop. about 1,500. H. H. S.

Malebranche, maăl'braăńsh', NICOLAS: philosopher; b. in Paris, Aug. 6, 1638, of a rich and respectable family; was prevented by a feeble constitution from attending any public school as a youth; when older studied theology at the Sorbonne, and entered in 1660 the congregation of the Oratory. The incidental perusal, in 1664, of Descartes's *Traité de l'Homme* filled him with such an enthusiasm that henceforth he devoted himself exclusively to philosophy, and after ten years' preparation he produced his principal work, *De la Recherche de la Vérité* (1674), which contains the substance of his entire system of thought. His health was still very precarious, but by his quiet and cautious manner of living he reached a good old age. The study of philosophy he alternated with that of mathematics, in order to sharpen his powers without burdening his memory. As he was a man of genuine piety, it was to him a most serious task to demonstrate the true relation between the metaphysical ideas set forth in his first book and the doctrines of Christianity, and all his subsequent writings reveal more or less directly the same tendency: *Conversations Chrétiennes* (1677); *De la Nature et de la Grace* (1680); *Méditations Chrétiennes et Métaphysiques* (1683); *Traité de Morale* (1684); *Entretiens sur la Métaphysique et sur la Religion* (1688); *Traité de l'Amour de Dieu* (1697); *Entretiens d'un Philosophe Chrétien et d'un Philosophe Chinois sur l'Existence de Dieu* (1708), etc. On this point, however, he met with much censure and opposition from Arnauld, Régis, and even from Bossuet; but in spite of the fierceness of the controversy, he himself remained calm and benign to the last. D. in Paris, Oct. 13, 1715, after a protracted sickness and much suffering. The system of Malebranche is a further development of the doctrines of Descartes and especially of occasionalism. With Descartes he assumed a difference between matter and mind so absolute that no transition from one to the other, no influence of one on the other, is possible. The question then became: How is the striking harmony between the material and spiritual phenomena which pervades the whole world to be explained when there is no causal connection between the two spheres? To this Malebranche answered: All that exists, matter and mind, and the movements going on in their respective spheres, rests on God as its sole and immediate cause; and as God is one and the same, there must be a certain consistency between the phenomena of the various spheres, even though that which takes place in one sphere is only a *causa occasionalis*, and not a *causa efficiens* for that which occurs in another. Bodies are explained in his *Search after Truth* as modifications of infinite extension which belongs to God. In chap. vi. of book iii. he develops his famous principle that "We see all things in God." We see in God the archetypes of the corporeal world, and thus come to know bodies indirectly. Mind is so different from matter that it could not know it directly. This is his theory of occasionalism, while Leibnitz adopts pre-established harmony, and Spinoza the theory that mind and matter are two phases of one reality. See his *Œuvres Complètes* (11 vols., Paris, 1712); *Œuvres choisies de Malebranche* (2 vols., Paris, 1846); English translations of the *Search after Truth* and of *Nature and Grace*, by T. Taylor (London, 1694).

Revised by W. T. HARRIS.

Malecki, maăl-et'ski, ANTONI: poet and philologist; b. at Obiezerz, near Posen, Poland, in 1821; educated privately, at Posen, and at Berlin; won in 1844 the degree of Ph. D. by his dissertation *De Academia vetere* (The Ancient Academy); lectured on Philology at Posen (1845–50), Cracow (1850–54), Innsbruck (1854–56), and finally became Professor of the Polish Language and Literature at the University of Lwów (Lemberg), 1856–73. In 1881 he was appointed member of the Austrian House of Lords. He wrote a number of literary essays; *List żelazny* (An Iron Letter, Posen, 1854), a drama depicting the life of seventeenth century serfs; *Grochowy wieniec* (A Wreath of Peaflowers, Posen, 1855), a comedy; *Jadwiga* (Lemberg, 1860), a tragedy; translated Sophocles's *Elektra* and *Antigone* (Cracow, 1854); and published specimens of ancient Polish oratory in *Wybor mów staropolskich*, etc. (Cracow, 1860). *Juliusz Slowacki, jego życie i dziela* (Jul. Slowacki, his Life and Works, 2 vols., Lemberg, 1866–67) is highly valued by literary historians. His greatest works are two epoch-making Polish grammars, comparative and historical: *Gramatyka języka polskiego* (Lemberg, 1863), and *Gramatyka historyczno-porównawcza*, etc. (2 vols., Lemberg, 1879). J. J. KRÁL.

Malesherbes, maăl'zãrb', CHRÉTIEN GUILLAUME DE LAMOIGNON, de: statesman; b. in Paris, Dec. 6, 1721, of a rich and influential family; was educated by the Jesuits; studied law and entered very early the civil service, in which he occupied with great honor the most responsible positions. From 1750 to 1771 he was censor of the press and president of the court of aids. In the former office he gained the esteem of all literary men by his liberality and courage; without him probably the *Encyclopédie* would never have been printed. In the latter he attained still greater popularity by the firmness with which he opposed all arbitrary measures of the Government and all extortions of the tax-farmers. In 1770, when Louis XV. dissolved the Parliament because they would not register his tax-edicts, Malesherbes presented a memoir to His Majesty, advising the convocation of the States-General, for which action he was banished from Paris. On the accession of Louis XVI. he was recalled to the court in 1774, and as he was now one of the most popular men in France, he was made Minister of the Interior in the cabinet of Turgot. He could do nothing, however, against the follies, prejudices, and intrigues of the court; and when he left the ministry in 1776, together with Turgot, he had lost much of his popularity. He then spent many years in travels in foreign countries and on his estates, always occupied by some plans of public usefulness; and when in 1792 Louis XVI. was arraigned before the National Convention, he undertook his defense, and, speaking with admirable courage, succeeded in making some impression. The immediate result, however, of this noble act was his own arraignment in Dec., 1793, and on Apr. 22, 1794, he was guillotined, together with several members of his family. He wrote several essays and pamphlets, mostly on subjects relating to political economy and finances. His *Œuvres Choisies* were published in 1809.

Malet, măă'lā', Claude François, de: conspirator; b. June 28, 1754, at Dôle, in the department of Jura, France; entered the army in 1771; was brigadier-general in 1799, and commanded in Italy in 1804 under Prince Eugene, but was dismissed from the army in 1807, and confined in La Force, suspected and in a measure convicted of having intrigued against the emperor. While in La Force he plotted a new conspiracy, but was again discovered, and Napoleon now ordered him to be shut up in a state prison. This order was either disobeyed or forgotten, and in 1812 he was allowed to take up his residence for the sake of his health in the house of a physician in Paris, one Dubuisson. Here he found the associates he needed, and planned with great shrewdness and circumspection a *coup d'état*, which he executed in the night between Oct. 22 and 23 with an astonishing audacity and admirable skill. The first rumor of the disastrous retreat from Moscow had just reached Paris. At midnight Malet appeared in the barracks, announced that the emperor had been killed in Russia, represented himself as an emissary from the provisory government, and at the head of a few companies of soldiers arrested the chiefs of the police and the postal department, whom he replaced with his own accomplices, and was just about taking possession of the military command of Paris when Laborde, chief of the military police, recognized him, disarmed and arrested him, and disclosed his fraud to the soldiers. He was shot Oct. 29, 1812. See the exhaustive representations by Lafon and Dourille, both entitled *Histoire de la Conspiration de Malet*—the former 1814, the latter 1840.

Malherbe, măă'lārb', François, de: poet and critic; b. at Caen, Normandy, in 1555. He enjoyed unusual advantages of education, studying at home and at Paris, Heidelberg, and Basel. He entered the service of the governor of Provence, after whose death (1586) he was for a time without employment. He sought the favor of Henry III., and a poem dedicated to the latter brought him 500 crowns. In 1600 he won the attention of Marie de Médicis by an ode welcoming her to France, and in 1605 was given a position at court by Henry IV., whose poetical commissions he executed. During the rest of his life he continued to be a court poet, addressing flattering verses to Louis XIII. and Richelieu, and came to be the great authority of the world of letters. D. Oct. 16, 1628. His work is small in amount, consisting of a few translations from Livy and Seneca, some letters, and one volume of *Stances, Odes, Sonnets, Épigrammes*, and *Chansons*. It owes its importance not to poetic feeling and imagination, but to the purity and appropriateness of its language and the harmony and polish of its versification. In these respects Malherbe led a reform. The sixteenth century had enriched both language and literature with a vast amount of new materials, but, aside from implanting in all minds an enthusiastic admiration for the literatures of antiquity, it had left free scope to individual caprice. There was absence of unity and authority. Malherbe made the French of Paris the standard, proscribed provincialisms, and sought to decide hesitating usage in accordance with logic. In versification he condemned hiatus and overflow, violent inversions, and too easy rhymes, and demanded that the end of the line and the cæsura in the alexandrine be marked by a pause in the sense. He exercised on his own productions the same criticism that he applied to others, and attained a purity, clearness, and simplicity of language and a smoothness, harmony, and elegance of versification that were unknown before him and that at once became models. Thus he was very influential in impressing upon French literature the tendency it was to follow for two hundred years, and has since been generally regarded as the inaugurator of French classicism. His works were first collected and published in 1630, then with a commentary by Ménage in 1666. The best edition is in the Édition des Grands Écrivains, by Lalanne (Paris, 1860–65). Cf. Allain, *Malherbe et la poésie française à la fin du XVI^e siècle* (Paris, 1892); Ferd. Brunot, *La doctrine de Malherbe, d'après son commentaire sur Desportes* (Paris, 1891).

A. G. Canfield.

Malheur (măă-loor') **River**: a river which rises by several head-streams in the southeastern part of Oregon; flows in a northeasterly direction, and empties into the Snake river, on the boundary between Oregon and Idaho.

Malibran, măă'lĕĕ'brăăn', Maria Felicità: opera-singer; b. in Paris, Mar. 24, 1808; a daughter of the celebrated singer and singing-master, Manuel Garcia; made her *début* June 7, 1825, as Rosina in *The Barber of Seville* in London; entered in the same year on an artistic tour through the U. S.; married (Mar. 25, 1826) M. Malibran, a French banker of New York. After he had become a bankrupt she separated from him, and returned the next year alone to Europe. She appeared for the first time in Paris Jan. 14, 1828, as Semiramis; sang for several years alternately in London and Paris, with occasional excursions to Italy and Belgium; married after the dissolution of her first marriage the famous violinist de Bériot, Mar. 29, 1836. D. in Manchester, England, Sept. 23, 1836, in consequence of a fall from her horse. Her voice, a mezzo-soprano, beautiful by nature, was developed to perfection, and to these musical advantages were added a considerable dramatic talent, much natural grace, a rich imagination, and an astonishing audacity in following up her momentary inspirations.

Ma'lic Acid [*malic* is from Lat. *ma'lum*, apple]: a crystallized substance that is found widely distributed in the juices of plants. It was discovered by Scheele in unripe apples. It is also found in the berries of the mountain-ash, in cherries, gooseberries, strawberries, etc. It is obtained most easily from the berries of the mountain ash which have not quite reached ripeness. The berries are pressed and boiled with milk of lime, when the acid passes into solution as the calcium salt from which it is set free and purified. Tartaric and malic acids are related substances, and both are related to succinic acid. By chemical methods it is possible to convert succinic acid into malic acid and this into tartaric acid; and starting with tartaric acid, both malic acid and succinic acid can be made from it. The relations between the three substances are shown by the following formulas:

$CH_2.CO_2H$	$CH(OH).CO_2H$	$CH(OH).CO_2H$
$CH_2.CO_2H$	$CH_2.CO_2H$	$CH(OH).CO_2H$
Succinic acid.	Malic or hydroxy-succinic acid.	Tartaric or dihydroxysuccinic acid.

Malic acid is known in three forms. The natural variety is optically active, turning the plane of polarization to the right or to the left, according to the concentration of the solution. That variety which is made artificially is optically inactive. The optically inactive variety can be split into two optically active varieties, one of which is identical with the natural acid, while the other turns the plane of polarization in the opposite direction under the same conditions. When subjected to dry distillation malic acid is converted into maleïc and fumaric acids and maleïc anhydride.

Ira Remsen.

Malice [from Lat. *mali'tia*, evilness, malice, deriv. of *ma'lus*, bad]: in law, denotes (1) simply the absence of legal excuse, (2) "any corrupt motive, any wrong motive, any departure from duty." In the first case it is called "malice in law," in the second "express malice." In either sense it is a vague term, and eminent judges have not hesitated to declare it unfortunate. It is the chameleon of legal nomenclature, taking a different hue from each topic with which it is connected. Its varying shades of meaning are described in the numerous articles on particular crimes and torts.

Malicious Exercise of Rights.—The present article will be confined to the inquiry whether the performance of an act which one has a right to do with a good motive is tortious if actuated by malice. Undoubtedly the Roman law answered this question in the affirmative. If a landowner dug a well in his field and thereby drained his neighbor's well, his act was legal if done to improve his own property, but illegal if done to injure his neighbor's. This is understood to be the rule in Scotland; and German jurists declare that "the exercise of a right is not rendered unlawful by the fact that another is damaged thereby; it is only unlawful to exercise a right solely in order to injure another."

The common law gives no such clear and decisive answer. In the language of Lord Justice Bowen, it "presents us with no scientific analysis of the degree to which the intent to harm, or, in the language of the civil law, the *animus vicino nocendi*, may enter into or affect the conception of a personal wrong." In the case of digging or building on one's land, the weight of authority seems to be opposed to the Roman doctrine, and is in favor of permitting a landowner to do maliciously whatever he may do in good faith. (*Rideout* vs. *Knox*, 148 Mass. 368.) Accordingly, he may build a fence or wall on his land for the sole purpose of obstructing his neighbor's light or air; he may dig in his land with no other object than to drain his neighbor's well; he may cover his premises with shanties and let them to objectionable ten-

ants, for the mere sake of spiting the adjoining occupant of a fashionable mansion, without committing a tort.

A man has the right to engage freely in trade. He may exercise this right without incurring legal liability to another trader, though his motive is to spite that other by cutting off his gains, and not to benefit himself; but he must not damage the other by fraud or misrepresentation; and he must abstain from any intimidation, obstruction, molestation, or intentional procurement of a violation of the other's rights, without just cause or excuse. *Mogul Steamship Co.* vs. *McGregor*, 23 Queen's Bench Division 598; (1892) Appeal Cases 25.

A mortgagee has the right to foreclose his mortgage and a creditor to collect his claim as soon as they mature. "The law will not inquire into the motives of the party exercising such right, however unfriendly and selfish." *Randall* vs. *Hazelton*, 12 Allen (Mass.) 412.

As a rule, a person is free to contract with any one; but if A knows that B and C are parties to a contract, his right to contract with either of them becomes a qualified one. Should he, having such knowledge, persuade either to break his contract with the other and contract with himself, intending thereby to injure that other, or to benefit himself at the other's expense, and such injury follow, his act would be wrongful in law and fact and would subject him to a suit for damages. (*Bowen* vs. *Hall*, 6 Queen's Bench Division 333.) Lord Coleridge in this case strongly dissented from the doctrine that the same person, for doing the same thing, under the same circumstances, with the same result, is subject to an action or not, according to whether his inward motive was selfish or unselfish, declaring, "I think the inquiries to which this view of the law would lead are dangerous and inexpedient inquiries for courts of justice; judges are not fit for them, and juries are very unfit." His view has been accepted in a number of jurisdictions, but the decision in *Bowen* vs. *Hall* has been generally followed in the U. S. (see *Angle* vs. *Chicago, etc., Railway*, 151 U. S. 1; 14 U. S. Supreme Court Reporter 240, 1894): but it is submitted that even under this doctrine it is not the malicious exercise of the actor's right that is actionable, but the malicious invasion of another's right.

FRANCIS M. BURDICK.

Malicious Mischief: in law, injuring the property of another out of a spirit of wanton cruelty or wicked revenge. It seems not to have been an offense at English common law, but was made punishable by the statute of Westminster, 13 Ed. I., st. 1., c. 46, and a number of later acts of Parliament. (Stephen's *History of Criminal Law*, vol. iii., p. 188.) In most of the U. S. it has been considered by the courts an offense at common law; but in nearly all of them it is now, as in England, a statutory crime, embracing nearly every form of physical injury inflicted with malicious intent upon any kind of property of another, and in some States upon one's own property. In the absence of a statutory provision on the subject, malice means actual ill will against the owner of the property, or wanton cruelty provocative of a breach of the peace. See Wharton's *Criminal Law*, bk. 2, ch. xvi.; Bishop *On Statutory Crimes*, bk. 4, ch. xix., § 4.

FRANCIS M. BURDICK.

Malicious Prosecution: in law, the infliction of legal injury upon another, by prosecuting him from an evil motive and without probable cause. The plaintiff who brings an action for this wrong must prove (1) that the prosecution of which he complains has been terminated in his favor; (2) that there was a want of probable cause for the prosecution; (3) that it was undertaken in a malicious spirit; and (4) that it caused him legal damage. If he fails to establish either of these positions, he can not recover.

Termination of Former Suit.—The plaintiff is required to show that the previous action has terminated in his favor, in order to prevent his trying the same issue twice. Were such double litigation permitted, the plaintiff "might recover in this action, and yet be afterward convicted on the original prosecution." If the proceeding complained of does not permit the prosecuted party an opportunity to controvert the charge of the prosecutor, as in the case of an *ex parte* attachment or a warrant to keep the peace, this requirement has no application, and the party wronged may bring his suit for malicious prosecution at once (*Hyde* vs. *Greuch*, 62 Md. 577); but if the proceeding is one in which the defendant has the right to a hearing and thus an opportunity to obtain a favorable decision, it does not matter that the law denies to him the right of appeal from the decision. The proceeding is terminated when it has been so disposed of that the prosecutor must begin anew. Hence the refusal of a grand jury to find an indictment; the discharge from bail or imprisonment by a committing magistrate; the verdict of not guilty upon a criminal trial; the voluntary abandonment of a civil action without any compromise on the part of the defendant therein are instances of terminated proceedings. Whether a *nolle prosequi* amounts to a final disposition of a criminal prosecution is a question upon which the courts are at variance. As it ends the indictment and compels the prosecution to begin anew, it ought to be treated as a final determination unless entered by the procurement of the one prosecuted, and is in the nature of a compromise. *Brown* vs. *Randall*, 36 Conn. 56.

Want of Probable Cause.—A person is said to have probable cause for proceeding against another when he believes, on grounds that would warrant a reasonable man in believing, that the other is legally liable to such prosecution. If the facts which are depended upon by the defendant, in a suit for malicious prosecution, to show that he had probable cause for the original proceeding, are in dispute, the jury are to ascertain the facts and the judge is to decide whether those facts constitute such cause. Where the facts are undisputed the question is solely for the judge. If a party lays all the facts of his case fairly before reputable counsel, and acts in good faith upon the honest opinion thus obtained, though it may be erroneous, he acts with probable cause. He must, however, state the facts fully and fairly, and there must be no dishonest collusion between him and his counsel in the matter, and he must believe in the legal liability of the one against whom he proceeds. A judgment in favor of the original prosecutor, unless obtained by fraud, is generally held to be conclusive evidence that he acted upon probable cause, although it was subsequently reversed (*Crescent City, etc.*, vs. *Butchers' Union*, 120 U. S. 141); but a judgment against him is at most but *prima facie* evidence of the absence of probable cause. The holding by a committing magistrate of a person charged with crime, for the grand jury, or the finding of an indictment by a grand jury, is *prima facie* evidence that the complaining party acted with probable cause. If, however, it is shown that the complainant suppressed or misrepresented any material facts, or that he assumed to state as facts what he did not know to be such, and about which he had not taken reasonable care in informing himself, or, if it appears that he did not honestly believe in the charge that he preferred, his *prima facie* case is destroyed; but it must be borne in mind that the plaintiff in a suit for malicious prosecution has the burden of proving a want of probable cause, although this is a negative averment, and the facts relating thereto are peculiarly within the knowledge of the defendant.

Malice.—The prosecutor must have acted from an indirect and improper motive, and not in the furtherance of justice. It is not essential, however, that he was inspired by hatred against the individual prosecuted. Whether his conduct was malicious, in this sense, is a question of fact for the jury. They may infer malice from the same circumstances that establish a want of probable cause, but they are not bound to do so. The prosecution may have been instituted without probable cause, and to that extent improperly, and yet the prosecutor may have been free from actual malice; and it is malice in fact which the present plaintiff must prove. Such malice is ordinarily established by circumstantial evidence. A jury may infer its existence simply from the zeal and activity displayed by the present defendant in the prosecution complained of. An action for malicious prosecution will lie against a corporation, if the wrongful proceeding was instituted by its authorized agents. Their malice, in such a case, is its malice. *Reed* vs. *Home Savings-bank*, 130 Mass. 443.

Legal Damage.—In the early case of *Savile* vs. *Roberts* (1 Lord Raymond's *Reports* 374), Lord Holt declared that there are three heads of damage which will support an action for malicious prosecution: (*a*) Damage to a man's person, as when he is taken into custody. (*b*) Damage to a man's estate, by putting him to expense. (*c*) Damage to his fair fame and credit. Such is the rule to-day. Accordingly, the malicious institution of bankruptcy or lunacy proceedings, or the malicious seizure of the person or property of another, without probable cause, presents a case of legal damage. Whether it is inflicted by the malicious institution of a civil action, which does not involve scandal to reputation, or the seizure of person or property, is a question upon which the courts differ. According to the English view, which has been adopted in several of the U. S., the bringing of an

ordinary action does not as a "natural or necessary consequence involve any injury to a man's property, for this reason, that the only costs which the law recognizes and for which it will compensate him, are the costs properly incurred in the action itself." (*Quartz Hill Co.* vs. *Eyre*, 11 Queen's Bench Division, p. 690.) On the other hand, many courts in the U. S. hold that a person may be legally damaged by the malicious institution of a civil suit, because the taxable costs are so small that they may be no adequate compensation for the actual damages to which the groundless and malicious proceeding has subjected him. *Eastin* vs. *Stockton Bank*, 66 California 123.

A person who maliciously instigates another to prosecute a third without probable cause, and to his legal damage, is liable, as he would have been had the proceeding been in his own name.

Unauthorized Action in Another's Name.—If one brings an action against another, in the name of a third, without authority, he is liable in tort to the defendant for the actual damages sustained, even though he acts without malice and with the *bona fide* belief that his act is authorized, or will be ratified. If the suit is groundless and malicious, exemplary or punitive damages may be recovered.

Malicious Abuse of Process.—A person may have obtained legal process against another upon probable cause and in a valid form, and yet commit a tort by employing it for some unlawful purpose; as where he uses a warrant of arrest to extort money, or to compel the execution of a paper, or the surrender of a right. As this wrong consists, not in instituting the original prosecution, but in perverting lawful process to the attainment of an object not within its proper scope, it is immaterial to the maintenance of a suit for its redress, whether the original proceeding has terminated or was instituted with or without probable cause. The malicious abuse of the process and the legal damage to the present plaintiff constitute his cause of action. *Wood* vs. *Graves*, 144 Mass. 365. FRANCIS M. BURDICK.

Malicites: See ALGONQUIAN INDIANS.

Malignant Diseases: See CANCER.

Malignant Pustule: See ANTHRAX.

Malinche, or **Malintzin** (Mountain): See TLASCALA.

Malines: See MECHLIN.

Malingering: See FEIGNED DISEASE.

Mallalieu, WILLARD FRANCIS, A. M., D. D.: bishop; b. at Sutton, Mass., Dec. 11, 1828; educated at East Greenwich Academy, Rhode Island, Wesleyan Academy, Wilbraham, Mass., and Wesleyan University, Middletown, Conn.; joined the New England conference in 1858, and served in the pastorate until 1882; was presiding elder from 1882 till 1884; was elected bishop in 1884. From 1884 to 1892 he resided in New Orleans. A. O.

Mal'lard, or Greenhead: a very common wild-duck in North America and Europe; known to science as *Anas boschas*. It is the original from which have sprung almost all the varieties of the domestic duck, excepting some which are bred in China and Japan. The male is nearly 2 feet long, and has a grass-green neck and head, with a tint of violet; a white ring around the neck, brownish chestnut below. The speculum is a violet purple. The female is smaller, and her plumage is plain brown. The mallard is strictly monogamous, unlike the common domestic duck. See DUCK. Revised by F. A. LUCAS.

Mallarmé, măă'lăăr'mā', STÉPHANE: poet; b. in Paris, Mar., 1842. His outward life was uneventful, and was chiefly spent as teacher of English in the Lycée Fontanes. As a literary man, however, he was *chef-d'école* of one of the strongest of the innovating groups of French writers—the so-called "Décadents." He wrote much for the organ of the school, *Le Décadent*, and for *Le Parnasse contemporain*, and his often unintelligible style gave rise to the liveliest discussions. In 1876 he published a thin folio volume, illustrated by Manet, containing his curious *L'Après-midi d'un faune*. This was followed by *Petite philologie à l'usage des classes et du monde* (1878); *Les Dieux antiques: nouvelle mythologie* (1880); Beckford's *Vathek*, with an entirely incomprehensible preface (1880); *Poésies* (one *fascicule* only, 4to, 1887); *Poèmes d'Edgar Poe* (translated into French, 1888); *Vers et prose: morceaux choisis* (1893). Several of his pieces are to be found in Paul Verlaine's *Les Poètes Maudits*. See Edmund Gosse, *Questions at Issue* (New York, 1893). D. Sept. 9, 1898.

Malleability: See METALS.

Malleco, măăl-yā'kō: province of Chili; S. of Biobio, between Arauco and the Andes; area, 2,856 sq. miles; estimated population (1891) 63,329. It is crossed by the river Malleco, and the portion lying in the central plain is composed of rich agricultural land. Many of the inhabitants are semi-civilized Araucanian Indians. Wheat-raising and grazing are the principal industries. Angol, the capital, has about 8,000 inhabitants; Traiguen is an important commercial center; and Collipullí and Victoria are thriving towns. HERBERT H. SMITH.

Mallemuck: See MOLLYMAWK.

Mallery, GARRICK: soldier and ethnologist; b. in Wilkesbarre, Pa., Apr. 23, 1831. He graduated at Yale College in 1850; in 1853 was admitted to the bar of Philadelphia, where he practiced law until the civil war, and then entered the Union army; afterward was promoted lieutenant-colonel of volunteers and captain and brevet lieutenant-colonel in the regular army. In the reconstruction period in 1869–70, being on duty in Virginia as judge advocate on the staff of the successive generals commanding, he was appointed secretary of state and adjutant-general of Virginia, with the rank of brigadier-general. In Aug., 1870, he was detailed with the chief signal officer of the army at Washington to carry into effect the legislation initiating the meteorological duties of the signal service, of which he was soon appointed the executive officer, and for long periods was acting chief signal officer. In 1876 he was ordered to the command of Fort Rice in Dakota, and there made investigations into the pictographs and mythologies of the North American Indians; in 1877 joined Maj. J. W. Powell, then in charge of the survey of the Rocky Mountain region, for duty in connection with the ethnology of the North American Indians. In 1879 he retired from active service on account of wounds received in action, and was appointed chief of the bureau of ethnology on its organization at Washington in that year. D. in Washington, D. C., Oct. 24, 1894. Col. Mallery was president of many societies and clubs—e. g. the Anthropological Society, the Cosmos Club, the Philosophical Society, and the Literary Society of Washington, and vice-president of the American Association for the Advancement of Science, and president of the joint commission of the six scientific societies of Washington. His most important works, some of which have been translated, include *A Calendar of the Dakota Nation* (1877); *Introduction to the Study of Sign Language among the North American Indians as Illustrating the Gesture Speech of Mankind* (1880); *A Collection of Gesture Signs and Signals of the North American Indians, with some Comparisons* (1880); *Sign Language among North American Indians Compared with that among other Peoples and Deaf-mutes* (1881); *Pictographs of the North American Indians* (1886); *Israelite and Indian, a Parallel in Planes of Culture* (1889); *Greeting by Gesture* (1891); *Picture-writing of the American Indians* (1893). J. W. P.

Mallet, măă'lā', JULES THEODORE ANATOLE: civil engineer, first designer of compound locomotives; b. in the canton of Geneva, Switzerland, in 1837; studied in France, graduating at the École Centrale in 1858, with the diploma of mechanical engineer. Attached to the works of the Suez Canal, he established the first workshops at Port Said and erected there the first dredges; then became engineer of the general dredging contract for the seaports of the kingdom of Italy. He was specially occupied with steam-engines, both stationary and marine, and afterward studied the application of the compound engine to locomotives. This study, begun in 1873, led to the construction in 1875 of the compound locomotives of two cylinders for the railway from Bayonne to Biarritz, which were the origin of the compound locomotive now generally introduced on the best railways. In 1886 he built the articulated four-cylinder compound locomotive, the first for the Decauville railways (portable narrow gauge), but their use has extended considerably since that time. He has published many memoirs on marine and locomotive engines; has edited the *Chronique* and the *Proceedings* of the Society of Civil Engineers of France since 1880. In 1877 he obtained the Fourneyron prize of the Institute of France (Academy of Sciences) for the application of the compound system of locomotives, and in 1885 the decoration of the Legion of Honor. W. R. HUTTON.

Mal'leus [Mod. Lat. = Lat. *mal'leus*, hammer]: in comparative anatomy, a small bone forming one of the chain of

three bones in the internal ear of mammals, but morphologically answering to the quadrate bone with which the lower jaw articulates in the Ichthyopsida and Sauropsida.

Malleus: a genus of oysters allied to the pearl-oysters, and deriving its name from its shape.

Mallock, William Hurrell: author; b. in Devonshire, England, in 1849. He was educated at Baliol College, Oxford, where in 1871 he gained the Newdigate prize for a poem entitled *The Isthmus of Suez*. He first attracted general attention by *The New Republic* (1877), a clever satire on the confusion and doubt of contemporary thought, in the form of a "symposium" between different leaders of English public opinion, thinly disguised under fictitious names. A key to this was soon after published, and the book passed through numerous editions. Other writings of this author are *The New Paul and Virginia* (1878); *Is Life Worth Living?* (1879); *Poems* (1880); *A Romance of the Nineteenth Century* (1881); *Social Equality* (1882); *Property and Progress* (1884); *The Old Order Changes*, a novel (1886); *In an Enchanted Island*, experiences in Cyprus (1889); *Labour and Popular Welfare* (1894). H. A. Beers.

Mallophaga: See Entomology and Lice.

Mallory, Stephen Russell: civil engineer; b. in Trinidad, West Indies, in 1813; was the son of a shipmaster of Connecticut; settled with his parents at Key West, Fla., in 1820; was educated at Mobile and at Nazareth, Pa.; was admitted to the bar at Key West in 1833; was inspector of customs under Jackson, and became county judge and judge of probate for Taylor co., Fla.; became in 1845 collector of the port of Key West; was U. S. Senator from Florida 1851–61; declined the appointment of minister to Spain in 1858, and in that year removed to Pensacola; became secretary of the Confederate navy. After the war (1865) he was imprisoned, released on parole in 1866, and pardoned in 1867 by President Johnson. He afterward practiced law in Pensacola, where he died Nov. 9, 1873.

Mallow Family: the *Malvaceæ*. A family of dicotyledonous plants, mostly herbs or shrubs (rarely trees) consisting of about 800 species, which are widely distributed, but most abundant in hot climates. Their leaves are simple and alternate; the stamens are indefinite in number and united into a tube; the ovary is superior, and for the most part many-celled. There are about 125 native species in the U. S., besides a dozen or more which have been introduced, many of which are more or less weedy in habit. Some mallows (*Malva*) are grown for ornamental purposes, as are also the rose mallow (*Hibiscus*), hollyhock (*Althæa*), *Callirhoë*, etc. Okra, a species of *Hibiscus*, produces edible pods which are much used, especially in the Southern U. S. By far the most important plants of the family are those which produce cotton, which consists of the long hairs attached to the seeds of *Gossypium*, natives of the warmer portions of the Old World. The common cotton of cultivation, especially in the Southern U. S., is *G. herbaceum*. See Cotton. Charles E. Bessey.

Mallow Hemp: See Fiber.

Malma: See Dolly Varden.

Malmesbury, momz'ber-i, James Harris, First Earl of: diplomatist; b. in Salisbury, England, Apr. 21, 1746; was son of James Harris, the author of *Hermes*; studied at Oxford and Leyden; became secretary of legation at Madrid 1768, and in 1770, as *chargé d'affaires*, foiled the designs of Spain on the Falkland islands; was ambassador in Berlin 1772; in St. Petersburg 1776; at The Hague 1784; supported Fox in the House of Commons; knighted 1780; and was made a baron 1788 in reward for treaties of alliance negotiated with Holland and Prussia. He seceded from the Whigs in 1793, and in the same year, he was again ambassador at Berlin; negotiated the marriage of the Prince of Wales with Caroline of Brunswick 1794; was engaged in unsuccessful negotiations for peace with the French republic 1796–97; was created Earl of Malmesbury and Viscount Fitz-Harris 1800. D. in London, Nov. 20, 1820. His *Diaries and Correspondence* (4 vols., 1844) were edited by his grandson, James Howard Harris, third Earl of Malmesbury (1807–89), who also published *The First Lord Malmesbury, his Family and Friends, a Series of Leiters from 1745 to 1820* (2 vols., 1870).

Revised by F. M. Colby.

Malmesbury, maams'ber-i, **William of**: historian; b. in Somersetshire, England, about 1095; became a monk and librarian of the monastery at Malmesbury, whence he took his name, and wrote in Latin an historical work which, next to the *Saxon Chronicle*, is considered the most valuable authority for Anglo-Saxon times. D. in Malmesbury about 1143. His *History of the Kings of England* and its continuation, the *Modern History*, were published in Latin by Sir Henry Savile (1596) and by T. D. Hardy (1840), and a translation of the former by Rev. John Sharpe appeared in 1815, and again in Bohn's Antiquarian Library (1847).

Malmö: chief city in Southern Sweden; on the Sound opposite Copenhagen (see map of Norway and Sweden, ref. 14–D). It is surrounded by a canal, outside of which are two suburbs. It has four churches (one Roman Catholic), a governor's residence, where Charles XV. died in 1872, and some other public buildings. The palace built in 1434, destroyed by the citizens in 1534, and rebuilt by Christian III., is now used as a prison. The chief industries consist of ship-building and the manufacture of stockings, gloves, soap, and tobacco. It has an extensive trade with Copenhagen and the Baltic ports. The city gave its name to an armistice formed there between Prussia and Denmark in 1848, suspending hostilities for an interval of seven months. Pop. (1889) 47,539. R. B. Anderson.

Malmsey, maăm'zĕe [M. Eng. *malvesie*, from Fr. *malvesie*, from Ital. *malvasia*, from Mod. Gr. Μονεμβασία, the original place of manufacture]: originally a sweet white or red wine from Monembasia (or Napoli di Malvasia). The name afterward came to be applied to other sweet Levantine wines, and still later to any other very sweet wines. It is at present applied especially to "malmsey madeira," which is much weaker than standard madeira wine. It is understood that all wines of this class are from over-ripe and partly dried grapes. They have a peculiar bouquet.

Malm'ström, Bernhard Elis, Ph. D.: poet; b. in Sweden in 1816; studied at Upsala, where he graduated 1842, and in 1856 was appointed Professor of Æsthetics and History of Literature. In 1849 he was elected a member of the Swedish Academy. Among his poems may be mentioned the epos *Ariadne* (1838), one of his earliest efforts, and the idyl *Fiskarflickan vid Tynnelsö* (The Fisherman's Daughter, 1839). The elegy *Angelika* (1840) was awarded the grand prize of the Swedish Academy, and is considered one of the gems of Swedish poetry. About the same time he published the dramatized poem *Julianus*, by which he reached the zenith of his poetic productions. Two collections of his poems, *Dikter*, appeared 1845 and 1847. His prose writings on literary subjects were mostly published for the first time in newspapers and periodicals, and afterward collected under the titles *Litteratur historiska Studier* (1860–61) and *Tal och esthetiska afhandlingar* (Speeches and Æsthetic Essays). His complete writings, *Samlade Skrifter*, in eight volumes (1866–69), five of which were dedicated to academic lectures on the subject of the history of Swedish literature, were published after his death by K. F. Bergstedt. D. 1865. P. Groth.

Malmström, Karl Gustaf, Ph. D.: historian; b. in Sweden in 1822; brother of Bernhard E. Malmström, poet; studied at Upsala, where he graduated in 1848, and was in 1858 appointed Professor of History and Statistics. In 1878 he was called to a seat in the cabinet, and from 1878 to 1880 was chief of the ecclesiastical department. Since 1882 he has been keeper of the state archives. He was elected a member of the Swedish Academy 1878. Among his writings are *Sveriges politiska historia från Carl XII.'s död til Statshvälfningen 1772* (The Political History of Sweden from the Death of Charles XII. to 1772, in 6 parts, 1855–77); *Sveriges statskunskap i kort sammandrag* (Short Handbook of Swedish Political Institutions, 1863, many editions); and diverse essays in periodicals treating subjects of Swedish history. P. Groth.

Malone, ma-lōn': village; capital of Franklin co., N. Y. (for location of county, see map of New York, ref. 1–I); on the Salmon river, and the Cent. Vt. and the N. Y. Cent. and Hudson R. railways; 60 miles N. E. of Ogdensburg, midway between that city and Rouse's Point. It is in an agricultural region, with valuable timber and mining sections tributary to it, and has manufactories of woolen goods, paper, flour, tanned leather, men's clothing, doors, sash and blinds, and foundry and machine-shop products. Other important interests are dairying and hay, hop, and potato raising. There are four weekly newspapers. Pop. (1880) 4,193; (1890) 4,986; (1900) 5,935. Editor of "Farmer."

Malone, Edmond: Shakspearean scholar; b. in Dublin, Ireland, Oct. 4, 1741; studied at Trinity College 1756; was called to the bar 1767; inherited a considerable fortune soon after, and thenceforth devoted himself to literary pursuits in London. He wrote on the Rowley poems (1782), edited the works of Sir Joshua Reynolds (1797), of Dryden (1800), and of W. G. Hamilton (1808). in each instance accompanied by a memoir, and published a *History of the English Stage* (1790), but is chiefly known by his exposure of Ireland's Shakspearean forgeries (1796), and by his critical edition of Shakspeare (11 vols., 1790). The material for another edition of Shakspeare was edited by James Boswell, the younger, and was published in 1821 (21 vols.). It is known as the *Variorum Shakspeare*. Hallam characterizes him as a dull commentator, but laborious and truth-loving. D. in London, May 25, 1812. See *Life* by Sir James Prior (1860). Revised by H. A. Beers.

Malory, or **Maleore** (trisyllabic), Sir Thomas, Knight: English prose-writer of the fifteenth century. All that is known of Malory is that he was a knight, and that he finished his *Morte d'Arthur* in the ninth year of the reign of Edward IV., in 1469 or 1470. This information is derived from the closing words of the book itself. It has been thought that he was a priest, but, though "Sir" could be a parson's title, "Knight" is decisive against this conjecture. The statement that he was a Welshman, made by Bale, perhaps on the authority of Leland, is antecedently improbable to the last degree, nor are Bale and Leland so careful in their biographies of literary men that much weight need be attached to their testimony. The author of the *Morte d'Arthur* is most likely the Warwickshire Thomas Malory, Knight, who died Mar. 14, 1470, aged apparently about 70. The name Malory (variously spelled but doubtless always trisyllabic) was of long standing in the adjacent counties of Warwick, Leicester, and Northampton, and occurs rather frequently elsewhere. Prof. Rhŷs's conjecture that it is the Welsh *Maelor* (*Maelawr*) is easy to refute. The *Morte d'Arthur* is a prose compendium of what is called the "Matter of Britain," i. e., of the romantic material concerning King Arthur and the Knights of the Round Table. The full title as it appears in the first edition (printed by Caxton in 1485) describes the contents of the work with sufficient fullness, *The noble and joyous book entytled Le Morte Darthur notwythstondyng it treateth of the Byrth, Lyf, and Actes of the sayd Kyng Arthur, of his noble Knyghtes of the Rounde Table, theyr mervayllous Enquestes and Adventures, th' Achyevyng of the Sangreal, and in th'ende the dolorous Death and Departyng out of thys World of them al.* Beginning with an account of Arthur's parentage, it contains not only an account of his reign and his death, but also pretty complete biographies of the most distinguished of his knights. The purpose of the compilation was to reduce into order and compass the various cycles of the Round Table Romances (Arthur, Merlin, Lancelot, Tristan, etc.), and to make them accessible in English. Caxton expressly states that Malory's sources were "certain books of French." So far as the French books in question can be identified, they prove to be various prose romances, later than the Old French verse romances of Chrestien de Troyes and others, and containing many alterations and expansions of older romantic material. Dr. Sommer finds that Malory used the prose Merlin, the prose Lancelot, and the prose Tristan. He also thinks that he derived much material from the Middle English metrical romance *La Morte Arthure*, which has been ascribed, on insufficient evidence, to one Huchown. The sources of a considerable portion of the work remain to be discovered. As was to be expected, Malory rambles a good deal, but on the whole he has executed his task with considerable judgment. The sources from which he drew were often poor, and this accounts for the debased form in which some of the episodes appear in his work. The most serious defect of this kind concerns the character of Sir Gawain, which is systematically blackened in the French prose romances in order to exalt Lancelot. It is of course impossible to tell how far Caxton changed Malory's English or his matter, but probably the alterations he made were trifling. The success of the *Morte d'Arthur* was immediate. Caxton's edition (1485) was followed by six others in black letter, the last appearing in 1634. During all this time the work, which had become the standard version of the Arthur story in England, exercised a powerful influence on our literature. From 1634 it was not reprinted till the nineteenth century. In 1816 two editions came out, and since then there have been several others, of which the most important are that called Southey's (1817), Thomas Wright's (1856), Dr. H. Oskar Sommer's (London, 1890–91), and Dent's (1893), which has a preface by Prof. Rhŷs. In 1868 Sir Edward Strachey published a judiciously modernized and retrenched version, intended primarily for boys. The standard edition is Sommer's, which has an accurate text, very valuable studies on the sources, a glossary, full indexes, etc., besides an essay by Andrew Lang on Malory's style. It will be observed that the popularity of Malory's book was great in the Elizabethan age, and that the revival of interest in it was contemporaneous with the romantic revival in our literature. Its republication in 1816 put a large body of thoroughly romantic material within the reach of everybody. The effect was enormous. Modern English ideas of Arthurian story are, except for specialists, derived almost entirely from the *Morte d'Arthur* either directly or through Tennyson's *Idylls of the King*, for which Malory was a main source. Malory's importance in this respect, as well as his significance as an early writer of modern English prose, can hardly be exaggerated. Apart from these considerations, his merits as a story-teller are significant, though they have been much exaggerated. He is usually clear but somewhat monotonous; only occasionally does he rise to such heights as he reaches in the famous lament over Lancelot (in the closing chapter). His style is simple, and at times picturesque. For his language, see C. S. Baldwin, *Inflections and Syntax of the Morte d'Arthur* (Boston, 1894).

G. L. Kittredge.

Malot, măă'lō', Hector: novelist; b. at La Bouille, near Rouen, France, May 20, 1830. His father, a notary, educated him for the law, but he never practiced. He served a literary apprenticeship on Didot's *Biographie générale*, the *Journal pour tous*, and in collaborating on dramatic works. He gravitated surely toward the novel, and since his *début* in 1859 with *Les Amants*, first part of *Les victimes d'amour*, has been a prolific writer in that field, having written about fifty volumes. His works show a keen observation, the field of which is mainly French life under the second empire, an interest in the moral aspects of society, and an occasional tendency to sensation. His sympathy with children is quick, and his most widely read book is a story of children, *Sans Famille* (1878, known in English as No Relations). Among his works are *Un beau-frère* (1869); *Une bonne affaire* (1870); *L'Auberge du Monde* (1875–76); *L'Héritage d'Arthur* (1876); *Le docteur Claude* (1879); *Conscience* (1889); *Complices* (1893). A. G. Canfield.

Malpighi, măăl-pee'gĕe, Marcello: anatomist; b. at Crevalcuore, near Bologna, Italy, Mar. 10, 1628; held the chair of Medicine successively at Pisa, Messina, and Bologna; was called to Rome in 1691 by Innocent XII. as his chief physician; died there Nov. 29, 1694. He was the first to apply the newly invented microscope in the study of anatomy, and showed himself a sagacious observer. His principal discovery was that of the transition of the blood from the arteries to the veins, described in his *De Pulmonibus* (1661). In medical science various parts of the epidermis, spleen, and kidneys still bear his name.

Malplaquet, măăl'plăă'kā': a village in the department of Le Nord, France; 10 miles S. of Mons, in Belgium (see map of France, ref. 2–G); famous for the battle which took place here (Sept. 11, 1709) between the French under Villars and the allied British, Dutch, and Austrians under Marlborough and Eugene, resulting in favor of the allies and in the capture of Mons.

Malpractice: See Jurisprudence, Medical.

Malt [O. Eng. *mealt*: Germ. *malz*, malt; connected with the root of Eng. verb *melt*]: barley which has been allowed to pass through the earlier stages of germination, and then dried to destroy its vitality and prevent further change. See Beer and Adulteration.

Mal'ta: an island in the Mediterranean, belonging to Great Britain; situated in lat. 35° 53′ N. and lon. 14° 31′ E., 58 miles from Sicily and 180 from Africa. It is the principal island of the Maltese group, which, besides Malta, comprises Gozo, Comino, Cominotto, and Tilfla. Area of the whole group, 117 sq. miles; of Malta, 95. Pop. in 1890, 165,662. The surface is elevated and rocky and has only a shallow layer of soil, but it is well cultivated, and produces wheat, cotton, figs, oranges, and grapes in abundance. Many potatoes are raised for the English market. The climate is

hot, but healthful. Snow is unknown, though hail-storms occur. The *sirocco*, a hot wind from the African desert, on its way across the Mediterranean becoming loaded with salty moisture, is almost unbearable, but occurs only in August and September, and blows for only a few hours at a time. Excellent marble is quarried. The chief importance, however, the island derives from its position as a station on the route from Great Britain viâ Egypt to India, and its most remarkable features are the immensely strong fortifications which the British have built around the capital, Valetta, the foundations of which were laid by the Knights of St. John. Malta was known to the Greeks under the name of Ogygia. It was the residence of the nymph Calypso, whose grotto is still shown. The Phœnicians and Carthaginians colonized the island in turn, but at the close of the second Punic war it became a Roman possession. In 56 A. D. St. Paul was shipwrecked here, and the legend tells us that he founded the first Christian congregation here. After the fall of the Eastern Roman empire the island was conquered by the Vandals in 454, the Goths in 494, the Byzantines in 533, the Arabs in 870, and the Normans in 1090, who united it to Sicily. In 1530 Charles V. gave it to the Knights of the Order of St. John of Jerusalem, who shortly before had been driven by the Turks from Rhodes. Here, too, they were besieged by the Turks in 1557 and in 1565, but at the latter siege Sultan Solyman was compelled to re-embark with a loss of over 25,000 of his best troops. In 1798 Bonaparte took the island by treachery. In 1800 it was taken by the British, and they have held it since. The island is ruled by a governor, assisted by an executive council of ten members, and by a legislative council of six official and fourteen elective members. See VALETTA. Revised by W. B. SHAW.

Malte-Brun, Fr. pron. maalt'brŭn', rightly MALTHE CONRAD BRUUN: geographer; b. at Thisted, Jutland, Aug. 12, 1775. He was destined for the Church, but preferred literature, theatricals, and politics, and very early in his life became the favorite in all literary circles in Copenhagen. The boldness, however, with which he advocated the principles of the French Revolution, and the rather unprincipled violence with which he attacked the state of affairs in Denmark, caused considerable excitement, and after several conflicts with the Government he was exiled. He went to Paris, where he applied himself with zeal to the study of geography and politics. D. Dec. 14, 1826. For some years he was joint editor of the *Journal des Débats*, and several of the papers he wrote for this journal have been collected and republished by Nachet; but his fame rests on his geographical works. From 1803 to 1805 he published, in connection with Mentelle, *Géographie Mathématique, Physique et Politique*, in 16 vols., and from 1810 to 1825 he published his *Précis de Géographie Universelle*. Geography was at the beginning of the nineteenth century something almost unknown, but Napoleon's campaigns called attention to this branch of knowledge, and made geography a necessary element of a man's education; and to this new want Malte-Brun ministered with great talent and earnestness.

Maltese Vulture: See EGYPTIAN VULTURE.

Mal'tha: a word first used by Pliny and applied by him to what he called an inflammable mud from the Euphrates. In modern times the word has been used to designate those forms of bitumen that resemble tar in consistence, and hence are sometimes called mineral tar. It appears to be the product of the gradual metamorphosis of certain forms of petroleum under the influence of atmospheric oxygen, by which the bitumen becomes richer in carbon. Whether or no oxygen is a constituent of maltha is uncertain. It seems to be produced from petroleum at any depth below the surface to which oxygen dissolved in rain-water can penetrate. It is a black viscous fluid, of a specific gravity between ·9 and 1, and usually contains in mechanical admixture 10 to 12 per cent. of water and air. It issues from springs with water and floats on pools of water, when it often entangles insects or birds that touch its sticky surface in their flight. It consists chemically of a very complex mixture of compounds of carbon and hydrogen, often with oxygen and nitrogen in addition. These substances dissolve each other; but their exact relations are not yet clearly understood. (See PETROLEUM.) In many localities maltha is used in its natural state as a coarse lubricator. In South America it is used, after the lighter oils, water, and air are driven off by boiling, to plug the seams of boats. It has been used from time immemorial for similar purposes on the banks of the Tigris and Euphrates. In the construction of Babylon and Nineveh it was used to cement in their places the great sculptured slabs of alabaster that adorned the palaces of those cities. As compared with other forms of bitumen, maltha is not abundant. See BITUMEN.

S. F. PECKHAM.

Malthe'idæ [Mod. Lat., named from *Malthæ'a*, the typical genus, from Gr. μάλθη, a kind of fish, perhaps the angler]: a family of fishes of the order Pediculati, distinguished by the large, depressed anterior part and slender tapering posterior part of the body, which is usually covered with scattered spinous disks or tubercles. The head is covered by the integument in common with the shoulder-girdle, and this combination forms the anterior disk, which is abruptly distinguished from the small posterior region; the mouth is inferior, and the cleft mostly transverse; the teeth are villiform; the branchial apertures are small dorsal slits, and in the upper axillæ of the pectoral limbs; there are five branchiostegal rays; the dorsal fins are peculiarly developed—the first being represented by a tentacle on or under the snout, and the second being a small but true fin (with four rays) on the slender body; the anal is like the dorsal; the pectorals are at the end of the long arms, which appear to have elbows, and are flexed outward and to some extent forward; the ventrals are small but perfect (with a spine and five rays), and far forward on the throat; the skeleton is fibro-cartilaginous, and has seven or eight abdominal and ten or eleven caudal vertebræ; no air-bladder or pyloric appendages are developed. The singular and grotesque fishes belonging to this family are found in warm seas or in deep waters. They are able to progress on the ground by clumsy leaps by means of the arms, which are far behind the ventrals or representatives of the hind legs of land vertebrates. Revised by D. S. JORDAN.

Mal'thus, THOMAS ROBERT: expounder of the principle of population; b. at the Rookery in Albury, County of Surrey, England, in 1766; was admitted at Jesus College, Cambridge, in 1784, and graduated with high honors in 1788. In 1797 he received a fellowship at Cambridge. About the same time he was admitted to holy orders, and took the charge of a small parish in Surrey, dividing his time between parochial duties there and his studies in the university. In 1798 the first edition of his work on population was published anonymously—*An Essay on the Principles of Population as it Affects the Future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, Condorcet, and other Writers* (1 vol. 8vo). This work created a sensation at the time, and gained for Malthus his chief reputation. It went through several editions, the last of which appeared in 1826 under the modified title, *An Essay on the Principles of Population, or a View of its Past and Present Effects on Human Happiness, with an Inquiry into our Prospects respecting the Future Removal or Mitigation of the Evils which it occasions.* Its leading idea is that population unchecked increases in a geometrical ratio, while food can be made to increase at most only in an arithmetical ratio. Hence the inference that, in order to avoid the evils of a population in excess of support, some checks must be applied to the increase of population. Vice and misery, shortening human life, come in as natural checks. That which is most insisted on in the essay is the moral check of abstinence from marriage and sexual intercourse on prudential considerations. (See POLITICAL ECONOMY.) He married in 1805, and the same year received the appointment of Professor of History and Political Economy in the East India College at Haileybury, in which position he continued till his death. The other published writings of Malthus are *Observations on the Effects of the Corn-laws, an Inquiry into the Nature and Progress of Rent* (1815); *Principles of Political Economy* (1820); and *Definitions in Political Economy* (1827). D. at Bath, Dec. 29, 1834.

Revised by A. T. HADLEY.

Malting: See BEER.

Malus, maă'lüs', ÉTIENNE LOUIS: military engineer; b. in Paris, July 23, 1775; studied mathematics and engineering at Mézières, and afterward at the École Polytechnique; was employed in the reconstruction of the fortifications of Antwerp and Kehl; became examiner at the École Polytechnique in 1811. D. in Paris, Feb. 23, 1812. He was the discoverer of the polarization of light by reflection, and his memoir on the subject, entitled *Sur une Propriété de la Lumière réfléchie par les Corps diaphanes*, received a prize from the Academy.

Malvaceæ: See MALLOW FAMILY.

Malvern, maw'vèrn: town; capital of Hot Spring co., Ark. (for location of county, see map of Arkansas, ref. 4–C); on the Hot Springs and the St. L., Iron Mt. and S. railways; 25 miles S. E. of Hot Springs, 40 miles S. W. of Little Rock. It is in a cotton, grain, and fruit growing region, and has two weekly newspapers. Pop. (1890) 1,520; (1900) 1,582.

Malvern: town; Mills co., Ia. (for location of county, see map of Iowa, ref. 7–D); on the Burlington Route, the Omaha and St. L., and the Tabor and N. railways; 28 miles S. E. of Council Bluffs. It is in an agricultural region, producing abundantly corn and other cereals, vegetables, etc., and having large live-stock interests. There are 5 churches, high school, commercial college, water-works, electric lights, 3 banks, and 2 periodicals, and a large cold storage-house, elevators, creamery, and brick and tile works. Pop. (1880) 748; (1890) 1,003; (1900) 1,166. EDITOR OF "LEADER."

Malvern, Great: town; in Worcestershire, England; on the eastern side of the Malvern Hills; 9 miles S. W. of Worcester (see map of England, ref. 10–G); celebrated as a watering-place. It has an interesting church in Gothic style. Pop. (1891) 6,107.

Malvern Hill, Battle of: an engagement which occurred during the civil war in the U. S. Malvern Hill, Va., the scene of the last of the "Seven Days' fight" (July 1, 1862), lies near the James river, about 15 miles S. E. of Richmond. It rises by easy slopes on the N., E., and S. from the low ground of Western Run and Turkey Island creek, but on the W. it falls away by a steep bluff to the meadow-land of a ravine and creek running directly to the James river, through which ravine a properly directed fire from the Union gunboats could flank the western face of the hill. In McClellan's enforced change of base from the Pamunkey to the James his army occupied this position on June 30, repulsing at about 4 P. M. an attack by a part of Holmes's division in a sharp action known as the fight of Turkey Bridge or Malvern Cliff. On the morning of July 1 McClellan was in position and ready to meet the Confederates' attack. He was particularly strong in artillery, having some sixty field and ten siege guns sweeping the ground over which the Confederates must advance. The gunboats assisted with their fire during the action. About 10 A. M. the Confederate skirmishers and artillery began to feel the Union line, and from 1 to 4 P. M. desultory attacks were made, which were repulsed principally by the artillery. At about 5.30 P. M. the main attack was made upon the Union left and center under Morrell and Couch, and was pushed with great vigor, but the magnificent work of the artillery, seconded by the infantry fire which was largely reserved for short range, repulsed all attacks and drove back the Confederates with great slaughter, the Confederate losses being admitted as more than double those of the Union troops. The action ceased at 9 P. M., and the Union troops were immediately put in motion for Harrison's Landing, which they reached during the day (July 2), and took up their position supported by the gunboats and with their communications restored. See *Battles and Leaders of the Civil War*, and *History of the Civil War in America*, by the Comte de Paris.

JAMES MERCUR.

Mamar'oneck: town; Westchester co., N. Y. (for location of county, see map of New York, ref. 8–J); on Long Island Sound, and the N. Y., N. H. and Hart. Railroad; 22 miles N. E. of New York city. It is an attractive place for summer residence, contains the residences of many New York business men, and has 4 churches, 2 union schools, a State bank, a savings-bank, and 2 weekly newspapers. Pop. (1880) 1,863; (1890) 2,385; (1900) 4,722.

Mameli, GOFFREDO: patriot and poet: b. in Genoa in 1826. The son of a Sardinian naval officer, he studied at the university at Genoa, but early turned to poetry and patriotism. In 1843 he wrote four acts of a tragedy on a theme connected with Genoese history. In 1846 he fired his countrymen by his powerful song *L'Alba*, and on Sept. 8 of the same year, when Genoa was doing honor to Pope Pius IX., he produced his patriotic hymn, upon which his fame chiefly rests, beginning

Fratelli d'Italia,
L'Italia s'è desta.

After this he began to be compared with Tyrtæus and Körner. In 1848 he fought as a volunteer against Austria. In 1849 he went to Rome as one of Garibaldi's volunteers, and became aide-de-camp to the great patriot, dying in that city, July 6, 1849, of a wound received a month before in a desperate sortie upon the French besiegers. The best edition of his poems is that of Tortona, 1859; but that issued at Genoa, with an introduction by Mazzini, should be consulted. A. R. MARSH.

Mameluco [= Span. See MAMELUKES]: a Portuguese word, originally the same as the English Mameluke; applied in Brazil to the offspring of a Negro and an Indian. In the seventeenth and eighteenth centuries the Jesuits of Paraguay gave this name in an especial manner to the slave-hunters of São Paulo who raided their missions, and who were generally of mixed race. The so-called Republic of the Mamelucos, described by Jesuit authors, never had any real existence. H. H. S.

Mam'elukes [Fr. *mamelouk*: Span. *mameluco*, from Arab. *mamlūk*, slave (captive or purchased); liter., possessed, owned; perf. partic. of *malaka*, possess]: a former class of slaves in Egypt who became and long remained the dominant people of that country. Early in the thirteenth century the Sultan of Egypt bought of Genghis Khan 12,000 slaves, mostly Tartars and Turks. In 1242 Malek-el-Saleh made some of them his body-guard. In 1250 this body-guard killed his successor, Turan Shah, seized Egypt, and chose for their sovereign not a man, but the Sultana Chagereh-ed-Dorr. She married Ibeg Izzeddin, who founded the Baharite or Tartar-Mameluke dynasty, in its turn overthrown by Circassian slaves in 1382. The new Circassian-Mameluke dynasty reigned till 1517, when Egypt was subdued by Sultan Selim I. Though continuing subjects of the Ottoman empire, the Mamelukes recovered gradually their former power, but were almost destroyed by Napoleon Bonaparte at the battle of the Pyramids (1798). On the evacuation of Egypt by the French they again assumed control, but were treacherously massacred by Mehemet Ali (1811). The few survivors, escaping to New Dongola, were practically exterminated in 1820. The Mamelukes were famous for their courage and skill in horsemanship. Their wives, who were of the same stock as themselves and who were usually obtained by purchase, were almost always childless in the untoward climate of Egypt. Their few children were generally feeble and short lived; hence they kept up their numbers by buying slaves, to whom their property descended instead of from father to son. E. A. GROSVENOR.

Mamiani, maä-meĕ-aa'neĕ, TERENZIO, Count: philosophical writer and educationist; b. at Pesaro, Italy, in 1800; was educated in Rome by the Jesuits, and became in 1831 a member of the revolutionary provisional government of Bologna. Being afterward proscribed, he was captured by an Austrian vessel in the waters of Ancona, was conducted to Venice, where he was kept a prisoner four months, and then allowed to retire to France. He remained in Paris, devoting himself to philosophical and literary studies until 1847. In 1848 Pius IX. named him Minister of the Interior, and after the death of Pelegrino Rossi he assumed temporarily the duties of Minister of Foreign Affairs. Having been elected deputy to the Roman constituent assembly, Mamiani voted against the republic. On the arrival of the French he retired to Genoa, where he founded the Academia di Filosofia Italica. In 1859 he was elected deputy to Parliament, and afterward appointed senator. In 1860 he became Minister of Public Instruction, occupying at the same time the chair of Philosophy and of History in the University of Turin. Afterward he was sent as minister from Italy to Athens. He then presided in Rome over the superior council of public instruction, and edited a philosophical review. D. in Rome, May 21, 1885. His principal writings (besides a volume of poems, in which the sacred hymns are particularly noteworthy) are the following philosophical works: *Rinnovamento della Filosofia Antica Italiana* (Paris, 1834); *Dialoghi di Scienza* (Paris, 1848); *Le Confessioni di un Metafisico* (2d. ed. Florence, 1865); *Le Meditazioni Cartesiane* (Florence); *D'un nuovo Diritto Europeo* (Turin, 1859); *Psicologia di Kant* (Rome, 1877); *La Religione dell' Avvenire* (Milan, 1879); *Critica della Rivelazione* (Milan, 1880); *Questioni sociali* (Rome, 1882).

Mamma'lia: See MAMMALS.

Mammals [from Lat. *mamma'lis*, pertaining to or having breasts; deriv. of *mam'ma*, breast, pap, teat]: the highest class of the vertebrate branch of the animal kingdom, and therefore the most specialized or highest group of living creatures. The class includes all vertebrates with warm blood, a heart of four chambers, the lower jaw composed of two branches articulated directly with the skull, and the

body partly or wholly covered with hair. It thus includes man, all the hairy quadrupeds, and the various whale and porpoise like animals which possess hair only in the embryonic state and often then only on the upper lip. The habit of bringing forth the young alive is not exclusively a character of the mammals, being shared by various reptiles and fishes. On the other hand, the very lowest of the mammals, the Monotremes, lay eggs similar to those of the snakes, and the mammæ or milk glands of the female are scarcely differentiated. The characters of the mammals may be given in brief as follows:

Hair.—Hair is found in some degree on all mammals and in no other group. It is found in the embryo in whales only, and then confined to the upper lip. In the porcupines, hedgehogs, etc., the hair is stiffened into spines. In some groups, as the armadillos, the skin is hardened into a bony case sometimes suggesting the shell of a turtle.

Skeleton.—The skeleton is highly developed and perfectly ossified, its different parts more constant in the forms, numbers, and relations than in the reptiles and fishes. The vertebral column is divided into five distinct regions:

1. Cervical (neck) vertebræ, usually seven in number, rarely six or nine.

2. Dorsal (back) vertebræ, variable in number, having ribs attached.

3. Lumbar (loin) vertebræ, without ribs.

4. Sacral vertebræ, connected with bones of the pelvis, and 5. Caudal (tail) vertebræ, these varying greatly in number. In the Cetaceans and Sirenians, aquatic Mammalia, the pelvis and hinder limbs are wanting or aborted. In this case the lumbar, sacral, and caudal vertebræ are indistinguishable. The first two cervical vertebræ are always modified as the atlas and axis.

The skull is very characteristic, and may be divided into four parts: (1) cranium, (2) lower jaw, (3) auditory ossicles, (4) hyoidean apparatus. The cranium, as in other animals, is the modified anterior continuation of the vertebral column.

The skull undergoes considerable change in development from the low forms to the high ones, as well as with age. In the lower types the segmented or quasi-vertebrated character is much more evident, and is in correlation with the development of the brain, whose several parts are more nearly on a longitudinal axis. In the progress from the low to the high forms the several regions of the brain become concentrated and subordinated to the cerebrum. The skull follows, and in man the cerebral cavity forms the largest portion. In the lower forms the brain, and consequently the cerebral cavity, increases but little, if any, after birth; the subsequent growth being chiefly due to the development of ridges for muscular insertion, air-cells, and the extension of the jaw-bones. The brain also differs comparatively little in size in the members of a natural family, although the skulls may vary greatly: the differences as to the skulls between large and small animals are due chiefly to the outgrowth of bone. The skull is also modified to adapt the animal to its surroundings, and consequently in the aquatic forms, as the Cetaceans, it is excessively modified.

With the anterior ribs, at least, at their distal ends, are connected a chain of median bones or cartilages designated by the common name of *sternum*. This apparatus is very variable in its development.

(1) The cranium is most uniform in all the types at the posterior part, and deviates most at the distal and peripheral parts. The hindmost segment has an axial element (the *basioccipital*), with which, on the respective sides, are connected two lateral ones (the *exoccipital*), chiefly bearing the condyles for the articulation of the "backbone," and these are connected above by a keystone element (the *supraoccipital*): these four elements, always separately developed in early life, in some of the lower forms (e. g. marsupials) are persistent as separate bones throughout life, but in the higher forms early coalesce into a single bone, the occipital; they all bound the aperture through which the nervous system enters the skull, the "foramen magnum." On the axial line, in front of the basioccipital, also an unpaired bone, is the *basisphenoid*; with the upper sides of this are connected dilated wing-like elements, one on each side (the *alisphenoids*); with the anterior surfaces another axial element (the *presphenoid*) articulates; and with the upper margins of this and the anterior of the alisphenoid two lateral elements (the *orbitosphenoid*) are connected; finally, with the inferior surface of the previous axial bones, as well as with processes of the alisphenoids, is connected a median vertical element (the *pterygoid*); these several elements (i. e. basisphenoid, alisphenoid, presphenoid, orbitosphenoid, and pterygoid) are in various degrees combined, all being united in the higher animals, including man, in a single bone—the sphenoid: this itself, in its axial portion, finally coalesces behind with the occipital. The roof of the skull is formed, in front of the supraoccipital element, first, by two bones (the *parietal*), which are chiefly connected by their lateral margins with the alisphenoid elements, and these are followed forward by two other bones (the *frontal*), connected below with the orbitosphenoid elements; in front are the *nasal*. The foremost axial bone is the *mesethmoid*, which together with two lateral ones (the *ethmoturbinal* and *maxilloturbinal*) form the compound ethmoid. All the bones thus far enumerated, or at least the combinations, concur together and with the periotic bones (hereinafter mentioned) to form the cerebral chamber or calvarium. The olfactory chamber is in advance; its floor, and partly its sides, are constituted in front by the *intermaxillary* and *supramaxillary* bones, and behind by the *palatine*; its roof by the *nasal* and in part the *frontal* bones. Lodged between the frontal, supramaxillary, and palatine bones is one which enters into the front margin of the orbit, is in most a thin laminar bone, and, being generally provided with a canal for the lachrymal gland, is called the *lachrymal* bone. The periotic bones, already referred to, are interposed between the occipital, parietal, and sphenoid ones, and are represented, it is alleged, in the embryo by three centers of ossification: these, however, very soon unite and form a single bone (the *periotic*), which includes the labyrinth of the inner ear; the antero-internal portion of this forms the so-called "petrous" portion, and the postero-internal the "mastoid" portion. With this bone is connected, and often ankylosed (as in man), a scale-like bone called the *squamosal*, which emits from its anterior borders the zygomatic process to meet the malar or cheek bone; from the inferior portion is developed the *tympanic* bone, which forms the auditory bulla so ordinarily developed in mammals. These several elements frequently coalesce and form a compound temporal bone.

(2) The lower jaw is composed of two simple rami (*mandibles*), connected together at the symphysis, and each has a more or less convex condyle by which it articulates with a "glenoid cavity" at the base of the zygomatic process of the squamosal bone. In this simplicity of the rami and direct articulation with the skull the mammals differ widely from all other vertebrates.

A bar-like bone (*malar* or *jugal*) generally connects the zygomatic processes of the squamosal and frontal bones, but is frequently absent, as in many Insectivores, Edentates, and Cetaceans.

The limbs are formed in the same general way, although much modified by adaptation to the different functions in the different groups. There are always four limbs, except in the marine forms, in which the hinder pair are usually wanting.

The anterior limbs have each successively a long bone (*humerus*), two parallel bones (*radius* and *ulna*), a group of usually eight or nine small bones (*carpal bones*), a row of longer bones (*metacarpal*) forming in man the palm of the hand, and three rows of phalanges or finger-bones, the number and form varying much in different groups.

With the humerus is articulated the flattened shoulder-bone or scapula, and in many forms the clavicle connects the shoulder with the sternum. The clavicle present in man is wanting in many forms.

The pelvis is formed by the sacrum and two large compound bones (*innominata*), each composed of *ilium*, *ischium*, and *pubis*. The hinder limbs are formed of bones corresponding to those of the fore limb, the *femur*, the parallel tibia and *fibula*, the tarsus, metatarsus, and phalanges. An additional bone, the *patella* or knee-cap, is usually present, protecting the knee-joint.

Muscular System.—The muscles are extremely varied in the different groups. They are better differentiated than in the lower forms. Only the diaphragm is peculiar to mammals.

Nervous System.—The brain is highly developed; the cerebrum always larger than the cerebellum—much more so in the lower forms, and excessively preponderant in the higher ones (especially in man). While in the lower forms it leaves exposed the entire cerebellum, as well as the optic lobes and the olfactory ones, its increasing volume in the higher forms overlaps those parts, until finally in man all are covered from view from above. The hemispheres of the cerebrum are connected (1) by an *anterior commissure*, and

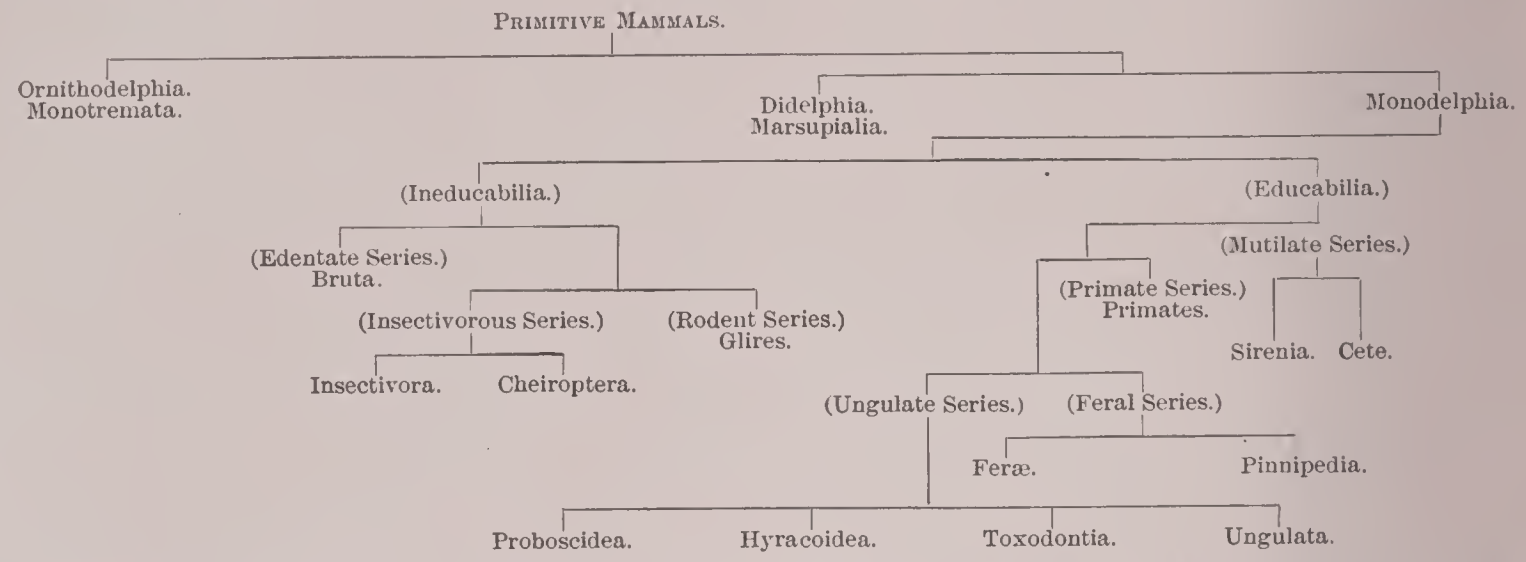
(2) by a great superior commissure, the *corpus callosum*; these are developed in inverse proportion, in the lower forms the anterior commissure being very large, while the corpus callosum is very small; in the higher forms the corpus callosum is greatly developed, while the anterior commissure is extremely reduced. The cerebral hemisphere in the smaller and inferior forms are nearly smooth, while in the larger and more highly organized ones they are deeply convoluted. The most characteristic feature in the brain of mammals is the development of the corpus callosum.

Dental System.—The teeth of mammals are usually well developed and well distinguished. In the whalebone whales, ant-eaters, and some related forms, they are wholly wanting. The narwhal has but one tooth, while some porpoises have 200. Usually the teeth are divisible into incisors, canines, and molars, and they are usually implanted by roots in the jaws.

Alimentary System.—The alimentary canal and its appendages exhibit great variations, but offer nothing especially distinctive of the group.

mæ vary greatly; they are without teats in the Monotremes, but have them in the marsupials and ordinary mammals. They are almost always on the inferior surface of the trunk, and either abdominal, inguinal, or on the breast.

Evolution and Genetic Relations.—The class of mammals is so decidedly differentiated from all others, and its early history is so fragmentary, that the exact line of descent of its members is not apparent. It is, however, most probable that the original progenitors of the class were modified from the Dinosaurian reptiles, or near allies of those animals, and that they culminated into the present types at a comparatively early epoch, the earliest known forms—those found in the Liassic formation—being quite specialized. Unquestionably, the Monotremes are the most reptile-like; the marsupials and the placental mammals are successively divergent and specialized from the primitive type. The successive differentiation and development of the various orders of the class may be exhibited in a diagrammatic form or genealogical tree. In this the more generalized forms, or quasi-eldest, are represented in each case by the left branch or fork:



Circulatory System.—The blood has its red blood-corpuscles non-nucleated. The circulation is complete and closed, the stream being received and transmitted by the right half of the quadrilocular heart to the lungs for aëration, therein oxygenated and warmed, thence sent to the left side of the heart, and finally transmitted through the system. Thus, although resembling birds, mammals are distinguished from the reptiles and inferior vertebrates.

Respiratory System.—Respiration is effected in all cases by inhalation of the air direct, and consequently by means of the lungs. These are, in common with the heart, in a special thoracic cavity, separated from the abdominal cavity by the diaphragm. This diaphragm, by its alternate contraction and expansion, assists the lungs in their inhalation and expulsion of air. The windpipe or trachea bifurcates, and sends special branches to the respective lungs.

Reproductive System.—The male and female organs, although strictly homologous and in early embryonic life undistinguishable, become greatly differentiated in after life. In the female the chief organs are the ovaries, which by oviducts communicate directly with the uterus, and thereby with the vagina. In the male the testes (which are homologous with the ovaries), although in the lower types abdominal, in the higher descend into external "serotal" pouches, and the penis is almost always external. The eggs are in the lowest type of considerable size, but in the others extremely small. Impregnation is always effected internally. The fœtus in the lower type is not long carried in the mother's womb, but is born in a comparatively immature state, and attached to the teats by the mother; in the higher type it is nourished by means of a peculiar outgrowth in connection with the embryo and wall of the uterus (the *placenta*) in the womb, and when born is of considerable size and quite mature in development.

The development of the uterus and its relations to the vagina, as well as the development of the vagina and its connections, exhibit several modifications in the various groups which are coincident with other phases of progress, and indicate successive stages of differentiation.

For the nourishment of the new-born young a peculiar provision is made in the development of certain glands (*mammary*), which in the female are highly specialized and secrete the milk. The position and number of these mam-

Geographical Distribution.—Mammals exist in almost every region of the globe, but were wanting, previous to their introduction by man, in the Polynesian islands, as well as in New Zealand. Monotremes are peculiar to Australasia. Marsupials are now confined to Australasia and outlying islands and America; in the former numerous types being represented, and in the latter but one—the opossums. Insectivores are wanting in the regions where marsupials abound, but are well represented in the entire northern hemisphere, as well as in Asia and Africa. Primates are represented especially in the tropical regions of Africa, Asia, and America, but in very different forms, the lowest type (Lemuroids) being now peculiar to the Old World, and best developed in Madagascar; and in Africa and Asia the highest type (catarrhine monkeys and apes) is also existent, while in America all the species are of an inferior type of monkeys —the platyrrhine group. The Edentates are represented only in warm countries, and have most members in America (the sloths, ant-eaters, armadillos, and pichiegos). The carnivorous mammals are quite widely distributed, extending almost between the extremes of the northern and southern hemispheres, and under the same generic forms on at least the continental areas of both the Old World and the New, Australia alone having no representatives except of a single species of dog (*Canis dingo*). The *Felidæ* (cat) and *Canidæ* (dog) families are especially thus distributed. The others are more limited, or have a greater number of genera restricted to limited countries. The ungulates are in recent times much restricted; the *Equidæ* (horses) and *Rhinocerotidæ* (rhinoceroses) being peculiar to the warmer regions of the Old World, although horses have become feral and greatly increased in numbers on the plains of South America. The proboscidians (elephants) are now restricted to the Old World; one generic form (*Loxodonta*) being represented in Africa, and another (*Elephas*) in Asia. Bats, fitted by their organization for extensive migrations, are found nearly everywhere; but many generic types, notwithstanding their apparent equal capability of extension, are quite confined in their range. The Cetaceans are abundantly represented in the polar regions by peculiar genera and species, but are also rich in types common to the entire tropical zone, and have also several peculiar fresh-water types in the tropics. About 2,500 species of Mammals are now recognized.

Geological Range.—For a long time it was believed that no representatives of Mammalia existed previous to the Tertiary epoch. The evidence, however, is now conclusive of their existence in the Mesozoic, both in the Triassic and Oölitic periods, although only fragments, chiefly of lower jaws, have been found. These remains have been mostly attributed to the order of Marsupials. In the Tertiary epoch numerous remarkable extinct types, representing even orders without living members, were in evidence, and have furnished clews for the appreciation of the genetic relations of the several groups of the class. Those of the U. S. have been chiefly studied by Leidy, Cope, Marsh, Osborne, and Scott. See PALEONTOLOGY and VERTEBRATES, FOSSIL.

Classification.—Prof. Huxley has divided the mammals into the following primary groups: (1) Sub-class Ornithodelphia, with the order *Monotremata*; (2) sub-class Didelphia, with the order *Marsupialia*; and (3) sub-class Monodelphia. The Monodelphia are first discriminated into (*a*) those with median incisor teeth developed (Edentata), and (*b*) those with median incisor teeth developed, and the latter into (1) *Non-deciduata*, including the orders *Unyulata*, *Toxodontia*, *Sirenia*, and *Cetacea*; and (2*a*) *Deciduata with a zonary placenta* (Hyracoidea, Proboscidea, and Carnivora), and (2*b*) *Deciduata with a discoidal placenta* (Rodentia, Insectivora, Cheiroptera, and Primates). Most modern writers have followed substantially this arrangement, although in some cases older names have been recognized for some of the orders.

THEODORE GILL.

Revised and abridged by D. S. JORDAN.

BIBLIOGRAPHY.—The best general work on mammals is *An Introduction to the Study of Mammals, Living and Extinct*, by Sir W. H. Flower and R. Lydekker (London, 1890). The various catalogues and hand lists of different groups, published by the British Museum, are useful for the identification of species and references to literature on the subject. Those issued most recently are much the best, the earlier catalogues being often unreliable and inaccurate.

Many descriptions of new or rare species, and lists of the mammals of particular localities, are to be found in the *Proceedings* of the Zoölogical Society of London, and in different American periodicals.

For the distribution of mammals, see Murray, *The Geographical Distribution of Mammals* (London, 1866); Wallace, *The Geographical Distribution of Animals* (London, 1876); and Allen, *The Geographical Distribution of the Mammalia*, Bulletin of the U. S. Geol. Survey, iv., 1878. For the embryology, Balfour, *A Treatise on Comparative Embryology* (London, 1880–81).

The *Ostéographie des Mammifères, Récents et Fossiles*, H. M. Ducrotay de Blainville (Paris, 1839–64), is an exhaustive treatise on the subject. Smaller but valuable works are *A Manual of the Anatomy of the Vertebrated Animals*, Huxley (London, 1872); *Anatomy and Physiology of Vertebrates*, Owen (London, 1866–68); *Lessons in Elementary Anatomy*, Mivart (London, 1873); and *An Introduction to the Osteology of the Mammalia*, Flower (London, 1885).

For the classification of mammals, Gill's *Arrangement of the Families of Mammals* (1872), is important.

The only general works on North American mammals are *The Quadrupeds of North America*, Audubon and Bachman (3 vols., New York, 1846–54), and *The Mammals of North America*, Baird (Philadelphia, 1859), both much out of date. The greater number of new species are described in *North American Fauna*, a periodical bulletin of the Dept. of Agriculture, the bulletins of the Am. Mns. Nat. Hist., New York, *Proceedings* U. S. Nat. Mus., Washington, and *Proceedings* of the Biological Society of Washington, D. C.

For particular groups, see Coues's *Fur-bearing Animals* (*Mustelidæ*) (Washington, 1877); Allen, *Monograph of North American Pinnipedes* (Washington, 1880); Coues and Allen, *Monographs of North American Rodentia* (Washington, 1877); and Scammon, *Marine Mammals of the Northwest Coast of North America* (San Francisco, 1874). Besides these should be mentioned the monographs of True on the Cetacea and H. S. Allen on the Cheiroptera. The chief recent authorities in the U. S. are Allen, Coues, and Merriam.

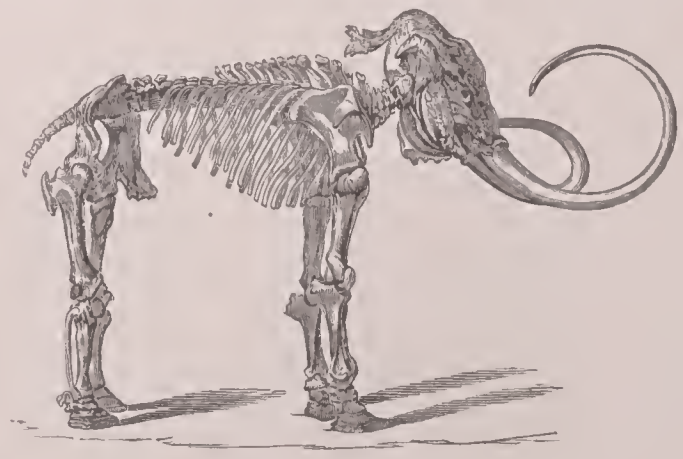
D. S. JORDAN.

Mammary Glands [*mammary* is from Lat. *mamma*, breast, pap]: the organs which produce milk; one of the most characteristic and distinctive marks of the mammalian class of vertebrates. No animal except the mammals produces milk, or has anything approaching the character of a mammary gland. Ordinarily the mammary glands of the male are undeveloped. The male of the human race has been known to secrete milk and actually nurse a child, and during a few days after birth the breasts of both sexes secrete a small quantity of liquid resembling milk. The mammary gland is of various structure in different animals. In the Ornithorhynchus it is a collection of simple cæcal follicles, opening on the surface, without a nipple; and the mother appears to possess the power of extruding the milk into the mouth of the young animal. The Cetaceans have very simple mammary glands, and the teat is inclosed in a slit. The marsupial mammals attach their young, in an exceedingly embryonic state, to the nipple, and the gland is provided with a muscular apparatus by which the mother feeds the feeble young creature at will, expressing the milk, which flows into the stomach of her offspring. In the higher animals the young are fed by suction. The mother does not feed her suckling, though her *consensus* is apparently needful to the free secretion of milk. Thus it is well known that if cows are beaten or irritated before milking, the flow of milk is small. The mammary glands are always in pairs, and placed symmetrically on either side of the mesial line and on the ventral aspect of the body, but in number and in position they vary greatly in the various species. Some animals, like the cow, have often a pair or two of abortive or undeveloped nipples, besides those which yield milk. In the human species the mammæ consist of lobes and lobules of gland-tissue, with interlobular fibrous and fatty substance. The lobules consist ultimately of little groups of vesicles which open into minute ducts; the ducts converge into larger ducts, which at the base of the nipple open into *ampullæ* or reservoirs of milk. The nipple is slightly erectile, and in the human species has several orifices for the discharge of milk. The milk-ducts are lined with pavement epithelium. Occasionally accessory rudimentary mammary glands are observed on the chest, abdomen, shoulders, or elsewhere. The gland itself is subject to many inflammatory, malignant, cystic, and other diseases. Of these, one of the most frequent is acute inflammation, an extremely painful affection occurring almost always during lactation. Hot stimulating lotions and the careful drawing of the milk are very useful. The gland should be suspended in a bandage. If it be not desirable to prolong the lactation, a solution of atropia should be applied, which often arrests lactation, and thus alleviates the disease remarkably; but if this be applied, the infant should not be fed from the breast, unless after the poisonous atropia has been carefully removed from the surface by washing. The breast is one of the common seats of cancer in the female. This disease is readily recognized by its appearance, the pain it occasions, and by the deterioration of the woman's health. Prompt removal may prolong life, but does not often prevent spread of the disease or recurrence *in loco*.

Revised by WILLIAM PEPPER.

Mammee' Apple [*mammee* is from Haitian *mamey*]: the fruit of trees of the order *Guttiferæ* (*Mammea americana* and *M. africana*), growing respectively in South America and the West Indies and in Africa. The fruit of the American species is very agreeable to the taste. The tree is very valuable for its timber.

Mammoth [from Russ. *ma'mont*, *ma'mantŭ*; cf. Tartar *mamma*, earth, the mammoth being believed by some Tartar tribes to have been a burrowing animal]: an extinct species (*Elephas primigenius*) of elephant, about twice the weight of the living species, formerly abundant in the higher latitudes of both the Old and New Worlds. Their remains are abundant in Siberia and Alaska, where their tusks are gath-



Skeleton of mammoth.

ered as an article of export. The mammoth was closely related to the existing Indian elephant, and some authors have considered them identical. It differs, however, in many respects, and one of the most important of these differences is found in the molar or grinding teeth. These teeth are broader than those of *E. indicus*, and have narrower, more numerous, and close-set transverse plates and ridges. They exemplify the extreme type of the peculiar elephantine dentition. The tusks are long and much curved, in some cases forming a complete circle, but being directed outward they clear the head, and the points are directed outward, downward, and backward. Two principal sizes of tusks are found —the larger averaging 9½, the smaller 5½, feet in length. They seem to have belonged to males and females respectively. Tusks have, however, been found over 12 feet in length. This animal is better known than any other species extinct before the historic period, as its remains have been perfectly preserved in the ice and frozen soil of the Arctic regions. A fine specimen was discovered at the close of the eighteenth century, in a cliff at the mouth of the river Lena. The flesh was so well preserved that dogs and wild animals fed upon it. The skin was thick, and covered with a reddish wool and long black hairs. This skeleton is now preserved at St. Petersburg, and measures 16 ft. 4 in. from the fore part of the skull to the end of the tail, which is imperfect. Parts of the skin of the head, the strong ligament of the nape, which principally sustained the head, and the hoofs remain upon the skeleton. The hairy covering enabled the mammoth to endure a much colder climate than that to which the existing elephants are confined. Its food consisted of the leaves and branches of northern pines, willows, birches, and other hardy trees, such as may now be found along the isothermal of 40° Fahr., which in that age may have run as high as Northern Siberia, where these animals then lived in large herds. They roamed also over Europe, where they were contemporary with at least two kinds of two-horned rhinoceroses, a hippopotamus, gigantic deer, three kinds of wild oxen (two of which were of large size, and one shaggy and maned), a tiger as large as that of Bengal, and another fierce carnivore of equal size, the *Machærodus*, together with troops of hyænas, and a savage bear larger than the grizzly of the Rocky Mountains. During the Palæolithic and Reindeer eras they were contemporary with men, who have left rude delineations of this animal engraved on the ivory of its own tusks. Much confusion has existed among naturalists in regard to the species of mammoth. Cuvier referred to the single species, *E. primigenius*, teeth from Europe, Northern Asia, and all North America, from strata as early as the Lower Pliocene, and as late as the frozen drift and ice-cliffs of Siberia. De Blainville included the existing Indian elephant in the species, thus giving it a range both in time and space unequaled by any known mammal in a state of nature. Later naturalists have more carefully discriminated the species, and restricted its range to Europe, Northern Asia, and Northwestern North America above the parallel of 40°, and in time to the Quaternary age. The mammoth of the warmer parts of North America is regarded as a different species, *E. americanus*, and is comparatively little known, as the remains hitherto found have consisted principally of teeth. These have often been found associated with more numerous and better preserved remains of the mastodon. From the Tertiary of Europe and Asia, Dr. Falconer enumerates ten species of the genus *Elephas*, which he divides into three sub-genera—*Euelephas*, *Loxodon*, and *Stegodon*. No remains of elephants have yet been found below strata referred to the Miocene.

O. C. Marsh.

Mammoth Cave: believed to be the largest known cavern in the world; near Green river, Central Kentucky. The Carboniferous limestone, which covers a large area in Kentucky and adjacent States, abounds in caverns, whose underground passages must measure many thousands of miles in length. Mammoth Cave was discovered in 1809, and for a time it was used chiefly to obtain niter for the manufacture of gunpowder, especially during the war of 1812, the niter being found in deposits on the floor of the cave, chiefly near the entrance, and owing its origin to the accumulation of animal remains, especially of bats. In later years the cave became a resort for travelers, and it is now a valuable property on this account. It has never been carefully surveyed, but its passages aggregate many miles in length. Its larger chambers are beautifully ornamented with stalactites and stalagmites. One chamber, called the Great City, is said to cover a space of 2 acres. Some of the passages are occupied by streams or pools. The cave air is dry, and almost constant in temperature, seldom varying more than 2 from 53° F. In summer time the relatively cool air flows out from the entrance, and external air is drawn down through sink-holes in the roof; in winter the cold external air flows in at the main entrance. The animals living in the cave are a few species of fish, two species of crayfish, and several insects, as well as the bats that divide their time between the cave and the outer air. Some species of the cave animals are white and blind; others have color and well-developed eyes. The former are thought to have occupied the cave for long ages, gradually adapting themselves to its darkness; the others are supposed to have been introduced later. W. M. Davis.

Mams: See Indians of Central America.

Mamun, Al (Abul Abbas Abdallah), or **Abdallah III.**: seventh caliph of the Abasside dynasty; b. at Bagdad in 786; a son of Haroun-al-Raschid: governor of Khorassan in 800; ascended the throne in 813, after the deposition and death of his elder brother, Mohammed II. el Emin. He was a mild and merciful prince, tolerant of other religions than his own, but weak, irresolute, and unable to hold his empire together. Several provinces declared themselves independent, and even over Syria and Egypt he exercised only nominal authority. He was, however, distinguished as a patron of literature and science. He himself wrote several books, and, like his father, made Bagdad the center of learning. He had the masterpieces of the Greeks translated into Arabic, and the first translation of Euclid ever made was dedicated to him. When in Egypt he is said to have become excited over the tales of immense treasures concealed in the Great Pyramid, and to have set many workmen at finding an entrance. After prodigious labor they effected a forced passage, whereby he was enabled to make his way into what has since been called "the king's chamber," there to behold only the solitary sarcophagus of Cheops. By the forced passage then made visitors now penetrate to the interior of the pyramid. He died in 834, near Tarsus, while marching against the Byzantine emperor Theophilus.

E. A. Grosvenor.

Man: collectively, the whole human species. The scientific study of man is sometimes called anthropology, although this word has other meanings, and by French writers is limited to the study of the physical structure of man. (See Anthropology.) By whatever term designated, the study of man should be regarded as a branch of natural science, to be pursued under the guidance of accurate observation and experimental research, embracing all his nature and all the manifestations of his activity, in the past as well as in the present, the whole co-ordinated in accordance with the inductive methods of the other natural sciences. It includes, therefore, history and archæology, as well as the examination of the living representatives of the species; as ethnography, it must define the physical and mental characteristics of races and peoples; and as ethnology and sociology it must trace the intellectual or psychical development of the various subdivisions of the species.

Zoölogical Position of Man.—In the realm of organic life man is classed as a vertebrate animal, belonging to the division of the Mammalia and the order of Primates. In this order he belongs to the highest family, that of the Hominidæ (Broca, Huxley), in which he is the sole species and genus, under the title *Homo sapiens*, man the intelligent. The two anatomical characteristics which beyond all others distinguish him from the other members of the order of primates are—1, his erect position, which enables him to walk upon his lower members only, leaving the higher, the arms and hands, free for other uses; and 2, the remarkable development of his brain, which confers upon him the intellectual superiority which has finally made him the master of the world. Besides these leading differences, there are many others less prominent or less constant. Among them are the nearly equal size of his teeth, all other Primates having a tendency to the elongation of the canine teeth; the greater length of the lower limbs as compared with the upper, the reverse being the case with apes and monkeys; a different anatomical arrangement of the structure of the foot, by which man walks on its sole, while anthropoids turn it slightly on the side; the position of the thumb on the hand in opposition to the fingers, while in the anthropoids it is more on a line with them, and is less flexible; and other minor points. It must be added that no one of these traits is of such a character as to separate man any

more widely from other families of the Primates than these in turn are separated among themselves. Even erect stature is not a characteristic either in infancy or in old age.

Date of Man's First Appearance on the Earth.—Before the sciences of geology and prehistoric archæology had been developed there were no data by which the date of man's first appearance on the earth could be even guessed at. The ancient Egyptians placed it about 25,000 years before the time of the Greek historian Herodotus, while illiterate tribes imagined it occurred but a few generations back. In Christian communities the chronology of the Old Testament was very differently computed, in Great Britain the estimate of Archbishop Ussher, that the creation of man took place 4004 B. C., being generally received. It is now acknowledged by every one that this is entirely inadequate, as there are still standing temples in Egypt whose foundations were laid much earlier than that. We must turn to geological measures of time in the discussion of the question. Of the two latest great periods, the Tertiary and Quaternary (see GEOLOGY), man appears to have existed only in the latter. The evidences of his presence in the Pliocene (or latest Tertiary), which have been alleged from time to time, have not borne examination. In the Quaternary the inquiry arises, Did he appear before, during, or after the remarkable lowering of temperature which took place about the middle of it, known as the Glacial Epoch or the Great Ice Age? The evidence is almost conclusive that he lived in Western Europe certainly, and in America perhaps, before this astonishing change occurred. His rude stone implements have been found in the river gravels of England, France, and Spain, associated in original deposition with the bones of tropical animals, such as the hippopotamus, the African elephant, and the hyæna. These belonged to the preglacial fauna of those localities. From that geological period onward the remains of human handiwork are constantly exhumed from many deposits; but when geologists are asked to assign in years the antiquity of the oldest strata containing such remains their estimates vary greatly. Some place them as far back as 250,000 years (Mortillet), while others are not willing to assign them a greater age than the tenth of this amount, or even less (Upham, Nadaillac). Omitting these extremes and following the average estimates of several careful observers, we may assume 30,000 years as the minimum time requisite to effect all the geologic and physical changes which have taken place since the deposition of the earliest discovered remains of man's industry.

Unity or Plurality of Origin.—While it is generally conceded that man is, zoölogically, of one species, it by no means follows from this that this species had but one origin; that all its members are descended from one original pair. Upon this question there has been and still is a wide diversity of opinion. Those defending the view that there was but one ancestral pair are known as monogenists, while those teaching a plurality of origins are called polygenists. To the latter school belonged the elder Agassiz, who assumed eight or nine centers of appearance for the human race; Dr. S. G. Morton, who thought he could point out twenty-two centers; Nott and Gliddon, who even taught a specific diversity of races, followed Agassiz; and in recent years the French school of polygenists have been ably represented by Topinard, Hovelacque, and Hervé, as well as many other writers. The arguments advanced in support of their views turn on the differences of the varieties of men, the difficulties in supposing wide migrations in the early history of the race, the less viability of the mixed population, and the analogy of lower forms which are believed to have developed the same specific traits in unconnected localities. A careful examination of these arguments does not strengthen them. All must acknowledge that the differences between the varieties of the human species are vastly less than between man and the highest anthropoid, and those who believe that he developed from such an ancestor need not hesitate to believe that his descendants could diverge to the extent now visible in the species. There is no good ground for asserting the less viability of mixed races when these arise under favorable hygienic conditions, and the theory of dispersion from one center becomes easy enough when sufficient time is allowed. Finally, the theory of a single origin is the simpler, and it is the rule in scientific reasoning always to adopt the simpler hypothesis when it explains the facts. From these considerations the majority of anthropologists, both in Europe and America, are inclined to favor the opinion that the human species arose in some one locality, and spread thence over the face of the earth, following in this the position of Darwin, who wrote: "All the races of man agree in so many unimportant details of structure, and in so many mental peculiarities, that they can be accounted for only through inheritance from a common progenitor."

Birthplace of the Human Species.—It is not an idle question, and it is one not beyond reply, to inquire where on the globe man first came into being. Through a process of exclusion we can define it with a certain amount of precision. The oldest known relics of the race, the physical geography of the earth and its geologic history, are the guides in this investigation. Wherever man first appeared, it must have been where other of the highest Primates also lived, as he must be regarded as the last and highest development of organic nature. This consideration at once excludes the American continent, Australia, and many other localities in which no high apes, those which are tailless and have thirty-two teeth, have been discovered either living or fossil. None of the oldest remains of man have been exhumed in the high northern latitudes of Europe, Asia, or America, nor in the islands of the oceans. In the early Quaternary, at the period man probably first appeared, Central and Southern Africa and Central and Southern India were large islands, cut off from the main body of the eastern hemisphere by broad seas (Suess, Huxley). These and allied considerations, which there is not space to recapitulate, lead almost certainly to the conclusion that the birthplace of man was somewhere on the southern slope of the vast mountain chain which extends in an almost unbroken line from the northern coast of Spain eastward to the Himalayas, and from our present knowledge the western rather than the eastern extremity of this chain is that which offers the higher probability of having been the cradle of the species. There is much more to be said for that locality than for some sunken continent (the Atlantis or Haeckel's Lemuria) as the scene of man's first activity.

Theories of the Origin of Man.—The belief formerly entertained was that man and the other species of animals were the results of acts of special creation by the Divine Will acting upon inanimate matter. When the laws of change in organic forms came to be more closely studied it became evident that such a view is consistent neither with the highest conception of divinity nor with observed facts. A universe requiring such constant interferences would be inferior to one acting under grand and eternal laws, just as any machine is less perfect the more frequently it requires the attention of its designer. In some form, therefore, the theory of the evolution or transformation of one organic form into another is alone that which at once satisfies the reason and elevates religious thought. This marvelous process goes on, however, under such strange and obscure laws that it is still far from being understood. Darwin thought that he had discovered in sexual selection, the survival of the fittest, and the transmission of accidental and acquired qualities, the main factors of change; but his explanations have been greatly weakened and modified by later observers. Especially with reference to man it has been found impossible to secure proof that he came into existence, as Darwin taught, by a series of slow and gradual modifications from some extinct form "of a hairy quadruped furnished with a tail and pointed ears, arboreal in its habits." No "connecting links" between these widely diverse forms have been exhumed in spite of the most prolonged and painstaking search. Other theories of evolution, supported by abundant observations, offer less difficult solutions of the enigma. Rapid acceleration in the evolutionary process has been observed in some organic forms under novel stimuli (Hyatt, Cope); and that form of evolution known as *per saltum*, or "with a bound," has been abundantly illustrated by competent observers (Meehan, Mivart, Ferris). New forms arise by what seems to be the action of chance, but undoubtedly in obedience to laws unknown to us, and these forms are perpetuated and improved by favoring circumstances. As we know that the highest qualities of humanity—beauty, strength, and genius—occasionally appear in the individual when there is no trace of them in his ancestry, so the sudden development of allied traits in the original pair may have gifted them and their children with the superiority requisite to endow the species Man with the powers which are his own. This is by some called the doctrine of *heterogenesis.*

Traits of Primeval Man.—No skeletons have yet been discovered which could with any certainty be attributed to the man of the drift; but in the caves of France and Bel-

gium there have been found at least five more or less complete which, from the nature of their surroundings, must have been those of the ancient Palæolithic inhabitants. They have been carefully studied and brought into comparison with some of the oldest human remains from the tombs of Egypt and the valley of the Euphrates (Virchow, Rohan). The result is that neither in stature, cranial capacity, muscular development (as judged by the marks of the insertions of muscles and the volume of the bones), nor in any other osteological criterion, did these earliest members of the species differ more from those now living than do these among themselves in their different varieties. The many thousands of years which have elapsed, and the extensive changes in the conditions of life, have exerted no marked and permanent effect on the osseous system, and therefore, we may reasonably infer, none on the soft parts. All adaptations have been strictly within the limits of specific variation; and we have no grounds for assigning to these earliest known men an inferior brain or a lower intelligence than is seen among various savage tribes still in existence. The tools and weapons they manufactured were equal and often notably superior to those of the Tasmanians or Fuegians of the nineteenth century; and the etched figures on bones which they left (see CAVE-DWELLERS) prove that an artistic spirit and an appreciation of symmetry arrived very early in the history of culture. On the other hand, an examination of the most ancient relics of man's handiwork wherever found proves conclusively that he began at the foot of the ladder of culture, that his condition was one of utter savagery, and that the idea once entertained that his first state was one of high civilization, from which he subsequently fell, is utterly baseless. It is very doubtful whether he had any other language for generations than emotional cries; and it is almost certain that for a much longer time he had no religious conceptions whatever, because among his earliest remains no objects of a religious significance have been found.

The Dissemination of the Species.—Man is by nature a migratory and not a sedentary animal. His constitution more than that of any other mammal enables him to bear without injury the extremes of climate and the greatest variations in temperature. At his origin for an indefinitely long time the sources of his subsistence were exclusively hunting and fishing, and these occupations always forced him to wide wanderings in search of his food-supply. We know from the character and location of the oldest signs of his industry that his favorite home was along the shores of seas and the banks of streams. These are the natural highways of nations, and when urged by a scantiness of returns, the pressure of foes, the desire for a more genial climate, or simple restlessness, to extend his journeys, the roads lay ready-made before him. This explains why men seem already to have reached every continent before they had emerged from what is known as the Palæolithic or old Stone Age. At a later time, but still far within the prehistoric period, other motives led to a wide distribution of peoples. The lust of conquest spurred to many a distant voyage by sea or campaign by land; and the establishment of commercial relations brought very remote tribes into communication. Herodotus describes trade routes existing at and long before his time from the Straits of Gibraltar to the Euphrates valley, and in North America shells from the Pacific and obsidian from the Yellowstone Park were transported to the shores of the Delaware and the Hudson.

Causes of Variations in Man.—Those who accept the theory of monogenism, or that all men are descended from one original pair, have to explain by what natural causes the races of men have come to differ so widely in their mental and physical characteristics as we find to be the case at the present day. The problem is a complicated one, and a number of influences must be considered. First in importance is the food-supply, which must be considered both in respect to quantity and quality. Although man is by nature omnivorous, his organs are materially modified by the character of his sustenance, whether animal or vegetable, whether easily digested or the reverse, whether abounding or lacking in nitrogenous elements. Even more is his development influenced by its quantity. Insufficiency infallibly leads to degeneration and retardation or arrest of development, and this in turn to mental or physical depravity. Mainly through what he eats and drinks he becomes liable to, or is enabled to resist, the attacks of diseases; and this bears directly on his death or survival under given conditions. Climate is next in importance, as its chief factors—drought or humidity, heat or cold, cloudiness or sunlight—increase or diminish the conditions of health or disease. The pernicious effects of malaria and other so-called "endemic" diseases depend directly on climatic relations. Altitude must also be considered. Its influence on the physical traits is sometimes very conspicuous, as among the Aymaras of Peru. External causes of this nature react powerfully on the emotional and intellectual faculties and their activity. The heat of the tropics, as well as the cold of the Arctic regions, militate against the highest energy of the psychical attributes. They tend to leave man under the influence of the mighty forces of nature around him, and prevent his emancipating himself from his merely animal life. See CLIMATE.

Areas of Characterization.—The general effects of such influences as have just been described make themselves felt over definite areas of wide extent. These have been called areas of characterization (de Quatrefages), or geographical provinces (Bastian), or natural kingdoms (Wallace). They present throughout their length and breadth a prevailing similarity of fauna and flora extending in time throughout most of the Quaternary period or longer. In general terms they correspond to the great continental areas, but rather as these existed in early Quaternary times than at the present day. Europe, for instance, was connected both with Western Asia and Northern Africa. Undoubtedly man has also been profoundly influenced by the same general causes which define these zoölogical kingdoms. His separation into various sub-species, characterized by indelible differences, arose at some remote epoch, when for a long time the men of the primitive type were subjected to the contrasted conditions of these areas, and the species being in its early youth, and hence more susceptible to impressions than later, became divided into its several races as we now know them, the differences being constantly strengthened by close intermarriage.

Racial Characteristics.—We know that the characteristics of races are of great antiquity and singular permanence, for we find in the paintings on Egyptian tombs, dating three or four thousand years before the Christian era, the traits of the white and black races depicted as clearly as they exist to-day. The most prominent of these characteristics is the color of the skin. Its three chief shades are white or whitish, yellow or olive, and dark brown or black. Equally important and persistent is the character of the hair, which is either straight, wavy or curly, or frizzly and woolly—peculiarities which depend upon the shape of the single hairs, whether cylindrical or flattened, the latter giving the "kink" or twist, while the former lies straight and without curliness. Of the features the most characteristic is the nose, which is broad and flattened in some races, narrow and prominent in others. The latter are called *leptorhinic*, the former *platyrrhinic*. Much attention has been paid to the shape of the skull as an ethnic criterion, but it must be said with little positive results. The chief measure considered is the proportion which its length bears to its width. When the head is notably long it is called *dolichocephalic*, when shorter than the average, *brachycephalic*. The size and permanence of the teeth, the proportions of the upper and lower extremities, the greater or less obliquity of the pelvic bones, and the persistence of fœtal or infantile developments, have also considerable value in certain races and nations. As for stature, muscular strength, longevity, and corporeal symmetry, these can not be said to be characteristics of any special race.

Classification of the Races of Men.—The differences above referred to have been taken as the bases to divide the species Man into a number of sub-species, varieties, or races, some writers preferring one criterion, some another. The founder of scientific anthropology, Blumenbach (b. 1752), established five races, which he named the Caucasian, Mongolian, Ethiopian, Malayan, and American. This is the groundwork of many of the modern systems, but it is defective in several respects, especially in applying the term Caucasian to the white race and Ethiopian to the blacks. The naturalist Cuvier sought to simplify it by assuming only three races, the white, the yellow, and the black—a scheme still generally adopted in France, but objectionable as confounding the American with the Asiatic varieties. Huxley, Haeckel, and others have endeavored to define races by the appearance of the hair, the former distinguishing between the Australoid, Mongoloid, Negroid, and Xanthrochroic (yellow-haired) types; while the latter reduced all to two main varieties, the woolly haired, subdivided into the

33. SIOUX.
34. MEXICAN.
35. PUEBLO INDIAN.
36. BRAZILIAN.
37. AMAZONIAN.
38. PATAGONIAN.
39. HAWAIIAN.

fleece-haired and the tuft-haired, and the smooth-haired, this again subdivided into the straight and the curly haired. The Swiss anatomist Retzius maintained that the shape of the skull and the bones of the face offered the most salient traits, and upon this established four sub-species—those with narrow heads and projecting jaws; with narrow heads and straight jaws; with broad heads and projecting jaws; and with broad heads and straight jaws. Others (F. Müller, Latham) have classified the races according to the peculiarities of their languages; and others, again (Waitz, Ratzel), according to their progress in culture. It is safe to say that none of these schemes has given satisfaction, and, indeed, owing to the extensive intermixture which has taken place between races, it is impossible to frame any which does not reveal incompleteness in some directions. We are building on secure ground, however, if we take as a point of departure the great "areas of characterization" or zoölogical provinces above referred to, and derive from them the fundamental variations of the human species. Proceeding from these, we can classify the principal peoples of the earth in the following manner without notable error:

I. The Eurafrican Race.

So called from its earliest historic location in Central and Southern Europe, and in Northern Africa; portions of it also occupied Eastern Asia. Its physical traits are a white or whitish color of the skin, wavy or curly hair, and a narrow, prominent nose. Its two branches are the South Mediterranean and the North Mediterranean, which embrace the following stocks and groups or peoples:

A. South Mediterranean Branch: I. The Hamitic stock. This includes the ancient Libyans and Numidians, and their descendants, the modern Berbers, Kabyles, Tuaregs, and related tribes of the Sahara Desert and Atlas Mountains; the Gallas, Somalis, Danakils, and related tribes of East Africa between the Gulf of Aden and the Indian Ocean; and in all probability the Copts or Ancient Egyptians, represented today by the Fellaheen. II. The Semitic stock. This seems to have developed in Arabia, and includes the tribes of that peninsula, ancient and modern. Colonies from it passed into Africa, and became the Ethiopians or Geez, the Tigres, the Amharas, the Harraris, and the modern Abyssinians. All these speak Semitic dialects. Another early migration journeyed eastward, and became the ancestors of the Syrians and Arameans, the Assyrians and Babylonians, the Israelites, Samaritans, and modern Jews, as well as the Phœnicians and Hittites of the Old Testament.

B. North Mediterranean Branch: I. The Euskaric stock. The only representatives of this are the modern Basques, descended from the ancient Iberians, and speaking a language without known affinities. II. The Aryan or Indo-European stock. This includes most of the nations of Europe and the non-Semitic whites of Asia. It is now believed to have originated in Western Europe, and to have migrated easterly. Its main groups are (1) the Celtic peoples, as the Welsh, Irish, and Highland Scotch, the Manx and the Armoricans of Brittany. (2) The Italic peoples, chief of whom were the ancient Romans and their descendants. (3) The Illyric peoples, represented by the modern Albanians. (4) The Hellenic peoples, embracing the ancient and modern Greeks. (5) The Lettic peoples, who are found on the Baltic Sea as Letts and Lithuanians. (6) The Teutonic peoples, among whom were the Goths and Vandals, the Angles and Saxons, the Danes, Northmen, Franks, and Lombards. From them are descended the modern Germans, Scandinavians, Danes, Dutch, and English. (7) The Slavonic peoples, as the Russians, Poles, Bohemians, Servians, Montenegrins, Dalmatians, and Croatians of modern Europe. (8) The Indo-Eranic peoples, or Asiatic Aryans, chief among whom are the Armenians, the Persians and Parsees, the tribes of Afghanistan and Beluchistan, the Kurds and Ossetes, and the Hindus of India, with many less important members. III. The Caucasic peoples, living in and near the mountains of the Caucasus range. The Circassians, Georgians, Lesghians, Kists, and Mingrelians are the chief groups.

II. The Austafrican Race.

So called from its earliest location in Africa in its southern or austral regions. Its physical traits are a black or dark color of the skin and eyes, hair frizzly or woolly, nose flat and broad. It is divided into three branches, as follows:

I. The Negrillo Branch. Most of these are small in size, and dwell near or S. of the equator. The equatorial group is represented by the dwarfs or pygmies of the Congo basin, known as Akkas, Tikkitikkis, Obongos, Dokos, etc., while the more southern group includes the Bushmen, Hottentots, Namaquas, and Quaquas.

II. The Negro Branch. This includes the innumerable tribes and petty nations living between the Atlantic and the Nile, S. of the Sahara Desert and N. of the Congo basin, in the modern Guinea, Senegambia, and the Sudan. They present the purest types of the black race.

III. The Negroid Branch. Divided into the Nubian group, in which fall the Nubas, Barabras, Pouls, Nyamnyams, etc.; and the Bantu group, where are found the Caffirs, Zulus, Bechuanas, Suahelis, and numerous others. All of these are probably the result of an intermixture of races.

III. The Asian Race.

Located originally in Central, Eastern, and Northern Asia, with an outlying branch in Northern Europe. Its physical traits are a yellow or olive color of the skin, hair straight and black, nose medium and often depressed at the bridge. Its two main branches are the Sinitic and the Sibiric; members of the former speak monosyllabic, tonic languages; of the latter, agglutinative, polysyllabic tongues.

I. The Sinitic Branch. So named from the Latin *Sina* = China. It embraces the Chinese proper, the Tibetans, and the Indo-Chinese of Siam, Annam, Burma, and Cochin China.

II. The Sibiric Branch. So called from Siberia, the chief geographical location of its members; known also as Turanian and Ural-Altaic. It is divided into a number of groups: (1) The Tungusic peoples—the Tungus, Manchus, and Lamuts. (2) The Mongolic peoples, embracing the Mongols and Kalmuck Tatars. (3) The Tataric peoples, among whom are the Tatars (Tartars), Jakuts, Cossacks, and Turks of Europe. (4) The Finnic peoples, with whom belong the Finns, Lapps, and Magyars of Europe, and the Samoyeds of Siberia. (5) The Arctic peoples—the Chukchis, Kamtchatkans, Ghiliaks, etc., of Northern Siberia. (6) The Japanese peoples, represented by the modern Japanese of mixed descent.

IV. The American Race.

Usually, though erroneously, called American Indians. Their physical traits are a coppery or reddish color, hair generally straight and dark, with a reddish undertone, nose medium or narrow. The racial peculiarities are strikingly alike throughout the continent, so that the subdivisions are mainly geographical. Among the more important tribes in the extreme north are the Eskimos and their connections, the Aleutians, the Kolosch on the Pacific coast, and the Tinneh or Athabascans, who roam over Northern British America. S. of them, at the time of the discovery, dwelt the Iroquois and Algonkins. Around the shore of the Gulf of Mexico were the Creeks or Muskokees, the Choctaws, the Timucuas in Florida, the Nahuas about Vera Cruz, the Totonacos adjoining them, the Mayas in Yucatan, and numerous smaller tribes. The three last named were semi-civilized, as were also the Tarascos and Zapotecs of Mexico, the Mangues of Nicaragua, and the Huetares of Costa Rica.

In South America the most widely extended families were the Caribs, Arawacks, and Tupis, who possessed most of the soil of Brazil and extended over the West Indian Archipelago. The Botocudos continue to survive in a state of extreme savagery in Central Brazil. On the plateau of Colombia the Muyscas or Chibchas had developed a moderately high culture, especially in fine gold-work. S. of them, the kingdom of the Incas or Kechuas controlled the coast between the Andes and the sea for a distance of 1,500 miles, and erected architectural monuments which still excite the surprise and admiration of travelers. The tribes of the Gran Chaco in the Argentine Republic were in a low stage of development, like those of Patagonia and Tierra del Fuego. The Araucanians of Chili were not much higher, but became celebrated for their stubborn resistance to the Spanish and their unquenchable love of liberty.

V. Insular and Littoral Peoples.

These can scarcely be said to constitute a race by themselves, but rather the fragments of various races, much intermingled in blood. As a rule, they are dark in color, the hair wavy or frizzly, the nose medium or narrow. They may be classed as the Nigritic, Malayic, and Australic branches.

I. The Nigritic Branch. This is represented by the true Negritos, a small dark people, found in many of the tropical islands S. of Asia. They are known as Mincopies, Aetas,

Mantras, Semangs, etc. Resembling them in many respects are the black Papuans of New Guinea and the adjacent isles, and from some cross arose probably the less Negroid inhabitants of the Melanesian Archipelago, the Feejee islands, etc.

II. The Malayic Branch. This includes the Malays proper, the Battaks and Dayaks of Borneo, the Tagals of the Philippines, the Javanese, the Hovas of Madagascar, etc., and there is little doubt that with these should be grouped the Maoris of New Zealand and the Polynesians, quite to the Sandwich and Easter islands.

III. The Australic Branch. The Australians constitute the typical members of this branch. The Tasmanians probably were allied to them, and, according to an opinion which seems growing in favor, we should include in the same branch, as related both in language and physical traits, what are known as the Dravidians of India, who embrace the Tamils, Telugus, Canarese, Todas, Khonds, and many minor tribes, although these have reached a far higher status of culture than any Australian clan.

AUTHORITIES.—The following may be named as among the leading recent authorities on this subject: Brinton, *Races and Peoples* (New York, 1890); Hovelacque and Hervé, *Précis d'Anthropologie* (Paris, 1887); Rätzel, *Völkerkunde* (Leipzig, 1891); Schurtz, *Völkerkunde* (Leipzig, 1893); Topinard, *L'Homme dans la Nature* (Paris, 1891); the same, *Éléments d'Anthropologie Générale* (Paris, 1890); Tylor, *Anthropology* (London, 1881). D. G. BRINTON.

Manabí, maä-naä-bee', or **Manaví**: a province of Ecuador; on the Pacific coast, N. of Guayas, and directly under the equator. Area, 9,427 sq. miles. It lies entirely in the coast zone, consisting of comparatively low but much broken lands, covered in part with heavy forest and watered by several small rivers. Cacao and sugar are the principal products. Pop. (1885) 64,284. Capital and principal town, Puerto Viejo, which has about 6,000 inhabitants, and is the seat of a bishop. H. H. S.

Managua, maa'naä-gwaä: capital of Nicaragua; beautifully situated near the southern shore of Lake Managua; lat. 12° 7′ N., lon. 86° 12′ W. (see map of Central America, ref. 6–H). At the time of the conquest it was a large Indian town, but under the Spaniards it was neglected and reduced to an insignificant village. The rivalry of Leon and Granada led to the selection of this place for the capital of the republic in 1855, and since then it has been steadily growing. It is now united by railway with Granada, Leon, and the Pacific port of Corinto. The houses and Government buildings are unpretentious, but the city has been greatly improved of late years. Most of the coffee exported from Nicaragua comes from plantations around Managua. Pop. estimated (1888) 16,700. HERBERT H. SMITH.

Managua, Lake: See NICARAGUA.

Man'akin: a name given to the members of the family *Pipridæ*, a group of small birds peculiar to tropical and subtropical America, having as their most obvious characters a weak bill and the union of the middle and outer toe for about two-thirds of their length. The greater portion of the manakins are birds of gay or striking plumage, red, blue, yellow, chestnut, black, and white occurring in various combinations. The tail is usually short and square. A few are crested, and in some species several of the secondaries are very curiously modified in shape. The birds are active, associate in small flocks, inhabit dense forests, and feed on berries. F. A. LUCAS.

Golden-winged manakin.

Manáos, maä-nowz,' formerly *Barra do Rio Negro*; capital and principal city of the state of Amazonas, Brazil; on the left bank of the Rio Negro; 6 miles above its mouth in the Amazon, and about 1,000 miles by the river from Pará; lat. 3° 8′ 4″ S., lon. 60° 0′ 12″ W. (see map of South America, ref. 3–E). It was a Portuguese fort and village of semi-civilized Indians, of small importance until 1852, when it became the capital of the new province (now state) of Amazonas. With the opening of steam navigation on the Amazon, it became a central point for the commerce of the upper rivers, the Madeira, Negro, Purús, etc., and especially for the trade in rubber; its exports of this product in 1891 were over 22,000,000 lb. Other important exports are cacao, Brazil-nuts, dried fish, etc. Ocean steamers now ascend the Amazon to Manáos, carrying their freights directly to Europe and the U. S., but a portion of the trade is carried on through Pará. By its situation Manáos must, in the near future, become a city of great importance. The city contains several well-built public edifices, barracks, schools, a library, museum and a meteorological observatory. It is well supplied with water by an aqueduct half a mile long. The climate is healthful, though warm (mean temperature, 78° F.). Pop. (1893) about 20,000. HERBERT H. SMITH.

Manar', Gulf of: a wide inlet of the Indian Ocean between Ceylon and the southern extremity of Hindustan, and separated from Palk's Strait by the islands of Rameswaram and Manar, and a low reef called Adam's Bridge.

Manasquan: town; Monmouth co., N. J. (for location of county, see map of New Jersey, ref. 4–E); on the Cent. of N. J. and the Penn. railways; 15 miles S. of Long Branch, 40 miles S. of New York city. Its location near the Atlantic Ocean and on the line of popular watering-places has made it a favorite summer resort. Pop. (1880) not in census; (1890) 1,506; (1900) 1,500.

Manassas Junction, Battle of: See BULL RUN, BATTLE OF.

Manas'seh: the eldest son of Joseph; was adopted by Jacob on his deathbed, and became the head of a tribe of Israel, which numbered 32,200 warriors on the exodus from Egypt and 52,700 on the entrance into Canaan. It received land on both sides of the Jordan—on the western side, between the tribes of Issachar on the N. and Ephraim on the S.; on the eastern side, N. of Gad. In the eastern part lay the towns of Gadara, Gamala, Jabesh-Gilead, Gerasa, etc.

Manasseh: the fourteenth King of Judah; a son of Hezekiah; reigned from 696 to 641 B. C.; became an open idolater; was taken prisoner by the King of Assyria, and detained for several years at Babylon, but repented and was restored to his kingdom. His later reign was marked by zeal and prosperity. The apocryphal composition called *The Prayer of Manasseh* is received as canonical by the Greek Church.

Manasseh ben Israel, also less commonly known as **Manasse ben Joseph ben Israel**: Hebrew writer; b. in Lisbon in 1604. His family fled during the Inquisition to Holland, settling in Amsterdam. In 1622 Manasseh was far enough advanced in biblical and Talmudic studies to be ordained rabbi. He was also a good linguist. Though a prolific writer, he was merely a compiler. His extensive knowledge made him sought after by such Christian scholars as Caspar Barläus, John Gerhard Voss, and Daniel Huet. Unfortunately, Manasseh was very early in life caught in the meshes of the Cabbala; and the Christian mysticism of the time, which busied itself with apocalyptic reckonings, influenced him greatly. In order to earn a livelihood he became a printer, and set up the first Hebrew printing establishment in Amsterdam. Shortly afterward he published his first large work, *Conciliador* (1632), in Spanish, in which he endeavored to settle many difficulties met with in the Bible; but Manasseh soon turned to his more favorite studies. He believed that the Messianic time was at hand, and that the ten lost tribes had been found in America. Before, however, the Jews returned to their native place, prophecy had said they should be scattered to the four corners of the globe. In England the Jews had been forbidden to settle since they had been driven out in 1290. Manasseh set his heart upon gaining for his brethren permission once more to settle in England. He composed a work, *Esperanza de Israel* (Amsterdam, 1650), originally written in English, which he sent over to the state council with a letter begging for the readmission of the Jews. A favorable answer was received from Lord Middlesex. The Puritan movement in England had prepared the soil. The deeper study of the Old Testament had aroused a lively interest in the people of the Book; but nothing came of the attempt. On July 5, 1653, Manasseh renewed his petition to the Barebone Parliament. Though he had received his pass, he hesitated to go, in the meanwhile publishing *Pedra Gloriosa ó de la Estátua de Nebuchadnezar* (Amsterdam, 1655), illustrated with four copper-plates by Rembrandt. At last (about Oct. 25, 1655) he set out with some friends. He laid an *Humble Address to the Protector* before Cromwell, and published a *Declaration to the Commonwealth of England*. He was well received by Cromwell. A commission was appointed to consider the matter; but the opposition was great. Manasseh found it necessary to refute the many cal-

mmnies which had been spread abroad regarding his people. This he did in his *Vindiciæ Judæorum* (London, 1656). Cromwell was unable to carry his point; he dismissed Manasseh, after granting him a yearly pension of £100. On his way back Manasseh died at Middelburg, Mar., 1657 Though the resettlement of the Jews was retarded, largely by Manasseh's own indiscreet actions, he paved the way. In a short time the small number of Jews who had for years secretly lived in London was re-enforced by large numbers from Holland.

Richard Gottheil.

Manatee', or **Laman'tin**: an aquatic herbivorous mammal of the order *Sirenia* and genus *Manatus* or *Trichechus*, often termed sea-cow. The adult manatee is from 8 to 12 feet long, clumsily built, the round body merging gradually into the tail, which is flattened and rounded at the end, quite different from the flukes of the whale or dugong. Fore limbs alone are present as flattened paddles; in one species, *M. australis*, the presence of the digits is indicated by nails. The head is small, the lips thick and extensible, the eye little, the ear a mere opening. The skin is thick, rather granular, with a few deep wrinkles marking the points of movement, and sparsely sprinkled with hairs. The bones are extremely

The manatee.

large and dense, and serve as ballast, rendering it easy for the animal to gather the aquatic vegetation on which it feeds and which it eats under water. Manatees are found in America from Florida to the Amazon and in some of the rivers of Western Africa. They are occasionally found along the coast, but their home is in quiet rivers and estuaries. They are shy and sluggish, and are hunted for their hide and flesh. The manatee is one of the animals which it is allowable for Roman Catholics to eat on fast-days. Three or four species are known—*Manatus senegalensis*, from Western Africa; *M. latirostris*, from Florida and about the Gulf of Mexico; *M. australis* and *M. inunguis*, from the rivers of South America.

F. A. Lucas.

Man'cha, La: an old province of Spain, comprising the modern province of Ciudad Real and portions of Toledo, Albacete, and Cuenca. It occupies the bare and monotonous elevated plateau of Central Spain, which is bounded S. by the Sierra Morena and N. by the Alcarria. It is sparsely peopled, and this circumstance, in connection with scarcity of water and the absence of trees, gives the region the dismal aspect of a desert. Nevertheless, whenever a little irrigation is attempted—and there is no difficulty in reaching water by digging—great crops of wheat, rye, barley, wine, oil, flax, etc., are raised. The mules reared in the province are considered the best in Spain, and the mineral wealth is considerable, quicksilver being produced at Almaden, saltpeter at Herencia and Alcazar de San Juan. The principal towns are Almodovar del Campo, Ciudad Real, and Valdepenas. The province, of which, during the Middle Ages, the eastern portion was known as La Mancha de Aragon and the western as La Mancha, is the scene of *Don Quixote*.

Manche, mänsh: department of France, bordering on the English Channel. Area, 2,289 sq. miles. The ground is mostly low, and in many places even marshy, though a range of hills traverses the department from N. to S., being connected with the hills of Maine and Brittany on the S., and at various places forming quite picturesque landscapes. The soil is fertile; grain, flax, hemp, and apples are produced, and many thousand gallons of cider are made annually. Large cattle and very strong horses are reared; also sheep of an inferior kind. Of the entire area, more than half is arable. The coast is often inhospitable and dangerous. Between it and the Channel islands the tide flows with tremendous force; the great Bay of Mont St.-Michel, comprising an area of 60,000 acres, was covered with forest until swallowed up by the tide of the year 709. Pop. (1891) 513,815; (1896) 500,052. Capital, St.-Lô.

Man'chester: city and borough (parliamentary and municipal); in the southwest of Lancashire, England; on the left bank of a narrow stream, the Irwell. By rail it is 183½ miles N. W. of London and 32 miles N. E. of Liverpool (see map of England, ref. 7–G). It is the center of the English cotton-manufacture, and both the seat and the headquarters of many industries. A number of bridges over the Irwell connect it with Salford (*q. v.*), which has a parliamentary representation and a municipality of its own. The Irwell, after receiving the waters of the Medlock and Irk, falls into the Mersey about 10 miles from Manchester. The area of the municipal borough of Manchester is 6,349 acres, and of the parliamentary borough 4,294 acres. For parliamentary purposes it is divided into six electoral districts, each of which returns one member to the House of Commons.

Thoroughfares and Public Parks.—Market Street, having at its western end the Royal Exchange, the great mart of the city, is the central thoroughfare. Behind the Exchange is St. Ann's Square, one of the chief shopping quarters. It leads into Deansgate, which is full of handsome shops and offices. Out of Deansgate is King Street, in which are the principal banks and insurance offices. Portland Street and Mosley Street contain many large warehouses of considerable architectural pretensions. From St. Peter's Square, which divides Mosley Street into two, proceeds a great arterial thoroughfare, Oxford Street. From the Royal Exchange a thoroughfare runs northward past the cathedral to the Bury New Road. This ascends almost the only high ground in the immediate vicinity of Manchester, and, traversing the semi-fashionable suburb of Higher Broughton (properly in Salford), leads to Kersal Moor, from which is obtainable a fine view of Manchester under its canopy of smoke. Many of the wealthy business men reside in the suburbs S. of the city, and at Sale, Bowdon, and Altrincham, in Cheshire. Manchester proper has six public parks. Of these the chief are Queen's Park (30 acres), and, also on the northeast, the pretty Philips Park (31 acres), in close proximity to the densely populated districts of Ancoats and Bradford. Alexandra Park (60 acres), the most extensive and picturesque of all, is at Moss Side, on the S. In the northeastern and very populous districts of the city there are five recreation-grounds. At Old Trafford are situated the Royal Botanical Gardens. For Peel Park and other Salford open spaces, see Salford.

Public Buildings.—The principal of these is the architecturally magnificent and profusely decorated new Town Hall (1868–77) in Albert Square, considered to be the finest municipal building in the kingdom. It is Gothic in style, covers 8,000 sq. yards, and contains more than 250 rooms. The building, site, etc., cost, up to 1890, more than £1,000,000 sterling. The new Royal Exchange (1869), in the Italian style, is said to be the largest in Europe devoted to commercial uses. The General Post-office (1881–87), between Brown Street and Spring Gardens, is in the Italian Renaissance style, and cost £100,000. The same sum was expended on the erection of the Assize Courts (1861–64), Great Ducie Street, a noble pile of buildings in Decorated Gothic. The Art Gallery in Mosley Street, formerly the Royal Institution, a fine building, now belongs to the corporation, and is to Manchester what the National Gallery is to London. The Free Trade Hall in Peter Street, for public meetings, concerts, etc., is built on the site of that in which the Anti-Corn-law League held its greatest meetings. The cathedral, the old parish church of Manchester, founded in 1422 and restored in recent times, has a fine choir, and its six side chapels make it, with the exception of that of Coventry, the widest church in England. The Memorial Hall, in Albert Square, is an edifice built by

Nonconformists in memory of the 2,000 ministers ejected in 1662. The Royal Infirmary (1752–1880), a spacious quadrangular building, is in Piccadilly, an eastern continuation of Market Street. It contains 300 beds, and has annually an average of 4,000 in- and more than 20,000 out-patients.

Public and Educational Institutions, Societies, etc.—Owens College, founded in 1846 as a university in miniature by John Owens, who bequeathed £100,000 for the purpose, is now, with some other provincial colleges, affiliated to the new Victoria University, the headquarters of which are in Manchester. The Grammar School, founded in 1592 by Hugh Oldham, Bishop of Exeter, has many exhibitions to Oxford and Cambridge. Chetham Hospital, for the education of poor boys, and the Chetham Library were founded in 1651 by Humphrey Chetham. Its library, open to the public, probably is the oldest free library in the kingdom. There are 50 Board schools and about 130 elementary schools, with an attendance of more than 72,000 scholars. Manchester was the first provincial town to avail itself of the Public Libraries Act of 1850. The headquarters of the free public libraries of Manchester is that in the old Town Hall in King Street. It contains a reference library open to all comers, and a lending library. It has seven branch free-lending libraries and newsrooms, and the number of volumes available for general use is considerably more than 200,000. A technical school, with workshops attached to it, is now supported by the corporation in connection with the old Mechanics' Institution. The Manchester Athenæum, a literary institution with library, news-room, and lecture-room, was founded by Richard Cobden and others for young men of the middle class. Of the many literary and scientific societies, the oldest, founded in 1791, is the Literary and Philosophical Society. The Chetham Society issues a valuable series of works on the history, biography, and general antiquities of Lancashire and Cheshire. There are upward of 130 places of worship belonging to the Church of England, and about twice that number belonging to Nonconformists. There are 12 Roman Catholic churches, several monasteries and convents, and 6 synagogues. Manchester has five theaters, the chief of which, the Theatre Royal, has the most capacious stage of any out of London. The principal music-hall is the Palace of Varieties. The Manchester races are among the best attended in the north of England. In 1893 the city contained 524 public-houses and 2,410 beer-houses.

Municipal Government.—Manchester is governed by a lord mayor and corporation. The corporation owns the markets, gas-works, and water-works, and the local tramways are mainly its property. It is now (1894) constructing, at an enormous cost, a system of water-works to bring a new supply of water from the Lake of Thirlmere in Cumberland; and has obtained powers for the supplying of electric light. It has erected public baths and abattoirs, and has laid out two public cemeteries. The public free libraries and parks, the Technical School, the Art Gallery (for which it has expended many thousands of pounds in the purchase of works of art)—all belong to it and are administered by it. The Manchester corporation derives from its markets, gas and water works, a large revenue, which is applied to relieve the ratepayers and in public improvements. In 1893 its income from all sources was £1,254,647, and its total expenditure £1,239,183. Manchester has also an energetic school board, which has erected a number of public elementary schools.

Manufactures, Commerce, etc.—There are still in Manchester proper a large number of factories and works in which the various processes of the cotton-manufacture, calico-printing among them, are carried on, sometimes on a very extensive scale, but cotton-spinning itself is receding from Manchester to outlying districts. Machine and boiler making, iron-founding, chemical works, and literally hundreds of other industries are displacing the ancient supremacy of cotton. Manchester is, moreover, not only a great manufacturing city, but a great emporium and commercial center. Most of the manufacturers and other producers of the busy towns surrounding Manchester—within 20 miles of it there is a population of 3,000,000—have places of business in Manchester, and make the exchange their rendezvous. Thus a worldwide commerce is centered in Manchester. Its enormous industrial interests are watched over by the chamber of commerce. This body sometimes makes independent inquiries at its own cost, and its suggestions in regard to industrial and other legislation and the duties of the imperial Government in furtherance of commerce and navigation are always attentively considered by the ministry of the day.

The Ship-canal.—Manchester has ample communication by railway with all parts of Great Britain, and before the railway era profited by canal communication with the principal centers of industry and population in England. Its chief traffic was with Liverpool, through which it received its imports of raw cotton and foodstuffs, and, like the other districts of South Lancashire, exported its manufactured textiles and the many other products of its industry. The payments for Liverpool dock-dues and the carriage of goods by the Liverpool and Manchester Railway were a considerable tax on the industries centered in Manchester, and it was thought that a great saving would be effected if the city were placed by a ship-canal in direct water communication with the sea. In 1882, when Parliament was asked to sanction the construction of a ship-canal from the estuary of the Mersey to Manchester, the undertaking was so strongly opposed by Liverpool that it was not until 1885, and after an expenditure of £200,000, that the act of Parliament constituting the company was passed. Its capital was ultimately fixed at £10,000,000 sterling, which was raised with difficulty, not more than £3,000,000 being subscribed in the Manchester district. The work was begun in Nov., 1887. Before it was finished the whole capital of the company was exhausted, and the Manchester corporation advanced a loan of £5,000,000 sterling, on the condition, which was agreed to, that it should have the virtual control of the administration of the canal, through being represented by eleven members on the board of twenty-one directors. The canal was informally opened for traffic on New Year's Day, 1894, and formally on May 21, with full state ceremonies, by Queen Victoria in person. The canal, being much of its course a canalized river, is 35½ miles long, twice the width of the Suez Canal, and has a depth of 26 feet, allowing vessels of the greatest burden to sail from the Mersey to Manchester. For a detailed description of its route and the manner of its construction, see SHIP-CANALS.

From the extensive quays and wharfages at the principal points on the canal, it has been described as one large dock. At Manchester and Salford there are seven docks with a total water area of 104 acres, and about 5 miles of quays, occupying an area of 152 acres. Up to June, 1894, the chief development of the canal traffic had been through coasting vessels to and from British ports, and with Holland, France, and Spain. According to an official report for the first five months of 1894 the proceeds of traffic on the canal during that period amounted to £33,701. The merchandise transported in seagoing vessels amounted to 211,915 tons; that transported in barges to 63,785 tons; while the passengers numbered 323,056.

Population, etc.—At the census of 1891 the population of Manchester was 505,368. In 1893 the registrar-general estimated it at 515,598, and that of Salford at 203,431; together 719,029, the largest urban population in the United Kingdom with the exception of that of London. In 1881 the population of Manchester was only 341,414; the subsequent increase has been in some measure due to the addition to Manchester in 1890 of outlying townships. Of the population of Manchester in 1891 26,394 persons (9,444 males and 16,950 females) were employed in the textile industries, chiefly cotton, and 7,200 in the production of machinery of various kinds. The foreign population, 8,941 in number, included 5,078 natives of Russia and Russian Poland, 2,016 natives of Germany and Austria-Hungary, and 431 natives of the U. S. In 1893 the death-rate was the very high one of 24·9 per 1,000. The population in 1901 was 543,930.

History.—In the sixteenth century Manchester was noted for its woolens, which, singularly enough, were called "cottons" (supposed to be a corruption of "coatings") long before the textile use of the cotton-plant was known in England. Traces of the use of cotton woven in the textile manufactories of Manchester are found toward the middle of the seventeenth century, but yarn spun of cotton was used by the weaver only as weft and not as warp until in the latter half of the eighteenth century textile fabrics wholly of cotton were made possible by Hargreaves's invention of the spinning-jenny and Arkwright's of the rollers. (See COTTON MANUFACTURES and LANCASHIRE under *History.*) Manchester sided with the Parliament in the great civil war of the seventeenth century, while in the eighteenth century it appears to have developed to some extent Jacobite sympathies. Except under Cromwell's Protectorate, Manchester was without parliamentary representation, but the Reform Act of 1832 gave it two members. In still more re-

cent times it became very important politically as the headquarters of the Anti-Corn-law League (*q. v.*). In 1853 it was made a city by royal charter. A bishopric of Manchester was created in 1847. See Baines, *History of the County Palatine of Lancaster* (latest edition, 1886–93), vol. ii., under *Parish of Manchester*; Saintsbury, *Manchester*, 1887 (a compact and lively history of Manchester from the earliest times to the date of publication); Kelly, *Directory of Lancashire, Liverpool, and Manchester* (1892).

Francis Espinasse.

Manchester: town; Hartford co., Conn. (for location of county, see map of Connecticut, ref. 8–I); on the Hockanum river, and the N. Y. and N. E. Railroad; 8 miles E. of Hartford. It contains the silk-mills of one firm, which cover about 8 acres of ground and employ about 2,000 persons; 9 paper-mills; a manufactory of electric dynamos, generators, and motors, and one of incandescent lamps; and cotton, woolen, stockinet, needle, and other factories. The town is lighted by electricity, and has water and sewerage systems, electric street-railway, high school library, and a weekly newspaper. Pop. (1880) 6,462; (1890) 8,222; (1900) 10,601. Editor of "Saturday Herald."

Manchester: city; capital of Delaware co., Ia. (for location of county, see map of Iowa, ref. 4–J); on the Maquoketa river, and the Ill. Cent. Railroad; 47 miles W. of Dubuque. It has a high school, library and reading-room (founded in 1883), containing 9,000 volumes, several mills and factories, large dairy trade, and two weekly newspapers, and is principally engaged in farming and dairying. Pop. (1880) 2,275; (1890) 2,344; (1900) 2,887.

Manchester: village; Washtenaw co., Mich. (for location of county, see map of Michigan, ref. 8–J); on the Lake Shore and Mich. S. Railway; 22 miles S. of Ann Arbor, 55 miles W. of Detroit. It is in an agricultural region, has considerable fruit interests, and contains large roller-process flour-mills, several planing-mills, foundry and machine-shops, brewery, stone-boat factory, book-publishing and stationery manufacturing-house, refrigerator-factory, electric-light plant, and a weekly newspaper. Pop. (1880) 1,156; (1890) 1,191; (1900) 1,209. Editor of "Enterprise."

Manchester: city (settled in 1772, incorporated as the town of Derryfield in 1751, name changed to Manchester in 1810, made a city in 1846); one of the capitals of Hillsboro co., N. H. (for location of county, see map of New Hampshire, ref. 10–E); on both sides of the Merrimack river, at the mouth of the Piscataquog river, and on the Concord and Montreal and the Boston and Maine railways; 16 miles S. of Concord. The Amoskeag Falls, the highest on the Merrimack river, with a fall of 54 ft. 10 in., provide a valuable water-power, which is utilized by means of two canals by four large manufacturing establishments. The city owes its importance as a manufacturing center to the Amoskeag Manufacturing Company, which has controlled the water-power of the Merrimack river for many years. The census returns of 1890 showed that 371 manufacturing establishments (representing 53 industries) reported. These had a combined capital of $21,462,683; employed 14,467 persons; paid $5,558,962 for wages and $10,842,645 for material; and had products valued at $18,654,547. The principal industry was the manufacture of cotton goods, which had 4 establishments, $14,017,554 capital, and 9,617 employees; paid $3,417,235 for wages and $6,441,521 for materials; and had products valued at $10,957,219. Next in importance was the manufacture of foundry and machine-shop products, which had 10 establishments, $583,014 capital, and 205 employees; paid $106,616 for wages and $317,494 for materials; and had products valued at $506,115. The Amoskeag, Manchester, Stark, and Amory mills have in the aggregate 478,000 spindles and 15,800 looms, and make about 287 miles of cloth per day, including sheetings, drillings, ginghams, denims, tickings, seamless bags, etc. The Manchester locomotive-works, with a capital of $150,000, have a capacity of 50 Amoskeag steam fire-engines per annum and 14 locomotives per month. Other manufactories make about 171,000 dozen pairs of stockings per annum, 26 tons of paper per day, and a large amount of edge-tools, files, machinery, carriages, leather, boots and shoes, wood-work, ale, needles, etc. The city has a system of water-works, completed in 1874 at a cost of $600,000, with a reservoir of 16,000,000 gal. capacity, fed from Lake Massabesic, 4 miles from the city. The city contains a Roman Catholic cathedral, academy, convent, and orphan asylum; State Industrial School; county court-house; U. S. Government building that cost $250,000; a hospital, a high school, 8 grammar-schools, and a training-school for teachers; 5 public parks; public library, with over 32,000 volumes, founded in 1854; 5 national banks, with combined capital of $750,000, and 6 savings-banks, with surplus of $855,500; and 3 daily, 2 semi-weekly, 8 weekly, and 6 monthly periodicals. Pop. (1880) 32,630; (1890) 44,126; (1900) 56,987. Editor of "Union."

Manchester: village; Adams co., O. (for location of county, see map of Ohio, ref. 8–D); on the Ohio river, and the Ches. and O. Railway; 40 miles W. of Portsmouth, 72 miles E. by S. of Cincinnati. It is a shipping-point for a large agricultural region, and has three churches, Soldiers' Memorial Hall, weekly newspaper, flour and planing mills, and a furniture-factory. Pop. (1880) 1,455; (1890) 1,965; (1900) 2,003. Editor of "Signal."

Manchester: town; one of the capitals of Bennington co., Vt. (for location of county, see map of Vermont, ref. 9–B); on the Battenkill river, and the Benn. and Rutland Railway; 30 miles S. of Rutland. It is one of the oldest settled towns in the State, has a picturesque mountain location, contains several miles of marble sidewalk, and is a popular summer resort. It is the seat of Burr and Burton Seminary, and of a classical school for both sexes. Water is bottled from newly discovered mineral springs. Pop. (1880) 1,928; (1890) 1,907; (1900) 1,955.

Manchester: city; Chesterfield co., Va. (for location of county, see map of Virginia, ref. 6–H); on the James river, and the Richmond and Danville Railroad; opposite Richmond. It is in an agricultural and coal-mining region, is principally engaged in manufacturing, and has a daily newspaper. Pop. (1880) 5,729; (1890) 9,246; (1900) 9,715.

Manchester New College: a theological school at Oxford, England, not connected with the university, but supported mainly by Unitarians for the education of their ministers. It is a lineal successor of the famous Warrenton Academy, in which Priestley taught and Malthus was educated. As Manchester Academy it received its first class in 1786. It has had a migratory existence. In 1803 it was moved to and remained in York till 1840, when it returned to Manchester. In 1853 it was transferred to London, and in 1889 to Oxford, where it has been housed in new buildings that compare favorably with those of the university. It was first called Manchester New College on its return to Manchester in 1840. Its most famous teacher was Dr. James Martineau, who joined the faculty in 1840 and retired in 1885. His department was that of mental, moral, and religious philosophy. The head of the college is now Dr. James Drummond; Prof. Charles B. Upton and Prof. J. Estlin Carpenter are his colleagues in the departments of philosophy, New Testament criticism, and Oriental languages and religions. John W. Chadwick.

Manchineel' [from Span. *manzanillo*, deriv. of *manzana*, apple]: a very poisonous evergreen tree of the West Indies, the *Hippomane mancinella*, belonging to the family *Euphorbiaceæ*. Its white *latex* or juice burns the skin upon which it falls. To taste its fragrant fruit would be dangerous were it not that the mouth is at once blistered by it. It is affirmed that men have died from sleeping in its shade, but it is believed that the bark of the *Bignonia leucoxylon* (which often grows near by) is an antidote to the poison. The beautiful wood is of excellent quality, but is poisonous even when dry. The bastard manchineel of the West Indies, also poisonous, is *Cameraria latifolia*, family *Apocynaceæ*.

Manchuria: the land of the Manchus; an extensive region of Northeastern Asia, forming the most easterly part of the Chinese empire. It extends from 40° to 53° 30′ N. lat., and from 118° to 135° E. lon. It is bounded on the S. by Korea and the Gulf of Liao-tung, on the W. by Mongolia, and N. and E. by Asiatic Russia, from which it is separated by the Amur and the Usuri rivers. The country formerly extended as far N. as 58° N. lat. and as far E. as 142 E. lon., but in 1860 the parts which lay N. of the Amur and E. of the Usuri were ceded to Russia. (See Maritime Province.) Its present area is estimated at 362,310 sq. miles, and its population (mostly Chinese) at from 7,500,000 to 18,000,000.

Physical Features.—Two well-marked natural divisions present themselves, one draining to the N. and the other to the S., the dividing line being a slightly elevated ridge which stretches westward to Mongolia from the Shan-alin or Long White Mountains, the true main chain of the mountain system of the country, which runs in parallel

ridges from N. E. to S. W. The northern division consists of large plateaus, bordered on the W. by the Hingan (or Khingan) Mountains, and traversed by several broad valleys, of which that of the Sungari is the most remarkable. Both plateaus and mountains are covered with many dense forests, in which roam the tiger and other wild animals. Most of the heavy timber used in North China comes from the virgin forests of Manchuria, or from the neutral strip which separates it from Korea. The valleys and the great alluvial plains of the southern division are well cultivated, and yield large crops of pulse, barley, wheat, millet, maize, rice, cotton, indigo, tobacco, sesamum, etc. Ginseng and rhubarb are also extensively produced.

The chief rivers are the Sungari, the Hurka, and the Usuri, which rise on the north side of the Shan-alin, and flow northward to the Amur, and the Liao, which rises in Mongolia, and flows E. and S. into the Gulf of Liao-tung. Some of the peaks of the Shan-alin attain heights of from 10,000 to 12,000 feet.

Climate.—The climate is healthful but severe, the temperature ranging from 10° F. below zero to 90° and 95° F. above. The rivers are frozen from four and a half to five months every year, during which all navigation ceases.

Divisions.—For administrative purposes Manchuria is divided into three provinces—Liao-tung or Shing-king (*q. v.*) in the S., Kirin in the center, and Tsitsihar in the N. Mukden, also known as Shin-yang and Fung-t'ien-foo, is the capital.

Inhabitants.—The Manchus, who now form about one-twelfth of the population, are a Tartar people of Tungusic origin, descendants of the Jurchin or Niu-chi, who overran Northern China in the twelfth century and established the Kin or Golden dynasty (later overturned by the Mongols), and of the tribes who followed Nurhachu (1559–1626) and his successors in his conquest of Liao-tung and Liao-si, in the first half of the seventeenth century, who aided the Chinese general Wu-san-kwei in suppressing the rebel Li-tse-ching, and who retained the country for themselves, establishing (in 1643) the *Ta-Tsing* or "Great Pure" dynasty now in power in China. Though for military purposes they are divided into "eight banners," they are a quiet, inoffensive people, noted for their politeness, and are rapidly being outnumbered by Chinese settlers from the northern provinces. They now speak the Chinese language, and Chinese is the only language taught in their schools. Their own language is practically dead. R. L.

Mancinelli, Luigi: See the Appendix.

Mancini, măăn-chee'nĕe: the name of an Italian family which during the minority of Louis XIV. played a very prominent part in the history of the French court. The father, Michele Lorenzo Mancini, married in 1634 a sister of Cardinal Mazarin; she bore him five daughters, and to provide for this "battalion of nieces" by means of good marriages was for several years the chief aim of their uncle's policy. I. Laure (1635–57) married the Duke of Mercœur, and was mother of the Duke of Vendôme. II. Olympe (1639–1708) married the Prince of Carignan, and was mother of Prince Eugene. III. Marie (1640–1715) married Prince Colonna, but left him and died in obscurity. Though unprepossessing in appearance, she was accomplished and attractive, and the young Louis XIV. proposed to marry her, but was prevented by her uncle. IV. Hortense (1646–99) married the Marquis of La Meilleraye, who assumed the title of Duke of Mazarin. V. Marie-Anne (1649–1714) married the Duke of Bouillon. It is said that they were all at one time or another the mistresses of Louis XIV.

Mancini, Pasquale Stanislas: lawyer and statesman; b. near Ariano in 1817; at an early age became prominent as a publicist; took a lively part in the Neapolitan movements of 1848, after which he retired to Turin with his wife (the gifted poetess, Laura Beatrice Oliva Mancini, who died in 1869), and there practiced with great success as an advocate. In 1851 he was elected Professor of International Law in the University of Turin, where his lectures were enthusiastically praised. In 1855 Cavour invited Mancini to take part in the Consiglio del Contenzioso Diplomatico. As an opposition member of Parliament the speeches of Mancini were listened to with lively interest. In 1862 he was for a short time Minister of Public Instruction while Rattazzi was president of the council. He afterward lived in Rome, being at the same time a deputy in Parliament, a professor in the university, and an active advocate. In the peace conference at Ghent in 1873 Mancini, as representative from Italy, was chosen president of the congress. He published in 1873 his *Prelezioni di Diritto Internazionale*, and also an admirable essay on Machiavelli. He was Minister of Foreign Affairs in 1881–83. D. Dec., 1888.

Manco, maan'kō, called Manco Inca, Inca Manco, and by some authors Manco Inca Yupanqui, or Manco Capac II.: son of Huaina Capac, Inca sovereign of Peru, and brother of Huascar; b. about 1500. After the death of Atahualpa and Huascar he became the rightful sovereign of the Inca empire. As Pizarro and his Spaniards approached Cuzco (Nov., 1533) Manco, judging that resistance would be useless, went out to meet them peacefully; he proved his legal claims, which were so far recognized that, by Pizarro's order, he was crowned at Cuzco according to the ancient ceremonies; but his sovereignty was little more than an empty show, the Spaniards being now the real masters of Peru. Manco served them as a loyal ally, and even marched with them against the hostile army of Quizquiz; later he detailed an army to accompany Almagro to Chili, but his position became more and more irksome, until he was virtually a prisoner in Cuzco. In Apr., 1536, he escaped, speedily raised an army of Indians, being recognized everywhere as Inca, and for several months besieged Cuzco, then under the command of Hernando and Juan Pizarro. The Spaniards were driven to great extremities, losing many men, among them Juan Pizarro; and meanwhile other armies, acting under the Inca's orders, attacked the various Spanish strongholds, so that for a time they were threatened with the loss of Peru. The pressing danger brought strong re-enforcements from Panama, Guatemala, and Mexico. On the return of Almagro from Chili Manco attacked him at Yucay (early in 1537), but was defeated. Later in the same year he was driven into the mountains between the rivers Apurimac and Vilcamayu, where he maintained his independence and kept up a predatory war on the Spaniards. When the younger Almagro rebelled (1541), Manco sent a force to assist him, and on the defeat of that leader he gave refuge to some of his fugitive followers. In a quarrel he was killed by one of these men (1544). Herbert H. Smith.

Manco Capac, or **Ccapac**: See Incas.

Mandæ'ans: a religious sect in South Babylonia, living in great poverty in the marshy land near Wāsit, Basra, Sūk Esh-Shiyuch, and in Chuzistan. Ignatius a Jesu in 1652 gave their numbers as 25,000; Siouffi in 1873 as 4,000. They are erroneously called by Europeans "Christians of St. John," "Nazareans," "Sabæans." They call themselves Mandæans—believers in *Manda* (*γνῶσις*), i. e. *γνωστικοί*. Their history is involved in great obscurity, their own traditions in this respect being utterly worthless. They possess quite an extensive religious literature, written in an Aramæan dialect which is very similar to that of the Babylonian Talmud, and in a script similar to the one brought by Syriac missionaries into Mongolia and Manchuria. Their chief works are *Ginza* (Treasure), called also *Sidrā Rabbā* (Great Book); *Sidrā de Yahyā* (Book of John), called also *Derāshē demalkē* (Discourses of the Kings); *Qolasta* (Book of Songs); *Dīwan*; and *Asfar Malwāshē* (Book of the Signs of the Zodiac). According to Nöldeke, these date from about 650–900 A. D., though they undoubtedly are based upon earlier documents. It is difficult to give a clear conception of what the Mandæan religion teaches, as it shows very little unity. It is a purely local religion, based upon old polytheistic ideas, to which elements have been added drawn from Babylonian, Persian, Jewish, Christian, and Manichæan speculations. According to Brandt, four layers can be distinguished in the earlier writings: (1) Oldest layer of heathen Gnosticism, polytheistic and full of mythological ideas; (2) reproduction of Christian Gnostic ideas; (3) theories in regard to life after death, drawn from Persian sources; (4) the system of the "King of Light," which is made up of Persian dualism and Christian monotheism.

The Mandæan religion seems to be based upon the idea that the soul really belongs to a better world, that of the *First Life*. It is only temporarily attached to the body; it can be brought back to the world of spirit by the exercise of those rights which the Mandæan religion demands. The *gods of light* have chained the powers of darkness in the lower world. Our world was created by the powers of the *Second Life*, and was badly made. Demons of darkness try to drag men down from the world of light; but man has been taught that he belongs to the higher regions. He must worship the *Manda of Glory*, and must acquire that cleanliness which is to be found in rivers. In these he must bathe, and then at death he will return to the shining ether. To this original system many additions were made. The

story of John the Baptist must have reached the Mandæans at an early time. He has become one of their heroes. Other Christian elements found entrance at a later date, when they began to style themselves *Nazōrāyē*; but in consequence of the Nestorian propaganda a bitter enmity arose between the Mandæans and Catholicism. They declared the Holy Spirit and the Christian Messiah, his son, to be the authors of all false religion. They speak of the lying prophet, who was crucified because of his lies. Christian institutions are said to be copied from those established by their own *Mandā de Ḥayyē*.

RICHARD GOTTHEIL.

Man'dalay: formerly capital of the kingdom of Burma, and now of British Upper Burma; situated 3 miles from the Irawadi river, a little N. of Amarapura, the former capital (see map of N. India, ref. 8–L). It was founded in 1859, and is laid out in three parallelograms, one within the other, separated by walls, ditches, towers, palisades, and other kinds of fortifications. The innermost parallelogram is occupied by the king's palace, with a spiral tower rising above his throne, and its gardens; the second by the military and the government officials; the third by the merchants and mechanics. It was taken by the British in 1885. On Mar. 30, 1892, a large part of the city was burned. Pop. (1891) 188,815. Revised by M. W. HARRINGTON.

Manda'mus [Lat., liter., we command, 1st pers. plur. pres. indic. of *manda're*, command]: a common-law writ issued by a court (usually one of general jurisdiction) commanding the performance by the person (a public officer or officer of a corporation) to whom it is issued of some particular and specific thing which the law provides he shall do. Originally, in England, law was administered by popular courts, in which the people were at the same time judges of the law and of the facts. This system of popular courts soon gave way to a system of royal courts in which professional judges learned in the law decided the questions of law, while the questions of fact were left to the juries, which are the direct successors of the old popular courts. The substitution of royal and professional courts for popular tribunals was due to the issue by the king, who was from the earliest times considered to be the fountain of justice, of writs through which he supplemented the injustice which was so characteristic of the original system of popular courts. These writs originally issued from Chancery, and were modeled upon the writs which were developed on the Continent by the Carolingian lawyers. Later, however, they were issued directly by the royal courts themselves without the intervention of the chancellor. Soon most of the writs by which ordinary actions at law were begun became writs, as the law expressed it, *ex debito justitiæ*, or writs of right, which issued as of course upon the application of any person who deemed himself aggrieved. While most of these writs became thus open to any individual, certain of them still remained prerogative in character—that is, the courts could refuse to issue them if they thought the cause of justice would not be subserved by their issue. Among these writs which retained their prerogative character was the writ of *mandamus*. Originally it was merely a means by which the crown might exercise a general control over the action of its subordinate officers. It finally, however, became one of the well-recognized means by which one of the royal courts—namely, the court of king's bench, in which the king was supposed always to be present—exercised the control, which on this account was attributed to it over other tribunals. While the writ of *mandamus* became one of the well-recognized remedies to be administered by the court of king's bench, it never became a remedy which was open to all individuals, and which could be made use of in the settlement of the ordinary relations of private life. It has always retained a certain public character, and is even now made use of generally only where the public is concerned. It may not be employed to enforce the performance of an action by a merely private person (*State* vs. *Tolle*, 71 Missouri 645. In this case the court refused to issue it in order to force an executor to publish a notice of the sale of real estate. See also *State* vs. *Turnpike Company*, 16 Ohio State 308, where it was refused to enforce the performance of a merely private contract); but issues only to an administrative or inferior judicial authority or to a municipal or a private corporation where such private corporation is regarded as acting somewhat as a governmental agent.

The only exception to the rule of the public nature of this remedy is to be found in some cases of its issue to officers of private corporations. Thus it lies to compel the surrender of corporate books and records to officers properly entitled to have them. (*American Railway Frog Company* vs. *Haven*, 101 Mass. 398.) Here the theory of its issue is that it is to the public advantage that officers in these corporations shall perform regularly the duties imposed upon them by law. Another result of its public character is that the people or the State is, nominally at least, a party to the action which results from its issue. The title of the action instituted by a writ of *mandamus* is almost invariably the State or the people on the relation of some private individual against the person to whom the writ is issued.

The fact that the writ was originally issued by the court of king's bench, the acknowledged superior of all other English courts, has, like other incidents of its origin and early history, had an important influence in deciding what court in the U. S. may issue it. This is determined very largely by statute, but at the same time is determined in accordance with its history. It is usually issued by the common-law court of general jurisdiction, the court which has inherited the jurisdiction of the court of king's bench. As a result, it is not issued by a court possessing appellate jurisdiction only. (*State* vs. *Biddle*, 36 Indiana 138; *Cowell* vs. *Buckelew*, 14 California 640.) The only possible exception to the rule is to be found in the case where the writ is issued to enforce an already acquired jurisdiction, as, for example, where it is issued to enforce the payment of a judgment already obtained in the appellate court, and which some public authority has refused to satisfy. (*Ex parte Crane*, 5 Peters 189, *Ex parte Bradley*, 7 Wallace 365.) Further, it may be issued by an appellate court to an inferior court, to order such court to exercise its jurisdiction, when it may be regarded as issued either in the exercise of an appellate jurisdiction, or as in aid of an already acquired jurisdiction. *People* vs. *Bacon*, 18 Michigan 247.

While the whole tendency of modern development has been to assimilate the writ of *mandamus* more and more to an ordinary action (*Commonwealth* vs. *Denison*, 24 Howard 66), nevertheless, as a result of its originally prerogative characteristics the issue of the writ still lies in the discretion of the court. This discretion, however, is a legal discretion, and therefore the decision of the court to which application is made for its issue is generally regarded as appealable. (*People* vs. *Board of Police*, 107 New York 235, and *People* vs. *Chapin*, 104 New York 96.) Another effect of its originally prerogative character is that it is at the present time an extraordinary remedy, that is, it will never issue where there is another adequate remedy. (*People* vs. *Hawkins*, 46 New York 9, and *State* vs. *Supervisor*, 26 Wisconsin 79.) It has been held by the courts that neither a civil action for damages against officers for neglect of duty nor the remedy by indictment is an adequate remedy. *People* vs. *Green*, 58 New York 295, 306, and *Fremont* vs. *Crippen*, 10 California 211.

The purpose of the issue of the writ is also somewhat peculiar. This is, as it originally was and as the meaning of the Latin word by which the writ is known would imply, to command directly the performance by the person to whom it is issued of some particular and specific thing which the law provides he shall do. It corresponds as a public legal remedy somewhat to the private legal remedy of specific performance.

As the purpose of the writ is to enforce the performance by public or quasi-public agencies of the duties specifically required by the law, the writ will issue to all officers of the Government, both administrative and judicial, no matter what their rank may be (*United States* vs. *Schurz*, 102 United States 378); but will not issue to control the discretion of even the humblest officer. The rank of the officer is of no significance. The issue of the writ depends almost altogether upon the character of the duty, whether ministerial or discretionary, whose performance it is sought to

enforce. The only possible exception to this rule is to be found in the case of the President of the U. S., against whom the writ has never been issued, and against whom it is fair to suppose it never will be issued, on account of the reluctance of the court to interfere with the executive. Most of the State courts extend this exception to the Governor also. (*State* vs. *Drew*, 17 Florida 67, and *State* vs. *Towns*, 8 Georgia 369, 372.) While the spirit of the rule as to discretion is the same when the *mandamus* is issued to administrative as it is when it is issued to judicial officers, the fact that judicial officers have as a rule to perform only discretionary duties, whereas in the case of administrative officers many, if not most, of their duties are ministerial in character, a practical difference arises from the application of this rule to these different authorities. Thus the *mandamus* almost never issues to inferior courts to compel the performance of a specific action. It issues merely to force such bodies to exercise their discretion where they have refused to exercise it, on the ground that the duty of exercising their discretion is a ministerial duty, while the way in which they shall exercise it is of course a matter of discretion. (*Ex parte Loring*, 94 United States 418.) The rule is the same in the case of discretionary duties of administrative officers; here, as in the case of judicial officers, it is obligatory upon them to exercise their discretion in some way, and their negligence in this regard is considered to be the violation of a ministerial duty. *People* vs. *Auditors*, 82 New York 80.

While the main purpose of the *mandamus* is to protect private rights from encroachment by the officers of the Government, it is also made use of merely to maintain the law, where no particular private right is violated. While there is some conflict upon this point, by far the better rule, both from the point of view of political expediency and from that of legal authority, is that in the case of matters affecting the public as a whole any individual citizen may apply to the court for the issue of the *mandamus* to compel the performance by public officers or corporations of duties imposed upon them by the law. (*Union Pacific Railway Company* vs. *Hall*, 91 United States 343, 355.) In these cases not only the individual citizen, but also the proper officers of the Government, may apply to the court for the writ. See *Attorney General* vs. *Boston*, 123 Mass. 460.

The practice of the writ is, of course, regulated in detail and somewhat differently by the statutes of the different States, but generally as follows: The person desiring the issue of the writ makes application by affidavits to the competent court, which will then issue to the person against whom it is demanded that it shall go, either a rule to show cause why the *mandamus* should not issue or what is known as an alternative *mandamus*. This procedure has the effect of bringing the defendant into court, and on the return to either the rule to show cause or the alternative *mandamus*, the matter is decided upon its merits, and the *mandamus* is either granted or refused. As has been said, the decison granting or refusing the writ is generally now regarded as appealable. FRANK J. GOODNOW.

Mandan: city; capital of Morton co., N. D. (for location of county, see map of North Dakota, ref. 3–D); on the Missouri river at the mouth of the Heart river, and on the N. Pac. Railroad; 5 miles W. of Bismarck, the State capital. It is in a stock-raising region, has valuable coal mines in its vicinity, ships large quantities of wool, and has three weekly newspapers. Pop. (1880) 239; (1890) 1,328; (1900) 1,658.

Mandans: See SIOUAN INDIANS.

Manda'ra, or **Wandala**: kingdom of Central Africa, S. of Bornu; consists of a large, well-watered, very fertile, and well-cultivated valley, partly encircled by high mountains. The inhabitants are Mohammedan Negroes, who are industrious in the manufacture of cotton fabrics and articles of iron, and possess a celebrated breed of horses. The capital is Doloo, with 30,000 inhabitants. The former capital, Mora, was entirely destroyed in the war with Bornu in 1863. Revised by C. C. ADAMS.

Mandarin-duck: a species of duck, *Aix galericulata*, related to the wood-duck of North America; found in China and Japan. The plumage of the male is very gorgeous, varied with brown, yellow, and red, though these last two colors are in subdued tints. Besides a crest of steel-green with purplish reflections, there is a collar of loose reddish feathers, and the innermost tertiary is modified into a fan shape, and stands out from the rest of the wing. This duck is often kept in captivity, especially in China, where it is looked upon as the emblem of conjugal attachment. F. A. LUCAS.

Mandate [from Lat. *manda'tum*, command, mandate, deriv. of *manda're*, command]: at Roman law, is a contract by which the one party agrees to execute a commission received from the other. The person commissioned (*mandatarius*) is bound to do what he has undertaken to do, provided it be lawful and possible, and is held to exercise ordinary diligence. He is of course responsible for whatever comes into his hands in the execution of the commission. The mandator is responsible for expenses incurred by the mandatary. The contract is a friendly one (*ex amicitia*); and while the mandatary may receive a fee (*honorarium*, *salarium*), he may not receive payment (*merces*). If it is agreed that he shall be paid, the contract is not mandate, but a hiring of service (*locatio conductio operarum* or *operis*).

Mandate may include an authorization to the mandatary to represent the mandator in a legal act, e. g. in concluding a contract or in conducting a law suit. In this case the mandatary is the agent or attorney (*procurator*) of the mandator. Such an agent, however, must act in his own name. The rights acquired do not vest directly in his principal (*dominus*), but must be transferred to the latter. The liabilities incurred are also primarily those of the agent, although his creditors may have recourse against the principal on the ground that the latter has expressly or impliedly authorized them to deal with the agent. An implied guaranty of this sort does not result from the mandate to the agent and his disclosure of his agency, but from other acts of the principal, e. g. from his putting the agent in charge of a ship or a shop.

"*Qualified*" *Mandate*.—The contract of mandate, however, may be simply a contract of guaranty. When, for example, one person authorizes another to lend money or furnish goods on credit to a third person, he who has given such authorization is responsible *as mandator* for any resultant loss. The reason for this extension of mandate was a practical one. The regular contract of guaranty was a formal contract (*stipulatio*); mandate was informal.

Mandatum actionis.—In the appointment of a procurator to represent the mandator in enforcing a right of action, the Roman jurists found a means of ceding rights of action, which in principle was not permitted. The cessionary, figured, technically, as a mere attorney, but it was agreed between him and the mandator that he should keep whatever he obtained from the debtor. He is procurator in his own interest—*in rem suam*.

Extinction of the Contract.—Mandate is revocable at the pleasure of the mandator, and is extinguished by his death; but such revocation or death does not affect the claim of the mandatary against the mandator or his heir for expenses incurred before he learned that the mandate was at an end. The procurator *in rem suam* was partially protected by imperial legislation against the results of such a technical extinction of his rights as cessionary.

MODERN EUROPEAN LAW.—The law of *agency* in modern Europe is a further development of the Roman law of mandate. As far as the relations between principal and agent are concerned, the Roman rules are substantially unchanged; but the relations of principal and agent to third parties have been wholly reconstructed. Mediæval practice worked out the rules that the mandatary or procurator might contract in the name of his principal; that in such case all the rights created by the contract were directly and immediately vested in the principal; and that the liabilities incurred were not liabilities of the agent (so long as he has acted within the limits of his commission), but of the principal. Strictly considered, these results do not flow from the mandate to the agent, but from the grant of power (*procuration*, *Vollmacht*) which accompanies the mandate; and some modern legislations (e. g. the Swiss federal law of obligations and the German (draft) code) separate the law of agency or representation (*Vertretung*) from the law of mandate. In most of the European codes the whole subject is treated under the head of mandate (*mandat*, *Auftrag*). The rules laid down are very similar to those of the English common law. See AGENCY.

The "*qualified*" *mandate* has practically disappeared. The contract of guaranty is in principle informal, so that there is no need of having recourse to the theory of mandate; and where special kinds of guaranty, or contracts of guaranty involving more than a certain amount, are required to be in writing, it is not admissible to evade this requirement by invoking the rules of mandate. Modern codes, therefore, either ignore this form of mandate, or declare that it is governed by the rules of guaranty.

Apart from the cases above discussed, mandate is still recognized in very much the Roman sense, as a friendly contract of service. The requirement that the service shall be gratuitously rendered is generally disearded; but in spite of the abandonment of this technical distinction between mandate and hire of service, the two are still treated as distinct contracts.

MANDATE AND BAILMENT.—At Roman law mandate might incidentally include the transfer of property for safe-keeping or for other purposes. In such cases a "real contract," or, in English phrase, a "bailment," is associated with the mandate, and at Roman law the property might be recovered either by action on the real contract or by action on the mandate. It was probably through a misconception of these Roman rules that the Roman term "mandatum" came to be used, in English common law, to designate a particular form of bailment. See BAILMENT.

LITERATURE.—Domenget and de Peyronny, *Du Mandat* (2d ed. Paris, 1870); Amann, *Der Procurator und der Mandatarius* (Heidelberg, 1880); Le Jolis, *Du Mandat* (Paris, 1882). MUNROE SMITH.

Mandelgren, NILS MÅNSSON: critic; b. in Sweden in 1813; studied at the academies of Stockholm and Copenhagen. Among his writings are *Monuments scandinaves du moyen âge* (1855–62) and *Samlingar till svenska odlingshistorien* (Collections bearing upon the History of Swedish Civilization, 1866–68). Besides these he has published minor writings, partly of a polemical nature. P. G.

Man'derson, CHARLES FREDERICK: soldier and lawyer; b. in Philadelphia, Feb. 9, 1837; received an excellent education; removed in 1856 to Canton, O., and studied law; was admitted to practice and elected city solicitor. He entered the Union army in 1861 as first lieutenant in the Nineteenth Ohio Regiment, and served through the civil war with great bravery in Mississippi, Alabama, Tennessee, and Kentucky, taking part in all the principal engagements, rising to be colonel and brevet brigadier-general of volunteers. At the close of the war he resumed the practice of law at Canton, O.; removed to Omaha, Neb., in 1869, and devoted himself to his profession. He was elected to the U. S. Senate Jan. 31, 1883; re-elected 1888; was president *pro tem.* of the Senate 1891–93.

Mandeville, BERNARD: b. at Dordrecht (Dort), Holland, about 1670; studied medicine, and took his degree at Leyden, Mar. 30, 1691, after which he settled in London as a physician. Published *Esop Dressed, or a Collection of Fables in Familiar Verse* (1704): a *Treatise of the Hypochondriac and Hysteric Passions* (1711), highly commended by Dr. Johnson; *The Grumbling-hive, or Knaves turned Honest* (1705); and in 1714 an enlarged edition, under the title *The Fable of the Bees, or Private Vices Public Benefits* (2d ed., 1723), which was censured by Berkeley and others, and presented as a nuisance by the grand jury of Middlesex. A second part of the *Fable* appeared in 1728, and both parts in 1732. He also published *Free Thoughts on Religion* (1720); *Origin of Honor* (1732); *A Letter to Dion* (1732); and *A Modest Defense of Public Stews* (1740). He was patronized by Lord Macclesfield, and died in London, Jan. 21, 1733. Revised by A. R. MARSH.

Mandeville, or **Maundeville**, Sir JOHN: the reputed author of an early English book of travels. According to the account which he himself gives in the book, he was a native of St. Albans; left England in 1322, and traveled until 1357 in Turkey, Armenia, Tartary, Persia, Syria, Arabia, India, Egypt and Upper Egypt, and a great part of Ethiopia; was for some time in the employ of the Sultan of Egypt, and wrote especially for the benefit of pilgrims going to Jerusalem, where he had often been. The work was written in popular style, was widely read, and translated in manuscript into various languages, and was one of the earliest of printed books. It appears to have been first printed in German about 1475; the earliest (dated) English edition was in 1499. Until quite recently it was assumed that Mandeville was a veritable person, if not the extensive traveler which he claimed to be; and he has been called the father of English prose. Recent investigations have shown—(1) that the earliest known manuscript of the work is French (dated 1371), and there is internal evidence that all others were derived from it; (2) that the whole, or almost the whole, of the matter is taken from earlier authors, especially from William of Boldensele, a German knight who visited Jerusalem 1322–23, from Friar Odoric, who traveled in Asia 1316–20, and from the *Speculum* of Vincent de Beauvois; there are even statements taken from Pliny; (3) that the author is identical, in all probability, with one Jean de Bourgogne (perhaps an Englishman), who died at Liège in 1372—whether Bourgogne or Mandeville was the fictitious name is doubtful. Notwithstanding these facts, there can be no doubt that Mandeville's travels were widely read and believed, and that they had considerable influence in promoting the spirit of discovery during the fourteenth and fifteenth centuries. See Yule, *Cathay and the Way Thither* (1866); Schönborn, *Bibliographische Untersuchungen über die Reise-Beschreibung des Sir John Mandeville* (1840); E. B. Nicholson and Sir H. Yule in *Encyclopædia Britannica*, 9th ed.; *Dictionary of National Biography*, article *Mandeville*. HERBERT H. SMITH.

Mandin'go: a vast territory in Western Africa, extending E. of Liberia and Sierra Leone and N. of the European possessions and Ashantee on the Gulf of Guinea, its northern limit being about 12° N. lat. It is mostly a high table-land. Its people, supposed to number 5,000,000, are among the finest specimens of the Negro tribes, and are divided into small states of considerable power, the largest of which is the empire of Samory, which, though at war with the French for years, is not yet fully subjugated. The most powerful element in the population is the Fulbe or Fellata, whose influence is potent over a large part of the Western and Central Sudan. The inhabitants of this region are zealous Mohammedans, and every settlement has one or more rudely built mosques. The entire region is in France's sphere of influence, and the French explorer Binger has done most to reveal it to the world. He crossed the entire region (1887–88), and was the first European to visit Kong, its most important town. C. C. ADAMS.

Mandioca: See MANIOC.

Man'dolin [from Ital. *mandolino*, dimin. of *mandola* (by popular etymology) < Lat. *pandu'ra* < Gr. πανδοῦρα]: an instrument of music somewhat resembling the guitar and the lute. Its body is an open shell-shaped box made of strips of bent wood. It has four or five strings, which are struck by the plectrum. The neck has a finger-board. This instrument is chiefly Italian. Its sounds are peculiar, but sweet and loud.

Mandrake [O. Eng. *mandragora*, from Lat. *mandragoras* = Gr. μανδραγόρας. Cf. Fr. *mandragore* < Lat.]: a solanaceous perennial herb, *Mandragora vernalis*, a native of the warm parts of the Eastern continent. It is a narcotic poison, and was used by the ancients for its soporific and anæsthetic effects. Anciently it was believed to have many magical virtues: it could cure barrenness; its forked root was likened to a man, and believed to possess a soul; it was believed to shriek so loudly when dug up that the person removing it died. Consequently, the earth was carefully loosened by one whose ears were stopped with wax, and a black dog was attached by cords to the root to drag it out. The name has been applied in the U. S. to *Podophyllum peltatum*, the May-apple, of the barberry family.

Mandrill [= *man-ape*, from Eng. *drill*, ape, with the prefix *man*, given on account of its size; cf. Fr. *mandrille*: Ital. *mandrillo*]: a large, powerful, and short-tailed baboon (*Cynocephalus mormon*) found in Northern and Western Africa. The appearance of the full-grown male is at once ludicrous and repulsive. The sides of the long muzzle are much swollen and of a brilliant blue, furrowed with purple and scarlet. The end of the nose is bright red, the chin has a yellow beard, while the large ischial callosities are resplendent with red and blue. It is a hideous brute, and excels in cunning and strength, as well as in ferocity. F. A. LUCAS.

Mandu'ria (anc. *Mandy'rium*, or *Mando'nium*): town in a fertile part of the province of Lecce, Southern Italy (see map of Italy, ref. 7–H). It was originally a Greek settlement, and S. of the town are ancient sepulchers in which Greek vases of much interest have been found. Pliny mentions an intermittent spring which still exists here, and there is another of great antiquity issuing from an excavation in a rock. Pop. about 8,870.

Maneesa: See MANISSA.

Ma'nes [Lat., from adj. stem *mani-*, good; cf. *immanis*, translated by the Gr. χρηστοί]: in Roman religious language the name given to the dead, conceived of as bodiless spirits enjoying immortality like the gods, and hence the frequent formula *di* or *divi manes*. Their abode is in the depths of the earth, from which they emerge at certain seasons. Altars were erected to them, and sacrifices, con-

sisting of food, drink, perfumes, and flowers, were offered. LARES (*q. v.*), manes, and genii are different designations of the spirits of the dead which can not always be distinguished sharply. Manes corresponded, however, more nearly to the Christian conception of the soul, and accordingly the formula *dis manibus* is even found on early Christian inscriptions. G. L. HENDRICKSON.

Manet, mȧ̆ nā′, ÉDOUARD: genre and portrait painter; b. in Paris in 1833; pupil of Couture; was awarded a second-class medal at the Salon of 1881; decoration of the Legion of Honor in 1882. He is generally recognized as the chief of the impressionist school of painters in France, and his pictures were for several years rejected by the jury at the Salon. His influence on modern art has been very considerable and in the main for good, although his own works are of very unequal merit. One of his most celebrated works, *Olympia* (1865), is in the Luxembourg Gallery, Paris, and at the Metropolitan Museum, New York, is a picture that shows him at his best, *The Boy with the Sword* (1861). D. in Paris, Apr. 30, 1883. WILLIAM A. COFFIN.

Man'etho (beloved of Thoth): an Egyptian priest and temple-scribe of Sebennytus (*Thebneter*) in the Northern Delta; a contemporary of Ptolemy I., Soter (cf. Plutarch, *Isis*, c. 28), and of Ptolemy II., Philadelphus (286–247 B. C.). He was employed about 260 B. C. by the latter to compile from native sources a history of Egypt and its gods. For this task he was qualified by acquaintance with Greek as well as Egyptian literature. A number of other works have also been attributed to him, but all have perished. We possess only extracts made by Josephus, Eusebius, Africanus, and others. The quotations made by Josephus (*Contra Apionem*, i., 14; Whiston's translation, New York, 1824, vol. iv., p. 371 ff.) relate to the occupation and expulsion of the Hyksos. Those by Eusebius cover the entire period (*Eusebii Chronicorum Canonum quæ supersunt*. ed. Alf. Schoene, 2 vols., Berlin, 1866–75; *Georgii Syncelli Chronographia*, in *Corpus Script. Hist. Byzant.*, Bonn, 1829, 2 vols.; Scaliger, *Eusebii . . . Chron. Canon.*, lib. 2, Leyden, 1606). More or less complete collections of the entire material are contained in Müller's *Fragmenta historicorum Græcorum* (4 vols., Paris, 1841–51, vol. ii., p. 511–616, 1848); in Bunsen's *Egypt's Place in Universal History* (1848, vol. i., p. 605 ff.); in George Syncellus (see above); and in Cory's *Ancient Fragments* (London, 1876, p. 104 ff.). Manetho divided the history from Menes to Alexander into three parts (*τόμοι*), the first including the first eleven dynasties (*δυναστεία*), the second extending from the twelfth to the nineteenth, and the third from the twentieth to the thirtieth. (See EGYPT.) Before the first dynasty was the mythological rule of the gods and demi-gods (followers of Horus), extending over immense periods. As the Egyptians possessed no fixed era, the dynastic lists of Manetho afford the only means of dating events in Egyptian history. The dynasties appear to have been based upon geographical or historical considerations rather than upon heredity. Monumental lists, such as the tablet of Abydos (see MEMNONIUM), do not show any such divisions. Manetho's list gives a high antiquity to Menes, the first king; estimates vary between Champollion's 5857 B. C. and Wilkinson's 2320 B. C. The lower estimates are based upon the presumption of contemporaneous dynasties. On the other hand, it is contended that there is no monumental evidence of the fact to be found, and it appears probable that Manetho himself excluded all but legitimate lines from his record.

CHARLES R. GILLETT.

Man, Fall of: See FALL OF MAN.

Man'fred: King of Sicily; b. in Sicily about 1232; a natural son (afterward legitimized) of Frederick II. of the house of Hohenstaufen; received, on the death of his father in 1250, the principality of Tarentum, and acted as regent in Italy during the absence of his half-brother, Conrad IV. He subdued with great valor the insurrections in Capua, Naples, and other cities, but his services were ill rewarded by Conrad. In 1254 Conrad died, and Manfred was for the second time appointed regent in Italy during the minority of Conradin, and, on a rumor of the death of Conradin in Germany, he was proclaimed King of the Two Sicilies, and crowned at Palermo, Aug. 11, 1258. The rumor proved false, but he now refused to abdicate; and when the pope, Urban IV., put him under ban, he invaded the Papal States and conquered all Tuscany after the victory at Montaperto, Sept. 4, 1260. His government, thus consolidated, was vigorous and beneficial to the country. He founded Manfredonia, built the harbor of Salerno, and established schools in all the large cities. At his magnificent court poets and scientists gathered together, and he himself was the most brilliant in the whole circle, a true Hohenstaufen. Meanwhile the pope, Urban IV., and after him Clement IV., put up for sale in Europe the crown of Naples and Sicily, and Charles of Anjou, a brother of Louis IX. of France, was found to be the highest bidder. With a French army he landed in Italy, was crowned in Rome Jan. 6, 1266, and defeated Manfred, by treachery rather than by valor, in the battle of Benevento, Feb. 26, 1266. Manfred himself fell in the battle, and, being under the papal ban, was buried without ceremonies under a heap of stones, afterward called the "rock of roses." His wife and sons were imprisoned—the former for eighteen, the latter for thirty-one years.

Manfredo'nia: a maritime town in the province of Foggia, Southern Italy; on the Gulf of Manfredonia; about 23 miles N. E. of Foggia (see map of Italy, ref. 6–G). The commerce of the port is very considerable, and several European nations have consuls here. It is also an important fishing-station. The town itself is pleasantly situated at the foot of Monte Gargano. The site was chosen by Manfred in 1261, who induced the inhabitants of the large but fever-stricken Siponto to settle here. The Turks destroyed this town in 1620, and it has never recovered its former prosperity. Pop. about 8,330.

Mangalúr, or **Mangalore'**: town of British India; in the Presidency of Madras, on the Malabar coast, in lat. 12° 52′ N. (see map of S. India, ref. 6–C). It is poorly built, but stands in a fertile plain, surrounded with palm-groves and plantations of rice and sugar, and has a large trade in sandal-wood and rice. Pop. 32,100.

Man'ganese [: Fr. *manganèse*: Ital. *manganese*, prob. corrupted from Lat. *mag'nes*, magnet, or from *magnesia*, because of certain resemblances]: a chemical element. The earlier chemists considered the manganese ores as containing some modifications of iron, but Pott in 1740, and others subsequently, Kaim, Winterl, Scheele, and Bergmann, proved that they contained a metal chemically distinct from iron; and Gahn, the master of Berzelius, first obtained the metal manganese at a date not left on record. It was in examining the action of hydrochloric acid on pyrolusite, in the course of his investigation of this very question, that Scheele made the discovery of *chlorine* in 1774.

Manganese occurs widely distributed in nature, principally in the form of the dioxide, MnO_2, commonly called black oxide of manganese, and known to mineralogists as pyrolusite. It occurs also as *braunite*, which is an oxide of the composition Mn_2O_3; as *hausmannite*, Mn_3O_4; *manganite*, $H_2Mn_2O_4$; *rhodocroisite*, $MnCO_3$, etc. The metal is isolated from its oxides by heating them to a high temperature with charcoal; by decomposing a solution of the chloride by means of the electric current; by treating the fluoride with metallic sodium. Manganese is a reddish-white metal with a luster like that of iron. When it contains some iron and carbon it is gray and looks like cast iron. It is about as hard as this, is brittle, and can be powdered comparatively easily. It melts at a temperature between the melting-point of iron and that of platinum. Its specific gravity, according to the method of preparation, is 6·85 to 7·99. It decomposes water with evolution of hydrogen, slowly at the ordinary temperature, rapidly at boiling temperature. It dissolves easily in all dilute acids. It is not at all, or only very slightly, magnetic. Manganese forms valuable alloys with other metals, especially with iron. Pig-iron always contains some manganese. *Spiegel-iron* contains upward of 5 per cent. manganese; *ferro-manganese* contains 20 per cent. or more, and even as much as 86 per cent. Both spiegel-iron and ferro-manganese are used in steel-making (See IRON.) *Manganese bronze* is made by adding manganese to ordinary bronze. The symbol of manganese is Mn, and its atomic weight 54·8. Manganese forms a great variety of compounds. Thus with oxygen it forms the following: MnO, Mn_2O_3, Mn_3O_4, MnO_2, Mn_2O_7. Of the oxides the dioxide, MnO_2, or pyrolusite, is the most common. This occurs in nature in considerable quantities. It is used chiefly in the preparation of CHLORINE (*q. v.*). It is also used in the preparation of OXYGEN (*q. v.*), and for the purpose of decolorizing glass. If added alone to colorless glass it gives it an amethyst color, but when added to poor glass with a green color the two colors neutralize each other, and the glass becomes nearly colorless. Various attempts have been made to economize in the use of manganese dioxide in the prepa-

ration of chlorine, and *Weldon's process* has come into extensive use as a result of these efforts. In the first stage of the manufacture of chlorine, hydrochloric acid acts upon manganese dioxide as represented in this equation:

$$MnO_2 + 4\,HCl = MnCl_2 + 2H_2O + Cl_2.$$

The products are manganous chloride, chlorine, and water. For the preparation of chlorine, the chloride is, of course, of no value; but by Weldon's process it can be brought back again to a condition in which it has the power to give chlorine when treated with hydrochloric acid. It is first treated with lime in solution when it is converted into manganese hydroxide, $Mn(OH)_2$, and calcium chloride is formed at the same time:

$$MnCl_2 + Ca(OH)_2 = Mn(OH)_2 + CaCl_2.$$

When this hydroxide, mixed with lime, is allowed to stand in contact with the air it takes up oxygen, and a compound known as calcium manganite is formed. This has the composition $CaMnO_3$ or $CaMn_2O_5$, and is formed according to one of the following equations:

$$Mn(OH)_2 + Ca(OH)_2 + O = CaMnO_3 + 2H_2O;$$
$$2Mn(OH)_2 + Ca(OH)_2 + 2O = CaMn_2O_5 + 3H_2O.$$

Both these compounds give chlorine when treated with hydrochloric acid. The manganese again appears as the chloride, and can be again converted into the manganite, and so on. In practice, the waste liquor is mixed with calcium carbonate to neutralize the acid. After settling, lime enough is added to precipitate the manganese as hydroxide and to form with this the manganite. Then steam and air are passed into this mixture, when the oxidation takes place, the manganite being formed.

Manganic Acid and the Manganates.—When treated with energetic oxidizing agents in the presence of bases the oxides of manganese form manganates, of which potassium manganate, K_2MnO_4, may serve as an example. In composition the manganates are analogous to the sulphates and chromates, as shown by the formulas:

K_2SO_4.	K_2CrO_4.	K_2MnO_4.
Potassium sulphate.	Potassium chromate.	Potassium manganate.

When a solution of a manganate is treated with an acid the manganic acid is set free and is decomposed at once into *permanganic acid* and manganese dioxide; or, when carbon dioxide is passed into a solution of potassium manganate, *potassium permanganate* is formed. This has the composition $KMnO_4$. It is manufactured on the large scale, and is extensively used in the laboratory, and acts as an oxidizing agent. It is nearly black, with a grecnish luster. Its solution in water has a purple or purplish-red color, according to the concentration. When it gives up its oxygen it becomes colorless in acid solution. The permanganates and manganates are valuable disinfecting agents, and the sodium salts are extensively used under the name of *Condy's fluid.*

Revised by Ira Remsen.

Mange [formed as base to *mangy*, from Fr. *mangé*, liter., eaten, perf. partic. of *manger*, eat]: a cutaneous disease of dogs, horses, cattle, swine, and sheep, distinguished by the presence of *acari* or mites upon the skin, and also marked by scurfiness, itching, heat, and pimples. Sulphur ointments, carbolic-acid washes, corrosive sublimate in weak solution, and decoction of tobacco or of the green leaves of Indian poke or itchweed (*Veratrum viride*) are all useful applications. The afflicted animal should be kept alone, for the disease is contagious. When the mites have been destroyed the animal needs liberal feeding, and perhaps some mild tonic, like iron. A little copperas dissolved in his drink is generally sufficient.

Mangel-wurzel: See Mangold-wurzel.

Mangiagalli, măăn-jĕĕ-aa-gaăl'lĕĕ, Luigi, M. D.: gynæcologist; b. at Mortara, Italy, June 16, 1850; was educated at University of Pavia; was assistant at the Midwives' School, Milan, 1878–82; Professor of Obstetrics at the University of Sassari 1882–84; at University of Catania 1884–88; since 1888 has been director of the obstetrical and gynæcological clinic in the Great Hospital of Milan. He is the author of about forty professional essays in Italian medical journals.

Man'go [from Portng. *manga*, from Tamil *mānkāy*]: the fruit of an East Indian tree, *Mangifera indica*, of the family *Anacardiaceæ*, now naturalized in most warm climates. The tree is widespreading, and affords a dense shade. There are many varieties of the fruit, many of which are very fine for desserts, having an agreeable blending of sweetness and acidity. The fruits of other species of this genus are eaten, but none of the others are valuable. The tree is generally raised from seeds, but the finer varieties are propagated by layering and inarching.

Mangold-wurzel [= Germ., beet-root; *mangold*, beet + *wurzel*, root]: usually written mangel-wurzel in the U. S., and often abbreviated to mangel or mangold; a name adopted into English by farmers and others to designate the larger and coarser varieties of the beet (*Beta vulgaris*), extensively grown as food for domestic animals. (See Beet.) Mangolds are too coarse and rank for human food, and even for cattle they are often harsh and irritant to the bowels when first harvested; but in a few weeks they "ripen" and then they may be fed to all kinds of stock with great advantage, though too liberal feeding is believed to have a diuretic effect. Mangolds need a generous soil, clean culture, and liberal manuring. As much as 35 tons, or 1,200 bush., to the acre have been grown in favorable circumstances.

Revised by L. H. Bailey.

Mang-ka: See Bang-ka.

Man'gosteen [from Malay *mangusta*, the native name]: the fruit of a small tree, *Garcinia mangostana*, of the family *Guttiferæ*, a native of the Spice islands, now grown in many tropical regions, and cultivated in the Eastern Archipelago. The tree becomes about 20 feet high and has some resemblance to the fir, though its leaves are large, oval, and glistening. From the Moluccas it has been introduced into Ceylon and several points of Southern Asia, and even into the Antilles, though not without difficulty. The fruit externally resembles an orange, but is usually brownish red rather than yellow. The outer rind is very thick, rich in tannin, and very astringent and inedible, but it is sometimes used medicinally in dysenteries. The edible portion is a pulp which surrounds the seeds, large and five in number. This juicy pulp is described as having the whiteness and solubility of snow, and a delicate, delicious flavor. This fruit is perfectly wholesome, and is very refreshing in fevers. The tree is highly ornamental.

Man'groves [by analogy of *grove* (referring to its spreading by forming new stems) from Malay *manggi-manggi*, the native name]: shrubs and trees of the family *Rhizophoraceæ*, natives of the muddy coasts, tidal estuaries, and salt marshes of hot countries, where they form dense thickets. *Rhizophora mangle* and *candelaria* are the typical mangroves. The mangrove is found in many tropical regions, and is abundant on the coasts and keys of Florida. The fruit is eatable, the bark useful in tanning. Most of the mangroves are remarkable as invaders of the domains of the sea, which they slowly convert into dry land. Their stems put forth long aërial roots which extend down into the water; the seeds germinate in the fruit, and send down a long and heavy root, which on falling sinks into the mud; and thus the mangrove swamp slowly gains upon the shallow seas, spreading like a banyan-grove. The roots and stems give lodgment and shelter to innumerable bivalves, crabs, and other aquatic animals of different descriptions, while the branches swarm with aquatic birds. The wood of some species is hard, heavy, and useful in the arts, particularly in boat-building. Mangrove-wood is often brought to seaports as part of a ship's dunnage. It is sold as firewood, for which some species are excellent. The bark is also imported for tanner's use, and is useful for some kinds of woodwork. In some countries there are other trees which share the habits and the habitat of the mangrove, as the *Laguncularia racemosa* (family *Combretaceæ*) of the West Indies, Florida, etc. The white mangroves (*Avicennia*) of Australasia, India, South America, etc., are of the family *Myoporaceæ*, and have the habit of true mangroves. The bark of some species (as *A. tomentosa*) is excellent for tanning. The resin, the seeds, and the roots of this species are used as food by the poor in many countries. The *Conocarpus racemosa*, a mangrove of Brazil (family *Combretaceæ*) yields bark for tanning. Zanzibar exports to Arabia great numbers of mangrove poles, called "Zanzibar rafters," in trade.

Mangues: See Indians of Central America.

Manhattan: city; capital of Riley co., Kan. (for location of county, see map of Kansas, ref. 4–H); at the junction of the Big Blue and Kansas rivers; on the Atch., Top. and S. Fé, the Chi., Rock Is. and Pac., and the Union Pac. railways; 48 miles W. of Topeka. It is in an agricultural, fruit and stock raising region, and is noted for its magnesian limestone and cement. It contains marble-works, iron-foundry,

windmill-factory, sash and door factory, and 4 weekly and 2 monthly periodicals, and is the seat of the State Agricultural College. Pop. (1880) 2,105; (1890) 3,004; (1900) 3,438.
EDITOR OF "REPUBLIC."

Manhattan College: an institution in New York city, which began as a secondary school shortly after the arrival in New York city of the Brothers of the Christian Schools in 1853. In 1863 the course of studies was made broader and higher, and the former Academy of the Holy Infancy was incorporated with the University of the State of New York, empowered to confer degrees, and chartered as Manhattan College. The first graduates went forth from its halls in 1866. Its courses are chiefly two: one leading to the degree of bachelor of arts, the other to that of bachelor of science. Besides these departments it includes a polytechnic institute in Fifty-ninth Street, New York city, known as De La Salle Institute, occupying the building formerly known as the Charlier Institute, where special attention is given to preparing students for civil engineering. From its earliest days the college has always offered a business course to those young men who sought immediate preparation for commercial pursuits. The chief affiliations of Manhattan College are St. Joseph's College, Buffalo; Sacred Heart Academy, Classon-on-the-Sound; Christian Brothers' Academy, Irvington; De La Salle Institute, Troy; Christian Brothers' Academy, Albany; and La Salle Academy, Providence. The Alumni Association of the college, numbering over 400 members, is the oldest Roman Catholic society of the kind in the city of New York. C. H. THURBER.

Manhattan, Borough of: See the Appendix.

Manheim: borough (founded in 1762 by Baron Henry William Stiegel, who established here the first glass-works in the U. S.); Lancaster co., Pa. (for location of county, see map of Pennsylvania, ref. 6–H); on the Phila. and Reading railroad; 10 miles N. N. W. of Lancaster. It has large steam flour, saw, and planing mills, foundries, and machine-shops, carriage and cigar factories, and an extensive mill-furnishing plant; is in a rich agricultural region; and contains 2 national banks, with combined capital of $210,000, an attractive public park, and 2 weekly newspapers. Pop. (1880) 1,666; (1890) 2,070; (1900) 2,019. EDITOR OF "SENTINEL."

Mani: See CENTRAL AMERICAN ANTIQUITIES.

Mania: See INSANITY.

Man'ichæism [from Lat. *Manichæ'us* = Gr. Μανιχαῖος, Manichæus, a Manichæan]: a religious system which arose toward the end of the third century in the Persian empire, compounded mainly of Persian Dualism, Buddhism, and Syrian Gnosticism, and using certain Christian ideas as a gloss for a heathen theosophy. Its founder was Manes or Mani, b. at Marderin, Babylon, about 216; who appeared on Mar. 20, 242, as a religious teacher in Babylon, but, being unsuccessful there, he for forty years lived the life of a wanderer. He announced himself as the "Messenger of the True God," and among Christians as the promised Paraclete. Returning to Persia, he made at first a favorable impression upon the king, but was finally crucified by him at Gundesapur, about 277.

Ancient Persian Dualism furnished the fundamental idea of this system. In it good and evil were opposed from eternity, and were represented by light and darkness. The good god, Ormuzd, and his twelve sons, constituting the kingdom of light, were in eternal warfare with Satan and his demons, the kingdom of darkness. Inroads had been made by the latter upon the former, and in order to guard the borderland Ormuzd places over it an Æon (the mother of life), who gives birth to the ideal man; who, assisted by the five pure elements, enters on the contest, but is taken captive. Another Æon (the living Spirit) is now sent to his aid—not, however, in time to prevent the kingdom of darkness from swallowing up part of his luminous essence (the soul of the world). The remaining part of the ideal man—the Jesus Impatibilis—is now transported to the sun. Out of the mixture of the luminous essence, thus absorbed, with the kingdom of darkness, the living Spirit now creates this present visible world, in order that from a process of purification now entered on the particles of light may now regain strength and freedom. From this mixture every man has, besides a soul of light, an evil soul; the former of which is to gain the victory by drawing to itself the particles of light scattered through nature, and especially in the vegetable world. While this purification is being accomplished under the superintendency of the ideal man residing in the sun, and of the living Spirit, the evil demons, on the other hand, are attempting by false religions, as Judaism and heathenism, to bind souls to the kingdom of night. At last the ideal man in the sun—the Christ—descends in a seeming bodily form, and aims by his doctrine to liberate the imprisoned souls of light. He is seemingly killed by demons, but it is only the phantom of his body that is crucified; but his doctrine is misapprehended and misrepresented by his apostles, to restore which to its purity Mani, the promised Paraclete, is sent. He was thus the head of the Church, with apostles, bishops, presbyters, deacons, and evangelists under him. His community or Church was divided into the catechumens or *auditores*, and the elect or perfect; the latter to be supported by the former, while they, the elect, were to practice the most rigorous asceticism and to abstain from marriage and from sins of the mouth, the hand, and the body. Baptism and the Lord's Supper—the former with oil, the latter without wine—were part of the secret ceremonial of the perfect. They had no altars or images. The sun was revered by them merely as representative of the ideal man, or the principle of light. Fasts, prayers, and readings from Mani constituted their worship. Sunday was a festival devoted to the sun; but their great festival was the anniversary of the martyrdom of Mani. The Old Testament they rejected absolutely, and of the New they retained only what had been revised and redacted by the Paraclete, Mani.

In various forms and combinations, and under various names, its main elements were soon after the death of its founder widely diffused through the Roman empire. Africa was its chief seat in the West, and its chief apostle there was Faustus of Mileve, who wrote apologies for it and against Christianity. Through his influence Augustine was for a time captivated with its promises of occult and profounder wisdom, but afterward, disappointed and disgusted with its emptiness, he wrote largely and with great earnestness against it. From Valentinian I. (364–375) the Roman emperors issued frequent and severe edicts against it. In Africa it was also persecuted by the Vandals, and whole shiploads of its adherents (477) were transported by them to the continent of Europe. At the time of Leo the Great (A. D. 440–461) numbers of them were found at Rome. The sect was distinguished by rigorous formal asceticism, but was accused of Antinomian principles, and of the indulgence of secret lusts. The elements and principles of the Manichæan system were diffused through Spain through the Priscillianists, a dualistic sect, which, appearing 380, spread extensively, but was finally suppressed 583. Despite the rigorous measures taken against them in various countries, the elements of their system appear during the Middle Ages in various mystic and Gnostic schools, such as the Paulicians and the Catherini, by whom its doctrines were widely diffused through the south of France and Germany, where successively they established their chief seats. Indeed, the mystery of the origin of evil and the seeming dualism of human nature have ever tended to drive minds in the direction of their speculations, though entirely independent and ignorant of their system. Revised by S. M. JACKSON.

Manid'idæ [Mod. Lat., named from *Ma'nis*, the typical genus; from Lat. *ma'nes*, ghosts]: a family of mammals of the order *Bruta* or *Edentata* and the sub-order *Squamata*. The pangolins, or scaly ant-eaters—as these animals are called—feed principally on termites, and are mostly terrestrial in their habits, although one African species climbs trees. They roll into a compact ball when attacked or frightened. The tail of the long-tailed manis (*Manis longicauda*) contains more vertebræ—forty-six to fifty—than that of any other mammal. They are at once distinguished from all other mammals by the peculiar modification of the integumentary appendages, which are developed as large leaf-like scales arranged in regular rows and simulating the appearance of a pineapple or pine-nut; the body is elongated, with a long, flattened tail, and the scales extend on the tail as well as the head, and sometimes the feet; so much do they mimic lizards that the older authors confounded them with the latter under the name *Lacertus*; the feet are normal in form, and the digits are developed in full number—i. e. five to each foot—but the external are much shortened; the animals, however, are club-footed, and walk on the outer side of the feet. The skull is quite peculiar, depressed conic in outline, with small intermaxillaries; maxillaries short, and with the malar processes declivous; the palatines expanded in front; no malars or lachrymals; a large lachrymal opening; teeth are entirely wanting. The family has about eight

species. They have been by some combined in a single genus, and by Gray divided among five—viz., (1) *Manis*, (2) *Phatagin*, (3) *Pholidotus*, (4) *Pangolin*, and (5) *Smutsia*; the representatives of the first and second (*Manis*), as well as fifth (genus *Smutsia*), groups inhabit Africa, and those of the third and fourth (genus *Pholidotus*), India.

Revised by F. A. Lucas.

Manihiki (mă̆a-nē̆e-hee'kē̆e) **Islands**: a Polynesian group of twelve islands, occupied by the British in 1888. They lie N. of the Society islands and W. of the Marquesas, between lats. 3° 30′ and 13° S. and lons. 150° and 167° W. Area (combined), 53 sq. miles. Pop. estimated at 1,700. The natives are professing Christians. M. W. H.

Manil'a, or **Manilla**: the capital of Luzon and of the Philippine Archipelago; on the west coast of Luzon, lat. 14° 35′ N., lon. 120° 59′ E., on the west shore of the circular Bay of Manila (30 miles across), and at the mouth of the small Pasig river (see map of East Indies, ref. 3–G). The city proper, or *Manila murada*, is surrounded by a wall, and is properly only a large fort containing numerous public buildings. Most of the city lies outside the walls, and includes several suburbs of the natives. The population, according to the report of the Board of Health, May, 1901, was 244,732, made up as follows: Americans, 8,642; Filipinos, 181,360; Chinese, 51,567; Spaniards, 2,383; and other foreigners, 960.

The climate of Manila is hot and wet, but salubrious. The mean temperature is 81° F.; the death rate per thousand in 1900 was 34·47. The city is occasionally swept by the terrible typhoons of the China Sea, and is also subject to frequent earthquakes, some of which are very destructive. The city possesses a well-equipped observatory.

Manila is celebrated for the Manilla Hemp (*q. v.*) or *abaca*, which it exports. Its chief manufacture is that of cigars or cheroots, a state monopoly until 1882, which occupies many thousand workers of both sexes, and exports about 100,000,000 cigars annually.

The city was founded in 1571 by Miguel Lopez de Legaspi, and was surrounded with a wall in 1590. It was invaded by the British in 1762. Commerce with Spain was at first carried on by way of Acapulco in Mexico, and it was not until 1764 that Spanish vessels arrived by way of the Cape. The port was opened to foreign vessels in 1789, but commerce did not really flourish until the privileges of the Royal Company of the Philippines expired in 1834. Since 1880 Manila has been connected with Hongkong by telegraph. See Philippine Islands.

Mark W. Harrington.

Manil'ius, Marcus: Latin poet; wrote a didactic poem in five books, *Astronomica*, which has been preserved, but of his life and age nothing is known, though it is probable that he flourished under Augustus. The first manuscript was discovered by Poggio, and printed at Nuremberg in 1472. Scaliger in 1579, Bentley in 1739, and Jacob in 1846, have published editions based on several manuscripts. There is an English translation by Creech (1697) and a French by Pingré (1786). Manilius shows great learning, but is often obscure and sometimes stilted and forced. There are occasional flashes of genius, and here and there lines which haunt the memory like those of Lucretius, to whom, however, Manilius is as inferior in poetic fire as he is in sustained enthusiasm. In diction he is most indebted to Lucretius and Vergil. It seems singular that the poem should be mentioned by no Roman writer, but in the age of Constantine the Great it was known and used by the author of the Latin treatise on astrology, Julius Firmicus, and Robinson Ellis has found some traces of imitation in earlier writers. See his *Noctes Manilianæ sive dissertationes in Astronomica Manilii* (Oxford, 1891). M. Warren.

Manil'la Hemp [named from *Manila*, capital of the Philippines], or **Ab'aca** [the native name]: the fiber of a plant resembling the plaintain and the banana, *Musa troglodytarum*, belonging to the family *Musaceæ*. It is cultivated principally in the Philippine islands, and the fiber is obtained from the leaf-stalk of the plant. It is largely imported for the manufacture of cordage and canvas, which is of the very best quality, exceeding hemp in durability, but not in flexibility. Old Manilla is used for paper-stock, and makes a wrapping-paper of excellent quality and great strength. See Fiber.

Ma'nioc, Cassa'va, Juca, or **Mandioca** [*mandioca* is from Portug. *mandioca*, from Tupí *mandióg*; *cassava* is from Fr. *cassave*, from Span. *cazabe*, from Haitian *kasabi*]: the half-shrubby euphorbiaceous plant *Janipha manihot* (*Jatropha manihot*, L.), extensively cultivated for food in tropical America and Africa; its original habitat is unknown. At the time of the conquest, it was planted and used by the American Indians from Florida to Southern Brazil, constituting the chief source of food of the agricultural tribes in low and hot lands. The plants are propagated by cuttings. The tuberous roots, which are the only parts used for food, are grated and passed through a sieve (sometimes after maceration in water), and the resulting mass is subjected to pressure. This expels a juice which is very poisonous. A small portion of the poisonous principle remains, but this is very volatile, and is removed by roasting the mass in flat pans with constant stirring. The result is a nutritious and palatable meal, varying in quality according to the mode of preparation, and capable of being kept for a long time. It is eaten in this state or is made into cakes, porridge, etc. Soaked in water and allowed to ferment, it furnishes a mild alcoholic drink, much used by the Indians. Tapioca is the starchy matter precipitated from the poisonous juice; the latter, after boiling, is used as an ingredient of various sauces, and in the preparation of the West Indian dish called pepper-pot. *Janipha aipi*, Pohl, is an allied species, or probably variety, which is free from poisonous qualities, and is eaten as a vegetable, roasted or boiled. Many minor varieties have been described, but most botanists now regard them as modifications of a single species, produced by cultivation. H. H. Smith.

Manipur, or **Cassay**: a feudatory state of India, between Assam and Upper Burma, in lats. 23° 51′ to 25° 45′ N., and lons. 93° 2′ to 94° 40′ E. Area, 7,600 sq. miles. Pop. 221,070, mostly in the central valley—that of the river Namkathay, a tributary of the Kyendwen, and hence of the Irawadi. It is a very mountainous country; the highest points are in the N. (surpassing 8,000 feet), and the heights decrease toward the S. The rivers drain toward the S. to the Irawadi and toward the W. to the Meghna. In the middle of the central valley is Lake Logtak, at an elevation of 2,500 feet, apparently the remnant of an earlier lake of much larger size. It varies much with the season, and empties into the Namkathay river. The climate of the valley is temperate and equable. The nights are fresh in the hot season; in the cold season there are occasional white frosts. The rains are moderate, and the S. W. wind prevails during the year. There are occasional earthquakes, usually slight.

The only ores of value found so far are those of iron. The forests are dense, except in the central valley, and contain the teak, the wild tea-tree, the caoutchouc, the oak, and the ash. The bamboo is common. The elephant, rhinoceros, tiger, leopard, deer, wild buffalo, and monkeys abound. The principal culture is rice, but cotton, oil-seeds, pepper, tobacco, ginger, and Indian wheat are raised, as well as smaller quantities of bananas, pineapples, mangoes, potatoes of superior quality, plums, peaches, and apples.

The inhabitants are of Burman race with Naga intermixture. They profess Brahmanism, and this appears to be a recent introduction. Their language is classified by Cust as Tibeto-Burman. They are emigrants by nature, and are common over Upper Burma, where they are employed as porters and drivers. The capital is Manipur, or Imphal.

The kingdom of Manipur was allied to the Indian Government in 1762, and came under its protectorate in 1826, with an annual allowance of about $3,000 for care of the British-Burman boundary. The revenue of the rajah is $15,000 to $20,000, and the military force numbers about 27,000. The rajah was deposed by the mountaineers in 1891. The chief commissioner of Assam was sent to regulate the matter, when he and his escort and the resident agent were suddenly attacked and killed. More British troops were at once sent, and the chief officers of the rajahship were taken and executed or exiled. Chura Chund, a young relation of the ex-rajah, was placed on the throne and a British officer appointed to administer the state during his minority.

Mark W. Harrington.

Manipur (Burman *Imphal*): the capital of the state of Manipur; 236 miles N. W. of Mandalay, on the Namkathay, river; 2,330 feet above the sea, lat. 24° 44′ N., lon. 94° E. (see map of N. India, ref. 7–K). The city covers a considerable space and is surrounded by a wall. Villages are very numerous in the vicinity, some of them being really suburbs. M. W. H.

Manis: a general name for any member of the family Manididæ (*q. v.*).

Manis'a, or **Manis'sa** (anc. *Magnesia*): town of Asia Minor, Asiatic Turkey; on the Hermos; about 25 miles N. S. of Smyrna (see map of Turkey, ref. 5–D). It is a large city, containing more and finer public buildings, mosques, minarets, public baths, and bazaars than Smyrna, and carrying on an important trade in cotton, grain, and tobacco. This last article is raised in the immediate vicinity of the city, and is considered the best of its kind in Asia Minor. The streets of Manisa are generally protected against the sun by overspreading mats or vines. Pop. estimated at 50,000.

Man, Isle of: an island of Great Britain; in the Irish Sea; 16 miles distant from the nearest point of Scotland, and 27 miles distant from the nearest points of England and Ireland. Its length is 33 miles; breadth, 12½ miles; and area, 145,325 acres, of which two-thirds are cultivated. It is traversed from N. to S. by mountain ranges, whose highest peak, Snaefell, rises 2,024 feet above the level of the sea. The greater part of the island consists of clay; slate, zinc, and, in a lesser degree, copper and iron are mined, while lead is abundant, nearly 5,000 tons being extracted annually. The principal mine, at Laxey, on the east coast, is one of the most important in the United Kingdom. Agriculture and cattle-breeding are pursued to a considerable extent, the climate being very favorable. The fisheries are rich, and afford occupation to nearly 4,000 men and boys, the produce exceeding £60,000 annually in value. The inhabitants are of Celtic race, with an admixture of Scandinavian, and have a language of their own, the Manx—which, however, has been almost entirely supplanted by English. The Isle of Man has a constitution and government of its own. It has its own laws and law officers. The court of Tynwald consists of the lieutenant-governor and council, and the House of twenty-four Keys, or representatives. Since 1866 the latter has been elected by the people every seven years. The armorial bearings of Man are three legs in armor, conjoined at the thighs. Pop. (1891) 55,598. Principal towns, Douglas (the modern capital), Castletown, Peel, and Ramsey. See *The Isle of Man, its History*, etc., by Rev. J. G. Cumming; *History of the Isle of Man*, by Joseph Train; *Surnames and Place-names of the Isle of Man*, by A. W. Moore (1890). Revised by C. K. Adams.

Manistee': city (settled in 1841, incorporated as a city in 1869); capital of Manistee co., Mich. (for location of county, see map of Michigan, ref. 5–H); on Lake Michigan, at the mouth of the Manistee river, and on the Flint and Pere Marquette and the Manistee and N. E. railways; 72 miles N. of Muskegon. It is in the great peach and fruit belt of Michigan; has an excellent harbor; and ships annually 200,000,000 feet of lumber, and large quantities of shingles, lath, pickets, wood, bark, and salt. The river is here navigable for vessels drawing 16 feet of water. The salt interest has been developed rapidly, and the city claims to have the largest vacuum evaporating salt plant in the world, which in 1892 produced 6,295,000 bush. There are numerous steam saw, shingle, and planing mills, foundries and machine-shops, and furniture and other factories. The city has the Holly system of water-works, gas and electric light plants, electric street-railway, high school, 5 public and 5 parochial schools, 14 churches, hospital which cost $85,000, county infirmary, industrial home, driving-park association with grounds covering 23 acres, 2 national banks with combined capital of $200,000, a savings-bank with capital of $50,000, and a daily and 5 weekly newspapers. Pop. (1880) 6,930; (1890) 12,812; (1900) 14,260.

Editor of "Democrat."

Manistique, măn-is-teek': village (first mills erected in 1852, incorporated in 1877); capital of Schoolcraft co., Mich. (for location of county, see map of Michigan, ref. 2–G); on Lake Michigan, at the mouth of the Manistique river, and on the Minn., St. P. and Sault Ste. Marie Railway; midway between Escanaba and St. Ignace. It contains 7 churches, 3 graded public schools, and manufactories of pig-iron, lumber, sash, doors, and blinds, and has large shipping interests and a semi-weekly and 3 weekly newspapers. Pop. (1880) 693; (1890) 2,940; (1900) 4,126.

Editor of "Pioneer."

Manito'ba: a province of the Dominion of Canada, frequently spoken of as "The Prairie Province," the other divisions of Canada's prairie country, Assiniboia, Saskatchewan, and Alberta, being known as the Northwest Territories.

Location and Area.—It is a portion of the territory formerly known as Rupert's Land. In 1870 the Manitoba Act, passed by the Parliament of Canada, defined the boundaries of the new province of Manitobah, as it was at first spelled, which then comprised about 14,000 sq. miles, with a population of about 11,000, chiefly half-breeds. In addition to these, equally divided between men of French and British origin, there was a colony of descendants of Highlanders and a few Englishmen, native Canadians, etc.; also about 220 Indians, the masses of the Crees, Blackfeet, and others being W. of Manitoba. The province extends from 52° 50′ N. lat. to the 49th parallel (the international boundary-line), which separates it from the States of Minnesota and North Dakota, and from the 95th meridian to 101° 20′ W. lon. Area about 80,000 sq. miles, or over 51,000,000 acres.

Physical Features.—The province consists chiefly of prairie land, though extensive tracts are covered with deciduous trees, and at about 30 miles E. of Winnipeg (the capital) begins a region of swamp intersected by ridges and spaces of higher lands, the whole covered with spruce, a small quantity of white pine, tamarack, cedar, balsam-willow (white and red), aspen, and cottonwood, and, where fires have cleared the ground, in some places groves of aspen. It is in the main a flat country, but contains several stretches of high land, such as the so-called Riding Mountains, Turtle Mountain, Moose Mountains, and the Porcupine Hills. There are a great number of lakes in the province, some merely shallow depressions. The principal sheets of water are Lake Winnipeg, 270 miles long and from 20 to 60 miles broad; Lake Winnipegosis, 150 miles long and from 6 to 20 miles broad; and Lake Manitoba, 130 miles long and about 20 miles wide in its broadest part. The principal rivers are the Red, the Assiniboine, and the Winnipeg. The Red river rises in Lake Traverse, Minnesota, and for a long distance forms the boundary between Minnesota and North Dakota. It traverses Manitoba with many short and crooked stretches and empties into Lake Winnipeg. On its course through Manitoba it receives the Rosean and the Assiniboine rivers. In the U. S. it is called the Red River of the North. It is a muddy-colored stream, between banks of loose, pliable soil, and is liable to occasional freshets. It is high in the spring, but has cut itself so wide a channel that toward the end of the fall it is hardly navigable even for flat-bottomed steamboats. The Assiniboine rises a little to the N. W. of Manitoba, but the greater part of its crooked course is within that province, where it receives numerous smaller streams, the chief ones being the Little Saskatchewan, which unites with it near the city of Brandon, the Qu'appelle, the Shell, the Birdtail, and the Souris. The Winnipeg river flows out of the north end of Lake of the Woods, and empties into Lake Winnipeg near its southeast corner. It is a rocky, rapid river, with over thirty falls and rapids between the two lakes. All the waters of Manitoba flow into Lake Winnipeg, and thence through the Nelson river into Hudson Bay and the North Atlantic.

Geology.—The only minerals yet discovered are coal and, in Lake Winnipeg, a deposit of iron. The coal is a lignite, in some sections better than in others. It is largely used for household purposes. In Lake of the Woods, touched by the east boundary of the province, gold has been discovered and two mines are in operation.

Soil and Productions.—The soil is generally a loam on a clay bed, particularly rich in the valleys of the rivers. In some parts it is lighter and dryer. Here and there are unproductive alkaline spots or sandy hills. Every kind of root and vegetable common to temperate climates grows luxuriantly. Grain of all kinds ripens well; the Manitoba No. 1 hard, the highest grade of red Fyfe wheat, famous throughout the world, fetches the highest price in the London market. Large fruits do not prosper, but currants and berries yield well. In the woods are found wild grapes and plums. A yield of 3 tons of wild hay to the acre is not unusual. The total production of cereals in 1899 was 56,619,764 bush., of which 27,922,230 bush. were wheat and 23,318,378 were oats; of potatoes and other root crops, 5,896,503 bush.

Fauna.—There are many varieties of birds, ravens being the only ones that remain through the winter. The song-sparrow, the American robin, and the meadow-lark are the principal songsters. Wild fowl are in great abundance, including the swan, merganser, goose, sheldrake, duck, snipe, pelican, and plover. The Canada goose, the Arctic goose or wavy, and the laughing-goose are the most common. There are about twenty varieties of duck and three of snipe. Hawks, owls, eagles, and other smaller birds of prey are in all sections of the country. Prairie fowl are plentiful. The ruffed grouse or willow-partridge is common, and the pine

partridge is found in the more thickly wooded country. Bisons in a wild state are not now found in Manitoba. Elk (wapiti) are killed in the wilder parts, the Virginia deer is common, and in some parts of the wooded districts caribou are obtained. There are two kinds of wolves—the prairie-wolf, or coyote, and the larger and fiercer timber-wolf. The bear, fox, beaver, mink, and other fur animals, though rapidly decreasing wherever settlement is made, are still found in the province, the eastern and northern portions of which, being heavily wooded and sparsely settled, afford quiet retreats.

Climate.—The climate is cold in winter, the mercury sometimes, though rarely, falling to −50°. The province is very healthful, and not subject to violent storms. The winter begins about the close of November and lasts until April; the spring is short; summer lasts from June to the beginning of September; and the autumn is a delightful season, sometimes broken with rain. In a period of eleven years the maximum temperature was 95·34°; minimum, 40·51°; and mean, 33·06°. The mean annual rainfall was 16·977 inches; mean snowfall, 52·72 in.; mean number of days on which rain fell, 69; of snowfall, 45. Navigation opened between Apr. 12 and May 2, and closed between Oct. 28 and Nov. 21.

Divisions.—Manitoba is divided into seventy organized rural municipalities (besides cities, towns, and unorganized districts), each governed by a reeve and council, and for electoral purposes is divided into forty divisions for the provincial legislature, and seven divisions for the House of Commons at Ottawa. These seven are Winnipeg, Selkirk, Lisgar, Brandon, Marquette, Macdonald, and Provencher.

Principal Cities.—The principal cities, with population in 1891, are Winnipeg, the capital of the province, 25,642 (1896, 38,000); Brandon, the most important grain-market, 3,778 (1896, 5,500); and Portage la Prairie, on the Assiniboine river and three railways, 3,363 (1896, 4,000).

Government.—The government of the province is administered by a lieutenant-governor, appointed by the governor in council of Canada for a term of five years, with an executive council of five members, belonging to the legislature and responsible to it, and a single house of representatives called the legislative assembly, composed of forty members elected by popular vote for a term of four years. The province sends two senators (appointed for life by the federal cabinet) and seven popularly elected members of the legislature to the federal Parliament at Ottawa. There are a chief justice and three puisne judges of the court of queen's bench, and three county court judges.

Population and Races.—In 1881 there were 65,954 inhabitants, but 3,694 were taken off and added to Ontario when the boundary was changed; in 1891 there were 152,506, of whom 108,017 were Canadian born and 44,489 of foreign birth (England and Wales, 16,017; Scotland, 7,443; Ireland, 4,553; U. S., 3,063; Germany, 857; Scandinavia, 3,746; Russia, 6,220; France, 474; and miscellaneous, 2,116). There were also 4,236 Indians on reservations.

Industries.—Outside of Winnipeg the principal industry is farming in its several branches and the various occupations connected therewith. There is some lumbering, but the principal supply is from the country round the Lake of the Woods. In the city of Winnipeg and its suburb, St. Boniface, across the Red river, there is a variety of manufacturing industries, though as yet these are on a small scale. Winnipeg has a large number of branches of the principal banks of the Dominion, as well as of Canadian, English, and U. S. insurance and loan and mortgage companies. In the other cities and towns banks, insurance companies, and loan companies are represented by branches or agents. In 1894 there were in all twenty-eight local and branch banks and twenty-five private banking firms. At a great number of points there are grain elevators, the property sometimes of the railways and sometimes of private firms, and at every such point there is a market for grain, with close market quotations. Mills at Winnipeg, Keewatin, and other places through the province, constitute a large flour interest.

Finance.—Manitoba derives its means from a subsidy granted by the Dominion under the British North America Act on a basis of population, as is done in the case of all the provinces. The amount apportioned to Manitoba is $483,687. In addition, the province derives revenue from licenses, law stamps, succession duties, lands, and registration fees.

Means of Communication.—Besides the ordinary highways between municipalities, Manitoba is well served with railways. The Canadian Pacific Railway Company's main line enters the province near the north end of Lake of the Woods, and, passing through Winnipeg, traverses the province in a westerly direction, continuing on to the Pacific coast at Vancouver. This company has five branch lines radiating from Winnipeg, besides others in the Northwest Territories. In addition to these, the Northern Pacific Railway has three branches in the province connecting with its system in North Dakota and Minnesota, and the more northern portion of the province is served for about 225 miles from Portage la Prairie by the Manitoba and Northwestern Railway. There are no canals nor river connections, except so far as the lower part of Red river is served by the steamboat that at intervals goes from Selkirk on the west bank to the Grand Rapids of the Saskatchewan and the points on Lake Winnipeg.

Churches.—There is no state church in Manitoba, each denomination supporting its own ecclesiastical establishment; but there are a great number of churches throughout the province. The Roman Catholic Church is presided over by an archbishop, under whose jurisdiction are all the churches, convents, and schools of the denomination in the province. The Anglican Church has an archbishop at its head, who in 1894 was primate of all Canada; and the Presbyterian, Methodist, and other denominations are well organized.

Schools.—The separate school system was maintained in Manitoba till 1888, when the provincial legislature passed an act confining the government subsidy to undenominational schools. This act was challenged as being unconstitutional, but was sustained by the local court of queen's bench, whose decision was reversed by the Supreme Court of Canada, but reaffirmed by the judicial committee of the privy council in London, the final court of appeal. A "Remedial Act" (possible under the constitution of Canada) was demanded by the advocates of separate schools, but in 1895 had not been granted. There are four denominational collegiate institutions in Winnipeg—the Anglican, Roman Catholic, Methodist, and Presbyterian—and a college for women, an undenominational university, organized only for the conferring of degrees. The amount of money paid for education by the government is about $200,000 annually. There were in 1898 1,250 schools, 1,301 teachers, an enrollment of 44,070, and an average attendance of 24,958.

Charitable and Penal Institutions.—There is one penitentiary in Manitoba, 16 miles from Winnipeg; a lunatic asylum in the city of Brandon, and one at Selkirk; and court-houses and jails at these cities and at Portage la Prairie, the centers of the three judicial districts. There is a general hospital at Winnipeg, mainly supported by voluntary contributions, though the provincial government makes an annual grant to it and payment is made by patients in private wards. There are hospitals in St. Boniface, Brandon, and Morden, a deaf and dumb asylum and a Children's Home in Winnipeg, and a Home for Incurables in Portage la Prairie. The deaf and dumb asylum and the Home for Incurables are supported by the provincial government, the other institutions by municipal and government grants and voluntary contributions.

History.—The history of Manitoba properly dates back to 1812, when Lord Selkirk obtained a grant of land from the Hudson Bay Company, then owner and ruler of the country under a charter granted by Charles II. He then sent out viâ Hudson Bay a company of Sutherlandshire Highlanders. These, after various vicissitudes, settled at Kildonan along the west bank of Red river, about 4 miles N. of what is now Winnipeg. Frequent disturbances took place between the employees of the company and the Northwest Fur Company, in one of which Gov. Semple of the first-named company was killed; but on the amalgamation of the companies and the peaceful establishment of Fort Garry as a central trading-post at the junction of the Red and Assiniboine rivers, a settlement of French half-breeds, English half-breeds, discharged pensioners of the British army, missionaries, and retired employees of the company sprang up, radiating from the fort up and down the two rivers. In 1867 arrangements were made for surrendering the territorial possessions of the Hudson Bay Company to the British Government, to be transferred by it to Canada, the nominal consideration being £300,000 in cash, certain reservations around the company's posts, and one-twentieth of that part of Rupert's Land known as the "fertile belt." The transfer being made, the clerical advisers of the French half-breeds—alarmed at a possible influx of English-speaking Protestants from Ontario—induced a section

of the French half-breeds to resist the entry of William Macdougal, whom Canada had sent up as first governor, together with the public officers accompanying him. Having compelled him to return to Pembina, on the frontier of the U. S., the insurgents, headed by a half-breed named Louis Riel (subsequently hanged for inciting another rebellion in the Northwest Territories in 1885), seized Fort Garry, imprisoned the officers and other Hudson Bay Company's prominent settlers, and ended by shooting a Canadian named Thomas Scott, whom they had tried and condemned by a so-called court martial. Riel established a provisional government, which lasted until a force was sent up under Col. (now Lord) Wolseley, viâ Lake Superior and the Hudson Bay Company's bateaux route. This force, a regiment of British infantry (Sixtieth Rifles), two battalions of Canadian volunteers, and a few artillerymen and engineers, arrived in the Red river on Aug. 22, 1870, and, landing near Fort Garry on the 24th, took possession of the place and handed over the civil government to Donald A. Smith, the chief of the Hudson Bay Company. In a few days a new lieutenant-governor (Adams Archibald) arrived from Ottawa, and, being duly installed, the constitutional life of Manitoba commenced under the Canadian Act of Parliament (1870), called the Manitoba Act. The names of the several lieutenant-governors who have held this office since the restoration of order by the Red river expedition are Adams Archibald, Alexander Morris, Joseph Cauchon, James Cox Aikens, and John C. Schultz.

The first election for the provincial legislature took place on Mar. 2, 1871, and for the members for the House of Commons on Dec. 27, 1870. In 1871 Wemys Simpson was sent to negotiate treaties with the Indians, and since the completion of this duty there has been no interruption of peace. In 1878 the government of Canada began the construction of a line of railway from Emerson, on the international boundary, to Winnipeg, and a line from Thunder Bay, on Lake Superior, to Winnipeg. The rapid construction of the Canadian Pacific Railway and its many branches quickly converted the province into a great wheat-growing district, with market centers at all the principal railway points.

AUTHORITIES.—Hargraves, *Red River*; parliamentary documents; *Manitoba Free Press* (newspaper); Bryce, *Manitoba, its Infancy, Growth, and Present Condition*; *The Western World*; Macoun, *Manitoba and the Great Northwest.* MOLYNEUX ST. JOHN.

Manitoba Lake (Ind. Manitowapan, or Straits of Manitou): one of the three great lakes of the province of Manitoba, lying between Lake Winnipegosis and Lake Winnipeg. It is in lat. 50° to 52° N., lon. 98° to 100° W.; 80 miles long by 20 broad; area about 1,800 sq. miles; of very irregular form; 751 feet above the sea, and 121 above Lake Winnipeg, into which it empties through St. Martin's Lake, and 20 feet below Winnipegosis, from which it receives the drainage through the short Waterhen river. Otherwise it receives but little drainage. The shores are for the most part unsettled; the few residents are mostly Scandinavians. M. W. H.

Man'itou [Amer. Indian]: among the North American Indians of Algonquin stock, a name applied to any object of religious reverence or dread, whether it be a divinity, an evil spirit, a fetich, or an amulet. *Gitche Manitou* (the Great Spirit) is the Supreme Being.

Manitou'lin Islands [corruption of Indian *Manitowin*, divinity]: a line of rocky islands in the north end of Lake Huron, continuous geologically with the Saugeen peninsula, separating Lake Huron proper from Georgian Bay and the North Channel. They are, in order from the E., Fitzwilliam, Grand Manitoulin, Cockburn, or Little Manitoulin, and Drummond islands. The first three belong to Ontario, the last to Michigan. The largest and most important is Grand Manitoulin. It is very irregular in outline, having many deep bays, especially from the N.; is about 80 miles long by 20 broad; has a rough, irregular surface, innumerable lakes and streams, and is covered with forests of pines, spruces, and cedars. The largest lake is Tecumseth, area 55 sq. miles, near the center of the island. It has three different outlets to three distinct bays. Cockburn island has a diameter of 7 miles. The two islands together have an area of 1,182 sq. miles, and a population of about 2,000, more than half being Indians. The latter belong to the Algonquin race. The soil is poor and the climate cold for crops. The lakes and ponds abound in fish, and the islands make an agreeable summer resort. MARK W. HARRINGTON.

Manitou Springs: town; El Paso co., Col. (for location of county, see map of Colorado, ref. 4–E); on the Denver and Rio. G. and the Col. Midland railways; 6 miles N. W. of Colorado Springs, the county-seat. It is in the foot-hills at the base of the famous Pike's Peak, and is completely surrounded by hills, on which are many tasteful cottages. Six mineral springs, the Shoshone (sulphur), the Navajo and Manitou (both resembling seltzer-water), the Ute (soda), the Ute (iron), and the Little Chief, give the town its name. The town has an independent system of water-works, and an electric-light plant, both completed in 1887, a new union public school, several private schools, 4 churches, 5 large and many small hotels, numerous boarding-houses, and a weekly newspaper. Pop. (1880) 422; (1890) 1,439; (1900) 1,303. EDITOR OF "JOURNAL."

Manitowoc': city; capital of Manitowoc co., Wis. (for location of county, see map of Wisconsin, ref. 5–F); on Lake Michigan, at the mouth of the Manitowoc river, and on the Chi. and N. W. Railway; 75 miles N. of Milwaukee. It has a good harbor, direct steamboat communication with Milwaukee, Wis., and Ludington, Mich., and a considerable lake trade. There are foundries, machine-shops, tanneries, ship-yards, and edge and agricultural tool works, a subscription library, and six weekly newspapers. Pop. (1880) 6,367; (1890) 7,710; (1900) 11,786. EDITOR OF "PILOT."

Manizales, mäă-nēĕ-zaa′lās: a city at the extreme southern end of the department of Antioquia, Colombia; on a plateau E. of the river Cauca, 6,988 feet above the sea. It is in the midst of a rich grazing district, on the road leading from the upper Cauca to Antioquia, and near a pass in the Andes by which easy access is obtained to Bogotá. It was founded in 1848, and has had a more rapid growth than any other city of Colombia, though it suffered greatly from the earthquakes of 1875 and 1878. Owing to its position it is the military key to the Cauca valley, and has been a point of great importance in the civil wars of that region. Manizales has a large trade in cacao, which is brought from the plantations of the upper Cauca. On the side of the Ruiz volcano, near the city, there are hot springs, much used by invalids, and the water is brought in pipes into the city itself. Pop. (1892) 14,603. H. H. SMITH.

Manka'to: city; capital of Blue Earth co., Minn. (for location of county, see map of Minnesota, ref. 11–D); on the Minnesota river, at the mouth of the Blue Earth river, and on the Chi., Mil. and St. P., the Chi. and N. W., the Chi., St. P., Minn. and Om., and the Minn. and St. L. railways; 86 miles S. by W. of St. Paul, 140 miles W. of Winona. It is in an agricultural and timber region, with extensive stone quarries in and around it. The industries comprise the manufacture of woolen goods, linseed oil, flour, cement, fiber ware, brick and lime, foundry and machine-shop products, furniture, pipe, and candy. There are 3 national banks with combined capital of $350,000, a State normal school, public library, board of trade, and 2 daily, 6 weekly, and 2 monthly periodicals. Pop. (1880) 5,550; (1890) 8,838; (1900) 10,599. EDITOR OF "FREE PRESS."

Mankind: See MAN.

Manley, Mrs. DE LA RIVIÈRE: author; b. in the island of Guernsey in 1672. She published several scandalous novels, the best known of which is *Secret Memoirs and Manners of Several Persons of Quality of Both Sexes: from The New Atlantis* (1709), a licentious satire on distinguished public characters. The author published a key to this, entitled *Memoirs of Europe* (1710). The printer and publisher of *The New Atlantis* were arrested by warrant from the Secretary of State. Among Mrs. Manley's other books were a collection of letters, and *The Power of Love: in Seven Novels* (1720). D. in 1724. H. A. BEERS.

Mann, HORACE, LL. D.: educationist and philanthropist; b. at Franklin, Mass., May 4, 1796; graduated at Brown University 1819; studied law at Litchfield, Conn.; was admitted to the bar 1823, and settled in Dedham, Mass., whence he removed to Boston in 1833. He early entered political life, having been elected to the Assembly in 1827, and six years later to the Senate of Massachusetts. Of the latter body he became president in 1836. He identified himself from the first with all good causes, and had been selected to codify the laws of the State when his life work came to him. In 1837 the Legislature appointed a board of education to revise and reorganize the common-school system of the State. Mr. Mann was chosen secretary to this board. The pay was inadequate, and the duties most try-

ing; nevertheless he took up the work with joy. Unselfishly putting aside the most flattering opportunities in other directions, he devoted himself with absolute singlemindedness to the reform of the schools of Massachusetts. His twelve years of service in this office were epoch-making, not only in the educational history of Massachusetts, but in that of the U. S. as well. He sought to bring about needed reforms chiefly in three ways—1, by a series of teachers' conferences; 2, through a periodical, *The Common-school Journal*, which he founded and edited himself; 3, most important of all, through the annual *Report* that he was required to make to the board. The twelve volumes of these *Reports* (1837–48) are educational classics. In 1843 he visited Europe for the purpose of studying foreign school systems at first hand. The results of this tour of inspection, as published in his seventh report, stirred up bitter hostility. Indeed, all his work was accomplished in the face of uncompromising opposition from nearly all possible sources. In 1848 Mr. Mann was elected to Congress to fill the vacancy caused by the death of John Quincy Adams, and was reelected in November of the same year and again in 1850. In the opinion of many, one of his purposes in going to Washington was to aid in establishing a national bureau of education, but in this he was not successful, if he really cherished such a hope. From 1852 until his death, Aug. 2, 1859, he was president of Antioch College, Yellow Springs, O. The supreme work of Mr. Mann was the remodeling of the school system of Massachusetts. He introduced many of the features which are now widely accepted as invaluable elements of the school systems of the U. S., and to him as much as to any one person is due the founding of normal schools in the U. S. "Rarely have great abilities, unselfish devotion, and brilliant success been so united in the course of a single life." In addition to the *Reports*, his chief published works are: *Lecture on Education* (Boston, 1840); *Lectures on Education* (Boston, 1845); *On the Study of Physiology in Schools*; *A Few Thoughts for a Young Man* (1850); *Slavery, Letters, and Speeches* (1851); *Lectures on Intemperance* (1852); *Powers and Duties of Woman* (1853); besides numerous lectures and addresses. See his biography by his widow, Mary Peabody Mann (Boston, 1865); Boone, *Education in the United States* (1890); Gordy, *Rise and Growth of the Normal-school Idea in the United States* (1892).

C. H. Thurber.

Mann, Mathew Derbyshire, A. M., M. D.: gynæcologist; b. at Utica, N. Y., July 12, 1845; graduated at Yale in 1867; at the medical department of Columbia College in 1871; formerly was lecturer in the College of Physicians and Surgeons, New York, and in the Yale Medical School in 1893; is Professor of Gynæcology and Obstetrics in the University of Buffalo, New York. He is the author of a *Text-book on Prescription Writing* (1879); and editor of *The American System of Gynæcology* (1887–88).

Mann, William Julius, D. D., LL. D.: theological professor and author; b. in Stuttgart, Germany, May 29, 1819; was educated at the University of Tübingen; settled in the U. S. in 1845, following his schoolmate and life-long friend, Dr. Philip Schaff; was pastor in Philadelphia, first in the Reformed (German) church 1846–50, and from 1850 to 1884 of Zion's and St. Michael's church, the mother of the Lutheran churches of Philadelphia; was professor in the Theological Seminary (now at Mt. Airy, Philadelphia) from its establishment in 1864 until within a few months of his death in Boston, Mass., June 20, 1892. He was coeditor with Dr. Schaff of *Der Deutsche Kirchenfreund*, contributed to *Herzogs Real-Encyclopädie*, and was a constant writer to the German periodical press in the U. S. and Europe. His two most important works are *The Life and Times of Henry Melchior Muhlenberg* (Philadelphia, 1887), and, with the aid of Dr. Beale M. Schmucker, and Dr. W. Germann, an annotated edition of the so-called *Hallesche Nachrichten* (the reports of the founders of the Lutheran Church in Pennsylvania to the Orphan House in Halle). Of this work one volume has appeared (Allentown, 1886). See *Memorial*, by Dr. A. Spaeth, and *Memoir*, by Emma T. Mann, both published in Philadelphia in 1893.

Henry E. Jacobs.

Manna [= Lat. = Gr. μάννα, from Heb. *mān*: Arab. *mann*, manna, liter., favor. Cf. Heb. *man*, gift]: the concrete juice of a small tree native in the countries on the Mediterranean coast, the *Fraxinus ornus*. The manna of commerce is obtained exclusively from Sicily. It is in the form of cream-colored, brittle, spongy flakes of an agreeable sweet taste, and contains a large percentage of a peculiar sugar called *mannite*. Manna is a gentle laxative, and occasionally is used as such in medicine, especially in the case of children, from its pleasant taste. It is an ingredient of the old "black draught." The manna (Arab. *mon*) of the Sinaitic peninsula is found, during the month of June only, on the twigs and branches of the shrub *turfa*, whose botanical name is said by Porter to be *Tamarix gallica*. Small pots of it are kept for sale at the convent of Mt. Sinai. The present annual yield of the peninsula is 500 or 600 lb. only. See Food.

Manna-grass: the popular name for species of *Glyceria*, grasses growing in wet places in the temperate regions of nearly every quarter of the world. *G. fluitans* (called also floating manna-grass) is prized as affording abundant hay of very fair quality; and in Poland and parts of Germany the nutritious and palatable seed is collected and used as a grain under the name of Polish manna.

Manners, John James Robert, K. G., LL. D., D. C. L., P. C., by courtesy Lord John Manners: statesman; b. at Belvoir Castle, Leicestershire, England, Dec. 13, 1818; son of the fifth Duke of Rutland; educated at Eton and at Trinity College, Cambridge; was a member of the Camden Society, and took a deep interest in church restorations. He was in Parliament 1841–47 for Newark, 1850–57 for Colchester, and 1857–74 for North Leicestershire. In 1852 he became first commissioner of public works, and again in 1858 and 1866, in Lord Derby's administration. When the Conservatives again came into power, in 1874, he was appointed postmaster-general, and he held that position until they went out of office in 1880. In the brief Salisbury government of 1885 he took the same office, and in the ministry of 1886–92 he was chancellor of the duchy of Lancaster, also under Lord Salisbury. By the death of his brother, in 1887, he succeeded to the title of Duke of Rutland. He has published two volumes of poems, and some other works.

Mannhardt, maan'hărt, Johann Wilhelm Emanuel: writer on mythology and ethnology; b. in Friedrichstadt, in Sehleswig, Germany, Mar. 26, 1831; studied in Berlin and Tübingen; became editor in 1855 of the *Zeitschrift für deutsche Mythologie und Sittenkunde*; was privat docent in Berlin 1858; but subsequently retired on account of ill-health. D. in Dantzic, Dec. 25, 1880. Mannhardt's work was exclusively devoted to Germanic mythology and comparative ethnology. Of his scientific contributions may be mentioned *Wald- und Feldkulte* (2 vols., 1877), and especially his *Mythologische Forschungen*, published after his death by Patzig (Strassburg, 1884). See *Biographische Jahrbücher* (vol. iv., 1881, pp. 1 ff.).

Alfred Gudeman.

Mannheim, maan'hīm, or **Manheim**: town in the grand duchy of Baden, Germany; at the influx of the Neckar in the Rhine; 53 miles S. of Frankfort (see map of German Empire, ref. 6–D). It is well built, very regularly laid out, and contains a ducal palace, which is one of the largest buildings of the kind in Germany, and several fine churches. Its manufactures are important, and its trade is large and increasing. It is connected by a fine bridge (built 1865–68) with Ludwigshafen, on the opposite bank of the Rhine, and has a good harbor and extensive docks. Pop. (1900) 140,384.

Mannheim Gold: See Brass.

Manning: town; Carroll co., Ia. (for location of county, see map of Iowa, ref. 5–E); on the Chi. and N. W. and the Chi., Mil. and St. P. railways; 42 miles N. W. of Des Moines. It is in a farming region and is a grain and live-stock market. Pop. (1890) 1,233; (1900) 1,169.

Manning: town (county set off from Sumter 1885, town founded as the county-seat in 1886); capital of Clarendon co., S. C. (for location of county, see map of South Carolina, ref. 6–F); on the Central Railroad of S. C.; 70 miles E. by S. of Columbia, 77 miles N. W. of Charleston. It is in an agricultural and lumbering region, and has several churches and schools for white and colored people, and two weekly newspapers. Pop. (1890) 1,069; (1900) 1,430.

Editor of "Times."

Manning, Daniel, LL. D.: editor and politician; b. in Albany, N. Y., May 16, 1831; entered the office of *The Albany Argus* as an apprentice in 1842, and rose through all the various stages of the service till he in 1865 became associate editor, and in 1873 controlling proprietor. At the same time he took a very active part in politics, became a member of the Democratic State committee in 1876, and was its secretary in 1879–80 and its chairman in 1881–84. He was a delegate to the national Democratic conventions of 1876, 1880, and 1884, was chairman of that body in 1880,

and of the New York delegation to the convention of 1884. He was appointed Secretary of Treasury in Mar., 1885, by President Cleveland; resigned in Apr., 1887, on account of ill-health, and became president of the Western National Bank of New York city. D. at Albany, Dec. 24, 1887.

Manning, Henry Edward, Cardinal: b. at Totteridge, Hertfordshire, England, July 15, 1808; studied theology at the University of Oxford, and was appointed rector of Lavington and Graffham in Sussex in 1834, and Archdeacon of Chichester in 1840; but the Gorham case occasioned him to give up in 1851 his preferments in the Anglican Church and join the Roman Catholic. After residing for several years in Rome, he was ordained a priest in 1857, and appointed rector of St. Helen and St. Mary's, Bayswater, and on the death of Cardinal Wiseman in 1865 he was nominated Archbishop of Westminster. He was created a cardinal Mar. 15, 1875. He founded the Roman Catholic University of Kensington, Oct. 15, 1874, and took a very active part in the Council of the Vatican, defending the dogma of the infallibility of the pope. Cardinal Manning was a Christian socialist, public spirited, broad in his sympathies, and a friend of the laboring classes. D. Jan. 14, 1892. The most prominent of his writings are *The Eternal Priesthood*, *Religio Viatoris*, *The True Story of the Vatican Council*, *Independence of the Holy See*, *Four Great Evils of the Day*, *Fourfold Sovereignty of God*; *The Temporal Mission of the Holy Ghost* (1865); *The Temporal Power of the Pope* (1866); *England and Christendom* (1867); *Petri Privilegium* (1871); *Cæsarism and Ultramontanism* (1874); *The Internal Mission of the Holy Ghost* (1875); *Sin and its Consequences* (1876); *The Catholic Church and Modern Society* (1880), etc. Cardinal Manning replied to Mr. Gladstone's *Expostulation*, in *The Vatican Decrees in their Bearing on Civil Allegiance* (1875).

Mannite: See Manna.

Manoa: See El Dorado.

Manoel do Nascimento, mă-nō-el'dō-nă-sĕ-men'tō, Francisco: poet; b. in Lisbon, Portugal, Dec. 21, 1734. Though he was ordained priest in 1754, his intellectual sympathies were with the rationalists of his time, and he was an admirer of the French Encyclopædists. In consequence he was accused before the Inquisition by his former teacher of Latin, Antonio Felix Mendes, of reading and disseminating prohibited books. This was June 22, 1778, and on July 13 Manoel fled from Portugal to France, never to return. In Paris he wrote and published, under the name *Filinto Elysio* (by which he is better known than by his own), the greater part of his poetical works. His first model was Horace, and his experiments with Horatian meters, which curiously anticipate those of the modern Italian "Veristi," give him an important place in the history of the poetic art in Portugal. His opinions are always rationalistic in religion and liberal in politics, as may be seen in his ode to Washington. He excels rather in perfection of form than in poetic enthusiasm or imaginative impulse. Living in Paris during the beginnings of the Romantic movement in France, he saw the possibilities of this remarkable change of taste, and tried to make it known to his countrymen by translating into Portuguese Chateaubriand's *Martyrs* and Wieland's *Oberon*. He also made a version of La Fontaine's *Fables*. See *Obras completas de Filinto Elysio* (2d ed., 11 vols., Paris, 1817–19); *Obras, etc.* (new edition, ed. by Solano Constancio, 22 vols., Lisbon, 1836–40). D. in Paris, 1819. A. R. Marsh.

Man-of-war Bird: See Frigate-bird.

Manom'eter: See Pneumatics.

Manrique, mă-ree'kā, Jorge: Spanish poet. The date of his birth is unknown; he was killed in 1479 in a skirmish during an insurrection against the Spanish king. The son of Rodrigo Manrique, Count of Paredes, and the nephew of Gómez Manrique, both of whom were also poets (see the *Cancionero de Gómez Manrique*, ed. by D. Antonio Paz y Mélia, 2 vols., Madrid, 1885–86), he belonged to one of the oldest and most famous families of Spain. We have from him several love poems, printed in the *Cancioneros*, and, what his fame rests upon, a poem in *coplas de arte mayor* upon the death of his father in 1476. This work is commonly known by the simple title of *Coplas de Manrique*, as well befits its character, for few poems in the Spanish language are more simple, more sincere, or more profoundly moving. The *Coplas* were first printed in 1492, and at once produced a deep impression. They have often been printed since, both alone and in the *Cancioneros*. In the sixteenth century it became the fashion to accompany them with commentaries, or *glosas*, whether in prose or verse, no less than five such having come down to us. For a time these *glosas* much interfered with the popularity of the original poem. The *Coplas* are printed in volume xxxv. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1872); also with an English translation by H. W. Longfellow (Boston, 1833; the translation often since, in all editions of Longfellow's *Works*). A. R. Marsh.

Mansart, măn'saar', Jules Hardouin: architect; b. in Paris, Apr. 16, 1646; son of the painter Raphael Hardouin, and grand-nephew of Nicholas F. Mansart, from whom he took the name by which he is known. One of his earliest works is the Cathedral of Blois, a curious piece of belated Gothic. He was employed by the king's officers to erect pavilions at the five angles of the château at St.-Germain-en-Laye, but these were never completed, because Louis XIV. gave up St.-Germain as a residence about 1680, and they have since been destroyed. He was in great favor with the king, a member of the Academy of Fine Arts from its commencement, and architect of the king by special order, before the great undertaking of his life, the Château of Versailles, upon which he began to work about 1678. He built, during the same years, the royal château and pavilions at Marly, was made a noble in 1683, was named first architect of the king soon after, and in 1693 received the order of St. Michael. Constantly engaged upon the most important work, he was still the representative of a style and a way of looking at architectural problems which show little inspiration and little originality. These, however, were not the virtues of the art of the reign of Louis XIV.; Mansart is a perfect embodiment of the tendencies of his age. D. at Marly, May 11, 1708. Russell Sturgis.

Mansart, Nicholas François: architect; b. in Paris, Jan. 23, 1598. His brother-in-law, Germain Gauthier, was an architect of standing, and Mansart may have studied with him. His early work was in Paris, but has perished. The Hôtel Carnavalet, in which is now the Museum of the City of Paris, took its present shape under his direction. The Hôtel Toulouse, now the Bank of France, was his work in its original form. About 1635 he began the wing of Gaston d'Orleans at the Château of Blois, a building which, though overshadowed by the superior interest of the earlier parts of the château, has great value in its peculiar style. He was constantly occupied till his death in important work in Paris and elsewhere, and became titular architect of the king and member of the council of state. D. in Paris, Sept. 23, 1666. Russell Sturgis.

Man'sel, Henry Longueville, D. D.: metaphysician; b. at Cosgrove, Northamptonshire, England, Oct. 6, 1820; was educated at Merchant Taylors' School and at St. John's College, Oxford, where he became a fellow in 1842; was ordained priest of the Anglican Church 1845; became reader in Moral and Metaphysical Philosophy at Magdalen College, Oxford; delivered in 1858 the Bampton lecture on *The Limits of Religious Thought*; became Waynflete Professor of Philosophy 1859; Regius Professor of Church History and canon of Christ Church 1867; dean of St. Paul's 1868. D. in London, July 31, 1871. Besides the Bampton lecture volume aforesaid, his chief works are *Prolegomena Logica* (1851); *Metaphysics* (*Encyclopædia Britannica*, 1857); *The Philosophy of the Conditioned* (1866). He was one of the editors of Hamilton's *Lectures*. Dean Mansel was an elegant writer; in philosophy he was a follower of Hamilton. A posthumous work, *The Gnostic Heresies of the First and Second Centuries*, preceded by a memoir, was published in 1874. Revised by W. S. Perry.

Mansfeld, Peter Ernest II., Count: Protestant leader in the Thirty Years' war; son of Peter Ernest I., Count Mansfeld (1517–1604); b. at Luxemburg in 1580; entered the Austrian service in 1609, but angered at his ill-treatment by the Archduke Leopold he went over to the Protestant side, and on the outbreak of the Thirty Years' war joined the Bohemian rebels. He won a victory over Tilly at Wiesloch in 1622, and worried the imperialists by his repeated ravages of their dominions. When the Count Palatine Frederiek gave up the struggle, Mansfeld took service with the Netherlanders, but on the renewal of the war he returned to Germany with an army of 12,000 men, raised for the most part in England. He met with a crushing defeat at the hands of Wallenstein in the battle of Dessau, Apr. 25, 1626. D. at Racowitza, Bosnia, Nov. 29, 1626.

Mans'field: town; in the county of Nottingham, England (see map of England, ref. 8–I). It has a grammar school founded in 1561, a town-hall, manufactures of lace-thread and iron, and a large trade in corn, malt, and cattle. Pop. (1891) 15,925.

Mansfield: town; Bristol co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); on the Rumford river, and the N. Y., N. H. and Hart. Railroad; 24 miles S. of Boston. It contains 8 churches, a high school, 8 grammar schools, public library (1884), 3 hotels, co-operative bank, and a weekly newspaper. The industries comprise manufacture of jewelry, straw goods, baskets, shoes, machinists' tools, foundry products, knives, boilers, and yarn. Pop. (1880) 2,765; (1890) 3,432; (1900) 4,006. EDITOR OF "NEWS."

Mansfield: city; capital of Richland co., O. (for location of county, see map of Ohio, ref. 3–F); on the Balt. and O., the Erie, the Penn., and the Pitts., Cin., Chi. and St. L. railways; 180 miles N. E. of Cincinnati. It is in an agricultural region; has manufactories of agricultural implements, flour, stoves, pumps, and numerous minor articles; and has a wholesale mercantile trade aggregating $3,000,000 annually. The city contains a Holly system of water-works, electric lights, electric street-railway, 2 libraries (Mansfield Lyceum and Memorial), 2 public parks, 9 public-school buildings, 2 national banks (combined capital $250,000), 2 State banks (capital $231,000), an incorporated bank (capital $500,000), a private bank, and 2 daily and 5 weekly newspapers. Pop. (1880) 9,859; (1890) 13,473; (1900) 17,640. EDITOR OF "NEWS."

Mansfield: borough; Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5–B); on the Pitts., Chartiers and Yough. and the Pitts., Cin., Chi. and St. L. railways; 5 miles W. of Pittsburg. It is in a coal and lead mining and natural-gas region, and has manufactories of lumber, sheet iron, glass, and locks. Pop. (1880) 1,172; (1890) 2,352. Part of Carnegie Borough since 1890.

Mansfield: borough; Tioga co., Pa. (for location of county, see map of Pennsylvania, ref. 2–F); on the N. Y., Lake Erie and W. Railroad; 30 miles S. W. of Elmira, N. Y. It is in an agricultural region, contains a State normal school, and has a weekly newspaper. Pop. (1880) 1,611; (1890) 1,762; (1900) 1,847.

Mansfield, EDWARD DEERING, LL. D.: journalist and author; b. at New Haven, Conn., Aug. 17, 1801: graduated at the U. S. Military Academy in 1819, but declined appointment in the army, and graduated at the College of New Jersey 1822; studied law at the Litchfield (Conn.) Law School, and was admitted to the bar in Connecticut, but immediately removed to Ohio, where in 1836 he was elected Professor of Constitutional Law in Cincinnati College. Leaving the profession of the law for that of public writer, he was editor of *The Cincinnati Chronicle* 1836–49, of *The Atlas* 1849–52, of *The Cincinnati Gazette* 1857, and of *The Railroad Record* 1854–72; and for several years contributed to *The New York Times* over the signature of *Veteran Observer*; was commissioner of statistics for the State of Ohio 1857–67. He was the author of *Utility of Mathematics, Political Grammar, Treatise on Constitutional Law, Legal Rights of Women, Life of General Scott, History of the Mexican War, American Education*, a volume of *Personal Memories*, and other works. The degree of A. M. was conferred on him by the College of New Jersey and that of LL. D. by Marietta College, Ohio. He was a member of the Société Française Statistique Universelle. D. at Morrow, O., Oct. 27, 1880.

Mansfield, JOSEPH KING FENNO: soldier; b. at New Haven, Conn., Dec. 22, 1803; graduated at West Point and was appointed a second lieutenant of engineers in 1822. Prior to 1846 Mansfield was engaged entirely on engineering duty on the Atlantic and Gulf coasts. In the war with Mexico, as chief engineer of Gen. Taylor's army, he distinguished himself and was made brevet colonel. Returning to duty with his corps (in which he had attained a captaincy in 1838) at the close of the war, he was for five years a member of the board of engineers for fortifications on the Atlantic and Pacific coasts, when he was appointed (1853) inspector-general of the army, with the rank of colonel, which position he held at the outbreak of the civil war. In Apr., 1861, he was placed in command of the department of Washington, and at once began the work of fortifying the capital, receiving the appointment of brigadier-general of volunteers the following month. In November he was transferred to the command of Newport News, participating in the capture of Norfolk, May 10, 1862; was transferred in command of Suffolk June–Sept., 1862; promoted major-general of volunteers in July; assigned to the command of a division in the Army of the Potomac Sept. 10, at the head of which, a week later, at the battle of Antietam, he received wounds from the effects of which he died the next day, Sept. 18, 1862, at Sharpsburg, Md.

Mansfield, RICHARD: actor; b. on the island of Heligoland, May 24, 1857; spent his early youth in the U. S. He was the son of Mme. Mansfield-Rudersdorff, the singer. He studied for the East Indian civil service, but abandoned the idea of pursuing that career for business, afterward for literary and artistic work, in both of which he was unsuccessful. In 1877 he made his appearance at St. George's Hall, London, at a musical entertainment, but failed to make an impression. After undergoing many hardships, he traveled through the English provinces playing small parts in Gilbert and Sullivan's comic operas. In London he afterward appeared in comic opera, in comedy, and in tragedy. In Sept. 26, 1878, he made his first appearance in the U. S. at the Standard theater in New York, as Dromez, in the opera *Les Manteaux Noirs*, and was favorably received. In the production of *A Parisian Romance* at the Union Square theater, Jan. 10, 1883, he made an instant hit as Baron Chevrial. He began his career as a star May 3, 1886, at the Madison Square theater, New York, in the play of *Prince Karl*. The characters with which he is most identified are Dr. Jekyll and Mr. Hyde, in the dramatized form of that story; Tittlebat Titmouse, in *Ten Thousand a Year*; and Beau Brummell, in the play of that name. He appeared in *Dr. Jekyll and Mr. Hyde* in London in 1888, at the Lyceum theater, and subsequently as Richard III. On Sept. 12, 1892, he appeared at Daly's theater, New York, in Joseph Hatton's dramatization of *The Scarlet Letter*.

B. B. VALLENTINE.

Mansfield, WILLIAM MURRAY, Earl of: Chief Justice of England; b. at Scone, Perthshire, Scotland, Mar. 2, 1705; was the fourth son of Viscount Stormont, a Scottish nobleman of Jacobite opinions; educated at Westminster School, at Christchurch, Oxford, and at Lincoln's Inn, he traveled in France and Italy in company with the young Duke of Portland; was called to the bar in 1730, and, settling in London, soon acquired almost a monopoly of a lucrative practice consisting of appeals from the Scottish court of sessions to the House of Lords. At the same time he cultivated the society of men of letters, especially of Pope, who often sang his praises, and being endowed with a fine presence, engaging manners, great oratorical powers, untiring industry, and keen judicial insight, he rose rapidly in his profession; was soon in the receipt of an annual income of £3,000; married in 1738 a daughter of the Earl of Winchelsea; was elected to Parliament in Nov., 1742, on the downfall of Walpole, and in the same month received the appointment of solicitor-general from the ministry of Lord Wilmington. The Jacobite rebellion of 1745, favored as it was by many of his relatives, exposed Murray to an accusation of disloyalty, which was presented to the cabinet and afterward to the House of Peers, but without result, his only reply being the energy, conjoined with moderation and impartiality, with which he conducted the prosecution against Lord Lovat and other noblemen who were convicted of treason. In 1747, and again in 1754, Murray was re-elected to Parliament, was in May of the latter year appointed attorney-general, and on Nov. 8, 1756, chief justice of the king's bench, with the title of Baron Mansfield and a seat in the cabinet. In 1757, while filling temporarily the post of Chancellor of the Exchequer, he effected the coalition between Pitt, Fox, and Newcastle which resulted in the formation of the ministry of the former. For more than thirty years Lord Mansfield presided over the chief British tribunal, gaining golden opinions for his promptness, decision, equity, and integrity, but gradually losing popular favor by his decided leaning toward Toryism and the "principle of authority." In the American troubles consequent upon the repeal of the Stamp Act he gave his opinion that the colonists must submit to the authority of Parliament before their grievances could be considered. In the trial of Woodfall, the publisher of Junius's letters, he held that the jury was competent only to pronounce upon the fact of publication and the "sense of the paper," not upon any question of law; and this view he steadfastly maintained. His best work, however, was done in the domain of mercantile law, which he reduced to a systematic and harmonious form. He was created Earl of

Mansfield in 1776; had his house in Bloomsbury Square sacked in 1780 during the Gordon riots, for which loss he refused all compensation; retired from the bench June 4, 1788, and died at Highgate, Mar. 20, 1793. Having left no issue, the barony expired with him; the earldom, with most of his large fortune, descended to his nephew, David Murray, Viscount Stormont. See his *Life* by Roscoe (1838), Lord Campbell's *Lives of the Chief Justices*, and Foss's *Judges of England*.

Mansfield, Mount: the highest of the Green Mountains; in Cambridge, Lamoille co., Vt. Its most elevated part is 4,389 feet above sea-level. The mountain itself presents a grand appearance, and the view from the summit is one of the finest in New England, embracing the Adirondacks and Lake Champlain, the White and Green Mountains, and in clear weather the mountains about Montreal, 70 miles distant.

Mansilla de García, măăn-seel'yăă-dā-gaăr-see'ăă, Eduarda (*Mansilla*): author; b. in Buenos Ayres in 1838. In 1855 she married Don Manuel R. García, a diplomatist. Her first novel, *El Médico de San Luis*, appeared in 1857, and was followed by *Lucia Miranda*; *Pablo ó la vida en las pampas* (published also in French at Paris), etc. She described Argentine national customs and historical episodes with considerable skill. Besides novels, she has written numerous short sketches, a drama, etc. H. H. S.

Manslaughter: at the common law, the unlawful and felonious killing of another without any malice express or implied; that is, without the intent to kill, either proved by direct evidence or inferred from the facts of the homicide, which raises the crime to murder. (See Malice.) It is commonly separated into two classes, the *involuntary* and the *voluntary*. Involuntary manslaughter is the accidental killing of another by one doing an unlawful act, not a felony, or the causing of another's death through culpable neglect of a duty; voluntary manslaughter arises when upon a sudden quarrel two persons fight and one kills the other, or when one greatly provokes another by personal violence, and that other immediately kills him. In both of these instances of voluntary manslaughter the element which characterizes it is the heat of passion under which the act was done, and the want of time for the anger to cool and for reason to resume its sway over the man. In most, if not all, the U. S. the crime is entirely defined and regulated by statutes, which, however, in general closely conform to the common-law principle, but add thereto a number of special cases found to be necessary by the exigencies of modern society, and reduce to manslaughter some modes of killing which at the common law would have been murder. While the common law knew no grades or degrees of the offense, the statutes separate it into several degrees, according to the amount of culpability. The highest degree generally embraces cases of accidental killing while the slayer is engaged in the commission of some crime which at the common law would have rendered the homicide a murder; and often some other particular offenses which were not specially provided for at the common law, such as killing in the act of procuring an abortion, and the like. The degrees then succeeding generally include all cases of unintentional killing while in a heat of passion, while the remaining grades cover all the particular instances of homicide through negligence and wherever not entirely excusable or justifiable. The punishment is imprisonment in the State prison for different periods of time, varying with the degree of the crime. For the details of their provisions the statutes must be consulted. See Homicide and Murder; also Wharton's and Bishop's *Criminal Law*; and Stephen's *Digest of the Criminal Law*.

Manso: See Pueblo Indians.

Mant, Richard, D. D.: bishop and author; b. at Southampton, England, Feb. 12, 1776; was educated at Winchester School and at Trinity College, Oxford; became fellow of Oriel College 1798; was incumbent of several parishes in and near London; became Bishop of Killaloe 1820, of Down and Connor 1823, and of Dromore (in addition) 1842. D. at Ballymoney, Ireland, Nov. 2, 1848. He is chiefly known as one of the authors of an *Annotated Bible* (3 vols., 1814), known as D'Oyly and Mant's, which had an immense circulation in Great Britain, and was republished in New York, with additions by Bishop Hobart (2 vols., 1818–20). His *Bampton Lectures* for 1811 passed through several editions. His greatest work, *History of the Church of Ireland from the Reformation to the Revolution* (2 vols., 1840), passed to a second edition the year following. He is also the author of *Ancient Hymns, from the Roman Breviary, with Original Hymns* (1837). His annotated edition of the Book of Common Prayer was the basis of Bishop T. C. Brownell's *Family Prayer-book*, which has maintained its place in theological literature for upward of fifty years.

Revised by W. S. Perry.

Mantegazza, Paolo: physician and anthropologist; b. at Monza, Italy, 1831; studied at Pisa, Milan, and Pavia; made professor at Pavia in 1858, then Professor of Anthropology in the Instituto di Studii Superiori in Florence, and director of the Florence School of Anthropology. His principal works are *Fisiologia del Piacere* (Milan, 6th ed. 1890); *Fisiologia del Amore*; *Le Estasi Umane*; *Fisiologia del Dolore, Physiognomie et l'Expression* (French trans. Paris, 2d ed.). J. M. B.

Mantegna, măăn-tān'yăă, Andrea: painter; b. at Padua, Italy, in 1430; a pupil of Squarcione, who recognized his genius and adopted him as his son when he was quite a child. When a chapel in the Church of the Eremitani in Padua was allotted to Squarcione to paint, he intrusted the work to his two pupils, Andrea Mantegna and Niccolò Pizzolo. Mantegna's frescoes in the Eremitani received immediate recognition from all his fellow artists excepting Squarcione, who, incensed at his marrying the daughter of Jacopo Bellini, the head of the rival school of art, refused to see his adopted son after this. Mantegna then painted two saints on the principal door of the Basilica of St. Anthony, and a *St. Mark Writing the Gospel* for the Church of St. Justina, both in Padua. At this period of his career he went to Venice and painted with the Bellinis, thus acquiring a greater mastery over color. He returned to Padua, then went to Verona, where he worked in Sta. Maria degli Organi, and painted the altarpiece for San Zeno and other works. At the invitation of the Marquis Lodovico Gonzaga he went to Mantua, where he executed many important works for him, besides establishing a school of painting, and received a house and lands and the title of cavalier from the Duke of Mantua. Pope Innocent VIII. then required him to go to Rome to decorate the Belvedere chapel. He executed this work with infinite pains and increased his fame by its great beauty, though he had no reason to feel well satisfied by the pontiff's treatment of him. His love of the antique, which had always been great, increased after his sojourn in Rome. He returned to Mantua, which he never left after this, painting almost entirely for the duke, with the exception of small easel-pictures which he sent to his native city. Mantegna was also a skillful architect. He designed and built the Church of Sta. Maria della Vittoria in remembrance of the victory over the French at Fornovo, and decorated this temple with a commemorative picture of the event. He contributed greatly to the art of engraving, as he was one of the first in Italy to engrave on metal for printing. (See Engraving.) Mantegna's fame was great in his own time. Ariosto celebrated him together with Leonardo da Vinci and Giovanni Bellini. D. at Mantua, 1506. W. J. Stillman.

Manteuffel, maan'toi-fel, Edwin Hans Carl, von, Baron: field-marshal; b. at Magdeburg, Prussia, Feb. 24, 1809; entered the regiment of guard-dragoons in 1826, and became aide-de-camp to the king in 1848. He often held very important positions, especially of a diplomatic character, exercised a decisive influence on the reorganization of the Prussian army, and was made a lieutenant-general in 1861. He was very active in the negotiations between Austria and Prussia which ended with the convention of Gastein, and was in 1865 appointed governor of Schleswig. In 1866 he commanded the army of the Main. In the Franco-German war he drove Bourbaki across the Swiss frontier. In 1873 he was made a field-marshal, and in 1879 he was appointed governor of Alsace-Lorraine. D. at Carlsbad, June 17, 1885.

Man'ti: city (settled in 1849); capital of San Pete co., Ut. (for location of county, see map of Utah, ref. 5–M); on the Rio Grande, W. and the San Pete Val. railways; 80 miles S. of Provo, 120 miles S. of Salt Lake City. It is in an agricultural and sheep-raising region, and has an annual production of about 100,000 bush. of small grain and 500,000 lb. of wool. The city contains 3 Mormon churches, a Presbyterian church, Mormon seminary, Presbyterian seminary, 4 district schools, and a Mormon temple built on a hill of solid rock, begun 1877, completed 1888, cost about $1,500,000. The assessed valuation of taxable property in 1893

was $750,000. Pop. (1880) 1,748; (1890) 1,950; (1900) 2,408.
EDITOR OF "REPORTER."

Mantine'a (in Gr. Μαντίνεια): one of the oldest and most important cities of Arcadia, situated on the brook Ophis in the narrow part of the plain of Tegea. The plain is marshy and malarious, and the Ophis was always a source of danger to the city, and once was the cause of its capture. The city was formed in the fifth century B. C. by the union of five villages, into which the Spartans dissolved it again from 385–371 B. C. In 362 B. C. it became famous as the scene of the battle between the Thebans and the Spartans in which Epaminondas fell. From 222 B. C. up to the time of Hadrian the city bore the name of Antigoneia. Hadrian built here a splendid temple in honor of Antinous. The city was of great extent and the plan of its streets and the square of the theater could be seen even before the excavations that were made by the French, beginning in 1887. See *Bulletin de Correspondance Hellénique* (xiv., pp. 65–90 and pp. 245–271). J. R. S. STERRETT.

Mantiqueira, măăn-tēē-kā'-răă, SERRA DA: a mountain chain of Southeastern Brazil, trending N. E., parallel to the coast and 40 to 70 miles distant from it; extending from Paraná it crosses São Paulo, and separates Rio de Janeiro and Espirito Santo from Minas Geraes; after giving off a western branch, the Serra do Espinhaço, it subsides into hills and is lost in Bahia. Locally it has various names. In its culminating portion (lats. 24°–20° S.) it is separated from the sea by a lower chain, the Serra do Mar, the valley between the two being occupied by the river Parahyba. It divides rivers flowing to the Parahyba and Iguapé from those which flow to the Paraná. All the mountains mentioned are properly parts of one system, the Brazilian coast range, which in various subdivisions extends from Rio Grande do Sul to the river São Francisco. The Mantiqueira range is, on the whole, higher than any other of the division, and contains the highest peak in Brazil, ITATIAIA (*q. v.*).
HERBERT H. SMITH.

Mantis [Mod. Lat., from Gr. μάντις, prophet, seer]: a remarkable genus of large orthopterous insects, raptorial in their habits, and kindred to the *Phasmidæ*, or walking-sticks, from which *Mantis* and some four other genera have been separated and made a family, the *Mantidæ*. They are popularly called walking-leaves, race-horses, soothsayers, or prophets. When watching for their prey these creatures assume a sort of kneeling posture, doubling the great spiny fore legs under the thorax. Hence they were once believed to be engaged in prayer. The Hottentots regard the alighting of the local species, *M. fausta*, on any person as a token of saintliness and an omen of good fortune. There are numerous species. *M. argentina* of South America devours small birds. *M. carolina* is found in the U. S., where insects of the curious mimetic genus *Mantispa*, though neuropterous, have the appearance and habits of the true *Mantidæ*.

Mantis Shrimp: a peculiar form of Crustacea belonging to the *Stomatopoda*, and probably deriving its common name from a remote resemblance to the mantis insects. These forms, which belong to the genus Squilla, live in burrows in the sea-bottom and differ from most crustaceans in that they do not carry their eggs about with them.

Man'to (in Gr. Μαντώ): in Greek mythology, a daughter of Tiresias, the blind seer of Thebes. After the capture of Thebes by the Epigoni of the Seven Heroes, Manto fell to Alcmæon, son of Amphiaraus, by whom she became the mother of Amphilochus and Tisiphone. Alcmæon then presented her to the oracle at Delphi. According to another myth, both Tiresias and Manto were presented by the Epigoni to the Delphian Apollo, who sent Manto to Colophon, in Asia Minor, in order to found the oracle of the Clarian Apollo. Here she married the Cretan seer Rhacius, and by him became the mother of Mopsus, another distinguished seer. J. R. S. STERRETT.

Man'tua (Ital. *Mantova*): city of Northern Italy; chief city in the province of Milan, the strongest fortress of the celebrated Quadrilateral, and even of Italy (see map of Italy, ref. 3–C). It is in lat. 45° 07′ 45″ N., lon. 28° 27′ 33″ E., 8 miles N. of the Po, 95 miles E. S. E. of Milan, and 90 feet above the level of the Adriatic. This town is built on two islands formed by the Mincio, which here spreading out creates a lake that encircles the city. The channel or canal between the two islands dividing the city is called the *Rio*. Mantua, though its fortress and citadel are of immense strength, has a still more certain defense in the stagnant water that surrounds it, and that proves far more deadly to besieging armies than to those within the walls. The streets and squares are broad and regular, and the public and private buildings have a grand mediæval aspect, and are very rich in works of art. The town has five gates and a dockyard, called Porta Catena, whence there is navigable communication with the Po, making it an important port. The Cathedral of Mantua was designed by Giulio Romano, and contains fine frescoes. The Church of St. Andrea is magnificent, that of Santa Barbara very elegant. St. Martino and St. Egido are churches of the sixth century. The old ducal palace is very sumptuous, with frescoes by Mantegna, Giulio Romano, etc. Mantua was one of the political and religious centers of the Etruscans. Cæsar bestowed upon it the privilege of Roman citizenship. It was the birthplace of Vergil (70 B. C.). In 568 it was not yet surrounded by water. In the eleventh century it belonged to the celebrated Countess Matilda, and after her death passed to the Emperor of Germany. In 1328 the duchy was governed by Luigi Gonzaga, the first of an illustrious house that retained its power for 379 years. In 1708 it again fell to Austria, but was well governed only by Joseph II. Wurmser, the Austrian general, surrendered it to Bonaparte on Feb. 3, 1797, after which it became a part of the Cisalpine republic. In 1814, having changed masters several times meanwhile, it submitted again to Austria, and was treated with cruel severity until the treaty of Vienna (Oct. 1, 1866) made it a part of the kingdom of Italy. Pop. (1881) 28,048.

Mánu, or **Menu** [Sanskrit *mánu-*, man, mankind, Manu]: a revered name in Indic literature. In its oldest usage the word denotes man primeval, representative man, Manu, father of mankind, a sort of *heros eponymos* of the race. More particularly, however, *Manu* is the name given to the legendary Hindu law-giver, a Minos of the Brahmans, and supposititious author of the *Mānava-dharma-çāstra*, the ordinances of Manu, or law-book of the Mānavans, the earliest and most important law-code of India.

The existence of Manu as a historical personage is now denied; the code bearing the name is regarded as a collection of institutions of "man," founded on Hindu tradition and usage from time immemorial. The growth of the idea of a personal and authoritative author for such a work is natural and is easy to conceive. Manu, to whom the code is ascribed, is looked upon in Indic literature as an actual figure. He is called *Svāyaṁbhuva Manu*, the self-existent Manu, and is regarded as the first of a series of Manus, each of whom presides over a period of time called *Manvantara*, cycle of Manu, consisting of myriads of years. Six of these ages of Manu are supposed to have elapsed; we are living in the seventh, which was instituted by *Vāivasvata Manu*; there are seven such ages still to come.

The *Mānava-dharma-çāstra*, institutes of Manu, or ordinances of the Mānavans, as above said, is claimed by tradition to be the work of a divinely inspired author and lawgiver, Manu. It is further asserted that this legislator imparted the code to Bhṛgu, who in turn became the promulgator to men. The fact presumably is that the collection of ordinances in question is based on the Dharma-sūtra of the Mānavan school, and is ultimately traceable back to the Sūtra works of the Vedic schools. In its present form the code consists of twelve books, and comprises 2,685 *çlōkas*, or metrical couplets, or more than 5,000 verses. The code treats of the duties of a Brahman in the different stages of his life; of marriage and ceremonial observances; the duties of a king; the mutual relations of the castes; of civil and criminal law; and of penance and expiation. The first book dealing with the origin of the universe, and the last book treating of philosophical principles and final happiness, are regarded as later additions to the work. As to the age of the code, Sanskrit scholars were inclined at first to assign to it a hoary antiquity; the consensus of opinion now does not place this work earlier than the Christian era.

The laws of Manu have often been edited and translated. The standard edition of the text at present is by Jolly, *Mānava Dharma-śāstra* (the Code of Manu, London, 1887); older text editions are by G. C. Haughton (London, 1825) and Loiseleur Deslongchamps (Paris, 1830). A number of native editions have also appeared in India. The oldest translation by a European is in English, by Sir William Jones (Calcutta and London, 1794–96). In French there is one by Loiseleur Deslongchamps, *Lois de Manou traduites* (Paris, 1833).

More recent are Burnell and Hopkins, *The Ordinances of Manu, Translated, with an Introduction* (London, 1884); Georg Bühler, *The Laws of Manu Translated*, with extracts from the commentaries, and with *Introduction* (Oxford, 1886). There are special treatises on the code by E. W. Hopkins, G. Bühler, Gr. Johaentgen, R. West, A. Weber, and others. The oldest native commentary on Manu is by Medhātithi, and is called *Manubhashya*; it is referred by scholars to the ninth century of our era.

A. V. Williams Jackson.

Manual Training: the training of the hand in the use of tools and in practical drafting, as a part of a system of general edueation. The work with the tools is done in such materials as wood, iron, brass, tin, clay, cardboard, and paper, and the drafting consists in the preparation of working drawings suited to such tool-work. The term manual training does not include kindergarten work, laboratory work in science, and illustrative teaching on the one hand, or the teaching of trades on the other.

Origin and Development.—At the time when tool-work and practical drafting were first introduced into a scheme for general education, trade schools, where the use of certain tools and mechanical processes were taught, were numerous in every country in Europe. The aim was in every case a particular trade, the methods were only those of a trade, and the result was craftsmen of a particular trade, whether hatters, weavers, basket-makers, locksmiths, machinists, etc. Similarly, on the other side, there were in every civilized land professional schools where drafting was taught, and where more or less tool-work was incorporated into the curriculum of engineers and occasionally of architects. All such training was regarded as "special" in both the higher and the lower grades. This was the state of things till 1876. It is true that in every country there were educators who claimed a general value for tool-training and for drafting, and that occasionally young men learned trades and even professions, not for the purpose of following them, but for the general value their discipline afforded. Moreover, an exceedingly important step forward had been taken in Russia by Victor Della Vos, director of the Imperial Technical School for Government engineers at St. Petersburg, as early as 1868. Possibly he got his idea from Uno Cygnæus, in Finland, where certain elementary work had been introduced into the lower schools as early as 1866. His improvement consisted in the discovery of the true scientific method of tool-instruction. Previously boys had learned trades by working at them, beginning with coarse work requiring no skill, taking their chances as occasion offered for learning new processes and the proper use of tools, with no systematic instruction or logical sequence of steps. Della Vos conceived the plan of first teaching the elements of a certain kind of tool-work systematically, by means of models and drawings and practice exercises, before any attempt should be made at the execution of trade work. His motto was "instruction before construction," as reported by Prof. J. D. Runkle, of Boston, who made a full report upon the Russian exhibit at the Centennial Exposition at Philadelphia in 1876. The discovery of Della Vos started a revolution in tool-instruction which is still going on. Its value consisted not so much in his analysis and in the special exercises he employed as in the principle that every tool, every process, and every material should be analyzed, and that the elements should be presented and mastered in order according to scientific principles.

Sloyd.—Thus far no mention has been made of Sweden's contribution to the origin of manual training, the *sloyd* (Swed. *slöjd*, skill, dexterity) system. This has been partly because in point of fact manual training was firmly established in the U. S. with no aid from Sweden, and partly because *sloyd* as it exists to-day is more the product of non-Swedish than Swedish thought and experience. In the beginning *sloyd* was essentially trade-work in the elementary schools. Gradually its general value was recognized, and a series of whittling exercises was evolved, each one of which led to an article of use in the pupil's home. A series of flower-sticks, handles, wooden spoons, etc., from twenty to a hundred, afforded opportunity to become skillful with certain tools and to secure considerable mental and moral discipline; but the system lacked both breadth and variety. In 1876 very few tools were used; no joints, the essential parts in constructive work, were taught, or very few; and no drawings were made or used by the pupils, but everything was made from models by comparison.

Since 1876 Otto Solomon, the director of the Normal School at Naas, has made great progress in developing genuine manual training. The number of tools has been greatly increased, the scope of exercises has been extended, and exact drawings have been introduced; for elementary classes this leaves little to be desired. The idea of use in every finished exercise is still retained, but the order in which elements are taken up and the care with which all details are attended to render the sacrifice of ideals to uses so small as to be scarcely worthy of attention. The fact that individual instruction is still in vogue in the best Swedish schools is by no means a necessary one, for the class method is entirely applicable. It is thus evident that by 1876 the time was ripe for a manual-training school.

The general method of tool instruction seemed to have been found, and there was a growing feeling in the public mind that education should touch practical life at more points; that a general acquaintance with the materials used in the arts and the tools and processes employed in industrial life was worth the getting. What was now necessary was that suitable tools and materials should be selected; that they should be classified into separate shops or laboratories; that all the elements of pencil, pen, and brush work which enter into the most elaborate drawings of constructive work should be progressively arranged; that this drawing and tool-work should be incorporated into a curriculum of science, mathematics, and language in such a way that neither feature should seem to be subordinate; and then, most difficult of all, that the community or individuals should be persuaded to furnish the money to establish and maintain such a school. This work was undertaken simultaneously in the Massachusetts Institute of Technology and at Washington University, St. Louis, in connection with high-grade technical schools. Prof. Runkle in Boston organized in 1877, in connection with the institute, a school for special students in the mechanic arts. In St. Louis, where all engineering students had had some shop-work for several years, three shops were organized in 1877, and an appeal was made for a manual-training school of secondary grade.

Encouraged by the success of summer classes of younger pupils and a class of some twenty boys from a preparatory school, as well as by the reports from apprentice schools in Paris and elsewhere, the St. Louis Manual-training School was established in the spring of 1879. Money for ground, building, equipment, and support was subscribed, and the school was opened the following year, Sept., 1880. Various experiments had been made with whittling-schools, and temporary classes in Massachusetts and elsewhere, as well as in St. Louis, previously to the establishment of this school, but no properly called manual-training school, in which a broad range of shop-work and a thorough course in drafting were required of every pupil, and where the object of the course was neither a trade nor a profession, but a general education, had ever been organized before.

Success of Manual-training Schools.—The St. Louis school has continued with increasing popularity and success. The building was enlarged in 1882, but is still far too small for the demand. The records of the graduates are a standing recommendation of manual training. The general desire to know what becomes of the graduates has led to the publication of *The Record of Alumni* of the St. Louis school.

The success of the St. Louis school quickly attracted the attention of educators, and papers were read at Saratoga before the National Education Association in 1882 and 1883, and afterward published in *The Popular Science Monthly*, giving the full theory and method and apparent results of the school. Interest was quickened in every quarter, and almost simultaneously manual-training schools were organized in Chicago, Baltimore, Toledo (in 1884), and Philadelphia (in 1885). In Chicago and Toledo the expense was borne by individuals or private corporations, as had been done in St. Louis; in Baltimore and Philadelphia the schools were integral parts of the systems of free public schools. All these schools have been successful beyond the most sanguine expectations. The Chicago school has been enlarged and supplemented by a manual-training high school, supported by the city. The Baltimore school has upward of 500 pupils, while Philadelphia has two manual-training high schools, and is planning for a third.

Since 1885 manual-training schools and manual-training courses in existing high schools have multiplied. Manual training is an integral part of the curriculum in every agricultural and mechanical college in the U. S. These colleges

include secondary instruction in connection with the manual training, and as the students are less intent upon trade and professional life than students in classical colleges, they may with propriety be said to take manual training as a feature in their education. There were seventy exhibits of shop-work and drawing in the Liberal Arts Building at Chicago, not counting the numerous Roman Catholic and foreign schools, and many schools (probably as many more) are known to have sent no exhibits.

The most remarkable manual-training high schools of recent organization are those of Louisville, Providence, Denver, Boston, the Drexel Institute of Philadelphia, Armour Institute of Chicago, and the still unfinished Teachers' College of New York city.

The Curriculum.—There is great uniformity in the curricula and methods of the regular manual-training schools. The conditions of admission are usually the same as for other secondary schools, i. e. the completion of eight years of primary and grammar school-work, making the minimum age of admission about fourteen years. The length of the course varies from three to four years. The curriculum generally includes parallel courses in—

I. *Mathematics.*—Algebra, geometry (plane and solid) trigonometry, and astronomy or mechanics.

II. *Science.*—Botany, chemistry (with laboratory practice), physics (with laboratory practice), geology, and some branch of biology.

III. *Language and Literature.*—Composition, rhetoric, history, civics, standard authors, with opportunities in some schools for French, German, and Latin. In some schools manual training enters largely into the classical courses.

IV. *Drawing.*—Free-hand (from objects); projections and sections, design (sometimes with clay modeling), lettering; instrumental lining, details, intersections, developments, isometrics, tinting, graining, shadows and shading, tracing, and perspective.

V. *Tool-work.*—Joinery, wood-carving, wood-turning, pattern-making, molding, casting (generally in plaster), forging iron and steel, brazing and soldering, chipping, filing, turning, planing, drilling, fitting and finishing metal-work.

The order of subjects differs slightly in different schools, but there is a substantial agreement. It is evident that the combination of IV. and V. makes the manual-training school unlike any other school and justifies the name. I., II., and III. are taken for granted in a manual-training school, just as mathematics, science, and modern languages are taken for granted in a "Latin school." The daily programme generally assigns two periods to shop-work, one to drawing, and one each to mathematics, science, and language. In all regular manual-training schools all departments are in full operation at all hours of the school day.

Method of Instruction.—Class instruction is given in the shops and drawing-room as well as in other subjects, and a series of extra exercises is drawn upon to meet the wants of rapid and skillful workers. The instruction is similar to a science lecture. Pupils must be seated so that they can both see and hear. The teacher explains the purpose of each exercise, what new steps are to be taken, what new tools or new uses of old tools are required, and illustrates all by actual work before his pupils. This full general instruction is supplemented later by such repetitions to individuals as may be necessary. The maximum sizes of working divisions in charge of a single teacher vary from thirty in wood-work to eighteen or twenty in metal-work. Experience does not seem to approve the plan of two instructors for one large class; it is better to divide the class. In drawing, instruction may be given to a large class and assistants may supervise the work in progress. In elementary shop-work in the Boston grammar schools the usual size of a working division is thirty, and instruction or demonstration has been given to classes of sixty.

Shop exercises are always made from drawings, usually made by the pupils themselves. The forms of the exercises or models for the shop and drawing-room vary in different schools, but the aim is substantially the same—viz., to embody in logical order, and without unnecessary repetition, all typical forms and processes, and to develop all the functions of the tools and instruments. Although these considerations are based on the nature of tools and materials and not particularly on the nature of the mental and physical powers of the pupils, the result gives general satisfaction.

Manual Training in the Grammar Grades.—No sooner was the highly educational character of manual training recognized than came the imperative demand for a manual training for the lower grades. It was argued, if manual training invigorates the mind, assists in the formation of habits of close observation and precise execution in secondary schools where the number of pupils is small, how important it is that it should be introduced in the grammar (some said in the primary) grades where the number of pupils is very great. The answer to this argument was twofold: secondary education was to be made so attractive and withal so valuable by means of manual training that pupils were to be drawn in increasing numbers to secondary schools; and, secondly, any attempt to engraft regular shop-work like that already described upon the grammar schools would partially fail. Nevertheless, the demand did not cease, and scores of people in all parts of the U. S. entered upon the work of devising exercises and specifying the appliances for elementary tool-work. It is needless to say that a large majority of such attempts have failed. The most conspicuous cause for failure has been the unwise effort to encourage the factory idea of producing articles of immediate value. The unwisdom of such efforts is easily shown. First, immediate utility is not sought for in other branches, such as arithmetic, penmanship, music, and science; the object in all such is to master fundamental principles and processes. The pre-eminent value of such training should never be jeopardized by the trifling value of a concrete product. Second, in the construction of a useful article as an educational exercise the attention which ought to be given to the mastering of details is absorbed by one's interest in the efficiency of the article or machine itself. Many a boy has been encouraged to construct a steam-engine with entire disregard (because he is entirely ignorant) of the proper treatment of joints, bearings, and fittings, and been flattered by unreasonable praise because "the machine would go."

The educational exhibit at the Columbian Exposition at Chicago contained several admirable representations of courses in elementary woodwork and specifications as to methods and appliances. Contributions from New York and Boston deserve special mention. It is safe to say that the problem of elementary manual training has been substantially solved, and that to this solution ideas from the Swedish *sloyd* have contributed much, though by no means the whole. For the Boston systems which have been subjected to the test of actual school use for two or three years, the reader is referred to the *Annual Report* of the school committee of Boston for 1892.

Needlework is often spoken of as a species of manual training, though it would seem to involve the mastering of no tools properly so called, and has no occasion for the construction of exact drawings. Needlework has been very thoroughly developed in the public schools of Boston and Philadelphia. Cooking has been extensively taught in connection with the grammar schools of Boston through the liberality of two ladies. The *Report* already mentioned speaks of "fourteen cooking-schools attended by public-school pupils." Many high schools and academies and regular manual-training schools have introduced light wood-work, drafting, sewing and fitting, and the elements of cooking into the training of young women. One of the most successful of these, as well as one of the earliest, is the Scott Manual-training School of Toledo. Much remains to be done before the elements of cooking can be so presented as to harmonize with the scientific method of teaching. The nature of the materials and the list of fundamental processes must be studied thoroughly before edible products are thought of.

Objections.—As would be expected, manual training has not gained its present foothold without a struggle. It was resisted at every step by several classes of people: first, by those who were unwilling to admit that the old system of schooling lacked any essential feature of an all-round education, and who believed that whether for mental or moral discipline, or as a preparation for the duties of life, it was sufficient. Second, others feared that the effect of the introduction of tool-work would be to dwarf and narrow the mind and to corrupt and lower the aims and ambitions of pupils. Third, not a few of the teachers, particularly those who were in charge of schools, felt that new and unfamiliar subjects were claiming admission as school subjects, which would at once place former teachers at a disadvantage. Ignorant, for the most part, of what manual training was and of what it aimed at, they opposed it naturally, and inevitably misrepresented it. It has fairly met and overcome all opposition. It has been abundantly shown that manual training has great educational and moral value. Testimony on this point lies all around us. Instead of lowering aims, it has saved many

a discouraged boy and lifted whole classes to a higher appreciation of life and its duties, and to a purer and more manly ambition. Now that teachers are trained in the theories and methods of correct manual training, selfish opposition is no longer to be anticipated. The high quality of its intellectual discipline, the wholesome effect upon habits, tastes, and aims, and its marked efficiency as a preparation for the duties and responsibilities of life—all these have again and again in many places been so clearly demonstrated that they are no longer to be denied. Though only a part of elementary and secondary education, manual training is destined to be recognized in every community as something that should enter into the education of every boy and girl. Among those not already mentioned who have, in their several centers, aroused interest and organized effort in the direction of manual-training work are Dr. Felix Adler, of New York; President James McAlister, of Philadelphia; and Col. Augustus Jacobson, of Chicago. In like manner the movement for manual training in England owes much to the leadership of Sir Philip Magnus, Lord Playfair, and William Mather, M. P. The literature of manual training is largely unwritten. Labor commissioners, State and national, have prepared extensive reports upon the theory and the practice of manual training, and the reports of the U. S. commissioners of education contain valuable statistics and discussions. Aside from these a few books have been published on the general theory or its details. The principal ones are *Manual Training*, by Charles H. Ham (New York); *How to Use Wood-working Tools* (Boston); *The Manual-training School*, by C. M. Woodward (Boston); *First Lessons in Metal-work*, by Prof. A. G. Compton (New York); *Tool-work*, by Prof. Goss, of Perdue University, Lafayette, Ind.; *Manual Training in Education*, by C. M. Woodward (London and New York). Very valuable papers on this subject have been published by Dr. Nicholas M. Butler, at one time president of the Teachers' College, New York city.

C. M. Woodward.

Manucode: a name for certain birds of paradise of the genera *Phonygama* and *Manucodia*. They are 15 to 18 inches in length, of a beautiful steel blue, and have the third and fourth toes united for some distance. The name was adopted by the English from the French, by whom it was used as an abbreviation of the Latin *Manucodiata*, this in turn being a Latinization of the Malay *manukdewata*—bird of the gods. Intended originally for the king bird of paradise and its allies, it was for 200 years applied to any bird of paradise, and is now bestowed upon species whose place in the family *Paradiseidæ* has been questioned.

F. A. Lucas.

Manuel, Juan, Don (Infante de España): prince and writer; b. at Escalona, Spain, May 5, 1282; d. in 1349. He was a nephew of Alfonso X. (*q. v.*) and a cousin of Sancho IV., by the latter of whom he was educated and admitted to great intimacy. His public life was a restless and turbulent one. Before he was thirty he had attained the highest offices in the state; and when Ferdinand IV. died, in 1312, leaving his son Alfonso XI., only thirteen months old, he was a prominent figure in the troubles that ensued. In 1320 he became joint regent of Spain, and managed affairs skillfully in the interests of the young monarch. The latter, however, when he came of age, showed little gratitude, and as a result Don Juan undertook to vindicate his position by arms. Alfonso yielded and made promises, which in 1327 he broke. This time Don Juan actually rebelled, and carried on war with the king till 1335, when the latter was completely victorious. The ideas of the time were such, however, that the beaten infante was able to return to the king's service, and even became commander-in-chief against the Moors, over whom he continued to win victories almost up to the moment of his death. The chief claim of Don Juan Manuel to remembrance comes not from his public career, but from the fact that he was one of the first and one of the best of Spanish prose-writers. Despite the agitations of his life, he wrote in a style of singular simplicity and charm; and few Spanish authors have succeeded so well in giving to their words the calmness, the weight, the richness which come only from long experience and reflection, and which we find everywhere in him. Two lists of his works drawn up by himself have come down to us, but they do not coincide, nor does either correspond exactly with the works themselves as we have them. In his edition in vol. li. of Rivadeneyra's *Bibtioteca de Autores Españoles* (Madrid, 1884), D. Pascual de Gayangos prints the following: *Libro det cabattero y del escudero*; *Tractado sobre las armas de su familia*; *Libro de castigos ó consejos para su hijo*; *De las maneras del amor*; *Libro de los Estados*; *Libro de los Frailes predicadores*; *Libro de Patronio* (more commonly known as *El Conde Lucanor*); *Tractado en que se prueba . . . que Sancta María está en cuerpo y alma en Paraiso.* Besides these we have *El libro de la Caza* (ed. by G. Baist, Halle, 1880). There exist also in manuscript, in the Biblioteca Nacionál at Madrid, two chronicles (a longer and a shorter) which have never been printed. The titles of several other works are preserved, but the works themselves have not yet been found. Of all the above, the *Conde Lucanor* has been by far the most popular, and is the most interesting. It is essentially a collection of tales (fifty in number) intended for edification, after the Oriental fashion. The model was probably the *Disciplina Clericalis* of Petrus Alphonsus (see Exempla-books), a collection of stories in Latin made some two centuries earlier. The Oriental influence is strong in both, though Manuel by no means confines himself to such material. Several of the latter's tales are models of brief and witty narration. The *Conde Lucanor* was printed first by Argote de Molina (Seville, 1575; later at Madrid, 1643). Of modern editions we have that of A. Keller (Stuttgart, 1839), that in the *Tesoro de Autores ilustres* (Barcelona, 1853), and that of Gayangos cited above. There is a German translation by J. von Eichendorff (Berlin, 1840, with Eng. trans. about 1886); a French by A. de Puibusque (with *Life*, Paris, 1854); and an English by James York, London, 1868; new ed. 1888)). See G. Baist, *Atter u. Textüberlieferung der Schriften D. Juan Manuels* (Halle, 1881).

A. R. Marsh.

Manuel I., Comnenus: Byzantine emperor; b. in 1122; succeeded his father, John II., in 1143. As he was surrounded by powerful and restless enemies, his reign was a succession of campaigns against Geisa II., of Hungary, the Servians, Roger of Sicily, the Egyptians, Raymond of Antioch, and the Seldjuk Turks. A valiant and sagacious soldier, generally successful in battle, he was an unscrupulous and oppressive sovereign. At Myriocephalus, in Pisidia, he suffered a terrible defeat from the Turks, over whom he afterward gained some successes, but a profound melancholy took possession of him; he abdicated and became a monk. He died in 1180.

E. A. Grosvenor.

Manuel II., Palæologus: Byzantine emperor; b. in 1348; succeeded his father, John V., in 1391. Little was left for him to rule over. The Byzantine empire had never recovered from its conquest by the Latin crusaders, and, though it had been restored by the Greeks, comprised at the close of the fourteenth century hardly anything more than Constantinople. The Ottoman power was rapidly extending. Baïezid I. had forced the timorous John V. to give him Manuel as a hostage, but on his father's death Manuel escaped from the Ottoman camp and was crowned. He made a journey (1400–02) to Italy, France, and England to entreat help against the Ottomans, but everywhere in vain. Soon after his return Constantinople was besieged by Baïezid; its capture seemed imminent, when the sudden invasion of Asia Minor by Tamerlane called off the besiegers. It was again attacked in 1423 by Mourad II., when cannon were used for the first time in siege, but was heroically and successfully defended by Manuel. Although Manuel was brave, generous, eloquent, intelligent, and patriotic, he had to contend all his life against desperate odds. It was impossible to resuscitate his empire, but he did his utmost in delaying its fall. D. in 1425.

E. A. Grosvenor.

Manure [from O. Fr. *manuvrer*, to cultivate by hand > Fr. *manœuvrer*; Lat. *manus*, hand + *opera*, work]: in the broadest sense, any substance applied to the soil for the purpose of increasing its fertility; in the narrower, ordinary use of the term, the excrements of farm animals, either mixed or unmixed with straw or other absorbents. The quantity, as well as the quality, produced per year and per 1,000 lb. of live weight of the various kinds of animals is extremely variable. The weight of the voidings of cows fed on succulent foods exclusively is equal to three-fourths the weight of the food consumed, while the voidings of animals which are fed on dry matter exceed the weight of the food two to three times.

Boussingault gives the following averages of manure production:

Yearly voidings of a horse	(900 lb.)	solids and liquids	$7\frac{1}{2}$	tons.
"	"	" cow	(1,460 ")	"	"	4	"
"	"	" sheep	(135 ")	"	"	$\frac{3}{5}$	"
"	"	" pig	(135 ")	"	"	$1\frac{1}{2}$	"

Extended experiments at the Cornell University agricultural experiment station gave the following results per day, per 1,000 lb. of live weight:

Sheep	34·1	lb.
Calves	67·8	"
Pigs	83·6	"
Cows	74·1	"
Horses	48·8	"
Fowls	39·68	"

Animals fed on a highly nitrogenous or narrow ration (as 1 : 4), as were the pigs at the Cornell station, consume large quantities of water and produce a large amount of manure, while those fed on a carbonaceous or wide ration (as 1 : 9) consume comparatively little water and produce less.

Some of the general conditions affecting the production of manure may be stated as follows. The value of manure produced by animals is from 30 to 50 per cent. of the cost of the food they consume. Young animals produce poorer manure than mature ones. The excrements of animals which give a product, as milk or young, are poorer than those from non-productive animals. The more abundant the ration used, the less complete will be the digestion and the greater the value of the manure produced. Concentrated and nitrogenous foods result in richer excrements than unconcentrated or carbonaceous foods. High salting and excessively succulent foods lower the value of the manure. The amount and kind of bedding affect not only the quantity but the value per ton very considerably. Animals kept in cold quarters drink little water, digest their food closely, and make a manure small in amount and poor in quality.

Value of Manures.—Rich manures are relatively more valuable per unit of contained fertility than poor ones, because the plant-food they contain is more readily soluble, hence more available for the young plant, which is benefited far more by extra nourishment in early than in later growth. Coarse, low-grade manures are often weathered or rotted, in order to improve their quality and solubility, though some loss of plant-food may occur. As a rule, a unit of plant-food in high-grade fertilizers or manures is worth more than one in low grades; if the quality of manure has been reduced by neglect, the value of each unit of fertility left is decreased.

VALUE PER TON.*

Kind of manure.	Value per ton.
Sheep	$3.30
Calves	2.17
Pigs	3.29
Cows	2.02
Horses	2.21

VALUE PER YEAR PER 1,000 LB. LIVE WEIGHT OF ANIMAL.

Kind of animal.	Value per year.
Fowls	$51.10
Sheep	26.09
Calves	24.45
Pigs	60.88
Cows	29.27
Horses	27.74

Waste of manure occurs from allowing it to be scattered over by-places and around the outer edges of large yards; from heating, which dissipates the nitrogenous compounds in the form of ammonia. Manures which have been broken down by heating may have parted with so large an amount of water that the value per ton may have been increased, though the total amount of plant-food may have been greatly diminished. When manures are exposed in the open yards or heaped out under the eaves of the building, their values are greatly reduced. In the northern and central parts of the U. S. the rainfall exceeds 30 inches per annum. Many of the modern barns cover a quarter of an acre of ground, and the barn-yards twice as much. An inch of rainfall means 100 tons of water upon each acre; 30 inches means 3,000 tons per acre, or 750 tons from the eaves of the farm buildings, and 1,500 tons on the open barn-yards per year. Experience shows the common and wasteful practice of heaping manures. The loss of manure exposed to heavy rains for any length of time is usually very great, the only exception being where they are too dry, as occurs sometimes where bedding is liberally supplied.

*Nitrogen is computed at 15, phosphoric acid 6, and potash at 4½ cents per pound respectively. The value of the manure produced per year is based on the value determined for the winter months. The amount and value of manure produced by pigs, given in the table, is at least a third larger than the usual average.

The average rainfall at Ithaca, N. Y., for six months, April to September, is 19·3 inches for 1882–94. The loss of value in manures exposed at Ithaca, in loose heaps of from 2 to 10 tons, during the six months was as follows:

1889, horse-manure	42	per cent.
1890, "	62	"
1890, cow-manure	30	"
1889, mixed compacted	9	"

Kainit, gypsum, dry earth, and salt are all used to prevent wasting of manures in the stable and when heaped. If they are spread as soon as made, upon land occupied by plants, little loss of fertility is sustained. If not immediately applied, manures should be kept under cover or in deep compacted heaps.

Uses of Manure.—Manures are used to furnish plant-food, to improve the physical condition of the soil, and to conserve and increase heat and moisture. From 10 to 40 tons of manure is usually applied per acre, by machine or by hand. Too liberal an application is wasteful, unless, as in early gardening, the object is to warm the soil and force the plants ahead of the season. Ten to twenty times as much food is sometimes given to plants as they can use.

Five tons of average barn manure contain: Nitrogen, 60 lb.; phosphate, 30 lb.; potash, 47 lb.

Twenty-five bush. of wheat with straw contain: Nitrogen, 45 lb.; phosphoric acid, 18 lb.; potash, 27 lb.

In general farming, economy requires that such culture be given that the plant can obtain more than one-half of its food directly from the soil without the aid of manures. The first crop recovers not more than half of the plant-food contained in a moderate application of them. Barn manures are relatively poor in mineral matters and rich in nitrogenous compounds; therefore they should be used in connection with potash and phosphoric acid. The plant-food contained in farm manures is less valuable by about one-third than that contained in high-grade fertilizers, because it is not so available. If considerable benefit is received from the physical action of the manures in addition to that realized from the plant-food they contain, then their value would probably equal that given in the above tables. Farm manures should be spread thinly in the autumn on the surface where plants are growing, thus following nature's modes of action. See FERTILIZERS. I. P. ROBERTS.

Manuscript [from Lat. *manuscriptum*, liter., a thing written by hand; *ma'nus*, hand + *scrip'tus*, perf. partic. of *scri'bere*, write; abbreviated MS., pl. MSS.]: any writing, usually a written book or document. Manuscripts are distinguished, on the one hand, from inscriptions, on the other, from printed books.

The oldest MSS. left us are Egyptian, and date from 2,500 years or more B. C. They are written in characters already alphabetic, with reed and ink, on papyrus. This substance, the standard writing material of antiquity and the prototype of our modern paper, was made from a rush (the *Cyperus papyrus* of Linnæus), then abundant throughout Egypt, as still in the upper Nile, by slitting its stem lengthwise into strips, placing one layer of these transversely over another, and pasting, hammering, and pressing the two into union and smoothness. Other materials—the leaves and bark of trees, tablets of wood or ivory, pottery, skins, linen cloth, sheets of lead—were in early use for writing, and have left us memorials in such familiar words as "library," "code," and "book"; but from Egypt the use of the more convenient papyrus spread, like the alphabet itself, to the other Mediterranean lands. One form of book, however, besides the papyrus MS., remained in use throughout the classical time, and indeed almost to modern days—the waxed tablet. It consisted of two, three, or more leaves of wood, joined at one edge like the leaves of a modern book, and held by rings serving as hinges. Each leaf had a raised margin, like a child's slate at the present day, and the sunken center was covered with wax, on which one wrote with a metal *stylus*, whose other end was flattened or rounded for rubbing out the writing by smoothing the wax. It was this form of book, used not only for memoranda and letters, but for accounts and legal documents, which was known as *codex* and which lent both form and name to the mediæval MS., the parent of the modern book. In antiquity the more common form, though even for the brittle papyrus the codex was not unknown, was that of the roll—*volumen*. The sheets of papyrus were pasted together, end to end, to any desired length, the

width of the roll varying from 6 inches, in the earliest times, to 10 or 15 in the later. In Roman times one end of the roll was affixed to a wooden or ivory roller, which thus became the core of the roll. A label bearing the title of the book was attached to the outside of the rolled-up MS.; and it was usual to provide the whole with a vellum case, often gayly colored. The lines of the writing ran not crosswise of the roll, but lengthwise, in narrow columns, exposed one by one, like pages, as one unrolled the MS. The right side of the MS., therefore, was that where the fiber of the papyrus ran lengthwise of the roll, guiding the pen of the scribe and making ruled lines unnecessary. At Alexandria under the Ptolemies, where book-making for commerce was first thoroughly systematized, and later at Rome and at Athens, the production of MSS. was carried on upon a large scale, trained slaves being employed by hundreds as copyists, correctors, and binders, and editions of 500 or 1,000 copies produced. From very early times, besides papyrus, skins were in use, even in Egypt, as a writing material; but not till the second century B. C. did the increasing demand for books and the competition of Pergamos with Alexandria as a literary center lead to such improvement in their preparation that they could rival papyrus. And it was yet several centuries before this "Pergamos paper," *carta Pergamena*, our *parchment*, as it was called from the town whence it came, became with the decline of Mediterranean commerce the usual material for MSS. throughout Europe. Papyrus did not disappear entirely indeed till in the twelfth century the cheaper *paper*, whose manufacture was then creeping westward from the Orient, crowded it from use and inherited its name. With the advent of parchment (or *vellum*, as it is indifferently called), the codex, or tablet, form of MS. gradually supplanted the roll.

The ordinary pen of the ancients was the reed, though metal pens were not unknown. The quill is first mentioned in the sixth century A. D., but from that time became the exclusive implement in the West. Ink has been much the same since the earliest times, that of the ancients deriving its black usually from soot, while in the Middle Ages gall-nuts were more often used. Colored inks were also early in use, and the custom of illuminating MSS.—i. e. of adorning them with variegated letters or with pictures—was known to the ancients, and never passed from use till its culmination in beauty in the closing centuries of the Middle Ages. It is from the favorite red (*rubrica*, *minium*), beloved both for head-lines and for initials, that we get our words *rubric* and *miniature*. See ILLUMINATED MANUSCRIPTS.

Introduced into the monasteries by Cassiodorius in the sixth century and adopted by the early Benedictines, the production of MSS. found there for ages its chief home. The Irish monks and their Northumbrian disciples had independently turned to the same form of activity, and with a zeal that outran that of the Continent. When the two impulses met in the convent schools of Charles the Great his vigorous encouragement gave to the work of transcription an impetus that never died out. Throughout western Christendom every abbey had its *scriptorium* or writing-room, and the copying of books was counted one of the most meritorious of monkish tasks, profitable for this world and for the next: but in the thirteenth century, with the rise of the universities, there grew up again a body of lay copyists, into whose hands the making and sale of MSS. gradually passed. It was not till nearly a century after the invention of printing that the work of these professional scribes ceased to compete with the cheaper but coarser products of the press. The scarcity and cost of parchment led often to the erasure of a writing with sponge, pumice-stone, or knife, and the use of the sheet for a fresh writing. Such rewritten MSS. are *palimpsests*. (See PALIMPSEST.) The science which treats of the decipherment of MSS. is palæography, the older name of diplomatics being now restricted to the science which verifies and interprets documents (diplomas). The best study on the book-making of the ancients is Birt's *Das antike Buchwesen*; on the work of the mediæval scribes, the exhaustive monograph of Wattenbach, *Das Schriftwesen im Mittelalter*. In English, not to mention older works, may be named Middleton's *Illuminated Manuscripts*; Madan's *Books in Manuscript*; Putnam's *Authors and their Public in Ancient Times*; and in French, Molinier's *Les Manuscrits et les Miniatures*. See also the works cited in PALÆOGRAPHY, especially Thompson's *Handbook*. See BIBLIOGRAPHY, BOOK, and PALÆOGRAPHY.

GEORGE L. BURR.

Manu'tius (Manuzio, Manuzzi, Manucci), ALDUS: head of a family of printers of the Renaissance period: b. at Sermonetta, in the territory of Bassano, Italy, in 1449 or 1450; studied in Ferrara and Rome; was for a time tutor in several ducal families of Italy; learned Greek in Verona under the celebrated Guarini; and in 1488 established a printing-house in Venice, from which issued no fewer than twenty-eight so-called *editiones principes* of classical authors, to all of which he wrote elaborate introductions. The first book ever printed in Greek letters issued from his press (1494). He also substituted for the then current Gothic or monk's type a new one, the so-called Cursive, more familiar to us under the name of Italics, which was first used in the edition of Vergil (1501), some credit for the successful innovation being also due to his skillful engraver, Francesco of Bologna. He died of wounds inflicted by an assassin Feb. 6, 1515. See Schück, *Aldus Manutius und seine Zeitgenossen* (Berlin, 1862); F. Didot, *Alde Manuce et l'Hellénisme à Venise* (Paris, 1875); Renouard, *Annales de l'imprimerie des Aldes* (3d ed. Paris, 1834).—PAULUS, son of the former, b. June 12, 1512, took charge of his father's printing establishment in 1533. D. Apr. 6, 1574. He is best known for his editions of the Church fathers and of the complete works of Cicero, as well as for numerous learned commentaries to that author.—ALDUS the younger, son of Paulus, b. Feb. 13, 1547, taught the classical languages for a time; then took up his father's business, but as he was more of a scholar than a practical printer, the famous house fell into decay after 908 editions of Greek, Roman, and Italian classics had gone forth from its presses. D. as the head of the Typographia Vaticana in Rome, Oct. 27, 1597. The Aldine editions, though at the present day not so highly prized by bibliophiles as formerly, are among the most beautiful specimens of the typographer's art. Their distinguishing mark is an anchor entwined by a dolphin with the motto *Sudavit et alsit* or *Festina lente*.

ALFRED GUDEMAN.

Manx, or **Manks, Language**: the old dialect of the Isle of Man, still spoken by about a quarter of the population. It is a Celtic language, and forms with the Irish and the Gaelic of Scotland the Irish-Gaelic branch of the Celtic family. From these sister dialects it is grammatically not far removed, but as it is written in a different orthography—one derived from the English—it appears in its external form quite distinct. The orthography became established through the most important literary work in the language, the Bible translation of 1771–75. Literary records from an earlier period than the eighth century do not exist. The Manx Society (since 1858) is seeking to rescue as much as possible of the language, which is yielding place to the English. This society has published Kelly's grammar (1859–70) and the *Manx Dictionary* (1866). The Christmas carols called *carrels*, sung on Christmas eve, form the chief constituent of the literature. A general summary of the remnants of Manx is given by Jenner in the *Transactions of the Philological Society of London* (1875). See CELTIC LANGUAGES.

R. THURNEYSEN.

Manzanillo, măn-zaă-neel'yō: principal port of the state of Colima, Mexico; on a bay of the Pacific Ocean; lat. 19° 3′ 14″ S., lon. 104° 19′ 49″ W. (see map of Mexico, ref. 7–F). Population about 2,000. The harbor admits large vessels, and there is an active trade with San Francisco, the principal exports being silver ore and agricultural products. It is united by railway with the city of Colima. H. H. S.

Manzanillo, town in Cuba: See the Appendix.

Manzoni, măn-zō'nĕē, ALESSANDRO, Count: poet and writer; b. at Milan, Italy, Mar. 7, 1785. His mother was Giulia, daughter of the Marquis Cesare Beccaria, author of the famous treatise *Dei delitti e delle pene*. He studied at Merate and Lugano, afterward at Milan and Pavia, at the last of which places he took his degree before he was twenty. In 1805 he went to Paris, where his mother had been living at the house of a friend, Carlo Imbonati. Shortly before Imbonati had died, and Manzoni wrote in his honor his *Versi sciolti* (1806). He found his mother intimate with the circle of Mme. Condorcet at Auteuil, the last group of adherents to the philosophy of the eighteenth century. With these men the young poet also became intimate, and for a time he shared their skeptical opinions. With Fauriel, in particular, he entered upon a friendship that long endured. At this time he wrote his *Urania* (1807). In 1808 he married Enrichetta Blondel, daughter of a Genoese banker and a Protestant. About the same time his opinions in regard to religion

began to change, and he finally came to be a firm Catholic, carrying his wife with him into his new faith. In his *Inni sacri*, written from 1812 to 1822 (1st ed. 1815), he is ardently Christian; and in his *Osservazioni sulla morale cattolica* (1819) he stoutly defends Catholicism against the attacks of the Protestant historian Sismondi. Established at Milan, Manzoni began in 1816 his first tragedy, *Il Conte di Carmagnola*, published at Milan in 1820, and dedicated to Fauriel. This, the first romantic drama in Italian, was received with small favor by the poet's countrymen; but the German Goethe, in an article in the Stuttgart review, *Ueber Kunst und Alterthum*, bestowed upon it and its author the highest praise. On the death of Napoleon in 1821, Manzoni wrote his famous ode, *Il cinque maggio*; and in the same year another almost as famous, *Marzo 1821*. In 1822 appeared a second tragedy, *Adelchi*, whose importance the Italians again failed to recognize at first. It was difficult for persons accustomed to dramatic successes due mainly to style and constructive skill to understand the purpose of an author who was endeavoring to depict the original facts of human emotion and experience—albeit sentimental facts—after the manner of the romanticists. In 1827 appeared the three volumes of the work that most closely associates itself with Manzoni's name, the romance *I Promessi Sposi* (Eng. trans., Bohn's Library, 1883). Though in appearance an historical novel like Scott's, this is really more nearly allied to Werther than to the Waverley novels. The interest is inward, psychologic, sentimental, rather than outward and picturesque. The briefer sequel *La Storia della Colonna infame*, written in 1829, has both an historical and a moral purpose, and is not properly a romance. After the appearance of these works, Manzoni became absorbed in critical and linguistic questions, especially in that always burning one of the true form of the language of Italian prose. Converted to the view that Tuscan is the proper model, he defended it in a series of essays, and in 1840 published a new edition (the third) of *I Promessi Sposi*, rewritten in pure Tuscan. This gave rise to violent discussions, which have not yet ceased. Manzoni's last years were spent at Milan in retirement, devoid of great literary enterprises. He took no active part in the politics of his country, though he sympathized with the efforts to bring about a united Italy. When this had been accomplished, he was made a life senator by the new Government (1860) and given a pension of 12,000 francs. D. at Milan, May 22, 1873. The first collected edition of his works was that with critical notes by N. Tommaseo (6 vols., Florence, 1828–29); and many have been published since, e. g. *Opere Complete* (2 vols., Milan, 1875–81). See also his *Opere inedite e rare*, edited, with a *Life*, by Bonghi (2 vols., Milan, 1883, *seq.*); his *Lettere*, edited by G. Sforza (3 vols., 1882, *seq.*); his *Poesie*, new edition by G. Mestica (1888); his *Scritti vari sulla lingua italiana* (1868); Sauer, *Alessandro Manzoni* (Prague, 1872); A. Stoppani, *I primi anni di A. Manzoni* (1874); de Gubernatis, *Alessandro Manzoni* (1879); C. Cantù, *Alessandro Manzoni: Reminiscenze* (2 vols., 1882); Stampa, *A. Manzoni, la sua famiglia, i suoi amici* (1885); Vismara, *Bibliografia Manzoniana* (Milan, 1875).

A. R. Marsh.

Maoris, maa'ō-reez [native name]: a Polynesian people of New Zealand, numbering (1891) 41,993, probably far less than half the population a century ago. Many of them live in that part of the North island comprising about 10,000 sq. miles, known as the King Country. This district was set apart for their use (1840) by Great Britain. The chiefs, seeing that their authority over the tribes diminished with the advance of European settlement, convened a great tribal gathering (1854), and it was decided that no land should be sold to the Government, that no roads should be made by Europeans within the area, and that a king should be selected to reign over the Maoris. These provisions were all carried out. While the Maoris are still scattered over a considerable part of North and Middle islands, the King Country in the W. of North island is exclusively occupied by them. As late as 1883 it was not considered safe for a white man to travel in their territory, though in that year J. H. Kerry-Nicholls explored the King Country for two months without incurring serious risks. They have now come to live on excellent terms with the white colonists. The Maoris are among the finest of the so-called savage races. Physically they were, when first known, among the finest specimens of the human race. Their half-savage, half-civilized mode of life, however, has caused rapid deterioration. The few tattooed warriors of the old school who are left are much superior, physically and mentally, to the younger natives. They have fallen a prey to some extent to the vices of civilization, and particularly to the immoderate use of tobacco, among both old and young. Formerly the most elaborately and beautifully tattooed of savage peoples, the practice has fallen into almost entire disuse. Their legends with regard to their migration to New Zealand are very detailed. They say that 400 or 500 years ago their fathers reached their present home from the island of Havaiki, which is supposed to be one of the Tonga group. Their physique, language, customs, and legends leave no room for doubt that they are pure Polynesian. Human remains, evidently of Papuan origin, have led to the conclusion that the Maoris were not the aboriginal people of New Zealand, but that they exterminated the people they found there when they took possession of the islands. Cannibalism and polygamy were once common. For further information see *Maori Mementos*, by Sir George Grey, governor of New Zealand (Auckland, 1855); also his *Polynesian Mythology* (London, 1855); *Mythology of the New Zealanders*, in Maori (London, 1854); *On the Native Songs of New Zealand*, by J. A. Davies (appendix to the foregoing); *The New Zealand Government and the Maori War of 1863–64* (London, 1864); *Important Information relative to New Zealand* (Sydney, 1839); *A Summer's Excursion in New Zealand* (London, 1854); *Konga Whakapepeha, etc., or Proverbial and Popular Sayings of the Ancestors of the New Zealand Race*, by Sir George Grey (London, 1857); *The New Zealanders* (London, 1830); *Voyages de M. l'Abbé de Rochon aux Indes Orientales* (Paris, 1783); Marsden's *Visit to New Zealand* (1820); Nicholas, *Voyage to New Zealand*; Kerry-Nicholls, *The King Country* (London, 1884).

C. C. Adams.

Map [from Fr. *mappe* in *mappe-monde*, map of the world < Lat. *map'pa mun'di*, liter., cloth of the world]: a graphic representation on a suitable scale and on a plane surface showing the relative distances and directions between known positions, or an illustration of physical, statistical, and other ascertained facts. If a map refers to the earth's surface and the points are sufficiently numerous, it will define the boundaries of the continents, the location of islands, cities, etc.; the courses of rivers, ranges of mountains, and other features that will depict truthfully the surface in miniature. If it illustrates the celestial sphere or represents statistics of population, commerce, natural history, physical phenomena, etc., it may be called a chart. The line between map and chart is not so clearly defined that it can always be understood, but generally those graphic representations that are plotted on a geographic basis from isolated or independent facts or points, as distinguished from interdependent points forming the outline of a continent, or from statistical data, are called charts, when the geographic basis alone would be designated a map. The representations of hydrographic surveys prepared for the use of the mariner in navigation are also called charts for analogous reasons. "Map" was originally the designation in English of all representations of facts shown graphically; but in modern practice the tendency is to confine the use of the word to representations of the land surface of the earth, and to distinguish illustrations of celestial, statistical, physical, hydrographic, and other classes of ascertained facts as charts. In other tongues, however, the word chart seems to have general application.

Map compilation is an art requiring skill and judgment only acquired through experience, that the map may give due prominence to the salient features in proportion to their importance, without impairing its perspicuity. The publications are issued in various forms that must depend largely on the purposes they are designed to serve. The properties of the projection, the representation of the meridians and parallels that measure geographic distances, is one of the first importance, as upon this projection rests the relative accuracy of the different parts. If form and area are mainly desired, a projection to satisfy these conditions is necessary. It is impossible to roll out the surface of a sphere on a plane, and only small areas of such a large sphere as the earth can be developed without sensible error; the projection tends to minimize the distortion of the parts of the representation, but it is impracticable to develop or represent an area of the earth's surface larger than one square degree without sensible distortion of some of the parts. All maps, therefore, covering such areas as a hemisphere or continent are only conventional representations of area, though

affording precise geographic data for all its parts. See PROJECTION.

The oldest map extant is believed to be a papyrus roll in the Turin Museum, supposed to represent a gold-mining district in Nubia, and which, it is estimated, was drawn about B. C. 1500. Anaximander of Miletus, a scholar of the Greek school of philosophy, who lived from B. C. 611 to 547, is reputed to be the first man who attempted to draw a map of the world. Dicæarchus of Messina, in Sicily, a pupil of Aristotle (B. C. 310), is credited with having drawn a map dividing the then known world into parts. He worked on the assumption that it was one and a half times as large as it was broad, and dividing it into two parts by a straight line made what may be considered the first representation of a parallel of latitude. Eratosthenes, the keeper of the Alexandrian Library, born at Cyrene, B. C. 276, is believed to be the first who tried to measure the magnitude of the earth and to collect into a scientific treatise the scattered information respecting places and continents. He improved on Dicæarchus in his division of the world, by drawing on his map additional lines parallel to the first, and others at right angles to the parallels, dividing the area into sections for convenience of description, but really constructing a primitive projection and practically instituting the system of reference that is still maintained, though of course greatly improved by our knowledge of the size and figure of the earth permitting the sections to represent definite measures. The astronomer Hipparchus of Bithynia (B. C. 150) criticised the work of Eratosthenes, and contended that the map of the world should be constructed from known positions determined astronomically. It does not appear that Hipparchus made any attempt to construct a map on the principle he enunciated; and there is no record that the utility of the method was fully appreciated until the second century of the Christian era when Claudius Ptolemy constructed his series of twenty-six maps, together with a general map of the then known world. Ptolemy's maps were a material advance, and though containing many errors and great exaggerations from an erroneous computation for the length of a degree of longitude, they exhibit more completely the geographic knowledge of the epoch than any other maps of prior or subsequent epochs to the sixteenth century.

In mediæval times the scientific mapping of Ptolemy seems to have been supplanted in Europe by sentimental representations in which the holy city of Jerusalem is made the central point of the world, with all other lands circling around it, and the ocean encompassing the whole on the outer margin. The Hereford map of the world, drawn on vellum by Richard de Haldingham about the end of the thirteenth century is perhaps the best example of this style of construction. The spirit of true geography during this period found a resting-place for a time with the Arabians. The treatises on geography and travels by Abulfeda, Edrisi, Leo Africanus, Ibn Batuta, and others, are still interesting and valuable; but the Arabians were divided into two schools, one advocating the compilation of itineraries describing routes and provinces without reference to geographic positions from astronomical observations, while the other confined the maps to a representation of the positions determined astronomically, ignoring the valuable information that might have been added from the itineraries, with the result that mathematical geography that had received an early place and made some advance was ultimately omitted altogether. Ibn Haukal (976 A. D.) is credited with the declaration that mathematical division only brought confusion into geography.

The Romans had little more than compilations of itineraries, and do not appear at any time to have attempted the scientific methods of construction. The Peutingerian table, of which alleged copies have been preserved, is supposed to have been made about 230 A. D. It is one of the most famous of historical maps, and exhibits the military roads of the empire and the whole world known to the Romans, from Britain to Farther India. Its original form is not well ascertained, but there is strong reason to believe it was either circular or oval, after the usual conception of the earth's boundaries. It can not be fairly called a map, for, though it was doubtless constructed to aid in the political and military administration, for which purpose all their maps seem to have been designed, and shows the names of places and distances between them by the routes of travel, it does not give the bearings or directions between the places. The Italians, however, introduced the compass map in the thirteenth century, marking an approach of the return to scientific map-making developed by the revival of Ptolemy in the sixteenth century. Since then there has been a generous rivalry among civilized nations to improve the methods and obtain the data to construct a map that shall be correct and mathematically true.

In the seventeenth century great strides were made in geography, and the volumes of maps published by private individuals excel in costly elaboration the publications of the present day. Fair examples of this style will be found in the nine folios of the great atlas of Joannes Blaeu, published at Amsterdam about 1560; that of de Wit, also prepared in Amsterdam about thirty years later; and the atlas of Sanson, geographer to the French king, published in three huge folio volumes in Paris between 1690–96. The survey of China, given out in the name of Bre du Halde, was among the most important geographic works published in the early years of the eighteenth century. It was the work of a number of Jesuit missionaries who gained admittance into China about the end of the fifteenth century; this great work was completed in 1718, and still forms the basis for maps of the interior of the empire. It should be mentioned, however, that native Chinese maps of high value existed previously to this Jesuit survey, and that in both China and Japan geography and map-making had made great progress independently of the advance in the science by the Mediterranean and European countries. The Japanese maps of the present day present a still greater advance, and are a mark of the aptitude of this peculiar people.

The improvements in map-making from the inception of the art to the artistic representations of the modern workman are very marked. The greater accuracy and more complete detail obtained in the surveys have exerted a decided influence on the style, especially in the nineteenth century. The first maps were necessarily compiled from itineraries of travelers, and though controlled in a measure by determinations of latitudes, were greatly in error in longitudes, even after the sphericity of the globe was recognized as a fact. The discovery of the magnetic needle and its application to navigation toward the close of the twelfth century marked a great improvement in the reliability of itineraries, and the system of trigonometric surveying introduced in the beginning of the sixteenth century furnished a still more reliable method of controlling distances and directions. In the eighteenth century (1761) the chronometer was invented, affording a ready means for ascertaining differences in longitude, and soon after the reconstruction of the map of the world was begun. Since then the electric telegraph has supplemented the chronometer for longitudes; new methods and improved instruments have simplified astronomical observations; the civilized nations have completed, or have well advanced, detailed surveys of their territories, and obtained the outlines of nearly all accessible regions with an accuracy so far surpassing former efforts that cartographers have experienced a confidence in the permanency of their compilations that has inspired them to publish their work in more artistic form, or when dealing with the detail of more limited areas to devise symbols that would render the representation at once perspicuous and the most useful. The publication of the map of France by the Cassinis in the eighteenth century (1750–93) attracted the attention of all civilized governments. It was the first extended map constructed upon a trigonometric base exemplifying the principles of scientific map-making, and presented the merits of the system so forcibly that the empirical methods formerly in use soon became obsolete.

Near the close of the eighteenth century surveying had been developed into a science, but it is only within the present century the methods of the science have been perfected so that they will permit a rapid and reliable determination of the features of a region for cartographic purposes. The explorer can now maintain an itinerary of his wanderings over the land with the ease the navigator can record the courses he has sailed over the waters of the ocean. The facilities for travel and maintenance of parties in the field are also so vastly superior that, especially within the present generation, exploration has made wonderful strides, and has so reduced the regions of hypothetical or unknown geography that there is left over the whole habitable world an area scarcely larger than the U. S. that has not been explored and mapped with reasonable fullness.

Terrestrial maps may be divided into two general classes, *geographic* and *topographic*; the former representing the salient natural features, as mountains and rivers, the politi-

cal divisions, etc., of a region, generally embracing a large area; and the latter representing the same features with the details thereof in addition, and the cultural details, such as the plans of towns and villages, the roads, farms, etc. Many attempts have been made to classify maps under these two heads by the scale upon which they are drawn; but the greater detail obtained in modern surveys renders a classification by this factor impracticable. It is manifest that to map a region of which we have a very imperfect knowledge, on a large scale, will not supply the detail requisite for a topographical map; and that many regions of comparatively little detail can be mapped with perfect clearness on a much smaller scale than other regions of an equal area but much greater detail. It is therefore preferred to designate all those maps that are generalizations, that show only salient features, as *geographic*, and those that show the actual form and detail as *topographic*—no matter how large the scale. A further division has been made to classify all maps on a scale larger than one ten-thousandth part of nature as *plans*, but this is also objectionable if the information depicted on the map is the criterion; there are drawings, however, sometimes showing topographic detail, that are properly and universally called plans.

The geographic map is usually the base for charts illustrating economic statistics, as population, industries, etc.; the topographic map for natural history and phenomena, especially when the elevation above the sea is an essential in the interpretation of the classifications, as in animal and plant life. Both classes are used in the construction of hydrographic charts, the selection having to depend upon the purpose the hydrographic data is to subserve.

The globe furnishes the fairest information of the relation of the geographic features of the earth's surface, and also of celestial geography; but it is cumbersome, and limits the scale to such a small proportion of nature that its use is necessarily restricted. Globes will usually be found from a few inches to 3 or 4 feet in diameter. The largest ever made was exhibited at the Paris Exposition in 1889. Its diameter was one-millionth part of the diameter of the earth, about 42 feet. Stairways and galleries were constructed to facilitate its examination. A section of a globe on the same scale, representing the U. S. and Territory of Alaska, was exhibited by the U. S. Coast and Geodetic Survey at the World's Fair, Chicago, 1893. It was also so large that a gallery was necessary. It differed from the Paris globe in that it represented the elevations of the surface of the earth above sea-level, illustrating most forcibly the comparative insignificance of the highest mountains.

Relief-maps are a form of illustrating geography that have found much favor. Their construction is laborious, and they are necessarily limited in their application and generally have their greatest value in physiography. As they show the irregularities of the surface they are also instructive to the student of geology, and when made in sections placed side by side, with the various strata colored on their edges to show the dips and formations below the surface in addition to the exposures, they convey a better conception of the earth's structure than any other method.

The undulations of the earth's surface, forming mountains, hills, and valleys, have generally been represented on maps by hachures, or some other shading developed from rays of light falling vertically, or in some instances at an oblique angle. Dufour's grand atlas of Switzerland represents the elevations in hachures, and is one of the finest examples of this system. On geographic maps the system is still very generally followed when mountain ranges or other material elevations are to be shown. Hachuring was also used on topographic maps until the early part of the nineteenth century, when the system of *curves of equal elevation*, or *contours*, as they are generally called, was introduced, and that has since become almost universal in its application. The contour system is the most valuable that has been devised for expressing the relief of the topography. Each contour must be conceived as representing a new shore-line on the supposition that water has risen on the hill-sides a given interval; assuming an interval of 20 feet, a hill of 100 feet height would thus be delineated by five contours; where the slope of the hill-side is gradual the contours would be comparatively far apart, where it is steep they would be close together, the horizontal distance between the contours being variable, depending upon the grade, while the vertical interval is a predetermined fixed quantity. Similarly the forms of ocean beds are brought out by contour lines representing depths of the water. All the great powers of the world have completed, or have well advanced, topographic surveys, based upon precise triangulation, and delineating with greater or less detail the natural and artificial (works of man) features within their boundaries. Unfortunately, the topographic surveys are not all of equal precision; it is very seldom that the features represented by contours are delineated with absolute truthfulness. Generally the topographers only attempt to represent a generalization of the natural forms that will be readily recognized and sufficiently precise to permit identification on the ground of any locality selected on the map; where such surveys have been made they form the basis of all maps, being reduced to the geographic and atlas forms for general information, but retained in forms nearly like the manuscript surveys for detailed information required for governmental, local, and economic purposes.

A small portion only of the world can be mapped with great precision; much the greater part of it, except the bare boundaries, is compiled from itineraries of explorers, military expeditions, reports of governors of provinces, and similar sources. The frequent revision necessary in adding the most recent explorations in the comparatively unknown regions is a constant source of annoyance to map-makers, from which they will not be relieved until the arts of civilization have conquered the whole world. There are few maps covering any considerable area more detailed than the geographic. Maps are published by the cartographers of many nations, and present the art of map-making in many forms; which may excel, it would be invidious to say, but the student will be amply rewarded who examines the more recent publications by the French; they have also produced some of the most artistic and intelligible topographic maps of recent date, combining the system of contours with shading and coloring that is most pleasing to the eye and intelligent expression of form. The ordinance survey of Great Britain has a standard system of representation for the very precise surveys that have been made on the British islands, in which the detail is given with great minuteness on the larger scales, and gradually eliminated by fixed rules through various scales to the geographic map with its bare outlines and salient features only. The Geological Survey of the U. S. has developed a system, by eliminating the detail not considered necessary for the purpose the maps are to subserve, that presents great clearness. The hills are shown by contours without any attempt to emphasize the declivities and accidents of the ground beyond the natural expression of the contours; all verdure is omitted, and only those artificial or cultural details are given that can be considered to have a public or corporate value. Celestial and economic charts are published in a great variety of forms by all civilized nations; the reports of the U. S. census present some of the best statistical charts. The U. S. Coast and Geodetic Survey and the hydrographic office of the U. S. navy publish hydrographic charts of artistic and practical merit. The British Admiralty is the most extensive publisher of nautical charts in the world, but the artistic merits of the sheets are subordinated to their practical usefulness.

An interesting example of the capabilities of modern workmen to reproduce will be found in the collection of old maps recently issued by the Geographical Society of Berlin in commemoration of the four hundredth anniversary of the discovery of America, illustrating that event by the reproduction of maps showing the early discoveries and development of the continental outlines.

Ancient maps on tablets of stone can be seen at Rome, and maps on vellum can be found in many national museums. In modern times the most valuable maps are engraved on copper, sometimes on stone, and those intended to meet only an ephemeral demand are drawn on paper and published by some of the cheap and expeditious methods that have been devised with the intermediary of photography.

HERBERT G. OGDEN.

Mapes, or **Map**, WALTER: archdeacon and poet; b. in England, probably in Herefordshire, about the middle of the twelfth century; studied in Paris; became a noted theologian; a favorite of Henry II., by whom he was sent on missions to the French and papal courts; was canon of St. Paul and of Salisbury, precentor of Lincoln, incumbent of Westbury, Gloucestershire, and Archdeacon of Oxford (1196). D. about 1210. He wrote many Norman-French and Latin poems on festive and romantic topics, as also in prose in both languages, but the authenticity of the poems now attributed to him has been seriously questioned. The

Latin Poems commonly attributed to Walter Mapes were edited by Thomas Wright for the Camden Society in 1841, and the prose work, *De Nugis Curialium*, in 1850.

Revised by H. A. Beers.

Maple [O. Eng. *mapol, mapolder*. Cf. O. H. Germ. *mazzoltra* > Mod. Germ. *massholder*]: a name given to trees of the genus *Acer* and family *Sapindaceæ*; natives of North America, Asia, and Europe. Many of them are noble shade and timber trees. The American species are the following: (1) The sugar-maple (*A. saccharinum*), called also hard or rock maple, and its variety, *nigrum*, the black maple. In Canada and the northern part of the U. S. great quantities of sugar of good quality are made by boiling the sap of this tree. It is a handsome park and forest tree, and is prized as firewood and timber. It is used extensively in making furniture, especially the peculiar forms of the wood called birdseye and curled maple. (2) The white maple or silver maple (*A. dasycarpum*), a fine shade tree; its soft and white wood is not of value as fuel or timber, but is used for making shoemakers' lasts. (3) The red or swamp maple (*A. rubrum*), which shares with the preceding the name of soft maple, the red blossoms of which appear considerably later, but before the leaves. The wood is like that of the silver maple. (4) The striped maple (*A. pennsylvanicum*), sometimes called moosewood, and (5) the mountain maple (*A. spicatum*) are small trees or tall shrubs of little importance, although the former is planted for ornament. Their flowers appear later than the leaves. These are the Atlantic U. S. species. In the Rocky Mountains occur (6) *A. glabrum*, a handsome small tree, and (7) *A. grandidentatum*, of larger size. Finally Oregon and California have two species—(8) the vine maple (*A. circinatum*), a small tree or large shrub which obtained its popular name either from a sarmentose habit which it affects in its native swamps or on low banks of streams, or from the rounded and many-lobed leaves, which may be likened to those of the grapevine; (9) the large-leaved maple (*A. macrophyllum*), a very handsome tree, but never very large; its timber hard and close-grained, and greatly valued in Oregon, this and an ash being the principal hard-wood trees of the region. To the foregoing may be added two species of box-elders now placed in this genus—(10) *A. negundo* of the Eastern U. S. and (11) *A. californicum* of the Pacific slope. The box-elders are often called ash-leaved maples. (See Box-elder.) Of European species, the species commonly planted in the U. S. for shade and ornament are the Norway maple (*A. platanoides*), a round-headed tree with bright green leaves, most like those of sugar-maple, and the sycamore maple (*A. pseudoplatanus*), in England called simply sycamore, known by its large leaves, long and reddish stalks, and the lobes acute and pointed, both hardy trees of rapid growth and good timber. The wood of the latter is much used in Europe for carving.

Revised by Charles E. Bessey.

Mapleson, James Henry: operatic manager; b. in London in 1832. At the age of fourteen he entered the London Royal Academy of Music, where he remained two years. In 1848 he played first violin in the orchestra of Her Majesty's theater in London. In the season of 1849 he went out as a manager into the provinces, having a company which contained among other artists Sontag, Lablache, and Thalberg. He spent some years in England cultivating his voice, but he was attacked by an affection of the throat, and after an operation found that the career of a vocalist would be closed to him. In 1856, after having acted as business agent and manager of several traveling companies, he translated into Italian for Lumley, of Her Majesty's theater, the libretto of Balfe's *Bohemian Girl*. In 1858 he became the recognized director of Italian opera in London at Drury Lane theater. The season of 1860 was prosperous financially, and Mapleson was at this time associated with the lessee of several theaters in London. In 1861 Adelina Patti appeared under Mapleson's management, and he lost £9,000 by the venture. The season of 1862 was spent in labor at Her Majesty's theater. He paid £4,000 as advance rent and another £4,000 as security, and began again. On June 11, 1863, he first produced *Faust* in London. His first tour in the U. S. was made in 1878. He made other visits in 1880, 1881, 1884, and 1885–86. Some of his new productions to English-speaking audiences were *Faust*, *Un Ballo in Maschera*, *Carmen*, *Hamlet*, and *Falstaff*. He wrote *The Mapleson Memoirs* (Chicago, 1888).

B. B. Vallentine.

Maple-sugar: See Sugar.

Maquet, mȧȧ′kā′, Auguste: novelist and playwright; b. in Paris, Sept. 13, 1813; d. Jan. 10, 1887. He was educated at the Collège Charlemagne, where in 1831 he was appointed professor. He turned later to literature, and became *collaborateur* with Alexandre Dumas in some of the latter's most famous novels and their dramatizations—*Les trois Mousquetaires*, *Monte Christo*, *La reine Margot*, *Vingt ans après*, *Les Quarante-cinq*, *etc.* The announcement of this fact in a sensational way by Eugène de Mirecourt in his *Maison Alexandre Dumas et compagnie* (1845) produced one of the worst literary scandals of the period. After his separation from Dumas, Maquet produced a number of novels, most of which he also dramatized—*La belle Gabrielle* (1853), with its continuation, *La maison du baigneur* (1856); *Le comte de Lavernie* (1855); *L'envers et l'endroit* (1858); *La rose blanche* (1859); the fanciful tales *Voyage au pays bleu* (1859). The dramatization of *La maison du baigneur* (1864) was particularly successful, as was also the play *Le Hussard de Bercheny*.

A. R. Marsh.

Maquoketa, ma-kō′kĕeta: city; capital of Jackson co., Ia. (for location of county, see map of Iowa, ref. 4–L); on the Maquoketa river, and the Chi. and N. W. and the Chi., Mil. and St. P. railways; 40 miles N. of Davenport. It is in a timber, grain-growing, and live-stock region; contains the Boardman Library Institute, a national bank with capital of $50,000, 3 private banks, and 4 weekly newspapers; and has manufactories of flour, woolen goods, machinery, and cigars. Pop. (1880) 2,467; (1890) 3,077; (1900) 3,777.

Marabou Stork [Fr. *marabout*]: a large stork (*Leptoptilos marabou* or *crumenifer*) of Western Africa, having a huge bill and an enormous pouch on the neck. This is not, as is commonly supposed, a crop, but is an air sac, and has no connection with the gullet. The marabou is a good scavenger, and is valued for its services. The marabou feathers of commerce are the axillaries (?) and under tail coverts of this bird and of the East Indian adjutant (*L. argala*).

F. A. L.

Marabouts [Arab. *Morābit*, steadfast]: a kind of half priestly caste in the N. W. of Africa, descendants of the Almoravide sovereigns of Spain and Morocco. They profess to exercise miraculous powers, and are greatly revered by the common Mussulmans. They preside in all popular assemblies, and decide intertribal and important questions. Though dependent upon alms, they are very liberally supported. The French in Algeria have many times felt their power. Pilgrimages are made to their tombs and sacrifices and prayers offered. The famous sheik Abd-el-Kader belonged to their number.

E. A. Grosvenor.

Maracaibo, mȧȧ-raȧ-kī′bō: capital and principal city and port of the state of Falcon, Venezuela; on the west side of the passage or strait connecting Lake Maracaibo with the ocean, at the northern end of the lake; lat. 10° 35′ N., lon. 71° 45′ W. (see map of South America, ref. 1–C). It is built on low land, and has a picturesque appearance, due to the numerous cocoanut palms around it; the streets are badly paved and gloomy, owing to the high houses, and the heat is intense, the mean being 83° F. Water is obtained from cisterns, and is often bad. The pleasant suburb of Hatitos, to the S., contains many of the finest residences. Maracaibo is the center of trade not only for the lake towns, but of a large portion of the states of Falcon and Los Andes and of Eastern Colombia. The most important article of export is coffee, most of which goes to the U. S.; other exports are cacao, hides, dyewoods, cattle, cocoanut oil, and drugs. The harbor is good, but as large vessels can not reach this point a railway is projected to Cojoro, a seaport near the Colombian frontier. Alfinger, in 1529, had a slave-trading station at this point. A settlement made in 1568 was destroyed by Corsairs, but it was rebuilt by Pacheco in 1571. The prosperity of the port dates from the destruction of Gibraltar, by the pirate l'Olonais, at the south end of the lake (1668), the commerce of that place finding this new outlet. Maracaibo was long the literary center of Venezuela, and was especially renowned for its Jesuit college. Its inhabitants are still noted for their intelligence, and the place has several educational institutions. Pop. (1889) 34,284.

Herbert H. Smith.

Maracaibo, Gulf of, or Gulf of Venezuela: an inlet of the Caribbean Sea; in the coast of Northwestern Venezuela; between the peninsulas of Paraguaná on the E. and Goajira on the W. At its southern end it receives the outlet of Lake Maracaibo, which lies in the same depression, and is

only separated from it by islands and points of alluvial land. H. H. S.

Maracaibo, Lake: a great sheet of water in Northwestern Venezuela, lying principally within the state of Falcon, but at its southeastern end bordering on Los Andes. Area (according to L. Vincent, 1890), 8,392 sq. miles. Its outlet, opposite the city of Maracaibo, is 8½ miles wide; below it broadens, but 20 miles from Maracaibo is again shut in by several islands, between which it communicates with the Gulf of Maracaibo. Strictly speaking, the so-called lake is a deep gulf, but owing to its narrow entrance and to the numerous small rivers which discharge themselves into it, the water is fresh, becoming brackish or salt in the northern part during high tides or with long-continued northerly winds; ordinarily the effect of the tides is only observable in a slight rise and fall of the waters. The depth in parts reaches 500 feet, but vessels drawing more than 10 feet can not enter, owing to sand-bars in the passages between the above-mentioned islands. Lake Maracaibo occupies an extensive basin which has been partly filled in with alluvium, leaving numerous swamps and small lakes, which communicate with the larger one. The banks are low, in parts of difficult access, owing to the shallows, and about the southern end very unhealthful. Toward the outlet the land is somewhat higher and free from malaria, but the heat in all parts of the basin is very great. Small steamers now ply regularly on the lake. The waters abound in fish. The entrance to the lake was discovered in 1500 by Rodrigo de Bastidas and Juan de la Cosa. They found villages of the Indians built on piles in the shallow water, and, fancifully comparing them with Venice, called the region Venezuela, a name which has been extended to a much larger territory. Indian houses on piles are still found in this region.

HERBERT H. SMITH.

Ma'ragha: town; in the province of Azerbijan, Persia; on the Safi, whose waters are conducted through canals over a large territory and employed for irrigation (see map of Persia and Arabia, ref. 1–F). The raisins of this vicinity are considered the best in Persia. The manufactures of glass are considerable. Close by are the famous Maragha marble-pits, where the marble is cut in slabs so thin that it is nearly transparent. It is much appreciated throughout Persia. This place was the capital of the possessions of Holagoa, grandson of Genghis Khan. It was also the residence of the astronomer Nassiredin of the thirteenth century. He had an observatory here with which he fixed the geographical position in close accordance with modern determinations. Pop. (1885) 13,250.

Revised by M. W. HARRINGTON.

Marais' des Cygnes River [Fr., swans' marsh]: a stream which rises in Wabaunsee co., Kan., flows in a tortuous E. S. E. course, 125 miles to the Missouri line, near Fort Scott, and takes the name of OSAGE RIVER (*q. v.*). It receives numerous streams and drains a fertile region.

Marajó, măă-raă-*zh*ō′ (on old maps sometimes called **Joannes**): a large island of the state of Pará, Brazil; on the southeastern side of the mouth of the Amazon, between that river and the Pará, and separated from the continent on the S. W. by a network of channels, through which a portion of the Amazonian water flows to the Pará. Length about 120 miles, breadth from 80 to 100 miles; area, about 10,000 sq. miles. The surface is perfectly flat and, in great part, of alluvial formation, but traces of an older framework of rock are seen along the southern and western sides, and hence this is not, strictly speaking, a delta island, as are many smaller ones adjoining it. During the period of heaviest rains (February to June), and at the time of the annual river-floods, large portions of the surface are overflowed, though only to a small depth. About one-third of the island on the S. W. is covered with forests and abounds in rubber-trees, but is very unhealthful. It is, however, the seat of the principal settlements, and supports several thousand rubber-gatherers, who live miserably in the swamps. The remainder of the island consists of open lands varied with occasional groves and, in the northern part, with extensive swamps called *mondongos*. The grass-lands are generally healthful, and afford excellent pasturage; large herds are kept on them, though for weeks together the cattle are obliged to wade over the flooded lands in search of food. Horses, formerly numerous, have nearly disappeared, owing to the ravages of a disease common on low and wet ground. There are a number of navigable rivers, or, rather, drainage channels; the largest, called the Arary, leads to a small lake of the same name almost precisely in the center of the island. In this lake there is an artificial island of prehistoric origin, well known to archæologists from the large number of interesting objects obtained on it. Marajó abounds in game and fish. See Penna, *A Ilha de Marajó* (1870); Edwards, *A Voyage up the Amazon* (1857).

HERBERT H. SMITH.

Maranhão, măă-raăn-yowñ′, in old books **Maranham**: a northeastern state of Brazil; bounded N. by the Atlantic, S. E. by Piauhy, and W. by Goyaz and Pará; area, 177,533 sq. miles. Most of the interior is included in the Brazilian plateau, which is much broken by deep river valleys, so that the surface is very irregular; there are no true mountains, and probably the highest portions of the plateau do not attain 3,000 feet. Adjoining the coast there is a strip of low land from 20 to 50 miles wide. In the northern and coast regions there are extensive forests, continuous with those of the Amazon. The southern part is more open, and its climate resembles that of Ceará, having a well-marked dry season; the periodical droughts which are so destructive farther E. are also felt here, but are less severe than in Ceará. Besides the Paranahyba, which separates this state from Piauhy, and the Tocantins, which divides it from Goyaz, there are a number of considerable rivers flowing to the Atlantic; of these the Itapecurú, Pindaré, Mearim, and others are navigable. The only harbor of importance is the Bay of Saõ José or Maranhão. The climate is warm, but in most places healthful. The soil of the coast region and valleys is very rich, giving excellent crops of sugar, rice, and cotton, which constitute the principal exports. Grazing is a prominent and growing industry in the interior. Large areas in the southern and western parts of the state are inhabited only by wild Indians. Maranhão, though lying within the region claimed by Portugal, was first settled by the French in 1612. They were driven out in 1615 by the Portuguese, who retained possession of the region except from 1641 to 1644, when it was in the possession of the Dutch. In 1621 Ceará, Maranhão, and Pará were erected into the state of Maranhão, independent of Brazil, and only subject to Portugal. Ceará was subsequently detached; the state was divided into various captaincies which by suppressing and changes were reduced to four, Piauhy, Maranhão, Pará, and Rio Negro (now Amazonas); these correspond to the modern states. The state of Maranhão was suppressed in 1774, the captaincies becoming subject to the viceroyalty of Brazil; the captaincy of Maranhão, with some changes in the boundary, became a province under the empire, and finally a state in 1891. Pop. of state (estimated, 1894) 550,063. Capital, Maranhão. Caxias, Alcantara, and Itapecurú are considerable towns. See C. A. Marques, *Diccionario historico geographico da provincia do Maranhão* (1870) and *A provincia do Maranhão* (1876); Wells, *Three Thousand Miles through Brazil* (1886); and the historical works of Berredo and Candido Mendes de Almeida. HERBERT H. SMITH.

Maranhão: capital, principal city, and port of the state of Maranhão; on the northwest side of the island of São Luiz, which is situated at the entrance of the Bay of São José and is separated from the mainland on the S. by the Bay of São Marcos and a narrow channel (see map of South America, ref. 3–G). The city is on two low hills, and the streets are very steep, but they are wide and the town is substantially built. The climate is warm (maximum, 92° F., minimum, 76°) but healthful; yellow fever is seldom prevalent. The port is good, but the entrance is somewhat difficult, and very deep-draught vessels can not pass it. Small steamers ply on the neighboring rivers. Maranhão was founded by the French in 1612. Pop. (1892) with the immediate vicinity, 38,000. HERBERT H. SMITH.

Marañon, măă-raăn-yōn′: the name given by Peruvians to the Amazon. Geographers generally restrict the name to the Upper Amazon beyond the limits of Brazil. See AMAZON.

Maraschino, măă-raă-skee′nō: See LIQUEUR.

Mars'mus [Mod. Lat., from Gr. μαρασμός, a quenching, a dying away, deriv. of μαραίνειν, put out, quench (of fire), pass, go out, die or waste away]: a general wasting of the entire body, including all the tissues and organs, dependent on one or more of many causes. Two general classes may be described.

1. Premature marasmus—a decline, as above, due to any disease which may reduce the general strength and nutri-

tion for a long-continued period, by virtue of mal-assimilation or too rapid tissue disintegration; the causative factors being so varied necessarily indicates that there must be many phases of this condition. In the new-born infant marasmus may result from premature birth, exhaustive hæmorrhages, hereditary syphilis, suppuration, chronic diarrhœa, or early occurrence of an infectious disease. Most frequently, however, it is seen somewhat later, as the result of insufficient and improper nourishment (not an actual lack of food) generally in bottle-fed infants, especially those with poor hygienic surroundings, causing a disturbance in the absorption of the nutritive elements in the intestine. In these cases, when not too far advanced, much can usually be done by careful attention to the proper articles of diet and general management. In adults this condition sometimes follows chronic diseases in which the system is drained, such as recurring hæmorrhages, prolonged suppuration, chronic diarrhœa, long-continued fevers, as in tuberculosis, syphilis, diabetes, malignant tumors, and some diseases of the blood. It may also be brought about by some forms of mental disease as well as by continued privation or the excessive use of intoxicants. Among its symptoms may be mentioned a marked loss of flesh and strength, general weakness, with a pale and shriveled skin. The hair falls out and often turns gray. The nails do not grow. In severe cases the blood may coagulate in some of the veins. The outlook for these cases depends on the cause of the condition, but is usually grave, as it generally is the precursor of death. Treatment of this condition must also vary and is decided by the physician on the merits of each case.

2. Senile marasmus is a similar condition seen in old age; the seventieth year is said to be the time of its most frequent occurrence. No direct causes for this wasting are necessary, as it is the result of natural decline in the vitality of the tissues, etc., and therefore must occur to some extent at an earlier or later period, not being due to any irregularity in assimilation or disintegration. It is usually seen earlier in the poorer classes of society—people who have done very hard work and at the same time have had poor nourishment and bad hygienic surroundings; in these, well-marked senile decay may often be noted at the age of fifty. These changes are seen in all the tissues and consist in an atrophy of the parts, and at the same time more or less fatty and calcareous degeneration. This condition need not exist in the same measure throughout all parts; some organs may be exempt. The calcareous degeneration is frequently seen in the arteries (atheroma), changing their walls and resulting also in a lack of elasticity. In this state they are more liable to rupture especially in the brain, allowing hæmorrhages (apoplexy) and consequent paralysis. In the bones this increase of calcareous matter is also noted, making them more liable to fracture. A fatty change is observed in the muscles and in the heart, accounting for the loss of power, etc. The hair falls out. The digestive glands atrophy. In the same measure retrograde changes to a greater or less degree are observed in all other parts of the body.

A. Jacobi and F. E. Sondern.

Marat, maa'raa', Jean Paul: French revolutionist; b. at Boudry, Neuchâtel, Switzerland, May 24, 1744, of Protestant parents; studied physical science and medicine, read much, acquiring miscellaneous knowledge; traveled for several years, and practiced as a physician in London, where he published an *Essay on Man*, a sharp attack on the philosophy of Helvetius. In 1774 he published at Edinburgh *The Chains of Slavery*, translated into French in 1792 under the title of *Les Chaines de l'Esclavage*; settled in Paris in 1775; practiced as a physician with considerable success; wrote several books on optics and electricity, and at last entered the service of the Count of Artois, afterward Charles X., by whom he was appointed brevet physician to the guards. The Revolution drew him from his profession and turned him into a political fanatic. His dominant motives seem to have been a fierce hatred of all inequalities in the social or political system, and a constant suspicion of the ruling powers. This naturally drew to his side the worse elements in the state, over whom he soon gained an extraordinary influence. His paper, *L'Ami du Peuple*, begun under the title of *Le Publiciste Parisien* and continued as *Le Journal de la République Française*, was a power in France during its whole lifetime, from Sept. 12, 1789, to July 14, 1793. The virulence of his attacks, his continual cry of treachery on the part of the government, brought upon him the anger of all parties. In 1790 he was forced to take refuge in London, but returned to Paris two months later and continued to publish the *Ami du Peuple*. He was at this time hiding in the cellars and sewers of the city, where he contracted a painful skin disease. These hardships further embittered him, and he grew more violent than ever against royalists and Girondists. The guilt of the September massacres rests in great measure upon him, but this served only to enhance his power in the commune. He was elected to the Convention, where he was soon involved in a life and death struggle with the Girondists. The latter were at first successful, and Marat was brought before the Revolutionary Tribunal, but he was acquitted, returned in triumph to the Convention, and led the movement which resulted in their downfall. He did not, however, live to see his enemies brought to the guillotine. The disease contracted in the sewers of Paris was closing his life, and he would probably not have lived more than a few days, when he was stabbed (July 13, 1793) by Charlotte Corday. His body was brought to the Pantheon, his portrait hung in the hall of the Convention, and a pension was voted to his mistress, but hardly two years elapsed before this enthusiasm gave way to general indignation and disgust. His portrait and his body were transferred to other and more proper places. See F. Chevremont, *Jean Paul Marat, esprit politique, accompagné de sa vie scientifique, politique, et privée* (1881).

F. M. Colby.

Mar'athon (in Gr. Μαραθών): a plain on the coast of Attica; about 6 miles long, 1½ miles wide, and 22 miles E. N. E. of Athens. The river Charadrus runs through it, and two little hamlets (Vrana and Marathona) are on its western edge, under the hills. The battle fought there in Sept., 490 B. C., is one of the most important in history. Ancient accounts of it, however, are inexact and contradictory. On the Greek side there were 9,000 or 10,000 Athenians and 1,000 Platæans; on the Persian side at least 100,000, and perhaps 200,000. There fell of the Persians 6,400, and of the Greeks only 192, who were buried under the mound which still remains. The mound was partially excavated by Schliemann in 1884; but he did not dig deep enough, for in the excavations made by the Greek Archæological Society in 1890 a quantity of burnt bones were found, as well as a number of vases which certainly belong to the fifth century B. C., and prove that the burnt bones are those of the 192 Athenians.

Revised by J. R. S. Sterrett.

Marathon: village; Cortland co., N. Y. (for location of county, see map of New York, ref. 5-G); on the Tioughnioga river and the Del., Lack. and W. Railroad; 30 miles N. of Binghamton, 50 miles S. of Syracuse. It is in a farming and dairy region, ships large quantities of butter, cheese, and live stock, and has a large tannery and several manufactories. Pop. (1880) 1,006; (1890) 1,198; (1900) 1,092.

Marat'ta, Carlo: painter; b. at Camerino, near Ancona, Italy, in 1625; studied art in Rome. A *Nativity* painted in 1650 attracted public attention to his talent. Alexander VII. employed him, as also succeeding popes up to Clement XI., who made him a Knight of the Order of Christ, and intrusted many works to him both in Rome and Urbino. Maratta was also named painter in ordinary to Louis XIV. of France. It was he who restored the Raphael frescoes in the Vatican and in the Farnesina. He decorated the cupola of the cathedral at Urbino with frescoes of his own, which were destroyed by the earthquake of 1782, but preferred painting pictures of the Madonna. His most important works are *St. Carlo*, in the Church of St. Carlo in Rome, and the *Baptism of Jesus Christ*, at the Certosa, which has been repeated in mosaic at St. Peter's. Many of his works remain in Rome, where he directed a school of painting till he died, in that city, in 1713. He also painted on glass, and was an architect and engraver.

W. J. Stillman.

Maravatio, maa-raa-vaa-tec'o: a town in the northeastern part of the state of Michoacan, Mexico; 40 miles E. N. E. of Morelia; on the Mexican National Railroad; 6,612 feet above the sea (see map of Mexico, ref. 7-G). It lies in a broad, grassy plain, surrounded by mountain ridges. In the rainy season extensive marshes are formed in the vicinity. Pop. about 9,000.

H. H. S.

Marbach, Johann: theologian; b. at Lindau, on the Lake of Constance, Aug. 24, 1521; studied theology at Wittenberg; and was in 1546 appointed pastor of the Church of St. Nicholas, in Strassburg; afterward also Professor of Theology and director of the church convention; and died there Mar. 17, 1581. He was one of those Lutheran theolo-

gians who by their exclusiveness and jealousy caused so much disturbance in the Protestant churches. Strassburg had originally adopted the Swiss Reformation, but Butzer's long residence there, and his zeal for a reconciliation between Calvinism and Lutheranism, had given its church a decided stamp of toleration. Nevertheless, as soon as Marbach settled in the city, confusion and persecution began. Butzer's catechism was supplanted by Luther's, the Reformed hymns were struck out of the hymn-book, etc. Some of the Reformed pastors and professors left the city, and those who wished to remain were compelled to subscribe to the *Confessio Augustana.* Revised by S. M. Jackson.

Marble [M. Eng. *marbel*, *marbre*, from O. Fr. *marble*, *marbre* < Lat. *mar'mor*, from Gr. μάρμαρος, stone, marble; originally connected, probably, with μάρναμαι, to fight, Sanskr. *mṛṇâti*, smite, dash in pieces, but afterward interpreted as related to μαρμαίρω, sparkle, and thought of as the "sparkling stone"]: any stone composed essentially of carbonate of lime alone, or the carbonates of lime and magnesia in varying proportions, which, owing to its color and texture, is sufficiently beautiful for a high grade of building material, or for monumental or decorative work. Geologically such marbles differ from ordinary limestones and dolomites only in that the metamorphic action to which they have been subjected has been just sufficient to develop in them the essential color and structural features. As a matter of fact many marbles are less metamorphosed than are other stones to which the name limestone is still applied. The term is, indeed, a popular or commercial one, and is lacking in scientific precision. The essential qualities of a marble, together with other facts relative to texture and color, have already been given in the article Building-stone (*q. v.*), and need not be repeated here.

The principal sources of marbles in the U. S. are the beds of Palæozoic limestone and dolomite bordering the Appalachian Mountain system. Important belts extend in a general north and south direction throughout Western Vermont, Massachusetts, and Connecticut. The product is, as a rule, white or deep blue-gray in color, the finest grades occurring in Vermont, where the quarrying industry is an important feature, particularly in and about the towns of West Rutland and Proctor, in Rutland County. This State alone now produces some 60 per cent. of the entire output of the quarries in the U. S. A compact siliceous dolomite of a chocolate-red and white variegated color, and of Cambrian age, occurs at Mallett's Bay on the shore of Lake Champlain, and is utilized for flooring tiles and general interior decoration; it is known commercially as Winooski marble. A black, highly fossiliferous stone occurs on Isle La Motte in the same lake, and is used for similar purposes. The marbles along this belt in Massachusetts and Connecticut are all dolomitic, of a white color and granular texture, and best suited for building purposes. A coarse, snow-white Archæan dolomite, occurring in Westchester co., New York, has in times past been extensively used for general building under the name of snowflake marble. Another coarse building marble, but of a gray color and belonging to this same geological horizon, occurs at Gouverneur, in St. Lawrence co., N. Y. Colored, highly fossiliferous marbles, well adapted for furniture and interior decoration, are found at Plattsburg and Chazy, in Clinton County, in this same State. White and blue-gray building marbles occur in the Lower Silurian beds of Montgomery co., Pa. Prior to 1840 these were much more extensively utilized than at present.

Isolated areas of crystalline granular dolomite, of a white color, in Baltimore co., Md., furnish an excellent building marble, but this, on account of its color and texture, is not well adapted for decorative work. A coarse, calcareous conglomerate. of Triassic age, outcropping in Frederick County, has been used as a marble in the columns of the old Hall of Representatives in the Capitol building at Washington, but the cost of working is too great to make it of any practical value. At various points throughout the valley of East Tennessee beds of limestone, belonging to the Trenton and Nashville series, furnish the highest grade of decorative marble at present known in the Eastern U. S. The colors are gray, pink, chocolate-red and brown, the latter varieties being varicgated with white, and highly fossiliferous. Quarries in Pitkin and Cherokee Counties, in Northern Georgia, furnish unlimited quantities of white, blue-gray, and flesh-pink marble, admirably adapted for general structural purposes, but rather too coarse in texture for a high-grade decorative stone. In the Rocky Mountain region are many important sources of marble which are beginning to attract attention, but which, with one or two exceptions, are too little developed. A granular dolomite of a white color, occurring near the town of Keeler, in Inyo co., California, has been put upon the market as a marble for both building and decorative work. Other stones, the value of which is yet to be decided, occur at various points in Washington, Idaho, Colorado, and Arizona.

The so-called onyx marbles are in reality travertines or cave deposits. That is, they result not from the metamorphism of beds of calcareous organisms, but are chemical deposits from the waters of springs and streams. Such are among the most beautiful of all marbles, as well as the most expensive, bringing sometimes as much as $20 a cubic foot in the rough state. The colors are pearly white, amber, yellow, red, and green, often flecked, veined, and mottled in figures of marvelous beauty. Stones of this type have been in use from a very early period in human history. Mention is made of them in the writings of Herodotus and Pliny, and abundant traces of their extensive utilization are found in ruins of Egyptian and Roman civilization extending back some thousands of years prior to the beginning of the Christian era. In literature the stone is known under various names, as *onyx*, *onychites*, *alabaster*, *alabastrites*, and *Oriental alabaster*—names which are misleading, inasmuch as the true onyx is a banded variety of chalcedony, while alabaster is a variety of gypsum.

The derivation of the name is interesting, but can be only briefly touched upon here. The original Greek word from which our word alabaster was derived was ἀλάβαστρος, and is said to have been derived from ἀ-, not, and λαβή, a handle, or λαβεῖν, to hold, in allusion to the little handleless, phial-like, or amphora-shaped perfume vessel constructed from it. The word after a time passed from the thing made to the substance of which it was made, though Pliny mentions an Egyptian town called Alabastron, where the manufacture of the vessels was carried on. Be this as it may, the name alabaster, as now used by all authorities, applies only to a white though sometimes variously mottled and veined variety of gypsum, a calcium sulphate, while the onyx marbles are of calcium carbonate, and mineralogically mainly calcite.

Stones of this type, derived mainly from caverns and clefts in Eocene limestones near Cairo, were early made use of by the Egyptians for making small articles, such as jugs, bowls, spoons, canopic vases, and amphoræ, employed to hold offerings to the gods, the ashes of the dead, and for other religious and domestic purposes. We find it thus utilized as early as the second dynasty, or shortly after the arrival of Abraham in Egypt (1920 B. C.). The collections of the New York Historical Society, the British Museum, and various continental museums contain many objects of this nature taken from Egyptian as well as Greek, Roman, and Etruscan ruins. The same material was also used for statuettes, sarcophagi, wainscotings, and even for the construction of exterior walls, as in the celebrated "alabaster mosque" near Cairo.

The ancient sources of stones of this class seem to have been mainly the stalagmitic deposits in the Eocene limestones of Egypt, and travertines in the province of Oran, Algeria. More recently deposits near Lake Oroomiah, in Persia, and from various caverns in Italy have furnished considerable quantities of material for local use. The principal American sources are Southern Mexico, particularly sporadic areas in the state of Puebla; the peninsula of Lower California, S. of San Quentin; San Luis Obispo co., Cal.; and Yavapai co., Ariz. The prevailing color of the Arizona stone is green, with shades of yellow, brown, and opaque red. That of California is white, veined with red and brown or injected with smoky clouds. The Lower California stone is pearl white, greenish, or rose colored, beautifully veined and translucent. That of Mexico proper all shades of white, gray, green, yellow, and brown. The American material is now used mainly for furniture tops, lavatories, and wainscotings. The stalagmitic deposits in caves sometimes yield small blocks of fairly good marble, which is also called onyx. The stone is, however, as a rule, so defective and so poor in color as to be of little commercial importance.

The verdantique marbles, so called, are serpentinous rocks, usually variegated with more or less calcareous and ferruginous matter. The prevailing colors are green or oil-yellow, often streaked and blotched with white, brown, red, or black. Though very beautiful, and susceptible of a high, lustrous

polish, the colors are cold, and do not readily harmonize with their surroundings. Their use is therefore very limited, being confined mainly to columns for statues and small objects of art. The stone occurs naturally in a badly jointed condition, weathers poorly when exposed, and is therefore suitable only for interior work. There are several large deposits of this material within the limits of the U. S., upon which quarries have from time to time been opened. The result has in nearly every instance been financially disastrous for the reasons already mentioned. The more important localities which have thus far been operated upon in the U. S. are at Deer Isle, Me.; Roxbury, Vt.; Lynnfield, Mass.; Milford, Conn.; Essex co., N. Y.; Harford co., Md.; on the Gila river in New Mexico; and near the town of Victor, in San Bernardino co., Cal. The principal foreign sources of the stone are the Lizard district, Cornwall, England; County Galway, Ireland; and Genoa, Italy. It is from the last-named source that is obtained almost the entire supply of such stone in the markets of the U. S.

Below are given the statistics of marble production in the U. S. from 1895–99.

STATE.	1895.	1897.	1899.
Arkansas	.....	.....	$3,410
California	$22,000	$48,690	6,500
Colorado	.....	99,600	10,776
Georgia	689,229	598,076	742,554
Idaho	2,250	5,000	.....
Iowa	13,750	.....	.....
Maryland	145,000	130,000	77,000
Massachusetts	2,000	79,721	59,416
New York	207,828	354,631	338,816
Pennsylvania	59,787	62,683	139,506
Tennessee	362,277	441,954	384,705
Utah	.....	.....	2,355
Vermont	1,321,598	2,050,229	2,241,806
Washington	.....	.....	4,837
Totals	$2,825,719	$3,870,584	$4,011,681

The following list includes the principal foreign marbles: *Bardiglio*: a high grade of marble of a blue-gray color, traversed by dark lines; from Montalto, on the southern borders of Tuscany, Italy. *Black and Gold*: a compact black limestone with gold-colored veins; also from Italy. *Bougard*: a dark-gray and white stone variously mottled and clouded with yellow, pink, and brown; from Nassau, Germany. *Brocatelle*: a light-yellow stone traversed with veins and blotches of dull red; from the French Pyrenees. *Campan*: a pale yellowish-green stone mottled with white; a dark-green variety containing red blotches is known as Campan rouge, from the Hautes-Pyrénées. *Carrara*: a general name given to any of the white or blue-gray marbles from Carrara, Italy. *Caunes*, see GRIOTTE. *Cipolino*: a white crystalline marble with veins of greenish mica; from Italy. *Fior di Persicor*: a whitish stone injected with veins and clouds of red or purple; from Albania. *Egyptian alabaster*: a cave deposit, see ONYX. *Fire marble*. *Formosa*: a dark-gray and white stone mottled and blotched with pink, yellow, or red; from Nassau, Germany. *Giallo antico*: antique yellow; a yellow marble used by the ancient Greeks and Romans; the source is supposed to have been Algeria. *Griotte*: a brilliant red marble from the French Pyrénées. *Irish black*: a high grade of black marble from near Galway, Ireland. *Landscape marble*: a limestone injected with metallic oxides in such a manner that when cut along certain planes an effect is produced closely simulating a landscape. *Languedoc*: a brilliant red or scarlet marble from the Montagne Noire, in the French Pyrenees. It is usually blotched with white. *Lumachelle*: an indurated shell limestone in which the shells still preserve the pearly lining, whereby a beautifully iridescent effect is produced on a polished surface. *Lisbon yellow marble*: a compact yellow marble somewhat resembling the deeper-colored varieties of the Siena, but less beautiful; from Estremoz, Portugal. *Mischio*: a calcareous breccia of a violet or reddish color; from Serravezza, Italy. *Nero Antico de Prato*, or *Verde di Prato*: a deep-green serpentinous marble; obtained from Tuscany, Italy. *Numidian marble*: a general name for an extremely variable type of marbles found in the provinces of Africa and Mauritania, in Algeria; the prevailing colors are pink, yellow, and red, but all intermediate shades occur; many varieties are true breccias, and others conglomerates. *Oriental alabaster*: a name erroneously given to certain travertines and cave deposits used by the ancients in the manufacture of small objects of art; the stone is presumably identical with the so-called onyx from Egypt and Algeria. *Paonazza*: also called pavonazetta and Phrygian marble; so called from its resemblance to the plumage of the peacock; a compact siliceous limestone of green verging upon blue and gray colors, and with alternating bands of white. *Parian*: a white granular statuary marble from the island of Paros: one of the most esteemed of ancient statuary marbles. *Parmazzo*: a white marble variegated by a coarse network of dark lines; from Northern Italy. *Pentellic*: a famous statuary marble from Mt. Pentellicus, near Athens. *Petit Granit*: a compact bluish limestone, a polished surface of which shows innumerable fine white points or asterisks caused by fossil crinoids and polyps; from the Ecausines, Belgium. *Portor*, see under *Black and Gold*. *Rosso Antico*, or *Rouge antique*: a dull-red marble said to have been obtained from Cynopolis and Damaristica, and used by the Etruscans and Romans. *Ruin marble*: a brecciated limestone of a light color; from Florence, Italy; it takes its name from a fancied resemblance of the markings on a polished surface to ancient ruins. *St. Anne*: a Belgian marble of a deep blue-black color diversified with white lines. *St. Baume*: a yellow marble with brown and red veins; from the province of Var, France. *Sarrancolin*: a beautiful stone of a prevailing deep-red color, with white, brown, green, and orange in veins and blotches; from the province of Aure in the French Pyrenees. *Siena*: a compact limestone of a prevailing yellowish color, though often diversified with drab and purple in veins and dashes; it is one of the most esteemed of foreign or domestic marbles for interior decoration. *Statuary*: any marble of a pure-white color and granular texture such as fits it for making statues; the ancients obtained their choicest varieties from Mt. Pentellicus and the island of Paros; nearly all that is now to be had is from quarries near Carrara, Italy, though a small amount has been produced from the quarries in Rutland, Vt.

GEORGE P. MERRILL.

Marble, MANTON: journalist; b. at Worcester, Mass., Nov. 16, 1835; graduated at the University of Rochester in 1855; became a writer for newspapers in Boston and New York; took part in founding *The New York World* in 1860, and became its editor and proprietor in 1862. Retiring from the editorial management of the paper in 1876, he went to Europe as delegate to the bimetallic congress in 1885. In 1878 he published *A Secret Chapter of Political History*, for the purpose of defending the claims of Samuel J. Tilden to the presidency; and in 1888 was elected to the presidency of the Manhattan Club in New York.

Marblehead: town; Essex co., Mass. (for location of county, see map of Massachusetts, ref. 1–I); on Massachusetts Bay, and the Boston and Maine Railroad; 3 miles E. of Salem, 4 miles N. E. of Lynn. It has a deep and spacious harbor, nearly landlocked, and was for many years a noted fishing-port, but this industry is practically extinct, and the principal business is the manufacture of children's shoes. The town is a popular summer resort and the yachting center of New England, and has two national banks with combined capital of $240,000, a savings-bank, and a weekly newspaper. Abbott Hall contains a public library, free reading-room, and an art gallery in which are a number of celebrated paintings, including Willard's *Yankee Doodle*. Pop. (1880) 7,467; (1890) 8,202; (1900) 7,582.

EDITOR OF "MESSENGER."

Marbois: See BARBÉ-MARBOIS.

Mar'burg, Germ. pron. maar'boorch (anc. *Matiacum*): town; in Hesse-Nassau, Prussia; on the Lahn; 48 miles S. W. of Cassel (see map of German Empire, ref. 5–D). It is a quaint old town, climbing the sides of a hill whose top is crowned with a castle dating from the thirteenth century, formerly the residence of the landgraves of Hesse, afterward a prison, and now a kind of historical museum. The Church of St. Elizabeth is a fine building erected in 1235–83 by the grand-master of the Teutonic order and containing the tomb and silver sarcophagus of St. Elizabeth of Hungary. The town is the seat of a university founded May 30, 1527, and attended by about 840 students. It was the first university established without papal confirmation. Its library contains 140,000 volumes. Manufactures of leather and earthenware are carried on. Pop. (1891) 14,520.

Marburg, The Conference of: a conference which took place Oct. 2–5, 1529, between the Swiss and the German Reformers, and was brought about by Landgrave Philip of Hesse for the purpose of putting an end to the controversy concerning the Lord's Supper. Zwingli was anx-

ious for reconciliation and deeply moved, but Luther was cold and stubborn, and refused Zwingli's hand of brotherhood. Yet at the conclusion both parties signed a common confession which set forth their agreement upon everything save the presence of Christ in the Eucharist, and upon that they agreed to differ. The assertion of this substantial unity was the significance of the conference. The agreement prepared the way for the Augsburg Confession. See the full account in Schaff's *Church History*, vol. vi., 629, *sqq.* Revised by S. M. Jackson.

Marcantonio: engraver. See Engraving and Raimondi.

Marceau, măr'sō', François Séverin des Graviers: general; b. at Chartres, France, Mar. 1, 1769; studied first law, but enlisted in 1785 in the army; became noted for his valor and magnanimity; fought with great distinction in 1792 in the army of the Ardennes; was made a general of division in 1793; commanded with success in the Vendée in 1793; decided the victory at Fleurus, June 26, 1794; took Coblentz in 1794, and Königstein in 1796, but was mortally wounded on a reconnoissance at Altenkirchen in Rhenish Prussia, Sept. 20, 1796, and died three days after. Monuments in his honor were raised both in Chartres and Coblentz. In 1889 his remains were deposited in the Pantheon.

Marceline: town; Linn co., Mo. (for location of county, see map of Missouri, ref. 2–F); on the Atch., Top. and S. Fé Railway; 106 miles N. E. of Kansas City. It is in an agricultural and mining region, and has a semi-monthly and two weekly newspapers. Pop. (1890) 1,977; (1900) 2,638.

Marcelli'nus, Saint: a bishop of Rome who succeeded Caius on June 30, 296, and died Oct. 25, 305. The *Liber Pontificalis* states that under an outburst of persecution Marcellinus became a *thurificatus*—that is, a Christian who sacrificed incense on the altar of some idol in order to escape persecution; but later he repented of his action, and was "beheaded and crowned with martyrdom," and the statement is accepted even by Roman Catholic writers.

Marcel'lus: the name of a plebeian family of ancient Rome, belonging to the *gens Claudia*. The earliest member of it to attain distinction was (1) Marcus Claudius Marcellus, b. about 268 B. C. His military successes began with the victory over the Insubrian Gauls in 222, in his first consulship, when, having slain the leader of the enemy with his own hand, he dedicated for the last time in Roman history the *spolia opima* to Jupiter Feretrius. After the battle of Camral he did efficient service against Hannibal as prætor and proconsul; but he is chiefly remembered as the conqueror of Sicily. In 214 B. C., when consul for the third time, he went over to Sicily to make headway against the Carthaginian successes there, and after taking Leontini directed his operations against Syracuse, which was defended by the engineering skill of the famous Archimedes. His efforts to storm the city proved unavailing, and the assault was changed into a siege which lasted two years, when it was finally captured. The town was plundered by the Romans, and many of its art treasures were removed to Rome. He continued to be one of the leading generals placed in the field against Hannibal, in a battle with whom, near Venusia, he was defeated and slain in 208 B. C., being in his fifth consulship. Hannibal caused his body to be burned and all due rites to be performed over it. "His posterity continued in great splendor down to (2) Marcellus, the son of Gaius Marcellus and Octavia, the sister of Augustus. He died very young, in the office of ædile, soon after he had married Julia, the emperor's daughter. To do honor to his memory Octavia dedicated to him a library, and Augustus a theater, and these public works bore his name." (*Plutarch.*) Augustus had destined the young Marcellus thus referred to by Plutarch to be his successor, and great hopes had been entertained of him. A famous and touching passage of the sixth *Æneid* is devoted to his memory. He died in the year 23 B. C. at the age of twenty.
G. L. Hendrickson.

Marcellus I., Saint: a Roman; said to have become Bishop of Rome in 308, and to have been forced by Maxentius the emperor to become a slave in his stables. D. 310. —Marcellus II., Pope (*Marcello Cervini*), was cardinal-legate of Julius III. at Trent; became pope, retaining his own name. D. May 1, 1555, after a pontificate of twenty-two days.

March [from O. Fr. *march*, *mars* > Mod. Fr. *mars* < Lat. *Martius* (sc. *mensis*), March, liter., the month of Mars (*q. v.*)]: the third month of the year, consisting of thirty-one days. In the ancient Roman year it was the first month, and was so reckoned in many European countries until the adoption of the Gregorian calendar.

March (Lat. *Ma'rus*, Slav. *Morawa*): the principal river of Moravia. It passes by Olmütz, forms for some distance the boundary between Hungary and Moravia and Austria proper, and enters the Danube 7 miles above Presburg. It is navigable 50 miles from its mouth. The plain between the lower March and the Danube has often been the theater of war; here were fought the battles of Aspern and Essling and of Wagram.

March, Auzias: Catalan poet. The date of his birth is unknown, but he died well on in years, at Valencia, Nov. 4, 1458, (or Mar. 3, 1459). His family was a wealthy and eminent one, and he was given an education befitting his rank. He shows familiarity with many of the authors of antiquity, and he was well acquainted with Italian poetry. His life was spent in association with persons of distinction, one of his chief friends being the Prince D. Carlos de Viana. He seems to have taken part in the conquest of Naples by Alfonso V. By general consent he is the best poet in the whole history of Catalan literature. Though he was acquainted with the decaying poetry of the troubadours, he came under the influence of the Italian Petrarch, and, as a consequence, he abandoned that which was conventional and trivial in the older style. At the same time, he was not a servile imitator of his new master. There is much freshness and sincerity in his manner, though he is not free from obscurities. We have from him ninety-three love songs, *Cants d'amor*; eight laments, *Cants de Mort*; fourteen moral poems, *Cants morals*; a beautiful devotional poem, *Cant espiritual*; and a *Demanda feta á la Senyora Na Tecla de Borja.* The fame of Auzias March was great even during his lifetime, and his influence was strong on the poets of neighboring Spain. The Marquis of Santillana praised him, and, in the early sixteenth century, Boscan, Garcilaso de la Vega, and Mendoza were all under obligations to him. He was twice translated into Spanish—by Baltasar de Romani and Jorge de Montemayor, the former version appearing in 1539, in the same year with the *editio princeps* of the original. In the seventeenth century he was rendered into Latin by Vicente Mariner (*Op. omn. poetica et oratoria V. M.*, Tournay, 1633). Besides five editions of the original during the sixteenth century, we have one by Francesch Pelayo Briz (Barcelona, 1864); another by F. Fayos y Antony (Barcelona, 1884); and a critical text is promised by Amédée Pagès. See also J. Rubió y Ors, *Ausias March y su época* (Barcelona, 1864); Helfferich, *Raymond Lull u. die Anfänge der catalanischen Literatur* (Berlin, 1858); Denk, *Geschichte der altcatal. Literatur* (Munich, 1893); A. Pagès, *Documents inédits relatifs à la vie d'Auzias March* (in *Romania*, xvii., p. 186, *seq.*). A critical *Life*, with German translation of the poems, is announced by Denk. A. R. Marsh.

March, Francis Andrew, LL. D., L. H. D.: philologist; b. at Millbury, Mass., Oct. 25, 1825; graduated at Amherst College 1845; was tutor in Amherst 1847–49; was admitted to the bar in New York State 1850; was tutor 1855–56; Adj. Professor of Belles-Lettres and English Literature 1856–57; lecturer on Constitutional and Public Law and the Roman Law 1875–77; librarian; Professor of English Language and Comparative Philology 1857—all in Lafayette College; was president of the American Philological Association 1873–74; and has been president of the Spelling Reform Association since 1876. He succeeded James Russell Lowell as president of the Modern Language Association of America in 1891. He is a member of a number of learned societies in the U. S. and in Europe. He is the author of *The Relation of the Study of Jurisprudence to the Origin and Progress of the Baconian Philosophy* (1848); *Hamilton's Theory of Perception and Philosophy of the Conditioned* (1860); *A Method of Philological Study of the English Language* (1865); *A Parser and Analyzer for Beginners* (1869); *Comparative Grammar of the Anglo-Saxon Language* (1870); *Anglo-Saxon Reader* (1870); besides numerous articles on philosophy and philology in periodicals and cyclopædias. Editor of *Latin Hymns*, etc. Director of the American workers for the *Historical English Dictionary* of the Philological Society (England, 1879); D. C. L., Oxford, 1896. C. H. Thurber.

March, John: colonial soldier; b. in Newbury, Mass., June 10, 1658; served as captain under Sir Edmund Andros in the campaign against the French and Indians in 1688;

commanded the fort at Pemaquid 1692–95; as major he commanded the troops raised in 1697 to meet the forces under Count de Frontenac, and won the famous battle of Damariscotta. He served with distinction in the wars of 1703 and 1707, and commanded the ill-advised and unsuccessful expedition sent by Gov. Dudley against the fort at Port Royal, now Annapolis, Nova Scotia. He died in 1725. He was esteemed the foremost military leader in New England up to the time of the Port Royal expedition, the failure of which may fairly be charged in part to the Governor who sent him out, and to the officers of the Deptford which was the convoy of the expedition. C. H. THURBER.

Marchand, măr'shăn', FELIX, M. D.: pathologist; b. at Halle, Oct. 22, 1846; graduated M. D. at the University of Berlin in 1870; served in the medical corps of the German army from 1870 to 1876; was assistant in the Halle Pathological Institute from 1876 to 1879, and in that of Breslau from 1879 to 1881; in 1881 became Professor of Pathological Anatomy and General Pathology in the University of Giessen; subsequently was called to the same chair at Marburg. He is the author of numerous papers on pathological topics published in current medical journals. S. T. ARMSTRONG.

Marchand, FÉLIX GABRIEL, Lit. D.: Canadian statesman; b. at St. Johns, province of Quebec, Jan. 9, 1832; was educated at St. Hyacinthe College, and admitted a notary in 1855. He has been a member of the Legislative Assembly, province of Quebec, since 1867; provincial secretary 1878–79, when he was appointed commissioner of crown lands; resigned the same year; and was Speaker 1887–92. In 1897 he became Premier and Treasurer. He was in command of a brigade of militia during the Fenian excitement in 1870; holds from the Government of France the decoration of officer of Public Instruction; was for several years editor and proprietor of *Le Franco-Canadien* newspaper. He is the author of *Fatenville*; *Les Faux Brilliants*; *Faquino*; *Comédies*; and *Manuel et Formulaire du notariat.*

Marchand, JEAN BAPTISTE: See the Appendix.

Marchesi, MATHILDE DE CASTRONE: See the Appendix.

Marchetti, FILIPPO: See the Appendix.

Marchiafava, măăr-kĕĕ-ăă-faa'vaă, ETTORE, M. D.: pathologist; b. in Rome, Italy, Jan. 3, 1847; graduated M. D. at the University of Rome; in 1872, after graduation, was assistant in Tommasi Crudeli's pathological laboratory; in 1882 was appointed Professor of Pathological Anatomy in Rome, subsequently leaving that chair to take that of Hygiene. He is particularly known by his studies of the ætiology of malaria, at first accepting Tommasi Crudeli's and Klebs's *Bacillus malariæ*, but subsequently acknowledging that Laveran's *Hæmatozoön malariæ* was the true cause of paludal poisoning. He is the author of a number of papers on pathological topics published in current journals.

Marching [from O. Fr. *marcher*, walk, march < Lat. **marca're*, deriv. of *marcus*, hammer]: in military tactics, the movement of troops in ranks or files, in lines, columns, or other tactical arrangements. On long marches the *route step* is employed, an ordinary walk, the men preserving their places in the ranks. In musters, reviews, parades, drills, and the like, the cadenced step, in common, quick, or double-quick time, is employed. Music, preferably that of the drum and fife, assists in keeping the time and step. Marshal Saxe has the credit of being the first general in modern times to perfect the system of marching, but many improvements have been made upon his system.

Mar'cion: Gnostic philosopher; the son of a bishop of Sinope in Pontus; was excommunicated by his father on account of his heretical views; went to Rome about 140; associated with the Syrian Gnostic Cerdon; formed a new Gnostic system and founded a sect, the Marcionites, which found many adherents in Syria, Egypt, and Palestine, and continued as a separate sect till the sixth century. Some maintain that he established the first known canon of sacred books, from which, however, he excluded many writings which now belong to the New Testament. He hated Judaism, and the great object of his theological speculation was to eliminate from the doctrinal system of Christianity all those Judaizing elements which had crept in by tradition, but the absolute breach which he endeavored to establish between the New and the Old Testaments aroused a most decided opposition; all the great Christian teachers of the time wrote against him. It was not the merely speculative portion of his system which fascinated people, but its practical, moral portion, its austere asceticism. Not only flesh and wine, the circus and the theater, were forbidden, but everything ornamental, the very elegance of refined social forms, was looked upon with contempt, if not with horror. Marriage was rejected, and martyrdom set forth as the true crown of human life. Concerning the so-called Marcion's Gospel, see the respective writings of F. C. Baur, Hilgenfeld, and Volkmar.

Marcoman'ni [liter., border-men; cf. Germ. *mark*, boundary]: a German tribe, first settled in the regions between the Neckar and the Main; accompanied Ariovistus when in the time of Cæsar he invaded Gaul, but were later on led by their own chief, Maroboduus, into the land of the Boii (Bohemia), which they conquered, and where they maintained a standing army of 70,000 fighting men. Maroboduus's rule was of short duration, however; he was compelled to flee from his country, sought refuge with the Roman emperor, Tiberius, and died at Ravenna. The Marcomanni continued, nevertheless, to be the ruling people in Bohemia, and soon they began to push forward toward the Danube. Marcus Aurelius was occupied in war with them during almost his whole reign, from 161 to 180, and prevented them from effecting a settlement in Italy, but not from occupying the lands along the Danube, whence they made repeated incursions into the frontier province of the Roman empire. About 270 they invaded Italy, but with varying success. From this time their name seldom appears in history, and in the following century the traces of the tribe are lost.

Marco Polo: See POLO, MARCO.

Marcou', măăr'koo', JULES: geologist; b. Apr. 20, 1824, at Salins, in the department of Jura, France; studied geology; received in 1847 employment at the palæontological collection of the museum of the Sorbonne; made extensive scientific travels in the U. S. 1848–50, 1853–54, and 1860; was appointed Professor in Geology at Zurich in 1855. As results of his explorations in the U. S., partly undertaken in connection with Agassiz, he published in English *Geological Map of the United States* (1853) and *Geology of North America* (1855). He also published *Drias et Trias* (1859); *Carte géologique de la Terre* (1862); *Derniers Travaux sur le Drias et le Trias en Russie* (1870), etc. D. in Cambridge, Mass., Apr. 18, 1898.

Mar'cus: bishop of Rome; came to that dignity in 336, and died Oct. 7 of that year. He is said to have initiated the custom, still maintained, in virtue of which the new pope is consecrated by the Bishop of Ostia. It was already the custom at the beginning of the fifth century.

Mar'cus Aure'lius Antoni'nus: See ANTONINUS, MARCUS AURELIUS.

Marcy, HENRY ORLANDO, A. M., M. D.: surgeon; b. at Otis, Mass., June 23, 1837; received his preliminary and classical education at Wilbraham Academy and Amherst College; graduated M. D. at Harvard Medical School in 1863; entered U. S. volunteers as assistant surgeon immediately after graduation, and was eventually promoted to the rank of medical director; after the close of the civil war studied in Europe; in 1880 removed to Boston, where he has since resided. He was president of the American Academy of Medicine in 1882, and of the American Medical Association in 1892, and is a member of many medical societies. He translated from the Italian Ercolani's work *The Utricular Glands of the Uterus* (1880). He is the author of many journal papers and of *The Anatomy and Surgical Treatment of Hernia* (New York, 1892). S. T. ARMSTRONG.

Marcy, RANDOLPH BARNES: soldier; b. in Greenwich, Mass., Apr. 9, 1812; graduated at West Point in 1832; became first lieutenant Fifteenth Infantry 1837; during the Mexican war fought at the battles of Palo Alto and Resaca de la Palma May, 1846; promoted to a captaincy May 18, 1846; he was engaged for several years in the exploration of the Red river country, in operations against the Seminoles, and in the Utah expedition 1857–58; became paymaster, with the rank of major, 1859; was inspector-general, with the rank of colonel, Aug., 1861; was chief of staff to Gen. McClellan (his son-in-law) in West Virginia, on the Peninsula, and in Maryland, and was appointed brigadier-general of volunteers Sept. 23, 1861; he was engaged principally in inspection duty until the close of the war; was appointed brigadier-general and inspector-general U. S. army Dec. 12, 1868; retired Jan. 2, 1881. D. at Orange, N. J., Nov. 22, 1887. He published *Exploration of the Red River in 1852* (1853); *The Prairie Traveler* (1859); and *Personal Recollections* (1866). Revised by JAMES MERCUR.

Marcy, William Learned: statesman; b. at Southbridge, Mass., Dec. 12, 1786; graduated in 1808 at Brown University; was for a time a teacher, but became a lawyer in Troy, N. Y.; served as an officer of volunteers in the war of 1812–14, capturing at St. Regis, Canada, the first prisoners and the first flag taken on land in the war; became in 1816 recorder of Troy, and for a time conducted the Troy *Budget*, then a leading anti-Federalist organ. He was a member of the "Albany regency," and showed skill as a practical politician. He was made comptroller in 1823; a judge of the State Supreme Court in 1829; and was chosen U. S. Senator in 1831, but resigned this office in 1833 upon being elected Governor of New York, to which position he was twice re-elected, but defeated in 1838 by W. H. Seward. In 1839 President Van Buren appointed him commissioner to adjust the Mexican claims, and in 1845 President Polk selected him as Secretary of War. During his term of office the war with Mexico occurred, in which he displayed great ability, as well as in the settlement of numerous intricate diplomatic questions. In 1853 President Pierce appointed him Secretary of State, in which capacity he added to his already established reputation as a statesman of a high order. Many of his state papers are masterly productions. He retired on the accession of Mr. Buchanan to the presidency, and died at Ballston Spa, July 4, 1857.

Marcy, Mount: called by the Indians *Tahawus*, or the "cloud-splitter"; the highest land in New York State; is in the town of Keene, in Essex County, in a cluster containing several of the highest of the Adirondacks. It is 5,379 feet in altitude.

Mardi Gras: See New Orleans, La.

Mardin, maar-deen′: town of Asiatic Turkey, in the district of Diarbekir (see map of Turkey, ref. 6–I). It is built on the steep sides of a rock whose top is crowned with a castle, and presents a very picturesque aspect. It is difficult of access, and has long been a place of refuge for persecuted religionists. About half the population is Christian of various, now unusual, sects and recent Roman Catholic and Protestant converts. The Jews possess there a very ancient synagogue, and the Kurds are Mohammedans. The town is full of mosques and chapels, and the sects mingle harmoniously. It is the seat of a Jacobite library and several Jacobite institutions, and carries on a considerable trade. Pop. 15,000. Revised by M. W. Harrington.

Mardo′nius (in Gr. Μαρδόνιος): a son of Gobryas, one of the Seven Persians. He married Artazostra, the daughter of Darius Hystaspis. He was commander-in-chief of the Persian expedition of 493 B. C. against Greece, but the destruction of the fleet by a storm off Mt. Athos as well as reverses by land induced him to return to Asia. He was relieved of his command by Darius because of his ill-success. After the death of Darius he was restored to royal favor, and in 480 B. C. we find him one of the trusted generals of Xerxes in his expedition against Greece. After the disastrous battle of Salamis, Mardonius persuaded Xerxes to return to Asia and leave him behind with 260,000 Persian troops to complete the subjugation of Greece. He wintered in Thessaly, and sent Alexander I., King of Macedonia, to treat with the Athenians separately, offering them great freedom in return for submission to Persia; but failing to win or to frighten the Athenians, he marched against Athens in the spring of 479 B. C. with an army of 300,000, and ravaged the city for the second time. Upon the approach of the Spartan army from the Peloponnesus, he retired into Bœotia followed by the combined Greek forces, amounting to 110,000. In the battle of Platæa, in Sept., 479 B. C., the Persian army was utterly routed, and Mardonius himself was killed while fighting bravely.

J. R. S. Sterrett.

Maréchal, mă′rā′shăl′, Pierre Sylvain: atheistical writer; b. in Paris, France, Aug. 15, 1750; studied law, and was admitted as an advocate, but soon devoted himself exclusively to literature; acquired by his earlier verses some reputation and the appointment of sub-librarian at the Collège Mazarin; took Lucretius as his model; published some "fragments of a moral poem on God" (1781), in which he avowed atheistical opinions; wrote a parody upon the Psalms, purporting to be translations from an ancient MS. (1784), for which he was dismissed from his post; issued an *Almanach des honnêtes Gens* (1788), in which a calendar of his own invention replaced the usual lists of saints; wrote, besides other works, hymns in honor of the goddess of reason (1795); the *Voyages de Pythagoras* (1799); and, with the astronomer Lalande, a *Dictionnaire des Athées anciens et modernes* (1800). D. at Montrouge, near Paris, Jan. 18, 1803.

Mare Island: an island in the N. E. part of San Pablo Bay, near Vallejo, Solano co., Cal., with which it is connected by ferry. It has a U. S. navy-yard, sectional floating dock, and naval arsenal.

Marek, maa′rek, Jan Jindřich (*Jan z Hvězdy*): novelist; b. at Liblin, Bohemia, Nov. 4, 1801; studied theology; was ordained priest in 1826; officiated in various parishes. D. at Kralovice, Nov. 3, 1853. His literary career extends from 1820 to 1846. *Básně* (Poems) appeared at Prague, 1823; then followed *Konvalinky* (Lilies of the Valley, 2 vols. of novels, Prague, 1824, 1826). From 1826 till 1843 he contributed poems and novels to several Bohemian periodicals. During the years 1843–47 he published his collected works, *Zábavné spisy*, in ten volumes, at Prague. The first two volumes contain ballads, legends, and short poems; the other eight, novels: *Známosti z průjezdu* (Acquaintances from the Arcade); *Harfenice* (The Harper); *Čechové v Prusích* (The Bohemians in Prussia); *Nocleh na Kačerově* (A Night at Kačerov), etc.; and two historical romances: *Jarohněv z Hrádku* (3 vols.) and *Mastičkář* (The Quack, 2 vols.). His patriotic romances found many readers, and some were translated into German. An unjust criticism of his *Mastičkář*, published 1846, so impressed him that he gave up all literary work. J. J. Král.

Marem′me (anc. *Ora Mari′tima*): a name applied to a vast, marshy, unhealthful territory in Italy, bordering on the Tyrrhene Sea, from the mouth of the Magra to that of the Volturno. It covers about 1,000 sq. miles, and is divided into the Tuscan Maremma and the Roman Maremma, these being again subdivided. This great tract is covered with stagnant water or immense deposits of seaweed, interspersed with thorny thickets, wild forests, and verdant meadows. During the winter it is frequented by Apennine shepherds and haunted by lawless persons. In summer the fertile portions are cultivated on a large scale by peasants who descend from the mountains of Lucca, from the Sabine Hills, and the Abruzzi to plow and sow, then return home to wait for the harvest, when they redescend for as short a time as possible. Even this costs hundreds of lives every year. There are few villages, or even roads, in the Maremme, and the pestiferous exhalations extend even to the more elevated portions. They are, however, least felt on the slopes descending to the Arno and the Tiber. In Etruscan times this region was densely populated, and excavations show that an elaborate system of drainage was in use. Draining on a large scale, with careful cultivation and extensive planting of trees, may in time overcome the malaria, and the effects which have already followed wherever such efforts have been made are encouraging. The railway opened along the Tyrrhene shore has produced very favorable results. Revised by M. W. Harrington.

Marenco, Carlo: playwright; b. at Cassolo, Italy, May 1, 1800. His parents lived at Ceva, and the poet always regarded this as his native place, as his youth was spent there. He studied jurisprudence at Turin, and received his degree at the age of eighteen. He was more attracted to the drama, however, than to law, and early began to try his hand at writing plays. In 1827 he had his first success with the tragedy *Buondelmonte*, brought out at Turin. In this, as in his succeeding plays, Marenco's manner is essentially that of Alfieri, though he was much influenced also by Manzoni. His characters are severe, grandiose, and remote from the actual world; while religious and patriotic feeling finds expression in eloquent, but at times somewhat bombastic, sentences. Of his subsequent tragedies the following were actually played: *La famiglia Foscari*, *Adelisa*, *Manfredi*, *Giovanna I.*, *La Pia de' Tolomei* (based upon Dante, *Purgatorio*, V., 130, *seq.*, and Marenco's greatest success; Engl. trans. by T. Williams, London, 1856), *Berengario*, *Arigo di Svevia*. He wrote also, but never produced upon the stage, *Corso Donati*, *Ezzelino Terzo*, *Ugolino*, *La Guerra de' Baroni*, *Arnaldo da Brescia*, *Cecilia da Baone*, and *Corradino*. D. at Savona, Sept. 20, 1846. See his *Tragedie inedite, con l'aggiunta di alcune poesie, etc.* (Florence, 1856). A. R. Marsh.

Marenco, Leopoldo, Count: poet; son of Carlo Marenco; b. at Ceva, Piedmont, Italy, Nov. 8, 1831. At the age of twenty he brought out with success the tragedy *Isabella*

Orsini. The same year (1851) he obtained a position in the ministry of finance, but found himself unfitted for such employment. Later he taught Italian literature in Bologna (1860–64) and in Milan (1864–71), but found this also little to his taste, and devoted himself to a literary career at Turin. His *Picarda Donati*, in which Ristori acted, then his *Saffo* and *Speronella*, established his reputation. Subsequently the lyric and idyllic elements in his genius became more prominent, and his plays seemed for a time likely to indicate a new direction for Italian dramatists. In his *Celeste, idillio campestre* he took his material from the life of the fields; in his *Il ghiacciajo del Monte Bianco*, from that of the mountaineer; in his *Giorgio Gandi*, from that of the seafarer. In *Il falconiere di Pietro Ardena*, and others, he reverted to the knightly period of the Middle Ages. He has also written many comedies: *Un malo esempio in famiglia*; *Letture ed esempi*; *Lo spiritismo*; *Supplicio di Tantalo*; *Gli amori del nonno*; *Quel che nostro non è*, etc. A collected edition of his dramatic works in twenty volumes appeared at Turin (1883, *seq.*). A. R. Marsh.

Maren'go: a village of Italy, in the province of Alessandria; famous for the battle fought here between Napoleon and the Austrians. This battle closed one of Napoleon's most brilliant campaigns. While Moreau engaged the attention of the Austrians in South Germany, Napoleon, who in the spring of 1800 had secretly gathered a second army in the south of France, suddenly crossed the Alps at the Great St.-Bernard, and appeared in the plains of Lombardy, in the rear of the Austrian general Melas, who, not expecting an attack from that quarter, had advanced to Genoa. Completely cut off from retreat, Melas joined battle with the French at Marengo, June 14, 1800, and suffered a crushing defeat. Owing to the advantageous position of the French, this single action decided the campaign, and the Austrian general was at once forced to make terms.

Marengo: city (settled in 1835, incorporated as a town in 1857, and as a city in 1893); McHenry co., Ill. (for location of county, see map of Illinois, ref. 1–F); on the Chi. and N. W. Railway; 66 miles N. W. of Chicago. It is in a farming region devoted almost exclusively to dairying and fruit-culture; has a steam-foundry, stove-works, and canning-factory; and contains 6 churches, water-works, electric lights, and 2 weekly newspapers. Pop. (1880) 1,264; (1890) 1,445; (1900) 2,005. Editor of "Republican."

Marengo: city; capital of Iowa co., Ia. (for location of county, see map of Iowa, ref. 5–I); on the Iowa river, and the Chi., Rock Is. and Pac. Railway; 27 miles S. W. of Cedar Rapids, 30 miles W. N. W. of Iowa City. It is the center of a large prairie region, and has two weekly newspapers. Pop. (1880) 1,738; (1890) 1,710; (1900) 2,007.

Marenholz-Bülow, maa'ren-hōltz-bü'lō, Bertha von Bülow, Baroness: the principal apostle of Froebel's kindergarten idea, and the foremost authority on it; b. Mar. 15, 1816. In 1849 she made the acquaintance of Froebel, and through her intercession the injunction laid against his institution by the Prussian Government was removed. In 1855 she held meetings in her own parlors at Paris, and had the support of Michelet, Quinet, Abbé Michaud, and other distinguished people. Her lectures were in substance published, and went through two editions. She assisted personally in the establishment of kindergartens in Germany, Switzerland, Holland, Belgium, England, and Italy (aided in Florence by the influence of Mrs. George P. Marsh); in Berlin she lectured gratuitously during three years in a normal school for the education of kindergartners. Her lectures in Italy were condensed into a pamphlet, which was translated from the French into English, and printed in *The Circular of Information* (U. S. bureau of education), for July, 1872. Other works are *The Kindergarten, The Educational Mission of Woman, The Child and its Being, Work and the New Education According to Froebel's Method*, and *Die Erscheinungen der Zeit und die Aufgaben der Erziehung* (Dresden, 1879). She became chief lecturer in the new college for kindergartners in Dresden, and wrote reminiscences of Froebel in the monthly magazine *Erziehung der Gegenwart*, which were translated into English and published in the U. S. by Mrs. Horace Mann (Boston, 1877).

Elizabeth P. Peabody. Revised by C. K. Adams.

Mareo'tis, Lake, or **Birket-el-Mariut** [Arab., Lake of Maryut]: a salt lake or marsh in Lower Egypt, in the western part of the Delta, 30 miles long, 15 miles broad; separated from the Mediterranean by a narrow isthmus of sand. It had been perfectly dry for three centuries, when in 1801, during the war between England and France, the English, ascertaining that the tract of land lay below the level of the sea, and having some military purpose in view, dug through the isthmus and let in the waters, resulting in the submergence of forty villages and hamlets and a decrease in the salubrity of Alexandria. This passage was closed by Mehemet Ali, but the spot is yet an uninhabitable marsh.

Revised by M. W. Harrington.

Maret, Hugues Bernard, Duke of Bassano: diplomatist; b. at Dijon, France, May 1, 1763; at the beginning of the Revolution edited the *Bulletin* (afterward the *Moniteur Universel*), which reported the proceedings of the Constituent Assembly; in 1792 was appointed to the ministry of Foreign Affairs, and in the following year was sent as ambassador to Naples, but on the way fell into the hands of the Austrians, who held him prisoner till 1795, when he was exchanged for the daughter of Louis XVI. Under the consulate and empire his influence rapidly increased, owing to the favor of Napoleon, who made him general secretary of the consulate in 1799, Secretary of State in 1804, and employed him on many important missions. In 1811 he was made Duke of Bassano, and appointed Minister of Foreign Affairs. During the Hundred Days he was again Secretary of State, but on the restoration of the Bourbons was banished from France. Under the Orleans monarchy he was recalled, regained his peerage in 1831, and in 1834 was for a short time president of the cabinet. D. in Paris, May 13, 1839. See Ernouf, *Maret, Duc de Bassano* (Paris, 1884). F. M. C.

Maretzek, Max: conductor, composer, and teacher; b. in Brünn, Moravia, June 28, 1821; graduated at the University of Vienna; studied medicine for two years, and music under Jeyfried. Composed an opera, *Hamlet*, in 1843, which was produced at Brünn and other places. He conducted the orchestra in Germany, France, and England, and was assistant to Balfe in London in 1844. Removed to the U. S. in 1848 and was manager of Italian opera in New York from 1849 to 1878. Afterward he devoted his time to teaching. He composed the opera *Sleepy Hollow* in 1879 to a libretto by Charles Gayler, and also some chamber and orchestral music, piano pieces, and songs. D. at Pleasant Plains, N. Y., May 14, 1897.

Marey, maa'rā', Étienne Jules: physiologist; b. at Beaune, in the department of Côte-d'Or, France, Mar. 5, 1830; studied medicine in Paris; appointed Professor in Natural History at the Collège de France in 1869. His *La Machine Animale* was translated into English, entitled *Animate Mechanism* (New York, 1874). He has also written *Physiologie expérimentale* (1875–80): *La méthode graphique dans les sciences expérimentales* (1878–84); *La circulation du sang* (1881); and *Le vol des oiseaux* (1890).

Marey Tambour: See Recording Apparatus, Psychological, in the Appendix.

Marfo'ri, Carlos: favorite of Queen Isabella II. of Spain; b. in 1818, the son of an Italian cook; obtained an office in the Spanish civil service through the influence of Gen. Narvaez. He afterward became a deputy and counselor in the administration of various financial associations, and was known to Queen Isabella, who held him in high esteem. Always in association with Narvaez, who soon learned to appreciate the value of his friendship, he by degrees obtained political influence, and in 1866, when Narvaez became minister, Marfori was appointed governor of Madrid and chief of the royal household. Hated and scoffed at by the people, he was overloaded with honors by the queen. He contributed more than all her political mistakes to undermine her position. In 1868, when the revolution broke out, she was told from all sides, even by Napoleon III., that the dismission of Marfori was the only means of preserving the throne, but she remained faithful to her favorite, and sacrificed her crown. During her exile in Paris and other places Marfori continued to be the *maître de la maison* of the queen. He returned to Spain in 1875. D. June 2, 1892.

Mar'garet, Queen of Scotland (called The Saint): b. in Hungary about 1040; was grand-niece of King Edward the Confessor and daughter of Edward, son of Edmund Ironside, who was driven into exile by Canute. She resided at the English court at the time of the Norman conquest, when she accompanied her brother, Edgar Atheling, in his flight to Scotland. She there attracted the admiration of King Malcolm Canmore, whom she married in 1069 and earned canonization by her efforts in diffusing Christianity, and especially by connecting the Scottish with the Roman Church.

D. in Nov. 1093, a few days after the death of her husband, who was killed in battle while fighting against the English. She was canonized in 1251, and adopted as the patron saint of Scotland in 1673.

Margaret of Angoulême: See MARGUERITE D'ANGOULÊME.

Margaret of Anjou: queen of Henry VI. of England, and daughter of René, Count of Provence; b. at Pont-à-Mousson, Lorraine, Mar. 23, 1429; married Apr. 22, 1445; became unpopular in England on account of the cession of the provinces of Maine and Anjou, then in the hands of the English, to her father. The king being subject to protracted periods of imbecility, she soon became the real ruler of the kingdom. The opposition of the Duke of York, who claimed the throne by an elder line of descent, gave rise to the Wars of the Roses, which opened with the battle of St. Albans in 1455, and which continued thence for several reigns. Margaret was forced to flee to Scotland, but her party soon rallied. She invaded England, killed the Duke of York at Wakefield (1460); released her captive husband by the second battle of St. Albans Feb. 17, 1461; was herself defeated at the great battle of Towton Mar. 29, and forced to escape to Scotland and France; made another unsuccessful invasion 1462; succeeded by the aid of Warwick the "king-maker" in momentarily reinstating Henry upon the throne 1470; but Warwick being killed at Barnet, Margaret was defeated and captured at Tewkesbury May 4, 1471, her only son, Prince Edward, being killed, and the king put to death soon after. Margaret was put in prison in the Tower or at Windsor until 1475, when she was ransomed by Louis XI. of France at the cost of the independence of Provence, ceded to that monarch by her father. She lived in strict seclusion thenceforth at Reculée, near Angers, and died at Dampierre, Aug. 25, 1481.

Margaret of Denmark: queen-regnant of the three Scandinavian kingdoms; b. in Copenhagen in 1353, a daughter of Valdemar IV. Atterdag, King of Denmark, and married in her tenth year (Apr. 9, 1363) to Haco VIII., King of Norway, to whom she bore in 1371 a son, Olaf. In 1375 Olaf succeeded his grandfather as King of Denmark, and in 1380 his father as King of Norway. During his minority Margaret conducted the government of both countries, and this difficult task she fulfilled with so much discretion and vigor that on the death of Olaf in 1387 the estates of both kingdoms chose her queen-regnant, and left to her to appoint her successor. In Sweden a large party was strongly opposed to the king, Albert of Mecklenburg, and opened negotiations with Margaret; and as Albert always had shown himself very hostile to her, she sent her general, Ivar Lykku, into Sweden with an army. On Feb. 24, 1389, the combined Danish-Swedish army defeated Albert's German mercenaries at Falköping. The king himself was captured, and detained in prison for seven years, and after a short struggle with his party Margaret was acknowledged queen-regnant also of Sweden. She combined in her person a high degree of womanly fascination with a rare force of character. She was courageous, but she was also shrewd, and in her political actions she was led probably less by personal ambition than by plans of far-seeing statesmanship. On July 20, 1397, she promulgated an act of union between the three Scandinavian kingdoms, the so-called Calmar Union, drawn up and agreed upon by emissaries from all three countries; and this act shows that her idea was not to get possession of as much land as possible, but to form a powerful Northern empire. During her lifetime her plan succeeded in spite of the jealousies of the three peoples, but her successor, Eric of Pomerania, was an inefficient ruler, and soon after her death (Oct. 28, 1412) the Calmar Union became the source of many calamities to the three Scandinavian countries. Her vigorous and able rule has caused her to be ranked among the great queens of history, and to be known as "the Semiramis of the North."

Margaret of Navarre: See MARGUERITE D'ANGOULÊME.

Margaret of Parma: a daughter of Charles V. by Margaret van Gheenst; b. in Brussels in 1522; was educated at the court of Mary, Queen Dowager of Hungary, whom she somewhat resembled. She was first married in 1536 to Alessandro of Medici, Duke of Florence (who was assassinated in the following year), and then in 1542 to Ottavio Farnese, Duke of Parma and Piacenza, to whom she bore a son, the celebrated general, Alexander Farnese. She was masculine both in her appearance and in her tastes. With a somewhat imperious temper she united kindly and honest spirit, great shrewdness in judging character, and skill in handling political affairs. In 1559 Philip II. made her regent of the Netherlands, which position she filled for eight years, attempting the well-nigh impossible task of reconciling the principles of Philip II. and the instincts of the Dutch. Her regency marks the beginning of the revolt of the Netherlands. She had some sympathy for the Netherlanders, and in 1564 she dismissed Cardinal Granvella, immediately after which her relations to Philip II. became desperate. In 1567 she retired to Italy, richly endowed by the king, and not unregretted by the people. D. at Ortona in 1586. A fine delineation of her character and history is found in Prescott's *Philip II.* See also Motley, *Rise of the Dutch Republic.*

Margar'ic Acid and **Margarine** [from Lat. *margari'ta* and Gr. μαργαρίτης, pearl; so called from its crystallizing in pearly scales]: By the action of potash on cyanide of cetyl (margaronitrile) there is produced, besides cetylic ether, cetylic aldehyde, ammonia, and other products, a potassic salt of an acid which has the composition $C_{17}H_{34}O_2$, intermediate between palmitic acid, $C_{16}H_{32}O_2$, and stearic acid, $C_{18}H_{36}O_2$. This acid exhibits all the properties of a pure fatty acid. It melts at 59·9°C., and can not be resolved into acids differing in melting-point. This is the only process by which margaric acid can be prepared. The acids obtained from natural oils and fats by saponification, to which the name and formula of margaric acid were applied, were mixtures of stearic acid with palmitic acid or other acids of lower melting-point.

IRA REMSEN.

Margarita, măär-găă-ree'tăă [Span., pearl]: an island of Venezuela; in the Caribbean Sea, 15 miles N. of the peninsula of Araya; between 10° 50′ and 11° 10′ N. lat., and 63° 50′ and 64° 30′ W. lon. Area about 450 sq. miles. It consists of two mountainous masses, almost cut off from each other by a lagoon; the highest point, called Macanao, is 4,500 feet above the sea. The climate is warm, but equable and very healthful, and it is much recommended for persons suffering from pulmonary complaints. Much of the soil is sterile, only the valleys being available for agriculture; the principal industries are the excellent fisheries of the vicinity, and salt-making. The small islands of Cubagua and Coche, to the S., and several neighboring islets are united with Margarita in the province of Nueva Esparta. The group was discovered by Columbus in 1498; shortly after rich pearl-banks were found in the vicinity, and the Spanish pearl-fishers founded Nueva Cadiz on Cubagua about 1515, this being the earliest European settlement of the coast; it was abandoned in 1519, but a fort was built on Margarita in 1525. The pearl-banks are now unproductive. The islands suffered greatly during the war for independence (1810–22), owing to their attachment to the patriot cause. Pop. nearly 40,000, largely composed of civilized Guayquerie Indians. Principal town, Asuncion.

HERBERT H. SMITH.

Margarito'ne: sculptor, painter, and architect; b. at Arezzo, Italy, the date being stated as 1212, 1216, and 1236. Before Cimabue and Giotto, he was the most esteemed painter of his day. After working in the Byzantine manner, he formed a style of his own. He painted many frescoes in Arezzo that have been destroyed. There still exists a *Madonna and Christ* in the Church of St. Francis, and another work at the convent of Sargiano, as also one in the Church of Santa Croce of Florence. He painted on canvas, and decorated his figures with halos and diadems of raised gesso, which he gilded and toned. His architectural works are the palace of the governor, and the Church of San Ciriaco at Ancona. He also worked on the cathedral of his native town, designed by Arnolfoda Lapo. He sculptured in the bishop's palace, Arezzo, a monument to Pope Gregory X., which is very simple and realistic in certain details. His later years were embittered by Cimabue's successes, which decreased his own popularity. D. at Arezzo about 1290.

W. J. STILLMAN.

Margate: a seaport-town on the isle of Thanet, Kent County, England; 74 miles E. by S. of London (see map of England, ref. 12–M). Its fisheries are important, but it is best known as a fashionable watering-place, much frequented during the summer. It has two old churches, an asylum for the deaf and dumb, a sea-bathing infirmary, assembly-rooms. a theater, zoölogical gardens, and a pier 900 feet in length, Pop. (1891) 21,369.

Marganx, măär'gō': village; in the department of Gironde, France; on the left bank of the Gironde; 14 miles

N. W. of Bordeaux. Near it is the Italian villa Château Margaux, which gives its name to a fine red wine. Pop. (1891) 1,915.

Marghilan, maăr-gĕĕ-lăn′: capital of the Russian province of Ferghana, Turkestan, Central Asia; 40 miles E. S. E. of the old capital, Khokan, 1,475 feet above sea-level; lat. 40° 28′ N., lon. 71° 43′ E.; pop. (1887) 26,080 (see map of Asia, ref. 4–E). This place was chosen as capital because of its salubrity, though the Russian town of New Marghilan is actually 10 miles S. of the old. The inhabitants are mostly Sarts, with some Tajiks and a few Jews. The chief industry is the manufacture of camel's hair and woolen stuffs and of silks. The climate is severe; in 1881 the maximum temperature was 104°, the minimum was 2° F.; the rainfall was 10 inches, and there were two days of snow. Marghilan is a very ancient city, and contains many monuments of antiquity. A tradition says that Alexander the Great died near by and was buried here. MARK W. HARRINGTON.

Margoliouth, maăr-gō′lĕĕ-oot, MOSES, Ph. D.: divine and author; b. at Suwalki, Poland, Dec. 3, 1820, of Jewish parents; was converted to Christianity in 1838, while on a visit in Liverpool; studied at Trinity College, Dublin; took orders in the Church of England 1844, and after holding benefices in Liverpool and Glasnevin, became assistant minister of St. Paul's, Onslow Square, Kensington, London, and in 1877 vicar of Little Linford, Buckinghamshire. He wrote much upon the religious prospects of the Jewish race, contributed to Cassell's *Bible Dictionary*, wrote a *History of the Jews in Great Britain* (3 vols., London, 1851); *Fundamental Principles of Modern Judaism Investigated* (London, 1843); *A Pilgrimage to the Land of my Fathers* (2 vols., 1850); *The Lord's Prayer no Adaptation of existing Jewish Petitions* (1876); *Some Triumphs and Trophies of the Light of the World* (1882). D. in London, Feb. 25, 1881. See his autobiography in his *Fundamental Principles*, and his memoir in *Some Triumphs*. Revised by S. M. JACKSON.

Marguerite d'Angoulême, maăr′greet′ dăăn′goo′lem′, known also as MARGUERITE DE VALOIS, de-vaa′lwăă′, MARGUERITE D'ALENÇON, -dăă′lăăn′sōn′, and MARGUERITE DE NAVARRE, -de-năă′vaar′: daughter of Charles d'Orléans, Count of Angoulême, and elder sister of Francis I.; b. Apr. 11, 1492. She had great natural gifts of mind and person, loved study, and learned Greek, Latin, Italian, Spanish, English, and even Hebrew. In 1509 she was married to Charles III., Duke of Alençon, but the marriage was not happy. Her husband perished in the battle of Pavia. She made the difficult journey to Madrid to be near her brother Francis in his captivity, and was largely instrumental in effecting his release. In 1527 she married Henri d'Albret, Count of Béarn and King of Navarre, by whom she had one daughter, Jeanne, mother of Henry IV. At her court at Nérac she extended a large and liberal tolerance, if not sympathy, to Protestant ideas, protected Marot and other refugees from religious persecution, and was herself accused of heresy. She surrounded herself with scholars and poets and was a generous patron of art and letters, rivaling if not surpassing Francis I. in furthering the movement of the Renaissance. She cultivated literature industriously. Her best-known work is the collection of *Contes de la Reine de Navarre*, stories inspired plainly by those of Boccaccio, and cast in the same form as the *Decameron*; they purport to be told by a company of ladies and gentlemen to while away the time during which they are detained by a freshet in the Pyrenees. The work was interrupted by the mourning into which she was plunged by the death of Francis I. (1547), when she had completed only seventy-two tales, or seven of the ten days of which it was to consist; hence its common name, the *Heptameron*. These stories, while sufficiently marked by the gay and frank sensuality of the Renaissance, have a more delicate sentiment than those of Boccaccio, and are the pretext for subtle discussions on questions of morals or courtesy. She wrote also a large number of poems and other works, some of which appeared in 1547 with the title *Marguerites de la Marguerite des Princesses*, and *Lettres* and *Mémoires* that reflect the graces of her mind and character. D. Dec. 21, 1549. The *Heptameron* has been best edited by Leroux de Lincy (3 vols., 1853–54); the *Lettres* by Genin (2 vols., 1842–43); the *Marguerites* by F. Frank (4 vols., 1873–74). A. G. CANFIELD.

Marguerite de Valois, de-vaă′lwăă′, known also as MARGUERITE DE FRANCE, -de-frăăns′, and MARGUERITE DE NAVARRE: daughter of Henry II. and Catherine de' Medici; b. at St.-Germain-en-Laye, May 14, 1552. She was married to Henry of Navarre, afterward Henry IV., only a week before the massacre of St. Bartholomew (1572). While Henry fled she remained at court till 1578, when she rejoined him at Nérac. In licentiousness of morals she rivaled her husband, with whom she did not long remain, going to occupy the castle of Usson in Auvergne. After Henry's accession as Henry IV. her marriage was annulled by Clement VIII. (1599). In 1605 she removed to Paris, where she cultivated the society of scholars and men of letters. D. Mar. 27, 1615, the last legitimate Valois. She left *Lettres* and *Mémoires* of considerable value, published by Guessard, 1842. The *Mémoires* were also published by Lalanne in 1858. A. G. CANFIELD.

Marheineke, maăr-hī′ne-ke, PHILIPP KONRAD: theologian; b. at Hildesheim, Hanover, May 1, 1780; studied at Göttingen; became Professor of Theology in 1805 at Erlangen, in 1807 at Heidelberg, in 1811 at Berlin, where he was also appointed pastor of Trinity church, and where he died May 31, 1846. One of his principal works is his *Grundlehren der christlichen Dogmatik*, of which the first edition (Berlin, 1819) is based on the philosophy of Schelling, the second (1827) on that of Hegel. The attempt to mediate a full harmony between the data of science and the doctrines of Christianity by raising both into a higher, ideal, speculative sphere, the sphere of truth, is here undertaken with great ingenuity, but the enthusiasm with which the book was received has waned, and the standpoint from which Marheineke wrote his philosophical works, and even his sermons, has been given up as barren. His *Geschichte der deutschen Reformation* (4 vols., 1816–34) is of lasting worth.

Revised by S. M. JACKSON.

Mari'a Christi'na: Queen of Spain; b. at Naples, Italy, Apr. 27, 1806; a daughter of Francis I., King of the Two Sicilies; was married, Dec. 11, 1829, to Ferdinand VII., King of Spain, his fourth wife. On Mar. 29, 1830, when the queen declared herself pregnant, the king abolished the Salic law of inheritance, to which the Bourbons had conformed, and according to which only the male members of the family could inherit the throne, and reintroduced, by a pragmatic sanction, the old Castilian law, according to which the crown could be inherited also by females. On Oct. 10, 1830, the queen bore a daughter, Isabella (afterward Queen Isabella II.), and immediately the court and the country became divided into two parties, the Carlists and the Christinos, the former headed by Don Carlos, brother to the king, heir-presumptive to the throne according to the Salic law, and supported by the Ultramontane clergy and the absolutists—the latter headed by Maria Christina, vindicating the throne for her daughter according to the pragmatic sanction, and supported by the liberals. On the death of the king (Sept. 29, 1833) the two parties took up arms, and a civil war began which lasted till 1840, devastating the country and demoralizing the people. Meanwhile Maria Christina, who was appointed regent during the minority of Isabella II. soon lost the popularity she had gained by her alliance with the liberals. She was intrinsically indifferent in political matters, but her instincts were absolutist rather than constitutional. Her subserviency to the policy of Louis Philippe placed her in opposition to the progressists or radicals, who found much sympathy in England; and her personal relations gave general scandal; she bore ten children to one Fernando Muñoz, a member of her body-guard, created Duke of Rianzares, to whom she was not publicly married until Oct. 13, 1844. On Oct. 12, 1840, she was compelled to abdicate the regency to Espartero and leave the country. She resided for some years in Paris, but returned after the fall of Espartero in 1844 to Spain, and although Isabella II. had been declared of age in 1843, Maria continued to meddle with the government, until she was once more expelled in 1854. For ten years she lived in France, Italy, and England, and returned in 1864 to Spain, whence, by the revolution which dethroned Queen Isabella, she was again expelled in 1868. She returned after the accession of her grandson, Alfonso XII., to the throne, in 1876. D. Aug. 22, 1878.

Revised by C. K. ADAMS.

Mariager, P.: novelist; b. in Denmark in 1827. In 1853 he published an anonymous tale, and in the following year translated Balzac, Scribe, etc., and a number of popular scientific works from the French and German, the first being Flammarion's *Inhabited Worlds*, now in its fourth edition. *Fra Hellas: Fem antike Fortællinger* (From Hellas: Five Antique Tales, 1881) marks a new departure in Danish literature, being an attempt to reproduce Greek culture similar to Eber's to reproduce Egyptian. It met

with immediate success, and was translated into several languages. It was followed by *Den sidste Lamia, og andre antike Fortællinger* (The Last Lamia, and Other Antique Tales, 1884); *Magthaveren paa Rhodos* (The Potentate of Rhodes, 1885); *Sybaris*, a drama; *Dronningen af Kyrene, og andre antike Fortællinger* (The Queen of Cyrene, and other Antique Tales, 1891); and *Et Bryllup i Katakomberne* (A Marriage in the Catacombs, 1893). D. K. Dodge.

Maria Louisa: Empress of the French; b. Dec. 12, 1791; a daughter of the Archduke Francis of Austria; was married Apr. 2, 1810, at Paris, to Napoleon I., who had obtained a divorce from his wife, the Empress Josephine, for the sake of this connection with Austria, and bore him a son Mar. 20, 1811. During the campaigns of 1812 and 1813 she was appointed regent, and her actions under the difficult circumstances were marked by ability and dignity. She was not allowed to follow her husband when he abdicated and went to Elba. She took up her residence in Schönbrunn, near Vienna, where she remained also during the Hundred Days. By the Peace of Paris, Parma, Piacenza, and Guastalla were given to her. After the death of Napoleon she contracted a marriage with Count Niepperg. D. Dec. 18, 1847. See *Famous Women of the French Court*, by Imbert de Saint-Amand, translated by Thomas Sargeant Perry (New York, 1890–91).

Mariana, maă-rĕe-aa'naă, Juan, de: historian; b. at Talavera, Spain, in 1537; educated at the University of Alcala; joined the Society of Jesus in 1554; was Professor of Theology in the Jesuit College at Rome 1561–65; was afterward a lecturer on divinity in Sicily and in Paris 1569–74; settled at Toledo 1574; wrote a treatise, *De Rege et Regis Institutione* (Toledo, 1599), which was burned by the hangman in Paris on account of its justification of tyrannicide; published various works on theological and political topics, and a *General History of Spain* (1592–1609; Eng. trans. London, 1699, 2 parts). D. at Toledo, Feb. 6, 1623.

Revised by S. M. Jackson.

Marianna: a town of the state of Minas Geraes, Brazil; 5 miles E. S. E. of Ouro Preto: at the northeast base of the Itacolumí Mountain (see map of South America, ref. 6–G). It was founded in 1699 by gold-miners, and during the eighteenth century was one of the richest mining-towns of Brazil. The washings are now almost abandoned, and the town is important only as being the seat of the Bishop of Minas. Pop. about 8,000. H. H. S.

Marianna: village (incorporated in 1874); capital of Lee co., Ark. (for location of county, see map of Arkansas, ref. 3–E); on L'Anguille river at the head of navigation, and on the St. L., Iron Mt. and S. Railway; 45 miles W. of Memphis. It is in a corn and cotton growing region; is an important cotton-shipping point; and has 2 public and 3 private schools, several churches, and 2 weekly newspapers. Pop. (1880) 627; (1890) 1,126; (1900) 1,707.

Editor of "Index."

Marianne Islands: See Ladrones.

Mari'a There'sa: Archduchess of Austria, Queen of Hungary and Bohemia, and Empress of Germany; b. in Vienna, May 13, 1717; a daughter of the Emperor Charles VI.; was declared sole heir of all the possessions of the house of Hapsburg by the Pragmatic Sanction (*q. v.*), and married (Feb. 12, 1736) to Francis Stephen, grand Duke of Tuscany. On the death of her father (Oct. 20, 1740) she ascended the throne, and on Nov. 21 in the same year appointed her husband coregent, but in spite of the pragmatic sanction claims to various parts of her inheritance were raised immediately from different sides, a formidable alliance was formed against her between Spain, France, Bavaria, Saxony, and Prussia, and the Austrian War of Succession (see Succession Wars) was opened by the invasion of Silesia by Frederick II. The heroic resoluteness of the young empress, however, and the chivalrous enthusiasm of the Hungarian people, saved her crown, and by the Peace of Aix-la-Chapelle (Oct. 18, 1748) she lost only Parma and Piacenza to Spain and Silesia to Prussia, while her husband was recognized as Emperor of Germany; but the loss of Silesia she could never forget. In 1753 Prince Kaunitz, in whom the empress soon learned to put entire confidence, became Austrian chancellor, and he succeeded in forming an alliance between Austria, France, Saxony, and Russia for the humiliation of Prussia. Maria Theresa even stooped so far, in order to obtain revenge on Frederick II., as to write a letter to Madame de Pompadour and address her as "My dear cousin;" but the Seven Years' War (*q. v.*), although conducted by Austria with great vigor and some success, brought no result; the Peace of Hubertsburg (Feb. 15, 1763) left Silesia a Prussian possession. On Aug. 18, 1765, the Emperor Francis I. died, and Maria Theresa took her eldest son, Joseph, as coregent. His policy was decidedly one of aggrandizement, and it was probably due to his influence that she participated, though not until she received the consent of the pope, in the first partition of Poland (Aug. 5, 1772), which brought Galicia and Ludomeria under the Austrian dominion. Turkey was compelled to cede Bukowina (Feb. 25, 1777), but the plan of annexing Bavaria was foiled, and the Austrian influence in Germany received a severe check by the formation of the so-called *Fürstenbund* under the auspices of Frederick II. In the interior her government was successful, and marked with great energy and wisdom. The finances, the weakest point in the Austrian household, were improved by the emperor and Count Haugwitz. The army, previously an ineffective and disorderly mob, was organized and strengthened by Joseph and Count Lasey. Servitude and torture were abolished, a number of schools of different grades established, and a better criminal code was introduced; improvements partly due to the exertions of Van Swieten. Although she was a pious Catholic, and not disposed to be indulgent to her Protestant subjects, Marie Theresa had an open eye for the abuses of the Roman Church, and stopped them at many points. She forbade the priests to be present at the making of wills, and any person, male or female, to take monastic vows before his twenty-fifth year, and in 1773 she expelled the Jesuits. D. at Vienna, Nov. 29, 1780, leaving four sons, of whom the oldest, Joseph II., succeeded her, and six daughters, of whom the next to the youngest was Marie Antoinette. Even Frederick II. of Prussia, her great adversary, bore testimony to the purity and nobleness of her personal character, writing to d'Alembert on the occasion of her death: "I have shed tears at her death—sincere tears. She was an honor to her sex and to the throne. I have waged wars against her, but I have never been her enemy." See Duller, *Maria Theresa und ihre Zeit* (1843–44, 2 vols.); Wolf, *Oesterreich unter Maria Theresa* (Vienna, 1855); Lotheisen, *Oesterreich unter Maria Theresa* (1860).

Mariaz'ell: a village of Styria, Austria-Hungary, about 60 miles S. W. of Vienna (see map of Austria-Hungary, ref. 5–E); celebrated for its mineral springs, and a favorite place of pilgrimage. It is situated in the Styrian Alps, on the Salza, a tributary of the Enns, an affluent of the Danube, 2,927 feet above the sea. Pop. 11,000. It is annually visited by about 100,000 pilgrims, the object of veneration being an image of the Virgin, dating from 1157, in a chapel erected in 1363, which has been incorporated into a church built in 1644. Near by are important iron-foundries.

Maricopa Indians: See Yuman Indians.

Marie, pseudonym of Antoinette Meyn: a Norwegian writer, whose latest books have been published under the new pseudonym *Holger Birch*. The first book of this author, *I Tusmørket* (Between the Lights, 1875; 3d ed. 1881), won her many friends, and her popularity steadily increased. She is a fluent but not a great writer. Most of her books have been translated into Swedish and German. They include *Gjennem Kamp* (Through Struggles, 1876); *Fra Min Födeby* (From my Native Town, 1877); *I det Stille* (In the Home Circle, 1878); *Ved egen Kraft?* (By her own Power? 1879); *Hjemmet* (At Home, 1881); *I ensomme Timer* (During Lonely Hours, 1883); *Fra Fars og Mors Tid* (From Father's and Mother's Time); *Dyoeckes Hus* (The House of Dyocke: a Dream, 1885); *Pressede Blomster* (Dried Flowers, a manuscript, 1889); *Dröm og Virkelighed* (Dream and Real Life, 1891); *Svunde Tider* (From Times Gone By, 1893). P. Groth.

Marie Antoinette, maă'ree'aăn'twaă'net': Queen of France; the fifth daughter of Maria Theresa and Francis I.; b. in Vienna, Nov. 2, 1755; married at Versailles, May 16, 1770, to the dauphin (afterward Louis XVI.), to whom she bore four children, of whom two died in infancy; the other two were Louis XVII. and the Duchess of Angoulême. Her position at the French court was difficult from the very first, and it soon became dangerous. There was a difference of character between her and the people among which she had come to live which proved fatal in the end. Her morals were perfectly pure, and her heart full of noble and generous instincts; but she felt a haughty independence of eti-

quette, ceremonies, public opinion, etc., and in her character gay levity and impulsive caprices were singularly mixed up with innocence, virtue, and elevated purposes. At the French court every vice was committed, but none was shown; an elegant hypocrisy covered the rottenness. It was evident that such a character under such circumstances could not escape slander and intrigue, and after the affair of the diamond necklace in 1785 the young queen was completely overwhelmed and ruined by them. The indolence of her husband and the desperate state of affairs compelled her to meddle with polities. The character of her husband prevented him from following her influence, and the result was a series of half measures which became blunders, and of violence which ended in weak submission. At the outbreak of the Revolution she was actually hated by the French people, and after the unfortunate attempt at flight (June 21, 1791) her doom was certain; but her character developed with the situation, and under the horrors which surrounded her she grew heroic. Although broken both in body and mind, when placed after a long imprisonment before the Revolutionary Tribunal (Oct. 13, 1793), she flung back the accusation of having seduced her own son with an indignation which made every heart in the room tremble; and during the two hours' ride to the scaffold on Oct. 16, between rows of stern soldiers and under the execrations of a furious mob, she preserved her dignity to the last. See *Mémoires*, by Weber (1822); Lafont d'Ausonne (1824); Mme. Campan (1826); *Histoire*, by Goncourt (1859); and *Famous Women of the French Court*, by Imbert de Saint-Amand, translated by Thomas Sargeant Perry (New York, 1890–91).

Revised by C. K. Adams.

Marie de Médicis: Queen of France; b. at Florence, Apr. 26, 1573; daughter of Francis I., Grand Duke of Tuscany; was married Dec. 16, 1600, to Henry IV., King of France, to whom she bore in the next year a son, afterward Louis XIII. She was beautiful, passionate, ambitious, but singularly low and mean; Henry always avoided her, and she was not crowned until the day before his assassination (May 13, 1610). From this time she conducted the government together with her favorites, the Concinis, till the conspiracy of de Luynes (Apr. 14, 1617), after which she was confined in the Castle of Blois. On the death of de Luynes (Dec. 14, 1621) she returned to the court and took her place in the king's council, having been reconciled to him by Richelieu; but, jealous of the growing power of the new minister, she began intriguing against him, too, and was sent once more from the court in 1630, and confined in the Castle of Compiègne. Thence she escaped, wandered several years in England and the Netherlands, and died at Cologne, July 3, 1642, in miserable circumstances.

Marie Galante, măă-ree'gaă-laant' (Span. *Marigalante*): one of the French West Indian islands; 17 miles E. S. E. of Guadeloupe, of which it is a political dependency. Area, 63 sq. miles. It is nearly circular in form, mainly of calcareous formation, and the greatest elevation is 675 feet. The climate is dry, and there are few streams. The principal product is sugar. There are whale-fisheries of some importance off the coast. Pop. (1890) 13,850. The principal town is Grand Bourg. H. H. S.

Mariel: See the Appendix.

Marienbad, măă-ree'en-băăd: a small town of Bohemia; 18 miles S. of Carlsbad; picturesquely situated among wooded hills at an elevation of 2,057 feet, and much frequented as a watering-place and on account of its saline springs (see map of Austria-Hungary, ref. 3–C). The waters resemble those of Carlsbad, but are cold and contain more purgative salt. They are used both internally and externally in cases of gout, skin diseases, rheumatism, etc. The permanent population is about 2,000.

Marienburg, -boorch: town of Prussia, on the Nogat; 27 miles S. E. of Dantzic (see map of German Empire, ref. 2–J). Its castle, a magnificent and imposing edifice of Gothic architecture, was erected from 1274 to 1341 by the knights of the Teutonic order, whose grand-masters resided there for several centuries. At the time the building was one of the strongest castles in Europe. Under Polish rule it was allowed to fall into decay, but it was carefully restored in the beginning of the nineteenth century. The town has a normal school, several chemical-factories, important cattle, horse, and wool markets, and a considerable trade in grain, linen, feathers, brushes, etc. Pop. (1890) 10,279.

Marienwerder, văr-der: city of West Prussia; 45 miles S. S. E. of Dantzic (see map of German Empire, ref. 2–J). It is a handsome city, with many fine buildings, among which is the cathedral from the fourteenth century, and the castle built by the knights of the Teutonic order in the thirteenth century. It has many benevolent and educational institutions, and some manufactures. Pop. (1890) 8,552.

Mariéton, măă'ri-ā'tōñ', Paul: poet and critic; b. at Lyons, France, in 1862. He has been an ardent participator in the recent literary movement in Southern France, and a friend of Mistral, Aubanel, and the other poets of the new Provençal school. He is chancellor of the Society of Felibrige, and was in 1891 majoral of the Society for Provence proper. He is also director of the *Revue felibréenne*, the Parisian organ of the school. He has published three volumes of verse—*Viole d'amour*, *Hellas*, and *Souvenance*. Also a large number of articles and books devoted to the interests of his friends. Among these may be mentioned *Bonaparte Wyse* (1882); *Auguste Fourès* (1883); *Un félibre limousin* (1883); *Théodor Aubanel* (1883); *Le mouvement flamand* (1884); *Discours sur la jeunesse provençale* (1884); *Josephin Soulary et la pleïade lyonnaise* (1884); and particularly *La terre provençale* (1890). A. R. Marsh.

Mariet'ta: city (founded in 1833); capital of Cobb co., Ga. (for location of county, see map of Georgia, ref. 2–G); on the Marietta and N. Ga. and the W. and the Atlantic railways; 20 miles N. of Atlanta. It is in an agricultural and stock-raising region, and has several marble-mills, flour and paper mills, knitting and chair factories, iron-foundry, sash, door, and blind mills, and paper, twine, carriage, and excelsior works. Pop. (1880) 2,227; (1890) 3,384; (1900) 4,446. Editor of "Journal."

Marietta: city (settled in 1788); capital of Washington co., O. (for location of county, see map of Ohio, ref. 7–H); on the Ohio river, at the mouth of the Muskingum, and on the Balt. and O. S. W., the Cleve. and Marietta, the Toledo and O. Cent. Ext., and the Zanesv. and O. railways; 80 miles S. E. of Zanesville, 115 S. E. of Columbus, 175 S. of Cleveland. It is in the great oil region of Ohio and West Virginia, and within a few miles of rich coal and iron deposits; is principally engaged in manufacturing and river commerce; and has flour, planing, and saw mills, carriage, tub, bucket, and chair factories; foundries and machine-shops; tanneries, breweries, car-shops, oil-works, boat-yard, and tool-works. The city is the seat of Marietta College. There are 2 national banks with combined capital of $200,000, a private bank, and 3 weekly and 2 other periodicals. The limits of the city were enlarged in 1890 by the annexation of the village of Harmar. Pop. (1880) 5,444; (1890) 8,273; (1900) 13,348. Editor of "Register."

Marietta: borough; Lancaster co., Pa. (for location of county, see map of Pennsylvania, ref. 6–H); on the Susquehanna river, and the Penn. Railroad; 25 miles E. of Harrisburg, 81 miles W. of Philadelphia. It has iron-furnaces, rolling-mill, foundry and machine-shop, saw and planing mills, hollow-ware and enameling works, and agricultural-implement factory; is the Eastern market for the timber and lumber brought down the river, and contains a national bank with capital of $100,000, a private bank, a lyceum of natural history (founded in 1872), with library, and two weekly newspapers. Pop. (1880) 2,503; (1890) 2,402; (1900) 2,469.

Marietta College: an institution at Marietta, O.; located where the first settlement of the "territory northwest of the river Ohio" was made Apr. 7, 1788. The college was founded by the sons of the pioneers, among whom were many graduates of Yale and Harvard. It was opened for instruction in 1833 as the Marietta Collegiate Institute and Western Teachers' Seminary, but in 1835 a new charter was obtained, under the name of Marietta College. In its course of study and general arrangements the college has adhered to the New England type. The college is independent alike of ecclesiastical and of State control, having a self-perpetuating board of trustees. Though not denominational, its affiliations are rather with the Congregational and Presbyterian bodies. There are two courses of study, of four years each, leading to the degrees of B. A. and B. Ph. The latter course substitutes the modern languages for the Greek. The first class graduated in 1838, and the whole number of graduates to 1900 was 811. In 1900 the college had 252 students and a faculty of 19. In cabinets, apparatus, etc., the college is well fitted for its work. The number of volumes in the college and society libraries is about 65,000. The library is

specially rich in works of American history and of the early history of the Northwest, including many valuable manuscripts. The president is (1894) J. W. Simpson, D. D., LL. D.

Revised by C. H. THURBER.

Mariette, măă′rĕĕ-et′, AUGUSTE ÉDOUARD: archæologist; known as Mariette Pasha; b. at Boulogne-sur-Mer, France, Feb. 11, 1821; became professor in the college of his native place at the age of twenty. Having become interested in Egyptology, he removed to Paris in 1848, where he taught the science for two years. Seeing no propitious opening at home he secured an appointment in 1850 to visit Egypt upon a mission of excavation and research. During the following thirty years he devoted himself to similar pursuits, working principally at Saqqarah, the Serapeum at Memphis, at Abydos, Thebes, Edfu, Denderah, and Tanis. The founding of the Egyptian Museum at Bulak (afterward at Gizeh, and soon to be placed in a suitable and special building) was due to his efforts, and of it he was long the director, as well as inspector-general and guardian of the national monuments. He died at Cairo, Egypt, Jan. 18, 1881. He was principally noted as an archæologist, not as a decipherer of the hieroglyphic writing. His publications were largely at the expense of the khedive, and related principally to the historical materials which he discovered. The following are among his best-known books: *Choix de monuments* (Paris, 1856); *Deir el Bahari* (Leipzig, 1877); *Karnak* (Leipzig, 1875); *Abydos* (Paris, 1880); *Denderah* (4 vols. and supplement, Paris, 1869–80); *Monuments of Upper Egypt* (London, 1877; Boston, 1890). C. R. GILLETT.

Mar'igold: a popular name for various yellow-flowered plants, but especially for those of the genera *Tagetes* and *Calendula*, of the order *Compositæ*. The so-called African and French marigolds are of the first-mentioned genus. Both are South American. The true marigold (*Calendula officinalis*), indigenous to the south of Europe, has long been cultivated in gardens, and is prized in domestic medicine. It is sometimes employed in flavoring soups. See CALTHA.

Mari'na, called by the Indians *Malintzin'*: mistress of Hernando Cortés; b. in Goazacoalco (Campeche) about 1501. Accounts of her early life vary, but for some reason she was sold into slavery among the Maya Indians of Tabasco; in 1519 the Tabascan chief gave her, with other girls, to the Spaniards of Cortés's expedition. She soon acquired the Spanish language, and owing to her knowledge of Mexican she was of great assistance to Cortés as an interpreter. Marina followed Cortés to Mexico, was present during the siege, and is a prominent character in the events of that period. Of the children whom she bore to Cortés, one, Martin, became prominent in later history. In 1524 she was married to Juan Jaramillo, a Spanish captain, who subsequently held lucrative offices in Mexico; Marina was living there as late as 1550, but the date of her death is unknown.

H. H. SMITH.

Marine City: city (founded in 1836); St. Clair co., Mich. (for location of county, see map of Michigan, ref. 7–K); on the St. Clair river; 20 miles S. of Port Huron. It contains 4 ship-yards, 4 mills for sawing lumber and ship timber, 2 salt-blocks, stave and heading, hoop, planing, and flour mills, foundry and boiler and machine shops, and sash, door, and blind factories. There are 2 savings-banks with combined capital of $75,000, and 2 weekly newspapers. Pop. (1880) 1,673; (1890) 3,268; (1900) 3,829.

EDITOR OF "MAGNET."

Marine Glue: See GLUE.

Marine Insurance: the system by which owners of vessels are insured against pecuniary loss caused by shipwreck or other disaster at sea.

History.—Marine insurance may be regarded as a necessity of commerce; it has ever followed in its wake. It probably had its origin when maritime ventures were specially exposed to the depredation of pirates. In its inception it seems to have partaken more of the character of loans, still known, but practiced under different conditions, as bottomry and respondentia, the first meaning mortgage of a ship, and the second loan on the cargo. Large premiums were paid for these loans to cover interest for use of the money as well as for the maritime risk, because in case of shipwreck or capture the lender lost the money loaned. Suetonius refers to the Emperor Claudius as probably the contriver of marine insurance. It is stated that at a time of corn famine in Rome (A. D. 43) Claudius encouraged the merchants to send ships for supplies, guaranteeing to pay for the value of vessel and cargo in the event of wreck or capture. Further record gives the use of the same system in Italy in 1194. An ordinance of Barcelona indicates that marine insurance was known in Spain prior to 1435.

Policies appear to have been first issued in Florence in 1523. The development of marine insurance into a system may be traced to the commercial activity of the Mediterranean states. Its introduction into Northern Europe was doubtless through the Hanseatic League, whose early operations at Wisby, and later at Bruges, gave an impetus to the practice. The latter place was one of the great marts of the league, and indeed was acknowledged as the metropolis of the world's commerce; in it, it is stated, a chamber of insurance was established as early as 1311. The merchants of the steel-yard located on the Thames, London, were the representatives of the league in England. It is interesting to follow the record of their operations, and to notice the extent of their influence on the commercial activity of that country. For several centuries they seem to have held sway and had enormous privileges accorded to them by the various sovereigns. International intercourse through them doubtless gave marine insurance its foothold in England. In the reign of Elizabeth the steel-yard was closed, and the merchants were expelled from the kingdom. The first statute regarding marine insurance was passed by the English Parliament in 1601.

While the merchants of the steel-yard introduced marine insurance in England, it is to the Lombards who emigrated there the middle of the thirteenth century that the practice owes the rules and regulations handed down to this day. The form of policy now generally used is substantially the same as one arranged by them, drawn from the original forms used in Florence, Pisa, Venice, and Barcelona. Originating in such an early period, its language is quaint and somewhat incoherent, but, as has been remarked by a learned judge, through a prolonged series of judicial decisions it has "obtained a clear and definite meaning"; and again, "every word of it has been weighed in the judicial balances and assigned its proper value." The decisions of the learned Lord Mansfield have specially contributed to that end.

Origin of Lloyd's.—The business of marine insurance was originally done by individual merchants and moneylenders. The one seeking protection to his venture filled up the policy and submitted it to the one whose protection he sought; if the risk was accepted by the latter he underwrote the policy, i. e. signed it, and thus became the *underwriter*.

In the latter part of the seventeenth century coffee-houses were numerous in London, and they were the resort of merchants and underwriters. One of these houses, located in Tower Street and kept by Edward Lloyd, became famous on account of information concerning ships and maritime matters furnished by Mr. Lloyd. In the summer of 1696 he began to publish a small sheet called *Lloyd's News*, which was suppressed by the Government after seventy-six numbers had been issued. In 1726 the publication was revived in an enlarged and improved form, and has continued, changing its title only, to *Lloyd's List*. In this humble beginning originated the extensive system of individual underwriting known as "Lloyd's" in London and copied in various forms throughout the commercial world. Marine insurance at Lloyd's increased largely. (See LLOYD'S.) In 1810, during the war, one risk on treasure laden on the frigate Diana, valued at £656,000, was insured there from Vera Cruz to England at 4 per cent. premium.

Insurance by joint-stock companies originated with the Dutch in connection with their trading companies, but at first it did not meet with much favor in England. Through the efforts of Lord Chetwynd and Lord Onslow in 1720 two companies were chartered—the London Assurance and the Royal Exchange—for each of which the large sum of £300,000 was paid to the Government; the companies were granted a monopoly of the business of marine insurance; under their charters all but private underwriters were excluded from becoming insurers in the future. In 1810 a parliamentary investigation of the conduct of the business of those companies was made and strong appeals presented for the repeal of the monopoly to enable the incorporation of a large company, but the effort failed, mainly through the influence of individual underwriters. In 1824 the repeal was accomplished, and the large company was chartered. In the investigation referred to it was discovered that out of a total estimated value of £162,538,900 insured in the kingdom in 1809, the chartered companies had insured an

insignificant part, nearly the whole having been insured at Lloyd's.

Scope and Definition of Policy.—First, as to the scope of the policy. The risks insured against are fully set forth in the body, and may be epitomized as "perils of the sea," and include all marine hazards resulting from the violent action of the elements, all casualties as distinguished from the ordinary *undisturbed* prosecution of the voyage; they are such as the ordinary agency of man may not prevent. The policy does not assume liability for loss or injury arising from causes *inherent* in the article insured. Second, policies are distinguished by different names. A voyage policy is one covering a specific voyage, as from New York to Liverpool. A time policy is one covering a designated period of time, for example, on a ship for one year. An open policy is one in which an amount is insured without expressed *value* of the goods, that being left to be determined by the invoice, as "on 100 cases merchandise." The same designation is given to a form of policy common in the U. S., particularly in New York. It is issued to avoid multiplying policies, and made for a nominal amount, and insures only such risks as are accepted and indorsed on it by the underwriters upon application of the merchant. This latter is also sometimes called a general policy. A special policy is one insuring a specific risk, with name of vessel, etc. A floating policy is one insuring by vessel or vessels. A wager policy is one that shows on the face of it the assured has no interest in the property. This class of insurance, i. e. without interest, was quite common in England, but modern legislation has ever aimed to eliminate a gambling element from marine insurance. Under statute 19 George II., insurances without interest were declared illegal. In many States of the U. S. similar enactments exist. Insurances are, however, still made "policy proof of interest," but recovery for loss under such policies is not encouraged by the courts. It is important to observe that an interest in the property insured is an indispensable condition in all marine insurances.

It has been seen that the printed policy has been clearly defined by judicial decisions. The original conditions are, however, frequently modified or changed by clauses written, or printed in *red*. For example, the risk of capture or seizure is included among the perils enumerated as covered, but invariably a clause, commonly called "war clause," is inserted exonerating the underwriter from loss occasioned by those perils. When they are assumed the clause is waived, for which, in case of war, a considerable advance in premium is charged. In like manner the measure of liability for loss in respect to other perils may be increased or curtailed by clauses, as may be agreed upon by the assured and assurer.

It should be observed that written conditions supersede anything in the printed wording to which they are opposed.

Definition of Terms.—The word "average," frequently occurring in connection with marine insurance, is a name applied to certain descriptions of loss. There are two kinds of average: particular average and general average. The first means damage or partial damage to the ship or to the particular subject to which it relates. The second comprehends all loss arising out of a voluntary sacrifice made of any part of the ship or cargo to prevent loss of the whole, or to rescue the whole adventure from unusual peril. All extraordinary expenses incurred for the general good are likewise included in that definition. The main principle of general average has been derived from the "Rhodian law," but all commercial nations have endeavored to bring its practice within the highest rules of equity. Several international congresses have been held on the subject, notably those at York, England, in 1864, and at Antwerp in 1877; a new code was adopted and designated York-Antwerp rules. This code is frequently referred to as a basis of agreement in general average questions. An insurance made free of particular average excludes partial loss or damage. In English policies, however, it is invariably qualified by the clause "unless the vessel be stranded, sunk, burnt, or in collision." Some American companies have modified the qualification by making it "unless *caused* by stranding, sinking, burning or collision *with another vessel.*" In the latter form the element of uncertainty as to the cause of damage is removed. Insurances made free of general and particular averages reduce the liability under the policy to total loss only. There may be an actual as well as constructive total loss. Actual when the property insured is absolutely lost or destroyed by the perils insured against. Constructive when by any of those perils the voyage can not be performed, or the property is so damaged as to be of little value.

Under the head *memorandum* the policy excludes claim for particular average on certain articles and those which are perishable in their own nature. It also names the per centum of average at which others are insured. Thus grain, being one of the articles excluded, would not be insured against particular average unless specially provided for in writing.

Duration of the Risk.—Insurance on a ship begins at the port from which insured, and continues until moored at anchor for twenty-four hours in good safety at the port to which insured. Insurance on cargo begins immediately following the loading of it in the vessel, and continues until the discharge of it at the port of destination. If it is the custom of the port to convey goods in lighters from the ship to the shore, they are insured until so landed. Insurance on freight, i. e. earnings of the ship for transporting the cargo, begins and terminates simultaneously with the insurance on the cargo. When an insurance is made on chartered freight, i. e. freight to be earned under a charter, the policy attaches as soon as the vessel sails on the voyage covered, although she may be destined to a distant port for cargo.

Marine Underwriting in the United States.—There is no evidence that marine insurance was practiced to any extent in the North American colonies, nor for some time after the establishment of the Government of the U. S. There were a few individual underwriters, and associations were also formed for underwriting; but it was not until 1793 that the General Assembly of Pennsylvania chartered a company with the title Insurance Company of North America. The first company chartered by the State of New York was the New York Insurance Company in 1798, with a capital of $500,000. During the nineteenth century twenty-six companies have been chartered by that State, of which one only continues in active business; the others have failed or liquidated. There are also in New York two underwriting associations conducted by attorneys for the benefit of subscribers, one of which is named United States Lloyd's.

Mutual Companies.—A company chartered in New York in 1834 to do insurance on a mutual basis met with unexampled success at first, and drew a large part of the business from the stock companies. The profits of the latter companies accrued to their stockholders, while in this new method the profits reverted to the dealers, thus giving them their insurance at cost. The latter system became at once popular. Many of the stock companies liquidated in 1842, and reorganized on the mutual plan. Among the number was the Atlantic, now known as the Atlantic Mutual, a company that presents an interesting phase in marine underwriting, both in respect to the system by which it is characterized and the development of its business. American companies in the seaports of the U. S. have passed through the same experience as those in New York, and the business of marine insurance is now largely done through the agencies of British companies.

Probably on no other commercial subject has there been so much written as on marine insurance. The subjoined list gives some of the more important works on the subject: Phillips, *A Treatise on the Law of Insurance*; Arnould, *A Treatise on the Law of Insurance and Average*; Benecke, *A Treatise on the Principles of Indemnity in Marine Insurance*; Emerigon, *A Treatise on Insurance*, translated from the French, with notes; Duer, *The Law and Practice of Marine Insurance*; Parsons, *A Treatise on the Law of Marine Insurance*; Martin, *A History of Lloyd's and of Marine Insurance in Great Britain*; Park, *A System of the Law of Marine Insurance.*

A. A. Raven.

Marine'o: town in the province of Palermo, Sicily; in a grain, vine, and olive bearing district, about 15 miles S. of the city of Palermo (see map of Italy, ref. 9–E). In a little country church near Marinco are some very fine frescoes of the fourteenth century. Ficuzza, an old feudal seat and a favorite summer retreat of Ferdinand III., is in this vicinity. Pop. about 9,600.

Mariner's Compass: See Compass.

Marines [from Lat. *mari'nus*, pertaining to the sea, marine; deriv. of *mare*, sea]: troops enlisted for service on board men-of-war and at naval stations. Considered in the light of infantry serving afloat, marines are, as a distinct corps, coeval with navies. Among the Greeks they were known as *epibatæ*, a class described by historians as the fighting men who served exclusively on board ships of war.

Though armed like the infantry on shore, they were yet distinct from the land troops, and entirely unlike the rowers or mariners who served in the fleet. The number of epibatæ assigned to each vessel bore about the same proportion to the crew as the number of marines to the crew of a modern man-of-war. In the Roman navy marines were styled *classiarii milites*. In the early history of the English navy we read of men-at-arms still serving afloat, their armor and weapons differing but little from those of the ancients. The Scandinavians called them *båt-karler* or sea-soldiers—that is, carls, or sturdy fellows, who fought in boats. Later they were called *supra-salientes*, a word still preserved in the Spanish *sobresaliente*. The Genoese crossbowmen, the best marines of the period, were in the thirteenth century employed, and very highly esteemed, in the English navy. In Aug., 1387, Sir Henry Percy ("Gunpowder Percy") was appointed "captain of all the men-at-arms and archers of the fleet." He was, in fact, commandant of marines.

With the introduction and gradual increase of naval ordnance the occupation of men-at-arms afloat passed away. The earliest employment of marines under their present form was in 1653, when Admiral Blake embarked a number of soldiers to act as small-arms men (Schomberg's *Chronology*, vol. i., p. 51) in the battle with von Tromp off Portland. Subsequently, in 1664, troops from the line were detailed for service afloat, and came to be called *marine soldiers*, or *marines*. (Grose's *Military Antiquities of the English Army*.) For good conduct in battle, but more particularly for steadfast loyalty during the great mutinies in the fleet at the Nore and at Spithead, they were, in general orders dated Apr. 20, 1802, styled Royal Marines. The Royal Marine forces of Great Britain are divided into two branches: the Royal Marine Artillery and the Royal Marine Light Infantry, comprising 14,000 men. They are obliged to serve for fourteen years, and then may re-engage for seven years. At the expiration of the twenty-one years' service they are pensioned. The artillery consists of one division, quartered at Plymouth, and the infantry of three divisions, quartered at Chatham, Portsmouth, and Plymouth.

The U. S. Marine Corps was first established by the act of Congress of Nov. 10, 1775, authorizing the enlistment of two battalions, to be styled "first and second battalions of marines." After the adoption of the present Constitution and the reconstruction of the navy, the Marine Corps was again called into existence by the act of July 11, 1798, "establishing and organizing a marine corps." By this act the Marine Corps is at any time liable to do duty in the forts and garrisons of the U. S. on the seacoast or any other duty on shore, as the President may direct. The corps consists of 1 colonel commandant, 1 colonel, 2 lieutenant-colonels, 1 adjutant and inspector, 1 quartermaster, 1 paymaster, 4 majors, 2 assistant quartermasters, 20 captains, 30 first lieutenants, 12 second lieutenants; also 1 sergeant-major, 1 quartermaster-sergeant, 1 leader of band, 1 drum-major, 50 first sergeants, 140 sergeants, 180 corporals, 30 musicians, 96 drummers and fifers, 25 apprentices learning music, and 1,575 privates; total, 2,175. The Naval Appropriation Act approved Aug. 5, 1882, enacts that from the naval cadets (Naval Academy, Annapolis) who successfully complete the six years' course appointments shall be made to fill vacancies in the lower grades of the line and engineer corps of the navy, and *of the Marine Corps*, in the order of merit, as determined by the academy board of the Naval Academy, the assignment to be made by the Secretary of the Navy on the recommendation of said board. Marine officers are on the same footing as to rank, pay, and allowances as similar grades in the infantry; take precedence of like rank in the volunteers and militia; may be associated with officers of the army on courts martial, the senior to preside; are promoted up to colonel by seniority; can not exercise command over navy-yards or vessels of the U. S.; and no officer can absent himself without leave until notified of the acceptance of his resignation. The staff is separate from the line and appointed by the President by selection. The colonel commandant is also appointed by selection. Officers may be advanced thirty numbers in rank for gallant conduct in battle or extraordinary heroism, and retire at the age of sixty-four. (See *Laws United States Navy*.) The judge-advocate-general of the navy may be appointed from the officers of the Marine Corps. Privates enlist for five years. The recruit must be at least 5 ft. 5 in. high, between eighteen and thirty-five years of age, able to read and write, of steady habits, unmarried, well made, and in good health. Credit is given to both officers and men for previous service in the volunteer army or navy, and re-enlistment in either the army or the Marine Corps within thirty days after honorable discharge will count as continuous service, which brings increase of pay. Marines are exempt from arrest for debt or contract. The marine guard of the Chicago, flagship, consists of 1 captain, 1 lieutenant, 4 sergeants, 5 corporals, 2 musicians, and 45 privates; total, 58. Other vessels of similar size, like the Baltimore, Newark, San Francisco, etc., carry 1 commissioned officer, 3 sergeants, 3 corporals, 2 musicians, and 32 privates; total, 41. A fourth rate, like the Petrel, is entitled to 1 sergeant, 2 corporals, and 7 privates; total, 10. The marine guard constitutes the police force, and is an indispensable element of the organization of a ship of war. Marines may be detached for service on board the armed vessels of the U. S., and the President may detach, and appoint for service on board said vessels, such officers of said corps as he may deem necessary. (Sec. 1616, *Revised Statutes*.) The Marine Corps shall at all times be subject to the rules and regulations for the better government of the navy, except when detached for service with the army by order of the President, when they come under army regulations. The headquarters of the corps and the "school of application" for the instruction of officers and enlisted men are at the U. S. marine barracks, Washington, D. C. See *History of the United States Marine Corps*, by Capt. R. S. Collum, U. S. M. C.

S. B. Luce.

Marinette: city; capital of Marinette co., Wis. (for location of county, see map of Wisconsin, ref. 4–F); on Green Bay, at the mouth of the Menominee river, and on the Chi. and N. W. and the Chi., Mil. and St. P. railways; 49 miles N. by E. of Green Bay. It has an excellent harbor, in which the U. S. Government has expended over $275,000 for improvements, and is near large tracts of valuable hard and soft wood forests, and beds of iron ore. Two bridges, one of wood, the other of iron (cost $75,000), connect the city with Menominee, Mich., on the other side of the river. There are 14 churches, 5 public-school buildings (cost $100,000), water-works (cost $200,000), public park, driving-park with a half-mile track, 3 cemeteries, 2 national banks with combined capital of $200,000, electric lights, electric street-railway, and 2 daily and 8 weekly newspapers. The city has a large lake traffic, and is principally engaged in the lumber industry, and in pulp and paper making. Pop. (1880) 2,750; (1890) 11,523; (1900) 16,195.

Editor of "North Star."

Marini, maă-ree'neĕ, Giovanbattista: poet; b. in Naples, Italy, Oct. 18, 1569. His father, a lawyer, wished to bring him up in the same profession, but found him more inclined to poetry and dissipation than to serious studies. At length, weary of his spendthrift habits, he turned him out of his house. The youth was saved from misery for the time, however, by the Prince of Conca, grand admiral of Naples, who made him his secretary. In his family Marini made the valuable acquaintance of Torquato Tasso. In 1598 a disgraceful escapade obliged him to flee from Naples, and he went to Rome. Here he soon made friends among the great, but toward 1602 he went to Venice to see through the press a collection of his poems, *La Lira* (3 parts, 1602–14). Returning to Rome in 1603 he lived with Cardinal Aldobrandini, whom he accompanied to Ravenna a little later. In 1608 we find him living in Turin, where he found favor for a time at the ducal court. In 1615, however, he went to Paris, where he was kindly treated by Marie de' Medici and by Louis XIII. His literary fame was now very great, and he exercised a powerful influence upon the ideals, not only of Italian, but also of French writers. For a time, indeed, his style was the model to which all elegant poets strove to conform, and Marinism, like Euphuism in England and Gongorism in Spain, became a veritable disease. In 1623 he returned to Italy, and after a time in Turin he settled in Rome, where he was shown extraordinary honor, and made Prince of the Academy of the "Umoristi." Finally, he went back to Naples, where the splendor of his reception was in marked contrast to the manner of his departure years before. D. at Naples, Mar. 25, 1625. Few poets have exerted a greater influence than he upon their contemporaries, and it must be admitted that real excellences in his work in part justify this. His ideals, however, both moral and literary, were mainly vicious, and show us the decaying Renaissance at its worst. Besides the collection of poems mentioned above, Marini wrote many other works, but the most important is the long poem of 45,000 verses, entitled *Adone* (1st ed. Paris, 1623). Though purporting

to deal with the love of Venus and Adonis, the poem was used by its author as a receptacle for all kinds of matters. Much autobiographical information, for example, is to be found in it. The work is extremely licentious, and the style is often painfully mannered. See F. Mango, *Le fonti dell' Adone* (Turin, 1891). Also M. Menghini, *La vita e le opere di Giambattista Marini* (Rome, 1888).

Marino, maă-ree'nō: town in the province of Rome, Italy; beautifully situated on a slope of the Alban Hills; 12 miles S. E. of the city of Rome (see map of Italy, ref. 6–E). The walls and towers present a very picturesque appearance; its streets and squares are broad, and the public buildings, especially the churches, are well worthy of notice, both for their external architecture and their interior decorations. In 1347 it was the scene of a conflict between Rienzi and the great Orsini family, after which it was for a long time in the hands of the Colonna, who still have large possessions here. There is more manufacturing industry in this place than is usual in this part of Italy. Marino was the birthplace of the celebrated Victoria Colonna. Pop. 6,070.

Mario, maă-rec'ō, Giuseppe, Marquis di Candia: opera-singer; b. at Cagliari, Sardinia, Oct. 18, 1810; served for some time in the Sardinian army, from which he resigned, and, when his resignation was not accepted, succeeded in escaping to Paris. Having received a fine musical education, and possessing an admirable tenor voice, which he improved by two years' study in Paris, he accepted an engagement in opera, and made his *début*, under the assumed name of Mario, in *Robert le Diable*. He soon became the acknowledged leading tenor, and was a great favorite in England and on the Continent. He married Giulia Grisi, by whom he had several children. In 1854, in company with Grisi, he fulfilled a successful operatic engagement in the principal cities of the U. S. In 1871 he retired from the stage in London, but in 1872 appeared in concert in the U. S. with poor success, his voice having lost its beauty. D. in Rome, Dec. 11, 1883.

Mariol'atry [from Gr. Μαρία, Mary + λατρεία, priestly service, worship]: the worship of Mary, the mother of Jesus. This has no foundation whatever in the New Testament, but developed naturally as Jesus became the Church doctrine and less the Friend of man, the Elder Brother of the whole human family. The heart of the Church found in the mother of Jesus the tenderness and sympathy the intellect had deprived it of when it formulated its cold and abstract theories of the person of Jesus from the idea of Christ as the God-Man. Before the close of the fourth century there had been produced a considerable amount of apocryphal and legendary descriptions intended to supplement the meager information which the Gospels give concerning the mother of Jesus. From the Nestorian controversy this whole movement received a decided impetus. The question arose and was hotly discussed whether Mary should be styled "mother of God," or only "mother of Christ." Nestorius rejected the former title as inappropriate, but was condemned by the Synod of Ephesus (431), and the Fathers who had defended "mother of God" were accompanied with torchlights and incense-burning from the assembly-room of the synod through the illumined city to their respective stopping-places. Thus the worship of Mary was established, and it rapidly increased during the next centuries. After the iconoclastic controversies, images of her became very frequent not only in the churches and houses, but also in the streets and along the roads, and it became customary to light candles and burn incense in front of them. Numberless miracles were wrought by her relics and images, and Saturday was consecrated to her memory. The Synod of Toulouse (1229) fined people for neglecting her worship. The modern Roman Church, under the impetus of Pius IX., has declared (1854) that Mary was immaculately conceived. The Protestant position is that her worship brings to her the homage, trust, and affection which rightly belong to her Son alone. See Mary.

Revised by S. M. Jackson.

Marion: town; capital of Perry co., Ala. (for location of county, see map of Alabama, ref. 5–C); on the E. Tenn., Va. and Ga. Railway; 30 miles N. W. of Selma. It is the seat of the Marion Female Seminary (non-sectarian, chartered 1836), Judson Female Institute (Baptist, opened 1839), and Marion Military Institute (non-sectarian, opened 1887); is principally engaged in agriculture; and has weekly and quarterly periodicals. Pop. (1890) 1,982; (1900) 1,698.

Marion: city; capital of Williamson co., Ill. (for location of county, see map of Illinois, ref. 11–E); on the St. L., Alt. and Terre H. Railroad; 172 miles S. by E. of Springfield. It is in an agricultural and coal region, has woolen and cotton mills, and contains 6 churches, graded public school, county buildings, and 2 weekly newspapers. Pop. (1880) 881; (1890) 1,338; (1900) 2,510.

Editor of "Leader."

Marion: city; capital of Grant co., Ind. (for location of county, see map of Indiana, ref. 4–F); on the Mississinewa river, and the Cleve., Cin., Chi. and St. L., the Pitts., Cin., Chi. and St. L., and the Toledo, St. L. and Kan. City railways; 41 miles S. E. of Logansport, 67 miles N. E. of Indianapolis. It is an agricultural, fruit-growing, and natural-gas region; has 72 manufacturing establishments, including 10 glass-factories, malleable-iron works, and flour and rolling mills; is the seat of a national soldiers' home which cost over $1,000,000; and has a normal college, high-school building which cost $60,000, electric street-railway, and 2 daily and 5 weekly periodicals. Pop. (1880) 3,182; (1890) 8,769; (1900) 17,337. Editor of "Chronicle."

Marion: city; capital of Linn co., Ia. (for location of county, see map of Iowa, ref. 4–J); on the Chi., Mil. and St. P. Railway; 6 miles N. E. of Cedar Rapids, 70 miles S. W. of Dubuque. It has important manufactures, including foundry products, flour, carriages, furniture, and agricultural implements, and 2 public parks and 3 weekly newspapers. Pop. (1880) 1,939; (1890) 3,094; (1900) 4,102.

Marion: city; capital of Marion co., Kan. (for location of county, see map of Kansas, ref. 6–G); on the Cottonwood river, and the Chi., Rock Is. and Pac. and the Atch., Top. and S. Fé railways; 104 miles S. W. of Topeka. It is in an agricultural, fruit-growing, and stock-raising region; contains 4 churches, 2 public schools, several public parks, and valuable mineral springs; and has an iron-foundry, flour-mills, and 2 weekly newspapers. Pop. (1880) 857; (1890) 2,047; (1900) 1,824. Editor of "Record."

Marion: city: capital of Marion co., O. (for location of county, see map of Ohio, ref. 4–E); on the Cleve., Cin., Chi. and St. L., the Col., Hock. Val. and Toledo, the Col., Sandusky and Hock. Val., and the Erie railways; 40 miles N. of Columbus. It is in an agricultural region; has large steam-shovel works, malleable-iron works, thresher and engine works, track-sulky and mattress factories, and lime-kilns; and contains a normal school, business college, 2 State banks with combined capital of $425,000, a banking company with capital of $200,000, and a private bank, and 2 daily, a semi-weekly, and 3 weekly newspapers. Pop. (1880) 3,899; (1890) 8,327; (1900) 11,862. Editor of "Evening Star."

Marion: town; capital of Marion co., S. C. (for location of county, see map of South Carolina, ref. 5–G); on the Wilmington, Col. and Augusta Railroad; 85 miles W. of Wilmington, N. C., 125 miles E. by N. of Columbia. The Great Peedee river, navigable for steamboats, is 8 miles distant. The town is in a cotton-growing region, and has two weekly newspapers. Pop. (1880) 824; (1890) 1,640; (1900) 1,831.

Marion: town: capital of Smyth co., Va. (for location of county, see map of Virginia, ref. 7–C); on the Norfolk and Western Railroad; 160 miles W. of Lynchburg. It is in an agricultural, mining, and cattle-raising region; has flour-mills, iron-foundry, and agricultural-implement works; and contains Marion Female College, a high school, and two weekly newspapers. Pop. (1890) 1,651; (1900) 2,045.

Marion, Francis: soldier; b. at Winyaw, near Georgetown, S. C., in 1732, of Huguenot ancestry; received a very limited education; went to sea at the age of sixteen, and barely escaped with his life from a vessel that foundered on a voyage to the West Indies. He volunteered in the expedition of Gov. Lyttleton against the Cherokees (1759), and was a captain in Middleton's regiment in 1761. He served with honor in the Revolutionary war, taking part in the defense of Fort Moultrie, in the siege of Savannah, and in the defense of Charleston, but his most noteworthy achievements belong to the last two years of the war, during which he maintained a harassing partisan warfare against the British. He recruited a few companies from among his neighbors, who were obliged to content themselves with the rudest arms and equipments, and joined Gen. Gates in North Carolina, but this re-enforcement met only with ridicule on account of its ragged condition. Marion was returning from a bootless errand against the British boats on the neighboring rivers at the time Gates was defeated at

Camden (August), and falling suddenly upon the British guards he succeeded in rescuing the Continental prisoners. A few days later he surprised and dispersed in quick succession two bodies of Tories, baffled pursuit by Tarleton, and from that time was for more than two years engaged in a constant series of adventurous forays and manœuvers which procured him the name of the "Swamp Fox," and laid a basis for a thousand legendary tales. He occasionally undertook more formal warfare in the capture of British outposts, and took part in several battles in connection with the army of Greene. After the evacuation of Charleston (Dec., 1782) Marion disbanded his forces and resumed the life of a farmer, and married a lady of wealth. He served in the State Senate and the constitutional convention of 1790, was until 1794 a general of the State militia, and died on his plantation near Eutaw, Feb. 29, 1795. See his *Life*, by Horry and Weems, and that by W. G. Simms.

Marionettes' [plur. of *marionette* = Fr., liter., dimin. of *Marie*, Mary], or **Pup'pets** [from O. Fr. *poupette*, doll, puppet; cf. Fr. *poupée*, doll < deriv. of Lat. *puppa*, girl, doll]: small figures set in motion on a miniature stage by a concealed mechanism of springs and wires or cords, to represent the action of a pantomime. This amusement was known both to the Greeks and Romans (Gr. ἀγάλματα νευρόσπαστα; Lat. *imaguncula*), has been popular in Italy ever since the Middle Ages under the name of *fantoccini*, and was introduced into France in the time of Charles IX. In England the puppet-show was common in the time of Elizabeth, as may be gathered from allusions in *Hamlet*, *Two Gentlemen of Verona*, and Ben Jonson's *Bartholomew Fair*. Regular dramas were sometimes attempted, as in the case of Jonson's *Bartholomew Fair*, so named from the locality in London which was then the chief resort of puppet-players. Puppets were still popular in the days of Swift and *The Spectator*, but for a century and a half thereafter were rarely seen except at country fairs or as strolling "Punch-and-Judy shows," until in 1872 they reappeared in London, under the name of "marionettes," as a French novelty, and were exhibited for many months with very complete apparatus and scenery at the Egyptian Hall. Since that time the marionettes have been represented in various parts of the U. S. and in the Spanish-American republics. See PUNCH.

Mariotte's' Law: the principle, called otherwise **Boyle's Law**, that if the temperature remains the same the volume of a gas will vary inversely as the pressure. This formula was enunciated independently both by Mariotte (a French physicist, d. 1684) and BOYLE (*q. v.*), and is found very nearly true in experiment with gases not too near their point of condensation. With those which under severe pressure become liquefied, departures from the law occur, which are wider the more nearly the point of liquefaction is approached, the diminution of volume being more than proportional to the increase of pressure. See GAS and HEAT. E. L. N.

Mariotti, L.: See GALLENGA, ANTONIO CARLO NAPOLEONE.

Mariposa Lilies [*mariposa* is Span. for butterfly]: popular name for species of *Calochortus*, a genus of liliaceous plants, all natives of the Western U. S. and Mexico. They grow from corms, producing sparingly leafy, herbaceous stems, bearing large, showy, terminal flowers, consisting of three outer narrow segments, and three inner broad ones, which are mostly glandular and bearded. Thirty-two species are known, of which *C. venustus*, *C. luteus*, and *C. pulchellus* of California, and *C. nutallii* and *C. gunnisonii* of the Rocky Mountains, are best known. Many species are cultivated in gardens in the U. S. and Europe; they are sometimes called butterfly lilies.

Flower of *Calochortus venustus*.

CHARLES E. BESSEY.

Mariposan Indians, or **Yokuts Indians** [*Mariposan* is from the Spanish *mariposa*, butterfly, the name of a county of California; *yokuts* signifies Indian or Indians in the native tongue]: a linguistic stock of North American Indians comprising the Cholovone and Yokuts divisions. At the time of the American possession the latter inhabited a territory embracing that part of California bounded on the N. by Fresno river up to the point of junction with the San Joaquin, thence by a line running to the northeast corner of the Salinan territory, about Big Panoche creek, San Benito County, on the W. by a somewhat irregular line extending from San Benito to Mt. Pinos. The eastern boundary was the secondary range of the Sierra Nevada. The Cholovone division occupied the east bank of the San Joaquin, from the Stanislaus to the point where the San Joaquin turns westward to enter Suisun Bay, being thus separated from the Yokuts by Moquelumnan stock. Unlike most of the California tribes, the Mariposan, particularly the Yokuts group (which embraced some twenty-four small tribes), displayed great political solidarity, and hence were more capable of being grouped into coherent masses, before the advent of the whites. Their villages were very small. Every large natural division, such as a river-valley, constituted the domain of a tribe, which had its hereditary chief.

The food-supply of the Mariposan Indians included a number of farinaceous products, besides caterpillars, grasshoppers, a huge succulent worm resembling the tobacco-worm, dogs, and even skunks. The coyote and rattlesnake were considered sacred, the former being revered as the creator of the universe. Their medical treatment was chiefly by scarifications with flints, since it was believed that all diseases resided in the blood. Sweat-houses were in use by the Mariposan as well as, probably, by all other California tribes. Sorcery prevailed, and their wizards induced delirium by chewing jimson (*Datura*) seeds, their ravings while under its influence being regarded as divinely inspired oracles.

As a race the Mariposan tribes were considered peaceful. Although they celebrated a war-dance they took no scalps. They were devoted to gambling, the women having a separate game similar to dice-throwing. Marriage among the Yokuts was by purchase, and before the appearance of the whites all the Mariposan tribes, unlike the northern natives, were comparatively virtuous. Infanticide was practiced in case of deformity. Cremation was common to all the tribes of this stock except the Chukchansi, who were said to burn only those who died a violent death, or were snake-bitten. Among the ceremonials of the Yokuts was the weird "dance for the dead" which was continued for nearly a week.

In 1850 the population of the various Mariposan tribes was probably between 2,000 and 3,000. According to the census of 1890 but 167, classed as "desert Indians," survived. These are under the mission agency of California.

Maritime Law: See INTERNATIONAL LAW.

Maritime Province (in Russian, *Primorskaia Oblast*): the province which occupies the eastern coast of Siberia, including all the adjacent islands except Saghalin, which is an independent province. It is bounded on the N. by the Arctic Ocean, on the E. by Bering Sea, the Sea of Okhotsk, and the Sea of Japan, and on the S. by Korea. On the W. it is separated from Manchuria by the Usuri river as far as Lake Khanka, and S. of that by the coast watershed; from the Amur province and Yakutsk generally by the watershed of the eastern coast. The western boundary terminates in the Bay of Chaoun, on the Arctic Ocean, in lon. 170° E. As thus limited, the province is long and narrow, extending from 42° 19′ N. to 70° N., and having a breadth varying from only a few miles on the Sea of Okhotsk to over 400 within the Arctic circle. The total area is 715,982 sq. miles, of which 3,500 is in islands and 3,400 in lakes. Pop. (1889) 102,786. The coasts have abundant harbors, but they are all closed by freezing for a part of the year. The interior is generally mountainous, except beyond the Arctic circle, where large plains or tundras prevail. The Amur river passes through the province N. W. from the junction of the Usuri, a distance of about 700 miles. The Usuri rises in Lake Khanka, and flows N. 350 or 400 miles until it joins the Amur. The only other large river is the Anadyr, within the Arctic circle. It is a considerable stream, with a length of probably 700 miles, emptying into the Gulf of Anadyr of Bering Sea. The climate resembles that of the east coast of North America from Baffin's Land to New England. About the Amur it is like the Province of Quebec, and to the southward like New England. The soil is in

places excellent, the summers are hot, and the rainfall sufficient. It is a promising region for immigration, and efforts are being made by the Russian Government to fill it with Russians rather than with the Chinese, who are rapidly flowing in. For the Usuri region free passage was given to Russians in the following numbers for the years named: 1883, 1,596 persons; 1884, 1,879; 1885, 2,458; 1886, 2,847. The capital was at first Nikolacisk, at the mouth of the Amur, but was later moved to Kabarofka, at the junction of the Usuri. Later the southern part of the province was acquired, and the capital was moved to Vladivostok, a magnificent port near the southeast angle of the province, a place now strongly fortified. MARK W. HARRINGTON.

Maritza [anc. *Hebrus*, famous in mythology]: principal river of European Turkey. It rises in the Balkans, flows generally S. E., becomes navigable at Adrianople, and empties into the Ægean Sea at Enos.

Mar'ius, GAIUS: a Roman general; was born in 155 B. C. at Arpinum, the birthplace of Cicero. His parents were of humble station, although it has been suggested that the lowliness of his origin has been exaggerated. A career was opened to him by the fact that at the siege of Numantia (in 134) he attracted the attention of the younger Scipio Africanus, because of his valor. Fifteen years later he appears in the office of a tribune of the people, in which his opposition to the aristocracy was pronounced from the first. A little later he acquired distinction and influence by marrying Julia, a Roman lady of prominent family, the aunt of Julius Cæsar. In 109 he was legatus in the army of Quintus Metellus, who was directing the operation of the long-drawn-out war against Jugurtha in Africa. Here he speedily became known as an efficient officer, and won the sympathy of his soldiers to an unusual extent, thus paving the way to preferment in office. In the year 107 he was elected consul, and intrusted with the task of bringing the war with Jugurtha to a close. This he succeeded in doing, although much credit was due to the efficient aid of his questor Sulla, who secured possession of the person of Jugurtha. At the time of Marius's return from Africa, Italy was threatened with invasion from the north by vast hordes of Cimbri and Teutons. For years they had menaced the northern frontier, and had defeated many Roman armies that had been sent against them. In expectation of a contest with them Marius was elected consul for the third time in 103 B. C., and again in 102. In this year the barbarians returning from Spain were planning to invade Italy. One portion of them, consisting of Teutons, was met by Marius on the Rhône at Aix and totally annihilated. The Cimbri meantime had entered Northern Italy by the eastern defiles of the Alps, and in the following year they, too, were attacked and overwhelmingly defeated at Vercelli. Marius returned to Rome in triumph and was received with unprecedented marks of honor. He was elected to the consulship again in the year 100, but in peace he was unable to maintain the leading position which war had conferred upon him, and accordingly we hear nothing of him for a number of years. At the end of the social war in 88 B. C. he succeeded by violent and unconstitutional means in securing for himself the command of the war against Mithridates, which the senate had already intrusted to Sulla. The latter, however, was in possession of the army, and Marius had to flee for safety, first to Minturnæ (where a fruitless effort was made to kill him) and then to Africa. Meantime Sulla had proceeded against Mithridates, and in his absence Rome was the scene of great confusion and disorder, during which Marius returned. He allied himself with Cinna, the consul of the popular party, who had been excluded from Rome by his colleague Octavius, and together they inaugurated a reign of terror and vengeance such as Rome had never before seen. They were designated as consuls for the following year, 86 B. C., during which Marius died at the age of seventy. Marius was a soldier and nothing else; his influence on subsequent events of Roman history consisted chiefly in the establishment of an army of paid and professional soldiers in place of a citizen militia, and in the introduction of better methods of handling the legion. Many of the most characteristic features of Roman military organization and discipline date from his innovations; but the brilliancy of his victories over Jugurtha and the Cimbri and Teutons was heavily shadowed by the unscrupulousness and ferocity which he displayed in his old age. G. L. HENDRICKSON.

Marivaux, măă'rĕĕ'vō', PIERRE CARLET DE CHAMBLAIN, de: dramatist and novelist; b. in Paris, France, Feb. 4, 1688. His first literary efforts were travesties and novels: *Pharsamon, ou les Folies romanesques* (1712), a parody of *Don Quixote*; *Effets surprenants de la sympathie* (1713); *Homère travesti* (1716); *La Voiture embourbée* (1714). Losing a part of his modest means in the speculations of Law he turned to journalism, without much success, publishing in 1722–23 *Le Spectateur français* in imitation of Addison, and later two other periodicals, *L'Indigent philosophe* and *Le Cabinet du philosophe*. His chief fame is due to his comedies, which to the number of twenty-eight were given at the Théâtre Italien and the Théâtre Français between 1720 and 1756. The best of these, as the *Jeu de l'Amour et du Hasard* (1730), *Le Legs* (1736), *Les Fausses Confidences* (1737), and *L'Épreuve* (1740), have held their place upon the stage, and are among the best representatives of French comedy. His strength is in minute psychological analysis. Incidents count for little, and there are no strongly individualized characters or striking pictures of society; but a passion or sentiment is followed, in its birth, growth, or transformation, with the nicest skill through all its intricate turnings and doublings, advances, hesitations, and retreats. The delicate analysis of sentiment in nicely chosen and refined phrase is so conspicuously his mark that it has since been called *marivaudage*. The same qualities are found in his later novels, both unfinished, *La Vie de Mariane* (1731–41) and *Le Paysan parvenu* (1735–36), which have been of influence for the English novel. His *Œuvres complètes* were published in 1827–30 (10 vols.): his best comedies, as *Théâtre choisi*, are in the collections of Garnier and Didot. Cf. G. Larroumet, *Marivaux: sa vie et ses œuvres* (Paris, 1882).
A. G. CANFIELD.

Mar'joram [M. Eng. *marjoran*, from one of the Rom. langs.; cf. Span., Provenç., Ital. *majorana*, Mod. Fr. *marjolaine*; under influence of popular etymology corrupted from Lat. *ama'racus* = Gr. ἀμάρακος]: a popular name for several aromatic labiate herbs of the genus *Origanum*. The common marjoram (*O. vulgare*) has been naturalized in the U. S. from Europe. Its leaves are used in cookery, and its essential oil is employed in liniments. The sweet marjoram of the gardens, *O. majorana* of the south of Europe and the Levant, is much pleasanter in odor and taste than *O. vulgare*, and is employed in garnishing meats and seasoning soups.

Marjoribanks, maarch'bănks, EDWARD, Lord Tweedmouth: statesman; b. in London, England, July 8, 1849. He was educated at Oxford, and was called to the bar in 1874. He was Liberal member of Parliament for Berwickshire in 1880.; moved the address in answer to the speech from the throne in 1883; became second whip of the Liberal party in 1886; and patronage secretary to the treasury in Mr. Gladstone's administration in 1892. He became Lord Tweedmouth on the death of his father March 4, 1894.

Mark [= Germ. *mark* < M. H. Germ. *marc*, *marke*, half-pound of silver or gold, M. Eng. and O. Eng. *marc*, O. N. *mǫrk*. Origin obscure]: a term employed since the middle of the eleventh century, throughout the states of Germany and also in Spain and Portugal, to signify a half-pound weight of gold or silver. The same term has also been used in many of these states to designate the unit of account in their monetary systems. These monetary units were originally identical with the unit of weight, but by the continual degradation and debasement of the coinage came in the lapse of time to represent very inferior and, in different states, very unequal values. Thus the silver mark current of Hamburg became worth no more than 1*s.* 2½*d.* sterling = $0.29, the mark banco = 1*s.* 5·57*d.* = $0.35½. A mark also was used in England, equal to 13*s.* 4*d.* = $3.24⅓; and another in Scotland, equal to 13⅓*d.* = $0.27. In most of the German states it has been the usage during the past century or two to fix the standard of the silver coins in actual use by declaring what number of such coins shall be struck from one mark by weight of pure silver, the standard mark being the mark of Cologne, containing 3,608 English grains, exceeding half an avoirdupois pound by 108 grains. Thus 11⅓ thalers of Lubeck were coined from one Cologne mark of fine silver, and 14 thalers of Prussia from one such Cologne mark.

Since the formation of the German empire the term "mark" has been applied to the standard unit of the imperial monetary system, the value being fixed by the enactment that 139½ ten-mark pieces, or 69¾ twenty-mark pieces, shall be made from one German pound (500 grammes) of fine gold. A mark of the empire has therefore the value of

$0.23·8213 of the money of the U. S. As the standard of gold coinage is but nine-tenths fine, a ten-mark piece weighs 3·9825 grammes = 61·4593 grains, and a twenty-mark piece 7·965 grammes = 122·918 grains troy.

Mark, Saint [*Mark* is from Lat. *Mar'cus*, whence Gr. Μάρκος]: the author of the second book of the New Testament. I. *Life.*—There was in the primitive Church an office which occupied an intermediate position between the apostolate and the ministry—namely, that of *evangelist* or missionary of the second order, subordinate to the apostles (Eph. iv. 11). Mark belonged to this class of ecclesiastical functionaries. He is believed to have been a native of Jerusalem, where his mother, called Mary, owned a house (Acts xii. 12). His Israelitic name was John, but to this was added, according to a Jewish custom of that time, the Roman surname of Mark. A singular tradition preserved in some old documents tells that he was of priestly descent, and, having once embraced Christianity, he cut off one finger in order that the defect might make him unsuitable for the performance of any service in the temple.* The first part of this tradition is supported by the circumstance that, according to Col. iv. 10, he was a cousin of Barnabas the Levite. He was no doubt won to the faith by St. Peter, who was a friend of his family (Acts xii. 13, 14), and calls him *his son* in the same spiritual sense of the word in which Paul gives this name to Titus and Timothy (1 Pet. v. 13). The Gospel of Mark contains a short narrative, omitted in the other Gospels, of a young man who, observing what took place at Gethsemane, fled when surprised by the constables, leaving behind him the linen robe in which he was wrapped. The fact that the evangelist recorded this incident, which is of no particular interest, leads naturally to the conclusion that this young man was Mark himself, who, living in the vicinity, heard the noise and would see what was going on. Mark appears for the first time in the evangelical history in Acts xiii., when, about the year 44, Paul and Barnabas set out on their first missionary journey among the pagans to the island of Cyprus and the adjacent parts of Asia Minor. On their arrival in the wild regions of the Taurus Mountains, Mark left the two missionaries and returned to Jerusalem; and this circumstance was the reason why on his second journey St. Paul absolutely refused to have him for a companion, though Barnabas, whom their relationship no doubt made more lenient, insisted on it. The two missionaries then separated, Paul taking Silas along with him, instead of Barnabas, and Timothy instead of Mark, while Barnabas, together with Mark, went to the island of Cyprus, and thence to other countries which are not specially mentioned in the history (Acts xv. 37, *seq.*). Later on, however, Mark became reconciled to St. Paul. We find them together at Rome about the year 62, when Paul remembers him to the Colossians and Philemon (Col. iv. 10; Philem. 24), and toward the close of his life Paul called him a second time to stay with him as a coadjutor "profitable for the ministry" (2 Tim. iv. 11). Nevertheless, Mark appears to have been most closely connected with Peter. A tradition, almost unanimous, designates him as the companion of Peter, either his secretary or his interpreter. It is difficult, however, to ascertain at what time Mark thus accompanied Peter. In 62, when he was in Rome with Paul, Peter was certainly not there, since he is not mentioned in the Epistles written during the Roman captivity (Colossians, Ephesians, Philemon, and Philippians). It must have been either before or after. If *before*, it is necessary to consider the city of Babylon, whence Peter wrote his First Epistle (1 Pet. v. 13), as Babylon proper, situated on the Euphrates, and to admit that before Peter went to the Occident he had visited, together with Mark, the numerous Jewish settlements in Syria and Mesopotamia; but, then, why should Mark separate from him and go to Rome to stay with Paul? If *after*, there remains only the year 63 and the first half of 64 for the voyages of Mark with Peter, which is a very short term. In this case it must be admitted that at the time when the Epistle to the Colossians was sent off, Mark himself was going to the Orient (iv. 10); that he met Peter in Asia Minor, accompanied him, and went with him to Rome, whence Peter wrote his First Epistle to the churches of Asia. If so, Babylon is used figuratively for Rome, which, indeed, is the conception of most of the Fathers. Several ancient writers attribute to Mark the foundation of the Church of Alexandria. According to them he was the first bishop of that Church, died there, and left the episcopal see to Anianus.* At all events, it was from Alexandria that in the Middle Ages the Venetians carried his ashes, and deposited them in the cathedral to which they gave his name. It is possible that Barnabas and Mark after leaving Paul went to Alexandria, where there was a numerous and rich Jewish population wishing to have the Gospel preached to them. When St. Paul wrote the Epistle to the Romans, in the winter of 58–59, he declared that all the great centers of the Orient were evangelized, and that there was no more room for his labor in those countries (Rom. xv.). Could he have spoken thus if no missionary had as yet visited Egypt? If Mark and Barnabas are the founders of the Church of this country, it is easy to understand that it was hither Mark went when in 64 Peter died at Rome during the persecutions of Nero. Chrysostom, moreover, asserts that it was at Alexandria he composed his Gospel. Thus the career of Mark, although not so very conspicuous, is nevertheless very interesting. He forms a connecting link between the great apostles. Attached now to Barnabas. now to Paul, and now to Peter, he resembles a comet which successively traverses the orbits of the great planets, accompanying them for some moments, though always preserving its independence; and to these personal relations correspond the relations between his and the three other Gospels.

II. *Gospel.*—The testimonies of the Fathers relative to our second canonical Gospel are nearly unanimous with respect to the following three points: (1) That it was composed by the evangelist Mark; (2) that Mark wrote it from the narrations which he heard from the lips of Peter in the churches which he visited together with him; (3) that it was written at Rome, and on the demand of the Christians of that capital. With respect to the first point, it follows from the title, "according to Mark," which title the work must have received at the time when the collection of our Gospels was made; that is, at the latest, in the first half of the second century. With respect to the second point, we will only quote the tradition given by Papias, and by him received from an ancient presbyter of Palestine called John, who by some is identified with the apostle St. John: "Mark, having become the secretary of Peter, wrote down exactly all that he remembered of the words and deeds of Christ, though not in order. For he had never himself heard or accompanied the Lord, but, as above mentioned, he accompanied Peter, and Peter made his narrations according to the demands of the moment, and not for the purpose of giving a complete exposition of the discourses of the Lord. Thus Mark has made no fault in writing down the facts detached as he remembered them, simply wishing not to omit anything of what he had heard, nor to alter it." With respect to the third point, the composition of the Gospel as having taken place at Rome, we have a detailed testimony in two passages of Clement of Alexandria, of which we give this one: "As Peter preached the Gospel publicly at Rome, and stated several words of Christ in the presence of a number of prominent men, these desired to keep firmly in their memory what they had heard, and applied to Mark, the companion of the apostle, who afterward wrote those accounts, which are called the Gospel according to Mark." The contents of the Gospel itself confirm these three points. To begin with the last: (1) Is it not evident that the second Gospel was written for Christians of pagan origin, since it omits throughout the evidence of the Messiahship of Jesus drawn from the prophecies of the Old Testament, and gives explanations of Jewish customs unnecessary to Christians of Hebrew origin? The most striking example is found in Mark vii. 1–4, especially when compared with Matt. xv. 1–2, destined for converted Jews. Furthermore, is it not evident that these Christians were of Latin origin, since Mark always prefers Latin terms, Hellenized, to the Greek terms, and in the account of the poor widow even transfers the Greek money into Roman (xii. 42), which Luke does not? Does it not follow from the notice relating to Simon of Cyrene, "the father of Alexander and Rufus" (xv. 21), that these were Latin readers, since Rufus was a member of the church of Rome (Rom. xvi. 13), and this small detail could interest none who were not personally acquainted with the members of the family? (2) It is as incontestable that the statements of Peter must have served as a basis for the work. A multitude of small details betray the remembrance of an eye-witness: "And he was in the hinder part

* This is perhaps the reason why the *Philosophumena* call him the κολοβοδάκτυλος, the "stump-fingered," though it would be possible to explain this surname from the mutilated state of the last part of his Gospel.

* Eusebius, *Historia Ecclesiastica*, ii., 24.

of the ship, *asleep on a pillow*" (iv. 38); "and he, *casting away his garment*, rose, and came to Jesus" (x. 50); "*And when he had looked around about on them with anger*, being grieved for the hardness of their hearts, he saith unto the man" (iii. 5); "*And looking up to heaven, he sighed*, and saith unto him" (vii. 34); "*Then Jesus beholding him, loved him*" (x. 21). Who else but an eye-witness, quite near Jesus, and observing with deep interest his impressions, can have seized this flash of love in his eye and introduced such a feature in the narrative? The same conclusion follows from the Aramaic expressions which Mark inserts, such as *Abba*, *Talitha-cumi*, etc. The narrator reproduces the very words of the Lord, whose voice he seems to hear; but this witness so intimate can not be he who among the disciples loved Jesus most; it must be he who admired him most. Throughout the whole narrative he strives at one aim only —to impress the reader with that admiration which penetrated all who came in contact with Jesus; and all people were *amazed* and *filled with fear*, etc., are expressions common throughout the whole narrative, but such expressions make us immediately think of Peter, the passionate admirer and enthusiastic confessor of Christ. Of whom else could we think when reading the scene between Jesus and his disciples at Cæsarea Philippi (viii. 27–33)? Our evangelist here reports the crushing words of Jesus to Peter: "Get thee behind me, Satan; for thou savorest not the things that be of God, but the things that be of men"; but he omits the honoring words which preceded immediately, "And I say also unto thee, that thou art Peter, and upon this rock I will build my Church"—two traits which are closely connected in the account of Matthew (xvi. 13–23). Such a manner of narrating must either proceed from Peter himself or from a declared enemy of his; the latter supposition would be absurd. It is also in this Gospel alone that we find mentioned the crowing of the cock twice, a little trait which makes the denial of Peter still more inexcusable. In the Acts (x.) we find a specimen of Peter's manner of teaching while founding or traveling in order to build up the churches. This speech of the apostle at Cornelius is a sketch of the history of Jesus, exactly such as it is developed into details in our second Gospel; it is, indeed, as it has sometimes been called, the Gospel of Mark in a nutshell. (3) The authorship of Mark might be inferred from the two following facts, even if we had no tradition: First, the style of our Gospel is so absolutely different from that of the First Epistle generally attributed to Peter that even though the statements belong to Peter the narrative must have proceeded from another; next, in his Epistle, Peter calls Mark his son, thus designating him as his spiritual heir, with whom he had deposited his most precious treasure, his personal acquaintance with Jesus. The resemblance between this work and those of Matthew and Luke has been opposed to the explanation of the origin of Mark's Gospel which we have given, as if he had drawn his narration from them. The freshness and originality of his work forbid us to suppose that he had used those of the two others; but ought not the problem to be solved in quite a different manner? An apostolical tradition concerning the acts and discourses of Jesus was formed at Jerusalem, first in Aramaic and then in Greek, and on account of its purity and simplicity immediately received a fixed form, which was reproduced nearly identically in the reports of the apostles and evangelists. It is this narrative—so to speak, stereotyped—which constitutes the foundation of our first three Gospels, and it is from this the striking resemblance between Matthew and Mark arises. Matthew first wrote down this tradition at Jerusalem; Peter reproduced it in the churches through oral recital, introducing only such minor significant details as sprang from his personal remembrance. Thus the double fact which we have indicated may be easily explained; on the one hand, the common foundation for Mark and Matthew; on the other, the small picturesque features which characterize the narrative of the former. Klostermann supposes that Mark wrote with the work of Matthew before him, but such a supposition materializes the relation between the two evangelists in a manner open to very serious objections, from which our explanation is exempted. If Mark wrote, or began to write, his Gospel at Rome, it dates from the year 64 or 65, which date corresponds to a remark with which he interrupts the discourse of Jesus on the destruction of Jerusalem (xiii.). In the passage indicating the signs which shall show to the Christians of Judæa the moment when they must flee in order to escape from the catastrophe which threatens the country, Mark, like Matthew, interrupts the discourse of Jesus in order to fix the attention of the reader on the importance of the indication: "Let him that readeth understand" (14). This remark, which no doubt was used when the discourse was repeated in the churches of Palestine, proves that the present form of the discourse belongs to the time before the destruction of Jerusalem. At all events, the notice relating to the two sons of Simon of Cyrene shows that they were personally known to those for whom the Gospel was destined, and that the composition of the work thus belongs to the time of the apostles. The end of the second Gospel, from verse 9 of chapter xvi., is lacking in the oldest manuscripts (*C. Sinaiticus* and *C. Vaticanus*), and even the Fathers mention this gap. How is it to be explained, and whence is derived the traditional termination of the Gospel? Did Mark die before finishing the work, or has the last leaf of his manuscript been lost? Has another ecclesiastical writer finished the narrative? Surely Mark could not stop with the word γάρ, with which the eighth verse terminates. Furthermore, an angel had promised an apparition of Jesus, and the author must have had the intention of narrating it. Is it not possible that it was the persecution of Nero during the sojourn of Peter at Rome in 64 which caused the interruption of the work of Mark, and that an incomplete copy remained at Rome, whence the manuscripts having no conclusion, while the copy which Mark carried along with him was completed afterward, and hence the form which has finally prevailed in the Church? As to *the plan* of the work, which Papias found inconsistent with the historical order, it seems very natural, on the contrary, from our point of view. The author having placed Jesus in the center of his activity at Capernaum, shows us how this activity expands in every direction through excursions more and more prolonged, though at the end of each excursion the Lord always returns to Capernaum.* His final departure for Jerusalem thus appears as his last missionary voyage. The Gospel of Mark is the most picturesque delineation of the ministry of Jesus in its office of evangelization; and the first and the last words of the work confirm this view: "The beginning of the Gospel of Jesus Christ, the Son of God" (i. 1); "And they went forth, and preached everywhere, the Lord working with them, and confirming the word with signs following" (xvi. 20). Thus from heaven Jesus still continues through his apostles that office of evangelization which he filled himself so faithfully during his ministry on earth. See Godet, *The Origin of the Four Gospels*, in his *Studies on the New Testament*. FRÉDÉRIC GODET.

Markell, CHARLES FREDERICK: See the Appendix.

Market: the meeting together of people for the purpose of buying and selling commodities; secondarily, the place where such meeting is held, and in a more general sense the region or locality where anything is or may be bought or sold. The need of assembling in order to exchange commodities arose as soon as man emerged from the savage state—that is, as soon as the division of labor began to diversify production. During the Middle Ages the markets and FAIRS (*q. v.*) afforded the only means for the exchange of goods, the retail shop being an institution of modern growth. The market, as well as the fair, from which it is distinguished by its local and more permanent character, was subject to the complicated regulative system that characterized the economic policy of mediæval towns. The principle of *justum pretium*, or fair price—that the state should fix the price in the interest of the individual—expressed itself in numerous restrictions, such as the laws against forestalling or buying goods on their way to market with a view to enhancing their price, and against the kindred offenses of regrating and engrossing, which were nothing more than the ordinary operations of retail trade. These and other restraints on trade have been swept away with the rise of the modern commercial spirit and the doctrine of *laissez faire*. With the increase of trade, too, the market ceased to be the sole place in the town for purchase and sale, as the scattered shops of retail dealers performed many of its functions, and the markets of modern towns confine themselves as a rule to the sale of certain classes of goods. As a result, they are no longer the important source of profit to the state that they were in the Middle Ages, when the levying of market tolls was one of the most lucrative ma-

* Ch. i. 21–45; ii. 1–v. 20 (Gadara, E.); v. 21–vi. 52 (Bethsaida and Julias, N.); vi. 53–viii. 21 (Phœnicia, N.); viii. 22–ix. 50 (Cæsarea Philippi, N.); x. *seq.* (Peræa and Jerusalem).

norial rights. In the U. S. markets have not been such important features of town life as in Europe, because of the comparatively recent settlement of the country, nor can the market buildings be compared with the solid and imposing structures common in the older communities. The term is often used by political economists in a technical and restricted sense as applying to a single group of exchangers and to a particular article of uniform quality, as when it is said that there can be but one price for a given commodity at any time in the same market. The statement would be obviously untrue if the term market as here used included wholesalers, retailers, and importers, and referred to several grades of the article sold. F. M. Colby.

Market Overt [from O. Fr., liter., open market]: an open and public market, legally constituted by charter or prescription. In the country the boundaries of each market-place are defined, and the market-days are fixed. In the city of London, every day except Sunday is a market-day, and every shop in which goods are exposed publicly for sale is a market overt for such things as the owner ordinarily sells there. By English common law, the *bona-fide* purchaser of goods in market overt gets a valid title to them, although his vendor had neither title nor authority to sell. This exception to the general rule, that no one can give a better title to goods than he has, never obtained recognition in Scotland nor in the U. S. Even in England the tendency of courts and Parliament has been to limit its application. It never protected the purchaser of goods belonging to the crown, nor one acting in bad faith, nor one who began or completed the treaty of sale out of the fixed limits of market overt, nor one buying between sunset or sunrise. The courts have uniformly insisted that transactions are not to have the benefit of the market overt exception, unless they have been so conducted "as to give the fullest opportunity to the man whose goods have been taken to make pursuit of them, and prevent their being sold." Hence it has been held that a sale by sample in a market overt is not within the exception, nor a sale to a London shopkeeper of goods in which he dealt, nor a sale by him in a show-room over his shop to which customers were only admitted on special invitation. Moreover, as this exception exists for the benefit of the innocent purchaser, an innocent vendor of goods without a valid title in market overt can not take advantage of it, but is liable to the rightful owner for conversion.

As early as 1555 a statute was passed regulating the sale of horses in market overt, and providing that the property in them should not pass, as against the true owner, unless the prescribed requirements were complied with. Other statutes provide that property, though sold in market overt, shall revest in the true owner, upon the conviction for felony or misdemeanor by or on behalf of such owner of the person stealing, taking, obtaining, extorting, embezzling, converting, or disposing of the property. This legislation extends to property obtained by any criminal method, the early common-law rule that in the case of stolen goods the plaintiff in a proceeding by appeal, in which he established the theft, was entitled to their restitution, though they had been sold in market overt. It has been held that these statutes apply to chattels which have been intentionally transferred by the true owner to one obtaining the transfer, pursuant to a contract of sale, itself obtained by an indictable fraud, and sold by the latter in market overt to an innocent purchaser. (*Bentley* vs. *Vilmont*, 12 Appeal Cases 471.) Such legislation has gone far toward nullifying the peculiar rule governing sales in market overt, but has been modified to some extent by the Sale of Goods Act, 1893 (56 and 57 Vict., cap. 71). For rules laid down in modern European codes, see Possession. Francis M. Burdick.

Markham, Charles Edwin: See the Appendix.

Markham, Clements Robert: traveler, geographer, and historian; b. at Stillingfleet, Yorkshire, England, July 20, 1830. He was educated at Westminster; entered the navy as a cadet in 1844; served in the Pacific squadron, attaining the rank of lieutenant; and in 1852 accompanied an Arctic expedition in search of Sir John Franklin. Leaving the navy, he traveled in Peru 1852–54; and in 1860 visited Peru and India as commissioner to introduce cinchona-plants into the latter country. He accompanied the Abyssinian expedition as geographer 1867–68. Mr. Markham has held various positions in the Government departments, and was appointed assistant secretary of the India office in 1867, taking charge of the geographical department in 1868. Among his numerous works are *Franklin's Footsteps* (1852); *Cuzco and Lima* (1856); *Travels in Peru and India* (1862); a *Quichua Grammar and Dictionary* (1863); *History of the Abyssinian Expedition* (1869); *Peruvian Bark* (1880); *The War between Peru and Chili* (1882); *The Threshold of the Unknown Region* (relating to Arctic exploration, 1874); a *Sketch of the History of Persia* (1873); and *History of Peru* (1892). As secretary of the Hakluyt Society he has edited a number of its editions of old works, principally relating to Peru and the Amazon; he has been secretary of the Royal Geographical Society, and has contributed to its publications; edited *Ocean Highways*, a monthly publication merged in 1874 into *The Geographical Magazine*; and from 1871 wrote the valuable annual reports on the *Material Progress of India*. His studies on Peru are particularly valuable.

Herbert H. Smith.

Markland, Jeremiah: classical scholar; b. at Childwall, England, Oct. 29, 1693; studied in London and Cambridge. For many years a traveling tutor, he lived a life of scholarly leisure after 1743. D. at Milton, in Surrey, July 7, 1776. Apart from valuable text critical emendations to Lysias and Euripides, two of whose plays he edited, he is now chiefly known for his learned edition of the *Silvæ* of Statius and for his *Remarks on the Epistles of Cicero to Brutus*, whose authenticity he denied, thus starting a famous controversy, which has now been definitively settled in favor of their genuineness. Markland also condemned Cicero's orations *Post reditum in senatu*, *Ad Quirites*, *pro domo*, and the *De haruspicum responsis* as spurious, which hypercritical verdict subsequently found an ingenious but equally unsuccessful champion in F. A. Wolf. Alfred Gudeman.

Marks, Henry Stacy: genre and decorative painter; b. in London, Sept. 13, 1829. He was a pupil of the Royal Academy, London, and of Picot, Paris; was elected a Royal Academician in 1878. Among his pictures are *St. Francis Preaching to the Birds* (1870) and *Hermit and Pelicans* (1888). D. Jan. 10, 1898. W. A. C.

Marl: See Limestone.

Marlborough: city (incorporated in 1890); Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); on the Fitchburg and the N. Y., N. H. and Hart. railways; 15 miles E. of Worcester, 25 miles W. of Boston. It is in a choice fruit-growing region; contains Lake Williams, covering 73 acres, city-hall which cost $85,000, a public library with over 12,000 volumes, Unitarian parish library founded in 1847, soldiers' monument, gas and electric light plants, electric street-railway, 2 national banks with combined capital of $300,000, a savings-bank, and a daily, a monthly, and 4 weekly newspapers, and is widely noted for its extensive manufacture of boots and shoes. Pop. (1880) 10,127; (1890) 13,805; (1900) 13,609. Editor of "Times."

Marlborough, John Churchill, First Duke of: soldier and statesman; b. at Ashe, Devonshire, England, June 24, 1650, son of Sir Winston Churchill, who obtained for him shortly after the Restoration an appointment as page to the Duke of York, afterward James II. About the same time his sister Arabella was appointed maid-of-honor to Anne Hyde, Duchess of York, and soon became mistress to the prince. It was probably to this circumstance that young Churchill was indebted for rapid promotion in the army, which he entered in 1767 as ensign in the Guards. In 1672–77 he served with the rank of captain of Grenadiers in the corps sent to co-operate with France against Holland, and distinguished himself at the sieges of Nymwegen and Maestricht, attracting the attention of Turenne and of Louis XIV., by whose favor he was promoted to the rank of colonel. At the Peace of Nymwegen (1678) he returned to England, received a lucrative position in the household of the Duke of York, and increased his influence at court by marriage with Sarah Jennings, maid-of-honor to the Duchess, celebrated for her beauty and talent, who had been the most intimate friend of the Princess Anne from childhood. He now became the constant and favorite companion of the Duke of York, his confidant in his intercourse with Charles II. and with the King of France, to whom he was sent repeatedly on secret missions. He was created Baron Churchill of Aymouth in the peerage of Scotland in 1682, and in the following year was given the command of the only regiment of Dragoons then existing in England. On the death of Charles II., Churchill was sent as ambassador to Louis XIV., to announce the accession of James (Feb., 1685), as well as to sue for a continuance of the French king's friendship, alliance, and subsidies. On his return from this successful

negotiation he was created brigadier-general and Baron Churchill of Sandridge in the English peerage, rendered good service in the suppression of Monmouth's rebellion, and was advanced to major-general. He did not scruple, however, when the follies of James rendered his downfall imminent, to enter into treasonable correspondence with the Prince of Orange, nor to desert with many of his officers to the invading army (1688) at the critical moment. He received the reward of his baseness in the earldom of Marlborough (Apr. 9, 1689) and a commission as lieutenant-general; was in command of the English forces in Flanders (1689) and in Ireland (1690), where he captured Cork and Kinsale, but in 1692 was suddenly dismissed from all his official posts and thrown into the Tower in consequence of the partial discovery of treasonable intrigues with the exiled king. He was soon released from prison, but not restored to favor, and spent the ensuing years of the reign of William in false protestations of loyalty, soliciting military command while carrying on secret correspondence with James, and employing every artifice to strengthen his favor with Anne as the probable successor to the throne. In 1698 William so far restored Marlborough to favor as to appoint him governor to Anne's infant son, the Duke of Gloucester. On the accession of Anne (1702), Marlborough, who had recently been employed in military and diplomatic service in Holland, became at once the most influential subject of the new queen, since to his own favor at court was added that of Lady Marlborough, and that of his son-in-law Godolphin, who became Prime Minister. He was at once intrusted with the chief command of the armies of the formidable alliance then combined against France. His subsequent history for several years is merged in the military annals of England, and may be summarized as consisting of an extraordinary series of victories and a no less remarkable succession of rewards and honors. The capture of Liège (Oct. 29, 1702) brought him the dukedom of Marlborough and the thanks of Parliament; other successes were afterward recognized by the grant of the celebrated manor of Woodstock, on which Blenheim Palace was erected at the expense of Government. With the aid of Prince Eugene he terminated the campaign of 1704 by the important victory of Blenheim (Aug. 13). In the following years he gained the notable battles of Tirlemont (July 18, 1705), Ramillies (May 23, 1706), Oudenarde (July 11, 1708), Tournay (July 28, 1709), Malplaquet (Sept. 11, 1709), and Bouchain (Sept., 1711); was made a prince of the German empire; was rewarded by a magnificent pension (£5,000) by act of Parliament of 1706. Marlborough returned to England in Oct., 1711, but was charged with peculation shortly after, and the duchess having fallen from Anne's favor in the same year, the Tory ministry of Harley succeeded to power. Marlborough was dismissed from all his offices Jan. 1, 1712, and retired to Germany, where he became an energetic partisan of the Hanoverian succession; returned to England at the accession of George I. (1714), by whom he was restored to his offices and honors. He rendered prompt service in the direction of the campaign of 1715 against the Pretender, passed the remainder of his life in quiet enjoyment of his immense wealth, died at Windsor Lodge, June 16, 1722, and was buried in Westminster Abbey. He left no son, but the title has been perpetuated through the descendants of his second daughter. Through the brilliancy of his military genius Marlborough long found apologists as well as admirers among the historians of England, but the bare recital of unquestioned facts convicts him of numerous treasons under aggravated circumstances of ingratitude. Due justice was first meted out to him from this point of view in Lord Macaulay's celebrated *History of England*. His great military and political talents were intuitive, as his education was extremely limited. The Duchess of Marlborough survived until Oct. 18, 1744, having lived long enough to discern the rising greatness of the elder Pitt, to whom she bequeathed £10,000. See Murray's *Letters and Despatches of Marlborough* (5 vols., 1845–46); Coxe's *Memoirs* (3 vols., 1817–19); Alison's *Life* (2 vols., 1847); and Saintsbury's *Marlborough*, in the series English Worthies (1885).

Revised by C. K. Adams.

Marlborough Dog: See Blenheim Dog.

Marlin: town; capital of Falls co., Tex. (for location of county, see map of Texas, ref. 3–I); near the Brazos river; on the Hous. and Tex. Cent. Railroad; 97 miles N. E. of Austin. It is in an agricultural and stock-raising region, and has two weekly newspapers. Pop. (1880) not in census; (1890) 2,058; (1900) 3,092.

Marlitt, E. (pseudonym for Eugenie John): novelist; b. at Arnstadt, Germany, Dec. 25, 1825; went in 1842 to Vienna in order to study singing. She met with much success as a singer, but soon lost her voice, and became companion to the Princess of Schwarzburg-Sondershausen, who had assisted her in obtaining her education. She remained with the princess until 1863, and then began to publish novels in *Die Gartenlaube*, an illustrated journal. Her novels, *Goldelse* (1867), *Das Geheimniss der alten Mamsell* (1868), *Reichsgräfin Gisela* (1869), *Das Heideprinzesschen* (1872), *Die zweite Frau* (1874), *Im Hause des Commerzienraths* (1877), *Im Schillingshof* (1879), *Amtmanns Magd* (1880), *Die Frau mit den Karfunkelsteinen* (1885), reached a number of editions. She gained her popularity both by her clever narrative style and by cautiously appealing not only to the sentimentality but also to the lower instincts of a class of readers who cared little for the higher demands of art. D. June 22, 1887.

Julius Goebel.

Marlowe, Christopher: dramatist; b. at Canterbury, England, about 1564; studied at King's School, Canterbury, and at Corpus Christi College, Cambridge, and graduated 1583; produced upon the stage in 1586 the first part of his tragedy of *Tamburlaine*, which, though filled with extravagant flights, exhibited more poetic genius and better dramatic combination than any previous English play. In 1588 he brought out his *Tragical History of the Life and Death of Dr. Faustus*. A second part of *Tamburlaine* was added in 1590, and he wrote two other plays, *The Jew of Malta* and *Edward II.* Several anonymous dramas are generally attributed to Marlowe, and by many critics he is believed to be the author of the second and third parts of *Henry VI.*, included in Shakspeare's works. He also made translations from Ovid, and wrote the first portion of a narrative poem, *Hero and Leander*, which was completed by George Chapman. He died from a wound received in a quarrel at Deptford, June 16, 1593. The best edition of his works is that of Dyce (3 vols., 1850). See English Literature.

Revised by H. A. Beers.

Marmier, măr'mi-ā', Xavier: writer; b. at Pontarlier, Doubs, France, June 24, 1809; engaged in journalism and various literary enterprises, and spent a large portion of his time in traveling. He visited Switzerland and Holland in 1830, Germany 1832, the Scandinavian countries 1836–38, Russia 1842, the East 1845, Algeria 1846, and America 1849. In 1846 he was appointed librarian at the library of St. Geneviève, in Paris, and in 1870 he was elected a member of the Academy. Besides translations of dramas by Goethe and Schiller, novels by Hoffmann, Scandinavian folk-lore, etc., he published *Histoire de l'Islande* (1838); *Langue et littérature islandaises* (1838); *Histoire de la littérature en Danemark et en Suède* (1839); *Lettres sur la Russie, la Finlande et la Pologne* (2 vols., 1843); *Du Rhin au Nil* (1846); *Lettres sur l'Amérique* (1852, 2 vols.); *Lettres sur l'Adriatique et Monténégro* (1854); *Voyage en Suisse* (1861); *Les voyages de Nils à la recherche de l'idéal* (1869); *Les États-Unis et le Canada* (1874); *Nouveaux récits de voyages* (1879); *Voyages et littérature* (1888); and some novels: *Les fiancés du Spitzberg* (1858); *Gazida* (1860); *Les Hasards de la Vie* (1869); *Cimarosa* (1867); *Les drames du cœur* (1868); *Une grande dame russe* (1876). He has also published some volumes of verse: *Esquisses poétiques* (1830); *Poésies d'un voyageur* (1841). D. in Paris, Oct. 11, 1892.

A. R. Marsh.

Mar'mol, José: author; b. in Buenos Ayres, Argentine Republic, about 1818. He was proscribed during the dictatorship of Rosas, and spent many years in exile, traveling extensively in South America; in the civil wars which led to the expulsion of Rosas he took an active part; subsequently was senator and deputy to congress from Buenos Ayres, and was director of the national library. His works include many poems, several dramas, and *La Amalia*, a romance of the time of Rosas; this has been translated into French and German. D. in Buenos Ayres, Aug. 12, 1871. A volume of his poetical and dramatic works was published in Paris in 1875.

Herbert H. Smith.

Marmont, măr'mōṅ', Auguste Frédéric Louis Viesse, de, Duke of Ragusa: marshal of France; b. at Chatillon-sur-Seine, department of Côte-d'Or, France, July 20, 1774, received a military education; was aide-de-camp to Napoleon in 1796; accompanied him to Egypt; was made general of division after the battle of Marengo, commanded the forces in Dalmatia, 1806 to 1809; joined the great army the day before the battle of Wagram, and was made a marshal on the battle-field of Znaym; served in Portugal and Spain

in 1811–12, where he lost the battle of Salamanca (July 22, 1812) and was severely wounded. In 1814 he commanded the troops in and around Paris, and compelled Napoleon to abdicate by evacuating the capital and entering into negotiations with the allied powers. For this reason Napoleon excluded him, on his return from Elba, from the general amnesty, and he was compelled to flee, while afterward Louis XVIII. made him a peer of France and loaded him with honors. He lived mostly in retirement, until in 1830 Charles X. called him to Paris to quell the revolution of July. In this he failed, and so great was the indignation he excited that his name was struck from the lists of the French army. Afterward he resided mostly in Vienna. D. at Venice, Mar. 2, 1852. His *Mémoires* (9 vols., Paris, 1856–57) are important for the history of his time.

Marmontel, măr'mōñ-tel', Jean François: author; b. at Bort, in Limousin, France, July 11, 1723. He studied to enter the Church, but his taste for letters drew him away, and under the patronage of Voltaire he went to Paris (1745) to live by his pen. He began with journalism and the drama, winning success with the tragedies *Denys le Tyran* (1748) and *Aristomène* (1749). In 1753 he became *secrétaire des bâtiments* at Versailles; in 1758 and 1759 edited the *Mercure*; passed eleven days in the Bastile for a political satire in 1760; was in 1763 chosen to the Academy, of which he became in 1783 permanent secretary. D. Dec. 31, 1799. He wrote much, and some of his tragedies, his *Contes moraux* (1761), the novels *Bélisaire* (1767), one chapter of which was condemned as heretical by the Sorbonne for its plea for religious toleration, and *Les Incas* (1778), had an immense popularity. Of more permanent value are his *Poétique française* (1763), his contributions to the *Encyclopédie*, collected as *Éléments de Littérature* (1787), and his *Mémoires*. His *Œuvres* were collected in 1786–87 in 17 vols. Tourneux has given a good edition of his *Mémoires* (3 vols., Paris, 1891).

A. G. Canfield.

Mar'mora, or Marma'ra, Sea of (anc. *Propontis*): a body of water which separates European from Asiatic Turkey, and communicates with the Black Sea by the Strait of Constantinople, or Bosphorus, and with the Ægean Sea by the Strait of the Dardanelles (anc. *Heltespont*). It is 135 miles long and 45 miles broad. The island of Marmora, in this sea, is famous for its fine marble and alabaster.

Mar'moset [from Fr. *marmouset*, queer little figure, ugly little boy < Low Lat. *marmore'tum*, marble figure, deriv. of Lat. *mar'mor*, marble. See Marble]: a name applied to various small South American monkeys of the family *Mididæ* and genera *Hapale*, *Midas*, etc. They are the nearest of all the true monkeys to the Prosimiæ or lemurine Quadrumana. The thumbs are not opposable, nor is the tail prehensile. Their nails are long and sharp. These creatures are harmless, affectionate, and often very beautiful. They are, however, very delicate, and in cool climates soon die if exposed. The *Hapale jacchus* is one of the best-known species.

The marmoset.

Mar'mot [= Fr., ape, grotesque little figure, child (as term of endearment), marmot; cf. O. Fr. *merme*, little, and Fr. *marmaille*, troop of children; all < derivs. of Lat. *minimus*, least]: a name given to the larger rodent mammals belonging to the squirrel family. The typical species of marmot is *Arctomys marmotta*, the European marmot, which is abundant in the Alps. The Old World has several other species. The best-known American species is *Arctomys monax*, the woodchuck or ground-hog, which is very abundant E. of the Mississippi. Its flesh is sometimes eaten, but is not good. Its fur is not of much value. The Pacific coast region has several species. (See Sciuridæ.) Closely akin to the marmots are the prairie-dogs (*Cynomys*), which some, indeed, include in the genus *Arctomys*, to which the marmots belong. See Prairie-dog.

Marne: department of France, along the Seine and the Marne. Area, 3,159 sq. miles. In the southern part the soil is very fertile and much grain is raised; the northern part is chalky and sandy, but produces excellent wine, among which are several varieties of the famous champagne wine. Sheep of a good breed are reared here, and a great number of millstones are quarried. More than three-fourths of the total area is arable land. The principal manufactures are of woolens produced in the vicinity of Reims, and consist of flannels, merinoes, tartans, shawls, etc. Pop. (1896) 439,577. Capital, Châlons-sur-Marne.

Marnix, Philipp, van: theologian, diplomatist, and author; baron of Sainte-Aldegonde; b. in Brussels, 1538; was educated in Geneva under Calvin and Beza; in the Netherlands from 1560 to 1568 worked against Spanish political and religious tyranny; was exiled with William of Orange, whose praises he sang in his *Wittiam's Lay*. In 1573 he was a prisoner of the Spaniards. He played a prominent part in politics, but for a time was under suspicion for his dealings with the French. In 1583–85 he was burgomaster of Antwerp, and it was laid to his charge that the city surrendered to the Spaniards in the latter year without stipulating for religious liberty. During the rest of his life he lived quietly upon his estates. He died in Leyden, Dec. 15, 1598, whither he had gone to superintend a translation of the Bible into Dutch. His complete works appeared Brussels 1857–59, 7 vols., and his theological writings at The Hague 1871–78, 2 parts. Among his works may be mentioned his rhymed version in Dutch of the Psalms (1591); his *Traicté du Sacrement de ta Saincte Cene du Seigneur* (Leyden, 1599), and his satire on the Roman Church, *De Biencorfs der hetige roomeche keerke* (1569; n. e. under name of T. Fischarts, by J. Eiselein, St. Gallen, 1847). See his *Life*, by E. Quinet (Brussels, 1854); and by the Roman Catholic Alberdink-Thijm (Haarlem, 1878).

Samuel Macauley Jackson.

Maroa: city; Macon co., Ill. (for location of county, see map of Illinois, ref. 6–E); on the Ill. Cent. and the Vandalia line railways; 13 miles N. of Decatur, the county-seat. It is in an agricultural region, and has several large grain warehouses, grain elevator, flour-mills, library association (founded in 1870), and two weekly newspapers. Pop. (1880) 870; (1890) 1,164; (1900) 1,213.

Marocco: state of Northwest Africa. See Morocco.

Marochetti, măă-rō-ket'tĕĕ, Carlo, Baron: sculptor; b. at Turin, Italy, in 1805, naturalized and educated in France; began his studies under Bosio; visited Italy, and exhibited in 1829 in Paris a group, *A Girl Playing with a Dog*, which attracted much attention. He resided in Paris and produced many works, and after 1848 removed to London, where he died in 1867. His principal works are an equestrian statue of Emmanuel Philibert at Turin and a colossal statue of Richard Cœur-de-Lion in London, besides busts and statues of Prince Albert, the Queen, etc. His sculpture was popular, striking, full of lively interest and vigor of treatment, but it was extremely defective in technical and sculpturesque qualities.

Maroní, măă-rō-nee', called Marowijne by the Dutch: a river of Guiana, separating the Dutch from the French colony. It rises in the highlands near the frontiers of Brazil, takes a general northerly course and empties into the Atlantic after a course of about 425 miles. Seagoing vessels can ascend to the Armina fall, 50 miles from the mouth, and above that there are considerable stretches of navigable water. The lower portion is in parts nearly a mile wide, and the banks are covered with heavy forest. The region about the upper river is inhabited only by Indians and maroon Negroes. Gold is obtained in considerable quantities about the lower

falls. The Cottica channel forms a navigable waterway between the lower Maroní and the Surinam, parallel to the coast. HERBERT H. SMITH.

Mar'onites: a Christian people of Syria who take their name from their first monothelitic bishop, John Maron or Maro, who died 701 A. D. Their number is estimated at from 200,000 to 250,000. They live chiefly in the north part of the Lebanon, but are found also all over the Lebanon and the Anti-Lebanon, with a few in the larger cities of Syria. They are Roman Catholics of the SYRIAN RITE (*q. v.*). They have a patriarch who lives at Canubin, a monastery near the foot of Lebanon, but who bears, in common with five other dignitaries, the title of Patriarch of Antioch. They have also metropolitans of Tyre, Damascus, Aleppo, Tripoli, and Cyprus, besides seven bishops. They were anciently monothelites, but having joined in the second crusade against the Saracens, in 1182 renounced their heresy before the Latin Patriarch of Antioch, Aimeric III. In 1445 they were more formally united to the Roman Catholic Church. They are hospitable toward all Christians; have since 1840 been deadly enemies of their neighbors, the Druses; speak Arabic or Greek; consider the Syriac their sacred language, and make use of Syro-Chaldæan books, which they do not understand. Their secular clergy may marry before ordination, and the Eucharist is administered under both kinds. They have a great number of celibate monks and nuns, who follow the rule of St. Anthony, take no vows, but fast often, and never eat meat. The Maronites suffered much from the Druses, who are far inferior to them in numbers, and who were, it appears, the injured party at the origin of the bloody war of 1860.

Maroons' [from Fr. *marron* (in *nègre marron*, with clipping of *ci-*), from Span. *negro cimarron* (from *cimarron*, wild, fugitive), lit., fugitive Negro]: a name formerly used in Jamaica for runaway slaves and their descendants. It has been applied to a similar class in Guiana, where, however, they are generally known as bush Negroes. See GUIANA and JAMAICA. H. H. S.

Maros': a river of Europe which rises in Transylvania, near the frontier of Moldavia, flows in a western direction into Hungary, and joins the Theiss opposite to Szegedin, after a course of about 400 miles, for the greater part of which it is navigable.

Marot, mȧȧ'rō', CLÉMENT: poet; b. at Cahors, France, in 1495 (1497?). His father, Jean Marot, was a poet and *valet de chambre* of Francis I. At the age of ten he was taken to Paris, and later entered the *basoche* to study law, but left it soon to become page in the service of Nicolas de Neuville, Seigneur de Villeroy. His poetical talent was already declaring itself in translations and imitations from Latin poets and in light verses. In 1515 he dedicated an allegorical poem, the *Temple de Cupidon*, to Francis I., at whose recommendation he was attached to the suite of his sister, Marguerite d'Angoulême (1519). He accompanied the king in the field in 1520 and took part in the Italian campaign ending in the batte of Pavia (1525), in which he was wounded and taken prisoner. Soon released, he returned to France, fell under the suspicion of holding Protestant opinions, and, though he vigorously denied them, was thrown into the Châtelet. By the friendly intervention of the Bishop of Chartres he was transferred to Chartres, where his confinement was freed of all hardship. During it he composed *L'Enfer*, a satire on his imprisonment in the Châtelet. He was set at liberty by Francis I. (1527), but was soon in prison again for aiding the escape of a prisoner; an epistle in verse to the king again freed him. Meanwhile his father died, and he succeeded to his place as *valet de chambre* of the king. In 1532 a selection of his epistles, elegies, and other verses was published with the title *Adolescence Clémentine*, and was followed the next year by a second. His relations with Protestants, and probably his own unguarded speech, subjected him again to the suspicion of heresy, and he fled to the court of his patroness, Marguerite, now Queen of Navarre (1534), and, insecure even there, crossed into Italy and took refuge first at Ferrara and then at Venice. He returned to Lyons in 1536, where new difficulties awaited him in the quarrel which an inferior rival, Sagon, brought upon him. This ended to his advantage, and he again enjoyed court favor till 1543, when his translation of the first fifty Psalms, at first encouraged by Francis I., was condemned by the Sorbonne; but his translation was completed by Beza, and is used in the French Protestant churches. He fled to Geneva, but gave offense to the austere society there, and went to Turin, where he died in 1544. Besides writing original verse, he edited the *Roman de la Rose* and the poems of Villon. He is easily the foremost poet of his time, but it is not depth and seriousness that recommend him, but vivacity, sprightly wit, agile grace, and *esprit gaulois*. At first following in the steps of the rhetorical school, he later freed himself from its pedantic Latinizing tendency, felt the influence of Villon, and achieved a simple, easy, and fluent style that was like the familiar vernacular. He used the old forms of the ballade and the rondeau with effect, but excelled in his elegies, eclogues, and epistles, the last of which, especially by their qualities of grace, lightness, and badinage, have fixed upon this manner the name *style marotique*. His works were collected in 1538 (4 vols.), and more completely in 1544 (4 vols.). Recent editions are by Jannet (4 vols., Paris, 1868–72), and B. Pifteau (4 vols., Paris, 1884). A very thorough edition in six volumes was begun by G. Guiffrey (vol. ii., 1876; vol. iii., 1881). A very valuable edition of Marot's *Œuvres choisies* has been published by E. Voizard (Paris, 1890). See the *Life* of Marot, by Douen (2 vols., Paris, 1878–79). A. G. CANFIELD.

Mar'quardt, JOACHIM: classical scholar; b. in Dantzic, Germany, Apr. 19, 1812; studied from 1830–34 in Berlin and Leipzig; was director of a gymnasium in Gotha, where he died Nov. 30, 1882. He was widely known as the author of the *Römische Staatsverwaltung* (2d ed. 1881) and *Privatleben der Römer* (2d. ed. 1886, by Mau), forming vols. iv. and vii. of Mommsen-Marquardt's *Handbuch der römischen Alterthümer*. A. G.

Marque, Letters of [from Fr. *lettres de marque*; cf. Germ. *mark*, sign, symbol, seal]: in international law, the consent of a government, expressed in a formal permission, that a certain vessel may act as a privateer when the requisite bonds and formalities have been given or complied with. The words are explained best by the French *lettres de marque*—i. e. of stamp, or stamped letters, like *lettres de cachet*, letters of seal, or sealed with the king's signet, but specially giving authority to arrest. They are, then, stamped letters allowing reprisals or private warfare. See PRIVATEERING. T. D. WOOLSEY.

Marquesas (mȧȧr-kā'sȧȧs) **Islands** (French, *Les Marquises*; named by the discoverer, Mendana, *las Marquesas de Mendoza*, after the wife of the Viceroy of Peru): archipelago in Eastern Oceania, belonging to France since 1842; in lats. 7° 55′ to 10° 30′ S., and lons. 138° 40′ to 140° 46′ W., consisting of twelve islands; total area, 492 sq. miles; pop. (1889) 5,054. The largest island is Nukahiva; area, 186 sq. miles; pop. 988; greatest elevation (and highest in the group), 3,840 feet. The second in size is Hivaoa; area, 155 sq. miles; pop. 2,636. It is the most densely populated. Only six of the islands are inhabited. They are all mountainous, with great depths of water close to them, and poor harbors. The climate is warm and humid, but not unhealthful. The rainy season is from May to September, with a short rainy season in January. The winds are from the N. E. and S. E., and storms are rare. The surface of the islands is furrowed with deep valleys, and it is to these valleys that life is, for the most part, confined. Vegetation is here profuse and luxuriant. The commonest tree is that of the breadfruit, which furnishes a large share of the food of the natives. The land and air fauna are poor, but the marine fauna is very rich. The inhabitants are closely allied to the Tahitians, and have the reputation of having the finest physical forms known. Tattooing is universally practiced. Cannibalism was practiced as late as 1867. They profess Roman Catholicism almost universally. They were early visited by Protestant missionaries, who yielded to the Roman Catholics in 1858. The natives are warlike and skillful, yet hospitable, affectionate, and indolent. There are few foreigners on the islands, mostly deserters from vessels or Chinese. The political administration is under the Tahiti Government through a naval lieutenant, resident on Nukahiva, and the native chiefs. The southeastern islands were discovered by Mendana in 1595, and Capt. Cook touched there on his second voyage in 1772. The northwestern islands, which are somewhat separated and are sometimes called Washington islands, were discovered in 1791 by a captain named Ingraham from the U. S. See Clavel, *Les Marquisiens, études physiologiques, anthropologiques, et ethnographiques* (1885). MARK W. HARRINGTON.

Marquetry, or **Marqueterie** [from Fr. *marqueterie*, deriv. of *marqueter*, checker, inlay, deriv. of *marque*, mark,

sign]: the decoration of a surface by thin sheets of wood, ivory, metal, tortoise-shell, or the like, arranged in patterns for ornament. The thin sheets of wood are like those used in VENEERING (*q. v.*), but marquetry consists in making a pattern of different veneers, laid edge to edge, with or without other materials than wood. Marquetry differs from common inlaying, because there is no cutting of grooves or sunken patterns in a solid surface, but all is done by a kind of mosaic of thin pieces put upon the solid backing. Boule-work (called often in English BUHL-WORK, *q. v.*) is a variety of marquetry. RUSSELL STURGIS.

Marquette: city; capital of Marquette co., Mich. (for location of county, see map of Michigan, ref. 2–F); on Lake Superior, and the Duluth, S. Shore and Atlantic Railway; 425 miles N. of Chicago. It is an important shipping-point, having regular steamboat communication with all the principal cities on the Great Lakes. It contains a Roman Catholic cathedral and convent, 2 libraries (the State, founded in 1872, and the Peter White Public, founded in 1891), a public natural park, a national bank with capital of $150,000, a State bank with capital of $100,000, and a private bank, and a monthly, 2 daily, and 3 weekly periodicals. The city has iron mines, brownstone quarries, blast furnaces, rolling and powder mills, foundries and machine-shops, and large lumber interests. Pop. (1880) 4,690; (1890) 9,093; (1900) 10,058. EDITOR OF "MINING JOURNAL."

Marquette, JACQUES: missionary; b. at Laon, France, in 1637; sailed in 1666 as a Jesuit missionary to Canada; founded the mission of Sault Ste. Marie in 1668; went in 1669 from La Pointe du Saint Esprit (now in Michigan) to Mackinaw, where in 1671 he built a chapel; accompanied Joliet in his expedition of 1673 down the Wisconsin and Mississippi, and returned viâ the Illinois river and Green Bay, Wis.; opened in 1675 the mission at Kaskaskia, but, finding his strength failing, set out to return to Mackinaw. D. on the journey, May 18, 1675, near the mouth of Marquette river, in what is now Michigan. In Shea's *Discovery and Exploration of the Mississippi Valley* (New York, 1852) there are translations of his narrative and journal.

Marquez, măr'kāth, JOSÉ ARNALDO: poet; b. in Peru about 1825. In early life he took part in the civil wars; was several times banished, and resided in Chili, Cuba, and the U. S. He was private secretary of President Echenique in 1851, and subsequently held consular and diplomatic positions. Marquez is regarded as the best of the modern Peruvian poets, both for purity of diction and richness of poetic sentiment. His first verses date from 1848, and appeared in various journals. In 1862 he published the collection *Notas perdidas*, which was followed by various others, mainly in the lyric style; his *Flor de Abel* is particularly admired. Marquez edited, at different times, several journals. Among his prose works are *El Peru y la España moderna* and *Recuerdos de un viage á los Estados Unidos de América*. He was killed in the defense of Lima against the Chilians, Jan. 15, 1881. HERBERT H. SMITH.

Marquez, LEONARDO: soldier; b. in Mexico about 1820. He was an adherent of Santa Anna, headed a movement in his favor in 1849, and during his last presidency (1853–55) had important military commands. In the "Reform war" (1858–60) he was one of the most trusted generals of Zuloaga and Miramon, and after their defeat by Juarez he continued to wage an irregular warfare on that president, finally supporting the French intervention 1862–64. Maximilian made him minister to Constantinople, but the dangers threatening the empire brought him back in Oct., 1866, and he took command of a division. He was sent to Mexico in Mar., 1867, with directions to take charge of the defense of that city, form a new cabinet, and organize re-enforcements for the relief of Querétaro; but Diaz, having reduced Puebla, brought all his forces against Marquez, who, after various reverses, was driven into the city; finding resistance hopeless, and having heard of the death of Maximilian, he resigned his command on June 19, and escaped to Havana, where he took up his residence. He was expressly excluded from the amnesty of 1870. Marquez has been accused of great cruelty, and was nicknamed the "tiger of Tacubaya," in allusion to his massacre of prisoners at that place in Apr., 1859; in this, however, he acted under the orders of Miramon. HERBERT H. SMITH.

Marquis, or **Marquess** [readapted to Fr. from M. Eng. *markis*, from O. Fr. *markis*, *marquis* > Fr. *marquis*; cf. Germ. *mark*, boundary, and the title *markgraf*, nearly equivalent to marquis]: a British title of nobility, next in rank below that of duke, and next above that of earl. Like the ancient English title of *lord-marcher* and the German one of *Markgraf*, it originally signified an officer who governed a mark or frontier district. As an honorary title it was first bestowed in England in 1386. A marquis is addressed as "the most honorable." The title of his wife is "marchioness," and she is also addressed as "most honorable," or as "your ladyship."

Marquis, DAVID CALHOUN, D. D., LL. D.: minister and professor; b. in Lawrence co., Pa., Nov. 15, 1834; was educated at Jefferson College and Western and McCormick Theological Seminaries; was a teacher 1857–60; pastor of a Presbyterian church at Decatur, Ill., 1863–66; of the North Presbyterian church, Chicago, 1866–70; of Westminster church, Baltimore, 1870–78; of Lafayette Park church, St. Louis, 1878–83; moderator of the General Assembly at Minneapolis 1886; since 1883 has been Professor of New Testament Literature and Exegesis in McCormick Theological Seminary. He has published occasional articles, and has written a *Life of Christ*, for use as a text-book in schools. C. K. HOYT.

Marradi, măăr-raa'dĕĕ, GIOVANNI: poet; b. in 1852 at Leghorn, Italy. He studied at Pisa and Florence, and in the latter place, in 1877, joined Guido Biagi and Severino Ferrari in founding the literary periodical *I nuovi Goliardi*. By the name Goliardi he and his associates were for a time known. After the failure of the periodical, he published, under the pseudonym *G. M. Labronio*, a volume entitled *Canzoni moderne* (1878). He has since produced *Epicedio: poesie* (1880); *Fantasie marine* (1881); *Ricordi lirici* (Rome, 1884); *Poesie* (Turin, 1887); *Nuovi Canti* (Milan, 1891). Marradi has felt strongly the influence of Carducci, and echoes the note of paganism and naturalism that is characteristic of his master. His style has often a rare and personal perfection of its own. A. R. MARSH.

Marri: a sanitarium in Northern India. See MURREE.

Marriage [M. Eng. *mariage*, from O. Fr., deriv. of *marier*, marry < Lat. *marita're*, wed, marry, deriv. of *mari'tus*, husband, deriv. of *mas*, *ma'ris*, man, male, husband]: the contract by which a man and a woman assume the status or relation of husband and wife, or the status itself.

HISTORICAL OUTLINE OF THE CUSTOMS AND LAWS OF MARRIAGE.

I. EARLY CUSTOM AND LAW.—*The evolution of marriage* begins with the appropriation of one or more women by one man. The earliest form of complete appropriation seems to be *wife-capture* from a hostile horde. The right established by such a capture is ownership; the woman is the man's property, his slave. The second form of marriage, which develops insensibly out of the first, is *wife-purchase*. As the older and smaller hordes are united into tribes, by conquest or defensive federation, and as the tribes, under the operation of the same causes, grow larger and are welded into something like states, wife-capture becomes more and more difficult. Such capture is legally permissible only out of the limit of the tribe or state; within these limits it is a breach of the peace, and a wrong to the woman's kinsman; it has become theft. If, therefore, a wife is sought within the tribe, she must be bought; at first from her clan; at a later period, when the clan is in process of dissolution, from her father or guardian. Like the captured wife, the purchased wife is still, in legal theory, the husband's property, but her actual position rapidly improves. Her kinsmen are members of the same community; they claim the right to protect her against cruel treatment and to exact vengeance or penalty if her husband puts her to death or puts her away without good cause. This protection extends to her children also. Rights begin to be attributed to the wife and mother, and these rights, however slight and faintly marked, differentiate her from the slave. This evolution is often hastened by religious influences. Among many peoples a *religious marriage* supplements the sale or is substituted for it; the relation thus initiated is a religious relation, and the wife is protected by the priests. Even where no such religious marriage is developed, the sale of the wife tends to become fictitious. A symbolic consideration, a ring or a coin, is substituted for the purchase-money, and marriage, though technically a sale, is really a distinct contract. It is still, of course, in every early system of law a contract between the man and the woman's father or guardian; the latter "gives her to be married,"

and her consent is not necessary. When the woman's consent begins to be regarded as essential, marriage has practically reached its modern form.

Polygamy.—In the normal evolution of marriage polygamy (or rather polygyny, a plurality of wives) and monogamy may exist side by side; but for obvious reasons polygamy can never be a general system. Only the most powerful or most wealthy members of a community can capture or purchase a plurality of wives.

Manus-marriage and the Patriarchal Theory.—The form of marriage above described, which rests upon the appropriation of the woman by the man, is called by Semitic scholars the *ba'al* or ownership marriage; by students of Indo-Germanic custom the *manus*-marriage. In early Roman and in early Teutonic law marriage brings the woman into the "hand" (*manus, munt*) of her husband; and it seems certain that these words originally designated possession or proprietorship. The theory that *manus*-marriage is the primitive form of marriage is in accord with the so-called patriarchal theory, but does not involve the acceptance of the latter theory in its broadest form, as set forth by Maine, according to whom all early social organization is based on the patriarchal family.

Promiscuity, Group-marriages, Polyandry, and Marriage without Marital Power.—There are several other theories regarding the earliest form of the family. Some modern writers hold that the primitive horde was itself a single undifferentiated family, with complete promiscuity or hetairism. Others assert that the earliest marriages were group-marriages in a narrower sense; a number of husbands in every case holding a number of wives in common, and a number of such matrimonial groups being included within the horde. Others again (notably McLennan) declare that polyandry, a system under which one woman maintains more or less permanent relations with a number of husbands, is a primitive (if not the primitive) form of the family. Still others maintain that a frequent (if not universal) form of early marriage is that in which the wife remains in her own horde and the husband is adopted into it. In none of these forms of association is there any marital proprietorship or any considerable degree of marital authority. Paternal authority does not exist over the children; the woman is the head of the family (*matriarchate*).

These theories rest partly on customs actually prevailing in modern times, or said to have prevailed in the past among many savage or barbarous peoples, and partly upon early methods of tracing kinship. The evidence furnished by actual custom is, however, by no means conclusive. Promiscuity, polyandry, etc., are sporadic, not general, phenomena; and in many cases it is probable that they represent comparatively late conditions, due not to normal evolution but to social degeneration. It should also be observed that general license outside of the marriage relation proves nothing as to the nature of marriage itself; and that the selling or lending of wives, so frequently noticed among barbarous peoples, is rather an assertion than a negation of marital ownership. More important is the evidence furnished by early systems of kinship. It is coming to be generally conceded that in the earliest stages of social evolution relationship is not traced through the male line at all, but exclusively through the female (*Mutterrecht, uterine* or *cognatic relationship*). It also seems clear that kinship between father and child, when it comes to be recognized, is generally based on the power of the husband over the mother, her child being regarded as his child because she is his property. These facts are explained by the opponents of the patriarchal theory by asserting that in primitive society there is either no marriage at all, or no marriage to a single husband, or that in primitive monandrous marriage the husband does not own his wife. The latest and most careful investigations, however, seem to show that there is no necessary connection between the earliest theories of kinship and the earliest organization of the family. Relationship to the mother and through the mother is first recognized because it is the most obvious and most certain form of relationship. We find that relationship to the father and through the father is ignored by many of the lowest savages, in spite of the fact that their marriages are uniformly monandrous, and that the husband has the fullest power over the wife. In a much higher stage of social development, moreover, at the period of fully developed clan organization, the method of tracing relationship seems to depend primarily not upon the form of the family, but upon the custom of the clan. According to its own theory, the clan is always based on kinship; the tie which holds it together is always a tie of blood. If, now, the clan were regularly perpetuated by *endogamy*, i. e. by intermarriages between its members, it would not be forced to choose between "mother-right" and "father-right"; but this is not the case; *exogamy*, or a system of cross-marriages between clans, is the rule; and in order that each clan may establish and preserve a distinct and separate existence, the children of such cross-marriages must be assigned either to the mother's clan or to the father's. With the acceptance of a uniform rule of assignment, each clan perpetuates itself through one exclusive line of descent, either through the female line or through the male line; and the line which is excluded by clan custom is practically ignored by the entire community. It is perfectly conceivable that the female line may be chosen; and in this case "mother-right" will maintain itself long after paternity has become certain; but this solution of the question seems to be exceptional, or at least transitional. As a rule, the woman is taken into the man's clan, capture and purchase alike bring her there, and her children are accounted members of his clan. This certainly was the system which prevailed among the Aryan or Indo-Germanic races. Among them the clan name descended in the right male line, as our modern family names still descend. Among them, as long as the gentile or clan organization was still strong, kinship through the male line (*agnatic relationship*) was either the only legal kinship, as was the case for centuries at Rome, or it was at least the more important form of kinship. Cf. the position assigned in early German law to the "sword-kin" (*Schwertmagen*).

Conclusions.—In view of the above facts, it appears very doubtful whether promiscuity or group-marriage or polyandry can be regarded as a really primitive type of social organization; and it seems certain that none of them is a general type. It may be added that none of these forms of sexual association is really entitled to be called marriage; and it is not easy to see how any one of them can have furnished even a starting-point in the evolution of monandrous marriage. It is equally doubtful whether the form of marriage in which the husband enters the wife's family is a really primitive form; and it is certain that it is not the starting-point from which Indo-Germanic marriage has been derived.

II. ROMAN LAW.—Early Roman marriage was based on the acquisition, by the husband, of *manus*. In early Roman legends there are traces of wife-capture; but this form of marriage is not recognized in the sacral law (*leges regiæ*) nor in the Twelve Tables. Manus (and therefore marriage) was established among the patricians by a religious ceremony (*confarreatio*); among the plebeians by purchase (*co-emptio*). We find also in early Roman law that if a man exercises marital authority over a woman for a year, he acquires manus as he would acquire any other property right, viz., by prescription (*usus*). From the marriage by prescription there was ultimately developed a *free, consensual marriage*, without *manus*. The acquisition of *manus* could be defeated by a brief annual absence of the wife from her husband's home; and it came to be recognized that, even without *manus*, the voluntary union was legally a marriage. In the late Roman law this free union was the general form of marriage. It was based upon the agreement of the man and the woman (*consensus, non concubitus, facit nuptias*), although, if either of the parties was under paternal authority the consent of the father also was necessary to the validity of the contract.

Marriage was regularly preceded by betrothal (*sponsalia*); but the engagement to marry was not capable of specific en-

forcement, nor, in the later development of the law, could any penalty be recovered for breach of the promise.

Marriage was dissoluble at pleasure by either party. The Roman jurists described marriage as the sharing of fortune, good or ill, for life (*consortium omnis vitæ*); but they meant a voluntary sharing, and held that a promise not to exercise the right of divorce was invalid *because immoral*. The Christian emperors endeavored to check unreasonable divorce by penalty, and Justinian forbade divorce by mutual consent—a prohibition which his successor repealed.

Literature.—Rossbach, *Römische Ehe* (Stuttgart, 1853); Karlowa, *Römische Ehe und Manus* (Bonn, 1868).

III. Early Teutonic Law.—In the earliest written laws of the Scandinavians, Germans, Anglo-Saxons, etc., wife-purchase (*Brautkauf*) is the normal form of marriage; but wife-stealing (*Frauenraub*) is still recognized as establishing the relation of husband and wife (*Raubehe*), at least when the customary penalty (a certain number of cows or horses) has been paid. Among many German tribes the penalty paid for abduction and the price paid in buying a wife are identical in amount. Wife-purchase, like other contracts of sale, falls into the two stages of sale and delivery. Sale consists in the agreement to deliver, accompanied by the payment of a part of the price (*arrha*), or the giving of a pledge (*Wette*, *wadium*) to bind the bargain. Delivery of the bride was frequently clothed in the form of abduction, followed by the payment of the full price by the bridegroom and his kinsmen to the bride's kinsmen. "Bride-purchase," says Heusler, "is essentially nothing but an abduction previously agreed upon." At a later period both the pledge and the price are paid to the woman's father or guardian, and at a still later period to the woman herself. The modern betrothal ring represents the *wadium* of the primitive sale. The marriage settlement made by the husband represents the full payment of what was once penalty and afterward price. Whether, in Teutonic law, the relation of husband and wife was established by the sale or by the delivery, by the betrothal (*Verlobung*) or by the marriage ceremony (*Trauung*) is disputed. Sohm asserts that the betrothal, according to Teutonic ideas, was not an agreement to marry but a contract of marriage, and that the ceremonies of delivery represented simply the execution of the contract. (Cf. the etymological connection between *Wette* and the English "wedding," and the introduction of the troth-plighting into modern marriage services). Others—and this is the general opinion—hold that the matrimonial relation was established by the giving of the bride to her husband. Heusler asserts that the relation was fully established or "consummated" only by *concubitus* (*copula carnalis*). As a matter of fact, Teutonic custom seems to have attached some results of marriage to the betrothal, others to the ceremony of marriage, and yet others to its consummation. All these ideas had an influence upon the development of the canon law.

Early Teutonic custom allowed the husband to put the wife away for cause (e. g. adultery, barrenness), and it probably recognized divorce by mutual consent.

Literature.—See especially the controversial literature of Sohm and Friedberg: Sohm, *Eheschliessung* (Weimar, 1875); Friedberg, *Verlobung und Trauung* (Leipzig, 1876); Sohm, *Trauung und Verlobung* (Weimar, 1876); and *Zur Trauungsfrage* (Heilbronn, 1879). Cf. also Heusler, *Institutionen des Deutschen Privatrechts* (Leipzig, 1886), ii., 277–292; Brunner, *Deutsche Rechtsgeschichte* (Leipzig, 1887), i., 70–81.

IV. Roman Ecclesiastical Law.—The mediæval Church declared marriage a sacrament. It therefore claimed, and obtained, an exclusive jurisdiction over matrimonial cases; and in the exercise of this jurisdiction it developed a uniform law of marriage for the entire Christian world.

The Church accepted the doctrine of the Roman civil law, that marriage is established by the consent or agreement of the parties. It accepted the Roman age of consent, viz., fourteen for males, twelve for females. It rejected the Roman requirement of parental consent. It was customary, throughout the Middle Ages, to celebrate the troth-plighting at the church door (*ad ostium ecclesiæ*, *in facie ecclesiæ*) and then to consecrate the marriage within the church; it was also customary to require the previous publication of banns; but until the Council of Trent, in the sixteenth century, the clandestine, unconsecrated marriage was completely valid.

Betrothal (*sponsalia*).—Starting with the Roman idea of betrothal as a mere contract to marry at some future time, the Church was nevertheless strongly influenced in the early Middle Ages by Teutonic usages, and declared that betrothal established at least an inchoate marriage (*matrimonium initiatum*). In the Gallican Church, however, the Roman theory was retained, and a distinction drawn between *sponsalia de futuro* and *de præsenti*. This distinction was accepted by the Church as a whole in the twelfth century (Alexander III.), but some concessions were made to Teutonic ideas. An agreement *in præsenti* (e. g. *accipio*, I take) constituted a valid canonical marriage; but such a marriage, if not consummated, could be dissolved by a vow of celibacy on either side, and also by papal dispensation. An agreement *de futuro* (e. g. *accipiam*, I will take) was not marriage, but if followed by *concubitus* it became marriage. The *concubitus* was said to create a presumption of consent *in præsenti*, and this presumption was an absolute one, i. e. proof of the contrary was excluded.

Hindrances (*impedimenta*).—The Church established a formidable list of impediments to marriage, some of which made the marriage voidable (*impedimenta dirimentia*), while others did not have this effect, but simply subjected the parties to ecclesiastical censure (*impedimenta impedientia* or *prohibitiva*). To the latter class belonged, for example, the disregard of ecclesiastical rules concerning banns, and precontract (*de futuro*) between either of the parties and a third person. To the former class (*impedimenta dirimentia*) belonged, for example, lack of consent, whether due to insanity or essential error; lack of free consent, as in the case of intimidation; legal incapacity to give a binding consent because of non-age; and lack of physical fitness (*impotentia*). Precontract *de præsenti*, i. e. the existence of a previous marriage, a previous solemn vow of celibacy, and difference of religion also excluded marriage. The greatest innovation introduced by the Church consisted in its list of impediments based on relationship (*cognatio*). The Roman and the Teutonic law excluded marriage in only a few cases of very near relationship. The canon law forbade marriage between blood-relatives (*consanguinei*); between each party to a previous marriage (or to an unlawful *copula*) and the relatives of the other party (*affines*); and it added to these impediments the so-called "spiritual relationship," established by participation in the sacraments of baptism and confirmation. Before 1215 the impediments of consanguinity and affinity extended to the seventh degree (e. g. to sixth cousins), and marriage was forbidden not only with *affines* but with *affines* of *affines*; but Innocent III. abolished the latter rule, and limited the prohibitions based on consanguinity and affinity to the fourth degree (e. g. third cousins). All impediments of kinship, except between ascendants and descendants and brother and sister, may be removed by dispensation.

Separation.—The most important inference which the Church drew from the sacramental character of marriage was the indissolubility of the union, save by death. It refused to permit any separation *a vinculo* (divorce), and permitted only separation from bed and board.

The most peculiar feature of the canon law, viz., its extended list of impediments based on actual, legal, and spiritual kinship, has been variously explained. Some of the early Protestant Reformers insisted that the Church meant to supply a substitute for divorce by permitting frequent annulment of marriages. Others declared that its motive was fiscal; that many prohibitions were created in order that many dispensations might be sold. Modern historical investigation has discovered better and more probable reasons for the policy of the Church. After the disappearance of the marriage by capture, a strong tendency appeared, at least among the Germans, toward marriage within the *Sippe*, or body of relations, the motive being to keep property in the *Sippe*; and throughout the Middle Ages—indeed, until the nineteenth century—the tendency of European village life has been toward marriage within the village. In those parts of the Continent that have been least affected by modern migratory tendencies, villages may still be found where all the inhabitants are more or less nearly connected by blood or marriage. The prohibitions of the Church, in forcing men to seek wives outside of the narrow circle of their kinsfolk, exercised a beneficent influence in checking these tendencies to inbreeding.

Council of Trent.—The validity of clandestine marriages between minors was recognized as one of the most objectionable features of the mediæval law of marriage. The Council of Trent declared that marriage must take place in

the presence of the parish priest and two witnesses, and that no clandestine marriage should be held binding.

Literature.—Works on canon law (*jus canonicum*, *droit canonique*, *Kirchenrecht*), public and private, contain the canon law of marriage; works on the public law alone do not. Two of the most recent treatises on the Catholic law of marriage are Esmein, *Le Mariage en Droit Canonique* (Paris, 1891), and Bender, *Handbuch des Katholischen Ehcrechts* (4th ed. Freiburg i. Br., 1891). For the history, see Freisen, *Geschichte des Canonischen Eherechts* (Tübingen, 1888). For the doctrine of *sponsalia*, see Sohm and Friedberg, cited above, and Sehling, *Die Verlöbnisse im Kanonischen Rechte* (Leipzig, 1887).

V. Protestant Ecclesiastical Law.—The Protestant Reformation brought with it numerous changes in the law of marriage, the most important of which resulted from the rejection of the sacramental theory. In some territories these changes were made by ecclesiastical authority, in others by secular legislation; but until the nineteenth century legislation was generally guided by the opinions of the Church authorities. In Germany the territorial princes were thought to deal with marriage rather in their capacity of supreme bishops than in that of secular rulers.

Betrothal and Marriage.—Luther protested against the Catholic distinction between *sponsalia de futuro* and *de præsenti*, on the ground that it was foreign to the instincts and language of his countrymen. "Wilt thou" and "I will," he declared, were not, in German, *verba de futuro*; they expressed simply volition, consent. He therefore insisted that all betrothals, unless expressly made subject to condition precedent (e. g. "if my parents consent"), or term precedent (e. g. "if you will wait a year for me"), expressed a present matrimonial consent, and constituted at least an inchoate marriage. This view was dominant in Germany until the eighteenth century.

The evil of clandestine marriages, which was rather exaggerated than lessened by Luther's theory of betrothal, was met in different ways in different German territories. Consent of parents was demanded, or the presence of witnesses, or an ecclesiastical ceremony. Church marriage was regarded as the usual and regular consummation of the inchoate marriage established by troth-plighting; but it was still held that any sort of betrothal followed by *concubitus* established a marriage, a rule which made the requirement of publicity illusory.

Böhmer (*Jus Ecclesiasticum Protestantium*, Halle, 1714) reintroduced the Roman distinctions. He held that *sponsalia* are always, in principle, *de futuro*; that the consent given in betrothal is not a consent to marriage, but to betrothal. Betrothal followed by *concubitus* constitutes indeed a "natural" marriage, but by positive law the benediction of the Church is necessary to its legal recognition. The ecclesiastical marriage is therefore the only perfect marriage. The views of Böhmer were generally incorporated in German legislation during the latter part of the eighteenth and the early part of the nineteenth century.

The Church of England adhered, as far as these questions were concerned, to the older ecclesiastical law. Whether this was precisely the same as the ecclesiastical law of the Continent—whether the latter had not been supplemented and modified by English legislation, ecclesiastical and secular—is a matter of dispute. Many authorities hold that neither *sponsalia de præsenti* nor *sponsalia de futuro* with subsequent *copula* constituted a perfect marriage at English ecclesiastical law without a priestly benediction. (See *Queen* vs. *Millis*, 10 Clark and Finelly, where the judges were equally divided.) It is also maintained that the presumption of present consent derived from the *copula* was not absolute; that proof to the contrary was admissible. All uncertainty was removed by statutes passed in the reigns of George II. and George IV., requiring a church marriage preceded by publication of banns, except in the case of marriage by special license, and making any other sort of marriage invalid. The first of these statutes (Lord Hardwicke's Act, 26 Geo. II., c. 33) made even such a marriage void in the case of minors, unless the consent of the parents or guardians had been obtained; but this provision was afterward repealed.

None of these statutes applied to Scotland, and their passage gave rise to a great number of elopements to that country. See Gretna Green.

Hindrances.—Protestant ecclesiastical law rejected the theory of spiritual kinship, and narrowed the impediments resulting from consanguinity or affinity. In Germany the new rules were based in some territories upon the Roman civil law, in others upon the Mosaic law (Leviticus xviii.). In England the Levitical degrees were adopted by acts passed in the reign of Henry VIII. This system limited the impediments of consanguinity and affinity to the second degree, and permitted certain marriages within that degree, e. g. between first cousins.

Divorce.—The Protestant churches of the Continent regarded divorce *a vinculo* as permissible: in some cases for adultery only, in others for malicious desertion and cruelty, and by reason of the condemnation of either party to imprisonment at hard labor—particularly in those cases where a more humane tendency in legislation had substituted the penalty of imprisonment for an earlier penalty of death. The Church of England, on the contrary, opposed the granting of divorce for any cause, and where divorces were granted by special act of Parliament the ecclesiastical authorities were unwilling to sanction a second marriage.

Literature.—For Germany, works on Church law, Catholic and Protestant, e. g. Hinschius, *Kirchenrecht* (Berlin, 1869–88); Friedberg, *Kirchenrecht* (Leipzig, 1889). For England: Burn, *Ecclesiastical Law* (9th ed. London, 1842); Phillimore, *Ecclesiastical Law* (London, 1873).

VI. Modern Legislation.—*Europe.*—The modern state regards marriage as (primarily, at least) a civil relation, and even in Catholic states marriage and divorce are governed to-day by civil legislation. The most important changes introduced by modern legislation are as follows: (1) The *age of consent* is generally raised. (2) The *consent of parents* or guardians is generally made a condition of validity during minority, and in some states for several years after majority (so, e. g., in France, Italy, and Germany). (3) Marriage must be publicly contracted. The earliest form of *compulsory public marriage* was, as we have seen, the church marriage. In this form the principle of publicity was introduced into the Catholic states of Europe by the Council of Trent; into Protestant Germany and England by civil legislation. The church marriage meant, at first, marriage according to the rites of the established Church of each country; but the irritation excited by subjecting the adherents of other confessions, or of no confession, to such a form of marriage has led in some states to the recognition of marriages celebrated according to the rites of any recognized confession, and ultimately to the general establishment of *civil marriage*, i. e. marriage before a secular official. In England marriages before justices of the peace were authorized under the Commonwealth, but disappeared with the Restoration. In the nineteenth century the act of 6 and 7 Wm. IV., c. 85 (supplemented by acts of 1 Vict., c. 22, and 19 and 20 Vict., c. 119) furnishes an option between marriage according to the forms of the established Church, marriage according to the forms of other confessions, and marriage before a "registrar." An optional or "facultative" civil marriage exists also in Austria, Spain, and Portugal. In a larger number of continental states, however, conflicts with the Catholic Church—arising, in general, from the refusal of that Church to recognize the rules established by the state; in particular from its opposition to marriages between Catholics and non-Catholics, or its attempt to make the celebration of such "mixed marriages" conditional on a pledge that the children shall be brought up in the Catholic faith—have resulted in the establishment of the *obligatory civil marriage*, e. g. in France, Italy, Germany, Holland, and Switzerland. The civil marriage is regularly preceded by notices modeled on the banns of the Catholic Church, and subserving the same purpose of publicity.

The requirement of public marriage has swept away all doubt as to the nature of *betrothal*. It is merely an agreement to marry at some future time. It gives no claim for specific performance. That breach of promise of marriage creates a claim for damages is denied or disputed in many states, but affirmed in Germany.

Hindrances.—According to the law of most Protestant and some Catholic states, consanguinity is a bar to marriage only between ascendants and descendants (*linea recta*), brothers and sisters, uncle and niece, and nephew and aunt. Some states (e. g. Prussia) limit the collateral impediment to brothers and sisters. Affinity in some Protestant states (e. g. Prussia) is a bar only in the right line, and not between collaterals. England still adheres to the prohibition of marriage with the deceased wife's sister. Even in those Catholic states which cling most closely to the Roman ecclesiastical law there is a tendency to limit the impediments of consanguinity and affinity to the third degree.

Divorce a vinculo is generally permitted, but for causes which vary greatly. Italy, Spain, and Portugal grant no absolute divorce. Austria grants it only to non-Catholics.

LITERATURE.—For comparison of the laws of the principal countries, see Glasson, *Mariage Civil* (2d. ed. Paris, 1880); Grünwald, *Die Eheschliessung* (Vienna, 1881); Wright, *Report on Marriage and Divorce* (Washington, 1889).

United States.—The so-called "common-law marriage" recognized in the U. S. is simply the canonical marriage by agreement *de præsenti*. An agreement *de futuro*, though followed by cohabitation, does not establish marriage. Cohabitation is merely evidence of an agreement *de præsenti*, and is by no means conclusive evidence. In a few of the States consent is not sufficient to constitute marriage without a public ceremony or actual consummation. The law of Louisiana requires the observance of certain forms and solemnities. In Nevada marriages between minors require parental consent, and failing such consent, the marriage appears to be invalid. In the other commonwealths all rules regarding parental consent, solemnization of marriage by clergymen or secular magistrates, notices of intention, issue of licenses, etc., are merely directory, or entail no further result than the punishment (usually by fine) of the parties, or clergymen, or magistrates, who disregard them. The system which prevails in the U. S. accordingly offers an election between religious marriage, civil marriage, and completely formless marriage. It may be added that it would be practically impossible for any single commonwealth to suppress clandestine marriages, as its rules would not affect marriages contracted by its citizens beyond its borders.

In the absence of statutory provision to the contrary, the *age of consent* is the canonical age, viz., fourteen for males, and twelve for females. In many of the States the age has been raised, and varies from sixteen to twenty-one in the case of males, and from fourteen to eighteen for females.

All of the States prohibit marriage between ascendants and descendants (*linea recta*), and between brothers and sisters of the full or half blood. Nearly all prohibit marriage between uncle and nicce, or aunt and nephew. Ten States forbid marriage between first cousins. Affinity is usually a bar only in the right line, i. e. between step-parents and step-children, and between father-in-law and daughter-in-law, etc.; but in a few States close collateral affinity is made a bar. Marriages within the prohibited degrees are generally declared to be void. In many States marriage is unlawful between whites and persons of African descent, and in a few between whites and Indians or Mongolians.

Divorce is granted in all the States and Territories except South Carolina and New Mexico. The causes vary greatly in different States, some granting divorces only for adultery, some even for incompatibility of temper.

LITERATURE.—Bishop, *Marriage and Divorce* (6th ed. Boston, 1881); Noble, *Complete View of the State Laws of Marriage and Divorce* (New York, 1882); Robinson, *Marriage and Divorce* (Chicago, 1884); Stewart, *Marriage and Divorce* (San Francisco, 1884); Snyder, *Geography of Marriage, or Legal Perplexities of Wedlock in the United States* (New York, 1889); Wright, *Report on Marriage and Divorce* (Washington, 1889). MUNROE SMITH.

GENERAL LAWS GOVERNING MARRIAGE IN GREAT BRITAIN AND THE UNITED STATES.

The word marriage in law, as well as in popular usage, is commonly used of two things which are in their nature widely different—namely, a contract, that is, the act, the series of acts, or the ceremony by which a man and a woman agree to live together as husband and wife; and a "status," that is, the condition or relationship toward one another and toward the community which is contemplated in and arises out of the contract. Technically, this status is the condition or relationship in which a man and a woman may lawfully cohabit as husband and wife.

The marriage status is distinguished from a contract by the facts that when once created by the marriage contract it can not be dissolved or abrogated by the act of the parties; that incapacity of one of the parties to perform its duties does not affect its continued existence; that it ends only with death or dissolution by legal process; that a minor can not avoid its continuance if he entered into it when of the age of consent; that no suit for damages will lie for nonperformance of its duties; and that the causes for which it can be dissolved by legal process can be validly changed by legislation without violating the obligation of a contract, and also change with the domicile of the persons married.

Agreement or Promise to Marry and its Breach.—In the nature of the case there is customarily, and practically always, an agreement or promise to marry between the parties preliminary to the act of marrying, which constitutes a contract governed by the same legal principles as to capacity of parties, consideration, etc., as other contracts.

This contract may be proven, like any other contract, by any words or acts sufficient to show that the parties mutually expected and assented to the future entry into the state of matrimony by intermarrying. Both parties to the contract must be of marriageable age, or otherwise it will be void, and if one be a minor, the contract, like other contracts, is voidable at his option, but binding on the adult. The mutual promises or assents may be the only considerations; the time of performance, like that of any other contract is, when not expressly fixed, such a time as is reasonable under the circumstances of the case. The contract can not be specifically enforced under any circumstances, but the defaulting party is liable in a suit for damages, in awarding which the jury may, besides actual pecuniary damages, take into consideration the loss of worldly advantage reasonably expected from the marriage by the plaintiff, wounded feelings, the mortification arising from the breach, and the positive injury to the plaintiff's prospects in life. In Great Britain, and generally in the U. S., seduction under promise of marriage may legally be shown in an aggravation of damages, and in any case it is practically impossible to keep the knowledge of the fact from the jury. A breach of the contract which will be a sufficient basis for an action in damages may arise from the fact of a person promising to marry when he knows that he is legally disqualified, or is incapable of performing the duties of the marriage relation (as one already married or one impotent), from his rendering it impossible for him to fulfill the contract (as by marrying another), or from words or acts showing his intent not to do so, or from his failure to fulfill it at the proper time, or on such request as the law requires. It is generally held in the case of a woman that she need only prove that she held herself in readiness and willingness to be married. The contract may be rescinded by one party by reason of its becoming unsafe or improper for him to celebrate the marriage by reason of bad health; for the fraud or deception of the other party, such as the concealment of previous unchastity or the disposal of property in a manner injurious to his interests, without his consent; for the occurrence of such physical infirmity (as total blindness or deafness) as incapacitates the other party from properly fulfilling the marital duties; for duress, and for mistake of fact which goes to the essence of the contract. Either party may also rescind it for ill-conduct of the other party occurring subsequently to the promise, what constitutes such ill-conduct as to justify rescission being necessarily left without exact definition, but in any case being less than would be necessary to constitute a ground for divorce; thus subsequent lascivious conduct not amounting to fornication might be a sufficient ground for rescinding the contract, though not for obtaining a divorce.

Of the Marriage Contract itself, Valid, Invalid, or Void, and Voidable.—Any marriage contract by which the parties completely assume the legal relation of husband and wife is valid. To this end it is necessary to follow only those formalities required by the unwritten law and those statutory ones without the observance of which the statutes expressly provide that no valid marriage can take place, all other statutory formalities being by the policy of the law held to be directory merely, the failure to observe them not affecting the validity of the marriage, but subjecting the negligent parties to a penalty, usually a fine of small amount. In the U. S. at the unwritten (or common) law and in Scotland any agreement by which the parties intend to assume the legal relationship of husband and wife is a valid marriage; whether more is required in England (and Ireland) is a matter of dispute. See above under the subdivision of *Protestant Ecclesiastical Law.*

An invalid or void marriage contract is one which does not alter the status of the parties, and which without any legal proceeding may be treated as of no effect by all persons under all circumstances. Such marriage contracts in general are those between persons under some civil disability, as prior marriage or idiocy, etc.—that is, those disabilities which the policy of the law will not allow the parties to waive. A voidable marriage is one which by reason of some hindrance may be set aside in a legal proceeding instituted for that purpose, but until then is valid, and the validity of which can not be attacked after the death of

either of the parties, nor collaterally at any time. When set aside it generally becomes void from the beginning. The hindrances which make a marriage voidable are such as were originally canonical disabilities, as consanguinity, affinity, impotence, etc., or those which the policy of the law now allows the parties to waive, although these facts are not infrequently made absolute disabilities by statute. See above (under the subdivisions *Roman Ecclesiastical Law*, *Protestant Ecclesiastical Law*, and *Modern Legislation*) for mention of the disabilities imposed by the ecclesiastical law and by statutes.

Capacity, or Competency, of the Parties.—The disabilities which are now recognized as making a marriage contract void or voidable are want of age of consent; mental incapacity to enter into the contract; physical incapacity to perform the marriage functions; consanguinity (or blood-relationship) and affinity (or relationship by marriage); the condition of being a slave; racial difference; and a previous marriage still continuing.

At the common law the *age of consent* at which a boy or a girl becomes capable of entering into a valid marriage contract without the consent of the parents is fixed at fourteen and twelve years respectively, the age for this purpose being different from that of majority, and fixed with reference to the probable age of attaining puberty, the years being derived from the Roman law. A marriage by a child under the age of consent and over seven years of age is voidable by the child upon reaching the age of consent, and a marriage by parties under seven years of age is void, and a mere nullity. The age of consent has now been very generally changed by statute. See under the sub-heading *Modern Legislation*, above.

The law with regard to *mental capacity* of the parties to a marriage to enter into the contract is an application of the general rule governing the formation of contracts—namely, that the parties must be capable of understanding the nature and consequences of the contract entered into. No exact definition can be given of what constitutes such mental capacity, but it is sufficient to say that the question will be decided by considering the simple nature of the contract entered into, and that it is only the immediate consequences that must be understood by the parties, and not those remote and secondary ones, such as property rights, etc. This mental incapacity may arise from mental unsoundness, or from intoxication, or any other cause. (See Insanity and Intoxication.) So a marriage entered into by a person during a lucid interval is good at the common law, and subsequent insanity would not invalidate the marriage or be a ground for divorce except under statutory provisions.

Physical incapacity, or impotence, is the irremediable incapacity of a party to a marriage to have any reasonable sexual intercourse with the other party, and in order to render the marriage voidable (see above) or to be a ground for divorce must have existed at the time of the marriage and have continued unchanged. Mere barrenness or sterility does not render the marriage voidable, nor is it a ground for divorce. A marriage declared void for impotence is void from the beginning, and a statute making impotence a ground of divorce is construed as providing that the marriage is a nullity if the divorce be granted.

A marriage by *a person already married* to another at the time of the second marriage is of course void absolutely; and no decree of court or legal process is necessary to make it so, but it is void *ab initio*, the capacity of the parties to contract a future marriage being unaffected by a bigamous marriage. The celebration of such a second marriage constitutes bigamy or polygamy, which was not punishable as a crime, except in the ecclesiastical courts, in England until the time of James I. The act is now, however, a statutory offense both in Great Britain and in the U. S. At the common law the children of a bigamous marriage are illegitimate, but by statute in some States they are made legitimate. If, however, a husband or wife has been absent and unheard from for seven years, the other does not commit a crime in contracting a second marriage, although if the absent party afterward returns or be proved to be living, the second marriage is void except as otherwise provided by statute. See Bigamy.

Of the *other incapacities* or hindrances: (*a*) Relationship within the prohibited degrees renders the marriage voidable. (See *Roman Ecclesiastical Law*, *Protestant Ecclesiastical Law*, and *Modern Legislation*, above; and see also Incest.) In England the prohibited degrees were established by 32 Henry VIII., ch. 38, which, in the absence of statutes, is the law in the U. S. (*b*) The laws governing the marriage of slaves are now of historical importance only. The cases are not all in harmony, but in general it is settled that slaves were capable of entering into a certain inchoate or imperfect marriage relationship, which on emancipation and continued cohabitation became a complete marriage with no further acts of the parties. (*c*) Difference of race is an impediment only when so provided by statute, and in many of the States marriage between persons belonging to different races (miscegenation) is forbidden, and the celebration of such a marriage is made a crime.

Marriage Accomplished by Fraud, Error, or Duress.—Although the form or ceremony of a legal marriage may have been gone through with, if either by reason of fraud, error (or mistake), or duress there is no such meeting of the minds of the parties as is essential in the case of an ordinary contract the status of marriage does not arise. The party who acted under fraud, duress, or error may have the marriage declared null and void, or may ratify it, on discovery of the fraud or error. The ratification may be by words or by acts alone, as by continued cohabitation. The fraud or error for which a marriage may be declared void must be such as affects the capacity of the parties to properly fulfill the relations to one another of husband and wife, or the consent of the parties to the entering into or assuming the duties of this relation. Thus pregnancy at the time of the marriage by a party other than the husband is a sufficient ground for avoiding the marriage, but not deception as to the health, previous chastity, or wealth of the other party.

Foreign Marriages.—The institution of marriage is of such a nature and so universal that public policy demands that the validity of marriages wherever celebrated, whether by persons in the land of their domicile, or by persons not in the country of their domicile, but while abroad in a foreign land, shall be recognized as valid everywhere if valid under the laws of the country where celebrated, unless such marriage be of such a nature as to be inconsistent with the general rules of propriety or morality according to the standards of civilized nations. With some exceptions, which can not be particularly noted here, this is the almost universal rule; and the practice in this matter may be contrasted with that followed as to recognizing foreign divorces, where domicile of one party at least is necessary to the validity of a divorce.

Marriage Brocage Contracts and Contracts in Restraint of Marriage.—A contract by which one person undertakes to bring about or negotiate a marriage (technically called a *marriage brocage contract*) is void as against public policy, without regard to whom the consideration is to be paid, since such contracts tend to bring about marriages through fraud and collusion, or marriages for unworthy purposes. Contracts in restraint of marriage are also wholly void, for the policy of the law is to favor and uphold marriage contracts. So a gift or bequest made to a donee upon the condition that the donee never marry, or do not marry for a considerable length of time during which a marriage might lawfully be celebrated, is void, except under certain peculiar circumstances where the dictates of common morality would suggest the refraining from marriage although lawful.

The foregoing brief sketch, based upon the common law of England (and Ireland) and the U. S., will serve as an outline of the laws of Scotland upon this subject, since (with the above-noted exception of the recognition of irregular marriages; see Gretna Green) they differ from those of England chiefly in matters too unimportant or too technical to be noted here. For a bibliography and further information as to the effect of marriage on the rights and duties of the parties, see Married Women. F. Sturges Allen.

Medical Aspects of Marriage.

Marriage may improve or may injure the health of the contracting parties, and the probabilities of healthy offspring from any given marriage depend to a certain extent upon the physical characteristics of each of the parents. At all ages over twenty years the death-rates of married males are less than those of the unmarried, and at all ages over twenty-five the death-rates of married females are less than those of the unmarried. At all ages the death-rates of widowers are greater than those of men who are either married or have never been married, while at ages between twenty and forty the death-rate of widows is greater than that of other women, and over forty it is greater than that of married women, but less than that of single women. This will be seen by the following table, compiled by Bertillon, show-

ing the average annual death-rates per 1,000 of each class in France during the ten years 1856–65:

AGES.	MALES.			FEMALES.		
	Single.	Married.	Widowers.	Single.	Married.	Widows.
15–20	6·89	51·32	774·0	7·53	11·86	12·31
20–25	12·88	8·92	49·6	8·32	9·92	23·62
25–30	10·17	6·24	21·84	9·02	8·98	16·9
30–35	11·51	6·82	19·17	9·87	9·36	15·03
35–40	13·15	7·52	17·50	10·87	9·29	12·73
40–45	16·62	9·55	18·89	13·28	10·14	13·30
45–50	19·60	11·47	22·2	15·71	10·69	15·20
50–55	25·8	15·61	26·8	20·97	14·11	18·71
55–60	32·1	21·5	34·17	26·90	19·29	24·47
60–65	45·92	32·6	47·5	40·52	30·75	37·07
65–70	58·5	44·8	62·97	58·3	45·3	53·5
70–75	85·1	71·5	95·4	85·5	72·69	86·1
75–80	123·0	114·5	143·9	140·5	109·4	126·7
80–85	202·7	182·8	221·8	222·5	172·5	198·0
85–90	268·4	228·6	263·05	305·0	205·1	264·0
90–95	282·0	279·0	319·0	314·1	256·3	308·0
95–	480·0	357·0	385·0	387·7	416·0	324·0

It can also be shown by statistics that insanity, intemperance, suicide, crime, and deaths from certain forms of disease, as for instance, cholera, are less frequent among the married than among the unmarried. It does not, however, follow that these differences in death-rates, and the correspondingly greater longevity of married persons, are due wholly, or even partially, to marriage, or that marriage is a means of preventing disease and prolonging life to the extent which figures might seem to indicate. Normal, healthy, energetic men and women are more likely to marry than those who are deformed, feeble, or affected with chronic disease, and therefore their death-rates should be lower. This will probably not account for all the difference, the married state being somewhat healthier than the unmarried, especially for males. The excess of mortality is greater in monks than it is in nuns. The death-rate of both youths and girls who marry before twenty years of age is very high; and such marriages are, in almost all cases, unadvisable on hygienic grounds, especially for girls, who are liable to become chronic invalids as the result.

So far as health only is concerned, the best age for marriage in the U. S. is for males from 23 to 26 years, and for females from 21 to 25 years. The probabilities of offspring are decidedly affected by the age at which marriage takes place; thus of males under 30 years of age marrying, about 84 per cent. have children, while of males marrying between 40 and 50 years of age, 67 per cent. have children; and of females marrying at the age of from 20 to 25 years, 85 per cent. produce offspring, while of those marrying between 33 and 37 years, 50 per cent. have one or more children. The special dangers to health connected with married life affect the woman, as a rule, more than the man; they are due chiefly to the transmission of disease from the husband, and to the perils connected with pregnancy and childbearing.

The health of the children depends to a considerable extent upon the health of each parent, and to some extent upon their relationship and relative race, but the popular belief that the marriage of near blood relations tends to produce certain degenerations and deformities in the children is, in the main, erroneous.

The results upon the offspring of consanguineous marriages depend, not on the consanguinity, but on the health of each parent. If in each parent—no matter whether they are blood relations or not—there is a tendency, small or great, to abnormity of structure or function of some organ or system of organs, that tendency will be, as a rule, increased in the children, and thus such affections as gout, insanity, deaf-mutism, tubercular disease, or deformities of various kinds may be directly or indirectly produced or aggravated; but in a consanguineous marriage the risk of transmitting and increasing a family tendency or taint is evidently somewhat greater than in a marriage between persons not related. It may be said that the possibility of transmitting good conditions of certain organs is also greater; and this is true, as has been shown by Francis Galton in his studies on natural inheritance, but it must be remembered that the strength of a chain is measured by that of its weakest link, and that the fact that certain links or parts of links have been thickened or strengthened avails nothing to prevent the catastrophe resulting from the thinning or weakening of other links or parts of links. The marriage of people of different races sometimes produces a healthier and at other times a more sickly offspring. The general rule appears to be that the first results of the cross are often strong and healthy, but that these must marry among the purer blood to secure a perpetuation of healthy offspring. The children of mulattoes of the second or third generation do not seem to be so healthy as those of the original races, but definite statistics on this point, covering numbers sufficiently large to make the results reliable, have not as yet been obtained.

J. S. Billings.

Marriage Settlement: See the Appendix.

Married Women: By the celebration of the marriage contract, the parties, as already stated (see Marriage), place themselves in a new status or condition both as regards each other and as regards the public in general; and the capacities, rights, and relations of the parties arising out of that status are regulated by the general rules of law relating to marriage, and, with the exception of their mutual property rights, can not be varied by any act or agreement of the parties made either before or after the marriage contract. (See *Property Rights*, below.) That is, they can not give to the one or the other the right to do or refrain from doing any act or duty denied or enjoined by the general laws regulating the personal rights and duties of the parties standing in the marriage relation. Thus the husband can not by any agreement between himself and his wife, either before or after marriage, waive his right to change his and her domicile, or avoid such liability for her debts as the law imposes.

These capacities, rights, and relations are so many and so varied in their nature, and the laws relating to them are so manifold and complex, that the most that can be attempted in the space here available is to give a summary statement of the general rights and duties of the husband and wife with respect to each other and to third persons, omitting whatever is technical, exceptional, or obsolete in character. The confusion due to the wide reach and complexity of these laws is increased by the important changes which they are now undergoing by reason of the influence of changing public opinion, the numerous and uncertain changes made by statute, and in some of the U. S. by reason of the presence of conflicting systems of law relating to the same subject-matter. The laws which still form the basis of the jurisprudence of England (and Ireland) and the U. S. on this subject are those of the common law of England, and, except where it is otherwise stated, these alone are referred to in this article. The laws of Scotland do not differ from those of England sufficiently to make necessary a separate statement of them. The community system (which is an outgrowth of the Roman law) will be only briefly referred to under *Property Rights* (below); and statutory changes will be mentioned only so far as it is possible to state their general tendency. They are so varied, contradictory, and often uncertain, that more is impossible here. The general results of marriage upon the rights and capacities of the parties may be considered with respect to—

The Names of the Parties.—The husband retains his name unchanged, but the legal surname of the woman is immediately changed to that of her husband, and this continues to be her name until she is lawfully married again, or until she acquires or lawfully assumes a new one. See Names, Law of.

The Personal Rights.—These have been but little changed by statute, but such changes in law as have taken place have mostly arisen from the growing disposition of the courts to look upon the parties as standing upon an equality, following the change of public opinion as to the proper degree of independence to be asserted by and accorded to the wife. The entrance upon the marriage status necessarily imposes certain restraints upon the personal liberty of both of the parties. They are mutually bound to live in the society and companionship of one another as husband and wife, and a refusal so to do is a breach of the marital duties and may amount to what will be construed to be legal desertion, or to be such cruelty as will justify a divorce, where cruelty is a ground for divorce. What degree of default or misconduct by either party shall constitute a refusal of such society or companionship is necessarily incapable of any exact definition, mutual love and affection, solicitude for the welfare of offspring, and self-respect being, in the nature of the case, much more efficient than any interference of the law in regulating the conduct of the parties.

The old common law in England recognized the right of the husband to correct his wife by corporal punishment, and to restrain and regulate her in her actions in many ways which would now be considered brutal, and be held unlawful. He can not to-day lawfully inflict actual vio-

lence upon her nor forcibly keep her a prisoner against her will. He may, however, if possible, in any reasonable manner not amounting to force, as by moral coereion, regulate the going or coming of his wife, and under certain circumstances the application of gentle force or passive restraint might be justifiable, sinee the law is loath to interfere between husband and wife except upon clear neecssity. Guardianship over the persons (and in some plaees the property) of minors ceases upon marriage. See GUARDIAN.

The Home or Domicile, and its Government.—The husband has the legal right to fix the place of domicile, and any refusal of the wife to live in the place chosen by the husband is a desertion by her. His domicile is hers, and it is her legal duty to reside with him wherever he sees fit to live, and so long as they remain married she can not by living in a jurisdiction other than that of his domicile aequire there a legal domieile, except for the purposes of obtaining a divorce or some other redress for a breach of marital duties by him. In the application of this rule, however, the courts at present would be less harsh than formerly in England, and would not force upon the wife a change of domicile not made by the husband in good faith. Since many of the rights and capaeities of the wife depend upon her domicile, this is often a question of importance. See DOMICILE.

The citizenship, like the domicile, of the wife is the same as that of the husband, so that if an alien woman marry a citizen of the U. S. she becomes thereby a citizen of the U. S., and when both are aliens the wife becomes a citizen at the same time her husband does by his naturalization.

In the regulation of the household the voice of the husband is supreme, the extent to which he may go in asserting his right being limited only by the endurance of the wife, providing that he keep within the bounds of what the law construes to be such cruelty as will enable the wife to demand and receive a support separate from him or to obtain a divorce. This varies greatly, and what would be considered his legal right in the matter in England, where the law is still strict in the recognition of this right of the husband, might suffice in some of the U. S. to enable the wife to obtain one or the other of the above-mentioned remedies.

Support by the Husband and Services by the Wife.—The husband is bound to provide a home and support for the wife and their offspring whieh shall be in keeping with his circumstanees and means in life; and the wife on her part is bound to render sueh domestic services as these circumstances and means render reasonable, and to accommodate herself to whatever unfortunate vieissitudes may attend him. She can not in any case claim compensation out of his estate for serviees rendered to him.

Whenever the husband refuses to support his wife in a manner suitable to his circumstanees and condition in life, she by operation of law becomes his agent with power to pledge his credit and make him liable for obligations incurred by her in purchasing such things as may be neeessary for such support, even to one who supplies them against his express orders. If he offers her a home and support such as he deems consistent with and suitable to his means and station, in order to make him liable there must be very strong evidence to prove that his judgment was perverted or merely one simulated for sinister motives, since it is the policy of the law to allow him great discretion in deciding what expenditures are and what are not warranted. If he offer her a suitable home and support, but by his conduct make it impossible or intolerable for her to accept it, she is not bound to accept of it, but may leave the home and pledge his credit as fully as if he had refused to support her. In any case, however, those who furnish her necessaries do so at their own peril of being able to prove that the facts were such as to justify them, and what are necessaries must be determined by the exigencies of each case, depending upon the means and position of the husband.

Property Rights.—At the common law the celebration of the marriage vests in the husband (1) absolutely, all of her personal property in her possession, and the right during the marriage or as administrator after her death to appropriate or reduce to his possession all of her choses in action (bills, debts due her, etc.), her leasehold estates, and her personal estates in expectancy. What constitutes a reduction to possession varies with the circumstances, but the general statement is that the husband must acquire the title to the property by the exercise of acts of ownership intended to produce that result, and that mere actual possession by him is not sufficient unless accompanied with the intent to become the owner of the property. The chattels real (leases, estates for years, etc.) of the wife are exceptional, in that upon her death his title to them is absolute without any act of ownership on his part, and upon his death they vest absolutely in her unless he has during coverture made an absolute alienation or disposition of the whole term. (2) The right to manage and receive as absolutely his own the profits of her real estate during their joint lives, and after her death the right to the life estate of curtesy therein, he surviving and having had issue by her during her life. (See ESTATES.) Of this property the wife upon the death of her husband receives back absolutely as her own her real estate, such personal property as he has not by some act appropriated as his own, and her personal ornaments and clothing suitable to her condition, known as her *paraphernalia*.

Property acquired by the wife subsequent to marriage is governed by the same rules as that held by her when married, and so at the common law (which has generally been abrogated in this respect) the earnings of the wife in whatever capaeity belong absolutely to the husband, and he (or his agent) alone can receipt for them. These rights of the husband do not, however, extend to the property placed in trust for her sole and separate use; and equity abridges them with respect to her other property by protecting and enforcing any marriage settlements made between them, her equity to a settlement, and her right to a similar settlement of a proportion (usually a half) of property coming to him in her right during marriage.

While at the common law, as just stated, all of the wife's property held by her absolutely goes to her husband, at equity she may have a separate estate (i. e. an estate limited to her sole and separate use; see USES and TRUST) whieh she may manage, and with reference to which she may contraet, and sue and be sued, in her own name, in a manner mueh the same as if unmarried. The doctrine of the separate estate of the wife is a eomparatively late development of the equity courts of England; and in the U. S., owing to the lack of courts with equitable jurisdiction, the subject has generally been regulated by statutes, which have in general gone further than the equity doctrine in recognizing the wife's separate estate, and have in many States provided that the property of a woman married thereafter, or thereafter acquired by a married woman, should remain her separate property, giving her all or practically all of the powers of an unmarried woman with respect to it. The separate property of a married woman may be given to her by third parties, or it may be settled upon her by her husband by a contract (*post-nuptial settlement*) which is binding upon him exeept it be in fraud of third parties, the consideration of love and affection being sufficient to make him a trustee of the property for her.

The parties to a marriage may, however, by a contract (*marriage settlement*) in the nature of a conveyance or trust deed, entered into or agreed to be entered into (by promises and agreements called *marriage articles*) before marriage, vary their mutual property rights from those which they would otherwise have by operation of law. The eonsideration of such a contract may be either the promise of marriage itself (as is more often the case) or any other valuable consideration. The marriage settlement by its terms secures land or trust property as a provision for the widow (usually as a jointure in lieu of dower; see JOINTURE) and for the children, and (sometimes) for the husband. Such a settlement may be made or promised by third parties upon the consideration of the promise of marriage, and is then enforceable against them. The object of making a marriage settlement is frequently to preserve intact family estates.

The wife, on her part, obtains by the marriage no interest in or right of control over the property of the husband, except a certain right of inheritance to a share in his personal property (which he may generally defeat by will, except as to the paraphernalia), and the right to DOWER (*q. v.*).

These property rights of the husband and wife have, however, been very generally changed both in Great Britain and in the U. S. by statutes which more or less completely take away the rights of the husband to the property of the wife (enabling her to restrain and manage as her own with some or all the powers of an unmarried woman the property, real or personal, which belongs to her at the time of marriage, leaving untouched the common-law rights of dower and curtesy, or substituting for them some statutory equivalent), and which give a corresponding exemption to the husband from liability for the ante-nuptial debts of the wife.

Ante-nuptial Debts of the Wife.—The husband, whether infant or adult, immediately upon the marriage becomes jointly

liable with the wife for all her outstanding debts and obligations (whether arising from contract or tort), whatever be their amount and however little property she brings to him, even notwithstanding that he may have been purposely kept by her in ignorance of her debts. This liability continues, however, only so long as coverture lasts, neither he nor his estate being liable unless the debt or obligation is brought to judgment before the termination of the marriage by the death of either party or by divorce. Her liability revives immediately upon such termination to the same extent that it existed previous to the marriage; and upon her death, leaving him surviving, any choses in action not reduced to possession by him during her lifetime become liable for the payment of the debts, even though they be in his hands as her administrator.

Torts and Crimes of the Wife.—For the frauds and torts of the wife committed during coverture the husband is jointly responsible (in damages only) in an action which must be brought against them both as codefendants, and to charge him must be brought to judgment during coverture. If she commit a tort or crime in his presence (actual or constructive), it is *prima facie* presumed that she does it under coercion by him, and he alone is liable; but this presumption may be rebutted by evidence showing that she was under no coercion. In the case of crimes of the most heinous character, such as treason, murder, and robbery, the presumption of coercion does not exist, and in any case the general tendency is to hold the wife alone responsible, unless the husband is near enough to exert such influence as amounts to coercion.

Torts against the Wife.—As a natural result of the wife's incapacity to acquire personal property of her own during coverture, she can not during coverture recover damages for torts against her person or character committed during that time. Her husband, however, may bring suit in his own name for injury done him by reason of his being deprived thereby of her services or her society and companionship; and with her as coplaintiff he may sue for and recover damages for such injury as she herself has sustained. If the marriage be terminated, she surviving, before judgment is taken, the right survives to her, and she may recover the damages for herself.

Agency of the Wife.—The wife may be the agent of third parties in the same way that any other person may be, so long as such agency charges her with no obligations. She may be also the agent of her husband in the same way, and she practically always is his agent for the purpose of purchasing articles for use in the family. If the articles so purchased are not such as the law holds to be necessities for her support (see above), the question as to whether the husband is bound by the acts of the wife in making such purchases is governed by the same rule which governs in the case of any other agency—namely, whether as a matter of fact he had made her his agent for the purpose, or so acted as to estop himself from denying that she was his agent. The simple fact that the two live together as husband and wife is ordinarily held to raise a presumption that she is actually invested by him with the authority ordinarily bestowed upon the wife, and is rightfully making such purchase as she deems necessary. As a rule, a husband who supplies his wife with reasonable necessaries may prohibit third persons from selling to her on his credit, but actual notice is necessary to be effectual, and a newspaper advertisement of warning (in the absence of statutory provision to the contrary) will not be sufficient, except to those who have had actual notice thereby.

Wife's Capacity to Make a Will.—At the common law a married woman can not by will dispose of her fee to real property held by her husband by virtue of their marriage, she being denied this right by the Statute of Wills (32 Henry VIII., c. 1) and a subsequent statute (34 Henry VIII., c. 5). Neither can she by will abridge the rights of her husband to her personal property; but a will of hers disposing of her choses in action is valid upon her death, unless her husband asserts his right to them by reducing them to his possession. Her separate estate, however (see *Property Rights.* above), she is free to devise in any way she sees fit, and statutes have now very generally been passed removing her incapacity with respect to her other property.

Capacity of the Parties to Contract.—The capacity of the husband to make contracts with third parties is as full after marriage as before. The wife, on the other hand, at the common law is totally incapable of contracting either alone or in conjunction with her husband (except in certain special cases, as in case of the CIVIL DEATH (*q. v.*) of the husband, or of some special custom (as that of sole traders in London), and any contract entered into by her during coverture is absolutely void, binding neither her nor her husband, and not being made enforceable against her by her subsequent promise made after the termination of coverture, if this promise be without consideration. In equity, however, she may make contracts which are binding upon her separate estate, and which will be enforced against it in an action IN REM (*q. v.*). Her common-law capacity, however, has now been very much enlarged, both in Great Britain and in the U. S., by statutes expressly enabling her to contract, and by separate-property acts enlarging her capacities by implication. In England, as a consequence of her general disability to make a contract, the wife could not convey her dower interest in the estate of her husband, even by joining with him in a deed of conveyance, but only by the methods of a fine and common recovery, in which the husband must be a joint party. (See FINE and RECOVERY, COMMON.) In the U. S. fine and recovery have never been recognized, but either by legislation or by early colonial usage the wife may bar her dower by joining with the husband in due form in conveying the land, but she thereby merely releases her dower right therein, and is not bound by any covenants made in the deed of conveyance.

At the common law neither husband nor wife can contract directly with the other, but through the intervention of third parties the husband can validly contract with his wife, while her general disability to contract prevents her from contracting with him to the same extent as with any other person. Wherever, therefore, a third party can be interposed she may bind her separate estate in transactions with him as with any other person, although such transactions would be readily set aside by a court of equity upon any suspicion of fraud or undue influence on his part. Equity courts, however, will give effect, as against the husband, to many transactions made directly between them, such as the conveyance of lands to her for a money consideration or as a reasonable provision for her, by making him her trustee.

Incapacity to Testify.—Neither a husband nor a wife is competent to testify in any action or cause, civil or criminal, in which the other is a party, or in which the result of the decision will be to fix the interests or liability of the other, though not a party. An exception is made to this rule in certain cases where public policy requires it, as in those cases where the testimony of one party is necessary to afford protection from personal injury by the other, or is necessary to make it possible to obtain such redress as the law affords for wrongs at the hands of the other. Either party, however, may testify in collateral proceedings, that is in proceedings not immediately affecting the interests of either of them, even though such testimony may tend to incriminate the other. This rule rests partly upon the common-law rule, which precludes a party from being a witness in his own behalf (the legal interests of husband and wife being identical), and partly upon public policy, which forbids any violation of the confidence and fidelity to one another which the interests of society demands should exist between them. For this latter reason neither party is allowed to testify to any matters communicated to the other during the continuance of the marriage, even though neither of them be a party to or interested in the action. Neither this or the preceding disability can be waived by the parties, nor is either removed by the termination of the marriage. In Great Britain and in many of the U. S. statutes have been passed removing to a greater or less degree the disability to testify based upon the interest of the parties (especially in civil cases), but generally confirming the rule of the inviolability of communications made during marriage.

Legal Remedies against each other.—Formerly in England, by a resort to a suit for the "restitution of conjugal rights," an order could be obtained commanding a married person unreasonably refusing cohabitation to return thereto, for disobedience to which order such party was liable to be imprisoned for contempt of court. This action no longer exists as such there, nor has it ever been recognized as in force in the U. S., so that there is no way of enforcing the specific performance of the duties of marriage except by compelling a defaulting husband to support the wife separate from himself, and by refusing to a defaulting wife the right to support by her husband, and by standing ready to grant to either party a divorce from the other for such default or misconduct as the law of the domicile makes a ground for

divorce. At the common law neither party can sue the other, for they both constitute but one person at law, so that for injuries by one to the person or property of the other no suit in damages can be maintained; but resort for protection must be had to the criminal law, where for this purpose either is a competent witness against the other. Equity, however, and modern statutory law have worked a change in this matter (thus a wife may bring an equitable action against her husband for the enforcement of her equity to a settlement and to enforce other equitable rights); and by some statutes she is permitted to bring an action at law against her husband for damages to her separate estate.

F. Sturges Allen.

Roman and European Law.

In the *Roman law* the wife *in manu* was as completely subjected to her husband's authority as were his children. Her legal position was that of a daughter. Whatever property she possessed before marriage or acquired after marriage was his. On the other hand, if the wife survived the husband she had an equal share with their children in his estate. With the disappearance of the *manus*-marriage, the position of the wife was radically changed. The husband acquired no rights over her property. It was usual, however, since the husband was still reponsible for his wife's maintenance, for the bride's father or the bride herself to place in the bridegroom's hands a dowry (*dos*), the yield or income from which was to be used for "defraying the expenses of matrimony." On the dissolution of the marriage by the death of either party, or by divorce, the husband or his heir was regularly bound to restore the dowry or its equivalent to the wife or to her heirs.

It was also customary for the bridegroom to settle property upon the bride (*donatio ante nuptias*). This settlement was usually equal in amount to the *dos*, and as in the case of the *dos*, the income was intended to be used in meeting the expenses of the marriage. The principal, however, was intended as a provision for the wife in case of the husband's prior decease, for with the disappearance of the *manus*-marriage the widow had lost her right to a daughter's share of her husband's estate. This settlement, until the time of Justinian, had to be made before marriage, because gifts from wife to husband or from husband to wife were invalid.

The later form of Roman marriage imposed no restraints upon the personal liberty or capacity of the married woman. The husband had a summary remedy against any third person who deprived him of his wife's society (*interdictum de uxore exhibenda*), and this ran even against her father; but he had no power to force his wife to live with him against her will. Certain limitations were imposed upon the capacity of women to bind themselves by contract, but those affected all women, married or unmarried, and were mainly intended for their protection.

Mediæval Law of Europe.—In early Teutonic law, at the period when wife-purchase had become a mere ceremony, the portion (*Ausrade, Aussteuer*) which the wife brings with her from her father's house and the property settled upon her by the husband (*dos* or dower in the English sense, German, *Witthum*) constituted a sort of common *family estate*. It was all in the seizin (*saisina, Gewere*) of the husband, but the realty at least was tied up (*verfangen*) so that the husband could not destroy the eventual rights of his widow and children. On this basis there grew up, in Germany, the Netherlands, and Northern France, a great variety of local customs. German writers divide these customs into two or three principal groups, according to the greater or less stress laid upon the union of the husband's and the wife's property, the greater or less power of disposal attributed to the husband, and the extent to which the rules governing the joint property survive the dissolution of the marriage and modify the law of inheritance. These groups are (1) community of goods (*Gütergemeinschaft*), a sort of joint-ownership, and (2) common administration (*Verwaltungsgemeinschaft*, or *Gütervereinigung*), under which the wife's portion remains, in theory at least, her property. Under both systems the husband's power to dispose of movable property is practically unlimited, but his power to alienate realty is restricted. Under both systems the wife has no power to dispose of property, or to contract debts except in ordinary household affairs (*Schlüsselgewalt*). Under the system of full community the joint property is liable for the debts of each party; under the other system the wife's realty is not liable for the husband's debts. In many localities the second system is applied to the property which the wife has brought into the marriage, and the first system to later acquests (*partikuläre Gütergemeinschaft*). In the later Middle Ages, under the influence of Roman ideas, the second system was sometimes modified by declaring that the husband's powers are simply those of a usufructuary (*ususfructus maritalis*). After the marriage is dissolved by the death of either party, the complete or limited community often continues between the surviving spouse and the children. If there are no children, and if complete community existed, the surviving spouse sometimes takes half and sometimes all of the joint property. In the case of *Verwaltungsgemeinschaft*, the childless widow usually takes out of the estate what she brought into it and whatever was specially settled upon her.

With the reception of the Roman civil law at the close of the Middle Ages the system of separate property (*séparation de biens, Gütertrennung*) and the Roman *dotal system* obtained sporadic recognition in Northern and Northwestern Europe. In Southern Europe the Roman ideas, though modified by local usage, had remained dominant through the Middle Ages.

The provincial customs of the Middle Ages and the legislation of modern European states have developed endless variations and combinations of the systems above described. In the German empire at the present time (1894) there are said to be about 100 distinct systems.

Modern Legislation.—In all modern legislations the law of matrimonial property is merely subsidiary law, i. e. it takes effect only in the absence of ante-nuptial contract. In the codes of Austria and Italy the law is substantially Roman. The provisions of the French law represent a compromise between the Roman and the Teutonic systems. In the absence of any contract the *Code Napoléon* subjects the wife's property to a system of partial community (community of movables and acquests), but it lays down special rules for a community limited to acquests, for complete or "universal community," for complete separation of property, and for the dotal system; and it provides that the parties may elect any one of these systems by ante-nuptial contract—unless they prefer to make other arrangements. The German draft code proposes a similar compromise; but in the absence of special contract it proposes to place the wife's property in the administration and usufruct of the husband.

Under any system of community the power of the married woman to dispose of property and to contract debts is of course, restricted. Even under the system of separate property, the older codes imposed restrictions upon the wife, but the tendency of modern legislation is to remove them. The German draft code requires the consent of the husband only when the wife contracts to render personal service.

As regards the personal relations of husband and wife, European law generally recognizes a superior authority of the husband in matters of common concern. He determines the place of residence, and except in case of separation, or of desertion of the wife by the husband, her domicile is necessarily his. He has usually an action, not merely against third persons, but against the wife for "restitution of conjugal rights": but the tendency of modern legislation is to exclude the forcible execution of a judgment in his favor.

Marrow [Lat. *medulla*; M. Eng. *marou, mary* < O. Eng. *mearg*: O. H. Germ. *marg* > Mod. Germ. *mark*, marrow; cognate with O. Sloven. *mozgŭ*, Avest. *mazga*, Sanskr. *majjan*, pith, marrow]: the substance which fills the central canal of the long bones of the adult, the largest of the Haversian canals, and the hollows in cancellous bone. In the cavities of long bones of the adult it is of the yellow or fatty variety, of which 96 per cent. is fat: in the young subject and in some of the bones of the adult, it is of the

red and watery variety, which is almost without fat. The latter form is active in the production of the red corpuscles of the blood, and therefore is most abundant in that time of life—viz., embryonal life—when blood formation is most active. In cases of severe anæmia, after hæmorrhages, etc., the same necessity for rapid production of blood exists, and the marrow returns from its fatty character to the red or fœtal condition. The red character of the marrow is therefore a feature in pernicious anæmia, in leukæmia, in the cachexia of cancer, and in other conditions.

Marrow Men: certain Scotch Presbyterians who defended the book *The Marrow of Modern Divinity*. See PRESBYTERIAN CHURCH.

Mar'ryat, Capt. FREDERICK: novelist; b. in London, England, July 10, 1792; entered the British navy in 1812 as a midshipman; took part in many naval engagements with the French, gaining great credit by rescuing drowning shipmates on more than one occasion; served on the American squadron 1812–15; was engaged in the action on Lake Pontchartrain in 1814. Having attained the rank of captain and the command of a vessel in the Channel squadron, he began in 1829 the publication of a series of nautical romances which proved a brilliant success. The first was *Frank Mildmay; or, The Naval Officer*, followed in the next year by *The King's Own*. He wrote in all twenty-four novels; *Snarley-yow* (1837) is generally considered the best. He was also the author of a *Code of Signals for Vessels employed in the Merchant Service* (1837); of a record of travel in the U. S., *A Diary in America, with Remarks on its Institutions* (1839); and of numerous miscellaneous works. D. at Langham, Norfolk, Aug. 2, 1848. See his *Life and Correspondence* (2 vols., 1872), by his daughter Florence, later Mrs. Francis Lean, who also wrote several successful novels. D. Oct. 27, 1899.

Revised by H. A. BEERS.

Mars [Lat., derivation disputed, cf. form *Mavors* perhaps > **Mac-vors* (Gr. *μάχ-η*), the fighter]: next to Jupiter the principal national god of the Italic peoples, and, under the name of QUIRINUS (*q. v.*), worshiped as the father of Romulus and ancestor of the Roman people. He seems to have been conceived of not only as a god of war and strife, but also as a god of nature, especially of the awakening year, bestowing fertility upon fields and flocks. This is indicated by the fact that March (*Martius*), the first month of spring and the beginning of the old Roman year, was sacred to him, as well as by other evidence, especially certain rites connecting his worship with Juno as goddess of marriage and birth. At a later time familiarity with Greek mythological ideas caused him to become identified with ARES (*q. v.*), and henceforth his character as a war-god became more sharply defined. In this capacity he was characterized especially by the epithet *gradivus* (i. e. who strides to the fray), which seems to have been used in the worship of Mars by the college of the SALII (*q. v.*). The most important and most sacred celebrations in his honor took place in the month of March, and were performed especially in the sacred field of Mars (*Campus Martius*) between the city and the Tiber on the north. From the time of Augustus, who founded the magnificent temple of Mars in the Forum Augusti, he was worshiped as the avenger of the murder of Cæsar (*Mars Ultor*). The symbols or characteristic attributes of Mars were the wolf, the woodpecker, and the spear.

G. L. HENDRICKSON.

Mars [named from the god MARS (*q. v.*)]: the nearest of the superior planets; his orbit being next outside that of the earth, and the fourth in order of distance from the sun. There is no planet which can be studied under such favorable circumstances as Mars; for, though Venus in inferior conjunction is nearer to us than Mars in opposition, yet Venus then turns her darkened hemisphere toward the earth. Accordingly, ever since the invention of the telescope, Mars has been a favorite object of observation. So far back as 1643 Fontana, of Naples, detected spots on the surface of Mars, and suspected the planet's rotation. Cassini's more trustworthy observations were commenced in 1666 in Bologna. In about a month he had satisfied himself that the planet rotates on its axis once in 24h. 40m. Astronomers at Rome, however, assigned a rotation-period of only 13h., which Cassini explained by showing that they had mistaken two opposite faces of the planet (not greatly unlike) for one and the same aspect. The period of rotation of Mars on his axis is now fixed at 24h. 37m. 23s.

In 1877 Schiaparelli, at Milan, thought that he detected a network of fine lines, which he called canals, passing over the equatorial regions of the planet. Their nature is still an open question. As they must be at least 60 miles wide, the term "canals" seems a misnomer.

Among the markings of Mars, a whiteness around the south pole of the planet had been already noticed for sixty years when Maraldi first paid special attention to the peculiarity. He found that the outskirts of this white region were subject to notable variations, and even while his observations were in progress the fainter portion of the spot disappeared. At this time the northern polar regions had not been carefully examined, being, in fact, only brought favorably into view, as regards the position of the polar axis, when Mars is near his aphelion, but Sir W. Herschel, whose powerful telescope enabled him to disregard the planet's changes of opposition-distance, detected a similar whiteness around the northern pole of the planet. He was soon led to ascribe the peculiarity to the probable existence of ice and snow around the polar regions of Mars. "The analogy between Mars and the earth," he wrote, "is perhaps by far the greatest in the whole solar system. Their diurnal motion is nearly the same, the obliquity of their respective ecliptics not very different; of all the superior planets, the distance of Mars from the sun is by far the nearest alike to that of the earth; nor will the length of the Martial year appear very different from what we enjoy when compared to the surprising duration of the years of Jupiter, Saturn, and the Georgium Sidus. If we then find that the globe we inhabit has its polar region frozen and covered with mountains of ice and snow, that only partially melt when alternately exposed to the sun, I may well be permitted to surmise that the same causes may probably have the same effect on the globe of Mars; that the bright polar spots are owing to the vivid reflection of light from frozen regions; and that the reduction of these spots is to be ascribed to their being exposed to the sun."

Satellites of Mars.—In Aug., 1877, Prof. Hall, of the U. S. Naval Observatory, discovered two satellites of Mars. They are so minute as to be visible only with very powerful telescopes. Their most remarkable feature is the rapid revolution of the inner one, which takes place in less than eight hours, so that to an inhabitant of Mars it rises in the west and sets in the east.

Revised by S. NEWCOMB.

Mars, ANNE FRANÇOISE HIPPOLYTE BOUTET-MONVEL: actress; b. in Paris, Feb. 5, 1779; a daughter of Jacques Monvel, acting at the Théâtre Français, and Mars-Boutet, acting at the theater of Versailles; entered very early on the stage; made in 1800 a great impression by her presentation of the deaf and dumb girl in *l'Abbé de l'Épée*; was soon acknowledged as the greatest actress ever seen in certain *rôles*, the so-called *grandes coquettes*, Agnès, Célimène, Elmire, etc.: achieved a triumph by her impersonation of Gabrielle de Belle-Isle, a girl of twenty, herself being sixty; retired from the stage in 1841, honored, admired, and rich. D. Mar. 20, 1847.

Marsa'la [from Arab. *Mersa 'Ali*, liter., port of 'Ali]: a maritime town of Sicily; in the province of Trapani; about 19 miles S. S. W. of the port of Trapani; in lat. 27° 47′ N., lon. 30° 05′ E. (see map of Italy, ref. 9–D). The back country is fertile, the town itself well built and well fortified, and the public edifices contain many objects of historic and artistic interest. The splendid harbor was destroyed in 1567 in order to prevent it from being occupied by Turkish pirates. The port has been reconstructed, and the city is now flourishing. Its trade consists chiefly in marsala wine, which much resembles sherry, and is a favorite in Great Britain. Marsala occupies nearly the site of the old Carthaginian *Lilybæum*, and here are curiously painted sepulchers cut in the solid rock, the ancient Grotto of the Sibyl with its prophetic well, rare old mosaics, etc., which may be seen outside the western gate. May 11, 1860, Garibaldi landed here with his heroic thousand, and began the romantic campaign which so ignominiously terminated the kingdom of the Two Sicilies. Pop. 19,732.

Marsch'ner, HEINRICH: composer; b. at Zittau, in Saxony, Aug. 16, 1796; studied law for some time at the University of Leipzig, but devoted himself exclusively to music after 1817, when he composed his first opera; became in 1823 musical director of the opera at Dresden; went in 1831 to Hanover as chapel-master to the king. D. there Dec. 14, 1861. Of his numerous compositions, the two operas *The Vampyre* (1828) and *Hans Heiling* (1833) were well received, and are still often performed in Germany.

Mars'den, Samuel: missionary; b. at Horsforth, near Leeds, England, July 28, 1764, of humble parentage; was at first a tradesman at Leeds and a member of the Wesleyan Methodist Church, but after some years joined the Church of England, prepared for the ministry at St. John's College, Cambridge, and in 1794 went as chaplain to the recently established penal colony at Parramatta, near Sydney, Australia. After a visit to England he purchased a small vessel, the Active, at his own expense, and went to New Zealand, where he was well received by the natives. Marsden continued to reside in Australia, but visited New Zealand at intervals; in time persuaded the natives to adopt a fixed form of government, provided for the preparation of a grammar and dictionary of the Maori language, and lived to see the islanders generally Christianized, and himself to be regarded as the "apostle of New Zealand." D. at Windsor, near Sydney, Australia, May 12, 1838. See his *Life* by J. B. Marsden (London, 1859).

Marsden, William, D. C. L.: Orientalist; b. in Dublin, Ireland, Nov. 16, 1754; entered in 1771 the civil service of the East India Company at Benecolen, Sumatra; became principal secretary to the colonial government; studied the Malay language and literature; returned to England in 1779; published a *History of Sumatra* (1782); a *Grammar and Dictionary of the Malay Language* (1812); a translation of *Travels of Marco Polo* (1817); and *Numismata Orientalia* (1823–25). In 1795 he was appointed chief secretary to the admiralty; in 1834 presented his fine collection of coins and medals to the British Museum, and his Oriental library to King's College, London. D. near London, Oct. 6, 1836. Revised by Benj. Ide Wheeler.

Marseillaise, măär'sā'yāz': the grand anthem of the French Revolution, composed, both words and music, in 1792 by Rouget de Lisle, an officer of artillery at Strassburg. It was called the war-song of the army of the Rhine. The name *Marseillaise* was given it in Paris from the incorrect report that it had originated at Marseilles.

Marseilles, măär-sālz' (anc. *Massilia*): principal seaport of France and capital of the department of Bouches-du-Rhône; on the northeastern shore of the Gulf of Lyons; in lat. 43° 18′ N., lon. 5° 22′ E. (see map of France, ref. 9–H). The old part of the city consists mostly of narrow, crooked, and even dirty streets, with a few spacious squares, and is separated from the new part, with its broad, straight streets and magnificent quays along the harbors, by an elegant avenue running from the Porte d'Aix, a fine triumphal arch at the northern entrance of the city, to the Porte de Rome, which to the S. leads into the Prado, the principal promenade. The most elegant part of the new city is the Cannebière, a street running from the above-mentioned avenue to the old harbor, and containing, besides several public buildings, the most prominent hotels and the most brilliant shops. The liveliest and most characteristic part of Marseilles is the quays, thronged with people from Algeria, Egypt, Syria, and all parts of Europe. Of the public buildings, none has any great architectural merit; the most remarkable are the cathedral, situated in the old town, on the site of an ancient temple of Diana, and the town-house, the Bourse, and the mint in the new town, but the whole city presents a picturesque aspect, rising amphitheatrically around the bay, and surrounded with hills covered with olive-groves, vineyards, and elegant villas. The educational and benevolent institutions are numerous. There are a library of 80,000 volumes, several active scientific societies, a hydrographic institution, a botanical garden, an observatory, a lyceum, an excellent medical school, several free industrial and commercial schools, an academy of Oriental languages, etc. The manufacturing industry is very flourishing, especially of soap, leather, glass, porcelain, liqueurs, etc. Its principal importance the city derives from its commerce, extending to all ports of the Mediterranean Sea. The old harbor comprises a basin 1,000 yards long, 330 yards broad, from 18 to 24 feet deep, covering an area of 70 acres, and capable of accommodating about 1,200 merchant vessels; it is defended by Fort St. Nicolas and Fort. St. Jean. The new harbor, La Jolliette, formed by a breakwater 1,300 yards long, was opened in 1855. Still more recently the basin called Dieu-Donné, admitting the largest men-of-war, was formed between the islands of Ratonneau and Pomègue, both fortified. Four lighthouses show the way into the harbors. In 1891 9,014 vessels, of 5,307,619 tons burden, entered the port, and 9,065 vessels, of 5,303,201 tons burden, cleared.

Marseilles was founded in the sixth century B. C. by Phocæans from Asia Minor. In the fourth century B. C. it sent its traders into the Baltic (see Pytheas), and had founded a number of ports in the Mediterranean Sea. In 49 B. C. it was conquered by Cæsar and united to the Roman republic; Cicero calls it at this time the Athens of Gaul. In the ninth century of our era it belonged to Burgundy, in the thirteenth to Provence; in 1481 it was united to France. During the Revolution it suffered severely from Fréron's atrocities, but it rose rapidly after the Restoration, and the conquest by the French of Algeria gave its commerce a powerful impulse. Pop. (1896) 442,239.

Marseilles: city; La Salle co., Ill. (for location of county, see map of Illinois, ref. 3–E); on the Illinois river, and the Chi., Rock Is. and Pacific Railway; 8 miles E. of Ottawa, the county-seat, 77 miles S. W. of Chicago. A dam nearly 1,000 feet long at the rapids of the river here affords the city excellent water-power, which is utilized in the manufacture of flour, paper, agricultural implements, and other articles. The city has several grain elevators, a large trade in grain, and three weekly newspapers. Pop. (1890) 2,210; (1900) 2,559.

Marsh, Alfred Henry: See the Appendix.

Marsh, Arthur Richmond: scholar; b. at Newport, R. I., Oct. 3, 1861; A. B., Harvard, 1883; Professor of English, University of Kansas, 1886–89; traveled in Europe 1889–91; Assistant Professor of Comparative Literature, Harvard, since 1891; author of articles and reviews in *American Journal of Archæology*, *Nation*, *Andover Review*, *Harvard Studies and Notes*, etc., and associate editor in charge of the department of foreign literature in the *Universal Cyclopædia*.

Marsh, George Perkins, LL. D: philologist and diplomatist; b. at Woodstock, Vt., Mar, 15, 1801; graduated at Dartmouth College in 1820; studied law at Burlington, Vt., and practiced at the bar; was elected in 1835 a member of the supreme executive council of the State; studied comparative philology, and printed privately a translation of Rask's *Icelandic Grammar* (1838); was a member of Congress from 1842 to 1849, when he was appointed minister resident at Constantinople; went on a special mission to Greece in 1852; traveled extensively in Europe; returned to the U. S. in 1854; published in 1856 *The Camel, his Organization, Habits, and Uses, considered with Reference to his Introduction into the United States*: served as railroad commissioner in Vermont 1857–59; delivered in 1859 a course of thirty *Lectures on the English Language* (published 1861) at Columbia College, New York, and in the winter of 1860–61 a second course on the same subject before the Lowell Institute at Boston, *The Origin and History of the English Language* (published in 1862); published in 1861 a largely annotated edition of the first volume of Wedgwood's *Etymology*. He also wrote *Man and Nature* (1864), which was reissued with important additions in 1874, with the title *The Earth as Modified by Human Action*. Mr. Marsh was appointed in 1861 U. S. minister to Italy, a post he retained till his death July 24, 1882. A revised edition of his complete works was published in 1885. His *Life and Letters*, compiled by his widow, were published in 1888. He had an extensive library of Scandinavian literature, part of which became the property of the University of Vermont.—His second wife, Caroline Crane, b. at Berkeley, Mass., Dec. 1, 1816, published in 1857 *The Hallig, or the Sheepfold in the Waters*, translated from the German of Biernatski, with a biographical sketch of the author, and in 1860 a volume entitled *Wolfe of the Knoll, and Other Poems*.

Marsh, Herbert, D. D.: bishop and biblical critic; b. at Faversham, Kent, England, Dec. 10, 1757; educated at St. John's College, Cambridge; studied theology at the Universities of Göttingen and Leipzig; published a number of pamphlets in German in defense of the war policy of England, which obtained him a pension from Pitt; returned to Cambridge in 1792, and published a translation of Michaelis's *Introduction to the New Testament* (4 vols., 1793–1801), accompanied by an extended commentary—a work which first made known in England the results of the biblical researches of the founders of the modern school of German criticism, and which accordingly excited discussion and provoked opposition from conservative English theologians. In 1807 Marsh became Lady Margaret Professor of Divinity at Cambridge, and published an extended *Course of Lectures on the Criticism and Interpretation of the Bible* (7 parts, 1809–23), consisting chiefly of a popularization of the views of German scholars. In 1812 he published a *History of the Transla-*

tions of the Scriptures; in 1813 *Horæ Pelasgicæ*; became Bishop of Llandaff 1816, of Peterborough 1819; wrote numerous minor treatises on theology, politics, and classical topics. D. at Peterborough, May 1, 1839. Bishop Marsh was the most learned and acute English theologian of his time, and excelled in polemics, biblical criticism, and linguistics. Revised by W. S. Perry.

Marsh, Othniel Charles, Ph. D., LL. D.: paleontologist; b. at Lockport, N. Y., Oct. 29, 1831. He graduated at Yale College in 1860 and at the Yale Scientific School in 1862, and from 1862 to 1865 studied in the Universities of Berlin, Heidelberg, and Breslau. Returning to the U. S., he was appointed Professor of Paleontology in Yale College in 1866, and retained that position until his death, in New Haven, Mar. 18, 1899. He devoted himself especially to the investigation of the extinct vertebrate animals of the Rocky Mountain districts, and nearly every year since 1868 organized scientific expeditions to those regions. In these explorations more than 1,000 new species of vertebrates have been discovered, many of which represent new orders and others not before discovered in America. Of these, more than 400 were described by Prof. Marsh in papers, most of which appeared in *The American Journal of Science*. These papers are more than 300 in number, the last of them, on *The Dinosaurs of North America*, appearing in 1896. Since 1876 he had been engaged in preparing a series of reports, to be published by the Government, giving full illustrated descriptions of his Western discoveries. The first of these, on the *Odontornithes*, or birds with teeth (34 plates), was issued in 1880, and a second memoir, on the *Dinocerata* (56 plates), appeared in 1884. In 1878 Prof. Marsh was president of the American Association for the Advancement of Science. Since 1882 he had been vertebrate paleontologist of the U. S. Geological Survey. In 1883 he was elected president of the National Academy of Sciences, and held that office until 1895. He was a fellow of the Geological Society of London, and received from it in 1877 the first Bigsby medal. He was also a member of many other scientific bodies. In 1866 he received the degree of Ph. D. from Heidelberg University, and that of LL. D. from Harvard.

Marshal [from O. Fr. *mareschal* > Fr. *maréchal*, together with Ital. *mariscalco*, Span. *mariscal*, etc., from the Teutonic; cf. O. H. Germ. *marahscalc*, M. H. Germ. *marschalc*, stable-keeper; *marah*, horse (cf. Eng. *mare*) + *scalc*, servant > Mod. Germ. *schalk*. A Low Latin translation, *comes stabuli*, has yielded also Eng. *constable*, Fr. *connétable*]: originally the person who had charge of the king's horses. When chivalry became the only important secular pursuit, and nearly all offices about the royal courts were filled by noblemen, the marshal's position became one of great importance, and finally in England there was appointed an earl-marshal, who at present has only a ceremonial dignity except as the head of the College of Heralds. The office is hereditary with the Dukes of Norfolk. In Scotland there was an hereditary earl-marischal of the Keith family, but the office is now in abeyance. There are also knight-marshals. The highest military title in most European armies is marshal (field-marshal, *maréchal de camp*, *Feld-marschall*, *Feldzeugmeister*). This title is of direct descent from feudal times, when the marshal was the king's esquire and commanded the advance-guard. The gradual increase of his authority in the army after a time led to the creation of a distinct military office of this name. In the U. S. a marshal is an officer of the U. S. courts, whose duties correspond to those of the sheriff of the State governments. There is one U. S. marshal in each judicial district. The title is also applied to the chief police officer of small municipalities.

Marshall: city; capital of Clark co., Ill. (for location of county, see map of Illinois, ref. 7–G); on the Cleve., Cin., Chi. and St. L. and the Vandalia railways; 16½ miles S. W. of Terre Haute, Ind. It is in a farming and stock-raising region; has flour and woolen mills and considerable mercantile trade; and contains 7 churches, high school, 2 grammar schools, and 4 weekly newspapers. Pop. (1880) 1,885; (1890) 1,900; (1900) 2,077. Editor of "Herald."

Marshall: city; capital of Calhoun co., Mich. (for location of county, see map of Michigan, ref. 8–I); on the Kalamazoo river, and the Cin., Jack. and Mack. and the Mich. Cent. railways; 108 miles W. of Detroit. It is in an agricultural region; contains 9 churches, 5 public schools, Roman Catholic school, and a daily and 2 weekly newspapers; and manufactures caskets, bicycles, school-seats, carriages, stoves, furnaces, and windmills. Pop. (1880) 3,795; (1890) 3,968; (1900) 4,370. Editor of "Chronicle."

Marshall: village; capital of Lyon co., Minn. (for location of county, see map of Minnesota, ref. 10–B); on the Redwood river, and the Chi. and N. W. and the Great N. railways; 150 miles S. W. of St. Paul. It is in an agricultural and stock-raising region; ships much wheat, flax, beef, and pork, and has a county court-house which cost $30,000, public high school, 2 grammar schools, 6 churches, steam-roller flour-mill, and 2 weekly newspapers. Pop. (1880) 961; (1890) 1,203; (1900) 2,088. Editor of "Reporter."

Marshall: city (founded in 1839); capital of Saline co., Mo. (for location of county, see map of Missouri, ref. 3–F); on the Chi. and Alton and the Mo. Pac. railways; 84 miles E. of Kansas City, 85 miles N. W. of Jefferson City. It is in an agricultural region; is the seat of Missouri Valley College (Cumberland Presbyterian); and contains 7 churches for white people and 4 for colored, 3 large public-school buildings, St. Xavier's Academy (Roman Catholic), a Roman Catholic convent, and 2 daily and 3 weekly newspapers. Pop. (1880) 2,701; (1890) 4,297; (1900) 5,086.
Editor of "Democrat-News."

Marshall: city; capital of Harrison co., Tex. (for location of county, see map of Texas, ref. 2–K); on the Tex. and Pac. and the Paris, Marshall and Sabine Pass railways; 40 miles W. of Shreveport, 250 miles N. E. of Galveston. It is in an agricultural and lumbering region, has numerous mineral springs and valuable deposits of iron in its vicinity, and is becoming an important manufacturing place. It contains the machine-shops of the Tex. and Pac. Railway, a car-wheel foundry, ice-factory, gin-factory, several saw, planing, and wood-working mills, furniture-factory, and cotton-compress. Marshall is the seat of Wiley University (Methodist Episcopal, opened 1873), of Bishop College (Baptist, opened 1881), and of a non-sectarian female institute. It has water-works supplied by artesian wells, 2 national banks, with combined capital of $175,000, and 2 daily and 2 weekly newspapers. Pop. (1880) 5,624; (1890) 7,207; (1900) 7,855. Editor of "Star."

Marshall, Alfred, M. A.: political economist; b. in England in 1842; was educated at Cambridge; was lecturer on Moral Science at St. John's College in that university 1866–67; was appointed principal of University College, Bristol, 1877; lecturer on Political Economy at Baliol College, Oxford, 1883; Professor of Political Economy, Cambridge, 1884. He is the author of *Economics of Industry* (1879) and *The Principles of Economics* (1890–91).

Marshall, A. Milnes, M. D., D. Sc., F. R. S.: naturalist; b. in England in 1852; entered London University, where he received the degree of B. A. in 1870; then entered St. John's College, Cambridge, in 1871, graduating as senior in the natural science tripos in 1874; studied at Dr. Dohrn's zoölogical station at Naples for a few months, when he returned to Cambridge to assist Prof. Balfour in organizing the classes of comparative morphology; was appointed Professor of Zoölogy at Owens College, Manchester, in 1879; was elected F. R. S. in 1885; entered St. Bartholomew's Hospital in 1887; and in the same year was elected a fellow of St. John's College, and in due time took the degree of M. D. at Cambridge. He received the degree of D. Sc. from London University. He took an active part in organizing the courses of study for the Victoria University. His most important publication is *The Frog: an Introduction to Anatomy and Histology* (London, 1883). D. Dec. 31, 1893.
S. T. Armstrong.

Marshall, Humphrey: soldier, lawyer, and legislator; b. in Frankfort co., Ky., Jan. 13, 1812; graduated from the U. S. Military Academy in 1832, but resigned from the army Apr. 30, 1833; was admitted to the bar, and practiced his profession first at Frankfort till 1834, then at Louisville till the outbreak of the war with Mexico, when he led the First Kentucky Cavalry to the seat of war as its colonel, and was engaged at the battle of Buena Vista. On the disbandment of his regiment he returned to his native State, and settled on a farm in Henry County. In 1849 he was chosen representative to Congress, and re-elected in 1851; in 1852 President Fillmore appointed him commissioner of the U. S. to the empire of China, which was at once raised to a first-class mission; recalled in 1853, and practiced law in Washington; elected to Congress from Kentucky in 1855, and re-elected in 1857. Although opposed to secession, he espoused the Confederate cause in Sept., 1861, and was appointed briga-

dier-general; resigned his commission shortly after, and was elected to the Confederate Congress; practiced law in Richmond, Va., for a time, subsequently returning to Louisville, Ky., where he died Mar. 28, 1872.

Marshall, John, LL. D.: jurist; b. at Germantown, Fauquier co., Va., Sept. 24, 1755, the eldest of the fifteen children of Col. Thomas Marshall, a small planter, who served with great honor as an officer of the Revolution. The son never attended a college, but in his general education, which he received almost entirely at home, he was made familiar with the best of English literature. At the age of eighteen he began the study of law, but gave this up to join the colonial army in 1775, from which time till 1779 he was an officer in active service, distinguishing himself alike in the field and in courts martial, where he often acted as judge-advocate. In 1779, while on detached service in Virginia, he attended George Wythe's law lectures at William and Mary College, and in 1780 was licensed to practice. In 1781 he resigned his commission and entered upon the practice of law, and in 1783 married and selected Richmond as his permanent residence; he was elected a member of the Legislature of Virginia, and in 1788 of the Virginia convention for ratifying the U. S. Constitution, in which latter he distinguished himself as an advocate of the Constitution, the adoption of which by Virginia was due to the arguments of James Madison and himself. His marked discretion and fairness, and his great powers as a reasoner had quickly been recognized, and he was frequently called upon to exert his influence in the support of the measures of Washington's administration. He declined the U. S. attorney-generalship, a seat on the bench of the Supreme Court, and other important positions; went in 1798 with Pinckney and Gerry as envoy to France, which he and Pinckney were ordered to leave on account of their federalistic views; entered Congress in 1799, where he was one of the ablest Federalists in the House; was appointed in 1800 Secretary of War, and soon after Secretary of State; and in 1801, having been nominated Chief Justice of the U. S. by President Adams, was confirmed by the Senate without a dissenting vote. His work in this office, which he held until 1835, has made him the greatest of American jurists, and one of the greatest jurists of any age or country. His decisions, which are very numerous, are marked by sturdy justice, breadth of view, and a simple, convincing logic, and by his decisions on constitutional questions he did more than any other one man to establish such an interpretation of the Constitution as would support the dignity and power of the Federal Government and the power of the Supreme Court of the U. S. to deny the constitutionality of acts of Congress or of State Legislatures. Among his decisions upon constitutional questions which are of especial importance may be mentioned those in the cases of *Marbury* vs. *Madison* (1 Cranch 158), *Dartmouth College* vs. *Woodward* (4 Wheaton 518), *McCulloch* vs. *State of Maryland* (4 Wheaton 316), and *Sturges* vs. *Crowninshield* (4 Wheaton 122). His *Life of Washington* (5 vols., 1805; abridged and improved, 1 vol., 1832) and his *History of the Colonies* are more valuable to the historian than to the general reader. Chief Justice Marshall was a man greater in wisdom than in learning, a sincere Christian, and a true philanthropist. He was tall, ungraceful, and somewhat awkward in manner, but most genial and kindly in private life, and was loved and venerated by his family and his associates. D. in Philadelphia, July 6, 1835.

Revised by F. Sturges Allen.

Marshall, William Calder, R. A.: sculptor; b. in Edinburgh, Scotland, in 1813; studied sculpture in London under Chantrey and Bailey; visited Rome in 1836; took up his permanent residence in London in 1839. Marshall was one of the three sculptors employed for the decoration of the new houses of Parliament, for which he executed statues of Lord Clarendon and Lord Somers. He designed the statue of Sir Robert Peel at Manchester, that of Jenner (in Kensington Gardens), that of Campbell in Westminster Abbey, and other public statues and groups, but he is best known by a number of popular works of sentiment, such as the well-known *Sabrina*, which has been copied in many forms. D. in London, June 16, 1894.

Marshall Archipelago: a large group of coral islands in Micronesia, between the parallels 5° and 12° N. and the meridians 160° and 175° E.; consisting of innumerable islets in two principal ranges running S. E. and N. W. The eastern is called the Ratak group, and the western the Ralik group. They have belonged to Germany since 1885. The Ratak islands have an area of 51 sq. miles, the Ralik of 107 sq. miles, making a total of 158. The population (1891) was about 15,000, of whom 118 were strangers. The majority of the latter were settled on the lagoon of Yaluit on the island of Yabvor, formerly Borham island, near the southern end of the Ralik islands. Pandanus, breadfruit, arrowroot, and cocoanut-palms are the only forms of vegetation supported by the thin layer of soil. Copra is the only article of export. Cattle can not support themselves on these islands.

Mark W. Harrington.

Marshalling: See Heraldry.

Marshalltown: city; capital of Marshall co., Ia. (for location of county, see map of Iowa, ref. 4–H); on the Ia. Cent., the Chi. and N. W., and the Chi. and Gt. West. railways; 70 miles W. of Cedar Rapids. It is in an agricultural region, and has a high school, 5 ward schools, public library, State Soldiers' Home, 2 national banks with capital of $200,000, a State bank with capital of $100,000, and an incorporated bank with capital of $50,000, and a daily and 7 weekly newspapers. There are furniture, pickle, vinegar, and soap factories, foundries and machine-shops, flour and oil mills, grain elevators, pork and beef packing houses, and glucose, starch, and canning and bottling works. Pop. (1880) 6,240; (1890) 8,914; (1900) 11,544.

Editor of "Times-Republican."

Mar'shalsea Prison: a prison in Southwark, London; built in the twelfth century, and placed under the control of the king's marshal of the household. It was opened by the Gordon rioters in 1780. It was long a king's bench prison, but, like the Fleet, became a poor debtor's prison. It was abolished, with the ancient Marshalsea, in 1849.

Marshfield: town; Coos co., Ore. (for location of county, see map of Oregon, ref. 5–A); on Coos Bay, and the Coos Bay, Rose and East. Railroad; 110 miles S. by W. of Salem, 380 miles N. of San Francisco. It is in an agricultural region, ships large quantities of coal and lumber, and has considerable ship-building interests and three weekly newspapers. Pop. (1880) 642; (1890) 1,461; (1900) 1,391.

Marshfield: city; Wood co., Wis. (for location of county, see map of Wisconsin, ref. 5–D); on the Chi., St. P., Minn. and Om., the Mil., Lake Sh. and W., the Port Edw., Cent. and N., and the Wis. Cent. railways; 160 miles E. by S. of St. Paul, Minn., 180 miles N. W. of Milwaukee. It contains 6 churches, high school, 3 ward schools, Roman Catholic and Lutheran schools, St. Joseph's Hospital, a water-cure sanitarium, a national bank with capital of $50,000, a State bank with capital of $25,700, and 3 weekly newspapers. The principal industries are the manufacture of pine and hardwood lumber, furniture, beer barrels and kegs, staves, headings, veneers, and machinery. Marshfield was totally destroyed by fire in 1887. The great hardwood timberlands of Wisconsin form the chief source of the city's prosperity. Pop. (1880) 669; (1890) 3,450; (1900) 5,240.

Editor of "News."

Marsh-gas (Germ. *sumpfgas, grubengas*; Fr. *gaz de marais*): light carbureted hydrogen, methane, fire-damp; a gas of the composition CH_4 which is formed in nature under a variety of conditions. The name marsh-gas is given to it because it is formed in marshes. Wherever vegetable matter undergoes decomposition without free access of air, as under water, the carbon and hydrogen combine to some extent in the form of marsh-gas. The gas seen arising in bubbles from a pool of stagnant water always contains the gas, mixed generally with other gases. It is found in the gases of the alimentary canal of human beings, and in enormous quantities in some coal mines, where it issues from crevices in the earth. Further, it is a constituent of Natural Gas (*q. v.*). It is formed when organic matter is heated without access of air, as in the destructive distillation of coal in the manufacture of illuminating gas. (See Gas-lighting.) Mixed with air it is highly explosive, and is the cause of many of the explosions in coal mines. The explosion is caused by contact with a flame or spark, which starts chemical action between the gas and the oxygen. This proceeds with great rapidity throughout the mass, and the heat evolved causes great expansion. The products of the action of oxygen on marsh-gas are carbon dioxide (Carbonic Acid, *q. v.*) and water:

$$CH_4 + 4O = CO_2 + 2H_2O.$$

Miners are well acquainted with the fact that after an explosion the air left in the mine causes suffocation. They call it *choke-damp*, a name which is applied frequently to

the compound carbon dioxide, CO_2. The use of the safety-lamp has to some extent protected the miners from the explosions to which they are subject. The entire structure of organic chemistry is based on the conception that the molecule or smallest particle of marsh-gas consists of an atom of carbon holding in combination four atoms of hydrogen, each in the same way. Each of these atoms of hydrogen can be replaced by other atoms or groups, and thus all compounds of carbon can be formed. All the facts of organic chemistry find a simple and satisfactory explanation on this assumption. See HYDROCARBONS. IRA REMSEN.

Marsh-hawk, or **Harrier**: common name in the U. S. for the *Circus hudsonius*, a large and rapacious bird found in all parts of North America. The marsh-hawk of Europe and Africa is *Circus cyaneus*.

Marsh-hen: a name applied to the clapper rail, called also salt-water marsh-hen (*Rallus crepitans*), and to the *Rallus elegans* (fresh-water marsh-hen, king-rail), game-birds of the U. S., rarely seen except by sportsmen and naturalists. See RAIL.

Mars Hill: See AREOPAGUS.

Marshmallow: an herb of the mallow family, the *Althæa officinalis*, a native of the Old World, but naturalized in the U. S., principally in salt-marshes. The plant is remarkably mucilaginous, and is used chiefly in domestic practice as a demulcent in coughs and diseases of the bowels and kidneys. It appears to have mild diuretic virtues.

Marshman, JOSHUA, D. D.: b. at Westbury-Leigh, Wiltshire, England, Apr. 20, 1768; went to India in 1799 as a Baptist missionary; resided chiefly at Serampore; gained a competent knowledge of Bengalee, Sanskrit, and Chinese; prepared Chinese translations of Genesis, the four Gospels, and the Epistles to the Romans and the Corinthians; published a *Dissertation on the Characters and Sounds of the Chinese Language* (1809); *The Works of Confucius, containing the Original Text, with a Translation* (1811); *Clavis Sinica, Elements of Chinese Grammar* (1814); and a *Defense of the Deity and Atonement of Jesus Christ* (1822), in reply to Rammohun Roy. He aided Dr. Carey in the preparation of his *Sanskrit Grammar* and *Bengalee and English Dictionary*. D. at Serampore, Dec. 5, 1837.

Marsh-marigold: See CALTHA.

Marsh-rosemary, or **Sea-lavender**: a salt-marsh plant, the *Statice limonium*, common along the Atlantic shores of the U. S., Canada, and Europe. There are many varieties, by some botanists regarded as one species. Its root abounds in tannic acid, of which it contains nearly 12·5 per cent. It is used in medicine, especially as a remedy for sore mouth and sore throat, and is best prepared by infusion.

Marsh's Test: See ARSENIOUS OXIDE.

Marsh Trefoil: See BUCK BEAN.

Marsilia: See FERNWORTS.

Marsipobran'chia [Mod. Lat.; Gr. *μάρσιπος*, pouch + *βράγχιον*, gill]: a class of vertebrates generally confounded with the fishes, but distinguished by many remarkable peculiarities. The skeleton is of an inferior type, the notochord or embryonal vertebral column being persistent. The skull is in a most rudimentary condition, and represented by a small brain-case and capsules for the organs of sense (auditory and olfactory), as well as by an ethmo-vomerine plate; the inferior appendages are developed as elements designated as (1) the subocular arch, with a meta-pterygoid or "superior quadrate," and an "inferior quadrate" portion; (2) a "palato-pterygoid" element; and (3) a "stylohyal process"; labial cartilages form also a prominent feature of the skull; bones or cartilages representing the upper as well as lower jaws are entirely wanting; the branchial apparatus is sustained by a basket-like skeleton; no limbs are developed, and consequently no scapular arch or pelvic girdle. The brain, though small, is distinctly developed, and differentiated into the brain proper and medulla oblongata; the former is composed, as in the higher forms, of the "mesencephalon," "thalamencephalon," "prosencephalon," and "rhinencephalon"; the latter is small, with a fourth ventricle conspicuous from above; and the "cerebellum" very rudimentary. The auditory apparatus is very simple, being represented by a single membranous tube without any differentiation into canals and vestibules, as in the *Hyperotreti*, or, at most, as in the *Hyperoartii*, with two semicircular canals and a sacculated vestibule. The olfactory apparatus consists of a median sac, which is provided with but a single external aperture. The heart is distinctly developed, and is divided into an auricle and ventricle, the former having in front a venous sinus; and the whole is inclosed in a "pericardium," which connects with the peritoneal cavity. The intestinal canal is simple, the liver specialized as such, and the kidneys well developed, and with ureters opening behind into the rectum. The organs of generation have no ducts, but discharge into the abdomen, from which they depart by an abdominal pore.

The class thus distinguished is represented by very few species, but these exhibit two radically distinct types of structure, and have been differentiated into two orders—(1) *Hyperoartii*, in which the tube terminates in a blind sac and its posterior end; and (2) *Hyperotreti*, in which the narial canal perforates the pharyngeal roof and connects with the pharynx. These two orders differ very decidedly from each other in the skeleton, armature of the mouth, ovulation, etc. For details see under the respective titles.

A remarkable metamorphosis is undergone by the representatives of the order *Hyperoartii* (i. e. the Petromyzontids or lampreys), but the transformations of the *Hyperotreti* (i. e. Myxine or hags) are unknown; and this is a gap most desirable to be filled, as no general characters can be specified respecting the embryology of the class until these are made known. The species of the class are found both in fresh and salt waters, the Petromyzontids having members in all temperate and sub-temperate countries; while the Myxinoids are represented in the cold waters of the northern hemisphere by Myxinæ, as well as along the shores of a considerable portion of the Pacific—e. g. in the Japanese and Chinese seas, California, Chili, and Australia. Although no representatives of the class have been found in a fossil condition, their absence in the older strata is undoubtedly due rather to the difficulty connected with the preservation of the readily destructible cartilaginous skeleton than to their actual absence. It is, indeed, probable that the order was extensively represented in past times, and that it was more abundantly developed than any other type. THEODORE GILL.

Mars la Tour, maär'laä'toor': a village on the road from Metz to Verdun; 10 miles to the W. of Metz (see map of German Empire, ref. 6–C); noted for the battle which took place here Aug. 16, 1870, and which is often called after this place, though generally after Vionville, a village situated farther to the E., and nearer the center of the battle.

Marston, JOHN: dramatist; b. in England about 1575; was educated at Corpus Christi College, Oxford; became lecturer at the Middle Temple, London, in 1593, and was author of eight dramas and two volumes of poems which were edited by J. O. Halliwell (1856, 3 vols.), and the dramas again by Bullen (3 vols., 1885). He aided Ben Jonson and George Chapman in writing the comedy of *Eastward Ho!* (1605), which caused the imprisonment of the three writers on account of its satires upon the Scotch. The best of his dramas is *The Malcontent* (1604), a tragi-comedy, originally written by John Webster, but recast by Marston and dedicated to Ben Jonson. D. about 1634.
Revised by H. A. BEERS.

Marston, PHILIP BOURKE: poet; b. in London, 1850; d. Feb. 14, 1887. He was the son of John Westland Marston, a playwright and novelist, and was blind from early childhood. He was the subject of Hake's poem *The Blind Boy* and of Mrs. Craik's *Philip, my King*. His publications are *Song Tide* (1871); *All in All* (1874); *Wind Voices* (1884); *For a Song's Sake* (1887); *Garden Secrets*, with a biographical sketch by Louise C. Moulton (1887). See also *Song Tide*, with introductory memoir by William Sharp (1888).
H. A. BEERS.

Marston Moor: an open plain, 8 miles from York, England, memorable as the scene of the victory gained (July 2, 1644) by the allied Parliamentary and Scotch armies, commanded respectively by Lord Fairfax and the Earl of Leven, over the royal forces under Prince Rupert. York was then held by the royalists, and had been besieged by Fairfax. When Prince Rupert advanced to its relief, Fairfax drew off to Marston Moor. Each army consisted of about 25,000 men. The battle began with a cannonade on both sides, but with little effect. Rupert charged with his cavalry toward evening, and dispersed the left wing of the Parliamentary forces, the commanders of which fled, but the fortunes of the day were retrieved by Leslie's Scotch regiments and Cromwell's brigade of "Ironsides," who captured the enemy's artillery, taking 1,500 prisoners and 100 colors.

Four thousand royalists were killed. The result was the surrender of York to Lord Fairfax a few days later, which made the Parliamentary cause triumphant throughout the north of England.

Marstrand, Vilhelm Nicolai: painter; b. in Copenhagen, Dec. 24, 1810; studied at the academy at Copenhagen, in Munich, and Rome; d. Mar. 25, 1873. His works are exceedingly numerous and all excellent. He had a most fertile genius, and all that he touched turned into art. With the exception of Thorwaldsen he is the greatest artist that Denmark has produced. R. B. A.

Marsupia'lia [Mod. Lat., from Lat. *marsu'pium*, pouch, bag, from Gr. *μαρσύπιον*, dimin. of *μάρσυπος*, *μάρσιπος*, pouch, purse]: the only generally recognized order of the mammalian sub-class Didelphia, comprising the opossums, kangaroos, wombats, and related types. The characters which differentiate the group as a sub-class will be found under Mammals, and the common ordinal characters will alone be given here. The brain is small in comparison with the size of the body, the cerebrum but little convoluted and only partially covering the olfactory lobes and cerebellum. The anterior commissure is large, and the hippocampal fissure continued forward over the small corpus callosum. The bones of the skull remain separate for a long time, or throughout life. There are usually two or more vacuities—sometimes confluent—in the bony palate, and, except in *Tarsipedidæ*, the posterior angle of the lower jaw is bent inward. The number of thoracico-lumbar vertebræ is always nineteen; the number of pairs of ribs usually thirteen. The radius and ulna are present, and the forearm is capable of rotation. The pelvis, in all marsupials save *Thylacinus*, has moderately long bones articulating with the pubis, arising from ossification in the inner tendons of the external oblique muscles.

The muscles of the hind limbs in most (the saltatorial types being excepted) present a peculiar modification in that the *flexor longus digitorum pedis* "is inserted fleshy into the fibula, and the knee and ankle joints are so modified as, through the action of the muscle so inserted, to admit of rotary movements of the hind foot."

The teeth are peculiar in that there is only one perfect set, none having deciduous predecessors except one on each side of each jaw, the hindmost (and indicated as such by its development) of the premolars; in other respects the teeth vary greatly; they frequently, however, are peculiar in the great number (5×2) of upper incisors, and in the number of true molars (4×2) in each jaw.

The heart is peculiar in the absence of a *fossa ovalis* and *annulus ovalis* in the right auricle; and in all it receives the two *venæ cavæ superiores* by two separate inlets.

The living marsupials represent two distinct types of foot structure—the *chorisodactylous*, in which the toes are all free, and the *syndactylous*, in which the second and third toes are much reduced in size, and closely connected together in a common integument, which leaves only the claws visible, and gives the impression of a single toe with two claws.

The chorisodactylous marsupials are represented by three very distinct families, two of which (*Dasyuridæ* and *Myrmecobiidæ*) are confined to Australia, and one (*Didelphididæ*) to America, one species advancing far up into the U. S.

The syndactylous marsupials exhibit in their dentition two very decided types. In one the incisors are permanently rooted, and in the lower jaw are either two large incisor teeth opposed to six in the upper, or six in the lower opposed to eight or ten in the upper. All these are inserted by roots. To this group belong the *Phascolarctidæ*, *Phalangistidæ*, *Tarsipedidæ*, and *Macropidæ*. In the other in both jaws the incisor teeth are like those of rodents, there being two in each jaw, continually reproduced, and growing in a subcircular direction. To this group belongs the single family *Phascolomyidæ*.

The marsupial pouch is developed in all the living representatives of the order except *Thilomys dorsigera* (the opossum of South America), which derives its name from carrying its young upon its back, with their tails swung around their mothers. This pouch is formed, according to William S. Barnard, "by the infolding of the skin. Its concavity opens on the median line of the abdomen, and extends backward and laterally, forming a kind of double bag, in the bottom of which the milk-glands open through long papillæ."

The genital organs, as to their superior modifications, have been noticed under Mammals. The young are not connected with their mothers by a placenta, by means of which they are nourished for some time before birth, but are born in a very helpless condition, and, even in the largest species, do not exceed half an inch in length nor more than a few grains in weight; the organs are in a very undeveloped condition, and the animal is naked, blind, and perfectly helpless; its fore limbs are more developed than the hind ones. The newly born animal is taken by the mother with her lips and transferred to the pouch, where it instinctively grasps and clings to the teat to which it is presented, and the corners of the mouth growing around it, the animal remains clinging to the teat for several weeks, and until it has attained a considerable size and the adult characters have been in a large degree assumed. Although it is thus capable of grasping and clinging to the nipple, it is, however, at first incapable of directly sucking, and the milk is furnished by the mother through the compression of the gland by a muscle analogous to the cremaster. To guard against suffocation of the young a peculiar modification of the laryngeal apparatus is provided, by which the air-passage is completely separated from the fauces, and the injected milk passes in a divided stream on either side of the larynx to the œsophagus. After having assumed the characters of approximate maturity, it leaves the teat and the pouch itself, but for some time after resorts to the latter in case of danger, to be conveyed by the mother.

Although the marsupials are now confined to Australasia and South America (exclusive of a few stragglers beyond those borders), they formerly inhabited every part of the globe palæontologically known, and remains of representatives of the class recovered from the Trias have been referred to this order. By some authorities it is believed that these forms belong to distinct orders of mammals of primitive structure, and that marsupials did not make their appearance until the early Eocene. In the Eocene they are developed in several types, both in North America and in Europe, and among these were representatives of genera closely related to the opossums of the present age. Although none of the marsupials of the present epoch can vie with the largest placental mammals, in former times and as recently, perhaps, as the advent of man, species of gigantic size existed, the Diprotodontids of Australasia having been nearly as large as our rhinoceroses. Revised by F. A. Lucas.

Mar'supites [from Lat. *marsu'pium*, pouch, bag], or **Tor'toise Encrinite**: a genus of the Crinoidea peculiar to the Cretaceous rocks, remarkable for having no stem or attachment; its pelvis thus resembles a plated pouch surrounded by a circle of firearms.

Mar'sus, Domitius: a Roman poet, contemporary with Horace, although not mentioned by him. He composed a collection of epigrams under the title *Cicuta*, an epic *Amazonis*, a treatise on wit (*De urbanitate*) quoted by Quintilian, and nine books of *Fabellæ* (anecdotes) in verse. Only fragments are extant. See Baehrens's *Frag. Poet. Rom.*, pp. 346–348 (Leipzig, 1886). M. W.

Mar'syas (in Gr. Μαρσύας): in Greek mythology, (1) originally a Phrygian god, who gave his name to the river Marsyas at Celænæ, but after the myth-makers associated him with Athene and Apollo he was degraded to the rank of a Satyr or Silenus. Athene had invented the flute, but threw it away and cursed it when she saw how distorted her features became by playing it. Marsyas found the discarded flute, and became so skillful in playing it that he challenged Apollo, who played the lyre, to a musical contest, with the Muses for judges. The decision was in favor of Marsyas, but Apollo by adding song to the melody of the lyre maintained that he had won, and bound Marsyas to a tree, flayed him alive, and hung up his skin in the cavern at Celænæ from which the Marsyas river flows. The myth was utilized by both painters (Zeuxis, etc.) and sculptors (Myron, etc.). An excellent copy of the Marsyas that belonged to the group of Athene and Marsyas by Myron is preserved in the Lateran Museum in Rome. It represents Marsyas in the act of finding the flute. In Florence there are several statues of Marsyas suspended from a tree and about to be flayed. All are copies from a Pergamene group to which the barbarian whetting his knife (an original statue also in Florence) belongs. As he whets his knife the barbarian looks up grimly at the suspended Marsyas. For a detailed discussion, see any history of Greek art and the articles *Marsyas* and *Myron* in Baumeister's *Denkmäler*; also Hirschfeld, *Athene und Marsyas* (Berlin, 1872), and Mich-

aelis, *Apolline e Marsia* (Rome, 1858). (2) A river that wells out in two impetuous streams from beneath a precipitous cliff in Celænæ (Dineir) in Phrygia. It got its name from the fact that the skin of Marsyas was hung up in the cavern from which the river issues. There is a discussion as to the identification of the sources of the Marsyas and the Mæander. See Hirschfeld, *Ueber Kelainai-Apameia Kibotos* (Berlin, 1875); Hogarth, *Notes upon a Visit to Celænæ-Apamea* (in *The Journal of Hellenic Studies*, 1888, p. 343 ff.); Ramsay, *Historical Geography of Asia Minor* (London, 1890, p. 403); Weber, *Dinair Célènes Apamée-Cibotos* (Besançon, 1892). (3) Two historians of Macedonia: (*a*) Marsyas of Pella was a schoolfellow of Alexander the Great, a stepbrother of Antigonus, and a general of Demetrius Poliorcetes; (*b*) Marsyas of Philippi. See Ritschl, *De Marsyis rerum scriptoribus*, in his *Opuscula* (i., pp. 449–470).

J. R. S. Sterrett.

Marteau, Henri: See the Appendix.

Martel, Charles: See Charles Martel.

Martello Tower: a kind of tower which derives its peculiar name either (1) from the name of the Corsican engineer who is said to have first designed them; or (2) from Ital. *martello*, a hammer used to strike a bell, because they were used as watch-towers and were provided with alarm-bells; or (3) in corrupted form from Mortella (Corsica), from the vigorous defense of one of those towers in 1794. A martello tower is round, is about 30 feet high, and has walls 5 or 6 feet thick. The cellar and lower floor contain ammunition and supplies, the second and third living-rooms and armory for the garrison, and the vaulted roof is provided with a parapet and mounts one or more guns. The entrance is on the second floor by a ladder or drawbridge. A number of these have been built at different dates along the coasts of Italy, Sardinia, and Corsica, and during the French wars along the coasts of England, principally in Kent and Sussex. Similar towers of larger size were built by the Austrians along the Danube after the Napoleonic wars. At Lintz an intrenched camp was constructed with thirty-two connected towers, about 30 feet high and 80 feet in diameter, each mounting ten siege-guns. The Austrians called fortifications of this type Maximilian towers. In the U. S. Tower Dupré, Louisiana, and the tower on Tybee island, Ga., belong to this general class.

James Mercur.

Marten [earlier *martern*, from O. Fr. *martre*, probably of Teuton. origin; cf. Germ. *marder*: O. Eng. *mearþ*, though the Late Lat. *martes* has been by many regarded as the source]: the common name of several carnivorous fur-bearing animals of the family *Mustelidæ*. In North America is found the Hudson's Bay sable or pine marten (*Mustela americana*), which produces a very valuable fur, inferior in value to that of the Russian sable only. The latter animal (*M. zibellina*) is caught in Siberia. The pine marten of Europe (*M. martes*) and the stone marten or common European marten (*M. foina*) produce great quantities of cheap and useful fur. The Fisher (*q. v.*) belongs also to this genus. Martens are lithe, active creatures, with long bodies and very short legs; the claws are long and sharp, the tail bushy. Their movements are graceful, and they are expert in climbing trees. The marsupial analogue of the martens is the spotted marten, or long-tailed dasyure, a small but fierce carnivorous mammal of Australia, *Dasyurus viverrinus* or *macrurus*. It has a chestnut-colored fur spotted with white, and is 18 inches long, exclusive of the tail. It inhabits marshy places, and is nocturnal in its habits, sleeping during the day in a hollow tree.

Revised by F. A. Lucas.

Mar'tensen, Hans Lassen, D. D.: theologian; b. at Flensborg, Denmark, Aug. 19, 1808; studied theology at the University of Copenhagen. In 1832 he visited Berlin, Vienna, Munich, and Paris; and in 1838 was appointed professor at the university, first in philosophy, afterward in theology. His first book, *Meister Eckart*, which appeared in 1840, is an essay on the mysticism of the Middle Ages, and made a great sensation, both in Denmark and Germany, on account of the wonderful intuition and singular eloquence with which the old mysticism was interpreted and represented. In 1841 followed *Outline of a System of Ethics*, and in 1849 *Christian Dogmatics* (Eng. trans. Edinburgh, 1866), which found many admirers in Denmark, Germany, Sweden, Holland, and Scotland. As a disciple of Hegel, Martensen here undertakes to reconcile faith and reason, revelation and science, but, deeply impregnated by the Christian ideas as he is, he defines this process, with respect to the Bible, as "a reckoning of an account whose balance has been struck elsewhere; if we bring out another figure, we have reckoned wrong." The problem is solved, as far as it is solved, with great acuteness and ingenuity. In 1845 he was appointed preacher to the court, and in 1854 Bishop of Seeland, the highest dignity of the Danish Church. As such he took a very active part in the religious movements going on in the Danish community, and by the repose of his character, the superiority of his intelligence, and his sympathy with all that is genuine he exercised a great and beneficial influence. He published several collections of sermons, and in 1872 a *System of Christian Ethics*, second part, treating of the *State* (1878; Eng. trans., 3 vols., Edinburgh, 1873–83). German translations have appeared of *Jacob Böhme*, *Theosophische Studien* (Leipzig, 1882); *Aus meinem Leben* (2 vols., Karlsruhe, 1883–84); and his *Briefwechsel* with Dorner (Berlin, 1888). D. in Copenhagen, Feb. 4, 1884.

Revised by C. K. Adams.

Martha's Vineyard: the principal island of Dukes co., Mass., in the Atlantic. It is 19 miles long, averages 5 miles in breadth, is rather level, and in part has a very productive soil. It contains the towns of Edgartown, Chilmark, Tisbury, Gay Head, and Cottage City. The latter is a noted camp-meeting ground and watering-place on the northeast shore of the island.

Marti, José J.: See the Appendix.

Martia'lis, Marcus Valerius: poet; b. at Bilbilis, in Spain, Mar. 1, about 40 A. D.; went during the reign of Nero (in 64) to Rome, where he resided for thirty-four years, and achieved a great literary fame. He returned in 98 to his native city, where he seems to have died a few years afterward, not later than 104. Of his works, fifteen books, containing about 1,500 small poems, *epigrammata*, are still extant, all distinguished by cutting wit, an elegant and pointed form, a high degree of felicity of expression, and very interesting for the moral study of the time to which they belong, but sometimes revealing an offensive sensuality and a talent for flattery of a very doubtful character. There is a good edition of his works by Schneidewin (2 vols., Grimma, 1842), and one with excellent notes and indices by L. Friedländer (2 vols., Leipzig, 1886), a complete translation into French by E. T. Simon (1819), into German by A. Berg (Stuttgart, 1864), and numerous translations of single parts in English.

Martial Law [*martial* is from Lat. *martia'lis*, pertaining to Mars, pertaining to war, deriv. of *Mars*, *Mar'tis*, the god of war]: the law which is administered by the military power over a district or country in which the civil authority has been superseded by, or made subordinate to, the military for the purpose of subduing invasion or insurrection by opposing forces, or of restoring to power the civil courts in case of their inability to secure the administration of justice. It differs widely from "military law" and "military government," with each of which it is often confounded. *Military law* is a department of the municipal law prescribing the code of rules for the regulation of the army and navy alone, either in war or in peace; and in the U. S. it is enacted by Congress in the same manner and with the same force and effect as any other legislation, and civilians are expressly exempt from its operation. *Military government* is the government which the commander of an invading army exercises for the time being over a conquered country. Martial law can exist only in time of war or when the civil authorities are rendered powerless to enforce the laws of the land by the presence of hostile or rebellious forces, and it applies to civilians as well as to the military, and, unlike military government, is established only over those districts or territories which are friendly in fact or in contemplation of law.

The right to establish martial law is one of the sovereign powers essential to the existence of every government, the exercise of which, however, can be justified only by paramount necessity, what constitutes such necessity varying with the circumstances of the case. Restrictions and rules as to what may be lawfully done by the authorities administering martial law may be prescribed by the statutes of a State, as in many European countries in providing for the "state of siege"; or it may be left to be determined, as in Great Britain and in the U. S., by the question whether the acts of the officials were such as were necessary, or reasonably supposed to be necessary, to accomplish the object for which martial law was established, or whether their authority has been abused. At the time of the actual exercise of this species of military rule the commander is under no present limitation or restraint other than his own will or

discretion and his sense of ultimate responsibility to the civil authorities, which for the time are either entirely supplanted by martial law or are in subjection to it.

The officials in the exercise of their powers may, if necessary, resort to the destruction of property or the taking of life to any extent and in any manner that may be required for the purpose of the war or of suppressing the rebellion or insurrection and restoring the civil authorities to power; but they are not justified in resorting to means which under the circumstances are cruel or unusual, or which under the circumstances there was no reasonable ground for believing to be necessary or justified. For any violation of these restraints the officials are responsible, civilly and criminally, before the civil courts on their restoration to power; but in determining the reasonableness of an act due allowance is properly made for the lack of time for consideration, the necessity for immediate action, and other peculiar circumstances in which the commander is placed.

In Great Britain martial law may be declared either by the crown or by the Parliament; in the U. S. on the part of the Federal Government the power is vested in the President, and (according to some authorities) also in Congress; on the part of the State governments in the Legislature, and in the Governor. The President may declare and enforce martial law in a State either independently of, or even in opposition to, the State authorities; or he may do so at the request of the State authorities made under the clause of the Constitution (Art. IV., Sec. 4) which provides that "the United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the Legislature or of the executive (when the Legislature can not be convened), against domestic violence." This power of the Federal authorities to aid in suppressing local uprisings has become of great importance in quelling lawlessness and destruction of life and property in labor riots in the States where the State authorities were unable to put down the insurrection.

No definite rule capable of exact application can be laid down by which to determine whether or not it is necessary to establish martial law, but what shall constitute such necessity will vary with the circumstances. In the celebrated case of Milligan, growing out of the civil war, the Supreme Court denied the lawfulness of martial law within the U. S. except in districts actually occupied by the opposing forces, which are the very theater of hostilities, and in which the civil courts are for the time being completely displaced. This was an *obiter dictum*, however, given in the opinion of a divided court (five to four), and the subsequent "reconstruction acts," with the decisions upholding them, have been by eminent authorities considered to be inconsistent with them; and by some authorities it is maintained that martial law may be declared in a place where there is no actual overthrowing of the civil authorities, but where invasion is threatened, or where the purposes of the war render the existence of the martial law a necessity. In Great Britain Lord Chief Justice Cockburn also, in 1867, declared in an opinion that the crown has no authority to enforce martial law in any part of the British realm where the laws of England prevail; but he admitted that Parliament, by virtue of its unlimited power, might call it into operation. The general principles governing the existence and exercise of martial law in Great Britain and the U. S. are in effect the same, and the differences which exist are too technical for discussion here, and do not affect the application of the preceding general statement of the law. For a fuller treatment of the subject, consult Finlason's *Treatise on Martial Law in Time of Rebellion* (London), and the same author's *Review of the Authorities as to the Repression of Riot or Rebellion*; Stephen's *History of the Criminal Law of England* (London); Dicey's *Law of the Constitution* (London); Birkhimer's *Military Government and Martial Law*; Hares's *American Constitutional Law*; and Pomeroy's *Constitutional Law of the United States*. F. Sturges Allen.

Martin (Fr. *martinet*): a name given to several birds of the swallow family (*Hirundinidæ*). The purple martin of the U. S. (*Progne subis*), so called from the lustrous purplish-blue color of the male, is the largest of the North American swallows. It often inhabits boxes put up near houses, and is a popular favorite, being regarded as a bird of good omen. It ranges from the frontier of Patagonia to within the Arctic circle, but its numbers are in certain years and certain localities subject to sudden diminutions which have never been satisfactorily accounted for. The house-martin of Europe (*Chelidon urbica*) frequently attaches its nest to the walls of houses even in towns. The nests are extremely variable in shape and size, no two being exactly alike in both respects. Generally the form is cup-shaped, with the rim closely pressed against the wall, and having a small semicircular aperture cut out of the edge in order to permit the ingress and egress of the birds. Sometimes, however, the nest is supported on a kind of solid pedestal, composed of mud, and often containing nearly as much material as would have made an ordinary nest. The sand-martin (*Cotile riparia*) of Europe and North America is smaller, of a dull color, and builds its nest at the end of a long horizontal gallery, which it bores in some natural or artificial escarpment. Although its small beak and slender claws would seem at first sight to be utterly inadequate for the performance of miner's work, the sand-martin is as good a tunnel-driver as the mole or the rat, and can dig a burrow of considerable length (from 2 to 8 feet), and in soil which is by no means easy to excavate. The sand-martin hatches several broods during the year and is very gregarious, sometimes making its burrows so near together as to honeycomb the bank in which they are situated.

The European house-martin (*Chelidon urbica*).

Revised by F. A. Lucas.

Martin, Saint: Bishop of Tours and patron saint of France; b. in 316 at Sabaria, in Pannonia, the present Stein in Lower Hungary, of pagan parents, his father being a military tribune; visited the pagan school of Pavia, early showed an inclination to a monastic life, but was compelled by his father to enter the army in his sixteenth year, an imperial edict having ordered the enrollment of the sons of veterans, and he served under Constantine and Julian the Apostate. Having left the army at the age of twenty, he became a disciple of Hilary, Bishop of Poitiers; returned to Pannonia; converted his mother to Christianity, but suffered much from the persecutions of the Arian party, which finally expelled him from the country. Once more he went to Gaul; was made Bishop of Tours in 371, and founded the monastery of Marmontiers, where he died about 400 (perhaps Nov. 11, 397). His life has been described by a contemporary of his, Sulpicius Severus, adorned with many miracles and wonderful stories; and by the Roman Catholic Church he was made a saint, and his festival appointed on his death-day, which was considered his heavenly birthday. Nov. 11. In Scotland this day marks the winter term (*Martinmas*), and was formerly celebrated with feasting and drinking. The French expressions, *martiner, faire le St. Martin*, and *mal de St. Martin*, show that the same custom has existed in France. It arose from an old story, that at a great festival the Emperor Maximinus offered the drinking-cup first to the bishop, in order that he might receive it from his hand. The treatise *Professio Fidei de Sancta Trinitate*, ascribed to Martin, is generally considered spurious. See his *Life* by F. Chamard (Paris, 1873), and by J. G. Cazenove (London, 1883). Revised by S. M. Jackson.

Martin I.: pope and saint; b. in Todi, in Umbria; elected Bishop of Rome July 5, 649, succeeding Theodore I.; called the first Lateran Council, which met on Oct. 5, 649, and which affirmed the doctrine of two wills and operations in Christ. The Emperor Constans II. was a violent upholder of the doctrines condemned by the council: consequently he had the pope brought as a prisoner to Constantinople, 654,

on the trumped-up charge of treasonable designs against the emperor. He was cruelly treated, banished to Cherson, a town in the Crimea, and there died Sept. 16, 655.—MARTIN II. (or MARINUS I.), b. at Montefiascone became pope in 882, and d. Feb. 14, 884.—MARTIN III. (or MARINUS II.) succeeded Stephen VIII. in 942, d. 946; a man of learning and noble character.—MARTIN IV. (*Simon de la Brie*), b. in Touraine of very humble parentage; became a Franciscan at Tours; was patronized by St. Louis; became a cardinal in 1262; was long papal legate at Paris; became pope in 1281. The Sicilian Vespers soon followed (1282), and he excommunicated the enemies of the French, thereby greatly weakening his own cause in Italy. D. in Perugia, Mar. 28, 1285.—MARTIN V. (*Otho Colonna*), b. of noble stock in Rome 1363; became auditor of the rota 1394; cardinal-deacon 1405; was chosen pope by the Council of Constance 1417; fulminated a bull against the Hussites 1418; and soon proved himself one of the ablest and boldest of the popes. His policy overcame the reform movements begun at the Council of Florence. He healed the divisions of the Church, restored the diminished splendors of Rome, pacificated Europe, and advanced the cause of learning. In carrying out the orders at Constance he called a council at Pavia 1423, transferred it to Siena, but dissolved it the next year. D. in Rome, Feb. 20, 1431. Revised by S. M. JACKSON.

Martin, AUGUST, M. D.: gynæcologist; b. at Jena, Germany, July 14, 1847; was a special student of his father, E. A. Martin, graduating M. D. at the University of Berlin in 1870; has been assistant in the Berlin gynæcological clinic, and docent at the university since 1872. He has published valuable reports of his operative cases. Among his works are *Leitfaden der operativen Geburtshülfe* (Berlin, 1877); *Pathologie und Therapie der Frauenkrankheiten* (Vienna and Leipzig, 1885). S. T. A.

Martin, BON LOUIS HENRI: historian; b. at St.-Quentin, France, Feb. 20, 1810; began his literary career by writing historical novels and dramas, but turned soon to a more serious and thoroughgoing treatment of history. Of his *Histoire de France* there are three different editions: one in 15 vols. (1833–36); one in 19 vols. (1837–54), parts of which, such as vols. x. and xi., narrating the religious wars, and vols. xiv.–xvi., describing the age of Louis XIV., made a great sensation and were crowned by the Academy; and one in 16 vols. (1855–60), embodying the latest researches in Celtic antiquities, mediæval society, etc. The most prominent of his other writings are *De la France, de son Génie et de ses Destinées* (1847), which gives the ideal view on which his narrative of the history of France is based; *L'Unité Italienne* (1865), *La Russie d'Europe* (1866), etc. He became a senator in 1876, and member of the academy in 1878. D. Dec. 14, 1883.

Martin, EDUARD ARNOLD, M. D.: gynæcologist and obstetrician; b. at Heidelberg, Germany, Apr. 22, 1809; studied law from 1826–28 at the Universities of Jena and Göttingen, and then took up medical studies, graduating M. D. at Göttingen in 1833; studied in Prague, Vienna, Berlin, England, and France; settled in Jena in 1835; in 1837 was appointed Extraordinary Professor of Obstetrics, in 1838 was appointed director of the lying-in asylum, and in 1850 Professor of Obstetrics in the University of Jena. He here in 1843 established the first gynæcological clinic in Germany. In 1858 he went to the University of Berlin. His work and teaching exercised great influence in creating a scientific basis for gynæcology and obstetrics. He was the author of many monographs and works, some of which are *Zur Gynäkologie* (Jena, 1848); *Lehrbuch der Geburtshülfe für Hebammen* (Erlangen, 1854). He was coeditor of the *Jenaisches Annalen für Physiologie und Medicin* 1849–51, and of the *Zeitschrift für Geburtshülfe und Frauenkrankheiten* 1875. D. Dec. 5, 1875. S. T. ARMSTRONG.

Martin, HENRY AUSTIN, M. D.: surgeon; b. in London, England, in 1824; graduated M. D. at Harvard Medical School in 1845; practiced in Boston; in 1862 passed the examinations for a commission as staff surgeon in the U. S. volunteers, and was promoted to the rank of lieutenant-colonel and medical director; during his army service he performed many notable operations. At the close of the war he resigned his commission and returned home to practice. In 1870 he introduced the Beaugency animal vaccine virus into the U. S. In 1877 he brought before the profession the various uses for the rubber bandage, and in 1878 his operation of tracheotomy without tubes. D. Dec. 7, 1884. S. T. ARMSTRONG.

Martin, HOMER DODGE: landscape-painter; b. in Albany, N. Y., Oct. 28, 1836. He received no art instruction except a few weeks' study with William Hart in New York, and began exhibiting pictures at the National Academy about 1857. He became an Academician in 1875, and was elected a member of the Society of American Artists in 1877. His pictures are noted for quiet but effective color schemes and simple treatment. *Sand Dunes on Lake Ontario* (1878); *Adirondacks*, which was exhibited at the Centennial Exhibition at Philadelphia in 1876, and belongs to the Century Club, New York; *High Tide at Villerville* and *Lighthouse at Honfleur*, also the property of the Century Club, are some of his best-known works. D. Feb. 12, 1897.

Martin, HENRY NEWELL: See the Appendix.

Martin, JOHN: painter; b. at Haydon Bridge, near Hexham, Northumberland, July 10, 1789. He was made apprentice to a painter on porcelain; went to London and married very young, supporting himself by decorative painting while he went on with his studies. In 1812 he exhibited several pictures at the Royal Academy, and was a constant exhibitor from that time at both the Academy and the British Institution. In 1816 was shown his *Joshua Commanding the Sun to Stand Still*, and in this were visible many of the peculiarities of his art. A city with gigantic edifices in long perspective crowns a rocky hill to the right; on the left the plain stretches away to distant heights, on which are other large buildings; armies fill the plain and pour down from the city. The effect aimed at is the gigantic and overwhelming. *Belshazzar's Feast*, exhibited in 1821, carried still further the effect of architecture of colossal size and in long perspective. His painting for thirty years followed in these lines of composition, and his fame is that of an artist who, not a colorist and not a master of figure-drawing, nor very strong in chiaroscuro, nor in any of the qualities which make up the great artist, had a singular gift at producing grandiose effects. Such art as this is of course perilously near the ridiculous, but Martin generally knew how to avoid that result. He was greatly admired during his life, received several prizes at the British Institution, and a special medal from the French Government. Large mezzotint engravings exist of some of his works, and it is thought that some of these are by himself. D. at Douglas, Isle of Man, Feb. 17, 1854. At the South Kensington Museum are *A Mountain Landscape* and several water-colors. In the Manchester Gallery is *The Destruction of Herculaneum*. An edition of Milton's *Paradise Lost*, illustrated with mezzotints, which have much of Martin's peculiar power, was issued in 1826, and another with larger plates in 1827; later and inferior editions are numerous. RUSSELL STURGIS.

Martin, LOUIS AIMÉ: author; b. at Lyons, France, in 1781; d. in Paris, June 22, 1847. He was member of the Chamber of Deputies in 1815, then professor at the Ecole polytechnique till 1831, and after that keeper of the library of St. Geneviève. He wrote commentaries on Racine and Molière, a *Vie de Bernardin de Saint-Pierre*, and a book on the *Éducation des mères de famille*. A. G. C.

Martin, ROBERT MONTGOMERY: b. in England about 1803; author of a series of valuable geographical and statistical works—*The Colonies of the British Empire* (1834–38); *The British Colonial Library* (1836–37); *The History, Antiquities, Topography, and Statistics of Eastern India* (1838); *Ireland before and after the Union* (1843); *China, Political, Commercial, and Social* (1847); *The Hudson's Bay Territories* (1848); *The Indian Empire* (1858–61); and *Progress and Present State of British India* (1862). He also edited *The Colonial Magazine* for some years, superintended the issue of *The Illustrated Atlas and Modern History of the World*, and arranged for publication the papers of the Duke of Wellington. D. in 1868.

Martin, Sir THEODORE, LL. D.: author; b. in Edinburgh, Scotland, in 1816; settled in London as a solicitor in 1846; in 1851 married a lady who was prominent as an actress (see FAUCIT, HELEN); wrote verses for the magazines over the signature of *Bon Gaultier*; published *The Book of Ballads* in conjunction with Prof. Aytoun; translations of the *Poems and Ballads of Goethe* (1858); of several Danish dramas by H. Hartz and Oehlenschläger (1854–57); of the *Odes of Horace* (1860). and of his whole works (1882); of the *Poems of Catullus* (1861); of Dante's *Vita Nuova* (1862); of Goethe's *Faust* (1863, 1886); Heine's *Poems and Ballads* (1878); and Schiller's *Song of the Bell* (1889); and printed for private circulation translations of various miscellaneous poems by Goethe and Uhland. He also wrote a biography

of Prof. W. E. Aytoun (1868): *Life of the Prince Consort* (1874–80) from materials furnished by Queen Victoria; *Lives* of Princess Alice (1883) and Lord Lyndhurst (1885). In 1880 he was elected rector of the University of St. Andrews.

Martin, Thomas Mower: See the Appendix.

Martin, William Alexander Parsons, D. D., LL. D.: missionary and educator; b. at Livonia, Ind., Apr. 10, 1827; graduated at the Indiana State University at Bloomington 1846, and the Presbyterian Theological Seminary of New Albany, Ind. (now McCormick, Chicago), 1849; was acting Professor of the Classics in Anderson Collegiate Institute 1849–50; missionary under the Presbyterian board at Ningpo, China, 1850–60; founder of the Presbyterian mission at Peking in 1863, and was in charge till 1868; he was then appointed Professor of International Law in the Tung wên College of Peking, of which he has been president since 1869. In 1885 he was elected first president of the Oriental Society of Peking; he is a member of the European Institute of International Law, and of other similar societies. In 1880–81 he was sent by China to Europe and the U. S. to report on methods of education; and in 1885 he was made mandarin of the third rank. Dr. Martin has published, in English, *The Chinese: their Education, Philosophy, and Letters* (New York, 1881), and articles in reviews and periodicals; in French he has published papers in the *Transactions* of various learned societies of Europe; in Chinese he has published *Evidences of Christianity* (1855; reprinted in many editions, both in China and in Japan); *The Three Principles* (1856); *Religious Allegories* (1857); translations for the Chinese Government of de Martin's *Guide Diplomatique* (1874); of treatises on *International Law*, Wheaton's (1863–64), Woolsey's (1875), and Bluntschli's (1879); compilation of text-books on *Physics* (1868), and on *Mathematical Physics* (1885; both revised and reprinted for the emperor, 1889); and a number of widely circulated tracts. C. K. Hoyt.

Martina Franca, maăr-tee'năă-fraan'kaă: town; in the province of Lecce, Southern Italy; about 17 miles N. of Taranto (see map of Italy, ref. 7–H). This beautiful little city is built on a hill near the sources of the Tara. The churches and other buildings, private and public, are handsome; the ducal palace is one of the most magnificent in the south of Italy. Martina Franca was the feudal possession of the Caraccioli, and is not a very old town. Pop. about 18,100.

Martin de Moussy, maăr'tăń'de-moo'see', Jean Antoine Victor: physician and traveler; b. at Moussy-le-Vieux, June 26, 1810. He studied medicine in Paris, served as army health commissioner, and in 1841 went to South America, establishing himself in 1842 at Montevideo, Uruguay. During the war known as the nine years' siege (1843–52) he was medical director of the French and German legions raised in the city. He established at his own expense a meteorological observatory. From 1855 to 1859 he traveled extensively in Argentina and Paraguay, visiting the frontiers of Bolivia and Chili. The results of his explorations were published in Paris as *Description géographique et statistique de la Confédération Argentine* (3 vols. and atlas, 1860–64); this is a work of great value. Martin de Moussy wrote various minor works and papers on the Platine region, and was a contributor to encyclopædic works. D. at Bourg-la-Reine, near Paris, Mar. 26, 1869. Herbert H. Smith.

Mar'tineau, Harriet: author; sister of Rev. James Martineau; b. at Norwich, England, June 12, 1802, was descended from a family of Huguenot exiles; was educated under the auspices of her uncle, a distinguished surgeon; entered upon literary life in 1823, and published a very great number of works, including many tales, of which those illustrating the principles of political economy, the operation of the poor laws, and kindred subjects are especially noteworthy. She removed to London in 1832, but subsequently lived at Tynemouth and Ambleside; visited the U. S. in 1834, and traveled in Palestine and the East in 1846. Among her important works are *Society in America* (1837); *A Retrospect of Western Travel* (1838); *Eastern Life, Past and Present* (1848); *British India* (1851); a condensed translation of Comte's *Positive Philosophy* (1853); *History of England during the Thirty Years' Peace* (1849–50); *The Factory Controversy* (1855); and *Biographical Sketches* (1869). A Unitarian Christian in early life, she gradually assumed in her writings more radical religious opinions. She was a frequent contributor to newspapers and reviews. D. at Ambleside, England, June 27, 1876.

Revised by H. A. Beers.

Martineau, James, D. D., LL. D.: theologian; b. at Norwich, England, Apr. 21, 1805, of Huguenot extraction. His father was a manufacturer of bombazines, in humble circumstances. Dr. Martineau studied in the Unitarian College at York; was minister of societies first in Dublin, and afterward in Liverpool in Hope chapel. While in Liverpool in 1839 he took part, in connection with J. H. Thom and Henry Giles, in a controversy with thirteen clergymen of the Church of England on questions of Christian theology. Martineau's themes were—*The Bible*, *The Deity of Christ*, *Vicarious Redemption*, *The Christian View of Moral Evil*, and *Christianity without Priest and without Ritual*. All the lectures were published. *The Rationale of Religious Inquiry* and *Endeavors after the Christian Life*, two volumes of remarkable sermons, appeared in 1843–47; a volume of *Miscellanies*, edited by T. Starr King, was printed in Boston in 1852; in 1858, another volume, entitled *Studies of Christianity*, was collected by W. R. Alger, and published by the American Unitarian Association; two volumes of *Essays, Theological and Philosophical*, were issued by W. V. Spencer in Boston, 1866 and 1868, comprising significant papers from various English periodicals. The *Westminster*, *Prospective*, and *National* reviews contained his most elaborate essays. In 1853 Dr. Martineau was called to the chair of Moral and Metaphysical Philosophy in Manchester New College, London, whither he went to live, and in 1858 assumed joint pastorship with J. J. Tayler of the Unitarian chapel in Little Portland Street, of which, on the death of Mr. Tayler, he became sole incumbent. He has been distinguished as the defender of spiritual faith against the different schools of atheism, materialism, and skepticism, taking sharp issue with the negative tendencies of science and philosophy, not in the interest of any dogma, creed, or Church, but in the interest of the moral and spiritual nature of man. (See his *Religion and Modern Materialism*, New York, 1874.) Thackeray called him the greatest theologian in England. Ill-health compelled Dr. Martineau to desist from preaching. The Boston magazine *Old and New* (1874) contained able articles in criticism from his pen. He is the author of *Types of Ethical Theory* (1886); *A Study of Religion: its Sources and Contents* (1888); and *The Seat of Authority in Religion* (1890). His *Essays, Reviews, and Addresses* were published in four volumes in 1890–91. His *Study of Spinoza* is an extremely unsympathetic study of that great philosopher. His critical conclusions, which are extremely radical, have done much to qualify the admiration which his philosophical conclusions have excited in conservative minds. After the death of Cardinal Newman Dr. Martineau was the most conspicuous figure in English theological and religious thought. D. Jan. 11, 1900. Revised by J. W. Chadwick.

Martinez, town; capital of Contra Costa co., Cal. (for location of county, see map of California, ref. 7–C); on Carquinez Strait, which accommodates the largest sea-going vessels, and on the S. Pac. Co.'s Railway; 35 miles N. E. of San Francisco. It is in a rich grain, nut, and fruit region, has a delightful and uniform climate, and contains 5 churches, graded public school, and 2 weekly newspapers. There are coal, copper, and quicksilver mines in the vicinity, and 12 miles distant is Mt. Diablo, 3,986 feet high, whose summit commands an unobstructed view of an area of about 40,000 sq. miles. Pop. (1890) 1,600; (1900) 1,380.

Editor of "Contra Costa Gazette."

Martinez, maăr-tee'năth, Tomás: statesman; b. at Leon, Nicaragua, about 1812. He was engaged in trade and mining and took no active part in public affairs until 1854, when he became a colonel in the conservative forces. As general he fought successfully against Walker 1856–57, and on June 24, 1867, he and Jerez were appointed temporary dictators. War having been declared on Costa Rica, Martinez was about marching against that country when he was almost unanimously chosen president, assuming office Nov. 15, 1857. Peace was quickly established, and his administration was the most prosperous that the country had known. In Sept., 1862, war broke out with Honduras and Salvador, but ended in a victory gained by Martinez Apr. 29, 1863. Martinez was re-elected for four years Mar. 1, 1863, and he declined a third term in 1867. D. at Managua, Mar. 12, 1873. Herbert H. Smith.

Martinez Campos, -kaam'pōs, Arsenio: soldier and politician; b. at Segovia, Spain, Dec. 14, 1834; fought under O'Donnell in Africa and under Prim in Mexico; served against the revolutionists in Cuba 1869–72, and soon after his return was made *mariscal de campo* and captain-general

of Valencia; for his services against the Carlists he was promoted to lieutenant-general. The *pronunciamiento* made by him and Gen. Jovellar paved the way to the accession of Alfonso XII., and the final downfall of the Carlists was mainly due to his victory at Pena de Plata (1876). From 1876 to 1878 he was captain-general of Cuba, and during this period he extinguished the rebellion in that island, more by conciliation than by arms. From Mar. to Dec., 1889, he was Minister of War. On Feb. 8, 1881, he combined with Sagasta to form a new ministry, taking the presidentship of the council and the portfolio of war; and he retained the latter position in the cabinet of Jan. 9, 1883, finally resigning Jan. 18, 1884; took command of the army of the north, and commanded the army sent against the Riffs in 1894, when that tribe attacked Melilla. In 1895 he was appointed captain-general of Cuba. D. Sept. 3, 1900. HERBERT H. SMITH.

Martinez de Irala, DOMINGO: See IRALA.

Martínez de la Rosa, maăr-tee'nāth-dā-laă-rō'saă, FRANCISCO: statesman and writer; b. at Granada, Spain, Mar. 10, 1789; d. in Madrid, Feb. 7, 1862. A brilliant youth, he became Professor of Philosophy at Granada in 1808: but the war of independence against the French excited his enthusiasm, and he joined eagerly in the efforts to rid Spain of its invaders. He was deputy from Granada in 1813, and the Cortes employed him for a time as an agent in London. There, hearing of the heroic defense of Saragossa, he wrote his epic *Zaragoza*. In England, however, he became a believer in constitutionalism, and accordingly, after the return of Ferdinand VII., he was arrested, imprisoned, and then sent to the penal settlement Gomera, on the coast of Africa. Here he wrote his tragedy *Morayma*. After the uprising in 1820 he was recalled to Spain, and was for a time Minister of Foreign Affairs. On the subversion of the constitution through French intervention in 1823 he was obliged to go into exile, living for a number of years in Italy and Paris. In 1833, however, he returned, and in 1834 he again became Minister of Foreign Affairs as leader of the moderate party. From this time on he was recognized as the chief representative of constitutionalism in Spanish politics. Under Espartero he was ambassador to France, and in 1858 he was the leader of the ministry, becoming president of the senate in 1860. During all these years he had been writing much, always largely under the influence of French models. Among his literary works may be mentioned his tragedy *Edipo*; his comedies *El Español en Venecia* and *La hija en casa y la madre en la máscara*; his romance *Doña Isabel de Solis* (3 vols., 1837–40); his didactic poem *El arte poética*, elegant, but learnedly dull; his *Hernan Perez de Pulgar* (1834); and his *Espíritu del Siglo* (10 vols., 1835–51), a history of the French Revolution, but really only a reworking of Thiers's *Histoire de la Révolution française*. His lyric poems were collected in Madrid (1833; 2d ed. 1847). His *Obras completas* appeared in 5 vols. (Madrid, 1835; again Paris, 1844–46). His *Obras dramáticas* were published in 3 vols. (Madrid, 1861 and again in 1884). See L. Godard, *Martínez de la Rosa, ses œuvres, etc.* (Paris, 1862). A. R. MARSH.

Martinez de Rozas, -dā-rō'thaas, JUAN: Chilian patriot; b. at Mendoza (now in Argentina), 1759. He graduated at the University of Cordoba, taught in Chili, held various official positions there, and finally was made intendant of Concepcion. During his long residence in that city he acquired almost unbounded influence in the south of Chili, which at that time had little sympathy with the north; by disseminating republican ideas he prepared the way for the revolution. In 1808 Rozas was appointed secretary of the captain-general, Carrasco, a weak man who at first was much under the influence of his subordinate. Rozas used this power to effect reforms, but eventually Carrasco quarreled with him and he was dismissed. On the breaking out of the revolution Rozas became a member of the first popular junta (Sept. 18, 1810), and eventually acquired complete control over it. Among his important acts was the sending of a force to aid the patriots of Buenos Ayres. Carrera, who was jealous of Rozas, intrigued against him, and when the first congress met, July 4, 1811, a new junta was chosen. Rozas retired to the south, and his differences with Carrera for some time threatened a civil war; eventually Carrera gained entire ascendency, and in 1812 Rozas was banished to Mendoza. He died there Mar. 3, 1813. HERBERT H. SMITH.

Martinique, maăr-tēē-neek' (corruption of *Madinina*, the Carib name): an island of the Lesser Antilles, West Indies, belonging to France; lying between the two British islands of Dominica and St. Lucia, 25 miles S. of the former and 20 miles N. of the latter. Area, 381 sq. miles. It is of very irregular outline, the greatest diameter being from N. W. to S. E.; S. of the middle it is nearly cut in two by the opposite bays of Fort de France and François. The surface is mountainous, the highest peak being the Morne Pelée, near the northern end (4,430 feet); it is a volcano, but seldom active; the last eruption occurred in 1851. Other peaks are evidently ancient volcanoes to which the island owes its origin. The climate is generally healthful, though warm on the coast (mean temperature about 77·5° F.). Yellow fever is now rarely epidemic. Hurricanes are occasionally destructive during the months from June to October; in the great one of Oct. 10, 1780, 9,000 persons perished. Most of the interior is still covered with forest and uninhabited; notwithstanding this the island is one of the most thickly populated regions in the world, averaging 464 souls to the square mile. The cultivation of sugar-cane and the manufacture of sugar and rum are at present almost the only industries; coffee-planting, formerly prominent, has been almost abandoned, and cacao-planting has only recently been taken up. Much of the sugar is prepared in central usines, to which the planters sell their products. There are over 6,000 peasant proprietors. The exports, mainly of sugar and rum, average about 20,000,000 francs annually. Martinique is a colony of France, has a governor and a council elected by limited suffrage, and sends a senator and two deputies to the French parliament. Capital, Fort de France (formerly Fort Royal). The largest town is St.-Pierre, near the north end of the west coast (23,755 inhabitants). The island was one of the strongholds of the Carib Indians. It was settled by the French under d'Esnambuc, who founded St.-Pierre 1635; it became a crown colony 1675, and the Caribs were soon exterminated or exported. Sugar cultivation was introduced by Dutch colonists, who had been driven out of Brazil, about 1655. It was held by the British 1794–1802. Slavery was finally abolished in 1848, but many of the slaves had been freed before. Pop. (1890) 177,000, of whom a large proportion (probably at least 80 per cent.) are Negroes or colored. Of late years coolie (Asiatic) laborers have been introduced. See Daney, *Histoire de la Martinique* (6 vols., 1846); Rey, *Étude sur la colonie de la Martinique* (1881); *Annuaire de la Martinique* (annual, official); Ober, *Camps in the Caribbees* (1886). HERBERT H. SMITH.

Martinsburg: town; capital of Berkeley co., W. Va. (for location of county, see map of West Virginia, ref. 5–M); on the Balt. and O. and the Cumberland Val. railways; 80 miles W. of Washington. It has 12 churches, 6 public schools, U. S. Government building (cost $100,000), gas and electric lights, electric street-railway, 3 national banks with combined capital of $275,000, and a daily and 5 weekly newspapers. The manufacturing establishments include railway repair-shops, distilleries, lime and phosphate works, woolen and hosiery mills, planing-mills, bicycle-factory, etc. The vicinity produces much wheat, corn, and grass. Pop. (1890) 7,226; (1900) 7,564. EDITOR OF "INDEPENDENT."

Martin's Ferry: city (laid out in 1795); Belmont co., O. (for location of county, see map of Ohio, ref. 5–I); on the Ohio river, and the Cleve., Lorain and Wheel., the Penn., the Wheel. and Lake Erie, and the Wheel., Bridge and Term. railways; opposite Wheeling, W. Va. It contains 9 churches, a parochial and 3 public schools, an incorporated bank with capital of $25,000, a private bank, and daily, weekly, and monthly periodicals. Nearly $5,000,000 are invested in its manufactories, the products of which include sheet and bar iron, steel, pig metal, nails, glass, engines, kegs, barrels, boxes, stoves, and many kinds of heavy castings. Pop. (1880) 3,819; (1890) 6,250; (1900) 7,760.
EDITOR OF "TIMES."

Martinsville: city; capital of Morgan co., Ind. (for location of county, see map of Indiana, ref. 7–D); on the White river, and the Cleve., Cin., Chi. and St. L. and the Penn. railways; 29 miles S. W. of Indianapolis. It is in an agricultural region, and has numerous artesian mineral wells that have become noted for their curative properties in cases of rheumatism and kidney troubles. There are 5 sanitariums, 5 churches, 2 public schools, a daily and 2 weekly newspapers, a national bank with a capital of $70,000, and manufactories of foundry products, machinery, lumber, flour, and buckets. Pop. (1880) 1,943; (1890) 2,680; (1900) 4,038. EDITOR OF "REPORTER."

Martius, CARL FRIEDRICH PHILIPP, von: naturalist; b. at Erlangen, Bavaria, Apr. 17, 1794. He graduated in medi-

cine at the university of his native city, and studied botany at Munich. In 1817, when the Austrian Archduchess Leopoldina went to Brazil to become the wife of the crown prince, a number of Austrian and Bavarian naturalists were added to her suite, Martius and Spix being chosen for Bavaria. They remained until the end of 1820, and during this period traveled through the interior from Rio de Janeiro to Pará, and ascended the Amazon. Their narrative was published as *Reise in Brasilien* (3 vols. 4to and atlas, 1823–31), the greater part written by Martius, Spix having died in 1826. Their extensive collections were described in various large works with the collaboration of Agassiz, Perty, Andreas, Wagner, and others, the plants by Martius in *Nova Genera et Species Plantarum Brasiliensium* (3 vols., 1823–30), and *Icones Selectæ Plantarum Cryptogamicarum Brasiliæ* (1826–31). All these works were printed at the expense of the Bavarian Government, and were richly illustrated. Martius was knighted on his return from Brazil, was made Professor of Botany at the Munich University in 1826, and conservator of the botanical gardens in 1832. His greatest work, the *Natural History of Palms* (*Historia Naturalis Palmarum*) was published from 1823 to 1850 in three magnificent volumes, with 245 plates; 582 species are described. He planned and edited the first volumes of the great *Flora Brasiliensis*, begun in 1840, and wrote several of the monographs. His *Beiträge zur Ethnographie und Sprachenkunde Amerikas, zumal Brasiliens* (2 vols., 1867) was the greatest contribution ever made to the ethnography of Brazil. His minor publications are very numerous, embracing no less than 160 titles. In 1854, the Government having decided to erect an exposition building in the botanical garden, Martius resigned his positions after unavailing remonstrances. He died at Munich, Dec. 13, 1868. See Meissner, *Denkschrift auf Carl Friedr. Phil. von Martius* (Munich, 1869); Charles Rau, *Memoir of C. F. P. von Martius* (Washington, 1871).

HERBERT H. SMITH.

Martius Yellow: See NAPHTHALENE COLORS.

Mar'tos: town; in the province of Jaen, Spain; 16 miles W. S. W. of the town of Jaen (see map of Spain, ref. 18–E). It is celebrated for its cold mineral springs, which are much used for bathing, and much resorted to in cases of cutaneous diseases. The streets of Martos are crooked, steep, and narrow, and its public buildings are commonplace. The surrounding districts produce an excellent oil, the principal article of commerce of the town. Pop. about 14,700.

Martyn, HENRY, B. D.: missionary; b. at Truro, Cornwall, England, Feb. 18, 1781; graduated as senior wrangler at Cambridge in 1801; became a fellow of his college, St. John's, 1802; was ordained deacon of the Anglican Church 1803; priest in 1805, and went to Bengal 1806 as a missionary; subsequently was stationed at Dinapore and Cawnpore (1809); set out to return to England on account of his broken health in 1811, but remained more than a year in Persia, laboring for his faith. D. at Tokat, Asia Minor, Oct. 16, 1812, among strangers. A monument to his memory was erected there in 1856. Martyn translated the New Testament and Book of Common Prayer into Hindustani, the New Testament and Psalms into Persian, and the New Testament into Arabic. He wrote *Controversial Tracts* (1824); *Sermons* (1822); *Journals and Letters* (1837, 2 vols.); *Five Sermons* (1862). See *Memoir* by Rev. John Sargent (1819), often reprinted, and *Life* by George Smith (1892).

Martyn, WILLIAM CARLOS: See the Appendix.

Martyr [O. Eng., from Lat. *mar'tyr* = Gr. *μάρτυρ*, *μάρτυς*, martyr, liter., witness]: one who dies for his belief. In our New Testament the Greek word is generally rendered by its English translation, *witness*, "martyr" occurring but in three places—Acts xxii. 20; Rev. ii. 13; xvii. 6. The number of martyrs during the first three centuries has been variously estimated. H. Dodwell (the elder), in his *Dissertationes Cyprianicæ*, declares it to have been inconsiderable; and this opinion is shared by Gibbon (*Decline and Fall*, ch. xvi.), who cites Origen as his authority. Monkish enthusiasts, on the other hand, exaggerated both the strength of the "noble army of martyrs" and the sufferings of those who composed it. The truth lies between these extremes. If these martyrs died unbaptized their death was regarded as a nobler baptism, and they were believed to enter paradise at once (Matt. v. 10, 12; x. 39). Each anniversary of a martyr's death, called *natales*, or *natalitia* (birthdays), because on it he was born to eternal life, was commemorated at his grave, and by degrees it became usual to build over such honored tombs churches called *martyrii*, or *memoriæ*, each named after the saint buried beneath it. There his festival was kept yearly, his "acts" were read; prayers were offered, the Eucharist was celebrated, and *agapæ*, or love-feasts, were held. The patiently borne sufferings of martyrs made many converts. Their blood, truly declared Tertullian, "was seed" —*Semen est sanguis Christianorum.* (*Apol.*, c. 50.) Orations were spoken in their honor, and poems were written to celebrate them. As the days of martyrdom were left further behind the martyrs received higher honor. Heathen converts adored them as they had adored the heroes of paganism. Their remains were disinterred and laid under the altars of churches. Every relic of theirs became a sacred treasure. Their intercession was deemed all-powerful with God. Martyrs formerly unheard of announced themselves in visions and told the place of their graves.

All religions and forms of religion have had their martyrs. Jews have been scorned, oppressed, and murdered for holding fast to their ancient belief; Mohammedans have died calmly for their prophet; Buddhist missionaries have fallen victims to their zeal; Roman Catholics have burned Protestants, who, when their day of power came, retaliated. The word *martyr* is often applied to those who lose life or wealth in scientific research. It is used to denote innocent sufferers from almost any cause, and has also been affixed to the names of kings who underwent the last penalty for misgovernment. See Ruinart, *Acta Martyrum* (Paris, 1682), and the great Bollandist *Acta Sanctorum*; for Protestant martyrs, see Foxe, *Book of Martyrs.* Revised by S. M. JACKSON.

Martyr, PETER: See ANGHIERA, PIETRO MARTIRE, de; also VERMIGLI, PIETRO MARTIRE.

Martyrol'ogy [from Lat. *martyrolo'gium* = Gr. *μαρτυρολόγιον*, liter., register of martyrs; *μάρτυς*, martyr + *λέγειν*, reckon, count, tell]: a term which, used in a narrow sense, denotes the list of martyrs who have suffered for the Christian faith, arranged in chronological order. Usually, however, it signifies one of the official liturgical books of the Roman Catholic Church, and as such contains not only the names of martyrs, but many saints likewise. We know from the Epistle of the Church of Smyrna on the death of St. Polycarp, the letters of St. Cyprian, the *Liber Pontificalis*, and other sources, that the early Church kept accurate lists of those who died for Christ, and celebrated yearly feasts in their honor. During the persecution of Diocletian the Acts of the Martyrs were in great measure destroyed, partly by the pagans, partly by the acts of the Christians who gave them up to save the copies of the Scriptures especially sought for. In the following period of peace the churches sought to restore their ancient lists, but not always with success. They depended on the remnants of their archives, personal recollections, and local traditions. The decline of the Græco-Roman culture, the invasions of the barbarians, the absence of a trained critical sense, made the task a difficult one, and in the course of time much that was legendary or untrustworthy was accepted as truth. This, however, is different from a process of wholesale fabrication of acts, etc., of which there is no trace in Church history. The most reliable accounts of the pre-Constantinian martyrdoms are to be found in the small volume of Ruinart *Acta Sincera Martyrum* (Paris, 1690). Later martyrdoms are most easily found in the *Acta Sanctorum* of the Bollandists. The oldest extant Oriental martyrology is found in the well-known Nitrian manuscripts published by Wright in *The Journal of Sacred Literature* (1865–66), and belongs to the year A. D. 412. The oldest Western martyrology is the so-called *Martyrology of St. Jerome*, a compilation of the latter half of the fifth century out of the great collection (now lost) of Eusebius, and Roman and African Church calendars. In its present form, it bears traces of adaptation to the Gallic ecclesiastical life of the sixth century. In the eighth and ninth centuries several other martyrologies made their appearance, based substantially on the preceding. In 1586 Baronius revised the Roman martyrology by order of Gregory XIII., and enriched it with valuable notes. Under Benedict XIV. (1740–58) this edition was reissued with a learned preface. See de Smedt, *Introductio generalis ad historiam ecclesiasticam critice tractandam* (1876). JOHN J. KEANE.

Marvell, ANDREW: poet; b. at Winestead, Yorkshire, England, Mar. 2, 1621; was educated at Cambridge and on the Continent; became the friend and assistant of Milton in the Latin secretaryship. He was for many years member for Hull in the House of Commons; was the constant friend of liberty both under the Commonwealth and after the Res-

toration; from his probity was called the "British Aristides"; refused to be moved by the bribes of Charles II. or the persecutions of royalists, who frequently threatened his life. His political satires, although often vehement and coarse, are full of noble and generous thoughts, and much of his verse is very sweet and beautiful. Among his best-known poems are the *Song of the English Exiles in Bermuda* and the *Horatian Ode on Cromwell's Return from Ireland*. D. in London, Aug. 17, 1678. Revised by H. A. Beers.

Marwar, or **Jodhpur**: a feudatory state of Rajputana, British India. It occupies the basin of the river Luni, between lats. 24° 35′ and 27° 19′ N., and lons. 70° 8′ and 75° 23′ E. Area, 37,445 sq. miles. Pop. (1891) 2,521,727. Capital, Jodhpur. Nearly all the population is in the S. E. of the state, through which runs the Rajputana Railway. The Luni and its tributaries rise in the Aravalli Mountains, and are dry in some seasons. To the westward of the Luni the country is a sandy desert. The ruling people are Rahtor Rajputs, the subject classes mostly Jats. Among the latter are the Marwari traders, the Jews and Armenians of the East, well known through all Hindustan. Nearly all are Hindus, 10 per cent. Jains, and 4 per cent. Mohammedans. The chief industry is the rearing of cattle and sheep. The cattle of Marwar are renowned throughout India, and the camels of Pali (in the northern part of the state) are esteemed for their agility and endurance. The state pays a tribute to the British. The reigning dynasty dates from 1194, the direct line was extinguished in 1843, but a maharajah was selected from a collateral line, that of the rajahs of Ahmednagar in Guzerat. M. W. Harrington.

Marx, Karl: founder of modern German socialism; b. of Jewish parents at Treves in the Rhine Province, May 5, 1818; studied at Bonn and Berlin, and became in 1842 editor of the *Rheinische Zeitung*, a radical journal published in Cologne, which was suppressed in 1843 for its attacks on the Prussian Government. Having settled in Paris, he continued his attacks on Prussia in a socialistic sheet called the *Vorwärts*; was expelled from France in 1845, and stayed for a time in Brussels, where he founded a German workingmen's association, a type of the future German democracy, and issued in connection with his friend Engels his famous *Manifesto* to the laboring classes of all civilized nations, setting forth the creed of the communists. Driven in turn from Belgium, he returned in 1848 to Cologne and there published the *Neue Rheinische Zeitung*, but his revolutionary zeal brought down upon him the wrath of the Government, and he was obliged to leave Germany. He withdrew in 1850 to London, which thenceforth remained his headquarters. His activity both as a writer and as an agitator was now almost incessant. In 1859 appeared his *Zur Kritik der Politischen Ökonomie*, containing the principles afterward elaborated in his masterpiece *Das Kapital* (1867; 3d ed. 1883 and 1885). In 1864 at a meeting of workingmen in London he laid the foundation of the International (*q. v.*), which held its first regular congress two years later and continued under his direction till 1872. During the sixties his energies were also devoted to the formation of a democratic party in Germany in opposition to the followers of Lassalle, and in 1869 this object was attained largely through the efforts of Liebknecht and others of his disciples, who formed the Social Democratic Labor party. Marx died in London, Mar. 14, 1883. His influence on the workingmen of all civilized countries can scarcely be estimated. His theories, in spite of the often obscure language in which they were expressed, constantly appear in one form or another in the writings of modern socialists. The salient features of his social philosophy are the theory of surplus value and the belief in the inevitable downfall of capitalism, i. e. the possession of the instruments of labor by the capitalist class. He recognizes no other source of the different exchange values of commodities than the different amounts of labor that enter into their production. According to his view the gain of the capitalists proceeds from the exploitation of the laborers, whose remuneration is limited by the "iron law of wages," while the surplus value which their labor has created goes in the form of profits to their employers. "Capital," he says, "is dead labor, which, vampire-like, becomes animate only by sucking living labor, and the more labor it sucks the more it lives." He considers that the present system of distribution will inevitably give place to one in which capital will be held in common for the good of all, and in the meanwhile he favors agitation as a means of hastening that result. See Jäger, *Der moderne Socialismus* (1873); Rae, *Contemporary Socialism* (1884); and Dawson, *German Socialism* (1888). The first volume of *Das Kapital*, containing all the essential points of his theory, has been translated into English (London, 1887). F. M. Colby.

Mary [from Lat. *Maria* = Gr. Μαρία, Μαριάμ, from Heb. *Miriām*, liter., rebellion. See Miriam], **The Blessed Virgin**: the mother of Christ. Concerning the birth and parentage of Mary the Gospels tell us nothing; as to her share in the Incarnation, they are explicit, dwelling especially upon the events that immediately preceded the birth of Christ and upon certain circumstances of his childhood. The years at Nazareth, after the finding of Jesus in the temple, are summed up in the words, "He was subject to them," i. e. to Mary and Joseph. During the public life of Christ his mother appears but rarely. At the foot of the cross the "beloved disciple" takes her unto his own [home], and again on the day of Pentecost she is present in the "upper chamber." After that the sacred record in regard to her is silent.

It is natural, however, to suppose that the first followers of Christ knew more of Mary than is narrated in the Gospels; and it is therefore easy to understand how traditions concerning her originated either from actual information or from surmises based on her singular prerogatives. To such sources may be traced the belief that she was the daughter of Joachim and Anna; that her early years were spent in the service of the temple; that after death her body was assumed, together with her soul, into heaven. Exaggerated attempts to supplement the Gospel account, such as the *Protevangelium Jacobi Minoris* and the *Evangelium Nativitatis Mariæ*, were condemned by ecclesiastical authority. And while the teachings of the early Fathers concerning Mary have weight as showing the traditional belief of the Church, the numerous legends woven about her in subsequent ages are the outcome, not the cause, of the devotion paid her by Roman Catholics.

Its fundamental reason is the fact that Mary is the mother of the God-man. Since the Creator has so exalted her, she deserves from creatures the highest degree of veneration that is not divine worship. This veneration is called by theologians *hyperdulia*, to distinguish it from the *dulia* or veneration of the saints, and from the *latria* which can be offered to God alone. Catholics do not *worship* or *adore* Mary, though they honor her in a manner befitting her unique dignity. Nor can they conceive that the reverence shown to his mother should be offensive to Christ or detract from his glory; also they pray to Mary, not as though she were the source of grace, but because they believe that her prayers in behalf of men will avail more in proportion, as her merit is greater than that of any other mere creature. Finally, Mary is proposed as a model for imitation, inasmuch as she is the ideal of womanhood, in whose person "woman rose into a new sphere and became the object of a reverential homage of which antiquity had no conception."

That Mary was peculiarly venerated by the earliest Christians is evident from the frescoes and inscriptions of the Roman catacombs. A powerful impetus was given to her cult by the Council of Ephesus (431), in which Nestorius was condemned and the term θεοτόκος, God-bearing, was formally applied to Mary. The council had been held in a church dedicated to her, and in the next two centuries churches were built in her honor in various cities both of the East and of the West. As the Liturgy developed, the festivals of Mary became more numerous, and popular devotion assumed a variety of forms according to the circumstances of time and place. Christian art drew some of its best inspirations from the cult of the "Madonna," and helped in turn to strengthen the devotion. Mysticism and theological speculation united to develop the ideas implied in Mary's prerogatives, and thus to form a systematic "Mariology." The Church has fostered this outgrowth, and left it free scope on the condition that it should always be in harmony with revealed truth and in keeping with Mary's dignity. It is hardly necessary to add that expressions of enthusiastic devotion, in writing or in practice, are not to be judged by the rigorous criteria which are properly applied to dogma.

Literature.—Northcote, *Mary in the Gospels* (London, 1885); Liell, *Darstellungen der allerseligsten Jungfrau in den Katakomben* (Freiburg, 1887); Livius, *The Blessed Virgin in the Fathers of the First Six Centuries* (London, 1893); Newman's *Development*. J. J. Keane.

Mary, Queen of Scots: See Mary Stuart.

Mary I.: Queen of England; b. at Greenwich Palace, Feb. 18, 1516; a daughter of Henry VIII. by his first wife, Catharine of Aragon; educated entirely in Spanish fashion —Roman Catholic. In 1522 she was betrothed to the Emperor Charles V., but after the divorce of Henry VIII. from Queen Catharine the emperor broke the contract, and other marriage negotiations with Francis I. and his second son, the Duke of Orleans, failed. Meanwhile her strong adhesion to her mother's cause alienated her father's affection. Later she came naturally to be considered the head of the Roman Catholic party, which made her suspected in the king's eyes, and after the birth of Elizabeth her position became really perilous. James V. of Scotland asked her in marriage, but the proposition was refused on account of the consequences which such a union might have for the children of Anne Boleyn. She was even compelled to sign articles acknowledging that her mother's marriage was illegal and her own birth illegitimate, which involved a renunciation of her right to the succession. In the last years of the reign of Henry VIII. her position became better, however; she lived on a good footing with Catharine Parr, and her right to the succession was restored to her. During the reign of her half-brother, Edward VI., she lived in retirement and took no part in politics: the different suitors to her hand were not accepted. On the death of Edward VI. (July 6, 1553), she succeeded to the throne after a short struggle with the party supporting the claims of Lady Jane Grey; and a reaction immediately took place in the government, headed by Gardiner, who was made lord chancellor Aug. 23, 1553, and by Bonner. It was not until after her marriage with Philip II. of Spain, which took place July 25, 1554, that those persecutions against the Protestants began which have made her name so odious in the history of England. She experienced great disappointments in her marriage from the coldness of her husband and from her childlessness; a mistake she made on the occasion of an attack of dropsy even subjected her to great mortifications. Her character, by nature cheerless, sullen, and singularly mixed, seemed to change for the worse under these influences, and she yielded willingly to the counsels of Philip and Gardiner. On Nov. 30, 1554, Cardinal Pole declared England and Rome reconciled, and on Feb. 4, 1555, John Rogers was burned at the stake. Cranmer, Latimer, and Ridley shared the same fate, and were followed by 200 or 300 more, and the ruin of the country seemed impending, when in the summer of 1558 the queen was attacked by an intermittent fever, of which she died at St. James's Palace, Nov. 17, 1558. Tennyson calls her "unhappiest of queens and wives and women."

Mary II.: Queen of Great Britain; b. Apr. 30, 1662; daughter of James II. by Anne Hyde; was educated in the Protestant faith, and on Nov. 4, 1677, married her cousin, the Prince of Orange (King William III.), with whom she was declared joint sovereign in 1689. She died of smallpox Dec. 28, 1694. For details of the reign, see WILLIAM III.

Maryborough: an important port of Queensland, Australia; 144 miles N. of Brisbane, on the Mary river at its entrance into Hervey Bay; lat. 25° 35′ S. (see map of Australia, ref. 5–J). It is the terminus of the railway to Gympie, an excellent and large port, the receiving-point for the agricultural districts of Wide Bay and Burnett, and for the gold, copper, and coal of the districts of Gympie and Derry. It has several refineries, distilleries, sawmills, and iron-foundries. Pop. (1891) 8,700. M. W. H.

Maryland: one of the U. S. of North Ameriea (South Atlantic group); the first of the thirteen original States that ratified the Federal Constitution.

Location and Area.—It lies between 37° 53′ and 39° 44′ N. lat., and 75° 2′ and 79° 33′ W. lon.; is bounded on the N. by Pennsylvania, on the E. by Delaware and the Atlantic Ocean, on the S. and S. W. by Virginia, and on the W. by West Virginia. Its gross area is 12,210 sq. miles, of which 9,860 are land surface. Chesapeake Bay reaches to within a few miles of its northern boundary, dividing the State into what are known as the Eastern and Western Shores.

Topography.—The three great topographical areas into which the U. S. E. of the Mississippi is divided—the Coastal Plain, the Piedmont Plateau, and the Appalachian Region—are all represented in Maryland. To the Coastal Plain belongs that part of the State which lies to the E. of a line passing through Baltimore and Washington. It includes the whole Eastern Shore and part of the Western, and comprises about half the land area of the State. E. of the bay this region is very flat, but on the W. it is more rolling. The Piedmont Plateau lies to the W. of the Coastal Plain, and extends to the Catoctin Mountains. It contains about 2,500 sq. miles, and is broken into series of undulating

Seal of Maryland.

hills, increasing in height westward. The Appalachian Region begins at the Catoctin Mountains, and extends to the western boundary of the State, having an area of over 2,000 sq. miles. It may be divided into three districts—the eastern (Blue Ridge and great valley), the central (Appalachian Mountains), and the western (Alleghany Mountains). These mountains all lie in parallel ranges, with deep valleys between, and the height rises in places to over 3,000 feet. Maryland has no good harbor on the Atlantic coast, but the coast-line of Chesapeake Bay is deeply indented with larger and smaller estuaries and coves, giving a multitude of harbors suitable for vessels of light draught, and affording, with the rivers running into these, unusual facilities for water transportation. Of the numerous islands in the bay Kent island is the largest. Along the ocean frontier runs a reef of sand, inclosing and sheltering Synepuxent and Chincoteague Bays, and giving inland navigation along the coast. The rivers of Maryland are, on the Western Shore, the Potomac, Patuxent, Patapsco, Gunpowder, and Susquehanna; and on the Eastern, the Elk, Sassafras, Chester, Choptank, Nanticoke, Wicomico, and Pocomoke, besides a number of estuaries bearing the names of rivers. These all empty into Chesapeake Bay. To the W. of the central watershed the Monocacy, Antietam, and Youghiogheny flow into the Potomac. The western part of the State is traversed in a northeast and southwest direction by the Catoctin, Blue Ridge, Appalachian, and Alleghany Mountains.

Geology.—Maryland, notwithstanding her small area, contains a remarkably complete sequence of all the geological formations, not merely of the great eras, but of the subordinate periods. In Western Maryland are found the Silurian, Devonian, and Carboniferous series; in the Piedmont Plateau, granite, marble, gneiss, basalt, and other igneous and metamorphosed rocks; and in the Coastal Plain, the sands, clays, and gravels of more recent epochs. The mineral products are too numerous to specify, but of those possessing industrial value she has iron, copper, antimony, lead, zinc, gold, and chrome; coal; building and decorative stones in great variety; granite, sandstone, marble, and limestone; brick, potter's, and porcelain clays; sand, soapstone, and hydraulic cement. The semi-bituminous coal of the Cumberland basin is noted for its steam-generating qualities, and is the basis of one of the most important industries in the State, the total output in 1899 being 4,711,248 tons. The iron ores are chiefly hematite and magnetite.

Soil and Productions.—In the earlier history of the State tobacco, wheat, and maize were almost the sole crops. Of late years agricultural conditions have been much modified, and while these still remain staple products, they no longer hold an exclusive position. The emancipation of the slaves, leading to the subdivision of large estates, the growth of cities, the extension of steam transportation, and other causes have made a thorough cultivation of smaller areas the most profitable kind of farming, and particularly favored the increase of market-gardening and truck-farming, to which the lighter soils are especially adapted. Western Maryland has fine grass and wheat lands, and has developed an important industry in its extensive peach-orchards.

Northern Central Maryland has soils well suited to grass, wheat, and maize. Dairy-farming is an important industry, and much live stock is raised. Southern Maryland has a soil for the most part too light for grass and wheat, but excellent for early fruits and vegetables; and this industry is rapidly extending. Tobacco, though less cultivated than formerly, remains a staple crop in this section. The Eastern Shore has good corn and wheat soils, and others suited to fruits and vegetables, of which peaches and tomatoes are the most important. The canning and packing of fruits, vegetables, and oysters is the largest industry in the State. According to the report of the Maryland Bureau of Statistics, in 1900 there were packed 33,600,000 cans of tomatoes, of an average of three pounds each; 11,400,000 cans of corn, of two pounds each; 11,200,000 cans of peas, of two pounds each; and 19,200,000 cans of peaches, of three pounds each. The total pack of fruit and vegetables amounted in value to at least $15,000,000.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS. ETC.	1880.	1890.	Per cent.
Total number of farms	40,517	40,798	* 0·7
Total acreage of farms	5,119,831	5,952,390	† 3·3
Total value of farms	$165,503,341	$175,058,550	* 5·8

* Increase. † Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	585,877	15,232,802 bush.	$6,245,449
Wheat	778,864	15,187,848 "	10,783,372
Oats	74,309	1,783,416 "	552,859
Rye	24,729	408,028 "	212,175
Buckwheat	7,435	111,525 "	63,569
Tobacco (1896)	15,995	9,277,100 lb.	398,915
Potatoes	23,081	1,269,455 bush.	685,506
Hay	277,332	302,292 tons	4,247,203
Totals	1,587,622		$23,189,048

On Jan. 1, 1900, the farm animals comprised 130,959 horses, valued at $6,950,014; 12,891 mules, value $937,005; 154,712 milch cows, value $4,610,418; 102,723 oxen and other cattle, value $2,604,643; 138,177 sheep, value $485,553; and about 300,000 swine, value $2,000,000; total value, $17,587,633.

Climate.—The climate is mild, the chief differences being due to elevation. No part of the State is without some snowfall in the winter. The average temperatures of the four climatic divisions of the State are:

MEAN TEMPERATURE.

MONTHS.	Eastern Maryland.	Southern Maryland.	Northern Central Maryland.	Western Maryland.
January	34·8°	35·3°	30·7°	30·5°
February	36·1	37.4	33·9	31·6
March	40·5	42·3	38·2	37·2
April	52·6	53·4	50·9	49·8
May	62·1	63·9	63·5	60·7
June	72·8	74·1	72·8	70·3
July	75·8	77·7	75·7	73·8
August	74·8	75·7	72·4	74·2
September	67·5	68·6	65·8	65·3
October	56·5	56·5	54·2	51.4
November	55·3	46·5	42·8	41·2
December	37·3	37·6	34·0	33·0

The climate, however, is not quite so equable as these figures indicate. In the winter "cold waves" often send the temperature (in the central and western regions) down to 10°, or even 0°, for a few hours, and in summer it sometimes rises to 95° or over in the warmest part of the day. The monthly means of rainfall are:

MONTHS.	Eastern Maryland.	Southern Maryland.	Northern Central Maryland.	Western Maryland.
January	3·51	3·20	3·50	3·01
February	3·22	3·51	3·10	2·45
March	4·06	4·20	4·39	3·02
April	4·04	4·11	3·62	3·23
May	4·29	4·40	4·06	4·08
June	3·18	3·70	3·48	4·53
July	4·78	4·42	4·45	2·77
August	3·78	3·84	3·98	3·48
September	3·39	3·80	4·03	3·46
October	3·04	2·86	2·74	2·35
November	2·70	4·11	3·25	2·82
December	2·67	2·60	3·13	2·35

Divisions.—For administrative purposes, Maryland is divided into twenty-three counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

* Reference for location of counties, see map of Maryland.

Principal Cities and Towns, with Population for 1900.—Baltimore, 508,957; Cumberland, 17,128; Hagerstown, 13,591; Frederick, 9,296; Annapolis, 8,402; Cambridge, 5,747; Frostburg, 5,274; Salisbury, 4,277; Havre de Graee, 3,423; Westminster, 3,199; Crisfield, 3,165; Easton, 3,074; Chestertown, 3,008.

Population and Races.—In 1790, 319,728; 1880, 934,943; 1890, 1,042,390 (natives, 948,094; foreign, 94,296; males, 515,691; females, 526,699; whites, 826,493; colored. 215,657, of whom 189 were Chinese, 7 Japanese, and 44 civilized Indians); 1900, 1,190,050.

Fisheries.—One of the most important industries of Maryland is the oyster-fishery. The oysters of Chesapeake Bay are famed for their size and exeellenee, and the beds producing them aggregate over 200 sq. miles. During the season about 7,000 small vessels are employed in "dredging," "seraping," and "tonging" the oysters from the beds, the take being partly sent to the markets for immediate consumption, but the greater part being sealed up in air-tight eans for export. The catch of 1891 was about 10,000,000 bushels, worth, at the water-side, over $5,000,000; and 32,000 persons (besides the can-makers) are employed in taking and packing the oysters. A small fleet of armed boats, called the oyster navy, belonging to the State, polices the beds to enforce the laws and prevent illegal fishing. The present management of the beds is wasteful and injurious. The supply of shad was rapidly falling off until the U. S. Fish Commission introdueed a scientific system of artifieial propagation in 1880, when the take rose in eight years from 4,000,000 to 8,000,000. The menhaden, though not used for food, has a considerable commercial value, yielding in oil and fertilizing materials a product of over $300,000 per annum. The bay maekerel, crabs, wild ducks, and terrapin yield delicaeies to the market, and give employment to a large number of persons. In 1899 41,000 persons were reported as engaged in the fisheries; the capital invested, $8,000,000; and the value of the catch, $7,000,000. The oyster catch in 1900 was very small.

Finance.—The funded debt of the State on Sept. 30, 1900, was $6,309,326.13; sinking funds aggregated $3,424,057; leaving net debt $2,885,269.13. The reeeipts of the year ending Sept. 30, 1900, were $3,622,493.42; balance in the treasury Sept. 30, 1899, $707,926; other funds, $206,326.80; total, $4,536,746.22. The expenditures were $3,480,534.26. The assessed valuation for 1899 was $603,326,096.

Banking.—On Sept. 5, 1900, there were 72 national banks, with a combined capital of $15,122,660, surplus and undivided profits of $8,789,924.48, and individual deposits of $42,941,480.88. There were, on June 30, 1900, 26 State banks—capital, $1,783,410; surplus and profits, $824,613; and deposits, $7,106,607; 6 loan and trust companies—capital, $4,616,000; surplus and profits, $2,069,250; and deposits, $4,201,875; 6 private banks—capital, $50,501; surplus and profits, $7,324; and deposits, $229,653; and 18 mutual savings-banks, with $2,069,250 in surplus and profits, and $57,857,976 from 171,130 depositors.

Means of Communication.—The Baltimore and Ohio Railroad, the first opened in the U. S., extends N. E. to Philadelphia and New York and W. to Chicago and St. Louis, and has a branch to Washington. It operates 3,240.8 miles of lines. The Northern Central connects Baltimore with the great Pennsylvania system. It owns 145 miles of railway and leases 227. The Baltimore and Potomac operates 97 miles, and the Philadelphia, Wilmington and Baltimore has a main line of 95 miles, and operates 534 in addition. The Western Maryland (275.7 miles) traverses the State in a westerly direction, and opens communication with Southern Pennsylvania. The Baltimore and Lehigh (84 miles) extends to York, Pa. The Eastern Shore is opened up by a number of local railways connecting with the peninsula stem of the Pennsylvania system. The Chesapeake and Ohio Canal extends from Georgetown, D. C., to Cumberland, Md., and the Chesapeake and Delaware gives direct water communication with Philadelphia. A great part of the transportation of the State is effected by lines of steamers and sailing vessels running between Baltimore and the towns and landings on the bay. About twenty regular lines of seagoing steamers ply between Baltimore and foreign ports, and there are a number of coastwise lines.

Churches.—The U. S. census of 1890 gives the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	186	183	157,429	$2,449,440
Methodist Episcopal	925	919	82,069	3,771,717
Protestant Episcopal	166	244	23,938	2,381,406
Lutheran, General Synod	96	96	17,288	843,050
Methodist Protestant	174	173	13,283	654,625
African Methodist Episcopal	58	93	12,359	266,370
Reformed Church in the U. S.	67	65	10,741	484,225
Methodist Episcopal South	142	141	10,604	361,990
Presb. Church in the U. S. of A.	77	94	10,593	1,488,124
Baptist Church South	47	48	8,017	651,050
Baptist, Colored	38	34	7,750	150,475
United Brethren	57	55	4,736	113,789
Germ. Evang. Synod of N. A.	12	12	4,405	223,500
Lutheran, Synodical Conference	14	12	3,208	129,975
Jews, Reformed	9	9	2,800	223,500
Lutheran, Independent Cong.	7	7	2,535	66,000
Brethren, Conservative	29	41	2,446	60,200

The large number of Roman Catholics is to a great extent due to the fact that the colony was founded by a Roman Catholic, and religious toleration proclaimed at a time when adherents of that faith were persecuted in England. The Archbishop of Baltimore is the primate of the Church in the U. S.

Schools.—Francis Nicholson, royal governor of the province 1694–98, was the father of the public-school system of Maryland. Under his influence the Assembly founded King William School at the capital, and provided revenue for its support. This school afterward became St. John's College, which still flourishes. Under the present law the public schools of each county are controlled by local school boards, and those of Baltimore by commissioners, one from each ward. The schools are supported by State and local taxation. In 1899 there were 2,503 public schools, with 5,127 teachers with an average monthly salary of $32.43; there were 229,332 pupils enrolled, and an average daily attendance of 132,685. The expenditure for schools was $2,912,527. Of other educational institutions, the most important are Johns Hopkins University (*q. v.*), endowed with about $3,500,000, opened in 1876; the University of Maryland (faculties of medicine and law), chartered in 1807; the Peabody Institute, endowed by George Peabody, of London, which has a conservatory of music, a great library, and art galleries; the Baltimore City College and Polytechnic Institute (both connected with the public-school system); St. John's College, Annapolis, and the Woman's College of Baltimore. There are also colleges of medicine, pharmacy, and dentistry, and theological seminaries in the city and State.

Charitable, Reformatory, and Penal Institutions.—The charitable associations and institutions are numerous, and minister to every form of indigence and distress. Of the hospitals, the finest is that endowed by Johns Hopkins. The prison system consists of a State penitentiary in Baltimore, jails in the several counties and in Baltimore, a house of correction for minor offenses, and six reformatories for juvenile delinquents. Besides the official supervision of these institutions, a private organization, the Prisoners' Aid Association, is recognized by law, and has powers of visitation. Its exertions are directed to the reformation of prisoners, relieving their families, if dependent, during their incarceration, and finding them employment when discharged. The average population of the three principal prisons is: Penitentiary, 652; city jail, 497; house of correction, 275: the aggregate average of the county jails, 249. The Negro population, though only a fifth of the whole, furnishes half the occupants of the prisons.

Political Organization.—The government of the State is vested in a Governor, Legislature, and judiciary. The Governor is elected by popular vote for four years, and appoints all State, civil, and military officers, with consent of the Senate. The Legislature consists of a Senate and House of Delegates. Each county of the State and each of the three legislative districts of Baltimore city (which is coextensive with Baltimore County) elects one Senator for a term of four years. The delegates are elected by the counties and city in proportion to population, the lowest representation being two and the highest six. Each district of Baltimore has six. The delegates serve for two years, and the Legislature meets biennially at Annapolis. By a law dating from early colonial times, no priest, clergyman, or minister is eligible to the Legislature. The judiciary consists of a court of appeals, circuit courts, orphans' courts, Baltimore city courts, and justices of the peace. All the judges, except those of the orphans' courts, are elected by popular vote for a term of fifteen years. Maryland is divided into six congressional districts, of which two are entirely and two partly within Baltimore city. The U. S. Senators are chosen by the Legislature, one being always taken from the Eastern and one from the Western Shore. In politics the Democratic party is predominant, having a majority not only in the State at large, but (1894) in each congressional district.

History.—The foundation of Maryland is primarily due to George Calvert, first Baron of Baltimore. He had already settled a colony in Newfoundland, but the rigor of the climate and sterility of the soil determined him to ask of King Charles I. a grant of territory N. of the Potomac, which had been within the jurisdiction of the Virginia Company before the abrogation of its charter, but no part of which had been granted to any settlers. Calvert's request was granted, but before his charter had passed the great seal he died, and it was made out (1632) in the name of his eldest son, Cecilius, who named the province Maryland in honor of the queen. The privileges conferred by this charter were unusual. The proprietary was invested with all royal rights over the soil and inhabitants, subject only to the nominal yearly rent of two Indian arrows. He appointed all officers, civil and military, made war and peace, and writs ran in his name. The colony was governed by its own laws, made by the freemen or their representatives, and confirmed by the proprietary, and was entirely independent of Parliament. The king renounced for himself and his successors all rights of taxation. Thus of all the colonies Maryland was the most independent and autonomous. As Cecilius Calvert was a Roman Catholic, it was his intention to make Maryland a refuge for those of his own creed, but not to found a distinctly Catholic colony. In the next year he sent out his first colonists, consisting of twenty gentlemen and about 200 workingmen and servants, in two vessels, the Ark and Dove, under the government of his brother Leonard, assisted by two councilors. In the instructions for their guidance Cecilius charged them to be strictly impartial between those of different faiths, and established religious toleration as the policy of the colony. On their arrival on Mar. 25, 1634, at an island at the mouth of the Potomac, the colonists celebrated divine service and planted a cross. They then bought from the Indians a tract of land on the Potomac, and laid out a town which they called St. Mary's. The missionaries who had accompanied them began their labors among the Indians, who were uniformly friendly, and readily embraced Christianity, their chief asking to be baptized and married according to the Christian rite, and bringing his little daughter to be educated at St. Mary's. The enemies of the new colonists were men of their own race. William Claiborne, a Virginian, had established (without any grant of land) a trading-post on Kent island in Chesapeake Bay; and though Calvert proffered friendship, he remained bitterly hostile to the new colony. A battle was fought on Pocomoke river between a vessel of Claiborne's and two belonging to Maryland, in which blood was shed and Claiborne's shallop surrendered. Claiborne soon after went to England, and the establishment on the island was taken possession of by his

principals, a firm of London merchants. The residents on the island acknowledged Maryland's jurisdiction and received titles to the land they were occupying. The civil troubles in England produced some disturbance in Maryland. In 1644 Richard Ingle, professing to have letters of marque from the Parliament, seized St. Mary's with an armed force which plundered the province and kept it in a state of anarchy for about two years, when it was recovered without bloodshed by Gov. Calvert.

In 1648 the proprietary sent out a new great seal, consisting of an escutcheon with the bearings of the Calvert and Crossland families, surmounted by a coronet symbolic of his palatinate authority, with a farmer and fisherman as supporters. This device is still the great seal of Maryland; the escutcheon is placed on the State flag, and the Calvert colors, gold and black, are the colors of the State.

In 1649 the Toleration Act, as it was called, was passed, which formulated in a statute what had been the uniform policy of the province. It forbade the molestation or discountenancing of any believer in Christ on account of his religion, or in its free exercise. A number of Puritans, persecuted for their faith in Virginia, in 1643 had asked and received an asylum in Maryland, and had settled about the site of the present city of Annapolis, where they rapidly increased in numbers. These new settlers were strongly in sympathy with the Parliamentary party in England. Calvert's desire was to keep Maryland from being embroiled in the troubles of the civil war, but Parliament sent out commissioners under whose authority Gov. Stone was deposed, and Maryland placed under control of William Fuller, one of the Puritan immigrants. The Toleration Act was at once rescinded. Stone attempted to regain his authority by arms, and in a battle fought at the Severn, in 1655, was defeated; but the Protector, Cromwell, whose decision was invoked, referred the matter to commissioners, who restored Baltimore to his authority. Maryland had now no serious trouble until 1690, when a party headed by one Coode, an apostate clergyman, by false reports of an intended massacre of the Protestants by the Roman Catholics, succeeded in terrifying the people to such an extent that he and a small body of armed adherents were able to seize the government. This accomplished, they petitioned King William to take the government into his own hands, which he did, sending out a royal governor, though the charter was not abrogated; and the province remained under royal government until 1716, when it was restored to Charles Calvert, fifth Lord Baltimore, a Protestant.

Little of moment occurred in Maryland until the French and Indian war of 1754, in which Maryland took an active part, and her western counties suffered severely. The resistance to the stamp-tax (1765) was very fierce in the province, and that to the tea-duty still fiercer. A firm of Annapolis merchants having ventured to import a quantity of tea in 1774, public indignation rose so high that the owner of the brig—the Peggy Stewart—to avoid worse consequences, set fire to his vessel with his own hand, and burned it with its obnoxious cargo. The province entered with zeal into the measures of resistance to England, and declared its independence on July 3, 1776, but did not enter the Confederation until 1781, though it took an active part in the Revolution, and its troops did gallant service in both the northern and southern campaigns. The State government was inaugurated Mar. 21, 1777, with Thomas Johnson as first elected Governor.

In the war of 1812 Baltimore privateers did so much damage to British commerce that it was resolved to make an example of the city, and a formidable force was sent to attack it by land and water. The approach to the city was defended by Fort McHenry at the mouth of the harbor, and by several hastily constructed batteries and earthworks. The British land forces, under Gen. Ross, disembarked at North Point, at the mouth of the Patapsco, and on the march were met by a force of Baltimoreans, and a skirmish ensued (Sept. 12, 1814) in which Ross was killed. The fleet bombarded Fort McHenry for a day and night without success, and an attempt to land troops from boats having been repulsed with severe loss, the combined attack came to nothing. It was on the occasion of this bombardment that Francis Scott Key, a Marylander detained on the British admiral's ship, composed the patriotic song—*The Star-spangled Banner*. After the peace the history of the State was an unbroken record of peaceful prosperity until the outbreak of the war between the States in 1861, when a Massachusetts regiment on its way to Washington was pelted with stones by a mob (Apr. 19), and fired on the people, with loss of life on both sides. The only considerable battle of that war fought on Maryland soil was that of Sharpsburg, Sept. 16 and 17, 1862. With the restoration of peace the State again entered upon a career of prosperity and substantial development.

LORDS PROPRIETARY AND GOVERNORS OF MARYLAND.

Lords Proprietary.

Cecilius Calvert, second Lord Baltimore	1632–75
Charles Calvert, third Lord Baltimore	1675–1715
Benedict Leonard Calvert, fourth Lord Baltimore	1715
Charles Calvert, fifth Lord Baltimore	1715–51
Frederick Calvert, sixth Lord Baltimore	1751–71
Sir H. Harford, last proprietary	1771–76

Governors appointed by the Lords Proprietary.

Leonard Calvert	1633–47
Thomas Greene	1647–49
William Stone	1649–54
Commis. under Parl.	1654–58
Josiah Fendall	1658–61
Philip Calvert	1661–62
Charles Calvert	1662–67
Charles, third Lord Balt.	1667–78
Thomas Notley	1678–81
Charles, third Lord Balt.	1681–85
Wm. Joseph, president of Deputies	1685–89
Conven. of Prot. Asso.	1689–92

Royal Governors.

Sir Lionel Copley	1692–93
Sir Edmond Andros	1693–94
Francis Nicholson	1694–99
Nath. Blackistone	1699–1703
Thomas Tench, pres.	1703–04
John Seymour	1704–09
Edward Lloyd, pres.	1709–14
John Hart	1714–15

Proprietary Governors.

John Hart	1715–20
Charles Calvert	1720–27
Benedict Leonard Calvert	1727–32
Samuel Ogle	1732–33
Charles, fifth Lord Balt.	1733–35
Samuel Ogle	1735–42
Thomas Bladen	1742–47
Samuel Ogle	1747–52
Benjamin Tasker, pres.	1752–53
Horatio Sharpe	1753–69
Robert Eden	1769–74

The Revolution.

The Convention and Council of Safety	1774–76

State Government (1777–1838), Annual Elections.

Thomas Johnson	1777–79
Thomas Sim Lee	1779–82
William Paca	1782–85
William Smallwood	1785–88
John Eager Howard	1788–91
George Plater	1791–92
Thomas Sim Lee	1792–94
John H. Stone	1794–97
John Henry	1797–98
Benjamin Ogle	1798–1801
John Francis Mercer.	1801–03
Robert Bowie	1803–06
Robert Wright	1806–09
Edward Lloyd	1809–11
Robert Bowie	1811–12
Levin Winder	1812–15
C. Ridgely of Hampton	1815–18
Charles Goldsborough	1818–19
Samuel Sprigg	1819–22
Samuel Stevens, Jr.	1822–25
Joseph Kent	1825–28
Daniel Martin	1828–29
Thomas King Carroll	1829–30
Daniel Martin	1830–31
George Howard (acting)	1831–32
George Howard	1832–33
James Thomas	1833–35
Thomas W. Veazey	1835–38

Const. of 1838, Three-year Terms.

William Grayson	1838–41
Francis Thomas	1841–44
Thomas G. Pratt	1844–47
Philip F. Thomas	1847–50
Enoch Lewis Lowe	1850–53

Const. of 1851, Four-year Terms.

Thomas Watkins Ligon	1853–57
Thos. Holliday Hicks	1857–61
Augustus W. Bradford	1861–65

Const. of 1864, Four-year Terms.

Thomas Swann	1865–69

Const. of 1867, Four-year Terms.

Oden Bowie	1869–72
Wm. Pinckney White	1872–75
J. B. Groome	Mar. 1875–Jan. 1876
John Lee Carroll	1876–80
Wm. T. Hamilton	1880–84
Robert M. McLane	1884–85
Henry Lloyd	1885–88
Elihu E. Jackson	1888–92
Frank Brown,	1892–96
Lloyd Lowndes	1896–1900
J. Walter Smith	1900–

AUTHORITIES.—The most accurate and compendious authority on Maryland is *Maryland: its Resources, Industries, and Institutions*, edited by members of Johns Hopkins University, and published by the State in 1893.

WILLIAM HAND BROWNE.

Mary Stuart: Queen of Scots, daughter of James V. by Mary of Guise, and great-granddaughter of King Henry VII. of England through his daughter, Margaret Tudor; b. at Linlithgow, Scotland, Dec. 8, 1542. Her father died a few days after her birth, and on Sept. 9, 1543, she was crowned Queen of Scotland, the Earl of Arran, and afterward her mother, conducting the Government. In 1548 she was affianced to Francis, Dauphin of France, son of Henry II. and Catharine de' Medici, and in the same year she was brought to France to be educated at the French court. Buchanan and Ronsard were among her teachers, and when she grew up she added to a striking and fascinating personal beauty all the accomplishments and charms which a perfect education can give. Her marriage with the dauphin was celebrated Apr. 24, 1558, in the Church of Notre Dame, and when Mary I. of England died in the same year (Nov. 17) she had her arms quartered with those of England, and threatened to rouse the Catholics against Elizabeth's title. On July 10, 1559, Henry II. died, and was succeeded by Francis II. Mary thus became Queen of France, but Francis died Dec. 5, 1560; she was childless, and had little power at court, where the influence of Catharine de' Medici was now paramount. In the same year her mother died, and she then re-

turned to Scotland, landing at Leith in Aug., 1561. Brought up a Roman Catholic and used to the gay life of the French court, she found the dominant Protestantism and austere manners of her subjects almost intolerable. It was only under protest that she was allowed to hear mass in her own chapel, and she was repeatedly lectured by Knox for her levity and worldliness. Nevertheless, the first period of her reign was fairly successful. She followed the advice of James, her half-brother, whom she created Earl of Murray, and strove to conciliate the Protestants. The latter, however, were soon estranged by her unfortunate marriage (July 29, 1565) with her cousin Henry Stuart, Lord Darnley, a Catholic, and next to herself in the hereditary line of succession to the English throne. Murray and his party among the nobility were opposed to this marriage, and revolted; but, although she succeeded in suppressing the revolution, she came to despise her profligate and treacherous husband, whose jealousy and ambition soon showed themselves in an act of violence. On Mar. 9, 1566, he burst with Ruthven, Morton, and others into her chamber, dragged Rizzio, an Italian adventurer who had become her councilor after the breach with Murray, out into the corridor, and stabbed him. The horror of this night Mary never forgot or forgave. She detached Darnley from the other conspirators, fled with him to Dunbar, became reconciled with Murray, entered into an intimate alliance with the Earl of Bothwell, and thus strengthened began to persecute the murderers of Rizzio without mercy. On Feb. 9, 1567, the house in which Darnley lay sick was blown up by gunpowder, and his body was found at a distance. Bothwell's connection with this murder was apparent; his trial was a mere mockery; and when Mary married him, three months after the death of her husband (May 15), a general rising took place. In the battle of Carberry Hill (June 15) Bothwell was defeated and fled, and Mary was confined in Lochleven Castle and compelled to abdicate. She escaped, however, from Lochleven May 2, 1568, and rallied a new force, but was defeated at Langside, May 13, and fled to England. Here she was immediately imprisoned—first at Carlisle, afterward in various other places, and at last in Fotheringay Castle. After eighteen years' imprisonment, during which she was the center of Catholic plots, she was tried on a charge of complicity in the conspiracy of Antony Babington against the life of Elizabeth, and on Oct. 25, 1586, a sentence of death was pronounced against her. On Feb. 1, 1587, Elizabeth signed the warrant of execution, and on Feb. 8 Mary Queen of Scots was beheaded, persisting to the last in her innocence of Babington's plot. She was buried at Peterborough, whence in 1612 her body was removed to Henry VII.'s chapel at Westminster. That her life was not one of unmingled innocence and virtue is abundantly evident, but the exact measure of her guilt or the exact degree of her complicity in the crimes committed for her sake and in her name has not been made out. And still more obscure and entangled seem those ideas and passions from which such guilt sprung. There are two brilliant dramatical delineations of her character by Schiller and by Björnstjerne Björnson, and among the numerous prose works relating to her history the most interesting is perhaps Labanoff de Rostov's *Lettres, Instructions et Mémoires de Marie Stuart* (7 vols., 1844). See also Philippson's *Histoire du Règne de Marie Stuart* (1891–92); Skelton's *Life of Mary Stuart* (1893); and the works of Hosack, Strickland, Robertson, Hume, Burton, Laing, Tytler, Froude, etc.

Revised by F. M. Colby.

Marysville: city (incorporated in 1851); capital of Yuba co., Cal. (for location of county, see map of California, ref. 5–C); at the junction of the Yuba and Feather rivers, and on the S. Pac. and the N. Cal. railways; 52 miles N. of Sacramento. It is in an agricultural and mining region. Contains 6 churches, graded public schools, the College of Notre Dame (Roman Catholic), high school, a State bank with capital of $150,000, an incorporated bank with capital of $250,000, a savings-bank with capital of $40,000, and 2 daily and 2 weekly newspapers; and has flour and woolen mills, foundry and machine-shop, carriage-factory, winery, and 2 large fruit-canneries. Pop. (1880) 4,321; (1890) 3,991; (1900) 3,497.

Editor of "Appeal."

Marysville: city; capital of Marshall co., Kan. (for location of county, see map of Kansas, ref. 4–H); on the Big Blue river, and the St. Jos. and Grand Is. Railroad; 112 miles W. of St. Joseph, Mo. It contains 8 churches, 4 public schools, water-works, electric-light plant, a national bank with capital of $75,000, a State bank with capital of $75,000, and 4 weekly newspapers. The principal manufactures are flour and cigars. Good water-power is obtained from the river by means of a stone dam. Pop. (1880) 1,249; (1890) 1,913; (1900) 2,006.

Editor of "Democrat."

Marysville: city; capital of Union co., O. (for location of county, see map of Ohio, ref. 4–E); on Mill creek, and the Cleve., Cin., Chi. and St. L. and the Tol. and O. Cent. railways; 30 miles N. W. of Columbus, the State capital. It is in an agricultural region, and has 3 State banks with combined capital of $126,000, a private bank, an Odd Fellows' library (founded in 1877), and 2 weekly newspapers. Pop. (1880) 2,061; (1890) 2,810; (1900) 3,048.

Maryville: city; capital of Nodaway co., Mo. (for location of county, see map of Missouri, ref. 1–D); on the Chi., Burl. and Quincy and the Om. and St. L. railways; 45 miles N. of St. Joseph. It is in a farming and stock-raising region, and has 2 national banks with combined capital of $150,000, a private bank, and a daily and 4 weekly newspapers. Pop. (1880) 3,485; (1890) 4,037; (1900) 4,577.

Maryville: village; capital of Blount co., Tenn. (for location of county, see map of Tennessee, ref. 6–I); on the Knox. and Augusta Railroad; 16 miles S. of Knoxville. It is in an agricultural region; is the seat of Maryville College (Presbyterian, opened in 1819), which in 1900 had 16 instructors, 380 students, 12,000 volumes in its libraries, and $5,000 invested in scientific apparatus, $99,420 in grounds and buildings, and $198,000 in productive funds; and has manufactories of flour, woolen goods, and sash, doors, and blinds. Pop. (1880) 1,098; (1890) 1,686; not returned separately in 1900.

Marzials, Théophile: poet; b. of French parentage in Brussels in 1850. He was educated in Belgium, Switzerland, and England, and has been employed in the British Museum since 1870. His *Gallery of Pigeons and Other Poems* (1873) gave him a high place among the æsthetic or pre-Raphaelite school of poets, who were, in general, followers of Rossetti.

H. A. Beers.

Masaccio, maă-saat'chō (true name, Tommaso Guidi; nicknamed *Tommasaccio*, Hulking Tom, shortened to Masaccio): painter; b. in Florence in 1402. At the age of nineteen he was enrolled in the guild of the apothecaries, but at twenty-two he was registered in the guild of painters. He is supposed to have worked under Masolino, who encouraged a frank study of the nude and a direct recognition of nature in the details of his figures. The greatest work of Masaccio now remaining is the decoration in fresco of the Brancacci chapel in the Carmine at Florence. Its importance in the history of art may be judged by the fact that at one and the same time Michaelangelo, Raphael, and Leonardo da Vinci were engaged in studying these frescoes; and they have served as models to artists of succeeding generations. The only other probable work of Masaccio's, and the earliest, is in a chapel of San Clemente at Rome; it is a series of frescoes relating to the history of St. Catherine of Alexandria. On account of the naturalistic treatment of the subjects this chapel was attributed to Masolino; indeed, so little is known of the life of these two painters that their work is frequently confounded. D. in Rome in 1428 or 1429.

W. J. Stillman.

Mas-á-fuera: See Juan Fernandez.

Masal'skiĭ, Konstantin Petrovich: author; b. in Yaroslav, Russia, in the year 1802; studied at the University of St. Petersburg, and was in the Government service until 1842. In 1824 he first began to send short poems to the newspapers. In 1829 he published a novel in verse, *Terpi Kazak*, etc. (Have patience, Cossack, you will be Hetman), which was a great success. He is chiefly remembered, however, as a writer of historical novels, among the best known of which are *The Streltsi*, *The Black Trunk*, *The Regency of Biron*, *The Siege of Uglich*, *The Russian Icarus*, and *The First Love of the Last of a Race*. In 1838 he published a translation of *Don Quixote*. An edition of the works he had then written was brought out in 1843–45 (St. Petersburg, 5 vols.). D. in 1861.

A. C. Coolidge.

Masaniel'lo [Ital., clipped from full name, Tommaso Aniello. Cf. Masaccio]: revolutionist; b. at Amalfi, Italy, in 1623. He was a fisherman of Sorrento, and in 1647 excited a popular insurrection in Naples against the Duke of Arcos, the Spanish viceroy. Some state that the immediate cause of the tumult was the imposition of a new and oppressive tax; others, an attempt to establish the Inquisition as a means of extirpating the Reformed religion, then in

great favor in this city. It is certain that the previous forty years of Spanish misrule had exasperated all classes. Masaniello, stung to fury by indignities offered his wife for attempting to smuggle a few handfuls of flour, at the moment when the authorities were fixing on the doors of the duomo the detested inquisitorial brief tore it down amid the applause of the bystanders, and soon after raised the cry, *Morte al mal governo!* In an instant the whole population, even to the women and children, were in arms; the Spanish authorities were maltreated, the soldiers successfully resisted, and after great loss of life among the Spaniards the insurgents obtained from the terrified viceroy the revocation of the order for the Inquisition, the abolition of many cruel taxes, and a full pardon for all who had taken part in the rebellion. Whether Masaniello was really frenzied by his great success, or whether his enemies were crafty enough to magnify his excesses into insane crimes, it is now difficult to say; at any rate, the populace itself rose against him soon after his triumph, and he was assassinated on July 16, 1647.

Masaya, mă̆a-sī'yă̆a: a city of Nicaragua; 9 miles W. of Granada; at the foot of the volcano of Masaya or Popogatepec (see map of Central America, ref. 6–H). Pop. about 14,000, nearly all of Indian race. The situation is very picturesque, and the soil of the vicinity, composed of volcanic ash, is extremely fertile, being especially good for tobacco, which forms the prineipal product. The inhabitants are noted for their industry, exporting hammocks, cordage, straw hats, and other articles of native workmanship. Water is obtained from a erater lake at some distance from the town. Eruptions of the volcano occurred in 1670, 1782, and 1857. Masaya was attacked and burned by Walker in Nov., 1856. HERBERT H. SMITH.

Mascagni, mă̆as-kaan'yĕĕ, PIETRO: composer; b. in Leghorn, Italy, in 1863; the son of a basket-maker; studied music at home, and had composed two cantatas by the time he was seventeen; then went to the Conservatory at Milan and studied under Ponchielli, at the expense of Count Florestano de Landarel. He became leader of a traveling opera company, and wrote his first opera in 1883, but it is unpublished, and he declines to allow it to be performed. In May, 1890, his opera *Cavalleria Rusticana* appeared, and at once became famous. It was composed for a competition instituted by a firm of music publishers. Since then he has composed *Amico Fritz* and *I Rantzau*. D. E. HERVEY.

Mascalonge, Muskellunge, or **Muskinunge** [from Amer.-Indian name]: the largest, finest, and best-flavored fish of the pike family, *Esox* or *Lucius maskinongy*, especially abundant in the St. Lawrence basin, but frequently found in the basin of the Ohio and the upper Mississippi; reaches a length of 4 to 6 feet and a weight of 60 lb. or more. It is an extremely bold and vigorous biter, and is caught by the hook or the net. It is an excellent food-fish. It is distinguished from the true pike by the presence of dark spots or the absence of pale ones, and by the want of scales on the lower half of the cheek. See PIKE. Revised by D. S. JORDAN.

Mascara, mă̆as-kă̆a-raa': town; in the province of Oran, Algeria. It occupies the site of an old Roman colony on the slope of the Atlas Mountains, among fertile and well-cultivated surroundings. Pop. (1886) 15,453.

Mascarene, Isles: the collective name comprising the islands of Bourbon, Rodrigues, and Mauritius, situated in the Indian Ocean. The name is derived from Garcia Mascarentas, a Portuguese navigator who discovered the islands in 1505. Mauritius and Rodrigues belong to Great Britain; Bourbon belongs to France.

Mascart, mă̆as'kaar', ÉLEUTHÈRE ÉLIE NICOLAS: physicist; b. at Quarouble, France, Feb. 20, 1837. Mascart was educated at the College of Valenciennes and at the École Normale Supérieure. He was assistant successively at the lyceums of Lille and Douai and at the Éeole Normale; was professor in the lyceums of Metz and Versailles and in the Collège de France. In the last-named institution he succeeded to the chair of Physics so long filled by Regnault. Mascart has published many important papers, and he is the author of three great treatises, all of which are universally accorded a place in the first rank. These are his *Traité d'électricité statique* (2 vols., 1876); *Leçons sur l'électricité et le magnétisme* (2 vols., 1882), in collaboration with Prof. Joubert; and his *Traité d'Optique* (3 vols.), the last volume of which appeared in 1893. Aside from his collegiate work, Prof. Mascart has performed many scientific and technical labors for the French Government. During the Franco-German war he superintended the manufacture of cartridges and chassepots. Since 1878 he has been the director of the weather bureau. He took an important part in the Paris exhibitions in 1881 and 1889, and was a member of the electrical congresses held in Paris in those years, over the latter of which he presided. He was also present at the congress held in Chicago in 1893. He is a member of the French Academy (since 1884), commander of the Legion of Honor (1889), and is member or correspondent of many learned societies. E. L. NICHOLS.

Mascoutah: city; St. Clair co., Ill. (for location of county, see map of Illinois, ref. 9–D); on the Louis. and Nash. Railroad; 11 miles E. by S. of Belleville, 25 miles E. S. E. of St. Louis. It is in an agricultural region, has valuable coal mines in its vicinity, and contains steam flour-mills and two weekly newspapers. Pop. (1890) 2,032; (1900) 2,171.

Maseres, FRANCIS: See MAZERES.

Mashon'aland: a plateau region N. E. of Matabeleland, South Africa, to whose ruler it was subject when it was acquired from him (1890) by the British South Africa Company. A pioneer expedition was sent to take possession of the land, which was believed to abound in gold reefs. Careful investigation proved that the region was rich in gold and other valuable minerals; that its agricultural resources were worth developing; and that the undulating plateau is so high above the sea that white colonists may live there in comfort. Towns were soon founded along the wagon road built through the country from S. to N. The most important settlements are Fort Salisbury, Hartley Hill, Victoria, Umtali, and Fort Charter. A telegraph connects the principal centers with Cape Town, and a railway is building (1897) from Beira, on the Indian Ocean, to the northeastern part of the colony. Expensive machinery is required for mining, and no placer-gold finds have been discovered. Over 400 miles of gold-bearing formations have been located, and the region has been proved to be among the richest of the South African gold-fields. Salisbury, the chief town, has a bank, churches, hospitals, hotels, a newspaper, and many substantial brick structures. Many of the colonists, numbering (1894) about 3,000, engage in agriculture. All the small grains, most vegetables, and cattle-raising thrive. The native Mashonas, scattered throughout the country, are greatly depleted in numbers, having long been the victims of Matabele raids. The refusal of the white colonists to permit the continuance of these raids precipitated a war (1893) in which the Matabeles were defeated, and their country, also rich in gold, is opening to white settlement. In Mashonaland are found a considerable number of ancient stone structures and walls, large and solidly built, whose origin is not yet known. See Selous, *Travel and Adventure in Southeastern Africa*; Keltie, *The Partition of Africa*; Greswell, *Geography of Africa South of the Zambesi*; and Bent, *The Ruined Cities of Mashonaland.* C. C. ADAMS.

Masinis'sa, or **Massinissa**: King of the Massylians, one of the most powerful Numidian tribes; b. about 240 B. C.; a son of Gala. Hasdrubal having promised to give him his daughter Sophonisba in marriage, he attacked the Massæsylians, also a powerful Numidian tribe, which in the struggle between Rome and Carthage sided with Rome; defeated their king, Syphax, in 213; crossed over to Spain and fought with success against Cneius and Publius Scipio; but when Hasdrubal broke his promise and gave his daughter to Syphax in order to win him over from the Romans, Masinissa attacked Carthage. In the beginning he was unsuccessful, but when (in 204) Scipio landed in Africa, Masinissa entered into a firm alliance with him, routed the Massæsylians, fought with great distinction in the battle of Zama, and received by the peace of 201 the territories of Syphax. Sophonisba, who in the course of the war had become his prisoner, he now married, but Scipio, fearing her influence on her husband, demanded her as a Roman captive, and Masinissa, not venturing to refuse, sent her a cup of poison, which she drank. Steadily extending his dominions at the expense of Carthage, he occasioned the third Punic war, but died before its close 148 B. C. Numidia was then divided between his three sons, of whom the youngest, Mastanabal, was the father of Jugurtha.

Mask: See MASQUES.

Maskat: maritime city of Southeastern Arabia. See MUSCAT.

Maskegons: See ALGONQUIAN INDIANS.

Maskell, William: theological writer; b. at Bath, England, in 1814; was educated at University College, Oxford; took orders in 1837, and was instituted to the rectory of Carscombe, Dorset, in 1842. In 1846 he resigned that position, and in the following year he was appointed chaplain to the Bishop of Exeter and instituted to the vicarage of St. Mary's church, Devon. When the Gorham case, in which Mr. Maskell took an active and prominent part, was decided by the judicial committee of the privy council, early in 1853, he resigned all his preferments and was received into the Roman Catholic Church, but never took orders therein. His chief literary works were *The Ancient Liturgy of the Church of England* (London, 1844; 3d ed. 1882); *A History of the Martin Marprelate Controversy* (1845); *Monumenta Ritualia Ecclesiæ Anglicanæ* (1846–47, 3 vols.; 2d ed. Oxford, 1882); *A Dissertation on Holy Baptism* (London, 1848); *An Inquiry into the Doctrine of the Church of England upon Absolution* (1849); *Letters on the Position of the High Church Party in the Church of England* (1850), etc. After his conversion to Romanism he published *Odds and Ends* (1872); *A Dissertation on Ancient and Mediæval Ivories* (1875); and *What is the Meaning of the Infallibility of the Pope?* (1871). D. at Penzance, Apr. 12, 1890.

Mas'kelyne, Nevil, D. D.: b. in London, England, Oct. 6, 1732; graduated at Cambridge 1754; took orders in the Church of England; became a fellow of the Royal Society in 1758; was sent to St. Helena in 1761 to observe the transit of Venus, and to Barbados in 1762 to experiment with and report upon Harrison's chronometers; succeeded Nathaniel Bliss as astronomer-royal 1765, which post he retained through life, never absenting himself from the Greenwich Observatory except once in 1772, when he went to Scotland to experiment upon the aberrations of the plumb-line as fixing the mean density of the earth. He is the author of the method of determining longitudes by lunar distances. He published *The British Mariner's Guide* (1763); the *Nautical Almanac and Astronomical Ephemeris* (46 vols., annual, 1767–1811); *Astronomical Observations made at Greenwich from 1765 to 1810* (4 vols.); and several papers in the *Philosophical Transactions*. D. at Greenwich, Feb. 9, 1811. Revised by S. Newcomb.

Masolino da Panicale: See Panicale.

Mason: city (settled in 1835, incorporated in 1875); capital of Ingham co., Mich. (for location of county, see map of Michigan, ref. 7–J); on the Mich. Cent. Railroad; 12 miles S. of Lansing, 25 miles N. of Jackson. It is in an agricultural and dairy region, and has water-works, electric lights, 2 State banks with combined capital of $125,000, 2 weekly newspapers, and considerable mercantile and manufacturing interests. Pop. (1880) 1,809; (1890) 1,875; (1900) 1,828. Editor of "Ingham County News."

Mason, Charles, F. R. S.: b. in England about 1730; was assistant for several years at Greenwich Observatory to the celebrated astronomer-royal, Dr. James Bradley, and afterward to his successors, Dr. Nathaniel Bliss and Dr. Nevil Maskelyne; and with Mr. Jeremiah Dixon was sent to the Cape of Good Hope to observe the transit of Venus of June 6, 1761, while Dr. Maskelyne proceeded with them to St. Helena for the same purpose. In 1763 Messrs. Mason and Dixon were commissioned by the proprietors of Pennsylvania and Maryland to survey the boundary-line between their American possessions; arrived at Philadelphia Nov. 13, and were engaged upon this task until Dec. 26, 1767. (See Mason and Dixon's Line.) Messrs. Mason and Dixon embarked at New York for Falmouth Sept. 9, 1768. Dixon died at Durham, England, in 1777. Mason observed the transit of Venus of June 3, 1769, at Cavan, Ireland, and published his observations in the *Philosophical Transactions* for 1770; was employed by the bureau of longitudes to verify the celebrated *Lunar Tables* of Tobias Mayar, in which he made some changes and corrections, and they were published after his death by Dr. Maskelyne under the title *Mayer's Lunar Tables, improved by Charles Mason* (London, 1787). Mason returned to America, but at what date is unknown, and died at Philadelphia in Feb., 1787. His MS. journal and field-notes, from which the preceding account is chiefly drawn, was found at Halifax, Nova Scotia, in 1860, among a pile of waste paper flung into the cellar of the Government-house, whence it was rescued by a gentleman of that city. Revised by S. Newcomb.

Mason, Francis, D. D.: b. at York, England, Apr. 2, 1799; removed to the U. S. in 1818; worked as a shoemaker in several towns of Massachusetts; became connected with the Baptist Church at Canton, Mass., about 1825; married there; studied ancient languages under the guidance of his minister; entered Newton Theological Seminary in 1827, and was sent in 1830 as a missionary to Burma. He devoted himself chiefly to the Karens, among which tribe he had wonderful success, and with the aid of other missionaries made many thousands of converts among that wild but simple-hearted tribe. He translated the Bible into two Karen dialects, as well as numerous other religious books; educated many native preachers; prepared a work on the natural productions of Burma (1852), which contained a very valuable addition to the then existing scientific data on the subject; published a grammar, chrestomathy, and vocabulary of the Pali language; a *Life of Ko-Thah-Byu, the Karen Apostle*; a memoir of his wife, Mrs. Helen M. Mason (1847); a *Memoir of San Quala*, another Karen convert (1850); *Burma, its People and Natural Productions* (1860), being a revised edition of his earlier work on the same subject; and an autobiography, *The Story of a Workingman's Life, with Sketches of Travel* (1870). D. at Rangoon, Burma, Mar. 3, 1874.

Mason, George: a patriot of the American Revolution; b. at Doeg's Neck, Stafford (now Fairfax) co., Va., in 1725; settled after his marriage in Truro parish (which includes Mt. Vernon), built Gunston Hall on the banks of the Potomac, and became the intimate friend of Washington, his neighbor and fellow parishioner at Pohick church. Possessing considerable historical knowledge and legal attainments, as well as liberal sentiments, fine powers of reasoning, and a sound judgment, Mason was a valuable adviser to the future leader of the Revolution, for whom he drafted the "non-importation resolutions" which the latter presented to the Virginia Assembly, and procured their adoption 1769. One of these resolutions pledged the Virginia planters to purchase no slaves imported after Nov. 1 of that year. In support of the political rights of the "Old Dominion," Mason printed a pamphlet entitled *Extracts from the Virginia Charters, with Some Remarks upon them*, and at a meeting of the people of Fairfax, July 18, 1774, he presented a series of twenty-four resolutions on the questions at issue between Great Britain and the colonies, which were sanctioned by the Virginia convention in August, and substantially reaffirmed by the Continental Congress in October of the same year. In 1775 he was a member of the Virginia convention, declined an election to the Continental Congress, which was pressed upon him, nominated Francis Lightfoot Lee in his place, and reluctantly consented to serve as a member of the committee of safety. In May, 1776, he drafted the celebrated "Declaration of Rights" and the "Plan of Government," which were adopted June 12 and 29. In the revision of the statutes of Virginia his liberal sentiments were conspicuous, and his talents in debate elicited universal admiration. He was a member of the Continental Congress 1777, and of the convention for framing the Federal Constitution 1787. In the latter body Mason took a conspicuous part, proposing that the election for President should be direct, and for a single term of seven years, opposing the postponement of the repeal of the slave-trade, the counting of slaves as a basis for representation, and the establishment of a property basis for suffrage. Despite his efforts, several features which he considered dangerous were incorporated in the Constitution, which he consequently refused to sign; and having been elected to the Virginia convention to consider that instrument, he united with Patrick Henry in demanding its rejection unless some twenty amendments should be made. Several of these were subsequently adopted by the States and incorporated into the Constitution. He was chosen one of the first Senators from Virginia, but declined the post, and spent the remainder of his life in retirement, occupied in hunting, fishing, and congenial studies. D. at Gunston Hall, Oct. 7, 1792. His statue is one of the group which surrounds that of Washington in front of the State Capitol at Richmond, Va. See his *Life*, by Kate Mason Rowland (2 vols., New York, 1892).

Revised by C. K. Adams.

Mason, James Murray: Senator; grandson of George Mason; b. at Analosta island, Fairfax co., Va., Nov. 3, 1798; graduated at the University of Pennsylvania in 1818; studied law at William and Mary College; began practice in 1820; was prominent in the State Legislature; a member of Congress 1837–39; U. S. Senator 1846–61, and was the author of the Fugitive Slave law; entered in 1861

the Confederate Congress, and was sent with John Slidell as a commissioner to England and France; was taken off the British steamer Trent by Capt. Wilkes Nov. 8, 1861, and confined in Fort Warren, near Boston, Mass.; released on the demand of the British Government Jan. 2, 1862, and proceeded on his mission to Europe. D. near Alexandria, Va., Apr. 28, 1871.

Mason, Capt. JOHN: founder of the colony of New Hampshire; b. at Lynn Regis, Norfolk, England; served in 1610 in the navy against an insurrection in the Hebrides; went in 1616 as governor to Newfoundland, of which he published a description (Edinburgh, 1620) and a map (London, 1626); explored in 1617 the New England coasts; obtained in 1622 a grant of a region called Mariana, now the northeastern part of Massachusetts; procured in 1622, with Sir Ferdinando Gorges, a patent for the province of Maine; sent in 1623 a colony to the Piscataqua river. Mason was, 1624–29, treasurer and paymaster of the royal armies in the Spanish war. In 1629 he took a patent for the New Hampshire colony, and with Gorges took another patent for Laconia, a tract including Lake Champlain. Capt. Mason held various important positions in England. In 1635 he was a judge in Hampshire, and was appointed vice-admiral of New England. D. in London in Dec., 1635, and was buried in Westminster Abbey. Mason's rights in New Hampshire were sold to Gov. Samuel Allen in 1691, and proved a fruitful source of litigation to that gentleman and his heirs.—JOHN TUFTON MASON, one of John Mason's heirs, in 1746 sold his own rights to a Portsmouth company called the Masonian proprietors.

Mason, JOHN: soldier; b. in England about 1600; served in the Netherlands under Sir Thomas Fairfax; was one of the first settlers of Dorchester, Mass., 1630, and one of the founders of Windsor, Conn., 1635; was commissioned in 1637 to command an expedition against the Pequot Indians, who had massacred several settlers at Wethersfield, and with a party of 90 English, 70 friendly Mohegans under Uncas, and several hundred Narragansett warriors under Miantonomoh, he surprised one of the Pequot forts on Mystic river, between Groton and Stonington, before daybreak May 26, 1637, and destroyed more than 500 Indians, either by the sword or by the burning of the fort, his own loss being two killed and twenty wounded. Soon afterward he killed or captured most of the remaining members of the tribe in another expedition in Western Connecticut. Mason was appointed major of the Connecticut forces, retaining that office through life; settled first at Saybrook, and in 1659 at Norwich; was for many years a magistrate, and was deputy-governor 1660–70. At the request of the general court he published an account of the Pequot war, reprinted by Increase Mather in his *Relation of Trouble by the Indians* (1677), and by Prince (Boston, 1736). D. at Norwich in 1672. See his *Life*, by George E. Ellis, in Sparks's *Am. Biog.*, 2d series, vol. iii.

Mason, JOHN MITCHELL, D. D. (always called John M. Mason): pulpit orator; b. in New York city, Mar. 19, 1770; graduated at Columbia College 1789; studied theology under his father, Rev. John Mason, D. D., and later in the University of Edinburgh (1791–92). In 1793 he succeeded his father as pastor of the Cedar Street Associate Reformed church in New York city; in 1805 he established a theological seminary, which he taught himself; in 1806 he started *The Christian Magazine*, to which he was the chief contributor; in 1810 he resigned his charge and formed a new congregation, whose building, in Murray Street, was completed in 1812. In 1811 he became provost (i. e. really head) of Columbia College. In 1816 he broke down under these accumulated labors and traveled abroad for a year. In 1819 he had two paralytic strokes; in 1821 he resigned his charge. From 1821–24 he was president of Dickinson College, Carlisle, Pa. In 1822 he transferred his church relations to the Presbyterian Church. He returned to New York in 1824, and lingered, a mental wreck, until Dec. 26, 1829. He ranks by common consent among the greatest pulpit orators of the U. S., and his repute is the same in Great Britain. Two of his discourses, *Living Faith* and especially *Messiah's Throne*, are considered sufficient evidence of his pre-eminent ability. Famous also are his orations upon the deaths of Washington (1800) and of Hamilton (1804). Of note are his *Letters on Frequent Communion* (New York, 1798), which had the effect of inducing his denomination to celebrate the communion oftener than at most twice a year as had been the practice; and his *Plea for Sacramental Communion on Catholic Principles* (1816), which made a great sensation. His works were collected and edited by his son, Rev. Ebenezer Mason (New York, 1832, 4 vols.; 2d and enlarged ed. 1849); his *Life* was written by his son-in-law, Rev. Jacob Van Vechten (New York, 1856). SAMUEL MACAULEY JACKSON.

Mason, LOWELL, Mus. Doc.: musician; b. in Medfield, Mass., Jan. 8, 1792; began his career as instructor and leader of choirs in Savannah, Ga., 1812; in 1821 published the *Handel and Haydn Collection of Church Music*; removed to Boston in 1827, and gave himself entirely to the task of instructing classes in vocal music and encouraging the public taste for music. To him Massachusetts is indebted for the introduction of music into the public schools. His labors soon became arduous and extensive; his zeal was felt throughout New England; the Academy of Music was established in Boston; by means of classes, schools, lectures, institutes, text-books, glee-books, collections for family and Sunday use, a practical interest in the subject was awakened even in the Middle States. His own compositions were numerous, and his compilations exceeded in number those of any other man. Of juvenile collections, glee-books, compilations of church music, there are more than forty that bear his name, either alone or in association with George J. Webb. Besides these there were several small books and single pieces. In 1837 Mr. Mason visited Europe to study on the Continent and in Great Britain the latest methods of musical instruction, and whatever he approved he adopted and used. In 1855 the University of New York conferred on him the degree of doctor of music. D. Aug. 11, 1872.

Mason, OTIS TUFTON: anthropologist; b. in Eastport, Me., Apr. 10, 1838. Reared in Virginia, he was educated at Columbian University, Washington, D. C., and taught in that institution for a number of years. His whole life has been devoted to anthropological studies as they are related to geography. The first attempt to give public effect to his studies was the arrangement of the archæological and ethnological material of the Smithsonian Institution and the subsequent plan of the ethnological exhibit at the Centennial Exposition at Philadelphia in 1876. For many years he conducted the anthropological department of the *American Naturalist* and of *The Annual Record of Science and Industry*. Most of his works have been published by the Smithsonian Institution. Chief among them are *The Annual Summaries of Progress in Anthropology*, monographs on *The Antiquities of Guadeloupe*, *The Antiquities of Porto Rico*, *Basketry*, *Throwing-sticks*, *The Hupa Indian Industries*, *The Woman's Knife among the Eskimo*, *Woman's Work in Savagery*, *Cradles of the North American Indians*, and lectures on the general scope of anthropology. All of these are chapters in a comprehensive work on the primitive industries.

Mason, WILLIAM: poet; b. at Hull, England, in 1725; graduated at the University of Cambridge 1745; wrote *Musæus* (1747), a poem on the death of Pope; became a fellow of Pembroke College 1747; took orders in the Church of England 1754; became vicar at Ashton, Yorkshire, and later precentor and canon of York; wrote *Isis* (1748), a poem directed against Jacobitism in the university; *Elfrida* (1752) and *Caractacus* (1759), both dramatic poems, which were represented with moderate success; and *The English Garden*, a poem in four books (1772–82). Mason was a tasteful musician and painter as well as a poet, but will be best remembered as the intimate friend, executor, and biographer of the poet Gray—*Memoirs of Gray* (1775). D. at York, Apr. 7, 1797. His *Works* appeared in 1811.
Revised by H. A. BEERS.

Mason, WILLIAM, Mus. Doc.: pianist and teacher; b. in Boston, Mass., Jan. 24, 1829; the son of Dr. Lowell Mason; when twenty years old went to Leipzig, and continued at Prague and Weimar; studied under Moscheles, Moritz Hauptmann, E. F. Richter, and (1853–54) with Liszt. In 1853 he made a concert tour through Europe as a pianist; in 1854 returned to the U. S. as a professional pianist. In 1855, with Theodore Thomas, George Matzka, Joseph Mosenthal, and Carl Bergmann, he established the Mason and Thomas soirees of chamber music, which were continued until 1868. His life has been mainly spent in teaching. He received his degree from Yale College. His compositions, over forty in number, are almost entirely for the piano. He has published *A Method for the Piano-forte* (1867) and *System for Beginners in the Art of playing upon the Piano-forte* (1871), both in connection with Eli L. Hoadley;

and *Touch and Technic* (1878), in connection with William S. B. Matthews. D. E. Hervey.

Mason and Dixon's Line [named from the surveyors who projected it]: the line which forms the southern boundary of Pennsylvania, separating it from Delaware, Maryland, and Virginia. From the celebrity which this term acquired during the anti-slavery agitation as a synonym of the divisory line between free and slave territory, it has been generally confounded in Europe (and frequently in America) with the parallel of 36° 30′, fixed by the "Missouri compromise" of 1820 as the northern limit for the extension of slavery into the Territories. According to the original grants from the crown of England to William Penn and Lord Baltimore, the boundary between their respective colonies was fixed at the 40th parallel of N. lat. That line being found by subsequent observation to pass N. of Philadelphia, and to exclude Pennsylvania from Delaware Bay, negotiations ensued between the proprietors for the purpose of rectifying the blunder which the royal ignorance of geography had committed, and for the greater part of a century the matter was unsettled. An agreement was made between the proprietors (May 10, 1732) for fixing their boundary; and as Delaware then belonged by purchase to the heirs of William Penn, it was necessary to begin at its southeast extremity, then fixed at Cape Henlopen. The boundary between Pennsylvania and Delaware had been already defined to be the arc of a circle drawn with a radius of 12 miles from the court-house at New Castle from the Delaware to the Maryland line. It was now agreed to bisect the line drawn W. across the peninsula from Cape Henlopen to Chesapeake Bay, and from the point of bisection to project a line northward as a tangent to the arc which formed the northern limit, the same to constitute the western boundary of Delaware. From this point of tangency common to the three colonies, 12 miles N. E. of New Castle a line was to be projected due N. to a point 15 English statute miles S. of the southernmost point of the city of Philadelphia, and from this point a line was to be drawn due W. for 5° of longitude as the southern boundary of Pennsylvania. Commissioners were appointed to run these lines in 1732, 1739, and 1750, but disagreed, and chancery suits were the result. By decision of Lord Chancellor Hardwick of May 15, 1750, taken as the basis of a final adjudication signed July 4, 1760, commissioners and surveyors were again appointed, who began operations Nov., 1760, and spent three years in measuring the base and tangent lines separating Delaware from Maryland. The proprietors then determined to send out more skilled mathematicians to complete the operations, and selected Messrs. Charles Mason and Jeremiah Dixon, who verified the work of their predecessors, and ran the western line, fixed at lat. 39° 43′ 26·3″ N., since known by their names. They began work in Nov., 1763, and were stopped by the Indians in the summer of 1767 at a point 244 miles W. of the Delaware, and only 36 miles E. of the terminus they were seeking. Stones were erected at intervals of a mile, and every fifth stone was engraved on the opposite sides with the arms of the lords proprietors. The remaining part of the line was fixed in Nov., 1782, by Col. Alexander McLean, of Pennsylvania, and Joseph Neville, of Virginia, and was verified and permanently marked in 1784. In consequence of the accidental removal of the stone at the northeast corner of Maryland, commissioners were appointed by the three States in 1849 to revise the former survey, which was done by Lieut.-Col. James D. Graham, of the U. S. topographical engineers. The result of his revision was to confirm the work of Mason and Dixon, and Maryland gained less than 2 acres.

Mason-bee: a name applied to numerous bees, chiefly of the genus *Osmia*, which construct their cells of mud. They put their cells in the hollow stalks of plants, in empty shells, under flat stones, inside oak-galls, in chambers which they construct in rotten wood, etc. Some species form cells of great beauty and perfection, and line them with a kind of silk. The ceilings of many Egyptian temples are completely covered with these cells, masses of which hang down like stalactites. These bees are also very common in Northern Europe, in the regions of the Baltic, where they often cover the whole sunny side of the poor man's clay hut with their singular constructions. The cells are formed by boring into the clay wall, but at the orifice of each cell an outer tube is construeted, sometimes 2 or 3 inches in length, of pellets formed in the excavation. The U. S. has quite a number of mason-bees.

Mason City: city; capital of Cerro Gordo co., Ia. (for location of county, see map of Iowa, ref. 2–H); on the Ia. Cent., the Chi., Mil. and St. P. and the Mason City and Ft. Dodge railways; 150 miles S. of St. Paul, Minn. It is in an agricultural and stock-raising region; contains 13 churches, 4 public-school buildings, 2 national banks (combined capital $100,000), a State bank (capital $50,000), and a daily, monthly, and 4 weekly newspapers; and has limestone quarries, brick and tile works, flour-mills, machine-shops, and cold-storage houses. Pop. (1880) 2,510; (1890) 4,007; (1900) 6,746. Editor of "Times-Herald."

Masonry: a fraternal institution, existing in some form and to some extent in nearly every civilized country. Those seeking admission into it must be free men, and must be accepted with substantial unanimity; hence its members term themselves "Free and accepted Masons"; from this circumstance the institution is frequently called "Freemasonry."

Origin.—It is of ancient origin, so ancient that the time and place of its birth are unknown. Its legends say that it was organized at the building of the temple by Solomon; but while in former times Masons accepted this as fact, they no longer confound its legends with its history. That its origin is unknown is shown by the fact that almost every writer has found for it a source different from that found by any of his fellows: it has been ascribed to the Druids, to the Knights Templar, and to Pythagoras; and it has not even escaped the modern fad of attributing almost everything to the fertile genius and more fertile pen of Sir Francis Bacon! With considerable show of argument some writers trace it to the ancient mysteries (especially the Eleusinian), others to the Essenes, others to the Roman colleges, and still others to the Culdees. Within the past generation supposed traces of Masonry have been found in the Holy Land, on the Egyptian obelisks, and in the pyramids; indeed, it has been strenuously claimed in respect to the latter that the evidence found in their form, method of construction, and other particulars conclusively shows that they were built by masons from whom the present society has descended. Within fifty years a writer has demonstrated, to his own satisfaction at least, that the present system of masonry is directly attributable to the German stonecutters who flourished from as early as 1459 down to comparatively a modern date. But when all is said, it still remains a fact that the evidence in support of these claims rests wholly upon the discovery of characteristics, emblems, symbols, forms, ceremonies, and laws common—and in some cases to a very remarkable degree—to these ancient organizations and to Masonry; but while this evidence establishes the *possibility* of the truth of the theory which it is adduced to support, it utterly fails to establish the *certainty* of that theory. Those who would pursue the examination of this matter beyond the limits of an article of this character are referred to the able and exhaustive discussion of it in *The History of Freemasonry*, by Robert Freke Gould.

The theory that Masonry is an outgrowth of mediæval operative masonry has much greater support both from internal and external evidence. The magnificent cathedrals erected between the early part of the twelfth century and the close of the fifteenth were, in many if not in all cases, the productions of workmen united in organizations of a character precisely similar, in most material respects, to the Masonic organizations. The tradition of the society, from the earliest times, is that originally it was an operative institution. It is certain that when monasticism died out in England mediæval architecture went with it. When the building of churches ceased the builders' occupation was gone. There is abundant ground for the tradition that the originally flourishing brotherhood of operative masons at last fell into decay, and for the theory that some of its members, perceiving that as an operative institution it had no longer a reason for existence, determined to continue it as a "speculative" society to promote the practice of the moral, fraternal, and charitable principles which had characterized the old organization. The present form of organization was adopted in 1717, from which date the society has an authentic history; in the earlier times it was scarcely allowable to commit to writing anything relating to Masonry, and for that reason it has been all the more difficult to trace its history; but in spite of this, manuscript copies of old *charges* have been discovered, and are extant, made in the fourteenth, fifteenth, sixteenth, and seventeenth centuries. Some of them are not dated, and opinions differ as

to the time when they were written, but as one of them is dated Dec. 25, 1583, it shows the existence of an organization at that date which was not a new one. Some of these are entitled *The Constitution of Masonry* and some *The Constitutions of the Freemasons*. In 1646 Elias Ashmole was made a Mason, but previously to that date all the evidence of its existence in England is found in these old *charges* and in the statutes. In Scotland there is record evidence of its existence as early as 1599, for Edinburgh Lodge, No. 1, has a record continuous, save one break of less than twenty years, from that year to the present time. The conclusion can not be resisted that at a very early date there existed organizations of an operative character calling themselves "Masons," or "Freemasons," and the art or "mystery" which they practiced "Masonry," or "Freemasonry"; and it is equally certain that their operative character gradually changed until it became in their language "speculative"; and thus came into existence the Masonic institution of to-day.

Form of Government.—The primary organization is the lodge, with master, wardens, and other officers. Originally a master called the brethren together at his pleasure, and the assembly was called a lodge; but it was not till about 1717 that lodges of a permanent character were established. There is a dispute in relation to the character of the government previously to that date, but the evidence, tested by the rules which human experience has established, proves that before 1717 a grand-master governed the fraternity, which theoretically met annually in "general assembly" to choose a grand-master and make laws for the craft. It is true that in the decay of Masonry in the years immediately preceding 1717 the general assembly was not regularly held, and Masonry came near ceasing to exist. But on St. John the Baptist's Day in 1717 the brethren, chiefly members of four lodges, met in general assembly, chose a grand-master, and made changes of an exceedingly important nature in the form of government of the institution. The character of the lodges was entirely changed; theretofore they were merely temporary bodies without fixed membership, called together at the will of the master, but it was then enacted that in the future no lodge could exist without a charter or warrant from the grand lodge or the grand-master. The result of this was that lodges became permanent bodies with a fixed membership, with regular officers, and a prescribed place of meeting. In place of the general assembly provision was made for a grand lodge, composed of the grand officers (and later certain past grand officers) and the masters and wardens of the particular lodges. The grand lodge was thus made the supreme legislative, judicial, and executive authority of the fraternity; thereafter every lodge must be created by, and hold its existence at the pleasure of, the grand lodge, "for the members of the grand lodge are truly the representatives of all the fraternity." (Anderson's *Constitutions*, 1738.) Scotland and Ireland adopted the same system later. Lodges were in existence upon the Continent, but they established a different system of government. In a few jurisdictions this other system is not recognized as Masonic, but it is difficult to perceive how the four lodges had the right to prescribe the form of Masonic government for the whole Masonic world, or why the French lodges had not an equal right to establish a different system, provided the fundamental principles and landmarks of Masonry were preserved. Several grand lodges existed in England at different times, but one after another united with the grand lodge formed in 1717, although it was not till 1813 that one of them was merged in it.

The American Revolution was the cause of the affirmation for the first time of a principle growing out of the laws and usages of Masonry. In England, Scotland, and Ireland there then existed independent grand lodges for those several countries, the peers of each other. Each of them had established lodges in the U. S. Obedience to the law of one's country was then, as now, a law of Masonry. It was generally held in the U. S. that allegiance to the Masonic authority of another country was, or might be, incompatible with his duty to the government of his own country. The American lodges, therefore, took steps to form grand lodges of their own. This claim was at first resisted, but it has now become settled Masonic law that the majority of the lodges in a political division, possessing the right of self-government, not less than three in number, have the inherent right to form a grand lodge for such political division; this doctrine has been applied to the States and organized Territories of the American Union, as well as to the District of Columbia, and the several dependencies of the British crown. The consequence has been that the apparent intention of those who organized the grand lodge in 1717, that there should be but one grand lodge for the whole world, has been overthrown, and more than sixty grand lodges have been formed in the U. S., Great Britain, and the dependencies of the British crown.

Another law, growing out of the law just mentioned, and the creation under it of a plurality of grand lodges, has been asserted and finally acquiesced in by the British and American grand lodges, viz., that a grand lodge so created has at once exclusive and supreme jurisdiction over all lodges and Masons in its territory, with concurrent jurisdiction in autonomous territories in which no grand lodge exists. The grand lodges with their lodges and members of their respective obediences are Masonic nations, between whom the "necessary laws of nations" (that is, the laws growing out of natural justice) are in as full force as between civil nations. In the case of the British grand lodges there is a slight but necessary qualification of this law: each one of them has exclusive jurisdiction in its own home territory; but in the dependencies of the crown, in which no grand lodge exists, they have jurisdiction concurrent among themselves but exclusive as to all others.

The principal officers of a lodge are elected annually by the lodge, and the others are elected or appointed by the master, as the by-laws provide; they must be installed before entering upon their duties, and hold office until their respective successors are installed. Every lodge has the right to choose a proxy to represent it in the grand lodge in the absence of the master and wardens.

The principal officers of the grand lodge are elected by its members, and the others appointed by the grand-master. The same rule as to installation and tenure of office prevails in the grand lodge as in the lodge.

The British system provides for provincial or district grand lodges to aid in administering the affairs of the craft, in consequence of the large number of lodges and the extent of the territory over which they are scattered. At their head is a provincial or district grand-master appointed by the grand-master under the authority of the grand lodge; these officers and bodies have the powers and duties specifically defined in the constitution.

Although the proposition has in recent times been denied by some, it is generally held that there are powers inherent in the office of grand-master of which he can not be deprived; among these powers is that of dispensing with some of the provisions of the law in cases in which adherence to it would, in his judgment, be subversive of the interests of the craft.

The form of government of the institution seems happily calculated to secure strength, permanency, and prudent action. The representatives of the lodges represent the popular branch, while the permanent members are the senate of the order; the latter presumably, and in most cases actually, have no personal ambition to gratify; they have had a large experience, and have grown wiser thereby; these two elements, acting together in the same body, necessarily influence each other without any of the jealousies invariably arising between two sets of men acting separately in different bodies, whose action to be effective must be concurrent. Again, the permanent members are of the utmost importance when the grand lodge acts in its judicial capacity; its decisions are often more far-reaching than its legislation, while errors in the latter are much more easily corrected than in the former. It is believed that its form of government has contributed largely to its wonderful prosperity during the last half century.

Rites.—Thus far this sketch has been confined to what is usually called the "symbolic Masonry of the York Rite." But there are other bodies of this rite, and other rites. At one time there was an extensive manufacture of so-called Masonic degrees; some of them have survived, and this account would not be complete without some mention of those which have been very extensively cultivated.

The lodge has jurisdiction over three degrees, called Entered Apprentice, Fellow Craft, and Master Mason; about 1745 another degree began to be cultivated called the Royal Arch; other degrees were conferred in connection with it; finally, Thomas Smith Webb and John Hanmer in the latter part of the last century arranged a system including four degrees, those of Mark Master, Past Master, Most Excellent Master, and Royal Arch, given in bodies called chapters; they are conferred only on Master Masons in good standing.

In the early part of the nineteenth century three degrees (called Royal Master, Select Master, and Super-Excellent Master), which had been termed "side degrees," were combined in a system called the Cryptic Rite; they are conferred in bodies called councils and only upon Royal Arch Masons. The systems of government of Royal Arch Masonry and Cryptic Masonry are the same as that of symbolic Masonry, except that in the U. S. there are a general grand chapter and a general grand council, of which most of the grand chapters and grand councils are respectively constituents. The number of Royal Arch Masons in the U. S. and Canada is nearly 150,000, and the number of Royal and Select Masters between 30,000 and 40,000.

Mention should also be made of the order of Knights Templar, which is usually held to be a part of the American Masonic system. Candidates must profess a belief in the Christian religion, an important addition to the requisites for admission into symbolic Masonry. The orders are conferred only on Royal Arch Masons, in commanderies which in this country are subordinate to a grand commandery in each State and Territory (except there is only one in Massachusetts and Rhode Island), which in turn is subordinate to the grand encampment of the U. S., the supreme power of the order. The latter meets triennially, and its conclave is the occasion of the gathering together of a very large proportion of the 50,000 knights enlisted under its banner.

The Ancient and Accepted Scottish Rite is the only other rite that requires notice. Its scale of degrees, conferred upon Master Masons of the York Rite in good standing and in lodges, councils, chapters, and consistories, numbers twenty-nine, from the fourth to the thirty-second inclusive. It has also an official degree—the thirty-third. While the members of its obedience are less numerous than those of the York Rite, its cultivation is more widely extended throughout the world than that of the York Rite. In many jurisdictions, in which the York Rite does not exist, its governing body has jurisdiction over the symbolic degrees, and charters lodges to confer them. The governing body is a supreme council of the thirty-third degree, whose members have a life tenure; it alone confers the thirty-third degree upon postulants elected by itself, and fills vacancies in its membership. There may be one supreme council in each nation, but in the U. S. two—one in the North and one in the South. There are twenty-three supreme councils in the world recognized as regular. The Supreme Council of the Northern Masonic Jurisdiction of the U. S. has the largest obedience of the supreme councils of the world; the membership of its consistories is (1893) 17,553; of its chapters, 17,759; of its councils, 18,226; and of its lodges, 20,441.

There are organizations claiming to be legitimate bodies of this rite in the U. S. and other countries which are held to be clandestine by the other supreme councils in the world; they are also under the ban of very many of the grand lodges of the York Rite.

Principles.— The foremost fundamental principle of Masonry is *belief in God*, and, as a necessary incident, the acceptance of a Book of the Law as a revelation of his will. Attempts have been made to substitute a "creative principle" for God, the Creator, Ruler, and Father; but in the only case in which a governing body adopted the change, the other Masonic powers formally declared that, by that action, it has ceased to be a *Masonic* organization, and forbade Masonic correspondence with it, its subordinates, and the members of its obedience. "The fundamental principle of Masonry is the Fatherhood of God and the brotherhood of man" is another form in which the same idea has been expressed. To the Christian the Book of the Law is the Bible, and to the Hebrew the Old Testament; and no lodge can be lawfully opened unless the Book of the Law lies open upon the altar. Beyond this belief in God and a Book of the Law, no religious test is allowed; the laws governing Masons "oblige them to that religion in which all men agree, leaving their particular opinions to themselves"; but if a Mason "rightly understands the art, he will never be a stupid atheist, or irreligious libertine."

All rules of conduct growing out of this fundamental principle are taught and enforced by Masonry. It has been termed "a system of ethics—moral, religious, and philosophical—which relates to the social, ethical, and intellectual progress of man." "A Mason is obliged by his tenure to obey the moral law," as tersely stated in the ancient *charges*, which also declare that brotherly love is "the foundation and cope-stone, the cement, and glory of this ancient fraternity." The brethren are charged that "every human being has a claim upon your kind offices. So that we enjoin it upon you to 'do good unto *all*,' while we recommend it more especially to the '*household of the faithful*.'" The Mason is also taught that his duties to the institution and the fraternity do not conflict with, but are subordinate to, his duty to God, his country, his family, his neighbor, or himself; that the tenets of Masonry are brotherly love, relief, and truth; and that its "cardinal virtues" are temperance, fortitude, prudence, and justice. He is charged "to be a good man and true"; "to be a peaceful citizen, cheerfully to conform to the laws," and "to pay proper respect to the civil magistrate"; "to work diligently, live creditably, and act honorably by all men." To sum up, Masonry takes the law of God as the "rule and guide" of its *works* as well as of its *faith*.

It should be added that Masonry teaches most impressively the immortality of the soul, and the resurrection to a future life "in that celestial lodge above where the Supreme Architect of the Universe presides."

Laws.—The laws of Masonry are largely derived from the ancient usages of the craft; in its early days nothing was committed to writing, and naturally every one followed the practice which he had seen others follow; as a result, usage ultimately became law; but another result followed—that nothing was law that was not in accordance with ancient usage, and, as a consequence, that the law was unchangeable. It has become a maxim that "no man or body of men can make innovations in the body of Masonry." These unchangeable laws are termed landmarks. While grand lodges are the supreme governing bodies in their respective jurisdictions, they are subject to these laws. So absolute are they that if a governing body attempts to change them, it merely puts itself outside of the pale of Masonry. In all matters not controlled by the landmarks each grand lodge has full power of legislation. So we have three sources of Masonic law: (1) The ancient usages of the craft; (2) grand-lodge legislation; (3) by-laws of lodges. Masonry is so much a law unto itself that in deciding any question the first consideration is not "What are the general principles of civil law applicable?" but "What are the ancient usages of the craft?" There are many Masonic laws which would be held to be erroneous if tested by general principles of the civil law; for example, ancient usage requires the presence of the charter in order to open a lodge; on principle the charter is only *evidence* of the rightful existence of the lodge, and whether it be present or not there is no reason why the lodge may not be opened, and yet the Masonic law is that it *must be present*. In fact, the most frequent errors in the discussion of Masonic law arise from relying upon the principles of the common law and methods under it, instead of the ancient usages of the fraternity.

Methods of Teaching.—Masonry teaches by legends, allegories, symbols, forms, and ceremonies. This fact and the secrecy in its work indicate an ancient origin of the institution. Every ceremony, every badge of office, every adornment of the lodge, every article of Masonic clothing and furniture—in fact, every thing upon which the eye rests and every sound which reaches the ear in the working of a lodge—are intended to teach or impress upon the mind of the initiate a precept or principle of Masonry, while to the profane they are meaningless.

Masonic Charity.—While Masonry more than any other institution of human origin teaches the duty of charity in its largest and most sacred sense, it differs from other societies most essentially anent relieving distress and want. It has no system of "dues and benefits" by which one pays a fixed amount at regular intervals, and thereby entitles himself to relief in case of sickness without reference to his pecuniary condition. Every Mason is bound to relieve the distress of a worthy brother, his widow, or orphan to the extent of his ability, and of his ability he is himself the sole judge. It is true that dues are paid to lodges to create a charity fund, primarily to relieve the necessities of the members of the lodge, and secondarily any Mason in distress; but all claims for relief grow out of actual distress and not out of the payment of dues, and the lodge, as in the case of the individual Mason, is the sole judge of the amount of relief it is able to give in a particular case. Nor does Masonic relief give any ground for a claim to reimbursement. It must be admitted, however, that there has been a tendency to depart from the old rule, and to hold that a member of a lodge is *entitled* to relief from his lodge, even to a full support, without reference to the ability of the lodge; and also that a lodge which relieves a member of another lodge is entitled to reimburse-

ment; but it is generally held that both these claims are at variance with the law of Masonry in relation to charity. Another evil has grown out of affording relief by *lodges*; it has a tendency, and has had the result, to weaken the sense of obligation of individuals to give relief. Nevertheless, the right of every distressed Mason to ask relief and the duty of every Mason to grant relief according to his ability remain in all their primitive force; and under the landmarks of Masonry no power can take away this right, or relieve from this obligation.

Statistics.—Grand lodges or other governing bodies exist in almost every civilized country controlled by the Caucasian race, and there are lodges in almost every part of the habitable globe. In the very large proportion of them no statistics are published, and it is therefore impossible to give an accurate statement of the number of Masons in the world, or even of the number of lodges; an attempt to estimate them would be merely a guess based upon no reliable data. This is true of the whole Masonic world outside of the U. S. and the Dominion of Canada; in the former there are fifty grand lodges, and in the latter seven; the members of their respective obediences, according to the latest returns (for 1900), number 818,767 (in U. S.) and 38,810 (in Dominion of Canada).

This sketch would not be complete without the statement that among the people of color in the U. S. Masonry is claimed to exist, springing from the same source, professing the same principles, governed by the same laws, practicing the same rites, and organized in the same manner as the Masonry of the whites; but the latter do not recognize nor hold Masonic communication with these organizations or their members.

JOSIAH H. DRUMMOND.

Masonry [from O. Fr. *maçonerie*, deriv. of *maçon* (whence Eng. *mason*), from Low Lat. *ma'chio*, mason, of uncertain origin]: constructions in stone or brick with mortar, classified into stone masonry, brick masonry, and concrete or béton. *Stone masonry* is divided into *cut stone* (or *ashlar*) *masonry* and *rubble masonry*; and rubble may be *coursed* or *uncoursed*, while the uncoursed may be *squared rubble*, showing only vertical and horizontal joints on the face, or *irregular rubble*, with the joints running in random directions according to the shapes of the stones. *Concrete* may be *brick*, *stone*, *gravel*, or *shell* concrete, depending on the material used for ballast. The front of a wall is termed its *face*, and the material composing it *facing*, as distinguished from the *back* and *backing*, which apply to the rear or inner surface of the wall. The interior is called the *heart*, and the material *hearting* or *filling*. When the face or back of a wall is not vertical, but inclines toward the wall from bottom to top, the inclination is called the *batter* or *bâtir*. Thus "a face-batter of 1 in 20" means that in a height of 20 feet the face of the wall departs a foot from a vertical line. The method of arrangement of the stones or bricks in order to secure strength and unity of mass is called the *bond*. *Headers* are those stones or bricks which show an end upon the face and back of the wall, and therefore reach into the wall their entire length and bind it together transversely. *Stretchers* are laid to show their longest dimensions on the face or back, as the case may be, and to give longitudinal strength. For walls of stone masonry not exceeding 3 feet in thickness each header should extend through from face to back, and is termed a *through*. In thicker walls the headers should reach back at least 18 inches beyond the contiguous stretcher, and are termed *binders*. The lower surface of a stone is termed its *lower bed*, the upper surface its *upper bed*. All the spaces between contiguous stones are also called joints, whether above, below, or at the sides. *Ashlar* is an external facing of cut stone laid with close joints in courses, the quality of the face-dressing being such—either axed, tooled, rubbed, or polished—as will best suit the character of the material and the design of the work under construction. In *rock-faced* ashlar the face of each block is the natural fracture or split of the stone, left undressed or only deprived of large protuberances. The filling and backing behind an ashlar facing may be rough, irregular rubble, brickwork, or concrete, preferably the latter in most cases, unless rubble stones are plenty and cheap. The ashlar should be well bonded to the hearting, for which purpose one-fifth to one-third of the entire length of each course should be headers, and these should not be placed one above the other in contiguous course, but so that the headers of each course shall rest on or near the middle of the stretchers of the course below. In important work, such as sea-walls, for example, the face-ends of headers for a distance back equal to the breadth of the stretchers are usually cut dovetail on the sides, the ends of the stretchers fitting against them being cut to corresponding angles with the face of the wall, so as to give close joints. The *tails* of the headers, in order to secure a good bond with the hearting, are left with the rough rock-face on the sides, although the beds, for convenience of laying, are roughly dressed to general parallelism with each other. The vertical and horizontal joints for a distance back equal to the breadth of the stretchers should therefore be formed accurately and full. (Fig. 1 gives a transverse and a horizontal section of a sea-wall on a concrete foundation, with stone facing and concrete backing.) The practice of thinning off the blocks from a few inches from the face, so as to show close face-work, with little labor of stone cutting, as in Fig. 2, should be avoided. The method of building with headers and stretchers is not followed in laying the thin ashlar, a kind of veneering, generally not over 4 inches or 5 inches in thickness, used for facing the walls of city houses, in which the only bond-stones extending through or nearly through the wall are those forming the jambs to window and door openings. The face-stones, usually rubbed or finely axed brownstone or sandstone or polished marble, are tied to the brick backing with hoop-iron clamps, and even these are sometimes omitted where the distance between the jambs of the openings does not exceed 5 or 6 feet. The rise or height of headers should not exceed their width as seen on the face of the wall; that of stretchers should be somewhat less than their transverse breadth. Where the batter is great—say, exceeding an angle of 25° to 30° with the vertical—the bed-joints should not be carried out horizontally to the face of the wall, for the reason that the lower edge of each face-stone would present an angle so acute as to be liable to injury from accidents and the effects of weather. One method of construction recommended in such cases is to cut the beds of the stones so that at least 4 inches in width of the bed-joint shall be normal to the face of the wall, as shown in Fig. 3. There are objections to this device unless the wall is under water, for the joints will retain water, and will be injured by frost in cold climates, and from the growth of vegetation during the summer season in all climates. Moreover, the stone-cutting is expensive. A better design is to secure the requisite strength at the angle by allowing the stones to project beyond the face of the wall, as in Fig. 4. Indeed, it will generally be less expensive, and produce stronger work, to lay up the wall in offsets, as shown by the dotted lines of Fig. 4. In compressive soils, or where from any cause it is difficult to get a solid and unyielding foundation, additional thickness, so as to distribute the weight over a larger area, should be given to the wall at the base; and in order to lessen the weight and cost of the superstructure without endangering its stability it may be built hollow; a concave batter is sometimes given to the face. Fig. 5 shows a transverse section, and Fig. 6 a plan, of a structure of this description. It is a river-wall in Sheerness, England, designed by Rennie. Masses of cut stone in positions exposed to violent pressures and shocks, such as sea-jetties, piers, and lighthouses, should have the component parts fastened together with great

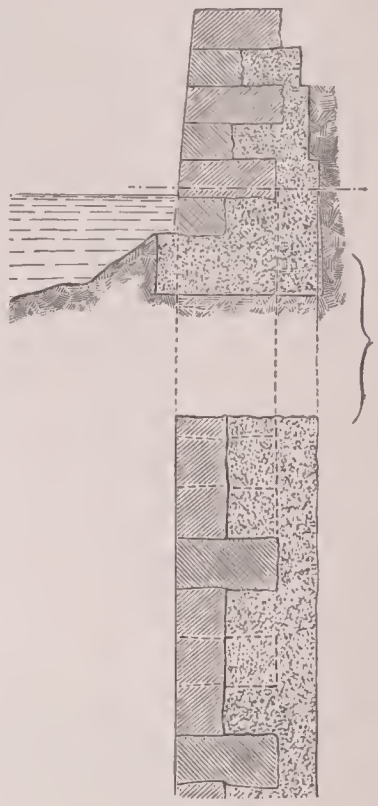

FIG. 1.

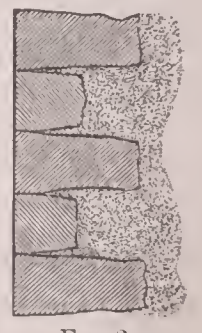

FIG. 2.

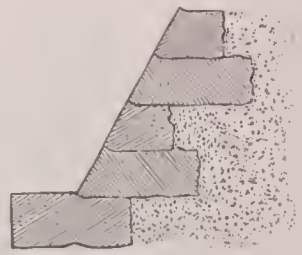

FIG. 3.

strength. Not only should the stones of each course be dovetailed and notched or clamped into each other, so that no single piece can move without displacing a large mass, but each course should be firmly connected with those above and below it. To prevent sliding projections may be left in the beds of one course to fit into corresponding cavities of the contiguous course, or cylindrical cast-iron dowels, 6 to 8 inches in diameter, may be placed in a vertical position between courses, extending some inches into the blocks above and below. Heavy wrought-iron bolts may be inserted vertically through several courses to prevent the uplifting of the mass.

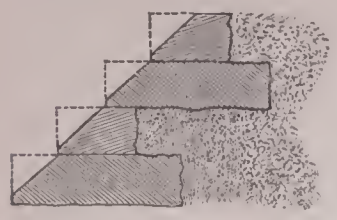

Fig. 4.

Common *uncoursed* rubble, generally styled random rubble, is built with stones of random shapes and sizes as they

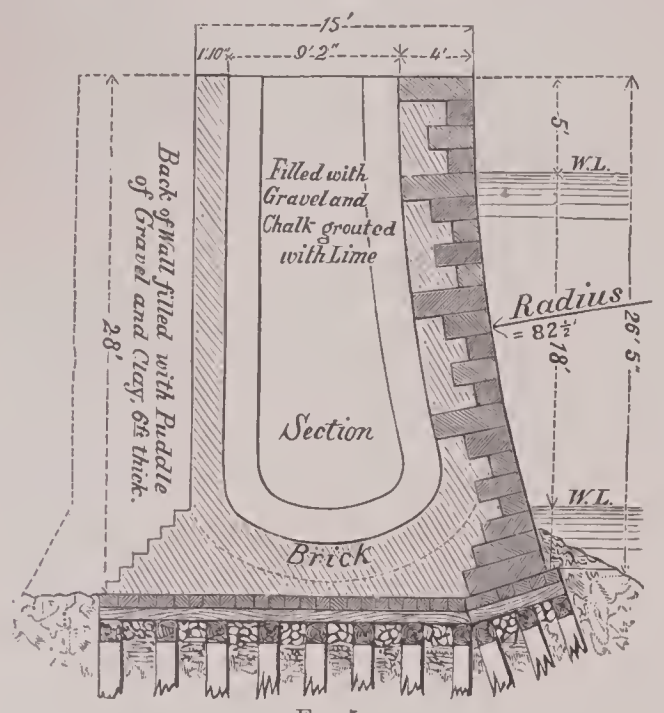

Fig. 5.

come from the quarry, with only their most salient protuberances broken off with the scabbling-hammer. The only implements used in laying are the trowel and plumb-rule, and no attention is paid to courses. The interstices of

Fig. 6.

the larger stones are filled in with those that are smaller and with spalls, all well bedded in mortar. The face and back of the wall should be well bonded to the hearting with headers, and the stones should be selected so as to fit to-

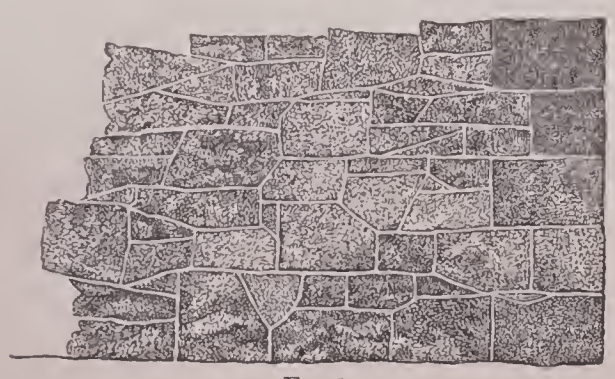

Fig. 7.

gether as closely as possible, and thus reduce to a minimum the volume of mortar necessary to completely fill all the voids; but no two stones should touch each other. For the angles or corners of a wall of this kind the stones should be as nearly rectangular as can be found. Ashlar is frequently introduced at the angles and around window and door openings to obtain architectural effect, after the manner of the *opus incertum* of the ancients. With stone of a dark color a fine effect can be produced by pointing the joints with white mortar (Fig. 7).

Coursed rubble, or squared rubble built in courses (Fig. 8), differs from *random* rubble in being built of stones that

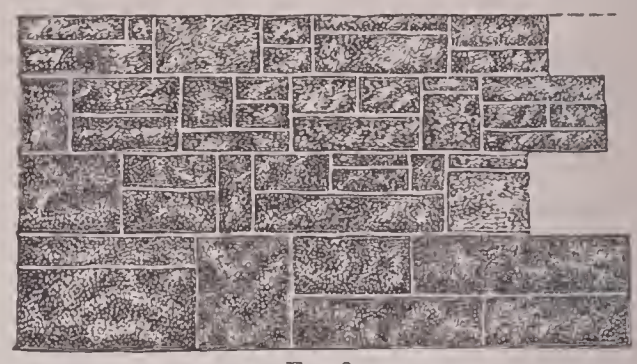

Fig. 8.

are, at least approximately, rectangular in form, so that only vertical and horizontal joints are shown upon the face of the wall, and they vary considerably in thickness. Although the stones are laid up in what are termed courses, there is no uniformity in the heights of the several courses, nor even in the stones of the same course, two or more small pieces being often employed to obtain a rise equal to that of a single large one; the height of a course being equal to that of the highest stone in it. The top of each course is carefully finished to a plane level surface by filling in voids and open spaces with rough rubble masonry or spalls set in mortar or with concrete, so as to get a good bed for the course which follows, especially for the headers, which should be set so as to be in close contact on their beds throughout their entire length. When the stones run very generally in rectangular blocks and of good size (containing,

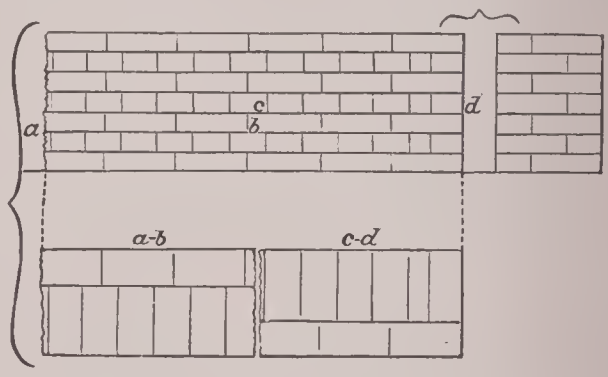

Fig. 9.

say, from 2 to 6 cubic feet), or are brought to that form by cutting, a good strong bond can be secured by frequent headers, and it is not desirable to lay them in *built* courses. Indeed, the wall will possess greater longitudinal strength by carefully avoiding continuous horizontal joints. Such work is sometimes called rubble masonry with horizontal and vertical joints, or simply *squared uncoursed rubble* or

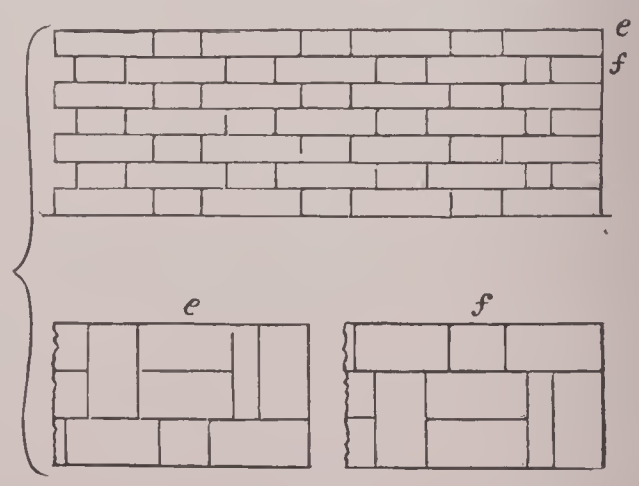

Fig. 10.

irregular coursed rubble. It is much used, and by most architects and builders is preferred to coursed rubble, and

by many to ashlar. With dark stone, showing a split rock-face, pointed with white mortar, a fine architectural effect can be produced. Stone having a fine cleavage is well suited to this kind of work. When rubble is laid without mortar it is called dry rubble. It is generally "random."

Brick masonry, when both the brick and mortar are of good quality and the work is well done, is strong and durable. Various kinds of bond are used, the most usual being

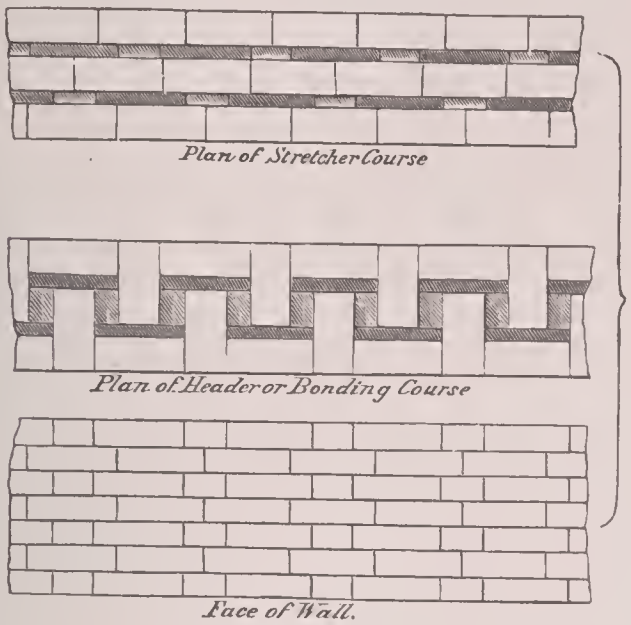

FIG. 11.

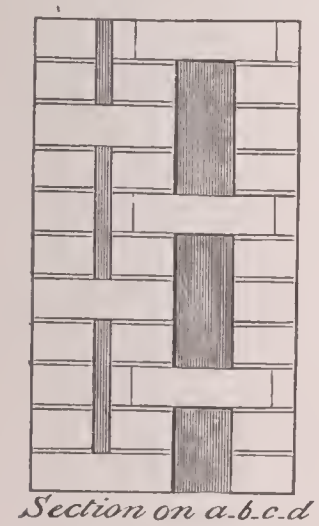
the *English* and *Flemish*. The first (Fig. 9) consists in arranging the courses alternately, entirely as *headers* or *stretchers*, the bricks through the course breaking joints. In the second (Fig. 10) the bricks are laid as headers and stretchers in each course. The first gives the strongest bond, and the second the best architectural effect. Hollow brick walls are much used, the thickness of the inner shell being usually 4 inches, or the width of one brick. It is tied to the outer wall at frequent intervals with iron clamps, or more generally with bricks laid transversely or diagonally (Figs. 11 and 12), and bonded into the masonry at both ends. Moisture will not condense on the inner face of such a wall. The expense of furring out with wood and lathing is therefore saved, and the danger from fire lessened. The mortar for brickwork should be made with clean, sharp, and rather fine-grained sand, or preferably grains of variable sizes. For common lime-mortar the proportions will be 1 volume of lime-paste to from 3 to 4 volumes of sand. Sea-sand, or sand rounded by attrition, is not suitable, and neither sea-water nor even brackish water should be used in mixing. (For the preparation of cement-mortar, for either stone or brick masonry, see CEMENT.) The bricks should be laid wet, so that they will not rapidly dry the mortar by extracting the moisture from it. All the void between the bricks should be completely filled with mortar, and no more mortar than will suffice for this purpose should be used. The joints, especially those between the courses, should not exceed a quarter of an inch in thickness.



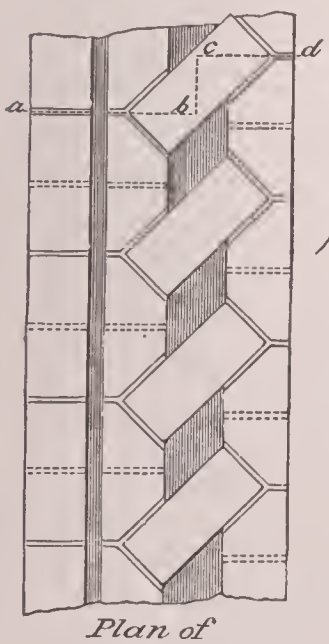


FIG. 12.

Concrete (*béton*) masonry is admirably adapted to many important purposes. A brief description of the method of preparing and laying it is given under CONCRETE. For foundations in damp and yielding soils and all kinds of submarine constructions; for quay-walls, jetties, piers; for foundations, hearting and backing of massive walls generally; for cisterns, reservoirs, and tanks; for tunnels and aqueducts, and for many other purposes, it possesses advantages over either brick or stone masonry. For submarine masonry concrete possesses the advantage that it can be laid without exhausting the water (which is an expensive operation under the most favorable circumstances), and also without the aid of a diving-bell or submarine armor. Groined and vaulted arches, and even entire bridges, dwelling-houses, and factories, in single monolithic masses, with molded ornamentation of no mean character, have been constructed of this material alone. By omitting the coarse fragments or ballast a smoother finish and a more elaborate ornamentation can be given to the surface. The material is then usually called artificial stone, of which an excellent variety may be made with Portland cement (dry) 1 volume and clean fine sand $2\frac{1}{2}$ volumes, mixed with little water, so as not to be plastic, and compacted in thin layers by ramming. The form to be given to the construction is accomplished by a plank molding. In Europe a portion of the Portland cement is usually replaced by siliceous hydraulic lime, like that of Theil, a good formula being $\frac{3}{4}$ volume of dry cement, 1 volume of dry (slaked) hydraulic lime, and 4 volumes of sand. This mixture was used in the construction of the aqueduct of the Vanne for supplying water to the city of Paris. The pipe is $6\frac{1}{2}$ feet in interior diameter, 9 inches thick at top, and 12 inches at the sides at the water-surface, resting on an arcade, the whole forming a single monolith. An entire Gothic church, with its foundation, walls, and steeple, was built of this material at Vesinet, near Paris, as well as several large houses in that city. It is extensively used in the U. S. A fine and highly ornamented bridge in Prospect Park, Brooklyn, and the fluted columns and other interior finish of St. Patrick's cathedral in Fifth Avenue, New York, are constructed of it. The foundation of the Statue of Liberty in New York harbor to a height of 60 feet above high water is a monolithic mass of concrete, 91 feet square at the base and 65 feet square at the top.

The strength of masonry is always less than that of the stone or brick of which it is formed, and it is a common rule that the greatest stress per square inch on the base of masonry structures should not exceed about 150 lb. per square inch. Stones should be laid in the wall in a similar position to that which they had in the quarry, as it is found that the greatest durability is thus secured. The joints should be laid so that the pressure is uniformly distributed, and so that the direction of the pressure is normal to them; in arched constructions this rule should be particularly observed. Masonry is measured by the cubic yard, except that trimmings and ornamental work is usually measured by the square foot of surface. The cost of rubble masonry ranges from $2 to $6 per cubic yard, that of ordinary bridge masonry from $6 to $12 for second-class and from $10 to $20 for first-class work, while dimension stone masonry in granite may often cost $40 to $60. See FOUNDATION, ARCHITECTURE, BRICK, BUILDING-STONE, and CEMENT; also see Mahan, *Civil Engineering* (1873); Rivingtons' *Notes on Building Construction* (1875); Gillmore, *Limes, Hydraulic Cements, and Mortars* (1874); same, *Béton-Coignet and other Artificial Stone* (1871); Baker's *Masonry Construction* (1890).

Masquerade, mas'ke-rād [from Fr. *mascarade*, Span. *mascarada*, masquerade, from *mascara*, a mask]: an amusement generally consisting of a ball, public or private, in which the participators wear masks for purposes of disguise. An eccentric costume was an early feature of the masquerade, and under the form of a "fancy ball" has nearly superseded it in Great Britain and the U. S., each guest personating some mythological or historical character or assuming the costume of some remote people. The masquerade proper flourished in Italy in the fifteenth century, and was introduced at the French court by Catharine de' Medici, and at the English in the time of Henry VIII. It doubtless arose from the "miracles and mysteries" which were so popular in the Middle Ages. To the present day a masked ball is in Roman Catholic countries an invariable feature of the carnival, and on that occasion processions of maskers often pass through the streets playing wild pranks.

Masques: histrionic spectacles, Italian in origin, which were popular in Europe during the fifteenth and sixteenth centuries. "Properly speaking, a masque was nothing more or less than a dance with masks, and a dance always remained its central point." (Ward, i., 587.) In Italy, as the masque was developed during the sixteenth century, it was either "a kind of ballet-interlude, to relieve the graver attractions of a formal comedy, or assimilated the type of processional pageantry upon occasions of public rejoicing." (Symonds, 337.) In 1474 we hear of the form at the celebrations in honor of Leonora of Aragon when she passed through Rome on her way to marry Ercole d'Este. During the succeeding century the masque, particularly at Ferrara, Florence, and Venice, gained rapidly in ingenuity of plan, expense, and magnificence. Vasari, Palladio, Tintoret, and Veronese helped to develop it.

We first hear of the masque in England in 1512–13, at Epiphany. Then Henry VIII. and some of his courtiers were "disguised after the manner of Italy, called a mask"—the disguising which Shakspeare represents in act i., sc. 4, of *King Henry VIII.* In England the masque was at first much simpler than in Italy during the same period, and differed in little except the masking from the "disguisings" that before 1513 had been common at court. Only in a few instances during the sixteenth century, though the masque was liked by Henry and Elizabeth, and was sometimes given even in the reign of Mary, did it at all approach the magnificence of the Italian masques of the same century. A notable instance was the entertainment given to Queen Elizabeth by Lord Leicester at Kenilworth in 1575. (See Laneham's *Letter Describing the Pageants at Kenilworth Castle.*) When, however, James I. came to the throne the masque developed rapidly, for the form was a great favorite with him and his family. The courtiers took delight in the masques because in them they could dance and pose to their own admiration and that of their friends, and because in them they could vie with one another in splendid entertainments for James that made easy the most fulsome flattery of him and his. The masques became the amateur theatricals of the period—very costly, but very popular. The interest of the common people in them passed all bounds, and when a masque was to be given at Whitehall citizens and their wives fought and intrigued to win entrance to the hall where the masque was given. (See Robin Goodfellow's words in Jonson's *Love Restored.*) At Christmas and at Shrovetide the king and the queen, each of them, provided a masque for the entertainment of the court; nobles gave them, at weddings, at tilts, at their country-seats when visited by royalty; the Inns of Court and the universities were rivals in flattering the king and the queen with splendid masques devised in their honor. To meet the demand some of the dramatists turned aside from their regular dramatic work to write these airy trifles. Foremost among them stands Ben Jonson, followed by Chapman, Fletcher, Beaumont, Middleton, Shirley, Daniel, and others. Inigo Jones devised the mechanical contrivances for the masques; Ferrabosco wrote the music; Thomas Giles, master of the children of the Chapel Royal, arranged the dances. The form always remained elastic. "The degree in which a masque mixed the elements of declamation, dialogue, music, decoration, and scenery was determined by no inner law, but merely by the circumstances of each particular case. In its least elaborate form—from a literary point of view—it nearly approaches the pageant, so consistently favored by the citizens of London; where the characters were more carefully worked out, where something like a plot kept the whole together, and where something like an action was introduced, it trenched to some extent upon the domain of the drama." (Ward, i., 587.) In England one very marked addition was made to the masque: in Italy the work of the poet in a masque had been but slight; in England genuine poetry—lyric particularly—became one of the characteristics of the form. Jonson developed, too, the anti-masque—usually, though not always, preceding the masque proper—which served as a foil of comedy to the grace and the splendor of the main masque. In this anti-masque professional actors and dancers appeared; in the masque proper, as a rule, nearly everything was done by the noble amateurs interested in presenting the masque. Queen Anne, the Princes Henry and Charles, the Countesses of Arundel and Bedford, Lady Arabella Stuart, and many others of the court, acted in these entertainments. They were very expensive, averaging £1,400 apiece, equivalent, perhaps, to four times that amount at the present day; and in special cases much more was spent—for the *Triumph of Peace* of Shirley and Jones, given at Whitehall in 1634 by the Inns of Court, £20,000 were expended. The care put upon the scenic effects and the mechanical contrivances was very great.

Necessarily, of course, the intense interest for a number of years of all ranks of the people in these masques had some effect on the regular drama of the time. The active part the nobility took in them aided in bringing the drama and the courtiers into that close connection of the two that marks the decadence of the Elizabethan drama; masques and masque-like effects appeared in plays of the time, for instance, in *The Tempest*, *The Maid's Tragedy*, and *The Duchess of Malfi*; and, chief influence of all, the attention paid to scenic effects must have done much to bring elaborate scenery to the rather barren boards of the regular theaters.

Charles I. by no means did without masques, but expended less upon them than did his father. As a whole, too, in his reign they fell off in literary value, though to this period (1634) belong the *Arcades* and the *Comus* of Milton, both of which show the influence of the masques that preceded them. Indeed, as Mr. Symonds has said, in *Comus* a reader sees "how the scenic elements of the masque, touching the fancy of a great poet, became converted into flawless poetry beneath his hand." With the coming of the Commonwealth and the cessation of all dramatic performances, the masque practically disappeared. See, in general, Symonds, *The Predecessors of Shakspere*; Ward, *A History of English Dramatic Literature*; for Jonson's masques, see Carisbrooke Library, *Masques and Entertainments of Ben Jonson.* GEORGE P. BAKER.

Mass: See FORCE and DYNAMICS.

Mass: in the Roman Catholic Church, the Eucharistic oblation. The derivation of the word is disputed. Most probably it comes from the termination of the service, *Ite, missa* (= demissio) *est* (sc. *ecclesia*)—Go, you are dismissed—and not from the Hebrew, מַסָּה, *missah*, or the Greek *μύησις*. The Mass is offered in obedience to Christ's command, "Do this for a commemoration of me." (See TRANSUBSTANTIATION.) It is a sacrifice in which the separate consecration of the bread and of the wine "shews the death of the Lord" (1 Cor. xi. 26), and in which his body and blood are received in communion. These essentials of the Mass are preceded and followed by extracts from the Psalms, Epistles, and Gospels, and by prayers, some of which are always recited, while others vary according to the season or according to the purpose for which the Mass is offered. These, as well as the ceremonies of the Mass, differ considerably in the various rites. In the Western Church, the Latin rite prevails; in the Eastern, the Greek, Syriac, Coptic, etc., are still distinct. A *Low* Mass is one which is celebrated without chant, incense, or the assistance of deacon and sub-deacon. With these additions it is called a *High* Mass. A *Requiem* Mass is offered for the dead, and *Pontifical* Mass is celebrated by a bishop. J. J. KEANE.

Mas'sa, or **Massa di Carrara**: town in the province of Massa, Italy; on the Frigido; 76 miles S. E. of Genoa (see map of Italy, ref. 4–C). The mildness and salubrity of the climate are almost unrivaled in Italy. The city is a bishop's see, and has several educational institutions and a public library. Tobacco, oil, and paper are manufactured. The national palace is a noble structure, built by the princes

of the house of Cybo. Massa is first mentioned in the ninth century. It was for a long time subject to the republic of Lucca, but in the fifteenth century the Cybo family became its feudal lords, and Alberic I. built the new town and gave Massa a civil and penal code remarkable for that age. Pop. (1881) 8,998.

Massachusetts: one of the U. S. of North America (North Atlantic group); the sixth of the original thirteen States that ratified the Federal Constitution; popularly known as the Bay State.

Location and Area.—It lies between the parallels of 41° 14′ (south shore of Nantucket) and 42° 53′ N., and between the meridians of 69° 55′ and 73° 30′ W. lon. from Greenwich; bounded on the N. by Vermont and New Hampshire, on the E. by the Atlantic Ocean, on the S. by the Atlantic Ocean, Rhode Island, and Connecticut, on the W. by New York State; greatest length, from Nauset Beach, Cape Cod, to the western line of Mt. Washington township, 184 miles; distance from Cape Ann to the New York State line, same parallel, 138 miles; greatest breadth from the New Hampshire line at Salisbury to the southern line of Nantucket, 113¾ miles; average breadth between Vermont and New Hampshire on the N. and Connecticut and Rhode Island on the S., 47¾ miles. The measurement of its area, taken from the Borden State map in 1844, is 8,500 sq. miles; from surveys and maps of H. F. Walling, 8,160 sq. miles; from the map of the Coast and Geodetic Survey, 8,336 sq. miles; from the topographical survey in 1887, as given in the report of Henry Gannett of the U. S. Geological Survey to the commissioners, 8,315 sq. miles. The mean of these different estimates is 8,327 sq. miles. The area of ocean water from the low-water line of the coast, as defined by statute, to the "outer line of the Commonwealth," one marine league from this low-water shore-line, is 1,941 sq. miles, making the total area of land and water within the jurisdiction of the Commonwealth, as based upon the above estimates, 10,268 sq. miles. Its entire coast-line, including the shores of capes and bays, but excluding minor indentations and islands, is nearly 300 miles.

Seal of Massachusetts.

Physical Features.—The extreme western part of the State is crossed by two mountain chains—the Taconic, or Taghkanic, and the Hoosac, a continuation of the Green Mountains of Vermont. These inclose the Housatonic valley, which at its northern end is 1,100 feet above the sea, and at its southern 800 feet. The Taconic range contains the highest eminence in the State: Greylock, or Saddleback, in Adams township, Berkshire County, 3,505 feet high, and Mt. Everett, or Washington, in the southwestern corner of the same county, 2,624 feet high. The Hoosac range has a somewhat regular elevation of from 1,200 to 1,600 feet, and never exceeds 2,510 feet. A rugged table-land from 1,000 to 1,500 feet high, and cleft by deep river valleys, extends from the Hoosac Mountains to the Connecticut river valley. Here is found a series of distinct trap ridges, the continuation of a range having its southern end in West Rock, at New Haven, Conn. This, as it enters Massachusetts, approaches the Connecticut in a northeasterly direction until, near the western bank of the river, a few miles below Northampton, it rises to a height (Mt. Tom) of 1,200 feet. On the opposite side of the river, in South Hadley, it attains (Mt. Holyoke) a height of 1,120 feet; then curving more to the E. it extends for 10 miles. The valleys of the Connecticut, the Deerfield, and the Housatonic, are noted for their beautiful scenery. The surface between the Connecticut and Blackstone rivers is mainly a broken table-land about 1,000 feet high, containing a number of isolated summits, which belong to the mountain system of New Hampshire. Wachusett, the most conspicuous, is 2,018 feet high. The State, E. of Worcester County, is undulating or hilly, descending gradually toward the ocean. The coast counties, especially Bristol and Plymouth, contain large tracts of nearly level land, from which rise rounded hills. The highest point of land near the ocean (620 feet) belongs to the Blue Hills of Milton. The rocks at Cape Ann are bold and picturesque. Cape Cod, comprising the county of Barnstable, largely consists of glacial sands and gravels, interspersed with numerous ponds, but contains arable land. From the line separating the towns of Plymouth and Bourne it extends eastward about 35 miles, rarely exceeding 7 miles in width, then bends toward the N. and finally curves toward the W. The eastern coast of the State is bordered in places by extensive salt marshes, and in the southeastern counties there are numerous swamps, where cranberry-culture is carried on. Like Cape Cod, the islands S. of the State are moderately level and sandy. The principal islands are Martha's Vineyard (about 100 sq. miles) and the sixteen Elizabeth islands (about 13 sq. miles), constituting the county of Dukes; Nantucket (about 17 miles long) which, with three or four small islands, constitutes Nantucket County; Monomoy, off the southeastern extremity of Cape Cod, and Plum island, a sand spit, off the northeastern coast of Essex County.

Bays, Harbors, Rivers, and Lakes.—The largest bay is Massachusetts, which contains Boston Bay, Lynn, Marblehead, Salem and Gloucester harbors; Cape Cod, next in size, contains Duxbury Bay, Plymouth harbor, Barnstable harbor, Wellfleet Bay, and Provincetown harbor, at Provincetown. Third in size is Buzzard's Bay, 30 miles in length and averaging 8 miles in width, sheltered from the Atlantic by the Elizabeth islands and containing New Bedford, Fairhaven, Wareham, and other harbors. Cotuit harbor and Lewis Bay on the south side of the Cape, and Pleasant Bay and Nauset harbor on the open Atlantic side, are among the numerous indentations of the coast-line. Martha's Vineyard has the harbors of Vineyard Haven and Edgartown; Nantucket has a deep and nearly landlocked harbor. North of Boston harbor are Lynn harbor, Nahant Bay, Marblehead, Salem, Beverly, and Gloucester harbors, Sandy Bay in Rockport, Annisquam harbor on the northern coast of Cape Ann, and the harbor formed by the mouth of Merrimac river. The harbor of New Bedford ranks next to that of Boston in its advantages. The stretch of water between the Elizabeth islands and Martha's Vineyard is called Vineyard Sound, and that between the mainland and Nantucket, Nantucket Sound. The principal river, the Connecticut, has a course of more than 50 miles in Massachusetts, cutting through the range containing Mt. Tom and Mt. Holyoke. Its width varies from 450 to 1,000 feet; at Montague and at South Hadley it is broken by falls; at Springfield its bed is only 40 feet above the ocean. Its watershed in the State has a breadth from E. to W. of about 60 miles. Its chief tributaries from the W. are the Agawam or Westfield and the Deerfield rivers. The principal tributaries from the east are Miller's and Chicopee rivers. The Housatonic rises in Berkshire County, and flows through Connecticut into Long Island Sound. The northwestern part of the State is drained by the Hoosac, which passes into New York State and joins the Hudson. The largest stream E. of the Connecticut, the Merrimac, has its sources in New Hampshire, but for 35 miles it flows through Massachusetts and empties into the Atlantic at Newburyport. It is navigable for vessels of 200 tons as far as Haverhill, 15 miles from its mouth, and on its banks are situated Lawrence, Lowell, and other large manufacturing cities. The Nashua unites with the Merrimac in New Hampshire, but has its sources in Worcester co., Mass. The Concord, another tributary, is formed by the junction of the Sudbury and Assabet rivers, and joins the Merrimac at Lowell. The Charles river, a winding stream about 75 miles in length, empties into the estuary between Boston and Cambridge. It is navigable to Watertown, 7 miles from Boston. The Blackstone river, 75 miles in length, rises in Worcester County, crosses the northeastern corner of Rhode Island, and below Providence expands into an estuary called Pawtucket or Seekonk river, an extension of Providence Bay. Taunton river rises in Plymouth County and empties in Mt. Hope Bay at Fall River. It is navigable as far as Taunton. Smaller rivers are the French, Mill, Ware, Swift, Shawsheen, Spicket, and Nemasket. Nearly all the streams are utilized for manufacturing purposes. Lake Quinsigamond, near Worcester, Watuppa Pond, near Fall River, and Long, Assowompsett, and Great Quittacus Ponds in Plymouth County are among the few landlocked bodies of water of large size.

Geology.—Most of the geological strata extend in broad bands across the State from N. to S. The rocks are largely metamorphic, both the Archæan and Palæozoic systems being represented. To the former Hitchcock assigns the feldspathic and calcarĕous gneiss of the Hoosac range, small areas of syenite on either side of the Connecticut valley sandstones, the wide stretch of gneissic rocks between the Connecticut river and Worcester, the mica schists found in connection with granite about Amherst and Leverett, the syenite and porphyry of Eastern Massachusetts, and possibly the feldspathic gneiss and the granite of Plymouth and Bristol Counties, and the gneiss and hornblende schist of Middlesex County. Syenite covers most of Essex and Norfolk Counties; Archæan and Palæozoic granite is found along the coast (on Cape Ann and at Quincy and other places there are extensive quarries), also in parts of Hampshire and Franklin Counties. Bolerites form the Holyoke range. The Palæozoic series W. of the Connecticut include Cambrian, Silurian, and even Devonian limestones, quartzites, schists, and slates. Olenellus and Paradoxides, limestones and slates occur in Essex and Middlesex Counties; grits and conglomerates, of probable Carboniferous age, in Suffolk County. A great part of Bristol and Plymouth Counties consists of Carboniferous rocks, but the anthracite they contain is of little value. The Connecticut valley basin is composed of Mesozoic sandstones and shales of great thickness, containing the fossil footprints of large reptiles, amphibia, and other forms of animal life. The strata of the west part of Martha's Vineyard are Cretaceous and Tertiary, the latter probably of Miocene age. Cape Cod, Nantucket, and the east part of Martha's Vineyard superficially are composed of drift material, a confused mass of bowlders, sand, and gravel. The same materials are found in the Connecticut, Housatonic, and other minor valleys; and the effects of the ice-sheet that at one time covered the State are everywhere seen. The Elizabeth islands and Nantucket are in part formed of terminal moraines. Bowlders of large size are numerous on Cape Ann, Cape Cod, and elsewhere. The famous Plymouth rock is a bowlder which was transported from the northern part of the State.

The principal mineral resource is granite, in the production of which the State has ranked first for many years. Several varieties are found, viz.: Hornblende, in Norfolk and Essex Counties; hornblende-biotite, in Essex County; epidote, in Norfolk County; biotite in Norfolk, Middlesex, Bristol, Worcester, and Plymouth Counties; biotite-muscovite, in Worcester and Berkshire Counties; and also biotite-gneiss, in Middlesex, Essex, Worcester, and Hampden Counties; diabase, in Middlesex and Hampden Counties; and melaphyre, in Suffolk County. In the census year 1890 there were 151 quarries in operation; the combined production was 9,587,996 cubic feet; and the total value was $2,503,503. Of the production 6,643,703 cubic feet were for building purposes; 1,475,093 cubic feet were for street work; 509,087 cubic feet were for cemetery, monumental, and decorative purposes; 252,288 cubic feet were for bridge, dam, and railway work; and 707,825 cubic feet were for miscellaneous purposes. Of sandstone, 21 quarries yielded 1,967,179 cubic feet, valued at $649,097; and of limestone, 12 quarries yielded a product valued at $119,978. Brick clay is found in the valleys of all the principal streams; cretaceous clay on the islands S. of the coast at Gay Head; rhodonite, a beautiful ornamental stone, said to be as rich as the Siberian variety, near Cummington; and rock kaolin at Andover. In 1899 the value of the principal mineral productions was: Granite, $1,798,294; sandstone, $131,877; slate, $800; marble, $59,416; and limestone, $168,147; total value, $2,158,534. Of iron ore, 29,611 long tons of brown hematite were mined in Massachusetts and Connecticut in 1899. There are a number of well-known mineral and other springs, whose waters have a large sale.

Soil and Productions.—Much of the soil is naturally sterile. Excepting Cape Cod, where there are long stretches of sandy, treeless flats, the surface was originally covered with heavy forests. After the forest growths were removed, the soil did not yield to the farmer so quickly and freely as had been anticipated, and the present productiveness is due to his skill and patience in cultivation in a larger measure than has been the case in almost any other agricultural State. There are found in the State, 3 species of pine, 12 of oak, 4 of hickory, 6 of birch, 5 of poplar, 11 of willow, 2 of elm, 2 of cedar, 3 of ash, 4 of cherry, 5 of maple, besides several species of laurel, cornel, viburnum, sumach, elder, and grape; the beech, butternut, black walnut, spruce, larch, hornbeam, tulip-tree, tupelo, buttonwood, mountain ash, sassafras, dogwood, holly, rhododendron, sweet bay or small magnolia, and many other trees and shrubs. The State board of agriculture and the State agricultural experiment station at Amherst have greatly aided the farmer in making fertile a soil naturally unpromising.

The following table shows the acreage, yield, and value of the principal crops for the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	40,667	1,545,346 bush.	$834,487
Oats	14,967	550,786 "	209,299
Rye	7,914	133,747 "	100,310
Barley	1,661	42,854 "	29,569
Buckwheat	2,187	37,179 "	26,769
Potatoes	28,626	2,261,454 "	1,492,560
Tobacco (1896)	1,975	3,199,500 lb.	383,940
Hay	567,079	550,067 tons	9,571,166
Totals	665,076	.....	$12,648,100

The number and value of farm animals on Jan. 1, 1900, were estimated as follows: Horses, 66,017, value $5,154,136; milch-cows, 181,589, value $6,755,111; oxen and other cattle, 73,378, value $1,990,270; sheep, 40,194, value $182,883; and swine (estimated), 60,000, value $725,000—total head 421,178, total value $14,807,400.

Zoölogy.—With the exception of deer, protected by law in Plymouth and Barnstable Counties, and the wild-cat the large wild animals have become extinct. The existing mammals include the gray and the red fox, the mink, land otter, raccoon, porcupine, muskrat, woodchuck, weasel, grampus, and porpoise. The authentic species of birds found in the State number 316. Of these, about 135 breed within the limits of the State and 70 are classed as rare or occasional visitors. There are over 100 species of marine fishes; about 20 species are found in the fresh-water streams and ponds. There are marked differences between many of the fishes and mollusks found on the north and south sides of Cape Cod. Among the reptiles are 3 species of venemous snakes.

Climate.—The climate in general is cool, with prevailing east and northeast winds from February to May, and with west and southwest winds during the summer and fall. A marked characteristic is its variety. A winter is seldom passed without a few days of extreme cold weather, and short spells of extreme heat are often experienced in summer. The winter season from December to March is usually cold and rigorous, the ground being sometimes covered with snow during most of the entire period. The proportion of snow and rain in the eastern or coast section is considerably less than in the interior or western part of the State. In the eastern section the spring is in advance of the interior and western parts, generally from a week to a fortnight, and the frosts, except in some particular localities, are not so early or severe. Droughts of longer or shorter duration are often experienced, but the climate on the whole is favorable for agriculture. The average annual rainfall is about 48 inches.

The following table shows the average rainfall at Springfield, in the Connecticut valley, and at Boston, on the coast:

MONTHS.	Boston, average for 23 years.	Springfield, average for 46 years.
May	3·57	4·17
June	3·22	3·80
July	3·59	4·51
August	4·47	4·53
September	3·00	3·49
October	4·06	4·15

The following table shows the average temperature of the two cities:

MONTHS.	Boston, average for 23 years.	Springfield, average for 26 years.
May	56·2°	59·2°
June	65·9°	68·8°
July	71·8°	73·2°
August	68·5°	70·6°
September	62·1°	62·8°
October	51·5°	50·9°

At Amherst, where the meteorological observatory of the Massachusetts Agricultural College is located, the average temperature from 1836–62 (twenty-five years) was December, January, and February, 24·53° F.; June, July, August, 68·26° F.; and from 1862–87 (twenty-five years) December, January, February, 25·21° F.; June, July, August, 68·53° F.

Divisions.—For administrative purposes, Massachusetts is divided into fourteen counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION, FOR 1900.

COUNTIES.	*Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.
Barnstable	5-K	29,172	27,826	Barnstable	4,364
Berkshire	2-C	81,108	95,667	Pittsfield	21,766
Bristol	5-I	186,465	252,029	New Bedford	62,442
				Taunton	31,036
Dukes	6-J	4,369	4,561	Edgartown	1,209
Essex	1-I	299,995	357,030	Lawrence	62,559
				Newburyport	14,478
				Salem	35,956
Franklin	2-E	38,610	41,209	Greenfield	7,927
Hampden	3-D	135,713	175,603	Springfield	62,059
Hampshire	3-E	51,859	58,820	Northampton	18,643
Middlesex	2-H	431,167	565,696	Cambridge	91,886
				Lowell	94,969
Nantucket	6-K	3,268	3,006	Nantucket	3,006
Norfolk	5-I	118,950	151,539	Dedham	7,457
Plymouth	4-J	92,700	113,985	Plymouth	9,592
Suffolk	2-I	484,780	611,417	Boston	560,892
Worcester	3-F	280,787	346,958	Fitchburg	31,531
				Worcester	118,421
Totals	.....	2,238,943	2,805,346		

* Reference for location of counties, see map of Massachusetts.

Cities and Towns, with Population in 1900.—Boston, 560,892; Worcester, 118,421; Fall River, 104,863; Lowell, 94,969; Cambridge, 91,886; Lynn, 68,513; Lawrence, 62,559; New Bedford, 62,442; Springfield, 62,059; Somerville, 61,643; Holyoke, 45,712; Brockton, 40,063; Haverhill, 37,175; Salem, 35,956; Chelsea, 34,072; Malden, 33,664; Newton, 33,587; Fitchburg, 31,531; Taunton, 31,036; Gloucester, 26,121; Everett, 24,336; North Adams, 24,200; Quincy, 23,899; Waltham, 23,481; and Pittsfield, 21,766, all other cities and towns being under 20,000.

Population.—Pop. (1890) 2,238,943, of whom 1,087,709 were male, 1,151,234 female, 1,581,806 native, 657,137 foreign, 2,215,373 white, 23,570 colored. The colored comprised the following elements: Of African descent, 22,144; Chinese, 984; civilized Indians, 424; Japanese, 18. The population in 1900 was 2,805,346.

Industries and Business Interests.—The State is extensively devoted to manufacturing. The leading industries are textiles, boots and shoes, machines and machinery, metals and metallic goods, and paper and paper goods. Bulletins of the eleventh U. S. census (1890) report the following statistics as to capital invested, persons employed, and output in the various branches of the textile industry: Cotton—persons employed, 75,544: capital invested, $128,838,837; value of output, $100,202,882. Woolen goods (including woolens, worsteds, wool hats, carpets, felt goods, and hosiery and knit goods)—persons employed, 43,038; capital invested, $75,665,637; value of output, $72,681,408. Shoddy—persons employed, 435; capital invested, $939,050; value of output, $1,170,080. Silks (including trimmings, braids, and other silk goods)—persons employed, 2,993; capital invested, $3,353,296; value of output, $5,557,569. Dyeing and finishing textiles—persons employed, 4,270; capital invested, $11,996,154; value of work done, $6,496,215. Returns annually made to the State bureau of statistics of labor indicate capital invested and annual output in the other leading industries as follows: Boots and shoes—capital invested, $41,906,981; annual output, $145,151,981. Machines and machinery—capital invested, $33,366,848; annual output, $31,101,816. Metals and metallic goods—capital invested, $39,580,082; annual output, $57,800,054. Paper and paper goods—capital invested, $22,931,364; annual output, $28,853,520. The entire capital invested in all industries in the Commonwealth is estimated at $568,963,681, and the aggregate output at $871,061,163. The official report for 1898 on manufactures showed 4,700 establishments with invested capital of more than $113,000,000. The wages paid amounted to $2,800,000 a week. In the State factories there were 7,799,872 spindles, and $110,655,603 invested in the manufacture of cotton goods.

Fisheries.—In the census year 1890 there were 101 vessels of the U. S. engaged in the pelagic whaling industry, and of the total 70, or 69·31 per cent., hailed from ports in Massachusetts, which also had 65·34 per cent. of the total tonnage. Of the home ports, Boston had 1 vessel; Edgartown, 3; New Bedford, 57; and Provincetown, 9. These vessels were valued at $578,800, and carried apparatus valued at $95,376, and an aggregate crew of 1,909 persons. The product of the year's fisheries was: Sperm oil, 718,065 gal., value $454,700; ambergris, 73 lb., value $23,200; ivory, 1,649 lb., value $1,424; whalebone, 125,931 lb., value $419,520; and whale oil, 232,238 gal., value $89,643: total value of products, $988,487. Both the whaling and inland fisheries have declined greatly in recent years. Of the latter the greatest falling off is in mackerel. From 1886 to 1894 the number of barrels inspected in Boston and Gloucester averaged fewer than 60,000. For the twenty-five years previous to 1886 the average was more than 200,000. The statistics of the State Bureau of Labor for 1895 give the following: Number of men engaged, 11,093; working capital, $4,488,564; value of apparatus, $599,267; chief catches, cod, 81,092,958 lb., oysters, 71,222 bush., lobsters, 2,119,587 lb. In the year ending Dec. 6, 1898, 49,952,000 lb. of fresh fish were landed at Gloucester, and 47,207,000 at Boston. These included, in addition to the above, haddock, herring, shad, menhaden, striped bass, scup, squeteague, Spanish mackerel, bluefish, tautog, flounders, flatfish, and other edible fishes.

Commerce.—Massachusetts has eleven ports of entry: Barnstable, Boston, Edgartown, Fall River, Gloucester, Marblehead, Nantucket, New Bedford, Newburyport, Plymouth, and Salem.

Finance.—On Jan. 1, 1901, the actual State debt, for the payment of which the State is directly liable, was $26,996,423.30; the contingent debt, for which certain cities and towns are liable, $39,043,412; sinking fund applicable to actual debt $15,292,256.85, to contingent debt $2,931,147.09. The receipts in 1893 were $33,188,466; expenditures, $30,374,333; and the cash in the treasury Jan. 1, 1894, $9,251,380.

In 1883 the assessed valuations were, real $1,226,111,297, personal $505,185,764, total $1,731,297,061; in 1893, real $1,839,663,813, personal $1,588,675,216, total $3,428,339,029. Of the 1893 total, $956,767,626 were assessed in Boston and other parts of Suffolk County. The State tax levied in 1893 was $2,500,000.

Banking and Insurance.—The national banks on Sept. 5, 1900, numbered 247, and had a combined capital of $78,502,500, surplus and profits, $42,823,202.40, and individual deposits, $213,178,519.47. June 30, 1900, there were 186 savings-banks, with 1,491,143 depositors, and $533,845,790 in deposits; surplus and profits, $34,629,320. On the same date there were 34 loan and trust companies, with $11,375,000 capital; surplus and profits, $11,026,552; and deposits, $105,674,935.

In 1893 there were 52 mutual fire-insurance companies, 2 mutual marine, and 11 joint-stock, all belonging to the State; 78 fire-insurance companies of other States licensed to transact business in Massachusetts, and 34 foreign fire-companies; total fire and marine companies, 177.

Means of Communication.—The building of railways in the State was begun in 1832. June 30, 1899, there were 2,122·86 miles of railway in the State. Massachusetts has more miles of railway in proportion to its area than any other State except New Jersey, and any country except Belgium. The railways are owned by fifty-one different corporations, but five companies, the Boston and Albany, the Boston and Maine, the Fitchburg, the New York and New England, and the New York, New Haven and Hartford, control and operate, under lease or otherwise, nearly the entire mileage.

Churches.—The U. S. census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	381	383	614,627	$9,816,003
Congregational	559	686	101,890	11,030,890
Baptist	318	361	59,830	6,107,830
Methodist Episcopal	394	394	58,477	5,180,825
Unitarian	189	224	34,610	5,278,370
Protestant Episcopal	166	180	26,855	4,676,193
Spiritualist	61	62	7,345	269,710
Universalist	121	124	7,142	2,110,193
Presb. in the U. S. of America	18	21	3,570	365,500

Schools.—The public schools, including all the text-books and appliances used in them, are entirely free to all, and education is compulsory between the ages of seven and fourteen. The control of the schools is vested in the local authorities, and the State gives aid in providing expert supervision which extends over most of the schools. There is a State school fund, half of the income of which supports the normal schools and other general educational work, and the other half is distributed to the towns. The balance expended comes from local taxation. The total expenditure

for public schools in 1900 was $13,826,243, of which all but $275,849 was raised by local taxation. The local tax rate for school purposes was $4.71 for each $1,000 of valuation. In 1899 there were 3,395 schools; valuation of school property, $39,077,405; number of teachers, 13,402—male 1,197, female 12,205; average monthly salaries, male $136.23, female $51.41. It was estimated that there were 627,000 children between 5 and 18 years of age, of whom 471,977 were enrolled in public schools and 71,460 in private schools. The average daily attendance was 360,317, and the average expense per pupil, based on the average daily attendance, $38.55. School was held 9½ months of the year 1900. Free normal schools are maintained by the State in Bridgewater, Fitchburg, Framingham, Salem, Westfield, and Worcester for the training of teachers, and there is a State Normal Art School in Boston. For industrial training there are finely appointed schools in Boston, Cambridge, and Brookline. The Horace Mann School for the Deaf in Boston, the Clarke Institution at Northampton for the same class, the Perkins Institution and Massachusetts School for the Blind in South Boston, and Massachusetts School for the Feeble-minded at Waltham, are noble and widely known institutions. There were in 1899, 386 kindergartens and private schools with kindergarten departments, with 733 teachers and 18,161 pupils. There were 232 public high schools, with 1,402 teachers and 34,425 pupils; and 101 endowed academies, seminaries, and other institutions for secondary instruction. The universities and colleges of liberal arts were Amherst College (*q. v.*), Boston College, Boston University, Harvard University (*q. v.*), French Protestant College in Springfield, Tufts College (*q. v.*), Williams College (*q. v.*), Clark University, and the College of the Holy Cross in Worcester. The colleges for women comprised Smith College (*q. v.*), Mt. Holyoke College (*q. v.*), Wellesley College (*q. v.*), and Radcliffe College (Society for the Collegiate Education of Women), Cambridge. Other notable institutions for female education are Abbott Academy, Andover and Bradford Academy, Lassell Seminary in Auburndale, and Wheaton Female Seminary in Norton. There were 2 schools of science endowed with the national land grant—the Massachusetts Agricultural College in Amherst, and the Massachusetts Institute of Technology in Boston. The principal schools of law, medicine, theology, pharmacy, veterinary surgery, dentistry, etc., were departments of the large colleges and universities.

Public Libraries.—The number of public libraries in 1891 in the State containing 1,000 volumes and upward was 508. The aggregate number of volumes in these libraries was 4,650,088, and the number of pamphlets 1,102,401. There are 352 towns and cities in the State, and 308 of these contain free public libraries—that is, libraries that allow the free circulation of books for general reading to the homes of all the inhabitants, and that are managed as a public trust. State aid is conditionally granted to aid the formation of libraries in the smaller towns, and over $6,500,000 has been given or bequeathed by individual citizens to found or provide buildings for this class of libraries. There are only 44 towns without such free collections of books. In this statement the collections owned by institutions and associations like those at Harvard College and the Boston Athenæum are not included.

Charitable, Reformatory, and Penal Institutions.—The principal ones are the State Lunatic Hospitals at Danvers, Northampton, Westborough, Taunton; two at Worcester, Hospital for Dipsomaniacs and Inebriates, School for the Feeble-minded at Waltham, State Almshouse in Tewksbury, State farm at Bridgewater, State Prison in Boston, State Reformatory in Concord, Reformatory Prison for Women in Sherborn, State Primary and Reform Schools at Westborough, Lancaster, and Monson, and the usual county institutions. There are also large general hospitals in Boston and many other cities, and special institutions for the care of deaf-mutes, the blind, children, and other special classes.

Post-Offices and Periodicals.—On Jan. 1, 1901, there were 844 post-offices, of which 175 were presidential (16 first-class, 55 second-class, 104 third-class) and 669 fourth-class. There were 816 money-order offices and 182 money-order stations. Of newspapers and periodicals there were 84 of daily, 5 semi-weekly, 448 weekly, 8 bi-weekly, 11 semi-monthly, 132 monthly, 1 bi-monthly, 25 of quarterly publications, and 1 five times a year; total, 715.

History.—The aboriginal inhabitants of Massachusetts at the time of its permanent settlement by whites belonged to the Algonquian stock, and chiefly lived E. of the Connecticut river. The claim is made by some writers that Southeastern Massachusetts, including the large islands, was discovered about 1000–03 by Leif Erikson (*q. v.*) and his brother Thorwald, of Norwegian descent; that several Norse settlements were made during a period lasting 300 years, and that one of these, called Norumbega, was situated on the Charles river. There is no evidence to prove that the Cabots landed on the shores of New England, but England laid claim to the territory because at the time of John Cabot's discovery of Newfoundland and the mainland he was in her service. In 1602 Bartholomew Gosnold, an Englishman, with a small colony, landed in or near Salem harbor, subsequently coasted along Cape Cod, as he named it, on account of the abundance of fish caught there, and discovered the Elizabeth islands and the island of No Man's Land. His party made a settlement on the island of Cuttyhunk, but soon became disorganized and abandoned it. In 1603 another attempt at a settlement was made on or near the present site of Edgartown, Martha's Vineyard, by a colony under Martin Prynne; this also failed, as did that of George Waymouth in 1605. The first colony that proved successful was one from Leyden, Holland. It was composed of a portion of a church of English exiles, originally from Nottinghamshire and adjoining counties, who had separated from the Established Church, and in 1607–08 had fled to Holland to escape persecution. (See Robinson, John.) Hoping to better their condition and to preserve their identity as Englishmen, they obtained a patent from the Council for New England, binding themselves, in return for assistance given, to return a share of their profits in trade for seven years. The emigrants sailed in 1620 from Delftshaven, Holland, and finally, 101 in number, from Plymouth, England, in the Mayflower, a vessel of 180 tons. They had intended to settle somewhere S. of the mouth of Hudson river, but the ship was driven by storms out of its course and anchored in Provincetown Bay, Nov. 11. This was beyond the limits of the territory covered by their patent, and deeming it prudent to establish some kind of government before landing, the leaders of the expedition drew up a constitution or social compact, by the terms of which the colony was to be ruled, and soon after John Carver was chosen Governor for one year. After exploring the coast they landed at Plymouth, Dec. 11 o. s. (See Forefathers' Day.) During the winter they endured great privations, and lost nearly half their number by death. Meanwhile (1622–23) a rival colony had been planted at Wessagussett (now Weymouth) by Thomas Weston, a London merchant, and had failed disastrously, as did another under Robert Gorges (1623–24). Plymouth colony, having attempted in vain to obtain a charter, continued to govern itself with success. In 1624 a board of five assistants was chosen to aid the Governor, and the governing council was chosen yearly by all the inhabitants. In 1623 a small company of fishermen from Dorchester, England, settled on Cape Ann, but in 1626 abandoned the site, and part of them removed to Salem. Here they were joined in 1628 by a party of Puritans under John Endicott, one of the proprietors of a land company which had obtained a grant on Massachusetts Bay. In 1629 a charter was granted to the patentees and their associates in England, establishing a corporation and making the associates a body politic with power to establish a subordinate government in the new world. The officers were to consist of a Governor, deputy, and eighteen assistants, to be annually elected, and the legislative powers were intrusted to a general assembly of the freemen. In 1629 another body of settlers arrived, and in the same year it was decided to transfer the charter and government to Massachusetts. John Winthrop was appointed Governor, and in 1630 arrived with about 1,000 persons. Immigration continued; Boston, Dorchester, Lynn, and other towns were settled, and the wealth and social standing of the colonists, a few of whom belonged to the nobility, gave the Bay colony prominence. These Puritans soon adopted the "congregational way" of church government as practiced by the Plymouth Pilgrims. In 1651 Congregationalism was established by law.

By the terms of the charter the founders of Massachusetts were permitted to make laws and ordinances "not repugnant to the laws of England," and to "repulse and exclude" all persons whom they should believe to be undesirable as settlers. They proceeded to give the charter a liberal construction and to build up a form of government patterned after the Jewish commonwealth, but, in striving to realize their dream, often were led to adopt extreme and sometimes cruel measures. (See Hutchinson, Anne; Quakers, and

WILLIAMS, ROGER.) Nevertheless, many wise and beneficent measures were enforced, manufactures and mining were encouraged, and above everything else, learning. Plymouth colony was more tolerant than Massachusetts, and few instances of injustice are found in its annals.

In 1636 and 1637 troubles with the Pequot Indians led to the Pequot war, the principal losses of which, however, fell upon the Connecticut colony, an offshoot from that of Massachusetts Bay. In 1643 a confederacy was formed, consisting of the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven. This confederacy lasted for twenty years, and then gave place to a more comprehensive one. Massachusetts Bay then included the settlements in New Hampshire and Maine. The Massachusetts Bay and Plymouth colonies had serious difficulties with the English Government, especially after the restoration of Charles II. The king appointed a commission to investigate and govern these colonies, but the colonial authorities refused to permit them to exercise their powers. The strained relations between Massachusetts and the mother-country were increased by the declaration of the general court in 1675, that for any power but itself to impose taxes was an infringement of the rights of the people as British subjects. The great struggle with the Indians in 1675 and 1676, known as King Philip's war, checked the prosperity of these colonies for a long time. Before this disastrous war had ended new troubles with the king had begun. Prompted by the vindictive spirit of Edmund Randolph, Charles II. had at last decided to annul the charter of Massachusetts Bay and to bring all the New England colonies under the sway of a royal Governor. In 1684 the English high court of chancery gave judgment against Massachusetts, and declared its charter forfeited. Joseph Dudley, son of the early emigrant Governor, was appointed president, but under the control of the revengeful Randolph, and the general court or legislature was abolished. On the accession of James II., Dudley was superseded by Sir Edmund Andros, already known to the colonists as an imperious and tyrannical commissioner. Upon the first report that the Prince of Orange had landed in England, Andros and all his coadjutors, including Joseph Dudley, whom he had made chief justice, were arrested, imprisoned, and held for trial; and immediately upon the receipt of the intelligence of the proclamation of William of Orange in England he was proclaimed in Massachusetts Bay, and simultaneously in the Plymouth Colony. In 1690 Massachusetts took part in the intercolonial war between the possessions of France and England, and to pay the colonial troops issued treasury notes for the first time in its history. In 1692, by a new charter granted by the king, Massachusetts Bay and Plymouth were consolidated into one government, Massachusetts having at that date a population of about 55,000 and Plymouth a population of 7,000. In 1692 the Salem witchcraft delusion occurred. There were frequent disturbances with the Indians for the next twenty-three years, the French colonists in Canada prompting the savages to make raids upon the colony of Massachusetts. From 1722 to 1725 these raids assumed the larger proportions of a war, and were finally ended by the almost complete extermination of the Indian tribes adjacent. From 1744 to 1748, in the war between England and France, Massachusetts contributed largely to the capture of Louisburg in 1745 and to the success of the Canadian expeditions. In the second war with France in the following decade, the colony again played a very conspicuous part. Her enterprise and her independent spirit excited the jealousy of Great Britain, and, as had been done by Charles II. and James II. eighty years before, occasion was sought to humiliate her. Oppressive measures of taxation were devised and her commerce was hampered by restrictions. The attempt to enforce the Stamp Act led to riots in Boston in 1765 and 1768, and as a result two regiments of British soldiers were quartered upon the citizens without their consent. In Mar., 1770, the "Boston massacre" occurred, in which three citizens were shot by British soldiers. On Dec. 16, 1773, occurred the famous destruction of the cargo of tea in Boston harbor. The port of Boston was closed in retaliation in 1774, and in the same year Gen. Gage, who had been placed in command of the troops in Boston, postponed indefinitely the meeting of the general court. The representatives, however, met at Salem. The seizure of the arsenal at Charlestown by the militia, the adjournment of the Assembly to Concord, and its reorganization there as a provincial congress, were among the many events which immediately preceded the revolution. The first blood of the Revolutionary war was shed at Lexington and Concord on Apr. 19, 1775; the battle of Bunker Hill occurred on June 17 of the same year. Massachusetts contributed 67,907 troops out of a total population of 231,779, and £164,000 toward the expenses of the war, but many of the people, especially among the educated class, were loyalists, and emigrated to Nova Scotia and New Brunswick rather than live under a republic. In 1780 Massachusetts adopted a State constitution; and it was decided not long after that, by a clause in the Bill of Rights prefixed to that constitution, slavery in the State was abolished. An insurrection, known as Shays's rebellion, occurred in the western part of the State in 1786, arising from the poverty and distress of the people and the severity of the taxes; some lives were lost in its suppression. The Constitution of the U. S. was ratified in Jan., 1788, by a State convention, by a vote of 187 to 168. In the division of parties which occurred at the beginning of the nineteenth century a large majority of the citizens of Massachusetts sided with the Federal party, and many of them were opposed to the war with Great Britain in 1812; nevertheless, the State furnished great numbers of seamen to the navy during that war, and in 1814 more than 20,000 militia were in service in the State and in the district of Maine. A number of delegates from the State appeared at the convention of the New England States which met at Hartford, Conn., in 1814, to confer upon their grievances. (See HARTFORD CONVENTION.) In 1815 "dissenters" were released from paying taxes for the support of Congregational churches, and in 1833 all religious denominations were placed on an equal footing. In 1820 the district of Maine was set off as a separate State. In the same year a convention met to revise the constitution. Another constitutional convention met in 1853. In 1831 the Anti-Slavery movement received an impetus by the establishment in Boston, by William Lloyd Garrison, of *The Liberator*, and by the formation of an Anti-Slavery society. Political agitations gave rise in the State to the Liberty party, which was succeeded by the Free-Soil party, and that by the Republican party. When the civil war broke out the people of the State supported the Union cause with enthusiasm, furnishing (1861–65) 159,165 men for all terms of service, including 26,329 who were in the navy, and paying in bounties (including interest on bounty loans to Dec. 31, 1885), $26,858,123.23. In addition to this sum there was paid in State and military aid to Dec. 31, 1885, $18,242,324.35. In Jan., 1865, the war debt of the State exceeded $14,500,000, the bonds for which were held chiefly by its citizens.

GOVERNORS OF MASSACHUSETTS.

Of Plymouth Colony, elected.

John Carver	1620–21
William Bradford	1621–33
Edward Winslow	1633–34
Thomas Prence	1634–35
William Bradford	1635–36
Edward Winslow	1636–37
William Bradford	1637–38
Thomas Prence	1638–39
William Bradford	1639–44
Edward Winslow	1644–45
William Bradford	1645–57
Thomas Prence	1657–73
Josiah Winslow	1673–81
Thomas Hinckley	1681–86
Sir Edmund Andros, gov.-gen.	1686–89
Thomas Hinckley	1689–92

Of Massachusetts, chosen annually under First Charter.

John Endicott (acting)	1629–30
Matthew Cradock (did not serve).	
John Winthrop	1630–34
Thomas Dudley	1634–35
John Hayues	1635–36
Henry Vane	1636–37
John Winthrop	1637–40
Thomas Dudley	1640–41
Richard Bellingham	1641–42
John Winthrop	1642–44
John Endicott	1644–45
Thomas Dudley	1645–46
John Winthrop	1646–49
John Endicott	1649–50
Thomas Dudley	1650–51
John Endicott	1651–54
Richard Bellingham	1654–55
John Endicott	1655–65
Richard Bellingham	1665–73
John Leverett	1673–79
Simon Bradstreet	1679–84
Jos. Dudley, pres.	1684–86
Sir Edmund Andros, gov.-gen.	1686–89
Thomas Danforth (acting)	1689–92

Appointed by the King under the Second Charter.

Sir William Phipps	1692–94
Wm. Stoughton (acting)	1694–99
Richard Coote, Earl of Bellomont	1699–1700
Wm. Stoughton (acting)	1700–01
The Council	1701–02
Joseph Dudley	1702–Feb., 1715
The Council	Feb.–Mar., 1715
Joseph Dudley	Mar.–Nov., 1715
Wm. Tailer (acting)	1715–16
Samuel Shute	1716–23
Wm. Dummer (acting)	1723–28
Wm. Burnett	Jau.–Sept., 1728
Wm. Dummer (acting),	Sept., 1728–June, 1730
Wm. Tailer (acting),	June–Aug., 1730
Jona. Belcher	Aug., 1730–41
William Shirley	1741–49
Spencer Phips (acting)	1749–53
William Shirley	1753–56
Spencer Phips (acting)	1756–57
The Council	Apr.–Aug., 1757
Thomas Pownal	1757–60
Thomas Hutchinson (acting)	June–Aug., 1760
Sir Francis Bernard, Bart.	1760–69
Thomas Hutchinson (acting)	1769–71
Thomas Hutchinson	1771–74
Thomas Gage	May–Oct., 1774
A Proviucial Congress,	Oct., 1774–July, 1775
The Council	July, 1775–80

Under the Constitution.

John Hancock	1780–85
James Bowdoin	1785–87
John Hancock	1787–Oct., 1793
Samuel Adams (acting),	Oct., 1793–94
Samuel Adams	1794–97
Increase Sumner	1797–June, 1799
Moses Gill (acting)	June, 1799–1800

Caleb Strong	1800-07
Jas. Sullivan	1807-Dec., 1808
Levi Lincoln (acting)	Dec., 1808-09
Christopher Gore	1809-10
Elbridge Gerry	1810-12
Caleb Strong	1812-16
John Brooks	1816-23
Wm. Eustis	1823-Feb., 1825
Marcus Morton (acting),	Feb.-July, 1825
Levi Lincoln	1825-34
John Davis	1834-Mar., 1835
Samuel T. Armstrong (acting)	Mar., 1835-36
Edward Everett	1836-40
Marcus Morton	1840-41
John Davis	1841-43
Marcus Morton	1843-44
George N. Briggs	1844-51
George S. Boutwell	1851-53
John H. Clifford	1853-54
Emory Washburn	1854-55
Henry J. Gardner	1855-58
Nathaniel P. Banks	1858-61
John A. Andrew	1861-66
Alexander H. Bullock	1866-69
William Claflin	1869-72
William B. Washburn,	1872-May, 1874
Thomas Talbot (acting),	May-Dec., 1874
William Gaston	1874-76
Alexander H. Rice	1876-79
Thomas Talbot	1879-80
John D. Long	1880-83
Benjamin F. Butler	1883-84
George D. Robinson	1884-87
Oliver Ames	1887-90
John Q. A. Brackett	1890-91
William E. Russell	1891-94
Frederick T. Greenhalge	1894-96
Roger Wolcott	1896-1900
William Murray Crane	1900-

Hutchinson (Boston, 1764–67) and by Barry (Boston, 1855–57); Young, *Chronicles of the Pilgrim Fathers* (Boston, 1841) and *Chronicles of Massachusetts* (Boston, 1846); Holland, *History of Western Massachusetts* (Springfield, 1855); Palfrey, *The History of New England* (3 vols., Boston, 1858–64); Schouler, *History of Massachusetts in the Civil War* (Boston, 1868–71); *Memorial History of Boston* (4 vols., Boston, 1880–81); Goodwin, *The Pilgrim Republic* (Boston, 1888); Ellis, *The Puritan Age and Rule in the Colony of the Massachusetts Bay* (Boston, 1888); Weeden, *Economic and Social History of New England, 1620–1789* (2 vols., Boston and New York, 1890); Wright, *History of Wages and Prices in Massachusetts 1752–1883* (State bureau statistics of labor, Boston, 1885); *Reports* of the census of 1885: I. *Population and Social Statistics*; II. *Manufactures, Fisheries, and Commerce*; III. *Agricultural Products and Property* (Boston, 1887–88). Among works of a special character, see Dexter, *As to Roger Williams and his so-called "Banishment"* (Boston, 1876); Hallowell, *The Pioneer Quakers* (Boston, 1886) and *The Quaker Invasion of Massachusetts* (Boston, 1887); Brooks Adams, *The Emancipation of Massachusetts* (Boston and New York, 1887); C. F. Adams, *Three Episodes of Massachusetts History* (2 vols., Boston, 1892) and *Massachusetts, its Historians and its History* (Boston, 1893). WILLIAM E. RUSSELL.

Massachusetts Institute of Technology: a technical school founded at Boston in 1862 by Prof. William Barton Rogers and others. The original plan included not only the "school of industrial science," by which the Institute is now best known, but also a society of arts and a museum of arts. Thirteen distinct four-year courses are offered, viz.: civil, mechanical, mining, chemical, electrical, and sanitary engineering, architecture, biology, chemistry, physics, general studies, geology, and naval architecture. For the completion of any one of these the degree of B. Sc. is given. A conspicuous feature is the laboratory instruction of large classes. The students number about 1,200, and the instructing staff includes 165 professors, instructors, and assistants. Although the Institute holds property valued at $2,500,000, the high cost of its real estate and equipment makes it dependent chiefly on students' fees. The presidents of the Institute have been William B. Rogers, LL. D. (1862–70 and 1878–81), John D. Runkle, LL. D. (1870–78), and Francis A. Walker, LL. D., 1881–97.

N. W. TYLER, *Secretary*.

Massage [Fr., deriv. of Gr. μάσσειν, to knead]: a mechanical method of medical treatment of the body, consisting chiefly in manipulation administered by the hand of a person trained to do this in a particular way. This form of treatment is sometimes confounded with what is known as the Swedish movement-cure, which, however, is not the same, as the latter involves active co-operation on the part of the patient. The history of massage has been traced through various stages of development to very early times. There can be no doubt that long ago rude and unsystematic methods of manipulating the body were practiced. For example, the early medical writers of India describe a sort of medical gymnastics. The Chinese also practiced something of this sort; and the very word "shampooing" is derived from a Hindu word, *chāmpnā*, which signifies rubbing or percussing the body in connection with the use of a hot bath. The Greeks evidently used something of this kind, for it is not only described in certain of their medical books, but seems to have been a common practice among athletes and warriors. After the fall of the Roman empire this mode of treatment seems to have been abandoned until near the end of the seventeenth century, after which time it was used more or less imperfectly until it was revived about the beginning of the nineteenth century by Peter Heinrick Ling, a Swede, and placed on a good medical and scientific basis, in connection with what is now known as the Swedish movement-cure, of which Ling was the originator. It was only about 1860 that massage, as it is now understood, was fully developed by Estradère. As now practiced, massage consists in several different processes. The French call the chief of these *effleurage* (stroking), *friction* (rubbing), *tapotement* (tapping), and *petrissage* (kneading). These are used by a trained person, and each process is subject to a large variety of modifications, which, in some institutions, are made the subject of prolonged study. Massage has been applied to the treatment of a large number of bodily disorders, both medical and surgical, and the range of its applicability is from mild hysteria to serious disorders of internal organs and fractures of the bones. It is used very extensively by medical men who treat nervous diseases especially, and usually in connection with prolonged bodily rest on the part of the patient, and the administration of simple food in large quantities. The successful use of massage depends upon several conditions: One is manual dexterity on the part of the manipulator; another is the selection of an appropriate form of massage for any particular disorder; another is the proper proportion of rest on the part of the patient to the passive exercise effected by the manipulator; and, finally, the combination of judicious psychical and medicinal treatment with massage. Massage does good by mechanically pressing out from the tissues material which needs to be removed or to have its natural flow accelerated; the first, in the case of inflammatory effusions; the second, in the case of imperfect circulation. Besides this, massage acts by provoking muscle-cells, and probably all cells, to greater physiological activity. Persons who administer massage as a calling are called *masseurs* (masculine), *masseuses* (feminine), or *massagists* (irrespective of gender). Interesting details in regard to the history and practice of massage may be found in the following works: Josef Schreiber, *Praktische Anleitung zur Behandlung durch Massage* (Vienna, 1888); M. Roth, *The Prevention and Cure of many Chronic Diseases by Movements* (London, 1851); Emil Kleen, *Handbook of Massage*, translated by E. M. Hartwell (Philadelphia, 1892).

CHARLES W. DULLES.

Massag'etæ [= Lat. = Gr. Μασσαγέται. Of doubtful etymology, thought by some to be the Magog of the Bible]: a tribe of doubtful origin inhabiting the steppes to the N. of the Jaxartes. According to Herodotus, it was with them that Cyrus of Persia went to war, and fell in battle, 529 B. C., their queen, Tomyris, having refused an offer of marriage made by Cyrus for the purpose of picking a quarrel with her. According to Ctesias, the war was with another tribe, and Cyrus died of his wounds after the battle.

Mas'sasoit: the chieftain of the Pokanoket or Wampanoag Indians, found by the colonists of Plymouth, Mass., living in their vicinity in 1621 as ruler of the territory from Cape Cod to Narragansett Bay. He made a treaty with the settlers at Plymouth, Mar. 22, 1621, and maintained friendship with them until his death. His permanent residence was in the present township of Warren, R. I., where he was frequently visited by commissioners from the neighboring settlements. He entertained Roger Williams for several weeks when banished from Massachusetts. He was supposed to be eighty years of age when he died in 1661. He left two sons, Wamsutta and Pometacom, called by the colonists Alexander and Philip. They succeeded him in the chieftainship, the latter being the celebrated "King Philip."

Massé, maă′sā′, Félix Marie Victor: opera-composer; b. at Lorient, Franec, Mar. 7, 1822; received his musical education at the Paris Conservatory, where he took the Grand Prix de Rome for composition in 1844. His first opera was *La Chanteuse Voilée* (1850), and his last *La Mort de Cléopâtre*, which was performed after his death. Between these he wrote many operas, the best known being *Paul et Virginie* (1876); *La Fée Carabosse* (1859); *La Reine Topaze* (1856); and *Les Noces de Jeannette* (1853). He was Professor of Composition in the Conservatory from 1866 till illness compelled him to relinquish it in 1876. He succeeded Auber as a member of the Academy of Fine Arts, and Félicien David as an associate of the Royal Academy of Belgium. D. July 5, 1884. D. É. Hervey.

Masséna, maă′sā′naa′, André, Duke of Rivoli, Prince of Essling, marshal of France: b. at Nice, May 6, 1758; began his career as a cabin-boy and afterward joined an Italian regiment in French pay, but left it in 1789, as his humble descent prevented him from obtaining a commission. After the outbreak of the Revolution, however, and the annexation of Nice to France in 1792, he re-entered the army; became chief of a battalion Aug. 1, 1792, and brigadier-general Aug. 22, 1793. His most brilliant exploits were his victory over the allied Austrian-Russian army at Zurich, Sept. 25, 1799, which freed France from invasion; the siege of Genoa in 1800, which he held for three months, though invested by an Austrian army and blockaded by an English fleet; and his valorous defense of the villages of Aspern and Essling during the battle (May 21, 1809) which saved the French army from total destruction. In 1810 he received the highest command in Spain, and drove Wellington back to the lines of Torres Vedras, in Portugal, but receiving no re-enforcement he was compelled to retreat into Spain, and in the spring of 1811 he resigned his command on acount of ill-health. In the events with which Napoleon's career closed he played no conspicuous part. D. Apr. 4, 1817.

Massenet, maă′se-nā′, Jules Émile Frédéric: opera-composer; b. at Montaud, near St.-Étienne, France, May 12, 1842; when nine years of age he entered the Paris Conservatory. His early life was a struggle with poverty, and he had to give up his music lessons, but tramped to Lyons, where a relative resided, who heard the boy's story and sent him back to Paris. In 1859 he took first prize. In 1863 his cantata *David Rizzio* won the Prix de Rome. Since then he has been a prolific composer, producing operas, oratorios, cantatas, orchestral suites, etc. His most famous works are the operas *Don César de Bazan* (1872); *Le Roi de Lahore* (1877); *Hérodiade* (1881); and *Le Cid* (1885); his oratorios or cantatas *Eve* (1875); *Marie Madeleine* (1873); *La Vierge* (1879); and his orchestral suites *Scènes Pittoresques*. D. E. H.

Mas'sey, Gerald: poet; b. at Tring, Herts, England, May 29, 1828, of poor parents; worked in youth in a silk-mill and as a straw-braider, and received a scanty education; went to London; published *Poems and Chansons* (about 1846); started in 1849 and became editor of *The Spirit of Freedom*, and was secretary of the Christian Socialists, a co-operative society; was placed upon the civil list with a pension in 1863. He has published several volumes of poems and some prose works, among which are *Robert Burns, and other Lyrics* (1859); *Havelock's March, and other Poems* (1861); and *A Tale of Eternity, and other Poems* (1870); *Concerning Spiritualism* (1872); *My Lyrical Life* (1889); is a frequent contributor to periodical literature, a popular lecturer, and an earnest believer in Spiritualism.

Massicot: See Lead.

Mas'sillon: city; Stark co., O. (for location of county, see map of Ohio, ref. 3–H); on the Tuscarawas river, the Ohio Canal, and the Cleve., Lorain and Wheel., the Penn., and the Wheel. and Lake Erie railways; 65 miles S. of Cleveland. It is in an agricultural, coal-mining, and sandstone-quarrying region; has water, sewerage, gas, electric-light, and electric street-railway plants, three white sandstone quarries, glass-works, stationary-engine works, flour-mills, rolling-mill, iron-bridge works, paper-mill, agricultural-implement works, and machine-shops; and contains 3 national banks with combined capital of $450,000, a private bank, and 2 daily and 6 weekly newspapers. Pop. (1880) 6,836; (1890) 10,092; (1900) 11,944. Editor of "Independent."

Massillon, maă′sē′yōn′, Jean Baptiste: pulpit orator; b. at Hyères, Provence, France, June 24, 1663. He studied under the fathers of the Congregation of the Oratory at Marseilles, and himself entered the order (1681). He resisted the wish of his superiors that he should give himself to preaching, distrusting his talents in that direction. He preferred the career of a scholar and teacher. Even after his first successes he hesitated, withdrawing for a time to the Trappist monastery of Sept-Fonts. He left it to become director of the Seminary of St.-Magloire in Paris (1699). His lectures here had such signal success that he had to recognize his vocation. He preached a series of Lenten sermons at Montpellier in 1698 and in Paris in 1699. The latter made such an impression that he was appointed to preach at court during Advent of that year, and he was court preacher for Lent in 1701 and again in 1704. He pronounced funeral orations on Conti (1709), the Dauphin (1711), and Louis XIV. (1715). In 1718 he preached before the Dauphin, then preparing for his first communion, the ten sermons of his famous *Petit Carême*, formerly counted the best of his works. In 1717 he was made Bishop of Clermont; the rest of his life was spent in the duties of his bishopric; its literary fruits were the *Discours synodaux*. His last oration was that on the Duchess of Orleans, mother of the regent (1723). He entered the Academy in 1719. D. in Clermont, Sept. 18, 1742. Massillon's sermons are distinguished from those of his great predecessors both by their matter and their form. They give less place to dogma, whence the criticism that they lack religious fervor; but they are more constantly concerned with morals, and are more searching and accurate in their analysis of conduct and motive. In form they are wrought and polished with more studied art. His *Œuvres complètes* have been published by Jos. Massillon (13 vols., Paris, 1745); by Renouard (13 vols., Paris, 1810); by Abbé Guillon (16 vols., Paris, 1828); and by Abbé E. A. Blampignon (Paris, 1865–68; 4 vols., 2d ed. 1886). Cf. Abbé E. A. Blampignon, *Massillon d'après des documents inédits* (Paris, 1879). Many of his sermons have been translated into English, e. g. the funeral oration of Louis the Great (London, 1872) and selected sermons (2 vols., 1889–90; with a biographical preface).

A. G. Canfield.

Mas'singer, Philip: dramatist: b. at Salisbury, England, in 1584; studied at St. Alban's Hall, Oxford; went in 1606 to London, where it has been supposed that he became a Roman Catholic. His first play is the *Virgin Martyr* (1622). Only eighteen of his works are extant, the MSS. of several others having been carelessly destroyed. He excelled in the drawing of tragic character, in the dignity, refinement, and moral superiority of his sentiments, and in melody of expression. Among his best works are the *Duke of Milan* (1623); *Fatal Dowry* (1632); *A New Way to Pay Old Debts* (1633), which still keeps the stage; *A City Madam* (1659); *A Very Woman* (1655); and *The Picture*. D. Sept. 18, 1640. He was the associate of Fletcher and Decker. The best editions of his works are those by William Gifford (London, 1850), and by Hartley Coleridge (London, 1859).

Mass'mann, Hans Ferdinand: philologist; b. in Berlin, Germany, Aug. 15, 1797; studied theology at Jena and Berlin; became greatly interested in the athletic movement started by Jahn, taught athletics (*Turnen*) in various institutions, and finally studied German philology in Berlin. While professor at Munich and subsequently in Berlin, his attention was devoted to pedagogical reforms as well as to German philology. In the latter field he became known chiefly as the editor of old German texts and manuscripts, as, e. g., *Ulfilas* (1857); *Die Kleineren Sprachdenkmäler vom 8–12 Jahrhundert* (1839); *Denkmäler deutscher Sprache und Litt. aus Handschriften des 8–16 Jahrh.* (Munich, 1828); *Deutsche Gedichte des 12 Jahrh.* (1837), etc. Though a great enthusiast his philological work is lacking in accuracy and critical acumen. D. Aug. 3, 1874. Julius Goebel.

Masson, David: author; b. in Aberdeen, Scotland, in 1823. He was educated at Marischal College, Aberdeen, and at the University of Edinburgh. At twenty-one he went to London and became a contributor to the reviews and magazines. In 1852 he was chosen Professor of English in University College, London, a position which he resigned in 1865 to accept the chair of Rhetoric and English Literature in the University of Edinburgh. In 1859 he became editor of *Macmillan's Magazine*; and since 1879 has been editor of the Registry of the Privy Council of Scotland. His great work is his exhaustive *Life of John Milton* (6 vols., 1858–79). Among his other publications are *Essays, Biographical and Critical* (1856); *British Novelists* (1859); *Drummond of Hawthornden* (1873); *Wordsworth, Shelley,*

Keats, etc. (1874); *The Three Devils* (1874); *Chatterton* (1874); and an elaborate edition of Milton (3 vols., 1874).
H. A. Beers.

Masson, Louis François Roderick: statesman; b. at Terrebonne, Province of Quebec, Canada, Nov. 7, 1833; was educated at the Jesuit College, Georgetown, Md., and College of St. Hyacinthe, Province of Quebec; and was admitted to the bar in 1859. He sat for Terrebonne in the Dominion Parliament 1867–82; was Minister of Militia and Defense 1878–80; President of the Council 1880; lieutenant-governor Province of Quebec 1884–87; and was appointed to the Senate in 1890. He has been mayor of Terrebonne; was promoted lieutenant-colonel of militia 1867; and created a commander of the papal order of Gregory the Great 1888; is author of *Les Bourgeois de la Compagnie du Nord-Ouest* (2 vols., Quebec, 1890). Neil Macdonald.

Massō'rāh, **Māsōrāh**, or **Massōreth** [from Mod. Heb. *māsōrāh*, tradition]: the technical name given to a collection of grammatico-critical notes on the Hebrew text of the Old Testament, with the object of determining its divisions, grammatical forms, letters, vowel-marks, and accents. Tradition carries the origin of the *Masorah* back to the times of Ezra and the Sōferīm. The use of the Bible, especially of the Pentateuch, in the synagogue service, tended to draw the attention of teachers to its wording; and R. Akiba's method (which prevailed) of attaching importance to every single word and letter of Scripture enhanced the care with which the text was treated. It was necessary also to teach the text in the schools, and for this purpose divisions were made into paragraphs, sentences, and clauses. Two names, Nakkai and Hamnuna, are mentioned who went as far as to count the number of verses contained in the twenty-four books of the Bible. This was about the time of the persecutions of Hadrian. Later Masorites went further, counted the number of verses in each book, the number of times certain forms occurred, and determined the way in which words were to be pronounced which, for one reason or another, were not to be read in the synagogue as written. A late Talmudical treatise, *Massecheth Sōferīm*, busies itself partly with these matters. It was the Masorites who invented the signs for the vowels, the older Hebrew having been written only with consonants. In this they probably followed the example of the early Syrian grammarians. Their first attempts commenced early in the seventh century, and only undertook to distinguish words which were spelled with similar consonants. The whole system was developed, however, before the split with the Karaites in the ninth century. Its origin is probably to be found in Babylon, where a certain Pinchas is mentioned (eighth century) as being foremost in these studies. At the end of the century, Asher founded the school in Tiberias. There are two different systems of vocalization—the Tiberian, the one ordinarily found in our Hebrew texts, and the so-called Babylonian or Superlinear, which can be seen in the celebrated St. Petersburg *Codex of the Prophets* (917 A. D.) and in MSS. coming from Southern Arabia. The Masorites also invented a most elaborate system of interpunctuation, which served the double purpose of marking the connection between the different parts of a sentence as well as the musical value of each word in the cantilation used in the synagogue. The *Masorah* led the way to a grammatical treatment of the text, and furnished the material. There are three kinds of *Masorah*: *Masorah parva*, containing short glosses which were placed between the columns of the text of the Bible; *Masorah magna*, made up of longer notes placed upon the upper and lower margins. When this did not suffice the Masoretic notes were placed at the end of the different books (*Masorah finalis*). The *Independent Masorah* contains collected notes on words and passages which were put together in the form of books. The most important of these collections is the *Ochlah Wëochlah*. Our present Masoretic system goes back almost entirely to Aaron ben Asher (ninth century), the most prominent of the Masoretic scholars. He was the author of the *Dikdukē Hattëāmīm* (ed. by Bäer and Strack, Leipzig, 1879). His opponent, Moses ben Naftali, does not enjoy the same consideration. A *Masorah* was also provided for *Targum Onkelos*. See Targum.

Massowa: an important port on a little island of the Red Sea within hailing distance of the African mainland, hence its name from the Ethiopic, through the Arabic Medsaúa = to call; the Saba of Ptolemy (see map of Africa, ref. 4–G). It was obtained by the Turks in the seventeenth century, and Abyssinia's attempts to acquire it as a port always ended in failure. In 1885 Italy, taking advantage of Egypt's difficulties with the Mahdists, and with the connivance of England, seized Massowa, which is now her chief settlement and port in her African possession of Eritrea. The climate is excessively hot and unhealthful, but as the leading gateway from the sea to Abyssinia Massowa is capable of considerable development. Pop. about 12,000. C. C. Adams.

Mast [O. Eng. *mæst*; cf. Dutch, Germ., Swed., and Dan. *mast*, mast, perhaps cognate with Lat. *mā'lus*, mast, earlier **mādus* < Indo.-Europ. *mazdos*]: a nearly upright spar of wood, iron, or steel rising upward through the decks of a vessel for the purpose of affording attachment to the sails and rigging of a ship. The fir and pine of Puget Sound and Norway are of great repute as material for masts. Iron and steel masts are constructed upon several different systems. In all vessels of any considerable size each mast consists of several parts, of which the lowest is the mast proper, next the topmast, the topgallant mast, and the royal mast, and sometimes a sky-scraper, the highest of all. The foremost mast of a ship is the foremast; the central one, the mainmast; the one farthest aft, the mizzenmast; and the separate parts of each are distinguished as the fore-topmast, the main-topgallant mast, etc., by combining the name of each mast with the appropriate name of each part of a mast. Ships, barks, barkentines and some schooners have three masts. Brigs, brigantines, and schooners ordinarily have two masts. Many sloops, smacks, luggers, and other small craft have but one mast. Large seagoing steamers have often four, and sometimes five, masts.

Mastaba: the name applied by the Egyptian Arabs to the tombs of the nobles of the fourth, fifth, and sixth dynasties, which are found at Saqqarah, near Memphis. The name is derived from the ordinary bench found in front of Egyptian houses. Though presenting the appearance of truncated pyramids they were different in their origin, being probably an outgrowth of the cairns erected to mark the burial-places of prominent persons. In the earliest specimens, however, the sides were already formed of sloping masonry walls, and the tops were paved. In latter times their place was taken by rock-hewn tombs. The largest specimens date from the fourth dynasty; the best executed from the fifth; those of the sixth show signs of decadence. One hundred and thirty-three mastabas have been found at Saqqarah; the largest and best preserved is that of Ti, and is situated near the "Step Pyramid." They vary in size (170 × 86 feet to 26 × 20 feet) and height (13 to 30 feet), are rectangular, and have their longest direction N. and S. Like all Egyptian tombs, they were intended to insure the preservation of the mummy, upon which the hope of "living again" depended. The ordinary mastaba contained three essential features: the mummy-chamber and pit, the *serdab* (hollow space, or cellar), and the chamber of offering. The first was subterranean, cut in the rock directly beneath the chamber of offering, and was reached by a pit which was usually vertical (40 to 80 feet deep) located on the longitudinal axis of the mastaba a little N. of the center. After the mummy had been placed within, the entrance was walled up and the pit filled with large stones. The chamber of offering was in most cases on the east side near the southeast corner, and contained a sculptured table of offering. To the mural decorations, sometimes very beautiful, we owe much of our knowledge of the customs of the period. A fine example of such a chamber is in the Berlin Museum. Some of the expressions used show that the mastaba may have been constructed during the life of the occupant. The *serdab* was a hidden chamber inside the mastaba in which a statue of the dead was usually placed, to serve as the home of the Ka (*q. v.*). It was frequently connected with the chamber of offering by a small passageway, only a few square inches in size, by which the incense might reach the representative of

the dead, the hidden statue, and also as a means of egress and entrance for the Ka. A false door, intended for the exclusive use of the departed, is sometimes found near the northeast corner, corresponding to the entrance to the chamber of offering. Other mastabas which may date back to the sixth dynasty have been found in Nubia. CHARLES R. GILLETT.

Mastacembel'idæ [Mod. Lat., named from *Mastacembelus*, the typical genus; Gr. μάσταξ, mouth, jaw + ἐν, in + βέλος, dart]: a family of eel-shaped fishes of the order *Opisthomi*. The vertebræ are in large number (in *Rhynchobdella* 32 + 40); confined to Asia and West Africa, and best represented in the fresh waters of the East Indies. Under the name of "eels" they are esteemed by the British residents of India.

Master [from O. Fr. *maistre* > Fr. *maître* < Lat. *magis'ter*, of same root as *mag'nus*, great]: a name applied to various persons in positions of authority, and specifically used to designate an officer of the navy, the chief officer of a merchant vessel, and certain chief officers or functionaries of law courts, and of some other officials. Their titles, powers, and duties are here noted in brief. For MASTER AND SERVANT, see that title; for the use of master as a term of scholastic distinction, see DEGREES.

In the U. S. and the British navies the term *master* was used to designate the navigator or sailing-master. In the U. S. navy his grade was between that of an ensign and that of a lieutenant, and he ranked with first lieutenant in the army. The title was changed by act of Congress Mar. 3, 1883, to lieutenant (junior grade). In the British navy he was a line officer of the lowest rank, and his title is now navigating lieutenant, or staff commander.

MASTER OF A SHIP.—This is the technical legal term for the chief officer of a merchant vessel, having supreme command of the crew and the sole management of the ship, in common speech called the "captain." This office, with its peculiar legal functions, is very ancient: it is described in the *Laws of Oléron*, and in other maritime codes of the Middle Ages. The master is appointed by the owners of the vessel, and as an agent represents both them and the owners of the cargo. He is clothed with very great powers in respect to the ship, the cargo, and the crew, and when in foreign countries his authority to act for and to bind his principals exceeds that of any other regular commercial agent, and is almost unbounded, having, in general, authority to do anything that under the circumstances may be or seem necessary to complete the voyage, or save the property in his charge from destruction. For a full description of his powers, duties, and functions, see SHIPPING, LAW OF.

MASTERS AT COMMON LAW.—Formerly in Great Britain these were five masters or clerks on the plea side of the court of queen's (or king's) bench, the court of exchequer, and the court of common pleas, appointed by statute (7 Wm. IV. and 1 Vict. c. 30), whose duties were to tax costs, compute damages, attend the judges in court, etc. Under the judicature acts and subsequent statutes these officers with the same duties were attached to the branch of the high court of justice, representing the court to which they belonged, and they also transact much of the business at judge's chambers.

MASTERS IN CHANCERY.—These were originally appointed as assistants to the chancellor, who had the power of appointing them himself from the time of Edward IV. They were first called clerks, but afterward received the name master, in the reign of Edward III., and are a survival of a council of twelve chief clerks of the time of Richard II. The chief of the masters in chancery was called the Master of the Rolls. (See below). They were generally required to be learned both in the civil and the common law. Their principal functions, which they still exercise where the office is retained, were the hearing of references of causes, the taking of affidavits and acknowledgments, the examination of witnesses in certain cases (e. g. for the perpetuation of testimony), the taking of recognizances, etc. When a suit involved a matter of account, particularly if this were long and complicated, it became the usual practice to refer its settlement to a master. The masters also examined upon reference the propriety of bills in equity, and if report was made that a bill contained scandalous and impertinent matter, it was struck out. In order to enable him to perform his duties he was given certain powers of the court, such as to compel the attendance of parties and witnesses, etc. The report of the master in chancery is not final as a determination of the rights of the parties until it has been confirmed by a judicial order, and before this is done the parties are given an opportunity to make such objections as they may desire as to his findings, either of law or of fact. In England masters in chancery were abolished by statute (15 and 16 Vict., c. 80), and their duties are now largely performed by the chief clerks, commissioners to administer oaths, and taxing-masters (who tax the costs)—offices created by statute.

In the U. S. there are still masters in chancery so called in some of the States, and in those States, as New York, where they do not exist as such, the matters which were formerly referred to them in equity cases, accounts, questions of fact, etc., are referred to attorneys at law or solicitors, who are technically styled referees. In performing such functions they have much the same powers as were formerly given to masters in chancery. The form of procedure varies with the customs and statutory rules of the jurisdiction in which he is appointed.

MASTER OF THE ROLLS.—This officer was originally the chief of the masters in chancery (see above), having the keeping of the rolls and grants under the great seal, and the records of the court of chancery in England. He subsequently acquired judicial powers, which were fully established in the reign of George II. (3 Geo. II., c. 30), and was one of the judges before whom equitable causes could be heard in the first instance; but an appeal lay from an order or decision by him to the court of appeal in chancery, or to the lord chancellor. By the Judicature Act of 1873, s. 31 (previous to which he alone of all the judges was allowed to sit in the House of Commons), he was made the second judge of the chancery division of the high court of justice, and by that of 1875, s. 4, an *ex-officio* member of the court of appeal. Under the act of 1881 (Jud. Act., 1881, s. 2) he sits in the court of appeal only, but he still has the keeping of the records.

MASTERS IN LUNACY.—In Great Britain these are certain officers created by statute (16 and 17 Vict., c. 70), to whom are referred inquiries and matters connected with the persons and estates of lunatics. Their powers correspond in many respects to those of the commissioners in lunacy in some of the U. S., but are more extensive.

MASTER OF THE CROWN OFFICE.—This officer was the queen's (or king's) coroner and attorney in the criminal department of the court of queen's (or king's) bench, who prosecuted at the relation of private informers, and now, with the same functions, is made by statute one of certain officers called masters of the Supreme Court.

MASTER OF THE FACULTIES.—A term in Great Britain for an ecclesiastical officer under the archbishop who grants licenses, dispensations, etc.

MASTER OF THE HORSE.—The name in Great Britain for an officer of the royal household, subordinate in rank only to the lord steward and the lord chamberlain.

F. STURGES ALLEN.

Master and Servant: in law, persons who sustain such a relation to each other that one has the legal right to direct and control all acts done on his behalf by the other. Servant is a word of wide scope and variable signification. As a generic term it includes every one who performs authorized acts for another. This is the only sense in which it was used in early English law. An apprentice, a bondman, a wife, a child, a master of a ship, a bailiff, a factor, an attorney, an under sheriff—all were servants. Agent, as the designation of a distinct species of this class, did not come into use until late in the sixteenth century. At present, however, servant is often employed as a specific term. It frequently occurs in wills in the sense of domestic servants. In a great variety of statutes its meaning is confined to laborers, or servants of an inferior grade. And legal writers and judges often use it in contradistinction to agent to designate those who are expected to receive and bound to obey special directions of their employers, as distinguished from the other class, whose chief function is to institute contract relations between their principals and third parties, and who are allowed to exercise their discretion and to enjoy a considerable degree of personal independence in conducting the business of their principals.

In this article servant will be used in its generic sense, but no reference will be made to particular kinds of servants, such as agents, apprentices, and slaves, since they are treated of separately. Moreover, many of the rules given under the head of agent are applicable to all servants, and will not be repeated here. The present discussion therefore will be confined to the mutual liabilities of master and servant, and to their liabilities for wrongs to third persons.

Mutual Liabilities. (*a*) *Breach of Contract of Service.*—As the contract relation of master and servant is a personal one, it is terminated by the death of either, or by the continued sickness of the servant. Such termination is not a breach, however, as it is not attributed to the acts of the parties, but to the act of God. In case the servant breaks his contract the master may recover damages for the breach, and in exceptional circumstances may obtain an injunction against him. (*Toledo, etc., Ry.* vs. *Penn. Co.*, 54 Federal Reporter 746, where railway employees were restrained from engaging in a strike which was ordered to enforce a boycott against a connecting line.) When the master breaks the contract the servant may proceed, in most jurisdictions, in either of three ways: He may sue for the unpaid value of the services he has rendered, treating the contract as rescinded by the master's breach. Or he may sue at once upon the contract for such damages as he can show he will probably sustain by the master's breach of it. Or he may wait until the expiration of the term for which the contract was made, and sue for the actual damages which the breach has caused him. If he sues for damages, the master may show in reduction of his claim that he earned wages, or that he might have earned them by other like employment in the same locality.

(*b*) *Breach of Duty.*—The servant is bound to obey all reasonable instructions of his master, and to exert himself faithfully in promoting the master's interests. For a breach of such duties, causing harm to the master, the servant is liable to him in damages. Hence if the master is obliged to pay third persons for injuries done to them by the servant without his authority or ratification, the servant is liable over to him therefor.

On the other hand, the master is bound (1) to use reasonable care in providing a safe place in which the servant can work; (2) to take suitable precautions that all tools and machinery are free from discoverable defects, and are kept in proper repair; (3) to warn the servant of any danger that is not apparent or that is not fairly incident to the business; (4) to make, promulgate, and enforce such rules as are necessary for the reasonable protection of those engaged in his business; and (5) to use reasonable care in selecting and continuing superintendents and fellow servants. For the breach of any of these duties, causing injury to a servant, an action in tort will lie to recover the damages sustained. If these duties have been fairly performed, and the injury results from the negligence of a fellow servant, the master is not liable.

(*c*) *Fellow Servants.*—This exception to the general rule—that a master is liable for the torts of his servants within the scope of their authority—is quite modern. It was first announced in England in the case of *Priestly* vs. *Fowler* (3 *Meeson* vs. *Welsby*, 1, A. D. 1837), and in the U. S. in *Murray* vs. *South Carolina Ry.* (1 McMullan (S. C.) 385, A. D. 1841). The courts of Scotland rejected it until the House of Lords forced its acceptance upon them by the decision in *Wilson* vs. *Merry* (Law Reports, 1 Scotch and Divorce 326, A. D. 1868), and it has no recognition upon the continent of Europe. In a number of the U. S. it has been greatly modified by statute. The reason assigned for the exception is that "a servant, when he engages to serve a master, undertakes, as between himself and his master, to run all the ordinary risks of the service, including the risk of negligence upon the part of a fellow servant, when he is acting in the discharge of his duty as servant of him, who is the common master of both." In applying this doctrine great difficulty has been experienced in determining who are fellow servants and what is a common employment.

In order for two persons to sustain the relation of fellow servants they must have a common master. Hence one employed by an independent contractor on a building is not the fellow servant of another working by his side on the same building, but employed directly by the owner. If persons having a common master are engaged in a common employment they are fellow servants, although they do not work in company, nor have an opportunity to control or influence each other's conduct, and are engaged in different departments of duty; for example, the carpenter, the porter, and the stewardess of a steamship; but their departments of duty may be so distinct that their employment can not be considered a common one, although they are engaged in promoting the business interests of the same master. Accordingly, it has been held that the captains of two ships which are owned by the same person, while carrying on his business, are not necessarily within the fellow servant exception to the master's liability. The safety of one captain was not, in the natural and ordinary course of things, dependent on the care and skill of the other. The injury of either by the negligence of the other was not an ordinary risk of the service. (The Petrel (British, 1893), 1 Reports 651.) Their relations are quite different from those of engineers or conductors of different trains on the same railway, where the risk of injury to one is the natural and necessary consequence of misconduct in the other. *Van Avery* vs. *Railway Co.*, 35 Federal Reporter 40.

According to the view which prevails in Great Britain and generally in the U. S., the relative rank of servants is immaterial. Employees do not cease to be fellow servants because the master has given to one the control over another while engaged in the common service, and he does not become liable for injuries sustained by an inferior servant through the negligence of his superior; but, as we have seen, the master owes certain duties to all his servants. If one of them is injured by reason of the master's failure to perform any of the five classes of duties mentioned above, he is liable for the damages resulting therefrom. He can not escape responsibility by delegating any of them to a servant. One to whom such a duty has been delegated is often called a vice-principal, and his negligence in its performance is the master's negligence. It is the nature of the negligent act, and not the rank of the actor, that determines the master's liability. (*Baltimore, etc., Ry.* vs. *Baugh*, 149 U. S. 368.) In a number of the U. S. the courts take a different view, and hold that where one servant is placed by his employer in a position of subordination to the orders and control of another, the master is liable for injuries sustained by the negligence of the superior. See the dissenting opinion of Justice Field in the last-cited case.

Liabilities to Third Persons.—The servant is liable to third persons for any wrong he does them, although he acts in obedience to his master's commands. His contract of service can not be invoked against an injured party as an authority to commit a tort, and, if he knew the act was wrongful, he can not obtain any indemnity from his master. The master is also liable if the servant's tort was committed "in furtherance of and within the scope of the business with which he was trusted." Even if the relation of master and servant did not subsist at the time of the wrongful act the master may make himself liable therefor by ratifying it. See RATIFICATION.

This extraordinary liability of the master is thought by some writers to be the "remnant of the obsolete institution" of slavery, and to require "men daily to pay large sums for other people's acts, in which they had no part and for which they are in no sense to blame." (Holmes, *The Common Law*, pp. 16, 17, 230.) Undoubtedly the primitive law of our Germanic ancestors held the master absolutely liable for the wrongs of his slaves or of his free servants; but this doctrine suffered a radical modification during the early common-law period, so that by the sixteenth century the established rule seems to have been that the master was liable only for the servants' torts which he was proved to have commanded or assented to. Apparently the rule was found to relieve the master unduly, and a reaction set in during Lord Holt's time, which has continued to our day, resulting in his present stringent responsibility. (See *Responsibility for Tortious Acts*, by Prof. John H. Wigmore, 7 Harvard *Law Rev.*, pp. 315, 383, 441.) Probably no better reason for the existing rule can be given than that offered by Chief Justice Shaw when he declared it "is obviously founded on the great principle of social duty that every man in the management of his own affairs, whether by himself or by his agents or servants, shall so conduct them as not to injure another; and if he does not, and another thereby sustains damage, he shall answer for it."

Independent Contractor.—This responsibility, however, does not ordinarily extend beyond the acts of servants. If a person employs another to do work for him in the capacity of an independent contractor he will not be liable for the other's torts save in exceptional cases. Nor should he be liable, for he does not retain the power of controlling the work. Whether such power is retained in a given case is often a difficult question; but where it is not retained, where the one employed undertakes to produce a given result and is free to use his own discretion in the manner of accomplishing it, he is an independent contractor; the business is his business, and a person injured by his conduct of it can not look beyond him for redress. (*Casement* vs. *Brown*, 148 U. S. 615.) If, however, the work to be done by the contractor is

unlawful, such as tearing up a street pavement and obstructing travel without authority; or, though it be lawful, if its performance necessarily will bring wrongful consequences to pass, unless guarded against, the employer is bound to respond for the contractor's torts precisely as he is for similar torts by his servants.

Who is the Master?—In some cases this question is a troublesome one, for the servant doing the harm, although selected and paid by one person, is engaged upon the work of another. The owner of a crane and employer of the man in charge of it hired them to another, who used them in loading his vessel. By the negligence of the servant injury was done to a third party, and the question was who must respond as master for this servant's wrong. On the one hand it was argued that he was liable who chose and had the right to discharge him. On the other, it was claimed that he was the master, who had the right, at the moment, to control the doing of the wrongful act. The court took the latter view, and this appears to be the correct one. It follows that a person may be the servant of one in a particular matter, though he is at the same time the general servant of another. He may have two masters at the same time, but not as to the same act; and the test of responsibility for a servant's act is the right to control it. (*Donovan* vs. *Laing* (1893), 1 Queen's Bench 629; *Wood* vs. *Fiber Co.*, 154 Mass. 419.) If a stranger interferes and directs a servant to do an act which causes injury, he will be liable, not as a master, but as the procurer and cause of the wrong.

Scope of Employment.—When the servant's wrongful act is specifically ordered by the master, or is the natural and probable consequence of his orders, he is clearly liable. He is also responsible if the act was done in furtherance of and within the scope of the business intrusted to the servant, and it will not matter that the employer has forbidden the particular act, and that it can not benefit him in fact. Accordingly, an omnibus-owner who had instructed his driver not to obstruct other vehicles was held liable for the damage done to another omnibus by his driver's pulling across the road in front of it and causing it to upset. If the master has given to the servant discretion to act in an emergency, the latter's decision will bind the former; as where trainmen eject a passenger without cause. He is also liable for the willful misconduct of the servant, provided it is within the scope of his employment, but not for wrongful acts done exclusively for his private ends. It was therefore held that a railway company must pay damages to one who was kicked by a brakeman while attempting to board a car, but not to one who was pursued by a conductor, caught, and carried off on its train. The difficulty in these cases is not in ascertaining the rule of law to be applied, but in determining, as a matter of fact, whether the servant's wrongful conduct is a part of his master's affairs. Although the master is liable to third persons for his servants' torts within the limits above described, he is entitled to reimbursement by the servant for any damages he is compelled to pay because of such torts, unless they were authorized or have been ratified by him.

Statutory Changes.—The common-law rules relating to master and servant have been modified to some extent by statute, but no attempt will be made to give the details of this legislation. One of its objects is to secure to workmen the payment of the entire amount of wages in money, unfettered by any promise, obtained by powerful employers, to spend any part at any particular shop or in any particular manner. (See the Truck Act, 1 and 2 Wm. IV., ch. 37.) Another is to reduce the hours of labor which a master can require of his servant. Still another object is the modification or abolition of the fellow-servant exception to the master's liability. See the English Employer's Liability Act of 1880, 43 and 44 Vict., c. 42; Georgia Code, §§ 2083 and 3036; Iowa Revised Code of 1880, § 1307; Rhode Island Public Statutes, 1882, c. 204, § 15; Alabama Civil Code of 1886, §§ 2590–92; Mass., chap. 270 L. of 1887, and chap. 359 L. of 1893; Texas, chap. 91 L. of 1893; Wood's *Master and Servant*; McKinney on *Fellow Servants.*

FRANCIS M. BURDICK.

Mastersingers [trans. of Germ. *meistersinger*]: the poets and rhymers who, after the decline of the minnesong in the thirteenth century, were the chief representatives of the poetic art in Germany for more than two centuries. Believing that poetry was an accomplishment that could be acquired by precept and diligent practice, they organized during the fifteenth century into regular guilds or schools, with statutes resembling those of the contemporary trade-unions. We may thus distinguish two periods in the history of the mastersong, a period previous to the organization into guilds, and a period following this organization. Concerning the former period and the origin of the mastersong we are poorly informed. The legend invented by later mastersingers, according to which twelve old masters were the founders of their art, is without the least historical foundation. Instruction in the technical requirements of poetry, i. e. in metrics and music, certainly existed in the times of classical minnesong. It was reserved, however, for the last representatives of the minnesong, who took special pride in the artificiality of their verse-structures, to systemize this instruction. Many of the last minnesingers were not of noble birth, and it is highly probable that with the appearance of democracy in the ranks of the poets the element of pedantry was ushered in also.

Numerous signs and facts point to Mentz as the oldest seat of the mastersong. Here we find at the close of the thirteenth and at the beginning of the fourteenth centuries Frauenlob (d. Nov. 29, 1318), a talented but extremely vain and artificial poet, who seems to have gathered around himself apprentices in the poetic art. Not only may we infer this from a picture which accompanies his poems in the famous Heidelberg (former Parisian) manuscript, but also from the influence which his poetry doubtlessly exerted on the later mastersingers. The religious and theological contents of most of the mastersongs, their fruitless versified speculations concerning the Trinity, the Immaculate Conception, and other problems of mediæval scholasticism may more or less be traced back to Frauenlob's example.

Mastersinger schools similar to that of Mentz were gradually established in the cities along the Rhine, like Worms, Strassburg (1493), and Freiburg, where the thrift of commerce and the awakening of the spirit of independence among the citizens had also given rise to the demand for higher education. All of these schools seem to have been highly conservative in spirit, for they did not allow their members the invention of new metrical measures, but restricted them to the use of the metrical models of the "old masters." During the fifteenth century a mastersinger, by name Nestler von Speier, introduced, however, a new measure (*Ton*), thereby causing a break with the traditions of the Mentz school, and the establishing of more schools in the interior of Germany. Simultaneously with this event, which meant the development of a greater freedom of spirit among the mastersingers, a more strict organization into guilds or associations must have taken place. As the leader of the younger and more progressive generation of mastersingers, we may consider Hans Folz, a poet from Worms. He took the part of Nestler in the latter's conflict with the Mentz school, ridiculed the conservatism of the old masters, and founded a new school in Nuremberg, which soon developed into the most prominent in Germany. For in this school Hans Sachs, the greatest of all the mastersingers, received his earliest instruction in the art of poetry. In him the mastersong could finally claim a real poet of national reputation, though we of modern times do not find the true greatness of Hans Sachs in his mastersongs. With the rise of humanism in Germany and the subsequent development of new poetical ideas the mastersingers are gradually lost to sight. Still, their guilds continued to exist in the seclusion of some of the small German cities up to the nineteenth century, the last of the guilds being formally dissolved by the twelve masters of Ulm in 1830.

In his masterly essay *Ueber den altdeutschen Meistergesang*, Jacob Grimm has demonstrated beyond doubt that the mastersong, from a metrical point of view, was the continuation of the minnesong. Concerning the metrical rules of the later mastersong, the customs and regulations which were observed by the guilds, we are excellently informed by the so-called *Tabulaturen* as they were published by Puschmann, *Gründlicher Bericht des deutschen Meistergesangs* (1573), and by Wagenseil, *Buch von der Meistersinger holdseliger Kunst* (1697). The general character of the contents of the mastersong has already been partly described. Its theological abstruseness and didactic dryness repel a reader of the present day. In spite of its fossilized appearance we must not forget that in times of general mental decay and poetical decline these guilds preserved at least the faint memory that poetry should be an art.

Goedeke, *Introduction to Dichtungen von Hans Sachs* (1883); Martin, *Die Meistersänger von Strassburg* (1882); Plate, *Die Kunstansdrücke der Meistersinger*. JULIUS GOEBEL.

Mas'tic [viâ Fr. from Lat. *mas'tiche, mas'tice*, from Gr. *μαστίχη*, mastic, apparently deriv. of *μαστάζειν, μασᾶσθαι*, chew]: a valuable gum-resin used as an ingredient of many varnishes. By itself it is transparent, tough, brilliant, and delicate, and is often employed in finishing maps and paintings. It is obtained from cuts in the bark of *Pistacia lentiscus, P. atlantica*, etc., shrubs of the order *Anacardiaceæ*. It comes from Barbary, the Levant, and especially from China. It has a limited use in medicine and in dentistry and in mounting objects for the microscope.

Mastication: the act or process of chewing, as of food. It is a complex co-ordinated muscular act which depends upon the activity of nerve centers in the brain, whose performances are guided by sensations generated in the sensory nerves distributed to the membrane lining the mouth, to the teeth, and to the muscles of the jaws and cheeks. The food is moved in various directions and mixed with saliva by means of the tongue chiefly, and is kept between the teeth by the opposing actions of the tongue on the one side and the lips and cheeks on the other.

Mastication is accomplished by the teeth of the lower jaw being brought with a cutting or grinding motion against those of the upper jaw. The movements of the lower jaw are of three kinds: vertical, lateral, and fore-and-aft, the first having for its object the cutting and laceration of the food, and the last two its grinding and comminution; consequently we find that the types of movement in different species of animals depend upon the nature of the food upon which the animal lives. In man mastication is performed by vertical and lateral movements, for although he possesses the power of fore-and-aft motions, they are not used in chewing. The upward movement is effected by the temporal, masseter and internal pterygoid muscles, and the downward movement by the weight of the jaw, which may be reenforced by the digastric, mylohyoid, geniohyoid, and certain other small muscles connected with the hyoid bone, and the platysma. The lateral movements are due to the alternate contractions of the external pterygoids. In herbivora the movements are lateral, having for their purpose the grinding of the pieces. In carnivora they are vertical, accomplishing nothing more than tearing and lacerating. In rodents they are fore-and-aft, combined with the vertical. The type of movement in mastication in any animal can be told with considerable accuracy by the nature of the teeth —in animals in which the movement is of the vertical character the teeth are chiefly pointed and wedge-like, as in the cat, and are especially adapted for cutting and tearing; in those in which the lateral type is marked the teeth are chiefly of the molar variety, having large, irregular surfaces which render them particularly useful for grinding, as in the cow; while in those in which we find both up-and-down and lateral movements both varieties of teeth are observed. Rodents and other species exhibit other peculiarities, which depend upon the nature of the food upon which they subsist.

During mastication the food is mixed with saliva which is poured into the mouth as a result of a reflex excitation of the salivary glands, and is moved to and fro by means of the intricate movements of the tongue so as to bring the particles between the teeth. After the jaws have been brought together the tongue, cheeks, and lips conjointly collect the mass and again get it in position to be chewed, and so the operations are repeated until a sufficient degree of comminution is accomplished. The tongue then gathers the mass and molds it in the form of a bolus. The tip of the tongue is now brought against the roof of the mouth, and the bolus lying in the hollow of the tongue is gradually forced back to the pharynx, as more and more of the tongue is brought against the roof of the mouth until it reaches the isthmus of the fauces, when various muscles are successively brought into operation and the bolus is swallowed. As a rule, but one side of the mouth is engaged in chewing at any given time; after a while the labor is shifted to the other side, and so on alternately. Most people habitually chew upon one side more than upon the other.

The degree of pressure which is exerted by the lower jaw is regulated by the sensations imparted by the extremely sensitive nerves of the teeth and muscles of the lower jaw; the degree of comminution of the food is afforded us by sensations coming through the same nerves distributed to the mucous membrane of the tongue.

While mastication is a voluntary act it is carried on almost automatically after it is started, the process being guided by the sensory impulses as above noted.

The object of mastication is to prepare the food for the actions of the digestive juices. In carnivora mastication is relatively of little value, owing chiefly to the comparatively small amount of non-digestible matter taken in the food, but in herbivora and omnivora it is essential that mastication be carried to a high degree in order that digestion can take place with proper speed. Food that is not properly chewed is far more difficult of digestion than that which is. The evil effects of bolting the food are only too frequently illustrated in the prevalence of dyspepsia. Graminivorous birds, which swallow seed, beans, etc., whole, ingest pebbles, small pieces of glass, etc., with their food, which by the aid of the powerful muscles of the gizzard gradually grind the food, and thus mastication is practically accomplished in the stomach. EDWARD T. REICHERT.

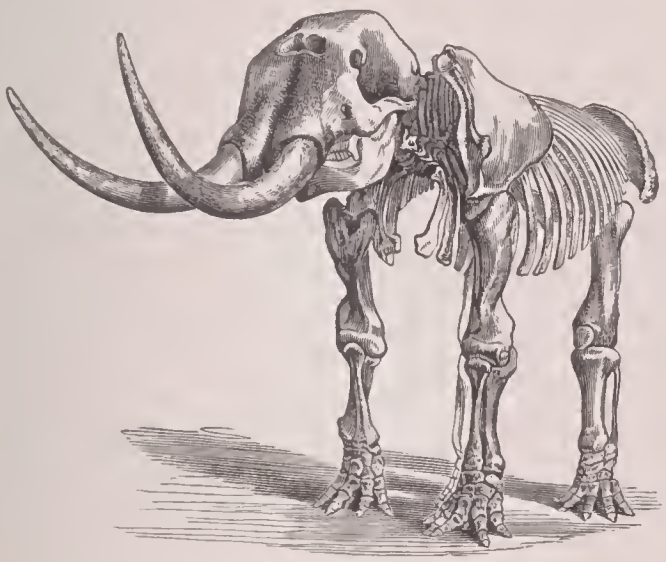
Mastiff [M. Eng. *mestif* = O. Fr. *mestif*, mongrel, apparently from a deriv. of Lat. *mixtus*, but cf. also O. Fr. *mastin* > Fr. *mâtin* < Lat. **mansueti'nus*, tamed dog; the word may have also been influenced by prov. Eng. *masty*, big, big dog, connected with *mast* fruit, food]: a name applied to several distinct breeds of large watch-dogs. The old English and Irish mastiffs (breeds which are unfortunately now nearly extinct) resemble the bulldog in courage and strength, but excel him in magnanimity, faithfulness, and affection for man. The mastiff should have a massive head, broad forehead, short muzzle, and small pendant ears. The neck should be muscular, chest full, legs straight. The hair should be short, the color fawn with black muzzle and ears. The tendency nowadays seems to be to breed this dog with a smaller head and muzzle than formerly. (See DOGS.) The Tibet mastiff, from Central Asia, is one of the largest of the dog tribe. He is bred both as a sheep dog and as a defender of the house. The so-called Cuban bloodhound is really a mastiff of Spanish origin, but in ferocity and bloodthirstiness appears to excel all other breeds.

Revised by F. A. LUCAS.

Mas'todon [from Gr. *μαστός*, breast, nipple + *ὀδούς, ὀδόντος*, tooth. Named from the conical projections on its molar teeth]: name of a genus of Tertiary and Quaternary quadrupeds of large size, belonging to the order *Proboscidea*, and closely related to the elephant and the mammoth. They are distinguished from those animals principally by the more simple structure of the crowns of the molar or grinding teeth. These teeth, according to Owen, are seven on each side, above and below. The first two, at least in the upper jaw, are followed by vertical successors, but the remaining teeth displace one another from behind forward, usually not more than two of each series being in use at one time, or eight in all. The molar teeth have wedge-shaped, transverse ridges, and the summits of the ridges are divided by a depression lengthwise with the tooth, and further subdivided into smaller cones, more or less resembling the teats of a cow, whence the name, meaning "nipple-tooth." The form of these teeth is of peculiar interest, as being intermediate between those of ordinary herbivorous animals and the complex teeth of the elephant. In the common American species, *M. americanus*, the posterior molars are crossed by three to five such ridges, the last molar above and below being subject to some variation; but in the three teeth preceding the last there are three such ridges, and this form was taken by Dr. Falconer as the type of his sub-genus *Trilopodon* (three-crested). *M. longirostris* of Europe has four such ridges on the corresponding teeth, representing his sub-genus *Tetralophodon* (four-crested). *M. sivalensis* has five ridges, while another group, considered by that author as intermediate between *Elephas* and *Mastodon*, and named *Stegodon*, has six or more such crests. These ridges are built up of dentine or the bony substance of the tooth, and covered by a layer of enamel. The fangs and base of the tooth are further covered by a coating of cement, which in the typical *Mastodon* extends only in a very thin layer over the enamel of the crown, while in *Stegodon* it is present in considerable quantity in the valleys between the crowded ridges. In the elephant the same process has been carried still further. The ridges of dentine coated with enamel have become numerous, thin, and proportionally high, and the intervals are filled with cement, which also invests the whole crown of the tooth. As such a tooth becomes worn by use the grinding surface will present a series of ridges of enamel crossing the tooth,

and uniting with each other in pairs at the sides of the tooth, so as to inclose an elongated area of dentine. Each of these areas represents a section of a dentinal ridge, while between the areas, and continuous with the exterior of the tooth, is a layer of cement. Both the cement and dentine being softer than the enamel, will be worn into hollows alternating with ridges of that material.

The coarser teeth of the *Mastodon* indicated a coarser food than that of the elephant, and the remains of twigs and branches of trees, especially spruce and hemlock, found in the position of the stomach of some mastodon skeletons, have given very positive evidence as to the nature of their food. There were no canine teeth, but two of the upper incisors were developed in the form of tusks, like those of the elephant. These were also preceded by a pair of deciduous tusks, and in some species were provided with a band of enamel upon their surface. Shorter tusks were also present in the lower jaw of many and perhaps all of the species. These were early deciduous in the females, and in the males one, usually the right, was frequently retained. The skull was massive, but considerably lightened by air-cavities. The form and position of the nasal opening, as well as the shape of the nasal bones, indicate the presence of an elongated and flexible proboscis, and the necessity of such an organ is shown by the shortness of the neck, the vertebræ of which are much compressed longitudinally and



Skeleton of American mastodon.

flattened. All the vertebræ are short, with the neural spines of the thoracic region elongated. The *M. americanus*, the earliest and best-known species, has been very fully described under the name *M. giganteus* by Dr. J. C. Warren, the description being mostly drawn from a very perfect skeleton discovered in a swamp at Newburg, N. Y. This skeleton measured 11 feet in height, and 17 feet in length to the base of the tail. The entire length of the tusk is 10 ft. 11 in., about 2½ feet being included in the socket. The fore foot measures nearly 2 feet across. The bones were massive compared with those of the elephant. When alive this animal must have been 12 or 13 feet high, and, including the tusks, about 25 feet long. Other skeletons more or less complete have been discovered in Orange co., N. Y., in New Jersey, Indiana, and on the banks of the Missouri, while isolated bones and teeth have been found in nearly all parts of the U. S. and in Canada. This species seems to have been confined to the Quaternary. At the same time there were living at least two species in South America, the *M. andium* and *M. humboldtii*, the former species extending into the southern parts of North America. From the Pliocene of Nebraska, Dr. Leidy has described a species, *M. mirificus*, smaller than *M. americanus*, and with a greater number of transverse ridges upon its molars. *M. obscurus* was first described from the Pliocene of Maryland, and remains of the same or a closely allied species have since been found in North Carolina, Georgia, California, and New Mexico. This species closely resembled the *M. angustidens* of Europe, and like that species was provided with a band of enamel upon the tusk. No American species are known earlier than the Pliocene, but in Europe *M. longirostris* and *M. tapiroides* are from the Miocene, and the explorations of Capt. Cautley and Dr. Falconer have made known several species from the Sewalik Hills of India, which are referred to the Miocene. Below that formation no species have yet been discovered. O. C. Marsh.

Masû'di, or **Al-Masûdi**, Ali-Abul-Hassan: b. at Bagdad about the close of the ninth century; received a brilliant education and spent many years in travel. The Mohammedan power and the Arabic language were then at their highest development, and Masûdi visited and described many regions which no writer of his race and creed had seen, including the shores of the Caspian, Persia, India (perhaps even China), Madagascar, Arabia, all the countries of North Africa, and Spain. His later years were passed in Palestine, Bassora, Antioch, and Damascus, and he died in Egypt in 956. His work, embracing the geographical and historical results of his travels, is the most celebrated of its kind in the Arabic language, and abounds in curious information illustrating the manners, morals, and beliefs of the time. It is styled *Meadows of Gold and Mines of Gems*, and is but an epitome of a larger work, now lost, called the *History of the Times*. The *Meadows of Gold* has been frequently printed, and one volume of an English translation was published by Dr. A. Sprenger in 1841 under the title *El-Masûdi's Historical Encyclopædia*. Other works of Masûdi are extant in MS., and several others have been lost. Revised by J. R. Jewett.

Masulipatam': maritime city of Kistna district, Madras, British India; at the mouth of a northern branch of the Kistna delta; 220 miles N. of the city of Madras; in lat. 16° 9′ N. (see map of S. India, ref. 4–F). It is the center of a manufacture of textile fabrics, which are, however, being crowded out by English ones. It is also the center of the Christian missions in the Telugu country. The port is being gradually silted up, and is now accessible only for native craft. The city is in marked decadence. The French possessed the city from 1660 to 1669, and there still remains a small patch of French territory (22 acres) in the city, where a market is held, besides two or three small patches outside. In 1864 a terrible storm passed over the city, causing enormous destruction and the loss of 30,000 lives.
Mark W. Harrington.

Mat, **Maa**, or **Mait**: an Egyptian goddess, "daughter of Ra" the sun-god, "eye of Ra," "mistress of heaven, queen of earth, mistress of the nether world," "queen of gods and goddesses." She was sometimes represented as the wife of Thoth (*q. v.*), and was regarded as the impersonation and goddess of truth and justice. In this capacity she had the higher grades of judges as her priests, and the chief judges wore her image suspended about their necks as the insignia of their office. In the judgment scene in Amenti (see Ritual of the Dead) she is represented as weighing the heart of the departed against the symbol of truth. Her sign was the ostrich feather, which she wore upon her head when standing, and sometimes upon her knees when in a sitting posture. Charles R. Gillett.

Mat, or **Matting** [O. Eng. *meatte*, O. H. Germ. *matta*, from Lat. *mat'ta*, rush-mat]: a coarse textile fabric made by weaving grasses, rushes, palm-fiber, bark, and the like, and used for summer floor-covering, for packing furniture and other goods, as material for bags, as covering for hotbeds and cold-frames in gardens, etc. In rude nations matting is used instead of sailcloth. Vast quantities of "bass matting," made from the inner bark of the European linden-tree (*Tilia*), are made in Northern Russia. Nearly all kinds of Russian exports are packed in this material, which has an extensive sale. Chinese or Canton matting is made from rushes, as are the excellent mats of the Japanese. The Mauritius exports sugar and grain packed in mats, which are made of the leaves of a tree. The beautiful India matting is woven from a sedge, the *Papyrus pangorei*. In Portugal and Spain very handsome mats are made from Esparto grass and reeds. Mats are also made from coir or cocoanut and other palm-fibers. These are used for covering the floors of public halls, and are very durable. The Japanese make mats so soft and elastic that they are used as bedding.

Matabeles, The: See Kaffraria.

Matagal'pa: city of Nicaragua; capital of the department of Nicaragua; situated nearly in the center of the republic, on a platcau surrounded by mountains, about 3,500 feet above the sea (see map of Central America, ref. 5–H). It is in a rich agricultural district, and is growing rapidly. Pop. about 10,000. The department has an area of 7,100 sq. miles and a population of 40,000. H. H. S.

Matamata': the native name, adopted as the common and specific name of a curious fresh-water turtle (*Chelys matamata*) from Northern South America, which has the

carapace raised into three rows of conical prominences, the neck broad and flattened, and the head wide and so depressed as to look as if actually crushed. The neck, which can not be withdrawn beneath the shell, bears along its sides little fleshy projections or fimbriations. The animal is about 2 to 3 feet long, of a dirty-brown color, and is sluggish in its movements. F. A. Lucas.

Matamo'ros (so named in honor of the patriot Mariano Matamoros; incorrectly written Matamoras): town; in the state of Tamaulipas, Northern Mexico; on the Rio Grande del Norte; 30 miles above its mouth and opposite Brownsville, Tex. (see map of Mexico, ref. 4–H). It is well built, and is the center of a rich grazing district. Near it there are gold mines of some importance. Matamoros, through its port Bagdad, near the mouth of the river, has had a considerable commerce, exporting horses, hides, etc., but this has been much hindered by the shifting bar of the Rio Grande. In 1892 it was reported that this bar was impracticable for vessels drawing 5 feet of water, though ordinarily it admits those drawing 10 feet or more. The city lies in the "free zone" (see Tamaulipas), and it is claimed that there is much contraband trade with Texas. The place dates from 1823. It was occupied by the U. S. forces under Gen. Taylor after the battles of Palo Alto and Resaca de la Palma, May 18, 1846, and was an important point during the struggles between the French and the Republicans in 1866. Pop. (1889) 13,000. Herbert H. Smith.

Matamoros Izúcar, or simply **Izúcar**: a town of the state of Puebla, Mexico, near the eastern base of the volcano of Popocatepetl, and 90 miles S. E. of Mexico city (see map of Mexico, ref. 7–H). It is in the center of a rich sugar region, and is connected with Puebla, and thence with Vera Cruz and Mexico, by railway. Rich deposits of iron and lead are reported from the vicinity. On Feb. 23–26, 1812, patriot forces in Izúcar repulsed an attack of the Spaniards. Pop. about 14,000. H. H. S.

Matamoros, Mariano: Mexican patriot; b. about 1770. He was a priest at Jantelolco, near Cuernavaca, and joined the revolutionary forces of Morelos in Dec., 1811. In the heroic defense of Cuautla (Jan.–Feb., 1812), he greatly distinguished himself. Sent to the relief of Bravo (Oct., 1813), he defeated Candano at San Agustin del Palmar (Oct. 14), this being one of the most signal victories gained by the patriots. Subsequently he shared in the repulse at Valladolid and the defeat at Puruaran (Jan. 5, 1814), where he was captured. Morelos's offer of 200 prisoners in exchange for him was refused, and he was shot at Valladolid Feb. 3, 1814; Morelos executed the 200 prisoners in reprisal. Mexican writers, especially Alaman, hold that Matamoros was the greatest military genius in the patriot forces, and claim that if his advice had been followed the war would have ended in the defeat of the Spaniards. Herbert H. Smith.

Matan'zas: a town and port of the northern coast of Cuba; on a bay of the same name; 52 miles E. of Havana, with which it is connected by railway (see map of West Indies, ref. 3–C). It is the second port in Cuba in importance, and has a large export trade, principally of sugar and molasses. The bay, though partly obstructed by shallows, is a good and safe port; it is defended by the fort of San Severino. The city is well built, mainly on heights overlooking the bay; it has a fine theater, government palace, an excellent educational institute called the Empreza Academy, etc. Three miles to the E. is the celebrated cavern of Bellamar, noted for its stalactites, and said to be 3 miles in depth. Matanzas was founded in 1695, and was destroyed by fire in 1845. It is the capital of a province of the same name. Pop. (1899) 36,374. Herbert H. Smith.

Matches [M. Eng. *macche*, from O. Fr. *mesche* (> Fr. *mèche*, wick) < Lat. *my'xa*, lamp-nozzle = Gr. *μύξα*, mucus, nostril, lamp-nozzle]: small sticks of inflammable material tipped with a substance yet more inflammable which can be ignited by friction.

The first matches of which we have any account were thin splinters of wood about 4 inches long tipped with sulphur. These were ignited, when live coals or other fire were not available, by means of a tinder-box and its copartners flint and steel. Fire was first communicated to the tinder by sparks of burning metal struck from the steel by the flint. Fire having been communicated to the tinder, the sulphur match could then be ignited. This method of obtaining fire was very inconvenient; sometimes the tinder, owing to dampness, would fail to ignite, or the steel would not respond to the stroke of the flint; at such times the usual recourse was to borrow fire from a neighbor, and in thinly settled regions miles were sometimes traveled for this purpose.

The discovery of phosphorus by Brandt in 1668 was first applied commercially as a means of obtaining fire by Godfrey Haukwitz, of London, who in 1680, under the direction of Robert Boyle, prepared and sold large quantities. It was used for procuring fire by rubbing small particles between the folds of brown paper, and a sulphur match was ignited from the resulting flame; but as phosphorus was both costly and dangerous this invention was not long employed. One of the best of the earlier inventions by which phosphorus was used for obtaining fire was the "phosphorus bottle." This was a small bottle in which a piece of phosphorus had been stirred with a hot wire, so as to coat the interior of the bottle with oxide of phosphorus; the bottle was kept tightly corked when not in use, but when a light was required the cork was withdrawn and a sulphur match was dipped in and thus ignited. This phosphorus bottle gave place to the so-called "oxymuriate matches," which were invented in 1805 by Chancel, of Paris. These consisted of splints of wood tipped first with sulphur and then with a mixture of chlorate of potash, gum, and sugar, colored with vermilion. These matches, when brought into contact with asbestos soaked in sulphuric acid contained in a small vial sold with them, immediately ignited. Such matches were very inconvenient to use in the dark, and an apparatus was devised for lighting them which could be put in action by pulling a cord; but this was expensive, not portable, and was more curious than useful. In the same year phosphorus matches were used in Paris, and in 1809 Derepas suggested the mixing of the phosphorus with magnesia in order to diminish the danger from such matches. Derosne is said to have made a friction match tipped with phosphorus in 1816; but the first really practical friction matches were made in England in 1827 by John Walker, a chemist of Stockton-on-Tees. These were called Congreves after Sir William Congreve, the inventor of the Congreve rocket. They consisted of wooden splints, or strips of cardboard, one end of each being first coated with sulphur, and then tipped with a mixture of sulphide of antimony, chlorate of potash, and gum. Each box was retailed at a shilling, and contained eighty-four matches and a piece of sandpaper, between the folds of which the match was drawn for ignition.

In 1830 a Mr. Jones, of London, patented the matches called Prometheans. These were made of a small roll of waxed paper having a minute glass globule of strong sulphuric acid coated with a mixture of chlorate of potash and sugar at one end. Ignition was effected by breaking the globule of acid, and its contents, acting upon the mixed chlorate of potash and sugar, produced fire.

Both the Congreves and Prometheans were endowed with many objectionable features; the former did not readily ignite, often the burning tip separated from the splint, and the fumes from the burning sulphur and antimony were offensive. The Prometheans were not popular on account of the danger from the acid and the explosive reaction at the moment of ignition; moreover, both were too expensive for extended common use.

These matches were supplemented by the original lucifer (Lat. *luciferus*, that which brings light) friction matches. These were made, for greater safety in transportation and use, in the form of wooden cards or combs having about a dozen teeth, each tooth being a match, which was broken off from the others when required for use. These matches were at first tipped with the same chemical composition as the Congreves, and were open to many of the same objections, but it was not long before phosphorus—of which the cost had been greatly reduced by improved methods of manufacture—was introduced as a component of the tipping composition.

Phosphorus friction matches were first manufactured on a commercial scale by Treschel, of Vienna, in 1833, but at about the same time such matches were also made at Moldenhauer, in Darmstadt, and for many years Austria and Southern Germany were the principal localities of the manufacture.

The work-people who prepare and apply the igniting composition are liable to necrosis of the lower jaw, called the "jaw" or "match" disease, or "the flute." The teeth decay and fall out, and then the decay extends to the jaw-bone, causing intense pain, which never ceases until an operation or death relieves the sufferer. It is said that cleanliness, ventilation, and careful attention to the teeth are almost

infallible preventives of the jaw disease. The discovery of amorphorus or red phosphorus, by Prof. Anton von Schrötter, of Vienna, in 1845, gave great hopes of immunity from the dangers arising from the use of common phosphorus, as the red variety is a perfectly innocuous substance; but notwithstanding this fact its use has not become general among manufacturers of matches. Red phosphorus is used in the manufacture of the well-known "safety matches" invented by Lundström, of Sweden, in 1855. These matches ignite only on the prepared surface which accompanies the box; this surface, and not the matches, contains the phosphorus required for ignition, making them less liable to cause accidental fires than the more common kinds.

Wax tapers, or vesta matches, are made by coating cotton wick with wax, and tipping them with igniting composition at one end.

Machinery is largely employed in the manufacture of matches, and the number produced annually is beyond computation; two European manufacturers are said to make (together) nearly 45,000,000,000 matches each year, and it has been roughly estimated that there are 200,000,000 matches consumed daily in Great Britain, or about eight per head of the whole population. Applying this estimate to the U. S., the daily consumption would be the enormous total of 520,000,000.

According to the census of 1880 there were 37 manufacturers of matches in the U. S., having an aggregate capital of $2,114,850, who disbursed in wages $535,911 per year, used $3,298,562 worth of raw materials, and produced goods valued at $4,668,446. W. F. Durfee.

Mate, maa'tā, or **Maté**, mă̆a-tā' [Span. *yerba*, or *yerba de mate*; the *mate* is properly the gourd in which it is prepared]: a name commonly given to the dried leaves and small shoots of *Ilex paraguariensis*, otherwise known as Paraguay tea. The plant is a small tree (10 to 20 feet), which grows in the highland forests of Paraguay and the neighboring parts of Brazil (Santa Catharina, Paraná, and Rio Grande do Sul); all modern attempts to cultivate it from the seed have failed. The Paraguayan mate is that best known in Europe, but a much greater quantity and better quality is obtained in Paraná. The product is gathered by special workmen who visit the forests, principally in June and July, that obtained in later months being inferior. The branches are cut off, passed through the flame of a hot fire, and the twigs stripped from the larger boughs are exposed for a day to the heat of a slow fire of aromatic wood; subsequently they are fully dried, broken into fragments, and packed in bundles bound in hides for the market. Often the product is adulterated with the leaves of inferior species of ilex, or even with plants of other orders. Mate is the common and popular beverage throughout the Platine states of South America, and, to a lesser extent, in Southern Brazil. In use it is placed in a gourd cup; boiling water is added, and the liquor is sucked through a silver or tin tube having an expanded and perforated end (*bombilla*). It is customary to pass the same gourd and bombilla to the different persons in a company, more water being added as needed. The gourds are often richly ornamented. The flavor of mate is quite unlike that of tea, but it is greatly enjoyed by those who have become accustomed to it. The physiological effects resemble those of coffee. See Couty, *Le Maté et les Conserves de Viande* (Rio de Janeiro, 1880). H. H. Smith.

Matehuala, mă̆a-tā-wàa'lă̆a: a city in the northern part of the state of San Luis Potosí, Mexico; near the frontier of Nuevo Leon; on the Matehuala Railroad (see map of Mexico, ref. 5–G). It contains many silver-reducing establishments, most of the ore being brought from the Catorce Mountains, though there are some mines in the immediate vicinity. Population about 15,000. H. H. S.

Matejko, mă̆a-tā'e-kō, Jan Aloysius: historical painter; b. at Cracow, Austrian Poland, July 30, 1838; studied at Cracow Art School and at the Vienna and Munich Academies; was awarded a first-class medal at the Paris Exposition of 1867 and a medal of honor at the Exposition of 1878; received the decoration of the Legion of Honor in 1870; became director of Cracow Art School in 1873. His pictures, many of large size, depict scenes from the history of Austrian Poland. D. Nov. 1, 1893. W. A. C.

Matera, mă̆a-tā'ră̆a: town; in the province of Potenza, Southern Italy; situated in a plain flanked by two deep valleys and surrounded by hills (see map of Italy, ref. 7–G). It contains several well-built churches and a remarkable chapel, San Pietro Barisano, consisting of three naves, the whole excavated in a single huge block of stone. This town suffered cruelly from wars and earthquakes during the Middle Ages. The present inhabitants are mostly agriculturists or shepherds. Pop. (1881) 15,700.

Material Cause: in ontology, the first of the four kinds of causes distinguished by Aristotle and accepted by later metaphysicians. As defined by him, the material cause of a thing is the physical basis of its existence—namely, the matter from which it was formed or developed; e. g. the block of marble from which a statue is carved. The material cause of a thing is thus partly, but not absolutely, identical with the thing itself (*das Ding an sich*). In the instance cited a portion of the material cause, or block of marble, must be eliminated in order to arrive at the semblance of the pre-existing type—i. e. the finished statue. See Matter.

Materialism [from Lat. *materia'lis*, deriv. of *mate'ria*, stuff, matter, matter as opposed to spirit.—originally, building material, timber, for **dmāteria*, connected with Gr. δέμειν, build: Goth. *timrjan*]: in general, the doctrine that nothing exists but matter with its sensible properties. It is opposed to idealism, the doctrine that nothing exists but mind. Spiritualism, which maintains the existence of mind or spirit as well as matter may be dualistic or monistic, in which latter case it becomes some form of idealism.

History.—Greek materialism led the way. The Greek philosophers, Leucippus, Democritus, and Epicurus, speculating upon the origin of the universe, posited an infinite number of atoms or refined particles of matter combining and recombining in mathematical proportions throughout space and time, until, after endless trials, all existing things have been produced. In these systems not only were solid objects, plants, and animals, regarded as mere masses of compounded atoms, but also the souls of men, which were supposed to consist of ethereal and luminous particles diffused like air or light through the body, and dispersed with it at death; and even the gods themselves were fancied as atomic beings or dream-like images in human form, dwelling in the interspaces between the worlds in happy indifference to the course of nature and the affairs of mortals. Roman materialism followed as little more than a reproduction of the Greek, and had its chief representative in Lucretius, who expounded the doctrines of Epicurus in a majestic philosophical poem, *On the Nature of Things*. Traces of Epicureanism are also to be found in the writings of Horace, Vergil, and other men of letters, but it did not maintain at Rome the high ethical character which it had claimed among the Greeks, having been so bitterly assailed by the Stoic philosophers that the very name has since remained a synonym for sensuous pleasure.

Italian materialism rose with the classical revival as a compromise between the dogmas of the Church and the speculations of the Alexandrian school of Aristotle. The leader of the movement, Pomponatius, until silenced by a decree of the Lateran Council, held the mortality of the soul, the necessity of the will, and the embodiment of God in nature, and subsequently the systems of Democritus and Epicurus were partially revived by Telesius, Campanella, and Magnenus, and at length fully sanctioned by Peter Gassendi, a French ecclesiastic, whose learned defense of Epicureanism as consistent with Christianity has caused him to be styled the father of modern materialism.

English materialism at the same time was opening new paths with greater boldness and freedom. Thomas Hobbes, in his work *Leviathan*, described the soul as a corporeal substance receiving ideas as material images, the state as an incarnation of absolute power, and God himself as but a name for the incomprehensible omnipotence of nature. In Hartley and Priestley the materialistic hypothesis began to receive the support from physiology which is in current discussion its main support.

French materialism grew out of the previous systems through the modification of the philosophy of Locke worked out by Gassendi. The Abbé Condillac, a disciple of the latter, illustrated the process of transforming sensations into ideas by an imaginary human being incased in marble and allowed to acquire successively the different senses and combine their impressions by acts of attention, memory, and judgment. It would seem to have been but a step further for La Mettrie, in his treatises *On Man a Machine* and *Man a Plant*, to reduce the mind to a perishable mechanism or organism. And at length the Baron d'Holbach, in his *System of Nature*, brought materialism to an ethical as well as theoretical climax, by not only denying the existence of

mind, freedom, and immortality, and maintaining the eternity of matter, the indestructibility of force, the immutability of physical law, but by assailing virtue, religion, and God as superstitious fictions. In Germany the newest phase of materialistic thought—the physiological—reached full statement by Büchner, Feuerbach, and others; and by those advocates of evolution, such as Haeckel, who find in it support for a positivistic or agnostic philosophy.

C. W. Shields. Revised by J. Mark Baldwin.

Contemporary Forms of Materialism.—The modern doctrines of materialism differ greatly from the older Greek and continental views, in being a new statement of the physiological doctrine begun by Hartley. Materialism has tended from the crude postulate of bulk matter as a metaphysical principle to a form of psychological doctrine which aims, by analyzing the mental functions into simple sensational elements, at showing their final dependence upon changes in the brain. The successive positions which modern materialism has taken show progress both in exactness of statement and adequacy of analysis. The problem which it now claims to answer is this: Given organized matter with the laws of conservation and uniformity, how may we account for thought? Thought, mind, is a function of nervous action.

Schiff's Experiments.—Much has been made of the experiments of Schiff, whereby he has shown that mental operations are accompanied by a discharge of heat. (*Archives de Physiologie*, 1870, p. 451.) Luys says (*Brain and its Functions*, pp. 78–79): "These experiments show us, on the one hand, that sustained intellectual work is accompanied by a loss of phosphorized substance on the part of the cellular cell in vibration; that it uses it up like an ignited pile which is burning away its own essential constituents; and that, on the other hand, all moral emotion perceived through the sensations becomes at the same time the occasion of a local development of heat." This may be perfectly true and yet valueless for the debate. Every one admits that there is a loss of phosphorized substance during thought; but this phosphorus is found passing off in the ordinary channels of the body (Byasson and Beaunis), and this latter fact is used by Luys to prove the passage of thought back into a material form. He says: "It (thought) uses it (phosphorus) up"; but phosphorus is also found passing from the body in the form of sulphates and phosphates and in increased quantities after periods of wakefulness and thought (Hammond), therefore (p. 70) these "serve as a chemical measure of the intensity of cerebral work done in a given time."

On either the materialistic or the spiritualistic hypothesis equally, a development of heat is possible during the play of intellectual processes. If mind and brain are distinct, and brain a necessary organ of mind, heat may be the equivalent in whole or in part of cerebral activity. In short, the evolution of heat means only that molecular change is going on in the brain. That there is no break in the continuity of brain processes is also strongly urged by Tyndall and Dubois Reymond, and stated by Fiske in these words, i. e. "The dynamic circuit is absolutely complete without taking psychical manifestations into account at all. No conceivable advance in physical science can get us outside of this closed circuit, and into this circuit psychical phenomena do not enter." (*Cosmic Philosophy*, vol. ii., p. 442.) If this be true, it is asked, how can the mind have any efficacy in directing or controlling the body?

Older View of "Mental Direction."—The common answer to this claim of the materialist is this: While the mind can not change the energies of the brain in quantity by adding to or subtracting from them, yet it can *direct* these energies in one channel in preference to another, just as an electrician directs his current on one wire or another without altering its strength. This answer is not adequate since it involves just as truly an exhibition of physical force to remove an obstruction or direct a current as to generate one. The modern materialist, who is also usually a physiologist, claims that the decision of the mind to direct the energies of the brain one way or the other is itself due to still earlier conditions of the brain. The mental determination is said to be due to an earlier physical change instead of the later physical change being due to the mental determination.

Late Physiological Views.—This last position is stated strongly by the French physiologist Marique, who attempts with others to show (*Recherches Expérimentales*, Brussels, 1885) that the brain is entirely a reflex organ; that the higher cerebral centers are in dynamic connection with one another, and that voluntary action and thought differ from reflex action and sensation only in their greater complexity and liability to delay. Maudsley works this view out, in its implications for psychology, in great detail. (*Physiology of Mind.*) This general position is now so well proved, as far as the brain processes themselves are concerned, that idealists no longer dispute it. The defense of Spiritualism against materialism is accordingly thrown further back, and the question asked: Granted uniformity of brain processes, are consciousness in general and the higher processes of thought by this sufficiently accounted for?

Late Idealistic Views.—The answer takes currently two forms in opposition to materialism: Some hold that the higher mental processes—thought, ethical emotion, volition, etc.—are not correlated to brain processes at all, i. e. go on without involving any brain action. This is held with reason to be directly disproved by cases of mental disease in which the loss of these higher mental functions is directly caused by lesions in the brain. The other answer to the materialists' claim at this point contends that consciousness with all that it is capable of doing is itself a fact no matter how the brain may work under it, and since all knowledge of science and everything else is dependent upon the use of the processes of consciousness, the problem as to which is the ultimate form of activity, mental or cerebral, must be decided on broader grounds than those purely psychological. The question at issue then becomes this: Granted a conscious process of thought and a brain process going on together, each for itself, how can we best explain man's personality as a whole comprising both these factors?

Thus thrown into metaphysics the materialist finds himself at the mercy of the idealist. (See Metaphysics.) The solutions, however, now most generally considered adequate, of the problem of mind and body and their relation fall under some form of *monism*, i. e. which holds that these two seemingly opposed things must after all be forms or manifestations of a deeper-lying First Cause or Ground which is one, and which in its nature must itself afford an adequate explanation of "man with all his mind." The two outstanding facts that seem to give adequate support to the view that this first principle of all things is mind are these: First, the nature of thinking as a reflective act involving a subject who sets himself over against his thoughts—what is usually called the fact of self-consciousness—and, second, the fact that all our knowledges get judged by us in a way which we call *ethical*, as worth more or less, some than others, and that we can not help judging those knowledges which involve self-consciousness and ideal things as worth more than the mechanical facts of objective science.

Materialism of Life.—As a metaphysical doctrine materialism has accordingly been practically abandoned in contemporary philosophy. It is now active as a theory only in psychology. In practice, however, what is called "materialism of life" was never more aggressively real. It is in fact rather to the absence of philosophy or of clear thinking and the desertion of high ideals of thought and conduct that this phrase has so common and so pertinent application in modern commercial, literary, and social life. When a man is filled up with material things, low aims, physical comforts, and indulgences, and "finds his meat and drink" in realistic situations, he is starving his thinking nature and blotting out his ideals. Better a man should think, even though he think wrong, than that materialism in this sense should paralyze his abilities and his endeavor. For references, see Metaphysics. The best single history and criticism is Lange, *History of Materialism.*

J. Mark Baldwin.

Materials, Strength of: See Strength of Materials.

Mate'ria Med'ica [Mod. Lat.; Lat. *mate'ria*, matter, subject-matter + *me'dica*, fem. of *me'dicus*, medical, of medicine]: a phrase used to designate the substances used in the practice of medicine; but as the art of the physician embraces the scientific use of articles in common vogue, as food and drink, and of moral and hygienic influences, fully as much as of drugs, it is plain that the term *materia medica* can not be used to designate a definite group of substances, but is simply a convenient phrase by which to refer to the weapons of the physician in general. So far as drugs are concerned, they are derived principally from mineral and vegetable sources, though some few are of animal origin. They are commonly classified according to their effects on the animal system in health or disease; but inasmuch as the majority produce an effect more or less complex, as these combinations of effects are almost endless, and as even

with the same drug the effect varies with varying circumstances of dose or state of the patient, it follows that an accurate division of medicines into groups on the basis of their effects on the living organism is impossible. Such terms as irritants, anodyne, astringent, etc., must be taken merely as defining a kind of effect. The meaning of these various terms and the uses of each drug will be found described under the individual headings. EDWARD CURTIS.

Materna, AMALIA: See the Appendix.

Mathematical Machines: See CALCULATING-MACHINE.

Mathematics [from Lat. *mathema'tica* = Gr. *ἡ μαθηματική* (sc. *τέχνη*, art), fem., and *τὰ μαθηματικά*, neut. plur. of *μαθηματικός*, pertaining to science or learning, especially to mathematics, deriv. of *μάθημα*, learning, deriv. of *μαθεῖν*, learn]: the science which reasons about the relations of magnitudes and numbers, considered simply as quantities admitting of increase, decrease, and comparison. It is divided into three great branches, arithmetic, algebra or analysis, and geometry; but in the extension given to the subject in modern times, these three branches merge into each other so gradually that no exact line can be drawn. Arithmetic is the branch which is concerned with the properties and relations of numbers, especially whole numbers; but when these relations are reasoned about, it is necessary to use algebraic symbols to express numbers, and thus the notation of algebra comes in. Algebra, or analysis, in itself reasons about quantity in general, expressed by means of symbols, without any relation to the particular kind of quantity. The distinction between algebra and analysis is not sharply drawn, at least in the English language. In French the term algebra is generally restrieted to the study of quantities supposed to be unehanged in value, while analysis comprises the study of quantities considered in the act of constantly varying, and therefore having no definite value. In the English language we commonly apply the term "calculus" to this subject. In modern mathematics algebra and geometry run together, because geometrical conceptions are found to be necessary in the development of algebra, while the theorems of the most advanced geometry can be expressed only in algebraic language. Thus arise extensive mathematical inquiries, in which the language and conceptions of the two are combined. S. NEWCOMB.

Mather, COTTON, D. D., F. R. S.: clergyman and author; son of Increase Mather and grandson of Rev. John Cotton; b. in Boston, Mass., Feb. 12, 1663; was trained by Ezekiel Cheever, and graduated at Harvard College in 1678; became a teacher, and in 1685 was ordained his father's colleague over the North church, Boston, having by persistent effort overcome an impediment in his speech; labored with great zeal as a pastor, endeavoring also to establish the ascendency of the churches and ministry in civil affairs. He was conspicuously connected with the witchcraft proceedings in Massachusetts. He was author of *Memorable Providences relating to Witchcraft* (1689); *Wonders of the Invisible World* (1693); *Essays to Do Good* (1710; Glasgow, 1838); *Magnalia Christi Americana* (London, 1702; Hartford, Conn., 1820; Boston, 1855), a very quaint and curious book, full of learning, piety, and prejudiee; and other works, large and small, numbering 382, not reckoning his *Illustrations of the Sacred Scriptures* and other unpublished writings. He was made D. D. in 1710 by the University of Glasgow, and F. R. S. in 1717. Mather, whatever were his faults, was a man of great excellence of character. He labored zealously for the benefit of the poor, for mariners, slaves, criminals, and Indians, opposed intemperance, and aided in introducing inoculation for smallpox. His eredulity was partly the fault of his age. D. in Boston, Feb. 13, 1728. His *Life* was written by Samuel Mather, his son (1729), by W. B. O. Peabody in Sparks's *American Biography*, also by B. Wendell (1882), and by A. P. Marvin (1889); also see W. F. Poole in *The North American Review*, Apr., 1869.
Revised by G. P. FISHER.

Mather, INCREASE, D. D.: b. at Dorchester, Mass., June 21, 1639; sixth son of Rev. Richard Mather (1596–1669); graduated at Harvard 1656, and at Trinity College, Dublin, 1658; preached in England and America; was ordained over the North church, Boston, in 1664; was president of Harvard College 1685–1701; received (1692) the first doctorate in divinity conferred in English-speaking America; was a leader in opposing the abrogation by Charles II. of the Massachusetts charter; was in England during the Revolution of 1688, and procured in England (1692) a new charter for Massachusetts, under which he was given the power of naming the governor, lieutenant-governor, and council; opposed the severe punishment of witches; was the author of ninety-two publications, large and small, of which one of the most noteworthy is *An Essay for the Recording of Illustrious Providences* (1684; republished London, 1856). He was a preacher for sixty-six years, sixty-two of which were spent in Boston. For many years he exerted a commanding influence in civil and ecclesiastical affairs. D. in Boston, Aug. 23, 1723. Revised by G. P. FISHER.

Mather, WILLIAM WILLIAMS, LL. D.: geologist; b. at Brooklyn, Conn., May 24, 1804; graduated at West Point 1828; Assistant Professor of Chemistry there 1829–35; first lieutenant in U. S. army 1834–36; Professor of Chemistry, University of Lousiana, 1836; engaged in the New York geological survey 1836–44; Ohio State geologist 1837–40; State geologist of Kentucky 1838–39; Professor of Natural Science in the University of Ohio 1842–45; its vice-president and acting president 1847–50; editor of *Western Agriculturist* 1851–52; author of *Geology of the First Geological District* (*Natural History of New York*, 1843); and of other geological reports and scientific papers. D. at Columbus, O., Feb. 27, 1859.

Matheson, GEORGE, D. D., F. R. S. E.: a minister of the Church of Seotland and author; b. in Glasgow, Mar. 27, 1842; lost his sight before entering the University of Edinburgh, but graduated with a remarkable record, having repeatedly taken the highest prizes in both academic and theological subjects; was assistant to Dr. Macduff in Sandyford church, Glasgow, 1867–68; minister at Innellan 1868–86; and since 1886 has been minister of St. Bernard's, Edinburgh. He was on the staff of *The Expositor* 1879–81, from which he was removed for holding the "larger hope." Besides contributing to the leading periodicals, he has published *Aids to the Study of German Theology* (Edinburgh, 1874); *Growth of the Spirit of Christianity* (2 vols., Edinburgh, 1877); *Originality of the Character of Christ* (in *Contemporary Review*, 1878; reprinted separately in the U. S.); *Natural Elements in Revealed Religion* (Baird lectures 1881; Edinburgh, 1882); *My Aspirations* (London, 1883; translated into German, 1892); *Moments on the Mount* (London, 1884); *Religious Bearings of the Doctrine of Evolution* (*Transactions* of the Pan-Presbyterian Council, 1884); hymn *O Love that will not let me go!* (Church of Scotland Hymnal, No. 176, 1885); *Can the Old Faith Live with the New?* (1885); *Evolution and Revelation* (1886); *The Psalmist and the Scientist* (1887); *Voices of the Spirit* (London, 1887); *Sacred Songs* (1889); *Landmarks of New Testament Morality* (1889); *Spiritual Development of St. Paul* (1890); and *The Distinctive Messages of the Old Religions* (1893). C. K. HOYT.

Math'ew, Sir JAMES CHARLES: See the Appendix.

Mathew, THEOBALD, known as Father Mathew: temperance reformer; b. at Thomastown, Tipperary co., Ireland, Oct. 10, 1790; studied for a time at Maynooth College; joined the Capuchins, in Dublin, and was ordained a Roman Catholic priest in 1814. He was distinguished for his laborious eharities and his heroism at Cork, especially in the cholera outbreak of 1832. In 1838 he organized the first total abstinence society in Cork. He afterward traveled over all parts of Great Britain and Ireland, and induced hundreds of thousands to sign the temperance pledge. The expenses of this tour involved him in heavy liabilities, and on one occasion led to his imprisonment for debt; from this embarrassment he was only partially relieved by a pension of £300 from the Queen in 1847. The duties on Irish spirits fell from £1,434,573 in 1839 to £852,418 in 1844, and crime as strikingly diminished. He was named by the clergy of the diocese for the vacant bishopric of Cork, but the pope would not ratify the choice (1847). He labored 1849–51 in the U. S., and met with remarkable success. D. at Queenstown, Dec. 8, 1856. See his *Life* by J. F. Maguire (London, 1863; 2d ed. London and New York, 1864).
Revised by S. M. JACKSON.

Mathews, CHARLES: actor; b. in London, June 28, 1776; after a brief apprenticeship to his father, a bookseller, went on the stage as an amateur, and then (1794) as comedian of the regular company at the Theater Royal, Dublin; made his first appearance in London in 1803 as Jubal in *The Jew*; in 1818 introduced his *At Home*, and on his return from a successful trip to the U. S. appeared in his specialty, a *Trip to America*, which was well received. D. at Plymouth, June 28, 1835. See the *Memoirs* by his wife (4 vols., 1838–39).

Mathews, Charles J., son of Charles: actor; b. in Liverpool, England, Dec. 26, 1803; though intended for an architect, he adopted the stage as a profession, achieving remarkable success on his first appearance in public in *The Hunchbacked Lover*; in 1838 married Madame Vestris, at the time lessee of the Olympic theater; they visited the U. S., and on their return to England managed the Covent Garden and Lyceum theaters, but not successfully. His wife dying in 1857, Mathews again visited the U. S. in 1858 and married Mrs. Davenport, better known as Lizzie Weston; in 1860 introduced a similar entertainment to his father's *At Home*, in which his wife assisted; in 1863 made a successful professional trip to Paris, and in 1869–72 visited the U. S. and Australia, returning to England in 1873. D. June 24, 1878. See his *Life*, edited by Charles Dickens (1879).

Mathews, William: See the Appendix.

Mathews, William Smith Babcock, Mus. Doc.: musician and musical critic; b. at Loudon, N. H., May 8, 1837; was educated in New Hampshire Conference Seminary, Boston, and under private teachers; has been an organist, teacher, and writer in Chicago since 1867; was editor of *The Musical Independent* (1869–71); was musical critic and editorial writer on the staff of *The Chicago Herald* (1880–83), and on that of *The Daily News* (1883–90); has been a publisher of music since 1891; is associate editor of *The Etude*; and is the author of numerous musical text-books. C. H. T.

Mathi'as, Thomas James: author; b. in England about 1754; graduated at Trinity College, Cambridge, 1774; wrote a volume of *Runic Odes* (1781), imitated from the Norse; an *Essay on the Evidence relating to the Poems attributed to Thomas Rowley* (1783), sustaining the authenticity of the Chatterton poems; and a poem, *The Pursuits of Literature* (4 parts, 1794–97), issued in sumptuous style, with copious notes, chiefly devoted to a savage criticism of the literary favorites of the time. Mathias was for many years previous to 1818 treasurer of the household to Queen Charlotte. He published in 1805 an edition of Tiraboschi's *History of Italian Literature* (4 vols.), and in 1814 an edition of Gray's works. His last years were passed at Naples, where he died in 1835. Mathias was proficient in the Italian language, in which he wrote several works. Revised by H. A. Beers.

Mathieu, măă'ti-ö', Anselme: modern Provençal poet; b. at Châteauneuf-du-Pape in 1829. He was one of the seven founders of the Society of Felibrige, and an intimate friend of Mistral. He has published verses and articles in the *Aiòle* and other organs of the new Provençal school; has translated into Provençal poems of Horace and Catullus; and has published a collection of original poems in the same dialect, of a rare poetical sentiment—*La Farandoulo, poésie provençale avec traduction française et avant-propos de F. Mistral* (2d ed. Avignon, 1868). A. R. Marsh.

Mathura: sacred city of India. See Mattra.

Mati, maa'tĕe, Tomaso, Commendatore: civil engineer; b. at Leghorn, 1825; studied in Florence and afterward in France under Poirel. He constructed the harbors of Leghorn, Civita Vecchia, Naples, Brindisi, and Venice. At the last-mentioned place, by using the large lagoon as a tidal basin, he has made a direct entrance 25 feet deep in place of a crooked channel of 10 or 12 feet. He has also constructed lighthouse works on all parts of the Italian coast. He is the inspector of the Government corps of civil engineers, and has published many books on the construction of harbors and on modern lighthouse works; is senior member of the council of public works. W. R. Hutton.

Matilda: Countess of Tuscany; b. in 1046; a daughter of Count Boniface of Tuscany and Beatrice of Lorraine; inherited very extensive possessions in Northern and Central Italy, including Tuscany, parts of Lombardy, Ferrara, Modena, Reggio, Mantua, and other dependencies, and played a most prominent part in papal history. The traditional policy of the family was firm adherence to the empire, but it was entirely reversed by Count Bonifaee on account of the treacherous manner in which he was treated by Henry III.; and during the pontificates of Nicholas II., Alexander II., Gregory VII., Victor III., Urban II., and Paschalis II., Countess Matilda was the principal support of the papacy. Especially intimate were her relations with Gregory VII., and Canossa, where the famous penance of Henry IV. took place, was a fief of hers. She was twice married—first to Godfrey of Lorraine, then to Guelph of Bavaria—but her marriages counted for little in her life; and after her death, which occurred in 1115, she bequeathed her enormous wealth to the papal see. It formed part of the so-called *patrimonium Petri*, and, though the will was hotly contested by the emperor, the pope succeeded in retaining the larger portion of the property. See her *Life*, by Luigi Torti (1859), and Amédée Renée, *La Grande Italienne* (1859).

Matile, măă'teel', George Auguste: jurist; b. at La Chaux-de-Fonds, canton of Neuchâtel, Switzerland, May 30, 1807; was educated in the colleges of Neuchâtel and Berne; studied law in Berlin, Heidelberg, and Paris, and was admitted to the bar in Neuchâtel in 1830. He served several terms in the legislature of his canton, and was appointed Professor of Law at the University of Neuchâtel in 1838, and one of the judges of the Supreme Court; emigrated in 1849 to the U. S.; was naturalized as a citizen in 1856, and was appointed Professor of History at Princeton, N. J., in the same year, and Professor of French Literature at the University of Pennsylvania in 1858. From 1863 he held various positions in the State Department in Washington. The principal of his works are *Points de Coutume* (1838); *Autorité du Droit romain de la Coutume de Bourgogne et de la Caroline dans la Principauté de Neuchâtel* (1838); *Musée historique de Neuchâtel* (3 vols., 1841–59); *Monuments de l'Histoire de Neuchâtel* (2 vols. fol., 1844–48); *Histoire de la Seigneurie de Valangin* (1852); *Political Economy* (translated from List), etc. D. in Washington, Feb. 6, 1881.

Mat'ins [from Lat. *matuti'nus*, of the morning, deriv. of *Matu'ta*, goddess of morning; cf. *mane*, in the morning, early]; specifically, the early morning service of the Roman Catholic Church, as distinguished from vespers or evensong.

Matsumaye, măăts'mī', or **Fukuyama**, foō-koō-yaa'măă: a town in the extreme southwest corner of the island of Yezo, Northern Japan (see map of Japan, ref. 3–D). Until 1868 Matsumaye was the center of Japanese civilization and trade in Yezo, but the departure of its lords and the growth of Hakodate have reduced it to a decayed condition. Its harbor never afforded advantages as a port, being a mere open roadstead, and its situation is isolated. The castle, situated on an eminence commanding the town, is now devoted to the purposes of an elementary school, and its grounds form a small public garden. The last struggles of the adherents of the Tokugawa party in 1868 were made in and around Matsumaye, and the town suffered considerably. Pop. 12,000. J. M. Dixon.

Matsys, Quintyn: See Messis.

Matta, maa'tăă, Guillermo: politician and poet; b. at Copiapó, Chili, in 1829. In 1859 as one of the leaders of the radicals, he was banished, returning in 1861; he was elected deputy 1870 and 1873; was *intendente* of Atacama 1875 to 1881, and subsequently held various diplomatic positions. His first literary attempts, short stories, published in 1853, were severely criticised for their freedom of style, but his verses are widely known and very popular. They are mainly in the lyric style. An edition of his poems, in two volumes, was published at Leipzig about 1880. H. H. S.

Mattaponies: See Algonquian Indians.

Mattap'ony River: a stream in Virginia, which unites with the Pamunkey to form the York river. It is itself formed from the union of four streams—the Mat, the Ta, the Po, and the Ny rivers.

Mattawa, măt-a-waa', or **Mattawan**: a town of Nipissing co., Ontario; on the left bank of the Ottawa river, at the junction of the Mattawa; on the Canadian Pacific Railway; 198 miles W. N. W. of the city of Ottawa. It is the fitting-out place for the large lumber interests in the vicinity, and has a considerable trade. It is a favorite starting-place for lovers of fishing. Pop. 1,200. M. W. H.

Mattawa River: a tributary of the Ottawa river; rising near Lake Nipissing, in Trout Lake, it passes through a series of picturesque small lakes and rapids, all of them, with their tributaries, well stocked with fish. After a course eastward of 50 miles through Nipissing County, it falls into the Ottawa river at Mattawa town. Before the construction of the Canadian Pacific Railway the stream was of capital importance as a favorable outlet to the Great Lakes of the productions of the upper Ottawa. M. W. H.

Matteawan: village; Dutchess co., N. Y. (for location of county, see map of New York, ref. 6–J); on the Fishkill creek, and the Newburg, Dutchess, and Conn. Railroad; 1½ miles from Fishkill Landing-on-the-Hudson. It has abun-

dant water-power, and contains manufactories of felt goods, lawn-mowers, wood-working machinery, hats, files, and other articles, the Howland Circulating Library (founded in 1872) containing over 6,000 volumes, a daily paper, a national bank, and a savings-bank. Pop. (1890) 4,278; (1900) 5,807.

Mattei, Tito: See the Appendix.

Matter [M. Eng. *matere*, from O. Fr. *matiere* < Lat. *mate'ria*, stuff, matter, originally building material, timber, for **dmāteria*, connected with Gr. δέμειν, build]: a term which has two main significations, which have changed gradually with the changes in philosophical thinking. They may be called the idealistic and the materialistic, the former dating from Parmenides, and receiving its full expression in Plato and Aristotle; the latter from Thales and the atomists Leucippus and Democritus. In the former signification *matter* is little more than a logical postulate; in the latter, it is an abstraction of the imagination. In Parmenides it is simply not-being (μὴ ὄν) as opposed to being, and is the ground of the phenomenal, illusory multiplicity of the world. This is virtually the view of Plato, who, however, is compelled to attribute to matter something more than a mere negative existence. With him it is the correlate of idea. (See Plato, Parmenides, Philebus, Timæus; Siebeck, *Platos Lehre von der Materie*, in *Untersuchungen zur Philosophie der Griechen*.) According to Aristotle, ὕλη is one of the four αἰτίαι or grounds of existence, the correlate of *form*, the ground of change, being pure potentiality, utterly devoid of determination, and therefore, as such, unknowable. (See Form.) Aristotle sees process where Plato sees but multiplicity. When united with *form*, *matter* gives οὐσίαι, or substantial things, which owe to it their imperfection. The Aristotelian doctrine was adopted by the Stoics, and the Platonic by the Neoplatonists. Proclus held that matter was neither good nor bad, but constituted the ground of necessity. The Fathers of the Church, mingling philosophic speculation with dogmatism, were divided on the question of the eternity of matter, as well as of the mode of its production. The same is true of the Arabic philosophers, who based their doctrines mainly upon Aristotle. Bishop Berkeley denied the existence of matter altogether, as did Lotze in our own day. The materialistic view of matter was held in a rude form by the Ionian philosophers, whose whole efforts apparently were a search for a single material principle to explain the world. The *atomic* theory was apparently first propounded by Leucippus or Democritus of Abdera, and has been held by the majority of materialists ever since. According to it, matter consists, in the last analysis, of an indefinite number of indivisible particles. Some naturalists, such as Democritus, imagined that these differed in form, position, and aggregation; which differences constituted the differences of material objects. Lucretius was the great atomist among the Romans. In modern times an atomic doctrine has been maintained by Diderot, Kant, Herbart, and by all or nearly all the natural scientists of the present day. (See Atom and Molecule.) By most of them matter is no longer looked upon as dead or separable from force, but as endowed with all the potencies of which existing things are the realizations. Whichever theory we adopt, matter remains an abstraction, the correlate of force, without which it would be unthinkable. Cf. Suarez, *De Corporum Natura Tractatus* (Bologna, 1877); Baümker, *Das Problem der Materie in der griechischen Philosophie*; Schneid, *Naturphilosophie im Geiste des hl. Thomas von Aquino*; Pesch, *Institutiones Philosophiæ Naturalis Secundum Principia S. Thomæ Aquinatis*; Ramière, *L'Accord de la Philosophie de Saint-Thomas et de la Science Moderne au Sujet de la Composition des Corps*; Stallo, *The Concepts and Theories of Modern Physics*; Lange, *Geschichte des Materialismus*; Fechner, *Ueber die physikalische und philosophische Atomlehre*; Hartmann, *Philosophie des Unbewussten*, § c. cap. v.; Büchner, *Force and Matter*; and various articles in *The Popular Science Monthly* and *Philosophie Positiviste*. Thomas Davidson.

Matter, maa'ter, Jacques: theologian and historian; b. at Alt-Eckendorf, Alsace, of German parents, May 31, 1791; studied at Strassburg, Göttingen, and Paris; became in 1819 Professor of History at Strassburg, in 1832 inspector-general of the University of Paris, in 1845 of the public libraries of France; retired to Strassburg in 1846 to become professor in the Protestant theological seminary. D. there June 23, 1864. His *De l'Influence des Mœurs sur les Lois, et des Lois sur les Mœurs* (1832), was crowned by the Academy. The most prominent of his numerous other writings are *L'Histoire de l'école d'Alexandrie* (Paris, 1820; 2d ed. 3 vols., 1840); *Histoire Critique du Gnosticisme* (1828; 2d ed. 3 vols., 1843–44); *Histoire Universelle de l'Église Chrétienne* (1829–32); *Schelling, ou la Philosophie de la Nature* (1842; 2d ed. 1845); *De l'État Moral, Politique, et Littéraire de l'Allemagne* (2 vols., 1847); *Saint-Martin* (1862); *Emmanuel de Swedenborg* (1863); and *Le mysticisme en France aux temps de Fénelon* (Paris, 1864), a work of both historical and theological interest. Revised by S. M. Jackson.

Matterhorn, Mount: See Cervin, Mont.

Matteuc'ci, maa-too'chĕe, Carlo: b. at Forlì, Italy, June 21, 1811; graduated at the University of Bologna in 1828, and began his scientific experiments at Forlì, but soon after went to Paris to prosecute them. After the publication of his articles upon electricity and upon torpedoes in 1840 he was appointed, on the recommendation of de la Rive and of Humboldt, to the chair of Physics in the University of Pisa. In 1848 he was sent by the Tuscan Government as civil commissioner into Lombardy with the Tuscan troops, and later on a diplomatic mission to the Diet of Frankfort. After the political events of 1849 he resumed his professorship at Pisa, and in 1859 the Tuscan Government gave him a mission to the court of Berlin, afterward to the Government of Turin before the annexation of Tuscany to Piedmont. After this annexation he took an active part in the moderate constitutional politics of Italy. In 1862 he became for a short time Minister of Public Instruction for the kingdom of Italy. On the transfer of the capital to Florence he was made director of the Museo di Fisica Fiorentina, and devoted himself almost exclusively to the prosperity of that institution. D. at Leghorn, June 25, 1868. Among his very numerous scientific publications the following are best known: *Cenni sull' Influenza dell' Elettricità nella Formazione delle Principali Meteore Acquee* (Bologna, 1827); *Sull' Influenza del Calore sul Magnetismo* (Forlì, 1831); *Sulle Correnti elettro-Magnetiche di Faraday* (Forlì, 1833); *Sur l'Electricité animale* (Florence, 1834); *Discorso sul Metodo Razionale Scientifico* (Forlì, 1835); *Essai sur les Phénomènes Electriques des Animaux* (Paris, 1870); *Lezioni di Fisica* (Pisa, 1852); *Cours d'Electro-Physiologie* (Paris, 1856). Revised by E. L. Nichols.

Matthew, măth'yoo, Saint: one of the twelve apostles and the author of the first Gospel. I. *Character.*—Among the twelve apostles there was only one whose previous occupation had made him familiar with the use of the pen; and this one, St. Matthew, seems also to have been the first among them to prepare an evangelical record. We know very little of his character and life. His apostolical calling is narrated in Matt. ix. 9; Mark ii. 14; Luke v. 27. He was sitting at the receipt of customs on the border of the sea, near Capernaum, filling the office of a publican. These officers were generally abhorred by the Jews, being considered as renegades because they served the pagan lords of the country. Jesus passing by, followed by a great multitude, noticed him, and discovered at first glance that there was in him a future apostle and preacher of the new faith. The publican, who perhaps previously had received salutary impressions from the teachings of Jesus, obeyed without hesitation the call of the Lord, and in order to celebrate the career which opened before him, he invited his former colleagues to a feast in his house together with Jesus and his disciples, desirous that they too should partake in some manner in the grace which had been conferred on him. It was his first missionary act. Mark and Luke call this publican Levi; and it is probable that this was the original name of the apostle, and that Jesus, as he had given to Simon the surname of Peter on their very first meeting (John i. 43), gave to Levi the surname of Matthew—that is, "a gift from God"—in order to designate the striking manner in which God had given him this disciple in the very moment when their eyes first met. The only surprising circumstance according to this explanation is that Mark and Luke do not indicate the identity of Matthew with this publican Levi in their lists of the twelve apostles (Mark iii. 18; Luke vi. 15; Acts i. 13). Thus, from the second century, and up to our days, some have been of the opinion that there were two different publicans whose callings occurred in a similar manner; but this is not probable; the story of the calling of Levi and Matthew is so similar that it is difficult to consider it as the record of two different facts. There is a more natural solution. From a regard to the apostle, tradition would not like to attach to his name the humiliating title of publican; and this seems to be the simple reason why it is omitted in the lists of the Gospels of Luke and

Mark, which were prepared from the general tradition, while Matthew himself when he narrated the fact had no fear of recalling the memory of his former profession; hence these words in the first Gospel: "Matthew the publican" (Matt. x. 3). The father of Matthew is called Alphæus, but must not be confounded with Alphæus called Clopas, who was the brother of Joseph and the uncle of Jesus. Matthew remained, no doubt, in Jerusalem, together with the twelve, as long as the preaching of the apostles in this city continued—that is, nearly up to the year 60. When Paul went to Jerusalem for the last time, in 59, he seems to have found none of the apostles there (Acts xxi.). Clement of Alexandria tells us of Matthew that he ate no meat, but only vegetables and fish. The historian Hegesippus, in the second century, attributes a similar ascetic practice to James, the brother of the Lord, the first chief of the congregation of Jerusalem and a contemporary of the apostles. It is also known that the Essenes, a Jewish sect which aspired to a particular sanctity, confined themselves to the same diet. In this privation the aim was merely a more complete consecration of the body to the service of God, and not the attainment of any legal merit; the law never gave any such precept. The Jewish Christians of Rome, mentioned in Rom. xiv., ought also to be remembered here. By this austere discipline, Matthew no doubt desired to recommend his ministration to the Jews and procure access among them for the gospel. Various later traditions, originating between the fourth and sixth centuries, tell us that Matthew went to Ethiopia, or Macedonia, or Parthia, or Arabia, or India; we are even told by some that he suffered martyrdom in Arabia or Persia; but so late and discordant traditions have little value.

II. *The Gospel.*—All the Fathers agree that the apostle Matthew wrote a Gospel, but in the Hebrew language, and not in the Greek, in which is written the book contained in the canon under the name of Matthew. Papias, at the beginning of the second century, says: "Matthew composed the speeches (the teachings of Jesus) in the Hebrew language (Aramæan), and each one translated them (into Greek) as well as he could." These last words signify, probably, that each preacher translated orally from Matthew into Greek while teaching in the church. Eusebius tells, furthermore, that Pantænus, the founder of the catechetical school of Alexandria, when in the second century he went to India to preach Christianity, found the Gospel of Matthew in Hebrew among some Christians to whom it had been brought by the apostle Bartholomew, the first missionary to that country. All the other Fathers have the same traditions concerning the original language of the first Gospel. Nevertheless, our Greek Matthew does not make the impression of being a translation, at least not in the narrative parts. The language is vigorous, fresh, pure, like that of an original writing. Thence it has been inferred, in accordance with the literal sense of the expressions of Papias, that the Gospel mentioned by him contained only the *speeches* of Jesus, and not a complete history of his ministration, and that the narrative part was added later as a historical framework, in which the primitive work of Matthew was inserted, translated into Greek. Two circumstances confirm this inference: First, in the record of the first Gospel five principal groups of speeches of Jesus can be distinguished—namely, chs. v.–vii.; x.; xiii.; xviii.; xxiv.–xxv.; all of which are connected with the narrative by very similar formulas, and which might very well have originally formed a separate work having for its subject the teachings of Jesus. Secondly, in these great speeches in our Matthew the Old Testament is most frequently quoted according to the translation of the Septuagint, while in the narratives it is most frequently quoted from the Hebrew text—a circumstance which seems to indicate a different origin. Accordingly, we must suppose that Matthew composed an Aramæan work which comprised only the teachings of the Saviour, arranged according to some leading principles. Thus (1) *the justice of the kingdom of heaven*, which division appears in our first Gospel as the sermon on the mount (v.–vii.): (2) *the apostolate*, which second division is found in our first Gospel in c. x.; (3) *the picture of the kingdom of heaven*, the grand collection of parables in c. xiii., which depicts the foundation of the kingdom (the sower), its anomalous development (the tares), its power, both externally and internally (the mustard-seed and the leaven), its worth both to him who finds it without seeking and to him who seeks (the hidden treasure and the pearl), and its terms (the net); (4) *the discipline of the Church*, which division is contained in ch. xviii. 1–20 of our first Gospel; and, lastly, (5) *the consummation of the present era*, or the judgment of Israel, the Church, and all the nations, which division (xxiv.–xxv.) formed the imposing conclusion of the work of Matthew, corresponding with the opening, the sermon on the mount. Christ thus appeared as the divine *legislator* (chs. v.–vii.), *king* (ch. xiii.), and *judge* (chs. xxiv.–xxv.). This original work by Matthew, in Aramæan, probably was the foundation of that *Gospel of the Hebrews* which was adopted by the Jewish Christian communities of the first centuries. This Gospel needed a complement, and this need was supplied, no doubt, by the narrative part of our first Greek Gospel, translated into Aramæan, and adorned with many legendary additions borrowed from an already falsified tradition. It also suffered mutilation in order to conform to the peculiar ideas of the different Jewish Christian sects. As for the narrative frame of the first Gospel, it was possibly composed by one of the companions of St. Matthew, who had partaken of his evangelical labors and written down the apostolical tradition, such as it had become fixed at Jerusalem and in Palestine. In the arrangement of the historical matter the same method of systematical grouping may be observed here as in the composition of the speeches: chs. viii. and ix., following after the sermon on the mount, give a collection of *acts of power*; chs. xi. and xii., following after the apostolical instruction, give a collection of *words of wisdom*; chs. xiv.–xvii., following after the collection of parables, contain a record of *various excursions* which preceded the teaching of the discipline (ch. xviii.) and the departure from Galilee (ch. xix.). Two small details show that Matthew had taken part in this labor, directly or indirectly: (1) the surname of "publican" added to his name, as we have seen, in the list of the twelve apostles in the first Gospel (x. 3); (2) the fact that in this same list, in the fourth couple of apostles—which couple in all the lists comprises Matthew and Thomas—the name of Thomas is placed before that of Matthew, while in the other lists Matthew is placed before his colleague. It is evident that he could not change the place of the couple to which he belonged, but he could change the place of his name in this couple; and this he did. Eusebius says, referring to his predecessors, that "Matthew, after preaching to the Jews, and about to depart in order to preach to other nations, composed in the language of the Fathers (in Hebrew) the Gospel he had preached, in order to fill the void which his absence would leave among his audience." This date is in accordance with the preceding, relating to the language in which Matthew wrote; and it accounts for the absence in this Gospel of all explanations of Hebrew customs, such as we find in Mark and Luke, writing for pagan readers. The time of the composition is indicated by Irenæus: "Matthew published among the Hebrews and in their native tongue his evangelical record at the time when Peter and Paul preached at Rome and founded the Church there." Some have taken umbrage at this tradition, because neither Peter nor Paul founded the Church of Rome, which follows clearly from the Acts of the Apostles and the Epistles of St. Paul, but they have forgotten that in the epoch in which Irenæus wrote (the last third of the second century) the apostolical times appeared in a general way as the epoch of the foundation of the Church. The work of Matthew bears, so to speak, its date marked on its face. This Gospel is a divine act, an official proclamation issued by the government of God. It is God himself who summons his people by a solemn ultimatum to recognize Jesus as Messiah, and threatens them with destruction if they will not obey. This is the reason why the Gospel opens with the genealogy of Jesus, and why he is called "Christ, the son of David, the son of Abraham" (i. 1), the Messiah who shall raise the "throne of David, his father," and redeem the promise of the salvation of the world attached to the posterity of Abraham. This is furthermore the reason why the whole Gospel is a demonstration of the Messianic dignity of Jesus; why the five traits of the history of his infancy, recorded in the first two chapters, are accompanied each by a prophecy; why his residence in Galilee at the beginning of his ministration is justified (iv. 14–16) by a prophecy of Isaiah; why the collection of the acts of power (viii.–ix.) is grouped around a prophecy by Isaiah, quoted viii. 17, which serves as text; why the collection of the words of wisdom (xi. and xii.) center in a prophecy by Isaiah, quoted xii. 17. Moreover, there is scarcely one trait in the history of the Passion which is not accompanied by a prophecy, because this ignominious death was the great offense for the Jewish feeling

(1 Cor. i. 23), and the last words, "Go ye, therefore, and teach all nations, baptizing them," etc., give the programme of the whole work of the Messiah. By such a book God said to his people, "The forty years of repentance which were accorded to thee (Matt. xxiv. 34) will soon expire; acknowledge Jesus as thy Messiah or thou shalt perish." This situation is indeed in harmony with the date indicated by Irenæus—namely, about 64, or five to six years before the destruction of Jerusalem. There is especially one passage which determines exactly the period of the composition. It is the parenthetical clause xxiv. 15, by which the author interrupts, in the same manner as Mark, the speech of Jesus on the destruction of Jerusalem, and invites the Church to take notice of the signal of flight which Jesus gave in advance. Such a *nota bene* shows evidently that the sign has not yet been realized, but is imminent. The sign was the invasion of Judæa by the Roman armies, which took place about 66, and the time of the composition is consequently about 64 or 65. Thus we arrive at nearly the same time of composition for all the three earlier Gospels composed as they were in different countries and for different nations (Romans, Greeks, Hebrews); and this chronological result coincides with the fact, evident to our eyes, that none of the three evangelists has employed the writings of any of the others in the composition of his work. This reciprocal independence, which seems to us to have been demonstrated by a minute exegesis, would have been impossible if one of the three had written a long time before the others; the last writer must necessarily have known the writings of the others. Moreover, the date indicated corresponds very well to the situation of the Church at this epoch. Was it not the time in which those who had witnessed the appearances of the Saviour began to die out? Hence resulted in the feeling of the Church a void and uneasiness, which demanded a rich compensation; and this was given to the Church in the different countries in which it existed by the publication of the first three Gospels. A fragment of an antique work, found in the eighteenth century by Muratori in the library of Milan, speaks thus of the four Gospels: "Although the beginning of each of our Gospels differs (each choosing its own point of departure), this is nevertheless of no importance to the faith of the believers, since all things are represented by them all *in the same ruling spirit*" (*uno ac principali spiritu*). Thus the relation between the four Gospels was understood in the second century, while modern criticism has attempted to place these works in opposition to each other, and to discover among their authors motives of mutual rivalry and hostility unworthy of the characters of such men and of the sanctity of such an object, but this false criticism will break down before the indestructible feeling of the moral purity of these books. The Church feels that in calling these authors the *holy evangelists* she has not followed an illusion. That spirit of holiness which is her own life-blood recognizes itself in the spirit which, one and the same, pervades all the four books. The picture of the divine work, its *history* proper, was written by Luke; the simple, apostolical *memoirs*, with all their dramatic freshness, were given by Mark; the official and theocratic proclamation of Jesus as King Messiah, was issued by Matthew; and to John we owe the revelation of Jesus as the Son of God, as the everlasting Word. Matthew forms evidently the transition from the Old to the New Testament. His Gospel is the Old Testament reflected in the New. Hence it was always placed at the head of the evangelical collection and of the whole New Testament. It is the *Genesis* of the New Testament. On the other hand, the Gospel of Matthew corresponds to the book of Revelation. As the former reproduces under the form of history in the New Testament that part of the Old which is already accomplished, the latter reproduces under the form of prophecy at the end of the New Testament that whole part of the Old which is not yet realized. The Revelation says, "All is accomplished." Thus in the divine word the beginning, middle, and end correspond with each other in a marvelous manner. See BIBLE and GOSPEL.

FRÉDÉRIC GODET.

Matthew of Paris: historian; b. in England about 1200; entered in 1217 the convent of St. Albans; wrote a continuation of the *Flores Historiarum* of Roger of Wendover, comprising the period from 1235 to 1259, the whole work, known as the *Historia Major*, having formerly been incorrectly ascribed to him; and superintended the preparation of an abridgment of that work, which under the same title of *Flores Historiarum* was ascribed to Matthew of Westminster, who probably never existed. The questions of authorship and authenticity were solved by Sir Frederick Madden, who published in 1866 the original manuscript of the abridgment, partly in the handwriting of Matthew of Paris. The larger work was translated by Rev. J. A. Giles (1849–54), the smaller by C. D. Yonge in Bohn's Antiquarian Library (1853). Nothing is known of the personal history of Matthew of Paris beyond a few references to his own writings, except the fact that he was sent to Norway in 1248 by Pope Innocent IV. as visitor of the Benedictine order. His stay there was brief. D. at St. Albans soon after May, 1259.

Matthews, EDMUND ORVILLE: See the Appendix.

Matthews, HENRY, LL. B., Q. C., M. P.: politician; b. in 1826 in Ceylon, where his father, Hon. Henry Matthews, was a judge; was educated in Paris and London; obtained the university law scholarship at the University of London; admitted at Lincoln's Inn at eighteen; was called to the bar in 1850; was examiner in common law to the council of legal education 1872–76; has been engaged in many notable lawsuits, including the Tichborne case; entered Parliament in 1868; and was Home Secretary in Lord Salisbury's second ministry 1886–92.

Matthews, JAMES BRANDER: author; b. in New Orleans, La., Feb. 21, 1852. He graduated at Columbia College and took up his residence in New York city, devoting himself mainly to dramatic literature, fiction, and literary criticism. In 1892 he was appointed lecturer on Literature at Columbia College. Among his plays are *Margery's Lovers*, a comedy (1884), and *This Picture and That*, a comedy (1887). His other publications include *The Theaters of Paris* (1880); *French Dramatists of the Nineteenth Century* (1881); *A Secret of the Sea, and Other Stories* (1886); *Pen and Ink* (1888); *A Family Tree, and Other Stories* (1889); an edition of *Sheridan's Comedies* (1885); *Americanisms and Britticisms* (1892); *In the Vestibule Limited* (1892); and *The Story of a Story* (1893). H. A. BEERS.

Matthews, STANLEY, LL. D.: jurist; b. July 21, 1824, in Cincinnati, O.; graduated from Kenyon College 1840; studied law, and, removing to Maury co., Tenn., was admitted to the bar and began the practice of his profession. He then married, and shortly after returned to Cincinnati. From 1846–49 he assisted in the editorial management of *The Cincinnati Herald*, an anti-slavery journal. In 1851 he was elected judge of the court of common pleas for Hamilton County, and in 1855 to the State Senate. In 1858 he was appointed U. S. district attorney for the southern district of Ohio. At the outbreak of the civil war he was commissioned lieutenant-colonel of the Twenty-third Regiment Ohio Volunteers; in Oct., 1861, was commissioned colonel of the Fifty-seventh Regiment, and in that capacity commanded a brigade in the Army of the Cumberland; in 1863 resigned his commission to enter upon the duties of judge of the inferior court of Cincinnati. In 1877 he took part as counsel before the electoral commission, opened the argument in behalf of the Republican electors in the Florida case, and made the principal argument in the Oregon case; was soon after elected to the U. S. Senate, and in 1881 was appointed associate judge of the Supreme Court of the U. S. D. at Washington, D. C., Mar. 22, 1889.

Matthews, WASHINGTON, LL. D.: ethnologist; b. in Ireland, July 17, 1843; was taken by his father to the U. S.; graduated M. D. at the University of Iowa 1864; entered the army immediately as acting assistant surgeon; served in the Indian wars in Dakota and Montana until 1868; also became an officer and rose to the rank of major; served in the regular army, largely in the Dakotas, New Mexico, and the States and Territories of the Pacific slope. From his earliest childhood his life has been mainly passed in contact with Indian tribes which retained their original customs and beliefs. Among his publications are *Grammar and Dictionary of the Language of the Hidatsa*; *Ethnography and Philology of the Hidatsa Indians*; *The Gentile Organization of the Navajo Indians*; *The Catlin Collection of Indian Paintings*; *Consumption among the Indians*; *The Inca Bone and Kindred Formations among the Ancient Arizonians*; *Apparatus for Tracing Orthogonal Projections of the Skull*.

Matthias, ma-thī'as, SAINT: the twelfth apostle, in place of Judas Iscariot; chosen during the ten days between Ascension and Pentecost. Of the 120 disciples in Jerusalem, apparently only two (Barsabas and Matthias) could be found

who had been companions of Christ during the whole course of his ministry; and of these two the latter was chosen somehow by *lot*. In spite of specious arguments against it, the validity of this election can be sustained. The New Testament makes no further mention of Matthias, and ancient traditions clash. See the *Acta Sanctorum*, Feb. 24.

Matthias: the assumed name of ROBERT MATTHEWS, a religious impostor; b. in Washington co., N. Y., about 1790; resided in Albany when, excited by the preaching of the celebrated revivalists Rev. Charles G. Finney and Rev. Edward N. Kirk (about 1830), he determined to become a religions leader. He began by ardent advocacy of temperance, and having had some success in street-preaching, claimed to have received a revelation, and undertook to convert the city of Albany. His violence defeated itself, while his absurd pretensions were promptly refuted. Enraged at the failure of his projects, he prophesied the destruction of Albany, and proceeded secretly to New York, where he succeeded in imposing upon several respectable families, and in creating a sensation. Having been accused of poisoning one of his wealthy disciples, he was tried and acquitted, but, having then lost all influence, quietly disappeared, and died some years later in Arkansas. See *Matthias and his Impostures*, by William L. Stone (New York, 1835).

Matthias: German emperor from 1612 to 1619; b. Feb. 24, 1557; a son of Maximilian II., and educated in Germany. In 1577 he repaired secretly to the Netherlands, and made an attempt at managing affairs there, but failed, and withdrew in 1580. On June 14, 1612, he succeeded his brother, Rudolph II., as Emperor of Germany, but his reign was very unsuccessful. The differences between the Protestant Union, formed in 1608, and the Catholic League, formed in 1609, grew now into open controversies. The emperor first tried to put himself at the head of the Catholic League, but, failing in this, he undertook to suppress both associations by an imperial decree, to which, however, neither of them paid any attention. In 1617 the bigoted Archduke Ferdinand was appointed King of Bohemia, and on May 23, 1618, the Protestant inhabitants of Prague took arms and broke out in open rebellion. Thus began the Thirty Years' war. Hardly a year after (Mar. 20, 1619) the emperor died, and was succeeded by Ferdinand.

Matthias I., Corvinus: See CORVINUS (MATTHIAS) I.

Matto Grosso, maa'tō-grō'sō (literally, thick copse): a western state of Brazil; the largest of the republic except Amazonas, but the most thinly settled of all; bounded N. by Amazonas and Pará, E. by Goyaz, São Paulo and Paraná, S. by Paraguay, and W. by Bolivia. Estimated area, 532,400 sq. miles. All the eastern and northern part is comprehended in the Brazilian plateau, having an average elevation of about 2,500 feet; it is much cut up by deep and wide river valleys, and the escarpments thus formed are frequently represented as mountains on maps. The immense depression of the Paraguay occupies the southwestern portion; it is perfectly flat, and is subject to periodical inundations. The plateau is nearly everywhere cut down abruptly, and even precipitously, to this depression, the edges forming the so-called serras of São Jeronymo, of Piquiry, etc. The depression of the Madeira (Guaporé branch), almost confluent with that of the Paraguay, fringes the western boundary, and the table-land is cut down to it in a similar manner (Serra dos Parecís). Bordering the western side of the Paraguay, on the frontiers of Bolivia, there are several isolated groups of high and rugged hills (Serra dos Dourados, etc.). The numerous streams of the plateau drain northward to the great Amazonian branches, eastward to the Araguaya, southeastward to the Paraná, and southwestward to the Paraguay. The Paraguay and several of its numerous affluents are navigable nearly to their sources. The other large rivers are much obstructed by rapids; they include the Tapajós and its branch the Pernatinga or São Manuel, and the Xingú, flowing to the Amazon; the Rio das Mortes, a branch of the Araguaya; and the rivers Verde, Ivinheima, etc., affluents of the upper Paraná. The climate of Matto Grosso is generally hot in the river depressions, temperate and delightful on the plateau; from June to September there are occasional cold spells, caused by south winds, apparently the same as the "pamperos" of the Rio de la Plata; during these the temperature sometimes sinks to freezing. The rainy season begins in September, is well marked from December to April, and ends in May; the remaining months are dry. The soil of the open plateau is generally sandy and unfit for cultivation, but it affords excellent pasturage in the rainy months. The forest lands and river valleys are very fertile. The gold and diamond washings of Matto Grosso were formerly among the richest in the world; they are now nearly abandoned, but are far from being exhausted. Many small Indian tribes occupy the wilder portions, but large areas are completely deserted. The civilized population does not exceed 60,000, of which one-third is gathered in the capital, Cuyabá. Corumbá, on the Paraguay, is the port of entry, and Villa Maria, Matto Grosso, Miranda, and Diamantina are small towns. Hides and small quantities of gold and drugs are almost the only exports; agricultural products are insufficient for the local demand. The upper Paraguay was early visited by Spaniards. Until the opening of the Paraguay to steam navigation (1859), the only means of communicating with the coast was by a long overland journey or by the rivers in canoes which were dragged around the rapids. The Paraguayans occupied part of the province 1865–68. See Fonseca, *Viagem ao Redor do Brazil* (1880); Castelnau, *Expédition dans les parties centrales de l'Amérique du Sud* (1850–51); Pimenta Bueno, *A Provincia de Matto Grosso* (1880); the works of von den Steinen. HERBERT H. SMITH.

Mattoon: city; Coles co., Ill. (for location of county, see map of Illinois, ref. 7–F); on the Ill. Cent., the Cleve., Cin., Chi. and St. L., and the Peoria, Dec. and Evans. railways; 56 miles W. of Terre Haute, Ind., 172 miles S. by W. of Chicago. It is in a corn and broom-corn growing region; is an important shipping-point; and has a high school, 2 national banks with combined capital of $110,000, a State bank with capital of $50,000, and a daily and 5 weekly newspapers. Pop. (1880) 5,737; (1890) 6,833; (1900) 9,622.

Mattra, Mathura, or **Muttra**: a town in the Northwestern Provinces, British India, on the Jumna; is a very ancient and celebrated city, mentioned by Ptolemy as the "Modoura of the gods," a railway station, and capital of a district of the same name (see map of North India, ref. 6–E). As the birthplace of Krishna it is venerated by the Brahmans, and visited by a great number of pilgrims. The shores of the river are provided with gorgeous flights of steps, and the city contains an immense temple, which once possessed idols of gold and silver, with eyes of diamonds. These were carried away by foreign conquerors. Sacred apes and swarms of holy parrots and peacocks are kept here. Pop. (1891) 60,020. Revised by M. W. HARRINGTON.

Maturin, mäă-too-reen': a town in the northeastern part of the state of Bermudez, Venezuela; on the open plains bordering the Guarapiche river, 22 miles above the port of Caño Colorado (see map of South America, ref. 1–D). It is the commercial center of the region on the southern slope of the Cumaná Mountains and of the plain bordering the Orinoco delta, and has a large trade, especially in cattle and hides. Its port on the Orinoco is San Rafael at the head of the delta. Maturin was formerly the capital of a province or state of the same name, now merged into Bermudez. Population (1889, with the district) 14,473. H. H. S.

Mat'urin, CHARLES ROBERT: novelist; b. in Dublin, Ireland, in 1782; educated at Trinity College; took orders in the Church of England, and became curate of St. Peter's, Dublin. Pecuniary losses induced him to write several novels of an extravagant character, which had little success—*The Fatal Revenge* (1807); *The Wild Irish Boy* (1808); *The Milesian Chief* (1812); *Women* (1818); *Melnoth* (1820); and *The Albigenses* (1824)—but his tragedy of *Bertram*, represented by Edmund Kean at Drury Lane theater, brought him £1,000 and a considerable reputation as a poet, which was scarcely justified by his later productions: *Manuel* (1817) and *Fredolpho* (1817). He was an eloquent pulpit orator and a bold opponent of Roman Catholicism. D. in Dublin, Oct. 30, 1824. Revised by H. A. BEERS.

Maubeuge, mō'bözh': town; department of Nord, France; on the Sambre, which here becomes navigable; about 10 miles N. of Avesnes (see map of France, ref. 2–G). It is fortified, and has iron-foundries and manufactures of firearms, iron and steel goods, saltpeter, oil, and sugar, and an active trade in coal, slate, and marble. It originated from a great double monastery for monks and nuns founded in the seventh century by St. Aldegonde, and was incorporated with France by the peace of Nimeguen. Its fortifications were planned by Vauban. Pop. (1896) 19,799.

Mauch Chunk, mawk'chŭnk': borough; capital of Carbon co., Pa. (for location of county, see map of Pennsylva-

nia, ref. 4–I); on the Lehigh river, the Lehigh Canal, and the Lehigh Val. and the Cent. of N. J. railways; 46 miles W. by N. of Easton, 83 miles N. W. of Philadelphia. It is the most important anthracite coal-trade center in the U. S.; lies between the Mahoning and Sharp Mountains, and is almost entirely surrounded by mountains and high hills. The mines on Sharp Mountain are among the oldest and most productive in the State. Formerly coal was conveyed from the top of the mountain to the chutes in the borough by means of the switchback railway, on which the cars descended by gravity. The cars were hauled back first by mule-power, and afterward by cables operated by stationary engines at the different inclines. Subsequently a tunnel at Nesquehoning took the place of this method of transportation, and the old gravity road is now used exclusively for pleasure excursions. The panorama from Mt. Pisgah, the highest point of Sharp Mountain, and the scenery through which the cars descend with great velocity, add much to the romantic interest which characterizes the trip. The borough consists of a single street; contains foundries, machine-shops, and flour-mills: and has 2 libraries (Dimmick Memorial and Public, both opened in 1884) with over 12,000 volumes, 3 national banks with combined capital of $600,000, and a daily and 2 weekly newspapers. Both the borough and Glen Onoko, near by, are visited by many thousands of people each summer. Pop. (1890) 4,101; (1900) 4,029.

Maudsley, Henry, M. D., LL. D., F. R. C. P.: alienist; b. at Giggleswick, Yorkshire, England, Feb. 5, 1835; studied at the University of London, where he graduated in medicine in 1857; was physician to the Manchester lunatic asylum 1859–62; settled in London as a consulting physician upon lunacy 1862; published *The Physiology and Pathology of the Mind* (1867); was made fellow of the Royal College of Physicians 1869; appointed Gulstonian lecturer to that body in 1870; published his course of *Lectures on Body and Mind* 1870; and wrote a treatise on *Responsibility in Mental Disease* (1874) for the International Scientific Series. He was Professor of Medical Jurisprudence in University College 1869–79, and editor of *The Journal of Mental Science* 1863–78. He received LL. D., Edinburgh University, in 1884. Published *Body and Will* (1883); *Natural Causes and Supernatural Seemings* (1886).

Revised by S. T. Armstrong.

Maui: See Hawaii Nei.

Maule, mow'lā: a river of Chili, rising in the Andes, flowing westward and entering the Pacific in lat. 35° 18′ S.; length about 140 miles, navigable for about 50 miles. The Maule formed the southern limit of the Inca conquests, and during the colonial period it separated Spanish Chili from the territory of the Araucanian Indians, which contained only a few Spanish forts. The Maule gives its name to a province on the southern side, having an area of 2,930 sq. miles and a population (1891) of 127,650. Capital, Constitucion.

H. H. Smith.

Maulmain', or **Moulmein**: city of Tenasserim, Burma; at the mouth of the Salwen, in the Bay of Bengal, in lat. 16° 30′ N. It is a flourishing place, important for its exports of teak. Ivory, grain, wax, and gum are also exported, and silks and cottons, wine and beer, tobacco, arms, and sugar are imported. Pop. (1891) 57,920.

Maumee, maw'mĕē: village; Lucas co., O. (for location of county, see map of Ohio, ref. 1–E); on the Maumee river, the Wabash Canal, and the Wabash and the Toledo, St. L. and Kan. City railways; 8 miles S. of Toledo, the county-seat. It is in an agricultural region, and has flour-mills, agricultural-implement factories, a private bank, and a weekly newspaper. Pop. (1880) 1,780; (1890) 1,645; (1900) 1,856.

Maumee River: a river formed by the union of St. Mary's and St. Joseph's rivers at Fort Wayne, Ind. Its mouth is at Toledo, O. It is navigable 8 miles to South Toledo, and in high water to Defiance, 50 miles.

Mauna Loa, maa'oo-nää lō'ää [from native name, Great Mountain]: the largest active volcano in the world, situated nearly in the center of the island of Hawaii. Its snow-crowned dome rises 13,600 feet above the level of the sea. It contains several craters, both on its summit and on the sides. The group of craters on the summit form an immense abyss a mile and a half in diameter, and 1,000 feet deep. No other volcano equals this in the volume of lava discharged in the principal eruptions. The lava flood of 1855, which reached the outskirts of Hilo, covered 200 sq. miles with an average depth of 100 feet, and its volume would nearly have built Vesuvius. In 1858 the lava stream flowed to the sea and half filled the Bay of Kiholo. Another great eruption (1880) threatened the destruction of Hilo, and the volcano was very active in 1888 and 1892. When quiescent Mauna Loa is a favorite resort for tourists. The eruption of 1880–81 poured forth for nine months a river of lava which ran 50 miles, varying from a few hundred yards to 3 miles in width.

C. C. Adams.

Maundy (mawn'di) **Thursday** [M. Eng. *maunde*, command, from O. Fr. *mandé* < Lat. *mandatum*, command, whence Eng. *mandate*; so called from the "new commandment" of John xiii. 5, 34]: the same as the Holy Thursday in Passion week. On this day, in Roman Catholic countries, the feet of pilgrims are washed in the church, while the *Mandatum novum* is sung, and doles are given to the poor.

Maupassant, mō'pää'sääṅ', Henri René Albert Guy, de: novelist; b. at Miromesnil, Seine-Inférieure, France, Aug. 5, 1850. After an indifferent education he went to Paris, and was employed as clerk in the Navy Department. Attracted to letters, he enjoyed the counsel of his uncle Flaubert, who was his master in the art of writing. This art he practiced and cultivated long before publishing. His first work, a volume of verse, *Des Vers*, dates from 1880. His great power in the short story in prose was revealed by *Boule-de-Suif* (1880), which showed also the influence of Zola. His reputation was made very rapidly, and he put forth volumes in quick succession till 1892, when mental disease showed itself. He became an inmate of a private asylum and died July 6, 1893. Among his more than twenty volumes are the collections of short stories, *La Maison Tellier* (1881); *Les Sœurs Rondoli* (1884); *Contes du jour et de la nuit* (1885); *La Horla* (1887); *Mont-Oriol* (1887); *La Petite Roque* (1888); *La Main Gauche* (1889); *L'Inutile Beauté* (1890): the novels *Pierre et Jean* (1888); *Fort comme la mort* (1889); *Notre cœur* (1890); descriptions of travel *Au Soleil* (1884); *Sur l'eau* (1888); *La vie errante* (1890). His pictures are mainly of the human animal of robust appetite and rudimentary intelligence and conscience, observed with much penetration, and set forth in a clear, firm, and direct style.

Maurel, Victor: See the Appendix.

Maurepas, mōr'pää', Jean Frédéric Phélypeaux, Count de: statesman; b. at Versailles, July 9, 1701; inherited in his fourteenth year an office as Minister of State, including the departments of the royal household, of the city of Paris, and of the marine. This office had belonged to his family since 1610, and when he was twenty-four years old he took charge of it himself. In 1749 he was banished from the court on account of a sarcastic epigram on Madame de Pompadour, but on the accession of Louis XVI. he returned as Prime Minister and held the position till his death, Nov. 21, 1781. His knowledge was superficial, his character frivolous, his administration a hotbed for all kinds of abuses. He rendered some service to the French marine, but his two most famous measures were the convocation of the parliaments and the alliance with the North American colonies in the Revolutionary war, both of which had a decisive influence in bringing about the French Revolution. A work in four volumes, purporting to be the memoirs of Maurepas, was published by his secretary 1790–92.

Maurer, mow'rer, Georg Ludwig, von: jurist and statesman; b. at Erpolsheim, in Rhenish Bavaria, Nov. 2, 1790; studied at Heidelberg; was appointed Professor of Jurisprudence at Munich in 1826; became a member of the Greek regency 1832–34; was for a short time Bavarian Minister of Foreign Affairs, and Minister of Justice in 1847, and died at Munich, May 9, 1872. His *Geschichte des Altgermanischen Gerichtsverfahrens* (1824) was crowned by the Academy of Munich. Besides a number of valuable works on jurisprudence and the history of legislation and government in Germany, he wrote in 1836 *Das Griechische Volk vor und nach dem Freiheitskampfe* (3 vols.)—His son, Konrad Maurer (b. in 1823 at Frankenthal in the Palatinate), studied at Munich, Leipzig, and Berlin, and was appointed Professor of Jurisprudence at Munich in 1847. He has made comprehensive studies of Icelandic language, literature, and history, and written several works on this subject, such as *Die Entstehung des Isländischen Staats und seiner Verfassung* (1852); *Gullthórissaga* (1858); *Isländische Volkssagen* (1860), etc.

Revised by W. B. Shaw.

Maurice, mō'rees', Count of Nassau, Prince of Orange: stadtholder; b. Nov. 14, 1567, at Dillenburg, in Nassau, a son of William the Silent, of Orange; studied at Leyden,

and was proclaimed stadtholder of Holland, Zealand, and Utrecht shortly after the assassination of his father in 1584, and appointed commander-in-chief by all the provinces after the recall of Leicester by Queen Elizabeth in 1587. His military career was very brilliant. He took Breda in 1590, Zutphen, Deventer, and Nymwegen in 1591, Geertruidenberg in 1593, Groningen in 1594. In 1597 he defeated the Spaniards at Turnhout in Brabant, and in 1600 at Nieuwport, near Ostend, in the latter battle destroying all chance of escape for his army, if defeated, by dismissing the ships. From ambitious designs he opposed the armistice of twelve years which Barneveldt succeeded in concluding with Spain in 1609, and by which the United Provinces were acknowledged as an independent republic. He aspired to sovereignty, and in the hot controversy between the Arminians and the Gomarists favored the latter as a means of overcoming the resistance of Barneveldt and the republican party. His success was but temporary. Barneveldt was executed in 1619, but the popularity of Maurice was lost, and it was hardly regained by some new exploits in the renewed war with Spain in 1622. D. at The Hague, Apr. 23, 1625. Next to Alexander Farnese, he was generally considered the greatest general of his age, and numbers of young men of royal or noble birth who wished to learn the art of war gathered in his camp. See Motley, *History of the United Netherlands* (1860–67) and *Life and Death of John of Barneveld* (1874); also Grorn van Prinsterer, *Maurice et Barneveldt* (Utrecht, 1875). Revised by F. M. Colby.

Maurice: Duke of Saxony, of the Albertine line; b. Mar. 21, 1521, at Freiberg, a son of Henry the Pious; joined the Protestant Church in 1539; married in 1541 a daughter of the Landgrave Philip of Hesse, and succeeded his father on the ducal throne in the same year. His relations with the Emperor Charles V. were most amicable at this time. He fought in his army against the Turks and against the French, and although he was an ardent Protestant, and his father-in-law was at the head of the Smalcald League, he ranged himself with the enemies of his religion, invaded the territories of his cousin, the Elector John Frederick, and finally helped the emperor to defeat the latter in the battle of Mühlberg Apr. 24, 1546. As a reward Maurice received from the emperor the electorate and all of John Frederick's possessions. As soon, however, as Maurice had realized his aim, the good relations with the emperor ceased, chiefly on account of the latter's alleged breach of faith in seizing and holding prisoner Philip of Hesse, to whom Maurice had pledged his liberty. Charles refused, moreover, to listen to the entreaties of Maurice on behalf of the imprisoned elector. Magdeburg was still under arms, and the work of reducing it was intrusted to Maurice, who now saw his chance of avenging his wrongs and righting himself with his former Protestant friends. Gathering a large force for the ostensible purpose of besieging the city, he made a secret alliance with Henry II. of France in 1551, and in the following spring marched on Innsbruck, where the emperor lay ill of the gout. By a hasty flight the emperor saved himself from being captured by Maurice, but by the Peace of Passau, 1552, he was compelled to consent to all his demands, the first of which was religious liberty for the Protestants. Next year, on July 9, 1553, Maurice was mortally wounded in the battle of Sievershausen against the Margrave of Brandenburg, and died two days afterward. He was succeeded by his brother. His daughter Anne was married to William the Silent. Revised by F. M. Colby.

Maurice, Frederick Denison: clergyman and author; b. in Normanston, Suffolk, England, Aug. 29, 1805; educated at Cambridge; took a degree in law, but because he was a Nonconformist was obliged to forego honors and degrees in other schools. He early took an interest in social, political, ecclesiastical, and scientific questions that agitated thoughtful men in England, writing fervently in *The Athenæum* and other periodicals. In 1831 he joined the Established Church, having convinced himself that it was the best ground for an Englishman to stand and work on, although holding the Church responsible, through its shortcomings, not only for the degradation of the working-classes, but also for the dissent that should have found room for expression within the Establishment. By his work, *The Kingdom of Christ* (1838), his *Lectures on Education* (1839), his *Thoughts on Conscientious Subscription*, and *Reasons for not Joining a Party in the Church* (1841), he laid the foundation of the Broad Church, as it was called, a new party name which he regretted, as pointing to another division in the Church. Maurice was a preacher from the time of his ordination in 1831. His first curacy was at Bubbenhall, a small village in Warwickshire, near Leamington; from 1836–46 he was chaplain at Guy's Hospital, London; from 1846–59 he was chaplain at Lincoln's Inn; and from 1860–69 addressed intellectual audiences in St. Peter's chapel, De Vere Street. In 1866 he became Knightbridge Professor of Casuistry, Moral Theology, and Moral Philosophy at Cambridge. D. in London, Apr. 1, 1872. Maurice was of fertile mind and fluent, abounding utterance. His writings, mostly publications in book-form of his copious lectures on nearly all questions of Church history, social and political ethics, practical and speculative theology, and philosophy bear the stamp of an earnest intellect, a sweet and consecrated spirit, a profoundly humane heart. His Warburtonian lectures on *The Epistle to the Hebrews* (1846), his Boyle lectures on *The Religions of the World* (1847), the lectures on *The Religion of Republican Rome* (1855), *The Patriarchs and Lawgivers of the Old Testament* (1855), *The Ten Commandments*, *The Gospel of the Kingdom of Heaven* (1864), *The Gospel of the Word*, *The Epistles of St. John* (1857), *The Apocalypse, a Vision* (1861), *The Prophets and Kings of the Old Testament* (1853), *History of Moral and Metaphysical Philosophy* (1850–57), the lectures on *The Ecclesiastical History of the First Two Centuries* (1854), on *The Unity of the New Testament* (1854), on *The Word "Eternal"* (1853), on *The Lord's Prayer* (1848) and *The Book of Common Prayer* (1849), on *The Claims of the Bible and of Science* (1863), *The Dialogues on Family Worship* (1862), illustrate the variety and the vitality of his labors. His last works were on *Conscience* (1868) and *Social Morality* (1869). Death surprised him in the fullness of his powers, while he was preparing lectures on *The Ethical Systems of Plato and Aristotle*. In 1854 he became principal of the London Workingmen's College, having as counselors and coadjutors men like Thomas Hughes, John Ruskin, Lawrence, Rossetti, Cave Thomas, and others eminent in science, history, literature, and art. His influence was exerted in favor of a relaxation of the laws respecting Sunday, of healthful Sunday recreations for the working people, the opening on Sunday of the Crystal Palace; his labors meanwhile being directed to the spiritual culture of the people. His *Life*, in two vols., edited by his son, Frederick Maurice, appeared in 1884, and a bibliography of his writings by G. J. Gray, 1885. Revised by S. M. Jackson.

Mauric'ius, Flavius Tiberius: Emperor of Constantinople from 582 to 602; b. at Arabissus in Cappadocia about 539, a descendant of a noble Roman family. His high character and eminent services in the wars against Persia caused the Emperor Tiberius II. on his death-bed to appoint him his successor. Though he was crowned amid universal rejoicing, his popularity soon waned. Constant and sometimes unsuccessful wars with the Avars and Persians, together with mutinies and conspiracies, filled his reign. Mauricius possessed every virtue save firmness. His gentleness provoked contempt; at last, a general named Phocas excited a simultaneous revolt in the army and capital, and seized the crown. Mauricius, unable to resist, fled with his family to Chalcedon. There he was discovered five days afterward and beheaded on the seashore by the tyrant's order, together with his five grown-up sons. His widow and their three daughters were likewise beheaded some time later. Mauricius wrote a work on military affairs, published at Upsala in 1664 by John Scheffer. E. A. Grosvenor.

Maurita'nia: the ancient name of Northwestern Africa, corresponding to the present Morocco and part of Algeria, and inhabited by the Mauri (Moors). After conquering it, the Romans founded many colonies here. In 429 A. D. it was overrun by the Vandals, but it was reconquered by Belisarius, and remained with Italy till the end of the seventh century, when it was taken by the Arabs.

Mauri'tia [Mod. Lat., named in honor of Prince Maurice of Nassau]: an interesting genus of American fan-leaved palm-trees, usually very tall and beautiful. Palm wine, edible fruits, and useful timber and leaves are produced by *M. vinifera* and *fluexuosa*.

Mauri'tius (formerly *Île-de-France*): one of the Mascarene isles; in the Indian Ocean; 550 miles E. of Madagascar, in lat. 20° 32′ S. and lon. 57° 46′ E., and belonging to Great Britain. Area, 705 sq. miles. Pop. (1890) 377,986. It is of volcanic origin, surrounded with coral reefs, and covered with mountains, not very high—the Montagne de la Rivière Noire (the highest in the island) reaches 2,707

feet, and Peter Botte 2,674 feet—but with the most extraordinary outlines. The valleys contain a very rich soil, and the climate is singularly fine, the heat seldom exceeding 90°. The island is subject to visitation by the typhoons of the Indian Ocean, which have several times been very destructive; on Apr. 29, 1892, a typhoon destroyed a third of St. Louis, killing 1,200 persons. The island was discovered in 1507 by the Portuguese, and colonized in 1598 by the Dutch, who soon left it. In 1712 it was colonized a second time by the French, who kept it till 1810, when it was taken by the British. As a British possession it has become very flourishing; the value of its exports in 1891 amounted to 23,705,238 rupees, or about $8,000,000. Sugar is the principal produce, cultivated by coolies who have been brought from India for this purpose. Coffee and rice are extensively cultivated. The soil is of great fertility. The forests which once covered the island have mostly disappeared. It has two railways from Port Louis, with a total length of 105 miles. The colony of Mauritius includes also the islands of Rodrigues, the Seychelles, Amirantes, Chagos, and Oil groups, and other smaller islands. Total area, 881 sq. miles, with a population of 397,637. The capital is St. Louis, on Mauritius; pop. (1891) 62,046. The population of the colony is more than two-thirds Hindu. See MAURITIUS in the Appendix. Revised by M. W. HARRINGTON.

Maury, mow-ree′, JUAN MARÍA: poet; b. in Malaga, Spain, in 1772; d. in Paris, Oct. 2, 1845. Educated in France and England, he traveled in Italy, and then returned to Spain to take part in the troublous affairs of the period of the French occupation. Having espoused the side of Joseph Bonaparte, and served as deputy in the Cortes of Bayonne, he was obliged to spend his last years in exile in Paris. He published an epic in twelve cantos, *La agresión británica* (Madrid, 1806; reprinted in vol. xxix. of Rivadeneyra's *Biblioteca de Autores Españoles*), an anthology of Spanish poetry with French translations and comments; *L'Espagne poétique* (2 vols., Paris, 1826–27); the romantic and chivalric poem *Esvero y Almedora* (Paris, 1840); and various fugitive poems and philological essays. All these were collected and published in the year of his death, under the title *Poesías castellanas* (3 vols., Valencia, 1845). See also vol. lxvii. of Rivadeneyra's *Biblioteca*, etc.

A. R. MARSH.

Mau′ry, MATTHEW FONTAINE, LL. D.: hydrographer; b. in Spottsylvania co., Va., Jan. 14, 1806; spent his childhood in Tennessee; entered the U. S. navy as midshipman Feb. 1, 1825, serving on board the Brandywine during its voyage to France to convey La Fayette thither, and afterward on the Pacific coast in the same vessel; made a voyage around the world in the Vincennes, during which he began his *Treatise on Navigation* (1835), which has since been a textbook in the U. S. navy and a popular manual for the merchant marine. He became lieutenant June 10, 1836, and was appointed astronomer to the Wilkes exploring expedition in the same year, but resigned before sailing. In 1839 Lieut. Maury met with an accident which resulted in lameness and a consequent permanent disability for active naval service. While confined from this cause he wrote, under the pseudonym *Harry Bluff*, in *The Southern Literary Messenger*, a series of articles entitled *Scraps from the Lucky Bag*, chiefly devoted to the exposure of abuses in the navy. He had previously began an accumulation of hydrographical observations, and on being appointed keeper of charts and instruments at Washington was enabled to enlarge the scope of his researches. In 1844 this bureau was united with the National Observatory, of which Maury was made superintendent. In that year he communicated to the National Institute a paper upon the Gulf Stream and other oceanic currents, in connection with great-circle sailing, which was printed in *The Southern Literary Messenger* under the title *A Scheme for Rebuilding Southern Commerce*. The results of these researches were also embodied in *The Wind and Current Charts* and *Sailing Directions* issued by the observatory. At his suggestion the U. S. Government took the initiative in convoking a general maritime conference, which met at Brussels in Aug., 1853, the chief object of which was the adoption of a common method of hydrographical observation and registry, which was effected by the adoption of a model for a log-book previously (1848) prepared by him. In 1855 Maury's great work, *The Physical Geography of the Sea*, was issued, and at once placed his name at the head of the great scientific department of which it treats. In 1855 he was made a commander, but resigned in 1861 to enter the Confederate service, in which he obtained the rank of commodore; spent a year or two in Europe during the war, at the close of which he took service under the Archduke Maximilian in Mexico as commissioner of emigration. This position proving ephemeral, he again went to Europe, where he resided until 1868, in Russia and in England, engaged in the preparation of a series of textbooks. In 1868 he accepted the professorship of physics in the Virginia Military Institute, declined in 1871 the presidency of the University of Alabama, and died at Lexington, Va., Feb. 1, 1873. See Mrs. Fontain Maury Corbin, *Life of Matthew Fontaine Maury* (London, 1888).

Mausole′um [= Lat. = Gr. *μαυσωλεῖον*, liter., tomb of Mausolus, deriv. of *Μαύσωλος*, Mausolus]: the tomb of Mausolus, Satrap and King of Caria; erected at Halicarnassus by Artemisia, his widow, in 353 B. C. It is often referred to by ancient writers as one of the Seven Wonders of the world, and it surpassed all other structures of the kind so much by its magnificence that the name of mausoleum came to be the generic term for a costly tomb. The architects were Satyrus and Pythius; the artists who executed the sculptures of the four sides were Scopas, Bryaxis, Timotheus, and Leochares. The sculptures are discussed in every history of Greek art. Pliny gives a minute description of it. It remained standing and in good condition until the twelfth century, but gradually it fell into decay. One part of it seems to have been destroyed by an earthquake; when in 1402 the Knights of Rhodes took possession of Halicarnassus, and built a castle there, they gathered their materials from the mausoleum, and continued to use it as a quarry until 1522, when most of the sculptures were converted into lime; finally, the Turks disturbed the building so completely that even the site of it was forgotten. In 1857, however, the excavations of Newton, undertaken under the auspices of the British Government, brought to light the site and fundamental outlines of the building, and so many fragments were found that it seems possible to make a complete ideal reconstruction of the whole structure. The sculptures, including the statue of Mausolus, unearthed by Newton, are now on exhibition in the British Museum.

LITERATURE.—Newton, *History of the Discoveries at Halicarnassus, Cnidus, and Branchidæ* (London, 1862–63), and his *Travels and Discoveries*; Ross, *Kleinasien und Deutschland* (Halle, 1850); *Bulletin de Correspondance Hellénique*, xiv., pp. 9–118; *Philologische Wochenschrift* (1890), p. 1126.

Mauso′lus (in Gr. *Μαύσωλος*): son of Hecatomnus, Persian Satrap of Caria, all of whose five children (three sons and two daughters) ruled independently over Caria. Mausolus married his own sister, Artemisia, and succeeded his father as Satrap of Caria, which he ruled for twenty-four years. At that time the capital of Caria was Mylasa, from which point Mausolus extended his power over Lycia, several of the Grecian islands, and toward the N. His wealth, gained by shrewd politics and violence, was said to equal that of Crœsus of old. He removed the seat of government to Halicarnassus, which he beautified and greatly enlarged by colonizing it with the people of six neighboring cities. He threw off the Persian yoke, supported the oligarchy in Rhodes, and induced Rhodes, Chios, etc., to revolt from Athens. He was a patron of literature, art, and science; Eudoxus came to the court of Mausolus, and upon the latter's death, Artemisia offered a prize for the best panegyric of him. Theodectes, Naucrates, Isocrates, and Theopompus competed for the prize, which was awarded to Theopompus. Theodectes wrote a tragedy entitled *Mausolus* in his honor, the first historical tragedy ever written. Mausolus was succeeded by his wife, Artemisia, who ruled over Caria from 353–351 B. C. See MAUSOLEUM.

J. R. S. STERRETT.

Mauston: city; capital of Juneau co., Wis. (for location of county, see map of Wisconsin, ref. 6–D); on the Lemonweir river, and the Chi., Mil. and St. P. Railway; 124 miles W. of Milwaukee. It has abundant water-power, several flour and grist mills, foundry and machine-shops, sawmills, barrel and carriage factories, and three weekly newspapers. Pop. (1880) 1,013; (1890) 1,343; (1900) 1,718. EDITOR OF "STAR."

Mauthner, mowt′ner, LUDWIG, M. D.: ophthalmologist; b. at Prague, Bohemia, Apr. 13, 1840; graduated M. D., University of Vienna, in 1861; was docent for diseases of

the eye 1864–69; was Professor of Ophthalmology at the University of Innsbruck from 1869–77; in 1877 accepted the same chair in Vienna. He has been an ardent student in his special field. Among his works are *Lehrbuch der Ophthalmoscopie* (Vienna, 1868); *Vorlesungen über die optischen Fehler des Auges* (Vienna, 1872); *Die Lehre vom Glaucom* (1882). S. T. Armstrong.

Mauthner, Ludwig Wilhelm Ritter von Mauthstein, M. D.: pædiatrist; b. at Raab, Austria, Oct. 14, 1806; studied in Vienna, graduating M. D. in 1831; entered the medical corps of the Austrian army as *Oberfeldarzt*, and was promoted *Regimentsarzt* for his services in a cholera and typhus epidemic in the military hospital; in 1837 settled in Vienna, devoting himself to diseases of children, and, with the assistance of the empress, founded the St. Anne Hospital. In 1844 he opened the first clinic for children's diseases. In 1850 he was made Professor of Pædiatries at the university. In 1849 he was elevated to the nobility. His best-known works are *Die Krankheiten des Gehirns und Ruckenmarks bei Kindern* (Vienna, 1844); *Kinder-Diätetik* (Vienna, 1853). D. Apr. 8, 1858.
S. T. Armstrong.

Mauvaises Terres, mō′vāz′tār′: See Bad-lands.

Mavors: See Mars.

Mavrocorda′tos, Alexander: soldier and statesman; the noblest and the most prominent figure of the Greek revolution, "the Washington of modern Greece"; b. in Constantinople, Feb. 11, 1791. He received a careful education; in 1817, as secretary of his uncle, John Caradja, hospodar of Wallachia, he went to Bucharest. There he learned diplomacy. A natural linguist, he early mastered Greek, Turkish, Persian, French, and Italian, and later acquired English and German. Ardently patriotic, he declined the flattering offers made him by Alexander I. of Russia, and devoted himself to Greece in the revolution just beginning against the Ottoman Government. He expended his entire fortune in equipping a vessel and arming volunteers. Appointed president of the executive council, he signed the proclamation of Greek independence and drew up the provisional Greek constitution. Factional dissensions were paralyzing the efforts of the Greeks, and he resigned his office, hoping that thus he might contribute to harmony. Lord Byron realized his worth and offered the Greeks £4,000 sterling toward the expenses of the war if they would place him again at the head of affairs. As a soldier Mavrocordatos rendered distinguished service in several battles, and at the defense of Missolonghi, Navarino, and Sphacteria. After the independence of Greece was acknowledged, he was head of the ministries of 1833, 1841, 1844, and 1854, and in the intervals filled various positions as ambassador. He was active in promoting popular education. He belonged to the British in distinction from the Russian party. D. Aug. 18, 1865. E. A. Grosvenor.

Mawe, John: mineralogist; b. in Derbyshire, England, in 1764. In 1804 he went to the Rio de la Plata; was imprisoned at Montevideo as a British spy, and after his release was attached to Whitelock's staff in the campaign against Buenos Ayres. From 1807 to 1811 he traveled in Brazil, where he was given the privilege—at that time rare—of visiting the gold and diamond mines. His *Travels in the Interior of Brazil*, etc. (1812), had a wide circulation, and has been several times reprinted. He also published *The Mineralogy of Derbyshire* (1802); *Diamonds and Precious Stones* (1813), etc. In his later years he was a noted practical mineralogist in London, where he died Oct. 26, 1829. H. H. S.

Max, Gabriel: historical, genre, and portrait painter; b. at Prague, Bohemia, Aug. 25, 1840. He studied at the Prague and Vienna Academies and with Piloty in Munich; became professor in the Munich Academy in 1883, and has received various medals at German exhibitions. His *Christ Healing a Child* (1884) is in the National Gallery, Berlin, and *The Last Token* (1874) is in the Wolfe collection, Metropolitan Museum, New York. Studio in Munich.
W. A. C.

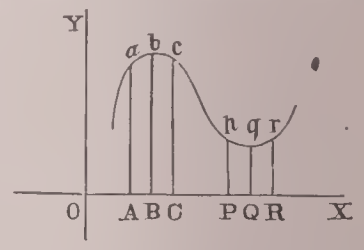
Maxen′tius, Marcus Aurelius Valerius: Roman emperor (306–312); son of Maximianus, son-in-law of Galerius, and brother-in-law of Constantine. On the division of the empire in 305 he received nothing, but was made emperor by an insurrection at Rome the following year. Of the rival emperors, he put Severus to death, defeated Alexander in Africa, and banished his father Maximianus. Soon, however, he declared war against Constantine, alleging as his reason that Constantine had caused the death of Maximianus. Defeated at Saxa Rubra, he endeavored to reach Rome, but was drowned in the Tiber, Oct. 27, 312. E. A. G.

Maxey, Samuel Bell: See the Appendix.

Maxfield, Thomas: preacher; b. in England about 1720; was one of Wesley's converts at Bristol, and subsequently was appointed "to pray and expound the Scriptures, but not to preach," at the Foundry church, London, during Wesley's absence. In contravention to his instructions he soon began to preach with great fervency and success, and Wesley, after hearing one of his sermons, gave him permission to preach. He thus became the first Methodist itinerant lay-preacher. Later he was ordained by the Bishop of Londonderry, attended the first Methodist conference at the Foundry June 25, 1744, and the third conference at Bristol 1746; suffered imprisonment and persecution; became separated from Wesley about 1764, in consequence of a doctrinal schism, and in company with Bell set up a congregation with 170 members, who seceded from the Foundry church. He preached for twenty years longer, and was visited and comforted by Wesley many years later when sinking under paralysis. D. at London in 1785. Revised by A. Osborn.

Max′ima and Min′ima [Lat., neut. plurs. of *ma′ximus*, greatest, superl. of *mag′nus*, great, and *mi′nimus*, least, smallest, superl. of *par′vus*, small]: a function of a single variable is at a *maximum* state when it is greater than the states that immediately precede and follow it; it is at a *minimum* state when it is less than the states that immediately precede and follow it. The terms greater and less are to be understood in their algebraic sense; that is, greater means nearer to $+\infty$, and less means nearer to $-\infty$. It may be shown that every function of one variable may be represented by the ordinate of some curve of which the independent variable is the corresponding abscissa; this curve is called the curve of the function. It may also be shown that the value of the first differential coefficient of the function for any value of the variable is equal to the tangent of the angle which a tangent line to the curve of the function, at the corresponding point, makes with the axis of abscissas. The tangent of this angle is called the *slope* of the curve.

Let *acpr* be the curve of any function, referred to the axes *OX* and *OY*, and suppose the ordinate *Bb* to be greater than *Aa* and *Cc*, *AB* and *BC* each being equal to dx; also suppose that the ordinate *Qq* is less than *Pp* and *Rr*, *PQ* and *QR* being equal to dx; then is *Bb* a maximum and *Qq* a minimum, the former corresponding to the abscissa *OB* and the latter to the abscissa *OQ*. An examination of the figure shows that a tangent to the curve at *a* slopes upward, and that a tangent at *c* slopes downward; in the former case the first differential coefficient is + just before reaching a maximum ordinate, and − just after passing it; that is, it changes sign from + to − in passing over a maximum. In like manner the first differential coefficient changes from − to + in passing over a minimum ordinate. In the case represented in the figure the differential coefficient corresponding both to a maximum and to a minimum is equal to 0. From what precedes we have the following rule for finding all the maximum and minimum states of any function of one variable: *Rule.* Find the first differential coefficient of the function, place it equal to 0, and solve the resulting equations with respect to the independent variable. The values thus found will embrace all that correspond either to maximum or minimum values of the function, and they may embrace other values. Then test each value by forming the second derivative of the function, and substituting in it the values of x, which reduce the first derivative to zero. If the result is *positive*, the function is a *minimum* for this special value of x; if negative, a maximum. If zero, we must proceed as follows: Substitute each root in the successive differential coefficients of the function until one is found that does not reduce to 0; if this is of an even order and *negative*, the root corresponds to a maximum, but if it is of an even order and *positive*, the root corresponds to a minimum. In all other cases the root corresponds to neither a maximum nor a minimum. Thus in the first example above given the second differential coefficient is + 2, which is positive for all values of x; hence $x = 1\frac{1}{2}$ corresponds to a minimum.



Revised by S. Newcomb.

Maximian II.: See GALERIUS.

Maximia'nus: a Latin poet from Etruria of the sixth century, by whom six love elegies, containing in all 686 lines, are extant. Although marked by occasional coarseness, the language and meter is for the period exceptionally good, and the author shows acquaintance with earlier elegiac and lyric poets and with Vergil. The best edition is by M. Petschenig (Berlin, 1890). See also articles by Robinson Ellis *On the Elegies of Maximianus* in *The American Journal of Philology*, vol. v., 1–15 and 145–163. M. WARREN.

Maximil'ian I.: Emperor of Germany; b. at Neustadt, near Vienna, Mar. 22, 1459; succeeded his father, Frederick III., as Emperor of Germany in 1493. Many of the most prominent events of his history are more or less intimately connected with his marriages and those of his children. After the death of Charles the Bold in 1477, he married the latter's daughter and sole heiress, Mary, thus securing Burgundy for his house. Mary died in 1482, and in 1493 Maximilian married Bianca Sforza, a daughter of Galeazzo Maria, Duke of Milan, who had been murdered in 1476. This marriage involved him in wars with Venice, Milan, the pope, Naples, France, and Spain. His participation, however, in the League of Cambray and in the Holy League, and his many Italian campaigns, were not of much consequence; nor was he successful in his attempt to hold Switzerland within the empire. He always lacked money and could form only a small and ineffective army. He was, however, most successful in aggrandizing the house of Austria. The marriage of his son Philip with the Infanta Joanna in 1496 united Spain to the possessions of the house of Hapsburg, and he laid the foundation for the annexation of Hungary to the Austrian crown by marrying his grandchildren into the royal family of that country. He died at Wels, Upper Austria, Jan. 12, 1519. His government of Germany showed his desire to escape from the anarchy and confusion that had marked the government of his predecessors. In his first diet, 1495, a perpetual national peace was decreed, putting an end to the private war within the empire. In the same year he established the imperial chamber (*Reichskammergericht*), and in 1501 the imperial Aulic council, insuring a higher degree of public security throughout the realm. See Ulmann, *Kaiser Maximilian I.* (1884); Kirchlechner, *Maximilian I. als Jäger* (1887); and Adler, *Die Organisation der Zentralverwaltung unter Kaiser Maximilian I.* (1886). F. M. COLBY.

Maximilian II.: Emperor of Germany; b. in Vienna, Aug. 1, 1527; succeeded his father, Ferdinand I., as emperor in 1564. Although he had spent several years at the court of Madrid, he was favorable to the Reformation, and it was even hoped that he might join the Protestant Church. This, however, he did not do, but he showed himself very tolerant. Protestants were appointed to government offices in Austria, and the evangelical theologian, Chytræus, from Rostock, was called to Vienna to arrange the Protestant service. On the other hand, he allowed the Jesuits free scope for their activity, and they gained great influence even in his own family. D. Oct. 12, 1576.

Maximilian, FERDINAND MAXIMILIAN JOSEPH: Archduke of Austria, and during three years Emperor of Mexico; b. in Vienna, July 6, 1832. He was the second son of the Archduke Franz Karl, and brother of Franz Josef who became Emperor of Austria in 1848; was carefully educated; entered the navy in 1846, and in 1854 became rear-admiral and commander-in-chief. In 1856 he visited Napoleon III. in Paris, and the intimacy then formed led to the most important results. In 1857 he married Marie Charlotte Amélie, daughter of King Leopold I. of Belgium, and for the next two years was Viceroy of Lombardy and Venice, where he gained great and deserved honor for his enlightened measures. After a visit to Madeira and Brazil he took up his residence at the palace of Miramar, near Trieste. His great popularity led to intrigues for placing him on the Austrian throne by revolutionary means, but these came to nothing. Late in 1861 a combined French, Spanish, and British force invaded Mexico, ostensibly to secure the rights of foreign creditors of that country; but it is now known that Napoleon III. contemplated from the first the establishment of a Mexican empire under French protection, and it is probable that the Archduke Maximilian was even then cognizant of the scheme, and had secretly agreed to accept the Mexican throne under certain conditions. Great Britain and Spain, so far as known, gave no countenance to the plot, and their forces were soon withdrawn from Mexico. The French, at first repulsed from Puebla (May 5, 1862), eventually took that place and Mexico (May–June, 1863), and established a provisional government. President Juarez was driven into the northern states. Disgusted by the endless civil wars and despairing of a stable government of their own, a large and influential portion of the people looked to the restoration of an empire under the rule of a foreigner as the only way out of their difficulties. In July, 1863, an assembly of notables offered the imperial crown to Maximilian, who after some hesitation accepted it Apr. 10, 1864. Maximilian was obliged by his new position to abdicate his rights of succession to the Austrian throne. He was given assurance from France of aid to establish his empire on a solid basis, and this was backed by a loan for immediate needs. Austrian and Belgian legions were formed; and after receiving the pope's blessing he and his wife set out for Mexico, landing at Vera Cruz May 28, 1864. They were welcomed at Cordoba, Orizaba, Puebla, and especially at Mexico with great apparent enthusiasm. In Apr., 1865, a provisional constitution was granted, and to insure succession to the throne (Maximilian and Carlota being childless) they adopted the infant grandson of the ex-Emperor Iturbide. The very independence shown by Maximilian tended to alienate political support. While his friends were falling away from him, his open enemies, who still held out in the north under Juarez, were gathering force, and they were supported by guerrilla bands in almost every state. Juarez having been driven over the frontier, Maximilian issued a decree (Oct. 2, 1865), in which he declared that no further legal pretense existed for resistance to the empire, and insurgents would henceforth be treated as bandits and executed. This decree was no more severe than various others which appeared during the civil wars in Mexico; but, coming from a foreigner, it raised a storm of indignation, the more so as advantage was taken of it soon after to execute some republican prisoners of rank. The evident favor which the emperor showed to French officers also excited much criticism; an instance occurred at the marriage of Marshal Bazaine to a Mexican lady, when he was presented with government property to the value of $100,000. The U. S., while professing and maintaining neutrality between the Mexican factions, steadily refused to recognize the empire so long as it was supported by France; moreover, it could not prevent the sympathy and financial support given by its people to the republicans. As soon as the close of the civil war left it free to act, the Washington Government intimated through its minister at Paris that the presence of French troops in Mexico was distasteful; this was emphasized by a significant massing of U. S. forces in Texas (July–Aug., 1865). After a number of diplomatic notes had been exchanged, Secretary Seward insisted (Feb. 12, 1866) that the French forces should be withdrawn, and to this Napoleon III. finally acceded, though in doing so he directly violated his agreement with Maximilian. In Mar., 1867, the last French troops left Vera Cruz. Long before this the republicans had been regaining ground in the north, and the imperial government, without any real support, was placed in great straits by its ruinous financial measures. Maximilian, plainly seeing that his throne could not stand alone, was on the point of resigning, a step which Bazaine himself had advised before he left; but the representations of the churchmen and politicians and an exaggerated sense of honor induced him to remain. In Feb., 1867, he took personal command of the army at Querétaro, Miramon, Marquez, Mejía, and Arellano being his principal lieutenants. The city was speedily invested by a republican army under Escobedo, and after a long siege and several bloody assaults it fell, partly through the treachery of an imperialist officer. Maximilian, scornfully refusing opportunities for escape, surrendered May 15. He was tried by a court martial and condemned to death with his principal officers; all efforts to obtain a reprieve or pardon were refused on the ground that he had forfeited indulgence by his severe decree against the Juarists; and he was shot at Querétaro, with his generals Miramon and Mejía, June 19, 1867. He met his fate with his usual chivalric courage. The ex-emperor's remains were surrendered to his family in the following year, and were buried with impressive ceremonies in the cathedral at Vienna, Jan. 18, 1868.—His wife, CHARLOTTE MARIE AMÉLIE (called CARLOTA by the Mexicans), was born at Brussels, June 7, 1840, and married July 27, 1857. In Mexico she was noted for her support of charitable measures, as well as for her winning manners; she strongly opposed sanguinary measures. In July, 1866, she went to France in the vain hope of inducing Napoleon III. to continue his support of Maximil-

ian. The French emperor received her coldly, refused, almost with insult, to fulfill his pledges, and finally dismissed her, it is said, by asking what route she preferred to take out of France. Carlota then went to Rome to seek the intervention of the pope, but received no encouragement, and her disappointment and forebodings brought on an attack of brain fever which left her hopelessly insane. She was not informed of her husband's death. Taken to Miramar and thence to Brussels, she has been kept in strict seclusion. See Bancroft, *History of the Pacific States: Mexico* (vol. vi., 1888); Keratry, *Kaiser Maximilian's Erhebung und Fall* (1868); Salm-Salm, *My Diary in Mexico* (1868); Hall, *Life of Maximilian I.* (1868); Arangoiz, Alaman, and other Mexican historians. H. H. Smith.

Maximi'nus, Caius Julius Verus: Roman emperor from 235 to 238; b. in the latter part of the second century, of barbarian parentage; attracted the attention of Septimius Severus by his strength and gigantic stature; was allowed to enlist in the cavalry, and was promoted by Caracalla; enjoyed the confidence of Alexander Severus, who intrusted him with the organization of a corps of soldiers destined for an invasion of Germany, and was proclaimed emperor by this army on the assassination of Severus. His campaigns against the Germans were successful, but his suspicion, rapacity, and cruelty knew no bounds. An insurrection in Africa and the sympathy it found in Italy threw him into a fit of frenzy. He hastened across the Julian Alps, but was stopped at Aquileia, and while besieging this city was killed by his own soldiers and his head sent to Rome.

Maxims, Legal: brief and epigrammatic expressions of general principles, either of justice, expediency, or policy, which, in their application by the courts to the innumerable varieties of facts and circumstances brought before them in judicial controversies, have furnished special rules for the decision of such disputes. These statements fulfill the same office for courts and lawyers which the ordinary popular proverbs have subserved for the community at large. It is impossible in most cases to trace them to their immediate authors. A considerable number came to us from the writings of Roman jurists; others were struck out and put into a permanent shape by the genius of some old English judge, and since they were either thus taken directly from the repositories of the Roman law, or else were invented during that ancient period of English history in which the Latin was the common tongue of all learned men, and especially of courts and judicial proceedings, they are all expressed in that language. They are very numerous, there being in all about 2,000, many of which, however, are now of no importance. The range of particular subjects over which they extend is also very wide, reaching from the principles fundamental to the science of government on the one hand, to those relating to the practical details and affairs of everyday life and the common rights and duties of person, property, and contract, on the other. See Broom's *Legal Maxims* and Noy's *Maxims*.

Maximum Alloys: See Bronze (*Bronze-brass alloys*).

Maxwell, George Troupe: See the Appendix.

Maxwell, James Clerk, LL. D., F. R. S.: physicist; b. at Edinburgh, Scotland, June 13, 1831; educated at the Academy and University of Edinburgh; graduated at Cambridge 1854; Professor of Natural Philosophy in Marischal College, Aberdeen, 1856–60, and at King's College, London, 1860–65, and became in 1871 Professor of Experimental Physics at Cambridge. D. Nov. 5, 1879. His writings on physics are of a very high order, and include an *Essay on the Stability of the Motion of Saturn's Rings* (1859), *Theory of Heat* (1871), and a *Treatise on Electricity and Magnetism* (2 vols., 1873). The last is the crowning work of his life, and is regarded as a classic on the subject of which it treats. By introducing the conception of a strain of a medium he constructed a theory of electricity in which the mysterious and unmeaning "action at a distance" has no place. He also devoted attention to the perception of color, and was the first to make color-sensation the subject of measurement. He made many investigations on the kinetic theory of gases; he discovered that viscous fluids, while yielding to stress, possess double refraction, and he published a great number of papers on other subjects. He took a prominent part in the construction of the British Association unit of electrical resistance, and in the writing of its reports on the subject. It may be said that the high position accorded to the study of physics at Cambridge is almost entirely due to his impulse. His *Scientific Papers* were edited by W. D. Niven (8 vols., Cambridge, 1890), and his *Life* has been written by L. Campbell and W. Garnett (1882).

Revised by R. A. Roberts.

Maxwell, Mary Elizabeth (*Braddon*): novelist, whose pen-name is *M. E. Braddon*; b. in London in 1837. She is the author of several plays and about sixty novels, some of which have passed through many editions, and is the editor of *The Mistletoe Bough*, a Christmas annual. She was married in 1874 to John Maxwell, a London publisher (d. Mar. 30, 1895). Among her novels are *Lady Audley's Secret* (1862); *Aurora Floyd* (1863); *The Lovels of Arden* (1871); *Ishmael* (1884); and *One Life, One Love* (1890).

Maxwell, William H.: See the Appendix.

Maxwell, William Hamilton: author; b. at Newry, Ireland, in 1794; graduated with honors at Trinity College, Dublin; studied theology; took orders in the Church of England, and in 1820 was presented with the prebend and rectory of Ballagh in Connaught. As there was not a single Protestant in the parish, the rector enjoyed abundant leisure, which he devoted to field-sports and to literature. He wrote many successful sketches of country life and adventure, and was the chief originator of the school of military novels. Among his numerous works were *Stories of Waterloo* (1829); *Stories of the Peninsular War* (1837); *Victories of the British Army* (1839); *Rambling Recollections of a Soldier of Fortune* (1842); *The Fortunes of Hector O'Halloran* (1844); and *History of the Rebellion in Ireland in 1798* (1845). Maxwell was a frequent contributor to *Bentley's Miscellany* and to *The Dublin University Magazine*. D. Dec. 29, 1850. See biographical sketch prefixed to *Rambling Recollections*.

Maxwell, Sir William Stirling, Bart., LL. D.: b. at Kenmure, near Glasgow, Scotland, in 1818; was known by the name of Stirling until 1866, when by the death of Sir John Maxwell, his maternal uncle, he succeeded to a baronetcy, and assumed the name of Maxwell. He graduated at Cambridge (1839), and devoted several years of residence and research in Spain and France to the history, literature, and art of Spain at the close of the mediæval period. He was the author of the valuable works, *Annals of the Artists of Spain* (3 vols., 1848), *Cloister Life of Charles V.* (1852), and *Velasquez and his Works* (1855); was elected to Parliament for Perthshire 1852, and represented that borough most of the time for more than twenty years; was rector of the University of St. Andrews 1863, of that of Edinburgh 1872, and elected chancellor of that of Glasgow Apr. 28, 1875. D. in Venice, Jan. 15, 1878.

May [from Lat. *Maius* (sc. *men'sis*, month), liter., month of *Maia* (= Gr. Μαῖα), daughter of Atlas, and mother of Mercury by Jupiter]: the fifth month of the year in the Gregorian calendar, consisting of thirty-one days, was by the ancient Saxons called *threo-meolee*, three-milk month, because in this season cows were milked three times a day. During the Middle Ages the month of May was generally ushered in by some popular merriment, but it is not clear whether this custom, which was found among all European nations, had any connection with the Roman festival of *Floralia*, beginning Apr. 28 and continuing for several days, or whether it sprang up spontaneously from joyous feelings on the arrival or approach of spring. In England the going out a-Maying was a very common custom in former days; Chaucer and Shakspeare mention it; Henry VIII. and Queen Catharine of Aragon followed it. On May 1, before sunrise, all the young folks repaired to the groves to gather flowers and branches with young foliage. With these the doors and windows of the houses and the Maypole of the village were adorned, and the day was spent in dancing around the pole. To preside at the festival a queen of May, the most beautiful girl of the village, was chosen in England; in Germany, a count of May, the wittiest and handsomest youth; and the life at court and in the castle was imitated in the village streets by the peasants, probably not altogether without satire. With the Puritans the Maypoles and all the merriment connected with them disappeared in England. In Germany and Scandinavia the custom is dying out, though in Denmark the peasants still turn out on May 1 early in the morning to see "the sun dance," and in Stockholm great popular rejoicings take place in Djurgården. In the Highlands of Scotland the day was formerly celebrated as *Bel-tein* day; a fire was made, and certain ceremonies were performed which were supposed to have had a reference to the worship of Baal, who was regarded as a personification of the sun. In Vienna the em-

peror, the empress, and the court drive through the Prater, and the whole city turns out to look at the spectacle.

May, Edward Harrison: figure and portrait painter; b. in England in 1823; was taken by his parents to the U. S. in 1834, and became a pupil of Daniel Huntington in New York; entered the studio of Couture in Paris in 1851, and resided thereafter in Europe, chiefly in Paris, where he was a regular contributor to the annual salons, and received several medals. *The Dying Brigand* is in the Philadelphia Academy of Fine Arts, and portraits of Count Gasparin and Laboulaye are in the Union Club, New York city. D. in Paris, May 17, 1887. William A. Coffin.

May, John Wilder: lawyer; b. in Attleboro, Mass., Jan. 19, 1819; was educated at Phillips Academy, Andover, Mass., and at the University of Vermont, from which university he graduated in 1846; studied law, and practiced in Roxbury and Boston most of the remainder of his life; was district attorney of the County of Suffolk (including the city of Boston) for six years, and subsequently chief justice of the municipal court of the city of Boston, which latter position he held at his death in Boston, Jan. 11, 1883. He edited *Angell on Limitations*, *Greenleaf on Evidence*, and *Stephen's Digest of Evidence*, and was the author of *The Law of Crimes* (Boston, 1881) and *The Law of Insurance as Applied to Fire, Life, Accident, Guarantee, and other Non-maritime Risks* (Boston, 1873; 3d ed. 1891).
F. Sturges Allen.

May, Samuel, A. M.: reformer; a cousin of Rev. Samuel Joseph May; b. in Boston, Mass., Apr. 11, 1810; graduated at Harvard in 1829; was pastor of a Unitarian church at Leicester, Mass., 1834–46; was general agent and corresponding secretary of the Massachusetts Anti-Slavery Society 1847–61, and for a part of this time held the same offices in the American Anti-Slavery Society; was secretary and agent of the committee which raised a national testimonial of $30,000 for William Lloyd Garrison; was a member of the State Legislature in 1875. After the termination of his ministry he made Leicester his home. Mr. May contributed for many years to *The Liberator* and *Anti-Slavery Standard*. He published *The Fugitive Slave Law and its Victims*, and in the *Memoir of James Freeman Clarke* a chapter on his anti-slavery work. D. Nov. 24, 1899.

May, Samuel Joseph: reformer: b. in Boston, Mass., Sept. 12, 1797; graduated at Harvard College in the class of 1817; studied for the ministry; was ordained in Chauncy Place church, Boston, Mar. 14, 1822; was settled immediately at Brooklyn, Conn.; was installed pastor of a church at South Scituate Oct. 26, 1836; in 1842 accepted the charge of the State Normal School at Lexington; in 1845 removed to Syracuse, N. Y., to become pastor of the Unitarian Society there, and remained till his death July 1, 1871. His health became so feeble that in the autumn of 1867 he resigned his ministry, but became a missionary throughout Central New York for the American Unitarian Association. Mr. May was one of the first and one of the most uncompromising advocates of the abolition of slavery, an ardent and enlightened philanthropist. As a writer he is chiefly known by a series of papers recording his *Recollections of the Anti-Slavery Conflict*. A memoir of Mr. May, prepared by T. J. Mumford, was published in Boston in 1873.

May, Thomas: historian and poet; b. at Mayfield, Sussex, England, in 1594; was educated at Sidney-Sussex College, Cambridge, and graduated 1612; began the study of law at Gray's Inn, London, but was never admitted to the bar; inherited a considerable estate on the death of his father, Sir Thomas May (1616), when he began to figure at court and in literary circles as a wit and a brilliant genius; became a favorite of Charles I.; published poetical translations of Vergil's *Georgics* (1622) and Lucan's *Pharsalia* (1627), to which he added a *Continuation* (1630), also in verse, bringing the history down to the death of Cæsar, and afterward translated this continuation into Latin hexameters, published under the title *Supplementum Lucani Libri VIII.* (Leyden, 1640; frequently reprinted). During his period of favor at court he produced five dramas, and by request of Charles I. wrote the historical poems, *The Reign of King Henry II.* (1633) and *The Victorious Reign of King Edward III.* (1635). For some unknown reason, May abandoned the royal cause at the outbreak of the great rebellion, offered his services to the "Long Parliament," and obtained the double office of secretary and historiographer. In the latter capacity he published *The History of the Parliament of England which began Nov. 3, 1640; with a Short and Necessary View of some Precedent Years; published by authority* (1647), which concludes with the battle of Newbury in 1643; in a Latin translation May brought down the narrative to the death of Charles I., and afterward wrote an English epitome with the title *A Breviary of the History of the Parliament of England* (1650). May was also the author of several political tracts, translated by request of Charles I. the poetical portions of John Barclay's famous allegorical romance, the *Argenis* (1628), and left in MSS. a tragedy entitled *Julius Cæsar*. D. in London, Nov. 13, 1650. Revised by H. A. Beers.

May, Sir Thomas Erskine, Baron Farnborough: jurist and historian; b. in England in 1815; was educated at Bedford School; entered the civil service of the crown in 1831 as assistant librarian of the House of Commons; was called to the bar at the Middle Temple 1838; published *A Treatise on the Law, Privileges, Proceedings, and Usage of Parliament* (1844), which was adopted as a parliamentary textbook, and as such translated into German and Hungarian; reduced to writing for the first time in 1854 the *Rules, Orders, and Forms of Proceeding of the House of Commons*, adopted and printed by command of the House; wrote other tracts on legal and parliamentary subjects; contributed biographies and articles on political economy to *The Penny Cyclopædia*, and published a *Constitutional History of England since the Accession of George III.* (3 vols., 1861–63; 3d ed., revised, 1871), reprinted in the U. S. and translated into French and German. He continued more than forty years in the service of the House of Commons in different capacities; was knighted 1866; became clerk of the House 1871; retired from office in 1886, and soon after was raised to the peerage as Baron Farnborough. His last work was *Democracy in Europe: a History* (2 vols., 1877). D. May 18, 1886.

Māyā: a Sanskrit term employed in different senses in the Puranic mythology, in the Buddhistic legends, in the Vedanta philosophy, and in some of the modern sectarian theologies of India. Originally it was the name of a goddess, the wife of Brahmā, who, through her, created the universe; hence when the universe came to be regarded as unreal, its creation was necessarily the work of illusion, which being personified in the goddess, her name became in late Sanskrit a synonym for "illusion," and it has preserved nearly the same mythical sense in the modern theologies. Gautama the Buddha was the son of Māyā, wife of the Prince of the Sakyas. See Buddhism and Gautama.

Mayagüez, mäă-yaa'goo-äth: a town and port of call of the island of Puerto Rico, West Indies; on a bay of the west coast; 70 miles W. S. W. of San Juan (see map of West Indies, ref. 6–J). The harbor is large and shallow, steamers anchoring a mile from the shore. The principal exports are coffee and oranges. Pop. 20,000. H. H. S.

Mayapan: See Central American Antiquities.

May-apple: the common name of a perennial herb, indigenous to the U. S. (the *Podophyllum peltatum*), once referred to the *Ranunculaceæ*, or thought to be the type of a separate natural order, now recognized as belonging to the *Berberidaceæ*. It has also received the name of *mandrake*, but improperly. From a perennial creeping rhizome a slender stem about a foot high rises, which forks near the top into two petioles, each surmounted by a large peltate leaf. At the crotch of the division appears a solitary white flower. The fruit of the may-apple is yellowish and fleshy, and about the size of a pigeon's egg. It is somewhat acid and mawkish in flavor, but may be eaten freely. The dried rhizome constitutes the drug *podophyllum*. Its virtues depend on a duplex resin improperly called *podophyllin*, which is obtained in the form of a light brownish-yellow powder. This resin is a rough and harsh drastic purgative, which seems, like calomel, to include the upper part of the small intestine in its action, and thus to bring away a good deal of bile in the dejections. Hence it has been called "vegetable mercury." In overdose, like all the drastic cathartics, it may cause serious irritation, and even inflammation of the intestinal canal, with severe purging, nausea, and vomiting. Resin of podophyllum is used in small dose in many digestive derangements with constipation and clay-colored stools, and in full dose as an active purge. In the latter case some anodyne extract is commonly combined with it to correct the griping. Revised by H. A. Hare.

Mayas: See Indians of Central America.

May-bug: See Cockchafer.

May, Cape: See Cape May.

Mayence: See Mentz.

Mayenne, mī'en': department of France, in the basin of the Loire, along the Mayenne. Area, 1,996 sq. miles. The ground is a plain, swelling toward the S. E. into a range of low hills. The soil is fertile, producing grain, flax, hemp, and apples, and yielding coal, iron, marble, and slate. Of the entire area, two-thirds are arable and one-twentieth is wooded. Agriculture is in a very flourishing condition. Linens and cider are the principal manufactures. Pop. (1896) 321,187. Capital, Laval.

May'er, Alfred Marshall: physicist; b. at Baltimore, Md., Nov. 13, 1836; was educated at St. Mary's College, Baltimore; devoted his attention to the physical sciences, in which department he became professor in the University of Maryland 1856–58, in Westminster College, Mo., 1859–61, in Pennsylvania College, Gettysburg, 1865–67, in Lehigh University, Pa., 1867–70, and in the Stevens Institute of Technology, Hoboken, N. J., since 1871. He spent a year (1863–64) in scientific studies at the University of Paris. At Lehigh University he made a series of observations of Jupiter; was at the head of the expedition which observed the total eclipse of the sun at Burlington, Ia., Aug. 7, 1869, securing forty-one perfect photographs; began at Hoboken an important series of researches in acoustics, which led to several important discoveries; was in 1873 one of the editors of *The American Journal of Science and Arts*. He published numerous scientific papers, containing his original researches in all departments of physics, and wrote several books, including *Sport with Gun and Rod in American Woods and Waters* (New York, 1883). D. at Maplewood, N. J., July 13, 1897.

Mayer, Brantz: author; b. in Baltimore, Md., Sept. 27, 1809. He studied at St. Mary's College; traveled in the East, and on his return entered the law department of the University of Maryland. In 1829 he was admitted to the bar. Subsequently he was editor of *The Baltimore American*, and in 1841–42 secretary of the U. S. legation in Mexico, traveling extensively in that country. During the civil war he was a strong Unionist, and was commissioned colonel in the Federal army. He published *Mexico as it Was and Is* (1844); *History of the War between Mexico and the United States* (1848); *Mexico, Aztec, Spanish, and Republican* (2 vols., 1853; his best work); *Captain Canot*, a novel (1854), etc. D. in Baltimore, Feb. 23, 1870. H. H. Smith.

Mayer, Constant: See the Appendix.

Mayer, mī'er, Johann Friedrich: theologian; b. at Leipzig, Dec. 6, 1650; studied theology in his native town and at Strassburg; was appointed superintendent at Leisnig in 1673, and at Grimma in 1679, and became in 1684 fourth Professor of Theology at the University of Wittenberg. He was a man of great mental vigor and possessed of a powerful eloquence; his lectures attracted large audiences, but his ambition and greed and certain scandalous disturbances in his domestic life made it difficult for him to remain in Wittenberg, and in 1686 he accepted a position as preacher at St. Jacob's church in Hamburg. He had received his first religious inspiration from Spener, but even while in Wittenberg a certain coolness arose between them, and when Mayer went to Hamburg and found his three colleagues in the ministry, Horbius, Winkler, and Hinckelmann, all more or less influenced by the pietism of Spener, he at once assumed a polemical attitude against this religious movement, and became in a short time famous, or rather notorious, on account of his polemics. By his singularly impressive eloquence he roused the mob of Hamburg to such a pitch of fanaticism against everything which looked like pietism or Spencrism that Horbius fled for his life and his house was razed to the ground, the senate being unable to defend either his life or his property; the emperor himself had to interfere. In 1688, while still pastor in Hamburg, he was appointed honorary Professor of Theology at Kiel, and discharged the duties of both positions, though the distance between the two places where he had to preach and to lecture could not be traversed in one day. In 1701 Charles XII. appointed him first Professor of Theology at the University of Greifswald, and superintendent-general of Pomerania and Rugen; and in this position he died at Stettin, May 30, 1712. His works, numbering in all 378, have no theological worth, but give an interesting picture of the circumstances and characters of the age in which he lived.

Revised by S. M. Jackson.

Mayer, Johann Tobias: one of the most celebrated astronomers of the eighteenth century; b. Feb. 17, 1723, at Marbach, Würtemberg; was principally self-educated; at twenty-two published a treatise on curves for the construction of problems in geometry; in 1751 was appointed professor in the university and director of the observatory at Göttingen, where, during the Seven Years' war, the French troops made the basement of his observing-tower a powder-magazine. Every evening Mayer passed through this magazine with a lantern. At the other extremity of the town the Saxons had established a similar magazine in a similar tower, and one evening this blew up with a frightful explosion, in which seventy persons perished. Mayer continued, nevertheless, his observations, disregarding the danger so startlingly illustrated; and it was under circumstances so unfavorable that he prosecuted the work of preparing his catalogue of zodiacal stars which has been of such value to modern astronomy. He published also tables of the sun and of the moon in 1755, which were sent to London in competition for the prize offered by the British Parliament for a satisfactory method of finding the longitude at sea. They were tested by Bradley, astronomer-royal, and pronounced worthy of the attention of the admiralty; but it was only after his death, in 1762 (Feb. 20), that the merited recompense was awarded: the sum of £3,000 sterling was paid to his widow. Revised by S. Newcomb.

Mayer, Julius Robert: physicist, originator of the doctrine of the conservation of energy; b. at Heilbronn, Würtemberg, Nov. 25, 1814; studied medicine in Tübingen, Munich, and Paris; practiced medicine and surgery in Heilbronn; sailed in 1840, on a Dutch freighting-vessel, to Java, and remained in Batavia through the summer. There he turned his attention to the study of the laws of heat, and through this to a consideration of the nature and relations of all the physical forces. His first publication on the subject, which appeared in Liebig's *Annalen der Chemie und Pharmacie*, under the title *Bemerkungen über die Kräfte der unbelebten Natur*, contained the announcement of what is now known as the doctrine of energy. (See Energy.) In the close of this paper the writer presented a determination of the mechanical equivalent of heat, derived from observation of the elevation of temperature in air compressed by a descending column of mercury. The value thus obtained involves as a factor the specific heat of air, a constant which was not then accurately known. By substituting for this constant the specific heat as established by the later investigations of Regnault, Mayer's result is found to accord very nearly with that obtained in the long-continued researches of Joule, conducted independently and in part simultaneously, but published later. Mayer's priority in the statement of the principle of the conservation of energy is universally acknowledged. Concerning his rank among the investigators to whom the doctrine owes its early development there has been much discussion. Current opinion of the present day would not class him with Helmholtz, Joule, and Clausius as to clearness of view, accuracy, or completeness of treatment. His second publication, which was more extended than the first, appeared in 1845, and embraced a bold extension of the principles of his theory to the phenomena of organic nature. It was published under the title *Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel*. His *Celestial Dynamics* (*Beiträge zur Dynamik des Himmels*) made its appearance in 1848, and in 1851 he published a somewhat extended memoir entitled *Bemerkungen über das mechanische Aequivalent der Wärme*. Three of these memoirs of Mayer, the first, third, and fourth above mentioned, have been published in English by Prof. Grove as an appendix to his work on the *Correlation of Forces*. In 1867 Mayer's collected works were published at Stuttgart under the title *Die Mechanik der Wärme*. D. Mar. 20, 1878.

Revised by E. L. Nichols.

Mayfield: city; capital of Graves co., Ky. (for location of county, see map of Kentucky, ref. 5–C); on Mayfield creek, and the Newport N. and Miss. Val. Railroad; 26 miles S. of Paducah. It is in a tobacco-growing and agricultural region; sells annually an average of 10,000,000 lb. of tobacco grown in the county; and has 2 flour-mills, woolen-mill, several tobacco-houses, tobacco-stemmery, creamery, fire-clay works, ice-factory, spoke-factory, water-works, electric lights, and 2 weekly newspapers. Pop. (1880) 1,839; (1890) 2,909; (1900) 4,081. Editor of "Mirror."

May-fly: the common name of several species of *Ephemeridæ*. (See Ephemera and Entomology.) The entire period

of the preparatory stages the May-fly passes in the water, during which time the larvæ and pupæ make themselves little burrows in the sides of the pond or stream in which they live. The emerging of these insects from the water seems always to take place in the evening, and they generally make their appearance in countless swarms for two or three evenings. By the next morning most of these insects are found lying dead in heaps upon the shore.

Mayhem [ultimately the same as *maim*, from O. Fr. *méhaigner*: Ital. *magagnare*, probably of Teutonic origin, possibly **man hamjan*, maim; cf. Germ. *hammel*, *hämmling*, Eng. *hamble*]: at common law was "a hurt of any part of a man's body whereby he was rendered less able, in fighting, either to defend himself or to annoy his adversary." Hence striking out a man's eye or front tooth was mayhem; but cutting off his ear or nose was not. The early common law dealt with it as a felony, and subjected the felon to the loss of the like part of his own body. This practice of retaliation gave way to punishment by fine and imprisonment, except in cases of mayhem by castration; and the offense remained a misdemeanor, until a number of statutes extending from 5 Hen. IV., c. 5, to 24 and 25 Vict., c. 100, changed it to a felony. By the last-named act every unlawful, malicious, and intentional wounding, disfigurement, or grievous bodily harm inflicted upon another is a felony, and renders the criminal liable to the same punishment as an attempt to murder. In the U. S. the common-law mayhem, unless committed by castration, has been treated generally as a misdemeanor. (*Commonwealth* vs. *Newell*, 7 Mass. 245.) The term has been extended by statute, however, to include nearly every form of bodily harm; and in some of the States the offense is declared to be a felony. Bishop's *New Criminal Law*, vol. ii., ch. xxxi.

FRANCIS M. BURDICK.

May'hew, EXPERIENCE: missionary; son of John, and great-grandson of Gov. Thomas Mayhew; born in Martha's Vineyard, Jan. 27, 1673; succeeded his ancestors in the pastoral charge over the Indians in Mar., 1694, and was employed by the Society for Propagating the Gospel to translate the Psalms and the Gospel of John into the Indian language, which he had learned in childhood. He published in 1727 *Indian Converts*, being the lives of thirty Indian preachers and eighty other converts, and a volume entitled *Grace Defended* (1744). D. Nov. 29, 1758.—His son, ZACHARIAH, was missionary at Martha's Vineyard from 1767 to his death Mar. 6, 1806.

Mayhew, HENRY: humorist; b. in London, England, Nov. 25, 1812; was educated at Westminster School; made a voyage in his boyhood to Calcutta, and served an apprenticeship to his father, a solicitor. He began a literary career by bringing out at the Queen's theater, in conjunction with Gilbert à Beckett, the farce of *The Wandering Minstrel*; founded a comic paper, *Figaro in London*; was one of the promoters of *Punch* (1841), and for some years its chief editor, and in association with his brothers Horace and Augustus wrote numerous popular humorous novels, fairy-tales, and farces. His chief achievement, however, was in making known the everyday life of the lower classes of the British metropolis in *London Labor and the London Poor* (1851; new ed. 1868), originally contributed to *The Morning Chronicle*. He wrote largely for magazines, was author of *The Mormons* (1852), and of several juvenile books. D. July 25, 1887.—His brother HORACE, b. in London in 1816, was for some years on the staff of *Punch*; published several humorous works in his own name; d. in London, Apr. 30, 1872.—Three other brothers, THOMAS (b. in 1810), EDWARD (b. in 1813), and AUGUSTUS (1826–75), aided Henry and Horace in some of their literary undertakings. Thomas was a pioneer in the publication of penny grammars, dictionaries, etc., as part of a Penny National Library; he was also editor of *The Poor Man's Guardian*, and was a conspicuous advocate of reform measures; Edward was theatrical manager and writer of farces in youth, and has published standard works on horses and dogs, especially on their diseases; while Augustus published several successful romances.

Revised by H. A. BEERS.

Mayhew, THOMAS: colonizer and preacher; b. in England, Mar., 1592; was a merchant at Southampton; emigrated to New England in 1631; resided several years at Watertown; obtained in 1641 from the agent of Lord Stirling a grant of a considerable portion of the island of Martha's Vineyard, with the title of governor; began the colonization in 1642, aiding his son Thomas in converting the Indians, and proving himself so true a friend that through his influence they not only abstained from joining in Philip's war, but protected the white settlers against the savages. Gov. Mayhew founded Edgartown in 1647, preached in his old age to the Indians, as well as to the English, in place of his deceased son and grandson, and died in Mar., 1682. From him was descended a remarkable line of missionaries to the Indians of Martha's Vineyard.

May Laws, The: See FALK LAWS, THE.

Maynard, GEORGE WILLOUGHBY: figure and portrait painter; b. in Washington, D. C., Mar. 5, 1843; studied at the Royal Academy, Antwerp; painted and studied in Paris and other places in Europe 1869–74; was elected a National Academician in 1885, a member of the Society of American Artists in 1880, and of the American Water-color Society; was awarded the Temple gold medal at the Pennsylvania Academy of Fine Arts in 1884. He has executed important decorative compositions for various buildings in the U. S. Studio in New York.

WILLIAM A. COFFIN.

Maynard, HORACE, LL.D.: statesman; b. at Westborough, Mass., Aug. 30, 1814; graduated in 1838 at Amherst College; was tutor and afterward mathematical professor in East Tennessee University; was admitted to the bar in 1844, and became a successful lawyer; represented Tennessee in Congress 1857–63; suffered much from loss of property and exile during the war of 1861–65, having immediately on the outbreak of the war declared his loyalty to the U. S. Government; was in Congress again 1866–75, representing the Knoxville (second) district until 1873, when he was chosen representative at large. In 1862 his alma mater gave him the degree of LL. D. In 1875 he was sent as minister to Constantinople, and in 1880 became U. S. Postmaster-General. D. at Knoxville, Tenn., May 3, 1882.

Maynard, ISAAC HORTON: judge of New York court of appeals; b. in Bovina, N. Y., Apr. 9, 1838; graduated at Amherst in 1862; was a member of the New York Assembly 1876–77; county judge and surrogate, Delaware County, 1878–84; was defeated for Secretary of State 1883; was deputy attorney-general, State of New York, Jan. 1, 1884, to June 1, 1885; second comptroller of the U. S. Treasury June 1, 1885, to Apr. 1, 1887; assistant Secretary of the Treasury Apr. 1, 1887, to Apr. 1, 1889; commissioner to revise the general laws of the State of New York May, 1889, to Feb. 1, 1892; deputy attorney-general, New York, Jan. 1, 1890, to Feb. 1, 1892; was appointed associate judge, court of appeals of New York, Feb. 1, 1892. D. June 12, 1896.

Maynard, Sir JOHN: constitutional lawyer; b. at Tavistock, England, in 1602; was educated at Oxford: studied law at the Middle Temple; was elected to Parliament in 1625; called to the bar 1626; was distinguished in the Long Parliament as one of the prosecutors of Strafford and Laud, and afterward as an opponent of the encroachments of the army and of the assumption of supreme power by Cromwell, for which conduct he was twice sent to the Tower; became sergeant-at-law 1654; sergeant to the Commonwealth 1658; made king's sergeant and knighted 1660, refusing to accept a judgeship; took an active part in the "Convention Parliament" (1689) in obtaining the formal acceptance of the resignation of James II., and in the same year was made first commissioner of the great seal. When waiting upon William III., that prince, struck with his great age (eighty-seven years), observed that he must have outlived all the lawyers of his time, upon which Maynard replied that "he had like to have outlived the law itself if his highness had not come over." Sergeant Maynard was a firm friend of liberty and of Presbyterianism, and is ranked by Sir James Mackintosh with Lord Somers as one of the greatest constitutional lawyers of England. Some of his *Reports* were printed, as well as a number of speeches and political tracts. D. at Gunnersbury, Oct. 9, 1690.

Maynooth: village; in the county of Kildare, Ireland (see map of Ireland, ref. 9–I); has a celebrated Roman Catholic college or ecclesiastical seminary, with about 500 students destined to become priests in Ireland. It was founded in 1795. Several attempts were made to repeal the act of endowment, though it was the only state endowment for religious purposes which the Roman Catholic population ever received in Ireland; and in 1869 such an act was carried into effect, the institution receiving instead a capital sum fourteen times the amount of the annual endowment. There is a population, including the college, of about 1,200.

May'o: a maritime county, in Connaught, Ireland; comprising an area of 2,131 sq. miles, and bounded N. and W.

by the Atlantic. It consists of a large and fertile plain inclosed by two ranges of mountains, whose highest peaks, Muilrea and Nephin, reach 2,680 feet. As the climate is moist and windy, the soil is better adapted for pasturage than for tillage; many cattle and sheep of a good breed are reared. Next to agriculture fishing is the chief branch of industry. Excellent marble is quarried. Pop. (1891) 219,-634. Chief towns, Castlebar, Ballina, Ballinrobe, Bellmullet, Claremorris, Swineford, and Westport.

Mayo, Amory Dwight, A. M.: educator; b. in Warwick, Franklin co., Mass., Jan. 31, 1823; was educated at Deerfield Academy and Amherst College; studied for the ministry with Rev. Hosea Ballou, president of Tufts College (Universalist); from 1846–54 was pastor of the Independent Christian Society in Gloucester, Mass.; from Oct., 1854, to Jan., 1856, preached in Cleveland, O.; from Jan., 1856, to Jan., 1863, was minister to the Division Street church at Albany, N. Y.; from Jan., 1863, till July, 1872, was settled in Cincinnati, O., at the Church of the Redeemer (Unitarian); from Nov., 1872, to 1879, was pastor of the Church of the Unity in Springfield, Mass. Mr. Mayo has always been engaged in public-school work; was an active member of the boards of education at Cincinnati and at Springfield, and has written many tracts and addresses on that and related subjects. For several years he has been Professor of Ecclesiastical Polity in Meadville Theological School, where he annually delivers a course of lectures. Since 1880 he has been engaged in furthering education in the Southern States. His published volumes are *The Balance*; *Memoirs of Mrs. S. C. E. Mayo*, his wife, who was also an authoress; *Graces and Powers of the Christian Life*; *Symbols of the Capitol*, a volume of discourses on the elements of Christian civilization; *Industrial Education in the South*, and *Southern Women in the Recent Educational Movement* (the two latter appearing as circulars of the U. S. Bureau of Education); besides many pamphlets on educational topics. Mr. Mayo received the degree of A. M. from Amherst College.

Mayo, Frank: actor; b. in Boston, Mass., Apr. 19, 1839; was educated at the public schools. He went to California in 1854, and made his first appearance in 1856 at the American theater, San Francisco, then under the management of Laura Keene; played through the mining-towns in the companies of Edwin Booth, Julia Deane Hayne, James Anderson, the English tragedian, and the Chapman family. In San Francisco he made a hit as Nana Sahib in Boucicault's drama of *Jessie Brown*, and became from 1863 to 1865, the recognized leading actor on the Pacific coast. On Aug. 28, 1865, he appeared at the Boston theater, Boston, playing Badger in *The Streets of New York* with great success, Hamlet, Richard the Third, Iago, Othello, Jack Cade, d'Artagnan, and Don Cæsar de Bazan. He became a star in 1867, and produced *Davy Crockett* at Rochester, N. Y., Sept. 24, 1872. His name thus became identified with the typical American backwoodsman, and he played the part almost exclusively until June, 1884. With John G. Wilson he wrote *Nordeck*, and played the title *rôle* himself. D. June 8, 1896. B. B. Vallentine.

Mayo, Richard Southwell Bourke, Earl of: statesman; b. in Dublin, Ireland, Feb. 8, 1822; was the eldest son of the fifth earl, and was known during his father's life by the courtesy title of Lord Naas. He was educated at Trinity College, Dublin; published a narrative of travels in Russia under the title *St. Petersburg and Moscow* (1845); was elected member of Parliament for the county of Kildare 1847, and for Coleraine 1852; was Chief Secretary for Ireland in Earl Derby's three administrations (1852, 1858–59, and 1866–68), and was a member of the cabinet during the third period; succeeded to the earldom Aug. 12, 1867; was appointed Viceroy of India in 1868; arrived at Calcutta Jan., 1869, and became noted for executive ability and the reform of abuses. While on a tour of inspection he was stabbed by a Mohammedan (Wahabee) convict in the penal settlement of Fort Blair, Andaman islands, and killed instantly, Feb. 8, 1872. A *Life* was written by Sir W. W. Hunter (1875).

Mayo, William Starbuck, M. D.: novelist; b. at Ogdensburg, N. Y., Apr. 20, 1812; graduated in medicine at the New York College of Physicians and Surgeon 1833; practiced his profession for several years; visited Spain for his health; passed over to Morocco with the design of penetrating into the interior of Africa, but found his project impracticable. Several years after his return to the U. S. Dr. Mayo published *Kaloolah, or Journeyings to the Djebel Kumri* (1849), a novel in which he utilized his knowledge of Northern Africa; *The Berber, or the Mountaineer of the Atlas* (1850); *Romance-dust from the Historic Placer* (1851); and *Never Again* (1873), a romance. D. Nov. 22, 1895.

Mayor, John Eyton Bickersteth: classical scholar; b. at Baddagamme, Ceylon, Jan. 25, 1825; educated at Shrewsbury School and St. John's College, Cambridge, of which he became a fellow 1849; assistant master at Marlborough College 1849–53; college lecturer 1853; took orders in the Church of England 1855; was librarian of the University of Cambridge 1863–67; and became Professor of Latin there in 1872. Prof. Mayor has published a famous edition of Juvenal's *Satires* in two volumes; Cicero's *Second Philippic* (1861); Homer's *Odyssey*, books ix.–xii. (1872); *Quintilian*, book x., unfinished (1872); and numerous Early English historical, biographical, and antiquarian works, and text-books of Latin grammar. He was one of the editors of *The Journal of Classical and Sacred Philology*, of *The Journal of Philology*, and until 1894 of *The Classical Review*.

Revised by A. Gudeman.

Mayo-Smith, Richmond: See Smith, Richmond Mayo.

Mayow, John, M. D., LL. D.: physician and chemist; b. in Cornwall, England, in 1645; was educated at Wadham and All Souls Colleges, Oxford; took degrees in both law and medicine; became a distinguished physician at Bath; wrote several learned medical works, published together in his *Opera Omnia Medica Physica* (Leyden, 1681), and propounded in his chapter on chemical affinities doctrines so far in advance of the science of that day that Dr. Beddow republished a great part in 1790 under the title *Chemical Experiments and Opinions extracted from a Work published in the Last Century*. It was claimed that the chief discoveries of Priestley and Scheele were known to Mayow a century earlier. D. in London, Sept., 1679.

Maypu: See Maipo.

Maysville: city (incorporated in 1833); capital of Mason co., Ky. (for location of county, see map of Kentucky, ref. 2–I); on the Ohio river, and the Ches. and O. and the Ky. Cent. railways; 79 miles N. E. of Lexington. It is in an agricultural region, and has important manufactures, including cotton goods, tobacco, cigars, plows, furniture, foundry and machine-shop products, flour, and lumber. There are water-works, fuel and illuminating-gas plants, electric lights, electric street-railway, academy, seminary, high school, 2 national banks with combined capital of $410,000, 2 State banks with capital of $125,000, and 2 daily and 2 weekly newspapers. Pop. (1880) 5,220; (1890) 5,358; (1900) 6,423. Editor of "Bulletin."

Mazamet': town; department of Tarn, France; on the Arnette; 43 miles E. S. E. of Toulouse; has extensive wool-spinning factories and manufactures of cloth (see map of France, ref. 8–F). At the beginning of the nineteenth century Mazamet was only an insignificant village, but the introduction of the manufacture of a peculiar kind of woolen fabric brought immediate and great prosperity to the place. Pop. in 1896, 13,712.

Mazanderan': province of Persia; bounded N. by the Caspian Sea, W. by Ghilan, and S. by Irak-Ajami, from which it is separated by the Elbruz Mountains, and E. by Astrabad. The ground is low along the shore of the sea, but farther inland it rises, covered with spurs of the Elbruz. The soil is fertile; rice, cotton, mulberry-trees, sugar-cane, and fine fruits are grown. The climate is cooler and more equable than that of the rest of Persia. Firdausī called Mazanderan the "land of roses," and Shah Abbas the Great often resided here. The province abounds in iron ores, and in mineral pitch in every state of transition from pure petroleum to the finest naphtha. The numerous rivers which flow from the Elbruz Mountains to the Caspian Sea are well stocked with trout, mullet, carp, and sturgeon, supplying large quantities of caviare to the Russian market. The domestic animals are noted for their small size, and include among the most important the black, humped cattle similar to the Indian variety, also horses, sheep, and goats. Area estimated at 10,000 sq. miles; pop. at 300,000. Capital, Sari. Bárfarósh, Amol, Ashraf, and Farah-ábád are also important towns. Revised by M. W. Harrington.

Mazarin, măă'zăă'răń', Jules (Ital. Giulio Mazarini): cardinal and French statesman; b. at Piscina, in the Abruzzi, July 14, 1602; was the eldest son of the intendant of the household of Philip Colonnar. Young Mazarin was

educated in the schools of the Jesuits at Rome, but refused to enter their order; studied law at Alcalá and Salamanca, where he led a very gay life; entered the military service of the pope, and was employed in some political missions in which he evinced great diplomatic skill. He was introduced in 1628 to Richelieu, who entertained so high an opinion of his abilities that he had him appointed vice-legate of Avignon in 1634, made a cardinal in 1641, though he never entered major orders, naturalized as a French citizen in 1639, and appointed his successor as minister. After the death of Richelieu (Dec. 4, 1642) Mazarin governed France for eighteen years with absolute power, though not without some violent interruptions. He was as crafty a diplomat as Richelieu, but he was far inferior to him as an administrator, and having no other ideas than those inherited from Richelieu, and no other aims than those dictated by his own vanity and rapacity, his subtlest intrigues sometimes turned out gross blunders. It has been well said however, that "he was not like Richelieu, a Frenchman, but a citizen of the world, and always paid most attention to foreign affairs; in his letters all that could teach a diplomatist is to be found, broad general views of policy, minute details carefully elaborated, keen insight into men's characters, cunning directions when to dissimulate or to be frank." The aversion of Anne of Austria—who, after the death of Louis XIII., May 14, 1643, became regent during the minority of her son, Louis XIV.—he conquered by his bland manners and elegant flattery; she became his firm friend, and the contemporary gossip was that they were secretly married. For this no serious proof has been offered, though the queen regent was devoted to him, and the minor orders he had accepted were no ecclesiastical obstacle; but the rich dotations he made in order to gain the good-will of the princes, the prodigality of the court, and his own lack of thorough capacity as a financier exhausted the treasury. The Parliament of Paris refused to register the new tax-edicts. He answered by throwing its president and several of its members into prison. The next day (Aug. 27, 1648) Paris rose in rebellion, and the wars of the Fronde (*q. v.*) began. A peculiar feature of this whole movement were the so-called *Mazarinades*—pamphlets, about 4,000 in number, published against the cardinal, and speaking in a very unrestrained manner of his life at Alcalá, his relation to Dame Anne, his foreign birth, his rapacity, and his nieces. He was intensely hated, and the hatred was not tempered with awe. Twice between 1651 and 1653 he had to resign his office and retire from the court—the first time to Brühl, near Cologne, the second time to Sedan, where Turenne and his army were. He was arraigned as a traitor and enemy of France; his property was confiscated; his library, furniture, and statues were sold, but after the end of the wars of the Fronde and the flight of the Prince of Condé to Spain, Mazarin re-entered Paris (Feb. 3, 1653) in triumph, and was received not only by the king and the court, but even by the people, with great ovations. The subsequent years of his government were more quiet. He could now prosecute the war against Spain, begun in 1635, with undisturbed vigor, and by the Peace of Westphalia (Oct. 24, 1648) and of the Pyrenees (Nov. 7, 1659) he succeeded in curbing both branches of the house of Hapsburg, and procured for France the foremost place in the political system of Europe. Another idea of Richelieu's, the establishment of the absolute authority of the crown in France, he carried out with considerable success, but the interior administration, the finances, commerce, industry, agriculture, etc., were in confusion and decadence when he died at Vincennes, Mar. 9, 1661. He left an enormous fortune, 200,000,000 livres, which he presented to the king a few days before his death, probably because he considered this manœuver the only means of securing it for his family; the king returned it graciously, and his nieces inherited it. Mazarin contributed very much to the triumph of the royal authority in France, and to the overthrow of the last vestiges of the old feudal powers and privileges. The memoirs of his rival, de Retz, have contributed to make his character darker than it really was, but the publication of his correspondence throws a new and favorable light upon his public life. Several volumes of these letters have already appeared, under the direction of Cheruel. During his life he was a friend of the arts and of men of letters; his will made ample provision for learned men and the advancement of the sciences, while he left to the Collège Mazarin his large and costly library. His was not a talent of the first order, but he rendered great services to France, among them being the treaties of Westphalia and the Pyrenees, the securing of Alsace for France, and the preponderance assured to the latter over Spain by his diplomatic skill. See Chernel, *Histoire de la France pendant la minorité de Louis XIV.* (4 vols., Paris, 1879–80), and *Histoire de France sous le ministère de Cardinal Mazarin* (2 vols., 1881–82); Cousin, *Jeunesse de Mazarin* (1865); Renée, *Les Nièces de Mazarin* (1856). Revised by J. J. Keane.

Mazar-i-Sherif (i. e. tomb of the sherif): city of Central Asia; capital of Afghan Turkestan; 20 miles E. of Balkh and 200 miles N. N. E. of Cabul, 1,200 feet above sea-level (see map of Asia, ref. 5–D); population, according to Grodebek, 25,000, consisting of Uzbegs and Afghans. The city contains the mausoleum of the prophet Ali and is a sacred place, attracting thousands of pilgrims from Turkestan, Afghanistan, and Baluchistan. The city has risen in importance since 1858, when the Afghan Government established the important fortress of Takhtipul, 3 miles to the W. This fortress contains a cannon-foundry and a factory of arms, and is the permanent residence of an Afghan governor and the occasional residence of the amir. The country around Mazar is well cultivated. In the mountains, 20 miles S., are some natural waters celebrated for their curative properties. See Grodekop, *From Herat to Samarkand* (trans. by Charles Marvin, 1885).

Mark W. Harrington.

Mazarredo y Salazar, maă-zaă-rā′dō-ee-saă-lăă-thaar′, José Maria: naval officer and statesman; b. at Bilbao, Spain, in 1744; entered the navy 1760; participated in the campaign against Algiers 1775; was instrumental in saving the remnant of the army from destruction; negotiated peace with the regency; was appointed major-general of naval forces; took part in the naval operations against the British 1780–83; was made lieutenant-general 1789; appointed commander-in-chief of the Spanish navy, which he reorganized, 1793; defended Cadiz against the British July, 1797; was ambassador to Paris 1799, and again 1804; was a partisan of Joseph Bonaparte, by whom he was made councilor of state and Minister of Marine, and held the offices until his death at Madrid in 1812. He was considered one of the most scientific seamen whom Spain has produced; published *Rudimentos de Tactica Naval* (1785), and built the naval observatory at Cadiz.

Mazatlan′: a city and port of the state of Sinaloa, Mexico; on a small peninsula opposite the Bay of Olas Altas, which forms its harbor, and near the entrance to the Gulf of California; lat. 23° 10′ 37″ N., lon. 106° 24′ 35″ W. (see map of Mexico, ref. 5–D). The surrounding scenery is very beautiful, but the climate is hot, and the town is poorly supplied with water. The bay is deep and of easy access, but is open to south and southwest winds, during which it is unsafe; the inner harbor does not admit deep-draught vessels. The exports consist mainly of silver ores, fruits, cabinet and dye woods, drugs, orchilla, and pearls. Pop. (1889) about 16,000.

Herbert H. Smith.

Mazdak: a Persian religious enthusiast and founder of a sect; b. at Persepolis about A. D. 470; became *mobed* or chief priest at Nishapur, and on the occasion of a pestilence and famine in 500 presented himself to King Kobad as a prophet sent for the regeneration of mankind. His system was based upon the dualism of Manes, and his practical teaching was a form of communism. He succeeded in converting the king, and his projects became law, causing great commotions. Under Khosru Nushirvan, Mazdak was put to death at Nahrvan between 530 and 540, with thousands of his followers, but his ideas took deep root after the rise of Islam in the following century.

Mazep′pa, John: hetman of Cossacks; b. about 1645; descended from a noble family in Podolia; was educated as a page at the court of John Casimir of Poland. Surprised in an adventure with a Polish lady, her husband stripped him naked, bound him stretched along the back of his half-wild horse, and put the frightened animal to flight. It carried its owner to his own estate, but Mazeppa fled for shame into the Ukraine, and joined the Cossacks. He soon made himself very popular among them, and became secretary to their hetman, Samvilowich, whom he overthrew in 1689, becoming hetman himself. In this position he soon gained the confidence of Peter the Great, who made him Prince of the Ukraine. After the Peace of Altranstadt (Sept. 24, 1706) he opened negotiations with Charles XII. for the purpose of throwing off the Russian authority. Peter the

Great was informed of this treachery, but did not believe it; he sent the informers to Mazeppa, and Mazeppa had them put to death. The czar afterward obtained indubitable proofs, and Mazeppa was compelled to join Charles XII. openly. He took part in the battle of Pultowa, June 27, 1709, and fled to Bender, where he died 1710.

Mazères, măă-zār', more correctly **Masères**, FRANCIS, M. A.: mathematician; b. in London, Dec. 15, 1731, of a French family who settled in England on the Revocation of the Edict of Nantes; was educated at Kingston and at Cambridge, where he was made B. A. 1752 and M. A. 1755; published *A Dissertation on the Negative Signs in Algebra* (1758), denying the propriety of such expressions as negative roots, etc.; was called to the bar, and appointed attorney-general of Quebec; returning to England, was made cursitor baron of the exchequer Aug., 1773, also agent to the Protestant settlers of Quebec. He urged the adoption of conciliatory measures toward the disaffected colonies in North America, and his deep interest in the laboring classes resulted in the publication of his *Principles of the Doctrine of Life Annuities* (1783). Besides many mathematical works, he edited or wrote *An Account of the Proceedings of the British and other Protestant Inhabitants of Quebec* (1775); *The Canadian Freeholder* (3 vols., 1779); *Inquiry into the Extent and Power of Juries* (1792); *Essays on Various Subjects, chiefly Historical and Political* (1809); *The Curse of Popery and Popish Pains* (1807); and *Select Tracts relating to the Civil Wars in England* (2 vols., 1815). D. at Reigate, May 19, 1824.

Mažuranić, măă-zhoor-aan'yich, IVAN: poet; b. at Novi, Croatia, a province of Hungary, Aug. 11, 1813; was educated at Fiume and Sombotel; was a zealous supporter of the "Illyrian" movement which, under the leadership of Ludevit Gaj, sought to unite the Serbians and Croatians, who are, in fact, one people whom religion and alphabet have divided. His first poems appeared in the *Danica*. In 1836 he returned home, studied, and afterward practiced law at Zagreb (Agram). When, in 1841, Gundulić's great epic *Osman* (originally written in 1627) was to be republished, Mažuranić supplied the two missing "songs" (xiv. and xv.) which made him famous. His greatest work is the epic *Smrt Smail-age Čengića* (The Death of Smail-aga Čengić), first published in the almanac *Iskra* (1846) and repeatedly re-edited (1853–57, etc.), since translated into Bohemian, Polish, Russian, Slovenic, and German. These poems make him the greatest among Croatian poets. In politics he was a moderate nationalist, issuing in 1848 a remarkable brochure *Hrvati Magyarom* (The Croat's Answer to the Magyars). In 1850 he became procurator-general; in 1861 first chancellor of Croatia and Slavonia; was recalled by Belcredi's cabinet in 1865, but in 1873 received the highest office, being appointed ban (*baan*, governor), and held the position until 1880. J. J. KRÁL.

Mazur'ka [Polish, named from the East *Mazurs*, the inhabitants of Mazovia, southern portion of East Prussia]: a dance in $\frac{2}{4}$ or $\frac{3}{8}$ time, having a peculiar and pleasant rhythm. From four to eight couples join in the mazurka, which is lively and sometimes rather grotesque. It was originally a Polish dance, but was by the music of Chopin spread over the whole of Europe.

Mazzara del Vallo, măă-zaa'răă-del-vaa'lō: town in the province of Trapani, Sicily; 32 miles by rail S. of Trapani (see map of Italy, ref. 9–D). It is a walled town, lying on the seashore, with a good harbor overlooked by a castle, but the roadstead is unsafe. The streets are narrow and crooked, and there is but a single square—that on which stands the cathedral. The first landing of the Arabs on the island was made here in 827. About 600 vessels of different sizes enter this port annually. Pop. (1881) 13,074.

Mazzi'ni, măăt-see'nĕe, GIUSEPPE: patriot; son of a physician; b. at Genoa, Italy, June 28, 1808. His first master, Giuseppe Patroni, a colonel of artillery and a cousin of his mother, had the insight to divine the future greatness of his pupil, who already gave proof of unusual abilities. The Piedmontese revolution of 1821, and the sight of his banished fellow citizens embarking from Genoa for the land of exile, made the deepest impression upon Mazzini, then a boy of sixteen; and from that time he devoted himself wholly to the liberation of his country. He studied at the university, became acquainted with the brothers Ruffini, and confided to them his bold designs. Giovanni Ruffini—afterward distinguished in England as a romance-writer, and the author of *Doctor Antonio* and of *Benoni*—describes the young conspirator, Mazzini, in his *Memorie d'un Cospiratore* under the name of Fantasio, representing him as something very like a utopist. Mazzini began to be known as an author at an early age. His first essay, which treated of Dante's love of country, was written in 1826, but did not appear till some years afterward in a Genoese journal entitled *Il Subalpino*. Mazzini felt that in order to have a free country it was necessary first to liberate the literature from classic and academic shackles, and make it a political instrument. He began his politico-literary conflicts in the journal *L'Indicatore Genovese*, where appeared his articles upon Manzoni, Botta, Guerrazzi, Monti, and Schlegel in the year 1828. Mazzini at an early age took part with the Carbonarists, and in consequence he was arrested in Genoa in 1830, and imprisoned at Savona. While there he became convinced that Carbonarism was no longer suited to the times, and he conceived while in prison the idea of Young Italy, an organization which had for its objects the unity, independence, and liberty of Italy—objects which he thought could be realized only by the Italian people themselves without the aid of the foreigner. The means to secure these ends were declared to be education and insurrection. Acquitted by the tribunal, but forced to choose between exile and police surveillance, he retired to Marseilles, where he began to organize his society and circulated manifestoes and a newspaper in its interest. Condemned to the gallows by Charles Albert, he nevertheless contrived to remain at Marseilles, and united with Garibaldi in planning the insurrection of Genoa. When this plot failed Mazzini withdrew to Switzerland, and there formed a conspiracy to invade Savoy; this was the unfortunate expedition of 1834, in which the conspirators dispersed on the first conflict with the troops, and Mazzini fainted away at the first fire. After this failure he returned to Switzerland where he continued his machinations, and founded the journal *La Jeune Suisse*; but the hostility of foreign governments caused the Swiss authorities to proceed against the revolutionists, and in Jan. 1837, Mazzini withdrew to London. From London, which then became his headquarters, he instigated various attempts at revolution in Italy—attempts that cost the lives of many noble victims, among others, of the brothers Bandiera in 1844, but which were not without fruit for the future. It was at this time that the British post-office incurred serious blame by opening Mazzini's letters. The moderate Guelph school turned to its own advantage the agitation created in Italy by Mazzini and his followers, and thus it may be said that the Italian revolutionary movements of 1848 were in great part the work of this active conspirator. In the spring of 1848 Mazzini established and edited in Milan *L'Italia del Popolo*, in which he manifested a strong opposition to King Charles Albert and the moderate monarchical party. The Grand Duke of Tuscany having been expelled, and Mazzini chosen member of the new provisional government, he hoped to secure the proclamation of a republic. Not succeeding in this, he withdrew to Rome, where the republic was proclaimed, and he himself became the first of the triumvirs. After the fall of Rome he first took refuge in Switzerland, then once more returned to London, where he entered into close relations with Kossuth and Ledru-Rollin, for it was a part of his programme to encourage revolutionary movements everywhere. Young Europe, Young Switzerland, and other radical organizations, framed on the model of Young Italy, already bore witness to his influence in several European states. He incited the Italians to fresh insurrectionary movements, which proved disastrous and fruitless—that of Mantua in 1852, that of Milan in 1853, and that of Genoa in 1857. In the events which occurred in Italy in 1859 and 1860 Mazzini took no active part, though he assured the Sardinian monarchy of republican support in attaining Italian unity and independence. When it seemed to him that the Italian monarchy had failed to satisfy the requirements of the people he renewed his conspiracies with a purely republican aim. In this last period of his revolutionary labors his desire to separate republicanism from socialism and atheism is most noteworthy. He was neither Catholic nor Christian, but he had taken for the motto of his banner "God and the People!" and in the last years of his life he struggled energetically against everything which implied the negation of a God. For this reason before his death he emphatically condemned the Commune of Paris and the objects and the acts of the Internationals. With the same zeal Mazzini opposed the ultra doctrines of the pontifical syllabus. Some of the last months of his life Mazzini

passed at Lugano, being already seriously ill, and finally, in search of a milder climate, he went to Pisa. In 1866 a general amnesty removed the sentence of death that had been passed against him; but in 1870 he was arrested for conspiring with Garibaldi, and imprisoned at Gaeta for two months. D. at Pisa on Mar. 10, 1872. Mazzini often wrote in English and in French, and his works in both these, as well as in his native language, are remarkable for ability, for purity and vigor of style, and for an elevation of sentiment which, in spite of great political indiscretions, distinguished him through life. The most complete edition of his works is *Scritti editi e inediti di Giuseppe Mazzini*, begun by himself and continued by Satti (18 vols., 1861–91). A partial collection of his writings, including autobiographical papers, has appeared under the title of *Life and Writings of Joseph Mazzini* (1891). His two principal works, *Thoughts on Democracy in Europe* and *On the Duties of Man*, are in *Joseph Mazzini*, a memoir (1875). For an account of his political career, see Thayer, *The Dawn of Italian Independence* (1893).

Revised by F. M. Colby.

Mazzo'ni, Guido: poet and scholar; b. at Florence, June 12, 1859. He studied first at Florence, then at Leghorn under the poet Giuseppe Chiarini, whose daughter he afterward married; and finally at Bologna, under Carducci. In 1881 he began his career as teacher of Italian literature in various secondary schools. In 1887, after a short period as private secretary to the Minister of Public Instruction, he was given a place as Professor of Italian Literature in the University of Padua. As a poet he has been largely dominated by the influence of Carducci; but he is a scholar, and his acquaintance with foreign literatures, notably English, has had a favorable effect upon his work. We have from him: *Epigrammi di Meleagro da Cadora* (1880); *In Biblioteca* (1882); *Esperimenti metrici* (1882); *Poesie* (1883); *Nuove Poesie* (1886); *Rassegne letterarie* (1887); *Fra libri e carte* (1887); *Un ritratto di Gesù* (1887). Besides these works, Mazzoni has edited several works of Italian authors, Cesarotti, Tasso, Monticchiello, Rucellai, etc. He has also contributed much to the *Nuova Antologia* and other reviews.

A. R. Marsh.

Mazzoni, Guido, called *Il Modenino*: sculptor; b. at Modena, Italy, about the middle of the fifteenth century. His work is interesting in comparison with that of Luca della Robbia and his successors, being all, so far as known, in enameled and colored terra-cotta, of extraordinary realism and generally of life size. In the Church of San Giovanni Decollato at Modena is a surprising and impressive group of the dead body of Christ mourned by the disciples. In the crypt of the cathedral is a nativity, with four life-sized figures besides the child. Works of his exist at Ferrara and Naples, and others are ascribed to him; but his work and life have not been adequately studied. D. at Modena in 1518.

Russell Sturgis.

Mazzuo'li, or **Mazzuola**, Francesco, known as *Il Parmigiano* and *Il Parmigianino*: painter; b. in Parma, Italy, in 1503; he studied painting with his uncles, and at the age of fourteen painted a remarkable picture, having as its subject the *Baptism of Christ*, and afterward became a pupil of Correggio. Five years later Pope Clement VII. was so much impressed with his talents that he commissioned him to paint the Sala dei Pontifici, which Giovanni da Udine had begun. He also painted a *Circumcision of Christ* for the Pope. In 1527, after the sacking of Rome, Mazzuoli worked at Bologna in St. Petronio; he painted some of his best portraits and Madonna pictures here, besides producing many wood-engravings and designs for goldsmiths. He then returned to Parma to paint the archway of the choir of the Madonna della Steccata. After returning to his earlier style, and executing many fine works, he gave up painting for alchemy in order to enrich himself. This soon led him into difficulties, and being condemned to prison as an alchemist and on other charges, he fled to Casalmaggiore, where he painted a *Madonna* for St. Stephen's and a Roman *Lucretia*. His mania for alchemy again took possession of him, and, after dissipating his fortune, he died of melancholia at the age of thirty-seven. Some attribute the discovery of engraving by aqua-fortis to Parmigianino, because he was the first Italian artist who etched his own subjects by this method. The Germans, however, claim that Dürer was the inventor.

W. J. Stillman.

Mead [M. Eng. *mede* < O. Eng. *meodo* : O. H. Germ. *metu* > Mod. Germ. *meth* < Teuton. *medu* : Lith. *midùs* : Welsh *medd* : Gr. μέθυ, wine : Sanskr. *mádhu*, honey]: an alcoholic drink made by fermenting a mixture of honey and water or the washings of honeycomb. It is sometimes flavored with aromatic substances. It is the same as hydromel and metheglin. It was a favorite drink among the Norse peoples of antiquity, and was known in ancient Greece and Rome. It is very intoxicating. According to Brande, it contains but 7·32 per cent. of alcohol, but the percentage is of course variable.

Mead, Larkin Goldsmith: sculptor; b. at Chesterfield, N. H., Jan. 3, 1835; removed in childhood with his parents to Brattleboro, Vt., where he was educated, and first made known his artistic genius by modeling in snow a colossal figure of an angel. He became a pupil of Henry Kirke Brown in Brooklyn, N. Y., for three years, after which he produced in marble his *Recording Angel* (1855); executed the colossal statue of *Vermont*, now placed over the dome of the State-house at Montpelier (1857), and a statue of Ethan Allen (1861), which stands in the portico of the same building. In 1862 he went to Florence, whence he returned to the U. S. some years later, bringing a model for a monument to Lincoln, which was ordered for his tomb at Springfield, Ill., and unveiled there Oct. 15, 1874. He has since executed several important works.

Mead, Richard, M. D., F. R. S.: physician; b. at Stepney, London, Aug. 11, 1673; was educated under Grævius at Utrecht; studied medicine at Leyden and Padua; settled at Stepney 1696; became physician to St. Thomas's Hospital 1703; anatomical lecturer at Surgeon's Hall 1711; attended Queen Anne in her last illness; removed to London 1714; was admitted fellow of the College of Physicians 1716; was consulted by the Government in 1719 as to the means of preventing the spread of the plague to England; wrote a treatise on the subject which ran through seven editions in that year, and was charged in 1721 with conducting experiments as to the effects of inoculation upon criminals condemned to death, which resulted so favorably that the Princesses Amelia and Caroline were soon afterward inoculated. In 1727 Dr. Mead became physician-in-ordinary to George II. The extraordinary reputation which Dr. Mead enjoyed for half a century as the highest English medical authority dated from his work, *A Mechanical Account of Poisons* (1703), and was strengthened by his intimacy with Boerhaave. Several of his medical works were written in elegant Latin; of these the best known was *Medicina Sacra* (1749), on the principal diseases mentioned in the Bible, notable for taking the position (then a novel one) that the demoniacal possessions of the Gospels are to be considered cases of lunacy and epilepsy. D. in London, Feb. 16, 1754. His *Medical Works*, which had appeared in Latin, French, and Italian, were published in English in 1762. See Maty, *Authentic Memoir of the Life of Richard Mead* (London, 1755).

Meade, George Gordon: officer and scientist; b. Dec. 31, 1815, in Cadiz, Spain, his father being at the time U. S. navy-agent at that port. After receiving a careful education he entered the U. S. Military Academy at West Point in 1831, where he graduated June 30, 1835, and was appointed in the army a brevet second lieutenant of artillery, receiving his full rank the same year. Remaining in the army little more than a year, during which time he was engaged in Florida against the hostile Seminoles, he resigned Oct., 1836, and entered upon the profession of civil engineer, which he followed for about six years, being employed by the Government to assist in an elaborate survey of the mouths of the Mississippi river, making some original experiments which led to important improvements of that river. He was next engaged in the survey of the boundary-line of Texas, and subsequently in the survey of the northeast boundary-line between the U. S. and Great Britain, where we find him in 1842, in which year he was reappointed in the army a second lieutenant of topographical engineers, and retained for some time upon the same duty; then in river and harbor improvements. In the Mexican war he served with distinction on the staffs of Gen. Taylor and of Gen. Scott in the battles of Palo Alto, Resaca de la Palma, and Monterey, winning the brevet of first lieutenant for the latter battle. In 1851 he was promoted to be first lieutenant in his corps, captain in 1856, and major in 1862. After the close of the Mexican war he was engaged in light-house construction, and during the four years preceding the civil war had charge of the geodetic survey of the Great Lakes, in which he added largely to his scientific and engineering reputation. In Aug., 1861, he was appointed a brigadier-general of volunteers, and placed in command of

the second brigade of the Pennsylvania Reserve Corps, which constituted a division in the Army of the Potomac, with which army he remained prominently identified until the close of the war. In the Virginia Peninsular campaign of 1862 he took an active part in the battles of Mechanicsville, Gaines's Mill, and Glendale, being severely wounded in the latter. Returning to the field as soon as his wound would permit, he was assigned to the command of a division, and distinguished himself in the battles of South Mountain and Antictam, being placed in command of the First Corps when Gen. Hooker was wounded at the last-named battle, where he was later himself slightly wounded. For these services he was promoted to be major-general of volunteers in Nov., 1862. Upon the recovery of Gen. Hooker he returned to the command of his division, and in Dec., 1862, at Fredericksburg, he led the attack which broke through the right of Lee's line and penetrated far to the rear, but being at length outnumbered, was driven back with heavy loss. In the latter part of this month he was promoted to the command of the Fifth Corps, and at Chancellorsville (May, 1863) his sagacious advice so impressed Gen. Hooker that upon requesting to be relieved, two months later, he designated Gen. Meade as his successor, and on June 28, 1863, he was appointed by President Lincoln to command in chief the Army of the Potomac, then scattered and moving hastily through Pennsylvania to the great battle-field of Gettysburg, at which he commanded, and on July 1, 2, and 3 won a victory with whose glory and decisive results his name will forever be identified. From that time he commanded the Army of the Potomac until the close of the war. For his skill and valor at Gettysburg he received the thanks of Congress, and was promoted in the regular army to the rank of brigadier-general. The operations of the army during the winter of 1863–64 were unimportant, and before the return of the season for active operations Gen. Grant had been placed in command of all the armies with the rank of lieutenant-general, and had taken up his headquarters with the Army of the Potomac. During the extraordinary campaign which opened in May, 1864, with the battle of the Wilderness, and terminated with the surrender of the army of Northern Virginia, Meade's ability as a commander was conspicuous; and his services were recognized by his promotion to the rank of major-general in the regular army in Aug., 1864. After the close of hostilities Meade was (July 1, 1865) assigned to the command of the military division of the Atlantic, with his headquarters at Philadelphia; this post he held, with one short period of detached service in Georgia, till his death, which occurred in Philadelphia, Nov. 6, 1872. A colossal equestrian statue of him was unveiled in Fairmount Park, Oct. 18, 1887.

Meade, Richard Worsam: See the Appendix.

Meade, William, D. D.: bishop; b. in Frederick (now Clarke) co., Va., Nov. 11, 1789; graduated at the College of New Jersey 1808. He was prepared for the ministry under the direction of the Rev. Walter Addison, of Maryland, and by Bishop Madison he was ordained in the Protestant Episcopal Church in 1811; for many years he preached gratuitously near his home, besides contributing freely to educational and missionary work. His first charge was Christ church, Alexandria. He became in 1829 assistant bishop and in 1841 Bishop of Virginia; was a recognized Low Church leader; opposed earnestly the secession of the State from the Federal Union in 1861, but when the separation was practically effected participated in the organization of the Church in the Confederate States, and was the presiding Bishop of the Southern Church; was author of valuable devotional works, and of *Old Churches, Ministers, and Families in Virginia* (2 vols., 1856). He contributed very much to revive the Episcopal Church in Virginia, and in 1823 was largely instrumental in founding the Protestant Episcopal Theological Seminary of Virginia. D. Mar. 14, 1862.

Revised by W. S. Perry.

Meade River: a river of Alaska, flowing northward into the Arctic Ocean, S. W. of Point Barrow; discovered by Lieut. Ray in 1883. It passes through a country rich in lakes, lagoons, marshes, and streams, covered in summer with abundant vegetation, but almost destitute of trees.

Meadow [O. Eng. *mād*, plur. *mādwe*: O. Fries. *mēth*: O. Low Germ. *mātha*; akin to Germ. *matte*, of different ablaut grade, and connected with Lat. *mē'tere*, mow]: the general name for any tract of grass-land in which the natural herbage is permanent and frequently made into hay, but more especially applied to the low grounds on the banks of rivers, which are kept moist by their situation and occasionally flooded by the rise of the waters. In the low, wet meadows the herbage is coarser and less nutritious than in those which lie higher and which are never, or only for short intervals, flooded. For this reason upland meadows are very valuable wherever there is a demand for good hay, but as they are not recruited by annual flooding, some pains must be taken to keep up their natural fertility. The best means of preventing them from degenerating is, of course, a frequent application of rich animal and vegetable manure, spread over the surface either early in spring or immediately after mowing, when showers are abundant and able to wash the nutriment down to the roots of the grass. Artificial manures, particularly those rich in phosphates and nitrogen, may also be used, and have the advantage of introducing no weed seeds. Whether the hay is taken off by mowing or by the grazing of cattle, the effect is nearly the same with respect to the formation of a closer sward; but it is a mistake to suppose that pasturing can replace manuring. The urine of cattle greatly promotes luxuriant vegetation in rainy weather, but in hot and dry weather it does more harm than good. The dung when dropped on the grass is of little value compared with what it would be if mixed with straw, earth, or peat, or diffused through water in a tank. If a natural meadow deteriorates and the grass becomes mixed with rank weeds and mosses, the shortest method of restoring it, and in most cases also the best, is to plow it up clean, and manure it during a course of tillage, without taking very exhaustive crops from it, and then to lay it down again in a clean and enriched state by sowing the best sorts of grass-seed. Another remedy is to harrow the surface thoroughly in early spring and sow liberally a mixture of grass-seeds, with a dressing of 100 lb. per acre of nitrate of soda and 300 lb. of bone-meal. Where the sward is thin it is prudent to mow before the seeds of the grasses are formed, contrary to a common notion that in a thin meadow the seed should be allowed to shed, in order to increase the number of plants. Such an increase should be effected by sowing seeds produced on other ground, as the ripening of the seed tends to exhaust the soil.

Revised by H. H. Wing.

Meadow-lark: a bird of the oriole family (*Icteridæ*), having a handsomely variegated plumage of pale brown, streaked with dark brown and blackish. The under parts are bright yellow, and there is a black crescent on the breast which is merely indicated in the young. The bird is not even a near relative of the lark, but possibly was called lark on account of its song, while meadow indicates its favorite haunts. The eastern meadow-lark (*Sturnella magna*) is common in the Eastern U. S. West of the Mississippi it is replaced by a paler race (*S. magna neglecta*), while a darker-colored variety (*S. m. mexicana*) occurs in Southern Texas and Northern Mexico. F. A. Lucas.

Meadow-mouse: See Arvicola.

Meadow-saffron: the common name of a small perennial bulbous herb (*Colchicum autumnale*) of the natural order *Melanthaceæ*, growing wild in moist soil in England and Middle and Southern Europe. The mode of growth is peculiar. From the corm of one year there sprouts a new one, from which, late in the summer, a stem grows, bearing for that season only flowers. These are from two to six in number, and are of a lilac or light-purple color. The following spring the young plant matures, bearing leaves and fruit, and the old corm shrivels. The leaves are large, broad, and lanceolate; the fruit is a three-celled capsule, containing small brown seeds about the size of black mustard-seeds. The corm and seeds are used in medicine. Their virtues depend upon a crystallizable principle called *colchicine*.

Edward Curtis.

Meadville: city (founded in 1788); capital of Crawford co., Pa. (for location, see map of Pennsylvania, ref. 2–A): on the Venango river, and the Pitts., Shen. and Lake E. and the N. Y., Pa. and O. railways; 126 miles N. of Pittsburg. It is in an agricultural region; contains 15 churches, high school, 2 graded schools, 2 conservatories of music, mercantile college, 6 libraries (Allegheny College, Allegheny Literary Society, Philo-Franklin Literary Society, High School, Theological School, and Library, Art, and Historical Association, with over 45,000 volumes in all), and 10 hotels; and has a national bank with capital of $100,000, 2 private banks, and 2 daily, 6 weekly, 2 monthly, and 2 other periodicals. The city is the seat of Allegheny College (*q. v.*, Methodist Episcopal, opened 1815) and of a Unitarian Theolog-

ieal School (opened 1840). The industries include the manufacture of engines and boilers, oil-well supplies, wood mantels, leather belting, sash, doors, and blinds, and distillery and brewery products. Pop. (1880) 8,860; (1890) 9,520; (1900) 10,291.

EDITOR OF "TRIBUNE-REPUBLICAN."

Meaford: a port on Nottawasaga Bay, the southern end of Georgian Bay, Lake Huron, Grey co., Ontario; the terminus of a branch of the Grand Trunk Railway (see map of Ontario, ref. 3–C). It is a good port, accessible for vessels drawing 12 feet, and has saw and grist mills and an iron-foundry. Pop. 2,000. M. W. H.

Meagher, THOMAS FRANCIS: revolutionist and soldier; b. at Waterford, Ireland, Aug. 3, 1823; studied at the Jesuit college of Clongowes Wood, Kildare, and at Stonyhurst College, England; became a favorite orator with the Young Ireland party of 1846–48; was sentenced to death for sedition; but the sentence was commuted to transportation for life; escaped from Tasmania in 1852 and went to New York; lectured with success in various parts of the U. S.; was admitted to the bar, and wrote for the press; became editor of *The Irish News* in 1856: became in 1861 a captain and then major of the Sixty-ninth New York Volunteers; raised a brigade of Irish volunteers in 1862; commanded this brigade as brigadier-general 1862–63; left the brigade after the battle of Chancellorsville; was assigned in 1864 to the command of the district of Etowa; resigned May 15, 1865. In 1865 he became secretary of Montana; was drowned by falling from a steamer into the Missouri river at Fort Benton, Mont., July 1, 1867. Revised by JAMES MERCUR.

Meal: See FLOUR.

Meal-worm: See TENEBRIO.

Mean [M. Eng. *mene*, from O. Fr. *meïen* > Fr. *moyen* < Lat. *media'nus*, median, in the middle, deriv. of *medius*, middle, mid; cf. Gr. *μέσσος*: Eng. *mid*]: a term expressing a quantity lying between two other quantities, and connected with them by some mathematical law. There are several kinds of mean values, the principal ones being the *arithmetical mean*, the *geometrical mean*, and the *harmonic mean*.

(1) The *arithmetical mean* of two quantities is one-half their sum; the arithmetical mean of several quantities is equal to their sum divided by their number; it is the same as their average. Thus we say that the mean temperature of a day is equal to the sum of the temperatures at every hour (or minute) of the day, divided by the number of hours (or minutes) in the day; and the mean temperature of a year is equal to the sum of the mean temperatures of every day in the year, divided by the number of days in the year.

A *mean by weights* is, in the simplest case, an arithmetical mean of quantities which are not all unequal. If m_1 of the quantities are each equal to a_1, m_2 of them to a_2, m_3 of them to a_3, etc., then the arithmetical mean of the whole of them is

$$\frac{m_1a_1 + m_2a_3 + m_3\,a_3 + \text{etc.}}{m_1 + m_2 + m_3 + \text{etc.}}$$

This is called a "mean by weights" of the quantities a_1, a_2, a_3, etc., the coefficient m_1, m_2, m_3, etc., being called *weights*. The term is extended to the case when these coefficients are not whole numbers.

(2) The *geometrical mean* of two quantities is the square root of their product; if several quantities form a geometrical progression, the first and last are called extremes, and all the others are said to be geometrical means between them. The ratio of the progression is equal to the nth root of the quotient of the last term by the first, $n + 1$ being the number of terms. Thus any ordinate of a circle is equal to the geometrical mean of the corresponding segments of the diameter.

(3) The *harmonic mean* of two quantities is the reciprocal of the arithmetical mean of the reciprocals of the two quantities. Thus the harmonic mean of 6 and 12 is $1 \div \frac{1}{2}(\frac{1}{6} + \frac{1}{12})$, or 8. The harmonic mean of two quantities is a third proportional to their arithmetical and geometrical means; that is,

$$\frac{a+b}{2} : \sqrt{ab} :: \sqrt{ab} : \frac{2ab}{a+b}.$$

(4) The *arithmetico-geometric mean* is a mean of two quantities formed by taking their arithmetical and geometrical means, then the arithmetical and geometric means of these means, and so on. The two sets of means will approach the same limit, which limit is the arithmetico-geometric mean.

The method of geometrical means is used in solving many practical problems. Thus to find the rate per cent. at which a sum of money will double in a given number of years, we regard the amounts at the ends of the successive years as terms of a geometrical progression, and then find the value of the corresponding ratio; this ratio (which is the annual amount per cent.), diminished by 1, is the required rate. Let it be required to find the rate per cent. at which a given sum of money will double in 10 years; here there are 9 geometrical means to be inserted between 1 and 2, and by the rule we find the ratio equal to $\sqrt[10]{2}$, or to 1·0717; hence the required rate is ·0717. Revised by S. NEWCOMB.

Meares, JOHN: navigator; b. in England about 1756; entered the navy in 1771; served against the French in the West Indies; became captain in the merchant service after the Peace of 1783; went to India; formed at Calcutta the Northwest America Company for opening trade with Russian America; sailed from Calcutta in the Nootka, a vessel of 200 tons, Mar. 12, 1786, with which he explored a portion of the coasts of the present Territory of Alaska; returned to the coast of China viâ the Sandwich islands; later he reconnoitered the neighboring coasts, of which he took possession for the crown of England. In 1789 he sent two more vessels to join the Nootka, all of which were seized by Spanish vessels on the ground that the coast and adjacent waters belonged to Spain. Thereupon Meares went to England to appeal to the House of Commons. A fleet known as "the Spanish armament of 1790" was equipped to bring Spain to terms, but before it sailed the Spanish Government acceded to the demands of Great Britain. He published *Voyages made in the Years 1788–89 from China to the Northwest Coast of America and China* (2 vols., London, 1790). Capt. Meares's discoveries form the chief basis upon which the British title to Oregon and British Columbia was based. He was made a commander in 1795. D. in London in 1809.

Mearns, The: See KINCARDINESHIRE.

Measles [cf. Dutch *mazelen* and Germ. *masern*, measles, liter., spots; cf. Eng. *mazer*, drinking-bowl, orig. spot or excrescence on a maple-tree]: an acute, exceedingly contagious eruptive disease of frequent occurrence. It is most commonly seen in the young, less frequently in the adult, and uncommon during the first half year of life. Most people are affected but once; cases, however, of second, third, and even fourth attacks are not very rare. It is due to a specific poison, as yet not isolated, which exists in the exhalations and secretions of the body, usually infecting by entrance of the active principle through the mucous membrane of the respiratory tract. The contagion is most effective about the time when the eruption is first seen, but it remains active until the skin has been restored by peeling (desquamation) and successive development to its normal state. The eruption consists of small, elevated, raspberry-like red spots, gradually merging into one another in places, and forming discolorations the size of a pea to that of a dime, separated from one another by normal skin. It appears from a few to thirteen days after the contagion has occurred, during which period of incubation a number of premonitory symptoms usually develop to a greater or less degree, such as a loose or barking cough, congested inflamed eyes, nasal catarrh, headache, fever, etc. The eruption then appears, first on the temples, forehead, and cheeks, progresses downward for a day or two, and slowly disappears in about four days. The skin then peels off in exceedingly small scales (not in flakes as in scarlet fever), and returns to a normal condition after a week. During this period the cough will decrease in severity, the discharge from nose and bronchial tubes lessens, and the fever subsides. The large majority of cases run this mild regular course with a very small mortality. There are cases and epidemics, however, in which great dangers in consequence of complications arise. The most frequent danger lies in an accompanying inflammation of the bronchial tubes and lungs, which may prove fatal in a short time or result in a chronic inflammation, perhaps consumption. Besides these, inflammations of the throat, ear (not as frequent as in scarlatina), eyes, kidneys, etc., may remain behind. As these affections are of a serious nature, every case, no matter how mild, should be under the guidance of a physician. The usual treatment of mild cases consists of rest in bed in a

well-ventilated cool room, darkened somewhat on account of the inflamed eyes, appropriate diet, and cooling beverages. Where the cough is obstinate a mild expectorant is indicated; a child two years of age may take twenty-five drops of paregoric or a grain of Dover's powder at bedtime. Any complications necessitate skillful medical aid. When convaleseence is complete a warm bath should be given and the clothing changed; then the room can be fumigated and thoroughly aired. In some cases there is a difficulty in regard to distinguishing measles from scarlet fever, especially when the former is also complicated with sore throat of a simple or diphtheritic character. The ushering-in symptoms belonging to the respiratory organs and eyes, as described above, are characteristic of measles, while scarlet fever symptoms are seen principally in the mouth, throat, and digestive apparatus. See FILTH DISEASES.

A. JACOBI and F. E. SONDERN.

Measure, or **Bar** [*measure* is viâ O. Fr. *mesure*, from Lat. *mensu'ra*, a measuring, measure; deriv. of *meti'ri*, *men'sus*, to measure]: one of the small regular portions into which written or printed music is divided by bar-strokes. These measures mark and regulate the accent and rhythm of the notes included in them. In every regularly constructed melody the ear observes a certain rhythmical order, under which the melody seems to form itself into clauses, phrases, sections, or periods. In the performance of each of these portions there will also be noticed a constant series of pulsations or accents recurring at equal distances or lapses of time. These smaller divisions, marked out and defined by the periodical strokes of the accent, are the "measures" or bars of modern music; and the first note of each such measure always bears the principal accent. A faulty form of expression consists in the misuse of the word *time* when only *measure* is meant. Thus we hear of "common *time*," three-quarter *time* ($\frac{3}{4}$), sixth-eighth *time*" ($\frac{6}{8}$), etc. These terms are scientific misnomers. The time of a musical piece is its relative *rate of speed*, an idea entirely separate from that of measure. The latter governs the accents and rhythms from bar to bar, reproducing such accents with continuous regularity quite irrespective of how fast or slow the composition may be performed. The proper expression, then, is common or $\frac{4}{4}$ measure, $\frac{6}{8}$ measure, etc. In other languages richer than the English in musical technology we find this criticism sustained by their usage.

Measure of Damages: See DAMAGES, MEASURE OF.

Measures: See WEIGHTS AND MEASURES.

Measuring-machines: machines for measuring and comparing units of length, usually called *comparators*. When a given length is defined by the perpendicular distance between the parallel faces of the two ends of a bar of metal, this distance is determined by end-measure comparison. When the unit is defined by the perpendicular distance between the initial and the terminal line traced upon the surface of the bar, the distance is determined by line-measure comparisons. The length of a bar of metal varies with its temperature; and for this reason it becomes a matter of the utmost importance to determine the temperature with exactness.

Two methods of determining the temperature of the bars compared are employed, viz.: by measuring the temperature of a liquid in which the bars are immersed, and from the readings of thermometers placed upon the graduated surface of the metal, or, when feasible, inserted in holes made longitudinally in the bars. By the first method, the bars are said to be compared under liquid contact, and by the second method, under air contact. Each method has its advantages and its disadvantages. When water is employed, the immersed bars of metal quickly take the temperature of the liquid, but the evaporation from its surface always prevents the temperature of the liquid from rising to that of the surrounding air, the cooling effect varying with the temperature. At 80° F. this difference in temperature amounts to nearly 2°. On the other hand, in air-contact comparisons, which are for the most part a necessity in practical work, the reading of the thermometer is dependent upon the action of several controlling forces which are not easily separated.

Fig. 1 gives a view of the instrument used at the International Bureau of Weights and Measures at Breteuil, near Paris, for comparing standards of nearly the same length. The bars to be compared are placed side by side in the water-carriage, by which they are brought in succession under the two microscopes, which are placed at a distance apart nearly equal to the length of the standards compared.

When, in addition to the comparison of the total lengths of two standards, it is required to determine the errors of

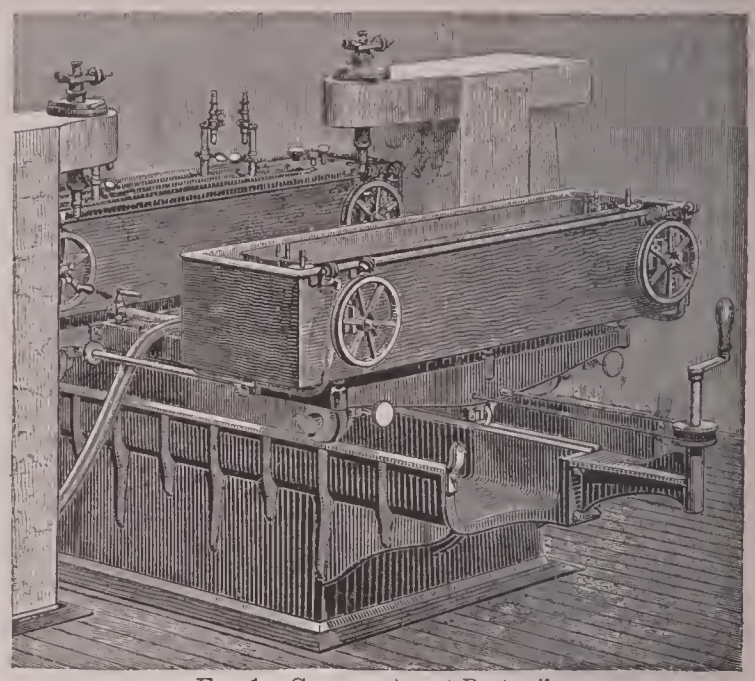

FIG. 1.—Comparator at Breteuil.

subdivision into aliquot parts, a good comparator must, in its construction, fulfill two conditions, viz.: (1) the carriage to which the microscopes are attached must move in the same horizontal plane from end to end, and (2) it must move in a straight line in that plane.

In Fig. 2 the end view of a comparator which fulfills these conditions is shown at (4). The microscope-carriage

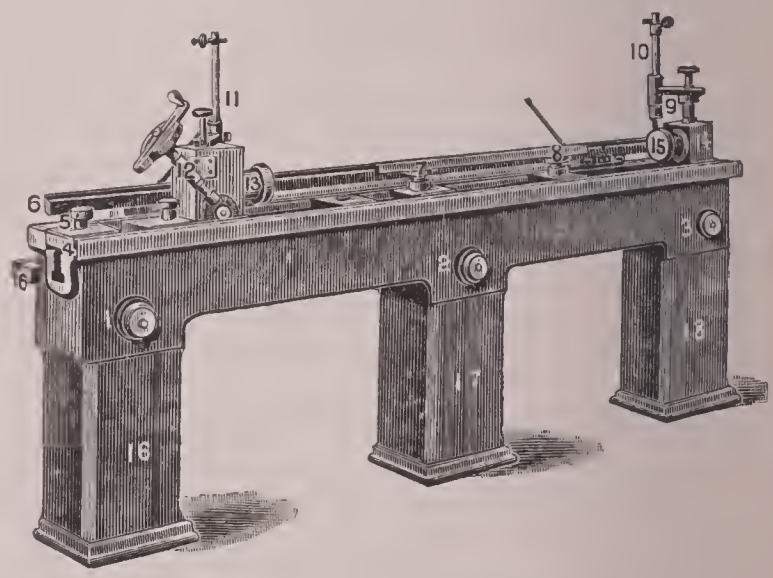

FIG. 2.—100-inch comparator.

(12) moves upon the surfaces of flat ways, and is kept in contact with the face of the vertical wall (4) by means of spring-plugs placed in the left side of the base, which, pressing against the opposite vertical wall, keep the carriage in contact with the vertical face of the right wall. This face is made a plane surface in construction.

Two methods of comparison may be employed in a comparator of this form, viz.: (*a*) the two-microscope method and (*b*) the stop method. In the first method the microscopes (9) and (11) are placed at a distance apart nearly equal to the distances to be compared. The bars to be compared are placed upon a universal adjustment carriage (not shown in this view), which rests upon the plate shown at (16). By means of these adjustments the bars can be brought into position successively under the two microscopes, without contact with the hands of the observer. By the stop method the stop-plate marked (5) and a corresponding plate placed between (7) and (13) are placed at a distance apart nearly equal to the distance to be compared. The microscope-carriage is brought into contact with each stop in succession, and the readings of the micrometer of the microscope (11) are taken for coincidence with the defining lines upon the bar. This operation defines the relation of the distance between the lines to the distance between the

stops. A similar operation being performed upon another standard, each distance is thus compared with the constant distance between the stops.

The comparison of the subdivisions of a graduated scale may be made either by means of two microscopes, both

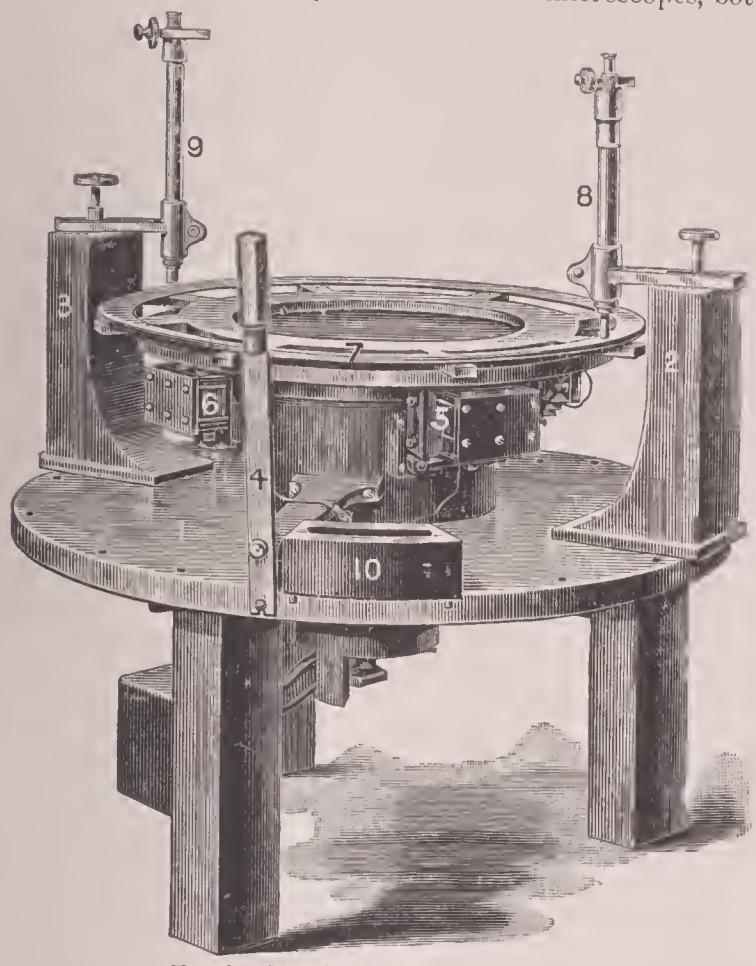

FIG. 3.—Circular measuring-machine.

placed upon the carriage (12) at the required distance apart, or by means of the stops. The latter method allows comparisons to be made between the most minute subdivisions, while in the former the smallest subdivisions of the same scale that can be directly compared are about 2 inches long.

In end-measure comparisons the bars to be compared are placed upon the adjustable supports (7) and (8). Contact is made between the plugs with conical ends with the parallel face-plates (13) and (15). The operation of comparison is as follows: Plate (9) is firmly clamped to the bed-plate of the comparator and (13) is brought into contact with (15). Coincidence is then made with the initial line of the bar (6) by means of (11). The microscope-carriage is then moved back to allow the insertion of the bar numbered (7) and (8). Contact of the end of the bar with (15) having been made, the carriage is then moved forward and contact is made between (7) and (13), when the micrometer is read for coincidence with the terminal line of the bar. It is evident that the microscope-carriage has moved from the position of contact between (13) and (11), a distance equal to that between the two faces of the end-measure bar.

In the circular measuring-machine shown in Fig. 3, only comparisons of the subdivisions of the circle into aliquot parts are required. Either the stop method or the two-microscope method may be employed. The graduated disk (7) revolves with a cylindrical shaft, to which it is attached, and which is accurately fitted to a bearing attached to the bed-plate (1). Four magnets (5) are attached to a deep ring, which is attached to the bearing within which the revolving shaft moves, and which has a movement in revo-

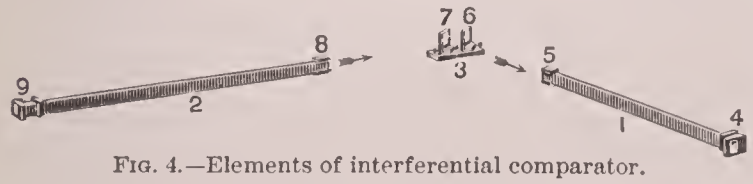

FIG. 4.—Elements of interferential comparator.

lution concentric with the motion of (7). The plates to which these magnets are attached move between guides, and contact with the under face of (7) is made by balancing weights. The electric current clamps the graduated disk (7) to the circular frame and the projecting arm (4). The disk is then moved forward a distance determined by the position of two stops, one numbered (10) and the other like it to the left of (4), but not shown in the figure. Breaking the circuit of the current, the magnet arm is moved backward into contact with the first stop without moving the disk (7).

Microscopes (8) and (9) can be set at any distance apart required to obtain an aliquot subdivision of the entire circle, and by the revolution of the disk (7) comparison of the lengths of the successive subdivisions can be made.

The Interferential Method.—By this method a given length is determined by counting the corresponding number of wave-lengths in a ray of monochromatic light of known refrangibility. The device by which interferences of light are formed is called a refractometer. The instrument with which such measurements are made has been called by Prof. Michelson, who devised this method of observation, an interferential comparator.

The form of the interferential comparator shown in Figs. 4 and 5 is the invention of Prof. Morley. His method proposes the determination in a vacuum of the absolute coefficient of expansion of metals between the limits of the freezing and the boiling points. The elements of the interferential comparator are shown in Fig. 4. Mirrors having plane and parallel silvered surfaces are attached to the ends of the bars shown in the figure. (6) is a mirror so silvered that one-half of an incident ray of monochromatic light is transmitted, and the other half is reflected. (7) is a plate of unsilvered glass, by means of which rays reflected from (5) and (8) pass through glass of the same thickness.

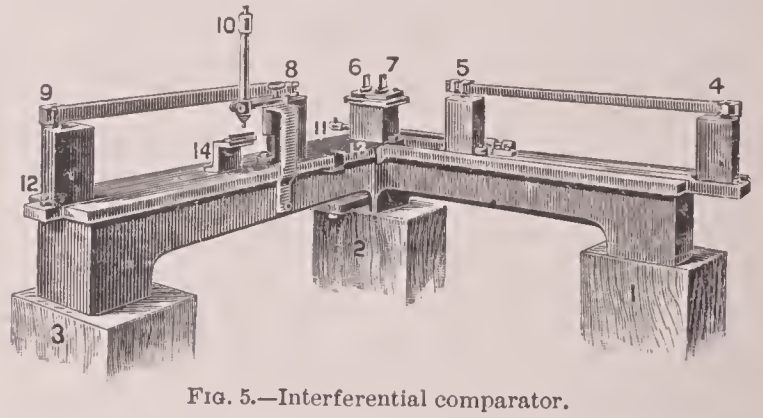

FIG. 5.—Interferential comparator.

A ray of monochromatic light enters (6). One-half is transmitted through (6) to (5) and is reflected back to (6). The utilized half of this reflected ray is again reflected from (6) to the eye of an observer. In the same manner, the reflected half of the incident ray is reflected from (8), and transmitted through (6), reaching the eye of the observer in front of (6). Since two rays which suffer internal and external reflection differ by half of a wave-length, the light of the ray is extinguished by interference.

The bars to be compared are mounted as shown in Fig. 5. Plate (14) is moved by a weight, which keeps it in contact with a wedge-shaped cross-plate actuated by a precision-screw. By means of interference phenomena, (5) and (8), and then (4) and 9), can be made equidistant from (6). The motion of the bar numbered (8) and (9) in passing from the first to the second position can be measured by counting interference bands during the motion. A microscope and graduated scale are shown at (10), with which distances corresponding to an observed number of wave-lengths are measured.

WILLIAM A. ROGERS.

Meat, or **Flesh**: in the main, the muscular tissue of animals, though this is always accompanied by blood-vessels, nerves, sinews, and fat. The constituents of meat are in general: (1) water; (2) albumen and albuminoids; (3) nitrogenous substances, not albuminoids, so-called extractive matter; (4) nitrogen-free compounds, mostly CARBOHYDRATES (*q. v.*); (5) inorganic salts. Meat free from fat contains on the average about 75 per cent. of water. The albumen and albuminoids constitute about 20 per cent. of meat. Among these substances are albuminoids soluble in water, myosin, collagen, etc. The nitrogenous extractive matter includes creatin, hypoxanthin, xanthin, and carnine. The substances included under the head of nitrogen-free compounds are certain carbohydrates, as glycogen and inosite, and, further, sarcolactic acid, glycerinphosphoric acid. When meat is treated with cold water, the inorganic salts, the creatine and similar substances, together with the nitrogen-free compounds, pass into solution. Some of the albuminoids are also dissolved. If the meat is boiled with water some of the albuminoids are coagulated, and not so

much of the meat passes into solution as when the temperature is kept down. Liebig gave much attention to the study of foods, endeavoring to determine which of the constituents of various kinds of food are of special value for nutrition. After an elaborate study of the changes effected in meat by treatment with water, he conceived the idea that the nutritious constituents of meat might be extracted in countries where meat is cheap and this extract transported to other countries where meat is dear. His principal object appears to have been to place within reach of the poor inhabitants of Europe some of the valuable material going to waste in other parts of the world. See EXTRACT OF MEAT and FOOD. IRA REMSEN.

Meath: county of Ireland; in the province of Leinster; bordering on the Irish Sea. Area, 906 sq. miles. It forms the eastern portion of the great limestone plain which occupies the whole central part of Ireland. The ground is level or gently undulating; the soil consists of a rich loam and is very fertile. The occupations are almost exclusively agricultural, chiefly grazing and dairy-farming. Of the total area about 92 per cent. (582,708 acres) are arable land. The coast is about 10 miles long, low, and shelving, but has no important harbor. The beautiful river Boyne divides the county into two nearly equal parts. Pop. in 1891, 76,987. The Irish language is still spoken to a large extent in the county. Principal town, Trim.

Meaux, mō: town; in the department of Seine-et-Marne, France; on the Marne; 28 miles N. E. of Paris (see map of France, ref. 3–F). It is the see of a bishop, and has a fine cathedral with a monument of Bossuet, who was bishop here. It has large manufactures of cottons, calicoes, sailcloth, vinegar, and saltpeter, and numerous flour-mills on the Marne from which great quantities of flour are sent to Paris. Pop. (1896) 13,520.

Mecca (probably the anc. *Makaraba* of Ptolemy; possibly the *Mesha* of Gen. x. 30): chief city in the vilayet of Hedjaz, Arabia; in lat. 21° 30′ N. and lon. 40° 8′ E.; 48 miles E. of Jeddah, its port on the Red Sea (see map of Persia and Arabia, ref. 7–C). It is situated in a narrow and barren valley inclosed by naked hills. Though it has neither trees, squares, public buildings, nor paved streets, and is dusty and muddy by turns, Mecca is handsomer and better built than most Eastern cities. As birthplace of Mohammed it is the most celebrated city of Islam. It also contains the KAABA (*q. v.*), around which has been built the immense mosque El Haram, begun by the Caliph Omar (634–644), added to by various caliphs, sherifs, and sultans, so that now the original form is lost in an agglomeration of buildings. El Haram has 7 minarets, more than any other mosque in the world, and 19 gates. According to Burckhardt it surrounds an oblong square 250 paces long and 200 broad, none of the sides of which are straight. The roof is sustained by 554 pillars. Inside the mosque is the well Zemzem. Over 200,000 pilgrims visit Mecca every year. The city has no manufactures or trade properly speaking, the main support of the inhabitants being derived from letting rooms to the pilgrims and supplying their necessities. Pop. 80,000, with lodging-room for three times that number. In 1517 Mecca and Medina passed under the control of the Ottoman sultans, part of whose title has since been Servant of the two Holy Cities. In 1803 Mecca was pillaged by the Wahabees, a fanatical sect of Mussulman reformers, and was held by them till their expulsion in 1818 by Mehemet Ali. See Burton's *Pilgrimage to El Medinah and Meccah*; Des Verger's *Arabie*; Nawab Sikander's *Pilgrimage to Mecca*, translated from the Urdu; and especially Burckhardt's *Travels in Arabia*; also see HADJ and MEHEMET ALI PASHA.
E. A. GROSVENOR.

Mecca Balsam, called also **Balm of Gilead**: the resinous exudation from a small evergreen shrub, known to botanists as *Balsamodendron gileadense*, that grows on the banks of the Red Sea. In the East it is much employed in medicine and perfumery, but the inferiority and spurious character of the material sent under its name into Western commerce have led to the almost entire abandonment of its use. I. R.

Mechanical Calculation: the employment of mechanical devices for assisting arithmetical computations. The practice dates from very early times, as is shown, in fact, by the etymology (Lat. *calculus*, a pebble), which indicates that the earliest "calculations" of a rude people were effected by means of an actual counting of grains or bits of stone, each representing a unit of the staple of traffic. They would not be employed, however, until the number of the fingers on the two hands, which forms the basis of the decimal notation, was exceeded. The second step in the development of arithmetic must have been to make a single pebble or grain represent a group of 5 or 10 units. The third step would be reached at a much later period by making a pebble or grain (of larger size or different color) represent 100, when a problem of addition involving many thousands of units could be mechanically performed by the aid of a small number of pebbles of three different kinds, the operation of "carrying ten" being mechanically represented by the substitution of a unit of the larger denomination for 10 of the smaller. This was the principle from which originated the abacus. It is thus seen that mechanical methods of computation preceded the perfection of mental arithmetic and the use of writing for the same purpose. Plato invented a sliding square to solve the problem of two mean proportionals, and Nicomedes in the first century B. C. devised a conchoid curve for the solution of the same problem, as well as for trisecting an angle. The Greeks and Romans employed the abacus for their ordinary problems of arithmetic, and the same or similar instruments continued in common use in Southern Europe till the end of the fifteenth century, and in England still later, until they were superseded by written arithmetic. (See ABACUS.) Gunter's scale and Napier's bones, invented in the seventeenth century, were extremely ingenious contrivances, but of little practical use from the limited nature of their operation. Blaise Pascal, constructed in 1642, at the age of nineteen, a machine for performing the routine operations of arithmetic. It consisted of a group of wheels and cylinders. On the convex surfaces of the latter were inscribed the numbers with which the operations were to be performed, consisting of the ten figures of the decimal system, and the numbers adapted for the addition and subtraction of livres, sous, deniers. These cylinders were connected by wheels in such manner that a single revolution of one wheel produced, according to the character of the desired operation, ten, twelve, or twenty revolutions of the other wheels. The first cylinder was turned by hand, and the others were moved in conformity to the desired arithmetical rule. In 1673 Leibnitz described a machine for a similar purpose, said to have been superior to Pascal's in practical operation, but too complicated and expensive to be brought into use. In 1822 Charles Babbage read two papers before the Royal Astronomical Society descriptive of a machine he had invented for solving mathematical problems of some complexity, and at the same time printing its own results by means of types. This would evidently have been of incalculable service in the tedious toil of computing astronomical tables, and the society therefore memorialized the Government for pecuniary aid in constructing a machine. The subject was referred to the Royal Society, and a committee, of which Herschel, Davy, Young, and Wollaston were members, reported in favor of the invention. The Government thereupon made a liberal grant, but the plan of the machine was extremely complicated, and was more than once modified, so that artisans had to be specially educated to understand it. Large sums were advanced from from time to time for many years, but the machine was never completed, and in 1843, after twenty years' labor and a fruitless expenditure of £17,000, the Government refused to countenance any further outlay, and the unfinished "difference engine," as it was called, was placed in the museum of King's College, London. Had the plan of the inventor been successfully carried out, this machine would perform all the operations of simple arithmetic on any numbers whatever; combine quantities algebraically or arithmetically in an unlimited variety of relations; use algebraic signs according to their proper laws, and develop the consequences of those laws; arbitrarily substitute any formula for any other; effect processes of differentiation and integration on functions in which the operations take place by successive steps; execute the operations of the combinatory analysis, and compute the numbers of Bernouilli. The cardinal principle of Babbage's machine is the fact that if we begin with a table of logarithms or sines, then make a second table consisting of the differences between the successive numbers of the first, then a third from the differences of the second, etc., we ultimately reach a table in which all the numbers are the same. Reversing the process, and the first number of each table being given, the first table could be recovered by a series of additions starting from the table of equal numbers.

Moreover, the machine stamps each figure as fast as calculated upon a stereotyped plate, so that no errors of the press could be made in the publication of tables thus calculated. A machine for effecting the same object upon a different principle was begun by two Swedish brothers, George and Edward Scheutz, in 1834, and successfully completed in 1853. It was exhibited in London in 1854, and in Paris in 1855, and was purchased by the Dudley Observatory at Albany in 1856. It calculates to fifteen places of decimals, impressing upon lead the result to eight places, at the rate of twenty-five figures per minute. By taking out certain wheels and putting in others it will calculate and record in pounds, shillings, and pence; in degrees, minutes, and seconds; in tons, hundredweights, and pounds, and in many other modes of notation. Some of the results obtained by the use of Babbage's machine were used by him as illustrations in his *Ninth Bridgewater Treatise* (London, 1838).

Revised by S. NEWCOMB.

Mechanical Engineer: See ENGINEERING.

Mechanical Powers: certain elementary forms of mechanism in which the simplest possible material connection between two points or surfaces is such that the action of a force applied at one point in a given direction is caused to overcome a resistance at another point in any required direction. In its general acceptation the term "mechanical power" implies also the condition that an "advantage" is gained by the use of one of these elementary machines; or, in other words, that a small force acting through a given space may be made to overcome a greater force acting as a resistance through a less space. When increase of motion is the principal object, a force acting through a given space may overcome a less resistance acting through a greater space. Where a simple transfer of the direction or point of application of a force takes place, without any possible "advantage" in either of these respects, the material connection between the points of application of the power and resistance does not necessarily involve the employment of one of the elementary machines or mechanical powers.

In discussing the motions which are transmitted by means of elementary machines it is unnecessary to take into account the nature of the forces which act upon them. These may be any of the ordinary forms in which force exhibits or is employed by men and animals, such as gravity, inertia, friction, etc.; one general principle being sufficient for all—viz., that in any elementary machine the product of the force or effort into the distance passed over by its point of application must be equal to the product of the resistance multiplied by the distance passed over by its point of application. If the force or effort be a liquid pressure acting on a surface, the resistance being a corresponding liquid pressure acting on a different surface, then the volumes through which the two surfaces move under the influences of the action and reaction must be equal. This latter enumeration of the general principle is applicable especially to hydrostatic machines.

Under these general definitions and conditions all the elementary machines which are met with in mechanical constructions, or which are employed by man and animals in locomotion, may be arranged under four heads, each depending, for the calculation of the work performed by the moving force and the resistance, upon certain elementary theorems of mechanics. The classifications are the *lever*; the *inclined plane*; the *jointed links* (called also the funicular machine, and also the "toggle-joint"); and the *hydrostatic press*. All machines of artificial construction and all movements of animals in locomotion depend on the action of these simple machines or mechanical powers, either in their elementary forms or in various combinations.

The lever is based on the theorem of *moments of forces*, and involves a rotation of a material, rigid bar or form about a point called the fulcrum. The moment of a force is the product of the force measured in units of force (pounds), multiplied by the perpendicular distance from its line of action to the center of rotation, the fulcrum. Whatever be the directions of the effort or power, and the resistance, applied to two points of a lever, the products obtained by multiplying each by the perpendicular distance from its line of action to the fulcrum must be equal. The pressure upon the point of rotation in the fulcrum acts as a third force, which at any instant maintains the other two in equilibrio. To find this pressure in any given direction, it is only necessary to find the components of the other two forces, which act in directions parallel to the given direction, and the equilibrium is established by the general theorem of parallel forces—viz., the resultant of two parallel forces is always equal to their sum if they act in the same direction, and to their difference if they act in contrary directions. This resultant in the case of the lever is the pressure upon the fulcrum, acting in the direction of the greater force if the parallel components of the forces act in opposite directions, and in the common direction of the forces if they act in the same direction. All problems of levers, whether they be straight or bent, and whether the forces applied to them are parallel or oblique, may be solved by the application of the preceding rules.

The wheel-and-axle and the movable pulley are elementary machines, depending for their action on the principle of the *lever*, although sometimes classed as separate mechanical powers. The fixed pulley merely changes the direction and point of application of the force applied to the cord passing over it, but no other advantage results from it. In the case of the movable pulley the fulcrum is movable, and acts as an instantaneous axis, the resistance acting between the power and the fulcrum.

The *inclined plane* and the *jointed links* depend for their action on the theorem of the parallelogram of forces. Representing the relations between the height, length, and base of an inclined plane by the altitude, hypothenuse, and base of a right-angled triangle, the relation between the forces which cause a sliding of a body on an inclined plane is as follows: If the effort or power be applied parallel to the length of the plane, and the resistance parallel to the height, the effort will be to the resistance as the height of the plane to the length. When a man rolls a barrel up an inclined plane into his wagon, he obtains not only the advantage of the inclined plane, but also the advantage of rolling over sliding friction. The total useful work performed, leaving friction out of consideration, is the work of elevating the weight of the barrel from the ground to the wagon; and this total work can in no way be avoided. It is, however, accomplished by a small muscular effort exerted through a greater space than the height of the wagon, the diminution of the effort necessary depending on the length of the plane.

The wedge is an example of an inclined plane. When a pressure is exerted against the end of a wedge to force it forward, the resistance against the face of the wedge will be to the pressure applied to the end as the distance through which the wedge moves is to the distance, perpendicular to the face, through which the material yields to the action.

The screw is an inclined plane in the form of a helix wound around a cylinder, and its action is determined by the same laws.

The jointed links, in which the relation between the power and resistance is found by the application of the parallelogram of forces, is not so often found in artificial constructions as some of the other elementary machines, but it possesses especial interest in being found applied in the mechanism of all walking or leaping animals. A few artificial constructions, among which may be named Hicks's press, are based on this mechanical power, the elements of which are two rigid bars or *links* jointed together, the effort being applied at the joint in such a manner as to enlarge the angle between the bars. If one bar rest against an immovable point of resistance, and the other be guided in a given direction, when the two bars approach a straight line the action of the force at the joint is to overcome a much greater resistance at the end of the guided bar. A succession of jointed links, as in the hinder legs of leaping animals, not only multiplies motion, but enables the animal to exert the greatest effort in the direction of the terminal motion.

The *hydrostatic press* is an elementary machine which depends for its action on the principle of distribution of pressures through the medium of a liquid. If a closed vessel filled with a liquid be tapped at any point, and a small piston be inserted in such a manner that an external pressure may be applied to the piston, no liquid being allowed to escape—when such a pressure is applied, every part of the internal surface of the vessel, equal in area to the piston, will feel the additional pressure independently of all the other parts. If one end of the vessel be closed by a tight piston movable outward, the total additional pressure upon the surface of this larger piston will be equivalent to the sum of all the additional pressures upon its parts, each of these small parts being equal to the area of the smaller piston. The force required to resist the total additional pressure on the large piston will then be as many times greater than the force applied to the small piston as the

surface of the larger is greater than the surface of the smaller piston. If motion take place, the extent of motion of the two pistons must follow the inverse of this rule. The distance passed over by the two pistons will be inversely proportional to their areas. See HYDROSTATIC PRESS.

Ordinary machines, whether they be *prime movers*—i. e. whether they receive directly and utilize the action of muscular force, the force of gravity acting through falling water, the wind, or the moving force of heat—or whether they be secondary machines driven by prime movers, are elementary machines, or combinations of the elementary machines which have been named. They consist generally of a framework for sustaining and supporting the moving pieces, and certain connections between the moving pieces by which motion is communicated from one moving piece to another, or from the driving point to the working point. The principles according to which such motions are communicated are based on the laws of motion (see MOTION), and have been fully developed for all ordinary machines in modern works on the principles of mechanism. Prof. Robert Willis, M. A., F. R. S., of the University of Cambridge, is entitled to the credit of having been the first to develop this interesting and useful branch of practical mechanics into a special science.

Mechanics [Gr. *μηχανικός*, mechanical, pertaining to machines or contrivances, deriv. of *μηχανή*, device, contrivance, machine]: a term originally employed to designate the principles of action of machines; the science which treats of the nature of forces and their action on bodies, commonly called the *science of mechanics*, having derived its origin principally from practical operations rather than from theoretical abstractions. The proficiency of the ancients in practical mechanics is sufficiently evinced by the descriptions of machines which have been preserved in their writings. In the construction of temples, pyramids, bridges, aqueducts, and other great works, the elementary machines must have performed an important part; indeed, some ideas of modern physics seem to have entered into the conceptions of the old Greek philosophers, such as that of the elements or atoms, the ether, and the idea that all things are in incessant motion. Archimedes (287–212 B. C.) may even be said to have laid the foundation of theoretical mechanics in his investigations in regard to the lever, centers of gravity, etc. The theory of Aristotle, that a body contains in itself the principles of rest and motion, uninfluenced by external causes, continued, however, to be received until the time of Galileo (1564–1642). Galileo disputed the ideas of Aristotle, and by experiments on falling bodies showed the existence of a force independent of the falling body which produced a velocity of motion dependent on the time of descent, and not on the mass of the body. After this the science made slow but gradual progress, and was extended in its signification beyond the principles of mere mechanical contrivances to embrace the laws of force and motion as exhibited in universal phenomena. With this signification the science became enlarged and subdivided, writers on mechanics dividing the subject into two parts—*statics*, embracing the principles or theorems which apply to bodies at rest under the action of natural forces; and *dynamics*, embracing the principles of action of bodies in a state of motion. (See MOTION.) There are further subdivisions according to the nature of the body acted upon. See HYDROSTATICS, HYDRAULICS, PNEUMATICS, and THERMODYNAMICS.

A brief summary of the laws and principles of the science of dynamics under this broad acceptation has been given under DYNAMICS (*q. v.*), and it only remains to follow a little further the enunciations of these general principles, and to give a brief history of their discovery or development. Benedetti (1530–90) was the first to discover the true *cause* of acceleration in falling bodies in properly considering the principle of inertia, it having been previously supposed that every movement was due to an independent and additional exercise of force.

Of the principles which form the foundation of the science of mechanics or dynamics—viz., the principle of inertia, the equality of action and reaction, the non-dependence of the effect of a force on the previous motion acquired by a body, and the independence of the effects of forces which act simultaneously upon the same body—the first was recognized by Descartes (1596–1650), who, observing the acceleration of bodies moving in straight lines, called the force of continuance the indwelling force of the matter, a property called by Newton (1642–1726) *inertness*, while the resistance to change due to the body alone he called *inertia*.

According to Lagrange, Guido Ubaldi (1545–1607) was the first to make an exposition of the principle of *virtual velocities*. The virtual velocity of a point due to a force is the motion of the point in a right line to a position infinitely near, projected upon the line of the force; and the *virtual moment* is the product obtained by multiplying the virtual velocity by the intensity of the force. This principle has been useful in investigating the analytical conditions of equilibrium of a system of forces.

Galileo announced the principle that two forces are in equilibrium if their moments are equal and opposed, the moments being proportional to the products of the forces by their virtual velocities. The conception of the parallelogram of forces is due to Galileo, and its subsequent applications to motions and velocities to Descartes, Wallis, Roberval, and others.

A theorem which has been most useful in analytical investigations, called the *Theorem of d'Alembert*, is found in most text-books. The principle is that at every instant the entire amount of force applied to a body is absolutely equivalent to the sum total of the effects produced.

The property called inertness—viz., that if there be no continuous action of forces upon a mass or material point, it either remains at rest or moves uniformly in a straight line—was announced by Descartes, Huyghens, and Newton.

The following are general theorems relating to any system whatever:

1. The center of gravity of any system acted upon by exterior force moves in the same path as if the whole mass of the system were concentrated at that point, and as though the exterior forces were transported parallel to themselves to that point. This theorem shows that the motion of a material system may be traced by referring it to the motion of its center of gravity regarded as a material point. As a familiar application of this general theorem, suppose a shell to be fired from a cannon. Its path will at first be approximately a parabola. If it explodes in its course, the resistance of the air being left out of consideration, the paths of the separate pieces will diverge, but the path of the common center of gravity of all the pieces will remain unaltered. The explosion of the powder, being only an exertion of internal forces, can not alter this path; it is only when one of the pieces strikes an obstacle that the path of the center of gravity of the whole is changed, a new external force being thus introduced. Applied to the planetary system, this theorem shows that if the influence of the fixed stars be disregarded, the center of gravity of the system must be either at rest or moving in some path due to forces external to the system.

2. The theorem of moments of momentum may be enunciated as follows: "The increase in the sum of the moments of momentum of a system in reference to any axis during a given time is equal to the sum of the moments of all the impulses of the exterior forces with reference to the same axis in the same time."

The principle of the indestructibility of force or the conservation of energy is of recent development, although discussions of the subject may be found in the works of the older writers. Some modern authorities give Newton the credit of anticipating the more recent discoverers. The investigations of Carnot, Clapeyron, Mayer, Colding, Joule, Clausius, Helmholtz, Rankine, and Thompson have served to definitely establish the principle. See ENERGY and FORCE.

The more recent establishment of the principle that the laws of dynamics embracing motion and force hold true as well for the minute invisible motions of the particles of bodies as for the great masses of the solar system has had a most important effect on the development of the physical sciences. The energy of a body is no longer confined to its sensible movements as a whole, but embraces the living force due to molecular motions which give rise to the phenomena of heat; and the sciences of heat, electricity, magnetism, chemistry, and even astronomy, have derived new interest and experienced a great expansion from a knowledge of the above principle.

Revised by R. A. ROBERTS.

APPENDIX.

Labori, lăă'bō'ree', FERNAND GUSTAVE GASTON: French lawyer; b. in Rheims, Aug. 18, 1860; studied law in Paris, where he became noted as a brilliant student; won the first prize in civil law in 1881, and the first prize in Roman law in 1883; and then traveled in England and in Germany. He was made a member of the bar of the court of appeal in 1881, and secretary of the conference of advocates for the judicial year 1887-88. While still a young man he achieved distinction as a special pleader, and was the advocate for the assassins Duval and Chevallereau. He defended the deputy Gabriel Compayre, in a suit for defamation, against the deputy Numa Gilly, and was advocate for the alleged traitor Dreyfus. He has also been retained in a number of cases involving important rights in theatrical productions, including the case of La Plume against Sar Peladan, the case of the *Théâtre réaliste*. He was chief redactor of the *Gazette du Palais*, and with others has undertaken the publishing of the *Répertoire encyclopédique du droit français*.

F. STURGES ALLEN.

Labrador: All of Labrador, except the coast regions which are a dependency of Newfoundland, now constitutes the Canadian district of Ungava. Until very recently the interior of Labrador was almost wholly unknown, but it has now been quite clearly revealed by the work of R. Bell, A. P. Low, D. J. V. Eaton, and Messrs. Hind, Bryant, Stupart, Payne, and others. Particularly notable were the journeys in 1895 and 1896 of Mr. Low, who traced the water-parting between the drainage tributary to the Atlantic and to Hudson Bay. Traveling through the interior to Ungava Bay on Hudson Strait, he found the country throughout a rolling plateau, broken by rocky ridges, with stunted trees confined to the valleys, the higher parts being without timber. The table-land, for the most part, is about 800 feet above sea-level, the water-parting rising to about 900 feet, and in the S. it is higher, where the eastern part of the peninsula, draining to the Atlantic, is 1,000 feet or more above the sea. He discovered two large lakes—Clearwater, 45 miles long, 25 wide in its broadest part, and dotted with numerous islands, and Seal Lake, more than 50 miles long and from 1 to 5 miles wide. In the latter fresh-water lake are seals that seem to be identical with a species known in the ocean. The facts point to their introduction when Labrador was overflowed by the ocean, and to their adaptation to the changed conditions when the land was raised above the sea. The coast fishing stations are surpassing in importance many of those of Newfoundland, and the catch of codfish has considerably increased in recent years. Salmon and trout are also caught and sent salted to Great Britain and to other parts of America. At the head of some of the bays are a few large areas of timber, chiefly spruce, adapted for lumbering. Twenty-one applications for timber limits were made in 1898. Some of them are said to have been granted, and capital will be invested in the lumbering industry. From the end of July to the middle of October there is a fortnightly steamer service between Labrador and Newfoundland, all the fishing stations being visited. The coast population, not including the Newfoundland fishermen, who are there only in the fishing season, was 4,106 at the time of the latest census.

C. C. ADAMS.

Lachaume, lăă'shōm', AIMÉ: pianist; b. in Paris, France, Dec. 13, 1871, and educated entirely at the conservatory there, taking the first prize in 1889. He then made his public appearance as a pianist at the Concerts Colonne. He went to New York with the Belgian violinist Eugene Ysaye, with whom he made a tour of the U. S. He has composed a few pieces for the pianoforte.

La Guaira: The increasing trade between Europe and Venezuela led to the establishment of three new lines of steamships to La Guaira in 1894, among them a monthly line from Genoa. The completion in 1897 of the cable line from Puerto Cabello to La Guaira, connecting with the line to New York, has been of much service to Venezuelan merchants; 312 vessels of 676,500 tons entered and cleared from La Guaira in 1897.

Lake Leopold II.: one of the fifteen administrative districts into which the Congo State is divided. The lake which gives it its name was discovered by Stanley in May, 1882. It is shallow, has an area of nearly 800 sq. miles, sends its waters to the Kassai and Congo through the Mfini river, and its head is situated in 1° 28′ S. lat. and 18° 35′ E. lon. Two German explorers, usually accurate, reported later that they could not find this lake where Stanley said it was, the fact being that they had forgotten to make allowance for the magnetic declination of the compass.

Lakey, EMILY JANE: artist; b. in Quincy, N. Y., June 22, 1837; was educated privately; taught in Ohio and Tennessee; studied painting, and exhibited at the National Academy of Design in 1873; afterward studied art in Paris. Her cattle pieces include *The Leader of the Herd*; *An Anxious Mother*; *Right of Way*; and *From Pasture to Pool*. D. in Cranford, N. J., Oct. 24, 1896.

Lambert, ALEXANDER: pianist; b. in Warsaw, Poland, Nov. 1, 1862. His first teacher was his father, and at the age of twelve, by the advice of Rubinstein, he was sent to the Vienna conservatory, where he remained for six years. Then he went to the U. S. and played at some concerts, and returned to Europe in 1882, but after fifteen months again went to New York, where he has since remained as a teacher.

Lambeth Conference: an assembly of all the bishops in communion with the Church of England, under the presidency of the Archbishop of Canterbury, at Lambeth Palace in London, sometimes spoken of as the *Pan-Anglican Synod*. The correct name is the Lambeth Conference, and four of these gatherings of bishops have been held at intervals of about ten years, in 1867, 1878, 1888, and 1897. They have grown greatly in size and importance, and may now be regarded as an established institution, though entirely without any legislative power.

The first suggestion of such an assemblage, including the English colonial episcopate and the bishops of the Irish, Scotch, and American Episcopal Churches, was made, so far as can be discovered, by the Right Rev. John Henry Hopkins, Bishop of Vermont, in 1851, in a letter to the Archbishop of Canterbury (Dr. John Bird Sumner). Nothing, however, came of the suggestion of Bishop Hopkins until the matter was taken up and urgently pressed by a Canadian bishop, Dr. J. T. Lewis, now Archbishop of Ontario, who brought the subject before a synod of the English Church in Canada. The idea was new, and there were difficulties to be overcome. The English bishops were hampered then, as now, by their connection with the state, and to take such a step as the calling of such a meeting required, in the first place, that the Primate of all England should be something more than the old-fashioned "Church and state" bishop. This proved to be the case when Archbishop Longley, a wise and gentle but courageous prelate, was translated from York to Canterbury. While the proposed conference was hailed with joy and satisfaction in the U. S. and the colonies, it excited no little apprehension in England. Archbishop Thomson (Dr. Longley's successor at York) held aloof, and Dean Stanley not only opposed the project, but persisted in refusing to allow the bishops to assemble as a conference in Westminster Abbey. His reason, as stated by himself, was that it was "impossible for him as guardian of a building like the abbey, which belongs to the whole Church and people of England, to take the responsibility of giving its sanction to a meeting which includes only a portion of the English bishops, and of which the objects are undefined, the

issues are unknown, and the discussions secret." (See *Life of Bishop Kerfoot*, of Pittsburg, p. 467, New York, 1886; also, *Life of Bishop Hopkins*, pp. 472–481, New York, 1873.) The above quotation from Dean Stanley well expresses the fears and objections on the part of many distinguished English churchmen which Archbishop Longley had to encounter and surmount. The archbishop was ably supported by Bishop Wilberforce of Oxford, the most eminent of all the English prelates. Bishop Wilberforce was perhaps the leading mind in the management of this first conference, and the actual penman of the pastoral letter that was issued.

Though Archbishop Longley did not succeed in removing the apprehensions of his brother primate of York and of like-minded churchmen, he carried out his purpose and issued his invitation (dated Feb. 22, 1867). The result was crowned with abundant success at the time, and the meetings have unquestionably proved very influential and advantageous to all the churches concerned. This is shown by the larger attendance of the bishops and increased interest of the general public, which are also proofs of the growth of the Anglican branch of the Church throughout the world. In 1867 Archbishop Longley invited 144 bishops, and 76 attended. In 1878 Archbishop Tait invited 173 bishops, of whom 108 accepted, and 100 attended. In 1888 Archbishop Benson issued 211 invitations, and 145 bishops attended. Of those who took part in the conference, 46 belonged to England and Wales, 11 to Ireland, 6 to Scotland, 29 to the U. S., and 53 to colonial and missionary dioceses throughout the world. In 1878 Archbishop Thomson of York had not only withdrawn his opposition, but he preached the sermon at the opening of the conference, and in 1888 (the third conference) both St. Paul's Cathedral and Westminster Abbey were thrown open to the bishops and impressive services were held. In 1897 the interest aroused was greater than ever. Archbishop Temple presided, and 200 bishops were in attendance.

In his opening address to the conference of 1867, Archbishop Longley clearly set forth the objects and limitations of the assembly, and the principles laid down by him have thus far not been departed from. "It has never been contemplated," said the archbishop, "that we should assume the functions of a general synod of all the churches in full communion with the Church of England, and take upon ourselves to enact canons that should be binding upon those here represented. We merely propose to discuss matters of practical interest, and pronounce what we deem expedient in resolutions which may serve as safe guides for future action. Thus it will be seen that our first essay is rather tentative and experimental in a matter in which we have no distinct precedent to direct us."

Few, if any, are now found who refuse to admire the wisdom and courage of Archbishop Longley in making this experiment, and none deny that the four meetings which have been held in the last thirty years "for brotherly communion and conference" have proved beneficial even beyond what the first promoters dared to hope. The London *Guardian*, the leading organ of the Church of England, spoke as follows in 1878 of the impression made by the American bishops: "No one can hesitate to acknowledge how largely any general conference of bishops must gain—and in fact how much these conferences have gained—from the presence of bishops of the Church in the U. S. They are just sufficiently foreigners in England to call for the exercise on our part of the courtesy due to guests and strangers, yet so far one with us as to share all the Christian feelings and highest Church interests which give an ecclesiastical conference its value and life. Their diocesan and conventional organizations demand careful study from us, even if they do not exactly harmonize with our traditions; and the spirit in which their laymen appear to do their part in the whole business of the Church is full of instruction to all promoters of Church assemblies on this side of the water. Their bishops seem to have commended themselves to the good opinion of their brethren at Lambeth by that straightforward simplicity of speech which springs from a practical habit of mind. It is always satisfactory to have to do with men who know what they mean, and who are accustomed to translate their meaning into action. American bishops have not been fettered by the social and political complications of an old country; and out of their freedom they can spare some gifts to us in return for the obligations under which the mother Church has laid them long ago. The eloquent sermon which the Bishop of Pennsylvania (Dr. Stevens) preached in St. Paul's on Saturday [July 27, 1878] must have suggested to many hearers that it is well for the churches to take mutual counsel, and that their members have some things mutually to learn." Similar expressions might be quoted from American bishops as to the benefits which they felt they had derived from meeting in council their English brethren and becoming more intimately acquainted with English Church life. It is not improbable, too, that one effect of the Lambeth Conference upon American bishops, and of the familiarity with English customs and ways, may be seen in a certain change which has gradually come over the Episcopal Church in matters of æstheticism and ritualism—a change which, be it for better or worse, has made considerable advances in the last quarter of a century.

Work of the Conferences.—The nature of the work attempted by the Lambeth Conferences can best be shown by mentioning briefly some of the many topics discussed and some of the conclusions arrived at.

In 1867, when the conference was, so to say, feeling its way, much less was attempted than in subsequent meetings. An unsuccessful effort was made by Dr. Gray, the Bishop of Cape Town in South Africa, supported by Bishop Hopkins of Vermont, to induce the conference to condemn the doctrines and writings of the famous Dr. J. W. Colenso, Bishop of Natal, and much time was occupied in this discussion. Perhaps the most important resolution passed by the conference of 1867 was the following:

"Resolution III. Question of appeal. That, in the opinion of this conference, it is very desirable that there should be a board of reference, or a spiritual tribunal for final appeal and decision in all matters of faith, including representatives from all branches of the Anglo-Catholic Church; and the bishops here assembled earnestly recommend this most important matter to the deliberate consideration of the convocations, conventions, and synods of the said Anglo-Catholic Church."

In 1878, under the presidency of Archbishop Tait, among the topics discussed were the following: Church organization; diversities in worship; laws of marriage; the "Old Catholics" and the Vatican Council of 1870; difficulties arising in the Church of England from the revival of obsolete forms of ritual, and from erroneous teaching on the subject of confession.

As to the Vatican Council, at that time a burning question, the conference said: ". . . It is therefore our duty to warn the faithful that the act done by the Bishop of Rome in the Vatican Council, in the year 1870—whereby he asserted a supremacy over all men in matters both of faith and morals, on the ground of an assumed infallibility—was an invasion of the attributes of the Lord Jesus Christ." As to ritual, "no alteration from the long-accustomed ritual should be made contrary to the admonition of the bishop of the diocese."

On the subject of confession, then and since so warmly discussed, the conference of 1878 spoke in very decided terms: "Further, having in view certain novel practices and teachings on the subject of confession, your committee desire to affirm that in the matter of confession the churches of the Anglican communion hold fast those principles which are set forth in the Holy Scriptures, which were professed by the primitive Church, and which were reaffirmed at the English Reformation; and it is their deliberate opinion that no minister of the Church is authorized to require from those who may resort to him to open their grief a particular or detailed enumeration of all their sins, or to require private confession previous to receiving the holy communion, or to enjoin or even encourage the practice of habitual confession, or to teach that such habitual confession, or the being subject to what has been termed the direction of a priest, is a condition of attaining to the highest spiritual life. At the same time your committee are not to be understood as desiring to limit in any way the provision made in the Book of Common Prayer for the relief of troubled consciences."

Although this opinion of the appointed committee was put forth by the conference as the judgment of the one hundred bishops assembled, it is needless to say that it was much criticised, and gave great offense to the "advanced" section of the High Church party.

The third Lambeth Conference (1888) issued an encyclical letter (about 12 pages 8vo), which began as follows: "To the faithful in Christ Jesus, greeting.—We, archbishops, bishops metropolitan, and other bishops of the

Holy Catholic Church, in full communion with the Church of England, 145 in number, all having superintendence over dioceses or lawfully commissioned to exercise episcopal functions therein, assembled from divers parts of the earth at Lambeth Palace, in the year of our Lord 1888, under the presidency of the Most Reverend Edward, by Divine Providence Archbishop of Canterbury, Primate of all England, and Metropolitan, . . . having taken into consideration various questions which have been submitted to us affecting the welfare of God's people," etc. The encyclical then delivers the conclusions of the conference on the following subjects: Temperance, purity, sanctity of marriage, polygamy, observance of the Lord's Day, socialism, care of emigrants, definite teaching of the faith, mutual relations, Old Catholics, the Eastern churches, and authoritative standards.

The conference of 1897 was one of the most important of all, as well as the largest in point of attendance. It was summoned to meet one year earlier than usual so as to coincide with the thirteenth centenary of the coming of St. Augustine, the first Archbishop of Canterbury. Coinciding also with Queen Victoria's diamond jubilee, the meeting of the bishops had a peculiar interest which had not attended any previous gathering, and may never occur again. The occasion was more than usually momentous, because there was an undefined movement in the air looking to some closer connection between the various churches represented at Lambeth, something in the nature of a more *organic* union, coupled perhaps with a promise of allegiance on the part of all the bishops to the see of Canterbury. This was strenuously opposed not only by the U. S. bishops, but also by the English colonial bishops. The views of the U. S. bishops were well expressed by Bishop A. C. A. Hall of Vermont, in an address to his convention prior to the assembling of the conference. As Bishop Hall is an Englishman by birth and education, his words are worth quoting. After emphasizing the fact that the conference would have no legislative authority, the bishop remarked that though most of the colonial churches have some kind of constitutional link with Canterbury, the Scottish and Irish churches are "as entirely free from any allegiance to the see of Canterbury as is the American Church, and as unlikely to allow any. A papacy at Canterbury, even in a modified form, is no more desirable than one at Rome." After a long discussion, in which Bishop Doane of Albany took a prominent part, a quietus was given to any movement designed to increase or extend the powers of the Archbishop of Canterbury. The proposed "tribunal of reference" disappeared, and in its place provision was made for appointing a "central consultative body," consisting of about eighteen bishops, for supplying information and advice. And it was expressly declared that this body would have no other than "a moral authority based on the services it may be able to render to the workings of the Church." Even this apparently harmless proposal has not yet been formally acceded to by the General Convention of the Episcopal Church. What may come of it is still *in futuro*.

Davidson, Dean of Windsor, now Bishop of Winchester (London, 1889); *Lives* of Bishops Hopkins, Kerfoot, Wilberforce, Selwyn, Ewing, etc.; *The Second Lambeth Conference: A Personal Narrative*, by Bishop W. Stevens Perry of Iowa; and the *Guardian*, London.

HALL HARRISON.

Lammas Lands, or **Lammas Meadows**: in English law, arable or pasture lands held in severalty and inclosed during the time of growth of corn and hay crops, but open as commons during the rest of the year, thus coming under the term of *commonable* lands and being distinguished from *commons*. Lammas lands are generally distinguished from *shack* lands by the fact that the former were commonable to others than those having rights in severalty in the land, but this distinction is denied by some authorities.

The period during which lammas lands were subject to common rights varied, generally beginning Aug. 12 for arable lands and July 6 for meadows, and ending in some cases in November and in others about the middle of February. The fixed dates for opening lands to the common rights gave rise to public disturbances, as the population in some cases issued out in considerable numbers to destroy the fences, tear down the gates, and commit other lawless acts. The rights of common in lammas lands during the winter season upon the introduction of root crops, requiring winter cultivation of two years for growth, made the custom of lammas lands wasteful, and owing to this and these disturbances they were gradually discontinued, although they were abundant in England as late as 1844.

The date of opening and closing the lands was variable in some instances by custom or by virtue of statutory enactment, by agreement of the occupiers of the land or the tenants of the manor. See Williams's *Rights of Common*; Alton's *Treatise on Commons and Waste Lands*; Main's *Village Communities*; Marshall's *Rural Economy*.

F. STURGES ALLEN.

Lampman, ARCHIBALD: author; b. in Kent, Ontario, Nov. 17, 1861; graduated with honors at Trinity University, Toronto, in 1882. The following year he became a clerk in the post-office of Toronto. In 1887 some of his poems were published in *Scribner's*, *Harper's*, and the *Century* magazines. Among his published books are *Among the Millet, and other Poems* (1888), and *Lyrics on Earth* (1896). He was elected a fellow of the Royal Society of Canada in 1895. D. in Ottawa, Can., Feb. 10, 1899.

Lancefield, RICHARD THOMAS: author; b. in London, England, Aug. 10, 1854; went to America while a child and was educated in the public schools of Hamilton, Canada. He became connected with the book-trade early in life, and in 1888 took a leading part in the copyright agitation. He was the founder of the *Canadian Bookseller and Literary Journal*, and in 1893 became its editor. He is a member of the American Library Association and of the American Academy of Political and Social Science. Among his works are *Utopias*; *Ideals and Idealism*; *One Man's Life-work*; *Notes on Copyright, Domestic and International* (1897); *Victoria, Sixty Years a Queen: a Sketch of her Life and Times* (1897).

Landry, AUGUSTE CHARLES PHILIPPE ROBERT: statesman; b. in Quebec, Jan. 15, 1846; graduated at Laval University, Quebec, in 1866. Later he studied agricultural science and devoted himself to farming. He was elected president of the Quebec Exhibition Company in 1894, and president of the Council of Agriculture in 1896. He served in the volunteer militia for many years and was promoted to the rank of lieutenant-colonel in 1885, and was an honorary aide-de-camp to the Earl of Aberdeen. He was a member of the Canadian House of Commons for many years, and was chosen Senator in 1892.

Lane, GEORGE MARTIN, LL. D.: educator; b. in Charlestown, Mass., Dec. 24, 1823; graduated at Harvard in 1846, taught there a year, and spent four years at the Universities of Berlin and Göttingen. He was Professor of Latin at Harvard 1851–94, and was then appointed professor emeritus and received the degree of LL. D. He promoted the introduction into the schools of the Continental system of Latin pronunciation. D. in Cambridge, Mass., June 30, 1897. He left unfinished a work on Latin grammar.

Lang, BENJAMIN JOHNSON: pianist and teacher; b. in Salem, Mass., Dec. 28, 1830; made his first public appearance as an organist at the age of fifteen; for many years, beginning in 1859, served as pianist for the Boston Handel and Haydn Society, and for a short time was conductor of that society after the resignation of Carl Zerrahn. He was also conductor of the Apollo Club of Boston, and during the long years of his service many of the best of American musicians have been his pupils.

D. E. HERVEY.

Lang, LOUIS: artist; b. in Waldsee, Würtemberg, Feb. 29, 1812; studied art in Stuttgart and Paris; removed to the U. S. in 1838; spent 1841–45 in Italy, then settled in New York city; became a member of the National Academy of Design in 1852. His best-known pictures include *Portrait of a Little Child*; *Maid of Saragossa*; *Mary Stuart Distributing Gifts*; *Blind Nydia*; *Jephtha's Daughter*; *Neapolitan Fisher Family*; *Little Graziosa among the Butterflies*; and *Romeo and Juliet* (in the Century Club). D. in New York city, May 8, 1893.

Lang, MARGARET RUTHVEN: pianist and composer; daughter of Benjamin J. Lang; b. in Boston, Mass., Nov. 27, 1867; pupil of her father and studied in Munich during the winter of 1886–87. On her return to Boston she studied composition under George W. Chadwick. Her works are numerous and important, and include several concert overtures for full orchestra; songs and dramatic arias with orchestral accompaniment; cantatas for male, female, and mixed choruses; many songs, and detached pieces for pianoforte.

D. E. HERVEY.

Lansdell, Henry, D. D.: Church of England clergyman; b. in Tenterden, Kent, Jan. 10, 1841; educated at the London College of Divinity 1865–67; curate of Greenwich 1867–69; Metropolitan Association secretary to the Irish Church Missions Society 1869–79; honorary secretary of the Church Homiletical Society, of which he was the founder, 1874–86; editor of *The Clergyman's Magazine*, of which he was the originator, 1875–86; since 1892 he has been chaplain of Morden College, Blackheath, London. He has traveled very extensively over Asia, and distributed tracts as an amateur missionary. His publications include *Through Siberia* (London, 1882, 2 vols.; 5th ed., 1 vol., 1883); *Russian Central Asia, including Kuldja, Bokhara, Khiva, and Merv* (1885, 2 vols.); *Through Central Asia* (1889); *Chinese Central Asia: a Ride to Little Tibet* (1893, 2 vols.).

S. M. J.

La Pérouse, laa-pā'rooz' (also written *Lapérouse*), Jean-François Galaup, de: French sailor and explorer; b. near Albi, Aug. 22, 1741. He served creditably in the French navy during the wars with England in 1759 and 1778–83, but his celebrity rests chiefly upon the expedition he led for the discovery of the northwest passage and its disappearance and loss, which were not explained for many years. His expedition sailed from Brest Aug. 1, 1785, on the frigates Astrolabe and Boussole, and visited the Hawaiian islands and the coast of Northeast Asia, where he discovered Sangar and La Pérouse Straits, proving that Yezo and Saghalien are each an island. Deterred by storms from attempting to search for the northwest passage, he visited the South Pacific, where twelve of his men were massacred by natives on one of the Navigator islands. Going to Botany Bay, Australia, he prepared for another attempt upon the Arctic Ocean, and sailed for that purpose in Jan., 1788. It was thirty-nine years before anything was known of the fate of the expedition, though the French had sought assiduously for information. In 1827 Capt. Peter Dillon found relics of the expedition on Vanikoro island, N. of the New Hebrides. The natives said both vessels were wrecked on the coast in a hurricane, that one crew perished in the surf or at the hands of the aborigines, the other reaching the land, where they remained a long time, and then departed to the W. in a small vessel they had built from the timbers of their ships. No further facts of the fate of the explorers have ever been learned, but a few more relics of the party were discovered on Vanikoro in 1898.

C. C. Adams.

La Salle, Jean Baptiste, de: ecclesiastic and educator; founder of the Institute of the Brethren of the Christian Schools; b. in Rheims, Apr. 30, 1651; embraced the ecclesiastical calling at an early age; studied at the college of the University of Rheims; became canon of the Chapter of Rheims Jan. 17, 1667; entered the Seminary of Saint-Sulpice for his theological studies, but after eighteen months returned home on account of the death of his parents; was ordained priest in 1678, and in 1683 resigned his prebendship, and during the winter of 1684 distributed all his property among the poor. On June 24, 1681, he had already received into his house some young teachers employed in charity schools in Rheims, an act which brought him more blame than praise. Little by little the number of the teachers in his house increased. In 1684 he called them together and gave to them the name of the Brothers of the Christian Schools, and admitted twelve of them for three years to the vows of obedience. At the same time the distinctive garb was adopted, which is still retained. With the Brethren of the Christian Schools begins the history of Catholic primary education. La Salle had early shown indications of strong character. He was weak and sickly, and to overcome sleep in order to prolong his studies he sometimes kneeled on sharp stones and sometimes placed in front of him on the study table a board fitted with iron points, against which his head would strike if he dozed. These traits were well calculated to make him the ascetic that he was. He was intensely devout, imposing upon himself the most rigorous manner of life, and inclined to impose it also upon others, so that he laid himself open to criticism on the ground of cruelty to his pupils. But he gave himself with rare devotion and single-mindedness to the work of primary instruction, and accomplished in that field work similar to that done by the Jesuits for secondary education. His task was by far the harder, however, since he undertook to instruct gratuitously, and in the face of pressing obstacles, large numbers of young children, whereas the Jesuits taught, under favorable circumstances, older pupils who paid tuition. The individual method of instruction prevailed before his time, but he introduced the so-called mutual-simultaneous method, and graded the pupils in his schools. In order to secure suitable teachers, he established in Rheims, 1684, a normal school, and afterward another in Paris. He also established a technical school in Paris, and in Saint-Yon a reformatory school and Sunday-school. For the direction of his institute he drew up a very minute code of rules entitled *The Conduct of Schools*, the first edition of which appeared in 1720. Practically the same work—*Management of Christian Schools*—was published in New York in 1893. In this book very minute and definite regulations are laid down, much after the plan of the Jesuit rules. La Salle recommends penances as well as corporal corrections. Corporal punishment has now been abandoned by the brethren themselves. Mutual espionage was recommended. It is not difficult at this date to find points to criticise in La Salle's Institute of the Brethren of the Christian Schools, but it should not be forgotten that his work marked a very great advance over anything that had preceded it. "Unlike some school reformers of the present day, he did not limit himself to destructive criticism. His mission was to build up, and he laid the foundation so deep, broad, and firm that, after many storms and sieges, after some alterations and additions, it is still a noble, commanding, and symmetrical structure." See *Management of Christian Schools*; Compayré's *History of Pedagogy*; Buisson's *Dictionnaire de Pédagogie*.

C. H. Thurber.

Laurie, Thomas: clergyman and author; b. in Edinburgh, Scotland, May 19, 1821; went to the U. S. in 1830, and graduated at Illinois College in 1838 and at Andover Theological Seminary in 1841. He was sent as missionary to the Nestorians in Kurdistan, but in 1844 he joined the Syrian mission, and in 1846 returned to the U. S., and held pastorates in South Hadley and West Roxbury, Mass., and in Providence, R. I. Among his published works are *Dr. Grant and the Mountain Nestorians* (1853); *Woman and her Saviour in Persia* (1863); *Glimpses of Christ* (1869); *The Ely Volume; or, The Contributions of Foreign Missions to Science* (1883); *Assyrian Echoes of the Word* (1894). D. in Providence, R. I., Oct. 10, 1897.

Lawson, John Davison, LL. D.: lawyer; b. in Hamilton, Ontario, Mar. 29, 1852; admitted to the bar in 1875. He practiced first in Illinois and then in Missouri, where he remained till 1885. During this time he was a director of the Missouri Bar Association, and for five years was editor of the *Central Law Journal*. Later he contributed many articles to legal journals. He received the honorary degree of LL. D. from the University of the State of Missouri, and in 1891 became Professor of Canon Law in the same university. Among his published works are *Contracts of Common Carriers* (1879); *Laws of Usages and Customs* (1881); *Concordance of Legal Words and Phrases* (1882); *Expert and Opinion Evidence* (1884); *Presumptive Evidence* (1884); *Defenses to Crime* (1886); *Rights, Remedies, and Practice in the Civil Law* (1892).

Lawton, Henry W.: soldier; b. in Ohio, Mar. 17, 1843; served as volunteer in the civil war, was breveted colonel Mar. 12, 1865, and was honorably mustered out Nov. 25, 1865. He was appointed second lieutenant in the Forty-first Infantry July 28, 1866, and first lieutenant July 31, 1867. He was transferred to the Twenty-fourth Infantry Nov. 11, 1869, and was assigned to the Fourth Cavalry Jan. 1, 1871. He was appointed captain May 20, 1879, served as acting assistant inspector-general in the Department of Arkansas from Jan. 15, 1881, to May 10, 1881; was appointed major inspector-general Sept. 17, 1888, and lieutenant-colonel inspector-general Feb. 12, 1889. In the war with Spain in 1898 he was put in command of the Second Division of the Fifth Army-corps in the operations against Santiago. El Caney was taken by his troops on July 1. He was made brigadier-general Mar. 4, 1898, and major-general July 8 of the same year. On Aug. 10, 1898, he was put in command of the Department of Santiago, and on Dec. 29 was ordered to duty in the Philippines as second in command to Gen. Otis. Killed in battle, San Mateo, Luzon, Dec. 19, 1899.

Lebret, le-brā', Georges, LL. D.: French deputy and lawyer; b. in Etampes, Nov. 7, 1853, of Norman parentage; studied law in Paris, where he was for a number of years a notarial clerk; received the degree of doctor of laws, and was by the Minister of Public Instruction placed in charge of missions for study in England and Scotland; was made a member extraordinary of the faculty of law at Caen, and five

years afterward filled the chair of the Civil Code, and was made full professor in 1885. He has held a number of public offices in the municipality of Caen, including that of municipal counselor, mayor, and Republican member of the first circumscription. He has published *Étude sur propriété foncière en Angleterre* (1882). F. Sturges Allen.

Lee, Fitzhugh: soldier; b. in Clermont, Fairfax co., Va., Nov. 10, 1835; graduated at the Military Academy in 1856 at the head of his class. He was commissioned second lieutenant in the Second Cavalry and was ordered to the Western frontier, where he was severely wounded in a fight with the Indians. At the outbreak of the civil war he was instructor in cavalry tactics in the Military Academy, but resigned his commission and entered the army of the Confederacy, in which he rose to the rank of major-general and had command of the entire cavalry corps of the Army of Northern Virginia. At the close of the war he returned to his home and devoted himself to farming. In 1885 he was elected Governor of Virginia. In 1896 he was sent to Havana as consul-general, which position he held until Apr. 5, 1898, when he was recalled on account of the threatened outbreak of war with Spain. He was nominated major-general May 4, 1898, and was put in command of the Seventh Corps of volunteer troops on May 26 of the same year. At the close of the war he was placed in command in Havana province.

Lee, Samuel Phillips: naval officer; b. in Fairfax co., Va., Feb. 13, 1812; entered the U. S. navy as a midshipman in 1825; commissioned lieutenant in 1837; commander 1855; captain 1862; commodore 1866; rear-admiral 1870; retired in 1873. In 1861, as commander of the war-sloop Oneida, he was active in the attack on Forts Jackson and St. Philip and the capture of New Orleans, preventing the capture by the Confederates of the officers and crew of the Varuna, and in other battles on the Mississippi. He was in command of the North Atlantic blockading squadron 1862–64, and of the Mississippi squadron 1864–65; was president of the board to examine volunteer officers for admission into the navy 1866–67; chief signal officer of the navy 1868–70, and in command of the North Atlantic fleet 1870–73. D. in Silver Springs, Md., June 7, 1897.

Leet Court: in the law of England, a court of record which originally was a court having criminal jurisdiction over the tenants and persons resident within the manor in those matters in which the sheriff's tourn had jurisdiction, and also was charged with the duty of view of frankpledge, or the duty of seeing that these associations were maintained perfect in order and number. The privilege of holding leet court still attaches to the lords of many manors in England, but the jurisdiction of these courts is now obsolete except for the purpose of presenting minor offenses in the nature of common nuisances requiring immediate redress.

In detail the jurisdiction of the leet courts originally included the presenting of minor criminal offenses arraignable at the next jail delivery, and also various smaller crimes, including the use of false weights and measures, breach of the peace, view of frankpledge, the breaking of manorial boundaries and hedges, the pursuit of villains, the impounding and release of stray cattle, eavesdropping, and numerous minor matters pertaining rather to the social and economical rights of the community and considered as nuisances, such as the corruption of public waters, keeping of diseased cattle, exposing for sale of stale fish and meat, etc. The leet courts were also charged with the duty of enforcing the repair of highways, the practice of archery, the preservation of fish and game, the wearing of such apparel as was prescribed by law as suitable to the rank of the wearer, the regulation of the consumption of wines according to the rank of the consumer, the fixing of the price of victuals to middlemen, the regulation of the felling of trees, the carrying on of the business of tanning, the receipt of tolls by millers, the prevention of forestalling the market and of laborers' conspiracies, etc. They have been gradually replaced since the sixteenth century by the issuing of commissions appointing persons to act as justices of the peace within certain districts. See Stubbs's *Constitutional History*; Pollock and Maitland's *History of England*; Pollock and Maitland's *Select Pleas in Manorial Courts*.

F. Sturges Allen.

Leeward Islands: Great Britain denominates her possessions in the Lesser Antilles as the Leeward and Windward island colonies; but the geographical expression Leeward islands, as applied to the northern part of the Lesser Antilles, is disappearing from some of the most authoritative atlases, because the name was based upon an erroneous distinction and has no geographical value. The British Government, in adopting the name, misunderstood or was misled by the reports of navigators, the fact being that all these islands on the outer margin of the Caribbean Sea are exposed at every season of the year to the action of the trade-winds and are all windward islands. Some of the leading atlases now apply the expression Windward islands to the entire chain, and designate the islands that hug the South American coast within the Caribbean Sea as the Leeward islands.

C. C. Adams.

Le Gallienne, Richard: author; b. in Birkenhead, England, 1865. He received education at the Liverpool College; abandoned a business life for the profession of letters. In 1887 he privately published a small volume of poems, later works being *Volumes in Folio* (1889); *George Meredith: some Characteristics* (1890); *The Book-Bills of Narcissus* (1891); *English Poems* (1892); *The Religion of a Literary Man* (1893); *Prose Fancies* (1894); *Robert Louis Stevenson, and other Poems* (1895); *Retrospective Reviews* (1896); *Prose Fancies* (1894–96); *The Quest of the Golden Girl* (1896); *If I were God* (1897); has edited an edition of William Hazlitt's *Liber Amoris*. In 1898 he traveled and lectured in the U. S.

Leggett, Mortimer Dormer: soldier; b. in Ithaca, N. Y., Apr. 19, 1831; graduated in medicine at Willoughby, O., in 1844; then studied law, and was admitted to the bar in 1845. In 1846 he organized the first system of union free schools in the State of Ohio. He was Professor of Pleadings and Practice in the Ohio Law College 1855–58, and superintendent of public schools in Zanesville 1858–62. Early in 1862 he recruited the Seventy-eighth Ohio Regiment of Infantry, and became its colonel, commanding it in the battles of Fort Donelson, Shiloh, and Corinth. In June, 1862, while acting as brigade commander, he captured Jackson, Tenn., and defended Olivia, Tenn., against a superior force. He was made brigadier-general in Nov., 1862. He was severely wounded at Champion Hills, and again at Vicksburg. Accompanying Gen. Sherman on his march to the sea, Gen. Leggett commanded the Third Division of the Seventh Army-corps. He was promoted to be major-general of volunteers in Aug., 1865, and resigned in September. He was appointed commissioner of pensions in 1871. He had been practicing law in Cleveland since 1881 until his death, in Cleveland, Jan. 7, 1896.

Legitim: in Scots law, the right of succession of children to one-third of the personal estate of their father. This right vests in them at once upon the decease of the father, and can not be diverted by him by a will, but may be expressly released or renounced by the child, or discharged by a special provision. This is one of the three parts into which the father's estate is divided, including the widow's Jus Relictæ (*q. v.*), and a third which is subject to his absolute disposal. F. Sturges Allen.

Lehmann, Liza (Mrs. Herbert Bedford): singer and composer; b. in London, England, of a German father and a Scotch mother; educated in Germany, Italy, and England. In 1896 she composed the work *In a Persian Garden*, by which she is best known. It is a selection from the *Rubáiyát* of Omar Khayyam, as translated by Edward Fitzgerald, set to music for soprano, contralto, tenor, and bass in solos and concerted numbers. D. E. Hervey.

Lemoinne, John Emile: French publicist; b. in London, Oct. 17, 1815; his education was begun in London and completed in France. He had been for some time employed in the Ministry of Foreign Affairs, and was acquainted with matters of state in England as few Frenchmen are, when, in 1840, he joined the editorial staff of the *Journal des Débats*. He retained this editorship more than fifty years, writing especially on English and other foreign political questions. He was alternately an advocate of the republic and of a constitutional monarchy, but in 1873 announced himself definitely in favor of the republic. Under the empire he often contrasted English institutions with French, and attacked the imperial rule with keen sarcasm. Under the republic, being no longer in the opposition and forced to look elsewhere for subjects to satisfy his critical bent, he directed against England his full force of sarcastic criticism. He was chosen a member of the French Academy in 1875, on the death of Jules Janin. In 1880, as a moderate Republican, he became a life member of the French Senate.

He was a frequent contributor to the *Revue des Deux Mondes.* He published numerous works on political history and biography. D. in Paris, Dec. 14, 1892.

Lenox, James: philanthropist; b. in New York city, Aug. 10, 1800; son of Robert Lenox, a merchant, from whom he inherited a large fortune in 1839; was educated at Columbia College, and studied law, but did not practice; during a visit to Europe began collecting rare books; spent the greater part of his life in gathering a library and paintings, which, together with numerous valuable manuscripts, engravings, marble statues and busts, and curios, he presented to New York city in 1870, together with the costly building which he had erected for their keeping; was president for many years of the Presbyterian Hospital, to which he gave about $500,000; was also president of the American Bible Society, which he liberally assisted financially; and gave freely to Princeton College and Theological Seminary and to many churches and charities connected with the Presbyterian Church; unostentatiously aided many poor authors and others; never married, and lived in strict seclusion, politely declining visits from many distinguished persons at home and abroad. He charged his relatives to give out no details of his life for publication after his death, and requested that not even the time of his funeral should be publicly made known. D. in New York city, Feb. 17, 1880.

Leo XIII., Encyclicals of: An encyclical is a circular letter sent by the pope to "all patriarchs, primates, archbishops, and bishops of the Catholic world," in which he condemns some erroneous teaching, emphasizes some line of conduct, warns against some impending danger, discusses some practical subject, or otherwise shows his paternal solicitude for the Church confronted by some problem or hindrance. The present pope has written a number of these letters, and each time has been listened to respectfully by the whole Christian world, while sometimes his opinions thus expressed have occasioned much discussion and even controversy. The original language of these letters is Latin, which the pope writes with the skill and elegance of a master, but they are always promptly translated. They abound in apt quotations of Scripture and the patristic writings, and are always in good temper.

Leo XIII. was enthroned as pope on Mar. 3, 1878; on Easter Sunday, Apr. 21, 1878, he issued his first encyclical, "The Church as the Mother of True Civilization," which is in the nature of a salutation to the Church and more general in its contents than those which follow. He deplored the degeneracy of the times, which he attributed to the widespread defection from mother Church; claimed that the Church has always been the bulwark of civilization and the source of popular happiness, that the popes as heads of the Church have fostered the things that make for progress, and that it is to them that Italy owes her "substantial glory and magnificence." But temporal power is essential for the guarding and continuing of the entire freedom of the spiritual power. Hence it is a crime to deprive the papacy of its secular government. His predecessor, Pius IX., was right in condemning the errors of the times. One such error is that marriage is a civil contract. In conclusion he declared that the unanimity with which the Church welcomed him was an inspiration in the discharge of his onerous duties.

On Dec. 28, 1878, he issued an encyclical against the "Dangers from Socialism, Communism, and Nihilism," each of which "sects" he declared to be inimical to authority, the family, and private property. He found their common source in the Protestant Reformation of the sixteenth century, whence rationalism sprang. Opposite these "sects" he put the Catholic Church, the determined foe to all error and the preserver of civilization. This encyclical so pleased Czar Alexander II. that he ordered it to be read in all the Catholic churches of Russia. On Aug. 4, 1879, his theme was the "Restoration of Philosophy according to the Philosophical Principles of St. Thomas Aquinas." (The pope evinced his devotion to Aquinas by being the inciter and patron of the definitive edition of the works of Aquinas, whose preparation began in 1880, and which has been appearing from the press since 1882.) On Feb. 10, 1880, his theme was "Christian Marriage." He laid great stress on its sacramental character, and deprecated the degradation involved in viewing it as a civil contract, and especially in the permission of divorce. On Sept. 30, 1880, he wrote on "The Sainted Apostles of the Slavs, Cyril and Methodius," whose feast he raised to higher rank, and thus gave a distinct mark of favor to Slav Catholics; on Dec. 3, 1880, on "Catholic Missions," which he commended to the prayers and pecuniary support of the faithful, and mentioned three especially worthy missionary societies by name.

On June 29, 1881, he discoursed on the "Origin of Civic Authority," which he found to be in God; on Sept. 17, 1882, on St. Francis of Assisi and the Third Order of St. Francis, whose history he sketched, and whose value, especially as a weapon against socialism, he particularly emphasized. It is interesting to know that the mother of Leo XIII. belonged to the Third Order of St. Francis, as it gave a personal note to this encyclical. On Sept. 1, 1883, Aug. 30, 1884, Sept. 22, 1891, Sept. 8, 1892, Sept. 8, 1893, and again on Sept. 8, 1894, his theme was the Rosary of the Blessed Virgin Mary, and to the special use of this rosary he urged the faithful to set apart the entire month of October. This fact accounts for the date of these encyclicals. Thus he gave public and repeated testimony to his faith in the rosary as teaching perseverance in prayer and in the Virgin Mary as the loving helper in the battle with the evils of the time. On Apr. 20, 1884, he condemned Freemasonry. On Nov. 1, 1885, he set forth the "Christian Constitution of States"—God is the founder of civil society and the source of public authority; he has founded the Church also, and thus State and Church both derive their authority from God and each has its proper sphere. He reaffirmed the syllabus of Pius IX., but showed how it had been misinterpreted. On June 20, 1888, he discoursed on "Human Liberty," showing the true and false views on the subject; on Dec. 25, 1888, on the "Christian Life," describing its nature and giving directions for its culture; on Jan. 10, 1890, on "The Most Important Duties of Christians in the State"—both Church and State are to be loved, and the latter obeyed, also, when not ordering contrary to divine authority; the Church is the ruler of rulers.

The encyclical which was issued on May 15, 1891, "On the Condition of Labor," attracted wide attention. It was promptly brought out in a special edition, with an open letter from Henry George to the pope. The pope acknowledged that his subject was difficult and delicate, but the urgency of the matter was the excuse for handling it. He began with a long deliverance against socialism, which he condemned because it would destroy private property; he denied that rich and poor are intended by nature to live at war with one another, but he exhorted the rich to deal kindly and liberally with the poor, and remember that all are alike the children of the same Heavenly Father. He asserted the claim of the Church to be considered the arbiter of all disputes between the poor and the rich, the dispenser of that divine grace whereby the ills of society are to be cured, and in an especial sense the friend of the needy. He then passed on to speak of the part the State should play in the work of remedy and relief. To it the interest of all should be equal. It should not interfere with the individual or the family, but should allow both to act freely, provided the common good is respected. It should protect the weak against the strong, the rights of property against spoliation; secure to the laborer rest on Sunday and on certain holy days, and arrange the hours of labor in accordance with the kind of work and the age and sex of the worker. As to wages, workman and employer should make free agreements, but the remuneration should be sufficient for the workman's reasonable and frugal support of himself and family. Societies for mutual help should be encouraged, as also workmen's associations, when they are founded in religion. Catholic associations are of invaluable service to discouraged and wronged work-people, as they help them out of their difficulties, invite them to companionship, and receive the repentant to a shelter in which they may securely trust.

On Nov. 18, 1893, Pope Leo's important deliverance on "The Study of Holy Scripture" appeared, in which he gave a sketch of the reception and study of the Scriptures in the Church, and directions for a thorough course of biblical study. On June 20, 1894, he pleaded for "The Unity of the Faith" of all princes and peoples on earth, and on June 29, 1896, for "The Unity of the Church." Both encyclicals showed how deeply desirous he was that the schismatic Greek and other Oriental churches and the heretical Protestant Church should return to the true fold. He set forth the advantages of such a reunion of Christendom both as it would affect the present Christian world and the heathen world, which would be quickly won by united effort.

Leo XIII. was the author of two apostolic letters which especially roused the English-speaking world. The first was on Apr. 14, 1895, addressed to the English people. He mourned the separation of so many of them from mother Church, and in gentle, earnest tones pleaded with the "separate brethren" to return. He called upon the Catholics of England to show their possession of the true faith by the superior lives they led. He reminded them that long ago England was called "Mary's dowry," and invoked the special aid of St. Gregory, St. Augustine, and "those other saints of God through whose wonderful virtues and no less wonderful deeds England has merited the title of 'Island of the Saints,'" and of SS. Peter and George, and especially Mary, the Holy Mother of God, to bring back the errant people to the fold. He appended a special prayer to Mary to this end, and promised an indulgence of three hundred days to whosoever would repeat it piously. The second letter was on "Americanism," dated Jan. 22, 1899, and was addressed to Cardinal Gibbons. It is sharper in tone than was customary with the pope, because he believed the evils it combated threatened "the integrity of the faith and the security of the faithful." The grievance was the currency given to "certain opinions concerning the way of leading Christian life," in the biography of Father Isaac Hecker, founder of the Paulist Fathers (d. 1888), as written by Father Walter Elliott, and published by the press of the order in New York city in 1891. "The underlying principle of these new opinions is that in order more easily to attract those who differ from her the [Roman] Church should shape her teachings more in accord with the spirit of the age, relax some of her ancient severity, and make some concessions to new opinions. Many think that these concessions should be made, not only in regard to ways of living, but even in regard to doctrines which belong to the deposit of the faith. They contend that it would be opportune, in order to gain those who differ from us, to omit certain points of her teaching which are of lesser importance, and to tone down the meaning which the Church has always attached to them." The letter showed that "such a policy would tend rather to separate Catholics from the Church than to bring in those who differ." So the pope was "not able to give approval to those views which, in their collective sense, are called by some 'Americanism.'"

A complete collection of the encyclicals of Leo XIII. has been published by Herder in Freiburg in Baden in the original Latin, with a German translation on opposite pages (4 collections, 1878–80, 1881–85, 1888–91, 1891–96). Several of them in English translation appear in one volume, *The Pope and the People: Selected Letters and Addresses on Social Questions* (London, 1895). Others have appeared separately. SAMUEL MACAULEY JACKSON.

Leonard, ALBERT, Ph. D.: educator; b. in Logan, O., Dec. 21, 1857; graduated at the Ohio Central Normal School in 1876, and at Ohio University 1888; A. M., Ohio University, 1891; Ph. D., Hamilton College, 1894; tutor in Ohio University; principal of high school, Dunkirk, N. Y., 1888–93; principal of high school, Binghamton, N. Y., 1893–97; dean of the College of Liberal Arts and Professor of Pedagogy, Syracuse University, since 1897; editor of *The Journal of Pedagogy*.

Leoncavallo, RUGGIERO: composer; b. in Naples, Italy, in 1858; studied in the conservatory there, and at the age of sixteen began a professional career as a pianist. Becoming acquainted with Wagner's works, he determined to be an opera composer. In 1888 he had finished the text of *I Medici*, and a year later completed the music. Three and a half years later he offered the opera *I Pagliacci* to Sonzogno, the publisher. This work established his fame. Since then he has composed several other works.
D. E. HERVEY.

Leschetizki, THEODORE: pianist and teacher; b. in Langert, Austrian Poland, in 1830; a pupil first of his father, and later of Carl Czerny; began to teach when fifteen years old; and from 1842 to 1852 played at many concerts with success. In 1852 he went to St. Petersburg, remaining there for twenty-seven years as a teacher, performer, and composer. He then returned to Vienna, where he has since remained. In 1880 he married Annette Essipoff, the pianist, his former pupil. He numbers among his pupils many of the world's best pianists. His compositions are not numerous, and are entirely for the piano, except an opera, *Die Erste Falte*, given in Prague in 1867. D. E. HERVEY.

Leutze, EMANUEL: historical painter; b. in Gmünd, Würtemberg, May 24, 1816; early emigrated to the U. S. with his parents, first living in Philadelphia, and then in Fredericksburg, Va.; after experimenting in art, studied in Düsseldorf, devoting himself to historical subjects, especially such as relate to the discovery and history of America; studied under Kaulbach in Munich in 1843; visited Venice and Rome, and after an Italian tour returned to Düsseldorf, where he remained for fourteen years; returned to the U. S. in 1859, and opened a studio in New York city. He was commissioned by the Government in 1860 to paint a large mural fresco for one of the grand staircases in the Capitol, Washington, the subject chosen being *Westward the Star of Empire Takes its Way*, for details in the scenery of which he visited the Rocky Mountains, and again resorted to Kaulbach in Munich for instruction in fresco mechanism. He became a member of the National Academy in the same year. Among his celebrated paintings are *Columbus before the Council of Salamanca* (purchased by the Düsseldorf Art Union); *Columbus in Chains* (purchased by the Art Union of New York); *Columbus before the Queen*; *Landing of the Norsemen in America*; *Cromwell and his Daughter*; *The Court of Queen Elizabeth*; *Henry VIII. and Anne Boleyn*; *The Iconoclast*; *John Knox and Mary Stuart*; *Washington Crossing the Delaware*; *Washington at Monmouth*; *Washington at the Battle of Monongahela*; *News from Lexington*; *Sergeant Jasper*; *Washington at Princeton*; *Elaine*; *Mother's Visit*; *The Storming of Teocalli*; *Settlement of Maryland by Lord Baltimore*; *Mary Stuart Hearing the First Mass at Holyrood after her Return from France*; portraits of Gen. Grant, Gen. Burnside, and some artists; and *Lafayette in Prison at Olmütz Visited by his Relatives*. He received other commissions from the Government, which were never finished, and had sketched in pencil a large picture to be called *The Emancipation*. D. in Washington, D. C., July 18, 1868.

Levasseur, *le-vaăs'sėr'*, PIERRE EMILE: geographer and economist, member of the Institute; b. in Paris, Dec. 8, 1828; studied at the Collège Bourbon; entered the École normale in 1849, and was assistant professor at the Lycée d'Alençon 1852–54. He was engaged in educational work in several higher institutions of learning in France till 1876, when he became Professor of Statistical and Economic Geography at l'École libre des sciences politiques in Paris. He has since taken a distinguished part in the international statistical and geographical congresses held in Europe and America. He was very active in the reorganization of geographical instruction in the French schools, was one of the founders of the Society of Commercial Geography in Paris, is the author of a series of school geographies, and has written many historical and geographical works, among which are *La France avec ses colonies* (1878); *Les Alpes et les grandes ascensions* (1889); and *Grand Atlas de géographie physique et politique* (1890–92). C. C. ADAMS.

Levi, HERMANN: conductor; b. in Giessen, Germany, Nov. 7, 1839, and after studying in Leipzig obtained his first engagement as a conductor, when twenty years old, in Saarbrucken. In 1861 he was opera conductor in Rotterdam, in 1864 in Carlsruhe, and in 1872 at the Court theater, Munich. He was selected by Wagner to conduct the first representation of *Parsifal* in Baireuth July 28, 1882. He ranks among the few great conductors of the world. D. E. H.

Lewis, ABRAM HERBERT, D. D.: Seventh-day Baptist clergyman; b. in Scott, Cortland co., N. Y., Nov. 17, 1836; graduated at Alfred University, Alfred Centre, N. Y., the chief denominational educational institution, 1863; was pastor in Westerley, R. I., 1864–67; in New York city 1867–68; became Professor of Church History and Homiletics in Alfred University 1868; was general agent of the American Sabbath Tract Society, 1869–72; pastor in Plainfield, N. J., 1880–96; since then has been corresponding secretary of the American Sabbath Tract Society. He edited *The Outlook and Sabbath Quarterly* from 1882 to 1896, and since *The Sabbath Recorder*, with which it has been merged. His publications include *A Critical History of the Sabbath and the Sunday in the Christian Church* (New York, 1886, 2 vols.); *A Critical History of Sunday Legislation from 321 till 1888 A. D.* (1888); *Paganism Surviving in Christianity* (1892); *Swift Decadence of Sunday: What Next?* (Plainfield, N. J., 1899).
S. M. J.

Liadow, ANATOLE: musician; b. in St. Petersburg, Apr. 29, 1855; educated there and has always remained there. He is a musician of the Neo-Russian school, and is now a

teacher of theory at the St. Petersburg conservatory and also at the imperial chapel. He has composed much music of great merit.

Liberia: The growing and exporting of coffee has become the leading industry. The exports increased from 600,000 lb. in 1886 to 3,000,000 lb. in 1896. American vessels seldom touch at Liberian ports, but about one-fourteenth of the coffee exports are sent to the U. S. viâ Liverpool. The best coffee grown there is the Liberian, which is limited to the latitude of the country. It was found growing wild by the original settlers in 1822, and they took it from the forests and transplanted it into their gardens. It is not a shrub, like many species, but grows to a robust and hardy tree which thrives for a long period. Coffee-trees are still in vigorous bearing that are known to be more than fifty years old. A plantation does not yield its full crop until about seven years after planting. It is still cleaned and prepared for market in a crude and primitive way. The population is nearly stationary, the citizens numbering not more than 20,000. In 1897 the population of Monrovia, the capital, was estimated to be 5,000; Robertsport, 1,200; Buchanan and Edina, 5,000; Harper, 3,000; and Greenville (Sinoe), 1,000. In the year 1896–97 Germany held the first place in the exports from Liberia, with $330,-106; England second, with $253,673; Holland third, with $102,023; and the U. S. received goods direct valued at only $3,227. All these European states have direct steamship communications. Total exports were $689,031, of which coffee, palm-kernels, and palm-oil were the chief items. The value of imports was $505,235, of which Germany supplied $260,510; England, $188,359; Holland, $33,323; U. S., $16,937; and British and Spanish colonies, $6,103. The chief imports were liquors, rice, and tobacco. C. C. A.

Liebling, George: pianist; b. in Berlin, Jan. 22, 1865, and studied there and with Liszt in Weimar; when sixteen years old was appointed teacher in Kullak's academy in Berlin, remaining until 1876. Since then he has been playing in concerts in all European countries. In 1890 he was appointed court pianist to the Duke of Saxe-Coburg-Gotha.

Liebling, Max Emil: pianist; b. in Hultschin, Silesia, Sept. 22, 1846; studied in Posen and Berlin; went to the U. S. in 1878 and made a tour of the West with Wilhelmj, the violinist, creating a great sensation by his brilliant performances. Settled in New York, where he remains teaching. His compositions are all for the piano and are of the light and popular style.

Liebling, Sally: pianist; brother of George Liebling; b. in Posen, Prussian Poland, Apr. 8, 1859, and was educated there and in Berlin; gave concerts when twelve years old in the principal German towns, and in 1875 went to the U. S. and played in concerts with Theodore Thomas's orchestra, also traveling with various violinists and singers on tours till 1883, when he returned to Berlin. In 1884 he remained for a season with Liszt in Weimar, and in 1888 founded the new Conservatory of Music in Berlin.

Lighthall, William Douw, M. A.: author; b. in Hamilton, Ontario, Dec. 27, 1857; graduated at McGill University in 1879. He took the degree of B. C. L. at the same university in 1881 and that of M. A. in 1885. He practiced his profession in Montreal, but devoted much of his time to letters. He became honorary corresponding member of the Scottish Society of Literature and Art, and a fellow of the Royal Society of Literature of Great Britain. Among his published works are *Thoughts, Moods, and Ideals* (1887); *The Young Seigneur* (1888); *Montreal after 250 Years* (1892); *The False Repentigny; or, The Life-Guard of Marie Antoinette* (1889); and *An Account of the Battle of Chateauguay* (1889).

Light, Standards of: In photometry, which is the art of measuring the illuminating power of flames and other sources of light, the unknown light is compared with some fixed and definite source as a standard. A *primary standard* is one which is accurately reproducible. The apparatus for producing the light must be so completely defined both as to construction and operation that it is always possible by following the description to obtain precisely the required illuminating power. Sources of light which are not thus reproducible, but which, after comparison with a primary standard, are steady enough to serve for photometric purposes, are termed secondary standards. On account of the great industrial importance of the art of photometry, long-continued efforts have been made to find a satisfactory standard of light. Many such standards have been proposed and have been subjected to searching investigation to determine their fitness.

Standard Candles.—The first of these in order of mention are the standard candles, which are important on account of the very long time during which they have been in use, and because, at the present time, illuminating power is almost invariably expressed as candle-power. The name, on account of its familiarity, seems likely to remain long after the candle as a standard of light has gone out of use. The unit most widely employed in photometry is the *British candle*, which was specified by act of Parliament in 1860 to be the light of a sperm candle weighing six to the pound and burning 120 grains an hour.

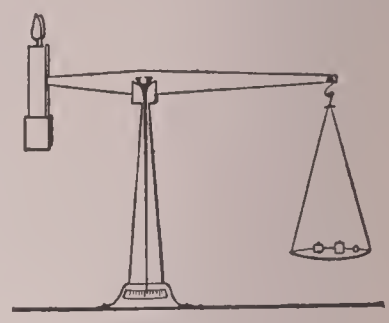

Fig. 1.

To test the rate at which the spermaceti wax of British candles is consumed, these are commonly weighed while burning upon a *candle-balance* (Fig. 1). Two such candles are lighted simultaneously, one at the large and one at the small end, so as to eliminate the effect of their conical form, and are placed in a holder at the end of the short arm of the balance. The ratio of the arms is 1 : 2, so that the two candles are equivalent to one candle suspended from a balance with equal arms. Weights not quite sufficient to counterbalance the candles are placed upon the scale-pan and the precise time is noted when, by the burning away of the latter, equilibrium occurs. A small known weight is now removed from the scale-pan, and the time when equilibrium is again restored by the further wasting away of the candles is noted. The intervening interval gives the rate of burning.

In Germany at least two standard candles have been extensively used. The first of these is the candle adopted by the German Association of Gas Manufacturers. It is known as the *Vereinskerze*. This is a paraffin candle which has a uniform diameter of 20 mm., differing in this respect from the British candle, which is cast in a conical mould. Its construction is defined to the minutest detail, even the number of strands of wick being given. Its performance is specified by designating the normal height of the flame (50 mm.), instead of attempting to prescribe the amount of fuel consumed in a unit of time.

The other German candle, which is known as the *Munich candle*, was devised for the purpose of specifying the unit of light in the negotiations between that city and the local gas-lighting company. It is a stearin candle slightly conical in form. The diameter is 20·5 mm. at the upper end and 23 mm. at the base. The wick is formed of 50 strands. This candle is designed to consume between 10·2 and 10·6 grams of stearin per hour and to burn without the necessity of snuffing. The normal height of the flame is 56 mm.

The French candle, *la bougie de l'étoile*, is less widely known. The standard of light in France had long been the Carcel lamp, to be described presently, and the candle has always been regarded as of minor importance. The flame of the French candle is supposed to consume 10 grammes of stearin per hour, with a flame-height of 52·4 mm.

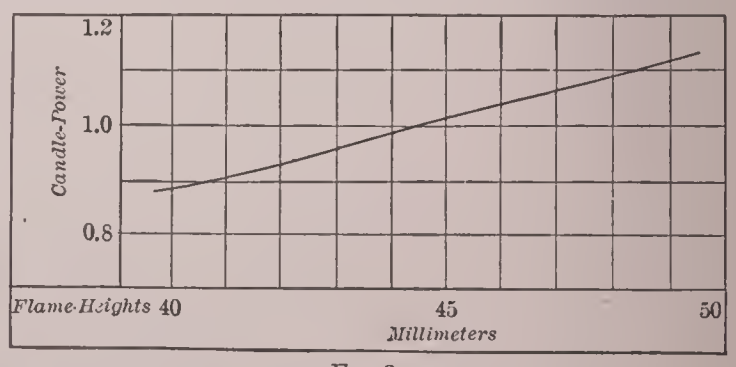

Fig. 2.

The *bougie décimale*, adopted by the International Congress of Electricians in Paris (1889), is a hypothetical standard merely, defined as one-twentieth of the light of the Violle platinum standard, which latter had been accepted by that body as the absolute standard of light. Its relation

to the various actual candles described above will be found in the table at the end of this article.

A comparison of the German method of specifying the performance of the candle by means of its flame-height with the British method, which defines only the amount of material consumed, is all in favor of the former procedure. A considerable number of experiments have been made in which flame-height and intensity are compared. The curve in Fig. 2 shows results of such measurements in the case of the British candle. It is from measurements by Sharp.* The curve agrees in character with those obtained by numerous other students of this subject, and likewise with curves taken by means of the galvanometer, in which the eye, and we owe our most precise knowledge of the behavior of the candle and of other sources of light to measurements made with the bolometer. Sharp and Turnbull* made an extended investigation by this method of the performance of various light standards. Curves representing their results were plotted with ordinates representing the relative brightness of the flame and abscissas corresponding to times measured from the instant when the flame was ignited. Three such charaeteristic life-curves are shown in greatly reduced size in Fig. 3. They represent the fluctuations in the flame of a British candle during sixty minutes after ignition. To avoid confusion, the base-line of the curve marked III is lowered two spaces, that of curve IV four

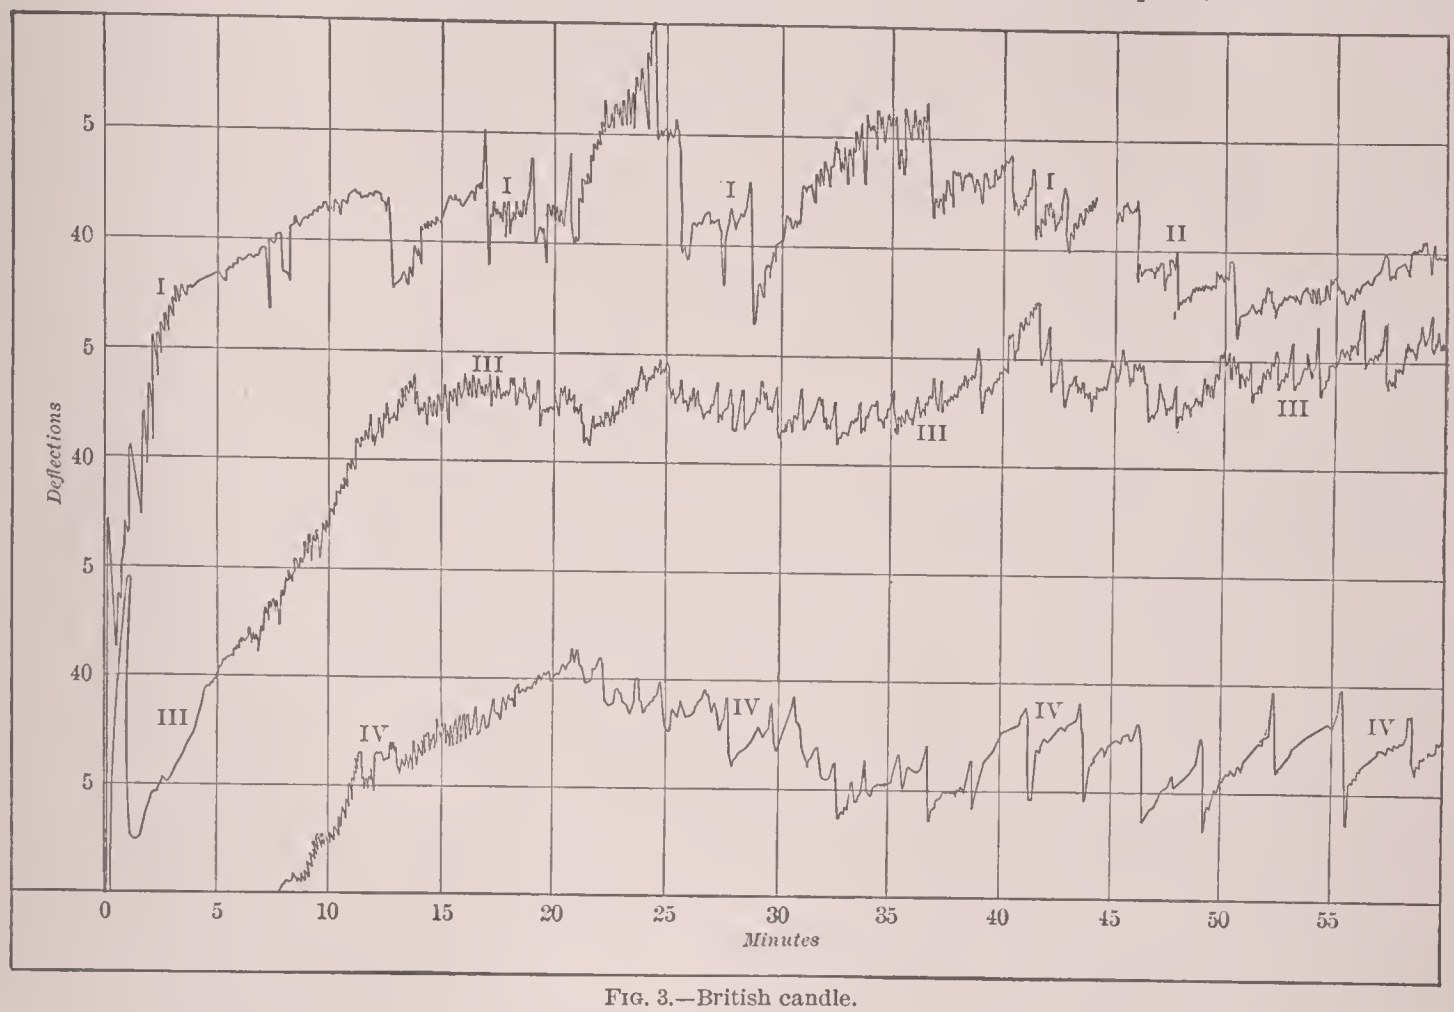

FIG. 3.—British candle.

total radiation was measured by means of the thermopile or bolometer and all uncertainty of the eye was eliminated.

Were the variation of intensity with the height of the flame the only difficulty with which the users of candles as standards of light have to contend, the matter would be a simple one. By means of a magnifying device, in which an image of the flame is thrown by a lens upon a small ground-glass screen provided with a vertical scale, flame-height can be readily measured. The investigations of practical photometry show, however, that the candle is subject to many other sources of variation than this. A committee appointed by the Board of Trade in Great Britain to investigate the performance of British candles found, for example, a difference of 15 per cent. in the average brightness. Another committee acting for the Council of the Gas Institute in London found the average difference between individual candles to be 7·05 per cent. Dibdin, working for the Metropolitan Board of Works, made extensive tests, as the result of which he reported that British candles showed a maximum variation of 14·9 per cent., and that the mean variation was 3·6 per cent. Variations of from 5 to 8 per cent. occurred frequently, while less than 14 per cent. of his measurements were within 1 per cent. of the mean of the entire set. A Dutch committee which made its report in 1894 confirmed these statements, and showed that every change in the length and shape of the wick, every difference in the height of the melted wax in the cup of the candle, affects the illuminating power. It has also been found that candles vary by more than 8 per cent. in intensity with the moisture of the atmosphere.

These fluctuations are difficult to follow by means of the spaces. It will be seen that the flame reaches approximately its normal height after twenty minutes, and that it is subject to many marked fluctuations, the most abrupt of which are downward, namely, in the direction of diminution of light. This sudden falling off of candle-power was found to be due to the burning away and breaking off of the wick, the light rising after each such crisis as the wick increased in length, until it was burned off anew.

The performance of the German candle (*Vereinskerze*) is shown in Fig. 4, which represents a portion of the life-curve

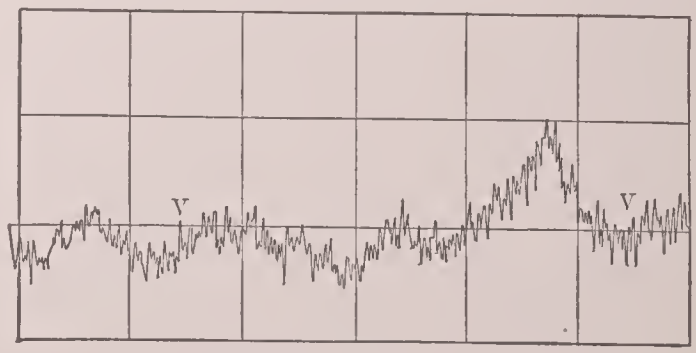

FIG. 4.—Vereinskerze.

of such a candle that had already been burning thirty minutes. The fluctuations in this case, although of a different character, are scarcely less marked than those of the British candle, and they are such in both cases as to suggest the abandonment of candles altogether as standards of light.

* Sharp and Turnbull, *Physical Review*, vol. ii., p. 1 (1884).

The Carcel Lamp.—Substitutes for the candle as a light standard have been very numerous. One of these, the Carcel lamp, of which brief mention has already been made, has been in use in France since the beginning of the nine-

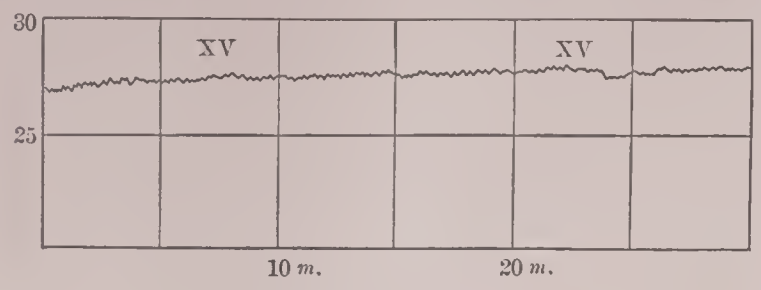

Fig. 5.—Carcel lamp.

teenth century. It is a modified form of the Argand burner supplied by clockwork with a mechanical central draught. The fuel burned in this lamp is colza oil. The flame of the Carcel lamp, which is protected by a chimney, is comparatively free from the fluctuations to which naked flames are subject. Fig. 5 shows a portion of its life-curve likewise taken by means of the bolometer. It will be seen that the flame was remarkably free from sudden disturbances, but that it showed a tendency to drift in total brightness during the half-hour covered by this portion of the curve. Dibdin found in thirty-two sets of observations a mean deviation of 1·33 per cent., with a maximum deviation from the mean of 4·1 per cent.

It has been held as an objection to the Carcel lamp that there are so many factors which it is necessary to control as to make it a satisfactory standard only in the hands of experienced and scrupulously careful observers. The height of the wick, the shape of the chimney, and the rate at which the central draught is supplied all affect the brilliancy of the flame. The determinations of Sharp and Turnbull upon this source show that unless these factors are carefully looked to very considerable deviations are to be expected. A lamp burning freely without attempt to control its performance showed total fluctuation of 18 per cent. By attending minutely to all adjustments and precautions, experienced photometricians have been nevertheless able to obtain excellent results from this lamp.

The Methven Standard.—Gas-flames are also widely used in photometric work. Methven (in 1878) provided a metal screen to be attached to the Argand burner, with a rectangular aperture so situated as to cut off all but the central and most highly luminous portion of the flame. With this device, which is known as the *Methven slit*, this burner may be regarded as a primary standard. The size of the opening in the Methven screen is varied according to the quality of the gas with which it is to be used. With a gas that has not been especially enriched the opening is 1 inch in height by 0·233 inch in width. These dimensions are intended to give a light through the opening of two candles. By running the gas through benzene or some such hydrocarbon, and thus enriching it, Methven found it possible to obtain better results. The size of the opening under these conditions was 0·585 inch in length by 0·310 inch in width. Fig. 6 shows the form of the screen applied to a standard London Argand burner. Studies of the behavior of this standard do not show a very satisfactory result. Dibdin found frequent fluctuations of from 2 to 5 per cent. when a gas of nearly uniform composition was used. With the varying richness of the gas much larger errors occurred. Indeed, the variations in the quality of ordinary illuminating gas are such as to throw the Methven standard out from serious consideration excepting as a secondary standard which needs to be repeatedly compared with some more staple source of light. Measurements with the bolometer fully corroborate the fluctuating character of the gas-flame even when provided with the screen.

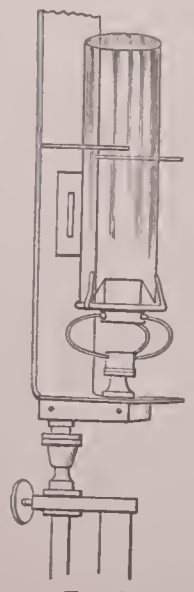

Fig. 6.

It has been shown by the study of these and other flames that the fluctuations in light standards are due to variations in the supply of fuel and consequently of flame-height, in the size and material of the lamp or burner, in the rate at which oxygen is supplied to the flame, and finally in the quality or composition of the fuel. Of these sources of variation the first can be corrected for by adjustment of the height of the flame or by the use of an intervening diaphragm. The second difficulty can be controlled by proper care in specifying the size and method of constructing the lamp, and the third by doing away with mechanical draughts. The fourth source of variation, which is the most serious of all —that due to differences in the quality of the fuel—can be met only by abandoning altogether the mixtures that serve ordinarily as burning oils, illuminating gases, and so forth.

The Pentane Lamp.—In England, Harcourt has attempted to supply a constant fuel by the use of pentane. The Harcourt lamp is shown in Fig. 7. It has a heavy metal chimney, within which the flame burns. The wick serves only to carry the volatile fuel up from the body of the lamp to the base of the chimney, where it volatilizes and feeds a flame at the top of an inner tube, as shown in Fig. 8. Only the central portion of the flame is visible, a second chimney, supported on two arms and adjustable as to height, serving to cut off the upper portions. In the hands of some observers this lamp has given excellent results. The flame is of a fine white color, and the measurement of its height is avoided by the use of the upper chimney, which is set once for all, so that the portion of the flame visible in the aperture will be the equivalent of two candles. The principal objection to this lamp lies in the fact that commercial pentane is by no means a fuel of constant composition. It is, in fact, simply a mixture of the lighter hydrocarbons, which is somewhat more uniform than the similar fluids known as benzene, gasoline, and petroleum ether.

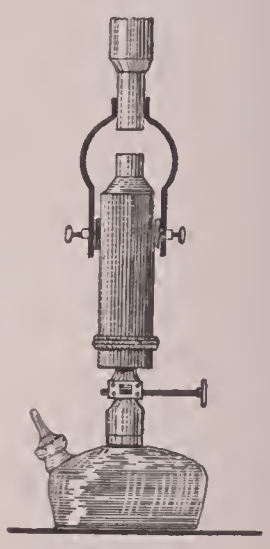

Fig. 7.

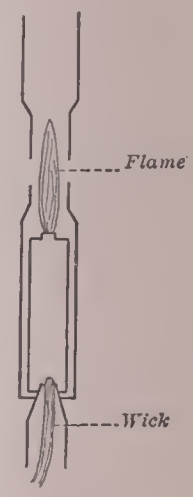

Fig. 8.

The Amyl Acetate Lamp.—In Germany the problem of providing a standard of light which should be supplied by a fuel of constant composition has been more successfully solved. Hefner-Alteneck * (1885) described a lamp in which amyl acetate ($C_7H_{14}O_2$), a volatile liquid of definite composition, is the fuel. This lamp, which has since been very carefully studied, has been found to give such uniform results that it has been adopted in Germany as the official standard in place of the candle. The entire lamp is of metal (Fig. 9), and the vapor of the volatile fuel burns at the end of a tube in free air. It is supplied by means of a wick which fills the tube, and the flame is adjusted to normal flame-height of 40 mm. by means of a magnifying eye-piece, which is permanently attached to the lamp itself. The materials of which the lamp is made and its dimensions are most carefully specified for the purpose of volatilizing the liquid at a fixed temperature, which depends upon the thickness of the walls and the conducting power of the metals of which they are composed. The wick-tube is of German silver 8 mm. of inner diameter, with walls 1·5 mm. in thickness. Its height is 25 mm. The advantage of this standard over all others thus far constructed consists in the ease and certainty with which the flame can be brought accurately to a fixed value. Liebenthal † found that with proper adjustment of the flame-height the mean error of an observation lay between 0·5 and 1·5 per cent. Dibdin found

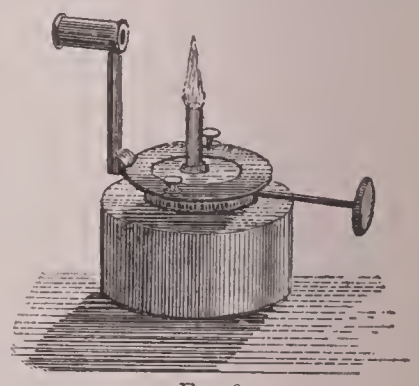

Fig. 9.

* Von Hefner-Alteneck, *Elektrotechnische Zeitschrift*, vol. iii., p. 445.

† Liebenthal, *Elektrotechnische Zeitschrift*, vol. viii., p. 504.

90 per cent. of his observations to lie within 1 per cent. of the mean of the entire series of 225 which he made.

The agreement among themselves of different specimens of the Hefner lamp depends upon the precision with which

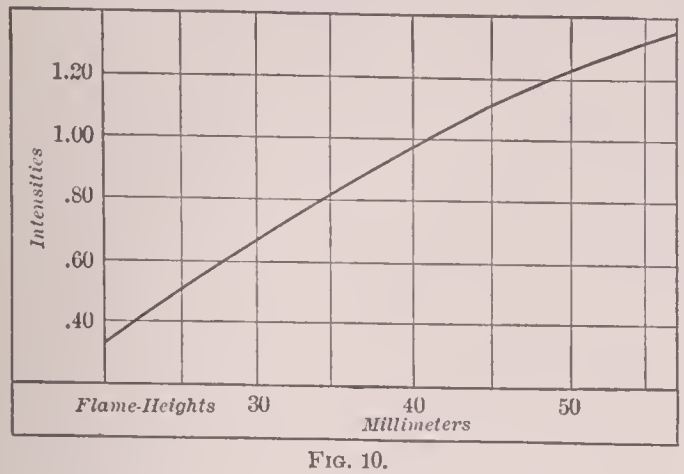

FIG. 10.

they are constructed. Until special attention had been called to this point it was found that the lamps produced by different makers varied through several per cent. They have, however, of recent years been much more closely standardized. Impurities in the amyl acetate affect the brightness of the flame only when present in considerable quantities. The addition of 20 per cent. of amyl alcohol, which is a frequent adulterant, was found to reduce the candle-power by 1·1 per cent. Ten per cent. of ethyl alcohol reduces the brightness of the flame by 3 per cent. The most serious of the uncontrolled errors to which the Hefner lamp is due is that which arises from the variation in the moisture of the atmosphere. Liebenthal,* who made observations running over more than a year, for the purpose of determining the relation between the hygrometric state pressure of the air and the amount of carbon dioxide which it contains, upon the brightness of the flame, found that the Hefner lamp was of normal intensity during March, April, and May, and again in October and November; that during the summer its intensity was on the average 2 per cent. too small, and during December, January, and February about 2 per cent. larger than the normal value. These fluctuations are traceable chiefly to the moisture of the air, the intensity decreasing uniformly as the moisture increases.

The variation in the candle-power of this lamp with the height of the flame is, as will be seen by a comparison of Fig. 10 with Fig. 2, very similar to that found in the case of the British candle. Bolometric observations show that, while the Hefner lamp is subject to marked disturbance from draughts, its average intensity fluctuates much less than that of the other naked light standards studied by this method. A compilation of the numerous comparisons of the candle-power of the Hefner lamp with that of the British candles, made by various observers, leads to the adoption of the value 0·88 as the proper candle-power of this source.

The Acetylene Flame.—Another fuel of constant composition which is available for use in photometry is acetylene (C_2H_2). The flame of this gas burning in air is white and of high illuminating power. Studies which have thus far been made upon it seem to indicate that when the proper method of constructing the standard burner has been specified a light standard will probably result which is superior to any hitherto produced. The details of this construction were in 1899 not yet completed.

Platinum Standards.—Violle † has proposed the use of the light emitted by melting platinum, one sq. cm. in surface, as a standard of illumination. The apparatus for producing the molten platinum is cumbersome, and the quantity sufficient for this purpose makes the process an expensive one. Moreover, the few attempts to repeat Violle's operation, as described to the Electrical Congress in Paris, and adopted by that body, have not led to a good result. Elaborate experiments at the Imperial Institute for Technical Research in Charlottenburg appear to have demonstrated the impracticability of the Violle standard. Various propositions to use glowing platinum at lower temperatures have been made, notably one by Lummer and Kurlbaum, ‡ in which the degree of incandescence is specified by means of the ratio of light-giving energy to total energy emitted by the foil. Their method has not been widely introduced.

Blondel's Arc Standard.—Blondel * has studied the use of the crater of the positive carbon of the arc lamp as a primary standard. The remarkable constancy of the temperature of the crater had long been known. It had been pointed out by Abney, and later by Violle and by S. P. Thompson, that the intrinsic brightness of this portion of the carbon surface under varying currents and lengths of arc shows no appreciable fluctuations. To isolate this portion of the surface, Blondel introduced a diaphragm containing an aperture of very small size (1 mm. in diameter). The crater of the arc, which is inclined to the vertical sufficiently to bring it into convenient view, is isolated by means of this diaphragm, which is placed close to it and is kept cool by a stream of water.

The study of the behavior of such a standard by means of the bolometer has shown that this source of light is not to be compared in constancy even with the worst of the ordinary flame standards used in photometry. Fig. 11 shows the character of a portion of the life-curve thus obtained. This standard has never come into practical use.

Many sources of light which at first sight might appear well adapted for standards are excluded because they owe their brightness in part to luminescence rather than to normal radiation. The behavior of such sources and the manner in which they fall off in intensity, with the time, is described in the article LUMINESCENCE (*q. v.*). The best practice in photometry at the present day consists in adopting as a primary standard the Hefner lamp or the pentane lamp,

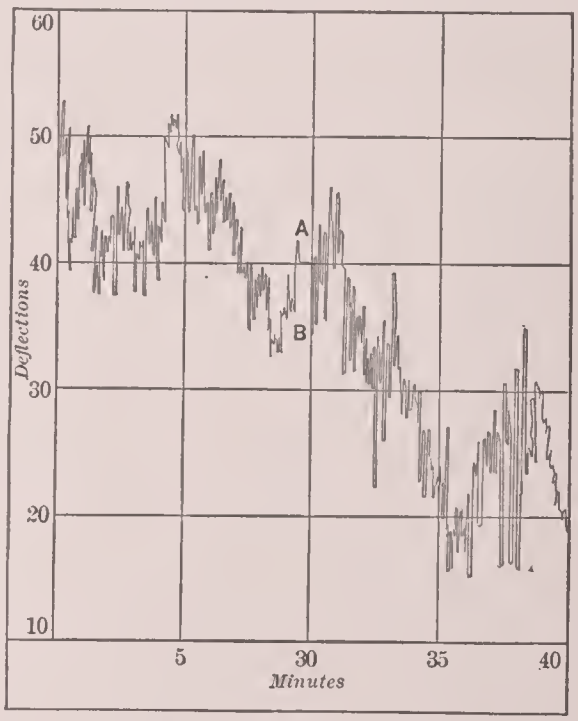

FIG. 11.—Blondel arc standard. (Between the points A and B there was a time-interval of 20·5 minutes.)

preferably the former, and comparing with this some definite secondary standard of greater candle-power. For this purpose incandescent electric lamps are frequently used to advantage. The flame of petroleum lamps properly handled likewise gives a satisfactory result, while for purposes of gas photometry the Methven slit is widely used. The ratio of the various sources of light already described, in so far as they have been accurately determined, is given in the following table. The data are compiled from the comparisons made by Violle † between his platinum standard and some of the others mentioned in this article.

VALUES OF VARIOUS LIGHT STANDARDS IN TERMS OF THE BRITISH CANDLE.

	Candle-power.
Violle standard	18·5
Carcel	8·91
Bougie de l'étoile	1·15
Vereinskerze	1·13
British candle	1·00
Hefner lamp	0·98
Bougie décimale	0·925

That considerable discrepancies are to be expected in such measurements is obvious. As has already been pointed out,

* Liebenthal, *l. c.*

† Violle, *Annales der Chimie et Physique*, 6th series, vol. iii., p. 373.

‡ Lummer and Kurlbaum, *Elektrotechnische Zeitschrift*, vol. xv., p. 474.

* Blondel, *Proceedings of the International Congress of Electricians at Chicago* (1893), p. 315.

† See Palaz, *Photometrie*, p. 155.

the most probable value for the candle-power of the Hefner lamp is 0·88, instead of 0·98. The latter is, for example, very nearly the value obtained by the German committee of gas and water engineers under the direction of Hugo Krüss.* They found for the Vereinskerze and the Hefner lamp in terms of the British candle:

$$\frac{\text{Vereinskerze}}{\text{British candle}} = 1{\cdot}07$$

$$\frac{\text{Hefner lamp}}{\text{British candle}} = 0{\cdot}885$$

These results were the mean in each case of nearly 2,000 measurements.

For further details, see Dibdin, *Photometry* (London, 1889); Palaz, *Photometrie Industrielle* (translated by Patterson, New York, 1894); also *Report on Standards of Light, Transactions of the American Institute of Electrical Engineers* (vol. xiii., 1896). E. L. Nichols.

Lily, or Lilly, William: English educator; b. in Odiham, Hampshire, England, 1466; educated at Oxford, traveled in the East, and studied in Greece and Rome, and also in Paris. Returning to London in 1509 with a high reputation for scholarship, he founded a grammar school, and was apparently the first who taught Greek in London. Dean Colet appointed him, in 1512, high master of Saint Paul's School, which Colet had just founded. In this position he labored until his death, in 1529. He was the author of several educational works, among them *Brevissima Institutio seu Ratio Grammatices Cognoscendæ*, commonly known as Lily's Grammar, one of the most celebrated of all textbooks. In the compilation of the work he had the assistance of Colet, Erasmus, and Cardinal Wolsey. King Henry VIII., who himself wrote an introduction to grammar, taking Lily's Grammar as a basis, caused a law to be enacted by which this grammar was prescribed for exclusive use in all the schools of the kingdom. It was the accepted grammar in the English schools for more than three centuries, and is still used in Saint Paul's School. Lily was a friend of Erasmus and of Sir Thomas More.

C. H. Thurber.

Lindley, Sir Nathaniel, LL. D.: English jurist; b. in Acton Green, Middlesex, 1828; son of John Lindley, the botanist; was educated at University College, London, and called to the bar at the Middle Temple in 1850; created queen's counsel in 1872; was appointed judge of the court of common pleas in 1875, and was lord chief justice of appeal 1881–97, in which last year he was appointed master of the rolls. He is well known for his *Introduction to the Study of Jurisprudence* (1855), and his treatise on *The Law of Partnership and Companies* (6th ed. 1893).

Lindsey, Charles: Canadian author and writer on public history; b. in Lincolnshire, England, in 1820, where he received his education; went to Canada in 1841 and was one of the editors of the *Toronto Examiner*; in 1853 became editor-in-chief of the *Toronto Leader*, the Conservative organ of Western Canada; in 1867 was made registrar of deeds for the city of Toronto; in 1882 fellow of the Royal Society of Canada, from which position he subsequently resigned; in 1890 became registrar for the western division of Toronto. He has written many articles on public questions for periodicals, and published among others the following works: *The Clergy Reserves: their History and Present Position* (1851); *Prohibitory Laws: their Practical Operation in the United States* (1855); *The Prairies of the Western States* (1860); *The Life and Times of William Lyon Mackenzie*, with an account of the Canadian rebellion of 1837 (2 vols., 1862); *Rome in Canada—The Ultramontane Struggle for Supremacy over the Civil Authority* (1878).

Lindsley, John Berrien, M. D., D. D.: educator; b. in Princeton, N. J., Oct. 24, 1822; graduated at the University of Nashville in 1839; studied medicine at the Universities of Louisville and Pennsylvania, receiving the degree of M. D. at the last-named institution in 1843; also studied theology and was ordained in 1846 by the Presbytery of Nashville. For some years he preached in the Nashville district and at the same time studied chemistry under Gerald Troost, whom he succeeded in 1850 as Professor of Chemistry in the University of Nashville. From 1853 to 1873 he was chancellor of that institution, also retaining the chair of Chemistry until 1870. The stone building that forms the main portion of the university owes its erection chiefly to his energy, and he gave more than $10,000 for its construction. Dr. Lindsley was active in the organization of the medical department of the university in 1850, and was its first dean. In 1867 he organized the Montgomery Bell Academy, and three years later had much to do with the founding of the Tennessee College of Pharmacy, in which he held the chair of Materia Medica from 1896 until his death, Dec. 7, 1897. He was also Professor of Chemistry and State Medicine in the University of Tennessee 1880–97. He was a member of the Nashville board of education 1856–60, superintendent of city schools in 1860, and secretary of the State board of education from its inception in 1875. Dr. Lindsley was also health officer of Nashville 1876–80. From 1877 until his death he was secretary and executive officer of the State board of health. The degree of D. D. was conferred on him by Princeton in 1856. He was a member of many medical and scientific societies. For many years he edited the *Nashville Journal of Medicine and Surgery*, for the support of which he contributed his salary from the medical department of the University of Nashville. He was a large contributor to scientific and popular journals, and was the author of *Our Ruin: its Causes and Cure* (Nashville, 1868) and *The Military Annals of Tennessee* (1886). Marcus Benjamin.

Liquid Air: Air was first liquefied in 1878, in which year Cailletet in Paris and Pictet in Geneva, by means of a combination of pressure and cooling, succeeded in converting both nitrogen and oxygen into the liquid form. In order to cool the gases of which air is made up to temperatures below their critical temperatures (−118° for oxygen, −146° for nitrogen), it was necessary to add to the effect produced by the liquid ethylene or the carbon dioxide which were the refrigerants used respectively by Cailletet and Pictet, by allowing the compressed gas to cool by its own expansion.

The principle of the early processes for the liquefaction of air and other gases may be stated briefly to consist in bringing gases to a high pressure, 100 to 300 atmospheres, in a vessel surrounded by a liquid refrigerant, which is reduced to the lowest possible temperature by being compelled to boil *in vacuo*, and in suddenly releasing the compressed gas thus cooled from pressure. This third operation suffices to lower the temperature beyond the critical point, with the result of liquefying a portion of the gas. This method with various modifications was developed and perfected independently by Wroblewski and Olszewski in Russia and by Dewar in England. Olszewski began his experiments in 1883, and in 1890 he constructed a machine by means of which it was possible to obtain liquid air in considerable quantities.

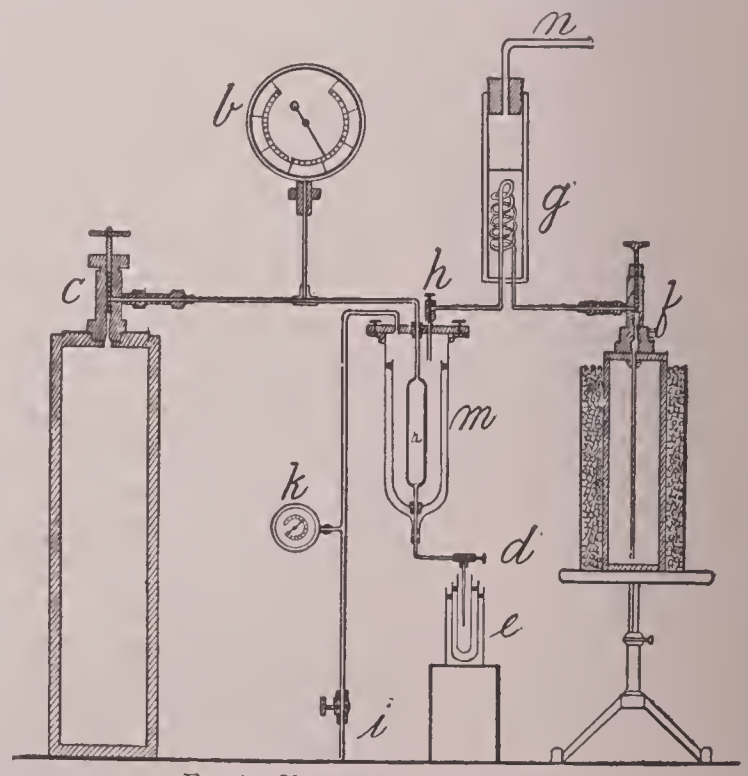

Fig. 1.—Olszewski's machine (1890).

The essential features of Olszewski's apparatus are shown in Fig. 1. A small steel cylinder, *a*, with a capacity of 200 cubic cm., is connected by means of a copper tube of fine

* Krüss, *Bericht der Lichtness-Commission des Deutschen Vereins von Gas- und Wasserfachmanner*, München, 1897.

bore with a pressure-gauge, *b*, and an iron flask which contains the gas to be liquefied (oxygen or air) at a pressure of 100 atmospheres. The hole in the bottom of the cylinder *a* is fitted with a similar copper tube, through which, by opening the small valve *d*, the liquid air can be drawn out into a glass vessel with three walls (*e*). In order to obtain in the *a* a temperature below the critical point of the gas, the cylinder is placed in a glass vessel with double walls, which is filled with liquid ethylene. This refrigerating substance is drawn from the iron flask *f*, which contains about one kilogramme of the liquid. The flask is cooled by a packing of salt and ice, and its contents before entering the refrigerating vessel *m* passes through a worm within the vessel *g*. This vessel is filled with a mixture of ether and solid carbon dioxide, the temperature of which when boiling in the open air is −78° C. By means of a small air-pump attached at *n*, the pressure in this vessel is reduced to 50 mm., and in this partial vacuum the temperature of the liquid falls to −100° C. The vessel *m*, within which *a* is situated, is then allowed, by opening the valve *h*, to receive the cold ethylene. The pressure in *m* is likewise reduced by the action of a second air-pump working through the tube *i*, which removes the evaporated ethylene and forces it into a gasometer, where it is stored for further use. As soon as the gauge *k* indicates that the pressure in the receiver *m* has fallen to a point such as to insure the necessary lowering of temperature, air or oxygen is allowed to enter from the cylinder *c* and becomes liquefied in *a*, after which *c* is closed and the stop-cock *d* is opened. The liquefied gas thereupon flows into the glass vessel *e* already described.

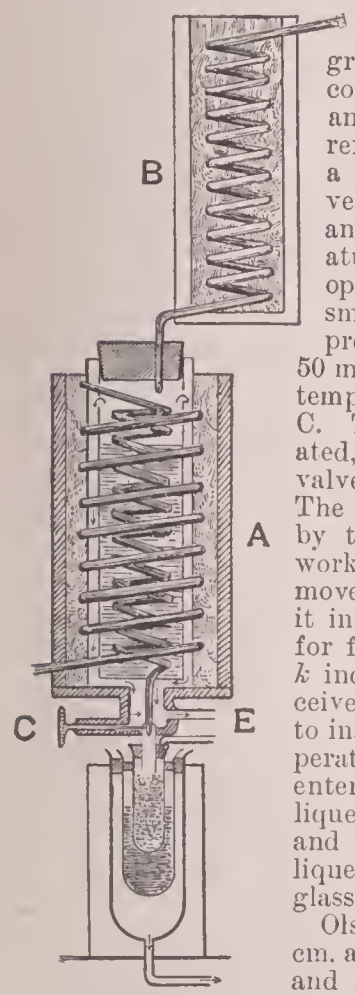

FIG. 2.—Dewar's apparatus (1886).

Olszewski was able to obtain 200 cubic cm. at one operation with this apparatus, and he states that when the machinery was once started it was possible to repeat the operation every fifteen minutes. The pressure to which it is necessary to reduce the liquid ethylene in order to carry the temperature below the critical point was found to be as follows:

TEMPERATURE OF LIQUID ETHYLENE AT VARIOUS PRESSURES.

Pressures.	Temperatures.	Pressures.	Temperatures.
146 mm.	−122° C.	31 mm.	−139° C.
107 "	−126	12 "	−148
72 "	−129·7	9·8 "	−150·4
56 "	−132		

To liquefy oxygen alone the pressure must be lowered, therefore, to about 100 mm., while to liquefy air the exhaustion must be carried to 20 mm.

Prof. Dewar, at the Royal Institution in London, whose long-continued investigations are better known to the English-speaking public than are those of the Continental experimenters, had as early as 1886 constructed an apparatus by means of which small quantities of liquid oxygen or air could be produced, and could be drawn off into an open vessel for use in scientific work. This apparatus, a diagram of which is shown in Fig. 2, consisted of a series of worms each surrounded with a refrigerating bath. Air or oxygen at a pressure of 75 atmospheres entered the outer of the two spiral coils in the lower vessel (A) at 0° C., and after passing upward through a bath of solid carbonic acid and downward through the inner worm, which is submerged in liquid ethylene, made its exit in the liquefied form through the valve C. In order to bring this inner worm below the critical temperature, the evaporation of the liquid ethylene was hastened by means of an exhaust-pump attached at E. A supply of liquid ethylene was obtained by means of a worm contained in a refrigerating bath, B, above the part of the apparatus already described as shown in the illustration. This apparatus was capable of delivering 22 cubic cm. of liquid oxygen at a time. This gas seems to have been employed rather than air for the reason that it has a higher critical temperature, and is therefore more easily converted into the liquid state.

In 1892 the Royal Institution possessed an apparatus by means of which a pint of liquid oxygen could be produced at a time. It was first exhibited in a lecture by Dewar on June 10 of that year. The machine consisted of a gas-engine which drove two compressing pumps. The oxygen to be liquefied was pumped into a chamber surrounded by two refrigerating agents; one of these was ethylene, the other nitrous oxide. A certain amount of liquid ethylene was admitted to the refrigerating chamber intended for that liquid and there evaporated. It was then returned in the form of gas to the compressing pump and liquefied, after which it again entered the refrigerating chamber. Alternate liquefaction and evaporation of the nitrous oxide was carried on simultaneously by means of the other pump. In these experiments a hundredweight of ethylene was used. The cycle of operations was essentially the same as that common in refrigerating machinery in which ether or ammonia is employed.

In 1895 Linde, of Munich, who had long been employed in the construction of refrigerating apparatus by the ammonia process, and who recognized the great value of liquid air for the production of extreme cold, brought out an apparatus for the production of that material in large quantities. Linde made use of one only of the cooling processes employed in the previous machines, that, namely, which has its source in the sudden expansion of the compressed gas. By means of a throttle-valve, air previously compressed to about 2,500 lb. to the square inch was allowed to expand, passing into a worm or spiral coil. This sudden reduction of pressure was accompanied, as is always the case, by a lowering of the temperature. The worm just mentioned consists of a double coil, one tube within the other, and it is to the inner tube that the throttle-valve is attached. The air, released from pressure and grown cold, is returned to the pump through the outer of these two tubes, and thus completely surrounds the oncoming air in the inner tube of the coil. The latter, therefore, when it reaches the valve, has the same temperature as the air previously released from pressure, and in turn its temperature is reduced to a still lower point. Returning through the outer tube, it chills the oncoming air still further, and thus a continuous process of refrigeration occurs, which finally reduces the

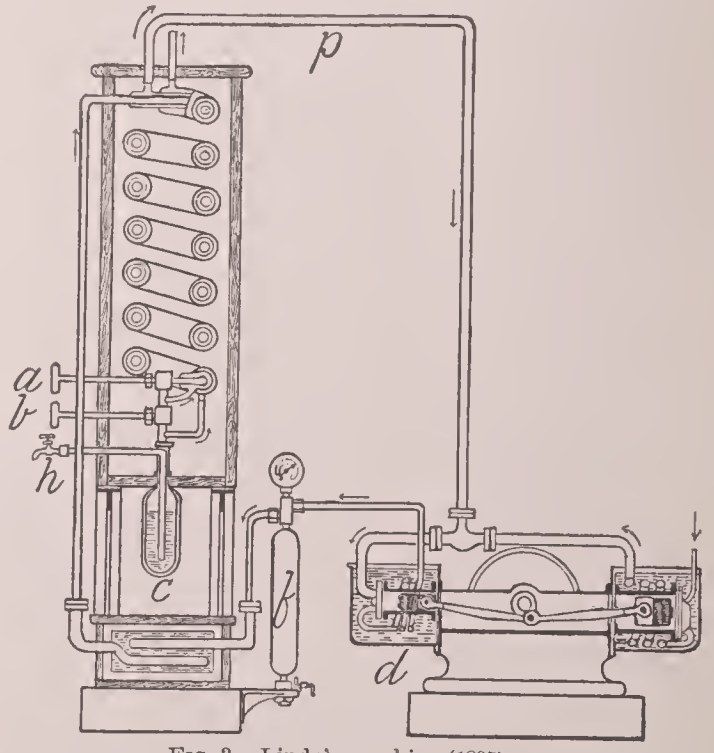

FIG. 3.—Linde's machine (1895).

temperature to a point below the critical temperature of air without the aid of an extraneous refrigerant. When this stage is reached a portion of the air is liquefied and may be drawn off.

In a later apparatus Linde makes use of a triple tube in his cooling worm. The arrangement is shown in Fig. 3. In this machine the compressing pump has two cylinders, the first of which receives air from the outer atmosphere and compresses it to 16 atmospheres, in which condition it is delivered to the second cylinder, *d*, to be further compressed to 200 atmospheres. After each of these com-

pressions the air passes through a coil of pipe shown in cross-section in the diagram, surrounded, as is the whole of each cylinder, by a water-jacket. In this way the heat developed in the process of compression is removed. In order to free the compressed air from moisture it is passed through a separator, *f*, then through a coil surrounded by a freezing bath of brine, the temperature of which is low enough to congeal entirely the remaining moisture. The compressed air thus cooled enters the innermost of three concentric coiled tubes, which constitute the refrigerating worm. At the lower end of this worm it reaches the first of two throttle-valves (*a*). In passing through the valve *a* the air is reduced to a pressure of 16 atmospheres, and returns, traversing the middle of the three tubes of the coil, through the pipe *p* to the pump, where it is recompressed to its original pressure of 200 atmospheres. About one-fifth of the air thus reduced in pressure is allowed to escape through the second throttle-valve, *b*, and to fall to a pressure of 1 atmosphere. This portion of the air passes through the outermost of the three tubes of the coil and escapes. The object of this double throttling is not only to utilize the complete expansion of a portion of the air for the sake of its cooling effect, but to maintain the larger part at the pressure of 16 atmospheres, by which means the work to be done by the compressing pump is materially reduced. In a short time after the apparatus has been put into operation liquid air begins to drop from the throttle-valve *b*. This is allowed to collect in the jacketed receiver *c*, and is drawn off through the tube *h*.

With Linde's machines nine-tenths of a liter of liquid air is produced, with the expenditure of three horse-power. In 1898 a large machine to be used in an improved process for the manufacture of chlorine was under construction. It will produce 50 liters of liquid air per hour, with an expenditure of 120 horse-power.

Numerous machines requiring from five to seven horse-power were at that time (1898) already in use on the continent of Europe.

In the U. S. investigations looking to the production of liquid air on a large scale have been carried on for several years. Mr. C. E. Tripler, of New York, began to experiment, indeed, according to his own statement,* as early as 1890. Mr. Tripler, like Linde, employs the method of expansion, and takes advantage of the cooling of the gas by its release from a pressure of 2,000 lb. per square inch to reduce the gas to a point below the critical temperature. In Tripler's apparatus compressed air, after having been cooled by contact with water from the city mains, passes into the inner portion of a double tube; the outer portion is supplied with expanded and consequently extremely cold air by means of the valve through which a portion of the air from the compressor passes, and in this way the temperature of the air within the inner tube is reduced to the point necessary to liquefaction.

The machine used by Tripler (1898) produces from 6 to 7 liters of liquid per hour, with an expenditure of 30 to 40 horse-power. Liquefaction is said to begin within fifteen minutes after the compressor is started.

Properties of Liquid Air.—Liquid air, like air in the gaseous state, is a mixture of nitrogen, oxygen, carbonic acid, and argon. There is usually present a certain amount of aqueous vapor and of other gases which may be regarded as impurities. At the extremely low temperatures at which air can be obtained as a liquid the aqueous vapor is frozen, and it thus appears as a solid suspended within the liquid. Carbon dioxide is likewise frozen, and the quantity of this gas usually present is sufficient to fill the otherwise clear liquid with white particles which give it a milky appearance. This can be removed by filtration, and the liquid air thus filtered is found to be clear, limpid, and of a slightly bluish color. The physical constants of the three gases of which this liquid may be considered a mixture are given in the following table:

GAS.	Critical temperature.	Critical pressure (atm.).	Boiling-point (760 mm.).	Freezing-point.
Nitrogen	−146° C.	35·0 atm.	−194·4° C.	−208·0° C.
Argon	−121	50·6	−187·0	−189·6
Oxygen	−118·8	50·8	−182·7	−184·0

The three components of liquid air differ greatly in specific gravity. Nitrogen has a density of 0·885, oxygen of 1·24, and argon of 1·5. These values are taken at a pressure of 1 atmosphere and at the respective boiling-points of the liquids.

The mixture which we call liquid air can scarcely be said to have physical constants, for the reason that, owing to the different boiling-points, the gases evaporate at very different rates. The result is that the mixture changes from the moment of its production, growing steadily richer in oxygen. This fact gives the process of liquefying air one of its chief commercial values, in that it affords a ready means of securing comparatively pure oxygen. When liquefied air evaporates, according to Linde's experiments, quoted by Ewing, the percentage of oxygen in the liquid increases during evaporation, as shown in the following table:

EFFECT OF EVAPORATION UPON THE COMPOSITION OF LIQUID AIR.

Amount of liquid not evaporated.		Amount of oxygen in the remaining liquid.	
100	per cent.	23·1	per cent.
50	"	37·5	"
40	"	50·0	"
30	"	60·0	"
20	"	67·5	"
10	"	77·0	"
5	"	88·0	"

Thus Linde found that in practice, after four-fifths of the liquid air had been allowed to evaporate, the residue would contain about 50 per cent. of oxygen. In order to secure a product rich in oxygen, he modified his liquefier in such a way as to utilize for cooling purposes the gas given off from the surface of the liquid already formed. This liquid contains chiefly nitrogen, and the unevaporated remainder consequently grows steadily richer and richer in oxygen.

Of the two principal components of liquid air, nitrogen is slightly diamagnetic. Oxygen, however, is very strongly magnetic, its magnetic moment being about one thousandth that of iron. When brought between the pole-pieces of an electro-magnet the liquid is strongly attracted and is held in the field against the action of gravity. Fig. 4 shows the

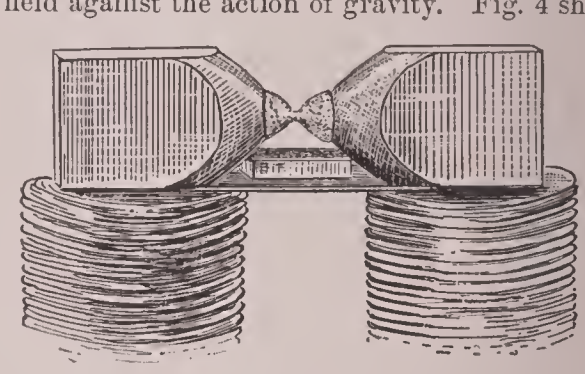

FIG. 4.—Liquid oxygen between the poles of an electro-magnet (Dewar).

appearance of the liquid thus suspended between the poles. Liquid air, on account of the large proportion of oxygen which it contains, behaves in the magnetic field much in the same way. Liquid air is an excellent insulator, and the effect of the very low temperature at which it exists at atmospheric pressure is to increase the conductivity of copper to about ten times its value at ordinary temperatures. The suggestion has been made to surround such conductors for the transmission of heavy currents with a layer of liquid air, for the double purpose of providing a high-class liquid insulator and of increasing in the above proportion the carrying capacity of the wires.

The effect upon the electric resistance of various metals which results from cooling them to the temperature of liquid air is shown in Fig. 5, in which ordinates are resistances and abscissas are temperatures from −273° C. (the absolute zero) to +100° C. It will be seen that the resistance is in every case rapidly diminished with falling temperatures, and it seems probable that if the absolute zero could be reached in such experiments all metallic resistances would become indefinitely small. The data are from measurements by Fleming and Dewar.

The scientific uses of liquid air are numerous. By the use of it as a refrigerant it has been found possible to reduce the last of the so-called permanent gases—namely, hydrogen and helium—to the liquid and even to the solid form, and likewise to study the physical properties of matter at temperatures in the neighborhood of − 200°. When apparatus for the production of liquid hydrogen shall have been developed to a point such as to permit the making of large quantities of this substance, it is probable that the range of

* *Scientific American*, vol. lxxviii., p. 214 (1898).

temperatures will be extended downward by the process of boiling this element *in vacuo* to temperatures extremely near the absolnte zero.

The time has already come when a machine for the liquefaction of air is felt to be an almost necessary portion of the equipment of physical laboratories.

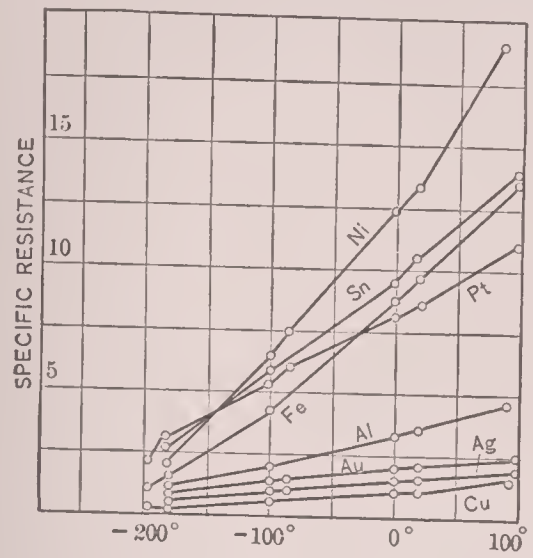

FIG. 5.—Resistance of metals at low temperatures. (Fleming and Dewar.)

The University of Leyden has had a completely equipped cryogenic laboratory in operation for several years under the direction of Prof. Onnes,* and several German laboratories have been provided with machines of the Linde type. The range of investigation which it is possible to make by means of this new refrigerant is a very wide and very important one. At the Royal Institution in London alone researches have been already carried on, on radiation at low pressures, on refraetive indices, on spectroscopy of the liquefied gases, on electric conductivity and thermo-eleetric properties of various metals, on latent and speeific heats of various substances at — 200°, on capillarity, on chemical action, on magnetic properties, on tensile strengths of metals, on phosphorescence and the photographie activity of sensitive plates, on dielectric constants of iee and aleohol and of oxygen and air in the liquid states, on permeability and hysteresis of iron and of oxygen and air, on the separation of helium from other gases in mineral waters, and in 1898, when for the first time hydrogen was made in considerable quantities, on the properties of that element in the liquid and solid forms.

In the domain of chemistry much has been achieved. Fluorin, for example, a substance chemically so universally active that it was for a long time found impossible to obtain it save in combination with other materials, has been isolated and its properties studied by produeing it at the temperature of liquid air. At this temperature it was found to be a comparatively inert substance. Argon, the very existenee of whieh in considerable quantities as a constituent of the air had been totally unsuspeeted, has been separated from the nitrogen with which it is eommonly mixed and its properties studied as one of the results of these researches. We owe to Prof. Dewar an ingeniously eonstructed vessel for the keeping of liquid air. Where large quantities are to be handled it is customary to pour the liquid into a large can containing several gallons and to jacket this with felt or other substances such as are commonly used for heat insulation. Under these cireumstances the liquid continues to boil with great activity and the loss by evaporation is considerable. Smaller quantities of the liquid can be much more completely prevented from gaining heat from outside by means of Dewar's flask (Fig. 6). This consists of an inner tube containing 100 or 200 cubie cm., which is sealed into the neck of a larger vessel of glass. The outer vessel is attached to a mercury-pump and its contents exhausted until a very high degree of vacuum is reached. Under these conditions all loss of heat by convection disappears. The liquid air contained in the inner tube ean then gain heat from outside only by the very slow process of conduction along and through the thin walls of the vessel and by direet radiation. The exchange of temperature by radiation is further reduced by the device of placing in the outer elosed vessel a small amount of mercury. This liquid evaporates, and its vapor freezes upon the wall of the inner tube, forming a very perfeet mirror. Such a mirror refleets a large proportion of the radiant heat reaching it from without, and in this way the liquid air is further shielded from the heating effects of its environment. The air when plaeed in such a flask boils very slowly, and the volume diminishes by evaporation so gradually that a considerable portion remains even after an interval of twenty-four hours. The good performanee of such tubes has been found to depend, however, upon the excellence of the vacuum. Hempel* found that a layer of eider-down, or even of wool previously dried at 100° C., was decidedly superior as a means of preserving freezing-mixtures to many of the Dewar tubes obtained from dealers.

FIG. 6.—Vacuum tube for liquid air.

Many industrial uses for liquid air have been suggested, among the most obvious of which are its use as a high explosive, as a substitute for the ordinary receivers of compressed air in the driving of air-engines, as a refrigerant to be used in increasing the thermal range of steam-engines (by which means it is plain that the theoretical efficiency of the engine can be somewhat inereased), and as an ordinary cooling material to take the place of those produced by the refrigerating machinery in which ammonia and other vapors are used at the present day. Its use in the manufaeture of ehlorine has already been mentioned. There are doubtless many technological proeesses in which it will be employed.

The following is a list of some of the more important memoirs on the liquefaction of air and other gases which have appeared since the beginning of Olszewski's experiments in 1883: 1884, Cailletet, *Comptes Rendus*, 98, p. 1565; 1885, Olszewski, *Comptes Rendus*, 100, p. 350; Wroblewski, *Wiedemann's Annalen*, 25, p. 371; 26, p. 134; 1887, Olszewski, *Wiedemann's Annalen*, 31, p. 58; Olszewski, *Monatshefte der Chemie*, 8, p. 69; 1888, Dewar, *Philosophical Magazine* (5), 26, p. 286; 1889, Dewar, *Proc. Liquid Assets: cash assets or such other assets as can be at once converted into cash. The term is most frequently employed in connection with the banking business or other forms of business that require large capital which it may be necessary at any time to convert into cash for use at once or on very short notiee. Strictly speaking, cash alone is a liquid asset; but the term liquid assets is usually applied in the case of bankers to cash, money at call, and government seeurities; and these, with bills of exchange, loans and advanees, and the real estate of the bank, constitute the general divisions into which a banker's assets are divided. The ease or readiness with which assets not strictly liquid assets can be converted into eash depends largely upon the extent to which it is neeessary to convert them, and the conditions under which the conversion has to be made. For example, call loans are loans made to other bankers or brokers or individuals, to be paid on demand, and are secured by bills of exchange or other securities, each borrower depending upon his being able to realize on his securities in order to pay his

* See *Beiblätter zu dem Annalen der Physik*, vol. xix., p. 554 (1895).

* W. Hempel, *Berliner Berichte* (1898).

loan if necessary, that is, if it is called; hence, in the time of panic, when the amount of money that can be borrowed on such assets is insufficient to meet the demand for money to pay such loans, these assets, which in ordinary times would be perfectly liquid assets, can not be realized upon or converted into cash when needed, and perhaps not for so long a time afterward as practically to rob them of their value as liquid assets. F. STURGES ALLEN.

Liquidator: in Great Britain, an officer appointed to conduct the winding up of a company. In case of a voluntary winding up, the liquidator is appointed by the company; in the case of a compulsory winding up, by the court; and if no other person is appointed as liquidator in the compulsory winding up, the official receiver acts in this capacity. His acts are subject to the control of the committee of inspection of the shareholders, the board of trade, and the court. He may carry on the business of the company and bring or defend actions and settle all claims with the consent of the committee; he can sell the property of the company or collect its assets, and distribute dividends without their consent. In the matter of the administration of the affairs of his office he is under the control of the board of trade, and his legal powers are subject to the order of the court. Prior to 1890 the court could, at any time after the presentation of a petition for winding up a company, appoint a provisional liquidator to protect the assets of the company, pending the appointment of the official liquidator. See Lindley's *Treatise on the Law of Companies*; Buckley on *The Companies Acts*; and Hamilton's *Manual of Company Law for the Use of Promoters and Directors*. F. STURGES ALLEN.

Liquor Laws: a general term designating the laws passed by a state or government regulating the use and sale of intoxicating liquors, and fixing the rights of individuals directly or indirectly injured by their illegal sale.

The term *liquor* alone when used in the statutes prohibiting its sale is construed to mean an intoxicating or spirituous liquor, and under this heading are included alcohol, ale, beer, whisky, brandy (including blackberry brandy), rum and gin, champagne, and vinous liquors generally. The question as to whether a liquor is intoxicating or not is usually a question of fact to be decided in accordance with the nature of the effects of the liquor when drunk by man; but a liquor such as alcohol, which is intoxicating, does not become any the less an intoxicating liquor by dilution. Hard cider is also usually construed to be an intoxicating liquor. Liquors are frequently divided into vinous, spirituous, malt, and brewed liquors. Where liquors are used as a basis for medicated bitters the question as to whether they continue to be regarded as intoxicating liquors or as medicines usually depends upon whether their use as a beverage is rendered practically impossible by the use of the medical ingredients.

History of Liquor Laws.—In Great Britain liquor legislation practically begins with the act 9 George IV., which with modifications has been extended down to the present time; but legislation on this subject is more advanced in the U. S. and the British colonies than it is in Great Britain. Sunday closing is only partially required in Great Britain, but is very general in the U. S. and in the British colonies; and the principle of local option, which is recognized in many of the colonies and largely in the U. S., and that of prohibition, which has gained considerable foothold in some parts of the U. S., are practically not recognized in Great Britain. As a result of the many amendments and modifications of the statutes in Great Britain without any general repealing act, the full scope and detail of many existing enactments are difficult to understand distinctly. In Great Britain the principal act regulating the subject at present is that introduced in 1872 by Henry Austin Bruce, afterward Lord Aberdare, and this act does not apply to Scotland, and applies to a part only of Ireland. In Scotland the matter of licensing the sale of liquors is in general regulated by the Home Drummond Act of 1828. In Ireland the licensing laws are similar to those in England, with some modifications favoring keepers of public houses.

In the British colonies the liquor regulations are very diverse. In New Zealand licenses are granted by elective licensing committees, but new licenses can be granted only after a poll of the ratepayers. In Australia, Victoria recognizes the principle of local option, combined with compensation to heirs or relatives of a person who meets his death through the use of intoxicating liquors. In Queensland a majority of two-thirds of the ratepayers have the power to prohibit the sale of liquor in any locality, and a majority can limit the number of licenses and prevent the issuing of new ones. In New South Wales a form of local option exists. In South Africa there are stringent regulations against the sale of intoxicants to the natives, but they are not well enforced. In India the sale of liquor to the natives is so great that the Government has been accused of endeavoring to increase it for the purpose of adding to the revenue. In Canada a local-option law exists known as the Scott Act of 1878, under which a majority of voters in a locality can close all license permits without compensation. In the U. S. some States have laws prohibiting the sale of liquor except as drugs, and others have what is known as the high-license system; local option also is very generally recognized. See LOCAL OPTION and PROHIBITION.

General Provisions and Regulations in the U. S. and in Great Britain.—In the U. S. each State has full power to license and control traffic in intoxicating liquors, and it may at its own discretion fix the terms on which the license shall be granted. The power may be in effect delegated to local governments under the system of local option, which authorizes the locality in question to control for itself traffic in intoxicating liquors; but where this local control is not expressly created by a statute the power rests solely in the State, except for the police powers granted to municipal corporations.

A license to sell liquor is decided to be a privilege and not to be a species of property, and therefore the depriving a person of a license by forfeiture does not constitute taking away of property without due process of law, and neither can the license be levied upon or sold by the sheriff, nor can it be transferred by the licensee except by the approval or permission of the authority by whom the license was granted. The regulation of the subject of traffic in intoxicating liquors, so far as it concerns the preservation of the public morals, is a part of the police power of the State, and so far as it concerns the raising of funds for public revenue is a part of the taxing power of the State. See POLICE POWER and TAXATION.

A *bona-fide* social *club* is not held to come within the meaning of the word person in acts prescribing the qualifications required in persons who may be licensed to sell liquors. An incorporated club or a *bona-fide* social club, whose membership is limited and whose property is actually owned by the members so that the public at large are not admissible, is not prohibited from the sale of liquors to its own members; and, generally speaking, such clubs are not subject to the license laws. It is held that the furnishing of liquors to the members of a club, or to their friends at the club, is the same as if this were done at the private house of an individual. The Legislature, however, has the power to control the use and sale of liquors even in incorporated or unincorporated social clubs; and such club may be required to pay a license tax in the same manner as any person licensed to sell liquors; and a sale of liquor by a club to its members in violation of a prohibition or local-option law is as illegal as the sale by a merchant, and the club may be subject to the annulment of its charter in consequence.

Throughout the larger part of the U. S., as well as in the larger part of Canada and the Australian colonies of Great Britain, it is provided by law that the relatives of a person who comes to his death through the use of intoxicating liquor may sue the liquor-seller responsible for the drunkard's condition for damages; and it is also provided that the relatives of any intemperate person may notify the seller of liquor not to supply it to such person, and magistrates also may notify liquor-sellers that drink can not be sold to such a person except under penalty of the law. Some of these laws make the sale of intoxicating liquor to a habitual drunkard after such notification a misdemeanor, and in this case a sale after the notification of the wife of the drunkard or other relative having authority to give the notification is such negligence as enables the relative to maintain an action for damages for injuries to him resulting from such sale. In the statutes of Illinois, where it is provided that all who furnish intoxicating liquors which contribute to the habitual drunkenness of a person are liable for injuries resulting from habitual intoxication, it has been held that a parent had a right to bring action against both a liquor-seller and his bondsman for the death of a minor son resulting from the sale of liquor to him, and also for the loss of his services. In the State of New York, a mother injured in her means of support by the death of her son, caused by intoxication, has been held to have a right of action against the owner of the

premises on which the liquor was sold, the premises having been leased for the sale of the liquor.

In the absence of statutory enactment there is no more legal restriction of the sale of liquor to minors than of that to any other individual. Where there are laws prohibiting the sale of liquor to minors, the vendor is not generally excused for the sale to a minor by his ignorance of the fact that the buyer is a minor. It has been held that where a minor brings a written order from an adult by whom he is employed or sent, the sale is to the adult, but not so where the order is oral; but no single decision can be taken as universally applying to the application of the law.

Although a State in the exercise of its police power may prohibit the sale and even the manufacture of liquors within its territory, it can not interfere with commerce between the States, in violation of Article 2, section 8, of the Constitution of the U. S. (see INTERSTATE COMMERCE); so that, except under authority of Federal statutes, no State can impose a tax or duty on persons engaged in the business of selling liquors within the State, but not having their principal place of business therein. It is also held that, in the absence of Federal statutes providing for such prohibition, no State may prohibit or interfere with the original packages in which the liquor may be sent, it being held that this is in contravention of Article 2, section 8, of the U. S. Constitution, vesting the power of controlling such traffic in the Federal Government. This fact led to the practical nullification of the State laws regulating the purchase and sale of liquor in any individual State; and, in order to remedy this, an act of Congress (known as the Wilson Act) was passed Aug. 8, 1890, which provides that all fermented, distilled, or intoxicating liquors transported into any State for use therein, regardless of whether they are in the original packages or not, shall be subject to the police laws of such State, and this act was held constitutional as being valid exercise of the police powers vested in Congress. In furtherance of the regulation of the sale of liquors, the State of South Carolina by the so-called Dispensary Act undertook to engage in the business of importing liquors for the purpose of profit to the State, and regulating the sale of liquors; but it was held that so much of the act was unconstitutional and void as attempted to interfere with or burden commerce between the citizens of South Carolina and other States, or to prevent the bringing into the State of any liquor in the original package. In its general provisions the act was held to be constitutional, but only so far as its provisions did not conflict with the Interstate Commerce Act.

The decisions affecting the question of what constitutes an *original package* have held that the original package is the casing in which the imported merchandise is kept and handled in the course of transportation, whether a hogshead, bottle, bale, or box. In the case of liquors, the original package is the hogshead, barrel, or bottle in which the liquor is shipped, and each such hogshead, barrel, or bottle constitutes an original package; but if a number of them are fastened or joined together and marked as a whole, or placed together in a box, crating, or the like, such box, crating, etc., with the contents, constitutes the original package. The act of Congress of Aug. 8, 1890 (above mentioned), does not authorize any State to prohibit the importation of liquors in the original package, but subjects the liquor when once delivered in the State to all the laws regulating the use and traffic in the State in question; and the liquor can not be given away or sold by its recipient or by any one else except in accordance with the laws of the State into which it is received.

In England the general subject of licensing the sale of intoxicating liquors is regulated principally by the above-mentioned act of 1872, introduced by Henry Austin Bruce, Home Secretary. This act provides severe penalties for the illicit sale of liquor, and also for drunkenness in any public place or highway, and for permitting drunkenness on licensed premises, or harboring constables upon such premises during their hours of duty. The act fixes the hours of closing, but authorizes the local authorities to grant exemptions from the closing requirements when this is a convenience to many persons engaged in lawful business. A licensed person forfeits his license upon a third conviction for offenses against the act, and is disqualified thereby from receiving another for five years; and the premises upon which he conducted his business can not be licensed again for two years. After the expiration of the five years, his previous conviction is not to be taken into account for the purpose of increasing any penalty. A register of licenses is required to be kept in every district, showing the particulars of all licenses, which registration must be open to the inspection of ratepayers, holders of licenses, and the owners of licensed premises. It provides for the appointment annually by the justices in counties and boroughs of a licensing committee of not less than three members; but borough licenses must be confirmed by the body of justices, who would not have been authorized to grant licenses except for the act. It fixes the annual value of all licensed premises according to their situation.

Penalties are recoverable under the act by summary conviction, subject to an appeal to the quarter sessions; but any justice who has a beneficial interest in the manufacture or sale of intoxicating liquors is disqualified from taking part in the administration of the act. In respect to the times of closing and some other points this act was modified by the act of 1874, which mitigated the character of many of the penalties imposed.

The first general scheme of excise taxes on liquor was introduced in 1784 by Pitt, and this was embodied in the Consolidation Act of 1826, which constitutes the basis of the present law. The duty on malt was abolished in 1880, but brewers and distillers are still required to take out an excise license, and to pay duty on their manufacture. Wholesale and retail dealers in beers, spirits, or wine are also required to take out a license. With regard to the civil damages to the wife or relatives of habitual drunkards, the laws of Great Britain are not as far in advance as those of the U. S.

In the U. S. in 1895 and subsequently, acts have been passed in a number of States, including New Hampshire, Vermont, New York, New Jersey, South Carolina, Tennessee, and Indiana, providing for the instruction of children in the public schools in the subject of the physiological effects of alcohol and intoxicants, and statutes have been passed prohibiting the employment of women where liquor is sold in New York, Washington, and Louisiana, and some of the other States. These acts are held to be constitutional.

Laws prohibiting the sale of liquors within a specified number of feet of schoolhouses or charitable institutions or churches are general in most parts of all the States, and in the State of New York police officers are forbidden to be interested in the manufacture or sale of liquors.

F. STURGES ALLEN.

Literature of Education: The growth in importance of any human interest is well measured by the literature by which it is represented. The nineteenth century has witnessed a vast increase in the quantity and quality of pedagogical literature, an increase that has been especially noticeable in the last quarter of the century. It has not been confined to any one country, nor to any one branch of the subject. Some works of certain great educators previous to this time may be regarded as educational classics. No two people would agree as to what constitutes the educational classics of the world, but the following list will probably meet with as wide acceptance as any: Plato's *Republic*, Aristotle's *Politics*, Plutarch's *Morals*, Quintilian's *Institutes*, the *Didactica Magna* of Comenius, Richter's *Levana*, Pestalozzi's *How Gertrude Teaches her Children*, Froebel's *Education of Man*, Rosenkranz's *Philosophy of Education*, Rabelais's *Gargantua*, Montaigne's *Essays*, Rousseau's *Émile*, Mulcaster's *Positions*, Ascham's *Schoolmaster*, Locke's *Thoughts on Education*, and Spencer's *Education*.

In Germany the production of pedagogical literature is enormous. Among the indispensable annuals issued is *Minerva*, the year-book of the learned world, which contains accounts of the world's universities, libraries, and museums. A recent work of great importance is Baumeister's *Handbuch der Erziehungs- und Unterrichtslehre für höhere Schulen*. Another monumental work is Schmid's *Geschichte der Erziehung*. Every possible phase and aspect of education is treated in extensive volumes, exhibiting wide research, or in monographs and fugitive brochures. Periodical literature also covers almost every field. Among the more prominent journals devoted to special fields are *Deutsche Zeitschrift für Ausländisches Unterrichtswesen*, which gives information in regard to current educational activity in all civilized countries; *Zeitschrift für Schulgesundheitspflege*, which is the one periodical in the world especially devoted to the subject of school hygiene; *Lehrproben und Lehrgänge*; *Centralblatt für die Gesammte Unterrichts-Verwaltung in Preussen*, the official organ of the

Ministry of Education; *Zeitschrift für Philosophie und Pädagogik*; *Das Humanistische Gymnasium*; *Pädagogische Studien*; *Zeitschrift für das Gymnasialwesen*; *Zeitschrift für die Östereichischen Gymnasien.* Several standard works of reference are published. Of the cyclopædias the most recent, and one that is indispensable for scientific students of education, is Rein's *Encyklopädisches Handbuch der Pädagogik.* Euler's *Handbuch des gesammten Turnwesens* is an encyclopædia of everything relating to physical culture and gymnastics. German literature on school hygiene is particularly valuable. Eulenberg and Bach's *Schulgesundsheitlehre* is one of the most valuable works on the subject, and is encyclopædic in its character.

In no way is the activity and interest now taken in France in educational matters better shown than by the pedagogical literature. The great *Dictionnaire de Pédagogie* by Buisson is, taken all in all, the most comprehensive work of the kind ever published. It was begun and completed since 1878. The *Statistics of Primary Education in France*, probably the most remarkable series of educational statistics in the history of education, began with the issue of 1876–77, and has been printed every five years since. The *Recueil des Monographes Pédagogiques* was issued in six volumes in 1889, and is a mine of gold for French primary education. The *Revue Internationale de l'Enseignement*, a monthly journal begun in 1881, is one of the best existing educational journals in the world.

England is not so rich in pedagogical literature, though recently there has been quite a development in that direction. The *Educational Review*, published in London, and edited by William K. Hill, has the highest literary and scientific standard of any periodical. The *Journal of Education* is one of the best educational newspapers in the world. With the exception of the *Educational Review*, the English school periodicals are very largely newspapers. The Government has recently established a department of special reports on educational subjects, under the direction of M. E. Sadler. Three volumes of these reports have been issued up to 1898. They contain much valuable material, not only on English schools, but on foreign schools, and on many special branches of educational work.

The U. S. has much that is creditable in the line of educational literature. Barnard's *American Journal of Education* takes rank as the foremost work of its kind in any language. When it is considered that the publication of it was begun in the early part of the century, and carried on under peculiar difficulties, and at a pecuniary loss to the editor, the greatness of the work becomes still more admirable. It remains to-day a great storehouse for educational history. It contains not only original articles, but also translations of many of the most important works of European scholars. The ten volumes of Horace Mann's *Common School Journal* are to-day among the choicest treasures of the pedagogical library that is so fortunate as to possess them. The series of St. Louis school reports published while W. T. Harris was superintendent at St. Louis may also be counted among educational classics. The annual reports of the U. S. Commissioner of Education, with their wealth of information on almost every phase of educational work, form a storehouse whose riches are all too little appreciated by the teaching fraternity of the country. The National Educational Association publishes an annual report of its meetings, in which are printed all the papers and addresses presented. These volumes now constitute a library in themselves. Special books on education have, within the last few years, appeared in large numbers. There are three important series: The *International Education Series*, edited by W. T. Harris, which in 1899 has reached 44 volumes; the *Great Educators Series*, edited by Nicholas Murray Butler, of which about 10 volumes have been published; and *Heath's Pedagogical Library*, which now numbers some 25 volumes. The several works in these series are of various degrees of importance; many of them are reprints of educational classics, and most of them have a high value. The *Cyclopædia of Education*, published in 1876, edited by Henry Kiddle and Alexander J. Schem, though limited in its scope and now out of date, is still valuable as a book of reference. Educational journalism has had an extensive development. Nearly every State has its State school journal, many of which are useful publications. There are several weekly papers published, mainly for primary and grammar school teachers, devoted largely to news and methods. Among the papers devoted to special fields are the *Kindergarten Magazine*, the *Kindergarten Monthly*, the *Child-Study Monthly*, the *Quarterly Transactions of the Illinois Society for Child-Study*, *Home and School*, and the *Northwestern Monthly.* Secondary education is represented by the *School Review*, scientific pedagogy by the *Pedagogical Seminary* and the *Year-Book of the National Herbart Society*, and the larger aspects of all educational fields are ably considered by the *Educational Review.* As yet the more scientific educational journals receive rather meager support, but that all of them have been founded within the last ten years, and have received sufficient support to continue their existence, is evidence of a growing demand for a better class of educational literature, indicating a growth in professional spirit and intellectual ideals among the teachers of the country.

C. H. Thurber.

Location: of land, the selection and designation of land by a person who has legal authority to select and designate. The term is specifically applied to the act of surveyors who are authorized by public authority to lay out lands by particular warrant. The act of selecting the land mentioned in the warrant and surveying it is called its location. The term is mostly used in the Western States of the U. S., where it also has the specific sense, in the mining law, of a piece or plot of land appropriated according to certain established rules, such as fixing in a conspicuous place a notice stating the fact that the land has been taken or "located," and setting forth the name of the locator, and appropriately describing the extent and boundaries of the plot of land according to custom.

In the Scotch law the term is applied to a contract for the hire of a movable object, or a contract by which a person hires out his work or services, the person who lets out his work or the use of the property being called the *lessor* or *locator*, and the hirer the *conductor* or *lessee.* See Bailments.

F. Sturges Allen.

Lockout: literally, in the general sense of the word, the locking out of any person from an inclosed place; specifically, in law, the refusal of an employer to continue or receive in his employ a body of men as such, usually intended as a means of coercing them into a certain course of conduct. A lockout is the natural accompaniment or complement to a strike, and is the means employed by the capitalist, or employer of labor, to oppose and meet the influences and coercion brought to bear upon him by the striking of organized labor, whether in his employ or so as to affect his interests. The term is sometimes applied to the act of employees who, by assembling in large bodies or by threats or other coercion, prevent other employees from access to or departure from their place of employment; but this is not the usual sense of the word.

The Rights of an Employer as to Lockouts.—As the law will not compel any man to continue in the employment of any private individual against his will, so neither will it compel any man to continue to employ another against his will, although it may award damages by way of breach of contract should this arise. Every individual has the right of absolute control over his own property so far as it does not conflict with the equal rights of others in the same community; and the conduct of others, whether in his employ or not, who attempt to control or to hinder or to annoy or interfere with the individual in the conduct and management of his property or business is unlawful, and furnishes a sufficient legal reason for the employer to discharge from his employ any parties concerned in the combination, notwithstanding that their period of service as per contract may not have expired. Participation in a combination to effect such a purpose unlawfully constitutes a criminal conspiracy for which the employer not only has his remedy at the criminal law, but also a civil remedy in damages. It follows, therefore, that every employer has the right to choose his own employees, and that he has the right to refuse to employ members of any confederation or combination which he deems it undesirable to have in his employ, and to refuse to employ workmen for any other reason, such as their unwillingness to work overtime when desired, their refusal to employ more or less than the number of apprentices desired by him, their refusal to work with members of other organizations or with parties not belonging to any organization, etc.

Right of Employers to Combine in Lockouts.—So far as concerns the act of a single employer in establishing or giving up a lockout, or in the refusal to employ any one person or class of persons for any reason whatever, the law is comparatively simple; but the laws relating to the right

of employers to combine in a refusal to employ men because they belong to certain organizations or for other reasons, and their liabilities when so combining, are much more complicated, and they are largely analogous to the law governing strikes by employees. Employers have the same right to combine in order to aid and assist each other—whether for their own improvement or the improvement of their business methods. or the determination of the rate of wages they will pay or the elass of employees they will hire—that employees or workmen have to combine for similar purposes. In general, they have the right to combine or associate for any lawful purpose; but where their combination or confederation is so made as to cause injury or oppression to others in their legal rights, and compel them by force or violence or intimidation not to do what they have a right to do, or to do what they are under no legal obligation to do, they are guilty of a criminal conspiracy in the same manner as workmen guilty of eonspiracy in a strike.

The most frequent instance in which this occurs is in the blacklisting of employees by employers—that is, the placing of the names of undesirable employees in a list and furnishing the same to other employers who are not in a position which entitles them to such information. In some States combinations of employers for this and other purposes have been made criminal by statute.

In some instances combinations of employers for purposes which are not criminal are considered by law to be in restraint of trade, and contracts entered into between the parties to enforce them will be deelared void. Thus in England a bond was made between eighteen manufacturers, with a penalty of £500, whereby the manufacturers agreed to carry on their work for twelve months in regard to the amount of wages, the time of engagement of workpeople, the hours of work, the suspending of work, and general discipline of the works, in conformity with the resolutions of a majority of the obligors present at any meeting to be convened, for the purpose of opposing and overcoming the influence of combinations of workmen which they considered injurious because they were supposed to hinder workmen from taking employment for fear of social perseeution or injury to their property, or other reasons; but in an action brought against one of the obligors it was held that the bond was void as in restraint of trade, and the obligor under no obligation by reason of having signed it.

In the U. S. such combinations may be affected by the provisions of the Interstate Commerce Act, which declares certain contracts, combinations, or eonspiracies to be in restraint of trade and illegal when there is a conspiracy to engross or monopolize the market. A eombination intended only to drive certain competitors out of the field of eompetition by violenee, annoyance, or otherwise is not included under the purpose of this act. See INTERSTATE COMMERCE. See also Cooley on *Torts*; Cogley on *Strikes and Lockouts*; the Interstate Commerce Act; and the various State digests.

F. STURGES ALLEN.

Lomax, LINDSAY LUNSFORD: soldier; b. in Newport, R. I., Nov. 4, 1835; after graduation at the Military Academy was assigned to the Seeond Cavalry Regiment. He resigned from the U. S. army and became a eaptain in the Virginia State forces at the time of secession; on Apr. 29, 1861, entered the Confederate army as captain and assistant adjutant-general to Gen. Joseph E. Johnston; was promoted major and assigned to duty with Gen. B. McCulloch, and in July, 1862, was made lieutenant-colonel and inspector-general under Gen. Earl Van Dorn. He beeame colonel of the Eleventh Virginia Cavalry in Feb., 1863; brigadier-general July, 1863; major-general Aug. 10, 1864. He took command of a brigade of cavalry under Gen. Fitzhugh Lee in Jan., 1864, of a division of cavalry under Gen. Early in Aug., 1864, of a eavalry division in the Army of the Valley District in Oct., 1864, and was assigned to the command of the district. After the surrender of Richmond he went to Lynchburg to intercept Stoneman, and surrendered with Gen. Joseph E. Johnston at Greensboro, N. C. Later he was for a long time employed in the War Records Office, Washington, D. C.

Lombard, LOUIS: violinist and conductor; b. in France, Dec. 15, 1861; studied in the Marseilles conservatory; went to the U. S. in 1876; returned to Paris for further study in 1878; went to the U. S. again in 1879 and traveled as a violin soloist and conductor; founded the Utica Conservatory of Music in 1890 and has since remained at its head. He has produced some worthy works, including the opera *Bounced*, to a text supplied by Julian Magnus and Henry C. Bunner.

D. E. HERVEY.

Lome, ENRIQUE DUPUY, de: diplomatist; b. in Valencia, Spain, Aug. 23, 1851; was an *attaché* of the Spanish department of foreign affairs at Madrid at the age of eighteen, soon afterward graduating from the law department of the University of Madrid; became third secretary to the legation in Japan in 1873, was transferred to Brussels in 1875, and was sent to Montevideo in 1877; in 1878, in a book of travel ealled *Madrid à Madrid*, reflected severely upon the U. S. and American women; was diplomatic representative to the Argentine Republic in 1880, later being transferred to Paris as second seeretary of legation; was sent to Washington as first seeretary in 1882, afterward serving in Berlin and Madrid; represented his country at the international sugar conference in London in 1887; became minister resident at Montevideo in 1888; was placed at the head of the commereial section of the Spanish foreign office in 1891; was elected to the Cortes in 1892, and became commissioner-general for the revision of commercial treaties the same year; was commissioner-general to the Columbian Exposition at Chicago in 1893, in which year he was appointed minister to the U. S., continuing to hold his post under the ministry of Sagasta after the assassination of Canovas, and favoring Canovas's schemes of autonomy for Cuba; on aceount of disrespectful criticism of President McKinley, in a letter to Don José Canalegas, proprietor of the Madrid *Heraldo*, was compelled to resign his post in 1898.

Long, JOHN DAVIS: statesman; b. in Buckfield, Me., Oct. 27, 1838; graduated at Harvard College in 1857. After teaching school for two years he began the study of law, and was admitted to the bar in 1861. He made his home in Hingham, Mass., and was eleeted a member of the State House of Representatives of 1875. For the next three years he was Speaker of the House. In 1878 he became Lieutenant-Governor, and was Governor during the following three years. He was eleeted in 1882 as a Representative in the Forty-eighth Congress, and was returned for the two sueeeeding Congresses. In Mar., 1897, he was appointed Seeretary of the Navy. He has published a translation of the *Æneid of Vergil* (1879).

Loofs, (ARMIN) FRIEDRICH, D. D.: Lutheran German theologian; b. in Hildesheim, Hanover, Germany, June 19, 1858; studied at Leipzig, Tübingen, and Göttingen; became tutor in church history at Leipzig 1882, professor extraordinary there 1886; the same at Halle 1887; Professor Ordinary of Church History 1888. His separate publications inelude *Leontius von Byzanz und die gleichnamigen Schriftstellen der griechischen Kirche* (Leipzig, 1887); *Leitfaden zum Studium der Dogmengeschichte* (Halle, 1889; 3d ed. 1893); *Predigten* (1892); *Studien über die dem Johannes von Damaskus zugeschriebenen Parallelen* (1892); *Das Apostolicum in drei Predigten ausgelegt* (Halle, 1895); *Eustathius von Sebaste und die Chronologie des Basilius-Briefe: Eine patristische Studie* (1898).

S. M. J.

Loomis, SILAS LAURENCE: scientist; b. in Coventry, Conn., May 22, 1822; after teaching mathematies and natural science at Holliston Academy, Mass., graduated at Wesleyan University in 1844; became prineipal of Western Academy, Washington, D. C., in 1855, graduated from the medical department of Georgetown College in 1856, and was Professor of Physiology there 1859–60; meantime aeted as astronomer to the U. S. Coast Survey, and was instruetor in mathematies to eruising naval cadets; was Professor of Chemistry and Toxicology in Georgetown College, surgeon on Gen. McClellan's staff 1862–63, and assistant surgeon on the steamer State of Maine and in various hospitals 1863–65; took the chair of Practiee of Medicine in Howard University in 1867, and was dean and Professor of Chemistry and Toxieology there until 1872, soon afterward returning to the practiee of his profession; invented a process for making a textile fabric from palmetto, and another for utilizing the ores of chromium; improved varions instruments of precision; was president of the Washington Seientific Association in 1862, and of the American Union Aeademy of Literature, Seience, and Art in 1872. Among his principal publications are *Normal Arithmetic* (1859); *Analytical Arithmetic* (1860); and *Key to the Normal Course* (1867).

Lord, JOHN, LL. D.: lecturer and author; b. in Berwick, Me., Sept. 10, 1812; graduated at Dartmouth College in 1833, and at Andover Theological Seminary in 1837; was

agent of the American Peace Society 1837–39; preached for a time in New Marlborough and in Stockbridge, Mass., but was never ordained; and in 1840 devoted himself to historical study and lecturing. He was in Europe 1843–46, and delivered lectures on the Middle Ages in the principal cities of England. In 1855 he settled in Stamford, Conn. The University of New York gave him the degree of LL. D. in 1864. He was lecturer on history at Dartmouth 1866–76. His lectures were published in five volumes, beginning in 1883, under the title *Beacon-lights of History*. He wrote also *Modern History for Schools* (Philadelphia, 1850); *The Old Roman World* (1867); and *Ancient States and Empires* (1869). D. in Stamford, Conn., Dec. 15, 1894.

Lorenz, Julius: conductor; b. in Hanover, Germany, Oct. 1, 1862; entered the Leipzig conservatory in 1880, where he won several first prizes, and during his student period several of his compositions were performed at the Gewandhaus. In Oct., 1884, he was appointed musical director of the singing academy in Golgan, Silesia. In July, 1895, he was called by the New York Arion Society to succeed Frank van der Stucken. He accepted the call and arrived in New York on Sept. 2. He also took charge of the Newark (N. J.) Arion Society, which had also been directed by Mr. van der Stucken. He has composed a few piano pieces and some vocal music. D. E. Hervey.

Lorimer, James: lawyer and jurist; b. in Aberdalgie, Perthshire, Scotland, Nov. 4, 1818; educated at Perth grammar school, at Edinburgh University, and spent three years (1840–42) in study at the Academy of Geneva and University of Berlin; returned to Edinburgh and took up the study of law, and was called to the bar in 1845; took up the practice of law, but, meeting with little success, devoted himself to a study of the theory of law and to writing for the reviews. He was appointed Professor of Public Law in the University of Edinburgh in 1862, which position he held until his death, in Edinburgh, Feb. 13, 1890. The most important of his publications are the *Institutes of Law* and the *Institutes of the Law of Nations*—the first treating of the law of nature and of positive law in general, and of the sources of the two and their relations to each other, that is, of the universal principles of jurisprudence; the second treating of the law of nature as it exists in different political communities, and setting forth international law as derived from the natural law. Together they exhibit a comprehensive view of jurisprudence and a very philosophical and minute examination of the Scotch law. He was opposed to the general ethical and juridical schools of Bentham and Austin, tracing law back, not to enactment, but to the laws of nature, or of God, whom he postulates to be the author of all existence, and from whom he derives all of the true rules of society, politics, and history. His theory of jurisprudence, however, is not based on *a priori* knowledge of divine nature or special revelation, but on what he believed to be rationally and inductively established. He was an active advocate of political and educational reform, one of the founders and supporters of the Institute of International Law, and a frequent contributor to the *Edinburgh Review*, the *North British Review*, the *Journal of Agriculture*, and the *Journal of Jurisprudence*. He is the most prominent exponent of the philosophy of law in Scotland in the nineteenth century. His works include *Handbook of the Law of Scotland* (6th ed. Edinburgh, 1894); *Institutes of Law: a Treatise on the Principles of Jurisprudence as determined by Nature* (2d ed. Edinburgh, 1880); *Institutes of the Law of Nations* (Edinburgh, 1883–84).—His son, John Henry Lorimer, b. in Edinburgh in 1856, is known as a painter. He was educated at the Edinburgh Academy and the University of Edinburgh, and at the Royal Scottish Academy, and made his first exhibit at the age of nineteen years. His picture entitled *Benedicite* was purchased by the French Government in 1894, and in the Luxembourg Gallery are that entitled *Children Saying Grace* and a portrait of Col. Anstruther Thomson, also purchased by the French Government. He has been a constant exhibitor, and received many second and third class medals.

F. Sturges Allen.

Lothrop, Harriett Mulford (*Stone*): author (*Margaret Sidney*); b. in New Haven, Conn., June 22, 1844; received academic education. Among her publications are *So as by Fire* (1881); *Five Little Peppers, and how they Grew*, a juvenile story (1882); *The Pettibone Name*, a novel of New England life (1883); *Ballad of the Lost Hare* (1884); *The Golden West* (1885); *The Minute-Man* (1886); *Two Modern Little Princes* (1887); *Dilly and the Captain* (1887).

Louisa: Queen of Prussia; b. in Hanover, Mar. 10, 1776; was a princess of the ducal house of Mecklenburg-Strelitz. In 1793 she married the Crown Prince of Prussia, who ascended the throne in 1797 as Frederick William III. The grace, beauty, and nobility of character of the young queen won the general affection of the Prussian people. This esteem was deepened by the circumstances of the unfortunate war with France. After the fatal defeat at Jena in 1806, the queen accompanied the king to Königsberg, and bore with dignity the humiliations attending the country's overthrow. In the negotiations of the Treaty of Tilsit in 1807 she endeavored by a personal interview with Napoleon to mitigate the peace conditions, but without effect. Napoleon's insulting conduct toward the queen only increased the regard in which she was held by her subjects. She took part in state matters thereafter, and supported Stein and the other administrative reformers. She died near Neustrelitz, July 19, 1810. Her younger son was the famous Emperor William I. Edmund K. Alden.

Luckey, George W. A., A. B.: educator; b. near Decatur, Ind., in 1855; teacher, county superintendent, city superintendent, and institute lecturer in Indiana 1873–87; supervising principal, Ontario, Cal., 1889–92; non-resident student, University of the City of New York, 1889–92; student in psychology and pedagogy, Leland Stanford Junior University, 1892–94; A. B., same, 1894; student of biology, Hopkins Seaside Laboratory, Pacific Grove, Cal., summers of 1893 and 1894; fellow in psychology, Clark University, 1894–95; called to organize department of pedagogy in the University of Nebraska as assistant professor in 1895, and became Professor of Pedagogy there in 1896. He is editor of the child-study department of the *Northwestern Monthly*; author of *Observations on the Indirect Color Range of Children and Adults* and *Some Recent Studies on Pain* (both in *American Journal of Psychology*), and of contributions to the *Proceedings of the National Educational Association*, *Child-study Monthly*, and *Northwestern Monthly*.

Ludlow, William: soldier; b. in Oakdale, N. Y., Nov. 27, 1843; graduated at the Military Academy in 1864; was appointed chief engineer of the Twentieth Army-corps under Gen. Joseph Hooker; took part in the battles of Peach Tree Creek, Atlanta, and Allatoona Heights; served on Gen. Slocum's staff as chief engineer of the left wing of Sherman's army, participating in all important operations until the close of the war; was breveted captain, major, and lieutenant-colonel for gallant conduct; was stationed at Jefferson barracks, Mo., in 1865; was assistant to Gen. Q. A. Gillmore, in charge of fortifications and harbor improvements on Staten Island and the South Atlantic coast 1868–73; accompanied the Black Hills and Yellowstone expeditions as engineer officer 1873–76; had charge of river and harbor improvements and fortifications 1876–82, and was engineer secretary of the lighthouse board in 1882; served as chief engineer of the water department of Philadelphia 1883–86, and afterward as engineer commissioner of the District of Columbia and on various duties until the outbreak of the Spanish-American war, when he was made brigadier-general of volunteers, afterward being promoted to major-general for conspicuous services at Santiago; was assigned to duty in Washington on his return from Cuba, and was appointed military governor of Havana in 1898.

Lukens, Herman T., Ph. D.: educator; b. in Philadelphia, Pa., Jan. 29, 1865; A. B., University of Pennsylvania, 1885, and A. M. 1888; studied in Europe, 1887, 1888–91, 1897–98, at Universities of Berlin, Halle, Leipzig, Paris, and Jena; Ph. D., Jena, 1891; teacher of biology, northwest division high school, Chicago, 1891–94; fellow in psychology, Clark University, 1894–95, and docent in pedagogy, 1895; lecturer on education, Bryn Mawr College, 1896–97; head training teacher, State Normal School, California, Pa., 1898–99. Author of *The Connection between Thought and Memory* (1895) and of numerous contributions to educational periodicals.

Luminescence: the emission of light at temperatures below that of ordinary incandescence, or the emission of light at any temperature which is not wholly due to the effect of that temperature alone. Luminescence embraces a variety of phenomena which have been known and described under the names of *fluorescence*, *phosphorescence*, and so forth. The name is due to Eilhard Wiedemann, who

recognized the kinship of these phenomena and grouped them together under a single head. Wiedemann distinguishes the following eight kinds of luminescence, and classifies the phenomena according to the nature of the stimulus which causes the body to glow:

1. *Chemie-luminescence.*—This name is given to the production of light as the result of chemical reactions such as the slow oxidation or decomposition of organic materials at ordinary temperatures. The shining of phosphorus which is slowly oxidized in moist air is an example; likewise the light emitted by decaying wood and decaying fish. The light of the firefly and the glowworm, and that of the various marine animals to which the so-called phosphorescence of the sea is due, are probably cases of chemie-luminescence.

There are many obscure chemical reactions which appear to be the ultimate cause of luminescence, even when this is directly excited or set up by other causes. The action of light, or of the kathode rays, or of moderate heating, may start these chemical processes going, and these once started are capable of maintaining sometimes for a very long time the emission of light. All luminescence may indeed be said to have its origin either in chemical or in purely physical changes. It is not always possible to distinguish between these two classes, but a number of criteria have been proposed by means of which chemical luminescence is to be distinguished. Whenever a body glows for a long time after the exciting cause has ceased it may be put down to chemie-luminescence. The shining of self-luminous paints and the green glow of glass under the action of strong kathode rays have both been ascribed to chemie-luminescence on account of the long duration of the effect. In some cases the existence of chemical reactions can be detected by the changes of color which the body undergoes.

2. *Photo-luminescence* (two types).—(*a*) *Fluorescence.*—The emission of light by a body in consequence of the impact of other light-waves upon it, in so far as it is transient, lasting only during the period of illumination, is called *fluorescence.* Many substances show this property. Fluor-spar, the first substance in which it was noted, and from which the name comes, is a good example. Uranium glass, solutions of sulphate of quinine, the double cyanides of platinum and of various metals, such as potassium, magnesium, barium, etc., which have come into prominence recently on account of their availability for the making of X-ray screens, afford familiar examples. Many products of distillation of coal-tar, especially eosin, likewise crude and refined petroleum, show the same phenomenon in varying degrees. A decoction made by soaking the bark and leaves of the horse-chestnut in water is very powerfully fluorescent.

If the light given off by fluorescent bodies were identical with the impinging light which forms the stimulus, it would be difficult indeed to distinguish between fluorescence and light reflected from the surface of the body in question. Photo-luminescent bodies, however, both as regards fluorescence (the effect produced during the time of exposure) and as regards phosphorescence (the after-effect), emit rays differing in color (i. e. wave-length) from those which are the exciting cause of the luminescence. Stokes pointed out that the emitted color of fluorescent bodies is of wave-lengths longer than those to which the body is exposed. Becquerel has shown Stokes's law to hold true for phosphorescence of many solid bodies, and Wiedemann and Schmidt have so greatly extended the list of substances examined that it is safe to say that for solids this law is universally true.

Many bodies are most strongly fluorescent when placed in the path of the ultra-violet rays, which themselves are incapable of affecting the retina. Thus uranium glass, fluor-spar, and the solution of horse-chestnut bark shine most brilliantly when placed just beyond the visible limit at the violet end of the spectrum. Quinine in solution, on the other hand, possesses the power of converting the long waves of the infra-red into wave-lengths which are visible to the eye. It was by the use of an eyepiece containing such a solution that Becquerel was able to explore the infra-red spectrum, and to discover very many dark lines corresponding to the Fraunhofer lines of the visible spectrum, and even to determine their wave-lengths. This and a few other aqueous solutions are exceptions to Stokes's law.

The phenomena of fluorescence were very thoroughly studied by Becquerel,* who devotes a considerable portion of his treatise on light to this subject. The reader is also referred to the article FLUORESCENCE, where many references will be found.

(*b*) *Phosphorescence.*—In many cases the exciting effect of light upon luminous bodies persists for a greater or less time after the stimulus has been removed. Bodies which continue to shine after excitation has ceased are said to be phosphorescent. Diamonds sometimes possess this property, but it is chiefly notable in the case of sulphides of the alkaline earths. Of these the sulphite of calcium, which forms the basis of so-called luminous paint, exhibits phosphorescence which lasts for so long a period that the excitation received from sunlight during the day serves to cause the body to glow throughout the entire night. How long this after-effect persists in such cases has not been definitely determined. The writer recalls a case in which a clock with luminescent face—namely, coated with self-luminous paint—was placed in a photographic dark room. In this position it continued for many months to give off light enough to fog a sensitive plate.

The instrument used for the study of phosphorescence is called a *phosphoroscope.* The essential features of the original form given to it by Becquerel are shown in Fig. 1. It consists of two revolving disks, between which the body to be observed is placed. Through an open sector in one of these, the width of which can be varied, the substance is illuminated. Through a corresponding opening in the second disk the observations are made. By shifting the position of these disks with reference to each other the second opening permits of observation at any desired time-interval after the exciting cause has ceased. The duration of excitation and the time between excitation and observation are also subject to control and may be changed at will.

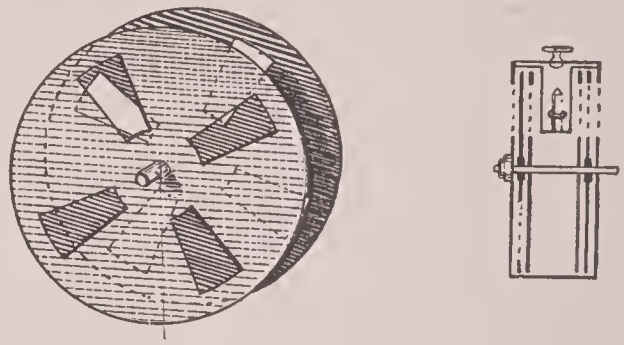

FIG. 1.—Becquerel's phosphoroscope.

E. Wiedemann (1888) used a phosphoroscope based upon the same principles. F. E. Kester (1899), in the course of his spectro-photometric studies of phosphorescent surfaces, employed a cylinder, the face of which was coated with the luminescent material. This cylinder (*l*, Fig. 2) was mounted upon a vertical axis and driven by means of an electric motor. The source of light—an arc lamp (*a*)—illuminated the surface of the cylinder through an interposed slit (*s*), and the observations were made at a point 180° distant, as shown in the figure. By varying the width of the slit and the rate of rotation it was possible to secure the desired range in the time of exposure and in the subsequent interval of darkness before observation.

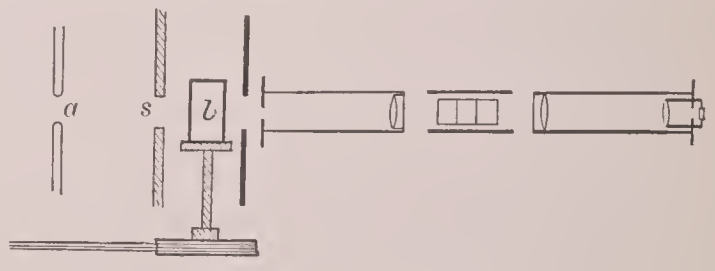

FIG. 2.—Kester's apparatus.

Phosphorescence continues to show itself at quite low temperatures. Dewar* found that calcium sulphite ceased to be luminescent when cooled to — 80°, but that if it was illuminated at that temperature it would show the luminescent glow afterward when warmed to ordinary temperatures. Very many substances, even those which are weakly phosphorescent at ordinary temperatures, are, on the other hand, strongly so when cooled in liquid air to — 200° C.

* Becquerel, *La Lumière*, tome i., livre vi.

* Dewar, *Chemical News*, vol. lxx., p. 259.

3. *Thermo-luminescence.*—This term is applied to substances which when heated are found to glow, although the temperature reached is below that of ordinary incandescence. This property was first noticed in green fluor-spar, the crystals of which shine in the dark when warmed. This property is possessed by many crystalline substances, and it has been shown by Wiedemann that certain salts and mixtures become thermo-luminescent after exposure to the action of the kathode rays. The most important of these are (1) the sulphides of calcium, barium, strontium, etc., which maintain the property for a very long time—certainly for several months; (2) sulphide of zinc, a substance which had been shown by Becquerel to be slightly thermo-luminescent under ordinary conditions, but which becomes increasingly so when previously exposed to kathodic action; (3) the haloid salts of the sodium group, which take on brilliant coloring under the action of the kathode rays, and when subsequently heated become strongly luminescent. The color of the emitted light differs from that which these materials show in the phosphoroscope.

An interesting case of thermo-luminescence is that of calcium sulphide, already described, which ceases to be photo-luminescent at low temperatures, but which after being subjected to light at these temperatures and restored to temperatures above the freezing-point of water emits light. In this variety of luminescence heating is a process which unlocks or sets free energy, capable of producing luminescence, that has been stored in the body by previous action.

4. *Tribo-luminescence* (luminescence by friction).—This property, which is particularly prominent in certain diamonds, is found likewise in sugar, in quartz, and in a variety of organic substances. Flashes of light noticed in the dark when quartz crystals are rubbed together come under this head; likewise the glowing of loaf sugar when lumps are broken in a perfectly dark room or when the crystals are ground in a mortar. The haloid salts, which after exposure to kathode rays become thermo-luminescent, likewise glow brilliantly when crushed. We have here another instance of a primary and secondary action necessary to the production of the light. Kathode rays store energy within the substance, probably by bringing about certain chemical changes, and this energy is subsequently set free by friction.

5. *Lyo-luminescence* (luminescence by solution).—Certain salts, when thrown into water in a beaker and shaken, give off light in the process of solution. The haloid salts mentioned in the previous paragraph (i. e. NaCl, KCl, etc.) which have been under the action of the kathode rays show this effect in a striking manner.

6. *Crystallo-luminescence.*—This name is given to emission of light shown by certain substances during the process of crystallization. Arsenious acid is the best known example.

7. *X-luminescence* (luminescence under the action of the Röntgen rays).—Many substances show luminescence when placed in the path of the X-rays. The most notable examples are those substances which are used in the preparation of the screens for fluoroscopes—i. e. platino-cyanide of potassium, platino-cyanide of barium, calcium tungstate, etc. See X-Rays, in the Appendix.

8. *Kathodo-luminescence* (luminescence under the action of the kathode rays).—The number of substances which emit light when subjected to the kathode rays is very large. Some of the most remarkable effects are obtained with the following materials:* Lead sulphate, violet; zinc sulphate, white; zinc sulphide, white; cadmium sulphate, yellow; calcium sulphate + manganese sulphate, green; magnesium sulphate + manganese sulphate, red; zinc sulphate + manganese sulphate, red; quinine (bisulphate), dark blue; anthracene, green. For the methods of producing kathode rays and of exciting kathodo-luminescence, see Kathode Rays, in the Appendix.

Substances which show strong kathodo-luminescence exhibit, as a rule, photo-luminescenee also. Those that are faintly luminescent or non-luminescent under the action of the kathode rays do not respond to the action of light. The colors produced by light-rays are in nearly every case the same as those of kathodo-luminescence.

Spectra of Luminescent Bodies.—The light emitted by fluorescent and phosphorescent surfaces shows a continuous spectrum consisting of one or more bright bands. The usual case is that of a single broad band, but Becquerel, who has reproduced in colors many such spectra in his *Treatise on Light*,* has depicted eight narrow bands in the spectrum of luminescent uranium nitrate.

For the study of the spectra in kathodo-luminescence Wiedemann exposed the substance in the form of a pastile (F, Fig. 3) to the action of kathode rays, from K, in a vacuum tube. He found the spectrum, as in photo-luminescence, to be a continuous band, usually of considerable width.

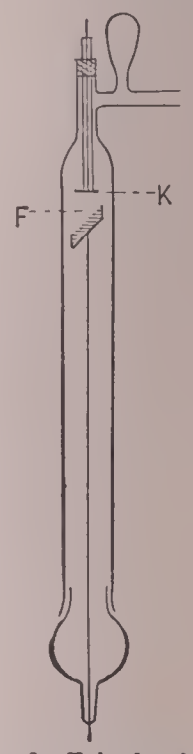

Fig. 3.—Tube for the study of luminescent bodies.

Luminescence of Incandescent Bodies.—Although luminescence shows itself chiefly at ordinary temperatures, and nearly all the existing studies of it have been made below the red heat, there are many cases in which the light emitted by incandescent bodies appears to be due in part to other causes besides temperature. Substances in the flame of the blowpipe, for instance, shine with characteristic colors altogether different from the glow of carbon at the same temperature, doubtless because they are thermo-luminescent. The extraordinary whiteness of the magnesium flame, which surpasses all other artificial sources of light in brilliancy, is probably due to luminescence of the newly formed magnesium oxide which is the product of the chemical reactions within the flame. W. H. Pickering† estimated the light, assuming it to be due to ordinary incandescence, to be that corresponding to a temperature of 4,900° C. Rogers,‡ however, has shown the actual temperature of the flame to be lower than that of the ordinary air-blast lamp.

The glowing surface of the lime-light affords another example of luminescence at high temperatures. It is well known that the lime cylinders used in this source of light are much brighter when first subjected to the oxyhydrogen flame, so that to get the best results the cylinder must be turned every few minutes in order to bring a fresh portion of the surface into the flame. The decadence of the lime-light is shown graphically in Fig. 4, which is drawn from measurements made by Miss Mary L. Crehore§ (Mrs. Bedell). The ordinates of the curves are intensities, abscissas are times, in minutes. Readings were made in three parts of the spectrum, the red (wave-length 0·662μ), green (wave-

length 0·535μ), and violet (wave-length 0·418μ). It will be seen that the brightness fell off in each case, at first rapidly, then more and more slowly, until after half an hour the light from the cylinder was less than one-fifth of that originally emitted. Cylinders of magnesium oxide and of zircon showed a similar but less marked decadence.

The behavior of zinc oxide is even more strongly suggestive of luminescence at high temperatures. Nichols and Snow,* who compared the light given off by this substance with that from platinum at the same temperatures at various stages of incandescence, found that below 700° C. it was a poorer radiator than that metal. The spectrum of the zinc oxide was the weaker throughout. At 1,013° C., however, the oxide was much brighter and especially rich in blue rays. When first heated the brightness of the violet end of the spectrum was more than twenty times greater than that of a platinum surface at the same temperature. The decadence, which was very rapid, is shown graphically in Fig. 5. Ordinates are intensities in terms of corre-

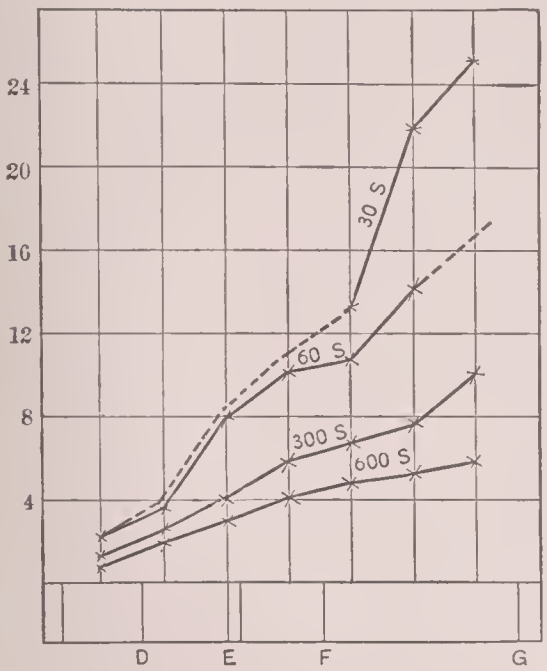

Fig. 5.—Radiation from ZnO, at 1,013° C.

sponding regions of the spectrum of the light from platinum. Abscissas are wave-lengths. The four curves show the relative brightness of the zinc oxide, 30 seconds, 60 seconds, 300 seconds, and 600 seconds after the surface had been brought to the required temperature. The experiments were performed by coating a strip of platinum foil with the oxide by holding it in a flame of burning zinc. An electric current sufficient to heat it to incandescence was then sent through the metal. The temperature was determined by noting the expansion of the strip. The light from the coated surface and that from the naked foil were studied by means of a spectro-photometer.

There is reason to believe that luminescence at temperatures of incandescence is a property common to many metallic oxides, and that the extraordinary amount of light which they emit when heated—as, for instance, in the case of incandescent mantel burners—is to be ascribed only in part to the ordinary influence of temperature. See, further, Stokes, *Lectures on Light*; S. P. Thompson, *Light, Visible and Invisible*; Hyndman, *Radiation*.

E. L. Nichols.

Lummis, Charles Fletcher: author; b. in Boston, Mass., Jan. 2, 1859; graduated at Harvard, and soon removed to the Pacific coast, where he has edited *The Land of Sunshine*, a California monthly, and has depicted life in various phases. His chief works are *A New Mexico David* (1891); *A Tramp across the Continent* (1892); *Some Strange Corners of our Country* (1892); *The Land of Poco Tiempo* (1893); *The Spanish Pioneers* (1894); *The Man who Married the Moon* (1894); *Indian Folk Lore Stories* (1894); *The Goldfish of Grand Chimú* (1896); *The Enchanted Burro* (1897); *The King of the Broncos* (1897); and *The Awakening of a Nation* (1898).

Lunacy Laws: laws regulating the rights of lunaties and their treatment. These laws for the sake of convenient treatment may be divided into those affecting the criminal liability of lunatics, properties of lunatics, and the rights of lunatics to personal freedom.

The question of what constitutes lunacy in the law, or such a degree of lunacy as to invoke the action of the law for the regulation of the affairs of a person as a lunatic, can not be definitely answered; and the importance of a strict definition is now less than it formerly was, because of the radical change which has taken place during recent years as to the criteria of capacity and responsibility in mental diseases. Numerous terms are used or have been used, implying either a greater or less degree of mental unsoundness or some specific phase of mental unsoundness, such as insanity, lunacy, idiocy, mania, imbecility, etc., all implied or covered by the meaning of the general term *non compos mentis*, which is now used generically to cover all the phases and degrees of mental unsoundness. The term *idiot* was defined by Coke as "one who from his nativity, by a perpetual infirmity, is *non compos mentis*." Hale defined idiocy as "fatuity *a nativitate, vel dementia naturalis*." The term *lunatic*, which alluded to the notion that the moon had an influence upon mental disorders, is defined by Coke as a "person who has sometimes his understanding and sometimes not, *qui gaudet lucidi intervallis*, and therefore he is called *non compos mentis* as long as he has not understanding." *Imbecility* was defined by Sir John Nichol (in 1828) as weakness of mind "between the limits of absolute idiocy on the one hand and of perfect capacity on the other." The term *unsound mind* Lord Eldon considered to be "contradistinguished both from idiocy and from lunacy, and yet such as to justify a commission."

At present, however, neither the term *lunacy* nor *unsoundness of mind* necessarily imports incapacity on the part of the person of unsound mind, and *idiocy*, although it imports incapacity, has not the fixed definition which it originally had when tests of idiocy, lunacy, or unsoundness of mind were to a certain extent arbitrary and fixed. Thus the test applied by Fitzherbert was the capacity of the alleged idiot to count twenty pence, or tell his age, or tell who his father and mother were; and another writer suggested as a test of capacity that the individual be required to measure a yard of cloth or rightly name the days in the week. Now, however, generally speaking, the question of whether a man is an idiot or not, or a lunatic or not, or unsound or sound in mind, is a question of fact triable by a jury, and determinable wholly, or to a considerable extent at least, by the capacity of the alleged unsound person with reference to the particular matter or the particular class of matters which makes his mental condition a subject of investigation. In each individual case, therefore, the general question is, Has the individual the mental capacity or comprehension to perform or do the act or acts in question in such a manner as to appreciate the nature of the act and its consequences? A person may be a lunatic or *non compos mentis* with reference to a particular act, such as entering into the marriage relation, or the purchasing or sale of certain species of property, or the making of a will, and still not be a lunatic or *non compos mentis* as regards certain other acts, such as the commission of crimes against the person or property of others. Or he may even be a lunatic so far as concerns the commission of certain crimes, such as stealing, and not be a lunatic with regard to certain other crimes, such as crimes involving acts of violence against the person of others.

The common law as to the capacity of the unsound to enter into the contract of marriage and as to their testamentary capacity has passed through three phases of development. In the first the capacity of the alleged unsound person was decided according to the ordinary rules of evidence as a fact to be proved by testimony as to the acts and conduct of the person in question, and a person might be held incompetent with regard to either of these matters in question without being necessarily considered as generally incompetent. But later the idea obtained that the mind was indivisible, and that any derangement of the faculties or any disease of the mind was fatal to all civil capacity. The courts, however, have again in recent years returned to the first method of deciding the question of disputed capacity by evidence as to the capacity to perform the particular act in question.

As to criminal responsibility, the legal test of what constitutes such insanity or mental unsoundness as to render a person legally responsible for criminal conduct is not at all settled. The general tendency is here to apply the same test which is applied in civil matters, which is, Was the

* Nichols and Snow, *Philosophical Magazine* (5), vol. xxxii., p. 401.

person able to understand the nature of his act and its consequences, and was he a free agent so far as that act was concerned? The decision as to this question, however, is more or less hindered and its accuracy destroyed by the bringing in of the idea of moral responsibility involving the idea of moral insanity, and also by the consideration of the circumstances under which the criminal act was committed.

The first rule as to the capacity of lunatics to contract was based on the civil-law rule that "an unsound person can not enter into a contract because he does not understand what he is doing." This rule, however, was subject to certain exceptions in favor of certain matters of record, such as fines and recoveries, statutes, recognizances, etc., which exceptions, however, were subject to equitable relief. The original doctrine was also subject to a second exception having special reference to deeds, feoffments, and grants, expressed in the rule that no man should be allowed to stultify himself by setting up his own incapacity.

Since the first quarter of the nineteenth century the laws in England regulating the personal liberty and the property of the unsound in mind or those whose mental unsoundness incapacitates them from taking charge of their own affairs have been subject to many statutory modifications, and they were all consolidated under the Lunacy Act of 1890, which, with the amendatory acts, constitutes the law of Great Britain to-day (1899) with regard to the treatment of the persons and property of lunatics. This law provides for (1) a competent body having supervision in all matters concerning persons of unsound mind; (2) proper establishments for the reception of lunatics; (3) a thorough investigation of the condition of an alleged lunatic prior to his confinement as such; (4) humane treatment during detention, and proper opportunities for discharge on recovery; (5) protection of the property of persons incompetent to manage their own affairs.

The principal control of lunacy matters is vested in a commission constituting a governing department and consisting of four unpaid commissioners, three salaried local commissioners, and three salaried medical commissioners, who are charged with the duty of supervising all establishments in which lunatics are received, and of enforcing the carrying out of all regulations for the welfare of the inmates. They have authority to investigate complaints made by the inmates detained as lunatics, and are vested with wide powers for the discharge of patients. The lay chancellor and the lay justices of appeal are vested with the jurisdiction over inquisitions and the management of the property of lunatics, their functions being mostly delegated, however, to two ministers in lunacy, who are required to be barristers of at least ten years' standing.

The establishments for the reception of lunatics are asylums or workhouses, registered hospitals, and licensed houses. The asylum is under the supervision of a visiting committee, and is intended for the reception of pauper patients. The registered hospitals are charitable establishments, intended, however, generally for patients who are not paupers, but are able to make a small annual payment. The number of patients which such a hospital may receive, and the regulations for its management and control, are subject to the approval of the Home Secretary, and their accounts must be submitted to the charity commissioners in lunacy. The licensed houses are private establishments whose licenses antedate the Lunacy Act of 1889, and they practically have a monopoly, since no new licenses are granted except to them or to their successors. These houses are subject to strict examination and regulation by the commissioners in lunacy and legal and medical visitors. Lunatics may be received in unlicensed houses as single patients; but even in this case in various ways they are subject to the control of the commissioners in lunacy.

The proper treatment of the inmates of these establishments, and of persons detained as single patients, is provided for by compulsory visitation by the commissioners and by chancery visitors, visitors of licensed houses, and asylum visiting committees; and every hospital and licensed house may be visited at any time whatever by any one or more of the commissioners in lunacy. The law also provides means for insuring to every person detained as a lunatic opportunity to communicate with the lunacy authorities and receive visits from his friends; regular medical attendance; proper regulation of the use of mechanical means of restraint; and facility for obtaining his discharge upon recovery.

The property of a person legally declared to be a lunatic is placed under the care and management of a committee of his estate, and is not controlled by the lunacy authorities.

In the U. S. the laws upon the subject of lunacy are in general analogous to those of Great Britain, but the special provisions obtaining in the different States for carrying out the laws vary widely in their details. They now in general provide for the establishment of proper places for the detention of lunatics, for the detention of lunatics in private establishments, the proper treatment of inmates during detention, and means of securing their release upon recovery. They provide for the appointment of a committee or conservator of the person, and a committee or conservator for the proper care and preservation of the property of the lunatic, who may or may not be the same person as the committee of the person.

Luther League of America: an organization first effected in 1888 by delegates from six Lutheran societies in New York city. The various societies of the different Lutheran churches in the U. S., chiefly composed of young people who are working for the interests of the Church, are brought together in the league, the constitution of which declares that its objects are "to encourage the formation of the young people's societies in all Lutheran congregations in America, to urge their affiliation with their respective State or Territorial leagues, and with this league to stimulate the various young people's societies to greater Christian activity and to foster the spirit of loyalty to the Church." The first national convention of the league was held in Pittsburg, Pa., in 1895. At a national convention held in New York in 1898 400 delegates were present, representing a membership of 80,000 in 15 States.

Lyall, Sir CHARLES JAMES, K. C. S. L., C. I. E., LL. D.: English civil service officer and author; b. Mar. 9, 1845; educated at King's College School and King's College and at Baliol College, Oxford; entered the British civil service in 1867, since which time he has held many important civil offices in the Indian Government, including that of judge and commissioner of Assam Valley districts 1883–84, secretary to Government of India in revenue and agricultural department 1886–87, and secretary to Government of India, home department, 1889–95, and chief commissioner of Central Provinces of India 1895–98. He is best known, however, for his studies and writings in Arabic, and has published *Translations of Ancient Arabic Poetry* (1885); *Ten Ancient Arabic Poems* (1894); and articles in the *Encyclopædia Britannica* (9th ed.). F. STURGES ALLEN.

Lyte, ELIPHALET ORAM, Ph. D.: educator; b. near Bird-in-Hand, Lancaster co., Pa., June 29, 1842; while preparing for college, left school during the early part of the civil war to join the Federal army, where he served with distinction for nearly three years; graduated at the State Normal School, Millersville, Pa., 1868; A. M. and Ph. D., Franklin and Marshall College; Professor of English and Pedagogics, State Normal School, Millersville, Pa., 1868–87, and principal since 1887; president of the National Educational Association 1898–99; author of several text-books.

Maas, JOSEPH: tenor singer; b. in Dartford, England, Jan. 30, 1847, and began as a choir-boy in Rochester Cathedral. In 1869, having developed a fine tenor voice, he went to Milan for study. In 1871 he made a tour of the U. S. with the Kellogg Opera Company, returning to London in 1877, and joined the Carl Rosa Opera Company. D. Jan. 17, 1886. D. E. HERVEY.

Maas, LOUIS: pianist; b. in Wiesbaden, Germany, June 21, 1852, the son of a music-teacher. Early in life his parents went to London, where he graduated at the age of fifteen years, at King's College. In 1867 he entered the conservatory of Leipzig. In 1868 his first overture was performed at the Gewandhaus, and his second the following year. In Apr., 1872, he produced his first symphony. In 1873–74 he taught in Kullak's academy, and spent the summers of those years at Weimar with Liszt. He made a concert tour of Germany in 1874 with great success, and in 1875 was chosen professor in the Leipzig conservatory. In 1881 he went to the U. S. with the violinist Wilhelmj, and

at the close of the concert tour remained there, settling in Boston, devoting himself to teaching, playing, and composing. D. in Jamaica Plain, near Boston, in Sept., 1889.

D. E. Hervey.

Mabie, Hamilton Wright: author: b. in Cold Spring, N. Y., Dec. 22, 1845; was educated at Williams College and at Columbia University; became associate editor of the *Outlook*. His more important publications are *Norse Stories Retold from the Eddas* (1890); *My Study-Fire* (1891); *Under the Trees and Elsewhere* (1891); *Essays in Literary Interpretation* (1892): *Essays on Nature and Culture* (1895); *Short Studies in Literature* (1896); *Essays on Books and Culture* (1897); *Essays on Work and Culture* (1898); and *The Forest of Arden* (1899).

McAdoo, William Gibbs: jurist; b. near Knoxville, Tenn., Apr. 4, 1820; graduated at East Tennessee University, Knoxville, 1845; was a member of the Tennessee Legislature 1845–46; an officer in the Mexican war 1847; was admitted to the bar, and was attorney-general of the Knoxville judicial district 1851–60; removed to Georgia in 1862; was a captain in the Confederate service; appointed judge of the twentieth judicial district of Georgia 1871; is author of published addresses, etc., and, with Prof. H. C. White of Georgia, of *Elementary Geology of Tennessee*.

Macareo River: a branch of the Orinoco delta entering the Gulf of Paria (Serpent's Mouth), not far from Port of Spain, Trinidad, and the only practical inland route for steamboats from Port of Spain to the Orinoco. The stream is of much commercial importance, and steamers ply on it between Trinidad and Ciudad Bolivar, on the Orinoco.

McBurney, Robert Raikes: general secretary of the New York Y. M. C. A.; b. in Castleblaney, Ireland, Mar. 31, 1837. His father was a physician. He landed in New York city in the summer of 1854, and, in unconscious prophecy of his career, on the very evening of his arrival went to the rooms of the Young Men's Christian Association, then in the Stuyvesant Institute, No. 659 Broadway. He obtained a clerkship in the city, but his interest in the association, which had been organized in 1852, was so manifest and intelligent that in 1862 he was chosen as its first paid employee, and given charge of the rooms and general oversight of the work in all branches. The wisdom of the choice was immediately apparent. He made it his meat and drink to serve the association, and he and it became synonymous. He was its life and soul. He drew young men of all grades toward him, for he genuinely loved them, and in a spirit of kindness and self-sacrifice befriended them. His appeal to their better nature in their times of uncertainty and temptation saved many of them from folly and moral death. He saw the association expand and grow in public confidence, move into better quarters, and in 1869 erect the first building specially adapted to its needs. In 1896 he was called upon to plan the ninth of its buildings in the city. Its membership was then 7,300, and in carrying on educational and physical work in addition to the spiritual and social it had greatly broadened its scope and somewhat changed its character. He had the wisdom to see the necessity of adopting these new currents of influence, and the tact to keep them in proper subordination to the great ends of the association. It was, however, in the spiritual and personal work of the association that he excelled. When the Y. M. C. A. became a feature of every city in Protestant lands national and international conferences were held, and in them he was always so much sought after for counsel that his position as the leading Y. M. C. A. officer in the world was universally conceded. He never married, had no social ties, but lived entirely for young men. He died after long illness from a complication of diseases, in Clifton Springs, N. Y., Dec. 27, 1898.

S. M. J.

McCabe, James Dabney: author; b. in Richmond, Va., July 30, 1842; educated at the Virginia Military Institute; wrote in early youth for the Abingdon *Virginian*; resided in Richmond during the war, writing in favor of the Confederate cause. He published a war story entitled *The Aide-de-Camp* in 1863, and wrote three plays on war topics. In the winter of 1863 he published a Christmas book, *The Bohemian*, in preparing which he was assisted by his wife and Charles P. Dimitry. In 1863–64 he was editor of the *Magnolia Weekly*. He wrote many popular war poems and several hundred short stories, essays, poems, and translations. After the war he lived chiefly in Brooklyn, N. Y. Among his works are *Life of Gen. Thomas J. Jackson* (1863; enlarged ed. 1864); *Memoir of Gen. Albert S. Johnston* (1866); *Life and Campaigns of Gen. Robert E. Lee* (1867); *The Gray-Jackets* (1867); *Planting the Wilderness* (1869); *History of the Late War between Germany and France* (1871); *Lights and Shadows of New York Life* (1872); *The Great Republic* (1872); *Paris by Sunlight and Gaslight* (1875); *Centennial History of the United States* (1875); *Pathways of the Holy Land* (1877); *History of the Turko-Russian War* (1879); *Our Young Folks Abroad* (1881); *Our Young Folks in Africa* (1882). D. in Germantown, Pa., Jan. 27, 1883.

McCall, George Archibald: soldier; b. in Philadelphia, Pa., Mar. 16, 1802; graduated from the Military Academy, West Point, and entered the army as second lieutenant of infantry in 1822; became first lieutenant in 1829, captain in 1836, and major in 1847. In addition to the routine of garrison life, he served for five years (1831–36) on the staff of Gen. Gaines, and in 1836 and 1841–42 was actively engaged in Florida against the Seminoles. In the war with Mexico he won the brevets of major and lieutenant-colonel for gallantry in the battles of Palo Alto and Resaca de la Palma; subsequently he served as chief of staff to Gen. Patterson. He was appointed inspector-general, with the rank of colonel, in 1850, and resigned from the army in 1853. In the civil war he organized the Pennsylvania Reserve Corps, and was commissioned, May 15, 1861, by the State a major-general of Pennsylvania volunteers. Two days later he was appointed brigadier-general of U. S. volunteers, but retained command of the reserve corps, which as a division of the Army of the Potomac held the right of the line of that army before Washington 1861–62, and a part of which was engaged in the action and occupation of Dranesville, Va., Dec. 20, 1861. In the Virginia Peninsular campaign of 1862 he was engaged with his command at Mechanicsville, Gaines's Mill, and Frazier's Farm, being taken prisoner in the battle at the last-named place and held until August, when he was exchanged; but his impaired health did not permit him to return to the army, and he resigned, Mar. 31, 1863, and retired to his farm near West Chester, Pa., where he died, Feb. 25, 1868. He was the author of *Letters from the Frontier* (1868).

McCallum, Daniel Craig: engineer; b. in Johnstown, Renfrewshire, Scotland, Jan. 21, 1815. His parents settled in Rochester, N. Y., while he was young, and he became an architect and builder there. In 1851 he invented the "inflexible arch truss bridge." In 1855–56 he was general superintendent of the Erie Railway. On Feb. 11, 1862, he was appointed military director and superintendent of railroads in the U. S., with the rank of colonel, and "for faithful and meritorious services" was breveted brigadier-general and major-general of volunteers. In July, 1866, he was mustered out of the service, and in the same year he published a valuable report on the military railroads during the war. D. in Brooklyn, N. Y., Dec. 27, 1878.

McClellan, Ely: physician; b. in Philadelphia, Pa., Aug. 23, 1834; studied at the University of Pennsylvania and at Williams College, and graduated at Jefferson Medical College in 1856. He became a surgeon in the U. S. army in Aug., 1861, and on June 1, 1876, was promoted major, and in Sept., 1891, deputy surgeon-general, with the rank of lieutenant-colonel. Among his writings are *Obstetrical Procedures among the Aborigines of North America* (Louisville, Ky., 1873); *Fibroid Tumors of the Uterus* (1874); *Cholera Hygiene* (1874); *Common Carriers, or the Porters of Disease* (1874); *A History of the Cholera Epidemic in 1873 in the United States* (Washington, 1875); *Battey's Operation* (Louisville, 1875); *A Note of Warning: Lessons to be Learned from Cholera Facts of the Past Year, and from Recent Cholera Literature* (1876); *On the Relation of Health Boards and other Sanitary Organizations with Civic Authorities* (Atlanta, Ga., 1876); and *A Review of Von Pettenkofer's Outbreak of Cholera among Convicts* (1877).

McClenachan, Charles Thomson: lawyer; b. in Washington, D. C., Apr. 13, 1829; was instructor in the Institute for the Blind, New York, 1845–50; was clerk of the board of councilmen 1850–61; served in the civil war as quartermaster of the Seventh Regiment of New York; was admitted to the bar in 1867; was general accountant in the street department and afterward in the department of public works for twenty-six years. He has published *The Laws of the Fire Department* (New York, 1855); *Compilation of the Opinions of Counsels to the Corporation* (1859); *New York Ferry Leases and Railroad Grants from 1750 to 1860* (1860);

The Atlantic Telegraph Cable of 1858 (1863); *The Book of the Ancient Accepted Scottish Rite of Freemasonry* (1867); an addendum to Dr. Albert G. Mackey's *Masonic Encyclopædia* (Philadelphia, 1884); and *The History of Freemasonry in the State of New York* (1888).

McClernand, John Alexander: lawyer and soldier; b. in Breckenridge co., Ky., May 30, 1812; admitted to the bar in Shawneetown, Ill., in 1832. In the Black Hawk war he served as a private, resuming his profession on his return, and in 1835 founded a newspaper called the *Democrat*; was elected to the Legislature in 1836, also in 1840 and 1842, and was a member of Congress 1843–51, and was again sent to Congress from Jacksonville in 1859, but resigned on the outbreak of the civil war and engaged actively in raising the brigade which bore his name, and which he commanded at Belmont, having been appointed brigadier-general of volunteers May 17, 1861. At Fort Donelson he commanded the right of the Union lines. He was promoted major-general Mar. 21, 1862, and commanded a division at the battle of Shiloh. In Jan., 1863, he relieved Gen. Sherman in command of the expedition for the capture of Vicksburg. He commanded the expedition that stormed and carried Arkansas Post, and was engaged in the Vicksburg campaign, including the assault on that place, in command of the Thirteenth Corps, until relieved in July, 1863. He resigned Nov. 30, 1864. D. Sept. 20, 1900.

McCrary, George Washington, LL. D.: statesman; b. in Evansville, Ind., Aug. 29, 1835; removed very early to the part of Wisconsin Territory which afterward became the State of Iowa; was educated in a public school and an academy, studied law in Keokuk, Ia., and was admitted to the bar in 1856; was elected to the State Legislature in 1857, and served in the State Senate 1861–63, holding the position of chairman of the committee on military affairs; devoted himself chiefly to his profession from 1863 to 1868, when he was elected to Congress, and was re-elected four times in succession, serving on the naval committee, on the committee on the revision of the laws, and as chairman of the committee on elections. He became Secretary of War Mar. 12, 1877, and U. S. circuit judge in Dec., 1879. In Mar., 1880, he resigned his judgeship and resumed the practice of law in Kansas City, Mo. He was the author of *The American Law of Elections* (Chicago, 1875). D. in St. Joseph, Mo., June 23, 1895.

McCulloch, Ben: soldier; b. in Rutherford co., Tenn., Nov. 11, 1811; left school when fourteen years old and became an expert hunter and boatman; went to Texas to join the expedition of Davy Crockett, but arrived after the death of the latter at the Alamo; served as a private in the battle of San Jacinto, and subsequently in the Mexican war commanded a company of Texan rangers, and was greatly distinguished at Monterey and Buena Vista, and at the final capture of the city of Mexico; appointed U. S. marshal in 1853, and commissioner to Utah in 1857. In 1861 he returned to Texas, and, in command of a temporary force of State troops, received the surrender of Twiggs at San Antonio. Appointed brigadier-general in the Confederate army May 14, 1861, he commanded in Missouri at Dug Springs and at Wilson's Creek, and was killed in the battle of Pea Ridge, while in command of a division, Sept. 7, 1862.

MacCunn, Hamish: composer; b. in Greenock, Scotland, the son of a shipowner, and educated in the schools of his native town till 1883, when he went to London, winning a scholarship at the Royal College of Music. This he resigned in 1886, and has since devoted himself to composition. Although still very young, he has produced a number of important works in the highest forms, including orchestral overtures and other works, several cantatas, an opera, *Jeannie Deans*, libretto by Joseph Bennett, and an opera to a libretto by the Marquis of Lorne, many songs and part songs, and several works for solo instruments and orchestra.

D. E. Hervey.

MacDonald, Arthur, A. M.: specialist in education; b. in Caledonia, N. Y., July 4, 1856: A. B., University of Rochester, 1879, and A. M. 1883; student of law 1879–80; graduated at the Union Theological Seminary, New York, 1883; graduate student, Harvard University, 1883–85; studied at Universities of Berlin, Leipzig, Paris, Zurich, and Vienna 1885–89; docent in criminology, Clark University, 1889–91; U. S. Bureau of Education specialist as related to the abnormal and weakling classes since 1892; author of *Abnormal Man* (1893); *Criminology* (1894); *Le Criminel Type* (1895); *Education and Patho-Social Studies* (1896); *Emil Zola* (1898); *Experimental Study of Children* (1898); *Abnormal Woman* (1897).

McDowell, William Fraser, S. T. D.: educator; b. in Millersburg, O., Feb. 4, 1858: A. B. 1879, A. M. 1882, Ph. D. 1891, S. T. D. 1894, all from Ohio Wesleyan University; S. T. B. 1882, Boston University; pastor, Lodi, O., 1882–83, Oberlin, O., 1883–85, Tiffin, O., 1885–90; chancellor of the University of Denver 1890–99; became general secretary of the Methodist Missionary Union in 1899; author of *The College Student and the Christian Confession*.

McEvoy, John Millar, LL. B: Canadian lawyer and essayist; b. in Caradoc, Ontario, in 1864; received the degree of B. A. at Toronto University in 1890; read law, and was called to the bar in 1893. He took up the practice of his profession in London, Ontario, where he still resides; in 1892 was appointed fellow in political science in Toronto University, and taught Canadian constitutional history; subsequently was appointed lecturer in the department of political science. Besides numerous other essays and pamphlets, he has contributed to the magazines an essay on *Canadian Currency and Banking*; *Karl Marx's Theory of Value*; and is the author of *The Ontario Township*, a study of the history of the municipal institutions of the Province of Ontario.

F. Sturges Allen.

McGee, Anita Newcomb: surgeon; b. in Washington, D. C., Nov. 4, 1864; daughter of Simon Newcomb, the astronomer, and wife of W J McGee, the ethnologist; educated in private schools, after which she spent three years in travel and study in Europe. In order to acquire a knowledge of medicine, she entered the medical department of Columbian University in Washington, where she was graduated in 1892, and then took a post-graduate course at the Johns Hopkins Hospital in Baltimore, after which she practiced for some years in Washington, and was an attending physician at the Woman's Hospital. For many years Dr. McGee has been active in the national society of the Daughters of the American Revolution, holding the offices of surgeon-general, librarian-general, and vice-president-general at various times. In connection with the war with Spain in 1898 she became director of the Daughters of the American Revolution Hospital Corps, a body which was formed at her suggestion, and was accepted by both the surgeons-general of the army and navy as an official examining board for women nurses. Under her influence the standard for army nurses was established, compelling them to be graduates from training-schools. On Aug. 29, 1898, she was appointed acting assistant surgeon in the U. S. army, and after short duty at Montauk Point was given charge, immediately under the surgeon-general, of all matters relating to women nurses. She examined more than 6,000 applications, and 1,500 women nurses were appointed to the army on her recommendation. Dr. McGee is the only woman who is an officer in the U. S. army. She is a member of many medical and scientific societies, and in 1897 was secretary of the section on anthropology of the American Association for the Advancement of Science. She is the author of a number of papers, chiefly relating to the communistic societies of the U. S., and has also contributed genealogical and medical papers to the journals of the societies of which she is a member.

Marcus Benjamin.

McGiffin, Philo Norton: naval officer; b. in Washington co., Pa., Dec. 30, 1860; graduated at the Naval Academy, passing the final examination after a two years' cruise, and was honorably discharged with a year's pay, because of an act of Congress reducing the navy. In 1883 he went to China and became Professor of Mathematics and Naval Matters in the naval college at Tientsin. In 1887 he and Lieut. Bourchier of the British navy assumed charge of the new naval college at Wei-hai-wei. At the beginning of the war between China and Japan, in 1894, he volunteered for service, and was appointed to command the ironclad Chen-Yuen, built in England under his superintendence, which was the flagship of the fleet in the battle of the Yalu river, Sept. 17, 1894. Capt. McGiffin and many of the crew were injured by the shock of the premature discharge of a gun, and he was so wounded during the fight that he partly lost both sight and hearing. After the fight he had to leave China, suicide being demanded of him, according to the custom of the country, because of his defeat, and he went to New York, where he died in hospital, Feb. 11, 1897. He

was the only American officer who had commanded a modern war-ship in actual battle before the fight in Manila Bay in May, 1898.

McGoun, ARCHIBALD: Canadian lawyer and law-writer; b. in Montreal, Dec., 1853; educated at the Montreal high school and subsequently at McGill University; was called to the bar in 1878, and took up his practice in Montreal, where he still (1899) resides; was appointed Professor of Civil Procedure and later of Legal Bibliography in McGill University, and in 1896 lecturer on constitutional law. He has published *Federation of the Empire*, an address (1884); *Commercial Union with the United States, with a Word on Imperial Reciprocity* (1887); *A Federal Parliament of the British People* (1890); and other essays and pamphlets on the question of the federal unity of Great Britain and her colonies. F. STURGES ALLEN.

McIlvaine, JOSHUA HALL, D. D.: educator; b. in Lewis, Del., Mar. 4, 1815; graduated at Prineeton College in 1837, and at the Theological Seminary in 1840; pastor in Little Falls, Utica, and Rochester, N. Y., till 1860; Professor of Belles-lettres at Princeton 1860–70; was founder (1887) of Evelyn College for young women in Princeton, and its president until his death, Jan. 30, 1897. In 1859 he leetured before the Smithsonian Institution on comparative philology in relation to ethnology, and in 1869 before the University of Pennsylvania on social science. He published *The Tree of Knowledge of Good and Evil* (1854); *Elocution: the Sources and Elements of Power* (1870); *The Wisdom of Holy Scriptures* (1883); *The Wisdom of the Apocalypse* (1886). The University of Rochester gave him the degree of D. D. in 1854.

Mackaye, JAMES STEELE: dramatist; b. in Buffalo, N. Y., in 1842. He went to Paris in 1868 to study painting, but, being impressed with François Delsarte's theories of dramatic expression, he studied with Delsarte until the beginning of the Franco-Prussian war. He then returned to the U. S., lectured in New York city, in Boston, and in Harvard University on dramatie art and expression, and produced two plays, *Monaldi* and *Marriage*, in the St. James theater, New York. In 1872 he played *Hamlet* at the Crystal Palace in London, and began a tour of the provinees, whieh was cut short beeause of ill health. It is said that while in London at this time he was associated with Tom Taylor in writing *Arkwright's Wife* and *Clancarty*, with Charles Reade in writing *Jealousy*, and with George Eliot in dramatizing her *Silas Marner*. In 1875 he produeed in New York an original adaptation of Blum's *Rose Michel*, in 1876 *The Twins*, in 1877 the comedy *Won at Last*, and in 1878 the melodrama *Through the Dark*, the last being afterward changed to *Money Mad*, with change of its seenes from England to the U. S. In 1879, with a new eompany under his management, he revived his play *Won at Last*, and introdueed some stage innovations, for the better applieation of whieh the Madison Square theater was built and opened in 1880 with his play *Hazel Kirke*. In 1885 he built the Lyceum theater. In 1887 he produeed in Buffalo, N. Y., a play ealled *Anarchy*, which was afterward successful in New York under the title *Paul Kauvar*. D. in Timpas, Col., Feb. 25, 1894.

McKenna, JOSEPH: jurist; b. in Philadelphia, Aug. 10, 1843, and taken to California when twelve years old, where the family settled in Benicia; educated at a collegiate institute in Benicia; admitted to the bar in 1865; elected district attorney of Sonoma County in 1865 and again in 1867; member of the California Legislature 1875–76; twiee defeated as a candidate for Congress, in 1876 and 1878, but elected in 1884, and was a member of three Congresses; was the only member of the ways and means committee from a State W. of the Rocky Mountains; appointed in Feb., 1892, a U. S. circuit judge for the Pacific slope circuit; appointed U. S. Attorney-General Mar., 1897; beeame U. S. Supreme Court justice Jan., 1898, on the retirement of Justiee Field.

Mackenzie, JAMES CAMERON, Ph. D.: educator; b. in Aberdeen, Scotland, Aug. 15, 1852; studied at Bloomsburg (Pa.) State Normal School and Phillips Exeter Academy; A. B., Lafayette College, 1878; studied in Princeton Theologieal Seminary; Ph. D. 1882; assistant principal Wilkesbarre (Pa.) Institute 1873–74; founder and principal Wilkesbarre Academy (now Harry Hillman Academy) 1878–82; first head master Lawrenceville School, Lawrenceville, N. J., 1882–99; in 1899 beeame a professor in the State Normal School at De Kalb, Ill.; author of numerous contributions to educational magazines.

McKibbin, CHAMBERS: soldier; b. in Chambersburg, Pa., Nov. 2, 1841; enlisted as a private in the regular army soon after the outbreak of the civil war; beeame second lieutenant in the Fourteenth Infantry in 1862, first lieutenant in 1864, was transferred to the Thirty-second Infantry in 1866, promoted to eaptain in the Thirty-fifth Infantry in 1867, transferred to the Fifteenth Infantry in 1869, beeame major of the Twenty-fifth Infantry in 1892, and lieutenant-colonel of that regiment in 1896; took part in the invasion of Cuba under Gen. Shafter, and was honorably mentioned in official reports for gallantry at the battle of Santiago; was advanced to brigadier-general of volunteers, and on the fall of Santiago was made military governor of that city, but was soon succeeded by Gen. Leonard Wood.

Maclaren, JOHN JAMES, LL. D.: Canadian lawyer and law-writer; b. in Lachute, province of Quebee, July 1, 1842; edueated at Huntington Academy, and at Vietoria University, Cobourg, and McGill University; read law and was called to the Quebec bar in 1868, and took up the practiee of his profession in Montreal; in 1884 removed to Toronto and was called to the Ontario bar; was made queen's counsel of Quebec in 1878, of Ontario and the Dominion in 1890; was secretary of the British and Ameriean joint commission on Hudson Bay claims 1867–69; member of the committee on the eode of civil procedure of Quebec 1887. He is now (1899) a senator of Toronto University, and of the Wesleyan Theologieal College, Montreal; member of the board of regents of Vietoria University, and an honorary member of the law faculty of Toronto University. Among his writings are *Roman Law in English Jurisprudence* (1887); *Bills, Notes, and Cheques* (2d ed. 1894); *Banks and Banking* (1894). In addition to his work as a lawyer he has been active in religious, educational, and temperance work, and is a member of many publie institutions and associations for the furtheranee of these ends. F. STURGES ALLEN.

McLaws, LAFAYETTE: soldier; b. in Augusta, Ga., Jan. 15, 1821; graduated at the U. S. Military Aeademy in 1842, and appointed brevet second lieutenant of infantry; served (1845–48) in the war with Mexieo; subsequently on frontier duty until 1860, having meanwhile attained the rank of eaptain; resigned Mar. 23, 1861, to join the Southern Confederaey, being soon appointed major-general in that serviee, and throughout the war served as division commander, mainly in Longstreet's corps. He was appointed in 1875 collector of internal revenue in Savannah, Ga., and in 1876 postmaster there. D. in Savannah, July 24, 1897.

MacLean, GEORGE EDWIN, Ph. D., LL. D.: educator; b. in Roekville, Conn., Aug. 31, 1850: prepared for eollege at Westfield Aeademy and Williston Seminary; A. B., Williams College, 1871; graduated at Yale Theological Sehool 1874; pastor of the Presbyterian and Congregational Soeiety, New Lebanon, N. Y., 1874–77; pastor Memorial Presbyterian chureh, Troy, N. Y., 1877–81; studied at the Universities of Leipzig and Berlin 1881–83; Ph. D., Leipzig, 1883; after an extended tour through Europe, he returned to the U. S., and soon thereafter aeeepted the chair of English Language and Literature in the University of Minnesota, a position he held until 1895, with two intermissions for European study, in England 1891–92, and in Paris 1894. Williams College eonferred on him the degree of LL. D. in 1895, and in the same year he was elected chaneellor of the University of Nebraska. In 1899 he accepted the presidency of the State University of Iowa. He is a member of many learned soeieties, and author, in addition to numerous shorter articles and reviews, of *Ælfric's Anglo-Saxon Version of Alcuini Interrogationes Sigewulfi Presbyteri in Genesin* (Halle, 1883); *An Old and Middle English Reader* (Boston, 1886); *An Introductory Course in Old English* (Minneapolis, 1891); *A Chart of English Literature, with References* (several editions); *An Old and Middle English Reader* (New York and London, 1893). C. H. THURBER.

Maclean, Rev. JOHN, M. A., Ph. D.: author (*Robin Rusiler*); b. in Kilmarnock, Ayrshire, Scotland, Oet. 30, 1851; went to Canada in 1873. He took the degree of M. A. at Vietoria University, Cobourg, in 1887, and that of Ph. D. at the Wesleyan University, Illinois, in 1888. Among his published works are *Our Savage Folk* (1895) and *The Warden of the Plains and other Stories of Adventure* (1897).

McLellan, ISAAC: poet; b. in Portland, Me., May 21, 1806; graduated at Bowdoin College in 1826, and practiced

law in Boston for several years. He wrote during his residence in Boston, for *Willis's Monthly Magazine*, the *New England Magazine*, and the *Knickerbocker*, both prose articles and poems; was associate editor of the Boston *Daily Patriot*, and afterward published a monthly magazine, which was eventually consolidated with the *Weekly Pearl*. In 1851 he removed to New York city and left the practice of law, devoting his whole time to literature. Through his passion for hunting and fishing and his many poems on field sports he became known as "the poet-sportsman." In 1898, when ninety-two years old, he lived in Greenport, Long Island, and spent much of his time fishing, continuing also his literary work. Two of his best-known early poems are *The Death of Napoleon* and *New England's Dead*. Among his published works are *The Fall of the Indian* (Boston, 1830); *The Year* (1832); *Journal of a Residence in Scotland*, from the manuscripts of H. B. McLellan (1834); *Mount Auburn* (1843); *Poems of the Rod and Gun*, edited, with a sketch of the author, by Frederick E. Pond (New York, 1886); and *New Poems* (1898). D. Aug. 20, 1899.

McMillan, Samuel James Renwick: jurist and U. S. Senator; b. in Brownsville, Pa., Feb. 22, 1826; graduated at Duquesne College, Pittsburg, in 1846; studied law with Edwin M. Stanton; was admitted to the bar in 1849, and opened practice in Stillwater, Minn., in 1852; was elected judge of the first judicial circuit of Minnesota in 1857; became associate justice of the State Supreme Court in 1864, and chief justice in 1874; was elected U. S. Senator in 1875, and again in 1881. In 1890 he served on the Presbyterian General Assembly's committee for revision of the Confession of Faith. His judicial opinions are given in vols. ix.–xxi. of *Minnesota Reports* (1864–75). D. in St. Paul, Minn., Oct. 3, 1897.

McMurry, Charles Alexander, Ph. D.: educator; b. in Crawfordsville, Ind., Feb. 18, 1857; graduated at the Illinois Normal University in 1876; studied for two years at the University of Michigan, and for four years at the Universities of Halle and Jena, Germany; Ph. D., Halle, 1887; taught in Illinois, Colorado, and Minnesota; principal of practice school, Illinois State Normal University, and lecturer in Teachers' College, University of Chicago, 1899. He is the author of *The General Method of the Recitation* (with F. M. McMurry); *Special Method in Reading*; *Special Method in Literature and History*; *Special Method in Geography*; *Special Method in Natural Science*; *Pioneer History Stories*; *Course of Study in the Eighth Grades*; editor of *Year-Books of the National Herbart Society*.

C. H. Thurber.

McMurry, Frank Morton, Ph. D.: educator; b. near Crawfordsville, Ind., July 12, 1862; graduate of Illinois State Normal School 1879; student at the University of Michigan 1881–82; student at Universities of Halle and Jena 1886–89; Ph. D., Jena, 1889; student at Universities of Geneva and Paris 1892–93; principal of schools in Illinois 1883–86; principal of grammar schools in Chicago 1889–90; Professor of Pedagogics and training teacher in Illinois State Normal University 1891–92; Professor of Pedagogy in University of Illinois 1893–94; principal of Franklin School, Buffalo, 1894–95; dean of Teachers' College, University of Buffalo, 1895–98; Professor of Theory and Practice of Teaching, Teachers' College, Columbia University, since 1898; author of *Concentration* (in *First Year-Book of the Herbart Society*) and (with C. A. McMurry) of *The General Method of the Recitation*.

C. H. Thurber.

McNair, Frederick Vallette: naval officer; b. in Pennsylvania, Jan. 13, 1839; graduated at the Naval Academy in 1857; became a lieutenant in 1861, lieutenant-commander in 1864, commander in 1872, captain in 1883, commodore in 1896, rear-admiral in 1898. He served on the Iroquois in the passage of Forts Jackson and St. Philip and the capture of New Orleans, and in most of the engagements on the Mississippi in 1862. Later he was executive officer of the Juniata in the South Atlantic blockading squadron, and participated in both the attacks on Fort Fisher. He was on duty in the Brazil squadron 1865–66, and in the South Atlantic squadron 1866–67. In 1868 he was stationed at the Naval Academy, and afterward served on the flag-ship of the European squadron. In 1872 he commanded the Kearsarge and the Portsmouth, and in 1879 he became commandant of cadets at the Naval Academy. He was afterward captain at the navy-yard at Mare island, Cal., commanded the Omaha, of the Asiatic squadron, and later, as commodore, the squadron itself. He was succeeded in this command by Commodore (afterward Admiral) George Dewey early in 1898, and as rear-admiral became superintendent of the Naval Academy.

Macnaughton, Edward Macnaughton, first Baron: English lawyer and jurist; b. in 1830; received his education at Trinity College, Cambridge, and studied for the bar at Lincoln's Inn, of which he is a barrister and bencher; was Conservative member of Parliament for Antrim 1880–85, and for the northern division of Antrim 1885–87. In 1887 he was appointed lord of appeal in ordinary, and in 1895 chairman of legal council of education. He was created a baron and a life peer in 1887.

Macneill, John Gordon Swift: Irish lawyer and publicist; b. in Dublin, Mar. 11, 1849; was educated at Trinity College, Dublin, and at Christ Church College, Oxford, receiving his degree of M. A. at Oxford in 1875; was called to the Irish bar in 1875, and was Professor of Constitutional and Criminal Law at King's Inns, Dublin, 1882–88; has been a Nationalist member of Parliament for Donegal since 1887; was made queen's counsel in 1893. His publications include *The Irish Parliament, What it Was and What it Did* (1885); *English Interference with Irish Industries* (1886); *How the Union was Carried* (1887); *Titled Corruption* (1894).

Madagascar: After the French army captured the capital, Antananarivo, and particularly after the queen was exiled to Réunion, in Feb., 1897, many far-reaching reforms were introduced under the administration of Gov.-Gen. Gallieni, which tended to maintain peace, improve the condition of the people, and reconcile most of the Malagasy to the new *régime*. Slavery was abolished by law, and slaves were declared to be the equals of their former masters. Slaves captured in intertribal wars were returned to their tribes. Thus a prolific source of internal warfare was removed, but the evil of slavery is not yet wholly eradicated. A taxation system distributing tax burdens more equally upon all was introduced. Non-interference with religious beliefs has been rigidly enforced, but French Catholic missionaries have been encouraged to extend their operations and in particular to spread the use of the French language among the people. Protestant missionaries assert that the Catholic propaganda has been pushed at the expense of the Protestant missions. Occasional local revolts against the French control have been severely repressed. Numerous primary schools have been established, and also a medical school, a school for the training of native teachers, and a French technical school at the capital, with workshops in which practical instruction is given in many trades. The old Hova system of forced labor in the public service is still continued, on the ground that many are otherwise unable to pay their taxes. Able-bodied male adults are required to give the Government fifty days' service a year, and in this way a large part of the road-making and other public works is carried out. A road has been opened for cart traffic from the northwest coast to the capital, and other roads are building, so that wagon transport is gradually supplanting porterage on the backs of men. French enterprises are in every way favored to the disadvantage and often the exclusion of enterprises in the hands of the non-French foreigners. The people are specially encouraged to wear French clothes and buy French products. Still France, in spite of favoring tariffs, does not control the trade. The value of imports in 1896 was $2,862,975, of which $656,140 came from France, $1,349,964 from England, $495,352 from the U. S., and $137,572 from Germany. The largest imports were cotton goods from England, and almost the entire imports from the U. S. were cotton cloths, chiefly sheetings. In 1899 the imports were valued at $5,492,842; the exports, $1,552,878. The series of lakes and lagoons south of the east coast port Tamatave and on the road to the capital are being connected in 1901 by canals to afford water transport part of the way, and a railroad between these points is also under negotiation. The ex-queen, in Feb., 1899, was removed from Réunion to Algeria, as it was believed that her proximity to the island would encourage malcontents to plot for her restoration.

C. C. Adams.

Main, Hubert Platt: musical editor; b. in Ridgefield, Conn., Aug. 17, 1839, and received his education there till 1854, when he went to New York city. His first experience in compiling music-books was in 1855, when he helped his father edit *The Sunday-School Lute*, by I. B. Woodbury. Since then he has been constantly busy editing, compiling, and assisting others in compiling music-books, both sacred and secular. He entered the publishing house of W. B.

Bradbury, and later went with Biglow & Main, with whom he has since remained. He has composed more than a thousand separate pieces, hymn tunes, secular songs and choruses, organ pieces, anthems, etc. D. E. Hervey.

Maisch, John Michael: pharmacist; b. in Hanau, Germany, Jan. 30, 1831; educated in the scientific schools of Hanau; participated in the attempted revolution of 1848, and in 1849 emigrated to the U. S. In 1861, having meantime been employed as a clerk in Baltimore, Washington, Philadelphia, and New York, he became Professor of Materia Medica and Pharmacy in the New York College of Pharmacy, and in 1863 chief chemist of the U. S. army laboratory in Philadelphia. In 1866 he was made Professor of Pharmacy in the Philadelphia College of Pharmacy, and in 1867 Professor of Materia Medica. He had charge of the chemical laboratory of that college 1870–81. He received the degrees of Phar. M. and Phar. D. from the Maryland College of Pharmacy in 1871. He is a member of the American Pharmaceutical Association, and was made its permanent secretary in 1865, as such having editorial charge of the annual reports of proceedings of the association. He was a member of the committee of revision of the *U. S. Pharmacopœia*. He has written many papers on improved processes of analysis, botanical methods, and chemical research, mostly published in the *American Journal of Pharmacy*, of which he became editor in 1870. He has edited *Griffith's Universal Formulary* (3d ed. Philadelphia, 1874); *The National Dispensatory*, with Alfred M. Stillé (1879); and *Manual of Organic Materia Medica* (1882).

Maize: The section of foreign markets of the U. S. Department of Agriculture is investigating (in 1898–99) the possibility of bringing about a larger foreign demand for American corn, the results of the inquiry to be published later. The investigation is chiefly directed to the prospects of a more general introduction of this grain into Europe as an article of human food. Less than 10 per cent. of the total product is at present marketed abroad, where it is purchased as food for domestic animals. The U. S. produces a yearly average of about 2,000,000,000 bush., or four-fifths of the world's crop. In the largest crop seasons it is difficult to dispose of the surplus corn at a profit. If through a larger export demand the price per bushel might be raised, the addition of every cent would mean an increased profit to the producers of $20,000,000. C. C. A.

Malcolm, Sir George: soldier; b. in Bombay in 1818; entered the Bombay army in 1836. He served in the Afghan campaign of 1838, and was present at the capture of Ghuzni and the occupation of Cabul; commanded a detachment of Sindh horse in Eastern Kutchi, fighting the Beluchis, 1840–42; served against Mir Shah Mohammed in 1843, and again in Kutchi 1844–45, in Sir Charles Napier's campaign against the hill tribes; participated in the defeat of the Sikhs and the occupation of Peshawar after the Punjaub campaigns of 1848 and 1849, and was breveted major. He commanded Mahratta horse in Persia in 1857, and the force that reduced the fortress of Sherapur in 1858, and was at the head of a division in the Abyssinian war of 1868. He became a colonel in 1860, major-general in 1857, lieutenant-general in 1875, and general in 1877. D. in Leamington, England, Apr. 6, 1897.

Mancinelli, măăn-chĕĕ-nel'lĕĕ, Luigi: opera conductor and composer; b. in Orvieto, near Rome, Italy, Feb. 5, 1848; studied at Florence, and in 1868 was second violoncellist in the orchestra of the Pergola theater, Florence, and in 1871 occupied a similar position in Rome, where he began, in 1874, as *maestro al piano* and occasional conductor, becoming full conductor in 1875. Here he remained six years. In 1881 he was elected director of the conservatory in Bologna; in 1887 was engaged as principal conductor at Drury Lane, London, going the next year to Covent Garden, conducting opera in London during the season, and in the winter seasons from 1887 to 1893 at the Teatro Real, Madrid. The Abbey and Grau Company engaged him as principal conductor at the Metropolitan Opera-house, New York, and re-engaged him year after year. His compositions include *Isaias*, oratorio for the Norwich Festival, England; an opera, *Isora de Provenza* (1884); an opera, *Ero e Leandro*, first performed as an oratorio at the Norwich Festival, and as an opera twice in New York in 1899; overture and *entr'actes* for *Cléopatra*, prelude and *entr'acte* for *Messalina* —both dramas by Pietro Cossa; an orchestral suite, *Scenes Veneziane*; two masses, and a number of songs and smaller pieces. D. E. Hervey.

Manhattan, Borough of: one of the boroughs of the city of New York as constituted under the charter of Jan. 1, 1898. It comprises the old city of New York exclusive of the present borough of the Bronx, including Manhattan island (see New York, the city), Governor's island, Bedloe's island, Ellis island, the Oyster islands, Blackwell's island, Randall's island, and Ward's island. Pop. (1900) 1,850,093. For the new government, see New York, City of, in the Appendix.

Manzanillo, măăn-zaă-neel'yō: a port on the south coast of Cuba, Santiago de Cuba province, and the outlet for all the products of the Cauto river basin, including tobacco, sugar, wax, honey, and other agricultural commodities. It is situated on a fine bay, and produces annually more than 25,000 tons of sugar. Pop. (1899) 14,464.

Marchand, Jean Baptiste: officer in the French army; b. in Thoissey, department of Aisne, in 1863; entered the army in 1883, and was sent with French forces to Senegambia; served in 1890 on an expedition to the sources of the Niger, and acquitted himself so well in later responsible positions that the French Government intrusted largely to him the carrying out of a secret political mission in Africa, undertaken in 1896 and not concluded until more than two years later. The mission in effect was to lead a large force through the French Congo territory to the old Bahr-el-Ghazal province of Egypt, long abandoned on account of the Mahdist revolt, take possession of it in the name of France, descend the Bahr-el-Ghazal to the Nile and the Nile to Fashoda, occupy that place, hold it against the Mahdists, and claim territorial rights for France on the upper Nile. He was to have the co-operation of the French Congo forces and also of two strong expeditions which were to advance on Fashoda from the Obock protectorate near the Red Sea. The contingent from Obock was not sent to him, but Col. Liotard, the governor of the Mobangi district of the French Congo, was of the greatest assistance. On July 23, 1896, Marchand, with 19 officers of the French army and navy and 150 native soldiers of Senegal, reached West Africa, and about seven months later started from Brazzaville, Stanley Pool, with a very large equipment and ascended the Mobangi river to the Mbomu affluent. From this point most of the native contingent, numbering some thousands of men, was supplied by Col. Liotard.

As a *tour de force*, the later proceedings of Marchand has scarcely been equaled in Africa. The advantages, if any, offered by the country for the transportation of material weighing several hundred thousand pounds, and including two steel gunboats, to the Nile were wholly unknown. Exploration was the essential forerunner of farther advance toward Fashoda. In a twenty days' survey of the lower Mbomu, begun on May 1, 1897, a series of 5 high falls and 30 smaller ones were discovered extending far up the river. Marchand decided that the Mbomu must be the route used. Around each of the falls he built roads 30 feet wide on which he laid timbers, trimmed and smoothed, so that the boats might be hauled over them. When one of the falls was reached the river-craft were hauled up the bank and past the obstruction with 1,700 to 1,800 men at the tow-ropes. Meanwhile 2,000 men, with expeditionary stores on their backs, were sent around the cataracts to the upper river, which was explored and declared to be navigable by the time the boats had been carried around the falls. On the upper Mbomu, and its tributary the Boku, the expedition advanced to within 45 miles of the Nile basin, having utilized Congo waterways for 2,064 miles from Stanley Pool.

Marchand set out in advance to determine the nearest point of navigation in the Nile basin in order to connect this point with his camp by the shortest overland route. He found this point on the Sueh river, which he descended about 200 miles. His boats, barges, and baggage were then transported through the scrub 99 miles to the Such, piece by piece on the backs of some thousands of porters. Meanwhile four forts had been established by Marchand and Liotard in the Bahr-el-Ghazal province as bases of operations on the Nile. Marchand started down the Sueh with the first detachment on June 4, 1898, and after meeting great difficulties on the Bahr-el-Ghazal, which was almost choked with sudd, he arrived at Fashoda on July 10, where he was well received by the natives. The Mahdists appeared once in small force, but retired when he fired at them. High water overcame the obstructions to navigation, the gunboat Faidherbe kept Fashoda connected with the posts in the Bahr-el-Ghazal, and Marchand was about to

bring up other detachments and supplies, when late in September the British, who had occupied Omdurman, demanded that he retire from Fashoda. He declined to do so unless ordered to retire by his Government. Negotiations between Great Britain and France resulted in the adoption of satisfactory bases for the settlement of the controversy as to the rights of France on the Nile in view of Marchand's occupation of a large territory in the Nile basin. France thereupon ordered Marchand to evacuate Fashoda, which he did on Dec. 11, 1898, taking his expedition up the Sobat river, and through Abyssinia to the Obock colony, arriving at the French port of Jibouti on May 16, 1899. France received as the price of her relinquishment of territorial claims in the Nile basin the right to use the Nile as a commercial highway and outlet from the French Congo, and the consent of Great Britain to the extension of the French sphere of influence over the central Sudan states of Wadai, Kanem, and Bagirmi and a vast region N. in the Sahara, including the mountainous inhabited region of Tibesti. C. C. Adams.

Marchesi, maăr-kā'see, Mathilde de Castrone (*Graumann*): singer and vocal teacher; b. in Frankfort-on-the-Main, Mar. 26, 1826, of wealthy parents, by whom she was highly educated; adopted the musical profession in 1843; studied in Vienna and in Paris; sang in London in 1849 and elsewhere with much success; married Salvatore Marchesi, Cavaliere de Castrone, Marchese della Rajata, in 1852, and in 1854 began teaching in Vienna, where she turned out some famous singers, among them Ilma di Murska; went to Paris in 1861, and since then many famous pupils have received instruction from her. Her daughter, Blanche Marchesi, is also a fine singer, and made a tour of the U. S. during the season of 1898–99. D. E. Hervey.

Marchetti, maăr-ket'tee, Filippo: composer; b. in Bolognola, in the Central Appenines, in 1834 (1831 according to some authorities). His father sent him to the conservatory in Naples. He began composing at once, and each year of his studies produced something. His first opera was composed to a libretto by his brother, Raffaele Marchetti, for the carnival of 1856 in Turin. His second, *La Demente*, was given in Turin in 1857. Then followed *Il Paria*, which was laid aside. His greatest work, *Giulietta e Romeo*, was produced in Trieste in 1865; then *Ruy Blas* (1869), which also had some success in New York at the Academy of Music (1874). *Don Giovanni d'Austria* followed, and some other works of lesser fame. D. E. Hervey.

Mariel, maă-ree'el: a small town with a fine harbor on the north coast of Cuba, W. of Havana, province of Pinar del Rio. It stands at the north end of the trocha or fortified line which the Spaniards stretched across the island during the last Cuban insurrection (1896). Pop. (1899) 3,631.

Marked Check: in England, a check presented by a banker after the closing of the clearing-house, in accordance with a custom by which the bankers present at various offices checks which have been shut out of the clearing, the cashier at each bank waiting to "mark" or "answer" such checks. These checks are payable at the first clearing of the next day, and, generally speaking, payment can not be refused for any reason. In some cases the mark which is so put upon checks is "Good for —— £." Marked checks correspond closely to the certified checks used in the U.S., which term, however, is applied to checks presented at any time during business hours to the bank for certification as good. The national bank acts of the U. S. prohibit, under severe penalties, the certifying of checks for any amount beyond that which the drawer has to his credit at the time of their presentation for certification. The State banks of New York are not so limited. By the judicial decisions it is generally held that the certification of a check is an acceptance, and renders the bank liable whenever the check is presented. F. Sturges Allen.

Markell, Charles Frederick: author; b. in Frederick, Md., Oct. 16, 1855; received classical education; graduated at the law department of Columbian University 1876; after traveling in Europe, practiced law in his native town; was a member of the House of Delegates 1884–85 and 1896–97; was appointed by President Harrison secretary of legation to Brazil in 1892, and while acting as *chargé d'affaires* caused the Brazilian Government to remove the *expediente* tax on flour from the U. S. His publications are *Chamodine, and other Poems* (1886); *The Chaskell Papers* (1894); and *Ypiranga: a Love-Tale of the Brazils* (1897).

Markham, Charles Edwin: poet and educator; b. in Oregon City, Ore., Apr. 23, 1852; youngest son of pioneer parents who crossed the plains a short time before his birth; after the death of his father, settled with his mother and brothers in a valley of Central California, where he helped to conduct a cattle-ranch and attended country schools: entered the State Normal School at San José in 1871, afterward taking the classical course at Christian College, Santa Rosa, Cal.; studied law for a time after leaving college, but has never practiced; has rendered important service in the educational field of California as superintendent and principal of schools in various places, and became head master of the Tompkins Observation School at Oakland, connected with the University of California. He has contributed poems to the leading American magazines, but attracted no marked attention until the publication of *The Man with the Hoe*, a poem inspired by Millet's celebrated painting with that title—a poem that has excited much comment on the condition of the laboring class.

Marriage Settlement, or **Antenuptial Settlement**: a contract, made in contemplation of marriage, by virtue of which property contributed by or on behalf of the parties to the intended marriage is settled upon those parties in accordance with the terms of a conveyance or trust deed then entered into. Such settlements usually provide for the payment of the income of the property contributed by or on behalf of the husband to him for life, and the income of the property contributed by or on behalf of the wife to her for life; and after the death of either of them for the payment of the income of the entire property to the survivor for life or until remarriage, and in case of the remarriage or death of the surviving party, for the division of the funds among the children or issue of the marriage, according to the terms specified. A marriage settlement is not defeasible by the bankruptcy of either party, and can not be defeated by the voluntary act of either party. The custom of marriage settlements arose largely out of the unequal rights of the husband over the wife's property by the common law, but has continued notwithstanding that the Married Women's Property Act of 1882 in Great Britain, and acts amendatory thereof, have largely removed these inequalities. In the U. S. marriage settlements are comparatively rare. See Marriage and Married Women.
F. Sturges Allen.

Marsh, Alfred Henry: Canadian lawyer and law-writer; b. near Brighton, Ontario, May 30, 1851; educated at Brighton grammar school and the University of Toronto, graduating in 1874; read law, and was called to the bar in 1877; was appointed lecturer on equity in the law school, Osgoode Hall, 1883, and reappointed in 1889, in which year he was also created a queen's counsel; he is a well-known writer on legal topics connected with Canadian local matters, and international law affecting Canadian questions, in the *Canada Law Times*, the *American Law Review*, etc. He has published a *History of the Court of Chancery and of the Rise and Development of the Doctrines of Equity* (1888).

Marteau, Henri: violinist; b. in Rheims, France, in 1874, his father being an amateur violinist, and his mother a pianist, a pupil of Madame Clara Schumann. When five years old he attracted the notice of Sivori, the violinist, who presented to him a little violin. He then began his studies, continuing them in Paris, and in Apr., 1884, he first appeared in public in Rheims. Since then he has performed in Paris, London, Vienna, Berlin, and Dresden, and afterward he went to New York. D. E. Hervey.

Marti, mar-tee', José Julian: Cuban patriot; b. in Havana, Jan. 28, 1853; forced to work in the quarries as a convict in 1868, and afterward sent to Spain; studied in Madrid and Saragossa, and became a lawyer in 1876. He was a close student of American history, and enthusiastically asserted that Spanish America could independently become so prosperous as to secure the permanent friendship and respect of all other countries. He demanded absolute independence for Cuba, and was twice imprisoned in Spain as a rebel, but escaped each time, and finally was considered by the Cubans as the creator of the latest Cuban revolt. He was noted also as a teacher, journalist, and poet. He was for a short time Professor of Philosophy and Literature in the University of Guatemala, and was consul in New York for Uruguay, Paraguay, and the Argentine Republic, and a member of the Pan-American Congress held in Washington. He was a regular contributor to a number of journals. He translated into Spanish Helen Hunt Jackson's novel *Ramona*

(1888), published *Ismaelillo*, a small volume of poems, and a book on Guatemala, and wrote several plays. He founded in New York the newspaper *La Patria*. Killed in battle at Dos Rios, Cuba, May 19, 1895.

Martin, Henry Newell: biologist; b. in Newry, Ireland, July 1, 1848; was educated at University College, London; received the degrees of B. S., M. B., and D. Sc. 1870–72, and was appointed university scholar in zoölogy and physiology; took the degree of B. A. at Christ College, Cambridge, 1874, where he became a fellow and lecturer on natural history; removing to the U. S., became Professor of Biology at Johns Hopkins University in 1876, and was made director of the biological laboratory; demonstrated that the heart of a warm-blooded animal can be kept beating normally long after death, that alterations in arterial or venous pressure do not directly cause any change in the pulse-rate, and that the rate of the heart-beat may be greatly influenced by slight changes of temperature in the blood supplied to the heart, thus proving that the rapid pulse in fever is not a nervous phenomenon; was appointed Croonian lecturer of the Royal Society of London for 1883; received the honorary degree of M. D. from the University of Georgia in 1881; is a member of many scientific societies in the U. S., and a fellow of the Royal Society of London. He edits the *Studies from the Biological Laboratory* of Johns Hopkins, and is associate editor of the *Journal of Physiology*; collaborated with Thomas H. Huxley in the preparation of *Practical Biology* (1876). His published works include *The Normal Respiratory Movements of the Frog and the Influence upon its Respiratory Center of Stimulation of the Optic Lobes* (1878); *On the Influence of Stimulation of the Mid-Brain upon the Respiratory Rhythm of the Mammal* (1878); *On the Respiratory Function of the Internal Intercostal Muscles* (1879); *The Human Body* (1881); *Handbook of Vertebrate Dissection*, with William A. Moale (1881–84); *Observations in Regard to the Supposed Suction-Pump Action of the Mammalian Heart* (1887).

Martin, Thomas Mower: artist; b. in London, England, Oct. 5, 1838; educated at the Military College, Enfield. He studied art in the South Kensington Galleries, and in 1862 moved to Toronto, Ontario. He was one of the founders of the Royal Canadian Academy, and in 1877 became director of the Ontario School of Art, which he had established. Among his pictures are *The Untouched Wilderness*, painted for Queen Victoria and now in Windsor Castle; *A Summer Idyll*; *Whisky Ring*; *Sunrise*; *Muskoka*; *Bear-Hunting*; *Trappers and Wolves*; *The Return from the Raid*; *Post Office*.

Martyn, William Carlos. D. D., Lit. D.: clergyman and author; b. in New York city, Dec. 15, 1843; graduated at Union Theological Seminary in 1869; held pastorates in St. Louis, Mo., Portsmouth, N. H., New York city, Newark, N. J., and Chicago, Ill., 1869–94. His publications are *Life of John Milton* (1865); *Life of Martin Luther* (1866); *History of the English Puritans* (1866); *History of the Huguenots* (1867); *The Dutch Reformation* (1867); *History of the Pilgrim Fathers* (1867); *Wendell Phillips, the Legislator* (1891); *William E. Dodge, the Merchant* (1892); *Life of John B. Gough* (1894); *Christian Citizenship* (1896); and *Sour Saints and Sweet Sinners* (1898).

Masson, Antoine Philibert: French scientist; b. in Auxonne, Côte-d'Or, in 1806; in 1845 became Associate Professor of Physics in the Faculté des Sciences at Paris. He wrote two important works, entitled *Théorie physique et mathématique des phénomènes electro-dynamiques et du magnétisme* (1838) and *Etudes de photométrie électrique* (1845), besides various articles in the *Annales de physique et de chémie*. He also invented the Masson disk. (See Recording Apparatus, Psychological.) D. in Paris, Dec. 1, 1860.

Materna, Amalia: singer; b. in St. Georgen, Styria, July 10, 1847, the daughter of a schoolmaster. Her first public appearance as a singer was in 1864, and soon afterward she married Karl Friedrich, a German actor. In 1869 she took the part of Selika in Meyerbeer's *L'Africaine* at the Imperial Opera-house, Vienna, and at once took a leading place. She sang Brunhilde in the Wagner Festival at Bayreuth in 1876, and when Dr. Leopold Damrosch established German opera in the Metropolitan Opera-house, New York, he engaged her for leading parts. She also sang in the great music festival in the Seventh Regiment armory in New York in May, 1882, and in the Wagner festival concerts in Apr., 1884, both under the direction of Theodore Thomas.

D. E. Hervey.

Mathew, Sir James Charles, LL. D.: English judge; b. in Bordeaux, July 10, 1830; he studied law and was called to the bar in 1854, after taking his degree at Trinity College, Dublin, where he was senior moderator in 1850; he then entered upon the practice of his profession and at once achieved distinction; was junior counsel for Lloyds in 1866, junior counsel for the crown in the Tichborne case in 1873, member of the law procedure committee in 1880. He was made a bencher of Lincoln's Inn, and appointed judge of the high court of justice in 1881. In 1890 he was made member of the council of legal education, and chairman of the board of studies, and in 1892 chairman of the evicted tenant commission; in 1895 was appointed judge of commercial court.

F. Sturges Allen.

Mathews, William, LL. D.: author; b. in Waterville, Me., July 28, 1818; graduated at Waterville College (now Colby University) in 1835; studied law in Waterville and at Harvard; was admitted to the bar in 1838, but devoted another year to study and traveled and taught in Virginia during the next year. He began to practice law in Waterville in 1841, but soon left it to publish the *Watervillonian*, a literary and family newspaper, changed a year later to the *Yankee Blade*, which was published in Gardiner, Me., 1843–47, in Boston 1847–56, and then sold and united with the *Portfolio*. In 1856 Dr. Mathews settled in Chicago, Ill., and in 1862 became Professor of Rhetoric and English Literature in the University of Chicago, which professorship he held until 1875. In the meantime he had published two books, the success of which caused him to resign, in order to devote his whole time to literary production. He moved to Boston, Mass., in 1880. In 1868 he received the degree of LL. D. from Colby University. His works include *Getting On in the World* (Chicago, 1872; reprinted in London and translated into Swedish and Magyar); *The Great Conversers, and other Essays* (1873); *Words, their Use and Abuse* (1876; enlarged ed. 1884); *Hours with Men and Books* (1877); *Monday Chats*, translations from Sainte-Beuve's *Causeries du Lundi*, with an essay on the life and writings of Sainte-Beuve (1877); *Oratory and Orators* (1879); *Literary Style, and other Essays* (1881); *Men, Places, and Things* (1887); *Wit and Humor, their Use and Abuse* (1888); and *Nugæ Litterariæ, Essays on Social and other Themes* (1896).

Mattei, Tito: pianist; b. in Campobasso, Italy, May 24, 1841, and studied in Naples. He soon became a fine pianist. As early as 1852 he was named "professore dell' Academia di Santa Cecilia," and later received a gold medal for playing before Pope Pius IX., besides many decorations and orders from the King of Italy, who appointed him pianist to the king. For many years he has lived in London, where his piano compositions and songs are much admired. His song *Non e ver* had a remarkable popularity.

D. E. Hervey.

Matthews, Edmund Orville: naval officer; b. in Baltimore, Md., Oct. 24, 1836. Appointed to the Naval Academy from Missouri, he graduated in 1855; became master 1858, and lieutenant 1860; attached to the Wabash, he took part in capturing the Confederate forts at Hatteras Inlet 1861; was made lieutenant-commander 1862; commanded the Sonoma, South Atlantic squadron, 1864–65; served on the staff of Admiral Dahlgren; was on duty at the Naval Academy 1865–69; chief of the torpedo corps 1873; was advanced to commander in 1870; with the Asiatic squadron 1873–77; inspector of ordnance at the Brooklyn navy-yard 1878–81; became captain 1881, commodore 1894, rear-admiral 1898, retired in the same year and was appointed president of the examining board.

Maurel, Victor: singer; b. in Marseilles, France, and educated at the conservatory in Paris, gaining the first prize in 1867. He developed a fine barytone voice and speedily made his name famous in opera, singing in Paris, Italy, London, and for several seasons in New York.

Mauritius: The sugar-export bounties offered by various states of Europe so increased production and glutted the European market that the sugar exports from Mauritius to Great Britain almost ceased in 1896, and the sugar industry of the island would have been killed if the newly opened East Indian market had not taken about as much as Great Britain had formerly imported. The sugar exports to Great Britain in 1894 were $772,840 and in 1896 only $83,-

655. The mother country had usually taken nearly all the raw sugar; but of 116,454,600 kilogrammes exported in 1896, she took only 6,582,789 kilogrammes. A larger business with India, South Africa, and Australia kept the island's trade flourishing. The exports in 1899 were $12,001,339; imports, $9,261,663. C. C. A.

Maxey, Samuel Bell: soldier; b. in Tompkinsville, Monroe co., Ky., Mar. 30, 1825; graduated at the U. S. Military Academy in 1846, and became a brevet second lieutenant of infantry; served throughout the Mexican war, and was breveted first lieutenant; resigned on Sept. 17, 1849, studied law, and in 1850 began its practice in Albany, Clinton co., Ky., and practiced in Paris, Texas, 1857–61. He raised a regiment, and entered the Confederate army as its colonel, joining Gen. Albert Sidney Johnston in Mar., 1862, at Decatur, Ala., and was soon promoted to be brigadier-general. Serving under Bragg, he assisted in an assault on the rear of Gen. Buell's army, and made valuable captures. He was at Port Hudson during the first siege, and took part under Gen. Joseph E. Johnston in defending Jackson, Miss. In 1863 he took command in Indian Territory, gathered an army of 8,000 men, and in Apr., 1864, engaged Gen. Frederick Steele and captured his train of 227 wagons, for which he was made a major-general. Gen. Maxey was elected to the U. S. Senate in 1874, and re-elected in 1881. D. in Arkansas, Aug. 16, 1895.

Maxwell, George Troupe: physician; b. in Bryan co., Ga., Aug. 6. 1827; studied at the Chatham Academy in Savannah, Ga., and graduated at the medical department of the University of the City of New York in 1848; practiced in Tallahassee, Fla., until 1857, and then became surgeon in the Marine Hospital in Key West, Fla. In 1860 he was made Professor of Obstetrics and Diseases of Women and Children in Oglethorpe Medical College, Savannah, Ga. A year later he enlisted as a private in the Confederate army, and after four months' service was commissioned a major, and in 1862 was promoted colonel. He organized in 1863 the Florida brigade in the Army of the Tennessee, and commanded it until the battle of Missionary Ridge, where he was captured. He was imprisoned on Johnson's island in Lake Erie until Mar., 1865. He returned to Florida, was a member of the convention to remodel the constitution and reorganize the State government, and in 1866 was elected to the Legislature. In 1871 Dr. Maxwell moved to Delaware, and settled in Middletown. He published *An Exposition of the Liability of the Negro Race to Yellow Fever*, and a history of his invention of the laryngoscope, for which he claims precedence to that of Prof. Johann N. Czermack.

Maxwell, William H., A. M., Ph. D.: educator; b. in Stewartstown, Ireland, Mar. 5, 1852; educated at Royal Academical Institution, Belfast, and Queen's University, Dublin (Belfast and Galway Colleges); B. A. 1872; M. A. 1874; Ph. D., St. Lawrence University, New York; instructor in English, Victoria College, Belfast, 1872–74; associate superintendent of schools, Brooklyn, N. Y., 1882–87; superintendent of schools, Brooklyn, 1887–98; city superintendent of schools of the city of New York since 1898; author of *First Book in English*; *Introductory Lessons in English Grammar*; *Advanced Lessons in English Grammar*; *Pope's Homer's Iliad* (in collaboration with Percival Chubb). C. H. Thurber.

Mayer, Constant: artist; b. in Besançon, France, Oct. 4, 1832; studied art in Paris, where he worked until 1857, when he removed to New York city; has often exhibited at the Paris Salon; became an associate of the National Academy of Design in 1866, and was made a chevalier of the Legion of Honor in 1869. Among his paintings are portraits of Gens. Grant and Sherman; *Consolation*: *Riches and Poverty*; *Maud Muller*; *Street Melodies*; *Early Grief*; *Song of the Shirt*; *The Vagabonds*; *Lord's Day*; and *The First Communion*.

Meade, Richard Worsam: naval officer; b. in New York city, Oct. 9, 1837; eldest son of Commodore Richard W. Meade, U. S. N., and a nephew of Gen. George Gordon Meade; entered the navy as a midshipman Oct. 2, 1850; promoted passed midshipman June 20, 1856; master Jan. 22, 1858; lieutenant the next day; lieutenant-commander July 16, 1862; commander Sept. 20, 1868; captain Mar. 13, 1880; commodore May 5, 1892; rear-admiral Sept. 7, 1894; was retired May 20, 1895. He was very actively employed during the civil war on the Mississippi river and in the South Atlantic and West Gulf blockading squadrons. He commanded the Narragansett on a cruise in the Pacific ocean from Mar. 21, 1871, to Apr. 1, 1873, during which time he surveyed harbors and islands, collected overdue indemnities, and negotiated treaties. He was naval commissioner to the World's Columbian Exposition in 1893, and in Aug., 1894, succeeded Admiral Stanton in command of the North Atlantic squadron. A disagreement between Admiral Meade and the Navy Department, in connection with which it was rumored that he would be court-martialed for disrespect to the President, led to his retirement. D. in Washington, D. C., May 4, 1897.
